

IDEAL INDICATORS

Care and Use of Ideal Indicators: The contact can be moved into any position from one side of the indicator to the other according to the requirements of the work to be tested. This is done by simply pushing it into the desired position. A little more pressure is required to change the position of the contact than is required to move the indicating finger across the scale.

Keep free from dirt, dust and oil as much as possible.

When inclined to stick, hold contact between thumb and finger and move it back and forth quickly, causing the finger to move from one extreme end of the scale to the other in rapid succession; repeat this operation with the contact in various positions; this will tend to remove any particle of dirt that may have become lodged inside of the indicator.

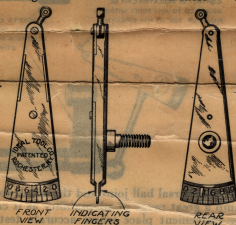

Repairs: Send **ONLY** the part that needs repairing direct to factory. A card will be mailed to you stating cost. Upon receipt of money immediate attention will be given.

Extra Parts:

Contact complete with lever	\$.65
