If any part appears to have been bit too dark, it must be burnished down with a steel burnisher; and this requires great delicacy and good management not to make the shade streaky; and the beauty and durability of the grain are always somewhat injured by it, so that it should be avoided as much as possible.

Those parts which are not dark enough must have a fresh grain laid over them, and be stopped round with varnish and subjected again to the aqua fortis. This is called *re-biting*, and requires peculiar care and attention. The plate must be very well cleaned out with turpentine before the grain is laid on, which should be pretty coarse, otherwise it will not

lie upon the heights only, as is necessary in order to produce the same grain. If the new grain is different from the former, it will not be so clear nor so firm, but rotten.

We have now given a general account of the process of engraving in aquatinta; and we believe that no material circumstance has been omitted, that can be communicated without seeing the operation. But after all, it must be confessed, that no printed directions whatever can enable a person to practise it. Its success depends upon so many niceties and attention to circumstances apparently trifling, that the person who attempts it must not be surprized if he does not succeed at first. It is a species of engraving simple and expeditious, if every thing goes on well; but it is very precarious, and the errors which are made are rectified with great difficulty.

It seems to be adapted chiefly for imitations of sketches, washed drawings, and slight subjects: but does not appear to be at all calculated to produce prints from finished pictures, as it is not susceptible of that accuracy in the balance of tints necessary for this purpose. Nor does it appear to be suited for book plates, as it does not throw off a sufficient number of impressions. It is therefore not to be put into competition with the other modes of engraving. If confined to those subjects for which it is calculated, it must be allowed to be extremely useful, as it is expeditious, and may be attained with much less difficulty than any other mode of engraving. But even this circumstance is a source of mischief, as it occasions the production of a multitude of prints that have no other effect than that of vitiating the public taste.

Engraving in aquatinta was invented by Le Prince, a French artist, who kept his process for a long time secret: and it is said he sold his prints at first as drawings. But he appears to have been acquainted only with the powder grain, and the common method of stopping out. The prints which he produced are still some of the finest specimens of the art. Mr. Paul Sandby was the first who practised it in this country, and it was by him communicated to Mr. Jukes. It is now practised very generally all over Europe, but no where more successfully than in this kingdom.

AQUATULCO. See **AQUATULCO.**

AQUAVIVA, CLAUD, in *Biography*, the son of Andrew Aquaviva, duke of Atri in Naples, was born in 1542, and at the age of 25 admitted among the Jesuits. In 1581. he was advanced to the office of general of the fraternity, and in the exercise of it was distinguished by his prudence and mildness. He drew up an order under the title of "Ratio Studiorum," printed at Rome in 1586, 8vo.; which much offended the Jesuits, and was suppressed by the inquisition; but it was reprinted in a mutilated state, in 1591. This ecclesiastic has left "Letters" in French and Latin, "Meditations on the 44th and 93d psalms," and also a treatise intitled "Industria ad curandos animæ morbos," printed in 1606, 12mo. *Nouv. Dict. Hist.*

AQUAVIVA, in *Geography*. See **AQUAVIVA.**

AQUEDOCHTON, the outlet of lake Winnipicogee in New Hampshire, North America, N. lat. 43° 40': whose waters pass through several smaller ones in a south-west course, and empty into Merrimack river between the towns of Sanburn and Canterbury.

AQUELAOR, one of the Lacadives islands; N. lat. 10° 45'. E. long. 73° 25'.

AQUENSIS COLONIA, in *Ancient Geography*, the town of AIX.

AQUENSIS, the name of an episcopal see of Africa, in Mauritania Cæsariensis: also, an episcopal see in Bizacium.

AQUENSIS VICUS, or *Aque Onofia*, is the ancient name of the present Bagneres.

AQUEOUS, **AQUOSUS**, something that partakes of the nature of WATER, or abounds therewith.

AQUEOUS bath. See BATH.

AQUEOUS humour, in *Anatomy*, is the front humour of the eye, which occupies the space between the cornea and the crystalline lens, and across which the iris may be considered as floating. See EYE.

AQUETTA, a name for a kind of liquid poison made much use of by the Roman women, under the pontificate of Alexander VII.

This poison was prepared, and sold in drops, by Tophania, or Toffania, an infamous woman, who resided first at Palermo, and afterwards at Naples. From her they obtained the name of *aqua Tophania*, *aqua della Toffana*, and also *acquetta di Napoli*. It is said, that she distributed her preparation to wives who wished to have other husbands, and that it was secretly administered in many cases, which rendered the removal of obnoxious persons desirable; and that five or six drops were sufficient for destroying a man, and that the dose might be so proportioned as to operate in a certain time. This woman was imprisoned at Naples, and was living there in 1730, when Keyser visited the city. This traveller says, that since it has been discovered that lemon-juice is an antidote to it, the composition is sunk into disrepute. He adds, that Dr. Branchaletti wrote a book expressly on the remedies or antidotes against these stygian drops, which continued to be privately made and vended at the period above mentioned. (Keyser's Travels, vol. iii. p. 37.) Tophania (says Labat in his Travels through Italy, vol. iv. p. 33.) distributed her poison in small glass phials, with this inscription, *Manna of St. Nicholas of Bari*, under a pretence that it was a miraculous oil which dropped from the tomb of that Saint at Bari in the kingdom of Naples, and that it was effectual for the cure of many diseases. Upon being put to the rack, this woman acknowledged her wickedness, and impeached several ecclesiastics by whom she was protected. She was afterwards strangled. This art of administering secret poison was much practised in France and Italy about the close of the 17th and commencement of the 18th century. It was communicated by Godin de Sainte Croix, a dissipated young man of respectable family in France, to the Marchioness de Brinvillier, with whom he had intrigues. St. Croix was suffocated in his laboratory, whilst he was preparing his poison; and the Marchioness, whose whole life had been singularly infamous, and who confessed her horrid crimes, was executed at Paris, July 16th, 1676, and afterwards beheaded and burned. Garelli, physician to the emperor Charles VI. who was king of the two Sicilies when Toffania was arrested, in a letter to the celebrated Hoffman, in 1718 or 1719, says, that the slow poison administered by this wretch to the destruction of 600 persons, was nothing else than crystallized arsenic, dissolved in a large quantity of water by decoction, with the addition, for some purpose unknown to him, of the herb *cymbalaria*. Hoffman. Med. Ration. System. t. ii. p. 2. c. 2. § 19. p. 185. Hala 1729. 4to. It has been concluded also from the effects produced by the poisons of Toffania and Brinvillier, that they were arsenical mixtures; though some have maintained, that they were composed of opium and cantharides. This mixture is represented as a liquor, no less limpid than rock-water, and altogether insipid. Its effects were slow and almost imperceptible, and a few drops of it were administered in tea, chocolate, or other dietetic liquid.

AQUI, or **AQUITA**, in *Geography*, a town and province of Japan, in the southern part of the island of Nippon, near the straits of Sanguar.

AQUIABENSIS, in *Ancient Geography*, an episcopal see of Africa, in Bizacium.

AQUIDNECK, the ancient name of Rhode island.

AQUIFOLIUM. See ILEX.

AQUIGUI, or **ACQUIGNI**, in *Geography*, a town of France in the department of the Eure, one league from Louviers.

AQUILA, in *Astronomy*, a constellation of the northern hemisphere; usually joined with Antinous.

The stars in the constellations, Aquila and Antinous, in Ptolemy's catalogue, are 15; in Tycho's, 19; in Hevelius's, 42; in the Britannic catalogue, 71: but in Aquila alone, Tycho reckons 12 stars, and Hevelius 23: the principal star being Lucida Aquila, between the first and second magnitudes.

AQUILA, in *Chemistry*, has several significations, according to the epithets joined with it.

AQUILA alba is a name given to a combination of corrosive sublimate with fresh mercury, called *mercurius dulcis*.

AQUILA, in *Ancient Geography*, a river of Scythia, near mount Caucasus.

AQUILA, anciently *Avia* or *Avella*, in *Geography*, a city of Italy, and the capital of Abruzzo ultra, situate on a hill near the river Pescara; is the see of a bishop, and was once fortified, but now quite dismantled. In 1703, it suffered much from an earthquake, which damaged a great part of the town, and destroyed 24,000 persons, and dangerously wounded 1500; on this occasion, 800 were swallowed up, together with the church, to which they had fled for refuge. The territory of Aquila formerly furnished Italy, almost exclusively, with saffron; but since that plant has been so much cultivated in Lombardy, it has declined in Abruzzo. Aquila is 50 miles NE. of Rome, and 93 N. of Naples. N. lat. 42° 19'. E. long. 14° 20'.

AQUILA, in *Biography*, a native of Sinope, a city of Pontus, flourished at the beginning of the second century, under Adrian, and was employed by him as superintendent of the public buildings, and particularly of the new city called *Ælia*, which the emperor was erecting on the site of the ancient Jerusalem, destroyed by Titus. Here he became a proselyte to Christianity, and was baptized; but his attachment to astrology offended the Christians, and they excluded him from their communion. Disgusted by this treatment, he renounced Christianity, joined the Jews, and became a disciple of the rabbi Akibha. At their request, being previously instructed in the Hebrew language, he undertook, about the year 128 or 129, a new Greek version of the Hebrew scriptures. In this translation, which was very acceptable to the dispersed Jews, and which was read in their synagogues, he proposed to adhere more literally and accurately to the Hebrew text than the Septuagint; but he has been charged, both by ancient and modern writers, with perverting the original text, in order to render his version less favourable to the Christians. On the other hand, it has been alleged in favour of its accuracy and fidelity, that it was not only adopted by the Jews in their synagogues, but mentioned with approbation by many Christian writers, and frequently cited by the Christian fathers, instead of the Hebrew text, which few of them were capable of reading. This version was corrected and improved by Aquila, in a second edition; the public use of which was prohibited, as some have thought, in Justinian's Novella 146, under the title of *Δεσπερσιον*: but others have supposed, with greater probability, that this prohibition refers to a distinct work, framed by Aquila, from the instructions of his master Akibha; and containing the traditional institutions of the Jews. Of Aquila's version, some few fragments only are extant. See HEXAPLA.

Eusebius Eccl. Hist. l. v. c. 8. p. 173. Cave, Hist. Lat. vol. 1. p. 54. Fabr. Bib. Græc. l. iii. c. 12. t. ii. p. 332, &c.

AQUILA and PRISCILLA were natives of Pontus, and converted to the Christian faith by the apostle Paul. They lived at Corinth, being obliged to quit Rome and remove thither by the edict of Claudius, which banished all Jews from that city; and here Paul lodged with them. When the apostle left this city, Aquila and Priscilla accompanied him to Ephesus, A. D. 56, where they exposed their own lives to danger for preserving him. When the apostle wrote his epistle to the Romans, A. D. 58, they were at Rome, as he distinguishes them in this epistle by his salutations. We find them again at Ephesus, when St. Paul wrote his second epistle to Timothy, A. D. 61., but what became of them afterwards is not known. These early converts were tent-makers; and as they had, probably, a considerable number of servants in their house, who were instructed by them in the Christian faith, they had, by means of these, "a church in their house," wherever they settled. Acts, xxvii. 2. &c. Rom. xvi. 4. 2 Tim. iv. 19. The Greeks call Aquila, bishop and apostle, and honour him July 12. The festival of Aquila and Priscilla is placed, in the Roman calendar, July 8.

AQUILA, FRANCESCO FARABONE, an engraver of some eminence, who flourished from 1691 to 1722, was born at Palermo, but chiefly resided at Rome. His engravings are numerous, and many of them esteemed. His style of engraving, in general, is rather neater than that of Pietro, but much inferior in drawing and expression. Strutt.

AQUILA, PIETRO, an eminent engraver, was born at Palermo, and flourished about the year 1696, and resided at Rome. As a designer and painter, he stands high in the estimation of the curious; but he is more generally, and perhaps more deservedly known, as an engraver. He drew admirably, and etched in a bold free manner, finishing his lights and harmonizing his shadows with small dots. His general faults are want of effect from scattering his lights, and what by the artist is called "manner" in his drawing. In all his works he manifests much scientific knowledge. Strutt.

AQUILÆ Arbor, in Botany, a name given by some authors, to the tree whose wood is the *agallochum*, or lignum aloes of the shops.

AQUILANO, SERAFINO, in Biography, so called from Aquila in Abruzzo, the place of his nativity, was born in 1466; and obtained great reputation as an "improvvisatori," or extemporaneous maker of verses, which he recited with enthusiasm, and accompanied with the strains of his lute. In consequence of his performances in this way, he was patronized by many Italian princes; and his written poems also gained considerable applause. A collection of his sonnets, eclogues, epistles, &c. was printed at Rome in 1503, 8vo. The sonnets have obtained the highest reputation, and some have preferred them even to those of Petrarch; but the works of Serafino have now sunk into oblivion. He died at Rome in 1500. Nouv. Dict. Hist.

AQUILANUS, SEBASTIANUS, supposed to have taken his name from Aquila, the place of his birth, was professor of medicine at Padua, in the latter part of the fifteenth century. He is one of the early writers on the venereal disease, his account of which "De Morbo Gallico," dedicated to Lewis de Gonzaga, bishop of Mantua, was published, Alruic supposes, in 1489. It now stands first in Lufinus's collection of writings on the subject. He was acquainted with the use of mercury in the cure of the disease, and cautions us against employing it in weak and debilitated habits. His work passed through several editions. He also wrote "Questio de febre sanguinea,"

first printed at Basil, in 1537. Alruic de morbo Gallico, p. 578, and Haller's Bib. Med. Pract.

AQUILARIA, in Botany, from *Aquila*, an eagle, a large tree affecting a lofty situation. Lin. gen. Schreb. 1753. Juss. 439. Cavanill. Diff. 7. p. 377. t. 224. *Alcesylva*, Loureiro Cochinch. 274. Class, *decandria monogynia*. Gen. char. Cal. perianth. one-leaved, permanent; tube, bell-shaped; limb, five-cleft; clefts ovate, acute, flat, spreading. Cor. none; nectary one-leaved, pitcher-shaped, of the length of the tube of the calyx, half five cleft; clefts bifid, obtuse. Stam. filaments ten, alternating with the clefts of the nectary; anthers oblong, versatile. Pist. germ ovate superior; style none; stigma simple. Per. capsule on a very short pedicel, obovate, woody, two-celled, two-valved; with the partition contrary, and bipartite. Seeds solitary, oblong.

Ess. gen. char. Cal. five-cleft. Cor. none; nect. pitcher-shaped, half five-cleft; clefts bifid; capsule superior, woody, two-celled, two valved. Seeds, solitary.

Species, 1. *Aquilaria ovata*; leaves alternate, ovate, mucronate. This is a large tree covered with greyish bark. Its leaves are entire, smooth, veined, about eight inches long, and stand on short hairy footstalks. The flowers terminate the branches, on many-flowered peduncles. A native of the mountains of Malacca and Cochin-China. The wood of this tree has been long used as a perfume; and was formerly an article of the materia medica, under the name of *agallochum*, lignum aloes, or aloes wood. This wood in its natural state is white and inodorous. That which possesses the peculiar *aroma* for which it is valued, is supposed to be the consequence of a diseased process in the tree, causing the oleaginous particles to stagnate and congregate into a resin, in the inner parts of the trunk and branches; by which the natural appearance of the wood is altered, so as to become of a darker colour, and of a fragrant smell. At length the tree dies, and when split, the resinous part is taken out. The perfumes which this wood affords, are highly esteemed by the oriental nations; and from the bark of the tree is made the common paper which the Cochin-Chinese use for writing; in the same manner the Japanese make use of the bark of a species of mulberry (*morus papyrifera*). This perfume is said to be useful in vertigo and palsy: given in the form of powder, it is recommended to restrain vomitings and alvine fluxes. To us, however, it seems to contain little else than that camphoraceous matter common to many other vegetable substances. From its bitter taste, it has the name of aloes, although no otherwise allied to it.

AQUILARIA, in Ancient Geography, *Lowbareab*, a town of Africa, east-north-east of Nisua, or Seedy Doude, and south-west of the promontory of Mercury. In this place, says Cæsar (De Bell. Civil. l. ii. 21.), Cæsar disembarked his troops, which were afterwards cut in pieces by Sabura. Many fragments of antiquities are still extant in this place. Shaw's Trav. p. 88.

AQUILEGIA, in Botany, also called *Aquilina* (from *Aquila*, an eagle; the nectaries being fancied to resemble an eagle's claws), the plant named columbine, from a supposed resemblance the same parts of the flower bear to the head of a pigeon (*columba*). Lin. gen. 684. Schreb. 934. Juss. 234. Gært. t. 118. Class, *polyandria pentagynia*. Nat. order, *multistigæ, ranunculaceæ*, Juss. Gen. char. Cal. none. Cor. petals five, lanceolate-ovate, flat, spreading, equal; nectaries five, equal, alternate with the petals, horned, gradually broader upwards, with an oblique mouth, attached to the receptacle; each produced below into a long attenuated tube, with an obtuse top. Stam. filaments thirty or forty, subulate, the outer ones shorter; anthers oblong, erect, the height of the nectaries. Pist. germs five, ovate-oblong, ending in subulate

ulate styles, longer than the stamens; stigmas erect, simple; chaffs ten, wrinkled, short, separate, involving the germs. *Per.* capsules five, distinct, cylindric, parallel, straight, acuminate, one-valved, gaping from the tops inward. *Seeds* very many, ovate, keeled, annexed to the gaping future.

Ess. gen. char. *Cal.* none; petals five; nectaries five, horned between the petals. *Capsf.* five, distinct.

Species, 1. *A. viscosa*; clammy columbine; stem almost naked, with viscid hairs, and one or two flowers; leaves subtrilobate. It rises about a foot high, covered with glutinous hairs. Radical leaves palmate, three-lobed; stem leaves commonly one, sometimes two, ternate; peduncles one-flowered. A native of the south of France. 2. *A. vulgari*; common columbine. It grows three feet high, producing its flowers, which are blue, from the tops of its naked branches. The lower leaves are petiolate, biternate, smooth, glaucous underneath; the upper digitate. This plant grows wild in England, and in most parts of Europe; and varies much not only in the colour of its flowers, but in the number of its pistils and nectaries. The varieties to be found in gardens, are α . single garden columbine; β . double-flowered columbine; γ . double inverted columbine; δ . rose columbine; ϵ . *A. degener virescens* of Ray, Parkinson, &c.; ζ . Harry columbine; η . Siberian columbine. The common columbine has been esteemed for its medicinal virtues; and for this purpose every part of the plant has been used: but judging from its sensible qualities, there seems little or no foundation for its supposed medical properties, although Linnæus has affirmed that children have lost their lives by an over dose of it. 3. *A. alpina*; Alpine columbine; nectaries straight, shorter than the lanceolate petal. It has been doubted by some botanists, whether or not this is a variety of the *A. vulgari*, from which it differs in having larger flowers, though its stem and leaves are smaller than those of the common columbine. A native of the Alps, and also said to have been found in Westmoreland; cultivated by Miller, in 1731. Biennial. 4. *A. Canadensis*; Canadian columbine; nectaries straight; stamens longer than the corolla; root perennial; stems very slender, reddish; lower leaves biternate, irregularly divided, the extreme lobes blunt; the upper lobes simply ternate, toothed, or perfectly entire; the uppermost simple, lanceolate, acuminate; the corollas yellow within and red on the outside. A native of the northern parts of America. Miller, fig. t. 47. Introduced here by Mr. John Tradescant, sen. before the year 1640. 5. *A. viridiflora*; green-flowered columbine; nectaries straight, thickened, and a little bent at the tip; stamens nearly equal to the corolla; root perennial; stems a foot high or more, slightly angular, villose; petals pale green, wrinkled, shorter than the borders of the nectaries; which are of a greenish yellow within, and brownish on the outside; stamens only half the length of the corolla; styles longer than the corolla. A native of Siberia, where it was found by Pallas.

Propagation and culture. These plants are all raised by sowing the seeds, or parting the old roots, but the former is chiefly practised; for the old roots are very apt to degenerate, and produce plain flowers. The seeds should be sown in August or September, in a nursery-bed. The spring following the plants will appear, when they should be constantly cleared from weeds, and occasionally refreshed with water. Towards the latter end of May, these plants will be strong enough to transplant into a bed of good fresh earth; and in the following autumn, the roots should be carefully taken up and planted in the borders of the flower-garden, where they will flower the succeeding spring. To prevent the

plants from degenerating, the flower stem should be cut off as the flowers begin to wither. In order to keep up a succession of good flowers, fresh seeds should be sown every year, observing, not to sow those that are produced from plain flowers. See Miller's Dict. by Martyn.

AQUILEIA, in *Ancient Geography*, *Aquilea*, an ancient and a large city of Italy, situate on the sea coast at the entrance of the Sinus Tergetinus, or gulf of Trieste, was built, according to Strabo (l. v.), by the Romans, in order to restrain the barbarians; and a Roman colony was conducted thither between the first and second Macedonian wars. It was washed, says Pliny (H. N. l. iii. c. 18.), by the two rivers Natifo and Turrus. It was augmented, according to Livy (l. xliii. c. 17.), by 1500 families, by a decree of the senate; and afterwards, as Herodian (l. vii. c. 11) informs us, became a celebrated emporium. Julian ascribes its name to the augury of an eagle (*aquila*) at the time of building it: Vossius deduces it from the abundance of its waters, as if it were "Aquilegia;" but the appellation was more probably derived from aquila, the eagle, which was the standard of the Romans, who had long encamped in this place. Strabo (ubi supra) says, that the harbour, at the mouth of the Natifo, was at the distance of 60 stadia from the city, so that ships of burden were towed up the river. This city was of such importance, that it was one of the first places which the partisans of Vespasian took possession of A. D. 69. In the year 166, the emperors Marcus Aurelius and Verus wintered there, previously to their taking the field against the Marcomanni; who, having defeated Vindex, the prætorian prefect, in 170, entered Italy, and approached Aquileia. In 278, it was besieged by the troops of Maximin, who demolished its suburbs and beautiful vineyards, and employed the timber of the buildings, in the engines and towers with which the city was on every side assaulted. It was defended, however, by the invincible constancy of the citizens, and the army of Maximin was repulsed in repeated attacks: his machines were destroyed by showers of artificial fire; and the generous enthusiasm of the Aquileians was exalted into a confidence of success by the opinion that Belenus, their tutelary deity, combated in person in the preservation of his distressed worshippers. The Celtic deity, supposed to be Apollo, received, under that name, the thanks of the senate; and a temple was likewise erected to Venus the bald, in honour of the women of Aquileia, who had parted with their hair to make ropes for the military engines. In 452, Attila invaded Italy, and besieged Aquileia with an innumerable host of barbarians. On this occasion, the walls of the city were assaulted by a formidable train of battering rams, moveable turrets, and engines that threw stones, darts, and fire; and the monarch of the Huns employed the forcible impulse of hope, fear, emulation, and interest, to subvert this only barrier which delayed his conquest of Italy. Aquileia was, at that period, one of the richest, the most populous, and the strongest of the maritime cities of the Adriatic coast. After an ineffectual siege of three months, Attila was compelled, by the want of provisions, and the clamours of his army, to relinquish the enterprise, and to issue orders for this purpose; but as he rode round the walls, pensive, angry, and disappointed, he observed a stork preparing to leave her nest in one of the towers, and to fly with her infant family towards the country. He seized, with the ready penetration of a statesman, this trifling incident which chance had offered to superstition, and exclaimed, in a loud and cheerful tone, that such a domestic bird, so constantly attached to human society, would never have abandoned her ancient seats, unless those towers had been devoted!

devoted to impending ruin and solitude. The favourable omen inspired an assurance of victory; the siege was renewed and prosecuted with fresh vigour; a large breach was made in the part of the wall from whence the flock had taken her flight; the Huns mounted to the assault with irresistible fury; and the succeeding generations could scarcely discover the ruins of Aquileia. Gibbon's Hist. vol. vi. p. 122—124.

This place, formerly so rich and flourishing, is now known only by its ruins; and is reduced into a mean village, whence the patriarch of Aquileia derives his title: but as the territory of Aquileia belonged to the house of Austria, this house, and also the Venetians, pretended to nominate the patriarch. However, in 1751, the pope suppressed this patriarchate, and erected Udine, where the patriarch had used to reside, into an archbishopric for the Venetians, and Gorizia, or Goritz, a town of Carniola, into an archbishopric for the house of Austria. Aquileia is distant 18 miles S. S. W. from Goritz, and 20 S. from Friuli. N. lat. 45° 55'. E. long. 13° 30'.

AQUILEIA, *Aquapendente*, a small town of Italy, in Etruria, S. E. of Florentia. The name of *Aquileia* has been also sometimes applied to Forum Julii (Civitas del Friuli), the more recent capital of the Venetian province.

AQUILICIA, in *Botany*. See LEEA.

AQUILICIUM, or AQUÆLICUM, in *Antiquity*, a sacrifice celebrated among the Romans, in time of excessive droughts, to obtain rain of the gods.

Danet calls this *aquiliciana*. The priests who officiated at it were denominated *aquilices*, *quia aquam eliciebant*, because they brought down water: but where he finds this new order of priests, he does not tell us.

AQUILIFER, from *aquila*, eagle, and *fero*, I bear, among the Romans, an ensign-bearer, who carried the standard on which the eagle was represented.

AQUILINE, something belonging to an eagle. Hence, aquiline nose denotes an hooked nose, or such as is like the beak of an eagle; called also a hawk's nose.

AQUILO, is used by Vitruvius for the north-east wind; or that which blows at 45° from the north towards the east point of the horizon.

The poets gave the name *aquilo* to a stormy wind dreaded by the mariners.

AQUILONDA, in *Geography*, a large lake of Africa, in Ethiopia, at the foot of the mountains of the sun, on the confines of Congo and Angola.

AQUILONIA, in *Ancient Geography*, a town of Italy, in Apulia, situate in the road from Beneventum to Venusia. It belonged to the Samnites. This is also the name of another town in Apulia, in the road from Beneventum to Canusium, between Æquus Tullicus to the south-west, and Æce to the north-east.

AQUILUS, among the *Ancients*, a dark or dusky colour, approaching to black.

Hence some of the heathen gods were called *dii aquili*, q. d. *nigri*.

AQUIMINARIUM, in *Antiquity*, a kind of lustral vessel wherein the Romans carried their holy water for expiation, and other religious offices.

AQUINAS, THOMAS, in *Biography*, a famous scholastic divine, a descendant of the illustrious family of Aquino in the Terra di Lavoro, in Italy, was born at Aquino in the year 1224. He was sent, at five years of age, for education to Mount Cassino, and from thence he was removed to the university of Naples. Here he acquired that strong predilection in favour of a retired and studious life, which in-

duced him to enter himself, without the knowledge of his parents, among the Dominicans, in the order of the preaching friars. His mother was peculiarly solicitous to divert his design, and wished to obtain an interview with him for this purpose; but the monks were as anxious to retain him; and in order to prevent the effect of his mother's persuasion, removed him from one place to another, that she might have no opportunity of seeing him. At length, whilst they were conducting him to Paris, her other sons seized him and conveyed him to her castle, where he was confined for two years. Notwithstanding all his mother's importunities, his purpose was fixed; and for the accomplishment of it, he let himself from a window by night; and aided by his Dominican brethren, he escaped to Naples. In the year 1244, he was conducted by the master of the Teutonic order to Paris; and after some stay there, he removed to Cologne, and became a disciple of the famous Albert. Under this eminent preceptor, he was assiduous in his application, and made great attainments. His science, however, and apparent stupidity, induced his fellow-students to call him by the contemptuous appellation of the "dumb ox;" but Albert, more penetrating than they, said, "this ox, if he begin to bellow, will fill the whole world with his roaring." Accompanying Albert to Paris in 1246, he remained as a student in that university till 1248. At length Aquinas, having made himself master of the dialectics, philosophy, and theology of the age, became, at 24, an eminent teacher at Paris; and in 1255, obtained the degree of doctor in divinity. Such was his distinguished reputation, that he was honoured by the peculiar attention of princes and of popes. On one occasion, as he was dining with Louis IX. of France, called St. Louis, his thoughts were busily employed on the objections of the New Manichæans against the orthodox faith, and striking the table with his hand, after musing a long time in science, he suddenly exclaimed, "this is a decisive answer to the Manichæans." Upon a visit to Rome, whilst he was in the closet of pope Innocent IV., an officer brought in a bag of money, procured by the sale of absolutions and indulgences: "You see, young man," said the pope, "the age of the church is past, in which she said, *silver and gold have I none*:" Aquinas, replied, "True, holy father; but the age is also past, in which she could say to a paralytic, *rise up and walk*." In 1263, he returned to Italy, and was appointed rector of his order in the Roman province; and he continued to distinguish himself as a public preceptor in scholastic theology in several of the chief universities of that country. He was offered the archbishopric of Naples by pope Clement IV., but declined accepting a charge so weighty; and when the university of Paris, at a general chapter of the order held at Florence in 1272, demanded his return, he was detained by Charles, king of the Sicilies, and appointed professor of theology at Naples, with a monthly allowance of an ounce of gold as his pension. Being summoned to a general council held at Lyons in 1274, in order to present a book which he had written by order of pope Urban IV. for refuting the errors of the Greek church, he was seized, in his way through Campania, with a violent disorder; and died in the monastery of Fossa Nova, in the diocese of Terracina, in the year 1274. After his decease, the whole western world began to load him with honours. The Dominican fraternity removed his body to Toulouse; pope John XXII. canonized him; Pius V. gave him the title of "The fifth doctor of the church;" by others he was denominated "the angel of the schools," "the eagle of divines," and "the universal and angelic doctor;" and the

the vulgar believed that many miracles were wrought at his tomb; and it was said that the soul of Augustine had passed into Thomas Aquinas. His writings were held in the highest estimation; and his name was assumed, in the next century, by a sect, who, under the appellation of Thomists, long occupied the field of controversy with the Scotists, followers of Duns Scotus, in various metaphysical and theological questions.

Notwithstanding all the extravagant praises and honours which were lavishly bestowed on Thomas Aquinas, it is certain, that his learning was almost wholly confined to scholastic theology, and that he was so little conversant with elegant and liberal studies as not to be even able to read the Greek language. For all his knowledge of the Peripatetic philosophy, which he so liberally blended with theology, he was indebted to the defective translations of Aristotle, which were supplied by the Arabians; but he obtained from some unknown person a more accurate version of his philosophical writings. Adopting the general ideas of the age, that theology is best defended by the weapons of logic and metaphysics, he mixed the subtleties of Aristotle with the language of scripture and of the Christian fathers; and, after the manner of the Arabians, framed abstruse questions without end upon various topics of speculative theology. Upon the whole, his talents and industry, which under better direction might have been usefully employed, were misapplied to subtleties, which tending neither to enlighten the understanding nor to improve the heart, must be pronounced altogether useless. His writings are numerous: but the most celebrated are his "Summa Theologiæ," or summary of theology, which was received with great applause, and used as a text book of high authority in the instruction of youth; of this the second section, treating of morals, may be read with advantage; and his "Commentaries upon the works of Aristotle." A collection of his works was published, in seventeen folio volumes, at Venice, in 1490; at Nuremberg, in 1496; at Rome, in 1570; at Venice, in 1594; and at Antwerp, in 1612. The "Summa Theologiæ," has separately passed through several editions, as at Cologne, in 1604; Antwerp, 1624; Paris, 1638. But as neither the matter nor the style of the angelic doctor is much suited to modern taste, his writings have sunk into neglect and oblivion. Lord Herbert, in his life of Henry VIII., says, that one of the chief reasons that induced him to write against Luther, was his having spoken contemptuously of Aquinas. Cave. Hist. Lit. vol. ii. p. 306, &c. Brucker's Hist. Phil. by Enfield, vol. ii. p. 372, &c. Nouv. Dict. Histor.

AQUINO, PHILIP, a learned Jew, was converted to the Christian faith, and baptized at Aquino his native place, whence he derived his name. The clergy of France allowed him a pension. Such was his knowledge of the Hebrew language, that Le Jay entrusted him with the charge of printing and correcting the Hebrew and Chaldee texts of his polyglot bible. He was the author of several works; but the principal was his "Dictionarium Hebræo Chaldæo-Thalmudico-Rabbinicum," printed in folio, at Paris, in 1629. His son, Lewis Aquino, was also very learned in the oriental languages, and has left several rabbinical works. His grandson, Antony Aquino, was first physician to Louis XIV. Nouv. Dict. Histor.

AQUINO, *Aquinum*, in *Geography*, a town of Italy, in the kingdom of Naples and territory of Lavora; thirteen miles S. S. E. from Sora. It was the birth-place of Juvenal and of Thomas Aquinas. It was formerly a large municipal town, and a Roman colony; but the emperor Con-

rade ruined it; and it is now reduced to about thirteen houses. There are some remains of a theatre and amphitheatre, which indicate its former grandeur. N. lat. 41° 32'. E. long. 14° 30'.

AQUIQUI, in *Zoology*, the name of a particular species of monkey, called by the people of Brasil, the king monkey, as being much larger than all the other monkeys. It is the *SIMIA Beetzbuli* of Linnæus.

AQUITANI, in *Ancient History*, a people of Gaul, situated between the Garonne and the Pyrenees. Cæsar distinguishes the Aquitani from the Celtæ or Gauls; and, in reality, they were a different nation, and derived their origin from Spain. They were distributed in various districts; but that which preserved the name, was situated at the foot of the Pyrenees, where are now found Bearn and the diocese of Auch. The Aquitani were rich, as they possessed many mines, and an extensive commerce both by sea and land; hence they became corrupt and effeminate; and in this state the Romans found them; and though they made many efforts for resisting the attacks of these conquerors, they were at last compelled to submit in common with the other Gauls.

AQUITANIA, *Gallia Aquitanica*, or *Provincia Aquitanica*, in *Ancient Geography*, a considerable province of Transalpine Gaul, *Gallia Comata*, or Gaul properly so called. Some have supposed that it derives its name from the abundance of waters which the Romans found in this country. Aquitania, in the time of Julius Cæsar, was bounded by the Pyrenees and the Garumna or Garonne: Augustus extended it to the Liger or Loire. From his time it comprehended two provinces, known afterwards by the names of Aquitania Prima and Secunda; to which, in the time of Honorius, was added a third province, which had formerly been denominated *Novempopulania*. *Aquitania Prima* was bounded on the north by the Aureliani; on the east, by the Senones, Ædui, and Segusiáni, the Helvii, and the Volcæ Arecomici; on the south by the Volcæ Arecomici, the Umbranici, and the Tolosates; and on the west, by the Nitobriges, the Petroconi, and the Picinnes. It extended about 84 leagues from north to south, and in its greatest breadth about forty. Its chief city was Avaricum, afterwards Bituriges, and now Bourges. *Aquitania Secunda*, situate towards the sea, had on the north the river Liger; on the east, the Bituriges, Lemovices, and Cadurei; on the south, the Vesales, and Cecosates; and on the west, the ocean. It comprehended the Meduli on the left of the Garumna, towards its mouth. Its length was sixty-three leagues, and its greatest breadth forty. Its metropolis was B. rdigala, now Bourdeaux. *Aquitania Tertia*, or *Novempopulania*, was bounded on the north by the Bituriges Vivisci; on the east by the Nitobriges and Volcæ Tectosages; on the south, by the Pyrenees; and on the west, by the sea. It was about forty leagues long and as many broad. The first two provinces, viz. Aquitania Prima and Secunda, were conquered by Cæsar; the third by his lieutenants. When the emperor Honorius was under a necessity of surrendering to the Visigoths that part of Gallia Narbonensis, which was afterwards called Septimania, they soon took possession of the three provinces of Aquitania, and retained them till the time of Clovis, A. D. 486. Aquitania, after having undergone many revolutions, was erected into a kingdom in 778, by Charlemagne, and afterwards reduced into a dukedom by Charles the Bald. Aquitania, or Aquitaine, in later times, has been included between the Loire, the ocean, and the Pyrenees, and comprehended Guienne and Gascony.

AQUIZEBÁ,

AQUIZEBA, in *Geography*, a river of Spain, which runs into the Oris, below Tolosa, in Guipuscoa.

AQUISA, in *Geography*, a port on the fourth side of the island of Candia. N. lat. $35^{\circ} 3'$. E. long. $24^{\circ} 55'$.

AQUULA, the name of a disorder of the eyes, called also *hydatis*.

AR. See AAR.

AR, called also *Arcopolis*, *Ariel* of Moab, and *Rabbath-Moab*, in *Scripture Geography*, the capital of the Moabites, on one side of the river Arnon, opposite to *Aroer* on the other, in Arabia Petraea. St. Jerom says, that this city was destroyed by an earthquake, when he was young.

ARA *thuribuli*, the *Star of incense*, in *Astronomy*, a southern constellation, not visible in our hemisphere, consisting, according to Ptolemy, of seven stars; and according to Sharp's Catalogue, annexed to that of Mr. Flamsteed, of nine stars.

ARA, *Cape*, in *Geography*, anciently *Neptunium promontorium*, is the most southern cape of Arabia Felix, forming with the coast of Ajan, in Africa, the straights of Babel-mandel.

ARA *Amoris*, in *Ancient Geography*, a cape of Ethiopia, upon the Arabian gulph, according to Ptolemy.

ARA *Casaris*, *Arfago*, a place of Italy in Insubria, ten miles north of Melodunum.

ARA *Flavia*, a colony of Germany, noticed on a medal of Domitian.

ARA *Jovis Montani*, a place near the isthmus of the Thracian Chersonesus, between Pteloc and Leucæ-Acté.

ARA *Jovis Panomphæi*, a place in the Troade, between the Sigæan and Rhætian promontories.

ARA *Lugdunensis*, an altar consecrated to Augustus by sixty cities of Gaul, in the year of Rome 742, upon the point of land formed by the confluence of the Rhone and Saone; called by the writers of the middle age *Attanacum*, now the point of Annai. Dion Cassius informs us, that in his time, two centuries after Augustus, the altar, and the honours rendered to this emperor, subsisted. Juvenal mentions it in his first satire, v. 44.

ARA *Palladis*, an island of the Arabian gulph, mentioned by Ptolemy.

ARA *Tutila*, an ancient city on the eastern side of the island of Corfica, according to Ptolemy.

ARA *Ubiorum*, *Gots-berg*, a place of Gaul, in Germania Secunda, now occupied either by Cologne or Bonn. In this place the Roman Legion, called *prima legio*, was encamped.

ARA *parva*, the *little altar*, a denomination in the *Ancient Surgery*, given to an elegant kind of bandage, said to have been invented by Sosthratus.

ARA, in *Geography*, a river of Spain, which joins the Cinca at Ainsa in Arragon.

ARA, in *Ichthyology*, a name by which the Linnæan species of SCOMBER, *Trachurus*, has been called by Kæmpf. jap. i. pl. ii. fig. 5. Vide Donovan. Brit. Fishes.

ARA, in *Ornithology*, a generic name given by Brisson, Buffon, and others, to some birds which belong, in the Linnæan arrangement, to the genus PSITTACUS; thus, for example, PSITTACUS *Macao* of Linnæus and Gmelin is called ARA *Brasiliensis* by Brisson, ARA *premier* by Fermin, and ARA *rouge* by Buffon; in like manner also, PSITTACUS *Aracanga* Linn. is ARA *Jamaicensis* of Brisson, and *Petit ARA rouge* of Buffon; PSITTACUS *ater*, Linn. ARA *noir* of Buffon; PSITTACUS *caruleus*, ARA *Jamaicensis cyano-erocca* of Brisson, &c.

ARA, is also a synonym of *Cuculus tabitius* of Gmelin, a bird that inhabits the Society Islands, and is called by the natives ARA WIREROA. Vide Cook's Voyages.

ARAB, or ARABIAN *horse*. See HORSE.

ARAB, in *Scripture Geography*, a town of Palestine, belonging to the tribe of Judah. Josh. xv. 52.

ARAB, in *Geography*, a town of Asia, in Arabia Deserta, in the country of Najed or Nedjed; one of the most ancient of this country, and perhaps of Asia.

ARABA, a town of Persia, in Segellan, between the city of this name and Candahar. Some have thought that this is the ancient town of Araspe, the capital of Draugiana.—Also a river of Persia, which serves as a nominal boundary towards Hindostan.

ARABA, in *Ancient Geography*, a city of Ethiopia, situate, according to Pliny, on the bank of the Nile.

ARABAH, in *Scripture Geography*, a town of Palestine, belonging to the tribe of Benjamin. Josh. xviii. 18.

ARABAN, in *Geography*, a small town of Asia, on the river Kabur, in Diarbekir, in the Turkish government of Urfa or Raca.

ARABANT, from *aro*, *I plough*, in *Law*, *ad curiam domini*, was a term applied to those who held by the tenure of ploughing and tilling the lord's lands within the manor.

ARABAT, in *Geography*, a small maritime town of Europe, in the eastern part of Crim Tartary, on the borders of the sea of Azof, south of Bacha-ferai, and sixty miles south-east of Perekop. In 1771, it was assaulted and taken by the Russians, under the conduct of prince Tschibaloff. Most of the besieged were put to the sword, and the rest made prisoners of war.

ARABAZARI, a town of Asiatic Turkey, in the province of Caramania, sixteen miles north-east of Alameh.

ARABEIA, or ARBELA, in *Ancient Geography*, a town of Sicily, mentioned by Silius Italicus, l. xiv. v. 271.

“Sidonios Arbela ferox, et celsus Ictas.”

Those critics who would substitute Artheia for Arbela, introduce the epithet *ferax*, denoting *fertile*, instead of *ferox*. See Sil. Ital. ed. Drakenborch. in loc.

ARAB-HISAR, in *Geography*, a town of Asiatic Turkey, in the province of Natolia, twenty-eight miles north-west of Mogla.

ARABESQUE, or MORESQUE, denotes a style of painting or of sculpture, so called from the Arabians and Moors, who employed ornaments of this kind for want of human and animal representations, which their religion prohibited their using. These ornaments are still in practice; but executed only in painting, and not in sculpture. Such are seen at the chateau of Meudon, that of Sceaux, of Chantilly, at the Menagerie, and at Trianon, painted by Audran; and, in short, at the seats of various noblemen, &c. at home and abroad. Berin, Gillot, and Vateau, likewise excelled in this species of decoration, which has furnished models for tapestry at the Gobelins and La Savonnerie, as hangings in the royal private apartments, to which this sort of ornament is adapted, and no where else. Accordingly the best architects have only made use of them in retiring rooms, or at most in small apartments, treating with contempt the bad taste of those artists, who are profuse of these chimerical and imaginary ornaments in apartments that demand gravity, instead of preferring the real and beautiful productions of nature.

Arabesque is used by Stephen Riou, esq. in his book on architecture, to denote that style of building which is vulgarly called

called *Modern Gothic*, which he also terms *Saracenic* and *Moresc*; the introduction of which he ascribes to the Moors, or, which he says is the same thing, to the Arabians or Saracens, who have expressed, he adds, in their architecture, the same taste as in their poetry, which are both falsely delicate, crowded with superfluous ornaments, and often very unnatural. This manner of building, he says, was introduced into Europe through Spain. The crusades gave the Christians an idea of *Saracenic* architecture, which they afterward imitated. Sir C. Wren distinguishes the heavy *Gothic* as *Anglo-Saxon*, the lighter as *Arabeſc*.

ARABI, *gulf of Gli*, in *Geography*, called also *Cyſis* or *Zyſis*, a small gulf on the coast of Barbary, between the coasts of Barca and those of Egypt.

ARABIA, in *Ancient and Modern Geography*, a considerable country of Asia, which, taken in its largest extent, lies between N. lat. $12^{\circ} 30'$ and $31^{\circ} 30'$, and E. long. $34^{\circ} 14'$ and $59^{\circ} 14'$, and forms one of the largest peninsulas in the world. It is bounded on the east by the Euphrates, the Persian gulf, and the bay of Ormus, on the west by Palestine, part of Syria, the isthmus of Suez, and the Red Sea, on the south by the straits of Babelmandel, and the Indian ocean, and on the north by part of Syria, Diarbekir, Irak, and Khuzestan. Its northern limits, however, are less strongly marked than the others; for in both ancient and modern times, they ascend to an angle about 100 miles to the east of Palmyra, which is not included in Arabia. In these parts, the proximity of the Euphrates to the Mediterranean forms a peninsula. Its length, estimated from the cape of Babelmandel to the extreme angle on the Euphrates, may be stated at about 1800 British miles, and its mean breadth at about 800; or from the port of Jedda to the cape of Razal-Gad, not less than 1200. Its limits, however, have been either enlarged or contracted by various geographers, according to the times in which they wrote; some having comprised under the name of Arabia, such of the neighbouring countries as might perhaps be subject to some particular tribes, and others detaching from it certain districts submitted to a foreign dominion. Accordingly the limits of the Proper Arabia reached no farther than the isthmus, extending from Ailah at the north point of the Arabian gulf to the extremity of the Persian gulf, and the borders of the territory of Cufa; which tract of land was nearly comprehended by the Greeks under the appellation of Arabia Felix: and here the Arabs have been settled almost ever since the flood. The eastern geographers assign Arabia Petræa partly to Egypt and partly to Syria; and they call Arabia Defertâ, the deserts of Syria: but as the Arabs have for many ages reduced these two provinces, the Turks and Persians now include them in Arabistan. The ancients also assigned different limits to this large peninsula. Piny extended it as far as the border of Commagène, the northern part of Syria, on account of the many Arabian colonies established there by Tigranes; and Xenophon included in it the greatest part of Mesopotamia: but, according to Ptolemy, the city of Phara, between the Elanitic and Heroopolitan gulfs, or rather a line passing a little westward of this city, near the district of Heroopolis, was its boundary on the side of Egypt. On the west, it was terminated by Palestine, part of Syria, the confines of Egypt, and the Arabian gulf; on the north, by the Euphrates, from the city of Thapsacus, near the borders of the Palmyrene, to the district of Idicara in Babylonia; on the east, by the Chaldean mountains and the Persian gulf; and on the south, by the Erythræan sea. The same situation and extent are assigned to it by Diodorus and Strabo. Whatever be deemed its extent, it may justly

be considered as a peninsula, because in the northern region it is confined between the Euphrates and the Mediterranean.

The revolutions of time have produced no change in its primitive denomination; since even in the ages bordering upon the deluge it was known by the name of Arabah; which some derive from the Hebrew אַרָב, *arab*, or *ereb*, signifying *the west*, a mixture, or *merchandise*, or *traffic*; others from Jarab, the son of Joktan, and grandson of Eber; and others again from Arabah or Abah, a district of Tehama, inhabited by Ishmael. By the Syrians and many of the orientals, it was called Arabistan; and, in our sacred books, it is sometimes denominated the land of Cush. Moses himself styles the western Arabia, Arabah, which affords a strong presumption, that its original name was derived from its situation: and when the Ishmaelites, who possessed it, gradually reduced the adjacent parts, they carried with them the appellation Arabah, and applied it to the whole peninsula. The first part of the peninsula of the Arabs was divided into Kedem and Arabah, as we learn from scripture. Kedem comprehended the Arabia Felix and Arabia Deferta of Ptolemy. Arabah corresponded to that country which was called, from Petra its metropolis, Arabia Petræa by Ptolemy; Arabia Citerior, from its situation with respect to Italy, by Pliny; and Arabia Vetus, by Stephanus and Procopius. Moses, with a geographical accuracy that defies the severity of criticism, determines the boundaries of this kingdom, when he tells us, that on the south, it reached to the sea of Suph, or the Red Sea; on the west, to Paran and Tophel; on the north, to Laban, Hatseroth, and Di Zahab, that is, to the borders of Syria; and on the east, to Kadesh-Barnea, about eleven days journey from Mount Horeb. As Arabah imports the *west*, so Kedem does the *east*: and these significations correspond to the respective situation of these countries. The first inhabitants of Arabah, or the western Arabia, were the Casluhim, descended from Mizraim, the Caphtorim, and the Horites, who occupied Mount Scir, before they were expelled from thence by Esau and his posterity. Afterwards Ishmael and his descendants settled here; and last of all, the Edomites or Idumæans. Kedem, or the eastern Arabia, was first peopled by the sons of Joktan, who are reputed the aboriginal Arabians; though, in process of time, the Ishmaelites spread themselves over this country. Some of the Cushites also gained early possession of part of it; and the children of Abraham by Keturah contributed, as sacred history informs us, to augment the number of its inhabitants.

Ptolemy seems to have been the first who divided this peninsula into Arabia Petræa, Arabia Deferta, and Arabia Felix; and since his time this division has generally prevailed.

Arabia Petræa, or the *stony*, was contiguous, on the east, to Syria and Arabia Deferta; on the west, to Egypt and the isthmus of Suez; on the north, to Palestine, the lake Asphaltites, and Cœlosyria; and on the south to Arabia Felix. This tract did not admit of much cultivation, the greatest part of it being covered with dry sands and rocks (whence its name), interspersed with some fruitful spots. Its metropolis was Petra: the other most considerable places noticed in scripture as belonging to this district were Paran, Duma, and Pithom. The principal people that inhabited it were the Ishmaelites, the Nabathæans, the Cedraï or Kedareni, and the Hagareni or Agareni. Of these the Ishmaelites were the most powerful, if they did not comprehend the whole of it. The most remarkable places in this region were the town of Kolfum or Kolzom, the wilderness of Shur, that of Sin, that of Sinai, the mounts Casius and

Sinai, Ezringaber, the promontory of Paran, Adæa, Elufi, Boltra, and Blocha. See the several articles.

Arabia Deserta was bounded on the north by the Euphrates, separating it from Mesopotamia: on the west, by Syria, Judæa, and Arabia Petræa; on the east, by Chaldæa and Babylonia, or a ridge of mountains dividing it from those countries; and on the south, by Arabia Felix, from which it was disjoined by several ranges of hills. The Cauchabeni, according to Ptolemy, inhabited that part of this province bordering upon the Euphrates, and the Batamei occupied that which lay on the confines of Syria. The Agubeni and Rhaabeni were placed more southerly towards the frontiers of Arabia Felix, and near the Persian gulf, the Oreheri. Near the Cauchabeni, on the borders of Babylonia, dwelt the Zilitæ, supposed by Bochart to have inhabited that tract in which was the country of Job; and above the Rhaabeni were the Masæi. In the interior part were the Agræi; and in the mountainous region, near Chaldæa, were situated the Marteni. The towns of this district, enumerated by Ptolemy, if such they might be called, were places of no great importance.

Arabia Felix was limited on the north by the provinces already mentioned; on the south, by the Erythrean sea; on the east and west by part of that sea, together with the Arabian and Persian gulfs; and corresponded to that tract which the oriental geographers regarded as the proper peninsula of the Arabs. Strabo says (l. xvii.) that, in his time, it was divided into five kingdoms, corresponding to the division of the proper Arabia into five provinces by the eastern writers. The principal nations noticed by the ancients in this province were the Sabæi, Gerræi, Minzæi, Atramitæ, Maranitæ, Catabani, Afcitæ, Homeritæ, Saphoritæ, Omanitæ, Saraceni, Nabathæi, Thamydeni, and Bnizomenæ. The most remarkable places were Nyfa, Arga, Badoo, Pudni, Mufa, Ocelis, Arabiæ emporium or Adæa, Mofcha or Maskat, and Atamas portus or Cadhema.

The best eastern writers have divided this peninsula into five provinces or kingdoms, namely Yaman, Hejaz, Tehama, Naid, and Yamama. The province of *Yaman* or *Yemen*, so called either from its situation to the right hand or south of the temple of Mecca, or from the verdure of its soil, extends along the Indian ocean from the straits of Babelmandel to cape Razal-Ghad or Rafalgat. It is bounded by part of the Red Sea on the west and south, and on the north by the town of Nairan, the Nagara of Ptolemy; Halj or Haljo on the sea Al Kolzom, and Oman or Sohar; and it is subdivided into several lesser provinces as Hadramaut, Shihr, Oman, Najran, and Mabra, of which Shihr alone produces the frankincense. This country has been famous, from a very remote period, for its fertility and riches, and the happiness of its climate. The principal cities known to the ancients were Mocha, Aden, Sanaa the capital of the province, and now reckoned the chief city of Arabia, Saba or Mareb, Shibam, Dhafar, and Oman or Sohar. This province, known under the appellation of Arabia Felix, called by the Greeks *most happy*, and formerly extolled for the verdure of its trees, the purity of its air, the flavour of its fruits, and the diversity and abundance of its products, manifests at present few traces of its ancient opulence; inasmuch that it is difficult to conceive how it has acquired the name of *happy*; being a country where the greater part of the land remains without culture; and, excoriated by burning heats, it is destitute of inhabitants, excepting in places remote from the sea, where the mountains afford a refuge by their shade. It may therefore be presumed, that the articles of luxury which it produces, and which polished nations have converted into wants, have given rise to the belief, that where-

ever superfluities are found, there the necessaries of life must be enjoyed in abundance; just as the vulgar imagine, that the most fortunate countries are those which produce gold, pearls, and diamonds. This province, far less fertile than either Egypt or Syria, which lie at no great distance, seems only to have usurped the title of *happy*, from a comparison with the barren and indigent tracts that surround it.

Hejaz, so called because it divides Najd from Tehama, is limited on the south by Yemen and Tehama; on the west, by the sea Al Kolzom; on the north, by the deserts of Syria; and on the east, by the province of Najd. The chief towns are Mecca, Medina, Taifu, Aidab, Yanbo, Madian, and Hejr. The soil in this province is more barren than that of Yemen, and it is so parched as to afford neither water, nor fruits, nor genial harvests; and yet superstitious credulity produces plenty, inasmuch that a province, doomed by nature to scarcity and want, is become the wealthiest and most flourishing of Arabia. It was known, in the earliest ages, under the name of the Madianite, or Arabia Petræa. It owes its opulence and celebrity to the towns of Mecca and Medina; the former having had the honour of giving birth to Mahomet; and the other boasting of having granted him an asylum, when, at the commencement of his ministry, he was obliged to retire from the sword of his persecutors. Many honourable pretensions add lustre to this province. It was here, according to report, that Abraham laid the foundations of the most ancient temple in the world; it was hither that Ishmael, on being forced to quit the paternal roof, came to seek a second country; it was hither that Moses, when a fugitive from Egypt, withdrew from the vengeance of those who wanted to punish him for having killed the Egyptian; here he married the daughter of Jethro, a prophet highly revered, who, as the Arabians relate, gave useful lessons to the leader of the Hebrews; in short, it is here that we behold the two mountains of Horeb and Sinai, where Jehovah gave laws to his people, amidst awful thunder and lightning. It is from these illustrious claims that a province, which offers to the sight only sands and rocks from whence flow bitter waters, establishes its pre-eminence, and finds resources ever new in a glorious and profitable tradition.

The province of *Tehama*, so denominated from the vehement heat of its sandy soil, and *Gaur*, from its low situation, is bounded on the west by the Red Sea, and on the other side by Hejaz and Yemen, extending almost from Mecca to Aden. The Arabian geographers have sometimes confounded this province with Yemen and Hejaz. Abulfeda mentions several towns in Tehama, which must have been undoubtedly of great antiquity, but unknown both to the Greeks and Romans. As the ground of this district is the lowest in Arabia, it abounds with springs, which are an invaluable treasure to a dry and parched region.

The province of *Najd* or *Neged*, signifying a rising country, lies between those of Yamama, Yemen, and Hejaz, and is bounded on the east by Irak. This elevated country presents to the view only rocks and deserts, from whence men and animals are totally excluded, on account of the scarcity of water, except in some few more favoured districts, where the shade of the mountains affords a defence against the scorching heat of the sun.

Yamama, called also *Arud*, from its oblique situation in respect of Yemen, is surrounded by the provinces of Najd, Tehama, Bahrein, Oman, Shihr, Hadramaut, and Saba. The chief city is Yamama, which gives name to the province; and it was anciently called Jaw or Gjava; it is particularly famous for having been the residence of Mahomet's competitor, the false prophet Moseilama.

The inland parts of Arabia, occupied by the extensive province

province or desert called *Neged*, were, till of late years, almost utterly unknown. The relations of travellers were confined to the coasts of that vast country, to which, without doubt, their peregrinations were limited. Michaelis, the celebrated professor of Gottingen, proposed to the late king of Denmark, to find five able persons to explore the territory and productions of Arabia. Of these five Danes, four dying in the journey, M. Niebuhr, who had been appointed to the geographical department, took upon him to execute the object of the expedition alone. From the relation which he published in 1772, we shall make some extracts. Of all the maps of Arabia that have hitherto been published, this learned traveller gives the preference to that of M. D'Anville, published in 1751, under the title of "Première Partie de la Carte de l'Asie, la Turquie, l'Arabie, l'Inde, & la Tartarie." He collected a great number of inscriptions and medals in Cufic characters, to which he annexes the explications given by Mr. Reiske, professor at Leipzig. Among these antiques, he presents one of bronze, on which appears the figure of the cross, with the name of a caliph and a Turkish legend. Our astonishment at this curious mixture will cease, on learning that the medal was struck in a country that was, at the same time, governed by the Greek emperors and the caliphs of Bagdad.

Arabia is divided by the inhabitants themselves into eight provinces, entirely independent on one another, viz. Yemen, on the south, towards the straits of Babelmandel, Hadramaut, on the shores of the Indian Ocean, Oman, on the south of the entrance of the Persian Gulf, Hadsjar, or Hajar, the Héjer of M. D'Anville, or Lahsa, Nedjed, or Neged, and Hedjas, or Hejaz. The territory of the Bedouins, or of the Arabs in the desert of Syria, may be reckoned a seventh province; and to this again may be added the Arabian establishments on the southern coast of Persia. See the several articles.

Of all the governments of Arabia, which is divided among numerous Imams and Sheiks, that of Yemen is the most uniform and best regulated, and an idea of the rest may be formed from that of Yemen, described by Niebuhr. The title of IMAM, denoting Vicar, that is of Mahomet, is ecclesiastical; in Arabia it is considered as synonymous with Caliph, and Emir el Mumenin, or prince of the faithful. Its antiquity is not explained, but the history of the Imams of Yemen is very modern: and though they sometimes celebrate divine service, the style of Emir, which they themselves assume on their coins, seems more proper and precise. The inferior governments are conducted by Sheiks, a term signifying old men, and rarely blended with the ecclesiastical character.

The throne of Yemen is hereditary; and the Imam, or Emir, an independent power, acknowledging no superior in spiritual or temporal affairs. He possesses the prerogative of peace and war; but cannot be called despotic, as he cannot deprive even a Jew or a Pagan of life; but the cause must be tried before the supreme tribunal of Sana, consisting of several Cadis, while he is only president. When an Emir shews a despotic disposition, he is merely dethroned. The next in rank are the Fakis, a title so lax as seemingly only to imply gentlemen. The governors of districts are called Dolas; or, if superior in birth, Walis. The Dola corresponds in some degree with the Turkish Pasha. The chief magistrate of a small town without a garrison is called Sheik; as a superior governor is sometimes called Emir, and in little villages, Hakim. The Bakateb, or comptroller, is an officer who depends on the prince, and inspects the conduct of the Dola, and the management of the revenues. In each district there is also a Cadi, who, like those in Turkey, are judges of ecclesiastical and civil affairs; and perhaps depend

on the chief Cadi at Sana, as those of Turkey do on the Mufti: but in Arabia the prince himself is the high priest. His army, in peace, was computed at 4000 infantry, and 1000 cavalry; the soldiers being, as usual in the east, without uniforms. There is no navy, and the vessels in general are very rudely constructed, those of Yemen having sails made of matting. Yemen adopted the koran in the 7th year of the Hegira. This fine province has at several times excited the ambition of Egypt, and been subjected to the Ottoman sultan. It successively became a prey to Saladin, Guri, and Solyman; but the love of liberty always triumphed in the mountains over the Ottoman arms. In 1630, Khaffem, one of the independent Sheiks, forced the Turkish Pashas to quit the country; and Ismael, his son, established this happy revolution, and took on himself the office of Imam.

The general aspect of Arabia, says a modern geographer (Mr. Pinkerton), presents a central desert of great extent, with a few fertile "oases," or isles, as in Africa; while the flourishing provinces are those situated on the shores of the sea, which supplies rain sufficient to maintain the vegetation. In Yemen there are mountains of considerable height, but chiefly barren and unwooded; while the temperature and plants form a striking contrast with those of the plains; yet the want of rivers, lakes, and perennial streams, must diffuse ideas of sterility through the Arabian landscape. In the defect of rivers strictly belonging to Arabia, the Euphrates and Tigris, which pass through Irak-Arabi, have been claimed by some geographers; and the Euphrates may be justly considered as an Arabian river. But in Arabia Proper, what are called rivers are mere torrents, which descend from the mountains during the rains, and for a short period afterwards. Such is the Aftan of Neged. The most important river is probably that which arises near Sana, and joins the Indian sea below Harjiah. The little river of Krim flows from Mahrah into the same sea, and is followed by two or three brooks in Omon, or Oman. One or two small saline lakes occur in situations encircled with hills, which prevent the escape of the water.

The chief range of mountains seems to proceed in the direction of the Red sea; towards the north, not more than 30 miles distant, and sometimes in the south about 150; a circumstance which imparts extent and fertility to Yemen. The hills of Oman seem a continuation of those on the other side of the Persian gulf; and the isles in the mouth of that gulf may be regarded as summits of that range. In the country of Segar, commonly ascribed to Hadramaut, there is a range of hills remarkable for the product of frankincense. The direction of the other ranges cannot be accurately ascertained in the imperfect geography of the country. In Arabia Petraea is the celebrated mountain of Sinai, with its two sublime summits of red granite.

The agriculture of Arabia is employed in the production of wheat, maize, "durra," or a kind of millet, barley, beans, lentiles, and rape, with the sugar cane, tobacco and cotton. Rice seems unknown in Yemen, and oats throughout Arabia: the horses being fed with barley, and the asses with beans. They also cultivate "uars," a plant which dyes yellow, and is exported in great quantities from Mocha to Oman; and "sua," used in dyeing red; likewise indigo. The wheat, in the environs of Maskat, yields little more than ten for one; and in the best cultivated districts of Yemen, 50 to one; but the durra sometimes much exceeds this ratio, yielding in the highlands 140, and in the Tehama, or plain, from 200 to 400. By their mode of sowing, and watering this grain, the inhabitants of Tehama reap

three successive crops from the same field in the same year. The plough is simple, and the pick is used instead of the spade. The principal exertion of the husbandman's industry is to water the lands from the rivulets and wells, or by conducting the rains. Barley is reaped near Sana in the middle of July; but the season depends on the situation. At Makkah, wheat and barley are sown in December, and reaped in March; but durra is sown in August, and reaped in the end of November. The Arabians pull up their ripe corn by the roots; but the green corn and grass, as forage for the cattle, are cut with the sickle. In thrashing their corn, they lay the sheaves down in a certain order, and then lead over them two oxen dragging a large stone.

The greater part of Arabia, being composed of dry barren deserts of sand, either wholly destitute of water, or furnishing scanty springs of that which is brackish, presents few objects to botanical investigation. The vegetables in such districts, exposed to the vertical sun, and refreshed merely by nightly dews, belong for the most part to the genera of aloe, mesembryanthemum, euphorbia, flapelia, and falsolia. On the western side of the Arabian desert, numerous rivulets, descending into the Red Sea, diffuse verdure; and on the mountains from which they run, vegetation is more abundant. Hither many Indian and Persian plants, distinguished for their beauty or use, have been transported in former ages, and are now found in a truly indigenous state: such is the case probably with the tamarind, the cotton tree (inferior to the Indian), the pomegranate, the banyan tree or Indian fig, the sugar cane, and many species of melons and gourds. Arabia Felix may peculiarly boast of two valuable trees, namely, the coffee (*caffæa Arabica*), found both cultivated and wild; and the amyris opobalsamum, which yields the balm of Mecca. Of the palms, Arabia possesses the date, the cocoa nut, and the great fan palm. It has also the sycamore fig, the plantain, the almond, apricot, and peach, the papaw, the bead tree, the mimosa nilotica, and sensitive, and the orange. Among its shrubs and herbaceous plants may be enumerated the ricinus, the liquorice, and the fenna, used in medicine; and the balsam, globe amaranth, the white lily, and the greater panceratium, distinguished for their beauty and fragrance.

The mineralogy of Arabia is not very important. It has no native gold, nor any silver, besides that which is mingled in the lead mines of Oman. In the northern district of Yemen, called Saade, there are some mines of iron, which is brittle. Its precious stones have been imported from Hindostan; its agates, called Mocha stones, are brought from Surat, and the best cornelians from the gulph of Cambay. Yemen, however, produces onyxes; a kind of Sardonix is found near Damar. Rock salt appears near Loheia; and in Ajemen, Niebuhr has observed pentagonal pillars of salt, with bluish alabaster, selenite, and various spars; but it does not appear that any of the gems are produced in Arabia. The pearls and spices, of which Arabia formerly boasted, were probably the products of the Indies and the coasts of Africa, whither the Egyptians went to fetch them, in order to disperse them among the nations of the west; and as it was their interest to conceal the source of their wealth, they chose rather to have it thought that they traded to Arabia, where it was impossible to penetrate far, without imminent danger of death in the sands of the deserts.

The principal riches of Arabia consist in flocks and herds, and especially those species of animals that require only succulent herbs for their nourishment. The cow here yields

but little milk; and the flesh of the ox, which like her delights in fat pastures, is insipid and juiceless. The wool and mutton of the sheep are coarse. In the mountains of Arabia Petraea is found the rock-goat. It is probable that Arabia, notwithstanding the sterility of its soil, was formerly overstocked with cattle, since that commodity formed a prime object of commerce with the neighbouring countries; nevertheless it is a well-known fact, that in all the torrid regions there is a greater consumption of fruits and vegetables than of flesh. Of all the animals of Arabia, the horse claims the pre-eminence. According to Zimmerman (*Zool. Geog.* 1777, 4to. p. 140.), this animal is found wild in the extensive deserts on the north of Hadramaut: this might have been the case in ancient times, unless it should be thought more probable that the wild horse of Tartary has passed through Persia, and has been only perfected in Arabia. The horses here are distributed into two classes, *viz.* the *Kadisebi*, or common kind, whose genealogy has not been preserved, and the *Kochlani*, or noble horses, whose breed has been ascertained for 300 years, proceeding, as their fables assert, from the stalls of Solomon. They are reared by the Bedouins in the northern deserts between Bassora, Merdin, and the frontiers of Syria; and though they are neither large nor beautiful, their race and hereditary qualities being the only objects of estimation, the preservation of their breed is carefully and authentically witnessed; and the offspring of a Kochlani stallion with an ignoble race is reputed *Kadisebi*. These will bear the greatest fatigues, and pass whole days without food, living, according to the Arabian metaphor, on air. They are said to rush on a foe with impetuosity; and it is asserted that some of them, when wounded in battle, will withdraw to a spot where their master may be secure; and if he fail, they will neigh for assistance. Accordingly their value is derived from their singular agility, an extreme docility, and an uncommon attachment to their masters. The Arabian steeds are sometimes bought at excessive rates by the English at Mocha. The duke of Newcastle asserts, that the ordinary price of an Arabian horse is 1000, 2000, or even 3000*l.*; and that the Arabs are as careful in preserving the genealogy of their horses, as princes in recording that of their families: the grooms are very exact in registering the names of the sires and dams of these animals, and some of them are of very ancient date in this species of pedigree. It is affirmed that Arabian coats are brought up with camel's milk. In this country there is also a superior breed of asses, in form and qualities approaching to the mule, and sold at high prices. Arabia, or Africa, seems to be also the native country of the camel. Niebuhr observed camels of different kinds, and he seems to have decided the question concerning the dromedary, by saying that this animal in Arabia and Egypt has always one hump only, and can otherwise be scarcely distinguished from the camel, but in being more light and speedy. The buffalo seems to be unknown in this country; and the cattle in general have a hump on the shoulder. Arabia is infested with almost all kinds of ferocious beasts, that prefer burning sands and arid mountains to humid regions: they fix their abode in the caves of the mountains, in the clefts of the rocks, or in dens which they dig for themselves. The other animals are the jackal, or chacal; the hyæna, towards the Persian gulf and the desert mountains of Arabia Petraea; numerous monkeys in the woods of Yemen; the jerboa, or rat of Pharaoh, in Neged; and there are also antelopes, and wild oxen, with wolves, foxes, and wild boars, and the large panther, called in Arabia, "nemer," and a small panther, called the "fath." The tiger seems utterly unknown, and the lion only appears beyond

yond the Euphrates. But if ferocious animals of various kinds exercise with impunity their ravages in the deserts, the mountains teem with other animals, which produce great advantages to commerce; such as the civet-cat, the bezoar goat, the musk-rat, and various others, which are divelled by nurture of their savage disposition, and inured by habit to domestic discipline.

Among the birds may be named the pheasant, common in the forells of Yemen, and the grey partridge in the plains, besides all sorts of common poultry. On the coasts of the Red Sea, the species of sea-fowls that live on fish are numerous, and in an island of this sea are pelicans; in the deserts are ostriches; and the birds of prey in Arabia are eagles, falcons, vultures, and sparrow-hawks. A bird of the thrush kind, called by Mr. Forskal, "turdus seλεύcus," is very serviceable in destroying locusts, and is thought to come annually from Khorasan. It is denominated "Samarman," or, "Samarmog." Arabia abounds with land-tortoises, which are eaten by the eastern Christians in Lent; several sorts of lizards, and also of serpents; and of the latter, the only sort that is formidable is that called "Batan," which is small and slender, and spotted with black and white; its bite is so poisonous, that it occasions instant death. The Red sea is stored with a great variety of fishes. Mr. Forskal is said to have observed more than 100 new species; some of which he could not rank among any of the known genera. The locusts are very numerous; and that species which infests Arabia is called by Mr. Forskal, "Gryllus gregarius," which he thinks to be different from the "Gryllus migratorius" of Linnæus. All the Arabians, whether living in their native country or in Persia, Syria, and Africa, are accuomed to eat locusts; and they ascribe a peculiar delicacy to the red sort, which they esteem fatter and more succulent than any of the others. The swarms of these insects darken the air, and at a distance appear like clouds of smoke. In flying, their noise is tremendous, and resembles that of a water-fall. When such a swarm falls upon a field, it is soon consumed and despoiled of its verdure. A small insect, named "Arda," (the "Termes fatale" of Linnæus,) is another scourge of Arabia, as well as of hot countries in general. These live and work together like ants, and are very destructive to trees. The inhabitants of the country, for preserving their gardens from the depredation of these mischievous insects, surround their trees with sheep's dung, the smell of which the arda cannot endure. A species of "scelopendra" torments the Arabians, and affects those on whom it fixes with burning pains. Among the "Tenebriones," there is one species which the women of Arabia and Turkey dig out of the filth of the garden; and they swallow three of them fried in butter every morning and evening, in order to acquire that plumpness which is deemed in the east a beauty.

The Red Sea is full of marine insects; and Mr. Forskal, from a number of observations, inferred, that an immense number of these animals contribute to produce the retulence perceived at night in sea-water. The shells of the Arabic gulf are numerous, and some of them belong to rare species. The most beautiful is a "pinna," with superb colours. The Arabic gulf abounds with immense banks of coral; so that most of the houses in the Tehama are built of coral rock. These rocks, rising sometimes ten fathoms above the surface of the sea, are soft under the water; and as they are easily wrought, they are preferred to all other stones for the purposes of building.

In the whole peninsula of Arabia the year has only two distinct seasons, the dry and the rainy. The latter commences in the province of Yemen, about the middle of

June, and terminates in September; but the sky is rarely covered with clouds for 24 hours at a time. At Maskat, and in the eastern mountains, it lasts from the middle of November to the middle of February; and in Oman and Hadramaut, from the middle of February to the middle of April. These regular rains are very beneficial, as they render the valleys lying among the mountains fertile and delightful. In the plains of Yemen rain is sometimes uncommon for a whole year; and in the dry season, a cloud is scarcely to be seen. The heat is no less subject to variation, than the wet and cold. At Sana, in the mountains, it has never exceeded 85° from the 18th to the 29th of July; whereas in Tehama, which is lower than Yemen, it has stood at 98° from the 6th to the 20th of August. It sometimes, though rarely, freezes at Sana, while at Loheia the thermometer is at 86°. Hence the inhabitants of Yemen live as if they belonged to different climates; and even at a small distance are found fruits and animals which might indicate remote countries. The wind from the sea is generally moist, that from the interior deserts dry; and in the northern deserts are chiefly perceived the disastrous effects of the burning wind called Sam, Simam, or Samiel. The Arabs discern its approach by an uncommon redness in the air; and to defend themselves from the imminent danger, they throw themselves flat on the earth. The people of the isle of Chaudli and of the Mareidin, have nothing to dread from this deadly wind; sleeping in the open air from the 18th of May to October, without feeling any inconvenience.

Although the Arabians are ingenious and diligent, their manufactures are of little consequence. Even in Yemen, the works in gold and silver, and the coin itself, are produced by Jewish manufacturers. In the whole country of Arabia there are neither wind-mills nor water-mills. The mulkets that are made in the country, warlike as the Arabians were formerly deemed, are mere matchlocks of mean fabric. At Mocha there is one glass-house; and in Yemen there are some linen manufactures, chiefly coarse. Among the chief vegetable products of Arabia, Niebuhr reckons aloes, myrrh, frankincense of an inferior kind, and coffee; and also cocoa trees, pomegranates, dates, apricots, peaches, almonds, filberts, pears, figs, and tamarinds. But the best frankincense, with spikenards, cinnamon, cassia, cardamums, and pepper, are imported from Hindostan. The orange trees are brought from Portugal, and the lemon from Italy; the mangoften and cocoa, with several others, are imported from Hindostan.

The commerce of Arabia was formerly very considerable, as its ports facilitated a communication between the eastern and western world. But since the Portuguese opened a passage to India by the Cape of Good Hope, its intercourse with Hindostan has very much declined.

The chief articles exported from Yemen are coffee, aloes, and myrrh (of which the best is brought from Abyssinia), oliban (or an inferior kind of frankincense), fenna, ivory, and gold from Abyssinia. The European imports are iron, steel, cannons, lead, tin, cochineal, mirrors, knives, sabres, cut glass, and false pearls. Niebuhr regards aloes and frankincense (the latter chiefly from Hadramaut) as the only native articles of commerce, before coffee came into use. The principal trading ports are Jidda or Gedda, the harbour of Mecca, Loheia, and Beit el Fakih, carrying on a considerable trade in coffee; Gezan, trading in fenna and coffee; Hodeida, Mocha, Aden, Maskat, Sur or Seger, Faitach and Datar, on the Arabian ocean; Bahrin and El Katif, in the gulf of Bassora; Bassora, &c. See the articles.

Besides the maritime commerce, a considerable traffic is carried on by land by means of the caravans of Aleppo and

Suez, which bring hither velvets, fattins, armoilins, and all sorts of rich stuff; saffron, mercury, vermillion, &c.; and take in return, partly the natural products of the country, partly manufactures, and partly the foreign merchandizes that have been brought from the Indies, from Aleppo, and from Europe. Niebuhr observes, that the trade on the coast of the Red Sea cannot be advantageous to any nation that has not settlements in India. The Arabians, he says, make no use of the productions of Europe. It will be, therefore, necessary to supply them with India goods, and to take coffee in return, which can be bought cheaper from ships which take it in merely to avoid returning empty. There is, however, a great quantity of iron sold in Arabia, which the English purchase chiefly from the Danes. This ingenious traveller cautions strangers against the knavery of the Mahometan brokers; and he recommends their applying rather to the Banians, among whom are many very considerable merchants, who are very honest men. In his description of the extensive country of Neged, he informs us, that the Arabs, who inhabit it, are not more inhospitable towards strangers than the rest of their nation, nor less hospitable; but as this country contains many little independent states, each governed by a Sheik, it may be easily conceived that travellers here find little security. Each prince endeavours to get from them all he can; and as they are commonly at war with each other, strangers are despoiled by the first, that his neighbours may not be the richer. Hence opulent foreign merchants cannot hazard their caravans in these regions; and those that come from Oman and Lahfa to Mecca, are generally composed of beggars, or people who wish to pass for such; and the caravan which every year leaves Bagdad for Mecca, accompanied with many rich Persians, is, in proportion to its number, charged with similar expences and extortions with those of Turkey, Egypt, and Magreb, which pass by Hejaz. Yet there is reason to believe that the towns of Neged carry on a considerable trade among themselves, and with the neighbouring places in Hejaz, Yemen, and Lahfa; and by these means it may be possible for an European traveller to inspect this internal part of Arabia.

The population of Arabia consists chiefly of Mahometans, intermixed with some Jews and Christians. Banians also from India are settled in great numbers in their commercial cities. For their manners and customs, language, and literature, and other particulars, see the following articles, and those already referred to in the general account of the country.

Of the various Arabian colonies settled in the maritime parts of the gulf of Persia, the most considerable is the city of Abufchar, 28° 59' from the equator. That of Gombron, founded by Shah Abbas, has been losing, ever since the troubles consequent on the death of Shah Nadir, the opulence and splendour which it derived from the extent of its commerce. Besides several isles of little consequence in the Arabian gulf, there are SOCOTRA in the Arabian sea; and the isle of BARRIN, or AUAL, in the Persian gulf, in which there is a fortified town; and on this and the groupe of adjacent small isles, there are 50 or 60 mean villages.

ARABS, *history, Character, customs, &c. of the.* According to the oriental writers, the Arabs are distinguished into two classes, viz. the old lost Arabians, and the present. The former were very numerous, and divided into several tribes, which are now all destroyed, or else lost and swallowed up among the other tribes; nor are any certain memoirs or records extant concerning them. The most famous tribes among these ancient Arabians were *Ad, Thamud, Tefin,*

Jadis, the former Jorban, and Amalek. The present Arabians, according to their own historians, are sprung from two stocks, Kahtan or Joktan, the son of Eber, and Adnan, descended in a direct line from Ishmael, the son of Abraham and Hagar. The posterity of the former they call *Al Arab, Al Arabi*, i. e. the genuine or pure Arabs; and those of the latter, *Al Arab al Mustaraba*, i. e. naturalized or insidious Arabs. Besides these tribes of Arabs, mentioned by their own authors, who were not descended from the race of Shem, others of them were the posterity of Ham, by his son Cush, who inhabited the banks of the Euphrates, and of the Persian gulf, whether they came from Chuzellan, or Sufiana, the original settlement of their father. To these three stocks traditionary report ascribes the origin of the Arabians. Some time after the confusion of languages at Babel, or according to the computation admitted in Europe about 3600 years ago, Yarab, the elder of Joktan's sons, it is said, succeeded his father in the kingdom of Yemca, giving name, as the Arab writers maintain, to their country and language; and Jorban, the younger, founded the kingdom of Hejaz, where his posterity possessed the throne till the time of Ishmael. The kingdom of Yemen, or at least the better part of it, particularly the provinces of Saba and Hadramaut, was governed by princes of the tribe of Hamyar, the son of Saba, and the great grandson of Kahtan; though at length the kingdom was translated to the descendants of Cahlan his brother, who still retained the title of king of Hamyar. The princes of the Hamyarites, called Homerites by the later Greek and Latian authors, had the general title of "Tobba," signifying successor, as the Egyptian kings had that of Pharaoh, the Roman emperors that of Cæsar, and the successors of Mahomet that of Caliph. This kingdom lasted, according to Abulfeda, 2020 years; or, as other Arabian writers say, above 3000; the length of the reign of each prince being very uncertain. The first great calamity that befel the tribes settled in Yemen was the inundation of Aram, which is said to have happened soon after the time of Alexander the Great, and to have been occasioned by the irruption of a moond, or dam, erected near the city of Saba, afterwards called Mareb, and serving as a reservoir for receiving the water which came down from the mountains for the supply of the city, and for watering their lands. On this occasion, eight tribes were forced to abandon their dwellings; and some of them, in their migration, gave rise to the two kingdoms of Ghassan and Hira; both of them out of the proper limits of Arabia. The founders of the former, in Syria Damascena, maintained their kingdom, according to Abulfeda, 616 years. Five of these princes were named Hareth, written by the Greeks Aretas; and it was the governor of one of these who ordered the gates of Damascus to be watched, for the purpose of apprehending the apostle Paul. This tribe was Christian; but their last king, on occasion of the successes of the Arabs in Syria, professed Mohammedism under the Caliph Omar; however, on receiving some disgust, he returned to his former faith, and retired to Constantinople. The other kingdom of Hira, founded in Chaldaea, or Irak, continued, with some small interruption by the Persians, till the caliphate of Abubeker, and its duration was near 623 years. The princes were under the protection of the kings of Persia, acting as their lieutenants over the Arabs of Irak, as the kings of Ghassan were for the Roman emperors, over those of Syria.

Jorham, the son of Kahtan, who founded the kingdom of Hejaz, and his posterity, maintained possession of it till the time of Ishmael, who, marrying the daughter of Modad,

one of the princes of the country, had 12 sons; to one of whom, called Kidar, the crown was resigned by his uncles, the Jorhamites; but others say, that the descendants of Ishmael expelled that tribe, who, retiring to Johainah, were, after various fortune, all destroyed by an inundation. Of the successive kings of Hamyar, Hira, Ghaffan, and Jorham, Dr. Pococke, in his "Specimen Arab." has given catalogues, that are said to be tolerably exact.

After the expulsion of the Jorhamites, the government of Hejaz seems not to have remained for many centuries in the hands of one prince, but to have been divided among the heads of tribes, almost in the same manner as the Arabs of the desert are governed at this day. At Mecca, an aristocracy prevailed, where the chief management of affairs, till the time of Mohammed, was in the tribe of Koreish; more especially after they had obtained the custody of the Caaba from the tribe of Khozaah, one of those tribes that had migrated from Al-Aram.

Besides the kingdoms already enumerated, there were some other tribes, which in latter times had princes of their own, and formed states of inferior note; such, in particular, was the tribe of Kenda, which had several kings.

Having given a brief abstract of the history of the ancient Arabs before Mahomet, it may not be improper to subjoin a concise account of the principal transactions in which those people were concerned with the Egyptians, Persians, Greeks, and Romans, extracted from the most approved writers of the two last nations. According to Diodorus Siculus (lib. i.), Sesostris, the Sefac of Josephus and Sir Isaac Newton, subdued Arabia. But it is evident, that the Arabs were never completely subjugated, nor for any long time rendered any homage to the kings of Egypt, because Sefac himself, as the same author informs us, was obliged to draw a line from Heliopolis to Pelusium, in order to secure Egypt from the incursions of the Arabs and Syrians. The Seenite Arabs, contiguous to Palestine and Syria, must, therefore, have been independent on that prince. Nor can it be inferred from Diodorus, that he ever harassed Arabia Felix, though he had a fleet of 400 sail upon the Red Sea; but only coasted it, or at most seized upon some of its maritime provinces in his voyage to India: and by the testimony of this historian, who has extolled the conquests of Sesostris, it sufficiently appears, that the whole peninsula of the Arabs never was, at least for any considerable time, in a state of servitude to the Egyptians. It appears on the contrary, that they gave kings to Egypt, who were known under the name of Shepherds. From Diodorus (l. ii.) we also learn, that neither the Assyrians, Medes, nor Persians, could ever gain any considerable settlement among them. The Persian monarchs were respected by them as their friends, and received from them, as Herodotus informs us (l. iii. c. 97.), an annual present of frankincense; and yet they never made them tributary, and gave law to them; nor is Arabia found in any enumeration of their provinces: so far indeed were the Persians from being their masters, that Cambyfes, in his expedition against Egypt, was obliged to ask permission to pass through their territories. The Spartans, inured to conquest, made a descent on their coasts, and repented of their temerity. When Alexander the Great had subdued the Persian empire, the Arabians, however exorbitant and generally dreaded his power was, in consequence of the extent and fame of his victories, had so little apprehension of him, that they alone, of all the neighbouring nations, sent no ambassadors to him. The preparations which he made shew, that he regarded this conquest as worthy of his utmost exertions, but death put a stop to his enterprize, so that it is impossible to decide what would have been the event; but

perhaps this people might have convinced him that he was not absolutely invincible. The successors of Alexander, who attempted to prosecute his design, were as often defeated. For an account of the unsuccessful enterprize of Athenæus, the general of Antigonus, see ANTIGONUS.

The reply of the Arabs to Demetrius, who undertook a second expedition against them, demonstrates their manly resolution, and their indifference to the fame that is acquired by arms. "King Demetrius" said they, "what are thy pretensions? what wouldst thou have of us? what motive brings thee to disturb the silence of our deserts, where nature, a cruel stepmother to us, grants her children no other than the painful means of subsistence? our parched and sandy deserts have no charm for us except the liberty they allow us to enjoy, and which thou art come to ravish from us. It is the love of independence, that renders such hardships as are unknown to the other inhabitants of the earth, supportable to us. Our rocks are too hard to be broken by thy sceptre: if then thou wouldst subvert us to thy yoke, begin by subjugating our sentiments; alter our manner of life; but first contrive means of subsistence in a country that has nothing but sand, and rocks, and metals. Be advised, and let those people live in peace against whom thou hast no cause of complaint, and who desire to have no quarrel with thee. Accept the presents we here bring thee; and may they induce thee to believe that the Nabathæans are thy friends."

The Romans made incursions into Arabia, but never subdued it. Some few tribes, vanquished by Lucullus, did homage to the majesty of the Roman people. Pompey, as Plutarch informs us, obliged Aretas, an Arab prince, whose dominions bordered upon Syria and Mesopotamia, to receive a Roman garrison; and the same general likewise subdued the Arabs who dwelt about mount Amanus, by his lieutenant Afranius. After which the king of the Arabs, residing in Petra, addressed a letter of submission to him; but it does not appear that Pompey ever gained possession of that fortress. Crassus, ambitious of making the conquest of this country, entered a district of it with a numerous army, which perished in the deserts from thirst and misery. Aelius Gallus, in the reign of the emperor Augustus, in some measure repaired the disgrace of this disaster. He, of all the Roman generals, seems to have penetrated farthest into these immense and frightful deserts. At first he met with some brilliant successes; but the deadly heats consumed the flower of his troops, and he was obliged to retire with the remains of his army, whose fruitless victories were celebrated by the flatterers of Augustus. Caius, his grandson, convinced of the impossibility of subjugating a people, who only regarded life inasmuch as they could live free, invested their towns with fire and sword; and having forced them to surrender, he thence made excursions upon the territories of the empire; but after all his exertions, contented himself with the glory of having deprived them of the means of offence. From that time to the reign of Trajan, we read of no contest between the two nations. This emperor laid siege to the capital of the Hagarenes; and after repeated efforts, submitted to the disgrace of raising it. Notwithstanding the flatteries of Trajan, by the historians and orators of his time, and the medals struck by him, he did not subdue the Arabs; the province of Arabia, which he is said to have added to the Roman empire, scarcely reaching farther than Arabia Petraea, or the very skirts of the country. About eighty years after this period, the emperor Severus, being greatly incensed against the Arabs bordering on Syria, laid siege to Atræ their capital, with a formidable army; but he was obliged to raise it, and to retire into his own dominions. The Sa-

racens,

racens, the most celebrated people among the Arabs, ravaged Mesopotamia in the time of the emperor Constantius, and joined the Persians against Julian. This prince, and some of his predecessors, had paid a subsidy to the Saracens who served in their armies; but Julian, who considered them as his subjects and not as his allies, thought the treaty degrading to the majesty of the empire, and refused to pay a tribute under the qualifying term of a subsidy. Of this infraction the barbarians complained; but the prince, who knew how to fight as well as to govern, haughtily answered: "My implements are iron: I know nothing of gold." This expression they resented, deserted to the Persian, and ever after continued faithful to him. Sometime afterwards these warlike people marched to the relief of Constantinople, of which city they became the deliverers. It was under the reign of Theodosius that they began to make war in their own behalf; and after having been the stay of the tottering empire, they became its terror. The Arabs, hitherto divided in tribes, now united their forces, and sallied forth to make conquests. It appears that the seeds of that barbarous valour they now displayed had been concealed in their breasts, and that their hard and laborious life had prepared them for becoming intrepid soldiers. Their deserts were a rampart that secured them from foreign incursions; it was impossible to penetrate them without the danger of perishing for want of water, as the wells for the supply of it were known only to the inhabitants, who never disclosed the secret. Their towns were little else than magazines, in which they stored up the fruits of their predatory attacks, consisting of little more than a collection of huts, which they abandoned on the approach of an enemy; their citadels were the work of nature, steep rocks from whence they defied the most numerous hosts, who, like them, had nothing to fear, except the dearth of water and famine. Being ignorant in the art of fortification, they were but little versed in the attack of strong holds; thus their offensive wars were nothing more than transitory incursions: the forts which their enemies erected on the frontiers were sufficient to restrain their depredations. They were wont to thank heaven for giving them swords instead of ramparts. Their education was martial; they trained their children to the use of the bow and the sword, and in breaking their horses. An excellent sword was a family token, which a father bequeathed to his children, to remind them of the bravery of their ancestors. Prodigal of their own blood, it cannot be imagined that they were sparing of that of others. They fought only by day-light, because courage is roused by having witnesses of its efforts, and they thought that darkness was favourable to cowardice. It is therefore by no means surprising, that a people born with such noble propensities should have achieved such prodigies of valour, when once they had yielded to the ambition of conquests. The Arabs then, naturally warlike, only waited for circumstances to render them conquerors; for a long time, however, pacific and obscure, they took up arms merely from greediness of spoil, and never with a view of extending their borders, holding mankind in too great contempt for wishing to have them for subjects. They marched to battle without order or discipline; but accustomed to contend with ferocious animals, they carried courage to the excess of ferocity. Some, however, more savage than the rest, sold their blood and their services to such kings as were able to buy them; and it was not so much from a sentiment of honour, as from the hope of spoil, that they abandoned the tranquillity of their solitudes. The Romans and the Persians, as we have seen, had in their armies a body of Saracens, who frequently decided the fortune of war. Though satisfied

with their independence, they were scrupulous of attacking the liberty of their neighbours; and their greatest glory was their never having submitted to foreign dominion. To this, however, they have undoubtedly a distinguishing claim; those who at different times attempted to subjugate them, having merely succeeded against a few tribes, settled in the cities on the Arabian gulf, or in the vicinity of Syria; and even here their power was extremely transient. After the time of Mahomet, Arabia was for about three centuries under the Caliphs his successors; but neither he, nor the Caliphs, could ever entirely subdue their own nation. Many chiefs in the interior parts of the country still maintained their independence, without respecting the Caliph in any other light than as the head of their religion; and the authority of the Caliphs was merely spiritual, except in their dominions over a part of the coast, where they were acknowledged as sovereigns. In the year 325 of the Hegira, a great part of the country was possessed by the KARMATIANS, to whom the Caliphs were obliged to pay tribute, that the pilgrimage to Mecca might be regularly performed. After the ruin of the power of the Caliphate by the Turks, Arabia shook off the yoke to which it had been partly subjected, and was governed, as it formerly had been, by a number of chiefs more or less powerful, descended from different indigenous families. No neighbouring power ever attempted to subdue this country, till the Portuguese penetrated into India, and made their appearance in the Red Sea. Then, in the beginning of the 16th century, Sultan "El-Gury," fitted out a fleet to expel these invaders; and their fleet seized almost all the sea-port towns of Arabia. But when the dynasty of the Mamelukes was terminated by the Turks, these cities fell again into the hands of their natural sovereigns. In the continuance of the war between the Turks and the Portuguese, Solomon Pacha, with a powerful fleet, seized all the towns upon the Arabian gulf. His successors pushed their conquests still farther, and subdued great part of Yemen, penetrating into the highlands; so that Arabia became almost entirely a province of the Sultan of Constantinople, and was governed by Pachas, like the other provinces of the Ottoman empire. These events happened, under a lieutenant of Soliman I., A. D. 1538, and under Selim II., A. D. 1568. In the interior parts, however, there were still independent princes and Sheiks, who had never been subdued; but continued to harass the Turks, and to drive them towards the coasts. After various reiterated efforts, a prince of the family now reigning at Sana, at length succeeded, about the middle of the 17th century, and obliged the Turkish nation to evacuate all the places upon the Arabian coast, which they had occupied for more than a century. The Turks now possess nothing in this country, says Niebuhr, but a precarious authority in the city of Jidda; and it is therefore absurd to reckon Arabia among the Ottoman provinces, since it is properly to be considered as independent of all foreign powers. From the view above presented of the independence of Arabia, the contemptuous reflection of a popular historian (see Gibbon's Hist. vol. ix. p. 229.), seems not justly warranted; who, after observing, that "the perpetual independence of the Arabs has been the theme of praise among strangers and natives," adds, "the arts of controversy transform this singular event into a prophecy and a miracle, in favour of the posterity of Ishmael. Some exceptions, that can neither be dissembled nor eluded, render this method of reasoning as indiscreet as it is superfluous." This reflection was aimed at the authors of the Ancient Universal History, who had observed (vol. xvi. p. 299.), that the manner of life, disposition, power, and government

of the Scenite Arabs, now known under the name of Bedouins, as well as their never having been thoroughly subjugated by any foreign power, from the age of Ishmael to the present time, illustrate the truth of a scripture prediction, Gen. xvi. 12. The learned historian himself allows, that, though the kingdom of Yemen has been successively subdued by the Abyssinians, the Persians, the sultans of Egypt, under a brother of the great Saladin, A. D. 1173, who founded a dynasty of Curds or Ayoubites, and the Turks: though the holy cities of Mecca and Medina have repeatedly bowed under a Scythian tyrant; and though the Roman province of Arabia embraced the peculiar wildness, in which Ishmael and his sons must have pitched their tents in the face of their brethren; yet these exceptions are temporary or local, and the body of the nation has escaped the yoke of the most powerful monarchies. This writer, however, has admirably delineated the causes of the freedom and independence of the Arabs, and also the effects thus produced on their disposition and character.

Arabia, like other nations of the east, was partitioned into different tribes, each of which had its chief, its customs, and its sacred rites peculiar to itself: although every family formed a species of domestic government absolutely independent, though distant from one another, without any relations of interest or friendship, they had retained certain features which clearly indicated, that they were so many branches sprung from the same stock; all had the same love of independence, and, free in their native deserts, they pitied the nations that were subjected to masters. This love of liberty which is the passion of noble and generous minds, was in them a national fanaticism; which, causing them to despise the rest of mankind, prevented their participating in the disorders and crimes which have poisoned the source of public morals. The long memory of their independence was the firmest pledge of its perpetuity; and succeeding generations were animated to prove their descent, and to maintain their inheritance. Their domestic feuds were suspended on the approach of a common enemy; and when they advanced to battle, the hope of victory was in the front; in the rear, the assurance of a retreat. The arms and deserts of the Bedouins are not only the safeguards of their own freedom, but the barriers also of Arabia Felix; whose inhabitants, remote from war, are enervated by the luxury of the soil and climate. In every tribe among the Arabs, superstition, or gratitude, or fortune, has exalted a particular family above the heads of their equals. The dignities of sheik, and emir, invariably descend in this chosen race; but the order of succession is loose and precarious; and the most worthy, or aged, of the noble kinsmen, are preferred to the simple though important office of composing disputes by their advice, and guiding valour by their example. The momentary junction of several tribes produces an army, their more lasting union constitutes a nation: and the tribes and families are held together by a mutual and voluntary compact. In the simple state of the Arabs, the nation is free, because each of her sons disdains a base submission to the will of a master. His breast is fortified with the austere virtues of courage, patience, and sobriety; the love of independence prompts him to exercise the habits of self-command; and the fear of dishonour guards him from the meaner apprehensions of pain, of danger, and of death. The vigour of their frame is preserved by the laborious exercises of an active life, that enures them to toil and fatigue. The frugality to which they are constrained by the sterility of their climate, seems to be a virtue in them; and they are thus preserved from the imbecility and disease that are the

result of intemperance either in eating or drinking, and enabled to prolong their life to old age. Their virtues and their vices partake of the influence of their situation and climate. That complexional gravity, which renders them insensible to whatever affects the rest of mankind, that scornful indifference and insolent pride with which they regard others, and that torpid insensibility which they manifest, are contracted and nourished in their state of solitude. The gravity and firmness of the mind are indicated in the outward demeanour of an Arab; his speech is slow, weighty, and concise; he is seldom provoked to laughter; his only gesture is that of stroking his beard, the venerable symbol of manhood; and the sense of his own importance teaches him to accost his equals without levity, and his superiors without awe. A more serious charge than any thing already mentioned is brought against the Arabs, and from which it is difficult to justify them: this is an habitual cruelty prompting them to shed human blood without benefit and without remorse. Their own historians have transmitted to us such acts of atrocity, as testify that this ferocious people proposed not so much to conquer the world, as to destroy it. "In the study of nations and men," says Mr. Gibbon, "we may observe the causes that render them hostile or friendly to each other, that tend to narrow or enlarge, to mollify or exasperate the human character. The separation of the Arabs from the rest of mankind has accustomed them to confound the ideas of stranger and enemy; and the poverty of the land has introduced a maxim of jurisprudence, which they believe and practise to the present hour. They pretend, that in the division of the earth, the rich and fertile climates were assigned to the other branches of the human family; and that the posterity of the outlaw Ishmael might recover, by fraud or force, the portion of inheritance of which he had been unjustly deprived." Thus, the seizure of a caravan is not a robbery that can excite in them any remorse. They look upon it as the recompence of their courage, as well as a restitution of usurped property; and hence their errors concerning the right of war have precipitated them into a deluge of crimes. According to the remark of Pliny, the Arabian tribes are equally addicted to theft and merchandize. If a Bedouin discovers from afar a solitary traveller, he rides furiously against him, crying with a loud voice, "Undrests thyself, thy aunt (my wife) is without a garment." A ready submission entitles him to mercy, resistance will provoke the aggressor, and his own blood must expiate the blood which he presumes to shed in legitimate defence. A single robber, or a few associates, are branded with their genuine name; but the exploits of a numerous band assume the character of lawful and honourable war. The temper of a people, thus armed against mankind, was doubly inflamed by the domestic licence of rapine, murder, and revenge. Each Arab might, with impunity and renown, point his javelin against the life of his countryman; as in each community, the jurisdiction of the magistrate was weak and impotent. Hostility was embittered with the rancour of civil faction, and the recital, in prose or verse, of an obsolete feud, was sufficient to rekindle the same passion among the descendants of the hostile tribes. In private life, every man, at least every family, was the judge and avenger of its own cause. The nice sensibility of honour, which weighs the insult rather than the injury, sheds its deadly venom in the quarrels of the Arabs; the honour of their women, and of their beards, is most easily wounded; an indecent action, or a contemptuous word, can be expiated only by the blood of the offender; and such is their patient inveteracy, that they expect whole months and years the opportunity for revenge.

A fine or compensation for murder is familiar to the barbarians of every age; but in Arabia, the kinsmen of the dead are at liberty to accept the atonement, or to exercise with their own hands the law of retaliation. The refined malice of the Arab refuses even the head of the murderer, substitutes an innocent to the guilty person, and transfers the penalty to the best and most considerable of the race by whom they have been injured. If he falls by their hands, they are exposed, in their turn, to the danger of reprisals; the individuals of either family lead a life of malice and despotism; and fifty years may sometimes elapse, before the account of vengeance is finally settled. The modern theory and practice, in the revenge of murder, are described by Niebuhr; and the harsher features of antiquity may be traced in the Koran, c. 2. p. 20, c. 17. p. 230, with Sale's observations. The attachment of the Arabs to their customs and opinions, their secluded life severing them from mankind, and their contempt of death, which they contemplate with a cold intrepidity, were so many causes adapted to render them barbarous. He who despises life is inaccessible to pity; and no enemy is more formidable than he who is ready to die. Nevertheless, this sanguinary spirit, ignorant of pity or forgiveness, has been moderated by the maxims of honour, which require, in every private encounter, some decent equality of age and strength, of numbers and weapons. An annual festival of two, perhaps of four months, was observed by the Arabs before the time of Mahomet, during which their swords were religiously sheathed, both in foreign and domestic hostility. But the spirit of rapine and revenge was further tempered by the milder influence of trade and literature. The solitary peninsula is encompassed by the most civilized nations of the ancient world; the merchant is the friend of mankind; and the annual caravans imported the first seeds of knowledge and politeness into the cities, and even the camps of the desert. The Arabs have always blended a very considerable degree of beneficence, hospitality, and politeness, with their ferocity. The same hospitality which was practised by Abraham, and celebrated by Homer, is still renewed in the camps of the Arabs; and examples of this kind, among them, exceed any thing that can be produced from other nations. The contrary vice was held among them in such contempt, that one of their poets upbraids the inhabitants of a certain district in terms of bitter reproach, alleging, that none of their men had the heart to give, nor their women to deny. After the time of Mahomet, they were no less liberal than their ancestors had been. Sale (Pref. Koran, p. 21.) mentions the following singular instance. Three men were disputing in the court of the Caaba, who was the most liberal person among the Arabs. One gave the preference to Abdallah, another to Kais, and a third to Arabah. It was proposed, however, for the decision of the dispute, that each should go to his friend, and ask his assistance. Abdallah's friend found him with his foot in the stirrup, mounting his camel, and just setting out on a journey, and thus accosted him; "Son of the uncle of the apostle of God, I am a traveller, and in distress." Upon which Abdallah instantly dismounted, and presented the pilgrim with his camel, its rich caparison, some vests of silk, and a purse of 4000 pieces of gold. The servant of Kais informed the second suppliant that his master was asleep, but that he had rather relieve his necessity, than awake his master: accordingly, he gave him a purse of 7000 pieces of gold, assuring him that it was all the money they then had in the house; and he directed him to go to those who had the charge of the camels, with an order for a camel and a slave. When Kais awoke, and was informed

of what his servant had done, he gave him his freedom, and asked him why he did not call him; for, says he, "I would have given him more." The third person went to Arabah, who, being dim-sighted, was leaning on two slaves, and just coming out of his house in order to attend the hour of prayer. As soon as his case was made known, Arabah clapped his hands, lamented his misfortune, as he had no money, but desired him to take his two slaves. When these were refused, Arabah protested, that if they were not taken, they should be enfranchised; and, leaving the slaves, groped along by the wall. Arabah was pronounced the most generous of the three. The character of Hatem is the most perfect model of Arabian virtue. He is represented, by D'Heibelot (Bibl. Orient. p. 406.), as brave and liberal, an eloquent poet, and a successful robber; forty camels were roasted at his hospitable feasts; and at the prayer of a suppliant enemy, he restored both the captives and the spoil. In the desert, and on the roads, the Arabs will carry off the spoils of the traveller, and in a moment afterwards embrace, without inquiry or hesitation, the stranger who dares confide in their honour, and enter their tent. His treatment is kind and respectful; he shares the wealth or the poverty of his host; and, after necessary repose, he is dismissed on his way with thanks, with blessings, and perhaps with gifts. In every inhabited district, fires are lighted up at night, which are called the fires of hospitality, to invite the travellers that miss their way, or are in want of rest from the fatigues of their journey; and after well regaling them, they are set forward on their route with the sound of instruments and with presents. Their humanity is also manifest in the modes and degrees of punishment which they inflict on persons convicted of crimes. The Arabs extend their generosity and kindness even to the animals that grow old in their service; granting them the privilege of grazing in the richest pastures, exempt from every species of labour; and they send them provender even to the summits of their mountains. In politeness, the Arabs vie with the Persians. The common mode of salutation is the "salam aleikum," or, peace be with you; in pronouncing which words, they raise the right hand to the heart; but this form is seldom addressed to Christians. On meeting, in their wide deserts, the salutations are multiplied; and the hand of a superior is kissed in token of respect, a ceremony which sometimes passes among equals; and hence probably was derived, by means of their Moorish victors, the Spanish expression of kissing the hands. Nor were these the only good qualities of the Arab; they are commended by the ancients for the affection and respect that subsist between parents and children, and other kindred; and for the fidelity with which they fulfil their engagements. He who violates the sanctity of an oath, is doomed to grow old in ignominy; and it is with their blood that they sign their alliances, in order to impress upon them a more sacred character. The rights of friendship are deemed inviolable; and when two friends contract reciprocal obligations, they cannot decline them without being treated as profligates.

The primitive form of government, among the Arabs, was of the patriarchal kind; and the same form, according to Niebuhr, has ever subsisted without alteration; a circumstance which proves the antiquity of this people. Among the Bedouins, or pastoral Arabs, the descendants of the ancient Scenites, it is preserved in all its purity. Of these, such who live in tents, have many sheiks, each of whom governs his own family with a power almost absolute. All the sheiks, however, who belong to the same tribe, acknowledge a common sheik, whose authority is limited

by custom. The dignity of grand sheik is hereditary in a certain family; but the inferior sheiks, upon the death of a grand sheik, choose a successor out of his family, without regard to age, or lineal succession, or any other consideration, except superiority of abilities. This right of election obliges the grand sheik to treat those of the inferior order rather as associates than subjects, sharing with them his sovereign authority. The spirit of liberty, which animates this warlike nation, renders them incapable of servitude. But this spirit is less prevalent among those who live in towns, or who are employed in husbandry. In the fertile districts of this country, there have been always monarchies, formed either by conquest, or religious prejudices. Such are the present dominions of the sheriff of Mecca, of the imams of Sana and Maskat, and of some princes in the province of Hadramaut. However, as these countries are intersected by large ranges of mountains, the mountains are occupied by independent sheiks. But, although so many independent chieftains have their domains interspersed through the territories of these several sovereigns, yet nothing of the feudal government appears here. The sheiks possess no fiefs; they have only a sort of property in the persons of the people of their several tribes. Even those who seem to be tributary subjects to the princes within whose dominions they dwell, are not actually so, but they retain their independence; and the tribute they pay, is merely a title for the use of the land of which they are a sort of farmers. Such are the sheiks settled in Syria, Egypt, and over the whole of mount Atlas. This multiplicity of petty sovereigns, occasions several inconveniences to the people in general. Wars cannot but frequently arise among states, whose territories are so intermingled together, and whose sovereigns have such a variety of jarring interests to manage. But, happily, these quarrels are scarcely ever productive of very fatal consequences. An army of a thousand Arabs will betake themselves to flight, and think themselves routed, if they lose seven or eight of their number; and their contels are terminated as easily as they are excited. It is somewhat surprising, that the Arabs, in a country so rich and fertile, should be so uncomfortably lodged, indifferently fed, ill clothed, and destitute of almost all the conveniences of life. But the causes are sufficient to account for the effects. As to the wandering Arabs, their poverty is voluntary. They prefer liberty to wealth, pastoral simplicity to a life of constraint and toil, which might procure for them a greater variety of gratifications. Those who live in cities, or who are employed in the cultivation of the land, are kept in poverty by the exorbitancy of the taxes to which they are subject. The whole substance of the people is consumed in the support of their numerous princes and priests. The general cause of the impoverishment of Arabia is, without doubt, its having ceased to be the channel of trade with India, since the discovery of the passage by the Cape of Good Hope. Yet, if the lands were better cultivated, this country might, without the aid of foreign trade, afford sufficient resources to supply all its inhabitants with abundance of the necessaries and common conveniences of life.

The houses of the Arabs are built of stone, and have terrace roofs; but those occupied by the lower people are small huts, formed, for such as inhabit the banks of the Euphrates, of branches of the date-tree, having a round roof, covered with rush mats. The poor spread their floors with straw mats, and the rich with fine carpets. No person ever enters a room, without having first put off his shoes. The men occupy the fore part of the house, and the women the back part. If there are no separate apartments for the dif-

ferent sexes, the Arabians, when they introduce a stranger, enter before him, and cry out, "Tarik," retire; upon which the women instantly disappear. The great have often in their halls basins with *jets d'eau* to cool the air. The Arabians practise several modes of sitting; but that to which they recur, for the greatest ease, is crossing their legs under their body; but in the presence of superiors, an Arab sits with his two knees touching each other, and with the weight of the body resting upon the heels. The chief amusements of the Arabians are sought at coffee houses, in markets, and public meetings, which they are fond of frequenting; and in order to divert the dulness of domestic life, they recur much to the use of tobacco; and persons of opulence and fashion carry with them a box of odoriferous wood, a piece of which they put into the pipe of a person to whom they wish to shew respect; this communicates a fragrant smell and an agreeable taste. Instead of opium, which the Arabians do not use, they constantly chew "kaad," or the buds of a certain tree, which are brought in small boxes from the hills of Yemen. The lower people addicted to intoxication, snoke, for this purpose, the dried leaves of a sort of hemp, which raises their spirits, and throws them into a state in which delightful visions dance before their imagination. At their meals, they squat themselves upon the ground when they sit; and as they have no knives nor forks, they use their fingers with great dexterity, and eat of all dishes with the hand. The food of the most eminent sheiks is "pilau," or boiled rice. The Arabs repeat always a short prayer before they sit down to a meal; "In the name of the most merciful God;" and every one when he has done retires, pronouncing, "God be praised." As they drink little when they eat, after washing they drink cold water and a cup of coffee, which they use without either milk or sugar. In Yemen, however, of which the coffee-plant is a native, the use of coffee is rare. The favourite drink of this province is prepared from the husks of coffee-beans slightly washed and pounded; it tastes like tea, and is deemed refreshing. Intoxicating liquors of various kinds are privately used in different parts of Arabia; and they are obtained from the Christians and Jews. The Arabians, in general, are sober, frugal, and abstemious. Their usual articles of food are rice, pulse, milk, butter, and whipped cream. They seldom eat animal food. Of this, mutton is the most common; and the Arabians in the desert use it freely. The common people in Arabia have little other food besides bad bread, made of "durra," by kneading it with camel's milk, oil, butter, or greafe. Their grain is bruised with stones, as they have no mills; and in the desert they bake their cakes on a plate or gridiron, or on live coals, or on camel's dung, where they cover it till it is penetrated by the heat. In the towns, they have ovens like ours, and their bread is of barley meal, in form resembling our pancakes.

There is a great variety in the national dress of the Arabians. Their head-dress consists of fifteen caps laid over one another; some of which are of linen, and the rest of thick cloth or cotton. The uppermost is one richly embroidered with gold, and some sentence of the Koran; and over all they wrap a large piece of muslin, ornamented at the ends, and flowing loose upon the shoulders, with silk or golden fringes. The Arabs of the common class wear only two caps, with the sash carelessly bound on the head. Some have drawers and a shirt; but the greater number have only a piece of linen about their loins, a large girdle, and a piece of cloth upon their shoulders; in other respects they are naked, having neither shoes nor stockings. In the highlands, where the weather is colder, the people wear

sheep skins; and in the night, as a security against insects, they sleep in sacks. Persons of middle rank wear sandals instead of shoes. The ordinary dress of the Arabs is very simple; but they have also a sort of great coat without sleeves, called "abba," which is still more simple. In several parts of Arabia, the men wear no drawers; but these, with a large shirt, are the whole dress used by the women. In several provinces, they wear different sorts of veils. All wear rings on their fingers, arms, nose, and ears. They stain their nails red, and their hands and feet of a brownish yellow, with the juice of the alhenna; and they paint the circle of the eyes, and even the eye-lashes, black, with a preparation of lead ore. The women of Yemen also make black punctures in the face, to improve their beauty. Every body, without exception, wears the beard of its natural length; but the Arabs keep their mustachios very short. The Jews are forbidden the use of the turban, using instead of it a small bonnet; nor are they permitted to dress in any colour but blue. The dress of the Banians settled in Arabia, consists of a red turban of a particular form, a piece of white linen upon the shoulders, another about their loins, and slippers.

The Arabs are attached to certain customs, which they inherit from their progenitors, and which they observe in common with other oriental nations with which they have no immediate connection; and this circumstance seems to prove that they have been led to them by the nature of their climate. As cleanliness is indispensably necessary to health, the founders of several sects have enjoined various purifications and frequent ablutions as a religious duty; and the Arabians are scrupulous in the observance of the precepts that enforce them. They not only wash, bathe, and pare their nails very often, but cut away all hairs from the body. The painful rite of circumcision, which they adopted from Ishmael, has been retained under the persuasion that it checked the ravages of particular diseases; and hence the practice of circumcising girls is general in the same countries where boys are circumcised. The distinction of meats into allowed and prohibited was a lesson deduced from experience, teaching that such aliments as have an influence on the physical constitution, had in like manner a secret influence on the moral; and therefore a discreet police was authorized to interdict the flesh of the hog, and other unclean animals, that might at once be prejudicial to the health and to morals. With similar views, Mahomet, and some other founders of sects, have affixed ideas of spiritual impurity to the act of touching a dead body.

Polygamy, which was authorized by the example of the patriarchs, has been perpetuated in Arabia; but the Arabians seldom avail themselves of the privilege of marrying four lawful wives, and entertaining at the same time any number of unlawful ones. None but rich voluptuaries marry so many, and their conduct is blamed by all sober men. An Arabian, in moderate circumstances, seldom marries more than one wife; and as the husband is by law obliged to treat his wives suitably to their condition, and to dispense his favours among them with perfect equality, the privilege of polygamy is thought rather troublesome than convenient. Besides, divorce may be obtained without much difficulty; though the Arabians never exercise the right of repudiating a wife, unless urged by the strongest reasons, because this is considered as dishonourable, and entails disgrace on the woman and her relations. Wives are entitled to demand a divorce, when they think themselves ill used by their husbands. The Arabian women enjoy a great portion of liberty, and often, of power, in their families. Their dowries, and the annual income which they afford, remain at their disposal

during marriage; and, in the case of divorce, the whole of their own property is reserved to them. Some travellers have absurdly said, that the Mahometan wives are all slaves, and so entirely the property of their husbands, that they are even inherited by their heirs. This representation confounds slaves that have been purchased with women of free estate, who dispose of themselves in the East as they do in Europe; and the erroneous opinion seems to have arisen from the equally mistaken notion, that fathers in Arabia sell their daughters to the highest bidder. The case is so much otherwise, that every man, in tolerably easy circumstances, instead of selling his daughter, strives to give her a dowry, which may continue her own property. The marriage is made out by the Cadi, and signed in his presence; and it secures to the wife not only her dowry, but also a separate maintenance in case of a divorce. Many ridiculous stories have been related of the tests of virginity which an Arab expects when he marries a young woman: but most of these stories greatly exaggerate the truth. The Bedouins and the highlanders of Yemen, a rude and almost savage race, do indeed regard the want of these tokens as a mark of dishonour, and send a woman back to her relations, when her chastity cannot be thus evinced; but the more civilized inhabitants of the towns seldom or never concern themselves about such trifles. Many superstitious observances respecting marriage still prevail in Arabia. The Arabs believe in the virtue of enchantments, and in the art of tying and untying the knots of fate. The miserable victim of this art addresses some physician, or some old woman; for the old women are always skilled in sorcery. The Christians of the East have still a more certain remedy against the effects of witchcraft. They say masses for the afflicted person, and the honour of his cure is always ascribed to the influence of these masses. In Arabia there are no eunuchs; and the Arabians abhor the cruel operation which is requisite to render a man a fit guardian of the chastity of a haram.

The characters of nations are very much formed and modified by climate, government, and education. To the first of these the Arabs owe their vivacity and their disposition to indolence; the second increases their sloth, and gives them a spirit of duplicity; and the third is the one principal cause of that formal gravity which influences the faculties of their minds, as well as their carriage and exterior aspect. The mode of education among the Arabs is very different from that of the Europeans. The former strive to hasten the age of maturity, as much as the latter endeavour to retard it. The Arabs, says Niebuhr, are never children; but many Europeans continue children all their lives. As soon as boys in Arabia leave the Haram, about the age of five or six years, they are accustomed to think and speak with gravity, and to pass whole days in the company of either fathers or preceptors. As music and dancing are esteemed indecent among the Arabs, women are also excluded from all assemblies, and the use of strong drinks is forbidden. The young Arabs thus become pensive and serious even in infancy. Nevertheless they have in reality a great degree of vivacity, which varies in the different provinces. This vivacity makes them fond of company and of large assemblies, notwithstanding their seeming seriousness. Several travellers accuse the Arabs of being cheats, thieves, and hypocrites. An arbitrary government, which impoverishes its subjects by extortion, can, indeed, have no favourable influence upon the probity of the nation, yet Niebuhr avers, from his own experience, that such accusations have been exaggerated beyond the facts. The irritable and vindictive spirit of the Arabians has been already noticed.

The Arabs, proud of their remote origin, have always
made

made their genealogies a subject of serious study; and as their ancestors could neither read nor write, they were unable to transmit to them the records of their descent; and for the same reason, it is impossible to convict them of error. For about thirty-six centuries, however, the filiations have been deposited in the public archives. This custom, which is religiously observed, is said to have been introduced by Adnan, one of the ancestors of Mahomet. In short, a people so little numerous, that has not contracted any foreign alliance, and which, in its solitary leisure, is always occupied about the interests of its vanity, may easily have preserved the remembrance of its ancestors, and the series of its generations. All those petty princes, who govern in Arabia, are very proud of their birth, and this pride may be ascribed to the independence and sovereign power which their families have enjoyed from time immemorial. The nobility, who are free, or dependent only on the chiefs of their tribes, are infected with the same vanity. What adds to the high conceit which the Bedouins have of their nobility is its being incommunicable, and not to be transferred by any sovereign prince, nor even by the caliphs. The descendants of Mahomet are those who hold the first rank among the great families in Arabia. These descendants have received different titles; in Arabia, they are called *SHERIFFS* or *SEJIDS*; in the Mahometan countries situate northward, *Sheriffs* or *Emirs*; and in the Arabian colonies in the east, simply *Sejids*. Of all the titles in use among the Arabian nobility, the most ancient and most common is that of *SCHEICK* or *SHEIK*. Other families that are anxious to preserve their genealogies, are those that are descended from the tribe of Koreish, and who have held, by hereditary right, certain employments since the days of Mahomet and his successors. The Arabs seem still to be vain of those long names which are so disgusting in their history; but their length of names and titles is occasioned by the difficulty of distinguishing individuals among a nation that knows not the use of family names.

Although in Arabia there are neither numerous academies nor men of profound learning, yet the Arabian youth are not entirely neglected. In the cities, many of the lowest rank are taught both to read and write; and the same qualifications are also common among the sheiks of the desert, and in Egypt. Persons of distinction retain preceptors in their families to instruct their children and young slaves. In almost every mosque is a school, having a foundation for the support of teachers, and the entertainment and instruction of poor scholars. In great towns, there are likewise other schools, to which people of middle rank send their children to receive religious instruction, and to learn reading, writing, and arithmetic. There are no girls taught in these schools, but they are privately taught by women. Besides these small schools, there are more considerable seminaries of education in some of the great towns of Arabia. There are colleges in which the sciences of astronomy, astrology, philosophy, and medicine are taught; but the Arabians, for want of books and good masters, make little progress, and their attainments are very partial and imperfect. In the dominions of the Imam, there have been for a long time two famous academies; one at Zebid for Sonnites, and the other at Damar for the Zedites. The chief employments of men of letters among the Arabians are the interpretation of the Koran, and the study of the ancient history of the Mahometans.

Some seeds of the sciences seem to have sprung up in Arabia before they were known to other nations. They were the first who studied the laws of the heavenly bodies. A roaming people, in a region lying beneath a serene and cloudless sky, solely employed in tending their flocks, either

in the open plains, or on the tops of mountains, must, at an early period, have acquired some knowledge of the planets and the stars; and it affords a presumption of their having been among the first astronomers, that the names which denote the different constellations, are taken from the different species of animals known in those parts, and many of the stars are called by their names. Their knowledge, however, was neither very accurate nor very extensive. It was derived from long observation and experience, and not from any regular study or astronomical principles and rules. The Arabians, as well as the Indians, chiefly restricted themselves to the observation of the fixed stars, and in this they differed from other nations, whose observations were almost confined to the planets; and they foretold their effects from their influences, not from their nature; and hence, it hath been said, arose the difference between the idolatry of the Greeks and Chaldeans, who chiefly worshipped the planets; and that of the Indians, who worshipped the fixed stars. The stars by which they most usually observed the weather, were those they called "*Anwâ*," or houses of the moon, which were twenty-eight in number, and divided the zodiac into so many parts, through each of which the moon passes every night; and from their rising and setting, the Arabs, by long experience, observed the changes that happened in the air; and at length they were led to ascribe a divine power to them, saying that their rain was from such and such a star, which expression Mahomet condemned and prohibited. The old Arabians, therefore, seem to have made no farther progress in astronomy, which science they afterwards cultivated with so much success and applause, than to observe the influence of the stars on the weather, and to give them names: so that they became astrologers and magicians, rather than astronomers. The infancy of science is generally infected with an inclination to the marvellous; accordingly, in Arabia, pretended sages arose who boasted of understanding the language of birds; and others, profaning the name and office of prophet, retired into caverns and deserts, where, after long fastings and painful macerations to gain the favour of the deity, they were gratified with visions, which they solemnly related to the multitude, who could not discern the impostor concealed under the figure of a pale and haggard being, often covered with wounds and ulcers which they fondly and foolishly imagined to be the marks of sanctity. It was likewise in that part of Arabia, which borders on Egypt, that the swarms of adventurers started up, who, wandering on the globe, without a native home, under the appellation of gypsies and fortune-tellers, procure a wretched livelihood by their tricks from the stupid vulgar. It was with arrows, divinity rods, philters, amulets, and charms, that these vagabond impostors, by pronouncing certain mysterious words, practised their magical operations, and imposed on the credulity of mankind in an *age of ignorance*: such was the Arabian expression for the period that preceded the time of Mahomet. The Arabians, even in a later period, destitute of books and instruments, have made little progress in astronomy. Although it is known to all men of sense in Arabia, that eclipses are owing to the interception of one heavenly body by the interposition of another, yet the multitude still maintain the absurd opinion, that a huge fish pursues the planet which is eclipsed; and women and children ascend the roofs of their houses, and make a hideous noise with brazen kettles and basons, in order to chase away the fish. The Arabians, indeed, at this time, seem to study astronomy solely with a view to their success in the cultivation of astrology, which is a science highly esteemed, and very lucrative, in the east. The occult sciences, as they are called, are in high estimation.

tion among the Arabians. One of these is denominated "Ism Allah," or the science of the name of God, which is the most sublime of all: for God, they say, is the lock, and Mahomet the key: and consequently none but Mussulmans can acquire it. It enables its possessor to discover what is passing in the most distant countries, to make himself familiar with genii, and to oblige them to obey his pleasure; to dispose of the winds and seasons as he chuses; and to cure the bites of serpents, and many other diseases and infirmities. To this science, the absurdity of which is evident from the mere mention of it, belongs also the art of discovering hidden treasure; and in this the Magrebins, or Arabians of Barbary, are known to excel. The art of procuring sublime visions is also known to the Arabians. The second of the occult sciences, called "Simia," teaches juggling tricks, and this is practised even by some orders of the dervises to prove the truth of their religion and the sanctity of the founder of their order. The science of "Kurra" teaches a person to compose billets which secure him that wears them from the power of enchantment, and from all sorts of accidents. These billets are inclosed in small purses of skin, and worn on the head, arm, or breast; and bound for particular purposes upon the necks of horses or asses. The science of "Rame" is the art of fortune-telling; and that of sorcery is called "Sihhr," which is applied to many infamous purposes. Alchemy is still in vogue among the Arabians.

The grave and serious sciences that depend on calculations and reasoning could not make any great progress among a people governed by an imagination always heated, and almost incapable of direction and restraint. These sciences, banished from the climate bordering on the tropic, have been replaced by the agreeable arts that delight in the irregularities and disorders which astonish the mind, and captivate the heart. In Arabia we find the cradle of poetry and eloquence, which had scarcely appeared before they arrived at a sudden maturity. The Arabs are all poets and orators; for an account of the poetry of the Arabs, see *ARABIAN Poetry*. Among the ancient Arabs, eloquence was an accomplishment for which they valued themselves. Their orations were of two sorts, metrical and prosaic: the one being compared to pearls strung, the other to loose ones. They attempted to excel in both; and whoever was able, in an assembly, to persuade the people to a great enterprise, or to dissuade them from a dangerous one, or gave them any other salutary advice, was honoured with the title of "Khatib," or orator, which is now given to the Mahometan preachers. They pursued a method very different from that of the Greek and Roman orators; their sentences being like loose gems, without connection; so that this sort of composition struck the audience chiefly by the fulness of the periods, the elegance of the expression, and the acuteness of the proverbial sayings; and so confident were they of their pre-eminence in this way, that they would not allow any nation to understand the art of speaking in public, except themselves and the Persians; and the Persians were reckoned, in that respect, says Pococke (*Spec.* 161.), much inferior to the Arabians. In Arabia, eloquence is not now much cultivated. Occasions for the exercise of it very rarely occur. The Arabians, however, tell us that they have great orators in their mosques. The only theatres for the exercise of profane eloquence are the coffee-houses, which are commonly large halls, having their floors spread with straw mats, and illuminated at night by a multitude of lamps. The guests are served with pipes and a cup of coffee. They are also amused by readers and orators, who are commonly "Mullahs," or poor scholars, and who either read or repeat passages from some favourite authors, or recite tales and

fables of their own invention. When the orator has ended, he obtains a voluntary contribution from his hearers.

It was Arabia that gave birth to the Apologue, a method of instruction, which, in all ages, has been in use among the oriental nations, who love to conceal under a mysterious veil the most trivial subjects, in order to give them an air of dignity. The Arabs especially have displayed their subtilty in the solution of enigmas. They boast of having produced a Lokman, surnamed "Al Hakim," i. e. the wise or the sage, whose features bear too great a resemblance to those of Æsop, to admit a doubt concerning the identity of their persons. Some, however, have thought it more likely that the compiler of these fables had seen those of Æsop, and chose to insert some of them in his own collection. This celebrated fabulist has served as a model to all those who have come after him; and the Arabians have thus, guided by their own genius alone, drawn from its native funds those riches which others have reciprocally borrowed of their neighbours. For the Arabic characters, chronology, language, music, philosophy, physics, poetry, and religion; see the following articles.

The mechanical arts could not well be brought to any considerable degree of perfection among a people who knew but few wants. As their productions are less splendid than useful, it is rather in towns than in the bosom of deserts that they grow up, because necessity is the parent of industry. The Arabs, entirely occupied in warring against man and beast, excelled only in the manufacture of scymetars, bows and arrows, and darts; nor, as it has been already observed, have they made any great progress in modern times. Their cotton stuffs were never greatly esteemed; and few of their other manufactures are the produce of the skill and labour of native Arabians. Sale's Koran Pref. Anc. Un. Hist. vol. xvi. p. 242—327. Asiatic Researches, vol. ii. p. 1, &c. Niebuhr's Travels through Arabia, &c. passim. Pinkerton's Mod. Geog. vol. ii. p. 405—430.

ARABIC, or ARABIAN, something that relates to Arabia, or the Arabs.

ARABIC Characters or Figures, are the numerical characters commonly made use of in arithmetical computations; and they stood contradistinguished from the Roman. Concerning the origin of these figures, see *FIGURES*.

ARABIC Chronology. The Arabs divided their year formerly, as is now the case, into twelve months, to which they gave names; but an ancestor of Mahomet gave them new names deduced from certain events happening in every month; and the old ones were, by the authority of Mahomet, totally abolished in every part of Arabia. The year was also anciently divided into six seasons, viz. 1. The season of herbs and flowers; 2. Summer; 3. The hot season; 4. The season of fruits; 5. Autumn; 6. Winter. The ancient Arab year was lunisolar; but the custom of intercalary months, in order to make the course of the moon agree with that of the sun, was abolished by Mahomet; and the learned now reckon by months corresponding to the course of the solar year, and consisting of the same number of days with ours. See *YEAR*. The Arabs, like the Egyptians, Indians, Greeks, and Romans, anciently computed their time by weeks, or periods of seven days, as we learn from a very ancient poet, who died many ages before the publication of the Koran. The Arabian day consists of twenty-four hours, and lasts from sun-setting to sun-rising; so that their hours are of uncertain duration, and vary with the length of the natural day, or the time during which the sun is above the horizon. The different parts of the day, as they have no precise idea of the duration of their hours, are distinguished by vague and uncertain denominations.

ARABIAN Gulf. See RED Sea.

ARABIC gum, *gum Senegal*, *gummi Arabicum*, *Acacie vera succus*. This valuable article of commerce is a very pure concrete mucilage, which exudes from the *Mimosa Nilotica*, or *Acacia Vera*, a tree that grows abundantly on the sandy soil of Egypt and Arabia, on the banks of the rivers Senegal and Niger, near the Cape of Good Hope, and in several other parts of Africa. The fruit of the same tree also yields another mucilaginous juice, but at the same time considerably astringent, and of a brown colour, which has been already mentioned under the article ACACIA.

The purest gum arabic is brought in caravans to Cairo by the Arabs of the country around mount Tor and Sinai, who bring it from this distance on the backs of camels, sewn up in bags of skin, and often adulterated with sand and other matters.

The settlement at Senegal is another great mart for this commodity; and the gum, which bears the name of this place, is generally in larger masses, and of a yellowish or amber colour, but it does not sensibly differ from the Egyptian gum in any of its properties.

This mucilage exudes spontaneously in a liquid state from the trunk and boughs of the tree, and hardens by contact with the air and the heat of the sun. It begins to flow about December, immediately after the rainy season, near the flowering time of the tree. Afterwards as the weather becomes hotter, incisions are made through the bark, to assist the transudation of the juice.

The best gum arabic is brought over in oblong or roundish lumps seldom bigger than a walnut, nearly transparent, white, or of a pale yellow, wrinkled, and of a shining fracture. It is so brittle as easily to be reduced to a fine powder. It is also perfectly insipid and inodorous, dissolving in the mouth into a clammy liquid.

As the gum arabic is the most perfect specimen of a *gum MUCILAGE*, all the properties which we shall now mention to belong to it, may be considered as descriptive of this whole class of chemical substances.

The habitudes of this gum with water affords one of its most striking characters. When added to water, either cold or hot, and not less than twice its weight, it dissolves slowly, and converts the whole into a very slimy viscid liquor. Heat does not coagulate this solution; a gentle evaporation will expel the water and leave the gum as solid and brittle as before, equally resolvable in water, and unaltered in any of its properties. In this respect it differs in a striking manner from most other vegetable substances.

It is entirely insoluble in ardent spirit and in oils; alcohol indeed coagulates the watery solution, by uniting with the water, and thus precipitating the gum.

Gum mucilage is but little inflammable, when put into the fire it swells and grows puffy, and soon is reduced into a voluminous coal. Distilled *per se* in a retort, it first yields a limpid water, then an acid (which was at one time supposed to be peculiar, and was termed the *Pyro-mucous*), and afterwards a thick empyreumatic oil, and a little volatile alkali, like all the distillations of vegetable matter.

The pure gum mucilages, when dry and solid, will remain unchanged for any length of time: the watery solution is likewise the least alterable of all the vegetable liquids; but by long keeping it becomes sour and grows mouldy on its surface, if it is prevented from drying up by the evaporation of its water.

When nitric acid is distilled off gum arabic, or any other of the gum mucilages, a peculiar acid is formed, which appears as a white powder of difficult solution, and has been termed the *Mucous acid*. It is the same with the *SACCHOLACTIC acid* of Scheele.

The specific gravity of the solid mucilages, according to Fourcroy, is from 1.3 to 1.48.

The gum which exudes in considerable abundance in our own climates from the apricot, plum and cherry trees, bears the strongest resemblance to the gum arabic in all its properties, only it is generally of a yellow colour, not so brittle, and forms a mucilage of somewhat less tenacity.

Gum arabic is employed for a number of valuable purposes both in the arts and in medicine. It may be used either to suspend in water a number of substances which could not otherwise be kept equally dissolved in this liquid, or as a means of glueing together a variety of articles of light work; and as a clean colourless cement perfectly easy of application, and which may be prepared in a few minutes, it is peculiarly valuable. Gum Senegal is used in very large quantities by the calico printers, to mix the colours and the mordants in block printing; gum arabic forms the basis of crayons, and the cakes of water colours, and of several liquid colours, of which common writing ink is a familiar example.

All the gum mucilages are considerably nutritious; in the countries where the gum arabic and senegal grow native, it forms an important article of food, either by itself, or mixed with milk, rice, &c. Hasselquist relates an instance of the travellers of a large caravan, who had consumed all their provisions in the middle of their journey, preserving themselves from famine by the gum arabic which they were bringing as merchandise.

In medicine, this gum is employed, either by itself, or as a vehicle for other substances. Taken internally, it has been supposed to be inassating and obtunding; qualities, however, which probably have little foundation in fact and real observation. As it is simply mucilaginous, it will certainly in some degree protect the parts with which it comes in contact from the effect of any acrid and stimulating substances; and thus it is of use in quieting the tickling cough which arises from any acrimony in the fauces, and in some cases it is of material service in diarrhoea and dysentery. It is given either in powder, or dissolved in water, almond milk, &c.; and one ounce of the gum is sufficient to give a considerable thickness to a pint of liquid, without making it too slimy to drink with pleasure.

In pharmacy, gum arabic possesses the valuable property of rendering miscible with water the balsams, resins, fixed oils, and similar substances, whereby they may be very commodiously taken in a liquid form. One part of gum arabic previously softened with water (or an equivalent quantity of the mucilage), will thus render four parts of balsam or oil soluble in any watery liquid, and will form an uniform emulsion. Even mercury may be thus suspended in water by being previously rubbed for a considerable time with gum arabic, which preparation is called, from the inventor, *Plenk's solution*. The corrosive acids, when taken internally, are best diluted with a solution of this gum.

The pharmaceutical preparations, in which gum arabic enters as a principal ingredient, are the *Mucilago gummi Arabici*, a simple solution of one part of the gum in two parts of boiling water; the *Emulsio Arabica Ph. Edin.* which is gum arabic dissolved in almond milk; the *Trochisci Arabici*, with gum arabic, starch and sugar; and the *Pulvis tragacanthæ compositus Ph. Lond.* a powder made of tragacanth, gum arabic, starch, and sugar. *Murray Appar. Med. Fourcroy, &c.*

ARABIC language is derived from the same stock with the Hebrew, Syriac, and Chaldaic tongues. Its near affinity to the Hebrew is almost universally acknowledged, and some have even maintained, that it was not only a sister dialect of

this language, but in its original and unsophisticated state, pure Hebrew. Of course it must unquestionably be one of the most ancient languages in the world. The Arabs, by whom it was spoken, having inhabited the country now possessed by their descendants almost from the deluge, without intermixing with other nations, or being subjugated by any foreign power, their language must have been formed soon after, if not at the confusion of Babel. The Arabian writers ascribe it to Joktan, the son of Eber, and its name to Yarab, the son of Joktan or Kahtan, supposed to be the same that is mentioned, Gen. x. 26. This opinion is adopted by many learned moderns. See Hunt. *Orat. de Antiq. et Eleg. Ling. Arab.* p. 1. Pococke *Spec. Hill. Arab.* p. 29. Bochart in *Geog. Sacr.* c. ii. c. 15. Golius, in *Lex. Arab. Schultens*, in *Orig. Hebr.* The two principal dialects of this language were, that spoken by the Hamyarites and other genuine Arabs, and that of the Koreish in which Mahomet wrote the Koran. The Hamyaritic dialect is supposed to have approached nearer to the purity of the Syriac, and consequently to have been more remote from the true genius of the Arabic than that of any other tribe. The dialect of the Koreish, usually termed the pure and ancient Arabic, and in the Koran the perspicuous and clear Arabic, is referred to Ishmael as its author, who, according to the oriental writers, first spoke it; and, as Dr. Pococke apprehends, after he had contracted a matrimonial alliance with the family of Jorham, formed it of their language and the original Hebrew. This latter dialect of the Koreish was conceived to consist chiefly of the Hebrew; but its politeness and elegance should rather be attributed to their having the custody of the Caaba and dwelling in Mecca, the centre of Arabia; for by their situation, they had less intercourse with foreigners, who might have corrupted the language, and were more frequented by the Arabs of the whole circumjacent country, who resorted to Mecca on a religious account, and for the accommodation of their differences; from their discourse and verses the Koreish took the words and phrases which they judged to be most pure and elegant, and thus the beauties of the whole tongue were transfused into this dialect. Other circumstances also contributed to the improvement of this dialect. Of the pilgrims who resorted to Mecca, many were of the first rank, and possessed all the science of their country and age. In the great feasts which were held during their stay in this city, a variety of amusements occupied their attention, and literary compositions, which called forth an emulation to excel, formed some of their principal entertainments on these occasions. Hence the dialect of the Koreish, the noblest and the most learned of all the western Arabs, became the purest, the richest, and the most polite of all the Arabian idioms; and about the beginning of the seventh century, it was the grand language of Arabia; the other dialects being either gradually disused, or incorporated with it. By this union, and by commercial intercourse with Alexandria, the seat of learning, and with other places where they might obtain an acquaintance with Grecian literature, the Arabic language acquired a fecundity and also an elegance, in a great degree peculiar to itself.

The Arabs are so extravagant in the commendations of their language, that they not only represent it as peculiarly harmonious and expressive, but they also say, that it is so copious and comprehensive, that no uninspired person can be a perfect master of it in its whole extent. To this purpose it has been alleged, that this language has 500 names for a lion, 200 for a serpent, more than 80 for honey, and above 1000 for a sword. Nevertheless, the Arabs believe that the greatest part of their language has

been lost; and this opinion is not very improbable, when we consider how lately the art of writing was introduced into Arabia. To this purpose Dr. Robertson (*ubi infra*) has observed, that the genius of the Arabic language resembles that of the Hebrew; as all its primary or radical words are composed of different combinations of consonants by *triads*, so that the various combinations and copulations of three letters form more than 10,000 roots, without including those which may arise from the concomite of guttural letters. To this quality of the language he partly ascribes that stability or permanence which this language possesses in common with the Hebrew, by reason of which it has retained its purity and integrity for so many thousand years, without those changes and fluctuations to which other tongues have been subject. Sir William Jones also observes (*Asiatic Researches*, vol. ii. p. 6.), that as the Arab roots are universally trilateral, the composition of the twenty-eight Arabian letters would give 22,000 elements of the language; and this circumstance demonstrates its surprising extent; for although great numbers of its roots are confessedly lost, and some perhaps were never in use, yet if we suppose 10,000 of them, without reckoning quadrilaterals, to exist, and each of them to admit only five variations, one with another, in forming derivative nouns, even then a perfect Arabic dictionary ought to contain 50,000 words, each of which may receive a multitude of changes by the rules of grammar. To this circumstance it is probably owing, that the Arabic, and also all its sister dialects, abhor the compositions of words, and invariably express any complex ideas by circumlocution; and this genius of its language has been one source of its copiousness and extent. And yet, notwithstanding the variety of its words, in which it is far superior to the Greek and Latin, and indeed to most other languages ancient and modern, it is equally distinguished by its perspicuity and precision. This excellence of the ancient Arabic, this union of brevity and variety, by which it is able to express with clearness and energy what could not be described in other tongues without hideous circumlocutions, is particularly mentioned and illustrated, among other distinguishing qualities of this language, by the learned Pococke in his "Oration on the Arabic language."

Dr. Robertson has cited an apposite passage to this effect, which is here subjoined for the satisfaction of the curious and learned reader. "Neque in nullâ certè laudis parte, mira illa (inquit doctissimus Pocockius), quâ non solum verborum in significando perspicuitati, sed in prolacione elegantiae et dulcedini cavent, sedulitas; quâque non solum accuratâ inter literas et significatâ proportione, sensus vel intentioni vel remissioni, prout res postulaverit, literarum appositione, subductione, vel juxta organorum ratione, prospexerunt; sed et nè quid delicatulis auribus ingratum, nè quid horridum aut ασχημον reperiatur, effecerunt. Hoc in genere est, quod nuspiam in verbo aliquo, genuinae apud Arabes originis, concurrant, non intercedente vocalis alicujus motione, consonantes, cum vel tres vel plures, aliis in linguis frequenter colliduntur. Immo neque, si adint, quæ asperitatis remedio sint, vocales, quælibet tamen temere committunt consonantes; sed si ita rei natura postulat, ut concurrere debeant illæ, quæ se invicem sine asperitatis alicujus inductione consequi, et inter se connecti non possunt, illi vel situs vel literarum mutacione, eas abjiciendo, inferendo, emolliendo, aliiive quibus possint modis, remedia quærunt; adeo ab omni, quod vel absonum vel dissonum est, abhorrent. Quod si nobis secus videatur, et asperius sonare ab Arabibus prolata, illud auribus nostris et usu, non linguæ imputandum; nec mollius illis sonare nostra, quam eorum nobis censendum. Quin et gutturalium, quæ

nobis maxima asperitatis causa videntur, absentiam, ut magnum in lingua Græcâ defectum, arguunt Arabes." The learned Dr. Hunt, late professor of the Hebrew and Arabic languages at Oxford (in his *Orat. de Ling. Arab.* p. 17.), expresses his opinion of the excellencies of this language much to the same purpose: "Nusquam mihi credite (inquit), auribus magis pareatur, quam in Arabiâ; nulla lingua a *κκκοφνωια* omni alienior, quam Arabica. Quamquam enim nonnullæ ejus literæ minùs fortasse suaviter, immo duriùs etiam sonuerint, ita tamen Arabes eas temperârunt, ut asperas cum lenibus, duras cum molibus, graves cum acutis, miscendo, voces inde non minùs auditu jucundas, quam pronuntiati faciles confecerint, totique sermoni miram sonorum tam dulcedinem quam varietatem addiderint. Quod quidem orationis modulandæ studium in Corano adeo manifestum est, ut primi Islanissimi oppugnatores cum libram magicâ ideò arte scriptum dixerint. Nec auribus tantum gratus est Arabismus, sed et animi conceptibus exprimentis aptus, sonos suos sententiis semper accommodans, et felici verborum juncturâ ipsam rerum naturam depingens." It is needless to multiply testimonies of a similar kind, extracted from the writings of Bochart, Erpenius, Golius, Schultens, &c.

Some have maintained that the Arabic tongue descended from the deluge to the time of Mahomet in its original purity; but that it should remain altogether unsophisticated for a period of more than 3000 years, is not very probable. Whatever care might have been taken of it, however tenacious the Arabs were of their ancient customs and institutions, and however favourable their situation might have been for preserving the language unmixed, it is not likely, nor indeed can we conceive it to be possible, that it should have escaped a variety of changes in that long period; or that it should have not acquired in its progress downwards from the mere lapse of time, from necessary or voluntary intercourse with distant and neighbouring nations, and from a variety of other causes, diminutions or additions, or intermixtures, which render the words, idioms, and phraseology of the Koran very different from the Hebrew, Syriac, or Chaldaic, to either of which the ancient Arabic must have been nearly allied. But these changes affected merely or principally the dialects of the language, whilst the substance or marrow of it, as Schultens calls it, remained untouched; and comprehended the letters, vowels, and pronunciation. Dr. Robertson, professor of oriental languages in the university of Edinburgh, in an elaborate dissertation, "*De Origine, Antiquitate, Conversatione, Indole, et Utilitate Linguae Arabicæ*," prefixed to his "*Clavis Pentateuchi*," is an able and zealous advocate for the unsophisticated purity of the ancient Arabic; inasmuch that it did not degenerate from its original purity in the same manner as the Spanish, Italian, and French dialects have degenerated from the Latin stock. This opinion is sanctioned by the authority of the learned Schultens, in his *Orig. Heb.* vol. ii. p. 20, 21. *Orat. Ling. Arab.* p. 28. and by several others, who have been best acquainted with the structure of the Arabic language, and with the history of the ancient Arabs. Without deviating into the unfounded extreme of Hutchinson, who ascribes a comparatively modern origin to this language, and traces it no higher than the age of Mahomet, we may allow that such changes as have been already mentioned might have been introduced into it, without disputing its antiquity, or upon the whole its uncorrupted state for many ages previous to the time of Mahomet. This celebrated impostor indeed makes his boast, that the language of the Koran was the same, with respect to its purity and perfection, with that which was anciently used by Abraham and Ishmael. Dr. Robertson (ubi supra) maintains, that the Arabic language

VOL. II.

used by Mahomet was the same with that of the Joktanites and Ishmaelites; and, in support of this opinion, he refers to seven poems written before his time, and suspended in the temple of Mecca, intitled "*Moallekat*," and still extant at Paris and Leyden; and also to ancient monuments found near Aden in Arabia Felix, of which an account was published by Schultens in his "*Monumenta Venerabiliora Arabiæ*," 4to. Leyden, 1740.

The learned Hyde is also an advocate for the affinity of the Arabic to the Hebrew, and also for its permanent purity. To this purpose he says (*Dissert.* vol. ii. p. 454, &c.) that the Arabic is more pure and unmixed than any other, allowing merely for some Persian medical terms, and for a few Latin words which it acquired by means of the wars and negotiations between the Arabians and Romans. In other respects, he says, it is pure and free from mixture; and this he ascribes partly to the number of books and writers who preserved it entire, partly to the cultivation of it by the Arabs, who were devoted to poetry and eloquence, and partly also to the desert, inaccessible, and un subdued country which they inhabited.

Since the age of Mahomet, it is an acknowledged fact, that all the dialects of the Arabic have been greatly corrupted, so that the language in which the Koran was written is become a dead language, and studied in the colleges of Arabia just as the European Christians acquire the Hebrew, Greek, and Latin. It is not easy to conceive how the identity and purity of a language could be preserved for many ages among a people who had no written characters. Among the Hanyarites or Homerites, who for many centuries had possession of the principal part of Arabia, the art of writing seems, indeed, to have been known at a very early period. Their character was perplexed, the letters not being distinctly separated; and from the mutual connection and dependence of the letters and their several parts, it was denominated "*Al Mofaad*." But this alphabet was neither publicly taught, nor suffered to be used without permission. It corresponded in the number and order of the letters to the Hebrew alphabet, and was called "*Abgad Hevez*," from the first Hebrew letters in their natural order, viz. אבגדה. According to Chardin (vol. iii. p. 54.), the first word is formed by the letters, A, B, G, D, which were formerly the first of the Arabic language, as they are still of the Hebrew. These, according to this learned traveller, were the ancient characters of the Arabs, and differed from the Cufic characters which were afterwards introduced; and he is of opinion that they were furnished with vowel points. Some ancient monuments are said to be still remaining of this character, which Pococke apprehends to have been the rude Chaldaic in its unimproved and unpolished state. To these Job is supposed to refer, ch. xix. v. 23, 24; and Ebn Halthem relates that an inscription in this old Arabic character was found in Yemen, as ancient as the time of Joseph. These traditions may have led some authors to conclude, that the Arabians were the inventors of letters; and Sir Isaac Newton (*Chronology, Oper.* vol. v. p. 155. Ed. Horsley) supposes that Moses learned the alphabet from the Midianites, who were Arabians.

The Koreishites and other Arabs, some Jews and Christians excepted who were called the people of the book, were for many ages ignorant of the art of writing, and do not seem to have acquired it till the sixth century. Moramer Ebn Morra of Anbar, a city of Irak, who lived not many years before Mahomet, was the inventor of the present Arabic character, which Bashar the Kendian is said to have learned from those of Anbar, and to have introduced at Mecca among the Koreishites, a little while before the institution of Mahometanism. The letters of Moramer

were different from the Hamyaritic; and though far from being either convenient or beautiful, they were long used by the Arabs. They were denominated Cufic from Cufa, a city of Irak; and in this character the Koran was first written. These letters are also used occasionally, at this day, by the Arabs for the titles of books and public inscriptions. The more elegant and expeditious character that is now used, was first formed from the Cufic by Abuali Ebn Moklah, vizier to the caliph of Bagdad, about 300 years after Mahomet, and perfected by Ali Ebn Bowab, who died in the year of the Hegira 413, A. D. 1022. Herbelot, Sale, and Dr. Hunt inform us, that the person, who completed and reduced it to the form in which it now exists in some of the most beautiful copies of the Koran, was Yakut Al Mofafemi, the last of the caliphs of the family of Abbas, a little after the year of the Hegira 640, A. D. 1242; for which reason he obtained the appellation of "Al Khattat," or the scribe.

Concerning the æra of the invention of the Arabic vowel points, there has been a difference of opinion among the learned. Hottinger (Tract. Philolog. p. 400. 4to. Tiguri, 1659) maintains and adduces testimonies from the Arabian writers to prove, that vowels were in use from the most ancient times. But they are not now the same as they were formerly. A single point, in the most ancient copies of the Koran, denoted different vowels, according to its position above, below, or within the letter. Schultens (Clav. Dialect. p. 323, &c.), speaking of the improvement of the Arabian alphabet in the 10th century by Ebn Moklah, says, that its form, at this time, underwent a change; and that its former clumsy embarrassed character was made to give way to the polished, easy, and expeditious type. Regarding this expedition alone, the author of the invention left very few vowel characters; and as the Hebrew mode of writing admits five long ones and five short ones, in different shapes, he taught how to express all the vowels, both long and short, agreeably to the genius of the language, by three, or rather by two, small points, without any danger of mistake; an abbreviation truly admirable, and worthy of being recorded! For by placing a small line above **ب**

he expressed the sounds of *a* and *e*, and by placing the same below, **ب** he meant to express *i* only. To the other short ones

o and *u*, he assigned a small *waaw* or *w* above, as **ب**

For representing the long ones, he used the "matres lectionis," or quiescent letters, **ا, و, ي**. So that *phata* with *elif* expressed *a* and *o* long, that is *kametz* and *hbolem*; and *jod* placed after *kefrani* became *tzeri* and *chirek* long, and *waaw* added to *damma* became *schurek*. From this statement we may infer that, before the tenth century, the Arabians had no vowel points; and consequently that they read without vowels, or contented themselves with the "matres lectionis" above mentioned. Dr. Gregory Sharp, in his "Dissertation upon the Origin, Construction, &c. of Languages," p. 87, expresses his opinion, that the Arabians were the original authors of the vowel points; and that they invented three called *fatba* (*a*) and (*e*), *damma* (*o*) and (*u*), and *kefra* (*i*). But these, he conceives, were not in use till several years after Mahomet; for the first copies of the Koran were without them. The rabbins, he adds, stole them from the Arabs. Capellus, Walton, Simon, and others are of opinion, that all the vowels were expressed by the three letters **ا, و, ي**, called "matres lectionis." But it has been alleged, that these three letters have, in the Koran and in other punctuated copies, various vowel points

annexed to them: whence it is inferred, that they are consonants. See POINTS.

The importance and utility of an acquaintance with the Arabic tongue cannot be disputed. To the divine, such is the affinity between this language and the Hebrew, it must be of great use in explaining and interpreting the scriptures of the Old Testament. How much Schultens has availed himself of his knowledge of this language in the illustration of the book of Job, and also of the Proverbs, those will readily allow who have examined his learned commentaries on these books. There are also many valuable works to which the Arabic scholar may have access. And to those who travel for purposes of curiosity or commerce into those parts of the east, the knowledge of this language must be peculiarly useful. But the acquisition of it, it may be justly said, is attended with great difficulty. For the knowledge, says Sir William Jones (Asiatic Researches, vol. ii. p. 4.), which any European may, at his pleasure, obtain of the Arabic language, we are principally indebted to the university of Leyden. Schultens, Erpenius, and Golius, to whom we may add Richardson of our own country, will afford him all necessary assistance, and enable him to understand Arabic better than the most profound scholar at Constantinople or at Mecca. Niebuhr informs us, that the dialect spoken at Mecca in the days of Mahomet differs very widely from the modern language of Arabia. That of the highlands of Yemen has the strongest analogy to the language of the Koran; because those highlanders have little intercourse with strangers. The old Arabian language is, through all the east, a learned tongue, to be acquired only in colleges, or by the perusal of the best authors. Perhaps there is no other language diversified by so many dialects as that of Arabia; and the pronunciation of one province differs as much as the dialect from that of other provinces.

ARABIC, or ARABIAN learning, is divided into two states, or periods, viz. Ante Mahometan, and Mahometan.

The *Arab* learning in the first period, called the time of ignorance, consisted, according to Abulpharagius, in the knowledge of their language, the propriety of discourse, the composition of verse, and the science of the stars: but their chief attention seems to have been directed to *oratory* and *poetry*. Hist. Dynast. Renaudot de Barbar. Arist. vers. Fabricii Bibl. Græc. lib. vi. cap. 5. § 6.

The second period is more distinguished, at least from the time of Al Mamon, the seventh caliph of the family of the Abbassides, who flourished about the year 820, and has the honour of being the founder of the modern Arabian learning. Almanzor, about fifty years before Al Mamon, commenced the literary reform, when he moved the imperial seat from Damascus to Bagdad; and when he extended the Arabian literature, which had been confined to medicine and a few other branches, to sciences of every denomination. His grandson, Al Mamon, completed the work which was only begun, and sent for all the best books out of Chaldea, Greece, Egypt, and Persia, relating to physics, astronomy, cosmography, music, chronology, &c. and pensioned a number of learned men, skilled in the several languages and sciences, to translate them into Arabic. By this means, divers of the Greek authors, lost in their own country and language, have been preserved in Arabic. The eastern conquerors carried their empire from Asia even into the remote regions of Spain; and letters followed them wherever they went. Elmac. Hist. Sar. lib. ii. cap. 8. Leo Africanus de Viris illust. ap. Arabes, cap. 1. Fabricii Bib. Græc. lib. vi. cap. 9. Grav. in Præf. ad. Tab. Geog. Voss. de Sect. Phil. cap. 3 § 17. See AL MAMON.

From that time Arabia became the chief seat of learning; and

and we find mention by Abulpharagius, Poccocke, D'Herbelot, and Hottinger, of learned men, and books without number.

The revival of learning in the tenth century, by Gerbert, known after his elevation to the pontificate by the title of Silvester II. and afterwards among the Europeans in general, may be ascribed to the instructions and writings of the Arabian doctors and philosophers, and to the schools which they founded in several parts of Spain and Italy. And in the twelfth century, the inquisitive of different countries frequented the schools of the Saracens in Spain, and disseminated the knowledge which they obtained there, after their return. At this time, many of the learned productions of the Arabians were translated into Latin, which facilitated the general progress of science.

ARABIC or ARABIAN *logic*, was that of Aristotle, as explained by Avicenna and Averrhoes. As the Arabians applied themselves to this branch of science, they became proficient in the knowledge of words rather than things. Whence they have been sometimes denominated, "masters of the wisdom of words;" and sometimes the talking sect.

ARABIC *marble*, *Arabicum marmor*, a name given by the ancient Greeks to a species of marble brought from Egypt and Arabia, and remarkable for its beautiful whiteness.

ARABIAN *music*. In the Encyclopedie Methodique, we have a long article on this subject, chiefly taken from the *Essai on Music*, by M. la Borde. If, in a careful perusal of this article, we had been able to discover any essential qualities in this music that would improve our scale, intervals, melody, harmony, measures, or the tone of our voices or instruments, we should sedulously have studied and adopted them. But notwithstanding the inflated praises bestowed on their music, by their own and the Persian poets, and the parade with which the Arabian scale and musical terms have been exhibited, we do not find ourselves much enlightened by the perusal. Indeed we are inclined to imagine that music in Europe has been cultivated with so much more success than that of any other quarter of the globe; our instruments, our harmony, and our melody, are arrived at such a superior state of perfection, that to abandon or neglect them for any refinements or properties which the music of Asia, Africa, or America could furnish, would indeed be letting our corn-fields lie fallow, and feeding on acorns; or throwing aside the poetry of Milton, Dryden, and Pope, to read and imitate only Chaucer, Gower, and Lidgate.

As national tunes, the airs of the Arabians, Turks, and Persians, would amuse curious inquirers after exotics; but as to their theory, practice, and taste, faith in their excellence is wanting to make us imagine them worth the time and labour necessary to their acquisition. If, therefore, the article Arabian music has not been further extended, and should disappoint our readers by its brevity, the concessions made by M. Ginguené, who has compiled and digested the article in the new Encyclopedie, will a little abate their curiosity, and apologize for our want of time and zeal to investigate this music.

After giving us the scale and technica of the Arabian music in the language of the country, but expressed in letters of the French alphabet, M. G. says; "The Arabians, like other oriental people, never pass from one sound to another, however distant, either in rising or falling, without running through all the intermediate intervals. These continual slides of the voice, which to us are insupportable, constitute, according to them, the charm of their music, and grace of their melody." Now the difficulty and effects of such meandering or mewling passages will be easily conceived by our readers, from what follows in the article of M. G. "From

C to D they reckon four intervals; from D to E the same, and from E to F two." So that it is all done in quarter tones, or the enharmonic genus and scale. And where shall we find voices or instruments to furnish these intervals? "They have no knowledge of harmony (continues M. G.), and in their concerts, all the parts are performed in unisons and octaves, and all on stringed instruments; of which they sometimes sweep the whole number, to produce more or less effect, or at least more noise, which necessarily occasions a discordance, to which, from their ignorance of harmonic chords, their ears are insensible." Their instruments are chiefly those of percussion, or thrummed with the fingers or nails; they have, indeed, a flute, called *Mai*, with ventages. The tube is a section of a reed, with a mouth-piece of horn. It is to the sound of this flute that the dervises dance. Two or three musicians are placed in a gallery that surrounds the mosque. The *Iman* is stationed in the midst of the dervises; he gives the signal, the *Nais* begin to sound, and the dervises turn round with extreme rapidity. The *Iman* gives another signal, the flutes then cease to sound, and the dervises stop, and throw themselves into a particular attitude.

They have an instrument which resembles a lute, to which they assign more marvellous effects than the Grecians did to the lyre of Apollo. "They tell you, with the utmost gravity, that each of the strings of this instrument, four in number, has particular virtues: the first, for instance, acts as a specific against bile and phlegm; the second is a sovereign cure for the most inveterate melancholy and vapours; the third gives health and vigour to young people of both sexes; and, lastly, the fourth string affords relief the instant it is heard, to a sanguine temper and disposition."

But the power of these strings depends much on the manner with which they are pinched or thrummed; which, like the power of the bow on the violin, is attained by long and laborious practice. "They have a particular *pizzicato*, or pinch, for every action and passion; courage, liberality, and noble sentiments, by one mode of thrumming; love and pleasure by a second; the dance is inspired by a third; sleep and tranquillity by a fourth.

"At the distance which separates us from Arabia, and the difference in our ideas and sentiments (concludes M. G.), we can form no just conception of these fancied effects, from which we must doubtless abate much of the marvellous. What they ascribe to each instrument, string, and stroke of the fingers, and delicate shades of perfection, only convinces us, that they are a people endowed with a sensibility very different from ours."

ARABIC or ARABIAN *oratory*, according to Renaudot, consisted in a luxuriance of quaint, high-flown words, epithets, and descriptions. That the ancient Arabs were eloquent in a high degree, and that they possessed wonderful powers of speaking, without preparation, in flowing and forcible periods, is evident from their whole history. Their eloquence was an harmonious and cadenced prose, adapted to their ears, and accommodated to the genius of their language, and to the cast of their character, but can never serve as a model for foreigners. Their orators, like their poets, were honoured and rewarded; and their orations were much the offspring of the imagination, without concatenation in the arguments, but consisting of distinct sentences following one another without connection, and remarkable for abrupt antitheses, and for sudden and unexpected transitions, rather dazzling than enlightening. See *History of the ARABS*.

ARABIC or ARABIAN *philosophy* claims, according to some writers, and more particularly Ludwig, a very remote antiquity. On this subject the Greek writers are silent; but this, it is alleged, is a proof of their pride, and not of the barbarism of the Arabs. The Saracens themselves have

confessed, that before the rise of Mahometanism, their country was in a low state of civilization; and to this effect we have the testimony of Abulpharagius. Nevertheless, the advocates of the wisdom of the ancient Arabians have alleged, that from them, according to the relation of Porphyry, Pythagoras acquired a great part of his knowledge; that Moses fled out of Egypt into this country, and carried with him the wisdom of the Egyptians; that the queen of the east, who visited Solomon, was of Saba, a region in Arabia; and that the wise men, who paid their homage to Jesus, were from this country. Besides, their origin leaves no doubt concerning the culture of their minds; for as they were descended from Abraham, it is pretended that they must have derived from their common father, not only a philosophic spirit, but a considerable portion of science. To all which is added the acknowledgment of Abulpharagius, that even before Islamism, to which, in that country, is owing the revival of letters, they thoroughly understood their language, that they knew its value, and the several properties of it; and that they were good poets, excellent orators, and able astronomers. It is very possible, that the Arabians might have polished their language; that they were skilled in divination, and the interpretation of dreams; that they were successful in the composition and solution of enigmas; that they had even some knowledge of the courses of the planets; and yet have no just title to the character of philosophers: since all these arts, if they can deserve the appellation, tend rather to nourish and foment superstition, than to disseminate truth, and purge the soul from the tyranny of the passions. As to Pythagoras, nothing is more uncertain than his journey to the east; and if it were more unquestionable, we can only infer from this circumstance, that he learned from the Arabians the arts of divination, with which they, in common with other eastern nations, were well acquainted. If Moses went into Arabia, and settled there on marrying one of the daughters of Jethro, it could not be with the design of studying among the Arabians, or of gratifying their idle curiosity with philosophical systems. Providence permitted this retreat of Moses, for conveying thither the knowledge of the true God, and his religion. With respect to the remaining arguments, if they be allowed their utmost force, they will give the Arabians a very small share of the credit arising from the ancient philosophy of the east. But it has been further said, that there was in Arabia, at a very remote period, a sect of philosophers called Zabians or Sabians. But the existence of this sect is doubtful. No mention is made of it by Greek or Roman writers. We owe all our information concerning them to the Arabians, from whom Maimonides, the Jew, borrowed his account. The probable truth concerning them is, that they were a mixed body of Gentiles and Jews, who, to give the sanction of antiquity to their institutions, pretended to derive them from Sabi, the son of Seth. Their system of opinions was an heterogeneous mass, which must have been the produce of a period much later than that to which we now refer. See SABIANs. The Arabians, besides what has been already said of their science, in this article, and that of the *History of the ARABIANs*, seem, like the neighbouring Chaldeans and Persians, to have had their wise men, by whom their knowledge, such as they had, was taught, and their religious ceremonies and superstitious arts were practised. Pliny (H. N. l. xxx. c. 1.) mentions the Arabian magi, and speaks of Hippocus, an Arabian, as belonging to their order. It can scarcely be supposed, that the Arabians were unacquainted with moral wisdom. The fables of Lokman, mentioned in a preceding article, translated from Arabic into Latin by Erpenius, afford no inelegant specimen of the moral doctrines of the

Arabians; better adapted, however, to popular instruction than to the improvement of philosophy, which the Arabians do not appear to have cultivated, till the period when their government fell into the family of the Abbassides. Brucker's Hist. Phil. by Enfield, vol. i. p. 56. See the article ARABIAN learning. Sir William Jones (Asiatic Researches, vol. ii. p. 9.) says, that he finds no trace among them, till their emigration, of any philosophy but ethics; and even their system of morals, generous and enlarged as it seems to have been in the minds of a few illustrious chieftains, was, on the whole, miserably depraved for a century at least before Mahomet; the distinguishing virtue which they boasted of cultivating and practising, was a contempt of riches, and even of death.

ARABIC, or ARABIAN *physic* and *physicians*, succeeded the Grecian, and handed down the art to us, having made considerable improvements, chiefly in the pharmaceutical and chemical parts.

It is certain we owe to them most of our spices and aromatics, as nutmegs, cloves, mace, and other matters of the produce of India. We may add, that most of the gentler purgatives were unknown to the Greeks, and first introduced by the Arabs; as manna, senna, rhubarb, tamarinds, cassia, &c. They likewise brought sugar into use in physic, in which, before, only honey was used. They also found the art of preparing waters and oils, of divers simples, by distillation and sublimation.

The first notice of the small-pox, and the measles, is likewise owing to them. Lastly, the restoration of physic in Europe took its rise from their writings.

M. Le Clerc has given a sketch, and Dr. Freind an ample history of the Arabian physic. We have also a *notitia* of all the Arabian physicians by Fabricius.

Those who now practise the art of medicine in Arabia, know little more than the technical terms as they find them in the writings of Avicenna, and the use of simples. All the physicians in Yemen, Niebuhr says, acted at the same time as chemists, apothecaries, surgeons, and horse-doctors; and yet, by the practice of all these arts together, they could hardly earn a livelihood. A disease very common in Yemen, and ascribed to the use of putrid waters, is occasioned by the Guinea-worm; but it is not dangerous if the person that is attacked can extract the worm without breaking it. The leprosy seems to have been always an endemic disease in Arabia; and there is one species which authors distinguish by the character of Arabian. Three different variations of it are known there at present; of which two, named "bohak," and "barras," are rather disgusting than dangerous; but the third, called "juddam," is very malignant, and apparently infectious. The last prince of Abushahkr used to send to the isle of Bahrein all who were attacked with the leprosy, or with venereal complaints. At Basra, all lepers are shut up in a house by themselves; and in Bagdad there is a quarter surrounded with walls, and full of barracks, to which lepers are carried by force, if they retire not thither voluntarily; but government does not provide with due care for the maintenance of these lepers. Inoculation for the small-pox has been in use from time immemorial among the Bedouins: mothers perform this operation on their children, by opening the skin of the arm with the prickle of a thorn.

ARABIC or ARABIAN *poetry*, may be divided into two ages. The ancient, according to Vossius, was no other than rhiming; was a stranger to all measure, and rule; the verses loose and irregular, confined to no feet, number of syllables, or any thing else, so that they rhimed at the end; oftentimes all the verses in the poem ended with the same rhyme. It is in such verse that the ALCORAN is said to be written.

Poetry was in so great esteem among the ancient Arabs, that it was a great accomplishment, and a proof of ingenious extraction, to be able to express one's self in verse, with ease and elegance, on any extraordinary occurrence; and even in their common discourses, they made frequent applications of celebrated passages of their famous poets. In their poems they preserved the distinction of descents, the rights of tribes, the memory of great actions, and the propriety of their language; for which reasons an excellent poet reflected an honour on his tribe. So that as soon as any one began to be admired for performances of this kind in a tribe, the other tribes sent publicly to congratulate them on the occasion; and made entertainments, at which the women assisted, dressed in their nuptial ornaments, singing to the sound of timbrels, the happiness of their tribe, who had now one to protect their honour, to preserve their genealogies, and the purity of their language, and to transmit their actions to posterity; for this was wholly performed by their poems, to which they were solely obliged for their knowledge and instruction, moral and æconomical, and to which they resorted, as to an oracle, in all doubts and differences. It is no wonder then, that a public congratulation was made on this account; an honour so distinguishing, that it was conferred only on one of these three occasions; namely, on the birth of a boy, the rise of a poet, and the fall of a foal of generous breed. To keep up an emulation among their poets, the tribes had once a year, a general assembly at Ocadh, a place famous on this account, and where they kept a weekly mart or fair, held on our Sunday. This annual meeting lasted a whole month, during which time they employed themselves, not only in trading, but in repeating their poetical compositions, contending and vying with each other for the prize; whence the place, it is said, took its name. The poems that were judged to excel, were laid up in their king's treasuries, as were the seven celebrated poems thence called "Al Moailahat," or "Moallekat," rather than from their being hung up in the Caaba, which honour they also had by public order, being written on Egyptian silk, and in letters of gold; for which reason they had also the name of "AlMod-hahabat" or the golden verses. These poems, which have appeared in our own language, exhibit an exact picture of the virtues and vices of the Arabians, their wisdom and their folly; and shew what may be constantly expected from men of open hearts and tumultuous passions, with no law to control, and little religion to restrain them. The fair and assembly at Ocadh was suppressed by Mahomet; in whose time, and for some years after, poetry seems to have been in some degree neglected by the Arabs, who were then employed in their conquests. When these were completed, and peace was established, this study was revived; and almost all kinds of literature were encouraged and greatly improved by them. This interruption, however, occasioned the loss of most of their ancient pieces of poetry, which were then chiefly preserved by memory; the use of writing being rare among them, in their time of ignorance. Though the Arabs were so early acquainted with poetry, they did not at first write poems of a just length, but only expressed themselves in verse occasionally. Albert Schultens has preserved, in his Ancient Memorials of Arabia, two little poems, in an elegiac strain, which are said to have been found about the middle of the seventh century, in some fragments of ruined edifices in Hadramaut, near Aden, and which are supposed to be of an indefinite, but very remote age. Sir W. Jones suggests, that these were modern compositions on the instability of human greatness, and the consequences of irreligion; illustrated by the example of the Hamyaric princes; and to the same class of literary impostures belongs, as he suspects, the first poem quoted by Schultens, and ascribed by him to an Arab in the age of Solomon.

The modern Arabian poetry takes its date from the caliphate of Al Raschid, who lived towards the close of the eighth century. Their poetry then became an art, and rules of profody were digested by Al Khalil Ahmed al Farahidi, who lived in the reign of this caliph. The Arabians still cultivate poetry, and sometimes reward those who excel in it, though they have at present among them no great poets. The best are among the Bedouins of Dsjof. To this purpose it is mentioned by Niebuhr, that a sheik of that country was imprisoned at Sana, and that observing a bird upon the roof of a house, he recollected the opinion of those pious mussulmans, who think it a meritorious action to deliver a bird from a cage. He thought that he himself had as good a right to liberty as any bird, and expressed this idea in a poem which he got by heart, and which becoming generally known, at length reached the monarch's ears, who was so pleased with it, that he set the sheik at liberty, although he had been guilty of various acts of robbery. The exploits of their sheiks are now frequently celebrated in the Arabian songs.

ARABIC, or ARABIAN *Religion* was, in the state of ignorance, as they called the period before Mahomet, entirely Sabian; but the Sabian faith is not clearly and satisfactorily ascertained. See SABIANs.

It is generally allowed, that they admitted the existence of one supreme God, the Creator and Lord of the universe, whom they denominated "Allah Taala," the most high God: and the religion of the noble and learned Arabs, as well as of the poets, was pure theism. We have Arabian verses of unsuspected antiquity, which contain pious and elevated sentiments with respect to the goodness, and justice, and omnipotence of "Allah," or God. If an inscription, said to have been found on marble in Yemen, be authentic, the ancient inhabitants of that country preserved the religion of Eber, and professed a belief in miracles and a future state. It is certain, however, that the people of Yemen very soon degenerated, and fell into the error of adoring the sun and the firmament; for even the third in descent from Joktan, who was consequently as old as Nahor, took the surname of "Abdusnaes," or servants of the sun; and his family, we are assured, rendered particular honours to that luminary. Other tribes worshipped the planets and fixed stars; and by degrees a stupid idolatry prevailed among the lower orders of the people. The idolatry of the Arabs, or Sabians, chiefly consisted in the worship of the fixed stars and planets, and the angels or intelligences which, as they supposed, resided in them, and governed the world under the supreme Deity. These they honoured as inferior deities, and as mediators with God, implored their intercession. To the worship of the heavenly bodies the Arabs were easily led, by observing the regularity of their motions, whence they thought them to be animated: and also that the changes of the weather happened at the rising or setting of some of them for a considerable period; and hence they ascribed to them a divine power, and conceived themselves indebted to them for their rains, which were highly beneficial to their parched country. This kind of worship was proscribed by Moses, and is frequently alluded to in the book of Job, particularly ch. xxxi. 26—28. Accordingly they had seven celebrated temples dedicated to the seven planets; and this planetary worship has been supposed by some persons to have been the first species of idolatry. To this purpose Pausanias intimates (Laconic. Oper. lib. iii.), that the worship of the planets was earlier than the first arrival of the Pelasgi in Greece; and that before this time they had statues erected to their honour. Besides those stars, which were the general objects of worship throughout Arabia, there were some that were more peculiarly revered in particular provin-

ces Of the angels or intelligences which they worshipped, the Koran mentions three, namely, Allat, Al-Uzzab, and Manah; these were called Goddesses, and the daughters of God; and this appellation they bestowed not only on angels, but on their images, which they believed to be animated by the angels. All religious addresses, they conceived, were made as effectually before the one as before the other; and to this practice some have traced the origin of image-worship. Allat, or Allah, was the idol of the tribe of Thakif, who dwelt at Tavef, and had a temple consecrated to her in a place called Nakhlah. Al-Uzza was the idol of the tribes of Koreish and Kenanah, and part of the tribe of Saban, as some say; but according to others, it was a tree called the Acacia, worshipped by the tribe of Ghatfan, and first consecrated by Dhalem, who built a chapel over it. Manah was the object of worship of the tribes of Hodhal and Khozab, possibly the Callanixæ of Ptolemy, who dwelt between Mecca and Medina; and as some say, of the tribes of Aws, Kinazrai and Thakif also. Dr. Pococke suggests, that the Manah of the Arabs was the Meni of the prophet Isaiah. This idol was a large stone, demolished by Saad in the 8th year of the Hegira, a year so fatal to the idols of Arabia; and its name is supposed to be derived from "Manah," to flow, from the effusion of the blood of the victims sacrificed to the deity and intelligence represented by it; others say it was the name of a constellation. Besides these, the Arabian writers describe five antediluvian idols, who are said to have been men of great piety and reputation, whose statues the Arabs at first revered with a civil honour only, which in process of time was heightened into religious worship. The Arabs had also a great number of other idols; and each country, and even each family, had its appropriate deity. There were, it is said, no less than 360 idols, equal to the number of days in their year, in and about the Caaba of Mecca.

Some of the Pagan Arabs believed neither a creation past, nor resurrection to come; but attributed the origin of things to nature, and their dissolution to age. Others allowed both. Some adopted the opinion of a metempsychosis, or transmigration of souls. The Arabs in general were strongly prepossessed in favour of auguries and fatality. On perceiving any beast or bird of ill omen, they kept close within their tents; and the most pressing occasions of business or curiosity would never have determined them to set out on a journey under such unfavourable auspices. The priesthood among them gave no pre-eminence over the rest of the people; every family had its altar, its idol, and its sacrificer, who was not excused from bearing arms in defence of the common cause, nor from the other obligations imposed on their fellow-citizens. They were selected from among the aged; and it seems probable that the priesthood was a temporary dignity conferred on every minister employed in acts of religious worship; and when the service ended, these ephemeral priests returned into the class of ordinary citizens; but whilst they were in office, it was expected that they should exhibit examples of moderation and sobriety. The Sabian priests reserved to themselves no part of the sacrificed victim, which was the case with the Pagan priests, but reduced it to ashes; abhorring the profanation and sacrilege of sitting down to the tables of the gods, and touching the viands that were offered to them. The ancient Arabs never imagined that tears and maceration could be grateful to the deity; and therefore they celebrated their religious festivals with dances and concerts, and the public jubilation was considered as the testimony of their gratitude towards the God who showered his bounty upon them. It is true, however, that every tribe had its particular customs, and stamped its own character, jovial or gloomy, on its ceremonies of devotion. The Magian reli-

gion was introduced among some tribes of Arabia a long time before Mahomet, in consequence of the vicinity of the Persians, and their intercourse with the Arabians; and hence this impostor borrowed many of his institutions from it. Judaism also is said to have been introduced among the idolatrous Hanyarites by Abu Carb Asad, who was the sovereign of Yemen about 700 years before Mahomet; and the Jews, who fled into Arabia in great numbers after the destruction of their country by the Romans, made profelytes of several tribes, and particularly those of Kenanah, Al Hareth Ebn Caaba, and Kendah; and in time they became very powerful, and obtained possession of several towns and fortresses. At length Yusuf, king of Yemen, raised a dreadful persecution against them, and put them to death by various tortures, one of which was throwing them into a glowing pit of fire, from which circumstance the Arabs gave him the opprobrious title of the "Lord of the pit;" and Caleb, or Elcshian, king of Ethiopia, to revenge the massacre of the Christians at Najran, put an end to Judaism and the kingdom of the Hanyarites in Yemen, at the same time. This event happened in the reign of the emperor Justin.

Christianity had likewise made a great progress in Arabia before the time of Mahomet. Whether St. Paul preached in any part of Arabia, properly so called, it is not easy to determine; but that the Christian religion was planted at a very early period in this country is an unquestionable fact. When the eastern church, soon after the beginning of the third century, was much harassed by disorders and persecutions, great numbers of them sought shelter in Arabia; and as these were for the most part of the Jacobite communion, this sect generally prevailed among the Arabs. The principal tribes that embraced Christianity were Hamyar, Ghafsan, Rabia, Taghlah, Bahra, Tomuh, part of those of Tay and Kodaa, the inhabitants of Najran, and the Arabs of Hira. See JACOBITES.

Such as we have above recited were the principal religions which obtained among the ancient Arabs; but as freedom of thought, says Sale, was the natural consequence of the political liberty and independence of the Arabs, some of them fell into other opinions. The Koreish, in particular, were infected with Zenticism, an error supposed to have a near affinity with that of the Sadducees among the Jews, and perhaps not much different from modern Deism; for several of that tribe, before the time of Mahomet, worshipped one God, and were free from idolatry; though they embraced none of the other religions of the country.

Since the establishment of Mahometanism in Arabia, there are several sorts of this profession in the country; such as the Sonnites, Sciites, Zeidites, &c. of which an account will be given in the course of this work. In Arabia there are at this time many Jews, who are dispersed through different cities, having their synagogues, and enjoying a considerable degree of freedom. As they are fond of living together, they commonly form a village near every principal town. In the neighbourhood of Kheibar, there are some Jewish tribes; who are not barely tolerated, but possess the sovereign authority. Although the Christians were once numerous in Arabia, Niebuhr says, that he knows no Christian church remaining at present in this whole country. In the province of Laclisa were many Sabæans, or Christians of St. John; but the Christianity of this sect is a kind of confused medley of the opinions and ceremonies of several different religions. In the commercial cities there are many Banians from India: at Mocha, however, they undergo many mortifications; but at Muscat, among the tolerant sect of the Berafi, they are permitted to observe the laws and cultivate the worship of their own religion, without disturbance. A considerable degree of religious toleration

is exercised among the Arabs. Their contempt, however, of those who differ from them is more chiefly manifested towards the Banians than the Jews, and least of all to the Christians; who, in return, express the least aversion for the Mussulmans. This progress towards general toleration among the Arabians preserves them from the rage of making proselytes. They seek neither to entice nor constrain any person, except sometimes their young slaves, whom they compel to embrace Mahometanism; but when a proselyte voluntarily enters himself, they are, by the laws of their religion, obliged to receive him, and to provide for his maintenance.

ARABIC *Version*. See ARABIC BIBLES.

ARABIC *Year*. See ARABIC Chronology, and YEAR.

ARABICA, in *Conchology*, a species of CYPRAEA that is found in India. This shell is slightly turbinated; charactered with irregular letter-like marks; and has a simple longitudinal streak down the back of it. Lin. Gmel. &c. *Cypræa Arabica*, or Arabic cowry, is about three inches in length; its ground colour is whitish or bluish, and is covered with characters of a chestnut or dark brown, that somewhat resemble Arabic letters upon the back; the edges are thick and spotted with purple. When the outer coat is worn off, the back of the shell is pale, with dark transverse bars. The inside of the mouth is violet; lips reddish-grey; crenulations chestnut. It is called by Rumphius, *Porcellana literata* f. *Arabica*.

ARABICI, a sect which sprung up in Arabia, about the year 207, whose distinguishing tenet was, that the soul died with the body, and also rose again with it.

Eusebius, lib. 6. c. 38, relates that a council was called to stop the progress of this rising sect; and that Origen assisted at it; and convinced them so thoroughly of their error, that they abjured it.

ARABICUS *costus*. See COSTUS.

ARABIS, in *Botany*, Wall-crefs (*Αραβίς*, Diofc. from Arabia, Lin.), Lin. gen. 818. Schreb. 1094. Juss. 238. Class, *tetradynamia siliquosa*. Nat. Order, *siliquosa*. *Crucifera*, Juss. Gen. char. *Cal.* perianth, four-leaved, deciduous; leaflets from parallel-converging; two opposite larger, ovate-oblong, acute, a little prominent at the base, gibbous, concave; the other two linear, erect. *Cor.* four-petalled cruciform, each ending in claws of the length of the calyx. *Nectarics*, four; each from a little scale within the bottom of the calycine leaflet, affixed to the receptacle, reflex, permanent. *Stam.* Filaments subulate, upright, two the length of the calyx, four twice as long; anthers cordate, erect. *Pist.* Germ. columnar, the length of the stamens. *Style*, none. *Stigma* obtuse, entire. *Per.* siliques, compressed, very long, linear unequal, with swellings at the seeds; valves almost the length of the partition. *Seeds*, many, roundish, compressed. Ess. gen. char. Nectarous glands four, one within each leaflet of the calyx, like a reflex scale. Species 1. *A. Alpina*, alpine wall-crefs; leaves clasping the stem, toothed; root perennial, creeping, from which proceed many leaves collected into heads, spreading circularly: they are whitish, oblong, and indented at the edges. From the centre of these arise the flowering stems, which grow nearly a foot high, with alternate leaves closely embracing the stem. The flowers are white, in bunches towards the top. Flor. Dan. t. 62. A native of the Alps and other mountains of Europe, on rocks, in caverns, and in woods. It was cultivated in the botanic garden at Oxford, in 1658, and is now common in gardens. 2. *A. lucida*, shining wall-crefs, leaves embracing the stem, shining. Stem four inches high, simple, smooth, leaves entire; those at the bottom obovate, obtuse; those on the stem alternate, cordate, clasping the stem. Petals erect, white, linear, in corymbs, which become racemose. A native of Hungary, perennial. 3. *A.*

grandiflora, great flowered wall-crefs, stem naked; root-leaves many, two inches long, lanceolate, cut beyond the middle like pinnate leaves, with acuminate divisions. Corymb terminating with alternate flowers, on very short peduncles. A native of Siberia, perennial. There is one variety of this species with entire leaves, and another with white flowers. 4. *A. thaliana*, common wall-crefs, leaves petiolate, lanceolate, perfectly entire. Curt. Lond. 2. 49. Eng. Bot. Root-leaves sometimes toothed near the base, stem-leaves sessile and toothed, hairy; stem upright, somewhat branched, round, crooked, hairy; the little branches alternate and drooping; petals white, entire, obtuse, twice the length of the calyx; siliques half an inch long, containing several yellowish seeds. A common annual, growing in sandy grounds, and on old walls. 5. *A. bellidifolia*, daisy-leaved wall-crefs, leaves subdentate; those of the root obovate, of the stem lanceolate. Jacq. Flor. Aust. 3. t. 280. Root perennial, producing tufts of leaves, and several stems, which are undivided, round, smooth, bending, lengthened out gradually at top, into a long raceme; flowers corymbed, inodorous, white, consisting of obovate petals; siliques parallel to the stem, linear, compressed, opening at both ends. A native of the foot of the Alps in Switzerland and Austria: Introduced into the Royal garden of Kew, by John earl of Bute, in 1773. A smaller variety of this species is described and figured by Jacquin; see l. c. *A. pumila*. 6. *A. lyrata*, lyrate-leaved wall-crefs, leaves smooth; those at the root lyrate, on the stem linear; root annual; the flower-stalks nearly a foot high, terminated by white flowers. Linnæus observes, that this differs in no respect from the fourth species, except that the root-leaves are lyrate and smooth, and the flowers larger. A native of North America. 7. *A. hispida*, rough wall-crefs: this, according to Professor Martyn, is the *A. striata* of Hudson and Withering; leaves wedge-shaped, sublyrate, hispid; stem-leaves half embracing the stem, lanceolate; siliques stiff, ancipital; root annual; stems many, six inches high; root-leaves very many, toothed and gash-toothed, rough, hairy; stem leaves three or four, toothed, hispid; flowers white, in racemes, on short peduncles; siliques an inch and a half long, quadrangular at the base, striated. It grows wild in most parts of Europe; and was found on St. Vincent's rocks near Brillot, by Mr. Hudson, who describes it as a new species. 8. *A. Halleri*, Haller's wall-crefs, stem-leaves sublyrate, those on the branches lanceolate, gashed; stem erect, six inches high; root-leaves on long petioles, obtuse, repand, a tooth or two at the base; stem-leaves petioled, oblong, sinuate-toothed; petals white, with green claws. This plant sends off runners from the root and base of the stem. A native of Germany, Carniola, and Piedmont. 9. *A. canadensis*, Canadian wall-crefs; stem-leaves lanceolate, toothed, smooth; flowers pendulous. A native of North America, two feet high, with broad, lanceolate, irregular, ferrate leaves; flowers in lateral racemes. 10. *A. pendula*, pendulous wall-crefs; leaves stem-clasping; siliques ancipital, linear; calyces sub pilose; stem nearly a foot high, rough with scattered stiff hairs; leaves rough, partly embracing the stem, ferrate; peduncles long, filiform, loose; flowers white; siliques smooth, nodding. A native of Siberia. Cultivated by Miller, in 1759. 11. *A. turrita*, tower wall-crefs, Eng. Bot. Leaves stem-clasping; siliques bending down, flat, linear; calyces subrugose; root woody, biennial; stem usually simple, from one inch to two feet in height, upright, downy, round; leaves hairy on both sides; root-leaves petioled, oblong, thick, hispid, waved, and toothed; stem-leaves similar, stem-clasping, tomentose, regularly decreasing as they approach the top; flowers upright, white or yellowish, on short peduncles; siliques

very long, linear, compressed, curved; seeds round, compressed: common on old walls, rocks, &c. 12. *A. saxatilis*, stem erect; leaves stem-clasping, lanceolate, toothed; filipes the length of the raceme; stem about six inches high, round, simple; leaves crowded, upright, cored at the base, deeply toothed, and as well as the whole plant covered with soft hairs; nabel of doves terminating, nodding; petals white, flat, squarish; siliqua in short racemes, flat, compressed, annual. Alboini and Villars differ considerably in their descriptions of this plant. A native of the south of Europe, on rocks. 13. *A. juliana*, root leaves roundish, rough, toothed; stem leaves embracing, hairy. This, in many respects, agrees with the 5th species. Its stem is smooth, erect, from four to six inches high; simple, furnished with one or two ovate-lanceolate leaves; flowers large, white; calyces whitish; siliques broadish, bowed at the end, upright, parallel to the stem. A native of the south of Europe. 14. *A. serpyllifolia*, all the leaves elliptical entire; stem flexuose; stems filiform, bending, entangling one with another; leaves small, sessile, beset with forked hairs; petals small, white; siliques very thin, a little compressed. A native of Dauphiné. 15. *A. recta*, stem straight, leaves rectangularly toothed, sessile; siliques from erect spreading. This resembles the 14th species, except that its stems are constantly straight. It is annual or biennial, and found on walls or rocks about Grenoble.

Propagation and Culture. All the above are hardy plants, and will thrive in any situation. They may be easily propagated by seeds, which they produce in great plenty. The first species is most common in our gardens, and by multiplying fast by its creeping roots, few persons are at the trouble of sowing its seeds. It flowers early, and having many strong stems from one root, it makes a pretty variety in cold situations, where many finer plants will not thrive.

ARABIS. See CARDAMINE.

ARABIS, or ARBIS, in *Ancient Geography*, a river of Persia, in the province of Gedrosia, which took its rise on a ridge of mountains that ran across the province, and after a short course, discharged itself into the Indian ocean. The mouth of the Arabis is placed by Mr. Rennell in E. long. 65° 34', and N. lat. 25° 26', about 44' West from the western mouth of the Indus. Arrian mentions an island at the mouth of the river; and there is still a small town, called Sommeany, at the entrance, and labouring under the same difficulty for water, which is noticed by Arrian; who says, that they were obliged to go up the country above two miles to find a well. From the Indus to the river Arabis, the Greeks, in the voyage of Nearchus, found the coast inhabited by an Indian tribe, whom they have named Arabies; and contiguous to them were the Orizæ, whose territory extended from the Arabis to Malana, or Cape Moran, which terminates a ridge of mountains shooting off from a chain which bounds this country on the north. Ara, the capital, now Haur, is placed by M. D'Anville on the Tomerus; the country appears to have been fully peopled; and the Orizæ are described as dressed and armed like the Indian tribes; but their customs, manners, and language, says Dr. Vincent, "On the Voyage of Nearchus," mark them as a different race. The modern inhabitants consist chiefly of a predatory people, denominated "the Balluches."

ARABISM, ARABISMUS, an idiom, or manner of speaking peculiar to the Arabs, or the Arabic language. R. Martin maintains that the γ sometimes expresses an oath in the Hebrew as well as the Arabic.

ARABISSUS, in *Ancient Geography*, a town of Asia, situate on a plain to the south of the river Melas.

ARABIST, a person curious of, and skilled in the learn-

ing and language of the Arabians: such were Erpenius and Golius. The surgeons of the 13th century are called *Arabists* by Severinus. Freund, Hist. Phys. tom. ii. p. 301.

ARABISTAN, in *Geography*, a name given by the Turks and Persians to modern Arabia.

ARABKIR, a town of Asia, in the province of Carmania, 105 miles south-east of Yuceup.

ARABIE FARM, in *Agriculture*, that sort of farm which is either wholly or in a great part under the plough. See FARM.

ARABLE Land, that kind of land which is proper for being tilled or cultivated by means of the plough, with the view of producing grain or other crops. The dry and friable sorts of soil are most adapted to this purpose. See LAND.

ARABS, in *Entomology*, a species of TENEBRIO that inhabits the east. It is black; thorax ferrated; antennæ and legs testaceous brown. Fabricius. Gmelin.

ARABS, a species of CIMEX found in South America. The thorax is spinous; body ovate, livid; end of the abdomen bidentated. Linn. Fab. Gmel. This is called by Sloane, Cimex sylvestris fatens viridis triangularis.

ARABS, in *Ornithology*, a species of OTIS that inhabits Arabia Felix, and which Dr. Latham concludes must be the flying ostrich of Le Maire and Adanson; though Buffon supposes that bird to be the Linnean OTIS ATRA. Its specific character is very concise, "ears with erect crest." Gmelin. Brisson calls it *L'Ouarde d'Arabie*; and Buffon, *Le Lobong, ou l'Ouarde huppé d'Arabie*; and it is likewise the *Arabian Bustard* of Edwards and Latham.

The size is that of the great bustard, but the bill, neck, and legs are longer in proportion. The bill is pale horn colour; back of the head black and erected; forehead whitish; a black mark on each side of the head, passing into the crest behind; the rest of the head, neck, and upper parts of the body, rufous, mixed with black, and somewhat resembling the markings on the plumage of the woodcock; the throat, and fore-part of the neck, ash-colour crossed with brown lines; breast and belly white; quills black; secondaries black and white in spots, those nearest the body rufous, with dusky marks across; tail white except the two middlemost feathers, which are blackish rufous; all of them are mottled and marked with a black band across; the legs are pale brown.

ARABSCHAH, in *Biography*, a Mahometan writer of the fifteenth century, was a native of Damascus, where he died in the year 1450. He is the author of a history of Tamerlane, intitled, "The wonderful effects of the divine decrees in the affairs of Tamerlane," and of a theological treatise "On the unity of God." D'Herbelot Bibl. Orient.

ARABUM LEPRA. See LEPROSY.

ARABUM sandaracha. See SANDARACHA.

ARAC, or ARRAC, a spirituous liquor, imported from the East Indies; chiefly used by way of dram, and in punch. The nature and composition of this celebrated liquor have been much controverted.—The name arac, Mr. Lockyer assures us, is an Indian word for strong waters of all kinds; as they call our spirits and brandy, English arac.—But what we understand by the name arac, is really no other than a spirit procured by distillation from a vegetable juice called *toddy*, which flows by incision out of the cocoa nut tree, and some other trees, like the birch-juice procured among us.

The *toddy*, Mr. Lockyer adds, is a pleasant drink of itself, when new, but purges those not used to it; and when stale, is heady; and finally makes good vinegar. The English at Madras used it as leaven to raise their bread with.

Others are of opinion, that the arac, or arrac, is a vinous spirit

spirit obtained by distillation, in the East Indies, from rice or sugar fermented with the juice of cocoa nuts.

The Goa arac is made from the toddy, the Batavia arac from rice and sugar. There is likewise a kind of shrub from which arac is made.

Goa and Batavia are the chief places for arac.—At Goa there are divers kinds; single, double, and treble distilled. The double distilled, which is that commonly sent abroad, is but a weak spirit in comparison with Batavia arac; yet, on account of its peculiar and agreeable flavour, it is preferred to all the other aracs of India. This is attributed to the earthen vessels which they use at Goa to draw the spirit; whereas at Batavia they use copper stills.

The Parier arac, made at Madras, and the Columbo and Quilone arac, at other places, being fiery hot spirits, are little valued by the Europeans, and therefore rarely imported: though highly prized among the natives. In the best Goa arac, the spirits of the cocoa juice do not make above a sixth or eighth part: the manner of making the Goa arac is this. The juice of the trees is not procured in the way of tapping, as we do; but the operator provides himself with a parcel of earthen pots, with bellies and necks like our ordinary bird-bottles: he makes fast a number of these to his girdle, and any way else that he commodiously can about him. Thus equipped, he climbs up the trunk of a cocoa-tree; and when he comes to the boughs, he takes out his knife, and cutting off one of the small knots or buttons, he applies the mouth of the bottle to the wound, fastening it to the bough with a bandage; in the same manner he cuts off other buttons, and fastens on his pots, till the whole number is used: this is done in the evening, and descending from the tree, he leaves them till the next morning; when he takes off the bottles, which are mostly filled, and empties the juice into the proper receptacle. This is repeated every night, till a sufficient quantity is procured, and the whole being then put together, is left to ferment, which it soon does.

When the fermentation is over, and the liquor or wash is become a little tart, it is put into a still, and a fire being made, the still is suffered to work as long as that which comes over has any considerable taste of spirit.

The liquor thus procured is the low wine of arac, and this is so poor a liquor, that it will soon corrupt and spoil, if not distilled again, to separate some of its phlegm; they therefore immediately after pour back this low wine into the still, and rectify it to that very weak kind of proof spirit, in which state we find it. The arac we meet with, notwithstanding its being of a proof test, according to the way of judging by the crown of bubbles, holds but a sixth, and sometimes but an eighth part of alcohol, or pure spirit: whereas our other spirits, when they shew that proof, are generally esteemed to hold one half pure spirit. Shaw's *Essays on Distilling*.

There is a paper of observations on arac, in the *Mélanges d'Histoire Natur.* tom. v. p. 302. By fermenting, distilling, and rectifying the juice of the American maple, which has much the same taste as that of the cocoa, the author says he made arac not in the least inferior to any that comes from the East Indies; and he thinks the juice of the sycamore and of the birch trees would equally answer the end.

Beside the common sorts of Goa and Batavia arac, there are two others less generally known; these are the bitter arac, and the black arac.

By stat. 11 Geo. I. c. 30. arac on board a ship within the limits of any port of Great Britain, may be searched for and seized, together with the package; or if found unshipping or unshipped before entry, may be seized by

the officers of excise, in like manner as by the officers of the customs. 33 Geo. II. c. 9. 9 Geo. III. c. 6.

Upon an excise officer's suspicion of the concealment of arac, and oath made of the grounds of such suspicion, before the commissioners or a justice of the peace; they may empower him to enter into such suspected places, and seize the liquors, with the casks, &c. If the officers are obstructed, the penalty is 100*l*.

Arac is not to be sold but in warehouses, entered as directed in the 6th of Geo. I. c. 21. upon forfeiture, and the casks, &c. If permits are not returned, which are granted for the removal of arac, or if the goods are not sent away within the time limited, the penalty is treble the value. If the permits are not returned, and the decrease is not found to be sufficient, the like quantity is forfeited. Permits are not to be taken out but by direction in writing to the proprietor of the stock, or his known servant, upon forfeiture of 50*l*. or three months' imprisonment.

By statute 9 Geo. II. c. 35. if arac is offered to sale without a permit, or by any hawker, pedlar, &c. with a permit, the person to whom it is offered, may seize and carry it to the next warehouse belonging to the customs or excise, and bring the person offering the same before any justice of the peace, to be committed to prison, and prosecuted for the penalties incurred by such offence. The person seizing such goods may prosecute in his own name; and on recovery is entitled to one-third part of the gross produce of the sale; and the commissioners are, if desired, upon a certificate from the justice of the offender's being committed to prison, to advance to the seizer 15*s*. per gallon for the arac so seized.

Arac (except for the use of seamen, two gallons each) found in any ship or vessel arrived from foreign parts, at anchor, or hovering within the limits of any port, or within two leagues of the shore, and not proceeding on her voyage (unless in case of unavoidable necessity and distress of weather, notice whereof must be given to the collector or chief officer of the port, upon the ship's arrival), is forfeited; with the boxes, casks, or other package, or the value thereof. 5 G. III. c. 43. 19 G. III. c. 69. 21 G. III. c. 39. 24 G. III. c. 47.

ARAC is also the name of a spirituous liquor made by the tartars of Tungusia, of mares' milk, allowed to become sour, and afterwards distilled twice or thrice between two earthen pots closely stopped, whence the liquor runs through a small wooden pipe. It is said to be more intoxicating than brandy.

ARACA-PUDA, in *Botany*. See *DROSER*.

ARACÆI, ARACEANS, or ARKITES, in *Ancient Geography*, a people supposed to be descended from Arac the son of Canaan, who inhabited a district in the vicinity of Sidon, which afterwards fell to the lot of the tribe of Asher, where Josephus places a town called Arce or Arca. From hence they removed farther north to a town of the same name between Aradus and Tripolis. The Arce mentioned by Josephus, and belonging to the tribe of Asher, was otherwise called Antipas. The Jewish historian says, that Baanah, mentioned, 1 Kings, iv. 16. as superintendent of the tribe of Asher, was governor of the country round about the city of Arce, which lies upon the sea. In the latter times of the Jewish commonwealth, this city was a part of Agrippa's kingdom.

ARACAN, in *Geography*. See *ARRACAN*.

ARACANGA, in *Ornithology*, a species of *PSITTACUS*, or parrot, in the Linnæan system; the *Aracanga* of Marcgrave, the *Aracanga Maccaw* of Willughby, *Ara Jamaicensis* of Brisson, *Petit Ara Rouge* of Buffon, *Jamaica Maccaw* of Albinus and Brown, *red and yellow Maccaw* of Bancroft and Latham. It is of a pale scarlet colour, with

naked wrinkly cheeks; the scapular feathers are yellow, and tip with green; the wing quills are blue above, and red beneath. Mr. Latham suspects, that this may be a younger bird of the species called *ARA*, which is somewhat bigger. It inhabits Guiana, Brasil, and Jamaica.

ARACARI, a species of *RAMPHASTOS*. It is green; abdominal band, vent, and rump red; belly yellow. Gmel. &c. Ramphastos with a black beak, the upper mandible white on the sides, and three-lobed at the base. Linn. Syst. Nat. Maregrave calls this bird *Aracari*; Brisson, *Tucana Brasiliensis Viridis*; and Buffon, *Grigri*, and *Toucan Verd du Brésil*.

The length of this bird is sixteen inches, of which the bill measures four inches and a quarter; it is hooked at the tip; the upper mandible white, marked above with a black stripe the whole length; the lower mandible is wholly black, and deeply serrated at the edges. The head, throat, and neck black; on each side of the head is a small chestnut spot just above the ears; the upper part of the back, scapulars, and wing-coverts are dull green; lower part of the back, rump, and upper tail-coverts, bright red. Breast, belly, and sides brimstone, with a bright red band across the belly. Tail wedge-shaped; legs blackish green; claws black. Inhabits South America.

ARACCA, in *Ancient Geography*, a town of Asia, in Susiana, on the eastern branch of the Tigris, according to Ptolemy. This is probably the city of Chaldaea, built by Nimrod the grandson of Cush, and mentioned under the name of Erach, Gen. x. 10. Ammian calls it *Aracha*; hence originates the name of *Arachæan* plains, described by Tibullus (l. iv. p. 403. ed. varior.):

“Ardet *Aræteis* aut unda per hospita campis.”

And this city might probably have led the Arabians to call the large province of Asia, *Iraca* or *Irak*, the capital of which was formerly *Babylon*, and now *Bagdad*.

ARACENA, in *Geography*, a town of Spain, in the province of Andalusia, situate near the Sierra Morena, in the country of Seville, with a castle on an eminence; 10 leagues N. N. W. from Seville.

ARAC-GELERAN, a small district of Chusistan, a province of Persia.

ARACH, or *ERACH*, a name now given to the ancient *PARTHIA*.

ARACH, in *Botany*. See *ATRIPLEX*.

ARACHIDNA, and *ARACHIDNOIDES*. See *ARACHIS*, *GLYCINE*, and *LATHYRUS*.

ARACHIS (from *ἀράξ*, *damnum*, *vel noxa*), in *Botany*, *earth-nut*. Linn. gen. 876. Schreb. 1177. Gærtn. t. 144. Juss. 354. *Arachidna*, Plum. 37. *Arachidnoides*, Niss. act. gall. 1723. t. 19. Class, *diadelphidæ*. Nat. Order, *Papilionaceæ* or *leguminosæ*. Gen. Char. *Cal.* perianth two-parted, gaping; upper lip ovate, semitrifid; the intermediate division the largest, emarginate; under lip lanceolate, concave, acute, rather longer than the upper. *Cor.* papilionaceous, resupine; banner roundish, flat-deflex, very large, emarginate, longer than the calyx; wings free, sub-ovate, shorter than the banner; keel subulate, incurved, the length of the calyx, very slightly bifid at the base. *Stam.* filaments ten, all united at bottom, subulate; anthers alternately roundish and oblong. *Pist.* germ oblong; style subulate, the length of the germ; stigma simple. *Per.* a legume, ovate-oblong, columnar, valveless, gibbous, one-celled. *Seeds* two, oblong, obtuse, gibbous, truncate. *Obs.* Most of the flowers have a pistil without a germ.

Ess. Gen. Char. *Cal.* bilabiate. *Cor.* resupine. *Fil.* connected. *Legume* gibbous, torulose, veined, coriaceous.

Species, 1. *A. hypogæa*, common earth or ground nut.

Stem herbaceous, procumbent. The stem is annual, three feet high, round, very hairy, reddish, suberect, with spreading procumbent branches; leaves scattered, abruptly pinnate; leaflets two pairs, ovate, hairy, entire; stipules sharp, bifid, opposite, half stem clasping; flowers gold-coloured, growing singly on long axillary peduncles; the legumes contain three or four seeds. Native of the East Indies, and cultivated very abundantly in China and Cochinchina. *β.* The African ground nut differs from the Asiatic in having the leaflets smooth, the stipules entire, the flowers usually in pairs, and only two or three seeds in each legume. All the European settlements in America now abound with the ground nut, but it is generally supposed that it was originally brought by the slaves from Africa. In South Carolina there is great plenty of this plant; the inhabitants roast the nuts, as they are commonly called, and make use of them as chocolate. In the eastern countries, they are a substitute for almonds, and like them afford a limpid oil, which in Cochinchina is very much used for lamps. It is also used at table, but not so much esteemed as the oil of olives. The ground nut was cultivated in the Chelsea garden so early as the year 1712. 2. *A. fruticosa*, shrubby earth or ground nut; stem shrubby, upright; the whole plant is viscid; stems slender, many, siform; leaves resembling those of myrtle, of different sizes, oblong, ternate, hirsute, partly sheathing the stem at the foot-stalks; flowers at the end of the branches, yellow, collected into solitary heads with bractes under them. A native of the East Indies, in Tranquebar and the island of Ceylon.

Propagation and Culture. In England, the seeds of the earth nut must be sown on a hot-bed in the spring, and the glasses kept over the plants till towards the end of June; after which, if the weather proves warm, they may be exposed to the open air by degrees. The branches trail upon the ground, and as soon as the flower begins to decay, the germ thrusts itself under ground, and the pod is formed and ripened.

ARACHNE, in *Entomology*, a species of *PAPILIO* (Nymph. G. Linn.). The wings are entire, black; a rufous band with two eye-shaped spots on both sides of the anterior pair; posterior pair marked with a cinereous jagged band on the under side. Inhabits Austria. Fabr. Gmel. *Obs.* This is not *PAPILIO Arachne* of Cramer, described by Fabricius and Gmelin under the specific name *Morvus*.

ARACHNE, in *Fabulous History*, a Lydian damsel, the daughter of Idmon, of the town of Colophon, who contested with Minerva the honour of pre-eminence in the arts of spinning linen and manufacture of tapestry. Minerva was so incensed by her presumption, that perceiving the peculiar excellence of her rival's performance, she flung the shuttle at her head: this insult so offended the distressed Arachne, that she hung herself in despair. Minerva, it is said, restored her to life under the form of a spider, which employs itself in spinning. The fable is undoubtedly derived from *αράχνη*, the Greek name of the spider.

ARACHNOIDEA TUNICA, or *Arachnoides*, from *αράχνη*, a spider, and *ειδος*, a form, in *Anatomy*, is a semi-transparent thin membrane which is spread over the brain and pia mater, and for the most part closely connected with the latter membrane. See the article *BRAIN*.

The same term, or *Tunica Aranea*, has been also applied to that capsule of the crystalline lens, which is a continuation of the membrana hyaloidea. See *EYE*.

ARACHNOIDES, in *Natural History*, a genus of the *ECHINI marini*, in Klein's arrangement of testaceous and crustaceous animals. There is only one shell of the Echinus genus that strictly agrees with the character of *Arachnoides*,

which is *Plazenta*; it therefore forms a subdivision of the genus in the Linnæan system, and is thus defined; circular mouth central; vent square, and placed on the surface: *Arachnoides Kleinii*.

ARACHNOIDES is also a species of MADREPORA found fossil. The stars are very small, crowded, and flattened; rays somewhat undulated, short, and equal. Gmel. Sec.

ARACHNOIDEUS, in *Botany*, denotes cobwebbed.

ARACHOSIA, in *Ancient Geography*, a province of Persia, bounded on the west by Drangiana, on the north by Paropamisus, on the east by the river Indus, and on the south by Gedrosia. It was anciently inhabited by the Arimafpi. Ptolemy enumerates thirteen cities in this province; the principal of which were Arachotus, Alexandria, and Arbaca. The ancient Arachosia is traced by major Rennell in the present AROKHAGE. Captain Wilford says (see Asiatic Researches, vol. vi. p. 517.) that *Rob Coi*, according to the Balluch pronunciation, denoting the mountains of Coi, or *Row-Coz* as softened by the Pattans, is the Arachosia of the Greeks; and that it includes the districts of Gazni and Candahar. Arachosia is now called Cawer or Caweran; but even this appellation is becoming obsolete. By a strange mistake, says this ingenious writer, the country of Arachosia, and the river which flows through it, have been placed by the learned D'Anville to the south of Candahar. He adds, that if this famous geographer had recognized Gazni in the Shakeni-Couze of Tavernier, this mistake would not have happened. Mr. Wilford having conversed often with natives of Candahar, of Kálá-at-Násir-Khán, and Cojhur, as well as other intermediate places, obtained sufficient local knowledge of that country to rectify this error.

ARACHOTI, an ancient people of India, supposed by Bryant (*Anal. of Anc. Mythol.* v. III. p. 199) to be the same with the CATHAIANS, and so denominated from their city Ar-Chota, the same as Cothopolis, or city of Cutha. The Arachotians are styled *Λινοχλωστοί* from their particular habit which was of linen; and were a branch of the Amonians, who, wherever they settled, were famous for this manufacture.

ARACHOTUS, a town of Asia in Arachosia, built on a lake of the same name by the famous Semiramis, who is said to have given it the name of Cophes. This city, says captain Wilford, (*ubi supra*), was probably Coj-vara or Cojhar, Cojwar, and Cajhur, the Kodzar and Kodzar of Persian authors; and literally the habitation of Coj, and by implication, the capital city of Coj. The river Arachotus, called also Choafes and Cophes, is now called Abeltarnic, or the river Tarnic. It rises in the hills north-east of Gazni, and after having watered the whole valley of Arachosia, loses itself in a marsh about four miles to the south of Candahar, which marsh was the Arachosian marsh of the ancient geographers. The present river Arachotus is formed by a small stream, which rises a little above Mucur in this marsh, and hence it is often called the water of Mucur.

ARACHTHUS, a town of Ætolia, according to Ptolemy

ARACHTHUS, a river of Epirus, which ran into the gulf of AMBRACIA.

ARACHUS, in *Botany*. See ERVUM.

ARACIA, in *Ancient Geography*, an island of the Persian gulf, situated on the Persian side; and placed by Nearchus between the isle of Caicandros and the mountain Ochus.

ARACIANA, a town of Parthia, mentioned by Ptolemy,

ARACILLUM, an ancient town of Spain, taken and destroyed by Augustus.

ARACINTHUS, in *Entomology*, a species of PAPILIO (*Hes. Urb. Linn.*). The wings are rounded, entire, and brown; posterior pair beneath grey, with white eye-shaped

spots. Fabr. Sp. Inf. This butterfly inhabits France, Germany, and Siberia; it is *Papilio morpheus* of Pallas, and *Papilio steropes* of Esper.

ARACLEA, in *Geography*, a sea-port town of European Turkey, in Rominia, on the north-west coast of the sea of Marmora, called by the Turks Erckli, 15 leagues west of Constantinople.

ARACNÆUS MOUNTS, in *Ancient Geography*, a mountain of the Argolide, part of a chain which separated the peninsula of Morea on the south-east. It lay to the north-west of Epidaurus.

ARACOUA, or ARAGHOVA, in *Geography*, a borough of Greece in Livadia, near the gulf of Lepanto; supposed to be the ancient *Ambriffa*.

ARACUITES, a people of South America in Brazil, in the vicinity of the prefecture of Pernambuco.

ARACUS, in *Botany*. See OROBUS.

ARACUS *Aromaticus*, in the *Materia Medica*, a name given by some authors to the *Vanilla* used in making chocolate.

ARACYNTHUS, in *Ancient Geography*, a mountain of Greece in Bœotia, whence, according to Steph. Byz. Minerva was denominated *Aracynthis*. Strabo places this mountain in Ætolia, and Pliny in Carmania.

ARAD, ARADUS, a town in an island of the same name on the coast of Phœnicia, over against Antaradus. Strabo says that this town was built by the exiles of Sidon: and Josephus informs us, that it had at first its own kings, in common with the other cities of Phœnicia; but, in progress of time, it was subdued by the Tyrians. After the Persians took possession of Phœnicia, the kings of Aradus were tributary to Persia. Arrian says, that Strato, the son of Gerostratus, obtained of Alexander the Great, for himself and his father, the established possession of this kingdom. It afterwards, as a part of Phœnicia, was subject to the Lagidæ, to whom Egypt was assigned under the successors of Alexander. During the war carried on by Antiochus the Great against Ptolemy Philopator, the Aradians were governed by their own laws, and Antiochus did not molest this privilege: but they were deprived of it by Antiochus Epiphanes, who, on his return from Egypt, took their city, and ravaged the whole province. When Pompey made a conquest of Syria and Phœnicia, the Aradians became subject to the dominion of the Romans. The city of Arad, though it had no harbour in the island, became powerful at sea by means of a port which it had on the continent at the mouth of the river Eleutherus. Its inhabitants detested piracy, and separated from the Cilicians, who were addicted to it. Strabo, l. xvi. The island Aradus, the Arpad of the Scriptures, and the seat of the Arvadite or Aradite (see Gen. xi. 17.), is at present called *Rou-Wadde*: and this island, and also El-Hammah, the ancient Hamath, the seat of the Hamathite, lying over against it (*Ezek. xlvii. 29.*), ten leagues to the eastward, are the most northern settlements of the sons of Canaan. The prospect of Rou-wadde from the continent is very magnificent, and furnishes at a distance a continued train of fine buildings and impregnable fortifications. But this is altogether owing to the height of its situation, and the rocks that abound in it. Its whole strength and beauty, though it was called Rou-wadde, or Arpad, probably from the Hebrew *רוד, firmus fuit*, consists of a weak unfortified castle, defended by a few small cannon. Formerly, however, it was surrounded by a strong wall, constructed with stones of an immense size adapted to each other without cramps and mortar, so as to withstand the violence of the sea, and the battering engines of an enemy. In the time of its prosperity, art and nature had conspired to render it a place of such strength and im-

portance, as sufficiently to justify the boast, "Where is the king of Arpad?" (II Kings, xix. 17.) which Sennacherib made in the conquest of it. This island is now deserted, nor has tradition retained the memory of a spring of fresh water in its vicinity, which the people of Arados are said to have discovered at the bottom of the sea; and from which they drew water in time of war, by means of a leaden bell and a leathern pipe fixed to its bottom.

ARAD, or *Arada*, a city of Palestine, situate in Arabia Petraea, south of the tribe of Judah, and of the land of Canaan. The Israelites, in their progress towards Canaan, were opposed and defeated by the king of Arad; but as soon as they became masters of Canaan, they destroyed all its cities. Numb. xxi. 1. ch. xxxiii. Arad was afterwards rebuilt; for Eusebius places it in the neighbourhood of Kades, four miles distant from Maletis, and twenty from Hebron. See **AREB**.

ARAD, in *Geography*, a town of Upper Hungary on the river Marisch, twenty-four miles north of Temeswar.

ARADA, in *Ornithology*, a name given by Buffon to the Gmelinian *Turdus cantans*; which see.

ARADI, in *Geography*, a town of Asiatic Turkey in the province of Nátolia, sixteen miles north-west of Kastamemi.

ARADIS, in *Ancient Geography*, the name of a town in the island of Sardinia, which, according to Dion, was taken by Menas.

ARADITA, an episcopal city of Africa, in the provincial province.

ARADOS, in *Medicine*, signifies, according to Hippocrates, that perturbation which is excited in the stomach by concocting meats of different qualities. It also signifies any internal perturbation, occasioned by purging medicines, vehement exercise, or other causes.

ARADRIPHE, in *Ancient Geography*, a town of Media according to Ptolemy.

ARADUCA, a town of Hispania Tarragonensis.

ARADUCTA, a town of Lusitania, according to Ptolemy.

ARADUS. See **ARAD**.

ARADUS, an island of the Red Sea, mentioned by Steph. Byz.—Also, the name of an island in the Persian gulf, mentioned by Eustathius, and also by Strabo.

ARÆ. Athenæus mentions three islands of this name on the coast of Ionia. There are several places under this denomination, derived from the altars that were erected in them, on various occasions and for different purposes.

ARÆ *Philænorum*. See **PHILÆNI**.

ARÆGENUS, a town of ancient Gaul, supposed by M. D'Anville to have been Bayeaux; formed of Bajocassos, whose capital was this city.

ARÆOMETER, formed of *αραιος*, thin, and *μετρον*, measure, an instrument wherewith to measure the density or gravity of fluids.

The invention of the aræometer has been commonly ascribed to Hypatia, the daughter of Theo, about the end of the fourth century; but this account, says Salvete (*Annales de Chemie*, xxvii. 13.), is not accurate, if the poem, "de pondicibus et mensuris," annexed to the works of Priscian, and written by Rhemnius Fannius Palæmon, be truly ascribed to him. Rhemnius has given a perspicuous and exact description of aræometry; and he lived under Tiberius, Caligula, and Claudius Cæsar, three centuries before Hypatia; and he attributes the invention to Archimedes. However, if it be considered that valuable inventions are forgotten and discovered again during the lapse of a shorter period than three centuries, Hypatia may be allowed the honour of a second invention.

The aræometer, or water-weigher, is usually made of glass; consisting of a round hollow ball, which terminates in a long slender neck, hermetically sealed at top; there being first as much running mercury put into it as will serve to balance or keep it swimming in an erect position.

The stem is divided into degrees (as represented *Plat. IX. Pneumatics*, fig. 70.); and by the depth of its descent into any liquor, the lightness of that liquor is concluded; for that fluid in which it sinks least must be heaviest; and that in which it sinks lowest, lightest.

M. Homberg has invented a new aræometer, described in *Philos. Transact.* N^o 262. thus: *A* (fig. 71.) is a glass bottle or matrafs, with so slender a neck, that a drop of water takes up in it about five or six lines, or half of an inch. Near that neck is a small capillary tube *D*, about six inches long, and parallel to the neck.—To fill the vessel, the liquor is poured in at the mouth *B* (which is widened to receive a funnel), till it run out at *D*; that is, till it rise in the neck to the mark *C*, by which means you have always the same quantity of liquor; and consequently by means of the balance, can easily tell, when different liquors fill it, which weighs most, or is most intensely heavy.

Some regard, however, is to be had in these trials to the season of the year, and the degree of heat and cold in the weather; because some liquors rarefy with heat, and condense with cold, more than others; and accordingly take up more or less room.

By means of this instrument, the ingenious author has made a table to shew the different weights of the same bulk of the most considerable chemical liquors, both in summer and winter, as follows:

	Weighed in summer.		In winter.	
The aræometer full of	oz.	dr. gr.	oz.	dr. gr.
Quicksilver,	- - -	11 00 06	- - -	11 00 32
Oil of tartar,	- - -	01 03 08	- - -	01 03 31
Spirit of urine,	- - -	01 00 32	- - -	01 00 43
Oil of vitriol,	- - -	01 03 58	- - -	01 04 03
Spirit of nitre,	- - -	01 01 40	- - -	01 01 70
— salt,	- - -	01 00 30	- - -	01 00 47
Aquafortis,	- - -	01 01 38	- - -	01 01 55
Vinegar,	- - -	00 07 55	- - -	00 07 60

River water,	- - -	00 07 53	- - -	00 07 57
Distilled water,	- - -	00 07 50	- - -	00 07 54

The instrument itself weighed, when empty, one dram twenty-eight grains. See **HYDROMETER**.

ARÆOPAGUS. See **ARÆOPAGUS**.

ARÆOSTYLE, ARÆOSTYLOS, in the *Ancient Architecture*, a sort of intercolumniation, wherein the columns were placed at the distance of eight, or, as some say, ten modules from one another.

In the aræostyle, the columns were the widest and openest they were ever planted at; whence the name—from the Greek *αραιος*, rarer, and *στυλος*, column.

The aræostyle is chiefly used in the Tuscan order, at the gates of great cities and fortresses.

ARÆOTICS, in *Medicine*, such remedies as tend to open the pores of the skin, and render them large enough for the morbid matter's being carried off by sweat, or insensible perspiration.

To the class of aræotics belong diaphoretics, sudorifics, &c.

ARÆETHUS, in *Ancient Geography*, the name of a river in Epirus.

ARAF, or AL-ARAF, in the *Mahometan Theology*. See **AL-ARAF**.

ARAF A. See **CORBANI**.

ARAFAT, in *Geography*, a mountain of Arabia, near Mecca, so called, as some say, because Adam there met and knew his wife, after a separation of 200 years; or, according to others, because Gabriel, after he had instructed Abraham in all the sacred ceremonies, coming to Arafat, there asked him if he *knew* the ceremonies which had been shewn him; to which Abraham replying in the affirmative, the mountain thence had its name, and was called "the mountain of knowledge." To this mountain the Mahometan pilgrims proceed in a tumultuous manner on the ninth day of the month Dhulhajja, after morning prayer; and here they continue performing their devotions till after sun set. When their devotion is finished on this mountain, they depart to Mozdalifa, an oratory between Arafat and Mina, and there spend the night in prayer and reading the Koran.

ARAGON. See **ARRAGON**.

ARAGON, a town of Arabia, 100 miles E. S. E. of Sanaa.

ARAGUA, a town of South America, in the country of Terra Firma, and province of Cumana.

ARAGUAGUA, in *Ichthyology*, a name given by Marcgrave to a species of shark, since called by Linnæus **SQUALUS PRISTIS**, which see.

ARAGUS, in *Ancient Geography*, a river of Asiatic Iberia, which, according to Strabo, joins the Cyrus; but Pliny calls it *Alazon*, and says that it descends from mount Caucasus, separates Iberia from Albania, and discharges itself into the Cyrus.

ARAHUM, or **HARAHUM**, in *Ancient Writers*, denotes a place consecrated or set apart for holy purposes. *Ducange*.

Hence the phrase, *in arabo jurare*, or *conjurare*, to make oath in the church; because by the Riparian laws, all oaths were to be taken in the church on the relics of the saints.

ARALIA, **FRANCINO**, in *Biography*. See **FRANCINO**.

ARAIGNEE, in *Fortification*, sometimes denotes a branch, return, or gallery of a mine.

ARAIRE, the name of a small plough used in Provence and Languedoc, in France.

ARAL, in *Geography*, the name of a lake or sea of Great Bucharia, in Independent Tartary, about 100 miles to the east of the Caspian sea. It is about 200 miles long, and about 70 broad; and receives the river anciently called *Jaxartes*, and more recently the *Sirr* or *Sihon*, and the *Oxus* of antiquity, now called the *Gihon*. It is very probable that the Caspian sea and the Aral formerly constituted one lake, though they are now separated by an elevated plane, occasioned, perhaps, by the sand rolled down by the *Gihon*, the *Sirr*, and other rivers which now flow into the sea of Aral. The waters of this lake are saline, like those of the Caspian, and the fish found in both are of the same species. N. lat. 42° 45' to 46° 40'. E. long. 57° 4' to 61° 14'.

ARALIA, in *Botany*, *angelica tree*. Linn. gen. 386. Schreb. 525. Juss. 218. Clais. *pentandria pentagynia*. Nat. Ord. *hederaceae: aralie*. Juss. Gen. Char. *Cal.* involucre very small, of a globular umbellule. *Perianth.* five-toothed, very small; superior. *Cor.* petals five, ovate, acute, sessile, reflex. *Stam.* filaments five, subulate, of the length of the corolla; anthers roundish. *Pistl.* germ roundish, inferior; styles very short, permanent; stigmas simple. *Per.* a berry roundish, striated, crowned, five-celled. *Seeds* solitary, hard, oblong.

Ess. Gen. Char. Flowers in an umbellule, with an involucre; *Cal.* five-toothed, superior. *Cor.* five-petalled. Berry five-seeded.

Species, 1. *A. spinosa*; thorny aralia, or angelica-tree; angelica arborefcens, &c. Comm. hort. 1. t. 47. christopho-

riana, &c. Pluk. phyt. t. 20. Sp. char. arborefcens. Stem and leaves prickly. This rises with a woody stem to the height of eight or ten feet, dividing into several branches, with branching leaves, composed of many divaricating wings. The ribs of the leaves, as also the branches and stem, are armed with strong crooked spines, rendering the place where the plants grow in plenty, very difficult to pass through. The flowers are produced in large loose umbels, at the extremities of the branches, and are of an herbaceous colour. The berry is three-cornered and three-celled. A native of Virginia, whence it was sent to England in 1688, and cultivated by bishop Compton at Fulham. 2. *A. pentaphylla*; five-leaved aralia; arboreous, prickly; leaves quinate. The branches of this tree are prickly, round, flexuose, ash-coloured; prickles axillary, solitary, horizontal; leaves petioled, from one bud, to three, four, or more; leaflets ovate-acute, serrate at top, smooth; flowers in umbels, which are peduncled; stamens longer than the corolla. A native of Japan. 3. *A. chinensis*; Chinese aralia; frutex aquosus mas, Rumph. amh. 4. t. 44. Nalugu, Rheed. mal. 2. t. 26. shrubby; stem and petioles prickly; leaflets unarmed, villose; stem simple, closely beset with prickles; leaves confined to the top of the plant, on three-parted prickly villose petioles; partial leaves pinnate; leaflets ovate-ferrate, villose, large; panicle branching, with numerous umbellules. It was found in China by Osbeck, also in Cochin-China by Loureiro. It is a native of Malabar, and of Amboina; but Rumphius speaks of it as a large tree growing in the woods; whereas Loureiro describes it in Cochin-China as procumbent or scandent. See his Fl. Cochin. 187. 4. *A. japonica*; Japanese aralia; Kæmp. ic. sel. t. 10; shrubby, leaves lobate: stem unarmed, upright, six feet high; leaves towards the top close, alternate, petioled, seven-lobed, young leaves five-lobed; bractes many, involving the whole panicle of flowers, which are terminal in compound panicles, with alternate umbelled peduncles; umbels simple; no involucre. A native of Japan. 5. *A. racemosa*; berry-bearing aralia; stem leafy, herbaceous, smooth. This grows three or four feet high, dividing into many irregular branches; leaves ramose, alternate; peduncles axillary, terminated by round umbels of small four-leaved flowers, of a whitish colour, succeeded by round channelled berries. A native of Canada, where the berries are eaten, and the leaves and roots used as fallads and pot-herbs, by the Indians and French. 6. *A. nudicaulis*; naked-stalked aralia; stem naked; leaves in pairs, ternate; stem so very short, as to scarcely deserve the name: leaves decomposed; leaflets pinnate, with five serrate pinnae; scape long, supporting about three umbellules, in shape and colour like those of the preceding species. This, and also the fifth sort, were cultivated by Miller in 1731. It is a native of Canada and Virginia. See Pluk. alm. 98. t. 238. f. 5. The roots of this plant have been sold for those of sarsaparilla, and are still used as such by some of the inhabitants of Canada, though very different from the true sarsaparilla. 7. *A. cordata*; heart-leaved aralia; herbaceous; stem angular, unarmed; leaves simple, heart-shaped: stem suffruticose, ascending, villose, branching but little; leaves alternate, petioled, ovate-acute, toothed, rough on both sides; pale and ribbed beneath, unequal; flowers axillary, umbelled; peduncles trichotomous. A native of Japan. 8. *A. octophylla*; digitate-leaved aralia; stem arboreous, unarmed; leaves digitate, with eight leaflets; panicle umbelled. A tree, ten feet high; leaves on long footstalks; leaflets oblong, obtuse, entire, smooth, unequal, disposed in a ring; flowers yellow, sprinkled with red, in a vast terminating panicle, ending in umbels; no involucre; calyx truncate; petals oblong spreading.

spreading. It is a native of Cochin-China, where it is also cultivated, and used as a medicine in dropries. Near Canton there is a species or variety of aralia with ten stamens, and a ten cleft stigma. *A. palmata*; palmate-leaved aralia; stem scandent, prickly; leaves five-lobed; umbels simple, lateral: stem shrubby; leaves large, scattered, on long foot-stalks; flower white, without an involucre; petioles and peduncles unarmed; prickles on the stem, scattered, bowed back. A native of China. The bark of this is also used in dropries, and in cutaneous disorders. Possibly some of the above species may, on more accurate examination, be found to belong more properly to the genus *HEDERA*, which seems nearly allied to the aralia.

Propagation and Culture. The first sort is propagated by seeds, which are easily procured from North America, and which should be sown in pots filled with light earth, and placed in a shady situation till autumn, when the pots should either be plunged into an old bed of tan, or planted in a warm border, sheltered by a hedge or wall; and if the winter prove severe, it will be proper to cover the pots with straw or peas-haulm, to prevent the frost from penetrating deep into the ground. In March the pots should be plunged into a temperate hot-bed, which will bring up the plants early, so that they will have more time to get strength before the following winter. The pots should be constantly kept clean from weeds, and when the plants come up, they ought to be frequently refreshed with water; in May they should be inured to the open air; and when they are removed out of the bed they ought to have a shady situation. In mild weather these plants should be always exposed to the open air; but great care must be taken to guard them against frost; therefore the frames under which they ought again to be placed in October, are to be constantly opened when the weather is not severe. In the spring, before the plants begin to push, they should be carefully shaken out of the pots and separated; part of them should be planted singly in small pots, and the other may be planted in a bed of light earth, in a warm situation. If those which are planted in small pots, be placed in a moderate hot-bed, it will greatly forward their growth; but they must be early inured to bear the open air, otherwise they will draw up weak. In the following summer, they must have a shady situation, and next winter sheltered again; the spring following they may be shaken out of the pots, and planted where they are designed to remain. Those plants which were planted in the beds will require protection from the frost the first winter; but if the surface of the ground be covered with old tanner's bark, it will prevent the frost from penetrating to the roots; and in hard frosts some straw, peas-haulm, or any light covering, will secure the stems from being injured; and after they have remained in the beds two years, they will be strong enough to be transplanted in the places where they are intended to grow. This plant may be also propagated by its roots. The fifth and sixth species are hardly enough to be propagated with very little trouble. Their seeds should be sown in autumn. See Miller's Dict. by Martyn.

ARALIA arborea & capitata. See *HEDERA*.

ARALIA. in *Ancient Latin Writers*, denotes arable, or ploughing lands.

This is otherwise denominated *aratoria, araturia*.

In *Domesday* for Essex, we meet with *decem acras prati, duos runcal, quatuor aralia*—Where *aralia* seems to denote land fit for ploughing and tillage, by way of contradistinction to *runcalia*, which was over-run with briars and thorns. Du-Cange.

ARALIASTRUM, in *Botany*. See *PANAX*.

ARALUCUS, in *Ancient Geography*, a place of Gallia

Narboensis, north-north-east of Forum Julii. Venus had in this place a temple, which was destroyed in the year 447.

ARAM, a name given in scripture to Syria, from Aram the fifth son of Shem, by whose descendants, called Arameans, Syria was peopled.

ARAM, a town of Judaea, in the half tribe of Manasseh, on the other side of Jordan.

ARAM, in *Geography*, a town of Arabia, 58 miles N. E. of Chamir.

ARAM Rub-Rub, that part of Syria which lay N. of Palestine, and was the territory of the city of Rub, belonging to the tribe of Asher.

ARAM Damasc. or Syria Damascena, a principal and most powerful part of Syria, of which Damascus was the capital.

ARAM-Marchi, a district of Syria at the foot of mount Hermon, on the borders of the half tribe of Manasseh, on the other side of Jordan, called the coast of Marchi.

ARAM Nahrain, or Syria of the rivers, or Mesopotamia, situate between the Euphrates and Tigris, whence the name.

ARAM-Zohi, a county of Syria, near the Euphrates, conquered by David, and afterwards the site of Palmyra; bounded on the E. by the Euphrates, and on the W. by the land of Canaan and Syria Damascena.

ARAMACA, in *Ichthyology*, a name given by some naturalists to the species of *PLEURONECTES*, called by Linnæus mancus. Vide Ruysch. theat. anim. Maregrave, &c.

ARAMAGARA, in *Ancient Geography*, a town of India, on this side of the Ganges, according to Ptolemy.

ARAMASCHEVA, in *Geography*, a town of Siberia, 30 leagues S. of Tobolsk.

ARAMATHA, in *Ancient Geography*, a metropolitan city of the Ammonites, according to Josephus.

ARAMAYA, the name of a town of Arabia Felix, according to Ptolemy.

ARAMBYS, the name of the five factories established by Hanno, the Carthaginian admiral, on the western coast of Africa, between the river Lixus and the promontory of Solœ.

ARAMEI, ARAMÆANS, a name given by the Jewish lawgiver Moses, to the inhabitants of Syria and Mesopotamia. See *ARAM*. Pliny places a people of this appellation among the Scythians.

ARAMIS, in *Geography*, a town of France, in the department of the Lower Pyrenées, and chief place of a canton in the district of Oleron, on the Vert, seven miles S. W. of Oleron. The place contains 1050 and the canton 5,883 inhabitants: the territory includes 262½ kilometres, and 6 communes.

ARAMO, a town and fortress of South America, in the kingdom of Chili, near the Pacific Ocean.

ARAMONT, a town of France, in the department of the Gard, and chief place of a canton in the district of Nîmes, on the west side of the Rhone; 8 miles below Avignon. The place contains 2200 and the canton 10,577 inhabitants: the territory comprehends 120 kilometres, and 10 communes.

ARAMPO, or *MAN-EATER*, in *Zoology*, a name given by the negroes on the gold coast of Africa, to a long slender animal, in shape resembling a weasel, with a long tail, and large brush at its extremity, of a pale brown colour, and long thin hair. It is so called because it digs up graves, and is eager for human flesh. See *ADIVE*.

ARAMROY, in *Geography*, one of the principal ports of the district inhabited by a piratical tribe named Sangarians, and situated on the south coast of the gulph of Cutch, between the mouth of the river Indus or Sinde, and the river Puddar.

ARAN, a town of Persia, in the province of Irak, 35 leagues north of Isfahan.

ARANAS,

ARANAS, a town of Sweden, in the province of West Gothland. Also, a river of Spain, which runs into the Agra, one league below Pampeluna.

ARANCE, a town of France, in the department of the Ain, and chief place of a canton in the district of St. Rambert; 8 miles E. of Ambronay.

ARANDA, a town of Spain, in Arragon, 19 miles N. W. of Calalaid.

ARANDA de Duero, a small town of Spain, in Old Castile, on the Duero; 30 leagues north of Madrid, and 11 south of Burgos.

ARANDON, a town of France, in the department of the Ilere, and chief place of a canton in the district of la Tour du Pin, 10 miles S. of St. Sorian.

ARANE, in *Ancient Geography*, a town of the Lesser Armenia, according to Ptolomy.

ARANEÆ, in *Entomology*, a genus of apterous insects, well known by the common English name, SPIDER. The mouth is furnished with short horny jaws; lip rounded at the apex: feelers two, incurved, jointed, very acute at the tip, clubbed, with the genitalia in the male; no antennæ; eyes eight, or rarely six; feet eight; anus furnished with papillæ, or teats for spinning. Gmel Linn. &c.

Schæffer adds to the Linnæan character, that the feet are made for running; the head united to the thorax and the abdomen, which is of an oval form, and joined to the thorax by a short pedicle or stalk. He divides them into different families, according to the various situations of the eyes, in which he followed Frisch, Geoffroy, and others. The eyes of spiders are immoveable, and their structure is different from those of most other insects; consisting each of only one lens, which deprives them of the faculty of multiplying objects, as their immobility does that of seeing them if placed otherwise than exactly before either of them. Geoffroy had observed before, that all spiders have eight eyes, and that the eye at each extremity of the line, in the species which Linnæus believed to have only six, is double.

Fabricius and Gmelin have attended, in the subdivisions of the genus, very carefully to the situation of the eyes, which differs greatly in different species: in some, for example, they form a quadrangle on the back of the head, two looking in front, two behind, and two on each side; the disposition of them in the species globosa is altogether different; five of them form a semicircle in front, and three lie parallel to each other behind; in argentata, the order is precisely reversed, three parallel eyes are in front, and the semicircle of five are behind them; in extensa, they form two parallel lines across, of four eyes each; again, in pulchra, two are in front, and six in a transverse streak; three of which incline to one side, and three to the other; in goezii, they form two somewhat oblique longitudinal streaks, having four eyes in each; in avicularia, four are contiguous in the centre, and form a quadrangle, and the four others are disposed in the same order, one at each angle; in conica, according to Gmelin, are two more than usual; three being placed in front, three behind, and two on each side; and in albifrons, all the eyes are disposed in one line, which bends a little in the middle.

The species are numerous; Gmelin describes the following: fasciata, diadema, marmorea, reticulata, cucurbitina, calycina, octopunctata, bipunctata, arundinacea, angulata, riparia, labyrinthica, quadrilincta, redemita, corollata, montana, sanguinolenta, nigra, notata, rufipes, nocturna, sexpunctata, carnifex, flavissima, binaculata, quadri punctata, militaris, truncorum, rupestris, aquaticæ, palustris, triguttata, scopiformis, virefcens, fornicata, hexacantha, tetracantha, acukata, spinosa, spinipes, fuscata, opilionoides, Olbeckii,

Willkii, speciosa, horrida, latro, domestica, trilineata, dor-fata, impressa, viatica, laevipes, tricuspudata, globosa, argen-tata, fumigata, clavipes, faceata, extensa, lobata, longimana, cancriformis, nidulans, latens, signata, maftans, nigrita, cornuta, fimbriata, dorsalis, tarantula, cinerea, pubescens, fulvata, scenica, pulchra, goezii, avicularia, truncata, conica, albifrons, myops, longipes, serosa, fenoculata, scopulorum, luca, bicornis caspia, argentea, holofericea, spinimobilis, eruentata, hirtipes, venatoria, ocellata, tribullus, alba. Which see respectively.

Spiders have usually five teats or nipples at the extremity of the abdomen, whos' apertures they can enlarge or contract at pleasure. It is through these apertures that they spin a gluey substance, with which their bellies are full. They fix the end of their threads by applying these nipples to any substance, and the threads lengthen as the animal recedes from it. They can stop the issuing of the threads by contracting the nipples, and re-ascend by means of the claws on their feet, much in the same manner as men warp up a rope. When the common house-spider begins her web, she generally chooses a place where there is a cavity, such as the corner of a room, that she may have a free passage on each side, to make her escape in case of danger. Then she fixes one end of her thread to the wall, and passes on to the other side, dragging the thread along with her, (or rather the thread follows her as she proceeds), till she arrives at the other side, and there fixes the other end of it. Thus she passes and re-passes, till she has made as many parallel threads as she thinks necessary for the purpose. After this, she begins again, and crosses these by other parallel threads. These are the toils or snares which she prepares for entangling flies, and other small insects. But besides this large web, she generally weaves a small cell for herself, where she lies concealed, watching for her prey. Betwixt this cell and the large web she has a bridge of threads, which, by communicating with the threads of the large one, both give her early intelligence when any thing touches the web, and enables her to pass quickly in order to lay hold of it. There are many other methods of weaving, peculiar to different species of spiders, and some that deserve particular notice. Aranea venatoria forms a large cylindrical web under ground, with a lid connected by a kind of hinge, which she can open or shut at pleasure; she watches for her prey at the entrance of her den, which is level with the surface of the ground, and at the least approach of danger retreats into it and shuts the lid, by which means she is completely secure; this is a native of the hotter parts of South America. An European species, labyrinthica, spins an horizontal web on the ground, with a cylindrical cavity below the surface, in which she watches her prey: marmorea spins on the ground nearly in the same manner: some live in trees, and spin long perpendicular webs, as angulata: latens, horrida, and others, spin little webs on the under-side of the leaves of plants: and one kind, calycina, will secrete itself in the calyx of a flower, after the corolla has fallen off, and fasten on flies and other insects that may come to extract its juices.

The darting of long threads, by means of which some species also can convey themselves to a vast distance, is remarkable; and some have asserted, on that account, that spiders have the power of flight; though unquestionably no one will believe that a spider can have wings, as it could no longer be an apterous insect. Dr. Lister says, that attending closely to a spider weaving a net, he observed it suddenly to desert in the mid-work; and turning its tail to the wind, it darted out a thread with the violence and stream with which we see water spout out of a jet; this thread taken up by the wind

wind was immediately carried to some fathoms length, still issuing out of the belly of the animal. Some time after, the spider leaped into the air, and the thread mounted her up swiftly. Upon this discovery, he made the same observation on near thirty different sorts of spiders, and found the air filled with young and old, sailing on their threads, and doubtless seizing gnats and other insects in their passage, there being often manifest signs of slaughter, legs and wings of flies, &c. on these threads, as well as in their webs below. Dr. Hulse made the like discovery about the same time.

Dr. Lister thinks there is a fair hint of the darting of spiders, in Aristotle, Hist. An. lib. ix. cap. 39.; and in Pliny, lib. x. cap. 74. But with regard to their sailing the ancients are silent, and he thinks it was first seen by him. He also observes of those sailing spiders, that they will often dart, not a single thread only, but a whole sheaf at once, consisting of many filaments, yet all of one length, all divided each from the other, and distinct, until some chance either snap them off, or entangle them: but for the most part it may be observed, that the longer they become the more they spread, and appear like the numerous rays of a blazing star. As for that which carries them away in the air so swiftly, it is partly their sudden leap, partly the length and number of the threads projected, and partly the posture and management of their feet. Dr. Lister observed some sorts to use their legs, very like wings or oars; these being sometimes close joined, at others opened, and again bent and extended as necessity required. To fly they cannot be strictly said, because they are carried into the air by external force; but they can, when the wind will suffer them, steer their course, and perhaps mount or descend at pleasure; and in rowing themselves along the air, it is observable that they ever take their flight backwards. It is scarcely credible to what height they will mount; which yet is precisely true, and may be easily observed by any one that shall fix his eye some time on any part of the heavens, the white webs at a vast distance very distinctly appearing from the azure sky; but this is in autumn only, and in very fair and calm weather. Such are briefly the remarks of Dr. Lister, to which may be added part of his letter to Mr. Ray on the same subject: "Last October, &c. I took notice that the air was very full of webs; I forthwith mounted to the top of the highest steeple on the Minster (in York), and could there discern them exceeding high above me." He further observes, that they not only thus shoot their threads upward, and mount with them in a line almost perpendicularly; they also project them in a line parallel to the horizon, as may be seen by their threads running from one wall to another in a house, or from one tree to another in a field, and even from wall to wall across gardens of considerable extent.

The matter of which the spider's web is formed, as before observed, is a viscid juice prepared in the body of the creature, and emitted from the teats at the extremity of the abdomen. The apertures in these are numerous, and according to Reaumur, there are enough even in the compass of a pin's head to yield an amazing number of distinct threads. The holes are perceived by their effects: take a garden spider ready to lay its eggs, and apply the finger on a part of the papillæ, and as you withdraw the finger a vast number of distinct threads will appear. Reaumur has often counted seventy or eighty with a microscope; but has perceived that there were infinitely more than he could tell. In effect, if he should say that each tip of a papilla furnished a thousand, he is persuaded he would say much too little. The part is divided into an infinity of little prominences, like the eyes of a butterfly. Each prominence, no doubt,

makes its several threads; or rather between its several protuberances, there are holes that give vent to threads; the use of the protuberances, in all probability, being to keep the threads asunder, at their first exit before they are yet hardened by the air. In some spiders these protuberances are not so sensible; but in lieu thereof there are tufts of hairs which may serve the same purpose, viz. to keep the threads at a proper distance from each other. Be this as it will, there may threads come out at above a thousand different places in every papilla; consequently the spider having five papillæ, has holes for above five thousand threads.

Such is the tenuity of the threads in the larger sort of spiders. But if we examine the young produced by those, we shall find that they no sooner quit their egg than they begin to spin. Indeed their threads can scarcely be perceived, but the webs may; they are frequently as thick and close as those of the house-spiders; and no wonder, there being four or five hundred little spiders concurring to the same work. How minute must the apertures in the papillæ of these spiders be! The whole spider is perhaps less than a papilla of the parent which produced it. But there are even some kinds of spiders so small at their birth, that they are not visible without a microscope. There are usually found an infinity of these in a cluster: they only appear like a number of red points; and yet there are webs found under them, though well nigh imperceptible. What must be the tenuity of one of these threads? Leeuwenhoek has computed that one hundred of the single threads of a full grown spider are not equal to the diameter of the hair of his beard; and consequently, if the threads and hair be both round, ten thousand such threads are not bigger than such a hair. He calculates further, that when young spiders first begin to spin, four hundred of them are not larger than one which is of a full growth; allowing which, four millions of a young spider's thread are not so thick as the single hair of a man's beard.

Some experiments have been made to manufacture the threads of spiders into a kind of silk; and it is said that a *short-legged* species of garden-spider yields a silk scarcely inferior to that of the silk-worm. The webs of some foreign species might even be employed with still greater propriety for this purpose, than those which inhabit Europe. A later writer, Sir G. Staunton, in "the Embassy to China," alludes to this when speaking of the Java forests. "In some open spots (says that author) were found webs of spiders, woven with threads of so strong a texture, as not easily to be divided without a cutting instrument; they seemed to render feasible the idea of him who, in the southern provinces of Europe, proposed a manufactory of spiders' threads, which was so ridiculous to the eyes of those who have only viewed the flimsy webs such insects spin in England."

M. Bon, of Languedoc, about seventy years ago, contrived to manufacture a pair of stockings and mittens from the silk of the spider already mentioned: they were of a beautiful natural grey colour, and were almost as strong as those of common silk; and he published a dissertation concerning his discovery. M. Reaumur being appointed by the Royal Academy to make farther inquiry into this new silk-work, raised several objections and difficulties against it, which appeared in the Memoirs of the Academy for the year 1710. His arguments against it are chiefly these: the natural fierceness of the spiders renders them unfit to be bred and kept together. Four or five thousand being distributed into cells, fifty in some, one or two hundred in others, the big ones soon killed and eat those which were least, so that in a short time there were scarcely above one

or two left in each cell; and to this inclination of devouring their own species in common with any other insect they can overcome, Reanmur ascribes the scarcity of spiders, considering the vast number of eggs they lay.

But this is not all; he affirms, and it is well known since, that the spider's bag is inferior to that of the silk-worm, both in strength and lustre, and produces less of the material proper to be manufactured. The thread of the spider's web, he says, can only bear a weight of two grains without breaking; and that of the bag bears thirty-six. The latter therefore, in all probability, is eighteen times thicker than the former; yet it is weaker than that of the silk-worm, which bears a weight of two drams and an half. So that five threads of the spider's bag must be put together to equal one thread of the silk-worm's bag. Now it is impossible these should be applied so justly over one another as not to leave little vacant spaces between them, whence the light will not be reflected; and of consequence, a thread thus compounded must fall short of the lustre of a solid thread. Add to this, that the spider's thread cannot be wound off as that of the silk-worm may, but must of necessity be carded; by which means being torn in pieces, its evenness, which contributes to its lustre, is destroyed. In effect, this want of lustre was taken notice of by M. de la Hire, when the stockings were presented to the Academy. Again, spiders furnish much less silk than the worms: the largest bags of these latter weigh four grains, the smaller three grains; so that 2304 worms produce a pound of silk. The spiders' bags do not weigh above one grain; and when cleared of their dust and filth, lose two-thirds of that weight. The work of twelve spiders, therefore, only equals that of one silk-worm; and a pound of silk will require at least 27,648 spiders. But as the bags are wholly the work of the females, who spin them to deposit their eggs in, there must be kept 55,296 spiders to yield a pound of silk: yet this will only hold good of the best spiders; those large ones ordinarily found in gardens, &c. scarcely yielding a twelfth part of the silk of the others. Two hundred and eighty, it seems, of these would not yield more than one silk-worm; 663,552 of them would scarcely yield a pound.

The act of generation among spiders varies in different species. As these insects prey upon each other, except during the time of their amours, they dare not come within reach of one another but with the utmost caution. They may be sometimes seen stretching out their legs, shaking the web, and tampering with each other by a slight touch with the extremity of their feet; then, in a fright, dropping hastily down their thread, and returning in a few moments to make a fresh trial by feeling. When once both parties are well assured of the sex they have to deal with, the approaches of their feet in order to feel are more frequent, confidence takes place, and amorous dalliance ensues. "We cannot," says Lyonnet, "but admire how careful they are not to give themselves up blindly to a passion, or venture on an imprudent step, that might become fatal to them." A caveat this to the human kind. Lister and Lyonnet, two accurate observers, say, that the extremity of those arms or claws, which the spider uses to grasp his prey with, suddenly opens, as it were by a spring, and lets out a white body, the sexual organs in the male; those of the female are beneath the abdomen; a fact which later naturalists have ascertained.

These disgusting animals, in every stage of their existence, prey with the most savage ferocity upon all insects they can overcome, and also upon one another, as already observed. They cast their skins once in a year, and this

they perform by suspending themselves in some corner, and creeping out of it. In respect of colour, they vary greatly in individuals of the same species. The sphex and ichneumon are their mortal enemies.

The weapon wherewith the spiders seize and kill their prey is a pair of sharp crooked claws, or forceps, placed in the fore-part of the head. They can open or extend these pincers as occasion may require; when undisturbed, they suffer these to lie one upon another. Leeuwenhoek says, that each of these claws has a small aperture, or slit, through which he supposes a poisonous juice is injected into the wound it makes. Dr. Mead, in his Essay on Poisons, dissenting from this opinion altogether, having never been able, on repeated examinations, to discover any such opening, not even in the claws of the largest spiders; which being above fifty times larger than any of the European spiders, would have more easily afforded a view of the opening, if nature had allotted any to this part of the animal. Besides, repeated observations also convinced him that nothing dropped out of the claws of the living spider when he bit any thing, because they were always perfectly dry; but that a *scort proboscis* was at the same time thrust out of the mouth, which insinuated a liquor into the wound. And the same writer observes, that the quantity of liquor emitted by the common spiders when they kill their prey is visibly so great, and these wounding instruments (the claws) so minute, that they could contain but a very inconsiderable portion thereof, if it were to be discharged through them. In justice to this remark of Dr. Mead, it may be added, that though there is an apparent groove or indentation visible on these fangs, in some very gigantic species, they do not appear to be perforated; and in general they are smooth without even this apparent indent. The form of the fang may be compared in some respects to those of a poisonous snake: the latter, beside the aperture at the base, has a linear opening near the tip; and through this, and perhaps the other also, it discharges a mortally poisonous fluid into the wound it inflicts, in the same manner as the spider is supposed to do: now, in some great spiders, these fangs are nearly, if not quite, as large as those of a rattlesnake of a moderate size; and yet, in such, this aperture, if it does really exist, is not only invisible to the naked eye, at the same time that they are sufficiently obvious in the fang of the snake, but appears even doubtful under the deepest glasses with which the claw can be examined. There is, as before said, a kind of grooved indent in the claws of some species; but whether they answer the above purpose, or are even perforated, is a point on which the naturalist must decide with caution.

The skins that have been shed, and are found in the webs, being dry and transparent, have also the claws attached to them; and these may be more easily examined than in the living spider.

ARANEA, in *Mineralogy*, a silver ore found only in the mines of Potosi, or in the single mine there of Catamito. It owes its name to some resemblance it bears to a cobweb, being composed of threads of pure silver, which to the sight appear like a silver lace when burned to separate the silk from it. It is the richest of all kinds of silver ore.

ARANEA *Tunica*. See ARACHNOIDES.

ARANEIFORMIS, in *Entomology*, a species of CERAMBYX. The thorax is spinous and tuberculated; wing-cafes porous; antennæ long, with a single tooth on the fifth joint. Fabr. Spec. Inf. *Obs.* Gmelin misquotes the Fabrician character, "articulo quinto unideutato," for "articulo quinto barbato," p. 1819. This insect inhabits South America.

ARANEIFORMIS, in *Natural History*, a species of ECHINUS. It is orbicular, grey, with shining greyish-purple

spines, which are thickest in the middle. This is *Echinometra multipes* *f. spinosissima Americana* of Seba; and *Spinneckhoff*. Phleif. Zee-egcl. Inhabits the American seas. Gmelin.

ARANEOIDES, in *Entomology*, a species of CIMEA, in the section "oblongus." It is yellow, with very long legs, and inhabits Germany. Schæff. Gmelin.

ARANEUS, a species of CANCER, found in the European seas. The thorax is ovate, tuberculated, and hairy; front bifid; claws ovated. Linn. Fabr. Gmel.

ARANGAS, in *Ancient Geography*, a mountain placed by Ptolemy in the interior Libya.

ARANGHERA, in *Geography*, one of the Bissagos islands in the Atlantic, at the mouth of the river Grande, near the coast of Africa.

ARANIMEGLIES, a small but beautiful town of Hungary, in the country of Zatmar, situate in the middle of a plain between the rivers Samos and Tur; three leagues north-east of Zatmar.

ARANIOS, a river of Transylvania, which rises near Clausenburg, and joins the Marisch.

ARANJUEZ, a village and royal palace of Spain, in New Castile, situate on the Tagus, six leagues north-east of Toledo, and ten south of Madrid.

ARANJUEZ, a town of South America, in Mexico, in the province of Costa Rica.

ARANNOS, a town of Spain, in Navarre, three leagues from St. Estevan.

ARANTA, a sea-port town of South America, in Peru, and jurisdiction of Arequipa, with a deep harbour and narrow entrance; ten leagues south-west of Arequipa.

ARANTIA, in *Ancient Geography*, a country of Peloponnesus, according to Pausanias; and also a town of the same country, situate on a hill, called "Arantinus Collis."

ARANTIUS, JULIUS CÆSAR, in *Biography*, a celebrated anatomist and physician, born at Bologna, about the year 1530; studied under his uncle Bartholomew Maggius, and under Vesalius; and took his degree of Doctor in Medicine, and was afterwards made professor of medicine, anatomy, and surgery, in the same university; in which situation he continued to the time of his death, in 1589. He was indefatigable in his researches into the structure of the human body, which he took every opportunity of dissecting and examining. In his first work, "De humano fœtu," published at Rome, in 1564, he corrected many mistakes of former anatomists, in their description of the uterus, which they had generally taken from brutes. He properly describes the vessels of the uterus as derived from the spermatics and hypogastrics. He described the foramen ovale, and ductus arteriosus in the fœtus; and denies the existence of urachus, or of allantoid membrane, in the human subject. This book has been frequently republished. In 1579, he published "In Hippocratem de vulneribus capitis brevis commentarius;" and in 1581, "De tumoribus præter naturam liber," 4to.; in which he describes a pair of forceps he had contrived to extract polypi from the nostrils. He shewed there was no passage from the right to the left ventricle of the heart, but that the blood was carried from the heart, through the lungs, by the pulmonary artery; thus making one step towards the discovery of the circulation of the blood, which was afterwards completed by Harvey. Haller Biblioth. Anat. et Bib. Chirurg.

ARANYVAN, in *Geography*, a fortress of Transylvania, in the county of Weissenburg, on the north side of the Marisch, six miles north of Millenbach.

ARAPABACA, in *Botany*. See SPIGELIA.

ARAPIIA, in *Ancient Geography*, an island which belonged to Caria. Steph. Byz.

ARAPUS, the name of a river of Carmania, according to Ptolemy.

ARAQUES, in *Geography*, a town of Spain, in Arragon, four leagues north-north-west of Jaca.

ARAQUIL, a town of Spain, in Navarre, five leagues west of Pampeluna; supposed to be the ancient Aracillum, or Arocellis.

ARAR, in *Ancient Geography*, the Saone, a river of Celtic Gaul, which, according to Cæsar, separated the territory of the Sequani from that of the Ædui; and the course of which is so slow, that its motion cannot be perceived; whence Pliny calls it "the sluggish river;" and Silius Italicus describes it (lib. xv. v. 504. p. 773. ed. Drakeb.) to the same purpose:

"Quorum serpit Arar per rura pigerimus undæ."

Over this river the soldiers of Cæsar built a bridge in one day.

ARARAT, a mountain of Asia, in Armenia, on which the ark of Noah rested after the cessation of the deluge. Concerning the etymology of the name, Dr. Bryant observes (Anc. Myth. v. iii. p. 2.), that it is a compound of *Ar-Arat*, and signifies "the mountain of descent," being equivalent to *הר-ירד*, Har-irad, of the Hebrews.

Of the precise situation of this mountain different accounts have been given. Some have supposed that it was one of the mountains which divide Armenia on the south from Mesopotamia and that part of Assyria inhabited by the Curds, from whom those mountains took the name of Cardue, or Cardu; by the Greeks denominated Gordyæi. It is called by the Arabs Al-Judi, and also Thamanin. In confirmation of this opinion, it is alleged that the remains of the ark were to be seen on these mountains; and it is said, that Berofus and Abydenus both declare, that such a report existed in their time. Epiphanius pretends, if we may credit his assertion, that the relics of the ark were to be seen in his time; and we are further told, that the emperor Heraclius went from the town of Thamanin, up the mountain Al-Judi, and saw the place of the ark. Others maintain, that mount Ararat was situated towards the middle of Armenia, near the river Araxès, or Aras, about twelve miles from it, according to Tournefort, above 280 miles distant from Al-Judi, to the north-east. This mountain is called "Mafis" by the Armenians, and by the Turks "Agridagh," or the heavy and great mountain; and stands about twelve leagues to the south-east of Erivan, and of Ejmiadzin, from which it is distant about two short days' journey; four leagues from the Aras, and ten to the south-west of Naxuan, or Naclidshevan, or Naçshevan, of M. D'Anville, and the Naxuana of Ptolemy. Near this city is another small town, mentioned by William de Rubruquis, who travelled through Armenia in 1253, and called Cernainum, which is by interpretation eight, and as he says, so called from the eight persons who came out of the ark and built it. This is supposed to be the same with Shemainum or Shemanum, formed of the Hebrew *שמן*, eight, or the Themanim and Thamanim of Elmacieri and others, which was said to have been built by Noah. Ararat seems to be a part of that vast chain of mountains called Caucasus and Taurus; and upon these mountains and in the adjacent country, were preserved more authentic accounts of the ark than in almost any other part of the world. The region about Ararat, called Araratia, was esteemed among the ancients as nearly a central part of the earth; and it is certainly as well calculated as any other for the accommodation of its first inhabitants, and for the migration of

of colonies, upon the increase of mankind. The soil of the country was very fruitful, and especially of that part where the patriarch made his first descent. The country also was very high, though it had fine plains and valleys between the mountains. Such a country, therefore, must, after the flood, have been the soonest exsiccated, and consequently the soonest habitable.

Some have objected to the Mosaic account of the dove and olive, and will not allow that the ark rested in Armenia, because travellers of late have discovered no olives in that country. Thus also it might be said, that because there are in these days no balsam at Jericho, nor date trees in Babylonia, there were none in ancient times; but the inference with regard to Armenia would be as false as it is frivolous. Strabo, who was a native of Asia Minor, speaks expressly of the fertility of Armenia, and especially (lib. xi. t. ii. p. 800.) of the region Gogarene, which he particularly mentions as productive of the olive.

It is not certain when the descendants of Noah quitted this country. Many of the fathers were of opinion, that they did not leave it for some ages. According to Epiphanius (Hær. lib. i. p. 5.), they remained in the vicinity of Ararat for five generations, during the space of 659 years. Probably Noah might never depart from it; nor have we any account of his sons leaving it till the general migration.

The mountain has still the name of Ararat, which it has retained through all ages. Tournefort (vol. ii. 267, &c.) has particularly described it, and from his account it seems to consist chiefly of free-stone, or calcareous sand-stone. It is a detached mountain in form of a sugar-loaf, in the midst of a very extensive plain, consisting of two summits; the lesser more sharp and pointed, the higher, which is that of the ark, lies north west of it, and raises its head far above the neighbouring mountains, and is covered with perpetual snow. When the air is clear, it does not appear to be above two leagues from Erivan, and may be seen at the distance of four or five days journey. Its being visible at such a distance, however, is ascribed not so much to its height, as to its lonely situation, in a large plain, and upon the most elevated part of the country. The ascent is difficult and fatiguing. Tournefort attempted it; and after a whole day's toil, he was obliged, by the snow and intense cold, to return without accomplishing his design, though in the middle of summer. On the side of the mountain that looks towards Erivan, is a prodigious precipice, very deep with perpendicular sides, and of a rough black appearance, as if tinged with smoke.

ARARAT, *Mount*, or the *stone head*, is the name of a short range of mountains on the north frontier of North Carolina, in a north-east direction from Ararat river, which is a north-west branch of Yadkin river.

ARARAUNA, in *Ornithology*, a species of PSITTACUS. Above blue, beneath yellow; cheeks naked, with feathered lineations. Gmelin, &c. The length of this bird is two feet seven inches. Its bill is black; forehead to the crown and sides of the head dull green, the rest of the body above fine blue to the coverts of the tail; cheeks and throat covered with a bare white skin; each cheek marked with black lines composed of very short feathers, which arise at the angles of the mouth, and pass beneath the eyes towards the back of the head; the eye-lids are edged with black; irides pale yellow; beneath, the body is of a pale saffron colour, and in some there is an intermixture of this colour on the wing coverts; the tail is blue above, and the inner margins of the feathers violet, except the two in the middle; it is wedge-shaped; the legs cinereous, and the claws black.

This bird inhabits Jamaica, Guiana, Brasil, and Surinam.

Another parrot, nearly resembling this, is described by different authors; it has not the feathered lines on the cheeks which are so conspicuous in this species, and the top of the head is blue instead of green. Gmelin calls it a variety (β), though he gives it a specific name *cæruleus*; blue parrot, or maccaw; psittacus maximus cæruleus varius, cauda producta, Brown, Jam. & Gmel. This bird inhabits the same places as the other, but is more uncommon. The natives know the two birds by their cry, and they say the latter does not pronounce the word *ara* so distinctly as the blue and red maccaw, or parrot.

ARARI, in *Geography*, a river of South America, in Brasil, which runs into the Northern Sea, in the prefecture of Tamaraca.

ARAS, the ancient ARAXES, a river of Asia, which rises in the Caucasian mountains, and after traversing Armenia and part of Persia, discharges itself into the Kur, or Cyrus.

ARASENG, a town of Persia, in the province of Irak, ten leagues south of Casbin.

ARASSI, a maritime town of Italy in the state of Genoa. It is a place of some trade, and well peopled; and here vessels may be hired for Genoa or any part of Italy. N. lat. 44° 4'. E. long. 7° 20'.

ARATEIA, in *Antiquity*, a yearly festival celebrated at Sicyon, on the birth-day of Aratus, wherein divers honours were paid by a priest consecrated to this service, who for distinction's sake wore a ribband bespangled with white and purple spots.

The aratea were solemnized with much pomp of music, the choirsters of Bacchus attending. Potter, Archæol. lib. ii. cap. 20.

ARATHAPESCOW, in *Geography*, an Indian tribe, inhabiting the shores of the lake and river of that name, in the north-west part of North America, between N. lat. 57° and 59°. North of the abode of this nation, and near the Arctic circle, is lake Edlande, around which live the dog-ribbed Indians.

ARATO-BAFABEN, in *Astronomy*, a fixed star of the second magnitude in the head of the DRAGON.

ARATUM *terre*, in our *Ancient Law Books*, as much land as can be yearly tilled with one plough.—“Hoc manerium est 30 aratorum.”

ARAFURA *terre*, an ancient service which the tenant was to do his lord, by ploughing his land.

ARATUS, in *Biography* and *Ancient History*, a famous general of the Achæans, was the son of Clinias of Sicyon, and born about the year before Christ 273. When his father and several of his kindred and friends were either massacred or banished by the tyrant Abantidas; Aratus, being then about seven years of age, made his escape, and found an asylum in the house of the tyrant's sister: after concealing him for some time, she sent him privately to his friends at Argos. Here he received a liberal education, and distinguished himself by his skill and strength in athletic exercises. Having conceived betimes a detestation of tyrants, he had scarcely attained his 20th year before he formed a plan of rescuing Sicyon, his native place, from Nicocles, who was then its tyrant. With his view he scaled the walls by night, and at day-break invited the citizens, by the voice of a herald, to resume their ancient liberty. The summons was joyfully obeyed, and the city regained its freedom by a revolution, which did not cost a single life. For its future security against the partisans of Nicocles, he found it necessary to unite this city with the confederacy, called the Achæan league; and having been entrusted with supreme constitutional power in Sicyon, he exercised it in a manner which gained him universal esteem, and contributed

to the establishment of order and tranquillity. In the office of prætor, or general of this league, to which he was afterwards advanced, he recovered the citadel of Corinth from a Macedonian garrison, by a military stratagem that has been highly applauded, and thus induced other cities to join the confederacy. Aratus also rescued Argos from its tyrant Arilippus, by persevering skill and valour. In the mean time the Ætoliæ, jealous of the growing power of the Achæans, pursued hostilities which were injurious to the reputation of Aratus, and reduced the league to great extremities; and for suppressing parties which were formed against him both in Sicyon and in Corinth, he was under the necessity of recurring to severe measures. In order to obtain effectual assistance, he was constrained, against his own principles and inclinations, to advise the Achæans to engage the support of Antigonus Dofon, king of Macedon; who, entering the Peloponnesus with a large army, afforded them seasonable relief. When, on a subsequent occasion, the Achæans took part with the Messenians against the Ætoliæ, Aratus marched against the invaders, and avoided an action. But, during their retreat, and perceiving that they were laden with plunder, he made an unexpected attack upon them, by which they were completely defeated. For this conduct he was publicly accused, and escaped a censure by his submission. The Achæans were then obliged to have recourse to Philip, the successor of Antigonus: and in the war that ensued, the king of Macedon conceived a dislike to Aratus, which induced him to retire to Sicyon, where he reflected with regret on the imprudence of ever calling the Macedonians into Peloponnesus. This dislike on the part of Philip was gradually heightened into an invincible hatred: and he determined to sacrifice the object of his resentment and aversion. For this purpose he employed Taurion, one of his officers, to dispatch him secretly, and it is said that the charge was executed by means of poison, which was administered at an entertainment to which Aratus was invited. The consequence was a lingering disorder, which the Achæan general bore with patience and without complaint, though he was not ignorant of its cause. Happening one day to spit blood before one Cephalion, who was his intimate friend, and who seemed surpris'd, he said, "Behold, my dear Cephalion, the effect of friendship with kings." Aratus died at Ægium in the year before Christ 216, in the 57th year of his age; being then prætor of the Achæans for the 17th time. The Sicyonians claimed the honour of burying him; and brought his body in triumphal procession from Ægium to Sicyon, dancing before it, and singing hymns and odes in commendation of his eminent virtues. They then buried him in the most elevated and conspicuous part of the city, which was long after called "Aratium," and where they offered two annual sacrifices, one on his birth-day, and the other on the day when he delivered the city from its tyrants. A priest was appointed for performing the rites that were instituted in honour of him by the Achæans.

Aratus was regarded as one of the greatest men of his time, and may be justly denominated one of the founders of the Achæan republic. As a military commander, he excelled more in forming and projecting extraordinary enterprises, than in executing them. In his administration, he adopted measures of policy which his judgment condemned, and which proved detrimental in the issue both to the Achæans and to himself; such especially was that of calling in the kings of Macedon to the assistance of the republic. He was less superstitious than most of the Greeks, and acted from the suggestions of his own mind rather than from omens and oracles. His temper was amiable, and his

manners virtuous. As an historian, he wrote "Commentaries" of his own actions, and the affairs of the Achæans. Plutarch de Arato, apud op. t. i. p. 1027—1052. Polybius, l. viii. p. 518, &c. Anc. Un. Hist. vol. vi. p. 81—89.

ARATUS, a Greek poet and astronomer, was born, according to Strabo, at Soli or Solæ, afterwards called Pompeiopolis, in Cilicia, according to others at Tarsus; and flourished about the 125th Olympiad, or about 278 years before Christ. Having received instructions from Menecrates the Ephesian grammarian, and the philosophers Timon and Menedemus, Dionysius Heracleotes, and Perseus the stoic, he was patronized by Antigonus Gonatas king of Macedon, who encouraged him in his studies and appointed him his physician. He went to Macedon at the time of the celebration of the nuptials of Antigonus and Phila the daughter of Antipater, and continued at his court during the remainder of his life. Of his poetical works, which were his chief productions, the only piece extant is an astronomical heroic poem, in Greek, entitled "Phænomena." In this poem he treats of the nature and motions of the heavenly bodies, the figures of the constellations, their relative situations in the sphere, their rising and setting, and the fables connected with their names. Cicero, when young, translated this poem into Latin verse, and highly commended the poetry, though he does not allow that he understood astronomy. De Orat. lib. i. For the materials of this poem, it is said, that he was indebted to Eudoxus. Grotius thinks, that he transferred into his poem the observations of various authors in different climates, and for want of astronomical knowledge, confounded them. Among the ancients this poem had many admirers, and it has had numerous commentators: Virgil has copied it in his "Georgics;" and St. Paul has made a quotation from it. Act. xvii. 28. The words "Τὸ γὰρ καὶ γένος ἐσμεν," for we are also his offspring, are a part of the fifth line of this poem: and other passages, to which this citation hath been referred, in Cleanthes's hymn to Jupiter, Pythagoras's golden verses, and Oppian's Halieutica, though they agree in sentiment, vary in expression. Quintilian (Instit. Orat. l. x. c. 1.) observes, that the subject of this poem has nothing of the pathos, no variety, no fictitious persons introduced speaking, with the other ornaments which have so great an effect in other kinds of poetry; however that the author was very capable of executing the design he undertook. Besides Cicero's translation of Aratus, of which a few fragments remain, we have an entire version in Latin hexameters, by Cæsar Germanicus, and another by Avienus. In later times, the poem of Aratus has been translated into Latin by Alenus, printed in 4to. at Paris, in 1651; and in 4to. by Grotius at Leyden, in 1600; and also into various modern languages. The principal editions of the Greek original are in 4to. by Morell, at Paris, 1559; in folio, by H. Stephens, at Paris, in 1566; in 8vo. at Oxford, by bishop Fell, in 1672; in Greek and Latin, with the ancient versions, &c. at Paris, in 4to. 1540; at Basil, in 1649; in 8vo. by Salvinus, in Greek, Latin, and Italian, at Florence, in 1765. It is also contained in the editions of the ancient astronomers. Fabr. Bib. Græc. l. iii. c. 18. t. 2. p. 490, &c. Gen. Diçt.

ARAVA, in *Geography*, a fortress of Upper Hungary, in a country and upon a river of the same name. N. lat. 49° 20'. E. long. 20°.

ARAVACOURCHY, a town of Hindostan, in the Mysore country, 17 miles south-west of Carroor, and 23 north of Dindigul. N. lat. 10° 45'. E. long. 73° 1'.

ARAUCO, a fortress and town of Chili in S. America, situate in a fine valley on a river of the same name, north by west from Baldivia. The native Indians, called Arauques

or Arauceans, are so brave that they drove the Spaniards out of their country, though destitute of fire-arms. A peace was concluded between them and the Spaniards in 1659, which was celebrated in a poem by Alonzo de Ercilla. S. lat. $37^{\circ} 30'$. W. long. $73^{\circ} 20'$.

ARAVITA, a town of Spain, in the country of Cordova, 16 leagues from Cordova.

ARAUROS, now *Eraut*, in *Ancient Geography*, a river of Gallia Narbonensis, called by Strabo, Araura.

ARAUSA, a town of Iltria, placed in the itinerary of Antonine, 20 miles from Blandona, in the way to Salona.

ARAUSIO, *Civitas Arausensis*, or *Arausicorum*, called *Colonia Secundanorum*, because the veterans of the second legion were settled there, the capital of the Cavares in Gallia Narbonensis. This is now Orange in the west of Provence, on an arm of the River Egue, which soon after falls into the Rhone, from which it is distant about a league to the east, at the foot of a mountain. An ancient amphitheatre is still to be seen in this place. N. lat. $44^{\circ} 10'$. E. long. $4^{\circ} 46'$.

ARAUZONA, a town of Illyria, according to Ptolemy.

ARAW, or ARAU, in *Geography*, a town of Switzerland, in the Argow, and canton of Berne, situate on the river Aar, in a fertile country, and containing about 1700 inhabitants. The principal manufactures are cotton, cotton fluffs, printed linens, cutlery, and tanning. It is a large and handsome town; 21 miles south-east of Basle. The treaty of peace concluded in 1712, at Aarau, between the protestant and catholic cantons, is one of the fundamental principles of the Helvetic union, or of the code of public law between the combined republics of Switzerland. N. lat. $47^{\circ} 23'$. E. long. $4^{\circ} 46'$.

ARAXA, a river of Spain, which runs into the Orio at Tolosa.

ARAXA, in *Ancient Geography*, a town of Asia, in Lycia, according to Ptolemy and Stephan. Byz.

ARAXAI, in *Geography*, a river of South America, in Brasil; its course was towards the prefecture of Paraiba, where it discharged itself into the river Mongaguaca.

ARAXES, in *Ancient Geography*, now ARAS, a river of Armenia Major, which rose in a mountain called by Strabo Abus (see ABA), and by others Capotes and Achos, a part of the Caucasus; continued its course eastward to the city of Atropatane, and thence inclining north-westward, flowed near Azara and Artaz, and fell at length, as Strabo and other geographers say, into the Caspian sea, near the mouth of the Cyrus; but according to Plutarch, Pliny, and Arrian, with whom our modern geographers agree, into the Cyrus. Ptolemy, indeed, divides the Araxes into two branches, and represents one as falling into the Cyrus and the other into the Caspian sea. Its impetuous course, which would not admit of a bridge, is described by Virgil, *Æn.* viii.

“ — pontem indignatus Araxes.”

On the banks of this river have appeared, at different times, the most renowned warriors of antiquity, Xerxes, Alexander, Lucullus, Pompey, and Mithridates. See ABORAS. Reland and Calmet are of opinion, that the Araxes is the Gihon of Genesis; and the name of Gihon signifying, according to its Hebrew etymology, the *impetuous, eruptive* river, confirms this opinion. However, the Gihon of the Arabians was the Oxus, and not the Araxes of the ancients. There are two rivers which bear the name of Araxes, one in Media and the other in Persia, which have been sometimes confounded. The first is that above described; the other runs through Persia, washes the walls of Schiras, and is now distinguished by the name of Bend-Emür, or BUNDAMIR.

ARAXUM, a promontory of Achaia, bearing towards the north-west.

ARAYA, in *Geography*, a celebrated cape of South America, in S. lat. $11^{\circ} 2'$, situate in Terra Firma and New Andalusia, and forming the gulph called by the Spaniards “Golfo di Cariaco.”

ARAZ, a mountain of Africa, within the precinct of Gigeri or Jigel, bordering on the Numidian deserts; which stretches between 25 and 30 leagues in length from north to south, and is every where very difficult of access. The inhabitants are a race of Arahs, called Cabeyl zen: a warlike people, who made this ridge the last refuge of their liberty, and have preserved it ever since by the natural strength of their precipices. Before the year 1664, they used to traffic with the French factory at Gigeri, and carried thither hides, corn, and wax; but upon the breaking out of a war between France and Algiers, a fort was built on the sea-coast to be a check on these Arabs. The French admiral was attacked during the work, and the fort demolished; and since this time they have occasionally plundered all strangers that are wrecked upon their coasts, and indiscriminately made slaves of their prisoners, though they have belonged to nations in amity with Algiers and the Porte; the Mahometans only are discharged, and sent home with a small viaticum.

ARBA, in *Ancient Geography*, a name given to Hebron, first possessed by giants of the race of Anak; and afterwards given to the tribe of Judah, and the property of it to Caleb. The rabbins pretend that Hebron had the name *Arba*, signifying *four*, because the four most illustrious patriarchs, Adam, Abraham, Isaac, and Jacob, were buried there; or, as others say, with as little reason, because four of the most celebrated matrons of antiquity were interred there; viz. Eve, Sarah, Rebecca, and Leah.

ARBA, now *Arbe*, an island and city of Illyria, now belonging to the states of Venice, and situate in the gulf of Quarnero on the coast of Dalmatia. The city is a bishop's see. Although this island is not larger in circumference than about 30 miles, wholly uncultivated, and in some parts uninhabitable, the city has always, from the time of the Romans, maintained its reputation. In the eleventh century, gold and silk were not rare among the inhabitants. It became subject to the kings of Hungary, and afterwards dependent on Venetian feudatories, and at length it was reduced under the dominion of the republic, which appoints a governor with the title of count and captain. The whole number of people in the island does not exceed 3000, who are nevertheless obliged to maintain three convents of friars, and as many of nuns, and near 60 priests. The climate is very variable, and subject to tremendous and destructive storms, which are very fatal to the sheep that are kept in the pastures of the mountain; and no less injurious, when they occur, to the plants and corn. The air, however, is upon the whole salubrious; and the aspect of the island is very pleasant. On the east it has a high mountain, at the foot of which, towards the west, are fruitful plains interspersed with little hills which are very productive. At the northern extremity is a delightful promontory called Loparo, that stretches into the sea, and that incloses a cultivated plain; near which are two small islands called S. Gregorio and Goli, very useful to shepherds and fishermen. The coast that faces the Morlaccia mountains is steep and inaccessible, and the channel between them is very dangerous. The long and narrow island, called Dolin, lying parallel to Arbe, along the coast of Barbado, forms a channel less dangerous. In the vicinity of the city of Arbe there are several harbours, by which the trade of the best part of the island is facilitated. The city stands on an eminence between two harbours, which form a peninsula, and contains about a thousand inhabitants.

inhabitants. At the foot of the Moracca, the soil towards the shore is nothing but marble; but in the district of Barbado it is gravelly and fit for vines, which yield a wine that is much esteemed. Below the ruins of Colento, the land bears vines, olives, mulberry, and other fruit-trees; and also in the lower parts, corn. The island is well supplied with springs of water, and would furnish its inhabitants with ample subsistence, if they were not in the extreme stupid and indolent. It produces, however, fire-wood, of which quantities are annually conveyed to Venice; corn, oil, wine, brandy, and silk; and also hides, wool, sheep, hogs, and horses of a good breed. It has likewise abundance of good salt; and the fisheries of tunny and mackerel supply no inconsiderable articles of trade. The island, notwithstanding these advantages, is poor, because much of the land remains uncultivated, and the peasants are lazy.

ARBA, *Astab*, a river of Asia in Persia. Its source is in about 34° 36' N. lat., and after flowing in a south-west direction, it discharges itself into the Delas, a little above its mouth. It was near this river that the Persian army assembled to protect Ctesiphon, when it was threatened by Heraclius.

ARBA, a town of Peloponnesus, in Achaia.

ARBACA, a town of Persia, in Arachosia, supposed to have derived its name from some of the kings of Parthia named Arbaces.

ARBACE, the name of a town of Celtiberia, mentioned by Steph. Byz.

ARBACES, in *Ancient History*, was general of the Medes and governor of Media under Sardanapalus, king of Assyria. Disgusted by the effeminate manners of Sardanapalus, he took up arms in conjunction with some of the principal officers of the Median army; and having formed an alliance with Belshis, governor of Babylon, attacked Sardanapalus, with an army of 400,000 men. After three successive defeats, Arbaces was joined by the Bactrians, and falling suddenly in the night on Sardanapalus, drove him from his camp; upon which this prince retired to Nineveh, and entrusted the command of his army with Salamanus, his wife's brother, who was overpowered by the conspirators, and lost almost the whole of it. The conspirators proceeded to besiege Nineveh, and after ineffectual efforts, during two years, for reducing it, a considerable breach was made in the wall by the inundation of the river Tigris, and thus they were enabled to enter and take possession of the city. Upon this success, Sardanapalus retired into his palace, and placed himself, his companions, and his treasures, on a pile of wood, to which he set fire, and they were thus all destroyed. This event terminated the Assyrian empire about the year 820 before Christ, according to Eusebius; but according to Justin and others, in the year 900 before Christ; and Arbaces was declared king. With him commenced the monarchy of the Medes, and he reigned 28 years. He is represented as a prince of great generosity and gratitude; and Dr. Prideaux supposes that Tiglath-Pileser and Arbaces are the same person, under different names; whereas archbishop Usher distinguishes them, and assigns to the one the possession of Media, and to the other that of Assyria. Prid. Conn. pt. i. b. 1. See MEDIA.

ARBAEJN, in *Geography*, a town of Arabia, 12 miles north of Zebid.

ARBALET. See *Cross Bow*, and BALLISTA.

ARBALI, in *Ancient Geography*, a Sarmatian nation, according to Ptolemy, and supposed to have inhabited the part of Asia which is near the Wolga.

ARBANA, the name of an island in the vicinity of Taprobana, according to Ptolemy.

ARBANIUM, a town placed by Stephan. Byz. in the neighbourhood of the Euxine sea.

ARBASERA, a town of Asia Minor, towards Galatia.

ARBATTIS, a town of Palestine in Galilee, taken and destroyed by Simon Maccabaeus. 1 Mac. v. 23.

ARBECA, in *Geography*, a town and castle of Spain in Catalonia, 10 miles east of Lerida.

ARBEGEN, a town of Transylvania, seven miles north of Stoltzenburg.

ARBELA, now called *Erbil* or *Irbil*, in *Ancient Geography*, a city of Assyria, in the province of Adiabene, and district of Arbelis, famous for the complete victory gained by Alexander the Great in the battle with Darius Codomannus, which was fought at the village of Gaugamela in its neighbourhood. Ptolemy places it on the river Capros; but Strabo on an equal distance from that river and the Lycus, near mount Nicatorius, so called by Alexander, from the above-mentioned victory. Diodorus Siculus and Curtius call it a village; but Arrian (l. vi. p. 391.) dignifies it with the name of a city; and from this the adjacent country was denominated Arbelis and Arbelitis. This battle was fought in the month of October, in the second year of the 112th Olympiad, or 331 years before Christ. According to Arrian (*De Exped. Alex.* l. iii. p. 115. ed. Gronov.), the army of Darius consisted of a million of foot, and 40,000 horse; but according to Diodorus (l. xvii. vol. ii. p. 202. ed. Wesseling.) of 200,000 horse, and 800,000 foot. Plutarch (*Oper. t. i. p. 682.*) says that the whole army consisted of a million; and Justin (l. xi. c. 13.) states the number at half that of Diodorus. The Macedonian army consisted of 40,000 foot, and 7000 horse. Arrian (*ubi supra*) and Curtius (l. iv. c. 25, &c.) have given a particular description of this famous battle. We shall here subjoin the account of it given by Dr. Gillies, in his "History of Greece." Alexander, when apprized of the great strength of the enemy, expressed neither surprise nor apprehension. When advised by Parmenio to attack Darius's camp in the night, he replied, that it did not become Alexander to steal a victory, and therefore he was resolved to fight and conquer in broad day-light. Darius, he also said, by bringing all his forces into one place, had freed him from the trouble of thinking how he might pursue them into different countries. "Having commanded a halt (says Dr. Gillies), he encamped four days, to give his men rest and refreshment. His camp being fortified by a good intrenchment, he left in it the sick and infirm, together with all the baggage; and, on the evening of the fourth day, prepared to march against the enemy with the effective part of his army, which was said to consist of 40,000 infantry and 7000 horse, unincumbered with any thing but their provisions and armour. The march was undertaken at the second watch of the night, that the Macedonians, by joining battle in the morning, might enjoy the important advantage of having an entire day before them to reap the full fruits of their expected victory. About half way between the hostile camps, some eminences intercepted the view of either army. Having ascended the rising ground, Alexander first beheld the Barbarians drawn up in battle array, and perhaps more skilfully marshalled than he had reason to apprehend. Their appearance, at least, immediately determined him to change his first resolution. He again commanded a halt, summoned a council of war; and different measures being proposed, acceded to the single opinion of Parmenio, who advised that the foot should remain stationary until a detachment of horse had explored the field of battle, and carefully examined the disposition of the enemy. Alexander, whose conduct was equalled by his courage, and both surpassed by his

his activity, performed these important duties in person at the head of his light horse and royal cohort. Having returned with unexampled celerity, he again assembled his captains, and encouraged them by a short speech. Their ardour corresponded with his own; and the soldiers, confident of victory, were commanded to take rest and refreshment.

“Meanwhile Darius, perceiving the enemy’s approach, kept his men prepared for action. Notwithstanding the great length of the plain, he was obliged to contract his front, and form in two lines, each of which was extremely deep. According to the Persian custom, the king occupied the centre of the first line, surrounded by the princes of the blood and the great officers of his court, and defended by his horse and foot guards, amounting to 15,000 chosen men. These splendid troops, who seemed fitter for parade than battle, were flanked on either side by the Greek mercenaries and other warlike battalions, carefully selected from the whole army. The right wing consisted of the Medes, Parthians, Hyrcanians, and Sææ; the left was chiefly occupied by the Bactrians, Persians, and Cardusians. The various nations composing this immense host were differently armed, with swords, spears, clubs, and hatchets; while the horse and foot of each division were promiscuously blended, rather from the result of accident than by the direction of design. The armed chariots fronted the first line, whose centre was farther defended by the elephants. Chosen squadrons of Scythian, Bactrian, and Cappadocian cavalry advanced before either wing, prepared to bring on the action, or, after it began, to attack the enemy in flank and rear. The unexpected approach of Alexander within sight of his tents prevented Darius from fortifying the wide extent of his camp; and, as he dreaded a nocturnal assault from enemies who often veiled their designs in darkness, he commanded his men to remain all night under arms. This unusual measure, the gloomy silence, the long and anxious expectation, together with the fatigue of a restless night, discouraged the whole army, but inspired double terror into those who had witnessed the miserable disasters on the banks of the Granicus and the Issus.

“At day-break, Alexander disposed his troops in a manner suggested by the superior numbers and deep order of the enemy. His main body consisted in two heavy-armed phalanxes, each amounting to above 16,000 men. Of these the greater part formed into one line; behind which he placed the heavy-armed men, reinforced by his targeteers, with orders that when the out-spreading wings of the enemy prepared to attack the flanks and rear of his first line, the second should immediately wheel to receive them. The cavalry and light infantry were so disposed on the wings, that while one part resisted the shock of the Persians in front, another, by only facing to the right or left, might take them in flank. Skilful archers and darters were poited at proper intervals, as affording the best defence against the armed chariots, which (as Alexander well knew) must immediately become useless whenever their conductors or horses were wounded.

“Having thus arranged the several parts, Alexander with equal judgment led the whole in an oblique direction towards the enemy’s left; a manœuvre which enabled the Macedonians to avoid contending at once with superior numbers. When his advanced battalions, notwithstanding their nearness to the enemy, still stretched towards the right, Darius also extended his left, till, fearing that by continuing this movement his men should be drawn gradually off the plain, he commanded the Scythian squadrons to advance, and prevent the farther extension of the hostile line. Alexander immediately detached a body of horse to

oppose them. An equestrian combat ensued, in which both parties were reinforced, and the barbarians finally repelled. The armed chariots then issued forth with impetuous violence; but their appearance only was formidable; for the precautions taken by Alexander rendered their assault harmless. Darius next moved his main body, but with so little order, that the horse, mixed with the infantry, advanced, and left a vacancy in the line, which his generals wanted time or vigilance to supply. Alexander seized the decisive moment, and penetrated into the void with a wedge of squadrons. He was followed by the nearest sections of the phalanx, who rushed forward with loud shouts, as if they had already pursued the enemy. In this part of the field, the victory was not long doubtful: after a feeble resistance, the barbarians gave way; and the pusillanimous Darius was foremost in the flight.

“The battle, however, was not yet decided. The more remote divisions of the phalanx, upon receiving intelligence that the left wing, commanded by Parmenio, was in danger, had not immediately followed Alexander. A vacant space was thus left in the Macedonian line, through which some squadrons of Persian and Indian horse penetrated with celerity, and advanced to the hostile camp. It was then that Alexander derived signal and well-earned advantages from his judicious order of battle. The heavy-armed troops and targeteers, which he had skilfully posted behind the phalanx, speedily faced about, advanced with a rapid step, and attacked the barbarian cavalry, already entangled among the baggage. The enemy, thus surprised, were destroyed or put to flight. Meanwhile, the danger of his left wing recalled Alexander from the pursuit of Darius. In advancing against the enemy’s right, he was met by the Parthian, Indian, and Persian horse, who maintained a sharp conflict. Sixty of the *Companions* fell; Hephæstion, Cœnus, and Menidas were wounded. Having at length dissipated this cloud of cavalry, Alexander prepared to attack the foot in that wing. But the business was already effected, chiefly by the Thessalian horse; and nothing remained to be done, but to pursue the fugitives, and to render the victory as decisive as possible.

“According to the least extravagant accounts, with the loss of 500 men he destroyed 40,000 of the barbarians, who never thenceforth assembled in sufficient numbers to dispute his dominion in the East. The invaluable provinces of Babylonia, Susiana, and Persis, with their respective capitals of Babylon, Susa, and Persepolis, formed the prize of his skill and valour. The gold and silver found in those cities amounted to thirty millions sterling; the jewels and other precious spoil, belonging to Darius, sufficed, according to Plutarch, to load 20,000 mules and 5000 camels.”

ARBELA, a town of Sicily mentioned by Steph. Byz. and also by Suidas.

ARBELA, a village of Palestine on the other side of Jordan, dependent upon Pella, according to Eusebius.—Also a place of Galilee, in the vicinity of Sephoris, according to Josephus, Antiq. 1. 12.—Also, a village of Upper Galilee, near which were caverns, where thieves retired for concealment.

ARBENGIAN, in *Geography*, a town of Tartary, in the country of Zagatai, and territory of Samarcand.

ARBERG, a town of Switzerland, in the canton of Berne, situate on the river Aar, which almost encompasses it. N. lat. 47°. E. long. 17° 15’.

ARBEROUE, the name of one of the seven districts that compose lower Navarre, containing seven parishes.

ARBESPACH, a town of Germany, in the archduchy of Austria, six miles south-west of Zwettl.

ARBESTAAL, a town of Germany, in the archduchy of Aultria, five miles north of Brugg.

ARBI, a small country of South America, near the Andes, between Popayan and New Granada.

ARBIA, a small river of Italy, which rises in the territory of Florence, passes through that of Sienne, and discharges itself into the Ombrina.

ARBICA, a town of Spain, in Navarre, ten leagues W. N. W. of Pampeluna.

ARBII, in *Ancient Geography*, a people of Asia, in Gedrosia, mentioned by Pliny (H. N. l. vi. c. 23.), being the same that are placed by Strabo near the mouth of the Indus.

ARBIS, a river of Asia, which ran, according to Pliny, between the Orite and Indians, and after watering a town of the same name, fell at a small distance from it into the Indian Ocean.—Also, the name of a town of Gedrosia, belonging to the Arbi, and situate on a river of the same name.

ARBIS, in *Geography*, a town of France, in the department of the Gironde, and chief place of a canton, in the district of Cadillac, seventeen miles south-east of Bourdeaux.

ARBITER, in the *Civil Law*, a judge nominated by the magistrate, or chosen voluntarily by two contending parties, on whom they confer a power, by compromise, of deciding their differences according to law.

The Romans sometimes submitted to a single arbiter; but ordinarily they chose several, and those always of an uneven number.

In matters wherein the public was concerned, as crimes, marriages, affairs of state, &c. it was not allowed to have recourse to arbiters: nor was it permitted to appeal from an arbitral sentence; the effect of an appeal being to suspend the authority of a jurisdiction, not of a compact.

The arbiter, among the Romans, judged in those causes which were called “*bonæ fidei*,” and arbitrary, and was not restricted by any law or form; hence he was called “*honorarius*.” A person chosen by two parties by compromise to determine a difference, without the appointment of the prætor, was also called arbiter, but more properly “*compromissarius*.”

Among the moderns, there are properly divers kinds of arbiters; some obliged to decide by the rigour of the law; and others are authorized by the contending parties to relax, or give way to natural equity: these are properly called ARBITRATORS.

The ancient Romans, at their feasts, appointed a person to preside, by throwing the dice, whom they called “*arbiter bibendi*,” and who directed every thing at his pleasure. Vid. Hor. Od. l. 4. 18. II. 7. 25.

ARBITRARY, in a general sense, that which is not defined or limited by any certain express law or constitution, but is left solely to the judgment and discretion of another. Thus arbitrary punishments denote such as are left by the statute to the discretion of the judges. Arbitrary fines or mulcts are usually called *amercements*.

The word is formed from *arbitrium*, will; whence also *arbiter*, *arbitrator*.

ARBITRARY power. See DESPOTISM, MONARCHY, &c.

ARBITRATION, or ARBITRAGE, the referring of a cause or dispute concerning any personal chattels or personal wrong, to the decision of two or more indifferent persons, under the quality and denomination of arbiters or arbitrators.

If in deciding the controversy, these do not agree, it is usual to add that another person be called in as umpire

(*imperator*, or *impar*), to whose lot the matter is then referred: or frequently there is only one arbitrator originally appointed. This decision, in an arbitration, is called an *award*. Thus the question is actually determined, and the right transferred or settled, as it could have been by the agreement of the parties, or the judgment of a court of justice. But the right of real property cannot pass by a mere award: yet, doubtless, an arbitrator may now award a conveyance or a release of land; and it will be a breach of the arbitration bond to refuse compliance. For, though originally the submission to arbitration used to be by word, or by deed, yet both of these being revocable in their nature, it is now become the practice to enter into mutual bonds, with condition to stand to the award or arbitration of the arbitrators or umpire therein named. And experience having shown the great use of these peaceable and domestic tribunals, especially in settling matters of account and other mercantile transactions, which are difficult and almost impossible to be adjusted on a trial at law; the legislature has now established the use of them, as well in controversies where causes are depending, as in those where no action is brought, enacting by statute 9 & 10 W. III. c. 15., that all merchants and others, who desire to end any controversy, suit, or quarrel, for which there is no other remedy but by personal action or suit in equity, may agree, that their submission of the suit to arbitration or umpirage shall be made a rule of any of the king's courts of record, and may insert such agreement in their submission, or promise, or condition of the arbitration bond; which agreement being proved upon oath by one of the witnesses thereto, the court shall make a rule that such submission and award shall be conclusive: and, after such rule made, the parties disobeying the award shall be liable to be punished, as for contempt of the court; unless such award shall be set aside for corruption or other misbehaviour in the arbitrators or umpire, proved on oath to the court, within one term after the award is made. And, in consequence of this statute, it is now become a considerable part of the business of the superior courts, to set aside such awards when partially or illegally made; or to enforce their execution when legal, by the same process of contempt as is awarded for disobedience to those rules and orders which are issued by the courts themselves. Blackl. Comm. b. iii. vol. iii. p. 16.

The power of arbitrators is to be regulated by the compromise between the parties, as to what concerns the differences they are to determine; and whatever they decree beyond that is of no effect.

Among the Athenians, any one who submitted his cause to arbitration, was to abide by its sentence. Arbitrators were to swear before verdict was given. If the plaintiff did not appear before sun set, he might be fined; and appeal might be made from arbitrators chosen by lot to other courts of justice. The office of arbitrators was annual, and if they were found guilty of corruption, they were punished with *αἴμα*, infamy.

ARBITRATOR, an extraordinary judge or commissioner, in one or more causes between party and party, chosen by their mutual consent.

The civilians make a difference between arbiter and arbitrator: though both ground their power on the compromise of the parties, yet their liberty is diverse; for an arbiter is tied to proceed and judge according to the forms of law; whereas an arbitrator is permitted wholly to use his own discretion, without solemnity of process, or course of judgment, to hear and accommodate the controversy committed to him; so it be *justa arbitrium boni viri*. See EPITROPUS.

ARBITRIO, in *Musie*, is equivalent to *ad libitum*, *al suo arbitrio*, at your pleasure, *al suo commodo*, at your convenience. In lessons and solos, and in the solo parts of concertos, where all the other parts wait at a pause or close on the pleasure of the principal performer, these notices are given. See *AD libitum*.

ARBOGA, or **ARBOGEN**, in *Geography*, a town of Sweden, in the province of Westmanland, situate on the river Stora. Within a quarter of a mile is the canal of Arboga, begun in the reign of Christina, widened and deepened by Charles XI. and finished under the reign of his son Charles XII. which joins the lake of Hielmars with that of Mælars. In this place a synod was held in 1297, under Nicholas, archbishop of Upland.

ARBOIS, a town of France, in the department of Jura, and principal town of the district of Poligny, celebrated for the excellent wine made in its environs. The place contains 6414, and the canton 12,888 inhabitants: the territory includes 150 kilometres and 14 communes. N. lat. 46° 55', E. long. 5° 40'.

ARBON, a town of Switzerland, in the Turgov, situate on the south side of the lake of Constance. The inhabitants are chiefly protestants. N. lat. 47° 38', E. long. 9° 30'.

ARBOR, in *Botany*, *Gardening*, &c. signifies a tree or perennial plant that has the property of rising with a simple woody and durable stem or trunk to a considerable height and thickness. These last circumstances, in some measure, form a distinction between trees and shrubs, which last are supposed to be of a smaller growth, and to have generally several stems proceeding from the root, or the same stem dividing near to it, into different smaller ones; and also from herbaceous plants, whose stems are soft, often succulent, and mostly rise in spring, and perish in autumn. This is not, however, general.

It has, indeed, been observed by Linnæus, that this distinction between trees and shrubs is by no means universally obvious. Nature, says he, has put no limits betwixt trees and shrubs; for to say that trees are taller than shrubs is, in fact, saying nothing; unless a certain immutable standard were previously established. Besides, every thing respecting dimensions is so variable in its nature, and depends so much upon the difference of climate, soil, and culture, that no certain standard or boundary can, with propriety, be fixed between them, since the same plant, in different countries, often assumes very different growths: thus the *arbutus* and *laurel*, in warm climates, grow to large trees; while in this country they are generally considered as shrubs. See **FRUTEX**.

ARBOR Camphorifera. See **LAURUS**.

ARBOR crepitans. See **HURA**.

ARBOR Jude. See **CERCIS**.

ARBOR, in *Chemistry*.—**ARBOR philosophica** is a name common to several metalline crystallizations; thus called from their ramifications resembling a tree.

ARBOR Dianæ.—**Arbor mineralis philosophica**.—**Arbre de Diane**.—**Dianenbaum**, **Silberbaum**. It is the property of silver, lead, and tin, when combined with an acid into a readily soluble salt, to be easily separable in the reguline state from such acid by the superior affinity of zinc, mercury, &c.; and while precipitating, to arrange themselves in a branching filamentous mass. Hence they were called by the ancient chemists *arbores*, trees. Silver being denoted in alchemical language by the moon, Luna, or Diana, the term **Arbor Dianæ** means therefore metallic silver brought by art into an arborescent form. As this is a very beautiful preparation, and susceptible of great varieties of figure, a mul-

titude of receipts are to be found in different writers, all of which, however, may be reduced to two. The first consists in the decomposition of a solution of pure *nitrat of silver* by mercury: the second varies from the first in the silver being amalgamated with mercury previously to solution in nitrous acid. The latter of these methods is the most ancient, being described by Homberg (Mem. de l'Acad. de Paris, 1692) in the following terms: "Make an amalgam without heat of four drams of silver filings, or still better of silver leaf, and of two drams of mercury (see **MERCURY**, *Alloys of*); dissolve this amalgam in four ounces or a sufficient quantity of nitrous acid, pure and moderately strong; dilute this solution with about a pint and a half of distilled water, shake the mixture, and preserve it in a bottle with a glass stopper. When this preparation is to be used, an ounce of it is to be put into a vial together with about the size of a pea of an amalgam of gold or silver about as soft as butter, and the whole is to remain at rest: soon afterwards small filaments will be seen issuing from the amalgam, which quickly increase, branch out on both sides, and take the form of shrubs."

The simpler method appears to have been first mentioned by Lemery (Cours de Chymie, 1726). He advises to dissolve an ounce of fine silver in a sufficient quantity of pure nitrous acid, and afterwards to mix the solution in a flask with about twenty ounces of distilled water: add to this mixture two ounces of mercury, and let the whole remain at rest. In about forty days a kind of silver tree will be formed upon the mercury with branches resembling vegetable ramifications.

The two essential conditions for the complete success of this experiment are, first, that the nitrat of silver should be free from any excess of acid; and secondly, that the silver should have a firm base to adhere to as soon as it begins to be precipitated. To ensure the first, it is advisable so to proportion the acid to the silver, that a very minute portion be left undissolved, and then by concentrating the solution to dispose it to crystallize. The crystals thus obtained, being dried on blotting paper, should be dissolved in distilled water, the proportions of which may be varied at pleasure, provided the solution is not, on the one hand, so strong as to deposit crystals by standing, and, on the other hand, so dilute as to require many days before the experiment is completed: from five to twelve times as much water as nitrat of silver is upon the whole, the most convenient proportion. The fibres of the precipitate will be crowded and short, when the process is brought about rapidly; but long and branched, if a greater time is allowed.

The mercury that is added to effect the precipitation should be mixed with silver so as to destroy its fluidity; for when pure mercury is poured in, the first portions of silver that are deposited unite with and dissolve in the mercury till it is thus brought to a proper consistence.

The tree or arborescent precipitate thus obtained is an amalgam of silver, the proportions of which appear subject to some variations. For the theory of this and similar phenomena, see **PRECIPITATION**, and **METALLIC PRECIPITATES**. Macquer's *Chémisches Wörterbuch*, art. **Dianenbaum**. *Encyclopedic Method*, art. **Arbre de Diane**, &c.

ARBOR plumbi, is the result of a beautiful vegetation of lead. For producing it, two drams of acetite of lead are dissolved in six ounces of distilled water; the filtered solution is poured into a cylindrical glass, and a thin roll of zinc being hung in it, the whole is left standing at rest. The lead precipitates, adhering to the zinc in metallic leaves, in the form of a tree. Gren's *Chem.* vol. ii. p. 382.

ARBOR Genealogica, tree of consanguinity, signifies a lineage

neage drawn out under the figure or resemblance of root, stock, branches, &c.

ARBOR Porphyriana, among the schoolmen, denotes a scale of beings; or a figure consisting of three rows or columns of words; the middlemost whereof contains the series of genera and species, and bears some analogy to the trunk; and the extremes, containing the differences, to the branches of a tree.

	SUBSTANCE	
Thinking		Extended
	BODY	
Inanimate		Animate
	ANIMAL	
Irrational		Rational
	MAN	
This		That
	PLATO	

The *arbor porphyriana* is otherwise called *scala predicamentalis*.

ARBOR Vita, in *Botany*. See *THUYA*.

ARBOR is also figuratively used in *Mechanics*, for the principal part of a machine, which serves to sustain the rest.—It is also used for a spindle, or axis, whereon a machine turns; thus, *arbor* of a crane, a mill, windmill, &c.

ARBOREA, in *Entomology*, a species of *PODURA* described by Scopoli and others. It inhabits trees in Europe; is oblong and black; legs and fork white. Linnæus. Gmelin.

ARBOREA, in *Ornithology*, a species of *ANAS*, that inhabits Jamaica, and is called by Ray, Sloane, and Edwards, the black-billed whistling duck. It is brown; the head slightly crested; and the abdomen spotted with black and white. Gmelin. This is also *Anas ffulularis Jamaicensis* of Brisson; *Canard siffleur de la Jamaïque* of Buffon Pl. Enl.; and *Siffleur à bec noir*. Nat. Hist. Ois. of the same author.

The most remarkable circumstances of this duck are, that it builds its nest in trees, and makes a whistling noise. It is supposed to frequent Carolina in winter, at least one of the same name is said to be found on those coasts at that time by Lawson and Catesby. A bird of this kind is in the British Museum, and is called the Opano Duck, which is the name it bears at Guiana.

In size it is less than the Mallard, and stands high upon its legs; the neck is also long and slender. The bill is black; irides hazel; crown of the head dusky, somewhat crested behind, and of a rufous brown; hind part of the neck brown; back and scapulars the same, but the feathers margined with rufous; rump and upper tail-coverts darker; sides of the head and throat white; fore-part of the neck white spotted with black; the breast pale rufous spotted also with black; belly, thighs, and vent much like the forepart of the neck, but the spots are smaller and most numerous on the sides; the wing-coverts rufous spotted with black; quills and tail dusky; legs lead-colour; claws black.

ARBOREA, a species of the *ALAUDA* genus. See *ALAUDA*.

ARBOREA, in *Zoology*, a species of *RANA*, called the tree frog, and thus defined by Gmelin: body granulated beneath, and the feet cleft. Linnæus describes it as having the body smooth; the underpart beset with contiguous tuberculations; the feet cleft, and the toes terminated in orbicular dilated tips. Gmelin enumerates eight supposed varieties of this species, which are as follows:

β. *HYLA fusca* of Laurent. Amph.—*Rana pedibus fissis, palmis tetradactylis, plantis pentadactylis; geniculis subtus*

tuberosis. Amoen. Acad. I. p. 135. (Frog with cleft feet, four toes on the anterior, and five on the posterior feet; and the knees warted beneath.)

γ. *HYLA viridis*, lineæ flava utrinque recta. Laurent. and Catesby. (Green, with a straight yellow line on each side.)

δ. *HYLA ranaformis*. Laurent. Amph. p. 33. n. 25.

ε. *RANA americana rubra*. Seb. Mus. 2. t. 70. f. 4.

ζ. *HYLA viridis fusca*. Laurent. Amph. p. 34. n. 29.

η. *HYLA tiliatrix*. Laurent. Amph. p. 34. n. 30.

θ. *HYLA rubra*. Laurent. Amph. p. 35. n. 31.

ι. *HYLA sceleron*. Laurent. Amph. p. 35. n. 33.—*Rana brassiliensis gracilis* of Seba.

Dr. Shaw gives a new specific character to this creature; *RANA arborea; viridis, subtus albida, lineæ laterali nigricante, abdomine granulato, pedibus fissis*. (Green frog, whitish beneath, with blackish lateral line, granulated abdomen, and unwebbed feet.)

“In the beauty of its colours, as well as in the elegance of its form, and the agility of its movements, the tree frog exceeds every other European species. It is a native of France, Germany, Italy, and many other European regions, but is not found in the British islands. Its principal residence, during the summer months, is on the upper parts of trees, where it wanders among the foliage in quest of insects, which it catches with extreme celerity, stealing softly towards its prey in the manner of a cat towards a mouse, and when at a proper distance seizing it with a sudden spring, frequently of more than a foot in height. It often suspends itself by its feet or abdomen to the under parts of the leaves, thus continuing concealed beneath their shade. Its size is smaller than any other European frog, except the fire frog. Its colour, on the upper parts, is green, more or less bright in different individuals; the abdomen is whitish, and marked by numerous granules; the under surface of the limbs is reddish; and the body is marked on each side by a longitudinal blackish or violet-coloured streak, separating the green of the under parts from the white colour of the lower; the inferior edge of this dark lateral stripe is tinged with yellow. The body is smooth above, and moderately short or plump; the hind legs are very long and slender; the fore feet have four, and the hind feet five toes, all which terminate in rounded, flat, and dilated tips, the under surface of which being soft and glutinous, enables the animal to hang with perfect security from the leaves of trees, &c. The skin of the abdomen is also admirably calculated by nature for this peculiar power of adhesion, being covered with small glandular granules in such a manner as to fasten closely even to the most polished surface; and the animal can adhere at pleasure to that of glass, in whatever position or inclination it be placed, by merely pressing itself against it.” Dr. Shaw, Zool. &c.

It is further remarked by this and other authors, that though the tree frog inhabits the woods during the summer months, on the approach of winter it retires to the water, where it conceals itself in the soft mud or banks, and remains in a state of torpidity till the spring; when it again emerges; and, like the rest of this genus, deposits its spawn in the water at that season. The male, at this period, inflates its orbicular gular pouch in a surprising manner, and emits a loud and sharp croak, which may be heard at a vast distance; they make the same noise on the approach of rain while they live among the trees, and may be considered, in some measure, as a kind of living barometers, more especially the males, which, if kept in glasses and supplied with proper food, will afford an infallible preface of the changes of weather. In the German Ephemerides Naturæ Curioforum

Curioform, we meet with an account of one which was kept in this manner for the space of seven years.

ARBOREOUS, ARBOREUS, is applied by some naturalists to such excrescences, funguses, mosses, and other parasites, as grow on trees; in contradistinction to such as grow on the ground; such are the *lichenoides* and *agarics*.

ARBORESCENS, in *Natural History*, a species of DORIS (*Vermes Mollusca*), that inhabits the Norway seas. The feelers are ramose; back gibbous, and beset with protuberances. Müll. Zool. Gmelin.

ARBORESCENT, a term used to denote any thing that shoots or grows up in form of a tree, or which gradually becomes firm and woody; and *arbores* is that which resembles a tree, having a permanent woody stem.

Botanists speak of arborescent shrubs and plants, &c. Mineralists treat of arborescent metals, arborescent silver, arborescent iron, arborescent stones, &c. The fungus marinus is ranked by some in the class of arborescent sponges; the chemists produce arborescent crystallizations, which they call philosophical trees. Phil. Trans. N° 198, N° 111, and N° 129.

Zoologists give instances of arborescent animals, particularly fishes.

The *arborescent star-fish, stella arborescens*, a species of ASTERIAS, is one of the curiosities of nature found in several cabinets of natural rarities.

ARBORETI, in *Entomology*, a species of CURCULIO, that inhabits Cayenne. It is of a cinereous colour; thighs of the anterior legs toothed; wing-cases striated with punctures. Fabr. Gmelin.

ARBOREUM, in *Natural History*, a species of ALCYONITUM (*Vermes Zoophyta*), found in the Norway and Indian seas. The stem is arborescent, with obtuse branches and papillary pores. This is LITHOXYLON *Norvegicum* of Müll. Tassin.; ALCYONITUM *ramosum*, poris papillaribus in tubera lateralia terminaliaque congestis of Pallas; ARBUSCULA *marina coralloides* of Clusius; *Planta marina coralloides rubra*, J. Bauh.; and *Accarbaar gabba-garba f. Accarbaar boazagu, Amboynensibus Hualupia*, Rumphius.

ARBOREUS, in *Entomology*, a species of CIMEX described by Degeer. Above it is brown-green, beneath yellowish; a transverse yellow line across the thorax; wing-cases bordered with red; tail of the same colour, and bidentated. This is a small insect, being only five lines in length, and lives in trees. Gmelin.

ARBORIBONZES, in *Modern History*, priests of Japan, who live an erratic life, and subsist on alms. They dwell in caverns, and cover their heads with bonnets made of the bark of trees.

ARBORIS PECTEN. See PECTEN.

ARBORIST, ARBORISTA, a person skilled in trees, their forms, natures, &c.

Arborist is an appellation of less extent than botanist.

ARBOR SCIENTIÆ, a general distribution or scheme of science or knowledge.

ARBOUC, in *Geography*, a town of Arabia, 116 miles north-west of Mecca.

ARBOUCAVE, a town of France, in the department of Landes; four leagues south-east of St. Sever, and $4\frac{1}{2}$ E. N. E. of Orthez.

ARBOURS, in *Gardening*, are small compartments formed with various sorts of trees and shrubs, in such order as to inclose a certain space, and make a kind of recess or shady retreat for the hot summer months. They were formerly held in much higher estimation than at present, and were commonly formed of ever-greens, as yews, planted very close, the sides trained erect six, eight, or ten feet high,

and the tops formed like vaults or trained archways, over arched frames or lattice-work of wood or iron; having arched openings or arcades formed on the sides, the whole being shorn or clipped annually to keep them in due order, which in many cases appeared very ornamental, according to the ancient style of gardening. They were also frequently formed of deciduous trees, particularly the elm, and sometimes with the horn-beam, beech, and lime, which were constantly shorn every summer. The forms of both the ever-green and deciduous kinds, were either square, hexagonal, octagonal, or round, and their dimensions generally from ten to fifteen feet in width and height; the tops were mostly made either pavilion, turret, or dome-shaped, and sometimes terminated by a globe, pyramid, or other figure, formed of the extreme branches.

The authors of the "Universal Gardener" observe, that covered arbours or bowers may be formed very quickly, even in one season, with several sorts of shrubby herbaceous climbing plants; some of which will advance fifteen or twenty feet in one summer. It is likewise added, that they should, if possible, be erected upon a somewhat rising ground, for the greater advantage of free air, and to enjoy the prospect of the garden and adjacent country.

They are also sometimes formed in the heads of single large trees, particularly elms, where the trunks have divided at the height of ten or twelve feet, into several lesser spreading stems, so as to admit of erecting a small platform between them, cutting down the large boughs, and training the pliable branches archways over lattice-work, till those on each side meet; then clipping the sides annually, the tops may either be cut, or permitted to grow up, or the whole suffered to advance in a natural growth. They may likewise be formed on the ground in this manner: plant some of the tallest-growing flowering shrubs round the inside, to form the dimensions of the arbour; then, on the outside of these, others of somewhat lesser growth; so continue three or four ranges, diminishing gradually in stature from the arbour outwardly, permitting the whole to take their natural growth; so that at a distance it may assume the appearance of one of the common shrubby clumps.

The bottoms of them when on the ground, should be well gravelled, and garden chairs placed in them during the summer.

ARBRE DE MER, in *Natural History*, a name given by one French author to the Linnæan GORGONIA FABELLUM. Vide Rochef. Antill. c. 19. act. 13. p. 234.

ARBE Coche, in *Geography*, an island in the north part of lake Michigan in Upper Canada. N. lat. $45^{\circ} 25'$. W. long. $85^{\circ} 18'$.

ARBRESLE, L', a town of France, in the department of the Rhone and Loire, and chief place of a canton in the district of Lyon; nine miles north-west of Lyons. The place contains 871 and the canton 11,597 inhabitants; the territory includes 170 kilometres, and 17 communes.

ARBROATH. See ABERBROTHICK.

ARBUCKLE, JAMES, M. A. in *Biography*, was born at Glasgow, in 1700, and educated in the university of that city, and afterwards kept an academy in the north of Ireland. His poems were published in one volume, 12mo.; but his translation of Virgil, which he undertook, was never finished. He was a person of fine taste, and much esteemed by the learned in general. He died in 1734. Biog. Diet.

ARBUSCULA is used by Bradley to denote a little, or dwarf-tree, above the rank of shrubs, but below that of trees, such e. gr. as the elder.

ARBUSCULA *marina coralloides alba*. Valent. Ind. 4.

t. 52. f. D. D. This is *MADREPORA muricata* of Gmelin.

ARBUSTIVA, in *Botany*, an order of plants in the *Fragmenta Methodi Naturalis* of Linnæus.

ARBUSTORUM, in *Conchology*, a species of *HELIX*; a land snail found in hedges and shrubberies in Europe. This shell may be better characterized in the words of Da Costa than Linnæus; for the latter neglects to include in its specific character the single spiral line which is invariably found upon this species. It is thus defined by Da Costa; shell somewhat umbilicated, spotted, with a single narrow spiral band along the middle of the wreaths of whorls.—*Testa umbilicata convexa acuminata; apertura suborbiculari bimarginata; anterius elongata.* Linn. F. Sv.—The shell is brown with yellow lines, or yellowish with brown lines, in little irregular dashes, and the spiral streak is darkest. Vide Donovan. Brit. Shells.

ARBUSTORUM, in *Entomology*, a species of *MUSCA*, (*Syrphus*, Fabr.) that inhabits Europe, and lives in trees. The thorax is grey; abdomen black, except the first joint and sides of the second, which are rufous. Linnæus. Gmelin.

ARBUSTUM implies a number or multitude of trees planted for the sake of the fruit.

The word was more peculiarly applied to a place planted with trees for fastening vines to, which are hence called by Columella, *arbutina*.

ARBUSTUM is sometimes also used to denote an orchard or field wherein trees are planted at such a distance, that there is room for ploughing and growing corn between them.

ARBUTELLA, in *Entomology*, a species of *PHALÆNA* (*Tinea* Linn.). The wings are rufous, with streaks of silver, the middle ones bifid. Fabricius.

ARBUTHNOT, ALEXANDER, in *Biography*, an eminent Scots divine, was the son of the baron of Arbuthnot, and born in the year 1538. Having studied the languages and philosophy in the university of Aberdeen, and civil law under Cujacius at Bourges in France, he took ecclesiastical orders, and became a zealous advocate and promoter of the reformation. In 1568, he assisted as a member of the general assembly at Edinburgh; and by this assembly he was entrusted with the charge of revising a book, intitled, “The Fall of the Roman Church,” which had given great offence, and which incurred the censure of the assembly, chiefly on account of an assertion contained in it, “that the king was the supreme head of the church.” On this occasion the assembly, in direct opposition to the principles of the reformation, to which they professed a zealous attachment, issued an order that no book should be published for the future, till it should be licensed by commissioners of their own appointment. In the following year, Mr. Arbuthnot was advanced to the office of principal of the king’s college at Aberdeen. In 1572, he was a member of the general assembly held at St. Andrews, which strenuously opposed a scheme of church government called “the book or policy,” and which was formed by some statesmen for the purpose of restoring the old titles in the church, and retaining among themselves all the temporalities annexed to them. In the general assemblies held at Edinburgh in 1573 and 1577, Mr. Arbuthnot was moderator; and he seems to have been constantly employed, on the part of the church of Scotland, for conducting the contest with the regency concerning the plan of ecclesiastical jurisdiction to be adopted in this church. By the course he pursued in this business, and also by his publication of Buchanan’s History of Scotland, he gave offence to James VI.; and a royal order was issued forbidding him to absent himself from his college at Aberdeen. The clergy, who were likely to be thus de-

prived of his important and useful services, remonstrated; but the king was inflexible, and the clergy submitted. By this persecution Arbuthnot’s health and spirits were affected; and in the next year, viz. 1583, he sunk into a decline, and died. Arbuthnot appears to have possessed a degree of good sense and moderation, which eminently qualified him for the conduct of public business. Possessed of a considerable share of learning, he patronized and promoted it, and contributed to revive in Scotland a taste for polite literature. The only literary work which he has left is a learned and elegant treatise in Latin, intitled, “*Orationes de origine et dignitate juris*,” printed at Edinburgh, in 1572, in 4to. Biog. Brit.

ARBUTHNOT, JOHN, M.D. not less celebrated for his wit than for his learning, was son of an episcopal clergyman in Scotland, and born at Arbuthnot, near Montrose, soon after the restoration. He received his education at the university at Aberdeen, where he took his degree of Doctor in Medicine. He then came to London, and taught mathematics, in which he was well skilled. In 1697, he published “An Examination of Dr. Woodward’s Account of the Deluge.” This first brought him into public notice, and the reputation thence acquired was increased by his “Treatise on the Usefulness of Mathematical Learning,” which soon followed. In 1704, he communicated a paper to the Royal Society, which is published in their Transactions for that year, “On the constant regularity observed in the births of both sexes.” Though there is a small disparity, the males exceeding the females by about one in twenty, yet as the males are engaged in occupations of greater hazard and danger, he supposes their number to be nearly equal, at an adult age. Whence he concluded, “that polygamy is contrary to the law of nature and justice, and to the propagation of the human race:” an argument affording a complete answer to the doctrine contained in the *Thelyphthora*, a publication by the late Mr. Madan. On the credit of this paper he was made fellow of the Royal Society, and obtained a more intimate connection with the principal literary characters in the country. Being soon after called to attend prince George of Denmark, who was taken ill at Esom, where the Doctor happened to be at the time, his success in restoring him to health brought him into favour with queen Anne; and in 1709, Dr. Hannes being indisposed, he was made her physician in ordinary, and admitted Fellow of the Royal College of Physicians. This would be attended of course with an increase of professional fame and employment; but it does not appear he was ever popular as a physician, or had much general practice, as on the death of queen Anne, in 1714, he found himself so much neglected, as to have leisure to go to Paris. On his return he thanks Mr. Pope for “taking notice of a poor old distressed courtier”; and tells him, “that his friends shall find the same welcome at Martin’s Office in Dover-street, they had met at his house in St. James’s, and that he can still afford to give them half a pint of claret.” His fondness for the conversation of Pope, Swift, Gay, and the other wits of the time, and their affectionate attachment to him, although contributing to his pleasure, as most congenial to his disposition, was probably the real cause of the little estimation he was in as a physician, except among his friends. For though Apollo is called the father of medicine as well as of verse, yet those who addict themselves to him in his latter capacity, rarely attain eminence in the first. This was afterwards exemplified in the fate of Armstrong and Akenfide, whose fame as physicians decreased in proportion to their increasing celebrity as poets.

Arbuthnot had been for some time engaged with Pope and

and Swift in writing the "Memoirs of Martinus Scriblerus," intended as a general satire on the abuses in human learning; but which was never completed. It was in allusion to this, that he called his house in Dover-street *Martin's Office* (see his letter to Pope in 1714), which shews also that he had no inconsiderable share in that exquisitely witty production. "The life of that solemn and absurd pedant, Dr. Scriblerus," Warton says (Introduction to the Memoirs), "of which Johnson speaks too contemptuously, is the only true and genuine imitation we have in our language of the ferious and pompous manner of Cervantes." Besides the large share Arbuthnot contributed to these memoirs, he is upon good authority supposed to have written "The history of John Bull," "A Treatise on the scolding of the Ancients," and "The Art of Political Lying." There is also a philosophical poem written by him, remarkable for its philosophical sentiment, in Dodsey's collection the title "Know thyself;" but his principal work is, "Tables of ancient Coins, Weights, and Measures," consisting of several dissertations on these subjects, which he collected together and published in 4to. in 1727; they are still held in esteem. In 1732, now in the decline of life, he published a treatise "On the Choice of Aliments;" and in the following year, "On the effect of Air on human Bodies;" both founded on the doctrine of Boerhaave, the prevailing system of the time. Among his satirical pieces should be mentioned his "Epitaph on Chartres," a noted usurer of the time. "Here continues to rot, &c." It is written with uncommon asperity, but not more than the subject demanded. In almost all his satirical poems there is a good-humoured vein of pleasantry, which confirms the character given of him by Swift to a lady who desired his opinion of him: "he has more wit than all our race, and his humanity is equal to his wit." Although they are strongly tinged with party, yet they are generally free from the gall and rancour that too often affects party writings. If indeed the "Memorandums of the six days preceding the death of a late Right Reverend," (meaning bishop Burnet) be his, he cannot, in this instance, be acquitted of suffering his personal dislike to get the better of his humanity. Dr. Arbuthnot was also skilled in music; and sir J. Hawkins mentions an anthem, and a burlesque song of his composition. (Hist. Mus. vol. v. p. 126.) The two volumes published in 12mo. in 1751, and entitled, "The Miscellaneous Works of the late Dr. Arbuthnot," contain some of his genuine productions; but as for the greatest part of them, his son George Arbuthnot, Esq., upon whose judgment and probity we may depend, says that they were not written by his father. He had been long afflicted with an asthma, to which a dropsy was now added. With a view of obtaining relief under this accumulated distress, for he did not, he told his friends, expect a cure, he removed to Hampstead, a village in the neighbourhood of London; but, finding little advantage from change of situation, he soon returned to his house in town, where he died Feb. 27, 1735; and supposing him to have been thirty, when his "Examination of Woodward's Account of the Deluge" appeared, in the 68th year of his age. Dr. Arbuthnot passed his days amidst the endearments of domestic life, and the affectionate esteem of his friends; and bore, with resignation and cheerfulness, the afflictions that fell to his lot. His literary associates, by whom he was beloved, have recorded their mutual friendship. Pope dedicated to him an epistle, called "A Prologue to the Satires;" and Swift feelingly laments, in one of his poems, that he is

"Far from his kind Arbuthnot's aid,
Who knows his art, but not his trade."

During his last illness, his serenity supported by habitual piety, never deserted him; and these qualities, with an ardent love of virtue and disdain of meannesses and vice, are beautifully displayed in his latest letters.

ARBUTI, in *Entomology*, a species of *PHALÆNA* (*Noctua* Linn.) found in England. The anterior wings are brown; posterior black, with a yellow band across. Fabr. *Donov. Brit. Inf.*

ARBUTUS, in *Botany*, *Strawberry-tree*. Linn. *gen.* 552. Schreb. 750. Gærtn. 59. Juss. 160. *Uva ursi*. Tournef. 370. Class. *decandria monogynia*. Nat. Order. *Bicornes. Erica*. Juss. *Gen. Char. Cal.* perianth five-parted, obtuse, very small, permanent. *Cor.* monopetalous, ovate, flatish at the base, diaphanous, with a quinquelid mouth; divisions obtuse, revolute, small. *Stam.* filaments ten, subulate-swelling, very slender at the base, affixed to the edge of the corolla, and half the length of it; anthers slightly bifid, nodding. *Pist.* germ subglobular, on a receptacle marked with ten dots; style cylindrical, the length of the corolla; stigma thickish, obtuse. *Per.* berry roundish, five-celled; seeds small, bony.

Ess. Gen. Char. Cal. five-parted. *Cor.* ovate, diaphanous at the base. *Capf.* five-celled.

Species, 1. *A. unedo*, common strawberry-tree; stem arboreous; leaves oblong-lanceolate; panicles smooth, nodding. This tree rises to the height of twenty or thirty feet and usually puts out branches very near the ground. It is in constant verdure; for, during the whole winter, it retains its leaves till pushed off by those which appear in the spring. In the months of October and November, the arbutus makes a very beautiful appearance, as, at this time, its fresh flowers and fruit of the preceding year are in their utmost perfection: hence it becomes a very desirable tenant in shrubberies, producing a pleasing contrast with most other plants, whose season of beauty is past. Mr. Aiton enumerates the following varieties, viz. α . Common white-flowered strawberry-tree. β . Red-flowered strawberry-tree. γ . Double-flowered strawberry-tree. Besides these varieties the nurserymen make others founded upon the shape and size of the leaves. It is a native of the south of Europe and of Asia. This arbutus, we are told, is also a native of some parts of Ireland, especially about the lake Killarney. 2. *A. laurifolia*, laurel-leaved strawberry-tree; stem arboreous; leaves oblong, acuminate, sharply serrate, smooth; racemes axillary, one-ranked, sessile, solitary. This is very like the common arbutus, but differs in its sharp cuspidate serratures, and its axillary, very simple racemes, shorter than the leaves, with the flowers all directed the same way. A native of North America. 3. *A. andrachne*, oriental strawberry-tree; stem arboreous, leaves ovate, entire, and serrate; panicles pubescent, erect. This also has some resemblance to the common arbutus, but the bark is not rough; some of the leaves are not serrate; the panicle is viscid. It grows to a middle-sized tree, with large smooth leaves. The flowers resemble those of the first species, but grow more thinly on the branches. The fruit is oval, and the seeds flat. It grows abundantly in the East, about Magnesia. Cultivated in 1724, by Dr. Sherard, at Eltham. 4. *A. ferruginea*, long-flowered strawberry-tree; stem arboreous; leaves oblong, obtuse, smooth, entire; racemes terminal. Branches singular, smooth; leaves alternate, petioled; racemes axillary, solitary, terminating the branches; flowers remote, nodding, longer than those of the other species. Found in America by Mutis. 5. *A. mucronata*, pointed-leaved strawberry-tree; stem shrubby; leaves alternate, ovate, serrate, pointed; peduncles axillary, one-flowered. This is a very stiff shrub.

Leaves

Leaves flat, stiff, cartilaginous at the edge, with four serratures on each side, on very short petioles; peduncles single, one-flowered. Found in Terra del Fuego, by Back. 6. *A. pumila*, dwarf Strawberry-tree; stems diffusid; leaves alternate, distich, oblong, entire; flowers lateral, solitary. A low shrub, with leaves like those of *Empetrum*, very smooth above, keeled beneath. It is a native of the same country as the fifth species. 7. *A. acadiensis*, Acadian Strawberry-tree; stems procumbent; leaves ovate, subserrate; flowers scattered; berries many-seeded. A small shrub with slender trailing branches. Flowers in thin loose bunches, axillary. It grows in Acadia and other northern parts of America, affecting swampy land. 8. *A. alpina*, black-berryed alpine arbutus; stems procumbent; leaves rugose, serrate. Branches trailing, flat on the ground; leaves alternate, oval, slightly serrate, reticulated underneath, wrinkled above; flowers in reflex clusters, white, each standing upon a single short peduncle; berries globular, on a small blood-red calyx, about the size and, when ripe, the colour of a sloe. It grows in alpine situations in the northern parts of Europe; and with us, on many of the highland mountains of Scotland. 9. *A. uva ursi*, bear-berry or trailing arbutus; stems procumbent; leaves entire. Branches trailing upon the ground to the extent of two or three feet round the root; leaves like those of the preceding species, firm and rigid like those of box; flowers of a flesh-colour, in small clusters at the ends of the branches, upon short red peduncles; berries, when ripe, are red, and of the size of a holly-berry. Common in many mountainous parts of the continent, and in the north of England and Scotland. Eng. Bot. 714. W. Med. Bot. 70. The leaves of this plant, about the middle of the last century, acquired great celebrity, not only for their efficacy in gravelly complaints, but in almost every other to which the urinary organs are liable, as ulcers of the kidneys and bladder, cystirrhœa, diabetes, &c. Among the numerous physicians who extolled the virtues of *uva ursi* in calculous complaints, De Haen may be considered the principal, and upon his authority it has been much used in this country; but in no instance does it appear to have produced that essential or permanent relief which is said to have been experienced by the German physicians. The leaves of this plant are powerfully astringent, and the advantage they have occasionally afforded in gravelly pains is now wholly ascribed to this quality. They are usually given in powder from a scruple to a dram, two or three times a day. This plant has been used in tanning leather, and also in dying an ash-colour. 10. *A. thymifolia*, thyme-leaved arbutus. Aiton. Hort. Kew; stems procumbent; leaves oval, acute, obscurely serrate, strigose underneath; flowers axillary, eight-flowered. This has the structure of the *vaccinium oxycoccus*, or cranberry, but all the parts are larger. The stem is imbricate, with bristle-shaped scales. A native of North America, in swamps; and extremely abundant there. The berries are brought to market at Philadelphia late in autumn, and used for tarts and other kinds of pastry. Considerable quantities of them are exported to Europe and the West Indies. They are much used by our pastry-cooks in London, though thought to be inferior to the cranberries of British growth. The plant was introduced by Dr. Fothergill in 1776.

ARBUTUS, trailing. See *EPIGÆA*.

ARBUTUS, in *Ornamental Gardening*, is applied to a genus of plants, the different species of which supply the finest evergreens for the principal situations in shrubberies and pleasure-grounds. They are such as may be set out in the open ground or in pots, but in whatever mode of planting it is designed to employ them, they should be

placed in so detached a manner, as to appear conspicuous at all times, and be permitted to take their own natural growth. The best season for transplanting all sorts of these shrubs is in the end of September or October and beginning of November, or in March and April.

The propagation of the different species is effected most commonly by seed; they will, however, sometimes grow by layers and cuttings, though in the latter mode rather more reluctantly; but the seed grows freely, from which the handsomest plants are frequently obtained. To continue the double-blossomed and scarlet kinds with certainty, it must be done either by layers, cuttings, grafting, or inarching, as these varieties will not retain their difference if continued from seed. From the seed of either the common oval or round-fruited kinds some of both sorts may be expected; but that of the former is rather to be preferred for sowing. The berries containing the seed may be had of the nurserymen and seedsmen in October, November, and Spring; and the seeds may either be sown in pots in autumn, and sheltered in a frame all winter, or be preserved in dry sand until March, and then sown in pots of light dry earth, and covered about a quarter of an inch deep; if the pots are then plunged into a hot-bed, it will so greatly forward the germination of the seed, that the plants will rise in a month or six weeks; when they must have plenty of air admitted to them, moderate waterings, and be inured by degrees to the full air in summer, at which season the pots should be plunged into the common ground until October, and then be set in a green-house or frame, to have shelter from the frost, till March, at which time it is advisable to transplant the seedlings singly into small pots, which if directly plunged into a slender hot-bed, shielded and shaded occasionally with mats, giving moderate waterings, they will quickly take root, when the pots may be plunged into a bed of common earth in a sheltered place, to remain two or three years, indulging the plants with larger pots and protection from severe frosts, till they are two or three feet high; then transplanting them with balls of earth about their roots into the full ground.

To propagate them by layers, the young shoots must be employed, otherwise they rarely emit roots in less than two years. Cuttings will send out roots by the aid of heat; in this view plant a number of the short young shoots in pots in spring and summer, and plunge them into a substantial hot-bed of tan and dung.

Inarching or grafting is performed in the usual way upon stocks of any of the varieties. See *INGRAFTING*, and *IN-ARCHING*.

ARC, ARCH, or ARK, formed of *arsus*, a bow. See *ARCH* and *ARK*.

ARC, Joan of, in *Biography*, called also "the Maid of Orleans;" an extraordinary heroine, was the daughter of a peasant of Domremi, near Vaucouleurs, on the borders of Lorrain, and born about the beginning of the 15th century. At the age of twenty-seven years, she was servant in a small inn, where she was accustomed to tend horses, and to perform other menial offices which commonly fall to the share of men-servants. About this time king Charles VII. was reduced to the most distressed condition by the English; but the siege of Orleans, which was bravely defended by the garrison and inhabitants, in some measure retarded their progress. Joan partook of the feelings of sympathy with the beleagued, that very generally prevailed, and determined to make some effort for relieving her sovereign in his present distresses. Whilst she was indulging these feelings, her enthusiasm led her to fancy that she saw visions and heard voices exhorting her to re-establish the throne of France, and to expel the foreign invaders.

vaders. Under the strong impulse of passion and of imagined inspiration, she obtained admission to Baudricourt, the governor of Vaucouleurs, who after being informed of her inspiration and intentions, treated her for some time with neglect; but, in consequence of her renewed and importunate solicitations, he gave orders that she should be conducted to the French court, which then resided at Chinon. It is pretended that Joan, immediately on her admission, knew the king, though she had never seen his face before, and though he purposely kept himself in the crowd of courtiers, and laid aside every thing in his apparel that might seem to distinguish him; and that she offered, in the name of the supreme creator, to raise the siege of Orleans, and to conduct him to Rheims to be there crowned and anointed. In order to remove his doubts of her mission, it is said, that she disclosed a secret, known only to himself, and which she must have derived from heavenly inspiration. She also demanded, as the instrument of her future victories, a particular sword which was kept in the church of St. Catharine of Fierbois, and which, though she had never seen it, she described by all its marks, and by the place in which it had long lain neglected. Her intrepid and determined mode of address excited attention, and gained confidence; and she was referred to matrons for proofs of her virginity, and to doctors of the church for evidence of her inspiration; their report being favourable, she was sent to the parliament at Poitiers; but they, considering her as insane, demanded from her a miracle. Her reply was, that she would soon exhibit one at Orleans. Accordingly she was at length completely armed, mounted on horseback in the presence of the multitude, and sent amidst the loudest acclamations to join the army destined to the relief of Orleans. Upon joining the army, consisting of 10,000 men, she ordered all the soldiers to confess themselves before they set out on the enterprise; she banished from the camp all women of bad fame; she displayed in her hands a consecrated banner, representing the Supreme Being as grasping the globe of earth, and surrounded with slower de lucas; and after thus communicating to the soldiers a great degree of that enthusiasm by which she herself was actuated, she advanced towards Orleans. The English besiegers were overawed by her orders and menaces, dictated in the name of the Almighty Creator; and she entered Orleans arrayed in her military garb, and displaying her consecrated standard, and was received by all the inhabitants as a celestial deliverer. The convoy approached without finding any resistance on the part of the besiegers; the waggons and troops passed without interruption between the redoubts of the English; and a dead silence and astonishment reigned among those troops, formerly so elated with victory, and so fierce for the combat. Joan, having thus far succeeded, ordered the garrison, at the same time encouraging them with the promise of heavenly assistance, first, to attack the English redoubts, in which measure they were successful; and then to fall upon the main body of the English in their entrenchments. In one of these latter attacks the French were repulsed, but the intrepid maid led them back to the charge and overpowered the English. In one of these attacks, she was wounded in the neck with an arrow; but retreating behind the assailants, she pulled it out with her own hands, had the wound quickly dressed, and hastened back to head the troops, and to plant her victorious banner on the ramparts of the enemy. In consequence of these successes, attended with a loss to the English of more than 6000 men, their courage and confidence gave way to amazement and despair. The French, in order to magnify the wonder of all these prosperous events, represent the maid, as not only

active in combat, but as performing the office of general; directing the troops, conducting the military operations, and swaying the deliberations in all the councils of war. But whatever the policy of the French court might suggest for maintaining this opinion among the multitude, it is much more probable that this unexperienced country girl was prompted in all her measures by the wiser commanders. Having raised the siege of Orleans, Joan now insisted that she should proceed to the accomplishment of the second part of her promise, which was that of crowning the king at Rheims. The king, accompanied by the victorious maid, marched at the head of 12,000 men towards Rheims; receiving the submission of the towns through which he passed; till at length arriving near Rheims, a deputation met him with the keys of the city, and he was admitted into it with transport. Here the ceremony of his coronation was performed with the holy oil of Clovis; and the maid stood by his side in complete armour, and displayed her sacred banner. When the ceremony was finished, she threw herself at the king's feet, embraced his knees, and with a flood of tears she congratulated him on this singular and marvellous event. Charles testified his gratitude by ennobling the family of Joan, giving it the name of *du Lys*, probably in allusion to the lilies of her banner, and assigning to her a suitable estate in land. Having accomplished both the objects which she had proposed, the maid of Orleans expressed her wish to return to her former condition, and to the occupation and course of life which became her sex; but the French general Dunois urged her continuance with the army, till the English should be completely expelled, and her predictions fully accomplished. Overpowered by his advice, she threw herself into the town of Compiègne, which was then besieged by the duke of Burgundy and the English; where, on a sally, having twice driven the enemy from their entrenchments, and finding their number increasing, she ordered a retreat; but was deserted by her friends, surrounded by the enemy, and taken prisoner by the Burgundians. Instead of treating Joan as a prisoner of war, with the courtesy and good usage, to which, as such, she was entitled, and which civilized nations practise towards enemies on occasions of this kind, she was purchased from the captors by the regent duke of Bedford, and a criminal prosecution was instituted against her on the charges of sorcery, impiety, idolatry, and magic. The clergy in his interest, and even the university of Paris, concurred in the accusation. An ecclesiastical commission was held at Rouen for her trial, and the maid, clothed in her former military apparel, but loaded with irons, was produced before this tribunal. Her trial lasted four months; and in the course of that time, many captious interrogatories were put to her, which she answered with firmness and dignity. Upon being asked, whether she would submit to the church the truth of her pretended visions, revelations, and intercourse with departed fairs? she replied, that she would submit them to God, the fountain of truth; and when she was charged with being a heretic, and denying the authority of the church, she appealed to the pope; but her appeal was rejected. When she was asked, why she put her trust in her standard, which had been consecrated by magical incantations? she answered, that she put her trust in the Supreme Being alone, whose image was impressed upon it. When it was demanded, why she carried in her hand that standard at the unction and coronation of Charles at Rheims? she replied, that the person who had shared the danger was entitled to share the glory. When she was accused of going to war, she scrupled not to declare, that her sole purpose was to defeat the English, and to expel them the kingdom. In the issue, however, she

was condemned for all the crimes of which she had been accused, aggravated by heresy, her revelations were declared to be inventions of the devil to delude the people; and she was sentenced to be delivered over to the secular arm. At length her resolution failed her; and through dread of the punishment to which she was sentenced, she declared that she was willing to recant; and, accordingly, she acknowledged the illusion of those revelations which the church had rejected; and she promised never more to maintain them. Upon this her sentence was mitigated; and she was condemned to perpetual imprisonment and to be fed during life on bread and water. But with this vengeance her enemies were not satisfied. In order to justify the severest measures against her, they insidiously placed in her apartment a suit of men's apparel; upon the sight of this garb, in which she had acquired so much renown, and assumed, as she once believed, by the appointment of heaven, her former ideas and passions revived, and she ventured in her solitude to put on the forbidden dress. In this apparel she was detected; it was regarded as a relapse into heresy; her recantation became void; her partial pardon was revoked; and she was to be burned in the market-place of Rouen. In June 1431, this barbarous sentence, much more ignominious to those who inflicted it than to her who was the object of it, was executed. "This admirable heroine, to whom the more generous superstition of the ancients would have erected altars, was, on pretence of heresy and magic, delivered over alive to the flames, and expiated, by that dreadful punishment, the signal services which she had rendered to her prince and to her native country." She met her fate with resolution, and the English themselves beheld the scene with tears. The king made no effort for avenging her cause; he merely procured a revision of the process, and a restoration of her memory ten years afterwards by the pope, in an act which styled her a "Martyr to her religion, her country, and her king." Her countrymen, more prompt in the tribute of their respect, propagated many tales relating to her execution; and some of them would not even allow her to be dead, but professed to expect her speedy return to conduct them again to victory. Of the character and conduct of this singular heroine, the most probable opinion is, that of her being an honest and deluded enthusiast, of whose fancies and passions the principal persons in the interest of Charles availed themselves for deluding and rousing into exertion the passions of the people, at a crisis of peculiar importance; in which the maid of Orleans was instrumental in giving a decisive turn to the contest between the French and English. The exploits of Joan of Arc have been celebrated both in prose and verse. Of the latter, the serious poem of Chapelain has been much less successful than the burlesque and licentious one of Voltaire; but the injury done by it to her memory has been in some degree repaired in England, by Southey's sublime and spirited poem of "Joan of Arc," which exhibits her in the brightest colours of virtue and heroism. Hume's Hist. of Engl. vol. iii. p. 141, &c. Nouv. Dict. Histor. art. *Jeanne*.

ARC, in *Geography*, a rapid river of Savoy, which rises in the northern part of mount Cenis, on the confines of Aosta, traverses the country of Marienne, and discharges itself into the Isere about four miles from Montmelian.

ARC, or *Ar*, a river of France, rises on the side of Porciouls, traverses the plain of Pourieres, where Marius defeated the Cimbric; passes by Aix, and loses itself in the lake of Martigues in the department of the mouths of the Rhone. Some have supposed this to be the *Canum flumen* of Ptolemy.

ARC en Barrois, a town of France, in the department of the Upper Marne, and chief place of a canton in the district of Chaumont, fourteen miles north-west of Langres. The

place contains 1768, and the canton 5,737 inhabitants: the territory includes 26,5 kilom. tres, and 9 communes.

ARC sur Tille, a town of France, in the department of the Côte d'Or, and chief place of a canton in the district of Dijon, on the river Tille, seven miles east-north-east of Dijon.

ARCA, in *Ancient Geography*, a town of Asia in Melitene on the well of the river Melas, and toward 37° 50' N. lat.

ARCA, a town of Phœnicia, at the foot of mount Libanus, between Antaradus and Tripoli, upon a small river about half a league from the sea coast. This was the city of the Arkites, who were the off-spring of Canaan, and said by some to have been founded by Arac, one of his sons. The inhabitants consecrated a temple in this place to Alexander the Great; and the city was denominated in honour of the Roman Emperors, and on account of its situation, "Cæsarea of Libanus," which name, as is seen in medals, it had borne about a century before the time of Alexander Severus. Shaw, in his travels (p. 270) speaks of the ruins of Arca, and says, that the situation of this ancient city was very delightful; having to the north the prospect of an extensive plain, diversified with a great variety of towns and villages, ponds and rivers; to the west the sun might be seen setting in the sea, and to the east rising over a long and distant chain of mountains. The citadel was erected upon the summit of an adjacent mount of a conical form, and mult in former times have been impregnable. Water was conveyed from the mountains to the city by an aqueduct, whose principal arch could not have been less than 100 feet in diameter.

ARCA, *Cape d'*, in *Geography*, lies on the coast of Africa, E. S. E. from the N. E. end of the island of Forteventura, the most southerly of the Canaries. It is about N. lat. 27° 15', and W. long. 12° 10'.

ARCA cordis is used by some *Anatomists*, to denote the PERICARDIUM.

ARCA, in *Conchology*, a genus of Bivalves, the animal of which is supposed to be a *Tethys*: the valves are equal; and the hinge beset with numerous sharp teeth, inserted between each other. The species are arranged in two sections, viz. the first has an entire margin, and in the other the margin is crenulated: each of these sections is subdivided into two parts, the first having the beaks recurved, and in the second they are inflected. The species enumerated by Gmelin are, tortuosa, noae, barbata, modiolus, pella, ovata, pellicuda, rostrata, striata, pulchella, afra, fossilis, cancellata, minuta, lactea, nodulosa, antiquata, fenilis, granosa, corbicula, decussata, aquilatera, pallens, cucullus, magellanica, reticulata, candida, indica, jamaicensis, campechiensis, lata, senegalensis, undata, pectuncululus, pectinata, glycymeris, pilosa, nummaria, nucleus, rhomboidea, marmorata, angulosa, scapha.

ARCADE, in *Architecture*, is used to denote any opening in the wall of a building formed by an arch.

ARCADES, or *Arcadia*, in *Ancient Geography*, a town on the west side of the island of Crete.

ARCADIA was one of the six districts into which the Peloponnesus was divided. Its name is said to have been derived from Arcas their fourth king; and it was anciently called Pelasgi, being inhabited by the Pelasgi, who boasted of their descent from Pelasgus. The Pelasgians were found in several parts of Greece; but their chief and primitive seat is generally supposed to have been Arcadia, whose inhabitants are universally allowed to be the most ancient people in Greece. Bounded on the north by Elis, on the east by Argolis, on the south by Laconia, and on the west by Messenia, Arcadia occupied a central situation, and was the only district of the Grecian peninsula which was not maritime

time. It consisted chiefly of mountainous regions, embosoming vallies which were often intersected by rivers and streams; but in certain places there descended from the mountains too abundant waters, which finding no outlet in the plain, suddenly precipitated themselves into profound gulphs, pursued their course for some distance through subterraneous caverns, and at length burst forth and again appeared above the earth. The soil, in most parts extremely fertile, was peculiarly favourable to pasturage, and nourished a race of herdsmen who, like other highlanders, invigorated by the exercise and efforts which the rugged scenes of their occupations often required for subsistence, and emboldened by the dangers of the chase, encountered not merely for amusement but for the security of their flocks, were strong and courageous; and their courage was increased by the confidence which the natural bulwarks of their country afforded against foreign invasion.

Arcadia was divided into upper and lower, the former on the north, and the latter on the south; and this which was the most mountainous of the two, was famous for its breed of horses and asses, whence the lait of these animals was denominated the Arcadian nightingale. Both these districts abounded with cities, of which the following have been recorded, viz. Megapolis, now Leontari, Mantinea, now Goriza, Palantium, Mœnalus, Tegea, Orchomenon, Clitorium, Nonacris, Psophis, now Dimazana, Heræa on the river Alpheus, Stymphalus on the lake and river of its name, in which there was a temple of Minerva, and Phialia or Phigala on the river Neda. The chief mountains were Cillene, Pholoe, now Xiria, Stymphalus, now Poglii, Parthenus, and Lycæus, called also Olympus, by Pausanias Ceraufus, and by the present inhabitants Mitena.

At first the Arcadians were a savage people, living in the woods and fields, and feeding promiscuously on the products of the ground. At last they were taught by Pelægus, the founder of their monarchy, to build huts, to live sociably, to exchange their common food for nuts, acorns, or beech-mast, and to clothe themselves with the skins of wild beasts. They began afterwards to feed cattle, being invited to it by the fertility of their soil. The shepherds of Arcadia, amidst their numerous flocks and herds, were distinguished by the tuneful strains of their vocal and instrumental music, and for the worship which they paid to their god Pan.

Affording few temptations to commercial adventures, they had very little of the intercourse of peace with surrounding principalities. The secure and insulated position of their territory long preserved the Arcadians, on the one hand unimproved by the advancing refinement of Grecian civilization, and on the other uninfected by Grecian degeneracy; and when other states had exhibited the highest exertions of genius, and were advanced to eminence in the arts, accommodations, and luxuries of life, the Arcadians were distinguished by the innocent simplicity of their manners and by their fond attachment to pastoral retirement. "The exuberant fertility (as Dr. Gillies observes) the inland situation, the generous warmth, yet lively verdure, together with the picturesque and animating scenery of this delightful region, seemed peculiarly adapted to inspire, and to gratify, the love of rural happiness; and to afford in all their elegance and dignity, those sublime and sacred joys of the country, which the genius of ancient poets had felt and described with such affecting sensibility."

Lycaon, the son of the founder of the Arcadians, improved what his father had done towards civilizing them, by introducing among them the worship of Jupiter. Each of his sons built a city, which they called respectively by their own names; in them the people acquired the habits of social

life; and in the next reign they began to sow corn, make bread, spin wool, and manufacture cloth for garments; so that in four generations, the Arcadians, from being but one remove from wild beasts, became civilized, industrious, inured to society, husbandry, and a regular police.

Arcadia, like other states of Greece, was anciently governed by kings. Of these kings they reckon twenty-five from Pelægus, the founder of their monarchy, to Aristocrates II. with whom it terminated. This last king was murdered by his subjects for his treachery to the Messenians his allies, whom he betrayed to the Spartans, then at war with them. This event happened in the first year of the 28th olympiad, or the 668th year before Christ; and if Pelægus was contemporary with Cærops, the founder of Athens, as Sir Isaac Newton supposes, and we refer him, with Blair in Tab. ii. of his Chronology, to the year 1556 before Christ, the duration of the Arcadian monarchy will be about 888 years. But about the commencement of this period there is a considerable difference of opinion among chronologers. However this be, the kings of Arcadia possessed only limited authority, but afterwards constructed a federal republic, of which the several departments sent respectively deputies to the states general. With such manners, and a form of policy so well adapted to virtuous simplicity and a moderate extent of territory, the Arcadians, while they adhered to their innocent pursuits and occupations, were contented and happy.

But the ambition of neighbouring states, and especially the rivalry of the two chief powers of Greece, Athens and Sparta, which involved intermediate and adjacent countries in their contentions, reached the mountains of Arcadia, and compelled the inhabitants frequently to change the crook for the sword. When obliged by necessity, or excited by honour, the Arcadian Islanders took the field, they displayed such stubborn valour, and exerted such efforts of vigour and activity, as made their services eagerly desired, and purchased with emulation, by the surrounding states. They commonly appeared clad with the skins of wolves and bears, and carried either a little bundle of javelins, or a lance in their hands, which they used with a peculiar dexterity. Their women also became at length such expert warriors, that they have sometimes by their seasonable succour decided a doubtful victory. Hence such offers were made to them as induced many, when their own country was at peace, to serve as mercenaries in foreign armies. The warfare in which the Arcadians were engaged, first from necessity, and afterwards from choice, made a very important change in their internal situation. From farms and villages they assembled into walled towns; they fortified Tegea, and afterwards Mantinea.

The Arcadians of Tegea joined the Grecian patriots of Athens and Sparta, in vindicating the freedom and independence of their native land against the attempts of oriental despotism, and bore an important share in the battle of Plataea, which consummated the victories of liberty. In the Peloponnesian war, Arcadia, situated between the contending parties, was involved in their hostilities. The Spartans, after having vanquished their principal rival, endeavoured to subjugate the Arcadians, but though sometimes victorious, yet they were never completely successful. At length, after the peace of Antalcidas had withdrawn their chief enemies from the field, they directed their efforts against Mantinea, and that city, become the capital of Arcadia, was after a gallant defence compelled to submit. The Arcadians however were not ultimately subdued; Epaminondas, in vindicating the liberties of his own country, asserted the independence of other states against the overbearing domination of Sparta. In the

first invasion of Laconia, the Arcadians joined the punisher of their imperious oppressors. Now so much accustomed to the conflicts of war, they also partook of its rapacity, and instead of the honest simplicity of shepherds, imbibed the plundering spirit of mercenary soldiers. Auxiliaries to the Theban hero, they had profited by his success: encouraged by their advantages, and the depression and distress of Sparta, they gave scope to their ambition, and planned the subjugation of the whole peninsula. Acquiring the policy as well as views of their changed national character, to pave the way for the total conquest of the Peloponnesus, they began by wresting several places from the Elians, the least warlike and most wealthy of their neighbours. But the ardour of rapacious avarice operating with too much violence and precipitation, by rousing confederate resistance, ultimately defeated the purposes of ambition. Injustice and robbery they aggravated by impiety and sacrilege; they directed their depredations against the temple of Olympia, containing the collected treasures of many centuries, the rich gifts of vanity and superstition. Not only neighbouring powers but many of their own countrymen censured this spoliation; internal discord arose between the plunderers and those who reprobated the deed, and their schemes of boundless aggrandisement proved abortive. The Arcadians now intermingling so much in the wars and intrigues of the Grecian states, accompanied them in their declension from patriotism to selfish corruption, from corruption to enervation and the decay of military prowess, until they became dependent and tributary appendages of the Macedonian kings, and afterwards provinces of the Roman empire. Since that time all traces of Arcadia are lost, and the country is only known as a part of the Grecian or the Turkish empire. Several colonies of Arcadians migrated at different periods from their own country, and settled in Latium; and may therefore be justly reckoned among the first inhabitants of Italy. Pausanias in *Arcad. lib. viii. oper. p. 511. ed. Kuhnii. Anc. Un. Hist. vol. v. p. 64, &c.*

ARCADIA, or CYPARISSA, in *Geography*, a sea-port town of European Turkey, in the Morea, situate on a gulf to which it gives name, open to the Mediterranean sea, six leagues to the north of Navarin. N. lat. $37^{\circ} 24'$. E. long. $21^{\circ} 42'$.

ARCADIUS, in *Biography and History*, an emperor of the east, and eldest son of Theodosius the Great, was born in Spain, A. D. 377, and invested by his father with the purple at the age of six years, A. D. 383. At his death, in 395, Theodosius divided the empire between his two sons, Arcadius and Honorius; allotting to the former Thrace, Asia Minor, Syria, and Egypt, with Dacia, Macedonia, and half of Illyricum. Arcadius possessed none of those qualities that were adapted to his station, and to the extensive dominion which was assigned him; and he had the misfortune, at the commencement of his reign, to be under the direction of his father's unworthy favourite, Rufinus, whose ambition led him to aspire to the sovereignty itself. In order the more effectually to secure his influence over the young prince, he concerted a marriage between Arcadius and his daughter: but the eunuch Eutropius contrived to attach the emperor's affections to Eudoxia, and he was married to her in the first year of his reign. Rufinus being cut off by an untimely death, Eutropius, who was even a worse man than Rufinus, succeeded to the ministerial power, and by fraud or violence, removed from the view of Arcadius all those in whom he placed any confidence. This minister, however, did not long enjoy the power which he acquired by artifice, and which he exercised merely to serve the purposes of his own ambition and avarice. Having fomented

discord between Arcadius and his brother Honorius, and persuaded Gildo to transfer the allegiance of Africa from the latter to the former, he caused the emperor A. D. 397, with a view to his own security and that of his adherents, to pass an unjust and cruel law of treason, extending the crime to all practices against the ministers and officers of the sovereign, and the punishment of it to descendants. His power was at length overthrown by the rebellion of Tribigild, the Ostrogoth, A. D. 399, and by the concurring influence of the empress Eudoxia, by whom he was succeeded in the absolute direction and government of the feeble Arcadius. She assumed the title of "Augusta," and had her image borne through all the provinces of the empire, which was honoured with the respect bestowed on that of the emperor himself. By her persecution of the venerable Chrysostom, who was banished and died in exile, because he too freely exposed the vices of the court, and of the empress, Eudoxia excited disturbances at Constantinople; but in the bloom of youth she died of a miscarriage, A. D. 404. Arcadius survived her a few years, and witnessed the calamities that were accumulating on the eastern empire. At length in his thirty-first year, he died at Constantinople; A. D. 408, after having reigned twelve years with his father, and nearly fourteen years after his death. He had one son, viz. Theodosius, who at the time of his decease was eight years of age, and four daughters. Arcadius was a prince of very moderate talents; being indolent, and also addicted to pleasure, he was shamefully imposed upon, and entirely governed by his ministers and the empress, who, under the sanction and by an abuse of his authority, oppressed the people in the most despotic and tyrannical manner. "It is impossible," says Mr. Gibbon, "to delineate his character; since, in a period very copiously furnished with historical materials, it has not been possible to remark one action that properly belongs to the son of the great Theodosius."

The supposed testament of Arcadius, by which he appointed Jezdegerd, the Persian monarch, guardian of his son, and which is mentioned by Procopius, is not authenticated by any sufficient evidence. *Anc. Un. Hist. vol. xiv. p. 324—356. Gibbon's Hist. vol. v. p. 372. 412.*

ARCADIUS, in *Entomology*, a species of PAPILIO (P. Nymph. Fab.) The wings are very entire; the anterior ones black with blue and white spots; posterior ones fuscous, beneath chestnut-brown. This kind inhabits Africa. Fabricius. Obs. Gmelin overlooked this new species in his *Syst. Nat.*

ARCÆ CUSTOS, in *Ecclesiastical Antiquity*, a title formerly given to the archdeacon, on account of his having the custody of the church's chest, or treasure.

ARCAGANTES, in *Ancient Geography*, called also Liligantes and Limigantes, were Sarmatians, who, being expelled their own country, took possession of some parts of the Roman territory.

ARCALU, in *Geography*, the name of a small principality of the Tartar Moguls, on the river Hoamko; where the great wall of China commenced.

ARCAN, a town of Asia, in Tartary, upon the frontiers of Mawaralnabrah, situate upon the river Cassima, and called also Adereand.

ARCANE, a small town of Asiatic Turkey, in Natolia, upon the coast of the Black Sea, between Seriape, or Sinape, and the Cape Pisello.

ARCANGIS, in the *Turkish Armies*, an inferior kind of infantry, which serve as *enfants perdus*, and to harass and pillage the enemies' frontiers.

The Arcangis are an order inferior to the Janizaries; and,

and, when any of them distinguish themselves, are usually preferred in the Janizaries order. They have no pay, but are to subsist on their plunder.

ARCANI, in *Geography*, a town of Mingrelia, at the mouth of a river of the same name, supposed to be the ancient Apfarrus.

ARCANIUS, in *Entomology*, a species of PAPILO (Dan. Fell.). The wings are very entire, ferruginous beneath, on the anterior pair one ocellated spot; on the posterior pair five, the first of which is separated from the others by a band. Fabricius. This is *Papilio Amyntas* of Scopoli and Poda, and inhabits Europe. It is produced from a green larva, which has an obscure line along the back, is yellow on the sides, and bidentated at the tail.

ARCANNA, a kind of red chalk, called by physicians *rubrica fabrilis*, as being used by carpenters to colour their lines for marking timber, &c.

ARCANO, in *Geography*, a town of Italy, belonging to the Venetian states, in the province of Friuli, eleven miles west of Udina.

ARCANUM literally signifies a *secret*; and is therefore very pertinently applied by quacks and impostors in medicine, who conceal their ignorance and fraud under the pretence of secrecy. Hence a multitude of arcana.

ARCANUM CORALLINUM, a name formerly given to red mercurial precipitate, on which spirit of wine has been burnt in order to render it milder.

ARCANUM DUPLICATUM. This term was invented by Glauber, and applied by him to the salt remaining after the distillation of nitrous acid, from nitre and sulphuric acid. It is the same as was afterwards known by the name Vitriolated Tartar; or, according to the modern nomenclature, SULPHAT of Potash.

ARCAS, in *Astronomy*, a name given by some old writers to the star Arcturus, in the constellation Bootes. Arcas, the son of Calisto by Jupiter, it is said, when he was about to kill his mother in the shape of a bear, was, together with her, snatched up into heaven; where she was converted into the constellation of the Great Bear; others say into this single star.

ARCAS, in *Entomology*, a species of PAPILO. The wings are very entire and fulvous; margin and spots black; posterior ones beneath grey, and without spots. Inhabits the Cape of Good Hope. Fabricius and Gmelin.

ARCAS, in *Ancient Geography*, a town of Armenia Minor, according to the Antonine Itinerary.

ARCAS, in *Geography*, a small place of Spain, in Castile, the Arcabrica of the ancients.

ARCAS, an island in the gulf of Mexico, in the bay of Campeachy. N. lat. 20°. W. long. 92° 50'.

ARCASSON Bay, lies on the coast of France, 18 leagues south-westerly from the river of Bourdeaux to Cape Ferret, its north entrance; and before it lies the island Terry, with a channel on each side.

ARCASTE, an island on the west coast of Africa, south of the river Gambia, and of Cape Roxo.

ARCATIS *Regia Sora*, in *Ancient Geography*, ARCADE, a town in the interior of the Indian peninsula, on this side the Ganges, and the capital of a country called Soretanum Paralia.

ARC-BOUTANT, in *Building*, a kind of flat arch, or part of an arch, abutting against the feet of an arch, or reins of a vault, to support, and prevent their giving way.

The name is French; formed of *arc* and *bouter*, to abut. Arc-boutants are only arched BUTTRESSES.

ARCE, in *Ancient Geography*, also called Rakem and Petra, the capital of Arabia Petræa.

ARCE. See ARCA and ARACEANS.

ARCE, in *Geography*, a town of Italy, in the kingdom of Naples, and country of Lavora, six miles south of Sora.

ARCEGOVINA, a province of Dalmatia, between the country of the Dulcignotes to the south-east, the republic of Ragusa to the north-west, a part of Bosnia to the north-east, and the Adriatic sea to the south-west. The principal towns are Rifano, Castel-Novo, Cataro, and Budoa, which are all fortified; and the river Moracica traverses the country, which abounds with mountains, and yet is very fertile, from the north-west to the south-west. The Venetians possess the greatest part of it, and the rest belongs to the Turks.

ARCELES, a town of France, in the department of the Eastern Pyrenées, and chief place of a canton, in the district of Ceret, four leagues south-east of Perpignan, and four east-north-east of Ceret.

ARCELLA, in *Entomology*, a species of PHALÆNA (*Tinea*); wings pure white, with a common arched mark, and two marginal spots of brown. Fabricius, Gmelin. Inhabits Germany.

ARC-EN-QUEUE, in *Ornithology*, the name of the Linnæan ORIOLEUS *Annulatus*, in Buffon's Hist. Nat. des Ois.

ARCES, in *Geography*, a town of France, in the department of the Eastern Pyrenées, and chief place of a canton, in the district of Ceret, seven leagues south-south-west of Perpignan, and two south-west of Ceret.

ARCESILAUS, in *Biography*, a Greek philosopher, the founder of the Middle Academy, was a native of Æolis, and born in the first year of the 116th olympiad, or the 316th year before Christ. He followed his first preceptor, Autolycus the mathematician, to Sardis; but he afterwards went to Athens, where he studied music under Xanthus, geometry under Hipponicus, and philosophy under Theophrastus, Aristotle, Polemon, and Crantor. With the latter, and also with Zeno the founder of the Stoic sect, he formed an intimate friendship. Poetry was his favourite amusement, and he was so familiarly acquainted with Homer and Pindar in particular, that he often cited in conversation pertinent passages from their works; and it was his practice every night before he went to sleep, to read a portion of Homer. After having in early life been initiated in mathematics and polite literature, he was designed for the profession of the law, but he rather chose to devote himself to philosophy. After the death of Crates, he took possession of the academic chair, and his method of instruction was universally admired. However, the innovations which he introduced in the Platonic school, gave rise to a new school, called, in reference to Plato's school, the Second Academy; and with respect to a subsequent innovation by Carneades, the Middle Academy. See ACADEMY.

The school of Arcesilaus was founded upon the principle of the uncertainty of knowledge; and it was instituted in opposition to the Dogmatists, and particularly the Stoicks, whose doctrine was different from that of Plato. This philosopher, under the sanction of Socrates and Plato, and without explicitly avowing the doctrine of universal scepticism as taught in the school of Pyrrho, maintained, that whatever certainty there may be in the nature of things, every thing is uncertain to the human understanding. He, therefore, taught his disciples not with confidence to assert their own opinions, but to controvert those of others; that truth has no certain characters by which it may be distinguished from error; and therefore he suspended his judgment, and disputed merely with a view of convincing him-

self that opposite opinions may be supported by arguments of equal weight. Hence his school became a theatre of unprofitable contention, in which his disciples were allowed to propose and to maintain their opinions; and then the master, by his skill in disputation, and by his captivating power of address, astonished the audience by confuting them. Thus the point in debate seemed to be determined, till the same ingenuity was employed on the opposite side of the question.

Arcefilus has been compared to Tiberius Gracchus, as a disturber of the peace, who endeavoured to overturn the established philosophy, without the merit of that political reformer; who attempted the correction of abuses and errors; for he brought the world of science into a worse state of confusion than that in which he found it. Accordingly his doctrine of uncertainty alarmed not only philosophers but civil magistrates; and he was considered as a common enemy to science and to society; and unquestionably his tenets seem necessarily to destroy the foundations of virtue, and to introduce uncertainty and indifference with regard to the obligations of morality. When Arcefilus was once reproached by an enemy for living according to his principles, Cleanthes, though a Stoic, justified him, and averred, "that though he destroyed morals by his doctrine, he established them by his conduct." "You flatter," said Arcefilus. "Is this flattery," replied Cleanthes, "to assert, that you say one thing and do another?" This, however, was a mere compliment, to which Arcefilus was not entitled; for, according to the representation of Diogenes Laertius, he was addicted to the most shameful intemperance and lewdness, and deserved the character of the corruptor of youth; so that the pernicious tendency of his principles was exemplified in his own practice. He died, in the 4th year of the 134th olympiad, 241 years before Christ, though at the age of 75, a martyr to his licentious conduct; for the cause of his death was a delirium produced by excessive drinking. On many occasions, however, he manifested a generous and liberal spirit. When one of his pupils expressed a predilection in favour of a Peripatetic philosopher, named Hieronymus, Arcefilus took him by the hand, and conducting him to his school, requested the philosopher to treat him in a manner suitable to his merit. When Cleanthes, who was the successor of Zeno, the professed adversary of Arcefilus, was affronted by one of his pupils, he would not restore him to his school till he had made a satisfactory acknowledgment for the offence. Having lent some silver vessels to a friend for an entertainment, when he found that he was poor, he would not allow them to be returned. Visiting a sick friend, whom he observed to be in poverty, he silently conveyed a purse of gold under his pillow. When the sick man discovered it, he said with a smile, "This is one of the generous frauds of Arcefilus." He is said to have spent a great part of the ample income arising from an estate at Pitane, the place of his birth, in similar acts of liberality. None of the writings of this philosopher have descended to our times. During his life he was honoured, and after his death the Athenians paid respect to his memory by a magnificent funeral. Two Christian fathers, viz. Numenius and Lactantius, have inveighed against his doctrine. Diogenes Laertius, l. iv. § 28, &c. Suidas. Athén. l. vii. p. 276. Cic. Acad. Quell. l. i. c. 5—12. 24. De Fin. l. ii. c. 1. l. v. c. 31. Euseb. Præp. Evang. l. xiv. c. 6. 9. Lactant. Inst. l. iii. c. 4. Gen. Dict. Brucker's Hist. Philos. by Enfield, vol. i. p. 244, &c.

ARCESINE, in *Ancient Geography*, a town formerly situate in the island Amorgus, one of the Cyclades.

ARCESIUM, a cavern of mount Ida, in the isle of Crete.

ARCEUTHIUS, a river of Syria, which watered the territory of Antioch, according to Strabo.

ARCEUTUM, is used in some *Ancient Law-Writers*, for a procurator due to a bishop, abbot, or archdeacon, from their clergy, in time of entertainment.

ARCII, ARC, ARCS, in *Geometry*, a part of any curve line; e. gr. of a circle, an ellipse, or the like. The arc of a circle is any part of its circumference. Such is A F B, *Plate III. Geometry, fig. 35.*

The base or line A B, that joins the two extremes of the arc, is called the CHORD; and A D, half of the chord bisected by the diameter at right angles, is the SINE of half the said arc, viz. A E.

All angles are measured by arcs. For this purpose an arc is described, having its center in the point or vertex of the angle: and as every circle is supposed to be divided into 360 degrees; an arc is estimated according to the number of degrees which it contains. Thus an arc is said to be of 30, of 80, of 100 degrees. However, the measure of angles by the arcs of a circle is founded upon the uniform curvature of the circle.

ARCS, *concentric*, are those which have the same center.

ARCS, *equal*, are such arcs of the same or equal circles, as contain the same number of degrees. Hence, in the same or equal circles, equal chords subtend equal arcs. And hence, again, arcs intercepted between parallel chords are equal.

A radius, C E, *fig. 35*, which bisects the chord in D, does also bisect the arc in E; and is perpendicular to the chord; and on the contrary. And hence the problem, to *bisect an arch*, is solved, by drawing a line C E from the center perpendicular to the chord in D. Equal arcs have equal chords, sines, tangents, &c.

ARCS, *similar*, or *like*, are those which contain the same number of degrees of unequal circles. Such are the arcs A B and D E, *fig. 36. or fig. 1. Plate VI. Architecture.*

Two radii being drawn from the center of two concentric circles, the two arcs intercepted between them bear the same ratio to their respective peripheries, and their radii; and also the two sectors to the areas of their respective circles. Similar arcs and other like curves are also like parts of the whole, or determined by like parts alike posited.

ARC of a circle, the length of an, may be found by the following rule: viz. as 180 is to the number of degrees in the arc, so is 3.1416 times the radius to its length. Or, as 9 is to the number of degrees in the arc, so is .0174533 times the radius to its length. For, when the radius is 1, half the circumference is 3.14159265, &c. consequently

$\frac{3.14159265}{180 \text{ degrees}}$, &c. = .0174532925199, &c. = the length of

an arc of 1 degree; hence $r \times .01745$, &c. = the length of 1° to the radius r , and, therefore, $.01745$, &c. $\times r \times$ number of degrees in any arc = the length of that arc: e. g. let the length of the arc A D B (*fig. 37*), whose chord A B is 6, the radius being 9, be required. By trigonometry, 9

(A C) : 3 (A P) :: 1 (radius of the tables) : $\frac{3}{9}$ = .3333333

= sine of the angle ACP, or arc A D, to the radius 1; and the degrees in the table of sines answering to the sine are 19.4712206, the double of which is 38.9424412, or the degrees in the whole arc A B. Then, by the rule, $38.9424412 \times .0174533 \times 9$ = 6.117063 = the length of the arc required. Dr. Hutton has given several other theorems, with

with their demonstrations, for finding the lengths of circular arcs in his "Treatise of Mensuration," p. 124, &c. : some of which are as follow. Let the radius of a circle be 1, any arc a , tangent t , line s , cosine c , and versed sine v : and we shall have,

$$a = t - \frac{1}{3} t^3 + \frac{1}{5} t^5 - \frac{1}{7} t^7 + \frac{1}{9} t^9 \text{ \&c.}$$

$$a = \frac{s}{c} - \frac{1}{3} \cdot \frac{s^3}{c^3} + \frac{1}{5} \cdot \frac{s^5}{c^5} - \frac{1}{7} \cdot \frac{s^7}{c^7} \text{ \&c.}$$

$$a = s + \frac{1}{2.3} s^3 + \frac{1.3}{2.4.5} s^5 + \frac{1.3.5}{2.4.6.7} s^7 \text{ \&c.}$$

$$a = \sqrt{2v} \times 1 + \frac{1}{2.3} \cdot \frac{v}{2} + \frac{1.3}{2.4.5} \cdot \frac{v^3}{2^2} + \frac{1.3.5}{2.4.6.7} \cdot \frac{v^5}{2^3} \text{ \&c.}$$

$$a = \frac{3.14159}{180}, \text{ \&c. } d = .01745329, \text{ \&c. } \times d, \text{ where } d$$

denotes the number of degrees in the given arc ; $a = \frac{8c-C}{3}$ nearly, when C is the chord of the arc, and c the chord of half the arc, whatever be the radius.

To investigate the length of the arc of any curve, put $x =$ the abscisse, $y =$ the ordinate of the arc z of any curve whatever, put $\dot{z} = \sqrt{\dot{x}^2 + \dot{y}^2}$; then, by means of the equation of the curve, find the value of \dot{x} in terms of \dot{y} , or of \dot{y} in terms of \dot{x} , and substitute that value instead of it in the above expression $\dot{z} = \sqrt{\dot{x}^2 + \dot{y}^2}$; and hence, taking the fluents, they will give the length of the arc z in terms of x or y . See RECTIFICATION.

TABLE for finding the Length of Circular Arcs, Radius being Unity.

Deg.	Length.	Deg.	Length.	Min.	Length.	Sec.	Length.
1	0.0174533	60	1.0471976	1	0.0002909	1	0.0000048
2	0.0349066	70	1.2217305	2	0.0005818	2	0.0000097
3	0.0523599	80	1.3962634	3	0.0008727	3	0.0000145
4	0.0698132	90	1.5707963	4	0.0011636	4	0.0000194
5	0.0872665	100	1.7453293	5	0.0014544	5	0.0000242
6	0.1047198	120	2.0943951	6	0.0017453	6	0.0000291
7	0.1221730	150	2.6175939	7	0.0020362	7	0.0000339
8	0.1396263	180	3.1415927	8	0.0023271	8	0.0000388
9	0.1570796	210	3.6651914	9	0.0026180	9	0.0000436
10	0.1745329	240	4.1887902	10	0.0029089	10	0.0000485
20	0.3490659	270	4.7123890	20	0.0058178	20	0.0000970
30	0.5235988	300	5.2359878	30	0.0087266	30	0.0001454
40	0.6981317	330	5.7595865	40	0.0116355	40	0.0001939
50	0.8726646	360	6.2831853	50	0.0145444	50	0.0002424

In using the above table, take the degrees, minutes, and seconds from the first, third, and fifth column, and against them are the corresponding lengths, the sum of which is required : e. g. what is the length of an arc of $37^\circ 42' 58''$?

30°	0.5235988
7°	0.1221730
$40'$	0.0117355
$2'$	0.0005818
$50''$	0.0002424
$8''$	0.0000388

the length required . 0.6582703

If the radius be not unity, the length may be found by proportion, thus, unity : radius :: the length here found : the length required.

See a table of circular arcs for each degree, minute, second, and third, of the semiperiphery, in Hutton's Tables, p. 340. See a paper on an elementary manner of obtaining series for expressing circular arcs, by Mons. L'Huilier in the Phil. Transf. for 1796, pt. i. p. 142—163.

To find the center of gravity of an arc of a circle ; see CENTER of gravity.

For the sines, tangents, &c. of arcs, see SINE, TANGENT, &c.

ARCH, in Astronomy, has various denominations according to the circle to which it is applied.

ARCH, Diurnal, of the sun is part of a circle parallel to the equator, described by the sun in his course betwixt rising and setting. The half of this comprehended between the meridian and horizon, is called the *semidiurnal arch*, and by

means of this the time of his rising and setting is easily ascertained. Tables of femidiurnal arcs may be found in most of our astronomical almanacs or ephemerides. The term is also applied to other celestial bodies, as the planets and stars. His nocturnal arch is of the same kind, excepting that it is described between his setting and rising.

The latitude and elevation of the pole are measured by an arch of the meridian ; and the longitude, by an arch of a parallel circle.

ARCH of progression or direction, is an arch of the ecliptic, which a planet seems to pass over, when its motion is direct, or according to the order of the signs.

ARCH of retrogradation, is an arch of the ecliptic, described while a planet is retrograde, and moves contrary to the order of the signs.

ARCH between the centers is an arch, as AI (Plate I. Astronomy, fig. 11.), passing from the center of the earth's shadow, A, perpendicular to the moon's orbit, OB, and meeting her center at the middle of an eclipse. See ECLIPSE.

If the aggregate of the arch between the centers AI, and the apparent semidiameter of the moon, be equal to the semidiameter of the shadow, the eclipse will be total without any duration ; if less, total with some duration ; and if greater, yet less than the sum of the semidiameters of the moon and the shadow, partial.

ARCH of position, or angle of position, is the same with the horary angle. See POSITION.

ARCH of vision is the sun's depth below the horizon, at which a star, before hid in his rays, begins to appear again.

TABLE exhibiting the *Arch of Vision* of the PLANETS and FIXED STARS nearly.

Planets.			Fixed Stars.	
	(^o)	(')	Magnitude	(^o)
Mercury,	-	10 0	1	- 12
Venus,	-	5 0	2	- 13
Mars,	-	11 30	3	- 14
Jupiter,	-	10 0	4	- 15
Saturn,	-	11 0	5	- 16
			6	- 17

However, the quantity of this arch is not always the same; but varies with the latitude, declination, right ascension or descension, and distance of any planet or star. With respect to Venus, it is sometimes reduced to nothing, as the is sometimes visible when the sun is at a considerable elevation above the horizon. Ricciol. Alm. v. i. p. 42.

ARCH, in *Architecture*, is a concave structure, raised or turned upon a mould, called the centering, in form of the arch of a curve, and serving as the inward support of some superstructure. Sir Henry Wotton says, an arch is nothing but a narrow or contracted vault; and a vault is a dilated arch.

Arches are used in large intercolumnations of spacious buildings; in porticoes, both within and without temples; in public halls, as ceilings, the courts of palaces, cloisters, theatres, and amphitheatres. They are also used to cover the cellars in the foundation of houses, and powder magazines; also as buttresses and counterforts to support large walls laid deep in the earth; for triumphal arches, gates, windows, &c.; and, above all, for the foundations of bridges and aqueducts, and they are supported by piers, butments, &c.

Arches are of several kinds, and are commonly denominated from the figure or curve of them, as circular, elliptical, cycloidal, catenary, &c. according to their curve, in the form of a circle, or ellipsis, cycloid, catenary, &c.

There are also other denominations of circular arches, according to the different parts of a circle, or manner of placing them; thus,

Semicircular arches, which are those that make an exact semicircle, having their center in the middle of the span or chord of the arch; called also by the French builders, perfect arches, and arches en plein centre. The arches of Westminster bridge are semicircular.

Scheme arches, or ikene, are those which are less than semicircles, and are consequently flatter arches, containing 120 or 90 or 60 degrees; &c.; they are also called imperfect and diminished arches.

Arches of the third and fourth point, or Gothic arches, or, as the Italians call them, di terzo and quatro acuto, because they always meet in an acute angle at top, consist of two eccentric circular arches meeting in an angle above, and are drawn from the division of the chord into three or four, or more parts at pleasure; of this kind are many of the arches in churches and other old Gothic buildings.

Elliptical arches usually consist of semiellipses, and were formerly much used instead of mantle-trees in chimnies, and are now much used, from their bold and beautiful appearance, for many purposes, particularly for the arches of a bridge, like that at Blackfriars, on account of their strength, beauty, convenience, and cheapness.

Straight arches are those which have their upper and under edges parallel straight lines instead of curves; these are chiefly used over doors and windows, and have their ends and joints all pointing toward one common center.

The term arch is peculiarly used for the space between two piers of a bridge, intended for the passage of water, boats, &c.

Arch of equilibration, is that which is in equilibrium in all its parts, having no tendency to break in any one part more than in another, and which is therefore safer and stronger than any other figure, the materials and all other circumstances being alike.

An investigation of the nature and property of arches of equilibration will be found in the following propositions and examples:

Problem I. (*Plate VI. Architecture, fig. 3.*) The nature of the curve ABD, forming an arch, being given to find the nature of the extrados or curve PSR, bounding the top of the wall APRD, supported by that arch, by the pressure or weight of which wall all the parts of the arch are kept in equilibrio.—1st. Let several equal right lines AB, BC, CD, &c. (*fig. 2.*) placed in a vertical plane, be moveable round the angles A, B, C, D, &c. whilst the points A, G at the base remain fixed and immovable; through B, C, D, &c. draw the lines Bi, Cm, Dp, &c. perpendicular to the horizon, and complete the parallelogram Bbik, and make Cl = Bk, and complete the parallelogram Clmn. In like manner make Do = Cn or Im, Er = op, Ft = rs, and complete all the parallelograms in the figure as at first.—2d. Let several weights which are to one another as the lines Bi, Cm, Dp, &c. lie respectively on the points B, C, D, &c.: now the force Bi is equivalent to Bb, Bk, acting in the directions BA, BC; the force Bb is destroyed by the resistance of the point A, but Bk endeavours to move the point B towards C; in like manner the force CM is equivalent to Cl and Cn; the force Dp to Do, op, &c.; now the forces Bk, acting towards C, and Cl, acting towards B, being equal by construction, destroy one another; and in like manner the forces Cn and Do, Dp and Er, Ev and Ft, &c. destroy one another; and the point G, being fixed, it is manifest the figure ABCD, &c. will not be moved by the incumbent weights Bi, Cm, Dp, &c. but all its parts will remain in equilibrio.—3d. The force Bb : force Bk or Cl :: sine \angle biB or iBC : S, \angle ABi :: $\frac{1}{S \cdot ABi}$

: $\frac{1}{S \cdot iBC}$ or $\frac{1}{S \cdot mCB}$. Likewise the force Cl : force Cn or

Do :: S. mCD or pDC : S. mCB :: $\frac{1}{S \cdot mBC}$: $\frac{1}{S \cdot mCD}$ or $\frac{1}{S \cdot pDC}$, and so on; whence it is plain, in general, that

any force Cl is as $\frac{1}{S \cdot \angle mCB}$; now since Cm = $\frac{S \cdot Clm \times Cl}{S \cdot Cml}$ = $\frac{S \cdot BCx \times Cl}{S \cdot mCD}$, therefore the force Cm is as $\frac{S \cdot BCx}{S \cdot mCB \times S \cdot mCD}$. —4. Now let the number of the

lines AB, BC, CD, &c. be increased and their lengths diminished ad infinitum, that the figures may obtain the form of a curve, and the pressure will then act on all parts of it; and the angle BCx will then become the angle of contact, and the sines of mCB and mCD become equal to the sine of mCx; therefore drawing the tangent An (*fig. 3.*), the pressure on any point A to preserve the equilibrium will be as the angle of contact at A directly, and the square of the sine of the angle mAn reciprocally; but the angle of contact is as the curvature, or reciprocally as the radius of curvature, therefore the pressure is reciprocally as that radius, and the square of the sine of that angle mAn.—5. Cor. 1. If a weight like a wall nPSR, be incumbent on the arch ABD, standing

ing in a vertical plane, and all the parts kept in equilibrio, then the weight Ag , on any point A , is as the curvature at A directly, and the cube of the sine of ATC reciprocally; AT being a tangent at the point A , meeting the axis BC produced in T : for the weight on the given part of the arch is as

$\frac{C}{S.ATC^3}$, C being the curvature at A , and the weight of the column Ag bris as $Ag \times wr = Ag \times Ar \times S.ATC = Ag \times S.ATC$, because Ar is given; therefore $Ag \times S.ATC$ is as $\frac{C}{S.ATC^3}$, and Ag as $\frac{C}{S.ATC^4}$, to keep the parts in equilibrio.—Cor. 2. If R be the radius of curvature in

A , then the weight Ag is as $\frac{1}{R \times S.ATC^2}$. —Cor. 3.

If $BC = x$, $AC = y$, $BA = z$, then Ag is as $\frac{-\dot{x}\dot{y}}{j^3}$, where \dot{x} is constant; for $\dot{z} : j :: AT : AC :: \text{rad. } 1 : S.ATC = \frac{j}{z}$; therefore $Ag = \frac{\dot{z}^3}{R \times j^3}$, and R may be found by supposing either \dot{x} or j given. If \dot{x} be given, $R = \frac{\dot{z}^3}{-\dot{x}\dot{y}}$, therefore Ag is as $\frac{\dot{z}^3}{j^3} \times \frac{-\dot{x}\dot{y}}{\dot{z}^3} = \frac{-\dot{x}\dot{y}}{j^3}$.

Problem II. The nature of the curve ABD (*fig. 3.*) being given for the figure of an arch to find the height Ag of the wall insisting thereon, at every point A , so that all the parts shall remain in equilibrio. Draw the ordinate AC , and let $BC = x$, $AC = y$, Arch $BA = z$, BS the height of the wall at the vertex = a , $R = \text{rad. curvature in } A$, draw the tangent AT , which will be found from the nature of the curve; find the $S.$ angle ATC ; then take Ag as

$\frac{1}{R \times S.ATC^3}$ for the height.

Example I. Let AB (*fig. 4.*) be the arch of a circle, radius = r , $BC = x$, cof. $BC = c$, $BS = a$, then $c = S.ATC$, whence Ag is as $\frac{1}{r^3}$ or as $\frac{1}{c^3}$ which at B is

$\frac{1}{r^3}$, therefore $\frac{1}{r^3} : \frac{1}{c^3} :: a : Ag = \frac{ar^3}{c^3}$. Let $BO = ON$, $BS = a$, (*fig. 4.*). Then as $\text{rad. } r : \text{cof. } BA = c :: BO : CO$ and $r^3 : c^3 :: BO^3 : CO^3$, where $\frac{r^3}{c^3} = \frac{BO^3}{CO^3}$ and $\frac{ar^3}{c^3}$

$= \frac{aBO^3}{CO^3} = \frac{BS \times BO^3}{CO^3} = Ag = BS$ when $CO = BO$,

and when $CO = 0$, Ag is infinite; hence SgM is a curve running up to an infinite height towards M , the perpendicular NM being an asymptote to it, and the curve is as accurately as represented in the figure, when the thickness BS at the top is about 1-tenth of the span diameter. But if a circular arch, and a right line at the top was necessarily required, the proportion of BS to the radius BO may be found, so as the arch may be nearly in equilibrio thus:—When Sg is a right line, then SQ in the figure must be nothing, or rather when the curve crosses the horizontal line, then SQ is equal to nothing. Now to find that

point from the general equation: $Ag = \frac{ar^3}{c^3} = \frac{BS \times BO^3}{CO^3}$

$= \frac{BS \times BO^3}{BO - BC^3}$. Put $BC = x$, then $\frac{ar^3}{c^3} = \frac{ar^3}{r-x^3} = Ag$

$= x + a$ when the curve crosses the horizontal line, whence $ar^3 - a \times r - x^3 = x \times r - x^3$, and by division $a = \frac{x \times r - x^3}{r^3 - r - x^3}$

Now this value of a or BS evidently becomes = 0 , when the arch consists of the whole femicircle; but when the arch is less than the femicircle, a will have a finite value; and between 60 and 120 degrees, many arches of equilibration of a certain thickness at the top may be found. Thus, if the half arch contain 30 degrees, then a will be $= \frac{1}{4}r$ very nearly. And if BA was an arch of 45 degrees, then a or $BS = \frac{1}{2}$ of the span nearly. Farther, if BA were 55 degrees, then $a = .0992r$, which is between the sixteenth and seventeenth part of the span or chord; so that in each of these cases, the points A and B would be in equilibrio; but then about the middle parts between B and A , or rather nearer to B than to A , the materials should be a little lighter than at B and A , and the exact proportion in which their gravity should be diminished, might be easily found by calculation: thus, in the first case in particular (*fig. 5.*) the specific gravity of the materials in the middle of the arch between B and A , that is, at 15 degrees from B , should be to that at B or A , as 278 to 284 ; which is but a very inconsiderable decrease, and may be very well neglected. In the first two cases, the thickness at the top would be too much; but in this latter one, when the whole arch is 110 degrees, the thickness is but just about that which the best architects now allow, and in greater arches the thickness would become too little; so that an arch of nearly about 110 degrees is the only part of a circle that can be used with much propriety.

Example II. Let NAB (*fig. 6.*) be an ellipse, $t = NO$, the semitransverse parallel to the horizon, $r = BO$ the semi-conjugate, $BC = x$, $CA = y$, $BS = a$; then by the nature

of the ellipse, $r : t :: \sqrt{2rx - x^2} : y = \frac{t}{r} \sqrt{2rx - x^2}$; hence

$j = \frac{t \times \dot{x}}{r} \times \frac{r - x}{\sqrt{2rx - x^2}}$ and $\dot{y} = \frac{-t\dot{x}^2}{2rx - x^2}$ by making \dot{x}

constant. Then $Ag = \frac{-\dot{x}\dot{y}}{j^3} \times Q$, is $= \frac{tr\dot{x}^3 Q}{2rx - x^2}$

$\frac{r^3}{t^3 \dot{x}^3} \times \frac{2rx - x^2}{r - x} = \frac{rQ}{t^2 \times r - x^2}$; but when $x = 0$, this ex-

pression becomes $a = \frac{rQ}{t^2}$, and then $Q = \frac{at^2}{r}$, consequently

$= a \times \frac{r}{r - x} = \frac{BS \times BO^2}{CO^3}$, the same as in the circle;

but the elliptic arch may take a straight line at top better than the circular one, when the longer axis is horizontal, because the arch is flatter, or of a less curvature; and worse than the circular, when the shorter axis is horizontal.

For the convenience of those readers who may not be acquainted with the fluxionary or algebraical expressions, we shall give the calculation in numbers for the two last kinds of arches, viz. the circular and elliptical. Let ABD (*fig. 5.*) be a segment of a circle of 110° whose chord or span AD may be 100 , then the versed sine CB will be 26 nearly, and the radius AO or BO 61.04 nearly. Take $BS = 6.05$, which will be a little less than the 16th part

of the span AD , then $\frac{AC^3}{CO^3} \times BS$ will be equal to the

height AG . First suppose BC equal 5 , and $CO = 56.04$, then AG , the height of the wall from the arch to the top, will be equal to 6.05 multiplied by 61.04 cubed and divided

by.

by 56.04, cubed equal to 7.8248: if BC be equal to 10, AG will be equal to 10.368, and so on, whatever number BC be taken.

For the ellipsis, let NABD (fig. 6.) be an ellipsis with the longer axis NH horizontal and semitransverse NO = 48.29 semi-conjugate BO = 41.04 feet: then if we suppose AD to be the span of the arch ABD, its height BC will be 30 feet; and when AD = 8; nearly, let BS be taken = 6 feet. Then the general equation for any height

AG of the wall is $\frac{BS \times BO^3}{CO^3}$. Suppose BC = 10, then

$$CO = 31.04, \text{ and AG in this case is equal to } \frac{6 \times 41.04^3}{31.04^3}$$

$$= 13.86; \text{ again suppose BC} = 20, \text{ then AG} = \frac{6 \times 41.04^3}{21.04^3}$$

= 44.53, and by cubing the value of CO for a denominator to the constant numerator, 6×41.04^3 , the value of AG in every point of the arch may be readily found.

For the method of determining the figure of the extrados of the parabola, hyperbola, and catenarian, see Dr. Hutton's Principles of Bridges, sect. 2. from page 31 to 40. Emerson's Miscellanies, p. 156, &c.

Problem III. Having the form of the extrados given to find the intrados; that is, having given the form of the line bounding the top of a wall supported by an arch, to find the figure of that arch, so that by the pressure of the superincumbent wall, the whole may remain in equilibrium. When the extrados is an horizontal line, Dr. Hutton and Mr. Emerson have both determined the nature of the curve, and calculated tables for constructing it, where the height, the span, and the thickness at the crown are given. Dr. Hutton supposes the span NH = 100, height BO = 40, and the thickness BE at the crown = 6. Put a or BE = 6, b or NO = OH = 50, and r or BO = 40, x = BC, y = AC, (fig. 7.) The equation of the curve is thus expressed:

$$\text{hyp. log. of } \frac{a + x + \sqrt{2ax + x^2}}{a}$$

$$y = b \times \text{hyp. log. of } \frac{a + r + \sqrt{2ar + r^2}}{a}$$

Then the corresponding values of ED and DA, or horizontal and vertical lines, will be as in this table.

TABLE for constructing the curve of equilibration.

Value of DE.	Value of AD.	Value of DE	Value of AD.	Value of DE.	Value of AD.
0	6.000	21	10.381	36	21.774

19	9.517	34	19.617	49	43.581
20	9.934	35	20.665	50	45.000

The chief properties of arches of different curves may be seen in sect. 2. of Dr. Hutton's "Principles of Bridges," above quoted. It there appears that none, except the mechanical curve of the arch of equilibration, can admit of a horizontal line at top; that this arch is of a form both graceful and convenient, as it may be made higher or lower at pleasure, with the same span or opening; that all other arches require extrados that are curved, more or less, either upwards or downwards: of these, the elliptical arch approaches the nearest to that of equilibration for strength and convenience; and it is also the best form for most bridges, as it can be made of any height to the same span, its hanches being at the same time sufficiently elevated above the water, even when it is very flat at top. Elliptical arches also appear bolder and lighter, are more uniformly strong, and are much cheaper than most others, as they require less materials and labour. Of the other curves, the cycloidal arch is next in quality to the elliptical one for these properties, and lastly the circle. As to the others, the parabola, hyperbola, and catenary, they are quite inadmissible in bridges that consist of several arches; but may, in some cases, be employed for a bridge of one single arch which may be intended to rise very high, as in such cases they are not much loaded at the hanches. The weight of the arch, the pressure on the abutment, &c. &c. will all be considered under the article BRIDGE.

ARCH, in Building, is a number of stones placed together over a hollow space, in the form of some curve, as a part of a circle, of an ellipsis, a parabola, hyperbola, &c., having the joints so formed, that it is supported without falling, by the piers or abutments from which it springs. Of circular and elliptical arches, some consist of semicircles or semiellipses, others are composed of segments of these curves.

Arches are chiefly used for bridges, entrances to cities and large buildings, and in general for the covering of any very large opening in walls; as also for smaller apertures, as doors, windows, &c.

The decoration of arches is various according to the nature and destination of the building, but it generally consists of mouldings surrounding the curve, called an archivolt.

For the application of arches to particular purposes, see BRIDGE, TRIUMPHAL ARCH, GATE, DOOR, WINDOW, DOME, VAULT.

ARCH, triumphal, is a gate or passage into a city, built of stone or marble, and magnificently adorned with architecture, sculpture, inscriptions, &c. serving not only to adorn a triumph at the return from a victorious expedition, but also to preserve the memory of the conqueror to posterity.

These arches were at first very simple, being built of brick, such as that of Romulus; or of roughly hewn stone, as that of Camillus; and they were also for a long time of a semicircular figure, and hence called "fornices" by Cicero. In process of time they acquired a greater degree of magnificence; and they were constructed of the finest marble, and of a square figure, with a large arched gate in the middle, and two small ones on each side, adorned with columns and statues, and various figures executed in sculpture. From the vault of the middle gate hung small winged images of victory, with crowns in their hands, which they let down on the victor's head as he passed in triumph. This kind of magnificence commenced under the first emperors; so that Pliny (H. N. xxxiv. 6. § 12.) calls it "novicium inventum." During the time of the republic, arches were appropriate to generals who obtained victories over

over the enemies of Rome; and none were erected in honour of the dead. But when Augustus became emperor, this was one species of adulation that was rendered him; and the Roman senate proposed to him to have a triumphal arch erected in honour of Nero Drusus who died in Germany. He approved the proposal; and an arch of marble, adorned with trophies, was erected on the Via Appia. Caligula was the second on whom this honour was conferred after his death by the Pisans, to whom he had sent a colony. Germanicus was the third. This honour was afterwards extended to women; which Dion considers as an evidence of the degeneracy and fervility of the Romans: it was granted to Livia after her decease.

Antiquarians have reckoned 36 triumphal arches in Rome. The most celebrated of the ancient arches now remaining at Rome, are those of Titus, of Septimius Severus, and of Constantine; of which we have figures given us by Des Godetz.

The arch of Titus, placed between the forum and the coliseum, was erected, as some have thought, by the senate and Roman people, to Titus and his father Vespasian, in honour of their victories: but it was more probably dedicated to Titus after his death and apotheosis, as the epithet "divo," applied to him in the inscription still extant, suggests; and its chief design seems to have been to commemorate the conquest of Judæa, and the destruction of Jerusalem. The frieze of this arch, which is of the Composite order, is supported by two columns, and upon it is represented the triumphant procession of Titus, including a figure of the river Jordan, with captives and animals, as well as instruments of sacrifice, in sculpture. On the inner sides of the arch are two basso-relievos, one of which exhibits the emperor drawn in his triumphal car by four horses; the lictors accompany the chariot; and victory follows, holding in her left hand a branch of palm, and in her right hand a crown of laurel over his head: the horses are conducted by a figure representing the city of Rome, with a helmet and spear; and she is followed by magistrates, &c. bearing branches of laurel. The other bas-relief represents the table of shew-bread, the trumpets, the golden candlesticks with seven branches, the tables of the law, the ark of the covenant, and other utensils, brought as spoils by the conqueror from the temple of Jerusalem.

The arch of Septimius Severus was erected by the Roman people, as the inscription intimates, in honour of his victory over the Parthians and other barbarous nations, that were enemies of Rome. This arch stands near the back part of the capitol; and though it is much sunk in the earth and mutilated, several basso-relievos are still distinguishable. On the two sides of the vault of the grand arch are two winged victories bearing trophies, two genii with perfumes, flowers, and fruits, symbolical of the provinces subdued by Severus, and four rivers. Eight fluted columns, of the Corinthian order, support the frieze that bears the inscription. A staircase of marble led to its summit, on which were placed Caracalia with his father and brother, in a triumphal chariot drawn by six horses, and at their sides ranks of soldiers who accompanied the triumph. The inscription imports that this arch was erected in honour of Marcus Aurelius, as well as of S. Severus, "in acknowledgment of the restoration of the safety of the state, and the aggrandizement of the Roman empire, by their valour and eminent virtues."

The arch of Constantine subsists almost entire, and is by much the finest of the three. It was erected by the senate and Roman people in honour of Constantine after his victory over Maxentius, and stands in the Appian Way at the junction of the Cœlian and Palatine mounts. The inscription on both

sides of the architrave imports, that it was dedicated "to the emperor Cæsar Flavius Constantine Augustus, the greatest, the pious, and the happy; because, by a divine impulse, the greatness of his courage, and the aid of his army, he avenged the republic by his just arms, and, at the same time, rescued it from the tyrant and his whole faction." On one side of the arch are the words "Liberatori urbis," to the deliverer of the city; and on the other, "Fundatori quietis," to the founder of public tranquillity. Antiquarians have observed that some of the basso-relievos, and other carvings upon this arch, appear to have been borrowed from the forum of Trajan, and that they represent that emperor's victories over the Dacians. This was the case with respect to the eight mutilated statues, whose heads Lorenzo de Medicis broke off and conveyed away to Florence. This theft might not, perhaps, have been so notorious to posterity, if the artists of Constantine's time had not added some figures which make the fraud apparent, and by their manifest inferiority evince the great decline of the arts in the interval between the reigns of those emperors. Although the decree for erecting this arch was, without doubt, passed immediately after the defeat of Maxentius, it appears from the monument itself, that the building was not finished and dedicated till the tenth year of Constantine's reign, or the year of Christ 315 or 316.

Triumphal arches were not confined to Rome and its environs. Two arches, with statues of the natural size, were erected on the Flaminian way, one on the bridge of Tiber, and the other at Rimini, in honour of Augustus, who made this way from Rome to Rimini; and another arch was constructed on the summit of mount St. Bernard in the Alps, in honour of the victory which Augustus obtained over the inhabitants of these mountains. The triumphal arch of Ancona was erected in honour of Trajan, the empress Plotina and her sister Marciana. One of the gates of Orange is a triumphal arch of C. Marius, supposed to have been erected in honour of the victory obtained by him and Catulus over the Teutones, Cimbri, and Ambrones. The gates, Peyro at Montpellier, and of St. Denis, St. Martin, and St. Antoine, at Paris, may also be reckoned triumphal arches of the moderns.

In China, triumphal arches are very numerous. They are erected not only in all the cities, but on the mountains and eminences along the roads; and were originally designed for the commemoration of their illustrious heroes, such as princes, generals, philosophers, and ministers of state. The number is computed to exceed 1100, among which there are nearly 200 of exquisite beauty and grandeur. Some few, less noble and beautiful, are erected to their most distinguished females. The height of these arches is commonly between 20 and 25 feet, and they are decorated with figures of men, beasts, and birds, placed in various attitudes, festoons and other ornaments, which are but indifferently carved; but in some the relievos are so bold, that they seem to be separated from the work.

ARCH, *Mural*. See MURAL.

ARCH, in the *Scripture History*. See ARK.

ARCH, or Arco, in *Geography*, a small town of Germany in the Tyrol, seated on the Sarca, with a citadel standing on a mountain. It is the capital of a country, founded in 1413 by the emperor Sigismund. It is distant six leagues south-west from Trent, and twelve north-west from Verona.

ARCH, or ARCHI, formed of αρχη, *beginning*, whence αρχη, *princeps*, *chief*, is also a term without any meaning of itself, but which becomes very significant in composition with other words; as it heightens and exaggerates them; and has the force of a superlative, to shew the greatest degree or eminence of any thing.

Thus we say, *arch-treasurer, arch-angel, arch-bishop, arch-heretic, &c.* to denote such as have a pre-eminence over others. So also *arch-fool, arch-rogue, &c.* to express folly and knavery in the utmost degree.

In English, we usually cut off the final *i*, from *archi*, though with very ill effect, as the words with which it is joined sound much harsher on that account, than they would do, were it preserved entire, as it is in most other languages.

ARCHABIS, in *Ancient Geography*, a river of Asia, in the territory of Colchis, which, according to Arrian, discharges itself into the Euxine sea.

ARCHAD, or **ACCHAD**, was built by Nimrod after he had founded Babylon, from which it was not far distant. Bochart supposes that it was seated on the banks of the Argad, which passed by the walls of Sitace; and indeed he suggests that there were the same city under different names.

ARCHADIAPOLIS, an episcopal city of Asia, mentioned in the sixth council of Constantinople.

ARCHÆA, the name of a city of Asia, in the district of Eolis, according to Pausanias.

ARCHÆOGRAPHIA, the art of describing or explaining ANTIQUITIES. See ANTIQUE.

ARCHÆOPOLIS, a city of Asia Minor, in Ionia, according to Pliny, in whose time it was destroyed, after having been often rebuilt. It was also called Cobe, Sipyllum, and Lebade.

ARCHÆOPOLIS, a town of the territory of Colchis, and metropolis of Lazica, seated, says Procopius, on a barren hill, and watered by a river that flowed from an adjacent mountain.

ARCHÆOTA, a keeper of ancient records.

ARCHÆUS. See ARCHEUS.

ARCHAISM, properly denotes a phrase or diction now obsolete and out of use, though anciently deemed good, or passable.

ARCHAISM, *etymologic*, *archaismus etymologicus*, is when either an obsolete word, declension, or conjugation, is used.

ARCHAISM, *syntactic*, *archaismus syntacticus*, is an unusual and obsolete construction in discourse.

ARCHAMA, in *Ancient Geography*, a town of Capadocia, in the state of Cilicia, according to Ptolemy.

ARCHANDROPOLIS, a city of Egypt, according to Herodotus and Stephan. Byz.; but not mentioned by Ptolemy, and probably not existing in his time.

ARCHANGEL, compounded of the Greek *αρχος*, *prince*, and *αγγελος*, *angel*, an intellectual substance or angel, placed in the ninth order among the blessed spirits which compose the celestial HIERARCHY. See ANGEL.

The scripture (says lord King, Prim. Church. p. 73.) mentions but two orders of angels; viz. archangels, presiding over the angels; and the angels, obeying and attending on the archangels. Indeed, we have no account in scripture but of one exalted spirit, anciently styled archangel (see 1 Thess. iv. 16.); though it is not improbable that as there are different degrees of glory in the celestial state, there may be different ranks, and corresponding denominations and offices among these superior beings.

ARCHANGEL, in *Botany*. See LAMIUM.

ARCHANGEL, *baum-leaved*. See MELITTIS.

ARCHANGEL, *yellow*. See GALEOPSIS.

ARCHANGEL, in *Geography*, a sea-port town of Russia, and capital of the government to which it gives name. This government is bounded on the north by the Frozen Ocean, on the east by the government of Tobolsk, on the south by the governments of Olonetz and Vologda, and on the west by the White Sea and the dominions of

Sw den. It was formerly included in the government of Vologda, but separated by a late partition of Catharine II. Accordingly it contains 7 districts; viz. Archangel, on the Dvina, about 70 versts from its mouth; Kolmogori, on the Dvina; Schenkursk, on the river Vaga; Pineg, on the right side of the Dvina, where the river Pinega falls into it; Onega, on the river Onega, in Russian Lapland; Kola, on the river Kola, near the bay of Kola, in the Frozen Ocean; and Mefen, on the river Mefen, falling into the Frozen Sea. The town of Archangel is seated on the river Dvina, near its mouth, where it forms the gulph of Archangel in the White Sea. It was discovered in 1553, on occasion of the first enterprize of the English for opening a trade with Russia, by Richard Chancellor, who, under Sir Hugh Willughby, had the command of a small fleet of 13 ships, destined for discovering a north-east passage to China and India. Two of these ships were forced by effects of weather into the bay of the river Arzina, in Russian Lapland; and Sir Hugh Willughby, together with both crews, were frozen to death. Chancellor, discovering the country bordering on the White Sea, landed near the mouth of the Dvina, in a bay which he denominated the bay of St. Nicholas, from a convent near the present port of Archangel. Soon after this, the tzar Ivan Vassilievitch II. caused the harbour of the Archangel Michael to be constructed; granted several privileges to the English nation; and thus grew up at length the trading port Archangel: the commerce soon increased, and with some occasional interruptions, Archangel continued the sole port for the exports and imports of Russia, until the building of St. Petersburg, when Peter the Great removed the commerce of the White Sea, to the havens of the Baltic. From 1691 to 1701, the exports, on a yearly average, amounted to the value of 112,251 pounds sterling; whereas the imports from England were estimated at only 58,834 pounds sterling. The revenue of the crown at Archangel amounted annually to about 100,000 rubles; a sum which, according to the value of money at that time, may be deemed very considerable. The principal articles of export were then potashes, caviar, tallow, wax, hides, hemp, feathers, tar, yarn, beef, rhubarb, silk (probably Chinese and Persian), cork, bacon, cordage, furs, bristles, &c. all rough commodities. In 1752, Elizabeth again restored the ancient immunities of Archangel; and its present trade is not inconsiderable. To the former articles of exportation, several others of importance are added, such as corn, linseed, iron, flax, train-oil, sail-cloth, and other coarse linens, tobacco, &c. This port supplies the government of Archangel, and part of those of Nishnei-Novogorod, and Casan, with European commodities, and draws in exchange from those parts corn, flax, hemp, coarse linen, cordage, sails, malts, tallow, which are mostly conveyed by the Dvina: and it also forms a principal communication with the northern and western parts of Siberia, whence fur-skins and iron are procured. A ship goes every year from Archangel to winter at Spitzbergen; and at least one frequently goes to Novaya Zemlia, for the benefit of the fishery.

From a statement of the port-duties, given by Mr. Tooke for 1775, it appears that the imports of Archangel amounted to 281,747 rubles, 63 kop; its exports to 1,367,926 rubles, 38 $\frac{3}{4}$ kop; and duties to 144,961 rubles, 84 $\frac{1}{2}$ kop. The water of the sea near Archangel is so briny, that quantities of sea-salt are prepared from it; though that of the White Sea in general contains proportionably but little salt. The fishery here, and on other parts of this sea, is very considerable, particularly of stock-fish, herrings, whales, morfes, porpoises, sea-dogs, &c. The

dock-yards of Archangel are not in the town, but at the distance from it of five versts, on an island in the Dvina, named Solombol, which is pretty large, and inhabited by people belonging to the yards. The ships are built in docks, and then launched from the stocks; and the timber of which they are constructed is that of the larch-tree, which is very cheap: a quantity sufficient for a ship of 60 guns costs there, if carefully and honestly purchased, somewhat more than 2000 rubles. The oak timber, which is used for particular parts of the vessel, is brought thither from the precincts of Casan.

In the government of Archangel, and particularly in the southern parts, the breeding of cattle is carried on with great success; and every where about the town there is a fine breed of large cows, brought originally from Holland, and which are not found in the least to degenerate. In the district of Archangel is also found a good kind of poney, fleet and hardy; but the genuine breed begins to be rare.

Mr. Coxe informs us, that the most honest and intelligent persons of the mercantile and trading order among the Russians are the inhabitants of Archangel and its environs: most of them are able to read, write, and cast accounts: many of them are much employed at Petersburg by the members of the British factory, to superintend their warehouses, and they have the general character of industrious and faithful servants. This ingenious traveller traces the distinguishing character of the inhabitants of Archangel and its environs, to this town's having been, during a considerable period, the great emporium of Russia; so that many of them, being connected with foreign merchants, who required great exactness in their dealings, were gradually trained to business. By a kind of local enthusiasm, and traditional instruction, they have continued to distinguish themselves among their countrymen, by acquiring the rudiments of arithmetic, and by a diligent discharge of their trust. Archangel is situated in N. lat. $64^{\circ} 34'$. E. long. $38^{\circ} 55'$.

ARCHANGELICA, in *Botany*. See ANGELICA.

ARCHANGELICÆ, in *Entomology*, a species of APHIS, found on the plant Angelica Archangelica, and described by Scopoli: it is black; beak and abdomen greenish. Gmelin.

ARCHANGELSKOI, in *Geography*, a town of Siberia, in the government of Irkutsk, at the conflux of the Tangui and the Oka, 116 miles north-east of Udinsk. N. lat. $53^{\circ} 20'$. E. long. $101^{\circ} 44'$.

ARCHARD, in *Commerce*, a kind of green fruit, pickled in vinegar, and much valued throughout the East Indies.

The best are those brought from Persia, in bottles, much like small cucumbers among us.

ARCHASIA, in *Entomology*, a species of PAPILIO found in Java. The wings are dentated, brown, with a common fulvous band, the first half of which is blue on the anterior wings. Gmelin. *Olf.* This author is indebted to Fabricius for his description, and by him this species is called ARCHESIA. It is the same size as Papilio Atalanta.

ARCHBISHOP, ARCHIEPISCOPUS, a metropolitan prelate, having several suffragan bishops under him.

Archbishops were not known in the East till about the year 320; and though there were some soon after this who had the title, yet that was only a personal honour, by which the bishops of considerable cities were distinguished. It was not till of late that archbishops became metropolitans, and had suffragans under them.

Athanasius appears to be the first who used the title archbishop, which he gave occasionally to his predecessor.

Gregory Nazianzen, in like manner, gave it to Athanasius; not that either of them was entitled to any jurisdiction, or any precedence, in virtue of it.

Among the Latins, Isidore Hispalensis is the first that speaks of archbishops. He distinguishes four orders or degrees in the ecclesiastical hierarchy, viz. patriarchs, archbishops, metropolitans, and bishops.

In the fourth century, when Constantine the Great modelled the ecclesiastical government according to the civil, new gradations of eminence and rank were introduced among the bishops, corresponding to those that were established in the state. Before this period, three prelates seem to have enjoyed a certain degree of pre-eminence above the rest of the episcopal order; these were the bishops of Rome, Antioch, and Alexandria; and to these the bishop of Constantinople was added, when the imperial residence was transferred to that city. These four prelates answered to the four prætorian prefects created by Constantine; and it is possible that in this century they were distinguished by the Jewish title of patriarchs. After these followed the exarchs, who had the inspection over several provinces, and answered to the appointment of certain civil officers who bore the same rule. In a lower class were the metropolitans, who had only the government of one province, under whom were the archbishops, whose inspection was confined to certain districts; but in this gradation the bishops brought up the rear. Mosh. Eccl. Hist. v. i. p. 349. See BISHOP.

ARCHBISHOPRICK, ARCHIEPISCOPATUS, the dignity of archbishop, or the province under his jurisdiction.

There are now two archbishopricks in England; viz. of Canterbury and York; the prelates whereof are called *primates*, and *metropolitans*; with this only difference, that the former is called primate of all England, and the latter, simply, primate of England.

The latter yields likewise in prerogative and jurisdiction to the former. The archbishoprick of York extends over the counties of Northumberland, Durham, Cumberland, Westmoreland, Cheshire, Lancashire, and the isle of Man, besides its proper and peculiar diocese of the greatest part of Yorkshire and Nottinghamshire. That of Canterbury comprehends the other counties, and has its peculiar diocese, being a great part of Kent. The archiepiscopal office is rather a dignity than a jurisdiction; and the primates rarely interfere in any dioceses except their own. They are appointed by the king, in the same manner as the bishops, by what is called a "congé d'elire."

The archbishop, beside the inspection of the bishops and inferior clergy in the province over which he presides, exercises episcopal jurisdiction in his own diocese. As archbishop, he, upon receipt of the king's writ, calls the bishops and clergy of his province to meet in convocation; but he cannot assemble them without the king's writ. To him all appeals are made from inferior jurisdictions within his province; and, as an appeal lies from the bishops in person to him in person, so it also lies from the consistory courts of each diocese to his archiepiscopal court. He is guardian of the spiritualities of any vacant see in his province, as the king is of the temporalities; and exercises ecclesiastical jurisdiction in it. He is entitled to present by lapse to all the ecclesiastical livings in the disposal of his diocesan bishops, if not filled within six months. He has likewise a customary prerogative upon consecrating a bishop, to name a clerk or chaplain to be provided for by such bishop; in lieu of which it is now usual to accept an OPTION. He is said to be *enthroned* when vested in the archbishoprick; whereas bishops are said to be *inflated*.

Archbishops, as well as bishops, may become void by death, deprivation for any gross and notorious crime, and resignation, which, on the part of an archbishop, must be made to the king himself. When an archiepiscopal see is vacant, the dean and chapter are the spiritual guardians, ever since the office of prior of Canterbury was abolished at the reformation.

The archbishop of Canterbury had anciently, viz. till the year 1152, jurisdiction over Ireland as well as England, and was styled a *patriarch*, and sometimes *alterius orbis papa*, and *orbis Britannici pontifex*. Matters were done and recorded in his name thus, *anno pontificatus nostri primo*, &c. The first archbishop of Canterbury was Auslin, appointed by king Ethelbert, on his conversion to Christianity, about the year 598. He was also *legatus natus*. See LEGATE. He even enjoyed some sort of royalty: as to be patron of a bishoprick, which he was of Rochester; and to make knights, coin monies, &c.—He is still the first peer of England, and the next to the royal family; having precedence of all dukes, and all great officers of the crown. It is his privilege, by custom, to crown the king and queens of this kingdom. He may retain and qualify eight chaplains; whereas a duke is by statute allowed only six.

He has, by common law, the power of probate of wills and testaments, and granting letters of administration.

He has also (by stat. 25 Hen. VIII. c. 21) a power to grant licences and dispensations in all cases formerly sued for in the court of Rome, and not repugnant to the law of God. He accordingly issues special licences to marry, to hold two livings, &c.; and he exercises the right of conferring degrees.

He is addressed with the title of *Grace*, and *Most Reverend Father in God*; and writes himself by *Divine Providence*; whereas bishops only use by *Divine Permission*.

He also holds several courts of judicature; as court of arches, court of audience, prerogative court, and court of peculiars.

The archbishop of York has the like rights in his province, as the archbishop of Canterbury. He has precedence of all dukes not of the royal blood; and of all officers of state, except the lord high chancellor. He has also the right of a count palatine over Hexamsire.

The first archbishop of York was Paulinus, appointed by pope Gregory about the year 622. He had formerly jurisdiction over all the bishops of Scotland; but in the year 1470, pope Sextus the IV. created the bishop of St. Andrews, archbishop and metropolitan of all Scotland.

ARCH-BUTLER, ARCHIPINCERNA, the great butler or skinker of the empire.

The king of Bohemia is archbutler: and his business is such is to present the first cup at an imperial entertainment; but he is not obliged to officiate with his crown on.

His other prerogatives are, that he precedes all other temporal electors; walks in procession immediately after the emperor, the empress and the electors of Mentz and Cologne following next; and in the electoral college he has the third voice, &c. He has for vicar or deputy the hereditary prince of Limbourgh.

ARCH-CHAMBERLAIN, ARCHICAMERARIUS, an officer of the empire; much the same with what in England we call *great chamberlain*.

The elector of Brandenburg is arch-chamberlain of the empire, being so appointed by the golden bull; and in that quality, he bears the sceptre before the emperor, which he bears in his coat of arms, walking on the left hand of the elector of Saxony. At some solemnities he also serves on

horseback like other electors, carrying a basin with a towel in his hands; which, alighting, he sets for the emperor to wash. He may proceed with respect to his fiefs, principalities and lands, as with all-odial estates; and at his own pleasure impose new tolls, and erect mills on all the rivers. He has his vicar, or sub-arch-chamberlain, who is prince of Hohenzollern, of the house of Brandenburg, and also bears the sceptre in his arms.

ARCH-CHANCELLOR, ARCHICANCELLARIUS, a great chancellor who anciently presided over the notaries, that is, the secretaries of a court.

This office chiefly obtained in France, under the two first races of their kings; and afterwards under the empire; as they had three several territories, Germany, Italy, and Arles; they had three arch-chancellors; and hence the three arch-chancellors still subsisting in Germany; the archbishop of Mentz being arch-chancellor of Germany, the archbishop of Cologne of Italy, and the archbishop of Treves of Arles.

The arch-chancellor of Germany is also denominated director, and also dean or decanus of the electoral college. To him it belongs to notify the demise of a Roman emperor to his co-electors, to appoint the diet, to administer the oath of election to the whole body of electors or their envoys, to collect their voices, to proclaim the election, and also to anoint the elected emperor, when the coronation happens within his diocese. At the diet he bears the general director, in which he acts without controul; and before him or his envoys all those of the states of the empire, as well as of foreign princes, legitimate themselves. He names the vice-chancellor of the empire, or an aulic vice-chancellor, who is obliged to take an oath to him as well as to the emperor. He also appoints all the chancery officers of the empire, and has supreme jurisdiction over them, and also the inspection of its archives. By him the emperor causes the aulic council of the empire to be visited. The arch-chancellor of Italy has the second voice at an election of a king of the Romans; and when the emperor is crowned at Aix-la-Chapelle, and in the archbishoprick of Cologne, the right of performing the coronation belongs solely to him.

The arch-chancellor of the holy Roman empire in Gaul and Arles is at present only a bare title, without any power belonging to it. At an election of a king of the Romans, he has the first voice, and constantly precedes the elector of Cologn.

Bern. de Mallinerot, in an express treatise *De Archicancellariis Imperii Romani*, shews that these three archbishops were arch-chancellors before they were electors.—We also read of arch-chancellors of Burgundy, &c.

ARCH-CHANTOR, ARCHICANTOR, the chief or president of the chantors of a church.

ARCH-count, *archicomites*, a title anciently given to the earl of Flanders, on account of his great power and riches.

ARCH-DEACON, ARCHIDIACONUS, a church officer vested with ecclesiastical jurisdiction over the laity and clergy, next after the bishop, either through the whole diocese, or only a part of it.

He is usually appointed by the bishop himself, and hath a kind of episcopal authority, originally derived from the bishop, but now independent and distinct from his. He therefore visits the clergy, and has a separate COURT for punishment of offenders by spiritual censures, and for hearing all other causes of ecclesiastical cognizance.

The archdeacon, sometimes also called *arch-levite*, was originally the first and eldest of the deacons who attended on the bishop: whence his name.

But as the archdeacons, in their original institution, had

no relation to the diocese, but only to the episcopal see, so it was by several steps and degrees that they attained to the power they now enjoy. At their first institution, their proper business was, to attend the bishop at the altar; to direct the deacons and other inferior officers in their several duties, for the orderly performance of divine service; to attend the bishop at ordinations; and to assist him in the management of the revenues of the church: but without any thing that could be called jurisdiction in the present sense of the word, either in the cathedral or out of it. Gibson.

An archdeacon was not known before the council of Nice: his function has since become a dignity: and even set above that of priests; though anciently it was quiet otherwise. The archdeacon was the bishop's chief minister, for all external concerns, and particularly the administration of the temporalities. He took care that order and decency were observed in divine service; looked to the ornaments and utensils of the church; had the direction of the poor, and inspection of the manners and behaviour of the people: for which reason he was called the *bishop's heart and eye*; *oculus episcopi, & cor episcopi*. These advantages soon gained him superiority over priests, who had only spiritual functions. But he had no jurisdiction over them till the sixth century; though by that time he was become superior to the archimandrite, or rural dean.

In the tenth century, archdeacons were considered as having jurisdiction in their own right, or attached to their office; with a power of delegating it to others. But from that time measures were taken to lessen their power, by increasing their number.—He whose district lay in the capital city, took the quality of *great arch deacon*.

We have sixty archdeacons in England: their office is to visit every two years in three, to inquire into the reparations and moveables belonging to the church, reform abuses in ecclesiastical matters, and bring the more weighty affairs before the bishop: besides which they have also a power to suspend, excommunicate, and in many places to prove wills, and in some to institute to benefices.

It is one part of the archdeacon's office to induct all clerks into their benefices within his jurisdiction; and, by the act of uniformity, he is now obliged to be in priest's orders.

Many archdeacons, in old foundations, have, by prescription, their courts and officials, as bishops have.

Archdeaconries are commonly given by bishops, who do therefore prefer to the same by collation; but if an archdeaconry be in the gift of a layman, the patron doth present to the bishop, who institutes in like manner as to another benefice; and then the dean and chapter do induct him, that is, after some ceremonies, place him in a stall in the cathedral church to which he belongeth, whereby he is said to have a place in the choir.

ARCH-subdeacon, archisubdiaconus, the first or chief among the subdeacons, as the archdeacon is among the deacons. In some copies of the Roman ordinal, he is called *subarchidiaconus*.

ARCH DRUID, ARCHIDRUIDA, the chief or pontiff of the ancient DRUIDS in a nation.

ARCHDUKE, ARCHIDUX, a duke vested with some quality, pre-eminence, and authority, above other dukes.

The archduke of Austria is a very ancient title. There have also formerly been archdukes of Lorraine and Brabant. Austria was erected into a marquissate by Otho I. in favour of his brother-in-law Leopold, or by Henry I. in 944, who is said to have bestowed it on Leopold, called the "illustrious," and the first that brought the Austrian countries as an inheritance to his posterity, under that dignity; and it was

raised into a duchy by Frederic I. in 1156; but we do not well know when, or why, the title archduchy was given it.—It is commonly maintained, that Frederic III. called the "Pacific," erected it into an archduchy for his son Maximilian, about the year 1477. Others say, that the title was conferred by the same emperor on Philip, the son of Maximilian; and that he was the first of the Hapsburg family distinguished by the appellation of Archduke. However this be, it is certain, that it has been uniformly used since the fourteenth century, and that considerable privileges are annexed to it.

The principal privileges of this state are, that the archduke shall distribute justice in his own dominions, without appeal: that he shall be judged to have received the investiture of his states, after having demanded it three times; and that he cannot be deprived of his countries, even by the emperor, and the states of the empire: that no affair of the empire can be concluded without his participation; and that he have a power of creating counts, barons, and gentlemen, throughout the whole empire; which are privileges to which the other dukes of the empire are entire strangers. Besides, he is born privy-counsellor of the emperor; all attempts against his person are punished as crimes læsæ majestatis; he is exempt from challenge to single combat; may assist at the assemblies, or be absent, at pleasure; and he has the privilege of being exempt from contributions and public taxes; and ranks immediately after the electors. His subjects cannot be summoned out of his province, upon account of law-suits, or to give witness, or to receive the investiture of fiefs: any lands of the empire may be alienated in his favour, even those that are feudal; in the succession to his states, the right of birth takes place, and upon the failure of males, the females succeed according to the lineal right; and if no heir be found they may dispose of their lands, as they please.

ARCH-monastery, archimonsasterium, an appellation sometimes given to the greater monasteries and abbies.

ARCH-notary, archinotarius, the *primicerius*, or chief of the notaries.

This office is supposed by some to have differed from the *arch-chancellor*, though wherein the difference consisted does not appear.

ARCHE, αρχη, is a Greek word, importing the *beginning*.

ARCHE, among *Physicians*, is the beginning or first period of disease.

ARCHE, L', in *Geography*, a town of France in the department of the Correze, and chief place of a canton, in the district of Brive, two leagues south-west of Brive.

ARCHED fountain. See *FOUNTAIN*.

ARCHED skene, or scheme, in Architecture, is used to denote a flat *arch*, less than a semicircular one.

ARCHED legs, is an imperfection in a horse, when being in his natural position, he has his legs bent forwards; so that his whole leg makes a kind of arch or bow.

This usually arises from excessive labour, whereby the back-sinews are made to shrink up, so that the legs remain arched, and naturally tremble after a little riding; though the disorder is natural to some horses.

ARCHEGETES, formed of αρχων, chief, and ηγεμοναι, to conduct, in *Mythology*, a title of Apollo, under which he had an altar and worship in the isle of Naxos. The coins of this island bore a figure of Apollo's head with this appellation. In the island of Malta, Hercules had the same title, whither his worship was brought from Tyre.

ARCHEION, a name given by the Greeks to the most retired and secret place of their temples, where were deposited.

fired the richest treasurers pertaining to the deities, to whom they were consecrated, and also other valuable articles which they were desirous of preserving secure. The Romans imitated the Greeks in this respect, and lodged their public treasure in the temple of Saturn.

ARCHELAUS, in *Ancient Geography*, a town of Cappadocia. Piny says, that it was a Roman colony, and that it was near the river Halys.—Also, a city of Judæa built by Archelaus, son of Herod the Great, before his exile. Ptolemy places it to the west of Jericho, and the Peutingerian tables fix its situation between Jericho and Scythopolis.

ARCHELAUS, in *Biography*, a Greek philosopher, was born either at Miletus or at Athens. He was a disciple of Anaxagoras at Lampascus, occupied the chair of that philosopher after his death, and may be considered as the last preceptor of the original Ionic school. Afterwards he removed to Athens, and with him the Ionic school was removed thither. Here he acquired distinguished reputation by publicly teaching the doctrines of Anaxagoras concerning natural bodies; whence he was denominated the natural philosopher. Among the tenets ascribed to him are the following: that similar parts were the material principles of all things, and that a superintendant mind, by collecting and uniting these, formed natural bodies; that the universe is infinite; that heat is the cause of action, and cold of rest; that the earth was originally a muddy mass, from which living animals were produced and nourished; and that animals have souls, differing in their powers according to the structure of the bodies in which they reside. In ethics, it was his fundamental principle, that there was in nature no essential distinction between right and wrong, but that it resulted from positive institution, and consequently that all actions were indifferent, till human laws declare them to be good or evil. This doctrine, so subversive of all moral obligation, gained little credit at the time when it was propounded; and it has had few advocates either in ancient or in modern times. Amongst the scholars of Archelaus, who were numerous, Socrates was eminently distinguished; and under him philosophy assumed a new character. Diog. Laert. l. ii. § 17. T. ii. p. 89. Cic. Tuscul. Quest. l. v. c. 4. T. ii. p. 454. ed. Olivet. Plut. de Placit. Phil. l. i. c. 3. T. ii. p. 876. August. de Civ. Dei. l. xiii. c. 2. Suidas. Brucker's Hist. Phil. by Enfield, vol. i. p. 153.

ARCHELAUS, a Christian divine, was bishop of Mesopotamia, and flourished under the emperor Probus, about the year 278. Of the author and authenticity of the work against the Manichees, intitled, "The Acts of the Disputation of Archelaus with Mani or Manichee," ascribed to him by Jerom and others, and said to be written in the Syriac language, many different opinions are entertained. Photius, on the authority of Heraclian, bishop of Chalcedon, ascribes it to Hegemonius; and hence Cave and others have been induced to consider Hegemonius as the translator. Fabricius conjectures, that this author, whose age is unknown, published an abridgment of the work of Archelaus. Dr. Lardner, who with his usual accuracy and impartiality has examined and weighed the evidence on this subject, inclines to the opinion of Beauobre, who thinks, that this work was originally written in Greek, near the end of the third or beginning of the fourth century; and that it contains some truths disguised and mixed with manifest falsehoods. It was edited from a manuscript of the Latin translation found at Cassino, and from some fragments of the Greek in Cyril and Epiphanius, by Zaecagni, in his "Collestanea Monumentorum Vet. Rom." in 1698. The writer's respect for the scriptures now commonly received, says Lardner, is manifest from his very numerous and frequent quotations of

them as decisive and of authority in all disputed points of religion. Cave, Hist. Lit. vol. i. p. 144. Fabr. Bibl. Græc. l. v. c. i. § 31. T. v. p. 362. Lardner's Works, vol. iii. p. 368—374.

ARCHELAUS, king of Judæa properly so called, together with Samana and Idumæa, was the son of Herod the Great by Martæ his fifth wife, and appointed by his will to succeed him in the 1st year of Christ, or the 3d year before the vulgar æra. Notwithstanding a conciliatory speech made by the new king on his accession to the throne, and some grants to the people, a tumult was raised, by which the paschal solemnity for that year was interrupted, and 3000 of the mutineers lost their lives. After the suppression of this tumult, Archelaus proceeded to Rome, in order to obtain the ratification of his father's will, and a permanent establishment in the kingdom. Upon his arrival he found his brother Herod Antipas, who was his competitor for the crown, together with several of his family who favoured Herod's pretensions, not so much from love to him as from hatred to Archelaus. An embassy also of fifty of the principal persons of Jerusalem was sent to Rome with a petition to Augustus, that they might be permitted to live according to their own laws under a Roman governor; and these deputies were joined by above 8000 Jews, that were resident in the city. Archelaus, however, by his humility and address, obtained the grant of half his father's kingdom, including Judæa Proper, Idumæa, and Samaria, under the title of Ethnarch, or governor of a nation, and also a promise of adding that of the king, as soon as he heard that his conduct merited that distinction. St. Matthew indeed (ch. ii. 22.) says, "that Archelaus did reign in Judæa;" and against this mode of expression there can be no just objection, because his father in his last will had appointed him his successor with the title of king; and Josephus (Antiq. l. 18.) calls him, notwithstanding the limitation of Augustus's decree, the king that succeeded Herod, and he has used (De Bell. l. ii. c. 7.) the term reigning for the duration of his government. Archelaus immediately upon his return to Jerusalem began to betray some offensive tokens of his arbitrary and vindictive temper. He first deposed Joazar, and afterwards his successor Eleazar, from the high-priesthood; and, in direct opposition to the Mosaic law, he repudiated his wife Mariamne, and married Glaphyra, the widow of his brother Alexander, though she had several children. In other respects, his reign was tyrannical, and, Antipater excepted, he seems to have been the worst of all Herod's sons; and therefore in the tenth year of his government, A.D. 6, or 7, the chief of the Jews and Samaritans, not being able any longer to endure his cruelty and tyranny, presented complaints against him to Cæsar. Augustus sent for him and some of his chief accusers to Rome, and having heard both the charge and the defence, condemned him to be banished to Vienne or Vienna in Gaul, where he died, and all his goods to be confiscated. Upon this, Judæa was reduced to a province of the empire and annexed to Syria; and Cyrenius, a consular person, was sent by Cæsar to make an assessment in Syria, and to seize the estate of Archelaus. From different statements given by Josephus in his war (De Bell. l. ii. c. 7. § 3.), Antiquities (l. xvii. c. 15. § 2.), and Life (§ 1.), there is reason to conclude, that Archelaus reigned nine years complete, and that the tenth year was current when he was banished. And Dio (l. lv. p. 567.) places Archelaus's banishment in the 759th year of Rome. If Herod did not die till the beginning of A.U. 751, the ninth year of Archelaus's reign could not be completed in the 759th year of Rome: but if it be supposed that Herod died in the beginning of A. U. 750, Josephus

fephus and Dio will be found to agree. There is probably a reference to the recent history of Archelaus in our Lord's parable recorded by St. Luke, ch. xix. 12—15. *Anc. Un. Hist.* vol. iii. p. 207—218. *Lardner's Works*, vol. i. p. 14, 15. 290. 425.

ARCHELAUS, king of Macedonia, was the natural son of Perdiccas II; and though he obtained the crown by assassinating the lawful heirs, he determined to maintain it with valour and glory. With this view he fortified the principal towns of Macedonia, disciplined his armies, and fitted out armed ships, which was a kind of force to which the Macedonians had not been accustomed. He also distinguished himself as a patron of literature and of the arts, and some of the most learned men of Greece frequented his court; with them he conversed in the most familiar manner, and some of his sayings at table are recorded amongst the apophthegms of antiquity. Euripides lived with him on terms of peculiar intimacy; and this is the more surprising, if we credit the tradition that he refused to write a tragedy, at his request, on some subject relating to himself, and offered this apology, that he did not wish to represent the cruelties of a tyrant. When Socrates was invited by him, he declined paying him that respect, alleging, as Seneca says, "that he could not go to see a man from whom he might receive favours, without being able to return the like;" and it is said, that Socrates censured the great expence which he bestowed on his palace which was painted by Zeuxis, whilst he had taken no pains to adorn his mind. Some have pretended that Aristophanes wrote his comedy of "the Clouds," from envy of Socrates, because Archelaus took more notice of this philosopher than of himself. Archelaus instituted sacrifices and scenic games in honour of Jupiter and the nine muses; and a day was devoted to each muse. He also sent chariots to the Olympic and Pythian games. The manner of his death and the duration of his reign are not precisely ascertained. It is generally supposed that he was assassinated by Craterus, the object of his lascivious passion, in consequence of an affront. According to Diodorus Siculus, he began his reign in the 3d year of the 93d Olympiad, 406 years before Christ, and reigned seven years. Others have extended it to fourteen, sixteen, and even twenty-four years. *Gen. Dict. Anc. Un. Hist.* vol. iii. p. 269.

ARCHELAUS, a famous sculptor, the son of Apollonius, was borne at Priene, a town of Ionia. The marble monument of the apotheosis of Homer is ascribed to him, and such is its distinguishing excellence, that, independently of his poems, it would have insured his immortality. It was dug up in 1658 in a field belonging to the princes of Colonna, where it is said the emperor Claudius, in whose time it was executed, had a house of pleasure.

ARCHEMORUS, in *Ancient Geography*, a river of Greece in the Peloponnesus, which separated the territories of Sicyon from those of Corinth. It is called Nemea by Strabo.

ARCHEMY. ARCHEMY, is used by some to denote the art of transmuting less perfect metals into the more perfect. In which sense *archemy* differs from *alchemy*, as a part from the whole.

ARCHENDA, in the *Ancient Physic*, a kind of powder prepared of *alcanna* and leaves of the Egyptian *LIGUSTRUM*, wherewith the people smeared their feet after bathing, as a preservative against sweating and stench.

ARCHER, JOHN, in *Biography*, an English physician, who practised in London in the reign of Charles the Second, author of a manual, "Every man his own physician," published in 1673; and though little noticed, it appears to have

been not void of ingenuity. At the end of his works, he boasts of three inventions, a vapour bath, of considerable efficacy in rheumatism, and various other diseases; an oven "which doth with a small faggot bake, distil, boil a pot, or stew, all with the same charge of fire, time, and labour;" and a chariot, so contrived, that the person sitting in it may move it at pleasure. It is not improbable that some of our modern inventors took hints from this book for their contrivances.

ARCHER, EDWARD, M.D. in *Biography*, was born in the borough of Southwark, in London, about the year 171^o. He received his medical education partly at Edinburgh, and partly at Leyden, at which latter place he graduated in the year 1746, and gave for his thesis a dissertation *De Scorbuto*. In the year 1748 he was elected physician to the small-pox hospital in Cold Bath Fields, in the place of Dr. Poole, the first physician to that institution; and in 1752 he was admitted licentiate of the college of physicians, London. In the year 1782, the committee of the small-pox hospital, consisting of thirteen of the governors, prevailed on him to suffer a whole length portrait of him to be painted by Mr. Pine, for which they paid one hundred guineas, and placed it in the court-room as a mark of their respect, and of the high opinion they entertained of his abilities, and of his zeal for the institution. This, though he then accepted, yet he was mindful to return it; and therefore ordered by his will, that each of the contributors should be paid back the money they had advanced, with interest to the time of its being repaid. He also left 500*l.* to the hospital, where he resided to the time of his death, which happened on the 28th of April 1789, having now been physician to the institution forty-one years.

He was of an humane and benevolent disposition, and possessing an ample fortune, was never solicitous about practice; and during the latter part of his life, entirely declined all business, excepting his attendance on the patients in the hospital. To this he might in part be inclined from his corpulence, and from the nature of the complaint, a dropsy in the chest, to which he at length fell a sacrifice, and which must make all motion particularly troublesome to him. He was a man of considerable learning, and had collected a magnificent and valuable library. This was sold a few months after his death by Messrs. Leigh and Sotheby. He was buried at Woodford in Essex.

ARCHERS, a kind of militia or soldiery, armed with bows and arrows. The word is formed of *arcus*, a bow; whence *arcuarius*, and even *arquis*, and *arquites*, as they are also denominated in the corrupt state of the Latin tongue.

Archers were much employed in former times; but they are now laid aside, excepting in Turkey, and some of the eastern countries; where there are companies of *archers* still subsisting in their armies; and with which they did terrible execution at the battle of Lepanto. As an amusing exercise and trial of skill, the occasional practice of archery is still continued in many parts of Europe, and even in our own country.

The name archer is still retained even where the thing is lost: thus in France, the officers who attend the lieutenants de police, and provosts, to make captures, seizures, arrests, &c. are called archers; though their arms be only halberds or carabines.—In this sense they say, the archers of the *grand prevot de l'hotel*; of the *prevot des marchands*; the city *archers*; the *archers du guet*, or of the watch, &c.—Small parties of archers, called also *gens de marcheuffee*, have been employed to patrol the great roads, to secure them against robbers.—The carriages of Lyons, &c. were always escorted

by a party of archers. To the diligence of these archers, or marshal's men, it has been partly owing, that persons have travelled in all parts of France in the utmost security; and that there have been fewer robberies on the highway in that whole kingdom in a year, than about London in a week. They have also their *archers des pauvres*, archers of the poor; whose office it is to seize such beggars as they find in the streets, and carry them to the hospitals.

ARCHERY, the art or exercise of shooting with bow and arrow.

Among the nations of antiquity, the bow was a principal implement of war. Its use may be traced to the very earliest times, and followed in the history of almost every country. In this article, however, we shall principally confine ourselves to the practice of archery in England; where it was once carried to a degree of perfection that it is even yet unrivalled.

Our ancestors used the bow for a double purpose: in time of war it was a dreadful instrument of slaughter; and in peace an object of amusement. That both the Anglo-Saxons and the Danes were well acquainted with its use, is certain; and they must have derived their knowledge of it at an early period; as the Scandinavian seals, when praising the heroes of their country, enumerate among their acquirements a superiority of skill in handling the bow. Among the Saxons and the Danes, however, it seems only to have been used for the purposes of food or pastime; and we are perhaps indebted to the Norman conquest for its introduction as a military weapon. The bow employed among the Saxons will be accurately described hereafter. That which the Normans used at the battle of Hasting was the arbalest or cross-bow; while no mention is made of archers on the side of Harold.

The exact time when shooting with the *Long* bow began is unsettled; and our chroniclers do not mention the use of archery as applied either to one bow or the other, till the death of king Richard the first in 1199, who was killed at the castle of Chalus by an arrow, said to have proceeded from a cross bow. From this time till that of Edward the second, our notices of archery are scanty; the king's *ballistarius*, or cross-bow-man, is often mentioned, and it is in this reign that we met with *sagittarius*, a term which perhaps has particular relation to the shooters with the long-bow. Many of the soldiers employed in the unsuccessful expedition against Scotland in 1323 were of this description, as well as those who are sent the next year to the relief of Aquitain. Under Edward III. the glory of the English long-bow was at its zenith; and that monarch appears to have been very anxious that its lustre should remain untarnished. In 1342 a precept was issued to the sherives of most counties in England, for providing 500 white bows and as many bundles of arrows, for the then intended war against France. And the king afterwards ordered a letter of complaint to be directed to the sherives of London, declaring that the skill in shooting with arrows was almost totally laid aside for the pursuit of various useless and unlawful games; and commanding them not only to prevent such idle practices in future, but to see that the leisure time upon holidays was spent in the recreations of archery. The battle of Cressy, in 1346, was attended by a circumstance that seems to have a particular reference to the use of the long-bow among the English. Previously to the battle, a shower of rain so slackened the strings of the Genoese cross-bows, that they became almost unserviceable; while the English were still capable of annoying their enemies with success. Both this victory, and that of Poitiers, ten years

afterwards, were chiefly ascribed by the English to their archers. The decisive victory of Hamilton, against the Scots, in 1402, was achieved by them entirely: and the earl of Douglas found to his cost, that the English arrows were so swift and strong, and so charged with so much force, that no armour could repel them. In 1403, at the battle of Shrewsbury, where Hotspur was slain, the archers on both sides did terrible execution: and the victory of Azincourt, in 1417, was entirely owing to their skill. Yet, notwithstanding the advantages which had evidently accrued to the English from the use of the long-bow, the French were still attached to the arbalest: for which reason Henry V., as duke of Normandy, confirmed the charters and privileges of the habillaris, who had been long established as a fraternity at Rouen. Under Edward IV. an ordinance was made, that every Englishman and Irishman dwelling in England, should have a bow of his own height, to be made of yew, wych, hazel, ash, or auburne, or any other reasonable tree according to their power. Butts, also, or mounds of earth, as marks, were directed to be made in every township, and the inhabitants to practise archery, under certain penalties. In the fourteenth year of the same king, it appears by Rym's *Fædera*, that one thousand archers were to be sent to the duke of Burgundy, whose pay is settled at six-pence a day: a circumstance, which, considering the value of money at that time, proves very strongly the great estimation in which English archers were still held: and even afterwards, when the use of what we now call *Artillery* gained ground, that of the bow and arrow were by no means neglected. In the 19th of Henry VII. and the 6th and 25th of Henry VIII. the use of the cross-bow was entirely forbidden, and by the last-mentioned statute a penalty of ten pounds was to be inflicted on every one in whose house a cross-bow might be found. Other statutes, in the early part of Henry's reign, afforded great encouragement to archery with the long bow. One in his third year directs that every father shall provide a bow and two arrows for his son, when he shall be seven years old: and another was enacted in his 33d year to reduce the price of bows. Edward VI., as we learn from his own journal, was fond of archery; and in the succeeding reign, the statutes of Henry VIII. for its promotion were much commended, with directions to enforce them. Under Elizabeth, James, and Charles I. other statutes were ordained. In 1566 the price of bows was again regulated; and in 1571 it was enacted, that bow staves should be brought from the Hanse towns and the eastward. Ten years after this, a society of archers existed in London, who, from the same which Arthur, elder brother to Henry VIII., had acquired at the long bow, were termed prince Arthur's knights. John Lyon, who founded Harrow school in 1590, two years before his death, drew up rules for its direction, whereby the amusements of the scholars were confined to "driving a top, tossing a hand ball, running, and shooting;" the last mentioned diversion is in a manner insisted on by the founder, who requires all parents to furnish their children with "bow-strings, shafts, and brettlers, to exercise shooting." A silver arrow used, till within these few years, to be shot for by the young gentlemen of Harrow school.

The last time the legislature interfered for the protection of archery, seems to have been in 1633, when Charles I. issued a commission for preventing the fields near London being so enclosed as "to interrupt the necessary and profitable exercise of shooting;" as also to lower the mounds where they prevented the view from one mark to another. The same commission directs that bridges should be thrown

over the dikes, and that all shooting marks which had been removed should be restored. During the grand rebellion, the practice of archery seems to have received no encouragement, but rather to have fallen into disrepute. Sir William Davenant, in a mock poem, entitled "the long vacation in London," describes the attorneys and professors as making matches in Finsbury Fields:

"With loynes in canvas bow-case tied,
Where arrows stick with mickle pride;
Like ghosts of Adam Bell and Clymme,
Sol sets for fear they'll shoot at him."

Adam Bell and Clym of the Clough were noted outlaws, whose skill in archery rendered them as famous in the north of England, as Robin Hood and his contemporaries were in the midland counties. In 1676, Catharine of Portugal, queen of Charles II., by the contributions of Sir Edward Hungerford and others, presented a silver badge, weighing 25 ounces, to the marshal of the archers' fraternity, on which was represented an archer drawing the string of a long-bow (in the proper manner) to his ear; with the following inscription: "Reginæ Catharinæ Sagittarii." The supporters, two bowmen with the arms of England and Portugal. In 1682, there was a most magnificent cavalcade and entertainment given by the archers of Finsbury. Charles II. was present on this occasion, but the day being rainy, he was obliged soon to leave the field. Archery had by this time degenerated. From the glory of British warriors, it dwindled to a mere manly recreation; and the very name of archer seemed forgotten, till, in 1753, targets were erected in Finsbury-fields, during the Easter and Whitsun holidays, when the best shooter was stiled captain for the ensuing year, and the second, lieutenant. Of the original members of this society, there were only two remaining when Mr. Barrington compiled his observations in the *Archæologia*. It is now incorporated with the archers' division of the honourable the Artillery Company.

Archery, with the long bow, continues to be used as a manly exercise by the inhabitants of Geneva, and in many parts of Flanders; nor is it totally neglected in Great Britain. The most noted society of this kind, now existing, is the Royal Company of Archers in Scotland, who arose about the time of James I. During the last century, in England, many smaller societies had their origin, which have now dwindled. The chief that remain are the Archers' division of the Artillery Company, the Toxophilites, and the Kentish bowmen.

How effectual the long-bow must have been before the use of fire-arms, need hardly be suggested; and the neglect into which it occasionally fell must be solely attributed to the length of time that was required to train an expert archer, of which the preambles to many of our statutes are sufficient evidence. Why it continued in estimation so long after the use of gunpowder, will excite no astonishment in those who remember, that, till the last century, muskets were among the unwieldiest instruments of war; they were never used without a rest, had no bayonets, and could be discharged not near so frequently as at present. Strutt's *Sports and Pastimes*. *Archæol.* vol. vii. p. 46, &c. Henry's *Hist. Brit.* Ellis's *Hist. of Shoreditch*. See *ARROW*, *ARTILLERY*, and *BOW*.

ARCHERY, in our *Ancient Customs*, a service of keeping a bow for the use of the lord to defend his castle.

ARCHES, or *Court of ARCHES*. See *COURT of Arches*.

ARCHES, in *Heraldry*, are borne in coat-armour, both double and single; and they are drawn as springing from, or supported by, pillars.

VOL. II,

ARCHES, among *Navigators*, is particularly used for the Archipelago.

ARCHET, *French*; *ARCO*, *Ital.*; the bow of a violin, tenor, or violoncello. In the history of music, great pains were taken in tracing the origin of this powerful engine in the hand of a great artist, which seems to have been utterly unknown to the ancients, as it can only be traced up to the middle ages; nor was it used with much dexterity till the seventeenth century. In music for the violin, tenor, or bass, after the word *Pizzicato* occurs, the strings are to be pinched or thrummed, till the bow is ordered to be resumed, by the words *con arco*, with the bow. See *BOW*.

ARCHETYPE, *ARCHETYPUS*, compounded of *αρχη*, *beginning*, and *τυπος*, *type*, the first pattern or model by which any work is formed, or which is copied after, to make another like it. In this sense the word coincides with original, or prototype; and stands opposed to copy.

Among minters, &c. archetype is peculiarly used for the standard or original weight by which the other weights are to be adjusted and examined.

Philosophers, particularly the Platonists, talk of an *archetypal* world; meaning the world, such as it existed in the Divine Mind, or in the idea of God, before the visible creation.

ARCHEUNUCH, *ARCHIEUNUCHUS*, the chief of the eunuchs. The archeunuch was one of the principal officers in Constantinople under the Greek emperors.

ARCHEUS, an obscure term, used chiefly among the *Ancient Chemists*, to express some occult principle of life and motion, the cause of all the effects which we observe in nature; derived from *αρχη*, *principle*. As the chemists differ in their ideas of a vital cause, the term archeus becomes applied to very different things; though most of them conceive it of the nature of fire. Some use archeus to denote the fire lodged in the center of the earth, to which they ascribe the generation of metals and minerals; and which they believe to be the principle of life in vegetables. Others by the word archeus mean a certain universal spirit diffused throughout the whole creation, the active cause of all the phenomena in nature. Others, instead of archeus, choose to call this the *anima mundi*; and others, the *Vulcan* or *heat* of the earth. They add, that all bodies have their share of this archeus; and that when this is corrupted, it produces diseases which they call *archeal diseases*. They likewise attribute ideas to it; which for this reason they call *archeal ideas*. Helmont is a great asserter of the dogma of an archeus. It is likewise used to signify that peculiar fluid among the vegetable classes, which determines every particular plant to its odour, taste, and other qualities.

ARCHI, in *Ancient Geography*, a town of Palestine, in the half tribe of Manasseh, beyond Jordan. *Josh.* c. xvi. 2.

ARCHI, in *Geography*, a town of Italy, in the kingdom of Naples, and province of Abruzzo citra.

ARCHIAC, a town of France, in the department of the Lower Charente, and chief place of a canton in the district of Jonzac, five leagues south of Saintes. The place contains 1533, and the canton 10,906 inhabitants: the territory includes 180 kilometres and 16 communes. *W. long.* 0° 39', *N. lat.* 45° 34'.

ARCHIACOLYTHUS, an ancient dignity in cathedral churches; the ministers whereof were divided into four orders, or degrees, viz. priests, deacons, subdeacons, and acolythi; each of which had their chiefs. The chief of the acolythi was called *archiacolythus*. Du-Cange.

ARCHIAS, *AULUS LICINIUS*, in *Biography*, a Greek poet,

poet, lived about the year 60 before Christ, and is better known by the eloquent oration pronounced by Cicero for vindicating his right to the citizenship of Rome, than by the fragments of his works now extant. Cicero (pro Archia, apud oper. t. v. p. 397. ed. Olivet.) informs us, that he was a native of Antioch, and that his poetical talents, even in his youth, were generally acknowledged and admired in all the Greek cities of Asia and Europe which he visited. At Rome, where he arrived under the Consulships of Marius and Catullus, about the year before Christ 102, he was first received by the Lucullan family, and afterward highly favoured by the Metelli, Catuli, Crassi, and other persons of the most distinguished rank and character. Cicero speaks in terms of high commendation of his powers, which probably consisted rather in facility and copiousness of versifying, than in the other superior qualities of a poet; and he says, that by previous study and meditation, his performances were equal to those of antiquity. Archias wrote a poem on the Cimbric war, and began another on the consulate of Cicero, which was left unfinished. Some of his epigrams, now extant, are preserved in the "Anthologia."

ARCHIATER. ARCHIATRUS, formed of αρχη, *principium*, chief, and ιατρος, *medicus*, a physician, properly denotes the chief physician of a prince who retains several.

On the real signification of the term, or on the office and designation of the Archiater, authors are not agreed: some, as Hieronimus Mercurialis, considering it as a title given to the physician to the emperor or prince; others, as Aleciatus, Meibomius, &c. as belonging to the principal physician in the country, who had some power or authority over the other physicians. It is remarkable that the word does not occur in Pliny, though he frequently mentions physicians both of his own and of earlier times, some of whom were said to have been dignified with the title; and that Galen, who had the care of the health of Marcus Aurelius and his sons, is no where called by it. Perhaps, as Le Clerc conjectures, "Histoire de Médecine," p. 59; the office did not exist until after their time: for though, he observes, we find the title affixed to the works of writers who lived anterior to the time of Pliny, it may be that the copies we are in possession of were written much later, and the transcribers may have honoured the authors with this title, to enhance the value of their works, and increase the sale of their manuscripts. However this may be, the office was under the later emperors held in great honour, and its authority and privileges sanctioned by the laws. Le Clerc, who has written a long dissertation on the subject, "Hist. de Méd." p. 583, cites several laws concerning them: by these we find they had salaries appointed them, which were paid by the prince, or by the cities or provinces where they were established. They were exempt from all taxes through the whole of the Roman empire; their persons were protected; they were not obliged to entertain soldiers, &c. On the other hand, the Archiaters, not immediately in the service of the court, were obliged to give assistance to all sick persons indiscriminately, without exacting any fee for their attendance. They were also frequently ennobled and made counsellors of state, an office or dignity not unfrequently at this present time bestowed by many of the princes of Europe upon their physicians. Dr. Dimisdale, who went to Russia in the year 1768, to inoculate the late empress and the grand duke, was made physician and actual counsellor of state to her imperial majesty, and baron of the whole Russian empire.

ARCHIDAMUS, the son and successor of Agesilaus the Great, king of Sparta, commanded the Spartan army during the life of his father, before Christ 367, and obtained

a victory over the Arcadians, without the loss of a single Lacedæmonian, whence this was called "the tearless battle." When Epaminondas afterwards attacked Sparta, he obliged the Theban general to retire. He succeeded his father in the throne in the year before Christ 361; and, in the sacred war, succoured the Phœceans. To a haughty message received from Philip of Mædon, who was elated with his success, Archidamus replied, that "if he would measure his shadow, he would find it no longer than before:" and when he was asked how far the dominion of Sparta extended? his answer (indicating more his magnanimity than his sense of justice) was, "as far as they can stretch their lances." His life was prematurely terminated in a combat near the city of Mandonium in Italy, between the Messapians and Tarentines, to whose assistance he was deputed by a public decree of his country, after a reign of fifteen years; and his character was distinguished by valour and public spirit. His statue was erected in the temple of Jupiter Olympius, an honour which none of the Spartan kings had enjoyed except himself, and which Pausanias supposes was granted to him because he died fighting against the Barbarians, and did not receive those sepulchral honours which had been given to all his predecessors. He was succeeded by his son Agis. Anc. Un. Hist. vol. v. p. 483.

ARCHIDAPIFER, or chief sewer, is a great officer of the empire.

The elector of Bavaria is archidapifer.—The palatine of the Rhine at one time pretended this office was annexed to his palatinate, but he has since desisted. At the peace of Baden, the office was fully restored to Bavaria. At the coronation of the emperor he carries before him the monde of the empire, which by virtue of his office he also bears in his arms, ranks next to Bohemia, places on the imperial table the silver dishes, and serves up the first course.

ARCHIDIUM, in *Ancient Geography*, a town of the island of Crete, according to Pausanias, in *Arcad*.

ARCHIDONA, in *Geography*, a town of Spain, in the province of Andalusia, with an ancient castle, two leagues east of Antequera.—Also, a town of South America, in Peru, built by the Spaniards, in the province of Canela.

ARCHIEROSYNES, in the *Grecian Antiquity*, a high-priest vested with authority over the rest of the priests, and appointed to execute the more sacred and mysterious rites of religion.

ARCHIGALLUS, in *Antiquity*, the high-priest of Cybele, or the chief of the eunuch-priests of that goddess, called Galli. This officer was always chosen from among the most distinguished families.

ARCHIGENES APAMEUS, so called from Apamea, the place of his birth, in *Biography*, a physician of eminence in the time of the emperors Donatian and Trajan. Galen speaks of him as deserving high credit for his diligence and ingenuity, and cites several of his works with commendation. Haller gives an epitome of his doctrines, and though he commends his practice in the cure of many diseases, yet, from his fondness for amulets and charms, places him among the empirics. That he was in high repute, however, cannot be doubted, Juvenal having mentioned him several times in his satires, and always with honour. "Ocyus Archygenem quære, atque eme quod Mithridates composuit."

Various fragments of his writings exist in the collections of Aetius and Amida. Besides his writings on the subject of pharmacy, he also wrote treatises on local affections, on the cure of chronic diseases, on the nature and types of fevers, on pulses, &c. Le Clerc Hist. de la Méd.

ARCHIGERONTES, in *Antiquity*, the chiefs or masters

masters of the several companies of artificers at Alexandria.

Some have mistaken the archigerontes for the arch-priests, appointed to take the confessions of those who were condemned to the mines.

ARCHIGUBERNUS, ARCHIGUBERNETA, or ARCHIGUBERNITES, in *Antiquity*, the commander of the imperial ship, or that which the emperor was aboard of.

Some have confounded the office of archigubernus with that of *praefectus classis*, or admiral, but the former was under the command of the latter.

Potter takes the proper office of the archiguberneta to have been to manage the marine affairs, to provide commodious harbours, and order all things relating to the sailing of the fleet, except what related to war. Vid. Diod. Sicul. 26. 51.

ARCHIL, *Argol*, *Archilla*, *Rocella*, *Lichen Rocella* of Linnæus, or *Orseille*, is a moss of a lightish or dark grey colour, which grows on the rocks in many parts of the Archipelago, and in the Canary and Cape de Verd islands; and, according to Linnæus's account, on the Western Coast of England. It belongs to the third of Dillenius's genus of *coralloides*, and to the *lichenes fruticulosi* of Linnæus. This moss grows upright, partly in single, partly in double stems, which are about two inches in height; when it is old, these stems are crowned with a button, sometimes round and sometimes of a flat form, which Tournefort very properly compares to the excrescences on the arms of the Sepia. The dark red paste formed of this moss has in commerce the same name of Archil or Argol, and is much used in dyeing; that well-known substance called Lacmus, or Litmus, is also made of it. See LITMUS. Those who prepare it for the use of the dyer grind it betwixt stones, so as to bruise it thoroughly without reducing it to powder, and then moisten it occasionally with strong spirit of urine, or urine itself, mixed with quicklime. Alkalies extract a violet colour. In a few days it acquires a purplish red, and at length a blue colour. The dyers seldom use this drug by itself, because of its dearth and the perishableness of its beauty; but they chiefly employ it to give a bloom to other colours, as pinks, &c. and this is done by passing the dyed cloth, or silk, through hot water lightly impregnated with the archil. However, the bloom thus communicated soon decays upon being exposed to the air; though, M. Hellot says, that by adding a small quantity of the solution of tin, the colour obtained from this drug changes towards a scarlet, and gives a durable dye. Prepared archil will readily yield its colour to water, to volatile spirits, and to spirit of wine; and it is accordingly used to colour the spirits of thermometers; but being confined from the air, the spirits lose their colour, and as M. l'abbé Nollet observes, regain it upon being exposed to the air. He repeated the experiment several times with success. A solution of archil in water gives a durable stain of a beautiful violet or purplish blue colour to marble. M. du Fay informs us that he has seen pieces of marble stained with it, that preserved their colour for two years, without any sensible change. It sinks deep into the marble, and makes it more brittle. The dye yielded by this substance, it is supposed, was known as early as the days of Theophrastus. Theophrastus, Dioscorides, and Pliny, give the name of "Phycos thalassion" or "pontion," to a moss which grew on the rocks of different islands, and particularly on those of Crete or Candia. This moss had, in their time, been long used for dyeing wool, and the colour it gave, when fresh, was so beautiful, that it excelled the ancient purple, which was not red, as many suppose, but violet.

Pliny says, that with this substance the dyers gave the ground or first tint to those cloths which they intended to dye with the costly purple. Thus Hardouin and others understand the words "conchyliis subternitur," which the French dyers express by the phrase "donner le pied." This "phycos thalassion" is supposed by Dillenius to be our argol; for at present, no species is known which communicates so excellent a colour, and which corresponds so nearly with the description of Theophrastus. Besides, it is still collected in the Grecian islands, and it appears that it has been used there since the earliest ages. Tournefort found this moss in the island AMORGOS, now called Morgo; and in his time it was sent to England and Alexandria, at the rate of 10 six dollars per hundred weight; and he adds, that it was common in the other islands. He also shews, from Sidas, Julius Pollux, and other ancient writers, that this island was once celebrated for a kind of red linens, which in commerce had the name of the island; and he conjectures that it was dyed with this moss. Hence Beckman (*Hist. Inventions*, vol. i. p. 61.) concludes, that our argol was not unknown to the ancient Grecians; and he apprehends, that the Europeans, and first of all the Florentines, were made acquainted with this dye-stuff, and its use, in the beginning of the fourteenth century. To this purpose he observes, that among the oldest and principal Florentine families is that known under the name of the Oricellarii, Rucellarii, or Rucellai; one of whom, in the year 1300, carried on a great trade in the Levant, and returning with great wealth to Florence, first made known in Europe, the art of dyeing with argol; and from this useful invention the family received the name of Oricellarii; from which, in process of time, was formed Rucellai. After that period, the Italians procured argol from the Levant for themselves, and afterwards for all Europe. But since the discovery of the Canary islands, about the end of the fourteenth or beginning of the fifteenth century, the greater part of this substance has been procured from them. In the islands of Canary, Teneriffe, and Palma, this moss belongs to the crown; and in 1730, it was let by the King of Spain for 1500 piastras. In the rest of the islands it belongs to private proprietors, who cause it to be collected on their own account. About the end of the year 1730, the captain of an English vessel brought a bag of argol from the Cape de Verd islands to Santa Cruz, by way of trial; and discovering his secret to some Spanish and Genoese merchants, they fitted out a ship in 1731 for these islands, whence they brought it in large quantities. The argol of the Cape de Verd island appears larger, richer, and longer than that of the Canaries, which, perhaps, is owing to its not being collected every year. Adanson, in 1749, found the greater part of the rocks in Magdalen island, near Senegal, covered with this moss. Although most of our argol is at present procured from the Canary and Cape de Verd islands, a considerable quantity is also brought from the Levant, from Sicily, and from the coast of Barbary; and some years ago the English merchants at Leghorn, caused it to be collected in the island of Elba, and paid for it a high price. Our dyers do not purchase raw argol, but a paste made of it, which the French call "orseille en pate." The preparation of it was for a long time kept secret by the Florentines: the person who is supposed to have first made it known was Roletti, a dyer at Florence. Some information concerning it was afterwards communicated by Imperati, and Micheli the botanist. In latter times this art has been much practised in France, England, and Holland. Many druggists, instead of keeping this paste in a moist state with urine, as they ought to do, suffer it to dry, and it has then the appearance

pearance of a dark violet-coloured earth, with some white spots interpersed in it. See *LITHIUS*.

Linnæus apprehends that there are several other common mosses from which valuable colours might be extracted. The French dyers use a crustaceous moss growing upon rocks in Auvergne, and prepared with lime and mine, as a succedaneum to the Canary archil. This Archil, called "Orseille de terre," and "Orseille d' Auvergne," contains fewer and weaker colouring particles. It is the *lichen parellus* of Linnæus, and is distinguished from the *rocella* by its figure, as it grows only in a thin rind on the rocks. It is collected in Auvergne on rocks of granite and volcanic productions, and in some parts of Languedoc; the greater part of it comes from St. Flour. The use of it is very trifling; however the Dutch purchase it to make their lacmus or litmus, on account of its low price. This moss has also been found in Northumberland; but it is not collected there for any purpose.

Archil is made in Corsica, at Lyons, &c. The archil of the Canaries is said to be less charged with lime. Dr. Lewis's ed. of Neumann's Chem. Works, p. 438. Phil. Trans. vol. li. p. 652. Raii Hist. Plant. i. p. 74. Micheli Nova Plant. p. 78. See *LICHEN*.

ARCHILE, in *Ancient Geography*, a city of Africa, in the Pentapolis; situate, according to Ptolemy, at some distance from the coast.

ARCHILOCHIAN, a term in *Poetry*, applied to a sort of verses, whereof *Archilochus* was the inventor.

These consist of seven feet; the four first whereof are ordinarily dactyls, though sometimes spondee; the three last trochees: for instance:

"Solvitur acris hyems grata vice veris et Favoni." HOR. It is usual to mix iambic verses of six feet, abating a syllable, with Archilochian verses; this Horace himself has done in the ode now cited.

These verses are called dactylic, on account of the dactyls at the beginning.

ARCHILOCHUS, in *Biography*, a Greek poet and musician, was the son of Telecles, a person of high rank, and a native of Paros, one of the Cyclades. According to Herodotus, he was contemporary with Candaules and Gyges, kings of Lydia, who flourished about the fourteenth olympiad or 724 years before Christ. Blair refers him to the year before Christ 686, and Priestley to the year 660. To him is ascribed the invention of the iambic verse, and his reputation ranked so high amongst the Greeks and Romans, that Plutarch says of him, that there is no bard of antiquity by whom the two arts of poetry and music have been so much advanced as by Archilochus. According to this author, he was the inventor of dramatic melody, or the melody used in declamation, or that which, in modern language, might be termed "recitative to strict measure," such as the voice-part observes in many modern pieces of accompanied recitative; and from him we learn, that he performed the music to his iambic verses in two different ways; reciting some of them to a partial accompaniment, and singing others, while instruments performed the same notes as the voice; and this, it is said, was the method which the tragic poets afterwards adopted. Plutarch also attributes to Archilochus, the rhythmopœia of trimeter iambs; the sudden transition from one rhythm to another of a different time, as from iambic rhythm or triple time, to dactylic or common time; and the manner of accompanying those irregular measures upon the lyre. Accordingly, if Archilochus was the first author of this mixture or transition from one rhythm to another, he might, with propriety, be styled the inventor

of lyric poetry, which required this mixture, and which, after his time, became a species of versification wholly distinct from heroic. To Archilochus is likewise ascribed the invention of epodes, considered as denoting small lyric poems, composed of trimeter iambs, of six feet, and dimeters of four feet, alternately; such are those of the fifth book of the odes of Horace. Archilochus is generally ranked among the first victors of the Pythian games; and Pindar says, that he wrote hymns in praise of the gods and heroes. One of them in praise of Hercules, gained for him the acclamations of all Greece; for he sung it in full assembly of the Olympic games, and received in recompence from the judges, the crown of victory. This hymn, or ode, was afterwards sung in honour of every victor at Olympia, who had no poet to celebrate his particular exploits. The names of Homer, and of Archilochus, were equally revered and celebrated in Greece, as the two most excellent poets produced by the nation. Cicero ranks him with poets of the first class, and in his "Epistles," (xi. l. 16. ad Atticum) he says, that the Grammarian Aristophanes used to say, that the longest poem of Archilochus was, in his estimation, the most excellent. Horace professes in his satires, to be an imitator of the Grecian bard, as to his style and manner, but not in his malignity; and he says, (Art. Poet.) that he was armed by the violence of his resentment with iambs;

"Archilochum proprio rabies armavit iambo."

Ovid likewise refers to Archilochus: Paternulus and Quintilian bestow great praises on his poetry. The latter (l. x. c. 1.) says of him, that he had an uncommon force of expression, abounding with bold thoughts, and short but keen and piercing strokes, and that his style was singularly strong and nervous. The estimation in which he was held among the Greeks may be inferred from the conduct of the Delphian oracle, which expelled from the temple of Apollo, Cerax of Naxos, by whom he was killed, though he did it in open war. His satires, however, were not only unjustifiably severe, but offensively licentious and indecent; and on this account his poems were prohibited at Sparta, as being more likely to corrupt the hearts and manners of young people, than to be useful in cultivating their understandings. Of the force of his satires, the following instance is frequently alluded to by the ancients. Lyeambes, who had promised him his daughter in marriage, and who had violated his contract, together with his family, was rendered so infamous by a torrent of abuse and detamation, that he terminated his life by the halter, and one, if not all of his daughters, followed his example. Indeed, the "rage of Archilochus" was proverbial in antiquity, which compared the provoking of this satyrist to the treading upon a serpent. In the army, into which he entered, Archilochus incurred a degree of ignominy, which probably contributed to imbitter the resentment, and malignity of his writings. When he saved his life by his cowardly retreat in the first battle in which he was engaged, he alleged in excuse of his dastardly conduct; "I have lost my buckler, but I have saved my life; and it is much more easy to get a new buckler, than a new existence." Some fragments of his writings may be found in the "Poetæ Græcæ" Genev. 1606 and 1614, 2 vol. folio. Nouv. Dict. Histor. Burney's Hist. Music, vol. i. p. 363.

ARCHILEUTO, or *ARCHILUTE*, a large lute, differing little from the *Theorbo*, on which thorough-bass used to be played in accompanying the voice. At the beginning of the last century, it was the favourite instrument all over Europe. *Arrigonini*, a famous lutenist, was employed in all Handel's early operas. And the office of lutenist remained till

till the last century in his majesty's chapel at St. James's. Gilier was the last who occupied the place and performed the duty.

ARCHIMAGUS, in the *Ancient Persian Religion*, the chief priest or head of the order of magi. The archimagus answered to the high-priest among the Jews, or the pope now among the Romanists, being the head of the whole religion. The archimagus resided in the fire temple, a place held in the same veneration among them as the temple of Mecca among the Mahometans, every person of the sect being under a kind of obligation to make a pilgrimage to it once in their lives. Zoroaster is ranked as the first archimagus, and he erected the first temple in the city of Balch. Here it remained till the seventh century, when the followers of Zoroaster, being driven by the Mahometans into Carmania, or Kerman, a southern province of Persia, another building of the same kind was raised, and there it hath continued to this day. The fire temple at Balch was rebuilt by Darius Hystaspis, with a grandeur suitable to its dignity, as it was the patriarchal temple of the sect; and from the name of its restorer it was afterwards called "Anzur Gultasp," i. e. the fire temple of Darius Hystaspis. In order to preserve its reputation, he assumed the office and title of archimagus, and as Porphyry informs us, he gave orders before his death, that among his other titles it should be engraven on his monument, that he was "master of the Magians," which plainly implies that he bore this office among them. From hence it seems to have proceeded, that the kings of Persia were ever after regarded as of the sacerdotal tribe, and were always initiated into the sacred order of the Magians, before they were inaugurated into the kingdom. *Prod. Con.* vol. i. p. 315. 322.

ARCHIMANDRITE, the superior of a monastery; amounting to what we now call **ABBOT**.

Covarruvias observes, that the word literally denotes the chief or leader of a flock; in which sense it may be applied to any ecclesiastical superior, and accordingly we find the name sometimes attributed to archbishops. But among the Greeks, by whom it is chiefly used, it is always restrained to the chief of an abbey. According to father Simon, *mandrite* is a Syriac term, signifying a solitary monk; and consequently Archimandrite is the chief of monks of this description. In the Greek church, the archimandrite is the second dignity under the patriarch.

ARCHIMEDES, in *Biography*, one of the most celebrated mathematicians of antiquity, was born at Syracuse, according to Torelli, in the second year of the 123d olympiad, corresponding to the 287th year before Christ; or, according to Rivaltus, who has taken considerable pains in ascertaining the true æra of his birth, the second year of the 122d olympiad, answering to the 291st year before Christ. If we may rely on the authority of Tzetzes, he lived 75 years; and Blair in his chronology, refers his death to the first year of the 142d olympiad, or the 212th year before Christ. Plutarch informs us, that he was nearly related, by his father, to Hiero the Syracusan king, with whom he lived in habits of the most intimate friendship and intercourse: but his mother was of obscure origin; and this circumstance may probably account for the degrading terms "humilem homunculum," which Cicero applies to him in the fifth book of his *Tusculan Questions*, *Oper. t. ii. p. 474.* ed. Olivet. Unallured by those prospects of preferment which his connection with Hiero might have presented, Archimedes devoted himself, with uncommon assiduity and singular success, to the study of geometry, in his youth; and in his maturer years he travelled into Egypt, whither the Greeks generally resorted in the pursuit of science. After an absence of several years,

which he spent in the society of Conon, and other eminent men, and during which time he exhibited very promising indications of his future fame, he returned to his own country, where he indefatigably prosecuted that course of application to mathematical and mechanical sciences, which led to the disquisitions and discoveries recorded in his works. Such, indeed, were the ardour and intenseness of his application, that he prosecuted his studies, to the neglect of both food and sleep, and improved the minutest circumstance that occurred into an occasion of making very important and useful discoveries. At the bath, it is said, he frequently drew geometrical figures in the ashes, or when, according to the custom, he was anointed, upon his own body. Of the ardour of his mind in the pursuit of science an instance occurs under the article *Hiero's Crown*; and was also manifest in his well-known declaration, pronounced in consequence of his accurate acquaintance with the powers of the lever, "Δος μοι σταυ, και Ινυ η γη κινησεται," i. e. "Give me a place upon which to stand, and I will move the earth." Such was the pleasure he derived from having discovered the proportion between the sphere and its circumscribed cylinder, that as a memorial of this discovery, he requested his friends to place upon his tomb a cylinder containing a sphere, with an inscription expressing the proportion of the one to the other. Cicero, when he was questor in Sicily, about 140 years after the death of Archimedes, discovered this monument in a neglected state, and over-run with briars and brambles, which he ordered to be cleared away. *Vid. Opera ubi supra.* As an evidence to Hiero of the astonishing effect of mechanical powers, Archimedes is said to have drawn towards him, by means of ropes and pulleys, a galley manned and loaded, which lay on the shore. But his mechanical knowledge was applied to more substantial use, at the time when Syracuse was besieged by the consul Marcellus; for he thus contrived to arrest the efforts of the besiegers for eight months. Plutarch (in Marcell.) and Livy (l. xxiv. c. 34.) inform us, that, whether the vessels of the enemy were nearer to the walls of the city, or more distant from them, Archimedes annoyed them. When they approached the rampart, he suspended long beams, which probably acted like levers, and struck the gallees with a force that sunk them; by means of grapping hooks at the extremities of other levers, he raised up vessels in the air, and then dashed them to pieces against the walls or projecting rocks. Whilst they were more remote, he used instruments which threw large stones, that demolished the ships or the machines employed in the siege. For the use he made of his burning mirrors, see *BURNING-Glass*.

Besides other inventions which Diodorus Siculus (l. v.) ascribes to Archimedes, he mentions that of the cochleon, or serew pump, which he communicated to the Egyptians. Livy also (l. xxiv. c. 23) records his distinguished excellence as an observer of the heavenly bodies and his talent for the contrivance and construction of warlike machines. His ingenuity in the solution of problems was, in Cicero's time, become proverbial, for in a letter to Atticus (l. xiii. ep. 28.), he alludes to the "προβλημα Αρχιμηδειον," or "Archimedian problem," as one that was of singularly difficult solution. His machine for exhibiting the motions of the celestial bodies is either referred to or more expressly mentioned by the Latin poets. To this purpose Silius Italicus (l. xiv. v. 341. p. 717. ed. Drakenb.) extols him:

"Vir fuit Ilhniaciis-deus immortalis colonis,
Ingenio facile ante alios telluris alumnos,
Nudus opum; sed cui cælum terræque patrent."

Claudian also, in his epigram on this invention of Archimedes, expresses himself in the following strong terms:

"Jupiter,

" Jupiter, in parvo cum cerneret æthera vitro," &c.
In English thus :

" When in a glass's narrow sphere confin'd,
Jove saw the fabric of th' Almighty mind,
He smil'd and said ; ' Can mortals' art alone
Our heavenly labours mimic with their own ?
The Syracusan's brittle work contains
Th' eternal law that through all nature reigns.
Fram'd by his art, see stars unnumber'd hum,
And in their courses rolling orbs return ;
His sun through various signs describes the year,
And every month his mimic moons appear.
Our rival's laws his little planets bind.
And rule their motions by a human mind.
Salmoneus could our thunder imitate :
But Archimedes can a world create.'

Ovid (Fall. vi. 277.) mentions the same machine :

" Arte Syracoliã suspensus in aëre clauso
Stat globus, immensã parva figura poli."

Plutarch (in Vit. Marcelli, Oper. t. ii. p. 307.) expressly says of Archimedes, after recounting the machines which he had employed during the siege of Syracuse, that in the construction of them " he gained the reputation of a man endowed with divine rather than human knowledge ;" but it is to be regretted that, as he adds, " no account of them was left in writing."

Amongst the various objects of mathematical speculation to which his attention and inventive faculties were directed, one of the principal was the mensuration of the conic sections. Unless we except the lunes of Hippocrates of Chios, he was the first who squared a curvilinear space : he also reduced the quadrature of the circle to the determination of the ratio between the diameter and the circumference ; and though unable to obtain the precise value of it, he assigned an useful approximation to it by the numeral calculation of the perimeters of the inscribed and circumscribed polygons. See CIRCLE, DIAMETER, and QUADRATURE. He determined the relation between the circle and ellipse ; and likewise attempted the hyperbola, though from the nature of the case he was not likely to succeed. He also found the proportion of the area of the spiral to that of the circumscribed circle, and that of their sectors ; he determined the relations of spheres, spheroids, and conoids to cylinders and cones, and of parabolas to rectilinear planes, whose quadratures were already known. In all his mathematical investigations, he imitated the example of his predecessor, Euclid ; and, like him, he was cautious in admitting any principles that were not strictly geometrical and unexceptionable.

No friend of science can forbear lamenting the premature death of this singularly eminent mathematician and philosopher, as well as the time and manner in which it happened. After he had been instrumental in protracting the siege of Syracuse for eight months, the city was at length taken by storm and devoted to the sword. Marcellus, indeed, respecting the character even of an enemy such as Archimedes was, had issued orders that his house and person should be inviolate ; but he was surpris'd and put to death, says Livy (l. xxxv. c. 31.), by a soldier who was ignorant of his person and character, while he was intent on figures which he had described in the dust, and was altogether negligent of his own safety. The account of the manner of his death given by Plutarch (ubi supra) is somewhat different. He says, that Archimedes being in his museum, was so absorbed in his attention to his diagram, that he was assaulted by one of the soldiers before he knew that the city was taken, and that he refused to accompany him to Marcellus till he had finished his problem, upon which the enraged soldier dispatched him with his sword. However this be, Marcellus,

it is said, lamented his death, paid respect to his memory by directing and superintending his funeral, and restrained the victorious army from offering any violence to his relations.

Of the numerous works of Archimedes many of them are lost, but the most valuable, as we have reason to believe, are preserved. Torelli has arranged and enumerated them in the following order : 1. " De Planorum Æquilibriis, liber primus, cum commentariis Eutocii Ascalonitæ." 2. " Quadratura Parabolæ." 3. " De Planorum Æquilibriis, liber secundus, cum commentariis Eutocii Ascalonitæ." 4. " De Sphæra et Cylindro, liber primus, cum commentariis Eutocii Ascalonitæ." 5. " De Sphæra et Cylindro, liber secundus, cum commentariis Eutocii Ascalonitæ." 6. " Circuli Dimensio, cum commentariis Eutocii Ascalonitæ." 7. " De Helicibus." 8. " De Conoidibus et Sphæroidibus, cum Torelli commentario, in Prop. 12." 9. " Arenarius." 10. " De iis quæ in humido vehuntur, liber primus." 11. " De iis quæ in humido vehuntur, liber secundus." 12. " Lemmata." 13. " Opera Mechanica, ut cujusque mentio ab antiquis scriptoribus facta est." These latter works, with the Author's descriptions of them, are lost ; they are as follow : 1. " An artificial sphere for exhibiting the celestial motions." 2. " Archimedes's method of investigating the mixture of gold and silver in Hiero's crown, mentioned by Vitruvius." 3. " His pneumatic and hydraulic engines, mentioned by Pzetztes, Pappus, and Testullian." 4. " Archimedes's screw, the structure and use of which are well known." 5. " The helix, by means of which, according to Athenæus, he launched a large ship belonging to Hiero." 6. " A singular kind of locket, the account of which is imperfect." 7. " The trispaston, by which large weights might be raised by a very small power." 8. " Various warlike machines, consisting of tormenta, balistæ, catapultæ, sagittarij, scorpiones, &c. which, according to Polybius, Livy, and Plutarch, were used in the defence of Syracuse." 9. " His burning-glasses, by the combination of which he is said to have set fire to the Roman ships."

When Constantinople was taken at the middle of the fifteenth century, such writings of Archimedes as exiled, together with the commentary of Eutocius, escaped the ravages of the conquerors, and were brought thence into Italy. Here they were found by the famous John Muller, better known by the appellation of Regiomontanus, who carried them into Germany, and they were soon afterwards, viz. in 1544, published in folio at Basil, in Greek and Latin, by Hervagius, with a preface by Thomas Gechauff. A Latin translation was published at Paris in 1577, by Pascalius Hemellus. An edition was published in folio, by Commandine at Venice, in 1588. The edition of Rivaltus, in Greek and Latin, in folio, with new demonstrations and notes, and a life of Archimedes, was published at Paris in 1615. At the close of this edition is annexed an account of the other works of Archimedes that have been lost. Maurolycus published an edition in folio, at Messina, in 1671 ; another by Borelli, was published at Palermo in 1685 ; and a Latin edition was published by Dr. Barrow in 4to. at London in 1675, with new illustrations and demonstrations. The last, most splendid and complete edition in folio, was printed at the Oxford press in 1792 ; this edition was prepared for the press by the learned Joseph Torelli of Verona, with a new Latin translation, Eutocius's commentary, with a preface and notes ; an account of the life and writings of Torelli, by Clemens Sibillati, is prefixed, and a large appendix is added consisting of two parts, the first being a commentary on the paper of Archimedes, relating to bodies floating in fluids, by the Rev. Abram Robertson of Christ-Church College Oxford, who had the whole care of this edition ;

and the second, a large collection of various readings in the MS. copies of Archimedes's works, preserved at Florence and Paris, collated with the edition of Basil. The works of Archimedes form a principal part of the valuable collection of Greek mathematicians, published in folio at Paris, in 1693, entitled "Mathematici veteres." Of distinct parts of the works of Archimedes we have various editions. The book "De dimensione circuli," was published in folio, at Paris, in 1561; at Leipzig, in 1602; and in octavo, at Oxford by Dr Wallis, in 1676; and in the third volume of Wallis's works, in 1699. This work, together with the book "De sphaera & cylindro," appeared at Paris in 1561; the book "De planis equiponderantibus," was published in quarto at Paris, in 1565; "De conoidibus et de spheroidibus," at Palermo, in 1685; "De iis quæ in humido natant, &c." with the commentary of Commandine, in quarto, at Bologna, in 1565; and the "Arenarius," by Wallis, at Oxford, octavo, in 1676; of which an English translation by G. Anderfon, was published in London, octavo, in 1784, with notes and illustrations. Torelli Pref. Rivalti Pref. Fabr. Bib. Græc. l. iii. c. 22. t. ii. p. 543, &c.

ARCHIMEDES'S *Screw*. See *SCREW of Archimedes*.

ARCHIMEDES'S *Burning-glass*. See *BURNING-glass*.

ARCHIMIME, ARCHIMIMUS, ἀρχιμιμῆς, and μιμιος, *mimic*, is the same thing in effect with archbuffoon or mimic.

The *archimimes*, among the Romans, were persons who imitated the manners, gestures, and speech, both of people living, and of those who were dead.

At first they were only employed on the theatre; but were afterwards admitted to their feasts, and at last to their funerals; where they walked after the corpse, counterfeiting the gestures and behaviour of the person who was carried to the funeral pile, as if he were still alive.

ARCHINARA, in *Ancient Geography*, a town of India, on the other side of the Ganges, according to Ptolemy.

ARCHIPELAGO, in *Geography*, a sea interrupted by a great number of islands.

The word is formed by corruption of *Ægeopelagus*, q. d. *Ægean sea*, which again is formed of Ἀργαίου Πελάγος, a name originally given it by the Greeks, but for what reason is not agreed on. See *ÆGEAN Sea*.

The most celebrated Archipelago, and that to which the name used to be appropriated, and whence all other groups of islands have derived it, is that between Greece, Macedonia, and Asia, in which are the islands of the *Ægean sea*; which is called the *White Sea*, in contradistinction to the Euxine, which they call the *Black Sea*. This part of the Mediterranean sea is bounded on the north by Romania, on the east by Natolia, on the west by Livadia and the Morea, and on the south by the isle of Candy. It divides, as far as it extends, Europe from Asia. All the islands contained in it, some of which lying on the coast of Natolia are called Asiatic, and the others European, lie between about the 35th and 40th degrees of north latitude, and 23d and 27th degrees of east longitude. Some of them are called Cyclades, because they form as it were a crown and circle round the isle of Delos; the others are called Sporades, as being dispersed without any order between Asia and the isle of Candy.

The modern geographers mention other Archipelagos, as that of Lazarus near the coasts of Malabar and Malacca; the Archipelago of Mexico; and that of the Caribbees, wherein are many islands; that of the Philippines, called by some the "great Archipelago," containing several islands, and all those of the Moluccas, of Celebes, &c. These Asiatic islands form a large group usually denominated the "oriental

Archipelago," and extending from 13° S. lat. to 22° 4' N. lat. that is 35 degrees, or 21,000 geographical miles, while the length from 95° E. long. to 132°, gives 37° not far from the equator, nearly corresponding with the breadth. The "northern Archipelago" consists of four groups of islands between the east coast of Kamtikatka in Asia and the west coast of America: the first, called *Saginaw*, comprehends five islands; that called *Khao* contains eight islands; and both these are now called *Alutian islands*. The third group includes sixteen islands, called *Andreznoffski Ostrova*; and the fourth, the *Lyssie Ostrova*, or *Fox islands*, which are sixteen in number. "Broughton's Archipelago," is a cluster of islands, rocky islets, and rocks, on the north-west coast of America, so called by Vancouver, after the name of their discoverer, and lying in about 50° 50' N. lat. and W. long. 126° 20'. The "dangerous Archipelago," or "labyrinth," is a name given to a group of islands discovered in the Pacific Ocean, eastward of Otaheite, by *Queiros*, *Schouten*, and *Le Maire*, *Roggewein*, *Byron*, *Wallis*, *Carteret*, *Bougainville*, *Cook*, *Edwards*, *Bligh*, *Vancouver*, *Broughton*, and *Wilson*, and so called from the intricacy and difficulty which they occasion to the navigation. They are dispersed from 14° to 27° of S. latitude, and as far as 25° eastward from Otaheite. The name was first given to some of these islands by *Bougainville* in 1768. To four of these islands *Captain Cook*, in 1769, gave the names of *Resolution*, in S. lat. 17° 24'. W. long. 141° 39'; *Doubtful island* in S. lat. 17° 20'. W. long. 141° 38'; *Furneaux island* in S. lat. 17° 5' and W. long. 143° 16'; and *Adventure island* in S. lat. 17° 14', and W. long. 144° 30'. All the inhabitants of these islands appear to be of the same race with the Society Islanders, but are somewhat darker in their complexions, and more ferocious in their manners. "Archipelago of the great Cyclades" is the cluster of islands first discovered by *Bougainville* in 1768, and called by *captain Cook*, who passed them in 1774, *New Hebrides*. "King George III.'s Archipelago" is a name given by *Vancouver* to a large group of islands, forming various channels, and lying on the north-west coast of America between 56° 10', and 58° 15' N. lat. and about 135° and 136° W. long. The exterior coast of this Archipelago from *Cape Crofs* to *Cape Edward* has several openings that appeared likely to afford shelter, but the rocks and islets, some producing trees, and others altogether barren, that extend to the distance of three or four miles from the shore, must render the entrance of such harbours unpleasent and dangerous, till they are better known. That which seemed to be the easiest of access was northward of *Cape Edward*, in lat. 57° 44', and was considered by *Vancouver* as *Portlock's harbour*. *Cape Edgcumbe* on this coast is situated in lat. 57° 2', and W. long. 135° 34½'. This cape forms the north-west point of a spacious opening that branches into several arms, and is called by *Mr. Dixon*, *Norfolk Sound*. One of the northern branches of the sound communicates with the land on which mount *Edgcumbe* stands, named by *Captain Cook* the *Bay of Islands*, and makes the intermediate part of the sea-coast an island. The south extremity of this Archipelago in lat. 56° 10'. and W. long. 134° 22½', constitutes a remarkable promontory that terminates in a high bluff rocky cliff, and becomes, on its eastern side, a narrow point of land, named by *captain Colnett*, *Cape Ommaney*; and the opening between this and *Cape Derision*, he called *Christian Sound*. *Vancouver's Voyage*, vol. iii. p. 267. A cluster of islands, or a single island, about twenty leagues in length, and lying between 53° and 54° N. lat. and about 130° W. long. was called by *Vancouver*, "*Pitt's Archipelago*." On the north of this group was *Chatham's Sound*,

Sound, on the east Grenville's canal, on the west Bank's island, and to the south Nepean sound, as they are severally denominated in one of Vancouver's charts. Other collections of islands under this appellation will be noticed in the course of this work.

ARCHIPHERACITÆ, ministers in the Jewish synagogues, appointed to read and interpret the Perakim, or titles and heads of the law, and the prophets.

The archipheracita was not the same with the archisynagogus, as Grotius and others have mistakenly imagined; but rather the chief or principal of these appointed to read, explain, and profess the law, in their schools.—And hence the name which is formed of *αρχος*, chief, and the Hebrew or Chaldee, *כַּרְתָּן*, *division*, or *chapter*.

ARCHIPPA, in *Ancient Geography*, a town of Italy, in the territory of the Marsi, said to be swallowed up by the Fucine lake.

ARCHIPPUS, in *Entomology*, a species of PAPILO (Dan. Felt Linn.) that inhabits South America. The wings are repandated, fulvous, veined with black: the margin black, dotted with white; fulvous spots at the tip of the anterior ones. Fabricius. Obs. This author believes it is the same insect as Cramer describes under the name PAPILO *Plexippus*. Gmelin thinks PAPILO *Archippus* of Cramer, f. A. B. is PAPILO *Misippus* of Fabricius.

ARCHIPRESBYTER. See ARCH-PRIEST.

ARCHIS, in *Ancient Geography*, a town of Asia, in Armenia Prima.

ARCHISTRATEGUS, the generalissimo or captain-general of an army. See STRATEGUS.

ARCHISYNAGOGUS, in the *Jewish History*, the chief or ruler of the synagogue.

These are sometimes also called the angels or princes of the synagogues: the Jews called them *chacamin*, i. e. *wife*.

Archisynagogi were persons of authority in each synagogue, who presided in assemblies held therein, invited those to speak whom they judged capable of it, and decided all disputes, relating to money, &c. They had a power to have those whipped who were convicted of acting contrary to the law; also a right of excommunicating, or casting out of the synagogue, those whom they found to merit this punishment. Their number was different according to the extent of the city, or the number of persons that came to the synagogue; in some there were seventy, in others eight or ten, and in others not above one. Vitringa de Synagog.

ARCHITECT, a person skilled in architecture, or the art of building; who forms plans and designs for edifices, conducts the work, and directs the several artificers employed in it.

The word is derived from *αρχος*, princeps, and *τεκτων*, *faber*, *workman*, q. d. the principal workman.

The most celebrated architects are Vitruvius, Palladio, Scamozzi, Serlio, Vignola, Barbaro, Cataneo, Alberti, Viola, Inigo Jones, De Lorme, Perrault, S. Le Clerc, Sir Christopher Wren, and the earl of Burlington.

Vitruvius enumerates twelve qualities requisite to constitute a good architect; that he be docile and ingenious; well educated; skilled in designing, in geometry, optics, arithmetic, history, philosophy, music, medicine, law, and astronomy.

Close application to the study of ancient masters, and the remaining works of the ancients, together with judgment and taste to select and properly to apply the hints which such examples afford, joined to a peculiar genius for the study of this art, are absolutely necessary to render an architect eminent in his profession.

ARCHITECTOGRAPHIA; the description of an-

cient buildings, temples, theatres, arches, pyramids, baths, gates, aqueducts, tombs, and the like.

ARCHITECTONIC, that which builds a thing up regularly, according to its nature and intentions.

ARCHITECTURE, ARCHITECTURA, the art of erecting buildings of any kind.

Amongst the various arts cultivated in society, some are only adapted to supply our natural wants; or assist our infirmities; some are instruments of luxury merely, and calculated to flatter our pride, or gratify our desires: whilst others tend at once to secure, to accommodate, delight, and give consequence to the human species.—Architecture is of this latter kind; and when viewed in its full extent, may truly be said to have a very considerable part in almost every comfort or luxury of life. The advantages derived from houses only are great, they being the first steps towards civilization, and having certainly great influence both on the body and mind. Secluded from each other, inhabitants of woods, of caves, or wretched huts, exposed to the inclement vicissitudes of seasons, and the distressing uncertainty of weather, men are generally indolent, dull, and abject, with faculties benumbed, and views limited to the gratification of their most pressing necessities; but wherever societies are formed, and commodious dwellings are found, in which well sheltered they may breathe a temperate air, amid the summer's heat or winter's cold; sleep, when nature calls, at ease and in security; study unmolested; converse, and taste the sweets of social enjoyments; there they are spirited, active, ingenious, and enterprising; vigorous in body, speculative in mind: agriculture and arts improve, they flourish among them; the necessaries, the conveniences, and soon even the luxuries of life, become there abundant. Mere strength however, even the steadiest perseverance, obtains with difficulty the desired produce; but inventions facilitate and shorten labour, multiplying productions so, as not only to supply domestic wants, but likewise to treasure up stores for foreign markets. Architecture then smooths the way for commerce; she forms commodious roads through marshes or other grounds naturally impracticable, fills up valleys, unites, or levels mountains; throws bridges over deep or rapid rivers, turns aside or deadens the fury of torrents; constructs canals of navigation, builds ships, and contrives ports for their secure reception in the hour of danger: facilitating thus the intercourse of nations, the conveyance of merchandise from people to people. A well-regulated commerce is ever the source of wealth; and luxury has ever been attendant on riches. As the powers of gratification increase, fancy multiplies wants; till at length, indolence or pleasure, vanity and superstition, fears and resentments, give birth to a thousand superfluous, a thousand artificial cravings; the greater part of which could not be gratified, without the assistance of architecture; for splendid palaces, magnificent temples, costly dwelling-houses, and amphitheatres, theatres, baths and porticos, triumphal arches and bridges, mausoleums, and an endless number of similar inventions, are all either necessary instruments of ease and pleasure; or striking testimonies of wealth, of grandeur and pre-eminence; either present or past. Nor are there any other objects, whether necessary or superfluous, so certainly productive of their design; so permanent in their effects, or beneficial in their consequences; fine furniture, rich dresses, brilliant equipages, numerous domestics, are only secondary attractions at first; they soon feel the effect of time; and their value fluctuates, or dies with the fashion of the day. While the productions of architecture command general attention; are monuments lasting beyond the reach of modes; and record to latest posterity the consequence, virtues, achievements, and munificence of those they

they commemorate. The immediate and most obvious advantages of building are, employing many ingenious artificers, many industrious workmen and labourers of various kinds; converting materials of little value into the most stately productions of human skill; beautifying the face of countries; and multiplying the conveniencies and comforts of life. But these, however great, are not the most considerable: that numerous train of arts and manufactures, contrived to furnish and adorn the works of architecture, which occupies thousands, and constitutes many lucrative branches of commerce; that certain concourse of strangers, to every country celebrated for stately structures; who extend your fame, adopt your fashions, give reputation, and create a demand for your productions; are considerations of the highest consequence: in short, the advantages of building extend to the remotest ages, and at this day, the ruins of ancient Rome, in a great measure, support the splendor of the present; by the number of travellers, who flock from all nations, to visit the ancient remains and modern magnificence of that famous city; and who, in the course of a few centuries, have there expended incredible sums of money, by long residence; and in the purchase of old pictures, antique statues, busts, bas-reliefs, urns, and other curious productions of art: of which, by some extraordinary good management, there is a treasure never to be exhausted. Nor is architecture less useful in defending, than prosperous in adorning and enriching countries; she guards their coasts with ships of war, secures their boundaries, fortifies their cities, and by a variety of artful constructions, controls the ambition and frustrates the attempts of foreign powers; curbs the insolence, and averts the danger, and the horror of internal commotions. Thus architecture, by supplying men with commodious habitations, procures that health of body and vigour of mind, which facilitate the invention of arts: and when, by the exertion of their skill or industry, productions multiply beyond domestic wants, she furnishes the means of transporting them to other markets; and whenever by commerce they acquire wealth, she points the way to employ their riches rationally, nobly, benevolently; in methods honourable and useful to themselves and their descendants; which add splendor to the state, and yield benefit both to their contemporaries and to posterity: she farther teaches them to defend their possessions, to secure their liberty and lives, from the attempts of lawless violence, or unrestrained ambition. An art so variously conducive to the happiness of man, to the wealth, lustre, and safety of nations, naturally commands protection and encouragement: in effect, it appears, that in all civilized times, and well regulated governments, it has been much attended to, and promoted with unremitting assiduity; and the perfecting of other arts has ever been a certain consequence; for where building is encouraged, painting, sculpture, and all the inferior branches of decorative workmanship, must flourish of course; and these have an influence on manufactures, even to the minutest mechanic productions; for design is of universal benefit, and stamps additional value on the most trifling performances, the importance of which, to a commercial people, is obvious; it requires no illustration. Let it not however be imagined that building, merely considered as heaping stone upon stone, can be of great consequence; or reflect honour, either on nations or individuals: materials in architecture are like words in phraseology; having separately but little power; and they may be so arranged, as to excite ridicule, disgust, or even contempt; yet when combined with skill, expressed with energy, they actuate the mind with unbounded sway. An able writer can move even in rustic language, and the masterly dispositions of a skilful artist will dignify the

meanest materials; while the weak efforts of the ignorant, render the most costly enrichments despicable. To such, the compliment of Apelles may justly be applied; who, on seeing the picture of a Venus magnificently attired, said to the operator, "Friend, though thou hast not been able to make her fair, thou hast certainly made her fine." See the preface to sir W. Chambers's *Treatise on Civil Architecture*.

Architecture is divided into CIVIL, MILITARY, and NAVAL *Architecture*, for which see these several heads.

ARCHITHALASSUS PRIMUS, in *Conehology*, a name given by Argenville to the shell called by Linnæus *Conus summus*.

ARCHITRAVE, in *Architecture*, the lower division of an entablature, or that part which rests immediately on the column.

In the most ancient buildings, which were probably of timber, the architrave was the beam which extended from column to column to support the roof, whence the name, which is from *αρχος*, chief, and *τραβς*, a beam.

In all the ancient examples of the Doric order still existing in Greece, such as those at Athens and Corinth, and also those at Pæstum, and in Sicily, it has only one fascia, and is of great height, being nearly equal to the diameter of the column. In the Doric order of the theatre of Marcellus at Rome, it has only one fascia, but is much lower, being only equal to half a diameter of the column. The moderns, such as Vignola, Scamozzi, &c. have generally confined it to this proportion nearly, but have divided it into two fascias, taking the idea from some ancient examples of the Doric order in Italy.

In some of the ancient examples of the Ionic order in Greece, such as the temple on the Ilissus near Athens, it has only one fascia, which is quite plain, and of considerable height; while in others, such as the temple of Minerve Polias at Athens, and that of Bacchus at Teos, it is divided into three fascias, and has the upper mouldings enriched. In the Ionic order of the temple of Fortune, and at the theatre of Marcellus at Rome, it also has three fascias. The moderns have generally given it two fascias.

In the Corinthian and Composite orders, both the ancients and moderns have divided it into three fascias, generally enriching the mouldings.

The practice of architects differs exceedingly in the proportions of the architrave, as in all the other parts of the orders. Character and propriety, however, seem to require, that in the massy and grave orders, such as the Doric and Ionic, this member, which represents a part subject to great pressure, should have a proportionate degree of strength; while in the gayer Corinthian and Composite, its appearance should be lighter and more ornamented.

In Gothic architecture there is no architrave, and this forms one of the most striking differences between this species of architecture and the Grecian. In the latter there is always a horizontal architrave over the columns, whereas from the tops of Gothic columns arches always spring. The Egyptian architecture is also characterised by horizontal architraves.

ARCHITRAVE *Cornice*. See CORNICE.

ARCHITRICLINUS, in *Antiquity*, the master or director of a feast, charged with the order and economy of it, the covering and uncovering of the tables, the command of the servants, and the like.

The word architriclinus properly imports the chief or master of a triclinium or dining-room. His office properly differed from that of modimperator, or arbiter bibendi, as the latter was appointed by the guests; the architriclinus, by the person who gave the feast.

The architræcinus was sometimes also called *seruus trichinarius*, and by the Greeks *πρωυστης*, i. e. *fragulator*, or *fore-tasler*. Potter also takes the architræcinus for the same with the SYMPOSIARCHA.

ARCHITYPE. See ARCHETYPÆ.

ARCHIVAULT, in *Architecture*, the inner contour of an arch; or a band or frame adorned with mouldings, running over the faces of the arch-illoes, and bearing upon the impost. See this represented in the lines that bound the arch over E. See BASILIC.

The word is French, *archivolte*, where it signifies the same thing, formed of *arcus volutus*.

It is different in the different orders. In the Tuscan, it has only a single face; it has two faces crowned in the Doric and Ionic; and the same mouldings with the architrave in the Corinthian and Composite.

ARCHIVE, or ARCHIVES, a chamber or apartment wherein the records, charters, and other papers and evidences of a state, house, or community are preserved, to be consulted occasionally.

The words come from *arca*, a chest; or the Greek *αρχων*, which Suidas uses in the same sense. In some Latin writers we meet with *archarium*.

We say the archives of a college, of a monastery, &c. The archives of ancient Rome were in the temple of Saturn; the archives of the court of chancery are in the Rolls office. In the code we meet with *archivum publicum vel armarium publicum, ubi acta & libri exponantur*. *Cod. de fid. instrum. auth. ad hæc.* xxx. q. 1.

ARCHIVIST, *archivista*, a keeper of an archive.

Under the emperors, the archivist was an officer of great dignity, held equal to the proconsuls, vested with the quality of a count, styled *clarissimus*, and exempted from all public offices and taxes. Among the ancient Greeks and Persians, the trust was committed to none but men of the first rank; among the Franks, the clergy, being the only men of letters, kept the office among themselves. Since the erection of the electoral college, the archbishop of Mentz has had the direction of the empire.

ARCHIZUPANUS, a title given to the prince or despot of Servia. The word is compounded of *αρχι*, and *ζυπανος*, *governor*. In an epistle of pope Innocent II. he is called *Magnus Zupanus*.

ARCH-MARSHAL, ARCHIMARISCALLUS, the grand marshal of the empire.

The elector of Saxony is arch-marshal of the empire; and in that quality he goes immediately before the emperor, bearing a naked sword, at the diet, and on other solemn occasions. He bears in his arms two swords placed crosswise. During the holding of the diets, he has jurisdiction over all electoral and other officers of the states of the empire, and also in criminal matters. His hereditary marshals are the counts of Pappenheim, who, by virtue of their office, bear the electoral swords of Saxony in their arms.

ARCH-MINISTER, derived from the Greek *αρχη*, and the Latin *minister*, the prime minister of a prince, or state. Charles the Bald having declared Boson his viceroy in Italy under the title of duke, made him also his first minister under that of arch minister.

ARCHON, *αρχων*, literally signifying a *commander*, in *Antiquity*, the chief magistrate of the city and commonwealth of Athens.

After the Athenians had abolished monarchy, they created archons, who were obliged to render an account of their administration to the people. Some of these were annual, and others perpetual. Medon, the son of Codrus, was the first of the latter; and Creon of the former, who

entered upon his charge in the first year of the twenty-fourth Olympiad, or the 684th year before Christ. The occasion of their institution was this: Codrus, king of Athens, having devoted himself for the good of his people, in the war with the Heraclidæ; his sons, Medon and Nicleus, disputed the crown betwixt them: the Athenians took this occasion of dissolving their monarchy, and, in lieu of kings, created perpetual governors, under the name of archons. Medon, son of Codrus, was he who first had this charge, being appointed in the year 1070 before Christ; but required to render an account of his administration. He held it for twenty years, and his twelve descendants in regular succession (from him called *Medontidæ*) enjoyed it for 287 years. But a perpetual magistracy seem'd to this free people too lively an image of royalty, the very shadow whereof they resolv'd to abolish. Accordingly, the administration of an archon, which had before been perpetual, they reduced, in the first year of the seventh Olympiad; or 752d year before Christ; or, according to Pausanias, the third year of the sixth Olympiad, or 754th year before Christ; to ten years: and, about seventy years after, to one year: with a view of recovering as oft as possible the authority into their own hands, which they never transferred to the magistrates but with regret. The first of the decennial archons was Charops, brother of Alcmæon and son of Æschylus; and the last was Eryxias, who closed the race of Codrus. The chief magistrates of Athens, distinguished by this common appellation, were nine in number; though the name archon belonged, by way of eminence, to the chief of the nine, who was also called *eponymus*, *επωνυμος*, because the year was denominated from him. His jurisdiction comprehended both ecclesiastical and civil affairs. He determin'd all causes between men and their wives, parents and children, and disputes relating to wills, dowries, and legacies: he had the charge and direction of orphans, minors, tutors, and guardians. He had also the first cognizance of several public actions. He kept a court of judicature in the odeum to decide in trials relating to provisions and similar matters. He appointed *επιμεληται*, or curators, who took care of the due celebration of the feasts called *Διονυσια*, *dionysia*, and *θαρραλια*, *thargelia*, and of the regulation of stage plays. He was punished with death if convicted of drunkenness during the time of his office. The second archon was called *βασιλευς*, or *king*: to him pertained the superintendance of the religious ceremonies and feasts: he decided all disputes between the priests and families sacred by inheritance, as the Ceryces and Eteobudæ: he punished all impiety and preparation of the holy mysteries or temples: he offered public sacrifices for the prosperity of the commonwealth: he had also some concern in secular affairs, as he took accusations of murder, and referred them to the *Αροπαγίται*, among whom he had a right of suffrage; but during the trial, he laid aside the crown which was the badge of his office. His court of judicature was in the royal portico. It was required, that his wife, called *βασιλισσα*, *basilissa*, should be a legitimate citizen of Athens, and a virgin. The third was the *πολεμαρχος*, so called from *πολεμος*, *war*, and *αρχων*, *to command*: to him belonged the care of strangers and sojourners, and the conduct of war; and he took care that the offspring of those who died in the service of their country should be maintained from the public treasury. These magistrates were assisted by the *Παραδροι*, or assessors, who were admitted into office in the same mode, and under the same restrictions. The other six were called *thesmotteta*, from *θεσμος*, *law*, and *τῆτα*, *I establish*. They formed a tribunal for judging concerning seductions, calum-

nies, bribery, &c. and for settling disputes between the citizens and strangers, and all controversies in trade. They ratified all contracts and leagues, directed and guarded the establishment of laws, and formed a kind of barrier between the other magistrates and the people: they preferred the appeals to the people, publicly examined several of the magistrates, and took the votes in the assemblies, and they prosecuted those who attempted to mislead the unwary into any act injurious to the commonwealth. They used to perambulate the city in the night, and to correct those who committed any disorder. The whole body had the power of life and death; they had a joint commission for constituting some magistrates and deposing others, when, upon inquiry into their conduct, and by the suffrages of the people, they were declared unworthy of their offices; they had also authority to assemble the people; and they were exempted from all taxes and contributions for building ships of war, in recompence of their service. They wore garlands of myrtle; and any person who struck them, when they wore their garlands, was punished with *αἰσχρῶς*, *infamy*. They were elected by lot, and previously to induction into their office, they underwent a twofold trial, one in the forum, called *doximasia*; and the other in the senate house, denominated an *arcisis*; and in these trials, they were asked, who were their ancestors? whether by three descents they were Athenian citizens? whether they were related to Apollo Patrius or Jupiter Hercæus? to what tribe and ward they belonged? whether they had been dutiful to their parents, had served the appointed time in the wars, had the estate which the law required, and were perfect in all their limbs? They were then conducted into the royal portico, where an oath was required of them, that they would administer justice without partiality, and never be corrupted by bribes. This custom was established by Solon, who also enacted that terrible law which condemned to death the archon who, after losing his reason in the pleasures of the table, should dare to appear in public with the ensigns of his dignity. Potter's Arch. Græc. vol. i. p. 71.

Under the Roman emperors, several other Greek cities had two archons for chief magistrates, which were the same with the *duumviri* in the colonies and *municipia*.

ARCHON is also applied, by some authors, to divers officers, both civil and religious, under the eastern or Greek empire. Thus, bishops are sometimes called archontes; and the same may be said of the lords of the emperor's court. We also read of the archon of the antimensia, archon of archons, grand archon, archon of churches, archon of the gospel, archon of the walls, &c.

ARCHON, LOUIS, in *Biography*, an antiquary, chaplain to Louis XIV., was born at Riom in Auvergne, in 1645, and died at Rome in 1717. His "History of the chapel of the kings of France," in 2 vols. 4to, abounds with curious researches. *Nouv. Dict. Histor.*

ARCHONTICI, in *Church History*, a sect which arose towards the close of the second century; thus called from the Greek *αρχοντες*; q. d. *principalities*, or *hierarchies of angels*; because they held the world to have been created not by the supreme God, but by certain subordinate powers, called archontes, or angels. The archontici were a branch of VALENTINIANS.

ARCHONTIUM, *αρχοντιον*, denotes a dignity of the Greek church.

ARCHOUS, in *Ancient Geography*, the name of a river in Asia, situate in Assyria. Also, a place of Asia in Mesopotamia, west of the Tigris, and near the wall of Semiramis.

ARCHPRIEST, ARCHPRESBYTER, a priest, or presbyter, established in some diocese, with a pre-eminence over the rest.

Anciently, the arch-priest was the first person after the bishop: he was seated in the church next after the bishop; and even acted as his vicar, in his absence, as to all spiritual concerns.

In the sixth century, there were found several arch-priests in the same diocese; from which time some will have them to have been called *deans*.

In the ninth century, they distinguished two kinds of cures or parishes: the smaller governed by simple priests; and the baptismal churches by arch-priests; who, beside the immediate concern of the cure, had the inspection of the other inferior priests, and gave an account of them to the bishop, who governed the chief, or cathedral church in person.

There are arch-presbyters still subsisting in the Greek church, vested with most of the functions and privileges of *chorepiscopi*, or rural deans.

ARCH-PRIOR, was a name sometimes given to the maller of the order of *TEMPLARS*.

ARCH-TREASURER, *architresaurarius*, the great treasurer of the German empire.

This office was created with the eighth electorate, in favour of the elector Palatine, who had lost his former electorate, which was given to the duke of Pavia by the emperor Ferdinand II. who took it away from Frederick V. elector Palatine, after the battle of Prague, where he was defeated in maintaining his election to the crown of Bohemia. Since the treaty of Westphalia, the elector Palatine has been arch-treasurer. The elector is protector through all Germany of the order of St. John, can raise noblemen and gentlemen to the degree of counts, and also admit as bondmen, in places subject to his jurisdiction, all those that are illegitimately born, and other persons of foreign countries, on condition of their binding themselves to the duties of the electorate, and to the payment of a certain tribute and mortuaries.

The dignity of arch treasurer was contested between the elector of Brunswick, now king of Great Britain, who claimed it in virtue of his descent from the elector Frederic, and the elector Palatine. This elector still styles himself arch-treasurer, till another suitable arch-office be assigned him. He enjoys the ultimate succession in the bishoprick of Osnaburg, together with some other rights and privileges. His electoral jurisdiction extends to the territories of Hanover, and to those of Zell. Although the illustrious house of Hanover was raised to the electoral dignity by the emperor Leopold, in 1692, it obtained neither voice nor seat in the electoral college till the year 1708.

ARCHYTAS, in *Biography*, a Pythagorean philosopher and distinguished mathematician of Tarentum, was a contemporary with Plato, who interposed for his rescue from death, under the tyranny of Dionysius of Sicily; and the eighth preceptor of the Pythagoric school, in succession from Pythagoras. Accordingly, he flourished about the ninety-fifth Olympiad, or 400 years before Christ. Such was the celebrity of this philosopher, that among his disciples are reckoned Philolaus, Eudoxus, and Plato. Archytas was in such high esteem among his countrymen for wisdom and valour, that he was chosen seven times general of their armies, and chief magistrate of Tarentum, in direct opposition to an established law; and in the exercise of his office he invariably recommended himself by his moderation, and also by his affability and condescension. As a speculative philosopher, he followed the doctrine of Pythagoras; and Aristotle is said to have borrowed from him the general arrangements known under the appellation of the "Ten Categories." To Archytas, this great philosopher was also indebted for many of his ethical principles and maxims; and more especially for the notion which he repeatedly inculcates, that

virtue consists in avoiding extremes. Virtue, according to Archytas, is to be pursued for its own sake, in every condition of life; and he taught, that all excess is inconsistent with virtue; that the mind is more injured by prosperity than by adversity; that there is no pestilence so pernicious to human happiness as pleasure; and that the love of it is a destructive disease of the human mind. To his ingenuity, as a mathematician, we owe, according to Eutocius, the method of finding two mean proportionals between two given lines, and the duplication of a cube; and we derive, from his skill in mechanics, the invention of the screw, and crane, and various hydraulic machines; to say nothing of his flying pigeon, or winged automaton. See AEROSTATION. The astronomical and geographical knowledge of Archytas is celebrated by Horace in a beautiful ode, recording also his death, which was occasioned by a shipwreck on the coast of Apulia, where his unburied corpse was found:—

“ Te maris et terræ, numeroque carentis arenæ
Menforem cohibent, Archyta,
Pulveris exigui prope litus parva Marinum
Munera; nec quidquam tibi prodest
Aërias tentasse domos, animoque rotundum
Percurrisse polum, morituro.”

Lib. I. Od. 28.

“ Archytas, what avails thy nice survey
Of ocean's countless sands, of earth and sea?
In vain thy mighty spirit once could soar
To orbs celestial, and their course explore;
If here, upon the tempest-beaten strand,
You lie confin'd, till some more liberal hand
Shall strew the pious dust in funeral rite,
And wing thee to the boundless realms of light.”

FRANCIS.

As to his moral disposition and conduct, Archytas was distinguished by modesty and self-command; and in his language he is said to have shewn a degree of regard to decency, not often found among the ancients. He never chastised a servant, or punished an inferior in wrath. To one of his dependents, who had offended him, he said, “It is well for you that I am angry; otherwise I know not what you might expect.” None of the writings of Archytas are extant, except a metaphysical work, entitled, “*Περὶ τοῦ παντὸς φύσεως*,” or “On the universe,” in which he distributes all things into ten classes or categories; written in the Doric dialect, and published in Greek and Latin at Venice, in 1571. 8vo. Several fragments “on Wisdom,” and “on the good and happy Man,” have been preserved by Stobæus, and edited by Gale, apud Opusc. Mythol. p. 673. Laertius, l. viii. c. 79—86. Val. Max. l. iv. c. 1. Strabo, l. vi. Aul. Gell. l. x. c. 12. Ælian, l. vii. c. 14. l. xii. c. 19. l. xiii. c. 55. l. xiv. c. 19. Suidas. Fabr. Bibl. Græc. l. ii. c. 13. § 1. t. i. p. 493. Brueker's Hist. Phil. by Enfield, vol. i. p. 410.

ARCIADES, in *Ancient Geography*, a river of Italy in Brutium, near Rhegium.

ARCILAUS, a town of Spain in Bætica, situate, according to Ptolemy, in the territory of the Turduli.—Also, a town of Hispania Tarragonensis, called *Archifana*, in the territory of the Bastitani, according to Ptolemy.

ARCILEUTO. See ARCHILEUTO.

ARCINA, in *Ancient Geography*, a town placed by Ptolemy in Dacia.

ARCINELLA, in *Conchology*, a species of CHAMA found in the American ocean. It is grooved, mucated, and marked with excavated dots; hinge with a sessile callus. Gmelin. The breadth is about two inches, and the length nearly the same; it is white, with the spines rarely of a rose colour; within it is yellowish; the margin crenated; po-

sterior excavation cordated, warty, rugose, and large, with an appendage in general on one side.

ARCIROESSA, in *Ancient Geography*, a town of Asia upon the Euxine sea.

ARCIS *sur Aube*, in *Geography*, a town of France, in the department of the Aube, and principal place of a district, five leagues north of Troyes. The place contains 2,500, and the canton 9,386 inhabitants: the territory comprehends 577½ kilometres and 21 communes. N. lat. 48° 33', E. long. 4° 2'.

ARCISA, a town of Italy in the Milanese, 11 miles west of Como.

ARCIVÆ *aves*, in *Antiquity*, birds which gave bad omens, either by their flight, noise, or manner of eating.

They were called *arcivæ*, sometimes also *arcule*, *quia arcebat ne quid fieret*, prevented or forbid things being done.

ARCO, in *Geography*. See ARCH.

ARCOBRIGA, in *Ancient Geography*, a town of Spain in the country of the Celtiberians, between Segontia and Bilbilis.—Also, a town of Spain, in Lusitania, according to Ptolemy.

ARCONATO, in *Geography*, a town of Italy in the duchy of Milan, 18 miles W. from Milan.

ARCONCEY, a town of France, in the department of the Côte d'Or, and chief place of a canton in the district of Arnay le Duc, five miles N. from Arnay le Duc.

ARCOS *de la Frontera*, a town of Spain, in the country of Seville, seated on a sharp rock near the river Guadalete, and fortified by both art and nature; anciently *Aresbriga*: 40 miles S. S. W. from Seville. N. lat. 36° 49', W. long. 4° 55'.

ARCOS, a town of Spain in Old Castile, on the river Xalon, and at the foot of a mountain in the road from Sigüenza to Saragossa, two leagues east from Medina-Celi.

ARCOS *de Valdevez*, a small town of Portugal, in the province of Entre-Minho and Douro. It is the ancient *Arcobriga Lusitanica* of Ptolemy.

ARCOT, a city of Hindostan and capital of the Carnatic, is seated on the river Paliar, at 56,6 geographical miles in horizontal distance from Madras, according to the measurement of major Rennell, and in N. lat. 12° 51' 30", E. long. 79° 28' 15". It appears to be a place of great antiquity, because it is taken notice of by Ptolemy as the capital of the Soræ, or Sora—mandalum; whence by corruption is derived Choro-mandel. Arcot is a pretty large city, and its citadel is esteemed a place of some strength for an Indian fortrefs. The defence of this place by Cave, in 1751, established the military fame of this nobleman. The Nabob of Arcot, or of the Carnatic, is an ally of the East India Company, and his dominions commence on the south of the Guntoor Circar, and extend along the whole coast of Coromandel to Cape Comorin. See CARNATIC. The revenue of the nabob is stated at about a million and a half sterling per annum; out of which he pays a subsidy of 160,000 *l.* per annum, to the East India Company, towards the expence of their military establishment. Rennell's Memoir, Pref. p. 137.

ARCS, LES, a town of France in the department of the Var, and the chief place of a canton, in the district of Draguignan, 10 miles from Frejus.

ARCTANES, in *Ancient Geography*, a people of Epirus.

ARCTAPELIOTES, in *Cosmography*, the wind which blows at the 45th degree from the north toward the east. In this sense, *arctapeliotes* amounts to the same with that we call the north-east wind.

ARCTIC, in *Astronomy*, an epithet given to the north pole, or the pole raised above our horizon. It is called the arctic pole, on account of the constellation of the *Little Bear*, in Greek called *αρκτος*, the last star of the tail whereof nearly points out the North Pole.

ARCTIC circle, is a lesser circle of the sphere, parallel to

the equator, passing through the north pole of the ecliptic, and $23^{\circ} 28'$ distant from the north pole, from whence its name. This and its opposite, the antarctic, are called the two polar circles; and may be conceived to be described by the motion of the poles of the ecliptic, round the poles of the equator, or of the world. The arctic circle is the boundary of the north frigid zone.

ARCTICA, in *Conchology*, a species of *Mya* that inhabits the north seas. The shell is striated; and keeled with two sub-spinous ridges; hinge without teeth, Mull. Gmelin, &c. This is *Mya tella striata, valvulis carinis denticulatis spinulosis saepe obsolete, cardine obsolete dentato*. O. Fabr. Fn. Groen. The length of this shell is from one line and an half to seven lines; of a pale yellow colour; within, milky white. It resembles an *Arca*; the anterior part is impressed and rather flattish; very obtuse in front; and behind, shorter, and rather sharp.

ARCTICA, a species of ARGONAUTA that inhabits the Greenland seas. The specific character is concise. Shell perforated; keel entire. Gmelin. This is *Clochelicina* of Pallas. In spring and autumn it is seen swimming on the surface of the water; is very fragile, finely grooved, and about three lines and an half in diameter.

ARCTICA, in *Ornithology*, a species of ALCA, known in England by the name of *puffin*. The bill is compressed, sharp-edged, with four grooves; orbits of eyes and temples white; with a sharp-pointed, and somewhat triangular protuberance upon the upper eye-lid; Linnæus, Pallas, Brünick, Gmelin, &c. This bird is called *Pica Marina* by Aldrovandus, *Psitacus Marinus* by Marten. *Ipatka* by Kraitschenn, *Macareux* by Buffon, and *Puffin* by Pennant, Latham, and Donovan, Brit. Birds, &c. The length from the point of the bill is twelve inches, breadth twenty-one; weight twelve ounces. The bill is an inch and a quarter long, and is of a singular shape, much compressed on the sides, and nearly an inch and a half deep at the base, from whence both mandibles tend to a point, which is a little curved: across the upper mandible are four oblique furrows; on the under, three; half of the bill next the point is red; that next the base is blue grey; and at the base is a sort of rising cere, full of minute holes; in the nostrils is a long and narrow slit on each side, near the edge of the upper mandible, and parallel to it; the irides are grey; the edges of the eye-lids crimson; on the upper a callous protuberance of a triangular shape; and on the under one, another callosity, but of an oblong form; the top of the head, hind part of the neck, and all the upper part of the plumage are black, passing round the throat in a collar; the sides of the head, chin, and all the parts beneath, are of the purest white; the legs are orange; in some birds there is a great portion of a dusky mixture on the cheeks, and a patch of the same on each side of the under jaw, and these have been supposed to be the females. They vary exceedingly in regard to the bill, according to age; in the first year it is small, weak, destitute of any furrow, and of a dusky colour; in the second, larger, stronger, and lighter coloured, with a faint vestige of a furrow at the base; but in those of a more advanced age the colours are brighter; hence these birds are supposed not to be perfect, or at least not to breed, till the third year; especially as not a single one has ever been observed at Priefholm which had not the bill of an uniform growth.

These birds are frequent upon several of the rocky coasts of England, as Priefholm Isle, the Needles, Isle of Wight, Beachy Head, &c. They are common in Ireland also, and in North Britain; inhabit Iceland and Greenland; frequent Carolina in America in winter; were met with by our late voyagers in Sandwich Sound, where the natives ornament

the fore parts and collar of their seal-skin jackets with the beaks of them; and in Oonalashka, where they make gowns of their skins. On the coast of Kamtskatka, and the Kurile islands they are common, even on the Putschinski Bay almost as far as Ochotka; the nations of the two first wear the bills about their necks fastened to straps, and, according to the superstition of these people, their shaman or priest must put them on with a proper ceremony, in order to procure good fortune.

The puffins arrive at their breeding places about the rocks of Priefholm the first week in May, and endeavour to dislodge the rabbits to save the trouble of making holes for themselves. Except in this respect, and the tenderness they have for their young, they are considered as a stupid race of birds. The female lays but one egg, which is of a white colour; the young are hatched in the beginning of July, and about the middle of August they take flight. The young that are late hatched become the prey of the falcons and hawks that live on these rocks, for the old ones leave the place, to a single bird. Notwithstanding their neglect of the young at this time, on every other occasion they shew great attention to them. They will suffer themselves to be taken by the hand, and use every means of defence in their power to save them; and if laid hold of by the wings, will give themselves most cruel bites on any part of their body within reach, as if actuated by despair; and when released, instead of flying away, will often hurry again into the burrow to their young. They feed on sprats, crabs, sea-weeds, &c. and the flesh is excessively rank, though the young, when pickled, are admired by some people.

A variety of this species is described by Dr. Latham from a specimen in the collection of Sir Joseph Banks, that was met with at Bird island between Asia and America. The length is sixteen inches; the bill is two inches long, much the same colours as the last, but not so deep at the base; crown of the head, as far as the nape, ash colour; sides of the head white; throat, neck, and all the upper parts of the body, wings, and tail, black; breast and under parts, white; legs, orange. The other sex has the bill more slender; the crown of the head, black brown; sides of the head white, passing backwards almost to the nape; thighs ash-coloured; and is in other respects like the former species.

ARCTICUS, a species of COLYMBUS. The head is hoary white; under the throat violaceous black, with a white interrupted band. Gmelin. This is *Colymbus (Arcticus) capite colloque cinereis, gutture nigro-violaceo, dorso nigro maculis quadrangularibus albis*; Brunnick. *Colymbus Arcticus*, Lumme, of Willoughby. *Colymbus Arcticus*, Hymber. Gunner Act. Nordf. *Mergus gutture nigro* of Brisson. *Hirundinis aquaticæ species exotica*, Bess. mus. Lumme, of Worm. mus. &c. *Lumme ou petit plongeon de la mer du nord*, of Buffon. *Speckled Loon*, of Edwards; and *Black-throated Diver*, of Pennant and Latham.

The length of this bird is two feet; bill near an inch long, slender and black; the forepart of the head and throat black; hind part of the head and neck, ash-colour, sides of the last, white spotted with black: on the forepart of the neck a large patch of black, five inches in length, changing to purple and green in different lights; the back and upper parts black: scapulars marked with square spots of white; wing-coverts the same, but the spots are round; breast and belly white; quills dusky; tail short and black; legs black, with a cast of red on the inside.

This bird is common in the northern parts of Europe, as Norway, Sweden, and Denmark. Frequent in the inland lakes of Siberia, especially those of the Arctic regions: also in Iceland, Greenland, and the Ferro isles; and likewise,

at Hudson's Bay in America. It is supposed to cry and be very restless against rain; hence the Norwegians think it impious to destroy this species; but the Swedes, less superstitious, dress the skins, which, like all of this genus, are exceeding tough, and use them for gun-scales, and facings for winter caps. Vide Latham, &c.

ARCTIUM (*ἄρκτον*, Dioscor.), in *Botany*, Burdock. Lin. gen. 923. Schreb. 1253. Juss. 173. Class, *Syngenesia Polygamia equalis*. Nat. Ord. *Umbelliferae capitatae Cirsaceae phloea*. Juss. Gen. Char. *Cal.* common, globular, imbricate; scales lanceolate, ending in long subulate prickles, reflex and hooked at the end. *Cor.* compound, tubular, uniform; corollules hermaphrodite, equal. Proper, monopetalous, tubular; tube slender, very long; limb ovate, quinquefid; divisions linear, equal. *Stam.* filaments five, capillary, very short; anther cylindrical, tubular, the length of the corolla, five-toothed. *Pist.* germ oblong, with a villose top. *Style*, filiform, longer than the filament. *Stigma* hid, reflex. *Per.* none. *Calyx* converging. *Seeds* solitary, vertically pyramidal, with the two opposite angles obliterated, gibbous on the outside. *Down* simple, shorter than the seeds. *Rec.* chaffy, flat; chaffs fetaceous. *Ess. Gen. Char.* *Cal.* globular, the scales at the end hooked, inflected.

Species 1. *A. Lappa*, common burdock or clot-burr; "leaves cordate unarmed petioled." Curt. Lond. fasc. 4. 55. Woodv. Med. Bot. 15. Bardana major. Ger. Pharm. Lond. &c. Root biennial, fusiform. Stem three or four feet high, erect, branched, round, grooved. Leaves alternate, large, rough, undulated. Flowers in panicles, terminal. The outer scales of the calyx by their hooks lay hold of animals, cloaths, or any soft substance with which they come in contact. Corolla purple. It is common on the sides of roads, flowering in July and August. There is a woolly-headed variety of this species: it also varies much in the size of the heads. *Medicinal properties.* The pharmacopoeias direct the root for medical use; it has no smell, but tastes sweetish and mixed as it were with a slight bitterness and roughness. Its virtues, according to Bergius, are cleansing, diuretic, and diaphoretic. It has been employed in chronic cases, as scurvy, rheumatism, gout, lues venerea, and pulmonary complaints. We have never had an opportunity of observing the effects of this root, except as a diuretic, and in this way it has proved very effectual in dropsies. The seeds also possess a diuretic quality, and have been given with advantage in the dose of a dram, in calculous and nephritic complaints; and in the form of emulsion, as a pectoral. The root is generally used in decoction, which may be made by boiling two ounces of the fresh root in three pints of water, two of which, in dropical cases, should be taken in the course of twenty-four hours. Woodv. Med. Bot. p. 42. 2. *A. Perfonata*, cut-leaved burdock. "Leaves decurrent, ciliate, spiny; root-leaves pinnate; stem-leaves oblong-ovate." Carduus perfonata, Jac. auct. 4. 25. t. 348. Root biennial, woody. Stem two feet high, angular leaves on the stem, tomentose beneath, ferrate, spined at the edges. Lower leaves petioled, consisting of three or four pairs of pinnae, with a very large leaf at the end. Flowers in terminal bunches on tomentose peduncles, armed with little spines. Scales of the calyx reflex at the point, but not hooked; florets six or seven, of a violet purple colour. A native of Switzerland, Austria, Silesia, and Siberia; flowering in July and August. Introduced here in 1776 by J. N. de Jacquin, M.D. 3. *A. Carduelis*, "leaves pinnatifid prickly;" stem upright, prickly, grooved, about a cubit high; leaves stem-clasping, deeply laciniate; calyces terminating, peduncled, with linear bristle-shaped scales spreading and bending inwards. A native of the mountains in Upper Carniola, and

in Silesia. These plants are seldom admitted into any but botanic gardens, where they may be readily increased from seed.

ARCTOMYS *Palestinorum*, in *Zoology*, the name of an animal of the rat kind, but very large, being of a middle size between the rat and the rabbit; it lives in caves, and feeds on vegetables, and is a fierce and bold creature. It uses its fore-feet as hands, and has a custom of sitting on the buttocks, and in this posture looks very like a bear. Ray.

ARCTONESUS, or **ARCONESUS**, in *Ancient Geography*, a desert island in the Ægean sea. Also, a town of Asia, near Halicarnassus, according to Strabo and Pliny.

ARCTONNESSUS, a town of Cyzicum, according to Steph. Byz.

ARCTOPHYLAX, from *ἄρκτος*, bear, and *φυλάξω*, I guard, in *Astronomy*, a constellation, otherwise called **BOOTES**.

ARCTOPUS, (*ἄρκτος πους*, Bear's-foot), in *Botany*, Lin. g. 1465. Schreb. 1601. Juss. 223. Class, *polygamia diœcist*. Nat. Ord. *Umbellatæ*.

Ess. Gen. Char. Male, Umbel, compound. *Invol.* five-leaved. *Cor.* five-petalled. *Stam.* five. *Pist.* two abortive. Female (or androgynous), on a distinct plant. *Umbel* simple. *Invol.* four-parted, spiny, very large, containing very many male floscules in the disk, and four female ones in the ray. *Male*, pet. five. *Stam.* five. *Fem.* pet. five. *Styles* two. *Seed* one, bilocular, inferior.

Species 1. *A. echinatus*, prickly-leaved Arctopus. A handsome plant from the Cape of Good Hope; introduced in 1774, by Mr. F. Masson. The leaves are crowded, sinuate, and ciliate with spines on the upper surface disposed starwise at the sinuses; flowers terminating among the leaves. It has the general appearance of Eryngo.

ARCTOSTAPHYLOS. See **VACCINIUM**.

ARCTOTHECA. See **GORTERIA** and **ARCTOTIS**.

ARCTOTIS, in *Botany* (from *ἄρκτος*, a bear, on account of the slagginess of the plant). Lin. g. 991. Schreb. 1340. Juss. 190. Class, *syngenesia polygamia necessaria*. Nat. Ord. *Compositæ; corymbiferae*. Juss. Gen. char. *Cal.* common, roundish imbricate; lower scales more lax, subulate; middle ovate; inmost oblong, scariose, rounded, and concave at the end. *Cor.* compound, radiate; corollules hermaphrodite, very many in the disk; females ligulate, near twenty, longer than the diameter of the disk; proper of the hermaphrodites funnel-shaped; border quinquefid; ends reflex, equal; of the females ligulate, lanceolate, very finely three-toothed; tube very short. *Stam.* of the hermaphrodites; filaments five, capillary, very short; anther cylindrical, tubular, five-toothed, the length of the corolla. *Pist.* of the hermaphrodites, germ scarcely visible; style cylindrical, a little longer than the corolla; stigma simple; of the females, germ ovate-four-cornered, villose, crowned with its proper calycle; style filiform; stigmas ovate, oblong, thickish, erect. *Per.* none. *Cal.* unchanged. *Seeds* in the hermaphrodites none; in the females, solitary, roundish, villose, crowned with a calycle, usually of five leaves; leaflets ovate, spreading. *Rec.* villose or chaffy, flattish. *Obf.* In some of the species the female floscules of the ray are barren, and the floscules of the disk fertile, while in others the former are fertile, and the latter barren. The leaflets of the calycle also vary from four to eight.

Ess. Gen. Char. *Rec.* villose or chaffy; down with a five-leaved crown. *Cal.* imbricate, with scales scariose at the end.

Species 1. *A. calendulacea*, marygold-flowered Arctotis. Of

Of this species we find the following varieties, viz. *α. A. calendula*, with "radiant florets twelve-fold, nearly entire." *β. A. hypochondriaca*, with radiant florets trifid, the middle inflected." *γ. A. trifida*, with "radiant florets four-parted." *δ. A. coruscans*, with "radiant florets three parted, the exterior one trifid." *ε. A. superba*, with "radiant florets barren, five parted; leaves runcinate and rather tomentose." Of the first, the peduncles are villose, nodding, beset with red bristles; ray yellow, purplish underneath, twisted during the night; the corollules of the disk black on the outside, and with black anthers; the outer scales of the calyx spreading, fubulate, short, hispid. Cultivated in 1752, by Miller. The second is supposed to be the same as *A. sulphurea* of Gaertner. The third has spreading hirsute stems, with runcinate thick ferrate leaves; disk of the flower black, with yellow florets, black at top; ray with four or five parted yellow florets, lead-coloured beneath. The fourth variety has not been described. Of the fifth the peduncles are villose, with hyaline bristles, decumbent in the night, but never nodding; ray greenish underneath, converging during the night; corollules of the disk yellow; anthers yellow. These are all annual, and, as well as all the other plants of this genus, are natives of the Cape of Good Hope. *2. A. ferrata* "radiant florets barren; leaves lanceolate, undivided, tooth-ferrate;" stems upright, simple, woody, subpubescent; leaves sessile, scarcely pubescent, somewhat crowded; peduncles terminating, many very long; calyx scarious, yellow; corollas yellow; crown of the seeds white. *3. A. tenuifolia*, "radiant florets barren; leaves linear, undivided, naked;" stems herbaceous, few; leaves filiform or linear, naked; peduncles long, solitary, naked, filiform; bracts small, filiform; calyx imbricate; ray yellow; perennial. *4. A. grandiflora*, "radiant florets fertile; leaves pinnatifid, toothletted, cobwebbed, three-nerved;" ray very large; petals straw-coloured, with a tinge of red underneath, yellowish near the base, with a dark purple mouth; biennial. Introduced in 1774. Discovered by Masson. *5. A. plantaginea*, plantain-leaved arctotis; "radiant florets fertile;" leaves lanceolate-ovate, nerved, toothletted, stem-clasping; leaves tomentose underneath; disk barren; perennial; flowers appear from June till August. Cultivated by Miller in 1768. *6. A. argentea*, silvery Arctotis; "radiant florets fertile; leaves lanceolate-linear, entire tomentose;" flowers yellow, appearing in August; biennial. Found by Masson, and introduced in 1774. *7. A. angustifolia*, "leaves oblong, toothed;" florets of the disk barren; receptacle very woolly. *β. A. spontanea*, a variety in which the whole plant is white, stems creeping, and leaves lyrate with two teeth on each side. *8. A. aspera*, rough arctotis; "radiant florets fertile;" leaves pinnate sinuate, villose, divisions oblong, toothed; stem stiff, perennial, villose, with purple streaks; leaves white underneath; corollas of the ray yellow, with red streaks beneath. There is a variety of this with narrow leaves and orange-coloured flowers. Cultivated in 1731, by Mr. Miller. The preceding eight species have the receptacle villose, but in those which follow it is chaffy. *9. A. paradoxa*; chamomile-leaved arctotis; "radiant florets barren; chaffs coloured, longer than the disk; leaves bipinnate, linear;" chaffs elongate, coloured, almost the length of the ray; whence the flower appears to be a double one. Gaertner has removed this together with the twelfth and thirteenth species to a genus named *Ursinia*. This species was introduced here by Masson in 1774. It flowers in August. *10. A. scariosa*, southern-wood-leaved Arctotis; "radiant florets barren; chaffs equaling the florets of the disk; leaves decomposed;" stem shrubby; all the calycine leaflets obtuse, scarious, screw-shaped, squarrose, spreading. It flowers from April till August, and was introduced in 1774, by Mr. Masson. *11. A. paleacea*, chaffy arctotis; "radiant florets barren; chaffs equaling the

florets of the disk; leaves pinnate, linear;" stem shrubby, branching; peduncles axillary, long; with few linear simple leaves; calyx and corolla yellow, like a chrysanthemum; ray simple, barren. It was cultivated in 1768, by Miller. The flowers appear from April till August. *12. A. dentata*, five-leaved arctotis; "radiant florets barren; leaves pinnate; pinnae pinnatifid, indented;" stem branching; leaves alternate, somewhat rigid, and villose; pinnae recurved; peduncles long, one flowered; flowers small, with the ray purple beneath; annual; flowers appear in July. Introduced by Mr. Haneman, in 1787. *13. A. anthemoides*; "chaffs shorter than the florets; leaves supra-decomposed, linear." This plant, as its name imports, resembles chamomile; ray barren, violet coloured. *14. A. tenuifolia*; "radiant florets barren; leaves linear, undivided, smooth;" stem branching, brownish, smooth; leaves linear, the length of the finger, smooth; peduncles very long, one flowered; calyx hemispherical, smooth, with the inner scales scarious and white; flowers yellow. *15. A. acaulis*, dwarf arctotis; "peduncles radical; leaves lyrate;" about six inches high. Flowers large, yellow, and appear from April to July. Cultivated by Miller, in 1759.

Propagation and Culture. These plants are all natives of the Cape of Good Hope. The annual sorts may be raised from seed, sown in the spring, either in a warm border of light earth, about the middle of April, or in a moderate hot-bed, towards the end of March. In favourable seasons the former will be the strongest plants; but in cold seasons they will seldom ripen their seeds. The latter must be transplanted, when they are fit, into pots; and as soon as they are well-rooted, enured gradually to the open air; they require much water in dry weather: they may also be propagated by cuttings or slips from the roots. The shrubby sorts are propagated by planting cuttings in a bed of light fresh earth in any of the summer months, observing to shade them from the heat of the sun, until they have taken root, and also to frequently refresh them with water. In six weeks after planting they will be rooted sufficiently to be transplanted into pots, which are to be placed in a shady situation, until the plants are new rooted; after which they may be exposed to the open air, till the latter end of October (or later, according to the state of the weather), when they must be removed into the green house. While they continue in the house they ought to have an open and dry situation, and be frequently supplied with water. They will also require to be shifted into other pots, two or three times every summer; and the pots should be often removed to prevent the plants from striking their roots through the holes into the ground. Several of these grow to the height of four or five feet, and as they send off several branches, they require to be frequently pruned. They are seldom without flowers, unless the winter be severe, which renders them very valuable, making a fine variety in the green-house or cape-stove; and when placed out in the summer, they produce flowers in great abundance. See Miller's Dict. by Martyn.

ARCTOTIS. See GORTERIA.

ARCTOUS, in *Entomology*, a species of *PAPILIO* (Danevelt.) that inhabits New Holland. The wings are very entire, and brown; both above and beneath is an ocellar bipupillated mark on the anterior ones; and another on the posterior ones, which is very faintly pupillated above. Fabricius, &c.

ARCTURUM *infra*, a small star of the seventh or eighth magnitude, to the south of *arcturus*; observed by Mr. Flamsteed, and so named by him, whose place is not determined in the British Catalogue.

ARCTURUS, in *Astronomy*, a fixed star of the first magnitude, in the constellation of ARCTOPHYLAX, or BOOTES.

The

The word is formed of *αρκτος*, and *ουρα*, tail, q. d. bear's tail; as being very near it.

This star was known to the ancients, as in the following verse of Virgil:

“*Arcturum, pluvialisque hyades, geminosque triones.*”

See also Job ix. 9. xxxviii. 32. Some critics have doubted whether the Hebrew word *אֲרִכְטָא*, or *אֲרִכְטָא*, *arikh*, denotes this star. For various opinions concerning its meaning, see Schultens, in Job, vol. i. p. 279.

Mr. Hornsby concludes, that *Arcturus* is the nearest star to our system visible in the northern hemisphere, because the variation of its place, in consequence of a proper motion of its own, is more remarkable than that of any other of the stars; and by comparing a variety of observations respecting both the quantity and direction of the motion of this star, he infers that the obliquity of the ecliptic decreases at the rate of 58" in one hundred years; a quantity which nearly corresponds to the mean of the computation framed by Mr. Euler and M. de la Londe, upon the principles of attraction. Phil. Transf. vol. lxxiii. p. i. N^o 14.

ARCTURUS, in *Botany*. See *CELSIA*.

ARCTUS, *αρκτος*, in *Astronomy*, a name given by the Greeks to two constellations of the northern hemisphere; by the Latins called *Ursa Major* and *Minor*, and by us the *Greater* and *Lesser* BEAR.

ARCTUS, in *Entomology*, a species of *CANCER*, that inhabits the seas in most parts of the world. Its specific character is thus concisely defined: scales of the antennæ ciliated, with spines. Fabricius and Gmelin. *Obs.* To this may be added, that the front is retuse, and armed with about ten unequal spines; the thorax oblong, and aculeated, and the posterior part of it, together with the upper part of the body, tuberculated, brown, and spotted with yellow. This is called *Poliquiquixé*, by Maregrave.

ARCUALIA OSSA, in *Anatomy*, a name used by some for the *ossa syncipitis*, by others for the *ossa temporum*.

ARCUALIS FUTURA, among *Surgeons*, denotes the coronal SUTURE.

ARCUANA, in *Entomology*, a species of *PHALÆNA* (*Tortrix*) found in Europe. The wings are pale yellow; on the anterior pair are three curved black bands, and a spot of the same colour; with a black spot in the disk, having three silvery dots upon it. Fabricius and Gmelin. *Obs.* Linnæus describes it as *Phalæna Tortrix alis luteis, fasciis tribus arcuatis, macula nigra tripunctata lineolisque duabus argenteis*. Syst. Nat. Fn. Su. &c.

ARCUANUS, in *Ichthyology*, a species of *CHAETODON*, found on the Indian and Arabian sea coasts. The tail is bifid; twelve spines in the dorsal fin, and body fasciated with brown. This species inhabits the shores among the coral rocks, and feeds on marine worms; it is silvery, back cinereous, with a deep brown or black band on the head, another on the breast, and a third extending from the dorsal to the anal fin. The flesh of this kind is eatable.

The head is large; front, and iris of the eye, white; gape narrow: jaws equal; teeth minute, and wedged; branchiostegious aperture ample; operculum simple, mucronate in the middle; ventral fins long, black; anal fin black; dorsal fins cinereous.

ARCUARIA, in *Entomology*, a species of *PHALÆNA* (*Geometra*). The wings are fuscous, with a thin streak, and a lunated spot of white near the posterior margin. Gmelin. Inhabits Europe.

ARCUATA, a species of *COCCINELLA*. This is of an ovate form; wing-cases red, with four dots, two bands and a dot at the apex black. Inhabits China. Fabricius. It is of the middle size; the body black, and head whitish; thorax black, whitish in front and on the sides.

ARCUATA, a species of *CASSIDA*, that inhabits Rio Janeiro. It is whitish, with a common black disk; border oval, ring, and arched mark behind, yellowish. This is about the middle size; and the breast and abdomen are black.

ARCUATA, a species of *LEPTURA*, in the Linnæan system, that inhabits Europe. The thorax is rounded; shells with four yellow bands, the first formed of three spots; the others curved downwards. Linn. and Donov. Brit. Inf. Gmelin has removed this, and some others of the *Leptura*, to the *Cerambyx* genus; it is therefore *CERAMBYX ARCUATUS* of that author, and is arranged in the division *Calidulum*.

ARCUATA, a species of *CICADA* (*foliacea*, Gmelin. *Membracis*, Fabricius) This insect inhabits Surinam. It is black brown; thorax compressed above, with a yellowish arch. Degeer, and Gmelin.

ARCUATA, a species of *CIMEX*, (*oblongus*, Gmelin). It is black; beak arched; wing-cases whitish, with a white spot, and black arched mark; four of the thighs clavated and red. Degeer. Inhabits Surinam, and is the size of the common house-fly, *Musca domestica*. Gmelin.

ARCUATA, a species of *PHALÆNA*, (*noctua*). The wings are whitish; the curved mark in the middle, and marginal spot behind are black. Fabricius. This moth inhabits Tranquebar, and in size and appearance somewhat resembles *Phalæna albicollis*.

ARCUATA, a species of *VESPA*, that inhabits New Holland, and is described by Fabricius. The body is black, variegated with yellow; the petiole connecting the thorax and abdomen is incurvated, and marked with four yellow spots.

ARCUATA, a species of *MUSCA*, found in Germany. It is testaceous; with two spots and a black curve at the apex of the wing; and a white dot at the tip. Fabricius. This greatly resembles *Musca stylata*. Gmelin also describes another insect under the name *Musca arcuata* (in the subdivision *SYRPHUS*). It is black, with long antennæ; thorax spotted on the sides with yellow, and four curved belts of the same colour on the abdomen.

ARCUATA, in *Ornithology*, a species of *FRINGILLA*, that inhabits the Cape of Good Hope, and is described by Dr. Latham as being of a chestnut colour above, beneath white; head and lower part of the neck black; collar and stripe behind the eyes white. This is also *FRINGILLA arcuata* of Gmelin, but his specific character is certainly less expressive than that of the preceding author; it is likewise *Passer Capitis Bonæ Spei*, of Brisson; *Croissant*, of Buffon; *Moineau du Cap de Bonne Espérance*, of the same author; *Pl. enl.* and crescent finch of Latham, Gen. Syn.

It is the size of a house-sparrow; length six inches; bill black; head and neck before as far as the breast are also black; at the eye begins a streak of white, which passes down on each side of the neck, and growing broader, passes round the fore-part like a crescent; hind part of the neck pale brown; back, scapulars, and lesser wing-coverts, chestnut; the middle coverts black, tipped with white; the greatest coverts and quills brown, edged with grey; tail deep brown; legs brown.

ARCUATION, from *arcus*, a bow, is used by some writers in *Surgery*, for an incurvation of the bones; such as we see in the case of rickets, &c.

ARCUATION, in *Gardening*, a term formerly applied to the practice of raising trees by layers. Switzer observes that in his time, it was the general method of producing such trees as could not be raised from seeds; as the lime, alder, willow, &c. See *LAYERS*, and *LAYING*.

ARCUATUS, in *Entomology*, a species of *SCARABÆUS*, found in Saltsburg. It is black, and glossy; shield rufous

in front; wing-cafes striated with punctures; fulture, marginal dot at the bafe, and abbreviated band inflected towards the fulture, reddifh; breast obfcure; abdomen yellowifh; palpi, antennæ, and legs ferruginous. Moll. naturh. Br. 1160. n. 7. Gmelin.

ARCATUS, in *Ichthyology*, a fpecies of CHÆTODON, that inhabits Brazil. The tail is entire; eight fpines in the dorsal fin; and four white arched bands acrofs the body. Gmelin. This is *Chætodon fufcus arcubus* 5 *nigris* of Muf. ad Fr.; *Guapere* of Maregrave; *Acarauua exigua nigra*. &c. of Willughby. The length is about four inches. See ACARAUNA.

ARCVATUS, in *Ornithology*, a fpecies of TURDUS, that inhabits China; and was firft defcribed by Dr. Latham under the name of the *Crescent Thrush*. Gmelin gives us this fpecific character. Above chefnut; the eye-brows, hue, chin, and vent, white; cheeks, and crefcet on the throat, white; tail rounded; towards the tip black; apex white. But as this author is indebted to Dr. Latham's account of this bird, his character fhould have read "cheeks and crefcet on the throat black." In the Index Ornithologicus the character runs thus;—rufo-fufcus, corpore fubtus fuperciliis lorifque albis, cervice jugulo pectoreque rubentibus, genis manulque fub gula nigris.

The length is eleven inches; bill lead-coloured, pale at the tip; upper parts of the body reddifh brown; over the eye a white line; lore and chin white; cheeks black paffing in a crefcet on the fore part of the neck; on the middle of the back part behind the eye, a patch of loofe white feathers; the hind part of the neck, and the breast reddifh; belly reddifh white; vent plain white; tail long; legs lead-coloured; claws white.

ARCUBALISTA, in the *Military Art*, a kind of *ballifta*, probably made after the fafhion of a bow.

It is mentioned by Vegetius; but the defcription of it omitted by him, as too well known then, though now hard to be gueffed at.

Those who fought with this weapon were called *arcuballiftarii*, fometimes *manuballiftarii*.

ARCUCCIO, ARCVTIO, a machine made of board, covered with pieces of hoops like the tilt of a waggon: ufed in Italy to prevent children from being overlaid and fmothered by nurfes, or others.

Every nurfe in Florence is obliged to lay her child in an arcutio, under pain of excommunication.—See a figure and defcription of the arcutio, given by Mr. St. John, in Phil. Tranf. N^o 412. Abridg. vol. vii. part iv. p. 46.

ARCUDIO, PETER, in *Biography*, a learned Italian; was born in the ifland of Corfu, and flourifhed in the feventeenth century. Having ftudied in the college of the Greeks at Rome, where he made great proficiency in literature, he fo much recommended himfelf by his zeal for the holy fee, that he was fent to Ruffia by Pope Gregory XIV. and by pope Clement VIII., in order to induce that nation to fubmit to the Roman pontiff; but in the courfe of twenty years, during which he remained in the country, his utmoft efforts were only fufficient for obtaining fome indulgences for thofe who obferved the Romifh ritual. After his return he diftinguifhed himfelf by his endeavours to refute the Proteftants on the fubject of the Sacraments; and for this purpofe he publifhed a work, intitled "On the harmony of the weftern and eaftern churches in the adminiftration of the feven facraments," printed at Paris in 1672, 4to. Among his other works were, "On the exiftence of Purgatory," printed at Rome in 1632, 4to.; "On the fire of Purgatory," Rome 1637, 4to.; and "A collection from the Greek theologians on the proceffion of the holy fpirit," Rome 1630, 4to. In all his performances he difcovers talents and erudition, and at the fame time ftrong traces of paffion and

bigotry. They are written in Greek; but without any pretention to Attic elegance. Arcudio was an indefatigable ftudent, and his foie amufement was derived from his library. He died at Rome about the year 1632 or 1633. Nouv. Diét. Hiftor. Fabr. Bib. Græc. l. v. c. 43. § 12. t. x. p. 417.

ARCUEIL, in *Geography*, a town of France, one league from Paris.

ARCULARIA, in *Conchology*, a fpecies of BUCCINUM in the fection *Gullefa*, (that in which the pillar lip is dilated and thickened). It inhabits the Indian fea, and is thus defcribed by Gmelin: fhell plaited, and crowned with papilla. This fhell is fometimes white, cinereous, or brown, with a white ftripe; and is *Arcularia major* of Ramplius, and *Buccinum fufciolum* of Cronovius.

ARCULPHUS, in *Biography*, a theologian of France, flourifhed about the year 690. Havi g vifited, on account of religion, the Holy Land, Conftantinople, Alexandria, and other places, he was thrown by a ftorm, on his return to France, on the coaft of Britain, and hofpitably entertained by Adammon, an abbot. To him Arculphus communicated the refult of his travels; and the account which he obtained from him in converfation formed three volumes, which were publifhed under the title of "Libri de Situ Terræ Sanctæ;" at Ingolftadt in 1619. Cave. Hift. Lit. t. i. p. 599.

ARCUS, in *Entomology*, a fpecies of PAPILIO (Dan. Felt.) The wings are very entire, and blue; anterior ones spotted with white; a large black fpot, terminating in another of white near the margin of the pofterior ones. This kind inhabits Surinaam. *Obf. Papilio Arcus* of Elper is a different infect; viz. *Papilio Alcon* of Gmelin.

ARDA, a fpecies of TERMES, that inhabits Africa. We are chiefly indebted to Mr. Smeathman, who difcovered them in Sierra Leona, for the hiftory of thefe destructive creatures. In their economy they greatly reſemble *Termes fatale*, and *deſtruitor*; for like them they attack and devour provisions, clothes, and furniture, and indeed they are in fuch numbers, and fo rapacious, that where they fettle, few things can eſcape them. They can perforate a piece of timber of the greateſt magnitude, and in a few hours leave nothing but a thin outer ſhell of it. The neſts are cylindrical, and from two to three feet high; they are formed of brown clay intermixed with grafs, and various other vegetables, and have a vaulted dome at top, with a prominent entire margin ſurrounding it. The *larvæ* are the labourers, and have a pale head; moniliform antennæ; no eyes; jaws ſhort and toothed; thorax and abdomen ovate; are of a cinereous lead colour; and the legs pale. The *Pupæ*, are the foldiers to protect them; their head is large and teſtaceous, elevated and gibbous in front, and obtuſely ovated behind; the jaws project, and are forked, black; antennæ moniliform teſtaceous, as long as the head; no eyes; thorax ſmall; abdomen ovated, cinereous lead-colour; legs teſtaceous. *Imago*, or perfect infect, is black; margins of the ſegments of the body white; wings incumbent, black, all the legs pale teſtaceous. Fabricius. The character of this ſpecies, according to the laſt-mentioned author, is thus defined, black; ſegments of the abdomen white at the tips; legs pale. Gmelin adopts this Fabrician defcription.

ARDA, in *Geography*, a town of European Turkey, in Romania, 60 miles ſouth of Filippopol — Alſo a river of European Turkey, which runs into the Mariza, 10 miles north of Trajanepoli.

ARDABIGANA, in *Ancient Geography*, a country of Aſſa, between Aſſyria and Perfarmenia, according to Procopius.

ARDACHAT, in *Geography*, a place in Armenia, ſo called from the name of Artaxias, denominated in the eaſt Ardechier; in which are ſeen ſome ruins of the ancient ARTAXATA.

ARDACHER, or ARDAGGER, a town of Germany, in the arch-duchy of Austria, near the Danube, ten miles south-west of Ips.

ARDAGH, in the county of Longford in Ireland, so called from its elevated situation, at present an insignificant village, but formerly of so much consequence as to have given name to a barony, and to have been a bishop's see. The church is one of the most ancient in Ireland, but cannot be called a cathedral. The see was founded in the middle of the fifth century. In 1658, it was united to the bishoprick of Kilmore; from which it was separated in 1741, and has been since held in commendam by the archbishops of Tuam. *Collectanea de reb. Hiberniæ.*

ARDAL, a town of Norway, 24 leagues north of Christiania.

ARDAMON, or ARDAMA, from *αἶψα*, *I water*, in *Antiquity*, a vessel of water placed at the door of a person deceased till the time of burial, as a token that the family was in mourning, and to serve to sprinkle and purify persons as they came out of the house.

ARDANIS, in *Ancient Geography*, a town of Africa, in Marmarica, according to Ptolemy.

ARDASSES, in *Commerce*, the coarsest of all the silks of Persia; and, as it were, the refuse of each kind. In this sense, they say, the *legis*, the *houfets*, the *choufs*, and the *payas ardasses*, to signify the worst of those four sorts of Persian silk.

ARDASSINES, in *Commerce*, called in France *ablaques*; a very fine sort of Persian silks, little inferior in fineness to the *sourbastis*, or rather *cherbassis*; and yet it is little used in the silk manufactures of Lyons and Tours, because that kind of silk will bear hot water in the winding.

ARDATOF, or ARDATOV, in *Geography*, one of the thirteen districts of the government of Nishnei Novogorod in Russia, situate on the river Tesh, falling into the Occa.—Also, a town of this district, sixty miles S. S. W. of Nishnei-Novogorod. N. lat. 50° 20'. E. long. 43° 4'.—Also, a district of the government of Simbirsk, situate on the Alator.—Also, a town of this district, ninety-two miles west of Simbirsk. N. lat. 54° 45'. E. long. 45° 44'.

ARDAXANUS, in *Ancient Geography*, a river of Illyria near Lissus, according to Polybius.

ARDEA, a town of Persia, according to Ptolemy, and Ammianus Marcellinus.

ARDEA, a very ancient town situate on an eminence south-west of Lavinium; at the time of the arrival of Æneas, it was the capital of the Rutuli, governed by Turnus. The Romans established a colony in this place in the year 311. The territory of Ardea was marshy and unhealthy. In its vicinity was a temple dedicated to Venus.

ARDEA, in *Ornithology*, a genus of the fourth order GRALLÆ. The bill is straight, pointed, long, slightly compressed, with a furrow extending from the nostrils towards the tip; nostrils linear; tongue acuminate; feet four-toed. Gmelin. Dr. Latham gives another character for this genus, viz. a long, strong, sharp-pointed bill; nostrils linear; tongue pointed; toes connected by a membrane, as far as the first joint; the middle claw of some of the species pectinated.

Gmelin divides his genus into five sections, and the following are the characters of those sections, with the species respectively referred to each.

* *Cristata*; rostro vix capite longiore (crested; bill scarcely longer than the head.)—Pavonina & Virgo.

** *Grues*; capite calvo, (cranes; head bald) canadensis grus, americana, antigone, & gigantea.

*** *Ciconia*, orbitis nudis (storks; orbits naked,) ciconia, maguari, & nigra.

**** *Ardeæ*; ungue intermedio introrsum ferrato, (herons; middle claw ferrated inwardly.) dubia, torquata, nycticorax,

grisea, jamaicensis, caledonica, caymenensis, purpurea, major, cinerea, garzetta, leucogaster, rufescens, egretta, agami, cocoi, johanne, hoactli, hohu, herodias, ludoviciana, violacea, eaculea, rubiginosa, ludfonias, comata, erythrocephala, ohula, cyanocephala, candidissima, castanea, squaiotta, galatea, ferruginea, erythropus, striata, virgata, rufescens, bellaris, botaurus, soloniensis, marshigli, danubialis, undulata, brasiliensis, tigrina, lineata, flava, bononiensis, alba, nyca, helias, sacra, atra, purpurata, spadicea, æquinoctialis, cræra, leucocephala, rufa, sinensis, virgata, cana, carunculata, malaccensis, cinramonea, pumila, badia, philippensis, novæ guineæ, cyanopus, maculata, gardeni, senegalensis, exilis & minuta.

***** rostro in medio hiante, (bill, gaping in the middle.) pondiceriana, coromandeliana & scolopacea. Which see respectively.

ARDEA, *exotica aurita*, Petiver Gz. 68. t. 43. f. 2. This is the Lianzan *Colymbus cristatus*.

ARDEÆ, in *Natural History*, the specific name of that kind of ECHINORHYNCHUS which infests ardea cinerea, (the common heron.) It is striated, and has the proboscis clavated. Gœze. Gmelin, &c. *Obs.* The body is conic behind, and sinuated on each side in the middle.

ARDEBIL, or ARDEVIL, in *Geography*, a town of Persia, in the province of Aiderbeizan, or Aderbijan; situate in the middle of a large plain, and surrounded by mountains which form a kind of amphitheatre. It was formerly a strong city, and had considerable trade; but it was plundered and burnt by the troops of Jenghiz Khan, about the year of the Hegira, 619. A. D. 1222. Its grand square, called "Meidan," has a caravanserai, and various conveniences for merchants, who frequent the city, from Turkey, Tartary, Hindostan, and other countries; and near it is a bazar or market, in which are sold the most valuable merchandize of the produce and manufactures of the country, as well as other articles, European and Asiatic. The tomb of Scheik Sefi, a celebrated saint, is an inviolable asylum, frequented by pilgrims from all parts of Persia. Caravans are frequently passing through this town from and to Constantinople and Smyrna. N. lat. 37° 20'. E. long. 47° 5'.

ARDEBIL, LITTLE, a town of Persia, in the province of Faristan, 18 leagues north of Schiras.

ARDECAN, a town of Persia, in the province of Irak, 43 leagues east of Ispahan.

ARDECHE, one of the departments of France, derives its name from a river of the Vivarais, which rises near Vals, and discharges itself into the Rhone, near Pont St. Esprit. This department is one of the seven formed of Languedoc, Cominges, Nebouzan, and Riviere Verdun. It is bounded on the north by the departments of the Dromé, Isere, and Lower and Upper Loire; on the east by that of the Dromé, which is separated from it, from one extremity to the other, by the Rhone; on the south, by the department of Gard; and on the west by the departments of Lozere and Upper Loire. Its superficies is about 1,077,929 square acres, or 550,004 hectares; the population consists of about 273,255 persons; and it is divided into three communal districts. The chief town is Privas.

ARDEE, or ATHERDEE, a small town in the county of Louth in Ireland, much declined in importance. Near it is a mount of great magnitude called Castle-guard. It is artificial and encompassed with a double ditch. It is now all planted with wood, and has a very romantic appearance. The perpendicular height of the mount from the bed of its foundation, is nearly ninety feet, and the depth of the main trench betwixt thirty and forty. The circumference at the top is not less than 140; and round the foundation it is upwards of 600 feet. There appear, from foundations yet remaining, to have been two concentric octagonal buildings upon

upon the summit of it. The Danes are supposed to have been the original authors of this and similar mounts; the design of which, whether for defence, or for burial places, or for holding assemblies of the people, has not been ascertained. Latitude, from observation of Dr. J. Hamilton, $53^{\circ} 50' 30''$.

ARDELICA or ARIOLICA, now *Peschiera*, in *Ancient Geography*, the place in Italy, at the conflux of the lake Benacus with the river Mincius, where Attila had an interview with Leo the Great, and the deliverance of Italy was purchased by the immense ransom or dowry of the prince's Honoria.

ARDELL, MAC, JAMES, in *Biography*, an eminent engraver, was born either in Ireland or in England, of Irish parents, and resided chiefly in London, where he died, June 2, 1765. Bafan calls him "one of the best engravers in Mezzotinto that England ever produced." His works are chiefly portraits, from the most celebrated painters of his time. His best engravings are said to have been from Vanduyke. Two most beautiful prints from this master are, "Time clipping the wings of Love," and "Moses in the ark of bulrushes."

ARDEN, or ARDON, in *Geography*, a county of Swiflerland, and one of the bailiwicks of the Valais.

ARDENBURGH, a town of Flanders, and formerly one of the most considerable maritime towns of the country; but now much decayed; four leagues N. E. of Bruges, and two S. E. of Sluys.

ARDENELLA, a town of Hindoostan, in the country of Coimbatore, forty miles south of Seringapatam.

ARDENNES, a forest of France, of ancient fame for events of chivalry, extends from Rheims to Tournay, and in the north-east to Sedan. Its extent, however, has been very variously assigned. From this forest one of the departments of France derives its name. It is one of the four composed of the former Champagne, Charleville, Sedan, Carignan or Mouson, Philippeville, Mariembourg, Givet, and Charlemont. It is bounded on the north by the department of Sambre and Meuse, and of Jemappe; on the east, by those of Sambre and Meuse, of the Forests, and of the Meuse; on the south, by those of the Meuse, the Marne, and the Aisne; and on the west, by those of the Aisne and of the Jemappes. Its superficies is about 1,029,189 square acres, or 525,281 hectares: the population consists of 253,902 persons; and it is divided into five communal districts. Its chief town is Mezieres.

ARDENSAN, a town of Asia, in the province of Aladulia, thirty-eight miles north-west of Arzingan.

ARDENT, ARDENS, from *ardere*, to burn, something hot, and as it were burning.

ARDENT fever is a burning FEVER, otherwise called CAUSUS.

ARDENT spirits are those distilled from fermented vegetables; thus called because they will take fire and burn; such as brandy, spirit of wine, rum, arrack, &c.

ARDENTES, in *Middle Age Writers*, an appellation given to those afflicted with the *ignis sacer*, or ERYSIPELAS. They are thus called, as seeming to be scorched or burnt with the disease.

Hence also the abbey of St. Genevieve at Paris is called *domus ardentium*, because, as it is said, great numbers were cured of that distemper at the shrine of this saint, in the reign of Louis VI.

ARDEOLA, and ARDEOLA *Naxia*, in *Ornithology*, the names by which Brisson calls the Linnæan *ARDEA minuta*.

ARDERN, JOHN, in *Biography*, contemporary with Guido of Chauliac, acquired considerable reputation for his skill in the practice of surgery and medicine. He was fet-

tled at Newark in the year 1349, when the plague broke out, and continued there until the year 1370, when the fame of his practice occasioned him to be called to London, where he was employed by persons of the first rank and consequence. He was successful in the cure of fistula in ano, having very much improved the method of performing the operation for that complaint, which, before his time, was effected either by the actual cautery, or by sawing through the rectum with a thread, which must have been a very painful operation. His treatise on fistula in ano, the only part of his large work that has been printed, was translated and published by John Read in the year 1588. He invented a new instrument for giving glysters, upon which he valued himself much, and with reason, as it seems to have been productive of much profit to him, "having gained much credit (he says) for his skill in injecting them an hundred times, and in distant places:" whence we learn the practice of giving them was little used or understood in this country at that time. He was very careful to make a good bargain with his patients, before he entered on the cure; "to stipulate for as large a sum as he could get, and to take security for the payment;" a practice, Aikin observes, that prevailed in France at the beginning of the last century. We are told in the eulogy of M. Mareschal, published in the memoirs of the Royal Academy of Surgery, that when he was appointed first surgeon to Louis the Fourteenth, in the year 1703, he generously threw into the fire obligatory bonds from his patients, to the value of 20,000 livres. Friend's *Hist. of Physic*, vol. ii. p. 325. Aikin's *Biog. Mem. of Med.*

ARDERO, in *Geography*, a town of Italy in the kingdom of Naples, and province of Calabria Ultra, seven miles south of Gierace.

ARDERS, in *Agriculture*, a term provincially applied to signify fallowings or repeated ploughings of land.

ARDES, in *Geography*, a narrow peninsula in the county of Down in Ireland, formerly a county of itself. It lies between Strangford lough and the North Channel, and is reckoned tolerably fertile. The people of the whole district, in general, are fishermen, sailors, and farmers, by turns. There are some weavers, and the women in general spin; but there are no bleach-greens, for want of water. The collecting of sea-wrack, for kelp, is also found a profitable employment.

ARDES. See ARDRES.

ARDESIA. See IRISH SLATE.

ARDFERT, in *Geography*, though now a small decayed village, was formerly the principal town of the county of Kerry in Ireland, and, till the union, retained the privilege of returning two members to parliament. It is also a bishop's see, which includes the whole county of Kerry and a small part of Cork. It is supposed to have been founded in the fifth century; and was at an early period so incorporated with Aghadoc as to form but one diocese, which was sometimes called the bishoprick of Kerry. In the civil wars of 1641, the cathedral was demolished, and the town in a great measure destroyed. Soon after the restoration, in 1663, it was annexed to the see of Limerick, and has ever since continued united to it. There are several ruins in the neighbourhood of the church, which is very old; and a round tower, one of the lofliest in the kingdom, built of a dark kind of marble, fell in 1770, tumbling at one crash into a heap of ruins. Ardfert is near the sea, and is 14 miles S. W. from Dublin. Dr. Smith's account of Kerry. Dr. Beaufort's Memoir.

ARDGLASS, a decayed town of the county of Down, in Ulster, Ireland; about seven miles from Downpatrick, situated on a small harbour of the same name. It was, in

the reign of queen Elizabeth, a place of considerable trade; and gave the title of a duke to a branch of the Cromwell family. The duties of its port were let to farm to Henry, at the beginning of Charles the first's reign. The revenues were very considerable. There is a long range of building, called by the inhabitants, the New Works; though they have no tradition of its design or use. It extends 274 feet in length, but is only 20 broad. It has three towers in front joined to it, one at each end, and one in the center. There are also the remains of several other castles, towers, and gates; and within the N. E. point of the harbour, there is a curious natural cave, with a large entrance on the shore. Tour through Ireland — Dublin, 1785.

ARDIA, or ARDEIA, in *Ancient Geography*, a river of Illyria, according to Stephan. Byz. and Strabo.

ARDIERE, in *Geography*, a river of France, which runs into the Saone, in the principality of Dombis.

ARDILA, a river which rises in Spain, and discharges itself into the Guadiana, near Moura, in Portugal.

ARDISIA, in *Botany*. Lin. g. Schreb. 1737. Swartz. prodr. 48. called also *Anguillaria* and *Bahia*. Just. 420. Clafs. *putandria monogynia*. Gen. Char. Cal. perianth one-leaved, five-cleft: clefts subulate, upright, coloured, permanent. Cor. one-petalled; tube short, the length of the calyx; border five-parted; parts lanceolate, acute, spreading, at length reflex. Stam. filaments five, subulate, upright; anthers acute, upright, bifid at the base, converging at top round the style. Pist. germ superior, ovate, very small; style subulate, longer than the stamens, upright, at length ascending; stigma simple, acute, permanent. Per. berry roundish, large. Seed single, roundish, covered with a hard, brittle bark, like a nut.

Ess. Gen. Char. Cal. five-cleft. Cor. one-petalled, five-parted; reflex. Stigma simple. Berry roundish, one seeded.

Species 1. *A. excelsa*, laurel-leaved ardisia; *anguillaria bahamensis*. Gært. fruct. 1. 372. "Racemes axillary, simple; leaves obovate, cartilaginous, ferrate at the edge; clefts of the corolla almost twice as long as the leaflets of the calyx; stamens inserted into the corolla." This tree is a native of Madeira, where it was discovered by Masson, and introduced here in 1784. 2. *A. zeylandica*; "flowers terminating panicle, leaves ovate, subpetioled, entire; stem arboreous;" leaves thick, oval, entire, evergreen, shining, very smooth, alternate, almost sessile, attenuated at the base; flowers at the tops of the branches, in numerous racemes, wheel-shaped, with a long tube of a red colour; berry smaller than that of the preceding species. A native of Ceylon. 3. *A. tenuifolia*. Swartz. prodr. Sloane jam. 2. 98. t. 205. f. 2. "Flowers panicle; leaves elliptical, entire, nerved; stem arboreous." This tree rises to about 30 feet high, having an ash-coloured smooth bark; leaves very smooth, of a dark green, four inches long, on short foot-stalks; flowers purplish. A native of Jamaica. 4. *A. coriacea*; "flowers panicle; leaves oblong, entire, veinless, coriaceous." 5. *A. ferrulata*; "flowers panicle; leaves ovate-lanceolate, acuminate, wrinkled; stem shrubby, pubescent." 6. *A. lateriflora*; "racemes lateral, or axillary compound; flowers umbellose; leaves oblong, acuminate, entire; stem shrubby." 7. *A. parviflora*; "racemes axillary, simple; leaves sessile, lanceolate-ovate, marked with lines; stem shrubby." The four last-mentioned species are natives of the West Indies, and are hitherto only known from Swartz's catalogue.

ARDISTAMA, in *Ancient Geography*, a town of Asia, in Galatia, according to Ptolemy.

ARDMORE HEAD, in *Geography*, a noted promontory on the south coast of Ireland, in the county of Waterford, a little to the east of Youghall bay. N. lat. 51° 56', W. long. 7° 42'. Near this is the village of Ardmore, an ancient episcopal see, and thought to have been a Danish settlement.

Its round tower is still in existence. The name Ardmore, signifies a great eminence. Smith's Waterford and Collection. de Rob. Hib.

ARDOIS, a mountain in Nova Scotia, between Windsor and Halifax, 13 miles N. W. from the latter; reckoned the highest land in the province, and affording a fine prospect of all the high and low lands about Windsor and Falmouth, and the distant country bordering the basin of Minas.

ARDOZZA, a town of Italy, in the kingdom of Naples, and province of Capitanata, 12 miles north of Ascoli.

ARDOR *ventriculi*, a heat of the stomach, usually expressed by the term *HEART burn*, or *CARDIALGY*.

ARDOVIUM, in *Ancient Geography*, a town of Illyria, far from the sea, in the territory of the Liburnians, according to Ptolemy.

ARDOYLE, in *Geography*, a town of France, in the department of Lys, and chief place of a canton in the district of Bruges. The place contains 5,875, and the canton 12,165 inhabitants: the territory includes 77½ kilometres and 4 communes.

ARDRAH, or ARDER, in *Geography*, a kingdom of Africa, on the Slave coast, bordering on Whydah. This kingdom extends for a considerable distance into the northern and interior country, abounds with populous towns and villages, and is in general fertile and well cultivated. The inhabitants are warlike. It is bounded on the west by the Rio Volta, on the east by the kingdom of Benin proper, on the south by the ocean, and on the north-north-west by the kingdoms of Oyo and Alghemi or Uleaim. To the south, or sea coast, Ardrah is very confined; and as it extends northward, widens into the form of a triangle. The coast, commencing four leagues east of Great Popo, and ending at Acqui, comprehends the space of twenty-five leagues, if the province of Jachen, which has a prince of its own, tributary to Ardrah, be included. Bosman and Barbot divide it into Great and Little Ardrah; comprehending under the latter the whole maritime coast, and under the former the interior country. Little Ardrah ascends up the country as far as Offra; and Great Ardrah includes the petty state of Torri. From Whydah to Little Ardrah, the coast is low and flat, but rises by a gentle ascent towards Jachen. North of Jachen, are Offra, Great Foro, and Assem, the capital of Ardrah. The other principal towns are Iajo and Ba. Iajo or Iago has two gates to the south, and is washed by the river on the north, that falls into the Rio de Formosa, or river of Benin, at Ba, where the Dutch have a small fishery. Between all the cities are great roads, and canals are cut from one river to another, which, by the canoes that traverse them, indicate wealth and industry. The vallies of Ardrah are pleasant, and produce wheat, millet, yams, potatoes, lemons, oranges, cocoa-nuts, and palm-wine. In the low and marshy grounds near the sea, they make salt by evaporation of the stagnated water; and with this they carry on a considerable trade with Alghemi and Oyo, by the great canal of Ba, which is the finest in the kingdom. The air is, in general, unwholesome. The vulgar, who can neither read nor write, use a small cord tied in knots, to each of which they affix certain ideas, and thus they convey their sentiments to a distance. The manners, dress, and religion of the Ardrians resemble those of the inhabitants of WHYDAH; and polygamy is equally allowed in both countries. The inhabitants of the sea-coast are employed in fishing, and manufacturing salt; and those of the interior country in husbandry. But they have no ploughs nor instruments of agriculture; the whole labour being performed with the spade and mattock. Instead of a public burying-place, the inhabitants of Ardrah are interred in a family-vault constructed in their own houses.

As to the government of Ardrab, it is monarchical and despotic. The court is numerous and splendid; and the chief-priest is second in dignity, and prime minister in temporals as well as in spirituals. The crown is hereditary; and its revenues arise from heavy capitations on the natives and foreigners, the sale of slaves, duties on foreign trade, taxes upon markets and the necessaries of life, and the confiscation of the estates of governors. Disobedience to the king's commands incurs the punishment of beheading; and the consequence is, that the wives and children of the offender become the slaves of the crown. Insolvent debtors are sold at the pleasure of the creditors; and the violation of the marriage-bed is punished with servitude. The goods proper for importation to Ardrab, are large white beads, glass or crystal ear-rings, gilt hangers, iron bars, sailors' knives, copper bells, guns, copper and brass basons, coloured taffeties, striped printed silks, coloured handkerchiefs, long white horse tails, looking glasses, large umbrellas, brandy, china, Indian silks, gold and silver in dust, with English and Dutch coins. Mod. Un. Hist. vol. xiii. p. 359—374.

ARDRE, a river of France, which joins the Loire at Nantes.

ANDRES, a town of France, in the department of the Straits of Calais, and chief place of a canton in the district of Calais. On an open plain between Ardres and Guisnes, was the celebrated interview of Henry VIII. of England with Francis I. king of France, in 1520. The two kings and their attendants displayed their magnificence with an emulation and profuse expence, which procured it the name of "the field of the cloth of gold." Feats of chivalry, parties of gallantry, and such exercises as were reckoned in that age manly or elegant, rather than serious business, occupied both courts during eighteen days that they continued together. After the wrestling between the French and English was concluded, in which the latter gained the prize, the two kings retired to a tent, and when they had drunk together, the king of England seized the king of France by the collar, saying to him, "My brother, I must wrestle with you;" and he endeavoured once or twice to trip up his heels; but the king of France, who was a dexterous wrestler, twisted him round, and threw him on the earth with prodigious violence. The king of England wished to renew the combat, but was prevented. Robertson's Ch. V. v. ii. p. 110.

—Also a town of France, in the department of Puy de Dome, and chief place of a canton in the district of Issoire, on a small river which runs into the Allier, nine miles south-west of Issoire. The place contains 1636, and the canton 10,582 inhabitants; the territory includes 300 kilometres and 16 communes.

ARDROSSAN, the name of a small promontory on the west coast of the county of Ayr, terminating in a ridge of rocks running out into the sea, twelve miles W. N. W. of Ayr.

ARDSALLIS, a village in the county of Clare, Ireland, near which is the abbey of Quin, the whole building of which, including the cloisters, dormitories, halls, &c. as well as the chapel, is still in a state of tolerable repair, except the roof. The buildings are in a good style of Gothic architecture, well contrived and neatly executed.

ARDSCHIR, or ARTAXERXES BABEGAN, in *Biography*, and *Ancient History*, a Persian king, and founder of a new dynasty, under the appellation of Sassanides; was descended, as his enemies say, illegitimately from an obscure family; or, by the flattery of his adherents, from a branch of the ancient kings of Persia, reduced to an humble station. If we credit the former, his mother was the wife of a tanner, whose name was Babe, and his father a common soldier, of the name of Sassan: from the former, Artaxerxes obtained

the surname of Babegan; and from the latter, all his descendants have been styled Sassanides. However this be, he was well educated, and served with great reputation in the armies of Artaban, the last king of the Parthians: but being driven into exile and rebellion by royal ingratitude, he fled into Persia proper where it is said his grandfather had been governor, and took up arms, in order to assert his right to the throne, as lineal heir of the monarchy, and also to rescue Persia from the yoke of the Parthians, under which they had groaned above five centuries, since the death of Darius. The Parthians were defeated in three great battles; and in the last of them their king Artaban was slain; so that in consequence of it, the spirit of the nation was for ever broken.

Ardschir then assumed the sovereignty, with the title of "King of Kings," which had been enjoyed by his predecessor; and his authority was solemnly acknowledged in a great assembly held at Balch in Khorasan. This great revolution, which established the empire of the Sassanides over Persia, till the invasion of the Arabs and the fatal influence of which was soon experienced by the Romans, happened in the fourth year of Alexander Severus, 226 years after the Christian era. Ardschir having ascended the throne, extended his conquests, and swayed the royal sceptre with singular reputation. Whilst he was active and enterprising in war, he cultivated the arts of peace, and administered the government with equal firmness and lenity. He reformed existing abuses, built new cities, promoted agriculture, distributed the people into classes, under appropriate instructors and magistrates, and abolished the frequency of capital punishments, agreeably to the maxim which he adopted, "that the sword ought not to be employed when the cane would answer the purpose." He likewise restored the Magian religion in its purity, and suppressed idolatry and schism. The articles of the national faith were established by a committee of seven Magi, selected from an assembly of 80,000, convened from all parts of his dominions. Ardschir, not content with his victories over the Scythians and Indians, engaged in a more perilous contest with the Romans, under Alexander Severus; but in his endeavour to regain those provinces of Asia, which had formerly belonged to the Persian empire, he lost the flower of his army, and was obliged to withdraw into his own territories. His domestic security was interrupted by the daughter of his predecessor Artaban, whom he married. Retaining her family hatred against him, she made an attempt to poison him; but her design being discovered, she was condemned to suffer death, but respited on the plea of pregnancy, till she was delivered of a son, afterwards called Sapor, who succeeded his father in the kingdom. One circumstance ought to be mentioned, which much redounds to his honour, and this was his practice of keeping a record or journal, in which all his actions were impartially noted down; and this journal was read to him daily. He likewise drew up a set of maxims, intitled "Rules for living well," adapted to all conditions of society, which were published by one of his successors. They are evidently the dictates of wisdom and benevolence. "When the king renders justice (says Ardschir), the people pay him with love and obedience." "The worst of princes is he who excites fear in the good, and hope in the bad." "The royal authority must be supported by military force; this force must be maintained by money; money can only spring from the culture of the land; and this cannot flourish without justice and good order." Ardschir, according to the most probable account, closed his life about the year 240; after a reign of 14 years. D'Herbelot. Bib. Or. p. 115. Gibbon's Hist. vol. i. p. 317. n.

ARDUBA, in *Ancient Geography*, a city of Dalmatia, which was taken by Tiberius.

ARDUINA, in *Botany*, a plant so named in honour of Pietro Arduin, curator of the æconomical garden at Padua. Lin. g. Schreb. 364. Lycop. Mill. fig. t. 300. Class, *Pentandria monogynia*. Nat. Ord. *Contortæ*. *Apocinea* Juss. Gen. Char. *Cal.* perianth five-parted, erect, acute, small, permanent. *Cor.* one-petalled, funnel-shaped; tube cylindrical, a little curved inwards at the top; border five-parted, acute, spreading. *Stam.* filaments five simple, shorter than the tube, and inserted into the lower part of it; anthers oblong, within the throat of the corolla. *Pistl.* gerin. superior, ovate; style filiform, the length of the tube; stigma bifid, thickish. *Per.* berry globular-oval, two-celled. *Seeds*, solitary, oblong, hard.

Ess. Gen. Char. *Cor.* one-petalled; stigma bifid; berry two celled. *Seeds*, solitary.

Species 1. *A. hispidula*, two-spined arduina; *Lycium cordatum*. Mill. t. 300. A shrubby plant, about four or five feet high. It is armed with strong spines, which appear in pairs or double pairs upon the same foot-stalks, immediately below the leaves. The leaves are heart-shaped, about an inch long; they continue green all the year, and are placed oppositely in pairs. The flowers are small, white, fragrant, in clusters at the ends of the branches, and appear in July and August. It is a native of the Cape of Good Hope, and was cultivated by Miller, in 1760.

Propagation and Culture. It may be increased by cuttings planted in July, and shaded from the sun; when they have taken root, they should be removed into small pots, and placed in the shade, till they have taken root again; they may then be removed to a sheltered situation till autumn, when they must be pot into a green-house, or under a hot-bed frame; this plant being too tender to live in the open air. See Miller's Dict. by Martyn.

ARDUINNA, in *Entomology*, a species of **PAPILIO** described by Fabricius. The wings are indented fulvous, with black spots; the posterior ones, beneath, white, with two fulvous bands, and speckled behind with black. This is *papilio arduinna* of Esper, and inhabits Russia. Obs. In the Fabrician arrangement, it belongs to the section *Satyri*.

ARE, in *French Measure*, is a superficial unit, or a square, the side of which is 100 metres in length, or 10,000 square metres; and the rectilinear metre being 3 feet 11.44 lines, the are will be 94831 square feet. The tenth of an are, called deciare, is a superficies 100 metres long, and 10 broad, or 1000 square metres=9483.1 square feet; and the centiare, equal to 100 square metres, is 948.31 square feet. See **MEASURE**.

ARE, or **A-LA-MI-RE**, in *Music*, denotes a sound in the scale of Guido, which is expressed by the abbreviation A in the musical scale or gammut, and implies the sound in the first space, and on the fifth line, in the base; the third sound below each tenor cleff; and that in the second space, and on the sixth line, in the treble. This is the sound to which all instruments are tuned at an opera concert, or other musical performance. But A in the Italian musical language, when it precedes a substantive, has the power of *in*, as *A battuta*, *A capella*. See the articles.

AREA, in general, denotes any plain surface, whereon we walk, &c.

The word is Latin, importing more properly a threshing floor; and is derived from *arere*, to be dry.

The area, or threshing floor, among the Romans, was sometimes paved with flint stones, but usually laid with clay, consolidated with great care, and smoothed with a large and heavy roller. Virg. Georg. i. 278.

AREA, in *Architecture*, denotes the space or scite of ground, on which an edifice stands. It is also used for inner courts, and those portions of ground.

AREA, in *Geometry*, denotes the superficial content of any figure.

Thus, if a figure, e. gr. a field, be in form of a square, and its side be 40 feet long, its area is said to be 1600 square feet: or it contains 1600 little squares, each a foot every way. Hence to find the area of a triangle, square, parallelogram, rectangle, trapezium, rhombus, polygon, circle, or other figure, is to find the magnitude or capacity thereof in square measure.—To do which, see the article **TRIANGLE**, &c. To find the area of fields and other inclosures, they first survey or take the angles thereof, then plot them on paper, and thus cast up their contents in acres, roods, &c. after the usual manner of other plain figures. The areas of all similar figures are in the duplicate ratio; or as the squares of their like sides, or of any like linear dimensions.

The law by which the planets move round the sun is this; that a line, or radius, drawn from the centre of the sun to the centre of the planet, always sweeps or describes elliptic areas proportional to the times. Thus the sun being supposed in S, and a planet in A, (*Plate 1. Astronomy, fig. 12.*) and letting it proceed in any given time to B; in such progress, its radius AS will have described the area ASB. Suppose again the planet to be arrived to P, then the elliptic space PSD being made equal to the other ASB, the planet will move through the arc PD in the same time as through the arc AB. This law of the planetary motions, discovered by Kepler, lies at the foundation of astronomy. Sir I. Newton demonstrates, that whatever bodies do observe such law in their motions about any other body, do gravitate towards such body.

AREA is also used, in *Medicine*, for a disease which makes the hair fall. The area is a general kind of depilation; and is distinguished into two species, *Alopecia* and *Ophiosis*.

AREA, in *Optics*. See **FIELD**.

AREALU, in *Botany*. See **FICUS RELIGIOSA**.

AREAS, D', an island, in *Geography*, lies on the west coast of the gulf of Mexico, in N. lat. 20° 45', and W. long. 92° 40'.

AREATA, in *Entomology*, a species of **PHALÆNA**, in the *Geometra* family, that inhabits Surinam. The wings are snowy white, with a marginal brown spot on the anterior pair, and four approximate streaks of the same colour on the posterior ones. Fabricius. Gmelin. Obs. This is **PHALÆNA area** of Cramer.

AREATUS, a species of **SCARABÆUS** (*Cetonia* section of Gmelin) found in Virginia. It is black and downy, with the disk of the wing-cases rufous. Fabricius.

AREB, a kind of imaginary money, used in the dominions of the great mogul.

Four arebs are equal to one crou, or 100 lacs; one lac to 100,000 rupees.

AREBICO, in *Geography*, a town of the island of Porto Rico, ten leagues from the town of St. John.

AREBO, or **ARBON**, a town of Africa, and capital of Benin, situate about sixty miles from the mouth of the river Formosa, to which ships of burthen may sail by means of the branches of that river, and collateral creeks. Arebo is represented as a large and populous city, and the centre of the commerce of Benin. The English and Dutch had formerly a settlement, with agents and factors in this place; but the English have neglected theirs, and carried on little or no trade to Arebo for several years past. The city and adjacent country are under the government of a viceroy and council. N. lat. 6° 0'. E. long. 5° 5'.

ARECA, in *Botany*, a genus of palms. Schreb. 1696. Gært. 7. Juss. 3. Class, *palme, monoccia enneandria*. Gen. Char. male flowers. *Cal.* ipathe bivalve; spadix branched; proper

proper perianth three-leaved. *Cor.* petals three, acuminate, rigid. *Stam.* filaments nine, the three outer longer than the others. Female flowers, in the same spadix; proper perianth and petals the same as in the male. *Per.* berry subovate, fibrose, surrounded at the base with the imbricate calyx. *Seed.* ovate.

Ess. Gen. Char. *Cor.* three-petalled; male nine-stamened; female a drupe with an imbricate calyx.

Species 1. *A. catechu*, "fronds pinnate; leaflets folded back, opposite, end bitten." *A. faufil.* Gært. fr. 1. 19. *Pinanga*, Rumph. Amb. 1. 26. t. 4. *Caunga*, Rheed. Mal. i. p. 9. t. 5—8. This palm grows to the height of forty or fifty feet; trunk straight, round, about six or eight inches in diameter, and covered with a smooth ash-coloured bark marked with parallel rings. The fronds spring forth in pairs, decussated, encircling at their base the top of the trunk, and forming an oblong head larger than the trunk itself; they are about six or seven, unarmed, reclining, six feet long, on a stipe four feet in length. From the axils of the fallen fronds issue the sheaths which inclose the flowers and fruits. These sheaths are simple, sharpish, white, coriaceous, thin, streaked, deciduous, nearly two feet in length, six inches broad, and defended by a wide involucre, formed of the dilated base of the frond involving the spadix and spathe; spadix axillary, branched, reclining; spikes linear, containing male and female flowers confusedly mixed; flowers white, very small, triangular, smelling sweet but faintly morning and evening; the calyx of the male is three-leaved, but that of the female six-leaved, imbricate and unequal. The fruit, according to Gærtner, is a berried drupe, or berry, having a thin cuticle and a thick filamentous pulp; shell very thin, brittle, white, with arched red veins; seed of a rounded conical form. A native of the East Indies. The Indian drug formerly called terra japonica, and now catechu, was very generally considered to be an extract prepared from the seeds of this palm; and hence Linnæus in his *Mat. Med.* has referred the catechu to the areca here described; but it is well known at present that this drug is manufactured from a species of mimosa. The trivial name of catechu, as tending to mislead, should therefore be abolished here, and confined to the mimosa. The fruit of the areca (betel-nut) is in general use by the Indians, who cut it into slices, and present it with a portion of terra japonica and shell-lime to their guests in all visits, wrapped in the leaf of a small tree called panno. It is chewed like tobacco, and tinges the saliva of a red colour, hence the following lines in *Misc. Nat. Cur.*

"Quis foliis credat commixta calce tenellis,
Cum fructu hoc Indos vescei, unde ore cruento
Purpureum ejiiciunt succum, tam dentibus atris
Horrendum arringunt, et dentibus ore minantur?"

2. *A. oryziformis*, "fronds pinnate; leaflets smooth, three-nerved." Gært. fr. 1. 20. *A. sylvestris.* Lour. Cochinch. 568. *Pinanga oryziformis*, Rumph. Amb. 1. 40. t. 5. f. c. This is a slender palm, growing to the height of ten feet; fronds more than three feet in length, without prickles; stipules triangular, dilated at the base, coriaceous, embracing the stem and fructification; leaflets two feet long, opposite, triplicate, distant, either pointed, or end bitten; spathe membranaceous, white, stiff; spadix spiked; spikes linear, with the flowers regularly disposed, one female between two males; calyx of the male three-leaved, with subulate unequal leaflets; anolla three-petalled, almost closed; anthers twenty-four, linear, without filaments; calyx of the female permanent; its leaflets broad, obtuse; germ oblong-ovate; style none; stigma three-cleft; berry ovate, red, scarcely

larger than a grain of wheat; pulp or rind thin, fibrose, smooth, adhering to the seed, so that the cell is not invested with its proper coat, as in the preceding species; seed ovate, conical, hollowed, at the base within which is a very minute teat; it is solid, horny, and half an inch in length. A native of Cochinchina, Amboina, &c. Its fruit, though much smaller than that of the preceding, is also used in pauns. Although this palm has the habit and fruit of the areca, yet the stamens and position of its flowers shew it to be very nearly allied to the caryota. 3. *A. oleracea*, cabbage-tree; "leaflets quite entire." Jacq. Amer. 278. t. 170. pi. 135. *Palma altissima.* Mill. Sloane, Browne. The cabbage-tree is the highest of the American palms. Some authors say that it frequently rises to above 200 feet in height, with a trunk no bigger than a man's thigh, and covered with a coat which is impenetrable to a musket ball. Modern writers, however, describe it from thirty to one hundred feet. It is very different from the East Indian areca. The sheaths of the leaves are very close, and form the green top of the trunk, a foot and a half in length. Below this come out green shining spathes, which fall off when the branching spadix bursts forth. The calyx is one-leaved, cut to the middle into three segments. The fruits are oblong, obtuse, berries of a blue purple colour, and about the size of an olive, containing a stone or nut which is oblong, membranaceous, smooth, brittle, inclosing a very hard cartilaginous kernel. Within the leaves, at the top of the palm, is found a white heart of eight or nine inches in circumference, which is called cabbage, and which is esteemed a great luxury by the inhabitants, who eat it either raw as salad, or fried with butter, as well as boiled, and compare its taste to that of artichoke. The seeds of this beautiful tree were first carried to Jamaica by admiral Knowles, when governor of the island, and it has since been cultivated with great care. It is there planted for its beauty, and seldom or never cut down for the cabbage or for any other purpose. The West Indian cabbage-tree was introduced into the king's garden at Kew by Hinton East, esquire, in 1787. There is also a species of palm, called by Solander *Areca Sapida*, which grows spontaneously in New Zealand, and abounds in Norfolk island: but the fructification of it is not known. Martyn's Miller's Dict.

ARECA, in *Ancient Geography*, a town of Syria, in the Com-magene, not far from Antioch, at the foot of mount Taurus.

ARECA, or *Karek*, in *Geography*, an island of Asia, on the east coast of the gulf of Persia, between Abufchiehr and Bender Rigk, one league south-west of Ormus, about three leagues in circumference. It contains only a single village; but the aqueducts cut in the rocks, which still remain, shew it to have been more populous in proportion to its extent. The Dutch attempted to establish a factory and build a fort here, but they were expelled by the Arabs under the conduct of Mir Mahanna, in the year 1765.

ARED, ARAD, or *Arud*, one of the two principal districts of the province of Neged or Nedsjed in Arabia; the other being called Kerje or Kerdsje. This district borders on Hejar or Lahfa to the east, and contains a district called Hanifa, anciently celebrated and still known under the same name. Its dependencies are Aijænc or Aijana, a town which produced Abud al Wakheb the new prophet, and Munsoha. Niebuhr mentions other towns of Ared, among which is Jebrin on the confines of Lahfa. See ARAD.

AREIRA, in *Botany*. See SCHINUS.

AREKEA, see ARKEEKO.

ARELATE, ARELATUS, now *Arles*, in *Ancient Geography*, a city of Gaul, situated to the left of the Rhone, at the place where it divides itself into three branches, near

its mouth, and belonging to the Salyii. At this city Cæsar, when he determined to lay siege to Marseilles, fitted a squadron of twelve long vessels; and Strabo speaks of this place as a commercial emporium. Pomponius Mela speaks of it as one of the richest cities in Gallia Narbonensis; and Pliny, Suetonius, and Strabo represent it as a colony. The colonies conducted thither under the father of Tiberius were detachments of the sixth legion, whence it was called "Colonia Sextorum." When the Roman province was divided into Narbonensis and Vienensis, Arelati belonged to the latter; and in the time of Cæsarotine, it was extended, by means of a bridge, from the left to the right side of the Rhone; and this emperor celebrated on it the Circensian and Olympic games, in 34. The emperors Valentinian and Honorius honoured it with many signal privileges, whence the poet Ausonius called it "the Rome of the Gauls." It became at length the seat of a prætorian præfect, and was in reality the chief city of the Gauls. While its civil state was improved by its population and commerce, and the distinguished patronage of the Roman emperors, its ecclesiastical power was also augmented by the activity of its bishops. By the council of Turin, in 307, it was erected into a metropolis; the fine arts likewise flourished in this city; and the fertility of its territory gave it the appellation of "Therissa," from the Greek word *βρασ*, the breast. The amphitheatre of this city, though it was never completed, is still one of the finest monuments of antiquity belonging to the Gauls. By an inscription it appears, that the shows of the gladiators were exhibited in this place. See ARLES.

ARELLI, in *Botany*. See NERIUM.

AREM, or AL-AREM, a vast mound or dam, which formed a stupendous reservoir above the city Saba, whose rupture caused an inundation, famous in eastern writers. Sale's Prel. Disc.

The word *arem* is Arabic, and literally signifies any mound, or dam, for the containing of water.

AREMBERG, in *Geography*, a town of Germany, in the circle of the lower Rhine, and capital of a duchy to which it gives name, situate on the Ahr in the Eifel, sixteen miles S.S.W. of Bonn, and twenty-six south of Cologne. N. lat. 50° 32'. E. long. 6° 24'.

AREMBUS, in *Ancient Geography*, a town of India, on this side of the Ganges, according to Ptolemy.

ARENA, among the Romans, sometimes signified the same with an amphitheatre; viz. a place where the gladiators had their combat. The word is Latin, and signifies *sand*; because the place was always strewed with sand or saw-dust, to prevent the gladiators from sliding, and to conceal from the view of the people the blood spilt in the combat. Properly speaking, arena was only the pit or space in the middle of those places where the athletic and gladiators performed. The arena was the same thing with regard to the gladiators, that the campus, or field, was to soldiers and armies; viz. the place where they fought.—He who fought in the arena was called *arenarius*. Nero is said to have strewed the arena with gold-dust.

ARENA, in *Architecture*, is the middle or body of a temple, and comprehends the whole space between the antæ and the extreme wall of the building.

ARENA GIUSEPPE, in *Biography*. See GIUSEPPE.

ARENA, in *Geography*, a river of Sicily, which runs into the sea near the town of Mazara.—Also a town of Italy, in the kingdom of Naples, and province of Calabria ultra, sixteen miles east of Nicotera.

ARENA, is also a port in the island of Puna, in Guaiquil bay on the western coast of South America, eight leagues

E.N.E. from Santa Clara, where all ships bound into the bay take pilots.

ARENACEA, in *Entomology*, a species of *PHALÆNA*, in the *Bombæ* family. The wings are yellowish; the first pair sprinkled with black specks above. Inhabits the Cape of Good Hope. Gmelin.

ARENACIUM, or ARENATIUM, in *Ancient Geography*, *Aren*, or *Arib*, the name of a Batavian fort situated on the Rhine, not far from the place where this river separates to form the Vahel. The Batavians, that Aquileius assembled an army in this place to attack the Batavi.

ARENÆ, or ARENÆÆ, a people of Asia Minor in Lydia, in the vicinity of Fayatina.—Arenæ was also a place of Spain in Bætica, on the coast of the Turdetani, extending from the mouth of a small river, where was seated Cuba, to the most eastern part of Bætis.

ARENARIA (from *arena*, *sand*), in *Botany*, sandwort. Lin. gen. 569. Schreb. 774. Gærtn. t. 130. Juss. 301. Class. *dicotyledonata*. Nat. Ord. *Caryophyllei*. Gen. Char. *Cal.* perianth five-leaved; leaflets obovate; acuminate, spreading, persistent. *Cor.* petals five, ovate, entire. *Stam.* filaments ten, subulate, five, alternately interior; anthers roundish. *Pist.* germ ovate; styles from erect reflex; stigma thickish. *Per.* capsule ovate, covered, one-celled, three or six-valved. *Seeds* very many, kidney-shaped. *Obf.* The number of filaments is not constant.

Ess. Gen. Char. *Cal.* five-leaved, spreading; petals five, entire. *Cass.* superior, one-celled, many-seeded.

Species 1. *A. peploides*, sea sandwort, or chick-weed. Hudf. With. Eng. Bot. t. 189. Flor. Dan. t. 624. "Leaves ovate, acute, fleshy;" calyx obtuse, nerveless, Smith; root creeping, long, perennial; stems prostrate, branched, angular, smooth; leaves opposite, sessile, ovate, acute, recurved, smooth, entire; flowers white, appearing in June and July; capsule roundish, three-valved; seeds large, black, obovate. Common on the sea-coast. 2. *A. tetraquetra*, square sandwort; "leaves ovate, keeled, recurved, imbricate four ways;" stems almost upright, and very numerous, shorter than the flowering stems; flowers marked with lines, in a head, upon terminating bifid peduncles. A native of the Pyrenean mountains, flowering in July. Introduced into Kew garden in 1776, by Dr. Ortega. *β. gyp-sophila aggregata*, Lin. sp. 581. Amœn. Acad. 3. 23. Allion. pedem. n. 1718. t. 89. f. 1. Schreb. Aët. Nov. Acad. N. C. 4. 140. A variety with "pointed recurved leaves, and aggregate flowers." 3. *A. biflora*, two-flowered sandwort; leaves obovate, obtuse; stems procumbent, peduncles two-flowered, lateral; its leaves resemble those of wild thyme, roundish, even; two linear bractes at the division of the peduncle, and also on the other pedicel. A native of the high Alps of Savoy and Switzerland near the melting snow. 4. *A. lateriflora*, side-flowering sandwort; "leaves ovate, obtuse; peduncles lateral, two-flowered. Its stem is short, small, simple; leaves smooth, on short footstalks; peduncles single, long, bifid, axillary; corolla longer than the calyx. Discovered by Gmelin in Siberia. 5. *A. trinervia*, plantain-leaved sandwort. Hudf. With. Curt. Lond. fasc. 4. t. 31. Flor. Dan. 429. "Leaves ovate, acute, petiolate, nerved," with the keel of the calyx rough, and obscurely trinerved, Smith; root fibrous, annual, stems about a span high, slender, erect, branched, round, hairy, and beset with leaves; leaves three or five-nerved, ciliated; peduncles one-flowered, long; flowers small, white; leaflets of the calyx lanceolate, acute, keeled, trinerved, rough on the back, and at the edges membranaceous and ciliated; petals obovate, scarcely the length of the calyx; capsule ovate, with an hexifid mouth; seeds small, smooth, black. This,

A R E N A R I A.

like the first, is a British species; it grows in woods and wet shaded situations, flowering in May and June. 6. *A. ciliata*, ciliate sandwort. Flor. Dan. 346. Jacq. Vind. 75. "Leaves ovate, nerved, ciliate, acute;" leaves sessile, pointed, ciliate at the base; corolla twice the size of the calyx; leaflets of the calyx oval, pointed, nerved; the stamens are placed on a circle of nectariferous glands. See Villars' Dauph. 62c. According to Linnæus, it is a native of mount Abraham in the Rhetian Alps (Grifons); and Villars states it to grow on the high mountains of Dauphiné. In the Kew catalogue, however, we are told that it is a native of Iceland, whence it was introduced by Sir Joseph Banks in 1773. 7. *A. balearica*, majorca sandwort. L'Heritier, Stirp. Nov. 29. t. 15. "Leaves ovate, shining, rather fleshy; stem creeping; peduncles one-flowered." A perennial growing in tufts, creeping and taking root at the joints; leaves opposite, petioled, acuminate, entire, nerveless, beset with short hairs; peduncles terminating, solitary, long, erect, one-flowered; flowers large, white, with two opposite, sessile, lanceolate bractes. A native of Majorca and Minorca. 8. *A. multicaulis*, many-stalked sandwort; *alpine*, Hall. helv. n. 6. t. 17. "Leaves ovate, nerveless, sessile, acute; corollas larger than the calyx;" leaves more or less ciliate; flowers very large. Some botanists consider this as a variety of the *ciliata*, and Villars thinks it a variety of the *serpyllifolia*. 9. *A. serpyllifolia*, thyme-leaved sandwort. Hudf. With. Curt. Lond. fasc. 4. t. 32. Flor. Dan. 977. "Leaves ovate, subsessile, rough; calyx hirsute and common, only five-nerved;" root fibrous, small, annual; stems many, about six inches high, spreading, rigid, branched, round, pubescent, dichotomous at the top; leaves small, ovate, pointed, entire, obscurely nerved; peduncles erect; flowers small, white; petals shorter than the calyx; leaflets of the calyx, ovate, acute, hirsute, those that are exterior five nerved, interior three-nerved; capsule ovate, six-parted at the mouth; seeds of a yellowish brown, subrugose. A common British plant; growing on walls, and dry barren or sandy situations. It flowers in June or July. 10. *A. triflora*, three-flowered sandwort; "leaves lance-subulate, ciliate;" branches mostly three-flowered; petals marked with lines, obtuse; its stems are numerous, about four inches high, diffusel, round, pubescent; leaves like those of juniper; peduncles terminating, three-flowered; bractes two, ovate, ciliate; petals obovate, twice the length of the calyx, white, marked with lines; pillil shorter than the stamens. A native of the south of Europe, on rocks, perennial. 11. *A. montana*, mountain sandwort; "leaves linear, lanceolate, rugged; stems barren, very long, procumbent." Its leaves form a tuft about the root, bristle-shaped, spreading, of a shining green; those on the stem are shorter than the internodes, stem-clasping; flower-stems half a foot high, hairy, bearing two or three flowers at the top on long peduncles; calyx three-streaked, with the leaflets separate; petals twice as long as the calyx, white, marked with lines, ovate, and slightly emarginate; fruit long, subcylindric. Linnæus remarks that the flowers are very large, and the fruit pendulous. A native of the south of France, Spain, and the Col de Tende. 12. *A. rubra*, purple sandwort. Hudf. With. *spargula purpurea*. Raij. Syn. 351. "Leaves linear, pointed; stipules membranaceous, sheathing;" seeds compressed, angular, roughish, Smith. Its root is small, fusiform, branched, annual; stems prostrate, divaricate, branched, round, smooth; leaves linear, very narrow, acute, with a sharp point, glaucous or whitish, nearly the length of the internodes; stipules from under the leaves, opposite, stem-clasping, rigid, white, acute, jagged; panicles terminal, dichotomous; flowers of a bluish flesh-colour; the divisions of the calyx lanceolate,

hirsute, with dry edges; petals shorter than the calyx; capsule ovate, three-valved; seeds many, brown, angular, rough, with little tubercles. A British plant growing in sandy fields, and flowering in July and August. 13. *A. marina*, sea sandwort. Flor. Dan. t. 740. *A. media*. With. *A. rubra*, β . sp. pl. 606. Light. Hudf. 193. (*media*) β . *A. media*. sp. pl. exclusis synonymis. *Alpine* *spargulae facie media*. Ray. Syn. 351. "Leaves semicylindrical, fleshy, smooth; stipules scariose, sheathing; seeds compressed, marginated, smooth." Smith. Its root is spindle-shaped, annual; stems prostrate, very smooth; stipules similar to those of the *rubra*; flowers larger, of a pale flesh or purplish colour; capsule three-valved, longer than the calyx; seeds in β having a dilated membranous white striated margin. This species and the *rubra* are found sometimes to approach as closely to the *spargula* as to the *arenaria*. A British plant, grows in pastures and sandy grounds washed by the sea, flowering in June and July. 14. *A. bavarica*, Bavarian sandwort. "Leaves semicylindric, fleshy, obtuse; petals lanceolate; peduncles terminal; mostly binate." Its stems are prostrate, with many slender divided branches, and a pair of leaves at each joint; these leaves are oblong, narrow, and of a pale green; petals white, acuminate, sometimes fringed and purplish; seeds minute, compressed, black, shining; perennial. A native of Bavaria, Monte Baldo, and Little St. Bernard. 15. *A. gypsophiloides*, "leaves linear, short, at the root bristly; panicle subpubescent; petals lanceolate;" root perennial; stem erect, jointed, a span high; stem leaves largest, and longer than the internodes; panicle terminating, brachiate, dichotomous; petals three times as long as the calyx. A native of the Levant. 16. *A. saxatilis*, rock sandwort; *alpine*, Gmel. fib. iv. p. 157. t. 63. f. 2. "Leaves subulate; stems panicled; leaflets of the calyx ovate, obtuse;" root perennial; stems exceedingly numerous, forming a very thick tuft half a foot high, and very full of flowers. A native of France, Germany, Switzerland, &c. 17. *A. verna*, vernal sandwort. Hudf. With. Lightf. Eng. bot. 512. "Leaves subulate, rather obtuse; stem panicled; petals obovate, longer than the calyx, three-nerved; nerves distant, equal, Smith." Root perennial, long, much branched; stems numerous, five or six inches high, round, somewhat pubescent and viscid, branched at the base, and panicled above; leaves erecto-patent, subulate, rather obtuse, three-nerved beneath, and above channelled, connate, and spreading at the base; bractes ovate, three-nerved, short; peduncles, erect, pubescent; leaflets of the calyx acute, hairy, three-nerved; margins membranous; petals longer than the calyx, obovate, obtuse; anthers fleshy; capsule longer than the calyx; cylindrical, three-valved; seeds almost kidney-shaped, rough, compressed. It grows on mountains in England, Scotland, and Wales, flowering from May till August. 18. *A. hispida*, hispid sandwort; "leaves subulate, hispid underneath;" this bears much affinity to spurry: stems simple, with scattered hairs; leaves opposite, flat, with a few hairs underneath; panicle first dichotomous, then branching, with alternate peduncles. A native of Montpellier. 19. *A. juniperina*, juniper sandwort, Smith. Icon. ined. 2 t. 35. "Leaves subulate, thorny; stems erect, calyx striated; capsules oblong;" root perennial; stems numerous, half a foot high, slightly pubescent; leaves spreading, connate at the base, three-nerved, almost triangular, mucronate; root leaves very short, blunt, without prickly points; flowers in terminal panicles, on smooth, filiform, one-flowered peduncles; bractes acute, three-nerved, with a scariose waving edge; leaflets of the calyx lanceolate, mucronate, three-nerved; petals obovate, lanceolate, obtuse, white, scarcely twice as long as the calyx, streaked;

capsule three-valved, obtuse, shining; seeds small, compressed, roundish, black; native place unknown. 20. *A. tenuifolia*, fine-leaved sandwort. Hedd. With. Eng. Bot. 219. Flor. Dan. 389. *Alfne tenuifolia*, Ray Syn. 350. "Leaves subulate, acute; stem paniced; capsules erect, three-valved; petals lanceolate, shorter than the calyx;" its root is small, annual; stems erect, commonly smooth, paniced, dichotomous; leaves three-nerved, connate, and dilated at the base; peduncles capillary, erect; flowers small, white; leaflets of the calyx lanceolate, acuminate, three-nerved, membranaceous at the edges; petals very small, lanceolate, obtuse, half the length of the calyx; stamina very short; capsule cylindrical, three-valved; seeds small, nearly of the shape of those of the *A. rubra*. It flowers in June, and grows in barren sandy fields, especially in Cambridgeshire, Norfolk, Worestershire, and Oxfordshire. 21. *A. laricifolia*, larch-leaved sandwort; "leaves bristly; stem nakedish above; calyx rather shaggy;" root perennial; stems many, half a foot high, harsh, and rough; peduncles roughish, one-flowered; calyx marked with lines, pubescent; petals ovate, large, marked with lines, twice the length of the calyx; fruit long, cylindrical. A native of France, Switzerland, &c. but not of Britain; the *A. laricifolia* of Withering being, according to Dr. Smith, a variety of the *A. verna*. 23. *A. striata*, striated sandwort. Allion pedem. n. 1712, t. 26. f. 4. Villars' Dauph. t. 47. "Leaves linear, erect, pressed to the stem; calyx oblong, striated." Allioni and Villars differ much in their representations of this species, and we have not the means of deciding which is right. It is a native of Switzerland. 23. *A. fasciculata*, cluster-flowering sandwort. Jacq. Aust. 2. t. 182. *Stellaria rubra*, Scop. Carn. n. 538. t. 17. "Leaves subulate;" stem erect, stiff; flowers in clusters; petals very short; root annual; stem four inches high, pubescent; leaves linear, acuminate, erect, subcylindrical; flowers in bunches, dichotomous, on very short pedicles; leaflets of the calyx long, subulate, striated; petals very small, ovate, white; capsule half the length of the calyx. A native of the south of France, &c. introduced here by Mr. Zier in 1787. 24. *A. grandiflora*, great-flowered sandwort. Allion. pedem. n. 1711. t. 10. f. 1. "Leaves subulate, flat, stiff; radical leaves crowded; stems one-flowered." A native of the south of France, Switzerland, &c. Gouan remarks, that Linnæus and Allioni have made their descriptions from dwarf plants. His description of the plant consequently differs much from theirs. See Gouan illust. p. 30. 25. *A. austriaca*, austrian sandwort. Jacq. Aust. 3. t. 70. Allion. ped. n. 1708. t. 64. f. 2. "Stems under shrubby, prostrate, thin, herbaceous, and erect; leaves subulate; flowers twin; petals emarginate;" perennial. Stems dichotomous or trichotomous; leaves linear, subvillose, pointed, connate at the base; stems, peduncles, and calyx villose; capsule five-valved, shorter than the calyx; seeds brownish. A native of the mountains of Aultria, Switzerland, and Piedmont. 26. *A. liniflora*, flax-flowered sandwort. Jacq. Aust. 5. t. 445. "Stems erect, branched below, under shrubby; leaves subulate; flowers twin;" perennial. Stems short, distorted. perennial; branches annual, simple, erect; peduncles subpubescent, terminal, generally two; leaflets of the calyx lanceolate, two-freaked; petals obovate, white. A native of the southern countries of Europe. 27. *A. recurva* Allion. ped. n. 1713. t. 89. f. 3. Ger. prov. 405 n. 7. t. 15. f. 1. "Radical leaves heaped, recurved, subulate; stem simple, bearing about three flowers;" perennial. Stems three inches high, simple; leaves towards the root aggregate, (in tufts,) brittle-shaped; stem-leaves setaceous, unequal, flattish above, with the edges rolled back, two-freaked. A native of Provence and

Alpine mountains. 28. *A. obtusa*. Allion. ped. 1714. t. 64. f. 4. "Leaves linear, flat, obtuse; calyx viscid;" perennial. Stems procumbent, branched; leaves connate, soft, green; branches usually terminating by two flowers on long peduncles; leaflets of the calyx ovate-lanceolate, green; petals entire, scarcely larger than the calyx; fruit conical, five-valved. A native of the high Alps of Switzerland. 29. *A. lanceolata*. Allion. ped. n. 1715. t. 26. f. 5. "Leaves lanceolate, three-nerved, acute; calyx lanceolate, three-nerved;" root perennial, dark coloured, tough, creeping; stems filiform, in a tuft, branched, creeping, beset with fine hairs; leaves lanceolate, acute, with three raised nerves; corolla spreading, large; stamens alternately shorter, longer than the petals; anthers small, purple; fruit conical, five-valved. This and many other species of the genus are involved in much confusion, from which they cannot easily be extricated. 30. *A. dianthoides*, Smith ic. ined. t. 16. "Leaves linear, scabrous at the edge; flowers capitated; bractes ventricose, longer than the peduncles." *Alfne*, &c. Tournesf. cor. 17. Root woody, perennial; stems a foot high, six or seven jointed; leaves connate; stem clasping, acute, serrulate, and rough at the edges; flowers monoecious, in a head or terminal spike, on short filiform peduncles, fenced with the bractes; petals obovate with claws; three times as long as the calyx. Found in Armenia by Tournefort. 31. *A. cucubaloides*, Smith ic. ined. t. 17. *Alfne orient.* &c. Tourn. cor. 17. "Leaves linear, scabrous at the edge; panicles dichotomous, pubescent; petals obovate;" root perennial; stems a foot high, round, smooth; leaves connate; stem clasping, acute; panicle spreading, terminating, viscid; flowers the size and appearance of those of common flax; bractes acute, scarious at the edge, only one fourth of the length of the peduncles; leaflets of the calyx ovate, acute, keeled, striated, viscid, pubescent; petals white, with subpellucid streaks; five of the stamens longer than the others; capsule one-celled, ventricose, shining, clothed with the calyx; seeds numerous. Found in Armenia by Tournefort.

Propagation and Culture. The greater part of these plants are natives of Europe, and most of them affect mountainous situations. They have neither size nor brilliancy to be generally cultivated in gardens; many of them, however, are neat elegant plants. The perennial sorts may be easily increased by slips, or parting the roots; but both these and the annual sorts may be propagated from seeds. They require no other care than what is necessary for all hardy vegetables. Martyn's Miller's Dict.

ARENARIA, in *Ancient Writers*, is used for sand-pits, or ground out of which sand is dug. Vitruvius.

ARENARIA, in *Conchology*, a species of HELIX of the minute kind, found on the sandy shores of Armenia. This shell is whitish, glossy, with extremely thin longitudinal striae; spire reversed and hemispherical. Spengl. Gmelin. &c.

ARENARIA, a species of SERPULA that inhabits India and Africa. The shell is articulated, entire, distinct, and flattish beneath. Gmelin. It is white or whitish, and sometimes marked with pale brown undulated rays; the inside is smooth, outside cancellated; the striae about one hundred in number, and frequently nodulous. The shell is twisted spirally. *Obs.* Gmelin doubts whether it may not be a *Teredo* instead of *Serpula*.

ARENARIA, in *Entomology*, a species of VESPA that lives in the sands in America. This insect is black; thorax spotted with yellow; abdomen fasciated on each segment with a six-dentated yellow band; the first linear, and interrupted. Fabricius, Gmelin, &c. *Obs.* Gmelin has another species of *Vespa*, under the same specific name, viz. *sphex arenaria*

arenaria of Linnæus: Fn. Suec. which he removes to this genus. It is black, with four yellow bands on the abdomen and two yellow dots on the first segment. This is found in Denmark and Sweden, and belongs to the section of the *VESPA*, genus *Crabro*, in Gmelin's arrangement.

ARENARIA, a species of *FORMICA* found in the moveable sands in Barbary. This is a large kind; has a great ovate head, and subglobose pubescent abdomen. The specific character is this, black; thorax impressed behind and furnished with two spines; ends of the legs piecous. Fabricius and Gmelin.

ARENARIA, in *Ornithology*, the name given by Brisson to the bird called by Linnæus and Gmelin, *Tringa Interpres*; and *Turnstone* or *Sea Dotterel*, by English writers.

ARENARIA, a species of *TRINGA* that inhabits the sandy shores of Europe and the Caspian sea. The beak and legs are black; body grey, beneath white; lores grey. This is *calidris grisea minor* of Brisson, Gmelin, &c.

ARENARIUM, in *Antiquity*, gladiators who combated with bealls in the *arena* or amphitheatre. The *arenarii* were slaves of the lowest rank, so that, though manumitted, they were not capable of being Roman citizens. They were the same with what were otherwise called *BESTIARIUM*.

ARENARIUM, in *Ecclesiastical Writers*, denotes a cemetery or burying-ground. The *arenaria* were properly a kind of pits, or holes under ground, wherein the ancient Christians not only buried their dead, but held their religious assemblies, in times of persecution. Baron. Annal. and Du-Cange.

ARENARIUS, in *Entomology*, a species of *CURCULIO* resembling *C. ligustici*, but only about half the size of that insect. The head is hoary; thorax granulated, and with the legs, black; wing-cases connate, grey, and striated with punctures. Herbst apud Fuesli: inhabits Berlin.

ARENARIUS, a species of *CIMEX*, very common in the northern parts of Europe. It is black; wing-cases cinereous; wings white. Linnæus, Fabricius. *Obs.* This belongs to the section *oblongus* in Gmelin's arrangement.

ARENARIUS, in *Ornithology*, a species of *TETRAO*, called by Latham the sand grouse. The collar, belly, and vent are black; two middle tail-feathers rather tawny, the rest fasciated with brown and grey, and white at the tip. Pallas Nov. Comm. Gmelin, &c.

According to Dr. Latham, this bird is bigger than a partridge; length, more than nineteen inches; bill, blue-grey; tip black; head pale ash-colour; crown and nape clouded yellowish-grey; chin deep yellow, terminated by a triangular black mark about the middle of the neck; the feathers of the throat and neck singularly truncated, and glossy like those of a dove; the upper parts of the neck and body testaceous white; each feather surrounded with a brown border, encircling an oval yellowish spot; on the lower part of the neck a crescent of black; the breast is white; belly, vent, and thighs, black; wings hoary, with a deep yellow spot on the secondaries; quills brownish, obliquely white at the base; the tail has sixteen feathers; the two middle ones pointed and yellowish, crossed with brown lines; the others brown with grey lines; the tips white; legs slender, feathered to the toes, and are short, naked, and callous beneath; claws black; behind is a spur, which turns inwards, and is prominent and pointed. The female is rather bigger; of a paler yellowish colour throughout; dotted on the head, neck, and throat, with black, and fasciated with the same on the back; the markings are less distinct than in the male, but it much resembles it.

This species is found only in the middle of the deserts extending towards the Caspian sea. It is very common about

Affracan in summer, and passes the winter in Persia. Their food is the seeds of various kinds of astragali, and particularly of the species *Alopecuroides*, *Cicer*, and *Phytodes*. They are seen in pairs in June; and as they drink much water, are obliged to frequent those parts of the desert where it is found. It is said they go to the pools three times in the day, when they are so eager that they do not mind the sportsmen, though at other times they are very shy. They are no where more common than about the famous fountains at Barle chuduk; fly like pigeons; and have a shrieking though not unpleasant cry. The eggs are bigger than those of a pigeon, and white.

ARENAS ISLANDS, in *Geography*, are islands that lie 20 leagues north from Cape Condecedo, or the North-west point of Campeachy bay in the gulf of Mexico.—Also four islands, situate on the coast of Terra Firma, on the north coast of the Spanish main or South America, before the bay of Bamba, west from St. Martha river and harbour; and sheltering the bay from all winds.

ARENATA, in *Entomology*, a species of *PHALÆNA*, in the *Geometra* family. It is of the middle size, and inhabits Tranquebar. The wings, above, are without spots, beneath, speckled and streaked with brown. Fabricius.

ARENATION, a term that has been used by some physicians to denote a kind of dry bath, in which the patient only sits with his feet in dry sand.

ARENÆ, in *Ancient Geography*, a town of Lycia, according to Ptolemy.

ARENATOR, or *ARRENDATOR*, is a term used in Livonia, Esthonia, and some other parts of the Russian empire, for a farmer of the farms, or a person who contracts with the crown for the rents of the farms; and the crown arendator is one who rents an estate belonging to the crown. The term "Arende" denotes both the estate that is let out, and the sum for which it is let. Arende-corn, is corn paid as rent by admodiation.

ARENONCK, in *Geography*, a town of Brabant, belonging to the French department of Deux Nèthes, and chief place of a canton in the district of Turnhout, two leagues east of Turnhout. The place contains 2482, and the canton 6,662 inhabitants: the territory includes 237½ kilometres and 6 communes.

ARENDSÉE, a town of Germany, in the circle of Upper Saxony and old mark of Brandenburg, ten miles west of Seehausen.

ARENE, or *AERNÉ*, in *Ancient Geography*, a town mentioned by Pausanias (Messen. c. 2.); and, according to him, founded by Arpharæus, the grandson of Perseus, but he does not give its situation. Stephanus of Byzantium mentions two cities of this name, one in Messenia, and the other in Triphylia.

ARENIVM, a place of Italy, upon the Via Flaminia, near the Adriatic gulf.

ARENOSA, in *Conchology*, a species of *MUREX*, found on the sandy shores of India. The whorls of the spire are decussated with ribs, the first of which is large, and the three outermost ones smooth; beak, acute; aperture, oval; and the lip toothed exteriorly. Gmelin, &c. This is a minute shell.

ARENOSA, in *Entomology*, a species of *SPHEX*, found in Germany. It is black and hairy; second and third segment rufous; wings as long as the body. Fabricius, Gmelin, &c.

ARENOSA, in *Natural History*, a species of *MADREPORA*, that inhabits some parts of Africa. It is white; the flars contiguous, flattish; rather large and ochraceous. Brander, &c.

ARENOSUS, in *Entomology*, a species of *SCARABÆUS*, in the section *Trox* of Gmelin. The thorax is somewhat

canaliculated; wing-cases, striated; body obscure. Fabricius. Inhabits Saxony; and resembles scarabeus fabulosus, but is not more than half its size.

ARENSBERG, in *Geography*, a town of Germany, in the duchy of Westphalia, fortified with a castle; the capital of a county incorporated with the electorate of Cologne. It is situated on the Rier, and divided into the old and new town; 48 miles north-east of Cologne, and 40 S. S. E. of Munder. N. lat. $51^{\circ} 23'$. E. long. $7^{\circ} 41'$ —Also, a town in the circle of Westphalia, and county of Schauenburg, 5 miles north of Rinteln.

ARENSBURG, a sea-port town and district on the south side of the island of Oesel in the Baltic sea, separated from Ambrook island by a bay, and belonging to the government of Riga or Livonia.

ARENSWALDE, a town of Germany, in the circle of Upper Saxony and new mark of Brandenburg, 94 miles north-east of Berlin, and 50 north-north-east of Kustrin. N. lat. $53^{\circ} 10'$. E. long. $15^{\circ} 28'$.

ARENTIA, in *Ancient Geography*, a river of Italy, near the frontiers of Etruria and Liguria. It sprung to the north-east of Luna, and discharged itself into the sea near Carara.

ARENUSA, in *Geography*, a town of Italy, in the kingdom of Naples, and province of Calabria ultra, 16 miles W. of St. Severina.

AREOLA, or AREOLA mamillaris, in *Anatomy*, the coloured circle which surrounds the nipple. See BREAST.

AREOLA, in *Conchology*, a species of BUCCINUM, that inhabits the Mediterranean, and India. This shell is sometimes smooth; sometimes striated; and the striae are larger, or smaller in different specimens: its specific character is thus defined by Linnæus and Gmelin; shell somewhat striated, with four bands of square spots; aperture dentated; beak recurved. This is *areola* of Rumphius, and *faburon* of Adanson. The length is three inches.

AREOLA, a species of TROCHUS described by Chemnitz and Gmelin. It is convex, and striated transversely; white, with square reddish spots; umbilicus crenulated; the whorls of the spire are separated by a white streak. Its native country is not ascertained.

AREOLA, in *Natural History*, a species of MADREPORA without stalk; undulations dilated, and in some places doubled, with narrow truncated margin. This is madrepora simplex subpedunculata, stella crispato laciniosa lamellis crenulatis, of Pallas, and madrepora (areolata) conglomerata, infracribus dilatatis, dissepimentis exilis subinæqualibus, ambulacris duplicatis hinc dilatatis, lamellis denticulato crenulatis of Solander and Ellis. Petiver calls it corallium album fungoides ovale; and Sloane, fungus lapideus undulatus. It is amaranthus marinus of Valent; morille of Molin.; cariophilloides of Argenville; mycedium cavatum undulatum of Hill: and cerebrites of Kuorr. It inhabits India and South America.

AREOLATA, in *Conchology*, a species of PATELLA, resembling *P. magellanica*, but is more depressed, and broader at the base; and by the direction of the striae which cross each other, is divided into triangular spaces; the longitudinal striae are about twenty-one in number; the habitat is unknown. Gmelin defines its specific character in these words; shell pyramidal and reddish grey, with very thin circular striae, crossed by others which are longitudinal; vertex violet.

AREOLATA, in *Ichthyology*, one of the varieties of perca summana, an Arabian fish described by Forsk. Fn. Arab.—Gmelin thus mentions it, areolata γ Perch, body whitish-cinereous, with yellowish-brown spots. See PERCA SUMMANA.

AREOMETER. See ARÆOMETER.

AREON, in *Ancient Geography*, a torrent which discharged itself into the Persian gulf, near a place called Gogana.

AREONESUS, an island of the Euxine sea, called by Pomponius Mela, *Aria*. The inhabitants were deemed excellent archers.

AREOPAGUS, or ARÆOPAGUS, in *Antiquity*, a sovereign tribunal at Athens, famous for the justice and impartiality of its decrees; to which the gods themselves are said to have submitted their quarrels.

Authors are divided, as to the reason and origin of the name: some imagine areopagus the proper name of the court of justice, which was situate on a hill near the citadel in Athens; and that in this court the senate of that illustrious city assembled.—Others say, that areopagus was the name of the whole suburbs of Athens, wherein stood the hill on which the court was built; and the name areopagus seems to countenance this last opinion; for it signifies literally, the hill or rock of Mars; from $\alpha\alpha\sigma$, *hill*, and $\alpha\epsilon\sigma\iota\sigma$, *belonging to Mars*. In effect, the denomination might either arise hence, that the areopagus was built in a place where had been a temple of Mars; or, because the first cause pleaded there was that of this god, who was accused of killing Halirrhothius the son of Neptune, and tried here before twelve gods, and acquitted by a majority of voices; or, finally, because the Amazons, whom the poets feign to have been the daughters of Mars, when they besieged Athens, pitched their tents, and offered sacrifices to the god of war in this place.

This tribunal was in great reputation among the Greeks, so that it was denominated “the most sacred and venerable tribunal;” and Socrates says that it was deemed so sacred, that if those who had been vicious were elected into it, they immediately gave up their former practices, and conformed to the rules of the senate, because they could not resist the authority of example, but were constrained to appear virtuous. The Romans themselves had so high an opinion of it, that they trusted many of their difficult causes to its decision. Demosthenes says, that in his time neither plaintiff nor defendant had any just reason to be dissatisfied with their proceedings. Innocence, summoned to appear before it, approached without apprehension; and the guilty, convicted and condemned, retired without daring to murmur. Authors are not agreed about the number of the judges who composed this august court. Some reckon thirty-one, others fifty-one, and others five hundred; in reality, their number seems not to have been fixed, but to have been more or less in different years. By an inscription quoted by Volaterranus, it appears they were then three hundred. At first, this tribunal only consisted of nine persons, who had all discharged the office of archons, had acquitted themselves with honour in that trust, and had likewise given an account of their administration before the *logistæ*, and undergone a very rigorous examination. Those who were admitted members of this assembly were strictly watched, and their conduct was scrutinized and judged by the court to which they belonged, without partiality. Trivial faults did not escape censure. A senator, it is said, was punished for having stifled a little bird, which from fear had taken refuge in his bosom: he was thus taught, that he who has a heart shut against pity should not be allowed to have the lives of the citizens at his mercy. The members of this august assembly were not allowed to wear crowns, or to obtain any marks of honour conferred by the people, as a recompence for their services; nor were they allowed to solicit any; but they were rewarded by a bounty from the public, which they called $\alpha\epsilon\sigma\iota\sigma$; and they had also three oboli for every cause in which judgment was given.

The

The areopagites were judges for life.—They never sat in judgment but in the open air, and that in the night time; to the intent that their minds might be more present and attentive; and that no object, either of pity or aversion, might make any impression upon them. However, some maintain, that the building in which the areopagites assembled, was not wholly uncovered; and they observe, that among the ruins, large stones had been found, whose joints are in the same angle with the pediment that must have been used for a covering. Mr. Spon, who examined the antiquities of that illustrious city, found some remains of the areopagus still existing in the middle of the temple of Theseus, which was heretofore in the middle of the city, but is now without the walls. The foundation of the areopagus is a semicircle, with an esplanade of 140 paces round it, which properly made the hall of the areopagus. There is a tribunal cut in the middle of a rock, with seats on each side of it, where the areopagites sat, exposed to the open air. At first they only took cognizance of criminal causes; but in course of time their jurisdiction became of greater extent. This court is recorded as the first that sat upon life and death; and the trial of wilful murder seems to have been the original design of its institution. In later ages, all incendiaries, assassins, conspirators, deserters of their country, treasons, and most capital causes in general, fell under its cognizance. The opinion which the state entertained of the wisdom, gravity, and sanctity of its members, gained for them an unlimited power; inasmuch that, according to Solon's regulation of this assembly, the inspection and custody of the laws, the management of the public funds, the guardianship of young men, and the education of youth according to their rank, were committed to them. Their power extended to persons of all ages and sexes, to punish the idle and profligate, and to reward the sober and virtuous, according to their own pleasure. For this purpose they were empowered, by entering and examining private houses, to condemn every useless person as dangerous, and every expence not proportioned to the means of the citizen as criminal. Besides they took cognizance of religious matters, blasphemy, contempt of holy mysteries, the erection and consecration of temples and altars, and the introduction of new ceremonies: nevertheless, they interfered in public affairs only in cases of emergency or danger. As this assembly exhibited the greatest firmness in punishing crimes, and the nicest circumspection in reforming manners; as it never employed chastisement till advice and menaces were slighted; it acquired the esteem and confidence of the people, even whilst it exercised the most absolute power. Its meetings were held three times in every month, viz. on the 27th, 28th, and 29th days, but on any urgent business, the senators assembled in the royal portico.

The Court was divided into several committees, each of which took cognizance of separate causes, if the multiplicity of business would not allow time for them to be brought before the whole senate: and this was done by lots, that the causes might not be pre-judged. In crimes that concerned religion or the state, the power of this court was limited to preparing the matter for a trial; and it then made its report to the people, without coming to any conclusion. The accused then had it in his power to offer new pleas in his defence; and the people named orators to conduct the prosecution before one of the superior courts.

Trials in the Areopagus were preceded by tremendous ceremonies. The two parties, placed amidst the bleeding members of the victims, took an oath, which they confirmed by dreadful imprecations against themselves and families. They called to witness the Eumenides, who, from a neighbouring temple dedicated to their worship, seemed to listen to

the invocation, and prepare to punish the perjured. They then proceeded to the trial; requiring all pleadings to be conducted in the simplest terms, without exordium, epilogue, or appeal to the passions. After the question had been sufficiently discussed, the judges silently deposited their suffrages in two urns, one of brass called the urn of death, and the other of wood called the urn of mercy. This mode of giving votes was afterwards abandoned, and they were delivered in public, by calling their calculi or flints upon two tables, one for those that acquitted, and the other for those condemned: when the numbers were equal, an inferior officer added, in favour of the accused, the suffrage of Minerva, so called, because, according to an ancient tradition, this goddess being present in the court of areopagus at the trial of Orestes, gave her casting vote to turn the scale of justice. In some causes the sentence of this court was not final; but an appeal might be made to the courts to which they respectively belonged.

This court is said by some, as by Plutarch and Cicero, to have been instituted by Solon; but others carry it much higher, and assert it to have been established by Cecrops, about the year before Christ 1556, or by Cranaus, one of his successors; maintaining also, that Solon only made some new regulations in it, increased its power and privileges, and made it superior to the ephetae, another celebrated court instituted by Draco.—In effect, Demosthenes himself, in his oration against Ctesiphon, owns himself at a loss on the point: "The institutors of this tribunal (says he), whatever they were, whether gods or heroes," &c.

This court preserved its authority uncorrupted and entire till the time of Pericles, who, not having borne the office of archon, could not be admitted into it; and therefore employed all his art and interest to undermine it. This at length he so effectually did, that his contempt of it served to lessen its dignity: and from that time the same excesses and vices which were practised in the city gained ground among the areopagites themselves, until by degrees they lost all their former power and esteem.

When the apostle Paul was summoned to appear before the court of areopagus, under a charge of being "a setter forth of strange gods," (see Acts, xvii.) and consequently of having violated the law that subsisted at Athens, which made it capital to introduce or teach any new gods, his conduct exhibited an admirable union of wisdom and fortitude. In such a case an impostor would have retracted his doctrine to save his life; and an enthusiast would have lost his life, without trying to save it by innocent means. St. Paul did neither the one nor the other: he availed himself of an altar which he had found in the city, inscribed, "To the unknown God;" and pleaded that he did not propose to them the worship of any new god, but only explained to them one whom their government had already received; "whom therefore ye ignorantly worship, him I declare unto you:" by this he avoided the law, and escaped being condemned by the Areopagus, without departing in the least from the truth of the gospel, or violating the honour of God. "An admirable proof, in my opinion," says Lord Lyttleton, (on the Conversion of St. Paul, in Misc. Works, vol. ii. p. 60.) "of the good sense with which he acted, and one that shews there was no mixture of fanaticism in his religion." See ALTAR.

AREOPOLIS, in *Ancient Geography*, a city of Arabia Petræa, situate on the river Arnon, and called also Ar and Rabbath-Moab.

AREOSTYLE. See ARÆOSTYLE.

AREOTICS. See ARÆOTICS.

AREQUIPA, or ARQUIBA, in *Geography*, is one of the largest

largest cities in Peru South America; and was founded by Don Francisco Pizarro, in 1539. It stands in the valley of Quilca, about twenty leagues from the sea, in a fertile country. Near it is a dreadful volcano. The air is very temperate, and the best in the country; but it has been four times laid in ruins by earthquakes. It is very populous, and well built, contains a convent and two nunneries, and had a college of Jesuits. It has a bishoprick in Lima, and lies 290 miles south by east from that city. S. lat. $16^{\circ} 40'$. W. long. $75^{\circ} 30'$.

ARES, a town in Germany in the county of Tyrol, eleven miles south-west of Tyrol.

ARES, a term framed by Paracelsus, to express a hidden disorder, in the three principles of things, from which each being receives its proper form and substance, and assumes its own specific nature, not that of any other being. Paracelsus distinguishes the *ares* into *archicæ*, which is *natural*; and *chemicæ*, which is *artificial*. See ARCHÆUS.

ARESCHE, in *Geography*, a town of France, in the department of Jura, and chief place of a canton in the district of Arbois, six miles east of Arbois.

ARESKUTAN, is the name of a solitary mountain of Jamland, in Norway, about four or five Swedish miles from the highest Alps which separate Norway from Sweden; and it is said to be 6162 English feet above the nearest rivers.

ARESTI, FLORIANO, in *Biography*. See FLORIANO.

ARESTINGA, an island of the Indian ocean, towards Kerman and the town of Dulcinda, supposed to be the Liba of Ptolemy.

ARETALOGI, in *Antiquity*, a sort of philosophers, chiefly of the cynic or stoic tribe, who having no school or disciples of their own, haunted the tables of great men, and entertained them in their banquets with disputations on virtue, vice, and other popular topics. Pitiseus Lex. These are sometimes also denominated *circulatores philosophi*. Calvin. Lex. Jur.

ARETÆUS of *Capadocia*, in *Biography*, an early Greek writer, practised medicine at Rome, but at what period is not exactly known. That he lived after the time of Andromachus, physician to the emperor Nero, is evident from his mentioning the Theriaca, a medicine invented by that writer, and that he did not live long after that time, Haller conjectures from the purity of his style. Dioscorides, who lived a little before the time of Galen, quotes Aretæus. Hence we may infer that he flourished some time between the reigns of Vespasian and Adrian. Eight of his books, on the causes, signs, and method of treating acute and chronical diseases, have been preserved, but all of them, as it appears, mutilated and imperfect; Ætius having quoted several passages from his works, which are not found in the copies that have come to our hands. The works, however, are in high estimation, as well for the accuracy with which the diseases are described, as for the judicious practice recommended in curing them. Aretæus was a bold and decisive practitioner, and made much use of hellebore and other drastic medicines. He is one of the earliest writers who recommends cantharides for raising vesications on the skin. The translation of the works into Latin by Junius Paulus Crassus, was published in 8vo. at Venice in 1552, and continued in use, being frequently republished, until 1723, when Dr. Wigan of Oxford made a new version. This was published in folio, with the Greek text in the opposite page, and enriched with a preface, notes, and critical dissertations. A Greek edition by Jacobus Goupylus, was printed at Paris in 1554, 8vo.; and reprinted by H. Stephens. A Greek and Latin edition was published by Henischius, in 1603, fol. It has been since edited by Boerhaave in 1731, with additional notes and observations; and again by Haller in 1771, with further

emendations. An English translation of Aretæus from the original Greek, was published by Dr. Mead in 1785, 8vo. Cæcellina Vite Illustr. Medic. Haller Biblioth. med. pract.

ARETÆ, the daughter of Arillippus of Cyrene, was a female of talents and learning, entailing her to a place in the catalogue of philotopæers. She flourished about 360 years before Christ, professed and taught the doctrine of her father, and presided over the Cyrenaic school after his death. Læct. l. ii. § 86. Clem. Alex. Strom. l. iv. p. 523. Brucker's Hist. Phil. by Enfeld, vol. i. p. 188.

ARETÆ, in *Entomology*, a species of PAPILLO (*Nymph. Gme.*) The wings are entire, brown, with a rufous band; on the posterior pair both above and beneath a streak of whitish dots. Fabricius. Inhabitans Aultria.

ARETHAS, in *Biography*, bishop of Cæsarea, was the author of a commentary upon the Revelation, collected, according to Mill, from that of his predecessor Andrew, and from the works of Irenæus, Hippolytus, Gregory Nazianzen, Cyril of Alexandria, and others. Cave, Mill, Lardner, and others, refer this writer to the middle of the sixth century; but Casimire, Oudin, and Fabricius, are of opinion that he lived in the tenth century. Dr. Lardner observes that he cites most or all the books of the New Testament, and hence infers, that he received all the same books which we acknowledge; he also quotes Solomon's song. Cave. H. L. t. i. p. 520. Lardner's works vol. v. p. 274.

ARETHION, in *Antient Geography*, a navigable river of Epirus, which had its source in Athamania, and discharged itself into the Ambracian gulph near Ambracia. Ptolemy calls this river Arachthus. Livy. l. xxxviii.

ARETHUSA, in *Botany*, a genus of plants belonging to the natural order *Orehideæ*. Lin. g. 1014. Schreb. 1373. Juss. 65. *Orebidion*. Mitch. 19. Class, *gynandria diandria*. Gen Char. Cal. spathe leafy, perianth none. Cor. ringent, petals five, oblong, subequal, two placed more outward than the others; all converging into a helmet. Nectary one-leaved, tubular at the base, within the bottom of the corolla, two-parted; lower lip reflex, broad, wrinkled, the length of the petals, hanging down forwards; upper lip linear, very tender, fastened to the style, lobed at the top. Stam. filaments two, very short, sitting on the top of the pistil; anthers ovate, compressed, covered with the folding of the inner lip of the nectary. Pist. germ oblong, inferior; style oblong, incurved, clothed with the inner lip of the nectary; stigma funnel-shaped. Per. capsule oblong-ovate, one-celled, three-valved, gaping at the angles. Seeds, numerous, chaffy.

Eff. Gen. Char. Nectary tubular, within the bottom of the corolla; lip fastened to the style.

Species, 1. *A. bulbosa*, bulbous rooted arethusa, "root globose; scape sheathed; spathe two leaved." It grows in watery places, as bogs, &c. in Virginia, Carolina, and Canada. Introduced here 1784, by Mr. William Young. 2. *A. opbioglossoides*, adders-tongue leaved arethusa. Helleborine virg. &c. Pluk. Alm. t. 93. f. 2. Cypripedium. Gron. virg. 1. 110. Hort. Cliff. 430. "root fibrous, leaf of the scape oval; spatheaceous; leaflets lanceolate." A native of the same places as the preceding species. 3. *A. divaricata*, lily-leaved helleborine or arethusa. *Serapius*, Gron. virg. i. p. 184. helleborine lillii folio, &c. Catæb. car. i. t. 58. "root subpalmate; leaf of the scape and leaflet of the spathe lanceolate; outer petals rising." It grows in the same countries and situations as the first and second species. 4. *A. capensis*, cape arethusa, supp. 425.; "bulb round; stem two-leaved; simple, one-flowered; leaves two, alternate, sheathing, awl-shaped." Found at the cape of Good Hope by Thunberg. 5. *A. villosa*, villose arethusa, supp. 405.; "bulb round; leaves ovate, ciliate, pubescent." This was

also discovered at the Cape by Thunberg. 6. *A. ciliaris*, ciliated arethusa; orchis burmanniana, syst. ed. 13; "root fleshy; leaf kidney-shaped, orbiculate; lip ciliate;" bulb villose, double; scape six or seven inches high; leaf one, subradical, heart-shaped, nerved, stem clasping; flower one, nodding; germ hairy, the length of the petals; upper petals rather erect, lanceolate; two lower longer, lanceolate, ensiform; horn of the nectary moon-shaped, shorter than the germ; lip large, subtripartite, ciliated, middle division bifid; raments fetaceous, longer than the lip itself; column of the stamens rising half the length of the petals. Found at the Cape, by Sparrman; introduced in 1787, by Mr. Masfon. 7. *A. biphurcata*, two-feathered arethusa, Smith, ic. ined. t. 23.; "scape sheathed; spathe cowl'd; the two lower petals elongated, bearded on the upper side;" stem simple, erect, a foot high; radical leaves linear-lanceolate, equitant at the base; stem-leaves six or seven, membranaceous, acute, sheathing, alternate; flower terminal, solitary, erect, purple: germ inferior, obconical, smooth: three outer petals of the corolla longer, irregular: the upper somewhat vaulted, acute, naked; the two lower ones subulate, broad at the base, bearded on the upper side near the top with club-shaped hairs, or stipulate glands; the two inner petals shorter, opposite, somewhat rhomb-shaped, acute, netted with purple veins; roots fasciated or in bundles.

Propagation and Culture. The three first are hardy and will endure the rigour of our climate. The three next must be kept in the conservatory or cap-slove. The last must be preserved in the bark stove. But none of these plants have yet been introduced into England, except the first and sixth. Considering their places of growth, in bogs and watery places, it will be no easy matter to preserve them long with us. See Martyn's Miller's Dict.

ARETHUSA, in *Entomology*, a species of PAPILIO (*Nymphalis*, Gm.). The wings are dentated, above brown, with a band spotted red; the anterior with a single ocellus on each side. Inhabits Germany, and is very like the Semela.

ARETHUSA, in *Ancient Geography*, a town of Asia, in Syria, situate on the river Orontes, south-east of Epiphania, between this town and Emefa, and distant from Antioch, according to Antonine's Itinerary, 16,000 paces. It was a bishop's see.—Also a town of Macedonia, in the district called Amphaxitis.—Also, a town of Judæa, mentioned by Josephus, and restored by Pompey to its original inhabitants.

ARETHUSA, a lake of Asia, in the greater Armenia, south of the mountain Niphates, and not far from the source of the Tigris, which traverses it. According to Pliny (H. N. l. vi. c. 27.) it exhales nitrous vapours.—Also a fountain of Greece, in Bœotia, not far from the city of Thebes.—Also, a fountain in the island of Eubœa.—Also, a fountain of Magna Græcia, in Brutium, now the gulf of Squilaci, according to Cassiodorus.—Also, a fountain of the isle of Ithaca, called Cypara, according to Stephanus Byz.—Also, a famous spring in the island of Sicily, near Syracuse. For an account of the fable relating to this fountain and Alpheus, see ALPHEUS. Virgil refers to it in his 10th Eclogue.

"Extremum hunc, Arethusa, mihi concede laborem—
Sic tibi, cum fluctus interlabere Sicanos,
Doris amara suam non intermiscet undam."

"Thy sacred succour, Arethusa, bring,
To crown my labour: 'tis the last I sing.
So may thy silver streams beneath the tide,
Unmixed with briny seas, securely glide."

The water of this fountain, formerly celebrated for its softness and sweetness, is now brackish, and fit for no pur-

pose but washing linen. It is defended from the sea by a wall, and almost hidden by houses on every side. Rubbish has choked up its salutary spring; the waves have found a passage through the rocks, split by repeated earthquakes; and not a fish is to be seen in it. After an earthquake it has been left dry; and at other times its waters have been tainted by subterraneous effluvia. Its fountain-head probably lies among the neighbouring hills.

ARETHUSA, in *Mythology*, was one of the Hesperides.

ARETHUSUS, in *Entomology*, a species of PAPILIO. (Dan. Fest. Gmel.) The wings are very entire, black, with blue spots; posterior pair dotted with sanguineous red beneath. Fabricius. *Obs.* This is *papilio arethusa* of Cramer; and *papilio laodamia* of the same author is supposed by Gmelin to be a variety (β) of this species likewise.

ARETHYREA, ARETHUREA, in *Ancient Geography*, a name given by Homer to a small country of Peloponnesus, near Achaia.

ARETIA, in *Botany*, so called by Haller, in honour of B. Aretius, a clergyman of Berne in the fifteenth century, the teacher of botany to the famous Gesner; Haller, *helv. t. 8. f. 1. Lin. gen. n. 195. Rich. 108. Schreb. 256. Juss. 96. Clafs. pentandria monogynia. Nat. Order of precie; lysimachie Juss. 96. Gen. Char. Cal. perianth, one leaved, bell-shaped, semiquinquefid, bluntish, and permanent. Cor. monopetalous, salver-shaped, tube ovate, length of the calyx, contracted at the neck; limb five-parted; divisions obovate: Stem. filaments five, conic, in the middle of the tube very short; anthers erect, sharpish, within the throat of the corolla. Pist. germ roundish; style filiform, length of the tube; stigma flat-headed. Per. capsule, one-celled, five-valved. Seeds five, Jacq.; three and five, Reich.*

Ess. Char. Cor. salver-shaped, five-cleft, tube ovate; stigma flat-headed; caps. one-celled, globular, with about five seeds.

Species, 1. *A. helvetica*, imbricated aretia; diapensia helvetica, Lin. Spec. 203. Mant. 205. Jacq. vind. 303. androface diapensia, Villars' Dauph. ii. 472. "leaves imbricate, flower subsessile; root perennial, with innumerable stems forming thick tufts, covering the rocks where it grows, each branch terminated by one flower; fruit roundish with angles; seeds longer, darker, and in number fewer than in primula and androface, and germ containing rudiments of five seeds two or three of which are abortive. A native of the western Alps of Switzerland, and of Dauphiné. 2. *A. alpina*, linear-leaved A. Androface caulescens, &c. Amæn. Acad. andr. aretia, Villars' Dauph. "leaves linear, spreading, flowers pedunculated;" tufts of leaves, linear, harder, and wider than the other; fruit often abortive, with sometimes ten or twelve seeds in dry airy situations. Haller enumerates three varieties; (α) harder and the leaves almost smooth; fruit round, compressed, five-valved; (β) more tender, leaves more villose, not spreading so much, and shorter; flower rose-coloured with the leaves and calyx covered with a close white scale; (γ) flowers purple; these are found on different parts of the Swiss Alps; the second on Mount St. Bernard, Simplon, &c.; the third in the Grisons, and valley of St. Nicholas. Villars gives three varieties, which he suspects to be distinct species: (a) hoary, with the hairs of the leaves branching, flowers white, often terminating: (b) hirsute, hairs of the leaves branching, flowers purplish, axillary, (c) hirsute, hairs of the leaves simple, flowers white, with a purple eye: the second forms fine tufts of red flowers on Mount St. Bernard, 1260 toises above the level of the sea, and carries vegetation to the height of nearly 1700 toises, not much less than two miles. This species occurs also in Austria: this and the foregoing were introduced in

1775, by Drs. Pitcairn and Fothergill. 3. *A. vitaliana*, grass-leaved aretia: *vitaliana perennis*, &c. Sest. epist. t. 10. f. 1. *fedum alpinum*, &c. colum. cephr. 2. t. 65. f. 1. Rai. hill. 1044. 1. *Sanicula alpina*, &c. Pluk. Alni. t. 108. f. 6. "leaves linear, recurved; flowers subsessile;" a small plant, always lying on the ground; root perennial, with distinct tufts, forming roses like the *fedum*; corolla deep yellow, with a long tube, with five large glands in the opening; fruit round and small, with five kidney-shaped seeds. Native of the Pyreæes, the High Alps, between the Valais and Italy, and in Dauphiné; introduced here in 1787, by Monf. Cels.

These are all small perennial alpine creeping plants; the little stems are covered with leaves; the flowers are axillary, and almost solitary.

Propagation and Culture. These plants are preserved in gardens with difficulty. They require a shady situation: and the seeds, if preserved, should be sown as soon as possible. They may be also propagated from offsets or slips, and by parting the roots. Martyn's Miller's Dict.

ARETINI, in *Ancient Geography*, a people of Italy, in Etruria. Pliny distinguishes them into three classes, viz. Aretini veteres, Fidentæ, and Julientes; and their territory was divided into three different districts.

ARETINO, FRANCIS, in *Biography*, see Francis ACCOLTI.

ARETINO, GUIDO. See GUIDO.

ARETINO, JOHN, surnamed *Tortellius*, a grammarian, flourished about the middle of the fifteenth century, and was librarian and chamberlain to pope Nicholas V. He was the author of a grammatical work "De potestate literarum," and of a life of Athanasius; and though not very much distinguished by literary attainments, he never dishonoured learning by fierce and injurious disputes. The treatise of Laurentius Valla, "De latinâ elegantia," was dedicated to him. Voss. de Hist. Lat. l. iii. c. 7. Gen. Dict.

ARETINO, LEONARD, a learned historian, derived his name from Arezzo, where he was born of the family of Bruni, in the year 1370. Having acquired under the instruction of Emanuel Chrysoloras an accurate acquaintance with the Greek language, he was distinguished as one of the first restorers of Greek literature in Italy. By his reputation for talents and learning, aided by the good offices of his friend Poggius, he obtained the office of secretary of the briefs under Innocent VII. which he enjoyed during this and the four succeeding pontificates. When pope John XXIII. whom he accompanied to the Council of Constance in 1415, was deposed, he returned to Florence, and devoted his leisure to the gratification of his taste in the pursuits of literature, and in the composition of various works. He was afterwards employed in several embassies on the behalf of the republic of Florence, of which he was chancellor; and by his economy, or rather parsimony, he amassed a large fortune. He died at Florence in 1444; his funeral was magnificently celebrated at the public expence, and whilst his funeral oration was pronounced, the orator, by order of the magistrates, crowned the coffin with laurel. Aretino was regarded as one of the first men of his age for genius and learning, and as one of those who formed the epocha of the revival of literature. The Latin inscription on his tomb in the church di St. Croce, is to this purpose: "Since Leonardo passed out of life, history mourns, eloquence is mute; and it is said, that neither the Grecian nor Roman muses could refrain from tears." His works, both as original compositions and translations, are very numerous: to the former class may be referred "The history of ancient Greece," 8vo. Venice, 1543; "An attempt to supply in

part the defect of the second Decad of Livy," in two books, 4to. Augsb. 1537; "An history of the transactions of his own times in Italy, from 1378 to 1440," 4to. Lyons, 1539; "History of Florence," fol. 1746; "On studies and letters," republished by Naude in 1642; and "Epistles," republished at Florence, with notes, and the life of the author, by Mehus, 8vo. 1741, which work is much valued for the historical information which it contains. His latin translations are several of Plutarch's lives, and Aristotle's ethics and politics; the latter of these translations was dedicated to Duke Humphrey of Gloucester, and the copy presented to him by the translator, most elegantly illuminated, is now in the Bodleian library at Oxford. His "History of the Goths," published, to his dishonour as an original work, but discovered to be a translation of the Greek of Procopius; and "Three books of the Punic war," published in 8vo. in 1537, another plagiarism, as the work is for the greatest part a translation from Polybius, though the author denies this in his preface. Erasmus, speaking of Aretino's Latin style, says, "that his works are written neatly and with ease, and sometimes are even Ciceronian; but his language wants strength, and his Latinity is not always pure." Voss. de Hist. Lat. l. iii. c. 5. Gen. Dict. Novy Dict. Hist.

ARETINO, PETER, denominated "the scourge of princes," was the natural son of Louigi Bacci of Arezzo, and born in the year 1492. His education was mean, and his knowledge did not extend even to the learned languages. The reputation which he acquired as a writer, was principally owing to the virulence of his satire. His career in this way commenced with attacks on the clergy; and he then proceeded to ridicule princes and sovereigns, whom by this kind of talent he held in such awe, that some of the first potentates in Europe, and particularly Charles V. and Francis I. became his tributaries. When the former came from his unfortunate and ill-concerted expedition into Africa, he purchased the silence of this profligate satirist by the present of a chain of gold that cost 100 ducats: "a trifling gift indeed," said Aretino, "for so great a folly!" So arrogant did his success make him, that he caused to be issued a medal, bearing on one side "the divine Aretino;" and on the other, a figure of himself, seated on a throne, receiving the envoys of princes. Some of the Italian princes, however, less compliant than these two kings, found the threat of cudgelling the satirist a more effectual mode of silencing him than pecuniary bribes. Aretino, when it served his interest, was no less profuse in his adulation than in his abuse; and whether he praised or blamed, his object was personal emolument. His works in prose and verse were very multifarious; but their distinguishing characteristics were far-fetched conceits and coarse jests, blended with some ingenious turns, and expressed in pointed and forcible language. They have now sunk, together with his ill-earned fame and influence, into merited oblivion. The performances which have entailed the chief disgrace on his memory by their licentiousness and indecency, were his "letters and sonnets, accompanying the sixteen postures," engraved by Marco Antonio of Bologna from the designs of Julio Romano; and his "Regionamenti," or discourses of a similar call, in three parts. Although his writings abound with indecent levities sufficiently culpable, they contain no avowal of irreligious principles; and therefore the charge of atheism brought against him, must have been founded on his satirical and unwarrantable abuse of the clergy. It may appear inconsistent and even astonishing that this licentious author was also employed in writing the lives of St. Catharine of Sienna and of St. Thomas Aquinas, and composing penitential hymns and other devotional pieces; but he thus contrived to separate religion from good

good morals. Arctino died at Venice in 1556, at the age of 66 years. An Italian wit wrote an epitaph for him, the turn of which was, "that he calumniated every one but God, whom he spared only because he did not know him." Gen. Dict. Nouv. Dict. Hist.

ARETOLOGY, ARETOLOGIA, that part of moral philosophy which treats of virtue, its nature, and the means of arriving at it.

AREVA, in *Ancient Geography*, now the *Adaja*, a river of Spain in the country of the Arevaci. See ADAJA.

AREVACI, a people of Spain, who inhabited the interior part of the country to the south-east of the Vaccæans, from the source of the river Nareva to the mountains in which was the spring of the Durus or Duero.

AREVALILLO, in *Geography*, a river of Spain, which runs into the Adaja, a little above Arevalos.

AREVALOS, a town of Spain, in Old Castile, on the confines of Leon, between the rivers Adaja and Arevalillo, six leagues S.E. of Medina del Campo.

AREUS, in *Ancient Geography*, a small river on the coast of Asia, in Bithynia.

AREZIBO, in *Geography*, a town of the island of Porto Rico, three leagues from St. John.

AREZZO, anciently ARRETIVM, or ARETIUM, a town of Italy, in the duchy of Tuscany, the see of a bishop, suffragan of the archbishop of Florence, but exempt from his jurisdiction. It lies on a declivity in the midst of a fertile plain, producing grain, wine, and oil. In the time of the Romans, it was one of the twelve principal cities of Etruria; but it was over-run and desolated by Sylla, because in the Social war it was leagued with the enemies of Rome; and he conducted thither the inhabitants who were denominated Aretini Novi. For some time it formed an aristocratic republic; afterwards it became incorporated with the territory of the Florentines; and at length was transferred to the dominion of the Medici, with the rest of Tuscany. This city was the native place of Mæcenæ, Guido Arezzo, Aretin, and Petrarch. It is situated thirty-four miles south-east of Florence, and twenty-five E. N. E. of Sienna. N. lat. 43° 28'. E. long. 11° 50'.

ARFARA, one of the smaller of the Shetland islands.

ARFAS, in *Ancient Geography*, a town of Judæa, in the half-tribe of Manasseh, on the other side of the Jordan. According to Josephus, it was the boundary of Trachonitis to the east.

ARFEUILLE, in *Geography*, a town of France, in the department of the Allier, and chief place of a canton, in the district of Cusset, four leagues east of Cusset, and four south of Donjon.

ARG, a river of Germany, in Suabia, passes to Wangen, and discharges itself into the lake of Constance. It is the Argus of the Latins.

ARGA, a river of Spain, rises in the Pyrenées, in the frontiers of Lower Navarre, traverses Pampeluna, and joins the Arragon over against Villa-Franca.

ARGA, or *Algjar*, a small town of Arabia Petræa, in the government of Medina, seated on the Arabic gulf, and west of Medina, to which it is considered as a sea-port. Some call it Egra, and others suppose it to be the same with Dsjar.

ARGA, a branch or rib of the ALTAY mountains which passes westward to the river Yus.

ARGADES, in *Ancient Geography*, a river of Asia, in Sitacene, mentioned by Ælian, Hist. Anim. l. xvi.—Also, a tributary town of Attica, noticed by Herodotus, and by Plutarch called Ergades.

ARGADINA, a small town of Asia in Margiana, according to Ptolemy.

ARGÆUS, a mountain of Asia, being the highest in Cappadocia, with its summit always covered with snow, according to Strabo.

ARGAIS, an island of the Mediterranean sea, on the coast of Asia Minor, in Lycia, according to Steph. Byz.

ARGAL, or ARGOL, the hard lees sticking to the sides of wine-vessels; more frequently called TARTAR.

ARGALI, in *Zoology*, a name synonymous with Mufflon, Ovis Ammon, Wild sheep, Mouflon, &c. See AMMON. It is the same animal from which it is believed all the varieties and domesticated kinds of that useful creature, the common sheep, have originated, and is found in a state of nature in the Alpine regions of the great continent of Asia.

Linnaeus, in the twelfth edition of the *Systema Naturæ*, places it in the genus CAPRA, from which it has been inferred, that he thought it rather the parent of the Goat, than the sheep; and Brisson seems to be of the same opinion. "Hircus (Capra orientalis) cornibus supra rotundatis, infra planis, femicirculum referentibus." Briff. regn. an. p. 71. n. 12. Dr. Shaw, who has entered more minutely into the history of this creature than the generality of writers, observes with his usual caution and discrimination, that, in fact, the two genera, Capra and Ovis, are so closely allied that the line of separation is not very easily discoverable; but that whether we consider the figure or manners of the present animal, it seems rather to be the parent or stock of the sheep than the goat race.

The celebrated Buffon has enlarged with equal elegance and inaccuracy on the history of the common sheep, and has ventured to advance one opinion at least which proves the fallacy of theoretical observations in a striking point of view:—after considering the weakness and stupidity of this animal in a domesticated state; reflecting that he is without defence; that he has for his enemies all devouring animals; and can alone find safety in flight; he is tempted to think, that from the beginning it was a creature confided to the care of man; that it was dependent upon his help, and could not have continued to subsist without it; and of this he is persuaded, because wild sheep were never found in the desert. The history of the Argali, considered as the parent of these creatures, proves this to be at best a visionary idea; and those who have seen the sheep of the domesticated kinds that are permitted to rove amongst the mountains, well know with what address these creatures guard to the best of their means against every enemy, and will not therefore give implicit credit to the rest of his observations. The Argalis have a far wider range, and are perfectly in a state of nature; they are endowed with greater strength and activity; and their mode of life proves them to be neither that helpless or defenceless race we might be led to imagine;—they contribute to the comfort, but *can* live independently of the fostering protection of man.

To Dr. Pallas we are indebted for much valuable information respecting the Argali; it was observed by him throughout the vast chain of mountains that extends through the middle of the Asiatic continent, to the eastern sea; and on the testimonies of Steller, Cetti, Gmelin, and others, varieties of it, differing only in a few slight particulars of size and colour according to the climate, are found in Kamtskatka, the Kurile isles, and California; and also in Barbary, Sardinia, Corsica, and the mountainous parts of Greece.

The character of the species is taken from the structure of the horns, which are arcuated, femicircular, and flat beneath, and the dew-laps being lax and hairy. From Pallas, Gmelin, Shaw, &c. it appears that the argali is about the size

of the fallow-deer; of a ferruginous ash-colour, intermixed with grey above, and white tinged with grey beneath; the face whitish, and behind each shoulder not unfrequently a dusky spot; the body is large, neck long, legs slender but strong, and the hinder ones longest; the tail is remarkably short, scarcely exceeding three inches in length, and is brown at the tip: the horns in full-grown animals are extremely large, placed at the top of the head, and stand close at their base, rising first upwards, and then bending down and twisting outwards as in the common ram. The body is covered with hair instead of wool, in which particular consists its chief difference from the general aspect of a sheep; but it is woolly at the rudiments of the hair: the face, and about the tip of the nose especially, becomes whiter in winter; the back more ferruginous, and the hair rather more rough, wavy, and curled. The female is smaller than the male; and her horns are smaller and less curved. The horns of the old males grow to a vast size, and have been found of the length of two Russian yards, measured along the spires, and weighing fifteen pounds each.

Like that analogous creature the goat, the argali entirely prefers the alpine regions in summer, and are seen in that season feeding on the scanty herbage that covers the highest mountains; in spring and autumn they are observed in the little vallies between the loftier precipices, and descend to the bottoms as winter approaches. They go in small flocks or parties, produce their young in the middle of March, and have one, and sometimes two at a birth. When first born, they are covered with a soft, grey, curling fleece, which changes to hair towards the end of summer.

"The argali," says Dr. Shaw, "is a very timid animal; and when closely pursued does not run in a directly progressive course, but obliquely from side to side, in the manner of other sheep, ascending the rocky mountains with great agility, and, like the wild goat, going over the narrowest and most dangerous passes with perfect safety. The males are said to fight frequently among themselves, and will sometimes precipitate each other down the rocks in their contests. Their chase is dangerous and difficult, but it is an important object with some of the Asiatics, since the animal furnishes a great number of necessary articles; the skin being used for clothing, and the flesh for food. Dr. Pallas informs us, that the flesh of the lamb is excellent; that of the old animals good, but more particularly when roasted."

"In Corsica, the argali is known by the name *mufro*; where it is so wild as to be rarely taken alive, but is shot by the hunters, who lie in wait for it among the mountains. When the young are taken, however, which is sometimes the case when the parent is shot, they are observed to be very readily tamed. The Corsican argali, or moufflon of Buffon, is of a darker colour than the Asiatic kind."

The bearded sheep and Siberian goat of Pennant's quadrupeds, Dr. Shaw conjectures to be a variety of the argali; a specimen of it was brought into England from Barbary in 1561, and is described by Caius or Dr. Kay, who named it *tragelaphus*, on a supposition of its being the same with the *tragelaphus* of Pliny; and the following account of it is given by Mr. Pennant.

"Sheep with the hair on the lower part of the cheeks, and upper jaws extremely long, forming a divided or double beard, with hairs on the sides and body short; on the top of the neck longer, and a little erect; the whole under part of the neck and shoulders covered with coarse hairs, not less than fourteen inches long; beneath the hairs, on every part, was a short genuine wool, the rudiments of a fleecy clothing; and the colour of the breast, neck, back, and sides a pale ferruginous; tail very short; horns close at their base, recurvated, twenty-five inches long, eleven in circumference in the

thickest place, diverging and bending outwards, their points being nineteen inches distant from each other."

ARGAN, in *Botany*. See *SIDEROXYLON*.

ARGANA, in *Geography*, a town of Asia, in the government of Diarbekir, under the dominion of the Turks. It is seated on an eminence, in a principality of the same name, abounds with vineyards, and furnishes exports of good wine. N. lat. 37°. E. long. 39° 14'.

ARGANCY, a town of France, in the department of the Moselle, and chief place of a canton in the district of Metz, 3 leagues S. of Thionville, and 1¼ N. of Metz.

ARGAND'S LAMP. See *LAMP*.

ARGANTA, in *Geography*, a town of Spain, in New Castile, and diocese of Toledo.

ARGANTE, in *Entomology*, a species of *PAPILIO*. (*Dan. Cand. Gmel.*) The wings are rounded, and fulvous beneath, speckled with ferruginous. Fabricius. This insect inhabits Brazil. *Olf.* This must not be confounded with *Papilio Argante* of Cramer, that being *Papilio Cantus* of Fabricius and Gmelin.

ARGANTAMAGUS, in *Ancient Geography*, now *Argenton*, a place of Gaul, between Finis and Ernoborum.

ARGANTONIUS MOUNTAIN, a mountain of Asia, in Mysia, near the town of Prusa. Strabo says, that in his time the inhabitants of Prusa held a festival, during which they ran upon this mountain, and called Hylas; probably in reference to Hylas, the friend of Hercules, who was carried off from this mountain by the nymphs.

ARGARADAUCA, a town of Asia, in Media. Ptolemy.

ARGARI, a place of India, in the peninsula on this side of the Ganges, according to Ptolemy; whence probably was derived the name of the Argaric gulf, on which it was situated. This gulf was opposite to the island of Taprobana, and between the promontories of Collis and Calbigicum.

ARGAROSSA, in *Geography*, a river of Savoy, which runs into the Isere, 3 miles north-west of Montier.

ARGASCH, a town of Russia, in the government of Simbirsk, 64 miles W. S. W. of Simbirsk. N. lat. 55°. E. long. 47° 4'.

ARGE, in *Entomology*, a species of *PAPILIO*. (*Nymph. Gem. Gmel.*) The wings are indented, white, streaked with black; a singular ocellar spot on the anterior wings, and five on the posterior ones. This inhabits the deserts of Russia, Esper. Gmelin, &c.

ARGE, in *Geography*, a town of Asia, in the Arabian Irak, seated on the Tigris, 175 miles north-west of Bassora.

ARGE, a river of Lithuanian Prussia, which runs into the Nemonin, 4 miles north-west of Wipe.

ARGE, in *Mythology*, sister of Hebé and Vulcan, was born of Jupiter and Juno, when this god disguised himself under the form of a cuckoo, and deceived his wife.

ARGEA, or ARGEI, in *Antiquity*, human figures made of rushes, thrown annually by the Vestals, from the pons Sublicius, into the river Tiber, on the day of the ides of May.

This ceremony we learn from Festus and Varro; the latter of whom, however, says, they were cast by the priests, unless by *sacerdotibus* we suppose he meant *priestesses*. He adds, that the number of figures was thirty. Plutarch, in his Roman questions, inquires, why they were called *argea*? There are two reasons assigned: the first, that the barbarous nation who first inhabited these parts called the Greeks they could meet with into the Tiber; for *Argians* was a common name for all Grecians; but that Hercules persuaded them to quit so inhuman a practice, and to purge themselves of the crime, by instituting this solemnity.—The second, that Evander, an Arcadian, and a sworn enemy of the *Argians*,

gians, to perpetuate that enmity to his posterity, ordered the figures of *Argians* to be thus cast into the river. Ovid speaks of this ceremony in his *Fest.* v. 621:

“ Sum quoque præcorum virgo simulacra virorum
Mittere roboreo scirpea ponte solet.”

ARGEADS, in *Ancient Geography*, one of the nations comprehended under the name of Macedonians, according to Appian; and the appellation *Argætes* is expressly given to certain kings who reigned in Macedonia, and who came originally from Argos, in a verse cited by Pausanias (l. vii. c. 8.); and Herodotus also speaks of these first Macedonians who came from Argos.

ARGELES, in *Geography*, a town of France, in the department of the eastern Pyrenées, and chief place of a canton in the district of Ciel, near the Mediterranean sea; 12 miles south of Perpignan. The place contains 1,360, and the canton 7,775 inhabitants: the territory includes 235 kilometres and 12 communes.

ARGELLEZ, or **ARGELÈS**, a town of France, and principal place of a district in the department of the Higher Pyrenées, seven leagues S. S. E. of Pau. The place contains 810, and the canton 9,910 inhabitants: the territory includes 477½ kilometres and 30 communes. N. lat. 45°. W. long. 0° 13'.

ARGEMON, or **ARGEMA**, in *Medicine*, an ulcer about the iris of the eye, comprehending part of the white, and part also of the black.

The argemon appears of a red colour, on the outside of the iris, and white within it. When it spreads far, and eats deep, it sometimes occasions the uvea to fall.

ARGEMONE, *Argemone*, Diosc. from *Argéma*, a disorder of the eye, which this plant is said to cure, in *Botany*. Lin. gen. n. 649. Schreb. 882. Tourn. 121. Gært. t. 55. Juss. 236. Cals. *polyandria monogynia*. Nat. Ord. of *Rhoeadeæ*. *Papaveraceæ* of Juss. Gen. Char. Cal. perianth three-leaved, roundish; leaflets roundish, with a point, concave, caducous. Cor. petals, six, roundish; stem erect, spreading, larger than the calyx. Stam. filaments numerous, filiform, length of the calyx; anthers oblong, erect. Pist. germ ovate, five-angled; style none; stigma thickish, obtuse, reflex, quincunx, permanent. Per. capsule ovate, five-angled, one-celled, half-valved. Seeds numerous, very small; receptacles linear, fastened to the angles of the pericarp, not gaping. Obs. The half-valved capsule distinguishes this from “*Papaver*.” The second species is three-valved; the third four-valved; and the first six-valved.

Ess. Char. Cor. six-petalled. Cal. three-leaved. Caps. half-valved.

Species 1. *A. mexicana*. prickly argemone, or poppy; papaver spinosum of Bauh. Clus. Mor. Ger. Carduus of Park. Ray. “*Capsules six-valved; leaves spiny.*” Annual, rising to the height of two or three feet, with stems armed with prickles; valves of the capsule varying in number, as well as the petals, from four to six; common in Mexico, and all the islands of the West Indies, where it is a troublesome weed in their cultivated lands; first brought into Europe by the Spaniards, under the title of “*figo del inferno*,” or devil’s-hg; now found wild in some of the southern countries of Europe; cultivated by Gerard in 1597, and flowering in July and August. It abounds with a milky glutinous juice, turning, in the air, into a fine bright yellow, and not distinguishable from gamboge; said to be efficacious, in small doses, in dropsies, jaundice, and cutaneous eruptions; deemed to be very detestive, and used in diseases of the eyes; the infusion is sudorific and resolutive; the seeds are a stronger narcotic than opium, and frequently administered in the sugar-colonies in diarrhæas and

bloody fluxes, working by stool and vomit. In the West Indies it is called the yellow thistle. 2. *A. armeniaca*, papaver orientale, &c. Tournef. “*Capsules three-valved;*” discovered by Tournefort in Armenia. 3. *A. tyrenaica*; “*Capsules four-valved, stem naked;*” approacheth much in habit to “*papaver alomum.*” A native of the Pyrenées.

Propagation and Culture. The seeds of the first species must be sown in a bed of light earth, in the spring, where they are to remain, and the plants thinned to the distance of four inches; when they have shed their seeds, a supply of plants, for several years, will not be wanting. The two other sorts have not been cultivated. Martyn’s Miller’s Dict.

ARGEMONE. See **PAPAVER.**

ARGEMONION, a name given by some of the late Greek writers, to the plant called **SARCOCOLLA** by the other writers of their times.

ARGENCES, in *Geography*, a town of France, in the department of the Calvados, and chief place of a canton in the district of Caen, 5 leagues W. of Lisieux, and 2½ E. S. E. of Caen.

ARGENCHUM, in *Ancient Geography*, a forest of Gallia Aquitania, near the place where Rochelle is now situated.

ARGENFELS, in *Geography*, a town and castle of Germany, in the district of the Lower Rhine, 17 miles N. N. W. of Coblenz.

ARGENNOS, in *Ancient Geography*, the name of one of the three islands called Trogilæ, situate in the Ionian sea, on the coast of Asia Minor.

ARGENNUM, a promontory of Asia Minor, in Ionia, near the island of Halonesus. Strabo and Ptolemy.—Also, a promontory on the eastern side of Sicily, now *Capo S. Alessio*.—Also, a promontory on the eastern side of the isle of Lesbos.

ARGENOMESCU, a town of Hispania Tarragonensis, in the territory of the Cantabri. Ptolemy.

ARGENS, or **ARGENTZ**, in *Geography*, a river of France, which discharges itself into the Mediterranean.

ARGENS, JOHN BAPTIST DE BOYER, *Marquis de*, in *Biography*, was the son of the solicitor-general to the parliament of Aix in Provence, and born in that city in 1704. He took up arms against the inclination of his father, at the age of fifteen; but on his return from Constantinople, he was constrained to enter himself at the bar. Being disgusted with this profession, he again embarked in the military service, in 1735. Disabled from pursuing it by a fall from his horse, he supported himself for some time in Holland by his pen. Upon the accession of Frederic, king of Prussia, he was appointed to be his chamberlain; and continued twenty-five years at Berlin; where he married, and maintained the character of a good husband, friend, and master. At length he returned to his native city, and lived there as a philosopher till the year 1771, when he died suddenly on a visit to his sister, the baroness de la Garde, near Toulon.

The marquis d’Argens formed himself upon the model of Bayle, and adopted those free sentiments with regard to religion and morals, which have been much in vogue on the continent from the time of Bayle and Montesquieu. With talents inferior to those of Bayle, he possessed an ardour of mind, which led him to make considerable acquisitions in literature and science; so that he understood several languages, had some acquaintance with chemistry and anatomy, and was a tolerable painter. As a writer, his style is diffuse and destitute of energy; and his works, though they manifest erudition and reflection, are rendered disgusting and offensive by the licentiousness of morals, and the perpetual attacks on religion and its establishments, which are his characteristic features. The principal of these are, his “*Jewish, Chinese, and Cabalistic Letters,*” which, with the “*Philosophy of*

Good Sense," compose twenty-four volumes in 12mo. published in French under the title of "The Works of the Marquis d'Argens," in 1768; a great number of romances, ill designed and negligently written, including "Memoirs of himself," of no great importance and value; "Translations from Greek into French of Ocellus Lucanus, Timæus Locrentis, and the Discourse of Julian on Christianity;" and "Secret Memoirs of the Republic of Letters," printed in Holland in 4 vols. 12mo.; and at Paris, in seven. The Jewish and Chinese letters are now the most known; but his other works have sunk into oblivion. *Nouv. Dict. Hist.*

ARGENSON, in *Geography*, a small town of France, in the mountains of Dauphiny and diocese of Gap, two leagues from Alpres; usually called St. Pierre d'Argenson.

ARGENT, a town of France, in the department of the Cher, and chief place of a canton in the district of Sancerre, one league and a half north of Aubigny. The place contains 1,042, and the canton 3,714 inhabitants: the territory includes 277½ kilometres and 4 communes.

ARGENT, in *Heraldry*, signifies white, or silver, and is so called in the blazoning of the arms of gentlemen, knights, and baronets; but for sovereigns and princes it is termed *luna*; for dukes, marquises, earls, viscounts, and barons, *pearl*. By engravings it is represented plain. The word is French, derived from the Latin *argentum*, *silver*; this colour being supposed the representation of that metal; whence the Spaniards call this field, *campo de plata*, *silver field*.

ARGENTA, in *Ancient Geography*, a town of Thessaly, mentioned by Livy.

ARGENTAC, in *Geography*, a river of Albania in European Turkey, which runs into the Adriatic, six miles north of Durazzo.

ARGENTAL, a town of France, in the department of the Correze, and chief place of a canton in the district of Tulle, four leagues south-east of Tulle. The place contains 2,574, and the canton 9,789 inhabitants: the territory includes 155 kilometres and 11 communes. N. lat. 45° 5'. E. long. 1° 47'.

ARGENTALIS, in *Entomology*, a species of PHALÆNA (*Pyrallis*, Gmel.) found in Germany and Piedmont, about the size of PHALÆNA *purpuralis*. It is cinereous brown, with three waved silvery streaks on the first pair of wings, and two on the second. Fabricius and Gmelin.

ARGENTAN, in *Geography*, a town of France, and principal place of a district in the department of the Orne, four leagues south of Falaise, and six and a half north of Alençon. The manufactures of this place consist of lace, linen cloth, and light stuffs. It is the Argentomum or Argentomagum of the ancients. The place contains 5,618, and the canton 9,409 inhabitants: the territory includes 135 kilometres and 15 communes. N. lat. 48° 44'. W. long. 0° 8'.

ARGENTINUM, in *Ancient Geography*, a town of Italy, in the territory of the Brutii, noticed by Livy.

ARGENTARIA, a town of Germany, near which the emperor Gratian defeated 30,000 Germans. Ptolemy calls it Argentuaria and Argentovaria. It was ruined by Attila about the fifth century.

ARGENTARIA *Creta*, *silver chalk*, in *Natural History*, a name given to an earth, not properly a chalk, but a kind of tripela. It is a very beautiful earth, of a loose friable texture, and perfectly pure white. It is dug in Prussia, and is much esteemed for cleaning plate. It has also been found in France, and of late in Ireland.

There are many white chalks of various hues, which are dug in Germany, America, Italy, and other countries. That dug in the duchy of Mantua in Italy, is much used by painters, and at Rome vulgarly called *geffo*.

ARGENTARIUS is frequently used, in *Roman Writers*, for a money-changer or banker.

The argentarii were monied people, who made a profit either by the changing or lending of money at interest. These had their tabernæ, or offices, in the forum Romanum, built there as early as the reign of L. Tarquinius Priscus. The argentarii and feneratores were much hated on account of their covetousness and extortion. Du-Cange and Pitiscus.

ARGENTARIUS, in *Writers of the Middle Age*, an officer entrusted with the custody of money.

In this sense argentarius amounts to the same with the Greek ἀργυροφύλαξ, and our *cashier*. Du-Cange.

ARGENTARIUS *Miles*, in our *Old Writers*, an officer of the exchequer, whose business it was to carry up the bag of money from the lower exchequer to the higher, in order to its being examined or told. Spelman.

ARGENTARI is also applied, in the *Civil Law*, to those who adorned military arms with silver or gold.

In which sense the word amounts to the same with BARBARICARI.

ARGENTARIUS *Mons*, in *Ancient Geography*, *Monte Argentaro*, a mountain of Etruria, in Italy, forming a promontory near the town of Lofa.

ARGENTARO is a cape of Tuscany, south of Orbittello, and east of the isle of Gigho. N. lat. 41° 55'. E. long. 14° 29'.

ARGENTATA, in *Entomology*, a species of PHALÆNA, (*Geometra*, Gmel.) The wings are yellow at the tips, with two silvery streaks on the anterior pair, and a quadruple black spot on the posterior ones. This is a native of China. Gmelin and Fabricius. The anterior wings are silvery at the base, with a large triangular brown spot; lower pair silvery, and yellow at the tip; and the four contiguous spots upon them have a brassy gloss.

ARGENTATA, a species of APIS found in Barbary. It is downy, cinereous; abdomen black; margin of the segments white beneath, with silvery hairs. Gmelin, &c.

ARGENTATA, a species of MUSCA, about the size of MUSCA *fasciata*; it inhabits Saxony. The scutellum is slightly bidentated; body black; abdomen covered with silvery down, with yellow lateral spots. This belongs to the genus *Stratiomys* in the Fabrician system, and must not be confounded with the following insect.

ARGENTATA, a species of MUSCA, that inhabits Europe. The colour is cinereous; with four black lines on the thorax; abdomen grey, changeable; front silvery on each side. Gmelin, &c.

ARGENTATA, a species of ARANEA. The abdomen is white, with the posterior part brown; the margin with six dentations. This is a large insect, and inhabits South America. Gmelin.

ARGENTATA, in *Ichthyology*, a species of SCIÆNA, that inhabits the Arabian shore. The scales on the upper parts are blackish, with the margins and apex silvery; on the lower parts pale rufous, with paler margins. Gmelin. There is a large blue curved patch under the eye, which extends towards the mouth; inferior lip longest; lower lateral teeth in a row of larger ones, and behind these a row of smaller ones; posterior gill-covers terminating in an acute angle; fins reddish brown, dorsal one glaucous, with a pale rufous margin; spines of the anal fin becoming gradually longer and larger.

ARGENTATA, in *Zoology*, a beautiful little creature of the SIMIA genus, a native of South America; named by Buffon *Mico*; and by Pennant, *the fair Monkey*. It is tailed and beardless; white; face red; and tail brown. Gmelin. This creature is not much larger than a squirrel, measuring only

only about seven or eight inches from the nose to the rudiment of the tail; and the tail itself is twelve inches long. The whole animal is covered with hairs of a beautiful fine silvery white; except the face and ears, which are red, and the tail, which is of a deep brown. It is thus described by Brisson: *cercopithecus ex cinereo albus argenteus, facie auriculisque rubris splendidibus, cauda castaneæ coloris*. *Quadr.* p. 142. 12.; and is *SIMIA argentata* of Schreber.

ARGENTATI MILITES, in *Antiquity*.—Livy, lib. vi. speaks of *argentati milites*, as distinguished from *aurati*. Aquinas supposes these to have been similar to the *argyraspides* and *chrysalpides*; but the descriptions do not quadrate. Livy only represents the *argentati* as clothed in white linen coats. *Aquin. Lex. Mil.*

ARGENTATUS, in *Entomology*, a species of CURCULIO, very frequent on oaks, nettles, nut-trees, &c. in England and other parts of Europe. Its specific character is simply this: the whole body silvery green. Gmel. &c. The colour of the shell itself is black, but being wholly covered with beautiful minute scales of a fine silvery green colour, the insect appears entirely of that colour before the scales are rubbed off. This species is *Curculio femoribus omnibus denticulo notatis, corpore viridi oblongo*, of *Fn. Suec.* 459. *Curculio squamosus viridi auratus*, of Geoffroy; *Curculio urticæ*, of Degeer *Inf.*; and *Curculio argentatus* of *Donov. Brit. Inf. &c. Obs.* Gmelin has given another species of CURCULIO under the same specific name, viz CURCULIO *argentatus*, of a silvery green, with the antennæ and shanks of the legs rufous, and the thighs brown and clavate; a native of Europe. This inattention of Gmelin is the source of endless confusion; it is no unusual circumstance to find in his arrangement two or even more very different species under the same specific name in those genera that are extensive; sometimes indeed, to avoid confusion, he places them in different families, but in the present instance, we find both in the same family: ** *Brevirofres*, † *femoribus denticatis*.

ARGENTATUS, in *Ichthyology*, a species of SPARUS that inhabits the rivers in Japan, and is distinguished by having a black spot behind the gills. It is covered with silvery scales, and is about six inches in length; and has two nostrils before the eyes. Gmelin, &c.

ARGENTATUS, a species of *Centrogaster* that inhabits the rivers in Japan. It is silvery, with a large brown spot on the nape, and a blackish one on the dorsal fin. This fish is about three inches and a half in length, and the tail is forked. Gmelin, &c.

ARGENTATUS, in *Ornithology*, a species of LARUS, called by Dr. Latham the silvery gull, and it is also the silvery gull of the Arctic zoology. It is white; the head and neck striated with cinereous: primary quill feathers black above, beneath grey, and white at the tips. Gmelin, &c.—This bird inhabits Norway.

Dr. Latham notices a species of Gull very much like this in the Leverian Museum. The length is near sixteen inches; bill an inch and a half long; quills as in the other; but the two first have the ends tipped with white for near an inch, instead of a small spot; and six of the prime quills had the ends black; the bill and legs are pale, but as the bird had been in spirits some time, nothing certain could be said about them. *Vide Gen. Syn.*

ARGENTEA, in *Conchology*, a species of VENUS, of a somewhat oblong shape, smooth, and silvery, with black lines united into bands. This shell inhabits the shores about Cadiz.

ARGENTEA, a species of PATELLA. This shell is smooth, thick, and somewhat silvery, with eleven brown rays; mar-

gin silvery; tip pale yellow; bottom like ivory, with a double white ring. It is a rare shell, about two inches in length; and the native country unknown. *Vide Schroet. and Gmelin.*

ARGENTEA, in *Entomology*, a species of CANTHARIS, found in Africa, and described by professor Thunberg. The thorax is flat, and with the wing-cases are green; the abdomen is silky silvery. To this is added, that the head is black; vent and legs yellowish; feet brown.

ARGENTEA, a species of SPHEX that inhabits Coromandel. It is black and glossy; front villous and silvery; wings white, and brown at the tip. This is a large insect. Fabricius and Gmelin.

ARGENTEA, a species of ARANEA that inhabits the deserts of Ural, and is deemed a poisonous creature by the Calmucks. The thorax is depressed, orbiculated, white, with two black stripes; abdomen ovate, lobed, silvery, with two pair of dots in the middle, and four rows behind. *Lepech. it. i. p. 316.* This insect spins a perpendicular web; the legs are long, black, and annulated with yellow. Gmelin.

ARGENTEA, in *Ichthyology*, a species of PERCA that inhabits America, and is thus very concisely defined by Linnaeus and Gmelin: nostrils tubular; there is a large black spot on the spinous part of the dorsal fin.

ARGENTEA, a species of SCIÆNA. It is silvery, spotted above with black; beneath immaculate. *Forsk. Fn. Arab.* The crown is scaly; two elevated lines between the nostrils; iris silvery above, brown; teeth numerous, setaceous, movable, the outer row largest; dorsal fin connected, and spotted with black; the first rounded, the other linear; ventral and anal fin pale rufous, pointed at the ends; tail somewhat bifid.

ARGENTEA, in *Natural History*, a species of SERTULARIA that inhabits the European and American seas; and is called by Ellis *the squirrel's tail*; it is also CORALLINA comis ad inftar caudæ vulpinæ sparfis of Mercat.; and MUSCUS marinus minor, denticulis alternis bijugis of Morif. *Hist. Pl. &c.* According to Linnaeus, Solander, Gmelin, &c. its specific character is this: denticles nearly opposite, and pointed, vesicles oval; branches alternate and panicled.

ARGENTEA, *Assem.* in *Ancient Geography*, a town situate at the northern point of the island of Jabadii. Ptolemy.

ARGENTEAU, in *Geography*, a desolated town of the Netherlands, in the duchy of Limburg, two leagues west of Dalem.

ARGENTEOLA, or ARGENTIOLUM, in *Ancient Geography*, a town of Spain, in Asturia. Ptolemy.

ARGENTELLA, in *Entomology*, a species of PHALÆNA (*Tinea*, Gmel.) It is entirely silvery, except the antennæ, which are annulated with brown. *Linn. Fabr.* This is *tinea perlella* of Wien. *Schmetterl. p. 134.* The larva is gregarious, glabrous, brown, and feeds on the nettle. *Degeer, &c.*

ARGENTERO, in *Geography*, a mountain of European Turkey, between Bulgaria and Macedonia.

ARGENTEUIL, a town of France, in the department of the Seine and Oise, and chief place of a canton, in the district of Versailles, eight miles N. W. of Paris. The place contains 4,726, and the canton 16,557 inhabitants: the territory includes 67½ kilometres, and 11 communes.—Also, a town of France, in the department of the Yonne, three leagues from Tonnerre.

ARGENTEUM OS, in *Natural History*. See OS ARGENTEUM.

ARGENTEUS, in *Coinage*. See DENARIUS.

ARGENTEUS, in *Entomology*, a species of SCARABÆUS, found in England, and the interior of Austria. It is black, beneath silvery, and shining; margin of the shield and wings-

caes testaceous. Fabricius and Gmel. *Obf.* In the Fabrician system it belongs to the *Melolontha* genus; and in that of Gmelin to the section of *Scarabæi melolontha*. It is the same species as Scopoli and Poda call *Scarabæus argenteus*.

ARGENTEUS, a species of CULEX, very common in Barbary. It is about the size of the common English gnat; the back is covered with silvery scales; and the legs are fasciated. Vide Poirer Journ. de Phys. 1787. Apr. p. 245.

ARGENTEUS, in *Ichthyology*, a species of CHAETODON, found in the Indian sea. The tail is bifid, with eight spines in the dorsal fin, and two spines instead of ventral fins. Amœn. Ac. The ventral spines are short, and the first dorsal fin scarcely visible. Gælin.

ARGENTEUS Moss, in *Ancient Geography*, *Sierra de Alcaraz*, a mountain of Spain, from which the river Bœtis springs. Strabo.

ARGENTEUS Codex, in *Biblical History*, a manuscript of the four gospels, is so called from its silver letters, and is supposed to be a copy of the Gothic version made by Ulphilas, the apostle of the Goths, in the fourth century. It is of a 4to. size; the leaves, which are vellum, parchment, or papyrus, are stained with a violet colour; and on this ground the letters, which are all capitals, were afterwards painted in silver; except the initial characters, and a few passages, in gold. Mr. Coxe, from a close inspection, was convinced that each letter was painted, and not formed, as some have asserted, by a hot iron upon leaves of gold and silver. Most of the silver letters are become green by time; but the golden letters are still in good preservation. This codex is mutilated in several places; but what remains is, for the most part, perfectly legible. It was first discovered in 1597, in the library of the Benedictine abbey of Werden in Westphalia, whence it was brought to Prague, and at the capture of this city in 1648, sent as a valuable present to Christina of Sweden. It afterwards came into the hands of Isaac Vossius, either by stealth, or as a present from the queen; and on the death of Vossius, it was purchased by Count Magnus Gabriel de la Gardie for two hundred and fifty pounds, and presented to the university of Upsal, where it now remains. Three editions of it have been given to the public: the first was issued at Dort in 1665, by T. Junius, who borrowed the MS. from Vossius; and accompanied with observations and a glossary, by Thomas Marshall. That printed at Amsterdam in 1672, is the same with this, having only a new title-page, date, and place of impression. The second edition, published at Stockholm, in 1672, by the learned Stiernhelm, differs from that of Junius, by having the text in Latin, and not in Gothic characters. Benzelius, first librarian of the university of Upsal, and afterwards archbishop, collated the MS., rectified mistakes, and made a literal translation into the Latin tongue. These collations and translation, together with various observations, were transmitted to Mr. Edward Lye, of Oxford, who published a third edition in 1750, from the Clarendon press; this is esteemed, by those who have compared it with the original codex, a complete work. Two opinions have divided the learned concerning the original tongue of the codex argenteus; the first opinion, that it is written in the language and character used in the fourth century by the Goths of Mœsia, ancestors of the present Swedes, and is a true copy of the version made by Ulphilas, is strongly supported by Junius, Stiernhelm, David Wilkins, Benzelius, and Lye. The second opinion, viz. that it is a translation in the Frankish idiom, is as warmly defended by Hickes, la Croze, Wettstein, and Michaelis. Mr. Coxe inclines to the former opinion, which is confirmed in an ingenious treatise of Ihre; by which it appears that several specimens of the Ostrogothic

tongue have been lately discovered in Italy, which perfectly resemble both the characters and language of the version in the codex argenteus. However this be, as the Gothic and Frankish idioms were dialects of the Teutonic or German, this MS. must be considered as the most ancient specimen extant of that language. Those who attribute the version to Ulphilas, refer its date to the fourth century; and those who deem it to be a Frankish translation, allow it to have been copied in the reign of Childeric, between 564 and 587. Besides, its high antiquity is proved from the chronology at the end of the Lord's prayer, Matt. vi. 13. which is not found in any of the most ancient versions; and also from the interpretation of many passages in a final manner with several of the Latin translations, which are antecedent to the vulgate of St. Jerom. Another fragment of this curious MS. containing a few chapters of St. Paul's epistle to the Romans, was found at Wolfenbuttle, and is now preserved in the library of that town. Of this fragment I re published a new and important edition, at Upsal, in 1767. Michaelis's Introduction to the New Testament, by Maith, vol. ii. p. 133—153. Coxe's Travels, vol. iv. p. 173—180. ed. 1802.

ARGENTHAL, in *Geography*, a small town of Germany, in the circle of the Upper Rhine, and duchy of Simmern, forty miles east of Treves, and four south-east of Simmern.

ARGENTICOMUS, among *Ancient Astrologers*, denotes a kind of silver-haired comet, of uncommon lustre, supposed to be the cause of great changes in the planetary system.

ARGENTIER, JOHN, in *Biography*, born at Castelnovo in Piedmont, in 1514, acquired considerable celebrity, though his talent was rather that of teaching the art than practicing, as he was well versed in the theory of medicine, and had read and commented on most of the old writers, but his memory was so defective, that he was rarely able to apply the observations he had made for the benefit of his patients. He taught medicine at Naples, Pisa, and lastly at Turenne, where he died in 1572, aged 58 years. His works were collected and published at Venice, in two vols. in folio, 1592; and have been since twice printed. He prided himself much in having discovered some errors in the works of Galen, whose doctrines he frequently opposed. Haller. Bib. Med. Pract. Eloy. Dict. Hist. de la Med.

ARGENTIERA, a volcanic island of the Archipelago, formerly called Cimolus, or Cimolis, one of the Cyclades, which is about eighteen miles in circumference, and derives its name from a mine of silver that was for a long time worked in it with success; but it is now unknown. The soil is extremely dry, and destitute of springs; nor is there any water here but what is collected in cisterns, or brought from Milo, an island at a little distance: the hills, vales, and the whole country stripped of trees, do not offer a single shade to defend from the sun. The Venetians, during their war with the Turks, cut down all the olive-trees, and did irreparable damage to the island; nor do the present inhabitants dare to make fresh plantations, lest they should draw on themselves heavier impositions. Such is the mistaken policy of the Ottoman government; if its subjects manifest any industry, it is immediately taxed, and stifled in its birth. Argentiera presents nothing but rocky hills, destitute of verdure, and vales producing worthless shrubs and thorny thickets. The vales are generally covered with a white and fat clay, called by the ancients *Terra Cimolia*, or *Cimolia Creta*, a kind of Fuller's earth, which the inhabitants employ instead of soap to wash their linen. See *CIMOLIA Terra*. Though the soil is barren, the industrious islanders make it produce for them a subsistence.

subsistence. They cultivate barley, and a little wheat, which they sow at the beginning of autumn, the rainy season, and reap in March; a small quantity of cotton, and a few vines. But their grapes are not sufficient for making wine, which they procure from the neighbouring islands, particularly from Milo. Their olive and mulberry trees are very few. They rear hogs, poultry, and some few goats and sheep; but as to the latter, they are chiefly supplied from Milo: and the country affords them quails, hares, and partridges in abundance. Their beasts of burden are asses; in the use of which they have no suitable accommodations. The women spin cotton, and knit stockings, whenever the labours of the country allow; and the men employ themselves in fishing and navigation. Excellent fish are taken round the island, especially the rouget (the *surmulot*, *mulus* Linnæi), a fish well known and highly esteemed for its delicate flavour on all the coasts of the Mediterranean. The tribe of Greeks which inhabits this island, is composed of two hundred persons, according to Olivier; two hundred families, as Sonnini reports; or, as others say, about five hundred persons; who have no Turkish officers resident amongst them, but have an annual visit from the captain pacha, who, besides levying an impost of 15 or 1600 piastres, which they find it difficult to pay, exacts presents to a considerable amount, so as to reduce the inhabitants to misery. Cotton is almost the only article that produces for them any money; their cotton stockings supply the Europeans; and the mariners purchase their hogs, poultry, and eggs. The dress of the Greek women of Argentiera is peculiar: they swell out their legs by wearing several pairs of stockings, and appear as if they were booted, which they consider an essential part of dress: their garments do not descend above two inches below the knee, and these are so contrived as to spoil their shape, and render it impossible to form any idea of the beautiful proportions with which they were formed by nature. The neck is concealed under a corset, quilted, and stiffened with whale bone; a piece of velvet, satin, or cloth trimmed with gold or silver net-lace, or set by a simple embroidery, adorns their whole front; and in their gala dress, two wide sleeves are fixed to the corset, and fall on each side to the middle of the thigh. In summer the whole arm is covered only by the sleeve of the shift, the head is enveloped with a handkerchief which passes under the chin. In other respects they are cheerful, lively, and handsome. Savary.

The only inhabited place in the island is seated on the summit of a mountain of rocks, to which the access is very difficult. The houses are few, miserably constructed, and filled with flies; but it is surrounded by high walls, and secured by two gates. Their dwellings, which may be rather called huts or dens than houses, are covered by a roof, consisting only of a sort of wicker hurdle, on which earth is spread and beaten. The superstitious Greeks rely on heaven, more than on the structure of their habitations, for their security. Accordingly, on the eve of the festival of the exaltation of the holy cross, it is an ancient custom to sweep and nicely clean the flat roofs of the houses; and towards evening, when the bells of the churches begin to ring, the inhabitants draw upon them large crosses, which figures are, in their estimation, the most effectual means of preserving the tops of their houses from being penetrated by the rains. The single street of which this wretched town or village consists, unpaved, is, in the rainy season, a long heap of deep mud; and the water, finding its way into the rooms of the ground floor, which are almost subterraneous, renders their habitations equally unwholesome and inconvenient. The small church or chapel of the Capuchins, serves for the catholics of Argentiera; and a secular priest, born in the island of Scio, and educated at Rome, performs divine service in

this chapel, and assumes the title of the grand vicar or nominal bishop. The town is of very modern construction, having been erected so lately as the year 1646, by some Greek fugitives from the island of Siphanto, who are said to have brought with them an image of the Virgin; and built houses, where this image had stopped with them, and preserved them from the attacks of their enemies. Several Greek churches or chapels are built behind the village, all of which have little bells above their portals, which are frequently in motion. About half a league from this town, Olivier found fragments of bricks and potter's ware, which indicated the position of the ancient town; and upon digging in this spot, he discovered some rude figures of baked earth, such as a toad, a sphynx, and a cock, and also a small vase with a handle in the Etrurian style. He also perceived canals in the bank of lava, probably for the purpose of affording a passage to boats, caves for shelter from the rain and sun, and other caverns, which might have been places of habitation or interment at different epochs which history has not recorded.

This island is nothing but a group of volcanic substances, and exhibits every where indications of a great combustion. In several places the rocks are calcined; pozzolana was found here by Olivier, and the hot waters which issue from a rock near the sea, in the north-west part of the island, attest the existence of a subterraneous fire in full activity. The heat of these waters is such, that a person cannot hold his hand in them, and an egg is in an instant boiled hard. The Greeks reckon them efficacious for curing rheumatism, sciatica, and other disorders of that nature, by means of linen cloths steeped in them and applied to the parts affected. Near these waters is the mouth or centre of an ancient volcano, which, for a long time, exhaled infectious vapours, whence the modern Greeks have called it "vromo limno," or stinking lake. This gulf is now a lagoon of the sea, which no longer yields any bad smell. To the north of this lake are several grottoes or caverns cut in the rock, which seem to have served as habitations. Sonnini observed in this place a great number of thrushes of the large species, together with blackbirds, linnets, pettychaps, partridges, woodcocks, &c. In the north-north-east quarter of the island is a district called "Kedros," because it is furnished with the species of tall junipers so denominated by the modern Greeks, being a variety of the "juniperus oxicedrus" of Linnaeus. They yield no gum in this island; but the Greeks make use of the oil, which they draw from the stem and branches, for the cure of the itch. The environs of "Prase," on the side of Kedros, furnish a great quantity of wild artichokes; which the inhabitants gather and eat with avidity. The most common shrub on the island is the lentisk, the fruit of which yields on expression an oil, which is fit only for burning, though the poor use it in their food, and it is applied as a topical remedy for rheumatic pains. Saffron also grows on the mountains, and between the rocks of the island; and it is sold in the markets by the weight of eggs. The roadstead of Argentiera, most frequented by the ships which navigate in the Archipelago, is formed by the isle of Milo to the south-west, by that of Argentiera to the north, and by the small islands of San Georgio and of Polivo to the east. Trading vessels anchor between the islands of Argentiera and San Georgio, and are here sheltered from the wind and sea. But this anchorage has not a sufficient depth of water for ships of war and large vessels, which pass more to the north or north-east, in a channel near Polivo. N. lat. 36° 48'. E. long. 24° 40'. Olivier's Travels in the Ottoman Empire, p. 126—133. Sonnini's Travels in Greece and Turkey, p. 281—327.

ARGENTIERA, a town of Italy, belonging to the Venetian states in the Cadore, eleven miles N. N. W. of Pieve di Cadora.

ARGENTIERE, L', a town of France, in the department of the higher Alps, and chief place of a canton in the district of Briançon, on the Durance, nine miles north of Mont Dauphin.

ARGENTINA, in *Botany*. See POTENTILLA.

ARGENTINA, in *Geography*, a town of Savoy, in the county of Marienne, near the river Arc, sixteen miles E. S. E. of Chambéry.

ARGENTINA, a town of Italy, in the kingdom of Naples, and province of Calabria Citra, at the foot of the Apennines, ten miles S. W. of Bitignano.

ARGENTINA, in *Entomology*, a species of PHALÆNA, (*Bambyx*, Gmel.) that inhabits Germany. The wings are indented, grey, with silvery spots. Fabricius. When this insect is at rest, the wings have three erect tufts on the back. The larva is naked and grey; with the fourth, eleventh, and twelfth segment tuberculated; the pupa is obtuse and brown; feeds on oaks.

ARGENTINA, a species of PHALÆNA, (*Noctua*, Gmel.) found in the southern part of Russia. The wings are grey, with a broad abbreviated silvery stripe. Fabricius and Gmelin.

ARGENTINA, in *Ichthyology*, a genus in the order *Abdominales*, containing only four species; viz. *sphyræna*, *glossodonta*, *carolina*, and *machnata*. The generic character is thus defined by Gmelin. Teeth in the jaws, and tongue; eight rays in the gill membrane; vent near the tail; and many rays in the ventral fins.

ARGENTINÆ, in *Natural History*, a species of ECHINORHYNCHUS, so named, because it infests the intestines of the atherine, atherina of Linnæus. Redi, Gmelin, &c.

ARGENTINE flowers of antimony. See ANTIMONY, § O. Oxyds of antimony.

ARGENTINE, of Kirwan. See SCHIEFER SPATH.

ARGENTINE Felspar, of Kirwan. See FELSPEAR.

ARGENTOMAGUS, in *Ancient Geography*, *Argentomagus*, a town of Gaul, belonging to the Bituriges, in the road that led to Mediolanum on the east, and Limonum on the west.

ARGENTON, in *Geography*, a small and mean, but gay and lively town of France, in the department of the Indre, and chief place of a canton in the district of Chateauroux, five leagues S. S. W. of Chateauroux. It is situated in a beautiful valley, surrounded by vineyards on the Creuse. The place contains 3395, and the canton 10,359 inhabitants: the territory includes 290 kilometres, and 10 communes. N. lat. 46° 35'. E. long. 1° 52'.

ARGENTON le Chateau, a small town of France in the department of the Two Seves, and chief place of a canton in the district of Thouars; 3 leagues west of Thouars. The place contains 270 and the canton 7937 inhabitants; the territory includes 342½ kilometres, and 19 communes. N. lat. 46° 59'. W. long. 0° 33'.

ARGENTON les Eglises, a town of France in the department of the Two Seves, four miles north of Thouars.

ARGENTOR, a river of France in the department of Charente, formed by two streams called Argent and Or, and running into the Charente at the village of Porfac.

ARGENTORATENSIS, in *Ornithology*, a species of FRINGILLA found in the environs of Strasburgh. It is called by Brisson *Linaria argentoratensis*; and by Buffon, *Cyntel de Strasburgh*. This bird is brown; beneath, rufous with brown spots; abdomen and vent whitish. Gmelin. To this specific character may be added, that it scarcely exceeds the size of the common linnet: the quills and tail are brown; and the legs reddish. It is familiarly known about Strasburgh by the name of *Cyntel*, and is said to lay sometimes four eggs, but seldom if ever more.

ARGENTORATUM, in *Ancient Geography*, *Strasburgh*, a city of Gaul, belonging to the Triboci, or Trebochi, which was a passage from Gaul to Germany, whence its name Strate-burgus, or Strasburgh. It had anciently a manufacture of offensive and defensive arms of every kind. In the fourth century, Julian gained, under the walls of this city, a famous victory over the Germans, and took their king Chondomarus prisoner. After the establishment of Christianity among the Gauls, it became an episcopal see.

ARGENTRE' sur Laval, in *Geography* a town of France, in the department of the Mayenne, and chief place of a canton in the district of Laval, four miles east of Laval. The place contains 1665, and the canton 7530 inhabitants: the territory includes 182½ kilometres, and 9 communes.

ARGENTRE' sous Vitré, a town of France, in the department of the Ille and Villaine, and chief place of a canton in the district of Vitré, seven miles north-north east of La Guerche. The place contains 2283, and the canton 12,805 inhabitants: the territory includes 202½ kilometres, and 9 communes.

ARGENTUARIA, in *Ancient Geography*, a town of Belgic Gaul. Ptolemy.

ARGENTUM. See SILVER.

ARGENTUM album, mentioned in Domesday book, signifies, according to Spelman, bullion, or silver uncoined. In those ancient days, such metal passed as money from one to another in payment. *Sumitur pro ipso hoc metallo pensili non facto.*

ARGENTUM Dei, God's penny, anciently signified earnest-money, or money given to bind a bargain; in some places called *erles*, or *arles*, and by the civilians and canonists, *ARRHÆ*. *Et cepit de prædicto Henrico tres denarios de argenti Dei præ manibus.*

ARGENTUM fulminans. See Salts of SILVER.

ARGENTUM mosaicum or musivum. This is a metallic alloy in the form of silvery flakes, used as a pigment for giving a white metallic lustre to plaster casts, paper, porcelain, &c.

It is prepared in the following manner. Take an ounce and a half of pure tin, and the same quantity of bismuth: melt them together in a clean crucible, and stir the mass repeatedly with a clean iron rod till the two metals are accurately mixed. Then remove the crucible from the fire; and when its contents are on the point of becoming solid, pour in an ounce and a half of warmed quicksilver; stirring it as before. Previously to using this alloy, it must be ground in a stone or earthenware mortar, with white of egg or spirit varnish, and in this state applied to the intended work: when dried it may be burnished in the usual manner, and has then very much the appearance of silver. Encycloped. Method. Arts & Metiers, art. arg. musicum.

ARGENTUM nitratum, in Pharmacy, otherwise known by the names Nitrated silver, and Lunar caustic.—See SILVER, *medical preparations of*.

ARGENTUM vivum. See MERCURY.

ARGENVILLE, in *Biography*. See DEZALLIER.

ARGENUS, in *Ancient Geography*, a port of Carmania. Pliney.

ARGENUSÆ, or ARGINUSÆ, in *Ancient Geography*, small islands situated near the coasts of Asia Minor, south-east of the isle of Lesbos and near it. They were rendered famous by the battle gained by the Athenians over the Lacedæmonians, in the twenty-sixth year of the Peloponnesian war, or the 406th year before Christ. Of these three islands, the largest had a town called Arginusa.

ARGEONESUS, a small isle of Egypt, near Canopus; so called from Argeus, king of Macedon, who began his reign in the 678th year before the Christian æra.

ARGESTES, is used by Vitruvius for the wind which blows from that quarter of the horizon, which is 75° from the south and westward.

Ricciolus uses the term to denote the wind which blows at 22° 30' from the west towards the north, coinciding with that which is otherwise called W. N. W. Aft. Reform.

ARGETÆ, in *Ancient Geography*, a people of Asia who inhabited the western banks of the river Indus. Pliny.

ARGETENAR, in *Astronomy*, a star of the fourth magnitude, in the flexure of the constellation ERIDANUS.

ARGHAN, in *Geography*. See RAGIAN.

ARGIA, in *Entomology*, a species of PAPILO (*Dan. Card. Gmel.*) The wings are rounded, entire, and white; tip of the anterior pair black. This is a native of Sierra Leona in Africa; and is figured by Cramer under the name of *Cassiopea*. There is a large brown spot near the apex of the anterior wings beneath; and the inner margin is beset with long, fasciculated, erect, white hairs. Fabricius, &c.

ARGIA, in *Geography*, a town of Arabia Deserta, 200 miles S. S. E. of Ana. This is also the name of one of the three principalities into which Arabia Deserta is divided.

ARGIADES, in *Entomology*, a species of PAPILO (*Pleb. Rural. Gmel.*) The wings are entire, and blue, with a blackish margin; beneath, the colour is a brownish-grey, with a lunar mark, and two rows of ocellated dots. Fabricius.—This insect inhabits Saxony.

ARGIÆ Insule, in *Ancient Geography*, islands of Asia Minor, on the coast of Caria. Pliny.

ARGIANS. See ARGIVES, and ARGOS.

ARGIL. See CLAY.

ARGIL native.—*Alumine native*, Fr. *Reine Thonerde*, Germ. *Argilla pura*. Werner.—This mineral (called also by some Lac Lunæ,) is of a snow white or yellowish white colour. It is found in various sized kidney-form masses; is amorphous; and presents a fine-grained earthy fracture; it flies when broken into indeterminate blunt cornered fragments. It is opaque, but when soaked in water acquires a degree of semitransparency like gum tragacanth; stains the fingers, feels somewhat meagre; adheres slightly to the tongue, and exhales, when moistened, an earthy smell. It is easily broken, being almost friable. Sp. gr. according to Bergman = 1,305; according to Gmelin 1,669.

Native Argil is infusible *per se* even at 166° Wedgewood. It is soluble in mineral acids sometimes with and sometimes without effervescence, on account of a small proportion of carbonated lime with which it is often mixed. By the analyses of Schreber and Frischmann, it is also found to contain a few slight traces of iron and silex. It is said, with little probability however, that this mineral has been procured in Silesia, at Poliniere, and in Lombardy; the most authentic specimens come from Halle in Saxony, being found in the garden belonging to the college there; hence it has been suspected to be an artificial product, and the store of it is understood to have been for some years past exhausted. It is not made any use of. Widenmann, p. 385. Lenz, *versuch*, &c. vol. i.—Brochant, vol. i. Kirwan, vol. i.

ARGILA, in *Ancient Geography*, a town of Asia Minor, in Caria. Steph. Byz.

ARGILETUM, the name of a small hill of Rome, between mount Aventin and the capitol. Numa erected on this hill the temple of Janus.

ARGILIUS, a mountain of Egypt, near the Nile, so called because Jupiter carried thither the nymph Argea, and had a son by her named Dionysius.

ARGILL, or HARGILL, in *Ornithology*, one of the synonym names of the Linnæan ARDEA *dubia*, and *gigantic crane* of Dr. Latham, being so called by Ives, it. p. 183.

ARGILLACEOUS, in *Agriculture*, such ground or soil as contains a large proportion of clayey matter in its composition. See SOIL.

VOL. II.

ARGILLACEOUS *marl*, that sort of mail which contains much clay. As a manure, this kind of marl is the most proper for the sandy and light sorts of soil.

ARGILLACEOUS *earth*. See ALUMINE.

ARGILLACEOUS *schistus*. See THONSCHEIFER.

ARGILLITE of Kirwan. See THONSCHEIFER.

ARGILLOCALCITE of Kirwan. See MARL.

ARGILLY, in *Geography*, a town of France, in the department of the Côte d'Or, and chief place of a canton, in the district of Beaune, fifteen miles south of Dijon.

ARGILUS, in *Ancient Geography*, a town of Thrace in the vicinity of Amphipolis, at the mouth of the river Strymon. Thucydides (l. iv. §. 103.) says, that the Argilians were a colony of Andrians, established in the neighbourhood of Amphipolis.

ARGINA, or ARGYNA, an ancient town of Greece in the country of the Ozolian Locrians. Pliny.

ARGINUSÆ. See ARGENUSÆ.

ARGIOLUS, in *Entomology*, a species of PAPILO (*Pleb. Rural. Gmel.*) The wings are tailless; above blue, with a black margin; beneath bluish, slightly dotted with black. This insect inhabits Europe. Linnæus, &c.

ARGIPPÆI, ARGIPPÆANS, in *Ancient Geography*, a people of Scythia, whose language was different from that of the Scythians, though they resembled them in their dress. They subsisted not on the produce of the chase, but on the fruit of a tree, called "ponteia," of which, when ripe, they made a black and thick liquor, which they drank either clear or mixed with milk. Of the husks they prepared a kind of cake which they reckoned nutritive. As they lodged both in summer and winter under trees, they formed a covering to shelter them. Such persons, it is said, were deemed sacred, so that they had no occasion for military weapons in their own defence; and such was their reputation for wisdom, that their neighbours referred disputes to their arbitration, and their abode served as an inviolable asylum.

ARGIRA, a small fountain of Achaia, not far from Charadrus.

ARGIRI, or, as it is called by Arrian, *Argali*, a town of India, on this side of the Ganges. Ptolemy.

ARGIRO CASTRO, in *Geography*, a town of European Turkey, in the province of Livadia, 26 miles north-west of Lepanto.

ARGISCH, a town of Wallachia, on the frontiers of Transylvania, 8 miles north of Helmanitat, and 8 south of Tergowitz.

ARGISH, a town of Asia in Armenia, seated on the lake Van. N. lat. 38° 32'. E. long. 43° 15'.

ARGITHAMNIA, in *Botany*, (from *αργος*, white, and *δαμνος*, a little shrub.) Schreb. g. 1418. Brown. 338. Swartz. Prodr. 39. 386. Juss. Clafs. *monoecia tetrandria*. Nat. Ord. *Tricocca. Euphorbie*. Juss. Gen. Char. male flowers. *Cal.* perianth four-leaved; leaflets lanceolate, erect. *Cor.* petals four, lanceolate, ovate, ciliate, shorter than the calyx; nectary, four glands between the petals, roundish, depressed. *Stam.* filaments four, longer than the petals; anthers simple. *Pist.* rudiments of a style only. Female flowers in the same raceme under the males. *Cal.* perianth five-leaved, leaflets lanceolate. *Cor.* none. *Pist.* germ ovate, obscurely triangular; styles three, spreading, half two-cleft, each of the clefts bifid; stigmas lacerate. *Inc.* capsule tricoccos, three-celled, six-valved. *Seeds* solitary, roundish.

Eff. Gen. Char. male, *Cal.* four-leaved. *Cor.* four-petalled. Female, *Cal.* five-leaved. *Cor.* none; styles dichotomous. *Caps.* tricoccos, with solitary seeds.

Species 1. *A. caudicans*. Swartz. This shrub rises about five feet high, covered with a whitish bark; leaves at the ends

of the branches which they surround; they are oval, serrate, of a dark green, about one inch and a third in length, and an inch in breadth; flowers axillary on short peduncles; calyx five-leaved; stamens six, greenish. The leaves when bruised are very odoriferous. A native of Jamaica, on a dry gravelly soil.

ARGITHEA, in *Ancient Geography*, a town of Greece, the capital of Athamania, according to Livy.

ARGIVES, a people of Greece, who inhabited that part of Peloponnesus called ARGOLIS; which see.

ARGIZALA, or AGRISAMA, a town of Asia Minor, in Galatia. Ptolemy.

ARGO, in *Antiquity*, a ship or vessel celebrated among the poets; being that wherein the Argonauts, of whom Jason was the chief, made their expedition in quest of the golden fleece.

This ship, according to Diodorus Siculus, Apollonius, Tzetzes, Servius, and many other writers, is said to have derived its name from Argus or Argo, the person who, under the direction of Minerva, constructed it; others have thought, that it was called Argo from the Greek word *argos*, *swift*. Some again have attributed its name to that of Argos, the city in which it was built. Cicero cites, in his first Tusculan, two verses from an ancient Latin poet, who ascribes the appellation of Argo to the Argives or Greeks who sailed in it. Ovid, and many others, call it a sacred ship; and it was thus denominated, probably, because Minerva was said to have given instructions for building it, or because it was partly constructed of some sacred timber from the grove of Dodona, which was sacred to Jupiter Tomarius, and which issued out oracles.

Authors generally represent this ship as a long vessel, resembling the modern galleys, and furnished with 30 benches of rowers. It could not, however, be of any great bulk, if the ancient tradition be true, which reports, that the Argonauts were able to carry it on their backs from the Danube to the Adriatic sea. However this be, Jason, it is said, happily accomplished his enterprise; and consecrated the ship Argo to Neptune; or, as others say, to Minerva, in the isthmus of Corinth; where, they add, it did not remain long before it was translated into heaven, and made a constellation. For an account of this enterprise, and of the persons concerned in it, see ARGONAUTIC expedition, and ARGONAUTS.

ARGO *Navis*, or the *Ship*, in *Astronomy*, is a constellation of fixed stars in the southern hemisphere, whose stars, in Ptolemy's catalogue, are 45; in Tycho's, 11; in the Britannic catalogue, and Sharp's Appendix, 64.

ARGO, in *Conchology*, a species of ARGONAUTA that is distinguished from others of the same genus, by having the flat keel of the shell slightly toothed along the ridges on each side; or, as Linnæus expresses it, "carina utrinque subdentata," keel subdentated on each side. This is *nautilus tenuis* of Rumphius, *cymbium* of Gualteri and Testin, *nautilus subcatus* of Klein, *nautilus papyraceus* of Argenville, and *paper-nautilus*, *sailor-shell*, or *sailing-shell*, of English collectors.

The animal inhabitant of this shell, as the generic character of the argonauta implies, is either a *sepia* or a *clio*; most probably the former; and its appearance and manners of life are so singular and interesting, that they did not escape the notice of some of the earliest writers on natural history with whom the moderns are acquainted. It is a native of the Mediterranean and Indian seas, and is supposed to have taught mankind the use of sails, and the art of navigation in the infant state of society; our admired poet alludes to this opinion in the following well-known lines in the "Essay on Man:"

"Learn of the little nautilus to sail,
Spread the thin oar, and catch the driving gale."

When this creature intends to sail, it discharges a quantity of water, by which its specific gravity is made less than the sea-water in which it lives, and rising immediately to the surface, erects its arms, and expands a membrane between them, by means of which it is driven before the wind like a vessel under sail; at the same time that two of its arms which hang over the sides of the shell, serve for oars and rudder, as occasion may require. In this manner it is not unfrequently seen by navigators sporting upon the surface of the water in calm weather; but the moment a storm rises, or that any thing disturbs them, they lower the sail, draw their arms into the shell, and taking in as much of the sea-water as will sink them, descend directly to the bottom. Pliny, H. N. ix. 29, &c.

ARGOB, in *Ancient Geography*, a district of Palestine, belonging to the half tribe of Manasseh, in the country of Bashan, one of the most fruitful on the other side of Jordan. In this district were 60 cities, called Havoth Jair, which had high walls and strong gates.—Also, the capital of this district, (Deut. iii. 4. 14. 1 Kings, iv. 13.) which, according to Eusebius, was 15 miles west from Gerasa. This is probably the same with Ragab or Ragaha, mentioned by Josephus, and in the Mishna.—*Argob* was also a place in Samaria, near the royal palace, where Pekah, the son of Remaliah, assassinated Pekahiah, the son of Menahem, king of Israel. 2 Kings, xv. 25.

ARGODA, or ARGHUM, a town in the interior of the Tauric Chersonesus, to the south of Portacra. Ptolemy.

ARGOENUS MOUNTS, a mountain of Asia, towards N. lat. 38° 20' north of mount Taurus.

ARGOL, in *Chemistry*, the same with TARTAR.

ARGOL, See ARCHIL.

ARGOL, in *Geography*, a town of France, in the department of Finisterre, and chief place of a canton in the district of Chateaulin, two leagues north west of Chateaulin.

ARGOLI, ANDREW, in *Biography*, an Italian mathematician, was born at Tagliacozzo, in the kingdom of Naples, whence he removed to Venice. Here his merit was acknowledged, and he was appointed professor of mathematics in the university of Padua; and in 1636 distinguished by the title of chevalier. He died in 1657, and left a treatise "De diebus criticis," printed in 1652, 4to.; and "Ephemerides," from 1620 to 1700, 4 vol. in 4to. Nouv. Dict. Hist.

ARGOLIC SEA, in *Ancient Geography*, a name given by some writers to part, and by others to the whole of the ÆGEAN SEA.

ARGOLIC Bay, now the *gulf of Napoli*, was formed by a part of the sea that intercepted the peninsula called Argolis on the south-east, and Laconia on the west. In this bay Pliny places the following islands: Pityusa, Irine, Ephyre, Tiparenius, Aperiopia, Colonis, Aristeria, and Calauria.

ARGOLIS, so called from an ancient prince whose name was Argos, one of the six districts of the Peloponnesus, situate on its north-east side, was bounded by Achaia on the north, Arcadia on the west, Laconia and the Argolic gulf on the south, and the Ægean sea on the east. The ancient limits are not clearly ascertained; but it was much enlarged by some of its monarchs, so that it extended from east to west about 70 miles; and from north to south, from 37½° to 38° 20' N lat. or about 50 miles. This province is peculiarly interesting to the Grecian antiquarian and historian, because it was the cradle of the Greeks, since it first received the foreign colonies by whom they were civilized. It became the theatre of most of the events recorded in the early annals of Greece. Here flourished Inachus, who gave

gave his name to the river which waters the territory of Argos: its other rivers were Charadrius, Erafinus, and Phryxus: there also lived Danaus, Hypermnestra, Lynceus, Alcæon, Perseus, Amphitryon, Pelops, Atreus, Thyelles, Agamemnon, and many other celebrated heroes and heroines. This province contained the cities of Argos, Nemæa, Mycenæ, Nauplia, Træzené, and Epidaurus. The kingdom of Argos was founded, according to Eusebius, 1080 years before the first Olympiad, or 1856 years before Christ, by Inachus, and continued under the name of the Argolic kingdom till the reign of Acrisius, the fourteenth king, who transferred the seat of it to Mycenæ about the year 512 from its foundation; from which time that part of it was called the kingdom of Mycenæ till the dissolution, when the Heraclidæ made themselves masters of this and of the whole peninsula, after it had stood upwards of 754 years under the government of twenty-one monarchs. The Argolic kingdom, properly so called, retained likewise its own kings after this division, until the Heraclidæ, who divided the peninsula of Peloponnesus into three kingdoms. That of Argos had not continued above 40 years, before Malpas, their last king, having made an effort to recover the royal prerogative, lost both his kingdom and life. At the period which Homer (*Iliad*, lib. ii. v. 559 to 580) celebrates, Argolis appears to have been governed by two dynasties, of which the one reigned at Argos, and the other at Mycenæ; and the respective princes were Diomede and Agamemnon. The king of Mycenæ was at that time the most powerful chieftain not only in Argolis, but in the whole of Greece. The misfortunes of the family of Agamemnon soon led to the humiliation of Mycenæ. Argos became pre-eminent in the district of Argolis, and the Argives, inhabitants of Argos and its dependencies, during the historic ages of Greece, occupy the most prominent part of their section of the peninsula.

In their domestic institutions, the Argives, in common with other Grecian states, were first governed by limited kings, and afterwards their princes having attempted to become absolute, they established a republican form of government. In a maritime situation, and having easy access to the growing refinements of Asia Minor, of Corinth, and of Athens, the Argives successfully cultivated commerce and the arts; and though they did not neglect rural occupations, they were much less exclusively addicted to pasturage and agriculture than their inland neighbours of Arcadia. The accessibility of their country, and their vicinity to the heroic and aspiring Spartans, exercised their courage in contests of defence, while their own ambition impelled them to offence and aggression.

About a century before the first Persian invasion, the Argives manifested a desire and intention to reduce and command the inferior towns of the province. The insolence of the capital provoked the indignation of the country. Mycenæ, Træzené, Epidaurus, and other places of less note, were often conquered, but never thoroughly subdued. Interest taught them to unite, and union enabled them to set at defiance the power of Argos, by which they were branded as rebellious, and which they reproached as tyrannical. Having many contests with the Spartans, with various success, they, about the time of Cræsus, received a decisive defeat (Herodotus, *Clio*), which depriving them of the valuable territory of Thyrsa, affected their interest much, but operating on the high spirit of Grecian heroism, affected their sensibility more. They had hitherto, like most of the Greeks, adorned their long hair to encase the gracefulness of manly beauty, and to render their appearance more terrible to their enemies. But in remembrance

of this disaster, they shaved their heads, deprived the Argive women of their golden ornaments, and bound themselves by a dreadful imprecation never more to assume their wonted appearance until they had recovered possession of Thyrsa. Although they were not able to recover this territory from the Spartans, now the most potent state of Greece, the Argives continued to be the second power in the Peloponnesus. But having, from jealousy of the Spartans, declined to participate in the defence of Greece against Persia, the Argives fell into the disrepute which never fails to overtake those that from intestine differences and selfish rivalry withhold the efforts of patriotism, when required to repel an invading enemy. As deserters of the common cause, the Argives incurred the hatred and contempt of their public-spirited neighbours. Mycenæ, Epidaurus and Træzené, which formed respectively the greatest strength and ornament of the Argive territory, threw off the yoke of a capital which for allegiance did not afford protection, and other towns of less importance obeyed the summons to liberty and independence. The insurgents strengthened themselves by foreign alliance, and renounced the authority to which they had so long submitted. By division, intestine war, and the devastation of the province, they paid the price of their baseness or folly, and left to posterity an awful lesson of the impolicy of obstinacy and separation, where common interest demands energy and concert.

If the Argives suffered by inaction when duty and interest called for activity, they did not rashly fall into the opposite extreme of embroiling themselves in the quarrels of their neighbours, when these were not likely to affect their interest or security. During the first years of the Peloponnesian war, they kept aloof from the contest, and employed themselves in repairing the evils of the late dissension; but finding the Spartans likely to attain a pre-eminence that must be dangerous if not fatal to neighbouring states, they formed a defensive confederacy, which taking its name from its chief promoters, was called the Argive alliance. Soon after, however, deviating from the prudent principle of the confederation, they at the instance of Alcibiades became aggressors, broke the amnesty with the Spartans, and brought upon themselves the punishment of precipitate injustice. The Spartans taking the field, ravaged the country; internal tumult co-operated with foreign hostility in distressing the unsteady Argives, and compelled them to seek again in peace and justice the recovery of those blessings which they had lost by war and rapacity.

When the Spartans, by the complete discomfiture of Athens, became predominant over Greece, remote as well as adjacent, it would have been madness in the conterminous Argives to have questioned their supremacy, or to have provoked the anger of a power which could now overwhelm them in destruction. They therefore acquiesced in a superiority which their opposition could not have destroyed. But when the imperious insolence of victorious Sparta excited general resentment, the Argives were among the first to join in a confederacy for repressing the ambition of Sparta, and restoring the independence of Greece. The policy of Antalcidas procured the establishment of a peace, wherein, by ignominious sacrifices to the ambition of Persia, Sparta was able to retain a great part of her influence over her neighbours. Her exercise of her dominion, however, did not peculiarly affect Argos; and it was reserved for another state finally to humble the Spartan power. But the battle of Leuctra had no sooner relieved the Argives from their dread of the Spartans, than intestine dissensions again broke forth.

The great defect of the Grecian republics was the want of

an efficient control, which should at once mingle liberty and order, and allowing to each class and individual all the power that was necessary for promoting public and private good, should restrain both tyranny and licentiousness. Hence there were frequent contentions between the aristocratical and democratical parties, not rarely leading to sedition and convulsion. The Athenians being the chief patrons of democracy, and the Spartans of aristocracy, the relative power of these parties, and other republics, was strongly affected by the preponderance of Athens, or of Sparta. Lacedæmon being humiliated by Epaminondas, the influence of aristocracy was weakened throughout Greece; and the nobles in many places were slain or driven into exile. At Argos, more than two thousand of the aristocratical party were killed. The Argives now joined the Thebans against the Spartans, and were instrumental in raising Thebes to a pitch of power which might have been dangerous to the independence of Argos, and of all Greece, had not the death of their consummate general dried up the source from which Theban prosperity and greatness flowed.

The Peloponnesus being now freed from fears of the Lacedæmonians, the Thebans being in a state of languor after their late and extraordinary efforts, and the Athenians immersed in pleasure and luxurious indolence, southern Greece was for several years quiet, and the Argives are rarely mentioned in history. But Sparta having recovered a part of her former power, resumed her pretensions to the direction of the Peloponnesus. The Argives formed with Arcadia and Messenia a league for maintaining their respective independence: with fatal impolicy they called in Philip of Macedon, who overcame the Spartans. But a nominal auxiliary proved a real master; the Argives now shared the fate of the other Grecian states, and became a dependency of Macedon. See ARGOS.

ARGONAUTA, in *Conchology*, the name of one of the Linnæan genera, the character of which is thus defined: animal a sepia or elio; shell univalve, spiral, involuted, membranaceous, and containing only one cell. The species of this genus are few. Gmelin describes five, viz. *argo*, *virgatus*, *cymbium*, *cornu*, and *arctica*; which see.

ARGONAUTIC, in *Ancient History*, denotes something belonging to the Argonauts. The Argonautic expedition is one of the most memorable transactions of antiquity; and references to it are interspersed in most of the writings of the ancients. By the Greek writers, who have transmitted complete histories of this event, we are informed that the intention of this armament was to bring back a golden fleece, which was detained by Æetes king of Colchis. It was the fleece of that ram on which Phrixus and Helle fled to avoid the anger of Ino. Upon his arrival at Colchis, Phrixus sacrificed it to Mars, in whose temple it was suspended. This fable has been thus explained: Phrixus flying with his sister Helle from the rage of their stepmother Ino, the daughter of Cadmus, went on board a ship, whose ensign was a golden ram, and sailed to Colchis. Helle was drowned by the way in that sea, which from her was called the Hellespont, now the Dardanelles. This, it is said, was the ground of the poetical fable, that a ram with a golden fleece swam away with them to Culchis; and that the Argonauts undertook their famous expedition in order to regain that fleece.

After an interval of some years, Pelias, king of Iolcus, commissioned Jason, son of his brother Æson, to go and recover this precious fleece. For this purpose a ship was built at Pagasæ, a city not far from mount Pelion in Thessaly. It was the first that was ever attempted; and the merit of the performance is ascribed to Argus, who was

instructed by Minerva, or divine wisdom. This ship, called Argo, was built partly with some sacred timbers from the grove of Dodona, sacred to Jupiter Tomarius; and on this account it is said to have been oracular, and to have given verbal responses; which history is beautifully described by Claudian, *De Bello Getico*, v. 16.

“Argois trabibus jactant fodasse Minervam:
Nec memoris tantam vixisse carentia sensu
Robora; sed, casu Tomari Jovis augure luco,
Arbore præstata tabulas animasse loquaces.”

As soon as this sacred machine was completed, a select band of heroes, the prime of their age and country, consulted together and engaged in this honourable enterprise. Among these Jason was the chief by whom the others were summoned and collected. Chiron, or, as others say, Musæus, framed for their use a delineation of the heavens, and constructed the first sphere, on which the stars were formed into asterisms for the benefit of the Argonauts, that they might be the better able to conduct themselves in their perilous voyage. The heroes being all assembled, waited for the rising of the Pleiades, at which season they set sail. The general account of their rout is, that they coasted Macedonia, and proceeded to Thrace, where Hercules engaged with the giants, as he is supposed to have also done in several other places. They visited Lemnos and Cyzicus, and from thence came to the Bosphorus. Here were two rocks called the Cyanean, and also the Symplegades, which used to clash together with a mighty noise, and intercept whatever was passing. The Argonauts let fly a dove, that they might discover by her fate if there were a possibility of escaping. The dove made its way, with some difficulty; and encouraged by this omen, the heroes pushed forward, and with the assistance of Minerva, escaped. After many adventures, which the poets have described in a manner wonderfully pleasing, they arrived at the Phasis, which was the chief river of Colchis. Immediately addressing Æetes, and informing him concerning the cause of their visit, they demanded a restitution of the fleece. The king was exasperated at their claim, and refused to give up the object in view, but upon such terms as seemed impracticable. Jason, however, accepted of the conditions; and after having engaged in many labours, and, by the help of Medea, soothed a sleepless dragon which guarded the fleece, he at last brought off the prize. This being happily effected, he retired privately to his ship, and immediately set sail, at the same time bringing away Medea, the king's daughter. As soon as Æetes was apprised of their flight, he fitted out some ships to pursue them, and arriving at the Thracian Bosphorus, took possession of that pass. The Argonauts, having their retreat prevented, returned by another rout, which writers have differently represented. The author of the Orphic Argonautics makes them pass up the Phasis towards the Mæotis, and from thence, through the heart of Europe, to the Cronian sea, or Baltic; and then to the British seas and the Atlantic; and afterwards, by Gades and the Mediterranean, home. Timæus says, they proceeded northward to the same seas, by the Ister. Timæus traces their rout to the fountains of the Tanais, through the Palus Mæotis; thence, through Scythia and Sarmatia, to the Cronian seas; and from thence, by the Atlantic, home. Hesiod and Antimachus conduct them by the Southern ocean to Libya, and thence over land to the Mediterranean. Hecateus Milesius supposed that they went up the Phasis, and turning south over the great continent of Asia, arrived at the Indian ocean; and thence proceeded to the Nile in Egypt, whence they made their progress regularly home. Valerius Flaccus copies Apollonius Rhodius, and pursues their course up the Ister,

Ister, and by an arm of that river to the Eridanus, and thence to the Rhone, and afterwards to Libya, Crete, and other places. Pindar conducts them by the Indian ocean. Diodorus Siculus brings them back by the same way as they went out. Upon their arrival in Greece, they offered sacrifices to the gods, and consecrated their ship to Neptune.

Although the object of this expedition has been differently stated, and the account of it has been intermixed with many poetical fables, the reality of it has been generally admitted both by ancient and modern writers. Among the most eminent ancient writers who admitted it as an historical truth, were Herodotus, Diodorus, and Strabo, and with them every Grecian mythologist; and among the fathers, Clemens, Eusebius, and Syncellus. Among the moderns, the principal are, Scaliger and Petavius; and of our country, Archbishop Usher, Cumberland, Dr. Jackson, and Sir Isaac Newton. The learned Bryant (*Anc. Mythol.* vol. 2. p. 484, &c.) rejects the history of the Argonautic expedition as a Grecian fable. The Grecians, he says, have applied to themselves an ancient history to which they had no relation; and as the real purport of it was totally hid from them, they have, by their colouring and new-modelling what they did not understand, run themselves into a thousand absurdities. He alleges the inconsistencies and contradictions of the different writers, who have given an account of this expedition. They differ as to the number of persons concerned in it; and yet, allowing the highest estimate, they were too few to have achieved what they are said to have performed. After many adventures, and long migrations in different parts, the Argonauts are said to have returned to Ioleus, and to have accomplished all their peregrinations in four, or, as some state it, in two months. "Is it possible," says Bryant, "for fifty persons, or ten times fifty, to have performed such mighty operations in this term, or indeed at any rate to have performed them? They are said to have built temples, founded cities, and to have passed over vast continents, and through seas unknown; and all this in an open boat, which they dragged over mountains, and often carried for leagues upon their shoulders." Besides, the æra of the expedition cannot be settled without running into many difficulties, from the genealogy and ages of the persons spoken of. Some make the event ninety years, others seventy-nine, others only forty years before the æra of Troy. Writers have also differed as to the place whither the expedition was directed, the builder of the ship, and various other circumstances minutely recited by this learned writer. According to him, the mythology and also the rites of Greece were borrowed from Egypt; and they were founded upon ancient histories, which had been transmitted in hieroglyphical representations. These by length of time became obscure; and the sign was taken for the reality, and accordingly explained. In the account of Argo, he says, we have undeniably the history of a sacred ship, the first that was ever constructed. This was no other than the ark, called by the Greeks "Argus" and "Arcas," originally framed by divine wisdom. As the history of the Argo related to an ancient event which the Egyptians commemorated with great reverence, the delineation of it in the sphere was intended as a lasting memorial of a wonderful deliverance; on which account one of the brightest stars in the southern hemisphere is represented upon the rudder of the ship. The star was called by the Egyptians "Canopus," which was one of the titles of their chief deity, and regarded under this denomination as the particular god of mariners. The star of this deity was put upon the rudder of the Argo to shew, that providence was its guide. According to this writer, all the mistakes in this

curious piece of mythology arose from hence, that the Arkites, who came into Greece, settled in many parts, but especially in Argolis and Theffalia, where they introduced their rites and worship; and the several circumstances of the Argonautic history afford wonderful evidence of the Arkites and their rites. The Grecians took the history to themselves; and in consequence of this assumption, wherever they heard that any people under the title of Arcades, or Argæi, settled, they supposed that there Argo had been. Hence they made it to pass not only through the most distant seas, but over hills and mountains, and through the midst of both Europe and Asia. They sent their heroes to Colchis, merely because some of their family had settled there. Jason, says Bryant, who was esteemed the chief in all the Argonautic adventures, was a feigned personage made out of a sacred title of the Arkite god, the same as Arcas, Argus, Inachus, and Prometheus; and the temples said to be built by him were such as were erected to his honour. Many of these were in Armenia, the region of the most ancient Minyæ, who were the worshippers of the lunar deity Menes; and particularly in the vicinity of Mount Paros, where the ark really rested, and where the memorials of the deluge were religiously observed.

Among those writers who have allowed the reality of the Argonautic expedition, very different opinions have been entertained concerning its object and design. Diodorus Siculus supposes that the golden fleece denoted the skin of a sheep sacrificed by Phrixus, and guarded with care, from an apprehension that, according to an ancient oracle, the king of Colchis would be killed by the person who succeeded in taking it away. Strabo and Justin supposed that Colchis, a country lying between the Euxine sea and Iberia, and now called Mingrelia, had considerable mines of gold, which gave rise to the fable of the fleece. These mines were apprehended by certain mythologists to have been contiguous to some of those torrents which fall from the neighbourhood of mount Caucasus, and to have brought down with them great quantities of gold dust, which the inhabitants saved by setting fleeces of wool across the narrow passages of those currents. This account was afterwards disguised by the fabulous poets after their manner, and embellished with the stories of dragons, brazen bulls, dreadful seas, dangerous passages, and many such perils and insurmountable difficulties as commonly attend the too eager search after that pernicious, though so much desired, metal. Pliny and Varro ascribe this voyage to the wish of some Greek merchants to get possession of the fine wool of Colchis. The account which Suidas gives of the golden fleece, namely, that it was a parchment book made of sheep's skin, and in which was written the whole secret of transmuting all metals into gold, scarcely deserves mention.

Sir Isaac Newton, in his *Chronology*, (*apud oper. tom. v. p. 79. ed. Horsley*), thinks that the Argonautic expedition was an embassy sent by the Greeks, during the intestine divisions of Egypt, in the reign of Amenophis or Memnon, to persuade the nations upon the sea-coasts of the Euxine and Mediterranean seas, to take the opportunity of Amenophis's stay in Ethiopia, for revolting from Egypt, shaking off the yoke laid upon them by Sesostris, and setting up for themselves, as the Libyans, Ethiopians, and Jews had done before; and fetching the golden fleece was only a pretence to cover their true design.

The following judicious and satisfactory account of the Argonautic expedition, and its effects, is given by Dr. Gillies, in his "*History of Greece*." The northern districts of Theffaly being peculiarly exposed to the dangerous fury of invaders, the petty princes of that province entered into a confe-

confederacy for their mutual defence. They assembled in spring and autumn at Thermopylæ, a place afterwards so illustrious, and then governed by Amphictyon, a descendant of Deucalion, whose name is immortalized in the Amphictyonic council. The advantages which the confederates derived from this measure, were soon perceived by their neighbours. The central states gradually acceded to their alliance; and, about the middle of the fourteenth century before Christ, Acrisius king of Argos, and other princes of the Peloponnesus, were allowed to share the benefits and security of this useful association.

After this event, the Amphictyons appear to have long confined themselves to the original purpose of their institution. The states, whose measures were directed by this assembly, found sufficient occupation in defending their own territories; and near a century elapsed, before they undertook, by common consent, any distant expedition. But it was not to be expected that their restless activity could be always exhausted in defensive war. The establishment of the Amphictyons brought together the chiefs most distinguished by birth and bravery. Glory and emulation prompted them to arms, and revenge directed those arms against the barbarians. Jason, Admetus, and other chieftains of Thessaly, having equipped a small fleet in the neighbouring harbour of Iolcus, and particularly the ship *Argo*, of superior size and construction to any before known, were animated with a desire to visit foreign lands, to plant colonies in those parts of them that appeared most delightful, and to retort on their inhabitants the injuries which Greece had suffered from strangers. The princes of the north having proclaimed this spirited design over the central and southern provinces, the standard of enterprise and glory was speedily surrounded by the flower of the Grecian youth, who eagerly embraced this honourable opportunity to signalize their manly valour. Peleus, Tydeus, Telamon, and, in general, the fathers of those heroic chiefs, who, in the succeeding age, shone with distinguished lustre in the plains of Troy, are numbered among the leaders of the Argonauts. They were accompanied by the chosen warriors, and by the venerable prophets, of their respective tribes; by an Esculapius, the admired father of the healing art, and by the divine Orpheus, whose sublime genius was worthy to celebrate the amazing series of their adventures.

These adventures, however, have been too much adorned by the graces of poetry, to be the proper subjects of historical composition. The designs of the Argonauts are veiled under the allegorical, or at least doubtful, phrase, "of carrying off the golden fleece;" which, though easily explained, if we admit the report that the inhabitants of the eastern banks of the Euxine extended fleeces of wool, in order to collect the golden particles which were carried down by the torrents from mount Caucasus, is yet described in such various language by ancient writers, that almost every modern who examines the subject, thinks himself entitled to offer, by way of explanation, some new conjecture of his own. But, in opposition to the most approved of these conjectures, we may venture to affirm, that the voyage to Colchis was not undertaken with a view to establish extensive plans of commerce, or to search for mines of gold, far less to learn the imaginary art of converting other substances into that precious metal; all such motives supposing a degree of speculation and refinement unknown in that age to the gallant but un instructed youth of Thessaly. The real object of the expedition may be discovered by its consequences. The Argonauts fought, conquered, and plundered; they settled a colony on the shores of the Euxine; and carried into Greece a daughter of the king of Colchis, the celebrated

Medea, a princess of Egyptian extraction, whose crimes and enchantments are condemned to eternal infamy in the immortal lines of Euripides.

Notwithstanding many romantic fictions that disfigure the story of the Argonauts, their undertaking appears to have been attended with a considerable and a happy effect on the manners and character of the Greeks. From the æra of this celebrated expedition, we may discover not only a more daring and more enlarged spirit of enterprise, but a more decisive and rapid progress towards civilization and humanity. The sullen and unsocial chiefs, whose acquaintance with each other most commonly arose from acts of mutual hostility, hitherto gave full scope to the sanguinary passions which characterize barbarians. Strength and courage were almost the only qualities which they admired: they fought and plundered at the head of their respective tribes, while the inhabitants of the neighbouring districts were regarded as fit objects only to excite their rage, and gratify their rapacity. But these gloomy warriors, having exerted their joint valour in a remote expedition, learned the necessity of acquiring more amiable virtues, as well as of adopting more liberal notions of the public interest, if they pretended to deserve the esteem of their equals. Military courage and address might alone procure them the respect of their immediate followers, since the safety of the little community often depended on the warlike abilities of the chieftain; but when several tribes had combined in a common enterprise, there was less dependence on the prowess of any single leader. Emulation and interest naturally rendered all these leaders as jealous of each other, as desirous of the public applause; and, in order to acquire this applause, it was necessary to brighten the lustre of martial spirit by the more valuable virtues of justice and humanity.

The Argonautic expedition is one of the greatest epochs or periods of history, which sir Isaac Newton endeavours to settle, and from thence to rectify the ancient chronology. This he shews, by several authorities, to have been one generation, or about 30 years, earlier than the taking of Troy, and about 43 years later than the death of Solomon. Blair refers this expedition to the year 1263 before Christ, or 79 years before the taking of Troy. Playfair places it 41 or 42 years before this event, or in the year 1225 before Christ. For an account of the Newtonian system, of the arguments in its favour, and of the objections that have been urged against it; see *CHRONOLOGY*.

ARGONAUTICA, in *Literary History*, denotes poems on the subject and expedition of the ARGONAUTS. We have the Argonautics of Orpheus, in epic verse, published by H. Stephens; the Argonauticon of Valerius Flaccus, in eight books of Latin heroic, in imitation of Apollonius, with respect to which Burman observes, that the imitator has often surpassed the original; the Argonautics of Apollonius Rhodius, an heroic poem, consisting of four books, "opus," as Quintilian calls it, "non contemptendum."

ARGONAUTS, in *Antiquity*, a company of fifty-one, according to Valerius Flaccus, or, according to Apollonius Rhodius, forty-four heroes, who embarked along with Jason in the ship *Argo*, for Colchis, with a design to obtain a golden fleece.

Hercules, Theseus, Castor, Orpheus, &c. were of the number of the Argonauts.

ARGONAUTS of *St. Nicholas*, was the name of a military order, instituted by Charles III. king of Naples, in the year 1382, for the advancement of navigation, or, as some say, merely for preserving amity among the nobles.

They wore a collar of shells, inclosed in a silver crescent, whence hung a ship, with this device, "Non credo temperi,"

pori," "I do not trust time." Hence these Argonaut knights came to be called *knights of the shell*. They received the order of St. Basil archbishop of Naples; and held their assemblies in the church of St. Nicholas, their patron.

ARGONNE, in *Geography*, a country of France, before the revolution, about 20 leagues in length, between the Meuse, the Marne, and the Aisne; of which the capital was St. Menchold.

ARGOON. See ARGUN.

ARGOPHYLLUM, in *Botany* (*Argos* and *φυλλον*, white-leaf; the leaves being of a glossy whiteness beneath). Forster. g. 15. Supp. p. 22. Schreb. 393. Juss. 161. Clafs, *pentandria monogynia*. Nat. Ord. *Erica*. Juss. Gen. Char. *Cal.* perianth short, quinquefid; divisions sharp. *Cor.* petals five, lanceolate, spreading, three times greater than the calyx; nectary five angled, pyramidal, open at the top, consisting of many converging papillas, connate at the base. *Stam.* filaments five, subulate, inserted into the receptacle, shorter than the nectary; anthers ovate. *Pist.* germ turbinate, fastened at the bottom to the calyx, flat above; style filiform; stigma globular. *Per.* capsule hemispherical, flat above, three-celled, opening into three parts. *Seeds*, numerous, globular, porous.

Ess. Gen. Char. *Capf.* three-celled. *Nect.* pyramidal, five-angled, the length of the corolla.

Species 1. *A. nitidum*, perennial, stems, petioles, leaves underneath, panicles, calyxes, shining with a silky down; leaves alternate, petiolate, ovate, pointed at both ends, entire; peduncles axillary, solitary, elongated, terminating in a panicle. Found in New Caledonia.

ARGOS, *αργος*, from *α* negat ve, and *εργον*, work, or business; as if it were *αεργος*. So *αργος αργυρος* is silver not worked; *αργος σπορος*, in Hippocrates, is crude wheat, not prepared, but such as it is taken from the floor.

ARGOS, in *Ancient Geography*, a name given to several cities; and more particularly to the capital of a small kingdom of Greece, denominated ARGOLIS. It was also called Argi, and Inachus, from its founder. It is said to have been built by a colony of ARGIVES, who migrated from Egypt under the command of Inachus, and settled in Greece. Inachus was styled the son of the ocean, because his origin was not known, and because he had come by sea into Greece. Before his arrival the inhabitants were rude and barbarous. These he united and civilized, and instructed in various arts. His son Phoroneus instituted the laws of government; and, on that account, he has been called the first king in Argos, the first of men, and the father of mortals. The city was seated at some distance from the sea, on the river Inachus, in a spacious, rich, and well-watered plain, from which it is supposed to have derived its name. To this purpose Strabo says (l. viii. p. 170, &c.) that Argos is a Macedonian or Thessalian term, signifying a plain or champaign country, and thus it is described by Homer. Hence it has been concluded that they are mistaken, who have represented this city and its territory as dry and barren, and that they have misunderstood the epithet of "thirsty," ascribed to it by the poet; which, it is conceived, should have been translated "desireable," because it was well watered by the Inachus, and by several other rivulets and springs. It was also distinguished by the epithet "hippobotos," from the goodness of its adjacent pastures, in which Neptune is said to have fed his horses, or perhaps from the excellent breed of horses which this territory produced. The epocha of its foundation is referred to the year 1080 before the first Olympiad, or 1856 before Christ; and it lost its distinction as the capital of the kingdom after the reign of Acrisius, or about the year 1344 before Christ,

when the seat of government was transferred to Mycenæ. Upon the arrival of the Heraclidæ, and the division of the peninsula into three kingdoms, about the year 1104, Argos recovered the rank which it had lost. Strabo speaks of Argos as the principal city of the Peloponnesus, next to Sparta. It was adorned by a number of magnificent edifices and statues. The most ancient of these edifices was the temple of the Lycian Apollo, erected to this god by Danaus; and in this temple was the statue of Apollo by Attalus the Athenian, that of Bacchus with a bull upon his back, one of Mercury by Epæus, and others dedicated to Apollo, Jupiter, and Diana. Over against this temple was that of Jupiter Nemæus, with the statue of the deity in bronze by Lysippus; the temple of Phoroneus, whose anniversary was celebrated by the Argives; the temple of Fortune, and another dedicated to the Seasons, &c. &c. Here were also the statues of the heroes who took Thebes, and the cenotaph of the Argians who perished at the siege of Troy. The celebrated citadel, called "Larissa," was seated on an eminence to the north-west of the city. Argos was also much enriched by its trade, and particularly by the fine race of horses that were bred about its territory. Bryant refers the origin of Argos, of the Argives, and also of the Argonauts, to a colony of Arkites, who came from Egypt and diffused themselves widely through various parts of Greece. Anal. Anc. Mythol. vol. ii. p. 506. The medals of this city were gold, silver, and bronze; and their ordinary type was a wolf, which was the symbol of the Argians. There were also imperial Greek medals struck in this city, in honour of Adrian, Antonine, Verus, Septimius Severus, Faustina, Donna, Geta, Elagabalus, Marcus Aurelius, Plautilla, Galien, and the younger Valerian. A small village, called *Argo*, still subsists on the ruins of the ancient Argos.

ARGOS, a town of the island of Nisyrus, one of the Cyclades. Steph. Byz.—Also, a town of Asia, in Cilicia, called in the time of Steph. Byz. Argeopolis, situated near mount Taurus.—Also, a town of Asia Minor, in Caria. Steph. Byz.—Also, a place in the island of Cyprus, famous for the temple of Apollo Erythius, where Venus found the body of Adonis.

ARGOS *Amphilochium*, a town situated in the Ambracian gulf, two stadia, according to Polybius, and according to Livy twenty-two miles, from the city of Ambracia. Thucydides, who represents it as a maritime town, ascribes its origin to Amphilochus, the son of Amphiarous, some years after the war of Troy; others say that it was founded by Alcmeon, in honourable remembrance of the friendship that subsisted between him and his brother Amphilochus.

ARGOS *Hippium*. See ARPI.

ARGOS *Orestium*, a town of the Orestiade, a country of Epirus, built by Orestes; where he made his escape, after having killed his mother. Strabo.

ARGOS, or *Argers*, in *Geography*, a mean town of Turkey, in the Morea on the bay Napolidi Romania, and on the river Najo or Inachus; N.N.W. from cape Angelo. The Turks took it from the Venetians, under Mahomet II.; twenty miles south of Corinth. N. lat. 37° 30'. E. long. 23° 5'.

ARGOS, a small town of Africa, in the kingdom of Dongola in Abyssinia, on the eastern bank of the Nile, through which the caravans that carry soap and linen pass, and where they pay a duty to the douane of the place.

ARGOSTOLI, a sea-port of the island of Cephalonia, opposite to Albania, the best in the island, at the distance of five miles from the fortrefs.

ARGOUGES, a town of France, in the department of the Channel, four leagues south of Avranches.

ARGOW,

ARGOW, ARGAU, or ARGOVIE, a country of Switzerland, situated on the river Aar, from which it derives its name, and forming the north-eastern part of the canton of Berne. It is divided into Upper and Lower Argow, which are separated from each other by the small town of Arburg. The upper Argow extends to the Thun, and the lower to the confluence of the Aar with the Rhine. By the division of 1798, Argow, the chief town of which is Arau, was made a distinct department or canton; but by the constitution of 1801, Argovie was re-united with Baden and with the upper part of the Frickthall, and thus formed into the fourteenth department or canton, and six persons were appointed to represent it in the diet. Argow is a very fertile country, well watered by rivers which flow into it from the canton of Lucerne, abounds with excellent pastures, and produces also corn and wine. The industry of the inhabitants in the Lower Argow compensates for the less fertility of the soil. The reformed religion is the general profession of its inhabitants. See BERNE.

ARGU, a town of Syria, five miles south-east of Damascus.

ARGUEDAS, a town of Spain, in Navarre, $2\frac{1}{2}$ leagues from Tudella.

ARGUEIL, a town of France, in the department of the Lower Seine, chief place of a canton, in the district of Neufchatel, six leagues north-east of Rouen. The place contains 340, and the canton 9,608 inhabitants: the territory includes 215 kilometres, and 22 communes.

ARGUENON, a river of France in the late province of Bretagne, which has its source near Jugon, and runs into the sea near St. Malo.

ARGUES, GERARD D', in *Biography*, a mathematician of France, was born at Lyons in 1597, and died there in 1661. He was the disciple and friend of Descartes, whom he defended in return for his instruction. The works of this writer in French, are "A treatise on Perspective," fol.; "A treatise on Conic Sections," 8vo.; "The practice of Drawing," 8vo.; and "A treatise on Stone-cutting," 8vo. *NOUV. DICTIONNAIRE.*

ARGUIER, in *Geography*, a town on the south point of Porto Galere, towards the north-west corner of the island of Sardinia, in the Mediterranean, nearly east from cape Cals.

ARGUIN, an island of Africa, in the Atlantic, situate on the northern part of the coast of Senegambia, and in a gulph of the same name formed by cape Blanco, about ten leagues from it. N. lat. $20^{\circ} 20'$. W. long $17^{\circ} 20'$. To the west of this island are two other long small islands, and in the bay, on the north side, are several shoals from the main. There is also a little island by the point called Terra Gorda, and more southwards another called Monzora. Arguin was probably the island, which was known to the ancients under the name of "Cerne." It became the chief station of the Carthaginians, in the voyage of Hanno, along that coast; and M. De. Bougainville contends, that the cisterns found there are monuments of the Carthaginian power and ingenuity. Although Arguin is scarcely two miles in length, it has been for nearly a century, an object of contest to the Portuguese, Dutch, English, and French: but at length the French, in 1725, demolished the fort, and it has not been since rebuilt by any European power.

ARGULUS, in *Entomology*, one of the genera or divisions of Müllerer, in his arrangement of Moxoculi. Gmelin adopts it as a subdivision of the genus, with this definition: eyes placed beneath; antennæ two; legs from four to eight. This subdivision includes the three following species, *Charon*, *Delybinus*, and *Armiger*; and it is remarkable that the first kind has four legs, the second eight, and the third six.

ARGUMENT, in *Rhetoric*, is some reason or series of reasoning, by which we establish the proof, or shew the probability of some given proposition. Logicians, somewhat more scientifically, define *argument*, a *medium*, from whose connexion with two extremes, the connexion of the two extremes themselves is inferred. To illustrate this definition by an example; let it be inquired, "whether virtue is to be loved?" The agreement between virtue and love might be found by comparing each of them separately with happiness, as a common measure to both. For since the idea of happiness agrees to that of love, and the idea of virtue to that of happiness, it follows that the ideas of virtue and love agree to one another; and therefore it may be affirmed, "that virtue is to be loved." But, on the contrary, because the idea of misery disagrees with that of love, but the idea of vice agrees to that of misery, the two ideas of vice and love must consequently disagree with one another: and therefore it would be false to assert, "that vice is to be loved." The third thing logicians call the "medium" or "middle term," because it does as it were connect two extremes, that is, both parts of a proposition. But rhetoricians call it an "argument," because it is so applied to what was before proposed as to become the instrument of procuring our assent to it. Ward's *Oratory*, vol. i. p. 43. See TOPICS.

Arguments are termed *grammatical*, *logical*, *physical*, *metaphysical*, *moral*, *mechanical*, *theological*, &c. according to the art, science, or subject, from whence the middle term is borrowed. Thus, if we prove that no man should steal from his neighbour because the scripture forbids it, this is a "theological argument;" if we prove it from the law of the land, it is "political;" but if we prove it from the principles of reason and equity, the argument is "moral."

Arguments are either *certain* and *evident*, or *doubtful* and merely *probable*. "Probable arguments," are those whose conclusions are proved from some probable medium. "Evident and certain arguments," are those which prove their conclusions by clear media and undoubted principles: these are called *demonstrations*. In reasoning, Mr. Locke observes, that men ordinarily use four sorts of arguments. The first is to allege the opinion of men, whose parts and learning, eminence, power, or some other cause, have gained a name, and settled their reputation in the common esteem with some kind of authority: this may be called "argumentum ad verecundiam." Secondly, another way is to require the adversaries to admit what is alleged, as a proof; or to assign a better: this he calls "argumentum ad ignorantiam." A third way, is to press a man with consequences, drawn from his own principles or concessions: this is known by the name of "argumentum ad hominem." Fourthly, the using of proofs, drawn from any of the foundations of knowledge or probability: this he calls "argumentum ad judicium;" and observes, that it is the only one of all the four that brings true instruction with it, and advances us in our way to knowledge. For, 1. it argues not another man's opinion to be right, because I, out of respect, or any other consideration but that of conviction, will not contradict him. 2. It proves not another man to be in the right way, nor that I ought to take the same with him, because I know not a better. 3. Nor does it follow, that another man is in the right way, because he has shewn me that I am in the wrong: this may dispose me perhaps for the reception of truth, but helps me not to it. That must come from proofs and arguments, and light arising from the nature of things themselves; not from any shamefacedness, ignorance, or error. See REASON and REASONING.

Beside these, there are other arguments enumerated by different writers, as the "argumentum ab amore," which is used to engage

engage the reason by the affections; the "argumentum ad ignaviam," called by the Greeks *αργος λογος*, which always concludes in favour of inaction; the "argumentum ab invidia," which is made use of to render an adversary's opinion odious; M. le Clerc has a dissertation on this argument as applied to theology: and also "the argumentum a tuto," drawn from the consideration of its being safer to choose one side of the question than the other, when the evidence is equal on both sides. This has been much used against atheists and infidels; it was first started by Arnobius, and adopted by several advocates for Christianity, as Paschal, Tillotson, Galtrel, &c. Lord Shaftesbury and others have endeavoured to explode it: Clarke and Leibnitz only allow it a moral force. Motheim has a dissertation on this argument, viz. "De Vi argumenti quod a tuto dicitur in Theologia." Wolfem. 1723. 48.

Logicians divide their arguments, with regard to their form, into syllogisms, enthymemes, inductions, &c. An "argument in form," is a syllogism framed according to the strict rules of logic.—According to Aristotle, the "enthymeme" is the argument of rhetoric, as the syllogism is that of logic.—Rhetoric is defined by some, the art of finding arguments adapted to persuade, or gain belief.

Rhetoricians divide arguments, with respect to the places they are drawn from, into *intrinsic* or *artificial*; and *extrinsic* or *inartificial*, or *remote*.

ARGUMENTS, *artificial*, or *intrinsic*, by the Greeks called *επιχειρημα*, by Cicero *instita*, are the proper invention of him who speaks: or they are those which are taken from the subject treated of; of which there are several kinds, viz. genus and species, form, cause, and effect, &c. See each in its place, GENUS, &c. To these some add two other places of argument, viz. the manners and the passions.

ARGUMENTS, *inartificial*, or *extrinsic*, *απειρημα*, by Cicero called *assumpta*, are those which are borrowed from abroad, and are only applied by the orator to the point in hand; such are laws, common report, books, oaths, torture, and witnesses. The places, or general heads of arguments, with regard to their end, may be divided into, 1. Those intended to persuade or dissuade, which are chiefly drawn from the considerations of profit, honour, and equity: 2. Those intended to praise or dispraise: and, 3. Those intended to accuse and defend. See TOPICS.

ARGUMENT, *dialectical*. See DIALECTICAL.

ARGUMENT is also used for a syllabus, or abridgment of the subject of a book, history, comedy, or the like. We have almost lost the original use of prologues, which was to give the argument of the play.

ARGUMENT, in *Astronomy*, is, in general, a quantity upon which depends an equation, an inequality, or some circumstance relating to the motion of a planet; or it is an arch whereby we seek another unknown arch, bearing some proportion to the first. Hence,

ARGUMENT of *inclination*, or of *latitude*, is an arch of a planet's orbit intercepted between the ascending node, and the place of the planet from the sun, numbered according to the succession of the signs; or, more generally, the argument of latitude is the distance of a planet from its node, because on this depends the latitude. Let φC (Plate I. *Astronomy*, fig. 13.) be the ecliptic, AB the orbit of a planet, N the ascending node, φC the order of the signs, P the place of the planet, and Pm perpendicular to φC ; then Nm reckoned from N, according to the order of the signs, is called the argument of latitude, because the latitude Pm depends upon Nm. In order to obtain it, we must always subtract the place of the node from the place of the planet reduced to the ecliptic, adding twelve signs to the

latter, if it be the least. Take $NA = N\varphi$, and the longitude of a planet upon its orbit is computed from the point A; hence the longitude on the orbit is $AP = AN + NP$, and the longitude on the ecliptic is $\varphi m = \varphi N + Nm = AN + Nm$; the difference of these longitudes is the difference between NP and Nm, which difference applied to the longitude of the planet upon the ecliptic, adding or subtracting it, as Nm is less or greater than NP, that is, as Nm is between 0° and 90° or 180° and 270° , or between 90° and 180° or 270° and 360° , gives the longitude upon its orbit. This difference is called the *reduction*. To find it, put $c =$ the cosine of the angle PNm, $t =$ the tangent of Nm the argument of latitude; then the cotang. $PN = \frac{\text{rad.} \times c}{t}$;

hence $10 + \log. c. - \log. t. = \log. \text{cotang. PN}$; and the difference between PN and Nm is the reduction required. E. G. Let the inclination of the orbit of Mercury be 7° , and the argument of latitude $30^\circ 17' 48''$: then,

$$\begin{array}{r} 7^\circ 0' 0'' \text{ - - - - - Cos. } + 10 = 19.9967507 \\ 30^\circ 17' 48'' \text{ - - - - - tang. } = 9.7066171 \\ \hline 30^\circ 29' 1'' \text{ - - - - - cotang. } = 10.2301336 \\ \hline 0 \ 11 \ 13 \ \text{the Reduction.} \end{array}$$

In the tables of the planets' motions, a table of reductions is given, which applied to NP gives Nm, or applied to the longitude of a planet on its orbit, gives the longitude upon the ecliptic; but if applied with a contrary sign to the longitude on the ecliptic, it gives the longitude on its orbit. In like manner a reduction may be applied to the sun's longitude, for the purpose of finding its right ascension, or the contrary. Vince's Astron. vol. i. p. 149.

ARGUMENT, *menstrual*, of *latitude*, is the distance of the moon's true place from the sun's true place.

By this we find the quantity of the real obscuration in eclipses, or how many digits are darkened in any place. See ECLIPSE.

ARGUMENT, *Annual*, or annual argument of the moon's apogee, is the distance of the sun's place from the place of the moon's apogee, or the arch of the ecliptic comprehended between these two places.

ARGUMENT of the *parallax*, denotes the effect which it produces in an observation, and which serves for determining the true quantity of the horizontal parallax.

ARGUMENT of the *equation of the center*, or of the equation of the orbit, is the anomaly or distance from the apogee or aphelion, because this equation is calculated in an elliptic orbit for every degree of anomaly, and varies according to the variation of the anomaly. Thus also, the *argument* of that part of the equation of time, which arises from the unequal angular motion of the earth in its orbit about the sun, is the sun's anomaly, because that part of the equation depends entirely upon the anomaly; and the latter being given, the former is found from it. In the computation of the place of the moon by the tables, there are fourteen arguments, corresponding to the fourteen inequalities in its motion, and the fourteen equations in the calculation: e. g. the first is $11' 16''$, multiplied by the mean anomaly of the sun; because this equation, which is $11' 16''$ when the sun is 90° from his apogee, decreases as the sine of the distance from the apogee, or the sun's anomaly. Thus, the anomaly is the argument of the first equation, and so of the rest.

ARGUMENTATION, the act of inventing or framing arguments, of making inductions, and drawing conclusions. See INDUCTION, &c.

Argumentation, according to Cicero, is the delivering or unfolding of an argument. The matter of argumentation is propositions; the form, their due disposition, with regard

to one another, so that a conclusion may be drawn from them. See ENTHYMEME, PROPOSITION, RATIOCIATION, SORITES, SYLLOGISM, &c.

ARGUN, or ARGOON, in *Geography*, a river of Asia, which rises in a lake of Chinese Tartary, called "Coulou Nor," or "Dalai," situated in N. lat. 49°. E. long. 110° 14', and joins the Amur or Amoor, in N. lat. 53°. E. long. 121° 14'. This river separates Russia from Chinese Tartary, according to the treaty of Nerchinsk in 1728. It has a pearl fishery, and near its banks are mines of lead and silver.

ARGUN, or *Argjan*, is also a mountain of Independent Tartary, forming the chain with the Kara Tau, though broken by the interfection of a river.

ARGUNA, a town on the coast of Africa, on the river Benin or Formosa, thirteen leagues from Benin.

ARGUNSKOI, in *Geography*, a town of Siberia, seated on the Argun, near the confines of China, one hundred and thirty miles east of Nerchinsk. N. lat. 50° 50'. E. long. 120° 14'. This is the farthest fort of the Russians towards the east, on the Mongolian frontiers, and was first built on the east bank of the Argun, in 1682, for the convenience of levying the tribute payable by the Tungusians, who inhabit these parts; and it was rebuilt in 1659 on the west side of that river. A considerable trade is carried on from this garrisoned town with the Monguls. The country round it is very fertile; and the air, though cold, very healthy. The territory of Argunskoi is often visited with slight shocks of an earthquake, in the spring or beginning of winter. The Chinese erect new pillars every year, on the east bank of the Argun, to mark the limits of their frontiers.

ARGURA or ARGISSA, in *Ancient Geography*, a town of Greece, in Thessaly, situate upon the Peneus, forty stadia from Atrax. Strabo.

ARGUS CAMPUS, a plain in the territory of Mantinea. Pausanias.

ARGUS, in *Fabulous History*, is said to have had an hundred eyes, some of which were open, whilst the others were closed. He was called Πανοπτις, *panoptes*, because he saw every thing. On this account Juno intrusted him with the custody of Io; but Jupiter, having compassion on Io in close confinement, commissioned Mercury to charm Argus to sleep with his flute, and to seal his eyes with his caduceus, and then to cut off his head. Juno, in recompence of his fidelity, took all the eyes of Argus, and fixed them to the wing and tail of the peacock; and, as the fable adds, transformed Argus into this bird. Macrobius (Saturn. i. 19.) gives this fable an astronomical origin: he says, that Argus represents the celestial sphere, on which are dispersed a thousand stars; and that Mercury is the sun, that makes them disappear by its brightness. But when it was known that the Mercury of the Greeks was the Anubis of the Egyptians, and that Anubis represented the horizon, the application of the fable was no less obvious, as Mercury caused Argus to sleep, and closed his hundred eyes, as the horizon every day veiled the stars of the celestial sphere.

ARGUS, in *Conchology*, a species of MUREX, found in India. The shell is gibbous, with transverse tuberculated ribs; brown, obscurely fasciated, and white within; aperture ovate. Gmelin, &c. *Obs.* There are three or more supposed varieties of this species, one of which is believed to be the shell figured in Martin's Universal Conchology under the name of *Flag-Buccinum*; and which is found in the Friendly and Society islands.

ARGUS, a species of CYPRAEA, that inhabits the Indian and Atlantic ocean. This shell is slightly turbinated, somewhat cylindrical, and sprinkled with ocellated marks; four

brown spots beneath. Gmelin. It is called *argus* by Rumphius, *argus magnus* by Argenville, and *argus covary* by English collectors. The length is about four inches; it is rather narrow, and of a grey or yellowish colour above, with three brown bands; the ocellar marks are sometimes connected; and it is also remarkable that the spots on one side, beneath, are larger than the other; the lips are straw-colour, and the teeth brown.

ARGUS *minor*, the name given by Argenville to the shell called by Linnæus and Gmelin *Cypræa cribraria*; which see.

ARGUS, in *Entomology*, a species of CURCULIO, described by Sparman in the Stockholm Transactions for 1785, as a native of the Cape of Good Hope. It is downy; head and anterior margin of the thorax dotted with grey and white; wing-cases with elevated striae, and both spotted and dotted with white and grey. Gmelin.

ARGUS, a species of CIMEX (*Scutellatus*, Gmel.) It is black, dotted with numerous ocellar fulvous spots. Fabr. and Gmel. This creature inhabits Surinam, and is about the same size as *Cimex Fabricii*; the under-side is yellow, varied with black.

ARGUS, a species of PAPILIO, (*Pleb. rural.* Gmel.) The wings are destitute of tails, and blue; beneath, a ferruginous border on the posterior pair, with blue silvery ocellated spots. Gmelin, &c. *Obs.* This character cannot be considered unexceptionable, since it agrees only with the male insect; the female is dark brown, and bluish only at the base of the upper surface. The larva from which it is produced is green, with a brown line along the back; and the head and fore-legs black.

ARGUS, a most singular species of PHALÆNA, (*Bombyx Att.* Gmelin,) in which the posterior wings are furnished each with a tail, that is more than thrice the length of the rest of the insect. The specific character is as follows: wings tailed, pale ferruginous, with numerous ocellar transparent spots; and tails very long. This is *phalæna brachyura* of Cramer; and found in Sierra Leona. A somewhat analogous species, being furnished with similar tails, has been recently discovered in the interior of Africa.

ARGUS, in *Ichthyology*, a species of PLEURONECTES, that inhabits the seas about the Antilles. The body is variegated and the tail rounded. Bloch and Gmelin. To this concise character of the species may be added, that it is white with yellow spots, which are dotted with brown, and encircled each with a blue ring; the other parts are also dotted with brown, and covered with soft scales; the head is broad; the eyes are unequal, and rather at a distance; the pupil blue; the iris white and brown; the lateral line bending in the middle, above the pectoral fin; the fins spotted with blue; the membrane yellowish; rays brown; dorsal fin extending from the nostrils to the tail. It has seventy-nine rays in the dorsal fin, pectoral ten, ventral eight, anal sixty-nine, and in the tail seventeen.

ARGUS, a species of CHAETODON, called by Renard *Ican Taci*, and by Valent *Cacatocha Babintang*. It has eleven spines in the dorsal fin; the body is entirely dotted with black; and the tail is entire. Gmelin, &c. The body of this fish is nearly square; and the sides are spotted and varied with brown; above it is violet, beneath white; the iris of the eye is golden; jaws equal; gill-covers large; the membrane loose; the lateral line is arcuated; vent nearly in the middle of the body; fins short and yellow; and four spines before the anal fin. This species is found in fresh waters and swamps, in India; lives on insects; and the flesh is sapid.

ARGUS, in *Ornithology*, a species of PHASIANUS, that inhabits

inhabits China and Chinese Tartary; and may be well esteemed one of the most elegant of the feathered race. It was first introduced to the notice of the English naturalist through the medium of the Philosophical Transactions, under the name of *Argus* or *Iucn*: it next appeared in the London Magazine for 1766, and Gentleman's Magazine for 1768; and, at length was very completely described by Dr. Latham in his General Synopsis of Birds, published nearly twenty years ago. Still it is rarely met with in cabinets of Natural History; though on the credit of some respectable and faithful writers, it is far from being an uncommon bird in its native country. There is at present a magnificent specimen of it in the Leverian Museum.

From Dr. Latham we learn, that this bird is common in the woods of Sumatra, as well as those of China; and that it is there called *Coo-ow*. Hitherto every attempt to keep it alive in a state of captivity for a considerable length of time, has proved ineffectual; it has been known to live for about a month after being taken from the woods, but never longer. One circumstance is very remarkable, it has a strong antipathy to the light, and remains perfectly inactive in the open day; and, on the contrary, when put into a dark place seems easy, and sometimes makes its note or call which corresponds with its name *Coo-ow*; it is rather plaintive, and not harsh like that of a peacock.

The size is that of the male turkey; the bill, like that of the common pheasant, and of a pale yellow colour; the fore part of the head and beginning of the throat are covered with a granulated skin, of a fine scarlet colour; the irides are orange; round the eye the skin is dusky, and it has a kind of whisker on each side of the lower jaw; the top and hind part of the head and neck, is changeable blue, with a forked crest on the former; the lower part of the neck, back, and wing coverts, dusky, marked irregularly and transversely with reddish brown: the nine outer quills are yellowish-brown, marked with small dusky spots as big as tares on the outer, and smaller spots of white on the inner webs. The eleven remaining quills, dark brown, marked with round and oblong spots on both webs; and on the outer, near the shafts, a row of large eyes, from twelve to fifteen in number, the largest an inch in diameter, somewhat resembling those on a peacock's train; the throat, breast, rump, and upper tail-coverts dull orange, marked with round dusky spots; the tail consists of fourteen feathers, the two middle ones are three feet in length, the next eighteen inches, and thence they gradually shorten to the outer ones which are twelve inches only in length; the colour dusky brown, dotted with white; and the two middle ones have round white spots encircled with black on the outer, and brown irregular ones surrounded with dusky on the inner webs; the lower belly and vent dusky, irregularly mixed with brown; the legs, like those of a turkey, and of a greenish ash colour. Vide Lath. Gen. Syn.

We must not omit observing that the description of this species by Dr. Latham, was partly taken from a drawing sent over with a specimen of the bird; both the head and legs were wanting in this specimen, and were supplied from the painted figure; in this figure the legs have no spurs; but in a drawing, done by Mr. Edwards, they are furnished with a spur like that of a cock.

Its specific character, according to Gmelin, &c. is thus defined; pale yellow, dotted (or spotted) with black; face red; hind part of the head crested, and blue. Buffon calls it *L'Argus, ou le Iucn*.

ARGUS, in *Zoology*, a species of *COLUBER* introduced by Linnaeus, and retained by Gmelin, in the *Systēma Naturæ*, on the authority of Seba; but as the specific characters assigned to the serpents by these authors are uniformly taken

from the number of scuta, and squamæ, which, in this instance, they were unable to ascertain, it unavoidably stands without any character by which the species may be distinguished. A general description is indeed added, yet, if either writers are to be depended on, it is not very remarkable for its accuracy; above, smooth brown, and somewhat reticulated; scales palest in the disk; beneath, tessellated: the back of the head likewise is bilobed and gibbous. Dr. Shaw gives a specific character to this creature, which is taken from the colours, form, and situation of the spots in these words: chestnut-brown snake, yellow beneath, and banded above by transverse rows of ocellated red spots. Gen. Zool.

This is a large species, measuring according to Seba above five feet in length, and is of a moderate thickness. The head is large, flattish, and covered with small scales in front; teeth large and strong; and the ocellated red spots on the body are each surrounded by a white iris, which is encircled with red. The tail is moderately slender, tapering to a point, and apparently about a foot in length. It is a native of Arabia, and is supposed from the appearance of the head to be a poisonous species.

ARGUTIÆ, in *Rhetoric*, witty and acute sayings, which commonly signify something farther than what their mere words at first sight seem to import. Writers on rhetoric speak of divers species of *argutie*, viz.

ARGUTIÆ ab alieno, when something is said, which seems repugnant either to the nature and property of a thing, or to common custom, the laws, &c. and yet in reality is consistent therewith; or when something is given as a reason of another, which yet is not the reason of it. For instance, "si Caius nihil didicisset, errasset minus:" again, "Aureum hoc sæculum est, quia plurimus jam auro honos venit."

ARGUTIÆ ab allusione, those wherein allusion is made to some history, fable, sentence, proverb, or the like; e. g. "multi umbram captant & carnem amittunt."

ARGUTIÆ a comparatis, when two things are compared together, which yet at first sight appear very different from each other, but so as to make a pretty kind of *simile*, or *aniffimile*; e. g. "Par est pauper nil cupiens principi omnia habenti."

ARGUTIÆ a repugnantibus, when two things meet in a subject, which yet regularly cannot be therein; or when two things are opposed to each other, yet the epithet of the one is attributed to the other; e. g. "Dum tacent clamant."

ARGUZIA, in *Botany*. See *MESSERSCHMIDIA*.
ARGY, in *Geography*, a town of France, in the department of the Indre, and chief place of a canton, in the district of Chatillon sur Indre, three and a half leagues east of Chatillon.

ARGYLE, a township of America, in Washington County and State of New York, on the east bank of Hudson river, containing 2,341 inhabitants, inclusive of fourteen slaves. In the state census of 1796, there appeared to be 404 electors.—*Argyle* is also a township of Shelburne County in Nova Scotia, settled by Acadians and Scots.

ARGYLESHIRE, or *ARGATHIA*, in Scotland, which together with Perthshire and the Western Islands, is said to have constituted the ancient kingdom of the Scots, while the rest of Caledonia was subjected to the Picts and Romans, comprehends Kintyre, Knapdale, Argyle Proper, Cowal, and Lorne. It is bounded on the south by the Irish sea and the Frith of Clyde; on the east, by Perthshire; on the north-east by Lochaber; and on the north-west by several islands. The extent of it from south to north, between the Mull of Kintyre or Cantire, and the point of Ardnamurchan, where it joins the shire of Inverness, is about 114 miles; and the breadth in some places,

including the isles, about 70. This country, like all other parts of the Highlands, affords a very wild and horrid prospect of hills, rocks, and huge mountains, piled upon each other in a stupendous and dreadful disorder; bare, bleak, and barren to the view; or at best covered with shagged heath, which appears black and dismal to the eye, except in the summer, when it is variegated with an agreeable bloom of a purple colour. The coast of Argyle is rocky; yet indented with bays and inlets, that afford good harbours for shipping. The country is well watered by rivers, brooks, and lakes, abounding with fish; the vales and flat parts of it are cultivated for corn; the mountains feed an innumerable quantity of black cattle, which run wild among the hills in winter as well as summer; the heath and woods, of which there is a considerable number, afford shelter to deer, roebucks and all sorts of game in great plenty: the circumambient sea, with its locks, bays, and harbours, pours forth myriads of fish; but the innate wealth of the country is dug from the bowels of the mountains in iron, lead, and other metals and minerals.

Argyle is the seat of a provincial synod, consisting of five presbyteries and 49 parishes; and gives the titles of *duke* and *earl* to the noble family of Campbell, the most powerful of all the Scottish nobility. The Duke of Argyle is, by hereditary right, great master of the king's household in Scotland; admiral of the Western isles; general of Denoon castle; keeper of Dunstaffnage and Carrick; and, before the jurisdictions were abolished, enjoyed other hereditary offices, which rendered him too powerful as the subject of a limited monarchy. He still possesses many royalties; his vassals, even of the name of *Campbell*, are so numerous, and his influence extends so far, that he could, on occasion, bring 3000 or 4000 fighting men into the field. Argyleshire is in general peopled by this clan; and affords a great number of castles and seats belonging to gentlemen who hold of the duke, and boast themselves descended from his family.

Argyle Proper is bounded by Knapdale and Cowal on the south; Lochaber on the north; Lennox and the Grampian hills on the east; and Lorne on the west. It lies between Lochfyn and Lochlow; which last is a fresh water lake about a mile broad, but extending 2½ in length, including 12 islands, on two of which are the castles of Erconel and Glenurquhart. This lake, which gives the title of viscount to the duke of Argyle, issues in the river Awe, which, after a course of six or seven miles, enters Loch Ertiff, and this falls into the west sea, opposite to the isle of Mull: all these abound with excellent trout and salmon. Argyleshire sends one member to parliament. Its chief towns are Inverary and Campbelltown.

When the projected canal shall be completed, and some villages and harbours erected, the populous county of Argyle (Mr. Knox affirms) will become one of the most valuable provinces of the British empire. It abounds in black cattle, sheep, and fish, though the latter are less numerous than those on the more northern shores. Washed on both sides by the sea, deeply indented by navigable lakes and bays; having an easy communication with the fishing grounds on the North Highlands; with Glasgow, and the trading towns on the Clyde; with Ireland, Wales, Whitehaven, Liverpool, Bristol, and other marts on the west coast of England, we may easily conceive, that the period is at no great distance, when Argyleshire will become a great commercial county. To corroborate this opinion, he observes, than after a vessel gets under sail from this coast, she enters at once into the Atlantic, where she meets with no interruption till she makes the coast of America or the west Indies. The line, therefore, which nature points out for

the inhabitants, is that of salt-making, fishing, ship-building, freights, or the carrying trade; soap and glass-making, by means of the kelp upon their shores, and sand found upon Gùisild, which is adapted for the latter.

ARGYNELLUS, in *Entomology*, a species of *CURCULIO*, that inhabits the Cop of Good Hope. It is silvery green; eyes black; black line above, with a black longitudinal red line. Sparrn. Nov. Act. Stockh. 1785. Gmelin.

ARGYNNIS, a species of *SPHINX* (*Zygenis*, Fabricius). The wings are greenish-black, with gold spots; posterior pair brown, and gold at the base. This is a beautiful insect, and inhabits Brasil. Græche. The abdomen is black, and red at the tail; a few green spots on the anterior wings, and violet spots on the posterior ones.

ARGYNNIS, in *Mythology*, an appellation of *Venus*. Agamemnon built a temple to this goddess, under this appellation, in honour of a young favourite named Argynnis, or Argeus, who was drowned in the river Cephissus in Bœotia. Propertius mentions it, lib. iii. eleg. vi. p. 699.

“Sunt Agamemnonias tellantia littora curas,

Quæ notat Argyni pœna natantis aqua.”

ARGYPANA, in *Ancient Geography*, a town of Italy mentioned by Polybius, who says it was ravaged by Hannibal.

ARGYPHEA, a town of the Peloponnesus, named in the hymn of Apollo ascribed to Homer.

ARGYRA, a country of India, on the other side of the Ganges, mentioned by Mela, Piny, and Pompey.—Also, a town of India, and the metropolis of the island of Iabadios, on the western side of which it was placed by Ptolemy. This island, called by Steph. Byz. Ibadis, seems to have been the same with that named Taprobana. It is said to have derived its name *Argyra* from *αργυρος*, *silver*, on account of its fertility, and the gold which it produced.—Argyra was also a town of Greece in Achaia. Pausanias informs us, that this, together with several other towns, was depopulated by Augustus, in order to supply Patras with inhabitants. A fountain of the same name was adjacent to its ruins.

ARGYRASPIDES, or ARGYROASPIDES, in *Antiquity*, persons armed with silver bucklers, or bucklers silvered.

The argyraspides, according to Quintus Curtius, made the second corps of Alexander's army; the first was the phalanx.

According to Justin's account, lib. xii. cap. 7. Alexander, having penetrated into India, and extended his empire as far as the ocean, for a monument of his glory, ordered the armour of his soldiers, and the housings of his horses to be adorned with silver. And hence he commanded them to be called argyraspides, from the Greek *αργυρος*, *silver*, and *ασπις*, *buckler*. By this author it should seem, that Alexander's whole army were called argyraspides.—After that prince's death, the argyraspides despised all other chiefs of the army, disdainful to obey any other, having borne arms under Alexander.

ARGYREIA, in *Botany*, a genus of plants so named by L. urcio, from the silvery appearance of the leaves, seems nearly related to *Argophyllum*, which approximates closely to ivy.

ARGYRELLA, in *Entomology*, a species of *PHALÆNA* (*Tinea*, Gmel.). The wings are silvery, glossed with brown and fringed. This is a large insect, and inhabits Aultria.

ARGYREUS, a species of *CURCULIO* found in India. The body is green, with spots of silver and gold. Fabricius and Gmelin. The latter author arranges it with those that have the thighs unarmed; but adds in his description

that

that they are somewhat armed, those of the first pair of legs having an obsolete spine.

ARGYRINI, in *Ancient Geography*, a people placed by Steph. Byz. and Lycophron among the Epirote, or in Epirus; but J. Vossius says they were the inhabitants of Argyrhium.

ARGYRIPA, a town of Apulia, in Italy; built by Diomedes. See ARPI.

ARGYRITES, in *Antiquity*, a denomination given to Grecian games, which formed part of the worship of some divinity. They were so called, because the victor obtained, as a recompence, either some coin or vases of silver, or bucklers of brass, &c. which were of a different kind in different places.

ARGYRITIS, in *Natural History*, a name given by the ancients to a substance resembling silver.

In this sense, argyritis was used to signify such litharge as was of a white colour, by way of distinguishing it from that which was yellow, which they dignified with the name *chrystitis*, as we do at present with that of litharge of gold. The argyritis of late writers seems to have been the same with the *lapis magnetis* of the ancients, mentioned by Theophrastus, and distinguished from the magnet.

ARGYROCOME, in *Botany*. See BACCHARIS, GNAPHALIUM, and XERANTHEMUM.

ARGYRODAMAS, in *Natural History*, a sort of silver-coloured tale, which bears the fire, and neither burns, melts, nor changes its hue. Plott's Hist. Staff.

Hence its denomination among the ancients of *argyrodamas*, quasi *argentum indomitum*.

ARGYRODENDROS, in *Botany*. See PROTEA.

ARGYROLIBANUS, in the *Materia Medica* of the ancient Greeks, a word used to express the white kind of oilbanum.

ARGYROPHTHALMUS, in *Ornithology*, a species of CORVUS, whose general colour is black; breast blue; eyes silvery; tail white at the tip; and bill and legs black. Gmelin.

The first account that we have of this bird is in Brown's illustration of *Natural History*; he figures it under the name of the *Surinam Crow* in the tenth plate of that work, from a specimen then in the collection of M. Tuntal, esq. The same was afterwards described by Dr. Latham, as being of the size of a common crow. Bill dusky; head deep green; hind part rich blue; beneath that pale green; under each ear, and on the hind part of the neck, a spot of the same; neck, breast, belly, back, and wing-coverts deep changeable green; prime quills dusky; ends rich blue; tail dusky; legs flesh-coloured. This bird he calls the *Surinam Crow*; but having lost its tail, one very striking characteristic of the species was unavoidably omitted, viz. the white spot at its extremity. In the year 1784, Jacquin published his "Bevtrage zur Geschichte der Vogel;" at Vienna, in which this species is more satisfactorily described; and his description was afterwards inserted in the Supplement to Dr. Latham's *Ornithology*, and the Gmelinian *Systema Naturæ*. From hence it appears to be about the size of a jay; the prevailing colour black; irides silvery white, with a spot of blue above, and another beneath; the breast and outer part of the wing deep blue; tip of the tail white; bill and legs black. It inhabits Carthagenia in New Spain, South America; and is called *Oiseau de Plata*; has a monotonous voice; frequents woods; and being easily tamed, is often kept in houses in that country.

ARGYROPOEIA, in *Alchemy*, the art of making silver out of other more imperfect metals.

The word is formed of *αργυρος*, silver, and *ποιω*, I make.

ARGYROPS, in *Ichthyology*, a species of SPARUS, found in Jamaica and Carolina; and called by Willughby, *Zanthurus indicus*. The tail is lunated; back grooved; iris of the eye silvery. Brown, in his Nat. Hist. of Jamaica, describes it as *Sparus iride argentea, dentibus anterioribus conicis*. The three first rays of the dorsal fin are very long and setaceous; this fin consists of twelve rays; the second of twenty-six; pectoral fin of seventeen; ventral fin of six; anal fin of fifteen; and tail of twenty rays. Gmelin, &c.

ARGYROPULUS, JOHN, in *Biography*, a Peripatetic philosopher, was born at Constantinople, in the beginning of the fifteenth century, and was one of the first Greeks, who fled from that city, and sought an asylum in Italy, where he came to reside several years before the taking of Constantinople by the Turks in 1453. In 1456, he was taken under the patronage of Cosmo di Medici, who committed to him the education of his son and nephew in the Greek language and philosophy; and who afterwards appointed him professor of the Greek language at Florence. At his request, he undertook to translate into Latin the physics and ethics of Aristotle. But, being obliged to leave Florence on account of the plague, he went to Rome, where cardinal Befarion conferred upon him the professorship of the Greek language. Here he read lectures upon Aristotle, and he had the honour of being the first modern Greek who taught philosophy in that city. His salary, though liberal, was not sufficient to defray the expences of his luxurious table; and at the age of seventy, in the year 1486, he fell a sacrifice to the unrestrained indulgence of his appetite, as, by eating melons to excess, he brought on a fever which was fatal to him. His learning was respectable; but his manners were not amiable; and he manifested a degree of literary jealousy which disgusted his friends, and prevented him from freely communicating his learning to the Italians. He affected to despise Cicero, whom he maintained to have been ignorant of philosophy and Greek learning. His translations, which are found in the more ancient Latin editions of Aristotle, and in the Greek and Latin editions of Basil, are valuable. He also wrote a "Commentary on Aristotle's Ethics;" Solutions of questions proposed to him by certain philosophers and physicians in the island of Cyprus; Epistles and several small pieces extant in MS.; Brucker's Hist. Philos. by Enfield, vol. ii. p. 405. Fabr. Bibl. Græc. l. v. c. 43. § 21. tom. x. p. 4-5.

ARGYROSTOMA, in *Entomology*, a species of MUSCA, found in the environs of Vienna. It is black and hairy; silvery in front, with bands of the same. Schranck, Gmelin, &c.—This insect is shining above; eyes reddish; and the wings transparent.

ARGYROSTOMUS, in *Conchology*, a species of TURBO, of a whitish colour, radiated with brown; the wreaths of the spire are six, and are rather rounded; the first spire considerably larger than the others; the aperture is silvery; and the tip sometimes red. It is a native of India; is called *Os argenteum* by Argenville, and is thus specifically described by Gmelin. Shell somewhat ovate; rough, with more elevated dorsal transversely striated lines.

ARGYROSTOMUS, a species of TROCHUS, that inhabits the southern ocean. This shell is ovate, with undulated ribs, and striated transversely; aperture somewhat compressed; wreaths of the spire swelled; the first slightly carinated at the base. Gmelin. The breadth is about two inches, and the height nearly the same; its colour is black; the first wreath terminates in a row of tubercles; and the pillar lip is very green.

ARGYRRHIUM, or ARGYRIUM, in *Ancient Geography*,

Argyrium, now *S. Filippo d'Argiro*, a town of Sicily, which was the birth-place of Diodorus Siculus. This city, built upon the point of a rock of a conical form, commanded its whole territory; and according to history, disputed the palm with that of Syracuse, as to extent and riches. Its population was encouraged and increased by Timoleon, after he had expelled the tyrants of Sicily. Enriched by commerce, the inhabitants who came to reside here, embellished it with superb edifices: they built a theatre almost as large and splendid as that of Syracuse; and erected magnificent mausolea in the form of pyramids. This city is now so much reduced, that scarcely a trace remains of its ancient grandeur. The site of the temple of Hercules, and of the lake dug there by Iolas, his son-in-law, is now called the "Lago d'Ercole." Nevertheless the soil is fertile, and admits of cultivation. The saffron of this territory is deemed excellent, and it yields a kind of potter's earth, which by its unctuous and detergent quality serves the inhabitants instead of soap. *Argyrium* was founded by the Sicilians, who came into Sicily from Spain; being compelled to leave the rich plains of Leontium by the attacks of the Lestrigons and Cyclopes, they retired to this place which nature seems to have previously fortified for their security. Historians relate, that the Argyrians cut off their hair in order to sacrifice it to Hercules, in token of their gratitude for the water with which he furnished them by means of the above mentioned lake, as *Argyrium* was before destitute of water. The modern inhabitants retain the practice, and cut their hair almost entirely off, preserving only two locks on their temples. De Non's Travels in Sicily, &c. p. 842.

ARGYRUNTUM, or **ARGYRUTUM**, in *Ancient Geography*, a maritime town of Illyria, according to Pliny and Ptolemy: now Novegrad in Dalmatia.

ARHAW, in *Geography*, a river of Africa, in the kingdom of Algiers and province of Tlemfan, which flows into the Sheliff, near a noted sanctuary, called Seedy Abid, at a small distance from mount Atlas.

ARHON, a large mountain of Africa, in the kingdom of Fez. It is a branch of mount Atlas, and extends for a considerable distance from east to west. Its inhabitants are partly Moors expelled from Spain, and partly some Arab families. The soil produces abundance of barley, which is the only grain of the country. They have also olives and dried raisins: and they rear great numbers of bees. They also manufacture soap, which is an article of commerce. Their habitations, which are rather huts than houses, are scattered over the country. The emperor of Morocco draws from them a considerable tribute: and it is said, that this simple district is able to furnish 10,000 soldiers.

ARHUS. See **AARHUS**.

ARI, a town of Italy, in the kingdom of Naples, and province of Abruzzo Citra, five miles south-east of Civita di Chieti.

ARIA, in *Ancient Geography*, the name of an island in the Euxine sea, opposite to Pharnacea, called also *Chalcidius*. Pliny.

ARIA, a mountain of Asia, part of a chain of mountains mentioned by Ammianus Marcellinus.

ARIA, the most considerable lake of Persia, is situated in the western part of the province of Segistan or Seistan, according to the map of major Rennel between $33^{\circ} 15'$ and $32^{\circ} 45'$ N. lat. and $59^{\circ} 15'$, and $61^{\circ} 20'$ E. long. In the French maps it is called the lake of Zeré, from a village of that name near its western extremity; and in the map of major Rennel, the sea of Durrah or Zurrah, from a village seated on a river at the distance of twenty miles from the

lake, which village is denominated Corra or Curra, whence is probably derived Zurrah. Pinkerton (Mod. Geog. vol. ii. p. 315.) suggests that this appellation might as well be supplanted by that of the sea of Segistan. According to Otter (Voyage en Turkie et en Perse, tom. i. 217.) cited by this geographer, the length of this lake is thirty leagues, or a day's journey, in breadth; and the water is fresh and full of fish. By his account it only receives the river of Ferah (Farree) or Parra, which runs from the north-east.

ARIA, and *Ariana*, are names that have been applied by ancient geographers very variously. Some have applied them to the same country, and others to distinct countries. Ptolemy mentions only Aria, without noticing Ariana, and the Ariani. Pliny (l. vi. c. 23.) mentions Ariana, but takes no notice of Aria; and yet he distinguishes (l. vi. c. 25.) between the Arii and Ariani. Parthia, he says, has the Arii to the east, and to the south the Ariani and Carmania. Hence it has been conjectured, that the Ariani were more widely extended than the Arii, and that under this general denomination were included the Gedrosii and the Drangæ, Arrian (l. iii. c. 25.) has Aria and the Arii, but is silent with regard to Ariana. Strabo has both names, and extends the limits of Ariana beyond those of Aria: observing in general, without settling their boundaries, that Ariana commences from India; and he cites Eratosthenes, who says that Ariana was bounded on the east by Indus, on the south by the Great Sea, on the north by Paropamisus and the mountains as far as the Caspian ports, and on the west by the boundaries which separate Parthia from Media, and Carmania from Parthacene and Persia; and, accordingly, Ariana is very extensive. Salmasius (Exerc. Plin. p. 553.) distinguishes his Ariana from Aria, but does not assign to it any precise limits. The limits of Aria; according to Ptolemy, are parts of Margiana and Bactria on the north, on the east the Paropamisadæ, and on the south Drangiana: and Strabo says, that the Arii are adjacent to the Paropamisadæ on the west. Ariana, in major Rennel's map, is a part of the province of Persia, called Korasan or Koresan.

ARIA, or *Artacoana*, the chief city of the country called Aria, seated on a river, called by Arrian, Areios; by Pliny, Aries; by Ammianus, Arias; which had several sources in the desert of Margiana, and in the Saraphi mountains, and runs into the Aria Palus, or lake of Aria. In its course it passed by Alexandria, according to Pliny, who calls this city Alexandria Arion or Arionum. Aria or Artacoana is the present Herat, placed in Rennel's map at the confluence of two streams, which form the river that runs into the lake of Durrah.

ARIA, Ital. for *Air*, English (which see). Herr Sulzer, an elegant German writer on the subject of the fine arts, has described the construction, and what was thought the perfection of an opera *Air*, about the middle of the last century, during *da capo* times; and not only apologized for second parts to airs, and a return to the first, but pointed out their utility and beauty in doctrines now quite exploded, both in theory and practice. In the remarks of Mr. Framery on the encomiums of H. Sulzer (Encycl. Meth. p. 95.), he allows that his precepts are excellent, but that his definition appears imperfect. He then gives his own notions, which tally more with modern practice. After which he adds, "as to the form of opera *Airs* indicated by M. Sulzer, it is much varied since he wrote on the subject." The Italians at length, tired of their eternal monotony, melt down the second part of their *Airs* into the first; or, if distinct, when the expression of the words requires it, they do not think themselves obliged to return to it by a *da capo*. The *Airs* of comic operas are constantly

stantly confined to one part or strain, unless some new measure, or dissimilar idea in the words, absolutely requires a different expression. The movement then is changed, and finishes by an *Allegro*, without returning to the first part.

ARIA-Βορρῶν, in *Botany*. See MELIA.

ARIA Theophrasti. See CRATÆGUS.

ARIA-Veelia. See CLEOME.

ARIACA, in *Ancient Geography*, a maritime country of India, situate, according to the *Periplus* of the Erythræan sea, towards the gulf Canthi Colpus, and thought by M. d'Anville to be the southern part of the country called *Larice*.—*Ariaca* was also a town of Margiana. Ptolemy.

ARIACÆ, a people of Scythia, on the left bank of the Iaxartes, near the Caspian sea. Ptolemy.

ARIACES SABINORUM, or *Sadanarum*, a people of India, on this side the Ganges.

ARIACOS, or ARIACE, a small town of Asia Minor, in Mysia, situate between Placia and Scylace, near Olympus. Pliny.

ARIADNEA, in *Antiquity*, solemn festivals held at Naxos, in honour of *Ariadne*.

The Ariadneæ are said to have been instituted by Theseus, in atonement for his cruelty in exposing Ariadne big with child on that coast. They were of a mournful cast; one part of the ceremony was for a young woman to lie down, and counterfeit all the agonies of a woman in labour. There was another festival, which was celebrated with various expressions of mirth, in honour of another Ariadne, who was of a gay and sprightly temper. Plut. in *Thef.* and *Potter's Arch.*

ARIADNE, in *Entomology*, a species of PAPILO (*Nymph. Phal.*) described by Linnaeus, Fabricius, and Gmelin. The wings are angulated, fulvous, with undulated black streaks, and a white marginal spot on the anterior pair. It inhabits Java.—*Obf.* Cramer has figured this insect under the name of *Papilio Merione*; and the *Papilio Coryta*, of the same author, appears to be only a variety of the former species.

ARIADNE, in *Fabulous History*, a daughter of Minos, king of Crete, who being prepossessed in favour of Theseus, commissioned to destroy the Minotaur, gave him, in token of her love, a clue of thread, which served to conduct him out of the labyrinth, after his defeat of the monster. Theseus, on leaving the island, took with him Ariadne, but abandoned her in the isle of Naxos. Bacchus found, and married her, and presented her with a crown of gold manufactured by Vulcan, which was afterwards transformed into a constellation. Ariadne had a son by Bacchus, called Eunemon, who was one of the Argonauts. According to Plutarch, there were two females of the name of Ariadne; one of them was espoused to Bacchus in the island of Naxos, and became the mother of Staphylos; the other was abandoned by Theseus in the same island, where she died. Hence were derived the two kinds of fountains, called ARIADNEA. Ariadne's fountain in the isle of Naxos is now only a simple streamlet of water, to which, says Olivier, (*Travels in the Ottoman Empire*, t. ii. p. 110.) travellers would pay no attention, if they were not thus reminded of the spot where Ariadne abandoned herself to all the despair of a forsaken mistress, and from which she perceived the vessel which was transporting her lover from her. At the brink of this fountain, it is said, where she came every day to shed tears, Bacchus found her; and equally compassionating her misfortunes, and enamoured of her beauty, succeeded in consoling her, and in prevailing with her to forget an ungrateful man.

ARIADNE, in *Statuary*, a beautiful statue of Parian marble, which was for near three hundred years one of the greatest ornaments of the Belvidere; where it was placed

by pope Julius II. It is now in the museum at Paris. Ariadne is here represented sleeping upon the rocks of Naxos; where she had been ungratefully left by Theseus. The disorder of the drapery in which she is wrapped, beautifully points out the distraction and anguish of her mind before she fell asleep. On the upper part of her left arm is a bracelet in the form of a little serpent, which the ancients called Ophis; and which, by being taken for the representation of the asp, has occasioned this statue for a long time to be called Cleopatra.

ARIALDUNUM, in *Ancient Geography*, a town of Spain, under the jurisdiction of Corduba. Pliny.

ARJAN, a name given by a tribe of Tartars, called Barschkirians, to their favourite drink, which is a mixture of four milk and mead, and which they keep in an oblong bottle, suspended near the chimney of their hut.

ARIANA, in *Ancient Geography*. See ABRIA.

ARIANA, in *Geography*, formerly called Abderana, a village in Africa, in the province of Tunis Proper, and about three miles distant from the city of Tunis. It is inhabited by poor gardeners, who supply the city with fruit and herbs. At this place the Carthaginian aqueduct forms a curious object, being seventy-four feet high, and supported by columns sixteen feet square, beautifully cut; and near it are several matamores or subterraneous magazines for corn, strongly arched, and capable of holding a great number of bushels.

ARIANO, a town of Italy, and a bishop's see, in the kingdom of Naples, and Principato Ultra. According to Mr. Swinburne (*Travels in the Two Sicilies*, vol. i. p. 202.), it is an ugly city, built upon the uneven summit of a mountain, with an extensive prospect, but much exposed. He supposes that it is not so ancient as the time of the Romans; and that it owes its rise to the demolition of some neighbouring town, and to the advantage afforded by its situation for discovery and defence. After having several times changed its possessors, it became a part of the demesne of the crown in 1466. It has neither trade nor manufactures, and has declined ever since the desolation occasioned by an earthquake in 1456. The number of inhabitants is estimated about 14,000, and it includes twenty parishes and convents, besides an ill-endowed cathedral. The wine of Ariano is pale, and resembles, both in colour and the sharpness of its taste, red champagne. The soil in its vicinity lies upon a soft argillaceous stone: at a small distance to the east, is a bank consisting of layers of volcanic earth, interspersed with thick strata of oyster-shells. The last and most destructive earthquake experienced in this territory, was that of the year 1732. N. lat. 41° 8'. E. long. 15° 19'.

ARIANS, a denomination given to a class of the ancient inhabitants of the Russian empire, called by the Russians Votiaks from the river Votiak, on which they were formerly situated. They call themselves Ari, and their territory Arimz. Their chief town is Chlueof, and the other towns are Slobodskoi, Kaigorod, and Orlof. At first they were subject to the Bulgarians, and afterwards to the Tartars, from whose language they adopted many words into their own.

ARIANS, in *Ecclesiastical History*, followers of Arius, a presbyter of the church of Alexandria about the year 315; who owned Christ to be God, yet maintained him inferior to the Father even as to his deity, and his essence to be different from that of the Father, and that he was neither co-eternal nor co-equal with him; also that the Holy Ghost was not God.

The Arians owned that the Son was the word, but denied that word to have been eternal; asserting, that it had only been created before all other beings. They held, that

that Christ had nothing of man in him but the flesh, with which the *λογος*; or *word* was joined, which supplied the rest.

The distinguishing sentiments of Arius may be deduced from his own writings. In his letter to Eusebius, of Nicomedia, he says; "We cannot assent to those expressions, always Father, always Son, at the same time Father and Son: that the Son always co-exists with the Father: that the Father has no pre-existence before the Son, not so much as in thought, or a moment. But this we think and teach, that the Son is not unbegotten, nor a part of the unbegotten by any means. Nor is he made out of any pre-existent thing; but, by the will and pleasure of the Father, he existed before time and ages, the only begotten God, unchangeable; and that before he was begotten, or made, or designed, or founded, he was not.—But we are perfected, because we say, that the Son has a beginning, and that God has no beginning. For this we are persecuted, and because we say, the Son is out of nothing; which we therefore say, because he is not a part of God, nor made out of any pre-existent thing." In his letter to Alexander, bishop of Alexandria, he says; "We believe, that there are three persons, the Father, the Son, and the Holy Ghost. God, the cause of all things, is alone without beginning. The Son, begotten of the Father before time, made before the ages, and founded, was not before he was begotten. Nor is he eternal, or co-eternal, or begotten at the same time with the Father." The creed, which was presented by Arius at the council of Jerusalem in 335, was this: "We believe in one God, the Father Almighty; and in the Lord Jesus Christ his Son, begotten of him before all ages; God the word, by whom all things were made, which are in heaven and in earth; who came down and was incarnate, and suffered, and rose again, and ascended to the heavens, and shall come again to judge the living and the dead; and in the Holy Ghost; the resurrection of the flesh; the life of the world to come, and the kingdom of heaven; in one catholic church of God, extending itself from one end of the earth to the other." In short, the Arians seem to have believed, that Christ was the Word of God, and was in the beginning with God; but was not the self-existent God, with whom he was in the beginning; but his Son, created by the Father before all ages, one super-angelical and perfect Spirit; and thereby became his only Son, by whom he created all other beings: and that, when he came down from heaven to inhabit the body which was prepared for him in the womb of the blessed Virgin, this super-angelical spirit alone was the soul that informed and enlivened it. From the following abstract of the real opinions of the Arians, as they are given by Dr. Cave in the words of Arius, the reader may be enabled to compare them with those that have been deemed orthodox. First, as the Arians believed the divine substance of the Father to be unbegotten and without beginning, they concluded that it was different from the substance of the Son, who was begotten and had a beginning. But the Athanasians believed the Father and the Son to be of the same substance; that is, of the same *generical* substance, as two men are of the same substance; and the Pseudo Athanasians believe them to be of the same *numerical* substance. Secondly, as the Arians believed the divine substance of the Father to be indivisible and uncompounded, they could not believe the Son to be generated of or from it, in any *literal* sense, either as being compounded with it, or divided from it; and therefore they concluded, that the generation of the Son was *figurative*; and was not a participation of substance, but a creation, as the word creation is frequently used in Scripture with respect to mankind; and

they consumed this from Prov. viii. 22. And because they believed it blasphemous to say, that this generation was out of the indivisible substance of the Father, and no other substance than existed, they said, he subsists, not of or from the Father, but from nothing, and he is not of the Father's substance, for he is created and made. But the Athanasians believed, the Son was *literally* generated from the Father's substance. Thirdly, as the Arians believed the Father and the Son to be of a different substance, they believed them also to be distinct beings, separately existing; in which they agreed with some of the orthodox fathers, as Origen, Gregory Nyssen, Cyril of Alexandria, Maximus the Martyr, Damascen, Dionysius of Alexandria, Alexander of Alexandria, &c.: and differed from others who believed him to be of or from the Father's substance, as the leaves are from the tree; but not divided from it, as the Athanasians. Fourthly, they believed that Christ was the only begotten Son of God, because he only was created by the *immediate* act and power of God himself; and that all other beings, the Holy Ghost not excepted, were created by Christ; in which they agreed with Origen and Eusebius, men of as great character as any in the Christian church. And therefore they called him a creature; but not like other creatures. Fifthly, they believed, that the Son was generated or created before all ages; and was a real person, when spoken of, Prov. viii. 22.; and that his generation was over, as soon as he existed. Whereas some of the orthodox believed him to be only an attribute, when there spoken of; and that he was afterwards generated into a Son; and some of them believed him eternally generating, as light from the sun. Sixthly, they believed the divine being, who descended from heaven and was born of the virgin Mary, was the only intelligent spirit that animated the *body* of Christ; and that this divine being suffered: but the orthodox believed, that the divine being, that descended from heaven and animated the body of Christ, was incapable of suffering; and that it was only the *human* nature, or *soul* of Christ that suffered; i. e. a mere man. Seventhly, as the Arians believed Christ to be the Son of the only true God, and not the only true God and Father of that Son, it was very consistent with their belief to say, "He is not the true God." But if it be imagined, that by this expression they meant to deny, that Christ was truly God the Son, the express words of Eunomius, who calls him, "The only begotten God, the first-born of the whole creation, Christ, true God, not unbegotten;" prove the contrary: and Arius himself explains his meaning sufficiently, when he says, "He is not the true (self-existent and unoriginate) God, but receives his divinity by communication; which was also the opinion of Origen, Eusebius, and Lactantius. It has been commonly asserted, that Arius denied the *eternity* and *divinity* of the Son of God: but the author of "The Apology of Ben Mordecai," p. 98. says, that this assertion never appeared to him to have been made upon good authority; for he never denied the *eternity* of the Son in any other sense than that in which it is denied by the orthodox, and signifies unoriginate and unbegotten; that is, self-existent: and that the charge against him of his not believing the *divinity* of Christ is not founded, appears from this circumstance; that his adversaries accused him of idolatry, because he worshipped the Son of God; supposing him at the same time to be a God created before all ages. Now if he was idolatrous in believing Christ to be a created God, it is impossible he should at the same time be guilty of denying his divinity. Besides, Theodoret says, it was the opinion of Arius and Eunomius, that Christ took a body; but the godhead or divinity performed the office of a soul: and Athanasius says, Arius taught that Christ had the flesh as a covering to the divinity or godhead.

Never

Nevertheless, Athanasius's enmity to Arianism is well known. He speaks of it as the worst of all heresies, and says, the devil was the father of it; nor will he by any means allow, that Arians can be rightfully called Christians. However, in declaiming against Arianism, as the worst and most hateful of all heresies, he makes this its peculiarity, that the Arians endeavoured to carry their point by externals, that is, civil authority, or the power of the magistrates. And on account of the violent methods to which they recurred, he says, that this sect, or heresy, had put on the devil complete.

The rise of the Arian controversy is referred by some to the year 316, by others to 319, by Baronius to 315, and by Basnage and others to the year 317. Socrates (Ecl. Hist. l. i. c. 5.) gives this account of its origin. "Alexander," he says, "discouring one day too curiously concerning the doctrine of the Trinity in Unity, in the presence of his presbyters and the rest of his clergy, Arius, one of the presbyters, supposed his bishop to advance the doctrine of Sabellius, and disliking that, he went into an opinion directly opposite." Theodoret also says (Ecl. Hist. l. iv. c. 1.) that Arius took occasion, from things said by Alexander, to raise a disturbance; and Constantine likewise, in his letter to Alexander and Arius, first blames the former for putting questions to his presbyters, which he ought not; and then the latter, for inconsiderately uttering notions that ought to have been buried in silence. Accordingly, it seems to have been the chief view of the Arians, as well as of the orthodox, to steer a kind of middle course between Sabellianism and Socinianism. To which purpose, the Arians maintain, against the Sabellians, that the Son of God is a being distinct and different from the Father, and not a mere virtue, or character, or mode of existence; and against the Socinians, as well as the Nestorians and Sabellians, that Christ was not a mere man, but a true God.

After Arius had for some time published the doctrines that are ascribed to him, Alexander was blamed for his indifference, and for his toleration of such novelties. Roused by reproaches and complaints, he appointed a time for hearing the subjects in dispute fairly debated between Arius and those who opposed him. Arius adhered to the opinions he had advanced; and they who opposed him asserted the Son to be consubstantial and co-eternal with the Father. And though another assembly was appointed for debating the points in agitation, they could by no means come to an agreement. Alexander himself is said to have been at first in some suspense; but at length he declared himself in favour of those who were the antagonists of Arius.

The Arians were first condemned and anathematized by a council at Alexandria, consisting of 100 bishops, in 320, under Alexander, bishop of that city; who accused Arius of impiety, and caused him and several ecclesiastics, of whom two were bishops, to be expelled from the communion of the church: and afterwards by 318 fathers in the general council of Nice, assembled by Constantine in the year 325. In the interval between these councils, Alexander had written a circular letter to all bishops, in which he represents Arius and his partisans as heretics, apostates, blasphemers, enemies of God, full of impudence and impiety, forerunners of antichrist, imitators of Judas and of men whom it was not lawful to salute, or to bid God speed. Yet Sozomen (l. i. c. 15.) acknowledges, that they were learned, and, in all appearance, good men. Eusebius of Nicomedia, and Eusebius the historian, endeavoured to pacify Alexander, and to persuade him to compromise the quarrel; and Constantine sent a letter, about the year 324, by Hosius of Corduba, addressed to Alexander and Arius,

in which he reproved them both for disturbing the church with their insignificant disputes, and exhorted them to mutual forbearance and forgiveness. But the dispute was not to be thus terminated; and Socrates represents the parties on both sides as equally contentious and refractory. Accordingly the Nicene council was summoned. At this council Eusebius proposed a creed, in which he avoided the offensive word *ὁμοούσιος*, *homoousios*, and anathematized every impious heresy, without specifying any; but his advice was not followed, the term was inserted, and the Arian doctrines were anathematized. But notwithstanding these measures, Arianism was not extinguished; on the contrary, it became the reigning religion, especially in the East, where it obtained much more than in the West. Arius was recalled from banishment by the emperor Constantine, in two or three years after the council of Nice, as some say in 327 or 328, or according to others in 330; and the laws that had been enacted against him were repealed. In the year 335, Athanasius, his zealous opponent, was deposed and banished into Gaul, by the council held at Tyre; and Arius and his followers were reinstated in their privileges, and received into the communion of the church: in little more than a year after this, he fell a victim to the resentment of his enemies, and died a tragical death, occasioned probably by poison, or some other violence. The Arian party found a protector in Constantius, who succeeded his father in the empire of the East; and the zeal with which he abetted them, produced many animosities and tumults to the time of his death, in the year 360. They underwent various revolutions, persecuting and oppressed, under succeeding emperors, according to the degree of interest they had in the civil power; till, at length, Theodosius the Great exerted every possible effort to suppress and disperse them. He drove them from their churches, enacted laws whose severity exposed them to the greatest calamities, and rendered, throughout his dominions, the decrees of the council of Nice triumphant over all opposition; so that the public profession of the Arian doctrine was confined to the barbarous and unconquered nations, such as the Burgundians, Goths, and Vandals.

The Arians were divided into various sects, of which ancient writers give an account, under the names of *Semi-Arians*, *Eusebians*, *Actians*, *Eunomians*, *Acacians*, *Pfathyrians*, and others. But they have been commonly distributed into three classes, viz. the genuine *Arians*, *Semi-Arians*, and *Eunomians*. The Arian cause suffered as much from the discord and animosity that prevailed among these sects, as from the laboured and zealous efforts of the orthodox party.

Arianism was carried in the fifth century into Africa, under the Vandals; and into Asia, under the Goths. Among those fierce and savage nations, which were overturning the Western empire, it found a fixed residence, and a peaceful retreat. As their security animated their courage, they treated the Catholics with the same violence which the latter had employed against them and other heretics; and they persecuted and vexed in various ways such as professed their adherence to the Nicene doctrines. The Vandals, who reigned in Africa, surpassed all the other savage nations in barbarity and injustice towards the Catholics. The kings of this fierce people, particularly Genseric and Hunneric his son, demolished the churches of those Christians who acknowledged the divinity of Christ, sent their bishops into exile, and maimed and tormented in various ways such as were firm and inflexible in the profession of their faith. During these persecutions in Africa, a stupendous miracle is said to have been wrought, by which the Supreme Being is supposed to have testified his displeasure

against the Arians, and his favour to their adversaries. This miracle consisted in enabling these Catholics, whose tongues had been cut out by the Arian tyrant Hunneric, to speak distinctly, and to proclaim aloud the divine majesty of the Saviour of the world. This remarkable fact, says Moheim, can scarcely be denied, since it is supported by the testimony of the most credible and respectable witnesses; but whether it is to be attributed to a supernatural and miraculous power is a matter not so easily decided, and which admits of much dispute. The reality of this extraordinary fact is attested by Victor, an African bishop; Eneas of Gaza, a platonic philosopher; a perpetual edict of the emperor Justinian; count Marcellinus in his Chronicle of the times; and pope Gregory the first, who had resided at Constantinople as the minister of the Roman pontiff. Among the moderns who have defended its miraculous nature, we may mention Abbadic, Berri-man, Chapman, and Dodwell; and we may refer to Mr. Middleton's "free Inquiry into the miraculous powers," &c. in his "Miscellaneous works," vol. i. p. 149, &c.; and to Mr. Toll's Defence, p. 80, &c. for arguments against it. The learned historian, Mr. Gibbon, observes in his usual manner, (Hist. of the Decline, &c. of the Roman empire, vol. vi. p. 295.), that "this supernatural gift of the African confessors, who spoke without tongues, will command the assent of those, and of those only, who already believe, that their language was pure and orthodox; but the stubborn mind of an infidel is guarded by secret, incurable suspicion; and the Arian, or Socinian, who has seriously rejected the doctrine of the Trinity, will not be shaken by the most plausible evidence of an Athanasian miracle." Italy, the Gauls, and Spain, were also deeply infected with Arianism; and towards the commencement of the sixth century, it was triumphant in many parts of Asia, Africa, and Europe. Many of the Asiatic bishops favoured the Arians secretly, while their opinions were openly professed, and their cause maintained by the Vandals in Africa, the Goths in Italy, the Spaniards, the Burgundians, the Suevi, and the greatest part of the Gauls. The Greeks, indeed, who had received the decrees of the council of Nice, persecuted and oppressed the Arians, wherever their influence and authority could reach; but the Nicenians, in their turn, were not less rigorously treated by their adversaries, particularly in Africa and Italy, where they felt, in a very severe manner, the weight of the Arian power, and the bitterness of their resentment. The triumphs of Arianism were, however, but transitory; and its prosperous days were entirely eclipsed, when the Vandals were driven out of Africa, and the Goths out of Italy, by the arms of Justinian; for the other Arian princes were easily induced to abandon themselves the doctrine of that sect; and not only so, but to employ the force of laws and the authority of councils to prevent its farther progress among their subjects, and to extirpate it entirely out of their dominions. Such was the conduct of Sigismund, king of the Burgundians; Theodemir, king of the Suevi, who had settled in Lusitania; and Reccared, king of Spain. However, it revived again in Italy, under the protection of the Lombards, in the seventh century.

Erasmus seems to have aimed, in some measure, to restore Arianism, at the beginning of the sixteenth century, in his commentaries on the New Testament: accordingly, he was reproached by his adversaries with Arian interpretations and glosses, Arian tenets, &c. To which he made little answer, save that there was no heresy more thoroughly extinct than that of the Arians: "*Nulla heresis magis extincta quam Arianorum.*" But the face of things was soon changed: Servetus, a Spaniard by nation, published, in 1531, a little treatise against the Trinity: which once more excited at-

ention to the sentiments of the Arians in the West — Indeed he rather showed himself a Photinian than an Arian; only that he made use of the same passages of scripture, and the same arguments against the divinity of our Saviour, with the proper Arians.

It is true Servetus had not, properly speaking, any disciples; but he gave occasion, after his death, to the forming of a new system of Arianism in Geneva, which did not a little please Calvin.—From Geneva, the new Arians removed to Poland, where they gained considerable ground; but at length became Socinians.

The appellation Arian has been indiscriminately applied, in more modern times, to all those who consider Jesus Christ as inferior and subordinate to the Father: and whose sentiments cannot be supposed to coincide exactly with those of the ancient Arians. Whilst they all concur in maintaining the pre-existence of Christ as a super-angelic spirit, which supplied the place of a soul to him upon his conception and birth, and also his derivation from and subordination to the Father; some of them ascribe to him a higher degree, rank, and dignity, than others. Accordingly they have been sometimes distinguished into High and Low Arians. The former, approaching in opinion to those that have been called Semi-Arians, or rather to the ancient Arians, whilst they believe the Father to be the one supreme God over all, absolutely eternal, underived, unchangeable, and independent; conceive the Son to be the first derived being from the Father, and under him employed in creating, and also in preserving and upholding the World, and in exercising a moral, as well as natural, administration over mankind; so that, under this distinguishing character, he is invested with the office of final judge. Of these high Arians, some suppose, that Jesus Christ, sustaining relations, and exercising offices so honourable in themselves and so interesting to mankind, is a proper object of subordinate worship; whilst others imagine, that worship in the proper and discriminating sense of the term, belongs only to the Father, the self-existent, infinite, and supreme deity. Some Arians of this class have maintained, that the son of God, before his incarnation, had only, or chiefly, the care and government of the Jewish people allotted to him; whilst other angels were appointed presidents or princes of other nations and countries. This was the opinion of Mr. James Peirce, an ingenious and learned commentator: see his "Paraphrase and notes, &c. on Coloss. ii. 15. and Heb. ii. 9." Others have also maintained, that the conduct of all the dispensations of Providence, in every period of time, as they related to the patriarchs, to the Jewish nation, to the prophets, to Christians, and to the world in general, has been entrusted to Christ; and that he was distinguished by various appropriate titles, as Jehovah, the angel of the covenant, the angel Jehovah, the angel of the presence, and the Logos, &c. To this purpose they allege, among other arguments, the declaration of the Apostle (Heb. i. 2. xi. 3.) that it was by Christ, God made the worlds, *αἰῶνας*, the ages or dispensations; i. e. by whom God formerly disposed and ordered those eminent and remarkable periods of time; the Antediluvian, the Patriarchal, the Mosaic, and the Present; being put under his government, according to the will of the Father. See Ben Mordecai's Apology, letter ii. passim. It is also alleged as a further presumption in favour of this hypothesis, that the sacred writings contain a revelation and history of the administration of Providence with regard merely to the inhabitants and concerns of our world, or of the terrestrial globe; and, of course, that the subordinate direction and superintendence of this part of the government of the supreme and infinite sovereign of this, and innumerable other worlds,

worlds, is entrusted with Jesus Christ; a superior being adapted, by his pre-existent dignity, and extraordinary perfections and powers, to the office of ruler and judge. The low Arians, on the other hand, are distinguished from the Socinians in no other respect, besides their maintaining the pre-existence, prior dignity, and transcendent native perfections of that super-angelic spirit, which was united to the body of Christ, in his miraculous incarnation: but that he is entitled to no kind of religious worship, in the peculiar and appropriate meaning of this term. Arians of both descriptions claim the appellation of Unitarians, though they do not adopt the dogma of the simple humanity of Christ, of late exclusively maintained by some modern Unitarians.

Mr. Whiston was one of the first divines who revived the Arian controversy, in the beginning of the eighteenth century. About the year 1706 he began to entertain some doubts about the proper eternity and omniscience of Christ. This led him to review the popular doctrine of the Trinity; and in order to execute this review, with a degree of diligence and circumspection suitable to its importance, he read the New Testament twice over, and also all the genuine monuments of the Christian religion, till near the conclusion of the second century. By this inquiry, he was led to think, that, at the incarnation of Christ, the Logos, or eternal wisdom, supplied the place of the rational soul, or *πνεύμα*; that the eternity of the son of God was not a real *distinct* existence, as of a son properly *co-eternal* with his father, by a true eternal generation, but rather a metaphysical existence *in potentia*, or in some sublimer manner in the father, as his wisdom or word; that Christ's real *creation*, or *generation* (for both these terms are used by the earliest writers), took place some time before the creation of the world; that the council of Nice itself established no other eternity of Christ; and finally, that the Arian doctrine in these points was the original doctrine of Christ himself, of his holy apostles, and of the most primitive Christians. Mr. Whiston was confirmed in these sentiments by reading Novatian's treatise concerning the Trinity; but more especially by the perusal of the "Apostolical Constitutions," the antiquity and authenticity of which he endeavoured, with more zeal than precision and prudence, to prove, in the third part of his "Primitive Christianity." The consequence to himself was, his removal from his theological and pastoral functions, and also from his mathematical professorship at Cambridge; "as if Arianism," says the translator of Mosheim, "had extended its baneful influence even to the science of lines, angles, and surfaces." Whiston was followed by Dr. Clarke, who published his famous book; intitled, "The Scripture Doctrine of the Trinity," &c. in consequence of which, he was reproached with the title of *Semi-Arian*. See SEMI-ARIANS. He was also threatened by the convocation, and combated by argument. Dr. Waterland, who has been charged with verging towards *Tritheism*, was one of his principal adversaries. The history of this controversy, during the last century, may be found in a pamphlet, intitled, "An Account of all the considerable Books and Pamphlets that have been wrote on either Side, in the Controversy concerning the Trinity, from the year 1712; in which is also contained an Account of the Pamphlets written this last Year, on each Side, by the Dissenters to the end of the year 1719;" published at London, 1720. The more recent treatises on the subject of the Trinity are well known to our theological readers. See TRINITY. Mosheim's *Ecl. Hist.* Lardner's Works. Ben Mordecai's Apology, Letter I. Jortin's Rem. on *Ecl. Hist.* vol. i.

ARIANISM, the doctrine of Arius, who lived in the beginning of the fourth century. See ARIANS.

ARIARATHIA, or ARIARATHERA, in *Ancient Geography*, a town of Asia, in Cappadocia. Steph. Byz.

ARIAS, or ARIUS, a river of Aria.

ARIAS *Montanus*, in *Biography*, a learned Benedictine monk of the sixteenth century, was born at Seville, of a noble but reduced family. Having completed his education at Alcalá, where, besides the study of theology, he made himself master of the Latin and Greek languages, and also of Hebrew, Arabic, Syriac, and Chaldee; he travelled through France, Germany, Italy, the Netherlands, and England, for the purpose of acquiring an acquaintance with the modern languages. Upon his return he took priest's orders, and then accompanied the bishop of Segovia to the council of Trent, where he obtained great reputation. He afterwards retired to Aracena, a pleasant spot near the mountains of Andalusia, to prosecute his literary labours. From this retreat he was summoned by Philip II. and entrusted with the care of a new edition of the *Polyglot Bible*, which he much enlarged and improved. The execution of this work contributed so much to his reputation, that he became the object of envy; and he was under the necessity of taking a journey to Rome, to vindicate himself from the censure of those who reproached him with having too closely followed the explanations of the Jewish Rabbis. As soon as he returned to Spain, Philip offered him a bishoprick, as a recompence for his labours; but this he declined accepting, and contented himself with a pension of two thousand ducats, and the office of chaplain to the king. He died at Seville in 1598, at the age of seventy-one years. His mode of living was singularly abstemious, as he drank no wine, and seldom tasted animal food. He was indefatigable in his studies; and was regarded as one of the first literary characters in Spain. His writings, which are numerous, bear evident marks of sound sense, as well as profound erudition. Besides his "Dissertations on Jewish Antiquities," prefixed to the Polyglot, printed in the "Critici Sacri," and published separately, in 4to. at Leyden in 1596; he has left in Latin, "Commentaries on several parts of Scripture," published at Antwerp, at different periods, between the years 1583 and 1599; a "History of Mankind," in 1593; "A Treatise on the History of Nature," in 1601; "A Version of the Psalms and Ecclesiastes," in Latin verse, in 4to. 1574, with other poetical pieces; and a translation of Jonathan's Chaldee paraphrase of Hosea, and of the Itinerary of Benjamin of Tudela. Dupin. *Nouv. Dict. Histor.*

ARIASPE, or AGRIASPE, in *Ancient Geography*, a town of Asia, in Drangiana, the *Bergasse* of major Rennell's map, seated on the river Heermund, in the province of Segistan or Scistan. N. lat. 32° 15'. E. long. 63° 46'.

ARIASSOR, or ARIASSUS, a city of Pamphylia, which was a bishop's see. Ptolemy.

ARICA, in *Geography*, a jurisdiction in the bishoprick of Arequipa in Peru, extending along the coast of the South sea. It produces little else than Agi or Guinea pepper, and in some places large olives, of which they make oil and pickles.

ARICA, a sea-port town of South America, in the province of Los Charcas in Peru. It is the port-town to most of the mines in that country; and it is the only place in this part of the coast which admits a landing. It was formerly strong and populous, and carried on a great trade, as the harbour is good and convenient for shipping. The immense booty taken here by sir Francis Drake in 1579, contributed to the decline of the opulence and trade of Arica. At that time most of the silver of Potosi was shipped in this port for

Lima; but since that period, the Spaniards have chiefly sent it by land, as the most secure, though most difficult mode of conveyance. It also suffered much by an earthquake in 1605. As they have little or no rain in this place, their houses are built without roofs. The valley of Arica is principally famous for the culture of Guinea pepper, which the Spaniards planted here, of which they raise annually to the value of eighty thousand crowns. This port is still much frequented, not merely on account of the mines, to which it affords an easy access, but for the rock-salt which is dug out of the adjacent mountains, and shipped for the western coast. S. lat. 18° 27'. W. long. 71° 5'.

ARICADA, in *Ancient Geography*, a town of Asia, in Diangiana. Ptolemy.

ARICARETS, in *Geography*, a nation of South America, in Guiana, on the banks of a river called Aricari.

ARICHAU, a town in the island of Cape Breton.

ARICHI, in *Ancient Geography*, a people of Asiatic Sarmatia, among the Mæota, near the Palus Mæotis. Ptol.

ARICIA, a town of Italy, in Latium, near the Alban mount, on the Appian way, about twenty miles from Rome. This city existed before the establishment of the Greeks and Latins in Italy; and the inhabitants of it were often distinguished among the enemies of Rome in its nascent state. Cicero speaks of it as a municipal town; and Frontinus, ranking it in the number of colonies, says, that its walls were erected by the orders of Sylla. Near it was the "Nemus Aricinum," or grove of Diana, who hence obtained the epithet of "Aricina." Here she had a temple frequented by her votaries, who travelled to it on foot from Rome, with flaming torches, and crowns on their heads.

ARICONIUM is placed, in Antonine's Itinerary, near Rofs, about eleven miles from Caerleon: our other antiquaries place it at Kenchester. It was a town of the Silures.

ARICOURIS, in *Geography*, a people of South America, in Guiana, towards the river of the Amazons. De Laet says, they manifest no signs of religion, but seem to respect the sun and moon, without paying them any worship; and yet they appear to believe the immortality of the soul, as they point to the heavens, as, after death, the abode of those who have lived well. They are timid, suspicious, and inclined to revenge. They are addicted to forcery, and consult soothsayers, who, as they think, are inspired by a demon called "Watipa," and thus enabled to foretel future events. Their eyes and hair are black, and they have no covering; but the men envelope themselves all over in a kind of gummy dye, to preserve their bodies from the heat of the sun, and the women paint themselves with it more slightly, and in a variety of figures.

ARIDANA, a town of Arabia, ten miles south of Mecca.

ARIDAS, a kind of tapestry, manufactured in the East Indies, from a shining thread obtained from certain herbs; and hence called "Aridas of herbs."

ARIDED, in *Astronomy*, a fixed star of the second magnitude, in the extremity of the Swan's tail. It is also called Hierezim, Adigege, and Arided.

ARIDELOSIS, ἀριδελωσις, in *Rhetoric*, is sometimes used for the figure commonly called ΣΥΝΟΝΥΜΙΑ.

ARIDSONG, in *Geography*, a town of Asia, in the country of Thibet, one hundred and fifty-two miles north of Carmandu. N. lat. 30° 40'. E. long. 84° 45'.

ARIDULLAN, in *Natural History*, the name of a file substance, used in the East Indies in intermittent fevers. It is of a greenish yellow colour, and coarse texture, and when burnt, emits fumes smelling like arsenic. It is properly of the ZARNIC kind, though somewhat different from all the European kinds.

ARIDURA, in *Physic*, a dryness, or want of juice and moisture of the parts. Hence it is also used by some for an aridity or consumption: and it is more particularly used to denote a hectic fever. The term is more frequently used by *Modern Writers*, to denote a particular atrophy, or wasting of some single member of the body: in which sense, it amounts to the same with what we otherwise call WITHERING.

ARIEN, in *Geography*, a small island in the Adriatic, near the coast of Italy, three leagues north of Venice.

ARIENZO, a town of Italy, in the kingdom of Naples, and country of Lavoro, fourteen miles north-east of Naples. Its situation is low, but delightful, and it is surrounded with vineyards and gardens. It now belongs to Caraffa, duke of Madaloni.

ARIES, or the *Ram*, in *Astronomy*, a northern constellation, the first of the twelve signs of the zodiac; from which also a twelfth part of the ecliptic takes its denomination, and into which the sun enters about the twentieth of March. The stars in this constellation, in Ptolemy's catalogue, are 18; in Tycho's, 21; in Hevelius's, 27; in the Britannic catalogue, 66; but they are most of them very small, one only being of the second magnitude, two of the third, and all the rest smaller.

ARIES, in *Artillery*, denotes a battering-ram, or a military engine with an iron head, much in use among the ancients, to batter and beat down the walls of places besieged.

Of this there were three kinds; the first rude and plain; the others artificial and compound.

The first seems to have been no more than a great beam, which the soldiers bore in their arms, and with one end of it, by main force, assailed the walls. This required a great force to work it; yet produced but a small effect.

The second or compound ram is described by Josephus (De Excid. Hierosol. 3.) thus: "The ram is a vast long beam, like the mast of a ship, strengthened at one end with a head of iron, somewhat resembling that of a ram, whence it took its name. This is hung by the middle, with ropes, to another beam which lies across two posts; and hanging thus equally balanced, is by a great number of men violently thrust forward, and recoiled backward, and so shakes the wall with its iron head, nor is there any tower or wall so thick or strong, as to resist the repeated assaults of this forcible machine."

The third only differed from the former, in that it was covered with a *χιτων*, or screen, to guard the soldiers; whence it was called *testudo arietaria*.

Mr. Felibien describes a fourth sort of battering-ram, which ran on wheels; and was the most perfect and effectual of them all. Vitruvius affirms, that the battering-ram was first invented by the Carthaginians, while they laid siege to Cadiz: theirs was the simple kind first mentioned. Pephasthenos, a Tyrian, afterwards contrived to suspend it with ropes; and finally, Polydus, the Thessalian, to mount it on wheels, at the siege of Byzantium under Philip of Macedon. Yet Pliny assures us, that the ram was invented at the siege of Troy; and it was this that gave occasion to the fable of a wooden horse. The invention has been ascribed by some to Artemorus, a Greek architect, who flourished 441 years before Christ. Some have supposed, that the walls of Jericho, mentioned in the book of Joshua, were beaten down by this instrument; the ram's horns by which they were overthrown being no other than the horns of the battering ram.

Plutarch tells us, that Marc Antony, in the Parthian war, used a ram of 80 feet long; and Vitruvius assures us,

they were sometimes made 106, and sometimes 120 feet long; to this great length perhaps the force of the engine was in great measure owing.

The ram was managed at once by a whole century of soldiers; so that it played continually and without intermission; being usually covered with a *vinca*, to protect it from the attempts of the enemy.

The battering ram is represented in *Plate I. Artillery*, *fig. 1.* This ram AB is suspended by a rope *x* to the cross beam *y*, at the top of the frame CD. Its head A is fastened to a large beam by three or four bands of iron four feet broad. At the extremity of each of these bands *a* was a chain *b* also of iron, fastened by one end to a hook *c*; and at the other extremity of each of these chains was a cable firmly bound to the last link. These cables extended through the whole length of the beam to the end of the ram B, where they were bound firmly together with small ropes. To the end of these cables was fixed another, composed of several strong cords plaited together for some length, and then running single. At each of these several men were placed to balance and work the machine. The unsuspended ram differed from this only in the manner of working it: instead of being slung by a chain or cable, it moved on small wheels, on another large beam.

These battering-rams, by their own weight, and by the action of the men who impelled them, excited a force which in some cases exceeded the utmost effect of our battering cannon. Dr Defaguliers (*Lectures*, vol. i. p. 65.) has demonstrated that the momentum of a battering-ram, twenty-eight inches in diameter, one hundred and eighty feet long, with a head of cast iron of one and a half ton, the whole ram weighing with its iron hoops, 41,112 pounds, and moved by the united strength of 1000 men, would only be equal to that of a ball of thirty-six pounds weight shot point blank from a cannon. Mr. Attwood, comparing the effect of the battering-ram, having its metal extremity equal to a twenty-four pounder, with a cannon ball of twenty-four pounds weight, observes, that in order to their producing the same effect in penetrating a wall or making a breach in it, the weight of the ram must exceed that of the cannon ball in the proportion of the square of 1700, the velocity of the ball, to the square of the velocity with which the battering-ram could be made to impinge against the wall expressed in feet. Estimating this at ten feet in a second, the proportion of the weights will be that of about 2,890,000 to 100, or 28,900 to 1; and therefore the weight of the battering-ram must be 346 ton. In this case, the battering-ram and the cannon ball, moving with the velocities of 10 and 1700 feet in a second, would have the same effect in penetrating any obstacle; but, as the weight of the ram was probably never so great as the above supposition states it to have been, the force of a cannon ball to make a breach in walls must exceed that of the ancient aries: but the momentum of this, or the impetus by which it communicated a shock to the whole building, was far greater than the utmost force of cannon balls; for if the weight of the battering-ram were no more than 170 times greater than that of a cannon ball, each moving with its respective velocity, the momenta or forces of both would be equal; but as the weight of these ancient machines was certainly much greater than 170 times that of our heaviest cannon balls, their momentum or impetus to shake or overturn walls and demolish buildings, was much superior to that which is exerted by the modern artillery. And since the strength of fortifications will in general be proportioned to the means which are used for their demolition, the military walls of the moderns have been constructed with less attention to their solidity and

massy weight than the ancients thought to be a necessary defence against the aries; that sort of cohesive firmness of texture which resists the penetration of bodies being now more necessary than in ancient times. Nevertheless it is manifest, that even now solidity or weight in fortifications is also of material consequence to the effectual construction of a wall or battery.

The ram was frequently used in the fourteenth century. Sir Christopher Wren employed it in demolishing the walls of the old church of St. Paul's previously to his rebuilding it; and found no machine so well adapted to this purpose. See CATAPULTA.

ARIES, in *Entomology*, a species of SCARABÆUS, a native of the Cape of Good Hope. The thorax is roundish, and the head armed with a very short subulate horn. Fabricius. Gmelin.

ARIES, in *Zoology*, the Linnæan and Gmelinian specific appellation of the common sheep, or kind of OVIS, with compressed lunated horns, "cornibus compressis lunatis," Faun. Suec. Syst. Nat. &c.; ovis domestica, of Ray; pecus, aries, ovis, verrex, agnus, of Plin. Aldr. Jonst. &c.; brebis et belier, of Buff.; schaaf, wedder, hammel, lamb, of Gefn. Thierb.; and ram or common sheep, of Penn. Briff. thus defines this species: "aries laniger, cauda rotunda brevi." Dr Shaw observes, in his *Zoology*, that the most prominent characters are: that the horns twist spirally outwards; that the tail is round and short; and that the body is covered with wool; but these characters, he remarks, are so greatly varied in different races, that it is hardly possible to fix on an absolute distinctive mark which shall apply to all the varieties.

Pallas, whose extensive travels through the Russian empire, and especially Siberia and Great Tartary, enabled him to make many important observations on these useful animals, found what he regarded only one species subdivided into four varieties, distinguished by their tails, the form of their heads, their ears, and fleece; and hence he condemns as unfounded and fanciful the idea of making specific differences of the accidental varieties, which he imagines the education or mode of life, the climate, food, and crossing of the breed have produced in sheep, as in other animals; and in conformity with this opinion, he considers not only those varieties found in Europe, but also those of other quarters of the globe, as only accidental varieties of the same species; an opinion in which he appears confirmed by finding that they produce a prolific race, though the breed be ever so crossed; and which he thinks would not be the case were they different species. Some preceding naturalists evidently entertain very opposite sentiments on this subject; but whether we are to regard the several apparently distinct kinds of the sheep as so many species, or as varieties originating from one parent flock only, it is desirable, nay highly requisite, to draw some line of discrimination between the more remarkable, or, if the expression may be allowed, more permanent varieties, by which they may be ascertained. This is confessedly a matter of the utmost difficulty. Linnæus has, we think, devised the best mode in which it can be accomplished without exciting the prejudices of naturalists, or clashing with their opinions; and Gmelin has certainly improved upon it. A name and character are assigned to each variety, so far as it is deemed practicable to define them; and by arranging them still as varieties only of the common species *Aries*, the reader is at liberty to form those conclusions he may think proper. The varieties enumerated by Gmelin amount to ten that are very distinct, and are arranged in the following order.

1. *Anglica. a.*—Ovis anglicana. Amoen. Acad. 4. p. 174.
Hornless

Hornless sheep of Pennant. In Lincolnshire, and other counties in England, and also in many other parts of Europe, the hornless breeds of sheep are reared in great numbers. Independently of this kind being destitute of horns, the tail and scrotum hang down as low as the knees; and by these characters it may be distinguished.

2. *Ruffica*. β .—*Ovis ruffica*. Amoen. Acad. 4. 174. This is the variety which Pallas calls *ovis brachyura* and *ovis ruffica*; it inhabits Russia, and is called the Russian sheep by the natives. According to Gmelin, this kind is horned; has a short tail; and is covered with short coarse wool. Dr. Pallas acquaints us that it is not only reared throughout all the northern parts of Russia, but likewise by the Fins and other neighbouring nations; and that some of this kind have been transported into Siberia, where they have supported themselves on some pastures, though in poor condition. In the southern countries they are, however, in less estimation than the long-tailed and fat-tailed kinds, which are much superior to them in size, fat, and flavour; but the ewe of the former will couple readily with the ram of the fat-tailed variety, and produce an animal larger and more noble than its mother, with a tail swelled at the base with fat, and meagre towards the end. This short-tailed kind bears some resemblance to the sheep of Iceland, especially in size, tail, and coarseness of the fleece; yet it differs from that breed in one essential particular, the horns, which are much smaller in proportion. The Tscherkessian sheep, we are told, resembles it also in the form of the head, straight erect ears, and thickness of the fleece; but in texture the fleece is very different, being fine in the Tscherkessian kind, and in the other as coarse as dog's hair; and the short-tailed kind is uniformly distinguished by the tail being about a quarter of a yard shorter than the other variety.

3. *Hispanica*. γ .—*Ovis hispanica*. Amoen. Acad. 4. 174. Spanish sheep. The spires of the horns are extended horizontally, and the wool is remarkably fine and plentiful on the animals of this breed. It is said to be peculiar to Spain.

4. *Polycerata*. δ .—*Ovis polycerata*. Amoen. Acad. 4. 174. *Ovis sexcornis* et *tricornis*. Aldr. *Brebis a plusieurs cornes*, *Belier d'Islande*. *Brebis d'Islande*. Buff. *O. e. Gotlandia* Pall.; and many horned sheep of Pennant. This kind is distinguished by having more than two horns; how far we are authorized to admit it as a definitive, rather than an accidental variety, is doubtful. In a supplement to the article sheep in the work of Buffon, the count inserts a few observations on the drawings of two Walachian sheep, a ram and ewe, which were sent him by Mr. Collinson, one of the members of the Royal Society of London at that time, in the course of which this animal is mentioned; and from thence we should rather conclude the variety is accidental. "The rams, ewes, and wedders of Iceland," says that writer, "differ chiefly from ours in having larger and thicker horns. Some of them have three, four, or five horns; but this peculiarity of having more horns than two must not be considered as common to the whole race of Iceland sheep; for in a flock of four or five hundred, hardly three or four wedders can be found with four or five horns; and when these occur, they are sent to Copenhagen as rarities. As a farther proof of their being scarce, they give a higher price in Iceland for this than for the common kind." Dr. Pallas speaks of an accidental variety of the Kirguise ram with five horns, and of another with four horns disposed with great symmetry. Dr. Shaw describes the many-horned sheep as a distinct variety. He observes that it occurs in the northern parts of Europe more frequently than in other regions, and that it is said to be most common in Iceland.

The horns are either three, four, or five in number; sometimes placed with great regularity, and sometimes differing in proportion and situation. A four-horned variety, with very long hairs hanging from the head, is also found in some parts of Europe: the two largest horns in this kind are straight and nearly upright on the top of the forehead, the smaller pair are seated on each side of the head, and turn downwards. Gen. Zool.

5. *Africana*. ϵ .—*Ovis Africana*. Amoen. Acad. 4. p. 173. *Aries pilosus*, *pilis brevibus v. silitus*, Briff. *Ovis Africana*, *pro vellere lanoso pilis brevibus hirtis vellita*, Sloane; *Ovis aethiopica*, Charlet.; and *ovis pilis brevibus*, Gmel. The African sheep covered with short hair instead of wool. *Ovis*. The African sheep of Mr. Pennant and Dr. Shaw is the following species.

6. *Guineensis*. ζ .—*Auribus pendulis*, *paleareibus laxis pilosis occipite prominente*, Linn.; *aries (ovis guineensis) pilosus*, *pilis brevibus vellitus*, *juba longissima*, *auriculis longis pendulis*, Briff.; *aries guineensis f. angolensis*, Mareg.; *Ovis guineensis f. angolensis* Maregravii, Raj.; *moutons*, Adanf.; *moutons de Guinée*, Des Marches; *belier de Senegal*, *belier des Indes*, *autre belier des Indes*, et *brebis des Indes*, Buff.; *sheep of Sahara*, Shaw, it.; *African sheep*, Penn.; *African sheep*, Shaw's Zool.; *Guinea sheep*, Linnæus, in the twelfth edition of the *Sytlema Naturæ*, considered this animal as a distinct species, and assigned it the character above mentioned: "ears pendulous, dewlaps lax and hairy; hind part of the head prominent." Gmelin deems it a variety only. In point of figure, this creature is so very remarkable that it cannot easily be confounded with any other variety: "its meagre appearance, length of neck and limbs, pendent ears, and long arched or curved visage," are strikingly characteristic; and as Dr. Shaw further observes, "it is covered rather with hair than wool, and has a pair of pendent hairy wattles beneath the neck, as in goats; the horns are small, and the tail long and lank." This kind is supposed to be most frequent in Guinea.

7. *Laticaudata*. η .—*Arabica platyura*, Ruffel; *Arabia ovis*, Alder.; *ovis Turcica*, Charletta.; *ovis cauda obesa*, Ludolf; *ovis laticauda*, Raj. Gmel.; *aries (ovis laticauda) laniger*, *cauda latissima*, Briff.; *moutons de Barbarie* ou *a grosse queue*, Chardin; *mouton de Barbarie*, *mouton d'Arabie*, Buff.; *ovis laticauda*, *platyceros f. Arabica*, Amoen. Acad. 4. p. 173.; *ovis theatopyga*, *aries kirgificus*, Pall.; *schaaf*, *deren Schwaentz gar feist*, *Rauwolf*; *arahisches schaafe*, *Gefn.* Thierb.; *die hiesige schaafe*, Ost. Broad-tailed sheep. This kind is asserted to be the largest breed of sheep in the world; and, according to Dr. Pallas and others, is reared throughout all the temperate regions of Asia, from the frontiers of Europe to those of China, in the vast plains of Tartary. All the Nomade hordes of Asia, the Turcomans, Kirguise, Calmucks, and Mongul Tartars rear it; and indeed it constitutes their chief riches, the number they possess being enormous. The Persians also rear it in abundance, as likewise the Hottentots, as Kolben relates in his Travels to the Cape of Good Hope. Osbeck says, in his Journey to China, that the fat-tailed sheep is reared throughout that vast empire, and it occurs in most parts of Syria, Barbary, and Ethiopia. Pallas thinks there is sufficient evidence that it is more universally reared in different countries than any other kind. The flocks of all the Tartar hordes resemble each other in having a large yeel with muzzle, the upper jaw often projecting beyond the lower one, and by having long hanging ears; by the horns of the adult ram being large, spiral, wrinkled, and bent in a lunar form. The tails of these sheep become oftentimes so large and heavy, as to greatly incommode the animal in walking

walking or grazing; they grow to the weight of fifteen, twenty, or thirty pounds, and even, according to some accounts, they have been known to increase to the weight of fifty pounds each. The shepherds are, therefore, very frequently obliged to fasten behind the sheep a small board furnished with wheels on which the tail may rest, and the animal be in some degree relieved of the weight he would be otherwise obliged to bear. This kind is in great estimation, the fatty substance of the tail resembling marrow, and the fleece in some countries being of an exquisite fineness. Mr. Pennant remarks that both the broad and long-tailed varieties of this kind of sheep were known to the ancients, being mentioned by Aristotle and Pliny; the former speaking of the first, and the latter of the second; one says the tail was a cubit broad, and the other a cubit long.

8. *Bucharica*. ♀.—*Auriculis magnis pendulis, pulvulari adiposa minore*, Pallas xi. 78.—Bucharian sheep, with large pendulous ears, and small fatty cushions. From Dr. Pallas we learn that this kind of sheep is reared in immense flocks by the Bucharian Tartars, and it is also common in Persia and Syria. Pallas and Gmelin both regard it as a mixed or hybrid breed, between the long-tailed and fat-tailed varieties; the former believes they never attain the size of either of the parents. The head is like that of the Kirguise sheep; but the muzzle is sharper like that of the Indian sheep of Buffon; the body is rather smaller than that of the Kirguise sheep; the ears large and pendent; and they have a small uropygium or fat rump, like that of the Tartar sheep on the Jeniffy, especially when begotten by a Kirguise ram; but in general they have a tail, fat and broad at the base, with a long narrow appendage, which resembles the tail of the Tscherkessian sheep. The Bucharian Tartars have a very valuable traffic with the furs of the lambs of this variety, which are exquisitely fine and beautiful. The same variety is likewise raised in great numbers by the Persians; and it is suspected by some writers that this is also the variety known more generally by the name of *ovis macroceras*, an inhabitant of Syria, Palestine, and various countries of Africa.

9. *Longicauda*, ♂.—*Cauda longissima*, Gmel.; alterum genus, Raj.; *ovis arabica*, Jont.; *aries (ovis longicauda) laniger cauda longissima*, Briff.; *ovis doichura sive Tscherkessica*, Pall.; Schaaffe, O.ear.; ein ander arabisch schaff, Gefn. Thierb. Long-tailed-sheep. The long-tailed, or, as the natives of Russia and Tartary call it, the Tscherkessian sheep, is described as a handsome animal, with a noble air, in its native country and the south of Russia, resembling in its habits, horns, fleece, and length of tail, the Spanish, but more particularly the English sheep. Its head is well-proportioned, and of an elegant form; ears straight; horns large, even, rounded in the angles, tapering to a point, and bending inwards towards the back. The rams are seldom without horns, and the ewes have them often bent in a lunar form. The wool, though coarse, is without admixture of hair, which is perhaps but an accidental distinction, and promises to be much meliorated by crossing the breed, and rearing the animal with more care and skill. It is even known to become much finer without the assistance of art, merely from the influence of a temperate climate, as on mount Caucasus. The tail of the ram is covered with fine long wool like the Indian sheep described by Buffon, which trails on the ground so as to efface the prints made by the animal's feet on the sand, and it contains often twenty joints or vertebrae. In passing from the state of nature to that of servitude, it seems to have lost its native ferocity, together with the coarseness of its fleece. Dr. Pallas says, it is a

mild gentle animal, and is less degenerate in form from the argali, which he deems the parent species, than the *steatopyga*; but which on the other hand has retained much more of its native wildness than the Tscherkessian breed; perhaps because it is allowed to range with little restraint on the wide extended plains of Great Tartary. The Tscherkessian breed is reared in all the European regions of the Russian empire, situated on this side the river Occa, in the nearer Poland, and by the pastoral people of mount Caucasus, and is commonly of a white colour. The same variety, we find in Ruffel's Natural History of Aleppo, is reared under the name of Bedouin sheep by the Arabs, and in the western parts of Mauritania. In the latter a trifling difference is observable, in the length and thickness of the tail. Long-tailed sheep are likewise reared in Morocco, and which it is supposed belong to this variety, because they possess the distinguishing character, a long tail, although in other respects they are different. These have an ugly look; the head is covered entirely with hair; the ears are small, and pendulous; and the wool remarkably long. The inhabitants of Ukraine and Podoli carry on an extensive traffic with the skins of the Tscherkessian variety.

10. *Capeensis*. ♂.—*Ovis auriculis magnis pendulis, cauda magna ex adipo vix prominente*.—Cape sheep of Pennant. An awkwardly formed animal with large pendulous ears, covered entirely with coarse hair instead of wool. The tail, Dr. Shaw observes, is sometimes so enveloped in fat as to be scarcely visible, the parts on each side swelling out into a pair of naked hemispheres, of such a size as sometimes to weigh nearly forty pounds. The legs are rather long; the visage somewhat arched; and the horns of the male like those of the common sheep.

In the General Zoology, by Dr. Shaw, the *Ovis Strepiceros*, or Cretan sheep, which Linnæus and Gmelin deem a distinct species, is considered also as a variety of *Aries*. The principal varieties of the sheep, according to Dr. Shaw, are the following: Cretan sheep (*ovis Strepiceros*, Linn.); many horned sheep (*ovis polycerata*, Linn.); African sheep (*ovis guineensis*, Linn.); broad-tailed sheep (*ovis laticaudata*, Linn.); fat-rumped sheep (*ovis Steatopyga*); Spanish sheep (*ovis Hispanica*, Linn.); and hornless sheep (*ovis Anglica*, Linn.).

Thus far have naturalists endeavoured to trace and define from the parent species, the more remarkable varieties into which these useful animals appear to be divided; and if we have digressed too far from the conciseness of the Gmelinian order, by attending more fully than that writer to the collateral observations of Linnæus, of Pallas, and other distinguished naturalists, who have entered minutely into the same inquiry; on a subject of so much importance, it is at least excusable. In the present instance, it is incumbent only to ascertain the principal varieties, so far as the characters assigned to them may justify: to dwell on the intermediate variations into which these varieties have again degenerated is needless; by education or culture, the effects of climate, food, and crossing breeds, these are now extended beyond the ability of the naturalist to ascertain with accuracy; and it would at best but tend to obscure the subject, were we to enlarge upon them. To the agriculturist, or the practical farmer of this country in particular, the history of the first variety, and perhaps one or two more, is obviously useful; but to treat on those would alone extend this inquiry to undue limits. Nor does it with strict propriety fall under the article *Aries*; it is a subject that deserves the fullest investigation, and elucidation the most ample; and will be duly attended to in its proper article, sheep, or *ovis*. See SHEEP, and OVIS.

ARIES Kill, in *Geography*, a small creek which runs northerly into Mohawk river, two miles and a half west from Schoharic river in New York.

ARIES Moromorus, in *Zoology*, a name given to the Gmelinian *CAMELUS Arcuatus*, or Peru camel, in Neiremberg's Natural History. This creature is called the sheep of Peru, moutons, or moutons de Perou, by Feuille, Friezler, and other writers.

ARIETIS, in *Entomology*, a species of *LEPTURA*, in the Fauna Suecica, and *Sytlema Naturæ* of Linnaeus, *Histoire des Insectes* of Geoffroy, and *British Insects* of Donovan. Degeer arranges it with the *CERAMBYCES*, under the specific name of *quadrifasciatus*; Scopoli calls it *STENOCORUS arietis*; Fabricius makes it a *CALLIDIUM*; and Gmelin a *CERAMBYX* in his family of that name, (palpis clavatis, *CALLIDIA*).

This is a very common insect in England; and probably throughout the other parts of Europe is not less frequent. It is found in gardens, and is easily distinguished from other species of the same genus. The thorax is black; wing-cases black, with four yellow transverse bands; the second of which is arched and curved upwards; and the legs are ferruginous. Fabr. Gmel. &c.

ARIETIS, a species of *VESPA*, that inhabits South America. The colour is in general black; petiole of the abdomen, and the legs rufous. Fabricius.

ARIETTA, in *Musie*, the diminutive of *Aria*. The French have a very confused notion of the meaning of this term, and call by the name of *ariette* the capital song of a musical drama, and which the Italians term *l'aria d'abilita*, generally composed to display the powers of a principal performer, in point of execution. *Arietta*, every where but in France, has been always understood to imply a little short air, a *cavatina*. "Now we begin to emerge from barbarism (says M. Guinguiné) why do we continue to speak like barbarians?"

ARIETUM LEVATIO, in *Antiquity*, a kind of sportive exercise, probably the same with that which in later times is called, "running at the quintain."

ARIGÆUM, in *Ancient Geography*, a town of India, supposed by major Rennel to be Irjab, in the modern Cabul, in the route of Tamerlane, near the southern mountains. Alexander found it burnt and abandoned, according to Arrian.

ARIGENUS, the capital of the Viducassi, situate in the northern part of Gallia Lyonnensis. Ptolemy.

ARIGNA, in *Geography*, a place situated amidst valuable coal and iron mines in the county of Leitrim, Ireland, at which great iron works have been lately established. As soon as the completion of the royal canal opens a communication between Dublin and the Shannon, so as to afford an easy conveyance of the articles to market, great advantages are expected. Dr. Beaufort.

ARIGNANO, a town or village of Italy, in the duchy of Tuscany, on the river Arno, between Florence and Arezzo.

ARIGNAY, a town of France in the department of Upper Garonne, and chief place of a canton in the district of St. Gaudens, 5 leagues W. of Rieux, and 3 N.N.E. of St. Gaudens.

ARII, or **ARIANS**, in *Ancient Geography*, a denomination by which several people of Asia were distinguished. Thus, the *Arii* or *Agēioi*, were the inhabitants of *ARIA*, in the vicinity of the Sogdians, according to Herodotus: he also says that *Arii* or *Agēioi* was an appellation commonly given to the Medes.—*Arii* were a people placed by Ptolemy in Arabia Felix.

ARII, or **Arians**, were also a people of Germany, occupying the first rank, according to Tacitus, among those who were denominated *Lygians*. They were more valiant, and also more fierce, than most of the other Germans; and with their ferocity they blended a considerable degree of cunning. They wore black bucklers, painted their bodies, and made their attacks in the night.

ARILLUS, in *Botany*, the seed-coat of the permanent husk that invests the seed. Some have objected to this term, as improper; but Dr. Smith (Linn. Transf. vol. v. p. 265.) is of opinion, that it expresses the true nature of the tunic, to which it is applied, much better than the hypothetical one of nectarium, the erroneous one of capsule, or even the analogical denomination of corolla.

ARIM, in *Geography*, a town of Asia, in India, supposed by the eastern geographers to be at an equal distance from the columns of Hercules on the west, and those of Alexander to the east, and therefore used by them in reckoning the longitudes.

ARIMA, a town of Japan, in a country of the same name. N. lat. 31° 45'. E. long. 129° 24'. The strait of Arima lies between the small island of Nangayuma, and that of Ximco.

ARIMA, in *Ancient Geography*, a mountain of Cilicia, or of Lydia.

ARIMANIUS, or **AHRIMAN**, in the *Persian Theology*, denotes the devil or the principle of evil, which, as some say, co-existed from eternity with Ormuzd or Oromasdes, the principle of good; each of them possessing the powers of creation, but each disposed, by his unchangeable nature, to exercise them with different designs. Others say, that Ormuzd first subsisted alone, but being dissatisfied with a solitary existence, and with having no power to oppose him, Ahriman was produced. Perhaps these divinities were originally, like *MITHRAS*, merely human beings; the one, a good prince, who had distinguished himself by rendering important services, civil or military, to his countrymen: the other, a tyrant, who had been the cause of grievous public calamities. Arimanius was not called by the Persians a god, but an evil dæmon; and they always wrote his name with the letters inverted. This rude and vulgar superstition, which had no other object than individual men, was afterwards corrected by philosophy, and changed into the worship of two spiritual beings, one the author of good, the other of evil. The system which supposes two such principles in nature, seems to have been held by the Persian Magi, before the time of Zoroaster; but it does not appear, how far they supposed them dependent upon the supreme divinity. Zoroaster, however, certainly taught the doctrine of their inferiority to the first parent of all things. According to this system the principle of good, it is said, is eternally absorbed in light, and the principle of evil eternally buried in darkness. The wise benevolence of Ormuzd formed man capable of virtue, and amply provided for him the means of happiness. By his vigilant providence, the motion of the planets, the order of the seasons, and the temperate mixture of the elements, are preserved. But the malice of Ahriman has long since pierced *Ormuzd's egg*, or in other words, violated the harmony of his works. Since that fatal irruption, the good and evil are blended; the rankest poisons spring up amidst the most salutary plants; deluges, earthquakes, and conflagrations attest the conflict of nature; and the mind, as well as the habitations of man, is perpetually agitated with vice and misfortune. Ahriman's power, however, is subject to limitation and restraint. Ormuzd will ultimately triumph over the furious malice of his rival; and at that decisive period, Ahriman and his followers, disarmed

disarmed and subdued, will sink into their native darkness; and virtue will maintain the eternal peace and harmony of the universe. The modern PERSEES exalt the Ormisd into the first and omnipotent cause, whilst they degrade Ahriman into an inferior, but rebellious spirit. Their desire of pleasing the Mahometans, says Mr. Gibbon (Decl. and Fall of the Rom. Emp. vol. i. p. 322, 8vo.), may have contributed to refine their theological system. Plutarch. de Iside and Osiride, apud Oper. t. ii. p. 351. Hyde de Rel. vet. Perf. c. 11. 21. &c. See MAGI, and ZOROASTER.

ARIMANNI, in *Antiquity*, the denomination of a class of persons employed in agriculture in the middle ages, who were free men. Among the writers of the middle ages, they were called also *conditionales*, *originarii*, *tributales*, &c. They seem to have been persons who possessed some small allodial property of their own, and, besides that, cultivated some farms belonging to their more wealthy neighbours, for which they paid a fixed rent, and bound themselves likewise to perform several small services, such as ploughing a certain quantity of their landlord's ground, assisting him in harvest and vintage work, &c. It does not appear whether these Arimanni were removable at pleasure, or held their farms by lease for a certain number of years. The former, says Dr. Robertson (Hist. Ch. V. vol. i. p. 276, 8vo.), if we may judge from the genius and maxims of the age, seems to be most probable. These persons, however, were considered as free men in the most honourable sense of the word. They enjoyed all the privileges of that condition, and were even called to serve in war; an honour to which no slave was admitted. Nevertheless, though their condition was greatly superior to that of slaves, such was the spirit of tyranny which prevailed among the great proprietors of land, and so various their opportunities of oppressing those who were settled on their estates, and of rendering their condition intolerable, that many free men, in despair, renounced their liberty, and voluntarily surrendered themselves as slaves to their powerful masters, who might thus become more immediately interested to afford them protection, together with the means of subsisting themselves and their families.

ARIMANON, in *Ancient Geography*, a city of refuge beyond Jordan; probably the famous Ramoth in Gilcad. Josh. xxi. 38.

ARIMANON, in *Ornithology*, the name given by Buffon to that species of PSITTACUS, since called by Gmelin *taitanus*, and Otahaitan blue parakeet by Dr. Latham. See TAITIANUS.

ARIMANTIS, in *Ancient Geography*, a town of Africa, in the Pentapolis. Ptolemy.

ARIMARA, a town of Asia, in Syria, situate on the Euphrates. Ptolemy.

ARIMASPI, a people who inhabited the northern part of European Scythia, called Scythia Arimaspa, which lay eastward joining to Scythia, in Asia. They were so called, it is said, from the Scythian *Arima*, one, and *Spon*, eye; not because they had but one eye, as some of the ancients absurdly believed, but rather, as Bochart conjectures, because they were such excellent archers, at which exercise it is necessary to shut one eye; that the nick-name of *one-eyed* was given to them on that account. According to Diodorus, who places them in Asia, to the south of the Oxus, they were called *Evergetes*, because, in an expedition of Cyrus, when his army was so distressed with famine, that the soldiers were reduced to the necessity of eating their comrades, this people supplied them with 3000 carriages of provisions. Steph. Byz. ascribes the appellation to the kind treatment which they afforded to the Argonauts, when they travelled through their country.

ARIMATHÆA, or RAMATHA, a city of Palestine, VOL. II.

placed by Jerome between Lydda and Joppa; but M. D'Anville places it a little to the south-east of Lydda and Diopolis. Modern travellers speak of a city called Ramatha, between Jeppa and Jerusalem. The name Ramatha, whence Arimathæa is derived, signifies height; but this place, which lay west of Jerusalem, was very different from Ramathaim-Zophim, Samuel's country (1 Sam. i. 1.), which was north in the mountains of Ephraim, and was probably the same as Ramah, near Bethel, four leagues distant from Jerusalem. Arimathæa was the city of Joseph, the honourable counsellor, mentioned Luke, xxiii. 50. The ancient Arimathæa, says Volacy (Travels in Egypt and Syria, vol. ii. p. 333.), is now *Ramla*, which is one-third of a league to the southward of Lydda, or the present Loudd, and is in as ruinous a state as Loudd itself. Within its boundaries nothing was found but rubbish; and yet the aga of Gaza resides here in a serai, the floors and walls of which are tumbling down. He maintains about 100 horsemen, and as many Barbary soldiers, who are lodged in an old Christian church, the nave of which is used as a stable, and in an ancient kan, which is disputed with them by the scorpions. The adjacent country is planted with lofty olive trees, disposed in quincunxes, which are decaying. Amidst these plantations are every where found dry wells, mouldering cisterns, and large vaulted reservoirs, which prove that, in ancient times, this town must have been upwards of a league and a half in circumference: at present it scarcely contains 200 families. The manufacture of the place is soap, which is sent into Egypt, and the spinning of cotton, which is chiefly purchased by two French houses established there. The aga built here, in 1784, a windmill, completed after the plan and under the direction of a Venetian carpenter; and this is the only windmill observed by Volney in Syria or Egypt, though it is said to have been originally invented in these countries. The only remarkable antiquity at Ramla is the minaret of a ruined mosque, on the road to Yafa, which appears, by an Arabic inscription, to have been built by Saif-el-din, sultan of Egypt. In the adjacent plain between Ramla and Gaza, there is a number of villages, consisting of huts built of dried mud, which, like their inhabitants, exhibit every appearance of poverty and wretchedness. The only fuel is dung kneaded into cakes, and dried in the sun. The environs of these villages are sown, at the proper season, with grain and water melons; and the rest is a desert, abandoned to the Bedouin Arabs, who feed their flocks in it.

ARIMINUM, RIMINI, a town of Italy, in Umbria, on the coast of the Adriatic, at the mouth of a river of the same name, and south-east of a small river called Rubicon. Strabo (l. v.) ascribes its foundation to the Umbri, who inhabited the country before the Senones. The Romans, when they became masters of it, sent a colony thither A. U. 485., and a new colony was sent thither by Augustus. This is the first town of which Cæsar took possession, after passing the Rubicon. It is now in a state of great decay; but there are some monuments of antiquity that claim the attention of the curious traveller. In the market-place there is a kind of stone pedestal, with an inscription, declaring, that on it Cæsar had stood and harangued his army; but the authenticity of this is not ascertained to the satisfaction of antiquarians. The harbour is now choaked with sand; and the brick tower, which formerly served for a faro or light-house, is surrounded with gardens; but they still shew on the coast the spot where St. Anthony is said to have stood when he preached to the fishes. N. lat. 44° 8'. E. long. 13° 30'. Keyssler, vol. iii. p. 223. Moore's Travels, vol. i. p. 276. In the collection of Dr. Hunter there was a medal of bronze, which Dr. Coombe ascribed to this city.

ARINE, GIRAN, a town of Africa, in Mauritania Cæfariensis.

ARINGA, in *Ichthyology*, a name given by Paulus Jovius and others to the herring, *Clupea Harengus* of Linnæus.

ARINGIAN, in *Geography*, a town of the province of Tranfaxana, belonging to Sannarcand.

ARINTHOD, a town of France, in the department of Jura, and chief place of a canton in the diftrict of Lons-le-Saulnier, $2\frac{1}{2}$ leagues fouth of Orgelet. The place contains 1,315, and the canton 10,603 inhabitants: the territory includes 220 kilometres, and 47 communes.

ARINUS, in *Entomology*, a fpecies of *PAPILIO* (*Plib. urb.*), defcribed by Cramer and Fabricius. The wings are deftitute of tails, above and beneath black, with a fnowy white tranfverfe fpot on the firft pair; extremity of the abdomen fanguineous. Fabricius, Gmelin, &c.

ARIOGE, the name given by Cramer to the variety β , *Papilio Eubule* of Fabricius. See *EUBULE*.

ARIOLA, in *Geography*, a fmall town in the kingdom of Naples, in the Principato Ultra, with the title of a principality.

ARIOLATER, in *Entomology*, a fpecies of *LAMIA*, in the Fabrician Species Infectorum. It inhabits India. The thorax is fpinous, and lined; wing-cafes brown, with a femicircular white line. Fab. *Obf.* Gmelin, in his Syft. Nat. adopts this fpecific character; it belongs, in his arrangement, to the *Lamia* family, in the *Cerambyx* genus.

ARIOLATOR, is a fpecies of *ICHNEUMON* that inhabits South America. The thorax is armed with two fpines, and is of a rufous colour; the abdomen black, with four white ftrreaks. Fab. This is the *Ichneumon spinofus* of Degeer, and is thus characterized by Linnæus in the twelfth edit. Syft. Nat.: *Ichneumon* thorace ferrugineo bifpinofa, alis fafcis binis fufcis, abdomine fafcis quatuor albis. *Obf.* The two erect fpines on the pofterior part of the thorax are white; and the wings fafciated with brown.

ARIOLI, in *Antiquity*, a kind of prophets, or religious conjurers, who, by abominable prayers, and horrid facrifices at the altar of idols, procured answers to their queftions concerning future events. Ifid. Orig. l. viii. c. 9. Thefe are alfo called *barioli*, and their operation, *bariolation*. Sometimes they were denominated *arufpices*, or *harufpices*. The arioli were diftinguifhed by a flovenly drefs, diforderly and matted beards, hair, &c.

ARION, in *Biography*, a perfon of great celebrity both as a mufician and poet, was a native of Methymne in the ifle of Lesbos, and flourifhed about the year before Chrift 620. He is faid to have been the inventor of the dithyrambic meafure, and to have excelled in lyric poetry, which he fung to his lute. After having been treated with great refpect and kindnefs at the court of Periander, king of Corinth, he vifited Italy and Sicily, and acquired great wealth by the exercife of his profefion. Determining to return to Greece, he embarked, with all his effects, on board a Corinthian veffel; but the failors, allured by fuch a prize, confpired to throw him overboard. In the mean while, he requested permiffion to fung one funeral ftrain before his death; and having obtained leave, he flood upon the prow with his inftrument in his hand, chanted with a loud voice his fweeteft elegy, and then threw himfelf into the fea. A dolphin, as the fable fays, charmed with his mufic, fwam to him while floating on the waves, bore him on his back, and carried him fafely to Cape Tænarus, in Sparta, whence he returned to his patron Periander. The failors, imagining that he was dead, and confiding in their own fecurity, arrived at Corinth; and confounded by his appearance againft them, paid the penalty of their evil purpofe with their lives. Such is the ftory which antiquity has preferved; and the fable, whatever

might be its origin, fufficiently attests his reputation as a mufician. His life has been recorded by Herodotus, and alfo by Solinus, Plutarch, Aulus Gellius, and others. Nouv. Dict. Hiftor.

ARION, in *Entomology*, a fpecies of *PAPILIO* (*Plib. rur.*) that inhabits Europe. The wings are without tails; above brown, difk blue, with black fspots; beneath grey, with ocellated dots. Fabricius, Donov. &c. The male has a fingle black fspot on the anterior wings, and a row of marginal fspots on the pofterior ones; the female has about fix black fspots on the difk of the anterior pair.

ARJONA, in *Geography*, a fmall town of Spain, in Andaluſia, on the river Frio, between Jaen and Andujar.

ARIOSO, in *Mufic*, an adjective ufed adverbially, implies, according to Rouffeau, a kind of melody bordering on the majestic ftyle of a capital air.

ARIOSTI, ATTILIO, in *Biography*, a native of Bologna, was defigned for the priefthood, but devoted himfelf to the profefion of mufic, and became an eminent mufical compofer and performer. He exercifed this profefion at Bologna and Venice, and alfo in Germany, where in 1700 he compofed a Ballet, and an Opera called "Attis," for the electoral princefs of Brandenburg, to whom he was appointed "Maftro di capella." Having continued for fome years in Italy and Germany, and diftinguifhed himfelf by his compofition of operas and other pieces, and alfo by his performances on the violoncello, and viol d'amore, an inftrument either invented or much improved by himfelf; he came to England in 1716, and played on his new inftrument, the firft of the kind heard in this country. When the Royal Academy of Mufic was eftabliſhed in 1720, he was employed to compofe feveral operas; and he formed one of the celebrated mufical triumvirate of the time with Handel and Bononcini; but both Attilio and Bononcini were obliged to give way to the fuperior genius of Handel. The former, without much invention, is faid to have been a perfect harmonift, and to have treafured up much good mufic in his head. By way of relieving his neceffities, he published a book of cantatas by fubfcription, and left England; after which his hiftory is not known. Burney's Hift. Mufic, vol. iv.

ARIOSTO, LUDOVICO, a celebrated Italian poet, was born in 1474, at the caſtle of Reggio in Lombardy, and defcended of a family allied to the dukes of Ferrara. At an early age he manifefted his poetical genius by a drama on the fubject of Pyramus and Thisbe, which was acted by his brothers and fifters; and though his father for fome time endeavoured to prevail with him to ftudy the law, which he feems to have reluſtantly profecuted for fome years without making any great progrefs, he was at length allowed to indulge his own inclination. At his father's death, when he was 24 years of age, he found himfelf in embarrassed circumftances, and was almoft induced to abandon his favourite ftudies. But being invited to the court of Alphonfo duke of Ferrara, he became the particular favourite of the duke's brother, the cardinal Hippolito of Efte, and maintained his attachment to him, with fome occafional interruption, as long as he lived. Having recovered and much improved his early knowledge of the Latin language, Cardinal Bembo wifhed him to employ it in his compofitions rather than the Italian; but Ariofto declined it, alleging, "that he preferred being the firft of Italian writers, to being the fecond or third among the Latin ones;" and alfo adding, "that his genius was moft inclined to the former." After the death of Hippolito, he was patronized by his brother Alphonfo, who was much delighted with his converfation, and enabled by his bounty to build a

ffmall

small house at Ferrara, where he employed himself in those studies and compositions which made his name immortal. This retirement, in which he lived with the plainness and simplicity of a philosopher, and where he enjoyed ease and liberty, he preferred to any other situation which he might have obtained under the offered favour of Pope Leo X. and several distinguished princes and cardinals. When he was asked why he had not built his house in a more magnificent manner, and more suitable to the noble descriptions which he had given of sumptuous palaces, beautiful porticos, and pleasant fountains, in his *Orlando Furioso*, he replied, "that words were combined together with less expence than stones." Upon his door he inscribed the following verse:

"Parva, sed apta mihi, sed nulli obnoxia, sed non
Sordida, parva meo sed tamen ære domus."

Thus translated by Sir John Harrington in his "*Life of Ariosto*," p. 420:

"This house is small, but fit for me, but hurtful unto none,
But yet not sluttish, as you see, yet paid for with mine owne."

Ariosto was so attached to a plain and frugal mode of life, that he says of himself in one of his poems, "that he was a fit person to have lived in the world when acorns were the food of mankind." But, though he was fond of retirement, he enjoyed the friendship of the most eminent men of learning of his time, who highly esteemed him, and whom he mentions with great respect in the last canto of his "*Orlando Furioso*." However, he was chiefly attached by obligation and friendship to the house of Este; and the adulation he bestows upon it in several parts of his works would have subjected him to the charge of insincerity and fervility, if it had not been sanctioned by the general practice of his age and nation. For the glory of his country he was ardently solicitous; and he often laments the injury and disgrace which Italy suffered under the dominion of foreigners. In his general behaviour he was affable and condescending; and, on particular occasions, he manifested a becoming degree of spirit and resolution, even when he thought himself ill-treated by persons of the highest rank. His charity and integrity are said to have been exemplary: to his mother he was singularly dutiful and affectionate; and shewed her the greatest respect in her old age. The writers of his life record several instances of his attachment to the fair sex; and it is said, that he was privately married to his mistress *Alessandra*, by whom he had two illegitimate sons; but that he did not acknowledge her as his wife, for fear of losing some ecclesiastical benefices which were incompatible with a married state. His constitution was delicate and infirm; and, notwithstanding his temperance and general abstemiousness, his health was often interrupted. He bore his last sickness with uncommon resolution and serenity; affirming, "that he was willing to die on many accounts, and particularly because he found that the greatest divines were of opinion that we shall know one another in the other world;" and he observed to those who were with him, "that many of his friends were departed, whom he desired to visit, and that he thought every moment tedious till he gained that happiness." He died at Ferrara, on the 6th of July 1534, according to *Sanfovino*; and on the 8th of July 1533, according to Sir John Harrington; at the age of 59 years; and he was interred with singular tokens of respect in the church of the *Benedictine* monks, who, contrary to their custom, attended his funeral. An epitaph, written by himself, was inscribed upon his tomb. His death was regretted by all who knew him, and particularly by

the men of letters, who honoured his memory in Latin and Italian poems. Sir John Harrington closes his account of him in these words: "his learning, his good behaviour, his honesty, made him both beloved of all good men in his life, and bewailed of all honest men in his death; so as methinks, reading over his life, I could find in my heart to wish (saying for some very few things),

"Sic mihi contingat vivere, sicque mori."

The works of Ariosto, who, as Dryden says, with all his faults, must be acknowledged a great poet, are satires, comedies, sonnets, songs, small pieces of poetry, and his great heroic poem, called "*Orlando Furioso*," on the composition of which he bestowed his principal attention, and which manifests the distinguishing exertion of his poetical powers. The author began this poem when he was about 30 years of age; and whilst he was engaged in the composition of it, he rose sometimes at one or two o'clock in the morning, both at home and abroad, and continued to write as long as he found himself properly disposed. The poem itself was singularly popular at its first publication, even among the lowest class; and inspired a very extraordinary degree of enthusiasm. Such were the reputation and authority which Ariosto acquired by it, that he commanded respect among the most licentious and abandoned. To this purpose it is related, that when he was governor of a province in the Apennines, which was overrun with smugglers and banditti, his influence was sufficient to preserve for some time the tranquillity of the district over which he presided. Once, however, as he wandered in a fit of reverie to some distance from the fortrefs which he inhabited, he was surprised by a party of free-booters, to one of whom he was known as the author of "*Orlando*:" as soon as this information was communicated to the rest, they fell at his feet, conducted him to the castle; and, at parting, told him that they respected him as governor on account of his character as poet. To such a degree was Ariosto himself charmed with his own verse, and so much did he also excel in his manner of reading, that he was always disgusted if he heard his own writings repeated with an ill grace and accent. Accordingly, it is said, that, when he accidentally heard a potter singing a stanza of his "*Orlando*" in an incorrect and ungraceful manner, he was so incensed, that he rushed into his shop and broke several of the pots which were exposed to sale; when the potter expostulated with him for this unprovoked injury, Ariosto replied, "I indeed have broken half a dozen of your pots, which are not worth so many half-pence; and you have spoiled a stanza of mine, which is worth a considerable sum of gold." A similar tale has been told by *Plutarch* of *Philoxenus*, and applied also to *Camoëns*. The "*Orlando Furioso*," after ten years labour, was published at Ferrara in forty cantos, in 1516; and the author gave it complete, in forty-six cantos, in 1532. This poem has been very differently appreciated by different writers, from the time of its first publication to the present day. Whilst some have unduly extolled it, others have degraded it below its just rank. A French writer prefers it to the *Odyssey* of *Homer*, and Sir John Harrington compares it with the *Æneid* of *Virgil*; and in answer to the objection, that Ariosto wants art, and recedes from the example of *Homer* and the precepts of *Aristotle*, he observes, that what was proper in *Homer* at the time when he wrote, would now appear otherwise from the different circumstances of the age, and that with regard to the rules of *Aristotle*, he followed them very liberally. Some have preferred Ariosto to *Tasso*; whilst others have regarded the latter as much superior to the former, and have adopted the common saying, that "*Ariosto's*

ton b was in Tasso." The "Orlando Furioso," says a Biographer of approved judgment and taste (see Aikin's Gen. Biog.) "is a tissue of adventures in love and arms, slightly, and often not at all, connected by reference to the principal hero, and formed upon the fictitious manners of chivalry, with all its accompaniments of enchantments, transformations, and supernatural events of every kind, and not without a mixture of moral allegory: it has its tragic and comic scenes, its serious and burlesque; and the transitions from the one to the other are often immediate: thus, as a whole, nothing can be more wild, incongruous, and absurd; and it might be thought prostituting the dignity of epic poetry to bestow the name on his performance, or to put it in parallel with any of the great works of that class. Yet the inexhaustible invention, the boundless variety, the wonderful facility, and the profusion of real poetical beauties of the most different kind, have ever rendered it a most attractive piece; and as far as the ends of poetry are to excite admiration or pleasure, it certainly has attained them. Many even of the most cultivated critics are inclined to prefer its wild charms to the more regular and studied beauties of Tasso; and perhaps, in general opinion, it still stands as the first specimen of Italian heroic poetry. It is not free from the licentiousness of its age, and has some singular strokes of ridicule upon topics thought sacred. But by much the greater part can offend the delicacy of taste only, and not that of morals." Editions of this work have been numberless, and in various countries; and translations, and imitations, of part or the whole, in different languages, have been very frequent. Mr. Hoole's translation in English verse is much esteemed. Gen. Dict. Nouv. Dict. Histor.

ARIPO, in *Geography*, a fort in Asia, on the western side of the island of Ceylon, at the mouth of the river Ceyronda.

ARIS, a town of Polish Prussia, 74 miles south-fourth-east of Konigsberg.

ARIS, in *Ancient Geography*, a river of Greece, in Messenia, on the banks of which was built the city Thuria. Pausanias.

ARISABIUM, a town of India, on the other side of the Ganges. Ptolemy. Some have thought that this is the modern Ava.

ARISARUM, in *Botany*. See AMBROSINIA and ARUM.

ARISBA, in *Ancient Geography*, a town of Asia Minor, in the Troade, founded, says Steph. Byz., by the Mitylenians, but according to Photius, by the Milesians. It was a little south-east of Abydos; the Trojans took it before the ruin of their city, and preserved it as an ally. Alexander's army, after passing the Hellespont, encamped near this city, when he went to visit the ruins of Troy. This city struck imperial Greek medals in honour of Trajan.—Also, a town of the island of Lesbos, ruined by an earthquake, according to Pliny.—Also, a town of Greece in Bœotia.

ARISBUS, a river of Thrace which ran into the Hebrus. Strabo.

ARISCH, ABU, in *Geography*, a principality of Arabia, is properly a part of Tehama, and stretching along the Arabian gulf northward from Loheja, for the space of two degrees: like the rest of Tehama, it is every where dry and barren, except in parts that are watered by the rivers from the mountainous regions of Yemen. The remarkable places in this principality are the capital, known by the same name, which is encompassed with walls, and is the seat of the she-riff, twenty leagues north of Loheja, in N. lat. 16° 45'. and E. long. 42° 15'.; and the sea-port town of Gezan, a day's journey from Abu Arisch.

ARISE, LICENCE TO, in *Law*. See LICENCE.

ARISH, EL, in *Geography*, a town of Egypt, near a gulf of the Mediterranean to which it gives name, in the road from Catich to Gaza, 42 miles east-north-east of Catich, and 115 miles north-east of Suez. The town is situated three leagues from the sea, in a sandy country; and it is the last place where water, which can be drunk, is to be found, until you arrive at Salahua.

ARISH, a Persian long measure, containing 3197 English feet. Arbuth. Tab. 32.

The Persian *arish*, according to Mr. Greaves, is a long measure equal to 38 $\frac{3}{8}$ English inches.

ARISI, *rice*, an Indian word, which does not properly signify the plant which produces the rice, but the seed itself when cleansed from its husk, and rendered fit for use. The Indians call it arisi in that state; but in the husk, and upon the plant, they call it neilon.

ARISTA, in *Astronomy*, the same as SPICA VIRGINIS.

ARISTA, in *Botany*, a long needle-like beard, that grows out from the husk of corn, or grass; called also the *awn*.

ARISTA, in *Ichthyology*. See ATHERINA.

ARISTÆNETES, in *Biography*, a Greek pagan writer of the fourth century, was the friend of Libanius the rhetorician, and mentioned with respect by Ammianus Marcellinus. He perished in an earthquake that happened at Nicomedia in the year 358; and left two books of amatory epistles, written with terseness, elegance, and tenderness, and containing quotations from Plato, Lucian, Philostratus, and others. An edition of these epistles, with notes, was published by Mercer, at Paris, in 1595, 8vo. and reprinted in 1600 and 1610. Fabr. Bib. Græc. l. ii. § 10. t. 1. p. 432.

ARISTÆUM, in *Ancient Geography*, a town of Thrace, built on the summit of mount Hæmus, mentioned by Pliny, and Diodorus Siculus.

ARISTÆUS, in *Mythology*, the son of Apollo and the nymph Cyrene. He is said to have communicated to mankind the art of curdling milk, of managing bees and forming hives, and of cultivating olives. At Thebes, he married Autonoe the daughter of Cadmus, by whom he had a son, the unfortunate Aëtion, and a daughter named Macris. After the death of his son, he removed to the island of Cea, where he restrained the progress of a destructive plague, and erected an altar to Jupiter, and offered sacrifices both to him and to Canicula, or the dog-star; by whose favour, the Etesian winds were caused to blow, and to mitigate the heat that had been so fatal; and from this time, it is said, these winds have been regular every year for forty days. From Cea, he passed over to Sardinia, which he established, cultivated, and peopled; and thence he proceeded to Sicily, and imparted his secrets to the inhabitants of that island. One of his principal stations was Arcadia, whither, according to Pindar, he removed from the island of Cea; and in Arcadia he taught the inhabitants the method of stocking their hives with bees; and hence Virgil (*Georg.* l. iv. v. 283.), gives him the name of *Arcadius*. He afterwards went to Thrace, where Bacchus admitted him to the mysteries of the Orgies, and imparted to him a variety of important and useful discoveries. This fabled benefactor of mankind lived for some time near mount Hæmus, and then disappeared. His numerous services were recompensed both by Greeks and Barbarians, with divine honours; and the gods are said to have placed him among the stars, so that he became the Aquarius of the zodiac. He was sometimes called Agreus or Nominus. Huëtius has curiously discussed the resemblance of the fable of Aristæus, to the true history of Moses. Gen. Dict.

ARISTÆUS, in *Biography*, was also an eminent Geometrician, of Crotonia, who lived before Euclid, 330 B. C. Pappus (*Mathem. Collect. in præm. lib. vii.*) speaks of him as a writer on conics, respected by Euclid. This Aristæus was a disciple of Pythagoras, and succeeded him in the care of his school after his death, and continued to teach his doctrine for thirty-nine years. *Fabr. Bib. Græc. v. i. p. 496.*

ARISTANDER, a famous soothsayer, was a native of Telmessus, a city of Asia, whose inhabitants were said to be naturally endowed with the gift of divination. He was first employed in the court of Philip of Macedon, and when this monarch dreamed that the queen's womb was closed with a seal, on which was engraved the figure of a lion, he interpreted it as signifying, that the son of whom she was pregnant would have the heart of a lion. He accompanied Alexander in his Persian expedition, and in order to answer the purposes of policy or superstition, he performed several mysterious rites before the famous battle of Arbela. On this, and also on several other occasions, he predicted victory, and perhaps contributed to obtain it; it is said, that by the success of his art, he gained a very considerable degree of influence not only over the credulity of Alexander's soldiers, but over the mind of Alexander himself. *Q. Curtius, l. iv. c. 2, 6, 13, 15. l. v. c. 4. l. vii. c. 7. l. ix. c. 4. Plut. in Alex. Oper. t. i. p. 684. Arrian. l. i. c. 8. Gen. Dict.*

ARISTARCHUS, a celebrated Greek astronomer and philosopher, was born at Samos, and flourished about the middle of the third century before Christ. There has been a considerable difference of opinion about the precise time of Aristarchus; according to Blair's tables, he died at the age of eighty-one, in the first year of the 125th olympiad, or 280 years before Christ. Playfair, with Plutarch, who makes him contemporary with Cleanthes the successor of Zeno, refers him to the 129th olympiad, or 264 years before Christ. But the time in which he flourished may be more satisfactorily ascertained by the testimony of Ptolemy; who informs us, that he made an observation of the solstice in the fiftieth year of the first period of Calippus; and supposing with Blair, this period to commence in the year of Darius's death, or the 330th before Christ, the fiftieth year must have been the 280th before Christ. Aristarchus is well known to have maintained the modern opinion with regard to the motion of the earth round the sun, and its revolution about its own center or axis. To this purpose Archimedes says in his "Arenarius," (apud Opera, p. 449. ed. Rivalti.) that "Aristarchus the Samian laid down a certain hypothesis, from which it follows, that the world is much larger than we have stated; for he supposes that the fixed stars and the sun are immovable, and that the earth is carried round the sun in the circumference of a circle." The editor remarks, that in this passage Archimedes seems to intimate that Aristarchus was the first author of this opinion. Sextus Empiricus also (*Adv. Mathem. p. 410.*), in speaking of the hypothesis of the earth's motion, plainly insinuates that Aristarchus had been the first discoverer of it. Plutarch (*Quest. Plat. apud oper. t. ii. p. 1006.*) observes, that this opinion was taught hypothetically by Aristarchus, and dogmatically by Seleucus. There is also a passage of Plutarch (*De facie in orbe lunæ. Opera, t. ii. p. 933.*), which, with the correction proposed by Gassendus, and adopted by Menage, Fabricius, and Bayle, affords another decisive testimony to prove, that the opinion of the motion of the earth was held by Aristarchus. "Bring not an accusation against us, as Cleanthes thought the Greeks ought to have done against Aristarchus the Samian, as a disturber of the foundation of the world, because he endeavoured to explain the celestial appearances on the supposition

that the heavens stand still, and that the earth is carried in an oblique orbit, and at the same time revolves about its own axis." Aristarchus also taught, that the annual orbit of the earth is but merely as a point, compared with the distance of the fixed stars. His method of determining the distance of the sun from the earth, was by means of the dichotomy of the moon (see *DICHOTOMY*); and in this way he concluded, that it contained at least eighteen or twenty times that of the moon from the earth. He also found by methods, the detail of which would be too tedious, that the diameter of the moon bears a greater proportion to that of the earth than that of 43 to 108, but less than that of 19 to 60, so that the diameter of the moon, according to his statement, should be somewhat less than a third part of that of the earth. He also estimated the apparent diameter of the sun at the 720th part of the zodiac. Besides his astronomical discoveries, Aristarchus invented a peculiar kind of sun dial, mentioned by Vitruvius, *l. ix. c. 9.* The only work of this ancient astronomer now extant is a treatise "On the magnitudes and distances of the sun and moon;" first published by Vallus, at Venice, fol. in 1498; afterwards by Wallis, with his own notes, and Commandine's version, at Oxford, in 1683, 8vo.; and again in Wallis's works, vol. iii. A fragment of this work is introduced by Pappus in his "Coll. Mathem. l. vi. prop. 48. p. 135." Another work "On the mundane system," has been ascribed to him, but it is generally understood to be a spurious work, written by Roberval. *Gen. Dict. Montucla. Hist. Mathem. tom. i. p. 218. Fabr. Bib. Græc. l. iii. c. 5. § 14. t. 2. p. 89.*

ARISTARCHUS, a Greek grammarian, was a native of Samothrace, resided chiefly at Alexandria under Ptolemy Philometor, who intrusted him with the education of his son; and died in the first year of the 156th olympiad, or the 156th year before Christ. To Aristarchus the ancient commentators upon Homer attribute the division of the Iliad and Odyssey into books, according to the order and number of the Greek letters. He was a rigid critic, and exercised his talents in this way upon Homer, Pindar, Aratus, and other poets. Erasmus (*Adag.*) says, that it was his practice, in revising Homer, to mark those verses which he thought unworthy of him with an obelisk, and to condemn them as spurious, and to distinguish those which he thought particularly excellent with an asterisk. Cicero alludes to this practice in two familiar epistles, viz. *Ad. Fam. lib. iii. ep. 11. lib. ix. ep. 10. Oper. t. vii. p. 95. p. 290. ed. Olivet.* Cicero in his oration against Piso, (*Oper. t. vi. p. 213.*) uses the name of Aristarchus proverbially for a severe critic, when he tells Piso, that he is not an Aristarchus to affix a mark to a bad verse, but a Phalaris to assault the person of the poet. Thus also when he requests his friend Atticus to examine his orations with strictness, he calls him his Aristarchus, (*Ep. ad Att. l. i. ep. 14. t. viii. p. 61.*). Horace also suggests the same idea in his *Ars Poetica*, v. 445, &c.

"Vir bonus et prudens versus reprehendet inertes,
Culpabit duros, incomptis allinet atrum
Transverso calamo signum: ambitiosa recidet
Ornamenta; parum claris lucem dare coget:
Arguet ambiguum dictum? mutanda notabit:
Fiet Aristarchus: nec dicet, cur ego amicum
Offendam in nugis?"

"A friendly critic, when dull lines move slow
Or harshly rude, will his resentment show;
Will mark the blotted pages, and efface
What is not polish'd to its highest grace;
Will prune th' ambitious ornaments away,
And teach you on th' obscure to pour the day:

Will mark the doubtful phrase with hand severe,
Like Aristarchus, *rig'rous* and sincere:
Nor say, For trifles why should I displease
The man I love?"

Aristarchus was of a contentious temper, and had frequent disputes, at Pergamus, with Crates the grammarian. In the decline of life he was dropsical, and sought a remedy by starving himself to death, which happened in the isle of Cyprus. His school of grammarians and critics subsisted at Alexandria for several ages after his time, and produced no less than forty grammarians. Suidas says, that he wrote 800 books of commentaries; and therefore the apology which he is said to have made for not writing, was not very proper: "I cannot write what I would, and I will not write what I can." Suidas. Gen. Dict. The name of Aristarchus has given title to several books.

ARISTARCHUS, a disciple and companion of the apostle Paul, accompanied him to Ephesus, and here his life was in danger, and followed him in his subsequent travels. He was originally a Jew of Thessalonica. Acts xix. Col. iv. 10. Philem. 24.

ARISTEA, in *Botany*. Schreb. 1-12. Aiton, Kew. 3. p. 506. Clafs, *triandria monogynia*. Nat. Ord. *Enfatæ*—*Iridæ*, Juss. Gen. Car. Cal. spathe bivalve; Cor. petals six roundish, spreading nearly equal. Stam. filaments three, shorter than the petals, filiform; anthers oblong. Pist. germ inferior, triangular; style filiform, longer than the filaments, declinate; stigma funnel-form, gaping, fimbriated, somewhat triangular. Per. capsule oblong, three-cornered, three-ceiled, three-valved. Seeds very many.

Ess. Gen. Char. Pet. six; style declinate; stigma funnel-form, gaping; caps. inferior, with many seeds.

Species, 1. *A. cyanea*, grass-leaved Arillea. Curt. Bot. Mag. 458. *Isia africana*, Lin. Spec. Plant. p. 51. Miller, &c. *Morea africana*, Murr. Syst. Veg. This is a small fibrous rooted plant, rising to six or eight inches in height; leaves grass-shaped, two or three inches long, bent inwards, forming a tuft at the root; flowers blue, with a white eye. A native of the Cape of Good Hope, whence it was introduced into the Kew garden by Mr. Masson, in 1774.

ARISTEAS, in *Biography*, a pagan officer under Ptolemy Philadelphus, king of Egypt, about two hundred and fifty years before Christ. To this person is ascribed a Greek work, still extant, entitled "An history of the interpreters of scripture," or of that Greek translation of the Hebrew scripture which we call the Septuagint. The account which Aristeas gives is briefly as follows. Whilst Demetrius Phalereus, a noble Athenian, was employed by order of Ptolemy Philadelphus, in collecting books from all nations for the royal library at Alexandria, he was instructed to procure a copy of the sacred books of the Jews, and to engage proper persons from Jerusalem to translate them into Greek. As the king wished for information what was proper to be previously done towards facilitating the accomplishment of his object, Aristeas, (the pretended author of the history of the seventy-two interpreters.) Sosibeneus of Tarentum, and Andreas, three noblemen of the king's court, favourably inclined towards the Jews, recommended the release of the Jewish captives who were detained in Egypt, and whose whole number amounted to 198,000, before any message was dispatched to Jerusalem. Accordingly, a decree was issued for their release; and twenty drachmas each were paid out of the treasury for this purpose, so that the whole sum devoted to their redemption was not less than 660 talents. When this was done, Demetrius proposed that a letter should be written to Eleazar,

the high-priest at Jerusalem, requesting him to send from thence a true copy of the Hebrew original of the sacred books, and with it six persons out of each of the twelve tribes of Israel, to translate it into the Greek language. The bearers of this message were Aristeas and Andreas, who carried with them, as royal presents, several gifts for the temple, in money for sacrifices and other uses of the sanctuary, 100 talents; in utensils of silver, seventy talents; and in those of gold, fifty talents; and of precious stones, as ornaments to the utensils, five times the value of the gold. Upon their arrival at Jerusalem, they were received by the high-priest, and by the Jews, with great respect, and their request was immediately granted. Having received from the high-priest a true copy of the law of Moses, written in golden letters, and six elders out of every tribe, i. e. seventy-two in all, they returned to Alexandria. The seventy-two elders being introduced to the king, they were tried by seventy-two questions, proposed to them, to each one in their order; and as their answers were satisfactory, the king gave to each of them three talents, and sent them into the island of Pharos adjoining to Alexandria, in order to perform the work assigned them. In the course of seventy-two days they completed their business, and as they agreed in the version of each period by common conference together, Demetrius wrote it down; and when the whole had been read and approved in the king's presence, each of the translators received another present of three rich garments, two talents in gold, and a cup of gold of the weight of a talent; and they were all sent home into their own country. Such is the account of Aristeas, which he addressed in form of a letter to his brother Philocrates. A Latin version of this history by Pa'merius was prefixed to the Latin edition of the Bible, printed at Rome in 1471. It was also printed in Greek at Basil, in 1561, 8vo. and as an appendix to the edition of Josephus, at Cologne, in 1691, with notes by Fabricius; and another edition was published at Oxford, in 1692, 8vo. It is universally allowed even by those who dispute the genuineness of this history, that it is ancient; because it agrees with the accounts of the Septuagint, given by Josephus and Eusebius, which appear to have been borrowed from Arilleas; and some modern writers have concurred with these and other ancient writers in admitting the truth of the narrative. But those who have taken great pains in examining this subject, have produced a conviction that now pretty generally obtains, that the tradition relating to the appointment of seventy-two interpreters by Ptolemy Philadelphus, for the purpose of translating the Hebrew scriptures into Greek, is entitled to no credit; and that the story was invented by the Jews of Alexandria, in order to give importance and authority to the translation, which they had been under a necessity of making, after Greek had become their common language. The work ascribed to Aristeas, a pagan officer in the court of Ptolemy, was probably written by some Hellenist Jew at Alexandria, not less than 200 years after the reign of Ptolemy Philadelphus; in proof of which it is alleged, that Alexander Polyhistor, who wrote about that time, mentions a history of the Jews by Aristeas. Hody (Bibl. Text. Orig. Oxon. 1705. fol.), Van Dale (Dissert. supr. Arist. de Septuag. Amst. 1704, 4to.), F. Simon (Crit. Hist. Vet. Test. l. ii. c. 2.), Dnpin (Proleg. ad Bibl. l. i. c. 6. § 2, 3.), and Prideaux (Conn. p. ii. b. 1. vol. iii. p. 49.) Archbishop Usher (Syntagma de Septuag. Interpret. verf.), Morinus (Exercit. Biblicæ), Walton (Prolegomena to the Polyglot Bible, c. 9.), Vossius (de LXX. Interpret.), and many others, concur in rejecting the history of Aristeas, as a fiction; and they have urged a variety

of objections, that seem to be unanswerable, against its authenticity. Although there was in the reign of Ptolemy Philadelphus a Greek translation, the narrative of Aivleas was written at a time when the Jews were much given to religious romances; and whilst the author pretends to be a heathen Greek, he every where speaks as a Jew. He makes Ptolemy advance an incredible sum for redeeming captives and obtaining this version; a sum which Prideaux estimates at nearly two millions sterling, which may be reckoned above twenty times as much as the whole library was worth. Besides, the questions proposed to the seventy-two interpreters, and their extemporary answers, carry very much the air of a fiction. The representation of seventy-two elders being sent from Jerusalem to Alexandria, and six being chosen out of every tribe, has the appearance of a Jewish fiction, as it concerns the Jewish sanhedrim, and the twelve tribes, of which a heathen Greek must probably have been ignorant. Besides, this is said to have been transacted by Demetrius Phalereus, who was banished, or poisoned, or dead, at the time when this version was made. Nor is it probable that six elders of every tribe in Palestine could have been found so well skilled in both languages as to make an exact version from the Hebrew into the Greek. Moreover, why should seventy-two be sent, when seven would have been sufficient for the work, and such a number might have been more easily obtained. Gen. Dict. Fabr. Bibl. Græc. lib. iii. c. 12. § 2. t. ii. p. 317.

ARISTELLA, in *Botany*. See STIPA.

ARISTERA, in *Ancient Geography*, an island south-east of the peninsula of Argolis.

ARISTERIA, a town of Syria, in the Cyrrhestic territory. Ptolemy.

ARISTIDA, in *Botany*, an exotic grass (from *arista*, an awn or beard). Lin. g. 94. Schreb. 125. Class, *triandria digynia*. Nat. Order, *Gramineæ*. Gen. Char. *Cal.* glume one-flowered, bivalve; valves linear-subulate, membranaceous, unequal. *Cor.* glume bivalve, thicker than the calyx; outer valve linear, converging longitudinally, hirsute at the base, terminated by three awns subequal, patulous; inner valve lanceolate, sharp, very short, wrapped within the outer valve; nectary, two-leaved; leaflets, lanceolate, obtuse. *Stam.* filaments capillary; anthers oblong. *Pist.* germ turbinate; styles capillary; stigmas, villose. *Per.* none; glume converging, involving, gaping. *Seed*, one, filiform, the length of the corolla, naked.

Species, 1. *A. adscensionis*. Browne, jam. 135, 1. "Panicle branching, spike scattered, corollas one-valved;" culms in tufts, one or two feet high, decumbent, jointed, simple; branches of the panicle pressed close, subdivided, upright; florets on short pedicles, narrow, brown; awn three-parted at the base; anthers dark purple. This species, according to Linnæus, has the habit of the *festuca ovina*. It is a native of the isle of Ascension, and of Jamaica, where it is called the bearded grass. 2. *A. americana*. Swartz. obs. 41. t. 2. f. 2. Browne, jam. 135, f. 2. "Panicle simple, corollas two-valved, one with dorsal, the other with terminating awns;" culm half a foot high, jointed, subdivided; leaves linear, stiff, even; panicle with simple alternate spreading branches; florets mostly pointing one way, approximated; rachis compressed, somewhat flexuose. Dr. Browne calls this the smaller bearded grass, a native of Jamaica. 3. *A. plumosa*, "panicked, the middle awn longest and woolly, culms villose." The woolly horns give this species the appearance of *stipa pennata*, but the panicle is more compound, all the parts smaller, and the culm villose; the awn is also naked towards the base, where it has two bris-

les or little awns, which are opposite, short, spreading. We are informed by Linnæus, that this species was found in America, by Schreber. 4. *A. arundinacea*, "panicked, corollas two-valved, middle awn longer, smooth;" culms four feet high; leaves rolled inwards, narrow, even, striated; panicle oblong, hoary; outer valve of the corolla awned at the tip; awn length of the flower, naked, and at its base, a minute awn scarcely visible. Found in the East Indies, by Koenig. 5. *A. gigantea*, "panicle elongated, loose, one-ranked; calyces one-flowered; awns of the corolla subequal, straight;" culm lofty, branched, smooth; panicles about eight inches long, terminal; calyx very smooth, unequal, bluish; corolla smooth, with equal short awns, almost naked. Found on the island of Teneriffe, by Masson. 6. *A. hystrix*. Pluk. Alm. 191. f. 3. "Panicle divaricated, very spreading; flowers simple, smooth, awns straight, divaricated;" culm creeping, stoloniferous, smooth, very tough, leafy, short; leaves convoluted; panicle terminating, large; peduncles and pedicels binate; rachis angular; flowers filiform, oblong; calyx one-flowered; valves unequal; corolla longer than the calyx, convoluted, terminated by three equal straight spreading awns. Observed in Malabar by Koenig.

ARISTIDES, surnamed *the Just*, in *Biography*, the son of Lyfimachus, an illustrious Athenian, was distinguished for valour and ability, and peculiarly eminent for justice, magnanimous self-denial, and virtuous patriotism, disregarding his own private interest or power, where these might interfere with the welfare of his country. From his early youth he manifested a firm and steady temper, and a disdain of meanness and dissimulation. In the course of his diligent application to study, he betimes directed his attention to the subjects of government. Accustomed to admire the laws of Lycurgus, he preferred an oligarchy to the unbounded democracy that prevailed at Athens, to which his early and persevering antagonist Themistocles was ardently attached. Hence arose that competition between them, which displayed itself on various occasions, in the progress of their advancement to public offices. Aristides engaged in the service of his country from the purest principles of patriotism; and his character was held in such general estimation, that when the following verses of Æschylus, describing Amphiarus, were once recited in the theatre,—

"To be, and not to seem, is this man's maxim;
His mind reposes on its conscious worth,
And wants no other praise,"

the attention of the whole audience was directed to Aristides, as the person to whom this description might with the utmost propriety be applied. Aristides and Themistocles were so much the champions of opposite parties in the Athenian state, that their mutual competition led them to counteract one another even in measures that were just and useful. Aristides, however, could not pursue this line of conduct without self-reproach; and having, on a particular occasion, refused a proposal of Themistocles, which he thought right in itself and conducive to the public good, he exclaimed, as he came out of the assembly in which the measure had been debated, "The affairs of the Athenians will never prosper, till they throw both of us into the *barathrum*," that is, the dungeon for condemned criminals. In the office of public treasurer, he convicted Themistocles and others with whom he was connected, of peculation; and thus he excited a party against himself, which accused him of having misapplied the public money; and he was cleared only by the interposition of the court of Areopagus. When he was again invested with the same public trust, he allowed the persons who were concerned

cerned with him to act fraudulently without controul, but at the same time kept a secret account against them. His conduct was universally applauded, and it was the general wish that he might be continued in office. However, when they were proceeding to elect him, he gave them a severe rebuke, and told them, "that while he had served them faithfully, he was the object of their displeasure and calumny; but when he had violated his trust, he was applauded, as an excellent citizen." He then exposed the frauds, and all parties were ashamed of their conduct.

The first public display of his generous and patriotic character was when Darius sent the Persian host to invade Attica. The republican equality of the Athenian democracy extending to military institutions, their army was commanded by ten generals, each of whom had the supreme direction for one day in their respective turn. Aristides, one of the ten, perceived that a vicissitude of command must interrupt unity of design, and prevent a regular system and steady plan of military operations. The ablest of the generals he well knew to be Miltiades; and he was aware that it was expedient for the country, in time of pressing emergency, to be guided by its greatest ability. The day approaching when it belonged to him to assume the command, he generously yielded his authority to the approved valour and experience of Miltiades. The other generals followed this magnanimous example, sacrificing the dictates of private ambition to the interest and glory of their country; and the commander in chief thus enjoyed an opportunity of exerting, uncontrouled, the utmost vigour of his genius.

After the defeat of the Persians in the famous battle of Marathon, in the year before Christ 490, Aristides was entrusted with the care of the spoils, which he faithfully brought to the public account, without reserving any thing to himself. The following year he was archon or chief magistrate, and he continued to watch the welfare and interests of his country. Formed in such schools of moral and political knowledge as then flourished at Athens, he had learned to prefer glory to pleasure, the interest of his country to his own personal renown, and the dictates of justice and humanity even to the interests of his country. His ambition was rather to deserve, than to acquire, the admiration of his fellow-citizens; and while he enjoyed the inward satisfaction of conscious rectitude, he was little anxious about the external rewards of splendid actions. Earnest to promote beneficence, he did not court popularity, but his conduct, without seeking the favour of the multitude, commanded their esteem and respect. His opinion gave law to the courts of justice, or rather such was the effect of his equity and discernment, that he alone became sovereign umpire in Athens. In all important differences he was chosen arbitrator; and the ordinary judges were deprived of the dignity and advantages formerly resulting from their office. The Athenian magistrates were extremely displeas'd with an authority which had in a great degree superseded their jurisdiction. But the most formidable foe of Aristides was Themistocles; pre-eminent in genius that exerted itself in every department of public conduct, and excelling in arms, in policy, in eloquence, he secured a certain path to popularity. The affability of his manners, the magnificence of his entertainments, and profusion of his gifts, confirmed among the populace the impression of his talents and qualifications. Themistocles beheld with jealousy the influence acquired by the stern integrity of Aristides, and being himself so much better calculated for winning the affections of the multitude, succeeded in rendering the upright patriot obnoxious to the people. Aristides trusting to the innocence

and integrity of his own heart, disdained to employ any unworthy means, either for gaining the favour, or for averting the resentment, of the multitude. The contest, therefore, ended in his banishment for ten years, by the ostracism, by which the majority of the Athenian assembly might expel any citizen, however inoffensive or meritorious had been his past conduct, who, by his present power and greatness, seemed capable of disturbing the equality of republican government. Among those who voted against him on this occasion, one person was a rustic citizen, who, unable to write his name on the shell by which his concurrence in the sentence was signified, accidentally met with Aristides, and requested him to inscribe his name. The patriot asked him, "Did Aristides ever injure you?" the voter replied, "I do not so much as know him; but I am disgusted with everywhere hearing him called 'the Just.'" Aristides took the shell, wrote his own name upon it, and returned it to the voter. Upon his leaving Athens, he lifted his hands towards heaven, and prayed that the Athenians might never be compelled to remember Aristides.

While Aristides was in exile, Xerxes had brought to a conclusion his immense preparations for the invasion of Greece. But when the Persian armament endangered his country, he sacrificed all resentment to patriotism, joined his countrymen, who lamented his absence and wished his return, and at Salamis performed important services. Some time after the victory at Salamis, in the year before Christ 480, to which his concurrence with Themistocles greatly contributed, this commander informed the Athenians that he had conceived a project of great advantage to the state, but which he could not safely communicate to the public. The people directed him to disclose it to Aristides. The object of this scheme was the destruction of the whole confederate fleet of Greece, their own ships excepted, which would render Athens sole mistress of the sea. Aristides reported his opinion, that the project of Themistocles was eminently advantageous, but that nothing could be more unjust; and this determined them against acquiescing in it.

Mardonius having attempted to induce the Athenians to submission, Aristides, now chief annual magistrate, inspired and invigorated his gallant countrymen to persevere in resistance, and in the following summer commanded the Athenian troops in the battle of Platæa, which entirely defeated the armament of Xerxes. When Athens was rebuilt, Aristides was active in promoting a popular decree, which gave to all the citizens a share in the government, and enjoined that the archons should be chosen out of the whole body. The virtues of Aristides were now celebrated throughout Greece; and the finances of the confederates were committed to his management. This important office he executed with such skill and fidelity, as very greatly improved the public resources. The placability of his disposition was eminently displayed in his conduct towards his inveterate antagonist, Themistocles; for when he had incurred the displeasure of the ruling party, Aristides declined concurrence in the capital prosecution of him; and when Themistocles was banished, he was so far from triumphing on occasion of his fall, that he ever afterwards spoke of him with a greater degree of respect. After having contributed so momentously to the good of Athens and of Greece, Aristides died of old age, about 467 years before Christ, either in Pontus, or at Athens, universally regretted by the affectionate admiration of his country. He, who had long managed the common treasury of Greece, left not a sufficient sum to defray the expence of his funeral. His son Lyimachus received a present of three hundred pounds from

the public, to enable him to pursue and finish his education. His daughters were maintained and portioned at the expence of the treasury. Plut. in vit. Arist. Oper. t. 1. p. 315, &c. Anc. Un. Hist. vol. v. p. 214—246. Travels of Anacharsis, vol. 1.

ARISTIDES, *Zelius*, a celebrated sophist, was born at Adriani or Adrianothera, a city of Mysia, in Bithynia, and flourished about the year 176, under the reigns of Antoninus Pius, Aurelius, and Commodus. He was a disciple of Polemon the rhetorician of Smyrna, of Herodes at Athens, and of Aristocles at Pergamus, acquired great reputation as an orator, and has left several orations, which appear to have been composed with peculiar attention, and abound with many excellent moral sentiments. The subjects were laudatory, in praise of the heathen divinities, of illustrious men, of great cities and states, &c.; gratulatory, on the restoration of Smyrna after an earthquake; suasive, to persuade the Athenians to aid the Spartans and Thebans, to induce the inhabitants of Smyrna to abolish licentious comedies, to recommend mutual harmony to the states of Asia, &c.; apologetic, in defence of Pericles, Miltiades, Cimon, and Themistocles, and also in vindication of himself from the charge of vanity, &c. From several of these orations it appears, that Aristides was credulous and superstitious, and rigidly devoted to the worship of the gods, particularly Esculapius, to whom he conceived himself much indebted for hints, communicated in his dreams, and conducive to his health. In one of his orations he expresses his displeasure against some sophists, whom he compares with christians, as Dr. Lardner supposes; and whom he calls the wicked or atheistical people of Palestine, because they did not worship the established deities of the Greeks and Romans. On another occasion he undesignedly pays a tribute of respect to the liberal disposition of the christians; for in an oration or epistle, written A. D. 178, congratulating the people of Smyrna upon their restoration after the destructive earthquake of 177, he celebrates not only the liberality of the emperors, but likewise the generous compassion of many others in the cities of Asia, among whom M. Tillemont reasonably imagines there were several christians. The people of Smyrna, in gratitude for the interest which he took in their calamity, and re-establishment of their city, for his pathetic representation of their circumstances which moved the compassion of the emperor Antoninus, and induced him to issue an order for restoring the city, honoured Aristides as the founder of their new city, and erected in their forum a brass statue to his memory. An instance of the vanity of this orator is mentioned by Philostratus (de vit. Sophist. l. 2. c. 9.); for, when Marcus Aurelius came to Smyrna, Aristides neglected, for three days, to pay his respects to the emperor. When at length he visited him, the emperor asked him, "How it had happened that he had so long delayed his visit?" "I was employed (he replied) in a work on which my mind was so intensely occupied, that I could not divert my attention from it." The emperor, pleased with his ingenuousness and his application, requested Aristides to appoint a time when he might hear him declaim. "Let it be to-morrow, if you please," said the orator; "but I must desire my friends to be present, and that they may be permitted to applaud, and clap their hands with all their might." The emperor smiling, told him, "that would depend upon himself." In the orations of Aristides there are many passages, which not only shew that he was a fine writer and good speaker, but an advocate for what he imagined to be truth and virtue. If he says, he had rather be a fine speaker than be Darius the son of Hytaspes, he joins with it a softer and virtuous life. And again, in another place, where

he expresses his superior value for learning and eloquence above all things, he says; "nor can he be so stupid as to despise glory if it comes to his share, and so far as it may flow from fine speaking, and a life of virtue suited to his discourses; for he did not desire to obtain it by other means." "A character of such eminence," says Lardner, "must have been an ornament to the popular religion and its rights; and the charms of eloquence in his hymns to the gods, and in his other orations, cannot but have had powerful attractions."

Among the works of Aristides, are found an epistle "On the Causes of the Increase of the Nile," in which he sets aside the common explanations of this phenomenon, and ascribes it wholly to the immediate power and providence of God; and an excellent treatise "On popular and simple Diction," exemplified from Demolthenes and Xenophon; which latter piece was published by Aldus, among the Greek rhetoricians, at Venice, in 1508. The oration of Aristides in praise of Athens, intitled "Panathenaica," written in imitation of Isocrates, is annexed to H. Stephens's edition of Isocrates, published in 1593. The entire works of this orator were published in Greek, at Florence, in 1517, folio; or in Greek and Latin, in three vols. 12mo., by P. Stephens, in 1604; at Upsal by Norman, in 1677; and by Jeb, in two volumes 4to., at Oxford, in 1722. Philostrat. de vit. Sophist. Suidas. Lardner's Works, vol. viii. p. 81—88. Fabr. Bib. Græc. l. iv. c. 30. § 4, 5. t. iv. p. 373, &c.

ARISTIDES, a painter of Thebes, was cotemporary with Apelles, about the year 334 before Christ, and distinguished for force and felicity of expression. He is said to have been the first who painted *mind*, and expressed the affections and passions. One of his subjects was the representation of the destruction of a town, and described by Pliny. Among other scenes of horror, a child was painted clinging to the breast of its wounded mother, who feared that after she was dead the child should suck blood instead of milk. This piece was carried by Alexander to Pella in Macedon. The Bacchus and Ariadne of this master was part of the plunder of Corinth; and after it had been bought by Attalus, king of Pergamus, at a very high price, it was reserved by Mummius for the temple of Ceres at Rome. For another piece Attalus is said to have given one hundred talents. Aristides's old man with a lyre teaching a boy to play, was fixed in the Capitol. His Sick Man was much admired. Pliny, H. Nat. l. xxxv.

ARISTIDES, an eloquent Athenian philosopher, and a convert to Christianity, flourished about the year 126; and retaining the habit of his former profession, presented to the emperor Adrian an apology for the Christians, which was extant in Jerom's time, and which he represents as a monument with the learned of his ingenuity. This apology was imitated by Justin in the book which he presented to Antoninus Pius, his sons, and the Roman senate. It is to be regretted that no fragment of this eminent Christian apologist's composition now remains. Euseb. H. E. l. iv. c. 3. Hieron. ad. Magn. ep. 84. Lardner's Works, vol. ii. p. 290.

ARISTIDES *Quintilianus*, author of the most ample and, in many instances, satisfactory treatise among the seven Greek writers on music published by Meibomius. He flourished after Cicero, and before Ptolemy; which is all the information that can be obtained concerning the period of his existence. With many wild and fanciful notions about musical effects, his doctrines often breathe taste and feeling, but the taste and feeling of an enthusiast. His moral distinctions of melopœia are as curious and fanciful as those which the Arabs assign to the strings of their lute. (See

ARABIAN *Musical*.) He allows of three modes, τριτοί, or styles of melopœia; the *dithyrambic*, or bacchanalian; the *ionic* consecrated to Apollo; and the *tragic*: acquainting us that the first of these modes employed the strings or sounds in the middle of the great system; the second, those at the top; and the third, those at the bottom.

“These modes had other subaltern modes that were dependent on them; such as the *erotic* or amorous, the *conic*, and the *encomiastic* used in panegyrics. All these being thought proper to excite or calm certain passions, were by our author imagined to have had great influence upon the manners, ἤθη; and with respect to this influence, melopœia was divided into three kinds: first, the *syllabic*, or that which inspired the soft and tender passions, as well as the plaintive, or, as the term implies, such as affect and penetrate the heart; secondly, the *diastolic*, or that which was capable of exhilarating, by kindling joy, or inspiring courage, magnanimity, and sublime sentiments; thirdly, the *hepsychallic*, which holds the mean between the other two, that is, which could restore the mind to a state of tranquillity and moderation.

“These imaginations are evidently drawn from the dreams of Pythagoras. Iamblicus, in his life of that philosopher, tells us, that he had invented certain musical airs, with which, by a happy mixture of genera, he could at his pleasure govern the passions of his scholars, and awaken terror, anger, melancholy, compassion, emulation, fear, and desires of all kinds, as well as stimulate appetite, pride, caprice, and vehemence; guiding such affections according to virtue, with suitable melodies, as with so many salutary and healing medicines.

“Aristides Quintilianus, however, defines the three genera in a manner more consonant to modern ideas and feelings than any of the other Greek writers.

“The *Diatonic* is the most natural, because all who have ears, though uninstructed with music, are capable of singing it.

“The *Chromatic* is more artificial, for it can only be sung by such as are adepts in music.

“The *Enharmonic* is the most refined and difficult of all, and has been received and practised only by the greatest artists.” Burney’s Hist. of Mus. vol. i.

ARISTIPPUS, founder of the Cyrenaic sect, was a native of Cyrene in Africa, and flourished about the first year of the 97th olympiad, or the 392d year before Christ. During his attendance at the Olympic games, he heard of the fame of Socrates, and immediately went to reside at Athens, that he might become his disciple. After his introduction to the school of this great master of wisdom, he was for some time esteemed, on account of his genius and improvement, one of its chief ornaments; but his fondness for effeminate and luxurious indulgence gave great offence to Socrates and his friends. Of this propensity on the part of Aristippus, and his master’s desire to correct it, we have a beautiful illustration in a dialogue preserved by Xenophon, Mem. l. ii. Involved in expences which his patrimony could not defray, he set up a school of Rhetoric, and he is remarked to have been the first disciple of the Socratic school who took money for teaching. With a view, probably, of diverting or of silencing the reproofs of Socrates, he sent him a present of 20 minæ, or about 64*l.*; but Socrates refused the present, alleging that his demon forbade him to receive it. At length the freedom of his manners alienated him from Socrates, and obliged him to leave Athens.

Devoted to a life of pleasure, Aristippus visited the island of Ægina, and there met with the celebrated Lais,

whom he accompanied to Corinth. In this voyage, he was terrified by a storm, and one of the crew observing that he was somewhat disconcerted, asked him, “Why are you philosophers afraid, when we illiterate seamen fear nothing?” “Because,” replied Aristippus, “we have more to lose.” In his way from Corinth to Asia, he was shipwrecked on the island of Rhodes; and accidentally perceiving a geometrical anagram on the sand, he exclaimed to his companions, “take courage, I see the footsteps of men.” When they arrived at the principal town in the island, he procured by his address accommodation for himself and his fellow-travellers, thus confirming one of his own aphorisms, “If you ask what advantage a man of learning hath above one that is illiterate, send them together among strangers, and you will see.” After some interval, Aristippus repaired to the court of Dionysius, tyrant of Sicily. When he first came to Syracuse, he was asked by Dionysius, “Why he visited his court?” To which he replied, “to give what I have, and to receive what I have not.” By the versatility of his disposition, and suppleness of the system which he had adopted, as well as by the politeness of his manners, he accommodated himself to every situation, verifying the maxim of the poet:

“Omnis Aristippus decuit color, et status, et res—”

“Yet Aristippus every dress became,
In all offices, in every state the fame.”

Hor. ep. i. 17. 23.

Whilst he ridiculed the singularities which were affected by other philosophers, particularly the stately gravity of Plato, and the rigid abstinence of Diogenes, he complied with the requisition of Dionysius, which enjoined all the guests at a public festival to appear in purple robes; whilst Plato refused, he adorned himself with a rich and splendid dress, and conversed and danced with the ease and grace of a courtier. By these flexible and captivating manners, he conciliated the regard of the Sicilian tyrant, and gained a command of the royal favours. Thus distinguished, he became the object of envy to his brethren; and this circumstance will account for many of those tales that have been circulated to the disadvantage of this philosopher both by ancient and modern writers. However it is impossible wholly to exculpate him from the charge of libertinism. The reason of Aristippus’s leaving Syracuse is not known, nor is it certain whither he removed. Æschines, who remained in Sicily till after the exile of Dionysius, on his return to Athens, found Aristippus teaching in the city, probably about the year 366 before Christ; and it is pretty certain that he and the rest of the philosophers left Syracuse before the expulsion of the tyrant. But whether he ever returned to his own country, and also when and how he died, are circumstances concerning which we have no certain information.

Aristippus was, without doubt, the man of pleasure in practice, as well as the preceptor of pleasure by profession. And yet, though he deviated from the strictness of Socratic morals both in his principles and his conduct, he must be allowed the credit of elegant manners, a thirst after knowledge, ready wit, and an ingenuous temper. The manner in which he became re-united to his friend Æschines, who had offended him, affords an amiable illustration of the latter quality. In the midst of a dispute which was becoming violent, “Let us give over,” said he, “and be friends, before we make ourselves the talk of servants; we have quarrelled, it is true, but I, as your senior, have a right to claim the precedency in the reconciliation.” Æschines acquiesced, and acknowledged his superior merit. The following repartees, selected from a great number attributed to Aristippus, deserve to be recorded. Polyxenus, a friend of
Aristippus,

Aristippus, happened to call upon him when preparations were making for a sumptuous entertainment, and began a tedious discourse against luxury: Aristippus, tired of the harangue, invited Polyxenus to stay and sup with him, and he accepted the invitation. "I perceive then," says Aristippus, "it is not the luxury of my table that offends you, but the expence." When he was asked, "what he had gained by philosophy?" he replied, "a capacity of conversing, without embarrassment, with all classes of men." A wealthy citizen complaining that Aristippus, in requiring 500 drachmas for the instruction of his son, had demanded as much as would purchase a slave: "purchase then one with the money," said the philosopher, "and you will be master of two." To one who boasted of his skill and activity in swimming, he said, "Are you not ashamed to value yourself on that which every dolphin can do better?" The following maxims are not unworthy of the Socratic school: "Philosophers," said Aristippus, "excel other men in this, that if no laws existed, they would live honestly." "It is better to be poor than illiterate; for the poor man only wants money, the illiterate want the distinguishing characters of human nature." "The houses of the wealthy are frequented by philosophers, for the same reason that induces physicians to frequent those of the sick." "The truly learned are not those who read much, but they who read what is useful." "Young people should be taught those things which will be useful to them when they become men." For the distinguishing sentiments of the Cyrenaic sect, founded by Aristippus, see CYRENAICI. Diogenes Laertius, lib. ii. § 62—So. Brucker's Hist. Philos. by Enfield, vol. i. p. 182—186. Travels of Anacharsis, vol. iii.

ARISTO of *Chios*, a Greek philosopher of the Stoic sect, was the son of Miltiades, and the intimate associate of Perseus; and as they both attended the lectures of Zeno at the same time, he must have flourished about 260 years before Christ. He was called, on account of his persuasive powers of eloquence, the Siren. His loquacity and love of pleasure displeased his master, from whom he removed to the school of Polemon; and afterwards he made unsuccessful attempts to establish a school of his own. He opposed the doctrine of uncertainty maintained by the Academic philosophers, and particularly by Arcesilaus; and made several innovations on the Stoic philosophy. He excluded from the course of his studies both physics and logic; the former as incomprehensible, and the latter as unuseful to the purposes of human life. He taught, with the Stoics, that virtue alone is the supreme good; but also that in other things there is no difference which can render one more desirable than another. This doctrine of indifference he applied to moral actions, representing all actions as alike; so that to a wise man it was the same thing whether he performed the part of an Agamemnon or a Thersites, provided he did it well. Seneca charges him with rejecting and condemning the preceptive part of philosophy in its relation to the particular duties of life. Whilst he discouraged all speculations in opinions, he maintained that the divine nature is incomprehensible, and he doubted whether the gods have perception or animal life, thus in effect denying the existence of deity. "Philosophers," says Aristo, "injure, instead of benefiting their disciples, if what is well meant be ill interpreted; and thus it is that the pupils of Aristippus became dissolute, and those of Zeno morose." He should have added, says Bayle, that every teacher should avoid ambiguous maxims, and prevent false glosses being put upon them; nor should we infer, that the doctrines of these philosophers had not a tendency, even

if rightly understood, to produce hurtful effects. While he inveighed against Arcesilaus, he himself became addicted to pleasure in his old age. His death is said to have been occasioned by his bald head being scorched with the heat of the sun. Cic. de Fin. l. iv. c. 27. Nat. Deor. l. i. c. 14. Seneca's Ep. 89. 94. Diogenes Laertius. Gen. Dict. Brucker by Enf. vol. ii. p. 352.

ARISTO of *Coos*, a Peripatetic philosopher, filled the Aristotelian chair about 230 years before Christ, being the fourth in succession from the celebrated founder of that school, and died about the year before Christ 183. He is represented by Cicero (de Fin. l. v. c. 5.) as a neat and elegant orator, but deficient with regard to the dignity and authority of a philosopher. Athenæus (l. x. p. 419. and l. xii. p. 456.) cites a work ascribed to him, and intitled "Amatory Similes."

ARISTO, *Titus*, a Roman lawyer, very much distinguished by his talents and character, lived in the time of Trajan, about the year 110. The younger Pliny, in his Epistles, (l. i. ep. 22. l. viii. ep. 14.) highly extols both his learning and his character; but if it be true that in an illness, which he is said to have borne with great patience, he summoned his friends, and intreated them to ask his physician, what was likely to be the issue of his disorder? so that if they pronounced it incurable, he might put an end to his own life; we must admit the high panegyric of Pliny with considerable abatement. Aulus Gellius (l. xi. c. 11.) speaks of him as the author of many books. Gen. Dict.

ARISTOBRAITHRA, in *Ancient Geography*, a town of India, on this side of the Ganges. Ptolemy.

ARISTOBULUS, in *Biography*, an Alexandrian Jew, was preceptor of Ptolemy Euergetes, eldest son of Ptolemy Philometor, king of Egypt, and flourished about 145 years before Christ. He was an admirer of the Greek philosophy, and united the study of the Aristotelian system with that of the Mosaic law. Eusebius represents him as a favourite of Ptolemy, and cites from his "Commentaries on the books of Moses," inscribed to that prince, several verses of Orpheus, in which mention is made of Moses and Abraham. These verses are also found in the works of Justin Martyr; but so much altered as to afford reason for suspecting their authenticity. In the Commentary the author also asserts, that part of the law had been translated into Greek in the time of Alexander; and that the whole was translated, under the care of Demetrius Phalereus, in the reign of Ptolemy Philadelphus. But the commentary was not written till 120 years after the reign of that king; and as Demetrius Phalereus was in exile during the reign of Ptolemy Philadelphus, he could not have superintended the Septuagint translation. It is therefore probable, that Aristobulus either invented the story of the Septuagint interpreters, or borrowed it from Aristæas, in order to support the credit of this translation with his brethren in Palestine. See ARISTEAS. Aristobulus seems to have been desirous of ascribing the Grecian philosophy to a Hebrew origin, as we learn from Clement of Alexandria (Strom. lib. i.); and of establishing an opinion that Pythagoras, Plato, and other Greek philosophers, were acquainted with the Jewish law. It is not unlikely that he forged the above-mentioned verses of Orpheus, and also the tales respecting the Greek versions of the Hebrew scriptures. Upon the whole, Aristobulus may be ranked with those who have been suspected of practising pious frauds. Euseb. Præp. Ev. l. xii. c. 13. l. viii. c. 8. Brucker by Enf. vol. ii. p. 167.

ARISTOCRACY, in *Politics*, a form of government, where the supreme power is lodged in the hands of the optimates, i. e. of a council or senate composed of the principal persons

persons of a state, either in respect of nobility, capacity, or probity. The word is derived from *αριστος*, *optimus*, and *κρατω*, *impero*, *I govern*.

In an aristocracy, the legislative and executive authority is vested in a select assembly, the members of which either fill up by election the vacancies in their own body, or succeed to their places in it by inheritance, property, tenure of certain lands, or in respect of some personal right or qualification. The separate advantage of an aristocracy consists in the wisdom which may be expected from experience and education; for a permanent council naturally possesses experience; and the members who succeed to their places in it by inheritance, will probably be trained and educated with a view to the stations which they were destined by their birth to occupy. In an aristocracy, however, there is less honesty than in a republic, and less strength than in a monarchy. Its mischiefs are dissensions in the ruling orders of the state, which, from the want of a common superior, are liable to proceed to the most desperate extremities; and oppression of the lower orders by the privileges of the higher, and by laws partial to the separate interests of the law makers. It would be a very happy thing, says Montefquieu, if by some indirect method or other, the people could be emancipated from their state of annihilation; and, consequently, the best aristocracy is that in which the part of the people who have no share in the legislature is so small and inconsiderable, that the governing party may have no interest in oppressing them. Thus when Antipater made a law at Athens, that any person who was not worth 2000 drachmas should be excluded from the right of suffrage, he formed by this means the best possible aristocracy; because the sum was so small, that few of any rank or consideration in the city were excluded. The more an aristocracy borders on democracy, the nearer it approaches to perfection; and it is the more imperfect in proportion as it draws towards monarchy. In an aristocracy, the laws should tend, as much as possible, to infuse a spirit of moderation, which would supply the place of the spirit of equality in a popular state; and as modesty and simplicity of manners constitute the strength of an aristocratic nobility, the nobles should not be invested with personal and particular prerogatives, distinct from those of their body. There are two principal sources of disorder, which should be avoided; these are excessive inequality between the governors and the governed, and the same inequality between the different members of the body that governs.

Aristocracies, says archdeacon Paley, are of two kinds; first, where the power of the nobility belongs to them in their collective capacity alone; that is, where although the government reside in an assembly of the order, yet the members of that assembly separately and individually possess no authority or privilege beyond the rest of the community; such is the case in the constitution of Venice. Secondly, where the nobles are severally invested with great personal power and immunities, and where the power of the senate is little more than the aggregated power of the individuals who compose it; such was the case in the constitution of Poland. Of these two forms of government, the first is more tolerable than the last; for although many, or even all the members of a senate should be so profligate as to abuse the authority of their stations in the prosecution of private designs, yet, whilst all were not under a temptation to the same injustice, not having the same end to gain, it would be still difficult to obtain the consent of a majority to any specific act of oppression, which the iniquity of an individual might prompt him to propose: or if the will were the same, the power is more confined: one tyrant, whether the tyranny reside in a

single person, or a senate, cannot exercise oppression in so many places at the same time, as may be carried on by the dominion of a numerous nobility over their respective vassals and dependents. Of all species of domination, this is the most odious; the freedom and satisfaction of private life are more restrained and harassed by it, than by the most vexatious laws, or even by the lawless will of an arbitrary monarch, from whose knowledge, and from whose injustice, the greatest part of his subjects are removed by their distance, or concealed by their obscurity. An aristocracy of this kind has been productive, in several instances, of disastrous revolutions; and the people have concurred with the reigning prince in exchanging their condition for the miseries of despotism. This was the case in Denmark about the middle of the seventeenth century, and more lately in Sweden. In England, also, the people beheld the depression of the barons, under the house of Tudor, with satisfaction, although they saw the crown acquiring thereby a power which no limitations, provided at that time by the constitution, were likely to confine. From such events this lesson may be drawn; "that a mixed government, which admits a patrician order into the constitution, ought to circumscribe the personal privileges of the nobility, especially claims of hereditary jurisdiction and local authority, with a jealousy equal to the solicitude with which it provides for its own preservation." Mont. Sp. of Laws, vol. i. p. 18. 72—77. Paley's Princ. of Philos. vol. ii. p. 180—182. See OLIGARCHY.

ARISTOGITON, in *Biography*, an Athenian who, with Harmodius, attempted to restore the liberty of their country by the overthrow of the two tyrants Hippias and Hipparchus.

Harmodius and Aristogiton, connected not only as citizens of Athens, but as friends, resolved to revenge an affront offered to the daughter of the former by Hipparchus, who had obliged her to retire from a public procession, at which she was entitled to have assisted, carrying a basket of flowers. Nothing less would satisfy the resentment of these two men, than the deposition of the tyrants. Having concerted the proper measures for their enterprise, they secretly imparted their plan to a small number of the citizens, and fixed the day of execution to be the feast of Panathenæa, when all the citizens wore arms. They accordingly attacked and slew Hipparchus, in the year 514 before Christ, but were themselves instantly apprehended, and Harmodius was put to death. Aristogiton was put to the torture, in order to force him to declare his accomplices. The most intimate friends of Hippias were named, and immediately put to death. When Aristogiton was asked by the tyrant, if there were any more? "There now remains," said he with a smile, "only yourself worthy of death." Leæna, the mistress of Harmodius, is said to have behaved with similar intrepidity; for fearing lest the pains of torture might extort from her a confession, she bit off her tongue, and spit it out. Though these champions of liberty perished themselves, yet the spirit which they excited continued to operate until it effected the emancipation of the Athenians, and drove Hippias into exile three years after this event, or about the year 510 before Christ. Having reinstated freedom, the Athenians erected in the forum statues, made by Praxiteles, to the memory of Harmodius and Aristogiton, who had begun this revolution, and set them up to public view, that the sight of them might inspire the citizens with a more violent hatred of tyranny. They sung hymns to their praise at the Panathenæa, decreed that no slaves should bear their names, and very extensive privileges were granted in perpetuity to their descendants.

How-

However, neither the characters nor the motives of these conspirators, whatever benefit might result from their conspiracy, seem to have deserved such testimonies of respect. Thucyd. l. vi. c. 56. Plat. in Hipp. t. ii. p. 220. Philostr. in Vit. Apollon. l. vii. c. 4. p. 283. Aulus Gellius, l. ix. c. 2. Travels of Anacharsis, vol. i. p. 171.

ARISTOLOCHIA, in *Botany*, birthwort (*αριστολος*, and *λοχια*, or *λοχινα*, from its supposed use in disorders attending parturition). Linn. g. 1022. Schreb. 1383. Juss. 73. Gærtn. 14. Class, *gynandria hexandria*. Nat. Order, *Sarmentacea*. *Aristolochia*, Juss. Gen. Char. *Cal.* none. *Cor.* monopetalous, tubular, irregular; base swelling, subglobular, tortulose; tube oblong, hexagon-cylindric; limb dilated, extended below into a long tongue. *Stam.* filaments none; anthers six, fastened at bottom to the stigmas, four-celled. *Pist.* germ oblong, inferior, angular; style scarcely any; stigma subglobular, six-parted, concave. *Per.* capsule large, six angled, six-celled. *Seeds* several, depressed, incumbent.

Ess. Gen. Char. Stigmas six. *Cal.* none. *Cor.* monopetalous, tongue-shaped, entire. *Capf.* six-celled, inferior.

Species 1. *A. bilobata*, two-lobed birthwort. *A. longa* scandens, foliis ferri equini effigie Plum. Ray. "Leaves two-lobed, stems twining;" stem filiform, subdivided, leaves cordate; lobes oblong, nerved, entire; petioles crooked smooth; peduncles one-flowered, longer than the leaves; corolla ligulate; tube globose, many-keeled, curved, hexagonal, bluish, funnel-shaped, at the throat marked with longitudinal brown lines; limb elongated, spatulate. Native of Dominica and Hispaniola, covering trees and shrubs, and flowering from November till January 2. *A. trilobata*, three-lobed birthwort. Jacq. obs. 8. t. 3. Browne, 329. 3. Swartz. obs. 341. "Leaves three-lobed, stem twining; flowers very large, bagged at the base, tongue linear, very long." This is a climbing plant like the former; the stem is aromatic, and the flowers large and ventricose. It is a native of the West Indies, and South America; introduced here about the year 1775; and flowers in June and July. 3. *A. pentandra*, five-flamed birthwort. Jacq. Amer. 232. t. 147. pict. 115. t. 224. "Leaves cordate, hastate-subtrilobate, stem twining, bracte cordate, embracing." The flowers of this are smaller, and have only five stamens. It is a native of America. 4. *A. peltata*, peltated birthwort. Jacq. Amer. pict. 114. 222. "Leaves kidney-shaped, subpeltate, stem twining;" stem filiform, striated; leaves small, nerved, entire, smooth, standing on footstalks which embrace the stem; corolla spotted, brown; tube globose at the base, crooked, reflex, an inch long, brown, dotted with green; throat funnel-shaped, pubescent at bottom; border having a lip an inch in length, tongue-shaped, retuse at the tip, slightly emarginate, set with convex, acute, dark purple dots, green below the tip to the throat. A native of St. Domingo and South America, where it flowers in February and March. 5. *A. maxima*, greatest birthwort. Jacq. Amer. 223. t. 146. pict. 114. 223. "Leaves oblong, acuminate, stem twining, peduncles many-flowered." This has strong climbing stems by which it mounts up to the top of the tallest trees; leaves four inches long, two broad, oval, obtuse, thick; flowers curved in loose clusters at the ends of the shoots; fruit like a purse, very large. It was sent to England by Mr. R. Miller, from New Spain, and since found by professor Jacquin, to whose elegant figure of it we have above referred. 6. *A. bilabiata*, two-lipped birthwort. Swartz. obs. 342. Plum. spec. 5 ic. 32. f. 1. "Leaves cordate-tongue-shaped, obtuse, stem twining, corolla two-lipped;" stems filiform; branchlets alternate, loose, three or four leaved; leaves entire, stiffish, smooth, petioles shorter than the peduncles; corolla middle-

sized, brown purple, striated; tube globose at the base; border elongated, oblong, blunt, reflex; funnel of the tube, split, so as to make the corolla bilabiate. A native of South America. 7. *A. creta*, upright birthwort. "Leaves lanceolate, sessile, subhirsute; stem erect, peduncles solitary, one-flowered, flowers very long; stalk three feet high, leaves long, narrow, hairy, with very short footstalks; flowers solitary, axillary, four inches long, of a dark purple colour; seeds flat, heart-shaped. Discovered at Vera Cruz by Dr. Houftoun, who sent the seeds to Europe about the year 1733, where it was cultivated by Mr. Miller. 8. *A. arborescens*, tree birthwort. Pluk. alm. 50. t. 78. f. 1. "Leaves cordate-lanceolate; stem erect, shrubby;" about two feet high; branches strong enough to support themselves; flowers solitary, axillary. A native of North America. 9. *A. caudata*, tailed birthwort, Jacq. Amer. 233. t. 145. pict. 114. t. 221. "Leaves cordate, obtuse, emarginate at the tip, lobes incumbent, lip tailed;" the lobes of the leaves lap over each other at the base; the lip of the corolla ends in a bristle-shaped tail. A native of America. 10. *A. odoratissima*, sweet-scented birthwort. Browne, 329, 1. Sloane, v. 1. 162. t. 104. f. 1. "Leaves cordate; stem twining, shrubby; peduncles solitary; lip of the corolla very large;" root long geniculated; stem climbing, six or eight feet high; branches numerous; leaves cordate or triangular, four inches long, longitudinally ribbed; corolla yellowish. The whole plant has a strong grateful smell. A native of Jamaica, where it is called *contrayerava*; cultivated by Miller in 1752. 11. *A. sphyro*, broad-leaved birthwort. L'Heritier, stirp. nov. 1. p. 13. t. 7. "Leaves cordate; petioled; flowers solitary; border trifid, equal; bracte ovate; stem twining, shrubby." This is a tall twining shrub with few branches, of a camphoraceous smell, leaves spreading, remote, roundish, sinuate-cordate, veined; peduncles lateral, one-flowered; bracte decurrent, embracing the peduncle; corolla of a purplish brown, an inch and a half long; tube shaped like a syphon, with a trifid flat border. A native of North America, and introduced here by Mr. Bartram about the year 1763. It flowers in June. 12. *A. anguicida*, snake killing birthwort. Jacq. Amer. 232. t. 144. pict. 114. t. 220. Morris. hist. 3. f. 12. t. 17. f. 7. "Leaves cordate, acuminate; stem twining, shrubby; peduncles solitary; stipules cordate;" root thick; stems slender, long, jointed, purple; corollas purple, straight, truncated as it were with a lanceolate lip. If the juice of the root mixed with the saliva be put into the mouth of a serpent, it may be handled with safety; but will recover in two hours. A native of Mexico and the West Indies. 13. *A. maurorum*, Moorish birthwort. Mor. hist. 3. f. 12. t. 17. f. 11. "Leaves hastate, quite entire; stem weak, simple; flowers solitary, recurved." It has several filiform stems producing seven or eight leaves on each side of the upper part of the stem, these are ash-coloured, opposite, resembling those of *osmunda regalis*. The flowers are larger than those of common birthwort, brown, and appear among the lower leaves. Discovered by Rauwolf in olive grounds about Aleppo. 14. *A. Indica*, Indian birthwort. Gærtn. Pract. i. 45. Carel. vegen. Rheed. Mal. 8. 48. t. 25. "Leaves cordate, rather acute; stem twining; peduncles many-flowered;" stems shrubby, striated, slender; leaves entire, smooth, frequently retuse or emarginate; peduncles axillary, with alternate acute bractes, within which stands a single flower on its proper pedicel; corolla a dusky purple. A native of the East Indies and Cochinchina. 15. *A. boetica*, Spanish birthwort. Mor. t. 17. f. 6. "Leaves cordate, rather acute; stem twining; peduncles about three, longer than the petioles;" the stems are slender, striated, spreading over hedges and bushes; leaves acuminate, on long petioles;

flowers.

flowers crooked, oblong, very dark purple; stipules ovate-rhomboid, and mucronate. Found by Clusius in Andaulia. An evergreen, and odorous plant, flowering in January and February, cultivated by Gerard, in 1507. This was formerly called climbing birthwort. 16. *A. sempervirens*, evergreen birthwort, *psilolochia cretica*. Bauh. pin. Mor. Hist. 12. t. 17. f. 16. "Leaves cordate-oblong, acuminate, waved; stem weak, flowers solitary;" the stems are many, trailing, more than a foot long, striated, angular; leaves nerved, dark coloured, evergreen, on long petioles; flowers axillary, crooked, longer than the leaves, of a dark purple externally, internally yellow. A native of the island of Crete or Candia, flowering in May and June. Cultivated in the Chelsea garden in 1739. 17. *A. serpentaria*, Virginia birthwort or snake-root. Woodv. Med. Bot. 291. t. 126. Mat. Med. "Leaves cordate-oblong, flat; stems weak, flexuose, round; flowers solitary;" root a congeries of small fibres, yellowish; stem jointed, firm, from six inches to a foot in height; leaves lanceolate cordate, nerved; flowers blue or purplish, on long footstalks, proceeding from the lower joints of the stem; tube compressed at the throat, ventricose and round at the base, spreading at the border. It flowers in May, and perfects its seeds in August. A native of Virginia and Carolina. Cultivated by Tradescant at Lambeth, in 1632. 18. *A. psilolochia*. Lin. sp. 1364. "Leaves cordate-crenulate, retted underneath, petioled; flowers solitary;" the stems are angular, branching, seldom rising to a foot in height, and scarcely strong enough to support themselves; bractes heart-shaped at the base of the peduncle; flowers small, lip bent inwards, tube and beginning of the petal yellow, broader and blood-coloured. A native of the south of France, Spain, and Switzerland. Cultivated by Gerard in 1596. 19. *A. rotunda*, round-rooted birthwort; "leaves cordate, subfessile, obtuse; stem weak, flowers solitary;" the roots are roundish, about the size of a small turnip; they send out three or four weak trailing branches, to the extent of two feet; leaves rounded at the end; flowers stand singly, close to the petioles, they are of a purplish black colour, and curved inwards at the lip. A native of the south of Europe, flowering from June till the end of August. 20. *A. longa*, long-rooted birthwort. Woodv. Med. Bot. p. 294. f. 107. "Leaves cordate, petioled, obtuse; stem weak; flowers solitary, fruit ovate;" the root is very long, somewhat fusiform; stems weak, angulated; branches trailing; peduncles at the axils of the leaves; flowers of a pale purple colour, angulated, tube gradually widening to the mouth, which is ovate and terminating in a pointed apex. A native of the south of Europe. It flowers at the same time as the *A. rotunda*, which it very much resembles. They were both cultivated by Gerard in 1596. 21. *A. lirifuta*, rough birthwort. Tournef. itin. i. t. 147. "Leaves cordate, rather obtuse, shaggy; flowers solitary, pendulous, recurved, subtruncate." This species has some resemblance to the preceding, but the leaves are hairy, and not so deeply cored at the bottom, the flowers are also much larger; stem striated, hairy, leaves obtuse, dagger-pointed; corolla incurved, and recurved, without an elongated lip. Tournefort says the root is nearly two feet in length, and two inches in thickness; stems two feet high, knotted, at each knot arises a single leaf three inches long; flowers axillary, of the shape of an S, and of a pale green, mixed with a purple colour. It is a native of the island of Scio or Chios. 22. *A. clematitis*, common birthwort. Hudf. 394. With. 1003. Woodv. Med. Bot. supp. f. 238. Eng. Bot. 398. "Leaves cordate, stem erect, flowers axillary, crowded;" stems two feet high, simple striated, smooth, a little zigzag; leaves alternate, on footstalks without stipules,

heart-shaped, entire, smooth, broad, veined, nerved; flowers five or six in a cluster, axillary, of a pale yellow, appearing from July till September, consisting of one petal, globose at the base, with six furrows, these funnel shaped, and terminating in a tongue-like figure; style simple, with six stigmas. Smith. Found in England about the ruins of nunneries, abbeys, &c. The following five are new species. 23. *A. scandens*, Mill. Dict. n. 10. "Leaves cordate, on very long footstalks; stems climbing; flowers terminal, on very long peduncles." This climbs to a very considerable height; leaves broad, longitudinally veined; flowers in loose clusters at the extremities of the branches, and on long peduncles. It grows about Tolu in New Spain, from whence Mr. R. Millar sent the seeds to England. 24. *A. conferti*. Mill. Dict. 11. "Leaves cordate, petioled; stem climbing; flowers in axillary clusters." This climbs to the height of three or four feet; leaves short, somewhat like those of *A. rotunda*; flowers dark purple. It was discovered by Mr. R. Millar at Campeachy. 25. *A. bracteata*, Retz. obs. 5. 29. n. 80. "Leaves cordate, obtuse; stem weak; flowers solitary; bractes cordate, petioled." Stem flexuose, striated; flowers peduncled, shorter than the leaf, with a long curved lip. Found by Koenig about Madras. 26. *A. obtusata*, Swartz. prod. 126. Plum. ic. 27. t. 53. "Leaves cordate, rounded at the tip, three-nerved, nerved, and tomentose beneath; stem twining; peduncles solitary." A native of the Caribbee islands. 27. *A. grandiflora*, Swartz. prod. 126. Browne, jam. 327. n. 2. "Leaves broad, cordate; stem twining, subherbaceous; peduncles solitary; tip of the corolla very large, with a long tail." Flowers large, five or six inches round the margin; throat closed longitudinally for a considerable time; lip terminating at the lower extremity in a long slender appendix. A native of Jamaica (about St. Ann's).

Medicinal Properties. The *A. rotunda*, *longa*, and *clematitis*, formerly were admitted into the materia medica of the British pharmacopoeias; and the last is still retained by the Edinburgh college. The virtues which the ancients ascribed to their roots were very considerable, and they were consequently employed in various diseases, particularly those thought to proceed from obstructions more especially of the uterine system; and we are informed by Dr. Cullen, that in some cases of this description, he found the *aristolochia* an useful remedy. Though many species of this genus have been recommended for their medicinal powers, it is only that of *Serpentaria* which has continued to maintain its character as a medicine of importance. The root of *Serpentaria*, as well as that of some of its congeners before mentioned, was first recommended as a medicine of extraordinary power in counteracting the poisonous effects of the bites of serpents; since that time it has been principally employed in fevers, especially those of the malignant kind; a practice founded on a supposition that the morbid matter of these fevers was to be subdued by the same means as that of the poison of serpents: hence the *Serpentaria* has been deemed the most powerful of those medicines termed alexipharmics. But since this theory has been exploded, its good effects are now ascribed to its tonic and antiseptic properties. It is certainly a powerful stimulant and diaphoretic, and has been found very useful in fevers, where these effects have been required, as appears from the writings of Huxham, Hillary, Pringle, &c. See Woodville's Med. Bot. p. 293.

Propagation and Culture. Those species that are natives of hot climates, as 1, 7, 9, 10, 12, 14, 23—27, require a stove to preserve them. The seeds, by which they are to be propagated, should be brought over in their pods, and immediately on their arrival here, should be sown in small pots filled with
light

light earth, and should this happen in autumn or winter, the pots should be plunged into the tan of the bark stove, and under the shade of large plants. After remaining till March, they should be plunged into a hot-bed under frames, where the plants ought to appear in May. But if the seeds arrive in spring or summer, they must be sown in small pots, and plunged into a moderate hot-bed, observing to shade them constantly during the heat of the day; but the seeds sown at this season of the year seldom grow the same year, and in that case the pots should be plunged in the tan-bed of the stove in autumn, and in the spring following treated as before directed. When they are strong enough, they should be transplanted into separate small pots, and treated as other tender plants of the same countries. 8. The tree birthwort will live in the open ground, but requires shelter in winter. 11. is hardy and may be propagated by seeds, suckers, or by parting the roots. 13, 15, 16, 18, are propagated by parting the roots; they should be screened from severe frost. 17, 19, 20, 21. are propagated by seeds, in pots placed under a frame to defend them against frost, but the glasses to be taken off when the weather is mild; and they would be greatly improved by removing them to a gentle hot-bed in March. As the season advances, they should be gradually enured to bear the open air; when the pots are taken out of the bed, they may be exposed to the morning sun, but screened during the heat of the day. They are to be refreshed with water moderately during dry weather only. In winter, the pots must be sheltered as before; and, in March, before the roots begin to shoot, they should be transplanted into separate small pots, and placed under the frame till spring, when they may be removed into the open air, and treated in the same manner as in the former year. The next spring they may be turned out of the pots, and planted in a warm border, where they will only require to be kept clean from weeds, and the roots defended from the frost, by covering the border, in autumn, with old tanner's bark. By this management the plants will become much healthier and stronger than if kept in pots, and when they are three years old, will flower, and produce plenty of seeds. The 22d species spreads so rapidly by its creeping roots, that it will be found troublesome, unless planted where it cannot injure other plants. All the species are perennial, and their stems generally require supporting. See Martyn's Mill. Dict.

ARISTOMENES, in *Biography*, a famous general of the Messenians, distinguished by his love of liberty and his valour, and also by the vicissitudes of his fortune, was the son of Nicomedes, and a descendant of the royal family of Messene. The oppression of the Spartans roused his indignation, and he took up arms, in connection with the Argives and Arcadians, for the rescue of his country; and thus commenced the second Messenian war, in the year before Christ 684, which terminated in the year 668 before the same æra. The first battle was fought in a village of Messenia, and the victory was long doubtful; but Aristomenes by his valour determined the fate of the day; and the army unanimously saluted him as king. This honour, however, he declined, and chose to retain that of general. His next object was to intimidate the Spartans by a single act of courage; and with this view he repaired to Lacedæmon, and having secretly entered the temple of Minerva, he affixed to the walls a buckler, with this inscription, "Aristomenes has consecrated this to the goddess, from the spoils of the Lacedæmonians." In a second engagement the Lacedæmonians were again defeated, and one of their towns was taken and pillaged; but in this action Aristomenes received a wound in the thigh, which however did not prevent his marching

to invest Sparta, whence he was under a necessity of retreating. In the third year of the war, the Messenians were betrayed by the treachery of Aristocrates, king of Arcadia, and suffered a defeat, attended with the loss of the greatest part of their army. Thus weakened and distressed, the resolution of Aristomenes was invincible; and with a small band of select men, he contrived to harass the Spartans, and to penetrate into Laconia. At length the valiant general was taken prisoner, and confined in a deep cavern amidst the other wounded and dying prisoners. In this noisome recess he continued three days; when perceiving at a small distance from him a fox preying upon a dead body, he seized its leg and permitted it to conduct him to a small hole through which he could discern the light. Having enlarged the aperture with his hands and nails, he obtained a passage through which he made his escape, undiscovered, to his countrymen at their post on mount Ira. He soon renewed his ravages among the enemy, and compelled them to a truce; but he was perfidiously seized by some Cretan soldiers in the service of Sparta, and carried away captive. These Cretans, who were seven in number, stopped at the house of a widow with one daughter; and whilst they were intoxicated with wine, the woman cut the thongs by which he was bound, and set him at liberty. Thus released, he slew all his guards, and accompanied by the mother and daughter, hastened to Ira, where the latter was married to his son. Ira was treacherously surrendered to the Spartans; but Aristomenes forming a small band of his followers into a column, marched directly to the enemy's line, which opening to the right and left, as he advanced, afforded him an unmolested passage. He then joined the Arcadians, by whom he was kindly received; and proposed to them a bolder exploit than any which he had yet achieved. "I have still left," said he, "five hundred brave soldiers who will follow me where I please; if you assist me, whilst the Spartans are occupied in the pillage of Ira, I will march immediately to Lacedæmon and surprise it." The proposal was received with great applause; but, before it could be executed, the Arcadian king contrived to delay it till he had forewarned the Spartans of their danger. His treachery was discovered, and the enraged people stoned him to death. Thus disappointed, he sent the Messenians, under the conduct of his son, to the island of Sicily, where they founded the city of Messina, about the year 668 before Christ, according to Pausanias; and he remained in Greece, watching a favourable opportunity for accomplishing the designs against the Spartans which he was still meditating. Such was his reputation, that when a person of the first rank at Rhodes consulted the oracle at Delos whom he should marry, he was directed to espouse the daughter of the most worthy of the Greeks, meaning Aristomenes. On a visit to his son-in-law, Aristomenes died, and a magnificent tomb was erected for him at Rhodes. The independence of his country, however, expired with him. Pausanias, l. iv. c. 21, 22, 23. Anc. Un. Hist. vol. v. p. 413—423. Travels of Anacharsis, vol. iv. p. 38—53.

ARISTONAUTÆ, in *Ancient Geography*, a town of Achaia, near the frontiers of Sicyonia, north of Pallene, and at the bottom of a small gulf.

ARISTONIS URBS, a city of Egypt in the road from Coptos to Berenice, 25 miles from Diospolis.

ARISTONUS, in *Biography*, an eminent Grecian sculptor. The exact time when he lived is not known. He erected a statue of Jupiter at Olympia, the face of which was placed towards the rising of the sun. The god held the eagle with one hand, and in the other the thunder. His head was crowned with the flowers of spring.

The eagle is necessarily attached to Jupiter in order to distinguish the god, but with respect to the other attributes, we may fairly infer that they were introduced in order to point out the union of justice and mercy in the divine nature. The thunder, an emblem of his power to execute judgment, is placed in his hand, but the blossoms of spring are as a crown upon his head, to shew that it is his delight and his glory rather to bless mankind. The face of this statue being turned towards sun-rise, seems to strengthen this idea, and might be intended to exhibit the care and government of the Divine Being in the conduct of his providence.

ARISTOPHANES, a celebrated comic poet, flourished about the middle of the fifth century before Christ, and was contemporary with Sophocles, Socrates, Euripides, and several others of the greatest men in Greece. The place of his birth is not known; but it is generally supposed that he was not a native of Athens, though he was much esteemed in this city, where he seems to have resided and been admitted to the honour of a denizen. Having been accused by Cleon of assuming the title of a citizen without possessing a legal right to it, in his defence he parodied two verses which Homer has put into the mouth of Telemachus, of which this is the sense: "I am, as my mother tells me, the son of Philip; for my part I know little of the matter; for what child knows his own father?" This stroke of pleasantry, it is said, having induced his judges to confirm him in his privileges as a citizen, he breathed nothing but vengeance against Cleon, and composed a piece against him abounding with the bitterest sarcasms. As he advanced in life he employed those talents for poetry which distinguished his early age, in that species of dramatic writing, called "The Old Comedy," which flourished during the Peloponnesian war, and a little before it, and which introduced on the stage real persons by name, in order to make them the objects of invective or ridicule. Having reduced this kind of comedy from its rude and unconnected state into a better and more useful form, he made it the vehicle of very unallowable and licentious severity and abuse. This was particularly the case in his first comedies; but he is said to have become more moderate in his later performances, and to approach in his manner to what was called "Middle Comedy," in which real persons were not introduced, but the characters were in some measure disguised by fictitious names; see COMEDY. His first efforts were directed to the reformation of abuses in the state; and he lashed, without discrimination, the usurpation and misconduct of the great, and the follies and vices of the people in general. Whilst he exposed the sinister designs of the magistrates and generals of the Athenians by his wit and satire upon the theatre, he at the same time took care to defend the commonwealth against its foreign enemies; inasmuch that Lacedæmon and other cities which were jealous of the grandeur of Athens, frequently experienced that Aristophanes alone was worth an army to that city, and that it was impossible to succeed while they followed the advice of this poet, who had made the stage a kind of school for the art of war, and all other virtues which can render a city formidable to its enemies. We are told that the freedom with which he reprehended the errors and faults of the philosophers, poets, generals, and ministers of state, and those of the mass of citizens, was so well received by the Athenians, that they cast handfuls of flowers upon his head, and carried him in triumph through the city with the greatest respect and loudest acclamations. As a recompence for the zeal which he manifested on behalf of the commonwealth, they passed a public decree, that he should be honoured with a crown of the sacred olive in the citadel, which was the highest token of respect that

could be paid to any citizen. Two excellent actors, Callistratus and Philonides, performed in the comedies of Aristophanes. When the first appeared, it was understood that the comedy was directed only against the vices of individuals; and when the second acted, that it attacked the leaders of the administration. But the licentious attacks of Aristophanes, though often applauded by the multitude, were disapproved and condemned by the most intelligent part of the public. Accordingly, by one decree, the acting of comedy was prohibited; by a second, it was forbidden to mention any person by name; and by a third, to attack the magistrates. But these decrees were soon forgotten or repealed; nor would the multitude consent to relinquish a species of entertainment in which all the abusive and obscene expressions their language afforded, were lavished on the objects of their jealousy or resentment. Towards the end of the Peloponnesian war, the licentiousness of the poets was restrained, and Aristophanes himself submitted to this reformation in his latter pieces. But no reformation which he might effect in the state, much less any gratification which he might afford to the spleetic humour of individuals, can atone for or excuse his malignant attack on the reputation and life of Socrates. His comedy of "The Clouds," was written with a view to expose to ridicule this admirable philosopher. To this purpose he represents him suspended in a basket, resembling his thoughts to the subtle and light air which he respire, and invoking the clouds, the tutelary deities of the fop-hills, whose voice he imagines that he hears in the midst of the fogs and darkness by which he is surrounded. To inflame the more against him the prejudices of the people, he accuses him of teaching the youth of Athens to contemn the gods, and to deceive men. This piece, which was received at its first and second recital with applause, though it did not obtain the crown, is thought to have contributed towards preparing the Athenians for that unjust decree, which bereaved that age of its brightest ornament. Aristophanes, notwithstanding the malignity of his satire, the occasional obscenity of his humour, and the licentiousness of his morals, was universally admired among the ancients on account of the Attic elegance of his style, and the peculiar poignancy of his wit. The purity and elegance of his diction was so much admired even by Plato, the disciple of Socrates, that in an epigram he represents the graces searching for a desirable mansion, and at length fixing it in the mind of Aristophanes; and St. Chrysostom, the most eloquent of the Greek fathers of the church, is said to have laid him always under his pillow when he went to bed. Nevertheless, many of the ancients felt and censured the faults of Aristophanes. The character which Plutarch (in Compar. Aristoph. & Menand., Oper. t. ii. p. 853 and 854.) gives of him, is as follows: "he outrages nature, and addresses himself more to the populace than to a genteel audience; his style is constantly mixed and unequal, elevated to bombast, familiar even to vulgarity, and buffoonish even to childifness. In him the father is not to be distinguished from the son, the citizen from the peasant, the warrior from the tradesman, nor a god from a menial servant. His impudence can only be endured by low people; his wit is bitter, sharp, and cutting; his pleasantry consists chiefly in a play upon words, gross equivocations, and far-fetched and licentious allusions. In him, subtlety of expression becomes malignant, and simplicity appears stupid; we are more inclined to hiss than to laugh at his rallery, and his gaiety is effrontery; in short, he writes not to please rational and worthy people, but to gratify envy, spite, and debauchery." Upon the whole, we may observe, that such wit as his would not be admired in any modern

modern composition. Frischlin has written an express vindication of Aristophanes, in answer to the objections of Plutarch. Cicero likewise, in his first book "De legibus," styles him the most witty poet of the "Old Comedy," and highly commends him for endeavouring to expel the new deities out of the city, and to prevent the admission of scandalous forms of religion. Brumoy thinks that Plutarch's remarks are too severe; and Mr. Cumberland has defended the author of the "Clouds," with true classical zeal, somewhat, perhaps, at the expence of Socrates and Euripides. Athenæus (Deipn. l. x. c. 9.) informs us, that he wrote his comedies when he was drunk, as Alcæus likewise did his poems. Julius Cæsar Scaliger compares Horace to this poet; but Frischlin is of opinion, that Plautus has a greater affinity to him in his manner of writing, and has actually imitated him in many parts of his plays. By others, his writings have been represented as containing within them the germ of true comedy, and the models of the best comic style; and they maintain that the author well understood that species of raillery, which, in his age, was pleasing to the Athenians, and which must please in every age.

Aristophanes is said to have invented a peculiar kind of verse, which was called by his name, and is mentioned by Cicero in his "Brutus." Suidas tells us, that he likewise invented the "tetrameter" and "octameter" verse. Eleven of the fifty-four comedies said to have been written by this poet, still remain, and these belong entirely to the first æra, known by the name of "the Old Comedy." Of this kind of drama Eupolis, Cratinus, and Aristophanes, were the three most celebrated authors. Of "the Middle Comedy," he gave a specimen in his "Cocalus," that is now lost, in which he did not introduce real persons, as in his "Equites," "Clouds," and "Frogs," but fictitious ones. Madame Dacier observes, that there are but two of them, "Plutus," and the "Clouds," which, with a regard to decency, will admit of a translation into the modern languages. The design of the latter has been already mentioned. The former, written after the magistrates had given orders that no person should be exposed by name on the stage, was intended to reproach the Athenians with their avarice, which had been the occasion of their committing many errors in concerns of the greatest importance. This is the most esteemed of any of the comedies now extant. Euripides, to whom this poet had a particular aversion, is satirized in several of his plays, particularly in his "Frogs," his "Acharnenses," and his "Theſmophoriuzasæ." The best editions of Aristophanes are those of Kufter, Bergler, and Brunck. Gen. Dict. Travels of Anacharsis, vol. iv. p. 48, 53, &c. Nouv. Dict. Histor.

ARISTOPHANEUM, in *Ancient Physic*, a name given to a kind of emollient platter, prepared of pitch, wax, opopanax, apocyma, and vinegar.

ARISTOPHILI, in *Ancient Geography*, a people of Asia, in the Paropamisus. Ptolemy.

ARISTOTELIA, in *Antiquity*, annual feasts, celebrated by the citizens of Stagira, in honour of Aristotle, who was born there; in gratitude for his having procured from Alexander, the rebuilding and re-peopling of that city, which had been demolished by king Philip. It is said, that after his death at Chalcis in the island of Eubœa, they fetched away his bones, built an altar upon his tomb, called the place by his name, and held their assemblies there afterwards. Mandeville, in his fabulous account of his voyages, says, that this was still in being in his time; that is, in the fourteenth century. Ammon. in Vit. Aristot. Stanley's Hist. of Philos. p. iv. c. 8.

ARISTOTELIA (from Aristotle), in *Botany*, a small shrub, a native of Chili. Schreb. n. 816. L'Heritier stirp. VOL. II.

nov. 31. t. 16. Juss. 433. Class, *dodecandria monogynia*. Gen. Char. *Cal.* perianth one-leaved, five-parted; divisions lanceolate, concave, acute, upright. *Cor.* petals five, wedge-shaped, concave, erect, lying over each other at the sides, scarcely longer than the calyx. *Stam.* filaments fifteen, very short; anthers linear, shorter than the germ. *Pistl.* germ superior, roundish, rather three-cornered; style filiform, longer than the corolla; stigmas three, recurved. *Per.* berry subglobular, obtusely three-cornered, three-celled. *Seeds* two, or solitary in each cell, angular.

Ess. Gen. Char. *Cal.* five-leaved. *Cor.* five-petalled, berry three-celled. *Seeds* two in each cell.

Species, 1. *A. macqui*, shining-leaved Aristotelia; root woody; stem brachiate, round, grey, tubercled; branches spreading, beset with wart-like glands; leaves opposite, oblong-ovate, acuminate, ferrate; the younger leaves of a shining bright green, somewhat viscid, on foot-stalks; stipules in pairs, minute, like glands; peduncles racemed, axillary, nodding; flowers pedicelled, drooping, globose, herbaceous; calyx villose; style often trifid; berry the size of a pea, of a dark purple, becoming black. This small shrub is a native of Chili, whence it was first sent to Europe by Dombey, and known by the name of *macqui*. The inhabitants of Chili make a wine of the berries, which they give in malignant fevers. It is hardy enough to bear the open air in general. But in severe winters it ought to have the protection of a green-house. It flowers in April and May, and was introduced here about 1773, by Messrs. Kennedy and Lee. Loureiro has given the name of *Aristotelia* to a genus of the class *gynandria*, found in China.

ARISTOTELIAN, something that relates to the philosopher Aristotle.—Thus we say, an Aristotelian dogma, the Aristotelian school, &c. See ARISTOTLE.

ARISTOTELIAN *philosophy*, the philosophy taught by Aristotle, and maintained by his followers.

The Aristotelian is otherwise called the *Peripatetic philosophy*; the rise, progress, vicissitudes, and fate of which, see under ARISTOTLE, and PERIPATETICS.

ARISTOTELIANS, a sect of philosophers, otherwise called Peripatetics.

ARISTOTELICA *rota*. See ROTA.

ARISTOTLE, in *Biography*, was born at Stagira, on the coast of Thrace, in the beginning of the ninety-ninth olympiad, eighty-five years after the birth of Socrates, and 384 before the birth of Christ. Stagira, as well as the neighbouring Greek cities, enjoyed the precarious dignity of independent government: it was the ally of Athens in the Peloponnesian war, and, like other nominal allies, experienced the stern dominion of that tyrannical republic. The city of Stagira indeed owes its celebrity wholly to Aristotle and his family; and, if its name is still familiar to modern ears, this proceeds merely from having communicated to our philosopher the appellation of Stagirite. His father, Nicomachus, who was the physician and friend of Amyntas, king of Macedon, derived his descent through a long line of medical ancestors from Æsculapius the companion of the Argonauts, whose skill in the healing art had raised him to a seat among the gods. Nicomachus improved a branch of knowledge which was the inheritance of his family, by writing six books on natural philosophy and medicine. The mother of Aristotle was Pheltis. He lost his parents in early youth, but inherited from them a large fortune. He was left to the guardianship of Proxenus, a citizen of Atarna in Mysia, who received the young Stagirite into his family, and skilfully directed his education. At the age of seventeen, Aristotle was attracted by the

love of learning to Athens, and particularly by the desire of hearing Plato in the academy, the best school of science as well as morals then existing in the world, and where the most studious student might find competitors fit for exciting his emulation and sharpening his diligence. Plato early observed of him, that he required the rein rather than the spur. His industry in perusing and copying manuscripts was unexampled, and almost incredible; he was named, by way of excellence, the student or reader. Plato often called him the "soul of his school;" and, when Aristotle happened to be absent from his lectures, often complained, "Intellect is not here," and that he spoke to a deaf audience. As the student advanced in years, his acuteness was as extraordinary in canvassing opinions, as his industry had been unrivalled in collecting facts: his capacious mind embraced the whole circle of science; and, notwithstanding his pertinacity in rejecting every principle or tenet which he could not on reflection approve, his very singular merit failed not to recommend him to the discerning admiration of Plato, with whom he continued to reside twenty years, even to his master's death; alike careless of the honours of a court, to which the rank and connections of his family might have opened to him the road in Macedonia; and indifferent to the glory of a name, which his great abilities might have attained by establishing a separate school, and founding a new sect in philosophy. While Aristotle thus attended to the improvement of his mind, he did not neglect whatever might adorn his person. His figure was not advantageous; he was of a short stature, his eyes were remarkably small, his nose was high, his limbs were disproportionably slender, and he lisped or stammered in his speech. For his ungracious person Aristotle is said to have been anxious to compensate by the finery and elegance of his dress: his mantle was splendid; he wore rings of great value; and he shaved both his head and his face, while the other scholars of Plato kept their long hair and beards. This fondness for dress, however, neither altered his character, nor interrupted his ardent passion for knowledge. When he was about six and thirty years of age, he lost his master Plato. Of that sage he always spoke with a degree of respect approaching to veneration. Soon after Plato's decease, Aristotle wrote verses in his praise, and erected altars to his honour. The epitaph inscribed by Aristotle on the monument of his master, is preserved in a Latin version of an ancient life of Aristotle, written in Greek, and ascribed by some to Ammonius, and by others to Philoponus, and it is as follows:

"Gratus Aristoteles fruit hoc altare Platoni,
Quem turbæ injustæ vel celebrare nefas."

"To Plato's sacred name this tomb is rear'd,
A name by Aristotle long rever'd!

Far hence, ye vulgar herd! nor dare to slain
With impious praise this ever-hallow'd fame."

These extraordinary tokens of respect on the part of Aristotle, afford a presumption amounting almost to certainty, that there is no truth in the relation of which Aristoxenus is said to have been the original author, and which has been transmitted by Ælian, Diogenes Laertius, and others, that Aristotle gave great offence to Plato by the effeminate elegance of his dress, and by his pertness and loquacity; and that in resentment of the preference manifested by his master in favour of Xenocrates and Speusippus, he intruded into the school, perplexed Plato at the age of eighty, when his faculties were failing, with subtle questions, drove him from the academy, and took possession of the chair, till it was reclaimed for Plato by his disciple Xenocrates. In the Latin translation of the life of Aristotle above mentioned, this

columny is charged on Aristoxenus, who, as Suidas observes, entertained a personal enmity against Aristotle, for preferring Theophrastus to him in the succession of his school. For the assertion that Aristotle instituted a new school before Plato's death, we have, therefore, no sufficient authority. It has been also related by Ælian, (Var. Hist. l. v. c. 9.) whose testimony, indeed, does not deserve implicit credit, and also by Athenæus (Deipnosoph. l. viii. p. 354.) that Aristotle, in his youth, was so much addicted to pleasure as to spend his patrimony; that he afterwards entered into the army; and abandoning a military life, professed medicine, and practised pharmacy; till at length he was led by accident to turn his attention to philosophy. But the age at which he was admitted into the academy, and other circumstances, very much invalidate the credibility of this account. The connections which Aristotle had formed, at the time of his master's death, with some of the most illustrious, as well as the most extraordinary, personages of his own or any age, might naturally inspire him with the design of leaving Athens, after he had lost the philosopher and friend whose fame had first drawn him thither, and whose instructive society had so long retained him in that celebrated city. Aristotle might probably have directed his views to the succession in his deceased master's chair at the academy; and upon the election of Speusippus, disappointment and disgust might have furnished additional motives to his leaving Athens. Whatever might have been the case in this respect, Aristotle, while a boy at Atarna, had contracted an intimacy with Hermias, who, originally in a state of servitude, had been enabled by the bounty of a patron to prosecute the study of philosophy; and having become a fellow-student with Aristotle at Athens, soon united with him in the bands of affectionate esteem, which finally cemented into firm and unalterable friendship. Aristotle through life pursued the calm and secure paths of science, but Hermias ventured to climb the dangerous heights of ambition. His enterprising spirit, seconded by good fortune, raised him to the sovereignty of Assus and Atarna, Greek cities of Mysia. Thither, at the invitation of his royal friend, Aristotle repaired. At Atarna he found the wish of Plato realized; and in his friend Hermias, philosophy seated on a throne. In that city he resided near three years, enjoying the inexpressible happiness of seeing his enlightened political maxims illustrated in the virtuous reign of his fellow-student and sovereign. But Hermias being afterwards deposed, Aristotle was obliged to fly. When Hermias was put to death by Artaxerxes, king of Persia, Aristotle erected a statue of his friend in the temple of Delphos, and wrote in praise of him an epitaph, and a hymn to virtue; of which we have an elegant translation, with ingenious remarks, in bishop Hurd's Notes on Horace's Art of Poetry, v. 219. Aristotle, on this occasion, escaped to Mitylene in the isle of Lesbos, in company with Pythias, the kinswoman and adopted daughter of the king of Assus and Atarna, but now miserably fallen from the lofty expectations in which her youth had been educated. But this sad reverse of fortune only endeared her the more to Aristotle, who married the fair companion of his flight in his thirty-seventh year; which is precisely that age pointed out by himself as the fittest, on the male side, for entering into wedlock. Pythias died shortly afterwards, leaving an infant daughter, whom Aristotle named after a wife tenderly beloved, and who repaid his affection with the most amiable sensibility. Aristotle was now distinguished throughout Greece, and Philip of Macedon, acquainted with his fame, and apprized of his merits, early designed to request his acceptance of the tuition of his son Alexander, and at length prevailed on him to undertake the charge,

charge, in the fourth year of the 105th Olympiad, or the 341st before Christ, when Alexander was fourteen years of age. See ALEXANDER.

In the education of Alexander, the Stagirite spent near eight years, or five (Justin: Hist. l. xii. c. 16.), during which long period, in an office of much delicacy, he enjoyed the rare advantage of giving the highest satisfaction to his employers, while he excited the warmest gratitude in his pupil. But the ambition of Alexander had early taken root; and the peculiarities of his character had displayed themselves in a very public and very important transaction, which happened long before the Stagirite arrived at the court of Pella. This was his intercourse with the Persian ambassadors, which has been mentioned under the article ALEXANDER. In training such a youth, says Dr. Gillies, the Stagirite had a rich field to cultivate; but he could only hope to give a new direction to passions, which it was too late to moderate or controul. In his treatise on politics, he has carefully delineated the plan of education best adapted to persons of the highest rank in society; and, in performing the task assigned to him by Philip, this plan was to be skilfully modified, by adjusting it to the peculiar circumstances and extraordinary character of his pupil. Alexander's loftiness could not be conquered, but it might be made to combat on the side of virtue; if he was angry, it was proved to him that anger was the effect of insult, and the mark of inferiority. His love for military glory, which, while it is the idol of the multitude, will always be the passion of the great, could neither be restrained nor moderated; but, to rival this tyrant of his breast, still more exalted affections were inspired, which rendered Alexander as much superior to conquerors, as conquerors deem themselves superior to the lowest of the vulgar. Agreeably to a maxim enunciated in that book of Aristotle's politics which relates to education, the two years immediately following puberty constitute that important period of life, which is peculiarly adapted for improving and strengthening the bodily frame, and for acquiring that corporeal vigour which is one main spring of mental energy. During this interesting period of youth, with the proper management of which the future happiness of the whole life is so intimately connected, Aristotle observes that the intellectual powers ought indeed to be kept in play, but not too strenuously exercised, since powerful exertions of the mind and body cannot be made at once, nor the habits of making them be simultaneously acquired. In conformity with this principle, Alexander was encouraged to proceed with alacrity in his exercises, till he acquired in them unrivalled proficiency; after which, the whole bent of his mind was directed to the most profound principles of science. Aristotle having directed the studies of his pupil to such subjects as expanded and invigorated the understanding, proceeded to those which regulate private and public conduct. He carefully instructed his pupil in ethics and politics. He wrote to him, long afterwards, a treatise on government; and exhorted him to adjust the measure of his authority to the various characters of his subjects, agreeably to a doctrine which he frequently maintains in his political works, that different nations require different modes of government, respectively adapted to their various turns of mind, and different habits of thinking.

The influence which Aristotle acquired with his royal pupil he employed to beneficent purposes. One distinguished instance is his conduct to his native country. See ALEXANDER, ARISTOTELIA, and STAGIRA.

After the most intimate communication during the space of eight or nine years, the pupil and the preceptor separated for ever, to pursue, in a career of almost equal length, the most

opposite paths to the same immortal renown; the one by arms, the other by philosophy; the one by gratifying the most immoderate lust of power, the other by teaching to despise this and all similar gratifications. During his eastern triumphs, terminated in the course of ten years by his premature death, Alexander gave many illustrious proofs of gratitude to the virtuous director of his youth. Although the tutor declined accompanying his pupil in this expedition, their mutual regard was maintained by a friendly correspondence; and the conqueror furnished the philosopher with materials for his Natural History, by sending him, at a great expence, from different countries, a large collection of animals. See Plin. H. N. l. viii. c. 16. Athen. l. ix. However, in a subsequent period, Alexander's resentment against Callisthenes was transferred to Aristotle, and a mutual alienation took place between the philosopher and the prince.

Having taken leave of the Macedonian capital, Aristotle returned to his beloved Athens, where he spent thirteen years, almost the whole remainder of his life, instructing his disciples, and improving the various branches of his philosophy. Finding the academic chair occupied by Xenocrates, the successor of Speusippus, he obtained permission to apply to the purposes of public instruction a large building in the suburbs of the city, called the Lyceum, which had been used for military exercise. Accordingly, about the second year of the 111th olympiad, or the 335th year before Christ, he opened his school, and founded a new sect of philosophers, denominated, from the circumstance of his walking when he delivered his lectures, PERIPATETICS. Here he delivered his acroatic, acroamatic, or esoteric and exoteric philosophy; the former, consisting of physics and logic, and delivered to a select audience; the latter, composed of rhetoric, ethics, and politics, and delivered to the public at large. See ACROATICS. The talents and virtues of Aristotle exposed him to envy and calumny, and the found wisdom of his philosophy excited the hatred of the many pretenders that naturally abounded in such a reservoir of literature as Athens. He regarded with equal contempt, vain pretenders to real science; or real professors of sciences which he deemed unproductive of any beneficial purpose. "He fought," (says his modern biographer and interpreter), "only for truth, and was careless of the obstacles which stood in his way to attaining it, whether they were found in the errors of philosophers, or in the prejudices of the vulgar. Such a man, in such a city as Athens, where, since the days of Socrates, the learned taught publicly, and conversed freely with all descriptions of persons, could not fail to have many rivals and many enemies. Sophists and sciolists, footsayers and satirists, and that worst of bana satirical historians, heaped obloquy on a character, the ornament of his own age, and destined to be the instructor of posterity." In pretended piety, the enemies of Aristotle found the means of accusing a sage whose incomparable wisdom corroded their envy. After having taught thirteen years in the Lyceum with the highest reputation, he was charged with irreligion before the Arcopagus by the microphant Eurymedon, abetted by Demophilus, a person of weight in the republic, and both of them infligated to this cruel prosecution by our philosopher's declared enemies. The heads of the accusation were, "that Aristotle had commemorated the virtues both of his wife Pythias and of his friend Hermias, with such ceremonies and honours as the piety of Athens justly reserved for the majesty of the gods." Though these accusations were extremely frivolous, yet Aristotle was condemned, but escaped punishment by leaving the country. After making a rhetorical defence of himself, and accompanying it with a proverbial line:

“ Ὀχμι πρὸ ἄχμι γρησσει, σικκὸν δὲ πρὸ σικκου.”

“ Pears upon pears, and figs on figs grow here :”

importing that Athenians would always be Athenians, he withdrew from Athens, assigning this reason for his conduct, according to Ehan, (l. iii. c. 36). “ I am not willing to give the Athenians an occasion of being guilty of injustice a second time against philosophy ;” referring probably to the case of Socrates, and which he considered as similar to his own. In the second year of the 114th Olympiad, or the 324th year before Christ, Aristotle, accompanied by a few friends, retired to Chalcis in Eubœa, and there, in the sixty-third year of his age, and the third year of the 114th Olympiad, or 323 years before Christ, he died.

The cause and manner of his death have been variously represented. Suidas says, that he drank hemlock, because he had been called to account for the hymn written by him in honour of Hermias. Others, for it is needless to advert to the tales of monkish writers, report, that the occasion of his death was too intense an application to abstruse inquiries, and particularly so on the question concerning the tides of the Euripus, which ebbed and flowed seven times in a day. He was twice married; first to Pythias, and afterwards to Herpilis a native of Stagira, by whom he had a son named Nicomachus, to whom he addressed one of his treatises on morals. His constitution was infirm; but his health was preserved, and his life prolonged, notwithstanding close and sedulous application, by his temperance.

Aristotle exhibited a character as a man, worthy of his pre-eminence as a philosopher; inhabiting courts without meanness and without selfishness; living in schools without pride and without austerity; cultivating with ardent affection every domestic and every social virtue; manifesting on all occasions that regard to truth, which is emphatically expressed in the adage said to be his, “ Amicus Plato, Amicus Socrates, magis tamen amica veritas ;” while with indefatigable industry he reared that wonderful edifice of science, the plan of which we are still enabled to discover from his imperfect and mutilated writings.

Of Aristotle's writings the fate was as extraordinary as unmerited; few of them were published in his life-time; the greater part of them nearly perished through neglect. The manuscripts and library were bequeathed to Theophrastus, the most illustrious of his pupils. Theophrastus again bequeathed them to his own scholar, Neleus, who, carrying them to Sceplis, a city of the ancient Troas, left them to his heirs in the undistinguished mass of his property. The heirs of Neleus, men ignorant of literature and careless of books, totally neglected the intellectual treasure that had most unworthily devolved to them, until they heard that the king of Pergamus, under whose dominion they lived, was employing much attention and much research in collecting a large library. Afraid that the despotic power of the prince might seize so valuable an accession, they hid their books under ground; and the writings of Aristotle, as well as the vast collection of materials from which they had been composed, thus remained in a subterraneous mansion for several generations, a prey to dampness and to worms. At length they were relieved from their prison, or rather raised from the grave, and sold for a large sum, together with the works of Theophrastus, to Apellicon of Athens, a lover of books rather than a scholar (see APPELLICON), through whose labour and expence the work of restoring Aristotle's manuscripts, though performed in the same city in which they had been originally written, was very imperfectly executed. To this, not only the ignorance of the editors, but both the condition and the nature of the writings themselves, did not a little

contribute. (See Dr. Gillies's Life of Aristotle, vol. i. p. 35.) History has not informed us what became of Aristotle's original manuscript; but the copy made for Apellicon was, together with his whole library, seized by Sylla, the Roman conqueror of Athens, and by him transmitted to Rome. Tyrannion, a native of Pontus, who had been taken prisoner by Lucullus, procured the manuscript from Sylla's librarian. He communicated the use of it to Andronicus of Rhodes, who then flourished as a philosopher at Rome. See ANDRONICUS. The Rhodian having undertaken the task of arranging those long injured writings, finally performed the duty of a skilful editor. From the æra of Andronicus's publication to that of the invention of printing, a succession of respectable writers, on civil and sacred subjects (not excepting the venerable fathers of the Christian church) confirm by their citations and criticisms the authenticity of most of the treatises still bearing Aristotle's name. According to the most credible account, he composed above 300 different treatises, of which only 48 have been transmitted to the present age. But many of these last consist of several books; and the whole of his remains together still form a golden chain of Greek erudition, exceeding four times the collective bulk of the Iliad and Odyssey.

The works of Aristotle are referred to three heads, God, Nature, and Man. Whatever reasonings relate to theology, though scattered in different treatises, may be referred to his metaphysics; a name unknown, indeed, to Aristotle, but given to his theological works by his editors, and importing, that the fourteen books which bear it, should immediately follow his numerous treatises on the subjects of physics or natural philosophy; that we may not rest satisfied with the knowledge of bare effects, but proceed to the investigation of causes, and of the deity himself, the primary cause of all. In connection with his “ fourteen books under the title of metaphysics,” we may mention his treatise “ of the universe and its cause,” and “ a refutation of Xenocrates, Zeno, and Gorgias.” Aristotle's doctrines concerning Being considered abstractedly, concerning deity, and concerning the soul, are comprehended under the term “ metaphysics ;” because they *pass beyond* sensible bodies to objects that are perceived only by the understanding; and this branch of science is called by him “ the first philosophy.” The doctrine of Being, or ontology, is nothing more than the definition and arrangement of general terms; and from a series of definitions Aristotle deduces such corollaries as necessarily follow from them. The first principle or axiom, as he states it, of this doctrine is, that it is impossible that the same thing should be, and should not be, in the same subject, at the same time, and in the same respect. To this universal principle, which is itself incapable of demonstration, because it is a primary truth, all demonstration may be reduced. Being exists either by itself, or by accident; on the first all properties or accidents depend; but of the latter no certain knowledge can be obtained. Being may be either in power, or act; and power is either active or passive. The former is the principle of motion or change, and the latter consists in the subject upon which active power is exercised. Power remains when it is not exerted in action; and action takes place when a thing is otherwise than when it was in power. Again, Being is either notional, as it is conceived in the mind, or real, as it exists in nature. To unity, which is one of the properties of Being considered with respect to numbers, are nearly related, identity, equality, and similarity. Being also admits of genus and species. The doctrine of Aristotle concerning the First Mover, is more important. From the circular motion

motion of the heavens, which he conceives to be eternal, he deduces his notion of the First Mover; itself unmoved and eternal, which eternally communicates motion to other substances. This substance, the cause of eternal motion, is itself simple, pure energy, immaterial, eternal, and immutable; and its act, by which it is the first cause of all motion, consists in the simple energy of pure intelligence. This influence operates, independently and immediately, upon inferior intelligences of the same nature with itself; and by their agency the motions of the primary and subordinate spheres are produced. The First Mover is in its essence incorporeal; indivisible, because unity is perfect; immutable, because nothing can change itself; and eternal, because motion is eternal. This incorporeal intelligence, happy in the contemplation of himself and the first cause of all motion, is, according to the system of Aristotle, the Being of Beings, or God. Perplexed with difficulties in his conception of the mode by which motion was communicated, he resorted to analogy, and supposed that the First Mover acts upon the first celestial sphere to give it motion, in a manner similar to that by which the mind of man acts upon the human body. From the well-known fact, that the motion of the body follows the conceptions and volition of the mind, he assumed a certain intellectual influence, exercised by the First Mover, as the principle of local motion, and thus imagined that he had solved the great problem that had hitherto been found inexplicable, in what manner mind acts upon body.

Hence has arisen an inquiry, whether Aristotle is to be ranked in the class of Theists or of Atheists. From the preceding cursory view of his system, it appears that it does not exclude the idea of deity; for he speaks of the First Mover as a being distinct from the world, separate from matter, and possessing intellect, desire, and a power of communicating motion; upon whom the universe is dependent, not as upon an animating principle, but an external moving power. This being he represents as superior to all other intelligent natures, and calls him God. At the same time, Aristotle's notion of a deity cannot be reconciled with just conceptions of the divine nature and attributes. Although he makes God the cause of all motion, yet, by supposing the universe to have existed from all eternity, he divests him of the glory of creation, and connects him with a world already formed by a chain of necessity, for no other purpose than to make him the first spring of a vast machine. God indeed, in the system of Aristotle, is immutable; so is likewise the celestial sphere, in which he is supposed to reside. In producing motion he acts necessarily; and eternally employed in the contemplation of his own nature, he observes nothing, and cares for nothing beyond himself. Possessing neither immensity nor omnipresence, and far removed from the inferior parts of the universe, he is not even a spectator of its inhabitants and their concerns, and cannot therefore be a proper object of reverence and worship. As to those intelligent natures which he conceived to be inferior to the First Mover, Aristotle taught, that they are simple immaterial substances, presiding over the lower celestial spheres; but he has no where clearly determined, whether they were proper objects of religious worship. It is probable, that he ranked every thing of this kind among the popular superstitions, and that this was the cause of the complaints which were brought against him by the Athenians.

On the subject of Mind, Aristotle asserted with Plato, that there are in man different faculties, which have respectively a different organ; but he expresses himself in such obscure terms, that it is not easy to perceive his true meaning. The soul, which is the first principle of action

in an organized body, possesses life potentially, but does not move itself. It is not a rare body, composed of elements; for it differs from these in having perception. It has three faculties, the nutritive, the sensitive, and the rational. The first is that by which life is produced and maintained. The second is that by which we perceive and feel, without perceiving itself or its organs, but some external object by the intervention of its organs, which are adapted to produce the sensations of sight, hearing, smell, taste, and touch. The external senses, by means of sensible species or forms that are immaterial, perceive objects as wax receives the impression of a seal without receiving any part of its substance; but the difference of these objects is perceived by the common or internal sense. Perception differs from intellect; the former being common to all animals, the latter belonging to a few. Fancy is the perception produced by the immediate action of the senses. Memory is derived from fancy, and has its seat in the same power of the soul; being the effect of some image impressed upon the soul by means of the senses. Reminiscence is that mental faculty, by which we search for any thing which we wish to recollect, through a series of things nearly related to it, till at last we call to mind what we had forgotten. The intellect is that part of the soul by which it understands; and it is passive and active: the former being the seat of the species or forms of things, and the latter the efficient cause of all knowledge. The principle of local motion is the desire or aversion which arises from the practical exercise of the understanding; and it produces either rational volition or sensitive appetite. The production of animal life arises from the union of the nutritive soul with animal heat. Life is the continuance of this union, death its dissolution.

As to the Soul or first principle of animal life, and of all perception, intelligence, or action, Aristotle was at a loss in explaining its specific nature. He could only define the mind to be that principle by which we live, perceive, and understand. When he attempted to form an abstract conception of this principle, he was perplexed; and he was so unacquainted with the nature of this substance, or so undecided in his opinion, or perhaps so anxious to conceal it, that he recurs to the use of a term, which merely expresses the confused idea which he had formed to himself from observing its operations, and called *Εντελεχεια*, or "perfect energy," denoting some unknown source of sensitive and rational life in certain organized bodies. It does not certainly appear from the writings of Aristotle, whether he thought the soul of man mortal or immortal; but the former appears most probable, from his notion of the nature and origin of the human soul, which he conceived to be an intellectual power, externally transmitted into the human body from an eternal intelligence, the common source of rationality to human beings. We have no evidence that he supposed the union of this principle with any individual to continue after death.

Aristotle's histories of the heavens and of the earth; of animals, plants, and minerals; and even of man, considered merely as a material and sentient being, may, conformably with modern language, be arranged under the head of Nature; though, in Aristotle's own acceptation, that term has a more limited sense; and is confined to terrestrial objects, and those existing between this earth and the lunar sphere.

The physical writings of Aristotle are the following: "Of Physics, or the Doctrine of Nature;" explaining the principles and properties of natural bodies: "Of Heaven;" treating of the universe, the celestial spheres, and simple bodies or elements: "Of Generation and Corruption;" "Of Meteorology;" "Of the History of Animals;"

"Of

A R I S T O T L E.

• Of the parts of Animals and their Causes;” “ Of the Production of Animals;” “ Of the Progression of Animals;” “ Of the Soul, or Vital Principle;” “ Of the Senses;” “ Of Memory;” “ Of Sleep;” “ Of Dreams;” “ Of Animal Motion;” “ Of the Length of Life;” “ Of Youth and Old Age;” “ Of Respiration;” “ Of Plants;” “ Of Breath;” “ Of Marvellous Facts;” “ Of Physiology.” “ Of Sounds;” “ Of Colours;” and “ Problems.”

In Aristotle's system of *Physics*, the principles of nature are neither the “similar part” of Anaxagoras, nor the “atoms” of Leucippus and Democritus, nor the “sensible elements” of Empedocles, nor the “unity” of Parmenides, nor the “numbers” of Pythagoras, nor the “Idea” of Plato; but they were the three following, viz. “form, privation, and matter;” the two former being contrary to each other, and the latter the common subject of both. Matter, according to Aristotle, is a primary substance without quantity or quality, form or figure, or any of the properties of body. This incorporeal matter, though really borrowed from the Pythagoreans, Aristotle claimed as his own invention, and he boasted of his having been the first who had discovered the true principle of bodies. Form is the peculiar nature or essence of any thing, or that which makes it to be what it is. Privation is the absence of form, so that matter and form are the constituent principles of things, and privation is accidentally associated with them. In order to unite matter and form, Aristotle for this purpose conceived in his mind a vague notion, which he has very obscurely and unsatisfactorily explained, of some internal cause of motion and arrangement, to which he applied the term “nature.” Causes are distinguished by this philosopher into four kinds; material, of which things are made; formal, by which a thing is that which it is, and nothing else; efficient, by the agency of which any thing is produced; and final, or the end for which it is produced. Substances he divides into eternal, as the heavens which revolve round the earth with a circular motion peculiar to the celestial spheres; and perishable, as animal or terrestrial bodies. The heavenly sphere has neither levity nor gravity, is liable to no change, and is eternal. Its natural motion is circular, but there are other spheres which move in a contrary direction to this, in order to produce the vicissitudes of terrestrial things. The motion of the first sphere, or “primum mobile,” is equable and uniform; and this the first mover being eternal and immutable. The stars are of the same nature with the spheres that support them, but more dense; and they communicate light and heat to the air, and thence to the inferior world, by means of friction; and they are moved in consequence of the motion of the spheres, in which they are placed. The earth is spherical, and immoveably fixed in the center of the motion of all the spheres. The first sphere revolves with the greatest velocity from west to east, and the inferior spheres in a contrary direction. The velocities of the spheres of the seven planets are inversely as their distances from the first sphere. The world, according to this philosopher, is finite and eternal; and there is only one world. Bodies, according to his system, are either simple elements produced by the union of the first matter and form, or compound terrestrial bodies produced from the combination of elementary bodies. The elements are four, namely, fire, air, water, and earth. The two principles of motion are gravity and levity; by the former, bodies descend towards the center of the world, and by the latter, they rise towards the heavens. The element of earth has simple gravity; that of fire, simple levity; air and water partake of both. Compound bodies suffer a perpetual succession of dissolution and production; and this change is effected by the action of the

circular motion of the heavens, by means of which the sun and stars, which are the immediate agents in production and dissolution, approach towards or recede from the earth. An action and a passion that are reciprocal arise from the mutual contact of different bodies. In sensible bodies there are certain primary qualities, some active and others passive, which constitute their specific difference. Of this kind are heat and cold, moisture and dryness, heaviness and lightness, hardness and softness, roughness and smoothness, and the like. From the union of the two first of these pairs of primary qualities, the elements are formed, as fire, from heat and dryness; air, from heat and moisture; water, from cold and moisture; and earth, from the union of cold and dryness. All the elements may be transmuted; and all mixed bodies are formed by the combination of all of them. From the general principles of production and dissolution, and from the mutual action and passion of the simple qualities, Aristotle endeavours to assign the causes of natural appearances, and to explain the nature of mixed bodies, both perfect and imperfect. In his speculative physics, Aristotle displays an extensive practical knowledge of nature. His writings in natural history are a continued chain of physical and anatomical facts, which appear to have been the result of accurate observation. He collected by diligence, and by the assistance of others, and particularly of Alexander his pupil, a great number of natural bodies which he accurately examined; and he appears to have himself dissected, or to have been present at the dissection of, many animals, especially of fishes.

Upon the philosophy of man, as our author calls it, that is, of man considered as a social and rational being, endowed with sentiment, affection, and intellect, Aristotle's writings are as clear and copious as they are solid and satisfactory. His treatises on logic, ethics, and politics, as well as his books on rhetoric and poetry, may all be referred to this one head, and viewed as connected parts of one great system of knowledge. In the most important, “ethics,” contained in ten books to Nicomachus, seven to Eudemus, two entitled “the greater morals,” and a small part comprehending definitions of “virtues and vices,” he considered, in the first place, their object, to wit, happiness; and afterwards the faculties of the mind, their exertions and determinations which tend to produce happiness. The excellencies of our species, he observes, all refer either to the understanding or the will; the first possesses reason essentially in itself, the second is capable of being combined and assimilated with this divine principle. From the two powers of the understanding and the will, are respectively derived two classes of virtues, the intellectual and the moral. Sagacity, penetration, intelligence, wisdom, are virtues of the understanding; gentleness, temperance, fortitude, justice, are virtues of the heart. The former class consists in the proper disposition and habit of the intellectual part of the soul; the latter in the proper disposition and habit of the desires and affections, which being formed subordinate to reason, and capable of listening to its dictates, then only perform their duty, when, like obedient subjects, they cheerfully observe the commands of their sovereign. The intellectual virtues depend chiefly on education and exercise; the moral proceed entirely from habit, from which they derive their name. It is by practising justice, that we become just; by practising temperance, that we become temperate; by practising courage, that we become courageous. Hence the wonderful power of legislation and early institution, by which the Cretans, the Spartans, and some other nations were honourably distinguished among the rest of mankind. Virtue is a practical art, and like all practical arts, can be preserved by practice only. It is neither

ether natural, nor contrary to nature. We are born capable of attaining it, but the invaluable attainment must be made and perfected by habit. The virtues depend on the propriety of the affections from which they arise; and lye in a mean betwixt the extremes of too much and too little. Thus, to fear every thing is cowardly; to fear nothing is audacious; courage requires that we should fear only such objects as are truly formidable, and only in that degree in which they ought to be feared. In the same manner, he who is too much affected by objects of pleasure, and seizes every opportunity to enjoy them, is called intemperate; he who is too little affected by such objects, and refuses every opportunity to enjoy them, may be called insensible. Temperance teaches us to pursue only such pleasures as we ought, at proper times, in proper places, and on proper occasions. According to the same view of things, generosity lies in the middle between avarice and profusion; modesty, between pride and diffidence; mildness, between irascibility and softness; magnificence, between ostentation and parsimony; popularity, between forbidding disdain and officious adulation; in a word, every virtue consists in a mean equally remote from two vicious extremes. Considered as the quality of an action, virtue consists in the propriety of that affection from which the action proceeds, when the affection is neither too strong, nor too weak, but has precisely that degree of strength which right reason teaches us to approve. As the quality of an action, virtue consists therefore in mediocrity; but as the quality of a person, it consists in the habit of this mediocrity, since in judging persons and characters, we regard not particular acts and feelings, but such acts and feelings as are frequent and habitual. There are many, and those the most important virtues, the exercise of which is not in the first instance attended with pleasure. To support labour, to endure pain, to encounter difficulties and dangers, which wisdom and fortitude on many occasions require, are not obviously recommended by any natural desire; nor is the practice of such duties immediately agreeable. It is still less agreeable, at first, to curb and restrain our natural appetites for pleasure, which is the proper office of temperance; nor can that vigilant circumspection, and ever-watchful attention to the most remote consequences of our actions, which is essential to the virtue of prudence, be acquired without trouble and care, without many painful efforts and difficult struggles. Yet it is the nature of all those virtues, as well as of the hardest lessons of justice, patriotism, and friendship, to become through habit agreeable; and the only sure test that we have acquired them is, that they are practised with pleasure. The moral virtues cannot, according to Aristotle, subsist without some mixture of the intellectual; but the latter may subsist alone and independent; and according to both Aristotle and Plato, the purest and most permanent felicity of which man is susceptible, results from the exercise of his rational powers upon subjects of abstract speculation. The labours of the statesman or general, the exertions of the legislator or patriot, all refer to some end or purpose, the attainment of which may be prevented by fortune, or frustrated by the weakness or wickedness of man. The practice of justice, generosity, temperance, and fortitude requires many conditions, and supposes a variety of situations, which it is not always in our power to command. The just or generous man must have objects to whom he may distribute his justice or generosity; he must possess the means by which to exercise those virtues which all participate of frail mortality; since, though directed by prudence, they are impelled by passion, and result from the exigencies of our present corporal state. But the energies

of contemplative wisdom are pure and simple, like the intellectual source from which they spring. Not subservient to remote purposes or contingent ends, they are immediately agreeable on their own account, and on every side round and complete in themselves. Such are the principal doctrines to be found in Aristotle's "*Ethics*."

His treatise on "*Politics*," comprehending eight books, in the very first paragraph, in a few plain words, states the only legitimate purpose of political establishments. "Every political society forms, it is plain, a sort of community or partnership instituted for the benefit of the partners. Utility is the end and aim of every such institution; and the greatest and most extensive utility is the aim of that great association comprehending all the real, and known by the name of the commonwealth."

Having stated and explained the grand purposes of society, he considers the best systems of means for attaining those purposes, and traces the distinction of ranks which arises from the inequalities of individual talents, virtue, and fortune. Political institutions are best fitted for promoting human happiness, when they are most suitable to the opinions and sentiments of the people, and the circumstances of the times and country. No one political system will equally suit all situations, and scarcely any two. Government being an arrangement, the best government must be the best arrangement, and the best arrangement is that in which the materials to be arranged are the best fitted both to receive and to preserve. The materials of the statesman or legislator are the number and character of his people, and the extent and quality of his country. The excellence of a commonwealth, however, is not to be estimated by its populousness or extent, but by its fitness for performing its proper functions; the same energies and habits constitute the happiness both of individuals and of nations. Men make governments, not governments them; nor by any system of political arrangements can a happy commonwealth be constituted from fools or cowards, profligates or knaves. The bricks must be first prepared, before the edifice can be reared. The human character is a compound of good and evil; the former arises from the balance of the affections, under the controul and guidance of reason, the latter results from passion operating without restraint. That government is the best, which most powerfully stimulates the energies of the people to beneficial purposes, and restrains them from hurtful pursuits. That must be a system of freedom in the first place tempered by order, and moderation in the second. Mixed governments, wisely formed and balanced, best correspond to the state of mankind. Democracy, though apparently most agreeable to the rights of man, is not the best adapted to his wants; the general will unrestrained is apt to run into excess, and precipitate in deliberation, to be tardy in execution. While simple democracy is inexpedient for the people themselves, simple aristocracy and simple monarchy are equally inexpedient; and being the subjection of the many to a few or to one, are moreover unjust. For these reasons Aristotle recommends a constitution that combines and balances the three orders as the most generally likely to promote the good of society. To his treatise on politics, Aristotle has added two books on "*Oeconomics*," in which he has treated in a similar way, on the management of domestic concerns.

In "*Logic*," or the art of reasoning, in which Aristotle has the merit of being an inventor, his writings are, "The Categories," or ten general heads of arrangement; "of Interpretation," explaining the philosophical principles of Grammar; "Analytics," including the whole doctrine of syllogisms and demonstration; "Topics," or common-places of arguments; and "Sophistic Refutations,"

tions," teaching the art of replying to an opponent. These pieces collected in one volume, are called the "Organon of Aristotle." The arrangement of the ten CATEGORIES (which see) was borrowed from the Pythagorean school, and is said to have been first invented by ARCHYTAS of Tarentum, and communicated to Aristotle by Plato, who conversed with this Pythagorean in Italy. The art of syllogistical reasoning (see SYLLOGISM), was perhaps altogether the invention of Aristotle; and, whatever may be thought of its utility, it must be allowed to have been a wonderful effort and display of ingenuity. On the invention and application of syllogisms, Aristotle treats with a degree of minuteness and subtlety, which produces obscurity. His logical dissertations would have been clearer, as well as more concise, if he had carefully distinguished between words and ideas, and confined his attention chiefly to the latter. The reader will find a distinct account of the logic of Aristotle, by Dr. Reid, in the second volume of lord Kaimes's Sketches of the History of Man. Edinb. 4to. 1774, p. 165. See also the articles DEMONSTRATION, DIALECTICS, LOGIC, PROPOSITION, SYLLOGISM, &c. in this work.

The "*Rhetoric*" of Aristotle is comprised in three books, in which the principles of eloquence are investigated, and the whole art of oratory taught with so much depth of invelligation, and accuracy of arrangement, that the work has been the basis of all that has been since delivered upon the subject by Cicero, Quintilian, and later writers. See ORATORY. Another treatise, addressed to Alexander, is added, in which are distinctly considered the several species of discourse belonging to the general heads of deliberative, demonstrative, and judicial pleading.

On the subject of "*Poetry*," the "Poetic" of Aristotle affords a correct analysis of the constituent parts of the drama and the epic; and contains general principles and particular observations, which could only have been written by a master in criticism.

The pieces on "*Mathematics*" which Aristotle has left, are, an obscure, and probably imperfect treatise on "Incommensurable Lines," and a book of "Questions in Mechanics."

Although among the works of Aristotle, nothing written expressly on Music has come down to us, if we except his tract *περὶ ἁρμονίας*, and the nineteenth section of his Problems; yet we find from these, and from his works in general, that he had thought much and deeply on the subject. Indeed among the titles of two hundred and fifty of his lost books, which have been collected by Fabricius, a work on Music appears, *Περὶ Μουσικῆς*, written expressly on the subject. We shall therefore do the art and science of Music the honour to rank this great, this first of men, among its benefactors.

For a further account of the reception, progress, and decline of the Aristotelian philosophy in the middle and in later ages; see PERIPATETICS. See also LOGIC, METAPHYSICS, PHILOSOPHY, PHYSICS, &c.

Having given a copious account of the life and writings of Aristotle, to which his distinguished talents, his rank as an author, his personal merit, and his reputation, and influence in the various departments and seminaries of literature for many ages, gave him a just claim, and without which a work of this nature must have been essentially imperfect; it may not be improper to collect a few particulars that may serve to aid us in appreciating his literary character as well as the importance and utility of his writings. Whilst we disregard the fictions of calumny and panegyric, we shall not unduly extol his talents and virtues, nor degrade them below their just standard. On the one hand, no credit can be attached to the abuse of Timæus the Tauromenite, who represents him as a pretender to learning, a vile parasite, and an habitual glut-

ton and drunkard; nor to the cavils that were raised against his reputation, in consequence of the honour he paid to the memory of his friend Hippias, and that of his wife Pythias; and, on the other hand, there is no foundation for ascribing his extraordinary wisdom to divine revelation; nor are we sufficiently authorized to say with the Jews, that he gained his philosophy in Judæa, and borrowed his moral doctrine from Solomon; much less that he was of the seed of Israel and the tribe of Benjamin; or with the Chrillians, that he was a special messenger, supernaturally ordained to prepare the way for divine revelation, and that we are indebted to the aid of his philosophy for the extent and accuracy of our acquaintance with the sublime mysteries of religion. Although we cannot believe that just before his death, he discoursed to his friends concerning "the contempt of death, and the immortality of the soul;" that in his last moments he dictated a book in order to shew, that wise men need not lament their exit from their tenement of clay, of which book, an Hebrew version of the Arabic translation from the supposed original was rendered into Latin, about the year 1200, by Maufred, son of the emperor Frederic I.; yet we cannot allow that either his doctrine or his life warranted his being condemned as an advocate for immorality or impiety, much less that he was the most infamous of human beings. On a fair and impartial estimate, it will perhaps be found, that neither were his virtues of that exalted kind which command admiration, nor his faults so criminal as not to admit of some apology. He may, perhaps, be justly censured for having taught his pupil Alexander principles of morals and policy, which were accommodated to the manners of a court, and which might be easily rendered subservient to his ambitious views. And it cannot be doubted, that his philosophical doctrines concerning nature were not favourable to the public forms of religion. Few will now be found such extravagant admirers of Aristotle as to join with Snidas in extolling him as "the secretary of nature," and as "having dipped his pen in intellect;" and yet all must admit, that he possessed a profound and penetrating genius, and a wonderful talent for classing ideas, defining terms, and analyzing the faculties and operations of the human mind. He had also, without doubt, an extensive acquaintance with natural objects, and he was a diligent observer of physical and moral phenomena. If he had bestowed that attention on the discrimination and arrangement of natural bodies which he devoted to words, he might have been a Linnæus; or if he had, according to the modern mode of philosophizing, deduced general principles from facts and experiments, he might have been a Bacon, a Boyle, or a Newton. Instead of doing this, his ambition to stand distinguished among philosophers as the founder of a new sect induced him to try his strength in abstruse disquisitions, and to indulge a too daring spirit of contradiction and innovation. His object was to erect his own edifice upon the ruin of every other structure. As lord Bacon has finely remarked (*De Augm. Scient. l. iii. c. 4.*), "like a Turkish despot, he thought he could not reign secure, unless all his brethren were slain. Innovating rather in words than in reality, and determining to oppose his new philosophy to ancient tenets, of which many were founded on truth and experience, he sometimes misrepresents the opinions of former philosophers; sometimes selects those which were most trifling, or most easily refuted; and sometimes has recourse to uncertain principles and vague terms, in hopes that obscurity might be mistaken for novelty. Having acquired the habits and manners of high life at the court of Amyntas to which his father introduced him, and having occasion, as preceptor to Alexander, to accommodate

his philosophy to the ambition of the young prince with whose education he was entrusted, he deserted the fanciful republic of Plato, and finding the morals of Socrates too confined for his purpose, framed a system of ethics for himself, which would allow full scope for the aspiring views of Alexander and his friends. Even the Syllogistic art, which was peculiarly his own, is very materially defective, tends to mislead by multiplying hypothetical propositions, or by teaching the practice or detection of sophistry, and affords little or no assistance in the investigation and discovery of truth. The conclusion in every syllogism is, in fact, contained in the premises; if the premises have not been previously proved by other means than syllogistic reasoning, the conclusion is not established; if they have, the syllogism is unnecessary; so that, as Dr. Reid observes in his account of Aristotle's logic (*ubi supra*), other kind of reasoning, independently of observation and experiment, only carries a man round, like a horse in a mill, without any real progress. Upon the whole, it has been observed by competent and candid judges, that the philosophy of Aristotle is rather the philosophy of words than of things, and that the study of his writings tends more to perplex the understanding with subtle distinctions than to enlighten it with real knowledge. The veneration that was paid to him in the Arabian, Jewish, and Christian schools, was rather the means of obstructing than of aiding and promoting the progress of useful science. It was not, as an excellent biographer remarks, till mankind were emancipated from their vassalage to Aristotle, that the human mind asserted its native freedom and dignity, and that genuine science began to enlighten the world. The principal writings of Aristotle have been often separately printed; and of his entire works, the chief editions are, Gr. 6 vols. fol. ap. Ald. Venet. 1498. 6 vols. 12mo. Ald. 1552. 10 vols. 4to. Sylburgii, Franc. 1587. Gr. and Lat. fol. Casauboni, Lugd. 1590. 1646, fol. Gener. 1605. 8vo. Lugd. 1597. 2 vols. fol. Du Val, Paris, 1629, 1654. Vid. Diog. Laert. t. i. p. 263. Dion. ARISTOTUS, in *Ichthyology*, a name given by Albertus and some other old writers to the fish which we call the *skad*; *CLUPEA Alofa*. Linn.

ARISTOXENUS, in *Biography*, is the most ancient Greek writer on the subject of music that has come down to us. He was the son of a musician, whom some call Mnesias, others Spintharus. He had his first education at Mantinea, a city of Arcadia, under his father, and Lampus of Erythra; he next studied under Xenophilus, the Pythagorean, and lastly under Aristotle, in company with Theophrastus. Suidas, from whom these particulars are transcribed, adds, that Aristoxenus, enraged at Aristotle having bequeathed his school to Theophrastus, traduced him ever after. But Aristotle the Peripatetic, in Eusebius, exculpates Aristoxenus in this particular, and assures us that he always spoke with great respect of his master Aristotle.

From the preceding account it appears that Aristoxenus lived under Alexander the Great, and his first successors.

His *Harmonics* in three books, all that are come down to us, together with Ptolemy's *Harmonics*, were first published by Gogavinius, but not very correctly, at Venice, 1562, in 4to. with a Latin version. John Meursius next translated the three books of Aristoxenus into Latin, from the MS. of Joseph Scaliger, but, according to Meibomius, very negligently. With these he printed at Leyden, 1616, 4to. Nicomachus and Alypius, two other Greek writers on music. After this Meibomius collected these musical writ-

ers together, to which he added Euclid, Bacchius senior, Aristides Quintilianus; and published the whole with a Latin version and notes, from the elegant press of Elzevir, Amst. 1652. The learned editor dedicates these ancient musical treatises to Christina, queen of Sweden.

Aristoxenus is said by Suidas to have written four hundred and fifty-two different works, among which those on music were the most esteemed; yet his writings upon other subjects are very frequently quoted by ancient authors, notwithstanding Cicero, and some others, say that he was a bad philosopher, and had nothing in his head but music. The titles of several of the lost works of Aristoxenus, quoted by Athenæus and others, have been collected by Meursius in his notes upon this author; by Tenison and Menage; all which Fabricius has digested in alphabetical order. We shall here only mention such as concern music, which are upon subjects so interesting to inquirers into the merits of ancient music, that their loss is much to be lamented. 1. "Of Performers on the Flute, and concerning Flutes and other musical instruments." 2. "Of the Manner of boring or piercing Flutes." 3. "Of Music in general." In this work, which was different from his *Harmonics*, he treated not only of the rhythmical, metrical, organical, poetical, and hypercritical parts of music, but of the history of music and musicians. 4. "Of the Tragic Dance." With respect to the tracts of Aristoxenus that are come down to us, they are cited by Euclid, Cicero, Vitruvius, Plutarch, Diogenes Laertius, Athenæus, Arist. Quintilianus, Ptolemy, and Boethius. And as a musical writer, he is so much celebrated by the ancients, and so frequently mentioned by the moderns, that his treatises which are extant, seem to deserve a particular attention. They are given by all his editors as divisions of one and the same work; but the two first books are evidently independent fragments. The second book is not a second, but another first part. It is surprising that Meibomius should regard it as a continuation, and wonder in his notes, that Porphyry should quote the second book as the first. The second book is plainly the opening of another work, as appears by its beginning with an explanation of the subject, and a sketch of the order in which the author proposed to treat it, all which is done in the first book. It is likewise full of repetitions. There appears, however, through the cloud of bad readings, and all kinds of corruptions in the text, to be an accuracy, and an Aristotelian precision in these old books, which are not to be found in later writers, who seem to have all the negligence and inaccuracy of compilers.

As Pythagoras and Aristoxenus were heads of the two most numerous and celebrated musical sects in antiquity, we shall endeavour to make such of our readers as are curious in these matters, acquainted with their different tenets.

The Pythagoreans, by their rigid adherence to calculation, and the accurate divisions of the monochord, may be said to have trusted more to the judgment of the eye, concerning the perfection of consonance, than to that of the ear. Intervals, according to them, were consonant or dissonant, in proportion as the ratios of the vibrations were simple or complex. Thus the octave was more perfect than the 5th, because the ratio of 1 to 2 is more simple, and more easily perceived, than that of 2 to 3; and the 5th, for the same reason, was more perfect than the 4th, $\frac{3}{4}$. It was upon this principle that they allowed of no deviation from the strict ratios of sounds. They left nothing to the uncertain judgment of the ear, which they thought no more able to determine a perfect consonance without a

monochord, than the eye to form a perfect circle without compasses.

Aristoxenus, on the contrary, referred every thing to the ear. He thought the senses sufficiently accurate for musical, though not for mathematical purposes; and that it was absurd to aim at an artificial accuracy in gratifying the ear, beyond its own power of distinction. The philosophy of the Pythagoreans, their velocities, vibrations, and proportions, he rejected with contempt, as being foreign to the subject; substituting abstract causes in the room of experience, and making music less the object of sense than of intellect.

According to these principles, his doctrine maintained, that concords were to be taken by the judgment of the ear only, and other intervals at which the ear was less able to determine the perfection, by the difference, or sum of concords. Thus the tone was the difference between the 4ths and 5ths: the ditone was taken by alternate 4ths and 5ths: as Ea, ad, DG, GC. Had he stopped here, nothing could reasonably have been alleged against him. But, taking the tone as a well-known interval, of which the ear, from the comparison of 4th and 5th, could judge with sufficient exactness, he made it the measure of all other intervals; of the greater by addition, and of the less by division. Thus the 4th contained, according to him, two tones and a half; the 5th, 3 and $\frac{1}{2}$; the octave, consequently, 5 tones and 2 semi-tones, or 6 tones. And, further, the tone he divided into 2, 3, and 4 equal parts. By this process, as it is justly objected to him by Ptolemy, he acted inconsistently with his own principles, pretending to trust solely to the ear, and to exclude reason and calculation, at the same time that he was making a parade of both, in a way either totally useless and nugatory, or more complicated and difficult than that which he had rejected. If the ear is unable to determine the exact ratio of a concord, still less is it able accurately to bisect a tone; and that a tone cannot be numerically divided into two, or more equal parts, has long been demonstrated. It can only be done by geometrical and lineal methods, more operose than the calculations of Pythagoras, and which, if accomplished, would give only false, incommensurable, and tempered intervals. Aristoxenus seems to have been led into this inconsistency by his desire of distinguishing himself from the mere practical musicians of his time, of whose inaccuracy and want of science he frequently speaks with great contempt.

The Pythagoreans, on the other side, were not without their errors. The principles were right, but they carried them too far, and forgot that they could not otherwise be known to be right, than as they were confirmed by the pleasure of the ear. How, for instance, did they know that the ratio from 2 to 3 was that of a perfect fifth but by the ear, which, upon repeated trial, found that interval most harmonious when produced by strings in that proportion? But it was the peculiar character of the Pythagorean philosophy, to erect abstract numbers and proportions into physical causes. Not content with pursuing their principle of the simplicity of ratios, as far as experience warranted, and the ear approved, they set it up as an *à priori* principle, and rejected intervals which the ear pronounced to be concords, merely because they did not fall within the proportions which they chose to admit. The compound interval, for instance, of the 8th and 4th, though undoubtedly concord, they would not admit as such, because its ratio, 3:8, is neither multiple nor superparticular, the only proportions they admitted as consonant, on account of their simplicity.

They are, besides, charged both by Ptolemy and Aristoxenus, with sometimes assigning such ratios to intervals as the ear did not approve; but no instance is given. It would be injustice, however, to quit these famous musical theorists, without acknowledging that their physical doctrines concerning the production of sound, and the causes of gravity and acuteness, have been confirmed by modern philosophy, and their metaphysical speculations concerning the causes of consonance, adopted by modern writers of no inconsiderable reputation. Gen. Hist. Mus.

ARITHMANCY. See ARITHMOMANCY.

ARITHMETIC, formed from *αριθμος*, *number*, the art of numbering; or, that part of mathematics, which considers the powers and properties of numbers, and teaches how to compute or calculate truly, and with expedition and ease. By some authors it is also defined to be the science of discrete quantity. It consists chiefly in the four great rules or operations of addition, subtraction, multiplication, and division: to which may also be added involution and evolution.

Besides these, for the purpose of facilitating and expediting computations, mercantile, astronomical, &c. several other useful rules have been contrived; as, the rules of proportion, progression, alligation, false position, fellowship, interest, barter, rebate, equation of payments, reduction, tare and tret, &c.—But these are only applications of the first four rules. See these rules under their several heads, ADDITION, &c.

Concerning the origin and invention of arithmetic, we have very little information; history fixes neither the author nor the time. Some knowledge, however, of numbers must have existed in the earliest ages of mankind. This knowledge would be suggested to them, whenever they opened their eyes, by their own fingers, and by their flocks and herds, and by the variety of objects that surrounded them. At first, indeed, their powers of numeration would be of very limited extent; and before the art of writing was invented, it must have depended on memory, or on such artificial helps, as might most easily be obtained. To their ten fingers they would, without doubt, have recourse in the first instance; and hence they would be naturally led to distribute numbers into periods, each of which consisted of ten units. This practice was common among all nations, the ancient Chinese, and an obscure people mentioned by Aristotle, excepted. But though some kind of computation must have commenced at a very early period, the introduction of arithmetic as a science, and the improvements it underwent, must, in a great degree, have depended upon the introduction and establishment of commerce: and as commerce was gradually extended and improved, and other sciences were discovered and cultivated, arithmetic would be improved likewise. It is therefore probable, that if it was not of Tyrian invention, it must have been much indebted to the Phœnicians or Tyrians. Proclus, indeed, in his Commentary on the first book of Euclid, says, that the Phœnicians, by reason of their traffic and commerce, were the first inventors of arithmetic; and Strabo also informs us, that in his time it was attributed to the Phœnicians. Others, however, have traced the origin of this art to Egypt; and it has been a general opinion, sanctioned by the authorities of Socrates and Plato, that Theut or Thot was the inventor of numbers; that from hence the Greeks adopted the idea of ascribing to their Mercury, corresponding to the Egyptian Theut or Hermes, the superintendance of commerce and arithmetic. With the Egyptians we ought also to associate the Chaldæans, whose astronomical disquisitions and discoveries,

series,

veries, in which they took the lead, required a considerable acquaintance with arithmetic.

From Asia it passed into Egypt, as Josephus says, by means of Abraham. Here it was greatly cultivated and improved; inso much that a large part of the Egyptian philosophy and theology seems to have turned altogether upon numbers. Hence those wonders related by them about unity, trinity; the numbers seven, ten, four, &c. In effect, Kircher (in his *Oedip. Ægypt. tom. ii. p. 2.*) shews, that the Egyptians explained every thing by numbers; Pythagoras himself affirming, that the nature of numbers pervades the whole universe, and that the knowledge of numbers is the knowledge of the Deity. From Egypt arithmetic was transmitted to the Greeks by Pythagoras and his followers; and among them it was the subject of particular attention, as we perceive in the writings of Euclid, Archimedes, and others; with the improvements derived from them, it passed to the Romans, and from them it came to us.

The ancient arithmetic was very different from that of the moderns in various respects, and particularly in the method of notation. M. Gouget (*Origin of laws, arts, &c. vol. i. p. 218.*) suggests, that the ancient Greeks first used pebbles in their calculations; and in proof of this he adduces the word *χρῆσις*, (derived from *χρῆσις*, a *little stone* or *pebble*;) which signifies to calculate: and he also supposes that the word calculation is derived from the term *calculi*, *little stones*, used by the Romans in their first arithmetical computations. To this purpose it has been also alleged, that the Indians are at this time very expert in computing by means of their fingers, without the use of pen and ink; and that the natives of Peru, by the different arrangements of their grains of maize, surpass the European, aided by all his rules, with regard both to accuracy and dispatch. The Hebrews and Greeks, however, at a very early period, and after them also the Romans, had recourse to the letters of their alphabet for the representation of numbers. The Greeks in particular had two different methods: the first resembled that of the Romans, which is sufficiently known, as it is still used for distinguishing the chapters and sections of books, dates, &c. See CHARACTERS. They afterwards had a better method, in which the first nine letters of the alphabet represented the first numbers from 1 to 9, and the next nine letters represented any number of tens, from 1 to 9, that is, 10, 20, &c. to 90. Any number of hundreds they expressed by other letters, supplying what they wanted by some other marks or characters: and in this order they proceeded, using the same letters again, with different marks to express thousands, tens of thousands, hundreds of thousands, &c.; thus approaching very near to the more perfect decuple scale of progression used by the Arabians, who acknowledge, as some have said, that they received it from the Indians. Archimedes also in his "Arenarius," used a particular scale and notation of his own. In the second century of the Christian Æra, Ptolemy is supposed to have invented the sexagesimal numeration and notation, and this method is still used by astronomers and others for the subdivision of the degrees of circles. These several modes of notation above recited, were so operose and inconvenient, that they so limited the extent, and restrained the progress, of arithmetic, that it was applicable with great difficulty and embarrassment to the other sciences, which required its assistance. The Greeks (if we except Euclid, who in his *Elements* furnished many plain and useful properties of numbers, and Archimedes in his *Arenarius*) contributed little to the advancement of this science towards perfection; its practical operations derived little benefit from their theory, abstract properties, and tedious distinctions

and divisions of numbers; and the imperfection of the art sufficiently appears from a treatise of Nichomachus, supposed to be written in the third century of Rome, and published at Paris in 1538; from the two first books of the *Mathematical Collections* of Pappus, of which only a small fragment remains; and also from that of Boethius, written at Rome in the sixth century after Christ, and still extant. From Boethius we learn, that some Pythagoreans had invented and employed, in their calculations, nine particular characters, whilst others used the ordinary signs, namely, the letters of the alphabet. These characters he calls *quæres*; and they are said greatly to resemble the ancient Arabic characters, which circumstance suggests a suspicion of their authenticity. Indeed, the MSS. of Boethius, in which these characters, resembling those of the Arabian arithmetic, are found, not being more ancient than three or four centuries, confirm the opinion that they are the works of a copyist. Upon the whole, this treatise of Boethius does not warrant our rejecting the commonly received system with regard to the origin of our arithmetic; but if we suppose that the Arabians derived their knowledge of it from the Indians, it is more probable that it was one of the inventions which Pythagoras spread among the Indians, than that those persons should have obtained it from the Greeks. See FIGURES.

A compendium of the ancient arithmetic, written in Greek, by Pfellus, in the ninth century, was published in Latin by Xylander, in the year 1556; a similar treatise was written soon after in Greek, by Jordocus Willichius; and a more ample work of the same kind was written by Jordanus in the year 1200, and published with a comment, by Faber Stapulensis, in 1480. The same author also wrote upon the new art of computation by the Arabic figures, and called this book "Algorismus demonstratus." This book in MS. is still extant, according to Dr. Wallis, in the Savilian library at Oxford, but has never yet been printed. A treatise on arithmetic was also written by Johannes de Sacro Bosco, who died about the year 1256. The introduction of the Arabian or Indian notation into Europe, about the tenth century, made a material alteration in the state of arithmetic; and this, indeed, was one of the greatest improvements which this science had received since the first discovery of it. This method of notation, now universally used, was probably derived originally from the Indians by the Arabians, and not, as some have supposed, from the Greeks; and it was brought from the Arabians into Spain, by the Moors or Saracens, in the tenth century. Gerbert, who was afterwards pope under the name of Silvester II. and who died in the year 1003, brought this notation from the Moors of Spain into France, long before the time of his death, or, as some think, about the year 960; and it was known among us in Britain, as Dr. Wallis has shewn, in the beginning of the eleventh century, if not somewhat sooner. See FIGURES. As literature and science advanced in Europe, the knowledge of numbers was also extended, and the writers in this art were very much multiplied. The next considerable improvement in this branch of science, after the introduction of the numeral figures of the Arabians or Indians, was that of decimal parts, for which we are indebted to Regiomontanus; who about the year 1464, in his book of "Triangular Canons," set aside the sexagesimal subdivisions, and divided the radius into 60,000,000 parts; but afterwards he altogether waved the ancient division into 60, and divided the radius into 10,000,000 parts; so that if the radius be denoted by 1, the sines will be expressed by so many places of decimal fractions as the cyphers following 1. This seems to have been the first introduction of

ARITHMETIC.

decimal parts. But this method was more expressly delivered in the extraction of the square and cube roots, by Peter Ramus in his Arithmetic, written about the year 1567, and published with other treatises, by Lazarus Schonerus, in 1586. Dr. Wallis has shewn (*Algebr.* p. 32.) that our countrymen William Buelley and Robert Record had used a similar method for extracting the square root in fractions, about the year 1550: but the first person who professedly treated on this subject, and introduced the name of "disme" or "decimals," was Simon Stevinus, in a treatise entitled "Disme," subjoined to his arithmetic, published in French, and printed at Leyden in 1585; since which the method of decimals has been practised by many others, and is now become universal. See DECIMAL.

To Dr. Wallis we are principally indebted for our knowledge of circulating decimals, and also for the arithmetic of infinites. The last, and perhaps with regard to its extensive application and use the greatest, improvement which the art of computation ever received, was that of logarithms, which we owe to baron Neper or Napier, and Mr. Henry Briggs. See LOGARITHMS. See also the subsequent articles.

Arithmetic, in its present state, is variously divided into different kinds; *theoretical, practical, instrumental, logarithmical, numerical, specious, decimal, dynamical, tetraëtical, duodecimal, sexagesimal, &c.*

ARITHMETIC, *theoretical*, is the science of the properties, relations, &c. of numbers, considered abstractedly; with the reasons and demonstrations of the several rules. Euclid furnishes a theoretical arithmetic, in the seventh, eighth, and ninth books of his Elements.—Barlaam Monachus has also given a theory for demonstrating the common operations, both in integers and broken numbers, in his *Logistica*, published in Latin by J. Chambers, an Englishman, in 1600.—To which may be added, Lucas de Burgo, who, in an Italian treatise intitled "Summa Arithmetica & Geometrica," published in 1494 at Venice, gives the several divisions of numbers from Nicomachus, and their properties from Euclid; with the algorithm, in integers, fractions, extractions of roots, &c. Malcolm has also treated the subject very fully, in all its branches, in his "New System of Arithmetic, theoretical and practical," printed at London in 1730.

ARITHMETIC, *practical*, is the art of numbering or computing; that is, from certain numbers given, of finding certain others, whose relation to the former is known. As if two numbers, 6 and 8, are given, and we are to find their sum, which is 14, their difference 2, their product 48, their quotient $1\frac{1}{2}$, or a third proportional $\frac{6^2}{8} = \frac{36}{8} = 4\frac{1}{2}$. Lucas de Burgo has given the practice of Arithmetic as it subsisted in his time, as well as the theory. Tonitall's practical treatise of Arithmetic was published in 1526; and Stifelius in 1544 wrote on the practical and other parts of arithmetic. An entire body of practical arithmetic was given by Nic. Tartaglia, a Venetian, in 1556, consisting of two books; the former, the application of arithmetic to civil uses; the latter, the grounds of algebra. The principal writers on this art, theoretical and practical, have been Barlaam, Lucas de Burgo, Tonitall, Aventinus, Purbach, Cardan, Scheubelius, Tartaglia, Faber, Stifelius, Record, Ramus, Maurolycus, Hemischius, Peletarius, Stevinus, Xylander, Kersey, Snellius, Tacquet, Clavius, Metius, Gemma Frisius, Buteo, Ursinus, Romanus, Napier, Ceulen, Wingate, Kepler, Briggs, Ulacq, Oughtred, Cruger, Van Schooten, Wallis, Dec, Newton, Morland, Moore, Jeake, Ward, Leybourn, Hatton, Malcolm, &c. &c., whose discoveries and inventions, as far as they have made any, will be noticed in their proper places.

ARITHMETIC, *binary*, or *dyadic*. See BINARY Arithmetic.

ARITHMETIC, *common* or *vulgar*, is that which relates to integers and vulgar fractions.

ARITHMETIC, *decimal*, or *decadal*, is that which is performed by a series of ten characters or figures, in a ten-fold progression, as from 1 to 10, from 10 to 100, &c. including both integers and decimal fractions in the common scale of numbers. See DECIMAL.

The characters now used are the ten Arabic or Indian figures, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9; for the history of which see FIGURES, and ARITHMETIC, *supra*.

ARITHMETIC, *duodecimal*, is that which proceeds from 12 to 12, or by a continual subdivision according to 12, and is much used by most artificers in calculating the value of their work; as bricklayers, carpenters, painters, tylers, &c.

ARITHMETIC, *fractional*, or of *fractions*, is that which treats of fractions both vulgar and decimal. See FRACTION.

ARITHMETIC, *harmonical*, is that part of the doctrine of numbers, which relates to the comparison, reduction, &c. of musical intervals.

ARITHMETIC of *infinites*, is a method of summing up a series of quantities, consisting of an infinite number of terms, or of finding their ratios. This method was first invented by Dr. Wallis, as appears from his treatise on the subject in the "Opera Mathematica," vol. i. p. 365, &c., where he shews its use in geometry, in finding the areas of superficies, and the contents of solids, and their proportions. This is also called the method of "Indivisibles," because magnitudes are here supposed to be resolved into their indivisible parts, or at least as far as there is any occasion to consider them as such. See INDIVISIBLES. But the method of FLUXIONS, which is an universal arithmetic of infinites, performs all this much more easily, and many other things, which the former will not reach.

ARITHMETIC, *instrumental*, is that in which the common rules are performed by means of instruments contrived for ease and dispatch; such are several sorts of scales, and sliding-rules; Napier's bones or rods, described under their proper article; the arithmetical machine of Pascal and others; sir Sam. Morland's instrument, the description whereof was published by himself, in 1672: that of M. Leibnitz, described in the Miscellan. Berolin.; that of Polenus, published in the Venetian Miscellany, 1709: and that of Dr. Saunderson, described in the introduction to his algebra. Such is also the ABACUS, or SHWAN-PAN of the Chinese.

ARITHMETIC, *integral*, or of *integers*, is that which relates to integers, or whole numbers.

ARITHMETIC, *literal*, or *algebraic*, is that which is performed by letters, that represent any numbers indefinitely. See ALGEBRA.

ARITHMETIC, *logarithmical*, is that which concerns logarithms, and is performed by tables of LOGARITHMS; which see.

ARITHMETIC, *logistical*. See LOGISTICAL.

ARITHMETIC, *mechanical*, is that which is performed by means of a lever or balance. See BALANCE.

ARITHMETIC, *numerous*, or *numeral*, is that which gives the calculus of numbers, or indeterminate quantities; and is performed by the common numeral or Arabic characters.

ARITHMETIC, *palpable*, is that which is performed by the sense of feeling, and practised by blind persons. Dr. Saunderson, Lucasian professor of mathematics in the university of Cambridge, had contrived, for his own use, a commodious notation for any large numbers, which he could express

express on his abacus, or calculating table, and with which he could very readily perform any arithmetical operations. His calculating table was a smooth thin board, somewhat larger than a foot square, raised upon a small frame, so as to be hollow; and this board was divided by a great number of equidistant parallel lines, and by others as many at right angles to the former. The edges of the table were distinguished by notches, at the distance of about half an inch from one another, and to each notch belonged five of the afore-mentioned parallels; so that every square inch was divided into an hundred little squares. At every point of intersection the board was perforated by small holes, capable of receiving a pin: for it was by the help of pins, stuck up to the head through these holes, that he expressed his numbers. Of these pins he used two sorts, some larger, and others smaller; or, at least their heads were different, so that they might be easily distinguished by the touch. A large quantity of these pins, with the points cut off, was kept in two boxes, which were always near him when he calculated. In order to understand his mode of calculation, it is necessary to premise, that to every numeral figure a little square was appropriated on the table, consisting of four of the little squares above described, and allowing a small interval between one figure and another; and this numeral figure was different according to the different magnitude or situation of the one or two pins which always composed it; for which purpose the ingenious professor had settled in his mind and strictly observed the following analogy or notation. A great pin in the centre of the square, its appropriate and invariable place, was a cypher, or 0, by which name we shall call it. Its chief office was to preserve order and distance among the figures and lines. This cypher was always present, except in the case of an unit, for expressing which, the great pin in the center was changed into a little one. When 2 was to be expressed, the cypher was restored to its place, and the little pin was put just over it. To express 3, the cypher remained in its place, and the little pin was advanced into the upper angle, on the right hand. To express 4, the little pin descended, and immediately followed the cypher. The express 5, the little pin descended to the lower angle, on the right hand. For 6, the little pin retreated, till it was just under the cypher. For 7, this pin retreated into the lower angle, on the left hand. For 8, it ascended, till it was just before the cypher. For 9, the little pin ascended into the upper angle, on the left hand. In this manner all the digits were expressed by an easy and uniform notation, which might readily enough be apprehended and distinguished by the feeling. These digits or figures are represented in *Plate I. Algebra, fig. 1.* Dr. Saunderson was able, by this contrivance, to mark, or write down, as we may say, any proposed number upon his table, and by lightly running his fingers over it, he could at any time easily read it, and know what it signified. The great pins or cyphers which were always placed at the center of the little squares, and most frequently at equal distances from one another, were a sure guide to direct him in keeping the line, in ascertaining the limits of every figure, and in preventing any ambiguity that might otherwise occur. As three of the erect parallels were sufficient for a single figure, so three of the transverse parallels would suffice for a line of figures, and the next three for another line, and so on, without any danger of interfering. Thus we may conceive, without much difficulty, how he might have any number of lines of figures upon his table at the same time, in a descending order, or how he might deduce one number from another, or how he might make any computation required. It is said that he could place and displace his pins with incredible quickness

and facility, to the surprize and amusement of spectators. He could even break off in the middle of a calculation, resume it when he pleased, and instantly know the state of it, by only drawing his fingers gently over the table. The table might also be previously prepared by himself or some other person, by filling every third hole of every third parallel line with large pins or cyphers; and then, when he intended to calculate, he would only need to complete every figure by adding a small pin in its proper place, except when he wished to express an unit, in which case he must have changed the large pin into a small one. He had composed and preserved for his own use certain arithmetical tables, which seemed to have some relation to the tables of natural sines, tangents, and secants. These were four pieces of solid wood, in the form of rectangular parallel-pipeds, each about 11 inches long, $5\frac{1}{2}$ broad, and somewhat above half an inch thick. The two opposite faces of every one were divided into little squares after the manner of the abacus above described; but they were perforated only in the necessary places, where the pins were stuck fast up to the head. Each face exhibited nine small arithmetical tables, of ten numbers each; and every number, generally speaking, consisted of five places or figures. One of these tables is represented in *Plate I. Algebra, fig. 2.*

Besides this arithmetical use of his table, for which it was primarily and chiefly designed, he could describe upon it very neat and perfect geometrical figures, consisting of right lines, intersecting one another in a variety of ways. This he did by two methods; either by pins set in rows, which exhibited the appearance of pricked lines, or by pins placed only at the intersections. Then by winding a piece of fine thread or silk about their heads, he could very well exhibit any continued straight lines at pleasure, or any system of such lines. Whether he had palpable letters also, somewhat like printing types, to distinguish the several angular points, and to assist in demonstrating the properties of these figures, does not now appear. It is not very difficult to conceive, how the same table might possibly be applied to the representation of all kinds of algebraical equations, and to the several reductions of such equations, especially by the use of the forementioned types, or some similar contrivance. Dr. Saunderson also might have had types, in the form of pins, for the common algebraic signs, and to serve the purpose of various operations; and thus his table would have had a near resemblance to a printer's form, which he might have read by the touch, if he had thought proper to use it. It is said that he could spell very well, that he knew the shapes of the letters, both small and capital, and would sometimes amuse himself, when opportunity offered, by reading the inscriptions upon tomb-stones with his fingers; and he is known to have often regretted, that he did not apply himself to learn to write in his younger years, which he thought he could easily have accomplished. Saunderson's Alg. vol. i. Introd.

The description of an apparatus for the improvement of this numerical board of Dr. Saunderson, was presented to the Society of Arts, &c. in 1786, by a blind person of the name of Thomas Grenville. The board is perforated with holes, in exact lines, horizontally and perpendicularly. The horizontal lines denote units, tens, hundreds, thousands, &c. reckoning from right to left, as usual; and the perpendicular lines allow the figures to be placed below each other, as is usual in every account. These holes are fitted with pegs, on the heads of which are painted the figures (or numbers) they respectively represent; which figures are distinguished by the blind person by means of certain pins placed in the heads of these pegs. Between the rows of holes for these

these pegs are rows of smaller holes, adapted to receive the but ends of brass wires, which perform the part of lines, placed either horizontally or perpendicularly, as is necessary for any arithmetical operation. The box is formed into proper divisions for holding the pegs and wires; and it is, without doubt, a very useful apparatus for blind persons, who, with a little attention, may perform by means of it every arithmetical operation which they could perform if they had the use of sight.

ARITHMETIC, political, is the application of arithmetic to political subjects, such as the strength and revenues of kingdoms, the number of inhabitants, births, burials, &c. See *POLITICAL Arithmetic*. To this head may be also referred the doctrine of CHANCES, GAMING, &c.

ARITHMETIC of Ration. See *RATIO*.

ARITHMETIC, sexagesimal, or sexagenary, is that which proceeds by sixties; or the doctrine of sexagesimal fractions; supposed to have been invented by Ptolemy, in the second century. In this notation the integral numbers from 1 to 59 were expressed in the common way; then sixty was called a *sexagena prima*, and marked I'; twice sixty, or 120, II'; and so on to 59 times 60, or 3540, which is LIX'. Sixty times sixty, or 3600, was called *sexagena secunda*, and marked with two dashes, I''; twice 3600, II''; and ten times 3600, X'', &c. And in this way the notation was continued. But if a number less than sixty was joined with any of the sexagesimal integers, their proper expression was annexed without the dash; e. gr. four times 60 and 25 is IV'XXV'; the sum of twice 60, ten times 3600, and 15, is X''LXV', &c. So nearly did the inventor of this method approach to the Arabic notation: instead of *sexagesimal* progression, he had only to substitute *decimal*; to make the signs of numbers from 1 to 9 simple characters, and to introduce a character which signifies nothing by itself serving only to fill up places. The *sexagena integrorum* were soon laid aside, after the introduction of the Arabic notation; but the *sexagesimal* fractions continued till the invention of *decimals*; and are still used in the subdivisions of circular arcs and angles.

Sam. Reyher has invented a kind of sexagenal rods, in imitation of Napier's bones, by means whereof the sexagenary arithmetic is easily performed.

ARITHMETIC, specious, is that which gives the calculus of quantities; using letters of the alphabet instead of figures, to denote the quantities; and coincides with what we usually call *algebra*, or *literal arithmetic*.

Dr. Wallis has joined the numeral with the literal calculus; and by means of it demonstrated the rules for fractions, proportions, extraction of roots, &c. a compendium of which is given by Dr. Wells, under the title of *Elementa Arithmeticae*. an. 1698.

ARITHMETIC, tabular, is that in which the operations of multiplication, division, &c. are performed by tables calculated for that purpose; such as those of Herwart at Hohenburg, called "the universal table of prostaphæreses," published in 1610; and Hutton's tables of powers and products, published by order of the commissioners of longitude, in 1781.

ARITHMETIC, tetraëtic, is that in which only the figures 1, 2, 3, and 0, are used. We have a treatise of this arithmetic, by Erhard Weigel; but both this and binary arithmetic, are little better than curiosities, especially with regard to practice; inasmuch as the numbers may be much more compendiously expressed by decadal arithmetic, or the common decuple scale, than by either of them.

ARITHMETIC, vulgar, is that conversant about integers and vulgar fractions.

ARITHMETIC, universal, the name given by sir Isaac Newton to the science of algebra. See *ALGEBRA*.

ARITHMETICAL, denotes something relating to, or performed after the manner of, arithmetic.

ARITHMETICAL complement of a logarithm, is what the logarithm wants of 10.0000000. Thus the arithmetical complement of 7 1079654, is 2 8920946, and it is found by subtracting each figure but the last from 9, and that from 10.

It is often used in trigonometrical calculations, when radius or 10.0000000 is the first term, to save the labour of subtraction. It is distinguished by placing a point before, and another after the index; thus, .2.8920946.

ARITHMETICAL division of the octave, in *Music*, is that which

a
D

divides it into two portions: as A, when the middle term is a fourth to the base or lowest sound, and which in the ecclesiastical modes constitutes those that are termed *plagal*. The

a
A

harmonic division constitutes the *authentic modes*, as D; when the middle term is a fifth to the lowest. From these two divisions of the octave all tones or modes of the church were regulated in the following manner:

Harmonic Division.	$\left\{ \begin{array}{l} d e f g a c \\ A B C D E G \\ D E F G A C \end{array} \right.$	Authentic modes.	$\left\{ \begin{array}{l} a b c d e \\ D E F G A \\ A B C D E \end{array} \right.$	Arithmetical Division.	$\left\{ \begin{array}{l} a b c d e \\ D E F G A \\ A B C D E \end{array} \right.$	Plagal modes.

The first of these divisions consists of fifths and fourths; the second of fourths and fifths.

These divisions still exist in *Canto fermo*, or plain chant; though they have been long abandoned in secular music. It is necessary, however, to know them, as they still serve to regulate the answer to figures. See *DIVISION in Music*, *FIGURE*, and *MODE*.

ARITHMETICAL instruments, or machines. See *INSTRUMENTAL ARITHMETIC*.

ARITHMETICAL medium or mean. See *MEDIUM*.

ARITHMETICAL progression. See *PROGRESSION*.

ARITHMETICAL proportion. See *PROPORTION*.

ARITHMETICAL ratio. See *RATIO*.

ARITHMETICAL scales, a name given by M. Buffon, in the *Mem. d'Acad.* of 1741, to different progressions of numbers adapted to arithmetical computations. Besides the common decuple scale, consisting of ten numbers, others have been devised, such as the binary, tetraëtic, &c. consisting of a different number of characters. M. Buffon lays down a concise and simple method, which serves to shew at once how to write down any given number in any scale whatever; and he also makes several observations on the different scales that have been proposed. It is evident that any scale of numbers, containing fewer or more than ten, would have both its advantages and inconveniences. In a scale of fewer and lower numbers, a given number would require more places of figures for denoting or expressing it; but multiplication and division would be more easily performed, as it is more easy to use the smaller numbers 2, 3, 4, than the larger ones 7, 8, 9: but in a scale ascending beyond 10, or containing more than 10 characters, any given number might be expressed by fewer of them, and yet the arithmetical calculations would be more difficult, on account of the larger numbers 11, 12, 13, &c. Hence it may be concluded, upon the whole, that the decuple scale is a convenient medium between the two extremes, as the numbers which it comprehends, are neither too small nor too large. The duodecimal scale, comprehending 12 characters, would express all numbers in a more compendious manner than

the decimal scale; and yet no single character would represent a number too large for ordinary computations. Accordingly the multiplication table is now made to extend to 12 numbers instead of 10, and the mode of multiplying and dividing by 11 and 12, is as easily acquired as that by 8, 9, or 10. Besides, the number 12 has this advantage, that it admits of more submultiples than 10, and therefore there would be fewer expressions of interminate fractions in this scale than in the decimal one; and hence it has been suggested that the duodecimal scale would be preferable to any other.

ARITHMETICAL Triangle. See TRIANGLE.

ARITHMOMANCY, compounded of *αριθμος*, number, and *μαντια*, divination, a kind of divination, or method of foretelling future events by means of numbers. Delrio distinguishes two sorts of it; one used by the Greeks, who from the number and value of the letters contained in the names, e. g. of two combatants, inferred, that the person whose name consisted of those that were most numerous and of greatest value, would be victorious; and thus they concluded, it is said, that Hector should have been vanquished by Achilles; the other was that of the Chaldeans, who divided their alphabet into three decades, and changing into numeral letters the letters of the names of those who consulted them, they referred each number to some planet, and in this manner formed their presages. The Platonists and Pythagoreans were addicted the Arithmomancy. The gematria, which makes the first species of the Jewish Cabbala, is a sort of Arithmomancy. See GEMATRIA, and CABBALA.

ARITIUM, in *Ancient Geography*, a town of Spain, in Lusitania, situate upon the Tagus, north-east of Olisipo.

ARITZAR, in *Geography*, a town of European Turkey, in the province of Bulgaria, ten miles south of Viddin.

ARIVATES, in *Ancient Geography*, a people placed by Pliny in Pannonia.

ARIUS, in *Biography*, founder of the sect called Arians, in the beginning of the fourth century, was, according to Epiphanius, a native of Lybia; but, according to Photius, of Alexandria. In early life he was probably of the school of Lucian, bishop of Antioch, who favoured the opinions of Paul of Samosata; for Arius, in a letter to Eusebius of Nicomedia, calls him a Collucianist; whence Cave and others have inferred that they were fellow disciples of Lucian. He was appointed deacon by Peter, bishop of Alexandria, and afterwards excommunicated, because he disapproved of the bishop's treatment of Meletius and his adherents. After the martyrdom of Peter, he was re-admitted by Achilles, the next bishop, to the office of deacon, and also ordained presbyter. At this time he was much approved by Alexander, the successor of Achilles, and he was not only presbyter, but officiated in one of the churches of Alexandria. About the year 315, the contest commenced between Arius and Alexander, of which as to its rise, progress, and consequences, an account is given under the article *ARIANS*. In the year 320, he was excommunicated from the church, and expelled the city by a council convened by Alexander, upon which he withdrew into Palestine, where he formed a strong party of persons who favoured him and his cause. Whilst he complained in a letter to Eusebius of Nicomedia, of the persecution he suffered for the sake of the truth, he derived encouragement from the number and rank of those who were attached to his opinions and interests; among whom were several presbyters and bishops. The breach between him and Alexander was thus gradually widened, and parties were formed, who became inveterate and invincible in their opposition to each other. This mutual altercation proceeded to such an extreme, that it furnished a subject of satirical exhibition

in the public theatres. The emperor Constantine, in this stage of the dispute, interposed with the best intention to produce mutual reconciliation. But his efforts, as a mediator, were altogether ineffectual; and he himself was at length induced, by the interference of ardent and bigotted ecclesiastics, probably against his judgment and disposition, to take an authoritative and active part, with a view of terminating a controversy which had riddled the milder methods of persuasion and remonstrance. For this purpose, he imprudently convened the council of Nice, in order to decide whether the Logos, or only begotten Son, was of the same substance with the Father; and thus, instead of terminating, he perpetuated the discussions of the church, and divided the whole Christian world into "Homousians" and "Homoiousians." This council having decided that Christ is consubstantial with the Father, the doctrine of Arius was of course condemned, and the presbyter himself, who was then at Nicewaiting its determination, was banished by Constantine into a remote province of Illyricum. By an edict of the same emperor, he and his adherents were stigmatized with the opprobrious name of Porphyrians, his books were ordered to be burnt, and those who concealed any of them were to be put to death. In a little while, the emperor, who seems to have naturally possessed a candid and benevolent mind, relented, and his conduct towards Arius underwent a total change. Eusebius of Nicomedia, it is said, by means of a presbyter who enjoyed the confidence of Constantia, the emperor's sister, gained over that lady to the interest of Arius. In her last sickness, she recommended to the favour of the emperor this presbyter, by whom he was persuaded to believe, that the faith and conduct of Arius had been misrepresented by his enemies. Upon this Constantine recalled him from banishment; and having received a satisfactory confession of faith, in which he professed his belief, that "the Son was begotten of the Father before all ages," but without any acknowledgment of consubstantiality, recommended to the bishops assembled in council at Jerusalem, A. D. 335, to re-admit him into the communion of the church. The bishops, who are supposed to have been concealed Arians, readily complied, and recommended Arius to a cordial reception among other churches. Attempts were made for restoring him to the church of Alexandria, but they were ineffectual, on account of the resistance of Athanasius, who had succeeded Alexander in that see. A day was appointed, by the express command of the emperor, for his re-admission into the church, at Constantinople; but on that very day, A. D. 336, as it is said, Arius walking in the city, and retiring to obey a sudden call of nature, he discharged his entrails and died on the spot. The story of his death is related both by the historian Socrates (l. i. c. 25. i. 38. Ep. ad Serap.) and Athanasius, but with circumstances which very much invalidate its credibility. The learned editor of Mosheim admits the testimonies of Socrates, Sozomen, Athanasius, and others, with respect to the manner of his death, as unexceptionable. The causes of it, however, have furnished much matter of dispute. The ancient writers, who considered this event as a judgment of heaven, miraculously procured by the prayers of the just, to punish the impiety of Arius, will find little credit in our times, among such as have studied with attention and impartiality the history of Arianism. "After having considered this matter with the utmost care," says the writer above mentioned, "it appears to be extremely probable, that this unhappy man was a victim to the resentment of his enemies, and was destroyed by poison, or some such violent method." He adds; "a blind and fanatical zeal for certain systems of faith has, in all ages, produced such horrible acts of cruelty and injustice."

The

The talents and learning of Arius have been generally acknowledged; but his disposition and character have been more variously represented by writers of different parties. To this purpose we shall take an extract from the account given of him by the eminent and impartial Lardner. "Arius was very tall, grave and serious, yet all big and courteous. With good natural parts, and no inconsiderable share of secular learning of all sorts, he was particularly distinguished by his skill in logic, or the art of disputing. He had at least the outward appearance of piety. In short, he is represented as a man exceedingly well qualified to form a party, and carry on any enterprise he should engage in. So far as I recollect, his conduct was unblameable, excepting what relates to his zeal for maintaining his supposed errors; and that he is charged with dissembling his real sentiments upon some occasions, in those difficult circumstances to which he was reduced by the prevailing power of his adversaries." "I may add here," continues the same author, "that he writes with much spirit, and a full assurance of the truth of his opinions; particularly in his letter to Eusebius at Nicomedia, whom he styles orthodox; and he tells that Bishop, that he and his friends were unjustly persecuted by Alexander for the truth's sake, which conquers all things; that all the bishops of the East in general had been anathematized by Alexander, except Pappologonius, Hellenicus, and Macarius, whom he calls ignorant heretics. As for himself, he was not able to endure their impious doctrine; nor would he ever receive it, though he were to suffer a thousand deaths from those heretics." One of his biographers says (Ger. Bi. g.), that "for aught that appears upon the face of his story, it may be confidently asserted, that his morals were untainted, and his piety sincere. The incidents of his life afford a strong presumption, that he possessed a genuine love of truth, and adhered to what he judged to be its cause with firm integrity. Had his party prevailed during his life, there can be no doubt, that after his death his name would have been recorded among the saints; having had the misfortune to be registered by the church which called itself orthodox, among heretics, he can only be found by posterity in the humbler list of honest men."

The works of Arius do not appear to have been voluminous; though it is probable, that he wrote many letters. We have still extant his epistle to Eusebius of Nicomedia, (Ap. Epiph. Hær. 69.); and another to Alexander, bishop of Alexandria (Theod. l. i. c. 5, 7, 8.). He also wrote several little poems, fitted for the use of common people, with a view of promoting his peculiar opinions. A book called "Thalia," but whether it was written in prose or verse, or partly in the one form and partly in the other, is not certain, is mentioned by Socrates (H. E. l. i. c. 9.) and Sozomen (H. E. l. i. c. 21.), and censured as wanton and dissolute. It was condemned, as they say, by the council of Nice. Athanasius (De Sent. Dion. n. vi. p. 247.) quotes its several times, and is supposed to have read it; he speaks of its effeminacy and buffoonery. It must be owned, however, that this is the testimony of enemies, and that other writers probably took their character of it from Athanasius. Tillmont also imagines, that Arius also published some work against the heathens, in defence of the Christian religion. See Hist. l. i. Sozom. l. i. Cave, Hist. Lit. vol. i. p. 174. Lardner's Works, vol. iv. p. 106—110. Mosheim's Eccl. Hist. vol. i. p. 412—418. Gen. Dict. Gibbon's Hist. vol. iii. p. 228—248.

ARJUZANX, in *Geography*, a town of France, in the department of Landes, and chief place of a canton in the district of Mont-de-Marsan, eleven miles north of Tartas. The place contains 559, and the canton 5275 inhabitants: the territory includes $46\frac{1}{2}$ kilometres and 12 communes.

ARIZA, a town of Spain, in Aragon, seated on the Xalon, eight leagues above Calataiud.

ARK, or *Arce*, *arcus* in *Geometry*, *Astronomy*, &c. See *ARCH*.

ARK, *Arca*, in the *Scripture Language*, denotes a kind of floating vessel built by Noah, for the preservation of several species of animals from the deluge.

The Hebrew word, by which the ark is expressed, is אֲרֹכָה, or אֲרֹכָה תִּיבֹת *archoth*, or *archoth*, the constructive form of אֲרֹכָה, which is evidently the Greek *Arca*; and so the LXX render the word in Exod. ii. 3. where only it once occurs. There they render it *καβαρέτιον*, and the Vulgate *arca*, signifying an ark, coffer, or chest. Although the ark of Noah answered, in some respects, the purpose of a ship, it is not so certain that it was of the same form and shape. It has been inconclusively argued by Michaelis and some others, that if its form had not been like that of a ship, it could not have resisted the force of the waves; because it was not intended to be conducted, like a ship, from one place to another, but merely to float on the surface of the waters." Gen. vii. 17. It appears to have had neither helm, nor mast, nor ears: but was merely a bulky capacious vessel, light enough to be raised aloft with all its contents, by the gradual rise of the deluge. Its shape therefore, was of little importance; more especially as it seems to have been the purpose of providence, in this whole transaction, to signify to those who were saved, as well as to their latest posterity, that their preservation was not in any degree effected by human means. The ark in which Moses was exposed, was a vessel of the same nature, and bears the same name; and some have thought that both were of the same materials. With respect to the etymology of the Hebrew word, the most rational seems to be that of Clodius, who derives it from the Arabic word *Arak*, *collegit*, from which is formed *Arka*, denoting a place in which things are collected. Forster (De Byfso Antiquorum) deduces it from two Egyptian words, *thoi*, a ship, and *bai*, a palm-tree branch; and such ships are still to be seen not only in Egypt, but in India and other countries; particularly in some isles of the Pacific ocean.

The ark has afforded to the critics and naturalists several points of curious inquiry relating to its form, capacity, materials, time of building, place of resting after the flood, &c.

Noah is computed to have been one hundred years in building the ark, viz. from the year of the world 1555, to the flood, which happened in the year 1656; at least this is the common opinion of the fathers, oriental authors, and other learned persons; and to this purpose they allege, that Noah is said to be five hundred years old before any mention is made of the ark. Origen, lib. iv. contra Cell. St. Austin, de Civit. Dei, lib. xv. c. 27. and contra Faustum, lib. xi. c. 18. and in his Quest. 5. and 23. on Gen. Rupert, lib. iv. in Gen. xx. assert as much; and are followed by Salian, Torniel, Spondeus, Pelletier, &c.

Yet Berosus affirms, that Noah only began to build the ark seventy-eight years before the flood: Solomon Jarchi, on the other hand, will have it to have been an hundred and twenty years in building, Tanchuma fifty-two, and the Mahometans only two years. See the texts, Gen. vi. &c.

Several interpreters of the sacred writings infer from the words of St Peter (1 Ep. iii. 20.), "the long-suffering of God waited in the days of Noah, while the ark was preparing," that Noah was employed in building the ark during the whole time of forbearance, which was 120 years; but others think the time much shorter, because Noah's three sons, the eldest of whom was born in his 500th year, are not only mentioned before the directions given for the ark, but they and their wives are ordered, in those directions, to be taken into the ark; a circumstance which

which seems to imply that they were then married. Some, in order to evade this difficulty, have said that when Noah is declared (Gen. v. 32.) to have begotten Shem, Ham, and Japheth, at the age of 500 years, it should be translated, "he had begotten," instead of "he begat." F. Fournier, in his Hydrography, adopts the opinion of the fathers; noting that the hands employed in it were only Noah and his three sons. To this purpose he alleges the instance of Archias of Corinth, who, with the help of three hundred workmen, built Hiero's great ship in one year. Add, that Noah's eldest son was not born till about the time when the ark was begun, and the younger after: so that it was a long time before they could do their father any service. Upon the whole it may be observed that there is no such connection or exact order of time in the whole narration as to establish any of these conjectures. But it is certain, that so large a building, and the previous preparations, could not have been the work of a few years.

The wood whereof the ark was built, is called in scripture גֹּפֶר עֵץ, *ese gopher, gopher wood*: and in the LXX. ξύλα τετραγωνία, *square timbers*. Onkelos and Jonathan render gopher by קֶדְרוֹס, *kedros, cedar*: St Jerom. in the Vulgate, by *ligna levigata, planed wood*: and elsewhere, *ligna bituminata*, q. d. pitched wood, which is adopted by Delgado, a learned London Jew. Kimchi translates it "wood most proper to float;" Vatable, "light wood," which swims in the water without corrupting; Junius Tremellius, and Buxtorf, a kind of "cedar," by the Greeks called κισσινάκη; Avenarius and Munster, "pine;" Fuller and Bochart, "cypress," and the "ebony-tree;" others, "fir;" Castalio, "turpentine," &c. Pelletier prefers the opinion of those who hold the ark made of cedar: his reasons are, the incorruptibility of that wood; the great plenty thereof in Asia, whence Herodotus and Theophrastus relate, that the kings of Egypt and Syria built whole fleets of it in lieu of deal; and the common tradition throughout the East imports, that the ark is preserved entire to this day on mount ARARAT. The Mahometans explain it by the word "Sag," or the Indian plane-tree. To these various conjectures may be added that of Dr. Geddes (Crit. Rem. vol. i. p. 67.), who apprehends, that the Syriac translator has given the true meaning in the word עֵץ קָנָה, rendered in the polyglot by the Latin word *vimen*, signifying in general a twig, rod, or wicker of any kind. In Arabic the same word signifies a chest, coffer, or basket made of twigs, particularly of palm-tree leaves. And, indeed, all the first vessels of capacity, whether coffer, ark, or ship, seem to have been composed of the same materials. The ship or ark of Noah, says this writer, was a large coffer formed of twigs, like basket work, and covered over with bitumen, both within and without, to keep out the water. Whether those twigs were of osier, or palm-tree, or hazel, or poplar, or birch, or juniper, or any other kind of vimineous wood, he does not presume absolutely to determine; but he thinks it must have been the osier, which, as we learn from Columella, was considered as the principal of the wicker kind. It is certain, that boats, baskets, and ships, were originally made of such twigs, and particularly of osier; and even those, which were externally covered with skins, had other ribs at least of that wood, on account of its pliability. See Herodotus (Clio); or Niebuhr's Arabia, vol. ii. p. 175.

The figure of the ark was that of an oblong square or parallelepiped, with a fiat bottom, and it was gradually contracted at the top, in the form of a sloping roof; and this roof rose in the middle a whole cubit higher than its extremities. This slope was sufficient, when covered with bitumen, to let the water pass easily off the deck. This vessel was,

without doubt, so contrived as to admit air and light, though the particular construction of the air-vents or windows be not mentioned. Bryant (Anal. Anc. Myth. vol. ii. p. 195.) suggests, that it was so closed up and fastened, that the persons within it were confined to darkness; having no light but what they received from lamps and torches. They could not therefore have been witnesses to the general calamity of mankind; nor see the mighty eruption of the waters, nor the turbulence of the seas. Some, with this writer, have supposed that they had one window above a cubit in diameter; but others have thought that the term קַרְוָה refers to the sloping roof, and that the windows are not particularly mentioned.

The ark, whatever were the materials of which it consisted, was pitched over, or coated with bitumen, such as some have supposed to be used in building the tower of Babel; and it has been observed, that the bitumen judaicum, or asphaltus, was the most proper of all substances for this purpose. At first, it was soft, viscous, and pliable, and might be thrust into every chasm and crevice with the greatest ease; but it would soon acquire a tenacity and hardness superior to those of our pitch. A coat of it spread over both the inside and outside of an ark, even of wicker work, would render it perfectly water-proof and impenetrable; and the longer it was kept in the water, the harder and stronger it would grow. The Arabs still use it in covering their vessels; and mixed with a tenth part of common pitch, it is called "pissasphaltus," and has been employed to the same purpose in our days by M. de la Sabloniere at L'Orient. Berofus says, that the people of Armenia, where it was supposed that the ark rested, scraped off the asphaltus, and used it as a charm; and Abydenus informs us, that small pieces of the wood were carried about by way of amulet.

As to the place where the ark was built, there have been different opinions: some have supposed that it was built in Palestine, and that Noah planted the cedars, of which it is said to be made, on the plains of Sodom; others imagine that it was built on mount Caucasus, on the confines of India; and others refer it to China, where Noah was supposed to have lived before the flood; but it was probably constructed not far from mount Ararat, where it rested, as it was not of a form which would allow of its being driven to a great distance. It is therefore most reasonable to imagine, that it was built in Chaldaea, in the territories of Babylon, where, it is said, there was so great a quantity of cypress in the groves and gardens in the time of Alexander, that he constructed a whole fleet of it for want of other timber; and this conjecture is confirmed by the Chaldaean tradition which makes Xisuthrus, the Noah of Berofus, sail from that country.

The dimensions of the ark, as delivered by Moses, are three hundred cubits in length, fifty in breadth, and thirty in height; which, compared with the great number of things it was to contain, seem to many to have been too scanty: and hence an argument has been drawn against the authority of the relation. Apelles, one of Marcion's disciples, objected to it, and Celsus ridiculed it, calling it κισσινάκη ἀλλοκότου, *the absurd ark*. To solve this difficulty, many, both of the ancient fathers and later critics, have been very much perplexed. Origen, St. Augustine, and others maintain, that by the cubit here spoken of, we are to understand the Egyptian geometrical cubit, equal, according to them, to six vulgar cubits, or nine feet. But the truth is, it does not appear there ever was any such measure as a geometrical cubit either among Egyptians or Jews.—Others, as sir W. Raleigh, account for it by asserting the stature of mankind

mankind in the first ages to have been much greater than in our days; and consequently the cubit, which is taken for a part of the human body, proportionably larger. But this does not avail, since the same reason will infer an equal augmentation of the size of other animals. Others suppose the sacred cubit to be that here spoken of, which was a hand's breadth longer than the civil one: but this only affords a small supply; beside, the sacred cubit does not appear to have been ever used, except in sacred edifices, as the temple and tabernacle.

This difficulty is much better solved by Buteo and Kircher, who, supposing the common cubit a foot and a half, prove geometrically that the ark was abundantly sufficient for all the animals supposed to be lodged therein. The capacity of the ark will be doubled, if we admit with Cumberland, &c. that the Jewish cubit was 21.888 inches. According to this measure, it must have been 54.72 English feet long, 91.2 broad, and 54.72 high; and its solid contents 2,730,781.9008 feet. Snellius computes the ark to have been about half an acre in area. Cuncus and others have also calculated the capacity of the ark.—Dr. Arbuthnot computes it to have been 81,062 tons.—Father Lamy says, that it was an hundred and ten feet longer than the church of St. Mary at Paris, and sixty-four feet narrower; to which his English translator adds, that it must have been longer than St. Paul's church in London, from west to east, broader than that church is high in the inside, and about fifty-four feet in height, of our measure.

The things contained in the ark were, beside eight persons of Noah's family, one pair of every species of unclean animals, and seven pair of every species of clean animals, with provisions for them all, during the whole year.—The former appears, at first view almost infinite; but if we come to a calculation, the number of species of animals will be found much smaller than is generally imagined; out of which, in this case, are to be exempted such animals as can live in the water; and bishop Wilkins imagines, that only seventy-two of the quadruped kind needed a place in the ark. Mr. Kirwan (Irish Transf. vol. vi. p. 291.) with a view of solving the objection arising from the difficulty of collecting or finding all the various species of animals now known, some of which can only exist in the hottest, and others only in the coldest climates, apprehends that no others were collected in the ark besides those that were most necessary for the use of man, and those only of the graminivorous or granivorous classes. At this early period, ravenous animals were not only unnecessary, but would have been even destructive to those which had just obtained existence, and probably not in great numbers: they only became necessary, when the granivorous had multiplied to such a degree that their carcases would have spread infection. Hence, he says, they appear to have been of posterior creation; and thus he also accounts for the existence of those that are peculiar to America and the torrid and frigid zones. Such is the singular hypothesis of this ingenious naturalist.

The ark appears to have been divided into three stories; and it is agreed on, as most probable, that the lowest story was destined for the beasts, the middle for the food, and the upper for the birds, with Noah and his family; each story being subdivided into different apartments, stalls, &c. Though Josephus, Philo, and other commentators add a kind of fourth story under all the rest; being, as it were, the hold of the vessel, to contain the ballast, and receive the filth and fæces of so many animals.

Drexelius makes three hundred apartments; father Fournier, three hundred and thirty-three; the anonymous au-

thor of the Questions on Genesis, four hundred; Buteo, Temporarius, Arius Montanus, Wilkins, Lamy, and others, suppose as many partitions as there were different sorts of animals.—Pelletier only makes seventy-two, viz. thirty-six for the birds, and as many for the beasts: his reason is, that if we suppose a greater number, as three hundred and thirty-three, or four hundred, each of the eight persons in the ark must have had thirty-seven, forty-one, or fifty stalls to attend and cleanse daily, which he thinks impossible. But there is not much in this; to diminish the number of stalls, without a diminution of the animals, is vain; it being perhaps more difficult to take care of three hundred animals in seventy-two stalls, than in three hundred. Buteo computes, that all the animals contained in the ark could not be equal to five hundred horses; he even reduces the whole to fifty-six pair of oxen. Father Lamy enlarges it to sixty-four pair, or an hundred and twenty-eight oxen; so that supposing one ox equal to two horses, if the ark had room for two hundred and fifty-six horses, there must have been room for all the animals. And the same authors demonstrate, that one floor of it would suffice for five hundred horses, allowing nine square feet to a horse.

As to the food on the second story, it is observed by Buteo, from Columella, that thirty or forty pounds of hay ordinarily suffice an ox for a day; and that a solid cubit of hay, as usually pressed down in our hay-racks, weighs about forty pounds; so that a square cubit of hay is more than enough for one ox one day. Now it appears that the second story contained 150,000 solid cubits; which, divided between two hundred and six oxen, will afford each more hay by two-thirds than he can eat in a year.

Bishop Wilkins computes all the carnivorous animals equivalent, as to the bulk of their bodies, and their food, to twenty-seven wolves; and all the rest to two hundred and eighty bees. For the former he allows the sustenance of 1825 sheep, and for the latter 109,500 cubits of hay: all which will be easily contained in the two first stories, and much room to spare. As to the third story, no body doubts its being sufficient for the fowls, with Noah and his sons and daughters.

Upon the whole, the learned bishop remarks, that of the two, it appears more difficult to assign a number and bulk of necessary things to answer the capacity of the ark, than to find sufficient room for the several species of animals already known to have been there.—This he attributes to the imperfection of our lists of animals, especially those of the unknown parts of the earth; adding, that the most expert mathematician at this day could not assign the proportions of a vessel better accommodated to the purpose than is here done; and hence finally concludes, that "the capacity of the ark, which had been made an objection against scripture, ought to be esteemed a confirmation of its divine authority; since, in those rude ages, men being less versed in arts and philosophy, were more obnoxious to vulgar prejudices than now; so that had it been a human invention, it would have been contrived according to those wild apprehensions which arise from a confused and general view of things, as much too big, as it has been represented too little." If we suppose that many animals would probably become torpid during the cold of the deluge, or consume little food whilst they were confined in a state of darkness, the means of sustenance laid up in store for them would be thus diminished. Besides, it would be sufficient to preserve the eggs of those animals that are oviparous; and many of them would be lodged in the earth with the seeds of plants, kernels of fruits, &c.; and thus the labour attending such as were preserved in the ark would be lessened; and room would be obtained for disposing a variety

variety of instruments and utensils which would be wanted immediately or soon after the deluge had subsided. So that, all circumstances considered, the capacity of the ark might be found fully adequate to all the purposes of its construction, and for preserving an ample supply of every thing that would be necessary for raising a new flock of animals and vegetables, after the deluge had subsided.

Those who have objected to the Mosaic history of the deluge, ought candidly to consider the several particulars that have been above stated; and they ought also to recollect, that the several varieties and species of both plants and brute animals, which differ from each other by small degrees, seem to be multiplied every day by the vicissitudes of climates, culture, food, mixture, &c. On the supposition of an universal deluge, which is confirmed by the general history of the world, and by a variety of existing facts and monuments, such a structure as the ark, for the preservation and sustenance of various animals, seems to have been absolutely necessary; for as we can trace up the first imperfect rudiments of the art of shipping amongst the Greeks, there could be no shipping before the flood; and, consequently, no animals could have been saved. Nay, it is highly improbable that even men and domestic animals could be saved, not to mention wild beasts, serpents, &c. though we should suppose, that the antediluvians had shipping, unless we suppose also, that they had a divine intimation and directions about it, such as Moses relates; but this would be to give up the cause of infidelity. Hartley's Obs. on Man, p. 372. Dr. Bryant (Anal. Anc. Myth. vol. ii. p. 213, &c.) has collected a variety of ancient historical relations, which shew that some records concerning the ark had been preserved among most nations of the world, and the general system of Gentile mythology. Abydenus, with whom all the eastern writers concur, informs us that the place of descent from the ark was Armenia; and that its remains had been preserved for a long time. Plutarch (De Solert. Anim. Oper. vol. ii. p. 668.) mentions the Noachic dove, and its being sent out of the ark. Lucian (De Dea Syria. vol. ii. p. 882.) speaks of Deucalion's going forth from the ark, and raising an altar to God. The priests of Ammonia had a custom, at particular seasons, of carrying in procession a boat, in which was an oracular shrine, held in great veneration: and this custom of carrying the deity in an ark or boat, was in use also among the Egyptians. Bishop Pococke has preserved three specimens of ancient sculpture, in which this ceremony is displayed. They were very ancient, and found by him in Upper Egypt. Vid. Diod. Sicul. l. xvii. p. 528. Pococke's Works, vol. i. p. 252. The ship of Isis referred to the Ark, and its name "Baris," was that of the mountain corresponding to Ararat in Armenia. Bryant finds reference to the ark in the temples of the serpent-worship, called "Dracontia;" and also in that of Sesostris, fashioned after the model of the ark, in commemoration of which it was built, and consecrated to Osiris at Theba; and he conjectures, that the city, said to be one of the most ancient in Egypt, as well as the province, was denominated from it; Theba being the appellation of the ark. In other countries, as well as in Egypt, an ark, or ship, was introduced in their mysteries, and often carried about in the seasons of their festivals. He finds also in the story of the Argonauts several particulars, that are thought to refer to the ark of Noah. As many cities, not in Egypt only and Bœotia, but in Cilicia, Ionia, Attica, Phthiotis, Cataonia, Syria, and Italy, were called Theba; so likewise the city Apamea was denominated Cibotus, from *Κιβώτιος*, in memory of the ark, and of the history connected with it.

The ark, according to the traditions of the Gentile world, was prophetic; and was regarded as a kind of temple, or residence of the deity. It comprehended all mankind, within the circle of eight persons, who were thought to be so highly favoured of heaven, that they at last were reputed to be deities. Hence in the ancient mythology of Egypt, there were precisely eight gods (Diod. Sic. l. i. p. 12.), and the ark was esteemed an emblem of the system of the heavens. The constellation Aquarius, in particular, and the great effusion of that element, as it is depicted in the sphere, undoubtedly related to this history. The principal terms by which the ancients distinguished the ark, were Theba, Baris, Arguz, Aren, Arene, Arni, Laris, Boutas, Bœotus, and Cibotus; and out of these they formed different personages. As the stay in the ark was an intermediate state between a lost world and a world renewed, this was alluded to in the hieroglyphical representations of the Gentile writers. See JANUS, PROMETHEUS, and SATURN. As the ark was represented under the figure of a ship, styled *αμφι-περυσνός*, i. e. whose extremities were alike, which formed a kind of crescent, the new moon, appearing in this shape, was made a type of the ark. Hence, in the mythology of the ark, and the Jönah or dove, there is continually some reference to the moon; and hence the moon was esteemed by the Egyptians the mother of all beings, for the moon and the ark were synonymous terms.

ARK of the Covenant, or of the Testimony, in Scripture, denotes a kind of chest made of shittim wood, overlaid within and without with pure gold, $2\frac{1}{2}$ cubits long, $1\frac{1}{2}$ broad, and $1\frac{1}{2}$ deep, in which, by God's command, Exod. xxv. 16. were kept the two tables of stone, on which God had engraven the ten commandments, given to Moses on the mount, and held in high veneration among the Hebrews. It contained likewise the golden pot that had manna, and Aaron's rod, and the tables of the covenant. Heb. ix. 4. The ark was reposit in the holiest place of the tabernacle.—It was taken by the Philistines, and detained twenty, some say forty years, at Kirjath-Jearim; but the people being afflicted with emroids on account of it, returned it with divers presents. It was afterwards placed in the temple. See Plate I. *Miscellany*.

The lid or covering of the ark was called the *propitiatory*, or mercy-seat; over which were two figures placed, called *Cherubim*, with expanded wings of a peculiar form. This covering was made of pure gold, of equal length and breadth with the ark, and kept steady by a crown or coronet of gold, which also served as an ornament. The covering was called *כַּפֹּת*, a word which may be derived from covering or from expiating sin, as in the language of scripture, when sins are forgiven, they are said to be covered. The septuagint have joined both senses together in their translation, *Ιλαστηριου επιθημα*. Over this covering, and between the wings of the cherubim, was the place, where the Schechinah rested, both in the tabernacle and temple, in a visible cloud; hence were issued the divine oracles by an audible voice; and the high priest appeared before this mercy-seat once every year on the great day of expiation; and the Jews, wherever they worshipped, turned their faces towards the place where the ark stood. In the second temple there was also an ark, made of the same shape and dimensions with the first, and put in the same place, but without any of its contents and peculiar honours. It was used as a representative of the former, on the day of expiation, and a repository of the original copy of the holy scriptures, collected by Ezra and the men of the great synagogue, after the captivity. And in imitation of this, the Jews to this day have a kind of ark in their synagogues, wherein their

hanced books are repositid: this they call *aron*. Leo of Modena gives a description of it, in his account of the customs and ceremonies of those of his nation: "The Jews (says he), in the eastern sides of their synagogues, have an ark, or armory, called *aron*; in memory of the ark of the covenant. In this are preserved the five books of Moses, written on vellum, with ink made on purpose," &c. Some have supposed that the figure of this ark is still remaining on the triumphal arch of Titus at Rome; though Villalpandus and others, with greater reason, are of opinion that it is the table of shew-bread. Priccaux's Conn. vol. 1. p. 209. Lowman's Tracts, p. 133. Tertullian calls this ark, *Armarium Judaicum*; whence the phrase, *to be in the armory of the synagogus*, q. d. in the number of canonical writings.

A chest or coffer, very nearly resembling the Jewish ark, and called the "house of the God," was found in Huaheine, one of the islands of the southern sea. Mr. (Sir Joseph) Banks could obtain no other information concerning it than what the name imports. Hawketworth's Account, &c. vol. ii. p. 252.

ARK is used for a large chest, in which corn and fruit are deposited.

ARK, or *Arks*, in *Conchology*, the trivial English name of all such shells as belong to the Linnæan genus *ARCA*, and corresponding with the French name *ARCHE*. See *ARCA*.

ARK island, in *Geography*, one of the two small islands, which lie between the islands of Guernsey and Sark; the other is called *Arm*.

ARKA. See *ARCA*.

ARKADELT, GIACOMO or JACQUES, in *Biography*, was a disciple of Jusquin, and seems to have spent the chief part of his life in Italy, as the first editions of his principal works were printed at Venice, between the years 1539 and 1575.

The number of his motets that was published then, in different collections of the times, is very considerable; but his madrigals were received with such avidity, that five books of them were published at Venice, between the years 1539 and 1541, in one of which is the celebrated madrigal, *Il bianco e dolce cigno cantando muore*, highly favoured all over Europe; and his reputation for this species of composition was so great in Italy, that, according to Adami, who enumerates him among the singers and composers of the pontifical chapel, his name was sometimes prefixed to the productions of others, in order to forward their sale.

Why Du Verdier and others have called Arkadelt a Frenchman, Dr. Burney doth not know: his master, at least, was a Netherlander, and his name has a very Flemish appearance. He was at Venice in the elder Doni's time, and composed chiefly to Latin and Italian words. Whatever country gave him birth, he was an excellent composer; and, for the time in which he lived, his melodies are uncommonly natural, smooth, and graceful.

ARKADINSKAIO, in *Geography*, a town of Russian Tartary, in the country of the Cossacks, on the river Medveditza, 240 miles north-east of Azoph, and 124 south-west of Saratov. N. lat. 50° 10'. E. long. 43° 4'.

ARKANSAS, a north-west branch of Mississippi river, which falls in by two mouths, and forms an island, whose north-western point lies in N. lat. 33° 35'. W. long. 91°. Its length is thirty-five, and breadth ten miles.

ARKEEKO, a town of Abyssinia, seated on a large bay of the Arabian gulf, and consisting of about 400 houses, of which some few are built of clay, and the rest of coarse grass-like reeds. There is water enough for large ships close to Arkeeko, but as the bay is open to the north-east, it is uneasy riding in blowing weather. The bottom is composed of soft sand. In standing in upon Arkeeko from the sea,

through the canal between Shekh Seide and the main land, it is necessary to range the coast about a third nearer the main than the island. The point, or Shekh Seide, stretches far out, and has shallow water upon it. The cape that forms the south west side of the large bay is called "Ras Gedem," being the rocky base of a high mountain of that name, seen at a considerable distance from sea, and distinguished by its form, which is that of a hog's back. In the bay between Arkeeko and Masrah are two islands, Toulahout and Shekh Seide; the first on the west, the other on the south, both uninhabited and destitute of water. Shekh Seide has a marabout, or saint's tomb, on the west end. It is not half a mile in length, when not overflowed; but has two large points of sand which run far out to the east and west. Its west point runs so near to Toulahout, as, at low water, scarcely to leave a channel for the breadth of a boat to pass. N. lat. 15° 35'. E. long. 39° 30'. Bruce's Trav. vol. iii. p. 56.

ARKEL, a district of the united provinces, in the low countries, belonging particularly to that of Holland; comprehending the town and seigniories of Asperia, of Heuchelnam, and some villages: and otherwise called the country of Gorkum.

ARKI, a town of European Turkey, situate in Bosnia, at the mouth of the river Bosna.

ARKITES, in *Ancient Geography*, the descendants of Canaan, who inhabited the town of Arka or Arca.

ARKITES, were also a people so denominated, according to Bryant in his "Analysis of Ancient Mythology," from Noah's ark, and the descendants of this venerable patriarch, who sent out various colonies that established themselves in different countries of the globe. They were distinguished by their peculiar rites, and they gave names to the different countries and towns in which they settled, which had a reference to the ark, and their ancestors who were preserved by it from the destruction of the deluge. Those of them who came into Greece, settled in many parts, but especially in Argolis and Thessalia, where they introduced their rites and worship. In the former of these regions, they were commemorated under a notion of the arrival of Danaus, or Danaus, supposed to have been a person who fled from his brother Ægyptus, and came over in a sacred ship given by Minerva; which, like the *ARGO*, is said to have been the first ship that was constructed, and he was assisted in the building of it by the same deity, divine wisdom. Danaus, upon his arrival, built a temple, called Argus, to Jönah, or Juno, of which he made his daughters priestesses. The people of the place had an obscure tradition of a deluge from which some few escaped, the principal of whom was Deucalion, who took refuge in the Acropolis, or temple. The Arkites who settled in Thessaly carried with them the same memorials, concerning Deucalion and his deliverance, which they appropriated to their own country. These Arkites, and their rites, extended very widely, from Chaldea and Babylenia, where they originated; and passed from Egypt and Syria, to Phrygia and Pontus, Thrace and the cities of Greece; and they were likewise carried into Hetruria, and into the regions of the Celtæ, and traces of them are to be observed as high up as the Suevi. Bryant thinks, that the Arkite rites prevailed in many parts of Britain, especially in the isle of Mona, which was afterwards the chief seat of the Saronides or Druids: and he conceives, that this island had its name Mona, or Menai, Men-ai, the island of the god Lunus, from its rites. The same worship was probably further introduced, as he imagines, into some of the Scottish isles, and particularly into that called Colum-kil or Columba. To the class of Arkite priests Bryant refers the Cabiri, or Curetes, Corybantes,

bantes, Telehines, and Idæi Daçtyli, who belonged to the same order, under different denominations. See ARGOLIS, ARGONAUTS, and ARK.

ARKIT-KAN, in *Geography*, a town of Asiatic Turkey, in the province of Caramania, eighteen miles east of Akshehr.

ARKLOW, a small neat town of the county of Wicklow, in Ireland, situate near the mouth of the little river Ovaca, or Ovo; and having a haven for small craft. The copper mine company have had thoughts of making the river navigable to Rathdrum; but the port is so bad, and the coast so shoaly, that the vessels must remain about a mile off, and put out to sea on the slightest appearance of bad weather. There was a desperate battle fought here, on the 9th of June 1798, between the insurgents, twenty thousand strong, and the king's troops and yeomanry under general Needham. The town was set fire to by the rebels, and great part of it destroyed; but they were finally repulsed with considerable loss. Distance from Dublin thirty-six miles. N. lat. $52^{\circ} 48'$. W. long. $6^{\circ} 8'$.—In 1795, a discovery was made of native gold in a brook that descends from the north-east side of a mountain about 600 yards above the level of the sea called Kinsheilly, and situate about seven English miles to the west of Arklow. This discovery was made public, and the researches for gold began early in the month of September, and continued till the 18th of October, during which period of about six weeks, the quantity of gold that is supposed to have been collected amounted to 800 ounces. The gold was of a bright yellow colour, perfectly malleable; and it was found in pieces of various weights, forms, and sizes, from the most minute particle to 202.7 dwts.; one piece of 2 oz. and another of 22 oz. were also found. Two specimens of this gold were assayed by his majesty's assay-master in the tower of London; one of which appeared to contain, in 24 carats, $21\frac{6}{8}$ of fine gold, $1\frac{7}{8}$ of fine silver, and $\frac{3}{8}$ of alloy, which seemed to be copper tinged with a little iron. The works were taken possession of by order of government; and the operations of the peasants, who in great numbers had been industrious in their researches, were discontinued. Phil. Transf. vol. lxxxvi. p. 34—45.

ARKLOW bank, denotes sand-banks in the Irish sea, about ten miles long, and scarcely one broad, five miles from the coast of Ireland, having the town of Arklow nearly opposite to the middle part of them.

ARKWRIGHT, SIR RICHARD, in *Biography*, an eminent manufacturer, advanced himself, by his mechanical inventions for carding and spinning cotton, from the humble station of a country barber to an immense fortune and an honorary title. For performing these operations of carding and spinning by means of machinery, it was required either that the usual manœuvre of the carder should be effected with square cards, or that cylinders, covered with a kind of metallic brush-work, should be made to revolve in contact with each other, either to card or to strip, according as the respective velocities, directions, and inclinations of their wires might be adjusted. With regard to spinning, it would be indispensably necessary, not only that the raw material should be very nicely prepared, but also that it should be regularly drawn out by certain parts representing the fingers and thumbs of the spinner. The contrivance for this purpose consisted of a certain number of pairs of cylinders, each pair revolving in contact with each other. Suppose then that a loose thread or slightly twisted carding of cotton were made to pass between one pair of cylinders, properly adapted with a facing for holding it, and that it proceeded from thence to another pair, whose surfaces revolved with a much greater velocity; it is evident, that this quicker revolution would draw out the cotton, and ren-

der it thinner and longer when it came to be delivered at the other side. This is the operation which the spinner performs with his finger and thumb; and if the cotton be delivered to a spinning apparatus, it will be converted into thread. Sir R. Arkwright contrived to make these rotatory carding and spinning engines to move by horse, by water, and by steam; and thus, by the saving of labour, and with the advantage of a patent monopoly, he was rendered one of the most opulent of our manufacturers.

After he had quitted his original business, in the year 1767, he came to Warrington, where he projected a mechanical contrivance for a kind of perpetual motion. A clock-maker of this town, whose name was John Kay, dissuaded him from it, and suggested that much money might be gained by an engine for spinning cotton, which Kay promised to describe. Arkwright at first objected, but afterwards asked Kay, if this engine might be made at a small expence? Kay had been employed in making a cotton spinning engine; and in the trial for setting aside Arkwright's patent, it was proved that he had invented such an engine, but he had not brought it to perfection. Kay and Arkwright applied to Peter Atherton, esq. of Liverpool, for assistance in the construction of such an engine, who, discouraged by the mean appearance of the latter, declined undertaking it; though he soon after agreed to lend Kay a smith and watch-tool maker to prepare the heavier part of the engine, whilst Kay himself undertook to make the clock-maker's part of it, and to instruct the workmen. In this way Arkwright's first engine, for which he afterwards took out a patent, was made. Mr. Arkwright soon after connected himself in partnership with Mr. Smalley of Preston in Lancashire; but their property failing, they went to Nottingham, and there, by the assistance of wealthy individuals, erected a considerable cotton mill turned by horses. A person of the name of Hayes had also employed himself in making cylindrical carding engines. Upon the whole, without minutely detailing further particulars, it appears that the cotton spinning was no new attempt when Mr. Arkwright embarked in it; but many difficulties occurred in bringing it to perfection. In the hands of Mr. Arkwright, the carding and spinning of cotton became a great national manufacture. According to his statement, it appears that the advancement of it during a period of five years, cost him and those that were concerned with him 12,000*l.* before they derived from it any profit; and it must be allowed, that he alone seems to have had sufficient perseverance, activity, and skill to perfect a scheme, in the prosecution of which many others had failed, and to render it valuable to himself and the public. The merits of sir R. Arkwright may be summed up with observing, "that the object in which he was engaged is of the highest public value; that though his family were enriched, the benefits which have accrued to the nation, have been incalculably greater; and that upon the whole, he is entitled to the respect and admiration of the world." He was knighted by his present majesty on the 22d of December 1786, on occasion of presenting an address from the high sheriff and hundred of Wirksworth; and died at his works at Crumford in Derbyshire, August 3d, 1792. Gen. Biog.

ARL, Gross, in *Geography*, a town of Germany, in the circle of Bavaria, and bishopric of Salzburg, 10 miles S.W. of Radstadt, and 38 S.S.E. of Salzburg.—Also, a river of Germany, which runs into the Salza, about 6 miles S.W. of St. John, in the bishopric of Salzburg.

ARL, Klein, a river of Germany, which runs into the Salza, near the town of St. John.

ARLANT, a town of France, in the department of Puy de Dome, and chief place of a canton in the district of Am-
bert-

bert, 3 leagues south of Ambert. The place contains 7,747, and the canton 10,954 inhabitants; the territory includes 167½ kilometres, and 9 communes.

ARLANZA, a river of Spain, which runs into the Pisuerga, between Valtencia and Valladolid.

ARLANZO, a town of Spain, in Old Castile, 3 leagues from Lerma.

ARLANZON, a river of Spain, which joins the Arlanza, near Palenzuela.

ARLAUD, JAMES ANTHONY, in *Biography*, a famous painter, was born at Geneva in 1668. His principal attention was devoted to portrait painting, and he excelled in it to such a degree, that the regent duke of Orleans, who favoured him with his patronage at Paris, said of him, that while other miniature painters produced only images, he had found the means to paint portraits. In 1721 he visited England, and having been recommended to the princess of Wales, afterwards queen Caroline, he was much favoured by the court. After leaving England, he made a tour through the provinces of France, and afterwards through Switzerland. Besides portraits, Arlaud produced some history pieces, and other works. His Leda, which he copied from a bas-relief of Michael Angelo, and which at a small distance appeared like the original marble, he destroyed, because he thought it too licentious. After a residence of about 40 years at Paris, he returned with a handsome fortune and a good collection of pictures to his native place; where he died in 1743, at the age of 75 years. His valuable collection of paintings, drawings, models, and rare books, he left to the public library of Geneva. *Moreri*.

ARLAY, in *Geography*, a town of France, in the department of Jura, and chief place of a canton in the district of Lons-le-Saunier, five miles north of Lons-le-Saunier.

ARLBERG, a mountain of Germany, in the Tyrol, being a part of the Alps, between Bregentz and the lake of Constance.

ARLE, a river of Denmark, which runs into the North sea, four miles south of Bredstede.

ARLEN, a town of Germany, in the county of Tyrol, situate on a mountain, 8 miles N.W. of Landeck.

ARLEQUIN, or HARLEQUIN, in *Natural History*, a trivial English name occasionally applied to some birds, insects, shells, and other objects of natural history, that are remarkable for a striking variety of colours; thus the *Trochilus multicolor* of Gmelin is called by Dr. Latham the harlequin humming-bird, and the same may be illustrated by various other instances of the like nature.—The French naturalists adopt the term *arlequin* also; for example, *arlequin de Cayenne* is the common name of the *prionus longimanus*, *Prione longimane* (*Cerambyx longimanus* of Linnæus); *arlequin doré*, the name given by Geoffroy to their *Chrysomele céréale* (*Chrysomele cerealis* of Linnæus); and *arlequin velue*, a name given likewise by Geoffroy to their *Cétone velue* (*Cetonia hirta* of Fabricius).

ARLES, in *Geography*, a town of France, in the department of the East Pyrenæes, and chief place of a canton in the district of Ceret, 18 miles S.W. of Perpignan. The place contains 1,226, and the canton 4,776 inhabitants; the territory includes 192½ kilometres, and 11 communes. N. lat. 42° 27'. E. long. 2° 32'.

ARLES, a city of France, and principal place of a district in the department of the mouths of the Rhone, and chief place of a canton, in the district of Tarascon, was, before the revolution, the see of an archbishop. It is situated in the midst of a fertile country, which produces corn, wine, manna, oil, and fruit of various kinds. This city has several monuments of antiquity, which are worthy of notice. The amphitheatre is of an oval form, and was begun by Julius Cæsar, but never finished. It is in circumference about

1164 feet, and the front is 102 feet in height. The arena, or middle, is 426 feet long, and 312 broad; the porticos or piazzas are three stories high, built with very large stones, and each of them consists of 60 arches, which in part still remain. The obelisk is of granite, 58 feet high, and 7 feet in diameter at the base, the pedestal is adorned with four lions in marble, and at the top is a blue ball, on which are flower-de-luces of gold, and terminated by a sun. It was dug up near the walls of the city in 1675, erected in the following year, and dedicated to Louis XIV. Here are the ruins of two temples; the remains of a triumphal arc; two large columns of Grecian marble; the wreck of a capitol built here by the Romans; the burying place of the Pagans and Christians, situate on the top of a hill, consisting of two parts, one called "Campus Elysius," or "Eliscamp," and the other "Moulaïres;" that of the Pagans being distinguished by two letters, D. M. "Diis manibus," and that of the Christians by a cross. Various pieces of gold, silver, and bronze have been found here: and also urns, lamps, and cups, without number. It was at Arles that the statue of Diana was dug up, which was removed to the gallery of Versailles. On a column erected in honour of Constantine the Great, who made this city the seat of empire, repaired its walls, and built a palace in it, is an inscription, which imports that he was the restorer of Arelata or Arles. Thirteen councils were held in this city, between the years 353 and 1261. At Arles there is an academy of belles lettres founded in 1669; the academy of sciences was discontinued after the life of Louis XIV., by whom it was founded. The marshy land that lies in the vicinity of Arles renders it unwholesome. The place contains 21,000, and the canton 23,020 inhabitants; the territory includes 1,047½ kilometres, and three communes. N. lat. 43° 4'. E. long. 4° 48'.

ARLESHEIM, a small but pleasant town of Switzerland, about 4 miles from Basle. Within a quarter of a mile from this town is a beautiful hermitage, designed for the employment of the poor in a season of great scarcity, and furnishing agreeable walks for the inhabitants of the town. The walks are carried along the sides of rocks, which are richly wooded, and through a semicircular plain, bounded by fertile hills, and watered by a small lake; several natural caverns add to the romantic singularity of the scenery; while many transparent streams, brought from a considerable distance, fall in small cascades, or bubble from the ground like real springs.

ARLEUX, a town of France, in the department of the North, and chief place of a canton in the district of Douay, 8 miles N.W. of Cambray. The place contains 1,460, and the canton 9,938 inhabitants; the territory includes 105 kilometres, and 15 communes. N. lat. 50° 17'. E. long. 3° 16'.

ARLINGTON, a township in Bennington county, Vermont, 12 miles north from Bennington, containing 591 inhabitants.

ARLINGTON Bay, lies on the east coast of Ireland, within the entrance of Carlingford bay.

ARLINGTON'S Island, is situated not far from the south shore of Maghellan's Straits.

ARLON, a town of the Netherlands, in the comté of Chim, annexed to the duchy of Luxemburgh; and by the new arrangement, in the department of the Forêts, and chief place of a canton in the district of Luxembourgh; situate on a hill near the source of the river Semois, 13 miles east of Luxemburgh, and 14 south of Battogne. The place contains 3,128, and the canton 11,688 inhabitants; the territory includes 310 kilometres, and 13 communes. N. lat. 49° 53'. E. long. 5° 28'.

ARLOTTO, IL PIOVANO, or *the De.m.*, in *Biography*,
was

was born of a family named "Mainardi," at Mugello, near Florence, in 1395, and at the age of 28 years assumed the clerical profession. By his peculiar talent of contributing to the amusement of society by his humorous extravagances and repartees in conversation, he obtained ecclesiastical preferment, of which the highest was the rural deanery of St. Cresci, in the diocese of Fiesole. Less celebrated as a poet than a buffoon, he rambled over Italy and other countries, diverting those with whom he associated by his pleasantries and singularities; and thus recommended himself even to Lorenzo and Giuliano del' Medici. After his death, which happened in 1483, at the age of 87, a collection of his jests, witticisms, and adventures, was printed under the title of "Facetie Fabule e Motti del Piovano Arlotto, Prete Fiorentino," which has been frequently reprinted. *Nouv. Dict. Hillor.*

ARLY, in *Geography*, a river of Savoy, which runs into the Isere, near Conflans.

ARLYNG, in *Ornithology*, a name by which the Linnean *Motacilla oenanthe* is known in some parts of England. This is the bird, called by Ray, Willughby, and other old writers, the fallow-smith, or white-tail, and is the wheat-ear of modern English ornithologists.

ARM, *brachium*, in *Anatomy*, strictly speaking, signifies the whole of that part of the upper extremity which intervenes between the shoulder and the elbow.

ARM, *Amputation of*, in *Surgery*. See **AMPUTATION**.

ARM-pit. See **AXILLA**.

ARM-presentation, in *Midwifery*, is when the arm or hand of the fœtus presents to the orifice of the uterus, instead of the head. In natural labours, that is, when the head of the fœtus is the presenting part, and frequently when the breech presents, they may be easily perceived through the parietes of the uterus and vagina, at whatever period of gestation labour comes on, even before the os uteri begins to be dilated; but when the arm, or any other part, presents, the body of the fœtus being thrust down with more difficulty, it frequently happens, we are not able to distinguish the presenting parts until the os uteri is considerably dilated; and sometimes they are not to be discovered until the membranes are ruptured, and the waters are flowing away. Whenever, therefore, on examining *per vaginam* during a pain, no part of the fœtus can be distinctly felt, we shall be generally right in concluding that the labour will be preternatural, that is, that the arm, shoulder, or some other part than the head or breech of the fœtus, will present to the orifice, unless the descent of the fœtus be prevented by the unnatural projection of the brim of the sacrum, or the pelvis be in some other way contracted and distorted. In these cases, by the general consent of practitioners, the child must be turned and extracted by the feet. For the manner of performing this operation, see **PRÆTERNATURAL LABOURS**.

ARM of a horse, is that part of his fore leg which is intercepted between his shoulder and knee. See **HORSE**.

ARM, in the *Manege*, is applied to a horse, when he endeavours to defend himself against the bit, to prevent obeying or being checked thereby.

A horse is said to *arm* himself, when he presses down his head, and bends his neck, so as to rest the branches of the bridle upon his brisnet; in order to withstand the effort of the bit, and guard his bars and his mouth.

A horse is said to *arm himself with the lips*, when he covers the bars with his lips, and deadens the pressure of the bit. This frequently happens in thick-lipped horses. The remedy is by using a bit-mouth, forged with a cannon or scratch-mouth, broader near the bankers than at the place of its pressure or rest upon the bars.

For *arming against the bit*, the remedy is, to have a wooden

ball covered with velvet or other matter, put on his chawl; which will so press him between the jaw bones, as to prevent his bringing his head so near his breast.

ARM, in *Geography*, is used for a branch of a sea or river. Italy and Sicily are only parted by an arm of the sea. St. George's arm, in the Mediterranean, is the Thracian Bosphorus.

ARM Island. See **ARK**.

ARM, among *Gardeners*, is sometimes used in respect of cucumbers and melons, in the same sense as branch of other plants.

ARM is also figuratively used for *power*. The secular arm is the lay or temporal authority of a secular judge; to which recourse is had for the execution of the sentences passed by ecclesiastical judges. The church sheds no blood; even the judges of inquisition, after they have found the person guilty, surrender him to the secular arm. The council of Antioch, held in 341, decrees, that recourse be had to the secular arm to repress those who refuse obedience to the church; for secular arm, they here use exterior power.

ARM, in the *Military Art*, *Heraldry*, &c. See **ARMS**, and **ARMOR**.

ARM, in *Sea Language*, a ship is said to be *armed*, when fitted out, and provided, in all respects for war.

Armed ship more peculiarly denotes a vessel that is occasionally taken into the service of government in time of war, and employed to guard some particular coast, or attend on a fleet. All ships of this sort are commanded by an officer of the navy, and are upon the same establishment with the king's sloops.

Also a cross-bar shot is said to be *armed*, when some rope-yarn, or the like, rolled round about one end of the iron bar which runs through the shot, both that the shot may be the better rammed down into the gun, and lest the sharp end of the bar should catch into any honey-combs within the cylinder of the piece.

ARM, *Yard*. See **YARD**.

ARM, in respect of the *Magnet*.—A loadstone is said to be *armed*, when it is capped, cased, or set in iron or steel; in order to make it take up the greater weight; and also to distinguish readily its poles. See **ARMED MAGNET**.

ARMA, in *Geography*, a small province of South America, with a town and a river of the same name. The soil is so fertile, that it produces maize twice in the year.

ARMA dare, to give arms, in some ancient charters, signifies to dub or make a knight.

ARMA deponere, to lay down arms, was a punishment anciently enjoined when a man had committed an offence. *Leg. Hen. I.*

ARMA mutare, q. d. to change arms, was a ceremony used to confirm a league or friendship.

ARMA moluta, were sharp weapons: *Fleta* calls them *arma emolita*.

ARMA reversata, inverted arms, was a punishment when a man was convicted of treason or felony.

ARMADA, a Spanish term, signifying a fleet of men of war. The armada which attempted to invade England in the time of queen Elizabeth A. D. 1588, is famous in history; it was partly scattered by the wind, and partly subdued by the English fleet. On which occasion a medal was struck with this motto, *Afflavit Deus, et dissipantur*.

The situation of Philip II. at the time when he projected this invasion, was such as furnished a variety of motives, not only to induce his undertaking it, but to flatter him with the hope of success. Whilst secretly meditating his design in the preceding year, and actually commencing his preparations, Drake destroyed a whole fleet of transports at Cadiz, laden with ammunition and naval stores; he also ravaged his western coast, insulted Lisbon, and took a rich carrack,

carrack, laden with treasure and papers of great importance. By this short expedition, the means of which had been furnished by the London merchants, the naval preparations of Spain were disconcerted, the proposed expedition against England was retarded twelve months, and the queen had leisure to make more secure measures against that formidable invasion. Cavendish had also, in the same year, committed great depredations on the Spaniards in the South-Sea; having taken nineteen vessels, some of which were richly laden; and after returning by the Cape of Good Hope, he had entered the river Thames in his way to London with a kind of triumph. His mariners and soldiers were clothed in silk, and his sails were of damask, his top-sail cloth of gold, and his prizes were esteemed the richest that had ever been brought into England. Philip, provoked by these hostilities on the part of Elizabeth, had harboured for a considerable time a secret and violent desire of revenge. His ambition also, and the hopes of extending his empire, were much encouraged by the present prosperous state of his affairs; by the conquest of Portugal, the acquisition of the East Indian commerce and settlements, and the yearly importation of vast treasures from America. Besides, his highest glory was connected with that perpetual object of his policy, which was the support of orthodoxy and the extermination of heresy; and as the power and credit of Elizabeth were the chief bulwark of the protestants, he hoped, by subduing that princess, to acquire the immortal renown of re-uniting the whole Christian world in the catholic communion. Above all, his indignation against his revolted subjects in the Netherlands, inflamed him to attack the English, by whom they were encouraged and supported. The period which he had chosen for this purpose was peculiarly favourable to his design; as a truce had been lately concluded with the Turks; the empire also was in the hands of a friend and near ally; and France, the perpetual rival of Spain, was so distracted with intestine commotions, that she was incapable of directing her attention to her foreign interests. Thus circumstanced, Philip was determined, by one bold effort, to acquire that ascendant in Europe, to which the present greatness and prosperity of the Spaniards seemed so fully to entitle them; and he therefore proceeded immediately to the execution of his ambitious project. His preparations had been for some time conducted with studied secrecy and reserve; but when his resolution was formed, every part of his extensive empire resounded with the noise of armaments. And all his ministers, generals, and admirals were employed in forwarding the design. The marquis of Santa Croce, a sea-officer of great reputation and experience, was destined to conduct the naval equipments, and to command the fleet. Accordingly the plans were laid and measures were taken in all the ports of Sicily, Naples, Spain, and Portugal, for fitting out such a fleet and embarkation as had never before had its equal in Europe. The military preparations in Flanders were no less formidable. Troops were collected from all quarters for reinforcing the duke of Parma; and an army of 34,000 men was assembled in the Netherlands, which was kept in readiness to be transported into England in boats and flat-bottomed vessels, previously prepared and conveniently stationed for this purpose. To the most renowned nobility and princes of Italy and Spain, who were ambitious of sharing in the honour of this great enterprise, might be added some hundreds of desperate English renegadoes under the conduct of Stanley, who had been already proscribed for selling a Dutch fortress to Spain. The Spaniards, ostentatious of their power, and elated with vain hopes, had already denominated their navy the "Invincible Armada."

As soon as the news of this proposed invasion reached

the court of London, the queen made preparations for resistance; nor was she dismayed by that power, by which all Europe apprehended the must of necessity be overwhelmed. Her forces, however, seemed very unequal to resist so potent an enemy. All the sailors in England amounted at that time to about 14,000 men, and the royal navy consisted only of 28 sail, many of which were of small size. The dexterity and courage of the seamen far surpassed those of the Spanish mariners, and compensated for the inferior size and force of their vessels. The alarm roused the exertions of the English people; and they concurred with singular alacrity in defending their liberty and religion against those imminent perils with which they were menaced. The city of London supplied thirty ships and 10,000 men; other ports followed this example; the nobility and gentry, among whom were several Roman catholics, and even aliens, hired, armed, and manned 43 ships at their own charge; and all the loans of money which the queen demanded, were cheerfully granted. The command of the navy was entrusted with lord Howard of Effingham, a man of courage and capacity, and under him, as admiral, served Drake, Hawkins, and Frobisher, the most renowned seamen in Europe. The principal fleet was stationed at Plymouth; and a smaller squadron of 40 vessels, commanded by lord Seymour, second son of the protector Somerset, lay off Dunkirk, in order to intercept the duke of Parma. An army of 20,000 men was disposed in different bodies along the coast; and a body of 20,000 foot and 1000 horse, under the command of the earl of Leicester, was stationed at Tilbury, in order to defend the capital. The principal army consisting of 34,000 foot and 2000 horse, commanded by lord Hudson, guarded the queen's person, and had orders to march whithersoever the enemy should appear. James, the Scots king, retained his engagements, with a fidelity that was of great importance to England and the protestant cause, and kept himself prepared to march with the force of his whole kingdom to the assistance of Elizabeth; and the queen obtained some secondary aid from Denmark and the Hanse-towns. In a word, all the protestants throughout Europe were interested and anxious spectators on this occasion. In order the more to excite the martial spirit of the nation, the queen appeared on horseback in the camp at Tilbury; and riding through the lines, discovered a cheerful and animated countenance, exhorted her soldiers to remember their duty to their country and their religion, and professed her intention, though a woman, to lead them herself into the field against the enemy, and rather perish in battle than survive the ruin and slavery of her people. The loyalty and enthusiasm of the soldiers were elevated into a kind of frenzy, and they were prepared for any exertion which the cause in which they were engaged might require.

In the beginning of May, the armada was ready; but when it was preparing to sail, the admiral, the marquis of Santa Croce, and the vice-admiral, the duke of Paliano, both died; and the duke of Medina Sidonia, a nobleman altogether unacquainted with naval affairs, and unexperienced in action, was appointed admiral. On the 29th of May, the Spanish fleet set sail from Lisbon; but the next day it was dispersed by a violent storm, and some of the smallest ships were sunk, whilst the others took shelter in the Groine. As soon as the armada was refitted, it sailed again towards the English coast. The fleet consisted of 130 vessels, of which about 100 were galleons of larger size than any before used in Europe; and it carried on board 19,295 soldiers, 8456 mariners, 2088 galley-slaves, and 2630 great pieces of brass ordnance. It was victualled for six months, and attended by 30 smaller vessels. Superstition too added her fanatic but powerful aid: bulls, denouncing

ing hell-fire to Elizabeth and her abettors, accompanied the Squadron; and a consecrated banner from Rome waved over the heads of these new crusaders. On the 19th of July, the armada arrived in the channel, disposing itself in the form of a crescent, and stretching to the distance of seven miles from the extremity of one division to that of the other. The English admiral had just time to get out of port, when he saw it in full sail, as Bentivoglio, an Italian writer, in a kind of poetical language, describes its progress, and yet advancing with a slow motion, as if the ocean groaned with supporting, and the winds were tired with impelling, so enormous a weight. As the armada proceeded up the channel, Effingham, with the English fleet consisting of 140 ships, gave orders to avoid a close fight, but to skirmish with the larger ships of the Spanish fleet, which it continued to do for six days. The armada, having reached Calais, cast anchor before that place; and waited the arrival of the prince of Parma, who delayed leaving the Flemish ports until he was assured that the Spaniards were masters at sea. Whilst the Spanish fleet lay confusedly in this position, the English admiral, by a successful stratagem, dispatched eight of his smaller ships filled with combustibles, one after another, into the midst of the enemy; and thus alarmed them to such a degree, that they immediately cut their cables, and betook themselves to flight with the greatest disorder and precipitation. The English fell upon them the next morning, took about 12 of their large ships, and damaged several others. The Spanish admiral having destroyed only one small vessel of the English, and perceiving that his own fleet had greatly suffered, and was in danger of being totally destroyed, prepared to return homewards; but as the wind opposed his passage through the channel, and the English vessels harassed his retreat, he determined to sail northwards, and making the tour of the island, to reach the Spanish harbours by the ocean. The English fleet for some time pursued him; and if their ammunition had not failed them, the whole armada must have been compelled to surrender at discretion; and indeed the duke of Medina was prevented from so doing merely by the advice of his confessor. The event, however, proved almost equally fatal to the Spaniards. A violent tempest assailed the armada after it had passed the Orkneys; and the mariners, unable to govern their unwieldy ships, yielded to the fury of the storm, and allowed their ships to drive either on the western isles of Scotland, or on the coast of Ireland, where they were miserably wrecked. At length, after the experience of inexorable humiliation and distress, the shattered fleet, consisting of less than half its number, returned to Spain; and the seamen and soldiers, very much reduced by famine and disease, and the various hardships with which they had encountered, filled the country with accounts of the desperate valour of the English, and of the tempestuous violence of the ocean that surrounds them. Philip, as soon as he heard of the disastrous event, so mortifying to his pride and ambition, with an affected philosophy fell on his knees, and rendering thanks for that gracious dispensation of Providence, expressed his joy that the calamity was not greater. The Spanish priests, who had frequently foretold the infallible success of this holy crusade, perplexed in accounting for the victory which had been gained over the catholic monarch by excommunicated heretics and an execrable usurper, at last discovered, that all the calamities of the Spaniards had proceeded from their allowing the infidel Moors to live among them. The first English newspaper, entitled the "English Mercurie," was printed during the time of the Spanish armada; the first number, dated the 23d of July 1588, is still preserved in the British Museum.

Hist. vol. v. p. 330—345. Watson's Hist. Philip II. vol. iii. p. 122. Andrews' Hist. Great Britain, vol. i. p. 145.

ARMADILLA, in the Spanish America, denotes a squadron of men of war, to the number of six or eight, from twenty-four to fifty pieces of cannon, which the king maintains to prevent foreigners from trading with the Spaniards and the Indians, both in time of war and peace.

The vessels of this armada are those that have been for much talked of, under the name of *guarda costas*.

They have even power to take all Spanish merchant-ships they meet with on the coasts, that have no licences from the king.

The South sea has its armada as well as the North sea. The ordinary abode of the former is at Calao, a port of Lima; that of the latter at Carthagena.

ARMADILLO, in *Entomology*, one of the species of the *ONISCUS* genus, described by Linnæus in his *Fauna Suecica*. It is oval, cinereous brown, with a tail obtuse and entire. This kind inhabits Europe; lurks under stones; and is called by Ray *afellus lividus*.

ARMADILLO, in *Zoology*, the name given by English writers to those quadrupeds which in the Linnæan system constitute the genus *DASYPUS*: it is derived from the Spanish word *armadillo*, and is synonymous with the French *tatou*. See *DASYPUS*.

ARMAGARA, in *Ancient Geography*, a town of India, on this side of the Ganges. Ptolemy.

ARMAGEDDON. See *MEGIDDO*.

ARMAGH, or ARDMAGH, in *Geography*, the name of one of the counties of the province of Ulster in Ireland. It has lough Neagh on the North; the county of Down on the east; Louth on the south; Tyrone on the north-west; and Monaghan on the west. Its length from north to south is nearly thirty-two English miles, and its breadth almost twenty, and the superficial content 181,450 acres, or 283 square miles (290,786 acres, and 454 square miles English). The number of houses, according to the last official return, is 22,900, in which, according to Mr. Bushe's statement, we cannot reckon fewer than 130,000 inhabitants; which is a population of near 460 persons to every square mile; a greater proportion than is found in any other county except Dublin. The number of parishes in this county are twenty, and, what happens only in Ulster, the number of churches is greater, being twenty-six. Besides the two county members, the city of Armagh sends a member to the Imperial parliament. There is in this county very little flat ground; but the gentle hills which diversify the face of it, are covered with a very rich soil, except in the district called the *Fews* which is full of mountains, and in the south-eastern angle which is occupied by the lofty *Sliebhgullen*; but great part even of this rough ground is cultivated, and thickly inhabited. Throughout this county, the farms are small, seldom exceeding from forty to sixty acres, more commonly from five to twenty acres; and the tillage in general is bad, which has been observed to be the case wherever the linen manufacture spreads, because tillage is there only a secondary object. To the industry of the people, and the flourishing state of this manufacture which is carried on in all its branches, the extraordinary population of the county is to be attributed, and indeed there is no part of Ireland which affords such pleasing spectacles to a philanthropic observer. Yet, strange to tell, this apparently happy spot, where industry seems to confer every blessing, has been the scene of most of the disturbances which have taken place in the north; and both the Oak-boys and Defenders had their origin in it. There is no river of consequence in Armagh,

but the Blackwater which separates it from Tyrone, on its north-western boundary is navigable for some miles into lough Neagh; and the river Bann, and the Newry canal, afford a water-carriage from the lough to the bay of Carlingford on the eastern side. There are some considerable bogs from which the inhabitants are supplied with abundance of good turf, which is much used for firing. Some good marble is also found in this county. Armagh was one of the counties forfeited to the crown after the reduction of the earl of Tyrone, in the latter end of queen Elizabeth's reign, and was colonized under James the First; and the northern part is still called Oneil-land from the family name of that noted chieftain. The assizes are held at the city of Armagh. Beaufort, Young, &c.

ARMAGH, a city, and the capital of a county to which it gives name, in the province of Ulster, Ireland. It is said to have been founded by St. Patrick in the fifth century (though the very existence of such a person has been questioned), on an eminence from which it acquired its name, which implies a great high place or field. On the establishment of Christianity in this country, Armagh became a considerable city, and a celebrated university, which was not only resorted to by the natives, but also by the Anglo-Saxon youths from Britain. In the seventh century it was nearly destroyed by fire; and on the arrival of the Danes, was frequently plundered, and the greater part of its records taken away and destroyed. In 1152, cardinal Papan being sent to Ireland as legate, constituted Armagh the metropolitan see of Ireland; and it was provided by solemn ordinance, that no one should be allowed to profess or teach theology, who had not been educated at its university. This University however has been long extinct. The town was frequently plundered by the English before the reduction of that part of the island, and it was entirely destroyed by O'Neil in the reign of queen Elizabeth. It was soon after rebuilt and garrisoned, and has lately become a pretty town of good size, and well inhabited, through the attention and munificence of primate Robinson, lord Rokeby. He built there a handsome archiepiscopal palace, and a noble house for the school, which is one of the royal foundations, and extremely well endowed. To these he added a public library for the promotion of science. He also erected a complete observatory; with a liberal establishment for the support of an astronomer, and secured the permanency of his endowments by several acts of parliament. The province of Armagh contains ten dioceses; the archbishop having under him, the bishops of Dromore, Down and Connor, Derry, Raphoe, Clogher, Kilmore, Ardagh, and Meath. The archbishoprick extends into five counties, viz. Armagh, Tyrone, Londonderry, Louth, and Meath, and is reputed to be worth 8000*l.* per annum. Armagh has one of the best linen markets in Ulster, and there are many bleach-grounds in its neighbourhood on the banks of the Callen, a small stream which passes near the foot of the rising ground on which it is built. Its distance from Dublin is sixty-two miles, N. by W. N. lat. 54° 20' 30". W. long. 6° 32'. Collet. de Reb. Hiber. N° 11. Beaufort. Leland.

ARMAGIA, a town of Arabia, sixty-eight miles south of Cathem.

ARMAGNAC, a province of France, in the district of Gascoyne, and government of Guyenne; before the late division, about thirty-six leagues long and twenty-five broad; is bounded on the north by Angenois and Condomois, on the east by Languedoc and the country of Comminges, on the west by Marfan and Bearn, and on the south by the Pyrenees, which separate it from Arragon, and Bigorre. The capital is Auch. It is divided into Upper and Lower

Armagnac; the former lies among the Pyrenean mountains, and comprehends four valleys; and the latter is more extensive and fruitful, and contains proper Armagnac, and several counties and earldoms. The soil is generally fertile, and produces corn, wine, fruits, and pasture; and the commerce is considerable in wine, brandy, wool, flax, &c. The Armagnacs, who were the adherents of the young duke of Orleans, and so called from the count of Armagnac, father to this prince, formed one of the two parties into which the whole kingdom of France was divided, about the year 1415. The city of Paris, distracted between them and the Burgundians, but inclining to the latter, was at this time a perpetual scene of blood and violence; the king and royal family were often detained captives in the hands of the populace; their faithful ministers were butchered or imprisoned before their faces; and it was dangerous for any man, amidst these enraged factions, to be distinguished by a strict adherence to the principles of probity and honour. The fraternity of butchers declared for the duke of Burgundy, and committed the most violent outrages against the opposite party; whilst the Armagnacs made interest with the fraternity of carpenters; the populace ranged themselves on one side or the other; and the fate of the capital depended on the prevalence of either party. At length the Burgundians prevailed; butchered many of the faction of Armagnac, and threw the count and several persons of note into prison, who were afterwards murdered by the populace.

ARMAMAR, a small town of Portugal, in the province of Beira and district of Lamago, containing two parishes and about 1300 inhabitants.

ARMAMAXI, composed of the Latin *arma*, and the Greek *μαξία*, *plaustrum*, *carriage*, in *Antiquity*, a kind of Scythian chariots, or carriages, composed of two wheels, variously adorned with crowns, shields, breast-plates, and other spoils, carried in procession after the images of the gods and great men. These were sometimes called *amaxi*, or *amaxæ*. Pitisc. Lex. Ant.

ARMAMENT, a large body of forces, raised and provided with the furniture of war, either for land or sea service.

ARMAMENTA, in *Roman Antiquity*, comprehended the rigging and tackling of a ship, its sails, sail-yards, oars, ropes, &c. Hence *arma* denotes the sails (Virg. *Æn.* v. 55.) and the rudder (vi. 353).

ARMANCE, in *Geography*, a river of France, which runs into the Armançon, near St. Florentin, in the department of the Yonne.

ARMANÇON, or ARMANSOON, a river of France, which rises near Semur-en-Auxois, and runs into the Yonne, near Igny.

ARMANT, a village of Egypt, seated on the Nile, in the route from Thebes to Esné; supposed by Savary to be the ancient Hermuthis.

ARMARCALES, in *Ancient Geography*, a name given by Abydenus to the artificial channel that connected the two branches of the Euphrates, more properly denominated by Ammianus NAARMALCHA; which see.

ARMARIUM *unguentum*, among *Hermetical Philosophers*, a sympathetic ointment, or weapon-salve, whereby wounds are said to have been cured at a distance, by only dressing the weapon.

ARMATA, in *Entomology*, an European species of *APIS*, described in the *Systema Naturæ* from Mus. Lesc. It is brown; the head and thorax grey; jaws armed with a tooth at the base; bottom of the feet yellow. This insect belongs to the genus *MELITTA* in Kirby's *Apum Anglæ*, where it is thus described under the specific name *armata*:
"nigra,

“nigra, cinerascens-villofa; maxillis longitudine capitis, basi dente armatis.”

ARMATA, a species of *LEPTURA* found in some parts of Europe. The thorax is black and spinous; antennæ and legs ferruginous; wing-cases yellow, with two dots, a heart-shaped spot, and three bands of black. Herbst. Gmel. &c.—This insect bears some resemblance to *leptura attenuata*; the head, feet, posterior thighs and shanks, are black.

ARMATIUM, in *Ancient Physic*, a detergent kind of collyrium, of great value in removing asperities of the eyelids. Its chief ingredients were *as yslum*, gum ammoniac, and the roots of the tree *thus*. The preparation is described by Galen, Aetius, Paulus, and Scribonius.

ARMATORIUS, in *Entomology*, an insect described in the *Fabrician mantissa*. It is small, and inhabits Germany; colour black, scutal white; thorax immaculate, posterior part bidentated; abdomen and legs ferruginous.

ARMATURA, ARMATURE, in a general sense, is the same with what we otherwise call ARMOUR.

ARMATURA is more particularly used in the *Ancient Military Art*, for a kind of exercise, performed with missile weapons, as darts, spears, arrows, and the like.

In this sense, armatura stands contradistinguished from *palatia*; the latter being the exercise of the heavy-armed, the former of the light-armed.

The armatura was practised with great diligence among the Romans; they had their *campidectores*, on purpose to instruct the tyrones, or young soldiers, in it. Under it were included the throwing of the spear or javelin, shooting with bows and arrows, &c.

ARMATURA is also an appellation given to the soldiers who were light-armed.

Aquinas seems, without reason, to restrain armatura to the tyrones, or young soldiers, under discipline or tutorage in the exercise above mentioned.

ARMATURA is also a denomination given to the soldiers in the emperor's retinue. Du-Cange.

Of these we find two schools mentioned in the *notitia imperii*, called the *armature seniores*, and *armature juniores*. Their commander was entitled *tribunus armaturarum*.

ARMATUS, in *Entomology*, a species of *CIMEX* that inhabits New Holland. The thorax is acutely spined; scutal black with two dots, and apex testaceous; antennæ and legs red. Fabricius. Gmelin.

ARMAVIARA, in *Ancient Geography*, a town of Asia, in the greater Armenia. Ptolemy.

ARMAXA, or ARMACA, a town of Asia, in Cappadocia. Anton. Itin.

ARME', in *Ichthyology*, a specific name given by the French naturalists to a fish of the *SILURE* genus, found in Asia; and according to Block, in Surinam; this is the Linnæan *Silurus militaris*. See *MILITARIS*.

ARMED, in *Lacu*. See *ARMS*.

ARM B, in *Sea-Language*. See *ARM*.

ARMED in *flute*. See *FLUTE*.

ARMED, in *Heraldry*, is used in respect of beasts and birds of prey, when their teeth, horns, feet, beak, talons, or tusks, are of a different colour from the rest.—He bears a cock, or a falcon, *armed* or, &c.

ARMED *at all points*, terms applied to a person who is completely covered with armour, except his face.

ARMEDON, or ARMENDON, in *Ancient Geography*, a name given by Pliny to a small island in the vicinity of Crete, opposite to the promontory of Sammonium; probably one of those nameless rocks which now encompass Candia.

ARMENA, in *Botany*, a name given by Pliny to a kind

of wild asparagus; but the ancient Greeks have used the same word to express the young shoots of the common asparagus, at the time when they are eaten; and not only these, but the young sprouts of the cabbage, and of all other esculent plants.

ARMENIA, in *Ancient and Modern Geography*, a country of Asia, derives its name, according to the Greeks, from Armonus, one of the Argonauts, who settled in this country. Bochart (*Phaleg*. l. i. c. 3.) supposes Armenia to be a contraction of *הר מני*, Har-mini, denoting the mountain of Mini, the name of a province of this country, mentioned by the prophet Jeremiah (ch. li. 27.) and placed by him between Ararat and Asschenaz; and probably referred to by Amos (ch. iv. 3.) under the name of *הר מונה*, Har-munah, or mountain of the moon. To this purpose Mr. Bryant (*Anal. Anc. Mythol.* vol. iii. p. 2.) distinguishing between this country and Aramea, or the land of Aram, which was separated from it by mount Taurus, supposed it to be denominated from Ar-men or Har-men, the mountain where the ark rested.

Armenia was anciently divided into Major and Minor, or the Greater and Lesser.

Armenia Major, or Armenia properly so called, was, according to Strabo, bounded on the south by mount Taurus, separating it from Mesopotamia; on the east by the two Medias; on the north by Iberia and Albania, or that part of Caucasia by which both are surrounded; and on the west by Armenia Minor, or the mountains Paryadres, by some Pontic nations, and by the Euphrates. Ptolemy divides the whole of Armenia into three districts: the first, comprehending that part which lies between the Cyrus and the Araxes; the second, those provinces which extend westward to the bending of the Euphrates; and the third, all the country lying between the springs of the Tigris, and that part of the Euphrates which separates Commagene from Armenia Major. The most considerable cities of ancient Armenia were Artaxata, Sebastia, Armosata, Tigranocerta, Artagera, Carthiocerta, Colonia, and Choria. Strabo enumerates six rivers of principal note; viz. the Lycus and Phasis, falling into the Pontus; the Cyrus and Araxes, discharging themselves into the Caspian Sea; and the Tigris and Euphrates, which disembogue themselves into the Persian Gulf. The most considerable mountains were the Mosehick, separating the western parts of Armenia from Colchis: the Paryadræ, extending from the former to the borders of Armenia Minor and Pontus; Masus, bounding the province of Sophene to the south, as Antitaurus does to the north; Niphates, Abus, and the Gordyæan mountains. As to the origin of the ancient Armenians, Herodotus, and after him Stephanus, derive them from the Phrygians, on account of several Phrygian words that had been blended with the ancient language of the Armenians. Strabo supposes, that they were originally Syrians, or that the Syrians and Armenians were two tribes of the same nation; and in this opinion Bochart acquiesces, as he discovered a great similarity between these two nations, in their manners and language. However, in process of time, many foreigners settled among them; namely, Phrygians, Greeks, and Persians.

Armenia was advanced at a very early period to the honour of a kingdom. After the death of Barzanes, the successor of its first king Scytha, it was divided into several petty kingdoms, as we learn from Pliny (H. N. l. vi. c. 9.). The Armenians were afterwards subdued by the Medes, to whom they were made tributaries by Astyages, but continued to be under the government of kings of their own country. During its subjection to the emperor of Persia,

Armenia was reduced to the form of a province, and its rulers were prefects appointed by the Persian kings. Armenia, as a part of the Persian empire, was subdued by the Macedonians under Alexander the Great; and remained in subjection to the Macedonians till the time of Antiochus the Great. During the minority of Antiochus, Artaxias and Zabriades, two governors of Armenia, united their forces, seized on the country they governed, and having added to it some neighbouring provinces, erected two kingdoms, viz. that of Armenia Major, which Artaxias reserved for himself, and that of Armenia Minor, which was allotted to Zabriades. Antiochus made several attempts to recover the provinces, which these governors had appropriated to themselves, but his efforts were unsuccessful; and by an alliance with the Romans, they secured to themselves and their posterity the continued possession of them. After the death of Artaxias, the Armenian history is interrupted by a chasm of about 70 years; it is only known, that the Armenians had engaged in a war with the Parthians, which terminated to their disadvantage. Tigranes, however, the king's son, who had been delivered as a hostage to the Parthians, was restored to his kingdom after his father's death, about the year before Christ 95; and entered into an alliance with Mithridates Eupator, against the Romans. Having married Cleopatra, the daughter of Mithridates, Tigranes invaded Cappadocia, and took possession of it, but surrendered it to Ariarathes, the son of Mithridates. Soon after his expedition into Cappadocia, he seems to have made peace with the Romans, and abandoned the cause of Mithridates; and having been chosen king of Syria, he indulged his ambition by invading Armenia Minor, and reducing the whole kingdom. After several successful expeditions, by which Tigranes enlarged the boundaries of his dominion, he was defeated with great slaughter by Lucullus the Roman general, in the vicinity of Tigranocerta, who at length took the town, and got possession of the immense treasures which it contained. The consequence of a second defeat was the total dispersion of the united armies of Tigranes and Mithridates, and the flight of the former to the most remote part of his dominions. During a cessation of hostilities, occasioned by the mutiny of the Roman soldiers against Lucullus, and a disagreement between him and Pompey, by whom he was superseded in the command, Mithridates and Tigranes rallied their forces, overran Cappadocia, and recovered all Armenia, with a great part of Pontus; but Tigranes's son, taking up arms against his father, joined the Romans, and conducted Pompey into Armenia. Tigranes, dispirited by his son's revolt, met Pompey on his march towards Artaxata, and surrendered himself into his hands. Pompey, after having heard the appeal of the father for justice against his son, restored the kingdom of Armenia to Tigranes, together with the greatest part of Mesopotamia; imposing upon him at the same time a fine of 6000 talents for making war against Rome without cause. Tigranes, being put in possession of his kingdom, voluntarily yielded to the Romans Cappadocia, Cilicia, Syria, and that part of Phœnicia which he possessed, and reserved for himself only his paternal kingdom. His successor Artaxades, called by Josephus, Artabazes, by Orosius, Artabanus, and by others, Artoadistes, was put to death by order of Marc Antony; and the kingdom of Armenia was conferred by Antony on Alexander, his son by Cleopatra. Artaxias, the eldest son of Artaxades, who was proclaimed king by the Armenians, was obliged by the Romans to abandon his kingdom, and fly into Parthia; but he was soon put to death. Tiberius, whom Augustus had deputed to settle the affairs of the east, bestowed the king-

dom of Armenia, after the death of Artaxias, on his younger brother, Tigranes; who was in a little while, by Tiberius's own orders, put to death. The kingdom was afterwards given by Augustus to Artaxades, supposed to have been the son of Artaxias II.; but the Armenians, tired with the Roman yoke, expelled him, and called in Phraates, king of Parthia, preferring subjection to the Parthians rather than to the Romans. Upon the approach of the Roman army, Phraates withdrew, and Artaxades was restored to the throne. After a succession of several kings, occasionally under the control of the Parthians, but generally holding the crown as vassals of the Roman empire, being either appointed or confirmed by the emperors; the ancient kingdom of Armenia was reduced by Trajan to the form of a province; and the Tigris was made the eastern boundary of the empire, which Augustus had thought fit to extend no farther than the banks of the Euphrates; but it soon recovered its liberty, and was again governed by its own kings, in the reign of Constantine the Great, and his successor, to whom the kings of Armenia were feudatories. In the Persian war, A. D. 365—378, the tributary kingdoms of Armenia and Iberia, the sovereignty and alliance of which had been solemnly renounced by the Romans, were exposed, without protection, to the arms of the Persian monarch. Armenia was reduced to the state of a Persian province by Sapor, and the administration was shared between a distinguished satrap and a favourite eunuch. In the reign of Justin II. it was subdued by the Saracens, A. D. 687, who held it till the irruption of the Turks; and when they took possession of it, about 755 or 884, they gave it the name of Torcomania. The Turks, by invading Persia, and other eastern countries, gave the Armenians an opportunity of throwing off the Turkish yoke, and of choosing kings for themselves, by whom they were governed till the country was again subdued by Occadan or Heccata, the son of Gengis, and first Cham of the Tartars. The conquest of the Tartars, however, was not so complete as wholly to extirpate from Armenia the race of its own kings; as we read of some of them who reigned afterwards, and particularly in our own chronicles, of Leo, king of Armenia, who, in the reign of Richard II., came into England to solicit aid against the Turks, by whom he had been driven from his kingdom. In the year 1372, Uffan Cassanes, king of Armenia, succeeding to the crown of Persia, made Armenia a province of that empire; and in this state it continued till the year 1522, when it was subdued by Selim II. and made a province of the Turkish empire; from which time it has ever continued subject to the Turks, except the eastern part of it, which belongs to the Persians.

Armenia Minor, was bounded on the east by the Euphrates, which separated it from Armenia Major; on the south by Mount Taurus, parting it from Cilicia; on the west and north by a long chain of mountains, called in different places Mons Scardificus, Amanus, and Antitaurus, which divided it from Cappadocia. This is a very mountainous country, but some of the mountains are interspersed with pleasant and fruitful vales, abounding with oil and wine, not inferior to the best in Greece. This country was a part of Cappadocia, till the reign of Antiochus the Great, when the distinction between Armenia the Greater and the Lesser was introduced; as we have already mentioned. In the time of the Romans it was divided into four provinces; viz. Laviniana, Mariana, Araviana, and Melitene, each of which had its cities, mentioned by Ptolemy; but those of chief note were Melitene, Nicopolis, Gannace, Aza, Arabyffus, Dascusa, Zimara, and Ladana. The manners, customs, and religion of the inhabitants of Armenia Minor, were

were similar to those of Armenia Major. Its first king was Zadriades, who, forming an alliance with the Romans, was maintained on the throne which he had usurped. Nero bestowed this kingdom on Aristobulus, great grandson of Herod the Great; upon whose death it fell to Tigranes, his near relation; and as he died without issue, Armenia Minor was made by Vespasian a province of the Roman empire, and thus continued till the division of the empire, when it was subjected to the emperors of the East. On the decline of their power, it was subdued, first by the Persians, and afterwards by the Turks, who called it "Genech," and have held it ever since. *Anc. Un. Hist.* vol. viii. p. 363—410. *Gibbon's Hist.* i. 435. ii. 139, &c. iii. 137. iv. 157, &c. v. 428. See ARMENIANS.

Armenia is still divided into *Lesser* and *Greater*. Armenia the Lesser is one of the two districts of ALADULIA; Cappadocia being the other. It has Greater Armenia on the east, Syria on the south, the Euxine on the west, and Cappadocia on the north. It is also called Western or Lower Armenia, and is subject to Turkey.

Armenia the Greater, or Turcomania, is bounded on the south by Mesopotamia, and the provinces of Diarbekir, Kurdistan, and Aderbijan; on the north by Georgia; on the east by Persia, and particularly the province of Shirvan; and on the west by Cappadocia and the Lesser Armenia, from which it is parted by the river Euphrates. It belongs partly to the Turks and partly to the Persians. The chief towns in that part which belongs to the Turks, are Erzerum, the capital of Armenia, Kars, Barazid, Mush, Argish, Van, &c. In that part of Armenia to which the dominion of Persia extends, are Erivan, the capital, Ganjals, near the Kur, Nacivan, Adabad, Astabad, Marend, Cors, &c. Armenia is one of the most healthy and fertile provinces in Asia; it abounds with mountains and valleys, lakes and rivers, so that the climate is temperate, and the soil rich; and some have conceived from its fertility, as well as its central situation on the globe, that it was the seat of Paradise, or the garden of Eden. Besides all sorts of grain, it produces tobacco, cotton, flax, melons, and grapes, and formerly olives. See ARARAT. It has also mines of salt, sufficient to supply all Persia. The extreme cold of this country has been long noticed; and to this purpose Sir John Chardin informs us, that he found ice in the rivolets in the mornings of the month of July. The inhabitants are sober and industrious; and they are described as a sensible and polite people. By their frugality and enterprise, they are singularly qualified for commercial transactions. Since the conquest of their country by Shah Abas, king of Persia, they have been dispersed through various parts of Asia and Europe, and have devoted themselves, as merchants and brokers, to trade, in the conduct of which they excel: hence they are become, in a great measure, masters of the whole trade of the Levant, and are much concerned in that of other places. It is common to meet with Armenians at Leghorn and Venice, and even in England and Holland; whilst they are also known, by their commercial dealings, in Persia, Turkey, and Tartary, and indeed all over the East. Shah Abas the Great, it is said, with a view of securing the conquest of Armenia, removed into Persia the first Armenians who ever settled there; and on this occasion about 30,000 families were transported into the province of Ghilan only, whence we have brought the finest Persian silks. He also caused all the inhabitants of Zulfa, a large city of Armenia, to settle at Ispahan, whence the new Zulfa of Persia took its name. This Zulfa is since become the center of the commerce of the Armenians; and to this same Shah Abas these people are said to owe their

genius and disposition for trade, little of which appeared before their transmigration into Persia. As Abas the Great had no other object in view but that of enriching his country, and was sensible that this must be effected by trade, he directed his views to silk as the most precious commodity, and to the Armenians as the most proper people to be employed in disposing of it. Accordingly, the Armenians, who were at first mere husbandmen, were converted by him into merchants; and these merchants are become some of the most able and most celebrated traders in the world. Such has been their extensive and established reputation in this respect, that the cardinal de Richlieu, we are told, had a design to make a settlement of them in France, for promoting the commerce of that country; and the chancellor Seguyer granted them a printing-house at Marseilles. See ARMENIANS.

ARMENIACA, in *Botany*. See PRUNUS.

ARMENIAN BIBLE. See BIBLE, and ARMENIAN *Version*, infra.

ARMENIAN *Bole*. See BOLE.

ARMENIAN *Language and Science*. The Armenians, according to the account given of them by Moses Chorenensis, were, in their original state, rude and savage, without letters, knowledge, and culture, in a great degree ignorant of the history of their ancestors; and indebted for the scanty information respecting them to the books of their neighbours. They had no written characters, and those of their neighbours were not fit for expressing the sounds of their language. At length, however, the art of writing was introduced among them. For a considerable time their transactions were recorded in the Assyrian language; in process of time they employed that of the Greeks; and afterwards they made use of that of the Persians. In the time of Moses Chorenensis, the names of their towns, and some other particulars, were expressed in one of these three languages. It was after the introduction of Christianity, that Miesrob, either towards the close of the fourth or the commencement of the fifth century, invented letters that accurately expressed the sounds of the Armenian language, and which are in use among them at this day. This invention, according to the tradition of the country, was revealed to Miesrob in a dream, after the author had in vain attempted to make the discovery himself, and after he had taken many useless journeys to procure assistance from the learned. Sir William Jones (*Asiat. Res.* vol. iii. p. 12.) is of opinion, that the basis of the Armenian language was ancient Persian, of the same Indian stock with the Zend, and that it has been gradually changed since the time when Armenia ceased to be a province of Irân. However, the letters in which it now appears are allowed to be comparatively modern; and if they be not derived from the Pahlavi, they are probably, as this ingenious writer imagines, an invention of some learned Armenians in the middle of the fifth century. According to Strabo, the language of the ancient Armenians was similar to that of the Syrians; at least it is very probable, from Polyæus (l. iv.), that they used the Syrian characters. The modern Armenians pretend, that, besides their vulgar language, they have a learned one, which has no affinity with the other oriental languages, and which is very expressive, and enriched with all the terms of religion, and of arts and sciences. Moses Chorenensis informs us, that Artefchisch II. took great pains to civilize the Armenians, and to rescue them from that state of barbarity in which they lived; and he says, that agriculture was little and rarely attended to in this country. They could neither build bridges nor construct boats; they had no method of dividing time, and were scarce able to distinguish

guish the succession of the moons. If, indeed, we credit the fables recorded by Berosus, we find that Noah left among the Armenians books of religious ceremonies; that he taught them astronomy, and the distinction of years and months; that on this account he was honoured amongst them, under the titles of Olybama and Arfa, i. e. the "heaven" and "sun;" that they dedicated many cities to him, under the name of Jupiter Sagus, esteeming him the soul of the heavenly bodies. The Armenians also tell us, that Noah taught them husbandry, and the planting of vines; that he was their first king; and that, when he quitted Armenia, he left his mother, wife, and several of his descendants, to people the country. However, in later times, the Armenians made considerable progress in the useful arts and sciences; and particularly in the science of commerce. See ARMENIA.

ARMENIAN Religion. Strabo informs us, that the ancient Armenians worshipped the same deities with those of the Medes and Persians; but this must be understood with some latitude, and as applicable to different epochs of their empire. The chief deity of the Armenians, according to Strabo, seems to have been the goddess Tanais, or Anaitis, whom we know, from other authorities, to be the Nâhéd or Venus of the Persians; and it is for many reasons highly probable, that one and the same religion prevailed through the whole empire of Cyrus. See ANAITIS. For an account of the Armenians after the introduction of Christianity, see ARMENIANS.

ARMENIAN Stone, lapis Armenus, a mineral cuprous stone, or earth of a blue colour, sometimes spotted with green, black, and yellow. It is a very scarce fossil, anciently brought only from Armenia, but is now found very pure, though in small quantities, in the mines at Gosselaer in Saxony.

The *Armenian stone*, in its harder state, bears a near resemblance to *lapis lazuli*, from which it seems only to differ in degree of maturity: they are distinguished by this, that the *lapis armenus* is softer, and instead of sparks of gold, is often speckled with green.

Boerhaave ranks it among semi-metals; and supposes it composed of a metal and earth. Woodward says, it owes its colour to an admixture of copper.

Mr. Kirwan says, that it consists of calcareous earth or gypsum, penetrated with the blue calx of copper: hence it sometimes effervesces with acids, sometimes not; but never gives fire with steel; it loses its colour when heated. *Elem. of Mineral.* p. 262.

Its chief use is in Mosaic work, though it has some place also in physic. It is a very valuable substance in painting, being a bright and florid blue. It was in so high esteem as a paint, among the ancients, that counterfeiters were continually attempted to serve in its place.

Both this and the *lapis lazuli* are ores of copper.

ARMENIAN Version, in *Biblical History*, an ancient translation of the scriptures, for which the church of Armenia, according to the unanimous testimony of the Armenian writers, is indebted to Mesrob, who is said to have finished it in the year 410. This is attested by Moses Chorenensis, a disciple of Mesrob; who adds, that he began with the Proverbs of Solomon. Moses lived in the fifth century, and assisted in the third version of the bible. The internal characters, and the readings of the Armenian version, have convinced the critics in that language, and especially Lacroze, a man of the most profound erudition, that the antiquity ascribed to the Armenian version does not exceed the truth. The learned, however, are divided in opinion, whether it was taken from the Greek original, or from the Sy-

riac version. The Armenians pretend that it was taken from the Syriac; and Moses Chor. (l. iii. c. liv. p. 300.) explicitly confirms this opinion. To which it has been added, that the Armenian version contains readings, which are found in no MS. or version, except the Syriac. But another relation from the same writer, (l. iii. c. lxi. p. 313.) is adduced on the other side of the question; and this is decisive: for it gives a full and credible account of the care bestowed by the Armenians on their version of the bible, and that they translated it twice from the Syriac, and a third time from the Greek. Hence may be assigned the reason, why the readings of the Armenian version are so frequently different from the Syriac. Another argument, which has been thought decisive in favour of the opinion, that our present Armenian version was not taken from the Syriac, is, that the former contains those books of the New Testament, which were never admitted into the latter. The Armenian version would be an inestimable treasure, if it had descended to the present age unaltered by time and superstition. But the churches of the Lesser Armenia, or Cilicia, submitted in the thirteenth century to the authority of the pope; and Haitho, or Hethem, who reigned from 1224 to 1270, became shortly before his death a Franciscan friar. This prince was not only attached to the church of Rome, but likewise acquainted with the Latin language; and, publishing a new edition of the Armenian bible, he altered, or rather corrupted it, from the Vulgate. He translated, for instance, all the prefaces of Jerom; and as the words of 1 John v. 7. were not in the old Armenian MSS., he inserted them probably from the Latin; for thirty-seven years after his death this passage was quoted at a council held at Cis, in Armenia, and is found in other Armenian records. *Michaëlis Int. N. T.* by Marsh, vol. ii. p. 98, &c. See ARMENIAN BIBLES.

ARMENIANS, in *Eccelesiastical History*, a division among the eastern Christians, thus called from *Armenia*, the country anciently inhabited by them.

Some have supposed, that Christianity was established in Armenia by the apostle St. Bartholomew; but this is certain, that in the beginning of the fourth century the Armenian Christians were in a flourishing state. In this century Tridates the king established an hierarchy; and in the beginning of the sixth, under the patriarch Nerses, the Armenian church seceded from other establishments, became independent, and embraced the theory of the Jacobites, some few articles of discipline excepted. The schism of the Armenians is placed eighty-four years after the council of Chalcedon, A. D. 535. It was consummated at the end of seventeen years; and it is from the year of Christ 552, that the æra of the Armenians is dated. In the fifth century, Armenia was divided into fifteen provinces, and subdivided into one hundred and ninety-one dioceses.

The Armenian church, in the sixteenth century, was governed by three patriarchs, the chief of whom resided in a monastery at Echmiazin, three leagues from Erivan. The diocese of this patriarch comprehends Greater Armenia; and he presides over forty-two archbishops; he is elected by bishops, and his election is confirmed by the king of Persia. The revenues of this spiritual ruler are such as would enable him to live in the most splendid and magnificent manner; and yet there is no mark of pomp or opulence in his external appearance, or in his domestic economy. His table is frugal, and his habit plain; nor is he distinguished from the monks, with whom he lives, by any other circumstance besides his superior power and authority. A second patriarch, subject to the first, and called "the Catholic," resides at Cis in Cilicia, and has twelve archbishops under him, who govern

govern the churches established in Cappadocia, Cilicia, Cyprus, and Syria. A third patriarch lives in the island of Aghtamar, in the midst of the great lake of Varapuracan; he has no more than eight or nine bishops under his jurisdiction, and is regarded by the other Armenians as the enemy of their church. Besides these prelates, who are patriarchs in the true sense of the term, the Armenians have other spiritual leaders who are honoured with the title of patriarchs, though it be unattended with the authority and prerogatives of the patriarchal dignity. Thus, the archbishop of the Armenians, who lives at Constantinople, and whose authority is respected by the churches established in those provinces that form the connection between Europe and Asia, enjoys the title of patriarch. The same denomination is given to the Armenian bishop who resides at Jerusalem; and to the prelate of the same nation, who has his episcopal seat at Camenee in Poland, and governs the Armenian churches that are established in Russia, Poland, and the adjacent countries. They assume the title of patriarchs, on account of some peculiar privileges conferred on them by the great patriarch of Echmiazin; for by an authority derived from this supreme head of the Armenian church, they are allowed to consecrate bishops, and to make every third year, and distribute among their congregations, the holy chrism or ointment, which, according to a constant custom among the eastern christians, is the exclusive privilege of the patriarchs. After the death of Abas the Great, the Armenian exiles, who, under his protection, had enjoyed the sweets of liberty and abundance, were involved in various kinds of calamity. The storm of persecution shook their constancy; and many of them apostatised to the Mahometan religion, so that it was apprehended that that branch of the Armenian church, which had been planted in Persia, and especially in Ispahan, would gradually perish. On the other hand, the state of religion in that church derived considerable advantages from the settlement of Armenians in different parts of Europe, for the purposes of commerce. These merchants, who had fixed their residence during the sixteenth century, at London, Amsterdam, Marseilles, and Venice, were not unmindful of their brethren in their native country; but supplied them with Armenian translations of the holy scriptures, and of other theological books, from the European presses, which prevented the illiterate and superstitious people, who lived under the Persian and Turkish governments, from sinking into the most consummate and deplorable ignorance.

The Armenians, though they agree with the other Monophysites in the main doctrine of that sect, relating to the unity of the divine and human nature in Christ, differ from them, nevertheless, in many points of faith, discipline, and worship; and hence it comes to pass, that they hold no communion with that branch of the Monophysites, who are Jacobites, in the more limited sense of that term. As to the eucharist, they agree with the Greeks, except in this that they mix no water with their wine, and use unleavened bread after the manner of the Latins. Infants of two or three months old are admitted to the communion; and the consecrated bread, soaked in the consecrated wine, is distributed with peculiar ceremonies. When the priest takes the chalice and patin, he is followed by his deacons and sub-deacons, with flambeaux and plates of copper furnished with bells: thus accoutred, with a censer before him, he goes in procession round the sanctuary; he then places them on the altar, pronounces the words of consecration, and turns himself to the people, who fall down, kiss the earth, and beat their breasts; then, after taking the bread himself, he

distributes it to the people. In the baptism of children, they practise triple immersion; and then the priest binds a small cord of silk and cotton round the neck of the child, anoints his forehead, stomach, arm-pits, hands, and feet, and makes on each part the sign of the cross. The child, after baptism, is carried home by the godfather with the sound of drums and trumpets. The women do not go to church for forty days after delivery; and they observe many Jewish customs. The Armenians celebrate an annual festival, called Caclacouran, which, half Armenian and half Persian, signifies the baptism of the cross. It is generally supposed that this is a religious ceremony, like the theophany of the Greeks, and the epiphany of the Roman catholics. It is celebrated on the sixth of January, and the terms signify "manifestation;" but it is not agreed, whether it commemorates the birth of Christ in his manifestation in the flesh; or his appearance to the wise men when he was manifested to the Gentiles; or his manifestation to the Jews by the voice from heaven at his baptism. Perhaps it is merely a civil institute, resembling the Roman lustrum. The Persians mark this Armenian festival in their almanacks; their Mahometan kings attend it; and some say, it is an imitation of the Abhirkan of the Guebres, or Gauris, i. e. the festival of lustral water, in use among the ancient Persians.

The Armenians abstain very rigorously from eating of blood, and meats strangled, and are much addicted to fasting; inasmuch that from their discourse, one would conclude that almost their whole religion consisted in fasting; and the higher the rank of their clergy, so much the greater must be their abstinence. Their monks, every Wednesday and Friday, eat neither fish, nor eggs, nor oil, nor any thing made of milk; and during Lent, they live upon nothing but roots; they are allowed wine only on the Saturday in the holy week, and meat on Easter Sunday. Besides the great Lent, they have four or five others of eight days each, preparatory for the four great festivals of the Nativity, the Ascension, the Annunciation, and of St. George, during which they are not allowed so much as to speak of eggs, flesh, oil, or butter.

Their monastic order is in great repute among them, since one of their patriarchs introduced that of St. Basil; but part of them, which have united with the church of Rome, have changed their ancient rule for that of the Dominicans.

ARME'NISTAIRE, in *Zoology*, a term occasionally given by some French writers to the MEDUSA tribe of *Vermes Mollusca*. See MEDUSA.

ARMENTA, one of the synonymous names of *Bos Americanus* of Gmelin, an animal which Dr. Shaw considers a variety only of *Bos Taurus*. "The American Bison," says that author, "seems to differ in no respect from the European, except in being more shaggy, and in having a more protuberant bunch or fleshy substance over the shoulders: the fore-parts of the body are extremely thick and strong; the hinder parts comparatively weak. The colour of the American Bison is reddish brown, and the hair in winter is of a woolly nature, falling down over the eyes, head, and whole fore-part of the animal. In summer, it often becomes almost naked, but particularly on the hind part of the body. It grows, according to Lawson, to a vast size, and has been found to weigh sixteen hundred, and even two thousand four hundred pounds; and the strongest man cannot lift one of the skins from the ground." Gen. Zool. Gmelin, who expresses some doubt whether it be distinct from *Bos Taurus*, assigns it the same character as Linnaeus

Linnæus had previously given to the variety of that species, *frus*: namely, cornibus divaricatis, juba longissima, dorso gibboso, only making it a second variety β . (horns divaricate, mane long, back gibbous, var. β) This is *Bos* (*Bison Americanus*) cornibus sursum reflexis, dorso gibboso, capitis pins longissimis obliquo. Brill. regn. an. *Bison d'Amérique* of Buff. *Buffalo*, Lawf. Carol. *Buffalo*, Catelby. *American oxen or beves*, Dobbs. Hudf. *American bull*, Pennant. See TAURUS.

ARMENTEQUI, or ARMENZA, in *Geography*, a village of Spain, in the country of Alava, once a city and see of an archbishop, one mile from Vittoria.

ARMENTIÈRES, a town of France, in the department of the North, and chief place of a canton in the district of Lille, seated on the Lys. It was taken and dismantled by the French in 1687. The place contains 7598, and the canton 14,914 inhabitants: the territory includes 55 kilometres and 6 communes. N. lat. $50^{\circ} 40'$. E. long. $3^{\circ} 3'$.

ARMENTO, a town of Italy, in the kingdom of Naples, and province of Basilicata, 20 miles S. S. E. of Potenza.

ARMERIA, in *Botany*. See DIANTHUS.

ARMERIUS. See DIANTHUS, and SILENE.

ARMET, in *Geography*, a town on the island of Noufflaout, one of the Molucca islands.

ARMIDA, in *Entomology*, the name of a species of PHALÆNA, in the *Bombyx* family, that inhabits Cayenne. The wings are yellow, speckled, and spotted with violet, and a streak behind of the same colour. Fabricius, Gmelin, &c. *Olf.* This is a large insect; the antennæ are yellow; the thorax yellow with a violet coloured spot on the back; abdomen yellow with a violet-coloured spot on the first segments; wings beneath yellow, with a violet spot in the middle. *Olf.* This must not be confounded with the moth figured by Cramer, t. 197. fig. A., under the specific name of ARMIDA, that being PHALÆNA *Erythrina* of Fabricius and Gmelin.

ARMIERES, in *Geography*, a small town of Hainault, on the Sambre.

ARMIGER, *armour-bearer*, in *Modern Writers*, denotes a title of dignity, rendered in English by *Esquire*.

ARMIGER, in *Entomology*, a species of CIMEX found in Africa. It is grey; thorax acutely spined; two dots on the scutel, the antennæ and legs pale. Gmelin and Fabricius. *Olf.* This is COREUS *armiger* of the latter author, and was first described by him in his *Species Insectorum*.

ARMIGER, a name given by Fabricius to a species of CANCER that inhabits the Southern ocean. The thorax is somewhat smooth, with eight teeth on each side, and five lobes in front; the arms are toothed on each side. Fab. Mant. Inf.

ARMIGER, a species of MONOCULUS, in the sixth section of the Gmelinian system, or those furnished with an univalve shell; eyes two, and placed beneath; two antennæ, and from four to eight legs. In this section (*Arguli*) are only three species, and the present is distinguished from the two others by having six legs. Slabb. microf. Gmel. &c.

ARMILAUSA, in *Antiquity*, a short military coat, reaching down only to the knee. Aquin. and Pitife. Lex. Ant.

It was thus called, as being divided both before and behind, and only close about the shoulders, in *armos tantum clausa*, quasi *armiclausu*. Ibid. Orig. l. xix. c. 22.

The word is sometimes also written, *armiclausu*, *armelauha*, *armicasia*, and *armilcasia*.

ARMILAUSA is also applied, in *Ecclesiastical Writers*, to the scapular of monks and canons; thus called on account

of its hanging from the arms or shoulders. Schmid. Lex. Eccl. p. 73.

The same habit is vulgarly called *patience*.

ARMILLA, in *Zoology*, one of the VERMES *infusoria*, belonging to the genus LIUCOPHRA, and both figured and described by Müller in his *Zool. Dan.* It is invisible to the naked eye, round, and annular; it is rather thickened above, and bent into the form of a ring.

ARMILLA *membranosa* is a name given by some *Anatomists* to the annular hyament.

ARMILLARIS, in *Zoology*, a creature of the VERMES *Mollusca* kind, in the genus NEREIS. It is subdepressed; peduncles come; cirri lenticular. This species inhabits the North seas, where it buries itself deep in the sands. The shape is siliform; length an inch and a quarter; on each side of the head are three moniliform feelers; in the body are a hundred and twenty joints, each of which is furnished with a small peduncle on both sides; and the tail terminates in two long filaments or threads. Müll. O. Fabr. Gmel. &c.

ARMILLARY, ARMILLARIS, formed of *armilla*, a bracelet or ring, in *Astronomy*, an epithet given to an artificial sphere composed of a number of metalline circles, representing the several circles of the mundane sphere put together in their natural order.

Armillary spheres serve to assist the imagination in conceiving the arrangements and the motions of the heavenly bodies.

Such is that represented (*Plate II. Astron. fig. 14.*)—Where P and Q represent the poles of the world, AD the equator, EL the ecliptic and zodiac, P A G D the meridian, or the solstitial colure, T the earth, FG the tropic of cancer, H T the tropic of capricorn, MN the arctic circle, OV the antarctic, N and O the poles of the ecliptic, and R S the horizon.

The armillary sphere constructed by Dr. Long, in Pembroke-hall, Cambridge, is eighteen feet in diameter; and more than thirty persons may conveniently sit in it. The lower part of the sphere invisible in England is cut off; the whole apparatus is so contrived, that, when in order, it may be turned round with as little labour as it takes to wind up a jack.

ARMILLARY *trigonomet*, an instrument first contrived by Mr. Mungo Murray, and improved by Mr. Ferguson, consisting of five semicircles; viz. meridian, vertical circle, horizon, hour circle, and equator; so adapted to each other by joints and hinges, and so graduated and divided, as to serve for expeditiously resolving many problems in astronomy, dialling, and spherical trigonometry. For the drawing, description, and method of using it, see Ferguson's *Traacts*, p. 80, &c.

ARMILLATI MILITES, in *Antiquity*, those who wore bracelets on their left arms, bestowed on them by their generals or emperors. But the term is more frequently applied to soft and effeminate soldiers, who wore bracelets on their arms, not as the rewards of their prowess, but marks of their foppery. Aquin. Lex.

ARMILLATUM, in *Conchology*, a species of BUCCINUM, figured and described by Lister and others. The shell is oblong; the aperture large and toothless; the whorls crowned with a single row of tubercles. Its native place is unknown.

ARMILLATUS, in *Entomology*, a species of CURCULIO that inhabits the Cape of Good Hope. The thorax is somewhat spinous on the sides; a grey belt near the tip of the thighs; shanks dentated. Sparm. nov. act. Stock. There is a variety of this insect entirely of a brownish grey colour, and

and another in which the wing-cases are clouded with grey, and an oblong spot placed obliquely on each side.

ARMILLATUS, a species of *CERAMBYX*, of a large size, that is found in India. On each side of the thorax are four spines; wing-cases ferruginous, with a black margin; a single tooth on the posterior thighs. Gronov. Fabr. &c.

ARMILUSTRIUM, in *Antiquity*, a feast held among the Romans; wherein they sacrificed, armed at all points, and with the sound of trumpets.

Some define *armilustrum* to have been a feast, wherein a general review was made of all the forces, in the Campus Martius. But this does not come up to the point; for Varro does not derive the word from the Latin *arma* and *lustrare*, to make a review; but from the custom of holding this feast in the place where the reviews were used to be made, or rather from their going round the place armed with bucklers.

The sacrifice was intended for the expiation of the armies, and the prosperity of the arms of the people of Rome; and was celebrated on the fourteenth of the calends of November. This feast may be considered as a kind of benediction of arms. It was first observed among the Athenians.

ARMINIACHA, in *Geography*, a small town of Asia Minor, in Aladulia, at the foot of mount Taurus; supposed to have been the ancient Cybistra.

ARMINGS, in a ship, are the same with *wash-cloths*, being red cloths hung about the outsides of the ship's upper works fore and aft; and before the cubbridge-heads.

There are some also hung round the tops, and called *top-armings*. See *TOP*.

ARMINIA, in *Ancient Geography*, a river of Italy, in Etruria, flowed from north to south between Saturnia and Vulturni, and discharged itself into the sea near Forum Aurelii.

ARMINIANISM, the doctrine of Arminius and of his followers. See *ARMINIANS*.

ARMINIANS, in *Ecclesiastical History*, the followers of Arminius, who, though educated at Geneva, and having imbibed the doctrines concerning predestination and grace, maintained by Calvin, Beza, Zanchius, &c. began to express his doubts concerning them in the year 1591; and upon farther inquiry, adopted sentiments more nearly resembling those of the Lutherans, than of the Calvinists. After his appointment to the theological chair at Leyden, he thought it his duty to avow and vindicate the principles which he had embraced; and the freedom with which he published and defended them, exposed him to the resentment of those who adhered to the theological system of Geneva, which then prevailed in Holland; but his principal opponent was Gomar, his colleague. The controversy which was thus begun, became more general after the death of Arminius in the year of 1609, and threatened to involve the United Provinces in civil discord. The Arminian tenets gained ground under the mild and favourable treatment of the magistrates of Holland, and were adopted by several persons of merit and distinction. The Calvinists, or Gomarists as they were now called, appealed to a national synod; accordingly the synod of Dort was convened by order of the States General, in 1618; and was composed of ecclesiastical deputies from the United Provinces, as well as from the reformed churches of England, Scotland, Hesse, Bremen, Swisserland, and the Palatinate. The principal advocate in favour of the Arminians was Episcopius, who at that time was professor of divinity at Leyden. It was first proposed to discuss the principal subjects in dispute, and that the Arminians should

be allowed to state and vindicate the grounds on which their opinions were founded; but some difference arising as to the proper mode of conducting the debate, the Arminians were excluded from the assembly; their case was tried in their absence; and they were pronounced guilty of pestilential errors, and condemned as corrupters of the true religion. In consequence of this decision, they were treated with great severity; they were deprived of all their posts and employments; their ministers were silenced, and their congregations were suppressed. However, after the death of prince Maurice, who had been a violent partisan in favour of the Gomarists, in the year 1625, the Arminian exiles were restored to their former reputation and tranquillity; and under the toleration of the state, they erected churches and founded a college at Amsterdam, appointing Episcopius to be the first theological professor. The Arminian system has very much prevailed in England since the time of archbishop Laud, and its votaries in other countries are very numerous.

The distinguishing tenets of the Arminians may be comprized in the following five articles; relating to predestination, universal redemption, the corruption of man, conversion, and perseverance. With respect to the first, they maintained, "That God, from all eternity, determined to bestow salvation on those, who he foresaw would persevere unto the end in their faith in Christ Jesus; and to inflict everlasting punishments on those who should continue in their unbelief, and resist unto the end his divine succours; so that election was conditional, and reprobation in like manner the result of foreseen infidelity, and persevering wickedness."

On the second, the Arminians taught, "That Jesus Christ, by his sufferings and death, made an atonement for the sins of all mankind in general, and of every individual in particular; that, however, none but those who believe in him can be partakers of their divine benefit."

On the third article, they held, "That true faith cannot proceed from the exercise of our natural faculties and powers, nor from the force and operation of free-will, since man, in consequence of his natural corruption, is incapable either of thinking or doing any good thing; and that therefore it is necessary, in order to his conversion and salvation, that he be regenerated and renewed by the operation of the Holy Ghost, which is the gift of God through Jesus Christ."

Fourthly, "That this divine grace, or energy of the Holy Ghost, begins and perfects every thing that can be called good in man, and consequently all good works are to be attributed to God alone; that nevertheless this grace is offered to all, and does not force men to act against their inclination, but may be resisted, and rendered ineffectual by the perverse will of the impenitent sinner." Some modern Arminians interpret this and the last article with a greater latitude.

Fifthly, "That God gives to the truly faithful, who are regenerated by his grace, the means of preserving themselves in this state;" and though the first Arminians made some doubt with respect to the closing part of this article, their followers uniformly maintain, "that the regenerate may lose true justifying faith, forfeit their state of grace, and die in their sins."

The modern system of Arminianism likewise, founded on a comprehensive plan projected by Arminius himself, as appears from a passage in his last will, extends the limits of the Christian church, and relaxes the bonds of fraternal communion in such a manner, that Christians of all sects and denominations, whatever their sentiments and opinions may

be, papists excepted, may be formed into one religious body, and live together in brotherly love and concord. But, in order to avoid the reproach of being altogether unconnected by any common principles, Episcopius drew up a confession of faith, expressed for the most part in words and phrases of Holy Scripture, which the Arminians have generally adopted, though not enjoined upon them by any authoritative obligation.

The Arminians are also called *Remonstrants*, from an humble petition intitled their *Remonstrance*, which, in the year 1610, they addressed to the states of Holland. Their principal writers are, Arminius, Episcopius, Vorstius, Grotius, Curcellæus, Limborch, Le Clerc, and Wettstein; not to mention many others of more modern date. Brandt's Hist. of the Reformation in the Netherlands; and Mosheim's Eccles. Hist. by Dr. Maclaine, vol. v.

The progress of Arminianism has been somewhat retarded, and its prevalence restrained, more especially in Germany, and several parts of Switzerland, in consequence of the ascendancy which the Leibnizian and Wolfian philosophy hath gained in these countries, particularly among the clergy and the men of learning. Leibnitz and Wolf, by attacking that liberty of indifference which is supposed to imply the power of acting, not only without, but against motives, struck at the very foundation of the Arminian system. Besides, by considering the multiplicity of worlds that compose the universe as one system or whole, whose greatest possible perfection is the ultimate end of creating goodness, and the sovereign purpose of governing wisdom, they removed from the doctrine of predestination those arbitrary procedures and narrow views with which the Calvinists have been charged with loading it, and gave it a new, a more pleasing, and a more philosophical aspect. As the Leibnizians laid down this great end as the supreme object of God's universal dominion, and the scope to which all his dispensations are directed, so they concluded, that if this end was proposed, it must be accomplished. Hence the doctrine of necessity, to fulfil the purposes of a predestination founded in wisdom and goodness: a necessity physical and mechanical in the motions of natural and inanimate things, but a necessity moral and spiritual in the voluntary determinations of intelligent beings, in consequence of prepollent motives which produce their effects with certainty, though these effects be contingent, and by no means the offspring of an absolute and immutable fatality. These principles are evidently applicable to the main doctrines of Calvinism; by them predestination is confirmed, though modified with respect to its reason and end; by them irresistible grace, irresistible in a moral sense, is maintained upon the hypothesis of prepollent motives and a moral necessity. The perseverance of the saints is also explicable upon the same system, by a series of moral causes producing a series of moral effects. The learned Canzius has written a book for the express purpose of shewing the eminent use that may be made of the Leibnizian and Wolfian philosophy, in throwing light upon the chief articles of our faith, "Philosophiæ Leib. et Wolf. usus in theologia per præcipua fidei capita." Francof. and Leipf. ed. 2. 1749. The scheme of necessity, and of partial evil tending to universal good, has been fostered in some parts of Great Britain, and has converted some zealous Arminians into moderate and philosophical Calvinists. But "the zealous Calvinists (says Dr. Maclaine) have for the most part held firm to their theology, and blended no philosophical principles with their system; and it is certain that the most eminent philosophers have been found, generally speaking, among the Arminians. If both Calvinists and Arminians claim a KING, it is certain that the latter alone

can boast of a NEWTON, a LOCKE, a CLARKE, and a BOYLE.

ARMINIUS, or HARMANSEN, JAMES, in *Biography*, founder of the sect called *Arminians*, was born at Oude-Water in Holland, in 1560; and he lost his father in his infancy. He was first instructed by a Catholic priest, who was secretly a friend to the reformed religion, and by his liberality encouraged as a student at Utrecht. Upon the death of this patron, he obtained assistance from Rodolphus Snelius, his countryman, and in 1575 accompanied him to Marpurgh. During his abode in this place, he received information that his native town was pillaged by the Spaniards; and hastening thither to visit his family, he found that his mother, sister, brother, and other relations, had been put to the sword. At Leyden he afterwards prosecuted his studies with reputation; and at length the magistrates of Amsterdam provided him with the means of finishing his education at Geneva. The lectures of Theodore Beza on the epistle to the Romans, are supposed to have first suggested to Arminius those speculations, which led him to form a new sect. As he adopted and privately taught the philosophical system of Peter Ramus, he was obliged to withdraw from Geneva; and he then removed to Basil, where he gained great credit by his lectures: after a short interval he returned to Geneva, and enjoyed in tranquillity the society of the learned. Desirous of farther improvement, he visited Padua, in order to attend the philosophical lectures of the celebrated Zabarella; and after having travelled in Italy for five or six months, he returned, in 1588, to Amsterdam, where he found his patrons much prejudiced against him. "It was reported and believed, that Arminius had kissed the Pope's toe, whom he had only seen in a crowd; that he had contracted an intimacy with Jesuits, whom he had never heard of; that he had introduced himself to Bellarmin, whom he had never seen; and that he had abjured the reformed religion, for which he was prepared to die." These prejudices, however, as they were occasioned by groundless rumours and calumny, gradually subsided; and the talents and zeal of Arminius, as a strenuous advocate for the reformed religion, and an eloquent preacher, raised him to distinguished notice; accordingly he was engaged to refute a work which had been written against Beza's doctrine of predestination. In the course of his examination, he became a proselyte to the opinions which he had undertaken to refute; and renouncing the Calvinistic doctrine concerning the decrees of God and divine grace, he maintained, that the merits of Christ extended to all mankind, and that the grace of God, which is necessary to salvation, is attainable by all. This change in the sentiments of Arminius took place in the year 1591; and his undisguised and honest avowal of it excited hostilities, which would have been injurious to Arminius, if the magistrates of Amsterdam had not interposed and suppressed the contest. After having officiated as a minister in the church of Amsterdam for fifteen years, Arminius, notwithstanding the heretical opinions which he had adopted, was elected, in 1603, to the professorship of divinity in the university at Leyden, and admitted to the degree of doctor in divinity. In his lectures, and also in his writings, the professor strenuously asserted and defended his opinions, and made many converts both among the clergy and the laity. His adversaries, however, were very numerous; and of these the most violent was his colleague, Francis Gomar. Unable to contend with the various modes of attack by which his enemies persecuted him, he sunk under a complication of diseases, and departed this life in the year 1609. Arminius was eminently distinguished by his piety and integrity,

integrity, and conciliated the esteem even of his enemies, by his modesty and diffidence, by the candour of his temper, and the affability of his manners. He chose rather, says Brandt, his biographer, to be religious in reality than in appearance, and preferred the approbation of his own mind to the opinion of the world. His motto was "Bona conscientia paradusus." "A good conscience is a paradise." Peter Bertius concludes his funeral oration upon him with these words: "He was a man who could not be sufficiently esteemed by those who knew him, and those who did not esteem him, never knew him sufficiently." He was a friend to universal toleration, and with him it was a fundamental principle, that Christians are accountable only to God for their religious sentiments, and that no individual can be justly punished by the magistrate for erroneous opinions, while he conducts himself as a virtuous and obedient subject, and makes no attempt to disturb the peace and order of civil society. As a writer, his manner of reasoning and his style are somewhat scholastic; but he is distinguished by simplicity and perspicuity. His works are comprised in one volume, 4to. printed at Frankfort in 1631 and 1634, &c. His "Disputationes publicæ et privatæ" afford a just and accurate notion of the doctrine and character of Arminius. Mosheim's *Eccl. Hist.* vol. v. p. 439, &c. Gen. Dict. See ARMINIANS.

ARMIRO, in *Geography*, a sea-port town of European Turkey, in the province of Thessaly or Janna, on the south-west side of the gulf of Volo; supposed to be the Eretria of the ancients. N. lat. 39° 42'. E. long. 23° 30'.—Also, a river in the isle of Candia, near Castell-Malvesi, which empties itself into the Mediterranean near Paleo-Castro, said to be the "Oaxes" of the ancients.—Also, a town of South America, in Guiana, four leagues from Cayenne.

ARMISTICE, ARMISTITIUM, in *Military Language*, from *arma stare*, or *stare*, a short truce, or a cessation of arms for a small time.

ARMOA, in *Geography*, a river of Arcadia, which discharges itself into the Alpheus, supposed to be the Amarynchus of the ancients.

ARMOACHUOIS, a tribe of wandering Indians on the borders of Canada.

ARMOISIN, in *Commerce*, a silk stuff, or kind of taffety, of an indifferent goodness; made at Lyons, and at several places in Italy. There are half armoisins, made at Avignon, which are of inferior quality, and less price than the others. Some pretend that the word *armoisin* comes from the Italian *armesino*; or that these silks were thus called, because there were coats of arms delineated on the cloths in which they were wrapped.

There is also a taffety of this name manufactured in the East Indies; but of an inferior quality to those made in Europe.

ARMONA, in *Geography*, a town of the island of Negroponte.

ARMONICAC. See AMMONIAC.

ARMONICA, from *αρμονια*, *harmony*, is a name which Dr. Franklin has given to a musical instrument constructed with drinking-glasses. It is well known that a drinking-glass yields a sweet tone, by passing a wet finger round its brim. Mr. Pockrich, of Ireland, was the first who thought of playing tunes formed of these tones. He collected a number of glasses of different sizes, fixed them near each other on a table, and tuned them by putting into them water, more or less, as each note required. Mr. Delaval, F. R. S. made an instrument in imitation of that which was contrived by Mr. Pockrich: and from this instrument Dr. Franklin took the hint of constructing his *armonica*.

The glasses for this musical instrument are blown as nearly as possible in the form of hemispheres, having each an open neck or socket in the middle. The thickness of the glass near the brim is about one tenth of an inch, increasing towards the neck, which in the largest glasses is about an inch deep, and an inch and a half wide within; but these dimensions lessen as the size of the glasses diminishes, only observing that the neck of the smallest should not be shorter than half an inch. The diameter of the largest glass is nine inches, and that of the smallest three inches: between these there are twenty-three different sizes, differing from each other a quarter of an inch in diameter. For making a single instrument, there should be at least six glasses blown of each size, and out of these thirty-seven glasses (which are sufficient for three octaves with all the semitones) may be found, that will either yield the note required, or one a little sharper, and fitting so well into each other, as to taper regularly from the largest to the smallest. The glasses being chosen, and the note for which each glass is intended being marked upon it with a diamond, they are to be tuned by diminishing the thickness of those that are too sharp, which is done by grinding them round from the neck towards the brim, comparing, by means of a well-tuned harpsichord, the tone drawn from the glass by your finger with the note you want, as founded by the corresponding string of the harpsichord. The largest glass in the instrument is G, a little below the reach of a common voice, and the highest G, including three complete octaves: and they are distinguished by painting the apparent parts of the glasses within side, every semi-tone white, and the other notes of the octave with the seven prismatic colours: so that glasses of the same colour (the white excepted) are always octaves to each other.

When the glasses are tuned, they are to be fixed on a round spindle of hard iron, an inch in diameter at the thickest end, and tapering to a quarter of an inch at the smallest. For this purpose, the neck of each glass is fitted with a cork, projecting a little without the neck; these corks are perforated with holes of different diameters, according to the dimension of the spindle in that part of it where they are to be fixed. The glasses are all placed within one another, the largest on the biggest end of the spindle with the neck outwards; the next in size is put into the other, leaving about an inch of its brim above the brim of the first; and the others are put on in the same order. From these exposed parts of each glass, the tone is drawn, by laying a finger upon one of them, as the spindle and glasses turn round. The spindle thus prepared, is fixed horizontally in the middle of a box, and made to turn on brass gudgeons at each end. A square shank comes from its thickest end through the box, on which shank a wheel is fixed by a screw: this will serve, like a fly, to make the motion equable, when the spindle is turned by the foot like a spinning-wheel. The wheel is eighteen inches in diameter, and conceals near its circumference about twenty-five pounds of lead, and may be made of mahogany. An ivory pin is fixed in the face of the wheel, about four inches from the axis; over which is put the loop of the string, that comes up from the moveable step to give it motion. The box is about three feet long, eleven inches wide at the biggest end, and five inches at the smallest end; it is made with a lid, which opens at the middle of its height, and turns up by back hinges. The instrument, thus completed, stands on a neat frame with four legs. This instrument is played upon by fitting before it, as before the keys of a harpsichord, turning the spindle with the foot, and wetting the glasses now and then with

a sponge and clean water. The fingers should be first soaked in water; and rubbed occasionally with fine chalk, to make them catch the glass, and bring out the tone more readily. Different parts may be played together by using both hands; and the tones are best drawn out when the glasses turn from the ends of the fingers, not when they turn to them.

The advantages of this instrument, says Dr. Franklin, are, that its tones are incomparably sweet beyond those of any other; and that they may be swelled and softened at pleasure by stronger or weaker pressures of the finger; and continued to any length: and when it is once well tuned, it never again wants tuning. Franklin's Letters, &c. on Philosophical Subjects, p. 428.

Mr. Poekrich, the first performer on runner glasses, by a fatal accident was burned in his bed at his lodgings in Swihin's Alley near the Royal Exchange, in 1759, by the house in which he lodged taking fire in the night, and being destroyed, before any assistance could arrive.

Mr. Schuman, a German harpsichord-master, played publicly afterwards with considerable success in several parts of London and Weilmünster. But the first and only performer on the Armonica, constructed and so accurately described by Dr. Franklin, in a letter to Padre Beccaria of Turin, was the eldest Miss Davies, sister to Miss Cecilia Davies, the celebrated opera singer, but best known in Italy by the title of *l'Inglese*.

The talents of our two countrywomen, the Miss Davieses, who resided a considerable time at Vienna, in the same house as the celebrated Haffé and Faustina (see Present State of Music in Germany, Art. Vienna, vol. i.), have been described by the admirable lyric poet, Metastasio; the eldest for her performance on the Armonica, at that time a new instrument; and the youngest, for her vocal abilities. The Empress-queen had been so pleased by their several talents, that in the year 1769, on the marriage of the infant duke of Parma with the arch-duchess Maria Amelia, she desired Metastasio to write a cantata, which was set by Haffé, in order to display their several talents. This cantata has been published in late editions of the poet's works, under the title of *l'Armonica*, the name of the new instrument on which the eldest Miss Davies accompanied her sister, in the performance of the cantata.

A letter written by the poet to the princess di Belmonte, at Naples, recommending these performers to her protection, will serve as a comment to the cantata just mentioned.

"The bearers of this most reverential address, are two English young persons, travelling under the conduct of their worthy parents, in order to give testimonies at Naples of their several abilities in music; their names are Miss Mary, and Miss Cecilia Davies: the first performs with admirable skill on an instrument of new invention called the Armonica. It is composed of glasses of different sizes, revolving, by means of a pedal, on a spindle. These glasses, forming a regular scale of tones and semi-tones, being delicately touched with wet fingers during their revolution, produce the most uncommonly sweet and celestial tones imaginable; particularly in pathetic strains, for which the instrument is eminently calculated. The other sister, who is possessed of a very pleasing and flexible voice, sings extremely well, with much art and natural expression; and when accompanied by her sister on the Armonica, she has the power of uniting her voice with the instrument, and of imitating its tones so exactly, that it is sometimes impossible to distinguish one from the other. They have been here universally admired and applauded: and my most august patroness, who

has deigned to hear them frequently, has honoured them with munificent testimonies of imperial approbation."

Miss Cecilia Davies performed in the theatre of San Carlo at Naples, the part of *Bradamante*, in Metastasio's new opera of Ruggiero.

In the first fol. edit. of the French *Encyclopedie*, t. xvii. printed in 1765, under the article *VERRES, MUSIQUE DES*, Musical glasses, it is said; "they have contrived within these few years to produce a new species of harmony from glasses, which is extremely pleasing to the ear.

"It is pretended that an Englishman of the name of Puckridge is the inventor. However this method has been long known in Germany. The instrument used on this occasion is an oblong square box, in which are arranged and fixed many round glasses of different diameters. In these there is water of different quantities. By rubbing the edge of the glasses with a wet finger very gently, the sweetest, most melodious, and sustained tones are produced, and with these the most agreeable airs are performed.

"The Persians, in very high antiquity, have produced musical sounds by a similar contrivance; by striking seven porcelain cups, tuned by water, with little sticks, a regular scale is produced." No authority is given for these assertions. Metastasio, who had resided near fifty years in Germany, calls the Armonica, "an instrument of new invention." The producing musical tones from drinking-glasses has been long known to the natives of Great Britain and Ireland; but the forming different toned glasses into an instrument, and tuning them by water, we have not the least doubt was the invention of a native of Ireland, of the name of Poekrich; as the placing a series of glasses on a cylinder, or spindle, turned with a pedal, was the invention of Dr. Franklin, who tuned his glasses by grinding, not by water. A drawing of Miss Davies's instrument will be found in one of the plates of musical instruments. Her performance on this musical instrument so pleased the great masters on the Continent, that Padre Martini, Haffé, Galuppi, Jomelli, Mozart, &c. presented her with original compositions, purposely produced for the Armonica, upon which she often plays, extempore, still more exquisite strains than these great composers, at an early period of its invention, thought this instrument capable of expressing.

ARMOR, or ARMOUR, in a general sense, is a term that may be applied to any defensive habit, used to protect the person of the wearer from the attack of an enemy; or abstractedly, to any part of such habit. Armour, in the aggregate sense of the word, is frequently called *barney*; by the English writers of the fifteenth and sixteenth centuries, as well as in our ancient statutes.

The materials anciently used for the making of armour were exceedingly multifarious; depending in some instances upon the produce of the country in which it was fabricated, but more generally upon the judgment or experience of the inhabitants. Among the more civilized nations, brass, iron, and other metals were preferred; and in the time of Asiatic magnificence, even gold was not spared: on the other hand, the Libyans, according to Herodotus (in Polymnia), who assisted Xerxes when he invaded Greece, were clothed in tunics of leather, to supply the place of body armour; and the same author (in Clio) assures us, that the military dress of the ancient Persians was composed of leather, and girt about the body with a leathern girdle; and speaking of the Asiatic Indians (in Polymnia), he tells us, that some of them used a species of armour made with wood; others again plaited rushes upon each other like mats, and worked them into the form of a *thorax*, or *breast-plate*; he also mentions (in Melpomene) a people who inhabited the maritime parts

parts to the westward of the Garamantes, who, "when they make war," (says he,) "wear the skins of ostriches instead of armour."

The shield, the helmet, and the breast-plate, may claim precedence of every other part of the ancient defensive armour; the first, from the obvious use of such an instrument and the extensiveness of its service; and the other two, from the protection they afforded to the sources of life and sensation. We must refer to the sacred writings for the earliest memorials of the ancient military habit; little more, indeed, than the names of the different parts of this habit occur; but with the assistance of more modern authority, we may be enabled to form some idea of the nature and usefulness of those parts, when applied to the protection of the wearer.

The defensive armour of the Israelites consisted of a shield, a helmet, a military vest, a thorax or breast-plate, and belts of metal, or plated with metal, to gird upon the body, beneath the breast-plate. It does not appear that they wore greaves or military boots for the defence of their legs; though the greaves are mentioned as a part of the armour belonging to Goliath, the giant of Gath (1 Samuel, chap. xvii. ver. 6.): they were also worn by other Asiatic nations; and at the siege of Troy, by the Grecians in general. Homer frequently distinguishes his countrymen by the epithet of well-greaved or well-booted Grecians. The greaves attributed by the author of the book of Samuel to Goliath, are called (גָּרְדָּיִם), literally, the shinners, or shining plates, and were made of brass, resembling probably those upon the legs of the little figure marked A. *Plate 1.* of *Armour*, which reach from the top of the knee, to the instep, but do not cover the feet; so those of the giant are expressly said to have been placed above his feet. The figure B. upon the same plate, of which we have two views, exhibits the greaves of a thicker consistency, and from the manner in which they are fastened upon the back part of the legs, they appear to have been made with the skins of animals, having the fur upon them. See GREAVES.

In the book of Exodus (chap. xxviii. ver. 32. and chap. xxxix. ver. 23), Moses mentions a garment, which our translators considered as a military one, and accordingly have rendered it an *habergeon*; that is, a short tunic of mail, fitted close to the neck, without sleeves, and descending something lower than the breast. The sacred penman, speaking of "the robe of the Ephod," says, "there shall be a hole in the top, in the midst thereof, and it shall have a binding of woven work round about the hole of it, as it were the hole of תַּחְרָה an *habergeon*, that it be not rent." But the deduction of the original word, from a root which signifies to make hot, justifies the lexicographers in conceiving it to have been a thick or quilted garment fitted close to the body; and probably it was the same as the vest which Saul put upon David, previously to his arming him with the thorax and girdle (1 Samuel, chap. xvii. v. 38, 39.). This vest, indeed, is distinguished by another name (רָצֵץ), but the objection is of little moment, for a redundancy of names applied to single objects, is common enough to be met with in the Hebrew, and other Asiatic languages. Saul's tunic was evidently placed under the body armour, to prevent the plates of metal from pressing too closely on the skin, and hurting it; and answered precisely the purpose of the doublet, or pourpoint, worn beneath the coat of mail in more modern times (see DOUBLET); and perhaps, like that, was made without sleeves. Upon the *fig. B. Plate I.* we find a similar kind of military garment which is worn without the breast-plate, and has only one sleeve occupied by the left arm; this tunic appears to have been fabricated with some rigid material, perhaps of thick leather,

and might have answered the double purpose of the pourpoint and the pectoral: the right sleeve, which is full of folds, is evidently made of more pliant stuff than the body garment, and probably belonged to an inner tunic; it was substituted for the leather sleeve, because it was less rigid, and did not equally impede the motions requisite for the sword-arm. This curious ancient figure is preserved in the British Museum; it is of Greek workmanship, and was found in the ruins of Herculaneum.

The *thorax* or *breast-plate*, called in the Hebrew שָׁרְיָן or שָׁרְיָן, derived from a word significant of *strength*; and usually rendered by our translators, *coat of mail*; formed another part of the Jewish military habit; it is first mentioned as such, 1 Samuel, chap. xvii. v. 38. and the same word is used for the body armour of Goliath the Philistine (ibid. ver. 5.), joined with an adjective, expressive of its having been covered with plates of brass in the form of scales. This word is totally omitted in our translation, but it is a very important one; and the passage may be rendered, "a thorax or breast-plate of scales of brass." Herodotus (in Polymnia) informs us, that the Median and Persian soldiers belonging to the army of Xerxes, had each of them a tunic covered with plates of iron like the scales of a fish, and adorned with sleeves of various colours; but over the tunic, it appears from the historian, they wore an Egyptian pectoral. This kind of scale armour consisted of small plates of metal fastened upon a garment fitted to the body and limbs of the wearer, and contrived to hang over each other like a fish's scales, but in such a manner, as not to prevent the flexibility of the garment, nor obstruct the exertions of the soldier's agility. The form and nature of this equipment are admirably represented by the Sarmatian horsemen, upon the Trajan column; a dress, somewhat similar, was partially adopted in the western parts of Europe by the heroes of the middle ages; but it was soon superseded by the chain, or ring mail, which became universal.

It is highly probable, that the *thorax* of the Philistine was much longer in proportion to his size than that of Saul, and might cover the greater part, if not the whole of the front of his body; at least one may so judge from its great weight, equal, it is said, to 185 pounds Troy weight; for had the breast-plate of Saul been longer or larger than the ancient pectorals usually were, and proportionate to his size, it would have been an absurdity in him to have attempted to put it upon David, who was a stripling, and at least a full head and shoulders beneath his stature. Yet we are told, he did put it upon David, and girded his sword upon the tunic beneath it. When David rejected the dress, it is not said he did it because it was too large or too long, or that he appeared ridiculous in it, but because he had not essayed, tried, or been used to such an equipment; for which reason, instead of being useful, it was an incumbrance to him, and obstructed the free use of his arms. See BREAST-PLATE.

If we turn to the little figure A. *Plate I.* we may meet with something resembling the body armour of Saul, and may easily conceive how it might be applied to a person of smaller stature, without the least inconsistency; first, we observe the short skirts of the tunic (above mentioned) with which David was first invested; secondly, the thorax or breast-plate, here apparently one solid plate of metal, worked into the form of a man's breast, and fastened upon the tunic; beneath the thorax, are two belts plated with metal, from one of which the sword was usually suspended. If we look to the sacred text, we shall find that Saul girded David with his own sword upon the tunic; and as he had been previously invested with the thorax, it reasonably follows that

that the sword was girded "upon" a portion of the tunic which hung below the thorax, agreeably to the representation of the belts upon the bronze. There is only one girdle mentioned in this passage of the scripture; and perhaps one was sufficient for David, though Saul, a much taller man, might require two or more. The little figure here engraved perfectly explains the manner in which Ahab king of Israel received his death's wound; we are told (1 Kings, chap. xxii. ver. 34.), that he was smitten by an arrow, "between the joinings of the belts, and between the breast-plate," that is, in the opening where the lower part of the breast plate was joined with the uppermost belt or girdle. See BELT.

Xenophon (Cyrop. lib. vi.), describing the military dress of Abradates king of Susa, mentions *arm-pieces* as part of it; and the Ancient Grecian sculptures exhibit broad plates of metal for the protection of the shoulders (see the *fig.* marked C. C. *Plate I. of Armour*); and also *cuisse's* for the thighs; and *tassels*, or plated straps, attached to the thorax, for the protection of the lower parts of the body. In process of time the thorax was gradually enlarged, and from its aggrandisement originated a complete suit of body armour, such as was introduced by the Grecians, and occasionally used by the Romans. In the middle ages, this custom of casing of men in brass or iron was revived, and carried in more modern times to a greater extent than it had been before. A front and a back view of a close-armed man according to the ancient Grecian fashion, is given, *Plate I.* marked C. C.; the succeeding alterations will appear hereafter, under the article *Coat of Mail*. We may here add, that the *lorica* or *mail*, a species of armour so famous in the ages of chivalry, is by no means of modern invention. The thorax of the Philistine giant appear to have been somewhat of this kind, consisting of small plates of metal quilted over each other like the scales of a fish: and if we turn to *Plate I.* and examine the body of the *figure* marked D. we shall find strong indication of a chain-mail or net-work of wire rings. If it should be thought, from the smoothness of the bronze upon the left side, that the armour was only made to cover the right, it will be necessary to observe, that this figure in its original state was supported by another figure, whose right arm, broken away near the elbow, appears beneath its left shoulder, and the part of the arm which is lost covered that portion of the body where we remark the deficiency of the mail; in the present case, the left hand of the supporting figure is also seen upon the right hip.

The Egyptian armour of defence for the person consisted of a *brass helmet*, and a *thorax* or coat of linen so plaited and folded as to resist the point of the enemy's weapon; the whole seems to be formed of rolls of linen or cotton fastened together like the stockings worn at present by the Tyrolese, or like the hay-bands which a countryman twists round his legs to serve instead of boots. *Fig. 1 and 2. Plate II.* were copied from the tombs of the kings of Thebes. Denon's Egypt. Herodotus.

In the earliest defensive armour for the person, the Greeks seem to have used the skins of animals. Hercules wore the lion's skin, which, in very ancient sculpture and painting, is tied round his neck by the paws, and again fastened round his loins with a ligature, in such a manner as to form a kind of coat. Jupiter wore the *ægis*, or goat-skin, for both breast-plate and shield, to which afterwards was added a cover of metal scales for better defence, and it was farther decorated with the Medusa's head to terrify the beholder; the *κύων*, or dog's skin, was the ancient hat and helmet.

The *κύων*, or *dog's skin*, is the name generally given to the helmet by the Greeks. Homer frequently uses it, but it is particularly given to that worn by Ulysses in the night expedition. *Τρυφάλεια*, *tryphalia*, is the triple-crested helmet;

the crests were principally made of horse-hair. *Fig. 4. Plate II.* is of the first description. *κόρυς*, *korus*, a word derived from *κόρυς* the head, is properly applied to N^o 13 and 15. *Plate III.* and the helmets of 7 and 8. *Plate II.* because this species of helmet being drawn over the face, at the same time that the form of the head was preserved, the features of the wearer appeared through the front of the helmet.

The Greeks made the thorax, or armour for the body, of brass, linen, or leather. Homer calls his heroes, *brass-coated*.

The plate-armour for the body consisted of four principal divisions, the breast-plate, the back-plate, the shoulder-plates and the *ζώνη*, or the *zone*.

The breast and back plates were formed to resemble the naked body (see *fig. 8. Plate II.* and *fig. 14 and 15. Plate III.*); these two pieces were fastened together by hasps on each side.

The shoulder-plates were tied to the paps of the breast, in some instances, which projected like high buttons, to allow room for the knot; see *fig. 8. Plate II.*

The *ζώνη*, or *zone*, comprehended the belt and hanging straps which formed the lower part of the thorax; see *fig. 3, 7, and 8. Plate II.*

Fig. 6 and 7. are coats of mail; in *fig. 6.* the shoulder-plates are fastened by strings to a small circle or *umbilicum*, close to the girdle. *Fig. 3. Plate II.* has the appearance of linen armour or a coat of mail.

Κνήμιδες, *ocreae* were greaves of brass or tin to defend the legs; these were fastened behind the leg with two straps and buttons each.

The *aspis* was the large round shield, see *fig. 9. Plate III.* The *pelta* was a smaller shield, *fig. 10. Plate III.*

There were several other shields, but those of the large round, and large oval forms, seem to have been most commonly used.

Fig. 12. Plate III. is one of the Roman heavy-armed soldiers called *principes*; his armour consists of plates of iron or brass. *Fig. 20. Plate III.* is one of the Roman *velites*, or light-armed soldiers, his covering consists of a leather jacket, breeches or femoralia, and sandals. *Fig. 15.* same plate, is a Roman general (the emperor Trajan), whose dress is sufficiently explained in the account of Grecian plate armour; the only peculiarity in this figure worthy of observation is, that he wears the military *chlamys* or cloak.

Fig. 11. and 19. Plate III. are two brazen swords in the British Museum, the latter is sheathed in the same metal; these with the helmets 13 and 16. and the breast and back-plates 14 and 18. were found in the field of Cannæ, and are believed to have belonged to the Carthaginians.

Fig. 5. Plate II. is a figure in an elegant suit of armour, copied from an antique paste in the collection of Mr. Tassie; but whether it is Etruscan or Roman would be difficult to determine, as it bears but little resemblance to any other ancient work of art that is known.

Although the foregoing observations will throw considerable light on the subject of Greek and Roman armour in general, yet it must be acknowledged that their species is almost infinite; and that all the antique statues, pictures, and gems of armed warriors, of which many hundred exist, exhibit those differences and peculiarities which must naturally be expected from the variety of times, countries, geniuses of men, and the gradual progress of improvement. In the representations of armour for the body made of leather, we see the imitations of that covered with hair, and made with plaited thongs: in the linen mail, we see those doubly and triply plaited, and others worked in oiled holes: in the mail of brass and iron, we see different kinds of scales and chain-works,

with

with the various combinations of rings; these differences may be observed in the structure of the armour itself, besides the great variety of animals, foliage, and devices, with which the different specimens are decorated. Concerning the magnificent *thorax* of Menelaus described by Homer in the beginning of the eleventh book of the *Iliad*, it is said to have had ten stripes of black steel, twelve of gold, and twenty of tin, besides three dragons on each side, which rose up to the neck of the *thorax*; all this could be only decoration, the general form resembling some one of those represented in *Plate II*.

Homer and Hesiod's descriptions of the shields of Achilles and Hercules strike the reader with astonishment, and bewilder his imagination; but we may form a simple and satisfactory conception of both, by remembering they were large circles, decorated with bas-reliefs of figures, the subjects of which followed in succession until the last reached the first. In an enumeration of the magnificent examples of ancient armour, the trophies of Augustus, formerly called those of Marius, in the capitol, excite our astonishment by the extreme richness and beauty of the helmets, coats of mail, shields, &c. which compose them; and the knowledge of these noble works has been widely communicated by Piranesi's admirable prints. In concluding this subject, it is to be remarked, that the excavations of Pompeia have furnished a great quantity of curious and interesting information on the subject of ancient armour, totally unknown to the moderns before. There are in the king of Naples' museum of Porici, ancient Roman helmets made of brass, with visors to cover the face and guard the eyes; armour for the upper and lower arms, shoulders, elbows, and thighs of a kind not to be seen in any of the antique statues or bas-reliefs. Some of these pieces are adorned with figures, groups, and other ornaments; but as no drawings are permitted to be made from them, except by those persons employed for the publication of the Herculanean antiquities, by the Neapolitan government, we must wait for the next volume of that work to satisfy our curiosity.

In *Plate I*, the figures C, C, and D, will be sufficiently explained by what has been said concerning the different articles in *Plates II* and *III*, there being nothing particular in these figures excepting the swan or goose's head which forms the crest of *fig. C*. The *fig. A*, and B, wear helmets with visors; the helmet of *fig. A*, has a high cone and two horns; the shield, which was originally a long square, is broken.

Vegetius observes (*De re militari*, l. i. c. 10.), that the Roman infantry was invariably covered with defensive armour, from the foundation of the city to the reign of the emperor Gratian. The relaxation of discipline, and the disuse of exercise, rendered the soldiers less able and less willing to support the fatigues of the service; they complained of the weight of the armour, which they seldom wore; and they successively obtained permission for laying aside both their cuirasses and their helmets. The heavy weapons of their ancestors, the short sword and the formidable *pilum*, which had subdued the world, insensibly dropped from their feeble hands. As the use of the shield is incompatible with that of the bow, they reluctantly marched into the field. The cavalry of the Goths, the Huns, and the Alani, had felt the benefit and adopted the use of defensive armour; and as they excelled in the management of missile weapons, they easily overwhelmed the naked and trembling legions, whose heads and breasts were exposed, without defence, to the arrows of the barbarians. The loss of armies, the destruction of cities, and the dishonour of the Roman name, ineffectually solicited the successors of Gratian to restore the helmets and cuirasses of the infantry. The enervated soldiers

abandoned their own and the public defence, and their pusillanimous indolence may be considered as the immediate cause of the downfall of the Roman empire. Gibbon, vol. iii. p. 67, 68.

Thus far we have chiefly considered the defensive *Armour* of the *ancients*; and shall now present our readers with a correct sketch of its history as it relates to Britain.

The early *Britons*, though by no means unacquainted with the stratagems of war, seem to have had no defensive armour; merely endeavouring to make their appearance dreadful, by tracing wild and horrid images upon the skin; and though they afterwards adopted many of the Roman customs, arts, and habits, they do not seem to have availed themselves of armour, perhaps thinking the freedom of exertion oppressed by such an incumbrance; and it must likewise be remembered, that it was the constant policy of the Romans to deprive all those nations whom they subdued of the use of arms, and to accustom them to a soft, effeminate way of life, that they might have neither ability nor inclination to shake off their yoke (*See Tac. vit. Agr.*). And the Britons perhaps had little inclination to adopt the Roman method of defence, since it could be no honour to wear the military habit of their conquerors. The *Saxons*, on the other hand, were a stout and hardy people, whose chief delight was war, and though among the earliest of them who arrived in Britain, we hear of nothing like what is now called armour, yet there seems some ground for thinking that it was not entirely unknown to them, since the first species of military habit they afterwards made use of, was the scale armour, similar to that which Xenophon describes among the Sarmatians, from whose neighbourhood it is now believed the ancestors of the Saxons had their origin. In manuscripts of the tenth century, the Saxon soldiers appear habited in a kind of mail, or scale armour, similar to that worn by the ancient Normans (*Strutt's Manners and Customs of the English*, vol. i. p. 29.), already described. And another kind of mail in use appears to have been composed of strong wires closely interwoven with each other, like fine wicker, with which the soldiers were clothed from head to foot (*see Pl. IV. f. 1. 2.*); others, however, appear to have been clothed with it in part only, its inflexibility seeming to require that it should be confined to the body, ending at the bottom of the stomach, and a little below the shoulders (*ibid.* vol. i. p. 30.). The helmets usually worn with this latter species seem to have been of skins. A manuscript in the Cotton library (*Cleop. c. 8.*) universally allowed to be as old as the reign of king Canute, represents the *Danish* soldiers in complete suits of armour (*see Pl. IV. fig. 3, 4.*), from the bends and folds of which they are supposed to have been made of leather, with a diamond crossing of strong wires, interwoven with each other, and made with strong joints in proper places. This armour covers the whole body, legs, and arms, half the left hand being left uncovered, for the better purchase in holding either the sword, the spear, or the shield. Their heads are covered with helmets, much superior to those we have mentioned of the Saxons, and still better fashioned to sustain the shock of a violent blow. A projection also crosses the face, to prevent the person armed from receiving any hurt from the cross stroke of an enemy's sword, not unlike what is sometimes seen in the ancient Greek and Roman helmets; and, with a little variation, in the modern helmets of the Mamalukes.

The defensive armour of the *Normans* was chiefly the coat of fence called *Mail*, especially for the better sort; others had body armour of iron or leather. The mail was made of small iron links, with joints at a convenient distance, and so contrived as to move upon each other with the greatest facility

facility (see *Pl. IV. fig. 5.*). With this defensive armour both the horsemen and better sort of foot were covered, the face and left hand excepted. When the mail itself did not compose the guard for the head, they wore helmets, either of iron or brass; the leaders and standard-bearers had generally beavers, composed of thin plates of iron, fastened on the mail before the face; and a few, apparently of an higher rank, wore helmets clumsily constructed.

Mail armour maintained its ground from the Norman invasion to the fifteenth century. Henry IV. is the last of our kings who appears in it on his great seal (Gough's *Sep. Mon. I. cxliii.*). Many instances, however, of persons armed *mi-partie*, plated and mail, occur about the middle of the fourteenth century (*Ibid. cxliv.*); at which time Mr. Grose affirms, that plated armour was completely introduced both here and in France. The transition from mail to plate armour is shewn (*Pl. IV. fig. 6.*), from the monument of Thomas Beauchamp, earl of Warwick, 1370. When *plated armour* came into fashion, it was composed of different pieces for the back, breast, shoulders, arms, hands, thighs, legs, and feet, under the several names of *cuiras*, consisting of a back and breast-piece; *pouldrons*, *brassarts*, or *gondebrass* or *avant-brass*, (corruptly, in English, *vambraces*); *gauntlets*, *cuissearts*, with *genouillieres*; *greaves*, and iron shoes. Such was the suit of armour in the tower, said to have been made for Henry VIII., when eighteen years of age (*Pl. V. f. 1.*). Plate armour continued in use, with few variations, to the close of the seventeenth century; when the introduction of firelocks, with the improvement of artillery, and a more active mode of warfare, superseded the incumbrance of heavy armour. Of all this furniture of war, scarce any thing is now retained, except the *cuirass*; the gorget or neck-piece, worn by officers, being at present only a badge of honour, and of no defence. The minute changes of our ancient armour may perhaps be best traced, by the inquisitive reader, upon sepulchral monuments.

The different articles of which the ancient armour was composed will be found under their respective heads.

ARMOR, OR ARMOUR, Horse. The horse belonging to the cavalry, in the army of Cyrus, according to Xenophon (*Cyrop. l. vii.*), were armed with forehead-pieces, breast-plates, and side-pieces, and the side-pieces served as thigh-pieces to the horsemen. The Sarmatian war-horses were covered with small plates, in imitation of the scales of a fish, after the manner of their riders. And Plutarch informs us, that when the Parthians opposed the younger Crassus, they were not only clothed with defensive armour themselves, but that their horses were completely armed in brass and steel (*οἱ δ' ἵπποι καταπεφραγμένοι χαλκοῖς καὶ σιδηροῖς ὑφασμασίν*), polished to the highest perfection (*Plut. Vit. v. iii. p. 280. ed. 1723.*). The investing of horses with defensive armour was common enough in the middle ages, and was perhaps introduced into England by the Normans (See *Hoveden Annal. p. 446.*). It continued to the close of the sixteenth century, when the horse-armour appears to have consisted of a *chanfron*, or kind of mask, which inclosed the face and ears, with sometimes a spike issuing from the center of the forehead; a *criniere*, to guard the mane; a *poitrinal*, or breast-plate; and a *croupiere*, or buttock-piece, that usually descended to the hocks. (See *Pl. V. fig. 2.*) After this time the *barde*, or horse armour, appears to have been neglected; except that in the thirteenth and fourteenth years of Charles the second, the horses of the militia were ordered to be provided with a pectoral and crupper (Grose's *Milit. Antiq. ii. 338.*). To prevent their horses from being fatigued under all their own incumbrances, and the enormous weight of their riders, and to preserve their vigour for the charge, the men at arms in ancient times had commonly hackneys for

riding on a march, and did not mount their war horses till they were certain of coming to action; a circumstance which sometimes occasioned them to be surpris'd and defeated, before they could mount their chargers and form.

ARMOR, OR ARMOUR, for the Tilt Yard. The splendor in which the tournaments of ancient times were held, will account for our making the armour of the tilt-yard a separate article. In the middle ages, the common armour seems to have been used, only sumptuously covered with drapery, both as to man and horse, and occasionally charged with the armorial bearings of the combatants. The saddle and furniture were oftentimes of goldsmiths' work, and the caparisons richly embroidered. Toward the reign of Henry the Eighth, the drapery was in a great measure thrown aside; and the taste of the combatants was usually displayed in the elegance and lightness of their tilting armour. Under Elizabeth, it seems to have been extravagantly ornamented, and, in many cases, materially to have differed from the military habit of defence. Mr. Pennant, in the history of London, has engraved the portrait of Robert Dudley, earl of Leicester, clad for the tilt-yard; from which it appears very plainly, that taste and show were chiefly consulted (See *Pl. V. fig. 3.*). Mr. Strutt too, in his *Manners and Customs of the English*, has engraved a portrait of Prince Henry, eldest son of James the First, in a sort of half-tilting habit, worn when the pike was exercised on foot (see *Pl. V. fig. 4.*).

The gallantry of going to the battle naked, without any defensive armour, prevailed so far, that the French, during the reign of Louis XIV. were obliged to be continually issuing ordonnances to restrain it; in consequence of which, the general officers, and those of the cavalry, were obliged to resume their cuirass, which yet has been but ill observed.

And now we conclude the article of armour; but not without informing our readers, that the first part of it was furnished by a hand of which death has now deprived us. The person we allude to was Mr. Joseph Strutt, of whose ability as an antiquary the world has been long convinced.

ARMOR, Coat, is the escutcheon of any person or family, with its several charges, and other furniture; as mantling, crest, supporters, motto, &c.

Thus we say, a gentleman of *coat-armour*, meaning one who bears arms. See **ARMS.**

ARMORACIA, in *Botany*. See **COCHLEARIA**.

ARMORACIÆ, in *Entomology*, a species of **CHRYSO-MELA**, described in the Linnæan Fauna Suecica, by Fabricius, Herbst, Gmelin, and others. It is very glossy; blueish black above; beneath black. Degeer names it *chrysomela plantaginis*, from its being found chiefly on the plantain. *Cochlearia armoracia ranunculo aquatili, flammula.*

ARMORIAL, something that relates to arms, or heraldry.

In this sense we say an armorial figure, armorial bearing, armorial ensign, the armorial lily of France, armorial lion or leopard of England, &c.

ARMORIAL is also a title given to several books, which contain the arms of a number of persons of quality.

In this sense we meet with the French armorial, the Spanish armorial, &c.

ARMORIC, OR ARMORIC, something that belongs to the province of Bretagne, or Britany, in France. See **ARMORICA**.

ARMORIC, absolutely used, denotes the language in use among the inhabitants of Britany.

The French usually call this language *Bas-breton*; compounded, says M. Menage, of *ar, upon,* and *mor, sea.*

The *Armoric* is a dialect of the Welch, and sister of the Cornish language.

The inhabitants of Britany, of Cornwall, and of Wales, formerly understood each other's speech; though considerable diversities have crept in between these languages, since their separation from each other.

The inhabitants of Britany, Mr. Llyd observes, by their intercourse with the French, have much altered their ancient orthography; besides that there are several words in the Armoric which have no affinity with the Welsh; and that both the Armoric and Cornish retain several ancient words and phrases which are lost in the Welsh. Julian Manoir, a Jesuit, has published an Armoric grammar and vocabulary, in French, which has been translated into English by Mr. Williams, and published with notes by Mr. Llyd. In *Archæol. tit. 3. and 4. p. 180, &c.* Before him, Yvon Quillevère had published an Armoric vocabulary at Paris, 1521.

Toland has given a catalogue of several Armoric words, which prove to be Irish; also a vocabulary Armoric and Irish.

ARMORICA, in *Ancient Geography*, the name given by the Romans, after the conquest of Gaul, to that portion of its maritime countries that is situate in the north-west corner between the rivers Seine, the Loire, and the Atlantic. The name Armorica was anciently given to the whole northern and western coast of Gaul, from the Pyrenæans to the Rhine; under which name it was known in Cæsar's time. *Cæs. De Bell. Gall. lib. vii. c. 14.* During the first three centuries of the Christian æra, this remote corner was with little interruption in tranquil subjection to the restless dominion of Rome. But its submission was the exaction of force, not the acquiescence of content. The Armoricans were impatient of slavery, and when the northern hordes shook the tottering fabric of the western empire, they were eager to revolt. They expelled the Roman magistrates who acted under the authority of the usurper Constantine; and a free government was established among a people who had so long been subject to the arbitrary will of a master. The independence of Armorica was confirmed by Honorius himself; but after the northern conquerors of Gaul had successively fallen, the maritime provinces were restored to the empire. Employed on this portion of history, Gibbon (*Hist. vol. v. p. 363.*) in a few lines marks the character of a people "restless under constraint, but unfit for liberty." Yet their obedience was imperfect and precarious; the vain, inconstant, rebellious disposition of the people, was incompatible either with freedom or servitude; and Armorica, though it could not long maintain the form of a republic, was agitated by frequent and destructive revolts. In the end of the fifth century, when Clovis established his Franks in Gaul, Armorica, after a long and obstinate opposition, at length capitulated on honourable terms, by which the people were admitted to be a part of the newly-formed kingdom of France. The Britons, when finally subdued by the Saxons, and expelled from their native land, sought and found refuge in Armorica, and coalescing with the natives, became a powerful though vassal state. This territory, says Warton (*Hist. Eng. Poet. vol. i. diss. 1.*), was, as it were, newly peopled in the fourth century, by a colony or army of the Welsh, who migrated thither under the conduct of Maximus, a Roman general in Britain, and Conan, lord of Meiriadoc or Dornighland. Milton more than once alludes to this Welsh colony:

"Et tandem Armoricos Britonum sub lege colonos,"
Manfus.

And, in the "Paradise Lost," (b. i. 579.), he mentions in—
Vol. II.

discriminately the knights of Wales and Armorica, as the customary retinue of king Arthur:

"—What refunds
In fable or romance, of Uther's son
Begirt with British and Armoric knights."

This migration of the Welsh into Armorica, which had thrown off its dependence on the Romans during the distractions of the empire, seems to have occasioned a close connection between the two countries for many centuries. From this connection of Wales with Armorica, the scene of ancient romances, we are able to deduce the reason why Wales was so constantly made the theatre of the old British chivalry, and also why so many of the favourite fictions which occur in the early French romances, should also literally be found in the tales and chronicles of the elder Welsh bards. It was owing to the perpetual communication kept up between the Welsh and the people of Armorica, who abounded in these fictions, and who naturally took occasion to interweave them into the history of their friends and allies.

Armorica, or Britany, was not annexed to the crown of France till the close of the fifteenth century, and the inhabitants retained various privileges and immunities, which continued in force until the revolutionary establishment of departments put an end to all local or provincial privileges, and amalgamated all former diversities into one mass.

From the settlement of the refugee Britons, Armorica received the name of Lesser Britain or Britany, and was governed by dukes. See BRITANY, and GAUL.

ARMORIST, a person skilled in the knowledge of arms.

ARMORUM CONCUSSIO, in *Antiquity*, the clashing of arms, practised by the Romans before an engagement, designed for striking a panic into their enemies. It always followed the *clasticum*, and *barritus*.

ARMORY, or ARMOURY, a store-house of arms, or a place where military habiliments are kept to be ready for use. There are armories in the Tower, and in all arsenals, citadels, castles, &c. Imbezbling or destroying the king's armour or warlike stores, is declared to be felony without benefit of clergy, by stat. 31 Eliz. c. 4. 22 Car. II. c. 5. 12 Geo. III. c. 24.

ARMORY, is also used for a branch of HERALDRY: being the knowledge of coat-armors, as to their blazons and various intendments.

ARMOSATA, or ARSAMOSATA, in *Ancient Geography*, a very considerable city of Armenia, and next in importance to Artaxata; situate between the Tigris and the Euphrates. It took its name from the river Arsamus of Pny, or Arsamatus of Tacitus, on which it was built. It was by turns taken and sacked by the Huns, Arabs, and other neighbouring nations.

ARMOSON, a promontory of Asia, in Carmania, near a place called Armasia, at the entrance of the Persian Gulf.

ARMOT, in *Geography*, a small island in the sea of Gascogne, on the coast of Santonge.

ARMOURER, a maker of arms, or armour. The profession of an armourer, which was formerly an office of great importance in this kingdom, is now totally extinct.

The Roman armourers were disposed in certain places in the empire, it being forbid, either to sell, to buy, or make arms elsewhere. They were exempt from all offices and taxes, and received a salary from the public.

When once they had taken that employment on themselves, neither they nor their children were allowed to quit it. To prevent this, they had a kind of note, or stigma, impressed on the arm, whereby they might be known.

known. If any of them fled, or secreted their ware, the rest were obliged to answer for him; on account of which, the effects of such as died without a legal heir went to the college.

There were fifteen *armamentaries* or repositories of arms in the Eastern empire, placed near the frontiers; and nineteen in the Western. Puffe, L. x. Ant.

ARMOURER *of a ship*, a person whose office is to take care that the arms be in a condition fit for service.

ARMS, ARMA, in a general sense, include all kinds of weapons, whether for offence or defence. Nicod derives the word from the Latin phrase, *quod operantur arma*, because they cover the shoulders or sides; but Varro derives *arma*, *ab arcendo*, *eo quod arcant hostes*. It is supposed, that the first artificial arms were of wood, and were employed only against beasts; and that Belus, the son of Nimrod, was the first that waged war; whence, according to some, came the appellation *bellum*. Diodorus Siculus takes Belus to be the same with Mars, who first trained soldiers up to battle. Lucretius is minute on this subject:

“Arma antiqua manus, ungues dentesque fuere
Et lapides, & item sylvarum fragmina, rami.
Et flammæ atque ignes postquam sunt cognita primum.
Pottius ferri, vis est ærisque reperta,
Et prior aris erat quam ferri cognitus usus.”

The most ancient and universal arms of offence seem to have been bows and arrows; to which succeeded the sling. See Gen. xxi. 20. xxvii. 3. Job, xli. 19. Hesiod expressly tells us, that in the early ages, the arms and instruments of the primitive heroes were composed entirely of brass.

The arms of the early Greeks were heavy, and principally defensive, consisting of an helmet, a breast-plate, and greaves, all of brass; with a shield, commonly of bull's hide, but often strengthened with the metal just mentioned; the shield being a superadded protection for every part. The Locrians, however, under Oilean Ajax, were all light-armed; bows were their principal weapons, and they never engaged in close fight. Mitford's Greece, vol. i. p. 102.

The infantry which composed the Roman legions were of three kinds, the *hastati*, the *principes*, and the *triarii*. Their arms, both offensive and defensive, were in a great measure the same. They wore an head-piece of brass or iron, coming down to the shoulders, but leaving the face uncovered; a coat of mail, generally made of leather, covered with small plates of iron, in the form of scales, or iron rings twisted within each other; greaves for the legs, or so sometimes only on the right leg; an oblong shield, with an iron boss; a sword; and two long javelins. Adams Rom. Antiq. 367. There was also a fourth kind of troops, called *vulvites*, from their swiftness and agility; they were first instituted in the second Punic war. They were assigned no regular post, but fought in scattered parties, wherever occasion might require, usually before the lines. They were equipped with bows, slings, and javelins, a small round shield, a sword, and a helmet of the skin of some wild animal. (Ibid. 368.) What contributed most to render the Romans masters of the world was, that having successively warred against all nations, they constantly renounced their own methods, arms, &c. whenever they met with better. Thus Romulus, during his war with the Sabines, a bold and warlike nation, adopted their broad buckler in lieu of the small Argian buckler, which he had used till that time.

The arms in use among the ancient Britons were slight, and unfit to withstand the Romans in a close encounter; though in light skirmishes, prudently made, the Britons generally gained considerable advantage (Strutt, Manners

and Customs, vol. i. p. 3.). Their young men were not only trained to the use of arms in early youth, but continued in the exercise of them to the very close of age; and were always ready to appear, when called by their leaders into actual service. Their very diversions and amusement were of a martial and a manly call; and the javelin they used in hunting was a principal weapon in the field of war. They had neither helmets, breast plates, nor defensive armour, but a light shield. Cæsar tells us they had a dart or javelin, which they threw from their war chariots to annoy the enemy; with a short spear for the infantry, that had a ball at the nether end filled with lead; this they shook with great violence before the battle, in hope to intimidate the enemy; and again when they engaged the cavalry: to the upper end of it a thong was fixed, that when used as a missile weapon, it might be recovered, and again used in the close encounter. They had also long and broad swords, without points, designed only for cutting, which were slung by a chain over the left shoulder; and occasionally a short dirk fixed in their girdles. The scythes that were sometimes fastened to their chariot-wheels, may perhaps be ranked among their offensive arms.

The ancestors of the Saxons, in their native woods, we are told, transacted no business, public or private, without being completely armed (Pac. De Morib. Germ. § xii.); and the custom of wearing swords on all occasions prevailed in every country where the Germans took possession.

The early Saxons, previous to their arrival in Britain, beside the buckler and the dagger, used a sword bent in the manner of a scythe; but their descendants soon changed it for one that was long, straight, and broad, double-edged, and pointed.

The Saxon infantry were not all furnished with the same offensive weapons; some being provided with spears, others with axes, and not a few with clubs, beside swords, which were common to them all. Their shields were generally of the middle size, for the most part oval, always convex, and having a sharp spike projecting from the center; with which, while they defended themselves, they annoyed their enemies. They fought with their swords and shields, much like the gladiators of the Romans; and in the earliest times had nothing like defensive armour, which they seem to have adopted about the eighth or ninth century. Some alteration in our national arms probably took place on the arrival of the Danes. Their swords were both longer and larger than the Saxon swords; the lance had a slight difference; and they appear to have brought the battle-axe into more general use. Verstegan enumerates the cross-bow as a Saxon weapon, but had no good authority for the assertion; as it neither appears in any ancient history or delineation, that the Saxons ever were acquainted with it. And though they used the common bow when following the chase, they never brought it to the field of action. Their cavalry were armed with greater uniformity than they who fought on foot; carrying in their right hands long spears, and at their left sides a sword. They were also better provided with defensive armour.

The Saxon and the Danish troops were chiefly infantry; and though not entirely for the introduction, we are certainly indebted to the Normans for the more general use of cavalry. In regard to defensive arms among the Normans, both horse and foot soldiers were differently clad; some to support the set battle, and some the lighter skirmishes (Strutt, Man. and Customs, vol. i. p. 96.). The offensive arms the cavalry used were long spears or lances, swords like those of the Saxons, and short dirks or daggers.

Those

Those of the foot soldiery were a spear, or a bow and arrow, or a sling, with a sword; to whom were added the arcuballarii, or shooters with the cross-bow, an instrument entirely of Norman introduction. By the famous assize of Henry II. the arms of the infantry are expressly ordered neither to be sold nor pledged, nor seized for debt, nor any way alienated, but to be transmitted by every man to his heir. Beside their lances, spears, darts, cross-bows, and slings, which may be called the small arms of the middle ages, the Normans introduced a kind of field artillery, which they used in battle, consisting of various machines of wood, which, by different contrivances and combinations of mechanic powers, threw darts and stones to a considerable distance (See ARTILLERY). To all which they added *spicula ignita*, arrows headed with combustible matter for firing towns or shipping (Henry's Hist. of Britain, iii. 470. 475.). And here we mention, *en passant*, the Greek fire, probably brought to Europe immediately after the first crusade. From this period to the reign of Edward I. our military weapons were but little altered: about this time we date the introduction, or perhaps the proper use of the English long-bow; which, as we have mentioned in a former article (see ARCHERY), rendered our ancestors, in one instance, superior to all the world.

The introduction of chemistry in the thirteenth century gave rise to many useful and curious discoveries, such as would have excited the admiration of a more enlightened age. One of these was the composition of gunpowder, whose ingredients and terrible effects were accurately, though under an humane concealment, discovered by friar Bacon. The art, however, was neither commonly known nor practised; and that of making instruments proper for applying it to the purposes of war, was still less known. See GUNPOWDER.

The exact time when gunpowder and fire-arms were first employed in war by the British nation, is difficult to be discovered. If the metrical life of Robert Bruce may be believed, Edward III. had cannon (*crakks of war*) in his first campaign against the Scots, 1327. The French undoubtedly used them in 1338, as well as Edward, at the battle of Cressy, in 1346. By degrees, the use of cannon became more and more common, so that, in a few years, the consideration that was at first produced by their explosion, was very much abated (Henry, vol. iv. p. 502.). Beside the greater guns or cannon, a smaller kind, called hand cannon, came in use, which were carried by two men, and fired from a rest fixed in the ground. Such, it is supposed, were the four hundred cannon with which the English besieged St. Malo, in 1378 (Ibid. 505.). The invention of gunpowder however, for a long time, made little alteration in the art of war. The Greek fire still continued in occasional employment; and so late even as the time of Elizabeth, the strength of our armies consisted in the archers, who having added halberds to their arms, first fixed them in the ground till they had discharged their arrows, and then rested the impression of the cavalry. The cannon of the fifteenth century were of different kinds, shapes, and sizes; some exceeding large, and others very small, distinguished from each other by different names, and all made of iron. The writ of Edw. IV. for the protection of the kingdom against the Scots, in 1481, enumerates bombardes, cannons, culverines, towellers, serpentine, and other ordnance; together with sulphur powder, saltpetre, stones, iron, lead, and all other materials necessary for charging them (*omnium alias stufuras pro eisdem cannonibus necessariis*. Rym. Fœd. xii. 140.): which reminds us here at the first invention of cannon, not only iron and lead, but quarrels, stones, and even arrows,

were thrown from them. Strutt's Manners and Customs, ii. 32.

The improvements in artillery are, at this distance, neither perceptible nor of much importance. Having stated that mortars and bombs were invented in 1544, by foreigners whom Henry the VIIIth employed (Henry, vi. 599.), we shall refer our readers to the article ARTILLERY.

Fire-arms of a portable construction were not invented till the beginning of the sixteenth century. In 1521, the musket, mounted on a stock, was used at the siege of Parma; and probably soon adopted in England (Henry, vi. 598). Its form, however, was clumsy, and its weight very inconvenient; while the bow, in the hands of an English archer, retained the credit of having, within a determinate range, a steadier aim and a greater execution. See ARCHERY.

The protector Somerset, who knew the importance of fire-arms, had above 3,000 foreigners in his pay, of whom the greater part were musketeers. Andrews' Hist. of England.

The first bayonets were daggers, which, after the soldiers had exhausted their ammunition, they fitted to the bore of their muskets. They were introduced in France about 1673; and among the English grenadiers in the short reign of James the second (Grose, Milit. Hist. ii. 339.). Many such are yet to be seen in the small armoury at the Tower. The use of them, fastened to the muzzle of the firelock, was also a French improvement, first adopted about 1690; it was accompanied, in 1693, at the battle of Marsaille in Piedmont, by a dreadful slaughter (De Limiere, Hist. Louis XIV. vol. vi. p. 88.); and its use was universally followed by the rest of Europe in the war of the succession. See BAYONET.

The pistol had its origin from Pistoye, a town of Tuscany (Moreri Dict. v. il Bayonette); and was introduced into England about the middle of the sixteenth century. Many of the shields, said to have been the spoils of the armada in 1588, have pistols in the center, with little gratings for the aim. They were sometimes introduced at the butt-end of the pike; as well as in the time of Edward VI. at the lower end of the battle-axe. Grose, i. 123.

In the reign of James I. no great alterations were made in our defensive arms; and with regard to those of the offensive kind, all the pikes, except the common pike, grew into gradual disuse; the chief weapons of the infantry were muskets, calivers, pikes, and swords; swords, carabines, and pistols of the cavalry. Under Charles I. our fire-arms seem to have been without improvements, and there was even some inclination to restore the bow. About 1625, Walter Neade presented his majesty with a book, explaining a new exercise for the soldiery, whereby the bow and pike being fastened together, might be used at the same time. The exercise was adopted for trial in the artillery garden, but was afterwards rejected (Neade's double-armed man by the new invention, Lond. 1625, 4to.). The great alteration, when matchlocks were no longer used, took place about the third or fourth year of William III. (Grose, ii. 342.); since which time their efficient use has proved indispensable.

The progress of fire-arms in France was not dissimilar to that in England. It was not till after the accession of Francis the first, 1515, that any considerable change was effected. Between that time, and the death of Henry the third, in 1589, pikes, the ancient weapon of the French infantry, gave place to the arquebuses; while in the cavalry, lances were gradually and reluctantly exchanged for the pistol (Wraxall's Hist. of France, vol. ii. p. 241.). At that period, the Spaniards were far superior to the French in the art of war. No general could emulate the fame of

the duke of Parma, who studied and conducted war as a science to which mathematical, geographical, and even historical aid was indispensable. The infantry of Philip the second and third spread terror over Europe.

In the middle ages, and even so late as the sixteenth century, the chief national weapon of the Scots was the spear, seventeen feet in length. It was undoubtedly formidable, when projected by a steady and complete battalion. But the Scottish troops were deficient in point of discipline. In pitched battles, they might have equal bravery, but seldom succeeded against the disciplined archers.

By the ancient laws of England every man was obliged to bear arms, except the judges and clergy. Under Henry VIII. it was expressly enjoined on all persons to be regularly instructed, even from their tender years, in the exercise of the arms then in use; viz. the long bow and arrows, and to be provided with a certain number of them. 33 Hen. 8.

ARMS, *Arma*, in *Law*, are extended to any thing which a man takes in his hand in his wrath, to cast at or strike another.—So Crompton—*Armorum appellatio non ulique scuta, & gladios, & galeas significat, sed & fustes & lapides*. See *Vl & armis*.

By the common law, it is an offence for persons to go or ride armed with dangerous weapons: but gentlemen may wear common armour, according to their quality, &c. 3 Inst. This is also declared by stat. 1 W. and M. II. c. 2. The king may prohibit force of arms, and punish offenders according to law; and herein every subject is bound to be aiding, stat. 7 Edw. I. None shall come with force and arms before the king's justices, nor ride armed in affray of the peace, on pain to forfeit their armour, and to suffer imprisonment, &c. 2 Ed. III. c. 3.

The importation of arms and ammunition is prohibited, by 1 Jac. II. c. 8. and by 1 W. and M. II. c. 2. Protestant subjects may have arms for their defence. So likewise, arms, &c. shipped after prohibition, are forfeited by 29 Geo. II. c. 16. sect. 2.

It is one branch of the royal prerogative vested in his majesty by statutes 12 Car. II. c. 4. and 29 Geo. II. c. 16. to prohibit the exportation of arms and ammunition out of the kingdom, under severe penalties.

Arms of offence in use among us at present are, the sword, pistol, musket, bayonet, pike, &c.

The arms of the Highlanders are, the broad-sword, target, poniard, and whinyar or dirk, &c.

There are several acts of parliament for disarming the Highlanders: see 1 Geo. I. c. 54. 11 Geo. I. c. 26. 19 Geo. II. c. 39. 21 Geo. II. c. 34. 26 Geo. II. c. 22 and 29.

ARMS of *Defence*. See ARMOR and ARMS.

ARMS, *Fire*, are those charged with powder and ball: such are cannon, mortars, and other ordnance; muskets, carbines, pistols, and even bombs, grenades, carcasses, &c. Fire-arms discharged by hand were first called hand-cannons, hand-culverines, and hand-guns; they afterwards acquired the appellations of hackbuts, arquebusses, muskets, and calivers; and, lastly, their present name of fire-locks.

In the history of the Royal Academy for the year 1707, we have an account of some experiments made with fire-arms differently loaded, by M. Cassini. Among other things, he observes, that by loading the piece with a ball which is somewhat less than the calibre, and only laying a little gunpowder below the ball, and a good deal above it, it will yield a vehement noise, but have no sensible effect or impulse on the ball. This he takes to have been all the secret of those people who pretended to sell the art of rendering one's self invulnerable, or shot-proof.

ARMS, *Bells of*, or *Bell-tents*, denote a kind of tents in

the shape of a cone, where the company's arms are lodged in the field. They are generally painted with the colour of the facing of the regiment, and the king's arms in front.

ARMS, *Past of*, was a kind of combat in use among the ancient cavaliers. See *PASS*.

ARMS, *Stand of*, signifies a musket, a bayonet, a sword, b. lt. and cartridge-box.

ARMS of *Parade*, or *Courtesy*, were those used in the ancient joust, and tournament; which were commonly unshod lances, swords without edge or point, wooden swords and even canes.

ARMS, *to*, a beat of the drum, is a signal to summon the soldiers to their alarm-posts on some sudden occasion.

ARMS denote the natural weapons, or parts of defence of beasts, as claws, teeth, tusks, of elephants, beaks of birds, &c.;—and also the defensive weapons of plants, as thorns, prickles, &c.

ARMS are also used figuratively for the profession of a soldier.—Thus we say, he was bred to arms.—See *FRATERNITY, LAW, PLACE, SUSPENSION of Arms*.

ARMS, or *Armorial Ensigns*, in *Heraldry*, are marks or badges of dignity and honour regularly composed of certain figures and colours, given or authorized by sovereigns, and borne on banners, shields, &c. &c. &c. for the distinction of persons, families, and states.

Concerning the origin and use of arms, or armorial ensigns, many authors, who have thought that comparative antiquity must necessarily decide on the merit of their favourite science, have traced it far beyond the scope of chronology, to the Egyptians, and “the land of darkness.” Diodorus Siculus is cited as an authority, asserting, that armorial distinctions were first adopted by Anubus and Macedo, sons of Osiris, under the emblems of a wolf and a dog. To the Greeks they are likewise attributed, and if the poetic delineations of the “shields” of heroes described by Homer, Æschylus, and Virgil, be not inapplicable to the devices of the middle centuries, with apparent propriety; these, however, were not analogous, being the personal furniture of the chiefs, only embellished according to the fancy of the artist, and allusive to some exploit past or predicted, but neither hereditary nor gentilitary. Some deduce the introduction of arms from the ancient mythology, and consider the hieroglyphics and emblems of Greece and Rome impressed on the reverses of their medals, as the indubitable prototypes of modern armories. It has likewise been supposed, that arms were attributed to individuals, and confirmed to them by the Romans; and it is further urged, that in their code of laws under Augustus, and in that selected by Justinian, the “*Jus imaginum*,” unequivocally referred to those rights, this distinction of families, or the right of having the images and statues of their ancestors, an honour which was allowed to those Romans only whose ancestors had borne some office in the state, as censor, prætor, consul, &c. He who had the privilege of using the images or statues of his ancestors, was termed “*nobilis*;” he to whom it was permitted to have his own statue or image only, was called “*novus*;” and the person who was not allowed to have the image or statue either of his ancestors or of himself, passed under the appellation of “*ignobilis*,” as do the common people amongst us who have no right to armorial ensigns. These images or statues were made either of wood, brass, marble, or wax, painted the better to represent the persons intended, and were dressed out according to the quality of the persons they represented, being adorned with the robes of the offices they had borne, and the marks of their magistracy. These images were usually placed by the Romans in cabinet,

which

which stood in the court before the entrance into their houses; and on solemn days were usually exposed to view, not only that the people might be reminded of the nobility and honours of the family to whom they belonged, but in order to excite the posterity of the possessors to imitate the virtues of their ancestors. When any of the family died, the statues and images were not only thus exposed, but in the funerals were placed on beds, and carried before the corpse, as ensigns of the nobility of the defunct. Thus, at the funeral of Marcellus, Augustus ordered six hundred beds of images to be carried before the corpse; and no less than six thousand are reported to have attended that of Sylla the dictator. The right of keeping and exhibiting the images and statues being hereditary, and allowed proofs and evidences of nobility and ancient descent, they partook so much of the nature of coat-armour, as in some measure to countenance a probability that the latter were contrived and introduced in lieu of the former. The *jus nobilitatis* of the moderns, say the advocates for this suggestion, is nothing else but the *jus imaginis* amongst the Romans; for as they placed the images and statues before the porches and gates of their houses, so our nobility and gentry used to have their banners, helmets, and other armour placed in some conspicuous parts of their castles or mansions, and their armorial ensigns, either cut in stone, or painted on escutcheons, over their gates, not only as monuments of their nobility and ancient descent, but with intent thereby to encourage the beholders to imitate the virtues and bravery of their ancestors. The analogy between this and the subsequent use of armorial ensigns, extends only to the single circumstance of hereditary appropriation. Acquired as they were by actual services to the state, so they were preserved to the descendants of illustrious characters by the sanction of the laws, and thus became a certain species of right and property, which at once endeared them to the possessors, and rendered them objects of honourable ambition. Besides, the pride of the Romans was remarkable, and on every occasion carried to the highest pitch; insomuch that, in case any particular hereditary tokens or marks designed for distinguishing one family from another, and established by public authority, had been used by them, they never would have suffered such pleasing testimonies of family honour and aggrandisement to have sunk into oblivion; but, on the contrary, would have endeavoured to perpetuate the memory of them, by representing some of those honourable badges in the paintings and sculpture of their villas, sepulchral monuments, triumphant arches, columns, temples, or other edifices: whereas no such have ever been hitherto discovered: consequently the difference between the *jus imaginum* of the Romans, and the bearing of coat-armour of later times, is wide and essential. Armorial ensigns are military, but the *jus imaginum* appears to have been a civil institution, established to do honour to such particular families only. Much honour must be attributed to those ensigns which were first adopted by the stipendiary bands of German soldiers; for their chiefs having the power of investing them, considered them not solely with respect to gentilitial distinction, but as personal appendages; and this in the very early centuries. When the Saxons, after their invasion of this kingdom, ratified the partitions of the whole territory, and established the heptarchy, to each principality its peculiar badge was assigned, and borne upon the banners; and it appears, that whenever any of the provincial kings became monarchs of the island, they retained the gentilitial bearing, as personal, not adopting any new device. This, however, applies only to a period prior to 959, when Edgar, surnamed the Peaceable, added to

the "Cross Florettè" four martlets; in 1042, five were used by Edward the Confessor, which remains the general armorial bearing of the Saxon nation.

Whether armorial ensigns were used by the Merovingian kings, whose race became extinct in the person of Childeric the Third in 754, or not till the close of the ninth and commencement of the tenth centuries, who shall determine? The fairest conjecture seems to be, that the tournaments held with such magnificence towards the end of the tenth century, under the auspices of Hugh Capet, were introductory of the more general usage and assumption of arms. No satisfactory account is preserved whether, after the personal use of arms, they were first painted or embroidered on rich stuffs in the form of pennons, or enamelled on shields. The more probable conjecture inclines to the former mode. The victorious William, who had been educated in the courts of Robert and Philip the First, successors of Hugh Capet, had imbibed an early taste for the martial exercises of which France was then the most magnificent and frequented theatre. After his successful enterprise, and establishment on the throne of England, together with his desire of signaling his followers, he encouraged, but under great restrictions, the individual bearing of arms. About the year 1189, it was usual to bear a small shield fastened to a belt, upon which arms were painted; and there is proof of this custom obtaining in England prior to Richard the First, upon whose great seal the shield is charged with three lions passant, or, as some term them, leopards.

The more general use of arms, and that which affords the best information concerning them, was the custom of engraving them on seals for the purpose of ratifying deeds and charters. This mode is said to be introduced by Edward the Confessor from Normandy, where he was educated, and to have been confirmed by him to the royal use. In the year 1095, being the commencement of the croisades, a period the most interesting in the history of heraldry now opens, when all Christendom united in one common and infatuated cause; when even rival princes engaged in the same enterprise, not merely because sanctioned by the church, but rather as being highly delightful to the romantic and warlike genius of that age. The great council of Clermont had determined in that year to recover the holy city from the Saracens, by enlisting the church under the consecrated banner from which they were to derive supernatural assistance. In the following year this immense army began their expedition; and, as a flattering badge, every private soldier wore a cross of red fluff sewed to his surcoat, from which circumstance these achievements were called "croisades." The hereditary use of arms, says Camden, was not established till the reign of Henry III. The last earls of Chester; the Quineys, earls of Winchester; and the Lacies, earls of Lincoln; varied still the father from the son. The Veres and Berkleys altered their paternal coats, "when they had taken up the cross," the phrase of that day for engaging in the holy wars.

The application of arms to the coin of this realm is of great antiquity; the *scutagium* being paid with shewes, a silver coin upon which a shield was impressed (see COIN). The first instances of sculpture of arms upon the effigies placed on sepulchral monuments remain in the Temple Church, London, of the date 1144. The nobility and principal gentry not only continued their armorial ensigns on their shields, but in order to be better known and distinguished, had them depicted on the breasts and backs of the tunics and surcoats which they wore over their armour, as also on the caparisons of their horses. This fashion of surcoats spread over their coats of mail, and hanging down

to their heels, appears by the figure of G. Mfridus, earl of Richmond, who died in 1186, and is so represented in that dress on his seal; the figure also of William de Valence, earl of Pembroke, in Westminster abbey, who died in 1206, has the surcoat charged with armorial ensigns. The custom of embroidering arms upon canopies of state prevailed from the fourteenth century; they were likewise introduced into castles and private houses, as well as churches, painted in compartments upon the wainscot, or stained in glass, and inserted in the windows of the cloister rooms, and painted in the choicest style on vellum rolls. Armorial bearings upon plate were in use as early as the beginning of the thirteenth century, as appears by an inventory of the crown jewels taken in 1334. In the reign of Richard II. the armorial device was no longer confined to the gorgeous array of warriors completely armed, but embossed and embroidered on the common habits of those who attended the sumptuous court. Upon the mantle, the surcoat, and the just-au-corps or bodice, the charge and cognizance of the wearer were profusely scattered, and shone resplendent in tulle and beaten gold. The wardrobe of a nobleman became no small part of his wealth, the articles of which were subjects of testamentary bequest. Even the ladies were as well versed in mantling their hereditary achievements, as in the service of oratory: the sumptuous veils and mantles, which they were employed in embroidering, were made in the form of escutcheons joined together, and were of velvet, satin, and taffete, according to the rank of the person, and were worn as the court dress till the commencement of the sixteenth century; since which they have been used only as the state dress of the officers of arms; from this custom we have the modern phrase "coat arms, or coats of arms."

The escutcheon was now no longer singly charged with the hereditary bearing, but admitted those of the wife by dimidiation or impalement, and of heirs general by quartering. The first that bore arms quarterly in England appears to be John Hastings, second earl of Pembroke, in 1348. Crests and cognizances were multiplied, and a mode of decorating the armories introduced, that of placing the shield of arms between two animals as supporters. Arms were first borne on a shield by king Richard I., on the caparisons for horses by Edward I., and the custom of embroidering them on the just-au-corps, or bodice, by Richard II.

Originally, none but the nobility had a right of bearing arms; but king Charles V. by his charter in 1371, permitted the Parisians "to bear arms;" from whose example the more eminent citizens of other places did the like. The use of arms became more closely connected with the study of genealogy; and when the mode of including in the same escutcheon the armorial bearing of every heir female, with whom an intermarriage had been made, was universally followed, they were the more necessary to each other. By the fully quartered escutcheon, a compendious scheme of connection presented at one view, and a general idea communicated of the comparative claims of each family in the scale of hereditary dignity. To determine the right of introducing the arms of others into the escutcheon, and to distribute them when altered in their proper gradation, opened a new field of professional ability, which required the most diligent application to the laws and confirmed practice of arms. No systematic or elementary treatise, by which the science could have been taught, was made public till the avenues to universal information were laid open by the typographic art. It was confined to the heralds, or painter-stainers whom they employed, who considered it as the mystery of their trade, and therefore

not to be divulged. Henry V. seems to have held a just opinion of the necessity of ascertaining those who were legally appointed to armorial distinctions, and of prohibiting an undue assumption of them: in 1417, the 7th of his reign, he issued an edict directed to the sheriff of each county, to summon all persons bearing arms to prove and establish their right to them. Many claims, examined in consequence of this inquiry, were referred to heralds, as commissioners; but the first regular chapter held by them in a collegiate capacity was at the siege of Rouen, on the 5th Jun. 1420. King Richard III. by his letters patent, dated 2d March 1483, the first of his reign, directs the incorporation of heralds, and established the "College of Arms" on its present foundation, investing them with full powers of summoning those that assumed the arms of others to appear in the earl-marshal's court, and of granting escutcheons to new families. This privilege multiplied the figures of course, and varied the differences. Forms of every description in the infancy of the graphic art, without any exact resemblance, it we may judge from the specimens now remaining, were universally introduced. The creation was exhausted in the representation of the different parts of it, and to Gothic fancy alone we owe the introduction of gryphons, mermaids, wyverns, and harpies. Every invention of art, whether military or mechanic, has been at one time or other a badge of heralbic honour. Arms at present follow the nature of titles, which being the federal marks for distinguishing or families and kindred, as names are of persons and individuals; they also shew who were the founders of towns, castles, churches, ancient abbies, and colleges, by having their arms affixed to them; and it is well known, during a war, that a ship taken carrying the armorial ensigns of an enemy, is declared a prize, though belonging to a power at amity. Arms are also variously distinguished by the heralds under the following heads.

Arms of Dominion, are those which belong to sovereign princes and commonwealths in right of their sovereignty. In regard to such ensigns, it may be observed, that if the person ascending the throne by legal succession be a sovereign, he marshals his arms with those of the dominion to which he succeeds. If he who ascends the throne by legal succession, be of the quality of a subject, he then lays aside his own arms, and uses only those of the dominion to which he succeeds. Those who ascend a throne by election, carry their arms on an escutcheon placed on the center of the arms of the dominion to which they are elected. William, prince of Orange, placed those of Nassau over those of England and Scotland, as an elective king.

Arms of Patronage, are part of the arms of those lords of whom the persons bearing them held in fee, either added to the paternal arms of the person assuming such addition, or borne as feudal arms in order to shew the dependence of the parties bearing them: thus, as the earls of Chester bore *garbs*, many gentlemen of the county bore *garbs* also. The late earls of Warwick bore *chequy* or *blue*, or *chevron ermine*, and therefore many gentlemen of Warwickshire bore *chequy*.

Arms, Feudal, are those annexed to dignified fees, as dukedoms, marquisates, earldoms, &c. and which arms the possessors of those fees carry in order to shew their dignities, in imitation of sovereigns displaying the ensigns of their dominions. In England there have been but few instances of feudal bearings, but there are many in Spain and in Scotland.

Arms of Pretension, are those borne by sovereigns who are not in possession of the dominions to which such arms belong,

long, but who claim or pretend to have a right to those territories; thus the kings of Spain quarter the arms of Portugal and Jerusalem; and England those of France, till lately.

Arms of Concession, are augmentations granted by the sovereign or part of his arms; thus the royal augmentation in the arms of the duke of Rutland, were granted by Henry the Eighth.

Arms of Community, are those of bishopricks, cities, universities, and other bodies corporate. (See *IMPALEMENT*.)

Arms, Coulez, or as the French call them "armes parlantes," or punning arms, alluding to names, a *trivet* for Trevet, *three herrings* for Herring, &c. These, though some ancient precedents exist, were not common till the commencement of the seventeenth century, when they prevailed under the auspices of king James I.

Arms Paternal and Hereditary, are such as belong to a particular family, and which no other has a right to assume.

Arms of Succession, are those taken by inheriting certain fiefs or manors, either by will, entail, or duration; as we find that Hubertus de Burgo, earl of Kent, who bore for his arms "gules seven lozenges vairé," granted the manor of Elmore in the county of Gloucester, in 1274, to Anselmus de Guise, at the yearly rent of a clove-gilliflower in acknowledgment of the gift, with the concession of his coat-armour: whereupon the said Anselmus de Guise bore the coat with a canton, or charged with a mullet pierced fable; and which arms have been continued by the family, and are now borne by the baronet of that name.

Arms of Alliance, are such as when an heir's marries, her issue quarter her arms to shew their maternal descent. By this means the memory of many ancient and noble families, extinct in the male line, is preserved and conveyed to posterity; which is the principal reason of marshalling several coats in one shield.

Arms of Adoption, are those which you take from another family quarterly with your own. The last of a family may by will adopt a stranger to take his surname, arms, and estate, thereby to continue to the world his name and family after his decease; permission for which is obtained by petition to his majesty for his royal licence and authority to comply with the request of the testator, and the sign manual is then recorded in the college of arms.

A test of the antiquity of a coat of arms is in general its simplicity; a single ordinary, or two at most, constituting the most noble.

Arms, in Falconry, denote the legs of a hawk, from the thigh to the foot. See *HAWKING*.

Arms, King of. See *KING OF ARMS*.

Arms, Herald at. See *HERALD*.

Arms, Pursuivant at. See *POURSUIVANT*.

ARMSON, in *Geography*, a town of Germany, in the circle of Westphalia, and county of Verden, seven miles east-south-east of Verden.

ARMSTRONG, JOHN, in *Biography*, was born in the year 1709, at Cattleton in Roxburghshire, where his father was minister, under whom he received the rudiments of his education. Being intended for the practice of medicine, he was sent to Edinburgh, and in 1732, took the degree of Doctor, and published for his thesis on that occasion, a dissertation "De tabe purulenta." He soon after came to London, where his wit procured him the notice of some of the most eminent men of the time; particularly he became acquainted with John Wilkes, who was then rising to celebrity. In 1735, he published "An Essay for abridging the

Study of Physic, with a Dialogue," written with much humour, "between Hygieia, Mercury, and Pluto, relating to the practice of physic, as it is managed by a certain illustrious society;" which gained him credit as a wit, but was probably one of the causes of his being but little noticed as a physician. To repair the injury this might have done him, in 1737, he published "A Synopsis of the history and cure of the Venereal Disease." This was however soon followed by the "Economy of Love," a piece ingenious, and licentious, and calculated entirely to efface any favourable impressions of his talents for the medical profession which his former work might have excited. Its luxuriances were considerably pruned by the author in an edition printed in 1738. But the work for which he is indebted for his fame as a poet, is his beautiful "Essay on the Art of preserving Health," which appeared in 1744. It is written in black verse, and is deservedly esteemed one of the finest specimens of didactic poetry in our language. Indeed he seems to have exhausted his stock of genius in the composition of this chef d'œuvre: his poems on "Benevolence," in 1751; "Taste," in 1753; and "Day," an epistle to John Wilkes, esq. the last of his effusions in this line, scarcely rising above mediocrity. His epistle to Mr. Wilkes was written in Germany, in the year 1761, while he was physician to the British army there; a post for which he was indebted to some of the friends his wit had procured him. In this poem he unfortunately hazarded a reflection on Churchill, which drew from that irritable bard a severe retort in his "Journey." Before this time, viz. in the year 1758, he had published a volume in prose, of "Sketches and Essays," under the name of Launcelot Temple, esq. which was well received. His friend Wilkes contributed some of the essays in this collection. In the year 1763, he returned to London, and found his practice in medicine somewhat increased, through the connections he had formed in the army: but that his calls that way were not very numerous, appears by his being able, in the year 1771, to make a tour through France and Italy, in company with the celebrated artist M. Fuseli. In his journey he met his friend Dr. Smollet, to whom he was much attached. On his return, he published an account of his ramble, under the name he had before assumed of Launcelot Temple, esquire. His last work, a 4to. pamphlet, intitled, "Medical Essays," appeared in 1773. In this he complains of the little attention that had been paid to him, while so many other physicians of inferior abilities had risen to fame and fortune, forgetting that the levity of his own conduct, and not the sickleness or want of discernment of the public, occasioned the neglect. A large portion of his time was spent at Slaughter's coffee-house in St. Martin's lane, where he usually took his meals, and where messages to him were ordinarily directed to be addressed. He died September 1779; and left about 3000 l., a larger sum than his friends supposed he could have amassed out of his very moderate income.

The reputation of Armstrong, as a poet, is almost solely founded on his "Art of preserving Health." Of his style and manner we have the following character by a very competent judge, in an essay prefixed to an ornamented edition of the poem, printed in 1795. "It is distinguished by its simplicity, by a free use of words which owe their strength to their plainness, by the rejection of ambitious ornaments, and a neat approach to common phraseology. His sentences are short and easy; his sense clear and obvious. The full extent of his conceptions is taken in at the first glance; and there are no lofty mysteries to be unravelled by a repeated perusal. What keeps his language from being profane, is the vigour of his sentiments. He thinks boldly,

feels strongly, and therefore expresses himself poetically. Where the subject sinks, his style sinks with it; but he has for the most part excluded topics incapable either of vivid description, or of the oratory of sentiment. He had from nature a musical ear, whence his lines are scarcely ever harsh, though apparently without much study to render them smooth. On the whole, it may not be too much to assert, that no writer in blank verse can be found more free from stiffness and affectation, more energetic without harshness, and more dignified without formality."

He left his fortune by his will to his three nieces, daughters of his brother Dr. George Armstrong; who, after having practised pharmacy successfully several years at Hampstead, at length obtained a diploma constituting him Doctor in Medicine, and came to London, and was made physician to a dispensary for the benefit of infant poor, opened at a house taken for him by the subscribers in Soho square. To aid the design, he published a small treatise on the diseases of children, in which he was supposed to have been assisted by his brother John. The work was well received, and contained some observations on the subject that were new and ingenious. The dispensary, however, did not succeed; and the Doctor died some years after in obscurity.

ARMUA, in *Ancient Geography*, the modern *Sci-bouze*, a river of Africa mentioned by Pliny, emptied itself into the Mediterranean between Aphrodisium and Hippo Regius, south-east of the former, and north-west of the latter.

ARMUS, in *Entomology*, a species of CURCULIO, found in France. It is black; the scutell whitish; wing-cases with denticulated striæ on each side.

ARMUYDEN, or ARNEMUDEN, in *Geography*, a strong sea-port town of Zealand, in the Low Countries, situate on the eastern side of the isle of Walcheren. It was anciently a large place, and divided into the Old and New Town. The convenience of the port, the depth of water, and its nearness to the sea, drew to it much commerce, especially in salt. But it has often been damaged by the sea, and the harbour is now choaked up with sand, so that the sea is made navigable by means of a canal to Middleburg, from which Armuyden is distant about a league to the east. N. lat. 51° 31'. E. long. 3° 42'.

ARMUZA, ARMOZUM, or ARMUZIA, in *Ancient Geography*, a city of Asia, in Carmania, near the promontory Armozum, to which it gave name, as well as to the island of Ormuz. Pliny, and Ptolemy.

ARMY, a large body of soldiers, consisting of horse and foot, under the command of a general, with several ranks of subordinate officers under him.

An army consists of brigades, regiments, battalions, and squadrons, and is usually divided into three corps; which are ranged in three lines. The first line is called the front-line, and part of it forms the van-guard; the second, the main body; and the third, the rear-guard, or body of reserve.—The middle of each line is generally possessed by the foot; the cavalry forms the wings on the right and left of each line; and sometimes they also place squadrons of horse in the intervals between the battalions.

The British army, when it takes the field, is divided into brigades, and these brigades into battalions, squadrons, companies, and troops, both in the infantry and cavalry respectively. The French have lately made a different distribution. Their infantry is divided into half-brigades, each half-brigade consisting of three battalions, and each battalion of nine companies. A company of artillery is attached to each half-brigade, for the management of its field-pieces. The half-brigade are either of the line, or light infantry;

each battalion of those in the line has its company of grenadiers, and each battalion of light infantry one of carabineers. For the arrangement of the army in order of battle, see *Order of BATTLE*.

The number of soldiers is necessarily much smaller, and bears a less proportion to the whole number of the people, in a civilized than in a rude state of society. Among the civilized nations of modern Europe, it has been stated, as the result of long experience, that a prince with a million of subjects cannot keep an army of above ten thousand men, without ruining himself. It was otherwise in the ancient republics: the proportion of soldiers to the rest of the people, which is now about one to a hundred, might then be as about one to eight; and in some of the little Agerian states of ancient Greece, a fourth or fifth part of the whole body of the people considered themselves as soldiery, and would sometimes take the field. The reason seems owing to that equal partition of lands, which the ancient founders of commonwealths made among their subjects; so that every man had a considerable property to defend, and had means to defend it with. Whereas among us, the lands and riches of a nation being shared among a few, the rest have no way of subsisting, but by trades, arts, and the like; and have neither any free property to defend, nor means to enable them to go to war in defence of it, without starving their families. A large part of our people are either artificers or servants, and so only minister to the luxury and effeminacy of the great. While the equality of lands subsisted, Rome, though only a little state, being refused the succours which the Latins were obliged to furnish after the taking of the city in the consulate of Camillus, presently raised ten legions within their own walls: which was more, Livy assures us, than they were able to do in his time, though masters of the greatest part of the world. A full proof, adds the historian, that we are not grown stronger; and that what swells our city is only luxury, and the means and effects of it. Vide Liv. dec. 1. lib. vii.; and Confid. sur des Causes de la Grand. des Rom. chap. iii. p. 24.

In the republics of ancient Greece and Rome, during the whole period of their existence, and under the feudal governments for a considerable time after their first establishment, the profession of a soldier was not so separate and distinct, as to constitute the sole or even the principal occupation of a particular class of citizens. In process of time, however, that industry which produces, and that wealth which follows, the improvements of agriculture and manufactures, provoked the invasion of neighbours, and rendered it necessary for a state, likely and liable to be attacked, to adopt some regular measures for the public defence, more especially as the people, by their natural habits, were incapable of defending themselves. In these circumstances, there seem to be but two methods to which the state can have recourse for its own security: one of these is the introduction of a military force under the denomination of a MILITIA; and the other, the establishment of a *standing army*. The soldiers of this latter description are solely or principally occupied in the practice of military exercises; and the maintenance or pay which the state affords them is the principal and ordinary fund of their subsistence. In a standing army, the character of a soldier predominates over every other; and the mode of their discipline, as well as the constancy of their exercise, renders the soldiers of this class superior to a militia, in whatever manner it may be either disciplined or exercised. This superiority of a well-regulated standing army is attested by the history of all ages. One of the first standing armies of which we have any distinct account, in any well-authenticated history, is that of Philip

of Macedon. His frequent wars with the Thracians, Illyrians, Thessalians, and some of the Greek cities in the neighbourhood of Macedon, gradually formed his troops, which were probably at first militia, to the exact discipline of a standing army, which, as he was seldom, or never for any long time, at peace, he was careful not to disband. With this army he vanquished, after repeated and violent conflicts, the gallant and well-exercised militias of the principal republics of ancient Greece; and afterwards, with very little struggle, the effeminate and ill-exercised militia of the great Persian empire. The fall of the Greek republics, and of the Persian empire, was the first great revolution in the affairs of mankind, which history has circumstantially recorded; and it was the effect of the irresistible superiority which a standing army has over every sort of militia. The fall of Carthage, succeeded by the elevation of Rome, is the second, which may be ascribed to the same cause. From the end of the first to the beginning of the second Carthaginian war, the armies of Carthage were continually in the field, and employed under three great generals, who succeeded one another in the command. These were Hamilcar, his son-in-law Asdrubal, and his son Hannibal. The army led by Hannibal from Spain into Italy, must necessarily have been gradually formed to the exact discipline of a standing army. The Roman armies on the other hand, which Hannibal encountered at Trebia, Thrymenus, and Cannæ, were militia opposed to a standing army; and this circumstance, perhaps, contributed more than any other to determine the fate of those battles. The standing army which Hannibal left behind him in Spain, had the like superiority over the militia which the Romans sent to oppose it, and in a few years, under the command of his brother Asdrubal, expelled them almost entirely from that country. The Roman militia, being continually in the field, became in the progress of the war a well-disciplined and well-exercised standing army; and the superiority of Hannibal was gradually diminished. Asdrubal judged it necessary to lead almost the whole of the standing army which he commanded in Spain, to the assistance of his brother in Italy, but being surprised and attacked by another standing army, in every respect equal or superior to his own, he was entirely defeated. When Asdrubal had left Spain, the great Scipio was opposed merely by a militia, inferior to his own; and having conquered and subdued that militia, his own militia necessarily became, in the course of the war, a well-disciplined and well-exercised standing army. That standing army was afterwards transported to Africa, where it was opposed only by a militia; and in order to defend Carthage, it became necessary to recal the standing army of Hannibal. The disheartened and frequently defeated African militia joined it; and at the battle of Zama, composed the greater part of the troops of Hannibal. The event of that day determined the fate of the two rival republics. From the end of the second Carthaginian war, till the fall of the Roman republic, the armies of Rome were in every respect standing armies: and to these the militias of all the civilized nations of the ancient world, of Greece, of Syria, and of Egypt, made but a feeble resistance. The militias of the barbarous nations defended themselves much better. The Scythian or Tartar militia, and also the Parthian and German militias, were formidable enemies to the Roman armies, and gained considerable advantages over them. In general, however, and when the Roman armies were well commanded, they appear to have been very much superior. Many different causes contributed to relax the discipline of the Roman armies. One of these causes was its extreme severity. Besides, under the Roman emperors, the standing armies of Rome, those especially which guarded the German and Pannonian frontiers, became dangerous to their

masters, by setting up their own generals against them. To remedy this evil, and to render them less formidable, Dioclesian, as some say, or, according to others, Constantine, first withdrew them from the frontier, and dispersed them in small bodies through the different provincial towns, where some of them became tradesmen, artificers, and manufacturers: and thus the civil acquired a predominance over the military character, and the standing armies of Rome gradually degenerated into a corrupt, neglected, and undisciplined militia, incapable of resisting the attack of the German and Scythian militias, which soon afterwards invaded the Western empire. The fall of this empire, which is the third great revolution in the affairs of mankind, distinctly recorded in ancient history, was brought about by the irresistible superiority which the militia of a barbarous has over that of a civilized nation. But the victories which have been gained by militias have generally been, not over standing armies, but over other militias, in exercise and discipline inferior to themselves. Such were the victories which the Greek militia gained over that of the Persian empire; and such were also those which in later times the Swiss militia gained over that of the Austrians and Burgundians. As arts and industry advanced, the authority of the chieftains gradually decayed, and the great body of the people had less time to spare for military exercises. Hence, the discipline and the exercise of the feudal militia gradually declined and sunk to ruin, and standing armies were at length introduced in order to supply its place. When once the expedient of a standing army was adopted by one civilized nation, it became necessary that all its neighbours should follow the example. They found that their safety depended upon their doing so, and that their own militia was altogether incapable of resisting the attack of such an army. The soldiers of a standing army, though they may have never seen an enemy, have nevertheless frequently appeared to possess all the courage of veteran troops, and the very moment in which they have taken the field have been fit to face the hardest and most experienced veterans. A well-regulated standing army, as it is superior to every militia, and as it can best be maintained by an opulent and civilized nation, can alone defend such a nation against the invasion of a poor and barbarous neighbour. Moreover, as a civilized country can only be defended by means of a well-regulated standing army, it is only by means of such an army that a barbarous country can be suddenly and tolerably civilized.

The first standing army that appeared in Europe, after the fall of the Roman legions, was that established in France by Charles VII. A. D. 1445. Such an establishment, however, was so repugnant to the genius of feudal policy, and so incompatible with the privileges and pretensions of the nobility, that during several centuries no monarch was either so bold, or so powerful, as to venture on any step towards introducing it. Charles VII. under pretence of keeping always on foot a force sufficient to defend the kingdom against any sudden invasion of the English, when he disbanded his other troops, retained under arms a body of 9,000 cavalry, and of 16,000 infantry. He also appropriated funds for the regular payment of these; he stationed them in different places of the kingdom, according to his own pleasure; and appointed the officers who commanded and disciplined them. By this measure he occasioned an important revolution in the affairs and policy of Europe. By depriving the nobles of that direction of the military force of the state, which had raised them to such high authority and importance, a deep wound was given to the feudal aristocracy, in that part where its power seemed to be most complete. The institution of standing armies hath since become general; and this can only be attributed to the superiority and success which are

every where observed to attend it. The truth is, the closeness, regularity, and quickness of their movements; the unreserved, instantaneous, and almost mechanical obedience to orders; the sense of personal honour, and the familiarity with danger, which belong to a disciplined, veteran, and embodied soldiery, give such firmness and intrepidity to their approach, as well as such weight and execution to their attack, as are not to be withstood by loose ranks of occasional and newly-levied troops, who are liable by their inexperience to disorder and confusion, and in whom fear is constantly augmented by novelty and surprise. From the acknowledged superiority of standing armies, it follows, not only that it is unsafe for a nation to disband its regular troops, whilst neighbouring kingdoms retain theirs, but also that regular troops provide for the public service at the least possible expence. A standing army adds more than any other force that can be provided to the common strength, and takes less from that which composes the wealth of a nation, or its stock of productive industry. Besides, when the state relies for its defence upon a militia, formed from the mass of the people, such as husbandmen, and artificers, and manufacturers, it is necessary that arms be put into the hands of the people at large. Such a militia, inferior indeed in discipline and force to a standing army, must be supplied by rotation, allotment, or some mode of succession, which replaces fresh draughts from the country; and of course a much greater number will be instructed in the use of arms, and will have been occasionally embodied together, than are actually employed, or than are supposed to be wanted at the same time. The effect of this diffusion of the military character upon the civil condition of the country, becomes a subject of inquiry, peculiarly delicate and important. "To me," says the ingenious archdeacon Paley, "it appears doubtful, whether any government can be long secure, where the people are acquainted with the use of arms, and accustomed to resort to them. Every faction will find itself at the head of an army. Every disgust will excite commotion; and every commotion become a civil war. Nothing perhaps can govern a nation of armed citizens, but that which governs an army—despotism." "I do not mean," continues this writer, "that a regular government would become despotic by training up its subjects to the knowledge and exercise of arms, but that it would ere long be forced to give way to despotism in some other shape; and that the country would be liable to what is even worse than a settled and constitutional despotism, to perpetual rebellions, and to perpetual revolutions; to short and violent usurpations; to the successive tyranny of governors, rendered cruel and jealous by the danger and instability of their situation."

The strength and efficacy of a standing army depend, in mixed governments, on its being submitted to the management and direction of the prince. A popular council, however well qualified for the purposes of legislation, is altogether unfit for the conduct of war; in which success usually depends upon vigour and enterprise, upon secrecy, dispatch, and unanimity, upon a quick perception of opportunities, and the power of seizing every opportunity immediately. The obedience of an army should also be as prompt and active as possible; and it ought, therefore, to be an obedience of will and emulation. Upon this consideration is founded the expediency of leaving to the prince not only the government and destination of the army, but the appointment and promotion of its officers; because a design is then alone likely to be executed with zeal and fidelity, when the person who issues the order, chooses the instruments, and rewards the service. There is, however, a danger to the liberty of a state, that is inseparable from standing armies, which ought not to be concealed nor dissembled, and which has been

thought by some to counterbalance its acknowledged advantages. These properties of their constitution, the soldiery being separated in a great degree from the rest of the community, their being closely linked among themselves by habits of society and subordination, and the dependency of the whole chain upon the will and favour of the prince, however essential they may be to the purposes for which armies are kept up, give them an aspect in no wise favourable to public liberty. The standing army of Cæsar destroyed the Roman republic. The standing army of Cromwell turned the long parliament out of doors. This danger, however, is diminished by maintaining, upon all occasions, as much alliance of interest, and as much intercourse of sentiment, between the military part of the nation and the other orders of the people, as are consistent with the union and discipline of an army. For which purpose, the officers of the army should be selected from the principal families of the country, and be encouraged to establish in it families of their own, as well as be admitted to seats in the senate, to hereditary distinctions, and to all the civil honours and privileges that are compatible with this profession; that by such circumstances of connection and situation they may have a share in the general rights of the people, and their inclination may be engaged on the side of public liberty, so as thus to afford a reasonable security that they cannot be brought, by any promises of personal aggrandisement, to assist in the execution of measures which might enslave their posterity, their kindred, and their country. To prevent the executive power from being able to oppress, says baron Montesquieu, it is requisite that the armies with which it is entrusted should consist of the people, and have the same spirit with the people; as was the case at Rome, till Marius new-modelled the legions, by insisting the rabble of Italy, and laid the foundation of all the military tyranny that ensued. Nothing then, according to these principles, says judge Blackstone, ought to be more guarded against in a free state, than making the military power, when such a one is necessary to be kept on foot, a body too distinct from the people. Like ours, it should be wholly composed of natural subjects; it ought only to be enlisted for a short and limited time; the soldiers also should live intermixed with the people; no separate camp, no barracks, no inland fortresses should be allowed. And perhaps it might be still better, if, by dismissing a stated number, and insisting others at every renewal of their term, a circulation could be kept up between the army and the people, and the citizen and the soldier be more intimately connected together.

Since the general introduction and prevalence of standing armies in Europe, it has also for many years past been annually judged necessary by our legislature, for the safety of the kingdom, the defence of the possessions of the crown of Great Britain, and the preservation of the balance of power in Europe, to maintain even in the time of peace a standing body of troops, under the command of the crown; who are however *ipso facto* disbanded at the expiration of every year, unless continued by parliament. SEE MUTINY BILL.

It is probable, says Andrews (Hist. of Great Britain, vol. i.), that the first standing military force in Britain was that garrison in Dover Castle, which, by resisting the arms of the Dauphin of France, invited by the barons to their succour in their contest with king John, saved the kingdom of England from a foreign dynasty. For, as Camden quotes from an ancient historian, "Sir Hubert de Burgo, when made constable of the castle, considering that it was not for the safety of the fortress to have new guards every month, procured, by the assent of the king, and of all that held of the castle, that every tenant for one month's guard should find his ten shillings, out of which certain persons

persons elected and sworn, both of horse and foot, should receive pay for guarding the castle."

If we advert to the ancient history of this country, we shall find, that by the Saxon laws, every freeman of an age capable of bearing arms, and not incapacitated by any bodily infirmity, was obliged, in case of a foreign invasion, internal insurrection, or other emergency, to join the army: that being one of the three services comprehended under the title of the *trinoda necessitas*: and all such as were qualified to bear arms in one family, were led to the field by the head of that family. Every landholder was obliged to keep armour and weapons, according to his rank and possessions, which he was prohibited from selling, lending, or pledging, or even alienating from his heirs. For their instruction in the use of arms, they had stated times for performing military exercise, and once in the year there was a general review of arms throughout each county. The greater part of the Anglo-Saxon forces consisted of infantry; which seems to have been of two sorts, the heavy and light-armed; and the cavalry was chiefly composed of the thanes, such men of property as kept horses. The Anglo-Saxon mode of drawing up their armies for battle, was in one large dense body surrounding their standard, and placing their foot, with their heavy battle-axes, in the front. The military establishment of the nation underwent a considerable change, when the feudal system was introduced about the year 1086. By this system, all the lands of the realm were considered as divided into certain portions, each producing an annual revenue, denominated a KNIGHT'S *Fee*: and every tenant *in capite*, or person who held from the king land amounting to a knight's fee, was bound to hold himself in readiness, with horse and arms, to serve the king in his wars, either at home or abroad, at his own expence, for a stated time, generally forty days in a year. When this service was accomplished, they were at liberty to return home; but if they remained with the army, they were paid by the king. Persons of this description, unable to serve, were by proclamation directed to find unexceptionable substitutes. Soon after the conquest, the constitutional military force of England consisted of such feudal troops, and of the *Posse Comitatus*, including every freeman above the age of fifteen and under the age of sixty, who were only liable to be called out in case of internal commotions or actual invasions. That this body of men might be ready to take the field, a law, called the assise of arms, was enacted by Henry II., A. D. 1181, in the 27th year of his reign; which law was further corroborated and enforced by the 13th of Edw. I., called the statute of Winchester, 33 Hen. VIII., c. 5. 2 & 3 Edw. VI. In the reigns of Richard II., Hen. VII., and Henry VIII., four military bodies, still existing, were instituted, viz. the SERJEANTS *at Arms*, the GENTLEMEN *Penfioners*, the YEOMEN *of the Guard*, and the ARTILLERY *Company*.

During the troubles under Charles I. the royal army consisted chiefly of regiments raised by the nobility and gentry who adhered to the royal cause, from among their tenants and dependants. After the restoration of Charles II. when feudal tenures were abolished by act of parliament, a national militia was established; which was declared, by an act of parliament, to be under the immediate orders of the king. See MILITIA. Besides these constitutional forces, there were in the English armies and garrisons, at all times from the conquest downward, stipendiary troops, both national and foreigners; the first hired by our kings, with the money paid by persons commuting for their feudal services, and employed in castle guards, foreign garrisons, and protecting the marshes or borders of the kingdom, adjoining to Wales and Scotland; and the latter, paid out of the

privy purse, or living upon free quarters. They were known by the various names of *ruptarii*, *routers*, and *ruyers*, from a German word signifying a horseman or knight; they were also denominated *Brabançons*, *Provençales*, *Coterelli*, and *Flemings*, and were in reality a set of freebooters of all nations, ready to be engaged for hire. These were chiefly called in by our kings in their disputes with the great barons. Since the time of king Edward III., when it became customary for our kings to engage with their subjects, and other persons by indenture, to furnish soldiers at certain wages, most of our armies consisted of stipendiary troops: such was the army raised and commanded by the bishop of Norwich, A. D. 1382, the 6th of Richard II., and that of the 16th of Henry V. These stipendiary forces were, the garrisons and castle guards excepted, kept up only in time of war; and though mercenary, were not standing armies. Their subsistence was drawn from the grants made by parliament, in which their specific numbers were sometimes stipulated. The first standing forces employed by our kings were their immediate body-guards, such as the serjeants at arms, the yeomen of the guard, and the gentlemen pensioners; and yet these were calculated rather for the splendour of a court than the operations of the field. Under the troubles of Charles I., a number of troops were levied by both parties, without any regard to law or custom. Two regiments of guards raised by Charles II. in 1660, one of horse and one of foot, formed the two first corps of our present army; and these were afterwards considerably increased. In 1661, the first regiment, or Royal Scots, were brought back from France, jocularly stiled from its antiquity, "Pontius Pilate's guards;" and there was also, about the same time, an English corps of cavalry in the French service. The revolution caused the military part of the constitution to be new modelled, and the army to be voted from year to year, by the act stiled the *MUTINY Bill*.

The methods of raising the stipendiary, or mercenary troops, were either by commissions, resenbling our present beating orders, authorizing persons to enlist volunteers; or by indenture, which was a practice that began about the latter end of the reign of king Edward III., and in that of Henry V. became general. By these indentures, different persons engaged to provide a certain number of able men, properly armed, to serve the king for a stated time, at a stipulated pay and bounty, then stiled wages and regards: and in these agreements it was usual for the king to advance part of the pay before-hand, afterwards called "Imprest Money," and also to give security for the regular payment of the remainder. For this purpose, king Henry V. pledged all his jewels, which were not redeemed till after his death. Criminals were also sometimes pardoned on condition of serving in the royal army abroad, and finding security to answer any prosecution if called upon at their return. Several of our sovereigns also, under the authority of the royal prerogative, obliged districts, cities, towns, and even individuals, to send men and horses, or to pay contributions for that purpose.

The present mode of recruiting our armies is by engaging volunteers, who are enlisted to serve for an indefinite time, that is, till they shall be discharged, or for a certain time, with an annexed clause, "or during the war." See ENLISTING. Pressing for soldiers was practised much in its present form in the time of queen Elizabeth; and it has been several times occasionally authorized by acts of parliament. This, however, in itself, is but a bad expedient, and in general timidly, partially, and improperly executed.

The army, as it now stands, may date its origin from the restoration; though some of the establishments, formed by Charles II., were taken from corps raised during the

civil wars; such as the first regiment of foot, and the Coldstream regiment of guards, which last came with general Monk from Scotland. The royal regiment of horse guards, commonly called the *Oxford Blues*, is among the first in this establishment. The two troops of horse-guards, embodied by Charles about the same time, and of which the privates were all gentlemen, have been for some years abolished; and in their room have been substituted two fine regiments of cavalry, subject to military discipline like the rest of the army, and called the first and second regiments of *LIFE GUARDS*.

The regular army established by Charles II. consisted at first of little more than 5,000 men, including garrisons abroad. In 1684, the standing army amounted to 8,000 men; that on the Irish establishment having been at the same time augmented to 7,000. During the two succeeding reigns the army was much increased, as the nation was engaged in continental wars. Under Geo. I., in 1717, the forces voted by parliament amounted to 16,000 men. The standing army was much augmented during the following reign, on account of foreign wars and internal disturbances. Every successive war has augmented the establishment of the army in proportion to our acquisition of foreign territory. At the conclusion of the American contest, the forces were reduced to about 40,000 men for Great Britain and Ireland: and the peace establishment, in 1802, consisted of 128,999 men, including 17,000 cavalry, six regiments of colour in the West Indies, amounting to 4,158 men, and the foreign corps of Swiss, &c. estimated at 5,530. For the different kinds of troops, see *CAVALRY*, *FENCIBLES*, *FOOT*, *GRENADIERS*, *GUARDS*, *INFANTRY*, *INVALIDS*, and *MARINES*, &c. For the arrangement of an army in an engagement, see *ORDER OF BATTLE*.

An army sometimes acquires different appellations from the services in which it is employed. Thus, a *covering* army is that which covers a place, by lying encamped or in cantonments for the protection of the different passes which lead to a principal object of defence. An army is said to *blockade* a place, when, being well provided with heavy ordnance and other warlike means, it is employed to invest a town for the direct or immediate purpose of reducing it by assault or famine. An army of *observation*, is so called, because by its advanced positions and desultory movements it is constantly employed in watching the enemy. Such a body of troops is employed by besiegers to prevent relief being brought into a place, or the siege being raised by the enemy. An army of *reserve* may not improperly be called a general depôt for effective service. In cases of emergency, the whole, or detached parts of an army of reserve are generally employed to recover a lost day, or to secure a victory. It is also sometimes used for the double purpose of secretly increasing the number of active forces, and affording the aid necessary according to present exigency, and of deceiving the enemy with respect to its real strength. A *flying* army is a strong body of horse and foot, usually commanded by a lieutenant-general, which is always in motion, both to cover its own garrisons, and to keep the enemy in continual alarm. Smith's *Wealth of Nations*, vol. iii. ch. 1. part 1. Robertson's *Charles V.* vol. i. p. 112. Paley's *Princ. of Mor. & Pol. Philosophy*, vol. ii. p. 425. Montefq. *Sp. of Laws*, vol. i. p. 229. Blackst. *Com.* vol. i. p. 415. De Lolme's *Const. of Eng.* p. 429, &c. Grose's *Milit. Ant.* vol. i.

ARMY, Naval, is a number of ships of war, equipped and manned with sailors and marines, under the command of an admiral, with other inferior officers under him.

ARMY, Royal, is an army marching with heavy cannon; capable of besieging a strong, well-fortified city.

For the diseases incident to armies, see *DISEASE*, *CAMP*, *GARRISON*, *HOSPITAL*, *SOLDIER*, &c.

ARNA, in *Ancient Geography*, a town of Italy, in the eastern part of Umbria, opposite to Perugia and near the Tiber, mentioned by Silius Italicus, l. viii. v. 458.; now known under the name of "La Civitella d'Arno."

ARNA, or *Arne*, a small territory of Greece, in Thessaly, so called from its metropolis. Piny places it in Phthiotis, a district of Thessaly. Strabo says, that Homer gives the name of Arna, or Arne, to Araxophium in Beotia, annexing to it the epithet *πελυαζίδου*, on account of its abundance of grapes. It is said to have derived its name from Arne, the daughter of Cæolus, by whose son Beotius it was built.—*Arna* was also a town of Asia Minor, in Lycia, called by some authors Xanthus.—Also, a town of Spain, on the right of Bætis, between Hispals to the south-west, and Corduba to the north-east.—Also, a town of the island of Andros, in the Archipelago.

ARNAB, in *Zoology*, the name of the hare (*Lepus*) among the Arabs.

ARNÆA, in *Entomology*, a species of *PAPILIO* (*Nymph. gem.*), found in Surinam. The wings are slightly indented and brown; posterior pair bluish, with five ocellated spots beneath. Fabricius. *Obs.* This author suspects that the insect figured by Cramer, under the specific name *Lea*, may belong to this species.

ARNAK, in *Ichthyology*, one of the Arabian fishes of the *RAJA* genus, described by Forkael in his *Faun. Arab.* p. 9. n. 13. The body is roundish and silvery; tail without fins, and armed with two spines. Fork. Gmelin. The teeth are granulate.

ARNALDIA, in *Physic*, a slow malignant kind of disease, frequent formerly in England; the most distinguishing symptom whereof was a falling of the hair.

Authors are much at a loss for the nature and kind of this disease, which appears to have been peculiar to our country. From the description given of it in an ancient chronicle, Mollerus concludes it to have been a species of the venereal disease, as that distemper appeared in those days in this country.

ARNAU, in *Geography*, a town of Bohemia, in the circle of Konigingratz, on the Elbe.

ARNAUD DE VILLA NOVA, so called from Villeneuve, the place of his birth, in *Biography*, a philosopher and physician of extraordinary talents, born about the middle of the thirteenth century, studied at Paris and Montpellier, and further improved himself by visiting the different schools in Italy. He then travelled to Spain, where he acquired a knowledge of medicine, and of their language, from the Arabian physicians. He here acquired so much reputation, that a sect was formed in the country, called from him "*A nol-distæ*." He is said to have had such faith in astrology, as to predict from the aspect of the stars the termination of the world, which he supposed would happen by the year 1376. He was a great chymist, and wrote several treatises on the subject. While in Spain, he became acquainted with Raymond Lully, who call's him his master. At Paris, he had given his opinion so freely on theological matters, particularly of the monks, and of the mass, that the faculty of theology there condemned fifteen of his positions, one of which was, "that the works of mercy and of medicine were more acceptable to God than the sacrifice of the altar." To avoid the consequences of their censures, and finding the Inquisition were proceeding against Apono, for taking similar liberties with religion, he retired to the court of Frederic of Aragon, who had formerly been his friend, and there wrote his treatise concerning the government of health, and his commentaries on the *Schola Salernitana*. He is supposed to have died about the year 1312. In 1313, pope Clement wrote

wrote a circular letter, adjuring every one under their apostolical obedience, to discover and send to him a treatise on the practice of physic written by Arnaud which he had promised to give his holiness, but was prevented, he supposed, by his death. *Friend's Hist. of Phys.* vol. ii. p. 251. — His works, which were numerous, were collected and printed at Lyons in folio, 1520; and again at Basle, 1585, with notes by Nicolas Tolerus. Eloy has given a catalogue of the treatises in his *Dict. Hist.* among them we find, “*Expositiones visionum quæ sunt in somniis, ad utilitatem medicinæ;*” “*Remedia contra maleficia;*” “*De conservanda juventute, et retardanda senectute;*” and others “*ejusdem farinae;*” but many of them are on more familiar and useful subjects. He complains in several parts of his works, of the interference of the clergy in the practice of physic, to the great detriment of the professors of the art, as well as of the art itself. The evil however continued to increase, notwithstanding the attempts of the popes to check it, until after the revival of letters.

ARNAUL, in *Geography*, a fortified island on the western coast of the hither peninsula of India, commanding the entrance of the Augaffyah or Mandavee river, between Bombay and Surat.

ARNAULD, ANTONY, in *Biography*, an eminent lawyer, was born at Paris in 1560. As advocate to the parliament of Paris, he was distinguished for his eloquence and probity, and consulted by persons of distinction on the most important affairs. His pleadings against the Jesuits in favour of the university of Paris, in 1594, which are famous, were published in 8vo. at Paris in 1594, and in 12mo. in 1717. He also published another work against the Society, in 1602, and “*Advice to Louis XIII.*” in 8vo. in 1615. He died in 1619; and several of his sons acquired great celebrity. *Nouv. Dict. Hist.*

ARNAULD, D'ANDILLY, the eldest son of the preceding, was born at Paris in 1588. In several posts of distinction which he occupied at court, he employed his influence in support of justice and virtue; and such was his character, that Balzac said of him; “*he was neither ashamed of the Christian graces, nor vain of the moral virtues.*” At the age of fifty-five, he retired to Port-Royal, and devoted himself to religious studies. He died at the age of eighty-five, having retained the full vigour both of his body and mind. Besides other works, his “*Translation of Josephus,*” said to be more elegant than faithful, was printed at Paris in folio, in 1667, and in five volumes 12mo. in 1672; and at Amsterdam, in two volumes folio, in 1681. His “*Apogetic memoir for the house of Port Royal,*” was written in 1654; “*Memoirs of his life by himself,*” were printed in two volumes 12mo.; and “*A Poem on the life of Christ,*” was printed in 1685, 12mo. *Nouv. Dict. Hist.*

ARNAULD, HENRY, brother of the preceding, abbot of St. Nicholas, and afterwards bishop of Angers, was born at Paris in 1597. For his services to the family of the Barbarini, in 1645, on occasion of their disputes with pope Innocent X., they struck a medal in honour of him, and erected his statue in their palace at Rome. From the time of his appointment to the see of Angers, in 1649, to his death in 1692, he left his diocese only once, which was for the purpose of reconciling the duke of Tremouille to his son. He is said to have appealed the queen mother when she was about to punish the inhabitants of Angers for their revolt in 1652, by saying to her at the communion, “*Receive your God, who, when he was dying on the cross, pardoned his enemies.*” It is reported concerning him, that the surest title to his favour was to have offended him. His whole time was devoted to study, religious exercises, and the affairs of his diocese; and being exhorted by a friend to allow himself one day for relaxation, he replied, “*I shall willingly do it,*

if you can find a day in which I am not a bishop.” Although he attained the advanced age of 95, his death was considered as premature, and he was lamented as the father of the poor, the comforter of the afflicted, and the best of bishops. His “*Negotiations*” at the court of Rome, and in other courts of Italy, containing many curious remarks, were published at Paris, in 1748. *Nouv. Dict. Hist.*

ARNAULD, ANTHONY, an eminent Jansenist, was the twentieth child of the advocate of the same name, and born at Paris in 1612. Having first studied the languages and philosophy in the college of Calvi, and afterwards theology in the college of Sorbonne, he was, in the year 1643, admitted a member of the Sorbonne. In the dispute between the Jesuits and Jansenists, concerning frequent communion, Arnauld took an active part; and in 1643 published his famous book on “*The Practice of communicating frequently—Traite de la frequente communion.*” The frequent celebration of the Lord's Supper was strenuously recommended by the Jesuits as the most certain and infallible method of appeasing the deity, and obtaining plenary remission; but the Jansenists, and also many other learned and pious doctors of the Romish communion, censured and condemned this mode of proceeding, whilst they rejected the intrinsic virtue and efficient operation, called the “*opus operatum,*” attributed to the sacraments; and maintained that the act of receiving the sacrament of the Lord's Supper can be profitable only to those whose minds are prepared by faith, repentance, and the love of God, for that solemn service. Arnauld's treatise on that subject gave great offence to the Jesuits; and their enmity against him was increased by the books written by him in defence of the Jansenists, on the subject of grace. In 1656, he was excluded from the faculty of divinity of Sorbonne, against the judgment of seventy-two doctors of this faculty; and from this time he withdrew into solitude, where he remained twelve years, and employed himself in writing curious treatises in various branches of science. When the persecution of the Jansenists was suspended by pope Clement IX. in 1669, Arnauld returned to Paris, and was respectfully received both by the pope's nuncio, and by Louis XIV. At their request he defended the Catholic faith against the Calvinists; but his enemies succeeding in bringing him into suspicion with the king, he thought it prudent to retire. Accordingly he left the kingdom in 1679, and took up his residence in the Netherlands, where he essentially served the cause of the Jansenists, and gained over by his eloquence and sagacity the Romish congregations in Holland to their party. In this retreat he also wrote “*An Apology for the Clergy of France, and the Catholics of England,*” in reply to the “*Politics of the Clergy of France,*” written by Jurieu, a Protestant minister, and published at the Hague; and this reply produced from the pen of Jurieu, a piece of keen satire, entitled “*L'Esprit de M. Arnauld.*” His “*Reflections philosophical and theological,*” were produced by Malbranche's treatise “*On Nature and Grace;*” and in a work, “*On true and false Ideas,*” he attacked the philosophical doctrine advanced by this author in his “*Search after Truth.*” His “*Practical Morality of the Jesuits,*” was levelled against this fraternity; and he also attacked father Simon on the inspiration of the scriptures, and wrote in defence of the propriety of translating the scriptures into the vulgar tongue. Notwithstanding all the zeal of Arnauld in vindication of the Catholic faith, his orthodoxy was suspected; and in 1690, a canonical warrant was issued against him, under the contemptuous and illiberal description of “*One Arnauld,*” by the superiors of the several monastic fraternities at Liege. Arnauld, however, persevered in his attachment to the church, notwithstanding the charges of heresy with which he was reproached; and in his last moments he received the sacrament from the hands of his priest,

priest, though he had only two days before celebrated mass. He retained his faculties to the advanced age of 82 years, and died at Brussels, on the 8th of August, 1694. His heart was carried, at his particular request, to Port Royal, and there it was honorably deposited. Arnauld possessed a vigorous and active mind; his memory was tenacious, his literature various and extensive: he excelled as a logician; and in theology and ecclesiastical history he was deeply read; and he was well acquainted with polite literature. His genius was original and inventive; and he is said to have taught in philosophy, opinions similar to those of Des Cartes, before his writings appeared, and to have maintained the doctrines of Janfenius several years previous to the publication of that prelate's book on grace. Although Arnauld suffered persecution with the Janfenists whilst he lived, it has been a problem of no easy solution ever since his death, whether he was not an heretic. His writings are chiefly controversial, and bear evident marks of a strong intellect and lively fancy. In polite literature and philosophy, he published "A general and rational Grammar," illustrating the universal principles of language, reprinted with notes by M. Duclos in 1756; "Elements of Geometry;" "The art of Thinking;" "Reflections on the Eloquence of Preachers;" "Objections to the Meditations of Des Cartes;" and "A treatise on true and false Ideas." On the subject of grace, his principal works are "Reflections philosophical and theological," and translations of several pieces of Augustine. In the controversy against the Protestants, he wrote "The perpetuity of Faith;" "The overthrow of Christian Morality by the Calvinists;" "The impiety of Calvinistic Morality;" "An apology for the Catholics;" "The Calvinists convicted of impious tenets in Morals;" and "The Prince of Orange, a new Absalom, a new Herod, a new Cromwell," which was extensively circulated through various courts of Europe by Louis XIV. Against the Jesuits, his most famous work is "The practical morality of the Jesuits," in eight volumes, to which several learned Janfenists are supposed to have contributed; it was republished at Amsterdam in 1742. His writings upon the holy scriptures are "Difficulties proposed to M. Steyaert;" "Defence of the New Testament of Mons;" "The translation of the Missal into the vulgar tongue, authorized by Scripture and the Fathers;" and an "History and Harmony of the Evangelists." After his death M. Quefnel published, in nine volumes, his "Letters" and several "Posthumous Pieces," among which is the "Dissertation on the method of Mathematicians," vindicating his mode of writing, and justifying, in certain disputes, the use of terms commonly thought harsh.

Arnauld was at the head of that learned body of Janfenist writers, known by the denomination of "Messieurs de Port Royal," who passed their days in literary pursuits, and pious exercises, in the retreat of Port Royal, a mansion situate at the distance of six leagues from Paris, originally a monastery, and afterwards a sanctuary of letters. Gen. Dict. Nouv. Dict. Hist. Mosheim's Eccl. Hist. vol. iv. p. 272. vol. v. p. 181. 208. 219. 251.

ARNAULD, GEORGE, son of an eminent surgeon at Paris, applied himself, during the latter part of his life, almost exclusively to the cure of ruptures, in which he acquired considerable knowledge. On account of some accident occurring while he practised midwifery, occasioned, as it was supposed, by mismanagement, he removed from Paris to London, where he continued to reside the remainder of his life. In 1748, he published "Dissertations on Hernias, or Ruptures, in two parts," in 8vo. In these he gives directions for enabling persons afflicted with ruptures, to avert the danger usually consequent to that accident. He supposes that one eighth part of our species suffer from this complaint, which, though perhaps an exaggerated account, shews its fre-

quency, and how necessary it is to direct the attention of surgeons towards making improvements in its treatment. He gives the signs by which the different kinds of ruptures may be distinguished, and clear and distinct directions for managing them. He relates cases of cures effected by him after a gangrene had taken place, by cutting out the mortified part of the intestine. In 1763, he published "Plain and easy Instructions on the Diseases of the Bladder and Urethra," in 12mo. in which he highly commends the use of bougies. In his "Memoires de Chirurgia," published in 1768, in 2 vols. 4to. he gives the whole of Dr. Hunter's treatise on the "Hernia congenita," with additional observations, from inspection of a case that fell under his notice; also further observations on ruptures, and observations on aneurisms. We have, by the same writer, "Remarks on the composition, use, and effects of the extract of lead of Goulard, and of his vegeto-mineral water," 1770, 12mo. Biblioth. Chirur. Haller.

ARNAUT BELIGRAD, in *Geography*, a town of European Turkey, in the province of Albania, 40 miles north-east of Valona.

ARNAUTS, in *Military Language*, denote Turkish light cavalry, whose only weapon is a very crooked sabre. Some such are in the Russian service.

ARNAY LE DUC, in *Geography*, a town of France, and principal place of a district, in the department of the Cote' d'Or, and chief place of a canton in the district of Beaune, 25 miles south-west of Dijon, and 24 south of Semur en Auxois. The place contains 2543, and the canton 11,550 inhabitants: the territory includes 267½ kilometres and 20 communes. N. lat. 47° 7'. E. long. 4° 26'.

ARNDAL, a small town of Norway, in the diocese of Christianland, and district of Nidanassahn, seated on a rock in the middle of the river Nid, and remarkable for a good wharf or landing-place. The houses stand mostly on the declivity of the rock, and the others are built on piles in the water. The inhabitants pass from house to house by means of bridges of boats. The town is commodiously situated for trade; and many ships are employed in the transportation of timber. The church stands near the summit of the rock, and there is an ascent to it from the houses by steps hewn in the rock. In the neighbourhood of this place are many iron mines.

ARNDORF, a town of Germany, in the circle of Bavaria, and principality of Saltzbach, four miles east of Kemnat.

ARNDT, JOHN, in *Biography*, an eminent Protestant divine, was born at Balleustadt, in the principality of Dessau in Germany, in 1555. In consequence of a vow which he made when he was sick, whilst he was prosecuting the study of medicine, he devoted himself to divinity; and was successively minister of Quedlinburg, and at Brunswick. His fame, as a preacher, excited jealousy among his brethren; and being charged with errors, he escaped persecution by retiring to Illeben; and in 1611, the duke of Lunenbourg gave him the church of Zell, and appointed him superintendent of all the churches in his duchy. The charge against him was occasioned by a book which he published at Jena, in 1605 and 1608, intitled "True Christianity;" asserting that many of the irregularities subsisting among Protestants were owing to a mistaken notion of the efficacy of a speculative faith, unproductive of good works: he laid great stress on the contrary doctrine; and intermixed some mystical ideas and expressions, borrowed from the writings of Bernard, Thomas a Kempis, and other ascetics. He thus gave offence to several of his brethren, and particularly to Osiander, a divine of Tubingen, who attacked him in a treatise, intitled "Judicium Theologicum." By Osiander, and others, it was alleged against him, that his style was infected with the jargon of Paracelsus, Weigelius, and other mystical chemists,

chemists, who pretended, by the power and ministry of fire, to unfold the secrets of nature and the mysteries of religion. Although he seems to have manifested his inclination towards the opinions of these fantastical philosophers, he was declared by many grave and pious divines exempt from any errors of moment, and universally allowed to be a man of exemplary integrity and piety. Arndt died in 1621; and his works have been translated into several modern languages. Gen. Dict. Mosheim's Eccl. Hist. vol. v. p. 337.

ARNDT, JOSHUA, a German divine, was born at Gultrow in 1626, and became professor of logic at Rostock, and preacher, and also ecclesiastical counsellor to the duke of Mecklenburg. He died in 1687, and left several works, particularly "Miscellanea Sacra," 8vo.; "Clavis antiquitatum Judaicarum," 4to.; and "Tractatus de Superstitione." His life, written by his son, was printed at Gultrow in 1697. Nouv. Dict. Histor.

ARNE, THOMAS AUGUSTINE, was the son of Arne, the celebrated upholsterer of King-street, Covent-garden, at whose house the Indian kings lodged in the reign of queen Anne, as mentioned in the Spectator, N^o 50. Arne had a good school education, having been sent to Eton by his father, who intended him for the law. But we have been assured by several of his school-fellows, that his love for music operated upon him too powerfully for his own peace, or that of his companions; for, with a miserable cracked common flute, he used to torment them night and day, when not obliged to attend the school. And he told us himself, that when he left Eton, such was his passion for music, that he used to avail himself of the privilege of a servant, by borrowing a livery, and going into the upper gallery of the opera, which was then appropriated to domestics. At home he had contrived to secrete a spinet in his room, upon which, after muffling the strings with a handkerchief, he used to practise in the night while the rest of the family were asleep; for had his father discovered how he spent his time, he would, probably, have thrown the instrument out of the window, if not the player. This young votary of Apollo was at length obliged to serve a three years clerkship to the law, without ever intending to make it his profession; but even during this servitude, he dedicated every moment he could obtain fairly, or otherwise, to the study of music. Besides practising on the spinet and studying composition by himself, he contrived, during his clerkship, to acquire some instruction on the violin, of Pestling, upon which instrument he had made so considerable a progress, that soon after he had quitted his legal master, his father accidentally calling at a gentleman's house in the neighbourhood upon business, found him engaged with company; but sending in his name, he was invited up stairs, where there was a large company and a concert, in which, to his great astonishment, he caught his son in the very act of playing the first fiddle! Finding him more admired for his musical talents than knowledge in the law, he was soon prevailed upon to forgive his unruly passion, and to let him try to turn it to some account. No sooner was the young musician able to practise aloud in his father's house, than he bewitched the whole family. On discovering that his sister was not only fond of music, but had a very sweet toned and touching voice, he gave her such instruction as soon enabled her to sing for Lampe, in his opera of Amelia. And finding her so well received in that performance, he soon prepared a new character for her, by setting Addison's opera of Rosamond, in which he employed his younger brother likewise in the character of the page. This musical drama was first performed March 7, 1733, at Lincoln's-inn Fields, where Mrs. Barber performed the part of the King; Leveridge, Sir Trufty; Page, Master Arne, who had never

appeared in public; Messenger, Mr. Corfe; Queen, Mrs. Jones; Grideline, Miss Chambers; and the part of Rosamond by Miss Arne. The opera was performed ten nights successively, and with great applause; the last time, for the benefit of Mr. Arne, jun. the composer. Having succeeded so well in a serious opera, our young musician tried his powers at a burletta, and fixed upon Fielding's *Tom Thumb* for that purpose; which, under the title of the *Tragedy of Tragedies*, having met with great success in 1731, he now got it transformed into the *Opera of Operas*, and setting it to music after the Italian manner, had it performed May 31st, at the new theatre in the Haymarket; the part of Tom Thumb by Master Arne, his brother. Princess Amelia and the duke of Cumberland honoured the second representation with their presence; the prince of Wales, the sixth; the youngest princesses, the eighth; and afterwards it had a considerable run.

In 1736, Miss Arne, his sister, now Mrs. Cibber, who had captivated every hearer of sensibility by her native sweetness of voice and power of expression as a singer, first appeared as a tragic actress, in the part of *Zara*, at Drury-lane, where her brother was engaged as composer; and it is difficult to say which of the two received the greatest applause, the actress for her truly interesting person, and pathetic voice and manner, or the musician for his natural and pleasing strains, particularly the *March*, which was encored every night, and remained in great favour throughout the kingdom during many years.

In 1738, Arne established his reputation as a lyric and dramatic composer, by the admirable manner in which he set Milton's *Comus*. In this masque he introduced a light, airy, original, and pleasing melody, wholly different from that of Purcell or Handel, whom all English composers had hitherto either pillaged or imitated. Indeed, the melody of Arne at this time, and of his Vauxhall songs afterwards, forms an æra in English music; it was so easy, natural, and agreeable to the whole kingdom, that it had an effect upon our national taste; and till a more modern Italian style was introduced in the pasticcio English operas of Messrs. Bickerstaff and Cumberland, it was the standard of all perfection at our theatres and public gardens.

In 1742, Mr. and Mrs. Arne went to Ireland, where they remained till 1744; in the autumn of which year he was again engaged as composer at Drury-lane; and on the death of Gordon, the first violin, who was successor to Charke, he accepted of the station in the orchestra of that theatre of leader of the band. His hand was enfeebled by rheumatism, but his skill surpassed that of any performer on the violin who had preceded him.

Mr. Arne and Mr. Boyce were frequently concurrents at the theatres, and in each other's way, particularly at Drury-lane. Arne was aspiring, and always regarded Handel as a tyrant and usurper, against whom he frequently rebelled; but with little effect, except upon his own purse, for he was always a loser when he had oratorios performed in Lent on the same night as Handel. But in his songs for the theatres and public gardens, he was ever triumphant over all competitors. At Vauxhall, particularly, where his ballads, dialogues, duets, and trios, were performed during many years with great applause, and were afterwards circulated all over the kingdom. In the summer of 1745, when vocal music was first added to instrumental, by Mr. Tyers, the proprietor of Vauxhall, Arne's little dialogue of *Colin and Phœbe*, written by the late Mr. Moore, author of fables for the female sex, was constantly encored every night for more than three months successively.

In 1759, this ingenious and popular composer had the degree of doctor in music conferred upon him at Oxford.

And in 1762, quitted his former style of melody, in which he had so well set Comus, and furnished Vauxhall and the whole kingdom with such songs as had improved and polished our natural taste; and when he set the bald translation of Metastasio's opera of *Artaxerxes*, he crowded the airs, particularly in the part of Mandane for Miss Brent, with all the Italian divisions and difficulties which had ever been heard at the opera. This drama, by the novelty of the music to English ears, with the talents of Tenucci, Peretti, and the doctor's scholar Miss Brent, had very great success; and still continues to be represented whenever fingers can be found who are possessed of sufficient abilities for its performance. But in setting *Artaxerxes*, though the melody is less original than that of *Comus*, Arne had the merit of first adapting many of the best passages of Italy, which all Europe admired, to our own language, and of incorporating them with his own property, and with what was still in favour of former English composers.

The general melody of our countryman, if analysed, would perhaps appear to be neither Italian nor English, but an agreeable mixture of Italian, English, and Scots. Many of his ballads, indeed, were professed imitations of the Scots style; but in his other songs he frequently dropped into it, perhaps without design.

Arne never was a close imitator of Handel; and was almost the only English composer of the last century, who did not build his fame on imitations of his works, and who was not proud to hear his admirers say of his compositions—*'tis all Handel!* On which account Arne was never thought by the votaries of their great model to be a sound contrapuntist. However, he had an inward and secret reverence for his abilities, and for those of Geminiani, as well as for the science of Pepusch; but except when he attempted oratorios, theirs was not the merit requisite for him, a popular composer who had different performers and different hearers to write for. In the science of harmony, though he was chiefly self-taught, yet being a man of genius, quick parts, and great penetration in his art, he betrayed no ignorance or want of study in his scores.

The oratorios he produced were so unfortunate, that he was always a loser whenever they were performed. And yet it would be unjust to say that they did not merit a better fate; for though the choruses were much inferior in force to those of Handel, yet the airs were frequently admirable. But besides the great reputation of Handel, with whom he had to contend, Arne never was able to have his music so well performed; as his competitor had always a more numerous and select band, a better organ, which he played himself, and better fingers.

None of this ingenious and pleasing composer's capital productions had full and unequivocal success but *Comus* and *Artaxerxes*, at the distance of twenty-four years from each other. *Rosamond*, his first musical drama, had a few songs in it that were long in favour, and the *Judgment of Paris* many: but except when his sister, Miss Arne, afterwards Mrs. Cibber, sung in them, he never gained any thing by either. *Thomas and Sally*, indeed, as a farce, with very little musical merit, was often acted; and previous to that, *Eliza* was a little while in favour; but the number of his unfortunate pieces for the stage was prodigious! yet none of them were condemned or neglected for want of merit in the music, but words, of which the doctor was too frequently guilty of being the author. Upon the whole, though this composer, who died March 5th, 1778, had formed a new style of his own, there did not appear that fertility of ideas, original grandeur of thought, or those resources upon all occasions, which are discoverable in the works of his predecessor Purcell, both for the church and stage;

yet, in secular music, he must be allowed to have surpassed him in ease, grace, and variety; which is no inconsiderable praise, when it is remembered, that from the death of Purcell to that of Arne, a period of more than fourscore years, no candidate for musical fame among our countrymen had appeared, who was equally admired by the nation at large.

Of near a hundred and fifty musical pieces that were brought on the stage at the two theatres, from the time of his composing *Rosamond*, to his decease, a period of little more than forty years, thirty of them, at least, were set by Arne.

ARNE, MICHAEL, the natural son of Dr. Arne, was brought at an early age on the stage by his aunt Mrs. Cibber, who took great pains in qualifying him for the part of the page in the *Orphan*, and his father also tried to make him a singer; but he was naturally idle, and not very quick. However, he acquired a powerful hand on the harpsichord, and played with neatness and precision some of Scariatti's most difficult lessons. It is recorded with reluctance as a beacon, that his moral character was less deserving of praise than his professional. Always in debt, and often in prison, he sung his first wife to death and starved the second, leaving her in absolute beggary.

ARNE, in *Ancient Geography*, a town of Asia, in Mesopotamia.—Also, a town of the territory of the Erastinians, in the vicinity of Thrace.—Also, a fountain of Peloponnesus, in Arcadia.

ARNE, in *Geography*, a river of Switzerland, descends from the lofty Alps in the vicinity of Mt. Blanc, and forms a junction with the Rhone about a quarter of a league from Geneva; and the two rivers run together for more than half a league before their waters are blended: the stream is broad, and on one side is the brown and muddy Arne, while on the other are distinctly seen the clear, blue, and untainted waters of the Rhone. This river, or rather torrent, is subject to sudden and considerable swellings; and its waters have flowed back on the bed of the river, and in their reverted course turned the mills that are constructed on its banks. The waters of the Arne, when it has deposited the slime with which it is charged, is of the purest quality. Saussure, *Voy. des Alpes*, tom. i. § 13, &c.

ARNEBURG, a small town of Germany, in the circle of Upper Saxony, and old mark of Brandenburg, seated on the Elbe. The principal subsistence of its inhabitants is derived from navigation and traffic in corn, and also in agriculture. From the town of Arneburg are denominated a circle and provincial riding. It is 50 miles west of Berlin. N. lat. 52° 45'. E. long. 11° 59'.

ARNEDO, a sea-port town of Peru, with a good harbour, in the Pacific ocean, 23 miles north of Lima. S. lat. 11° 38'. W. long. 76° 54'.

ARNEE, a town of Hindostan, in the Carnatic, 14 miles S. of Arcot, and 52 N. W. of Pondicherry.

ARNEE, in *Zoology*, a quadruped of the Bos or Ox tribe, a native of India, and which appears to have been first described by Mr. Kerr, in his work on the Animal Kingdom. To Gmelin it was very probably unknown. In the *General Zoology* by Dr. Shaw it is specifically described in these terms: *Bos Arnee*. B. *Cornibus erectis lunatis supra planiusculis rugosis*.—Ox with upright lunated horns, flat and wrinkled on their upper surface. The latter writer observes that this Indian species is known chiefly from its vast horns, which are sometimes seen in museums; and from Indian paintings, in which it is occasionally represented.

In the work of Mr. Kerr, it is said to have been met with by a British officer, in the woods above Bengal; and to have been fourteen feet high, measuring from the hoofs to the top of the horns. It partakes of the form of the horse, the bull, and the deer; and is represented as a bold and daring animal. The figure of this species in the work of

Mr. Kerr, is copied from an Indian painting, and the same figure is again introduced into Dr. Shaw's Zoology. The animal is of a black colour, quite smooth, and without either protuberance or mane.

ARNEMUDEN. See ARMUYDEN.

ARNEN, or ARNEM, in *Geography*, a town of Switzerland, in the Valais, thirty-five miles east of Sion.

ARNESEIO, a town of Italy, in the kingdom of Naples, and country of Bari, seven miles W. S. W. of Andria.

ARNE-SYSSSEL, a district of Iceland, in which is situated the episcopal see of Skaalholt.

ARNEVEL, a town of France, in the department of Sarre; and chief place of a canton, in the district of Sarrebrued. The place contains 502, and the canton 8514 inhabitants: the territory includes 31 communes.

ARNFELS, a town of Germany, in the duchy of Stiria, ten miles south-east of Landspurg.

ARNGITZES, a town of Walachia, forty-two miles S. S. E. of Hermanstadt.

ARNHAUSEN, a town of Germany, in the circle of Upper Saxony and duchy of Pomerania, twenty-four miles east of New Stettin.

ARNHEIM, or ARNEM, *Arnoldi-villa* or *Arenacum*, a large, strong, and populous town of the United Netherlands, the capital of Arnhem or the Veluwe quarter of Guelderland, lies on the north side of the Rhine, at the foot of the Veluwe hills, near the place where the Yssel and the Rhine separate their streams. The streets are regular, the houses well built, the walls are delightfully planted with elm and lime trees, and the town is the usual winter residence of many families, who spend the summer on their estates in the Veluwe, where they enjoy a much more salubrious air than that of the maritime provinces of Holland. The church of St. Walburg is a fine edifice; and that of Eusebius has an excellent chime of bells. Arnheim is fortified with a rampart of earth, paved with brick, and washed on one side by the Rhine, and on the other by a deep fosse, dug by Drusus Nero. This city was founded before the time of Tacitus, who mentions it under the name of Arenacum; and it was fortified and invested with the privileges of a city by Otho III. duke of Guelderland, A. D. 1233. It is thirty miles east of Utrecht, and forty-five south-east of Amsterdam. N. lat. 52° 2'. E. long. 5° 54'.

ARNIBERG, a mountain of Switzerland, in the district of Engelberg.

ARNICA, in *Botany*. Lin. g. 958. Schreb. 1296. Juss. 182. Gært. t. 173. Class. *syngenesia polygamia superflua*. Nat. Ord. *Compositæ discoideæ*. *Corymbifera*. Juss. Gen. Char. *Calyx*, common, shorter than the ray of the corolla; leaflets lanceolate, the length of the calyx, erect. *Cor.* compound, radiate; corollules hermaphrodite in the disk, very numerous; females in the ray about twenty; proper of the hermaphrodite, tubular, erect, five-cleft, equal; female lanceolate, very long, three-toothed, spreading. *Stam.* to the hermaphrodites, filaments very short; anther cylindrical; to the females, filaments subulate, erect; anthers none. *Pist.* germen oblong; style simple, the length of the stamens; stigma biind. *Per.* none; calyx unchanged. *Seeds*, solitary, oblong; down simple, in the hermaphrodites pubescent, long. *Rec.* naked. *Olf.* Corollules of the disk often trifid, with the outer division twice as broad as the others.

Eff. Gen. Char. *Rec.* naked; down simple; corollules of the ray have five filaments, without anthers.

Species, 1. *A. montana*, mountain arnica. Gært. fr. 2. 451. Flor. Dan. t. 63. Woodv. Med. Bot. t. 10. "Leaves ovate, entire, stem-leaves twin, opposite:" the root is woody; stem above a foot high, and not more than half this height in alpine situations, simple, obscurely angular; flowers two

inches in diameter, of a deep yellow, and placed on upright terminal peduncles; calyx cylindrical, composed of rough hairy scales; ligulate florets about fourteen, three-toothed, striated, twice as long as the calyx, hairy at the base; seeds oblong, blackish, hairy, crowned with a straw-coloured down. A native of most parts of the continent of Europe, and of Siberia, flowering in July; cultivated by Miller in 1759. 2. *A. piloselloides*, mouse-ear arnica; "leaves perfectly entire, elliptic, villose; scape one-flowered, woolly; calyx equalling the ray:" the stem and leaves covered with down; leaves two or three inches long, and about half this breadth, hairy, especially on the back, pointed; scape twice as long as the leaves, very woolly towards the top; flower large; calyx tomentose, of the length of the ray; florets of the ray very narrow, of a dark red or purple colour, and male. A native of the Cape of Good Hope. 3. *A. scorpioides*, alternate-leaved arnica. Jacq. Flor. Austr. 4. t. 349. "leaves alternate, toothed." The roots are contorted, and thus supposed to have some resemblance to a scorpion; stems several, from six inches to a foot in height, terminated by a deep yellow flower, of two inches diameter; root-leaves roundish or oval, deeply ferrate, on long foot-stalks; stem-leaves few, nearly sessile, viscid, soft, shaggy. The whole plant has a disagreeable smell. A native of Switzerland, Savoy, Dauphiné, &c. Cultivated by Miller in 1759. 4. *A. doronicum*, Jacq. Flor. Austr. 1. t. 92. A clusii allion. ped. A. siriaca. Villars Dauph. 210. "leaves alternate, subserrate, oblong, rough." The leaves are hairy; stem from four to eight inches high, and never bears more than one flower. A native of the high Alps of the Grisons, Dauphiné, Piedmont, and Austria. 5. *A. maritima*, sea arnica. Aster, helenium maritimum, &c. Gmel. lib. ii. p. 175. "leaves lanceolate, the lower ones ferrate; stem leafy, many flowered." A native of Kamtschatka and North America. 6. *A. crocea*, saffron-flowered arnica; "leaves ovate; repand toothletted, tomentose underneath;" scape one-flowered, with a few linear bractes; root-leaves oval, often heart-shaped, rigid, petioled; florets of the ray furnished with stamens. A native of the Cape of Good Hope. 7. *A. ciliata*, ciliate-leaved arnica; "leaves stem-clasping, ovate, toothed, ciliate, smooth; stem simple, one-flowered." The stem is erect, a foot high, angular, hispid, with white bristles; leaves alternate, lower attenuated at the base, obovate, gash-toothed, ciliate; upper roundish, scarcely toothed, smaller ciliate; flower terminating, red, the size of a small pear. A native of Japan. 8. *A. japonica*, japonese arnica. Thunb. j. 319. "Leaves gash-palmated, toothletted; flowers terminal, sub-binate:" the stem is hollow, round, striated, erect, more than a foot high; leaves petioled, alternate, smooth, lobes gash-pinnatifid, toothed; petioles of the lower leaves long, of the branches broad; stem-clasping, striated, short; flowers peduncled, red, few. A native of Japan. 9. *A. palmata*, palmate-leaved arnica. Thunb. l. c. "Leaves gash-palmated, toothed; flowers panicled:" the stem is two feet high, streaked, erect, smooth; leaves alternate, petioled; lobes of the lower leaves unequal, toothed, the upper undivided, ferrate; flowers terminating, small, yellow. A native of Japan. 10. *A. gerbera*. "Leaves pinnatifid; lobes rounded:" the lobes of the leaves are imbricated backwards, and, when young, tomentose underneath; the scape is surrounded with very slender leaves, and supports one large flower, with a dark purple disk, and a yellow ray, purple underneath. A native of the Cape of Good Hope. 11. *A. coronopifolia*. "Leaves pinnate; divisions linear." This very much resembles the *gerbera*, and is also a native of the Cape. 12. *A. opzrina*. Forst. Austr. n. 299. "Shrubby; leaves lanceolate, callous-crenate, tomentose beneath; peduncles one-flowered, solitary, terminating, scaly." A native of New Zealand.

Medicinal Properties. The only species supposed to possess

these in any considerable degree is the *arnica montana*, the virtues of which have been not extravagantly extolled in Germany. It was first recommended as peculiarly efficacious in bruises, and hence obtained the appellation of *panacea lapporum*; and to this resolvent power its utility in various diseases has been ascribed, particularly in pulmonary complaints, suppressio mensium, hepatic obstructions, &c. Of its use in paralytic and other affections of a similar nature, many testimonials are adduced: nor have its good effects been less praised in rheumatism and dropsy; but it is the extraordinary febrifuge and antiseptic powers of the arnica which have been peculiarly celebrated by Dr. Collin of Vienna. With the flowers of this plant made into an electuary with honey, he informs us, that he cured more than one thousand patients labouring under the different species of intermittent fevers, in the Pazman hospital, from December 1771 to July 1774, and with the watery extract of the flowers he cured thirty quotidians, forty-six tertians, and fifty-eight quartans. In putrid fevers the Doctor employed an infusion of the flowers, with which many hundreds of patients were snatched from the very jaws of death. There are some cases, however, in which the Doctor recommends the roots in preference to the flowers, believing the former to possess more cordial, tonic, and antiseptic qualities; he therefore prescribes it where putridity and debility are more prevalent than fever. It was also found very efficacious in a malignant dysentery, in which he adduces many hundred instances of its successful employment, confirmed by the practice of Dr. Dietl. In thirteen cases of gangrenes, this medicine proved its antiseptic virtue in a still more evident manner. The Doctor gave nine drams of the powder of the flowers of arnica, mixed with a sufficient quantity of honey, in the course of forty-eight hours. Of the infusion in the proportion of one ounce of the flowers to a quart of water, two ounces every two hours. When he employed the root, it was in double this proportion. At first this plant is apt to occasion vomiting or uneasiness at the stomach, so that it is necessary to begin with small doses. See Woodv. Med. Bot. vol. i.

Propagation and Culture. 1, 2, 3, 4, 5, the European species, are hardy, and require a moist situation. They may be propagated by parting the roots in autumn when the stalks begin to decay, or by the seeds sown in autumn soon after they are ripe, for those sown in the spring often fail; but if the seeds are permitted to scatter, the plants will often come up of themselves, and require no other care than keeping them clean from weeds. The other species must be kept in pots under a frame, or in a dry stove. They may be increased by seeds, cuttings, or parting the roots, and must be treated as other plants from the Cape of Good Hope. See Martyn's Miller's Dict.

ARNICA. See DORONICUM.

ARNICÆ, in *Entomology*, a species of STAPHYLINUS, found on the *Arnica*, and described by Scopoli. It is black, the thorax and antennæ ferruginous; legs testaceous. Inhabits Europe.

ARNICÆ is also a species of MUSCA that inhabits Europe, and is said to be found chiefly on the disk of radiate flowers, and especially on that of *Arnica montana*. It is described by Linnæus in his *Fauna Suecica*; and by Scopoli. The wings are hooked, grey, and spotted with black.

ARNIS, in *Geography*, a small island of Denmark, in the duchy of Sleswick, in the gulf of Schely.

ARNISÆUS, HENINGUS, in *Biography*, a celebrated philosopher and physician, born at Halberstadt in Lower Saxony, taught medicine at Helmstadt the beginning of the seventeenth century, where he acquired such reputation that he was invited to Denmark, and made physician and counsellor (archiater) to the king. In 1610, he published "Ob-

servationes aliquot Anatomicæ," in 4to. In dissecting a woman who died the sixth day after being delivered of her first child, he saw, he says, the ossa pubis separated from each other, and the ossa ilia from the sacrum, and hence accounts for the greater difficulty with which women part with their first, than with their subsequent children: "quia articulatio tum primum solvitur." Later observations have however shewn us, that this separation of the bones of the pelvis is of very rare occurrence, and when it does happen to any considerable degree, occasions incurable lameness. The following year he published, "De partus humani legitimis terminis." This he fixes at the end of the ninth, or the beginning of the tenth month, though he admits a certain latitude, that is, that as the fœtus may be perfect and fit for exclusion some weeks earlier, so it may sometimes be detained in the uterus beyond that period.

He wrote also several political works, which are still esteemed. His book "De autoritate principum in populum semper inviolabili," was printed in 1612; and his "Reflectiones politicæ," in 1715. To this work he intended making additions, which were never completed. He was industrious in his endeavours to acquire information, and for this purpose travelled over France and England. Haller. Bib. Chir. Gen. Dict.

ARNISSA, in *Ancient Geography*, a town of Greece, in Macedonia.

ARNO, anciently *Arnus*, a river of Italy, rises in the Apennine mountains, in the duchy of Tuscany; passes by Florence, divides Pisa into two parts, and enters the Mediterranean, in the gulph of Genoa, twelve miles north of Leghorn, and four below Pisa, to which it is navigable for small vessels. It receives in its course the Sieva, the Pesa, and the Elfa.

ARNO is also a river of Abyssinia, which falls below Emfras, into the lake Tzana.

ARNOBIUS of Africa, in *Biography*, a Christian divine, flourished about the beginning of the fourth century, and taught rhetoric, in the reign of Dioclesian, at Sicca in Africa, with great reputation. At this time, he was a blind and zealous idolater; but he afterwards became a convert to Christianity, and a distinguished advocate in its defence. The manner of his conversion is thus related by Jerom in his chronicle, at the twentieth year of Constantine, or the year of Christ 326. "Arnobius, a rhetorician, is famous in Africa; who, while he taught the youth rhetoric at Sicca, and was yet a heathen, was admonished in his dreams to embrace Christianity. But when he applied to the bishop of the place for baptism, he rejected him, because he had been wont to oppose the Christian doctrine. Whereupon he composed an excellent work against his old religion, and thus at length, as by hostages of his piety, he obtained the seal of the covenant." Dr. Lardner questions the genuineness of this passage; and he alleges, that Arnobius himself doth not any where ascribe his conversion to dreams; that Jerom does not elsewhere mention or even hint at this circumstance; that in Jerom's catalogue, Arnobius is said to have flourished in the time of Dioclesian; and that Arnobius says of himself, that he wrote 300 years, more or less, since the rise of Christianity, and about 1050 years since the foundation of Rome, or according to the common computation, in the year of our Lord 297 or 298. Besides, it is improbable, that Arnobius, if he wrote his work when he was a catechumen, as Jerom in the above cited passage intimates, should speak of himself as a Christian, which he does, and that a catechumen should undertake the defence of a religion, of which he was at the same time learning the rudiments. Upon the whole, we may conclude, with Cave and others, that Arnobius became a convert to Christianity in the time of the Dioclesian persecution, and in consequence

of observing the fortitude with which the Christians endured their sufferings.

Arnobius's work "*Adversus Gentes*," or "*Against the Gentiles*," was probably written some time after the commencement of Diocletian's persecution, about the year 305 or 306; for he speaks in it of the afflictions endured by the Christians, as if they were actually suffering at the time of his writing. This work, which consists of seven books, is a valuable defence of Christianity. It shews that he was acquainted with the Jewish scriptures, and with the books of the New Testament; though he did not think fit to quote them expressly in writing against the Gentiles. It evinces the learning and piety of the author; and though it contains a mixture of Pagan errors with Christian doctrines, and though some passages are obscure, and the style, which is strong and nervous, is harsh and unpolished, it may be read with pleasure and advantage. It is much to the honour of this rhetorician, who possessed a very considerable share of the learning of Greece and Rome, that he embraced the Christian religion in a state of persecution, and that he employed his talents in its defence. His summary of the Christian religion is as follows: "We Christians are men that worship the great Lord of the universe, according to the direction of Jesus Christ. If you examine it, you will find nothing else in this religion: this is the sum of the whole affair: this is the scope and design of all our religious offices: to this supreme Lord we all bow down; him we worship with united prayers; to him we present holy, and innocent, and honourable requests, fit to be heard by him." The arguments, by which he proves the truth and divine original of Christianity, are deduced from its excellence; from the amiable and perfect character of its author; from the miracles of our Lord himself and those of his disciples; from the great effect of the Christian religion in softening the tempers and amending the manners of its votaries, and sowing the seeds and principles of benevolence, peace, and friendship among mankind, and in rescuing them from idolatry and a false worship; from the extensive progress and influence of the Christian doctrine, inasmuch that there were then Christians, in all countries, as Syria, Persia, Scythia, Africa, Spain, Gaul, &c.; from its having been embraced under the greatest difficulties and discouragements by men of all ranks, as by orators, grammarians, rhetoricians, lawyers, physicians, philosophers, and the greatest wits, as well as by men of low condition and inferior attainments; from the absurdity of supposing that so many people should on a sudden, without any good reason, change their former opinions and customs, and forsake the religion of their ancestors, and thus expose themselves to singular danger and severe suffering; and from the character and situation of the first witnesses of Christianity, who had no interest to induce them to falsify, and who, by withholding their testimony, might have avoided many sufferings, and lived quietly and comfortably among their neighbours: so that they must have been fully persuaded of the truth of the things which they related. By such solid and convincing arguments did this Christian rhetorician and apologist vindicate the truth of our holy religion more than 1500 years ago. He has likewise examined and well refuted some of the principal objections against Christianity. To the Christian religion he bears this honourable testimony: "It trusts to its own evidence, and stands firm upon its own foundations, whether any man embrace it, or not." Of the time and manner of Arnobius's death we have no account. Among his disciples we may reckon the learned Lactantius. His treatise "*Adversus Gentes*," was first printed at Rome, in fol. in 1542; at Basil, in 1546 and 1560; at Paris, in 1580; at Antwerp, with Canter's notes, in 1582, 8vo.; at Cologne, in 1604; at Leyden, with various notes, in 1651, 4to.; and

at the end of Cyprian's works, at Paris, in 1666. *Lactantius's Works*, vol. iv. p. 1—22. *Cave Hist. Lit. t. i. p. 161.* *Fabr. Bib. Lat. l. iv. c. 3. t. ii. p. 289.*

ARNOBIUS the Younger, or of Gaul, a Christian divine, lived about the year 461, and published brief Commentaries upon the 150 Psalms. He took part with the Pelagians in the disputes on predestination, against the followers of Augustine. His work was dedicated to Leontius, bishop of Arles, and Ruficius, bishop of Narbonne; and printed at Basil, in 1522; by Erasmus, at Cologne, in 1532; and by Laurentius de Barré, at Paris, in 1609; and in the *Bibl. Patrum* of Paris and Leyden. *Fabr. Bib. Lat. t. ii. p. 292.*

ARNODI, in *Antiquity*, the same with RHAPSODI. The word is compounded of *αρνος*, a lamb, which was their usual reward; and *ωδν*, song or singing.

ARNOLD of Brescia, in *Biography*, an Italian monk, was a native of Brescia, but in his youth travelled to France, where he became a disciple of Abelard, and probably imbibed some of his notions concerning the Trinity and the Sacraments, that were repugnant to the orthodox creed. On his return to Italy, he assumed the monastic habit, and taught some doctrines that were deemed heretical. His heresy, however, was chiefly of a political kind. Having perceived the discords and animosities, the calamities and disorders, that sprung from the overgrown opulence of the pontiffs and bishops, he was persuaded that the interest of the church and the happiness of nations in general required, that the clergy should be divested of all their worldly possessions, and of all their temporal rights and prerogatives. He, therefore, maintained publicly, that the treasures and revenues of popes, bishops, and monasteries, ought to be solemnly resigned and transferred to the supreme rulers of each state; and that nothing was to be left to the ministers of the gospel but a spiritual authority, and a subsistence drawn from tithes, and from the voluntary oblations and contributions of the people. This doctrine was eagerly embraced by the laity; and it was recommended by the extensive erudition, irreproachable character, singular authority, and vehement zeal of the proposer. Arnold was honoured as a patriot, and the inhabitants of the diocese of Brescia revolted against their bishop. The church was alarmed, and the reforming monk and his doctrine were condemned in the council of Lateran, A. D. 1139, by Innocent II. Arnold fled from persecution to Switzerland, and found an asylum at Zurich, where his doctrine was at first received with applause; but at length he was obliged to leave Switzerland, and after the death of Innocent II. in 1151, he returned to Italy, and set up the standard of ecclesiastical reform and of civil freedom at Rome. His bold harangues on the inalienable rights of men and Christians, roused the populace, and produced tumults and seditions, which terminated in the emancipation of the inferior clergy from the despotic yoke of the cardinals, and in a change of the civil government of the city. Arnold, in fact, possessed the chief power in Rome during ten years, while the Popes "either trembled in the Vatican, or wandered as exiles in the adjacent cities." On the accession of Adrian IV., Arnold and his followers were driven from Rome, and found protection at Otricoli in Tuscany. After the coronation of Frederic Barbarossa, pope Adrian preferred complaints to the emperor against Arnold; and he was seized by cardinal Gerard, brought to Rome, and condemned by the prefect of the city to suffer death. Accordingly, in 1155, he was burnt alive; or, as Mosheim says, crucified, and afterwards burnt; and his ashes were thrown into the Tiber, lest the people should worship them as sacred relics. Arnold was undoubtedly of an impetuous and turbulent spirit, and his proceedings were imprudent and violent: but one of his

biographers has not truly observed, "that he lived in an age which provoked reform." "With his atheism," says Gibbon, "his sect was dispersed," though "his memory still lived in the minds of the Romans." But Mosheim says, that "this violent reformer, in whose character and manners there were several things worthy of esteem, drew after him a great number of disciples, who derived from him the denomination of *Arnoldists*; and, in succeeding times, discovered the spirit and intrepidity of their leader, as often as any favourable opportunities of reforming the church were offered to their zeal." Mosheim's *Ecl. Hist.* vol. iii. p. 119. Gibbon's *Hist.* vol. xii. p. 291, &c.

ARNOLD, NICHOLAS, was born at Lesna in Poland, in 1618; and after having studied in several universities, and visited England in 1644, was chosen professor of divinity at Franeker in Friesland, in 1652; which post he occupied till his death in 1680. He is the author of several tracts against the Socinians; particularly, "A Refutation of the Catechism of the Socinians;" "A Commentary on the Epistle to the Hebrews;" and "Lux in Tenebris," printed at Leipzig in 1698, 8vo., and explaining passages adduced by the Socinians in favour of their system. *Gen. Dict.*

ARNOLD, GODFREY, a German divine, and celebrated ecclesiastical historian, was born at Annaberg, in the mountains of Misnia in Saxony, in 1666, and studied in the university of Wittenberg, where he acquired reputation by his personal conduct and literary improvement. In 1697, he was appointed professor of history at Gießen, but disapproving of the forms of admission required in the German universities, he resigned his office, and in 1698 retired to Quedlinburg. In 1700, he removed to Alstedt, where he became chaplain to the duchess dowager of Eisenach. Being obliged to leave this city, in 1705, he was invited to Brandenburg by the king of Prussia, and preferred to the office of pastor of the church of Werben; and in 1707, his Prussian majesty appointed him pastor and inspector of the churches of Perleberg, and afterwards historiographer to that court. Here he died in 1714. He was considered as the patriarch of a sect of German mystics, called "Pietists." Besides many other works, he wrote in German, "A History of the Church, and of Heresies;" "Historia Ecclesiastica et Hæretica," printed at Leipzig in 1700, 8vo. which incurred the reproach of his being a defender of heretics; and in Latin, "The History of Mystic Theology." The rigid Lutherans have treated him with peculiar severity; and Mosheim represents his history, "as the production of a violent spirit, and dictated by a vehement antipathy against the doctrines and institutions of the Lutheran church;" he acknowledges, however, that "he became at last a lover of truth, and a pattern of moderation." *Gen. Dict.* Mosheim's *Ecl. Hist.* vol. v. p. 325.

ARNOLD of *Hildesheim*, an historian of the thirteenth century, flourished under the emperors Philip and Otho IV. His "Continuation of the Chronicles of the Slavonians by Helmoldus," is chiefly valuable in its relation to Slavonia. It was published at Lubeck in 1659; and by Meibomius in the "Opuscula Historica," printed at Helmstadt in 1660. Dupin.

ARNOLD of *Villanova*. See ARNAUD.

ARNOLD, SAMUEL, Mus. D. an eminent musical composer, received his musical education at the Chapel Royal, St. James's, partly under Mr. Gates, and partly under his successor, Dr. Nares. He manifested early indications of those talents by the cultivation and exercise of which he acquired celebrity in the science to which he was devoted; and his application, as well as subsequent attainments, fully justified the expectations which were formed concerning him both by his parents and preceptors. It is hardly necessary to mention that little lively air, "If 'tis joy to wound a lover,"

which first excited popular attention, as it was soon succeeded by various compositions of a superior kind, which evinced the genius and taste, and established the professional reputation, of Mr. Arnold. About the year 1760, Mr. Beard, one of the managers of Covent Garden theatre, duly apprized of his extraordinary merit, introduced him to the notice of the public, as composer to that house; and in the year 1776, he was engaged by Mr. George Colman, to conduct the musical department at the theatre in the Haymarket. The chief musical pieces that were produced for many years at this theatre, were composed by Mr. Arnold. Having in early life enjoyed the benefit of Handel's direction and superintendance, and having derived from this sublime composer, a taste for sacred music, he diverted his attention from those lighter pieces in which he had gained reputation, to the composition of oratorios; and his performances of this kind served to augment the fame which he had already acquired. In the year 1767, he made choice of the "Cure of Saul," written by the late Rev. Dr. Brown, for the subject of his first effort in the higher style of musical composition. Such was his success, that this production is generally allowed to be the best of its kind since the time of Handel. It was generously presented by the author to the society instituted for decayed musicians and their families; and to that society it proved a very valuable acquisition. The approbation of the public encouraged Dr. Arnold to proceed; and the "Cure of Saul" was soon followed by the oratorios of "Abimelech, the Resurrection," and the "Prodigal Son;" which were performed during several successive Lenten at the theatre-royal in the Haymarket, and Covent-garden theatre, under his own management and direction. About the time of his composing the "Resurrection," he published in score, four sets of Vauxhall songs, most of which are singularly sweet in their melodies, and display in their accompaniments a thorough acquaintance with the characters and powers of the various instruments. Of all his oratorios, says an anonymous writer, the "Prodigal Son" reflects the greatest honour on his talents and judgment. So high, indeed, was the fame of this sacred drama, that in 1773 it was performed with his permission, at the instigation of the late lord North, as chancellor of the university of Oxford. In consequence of his ready compliance with the request made to him for this purpose, he was offered an honorary degree in the theatre, but he preferred obtaining it in the academical mode; and, agreeably to the statutes of the university, he received it in the school-room; where he performed, as an exercise, "Hughes's poem on the power of Music." On this occasion it is customary for the musical professor of the university to examine the exercise of the candidate; but Dr. Hayes, then professor of Oxford, returned Mr. Arnold's score unopened, saying to him, "Sir, it is quite unnecessary to scrutinize the exercise of the author of the Prodigal Son." In 1771, Mr. Arnold married a lady of good family and fortune; and about the same year he purchased "Marybone gardens," which were then a much frequented scene of gaiety and fashion. Here he provided for the entertainment of the public, several excellent burlettas, which were very favourably received.

On the death of the late Dr. Nares, in 1783, Dr. Arnold was appointed his successor as organist and composer to his majesty's chapel at St. James's; and at the grand performances of the commemoration of Handel, in Westminster abbey, the first of which took place in 1784, he was one of the subdirectors, and presented with a medal, which his majesty permitted the subdirectors always to wear, as a testimony of his approbation of their conduct on that occasion. In 1786, Dr. Arnold projected the plan of publishing

lishing an uniform edition of all the works of Handel; and he proceeded as far as the 118th number, enriching his edition with beautiful engravings. He also published, about the same time, four volumes of cathedral music, intended as a continuation of Dr. Boyce's well-known work; three of the volumes are in score for the voices, and one for the organ. In 1789, the Academy of Ancient Music chose Dr. Arnold for the director and manager of this institution; and he conducted it with honour to himself, and with satisfaction to the academicians and subscribers. In 1796, he succeeded Dr. Hayes, as conductor of the annual performances at St. Paul's for the feast of the fons of the clergy; and in this situation he uniformly maintained his distinguished character as a musical professor. Dr. Arnold closed his life, after a gradual decay, in the sixty-third year of his age, on the 22d of October, 1802; and his remains were interred, with every mark of respect, in Westminster abbey. He had five children, of whom two daughters and one son survived him. His son, Mr. Samuel Arnold, is the author of several musical dramas, which have been well received, and of a novel, entitled, "The Creole;" and he is now making rapid progress in the profession of a portrait painter.

Of the abilities of Dr. Arnold as a musical composer, it is needless to add any thing by way of eulogium; the public approbation has anticipated the tribute of applause which the biographer might be disposed to pay to his memory. His oratorios are not unworthy of the disciple of so great a master as Handel; and such was the versatility of his talents, that he not only acquitted himself with high credit in those solemn and august subjects which relate to our religious duties, but in those tender, playful, and humorous compositions which belong to the belt of our public amusements. The "Maid of the Mill," the "Agreeable Surprise," "Ince and Yarico," the "Surrender of Calais," the "Shipwreck," and "Peeping Tom," will continue to delight as long as a sense of harmony subsists. Arnold's "Shunamite Woman," one of his latest productions, possesses the genius of his earlier compositions, with that additional science which he had derived from study and experience.

It may be further mentioned to the honour of Dr. Arnold's character and memory, that the exercise of his professional talents was not confined either to the amusement of the public, or to his own private emolument. Many charitable institutions have derived great benefit from his voluntary and gratuitous assistance. Besides his professional excellencies, and the general benevolence of his disposition, Dr. Arnold possessed many qualities which entitled him to the esteem of those who knew him. "His genius and science," says an anonymous writer, who seems to have known him well, and to have justly appreciated his merit, "procured him a numerous circle of friends, and his social and amiable disposition constantly preserved them. His conversation was pleasant and unaffected; his heart was framed to feel for the distress of others; and his friendship was zealous and sincere."

ARNOLDSGRUN, in *Geography*, a town of Germany, in the circle of Upper Saxony, 4 miles east of Oelsnitz.

ARNOLDSTEIN, or ARLSTEIN, a town of Germany, in Carinthia, 7 miles S.W. of Willach.

ARNON, in *Ancient Geography*, a river, or rather torrent of Palestine, had its source among the mountains of Gilead, in Arabia, traversed the desert, running at first from north to south, and then from east to west, and discharged itself into the lake Asphaltites, or the Dead Sea. By its course it divided the Amorites from the Moabites. This river gave name to a canton of Palestine, situate along its banks, on the other side of Jordan.

ARNON, in *Geography*, a river of France, which runs into the Cher, near Vierzon.

ARNOSERIS, in *Botany*. See LAPSANA.

ARNOSORA, in *Geography*, a town of Italy, in the kingdom of Naples, and province of Principato Citra, 12 miles S.E. of Salerno.

ARNOTA, a town of Wallachia, 18 miles west of Kimmick.

ARNOTTA, in *Botany*, a name given by the peasants of Burgundy, and many other places, to certain roots which they frequently turn up, from five or six inches depth, in plowing the ground. They carefully collect these, and eat them, after roasting in the ashes, or otherwise; by which sort of cooking they acquire the taste of a chestnut, and are found to be a very wholesome and nourishing food. They are blackish on the outside, and white within, and are of the size of a small walnut. They are common in the north of Scotland, and called *arnots*. See BUNIUM.

ARNOTTO. See BIXA.

ARNOYA, in *Geography*, a river of Spain, which runs into the Minho, near Rivadavia, in Galicia.

ARNSBURGH, a town of Germany, in the circle of Upper Saxony, and country of Schwartzburgh Rudolstadt, 3 miles S. E. of Sonderhausen.

ARNSBURG, is also a town of Germany, in the circle and county of Solms-Braunfels, 3 miles N.E. of Muntzenberg, and 6 S.S.E. of Gießen.

ARNSFELD, a town of Germany, in the circle of Upper Saxony, and country of Erzgebirg, 5 miles south of Wolkenstein.

ARNSHAUG, a town of Germany, in the circle of Upper Saxony and district of Neustadt, 1 mile south of Neustadt.

ARNSHEIM, a town of Germany, in the circle of the Lower Rhine, and palatinate of the Rhine, 20 miles N.W. of Worms, and 14 S.W. of Mentz.

ARNSTADT, a town of Germany, in the circle of Upper Saxony, and country of Schwartzburg, on the Gera, 12 miles south of Erfurt. N. lat. 50° 40'. E. long. 11° 3'.

ARNSTEIN, a town of Germany, in Thuringia, and county of Mansfeld, between Mansfeld and Quedlinburg.

ARNSTORF, a town of Germany, in the archduchy of Austria, 6 miles west of Maultern.

ARNTSEE, a town of Germany, in the circle of Upper Saxony, and old mark of Brandenburg, on the side of a deep lake formed by an earthquake in the year 811.

ARNULPH, or ERNULPH, in *Biography*, bishop of Rochester in the reign of Henry I., was born at Beauvais in France, about the year 1040. Having studied at the abbey of Bec, under Lanfranc, archbishop of Canterbury, he came over to England at his solicitation; and passed through the gradations of prior of the monastery of Canterbury, and of abbot of Peterborough, to the see of Rochester. He held this see nine years, and died in 1124, at the age of 84 years. His mind was tinctured in a very considerable degree with the superstition of the age in which he lived. His works are a history of the church of Rochester, known by the title of "Textus Roffensis;" "An epistle on incestuous marriages;" and "An epistle containing answers to divers questions of Lambert, abbot of Munster, especially concerning the body and blood of our Lord." Biog. Brit.

ARNULPHIN, *Arnulphinus*, a coin of the value of a ducat and a half, current in some parts of France in the fifteenth century. Du-Cange.

ARNULPHUS, in *Biography*, an Egyptian by birth, and a magician by profession, lived in the reign of Marcus Antoninus, and deluded the Roman people by his pretended miracles

miracles and incantations. Dion the historian (l. 55.) relates, that in 174, he obtained, by the invocation of Mars and other gods of the air, a shower, which secured to the Roman army the victory in an engagement with the Germans.

ARNWAY, JOHN, a divine of the English church, was born of a good family in Shropshire, in 1601, educated at Oxford, and preferred to the rectories of Hodnot and Ightfield, in his native county, where he was distinguished by his learning and his charity. Upon the breaking out of the civil war, he manifested his loyalty by cloathing soldiers for the king's service, and preaching against rebellion. His zeal in the royal cause exposed him to a variety of misfortunes; his house was plundered, his estate sequestered, and his person imprisoned. After the king's death, he was released from prison, but compelled to leave the kingdom. He continued some time at the Hague; but the penury of his circumstances obliged him to avail himself of an offer to remove to Virginia, where he died in 1653. During his residence at the Hague, he published "The Tablet, or the moderation of Charles I. the martyr;" and "An alarm to the subjects of England."

ARO, in *Geography*, a river of Spain, which runs into the Mediterranean, 2 leagues south from Palamus in Catalonia.

AROANI, in *Ancient Geography*, mountains of Arcadia, north-west of Amilos, inhabited by the Phœnæates.

AROBÉ, by some spelt and pronounced *arrobe*; in Spanish, *arroba*; in the language of Peru, *arrou*: a weight used in Spain, Portugal, Goa, Brazil, and throughout all Spanish America. All these *arobes* are scarcely like each other but in name, being very different in weight, and in their proportion to the weights of other countries. The *arobe* of Madrid, and almost all over Spain, weighs twenty-five Spanish pounds.

AROCELIS, in *Ancient Geography*, a town of Spain, in the county of the Vasconi, north-west of Pompelo.

AROCHA, a river of Italy, in Brutium, the course of which is placed by M. D'Anville from north to south into the gulf of Squilace, between Semirus to the west and Targines to the east.

AROCHE, in *Geography*, a town of Spain, in the province of Andalusia, and country of Seville, on the frontiers of Estremadura, near a chain of mountains to which it gives name, extending along Spanish Estremadura to the frontiers of Portugal, forty-six miles north west of Seville.

AROE, in *Ancient Geography*, a town of Achaia, now called Patras.

AROER, a town of Palestine, on the north bank of the river Arnon, which had belonged to Sihon, king of the Amorites, upon the confines of the country of the Moabites. In the general distribution, it pertained to the tribe of Gad; Numb. xxxii. 34. This was probably the Aruer beyond Jordan, mentioned 1 Sam. xxx. 28. There were other towns of this name, so called from *Arroer* in Hebrew denoting heath, on account of their situation. Reland (t. i. p. 583.) thinks there was a city of this name near Rabbah of the Ammonites, otherwise called Philadelphia, and that it is the Aruer referred to in Josh. xiii. 25. Judg. iii. 33.

AROKHAGE, in *Geography*, the capital city of a country in Asia, to which it gives name, corresponding to the ancient Arachosia, and lying about 100 miles to the south of Candahar. N. lat. 31° 28'. E. lon. 65° 29'.

AROLEC, the name of a weight, in use in some parts of America, and in quantity equal to twenty-five pounds of our weight.

AROLSEN, in *Geography*, a town of Germany, in the circle of the Upper Rhine, and county of Waldeck, near

the river Aar, twenty-nine miles S. S. E. of Paderborne, and thirty-eight W. S. W. of Gottingen. N. lat. 51° 15'. E. lon. 8° 36'.

AROMA, in *Modern Chemical Language*, is applied to a certain subtle attenuated principle, in which the smell of all odoriferous bodies is supposed peculiarly to reside.

The term aroma has superseded that of *spiritus rector*, used by the older chemists down to the time of the modern alterations in chemical nomenclature; but the latter appellation has had a more extended sense; of which, as a part of chemical history, it may be proper to say a few words.

The ancient chemists, who united in a rare degree the opposite qualities of ardent imagination and patient inquiry, supposed that in every animal or vegetable there is a certain *aura*, or spirit peculiar to that single body, and so subtle as only to be perceived by the senses of smell and taste, or by particular effects upon the nervous system of the animal body. This *aura* then exhibits the proper character of that body, and from its great penetrability, exquisite subtlety, and extraordinary volatility, it was termed the *spiritus rector*, or presiding spirit.

If we consider the appropriate and often intense odour possessed by the fragrant or the fœtid vegetables, by musk and other animal juices; the *notus odor* whereby living animals distinguish each other, whereby the hound selects his game or recognizes his master; the narcotic aura of opium; and the sickening and often deleterious effluvia of several of the most formidable poisonous vegetables found in tropical regions; and lastly the subtle matter of contagion which is scarcely evident to any sense, and only known by its terrible effects: when all these circumstances are taken in view, we cannot consider it as a very wild conjecture to suppose something peculiar in the nature and essence of odour independent of all other natural bodies.

The ancient chemists, however, have not limited themselves to general conjecture, but have attempted to analyse the properties of this odorous principle, to give it "a local habitation and a name;" and in so doing they have been carried beyond the sober bounds of rational inquiry, and have advanced opinions which have long been consigned to merited oblivion.

We shall not attempt the unprofitable task of unravelling the mysteries of Paracelsus and other chemists of the same standard, in order to pursue this inquiry; but shall avail ourselves of the learning and admirable judgment of the excellent Boerhaave, to select just so much of these opinions as is necessary to shew how the idea of a *spiritus rector*, which is very general in its nature, has come to be confined almost exclusively to the aroma of vegetables. This spirit, as Boerhaave observes, was supposed "to be lodged by the Creator in a tenacious durable matter, not easily to be dispersed either by air, water, or fire, and called *oil*, by whose *lentor* it is as it were inviscated and prevented from flying off and deserting the body for whose direction it was appointed." This oil, however, is more volatile than the common gross oils, and contains the *spiritus rector* in a very sparing quantity.

The idea and name of *essence* and *quintessence* have a similar origin. The ancient chemists conceived that the four elementary substances of fire, air, earth, and water, contributed to the composition of bodies, and to this was added a *fifth essence* (*quinta essentia*) extremely small in quantity, but rich in efficacy, which by its own particular virtue imparted odour, colour, taste, and inherent characteristic qualities.

Having formed this theory, an apposite illustration was requisite,

requisite, and none appeared so much to the purpose as the products obtained by the distillation of some of the aromatic vegetables. The following example which Boerhaave gives is very clear and intelligible: suppose cinnamon "which is an aromatic of a most fragrant smell and pleasant taste; on distilling a pound of this with boiling water, there will arise a milky odorous savoury liquor, to the bottom of which settles a little ruddy fragrant oil, strong of the virtue of the cinnamon, and such the first liquor was. After separating the liquors, let the remaining bark be distilled with a second water, upon this will arise a limpid watery juice of an acid taste, a faint smell, and affording none of the marks of cinnamon, &c." The inference which the author would draw from this is obvious; the *spiritus rectior*, or distinguishing characteristic of the cinnamon, resides in the water and oil, the products of the first distillation; and the remaining substance of the bark consists only of the common vegetable principles, is inert in its nature, inodorous, insipid, and incapable of producing those effects upon the nervous system of living animals which it exhibited before distillation. Again, if the distilled water separated from the oil be exposed to the air, the whole place will smell of cinnamon, and the water will after a while become insipid, and lose all its aromatic virtue, yet without suffering a greater loss of weight than common water would have done under similar circumstances; and also if the fragrant oil be exposed to the air, it will gradually lose its odour, but will remain nearly of the original weight: and from these facts it is inferred, that the *spiritus rectior* is extremely small in quantity, when separated from those substances with which it is naturally combined.

The example of the aromatic vegetables corresponding so well in these important particulars with the theory of a peculiar aroma or essential spirit, we ought not to be surprised to find the opinion of Paracelsus and the older chemists, divested of its mysticism and extravagance, supported by such respectable authorities as Boerhaave, Macquer, Beaumé, and many other excellent chemists; and the processes for obtaining the *spiritus rectior* have long formed a regular part of the practice of chemistry.

As the extraction of the aroma of vegetables makes an interesting branch of vegetable chemistry, we shall give the process and the remarks of the celebrated Beaumé, whose long experience as a pharmaceutical chemist entitles him to the highest attention.

"To prepare the *spiritus rectior* of thyme, take any quantity of this plant fresh gathered and flowering, put it in an alembic, and moisten it with a very small quantity of water (which addition however is not requisite where a succulent plant is employed). Distil with a water bath in a very gentle heat, not equal to that of boiling water, and a perfectly clear odorous water will arise. When about half an ounce of this liquor to the proportion of a pound of the plant has distilled over, stop the operation, and this liquor is the *spiritus rectior* of thyme. If however the process be continued till the plants be perfectly dry, a larger quantity of liquor comes over, and this is called *essential water of thyme*.

In like manner may be prepared the *spiritus rectior* of all other aromatic or acrid plants. This preparation is not used however in medicine, probably from being too expensive, and from not differing very materially in properties from the distilled essential water, which is yielded in much larger quantities, and prepared by the addition of more water to the plants before distillation.

If the liquid *spiritus rectior* be kept even in well closed bottles, it becomes mouldy and viscid in a year or two, but

the same effect takes place much more rapidly when exposed to the air.

The quantity of aroma furnished by the several odorous plants differs greatly: those that have a high and penetrating scent, but yield little essential oil in distillation, such as the tuberose, jasmine, jonquil, &c. are said to give the greatest proportion of *spiritus rectior*, but in so volatile a state that it cannot be procured in union with water in the usual way. The intermede of alcohol or fixed oil, is required in this case.

If the aroma be considered as a separate principle, there can be no plea for denying its production when the pungent acrid vegetables are submitted to distillation. Thus, mustard-seed, distilled with the precautions above mentioned, yields an intensely pungent aqueous liquid, in which the sensible qualities of mustard are certainly very much condensed, and it would be called by the older chemists the *spiritus rectior* of mustard.

We shall treat more fully of these processes under the articles *Distilled Waters of Pharmacy*, *Distilled Spirits*, and *Oil Essential*.

Even the inodorous plants, such as lettuce or borragé, when distilled with care by a very gentle heat, may be made to yield a liquor in which an odour peculiar to each plant may be selected, and this may be termed the aroma of these vegetables.

By the process of *cobobation*, or re-distilling the first liquor over fresh materials, the aroma appears to be condensed in a much smaller bulk of watery menstruum, and at the same time the liquor becomes supersaturated with the aromatic essential oil of the plant. This is shewn in a striking manner in the preparation of that exquisite oriental perfume, the *Attar of Roses*. That most speedily fatal of all known poisons, the *LAUREL Water*, is another example of the same; the aroma of the laurel has a sudden and violent operation on the nervous system of living animals; now if laurel leaves are distilled in a gentle heat with a small quantity of water, the first product is a clear liquor holding all the aroma in solution, smelling powerfully of the plant, and possessed of a poisonous quality, whilst the remaining leaves are insipid and inert; but if the same liquor be again distilled with fresh leaves, it receives all the aroma of this second quantity, becomes proportionably stronger, and acts with more energy on the living body; and thus by repeating the process, so much of the aroma is condensed into a small bulk of water, that the peculiar qualities of laurel may be exhibited in the most striking manner, unincumbered with the common vegetable materials of which the leaf itself is composed.

The extraction of the aroma of plants is the basis of the art of perfumery, an art in which there is much room for the exercise of skill and ingenuity, and to the senses at least it is one of the most agreeable branches of technical chemistry. We have mentioned that the aroma of some exquisitely scented flowers, such as the tuberose, jasmine, or honey-suckle, though most potent to the senses, is of so extremely volatile a nature that it cannot be prepared by common distillation with water; and if it does reside in an essential oil, the quantity of that oil is so minute as not to be extracted in the usual processes. The perfumers have therefore adopted a very ingenious method of fixing the aroma in expressed oils without the assistance of any but the gentlest heat. The oil which is used is either oil of ben or the purest olive oil, both of which are entirely scentless. The process is the following: the flowers whose aroma is to be extracted, the jasmine flowers for example, are thickly spread upon flakes of wool, previously soaked

in the fixed oil, then are inclosed in tin boxes, and suffered to remain till the flowers begin to decay and lose their texture and colour. They are then removed, fresh flowers are added, and the maceration repeated till the fixed oil becomes richly impregnated with the jasmine scent. The wool is then pressed, and the fragrant oil separated from the flowers is put in closely-stopped bottles, and sold under the name of *essence* of jasmine, or whatever other flower was employed. Care is taken during the operation to pick the flowers carefully. These essences therefore consist of a fixed oil saturated with the aroma of the plant, and if these essences are digested in pure alcohol, the oil remains insoluble in this liquid, but yields to it the aroma; and thus the scent alone is transferred to the spirit. By this method a spirituous water is prepared for the toilette, scented with these delicate and exquisite perfumes.

The chemical nature of aroma may be considered as still unknown to us; that is to say, we are still ignorant whether the powerful scent of a plant resides in some substance of so delicate a nature as to have eluded our research, or whether it is only an inherent quality in some known part of the plant (and if this is the case, probably it is the essential oil), which by being volatilized in the air is able to reach our olfactory organs.

Most chemical writers have brought the instance of the inflammable gas, which, in sultry evenings, is often found to hover round the fraxinella when in full blow, as an example of aroma in the purest form in which it is ever procured. This would certainly be an interesting subject for chemical examination, if we could flatter ourselves that the means which chemistry affords were at all equal to the task; but what chemist could yet flatter himself with the hopes of discovering the nature and composition of scented air, or finding a means of separating the odorous principle of the syringa that sickens with its fragrance, from the breeze that conveys it to his senses; or of distinguishing by chemical tests the inconceivably minute portion of the aroma of musk that loads with its oppressive scent an extensive chamber, from the dreadfully active effluvia which spreads disease and pestilence?

The most powerful argument in favour of the peculiar nature of aroma distinct from that of essential oil, seems to be the circumstance which we have just mentioned, namely, that the quantity of aroma emitted by several of the most fragrant flowers, and which is indicated by the extent of atmosphere saturated as it were with perfume, is not in the least degree commensurate with the quantity of essential oil which any process of art can extract from them. We shall forbear, however, to enter further into this inquiry, but as we may surely infer from the examples of effluvia, of galvanism, and of contagion, that the organs of sensation in the living animal are more delicate analyzers than the tests and re-agents of the chemists, they certainly ought to be considered as at least equally conclusive.

A very few words will be sufficient on the subject of the different species of aroma which have been supposed to be detected by various chemists. So many of the parts and products of living vegetables are in a certain degree volatile in an atmosphere of moderate warmth, that the aroma which is equally volatile may readily combine with all or any of them. The gas of the fraxinella has been already mentioned as one example of gaseous aroma; the pungent vapour of the cruciform plants has been found by late experiments to contain sulphurated hydrogen, which probably afflicts the volatilization of the aroma, and furnishes another example of the gaseous. The watery aromas and the essential or oily aromas are almost indistinguishably intermixed in

the products of the distillation of plants, in the old methods of obtaining the spiritus rector which have been already described. All the pure essential oils also contain aroma as a characteristic ingredient, though the intensity of this principle varies not only in different oils, but in the same species at different seasons; and, as we have mentioned, is almost entirely lost by long exposure to the air; but whether this change takes place by an actual loss of the aromatic principle, or by some internal chemical change, has not yet been ascertained. Lastly, various odorous plants yield an aromatic liquor which is slightly acid; the nature of this acid is not sufficiently known, but it has been suspected to be similar to the benzoic. Some further notice will be taken of this subject under the other articles belonging to vegetable matter, and that of *VEGETABLE ANALYSIS*.

Aroma is by some particularly applied to denote myrrh.

AROMA Germanicum, is a denomination given by Platerus to elecampane. Some writers give the title *aroma Germanicum* to juniper berries, on account of the great effect they are in among that people, for their spicy, warm qualities; in which respect they are by many preferred to ginger itself. *Aroma philosphorum* is used by some for saffron. Others give the appellation of *aroma philosphorum* to Paracelsus's aropl.

AROMATA, in *Ancient Geography*, a mountain of Asia Minor, in Lydia. Strabo.

AROMATA, Gardesau, a promontory and town of Ethiopia. It was, according to Ptolemy, the most eastern point of Africa. Here terminates the kingdom of Adel and the Barbaria of the Periplus; and here the coast of Ajam or Azaria commences.

AROMATIC, AROMATICUS, is understood of a drug, plant, or the like, which yields a brisk fragrant smell, and a warm spicy taste.

The word is formed of *αρωμα*, which is compounded of *αρι*, *very*, and *οδμη* or *οσμα*, *smell*.

AROMATIC Plants, in *Gardening*, are such as possess a fragrant aromatic flavour, combined with a strong odoriferous smell in many of the kinds. Many of these plants are proper to the kitchen-garden, being employed as savoury sweet herbs for various culinary purposes; and some of them are likewise employed for medicinal and domestic uses. The principal sorts necessary to be cultivated in the garden, as aromatics, are the following, being species of several different genera. They consist, according to the authors of the General Dictionary of Gardening, of under-shrubby and herbaceous perennials of many years duration, and of annuals and biennials of only one or two years continuance, which of course require to be raised every year or two from seed.

These are of the first kind: *thymus*, or thyme; *salvia*, or sage; *faturega*, or winter favory; *origanum*, or pot marjoram; *origanum*, or winter sweet marjoram; *hyssopus*, or hyssop; *ruta*, or rue; *rosmarinus*, or rosemary; *lavendula*, or lavender. The above have abiding tops, and continue furnished with leaves, in most cases, all the year round. But the following are herbaceous, and renew their stalks, and some of the other parts, every Spring and summer: *mentha*, or mint; *mentha*, or penny-royal; *melissa*, or baum; *anethum*, or fennel; *tanacetum*, or tansy; *artemisia*, or tarragon; *anthemis*, or chamomile; *mentha*, or peppermint; *ligusticum*, or lovage.

These are of the latter kind: *origanum*, or sweet marjoram; *fatureja*, or summer favory; *scandix*, or chervil; *anethum*, or dill; *calendula*, or marygold; *ocimum*, or basil; *apium*, or parsley; biennial, *carum*, or caraway; *pimpinella*, or anise; *angelica*, angelica, biennial-perennial.

Among the perennial kinds, the principal culinary or pot-herb

pot-herb aromatics are thyme, sage, winter savory, marjoram, mint, penny-royal, tansey, tarragon, and fennel. The others are not used as kitchen or culinary aromatics, but mostly for domestic occasions, as hyssop, balm, chamomile flowers, lovage, rue, and rosemary. And for simple medicinal purposes in a family; the peppermint for distilling; also the lovage and penny-royal occasionally for the same purpose; and the lavender for its flowers, both to distil for lavender water, and to lay among clothes to give them a sweet and agreeable scent; some sorts of sage, common mint, and balm, are also used occasionally by way of tea; and young green mint and tarragon often in fallads. But among the annual and biennial aromatics, the sweet marjoram, summer savory, chervil, dill, marigold, basil, parsley, and coriander, are the principal sorts to cultivate for culinary uses, &c. The caraway and anise are cultivated in some instances for seeds, both to use in the kitchen, and for distilling; also sometimes the coriander seed, but more generally the two former; and the angelica, principally for the young tender shoots of its stalks which are used in confectionary, to candy as a vegetable sweetmeat, and the seeds for medicine; some of these annual aromatics are also in some cases used to give flavour to fallads, as chervil, coriander, basil, &c.; the young leaves being used in small quantities to mix with some principal fallad herbs. See the description of each under its respective genus.

All of them, except the basil, are mostly of hardy growth, so as to succeed in any common soil and situation. The perennial sorts continue several years in the same plants, among which some are durable, both in root and top, and remain green for use all the year, as thyme, sage, winter-savory, marjoram, hyssop, rue, rosemary, &c.: the others are perennial only in root, and annual in stalk, as the mints, penny-royal, tansey, tarragon, fennel, chamomile, &c. and furnish their respective produce for use only in the spring, summer, and autumn.

All the perennial aromatics are easily raised, either by slips, off-sets, parting the roots, or by seed, and may be planted in spring, summer, or autumn, in beds or borders at from six to ten or twelve inches asunder; but the annual and biennial kinds, continuing in the former only one season, and in the latter only till the second year, must be raised every year or two, from seed in the spring, in any compartment of common earth in the open ground, except the basil, which being tender, must be raised in hot-beds, in order to be transplanted in May or June; most of the others generally remain where sown in the natural ground, but may be occasionally transplanted, the sweet marjoram and summer-savory in June, &c. and likewise the angelica, as being of large growth, in summer. As some of these only afford their useful parts at particular seasons, as mint, balm, penny-royal, tarragon, sweet marjoram, &c., they should be cut and preserved at such times for winter use, as about July and August. But for the marigold, chamomile flowers, and those of lavender, as well as sage-tops, marjoram, hyssop, and such like, which often stand the winter, autumn may be better, as they will then be ready in case of a severe winter. Parsley generally furnishes proper supplies of green leaves all the year; basil and dill only in summer; chervil and coriander, principally in summer and autumn, of the spring and summer sowings; or if some of each be also sown in August, they will continue green all winter, but the coriander will require a little protection in that season; and the caraway, anise, and angelica continue only in summer and autumn.

In regard to the general culture of these plants, the perennial sorts being planted in beds or borders, continue there,

as has been observed, several years, and only require to be kept clean from weeds in the summer and autumn, and to be cut down and the decayed stalks removed at the latter season; and in spring to give the beds, &c. a neat dressing by clearing off all weeds and litter, and then loosening the ground a little between the plants; and in some close running kinds, as mint, &c. to spread some earth thinly over the general surface; and when any particular sorts appear in a declining state, to make a fresh plantation in the proper season: as to the annual sorts, they only require to be kept clear from weeds during their growth and continuance, and that fresh supplies be raised every year from seed.

AROMATICUS CALAMUS. See CALAMUS.

AROMATICS, in Pharmacy. The Materia Medica contains a number of vegetable substances which possess a fragrant penetrating smell, a strong pungent taste, and a considerable stimulating power on the system in general. These are called *aromatics*, and their characteristic properties appear to depend chiefly, if not entirely, on an essential oil, which, when extracted from the vegetable, exhibits all its aromatic power in a very concentrated form.

The aromatic property is found in combination with a variety of other vegetable principles, many of which modify its effects on the constitution. The simple operation of the aromatic principle appears to be stimulant in a considerable degree; but the effect of several of the essential oils differs so entirely from that produced by common stimulants, that we cannot include these substances under a single class without very great limitation.

As the class of *aromatici* is distinguished entirely by certain properties of smell and taste, in each of these circumstances it approaches by insensible gradations upon the limits of other classes.

The aromatic or fragrant smell of nutmeg, peppermint, or rosemary, would be denied by none; but the strongly odorous or graveolent scent of wormwood or rue would be classed by many organs with the fetid; the odorous principle, however, in each of these substances appears to reside in the essential oil. In taste, likewise, the aromatic, when powerful, proceeds to the acid, and all the essential aromatic oils, when uncombined, produce very acrid, and sometimes even caustic or corrosive effects on the tongue, so as to destroy the surface of the part which they touch, even by a very short application. The vegetables, or parts of vegetables, that contain the aromatic principle, are chiefly the following.

1. *The Spices*, those exquisite productions of the tropical regions, which, besides being highly useful in medicine, form the most grateful condiments for the table. The power of habit in accustoming the constitution to excessive quantities of the hottest stimulants, and to substances that produce powerful local effects, is in few instances more striking than in the manner in which these valuable vegetable productions are employed by the inhabitants of the countries to which they are indigenous. In many of the spice-bearing plants various parts of the same vegetable are richly impregnated with the aromatic principle, as in the instance of the mace and nutmeg, productions of the same plant, or the leaves and bark of the cinnamon.

2. *The aromatic barks and woods*, such as the canella, orange peel, sassafras, and many trees of the fir tribe. In many of these the aromatic is combined with the astringent and the bitter principles, and this union is often of singular

service in the formidable bowel complaints so common in tropical climates.

3. *The fragrant herbaceous plants*, such as the lavender, mint, thyme, &c. Among this very extensive class of aromatic vegetables are included all the fragrant pot-herbs employed for culinary purposes in climates not blessed with the spices that require a burning sun. From this class also are procured several of the perfumes and other agreeable scents for the toilette.

4. *The resinous aromatics*, such as the Mecca balsam, myrrh, capivi balsam, frankincense, Cnio turpentine, and many others. The strong smelling resins and balsams, when submitted to distillation, yield a very large quantity of essential oil in which their characteristic properties of smell and taste reside, whilst the residue is hard, brittle, almost without odour, and insipid. The graveolent and foetid gums have the same character.

The aromatics are used very largely in pharmacy in a great number of forms and combinations, both on account of their proper stimulating cordial properties, and as powerful auxiliaries in a variety of instances. Their strong and agreeable smell and taste render them peculiarly proper for concealing and correcting those of the more nauseous and unpalatable medicines. As the essential oil to which the aromatics appear to owe their properties is soluble largely in spirit of wine, and partially in water, they are very conveniently employed under the forms of *Distilled SPIRITS* and *Distilled WATERS*.

AROMATICA, in *Ornithology*, the Gmelinian name of the species of COLUMBA, or pigeon, called by Brisson, *Columba viridis Amboinensis*; le pigeon verd d'Amboine, by Buffon; and aromatic pigeon, by Latham; from the latter of which Gmelin adopts the name *aromatica*. It is, as the synonyms imply, a native of the island of Amboyna; and is about ten inches and a half in length, or the size of the common turtle. The general colour is olive-green; back bay or chestnut; on the wing a double bar of black, edged with pale yellow; quill feathers black, with yellowish margins. Gmel. &c. The bill of this bird is greenish; the upper part of the head is grey, darkest behind; the sides, throat, neck, breast, belly, rump, upper tail coverts, and tail, olive-green, but inclining to yellow on the neck and breast; the under parts of the tail black at the base, and dirty white at the end; the under tail coverts dirty yellowish white; wing coverts, like the back, chestnut; and the legs and claws either grey or red; for Dr. Latham describes them of a grey colour, and in Les Planches elumines of Buffon, they are painted red.

AROMAZ, in *Geography*, a town of France, in the department of Jura, and chief place of a canton in the district of Orgelet, fourteen miles south of Orgelet.

ARON, PETER, in *Biography*, a voluminous writer of music in the sixteenth century, was a native of Florence, of the order of Jerusalem, and a canon of Rimini. He appears to have studied music as a profession under the patronage of Leo X., in whose pontificate he was admitted into the papal chapel at Rome. His most considerable work, in which there is little that is new, was intitled, "Toiscanello della Musica," and first printed at Venice in 1523, and with additions in 1539. This is divided into two books: the first containing a penagyric on music, an account of its inventors, definitions of terms, &c.; the second, an impartial account of the genera of the ancients, a decalogue or ten precepts concerning counterpoint, an explanation of proper terms, and directions for dividing the monochord, upon the principles of Guido Aretino. Burney's Hist. of Mus. vol. iii.

ARON, in *Geography*, a town of Persia, in the province of Irak, two leagues from Caehan.

ARONA, a small town of Italy, in the Milanese, belonging to Piedmont; seated on the side of a hill, near the west coast of lake Maggiore, the environs of which are exceedingly fertile, and supply wines that are much valued. Above it rises a ruined castle: two promontories project into the lake at this spot; the eastern is crowned with the castle of Anghiera, and gives name to this valuable province, which, in 1397, was erected into a county by the emperor Wenceslaus, and has since been transferred to the king of Sardinia. In doubling the promontory of Arona, the lake again enlarges, and forms a bay.

ARONABABAD, a town of Persia, in the province of Irak, twenty leagues south of Ispahan.

ARONCHES, a town of Portugal, in the province of Alentejo, walled and defended by a castle, and containing about 600 inhabitants; 95 miles east of Lisbon. N. lat. 38° 58'. W. long. 6° 14'.

ARONDE, a river of France, which runs into the Oise, opposite to Compeigne.

ARONDE, in *Fortification*. See DOVE-TAIL, and QUEUE d'Aronde.

ARONDELLE, and HARONDELLE, in *Ornithology*, the French synonymous names of the STERNA tribe; terns or sea-swallowers of English writers. See STERNA. The term *Aronde* is also applied in a general manner to the species of TRIGLA described by Linnæus under the name of *volitans*. This is one of the flying-fishes of our naturalists; and in the classification of Natural History by Lacépède, forms a new genus, which he called *Dactyloptere*. See TRIGLA *Volitans*.

ARONIA, in *Botany*. See ORONTIUM.

ARO *Orchis*. See GALENGAL.

AROO, in *Geography*, a town of the Russian empire, in the Ukraine, on the river Oca, eighty leagues north of Moscow. N. lat. 51° 48'. E. long. 38° 13'.

AROOSI, a territory of Abyssinia, being the southernmost division of Maitsha, on the west side of the Nile, inhabited by the Abyssinians, a kindred of the Agow. It is bounded on the north by the river Kelti, and on the south by the Assar; the Aroossi running through the middle of that district. This little territory is described by Bruce (vol. iii. p. 560), as by far the most pleasant which he had seen in Abyssinia, and perhaps, he says, it is equal to any thing which the east can produce. The whole is finely shaded with the acacia vera, or Egyptian thorn, that yields the Gum Arabic, which seldom rises above fifteen or sixteen feet high, and then spreads wide at the top, so that the branches of different trees touch each other, and under a vertical sun afford a cool, delicious shade. Below these trees the ground is chiefly covered with lupines; and wild oats grow up spontaneously to a prodigious height and size, and have, when ripe, the appearance of canes. The inhabitants make no use of the grain, though the taste of the meal, when made into cakes, is very good. The soil of this country is a fine black mould, like that of our gardens. Aroossi is finely watered with small streams.

AROPH, a term used by Paracelsus, to denote a medicine endued with a power of breaking or dissolving the stone in the human body. In which sense, *aroph* amounts to the same with *litontripctic*. Van Helmont assures us, that he was possessed of the *aroph*; and from his account, it seems to have been a preparation of saffron and rye-bread, digested with spirit of wine, in a horse-dung heat, and at length distilled. Vide Cnoeffel. in Ephem. Acad. N. C. dec. 1. an. 4. obs. 109.

AROPH

AROPH *Paracelsi*, is also a name given to a kind of chemical flowers, elegantly prepared by sublimation, from equal quantities of *lapis hematitis* and *sul ammoniac*; said to be of great efficacy in quartan agues, the *plica polonica*, and hypochondriac diseases. This is also called *aroma phisophoruna*.

AROPH is also used to denote **MANDRAGORA**.

AROSBAY, in *Geography*, a town of the East Indies, on the coast of the island of Madura, near Java. S. lat. 9° 30'. E. long. 114° 30'.

AROSIA, *Western*. See **WISTEROS**.

AROSIA, *Eastern*, or *Ostra Aros*, the ancient name of Upsala.

AROSIS, a river of Persia, which bounded Persia on the west, and separated that province from Susiana.

AROUANS, one of the islands which are near the mouth of the river of the Amazons in South America.

AROU-HARISI, in *Zoology*, according to Thüvenot, the name of the Rhinoceros in the East Indies.

AROUKORTEKEN, in *Geography*, a country of Tartary, near the great wall of China.

AROURA, a Grecian measure, of fifty feet.

AROURA was more frequently used for a square measure, the half of the plethron. The Egyptian *aroura* was the square of a hundred cubits. *Arbuth. tab. 9.*

AROW, ISLANDS OF, in *Geography*, a cluster of small islands in the Indian ocean, situate north-east of Timorland, and nearly south of the coast of New Guinea. South lat. from 5° to 7°. E. long. 137°.

AROY, a river of South America, flowing from the lake Cassipe in the province of Paria, and discharging itself into a river of this name.

ARPAD, **ARADUS**, or *Rouwadde*, in *Ancient Geography*, an island situate on the coast of Syria. See **ARADUS** and **ROUWADDE**.

ARPAGIUS, or rather **HARPAGIUS**, formed from ἀρπαζει, *rapiō*, I snatch, in some ancient inscriptions, signifies a person who died in the cradle, at least in early youth. The Romans made no funerals for their arpagii.—They neither burnt their bodies, nor made tombs, monuments, or epitaphs for them, which occasioned Juvenal to say,

“ —Terra clauditur infans,
Et minor igne rogi.”

In after-times it became the custom to burn such as had lived to the age of forty days, and had cut any teeth; though these they also called ἀρπακτοι, or ἀρπαγμανοι, q. d. *rapti, ravisibet*. The usage seems to have been borrowed from the Greeks; among whom, Eustathius assures us, it was the custom never to bury their children either by night or full day, but at the first appearance of the morning; and that they did not call their departure by the name of death, but by a softer appellation, ἡμερα ἀρπαγη; importing that they were ravished by Aurora, or taken away to her embraces.

ARPAIA, in *Geography*, a town or village of Italy, in the kingdom of Naples; and Principato Ultra, six miles west-south-west of Benevento; supposed to be the ancient *Caudium*.

ARPAION, or **ARPAJOU**, a town of France, in the department of the Seine and Oise, and chief place of a canton, in the district of Corbeil; 16 miles south of Paris. The place contains 2,093, and the canton 13,826 inhabitants: the territory includes 147½ kilometres and 19 communes.

ARPA-SOU, a river of Persia, between Erivan and Tauris.

ARPEGGIO, **ARPEGGIATURA**, in *Music*, is playing the sounds of a chord in a rapid manner upwards and downwards, after each other, instead of striking them together. In doing this on keyed instruments, the fingers of each hand

must be kept on to preserve each sound, till its turn comes for the key to be struck again. The word arpeggio is derived from *Arpa*, the harp; upon which instrument the sounds of a chord are usually struck in succession, by beginning at the lowest. There are as many kinds of arpeggio as sounds in a chord, or changes in their succession. The violin family having but four strings, and the viol family six, can only arpeggio four or six sounds; and from the convexity of the bridges of these instruments, there is no other way of playing chords with a bow, but in arpeggio.

The abbé Feyton says very truly, that the harmonies arising from a single string or sound, when first discovered, gave birth to arpeggio; or perhaps long before that, it was suggested by the section of the canon, or division of the monochord. The musical reader will find the examples of several kinds of arpeggio in the *Music Plates*.

ARPENBURG, in *Geography*, a town of Germany, in the circle of Upper Saxony, and old mark of Brandenburg, nine miles south of Saltzwedel.

ARPENT. See **ACRE**.

ARPHAXAD, in *Scripture History*, the third son of Shem, and father of Salah, was born in the second year after the flood, A. M. 1658, and died A. M. 2096, aged 438 years. Gen. xi. 12. &c. He was distinguished above the rest of his brethren, by having the patriarchal line continued through him. Arphaxad is placed by some in Arrapachitis, a province of Syria, towards the north part of the country; but others fix him, with his family, in Chaldæa, where we find his descendants till the time of Abraham. Some, who consider as one and the same person Arphaxad and Cainan, who is inserted between him and Salah in the Septuagint version, suppose him to be the founder of the monarchy of China. Some Mahometan authors make Arphaxad both a prophet and an apostle, and lodge the chief sovereignty over the nations of the world in his descendants.

ARPI, in *Ancient Geography*, a town of Italy, in Apulia, between Luceria and Sipontum. It was anciently called *Argos Hippium*, and afterwards Argyrippa, the capital of a kingdom founded by Diomedes after the siege of Troy; in the time of Livy it was large and populous, and furnished Hannibal with 3000 armed men. It is now in ruins, about fourteen miles west of Manfredonia, in the province of Capitanata, and kingdom of Naples.

ARPII, a people placed by Ptolemy in Lower Mysia. They inhabited the coast at the northern mouth of the Ister, at the entrance of the Bosphorus. Their capital was called **ARPIIS**.

ARPINAS, **JOSEPH CÆSAR D'**, in *Biography*, commonly called *Josquin*, a famous painter, was born at the castle of Arpinas in Naples, in 1560. After receiving some instruction from his father, who was an artist, he was sent, at the age of thirteen, to Rome, where he waited upon the painters in the Vatican, and at intervals sketched figures on the pilasters, which astonished the other artists. Under the patronage of Gregory XIII. he enjoyed the means of further improvement, by being employed first in the ornaments of the Vatican, and afterwards in history painting; and his bold and free manner was much admired. At Naples he painted the cupola of the Chartreux; and returning to Rome in 1560, he began to paint the great hall of the capitol in fresco. Clement VIII. distinguished him by his protection, and made him a knight of the order of Christ; and in a journey to France with cardinal Aldobrandini, in 1600, he was created knight of the order of St. Michael, by Henry IV. Arpinas, notwithstanding the honours that were conferred upon him, was of a discontented and querulous temper; and fell out both with Caravaggio his rival, and with Anibal Caraccio.

Carachio. He declined a duel with the former, because he was not a knight; and wishing to measure swords with the latter, Carachio presented his pencil, and said to him, "With this I defy you." He died at Rome, at the advanced age of eighty years. Notwithstanding the fire and elevation which distinguished some of his compositions, his colouring was cold, and his attitudes stiff and forced, so that his name now scarcely exists, in the list of great artists. Although his school was much frequented, he seems to have left no eminent disciples. His best performances are the pieces of Roman history in the capitol; and one of his capital works is his "Battle between the Romans and the Sabines." Arpinus also engraved in aqua fortis. *Nouv. Dict. Hist.*

ARPINO, in *Geography*, a town of Italy, in the kingdom of Naples, and country of Lavora, ten miles north of Casano. This was the ancient *Arpinum*, situate to the left of the river Liris, and south of Sora, and famous for being the birth-place of C. Marius and Cicero, two citizens, who, as Pompey said in a public speech, each in his turn preserved Rome from ruin. It was a city of the Samnites, which, upon its submission to Rome, acquired the freedom of the city, and was inserted into the Cornelian tribe. The territory of Arpinum was rude and mountainous, and Cicero (*Ad Attic. ii. 11.*) applies to it Homer's description of Ithaca, *Odyss. ix. 27*:

— τῆρχ' ἀλλ' ἀγαθὴ κρηταίφος, &c.

" 'Tis rough indeed, yet breeds a generous race."

Cicero's family seat was about three miles from the town, in a situation extremely pleasant, and well adapted to the nature of the climate. It was surrounded with groves and shady walks, leading from the house to a river, called *Fibrenus*, which was divided into two equal streams, by a little island, covered with trees, and a portico, contrived both for study and exercise, whither Cicero used to retire, when he had any particular work on his hands. "The clearness and rapidity of the stream, murmuring through a rocky channel; the shade and verdure of its banks, planted with tall poplars; the remarkable coldness of the water; and above all, its falling into a cascade into the nobler river Liris, a little below the island," give us the idea of a most beautiful scene, as Cicero himself has described it. The house, Cicero says, was small and humble in his grandfather's time, according to the ancient frugality, like the Sabine farm of old Curius; but his father beautified and enlarged it into a spacious and handsome habitation. It is now possessed by a convent of monks, and called "the villa of St. Dominic." The villa of Marius was about twelve miles distant from Arpino; and on the spot now stands the only convent of the austere order of La Trappe in Italy. Its present name is "Casa Mari."

ARPIS. See **ARPII**.

ARPONIUM, in *Ancient Geography*, a town of Italy, in Magna Græcia, which, as Diodorus Siculus informs us, was pillaged by the Brutians, during the war of the slaves.

ARQUA, or **ARQUATO**, in *Geography*, a village of Italy, in the P. duan territory, about three miles from Bataglia, famous for having been the residence and burial-place of Petrarch. N. lat. 45° 43'. E. long. 11° 43'. There are two other places of this name; one in the March of Ancona, on the frontiers of Abruzzo, and another in the duchy of Milan, situate on the Scrivia.

ARQUE, a town of France, in the department of the Straits of Calais, and chief place of a canton in the district of St. Omer, half a league south-east of St. Omer.

ARQUEBUSADE WATER. See **AQUA Vulneraria**.

ARQUEBUSS. See **HARQUEBUSS**.

ARQUENON, in *Geography*, a river of France, which passes by Jugon, in the department of the north coasts, and

runs into the English channel about 13 miles north of that town.

ARQUES, a town of France, in the department of the Lower Seine, and chief place of a canton, in the district of Dieppe, one league south-east of Dieppe. It is seated on a river of the same name, which runs into the English channel near Dieppe.

ARQUES is also a town of France, in the department of the Aude, and chief place of a canton, in the district of Limoux, three leagues south-east of Limoux. The place contains 488 and the canton 5743 inhabitants: the territory includes 275 kilometres and 10 communes.

ARRA, in *Ancient Geography*, now called *Maara*, a town of Asia, in Syria, which was formerly large and well-peopled, but is now reduced to a small place under the government of Aleppo; the territory of which is very fertile in grain and good fruit.

ARRA-BIDA, in *Geography*, a high mountain of Portugal, in Alentejo, on the frontiers of Algarva, forming part of the Sierra or mountain of Calderaon, and seeming to be a branch or continuation of the Spanish chain to the north of Madrid, called by some the mountains of Idubeda, which enters Portugal near the town of Guarda, and pursues its former course to the south-west. It is chiefly calcareous, and affords beautiful marble.

ARRACAN, **ARACAN**, or **ARRAKAN**, a maritime country of the vast peninsula which separates the gulf of Bengal from the Chinese sea, borders on the south-east province of British India, is separated on the east from the Birman empire by a range of lofty mountains called Anoupecc, and bounded on the north by Meckley, or the country of the Muggaloos, the Cassy of major Rennell, on the south by the flat lands of Pegu, and on the west by the bay of Bengal. This country is called by the Bengal Hindoos, who have settled in it, *Rossam*, whence, probably, Rennell has derived the name *Rossham* which he has given to it. The Mahometans settled in Arracan call it *Rovingaw*; and by the Persians it is denominated *Rekan*. The proper natives of the country, who use a dialect of the Birmah language, call their country *Yee-Kein*; and by the people of Pegu, the inhabitants are named *Takain*. From Islamabad, N. lat. 22° 20'. E. long. 91° 55'. the coasts of Arracan and Pegu take a south-south-east course to Cape Negrais, the extreme point of Pegu to the south-west, in N. lat. 16° and E. long. 94° 27'. Pennant (*Outlines of the Globe*, vol. iii.) says, that the kingdom of Arracan stretches along the coast to an extent of 200 miles; others make its length above 500 miles, and its breadth from 20 to 200 miles. Its topography, however, is still obscure. According to Symes (*Embassy to Ava*, vol. i. p. 243, &c.), Arracan, or *Yee-Kein*, stretches south-south-east from the river Naff, the boundary that divides it from the territories of the India company, as far as Cape Negrais, where the ancient Pegu empire commenced. The range of lofty mountains called Anoupecc-toumiou, or the great western hilly country, nearly encircles it. From the quarter of Bassien and Negrais, Arracan can only be invaded by water, through the many rivers that intersect the country adjacent to the sea. From the side of Chittagong, entrance into Arracan must be effected by a march along the sea-beach, which is interrupted by several channels, that chiefly owe their waters to the action of the tide. Arracan thus displays a great space of coast, very disproportionate to the internal extent. Cheduba and Ramree, called by the Birmans *Magou Kioun* and *Yamgee Kioun*, are extensive and highly cultivated islands, which, with Arracan and Sandoway, form four distinct provinces, and comprehend the whole of the Arracan empire. The ancient government

government of Arracan has never been so completely conquered as to acknowledge vassalage to a foreign prince. It experienced, however, in the two last centuries, the usual convulsions to which all states, and those of the eastern world in particular, are liable. The Moguls on the west, and the Peguers on the east, had, at different periods, carried their arms into the heart of the country. The Portuguese, sometimes as allies, and at other times as open enemies, gained an establishment in Arracan, which decayed only with the general ruin of their interests in Asia. Arracan, however, though often exhausted, was never wholly consumed; it always rose from its own ashes, a free and independent nation.

In 1783, Mind-ragee, who siled the throne of the Birman empire, subdued the country, and annexed it to the conquests of his father Alompra, consisting of Pegu, and the coast of Siam, as far as the port of Merghi, in N. lat. 12° 20'. In this conquest, the booty most highly valued was an image of Gaudma, the Boodh of the Hindoos, made of burnished brass. There were also five images of Rakufs, the demon of the Hindoos, of the same metal, and of gigantic stature; these were accounted valuable, as they were guardians to the sanctuary of the idol. All the spoils taken at Arracan were of brass, among which was a large gun, thirty feet long, two and a half in diameter at the muzzle, and the calibre ten inches; it was mounted on a low truck carriage, supported by six wheels, and had several shot of hewn stone fitted to the calibre. The surrender of Cheduba, Ramree, and the Broken Isles, followed the conquest of Arracan. Many of the Mughs, or ancient inhabitants of Arracan, so called from being subjects of the Great Mogo, preferred flight to servitude, and took refuge in the Dumbuck hills, on the borders of the province of Chittagong, and in the deep forests and jungles that skirt the frontier, where they formed themselves into independent tribes of robbers, that have since created infinite vexation to the Birmanis, and to this day commit merciless depredations on the persons and property of their conquerors. Many settled in the districts of Dacca and Chittagong, under the protection of the British flag; whilst others accepted the oath of allegiance, and bowed their necks to slavery, rather than abandon their country and their household god, to whom the sectaries of Budhoo are much attached. Arracan, with its dependencies, was afterwards constituted a province of the Birman empire; and a Maywoon, or viceroy, appointed to govern it. The reduction of Arracan was completed in the short space of a few months. The country is fertile, abounding with well-watered meadows and pasture lands; the soil luxuriant; the mountains are green through the year, though in winter, that is from August to October, the weather is for the most part wet and stormy; and the contiguous islands uncommonly fruitful. The population is estimated at between two and three millions. It produces great quantities of rice, cocoa-nuts, bananas, oranges, and many other kinds of excellent fruit. The rice is produced in such abundance, that it might be improved by proper policy into a lucrative branch of commerce. The trade of Arracan has never been very considerable; it is confined to salt, bees' wax, elephants' teeth, and rice. Articles of foreign importation are introduced into other parts of the Birman empire by way of Arracan, and carried over the mountains on the heads of coolies, or labourers: such as European broad-cloth, hard-ware, coarse Bengal muslins, Cossambuzar silk handkerchiefs, china ware, and glass; cocoa-nuts are also brought from the Nicobar islands, and bear a very high price; and merchants carry down silver lace, precious stones, and some other articles, to no great amount. Pos-

session of Arracan and the adjacent islands was a very desirable acquisition to the Birmanis, as it afforded protection to their boats, which, navigating in the north-west monsoon through the channel and along the coast, make an annual voyage from Bassien, Rangoon, and Martaban, to Chittagong and Calcutta, where they dispose of the produce of their countries, and in return bring back cloth and commodities of India. Elephants and buffaloes are very numerous, and are used instead of horses. The forests are infested with tigers. The natives of Arracan do not differ from those of China and Siam, except in their colour, which is somewhat blacker. They are fond of large flat foreheads, and, in order to obtain them, they apply a plate of lead to the foreheads of their children immediately after their birth. They have large open nostrils, small sparkling eyes, and ears so long that they rest upon their shoulders. They eat without disgust mice, rats, serpents, and putrescent fish. Their women are tolerably fair, and their ears equally long with those of the men. Buffon's Nat. Hist. vol. iii. p. 81. See *BIRMAN Empire*.

ARRACAN, the capital of the above country, is seated most singularly in a valley, surrounded with vast and craggy mountains; and these are assisted by art, so as to be made the most substantial fortifications. The entrances are cut through the solid rock, as are also the gates of the city. The precipitous face of the mountains serves for walls; besides which, it has a citadel and other artificial defences. The city is said to be fifteen miles in circumference, and to contain 160,000 inhabitants. The royal palace is very magnificent, and highly adorned and enriched with works of massy gold. Pennant.

ARRACAN is also the name of a river, which divides the above country by several canals, and discharges itself into the bay of Bengal, about fifty miles below the capital. Its banks are bounded by woods and plantations, that are animated, says Pennant, by the gambols of the monkey tribe, or the gay flights of numbers of peacocks. Dr. Buchanan says (Symes's Embassy to Ava, vol. ii. p. 413), that the Arracan river is not so considerable as has been supposed, but takes its rise in hills at no great distance to the north. He adds, that the river coming from Thibet, which is supposed to be that of Arracan, is in fact the Keenduem, or great western branch of the Ava river. Pennant (Outlines of the Globe, vol. iii.) says, that this river is the Tocofannæ of Ptolemy, and that it is faintly traced beyond the capital. A few miles below Tellakee, at the western foot, says Symes (Emb. to Ava, vol. i. p. 244.), the river, till then a streamlet that rises in the hills, becomes navigable from the influx of the sea; in two tides a boat reaches the fort of Arracan. From the fort to the sea, the river expands into a noble sheet of water, well adapted for trade and the reception of shipping.

ARRACHEE, in *Heraldry*, is understood of representations of plants forcibly torn up by the roots, with their roots hanging at them.

In this sense, *arrachee* amounts to the same with what is otherwise called *eradicate*, or *erased*. Nisb. Her.

ARRACIFES, *Cape of*, in *Geography*, is situated on the coast of the Cafres in Africa, about sixty leagues from the Cape of Good Hope.

ARRACIFFE, a port-town of Brazil, in the captainship of Pernambuco, esteemed the strongest in Brazil. The port consists of a suburb, in which are some large houses, and repositories for stores: and it is built upon a narrow passage, with a cattle to defend the entrance. Nevertheless, James Lancaster, with seven English vessels, made himself master of the town and castle in 1595, and obtained immense plunder:

plunder: but since that time the Portuguese have rendered it almost inaccessible to enemies. S. lat. 8° 20'. W. long. 36° 10'.

ARRACK. See ARAC.

ARRACOURT, in *Geog. vly*, a town of France, in the department of the Murte, and chief place of a canton, in the district of Chateau Salins, five miles south of Chateau Salins.

ARRADEZ, a town of Africa, in the kingdom of Tunis, famous for its baths. See RHADES.

ARRADON, a town of France, in the department of Morbihan, and chief place of a canton, in the district of Vannes, three miles south-west of Vannes.

ARRAGON, derived either by corruption from *Taraconenfis*, the name of the Roman province of which it formed a part, or from the little stream called Arragon, which falls from the Pyrenées into the Ebro, is a province of Spain, bounded on the north by the Pyrenean mountains, on the west by Navarre and the two Castiles, on the south by Valencia, and on the east by part of Valencia and Catalonia. Its extent from north to south is about 210 miles, and in breadth about 120. The country is, in general, mountainous, dry and sandy, badly cultivated, and thinly peopled; but it is interspersed with delightful fertile vallies, which are well watered, and produce corn, wine, oil, flax, fruits of different sorts, and some saffron. Arragon breeds a great number of sheep and cattle; its rivers abound with fish, and its forests with game. The mountains are said to have formerly yielded gold, silver, and other metals; but they now afford, probably on account of the indolence of the inhabitants, little besides iron. The principal rivers, besides the Ebro, which traverses the province from north-west to south-east, are the Cinca, anciently Cinga, the Gallego, Isuela, Xalon, and Xiloca. The metropolis is Saragossa; and the other chief towns are Balbastro, Jaca, Huesca, Calatayd, Daroca, and Aleanitz. The principal inhabitants of this country, in ancient times, were the Celtiberians, and they have been always deemed active, hardy, enterprising, courageous, and fond of liberty, but proud and positive, and bigotted in their religion. Marcellus, after a short war, taxed them at 600 talents of gold. When they fell under the dominion of the Goths, they frequently revolted, and made valiant and repeated struggles for the preservation of their liberty. On the irruption of the Moors, these people retired into their inaccessible mountains for the enjoyment of their freedom and independence; and there they erected, for their own security, a form of government, to which they submitted by common consent. Arragon was first erected into a kingdom by Don Sancho the Great, king of Navarre, who died in the year 1035, in favour of his son, Don Ramiro. He was succeeded by his son, Don Sancho Ramirez, who added to his own dominions part of Navarre, and obtained several advantages against the Moors of Saragossa and Huesca; but was at length mortally wounded at the siege of the latter of these places, in 1094. The kingdom devolved on his son, Don Pedro, who, after defeating the Moors in the plain of Alcaraz, took possession of Huesca, A. D. 1096. He was succeeded in the year 1104 by his brother, Don Alfonso, who, by the display of his martial virtues, obtained the surname of "the Warrior." Having reduced Tudela, and obtained a signal victory over the Moors, he laid siege to Saragossa, and compelled it to capitulate, after a long and obstinate defence, A. D. 1118. He dispossessed the Moors of several other strong places, and defeated them in several battles; but in his attempt to reduce Fraga, the capital of a Moorish government, he provoked an engagement, in which he was overpowered with great slaughter; and this defeat affected him so much that

within eight days he died of grief. After his death the monarchies of Arragon and Navarre were separated; and Don Ramiro, brother to the late king, ascended the throne of the former kingdom. But in 1137, after a short reign, he abdicated the government in favour of Don Raymond, count of Barcelona, to whom he married his daughter and heiress, Petronilla. Don Raymond dying in Piedmont, in 1162, was succeeded by his eldest son, Don Alfonso, who enjoyed the sovereignty of Catalonia, in conjunction with the realm of Arragon. Alfonso having, in 1166, confirmed the liberties of the clergy and nobility in an assembly of the states at Saragossa, soon after, viz. in 1168, collected a powerful army, commenced a war with the Moors, and drove them out of all the places which they held in that territory, which is now called Arragon. Alfonso closed a reign, rendered illustrious by many military exploits, at Perpignan, in 1196; and the crown of Arragon devolved on his son, Don Pedro II.; who, in 1203, paid a visit to the pope at Rome, acknowledged himself a vassal to the holy see, and continued to pay an annual tribute of 250 double pistoles. His premature death, in an action with the papal troops before Muret, A. D. 1213, was followed by great confusion and tumult, both in Arragon and Catalonia; but at length his son, Don Jayme, was proclaimed and acknowledged as his successor. This prince, being threatened by the pope with excommunication for his vices, assumed the cross, and actually embarked at Barcelona for the Holy Land, A. D. 1268; but he was driven back by a tempest, and returned to his own dominions. After a defeat by the rebellious Moors of Valencia, he fell sick, resigned the crown, took the habit of a Cistercian monk, and penitently bewailing the ill example he had given to his family and subjects, expired in 1276; upon which the crown descended to his son, Don Pedro III. Pedro, having subdued the Moors of Valencia, and composed the tumults of Catalonia, engaged in an expedition against the isle of Sicily, which he conducted with great spirit and success, and in consequence of which he was, with universal applause, proclaimed king of Sicily. The pope, Martin IV. who took part with his competitor, Charles, excommunicated Don Pedro, and proceeded to give away his kingdom, as a fief of the holy see, to Charles de Valois, son of king Philip the Hardy, and to publish a crusade against the deposed king of Arragon. In 1284, the king of France took the cross, and assembled a very large army in order to seize and secure the possession. During this contest, Don Pedro died, in 1285, and left the crown of Arragon to his son Don Alfonso, and that of Sicily to his second son, Don Jayme. Alfonso, having entered into a treaty for the marriage of princess Eleanor, daughter of Edward I. of England, was suddenly taken ill during the magnificent preparations that were made for this purpose at Barcelona, and died in 1291. His brother, Don Jayme II. succeeded him; and after having conciliated the affection of his subjects by many popular acts, he died much regretted, A. D. 1326. His son and successor, Alfonso IV., pursued the conduct of his father, and closed his life and reign, in the year 1336, much beloved and lamented; and on account of the gentleness of his administration, he was surnamed "The Kind." His son, Don Pedro IV. commenced his reign with all the anxieties of royalty; but protracted it to a very advanced period, and died in the year 1386, with the character of having been in many respects the wisest, and in many more the worst king that ever sat upon the throne; and of having been better obeyed, and much less beloved, than any of his predecessors. He was succeeded by his son, Don Juan, whose death, in 1395, occasioned great confusion in the

the kingdom of Arragon. After the death of his successor, Don Martin, duke of Montalban, there occurred an interregnum, occasioned by disputes about the succession of the crown. The titles of several claimants were examined by nine judges appointed for this purpose; and at length the majority determined in favour of Don Ferdinand of Castile, who was the son of Donna Leonora, the eldest sister of the two last kings; and the rest also acquiesced. Accordingly, he was proclaimed king, A.D. 1412, and in 1413 solemnly crowned at Saragossa. At his death, in 1416, he was succeeded by his son, Don Alonso V., who, in 1443, became sole and absolute master of the kingdom of Naples; and was afterwards esteemed the great arbiter of peace and war through all Italy. He died in 1468, respected as the greatest prince that ever sat upon the throne of Arragon (See ALPHONSO V.). Don Juan II. succeeded to his hereditary dominions; and after a reign of 21 years, Arragon, with its dependent dominions, was united to the crown of CASTILE, A.D. 1479, under his son Don Ferdinand, who confirmed the laws and privileges of the kingdom of Arragon, in Saragossa, Barcelona, and Valencia. *Mod. Un. Hist.* vol. xvii. p. 83—268.

ARRAGONITE, in *Mineralogy*, *Arragon spar*, Kirwan. *Arragonit*, Werner. The colour of this mineral is either greyish, or greenish white, or pale mountain green; in the center it is often of a violet blue, or brownish red. It occurs only crystallized; and its varieties may be referred to the following forms.

1. A perfect equiangular, six-sided prism (*Arragonite prismatique* of Haüy).
2. A six-sided prism, two opposite faces of which are the largest, and correspond with the two sides of a dihedral summit that terminates the prism (*Arragonite cuneolaire* of Haüy).
3. A rounded mass, deeply striated (*Arragonite cylindroïde* of Haüy).

The crystals are small, or of moderate size, often grouped in crosses; their faces are very rarely even and smooth, being generally striated longitudinally, and sometimes concave.

The lustre is vitreous, and varies from little shining to very brilliant.

The fracture is lamellar, but often so indeterminate as to pass into the imperfect conchoidal. The inside of the crystals often presents distinct, minute, wedge-shaped concretions, which give that fibrous appearance by which this mineral is characterized.

It is almost semi-transparent, and possesses a double refraction like calcareous spar; is considerably hard, brittle, easily broken: *sp. gr.* 2.94.

Arragonite is entirely soluble with effervescence in nitrous or muriatic acid. Before the blowpipe, it splits and crackles, and at length is calcined like calcareous spar; when pulverized and sprinkled on a hot coal, it gives out a reddish phosphorescent light.

This mineral was named by the celebrated Werner, because it was first discovered in Spain, on the borders of Arragon and Valencia, where it is imbedded in lamellar and fibrous gypsum; it has since been found in the Pyrenæes, and at Leogang in the country of Salzburg, in a shattery argillaceous rock, or in quartz, accompanied by calcareous spar and pyrites.

The crystals belonging to the first variety, present occasionally a singular kind of composition, being found to contain internally a second prism, the axis of which crosses that of the former nearly at right angles, and is engaged in its very substance in such a manner as to produce no alteration in its external figure. This arrangement appears in the

fracture of the crystal, at the crossings of the striæ; or in a kind of mosaic, representing four triangles united round a common point, upon making a vertical section of the whole prism; of these triangles, two opposite ones are nearly colourless, and the other two are violet.

The repeated analyses of Klaproth, Vauquelin, and Thenard, have discovered nothing in the arragonite but lime and carbonic acid, in the same proportions as calcareous spar; yet the crystalline structure of these two substances is wholly dissimilar. The primitive form of calcareous spar is a rhomboid; the arragonite is divisible only in two directions; the inclination also of the joints in the latter is about 116°, but in the former only 104° 28'; a circumstance worthy of special attention, as it is the only instance known in which the geometrical and chemical analyses of crystallized bodies are at variance. *Mineralogie de Brochant*, v. i. p. 576. *Haüy Traité*, &c. v. iv. p. 337.

ARRAI, in *Geography*, a town of Japan, in the province of Tootomi or Jentsju.

ARRAIATIO *peditum*, the ranging or arraying of foot-soldiers.

ARRAIGN, or ARAIGN, in *Law*, signifies to set a thing in order, or in its place.

It is derived from the French *arraisonner*, i. e. “ad rationem ponere, to call a man to answer in form of law;” which comes from the barbarous Latin *adrationare*, i. e. *placitare*.—In which sense, to arraign a criminal, is *ponere eum ad rationem*. Thus he is said to arraign a writ of novel disseisin, who prepares and fits it for trial before the justices of the circuit. To arraign the assize, is to cause the demandant to be called to make the plaint, and to set the cause in such order as the tenant may be forced to answer to it. A prisoner is also said to be *arraigned*, when he is indicted, and called to the bar of the court, to answer the matter charged upon him in the indictment.

But no man is properly arraigned, except at the suit of the king, upon an indictment found against him, or other record, wherewith he is to be charged: and this arraignment requires, that the prisoner appears to be tried, and holds up his hand at the bar, for the certainty of the person, and makes a sufficient plea to the indictment. 1 *Inst.* 262, 263. The prisoner is to hold up his hand only in treason and felony; but this is only a ceremony: if he own that he is the person, it is sufficient without it.

It was laid down in the ancient books, that the prisoner, though under an indictment of the highest nature, must be brought to the bar without irons, or any manner of shackles or bonds; unless there be an evident danger of an escape, and then he may be secured with irons. But in *Layer's case*, A.D. 1722, a difference was taken between the time of arraignment, and the time of trial; and accordingly, the prisoner stood at the bar in chains during the time of arraignment. Prisoners are now generally tried in their irons, because taking them off is usually attended with great pain and trouble. When the prisoner is at the bar, and confesses that he is the person named, the indictment is to be read to him distinctly in the English tongue, that he may fully understand his charge. After which it is to be demanded of him, whether he be guilty of the crime, of which he stands indicted, or not guilty. By the old common law, the accessory could not be arraigned, till the principal was attainted, unless he chose it, and waived the benefit of the law; in which case, principal and accessory might, and may still, be arraigned, and plead, and also be tried together. But if the principal had never been indicted at all, had stood mute, had challenged above 35 jurors peremptorily, had claimed the benefit of clergy, had obtained a pardon, or had

had died before attainder, the accessory, in any of these cases, could not be arraigned; for "non confitit," whether any felony was committed or not till the principal was attained; and it might happen, that the accessory should be convicted one day, and the principal acquitted the next, which would be absurd. The law still continues, that the accessory shall not be tried, so long as the principal remains to be tried hereafter. But by stat 1 Ann c. 9. if the principal be once convicted, and before attainder, i. e. before he receives judgment of death or outlawry, he is delivered by pardon, the benefit of clergy, or otherwise, or if the principal stands mute, or challenges peremptorily above the legal number of jurors, so as never to be convicted at all; in any of these cases, in which no subsequent trial can be had of the principal, the accessory may be proceeded against as if the principal felon had been attained; for there is no danger of future contradiction. And upon the trial of the accessory, as well after as before the conviction of the principal, it seems to be the better opinion, and founded on the true spirit of justice (Foster, 355), that the accessory is at liberty (if he can) to controvert the guilt of his supposed principal, and to prove him innocent of the charge, as well in point of fact, as in point of law.

When a criminal is arraigned, he either stands *mute*, or *confesses* the fact; which circumstances may be called "incidents" to the arraignment; or else he *pleads* to the indictment. For the law, as it formerly existed, and now subsists with regard to standing mute, see MUTE. Upon the prisoner's simple and plain *confession* of the indictment, the court hath nothing to do but to award judgment; but it is usually very backward in receiving and recording such confession, out of tenderness to the life of the subject; and will generally advise the prisoner to retract it, and plead to the indictment. For another species of confession, see APPROVEMENT. For the plea of the prisoner, or defensive matter alleged by him on his arraignment, if he does not confess, or stand mute, see PLEA. For the solemnity of the arraignment, and trial of a prisoner, see Dalt. c. 185. p. 515. An attainder of high treason has been reversed for the omission of an arraignment. In an action of slander, for calling one thief, the defendant justifies that the plaintiff stole goods, and issue is taken thereon; if it be found for the defendant, in B. R. and for felony in the same county where the court sits, or before justices of assize, &c. he shall be forthwith arraigned upon this verdict of 12 men as on an indictment. 2 Hale's Hist. P. C. 151.

AR-RAKIN, in *Geography*, a small town of Asia, in Arabia Petrea, in the district of Al-Bkaa, probably the ancient Petra, the capital of a country called Sela in the bible, and Adriana by the emperor Adrian. Most of the houses are cut in a rock, whence the name, *rakin* denoting to cut, and *ra* a town.

ARRAN, a province of Persia, situated between Georgia, Aiderbeitzan, and Shirwan, and surrounded by mountains.

ARRAN, or *Arr-inn*, i. e. the island of mountains, one of the Scottish islands, situated in the Firth of Clyde, between the main land of Ayrshire and the coast of Kintyre, and forming part of the county of Bute. This island is about twenty-three miles long and nine broad, and contains about 7000 inhabitants, who chiefly occupy the parts near the coasts: the interior mountainous part being for the greatest part uninhabited. The chief place is the village of Ranza; and the parishes are two, viz. Kilbride and Killmore. The principal mountains are Goatfell, Goatfield, Gaolbheinn, or the mountain of the winds, nearly 3000 feet high, composed of immense piles of moorstone, clothed with lichens and mosses, and inhabited by eagles and ptarmigans;

Buin-bharrin, or the sharp-pointed; Ceum-na-Caillich, or the steep of the Carline or old hag; and Grianan-Athol, inferior to none in ruggedness. The lakes are loch Jorfa, where salmon come to spawn; loch Tana; loch Na-Jura, on the top of a high hill; loch Machrai and loch Knoe-zacharbai, abounding with large eels. The chief rivers are Abhan-mhor, Moioa-mhor, Slondrai-machrei, and Jorfa, of which the two last are remarkable for abundance of salmon. From the mineralogy of this island, published by Mr. Jamefon in 1798, 8vo., it appears to be a mountainous region; the southern parts, however, present low and cultivated grounds: the base is chiefly sand-stone and granite, the former traversed by veins of basalt. Near Lamash, and also near to Brodie wood, there is an extensive vein of pitchstone, of a greenish colour, and the black also occurs. There is also granitic, composed of quartz, felspar, and hornblende; micaceous schistus likewise abounds; but there is little coal. The bays of this island are those of Lamash, Brodie, and Ranza, where ships of any burthen may safely ride in all weathers; and it is surrounded with fisheries of various denominations. The climate is severe; nevertheless in summer the air is salubrious, and many invalids resort hither on that account, and for the purpose of drinking the whey of goats' milk. The men are strong, tall, and well made; they speak the Erse language; but have laid aside the ancient habit. Their diet consists chiefly of potatoes and meal, with an occasional addition, in winter, of the dried flesh of sheep or goats. Their farms are leased for nineteen years; and each farm is commonly possessed by a number of small tenants, who are jointly and severally bound for payment of the rent. The arable land is portioned out by lot, and to each portion or ridge the occupier annexes his mark; and this species of farm is called "run-rig," i. e. ridge. All the tenants join in ploughing. The pasture and moor-land annexed to each farm are common to all the occupiers. All the farms are open, and inclosures are unknown. The produce of the island is chiefly oats and barley; its live stock milk-cows and other cattle, horses, sheep, and goats. Hogs have been lately introduced. The herring-fishery is beneficial. The exports are black cattle, horses, and barley, herring nets, and thread formed of the flax that is sown here. The women manufacture the wool for the clothing of their families, dress and spin the flax, set the potatoes, make butter, some of which is exported, and cheese for their own use. The inhabitants are sober, religious, and industrious; in summer they prepare peat for fuel; before and after harvest, they are employed in the herring fishery; during winter the men make herring nets, and the women spin their linen and woollen yarn. In spring they till their grounds; and in autumn they collect and burn fern for making kelp. Among the quadrupeds of this island, such as otters, wild cats, shrew mice, rabbits, and bats, flags, which were formerly numerous, are now reduced to few; and among the several species of birds, such as eagles, hooded crows, wild pigeons, black game, grouse, ptarmigans, itares, daws, green plovers and curlews, are partridges, which now inhabit the island, and prove the advancement of agriculture. The government of the island is the same with that of the county of Bute; and besides, justice is administered at the baron's baily court, who may fine as high as 20s. decide in matters of property not exceeding 40s. imprison for a month, and put delinquents in the stocks for three hours, but only in the day time. From the immense cairns, monumental stones, and many relics of Druidism, this island must have been very considerable in ancient times. Little is known concerning this island, till the time of Magnus, the Barefooted, the Norwegian victor, who probably included

Arran in his conquests of Kintyre. Acho, one of his successors, laid claim to it 1263, together with Bute and the Cumrays, and having subdued the first, was defeated in a bloody engagement at the village of Largs, facing the island of Bute, and obliged, after the loss of 16,000 men, to give up his conquests. Arran was the property of the clan. Robert Bruce, with several of his followers, found an asylum here in their distress. About the year 1334, this island seems to have formed part of the estate of Robert Stewart, afterwards Robert II. In 1356, it was ravaged by Donald, earl of Ross, and lord of the isles. It was still the property of James II. and was given by his successor James III. as a portion to his sister, who married Thomas lord Boyd, created earl of Arran. On the disgrace of that family, the countess was divorced; and both the lady and island were bestowed on sir James Hamilton, in whose family, with the exception of a few farms, it now continues. Pennant's Journey through Scotland, vol. ii. 172. 184.

ARRAN, or *Arrin*, the name of two clusters of islands near the west coast of Ireland, the largest of each of which is called Arranmore, i. e. the great Arran. The north isles of Arran are near Donegal, in W. long. 8° 25'. N. lat. 55°. and in one of them a town called Rutland has been built for the herring fishery. The south isles are on the coast of Galway, between W. long. 9° 30', and 9° 43'. N. lat. between 53° 1', and 53° 7' 30". They are three in number, and shelter the entrance of Galway bay. They are very fruitful, and produce a small kind of oats without any husk. They are also remarkable for the stoutest calves in the county. Mr. Young mentions that they are set for 2000l. per ann. In Arranmore several Irish saints were buried, and it is still held in veneration by the neighbouring peasantry. In this island also, on a high cliff over the sea, is Dun Aengus, a circle of monstrous stones without cement, capable of containing 200 cows. This is supposed to have been one of the Mandræ or inclosures of monastic buildings, common in the seventh and eighth centuries. Dr. Beaufort's Memoir. Young's Collect. Ledwiche's Antiquities of Ireland.

ARRANGEMENT, or RANGEMENT, the disposition of the parts of a whole, in a certain order. The modern philosophy shews us, that the diversity of colours of bodies depends entirely on the situation and arrangement of the parts, which reflect the light differently; the diversity of tastes and smells on the different arrangement of the pores, which render them differently sensible; and the general diversity of bodies on the different arrangement of their parts. The happy arrangement of words makes one of the greatest beauties of discourse.

ARRANGEMENTS, *Philosophical*, a title given by the ingenious J. Harris, esq. to an excellent commentary on the *Categories* of Aristotle: it is just as happy a simplification of *Logic*, as his *Hermes* is of *Grammar*. Both these valuable books, so well calculated to convey sensible and precise notions of logic and grammar, might be very usefully and compendiously exhibited in the forms of a logical and grammatical tree, after the manner of genealogical tables.

ARRAPACHITIS, in *Ancient Geography*, the most northern province of Assyria, according to the distribution of Ptolemy. It was watered by the Gyndas. The towns are unknown.

ARRAS, in *Geography*, a city of France, and capital of the department of the fraits of Calais, situate on the Scarp; before the revolution, the metropolis of the province of Artois. It was taken by the French king Louis XIII.; and annexed to France, in 1640, by the peace of the Pyrenées. Being seated on a mountain, it is surrounded by quarries, which supply stone for building. It is divided

by a strong wall, a large fosse, and the brook Chinchron, into two parts, called the town and the city, each of which is well fortified. It has four gates, and a strong citadel with five bastions. The great square, in which is kept the principal market, is full of fine buildings, surrounded with piazzas. The lesser market contains the town-house, the tower of which is covered with a crown, with a brazen lion on the top serving for a vane; in the middle of this market is the chapel of the Holy Candie, reported to have been brought by the Virgin Mary above 600 years ago for cure of the diseased inhabitants, and kept in a silver shrine. The cathedral church of Notre Dame is a large Gothic building, with a high tower, in which is a fine clock, embellished with small figures in bronze, representing the passion of Jesus Christ. In this church is a silver shrine, enriched with pearls and diamonds, and containing a sort of wool called manna, which, report says, fell from heaven 1400 years ago in time of drought, and which was carried in procession when rain was wanted. The greatest ornament of Arras is the church of St. Vedast, with a fine steeple, a pulpit of brass in the form of a tree, supported by two bears of the same metal. The chimes play a great variety of tunes. There are eleven parish churches. The tapestry, called *Arras hangings*, derives its denomination from this city. The place contains 19,364, and the canton 29,613 inhabitants: the territory comprehends 70 kilometres and 13 communes. N. lat. 50° 17'. E. long. 2° 56'.

ARRATS, a river of France, which runs into the Garonne, about two miles north-west of Auillard, in the department of the Lot and Garonne.

ARRAY, in *Law*, the ranking or ordering a jury or inquest of men impannelled on any cause. The word may be derived either from the obsolete French, *array, order*; or from *raye, a line, stroke*, &c. Hence, to *array* a pannel, ana. 3 Hen. V. is to set forth the men impannelled one by another. By the statute, every *array* in assise ought to be made four days before. For challenges to the array, see CHALLENGE.

ARRAY, in *Military Language*. See BATTLE.

ARRAYAL DE PORATE, in *Geography*, a town in Brazil, situate on the west side of Para river, below the junction of its two great branches.

ARRAYERS, or ARRAYSERS, ARRATOIRES, in *Military Language*. is used in some ancient statutes, for certain provincial officers, whose duty it was, not only to inspect the soldiers, and see that they were able-bodied and fit for service; but also that they were properly armed, accoutred, and otherwise appointed according to the station and nature of their service. They were likewise to arrange both the cavalry and the infantry into their proper bodies, equivalent to the present divisions of troops, squadrons, companies, and battalions. In some reigns, commissioners were appointed for this purpose; and the form of the commission of array was settled in parliament in the 5 Henry IV.

About the reign of king Henry VIII. or his children, lieutenants began to be introduced, as standing representatives of the crown, to keep the counties in military order; for we find them mentioned as known officers in the statute 4 & 5 Ph. & M. c. 3., though they had not then been long in use; for Camden speaks of them in the time of queen Elizabeth, as extraordinary magistrates constituted only in times of difficulty and danger. But the introduction of these commissions of lieutenantancy, which contained, in substance, the same powers as the old commissions of array, caused the latter to fall into disuse. In this state things continued, till the repeal of the statutes of armour in the reign of king James I. stat. 1 Jac. I. c. 2. 21 Jac. I.

c. 28. After this period, viz. in 1642, king Charles I. opposed his commissions of array to the ordinance of parliament concerning the militia, and thus brought on the agitation of the question which became at length the immediate cause of the fatal rupture between the king and his parliament.

ARRAYOLOS, in *Geography*, a small town of Portugal, in Alentejo; situate upon the declivity of a mountain, and containing about 2000 inhabitants, a large monastery belonging to the canons of St. John the Evangelist, and a monastery of Franciscans. It lies north of Evora, south-east of Montemor, and 6 leagues from Estremoz, in which distance a single village is not seen. The soil is sometimes granite in masses, and sometimes slaty granite. In the vicinity are tracts over-grown with broom; but within a league of Arrayolos the lands are cultivated.

ARREARS, ARREARAGES, ARRERAGIUM, or ARRIERAGIUM, the remains of an account, or a sum of money remaining in the hands of an accomptant. The word is derived from the French *arrearages*, which is formed from *arriere*, behind.

ARREARS is also used more generally for a remainder of rents or monies unpaid at the due time; whether they be rents of a manor, or any thing reserved: called also, in some writers, *arrieraquum firmarum*.

ARREARS, in *Military Language*, denote the difference between the full pay and subsistence of each officer, directed to be paid once a year by the agent. These arrears were abolished in 1797. See PAY.

ARREAU, in *Geography*, a town of France, in the department of the Higher Pyrenées, and chief place of a canton in the district of Begneres, 13 miles south-east of Begneres, and 23 south-south-east of Tarbes. The place contains 980 and the canton 5979 inhabitants: the territory includes 175 kilometres and 19 communes.

ARRENS, a town of France, in the department of the Higher, Pyrenées and chief place of a canton in the district of Argellez, on the Garonne, 8 miles south-west of Argellez.

ARRENTATION, in the *Forest Law*, the licencing an owner of lands in the forest, to inclose them with a low hedge, and small ditch, in consideration of a yearly rent. *Saving the arrentations*, denotes a power reserved to give such licences for yearly rent.

ARREST, in *Common Law*, the apprehending or restraining of one's person, in execution of the command of some court of record, or officer of justice.

The word *arrest* is French, and is used in that language for a decree or determination of a cause debated to and fro: in which sense it seems derived from *arrestor*, *placitum*, the pleasure of the court.

Hence when a person is legally stopped, apprehended, and restrained of his liberty, for debt, &c. he is said to be arrested, or put under an arrest; which is the beginning of imprisonment.

Arrests are either in *civil* or in *criminal* cases.

I. An arrest in a *civil cause*, is defined to be the apprehending or restraining one's person by process in execution of the command of some court or officer of justice. Wood's *Just.* 575. This arrest must be corporal seizing or touching the defendant's body; after which the bailiff may justify breaking open the house in which he is, to take him; otherwise he has no such power, but must watch his opportunity to arrest him. For every man's house is considered by the law as his castle of defence and asylum, in which he should suffer no violation. This principle is carried so far in the civil law, that for the most part, not so much as a common citation or summons, much less an arrest, can be executed upon a man within his own walls. But doors may be

broke open in pursuit of one arrested; otherwise, action of trespass, &c. lies for breaking open a house to make arrest in a civil action. But if it appears a bailiff found an outer door, &c. open, he may open the inner door to make an arrest. Comb. 327. The court of King's Bench has determined, in the case of *Lee v. Gen. Gansel*, that the chamber door of a lodger is not to be considered as his outer door; but that the street door being open, the officers had a right to force open the chamber door, the defendant being in the room and refusing to open it. Cowp. 1. Peers of the realm, peeresses by birth, peers of Scotland, a peeress by marriage, not afterwards having intermarried with a commoner, members of parliament, and corporations, are privileged from arrests, and of course from outlawries. And against them the process to enforce an appearance must be by summons, and distress infinite, instead of a *capias*. Also clerks, attornies, and all other persons attending courts of justice (for attornies, being officers of the court, are always supposed to be there attending), are not liable to be arrested by the ordinary process of the court, but must be sued by *bill* (usually called a *bill of privilege*), as being personally present in court. Clergymen, performing divine service, and not merely staying in the church with a fraudulent design, are for the time privileged from arrests, by stat. 50 Edw. III. c. 5. and 1 Ric. II. c. 16.; as likewise members of convocation actually attending thereon, by stat. 8 Hen. VI. c. 1.; and also ambassadors, or the domestic servants of an ambassador, "really and *bona fide* in that capacity." Suitors, witnesses, and other persons, necessarily attending any courts of record upon business, are not to be arrested during their actual attendance, which includes their necessary coming and returning. A bankrupt coming to surrender, or within 42 days after his surrender (5 Geo. II. c. 30. § 5. Cowp. 156.); witnesses properly summoned before commissioners of bankruptcy, or other commissioners under the great seal (1 Atk. 54.); but not creditors coming to prove their debts (4 Term Rep. 377.); heirs, executors, or administrators (R. M. 1654.), except on personal contracts by themselves (1 T. Rep. 716.), or in cases of *devastavit* (1 Salk. 98.), are exempted from arrests. By stat. 31 Geo. II. c. 10. no seaman aboard his majesty's ships can be arrested for any debt, unless the same be sworn to amount to at least 20l.; but by the annual mutiny acts, a soldier may be arrested for a debt which extends to half that value, but not to a less amount. In an action against husband and wife, the husband alone is liable to be arrested, and shall not be discharged till he have put in bail for himself and his wife (1 Vent. 4. 1 Mod. 8.); and if she is arrested, she shall be discharged on common bail (1 Term Rep. 486. 1 Salk. 115.). No arrest can be made in the king's presence, nor within the verge of his royal palace, extending by stat. 28 Hen. VIII. c. 12. from Charing-cross to Westminster Hall, or within 200 feet from the gate of any of the palaces and houses of the king, or any other house where the royal person shall abide; nor in any place where the king's justices are actually sitting. The king hath moreover a special prerogative (which indeed is very seldom executed) that he may, by his writ of protection, privilege a defendant from all personal, and many real, suits for one year at a time, and no longer; in respect of his being engaged in his service out of the realm. And the king also, by the common law, might take his creditor into his protection, so that no one might sue or arrest him till the king's debt were paid (F. N. B. 28. Co. Litt. 131.); but by stat. 25 Edw. III. ft. 5. c. 19. notwithstanding such protection, another creditor may proceed to judgment against him; with a stay of execution, till the king's debt be paid; unless

unless such creditor will undertake for the king's debt, and then he shall have execution for both. An arrest in the night, as well as the day, is lawful. 9 Rep. 66. And lastly, by stat. 29 Car. II. c. 7. no arrest can be made, nor process served, upon a Sunday, except for treason, felony, or breach of the peace. But a person may be retaken on a Sunday, when arrested the day before, Mod. Caf. 231; or, when he goes at large out of the rules of the King's Bench or Fleet prison, &c. 5 Ann. c. 9. By 13 Geo. I. c. 29. and 5 Geo. II. c. 27. both made perpetual by 21 Geo. II. c. 3. no person can be arrested, or held to bail, on a writ sued out of the superior courts, unless the cause of action be 10*l.* or upwards. And by 19 Geo. III. c. 70. no person can be arrested or held to bail upon process out of any inferior court, for less than 10*l.*, but proceedings are to be had in inferior courts according to the directions of 12 Geo. I. c. 29. extended by 19 Geo. III. to debts under 10*l.* It is now settled, both in K. B. and C. P. that a defendant may be arrested in an action on a judgment for 10*l.* for damages and costs, though the original debt alone were under 10*l.* 4 Term Rep. 570. on the authority of 2 Blackit. Rep. 1274.

When a person is apprehended for debt, &c. he is said to be arrested; and writs express arrest by two several words, *capias* and *attachias*, to take and catch hold of a man; for an officer must actually lay hold of a person, besides saying that he arrests him, or it will be no lawful arrest, 1 Lill. Abr. 96. If a bailiff be kept off from making an arrest, he shall have an action of assault; and where the person arrested, resists or assaults the bailiff, he may justify beating of him. If a bailiff *touches* a man, which is an arrest, and he makes his escape, it is a rescous, and attachment may be had against him. If a bailiff lays hold of one by the hand held out at a window, this is such a taking of him as will justify his breaking open of the house to carry him away.

2. An arrest in a *criminal cause* is the apprehending or restraining one's person, in order to be forthcoming to answer an alleged or suspected crime. To this arrest all persons whatsoever are, without distinction, equally liable, and doors may be broken to arrest the offender; but no man is to be arrested, unless charged with such a crime as will at least justify holding him to bail, when taken. There is this difference between civil and criminal cases; that none shall be arrested for debt, trespass, &c. or other cause of action, but by virtue of a precept or commandment out of some court; but for treason, felony, or breach of the peace, any man may arrest without warrant or precept. Terms de Ley, 54. But the king cannot command any one by word of mouth to be arrested; for he must do it by writ, or order of his courts, according to law: nor may the king arrest any man for suspicion of treason or felony, as his subjects may, because, if he doth wrong, the party cannot have an action against him. 2 Int. 186. In general, an arrest may be made four ways; viz. by WARRANT; by officers without warrant, as by a JUSTICE of the peace, the SHERIFF, the CORONER, the CONSTABLE, and WATCHMEN; by a private person also without warrant; and by an HUE and CRY. Arrests by private persons are in some cases commanded; so that any person who is present when any felony is committed, is bound by the law to arrest the felon, on pain of fine and imprisonment, if he escapes through the negligence of the by-standers. 2 Hawk. P. C. 74. And they may justify breaking open doors upon following such felon; and if they kill him, provided he cannot be otherwise taken, it is justifiable; though, if they are killed in endeavouring to make such arrest, it is murder. 2 Hal. P. C. 77. Upon probable suspicion also a private person may arrest the felon,

or other person so suspected. 30 Geo. II. c. 24. But he cannot justify breaking open doors to do it; and if either party kill the other in the attempt, it is merely man slaughter, 2 Hal. P. C. 82, 83. Every private person is bound to assist an officer, requiring him to apprehend a felon. In order to encourage the apprehending of certain felons, rewards and immunities are bestowed on such as bring them to justice, by several acts of parliament. By 4 & 5 W. & M. c. 8. persons who apprehend a highwayman, and prosecute him to conviction, shall receive a reward of fifty pounds from the public, to be paid them, or if they be killed, to their executors, by the sheriff of the county; to which is added by 8 Geo. II. c. 16. ten pounds, to be paid by the hundred indemnified by such taking. By 6 & 7 W. III. c. 17. and 15 Geo. II. c. 18. persons apprehending and convicting any offenders against those statutes respecting the coinage, shall, if the offence be treason or felony, receive a reward of 40*l.* or 10*l.* if the offence amount only to counterfeiting the copper coin. By 10 & 11 W. III. c. 23. any person apprehending and prosecuting to conviction a felon guilty of burglary, house-breaking, horse-stealing, or private larceny to the value of 5*s.* from any shop, warehouse, coach-house, or stable, shall be excused from all parish offices. By 5 Ann. c. 31. any person for apprehending and prosecuting a burglar, or felonious house-breaker, or, if killed in the attempt, his executors shall be entitled to a reward of 40*l.* By 6 Geo. I. c. 23. persons apprehending and prosecuting to conviction any one taking reward for helping others to stolen goods, shall be entitled to 40*l.* By 14 Geo. II. c. 16. explained by 15 Geo. II. c. 34. any person apprehending and prosecuting to conviction such as steal, or kill with intent to steal, any sheep or other cattle specified in the latter of the said acts, shall, for every such conviction, receive a reward of 10*l.* Lastly, by 16 Geo. II. c. 15. and 8 Geo. III. c. 15. persons discovering, apprehending, and convicting felons and others, being found at large during the term for which they are ordered to be transported, shall receive a reward of 20*l.* Blackit. Com. vol. iii. p. 288. vol. iv. 289. Jacob's Law Dict. by Tomlins, art. *Arrest*.

The method of procuring a man's appearance before a court of justice, is different from that above recited, in most of the countries of Europe, where the forms introduced in the Roman civil law, in the reigns of the latter emperors, have been instituted. The usual practice is to have the person sued, summoned to appear before the court by a public officer belonging to it, a week before the time. If no regard is paid to such summons twice repeated, the plaintiff, or his attorney, is allowed to make before the court a formal reading of his demand, which is then granted him, and he may proceed to execution.

In Rome, the method of seizing the person of a man, against whom a demand of any kind was preferred, previously to any judgment being passed against him, was adopted and continued to be followed after the institution of the prætor's court, to whom the civil branch of the power of the consuls was afterwards delegated; and it lasted till the times of the latter emperors, in whose reigns the Roman civil law underwent those alterations which gave it the form it now has in those codes or collections that are in our possession. In Rome, however, instead of employing a proper officer, and furnishing him with a writ or order for seizing a man's person, every one became a kind of public officer in his own cause, for asserting the prætor's prerogative; and without any ostensible legal licence, or badge of public authority, had a right to seize by force the person of his opponent, wherever he met him. The practice was, that

the "actor," or plaintiff, first summoned the "reum," or person sued, with a loud voice to follow him before the court of the prætor. If the defendant refused to obey this summons, the plaintiff, by means of the words "licet autellari," requested the by-standers to witness the fact, in token of which he touched the ears of each of them; and he then proceeded to seize the person of his opponent by throwing his arms around his neck "oborto collo," and thus endeavouring to drag him before the prætor. If the person sued was, by age or sickness, unable to follow the plaintiff, the latter was directed by the Twelve Tables to supply him with a horse. This method of proceeding was afterwards, though very lately and very slowly, mitigated. In the first place, it became unlawful to seize a man in his own house, as it was the abode of his domestic gods. Women of good family, or "matronæ," were protected from being dragged by force before the tribunal of the prætor. The method of forcibly placing a sick or aged person upon a horse was abolished during the latter times of the republic. Emancipated sons, and slaves who had obtained their freedom, were afterwards restrained from summoning their parents or late masters without the express leave of the prætor, under the penalty of fifty pieces of gold. However, so late as the time of Pliny, the old mode of summoning or carrying by force before a judge continued in general to subsist; though in the time of Ulpian, the necessity of obtaining the express leave of the prætor was extended to all cases and persons; and in the reign of Constantine, the method was introduced of having legal summonses served only by means of a public officer appointed for that purpose. After that time other changes in the former law took place, from which the mode of proceeding now used on the continent of Europe has been borrowed. De Lolme's Constitution of England, ch. 10.

ARREST of judgment, to move or plead in, is to shew just cause why judgment should be stayed, notwithstanding verdict given. Judgment may be arrested for good cause in criminal cases, as well as civil, if the indictment be insufficient. 3 Inst. 210. Motions in arrest of judgment may be made at any time before judgment signed. Doug. 747. Str. 845. Arrests of judgment arise from intrinsic causes appearing upon the face of the record. Of this kind are, first, where the declaration varies totally from the original writ; also, secondly, where the verdict materially differs from the pleadings and issue thereon; or, thirdly, if the case laid in the declaration is not sufficient, in point of law, to found an action upon. If judgment is not by some of these means arrested within the first four days of the next term after the trial, it is then to be entered on the roll or record. See JUDGMENT.

In criminal cases, whenever the defendant appears in person, upon either a capital or inferior conviction, he may at this period, as well as at his arraignment, offer any exceptions to the indictment in arrest or stay of judgment, as for want of sufficient certainty in setting forth either the person, the time, the place, or the offence. And if the objections be valid, the whole proceedings shall be set aside; but the party may be indicted again. A pardon may be pleaded in arrest of judgment; and it has the same advantage when pleaded here, as when pleaded upon arraignment; viz. the saving the attainder, and of course the corruption of blood, which nothing can restore but parliament, when a pardon is not pleaded till after sentence. Praying the benefit of clergy may also be ranked among the motions in arrest of judgment. If all these resources fail, the court must proceed to pronounce the judgment. See JUDGMENT.

ARREST of Inquest, or to plead in arrest of taking the inquest, is to shew cause why an inquest should not be taken. See INQUEST.

ARREST, in Military Language, is the exercise of that part of military jurisdiction, by which an officer is noticed for misconduct, or put into a situation to prepare for his trial by a general court-martial.

ARREST, or Arret, is sometimes used among French writers, in the sense of the Latin word "retiaculum," to signify a small piece of steel, which was formerly used in the construction of fire-arms, to prevent the piece from going off.

ARRESTANDIS bonis ne dissipentur, a writ which lay for him whose cattle or goods are taken by another, who during the controversy makes or is likely to make away with them, and will hardly be able to give satisfaction for them afterwards. Reg. Orig. 126.

ARRESTANDO ipsum, qui pecuniam recepit ad proficiscendum in obsequium regis, &c. is a writ which lay for the apprehension of him that hath taken press-money to serve in the king's wars, and hides himself when he should go. Reg. Orig. 24.

ARRESTMENT, in Scots Law, signifies the securing of a criminal till trial, or till he find caution to stand trial, in what are calledailable crimes. In civil cases, it denotes either the detaining of strangers or natives "in meditatione fugæ," till they find caution "judicio filii;" or the attaching of the effects of a stranger in order to found jurisdiction. But, in the most general acceptation of the word, it signifies that diligence by which a creditor detains the goods and effects of his debtor in the hands of third parties, till the debt due to him be paid or secured. *Arrestment* may be laid on by the authority either of the supreme court, or of an inferior judge. In the first case, it proceeds either upon special letters of arrestment, or on a warrant contained in letters of horning, and it must be executed by a messenger. The warrants granted by inferior judges are called precepts of arrestment, and they are executed by the proper officer of the court. All debts, in which one is personally bound, though they should be heritably secured, are grounds upon which the creditor may arrest the moveable estate belonging to his debtor.

Moveable debts are the proper subject of arrestment; under which are comprehended conditional debts, and even depending claims. But there are certain moveable debts which are not arrestable; such as debts due by bill, future debts, and alimentary debts, including salaries of public officers. If, in contempt of the arrestment, the arrestee shall make payment of the sum, or deliver the goods arrested, to the common debtor, he is not only liable criminally for breach of arrestment, but he must pay the debt again to the arrester. Arrestment is only an inchoate or begun diligence; for perfecting it, there must be an action brought by the arrester against the arrestee, to make the debt, or subject arrested, forthcoming. In all competitions of arrestments, regard is had to the dates, not of the grounds of debt, but of the diligences proceeding upon them. In the competition of arrestments with assignations, an assignation by the common debtor, intimated before arrestment, is preferable to the arrestment; if the assignation is granted before arrestment, but not intimated till after it, the arrester is preferred. See POUNDING.

ARRESTO facto super bonis mercatorum alienigenarum, &c. is a writ which lay for a denizen against the goods of aliens found within this kingdom, in recompence of goods taken from him in a foreign country, after he hath been denied

denied restitution there. This answers to what among the ancient civilians was called *clarigatio*, now barbarously *REPRISALIA*.

ARRETE-NEF, in *Zoology*, a common term among the French for the *Remora*, or sucking-fish; alluding no doubt to the fabulous relations of the ancient poets, who feigned that this fish, which is scarcely more than a foot or two in length, was capable of arresting the progress of a ship in full sail by fastening itself to the bottom of it. See *ECHENEIS remora*.

ARRETIUM VETUS, now *Arezzo*, in *Ancient Geography*, a town of Italy, in Etruria. It was seated on a hill not far from Umbria, and was celebrated for its manufacture of earthen vessels, its wine, a fountain whence were issued oracles, &c. See *AREZZO*.

ARRETIUM Fulvium, a town of Etruria, upon the Arnus, north of the former.

ARRETIUM Fidens, another town of Etruria, south of *Arretium vetus*.

ARRETTED, **ARRECTATUS**, *quasi, ad rectum vocatus*, is sometimes used in our ancient law-books for imputed, or laid to.—As, no folly may be arretted to one under age. It is applied also to a person who is convened before a judge, and charged with a crime.

ARRHA, in *Ancient Geography*, a town of Illyrium. Steph. Byz.

ARRHABON, a river of Asia, in Armenia, had its source in mount Caucasus, and ran into the Cyrus. Strabo.

ARRHABONARI, derived from *αρραβων*, *arrha*, *earnest*, in *Ecclesiastical History*, a sect, in the sixteenth century, who held that the eucharist is neither the real flesh and blood of Christ, nor yet the sign of them, but only the pledge or earnest thereof.

ARRHADA, in *Ancient Geography*, a town of Arabia Deserta. Ptolemy.

ARRHÆ, or *Argentum Dei*. See *EARNEST*, &c.

ARRHAPA, in *Ancient Geography*, a town of Asia, in Assyria. Ptolemy.

ARRAPHON, denotes a skull without sutures, found to be the cause of incurable *CEPHALALGIE*.

ARRHENA, in *Ancient Geography*, a town of Asia, in Armenia Major. Pliny says, that the rivers Tigris and Arsenius ran near one another through this country.

ARRHENOGOGON, in *Betany*, a name given by some to the *parietaria*, or peilitory of the wall.

ARRHEPHORIA, in *Antiquity*, a feast among the Athenians, instituted in honour of Minerva, and Herse, daughter of Cecrops. The word is compounded of *αρραβων*, *mystery*, and *φερω*, *I carry*; on account of certain mysterious things which were carried in procession at this solemnity.

Boys, or, as some say, girls, between seven and twelve years of age, were the ministers that assisted at this feast, and were denominated *αρρηφοροι*.

This feast was also called *Hersephoria*, from Herse the daughter of Cecrops, on whose account it is said to have been first established.

ARRIA, in *Biography*, a Roman lady distinguished by her fortitude and conjugal affection, was the wife of Cæcina Pætus, a man of consular dignity, who died in the 42d year of the Christian æra. Pliny the younger has preserved (*Epist. l. iii. ep. 16.*) several anecdotes, some of which are worth recording. Her husband and her son, who was a very amiable and promising youth, were both seized at the same time with a very dangerous disorder. The son died, but the mother concealed the distressing event from the sick father; and whenever she appeared in his presence, assumed a cheerful countenance, and answered his inquiries respecting the deceased with so much composure and serenity,

that she even prevented the suspicion of his death. When her husband was apprehended, in consequence of having joined Scribonianus in a rebellion against the emperor Claudius, and was conveyed by sea to Rome, Arria wished to accompany him in the same vessel; but being refused, she hired a fishing boat, and followed him. Having arrived at Rome, she determined to die with Pætus; and to the remonstrance of her son-in-law Thrasea, who asked her, "Would you wish that your daughter should accompany me, if I were to die?" she replied, "Yes, provided the dead lived so long and so happily with you as I have lived with Pætus." To those who watched her, and who endeavoured to divert the execution of her purpose, she said, "You may make my death more painful, but cannot prevent it;" and dashing her head against a wall, fell senseless on the ground. Upon her recovery, she calmly said, "I told you that I would find a difficult road to death, if you hindered me from obtaining an easy one." When her husband was ordered to destroy himself, Arria perceiving his hesitation, plunged a dagger in her breast, and then presented it covered with blood to her husband, exclaiming, in words celebrated by the ancients, who did not entertain that horror of self-murder which Christians have derived from better principles, "Pætus, it is not painful." Martial's epigram on this subject is well known; but it is remarked, that he has given an ingenious turn to the speech, which injures its noble simplicity:

"Casta suo gladium cum traderet Arria Pæto,

Quem de visceribus traxerat ipsa suis;

Si qua fides, vulnus, quod feci, non dolet, inquit,

Sed quod tu facies, hoc mihi, Pæte, dolet."

"When Arria pulled the dagger from her side,

Thus to her comfort spoke th' illustrious bride:

The wound I gave myself I do not grieve;

I die by that which Pætus must receive."

Tatler, vol. ii. N^o 72.

Arria, the daughter, who was married to Pætus Thrasea, proposed to imitate this example of her mother, when her husband was condemned to death under Nero; but she changed her resolution upon his request, who desired her to live in order to take care of their daughter. Tacit. *Annal. l. xvi. c. 34.* Gen. Dict.

ARRIACA, in *Ancient Geography*, a town of Spain, between Complutum to the south-west, and Seguntia to the north-east, on the same river with the first of these towns.

ARRIAGA, RODERIC DE, in *Biography*, a learned Spanish Jesuit, was born at Lucrona in 1592, and gained great applause by teaching philosophy at Valladolid, and divinity at Salamanca. Having voluntarily undertaken the office of teaching these sciences in Bohemia, he removed to Prague in 1624, whence he was deputed thrice to Rome by the province of Bohemia, to assist at the general congregations of the order of Jesuits; and after acquiring distinguished reputation in the several offices to which he was appointed, he died at Prague in 1667. Such was the vigour of his mind, that he broke through the trammels of the schools in the investigation of philosophical and theological subjects: but destitute of the right clue to guide his inquiries, he indulged the wildest conjectures in explaining the phenomena of nature, and wandered into the regions of general scepticism, so that he was more successful in demolishing the opinions of others than in establishing any of his own. His works are: "A Course of Philosophy," in one volume folio, printed at Antwerp in 1632, and several times re-printed; and "A Course of Divinity," in eight volumes folio, printed between the years 1643 and 1655, by Balthasar Moret, at Antwerp.

He.

He was prevented from finishing a ninth volume by his death. Gen. Dict.

ARRIAGI, in the *Materia Medica*, a name given by some authors, particularly by Serapion and Avicenna, to a fine kind of camphor.

ARRIAN, in *Biography*, a Greek historian, was born at Nicomedia in Bithynia, where he was priest of Proserpine, and flourished in the second century under the emperors Adrian and the Antonines. After his residence at Rome, he became a disciple of Epictetus, and by his talents and learning he recommended himself to the patronage of Adrian. Having been admitted to the honour of a Roman citizen, he was appointed prefect of Cappadocia, and in this station he distinguished himself by his prudence and valour in the war against the Alani and Massagetae. He was afterwards advanced to the dignities of senator and consul. Like Xenophon, he united the literary with the military character, and devoted a great part of his life to the pursuits of learning and philosophy. Of the numerous historical writings of Arrian, if we except some fragments preserved by Photius and Tzetzes, two only remain. The first is, "The expedition of Alexander the Great, in seven books;" a work in high estimation, not only on account of the accuracy and fidelity that distinguish the detail of facts, but for the simplicity and sweetness of the style in which they are recited. As his knowledge of political and military science was more extensive than that of Q. Curtius, he possessed a sounder judgment, and was less inclined to the marvellous than that historian. His facts were collected from the best authorities, particularly from the memoirs left by Ptolemy Lagus and Aristobolus, who had served under Alexander in his expedition, and who did not publish their accounts till after the death of Alexander, and with no other motive besides that of discovering the truth. His style was formed upon the model of that of Xenophon, and combined simplicity and ease with strength and elegance; so that he was not unjustly denominated the second Xenophon. "This work, says Dr. Robertson, (Hist. Disq. concerning India, p. 24.) though composed long after Greece had lost its liberty, and in an age when genius and taste were on the decline, is not unworthy the purest times of Attic literature." Arrian's "Account of the Affairs of India," in which the history of Alexander is pursued, has been considered by many as an eighth book of the former work; though it has been objected that this book is written in the Ionic, but the former seven in the Attic dialect, and that its facts are chiefly taken from Megasthenes, to whom Strabo allows little credit. Dr. Robertson (ubi supra, p. 344.) says, that the Indian history of Arrian is one of the most curious treatises transmitted to us from antiquity. The first part of it consists of extracts from an account given by Nearchus of the climate and soil of India, and the manners of the natives; and the second contains that officer's journal of his voyage from the mouth of the Indus to the bottom of the Persian gulf. For the elucidation of this curious monument of ancient navigation, see "The Voyage of Nearchus from the Indus to the Euphrates," by Dr. Vincent, 4to. 1797. We may add, that, notwithstanding some particulars, to which objections have been made, and which have been examined by Dr. Robertson and others, the account of Nearchus's voyage, detailed, probably only in part by Arrian, the promontories, the creeks, the rivers, the cities, and the mountains, which came successively in his view, are so clearly described, and the distances of such as were most worthy of notice are so distinctly marked, that M. d'Anville, by comparing these with the actual position of the country, according to the best accounts of it, ancient as well as modern, has been able to point out most of the places which Nearchus men-

tions, with a degree of certainty, which does as much honour to the veracity of the Grecian navigator, as to the industry, learning, and penetration of the French geographer. Mem. de Literat. tom. xxx. p. 132, &c. See also the learned and elaborate work of Dr. Vincent, above cited. Arrian's "Expedition of Alexander" was first printed in Greek, at Venice, in 8vo, in 1535; at Basil, in 1539, 8vo.; at Geneva, by H. Stephens, in 1575, fol.; in Greek and Latin, by Blancard, 8vo. with notes, at Amsterdam, in 1668; by Gronovius, at Leyden, in 1704, fol.; and at Amsterdam, in 8vo., with the notes of Raphaelius and others, in 1757. The book "De Indiciis" has usually been published with the "Expedit. Alex." The "Periplus Ponti Euxini," in a letter from Arrian to Adrian, containing a description of a voyage along the coasts of the Euxine sea, is still extant, and was probably written while Arrian was prefect of Cappadocia. The "Periplus Maris Erythraei" has been ascribed by some to Arrian, but Salmatus is of opinion that it was written in the time of Pliny the natural historian, or a little before his time; and that it could not have been composed by Arrian, and addressed to Adrian, because mention is made of several princes who lived in Pliny's time. M. Tillemont apprehends, that it was compiled by that Arrian to whom Pliny the younger wrote several letters, whom he represents as a man of great abilities and eloquence, and who was considered as an imitator of Demolthenes. But this Arrian, having retired from public employments about the time of Nerva, or the beginning of Trajan's reign, could not have been the same with the disciple of Epictetus. The "Periplus Ponti Euxini," and "Periplus Maris Erythraei," were published together at Basil, in fol.; at Leyden, in 1577; and among the Ancient Geographers, in 4to. by Gronovius, at Leyden, in 1697; and at Oxford, in 1698, 8vo. The "Tactics" of Arrian was written in the 20th year of Adrian. It treats of the order and arrangement of an army; and also the order which Arrian gave for the march of the Roman army against the Alani. His book "On Hunting" was published in Blancard's edition of the works of Arrian: and of his invaluable moral treatise, intitled "Enchiridion," containing the discourses of Epictetus, we have an excellent edition by Upton, printed at London in two volumes 4to., in 1739. Gen. Dict. Fabr. Bibl. Græc. l. iv. c. 8. t. iii. p. 269.

ARRIANA, in *Ancient Geography*, a town of Pannonia Prima, in the district of Norica Ripensis.

ARRIANA, in *Geography*, a village of Africa, two leagues north of Tunis, in which are seen some ruins of ancient Carthage, particularly a long range of the arches of the celebrated aqueduct, all of them entire, seventy feet high, supported by columns sixteen feet square. The channel, that conveyed the water, lies upon these arches, and is high and broad enough for a person of an ordinary size to walk in. It is vaulted, and plastered in the inside with a strong cement, which by the stream running through it, is discoloured to the height of about 3 feet. Shaw's Trav. p. 13.

ARRIB of *Rupes*, in *Commerce*, equal to 100 crores, each crore being 100 lacks, and each lack 12,500l.: so that an arrib is equal to about 125,000,000l.

ARRIBANTRUM, in *Ancient Geography*, a town of Dardania, a country of Upper Mysia. Ptolemy.

ARRIEGE, in *Geography*, a river of France, which rises in the Pyrenées, passes by Foix, Pamiers, Savarden, St. Gabelle, &c. and joins the Garonne about two miles from Toulouse. Gold has been found in several parts of this river near Pamiers.

Arriège gives name to one of the departments of France, formed of the territory called Couzerans, and the Pays de Foix. It is bounded on the north by the departments of Upper

Upper Garonne, and of Aude; on the east, by the departments of Aude, and the Eastern Pyrenées; on the south, by the department of the Eastern Pyrenées, and the Pyrenées; and on the west, by the department of Upper Garonne. Its superficies is about 1,037,533 square acres, or 529,540 hectares; its population consists of about 194,858 individuals; and it is divided into three communal districts. Its chief town is Tarascon.

ARRIENNES, a mountain of France, in the department of the Calvados, remarkable for the resort of birds of prey, such as eagles, falcons, kites, &c. one league from Falaise.

ARRIERE, Fr. denotes the rear.

ARRIERE-BAN, or *Ariere-ban*, in the *French Customs*, is a general proclamation, whereby the king summons to the war all that hold of him; both his vassals, i. e. the noblesse, and the vassals of his vassals.

M. Cafeneuve takes the word to be composed of *arriere*, and *ban*: the *ban*, according to him, denotes the convening of the noblesse or vassals, who hold fees immediately of the king; and *arriere*, those who only hold of the king immediately.

ARRIERE-fee, or *ief*, is a fee dependant on some other superior one.

Arriere-fees commenced at the time when the counts and dukes, rendering their governments hereditary in their families, distributed to their officers certain parts of the royal domains which they found in their provinces; and even permitted those officers to gratify the soldiers under them with parts of the same.

ARRIERE-guard. See REAR-guard.

ARRIERE-vassal, or *tenant*, the vassal or tenant of another vassal or tenant.

ARRIGNO, in *Geography*, a town of the island of Corsica, eight miles east of Calvi.

ARRIGONI, CARLO, in *Biography*, an eminent Italian Lutenist, who arrived in England about the time of the establishment of the Royal Academy, or opera, in 1721, where he accompanied on the lute out of the composer's book or score, during the whole time of Handel's regency. In 1732, he accompanied Farinelli: he had many scholars in singing in the great families of this country, and had the reputation of a good composer. He left England in 1733, and removed to Vienna, where he composed the oratorio of Esther, which augmented his reputation as a good musician.

ARRION, in *Geography*, a town of Persia, in the province of Adir-beitzan, thirty leagues south-east of Tauris.

ARRION, or CARRION, a river of Spain, which runs into the Pisuerga, near its union with the Duero.

ARRO, a river of England, which runs into the Lug, near Léominster, in Herefordshire.

ARROBAS, or AROBAS, in *Commerce*. See AROBE.

ARROE, in *Geography*, an island of Denmark, in the Baltic mountains, but intersected with vallies, and containing three parishes. It lies south of the island of Funen, and west of that of Langeland. N. lat. 54° 55'. E. long. 10° 10'.

ARROE, is also a small island of Denmark, in the Little Belt, west of Funen, and almost contiguous to the east coast of the duchy of Sleswick. It gives name to a Sound on that coast. N. lat. 55° 16'. E. long. 9° 40'.

ARROESKIOBING, a town of Denmark, in the island of Arroë, in the Baltic.

ARROGATION, See ADROGATION.

ARROJA DE ST. SERVAN, in *Geography*, a town of Spain, in the province of Estremadura, three miles south of Merida.

ARROIS, a village of Scotland, in the isle of Mull.

ARRON, or ARON, a river of France, which runs into the Loire near Decize.

ARRONCHES. See ARONCHES.

ARRONDIE, in *Heraldry*, CROSS-arrondie, or rounded, is that whose arms are composed of sections of a circle, not opposite to each other, so as to make the arm bulge out thicker in one part than another; but both the sections of each arm lie in the same way, so that the arm is every where of an equal thickness; and all of them terminating at the edges of the esccheon, like the plain cross.

ARROO, or ARRAU, *Iles*, in *Geography*, islands of that part of Asia called Australasia, lying to the south-west of New Guinea; in S. lat. 6°, and E. long. 135°. Although Pennant classed these among the spicy islands, they produce, according to his account, fago, and not spice. During the dry, or western monsoons, the mancodiatæ, or birds of Paradise, which breed in New Guinea, and reside there whilst the wet monsoon lasts, retire to Arroo; migrating in flocks of 30 or 40, under the conduct of a leader, called by the inhabitants of Arroo, the king: he is said to be black, to have red spots, and to fly far above the flock, which never desert him, but settle where he settles. During their flight they cry like starlings; but when surprised with a strong gale, they croak like ravens, and ascend to the superior regions of the air. They alight on the highest trees, and seem to feed on berries, or on nutmegs and butterflies; and they are either shot with blunt arrows, or caught with bird-lime, or nooses. The bowels and breast-bone being extracted, they are dried with smoke and sulphur, sold for nails or bits of iron, and exported to Banda. The Arroo islands appear, in Arrowsmith's chart, divided into five by intervening straits. The chief product is fago; and the people make expeditions to the main land, where they seize captives, and sell them at Banda. Since 1623, the Arroo isles have been considered as belonging to the Dutch East India Company, and subservient to those of Banda.

ARROS, a river of France, which runs into the Adour near Aire, in the department of Landes.

ARROSOIR, in *Conchology*, a name assigned by modern French naturalists, after Brugière and Lamarck, to a new genus of shells, formed exclusively of the Linnæan *Serpula penis*, and another analogous species figured in the seventy-ninth plate of Favanne's Conchology. The former is the *Penicillus marinus* of Argenville; *Chinese watering-pot* of the English; and *L'Arrosoir de Java* of the French; the latter is also called by them *L'Arrosoir de la Nouvelle Zélande*. See SERPULA PENIS.

ARROTINO, L', in *Sculpture*, a statue in the gallery of the great duke at Florence, representing an old man reeling upon one knee, and whetting a kind of broad knife upon a stone, with his head erect, and, as it were, listening with great attention, but very cautious of being observed. The head and the hair of this piece of sculpture are particularly admired. It is generally thought to have been a peasant, who, being in the field, happened to overhear some of Catiline's accomplices, and discovered them: but the history of that conspiracy, as also of that headed by Brutus's sons, makes no mention of their being detected by a country labourer. Keyser's Trav. vol. ii. p. 21. Leonard Agostini, cited by Gronovius, supposes that this statue represents a Seythian charged by Apollo with the destruction of Marsyas, and that it made part of a group, exhibiting the punishment of this audacious rival of Apollo.

ARROU, in *Geography*, a town of France in the department of the Eure and Loire, and chief place of a canton in the district of Chateaudun, 7 leagues S.S.W. of Chartres.

ARROUKHAGE. See AROKHAGE.

ARROUX, in *Geography*, a river of France, which rises near Arnay-le-Duc, and runs into the Loire, between Digoin, and Motte St. Jean, in the department of the Saone and Loire.

ARROW, in *Arbery*, in the Saxon *ape*, or *apepe*, a missile weapon of offence, slender, pointed, and barbed, made to be cast or shot from a bow. See ARCHERY. Muthew derives it from the Latin *arvus*, because the ancients so frequently made the shafts of their arrows from reeds: Skinner refers us to the Anglo-Saxon *æarp*, *ærvas*; and Junius to the French *arroyer*, because the arrows descended on the enemy like a shower.

The chief of the nations that composed the army of Xerxes had both their bows and arrows made of reeds: the bows, however, of the Lydians were of cornel wood; the arrows of the Indians were pointed with iron; those of the Ethiopians with a sharp stone that they sometimes used to cut their seals with; and the arrows of the Lycians were unfeathered (Herodotus, Polymnia). The Grecians headed their arrows with brass, as well as the Scythians; and from a particular passage in the *Odyssey*, it is supposed, that the heads of the Grecian arrows were fastened on as they were wanted. The ancient Germans generally prefixed pointed stones to their weapons; and Brotier, in his notes on Tacitus, observes, that many such have been discovered in the German sepulchres. Nor is it an uncommon thing to find arrow-heads of flint in the ancient cairns of stone in our own country. (See Gough, *Sep. Mon.* vol. i. p. 18.)

Among the Romans, although the tree called *Cornus* was very frequently made use of for the arrow-shaft, yet the most common material was the reed, which grew in Italy, not only with great strength, but in great abundance, particularly in the Pontine marshes.

The use of the arrow among our early ancestors has been already spoken of (see ARCHERY); the particular material, indeed, of which either the head or shaft was made, has not come down to us; but we can speak of the arrows of the middle ages with a greater degree of certainty.

Roger Ascham thought (*Toxoph.* ed. 1571. f. 166.) that for the pluming of an arrow, the feathers from the wing of a grey goose were preferable to any other: which strongly reminds us of part of a stanza in the well-known ballad of Chevy Chase, where an English archer aimed his arrow at sir Hugh Montgomery:

“The grey-goose wing that was thereon,
In his heartes blood was wett.”

The more ancient ballad, however, reads, *swane-feathers*. In the “*geste of Robyn Hode*,” among Mr. Garrick’s old plays, in the Museum, the arrows of the outlaw and his companions are particularly described:

“With them they had an hundred bowes,
The stringes were well ydyght;
An hundred these of arrows good,
With heedes burnish’d full bryght;
And every arrowe an ell longe,
With *peacocke* well ydyght,
And nooked they with white silk,
It was a femely fight.”

And Chaucer, in his description of the squyers yeoman, says:

“And he was clad in cote and hode of greene;
A shefe of *peacocke* arrowes bryght and shene,
Under his belt he bare full thiriftely,
Well coude he dresse his tackle yemanly:
His arrowes drouped not with fethers lowe,
And in his hande he bare a mighty bowe.”

ProL. to Cant. Tales.

In the wardrobe accmpts of the 28th Edw. I. (p. 359.) is a charge of verdigrease to stain the feathers of the arrows green. Nor are we to suppose that peacock-arrows are only to be found in poetry; a wardrobe accmpt of the 4th Edw. II. furnishes this entry; “*Pro duodecim flechiis*

cum pennis d. p. rous, emptis pro rege de 12 den’.” And Cervate Mulkham mentions that when he wrote, 1631, the peacock feather was sometimes used at the short butt; yet seldom or ever, he complains, did it keep the shaft either right or level. (*Art of Archerie*, p. 91.)

Ascham says, in the composition of an arrow there are three essential parts; the flet or vane, the feathers, and the head. The flet was not always made of the same species of wood, but varied according to the different modes of shooting practised. He commends sound *afb* for military arrows, and prefers it to *asp*, which in his day, as well as in the time of Charles I., was generally used for the arrows of the army: but for pastime he thought none were better than those made of oak, hard-beam, or birch. Occasionally, it should seem the arrow, toward the head, was pierced with brazil, holly, or other heavy wood, to make it fly the steadier. (Mulkham’s *Art of Archerie*, p. 86.)

The arrows at Chevy Chase were drawn to the ear, contrary to the usage of the ancients, as appears not only from many of their reliefs, but the traditionary circumstance of the Amazons parting with the right breast as an impediment to their using the bow. Some of our ancient ballads extend the length of the arrow to an ell; but the cloth-yard appears to have had the preference, and is mentioned not only in the old ballad of Chevy Chase, but by most of our historians, as the particular length of the arrow used by the English archers at the battle of Agincourt, 1415; and by Carew, (*Survey of Cornwall*, p. 73.) 1602, as in use among the Cornish bowmen. (See Strutt’s *Sports and Pastimes*, p. 50.)

Archers generally speak of an arrow weighing so many shillings; but they consider an arrow of an ounce weight to be the best for flight or hitting a mark at a considerable distance. As to the feathers, those of a goose are preferred; it is also wished that the bird should be two or three years old, and that the feather may drop of itself. Two out of the three feathers are commonly white, being plucked from the gander, but the third is generally brown or grey, being taken from the goose, and from this difference in point of colour informs the archer when the arrow is properly placed. (*Archæol.* vol. vii. p. 65.)

Mr. Grose, in his *Military History*, (vol. ii. p. 169.) quotes a curious particular respecting arrow heads from Swinden’s *Hillory of Great Yarmouth*; where the sheriff of Norfolk, in the 42d of Edw. III. being ordered to provide a number of garbs of arrows headed with steel for the king’s use, is directed for the heading of these to seize all the flocks of anchors (*omnes alas ancarum*) necessary for the purpose. Arrows were usually reckoned by the garb or sheaf. For immediate use they were carried in the girdle.

ARROW, for the *Cross-bow*. See BOLT.

ARROW, *Fire*. When the Persians, under Xerxes, encamped on the hill opposite the citadel of Athens, they commenced their attack by shooting against the barricade of wood, which the oracle had declared invincible, arrows wrapped in tow, and fired. (Herodotus, *Urania*.) This, as far as we remember, is the earliest instance of fire arrows on record. Among the Romans they were seldom used. But the warriors of the middle ages frequently fixed phials of quicklime, or other combustibile matter, to their arrow heads, and shot them from the bow; (See *Matt. Paris*, p. 1090, 1091) and in sea-fights they were found particularly serviceable. Even so low as the time of Edward VI. arrows with wild-fire, and arrows with fire-works, are mentioned among the stores at Newhaven and Berwick. (Grose, *Milit. Hist.* vol. ii. p. 270.)

ARROWS, *Whistling*. The use of whistling-arrows, at least in this country, cannot be carried to very high antiquity. It seems probable that they were first used on military occasions,

finns, and especially as signals during the quarrel of the roses. Hall (An. 7. Hen. VIII. fol. 56.) mentions a company of archers who met king Henry VIII. at Shooter's-hill, on a May-day morning, where they discharged their bows in his presence, and the arrows made a loud whistling in their flight, "by crafte of the head." The strangeness of the noise, we are told, surpris'd the king: but this is no proof that the use of the weapon was a novelty. In this case the arrow-head was usually made with horn, rounded at the end and pierced with several holes. See Archæol. vol. ii. p. 58. For the practice of divining by *arrows*, see BELOMANCY.

ARROW, in *Astronomy, Trigonometry, &c.* See SAGITTA.

ARROW, in *Fortification*, is a work placed at the salient angles of the glacis, and consists of two parapets, each forty toises long. The work has a communication with the covert-way, of about twenty-four or thirty feet broad, called *caponier*; and a ditch before it, of five or six toises.

ARROW, in *Geography*, the name of a lough, or lake, in the county of Sligo, in Ireland, which is about eight miles long, full of romantic and woody islands, and of a very irregular form; and also of a river proceeding from the lake, and running northward to Ballydore, where it rushes at once into the sea, breaking over rocks in the most romantic manner, from edge to edge, in many falls for the space of 200 yards, before it comes to the principal one, which is twelve or fourteen feet perpendicular. Beaufort. Young.

ARROW, in *Surveying*, is used for small straight rods, of which there are ten, about a foot or half a yard long, shod with iron ferrils. Their use is to stick into the ground, at the end of every chain, in measuring lines.

ARROWAUKS, or ARWACKS, in *Geography*, a name given to the ancient natives of Hispaniola, Cuba, Jamaica, and Porto-Rico, as well as of Trinidad, who were a mild and comparatively cultivated people, and who seem to have had one common origin, as they speak the same language, possess the same institutions, and practise similar superstitions. Columbus treats of them as such; and the testimony of many contemporary historians confirms his opinion. The Charaibes, or Caribbees, regarded them as the descendants of a colony of Guiana, a race of Indians to whose noble qualities the most honourable testimony is borne by every traveller who has visited them, and recorded his observations. Mr. Bryan Edwards thinks it extremely probable, that all the various nations of this part of the New World, excepting only the Charaibes, emigrated anciently from the great hive of the Mexican empire. But at what period such emigrations were made; whether the Charaibes were previously possessed of the widely extended coast that bounds the Atlantic, or, in posterior ages, accidentally found their way thither by sea from the continent, are points concerning which, as it is impossible to determine, it is in vain to inquire. Mr. Edwards has given a particular detail of their persons and corporeal endowments, their intellectual faculties and dispositions, their political institutions, and their religious rites. See his History of the West Indies, vol. i. p. 60. &c.

ARROW, *Elf*. See ELF-arrows.

ARROWSIKE, in *Geography*, an island in the district of Maine, in America, separated from Parker's island by a small strait. It is within the limits of George-town; and contains nearly one-third of its inhabitants, and has a church. It comprehends about 20,000 acres of land.

ARROW, *Magical*, a sort of weapon very common among the barbarous inhabitants of Lapland, and many other of the northern climates; and supposed to possess very strange virtues.

ARROW, *Wildfire*. See WILDFIRE.

ARROW-head, in *Botany*. See SAGITTARIA.

ARROW-beaded Grass. See TRIGLOCHIN.

ARROW-root, *Indian*. See MARANTA.

ARRUCI VETUS, in *Ancient Geography*, a town of Spain, in Bætica, near the mountains.

ARS NOTARIA. See ART.

ARS *Theffalica*, *Theffalian art*, is used by *Ancient Writers*, for a species of magic, whereby it is pretended, they could draw the moon and stars out of heaven.

It was denominated *Theffalian*, from its supposed inventors, the people of Theffaly.

ARS, in *Geography*, a town of France, in the department of the Creuse, and chief place of a canton in the district of Aubusson; five miles north-west of Aubusson.

ARS, a town of France, on the south-west coast of the island of Ré, two leagues west of St. Martin de Ré. N. lat. 46° 12'. W. long. 1° 37'.

ARS, a river of Spain, which runs into the sea near cape Finisterre, in Galicia.

ARSA, in *Ancient Geography*, a town of Spain, in Bætica, to the north-east.

ARSA, a town of Hispania Tarragonensis, in the territory of the Edutians. Ptolemy.

ARSA, a country of India, on this side the Ganges, between the rivers Indus and Hydaspes. According to Ptolemy it had two cities, viz. Ifaguras or Ithaguras, and Taxila or Taxilea.

ARSACIDÆ, in *Ancient History*, a denomination given to the kings of Parthia, commencing with Arfaces I., the founder of the Parthian monarchy, and terminating with Artabanus, who was put to death by order of Artaxerxes, after the Parthians were subdued by the Persians. The most probable account of this period, which is somewhat perplexed, is as follows. In the reign of Antiochus Theos, king of Syria, Arfaces, a Bactrian, excited the Parthians to shake off the Macedonian yoke, and to establish the national independence. This happened about the year before Christ 250. The success of Arfaces induced the Parthians to elevate him to the throne, and he fixed his residence at Hecatompolis. Seleucus Callinicus, the successor of Antiochus, attempted to recover the Parthian provinces; but he was defeated in a great battle by Arfaces, and made captive; and this event was by the Parthians commemorated at the commencement of their independence; and its anniversary celebrated with great solemnity for many ages. Having possessed himself of Hyrcania and some neighbouring provinces, he was at length killed in battle against the king of Cappadocia, after a prosperous reign of about thirty-eight years. Blair, in his Chronology, dates his death at the year before Christ 245. However this be, he left behind him a great reputation throughout the east; and his successors the Parthian kings all took his name, as the Roman emperors did that of Cæsar. The empire founded by him proved an impenetrable barrier against the Romans, in their attempts to extend their dominions eastward. After various events (see PARTHIA), Artabanus IV. succeeded to the throne; and his prosperity had elated him so much, that, first of all the Parthian monarchs, he assumed the double diadem, and the title of the "Great King." But his power was of no long duration. Ardshir Babegan, or Artaxerxes, excited the Parthians to revolt against him; and in a desperate battle he was defeated, taken, and soon after put to death, in 226. Blair refers this defeat to the year 229, and Playfair to 222. By this event, the Parthian empire, which had subsisted under the "Arsacidæ" 475 years, was finally overthrown, and once more transferred to the Persians. The family of the "Arsacidæ,"

faciæ," however, was not extinguished in Artabanus, but continued to reign in Armenia, till the time of the emperor Justinian, holding that kingdom of the Persian monarchs, to whom the "Arsaciæ" of Armenia were tributaries. *Anc. Un. Hist.* vol. viii. p. 120. vol. ix. p. 210.

ARSACIDES, *Land of*, in *Geography*, high land, covered with wood, situate north of New Britain, in that part of Asia called Australasia, forms a part of the islands of Gower, Carteret, and Simpson, seen by captain Carteret in 1767, observed by M. de Bougainville in 1768; and seen by M. Surville in 1769, who called it the Archipelago of the Arsacides. This land forms some part, at least, of the Solomon islands, which were first recognized by the English; though the discovery of them is claimed by M. Fleurieu, and other French writers, in favour of French navigators. These islands were visited in 1788, by Mr. Shortland, and called by him New Georgia. See *SOLOMON ISLANDS*.

ARSÆ, in *Ancient Geography*, a people of Arabia Felix, according to Ptolemy.

ARSAGALITÆ, a people of India, placed by Pliny beyond the Indus.

ARSAGO, in *Geography*, a town of Italy, in the Milanese, four leagues north of Milan.

ARSAMAS, a town of Russia, in the community of Neshnei Novogorod. It is the capital of the district of Arsamias, situate on the river Tesh, falling into the Ocea, and on the road from Moscow to Altracan, 120 leagues south-east from the former, and 200 north-west from the latter.

ARSAMATIAS, in *Ancient Geography*, a river of Armenia, over which the Parthians compelled the Romans to build for them a bridge. Lipsius has, without sufficient reason, corrected the text of Tacitus, and called it Arsanias.

ARSAMOSATA, *SIMSAT*. See *ARMOSATA*.

ARSANE', a town of Palestine, in which Afa, king of Israel, was buried, according to Josephus, *Ant.* l. viii. c. 6.

ARSANIAS, **ARSEN**, a river of Asia, which had its source in the mountains east of the Euphrates, and passing through a small lake, traversed the south-west between the mountains, passed by Arsamofata, and discharged itself into the Euphrates to the south-west of that city. Pliny, Dion, Plutarch, and Tacitus, mention this river; and the latter says, that it ran between Tigranocerta and Artaxata.

ARSARATHA, a town of Asia, in Armenia Major. Ptolemy.

ARŠCHIN, in *Commerce*, a long measure used in China, to measure stuffs; of the same length with the Dutch ell, which is two feet eleven lines.

ARŠCHOT, in *Geography*. See *AERŠCHOT*.

ARSE-verse, in *Antiquity*, a term, or formula, inscribed on doors, to prevent fire. It is said to be of Tuscan origin, where the word *arse* signifies *avert*, and *verse*, *fire*. *Pitisc. Lex. Ant.*

ARSEMINI, in *Geography*, a town of the island of Sardinia, seven miles south-west of Cagliari.

ARSEN, in *Ancient Geography*, a river of the western part of Arcadia, which ran from the north-east to the south-west, and discharged itself into the river Ladon.

ARSENA, a name given by Strabo to the lake Arethusa in Armenia Major.

ARSENAL, a royal or public magazine, or place appointed for the making and keeping of arms, necessary either for defence or assault. The Romans had arsenals in all the frontiers of their empire.

The arsenal of Venice is the place where the galleys are built and laid up. This is a fortification of between two and three miles in compass; on the ramparts are many little

watch-towers, where centinels are stationed. Like the arsenal at Toulon, it is both a dock-yard, and a repository for naval and military stores. Here the Venetians build their ships, cast their cannon, make their cables, sails, anchors, &c. —The arsenal of Paris is that where the cannon or great guns are cast. It has this inscription over the gate:

"*Ætna hæc Henrico vulcania tela ministrat,
'Tela Gigantum debellatura furores.'*"

There are arsenals or store-houses appropriate to naval furniture and equipments.—At Marseilles is the arsenal for the galleys; and at Toulon, Rochefort, and Brest, are those for the men of war.

ARSENARIA, in *Ancient Geography*, a Roman colony of Africa, in Mauritania Cæleriensis. This town was an episcopal see. It corresponds to the modern ARZEW.

ARSENIAT. See *ARSENIC*, § 10.

ARSENIC, *Arzenique*, Fr. *Arzenik*, Germ. *Arzenicum*, Lat. *Αρσενικον*, *Αρσενικον*, Theophr. & Dioscorid.

Arsenic is a brittle acidifiable metal, of a bluishwhite colour, easily tarnishing by exposure to the air: it does not melt, but volatilizes by a gentle heat, exhaling copious white fumes, with a peculiar alliaceous or garlic smell; it is soluble in nitro-muriatic acid, and is precipitable in the form of a light orange-coloured powder by sulphuret of ammonia, or of a green colour by ammoniated copper.

§ 1. *Ores of Arsenic.*

Besides the ores of arsenic properly so called, this metal is found in combination with silver, copper, iron, lead, cobalt, antimony, and lime, all of which will be treated of in their proper places: at present we shall confine ourselves to those substances which, by the common consent of mineralogists, are arranged as ores of arsenic.

Sp. I. Native Arsenic. *Arsenic testacée*, Born. *Arsenic natif*, Haüy and Brochant. *Gediegener arzenick*, Emmerling, &c. *Arsenicum nativum*, Werner. *Arsenicum nigrum*, *Cobaltum testaceum*, *Fliegenstein*, *Scherbenkobelt*, &c. of the older writers.

Its colour when newly broken is a very light lead-grey, often passing into tin white; but the surface, by a short exposure to the air, becomes yellow, then blackish grey, and finally almost black.

It is found generally in mass, more rarely disseminated; in kidney-shaped or clustered masses, or in plates, or curious, branched, bearing impressions, &c. Externally it is rough or granular, with little or no lustre; internally it is little shining, with a metallic lustre.

Its fracture is sometimes fine-grained, uneven, or curved lamellar; more rarely radiated or bundled. It flies when broken into indeterminate blunt-edged fragments, sometimes in the form of plates. It is also frequently composed of distinct concretions, either testaceous, concentric, or kidney-shaped.

It acquires a polish by friction, and emits an alliaceous odour; is half-hard and brittle. It rings when struck by a hard body.

Sp. gr. according to Brisson 5.724 . . . 5.763; according to Kirwan 5.67.

Before the blow-pipe native arsenic fuses without difficulty, giving out a copious, white, alliaceous fume; by an increase of heat it takes fire, burns with a bluish flame, and is wholly dissipated. It deposits on the charcoal, or any cold substance that is presented to it, a white powder, which is oxyd of arsenic.

Native arsenic is not, however, in a state of absolute purity; it always contains a small and variable proportion of iron; besides occasionally a little gold or silver.

A R S E N I C.

This mineral is found at Worlich and Joachimsthal, in Bohemia; at Freyberg, Annaberg, Schneeberg, Marienberg, and Johangeorgenthal, in Saxony; at Andreasberg, in the Hartz; at Geisberg and Seltzsch in Carinthia; at Nagyag in Transylvania; and St. Marie-aux-mines in France. It occurs only in the veins of primitive mountains: the substances that accompany it are red silver, realgar, galena, native silver, specular cobalt, kupfernikkel, spathose iron, fahlerz, pyrites, quartz, heavy spar, calcareous and fluor spars.

Sp. II. Marcasite or Mispickel. *Arsenical pyrites*, Kirw. *Fer arsenical*, Haüy. *Arsenik kies*, Germ. *Arsenicum mineralizatum pyriticum*, Werner.

Of this there are two varieties.

Var. 1. Common Marcasite. *Gemeiner arsenik kies*, Germ. Its colour where recently fractured is silvery white, but in general its surface is yellowish, greyish, or bluish, sometimes iridescent. It occurs in mass, disseminated, inveiling, or crystallized. The primitive form of its crystals is a striat rhomboidal prism, the angles of whose base are $103^{\circ} 20'$, and $76^{\circ} 40'$: the other varieties that have been ascertained are, the rhomboidal prism with dihedral summits (Fer arsen. ditetraedre of Haüy), and the same prism with tetrahedral summits (F. ar. quadrifacetal of Haüy). The lateral faces are also sometimes cylindrical, either concave or convex. The faces composing the sides of the prisms are always smooth and shining: those of the summits are crossed by striæ. Internally the marcasite is shining, with a metallic lustre. Its fracture is uneven, coarse, or finely granular; presenting occasionally columnar or granular distinct concretions. When broken it flies into indeterminate sharp-edged fragments. It is hard, generally giving fire with steel, and diffusing an alliaceous odour; is brittle, but difficult to break.

Sp. gr. according to Gellert 5.75; according to Haüy 6.52.

When exposed to the flame of the blow-pipe on charcoal, this mineral gives out a copious arsenical fume, and melts into a globule of brittle iron. Its analysis has not yet been made with any accuracy, and probably the amorphous kind at least, on account of the variable proportion of its ingredients, is incapable of affording an exact result. The constituent parts of pure mispickel appear to be only arsenic and iron, both of them in the metallic state: but it is often intimately mixed with iron pyrites, and hence affords an uncertain quantity of sulphur: two specimens analysed by Vauquelin, yielded respectively 38.8 and 4. per cent. of arsenic, which seems to shew that mispickel and pyrites, though, when pure and crystallized, sufficiently distinct from each other, are so intimately blended by nature, as to pass by insensible gradations from the one to the other extreme of the series. In several of these compounds, however, minute inspection has discovered small separate cubes of pyrites; and these intermediate varieties are rather to be considered as simple mixtures than chemical compounds.

The two substances with which marcasite is liable to be confounded, are arsenical cobalt and pyrites. It differs from the first in being harder, in having a yellowish white tint, while the colour of the other is reddish white, and in the form of its crystals: it is distinguished from the latter by giving out when struck an arsenical, instead of a merely sulphureous odour, by the lighter yellow of its colour, and by its crystalline forms.

Marcasite is found in Bohemia, in Saxony, in Silesia, in Cornwall, and various other places, either in veins, or disseminated through primitive mountains. The substances by which it is accompanied, are generally tin-stone and galena; more rarely black blende, spathose iron, copper pyrites,

quartz, fluor, and calcareous spars. At Reichenbach in Silesia, it is found in serpentine rock.

Marcasite appears to be made little or no use of: the more brilliant specimens are occasionally cut and polished, and made into buttons, and other small articles; this is particularly the case with some found near Dublin, and called Irish diamonds.

Var. 2. Argentiferous marcasite. *Weisserz*, Werner.

Its colour is similar to that of the preceding variety, but when exposed to the air it tarnishes to a deeper yellow. It is rarely found in mass, being generally disseminated or crystallized in minute acicular four-sided prisms. Externally it is shining, internally little shining, with a metallic lustre. Its fracture is fine-grained, uneven, with granular distinct concretions.

Its other external and chemical characters correspond with those of the preceding variety, from which it differs only in a variable proportion of silver, from 1 to 10 per cent.; and for which it is often worked.

It is found at Freyberg and Braunsdorf in Saxony; and is usually accompanied with common marcasite, red silver, galena, copper pyrites, &c.

For the affinities of this mineral with arsenical silver, see SILVER, *Ores of*.

Sp. III. Sulphurated Arsenic. *Rauschgelb*, Germ. *Arsenic sulfuré*, Haüy. *Arsenicum mineralizat. risgallum*, Werner.

This species is divided into two varieties, the red and yellow.

Var. 1. Realgar. *Rotbes rauschgelb*, Emmerling. *Arsen. min. risgall. rubrum*, Werner. *Arsenic sulfuré rouge*, Haüy. *Rubine d'arsenic*, Sanderac, *Rubinschwefel*, &c.

Its colour is a bright Aurora red, passing on one hand to scarlet-red, and on the other to yellow-orange. It is rarely found in mass, more frequently disseminated or inveiling, and very frequently crystallized. The primitive form of its crystals is a long octahedron, with scalene triangular faces exactly the same as sulphur. The two pyramids of the octahedron are sometimes intercepted by a quadrilateral prism (see *Crystallographical Plates*, fig. 94.), forming the variety A. f. r. émoussé of Haüy: other varieties are derived from bevilling and truncating the angles of the intervening prism; and a further variety (fig. 95.) A. f. r. surcomposé of Haüy, is produced by the truncature of all the solid angles of the terminating pyramids. The crystals are for the most part small, and not easy to determine. Their surface and interior are shining or much-shining, with a vitreous lustre. The fracture is uneven granular, passing into minute conchoidal: the fragments are indeterminate, blunt-edged. It is commonly translucent, occasionally semi-transparent or opaque. The colour of its break is orange-yellow. It is very tender, somewhat brittle, and easily broken by the nail. Sp. gr. according to Bergman 3.22. Brisson 3.33. It is idio-electric, acquiring the resinous electricity by friction.

Before the blow-pipe it melts easily, burns with a blue flame, and a sulphureous arsenical odour, and is for the most part volatilized. Nitrous acid in a short time deprives it of its colour. It has never been accurately analysed, but consists principally of arsenic and sulphur.

Realgar occurs native in the vicinity of Ætna and other volcanos, and also in the primitive mountains of Germany, Hungary, and Switzerland. The substances that are found most frequently to accompany it are native arsenic, red silver, and galena.

The substances that it resembles are red silver and chromated lead; it may, however, be distinguished from the first by the following properties: the powder of the silver ore is red, that of the realgar orange-yellow; the sp. gr of the

ARSENIC.

silver ore is the greatest, in the proportion of about 5 to 3; besides which, it does not become electric by friction, nor does it flame or volatilize by the blowpipe. Chromated lead is more than twice as heavy as realgar, and exhibits the same differences with regard to electricity and habitude before the blowpipe as red silver.

Native realgar is made no use of; for the purposes to which the artificial is applied, see § 11. of this article.

Var. 2. Orpiment. *Gelbes raufschgelb*, Emmerling. *Arsen. min. risgal. flavum*, Werner. *Arsen. sulf. jaune*, Haüy. *Auripigmentum*, Lat.

Its usual colour is a beautiful lemon-yellow, passing on one side into sulphur-yellow, gold-yellow, or honey-yellow, and on the other into aurora red. It is found disseminated, and in mass. It is internally shining, or very shining, with a bright waxy lustre, sometimes passing into the metallic. Its fracture is straight or curved foliated. In mass it is rarely more than translucent at the edges, but in thin plates is semi-transparent. Its streak is of the same colour as the mineral itself, only a little lighter. It is very tender, soft to the touch; when in plates is flexible though not elastic. Sp. gr. 3.45. It is idio-electric, and in its chemical characters, corresponds with the preceding variety. It consists of sulphur and arsenic, but the proportions are not ascertained with accuracy.

Orpiment is found in the Bannat in Natolia and Servia, at Nagyag in Transylvania, Felsőbanya in Hungary, &c.

It appears to be a mineral of late formation, being always found in stratiform mountains. It is, for the most part, accompanied by clay, quartz, &c. &c. sometimes by realgar.

The crystalline forms that are usually attributed to this mineral are, upon the authority of Haüy, referred to the preceding variety.

Sp. IV. Native oxyd of Arsenic. *Arsenic oxydé natif*, Fr. *Natürlicher arsenik kalk*, Germ. *Arsenicum ochraceum album*, Werner.

Its colour is snow-white or yellowish, reddish, or greenish-white; it is found also of a clear smoke grey. Its common form is that of a superficial earthy friable crust on the surface of other minerals: more rarely it occurs in an indurated state, either stalactitic, clustered, or crystallized. The crystals are always extremely minute, sometimes capillary, bundled, interlaced, or diverging, sometimes in octahedrons, sometimes in quadrilateral tables. When crystallized it appears to be translucent, but in the earthy state it is always opaque. It is very tender, often friable, brittle; has a very sharp disagreeable taste. Sp. gr. 3.7.

Before the blowpipe it gives out a white smoke, and the usual arsenical odour; the grey coloured, as being little oxydated, burns with a bluish flame: after a time, but not so quickly as native arsenic, it is almost wholly volatilized. It is soluble in fifteen times its weight of boiling water: and appears to be an oxyd of arsenic nearly pure with a variable proportion of oxygen. The only substance with which it is liable to be confounded, is the Pharmacolite, or native arseniat of lime: this latter however is insoluble in water, and leaves a considerable residue when exposed to the blowpipe.

The native oxyd of arsenic is a mineral of very rare occurrence; it is found at Joachimsthal in Bohemia, in Saxony, Hesse, Transylvania, and Hungary, in the vicinity of native arsenic, and in certain cobalt mines.

Lenz, *versuch der Mineralien*, vol. ii. p. 229. Kirwan's *Mineralogy*, vol. ii. p. 254. Haüy, *Traité de Mineral.* vol. iv. p. 220. Weidenmann, *Handbuch*, &c. p. 965. Brochant, *Traité de Mineral.* vol. ii. p. 435.

§ 2. *Affay and Analysis of Arsenical Ores.*

Arsenic is a metal in itself of so little value, and so noxious to other metals by its oblique adherence to them, rendering them brittle, and debasing their colour, that in all works in the great, and even in almost all docimastical assays, every method has been resorted to in order to drive off the arsenic, and its proportion to the whole mass has only been vaguely estimated by the loss of weight experienced during the process. The methods employed by Bergman, and the rest of his contemporaries, for ascertaining the quantity of arsenic in any of its ores, are extremely imperfect; even the accurate Klaproth confesses the imperfections of his mode, and till the publication of Mr. Chenevix's Analysis of the Arseniates of Copper and Iron, chemists had attained no certainty in the resolution of this important problem. We shall first mention the advantages and defects of the methods recommended by Bergman, Kirwan, Klaproth, &c. and then proceed to the more accurate ones of Chenevix.

For the decomposition either of the *native arsenic* or *marcasite*, Bergman proposes to treat the pulverized ore with four times its weight of nitro-muriatic acid, formed of one part nitrous and one and a half or two parts muriatic acid. By this menstruum the silver will be converted into muriated silver, and will, together with the flux, remain undissolved, and the arsenic and iron will continue in solution. The filtered liquor is to be evaporated to one-fourth of its bulk, and poured into water; the arsenic will thus be precipitated, and the iron may then be thrown down from the filtered liquor by ammonia, &c. Another way of proceeding is to boil the ore with dilute nitrous acid, in order to take up the silver, copper, &c., while the arsenic will remain behind in form of a powder, and may afterwards be taken up by nitro-muriatic acid, and precipitated from its solution by water.

To these methods, however, it may be objected, 1st, That the precipitation of arsenic from its solution in nitro-muriatic acid by water, is denied by some chemists; and even if the fact of precipitation be allowed, still it is certain that some of the arsenic will remain in solution. 2dly, Antimony, which is often mingled with arsenical ores, will also be thrown down by this process. 3dly, The Ammonia added to the remaining liquor, besides precipitating the iron, &c. will, by destroying the excess of the nitro-muriatic acid, allow the arsenic acid to combine with the oxyd of iron, and thus induce an error in the proportion of this last metal. 4thly, It appears from the uniform experience of Klaproth, and other eminent chemists, that arsenic is abundantly soluble in nitrous acid, and that the silver precipitated from such a solution, even by muriat of soda, contains a little arsenic; and whichever of the alkalies was afterwards used for throwing down the copper, &c. the necessary neutralization of the nitrous acid would afford an opportunity for the arsenic acid to combine with the oxyd of copper.

The *native oxyd of arsenic* is proposed by Kirwan to be dissolved in boiling water, and of course its proportion is to be estimated by the loss of weight sustained by the quantity of ore thus treated. But (besides other objections) the dark-coloured varieties of this ore are probably not sufficiently removed from the metallic state, to be thus soluble. In order to decompose *realgar* or *orpiment*, Bergman directs long-continued ebullition with muriatic acid, adding, if necessary, a little nitrous, till the insoluble residue becomes grey. The insoluble powder is the sulphur, and the arsenical solution is to be decomposed as before mentioned by water. In this process, however, the sulphur will still retain some arsenic; and a little of the sulphur will be oxygenated, and converted into sulphuric acid. Mr. Kirwan recommends

ARSENIC.

recommends to precipitate the arsenic from the muriatic acid by zinc; but, according to Mr. Chenevix, the precipitate is not pure metallic arsenic, but a mixture of this with arseniat of zinc.

The analyses in the dry way of the arsenical ores are still less satisfactory than those in the humid way above recited. If sublimation in close vessels is had recourse to, a very intense and long-continued heat will be insufficient to volatilize the whole of the arsenic; the sulphur will also rise at the same time and produce orpiment. Roasting in a muffle, provided the ore is mixed with powdered charcoal, is more effectual; but in this case, not only the arsenic, but the sulphur and antimony, if there happens to be any in the ore, will fly off, and the relative properties of these must be estimated by mere guesses.

Klaproth's method of treating the unfulphurated ores of arsenic may be deduced from his analysis of the arsenical silver ore, which consists of iron, arsenic, silver, and antimony. He first digests the ore with moderately strong nitric acid, which takes up the arsenic and the greatest part of the iron and silver: the addition of muriat of soda throws down the silver in the state of muriat combined with a few atoms of arsenic; and afterwards, the arseniat of iron is thrown down by potash; this precipitate being dried and weighed, is afterwards roasted with charcoal several times, till it ceases to give out arsenical fumes, and is attractable by the magnet: from the loss of weight sustained by the iron, the quantity of arsenic is then estimated. This however, as Mr. Klaproth himself observes, is a very imperfect method. Another way practised by him in the analysis of the arsenical cobalt is, to digest the ore in nitric acid, which oxydates the arsenic and takes up the greater part of it, leaving the residual arsenic soluble in water. The nitrous solution is then evaporated as long as it continues to deposit oxyd of arsenic, and the oxyd of cobalt afterwards separated by potash from the nitrous acid, is presumed to be pure, because it affords a sympathetic ink with muriatic acid. From this humid analysis the cobalt ore is stated by Klaproth to contain 54.5 cobalt, 45 oxyd of arsenic and $\frac{1}{2}$ sulphur: a specimen, however, of the same ore treated in the dry way, afforded only 44 cobalt; there was therefore required to make up the 100, $\frac{1}{2}$ sulphur, and 55.5 reguline arsenic. Hence it is evident, that little dependence is to be placed on the estimation of the quantity of arsenic from the oxyd precipitated by evaporation of the nitrous solution.

A more certain mode of ascertaining the proportion of arsenic is furnished by Mr. Chenevix. Let the ore, previously reduced to extremely fine powder, be digested in nitric acid sufficient to acidify and take up the whole of the arsenic; pour off the clear liquor, and boil on the residue some distilled water; filter, and add the water to the nitrous solution: then neutralize the excess of acid by potash, taking care, however, not to have an excess of alkali, and add nitrat of lead as long as any precipitate takes place: wash the precipitate in cold water, dry and weigh it. As the arsenical ores often contain sulphur, it is possible that the arseniat of lead thus procured, may be mixed with a little sulphat of lead: to decide this, digest the powder in some warm dilute muriatic or nitrous acid, and the arseniat of lead will be dissolved, leaving the sulphat behind. 100 parts arseniate of lead contain, of arsenic acid 33, oxyd of lead 63, water 4, and the 33 parts arsenic acid, denote 22 of the metal.

§ 3. *Reduction of Arsenical Ores, and Preparation of Crude Arsenic, and White Arsenic.*

Arsenic is a substance of such small value and such little demand, that none of the proper ores of this metal are

wrought in the great; the whole of the arsenic of commerce being prepared in Saxony, by roasting the cobalt ores in the manufacture of zalfire. These consist principally of arsenic, cobalt, iron, and a little sulphur: the first and last ingredients of which are got rid of by roasting: this process, instead of being performed in the open air, is done in an oven, the flue of which runs horizontally to a considerable distance before it bends upwards. By this contrivance the arsenic and sulphur, when liberated, are for the most part deposited in the horizontal flue in the form of a greyish meal, streaked with yellow (such portions as are nearest the fire being often melted into a semitransparent crystalline mass). In this state it is called *crude arsenic*, or *flowers of arsenic*; the yellow streaks proceed from the sulphur uniting with the arsenic into orpiment: and besides this, it is also sullied with other impurities.

The *white arsenic* of commerce is prepared from the crude, by mixing this last with potash, or as some advise, with lime, and re-subliming. By this the sulphur and other impurities unite with the alkali, and the white oxyd is driven over into a heated receiver, where it melts into a heavy colourless transparent glass: by exposure for a short time to the air, this glass becomes opaque, and resembles in its fracture the finest white china; and it is in this state that the white arsenic of commerce is found in our shops and laboratories.

§ 4. *Preparation of Reguline Arsenic.*

The old method of procuring the regulus of this metal consisted in mixing white arsenic with half its weight of black flux, one fourth part of borax, and the same proportion of filings of iron or copper, and fusing the whole as quickly as possible in a crucible. When the whole is grown cold, there will be found, on breaking the crucible, a mass of impure metallic arsenic, of a bluish white colour and considerable hardness and solidity. Probably this regulus was originally made from the crude arsenic, in which case the addition of iron or copper was for the purpose of separating the sulphur according to the process mentioned for martial regulus of ANTIMONY. (§. 4.—III.) It is obvious, however, that the arsenic must contain a variable proportion of iron or copper when prepared according to this method, by which its external and chemical characters will be in some degree modified. Another way of obtaining the regulus is recommended by Brandt, to which there can be no objection, upon the supposition that he used crude arsenic. He directs that white arsenic should be mingled with soap, and sublimed: in this operation the oil of the soap serves to de-oxydate the arsenic, and the alkali to keep down any portion of sulphur that may have been combined with the arsenic.

The white arsenic of commerce being an almost entirely pure oxyd of arsenic, the reduction of it into the metallic state is very easily effected. The most eligible way is to mix the white arsenic with any of the vegetable or animal expressed oils, till it becomes of the consistence of very soft glazier's putty; it is then to be made up into round or oblong pieces, and dropped into a Florence flask, so as not to adhere to the sides. The flask with its contents is to be put into a sand-bath, or over a gentle charcoal fire, and must be heated very gradually as long as any thick vapours proceeding from the decomposition of the oil are given out. When these cease, the heat may be by degrees increased till the bottom of the flask becomes obscurely red; shortly after the flask may be withdrawn from the fire, and when cold, upon carefully breaking it, there will be found in the neck and upper part of the vessel, a crust of brilliant triangular crystals of oxyd of arsenic, semi-transparent, and

A R S E N I C.

of a yellowish grey colour, below these there will be a thick amorphous crust of regulus, and some impurities will remain at the bottom. Let these products, except the impurities, be separated from the fragments of glass, and pulverized together with half their weight of charcoal; then re-sublime the whole as before, and the inside of the flask will be found lined with a crust and crystals of pure and shining regulus of arsenic. It is necessary that these sublimations should be performed under a chimney, for the vapours that arise are intolerably fetid, and extremely noxious to the operator, bringing on in a very short time headach, sickness, and other unpleasant symptoms. Instead of a flask, an earthen retort may be made use of.

§ 5. External Characters and physical Properties of Reguline Arsenic.

The fresh surface of arsenic is of a bright metallic lustre, and a colour between that of tin and lead; it very soon however tarnishes by exposure to the air, becoming first yellowish, then slightly iridescent, and lastly black, in which state it is also wholly destitute of lustre. Its fracture is compact, granular; in hardness it is said to be superior to copper, but it is so brittle as to be reducible to powder in a common mortar without any difficulty, being neither malleable nor ductile. It crystallizes in octahedrons or tetrahedral pyramids. Sp. gr. = 8.31, according to Bergman, but according to Morveau = 5.76. It is not sensible to the smell when cold, yet the fingers after handling it acquire a slight metallic odour: it is manifest to the taste by a peculiar acrid flavour; and when heated to volatilization, diffuses a characteristic fetid alliaceous odour.

§ 6. Chemical Properties of Reguline Arsenic.

I. Effects of Heat.

Arsenic, when pure, is incapable of being melted: in close vessels, at a heat inferior to that required for the fusion of tin, it begins to be volatilized, and is deposited in the upper and cooler parts unchanged in form or properties.

II. Effects of Atmospheric Air.

Atmospheric air at the usual temperature is slowly decomposed by this metal, the oxygenous part uniting with the arsenic, and converting it into a black oxyd, as mentioned § 5. At a heat of about 350° Fahr. the absorption of oxygen is much more rapid, and vapours of white oxyd begin to be visible, diffusing the well-known arsenical smell. At a higher temperature combustion takes place: thus if a vessel or crucible be made red hot, and a few pieces of arsenic be thrown in, a dense white vapour is immediately produced, accompanied by a light blue flame, and in a short time the whole is volatilized. This experiment must not be made in an iron ladle, for the affinity between the two metals at this temperature is so great, that artificial mispickel would be formed, and this being very fusible, the ladle would in all probability be found after the process to have a hole in its bottom.

III. Effects of Water.

Although arsenic is so easily oxydable, yet it does not appear capable of decomposing water; at least it may be immersed in it for any length of time without exhibiting any signs of solution or oxydation; and a covering of this fluid or of alcohol is the best preservative of arsenic against the tarnishing effect of the air.

IV. Arsenic with Hydrogen.

This combination was first discovered by Scheele. If liquid arsenic acid be digested with zinc, an effervescence will take place; and the air thus disengaged, has a strong arsenical smell, inflames by the contact of a candle, and deposits on the inside of the vessel a brown film, which is metallic arsenic. The same gas may also be produced by

granulated zinc in a hot solution of white arsenic in water with the addition of a little muriatic acid.

V. Arsenic with Phosphorus.

The union of these two substances was first observed by Margraaf, whose experiments have since been repeated and confirmed by Pelletier. Phosphuret of arsenic may be made in four ways: first, by subliming equal parts of phosphorus and white oxyd of arsenic, in which case, part of the phosphorus will be acidified at the expense of the metallic oxyd, while the remainder will combine with the metallic base; secondly, by subliming equal parts of reguline arsenic and phosphorus; thirdly and fourthly, in the humid way, by digesting equal parts of arsenic or oxyd of arsenic, with the same weight of phosphorus in a flask, containing a sufficient quantity of water. Phosphorated arsenic is volatilizable in a moderate heat, and is combustible on hot coals, exhaling the mixed odour of its ingredients.

VI. Arsenic with Sulphur.

Both arsenic, and the white oxyd, are capable of uniting with sulphur, by means of fusion or sublimation, into a beautiful red or yellow mass, according to the relative proportion of the ingredients. The yellow is called *orpiment*, or yellow sulphuret of arsenic, the red, *realgar*, or red sulphuret. The sulphur in the realgar is to the arsenic as 1 to 4 nearly, but in the orpiment as 1 to 9 or 10. Both preparations are fusible, and may be sublimed, but the realgar is more easily melted, and with care may be obtained quite transparent, and of a bright red colour; hence it has been called *arsenical ruby*, *rubine d'arsenique*. The sp. grav. of orpiment, according to Bergman, is = 5.315; but of realgar, only = 3.225.

These two substances have not been very accurately analysed, and it is the opinion of several modern chemists, that the differences between them does not depend so much on the proportions of the sulphur and arsenic, as on the presence of oxygen in the one, and its absence from the other. Hence they call realgar, sulphuret of arsenic, and orpiment, sulphurated oxyd of arsenic. This appears, however, to be a mistake, for the following reasons; when regulus of arsenic and sulphur are mixed together, the combination takes place without the extrication of any gas, but when the oxyd of arsenic is substituted for the regulus, at the moment of combination a portion of the sulphur is converted into sulphureous acid gas, probably on account of a decomposition of the metallic oxyd. Further, it appears from the experiments of Bucquet, that by continued fusion orpiment is made of a much redder colour than before, by the volatilization of part of its arsenic; and as an additional confirmation, it may be mentioned that realgar, being sublimed either with metallic or oxydated arsenic, is converted into orpiment.

It is not very easy to make realgar by the direct combination of its elements when they are in a state of purity, on account of the ease with which they are volatilized before they have experienced the proper degree of heat. In Saxony, where orpiment and realgar are made in large quantities, the method is to fill an oven like that described in § 3. with mispickel and iron pyrites, proportioning the quantities of each according as realgar or orpiment is intended to be produced. Now the sulphur and arsenic contained in these minerals being in natural combination with iron, require for their sublimation a degree of heat far greater than they could sustain without volatilization, if they were pure.

Sulphurated arsenic is wholly insoluble in water or alcohol. The nitrous and nitro-muriatic acids, especially when warm, take up the arsenic from the sulphur. The former of these, however,

A R S E N I C.

however, except it is so concentrated as to act on the sulphur also, only takes up a portion of the arsenic from realgar, converting it into orpiment. Nitro-muriatic acid completely decomposes both the red and yellow sulphuret, hepatic gas being given out at the same time, a circumstance worthy of notice, as affording additional strength to the opinion mentioned above, concerning the state of the metal in these compounds. Sulphuret of arsenic is also decomposed by distillation with two or three times its weight of *corrosive muriat of Mercury*, the acid and oxygen of the mercurial salt uniting with the arsenic into corrosive muriat of arsenic, § 7.; and the metallic base with the sulphur of the orpiment, forming cinnabar.

In the dry way, the fixed alkalies decompose orpiment into alkaline sulphuret and arsenic, which latter sublimes; but if the alkali is in excess, the arsenic is in part detained as well as the sulphur. A solution of caustic potash in water being boiled with orpiment, dissolves it completely, but by the addition of an acid a yellow precipitate is thrown down, which probably is a *hydrosulphuret of arsenic*. Quicklime and orpiment also unite by boiling in water, forming an arsenio-sulphuret of lime, which is sometimes employed as a **WINE-TEST.**

VII. Arsenic with Oils.

Any of the expressed oils being triturated with arsenic, gradually dissolve it, and thus acquire a dark colour and consistence like salve.

VIII. Alloys of Arsenic.

Arsenic unites with almost all the metals, debasing the red and yellow ones, and destroying in a great measure the lustre of all the rest, except tin. It renders those which are malleable and ductile, brittle, and for the most part increases their fusibility and hardness. For other particulars, see the several metals.

§ 7. Salts of Arsenic.

1. Reguline arsenic is acted upon by sulphuric acid when concentrated and assisted by heat: if the operation be performed in a retort with a pneumatic apparatus, there will be produced a considerable quantity of sulphureous acid gas, and sulphur will sublime into the neck of the vessel. What remains behind is a white mass similar to oxyd of arsenic, but combined with a little acid. By the addition of a fresh portion of sulphuric acid, the sulphated oxyd is taken up; as the liquor cools, however, a precipitation of crystalline grains happens, and these are *sulphat of arsenic*. This salt is much less soluble in water than white arsenic; when exposed to the flame of a blow-pipe, it fuses and begins to emit an arsenical smoke, but requires a much longer time for its volatilization than the simple oxyd. By repeated cohobation with sulphuric acid, the arsenic approaches more and more to the nature of arsenic acid, but always continues in some degree sulphated.

2. Nitric acid when hot is readily decomposed upon reguline arsenic, being itself changed into nitrous gas, and the metal becoming oxydated. An addition of dilute nitrous acid at a boiling temperature effects a complete solution of the residual oxyd, and the liquor by evaporation and cooling may be brought to deposit crystals of *nitrat of arsenic*. This salt being abstracted with fresh nitrous acid, and then heated red hot, is wholly converted into arsenic acid. Nitrat of arsenic is sparingly soluble in water, and with the blow-pipe exhibits nearly the same appearances as the preceding salt.

3. Oxymuriatic acid when pure, fresh made, and in the form of gas, exercises a very powerful action on the regulus of arsenic, and exhibits a very striking and beautiful appearance. For this purpose, let a common six or eight ounce

phial be filled in the usual way with oxymuriatic acid gas procured from salt, manganese, and sulphuric acid, in order to have the acid as dry as possible (for the further securing of which, the gas produced about the middle of the process is the best); stop the mouth of the phial with a cork, and place it on a table in an upright position; then reduce some reguline arsenic to a fine powder, and cautiously opening the mouth of the phial, shake in from the end of a knife, or in any other convenient way, a little of the powder. As soon as it comes in contact with the gas, a white vapour will first appear, and will be immediately followed by ignition of the metal, which in its passage to the bottom of the vessel will appear like a stream of fire: this phenomenon may be repeated with successive portions of powder till the acid is almost wholly decomposed. At the bottom will be found a white acidulous oxyd of arsenic. Liquid oxymuriatic acid also is capable of dissolving reguline arsenic; but during this process, the metal being oxygenated at the expense of the acid, the result is muriat of arsenic.

4. Arsenic acid has a remarkable action on its own regulus, though the two appear to be incapable of combining into a proper salt. If the regulus is digested with the acid, its surface becomes shortly covered with a white powder, which is oxyd of arsenic. If the acid is kept in a state of fusion in a retort, and small pieces of the regulus are dropped in from time to time, an inflammation and sublimation of white arsenic will be manifest at each addition. Hence it appears that the oxygen of the arsenic acid quits this to combine with the regulus, till an equilibrium is produced by the one and the other being brought to a common state of oxydation.

These are all the acids which are known to act upon reguline arsenic; many others however are capable of combining with this metal, when previously brought to the state of white oxyd. The salts hence resulting we shall proceed to mention.

1. Muriatic acid when boiling will take up one third of its weight of oxyd of arsenic; a saline precipitate is produced by cooling, and if this is managed gradually, there are formed spicular crystals of *muriat of arsenic*. This salt sublimes wholly if exposed in close vessels to a moderate heat. Before the blow-pipe on charcoal it is decomposed in part, and flies off, giving out at the same time the distinguishing odour of the metal. It is soluble, though sparingly, in warm water, and the solution is decomposable by an alkali, the oxyd of arsenic being thrown down.

Very dry and concentrated muriatic acid, or oxymuriatic acid, are capable of uniting with a much larger proportion of oxyd of arsenic than the liquid muriatic acid. This combination is called *butter of arsenic*, and is thus prepared: take one part of white arsenic, one and a half of red calcined sulphat of iron, and three parts of common salt; mix them accurately in a mortar, and distil in a glass retort from a sand bath. When the heat has been gradually raised so as to make the bottom of the retort nearly red, and nothing more comes over, the process is finished, and there will be found in the receiver two distinct liquors of different consistence. The lower one is of a clear iron brown colour, and is called *butter of arsenic*; the supernatant liquor is thinner, of a lighter yellowish colour, and is called *oil of arsenic*.

Butter of arsenic is a heavy thick liquor, excessively corrosive and poisonous; on exposure to the air it exhales a dense white suffocating vapour, deliquesces, becomes turbid, and finally is spontaneously decomposed. When, instead of this gradual absorption of moisture, it is directly mingled with water, an immediate turbidness and precipitation

ARSENIC.

tation ensues of a white pulverulent matter, which was formerly taken for pure oxyd of arsenic; it still, however, as in the case with similar metallic precipitates, retains a portion of acid; for by heating in a close vessel, a little butter of arsenic is sublimed. Liquid muriatic acid unites very sparingly and imperfectly with the butter; and if considerably diluted with water, produces a decomposition just in the same manner as pure water does.

Oil of arsenic, like the preceding, is decomposed in part by water or alcohol, but the precipitate is not so copious: it mingles with liquid muriatic acid without producing any turbidness. The addition of a carbonated alkali is followed by effervescence and the precipitation of oxyd of arsenic. By spontaneous evaporation it yields crystals of muriated arsenic, and a slight efflorescence of white oxyd of arsenic.

There are several other methods of obtaining the butter and oil of arsenic: thus, if orpiment is distilled with two or three times its weight of corrosive sublimate, the sulphur of the former unites with the mercury of the latter, and produces cinnabar, while the arsenic of the former combines with the oxygen and acid of the latter into the oil and butter of arsenic. It is remarkable, however, that corrosive sublimate is not decomposable by oxyd of arsenic; for when the two are distilled together, whatever be their relative proportions, the mercurial salt rises unchanged. Indeed the superiority in affinity of muriatic acid for oxyd of mercury over oxyd of arsenic is still more strikingly shewn by distilling butter of arsenic with oxyd of mercury, in which case a little butter of arsenic first comes over, then corrosive sublimate, and finally white arsenic. If, however, *reguline arsenic* is distilled with corrosive sublimate, the produce is butter of arsenic, a little calomel, and running mercury.

Although the salts of arsenic have not yet received that notice from chemists to which they are entitled, still there has arisen some difference of opinion respecting the combinations of this metal with muriatic acid, some asserting the butter of arsenic to be a proper oxymuriat, while others consider it as scarcely differing, except in concentration, from the muriat. From a careful collation of the scattered facts relative to this subject, it appears that there is no such salt as oxymuriat of arsenic, but that muriatic acid, when its affinities are not weakened by water, will take up a large quantity of arsenical oxyd forming the butter of arsenic; that when by the gradual or sudden addition of water, the affinities of this latter are brought into action, an unequal partition of the acid and oxyd takes place into a soluble and insoluble muriat of arsenic. Hence we have three distinct salts composed of muriatic acid and oxyd of arsenic: first, muriat of arsenic with the smallest proportion of metallic oxyd, this is soluble in water and crystallizable by cooling, and is also capable of sublimation without decomposition; secondly, muriat of arsenic with a larger proportion of metallic oxyd (butter of arsenic), decomposable by water, and not crystallizable; thirdly, muriat of arsenic supersaturated with the oxyd, insoluble in water, decomposable by sublimation.

2. Oxymuriatic acid gas passed into an aqueous solution of white arsenic, is itself decomposed into muriatic acid; and by distillation, the water and muriatic acid being drawn off, there remains in the retort solid arsenic acid. It is therefore probable that the three muriats of arsenic just mentioned differ from each other in the degree of oxygenation of the metallic base, as well as in the proportions of it that they contain; the first being the least oxygenated, and the latter the most so.

3. Fluoric acid, when digested on white oxyd of arsenic, dissolves a small proportion; and by evaporation and cooling,

a granular crystalline salt is obtained, *fluat of arsenic*, the properties of which have not been examined into.

4. Boracic acid combines with white arsenic by means of water, but not in the dry way, according to Reuls. Equal parts of the oxyd and acid digested together in a little water are entirely dissolved, and afforded by evaporation *borat of arsenic* in powder or spicular crystals.

5. Phosphoric acid and oxyd of arsenic combine together without difficulty in the moist way, and afford crystals of *phosphat of arsenic*. This salt is very sparingly soluble in water, and is decomposable by heat, the oxyd being volatilized.

6. Liquid tartareous acid unites by digestion with oxyd of arsenic into a crystallizable salt, *tartrate of arsenic*, the properties of which are as yet in a great measure unknown.

7. Oxalic acid dissolves very easily a considerable quantity of white arsenic, and the liquor affords by evaporation and cooling prismatic crystals of *oxalat of arsenic*: these melt in a very gentle heat, the water of crystallization with part of the acid is evaporated, and the residue affords a very beautiful saline vegetation. Oxalat of arsenic is soluble both in water and alcohol, changes the colour of litmus tincture to red, and sublimates at a moderate heat; but at a higher temperature the acid is first destroyed and flies off, leaving behind the metallic oxyd.

8. Acetous acid, by long digestion and boiling with white arsenic, dissolves a small proportion, and deposits by cooling and evaporation small crystalline grains of *acetite of arsenic*, which are very sparingly soluble in water.

9. Benzoic acid, according to Trommsdorff, dissolves white arsenic with considerable ease, and forms with it *benzoat of arsenic*. This salt appears in the form of long slender radiating crystals, possessed of a sour and pungent taste, which effloresce in the air, are very soluble in boiling water, and are again for the most part deposited by cooling.

10. *Gallat of arsenic* is not known, nor does the tincture of galls, according to the chemists of Dijon, produce any alteration in a solution of white arsenic.

11. Prussiat of potash, when pure, throws down an abundant white precipitate from the solution of arsenic in muriatic acid. This is soluble in a large quantity of water, and by sublimation in the dry way affords a semi-transparent mass; it is probably a *prussiat of arsenic*, but has been as yet scarcely at all examined.

The order of affinity of the various acids for oxyd of arsenic is not ascertained with much certainty. Bergman arranges them in the following order; muriatic, oxalic, sulphuric, nitric, tartareous, phosphoric, fluoric, arsenic, acetous, and prussic acids.

§ 8. Oxyd of Arsenic, or Arsenious Acid.

Oxyd of arsenic is prepared in the large way according to the method already mentioned in § 3. When pure, it is of an opaque white colour; or if recently fused, is perfectly transparent and colourless. It crystallizes artificially (§ 4.) in three-sided pyramids, the vertical angle of which is generally deeply truncated; the crystals are transparent, of a dilute wine yellow colour, and not liable to effloresce or become opaque by exposure to the air, probably owing to their containing rather a smaller proportion of oxygen than the white arsenic of the shops. The sp. grav. of the fused oxyd is about = 5. It slowly excites upon the tongue a sweetish acid taste. It is the most volatile of any of the metallic oxyds, rising at 383° Fahr.

Pure water at the temperature of 60° Fahr. will dissolve about $\frac{1}{80}$ of its weight of this oxyd, but when boiling it takes up $\frac{1}{5}$, the greater part of which it retains even when cold; by evaporation, however, minute three-sided pyramidal

A R S E N I C.

pyramidal crystals are deposited: the solution is clear and colourless. Alcohol also, when boiling, will dissolve about $\frac{7}{8}$ or $\frac{1}{8}$ of its weight.

From many of its properties white arsenic seems to hold a kind of middle place between an acid and metallic oxyd: thus, it reddens litmus tincture, but turns syrup of violets green, and its aqueous solution is incapable of causing an effervescence in the carbonated alkalies and earths. In the new chemical nomenclature it is denominated the arsenious acid (*acide arsenieux*, Fr.); and the salts that are formed by its combination with the alkalies, earths, and metals, are called arsenites. These seem to hold nearly the same relation to arsenic acid and the arseniats, as sulphureous acid and the sulphites do to sulphuric acid and the sulphats.

The white oxyd of arsenic is easily deoxygenated by carbonaceous matter, by hydrogen, phosphorus, and sulphur, as already mentioned § 4. and 6. and is reduced to the state of reguline arsenic: its habitudes with acids are described § 7.

If to a solution of caustic pot-ash in water there be added some finely powdered oxyd of arsenic, the whole combines together by a boiling heat into a thick, viscid, scarcely fluid matter, of a brown colour, and nauseous smell, which as it cools becomes solid and brittle. This was named by Macquer *liver of arsenic*, and in the modern system has obtained the name of *arsenite of potash*. By long exposure to the air it becomes deliquescent; it is readily soluble in water, but has not been made to crystallize. The addition of any of the acids to the solution causes an immediate decomposition with a copious precipitation of oxyd. Caustic soda produces the same general effects on white arsenic as potash, except that the arsenite of soda is crystallizable. Either of these salts, on being subjected to a full red heat, is decomposed; the greater part of the arsenic being volatilized in the form of a dense white smoke, while the remainder in the state of arsenic acid remains united with an excess of alkali. In the dry way, the white oxyd of arsenic melts together with the fixed alkalies, forming a mass not easily decomposable by heat. According to Bergman, potash is capable of thus fixing twice its weight of the oxyd, and soda three times its weight of the same.

When ammoniacal gas is passed two or three times over heated white arsenic, the two substances contract at length so intimate an union as to bear even fusion without separating from each other. In the moist way also, a combination takes place by the help of a gentle heat, which differs essentially from the common liver of arsenic in that the acids occasion no precipitation. These are singular facts, and the nature of the arsenite of ammonia is well worthy of more notice from chemists than it has yet obtained.

Quicklime and barytes combine by fusion with oxyd of arsenic into a vitreous mass, which however becomes milky and opaque by the continued action of the air. In the moist way, lime and white arsenic being boiled together form a soluble arsenite of lime, from which a precipitate is thrown down on the addition of an acid. Neither magnesia, alumina, nor silex, appear capable of uniting with white arsenic by fusion, but all or any of them combine into an easily fusible mass with the arsenites of potash, soda, lime, or barytes.

But few of the neutral salts have been examined with respect to their action on arsenious acid. The nitrats of potash and soda are decomposed by heat converting the arsenious into the arsenic acid, and therefore this combination is treated of in § 10. (*Arseniats*). The effect of white arsenic on acetite of potash, as recorded by Cadet and the other chemists of the academy of Dijon, is however too

remarkable to be omitted. A mixture of these two substances being subjected to distillation, there first passed over a limpid liquor, with a slight arsenical smell; this changed the colour of syrup of violets red, caused an effervescence in a solution of carbonated alkali, and rendered the liquor turbid. The next product was of a reddish brown colour, and filled the receiver with a dense vapour of a most pestiferous odour, different however from that of arsenic; towards the end of the process, some reguline arsenic sublimed into the neck of the retort. The red liquor, after being confined for three weeks in a stopped phial, was still smoking, and exhaled the same detestable smell as before; it produced no alteration in syrup of violets, and occasioned only a very feeble effervescence with carbonated alkali, depositing a little flocculent sediment: it occasioned a white precipitate in a solution of corrosive sublimate: being poured into a filter, in order to separate a yellowish thick portion that had separated from the rest, scarcely had a few drops passed through, than a dense suffocating vapour began to rise accompanied by an ebullition at the edges of the vessel, and immediately followed by a beautiful rose-coloured flame which lasted several seconds.

A hot solution of arsenious acid dissolves some of the metals, particularly copper, iron, and zinc; the differences, however, between these and the metallic arseniats have not been ascertained with much accuracy.

§ 9. *Arsenic Acid.*

The properties of the white oxyd of arsenic that have been mentioned in the preceding sections, especially its ready solubility in water, its crystallizability, its taste, its habitudes with alkalies and metals, had long induced a suspicion of its saline nature. This suspicion was at length confirmed by Macquer's valuable discovery of the *arsenical neutral salt* (see § 10. arseniat of potash); but chemists still continued ignorant of the precise difference between this and the liver of arsenic (arsenite of potash). The illustrious Scheele first cleared up this difficulty, and pointed out a method of procuring the arsenic acid in a state of purity, and uncombined with any other substances. Bergman's valuable essay on the same subject confirmed and extended the discoveries of his friend and countryman, and more recent experiments have brought new accessions to the interesting facts already collected. Arsenic, as well as some others of the metallic bodies, is not only a combustible and oxydable, but also an acidifiable base. It combines with oxygen, in at least three different proportions. By the spontaneous action of air and moisture, at the usual temperature, it is converted into the black oxyd, an additional portion of oxygen is absorbed by the assistance of a higher heat, forming the white oxyd; and by means, that we shall now proceed to mention, this latter substance may be saturated with oxygen, forming a perfect acid; the *arsenical*, or ARSENIC (*acidum arsenicum*, or *arsenici*, *acide arsenique*, *arseniksaure*.)

The method recommended by Scheele for the preparation of arsenic acid is the following.—Take two parts of finely powdered white oxyd of arsenic, and put it into a capacious tubulated retort, adapted to a quilled receiver, and fixed properly in a sand-bath; then pour in seven parts, by weight, of strong and pure muriatic acid, and close the tubulure of the retort; as soon as the acid begins to boil, the arsenic will be rapidly dissolved; and when the whole is taken up, lower the heat, and add three and a half parts of concentrated nitric acid; the mixture will immediately begin to foam, and there will be a copious extrication of nitrous gas.

The distillation is, at the same time, to be proceeding gradually, as long as any nitrous gas is produced; and when this ceases, one part more of the white oxyd of arsenic may

A R S E N I C.

be added. As soon as this is dissolved, pour into the retort one and a half part of nitric acid, and a fresh effervescence will take place. The whole is now to be distilled to dryness, and towards the end of the process the heat must be increased till the bottom of the retort, with its contents, is red hot. After the retort is grown cold, it must be broken, and there will be found within it a saline mass, which is the dry arsenic acid. In order to preserve it in its solid state, it must be put into a dry, well-stopped phial. The proportion of acid thus procured is nearly equal to the quantity of white oxyd employed. The use of the muriatic acid in this process, seems to be merely that of a solvent of the arsenical oxyd, which is thus presented to the action of the nitric acid in a state of extreme division. The nitric acid is decomposed into nitrous gas and oxygen, the former of which flies away, while the latter is expended in acidifying the oxyd; by the subsequent red heat, the undecomposed residue of the nitrous acid, and the muriatic, are driven off in vapour, and the arsenic acid alone remains behind. It generally, however, corrodes the retort, in a greater or less degree; whence the solid acid, when boiled with water, leaves a small insoluble residue of filix.

Bergman's method is to make a hot saturated solution of white arsenic in muriatic acid, and to add double the weight of nitric acid. The effervescence, however, thus occasioned, is so great, that a considerable portion of the arsenic is driven over in the form of butter of arsenic, and the consequent produce of acid is much diminished, the quantity of this being estimated by Bergman at no more than 50 per cent. of the white oxyd employed. Weigleb, by repeatedly returning the liquor collected in the receiver into the retort with fresh nitric acid, obtained $112\frac{1}{2}$ of arsenic acid for every 100 of oxyd.

Another method of preparing this acid, also discovered by Scheele, is by oxymuriatic acid. Take one part finely pulverized black oxyd of manganese, and mix it with three parts of strong muriatic acid, in a tubulated retort, large enough to allow ample room for the effervescence of the mass: the retort is to be connected, in the usual way, with a Woulfe's apparatus, containing the white oxyd of arsenic and a little water. By a gentle heat, the muriatic acid becomes oxygenated at the expense of the manganese, and passes into the bottles in the form of oxymuriatic acid; here it is decomposed, and the muriatic acid unites with part of the arsenic, while the oxygen combines with another portion. This compound liquor being then gently distilled to dryness, and towards the end of the process the bottom of the retort being made red hot, a complete separation will take place; in the receiver there will be found distilled muriatic, or butter of arsenic, and the saline mass remaining in the retort is arsenic acid.

A simpler way of procuring the acid, is to heat together the white oxyd of arsenic, with diluted nitrous acid, in a retort, and when the solution is complete, to add some strong nitric acid, and proceed to distillation: much nitrous gas will be given out, and some orange-coloured acid will come over into the receiver; return this upon the mass in the retort before it becomes dry, together with a fresh portion of strong nitric acid, and thus repeat the cobobation till the extrication of nitrous gas has almost ceased; then distil to dryness, and make the bottom of the retort red hot; all the remaining oxyd of arsenic and nitrous acid will be driven off, and nothing will be left behind but pure arsenic acid.

Besides the above processes, Pelletier has described another method of procuring the acid of arsenic. He mixes the white oxyd with nitrat of ammonia, and subjects the

mass to distillation in a luted retort. It is necessary to begin with a very gentle degree of heat, for the decomposition of the ammoniacal salt is otherwise so rapid, that a large portion of the oxyd of arsenic is carried over into the receiver. But by proper management, the operation goes on more slowly and quietly; there passes over some nitrous acid, and by a slight increase of the heat, ammoniacal gas is also produced; towards the end of the process, a little white oxyd usually sublimes, and a solid vitreous mass of arsenic acid remains at the bottom of the retort, which, when heated red hot, becomes perfectly pure.

Arsenic acid is a solid vitreous mass, of a milky white colour: its sp. gr. according to Bergman, is = 3.391. It fuses at a temperature a little below red heat, and becomes a transparent colourless fluid; but by cooling, it again becomes milky. When raised to a full red heat, it begins to boil, and gives out a portion of its oxygen; being slowly converted into white oxyd of arsenic, which sublimes in proportion as it forms. If this experiment is performed in a covered crucible, after a time, almost the whole of the arsenic acid will be dissipated, and the residue will be found closely adherent to the sides of the vessel, having dissolved a portion of its earth, and being thus converted into a permanent glazing. Arsenic acid is wholly insoluble in alcohol; but has so strong an affinity with water, as to deliquesce by exposure to a moist air: it dissolves completely in three or four times its weight of water, and has not been obtained in a crystalline form, either by refrigeration or evaporation. It has a sour, caustic, metallic taste, and reddens litmus tincture, though it produces no change on syrup of violets. Charcoal powder, digested with the aqueous solution, exerts no chemical action whatever on it, but if the mixture is distilled to dryness in a close retort, as soon as the bottom begins to grow red hot, the whole mass takes fire with violence, and the acid is deoxygenated, a beautiful sublimate of reguline arsenic being found in the neck of the retort. Sugar, and oil of turpentine, or any of the expressed oils, are charred even by digestion with a saturated solution of the acid. Six parts of the acid digested with one of sulphur suffer no change, but when the mixture is distilled in a close retort, as soon as the water is driven off, and the sulphur begins to melt, a sudden combination takes place, accompanied by a copious extrication of sulphureous acid gas, and the whole contents of the retort rise almost instantaneously, and attach themselves to the upper part in the form of beautiful realgar. It combines with various alkaline, earthy, and metallic bases, forming a genus of compound salts, known in chemistry by the name of ARSENIATS. None of the acids appear to have any action on the arsenic, for though it is soluble in some of them, it may be separated again unchanged. It unites with the boracic and phosphoric acids by fusion, but neither suffers nor occasions any decomposition.

The order of its affinities, according to Pearson, are, in the moist way, lime, barytes, strontia, magnesia, potash, soda, ammonia, alumine, metallic oxyds, water.—In the dry way, lime, barytes, strontia, magnesia, potash, soda, metallic oxyds, ammonia, alumine.

§ 10. Arseniats.

1. Arseniat of Potash.

If a solution of arsenic acid is dropped into caustic potash, till the mixture ceases to change syrup of violets green, and turns tincture of litmus red; thus shewing an excess of acid; there will be obtained by evaporation a crystallizable salt, arseniat of potash. But if on the other hand potash be added to arsenic acid till the mixture turns syrup of violets green, but produces no change on tincture of litmus,

A R S E N I C.

mus, an uncrystallized salt is the result, which being evaporated to dryness, again deliquesces on being exposed to the air. These varieties of arseniated potash are, however, rarely made by the direct union of their component parts, but from the white oxyd of arsenic and nitre. The phenomena attending this process we shall therefore first explain, before we enter upon an enumeration of the properties of the salt.

Let any quantity of nitre be melted in a crucible, the bottom of which is heated red, and small portions of white oxyd of arsenic be projected at intervals, taking care not to add a second portion till the effervescence and disengagement of the nitrous gas occasioned by the former has ceased. By degrees the matter in the crucible, provided the heat is not augmented, will grow thick; and being then examined by solution and crystallization, will be found to redden litmus, and consist of arseniat of potash in a crystallizable state, and some undecomposed nitre. If, however, the mass in the crucible is kept for a few minutes at a little higher heat, it will enter into perfect fusion, and give out some nitrous gas; after a short time it will again grow thick, and being then dissolved in water, will turn syrup of violets green, and refuse to crystallize, forming what Macquer and the old chemists call *Nitre fixed by arsenic*.

If a mixture of equal parts of nitre and white arsenic be put into a crucible (or still better, into a Florence flask), and the flask be heated gradually in a sand bath, till its bottom is obscurely red, there will happen a very copious disengagement of orange-coloured vapours; when these cease, the vessel is to be withdrawn from the fire, and will be found to contain a white saline mass, which, by solution in hot distilled water, and evaporation, will yield arseniat of potash, formerly called after the inventor *Macquer's neutral arsenical salt*. When, on the contrary, two parts of nitre and one of white arsenic are subjected to the above treatment, the result is an uncrystallizable deliquescent mass, the alkaline arseniat of potash. This may be converted into the crystallizable or acidulous arseniat, either by the addition of arsenic acid, in which case the whole will be arseniat of potash, or by sulphuric acid, which neutralizing the alkali, the liquor will yield by crystallization arseniat and sulphat of potash. In opposition to these facts, which are mentioned by Bergman, Scheele, Macquer, and most modern chemists, Pelletier has recorded an experiment, which, though he draws no conclusions from it, seems incapable of being reconciled with the theory of an alkaline and acidulous arseniat of potash. He mixed, according to the process of Lefevre, two ounces of white arsenic with four of nitre, and put the whole into a large crucible, the mouth of which was then closed with a smaller inverted crucible pierced with a small hole to give vent to the nitrous vapour. It was subjected first to a very gentle heat for three hours, and then exposed to a red heat for eight hours longer. The matter thus prepared was a compact saline white mass, easily separating from the crucible, and weighing one gros less than four ounces. Being dissolved in distilled water and filtered, there was separated a gelatinous mass, consisting no doubt of some of the potash combined with the earth of the crucible. The clear liquor that passed the filter afforded by evaporation crystals of arseniat of potash, and the mother water consisted almost wholly of caustic potash, which united quietly with sulphuric acid, and formed sulphat of potash. Here therefore we have an example of the crystallized arseniat formed in the midst of caustic potash, a circumstance wholly unaccountable if an excess of acid is necessary for this purpose.

Arseniat of potash crystallizes in rectangular quadrilateral prisms, terminated by four-sided pyramids. In close

vessels it fuses at a low red heat, but shews no signs of decomposition; when made to boil violently in an open vessel it gives out oxygen, and acquires alkaline properties. It neither effloresces nor deliquesces in the air. It is soluble in about six parts of boiling water, and deposits crystals by cooling. It is decomposable by lime and barytes, either in solution or by fusion, the acid quitting the alkali to unite with the earths. The sulphuric, nitric, and muriatic acids, abstract from it the alkaline base, setting the arsenic acid at liberty, and forming sulphat, nitrat, or muriat of potash. It decomposes and precipitates almost all metallic oxyds from their combinations, forming insoluble metallic arseniats. In the dry way, it is decomposed by charcoal, and the product is reguline arsenic of great beauty and purity, and carbonated potash. Sulphur, iron, and zinc, also decompose this salt, the reguline arsenic combining with one part of them, while the other is oxygenated.

2. *Arseniat of Soda.*

According to Scheele, if soda is saturated with arsenic acid, crystals of arseniat of soda are obtained, similar in figure to those of the preceding salt; however, the solution of them has no effect on litmus, but turns syrup of violets green. Some arsenic acid superadded, takes away the crystallizability of the mass, which, when evaporated to dryness, deliquesces in the air. Pelletier, by decomposing nitrat of soda by oxyd of arsenic, in the manner already recited for preparing arseniat of potash, obtained a permanent salt in truncated hexahedral prisms. The other properties of arseniat of soda are unknown; probably, however, they are analogous to those of the preceding article.

3. *Arseniat of Ammonia.*

Liquid ammonia, saturated with arsenic acid, affords by evaporation a salt similar in form to the rhomboidal crystals of nitrat of soda. It turns syrup of violets green, but produces no change on litmus; by a gentle heat it becomes opaque, and part of the ammonia flying off, it exhibits an excess of acid. In this state it forms long acicular acid crystals, which deliquesce in the air. When distilled, it first gives out some ammoniacal gas, then fuses, and again becomes solid after it has parted with some oxyd of arsenic which sublimes. By a further increase of temperature it again becomes fluid, and is now found to be wholly changed into arsenic acid. Muriat of Ammonia is decomposed by distillation with three parts of arsenic acid. There first rises muriatic acid, then ammoniacal gas, afterwards oxyd of arsenic, and arsenic acid remains behind; hence it is obvious that part of the arsenic acid is deoxygenated at the expense of a portion of the ammonia.

4. *Arseniat of Lime.*

If arsenic acid is dropped into lime water, a white precipitate is thrown down, which is resolvable in a fresh portion of acid; the solution being now evaporated, small crystals are obtained of arseniat of lime. Another way of procuring this salt is by digesting chalk in arsenic acid. An effervescence ensues, and afterwards by cooling, copious crystals are deposited. Arseniat of lime is sparingly soluble in water, and the solution is decomposed by sulphuric acid, sulphat of lime being precipitated. The affinity of arsenic acid for lime, is also inferior in the moist way to nitric, muriatic, or even acetic acid. Yet nitrat, muriat, and acetate of lime are decomposable by means of double affinity, by the uncrystallizable arseniat of potash, and the arseniats of soda and ammonia, arseniat of lime being in all these cases precipitated. This salt, if heated strongly in a close crucible, enters into fusion, forming a white enamel-like mass, but without undergoing any decomposition; by mixing with charcoal and subsequent heating, the greater

ARSENIC.

part of the acid is oxygenated, and reguline arsenic is sublimed. Arsenic acid in the dry way has so powerful an affinity for lime, as to be capable of uniting with this earth to the exclusion of sulphuric, fluoric, and nitric acids.

5. *Arseniat of Magnesia*

Acid of arsenic, when digested upon magnesia to saturation, forms a coagulum; this being dissolved in a fresh quantity of arsenic acid, and evaporated, yields a jelly which by further privation of its moisture is converted into an uncrystallizable viscous mass. The sulphat, nitrat, muriat, and acetite of magnesia, are not decomposable by arsenic acid, but readily so by the alkaline arseniats; the precipitate thus produced is insoluble in water, but readily so by acids. When heated in a close vessel with charcoal, it exhibits the same phenomena as arseniat of lime.

6. *Arseniat of Barytes.*

This salt may be obtained in an earthy form, according to Scheele, by digesting the acid upon barytes; at first the barytes dissolves readily, but when the acid is saturated, a spontaneous precipitation of arseniat of barytes takes place. Fourcroy informs us, that it may be procured in a crystalline form by mixing a warm concentrated solution of acetite of barytes and arseniat of potash; a decomposition takes place, and bright spicular needles of arseniat of barytes are deposited. In the moist way this salt seems undecomposable except by sulphuric acid and the easily soluble sulphats. In a full red heat, however, even sulphat of barytes is decomposed by arsenic acid, the sulphuric acid being volatilized.

7. *Arseniat of Alumine.*

Moist earth of alum is readily soluble in arsenic acid, and by evaporation it yields a gummy uncrystallizable mass. The alkaline arseniats will occasion a precipitate in sulphuric, nitric, and muriatic acids, previously saturated with earth of alum, and this precipitate is soluble in acids, though not so in water. It must however be remembered, that the earth precipitated from ALUM by an alkali is not pure ALUMINE, and therefore that the preparation here described is not arseniat of alumine. Scheele indeed expressly mentions, that the solution mixed with charcoal, and evaporated to dryness, and then ignited in a close vessel, yields a sublimate of orpiment, together with reguline arsenic and sulphureous acid, and that the residue, when dissolved in sulphuric acid, deposits after a time some crystals of alum. The arsenic acid, even by a long digestion with white clay, does not take up any portion of it. One part of clay and four parts of acid combine by fusion into a vitreous mass; and this, by being again heated with charcoal, affords a beautiful sublimed regulus of arsenic.

The combinations of Ironia, and the other earths with the arsenic acid, have not as yet been examined. The metallic arseniats will be found under the several metals.

§ 11. *Historical Notice concerning Arsenic.*

The native sulphuret of arsenic, was the only one of the arsenical ores known to the ancients. Aristotle speaks of the *Σανδαράχη*; and his pupil Theophrastus, in his treatise on minerals, mentions the *Αρσενικός*, corrupted afterwards by Dioscorides and others into *Αρσενικός*. Pliny also, in his Natural History, describes the arsenicum, auripigmentum, and sandaracha. The Syrian orpiment, probably from its colour, was supposed to contain gold, and an ineffectual attempt by order of the emperor Claudius to extract this metal from it, is recorded by the Roman naturalist just mentioned. The sandaracha of Pliny is realgar, being represented by him as friable, of a ruddy colour, and analogous to litharge. His arsenicum is expressly said to be of the same substance as sandaracha, and is thus described.

"The colour of the best is superior even to gold; the inferior sorts are paler, or else approach to the hue of sandaracha. It is of a fealy texture." The two last do not appear to have been considered of the same nature as auripigmentum: and the only use to which they were applied, was that of a caustic in medicine, and a pigment. The first mention of white arsenic is in the works of Avicenna, who lived in the 11th century. Paracelsus affirms, that arsenic sublimed with egg-shells becomes like silver; and in 1673, Lemery published the method of obtaining the regulus by sublimation from a mixture of white arsenic, fixed alkali, and soap. Albertus Magnus and Beccher considered arsenic (by which they meant the white oxyd) as of a saline nature. Kunkel was also of the same opinion; and Macquer, by his discovery of the arsenite and arseniat of potash, demonstrated that in these combinations it held the place of an acid. Finally, Scheele proved, that the base of arsenic (according to the Stahlia theory then in vogue) was not only similar to, but was actually an acid, by discovering the method of obtaining it in an uncombined state.

Arsenic being found in the ores of many metals, often serving as a mineralizer to them, and adhering with great obstinacy to them even when brought into the state of regulus, was long considered, like mercury, as an essential component part of metallic substances, nor was this opinion abandoned till the celebrated essay of Monnet in reply to a prize question proposed by the Royal Berlin Academy, in 1773, on the nature and peculiar agency of arsenic in the formation of metals. In this treatise he shews arsenic to be a peculiar metal, essentially differing from all others, and instead of being a necessary component part of them, is often totally absent, and when present is so far from perfecting them, that it always deteriorates and obscures their characteristic properties.

§ 12. *Uses of Arsenic.*

In the reguline state, it is used to whiten COPPER, and enters as an ingredient in several kinds of SPECULUM METAL. Oxyd of arsenic is employed as a poison for rats and other vermin, and a flux in GLASS-making. Orpiment and realgar are of extensive use in DYING and CALICO-PRINTING, and as a pigment. For the deleterious properties of arsenic, and its medical uses, see the next article.

Pünii Hist. Nat. Bergman's Essays. Scheele's Essays. Pelletier, Memoires de Chimie, vol. i. Encycloped. Method. art. Arsenique. Fourcroy, Syll. des Connoiss. Chem. vol. v. Macquer's Chemisches wörterbuch, art. Arsenik. Gren's Systematisches handbuch der Chemie, vol. iii.

ARSENIC, in Pharmacy, and its Operation upon the Human Body.—Arsenic is perhaps of all natural substances, that which exerts the most virulent and dreadfully active operation upon the living animal, when taken into the stomach or any other part of the system.

We ate, unfortunately, too familiar with its effects as a poison; its cheapness and abundance rendering it easily accessible to malevolence, or obnoxious to carelessness, and the history of almost every year adds to the number of sufferers from this formidable mineral.

Nevertheless, as every poison, when judiciously managed, may be converted into a powerful medicine, several very skillful practitioners have attempted, and not without advantage, to add this substance to the materia medica, and hence the effects of arsenic become important to the physiologist in a double point of view, both that he may relieve and counteract them, when they operate as a poison; and manage them with judgment and caution, when they are intended to cure disease.

A R S E N I C.

We may begin by observing, that all the preparations of arsenic appear, as far as experience goes, to operate in a similar manner, though some with much more activity than others, in proportion to their quantity; and likewise it is fully ascertained, that sulphur moderates the operation of this metal in a very striking manner, as indeed it does that of all the other metallic medicines. This comparative mildness of the sulphuret may be the reason why the native orpiment and realgar have been employed medicinally for ages by some of the oriental nations, particularly, among other cases, as an antidote to the bite of the cobra, and other venomous serpents; and we may remark, that the native arsenical sulphures (as observed by Hoffman, and confirmed by subsequent experiments) are much milder and safer in their operations, than any of the artificial combinations of these two minerals.

When the active arsenical salts (the white arsenic for example) have been taken into the stomach in the quantity of a few grains or upwards, the most dreadful consequences are observed to succeed: these are, first, a most horrible and almost indescribable anxiety at the pit of the stomach, to which succeeds a very acute burning pain in this organ, generally attended with violent retching and vomiting, whereby, indeed, the life of the sufferer is sometimes preserved, owing to the rejection of the arsenic; this is often followed with severe purging, and the pain proceeds with increased virulence, to the bowels, and almost the whole of the alimentary canal; to this succeed, in a shorter or longer time, convulsive tremors of the limbs, cold sweats, and a very sudden and characteristic swelling of the emphysematous kind, which puffs up the face, the neck, and at last every other part of the body. If no relief be obtained from these dreadful symptoms, they quickly proceed to the destruction of life; the unhappy sufferer becomes insensible to surrounding objects, lying on his belly, with every muscle distorted by the violence of the pain, his hands clenched, his eyes bloodshot and glassy, his jaws now immovably fixed, and unable to swallow either solids or liquids, his limbs convulsed with severe cramps, his face and neck so much swelled that the features can hardly be recognized, till at last death terminates his agony. On inspecting the body after death, the stomach is always found highly inflamed, partly gangrenous, and often actually corroded by sphacelated spots. The same inflammation and partial mortification also extend in most cases to parts of the small intestines. The body is said to putrefy with remarkable rapidity.

Even when persons have recovered from poisoning by arsenic, they feel its effects long after in griping pains, tremors of the limbs, partial paralysis, loss of appetite, and often a lingering hectic fever, which remains for a considerable time, and without great attention to health, are apt materially to injure the constitution. An exposure to the fumes of arsenic occasions similar accidents, particularly griping, bloody urine, and contraction of the body, and sometimes a general eruption like the nettle-rash; and hence in all chemical operations with this dangerous metal, the operator should be particularly cautious of avoiding its noxious fumes.

Arsenic, when applied to any wounded or ulcerated surface of the body, is equally liable to produce the above-mentioned symptoms in a greater or lesser degree; but as the first that appear are generally pains in the stomach and bowels, and swelling of the face, sufficient warning is hereby given to withdraw the cause of them.

A variety of remedies against the poison of arsenic has been proposed, all of which are intended to fulfil these two indications, to remove the noxious ingredient, and to protect the alimentary canal from its baneful operation. The first object is to get rid of the poison by most copious vomiting

and purging; and for this purpose all the substances known to produce these effects, may be employed with the greatest freedom. It has been thought that the rougher mineral emetic and purgative medicines should be avoided, and certainly the milder vegetable substances appear the most eligible; but it is of such infinite consequence to apply an immediate remedy, that the preference due to one over another medicine can hardly ever be equivalent to the mischief incurred by allowing this most corrosive and deleterious of all poisons to remain a moment longer in the stomach than can be avoided. Hence the first emetic medicine at hand is always the best, nor should the mechanical means of exciting vomiting, as by thrusting a feather down the throat, and the like, be neglected. In the intervals of vomiting, the stomach should be deluged with any mild mucilaginous liquid that is at hand; milk, gruel, linseed tea, broth, oil of any kind, or even warm water, in the largest possible quantity, should be taken, and where the arsenic itself excites constant vomiting, as is often the case, no other remedy than these mucilaginous or oily liquids is required. These should be assiduously persevered in till the burning pain and other symptoms produced by the arsenic are removed, and only the forenoon consequent to such a violent exercise of the alimentary canal remains; after which a cautious and judicious use of opiates will prove of material benefit: but the state of health will require much attention for a considerable time, before the constitution can entirely recover the effects of so rude a shock. When the poison has remained so long in the stomach that the sufferer lies insensible, racked with pain and unable to swallow, recovery seems to be hopeless; in such cases, the most probable method of exciting vomiting is to lay some tartar emetic upon the tongue, part of which may perhaps be carried by the saliva into the stomach, and relieve it from the poisonous mineral.

Some ingenious men have endeavoured to discover an antidote to arsenic, in the proper meaning of the term; that is, a substance which may prove a peculiar corrective to its baneful effects, by uniting with it when in the stomach, and destroying its acrimony. The well-known effect of sulphur to mitigate the operation of all metallic bodies, readily suggested this as the desired remedy, and the liquid alkaline sulphuret was proposed by Navier, an eminent physician of Chalons in France. Fourcroy has suggested the liquid hydro-sulphures (or solutions of sulphurated hydrogen in water, of which the sulphurated mineral waters are familiar examples) as an improvement on Navier's remedy. Experience, however, has not confirmed the utility of either of these preparations. It is true, that if the poison and the antidote were previously mixed, and in a state of solution, the former would be disarmed of its terrible powers; but to trust to the chance of a mere chemical operation in an organ so irritable as the stomach, so dreadfully susceptible of active inflammation, and actually suffering under a violent injury, which is hastening the destruction of the whole system, is to carry the ideas of a laboratory much beyond the bounds of sober prudence and sound practice.

It has been urged, however, that after the immediate danger from arsenic has been removed by the liberal use of emetics and emollient liquids, much advantage may be derived from the use of the liquid sulphurets. But at this period we have not (in all probability) any of the arsenic to remove, but only the inflammation, the effects of arsenic, and on what ground can sulphurated hydrogen be supposed to be of use in inflammation of the stomach and bowels?

The medical chemist is sometimes called upon by the magistrate to ascertain the presence or absence of arsenic in the stomach of persons who have died with some of the violent

A R S E N I C.

lent symptoms above described. Some of the appearances, on dissection, have been already mentioned. The presence of arsenic, in substance, in the stomach, is thus ascertained: first, make a ligature round the lower part of the oesophagus, and another at the pylorus, to prevent any of the contents of the stomach from spilling; then take out this organ, empty its contents in a basin, and rinse the inner surface with a little cold water, which add to the other contents. As white arsenic, in substance, is generally that which is found after death by this poison, it will be seen in the form of a heavy white powder, from which the slime, and other contents of the stomach, may be washed off by repeated affusions of cold water, which washings, however, should not be thrown away, but added to the liquid contents. Then let the powder be submitted to the following experiments: boil a portion of it in a Florence flask, in a few ounces of distilled water, and filter the liquid solution; add to a part of the clear liquid some water saturated with sulphurated hydrogen gas, or a few drops of sulphuret of ammonia, and if arsenic be present, a golden yellow sediment will fall down, which will appear sooner if a few drops of acetic acid be added; add to another portion of the solution a single drop of a weak solution of carbonate of potash, and afterwards a solution of sulphate of copper, when the arsenic will be indicated by a yellowish green precipitate, similar to that which is known in chemistry by the name of *Scheele's green*; collect the sediments and dry them, or if there is any of the powder to spare, take a portion of this, lay it upon red hot charcoal, when it will be entirely dissipated in a white dense vapour, having the garlic smell peculiar to arsenic.

But a portion of the white powder suspected to be arsenic should be reduced to the metallic state, which may be done in the following neat manner, proposed by Dr. Black: mix it with two parts of dry carbonate of potash, and one of powdered charcoal; procure a tube eight or nine inches long, and one-sixth of an inch in diameter, of thin glass sealed hermetically at one end; coat the closed end with clay for about an inch, and let the coating dry; then put into the tube the mixture of the powder and the flux, and if any of it should adhere to the inner surface, let it be brushed down by a feather; stop the open end of the tube loosely with a cork, and gradually heat the sealed end only, on a chafing-dish of hot charcoal. The arsenic, if present, will then rise to the upper part of the tube, on the inner surface of which it will form a thin, brilliant, metallic coating, whilst a portion will escape in garlic smelling fumes. When nothing more rises from the heated end, break the tube, and scrape off the metallic crust formed on the upper part. Of this, lay a part on heated iron, when it will totally exhale in a dense smoke, with the peculiar arsenical smell; put another part between two polished pieces of copper (halfpence, for example, rubbed quite bright), bind them together with wire, and expose them slowly to a low red heat; if the enclosed substance is arsenic, it will leave a white stain on the copper.

If it should happen that no white powder is found in the stomach, the liquid contents, when filtered along with the washings, should be evaporated to dryness, and the residue examined in the same manner as the white powder; but this would be a work of greater difficulty on account of the casual mixture with the other contents of the stomach.

By these means the presence of arsenic, even in very small quantity, may be detected by any one tolerably versed in chemical experiments; but, for greater security, it may be advisable to perform separate and parallel experiments with the white arsenic of the shops, and compare the results and appearances.

It is a matter of common observation, that no vegetable or mineral poison, however virulent, exists, which in diminished quantity and by prudent precautions may not be converted into a valuable remedy. This observation will apply even to arsenic, and we have the most respectable testimony to its value in the cure or relief of some complaints which entitles it to considerable notice. The medicinal use of the sulphurets of arsenic may be traced back to very early times, and the Greeks and Romans appear to have used it with considerable freedom. Dioscorides observes that the arsenic (*arsenikon*) is found in the same minerals which produce the sandarach. The test for medicinal purposes, he adds, is of a golden colour, unmixed with any other substance, which easily separates into scales, and comes from Mysia on the Hellespont. An inferior sort comes from Pontus and Cappadocia. It is prepared by roasting on hot coals, with constant stirring till it takes fire, and alters in colour, when it is to be cooled and carefully pulverized. The sandarach is prepared in the same manner as the arsenic or orpiment, and possesses the same virtues. When taken internally, they have a violent corrosive and attritive operation, exciting a burning on the skin, and causing the hair to fall off. These arsenical powders were used principally as external applications, mixed with pitch, oil, or fat, against a variety of cutaneous complaints, itch, phthiriasis, and other defecations of the skin, and also to ulcers of the nostrils and mouth, and condylomata.

Much attention has been bestowed in modern times to the power said to be possessed by arsenic of relieving or curing cancers, when employed both as a topical application, and taken into the stomach. The progress of this disorder is so dreadful, and the remedies usually employed have proved so inadequate to stop its ravages, that any medicine, however severe, may be employed without censure, which affords a chance of permanent relief. We have still to regret that the flattering hopes of a cure, and the real benefit often produced by this metal, have not been confirmed by frequent experiment; but the virtues of this remedy, however, are too important to be neglected. Several medical practitioners and empirics have gained much credit for supposed cures of cancers by remedies which appear to have been arsenical; and Mr. Jussamond, in his valuable *Surgical Tracts* (London, 1789), gives the recipe of an arsenic caustic, called "the earl of Arundel's receipt to cure a cancer," and found in the Harleian MSS. which appears to have been divulged by a woman in the lower order of people, in the year 1638, whose father had long employed it for the cure of cancers.

Mr. Jussamond, in his ingenious work above quoted, gives the history of many cases of cancer in different stages, in which the following arsenical preparations were topically applied:

1. The earl of Arundel's receipt above mentioned, composed of one ounce of yellow arsenic, and half an ounce of bole armenic; or else of one ounce of the yellow arsenic, half an ounce of the red precipitate, and half an ounce of bole armenic.

2. A sulphuret of arsenic, formed in the following way: Take four pounds of sulphur, and one pound of white arsenic, mix and put them into a glass retort, on a sand heat, and lute to the retort a long neck and receiver: raise the fire gradually till the mixture be fused: reject the sublimed portion, and reserve the fixed matter beneath, which must be finely levigated.

3. A mixed sulphuret of arsenic and antimony, formed by melting together in a crucible, with a very moderate heat, the native black sulphuret of antimony (or the common antimony

A R S E N I C.

timony of the shops), with white arsenic, in proportions varying according to the intention; being two parts of arsenic to one of antimony, where a violent arsenical caustic is wanted; and two parts of antimony with one of arsenic, where a milder escharotic is required.

Mr. Justamond began the above arsenical application, to the open or ulcerated cancers, which he used in the form of powder or scrapings, laid to the most ulcerated parts, whilst he frequently moistened the hard retracted edges of the wound with a solution of muriated iron, with sal ammoniac.

The immediate effect of the arsenic was to give a most acute and burning pain, which constantly attended every fresh application, and probably would be hardly tolerable to any, but to those who are suffering under one of the most dreadful, harassing, and hopeless disorders which ever come under the care of the surgeon. The first beneficial effect of the arsenical powder, was to correct, and almost entirely to remove the sickening stench which attends these species of ulceration; and this was invariably the case, even when it failed to give any other relief. Afterwards the powder (where successful) evidently improved the condition of the sore, and by repeating it daily, with much perseverance and attention, Mr. J. happily succeeded in producing a complete cure. It was only, however, in one or two instances that this was effected; and in others, the poison of the arsenic absorbed into the system, produced its baneful operation with so much rapidity, bringing on partial palsy, and severe pain with cramp in the bowels, that he was obliged instantly to discontinue it; with the unpleasant feeling, that he had added to the already diseased constitution of his patient, the severe disorder occasioned by the arsenical remedy itself. Mr. Justamond then made a trial of the stronger arsenical caustic (two parts of arsenic fused with one of antimony), to schirrous tumours of the breast, before they had proceeded to ulceration, with the view of *turning them out* entire, or as it were dissecting them out by caustic, instead of the knife. In this he followed the example of Guy and Plunkett, who had been celebrated for this species of operation, an operation only to be undertaken when the patient is too timorous to submit to the safer and more expeditious use of the knife. Mr. J. mixed the arsenical caustic with an equal weight of opium, brought the powder to the consistence of an ointment by the yolk of an egg, and having the day before separated the cuticle of the tumor by lunar caustic, he applied the arsenic over the whole surface. The pain was very great for twenty hours, after which it subsided. After some days the tumor began to separate, and by repeating the caustic round the separating edges, the schirrous gland, in about two months, "came out entire as a nut out of its shell, or as if it had been cleanly dissected with a knife."

We shall proceed to enumerate some of the other noted arsenical preparations, employed externally to cancers and schirrous tumours. The following is given as Plunkett's celebrated arsenical caustic, with which the inventor used to extirpate schirrous tumours before they had arrived to ulceration.

4. Take of the leaves of the *ranunculus acris* (crowfoot), and of the *flammula vulgaris* (lesser crowfoot, also a species of *ranunculus*), of each one ounce; of white arsenic levigated, one drachm; of flowers of sulphur, five scruples. The two former plants being fresh gathered and bruised, the arsenic and sulphur are to be added, and the whole beaten into a paste, which is to be formed into balls, and dried in the sun. When used they are to be beaten up with yolk of egg, and applied on a piece of pig's bladder to the surface

of the tumour. This is to remain till the escharotic separates spontaneously. The *ranunculus*, which is an acrid plant, is not here an useless addition, as it assists in separating the cuticle, and till this is done the arsenic is scarcely able to act.

5. The *arsenicum citrinum* (*gelber arsenik*) employed at Vienna, is one of the strongest of these preparations, being composed of ten parts of arsenic sublimed with one of sulphur. When used, the scrapings of it are laid on the cancerous ulcer till it is consumed. The pain which it occasions is most severe.

Mr. Febure's arsenical remedy (*Remède éprouvé pour guerir radicalement le Cancer occulte, ou ulceré*, Paris, 1775), which excited much attention at the time, is the following:

6. Take one pint of water; one ounce of extract of cicuta; three ounces of Goulard's extract; one drachm of liquid laudanum; and ten grains of arsenic; mix them into a liquid, with which the cancer is to be smeared every morning and evening.

Lastly, of the external applications, we may mention the following, which is simple, and probably as efficacious in ulcerated cancer as any of the preceding.

7. Take a solution of white arsenic in water, in the proportion of one grain to two pints, mix it with crumb of bread into a poultice, and apply it to the open sore.

Febure appears to be the first who ventured to recommend the internal use of arsenic in the cure of cancer; a practice which has rarely been openly followed, though probably this mineral forms the basis of many of the empirical remedies for this disease. Febure's internal arsenical medicine is the following:

8. Take of white arsenic, two grains; of syrup of chicory with rhubarb, half an ounce; of water, one pint. Of this one table spoonful is given every morning and evening, in an ounce of milk, with half a drachm of syrup of poppies. The dose is to be gradually increased, as the patient can bear it.

Mr. Justamond also was able to give internally as much as five grains of the arsenical sulphuret (N^o 2.) daily, without injuring the patient.

The inference which the reader will be disposed to draw from all that we have given, concerning the efficacy of arsenic in cancerous complaints, will not probably be very encouraging to its use. The actual pain attending its application is always very acute, though perhaps not more so than the disease itself; but the quantity of the remedy here requisite, either for external or internal use, is so considerable, as to incur great danger of poisoning the constitution irretrievably, and inducing calamities almost equal to those which it is designed to counteract.

With more satisfaction we can conclude our account of this mineral, with a history of its employment in another obstinate and often dangerous disorder, in which it promises very great advantage, unattended with any considerable risk where managed with great prudence and discretion. This is, in obstinate and lingering agues, such as have resisted ordinary remedies, and are proceeding gradually to undermine the constitution by their periodical and repeated paroxysms.

We owe the introduction, or at least the publicity of this remedy to Dr. Fowler's highly valuable series of experimental cases, undertaken in the Stafford infirmary, in 1784, and published in the following year. The circumstance that directed his attention to this remedy, was the very great sale and successful operation of certain *patent ague drops*, which were (probably with reason) supposed to be a preparation of arsenic.

Dr.

Dr. Fowler's arsenical solution is thus prepared.

9. Take white arsenic in fine powder, and pure salt of tartar, of each sixty-four grains, put them into a Florence flask, or other glass vessel, along with half a pint of distilled water, heat them slowly to boiling, till the ingredients are dissolved; when cold, add half an ounce of compound spirit of lavender, and distilled water sufficient to make up the whole quantity one pint, or rather fifteen ounces and a half troy-weight.

Of this solution, one ounce, apothecaries measure, contains four grains of arsenic, or one dram, half a grain; and Dr. F. calculates each dram to be equivalent to eighty drops.

In preparing this liquid, the operator should be aware that the salt of tartar of the shops, even the purest, seldom makes a perfectly clear solution with water, but leaves a small earthy sediment, which no continuation of the boiling will dissolve. Instead of this alkali, twice the weight of pure nitre has been employed, which promotes the solubility of the arsenic, and is perhaps somewhat preferable to the salt of tartar. These salts are not necessary to the immediate solution of arsenic, but they prevent this metallic oxyd from separating again from the water by long keeping.

The proportion of arsenic to water, in the solution, may be varied from the form above given; but as white arsenic requires eighty times its weight of cold water to remain dissolved, not less than this quantity should be employed, and the nitre or alkali should never be omitted, as it is of the utmost importance for the practitioner to know precisely the dose of arsenic which he prescribes.

Dr. F. found that for the cure of intermittents it was of importance to give the arsenic in divided doses as fast as the patients could bear it, without experiencing inconvenience from its poisonous effects. Strong adults could generally bear about ten drops of the solution (equivalent to one-sixteenth of a grain of arsenic) for a dose, which he repeated twice, or, if convenient, thrice a day. By slow increase, some were able to bear as much as twenty drops for a dose, and this course was continued for five days, when, if the fits of the intermittent were suspended, the drops were interrupted for two or three days, and then resumed for three days longer to prevent a relapse.

Infants could bear about two drops twice a day, and young or delicate persons took the solution in intermediate doses from two to ten or twelve drops.

The operation of this powerful remedy was truly surprising in checking almost immediately, and finally removing the paroxysms of the most obstinate intermittents, some of which had resisted bark and other remedies for a considerable time. In a few, however, it failed entirely; and in others the poisonous effects of the arsenic came on so speedily that it could not be continued, and the cure was completed by bark and other tonics.

Every practitioner will be aware of the great caution necessary in the exhibition of a remedy, which, though safe in prudent hands, might induce the most dangerous accidents if exposed to carelessness or ignorance. In most of the successful cases, the medicine removed the disease without producing any of the inconveniences attending its use in larger doses; but when the arsenic began to shew its poisonous effects, the symptoms were, nausea, often accompanied with a slight griping and purging, swellings of the soft integuments of the body, particularly the face, sometimes ureasiness at the stomach, and a slight eruption like the nettle-rash; and, in a very few instances, head-ach, sweat, and slight tremors. By attending to these serious and very characteristic warnings, and by the assistance of gentle aper-

ients, opiates, and other means which will readily suggest themselves to the prudent physician, this terrible mineral may be enlisted into the service of the healing art, whilst its cheapness, insipidity, and great activity in a very small bulk, may sometimes render it preferable to the safer drugs and barks, which oppress the stomach by their bulkiness, and disgust by their nauseous flavour.

We may add that,

10. The arseniat of potash, described in § 10. of the preceding article, has been employed in intermittents with the same effect as the solution, and its ready solubility and uniformity of composition may perhaps give it a claim to preference. The medium dose of this salt may be a fifth of a grain three times a day.

Arsenic has been occasionally employed with considerable success, when applied to the surface of the body in a variety of cutaneous complaints; and it might be adopted with more freedom, if it were not for the extreme danger to which any neglect of the warning symptoms of poisoning might expose the patient, a danger the more likely to be in chronic complaints often neglected, and not always sufficiently under medical inspection. Orpiment mixed with tar, with digestive ointment, or other unctuous substances, has been found of eminent service in tinea capitis, a prescription handed down to us from the ancients; but if the medical practitioner will venture on this hazardous, and not often necessary remedy, he should never forget the much superior virulence and activity which the artificial orpiments and arsenical sulphurets possess over the natural. Orpiment and quicklime, boiled in water for a short time, form a liquor which, if often applied to the cuticle, causes the hair to fall off; and the growth of it, when thus checked, is seldom renewed. Dioscorides. Plenck's Pharmacologia Chirurg. 1782. Fowler's Medical Reports on the Effects of Arsenic, 1786. Justamond's Surgical Tracts, 1789. Pharm. Danica. Henry's Epitome of Chem. 1801, &c.

ARSENIC, in *Surgery*, has been long employed as a local remedy. It is chiefly recommended in cases where a strong escharotic is indicated, and especially in cancerous or fordid ulcers; but, as its effects are entirely caustical, our account of the mode in which it should be applied is referred to the foregoing article and to that of CAUSTIC.

ARSENIUS, in *Biography*, archbishop of Malvesia in the Morea, was a learned philologist, in the sixteenth century. He submitted to the church of Rome, and thus incurred the displeasure of his brethren of the Greek church; so that he was excommunicated by the patriarch of Constantinople. He died at Venice in 1535. His works are, "A Collection of Greek Apophthegms," published at Rome; and "A Collection of Scholia on seven of the Tragedies of Euripides," printed at Venice, in 8vo. in 1534. Fabr. Bib. Græc. l. v. c. 41. § 8. t. x. p. 222.

ARSENOTHELYS, among *Ancient Naturalists*, the same with hermaphrodite.

The Greeks use the word both in speaking of men and beasts.—It is formed from *αρσεν* and *θηλυς*, male and female.

ARSEVAL, in *Geography*, a town of France, in the department of the Aube, and chief place of a canton in the district of Bar-sur-Aube, twenty-three miles east of Troyes.

ARSIA, in *Ancient Geography*, a small river which had a northern course, and served as a boundary between Histia and Illyria, to the north of the Flanatic gulf. It there terminated Italy on the north-east of the Polatic promontory.

ARSIANA, or ARIANA, a town of Asia, in Susiana, seated on a mountain to the west of the Tigris.

ARSICARITA,

ARSICARITA, an episcopal see of Africa, in Numidia.

ARSICUA, a town of Germany. Ptolemy.

ARSINARIUM, a promontory of the western coast of Africa, in Lybia Interior, now *Cape Verd*, or *Cape Bojador*.

ARSINIA, ARSINI, a town of Asia, in Armenia, W. N. W. of Amida, and near it.

ARSINNUARITANUS, an episcopal see of Africa, in Mauritania Cæsariensis.

ARSINOË is a name given to several places not only in Egypt, but also in other countries; and according to Bryant (*Anc. Myth.* vol. i. p. 209.), it was synonymous with Arsene, Arsine, and Arsiana. Arsinoë, says this writer, is a compound of *Arez-ain*, Sol's fons; and most places so denominated will be found famed for some fountain. To this purpose he observes, that Arsinoë in Syria had its name from the streams which issued out of the rising ground on which it stands; Arsine and Arsiana in Babylonia had fountains of bitumen; Arsene in Armenia was a nitrous lake; near Arsinoë upon the Red Sea were streams of bitter waters; and Arsinoë near Ephesus had waters equally bitter. The *first Arsinoë* we shall mention was a town of Egypt, seated on the west side of the Arabian gulf near its extremity, and not far from the situation of the modern Suz. Ptolemy and Strabo mention this city; and the latter says, that it was called by some Cleopatriis. It is said, that it was called Arsinoë from a queen of that name in the time of the Ptolemies; and that Cleopatra embellished it with new buildings, whence it was called after her name. In order to bring the trade from India, which began to revive at Tyre its ancient station, to center in Alexandria, Ptolemy Philadelphus undertook to form a canal, an hundred cubits in breadth, and thirty in depth, between Arsinoë and the Pelusiac branch of the Nile; and Mr. Rennell states the distance between Pelusium (Tinah), and Arsinoë (Suez), at fifty-six British miles; and by means of this canal he proposed to convey the productions of India to that capital wholly by water. But the work was never finished. A *second Arsinoë* was a town of Egypt, the chief place of a nome which bore its name, on the west side of the Nile, above Memphis, south of Acanthon and north of Ptolemais. It was also called the "City of Crocodiles," because the inhabitants worshipped that animal, and bred some of the species in the neighbouring lakes. This city must have stood at some distance from the river, since Ptolemy calls it a Mediterranean metropolis. It retained its name Arsinoë in the time of Adrian. Imperial Greek medals were struck in this city in honour both of Trajan and Adrian. It is now called FAÏOUM. The province, of which it was the capital, contained the LABYRINTH and its twelve palaces, the lake Mæris, and the pyramids described by Herodotus, but not existing in the time of Augustus, as they are not mentioned by Strabo; and it is extolled by Strabo (l. xvii.) for its beauty, fertility, and the variety of its productions. It abounded with wine, corn, vegetables, and seeds of every kind. A *third Arsinoë* was a port of the Red Sea, to the left of the entrance into it and near the promontory *Dire* or *Direx*, according to Strabo and Ptolemy. This was sometimes called Berenice. A *fourth* is placed by Strabo on the Red Sea, considerably more to the north than Philoteris. Its warm, saline, bitter waters flowed from a high rock and ran into the sea near this town. A *fifth* was a town of Africa, in the Cyrenaica, between Lepris and Ptolemais; the same that was formerly called "Teuchira." A *sixth* was a town of Cæloxyria, according to Steph. Byz. A *seventh*, a town of Asia, in Syria, seated on a hill near a valley which was near Damas. An *eighth*, a maritime town of Asia, in

Cilicia, to the east of the river Orymagdus, in the district called Cetidis; it had a port and road for ships. A *ninth*, a town of Greece, in Ætolia, at the passage of the Achelous, near Canopa; so called from the wife and sister of Ptolemy II., and mentioned by Cicero. A *tenth Arsinoë* is, according to Strabo, one of the names given to the city of Ephesus. An *eleventh Arsinoë* is a maritime town of the isle of Cyprus, situate to the west between old and new Paphos: so called from a queen of Egypt, Cyprus having been long subject to the Ptolemies. It had a port, a temple, and a grove. A *twelfth Arsinoë* was also a small town of Cyprus, on the northern coast, at the bottom of a small gulf closed to the north-west by the promontory Acamas. 13. There was another town of this name on the eastern coast of the same island, to the south-east, and very near Salamis. 14. *Arsinoë* was also the name of an inland town of Cyprus.

ARSINOË, in *Entomology*, a species of PAPILIO (*Nymph. Gem.*) found in the island of Amboyna, the wings of which are tailed, indented, fulvous, spotted with black; and the posterior ones marked both above and beneath with two ocellated spots. It is figured by Seba and Cramer.

ARSIS, and THESIS, in *Prosody*, are names given to the two proportional parts into which every foot or rhythm is divided.

By *arsis* and *thesis* are usually meant no more than a proportional division of the metrical feet, made by the hand or foot of him that beats the time.

And in measuring the quantities of words the hand is elevated, as well as let fall; that part of the time which is taken up in measuring the foot, by lifting the hand up, is termed *arsis* or *elevatio*: and the part where the hand is let fall, *thesis* or *positio*. Vid. Augustin, de Musica, lib. ii. cap. 10. In *plaudendo enim quia elevatur & ponitur manus, partem pedis sibi elevatio vindicat, partem positio*.

ARSIS and THESIS are used as musical terms when the subject of a fugue or point is inverted or reversed; i. e. when one part rises and the other falls. These two words are Greek: *arsis* comes from *αἴρω*, *tollo*, I raise or elevate; *thesis*, *depositio*, *remissio*, a depression or lowering. These terms were applied by the ancients to the motion of the hand in beating time.

ARSISACA, in *Ancient Geography*, a town of Asia, situate in the interior part of Media. Ptolemy.

ARSISSA, a lake of Asia, in Armenia, about a degree from east to west, called the lake of *Van* or *Argish*; between 37° 45', and 38° 30' N. lat.

ARSITIS, a country of Asia, near mount Coronos in Hircania. Ptolemy.

ARSK, a town of Russia, in the government of Casan, forty miles N. N. E. of Casan. N. lat. 56° 20'. E. long. 49° 34'.—Also, the name of one of the thirteen districts of Casan, situate on the river Cafanka.

ARSKOG, a large forest in the northern part of Sweden, in the province of Medelpad.

ARSLAN, a fortified place of Asia, in Persia, near Casbin, in the province of Erach.

ARSMART, in *Botany*. See POLYGONUM.

ARSOFFA, a fortified town of Asia, in that part of Arabia which is called the Desert of Syria; supposed by some to be the same with Resapha in the Palmyrene territory, mentioned by Ptolemy: it is ninety miles south-east of Aleppo.

ARSON, *ab ardendo*, in the *Law of England*, a felony at common law, in maliciously and wilfully burning the house, or out-houses, of another, by night or by day. See Hawkins's Pleas of the Crown, book i. chap. 39.

The out-houses, though not contiguous to the dwelling-house, nor under the same roof, that are parcel thereof, such as barns and stables, may be the subject of arson: and this by the common law, which also accounted it felony to burn a single barn in the field, if filled with hay or corn, though not parcel of the dwelling-house. The burning of a stack of corn was anciently likewise united arson. The offence of arson, strictly so called, may be committed by wilfully setting fire to one's own house, provided one's neighbour's house is thereby also burnt; but if no mischief is done but to one's own, it does not amount to felony, though the fire was kindled with intent to burn another's. For by the common law, no intention to commit a felony amounts to the same crime; though it does, in some cases, by particular statutes. However, such wilful firing one's own house in a town, is a high misdemeanour, and punishable by fine, imprisonment, pillory, and perpetual servitudes for the good behaviour. And if a landlord or reversioner sets fire to his own house, of which another is in possession under a lease from himself and from those whose estate he hath, it shall be accounted arson; for, during the lease, the house is the property of the tenant. A bare intent or attempt to burn a house, by actually setting fire to it, unless it absolutely burns, does not fall within the description of "incendit et combussit," which were words necessary, in the days of law-latin, to all indictments of this sort. But the burning and consuming of any part is sufficient; though the fire be afterwards extinguished. Also, it must be a malicious burning; otherwise it is only a trespass; and therefore no negligence or mischance amounts to it. But by 6 Ann. c. 31; any servant, negligently setting fire to a house or out-house, shall forfeit 10*l.* or be sent to the house of correction for eighteen months; in the same manner as the Roman law directed: "eos, qui negligenter ignes apud se labuerint, fustibus vel flagellis cedi."

The punishment of arson was death by our ancient Saxon laws. And in the reign of Edw. I., this sentence was executed by a kind of "lex talionis;" for the incendiaries were burnt to death; as they were also by the Gothic constitutions. The statute 8 Hen. VI. c. 6. made the wilful burning of houses, under some special circumstances therein mentioned, amount to the crime of high treason. But it was again reduced to felony, by the general acts of Edw. VI. and queen Mary; and now the punishment of all capital felonies is uniform, namely, by hanging. The offence of arson was denied the benefit of clergy by 31 Hen. VIII. c. 1. but that statute was repealed by 1 Edw. VI. c. 12.; and arson was afterwards held to be out of clergy, with respect to the principal offender, only by inference and deduction from the statute 4 & 5 P. & M. c. 4., which expressly denied it to the accessory before the fact: though even it is expressly denied to the principal in all cases within the statute 9 Geo. I. c. 22. Blackst. Com. vol. iv. p. 220. &c.

ARSON. *Appel of.* See APPEAL.

ARSTAD, in *Geography.* See ARAD and ROUWADDE.

ARSUF, a sea-port town of Palestine, in the Mediterranean, six miles north-east from Joppa. It is in ruins: but in its vicinity there is a small island called *Arsuffa*.

ARSURA, in *Ancient Customs*, a term used for the melting of gold and silver, either to refine them, or to examine their value. See MAN.

The method of doing this is explained at large in the Black Book of the Exchequer, ascribed to Gervaise, in the chapter De Officio Militis Argentarii, being in those days of great use, on account of the various places and different manners in which the king's money was paid.

ARSURA is also used for the loss or diminution of the metal in the trial. In this sense it is said *tot ardere denarius*, to lose so many penny-weights.

ARSURA is also used for the dust and sweepings of silver-smiths, and others who work in silver, melted down. Du-Cange.

ARSURA is also used, in some writers, for the disease called *crystellus*, or *ignis sacer*.

ARSURITA, in *Ancient Geography*, an episcopal see of Africa, in Bizacium.

ART, is defined to be a habit of the mind prescribing rules for the due production of certain effects; or the introducing the changes of bodies from some fore-knowledge and design in a person endued with a principle or faculty of acting.

The word art is derived from *αρε*, *utility*, *profit*; and is found in that sense in *Æschylus*.

According to lord Bacon, it is a proper disposition of the things of nature by human thought and experience, so as to make them answer the designs and uses of mankind. Nature, according to that philosopher, is sometimes free, and at her own disposal; and then she manifests herself in a regular order; as we see in the heavens, plants, animals, &c.—Sometimes she is irregular and disorderly, either through some uncommon accident, or depravation in matter, when the resistance of some impediment perverts her from her course; as in the production of monstrosities.—At other times she is subdued and fashioned by human industry, and made to serve the several purposes of mankind.—This last is what we call art.—In which sense, art stands opposed to nature. Hence the knowledge of nature may be divided into the history of *generation*, of *pretergeneration*, and of *arts*.—The first considers *nature* at liberty; the second, her errors; and the third, her restraints.

The ingenious Mr. Harris, after pursuing several regular gradations in his inquiries concerning this subject, deduces from it an answer to four different questions. If it be asked, "What art is?" We have to answer, "It is an habitual power in man, of becoming the cause of some effect, according to a system of various and well-approved precepts." If it be asked, "On what subject art operates?" We can answer, "On a contingent, which is within the reach of the human powers to influence." If it be asked, "For what reason, for the sake of what, art operates?" We may reply, "For the sake of some absent good, relative to human life, and attainable by man, but superior to his natural and unassisted faculties." Lastly, if it be asked, "Where it is the operations of art end?" we may say, "Either in some energy, or in some work." Harris's Three Treatises, dialogue i.

ART is also used for science or knowledge, reduced into practice.

Several of the schoolmen hold logic and ethics to be arts; inasmuch as they do not terminate in mere theory; but tend to practice.

In this sense some branches of the mathematics also are arts; others, matters of doctrine or science. Statics is wholly scientific, as it comprehends the mere contemplation of motion: mechanics, on the contrary, is an art, as it reduces the doctrine of statics into practice.

ART is more commonly used to denote a certain system or collection of rules, precepts, and inventions or experiments, which being duly observed, make the things a man undertakes succeed, and render them advantageous and agreeable. In this sense, art is opposed to science, which is a collection of speculative principles and conclusions.

The nature and origin of art, and its distinction from science,

science, are considered more at large in the preface to this work.

Arts, according to the foregoing definition, may be divided into *active* and *effusive*.—Such as leave no external effect after their operation, as dancing, fiddling, &c. are called *active* or *practical* arts: those which do leave an effect behind them, as painting, &c. are called *effusive* arts.

Farther, with respect to their scope and object, they may be divided into *human*, as medicine; and *divine*, as theology.

ARTS, *human*, again may be subdivided into *civil*, as law, politics, &c.; *military*, as fortification, &c.; *physical*, as agriculture, chemistry, anatomy, &c.; *metaphysical*, as logic, pure mathematics, &c.; *philological*, as grammar, criticism, &c.; *mercantile*, to which belong the mechanical arts and manufactures. See each in its place.

Arts are more properly divided into *liberal* and *mechanical*.

ARTS, *liberal*, or *polite*, are those that are noble and ingenious, or which are worthy of being cultivated without any immediate regard to the lucre arising from them. They are such as depend more on the labour of the mind than on that of the hand; or that consist more in speculation than operation, and have a greater regard to amusement and curiosity than necessity. Such are poetry, music, painting, grammar, rhetoric, the military art, architecture, and navigation. The liberal arts used formerly to be summed up in the following Latin verse:

“Lingua, Tropus, Ratio, Numerus, Tonus, Angulus,
Altra.”

In the eighth century, the whole circle of sciences was composed of the seven liberal arts, as they were called; viz. grammar, rhetoric, logic, arithmetic, music, geometry, and astronomy: the three former of which were distinguished by the title of *trivium*, and the four latter by that of *quadrivium*.

ARTS, *mechanical*, are those wherein the hand and body are more concerned than the mind: and which are chiefly cultivated for the sake of the profit attending them.—Of which kind are most of those which furnish us with the necessaries of life, and are popularly known by the name of trades and manufactures.—Such are weaving, turnery, brewing, masonry, clock-making, carpentry, joinery, foundery, printing, &c. These arts, which indeed are innumerable, were formerly comprised under this verse:

“Rus, Nemus, Arma, Faber, Vulnera, Lana, Rates.”

The mechanical arts take their denomination from *μηχανή*, *machine*, as being all practised by means of some machine or instrument. With the liberal arts it is otherwise; there being several of them which may be learnt and practised without any instrument at all; as logic, eloquence, medicine properly so called, &c.

The arts which relate to the sight and hearing, lord Bacon observes, are reputed *liberal*, beyond those which regard the other senses, and are chiefly employed in matters of luxury; these are usually called the *fine arts*; such are poetry, painting, sculpture, music, gardening, and architecture.

As all arts have this common property, according to the definition above cited from Mr. Harris's dialogue, that they respect human life, it is evident that some contribute to its “necessities,” as medicine and agriculture; and others to its “elegance,” as music, painting, and poetry. The former seem to have been prior in time to the latter. Men must naturally have consulted how to live and to support themselves, before they began to deliberate how to render life agreeable. Indeed this is confirmed by fact, as no nation has been known so barbarous and ignorant, as not in some

degree to have cultivated the rudiments of these necessary arts; and hence possibly they may appear to be more excellent and worthy, as having claim to a preference derived from their seniority. The arts, however, of elegance are not destitute of pretensions, if it be true, that nature formed us for something more than mere existence. Nay farther, if well-being be clearly preferable to mere being, and this, without the other, be contemptible, they may have reason perhaps to aspire even to a superiority. Harris, *ubi supra*, p. 54.

As the history of the origin and progress of the particular arts is recited under their respective denominations in the course of this work, it is unnecessary to enlarge in this place. It may be observed, however, in general, that most of the arts that are necessary to the subsistence, or conducive to the convenience and comfort of mankind, have had a very early origin. Some of them may be considered as almost coeval with the human race; and others have sprung up at different periods and in various nations, so remote, that the history of their rise and of their progress for many ages is involved in an obscurity which precludes any satisfactory investigation. The want of food, raiment, and habitations, would naturally suggest a variety of inventions; and when the first and scanty demands of necessity were satisfied, mankind would proceed by further discoveries to improve the ordinary means of supply, and at length to meliorate and embellish the condition which providence had assigned them. But for a long time their real exigencies would be few, and their views and wishes very limited; and of course their progress in improvement would be proportionably slow and tedious. In a more advanced state of society, their necessities and desires would be multiplied, and they would devise new methods of supplying and gratifying them; so that the arts they had already invented would be improved, and new ones would be discovered. At last, as a change of circumstances occurred, or some accident suggested the hint or afforded opportunity, they would proceed from the invention of the necessary and mechanical arts to those that contributed to elegance and ornament, as well as superior accommodation. As to the inventions and discoveries of the early ages, nothing certain is known. Those arts that may be referred to the class of such as are most necessary and useful, were the productions of periods when men had little acquaintance with letters, and when they possessed no certain mode of transmitting an account of them to succeeding generations. The records of tradition are obscure, doubtful, or fabulous; and other modes of conveyance are subject to corruptions and mutilations in the lapse of many ages. To this purpose, it may be alleged, that many passages in the works of Pliny, who appears to have been industrious in collecting whatever he thought to be useful or curious, and to have been as desirous of communicating knowledge as he was diligent in acquiring it, have suffered in this way to such a degree, that some of them have not been satisfactorily illustrated even by the best commentators. However, it is universally allowed, that the arts had their rise in the East, and that they were conveyed from thence to the Greeks, and from them to the Romans. The Romans, indeed, seem to have been chiefly indebted to the Greeks, by whom they were excelled in point of invention. The Romans acknowledged this superiority, for they sent their youth to Greece in order to finish their education; and from this circumstance we may infer, that they considered that country as the seat of the arts and sciences, and as a school where genius would be excited by the most finished models, and the taste corrected and formed. Pliny and other writers have, nevertheless, given hints which lead

us to conclude, that the Romans possessed a more extensive acquaintance with the arts than the moderns are perhaps willing to allow, and that some inventions, regarded as new, may be only old ones revived and again applied to practice. When Rome, abandoned to luxury and vice, became an easy prey to those hordes of barbarians who overspread the empire, her arts shared in the general wreck, and were either entirely lost, or for a considerable time forgotten. The deplorable state of ignorance in which Europe was afterwards plunged during several centuries, retarded their revival; and it was not till a late period, when favoured and protected by a few men of superior genius, that they began again to be cultivated. It cannot, however, be denied, that several important discoveries, altogether unknown to the ancients, which must have had considerable influence on the general state of society, were made in ages that can hardly be exempted from the appellation of barbarous. Of this kind were the inventions of paper, painting in oil, the mariner's compass, gunpowder, printing, and engraving on copper; see the several articles. After the invention of the compass and printing, two grand sources were opened for the improvement of science. As navigation was extended, new objects were discovered to awaken the curiosity and excite the attention of the learned; and the ready means of diffusing knowledge, afforded by the press, enabled the ingenious to make them publicly known. Ignorance and superstition, the formidable enemies of philosophy in every age, began to lose some of that power which they had usurped, and different states, forgetting their former blind policy, adopted improvements, which their prejudices had before condemned.

In countries, however, where civil and ecclesiastical tyranny prevailed, the progress of the useful and elegant arts was slow, and struggled with many difficulties. Particular events, indeed, have occurred in all ages and nations which have roused the exertions of genius, and furnished occasion for making important and useful discoveries. The history of Greece and Rome, and even of modern Europe, will afford many obvious facts that seem to confirm and illustrate this observation, and they will be found in detail under the respective titles in this work.

It has been well noted by philosophers, that, during the rise and growth of states, the *military* arts chiefly flourish; when arrived at their height, the *liberal* arts; and when in a declining state, the *voluptuary* arts.

There are also divers particular arts; the art of *memory*, the art of *decyphering*, the art of *swimming*, art of *diving*, &c.

Democritus maintained, that men learnt all their arts from brutes: that the spider taught them weaving; the swallow, building; the nightingale, music, and several kinds of medicine.

ART, *term of*. See TERM.

ARTS, *bachelor of*. See BACHELOR.

ARTS, *master of*. See MASTER, DEGREE, FACULTY.

ART is also applied to divers imaginary, and even superstitious doctrines and inventions.—Such are Lully's art, or the *transcendental* art. This is an art by means of which a man may dispute whole days on any topic in nature, without understanding the least tittle of the thing in dispute; thus called from its inventor Raymond Lully. It consists chiefly in disposing the several sorts of beings into divers scales or climaxes, to be run down in a descending progression.—Thus, whatever was proposed as the subject of discourse, they would say, first, it is a being, and consequently, one true, good, perfect: then, it is either created, or uncreated. Again, every created being is either body or spirit, &c.

ART, *ars notoria*, is a pretended manner of acquiring sciences by infusion, without any other application than a little fasting, and performing a few ceremonies. It was solemnly condemned by the Sorbonne in 1320.

ART, *St Anselm's*, is a superstitious manner of curing wounds, by barely touching the linen wherewith those wounds had been covered. Delrio, in his *Dissquisitiones Magicæ*, observes, that some Italian soldiers, who practised this art, attributed the invention thereof to St. Anselm: but he assures us also, that it was really invented by Anselm of Parma, a celebrated magician.

ART, *St. Paul's*, is a branch of the *ars notoria*, so called as being supposed to have been taught by St. Paul, after his being taken up into the third heaven.

ART and PART, is a phrase used in the north of England, and in Scotland. When any one is charged with a crime, they say he is *art and part* in committing the same; that is, he was concerned both in the contrivance and in the execution of it.

The facts inferring *art and part* need not to be particularly laid in the libel or indictment, for these general words, as terms of stated signification, are sufficient. Yet these facts may be set forth, and it is proper so to do, if the prosecutor chooses to confide in the court rather than in the jury. Vide Mackenz. Crim. Law.

One may be *art and part*, 1. By giving counsel to perpetrate, without distinction, whether the crime would have been committed without such counsel or not: this being what can never be perfectly known. But it is to be observed, that in the more atrocious crimes, he that gives counsel is equally punished as he that commits them; but in the less atrocious, less severely. And sometimes reasons of mitigation are taken from the age, the manner of advising, &c.

2. By aid and assistance, and that either previous, or concomitant, or subsequent, to the commission of the crime.

3. By a clear and explicit mandate to commit the crime, or to do somewhat unlawful in itself, which with great probability might produce it, if executed by the hand of the mandatory, and not that of another.

ART *hermetical*. See HERMETICAL.

ART, *hyssopic*. See HYSOPIC.

ART, *military*, comprehends the order and arrangement which is observed in the conduct of an army, when it is to fight, to march, or to be encamped, usually denominated *tactics*; and also the construction and application of warlike machines.

ARTA, in *Geography*, a town of Switzerland, in the canton of Schwitz, on the south border of the lake of Zug.

ARTA, a river of European Turkey, which runs into the gulf of Arta, near a town of the same name.

ARTA, or *Larta*, a town of European Turkey, with a Greek archbishop's see, in the province of Albania, on the river Afdhas, near a gulf to which it gives name. The cathedral is said to have as many windows and doors as there are days in the year; it is supported by above two thousand marble pillars, and was built by Michael Ducas Comneno, emperor of Constantinople. The inhabitants, who are partly Mahometans, and mostly Christians, are reckoned to be about seven or eight thousand, and carry on a considerable trade in tobacco and skins. The gulf is on the east side of the Adriatic. N. lat. 39° 28'. E. long. 21° 20'.

ARTABA, an ancient measure of capacity used by the Persians, Medes, and Egyptians.

The Persian artaba is represented by Herodotus as bigger than the Attic medimnus, by three Attic chœnixes; from which it appears that it was equal to $6\frac{2}{3}$ Roman modii, consequently that it contained 166 $\frac{2}{3}$ pounds of wine or water; or 126 $\frac{2}{3}$ pounds of wheat.

The Egyptian artaba contained five Roman modii, and fell short of the Attic medimnus by one modius; consequently held 133 $\frac{1}{3}$ pounds of water or wine, 100 pounds of wheat, or 60 of flour.

The Babylonians allowed their god Belus twelve artabas of fine flour for his daily sustenance; which will amount to 60 Roman modii, and consequently 720 pounds of flour.

The Median artaba was of the same content with the Attic medimnus, and consequently equal to six Roman modii, held 160 pounds of water or wine, and 120 of wheat. *Beverin. de Pond. & Mens. part ii. p. 125.*

ARTABANUS, in *Ancient History*, the common name of several kings of Parthia. The first died in the first year of his reign, in consequence of a wound received in a battle with a tribe of Scythians, about the year before Christ 129. The second was of the race of Arsaces, and was king of Media, when he was called to the throne of Parthia, about the year of Christ 16; and died much lamented by his subjects, about A. D. 48. The third lived in the reign of Vespasian or Titus, and espoused the cause of a counterfeit Nero; he died whilst he was meditating the invasion of Armenia. With the death of Artabanus IV. in the year 226, the Parthian empire terminated. See *ARSACIDÆ*.

ARTABRI, in *Ancient Geography*, a people of Europe, in Spain; deriving their name from Artabrum, a promontory near which they dwelt, and corresponding to cape Finisterre.

ARTACABANE, a town of Asia, in Aria. According to Pliny, it was larger and more ancient than Alexandria in the same country.

ARTACÆON, a small island of the Propontis, in the vicinity of Cyzicum. Pliny.

ARTACANA, a town of Asia, situate in the northern part of Aria, on the confines of Parthia, according to Strabo. *Q. Curtius* makes it the capital of *ARIA*.

ARTACE, the name of a colony established by the Milesians in Phrygia, in the year before Christ 694. Venus had a temple in this place, whence her name *Artacias*.—Also, a fortress of Asia, in Bithynia, situate on the Euxine sea.—A mountain of the peninsula of Cyzicum.—A small island of the Propontis, over against the mountain of this name.—A port of Asia, on the coast of the Propontis, near to, and west of Cyzicum.—A town of Asia, in Armenia.

ARTACENA, a country of Asia, in Assyria.

ARTACH, a town of Asia, according to *Curopalate*.

ARTACII, a people placed by *Dion* towards Thrace, and said to have been conquered by *Craffus*.

ARTACINA, a town of the island of Crete. *Ptolemy*.

ARTÆA, a country of Persia, according to *Pausanias*.

ARTAGERA, a town of Asia, in Armenia, near which *C. Cæsar* was dangerously wounded by one *Addus*, according to *Velleius Paterculus*.

ARTAGICARTA, a town of Greater Armenia, placed by *Ptolemy* between *Arsamosarta* and *Tigranocerta*.

ARTAGICERTA, *ARDIS*, a town of Asia, in Armenia, on the western branch of the *Tigris*, north-east of *Armidæ*.

ARTAGIRA, a town of Interior Libya.

ARTAKI, in *Geography*, a town of Asiatic Turkey, in the province of *Natolia*, on the south coast of the sea of *Marmora*, 76 miles south-west of *Constantinople*. N. lat. 40° 18'. E. long. 27° 39'.

ARTAKUI, a town of European Turkey, in the province of *Romania*, 48 miles north-west of *Gallipoli*.

ARTAMIS, in *Ancient Geography*, a town of the *Cyrenaic* territory in the *Pentapolis*.—Also, a town of *Asia*, in *Bactriana*.

ARTAMOVA, in *Geography*, a town of *Siberia*, 120 miles south-south-east of *Toholsk*.

ARTAN, a town of Asiatic Turkey, in the province of *Natolia*, 24 miles south of *Akferai*.

ARTANA, or *ORTANA*, a town of *Spain*, in *Navarre*, five leagues from *Pampeluna*.

ARTANES, or *ARTANUS*, a river of *Asia*, in *Bithynia*.

ARTANICA, in *Botany*. See *CYCLAMEN*.

ARTANISSA, in *Ancient Geography*, a town of *Asia*, in *Iberia*. *Ptolemy*.

ARTAS, a town of *Asia*, in *Syria*, situate at the foot, and to the east of one of the branches of *mount Amanus*.

ARTAS Bay, in *Geography*, lies in the island of *Majorca*, in the *Mediterranean*, S.W. from *Cape la Padre*, the western extremity of the island. The town lies between two rivers, which fall into the bay from the west and north-west. *Alcudi Bay* is to the north-west from the *Cape la Padre*.

ARTASIA, in *Ancient Geography*, a town of *Asia*, in *Syria*, in the neighbourhood of *Antioch*.

ARTATUS, a river of *Illyria*, mentioned by *Livy*.

ARTAVIVA, in *Geography*, a town of *Asia*, in *Min-grelia*, 110 miles north-east of *Trebisond*.

ARTAXATA, in *Ancient Geography*, the metropolis of *Armenia*, and the residence of the *Armenian* kings. This city was built upon a plain, which *Hannibal* recommended to *king Artaxes* as a proper site for the capital of *Armenia*. It was situated upon an elbow of the river *Araxes*, which forms a kind of peninsula, and surrounded the town, except on the side of the isthmus; and the isthmus was secured by a rampart and a broad ditch. *Lucullus*, after having defeated the *Armenians* under their king *Tigranes*, would not venture to lay siege to *Artaxata*, which he considered as impregnable. The gates of the city were thrown open to *Corbulo*, the *Roman* general; but the city itself was burnt and razed. It was afterwards called *Neronia*, in compliment to *Nero*, who ordered *Tiridates* to rebuild it. The ruins of this city are shewn at a place called *Ardachat*.

ARTAXERXES, in *Biography*, the name of three kings of *Persia*. The first furnished *Longimanus* and *Μακρο-χρυσ*, from the extraordinary length of his arms and hands, so that, on his standing straight, they could reach his knees; succeeded his father *Xerxes*, who was murdered by *Artabanus*, the captain of his guards. The traitor charged the death of *Xerxes* upon *Darius*, his eldest son, and induced the young prince to believe that it was his farther intention to get rid of him in the same manner. *Darius* was therefore, by the counsel and assistance of *Artabanus*, immediately assassinated, and *Artaxerxes* was placed upon the throne, in the year before Christ 464, notwithstanding the prior claim of his second brother *Hystaspes*, who was then in *Bactriana*. *Artabanus*, having thus far succeeded, proceeded to the accomplishment of the design which he had formed, of securing the crown to himself. But *Artaxerxes* being informed by *Megabyzus* of his conspiracy, prevented the execution of it by the death of the traitor. Thus established in the throne, notwithstanding the treason of *Artabanus*, and the hostile attacks of his brother *Hystaspes*, he pursued a much more prudent course than that of his father, and desisted from impracticable attempts to subdue the valiant *Greeks*, who were fighting for their liberty. At length a war between the *Greeks* and *Persians*, which had been protracted for fifty-one years, was terminated, happily for both

nations, and very honourably to the former. Artaxerxes proceeded, very much to the satisfaction of his subjects, to cultivate the arts of peace, and to redress the evils which had resulted from the frantic ambition of his father. Although he was an absolute prince, he distinguished himself during a long reign by his mildness and humanity. At his court Themistocles, the illustrious Athenian, who had been an avowed enemy to the Persian government, found an asylum; and here he was treated with great distinction and hospitality. Thucydides (l. i. p. 91.) refers the retreat of Themistocles to the commencement of this reign; but other authors, as Strabo, Plutarch, and Diodorus, fix this incident under Xerxes in the preceding reign. In this latter opinion Dr. Prideaux concurs. Artaxerxes was very favourable to the Jews: and he is supposed by Prideaux and many others to have been the Abasuerus of Scripture, who married Esther, and by whose permission Ezra restored the Jewish worship and civil government at Jerusalem. Archbishop Usher supposes that it was Darius Nothus, the son of Hytaspes, who espoused this illustrious Jewess. See DARIUS, and ESTHER. The seventy weeks of Daniel are reckoned to commence in the reign of Artaxerxes. See PROPHECY. Artaxerxes died within eight months after the beginning of the forty-first year of his reign, and was succeeded by Xerxes, his only legitimate son. Prid. Conn. vol. i. p. 370. &c. and vol. ii. p. 372. 579.

ARTAXERXES II., called *Mnemon* on account of the strength of his memory, was the eldest son of Darius Nothus by his queen Parysatis, and bore the name of Arfaeus before his accession to the throne, in the year before Christ 404. It is related (see Athenæus, l. 12.) that when he was attending his father, who was on his death-bed, he desired instruction for the successful conduct of government, and that the dying king gave him this memorable advice; "That," if he expected the felicity and success which he had enjoyed, "it must be by doing in all things that which was just both towards God and man." Artaxerxes had a younger brother named Cyrus, the favourite of his mother, and whom she wished to elevate to the throne upon the following claim: the birth of Artaxerxes had happened before the accession of his father to the throne; but that Cyrus was born the son of a king; a distinction which, however frivolous it may be deemed in modern times, had engaged Darius Hytaspes to prefer Xerxes, the younger of his sons, to his elder brother Artabazanes. Cyrus formed a conspiracy against the life of his brother, for which he was sentenced to death, but pardoned by the intercession of his mother; he afterwards attempted, with the assistance of a Grecian force, to dethrone his brother; but, though victorious, he was killed in battle. His friends on this occasion were all destroyed; but the Greek army kept entire, and in spite of all the force and artifice with which they had to encounter, made their way home by a retreat, which is one of the most brilliant events in history, and is recorded by Xenophon, who was a principal actor in it. Artaxerxes is much censured for the weakness betrayed by him in delivering up to the vengeance of Parysatis all who had been instrumental in the death of Cyrus, though he himself boasted of having inflicted the mortal wound; and for suffering this female monster to murder them with attendant circumstances of the most exquisite torment. She soon after poisoned the queen Statira, by which act she excited the indignation of her son so much, that he confined her to Babylon, and vowed never to enter the city as long as she remained there. At length, however, she was recalled to court, and maintained considerable influence as long as she lived. The

throne of Artaxerxes was next endangered by Agesilaus and the Spartans, in the year before Christ 396; but having adopted a more prudent policy than his ancestors, he sowed dissensions in Greece, which compelled the invaders to evacuate the Persian empire. The Athenians united with the Persians; but at length these differences were compromised by the peace of Artabazanes, in the year before Christ 353, which left the Greek cities of Asia subject to the Persian king. Artaxerxes next directed his power against Evagoras, king of Cyprus; and on this occasion the Athenians became the foes, and the Lacedæmonians the auxiliaries, of the Persians. Cyprus, after much bloodshed, became tributary. In an enterprise undertaken by the king in person, in the year B. C. 384, against the Cadusians, a hardy people who inhabited the mountains between the Euxine and Caspian seas, his army was almost wholly lost by famine; but part of it was saved by a reasonable negotiation. The sense of his disgrace on his return so much irritated his temper, which was naturally mild, that he put several of his satraps to death. His attempts for reducing his revolted subjects in Egypt proved at first successful, by the aid of some Greek mercenaries; but they ultimately failed. The close of his reign was disturbed and embittered by those domestic troubles to which eastern despots are peculiarly subject. His eldest son Darius formed a conspiracy against him; but the plot was detected, and the traitor, with all his accomplices, who were of the king's family, were cut off. Three others of the king's sons became afterwards competitors for the throne; and Ochus, the worst of them, removed the other two by poison and assassination. After a reign of 62 years, and at the advanced age of 94, according to Plutarch, but, as Diodorus says, after having reigned 43 years, Artaxerxes sunk under affliction and decay, and left the throne vacant for his successor. So great was the authority of this monarch among the republics of Greece, that the contending states made him the umpire of their various disputes and pretensions, and their deputies held a congress in his presence, that he might adjust their jarring interests. Prid. Conn. vol. ii. p. 615. &c.

ARTAXERXES III., whose name was *Ochus*, succeeded his father in the year before Christ 353. History paints him as a monster of cruelty. Having put to death all the members of the royal family within his reach, he caused his sister Ocha, who was also the mother of his wife, to be buried alive; and inclosing within a court of his palace one of his uncles, with one hundred of his sons and grandsons, he ordered his archers to shoot them all to death. His nobles in great numbers shared a similar fate. Having quelled a revolt in Phœnicia by the utter destruction of Sidon, and reduced Judæa, and carried away into captivity many of its inhabitants, he marched at the head of a great army, consisting chiefly of Greek auxiliaries, into Egypt, and totally subdued it. Here, however, a sacrilegious deed, by which he manifested his contempt of the Egyptian superstition, by killing the sacred bull Apis, and causing his men to eat the flesh, ultimately effected his ruin. Bagoas, a favourite eunuch, by birth an Egyptian, and zealously attached to the religion of his country, prevailed with the king's physician to administer poison to him instead of a medicine, which carried him off in the 21st year of his reign. The zealous devotee caused his body to be cut in small pieces, and given to the cats, and knife-handles to be made of his bones. After destroying the king's other sons, he placed Arses on the throne; but soon murdered him and his family; and thus the race of Ochus became extinct. Prid. Conn. vol. ii. p. 666—682.

ARTEA, or ARTELA, *Point*, in *Geography*, is a low point

point six leagues nearly east from the river Copalita, on the south-west coast of Mexico, in the north Pacific Ocean: appearing at a distance like a small island.

ARTEAGA, STEFFANO, in *Biography*. See STEFFANO.

ARTEDI, PETER, born in the province of Ingormandland in Sweden, in the year 1705, received the first part of his education at the College of Hurneland, whence he was removed to Upsal. He was intended for the church, but his disposition leading him to the study of Natural History, in which he was assisted by Linnæus, he preferred practising medicine, and applied himself to chemistry, but his principal attention was turned to Ichthyology, in which he made considerable progress. In 1732, he came to England in pursuit of his favourite study, at the same time that his friend Linnæus set off to examine the natural productions of Lapland. On parting, they mutually assigned to each other such manuscripts as they should be in possession of treating on natural history, in case either of them should die in their travels. This event however did not then take place, as they met together at Leyden in the year 1735. It was here that Linnæus engaged his friend to superintend the printing of the third volume of Seba's *Theſaurus*, which treated of fishes. Returning one evening from Seba's house to his lodgings, while prosecuting this business, he fell into the canal and was drowned, being only 30 years of age. Linnæus, who got possession of his manuscripts, published his "*Bibliotheca Ichthyologica*," and his "*Philosophia Ichthyologica*" in 8vo. in 1738, with the life of the author prefixed. He had before published his "*Classification of Umbelliferous Plants from the Calyx*." *Gen. Biog.*

ARTEDIA, in *Botany* (from P. Artedi, a student of medicine in Sweden), an umbelliferous plant, formerly called *gingidium*. Lin. g. 332. Schreb. 465. Juss. 224. Gærtn. t. 85. Clafs, *Pentandria digynia*. Nat. Ord. *Umbellata*. *Gen. Char. Cal. umbel universal*, spreading, flat, manifold. *Partial*, small, similar. *Involucre universal*, about ten-leaved; leaflets ovate-oblong, three-bristled at the end, nearly the length of the umbel; *Partial*, two or three-leaved, veering outwards; leaflets linear, pinnate, longer than the umbellule. *Cor. universal*, difform, radiate; floscules of the disk abortive. *Proser of the disk*, male; petals five, cordate-infl-x, erect,—*of the ray*, hermaphrodite, with similar petals, but the outermost largest. *Stam.* filaments five, capillary in all the florets; anthers simple, roundish. *Pist. of the ray*, germ small, inferior; styles reflex; stigmas simple. *Per.* none; fruit roundish, compressed, leafy-scaled on the edge, bipartite. *Seeds*, two, oblong, roundish, spreading, scales about the edge.

Ess. Gen. Char. Invol. pinnatifid. *Flsç.* of the disk, male; fruit, rough with scales.

Species, 1. *A. squamata*; stalks, about two feet high, sending forth a few lateral branches, with linear multifid leaves, resembling those of dill; flowers white, in a large terminal umbel; fruit-bearing umbel converging; involucre many leaved, having the leaflets margined at the base; petals as in the *tordylium*; annual, flowering in July. Found on Mount Libanus by Rauwolf, and by Tournefort in Natolia. Introduced by Mr. Thouin in 1788.

Propagation and Culture. The seeds should be sown in autumn in a warm border, where the plants are to remain, for they do not bear transplanting. To secure their seedling, they should be raised in a hot-bed, and kept in a greenhouse.

ARTEDIA muricata. See DAUCUS.

ARTEL, in *Commerce*, a name given to a commercial association, consisting of a certain number of labourers, who voluntarily become responsible, as a body, for the honesty

of each individual. The separate earnings of each man are put into the common stock; a monthly allowance is made for his support; and at the end of the year the surplus is equally divided. The number varies in different associations from 50 to 100; and it is considered so beneficial to belong to one of these societies, that 500, and even 1000 roubles are paid for admission. These societies are not bound by any law of the empire, or even written agreement; nor does the merchant restrain them under any legal obligation; yet there has been no instance of their objecting to any just claim, or of protecting an individual whose conduct had brought a demand on the society. Hence arises the denomination of *Artelschifts*, who are persons employed by the Russian merchants of St. Petersburg to collect payment on bills, to receive and pay money, and also to superintend the loading and unloading of the different cargoes. These Russians are mostly natives of Archangel and the adjacent governments, of the lowest class; they are frequently slaves, generally of the crown; and yet the merchant has no reason to distrust their fidelity, partly from the nature of their association, and partly from the natural reluctance of the Russian to betray the confidence that is reposed in him.

ARTEMIDIS, in *Ancient Geography*, a town of Asia, in Lesser Armenia, called by Ptolemy, Artemidia, or Artemita.

ARTEMIDORUS, in *Biography*, a remarkable visionary, who spent his whole life in attempting to solve the mysteries concealed, as he apprehended, in dreams. For this purpose he not only collected all that had been written on the subject, but travelled over Greece, Asia, and Italy, to learn such stories relating to them as were current in those countries. He was born at Ephesus, in the time of Antoninus Pius, as we learn from a passage in his work, called "*Oncirocritica*," the interpretation of dreams, which, though blemished by this strange fancy, still keeps its rank, on account of the information it contains relative to ancient rites and customs. "*Rem si spectes*," Gerard Vossius says, "*nihil eo opere vanius; sed utilis tamen ejus lectio erit ob tam multa, quæ admisceat de ritibus antiquis et studio humanitatis*." In this work he assumed the surname of "*Daldianus*," from Daldis, a small city of Lydia, the birth-place of his mother. The *Oncirocritica* was first edited in Greek, by Aldus, in 8vo., in 1518. Cornarius published a Latin translation at Basle, in 1537; which was reprinted with the Greek text in 4to., at Paris, in 1604, by Rigaltius. Lucian Philopatris, t. 2. p. 775. Suidas. Fabr. Bib. Græc. l. iv. c. 13. § 5. 8. t. iii. p. 402.

ARTEMIDORUS, a geographer of Ephesus, is frequently commended by Strabo, Pliny, and Steph. Byz., and flourished about the 169th olympiad, or the 104th year before Christ. His description of the earth is often cited by the ancients. Some fragments of this geographer are collected in the first volume of Hudson's *Lesser Greek Geographers*. Fabr. Bib. Græc. l. iv. c. 13. § 9. t. iii. p. 406.

ARTEMIS, in *Entomology*, a species of PAPIILIO (*Nymph. Phal.* Gmel.) that inhabits Germany and some other parts of Europe. The wings are indented, fulvous varied with black: a row of black dots both above and beneath on the posterior pair. Fabr. cius, &c.

ARTEMISIA, in *Antiquity*, yearly festivals observed in divers cities in Greece, particularly Delphi, in honour of Diana, surnamed Artemis.

In the artemisia, a mullet was sacrificed to this goddess, as being thought to bear some resemblance to her, because it is said to hunt and kill the sea-hare. Athen. lib. viii. The Syracusans also celebrated the artemisia for three days, with great joy and festivity.

ARTEMISIA, in *Biography*, the name of two queens of Caria. The first was among the auxiliaries of Xerxes against the Greeks, and attended in person with five ships well equipped, brought from Halicarnassus. She manifested such valour in the combat as to give occasion for saying, "that his men behaved like women, and his women like men." Being the last who fled, she was closely pursued by an Athenian ship, and, in order to secure her escape, she directed her galley against a vessel of an enemy, and sunk it with its crew; the pursuer upon this conceiving that she was a friend, ceased chasing, and she arrived in safety on the coast of Asia, where she was entrusted by Xerxes with the conveyance of his children to Ephesus. Her statue was placed at Sparta among those of the Persian commanders. By pretending to sacrifice to the mother of the gods, at Latmus, she was admitted into the city, and took possession of it. In revenge for this insult, the goddess is said to have excited her ardent passion for a young man of Abydos, whose eyes she put out in his sleep because he refused to gratify her desires; and she is reported to have then precipitated herself from a rock. *Anc. Un. Hist.* vol. iv. p. 164, &c. *Nouv. Dict. Hist.* The second Artemisia, the sister and wife of Mausolus, is principally famous on account of her conjugal affection. See **MAUSOLEUM**. Besides erecting this monument to the memory of her husband, she is said to have mingled his ashes in her drink, and to have instituted a prize for the best eulogy on his character. She died soon after the rearing of this structure in the year before Christ 351. *Anc. Un. Hist.* vol. vii. p. 72. *Nouv. Dict. Hist.*

ARTEMISIA, in *Botany*, a genus of plants, including mugwort, southernwood, wormwood, &c. (derived perhaps, from *ἄρτεμις*, Diana, or named after the wife of Mausolus, king of Caria). *Lin. g.* 945. *Schreb.* 1281. *Juss.* 184. *Gærtn.* t. 164. *Clafs.* *Syngenesia polyzamia aequalis*. *Nat. Ord.* *Compositæ. Corymbifera*, *Juss.* *Gen. Char.* *Cal.* common, roundish, imbricate; scales rounded, converging. *Cor.* compound; corollules hermaphrodite, tubular, several, in the disk; females almost naked, in the circumference; proper of the hermaphrodite, funnel-shaped; border five-cleft. *Stam.* in the hermaphrodites; filaments capillary, very short; anther cylindrical, tubular, five-toothed. *Pist.* in the hermaphrodites; germ small; style filiform, the length of the stamens; stigma bifid, revolute; females, germ very small; style filiform, longer than in the hermaphrodites; stigma similar. *Per.* none. *Calyx* scarcely changed. *Seeds*, solitary, naked. *Rec.* flat or villose.

Ess. Gen. Char. *Recept.* subvillose, or almost naked; down none. *Cal.* imbricate, with rounded converging scales. *Cor.* of the ray none.

* *Sbrubby, erect.*

Species, 1. *A. vermiculata*; "leaves acerose, crowded, very small; panicle racemed; flowers sessile." A stiff upright, somewhat ash-coloured, shrub; leaves linear, flat, on the upper surface tomentose, beneath naked, and rather convex; panicle copious, consisting of racemes, formed of sessile, ovate, imbricate spicules; flowers tomentose. A native of the Cape of Good Hope. 2. *A. capillaris*, *Thunb.* *Jap.* 309. "leaves simple, capillaceous." The stem is striated, reddish, a foot high; branches scattered, subsistigiate, from upright spreading, like the stem; leaves many, smooth, half an inch long; flowers in close racemes, on the extreme twigs. A native of Japan, where it flowers in October. 3. *A. Judaica*, absinthium halepense, &c. *Pluk.* *Alm.* t. 73. f. 2. "Leaves obovate, obtuse, lobed, small; flowers panicled, pedicled." The stem suffruticose, subpubescent, ash-coloured, a foot and a half high; leaves three or five-lobed,

subtomentose, ash-coloured, middle lobe the broadest; flowers roundish, rather depressed, the size of coriander seeds. A native of China, Judea, Arabia, &c. 4. *A. Atbiopica*; "leaves palmate, linear, very minute; flowers racemed, peduncled." A shrubby plant, one foot high, whitish; leaves the size of those of heath, in clusters, subtomentose; divisions linear, very narrow; flowers nodding, the size of those of wormwood; receptacle naked. A native of the Cape of Good Hope, and of Spain. 5. *A. contorta*; "leaves palmate, linear, minute; panicle racemed, flowers sessile." An upright, tomentose, white shrub; leaves crowded; flowers imbricate, small, in spikes, which sit close to the branches. Found by Lerebe in Persia. 6. *A. abrotanum*, southernwood. *Woodv. Med. Bot.* t. 119. α stem erect, common southernwood. β Dwarf southernwood. "Leaves fetaceous, very branching." A well-known under shrub, common in gardens, rising three or four feet in height; leaves alternate, petioled, multifid; leaflets linear, very narrow, pale green, tomentose-scabrous, lvs divided towards the top, where they become trifid, and even linear next the flowers, which are in upright spikes at the extremities of the branches; they are numerous, nodding, yellow, but rarely open in England. A native of the southern parts of Europe and of Asia. 7. *A. arborefcens*, common narrow-leaved tree-wormwood. "Leaves tripinnatifid, silky, cinereous; leaflets linear; flowers globose; flower-bearing branchlets simple." The stalk is woody, six or seven feet high; leaves resembling those of common wormwood, but much whiter, and more finely divided; flowers globular, in spikes, terminating the branches. This is by some considered as a variety of the common wormwood. A native of Italy. 8. *A. argentea*, broad-leaved tree wormwood. "Leaves bipinnatifid, silky, white; leaflets lanceolate-linear; flowers globose; flower-bearing branchlets wand-like." The whole plant is of a silvery colour; receptacle villose. A native of Madeira, where it was discovered by Masson, and introduced here in 1777. 9. *A. aragonia*; "leaves linear, bipinnate, hoary; flowers racemed," scarcely a foot high; upper leaves simple, linear; racemes small, axillary. 10. *A. messerschmidii*; "leaves linear, multifid; racemes erect, slender, loose." The stem is upright suffruticose; the whole plant tomentose. 11. *A. Tartarica*; "lower leaves bipinnate; pinnas equal; upper leaves pinnate, linear; racemes erect, loose, many-flowered." This, like the preceding species, is a tomentose under-shrub. They were both found in Tartary by Messerschmidt. See *Stechm.* p. 19. n. 9 & 10. 12. *A. nitrofa*, *Gmel. Sib.* 2. t. 50. f. 1. "Lower leaves finely multifid; upper entire, obtuse; corymbs erect, hoary, oblong, spiked, sessile." A native of Siberia. 13. *A. lerchiana*, *Gmel. Sib.* 2. t. 50. f. 2. 3. "Lower leaves pinnate, short, finely divided; pinnas palmate; upper leaves linear, undivided; corymbs sessile, copious, spiked, oblong." A shrubby hoary plant observed in Astracan, and on the banks of the Volga; and a variety by Gmelin between the rivers Jenifea and Irdis. 14. *A. tenella*, *Abf. seriph.* *Hisp. Tournes.* inst. 458. "Leaves short, very finely multifid; panicle slender, loose, leafy; peduncles one or two-flowered." Stem woolly. A native of Spain. 15. *A. pauciflora*, *Gmel. Sib.* 2. t. 52. f. 1. 2. "Branches virgate, lsh-form; corymbs one-ranked; spikes subsessile." Calyx three or four flowered. A native of the banks of the Volga. 16. *A. italica*, *Pluk. phyt.* t. 121. f. 2. "Leaves tomentose, loosely pinnate; pinnas long, linear; root-leaves dotted; spikes dense; flowers erect." A native of Italy. 17. *A. hispanica*; "leaves loosely pinnate; pinnas long, linear; spikes very dense; calyces oblong;" not tomentose. A native of Spain. 18. *A. Gmelini*, *Gmel. Sib.* 2. t. 56. f. 1.

f. 1. "Leaves doubly pinnate, obtuse, linear: corymbs green, roundish, nodding." The leaves are ash-coloured underneath. Found by Gmelin near the rivers Lena and Angara. 19. *A. lobelia*, Allion. ped. n. 607. *A. camphorata*. Villar's Dauph. 242. "Leaves petiolate, palmate, multifid, linear; upper ones simple, angular." This is a smaller plant than common southernwood, and has a strong camphoraceous smell. The leaves are less hoary, and those about the flowers broader, longer, and not so much cut. The corymbs are larger, and thinner, and the flowers of a fine yellow. A native of Piedmont, Dauphiné, &c.

** *Procumbent before flowering.*

20. *A. santonica*. Tartarian southernwood or worm-seed, Med. Bot. t. 123. "Stem-leaves bipinnate, multifid; branches undivided; spikes one-ranked, reflex; flowers with five florets." Stem panicled, rather hoary; lower leaves pinnate, multifid, linear; branches wand-like; spikes alternate, recurved; flowers round, nodding, solitary; leaves on the branches undivided, nearly linear. A native of Tartary, and cultivated by Miller in 1768. It flowers from September till November. 21. *A. campestris*, field southernwood, Hudf. 357. With. 739. Eng. Bot. t. 338. Smith. 863. *Abrotanum campestre*. Ray Syn. 190. Ger. Em. 1106. "Leaves multifid, linear; stems procumbent, wand-like; root fusiform." Stems prostrate, ultimately erect, about two feet in length, virgate, panniculate, angular, smooth, reddish, leafy; leaves irregularly bipinnatifid, rather fleshy, somewhat hairy underneath; radical leaves depressed, and with longer foot-stalks; those on the stem alternate, minute, compound; flowers in racemes, drooping, small, of a brownish green; scales of the calyx carinate, and rough at the margin; florets of the disk about fifteen, yellow, with a purple apex; those of the ray only two or three, very small, tubulate, closed, entire; receptacle naked, convex. It has been found in several places in Norfolk and Suffolk. This plant differs from common southernwood, as its odour is so weak as to be scarcely discoverable. 22. *A. pulystris*, marsh southernwood, Gmel. Sib. 2. t. 55. "Leaves linear, pinnate, entire; flowers glomerate, subsessile." The leaves resemble those of buck's horn plantain, with five or seven segments; flowers yellow, receptacle naked. A native of Siberia. 23. *A. crithmifolia*, samphire-leaved southernwood. "Leaves compound, divaricate, linear, fleshy, smooth; stem rising, panicled." It has the habit of the *A. campestris*; stems from half a foot to a foot in height; leaves pinnatifid and trifid. Found by Loesling on the sandy shores of Portugal. Cultivated by Miller in 1768. 24. *A. vallesiacae*, downy southernwood; "leaves pinnate, many-parted, filiform, tomentose; flowers sessile, erect, subcolumnar, having few florets." An erect shrub, a foot high; leaves hoary, bipinnate; pinnae pinnate, and also trilobate; flowering branches tomentose, alternate; flowers solitary, with linear bractes; scales of the calyx concave, outer tomentose, inner membranaceous. No female florets. A native of Spain, Piedmont, and the Valais, flowering in August. Introduced by Drs. Pitcairn and Fothergill. 25. *A. maritima*, sea wormwood, Hudf. 358. With. 709. Woodv. t. 122. Smith, 864. "Leaves many-parted, tomentose, racemes drooping; receptacle naked; female florets three." Root woody, perennial; stems erect or decumbent, leafy, furrowed; lower leaves pinnate; pinnae tripartite; upper various, divided, at the top simple, all entire at the margin, and white on both sides; racemes drooping; flowers ovate, nodding. There are three varieties of this species. A British plant growing on the sea-coast, and flowering in August. 26. *A. glacialis*, silky wormwood, Jacq. Aust. App. t. 35. "Leaves palmate, multifid, silky; stems ascending;

flowers glomerate, level-topped." Leaves small, three-parted, linear, segments trifid, subsulcate, silky white, tomentose, very short on long footstalks; those below sheathing the stems which are a span high, simple, subtomentose, leafy; flowers globose, yellow, terminal, on very short peduncles; receptacle hairy. Villars describes it as three or four inches high, with about four terminal flowers, inclosing from forty to fifty florets. A native of the south of Europe, flowering in August; cultivated by Miller in 1748. 27. *A. rupestris*, creeping wormwood, Flor. Dan. t. 801. "Leaves pinnate; stems ascending; flowers globose, nodding; receptacle pappose;" stems near a foot high, somewhat hirsute; leaves on long footstalks, narrow, having two or three pairs of pinnae, with an odd one; pinnae three or five-parted; flowers axillary, on long peduncles, nodding; receptacle hairy. A native of Alpine situations, cultivated by Miller in 1748; flowers in August. 28. *A. spicata*, spiked wormwood. Jacq. Aust. 5. App. t. 34. "Root-leaves biternate; stem ascending, spiked; flowers erect." Linnæus made this a variety of the *rupestris*, but Haller says, though it has the same habit, the leaves in this case are much broader and each pinna trifid, and the nerve is very broad; on the stem the leaves are sessile, semipinnate, with four pairs, the last largest, shortly trifid; stems not branching, scarcely a span high; peduncles ones-flowered; leaflets of the calyx ovate, dark coloured, and hence called *Genipi noir*. A native of the Alps of Switzerland, Austria, Piedmont, and Dauphiné.

*** *Erect herbaceous, with compound leaves.*

29. *A. anethifolia*, dill-leaved wormwood, Gmel. Sib. 2. t. 54. "Leaves multifid, very slenderly divided; corymbs roundish, nodding, one-ranked, loosely spiked;" the stem is herbaceous; florets reddish; calyces large, green, and streaked with white. A native of Siberia. 30. *A. pontica*, Roman wormwood. Jacq. Aust. 1. t. 99. "Leaves many-parted, tomentose beneath; flowers roundish, nodding; receptacle naked." Stems in their natural state short, of two feet high, but when cultivated in gardens, four; upright, reddish, smooth, hoary, branched. Stem-leaves bipinnate, tomentose, with sharp linear segments, uppermost entire, simple, those at the bottom of the branches and top of the stem are simple pinnate; flowers in racemes, nodding, hoary; disk yellow; florets 24, those in the circumference about six, female, apetalous, and of a greenish yellow; the others hermaphrodite; seeds naked; receptacle conical, naked. A native of Germany, Piedmont, &c. flowering in September. Cultivated here in 1683. 31. *A. austriaca*, Austrian wormwood. Jacq. Aust. 1. t. 100. "Leaves many-parted, tomentose, hoary; flowers oblong, nodding, receptacles naked." Stems from six inches to a foot and a half in height; branches numerous, sending forth simple short twigs, which are one-flowered on the shorter stems, but on the greater many-flowered; leaves on the twigs are first entire, then trifid, and so on, increasing the divisions till they become subtriplicate-pinnate; hermaphrodite florets about eight, females from four to seven, apetalous. It differs from the *maritima* in the leaves, being less tomentose and hoary, roundish, and not oblong. A native of Austria. 32. *A. annua*, annual wormwood, Gmel. Sib. 2. n. 108. "Leaves three-fold pinnate, smooth on both sides; flowers subglobose, nodding; receptacle smooth, conical." An annual, with an erect, smooth, streaked stem, rising to eight feet in height, though seldom higher than two in our climate; flowers yellow on axillary racemes; peduncles long, with lanceolate entire bractes; all the florets hermaphrodite. A native of Siberia and China; cultivated by Miller in 1759. It flowers in August. 33. *A. tanacetifolia*, tansey-

ARTEMISIA.

leaved wormwood, Allion. Ped. n. 608. t. 70. f. 2. Gmel. Sib. 2. t. 58. "Leaves bipinnate, underneath tomentose, shining; pinnae transverse; racemes simple." Stems numerous, simple, from six inches to a foot high; root-leaves sheathing, petioled, ovate-pointed, ash-coloured, having from five to eight pinnae; pinnules three-toothed; pinnules of the stem-leaves simple; upper oval, lanceolate; spikes terminal, compound, with racemes rising from all the axils; in the terminal spike there is a stipule to each peduncle, which is one-flowered; flowers nodding, in pairs, all towards the same side; receptacle naked; perennial. A native of Dauphiné, Piedmont, and Siberia. In high situations it is sometimes entirely tomentose. 34. *A. absinthium*, common wormwood. Hudf. 358. With. 710. Woodv. Med. Bot. t. 120. "Leaves multifid, of a silky white; flowers hemispherical, pendulous; receptacle hairy." Root woody, branched; stems rather erect, branched, angular, paniced at the top; lower-leaves, bipinnatifid; upper, pinnatifid, or digitate; divisions elliptic-oblong, obtuse, entire; racemes erect; flowers nodding, yellow; florets of the disk numerous, of the ray very few; receptacle very hairy. It grows wild among rubbish, rocks, and on road sides. 35. *A. vulgaris*, mugwort, Hudf. 359. With. 710. Med. Bot. t. 121. "Leaves pinnatifid, flat, gashed, tomentose underneath; racemes simple; flowers ovate; receptacle naked;" root woody; stems four feet high, erect, branched, paniced, furrowed, smooth, leafy, purplish. Leaves alternate, petioled, pinnatifid, gashed above and smooth, of a dark green, underneath tomentose, very white; racemes somewhat erect, simple, leafy; flowers sessile, erect, ovate, woolly; receptacle naked; florets of the ray five. It affects similar situations as the preceding species, and like it flowers in August. 36. *A. pectinata*. "Leaves pinnate, pectinate, smooth, sessile; flowers axillary, solitary, sessile, having four florets;" a fragrant annual having a stem about eight inches high. It is easily to be distinguished by its simply pinnate leaves; pinnae setaceous, parallel, pectinated; flowers solitary, from the axils along the stems. Found by Pallas in the dry lands of Dauria.

*** Leaves simple.

37. *A. integrifolia*, entire-leaved mugwort, Gmel. Sib. 2. t. 48. f. 1. "Leaves lanceolate, tomentose underneath, entire or with one or two teeth; female florets five." Stems simple, about two feet high; leaves narrow, cut into acute segments at their edges, somewhat like those of buck's horn plantain; flowers axillary, in small loose spikes, large, of a pale yellow. A native of Siberia. 38. *A. japonica*, Japanese mugwort, Thunb. Jap. 110. "Leaves on the branches smooth, lanceolate-entire, on the stem oblong, trifid; flowers racemed, nodding." An undershrub with an erect angular, streaked, wand-like, smooth, stem, branched at the top, and above two feet high; leaves on the stem alternate; sessile, attenuated, and entire towards the base, but towards the top cut, ferrate, spreading; those on the twigs similar, but very small; flowers pointing in the same direction, on capillary reflex peduncles. It differs from the *cærulescens* in having smooth leaves. A native of Japan. 39. *A. cærulescens*, bluish mugwort, Hudf. 359. With. 711. Smith, 866. Gmel. Sib. 2. 131. t. 64. f. 1. *Abf. maritimum* *lavandulæ* folio. Bauh. pin. Ray Hist. &c. "Leaves hoary; on the stem lanceolate, entire; lower leaves multifid; flowers cylindrical; receptacle naked." Root perennial fibrous; stems nearly erect, round, channelled, pubescent, leafy paniced; leaves alternate, petioled, hoary on both sides; racemes erect, simple; flowers ovate-cylindrical, small, woolly; florets of the ray three. A native of the southern parts of Europe, on the sea-coast; and found in Lincolnshire. Cul-

tivated by Tradescant, jun. in 1658. 40. *A. dracunculæ*, Tarragon. Scop. Carn. n. 1032. Gmel. Sib. 2. t. 59 & 60. f. 1. *Draco herba*, Ger. Emac. 249. Park. Raii Hist. "Leaves lanceolate, smooth, quite entire." Stem ill, smooth, branched, from one to two feet high; leaves petioled, green on both sides; flowers yellow, in a kind of spike all directed the same way; hermaphrodite florets twelve, female six; receptacle flat, glutinous, naked. A native of Siberia and Tartary. Cultivated in 1596, by Gerard; flowers appear in August. Tarragon is frequently used in salads, especially by the French, to correct the coldness of other herbs. The leaves make an excellent pickle, they have a fragrant smell, and aromatic taste. 41. *A. chinensis*, Chinese Mugwort. Gmel. Sib. 2. 61. f. 1. 2. Lour. 492. "Leaves simple, tomentose, obtuse, lanceolate; below wedge-shaped, three-lobed." Stem herbaceous, simple, cottony, branched, between two and three feet high; lower leaves obtuse, three-lobed; upper lanceolate-linear, entire, tomentose on both sides, sessile crowded, scattered; flowers small, on terminating erect racemes. A native of China and Siberia. In China the moxa is prepared from this species. See Med. Prop. 42. *A. maderaspatana*, Madras Wormwood. Jacq. Hort. 3. t. 88. called by him *Tanacetum Ægypt.* "Leaves simple, lyrate sinuate; stems procumbent; flowers pedunculate, solitary, globose, opposite to the leaves;" an annual, growing close to the ground; branches alternate, streaked, pubescent; leaves soft, widening outwards; peduncles one-flowered, naked, streaked, villose; flowers large, yellow, with a convex disk. A native of the East Indies. Introduced in 1780, by M. Thouin. 43. *A. minima*, least wormwood. Burm. Ind. i. t. 58. f. 3. *centipeda orbicularis*. Lour. 493. "Leaves wedge-shaped, repand; stem procumbent; flowers axillary sessile." This is a very minute annual; leaves smooth; flowers very small, axillary, solitary, with six or seven florets. A native of China, where it was found by Lagerstrom, and also of Japan; introduced here by M. Thouin in 1783. 44. *A. littoralis*, Retz. Obs. 5—28. n. 77. "Procumbent, fringed; leaves spatulate, ferrate-toothed; calyces naked, pedicelled." This resembles the forty-second species, but the whole plant except the calyces is covered with a downy or cottony substance. Gathered by Koenig in the East Indies, on the coast.

Medical Properties. Many of the species of artemisia possess similar sensible and medicinal qualities; but those species which now have a place in the *Materia Medica*, are southernwood, common wormwood, mugwort, sea wormwood, and Tartarian southernwood or wormseed. The first has been esteemed as a stomachic, carminative, and deobstruent, and used more especially for removing obstructions in the uterine system. But it is now rarely prescribed unless as an ingredient in fomentations. Common wormwood is intensely bitter, and is the most powerful medicine of the whole genus. Its qualities are stated by Bergius to be antiseptic, antacid, anthelmintic, resolvent, tonic, and stomachic. Though it is now chiefly employed in the two last mentioned characters, yet we are told of its good effects in a great variety of disorders, as intermittent fevers, hypochondriacal affections, visceral obstructions, gout, gravel, scurvy, dropsy, worms, &c. With some it is said to have a narcotic power, and to occasion head-ache. It may be given in powder, but it is more commonly preferred in infusion. The Edinburgh college directs a tincture of the flowers. Externally wormwood is used in discutient and antiseptic fomentations. Mugwort was by the ancients thought to be very efficacious in promoting the uterine evacuation, and relieving hysterical complaints, but it is now so little valued that

it has been expunged from the *Materia Medica* by the London college. A substance called *moxa* is prepared in Japan, from the dried tops and leaves of mugwort, by beating and rubbing them between the hands till only the fine lanuginous fibres remain, which are then combed and formed into little cones. These used as cauteries, are greatly celebrated in eastern countries for preventing and curing many disorders; but chronic rheumatisms, gouty and some other painful local affections, seem to be the chief complaints for which the moxa can be rationally employed. Sea wormwood, by being less powerfully bitter, must be considered in a proportionate degree a less efficient medicine than the common; but as it is less disagreeable to the stomach, it is more generally preferred; and a conserve of the tops of this plant is directed in the London Pharmacopœia. Wormseed is so called from the power of these seeds in destroying worms, for which their character has been long established. The dose is from one to two drams for an adult, twice a day. See Woodv. Med. Bot.

Propagation and Culture. Most of the plants of this numerous genus are hardy perennials, and may be increased without much difficulty by seeds, parting the roots, slips, or cuttings. The first species and a few others that are natives of very warm climates, and of course rather tender, must be placed in a green-house with myrtles, and other hardy exotics, which require a large share of free air, in mild weather, when they should be frequently watered. They love a light fresh soil, and may be propagated by slips, or cuttings. In general they will succeed in a shady border, defended from the frost. See Martyn's Miller's Dict.

ARTEMISIUM, in *Ancient Geography*, a promontory of Eubœa, on the northern side of the island, above the town of Histria, and opposite to the ancient Olyzon, and the Pegasæan gulf. It had a temple consecrated to Diana; and it was famous for the first victory gained by the Greeks over the fleet of Xerxes. This naval engagement happened on the same day with the glorious action at Thermopylæ. The Grecian fleet, consisting of 271 sail, was stationed in the harbour; but that of the Persians, which was much more numerous, had anchored in the road that extends between the city of Castanea, and the promontory of Sepias on the coast of Thessaly. The first line of their fleet was sheltered by the coast of Thessaly; but the ships of the other seven lines rode at anchor, with their prows turned towards the sea. On the morning of the second day after their arrival on the coast, and after their arrangement was made, there arose a dreadful storm, which raged for three days, and which destroyed 400 of their galleys, besides a great number of store-ships and transports. However, 800 ships of war, together with many vessels of burden, sailed into the Pegasæan bay, and anchored in the road of Aphetæ, which, at the distance of a few miles, lies directly opposite to the harbour of Artemisium. The Grecians, who had posted sentinels on the heights of Eubœa, to watch the effects of the storm and the motions of the enemy, upon receiving information of the disaster that had befallen the Persian fleet, poured out a joyous libation, and sacrificed with devout gratitude to "Neptune the Deliverer." The Persians, notwithstanding their loss, were still confident of victory; and detached 200 of their best-sailing vessels round the island of Eubœa, for the purpose of encompassing the Grecian fleet, and of preventing any of them from escaping through the narrow Euripus. After sun-set the Grecian fleet approached in a line, and were met by the Persians. At the first signal, the Greeks formed into a circle; and at the second, began the engagement. Surrounded as they were by the enemy, and crowded into a narrow space, they soon

took 30 of their ships, and sunk many more. When night came on, with a violent storm of rain and thunder, the Greeks retired into the harbour of Artemisium, and the enemy were driven to the coast of Thessaly. The greatest part of the Persians fortunately escaped immediate destruction, and gained the Pegasæan bay; but the ships that had been ordered to sail round the island, were overtaken by the storm at a considerable distance from the shore; and, unable to direct their course, they were under a necessity of contending with the storm during the greatest part of the night, and they were all wrecked amidst the shoals and rocks of an unknown coast. With the dawn of morning the Persians perceived the extent of their misfortunes: but the Greeks were seasonably reinforced with a fleet of fifty-three Athenian ships. Thus aided and encouraged, they seized the advantage of the ensuing dusk of the evening, to renew their attack; and, at the appointed time, availing themselves of their skill in fighting, and their knowledge of the coast, they sailed towards the road of Aphetæ; and having cut off the Cilician Squadron from the rest, totally destroyed it; and at night returned to Artemisium. The Persians, enraged by the disasters and disappointment they had experienced, and dreading the resentment of their sovereign, determined to make one other vigorous effort. As the Greeks had availed themselves of the night, they determined to choose the time of action. Accordingly, on the third day at noon, they sailed forth in the form of a crescent, which they conceived to be still of sufficient extent to enclose the Grecian line. The Greeks, emboldened by success, were too confident to decline any offer of battle, though their admirals, and particularly Themistocles, would probably have preferred delaying it to a more favourable opportunity. The deficiency of skill and courage on the part of the barbarians was supplied by the impetuosity and violence of indignation. The battle was protracted, and remained for a longer time doubtful than on any former occasion: many Grecian vessels were destroyed, five were taken by the Egyptians, who, on the side of the Persians, distinguished themselves as much as the Athenians did on that of the Greeks. The persevering valour of the latter at length prevailed; the enemy retired, and acknowledged their superiority, by leaving them in possession of the dead and the wrecks. However, the victory was dearly purchased; as their vessels, and especially those of the Athenians, were much shattered; and their great inferiority in the number and size of their ships, made them more sensibly feel every diminution of strength. The engagement at Artemisium, though it was not absolutely decisive, contributed greatly to encourage the Athenians, who were now convinced, that the enemies, notwithstanding their immense number, were not invincible. Gillies's Hist. of Greece. See ATHENS.

ARTEMISIUM, a town of Caria, situate in the eastern part of the gulf of Glancus.—Also, a place in the island of Delos, Herodotus.—A place in the Peloponnesus, Polybius.—A town of Italy, in Magna Græcia, belonging to the Oenotrians; now *St. AGATHA*.—An island of Greece, between that of Eubœa and the promontory Sunium, Arrian.—A mountain of Peloponnesus, in Arcadia, near the river Ladon. Pausanias mentions a mountain of this name, to which he refers the source of the river Inachus, and where was a temple of Diana.—A place of Sicily, where was the camp of Sextus Pompeius, Dion & Appian.—A fort of Greece, built by Justinian, at the mouth of the river Rechius or Regius.—A town on the eastern side of Spain, called also Dianium, and now Denia, on the sea-coast of Valencia.

ARTEMISIUS, in *Ancient Chronology*, the name of a Grecian month, the seventh of the year among the Macedonians,

nians, in Asia, at Ephesus, Pergamus, &c. among the Syromacedonians, Tyrians, Sydonians, and Lycians. Among the Lacedæmonians and Corcyreans it was the second month of the year, and corresponded nearly to our February.

ARTEMITA, in *Ancient Geography*, a small isle of the Ionian sea, opposite to the mouth of the river Achelous.—Also, a large town of Asia, in Mesopotamia, according to Pliny, but placed by Strabo in Babylonia, 500 stadia east of Seleucia, on the banks of the lake Arfissa.—A town of Asia, in the Greater Armenia.—A town of Asia, in Arabia Deserta. Ptolemy.

ARTEMIUS, a mountain of Peloponnesus. Pliny.

ARTEMON, or ARTEMAS, in *Biography*, the leader of an ancient sect among the Christians, and supposed by Tillamont to have arisen about the year 200. Eusebius (E. H. l. v. c. 27, 28.), early in the fourth century, speaks of him as the propagator of a heresy, which Paul of Samosata endeavoured to revive in his time. Artemas and his associates, according to Theodoret, concurred with other Christians in acknowledging the supreme deity, and owning him to be the creator of the universe. But they maintained, that Christ was a mere man, born of a virgin, and superior in virtue to the prophets. This, he said, was the doctrine of the apostles; and they alleged, that all the ancients, as well as the apostles themselves, received and taught the same things which they now held; and that the truth of the gospel had been preserved till the time of Victor, the thirteenth bishop of Rome; but by his successor, Zephyrinus, the truth had been corrupted. They are accused, however, in a work cited by Eusebius, with corrupting the scriptures, and transcribing them with variations, which they called emendations, but which their enemies denominated corruptions. They are said to have proceeded so far as to have rejected the law and the prophets. It was also charged upon Artemon and his followers, that they neglected the holy scriptures, studied geometry, and admired Aristotle, and Theophrastus, and Galen. From this account it appears, that whatever might be their error, they were men of inquiry and learning; and Dr. Lardner conjectures, they might join with the study of the scriptures that of mathematics and philosophy. He also imagines, that the alterations or corruptions, which were the subjects of complaint, related merely to some Greek copies of the old testament, probably the seventy; and though he does not wholly excuse these men, he thinks this consideration may serve to lessen the injury of their conduct. Lardner's Works, vol. ii. p. 379, and vol. ix. p. 465, &c. The followers of Artemon were called *Artemonites*.

ARTEMUS, in *Geography*, a cape of Spain, in Valencia, called also the "Cape of St. Martin," and the "Emperor's point."

ARTENA, in *Ancient Geography*, a town of Italy, in Etruria, in the territory of the Cerites, mentioned by Livy, as destroyed by the kings of Rome.—Also, a town of Italy, in Latium, in the country of the Volsci; which was taken, says Livy, about the year of Rome 351, and totally rased.

ARTENAY, in *Geography*, a town of France, in the department of the Loiret, and chief place of a canton in the district of Neuville, 11 miles north of Orleans.

ARTEENNA, or AVIS DIOMEDEA, in *Ornithology*, a name given by Ray, Willughby, and other old writers, to the bird called by Linnæus PROCELLARIA PUFFINUS; which see.

ARTERN, in *Geography*, a town of Germany, in the circle of Upper Saxony, and county of Mansfeld, 29 miles N. N. E. of Erfurt. N. lat. 51° 17'. E. long. 11° 8'.

ARTERIA ASPERA, in *Anatomy*, the tube by which the air passes into and out of the lungs in respiration. It is also called the trachea, and windpipe. See LUNGS.

ARTERIA Venosa, a name given by the ancients to what we call the pulmonary vein, or that vessel whereby the blood is conveyed from the lungs to the left ventricle of the heart. Gor. Def. Med. p. 54.

ARTERIACS, ARTERIACA, medicines proper for disorders of the *trachea*, and the voice. This term, says Dr. Cullen (Mat. Med. vol. i. p. 172.), conveys no precise meaning, and is therefore improper.

Arteriacs are reduced by Galen into three kinds: 1. Such as are void of all acrimony, serving to mollify the asperities of the part; to which kind belong, gum tragacanth, *aster samias*, amyllum, or starch, milk, &c. 2. Those of an acrimonious quality, whereby they stimulate even the sound parts; such are honey, turpentine, bitter almonds, iris root, &c. 3. Those of an intermediate kind, soft and mild, yet detergent; such are butter, and divers preparations made of almonds, milk, honey, &c.

ARTERIOSA Vena, or *arterial vein*, a denomination given to the pulmonary artery, or that vessel whereby the blood is conveyed from the right ventricle of the heart to the lungs.

ARTERIOSUS Canalis is the continuation of the trunk of the pulmonary artery of the fœtus into the aorta. See Fœtus, *Peculiarities in the Structure of*.

ARTERITOMY is a surgical operation, so denominated from *αρτηρια*, an artery, and *τομή*, I cut. It therefore signifies, the artificial section, or opening of an artery, for the purpose of evacuating blood. The advantages and disadvantages of this operation, as well as the manner of performing it, are considered under the head of BLEEDING: where the subject of PALPATOMY is likewise discussed at some length.
