ARTS and SCIENCES.

BATTERY.

BATTERY POINT, in *Geography*, lies on the north or starboard shore of the channel of Cork, in Ireland.

BATTERY, formed of *battre*, to beat or strike, in the *Military Art*, denotes an eminence cast up, on which to plant artillery, that it may play to better advantage. It consists of an epaulement, parapet, or breast-work, about eight feet high, and eighteen or twenty thick. The platform of a battery is laid with planks, that the wheels of the carriages may not sink; and it is made sloping towards the parapet, that the guns may not recoil much, and that they may be more easily drawn back. See *Plate II. Fortif. fig. 21. n. 2.* and *Plate VII. fig. 38.*

In all batteries, the open spaces left to put the muzzles of the great guns out at, are called *embrasures*; and the distances between the embrasures, *merlons*. The guns are generally from twelve to sixteen feet distant from one another, that the parapet may be strong, and the gunners may have room to work.

There are also *batteries of mortars*, the same with those of cannon, except that they have no *embrasures*; the shells being fired over the parapet, commonly at an angle of 45° elevation; and the slope of the breast-work is made inwards, contrary to that of other parapets; having their platforms about six feet square and eight feet asunder.

The *battery* of a camp is usually surrounded with a trench and palisades at the bottom, as also with a parapet on the top, having as many holes as there are pieces of artillery, and two redoubts on the wings, or certain places of arms,

VOL. IV.

capable of covering the troops which are appointed for their defence.

All field batteries consist of four parts, *viz.* the *ditch*, the *parapet*, the *platform*, and the *magazine*; which see respectively.

The *Sieur Remy*, in his *Memoirs of Artillery*, has given a table for the ready finding of all the requisites for the construction of temporary batteries, and for their daily service, the pieces being twenty-four pounders; and although these batteries are calculated only for sieges, and are of the coffer-kind, yet from this table may be derived such notions as will greatly help young artists on other occasions.

It is also proper to mention the number of fascines and pickets that is usually expected every day from the labour of each man employed in that service.

Of fascines five or six feet long, and five or six inches thick, bound with two wyth bands each, one man will make 16 or 18 in a day, with two pickets to each.

Of fascines eight or nine feet long by eight or nine inches thick, with two pickets to each, one man usually makes 10 or 12 in a day.

Of fascines 12 feet long by nine inches thick, with three pickets to each, eight or ten are usually expected from the day's work of one man.

The days here understood are such in which the men may work about twelve hours.

In the following table C. stands for hundred.

B

A TABLE

BATTERY.

ATABLE for the construction of Batteries.

Number of 24 pounders in battery.		Length of the parapet in yards.		Number of workmen to construct the battery.		Number of workmen's stools used at the battery, viz. shovels, spades, pickaxes, mattocks, &c.		Fascine-makers, each a bill and hatchet.		Fascines of 8 or 9 feet by 8 or 9 inches.		Fascines of 12 feet by 8 or 9 inches.		Fascines of 5 or 6 feet by 5 or 6 inches, made by the cavalry.		Pickets from 3 to 6 feet long, and about 1½ inch thick.		Mallets to drive the pickets.		Hand-bills, 2 for each embrasure, beside spare hatchets.		Planks for the platforms, 2 or 2½ inches thick.		Gunners to serve in battery.		Soldiers to assist the gunners.		Powder for 100 rounds, at 12lb. each per day.		Shot of 24 pounds for 100 rounds.

When batteries are erected at leisure, and are designed to stand for some years, they are best made of stone, or brick, or good loamy earth, as the materials may be most easily procured.

To construct the profile of a battery, let its ground line be AB (*Plate II. Fortif. fig. 23. N° 2.*), BD that of the parapet, the inner slope of which is formed by making $Da = 1\frac{1}{2}$ foot, and the perpendicular $aH = 6$ or seven feet; the crown of the parapet HI is formed by making bI a foot or two lower than aH ; and the front of the battery IB is found by making $bB = \frac{3}{4}bI$ when of earth, or $= \frac{1}{2}$ of bI when of masonry. If DC be made $= 2\frac{1}{2}$ or 3 feet, we shall have C the fill of the embrasure, the floor of which CG is to dip 2 feet or two below the level line CF. The platform DE is 18 or 20 feet, the tail E rising about 6 inches above the level line AB; the lower double line represents the sleeper laid lengthwise, and the upper double line shaded with the lines across shews the ends of the planks laid on the sleepers. A gun on its carriage, with the wheels against the knocker at D, is annexed to the figure, for the purpose of aiding the apprehension. For the construction of the embrasures, merlons, ramps, &c. see the articles respectively.

BATTERY, Open, is nothing more than a number of cannon, generally field pieces, or such as carry a ball not ex-

ceeding nine pounds weight, ranged in a line or row abreast of one another, on some small natural elevation of the ground, or an artificial bank about a yard or two high. These cannons are ranged at the distance of about 15 or 16 feet from one another; their shot and loading utensils lying by their sides, and the powder lodged in a hole at some distance behind the battery.

BATTERY, Covered, is when the cannons and gunners are covered by a bank made of brush-wood, faggots, and earth; about eighteen or twenty feet thick, and seven or eight feet high. The cannon used in such batteries are generally from nine to eighteen pounders; sometimes twenty-four pounders are used in them. See *FASCINE Battery*.

BATTERY, sunk or buried, is that whose platform is sunk or let down into the ground, with trenches cut into the earth against the muzzles of the guns, to serve for embrasures.

This sort, which the French call *batterie en terre*, and *ruimante*, is generally used upon the first making of approaches, to beat down the parapet of the place.

BATTERIES, Cross, are two batteries at a considerable distance from each other, which play athwart one another at the same time, and upon the same point, forming right angles; so that they thus combine and produce a greater effect;

BATTERY.

effect; because what one bullet flakes, the other beats down.

BATTERY *en Barbe, Barbet, or Open Battery*, is a name given to a battery, when the floor of part of it is so raised that the guns placed on it have an advantageous command over some part of the neighbourhood, and when the guns thus raised fire over the crown of the parapet without any embrasure. These barbets may be made either in a curtain, or at the salient angle of a flanker. They should be always $2\frac{1}{2}$ or 3 feet lower than the crown of the parapet, and about 8 or 9 yards broad at the top, with a proper slope to the base, of a length suitable to the number of guns to be mounted on them, allowing about five or six yards for each, and at each end have a proper ramp for ascending them. For the further illustration of their nature and construction, let P Q R V X (*Plate III. Fortif. fig. 25.*) be a common bank of a line, the parapet of which is R S T V; the inner slope R S being about 6 or 7 feet higher than Q R; then the bank *en* R, raised so high that the cannon may fire over the crown of the parapet S T, is the barbet, the height of which *en* is about 3 or 4 feet. On the top of the barbet is raised a platform, as in other batteries. Let the figures 26 and 27 represent part of the plan of a line, and one of its flankers, or of a battery constructed in such a form; where Aa is the length of the barbet, or raised battery, suited to the number of guns to be used, which are to be drawn up the ramps placed at the ends; the breadth being about 8 or 9 feet, and the length *ab* about 7 or 8 yards.

BATTERY, *Cavalier*. See CAVALIER.

BATTERY *d'Enfilade*, is one which sweeps the whole length of a straight line, &c.

BATTERY *en Echarpe*, is that which plays obliquely.

BATTERY *de Revers, or Murdering Battery*, is one that plays on the back of any place; and being placed on an eminence, sees into it.

BATTERY *joint, or par camarade, or cameretta*, is when several guns play at the same time upon one place.

BATTERY *en Rouage*, is that used to dismount the enemy's cannon.

BATTERY *à Ricochet*, is adapted to the method of *ricochet* firing, first invented and practised by Vauban, at the siege of Aeth in 1692. The guns are loaded with small charges, and are elevated, so as to fire over the parapet; and the shot is hereby made to roll along the opposite rampart. This method of firing with guns has since been applied to mortars and howitzers with success.

BATTERY, *Coffer*, is that where the sides of the wall and merlons only are formed of fascines, and all the cavities or included spaces filled with earth.

To construct a battery of this kind, mark out with a line the limits of the parapet eighteen or twenty feet thick; and three or four feet before the parapet, mark out with lines or stakes the limits of the ditch, ten or twelve feet broad, or even more, if earth is wanted; allowing eight yards in length for one gun, and six yards more for every other gun. On the outlines of the parapet cut a trench five or six inches wide and deep, and there lay a row of fascines, the ends being jammed one into the other; and let them be staked down. Lay on them another row, so that the joinings of these may not be directly over the joinings of the lower one, and let all the knots of the bands be turned inwards; stake these down; and on them lay in like manner a third and fourth row, &c. until the height be about three feet. The same kind of work being done at the ends, and for the emplacement if wanted, the coffer for the wall will be finished. Then let the men be disposed along the place intended for the ditch, and with proper tools break the ground and

throw it into the coffer; where, as the earth is thrown in, other men are to spread it, and stamp it down with rammers; and thus the coffer is to be filled. When the wall is finished, let the embrasures be staked out (see MERLON), and a coffer formed in like manner for each merlon, which is also to be filled with earth, and rammed down. Proceed to complete it in the same manner with FASCINE Battery.

BATTERY, *Fascine*. See FASCINE Battery.

BATTERY, *Gabion*. See GABION.

BATTERY, in Law, denotes an act that tends to the breach of the peace of the realm, by unlawfully striking, beating, or offering other violence to another person.

Battery is frequently confounded with assault, though in law they are different offences; because, in the trespass for assault and battery, one may be found guilty of the assault, yet not convicted of the battery; there may therefore be assault without battery; but battery always implies an assault. The least touching of another's person wilfully, or in anger, is a battery; for the law cannot draw the line between different degrees of violence, and therefore totally prohibits the first and lowest stage of it: every man's person being sacred, and no other having a right to meddle with it in any the slightest manner. Upon a similar principle the Coracian law "de injuriis" prohibited "pulsation" as well as "verberation;" distinguishing verberation accompanied with pain from pulsation without any. However, battery is in some cases justifiable or lawful; as where one who hath authority, a parent or master, gives moderate correction to his child, his scholar, or his apprentice. Thus also on the principle of self-defence, if one strikes me first, or even only assaults me, I may strike in my own defence, and if sued for it, may plead "son assault demesue," or that it was the plaintiff's own original assault that occasioned it. So likewise in defence of my goods or possession, if a man endeavours to deprive me of them, I may justify laying hands upon him to prevent him; and if he persist in violence, I may proceed to beat him away. 1 Finch. L. 203. Thus too, in the exercise of an office, as that of churchwarden or beadle, a man may lay hands upon another to turn him out of church, and prevent his disturbing the congregation. 1 Sid. 301. And if sued for this or the like battery, he may set forth the whole case, and plead that he laid hands upon him gently, "molliter manus imposuit," for this purpose. On account of these causes of justification, battery is defined to be the "unlawful" beating of another; for which the remedy is, as for assault, by action of trespass "vi et armis," in which the jury will give adequate damages. Atrocious battery is subject to trial by inspection in pursuance of the order of the court; in which case the battery must be alleged so certainly in the declaration, that it may appear to be the same with the battery inspected. In the case of a person's beating the servant of another, besides the remedy of an action of battery or imprisonment, which the servant himself may have against the aggressor, the master also, as a recompence for his immediate loss, may maintain an action of trespass, "vi et armis," in which he must allege and prove the special damage he has sustained by the beating of his servant, "per quod servitium amisit;" and then the jury will make him a proportionable pecuniary satisfaction. A similar practice obtained among the Athenians; with whom masters were entitled to an action against such as beat or ill-treated their servants. A person guilty of battery against a clergyman, is liable to three kinds of prosecution for the same offence; an indictment for the breach of the king's peace, a civil action for damages, and a suit in the ecclesiastical court; last, "pro correctione et salute animæ" by enjoining penance, and then

again for such sum of money as shall be agreed on for *taking off* the penance enjoined; it being usual in these courts to exchange their spiritual censures for a round compensation in money (2 Roll. Rep. 384.); perhaps, says judge Blackstone, because poverty is generally esteemed by the moralists the best medicine "pro salute animæ." Bl. Com. vol. iii. and vol. iv.

BATTERY is sometimes used in speaking of the fabric of metalline utensils. In this sense, battery-works include pots, saucepans, kettles, and the like vessels, which, though cast at first, are to be afterwards hammered or beaten into form.

Some make battery for the kitchen, *batterie de cuisine*, comprehend all utensils for the service of the kitchen, whether of iron, brass, copper, or other matters. Others take the term in a narrower sense, and restrain it to utensils of brass or copper.

A society for the mineral and battery work of England was incorporated by queen Elizabeth.

BATTERY, in *Electricity*, is a combination of coated surfaces of glass, so connected together, that they may be charged at once, and discharged by a common conductor. Mr. Galath, a German electrician, was the first who contrived to increase the shock, by charging several phials at the same time. Dr. Franklin, after he had analyzed the Leyden phial, and found that it lost at one surface the electric fire which it received at the other, constructed a battery, consisting of eleven panes of large sash-glass, coated on each side, and connected in such a manner that the whole might be charged together, and with the same labour as one single pane; and by bringing all the giving sides into contact with one wire, and all the receiving sides with another, he contrived to unite the force of all the plates, and to discharge them at once. A more complete battery is described by Dr. Priestley, of which he says, that after long use he sees no reason for wishing the least alteration in any part of it. This battery (see *Plate I. Electricity, fig. 1.*) consists of 64 jars, each ten inches long, and $2\frac{1}{2}$ inches in diameter, coated within $1\frac{1}{2}$ inch of the top; and contains in the whole 32 square feet. The wire of each jar has a piece of very small wire twisted about the lower end of it, to touch the inside coating in several places; and it is put through a pretty large piece of cork, within the jar, to prevent any part of it from touching the side, which would tend to promote a spontaneous discharge. Each wire is turned round, so as to make a hole at the upper end; and through these holes a pretty thick brass rod with knobs passes, one rod serving for one row of the jars. The communication between these rods is made by laying over them all a thick chain. When part only of the battery is used, the chain is laid over as many rods as will furnish the required number of rows of jars. The bottom of the box, in which the jars stand, is covered with a plate of tin, and a bent wire touching the plate passes through the box, and appears on the outside. To this wire any conductor designed to communicate with the outside of the battery is fastened, as the small wire in the figure, and the discharge is made by bringing the brass knob to any of the knobs of the battery. When a very great force is required, the quantity of coated surface may be increased, or two or more batteries may be used. Franklin's Exp. and Obs. ed. 1769. p. 28. Priestley's Hist. &c. of Electricity, ed. 1775. vol. ii. p. 99.

However complete the battery above described appeared to be at the time of its construction, later electricians have discovered many imperfections to which it was subject; of which the principal are those that result from the form and size of the jars, the substance of the glass, the height of the coating, and the connections within the battery. In

consequence of these imperfections in its structure and contrivance, it is prevented from receiving more than about half the charge which it ought to receive in proportion to the quantity of its coated surface.

The most perfect batteries of modern construction, since that of Dr. Priestley, have been made in Holland for Teyler's museum at Haerlem, by Mr. Cuthbertson of Polandstreet, London, then residing at Amsterdam. Of these batteries there are two, differing in their magnitude and mode of construction, but allowed to be equally perfect. The first was completed in the year 1784, and is composed of 135 jars in 9 boxes, each containing 15, which may be used separately or combined, as the nature of the experiment requires. Each box is a separate battery of itself; and the description of one box with a view of the figure, will be sufficient for explaining its construction and use. In *Plate I. Electricity, fig. 2.* is exhibited a perspective view of Teyler's first battery, with its parts arranged in proper order for receiving a charge from the electrical machine. Each box, as we have already observed, contains 15 jars; each jar is 11 inches high, and 6 inches in diameter, contracted at the mouth to 4 inches, and coated so as to contain about 140 square inches; and thus the whole battery will contain about 132 square feet of coated surface. Each box is divided into 15 partitions, 5 of which are in the length and 3 in the breadth; the height of the sides of the box being somewhat lower than the coating of the jars, as are also the partitions in which they stand. The lid of the box is made without hinges, for the convenience of releasing it from the box, that it may be removed while experiments are performed. It is taken off by lifting it upwards. The outside coatings of the jars are connected by means of cross wires passing under the bottom of each jar; and those on the inside by means of a brass frame, bearing 15 brass balls, fixed upon the frame above the centre of each jar. All these balls, excepting the four at the corners, have wires screwed to them and hanging downwards into the inside of each jar; but the wires of the four corner jars are screwed to a foot, which is cemented to the bottom of each in the inside. Upon these wires the whole frame rests, and is kept in its proper position. The four corner balls have holes, which receive the ends of the wires, and terminate at a proper height from the jars. By this contrivance the inside connecting frame may at any time be easily removed; and as this part of the machine is important, the construction of the said frame is shewn separated from the battery in *fig. 3.* It is according to the above construction that Mr. Cuthbertson forms his present batteries, excepting that he has increased the size of the jars, so as to make one battery contain about 17 square feet; and he engages to prove by experiment, that the batteries of his construction are far superior to any others. Teyler's second grand battery was finished by Mr. Cuthbertson in 1789. This is the largest and most complete battery that was ever made. The whole battery, standing in proper order for receiving a charge, is exhibited in *fig. 4.* It consists of 100 jars of the same shape with that of those already described, only that they are so enlarged in size, that each of them contains $5\frac{1}{2}$ square feet of coated surface, instead of 140 inches, and the whole battery contains 550 square feet of coating; and for convenience, it is put into four separate cases, each containing 25 jars in the form of a square, 5 on each side. The boxes are lined with lead on the inside for forming the outside communication; each jar has a perpendicular stand resting upon its bottom, and supported from falling sideways by three stays on the inside. Upon the top is screwed a three inch brass globe, from which proceeds a brass tube about one inch in diameter,

BATTERY.

diameter, to a large brass globe, supported by the middle jar at a proper height, so as to keep the inside communication properly arranged. A view of the figure will shew how the four are combined, so as to charge and discharge all the 100 jars at once.

Lieutenant colonel Haldane proposes the following method for measuring the force of an electrical battery, during the time of its being charged.

Let the battery be insulated, and at a small distance from it place an insulated electrical jar, and near the jar, one of Mr. Cuthbertson's electrometers. The electrometer being adjusted according to the degree of force which is intended to be employed as a measure of force to be communicated to the battery, connect the electrometer with the jar; make a metallic communication between the interior side of the jar and the exterior side of the battery, and connect the interior side of the battery with the conductor of an electrical machine; then, by the operation of the electrical machine, the battery receives a quantity of the electrical fluid, and becomes charged. The fluid, which departs from the exterior side of the battery, is received by the electrical jar, which also becomes charged; but this jar, being connected with the electrometer, explodes as soon as it acquires a force sufficient to put the electrometer into motion. The quantity of the electrical fluid which is received by this jar, between each of the explosions, is a measure of the quantity of the fluid in the battery; and the number of explosions or discharges of this jar shews the number of measures which the battery contains, and consequently the force which it is capable of exerting when discharged.

For the author's demonstration of this method, and the illustration of it by appropriate experiments, we must refer to Nicholson's Journal, vol. i. p. 156, &c.

BATTERY, Galvanic; the name usually given to an apparatus for accumulating the electricity which is produced by the mutual agencies of certain metallic and carbonaceous substances, and peculiar fluids.

The first instrument of this kind was invented by the celebrated Volta of Pavia, in 1800, and various forms of it have been since adopted by different philosophers.

The original battery, or the electrical pile, is composed of plates of zinc, plates of silver, and pieces of pasteboard, of the size of the plates, moistened in a solution of salt in water: and arranged in the order of zinc, silver, pasteboard, zinc, silver, pasteboard, and so on, till a series sufficiently numerous is formed. On account of the expence of silver, copper has been lately generally substituted for it, with but little diminution of effect; and solutions of muriate of ammoniac, of nitrous acid, and of muriatic acid, have been employed instead of the solution of common salt, with very great advantage as to the increase of the power of the combination. In general any two metallic substances which are perfect conductors of electricity, may be used, provided the interposed fluid is capable of oxidating at least one of them.

The powers of galvanic batteries appear to be very much connected with the chemical changes going on in them, and hence plates of one metal may be made to supply the place of the two metals provided their different sides be exposed to different chemically acting fluids, as has been shewn by the experiments of Mr. Davy. Thus copper, silver, and lead, all form efficient combinations when they are arranged with two different sets of pasteboard, one moistened with diluted nitric acid, and the other with solution of hydrosulphuret of potash; the order being metal, pasteboard moistened with acid, pasteboard moistened with hydrosulphuret, &c. In such a case, if the battery is required to be of considerable permanency as to its effects, it is necessary to separate the

pasteboard moistened in the chemical agents from each other by a third set of pasteboards, moistened in common water.

In instances when piles are erected perpendicularly either with two metals or with one metal, in consequence of the oxidation and the loss of moisture from pressure and evaporation, the electrical action usually ceases after a few days; and in order to renew it, a second construction of the series becomes necessary. Several methods have been proposed for making instruments more permanent in their operation than the pile, and more easily rendered active; but the most ingenious contrivance appears to be that of the trough, discovered by Mr. Cruickshank. It consists of a box of baked wood, in which plates of copper and zinc, or of silver and zinc soldered together at their edges, are cemented in such a manner as to leave a number of water-tight cells, corresponding to the number of the series: the arrangement becomes active when the cells are filled with the proper saline fluids; and it may at any time be easily freed from oxide by the use of muriatic acid.

In the common apparatus of Volta, that part bounded by the most oxidable metal, as, for instance, the zinc, is found in a positive state, with regard to electricity, and the other part, as the copper, in a negative state; and when a communication is made between the two ends, by means of a conducting body, a constant circulation of electricity is established.

The electricity of the galvanic battery is capable of being partly transferred into the Leyden phial; and its effects, as has been fully shewn by the experiments of Messrs. Nicholson, Carlisle, Woolaston, Van Marum, and Ritter, are similar to those of common electricity, in a low state of intensity. It gives shocks to living animal organs, and excites muscular contractions in bodies for a considerable time after death. It assumes the form of fire in passing from one conducting body to another in its highly concentrated state; and it ignites small metallic wires or leaves, and causes them to enter into combustion. It sets fire to charcoal, sulphur, alcohol, and other inflammable bodies; and it rapidly decomposes water and various other fluids.

The intensity of the electricity in Galvanic batteries is greater in proportion as the series composing them are more numerous: but the quantity of it depends upon the quantity of surface they contain. Hence equal numbers of large and small plates arranged in different batteries produce nearly the same effects on the human body which is an imperfect conductor, and which can admit of the passage only of a certain quantity of electricity of a low intensity in a given time; but the large plates are in a determinate ratio, much more powerful in igniting the metals, and in affecting perfect conductors through which a large quantity of electricity, in any state of intensity, easily and instantly passes.

Many important philosophical discoveries, which will be fully described in the article GALVANISM, have been already made, by means of the galvanic apparatus, in different parts of Europe; and a number of enlightened experimenters have been employed in investigating the principles on which its operation depends. The theory of it is, however, as yet obscure, and the perfect developement of it will probably be connected with views more profound than any that have been as yet obtained of the nature and agencies of electricity, and its relations to chemical changes. BATTERS *d'estrade*, scouts or horsemen, sent out before, and on the wings of an army, two or three miles, to make

make discoveries; of which they are to give an account to the general. See SCOUTS.

BATTEUX, CHARLES, in *Biography*, honorary canon of the church at Rheims, which was his native city, became professor of philosophy at the Royal College of Paris, and distinguished himself by his judgment, learning, and character. He was chosen a member of the Academy of Inscriptions in 1759, and of the French Academy in 1761. His death, which happened at Paris in 1780, is supposed to have been accelerated by the chagrin resulting from the want of success of the elementary works which he drew up by order of government, for the use of the military school. His chief publications, written in French, are the following: "A Translation of the Works of Horace," 2 vols. 12mo.; "The Morals of Epictetus, extracted from his own writings," 12mo. 1758; "A Course of the Belles Lettres," 5 vols. 12mo. 1760; to which are annexed his treatises, before published; "The Fine Arts reduced to a single Principle," and "On Oratorical Composition;" "History of Primary Causes," 8vo. 1769; "The four Poetics of Aristotle, Horace, Vida, and Boileau, with Translations and Remarks," 2 vols. 8vo. 1771; "Elements of Literature, extracted from the Course of Belles Lettres," 2 vols. 12mo.; "Elementary Course for the Use of the Military School," 45 vols. 12mo.; and "Translations of Ocellus Lucanus, and Timæus Locrensis." Nouv. Dict. Hist.

BATTIE, WILLIAM, born in Devonshire, in 1704, received his education at Eton School, whence he went in 1722, to King's College in Cambridge. On the death of his father, his mother moved to Eton, and afterwards to Cambridge, that she might be near her son, and assist in lessening his expences. The Craven Scholarship becoming vacant soon after his admission; the Doctor offered himself as a candidate, and had the good fortune to be successful. Of the importance this small stipend, only 25l. per annum, was to him, we may judge, from what he says on the subject, in a letter to a friend. "I shall now," he says, "begin to live agreeably, and have, I hope, got through the worst part of my life." A recollection of the utility of this stipend to him, it is probable, Bowyer says, induced him, in the latter part of his life, to found a similar scholarship, at the same university. Pursuing his studies, in 1726, he was made Bachelor, and in 1730, Master of Arts; he was also now one of the Fellows of the College. In 1729 he published a specimen of an edition of Isocrates, in one volume 8vo. He at first proposed studying the law, and his finances not being equal to the expence of taking chambers in one of the inns of court, in London, he communicated his intention to two wealthy cousins in the city, of the name of Coleman; but as they declined assisting him, he turned his mind to the study of medicine, and in 1737, he took the degree of Doctor in that faculty. For a short time he practised medicine at Cambridge. Removing thence, he went to reside at Uxbridge, where, acquiring the confidence of some of the principal families in the neighbourhood, he soon came into considerable practice. About the year 1739, he married the daughter of Barnham Good, one of the masters of Eton, having kept up an intimacy with the lady from the time of his quitting the school. He was now also noticed by his relations, the Colemans, who were so much gratified by the consequence to which they saw him rising, that the survivor of them left him 30,000l. Continuing a few years longer at Uxbridge, he at length removed to London. In 1745, we find him, Fellow of the College of Physicians. The same year he spoke the Harveian Oration, which was published the following year. About the same time he was elected Fellow of the Royal Society. In 1749, he com-

pleted his edition of Isocrates, which was published in two volumes, 8vo. Though this work was not well received by the critics, it was always a great favourite with the Doctor. The year following he experienced a serious mortification. For taking an active part in a dispute between the College of Physicians and Dr. Schomberg, and being one of the most strenuous in opposing his admission as a Fellow, he was held up to ridicule in a satirical poem, under the name of the Battiad, in which a ludicrous account is given of the dispute, as well as some severe sarcasms on his favourite work. The Battiad is supposed to have been the joint production of Moses Mendez, Paul Whitehead, and Dr. Schomberg. It was published, at the time, in folio, and afterwards, in 1776, in a collection of humorous pieces, in 2 vols. 8vo. Another edition of this collection, much enlarged, was printed in 1792, in 4 vols. 12mo. There being at this time but one public asylum in London, for the reception of insane persons, which had been long found insufficient to contain all the indigent objects labouring under this affliction, a subscription was set on foot by some wealthy and benevolent individuals, to erect another edifice for the purpose, on the plan of Bethlehem Hospital. The scheme was so much approved, and so largely patronized, that in 1751 the managers of the fund were enabled to take, and fit up, a large building on the north side of Moorfields for the purpose, and as Dr. Battie had been very active in promoting the subscription, he was appointed physician to the institution, which was called St. Luke's Hospital. It contained one hundred and ten beds, eighty of which were appropriated to recent cases, such as were supposed capable of being relieved, or cured by medical treatment, and thirty for old and incurable cases. By the good conduct of the managers, and the character the charity thence acquired, the committee found themselves enabled, in 1781, to take a piece of ground, in Old Street, and erect a large and magnificent building for the reception of the patients, who were removed into it in 1786. The new building contains beds for 185 recent and curable patients, and for 120 incurables. The present physician, who was elected into the office, in 1781, is Dr. Samuel F. Simmons.

In 1757 Dr. Battie published a treatise on Madnefs, 4to. in which, having thrown out some censures on the medical practice formerly used in Bethlehem Hospital, Dr. John Monro, whose father was implicated in the censures, replied, rebutting his charges, and having humorously taken for the motto to his remarks, "O major tandem parcas insane minori," the Dr. was afterwards called by the wits, Major Battie. In 1762 he published "Aphorismi de cognoscendis et curandis morbis nonnullis, ad principia animalia accommodati," taken principally from his Lumleian lectures. In February 1763 he was examined before a committee of the House of Commons on the state of the private mad-houses in the kingdom, which he shewed them, from instances that had fallen under his notice, to be so ill conducted, as sometimes to be used as prisons for persons whose relatives were interested in getting them out of the way. This gave rise to a series of regulations, made by the legislature, with a view of preventing the continuance of those practices; but they were not completely suppressed until the year 1774, when the power of licensing private mad-houses was vested in the college of physicians.

As the Doctor had for several years confined his practice to maniacal cases, he had now leisure to indulge his inclination for building, to which he was much attached. Besides a large house, No. 88, Great Russell Street, Bloomsbury, for his town residence, he built an elegant villa at Twickenham, lately the residence of the Countess Dowager Pawlet. He

also erected a more considerable house on the banks of the Thames, at Marlow, in Buckinghamshire, where he passed much of his leisure time, in the latter part of his life. These houses were built under the immediate inspection of the Doctor, and after his own designs. He died of a paralytic stroke, at his house in Great Russell Street, the 13th of June 1776, aged seventy-two years. Having no male issue, his great property, upwards of 90,000*l.* was divided between his three daughters, of whom the eldest was married to captain, afterwards admiral sir George Young, who sold the house at Marlow, called Court Garden, to Richard Davenport, esq. an eminent surgeon of Essex Street, in the Strand, London; the second, to Philip Rashleigh, esq. a gentleman of Cornwall; and the third, to the late sir John Call, baronet.

BATTIFOLIUM, or **BATTIFOLLUM**, in *Antiquity*, a kind of tower or defence, frequently mentioned by Latin historians of the middle age. It seems to have been wood, and to have been erected on sudden and hasty occasions.

BATTLE, in *Geography*, a small market town of England, in a hundred of the same name, in Sussex, is situated six miles from Hastings, and 56 south-east from London. It was originally called Epiton; but the decisive victory at Hastings, gained by William, duke of Normandy, over king Harold, induced the former, when he was fixed on the throne, and founded the abbey, to change the name of the town to that which at present it retains. Battle consists of one principal street, indifferently built; and the parish church is a neat building, the incumbent of which is styled dean of Battle. The inhabitants support also a charity school for forty boys. The gunpowder which is manufactured here is esteemed the best in Europe, and hence called "Battle powder," though the town cannot boast of any other trade. The neighbourhood, however, is so fertile, that an incredible number of large cattle are constantly sent up to the London markets for sale, especially what are denominated stall-fed oxen, which produce the largest beef in England. Henry I. granted a market to be kept on every "*Lord's Day*;" but Anthony, lord Montague, who, about 1600, built himself a beautiful seat here, obtained an act of parliament to change the market day to Thursday, as it now continues. Battle is reckoned unhealthy, on account of its low dirty situation. Its greatest boast is the magnificent abbey built by William the Conqueror, on Heathfield, near the town, in 1067, to compensate, in some small degree, for the effusion of blood the year before; the highest altar of the fabrick standing on the very spot where the body of the brave but unfortunate Harold was found. This abbey was filled with Benedictine monks from Normandy, and endowed with such extensive privileges, that if a convict were passing to execution, it was in the abbot's power instantly to release him, should they meet on the road. At the dissolution its revenues were valued at 88*l.* 14*s.* 7*d.* The ruins of the abbey are very stately; and what remains undestroyed, serves as a house for the family of Webster, and for the purposes of the town, the gate-house being used as the hall in which are held sessions and other meetings for this peculiar jurisdiction. From Standard and Tillman hills are very extensive prospects. A fact related of abbot Hamo, in 1581, is worth recording; a body of Frenchmen landing and attacking Rye and Winchelsea. Hamo raised whatever force he could collect, repaired to Winchelsea, and having fortified it as well as he was able, checked the progress of the enemy, till the force of the country was sufficiently powerful effectually to repel them. Battle has three fairs, and two hundred and ninety-four houses, inhabited by 2040 persons.

BATTLE Island. See **BAY of St. Louis.**

BATTLE, a river in New South Wales, which runs N.E. into Sashakawan river, S.E. from Manchester house.

BATTLE, or *Battel*, *Wager of*, in *Law*, a species of trial of great antiquity, which had its origin in the military spirit of our ancestors, blended with superstition, and which consisted in a kind of appeal to Providence, under an apprehension and hope, however presumptuous and unwarrantable, that heaven would give the victory to him who had the right. Concerning the early history and general prevalence of this mode of trial, see **COMBAT**. This trial, which had been the immemorial practice of all the northern nations, and which had been first reduced to regular and stated form among the Burgundi, about the close of the fifth century, and passed from them to the Franks and Normans, was introduced into England, among other Norman customs, by William the Conqueror; but it was only used in three cases, one military, one criminal, and the third civil: the first in the court martial, or court of chivalry and honour; the second in appeals of felony; and the third upon issue joined in a writ of right. In these writs of right, the "*jus proprietatis*" could not often be ascertained without difficulty; and this mode of determining it was allowed for the sake of such claimants as might have the true right, but yet by the death of witnesses, or other defect of evidence, be unable to prove it to a jury. Although the writ of right itself, and of course this mode of trial, be at present much disused, yet it is still law and in force, if the parties chuse to abide by it.

The last trial by *battel* that was waged in the court of common pleas at Westminster, though one afterwards occurs in the court of chivalry in 1631, and another in the county palatine of Durham in 1638, was in the 13th year of queen Elizabeth, A. D. 1571; and was held in Tottil fields Westminster, "*non sine magna juris consultorum perturbatione*," says sir Henry Spelman, who was himself a witness of the ceremony. The form of it, described by judge Blackstone, is as follows.

When the tenant in a writ of right pleads the general issue, viz. that he hath more right to hold, than the demandant hath to recover; and offers to prove it by the body of his champion, which tender is accepted by the demandant; the tenant in the first place must produce his champion, who by throwing down his glove as a gage or pledge, thus wages or stipulates *battel* with the champion of the demandant; who, by taking up the gage or glove, stipulates on his part to accept the challenge. The reason why it was waged by champions, and not by the parties themselves, in civil actions, is because, if any party to the suit dies, the suit must abate and be at an end for the present; and therefore no judgment could be given for the lands in question, if either of the parties were slain in *battel*; and also that no person might claim an exemption from this trial, as was allowed in criminal cases, where the *battel* was waged in person.

A piece of ground is then in due time set out, of sixty feet square, enclosed with lists, and on one side a court erected for the judges of the court of common pleas, who attend there in their scarlet robes; and also a bar is prepared for the learned serjeants at law. When the court sits, which ought to be by sun-rising, proclamation is made for the parties, and their champions; who are introduced by two knights, and are dressed in a coat of armour, with red sandals, barelegged from the knee downwards, bareheaded, and with bare arms to the elbows. The weapons allowed them are only batons, or staves, of an ell long, and a four-cornered leather target; so that death very seldom ensued this civil combat. In the court military indeed they fought with sword and lance, according to Spelman and Rushworth; as likewise in France only villeins fought with the buckler and baton, gentlemen armed at

BATTLE.

all points. And upon this and other circumstances, the president Montefquieu hath, with great ingenuity, not only deduced the impious custom of private duels upon imaginary points of honour, but hath also traced the heroic madness of knight-errantry, from the same original of judicial combats. But to proceed.

When the champions, thus armed with batons, arrive within the lists, or place of combat, the champion of the tenant then takes his adversary by the hand, and makes oath that the tenements in dispute are not the right of the demandant; and the champion of the demandant, then taking the other by the hand, swears in the same manner that they are; so that each champion is, or ought to be, thoroughly persuaded of the truth of the cause he fights for. Next an oath against sorcery and enchantment is to be taken by both the champions, in this or a similar form; "hear this, ye justices, that I have this day neither eat, drunk, nor have upon me, neither bone, stone, ne grass; nor any enchantment, sorcery, or witchcraft, whereby the law of God may be abased, or the law of the devil exalted. So help me God and his saints."

The battle is thus begun, and the combatants are bound to fight till the stars appear in the evening: and, if the champion of the tenant can defend himself till the stars appear, the tenant shall prevail in his cause; for it is sufficient for him to maintain his ground, and make it a drawn battle, he being already in possession; but, if victory declares itself for either party, for him is judgment finally given. This victory may arise, from the death of either of the champions: which indeed hath rarely happened; the whole ceremony, to say the truth, bearing a near resemblance to certain rural athletic diversions, which are probably derived from this original. Or victory is obtained, if either champion proves *recreant*, that is, yields, and pronounces the horrible word of *craven*: a word of disgrace and obloquy, rather than of any determinate meaning. But a horrible word it indeed is to the vanquished champion: since as a punishment to him for forfeiting the laud of his principal, by pronouncing that shameful word, he is condemned, as a recreant, "*amittere liberam legem*," that is, to become infamous, and not be accounted "*liber et legalis homo*;" being supposed by the event to be proved forsworn, and therefore never to be put upon a jury, or admitted as a witness in any cause.

This is the form of a trial by battle; a trial which the tenant, or defendant, in a writ of right, has it in his election at this day to demand; and which was the only decision of such writ of right after the conquest, till Henry II, by consent of parliament, introduced the *grand assize*, a peculiar species of trial by jury, in concurrence therewith; giving the tenant his choice of either the one or the other. Which example, of discountenancing these judicial combats, was imitated about a century afterwards in France, by an edict of Louis the Pious, A. D. 1260, and soon after by the rest of Europe. The establishment of this alternative, Glanvil, chief justice to Henry II., and probably his adviser herein, considers as a most noble improvement, as in fact it was, of the law.

The trial by battle may also be demanded at the election of the appellee, in either an appeal or an approvement, and it is carried on with equal solemnity as that on a writ of right; with this difference, that there each party might hire a champion, but here they must fight in their proper persons. And therefore if the appellant or approver be a woman, a priest, an infant, or of the age of sixty, or lame, or blind, he or she may counterplead and refuse the wager of battle; and compel the appellee to put himself upon the country. Also peers of the realm, bringing an appeal, shall not be challenged to wage

battle on account of the dignity of their persons; nor the citizens of London, by special charter, because fighting seems foreign to their education and employment. So likewise if the crime be notorious; and if the thief be taken with the "mainour," or the murderer in the room with a bloody knife, the appellant may refuse the tender of battle from the appellee; for it is unreasonable that an innocent man should stake his life against one who is already half convicted.

The form and manner of waging battle upon appeals are much the same as upon a writ of right: only the oaths of the two combatants are vastly more striking and solemn. The appellee, when appealed of felony, pleads *not guilty*, and throws down his glove, and declares he will defend the same by his body: the appellant takes up the glove, and replies that he is ready to make good the appeal, body for body. And thereupon the appellee, taking the book in his right hand, and in his left the right hand of his antagonist, swears to this effect. "*Hoc audi, homo, quem per manum tenco, &c.*" "Hear this, O man whom I hold by the hand, who callest thyself John, by the name of baptism, that I, who call myself Thomas, by the name of baptism, did not feloniously murder thy father, William by name, nor am any way guilty of the said felony. So help me God, and the saints; and this I will defend against thee by my body, as this court shall award." To which the appellant replies, holding the bible and his antagonist's hand, in the same manner as the other: "Hear this, O man, whom I hold by the hand, who callest thyself Thomas, by the name of baptism, that thou art perjured; and therefore perjured, because that thou feloniously didst murder my father, William by name. So help me God and the saints; and this I will prove against thee by my body, as this court shall award." The battle is then to be fought with the same weapons, viz. batons, the same solemnity, and the same oath against amulets and sorcery, that are used in the civil combat: and if the appellee be so far vanquished, that he cannot or will not fight any longer, he shall be adjudged to be hanged immediately; and then, as well as if he be killed in battle, providence is deemed to have determined in favour of the truth, and his blood shall be attainted. But if he kills the appellant, or can maintain the fight from sun-rising till the stars appear in the evening, he shall be acquitted. So also if the appellant becomes recreant, and pronounces the horrible word of *craven*, he shall lose his "*liberam legem*," and become infamous; and the appellee shall recover his damages, and also be forever quit, not only of the appeal, but of all indictments likewise for the same offence. Blackst. Com. vol. iii. p. 337, &c. vol. iv. p. 346, &c.

BATTLE, in the *Military Art*, signifies an engagement between two hostile armies, drawn up in regular order, in a country sufficiently open for them to encounter in front at the same time; or should some obstacle occur to hinder the readily entering into action of the whole line, for the greater part of an army to begin the attack upon the troops opposed to them, the rest remaining in fight, ready to act as occasion may require their assistance or co-operation.

Other conflicts, when only certain points of the armies are engaged, though generally of much longer duration, and often attended with superior slaughter, are only termed fights, or, as they are called by the French, *combats*. (Feuquiere's Memoires, chap. 80.) Under this denomination rank therefore, though as obstinate as most others on record, the engagements of Seneffe, of Steinsterke, of Oudenarde, and of latter days, those of Zorndorf and Hochkirchen, equally celebrated on account of the carnage which attended them, and the importance of their consequences.

The

The loss of a battle involves almost always that of the artillery of the vanquished, and frequently of the baggage. As all these losses must be repaired before the beaten army can again look their conquerors in the face, the enemy consequently remains for a length of time master of the country, and at liberty to carry all his projects into execution. These inconveniences are rarely so severely felt in case of ill success in a partial combat, however desperate. Greater part of the artillery is generally preserved, and the baggage almost entire; for the opposite armies not closing in front, the divisions which have been engaged alone become the sufferers.

But in a set or pitched battle, the present object of attention, where both parties have time and room sufficient to arrange and extend themselves in regular order, the case is widely different. The least unforeseen advantage afforded to an enemy, or the most trivial circumstance unattended to, may baffle the efforts of the most experienced general, may snatch the palm of victory from the hands of numbers and valour, convert a successful pursuit to a disorderly flight, and lead to the irretrievable ruin of an army, possibly even of a state.

The ancients never joined battle without a great deal of preparation and religious ceremony; as making auguries, offering up sacrifices, haranguing to excite the courage of the soldiers, giving the word, or a tessera, &c. The signals of battle were, among the Romans, sounding the classicum, or general charge, striking upon their shields with their javelins, and displaying from the prætorium a peculiar flag, called by Plutarch (in Fab. Max. and in Pomp.) a red mantle. Cæsar also mentions this flag in his *B. Gallico*, l. ii. c. 20. In the moment of onset, a shout was raised by the whole army, for the double purpose of encouraging their fellows, and striking terror into the enemy. Similar to this was the custom which prevailed among the Greeks, of singing the *præan*, or hymn of combat, as they moved forward to the charge.

The rigid superstition of the Jews at first prevented them from fighting, or even from defending themselves, on the sabbath-day; but fatal experience of the inconvenience of the latter precept, induced them, in their wars with the princes of the Syro-Macedonian dynasty, to dispense with its observance. It was, however, in consequence of the aversion they still retained to a violation of that holy day, that Pompey became master of Jerusalem by assault, without any effectual resistance. *Dion. Cass. lib. xxxvii.*

The Romans did not carry their regard for religion so far. They had indeed their peculiar days, called "*præliæres dies*," wherein alone it was *lawful* to join battle; and others whereon it was unfit, called "*dies atri*;" but less scrupulous than the Hebrews, these latter were only observed in respect of attacking. No day was too sacred for them to defend themselves in. (*Macrob. Saturn. lib. i. c. 6.*) We observe frequent instances of their engaging by night. It was by night that Scipio destroyed near Utica the armies of Asdrubal and Syphax (*Liv. xxx. c. 5.*); and the decisive battle between Pompey and Mithridates (*Plut. in Pomp.*) was fought by moonlight.

The Athenians were prohibited, by the ancient laws of their country, from drawing out their forces for battle till after the 7th day of the month; and Lucian, speaking of the Lacedæmonians, relates, that by the statutes of Lycurgus, they were not to fight before the full-moon. A similar custom prevailed among the ancient Germans, who reputed it an impiety to engage in the wane of the moon; and Cæsar intimates that his victory over Ariovillus was owing to that prince's having, contrary to the religious notions of his

countrymen, fought during the decrease of the moon. The barbarians were intimidated with the apprehension, and afforded Cæsar an easy conquest. To use his own words: "*Acie commissa impeditos religione hoste vicit.*" *Cæsar. de Bel. Gal. lib. i.*

An idea of the manner in which warlike operations were carried on, and battles fought, among nations in their primitive barbarous state, has been given under the article *ATTACK*. We shall not here repeat what has been already said on that subject.

Authors are fond of quoting the battle of Thymbra, between Cræsus and Cyrus (*Xenoph. Cyrop. lib. vi. vii.*), as the first general engagement ever fought. But as it is only related in the *Cyropædia*, a work whose historical veracity has been severely called in question, and as its recital is attended with circumstances of the most romantic cast, we shall content ourselves with barely mentioning it, and pass on to instances better authenticated, and less embellished by the marvellous.

At the battle of *Marathon* (*Herod. Erat. sect. 107. 117.*) the Greeks, conducted by Miltiades the Athenian, demonstrated the possibility of compensating by discipline, valour, and military skill, for any inferiority in numbers. A manœuvre not without its faults, but novel in the art of war as then understood, obtained for them a victory as splendid as extraordinary; and which we may rank as the earliest in profane history, of which any particular account has been transmitted to us.

The battle of *Platæa*, from the numerous forces engaged on either side, best deserves the denomination of a pitched battle. (*Herod. Calliope, sect. 61—74.*) It was fought upon the true ancient model. Hurry and confusion reigned predominant. Greeks and Persians engaged in two several places, without any attempt at co-operation, or the smallest exertion of military genius on the part of their commanders. In the true language of Homer, here "man was opposed to man, and shield met shield;" and the Greeks seem to have fairly achieved this astonishing conquest by excelling their adversaries in the vulgar qualities of bodily strength and brutal courage.

After toiling through the heavy and sanguinary period of the Peloponnesian war, where, though convinced at every page of the rapid improvement of the Greeks in tactics, we do not meet with any of those general or important contests, the subject of the present article; and after taking a cursory examination of the massacre of Cynaxa; we at length arrive at the battle of *Leuctra*. (*Plut. in Pelop. Xenophon. Hellen. lib. vi. Diod. Sic. lib. xv.*) This brilliant engagement, between numbers comparatively trifling, deserves from a scientific reader more attention than that of Platæa, as it is indisputably the first occasion on which victory was obtained merely in consequence of an able disposition. The famous column of Epaminondas, which obliged 24,000 Lacedæmonians, the bravest troops in Greece, to yield the honour of the field to 6,000 Thebans, has been repeatedly cited with admiration by the most learned authors, and imitated by the first military geniuses, on various occasions.

The battle of *Mantineæ*, the next instance worthy of particular observation, was won by the same general (*Xenoph. Hellen. lib. vii.*) on the very same principle. The Lacedæmonians, though conducted by their king Agesilaus, one of the ablest leaders of his age, suffered themselves to be again destroyed, by the precise disposition which had already proved so fatal to them at Leuctra. The Spartan glory, by the loss of this battle, sustained a blow it never afterwards recovered. Epaminondas, whose genius had made the bravest soldiers in all Greece shrink before weaker nerves, weaker spirits, and

inferior numbers, expired on the field he had immortalized no less by his personal exploits, than his able arrangements before the action. Henceforth pitched battles are more frequently distinguished by masterly strokes of generalship.

The formidable phalanx, then a late invention, no less than his own military talents, secured to Philip of Macedon his important triumph at Charonæa. (Diod. Sic. lib. xvi. ch. 86.) The three great battles of Alexander against Darius were gained but with little difficulty, owing to the superior tactics of the Greeks. Those of Issus and Arbela in particular (Arrian. Alex. iii. sect. 15. Quin. Curt. lib. iv.) were only slaughter. When we read that in the latter, with the loss of only 1200 of his own men, the Macedonian destroyed, according to the least exaggerated accounts, 40,000 of the Persians (Arrian says 300,000), it is pretty plain that the resistance was but nominal, and that the conquerors had little more trouble than to do execution on their enemies.

The Grecian history, subsequent to Alexander, is replete with instances of pitched battles; but of which little or no particular account has been left us. We are for the most part in the dark with respect to the order observed in drawing up the rival armies, and the manœuvres which accelerated or retarded a victory. The abrupt termination of the history of Diodorus Siculus, deprives us of any details respecting the battle of Ipsus, except the brief and unsatisfactory account of Plutarch (in Dem.). The number of the slain alone leaves us sometimes a little room to judge of the importance or the obstinacy of a conflict.

Polybius, however, has left us (lib. ii.) a full and interesting account of the decisive engagement at *Sellasia*; which, for a time, completely subjected the Grecian states to the power of Macedon. Here again the phalanx determined the fortune of the day, and demonstrated the superiority of its close and impenetrable order, over the more loose and shallow bat-talions of their antagonists.

Among the Romans we shall find still further occasion to remark the rapid improvement of ancient tactics. Guided by Polybius and Livy, we peruse with peculiar interest the account of battles fought for the mastery of the world, perpetually differing in situation, in success, and in consequences. That of *Tunis*, in particular, between Regulus and Xanthippus, calls strongly upon the attention. We are not dazzled by a long list of numerous forces and barbarous auxiliaries, fatigued by a repetition of desultory attacks and repulses, or bewildered amidst a series of complex manœuvres. Two armies, nearly equal in numbers, of small strength, but supereminent valour, headed by renowned generals, encounter on a spot of ground easily surveyed by the eye of imagination. We remark their several dispositions. The simple narrative of the historian points out clearly and satisfactorily the faults or advantages of those dispositions, the mistaken rashness of the Roman, and the consummate generalship of Xanthippus; and before we enter upon the vicissitudes of the action, we are fully convinced that the errors committed by Regulus must ultimately lead to his total defeat. Polyb. lib. i.

The march of Hannibal into Italy furnishes us with several instances of pitched battles, various in their nature, important in their consequences, and interesting in description. Far from being fatigued with following the brave Carthaginian through a continual scene of slaughter, we consider and admire his conduct, feel for his difficulties, eagerly accompany him in the field of carnage, and take a lively interest in his proceedings. The three famous engagements of the *Trebia* (Polyb. lib. iii. Liv. lib. xxi. sect. 53—56.); of

the lake *Thrasymenus* (Polyb. ib. Liv. lib. xxii. sect. 4—7.); and of *Cannæ* (Polyb. ib. Liv. xxii. sect. 44—52.); rising in importance one above the other, chiefly arrest our attention. We find that previous to every one of these, the arrangements made by Hannibal were such as almost to ensure success. A series of artful movements was constantly employed to draw the Romans into the snares prepared for them; and their commanders, destitute of the genius it was necessary to oppose to so formidable an enemy, rushed, as it were, blindfold upon their ruin; though possessed in each of the contests we have just named of every advantage of numbers, resources, and, we may even add, of valour. The talents of a single man reduced those advantages to nothing. Their numbers were converted into an hindrance to themselves, their resources were intercepted or rendered useless, and their valour, degenerating into despair, precipitated them madly upon certain destruction.

No action was ever more obstinately fought, or as a pitched battle deserves more consideration, than that of *Zama* (Liv. lib. xxx. sect. 32—35. Polyb. Fragin. lib. xv.), where the fortune of a Scipio finally triumphed over the Carthaginian republic. Without more than barely naming it here, we refer the reader for a more particular account of that celebrated affair, to the article *ZAMA*.

From this time, Roman discipline and valour reigned triumphant in every struggle with foreign nations. The armies of Antiochus, Perseus, and Mithridates, were destroyed, for the most part, with scarcely an effort; and the battles they ventured in defence of their dominions are only miserable instances of the inferiority of mere courage, supported by tenfold numbers, to the cool and steady bravery of veteran soldiers, directed and managed by the talents of an experienced general.

But however cheaply the legions of Flaminius, of L. Scipio, of P. Æmilius, and of Lucullus, had earned their laurels, a harder task was imposed on those who, under Cornelius Sylla, and Julius Cæsar, turned their arms against their own countrymen. They had to engage with troops equally courageous, expert, and strictly disciplined; with men who, under Marius and the great Pompey, had exterminated the hordes of the savage Cimbri, and had subjugated the eastern world; in a word, with Romans. Three pitched battles, those of *Pharsalia*, *Thapsus*, and *Munda*, signalized this bloody period, and gave ample scope for the exertion of the utmost talents of the matchless Cæsar. Yet in the last of these engagements, that consummate general confessed, that he contended not for victory, but for his life; a satisfactory evidence of the desperation with which it was fought. Plut. in Cæs.

The two battles of *Philippi* are equally famous. Few have been more decisive in the event, or more distinguished for the uncommon perseverance and obstinacy with which they were contested.

In the age of Tacitus, we find the military science of the Romans brought to perfection. Similar to the train of artillery which modern generals carry into the field, the army of Vitellius at *Cremona* planted its ballistæ to play upon the enemy, and with showers of immense stones, swept them away by whole ranks. (Tacit. Hist. lib. iii. sect. 23.) This battle, and the subsequent storming of the adverse camp by the legions of Vespasian, give us a perfect insight into the mode of warfare as then practised. Tacit. *ibid.* sect. 21—33.

In the lower ages of the empire we meet with very few instances of conflicts, remarkable either for their long duration or for any celebrated manœuvres put in execution by rival generals. Nations relapsed fast, even in this destructive science, into their original barbarism. Armies were no longer com-poled

composed of troops regularly trained and inured to service, but of cowardly and undisciplined plunderers, to whom victory or defeat was alike the signal for disbanding, on whose exertions therefore but small dependence could be placed, and from whose successes little or no benefit could be derived. Numbers soon became, as formerly, the criterion of advantage. War teemed with sanguinary combats, productive of trifling consequences. Courage supplied the place of generalship; fury and carnage, of discipline.

Never did a series of pitched battles follow each other in more rapid succession, than during the period subsequent to the first irruption of the Arabs into the more civilized provinces of Asia. These enthesiallic followers of their prophet, issuing from a peninsula of contemptible extent when compared to the empires they so madly attacked, dared to match their own puny forces against the united efforts of the Roman and Persian monarchies. As we accompany them in their progress, the most incredible victories crowd upon and harass our reflections. It is true, that among these engagements, so general, so bloody, and so decisive, we do not find the slightest trace of discipline or generalship. A religious fury, altogether irresistible, compensated with the Arabs the want of both these requisites. Aiznadin, Kadafia, and Yermouk, are lasting monuments of Moslem glory; but they do not convey the least information to the military reader, or recompense in interest the attention he may bestow in perusing them.

Alike barren, dry, and uninteresting, are the details of most of those battles fought between the time of Charlemagne and the beginning of the seventeenth century. Whether we peruse the murderous annals of the Crusades, where all Europe and Asia seem mingled in reciprocal carnage; or the bloodless combats of the Italians in the days of Machiavel, when, after fighting a whole day, armies have separated without the loss of a man on either side (Machiav. Hist. Flor. lib. vii.); we are alike disgusted with the want of circumstances to excite our attention.

Cressy, Poitiers, and Agincourt are names venerated with reason by every Englishman; but setting aside any consideration of the splendid carnage which attended them, and examining them in a military point of view, how little shall we find to extol, how much to censure. In all the three cases, the English armies were brought into the most imminent danger by the boyish imprudence of their leaders, who marched them, as it were blindfold, into the heart of an enemy's country, without taking the smallest pains, either to secure the necessary supplies of provisions, or to ensure a retreat. Not to be behind hand in imprudence, the French generals, although certain of starving their antagonists into a surrender merely by an inconsiderable delay, had three times successively the infantry to march up and attack the English, strongly and advantageously posted, and on ground too where not a fourth of their own numbers was capable of acting. Untaught by experience, they lost the three great battles by exactly the same fault; and in all three (the contested tradition of the artillery used at Cressy alone excepted), we find no reason to commend the military science of our ancestors. Indeed, at Poitiers, the Black Prince possessed sagacity sufficient to line the hedges on both sides of a narrow way with archers, for the purpose of annoying the French gens d'armes as they advanced through it to the attack: a stratagem not half so commendable as that of Nevil, earl of Salisbury, at the petty skirmish of Bloreheath, in the reign of Henry VI. (Holinshed); an affair as much surpassing Poitiers in a tactical consideration, as inferior in the bloody list of the killed, and the consequences that ensued upon it.

In proportion as we approach nearer to modern times, we view the military science making faster strides towards improvement. The invention of gunpowder effected by degrees an important change in the whole art of war. The arms and order of the battalions underwent a total alteration. The cavalry, formerly the main dependence of an army, inasmuch that no person of family would serve in any other capacity than as a horseman, became a mere appendage to the infantry, who, since the invention of fire-arms, have generally decided the event of battles. The musquet and bayonet are now substituted for the pike and sword; and armies, like fortified places, must be approached in form, and battered down by artillery, while the most complete defeat is rarely attended with worse consequences than the loss of the surrounding territory.

About the year 1630, the entrance of Gustavus Adolphus and his Swedes into the German empire, and the great events which signalized the war of thirty years, render military history more interesting. The celebrated battles of *Leipzig* and *Lutzen*, where the first modern use was made of the column, now the chief instrument of the gain of victories, are remarkable epochs. On those days the hard-earned laurels of Tilly and of Wallstein faded in a moment before the comprehensive genius of Gustavus, who, by his skilful dispositions bought, though with his life, the title of the first general of his age. A succession of heroes, Weimar, Bannier, Torstenfon, and Wrangel, adopted and improved upon his maxims. Condé and Turenne profited anew by the example; and a succession of victories obtained under their auspices, rendered the arms of Louis XIV. during 50 years invincible.

On entering upon the history of the war of 1690, we are surprized at the rapid improvements in that part of the military art, the subject of the present article. The engagement of *Steinkirk* presents a remarkable instance of the recovery of an affair judged entirely desperate. The battle of *Landen* shews us an army entrenched behind a number of fortified villages, driven from all its defences, and carried as it were by storm. The bayonet, used first by Catinat at the action of *Marfaglia*, added a new and terrible weapon of offence to the infantry, and by degrees entirely superseded the use of the pike. The reader will now observe armies more numerous and more regularly subsisted than formerly, plans of attack and defence more ingenious and connected, artillery more formidable and better served, and a degree of method in military operations not before practised.

In the war of succession, or that which took its rise from the separate claims of the houses of Bourbon and Austria to the Spanish monarchy, the three great battles of *Hochstedt*, of *Ramillies*, and of *Turin*, immortalized by the abilities and splendid victories of Eugene and Marlborough, claim particular attention. To enlarge upon each under the present article, would trespass too much on the boundaries assigned to us; we therefore refer the scientific reader to the heads *HOCHSTEDT*, &c. where he will find a succinct account of those engagements, illustrated by the critical remarks of an excellent military judge, M. de Feuquieres.

Of all the battles fought by Charles XII. in his nine years' war with the Russian empire about the same period, that of *Pultowa* alone is remarkable in a tactical point of view. *Narva*, *Duna*, *Cliffow*, &c. furnish but splendid and transitory instances of successful rashness in a military madman. The battle, or rather five battles, of *Lefno* on the *Soffa*, fought by general *Lewenhaupt* against the whole forces of the Czar, are interesting in so far as they display the astonishing resources of Swedish valour.

B A T T L E.

From a tranquillity of fifty years, hardly interrupted by the short contest for the succession of Poland, Europe was aroused by the war of 1740. With wonder we behold a nation, hardly before reckoned in the number of her powers, a nation of soldiers, start into energy; and, headed by a monarch who to the most consummate generalship joined the qualifications rarely found in military men, of love for the sciences, and genius for their improvement, perform the most astonishing and romantic exploits. It would be superfluous to follow the Prussian hero through his career of victory and glorious distress, or to enumerate the various means and manœuvres by which he triumphed at Friedberg, at Prague, at Lissa, at Zorndorf, and at Torgaw, over the firmness and discipline of Austrian forces, the talents of a Daun, and the enterprize of a Laudohn. Nor have we room to enter into details of his defeats at Kolin, Hochkirchen, and Cunnorsdorff; defeats which only throw additional lustre on his transcendent abilities.

It seemed impossible for human genius to surpass the bounds prescribed by the immortal Frederic to modern tactics. His hand had modelled armies into mere machines, liable to be directed with promptitude at the pleasure of the mover. The systems practised in the Prussian and Austrian schools, seemed to defy alteration or improvement; and the art of drawing up armies in order of battle particularly was reduced to certain rules, adapted to all situations, and which ensured every presumptive means of success.

A revolution, the effects of which have been severely felt in the most remote corners of the globe; a revolution, which has shaken the religious and political opinions of the most powerful nations, arrived to overturn monarchies, to change the face of Europe, and to convert it into one vast theatre of war. The military art did not escape the general influence. When the armies of Prussia and Austria, numerous, valiant, and bred up in the schools of Frederic and Laudohn, poured their united forces upon the French republic, opposed only by raw levies, undisciplined, half armed, and conducted by generals, many of whom knew nothing of service by experience; what resources could we suppose a nation to possess, capable of counterbalancing such disadvantages! But with amazement we view the disciplined invaders, at the end of the first campaign, driven back with shame and defeat. We view the best officers in Europe in a disgraceful retreat before mere novices in the art of war. We view enthusiasm supply the place of commanders, of numbers, and of discipline.

One general battle had subjugated Belgium to the disposal of France, when the treachery of a general not only occasioned the loss of that country, but endangered the frontier of the republic itself, then covered only by a disorganized army. Nevertheless, during a long and bloody campaign, the forces of almost the whole of Europe united strove in vain to break through the first line of the bordering fortresses. The scene was soon totally changed. The collected energy of a nation, overbearing all opposition, repelled the attack; retaliated invasion; and by seven of the most brilliant campaigns recorded in history, achieved such important, rapid, and extensive conquests as almost exceed credibility.

We must not place to the sole account of enthusiasm these wonderful successes. Enthusiasm alone, though backed by still greater numbers, must ultimately have proved insufficient, when opposed to disciplined troops and skilful generals. The art of war gradually assumed a new face. To the maxims of the German school, others succeeded still more prompt, more energetic, and peculiarly adapted to the nation which carried them into execution. To the excellence

of their artillery, their skill in the art of managing the bayonet, and the incredible rapidity with which they have executed the different modes of charging in column, as well as to the extraordinary talents of their self-taught generals, the French owe chiefly their successes in the late war. Under some future article we shall hazard some observations on their mode of engaging.

In a war so productive of bloody and general engagements as the last, it would be superfluous to dwell on particular instances. Never in one campaign did so many battles take place as in 1794, when from the beginning of April forwards hardly a day passed without some desperate conflict. In point of consequences, we must assign the first rank to Jemappe, Turlemont, Haguenau, Fleurus, Millefimo, Arcole, Marengo, and Hohenlinden; but if we only consider the slaughter on both sides, Lodi, Verona, Stockach, Novi, and Zurich stand pre-eminent. A few remarks upon these, with some other affairs of principal consequence, will be found under their proper heads.

When we consider the immense resources required to maintain a large army, and the inconvenience with which the movements of more unwieldy bodies are still attended, we shall find room to commend the less extensive scale on which we carry on our wars, compared to that of more ancient times. Indeed the armies, which we are assured have been brought forth to battle in the earlier ages, almost stagger our belief. Sesostris is said (*Diod. Sic. i.*) to have led 600,000 foot, 24,000 horse, and 27,000 armed chariots, on his famous expedition into Upper Asia. The same historian swells the armies of Ninus and Semiramis to two and three millions of men. We are told in scripture that Zerah, a barbarous potentate, invaded the kingdom of Judah with a million of his subjects, who were totally exterminated by the Jewish monarch Aza; nor are the accounts of the numbers engaged at mount Zemaraim on both sides, and the carnage of the Israelites on that occasion less marvellous. (*II. Chron.*) Darius, in his Scythian expedition marched at the head of seven hundred thousand of his subjects (*Herod. lib. iii.*). Xerxes invaded Greece with a fleet of more than 1300 triremes, and a land army of 2,100,000 men. According to Herodotus (*lib. vii.*), the whole of his sea and land forces numbered above five millions. These numbers, immense as they are, will hardly appear exaggerated, when we reflect on the hosts afterwards brought into the field by the Goths and Huns, and the formidable swarms of Croises in the middle ages. The last Darius, when he engaged Alexander at Issus, mustered in his army six hundred thousand men; and some historians make his forces at the battle of Arbela amount to a million.

The ease with which these immense hosts were defeated by comparatively trifling numbers of Greeks, gives us the most mean idea of their bravery and military skill. We must except the instance of Plataea, where the victory was obstinately disputed, and the carnage consequently dreadful. There are few instances upon record of a battle so completely decisive. Of 300,000 men, of whom the Persian army consisted at the commencement of the action, not four thousand escaped the destruction of that fatal day. (*Herod. ix.*)

The Romans, although they sometimes kept very numerous forces on foot in different parts of their dominions, seldom employed above forty thousand men in the same army. In their war with the Cisalpine Gauls, subsequent to the first Punic, they levied between seven and eight hundred thousand troops; but these all acted in separate corps. One of the largest armies they ever brought into the field, was that defeated, or rather destroyed, at Cannæ by Hannibal. It consisted of 76,000 foot and 7,200 horse, of all whom

only

B A T T L E.

only about 3000 escaped death or captivity. This defeat, terrible as it was, was some years after revenged by the slaughter of 60,000 Carthaginians on the banks of the Mætaurus. (Polyb. lib. ii & iii. Livy.)

We shudder at the cruelties which sometimes accompanied the triumphs of Rome over her more barbarous and undisciplined enemies. L. Scipio destroyed 50,000 Syrians at Magaelia. Marius, in his contest with the Teutones, took or exterminated above 300,000 of them. In a second battle, against the Cimbri, he slew 120,000, and captured half that number. In three battles against the generals of Mithridates, Sylla cut in pieces 200,000 men. The bloody defeats he sustained from Lucullus, during the siege of Cyzicus, cost the same Mithridates three hundred thousand of his forces. On one occasion, Julius Cæsar annihilated an army of 368,000 Helvetii; on another, he extirpated upwards of 430,000 Germans, who had crossed the Rhine in quest of new settlements. (Livy. Plut. in Mar., Sylla, & Lucull. Cæf. de Bell. Gall.)

In the civil wars of the Romans themselves, we find instances, considering the inferior numbers of the troops engaged, of slaughter equally dreadful. In the battle before the Colline gate of Rome, Telesphus, a general of the Marian faction, commanded 79,000 men against Cornelius Sylla; 12,000 of these being taken, were chiefly massacred in cold blood after the action; all the rest perished either on the field or in the flight by the swords of their implacable countrymen. In justice to Cæsar we must observe, that his triumphs over the Pompeian party were in a great measure exempt from these atrocities. (Plut. in Sylla. Eutrop.)

It is the well-founded remark of a judicious and elegant writer, that our European battles appear only as skirmishes, when compared to those which have deluged the plains of Asia with blood. (Voltaire, *Essai sur l'esprit et les mœurs des nations*) In the year 1218, fatally distinguished as being the epocha of the first irruption of the Moguls and Tartars into the southern provinces of Asia; the destroyer Ghengis-Khan marched to the siege of Otrar at the head of 700,000 combatants. Mohammed, the reigning sultan of Karazm, opposed him with an army 400,000 strong. The weaker party was defeated, and the Tartar conqueror commenced his sanguinary career by the destruction of 150,000 of his enemies. This first chastisement only paved the way for others still more terrible. In following the great Khan through the dreadful scenes transcribed by De la Croix from the best Eastern authorities, we are shocked at the unheard of severities exercised upon such cities as most incurred his anger by an obstinate resistance. The particulars of such tragedies would but disgust the reader. To select a few of the most remarkable instances:—At the storming of Karazm, Mohammed's capital, 200,000 persons were massacred, and half that number sold for slaves; 90,000 were shot to death with arrows in cold blood on the plains of Nefas; 1,747,000 were butchered in the two cities of Nisabur and Tars, and their dependencies; 1,600,000 in the district of Herat; and in the last battle fought by Ghengis Khan against the rebels of Targut, 300,000 are reported to have perished. To dismiss the subject, the Chinese record inform us, that in the first fourteen years of the Mogul empire, the numbers of persons destroyed by Ghengis Khan amounted to the dreadful total of eighteen millions and upwards. (Petit de la Croix, *Hist. de Gheng. Khan*, Par. 1740. *Mod. Univ. Hist.* vol. iv.)

The subsequent wars of the Moguls abound with examples of almost equal enormity. In the siege of the capital of the Chinese empire by Oktay Khan, a million of people were slain on both sides. Timur Bek, who carried on his expeditions upon the same plan as Ghengis, could bring

800,000 men at once into the field, with whom he so completely defeated at Ancyra 400,000 Turks under Bajazet, that not a fortieth part escaped the common destruction. In a word, it is in Asia that war has always been waged on the most gigantic scale.

Less bloody in their conquests, and more generous in their disputes, the armies, which during the two last centuries have been set on foot by European nations, were comparatively trifling in number. The battle of Malplaquet, where 220,000 men were engaged on both sides, is most remarkable for the number of the combatants; those of Hochstedt and Prague for the destruction of the human species. At Hochstedt, the French and Bavarian army, which before the action mustered 60,000 men, was reduced to one-third of that number. The battle of Prague cost the king of Prussia, by his own confession, 18,000 of his best troops, while the Austrians lost 24,000 men.

It is with sorrow we are obliged to remark, that the carnage on several occasions, during the last unhappy contest, has been unexampled in the history of modern war. Upon the Rhine, in particular, the loss on both sides, towards the latter end of December 1793, is computed at 80,000 men.

The following concise list of the most remarkable and decisive battles which have taken place (chiefly in Europe) from the earliest ages, may not prove wholly unacceptable.

	B. C.
Marathon, between the Greeks and Persians, fought 490	490
Himera, in Sicily, between the Greeks and Carthaginians,	480
Plataea, Greeks and Persians,	479
Mycale, in Ionia,	479
Eurymedon,	470
In Egypt, between the Athenians and Persians,	460
Of the Assinaros, in Sicily, between the Athenians and Syracusans,	413
Cynaxa, in Persia,	400
Coronea, between Agesilaus and the forces of the Theban alliance,	394
Leuctra, where the Spartans were entirely defeated by Epaminondas and the Thebans,	371
Mantinea,	363
Cheronea,	338
Of the Granicus,	334
Ilius,	333
Arbela, or Gaugamela, which subverted the Persian empire,	331
Of the Hydaspes, between Alexander and Porus,	327
Ipsus, in Phrygia,	301
Beneventum, in Italy, between Pyrrhus and the Romans,	274
Agrigentum, in Sicily, between the Romans and Carthaginians,	262
Tunis, in Africa, do.	255
Panormus, in Sicily, do.	251
Of the Macra, in Africa, between Hamilcar Barca and the revolted mercenaries,	239
Trabia, in Italy, between Hannibal and the Romans,	218
Of the lake Trasymenus, do.	217
Cannæ, do. one of the most complete defeats mentioned in history,	216
Sena, on the Metaurus, where the army of Afrubal was cut off by Nero, the Roman consul,	207
In Spain, between Scipio and Afrubal the son of Gisco,	206
Zama, Hannibal totally defeated by Scipio,	202
Magnesia, between L. Scipio and Antiochus,	190
Pydna, between Perseus and P. Aemilius,	168

BATTLE.

	B. C.	A. D.
Nepheris, decisive of the third Punic war,	147	1690
Cirta, in Numidia, between Marius and Jugurtha,	106	1690
Near the Rhone, where the Romans sustained a terrible defeat from the Cimbri and Teutones'	105	1690
Aquæ Sextiæ, between Marius and the Teutones,	102	1691
Verceilæ, in which Marius totally exterminated the Cimbri,	101	1691
Cheronæa, between Sylla and the army of Mithridates,	86	1692
Orchomenus, do.	85	1693
Before the gates of Rome, between Sylla and the Samnite Telestinus,	82	1697
Cabira, between Lucullus and Mithridates,	71	1700
Tigranocerta, between Lucullus and Tigranes,	69	1702
Carthæ, Crassus defeated by the Parthians,	53	2 Aug. 1704
Pharfalia, between Cæsar and Pompey,	48	12 May, 1706
Philippi,	42	27 August, 1706
Actium,	31	14 April, 1707
	A. D.	30 June, 1709
Bedriacum, between the legions of Otho and Vitellius,	69	11 Sept. 1709
Cremona, between the generals of Vitellius and Vespasian,	69	Denain, 1712
Lugdunum, in Gaul, between Severus and Albinus,	198	Peterwaradin, 5 Aug. 1716
Chalons, between Ætius and Atila, in which 300,000 persons fell on both sides,	451	Belgrade, 16 Aug. 1717
Aznadin, in Syria,	634	Parma, 18 June, 1734
Kadesia, in Fars, which subverted the empire of the Sassanides in Persia,	634	Guastalla, 8 Sept. 1734
Yermûk, in Syria, where the Saracen general Khaled totally defeated the Greeks,	636	Molwitz (the first defeat given to the Austrians by Frederic III.), 30 March, 1741
Fontenay, in France,	841	Czaflow, 6 May, 1742
Hastings,	1066	Fontenoy, a memorable battle, 30 April, 1745
Ascalon in Palestine, between the Croises and the Saracens,	1192	Friedberg in Silesia, where the king of Prussia totally defeated the Austrians, 24 May, 1745
Bouvines,	1214	Rotto-freddo in Italy, 31 May, 1746
Otrar in Tartary,	1218	Culloden, 16 April, 1746
Of the Indus, between Ghengis Khan and Jalalo'ddin,	1221	Prague, 6 May, 1757
Bannockburn,	1314	Kolin (the first defeat sustained by the king of Prussia), 18 June, 1757
Cressy,	1346	Plaffey, which laid the foundation of the future power of the British nation in Bengal and Hindostan, 23 June, 1757
Poictiers,	1356	Rosbach, 5 Nov. 1757
Angouri, between Bajazet and Tamerlane,	1402	Breslaw, 22 Nov. 1757
Agincourt,	1415	Lissa, 5 Dec. 1757
Towton,	1461	Zorndorff (in this battle the king of Prussia totally defeated the Russians with terrible slaughter), 25 Aug. 1758
Bosworth, between Henry VII. and Richard III. which finished the war between the houses of York and Lancaster,	1485	Hoehkirchen, 14 Oct. 1758
Flodden,	1513	Minden, 1 Aug. 1759
Marignano, between Francis I. and the Swiss,	1515	Cunnersdorff (the king of Prussia here sustained a complete defeat from the Russians), 12 Aug. 1759
Pavia, between Francis I. and Charles V.	1525	Torgau, 3 Nov. 1760
Mohatz in Hungary, which decided the fate of that kingdom,	1526	Freyberg, decisive of the seven years' war, 29 Oct. 1762
S. Quintin,	1557	Choczim, 30 April, 1769
Nieuport, by prince Maurice over Albert,	1600	Foczan, 1789
Prague, by the duke of Bavaria over the Elector Palatine,	1620	Jemappe, in which the Austrians were defeated by Dumourier, and lost in consequence all their possessions in the Netherlands, 6 Nov. 1792
Leipzig, by Gustavus Adolphus over count Tilly,	1631	Tirlemont, where Dumourier was defeated by the prince of Saxe-Cobourg, and the Netherlands subsequently recovered, 18 March, 1793
Lutzen, memorable for the death of Gustavus Adolphus,	1632	Between Dietz and Louvain, fought by the same generals, with similar success, 22 March, 1793
Nordlingen, where the Protestant league in Germany was totally defeated,	1634	Haguenau, 8 Dec. 1793
Breitenfeld, near Leipzig,	1642	In the neighbourhood of Landau (the Austro-Prussian army was almost destroyed by the republican generals Hoche and Pichegru), from the 22 to the 27 Dec. 1793
Edgehill,	1642	Moucron (Gen. Clairfait was again defeated by Pichegru), 29 April, 1794
Rocroy,	1643	Fleurus (the prince of Cobourg was defeated by Jourdan. This battle ultimately decided the fate of the Netherlands), 26 June, 1794
Naseby,	1645	Liege,
Jancowitz,	1645	
Worcester,	1651	
Before Vienna, which was relieved in consequence,	1683	

B A T T L E.

The chief view of the great commanders of modern times has been, till of late years, rather to harass, or starve an enemy, by frequent alarms, by cutting off his supplies of provisions, carrying off his baggage, seizing his posts, &c. than to stake their fortune and reputation on the event of a day; a battle generally deciding the fate of a campaign, and not infrequently of the war. It is therefore a rule never to venture a general action without important reasons, or when absolute necessity leaves no other choice.

Reasons for seeking and engaging the enemy are, a decided superiority in number or quality of forces; discord among the commanders of the opposite army, when actuated by different interests; an obvious incapacity on their part, demonstrated by a neglect of the ordinary precautions in encamping, or on a march, the necessity of relieving a considerable place besieged by the adversary; an apprehension of the total ruin and dispersion of an army, unless prevented by success in a general engagement; an intelligence of reinforcements coming to the enemy, whose junction would render him superior, and change the state of affairs; a particular advantage obtained in some preceding action, which, however indecisive, has given the enemy a smart check, and produced an evident superiority; or in fine, the obligation of putting all to the risk of a battle.

The most proper reasons for avoiding it are; the having less to hope for from a victory, than to fear from an overthrow; inferiority, either in number or courage of the troops; an expectation of fresh succours, or the junction of a considerable detachment; the impossibility of bringing the enemy, too advantageously posted, to an engagement on fair terms, or of forcing him in his entrenchments; or the prospect of ruining his army by temporising, and declining battle. See ACTION.

But a resolution to engage being once taken, in consequence of one or other of the reasons above recited, the next object to be considered is the means of carrying it into execution with the strongest presumption of success. Those

measures are partly preparatory to the affair; but the most important and essential chiefly take their rise out of the different circumstances of the action itself, and are those which almost always determine its success.

Preparatory to fighting, a general should carefully observe the following particulars. He should form the order of battle according to the strength and quality of the troops of which his own army is composed, always having an eye towards counteracting the disposition in which it is expected to find the enemy. The general officers should be assigned their respective posts, and copies of the order of battle carefully sent to such as have a separate command, who must be responsible for its observation in every respect. All the troops must be perfectly armed and equipped; the proper number of cartridges distributed previously to the battle; waggons loaded with ammunition, and arms stationed in the rear of those battalions, which, it is presumed, will have the hottest fire to sustain; and a fresh reserve provided at the park of artillery; as well to give out before and during the action, if wanted, as after it is over, when there are generally many missing. Time, if possible, should be allowed to the troops to rest and refresh themselves, before the engagement. Physicians, surgeons, and medicines must be provided, and rather more in number than may be deemed barely sufficient. The army must be totally disencumbered of the heavy baggage, and the remainder lodged in a place of safety at some distance. The advantages of sun and wind, however trivial, are not to be neglected. The soldiers should likewise be inspired with the desire of fighting, and a certainty of victory; inflamed with the hope of plunder and good quarters; and the officers reminded of glory and of rewards.

Those occasions of conquering which commonly only present themselves on the day of battle are, taking advantage of the ground; strict observance of the disposition already concerted, and, should a correction prove necessary, the making of it without confusion, and with the knowledge of all those officers, who, from their situations, should become apprised of it. The artillery is to be planted along the line, according to the nature of the country; and every opportunity narrowly watched of gaining an advantage, either by extending the wings to turn, if possible, the flanks of the enemy; or by closing and protecting, to draught sufficient troops from them for a grand attack where the enemy may appear most feeble. Should the march to the enemy be made by night, or little probability offer of finishing the contest before dark; the word should be given to the whole line before they march. If the advance is made in line, due care should be taken to preserve the equality of the wings, and the requisite distance between the lines; frequent halts should be made to give the artillery time to fire and load, and the ranks to recover their order. Frequent warnings, above all, should be given the soldiers to receive the enemy's fire, and abstain from returning it till they have drawn their adversaries' ammunition from them: for troops who have parted with their fire will most infallibly give way on seeing an opponent advance, ready to pour in a heavy volley upon them. If, however, both parties pursue the same maxim, the only expedient is, to march up close to the enemy, give in a general discharge upon them, and prevent its being returned by immediately having recourse to the bayonet, under cover of the smoke, which seldom fails to produce an important effect.

If the advancing army, by reason of the distance it has to march, or the inequality and close nature of the ground, or desiles, it must pass, cannot come at the enemy in front, the approach must be made in a sufficient number of columns, to admit the formation in order of battle, out of distance of be-

ing charged when in column. The general officers who conduct these columns should also carefully observe the motions of each other, so that the heads of their divisions may at least preserve a front; and that, when arrived at the ground where the army is to deploy into line, the movement may be executed with diligence and caution, and at too great a distance to be attacked by the enemy before all the battalions are drawn up in the pre-concerted order.

The commander in chief should post himself where he may best and most conveniently remark the effect of the first charge, and whence he may with the least difficulty disperse his orders, either to sustain the troops who may have broken the enemy, or to replace such as have themselves been thrown into disorder. For both these purposes he should make use of the supernumerary forces stationed between the two lines, or of those of the reserve, as he may judge most advisable. Every other general officer should be at his particular station, either to lead to the charge, or to remedy the disorders which may arise in the brigade entrusted to his command.

If the battle becomes general and bloody, and success inclines to neither side, the commander in chief should direct his principal effort against that part of the line where the enemy's resistance is most obstinate; and in this case he should himself hasten to the spot, to animate the troops by his presence, and induce them to charge, under his eye, with greater vigour. If success is complete throughout the first line, and it entirely overthrows that of the enemy, the principal attention of the general, and of the other officers, should be employed to restrain the soldiers, prevent them from leaving their colours to follow up the flyers, and, committing the pursuit to some detached corps of cavalry and infantry, to march in good order, at a steady pace, to sustain these detachments, and assail the second line of the enemy. The artillery should always accompany the first line, in the order already distributed, in case the nature of the ground allows of it. The remainder of the army should follow the movement, always observing, without confusion, the distance between the two lines appointed by the order of battle.

Should the first line give way, or be thrown into disorder by the enemy, the battalions are to retire through the intervals left between those of the second line, behind which they are to halt and rally. Great care is here necessary to be taken by the officers, that instead of passing through the intervals, the routed troops do not directly rush in upon the ranks of the second line, and either carry them off in the general flight, or throw them into such confusion and disorder as it may be impossible to repair before the enemy are upon them.

On the first line's giving way, the second should march up briskly to its relief, and charge furiously upon the enemy without giving him time to repair the disorder into which the action and pursuit must of course have in some measure thrown him. By executing this with promptitude and determination, it is often easy to retrieve the ground which has been lost, and to defeat and render useless the enemy's first line, already considerably weakened and deranged by the former attacks. It is the sooner effected, as the enemy's fire which does most execution is thrown away; the subsequent discharges, from the great hurry of loading, being of little consequence, in comparison with the first. The great mischief is, that the second line, on seeing the first give way, are usually struck with a panic which magnifies the enemy, and on his nearer approach, either betake themselves to flight, or make but a faint resistance.

If, on the other hand, the victory still remains constant, and the adverse second line is overthrown, the general in chief should use still greater care than formerly to prevent his sol-

diers from dispersing, lest they should be charged and routed by the first line of the enemy, which may have retired and rallied behind their second. He should push the beaten troops, still keeping his men in good order, and in line, till their confusion is general. He must then progressively augment the number of his detached forces; without, however, once suffering any individual to quit his colours unless commanded. It is at this moment that he should employ his reserve, and the different corps which have not been engaged, to pursue the enemy, prevent them from rallying, and, *last of all*, to make prisoners, which the men should never be suffered to do during the combat, or even to think of the booty, till the victory is absolutely gained, and the enemy so scattered and at a distance, as to leave no longer any fear of their turning upon the different detachments employed in the pursuit. The general may then, for the rest of the day, suffer his soldiers to collect the booty. If, in full pursuit, the detachment fall in among the enemies' baggage, they must not be suffered to disband instead of following up their advantage. Their officers must with extreme attention, severity, and even blows, if milder methods are of no avail, push them forward till they have got clear of the baggage, employ them only in taking the enemy prisoners, or cutting them down, and leave the pillage for the rest of the troops.

The first care of a general after the gain of a battle, should be to pay proper attention to his wounded, and visit, or at least send to visit, the principals among them; to learn what valiant actions have been performed in different parts of the field; and to praise in general the whole army, particularly those who most deserve it. He should collect the trophies of his conquest, such as the prisoners, colours, standards, kettle-drums, and artillery, taken from the enemy; give, without delay, a first account of his victory to his court, and follow it up by another and more circumstantial detail, accompanied by the colours and standards he has won. Then, after burying the dead, disburthening his camp of the wounded of both parties, the prisoners, artillery, and other superfluities, and suffered the army to take a little repose, in the execution of all which the least possible delay should be made, the victorious general may apply himself to derive from his success every advantage which time or place can furnish, in the execution of the plan already concerted or resolved on.

But as the fortune of war is changeable, and notwithstanding every possible precaution taken to ensure success, a defeat will sometimes happen, the whole care of a general, as well as his officers, should such an unforeseen event take place, must be exerted to prevent an entire rout. The commander should have this possibility always present to his mind. His own experience and sagacity, pointing out to him the critical moment preceding the loss of a battle, will also teach him to take all those measures proper for diminishing the disorder of a flight. A last effort may be made with such troops as yet remain unbroken, to give time to those already routed to re-assemble and rally in the rear, and thus secure an orderly retreat. A post may be occupied impregnable to the enemy; or a defile be secured through which the defeated army may pass, and re-form behind it in safety.

As the loss of the battle generally involves that of the baggage, should it accompany the troops, and almost always that of the artillery, the general should only remain in the first position to which he has retired for safety, as long as may be necessary to collect the remainder of his forces, after which he may conduct them to a fortified camp, and there repair his losses, as well with cannon and arms brought from the adjacent garrisons, as by the succours which may arrive to him. If the loss is so serious as to threaten that of some considerable place, he should throw the best of his infantry into the garrison, and keep the field with the cavalry, in
order

order to accommodate the enemy if he form the siege; or keep him in awe, and prevent him from dividing his forces, if his object is only to penetrate into the country, and lay it under contribution.

If the conqueror, on account of his loss in the engagement, finds his infantry too much weakened to undertake a heavy siege; should he be disabled from attempting it for want of heavy artillery and ammunition; or should he derive no other profit from his victory than that of disconcerting his enemy's projects, remaining master of the open country during the rest of the campaign, or procuring his men quarters upon hostile territory; the vanquished general ought after the first retreat, to occupy a defensible position in the vicinity of some large town, whence he may procure those accommodations and sustenance which he may have deprived himself of: such as, cordials and medicines for the sick, fresh baggage in lieu of that lost, &c. He should encourage his troops, without again facing the conquerors till he has repaired his losses by the arrival of new succours, new arms, fresh ammunition, and artillery, has cured the wounded, and find himself strong enough to oppose the enemy, and prevent his establishment in advantageous quarters.

Grand, Military Discipline.—Mémoire de Feuquieres, c. lxxx.

BATTLE was also a term formerly used to denote a body of forces drawn up in order of battle, and amounts to the same with what is otherwise called BATTALION.

In this sense we meet with the length or depth of the *Battle*; the front, rear, and flanks of the *Battle*.

BATTLE, *length of the*, is the number of soldiers in rank, or the space from the left flank to the right.

BATTLE, *depth of the*, is the extent of a file, or number of men from front to rear.

BATTLE, *line of*. See LINE.

BATTLE *array*, the same with order of Battle.

BATTLE, *order of*, signifies the disposition of the squadrons and battalions of an army, into one or more lines, according to the nature of the ground, either for the purpose of engaging an enemy, or being reviewed by the general.

The Egyptians, whose priority in civilization and in communicating the arts to the rest of mankind is universally allowed, were naturally, although they ranked many great conquerors among their first monarchs, a pacific nation. We have no authorities to enable us to judge of the progress they had made in the art of war; but from the fanciful account of the battle of Thymbra, given by Xenophon in his *Cyropædia*, we may fairly presume that they usually fought in large and deep battalions, forming a complete square. On the above occasion he mentions twelve of these unwieldy bodies, each consisting of ten thousand men, and who formed the chief dependence of Croesus against the army of Cyrus.

A people so particularly favoured and protected by heaven, as the ancient Jews, little needed the assistance of human invention, when, on any emergency, a new miracle was always ready to insure them success against their enemies. We find, therefore, nothing in the sacred scriptures that can give us an idea of any order of battle observed among them; although the regular division of their numerous forces under David, who distributed them into twelve main bodies according to their tribes, and each of these into thousands, or regiments, into hundreds or companies, into tens, and even into threes, and even into single men; that they would not entirely forget such matters in the field. The Jewish writer, followed by the author of the "Dissertation sur la tactique des Hébreux," asserts, that they arranged their armies in one single line, of considerable depth, for some between twenty and thirty miles. Along the front of these were

placed the light armed men, viz. the most expert archers, spearmen, and slingers, who began the onset by a warlike shout, and with casting thick showers of darts and stones against the enemy's front, in order to cause terror and confusion, and stop the rushing in of the chariots, which among the Canaanites were very numerous, by wounding the horses and drivers. This is the more probable, as it is a method common to most of the Asiatic nations. *Anc. Univ. Hist. vol. iii. p. 184.*

The order of battle described by Xenophon (*Cyropædia*) to have been used by Cyrus at the action of Thymbra, though perhaps a visionary one as applied in the text, may serve to give an idea of the method generally used by the ancient Persians in drawing up their armies, with which Xenophon must have been well acquainted. The cavalry, in the situation which it is indispensably necessary for them to observe, were posted on the wings. The heavy armed infantry, carrying, besides the pike, a sword for close combat, and drawn up twelve deep, formed the first line. The second consisted entirely of light armed, who threw their darts over the heads of the former, and annoyed and disordered the enemy in their approach. The third line, destined to the same purpose as the second, was composed entirely of archers; their bows which were extremely well bent and strung, carrying far beyond the front ranks, so as to excessively accommodate the enemy. With these were sometimes intermixed slingers, who threw large stones with great effect. For this purpose the Rhodians afterwards substituted leaden balls. The fourth line, consisting of heavy armed, and similar to the first, was intended to support the preceding ones, and prevent them from giving way. It also served as a rear-guard and a corps-de-reserve to repulse the enemy who should penetrate so far. The Persians also made use of moveable towers, erected on large carriages, each drawn by sixteen oxen, and containing twenty men, who threw stones and darts. These were placed in line in the rear of all the army, behind the corps-de-reserve, and favoured the rallying of those troops which were pushed and thrown into confusion by the enemy. They placed likewise great reliance in armed chariots, which they drew up sometimes in front of the battle, and sometimes upon the flanks, when in fear of being enveloped.

Such was the extent of the military science of those nations, who under Xerxes threatened Europe and the West with subjugation. But we see no occasion on which they knew how to profit by the advantage of the ground to carry the war, when necessary, into a difficult country, to make use of defiles and ambuscades, either for the purpose of covering themselves from the attacks of the enemy, or of annoying him on his march; or to protract an unequal campaign by avoiding a decisive action with a superior antagonist, and reducing him to distress for want of forage and ammunition. Neither do we observe that they paid the requisite attention to the supporting of their flanks by river, morasses, or heights, when it would have been advantageous by giving them an equal front to an army much more numerous, and putting them out of danger of being surrounded. *Rollin, Hist. Ancienne; liv. iv. ch. 4.*

The Persians made some alterations in this system; but they were far from being judicious. Artaxerxes Mnemon at the battle of Cunaxa, threw all his forces into one line, for the purpose of surrounding or outflanking those of his brother Cyrus; but he ruined the clumsy order of square battalions, whose narrow ranks rendered it impossible for them to take advantage of a success with the necessary promptitude, to retreat with facility, or manœuvre with any effect. The disposition of Mnemon to the Rhodian, in opposing the

passage of the Granicus by Alexander was less faulty. He formed two lines; the first of cavalry to assail and disorder the Greeks as they attempted to gain the bank of the river; and the second, at some distance, of infantry, with the intention, no doubt, of supporting the first: but, however judicious this arrangement might have been, he wanted genius or inclination to profit by it, and tamely suffered the Macedonians to reach the shore, defeat the cavalry opposed to them, and form their phalanx undisturbed for the attack of his heavy-armed foot, without stirring from his position, or casting a single javelin. It is impossible to read, without indignation, the unfoldlike details of the pompous march of Darius, and the extreme folly, as well as ignorance, conspicuous in the order of battle he made his armies observe at Issus and Gaugamela. His awkward evolutions on the former occasion, disordered his forces before the commencement of the action. In the latter instance he preferred the ruinous arrangement of his infantry by nations, in huge square battalions; he intermixed them with corps of horse not less unwieldy; and, not content with having committed faults so inexcusable, he surpassed them both by another. The nature of the ground, not allowing his immense army to extend itself upon a single front, seemed to point out the necessity of a second line, or at least a corps-de-reserve. He indeed drew up, behind his centre, several immense battalions for which he had no room in front; but so close to the first line, that when these gave way, the reserve, instead of supporting, served only to augment their disorder. Against such an enemy, it is by no means surprising that Alexander should have been, with inferior forces, so completely successful. Xenoph. Anab. lib. i. Arrian. in vit. Alex. lib. i. & iii.

We now turn to the Greeks, who, of all people of antiquity, the Romans excepted, were the best judges of warlike affairs and military conduct; but we cannot easily excuse them for the oversight they almost constantly committed in the drawing up of their whole army on one front, and trusting to a single effort the success of the day. Their infantry consisted of two kinds of soldiers. The heavy armed, who carried large bucklers, lances, and swords, and in whom consisted the principal strength of the army; and the archers and slingers who were generally distributed along the front of the line, and employed their stones, darts, and arrows, to disorder the ranks of the enemy. Having made their discharges, they retired round the flanks into the rear of the heavy armed, whence they continued throwing their darts during the rest of the action. As for the heavy armed, or Hoplites, we shall follow Thucydides in describing their disposition, according to the Lacedæmonian system, that nation being then reckoned the most expert among the Greeks in military knowledge. Their battalions consisted of four lesser divisions, each consisting of 128 men, and subdivided into four others, each of 32 men. The effective force of every large corps thus consisted of 512 soldiers, who were usually drawn up in smaller ones of four men in front, and eight in file. We find seven of these regiments engaged at the first battle of Mantinea, during the Peloponnesian War. The depth of the files was, however, often altered, when judged necessary by their commanders.

The Lacedæmonians never made use of cavalry before the Messenian war, on which occasion they were convinced of the impracticability of carrying on their operations in a flat country without it. Even then they rarely exceeded the number of six hundred, and these were chiefly composed of the inhabitants of a little district in Laconia called Sciritis, a circumstance from which they derived their appellation of Skirites. They were always drawn up on the left flank of

the army, a post they claimed by right. Soaverse were the Greeks in general to the use of cavalry, that in the most flourishing periods of the Athenian republic, they never mustered above 1,200 in their army.

The Greek tacticians of the middle ages have exhausted their imaginations in forming fanciful orders of battle, principally for the cavalry. Minute geometricians and theoretical soldiers, they have considered the art of war in a light entirely mechanical; and employing their pencils at random, have given us upon paper such plans and dispositions as only could exist in their own ideas, and could only originate in their ignorance of the practical part of the science. It is hence we derive the rhomb, the wedge, the orbicular, oval, and angular manner of disposing their forces, manœuvres perhaps of use in exercising a squadron, but not to be adopted in the field without imminent and inevitable danger. To form a proper estimation of ancient tactics, we should consult the writings of those celebrated characters, who only recount what they have in person seen, and themselves performed. Such are Xenophon, Polybius, Julius Cæsar, and Arrian. In reading them we trace the military art among the ancient Greeks and Romans to its highest pitch of perfection. The principal offensive and defensive operations of a campaign in the open country, or of a siege, are developed with order and perspicuity, and the images they present to us are distinctly imprinted on our imagination. Thucyd. lib. iii.—Rollin, Hist. Anc. liv. x. ch. 2.—Potter. Archæol. tom. ii. lib. 3. ch. 9.—Ælian. tact. ch. 18.—Guisehard, Memoires Milit. in disc. prelim.

Philip and Alexander put the last hand to improving the order of the Greek infantry in the creation and establishment of their formidable phalanx. For a particular account of its formation and evolutions, we must refer the reader to the article PHALANX. For several ages, this was the order of battle which most prevailed among the nations of the then known world. The Carthaginians, the Syrians, the Egyptians, adopted its use. We find the generals of Mithridates employed it against Scylla, and the barbarous Helvetii and Germans in their contests with Julius Cæsar. But the difficulty of preserving the necessary union and order in so large and numerous a body; and the want of a second line to support it when obliged to give way, were glaring defects in its disposition, and it was therefore eventually forced to give place to the more convenient and scientific arrangement of the Roman legion.

A Roman legion arranged in order of battle, consisted of thirty manipuli, of various strength according to the establishment of the legion. Supposing it of 5000 men, each manipulus of the Hastati and Principes was composed of 140 soldiers;—those of the Triarii only of 60; the remnant of the troops were Velites, or light armed. Livy, in describing the war with the Latins, gives the following account of the ordonnance of the legion. The Hastati, drawn up in separate manipuli, formed the first line. The Principes, chiefly old experienced soldiers, were placed behind the former, but with intervals between their companies sufficiently wide to receive the Hastati in case they should be obliged to retreat. The Triarii, all veterans, who besides the short sword common to all the legionaries, were armed with long pikes, composed the third line; their intervals being so extended as to enable them to receive both the Principes and Hastati within them without any disorder, and still facing the enemy. If therefore the Hastati found themselves unable to sustain the charge, they retired gently within the Principes, and joining with them, renewed the combat. If these proved too weak for resistance, both retired amidst the Triarii, where rallying, they formed a new line, and charged with more vigour than

over. If again defeated, the battle was lost : the Romans had no further resource. Livy, lib. viii.—Machiavel, art. di Guer. lib. iii. ch. i.

These successive retreats are no where mentioned except in Livy as above stated ; and prejudiced as we are in favour of the military science of the Romans, we find it difficult to conceive the practicability of their execution. Livy has, in fact, much mistaken the intention of the disposition in quinque of the ancient legion. Its sole design was to enable the army to form with facility in that order of battle which the situation of the enemy, or nature of the ground, might render most applicable. At the moment which preceded the charge, the manipuli of the second line, marching briskly up into the intervals of the Hastati, formed a continued front, ten files in depth, and equal to that of the enemy. The Triarii remained as a corps-de-reserve. It was thus, as we shall incontestably prove in our account of those actions, that the Roman infantry were arranged at the *Trebia* and at *Canna*. It was thus, with some little variation, that they fought at *Zama*. Neither was it unusual with them to dispose their manipuli according to the principles of the column, as in the battle of *Tunis*, and that between Scipio and Asdrubal the son of Gisco, in Spain. Where there was but little to fear from the impetus of the enemy, the intervals of the Hastati were filled up by the Velites ; the Principes remaining at their posts in a second line ; but, opposed to the close and heavy order of the Macedonian phalanx, a directly different disposition was observed. The manipuli of each line, preserving their intervals, and acting as separate corps, harassed the enemy by desultory attacks, obliged them to abandon their united order, in which situation only they were invincible, and penetrating the phalanx in every direction, obtained an easy triumph. Guisehardt, *Memoires Militaires*, ch. iv.

As to the Velites, and in later times the archers and slingers, they were not drawn up in this regular manner ; but disposed of either before the front of the Hastati, or feathered up and down among the void spaces of the first line, or finally, placed in two bodies on the wings. These always began the battle, skirmishing in flying parties with the foremost troops of the enemy. If they were repulsed, which was usually the case, they fell back to the flanks of the army, or retired through the intervals into the rear. When they retreated, the Hastati advanced to the charge. The auxiliary forces generally composed the two points of the battle, and covered the whole body of the Roman infantry. As to the cavalry, it was posted on the wings, fighting sometimes on foot as well as on horseback ; and here we find some reason to arraign the judgment of the Romans, who never allotted a proportion of more than 300 cavalry to each legion whatever might be the nature of that country which was the theatre of the war. They made no difference between the plains of Lombardy and the mountains of Liguria ; and in the Alps maintained the same number of squadrons, as in the fertile valleys of Apulia.

But the order of battle in quinque was in process of time abandoned by the Romans. The tactics of Cæsar widely differ from those of Scipio and Æmilius Paulus ; and the march and order observed by Metellus in his Numidian war against Jugurtha, transmitted to us by Sallust, are the last traces we find in history of the disposition which proved so fatal to Hannibal, to Philip, and to Persus. The manipuli with intervals ; the three lines of Hastati, Principes, and Triarii, differing in arms and in number, disappear, and about the age of Marius, the legion assumes a new form. Instead of thirty companies, we then find it divided into ten cohorts, equivalent to our battalions, since they each consisted of from five to six hundred men, drawn up in a single

line, with a depth of eight or sometimes nine in file. The legions of Vespasian, according to Josephus, were drawn up six deep. This last arrangement continued to be observed without alteration during the flourishing ages of Rome ; but as we advance nearer to modern times, we perceive their military art decline in its perfection, in proportion to the decay of their greatness. Under Leo and Mauritius it is as difficult to recognize the tactics, as the empire of the Cæsars. The difficulty of ascertaining the period of these successive alterations has deterred those authors who have been most capable from undertaking the office ; and finding it easier to suppose that Livy and Plutarch have furnished us with sufficient information on the subject, they have concurred with those writers to mislead and perplex us. Sallust, *bell. Jug.*—Cæsar.—Joseph. *de bell. Jud.*—Guisehardt, *prel. disc.*

For further observations on the discipline and constitution of the Roman infantry, see the article **LEGION**.

For a long succession of barbarous ages, we find nothing to interest us in military tactics. Imitating in a rude degree the order of battle pointed out to them by their ancestors, the western nations from the sixth to the fifteenth century, fought in large bodies, divided into an indefinite number of lines or *wards*, in every one of which the infantry, inferior in strength and importance of service, composed the centre, flanked by the heavy armed cavalry, who always decided the fate of battles. It is in vain to search for military science in these periods, and we shall therefore pass them over with all possible rapidity.

The introduction of artillery and fire-arms necessarily introduced an alteration in this system. The cavalry ceased to be the arbiters of success, and declined rapidly in their importance. The destructive effect of the newly invented engines rendered it impossible to avoid making a material change in the order of the battalions. Their depth was gradually decreased. The method of engaging in wards was abolished, as exposing numbers of troops to be sacrificed without occasion ; and two lines with a corps-de-reserve were in time thought quite sufficient for the purpose of action. The front of the army was proportionally extended, and embraced a greater extent of country. The advantages of ground, before judged in comparison trivial, were now eagerly sought after. Generals became from necessity tacticians, and by little and little, continually improving, sometimes slowly, sometimes with rapidity, the military art assumed the face it wears in our times ; under the auspices progressively of a Gustavus, a Condé, an Eugene, a Marshal Saxe, and a Frederic the Great, whose names will never be forgotten by the latest posterity.

Under the articles **COLUMN** and **LINE**, to which they of right belong, we shall attempt to illustrate and compare the French and Prussian systems of the order of battle as now practised by both these nations ; and accompany them with instances from among the number which have of late years fallen under our inspection.

BATTLE, in a *Naval* sense, denotes an engagement between two fleets, squadrons, or even single ships. See **ENGAGEMENT**. The ancients had divers forms of sea-battles ; as the half-moon, circle, and forecups. In all these, not only the ships engaged each other, and by their beaks and prows, and sometimes their sterns, endeavoured to dash in pieces, or overset and sink each other, but the soldiers also annoyed the enemy with darts and slings, and, on their nearer approach, with sword and spears, boarding each other by living bridges between the ships.

By way of preparation they took down their sails, and lowered their masts, and secured whatever might expose them to the wind, choosing rather to be governed by their oars.

BATTLE, Line of. See **LINE**.
BATTLE, Square. See **Square BATTALION**.
BATTLE, Attainder by. See **ATTAINDER**.

BATTLE royal, in *Cock-fighting*, denotes a fight between three, five, or seven cocks all together; so as that the cock which stands longest gets the day.

BATTLE-AXE, an ancient military weapon, which, at different periods, formed a principal part of the offensive armour.

Homer never ascribes this weapon to any but the barbarians, for the battle-axe was not used in war by the politer nations. Eustathius tells us, it was the favourite weapon of the Amazons. The only instance where Homer has placed it in the hands of a warrior occurs in the thirteenth book of the *Iliad*, when Pisander fights Menelaus; it is there called *ἄξιν*, and is described with singular minuteness.

— ἢ δ' ὅπ' ἀσπίδος ἔλατο καίην
 Ἄξιν εὐχάλκον, ἐλάτω ἀμὲν πέλεκυν,
 Μακρῆ, ἔϋξενω. 1. 611.

The *Πέλεκυς*, mentioned in the fifteenth book, 1. 710, was perhaps not very different:

Ἄλλ' αἰ γ' ἐβίβην ἰσχυροί, ἠὰ θυμὸν εἰχοντες
 Ὄξει, δὴ πέλεκυσσι, καὶ ἄξινισσι μακροῖσι.

Something of this kind, it seems, was in use among the Bactrians, when they attended Xerxes' expedition: beside bows and arrows, we are told they were armed with a sort of hatchet, called Sagaris: (Herodotus, *Polymnia* lxiv.) The Lycians had axes and daggers: (*Ibid.* xcii.) and the Egyptians huge battle-axes.

At the siege of the Roman capitol, by the Gauls under Brennus, we find one of the most distinguished warriors armed with a battle-axe (*Plut. Camillus*): and Ammianus Marcellinus, many centuries afterwards, describing a body of Gauls, furnishes them all with battle-axes and swords. From Tacitus, it should seem, the ancient Germans had clubs, but no such weapons as those we are speaking of: and the only instance in his writings where *securis* occurs as an implement of combat, is where the Othonians are particularly described as striking on the helmets of their antagonists with their axes. (*Taciti Hist.* II. xlii.) In short, it was even then never used but among the Roman auxiliaries.

The introduction of the battle-axe into this country has been frequently attributed to the Danes; but proofs of its earlier use among us are not wanting, and there are instances known where it has been found even among the sepulchres of the ancient Britons. Mr. Rooke, in the *Archæologia* of the Antiquary Society (vol. x. p. 113.) has described a fragment of an ancient battle axe found among some Druidical remains in a barrow at Aspatria in Cumberland, June 1789. And in the same volume (pl. xl.) are two representations of the old Galwegian bill, or battle-axe, found in a moss near Terreagles, the seat of Marmaduke Maxwell Constable, esq. of Netdale in Ireland. Others have been found among the barrows on the downs of Wiltshire, and in the north of Scotland.

That it was used in the early Saxon times, we have the authority of several manuscripts of the ninth century; and the French writers have recorded a particular instance of its use in France, so far back as the year 510. Clovis, they say, bribed the ministers and captains of Ragnacharius to deliver up both him and his brother: and when the prisoners were brought before him, he first reproached them for suffering themselves to be chained, and then dispatched them with his battle-axe. See *Greg. Turon.* l. ii. c. 42.

The battle-axe, however, was more used by the Danes than any other of the Northern nations: and they were, in course, more expert with it. At the battle of Stamford,

Oct. 24, 1066, between Harold king of England, and Harold Harfager of Norway, when the Norwegians were obliged to retire, and the English begun to pursue them with great eagerness, a total stop was put to their pursuit for several hours by the desperate boldness of a single Norwegian, who defended the pass of Stamford-bridge with his battle-axe; he killed more than forty of the English, and was himself slain only by stratagem. (*Hen. Hunt.* l. vii. p. 211.) The battle-axe principally in use among the Anglo-Saxons appears to have been the *bipennis*, or double-edged axe; the *gisarma* is supposed to have been the bipennis with a longer handle or halbert: and the *pole-axe*, with an edge on one side, and a sharp point on the other, probably came in with the Normans.

During the middle period of our history we read but little of this weapon, though the Welsh infantry at the battle of Agincourt, 1415, found it particularly serviceable in dispatching those whom the archers had wounded with their arrows. One of the last instances of its effectual service was at the battle of Tewksbury, during the quarrel of the Roses, when the duke of Somerset clave lord Wenlock's head.

Towards the sixteenth century, it seems to have been gradually disused, though one instance occurs where a pistol placed in its handle bespeaks a wish in the warriors of that period to improve its use. (See **ARMS**.) It was perhaps most serviceable when our knights were completely cased in armour; and has since degenerated into the halbert or partisan.

BATTEMENTS, in the *Military Art*, indentures, or notches in the top of a wall, parapet, or other building, in form of embrasures, for the sake of looking through them, &c. much affected in the old fortification.

BATTOCHES, or **BATTOGUES**. See **BATTACKS**.

BATTOLOGY, from *βαττός*, *battus*, *babbler*, and *λεγω*, *I speak*, in *Grammar*, a multiplying of words without occasion, or a needless and superfluous repetition of the same words, or things.

BATTONI, or **BATONI**, **POMPEIO**, in *Biography*, an eminent Italian painter of the Florentine school, was born at Lucca in 1708. He was the son of a goldsmith, and brought up to that business; but discovering a strong predilection for painting, he was supported in the Roman school by a subscription; and at Rome he employed himself in studying the antique, and copying the works of Raphael, and likewise in forming a style of his own, from a diligent observation of nature. Having distinguished himself both as a designer and a colourist, he was engaged in the execution of many important works, and painted altar-pieces and other pictures for various churches in Rome, Milan, Breiscia, Lucca, Parma, Messina, and other cities; as well as history-pieces for private persons. One of his most admired works, is a holy family, purchased for a large sum by the grand duke of Russia. Battoni, however, acquired his principal fame as a portrait painter. Besides three popes, he painted several of the Imperial families of Austria and Russia. In recompence for a picture, which commemorated the interview of the emperor Joseph with his brother at Rome in 1770, he received several magnificent presents; and he, with all his male issue, was ennobled by the emperor. By the beautiful daughter of the surveyor of the Farnese palace, whom he married in early life, he had several children; and two of his daughters were highly celebrated for their taste and proficiency in music. As to his character, he was simple and modest, sincere, friendly, and charitable; much attached to religion, and very assiduous in the exercise of his profession. He seldom appeared in public, preferring a retired life, partly on account of the defects of his education, and partly by reason of the awkwardness of his figure, which approached

proached to deformity. As a painter, he acquired eminence by the native force of his genius; and he had no rival but Mengs, who surpassed him in knowledge and learning, whilst he was inferior to him in natural talents. Battoni, having completed his 79th year, died in 1787. Pilkington. Biog. Diet.

BATTOON, or BATOON. See BASTON.

BATTORY, a name given by the *Hollanders* to their magazines or factories abroad: the chief of which are those at Archangel, Novogored, Bergheim, Lisbon, Venice, and Antwerp.

BATTOW, in *Geography*, a village on the west coast of Africa, S. E. from Cape C.ulloos, on the west side of a small river opposite to Zeebo, or Swibo, on the east side. About half a league east, are two rocks lying under water, and the breakers over them are seen at sea at the distance of a league, and serve to point out the Cape and Road. N. lat 5°. W. long. 8° 30'.

BATTRE LA MESURE, Fr. to beat time, in *Music*. There are various ways of marking the measure and accents in music: by dividing each bar into 2, 3, or 4 equal parts with the motion of the hand, the foot, a *baton*, or a roll of paper. In common time of 2 minims or 2 crotchets in a bar, called *binary* measure, the hand is merely moved down and up. In time of 4 crotchets in a bar, the French frequently mark each portion of it, by *beating* the hand down to the first crotchet, moving it to the left for the 2d, to the right for the 3d, and lifting it up for the last. In triple time, or *ternary* measure of 3 minims, 3 crotchets, or 3 quavers, it is usually beaten, 2 down and one up, or the 1st down, the 2d to the left, and the 3d up.

The beating time is of great antiquity. The ancient Greeks had various ways of regulating the accents of song, and steps of the dance. See RHYTHM and GREEK MUSIC.

The Italians often beat the two first portions of a bar, and lift the hand up for the rest, both in common and triple time.

At the Opera, concert-spiritual, and even at private concerts (formerly) there was a person at Paris, armed with a truncheon (*laon de Mesure*) like a general, whom Rousseau, in his Dictionary, ridicules, and says that he had been very aptly called the *Baclaron*, or wood-cutter; though when he wrote his musical articles for the *Encyclopedie*, the Italians and other nations, still had a *Coryphe* to regulate the measure in the numerous bands employed in their churches when there was a *grin Funzione* in celebration of some fast or holy time. But it was in England at the Commemoration of Handel in Wehne 1740, that, in the most numerous band that ever was assembled in modern times, a Corypheus was first dispensed with. See TIME, MEASURE, ARSIS & THESIS, BAR, ACCENT, & BATTUTA.

BATTUS, LISIEN, in *his History*, was born at Ghent, about the year 1540; but his father being obliged to remove to Rostock, on account of the troubles about religion, when he was only ten years old, he was put under the best masters that place could afford, and he so well profited by the instruction he received, that in 1559 he was appointed teacher in mathematics. In this office he continued until the year 1565, when the country being at once afflicted with war and the plague, he went first to Padua, and then to Venice, where he was admitted doctor in medicine. Returning to Rostock, he practised medicine with so much success and reputation, that he was appointed professor in that science, in which post he died, April 1591. Some small medical tracts, left by him in manuscript, were published in the Miscellanea of Henry Surenhus, at Frankf. 1611, 8vo. His son, Conrad Battus, following in the steps of his father, returning from his travel, took the degree of doctor in medicine at Basle, in 1604, but falling down stairs, at his brother's house at Rostock, soon after his return there, he received

a wound in his groin, from a knife he had in his pocket, which occasioned his death. He also left some short essays on medical subjects, which were published with his father's, in the Miscellanea.

BATTUS, CHARLES, a Flemish writer of some eminence, who flourished about the end of the 16th century, published in 1593, a translation of the works of Guillemaeo, into his own language, folio, Dordrecht, and in 1615, the works of Ambrose Para, folio, Amsterdam, with numerous plates engraved on wood; also a manual for fargeons, with a treatise on wounds of the head, from Hippocrates, 12mo. Haller. Bib. Chirurg. Elov. Diet. 11 fl.

BATTUS, in *Ecclesiastical History*, an order of penitents at Avignon, and in Provence, whose piety carries them to exercise severe discipline upon themselves, both in public and private.

BATTUSZANI, in *Geography*, a town of European Turkey, in the province of Moldavia, 44 miles N.N.W. of Jassy.

BATTUTA, Ital. a bar in *Music*, or those portions of a musical composition, where the time is *beaten*, or marked, with the hand or foot. The *Crucea* dictionary defines *battuta*; quella misura di tempo che da il maestro della musica, in *battendo a' cantori*. Varchi, who died in 1566, and who is quoted in the *Crucea* as authority for the use of this term, says; quanta noia, e fastidio n' apportino coloro agli oechi, e agli orecchi, i quale che non ballano a tempo, o non cantano a *battuta*. What pain and uneasy sensations do those give us, who neither dance nor sing in time!

Amendae parlarino in rime, canzoni, e altre spezie di dire con *mijura* di piede, e di tempo fillabitati. Both pronounced in rhyme, songs, and other species of poetry, in measured feet, and poetical numbers. This passage is cited from a MS. of 1400.

It is not easy to imagine how music, in many parts, could be composed *in score*, with bars or vertical lines drawn through them all, whence the term *score* was derived; nor what kind of bars could contain the quantity of a *maxima*, equal to eight semibreves, unless we suppose that semibreves were sung or played as quick as quavers are now. See TIME, ACCENT, ARSIS, and MEASURE.

The most ancient kind of time-table that has occurred in the course of our researches, consisted of only four several kinds of musical characters.

The Maxima		
equal to		
2 Longs		
4 Breves		
8 Semibreves		

Among Italian musicians we frequently find the words a *battuta*, which import *in time* or *measur'd*, after recitative or a "all'libitum." Accordingly, *a* in the Italian musical language, when it precedes a substantive, has the power of *in*.

BATU-PULUDAN, *fluens lapidei* (*Talent.*) in *Natural History*; one of the synonyms of MADERPORA LABYRINTHICA. *Gmel.*

BATTUA, *Butus, Butoc, or Bulhoue*, in *Ancient Geography*, a town of Dalmatia, now BUDUA, which see.

BATUA, in *Geography*, a kingdom of Africa, in the empire of Monomotapa, extending from the mountains of the

the Moon to the river Magnico, whose prince is a vassal of the emperor. It is famous for its gold mines.

BATUDA, a method of fishing mentioned in some *Middle Age Writers*, wherein the fish are driven by beating the water with poles, till flocking into one place, they are the sooner caught.

BATUECAS, *Los*, in *Geography*, a people of Spain, in the kingdom of Leon, and diocese of Coria, inhabiting a valley called "the valley of the Batuecas," encompassed by mountains that are almost inaccessible, between Salamanca to the north, Coria to the south, the river Tornez to the east, and the rock of France to the west. These people are supposed to be the remains of the ancient Goths, who took refuge in this valley among high mountains in their escape from the Moors. Others say, that their ancestors were ancient Spaniards or Iberians, who retired hither at the time of the invasion of the Goths. They are distinguished by their barbarism and rusticity to such a degree, that the Spaniards proverbially denominate an uncivilized person, one who comes from the valley of Batuecas.

BATURIN, a town of the Ukraine, on the river Desna, belonging to the Russians, and situate in the district of Neschin, which forms a part of Lesser Russia. It was destroyed by the Russians in 1708; but the castle has been twice rebuilt, and the town in some degree repaired.

BATUS, in *Entomology*, a species of *CERAMBYX*, found in India and South America. The thorax is wrinkled and spinous: wing-veins bidentated: antennæ long, with hooked prickles. *Linn.* This is *Capricornus niger*. *Mus. Petrop.*

BATUSABER, in *Geography*, the capital of the kingdom of Yohor, in the southern extremity of the peninsula of Malacca, situated about 6 leagues from the sea, on the river Yohor or Jor, in a marshy situation, so that its small wooden houses are raised upon poles about 8 feet from the ground.

BATZ, or **BATZEN**, in *Commerce*, a copper coin mixed with some silver, and current at different rates, according to the quantity of alloy, in many parts of Germany and Switzerland.

B. AV. See **CHARACTER**.

BAVANY, or **BOWANY**, in *Geography*, a river of Hindoostan, which runs into the Cavery, 7 miles north of Errood in Coimbatore. N. lat. $11^{\circ} 25'$. E. long. $77^{\circ} 50'$.

BAVARIA, **CIRCLE OF**, called *Bayern* by the Germans, one of the circles of Germany, derives its name from the duchy of Bavaria, which is the most considerable part of it, and is bounded on the east by Austria and Bohemia, on the south by Carinthia and Tyrol, on the west by Suabia and Franconia, and on the north by the Upper Palatinate, which, if considered as belonging to it, verges towards Upper Saxony. The dominions of the elector of Bavaria and the Palatinate, for these electorates are united, are computed to contain 16,176 square miles, and 1,934,000 inhabitants. Hoeck estimates Bavaria at 1,339,900, and the Palatinate at 305,000. See **PALATINATE**. Busching distributes the 20 states of the circle of Bavaria into ecclesiastic and laic. To the former he refers the archbishopric of Saltzburg, the bishoprics of Freisingen, Ratibon and Passau, together with the priory of Berchtoldsgaden, and the abbies of St. Emeran, Lower and Upper Munster, all which three lie in the city of Ratibon. The latter are composed of the electorate of Bavaria, the duchies of Neuburg and Sulzbach, the landgravate of Leuchtenberg, the princely county of Sternstein, together with the counties of Haag and Ortenburg, and also the lordships of Ehrenfels, Sulzburg, and Pyrbaum, Hohenwaldeck, Brieteneck, and the imperial city of Ratibon. Of this circle, the elector of Bavaria, and the archbishop of Saltzburg, are joint summoning princes. The diets, though usually held at Ratibon, are sometimes

summoned to Wasserburg, Landshut, and Muldorf. When the military force of the empire, in time of peace, was settled in 1681, at 40,000 men, the number required to be furnished by this circle was 800 cavalry, and 1494 infantry; and towards the 300,000 florins granted in 1707, it paid 18,252 florins, 9 kruitzers. The elector of Bavaria is the military commander of the forces of the circle.

Bavaria is part of the Rætia Vindelicia and Noricum of the ancients, and is supposed to have derived its name from the *Boii*, a warlike people that migrated from Gallia Celtica, crossed the Rhine, and first settled in Bohemia. About the time of the emperor Augustus, they were expelled the country by the Marcomanni, and removed into Noricum; and their settlement was called "Bojer" or "Bayerland:" in Latin, "Bujaria," or "Bujoraria," whence, in process of time, was formed Bavaria. In the 6th century, when the empire of the Franks was divided among the four sons of Clovis, Bavaria became subject to the dominion of the Austrasian kings, and was governed by dukes. In the 9th century, princes of the Franconic family assumed the style of kings of Bavaria, while Lieutpold in 889, was the first duke; and his progeny extend to the present day, though interrupted in 946, when, Berthold dying without children, the emperor Otho gave Bavaria to his brother Henry of Saxony. In 1071, Welf, son of Azo of Este, became duke of Bavaria, which, in 1138, passed to the house of Austria; but in 1154, it reverted to the house of Welf, in the person of Henry the Lion. In 1180, it finally returned to the first family, by the succession of Otho of Wittelbach, a descendant of Arnulph, second duke of Bavaria, A.D. 907. After the family had been unjustly deprived for more than two centuries, the Palatinate and Bavaria have recently been inhabited by a branch of the family of Deux Ponts, the son of the elector being now nominal duke of Deux Ponts.

BAVARIA, *Duchy or Electorate of*, comprehends the greater part of the circle, and is divided into Upper and Lower Bavaria, and the Upper Palatinate. The length from north to south is somewhat interrupted, but may be about 150 British miles, and the breadth about 120. The duchy is bounded on the north by Bohemia and the Upper Palatinate; on the east by Austria, and the bishoprics of Saltzburg and Passau; on the west by the duchy of Neuburg, the marquisate of Burgau, and the bishopric of Augsborg; and on the south by the county of Tyrol, and the bishopric of Brixen. Upper Bavaria is, for the most part, mountainous, cold, and barren, producing little corn and less wine; but it is covered with forests, interspersed with large and small lakes, and abounds in cattle, wild fowl, game, baths, medicinal springs, and salt works. It is also enriched with mines of silver and copper, lead and iron. It has also many quarries of marble. Lower Bavaria, being much more level, is more fertile, and produces plenty of grain, pasturage, and fruit. The mountains of Upper Bavaria may be considered as branches of the Alps. The chief rivers of this duchy are the Danube, the Isar, the Inn, the Lech, the Nab, the Atmuhl, and the Regen. Its large inland lakes are 16, and its smaller ones 160. Rander, in his "Tour through Germany," (Vol. ii. p. 290.) reckons 33 cities, besides Munich the capital, 80 market towns, 8000 villages and hamlets, 39,949 taxable farms, 12,000 solitary houses, 6000 uninhabited farm-houses, 180,000 hearths, 3,050 churches, 548 chapels, 908 parishes, 12 collegiate foundations, and 142 convents. Upper Bavaria is divided into two governments or regencies: that of Munich, and that of Burkhausem. The principal towns of the former are Munich, Pfaffenhausen, Abensperg, Ingolstadt, Donawert, Friedberg, Landeberg, Weilheim, Tölz, Wasserburg, Traunstein, and Reichenhall. Those of the latter, are Burkhausem, Octting, Troisburg, Brannau,

Braunau, Uttendorf, Friburg, Ried, and Scharding. Lower Bavaria is also divided into two governments; that of Landshut, comprehending, besides other towns, Landshut, Erding, Dingelring, Teisbach, Hals, Rottenburg, Mosburg, and Osterhofen; and that of Straubing, the chief places of which are Straubing, Pögen, Cham, Kelheim, Stadt-am-Hoff, and Deckendorf. The states of the duchy consist of the clergy, nobility, and burghesses, of which a committee assembles at Munich whenever it may be necessary: but before the accession of the house of Deux Ponts, the administration had become the most lethargic of any in Germany; and on this account the political importance of Bavaria has, in some measure, declined; and in the dangerous conflict that has subsisted, and may still subsist between France and Austria, it may be difficult for this power to preserve a shadow of independence. By the fifth secret article of the treaty of Campo Formio, October 17, 1797, the French republic engages to employ its influence, that his majesty the emperor shall receive the archbishopric of Salzburg, and that part of the circle of Bavaria which lies between the archbishopric of Salzburg, the river Inn, Salza, and Tyrol; including the town of Wasserburg, on the right bank of the Inn, with an arrondissement of 3000 toises.

The established religion of Bavaria is the Roman catholic; and no other is even tolerated: and thus the spirit of industry is very materially checked and restrained. The clergy, both secular and regular, are very rich; but the peasants are wretched in the extreme, their chief subsistence arising from the herds of swine that are fed on acorns and crabs in the woods and forests. The regular military force is estimated at 12,000. The principal manufactures of the country are those of coarse woollen cloth, silk and woollen stuffs, velvet, tapestry, stockings, clocks, and watches. The principal exports are wheat, cattle, wood, salt, and iron. Besides the mines of silver and copper near Podenmais, in the bailliage of Viechtach, and of lead at Reichenthal, the chief mineral riches of Bavaria consist in the salt springs at Traunstein, which pervade mountains of saline earth, like those at Hallein, in the archbishopric of Salzburg, and occupy many people in productive industry. There are other springs at Reichenthal. These latter springs are 20 in number; but salt is only made from 4 of them: for which purpose part of the water proceeding from them is conveyed by pipes to the cauldrons at Traunstein, which is about 3 leagues distant. The salt annually made from these springs amounts to 250,000 quintals.

The title of the elector is "By the grace of God, duke of Upper and Lower Bavaria, as also of the Upper Palatinate; Palgrave of the Rhine, arch-steward of the holy Roman empire, and elector and landgrave of Leuchtenberg." He has 5 hereditary officers, *viz.* a master of the household, a steward, marshal, cup-bearer, and huntsman. The Bavarian order of St. George was revived in 1729, by the elector Albert. The knights of the order are styled "defenders of the immaculate conception of the blessed Virgin Mary," and are required to produce unquestionable proofs of the nobility of their ancestry for 8 generations in both lines. The elector is grand master; and its ensign is a cross, enamelled blue, with a St. George in the middle; on the reverse of which is the name of the restorer of the order in a cypher surmounted with the electoral cap, and bearing at the 4 angles the letters L. V. P. E. which signify "justus velut palma florebit," *i. e.* the righteous shall flourish like a palm-tree. The cross is worn pendent to a broad sky-blue ribbon, with a black and white border. The elector has the fifth seat in the electoral college, and several votes at the diets, both of the empire and the circle, in the colleges of the princes and counts. His ordinary revenue, including the tolls on all

the vessels which pass up and down the Danube, and other navigable rivers, with that which arises from the monopoly of corn, salt, beer, tobacco, and wines, together with his own domain, is supposed, by some, to amount to 700,000*l.* per ann. Busching and baron Reissbach estimate it at 800,000*l.* Reider at 1,031,250*l.* and others at 1,166,600*l.*

The Bavarians are little distinguished in literature; but they are a vigorous race, adapted to the fatigues of war. They have, however, an university at Ingolstadt, and an Academy of Sciences at Munich. Baron Reissbach (*Trav.* 1, 107) gives a very unfavourable account of their corporeal form and general disposition and character. The character of a Bavarian, he says, is a very round head, a little broad chin, a large belly, and a pale complexion; so that many of them appear like caricatures of men! They have large fat bellies, short clubbed feet, narrow shoulders, a thick round head, and short necks; and they are heavy and awkward in their carriage. But the women are, in general, extremely beautiful, well shaped, of clear transparent complexions and much more lively and graceful in their gestures than the men. The chief ornament of the men is a long broad waistcoat, strangely embroidered, from which their breeches hang low and loose. The women disguise themselves with stays in the shape of a funnel, covering the breast and shoulders, and hiding the whole neck. He says, that no pen can describe the ridiculous mixture of debauchery and devotion, which is exhibited every day; and he adds, that the propensity to feasting, indolence, and beggary, which prevails in Bavaria, is countenanced and sanctioned by the example of the priests. Indolence, he says, is the prevailing character of the Bavarians: and Bavaria well deserves the character given of it by an officer of Gascony, of being the greatest brothel in the world. With their indolence, intemperance, and devotion, they unite, according to his account, a certain ferocity of temper, which often occasions quarrels, mutual abuse, and scenes of blood. The Bavarian peasant, says this writer, is gruff, fat, dirty, lazy, drunken, and undisciplined; but he is brave, economical, patriotic, and such a slave to his word, that when it has once been given, it is never violated. Considerable benefit, however, has been derived from the laudable plans for destroying mendicity and encouraging industry, proposed and carried into effect at Munich by count Rumford. See *MUNICH*.

By the plan of indemnities, agreed upon between the First Consul of France and the emperor of Russia, in pursuance of the 7th article of the treaty of Luneville, it was agreed to propose that the indemnities to the archduke, grand duke, should be for Tuscany, and its dependencies, the archbishopric of Salzburg, the provostship of Berchtoldsgaden, the bishopric of Trent, that of Brixen, and part of that of Passau, situate beyond the Itz and the Inn, on the side of Austria, except the suburbs of Passau, with a radius of 500 toises, and the abbey, chapters and convents, situate in the above-mentioned dioceses. These principalities were to be taken out of the circle of Bavaria, and incorporated in the circle of Austria, and their ecclesiastical jurisdictions, both metropolitan and diocesan, were to be also separated by the limits of the two circles; Mulldorf to be united to Bavaria, and its equivalent in revenue taken from those of Freisingen. To the elector Palatine of Bavaria were to be assigned, for the duchy of Deux-Ponts, the duchy of Juliers, the palatinate of the Rhine, the marquise of Berg-op-zoom, the seignory of Ravenstein, and others situate in Belgium and Alsace; the bishoprics of Passau, with the reservation of the part of the archduke; of Waltzburgh with the reservations herein-after mentioned: of Bamberg, of Aulstift, of Freisingen, and of Augsburg; the provostship of Kempten; the imperial

perial cities of Rothenbourgh, Weissenbourgh, Windshelm, Schweinfurt, Goelshelm, Sennefelt, Alltheufen, Kempten, Kaufbeuren, Memmingen, Dinkelsbuhl, Nordingen, Ulm, Bofstingen, Buchorn, Waugen, Lentkirch, Ravensbourgh, and Allichshausen : the abbeyes of St. Ulric, Itsee, Wengen, Soeflingen, Elchingen, Ursburg, Roehenbourgh, Weltenhaußen, Ottobeuren, Kaiserheim. By the treaty of Preburg, 26 Dec. 1805, the electorate (now the new kingdom) of Bavaria acquired the margraviate of Burgau and various other territories.

BAVARIA, *Palatinate of*. See UPPER PALATINATE.

BAVAY, PAUL, *Ignatius De*, in *Biography*, born at Brussels in 1704, applied himself early, and exclusively, to the study of chemistry, in which his father had wasted a considerable patrimony. At length, in 1735, he went to Lovain, where, at the end of two years, he was admitted Doctor in Medicine. He now returned to Brussels, and acquired so much reputation by his success in his practice, that, in 1746, when the French were in possession of the city, he was made physician to the military hospital there. In 1749, the French having evacuated Brussels, he was appointed Demonstrator in Anatomy, but being opposed by the principal physicians, and his practice condemned, probably on account of his professing to cure some diseases by a nostrum of his invention, he went to Dendermond, where he continued for some time. Returning again to Brussels, he died there, Feb. 20, 1768. His works are, "Petit Recueil D'Observations en médecine sur les vertus de la confection tonique, résolutive et diuretique," Bruxelles, 1753, 12mo. "Methode courte, aisee, peu couteuse, utile aux medecins, et absolument necessaire au public indigent pour le guerison des plusieurs maladies." Bruxelles, 1759, 12mo. The principal ingredients in his medicine, are said to be squills and Florentine orris. Eloy. Dict. Hist.

BAVAY, in *Geography*, a town of France, in the department of the North, and chief place of a canton in the district of Avesnes. The place contains 1455 and the canton 9266 inhabitants: the territory includes 145 kilometres and 20 communes. N. lat. 50° 25'. E. long. 3° 45'.

BAUBEE, a term used in Scotland for a halfpenny. Johnson.

BAUBIGNY, in *Geography*, a town of France, 1½ league from Paris.

BAUBIS, in *Zoology*, a French name of a race of running dogs, called *chiens Normans*, or dogs of Normandy.

BAUBULA, in *Geography*, a river of Spain, in the province of Arragon, which runs into the Xalon, about a league below Calatmaid.

BAUCIDIAS, in *Ancient Geography*, an island of Greece in the Saronic gulf. Pliny.

BAUCONICA, a town of the Vangiones, in Gallia Belgica, 9 miles from Mogontiacum, and 11 from Borbingtonum; supposed to be *Oppenheim*, which see.

BAUD, in *Geography*, a town of France, in the department of Morbihan, and chief place of a canton in the district of Pontivy, 3¼ leagues south of Pontivy. The place contains 6115 and the canton 13,007 inhabitants; the territory includes 242½ kilometres and 4 communes.

BAUDANVILLER, a town of France, in the department of the Meurte, and chief place of a canton in the district of Blamont, 1¼ league south of Blamont.

BAUDEKIN. See BALDACHIN.

BAUDELLOT, CHARLIS-CÆSAR, in *Biography*, was born at Paris in 1648, and studied first at Beauvais, and then at Paris. He was, against his inclination, bred to the law, and pleaded as counsellor of the parliament of Paris for some time with success. But he afterwards devoted

himself to the study of antiquities. Having had an opportunity, in a journey to Dijon, to visit the libraries and cabinets of the place, he began to make a collection of books and medals; and he was thus led to write a book "On the utility of Travelling;" 2 vols. 12mo, 1686; the subject of which was inscriptions, medals, statues, bas reliefs, and other relics of antiquity. It passed through several editions in French, and was translated into English. This work introduced him into an acquaintance with the most celebrated antiquaries of Europe, and was the means of his admission into the academy of Ricoverati at Padua. In 1705, he was made a member of the academy of Belles Lettres; and he had the charge of the valuable cabinet of the dukes of Orleans. He was the author of several dissertations on subjects of Medallic history and antiquities: and he is said to have composed the first travels of Paul Lucas. He died in 1722, with the character of a mild, modest, and benevolent man. Nouv. Dict. Hist.

BAUDERON, BRICE, born at Charolles, about the middle of the sixteenth century, distinguished himself by his knowledge in pharmacy, to which he applied with such success, that a Pharmacopœia, published by him in 1588, became the standard book for many years in France. It was founded on the Pharm. Lyonensis, and of Du Boys, with the observations of Catalaun on distilled waters. Philemon Holland translated it into Latin, and published it in London, in folio, 1639, and at the Hague in 1640. It has been since many times reprinted, both in French and Latin. He also published "Praxis de febribus, et de symptomatibus in morbis internis," 4to, 1620, Paris. In the preface to this book he says, he is now 80 years of age. He died three years after, 1623. His son, Gratian Bauderon, who was brought up to the same profession as his father, died in 1615, aged 35 years. Haller Bib. Med. Pract. Eloy. Dict. Hist.

BAUDIER, MICHAEL, historiographer of France under Lewis XIII. was born of a noble family in Languedoc. He was the author of many works containing valuable information, collected with greater industry than taste or genius. The principal are, "A general History of the Seraglio and Court of the grand Signior," 8vo. Paris, 1633; "A general History of the religion of the Turks, with the life of their prophet Mahomet, and the four first Caliphs," &c. 8vo. 1636; "A History of the Administration of Card. d'Amboise, minister of state under Louis XII.;" Paris, 1634, 4to; "History of Marshal de Thoiras," Paris, 1644, fol. and 1666, 2 vols. 12mo. He left in MS. a history of Margaret of Anjou, wife of Henry VI. of England, which is said to have been translated and published as an original work in England. Baudier was attached to the polite arts, and made a collection of medals and curiosities, such as his fortune would allow. The time of his death is not known. Nouv. Dict. Hist.

BAUDIUS, DOMINIC, a learned philologist, was born in 1561, at Lille, in Flanders, and retired with his parents, who were of the reformed religion, from the persecution of the duke of Alva, to Aix-la-Chapelle. After having studied at Leyden, Geneva, Ghent, and other places, he settled at Leyden, where he applied with assiduity to the study of jurisprudence, and was made doctor of laws in 1585. He visited England, and then travelled into France, where he obtained several distinguished patrons, and resided for 10 years. In 1602, he was nominated professor of eloquence at Leyden, and he also delivered lectures in history and jurisprudence. In 1611, the States made him joint historiographer with Meursius, and as such he wrote in polished

lished Latin, a "History of the Truce." He also acquired great reputation, both as a poet and prose-writer in that language. Towards the close of his life, he incurred the displeasure of prince Maurice, by his harangues in favour of peace; and he offended many persons by his political and religious sentiments, as well as by his moral conduct, which was not such as to secure respect. His poems indicate an irritable temper, and abound with classical abuse and defamations; and particularly against the enemies of Scaliger. Moreover, he was boastful, vain, importunate, and selfish: and his licentiousness, both with regard to wine and women, involved him in much disgrace. He died at Leyden in 1613. His poems, which manifest gravity and sonorousness of diction and elevation of sentiment, were first collected and printed in 1587; and a more complete collection was printed at Leyden in 1607, and reprinted at Amsterdam, and other places. The "Letters" of Baudius, published after his death, are more esteemed for their style, than his poems. He also published "Harangues," and some other pieces, all in Latin. Gen. Dict.

BAUDOBRICUM, or BAUDOBURGA, in *Ancient Geography*, a place of Gallia Belgica, upon the banks of the Rhine, south of Confluentes. The machines of war, called *Palatæ*, were under the conduct of a prefect residing in this place; and the head-quarters of the general were at Mogontiacum, or Mayence.—*Baudobrica* was also another place of Belgica Prima, north-east of Augusta Trevirorum, now *Boppard*.

BAUDOUIN, FRANCIS, in Latin *Baldwinus*, in *Biography*, an eminent civilian and man of letters, was born at Arras in 1525, studied at Louvain, and in his youth resided at the court of Charles V. At Geneva he became intimate with Calvin, and embraced the reformed religion. In France he conformed to the religion of the country, and taught the law at Bourges from 1538 to 1545. In Germany he delivered lectures at Strasburg, Heidelberg, and other places, avowing himself a protestant; but by joining Cassander in a project for bringing about a coalition of religions, he excited the lasting displeasure of Calvin and Beza, and others of the reformed party. He enjoyed the favour of cardinal Lorraine, the inveterate enemy of the Calvinists, and is supposed to have induced Antony, the weak king of Navarre, to abandon them. By that prince he was patronized, and appointed his delegate at the council of Trent. Upon the death of Antony in 1562, he was invited to Douay and Besançon, and finally settled at Paris, where his reputation, acquired by several learned works, which he had published, rendered his lecture popular among persons of the first distinction. The duke of Anjou afterwards Henry III. wished to engage his pen in the justification of the massacre of St. Bartholomew; but to this prince he delivered his sentiments like an honest man, and was so much esteemed by him that he appointed him one of his counsellors of state. Whilst he was preparing to follow Henry to Poland, he was seized with a fever, which terminated his life at the college of Arts in Paris in 1573. He was distinguished by his extensive knowledge, admirable memory, and persuasive eloquence. Notwithstanding the just reproach which he incurred by his versatility in religion, so that he was opprobriously denominated an "Hermaphrodite," he appears to have been a man of moderate and tolerating principles, and whilst he condemned the severities exercised against the protestants in the Low Countries, he also censured the unjustifiable zeal of Calvin in the persecution of Servetus. His Latin style was pure and elegant, and he left several works on the civil law, and also in ecclesiastical history and controversy, which have been much esteemed. Gen. Dict. Nouv. Dict. Hist.

BAUDRAND, MICHAEL ANTONY, a celebrated geographer, was born at Paris in 1633. When he had

finished his studies, he accompanied cardinal Antonio Barberini as his secretary to Rome; and upon his return to France, he was employed in revising Ferrarius's Geographical Dictionary, which he enlarged by one half, and published at Paris in 1671, fol. By his travels in Germany, and his visit to England, he was furnished with a variety of observations that were useful to him in the compilation of his geography. Upon his return to France in 1677, he composed his Geographical Dictionary in Latin, intitled "Geographia ordine literarum disposita;" Paris 1682, 2 vols. fol. After a journey to Rome in 1691, he applied himself at Paris to the completion of his French Geographical Dictionary, which he was prevented from publishing by his death in the year 1700. This work was published at Paris in 1705, in folio, but it is said to be a corruption rather than a translation of the Latin Dictionary, printed in 1682. Gen. Dict.

BAUDROYE, in *Ichthyology*, the name of the *angler*, or *spring fish*, *LOPHIUS PISCATORIUS* in *Comperac's Paris &c.*

BAUERWITZ, or PAURWITZ, in *Geography*, a town of Silesia, in the province of Jagendorf, on the river Zinna, 15 miles N.W. from Ratibor. The neighbourhood is a rich corn country.

BAUGÉ, in *Commerce*, a drugget manufactured in Burgundy, with thread, spun thick, and coarse wool.

BAUGE, in *Geography*, a town of France, and principal place of a district in the department of the Mayne and Loire, seated on the river Coesnon, 6 leagues E.N.E. from Angers. The place contains 5003, and the canton 13,935 inhabitants: the territory includes 280 kilometres and 17 communes. N. lat. 47° 31'. E. long. 0° 10'.

BAUGY, a town of France in the department of the Cher, and chief place of a canton in the district of Bourges. The place contains 723, and the canton 7933 inhabitants: the territory includes 262½ kilometres and 17 communes.

BAUHIN, JOHN, in *Biography*, born at Amiens in 1511, was early sent by his father to learn the practice of medicine and surgery, under an uncle of the same name at Paris. Here he had opportunity of hearing the lectures of Fernelius and Sylvius, and of seeing the practice of Tagault, then in high reputation. Under these celebrated masters he made such progress, that when only seventeen years of age, he was taken into the service of Catherine Queen of Navarre, and made her physician. Reading about this time the translation of the New Testament into Latin by Erasmus, and becoming thence a profelyte to the reformed religion, to avoid persecution he came to England, but at the end of twelve months, being assured of protection, he returned to Paris. Here however he was soon laid hold of, accused of heresy, and committed to prison, whence, at the end of eighteen months, he only escaped with his life, through the intercession of his patriess, queen Catherine. Removing from Paris he went to Antwerp, where for some time he taught and practised medicine and surgery: but the persecution against the favourers of the new doctrines commencing there, he fled with his family to Basle. Here he was at first employed by Frobenius, the famed printer, in correcting the press, until after giving the necessary proofs of his proficiency in medicine, he was admitted to practice, and soon acquired considerable celebrity, and in 1580, was made dean of the faculty. He died in 1582, aged 71 years. The only work left by him, is "Quæstiones tres medicæ, totidemque conclusionis;" printed at Basle, in 1558, fol.: probably an academical exercise. *Athenæ Bourgeoise*.

BAUHIN, JOHN, son of the former, born at Lyons, in 1541, shewing early a disposition to the study of botany, after going through the preliminary exercises, was sent by his father, when only twenty years of age, to accompany the celebrated Gesner in his excursions over the greater part

of France, Germany, Italy and Switzerland. In this journey he collected a prodigious number of plants, which formed the basis of his principal work, the "Historia Plantarum," which he even then had in contemplation, as appears by his correspondence with Gesner, carried on long after his return, but which was not published until several years after his death. Having accomplished the principal object of his travels, he first settled at Basle, where in 1566 he was elected professor in rhetoric. Some time after he removed to Yverdon, and at length, on the invitation of the duke of Wirtemberg, to whom he was made principal physician, he went to Montbelliard, where he continued to reside the remaining forty years of his life. Though botany engaged the greater part of his time and attention, yet he was not unmindful of other parts of natural history, as appears by his account of the medicinal properties of the principal mineral waters of Europe, particularly of the waters at Boll, in the principality of Wirtemberg, written at the command of the duke, to which he has added descriptions of those complaints in which mineral waters are mischievous; and his "Historia memorabilis luporum aliquot rabidorum, qui circa annum 1590, apud Mompelgartum, multorum damno, publicè grassati sunt," published at Montbelliard, 1591, 8vo. He died in 1613, aged 72 years. His correspondence with Gesner, principally on botanical subjects, with his book "De plantis a divinis sanctissime nomen habentibus," was published by his brother Gaspard, at Basle, 8vo, 1591, parvum libellum, Haller says, et quasi specimen fecuturi operis. In 1593, he published at Montbelliard also, in 8vo. "De plantis abfinthii nomen habentibus." The prodromus of his great work was published at Yverdon, in one volume 4to. in 1619, under the names of J. Bauhin and Henry Cherler, his brother-in-law, who had contributed to its perfection. In this specimen, Haller says, you see the rudiments of a natural classification of plants. The "Historia plantarum nova, et absolutissima, cum auctorum consensu et dissenfu, circa eas;" upon which the author had bestowed above forty years' labour, was at length published at Yverdon in 1650 and 1651, in three volumes in folio, under the care of Dr. Chabré. Notwithstanding the numerous errors in this book, many of which Haller says should be imputed to the editor, who was but indifferently qualified for the task he had undertaken, it is a noble and valuable work, and deservedly places the author in the first rank among the improvers of botany. Haller's Bib. Botan. Gen. Biog.

BAUHIN, GASPARD, born at Basle in 1560, twenty years later than his brother John, having the advantage of his brother's experience to guide him in his inquiries, made proportionally early advances in knowledge. After passing through the necessary preliminary studies, under Fabricius ab Aquapendente, Sev. Pinæus, and other celebrated anatomists at Padua, Montpellier, and Paris, and having collected in his travels a large number of plants, many of them unnoticed by his brother, he returned to Basle in 1580, and was admitted doctor in medicine. In 1582, he was made Greek professor, and in 1558, professor of anatomy and botany, of which he is called in his epitaph the Phœnix. He was afterwards made professor of the practice of medicine, archiater, or principal physician to the city of Basle, dean of the faculty of medicine, and rector of the university, which distinguished honours he continued to hold to the time of his death, which happened in 1624.

Indefatigable in his attention to the duties of his several offices, he discharged them with such regularity as to secure to him the affection of his pupils, who materially assisted him in collecting plants, necessary in completing his botanical works, to which also his correspondents in different parts of Europe largely contributed.

Notwithstanding the number and variety of his offices, much of his time must have been employed in composing and preparing for the press his numerous publications on anatomy and botany; and though great additions and improvements have been made in our knowledge in those sciences since his time, many of our author's works are still consulted, and held in estimation. A few of the titles to his principal works follow: for the rest, see the Bib. Anat. and Bot. of Haller. "Franc. Roussetti l. de partu cæsareo, e Gallico in Latinum transf." 4to. 1586, Basle Two years after he republished this work with an appendix, containing additional cases of women who are said to have undergone the operation and recovered; to which is also added a description of the valve of the colon, of which he claimed the discovery. "Theatrum Anatomicum, infinitis locis auctum, Francof." 1621, 4to. including several smaller works on anatomy, published by him before at various times. "Vivæ imagines partium corporis humani æneis formis expressæ, ex theatro anatomico Caisp. Bauhini desumptæ;" Basle 1620. The figures are principally from Vesalius and Eustachius; some are proper to the author. In this work also are contained other discoveries in anatomy made by the author. "De hermaphroditorum monstroforumque partium naturâ." Oppenheim, 1618, 8vo. In 1598, he published "Matthioli opera, quæ extant omnia," fol. Franc. in which there are many plants Haller, says, not before described. "Pinax theatri botanici, seu Index in Theophrasti Dioscoridis, Plinii, et botanicorum qui a seculo scriperant opera," &c. Basileæ 1623, 4to. a work extremely useful to persons consulting the older botanical writers. "Catalogus plantarum circa Basileam nascentium," Basil 1622, 8vo; the largest catalogue extant, Haller says, of plants growing in a single district.

BAUHIN, JOHN GASPARD, son of the former, born March 12th 1606, after being well instructed in the Latin and Greek languages, and initiated in the knowledge of botany, anatomy, and other branches of medicine under his father, went to Paris in 1624, where he continued two years, attending the schools of the most celebrated masters there. He afterwards visited England, Leyden, Padua, and various other places; the same of his ancestors procuring him an easy introduction, wherever he went, to the most distinguished persons. Returning to Basle in 1628, he was made doctor in medicine, and two years after professor in anatomy and botany, which offices he held for thirty years. In 1660, he was made professor in the practice of medicine, and was several times appointed dean of the faculty, and rector of the university. He died July 14, 1685.

Notwithstanding the numerous honours conferred upon him, he does not appear to have contributed much to the improvement of the science he professed, having only left three dissertations of little note or value. "De peste, de morborum differentiis et causis, et de Epilepsia."

BAUHINIA, so named by Plumier in honour of the two famous botanists, John and Caspar Bauhin, in *Botany*. Lin. gen. 511. Reich. 554. Schreb. 697. Plum. 13. Juss. 351. Class and order, *decandria monogynia*. Nat. Ord. *lomentaceæ*: *leguminatæ* Juss. Gen. Char. *Cal.* perianth oblong, gaping longitudinally on the lower side, reclining on the other, gaping also five ways at the base, with five cohering leaflets above, deciduous. *Cor.* petals five, oblong, waved with attenuated reflected tops, expanding; the lower ones a little larger, the upper ones more distant, all with claws placed on the calyx. *Stam* filaments 10, declining, shorter than the corolla; the tenth much the longest; anthers ovate, always on the tenth, seldom on the rest. *Pist.* germ oblong, sitting on a pedicel; style filiform, declining; stigma obtuse, rising. *Per.* legume long, subcolumnar, one-celled. *Seeds* many, roundish, compressed, placed according to the length of the legume.

BAUHINIA.

legume. *Leaf*. Char. *C. l.* five-cleft, deciduous. *Pet.* expanding, oblong, with claws, the upper one more distant, all inserted into the calyx. *Legume*. Species, 1. *B. f. mollis*, climbing mountain ebony. *Tobum*. Lingue, Rumph. *Amb.* 5. t. 1. *Chamaetis Indica*. Ray *Suppl.* 328. n. 13 & 14. *Naga-mu-valla*, Rheed. *Mal.* 8. 57. t. 30, 31. "Stem cirriferous." Rising with many slender stalks, which put out tendrils and fasten themselves to the neighbouring trees; leaves alternate, heart-shaped, on long foot stalks, six inches long, three and a half broad in the middle, deeply cut into two-pointed lobes, each having three prominent longitudinal ribs; flowers at first whitish, turning to a yellowish colour; fruit slender and flat, containing six or eight flat bony seeds, black with a silvery border. A native of both Indies, not producing flowers in England. The seeds were sent to Mr. Miller from Cayenne, probably before the year 1752.—2. *B. aculeata*, prickly, stalked mountain E. "Stem prickly." An erect elegant shrub, about a man's height; trunk and branches prickly, leaves roundish, with two roundish blunt lobes; cloven to one-third of their depth, smooth with nine nerves; petiole thicker and callous at both ends, from the base of which proceeds on each side a sharp short prickle, distilling when young nectareous drops; flowers large, white, and having an unpleasant scent; rising, in Jamaica, to the height of sixteen or eighteen feet, and plentiful there and in the other sugar islands of America; the flowers are succeeded by pods, about three inches long, containing two or three swelling seeds; the pods are glutinous, and these, as well as the bruised leaves, have a strong balsamic scent; called in America the Indian favin-tree, from its strong odour, which somewhat resembles the common favin. It is frequent about Carthagena in woods; cultivated by Mr. Miller in 1752.—3. *B. divaricata*, dwarf mountain E. "Leaves smooth, lobes divaricated, acute, two-nerved; petals lanceolate." A low shrub, seldom rising more than five or six feet high, dividing into several branches; corolla, white, and flowers in a simple upright raceme; having an agreeable scent, appearing during the greatest part of summer, and exhibiting one of the chief beauties of the hot-house: the pods are taper, about four inches long, and contain four or five dark-coloured seeds. A native of the north side of Jamaica, where it grows plentifully; cultivated by R. J. Lord Petre, before 1742; flowering from June to September.—4. *B. angustata*, "leaves ovate, lobes parallel," differing from the others in its more oblong leaves, entire at the base, cloven to the middle into two straight parallel lobes, and having nine nerves. The calyx is long, streaked, and of a grey colour; the petals are subulate, flowers alternate, short; legume very long, pendulous. It rises to the height of twenty feet, with a smooth stem, dividing into many small branches, terminated by loose bunches of white flowers, which are succeeded by very long, narrow, compressed pods, each including eight or ten seeds. A native of America; the seeds were received by Mr. Miller from Cayenne.—5. *B. variegata*, variegated mountain E. *Arbor S. Thoma*, Zucc. *H. B.* 26. t. 15. *Chovanna-Mandaru*; 1. *Rheed. Mal.* 1. 57. t. 32. "Calyx one-lobed, long; petals five, ovate; lobes of the leaves ovate-obtuse." Petioles with a strong stem, upward of twenty feet high, dividing into many strong branches; flowers large, in double panicles, at the extremity of the branches, of a purplish red colour, marked with white, and the bottom yellow; pods about six inches long, and $\frac{1}{2}$ of an inch broad, each containing three or four compressed seeds. Growing naturally in both Indies, and introduced here by Mr. Bentick in 1692.—6. *B. ferruginea*, purple mountain E. *Chovanna-Mandaru*; 2. *Rheed. Mal.* 1. 59. t. 33. "Leaves subcordate, two-lobed, rounded, tomentose underneath." A tall tree, differing from the foregoing in having larger leaves, more deeply cut, and more

contracted on the sides; the calyx is yellowish green, and red; the corolla of a very red purple, and one petal out of the five streaked with white on the claw within and without; all lanceolate and distant; legumes larger than those of any other sort, being one and half or two spans long, and an inch broad. A native of the East Indies, where it flowers through the year. Introduced here in 1778.—7. *B. cuneata*, downy mountain E. *Mandaru Madagapat-ns.* *Pluk.* *Alm.* 247. t. 44. f. 6. *Caulchea-pou*, *Rheed. Mal.* 1. 63. t. 35. "Leaves cordate, lobes semi-orbiculate tomentose." This grows to the height of two fathoms, with a trunk nearly six inches in diameter, and divides into many branches; leaves smaller than those of the foregoing, rounded, cloven half way, seven-nerved and blunt, with rounded lobes; having a strong scent if rubbed during the night, when the lobes are clapped together; the calyx of the flowers green and bell-shaped, the corolla yellowish white; one of the petals having a dusky red purple spot at the claw; stamens yellowish white; flowers without smell. A native of the East Indies. Cultivated, says Ray, by Compton bishop of London, in 1687.—8. *B. acuminata*, sharp-leaved mountain E. *Velutta-Mandaru*, *Rheed. Mal.* 1. 61. t. 34. "Leaves ovate, lobes acuminate semi-ovate." This rises to a man's height, with a trunk as thick as his arm; leaves more deeply cut, longer, contracted into a cusp or point towards the end, nine-nerved, less divaricated; flowers bell-shaped, pure white, without scent; petals rounded and blunt; stamens white; legumes smaller than in the others, being four or five inches long, an inch broad, smooth, with a round broad back. A native of the East Indies.—9. *B. marginata*, "stem prickly, leaves cordate with round lobes, tomentose underneath;" seldom rising more than ten feet high, dividing into many branches, armed with short crooked spines; leaves alternate, heart-shaped, with two roundish lobes; flowers two or three together at the extremity of the branches, large, of a dirty white colour, and succeeded by flat pods, each containing two or three seeds.—10. *B. rotundata*, "stem prickly, leaves subcordate, two-parted, rounded, flowers scattered;" rising twenty feet high, with a strong upright stem, sending out branches towards the top, armed with spines in pairs, strong and crooked; leaves like the former; flowers large and white, succeeded by long flat pods, narrow, and each including five or six seeds. This and the preceding are natives of Cathay in New Spain.—11. *B. aurita*, long-eared mountain E. "Leaves subtransverse at the base, lobes lanceolate, porrected, three-nerved; petals lanceolate." Cultivated by Mr. Miller, in 1756, and flowering in September.—12. *B. porrecta*, smooth broad leaved mountain E. "Leaves cordate, lobes porrected, acute, three-nerved, petals lanceolate." A tree rising about fifteen feet high, with several straight trunks, thick as a man's leg, covered with a whitish bark, dividing into many branches and twigs; leaves three inches long and two broad, yellowish-green, smooth, with seven or more ribs, and four transverse; the petioles an inch long; the flowers at the end of the twigs, on pedicels half an inch long; petals long, red-white variegated or striped; stamens long and white; legumes five or six inches long, brown. Growing on the hills in Jamaica. The wood very hard, and veined with black, whence the name of ebony. Cultivated by Mr. Miller, in 1739, and flowering in July.—13. *B. emata*, white-leaved mountain E. "Leaves cordate, pubescent underneath, lobes ovate, obtuse; calyx situated upward and elongated." A native of the East Indies, introduced by Dr. P. Russel in 1777; flowering in May and June. There are many other species both from the East and West Indies, not yet sufficiently examined. The whole genus needs farther investigation.

Propagation.—All these plants, being natives of hot countries, will not thrive in England out of the bark-stove. They are propagated by seeds, procured from their native countries, which should be brought over in their pods. These must be sown in pots filled with light fresh earth, and plunged into a moderate hot bed of tanner's bark; and if the seeds be good, they will come up in six weeks, and in a month after they should be carefully shaken out of the seed pot, without injuring their roots, and each of them planted in a separate small pot filled with light loamy earth, and plunged again into the hot-bed, shading them till they have taken fresh root, and then admitting fresh air to them every day in warm weather. In autumn they must be placed in the bark-stove, and treated like other tender exotics, giving them but little water in winter. As these plants frequently flower in winter, they deserve a place in the stove. Martyn's Miller's Dict.

BAVINS, in *War*, faggots made of birch, heath, or other sort of brush-wood, that is both quickly fired and tough, 2½ or 3 feet long, with the brush-ends all laid one way, and the other ends tied with two bands. They are dipped and sprinkled with sulphur, like reeds, excepting only that the brush-ends only are dipped, and should be closed together before they are sprinkled, to keep them more close, in order to give a stronger fire, and to keep the branches from breaking off in shifting and handling them. See FASCINES.

BAULA, in *Ancient Geography*, a district of Italy in Campania, between Baia and the Lucrine lake, formed according to Tacitus, by the sea; and the seat of many country houses.

BAULAS, in *Geography*, a town of Syria, 50 miles east of Damascus.

BAULEM's Kill, a western water of Hudson's river, 8½ miles below Albany.

BAULOT, or BEAULIEU, JAMES, in *Biography*, of mean and obscure parentage, was born in the province of Burgundy, in 1651. Becoming acquainted with Pauloni, an Italian itinerant lithotomist, he travelled with him, as an assistant, for some years; but having at length, from observation, acquired the art of cutting for the stone and of curing ruptures, he separated from him, and soon became celebrated for his skill in both those arts. Though illiterate, and totally unacquainted with anatomy, yet he is said to have considerably improved on the method of operating used by his master; and even to have approached very near the mode now followed by the most celebrated surgeons. Following the steps of Pauloni, he visited in turn all the principal cities on the continent. In 1697, he went to Paris, where he at first operated with success, but failing in some cases, he went to Geneva, Aix-la-Chapelle, and Amsterdam: in each of which places he was much resorted to; for having both improved his instruments, and his mode of using them, he was now generally successful. He next went to Strasburg, where he cut successfully a great number of patients, then to Venice, Padua and Rome, every where acquiring additional fame and reputation. He was of a singular disposition, and wore a sort of monkish habit, whence he became generally known by the title of Friar James. He at length settled in a village near Besançon, where he died, 1720, being sixty-nine years of age. In gratitude for the numerous cures he had performed at Amsterdam, the magistracy of that city caused his portrait to be engraved, and a medal to be struck, bearing for imprefs his bust. Haller Bib. Chirurg. Gen. Biog. Dict.

BAULTE, in *Geography*, a river of Prussia, which runs into the Frisch Haff, a little below Frauenburg.

BAUM, in *Botany*. See MELISSA.

BAUM, *Balsard*. See MELITTIS.

BAUM, *Molucca*. See MOLUCCELLA.

BAUM, *Moldavian* and *Turkey*. See DRACOCEPHALUM.

BAUMA, in *Ancient Geography*, a town of Ethiopia near Egypt. Pliny.

BAUMÆ, an ancient town of Asia, in Mesopotamia, seated, according to Ptolemy, on the Euphrates.

BAUMAN, a remarkable cave in Lower Saxony, about 18 miles from Goslar; which has a narrow entrance, but within is spacious, and has many winding paths. The peasants traverse it in search of bones, which they sell for unicorn's horns. Some say that it extends as far as Goslar; and skeletons have been found in it, supposed to be those of men who have been lost in its devious windings.

BAUMANNIANA, in *Entomology*, a species of PHALÆNA (*Tortrix*) that inhabits Austria. The anterior wings are yellow, with two ferruginous anastomosing bands bordered with silver: posterior one interrupted. *Fabricius*.

BAUME, ANTHONY, in *Biography*, chemist and apothecary, born at Senlis, February 26th, 1728. Applying early and diligently to the study of chemistry and pharmacy, he was soon distinguished for his superior attainments in those arts. In 1752 he was received into the company of apothecaries at Paris, and in 1773 made a member of the Royal Academy of Sciences. He was also several years lecturer in chemistry, an office he filled with distinguished credit to himself, and advantage to his pupils. In 1757 he published, in conjunction with doctor Macquer, "Plan d'un Cours de Chymie experimentale et raisonnée, avec un discours historique sur la Chymie;" 8vo. Paris. "Elemens de Pharmacie theorique et pratique;" Paris 1762, 8vo. "Manuel de Chymie, ou exposé des opérations," &c. Paris, 1763, 8vo. These two works have passed through several editions. He also published "Memoires sur les Argilles, ou recherches et experiences chymiques et physiques sur la nature des terres les plus propres à l'agriculture, et sur les moyens de fertiliser celles qui sont steriles," Paris, 8vo. 1770, which was well received. Eloy. Dict. Hist.

BAUME, *St.* in *Geography*, a mountain of France in the department of Var, between Aix, Marseilles, and Toulon. It is much frequented from a superstitious notion that Mary Magdalen died in this place.

BAUME Bay. See BALSAM Bay.

BAUMER, JOHN WILLIAM, in *Biography*, a German naturalist and physician, was born at Rheweiler in 1719, studied philosophy and medicine at Jena and Halle, and after having been settled as a clergyman, in 1742, at Krautheim, returned to Halle to study medicine, and in 1748, took the degree of doctor in that science. He afterwards became first professor of medicine at Erfurt, where he died August 4, 1788. His principal works are "Natural History of the Mineral Kingdom, particularly in regard to Thuringia." Gotha 1763, 1764, 2 vols. 8vo. "Historia Naturalis lapidum pretiosorum omnium," &c. Frankfurt, 1771, 8vo. "Fundamenta politia medicæ," &c. "Frankfort and Lips." 1777, 8vo. "Fundamenta Geographiæ et Hydrographiæ Subterraneæ." Gif. 1779, 8vo. and "Historia Naturalis Regni Mineralogici, and naturæ ductum tradita." 1780, 8vo. Gen. Biog.

BAUMES, LES DAMES, or BAUMES LES NONES, in *Geography*, a town of France and principal place of a district in the department of Doubs, on the river Doubs, 5 leagues N. E. of Besançon, and 8¼ N. of Pontarlier. The place contains 2300 and the canton 8927 inhabitants; the territory includes 205 kilometres and 33 communes. It derives its origin from an abbey of canonesses, which is said to have been founded in the 5th century, by St. Romain, abbot of Condat. Others assert that it was founded in the 7th century. About 5 miles from this town is shewn a remarkable cavern, in which, after descending 300 paces, is found the gate of a grotto, twice as large as that of a city. The grotto is

is 55 paces deep and 60 wide, and covered with a kind of vaulted roof, from which water continually drops. In this grotto is a small brook, that is said to be frozen in summer and not in winter. When the peasants observe a mild rising from this cavern, they predict rain on the following day.

BAUMGANS, in *Orniologia*, the name of the bernacle goshawk; *ANAS BENICOLA*, in *Frisch. Hist. Birds*.

BAUMGARTEN, ALEXANDER GOTTLIEB, in *Biography*, an eminent philosophical writer, was born at Berlin in 1714, and educated at Halle. Here he distinguished himself by his private lectures in philosophy; and after having officiated for some time as extraordinary professor he was invited in 1740 to be professor of philosophy at Frankfort on the Oder. His constitution, being naturally feeble, was much impaired before the year 1751, by close application to study, and his infirmities were aggravated by the loss of a great part of his property, during the bombardment of the fortrefs of Custrin, whither he had fled for shelter. In 1760, his health being in some degree restored, he resumed his labours with new ardour; but in 1762 he was carried off by a stroke of the apoplexy; having established the character of an acute and sound philosopher, who united to an extensive acquaintance with the sciences, a distinguished accuracy of judgment, and an agreeable cheerfulness of temper. His principal works are "Methophysica;" Halle, 1739, 1743, 8vo, published in German by Meyer, with many alterations, and reprinted by professor Eberhard; "Ethica Philosophica;" Halle, 1740, 1751, 8vo. "Æthetica;" Frankf. on Oder, 1750, 1757, 8vo. and "Instita Philosophiæ Practicæ Primæ;" Frankf. 1760, vo. G. Biog.

BAUMGARTEN, SIEBOLD JACOB, brother of the above, was born in 1706 at Wilmshardt on the Oder, and having studied at Halle became one of the chief of his school. He died in 1757, leaving behind him several Latin subjects, and numerous translations of the best authors into German. G. Biog.

BAUMHOLZ, a town of Germany, in the archduchy of Austria, 6 miles west of Peltsburg.

BAUMGARTE, a town of Bohemia, in the circle of Chrudim, 3 miles west of Peltsburg.

BAUMHOLDER, a town of Germany, in the circle of Upper Rhine, and Duchy of Deux Ponts, 10 miles west of Lauterbeck, and 25 north of Deux Ponts. Since the French revolution, it is the chief place of a canton in the department of Sarre, and district of Barkerfeld. The place contains 665 and the canton 6411 inhabitants: the territory comprehends 33 communes.

BAUMSWALDT, a forest of Prussia, on the borders of Lithuania, about 10 leagues long and 7 wide.

BAUNACH, a town of Germany, in the circle of Franconia, and bishopric of Bamberg, near the river Mayne; 7 miles north of Bamberg. This is also the name of a canton of Swabia, so called from the river Baumach, which runs into the Mayne.

BAVOSA, in *Ichthyology*, a name given by the Italians to a species of Ray, called by modern naturalists *Raja Oxyrinelus*, which see.

BAVOTA, *Pacavita*, in ancient *Geography*, a town of Italy, in Japygia.

BAUR, BAWR, or BOUWER, JOHN WILLIAM, in *Biography*, an eminent painter of landscape and architecture, was born at Strasburg in 1610. After having been the disciple of Frederick Brendel, he went to Rome for improvement; but though he possessed great genius and a fertile imagination, and resided for a considerable time in and about Naples and Rome, where he devoted himself entirely to architecture and landscapes, he retained the German taste in all his figures, and neglected the study of nature or the antique; so that he

never arrived at a grandeur of design. However his pencil was light, his composition good, and his general expression beautiful, though his figures were somewhat heavy. His paintings in water-colours on vellum are held in the highest estimation. For the duke of Bracciano, at whose court he resided for several years, he finished some charming perspective views of gardens, with statues and fountains, and a number of elegant buildings, with many figures, coaches, cattle, and horsemen; and he generally distinguished people of different nations by their appropriate dress. This artist also engraved a great number of plates from his own designs. His engravings from the Metamorphoses of Ovid are generally preferred to the rest. They are slightly etched, and retouched with the graver. The figures are small, and incorrectly drawn. The back grounds are dark and heavy, and the trees are destitute of that lightness and freedom, which would render the effect agreeable. His pieces of architecture are well executed, and the perspective finely preserved. In his style of engraving he seems, in some degree, to have imitated Callot, and the nearer he approaches it, the better are his productions. The Metamorphoses consist of 150 middling-sized plates. Baur died at Vienna in 1640. Pilkington and Strutt.

BAURAC, an ancient name for nitre, but in some places used in a restrained sense, as not signifying every thing that was called by that name, but only one of two different salts that were confusedly called nitre.

The Arabians give the name *baurach* to *tincal* or *tincal*, which when refined is called *borax*, but when it is rough, in little crystalline masses like the small crystals of *sal gem*, mixed with earth or other impurities, it is always distinguished by the name of *tincal*. Neumann, p. 227. See NATRON.

BAURINKEI, in *Geography*, a town of Germany, in the circle of Westphalia, and county of Lingen, 6 miles N. E. of Lingen.

BAUSCH, LEONARD, in *Biography*, a physician of Schweinfurd, in Franconia, acquired considerable reputation by his commentaries on the works of Hippocrates, published 1594, folio, at Madrid. His son, John Laurence Bausch, born at Schweinfurd, September 30th 1605, after the usual school education at home, visited the principal seminaries in Germany, France, and Italy, and was made doctor in medicine at Altdorf in 1630. He had the merit of forming a society of physicians, in 1652, who met at stated periods, and communicated such observations in philosophy and medicine as occurred in their practice, and seemed deserving of being preserved. This, in time, gave birth to the *Academia Naturæ Curiosorum*, of which he was the first president, and in 1671 they began to publish their memoirs, under the title of "Miscellanea Curiosa Medico-Physica, Academiae Naturæ Curiosorum," 4to. The society still continue their meetings, and have published near seventy volumes of the Miscellany. Haller Bib. Med. Pract. Eloy. Dict. Hist.

BAUSCHWITZ, in *Geography*, a town of Silesia, in the principality of Neysze, 8 miles E. N. E. of Neysze.

BAUSK, or BAUTKO, a town of Courland seated on the river Mufa, on the frontiers of Poland. It was taken by the Swedes, under Gustavus Adolphus, in 1625, and by the Russians under Czar Peter, in 1705, after a bloody battle between the Russians and Swedes. N. lat. 56° 30'. E. long. 24° 44'.

BAUSSET, a town of France, and chief place of a canton in the department of the Var, and district of Toulon. The place contains 2980 and the canton 12,285 inhabitants, the territory includes 270 kilometres, and 5 communes.

BAUTSCH, a town in Moravia, in the circle of Prerau, 18 miles N. of Prerau.

BAUTZEN, or BUDISZIN, the capital of Upper Lusatia.

fatia, in Germany, situate in the circle of Budiztu, on the river Spree, subject to the elector of Saxony, and fortified by a citadel, called the Castle of Ortenburg, standing on a high rock, and separated from the town by a ditch and ramparts. This citadel was founded before the town, which had its rise in the 9th century. This town had formerly a considerable manufacture of linen, hats, stockings, and gloves, and also of glazed leather, cloth, fustian, &c. It has frequently suffered much from fire. It was taken by the Prussians in 1757; and after their retreat, taken possession of by the citizens. The Lutherans and Catholics are allowed the free exercise of their religion. N. lat. 51° 10'. E. long. 14° 42'.

BAUX, LES, or BAULX, in Latin *Baltium*, a town of France, in the department of the mouths of the Rhone, and chief place of a canton in the district of Tarascon, seated on a hill, having a strong castle, formerly an independent barony, and afterwards a marquissate. N. lat. 43° 42'. E. long. 5° 0'.

BAUX *Island*, a name given by captain Marchand to a small island of the Pacific ocean; being one of the group called Hergest's islands near the Marquesas, and denominated by Hergest, *Sir Henry MARTIN'S Island*; which see.

BAUZELY, *St.* a town of France, in the department of Aveyron and district of Milka. The place contains 823 and the canton 5850 inhabitants: the territory includes 242½ kilometres and 12 communes.

BAWD, a person who keeps a place of prostitution, or makes a trade of debauching women, and procuring or conducting criminal intrigues. Some think the word is derived from the old French *baude*, bold or impudent; though Verleegan has a conjecture which would carry it higher, viz. from *bathe*, anciently written *bade*. In which sense, bawd originally imported no more than bath-holder, as if bagnios had anciently been the chief scenes of such prostitution. The Romans had their male as well as female bawds; the former denominated *lenones* and *proagogi*, among us *padlers*; the latter, *lena*.

By a law of Constantine, bawds were to be punished by pouring melted lead down their throats.

BAWDER, in *Geography*, a river of England, which runs into the Tees, about 3 miles N. N. W. of Barnard-castle in the county of Durham.

BAWD-MONEY, in *Botany*. See *ÆTHUSA MEUM*.

BAWDSEY HAVEN, in *Geography*, a small bay or anchoring place near the south point of the coast of Suffolk, formed by the ocean, and the mouth of the small river Deben, about a league to the east of Languard fort.

BAWDY-HOUSE, a house of ill-fame, to which lewd persons of both sexes resort for the purpose of licentious and criminal indulgence. Houses of this kind, under the denomination of brothels and stews, are licensed in some countries; and in England they were privileged by patent, regulated by statute, and tolerated as a necessary drain for corruption, from the reign of Henry II. to the last year of Henry VIII. when they were suppressed by found of trumpet; and their suppression was perhaps attended with greater solemnity than that of the convents. Their suppression, however, failed to extirpate lewdness; and Lztimer (Sermons, p. 43.), whose sermons are replete with a barbarous eloquence, inveighs bitterly at its subsequent prevalence. In 1650, the repeated act of keeping a brothel, and also of committing fornication, was upon a second conviction, made felony without benefit of clergy. But at the restoration, when hypocrisy deviated into the extreme of licentiousness, it was not thought proper to renew a law of such unfashionable rigour. The keeping of a bawdy-house is cognizable by the temporal law, as a common nuisance, not only because it endangers the public peace by drawing to-

gether dissolute and debauched persons, and promoting quarrels, but because it tends to corrupt the manners of the people by an open profession of lewdness. (3 Inst. 205. 1 Hawk. P. C. c. 74.) Those who keep bawdy-houses are punished with fine and imprisonment, and also such infamous punishment, as pillory, &c. as the court shall inflict; and a lodger, who keeps only a single room for the use of bawdry, is indictable for keeping a bawdy-house. (1 Salk. 382.) Persons resorting to a bawdy-house are punishable; and they may be bound to their good behaviour. But if a person be indicted for keeping or frequenting a bawdy-house, it must be expressly alleged to be such a house, and that the party knew it, and not by suspicion only. (Poph. 208.) A man may be indicted for keeping bad women in his own house. (1 Hawk. P. C. c. 61. § 2.) A constable, upon information that a man and woman are gone to a lewd house, or about to commit fornication or adultery, may, if he finds them together, carry them before a justice of peace without any warrant, and the justice may bind them over to the sessions. (Dalt. 214.) Constables may enter bawdy-houses, call others to their assistance, and arrest the offenders for a breach of the peace. In London, they may carry them to prison; and by the custom of the city, whores and bawds may be carted. (3 Inst. 206.) By stat. 25 Geo. II. c. 36. made perpetual by stat. 28 Geo. II. c. 19. if two inhabitants, paying scot and lot, shall give notice to a constable of any person keeping a bawdy-house, the constable shall go with them before a justice of peace, and shall, upon the oath of such inhabitants, that they believe the contents of such notice to be true, and their entering into a recognizance of 20l. each, to give material evidence of the offence, enter into a recognizance of 30l. to prosecute with effect such person for such offence at the next sessions. The constable shall be paid his reasonable expenses by the overseers of the poor, ascertainable by two justices; and upon conviction of the offender, the overseers shall pay the two inhabitants 10l. each. A constable, neglecting his duty, forfeits 20l. Any person appearing as master or mistress, or as having the care or management of any bawdy-house, shall be deemed the keeper of it, and liable to be punished as such. A wife may be indicted and set in the pillory with her husband, for keeping a brothel; for this is an offence respecting the domestic economy and government of the house, in which the wife has a principal share; and it is such an offence as the law presumes to be generally conducted by the intrigues of the female sex. 1 Hawk. P. C. 2, 3.

BAWLING, among *Hunters*, is spoken of the dogs, when they are too busy before they find the scent good.

BAWN, or BAN, derived from the Teutonick *baewen*, to construct and secure with branches of trees, in *Antiquity*, an area inclosed with thick ditches of earth square or circular, impaled with wooden stakes or the branches of trees, and surrounded with a deep trench. This was called in Irish *daingean*, a word of Celtic origin. Numerous remains of such fortresses are found not only in various parts of Ireland, but also in Britain, Germany, Sweden, and almost every country of Europe. The Irish gave great trouble to the English for many centuries by fortifying passes between the bogs and mountains in this manner, so that it was a tedious work to cut through them, and make the roads passable. This was called *plashing* a pass, from the Franco-Gallic word *plasser*, which, like *baewen*, signifies to entwine; and it consisted in securing the top of the vallum with sticks interlaced with branches. Before the English invasion, each family of the Irish is supposed by Mr. Ledwich, to have lived in a mud cabin surrounded by a *bawn*. The English introduced castles, in which they were imitated by the natives. In course of time, *bawn* came to signify an inclosure with a wall, instead

of plashed stakes; and we find queen Elizabeth and James I. requiring those to whom grants were made, to construct castles with *bawns*, or courts round them, for the protection of their families and tenants. When the grant was not very considerable, a bawn with a house within it was sufficient. Of the latter kind was *Hamilton's Bawn*, in the county of Armagh, which is mentioned in Dean Swift's works, and which now gives name to a village in that county. This was built of lime and stone, eighty feet square, with two round towers for flankers, and two stories high, vaulted, the wall itself being thirteen feet high. Within the bawn was a house of lime and stone, thirty-six feet long and twenty feet broad. Farther particulars may be found in Ledwich's *Antiquities of Ireland*, p. 185—196.

BAWOROW, in *Geography*, a town of Red Russia, in the palatinate of Lemberg, 64 miles east of Lemberg.

BAWT, a town of Persia, in the province of Irak-Agemi, 80 miles north of Ispahan.

BAWTRY, a market-town in the west riding of Yorkshire, and upon the confines of Nottinghamshire, in England, is seated on the high road to Scotland, and consists principally of one broad street, well furnished with inns. It is 9 miles from Doncaster, and 152 north from London. The river Idle induces a considerable trade from Derbyshire, of mill and grind-stones, as well as of lead and iron ware from Sheffield, which are conveyed hence to Hull and other parts of the country. The market is held on Wednesday and Saturday; and the town has also three annual fairs. Its houses are 174, inhabited by 798 persons. N. lat. 53° 27'. W. long. 1°.

BAXA TERRA, or *Barrer Bay*, lies on the west coast of Africa, 4 leagues south of the river Oro, which is in N. lat. 23° 30'. It is large, and has in several places good anchorage, especially on its northern side.

BAXAS BAHIA, lies on the coast of Brasil, in South America, 50 leagues E. and E. by S. from the sand-bank of Terra de Tortuga, on Turtle harbour. It has good anchorage, hard ground, and deep water; and it is well sheltered by a sand-bank from the north wind, and by the land from all other winds.

BAXAS, PUNTA, denoting a cape of shoals, is a low point, 12 leagues from the former, and 18 from Tortuga.

BAXFADORE, CAPE, is situated in the island of Lucerna or Malabar, in N. lat. 18° 44'. E. long. 120° 35'.

BAXIOS, APAXOS, or *Baxios*, are two clusters of rocks on the S. the east side of the island of Ceylon, called the Great and the Little Baxios. The former is in N. lat. 6° 10'. E. long. 81° 55'; and the latter in N. lat. 6° 25'. E. lat. 82° 15'.

BAXOS DE ABPOLOS. See *ABPOLOS*.

BAXOS de Indina. See *AFRICOS*.

BAXOS de la Cardelina, a shoal or reef of rocks, in the Pacific ocean, so called by Mariana in 1567, and lying, by M. Heuriot's calculation, near S. lat. 64° and E. long. from Paris 157°.

BAXOS, CAPE, or *Levo Cape*, is the east point of the entrance to the river Senegal, on the coast of Africa. It lies west of both cape Lomea and Palma island, 2 leagues distant from the latter. On the east of this cape are several dangerous rocks, some of which are under water, and should therefore be carefully avoided by the trading ships that navigate in those parts.

BAXOS Cape, lies also on the coast of Africa, eastward of the river Volta, 2 leagues from the Quatre Monts, or hills so called that are close together.

BAXTER, RICHARD, in *Bio-graphy*, an eminent divine

among the non-conformists of England, was born at Rowton, a small village in the county of Salop, in 1615. His father was a small freeholder of exemplary character, who, though belonging to the established church, was charged with puritanism on account of his religious demeanour. Under his instruction and example, Baxter manifested early indications of that contemplative and pious disposition for which he was afterwards so distinguished. In his youth he enjoyed few advantages for education; the schoolmasters whom he attended being men of little learning and loose morals. But under the tuition of Mr. Wickstead, chaplain to the council at Ludlow, he had access to an excellent library, of which he availed himself about a year and a half very much to his improvement. At this time his views were directed to the profession of a minister. However, in 1633, Mr. Wickstead prevailed upon him to relinquish this object, and to seek his fortune at court. Accordingly he was recommended to sir Hen. Herbert, master of the revels; but disgusted with the mode of living which this situation presented to him, he soon retired into the country, and resumed his purpose of prosecuting his studies for the ministry. Being appointed master of the free school at Dudley, his health declined; and under the impression produced by the immediate prospect of dissolution, and by the perusal of several practical treatises, he acquired that deep and settled sense of religion which formed the ruling and permanent principle of his future life. Being more than ever determined to engage in the ministerial office and having at this time no scruples against conformity to the church of England, he was ordained in 1638; though he afterwards condemned his precipitance in complying with the laws of subscription without due examination; and he frequently preached at Dudley and in the neighbouring villages, much to the satisfaction of those who heard him. He objected, however, to some of the ceremonies of the church, and he soon began to entertain doubts concerning the lawfulness of conformity. What led him and several others to study the case of episcopacy, and to think unfavourably of the establishment, was the imposition of the "et cætera" oath, which expressed an universal approbation of the doctrine and discipline of the church of England, and a determination never to attempt any alteration in its government. Mr. Baxter demurred against taking this oath; and though he would have submitted to the ecclesiastical jurisdiction that was actually established, he could not conscientiously declare his approbation of it, and his determination to support it to the extent which this oath required. In 1640, he was invited by the principal inhabitants of Kidderminster to reside with them as a preacher; and this place became the scene of his ministerial services for about sixteen years. Such, indeed, was the success which attended them, that he was eminently useful in reforming the morals of the dissolute, and in promoting in the town and its neighbourhood a strict regard to religion. About two years after his settlement at Kidderminster, the civil war commenced; and on this occasion he took part with the parliament, and recommended the protestation prescribed by it, to the people. He was thus reduced to the necessity of leaving this town, and of repeatedly changing his residence, till at length he settled at Coventry, where he preached regularly once a week both to the soldiers of the garrison and to the people of the town. After the battle of Naseby, he became chaplain to the regiment of colonel Whalley, and attended it at several sieges, though he was never present in any engagement; so that the story of his having killed a man in cold blood, and robbed him of a medal, was an unfounded and scandalous fabrication. During these times of confusion, Mr. Baxter was a zealous friend to regular government both in church and state; and it is said that he

took great pains to repress the sectaries. The accidental circumstance of a profuse bleeding at the nose, which reduced him to a state of great languor, was the occasion of his being separated from the army in 1647, and of preventing that service to his country, which might have been expected from a person of his principles and moderation. However, he resisted to the utmost of his power, the measures of those who afterwards usurped the government of the kingdom; he opposed taking the covenant, preached against the engagement, and dissuaded the soldiers from fighting against the Scots troops who came into the kingdom with Charles II.; and therefore the charge alleged against him, of his having been a trumpeter of rebellion, is altogether without foundation. When Cromwell assumed the supreme power, he boldly and openly declared, that he disliked his usurpation; and in a private conference expressly told him, that in his opinion the ancient monarchy was a blessing. To that form of government, Baxter always avowed his attachment; and in a sermon preached before the parliament on the 30th of April 1660, the day preceding that on which they voted the king's return, he maintained, that loyalty to their prince was a thing essential to all true protestants of whatever persuasion. About the same time he preached a thanksgiving sermon at St. Paul's, on occasion of the success of general Monk; and this circumstance refutes the charge of his having dissuaded his excellency from concurring in, or bringing about that change.

After the restoration, Baxter was made one of the king's chaplains, and was always treated by him with peculiar respect. To his majesty he spoke with the same freedom which he had used with the protector Cromwell. He strongly represented the great importance of tolerating those pious men who entertained doubts concerning the ceremonies and discipline of the church; and he observed, that the late usurpers had so well understood their own interest, that they had found the way of doing good to be the most effectual means to promote it; and therefore he besought the king that "he would never suffer himself to be tempted to undo the good which Cromwell or any other had done, because they were usurpers that did it;" and on the contrary, "that he would rather outgo them in doing good." At the Savoy conference he was one of the commissioners, and was employed in compiling the reformed liturgy. Having declined the preferment of the bishopric of Hereford, which was offered him, he wished to retire to his friends at Kidderminster, and to officiate among them in the humble station of a curate, but was not permitted. Disappointed with regard to the object of his wishes, he preached for some time occasionally in London; but the act against conventicles obliged him to retire first to Acton, and then to Totteridge. During the persecution of the non-conformists, he preached, as opportunity offered, and the state of the times allowed, either more openly or more privately; and he was sometimes a sufferer for his zeal, and sometimes unmolested. After the indulgence of 1672, he chiefly resided in London, and exercised his ministry, either occasionally or statedly, but not without interruption and molestation. To the sufferings attendant on his profession were added the infirmities of a feeble constitution, and frequent bodily disorders, together with the loss of the greatest part of his fortune, in consequence of the shutting up of the exchequer in 1671, and by the penalties inflicted upon him for the exercise of his ministry; but he bore all these evils with singular fortitude and patience. In 1684, he was treated with peculiar severity. Although he was so ill as not to be able to stand, a warrant was granted against him, in order to his being bound to his good behaviour; and the constables who were entrusted with its execution, watched him so incessantly,

that they prevented him passing from his study to his bed-chamber; and by thus depriving him both of food and sleep, at length effected their purpose, though they were not empowered to break open doors, and took him away to the Session's-house, where he was bound in the penalty of 400*l.* to keep the peace; and he was brought up twice afterwards, though he kept his bed during the greatest part of the time. In 1685, he was committed to prison by a warrant from lord chief-justice Jeffries, for his paraphrase on the New Testament, which was charged with being hostile to episcopacy, and brought to trial for sedition. In the course of this trial, he was treated with all the brutal insolence and tyranny, to the exercise of which that ruffian of the law, Jeffries, was accustomed; reviled by his judge in the grossest terms, and prevented from obtaining the full defence of his counsel; and at last found guilty on the most frivolous grounds, and sentenced to pay 500 marks, to lie in prison till he paid it, and to be bound to his good behaviour for seven years. From this heavy penalty, however, after a confinement of several months, he was released, in 1686, by king James, and allowed to remain in London, notwithstanding the provisions of the Oxford act. From this time he lived in a retired manner, neither interfering in the concerns of his party, nor taking any part in those addresses which some of his brethren presented to James II. on his indulgence. He perished, however, in the performance of his ministerial duties, till increasing weakness confined him to his chamber. The close of his life corresponded to the uniform tenor of it; the approaches of dissolution were regarded by him with pious resignation; and he died, with the tranquillity and hope appropriate to his exemplary character, on the 8th of December 1691. Urged by extreme pain to wish for a release, he checked himself by saying, "It is not fit for me to prescribe; where thou wilt, when thou wilt, and how thou wilt." To one who asked him in his sickness how he did, he replied, "Almost well." In 1662, Mr. Baxter married the daughter of Francis Charlton, Esq. a distinguished magistrate of the county of Salop; a woman of great piety, who entered thoroughly into his views concerning religion, and cordially approved all the sacrifices which he made from a conscientious regard to duty. She accompanied him in prison, and submitted, without repining, to all the hardships consequent upon the persecution which he suffered. She died 10 years before him.

"Richard Baxter was a man whose whole soul was engaged in his profession. Ardent piety towards God, and zeal for the best interests of his fellow-creatures, were the active springs of his conduct; and few men have ever devoted more time and labour to those objects. He passed a life of much contention and obloquy; but at this cool distance, no candid enquirer can mistake his true character. His early studies in divinity were not, perhaps, the best adapted to form a theologian. They consisted chiefly of the schoolmen and metaphysicians of a dark age, and gave him a turn to subtleties of distinction, which made him stand apart in some theoretical points from all his contemporaries. Yet, in practical religion, the devotional warmth of his temper allied him to the pious of all denominations, and inspired him with an enlargement of mind, which set him above the differences resulting from petty controversies. He was a most voluminous writer, and his works are sufficient to make a library of themselves. Above 145 distinct treatises of his composition have been reckoned up; of which 4 were folios, 73 quartos, and 49 octavos, besides several others of a smaller size. They comprise bodies of theology, practical and theoretical, besides a vast number of tracts on particular topics." His practical works have been collected together in

in 4 vols. in folio. His income, it is said, which was not great, was increased by the profit which he made of his writings, for which he sometimes received 60 or 80 l. a year of the bookellers. But this money he seems to have employed for charitable purposes. Of his numerous works some of the principal were his "Methodus Theologicæ," printed in Latin in 1674, folio; his English body of practical divinity, published in 1673, folio, under the title of "The Christian Directory," &c.; "Cædes Salvianus, or the Reformed Pastor," 8vo. 1676, much esteemed by many divines; "Universal Concord," 12mo. 1658, giving an account of the terms upon which all Christian churches may hold communion; "Reasons for the Christian Religion," 1667; "Catholic Theology," fol. 1675, intended to reconcile the differences between the Arminians and the Calvinists; "A Treatise of Episcopacy," 4to. 1681; "A Treatise of Universal Redemption," 8vo. 1694. The most popular of his practical pieces were his "Saints' Everlasting Rest," and his "Call to the Unconverted," of which latter 20,000 were sold in one year, and it was translated into all the European languages, and into the Indian tongue. To those which we have enumerated, we may add his "Reformed Liturgy," his "Poor Man's Family Book," his "Dying Thoughts," and his "Paraphrase on the New Testament." The first book he published was his "Aphorisms of Justification" and the "Covenants," printed in 1649; and the last in his life-time, "The Certainty of the world of Spirits," printed in 1691; so that he was an author 42 years. One of his works is "A Narrative of his own Life and Times;" "which, though a rhapsody," says Mr. Grainger, "composed in the manner of a diary, contains a great variety of memorable things, and is itself, as far as it goes, a history of non-conformity." Mr. Baxter was distinguished not only as a practical, but also as a controversial writer; and under this latter character, he particularly opposed the Antinomians. Few persons have suffered more rancorous abuse than Mr. Baxter; and few have been more highly respected both by his contemporaries and posterity. Among his friends and admirers we may reckon some of the most distinguished characters of the age in which he lived, of whom many were members of the establishment, such as chief justice Hale, sir John Maynard, Dr. Barrow, bishop Wilkins, bishop Patrick, and bishop Burnet. The great chief justice Hale honoured him with an intimate friendship, gave a high encomium of his piety and learning to all the judges, and when he was in prison, on the Oxford act, left him a legacy in his will, and several large books, in his own hand-writing, on the matter of their conversations. Dr. Barrow has testified concerning his works, that "his practical writings were never mended, his controversial skill confuted." Bishop Wilkins affirms, "that he has cultivated every subject which he has handled;" and he used to say of him, "that if he had lived in the primitive times, he had been one of the fathers of the church. Bishop Burnet's testimony is somewhat qualified. "Baxter," says he, "was a man of great piety, and, if he had not meddled in too many things, would have been esteemed one of the learned men of the age. He had a very raving and pathetical way of writing, and was his whole life long a man of great zeal and much simplicity; but was most unhappily subtle and metaphysical in every thing." Baxter was one of the last divines, whose name has distinguished a particular denomination or description of persons. See BAXTERIANS. Calany's Life of Baxter. Eng. Brit. Gen. Biog.

BAXTER, WILLIAM, an eminent philologist and antiquarian, was the nephew and heir of Richard Baxter, and

born of parents in mean circumstances at Lla'nbyddan, an obscure village of Shropshire, in 1650. He derived his pedigree, like a true Cambro-Briton, through a long line of ancestors from John Baxter, who, in the reign of Henry VI., settled at Surewbury; and he shews, that the name Baxter signifies originally a baker, in Saxon "Brecstler," and that it was given to that family, because they were bakers to the ancient princes of Wales, in which post, according to the custom of the ancient Celtes and Greeks, the noblest persons were employ'd.

In his infancy and youth, his education was so much neglected, that when he was sent to Harrow school in Middlesex at the age of 18, he knew not one letter, nor understood one word of any language but Welsh. But such were his talents and application, that he soon became distinguished by his extensive knowledge. In 1670 he published a Latin grammar, entitled "De Analogia, seu arte Latine lingue commentariolus," &c. 12mo. Thus qualified for the profession of a schoolmaster, to which he devoted himself, he employed the greatest part of his life in this occupation. For some years he kept a boarding school at Tottenham High-croft in Middlesex; and he was afterwards elected master of the Mercers' school in London. Having acquired great celebrity as a scholar, and in the prosecution of antiquarian researches, and distinguished, perhaps, more by his learning than his judgment, he died in 1723. In 1695 he published a new and correct edition of "Anacreon," with notes, which was reprinted with considerable additions and improvements in 1710. His abuse of Tanaquil Faber, a former editor of Anacreon, was amply retorted upon himself by J. Cornelius de Pauw, in his 4to. edition of the same poet, published at Utrecht in 1732, who held his comments in great contempt. His edition of "Horace," printed in 1701, and reprinted with improvements in 1725, has obtained a more lasting reputation. Dr. Harwood pronounces this the best edition ever published, and the learned Gesner has testified his approbation of it, by making it the ground-work of his excellent edition. Bentley, famed for the severity of his criticisms, in speaking of it, calls Baxter "Vir recondite eruditioris." In 1719 Baxter published his dictionary of British antiquities, under the title of "Glossarium Antiquitatum Britannicarum sive syllabus etymologicus antiquitatum veteris Britannicæ atque Iberiæ, temporibus Romanorum," 8vo. By his skill in the British or Welsh tongue, and by means of etymology, he professes to correct Camden, and to add about 200 names of ancient places and rivers omitted in his Britannia; of this work, a second edition was published, after the author's decease, in 1733. His glossary of Roman antiquities, proceeding no farther than the letter A, was published in 1726 by Mr. Moses Williams, under the title of "Reliquiæ Baxterianæ," &c. and republished in 1731, with the title "Glossarium Antiquitatum Romanorum," &c. Lond. 8vo. Baxter also wrote four letters on subjects of antiquity, inserted in the first volume of the "Archæologia." He left behind him notes on Pterius and Juvenal, and was the translator of some of Plutarch's lives "done into English" by several hands. Biog. Brit.

BAXTER, ANDREW, an ingenious metaphysician and philosopher, was the son of a merchant at Aberdeen, and born there in 1686 or 1687. He was educated in King's college in that city, and afterwards undertook the care of private pupils, some of whom were persons of rank and fortune. About the year 1730, he published in 4to. his celebrated work, entitled, "An Enquiry into the Nature of the Human Soul; wherein the Immutability of the

Soul is evinced, from the principles of Reason and Philosophy." This work, which was reprinted in 2 vols. 8vo. in 1737 and in 1745, was much applauded by several persons of eminence, and particularly by bishop Warburton, who, in his "Divine Lyegation," speaks of it as containing "the justest and precise notions of God and the Soul," and "as one of the most finished of the kind, that the present times, greatly advanced in true philosophy, have produced." Of the author's sentiments, see some account under the articles DREAM, SOUL, and *Vis Inertiae*. In 1741 Mr. Baxter went abroad with one of his pupils, and settled for some time at Utrecht, where he became acquainted with several literary persons, and whence he made several excursions into Flanders, France, and Germany. Upon his return to Scotland in 1747, he resided till his death at Whittingham, in the shire of East Lothian. His work entitled "Matho, five Cosmotheoria Puerilis," was drawn up for the use of his pupils, and first printed in Latin, and afterwards greatly enlarged, and published in English, in 2 vols. 8vo. The second edition of this work was published in 1745, and the third in 2 vols. 12mo. in 1765. The design of this work was to deduce the principles of natural religion from the phenomena of the material world. A mistake in the astronomical theory, which the author did not live to rectify, as he had intended, had disgusted some readers; and therefore, in the third edition, the conference that was chiefly affected by that error, was suppressed, and the vacancy supplied by another. In 1750 the author published "an Appendix to the first part of his Enquiry into the Nature of the Soul," vindicating it from some objections, which was dedicated to Mr. Wilkes, with whom he formed an intimate acquaintance abroad. In this year Mr. Baxter, after having endured great sufferings from the gout, and a complication of disorders, with exemplary patience, closed his life about the sixty-third year of his age. He left behind him several unfinished MSS. on philosophical subjects, and one in a complete state, concerning the controversy between the English and foreign philosophers on the subject of the force of bodies moving in free spaces, which however was never published.

Mr. Baxter's learning and talents are sufficiently displayed in his writings. His application was such, that he sometimes sat up whole nights reading and writing: and yet his disposition was cheerful and sociable. In conversation he was modest and unassuming; and in the discharge of the social and relative duties of life, his conduct was exemplary. His mind was possessed with the most reverential sentiments of the Deity, and the general tenor of his life was conformable to the rules of virtue. He was economical without parsimony. Such was his disinterestedness, that he declined considerable offers of preferment, which he might have obtained if he had taken orders in the church of England. His knowledge of the modern languages was extensive; so that he could write and speak in French, German, Dutch, Italian, and Spanish. By his wife, whom he married in 1724, and who survived him ten years, he had one son and three daughters. Biog. Brit.

BAXTERIANS, in *Ecclesiastical History*, derive their appellation from Mr. Richard Baxter, a nonconformist minister; of whom we have already given an account. His theological system has been called Baxterianism; and those who embrace his sentiments in divinity, are called Baxterians. The Baxterians have endeavoured to strike into a middle path between Calvinism and Arminianism; and to unite both these schemes. They profess to believe in the doctrines of election, effectual calling, and other tenets of Calvinism; and consequently, suppose, that a certain number,

determined upon in the divine counsels, will infallibly be saved. This they think necessary to secure the ends of Christ's interposition. But then, on the other hand, they reject the doctrine of reprobation, and admit that our blessed Lord, in a certain sense, died for all; and that such a portion of grace is allotted to every man, as renders it his own fault, if he doth not attain to eternal happiness. If he improves the common grace given to all mankind, this will be followed by that special grace which will terminate in his final acceptance and salvation. Whether the Baxterians are of opinion, that any besides the elect, will *actually* make such a right use of common grace as to obtain the other, and, at length, come to heaven, we cannot assuredly say, there may possibly be a difference of opinion upon the subject, as they approach nearer to Calvinism or Arminianism. Mr. Baxter appears, likewise, to have modelled the doctrine of justification, and the perseverance of the saints, in a manner which was not agreeable to the rigid Calvinists. Some foreign divines in the 17th century struck nearly into the same path; and, particularly, in France, M. le Blanc, Mr. Cameron, and the celebrated Monf. Amyraut. For a considerable time the non-conformist clergy in England were divided into scarcely any but two doctrinal parties, the Calvinists and the Baxterians. Of late the Baxterians have been less numerous. However, they are still a considerable body; and several persons are fond of the name as a creditable one, who probably go farther than Mr. Baxter did. The name, however, like other theological distinctions, will probably, in a course of time, sink into disuse, till it is either wholly forgotten, or preserved merely in the records of history. Biog. Brit. Art. BAXTER.

BAY, in *Botany*. See LAURUS.

BAY, *Loblolly*. See GORGONIA.

BAY, *Rose*. See NERIUM.

BAY, *Dwarf Rose*, and *Mountain Rose*. See RHODODENDRUM.

BAY, *Sweet Flowering*. See MAGNOLIA.

BAY *Plum*. See PSIDIUM.

BAY, in *Building*, denotes any kind of opening in walls; as a door, window, or even chimney.

BAY *windows* are the same with what we otherwise call *bow windows*.

BAY, in *Geography*, denotes a little gulf, or an arm of the sea, stretching up into the land; being larger in the middle within, than at its entrance, which is called the *mouth of the bay*. The largest and most remarkable bays are those of Biscay, Bengal, Hudson's, Panama, &c.

BAY of *All Saints*. See ALL SAINTS.

BAY of *Antngil*. See ANTONGL.

BAY, *Baffin's*. See BAFFIN.

BAY of *Cancalle*. See CANCALE.

BAY, *Chequitan*. See CHEQUITAN.

BAY of *Chesapeake*. See CHESAPEAKE.

BAY of *Fires* lies on the east coast of New South Wales or New Holland, in the Pacific ocean, to the north of St. Patrick's Head. The north point of the bay is called Edystone, and the south point St. Helen's. A small rocky island is near the middle of its entrance, on each side of which is an open passage.

BAY of *Fresh Water*, lies south of Afsension bay in the north part of the gulf of Mexico. N. lat. 30°. W. long. 93°.

BAY of *Fundy*. See FUNDY.

BAY of *Good Fortune*, lies on the north coast of Chaleur bay, which is a large bay of the gulf of St. Lawrence, and on the north east coast of Nova Scotia in North America.

BAY, *Hudson's*. See HUDSON'S.

BAY of *Inlets*, a bay on the south east coast of New Holland,

land, between cape Palmerston and cape Townshend. S. lat. 21° 30'. to 22° 30'. W. long. 209° 36. to 210° 40.

BAY of Islands lies on the coast of Nova Scotia, on the continent of North America, about 6 leagues south-west from cape St. Mary.

BAY of Islands is also a bay on the northern island of New Zealand in the south Pacific ocean, lying on the north-east coast between cape Brett and cape Pocke. This bay is large and deep, and has many small islands in it. The best entrance into the bay is on the west side; within it are several lesser bays. S. Lat. 35 12'. E. long. 174° 57'.

BAY of Islands is also a bay on the south coast of the straits of Magellan, towards the western entrance, W. by N. from Upright bay, and E. by S. from the bay of Disappointment. A cluster of small islands lies in the entrance, and in the east part of the bay; but the best entrance is between the westernmost of the two islands off the point of Cape Upright, and a small island further west, where a ship may have safe passage, and anchor in 20 fathoms in soft mud, near the west coast of the cape, in S. lat. 53° 9'. W. long. 75° 32'.

BAY of Isles is an extensive bay of the gulf of St. Lawrence, on the west coast of Newfoundland, about 8 or 9 leagues to the S. W. from la Belle bay, and 14 or 15 leagues to N. N. E. from Port-a-port. The centre of the bay lies in about N. lat. 49 5. W. long. 58° 15'.

BAY of Isles is also a bay situate towards the west end of the north coast of South Georgia island, in the south Atlantic ocean.

BAY of St. Louis, lies on the Labrador coast, and has cape St. Louis on the north, and cape Charles on the south. It has many small islands; the largest of which is Battle island, in the mouth of the bay. The middle of the bay is in N. lat. 52° 23'. W. long. 55° 23'.

BAY de Roche Fende, lies on the west side of Lake Champlain, and the state of New York, 17 miles above Crown-point.

BAY of Rocks is a spacious bay of the Arabian sea, which forms a part of the Indian ocean, and lies on the south-east coast of Arabia, with good anchorage for ships.

BAY of Seven Islands lies W. N. W. from Moisie river, and about 18 leagues to N. N. E. from Trinity point, on the north shore of the gulf of St. Lawrence.

BAY of Shoals. See *BAXAS Babia*.

BAY of St. Spirit, is a large bay of the Indian ocean, on the south-east coast of Africa, on the north of the island and cape of Ubasia. It is sufficiently spacious to receive a fleet of ships, and is so called from the river St. Spirit, or Mamea, which falls into this bay.

BAY, among *farmers*, is that part of the barn where the snow is laid.

BAY, in *Hydrostatics*, signifies a pen, or pond-head, made up against a height, to keep in a store of water for driving the wheels of a mill, or turning of a non-mill, by the stream that comes thence through a passage, or flood-gate, called the *pen-still*.

BAY colour, in *Metallurgie*. The word *bay* is formed from the *Ind. shans*, or *ladius*, and that from the Greek *bay*, a palm-branch, so that *bay* or *bay* properly denote *dark plumbeous*. Hence called, among the ancient, that colour which the horses were denominated *qui palati*.

The bay is the most ideal colour among horses. It is a strong and perhaps irremovable character in this colour to be attended with a black ear, and tail, which though but or any other colour that approaches it near it. The bay is also most frequently attended with black legs, and feet up to the knee and hock: the feet, however, are often varying to the white in horses of this colour, and is not with us esteemed so handsome as when entirely black. There are

several kinds of bays, as light bay, dark bay, brown bay, golden bay, dappled bay, &c.

BAY à miroir, the same as *DAFFLE bay*.

BAY, among *sportsmen*, is applied to flags, boars, foxes, &c. and also to dogs when they turn head against one another. Thus when a stag has been so long pursued, that he is almost exhausted, he turns round, and facing the hounds, defends himself with his antlers, and keeps the hounds at bay, till the sportsmen come up, draw off the dogs, and save his life. When a stag takes *foit*, that is, takes to the water, he will defend himself, and keep the hounds for a long time at bay, provided that he fathoms the lake or river so well as to keep the hounds swimming, without going out of his own depth, but if he is obliged to swim at the time, he *is up* or quite tired, and being surrounded by the dogs, he is inevitably drowned. In fox hunting, when the fox is supposed to have entered the earth, the place of his retreat is soon discovered by the terriers, "laying well at him," provided he has not *turned* in the earth; but if he has, the terrier and the fox are face to face, and are both baying, or keeping each other at bay; and the contest terminates with *digging out* the fox.

BAY salt. See *SALT*.

BAY yard, is a denomination sometimes used promiscuously with *woollen yarn*. 10 and 11 W. III. c. 10. 5 G. II. c. 21. See *YARN*, &c.

BAYA, in *Geography*. See *BATA*, and *BAYJA*.

BAYA, low, marshy land on the Gold coast of Africa, without any towns or people near the shore; 4 leagues W. S. W. from the river Volta, and 8 leagues E. and E. N. E. from Ningo ground.

BAYA, in *Ornithology*, Indian grosbeak, or *Loxia Indica*, is rather larger than a sparrow, with yellow brown plumage, a yellowish head and feet, a light-coloured breast, and a conic beak, very thick in proportion to his body. This bird is very common in Hindoostan; and is described as surprisingly sensible, faithful, and docile; never voluntarily deserting the place where its young are hatched, not averse from the society of mankind, and easily taught to perch on the hand of his master. In a state of nature the baya builds his nest on the highest tree which he can find; generally on the palmyra or Indian fig-tree, preferring that which overhangs a well or rivulet, forming it of grass in the shape of a large bottle, suspending it on the branches so as to be firm and yet to rock with the wind, and placing it with its entrance downwards, to secure it from birds of prey. This bird is taught with ease to fetch a piece of paper, or any small thing which his master wants. If a ring be dropped into a deep well, and a signal given to the bird, he will fly down with astonishing celerity, and bring it up to his master with apparent exultation; and it is confidently asserted, that if a house or any other place be shewn to him once or twice, he will carry a note thither immediately, on observing a proper signal. They are also trained by the youthful libertines of Bunnars to pluck off the pieces of gold called *ticas*, placed by way of ornament between the eye-brow of their mistress, which they bring in triumph to their lovers. The baya's natural food is grasshoppers and other insects; but it subsists, when tame, on pulle macerated in water. The female lays many beautiful eggs, resembling large pearls: their white, when boiled, is transparent, and the flavour of them is exquisitely delicate. Asiatic Researches, vol. ii. p. 109.

BAYAGARES, in *Geography*, a town on the island of St. Domingo.

BAYAMO, called also *St. Salvador*, a town in the eastern part of the island of Cuba, having the town of Almo to the west, and St. Barbara to the south. It lies on the east side

of Estero river, about 20 miles from the sea; and it gives name to a channel, that runs between the numerous small islands and rocks, called "Jardin de la Reyna, or Queen's gardens," on the north-west, and the shoals and rocks that line the coast on the south-east side of it, from the bold point called Cabo de Cruz.

BAYARD, or BAIARD, in some *Old Writers*, is an appellation for a horse. Hence the phrases, blind bayard, bayard's watering, bayard's green, &c.

BAYDER, in *Geography*, a small town of the Crimea or Taurida, which gives name to the delightful valley, called by the natives the "Tauric Arcadia," the "Crimean Tempe," &c. which is watered by two gentle murmuring streams. It is of an oval form, about 20 miles long, and surrounded by high mountains, covered with beautiful woods, intermixed with odoriferous flowering shrubs. It contains a number of Tartar villages, romantically situated and inhabited by the families of shepherds and husbandmen.

BAYDER, *Cape*. See BAJADOR.

BAYEN, PETER, in *Biography*, a French chemist, was born at Chalons in 1725. In 1749, he served under Charas in pharmacy. He gave analyses of the mineral waters of France; and he wrote memoirs on marbles, serpentine stones, porphyries, granites, jaspers, schists, and iron spar. He doubted the existence of the phlogiston of Stahl; and by operating on mercurial precipitates, he found that what are called metallic oxides owe their state, when obtained by calcining metals, to the absorption of one of the constituent ingredients of atmospheric air. This chemist also discovered the fulminating property of metals, when mixed with a very little sulphur; and he shewed that tin was not necessarily contaminated by arsenic; that what is used by potters contains copper and antimony, by which it is rendered hard; zinc, by which it is whitened; bismuth, by which it is rendered sonorous; and lead, in order to diminish the price. Bayen died at the age of 72 years. *Mem. de l'Institut. National, &c. vol. ii.*

BAYER, GOTTLIEB SIEGFRIED, a celebrated philologist, was born at Konigsberg, in Prussia, in 1694, and studied, chiefly, the languages, first in his native city, and afterwards at Dantzig, Berlin, and Leipsic; at which latter place he took the degree of master of arts in 1717. On his return to Konigsberg in the following year, he was appointed librarian of the public library. In 1726 he removed to Petersburg, became professor of the Greek and Roman antiquities in the Academy of Sciences, and acquired an extensive knowledge of the Chinese and other Asiatic languages. In 1730 he was chosen member of the Academy of Sciences at Berlin; and in 1731 invited to be professor of eloquence at Halle; which he was not allowed to accept, but continued in Russia with a considerable increase of salary. He died at Petersburg in 1738. His numerous dissertations on different subjects are inserted in Lillenthal's "Select. Histor. & Liter." the "Acta Eruditorum," and the "Comment. Acad. Petropol." &c. His "Museum Sincicum," published in 1732, in 2 vols. 8vo. is a work of great learning and ingenuity. *Gen. Biog.*

BAYER, JOHN, a German astronomer, flourished at the close of the 16th and commencement of the 17th centuries; but the time and place of his birth are not ascertained. Some have supposed that he was the grandfather of the subject of the preceding article, and that he was born at Augsburg. It was at Augsburg, however, that he published, in 1603, his excellent and useful work, entitled "Uranometria." This is a large celestial atlas, consisting of folio charts of all the constellations, with a nomenclature, collected from all the tables of astronomy, ancient and modern,

improved by his own useful invention of denoting the stars in each constellation by Greek letters, in alphabetical order according to the magnitude of each. The stars are thus as easily distinguished as if each of them had an appropriate name; and the utility of this mode of classification has been so much approved, that it has been retained, since Bayer's time, in all the atlases, catalogues, and celestial globes through the scientific world. This valuable work was gradually improved and augmented by the author himself. In the year 1627 Julius Schiller, a civilian, projected by the suggestion of Bayer, and published his *Uranographia*, under the title of "Cælum Stellatum Christianum;" in which he rejected the heathen names, characters, and figures of the constellations, and inserted in their stead others taken from the scriptures. Accordingly he placed the twelve apostles in the zodiac; and he deduced the southern constellations from the Old Testament, and the northern ones from the New Testament. This innovation, however, tended to embarrass astronomers, and was never adopted. The ancient names were therefore restored in the later editions of the *Uranometria* of 1654 and 1661. Montucla, *Hist. des Math. tom. ii. p. 333.* See CATALOGUE.

BAYERSDORF, in *Geography*, a town of Germany, in the circle of Franconia, and principality of Bayreuth, seated on the Rednitz, with a tribunal of justice and a large synagogue; 4 miles north of Erlang.

BAYETTE, in *Ichthyology*, a French name of the species of *Silurus* observed by Sonnini in the Nile, and figured pl. 27 of his "Voyage en Egypte." It is the same kind which Forskall calls *Silurus bajad*. It grows to a large size, but its flesh is not much esteemed.

BAYEUX, in *Geography*, a town of France, and principal place of a district, in the department of Calvados. Before the revolution it was the capital of Bessin, in the province of Normandy, the seat of a governor and the see of a bishop, whose diocese included 611 parishes. The cathedral is much admired. The principal commerce is leather. It is seated on the river Aure, about 4 miles from the sea. The place contains 9970 and the canton 15,261 inhabitants, in a territory of 80 kilometres, including 19 communes. N. lat. 49° 16' 30". W. long. 0° 42' 51".

The celebrated tapestry of Bayeux, which still exists, and is publicly exhibited at stated periods in the cathedral of the city, is a very curious monument of the state of the art of embroidering at the time of the Norman conquest. It is a web of linen, nearly two feet in breadth, and 442 in length, embroidered with the history of that memorable expedition, from the embassy of Harold to the Norman court in 1065, till his death in the following year. The scenes of this busy period are successively exhibited, and consist of many hundred figures of men, horses, beasts, birds, trees, houses, castles, and churches, with inscriptions over them explanatory of their meaning and history. This work is understood to have been performed under the direction of Matilda, consort to William I. and was not improbably executed by the hands of English women, whose superiority in performances of this kind was then universally acknowledged. The entire contents of this tapestry are represented in a series of engravings, which may be seen in Montfaucon, tom. 1 & 2; and Ducarel, *Anglo-Norman Antiquities*, App. No. 1.

BAYF, or BAIF, LAZARE DE, in *Biography*, was the son of a gentleman of Anjou, and having studied under Budæus and others, he pursued the profession of the law at Paris; and afterwards travelled into Italy, and learned Greek under Musurus, a Candiote, at Rome. Upon his return he devoted himself to literature, and retired to his own estate at Arjou. In 1531 he was sent by Francis I. as ambassador to Venice;

in 1539 he was deputed on public business to Germany; and after his return was made master of requests, and had also the abbacies of Grenetiere and Charroux. The precise time of his birth and death is unknown. As a writer he seems to have been the first who introduced the Greek tragedy among his countrymen, by his translations of the "Electra," of Sophocles, and the "Hecuba," of Euripides, into French verse. He was also the author of two learned treatises, "De re veterinaria, et de vniculis," Basil, 1526, 4to. and "De re Navali," Par. 1536, 4to.; and he translated some Lives of Plutarch. *MORRI.*

BAFF, *JAN ANTHONY.* See BAIF.

BAYJA, BAJA OR BAIA, in *Geography*, a town of Africa, in the kingdom of Tunis, not far from the frontiers of the Algerines, is supposed to be the ancient "Vacea" of Sallust, the "Oppidum Vagense" of Pliny, and the "BAFA" of Plutarch; and it is at this day, as it was formerly, a place of great trade, being the chief mart of the whole kingdom, particularly for corn, which is supplied in such abundance by the plains of Busdera, along the banks of the Mejerda, that the Tunisiens say proverbially concerning it, that if there was another such town for plenty of corn, it would become as common and cheap as sand. It has also every summer a public fair, to which the most distant Arabian tribes resort with their flocks, their manufactures, and their families. However, the inhabitants, subject to the oppressive exactions of government, and the frequent incursions of the Arabs, who are numerous and powerful in its vicinity, are extremely poor, and a great part of their ground remains uncultivated. It is seated on the declivity of a hill in the road to Constantina, about 10 leagues from the northern coast, and 36 W.S.W. from Tunis; and has the convenience of being well watered. On the summit of the hill is a citadel of no great strength. The walls, which are raised out of the materials of the old Roman Vacea, are still entire, and have some ancient inscriptions. N. lat. 36 42'. E. long. 9 25'. *Shaw's Travels*, p. 92.

BAYLE, *Pierre*, in *Biography*, an eminent critic and philosopher, was the son of a protestant minister at Carla, in the county of Toix in France, where he was born in 1647. Whilst he pursued his studies, first under his father, and afterwards in the protestant academy at Puy-laurens, whither he was sent in 1666, his application was so intense and unintermitting as to injure his health. His reading was very extensive; but his favourite authors were Plutarch and Montaigne. From Puy-laurens he removed in 1669 to the university of Toulouse, with the hope of enjoying superior advantages for improvement, and of making more rapid progress. Here he attended the philosophical lectures that were read in the college of the Jesuits; and his disputes with a parish priest, who lodged in the same house with him, first led to increase the scruple which he had already begun to entertain against the protestant religion, and at length to induce him to avow himself a Roman Catholic. The change of opinion, which seemed to be on his part the result of inquiry and of conviction, although produced by arguments which his more exacting mind would discover to be inadequate, manifested an integrity of mind. However it so grieved and offended his father, that he withdrew from him the necessary means of subsistence. In these destitute circumstances, he was miraculously relieved by the bishop of Rieux, who must unquestionably have been gratified by the accession of such a convert. Upon further inquiry Bayle found, that he had been too precipitate in abandoning his religion; and he therefore determined to leave Toulouse after having continued there about eighteen months, and to renounce the errors into which he had been betrayed. Having made his abjuration in the presence of his eldest

brother and some other ministers, he immediately set out for Geneva, in order to prosecute his studies. Here he soon found reason for relinquishing the philosophy of Aristotle, to which he had been zealously attached, and to adopt that of Descartes. His reputation introduced him to an acquaintance with several persons of eminence at Geneva, and particularly with Mr. James Basnage; between whom and Bayle an intimate friendship subsisted as long as they both lived. At this time Bayle acquired the means of support by private tuition; but dissatisfied with this mode of life, which did not suit the independence of his spirit, nor correspond to his desire of further improvement, he wished to exchange it for some situation better adapted to his genius and views. After a few years employed in this way an opportunity offered for gratifying his wishes. In the spring of 1675 he removed to Paris, and undertook the tuition of Messrs. de Beringhen, brothers to a counsellor in the parliament of Paris. From this city, however, to which his wishes had been directed, he soon removed, at the desire of his friend Mr. Basnage, in order to offer himself as a candidate for the vacant professorship of philosophy in the protestant university of Sedan. His views were favoured by Mr. Jurieu, the professor of divinity, who favoured Bayle, partly because he was anxious to exclude another candidate. Bayle evinced a decided superiority to the other competitors in a public disputation, and having secured his election, began his lectures, Nov. 11, 1675. By the assiduity with which he discharged the duties of his public office, and by the amiable temper which he manifested in private life, he gained great reputation, and many friends at Sedan; and he devoted his hours of leisure to compositions of the critical kind, which habituated him to that accuracy and depth of reasoning, that afterwards constituted his distinguishing excellence. The first work, which he committed to the press, was his Observations on the canon that made its appearance in December 1680; the first edition of which was printed at Rotterdam in 1682, without a name, and under the assumed character of a Roman catholic, under the title of "Lettre a M. L. A. D. C. docteur de Sorbonne," &c. and Cologne was the pretended place of publication. In this treatise, afterwards called "Pensées sur la Comete," &c. many delicate questions are discussed, relative to supposed miracles wrought, and prefaces given among the heathens, to the comparison of the mischiefs of atheism with those of idolatry, and to other points which afforded a range to the author's spirit of free inquiry. In 1681 the university of Sedan was suppressed by an arbitrary edict of Lewis XIV.; and Mr. Bayle, deprived of his professorship, was reduced to the necessity of seeking some new employment. At this time, the magistrates of Rotterdam established a "Schola Illustris;" and Bayle was appointed professor of philosophy and history; and at his recommendation Jurieu was engaged as professor of divinity. In December 1681, Bayle entered on his new office. In the next year he published a criticism on Maimbourg's "History of Calvinism," in the form of letters, under the title of "Critique Generale de l'Histoire du Calvinisme de M. Maimbourg." This work written in a lively manner, and with a vein of railery, was read with pleasure by persons of the reformed religion, and it was particularly agreeable to the prince of Condé, who was no friend to Maimbourg. Although it was publicly condemned at Paris, it became popular in Holland, and a new edition of it, with enlargements, was speedily published. Jurieu had also published a refutation of Maimbourg; but being much less popular than Bayle's, the author began to regard his brother professor with a considerable degree of jealousy.

jealousy. In 1684 Mr. Bayle was induced, by the freedom of the press in Holland, to print several controversial works, that were sent him from France; and particularly "A collection of some curious pieces relative to the philosophy of Descartes," with a preface, giving an account of these pieces, and containing some reflections on the inquisitorial power exercised in France over books on scientific topics. In this year he began his monthly literary journal, entitled "Nouvelles de la Republique des Lettres," which was written in a manner that served not only to support, but to increase the reputation which he had already gained. About this time he declined an offer of the professorship of philosophy at Franeker, though it was proposed very much to augment the salary which he received at Rotterdam. His "Nouvelles Lettres de l'Auteur de la Critique generale de l'Histoire du Calvinisme de M. Maimbourg," which was a continuation or second part of his former work, and printed in 1685, excited much less attention than the first. Having given an opinion in favour of M. Malebranche in his account of Arnauld's book written against him, he was engaged in a dispute with the latter; and in 1686 he had a correspondence with Christina, queen of Sweden, concerning a letter of her majesty's, which he had mentioned in his journal, and which condemned the persecution suffered by the protestants in France. This letter, he had said, was "the remainder of the Protestant religion in her." This expression had given some slight offence to the queen, and Bayle addressed to her a letter of apology. In an ample reply the queen declared her satisfaction with his excuses; and adds, "I will lay a penance upon you which is, that for the future you send me all the curious books, in French, Latin, or Italian, upon all kinds of sciences and all sorts of subjects, provided they be worth reading." Her majesty made no exception of romances or fables, and particularly requested books of chemistry, and the author's journal. Bayle was much affected by the revocation of the edict of Nantes, and the cruelties exercised against the protestants in France for the purpose of inducing them to abjure their religion. Upon this conduct he made some just and pointed reflections in his journal; and in 1686, he published a pamphlet, entitled, "Ce que c'est que la France toute Catholique sous le regne de Louis le grand," or, a character of France, become entirely catholic under Louis the great. It was published without his name; and contained very severe censures on the treatment which the protestants received, as well as on the iniquity and folly of all attempts to procure conversion by force. This was soon followed by his famous work, intitled, "Commentaire Philosophique," &c.; or, a Philosophical Commentary on the words "Compel them to come in." This work was an elaborate defence of toleration, which formed the first part of it; and in the second the author answers all the objections against it. It was followed in the next year by a third part, containing a confutation of St. Augustin's apology for persecution. The free sentiments expressed in this work gave offence to Jurieu; and though he was ignorant of the author, who had taken pains to conceal his name, he wrote a treatise against it. Bayle's health was so much impaired by the application devoted to the composition of his commentary, and probably also by the vexation occasioned by his controversy relating to queen Christina, that he found it necessary to discontinue his literary journal, in the conduct of which he had obtained numerous testimonies of approbation, not only from private persons, but from several societies of learned men, and particularly from the French Academy and the Royal Society of England. His situation also at Rotterdam became unpleasant to him, on account of

the quarrelsome disposition of Jurieu and some other circumstances; and he wished to leave it: but disappointed in his views of a removal to Berlin, he was under a necessity of continuing at Rotterdam. In 1688, Bayle published a fourth part of his philosophical commentary, in which he examined and confuted the persecuting principles maintained by Jurieu in his two treatises intitled "Vrai Systeme de l'Eglise," and "Droits des deux Souverains." Another circumstance also occurred which served to widen the breach between them. Jurieu, in his interpretation of some of the scripture prophecies, had presaged the approaching triumph of the protestants in France, and he had published some free opinions, with a view of preparing the people for this great revolution, on the right of subjects to resist by force of arms the tyranny of sovereigns over their consciences. Among other books that were written in order to counteract the effect of Jurieu's publication, the most remarkable was a treatise, intitled, "Avis aux Refugiez," or Important Advice to the Refugees, concerning their approaching return into France, and printed in 1690. The author personated a catholic, and his name was concealed; but Jurieu, attributing it to Bayle, was much incensed, and took occasion to attack his religious and political character, publicly accused him before the magistrates of Rotterdam, and attempted to get him dismissed from his professorship. Bayle made a spirited defence, and his cause was espoused by several able writers. The magistrates conducted themselves with impartiality and moderation; and the dispute subsided. Although Mr. Bayle denied his having been the author of the above mentioned treatise, there is reason to believe that the suspicions and charges of Jurieu and others were not unfounded. Bayle had been accustomed to write under fictitious characters, and on opposite sides of the same question; and this is a circumstance which has been alleged, and not without reason, against his character. Besides, it is not unlikely that national prejudice and early attachment might have induced him to vindicate the rights and interests of the French monarchy. However this be, he was afterwards suspected of being concerned in an intrigue to bring about a separate peace between France and the United States; and king William, dreading the consequences of this project of peace, gave orders to the magistrates of Rotterdam to deprive him of his professorship and of his pension. This event took place in November 1693; and Mr. Bayle, declining offers that were made him of entering into new engagements, lived in retirement.

The project of his "Critical Dictionary" had been announced in 1690: and in 1692, his plan, under the title of "Projet et Fragmens d'un Dictionnaire Critique;" but as it was disapproved by the public, he commenced the work, as it has since appeared, on a new plan. Accordingly the first volume appeared in August 1695. Such was the favourable expectation entertained concerning this work, that the duke of Shrewsbury, an English nobleman, distinguished by his talents as well as by his high rank and employments, expressed a wish to have it dedicated to him, and by means of Mr. Bafnage offered Bayle 200 guineas as an acknowledgment for this distinction. Mr. Bayle declined the offer, and maintained his independence. The second volume, which completed the first edition, though it has since appeared in a more enlarged form, was printed in 1697; and the sale of the whole was uncommonly rapid and extensive. Whilst Bayle professed to supply the numerous defects of Moreri's dictionary, and to correct its errors, it seems to have been his real purpose "to make his dictionary a kind of common place for all the critical and philosophical knowledge, all the curious information as to fact, and all the subtlety of

argumentation he had spent his life in acquiring." The text is concise; but the notes, which contain much valuable information, are spun out to a tiresome and uninteresting length. This dictionary, generally so well received, and containing a variety of unexceptionable matter, displayed freedoms of several kinds, both as to sentiment and diction, which were not likely to escape censure. Jurieu, the avowed and implacable antagonist of Bayle, attacked it from the press, and endeavoured to procure its condemnation from the ecclesiastical assemblies. The consistory of the Walloon church of Rotterdam contented itself with the detail of several objections against particular articles, for which indeed no satisfactory apology can be offered; but satisfied with Mr. Bayle's promise of amendment in a second edition, they proceeded no further. In 1702, Mr. Bayle published a second edition, with many additions. In the following year he wrote a volume entitled, "Réponse aux Questions d'un Provincial," containing an entertaining and instructive variety of historical, critical, and literary observations, to which he added a second and third volume in 1705, and a fourth in 1706. In 1704, he published "A Vindication of his Thoughts on Comets," which involved him in new disputes, particularly with the ingenious and learned Le Clerc. With his fame his adversaries multiplied; and attempts were made to prejudice lord Sunderland, the English minister of state, against him, and to procure his exclusion from the United States, as a man who was not only an enemy to religion, but chargeable with treason against the government. The storm, however, was diverted by the influence of lord Shaftesbury. He was offered at this time a liberal provision and hospitable refuge by several persons of distinction in England; but he declined all these generous proposals. The decline of his health made him averse from changing his situation; and towards the close of the year 1706, he was reduced by a pulmonary disorder, which was hereditary, to a very weak state. The approaches of death were regarded by him with philosophical firmness, nor did he intermit his literary labours to the last period of his life. In the morning of December 28, 1706, when his landlady entered his chamber, he asked her in a faint voice if his fire was kindled, and immediately expired; having attained the age of somewhat more than 59 years.

By his panegyrists, Mr. Bayle's talents, learning, and powers of reasoning have been unduly extolled; by his adversaries they have been no less unjustly degraded. M. le Clerc, who belongs to the latter class, and whose judgment is evidently biased by prejudice, has not allowed him the merit to which he is unquestionably entitled. He represents him as so ignorant of geometry, that, according to his own confession, he could never understand the demonstration of Euclid's first problem, and as having written in the latter period of his life against the evidence of mathematical demonstration. As a reasoner, he says, he had no settled principle, and he argued only with a design to puzzle the unlearned reader. His arguments, he adds, contain much more froth and empty words than sound reasoning. He was unacquainted with the books written in England upon experimental philosophy, and understood only a little of the philosophy of Des Cartes. He had perused only a few translations of English books upon metaphysical subjects. His knowledge of divinity was derived from his catechism, from sermons, or from a few French books. In ecclesiastical antiquity, and in that of Greece and Rome, he was indifferently skilled; law and physic were to him hidden treasures; and his knowledge of modern history was partial and imperfect. He had collected with great labour a thousand literary trifles and inconsiderable circumstances; and though he wrote in a very agreeable manner, it was only when he

was not in a passion. Saurin says of him, that he was one of those extraordinary men, whose opposite qualities leave room to doubt whether we ought to look upon him as the best or the worst of men. On the one hand, he was a great philosopher, knowing how to distinguish truth from falsehood, and perceiving at one view all the consequences of a principle and their connection; and on the other hand, a great sophist, confounding truth with falsehood, and deducing false inferences from his assumed principles. On the one hand, a man of learning and knowledge, who had read all that can be read, and remembered all that can be remembered; and on the other, ignorant, or feigning ignorance, with regard to the most common subjects, proposing difficulties which have been a thousand times solved, and urging objections which a school-boy could not make without blushing. On the one hand, attacking the most eminent men, opening a large field for their labours, and giving them a great deal of trouble to vanquish him; and on the other, using the worst authors, to whom he was lavish of his praises, and disgracing his works by such names (meaning probably Brantome and Rabelais) as a learned mouth never pronounced. On the one hand, free at least in appearance, from all the passions which are inconsistent with the spirit of Christianity, grave in his discourses, temperate in his diet, austere in his manner of living; and on the other, employing all the strength of his genius to overthrow the foundations of moral virtue, and attacking as much as lay in his power, chastity, modesty, and all the Christian virtues. On the one hand, appealing to the throne of the most severe orthodoxy, going to the purest springs, and borrowing his arguments from the least suspected writers; and on the other, following the paths of heretics, proposing again the objections of the ancient heresiarchs, lending them new arms, and collecting together in one age all the errors of past ages. The eloquent preacher closes this detail with the following benevolent wishes: "May that man, who had been endowed with so many talents, be acquitted before God of the ill use he made of them! May that Jesus, whom he so often attacked, have expiated his sins!"

Voltaire, speaking of his Critical Dictionary, says, "It is the first work of the kind in which a man may learn to think." He censures, however, those articles which contain only a detail of minute facts, as unworthy either of Bayle, an intelligent reader, or posterity. "In placing him," adds this author, "among the writers who do honour to the age of Louis XIV. although a refugee in Holland, I only conform to the decree of the parliament of Toulouse; which, when it declared his will valid in France, notwithstanding the rigour of the laws, expressly said, "that such a man could not be considered as a foreigner." "Without acourtry, or a patron, or a prejudice," says Gibbon in his "Miscellaneous Works," "Bayle claimed the liberty, and subsided by the labours of his pen." The inequality of his voluminous works is explained and excused by his alternately writing for himself, for the bookellers, and for posterity; and if a severe critic would reduce him to a single folio, that relief, like the books of the Sibyl, would become still more valuable. The ancient paradox of Plutarch, continues this writer, that atheism is less pernicious than superstition, acquires a tenfold vigour when it is adorned with the colours of his wit, and pointed with the acuteness of his logic. His "Critical Dictionary" is a vast repository of facts and opinions, and he balances the false religions in his sceptical scales, till the opposite quantities, adopting the language of algebra, annihilate each other. The wonderful power which he so boldly exercised of assembling doubts and objections had tempted him jocosely to assume the title of the *Uranographus*; *Ziv*; the cloud-compelling Jove; and in a conversation with

the ingenious abbé, afterwards cardinal, de Polignac, he freely disclosed his universal Pyrrhonism. "I am truly (said Bayle) a protestant, for I protest indifferently against all systems and all sects."

Upon the whole we may observe, that in private life Mr. Bayle was sober and temperate, modest and unassuming, disinterested and sincere. As a writer, his sentiments were fluctuating and sceptical, and he is not unjustly placed at the head of modern sceptics. Although he often takes pleasure in propagating his doubts, and perplexing his readers with a contrariety of opinions, yet he frequently combats hurtful prejudice and unwarrantable dogmatism. In many articles of his Dictionary, it does not appear to what country, sect, or persuasion he belongs; and this circumstance has been regarded by some persons as constituting a qualification for historical discussion. For the prudence of his ideas, for his notorious want of delicacy, and for his disposition to introduce offensive topics, his most partial advocates will find it difficult to devise an apology. The pernicious tendency of his sceptical system, with regard to religion and society, is well exposed by lord Lyttleton in his "Dialogues of the Dead," Dial. 24. Works, vol. ii. p. 315. "You have endeavoured," says this excellent writer, personating Locke, "and with some degree of success, to shake those foundations, on which the whole moral world, and the great fabric of social happiness, entirely rest; how could you, as a philosopher, in the sober hours of reflection, answer for this to your conscience, even supposing you had doubts of the truth of a system, which gives to virtue its sweetest hope, to impatient vice its greatest fears, and to true penitence its best consolations; which restrains even the least approaches to guilt, and yet makes those allowances for the infirmities of our nature, which the stoic pride denied to it, but which its real imperfection, and the goodness of its infinitely benevolent Creator, so evidently require?" As to his style of writing, it is natural and lively, but not always correct, and inclining to prolixity; and his manner is rather satirical and humorous, than inflammatory. The best editions of his Dictionary are those of 1720 and 1740. The English translation of Mr. de Maizeaux is reckoned a good one. A new and accurate translation of Bayle's dictionary is incorporated in the "General Dictionary, Historical and Critical," with reflections on such passages of Mr. Bayle, as seem to favour scepticism and the Manichee system. Maizeaux's Life of Bayle. Gen. Dict. Gen. Biog.

BAYLE, FRANCIS, many years professor in medicine and philosophy at Toulouse, and author of numerous learned and ingenious works, died September 24th, 1709, aged 87 years. The most esteemed of his productions are, "De Menstruis Mulierum," "Sympathia partium corporis humani cum utero, usu lactis ad tabidos," &c. Tolos. 1670. 4to. He attributes the menstrual flux to a fermentation occurring periodically in the mucous sinuses in the uterus, distending and opening their mouths, which collapse and close as soon as the fermentation subsides; a notion as philosophical as the periodical plethora of Friend. "Dissertationes physicae sex," Tolos. 1677, 12mo. The third dissertation is on physiognomy, in which the author had faith, as well as in the power of the imagination of the mother, in marking and mutilating the foetus in utero. "Discours sur l'expérience et la raison," Paris, 1675, 12mo. He here asserts the superiority of experience over theory in medicine. "Histoire d'un enfant qui a demeuré 25 ans dans le ventre de sa mère," Tolos. 1678, 12mo. The foetus was found uncorrupted, surrounded by a firm crust or shell. For the titles of the remainder of this author's works, which were collected and published in four volumes, 2to. in the year 1701, at Toulouse, see Hall. Bib. Anat. & Floy's Dict. Hist.

BAYLE, in *Fortification*, the space outside the ditch of our ancient fortresses, commonly surrounded by strong palisades, and sometimes by a low embattled wall.

BAYLY, LEWIS, in *Biography*, an English bishop in the reign of James I., was born at Carmarthen, in South Wales, and educated at Oxford. Being an eminent preacher, he was appointed one of the king's chaplains, and promoted to the see of Bangor in 1616. In 1621 he was committed to the Fleet, probably on account of his concern in prince Henry's match with the Infanta of Spain. He died in 1632, and was buried in the church of Bangor. This prelate was the author of a famous piece called "The Practice of Piety," which has been so popular that the edition of 1734 was the 59th. It was translated into Welsh and also into French in 1733; and a complaint was alleged against it, that the common people regarded its authority as equal to that of the Bible. Biog. Brit.

BAYNA, in *Geography*, a town of Hungary, in the Bodok district, the inhabitants of which are principally farmers and husbandmen.

BAYNES, a town of France, in the department of the Calvados, and chief place of a canton, in the district of Bayeux, $3\frac{1}{4}$ leagues W.S.W. of Bayeux.

BAYNET, a town and bay on the south side of the island of St. Domingo, $4\frac{1}{2}$ leagues from Petit Guave, on the north side of the island, and about 8 leagues west of Jackmel. N. lat. $18^{\circ} 17'$.

BAYON, a town of France, in the department of the Meurte, and chief place of a canton in the district of Lunéville, seated on the Moselle. The place contains 793 and the canton 7657 inhabitants, on a territory of 195 kilometres including 25 communes. N. lat. $48^{\circ} 30'$. E. long. $14^{\circ} 42'$.

BAYONA, a sea-port town of Spain in Galicia, situated in a small gulf, near the mouth of the Minho, with a convenient harbour. The coast near it abounds with excellent fish; and the land, watered by many springs, is fertile. N. lat. $42^{\circ} 15'$. W. long. $9^{\circ} 30'$.

BAYONA Bay and Islands, lie on the south part of the great bay of Vigo, and to the east of cape Paffelis, on the west coast of Spain, in the Atlantic ocean. The bay forms the harbour of the town of Bayona. The two islands are situated a little to the west of north from the town. They were anciently called "Insulae Deorum," or the isles of the Gods. A large rock, with many small ones about it, lies at the south end of Bayona islands.

BAYONET, in the *Military Art*, signifies a short broad dagger, used by all modern armies, since the sword has been laid aside, as a necessary appendage to the infantry. The origin of the term is not correctly known; but is most probably derived from having been first manufactured at the city of Bayonne, or originally invented by an engineer of that place.

Bayonets were formerly made with a round handle, adapted to the bore of a firelock, so as to be fixed there after the soldier had discharged his piece. They are now constructed with iron handles and rings which go over the muzzle of the firelock, and are screwed fast; thus enabling the soldier to fire and load with his bayonet fixed, and ready to act, if necessary, against horse. This is particularly of service to dragoons and fusileers, after they have expended all their powder and ball.

The use of the bayonet fastened on the muzzle of the firelock was a great improvement, first introduced by the French, and to which, according to the chevalier de Folard, (Comm. sur Polyb. vol. i. p. 135. edit Paris, 1727), they owed in a great measure their victories obtained in the war of 1689. To its neglect in the next war, the same writer attributes most of the losses they sustained. It is to marshal Catinat, the French are indebted for the great superiority they

they possess in the management of this weapon. During greater part of the seventeenth century, one-half of a battalion was armed with pikes, the other carried muskets; but the feeble effect of these last, and the frequent muzzling fire from the awkward use of matchlocks, suggested the improvement of firelocks with bayonets, which unite the two arms in the most effectual manner.

The battle of Maraglia, in 1693, was the first occasion on which Catinat put this improvement in practice, against the Spaniards and Savoyards. The French infantry marched boldly up to the enemy, received their fire, and without returning a shot, charged furiously with their bayonets. The slaughter was horrible, and the route of the allies complete. The same method was adopted by marshal Tallard at the battle of Spire in 1703: and by the duc de Vendôme at the battle of Calcinato in Italy, in 1705. On both occasions success was the same as in the former instances. Of late the bayonet has come into very general use; and battles of importance have been gained by it without the discharge of a musket. The late king of Prussia, although he relied greatly on the running fire which he taught his troops to practise with such terrible effect, yet highly recommended the charge with the bayonet as the most effectual means of throwing a wavering enemy into irreparable disorder.

But the French, whose natural genius seems particularly adapted to the use of this weapon, have not only invented, but have also employed it with the most astonishing success. In the last war, the favourite maxim of their generals, instead of losing time by cannonading, and firing on the enemy with musquetry, has been to bring the issue of the affair as early as possible to the point of the bayonet. The battles of Jemappe, Hagenau, and Ettingen, in particular, not to mention many others, were almost exclusively gained by it; and the Spaniards, throughout the dreadful contests between their own and the French forces, at the conclusion of the campaign of 1794, were uniformly defeated by the use of the bayonet alone.

BAYONNE, in *Geography*, a pleasant sea port town, on the western coast of France, in a corner of the bay of Biscay. It is the chief place of a district in the department of the lower Pyrenées, and situated at the conflux of the rivers Adour and Nive, about a league from the sea, with a good harbour, and having a narrow and dangerous entrance. The Adour divides the suburb from the citadel, and through the town itself flows the river Nive. A wooden drawbridge, which admits vessels to pass, connects the suburb with the town. The style of the buildings at Bayonne is principally Spanish, with balconies at every window, and arcades before the houses. From the "place de la Liberte," which is surrounded by very neat houses, and appears very gay, a gate leads to a pleasant promenade on the Adour. The trade of this town is very considerable, on account of its vicinity to Spain, and of the great quantity of wines which are brought hither from the adjacent country, and which the Dutch have been accustomed to take in exchange for spices and other commodities. Mails are also brought from the Pyrenées by means of the Nive, the Gave of Oleron, and the Adour, to Bayonne, whence they are shipped to Brest, and other ports. The common people generally speak the old biscayan or basque language. At Bayonne, and in the neighbouring country, the young women are very beautiful, combining with a tall slender shape great symmetry of features, a fair complexion, and black lively eyes. Before the revolution Bayonne was the see of a bishop, suffragan of Auch. In 1784, it was declared a free port. It is divided into the N. E. and N. W. cantons, the former containing 10,088 inhabitants in 5 communes, and the latter 10,750 in 4 communes. Each canton includes 65 kilometres.

The population of the place is said to amount to 13,190 persons. N. lat. $43^{\circ} 29' 21''$. W. long. $1^{\circ} 30' 6''$.

BAYS, in *Commerce*, a kind of coarse, open, woollen stuff, having a long knap; sometimes frized on one side, and sometimes not frized, according to the uses for which it is intended.

This stuff is without wale, being wrought on a loom with two treddles like flannel.—It is chiefly manufactured about Colchester, and Bocking in Essex; and in Flanders, about Lille and Tournay, &c.

This manufacture was first brought into England, together with that of says, ferges, &c. by the Flemings, who fled hither from the persecution of the duke of Alva, about the fifth year of the reign of queen Elizabeth, and had afterwards peculiar privileges granted them by the 12 Car. II. in 1660. The exportation of bays was formerly much more considerable than it is now, as the French manufacturers have learned to imitate them, and have set up manufactures of their own at Nismes, Montpellier, &c. However, a considerable quantity of bays is still exported to Spain, Portugal, and Italy. Their chief use is for the religious, and for linings in the army; the looking-glass makers also use them behind their glasses, to preserve the tin or quicksilver; and the case-makers to line their cases.

The breadth of bays is commonly a yard and half, yard and three quarters, or two yards; by forty-two, or forty-eight in length: those of a yard and three quarters are most proper for the Spanish trade.

BAYS, in *Geography*, a town of France, in the department of the Mayenne, and chief place of a canton, in the district of Mayenne, $3\frac{1}{2}$ leagues E. S. E. of Mayenne. The place contains 2,100, and the canton 14,470 inhabitants; in an extent of 192½ kilometres and 9 communes.

BAZA, or **BAZAR**, in *Commerce*, fine spun cotton, which comes from Jerusalem, whence it is also called Jerusalem cotton.

BAZA, in *Geography*, a town of Germany, in the duchy of Carniola, 7 miles S. S. W. of Feldes.

BAZA, or **Baça**, a town of Spain, in the province of Granada, between Guadix and Huescar, supposed to be the ancient Balthi. N. lat. $37^{\circ} 31'$. W. long. $2^{\circ} 31'$.

BAZADOIS, a district of the province of Guyenne, before the revolution, situated between Agenois, Condomois, and Guyenne. The soil is sandy and unproductive. The capital is Bazas.

BAZAR, or **BASAR**, in *Commerce*, a denomination among the Turks and Persians, given to a kind of exchanges or places where their finest stuffs and other wares are sold. They are also called *bez shins*.

The word bazar seems of Arabic, or rather of Persian and Turkish origin, where it denotes *sale*, or exchange of goods.

Some of the eastern bazars are open, like the market-places in Europe, and serve for the same uses, more particularly for the sale of the more bulky and less valuable commodities. Others are covered with lofty ceilings, or even domes pierced to give light; and it is in these the jewellers, goldsmiths, and other dealers in the richer wares, have their shops.

The bazar or maidan of Isphahan is one of the finest places in all Persia, and even surpasses all the exchanges in Europe; yet, notwithstanding its magnificence, it is excelled by the bazar of Tauris, which is the largest that is known, having several times held thirty thousand men ranged in order of battle.

At Constantinople there are the old and the new bazar, which are large, square buildings, covered with domes, and sustained by arches and pilasters; the former chiefly for arms, harnesses, and the like; the latter for goldsmiths, jewellers, furriers, and all sorts of manufactures. For an account of the bazars of Aleppo, see **ALEPPO**.

BAZAR, or **Bazaar**, a town of Hindoostan, 20 miles N. E.

of Attock, seated near the Indus, Nilab or Sinde river. N. lat. $33^{\circ} 45'$. E. long. $71^{\circ} 18'$.

BAZARUTO, or *Bocica islands*, lie off the south-east coast of Africa, in the Indian ocean, opposite to Asuca bay. S. lat. $21^{\circ} 55'$. E. long. $34^{\circ} 30'$.

BAZAS, a city of France, and principal place of a district, in the department of the Gironde, before the revolution the capital of Bazadois, and see of a bishop. It is seated on a rock. The place contains 4215, and the canton 9,862 inhabitants, in 13 communes and a territorial extent of 210 kilometres. N. lat. $44^{\circ} 26'$. W. long. $0^{\circ} 30'$.

BAZELLE, St., a town of France, in the department of the Lot and Garonne, in the district of Marmande, $\frac{1}{4}$ league N. W. of Marmande.

BAZGENDGES, in *Natural History*, the name of a substance used by the Turks, and other eastern nations, in their scarlet dyeing: they mix it for this purpose with cochineal and tartar, the proportions being two ounces of the bazgendges to one ounce of cochineal.

The bazgendges seem to be no other than the horns of the turpentine tree in the eastern parts of the world; and it is not only in Syria that they are found, but China also affords them. Many things of this kind were sent over to M. Geoffroy at Paris from China, as the substances used in the scarlet dyeing of that country, and they all proved wholly the same with the Syrian and Turkish bazgendges, and with the common turpentine horns. The lentisk or mastic tree is also frequently found producing many horns, of a like kind with these, and of the same origin, all being owing to the *puccerons*, which make their way into the leaves, and breed their young there. Reaumur's Hist. of Insects, vol. vi. p. 37.

BAZIEGE, in *Geography*, a town of France, in the department of the upper Garonne, and chief place of a canton, in the district of Villefranche, $\frac{1}{4}$ leagues S. E. of Toulouse.

BAZIN, NICCOLAS, in *Biography*, a French physician and corresponding Member of the academy of Sciences at Paris, graduated at Strasbourg, where he afterwards resided, and acquired considerable reputation as a practitioner in medicine, though his attention was principally turned to the study of natural history, which he enriched with the following valuable productions. "Observations sur les plantes, et sur leur analogie avec les insectes," Strasbourg, 1741, 8vo. He believed that plants respired, and that the juices absorbed by them for their nourishment were digested, or concocted in the root, prior to their distribution. "Histoire des Abeilles," 2 vols. 12mo. Paris, 1744. "Lettre au sujet des animaux, appellés polypes," 1745, 12mo. He died in March 1754. Hall. Bib. Bot. Eloy. Dict. Hist.

BAZIRA, in *Ancient Geography*, now *Bijore*, a district of a territory adjoining to the country of the Affaceni, or Affacani, corresponding to the present Sewad or Sowhad, between the rivers Bijore and Perjekoreh in Hindoostan. When Alexander had taken Massaga, the capital of the Affaceni, by assault, he summoned Bazira, the capital of the next adjacent territory; and the modern district of Bijore presents itself in a position that answers most unequivocally to that of Bazira; and the similarity of their names is no less striking. See *BIJORE*.

BAZIRGION, a town of Persia, in the province of Laritan, 57 miles east of Lar.

BAZIUM, a promontory of Egypt, on the western coast of the Red Sea. Ptolemy.

BAZOCHE, or *BASOCHE*, in *Law*, formerly a royal kind of jurisdiction exercised among the clerks of the palais, or courts of justice at Paris. It was administered in the name and by the authority of the king of *Bazoché, roi de la Bazoché*, by virtue of an ancient grant of the kings of France;

the elder among the clerks were the officers; and he who presided was the chancellor. This court only took cognizance of causes among the clerks, or between clerks and artificers for goods bought, or work done. The freedom they exercised with regard to private characters in their inquisition and remonstrances, occasioned several arrests to restrain their power, and prohibit their holding pleas without leave.

A collection of statutes, ordonnances, regulations, monuments, and prerogatives of the kingdom of Bazocne, was published at Paris in 1654, 8vo.

BAZOCHE, LA, in *Geography*, a town of France, in the department of the Eure and Loire, and chief place of a canton, in the district of Nogent le Rotrou, 5 miles S. E. of Authon.

BAZOCHE, *les-Gallerands*, a town of France, chief place of a canton, in the department of the Loiret; the place contains 1,046, and the canton 11,289 inhabitants, in 26 communes, and a territory including 305 kilometres.

BAZOCHE, *sur-Hoëfne*, a town of France, in the department of the Orne, and chief place of a canton, in the district of Mortagne, 9 miles N. W. of Argentan. The place contains 1,349 and the canton 7,229 inhabitants, in 14 communes, and on a territory of $122\frac{1}{2}$ kilometres.—Also, a town of France, in the department of the Aisne, and chief place of a canton, in the district of Soissons, 4 leagues E. of Soissons.

BAZOGE, LA, a town of France, in the department of the Sarthe, and chief place of a canton, in the district of le Mans, six miles N. of le Mans.

BAZOUGERS, a town of France, in the department of the Mayenne, and chief place of a canton, in the district of Laval, $2\frac{1}{2}$ leagues S. E. of Laval.

BAZOUGES LA PEROUSE, a town of France, in the department of the Ille and Vilaine, and chief place of a canton, in the district of Dol, $3\frac{1}{4}$ leagues S. S. E. of Dol.

BDELLIUM, *βδέλλιον*, an aromatic gum, brought from the Levant, of some use, both as a medicine and a perfume.

The word is supposed to have been formed of the Hebrew *בדלה*, *bedollach*, which the English translators render by the appellation *bdellium*. It is also written *bedellium*, *bedello*, *ptellium*, *petallium*, *megalium*, and *telinum*.

There is much uncertainty concerning both the plant and the place of its production, which is supposed to be in Africa. We find mention of the name both among the ancient naturalists, and in Scripture; but it is doubtful whether any of these be the same with the modern kind. As for the Scripture *bdellium*, we know very little of it. Moses describes manna as of the colour of *bdellium*; and Josephus explains the passage, by saying it is the gum of a tree resembling the olive tree; and that the manna wherewith the Jews were fed in the desert resembled this drug.—But Scaliger and others set aside this explication, and own they do not know what the *bdellium* mentioned in Scripture is.

The *bdellium* of the moderns is a gum-resin in irregular brittle masses, of a deep brown when broken, interspersed with more transparent parts; and mixed with small twigs and other accidental impurities. Its external appearance a good deal resembles myrrh. The smell of this gum-resin is somewhat fragrant, and its taste somewhat bitter and pungent. It grows soft and tenacious when chewed. It burns with ease, giving a fragrant smoke and a crackling noise. It is partly soluble in alcohol, and partly in water, or completely (the impurities excepted) in diluted spirit. By Neuman's experiments only about one-sixth is pure resin. The watery solution is sea-green, the spirituous red. Distilled with water it impregnates the liquid with its flavour, but it does not yield any sensible quantity of essential oil, when only a moderate quantity is used.

Bellium was formerly employed as a stimulating remedy, chiefly for external application, and is still retained in some of the warm plasters of the Paris dispensaries. It is entirely disused here, and seldom to be seen in the shops. It resembles myrrh in its properties, but less in degree, and is very deservedly neglected. Murray. Lewis. La Grange Elem. de Pharm.

BEACHY FORK, in Geography, a branch of Salt river, which rises in Nelson county, Kentucky, in America. On this river is found a fine clay, which it is thought might be manufactured into good porcelain.

BEACHY-HEAD, is a bold promontory which projects into the English channel on the Sussex coast, between Hastings and Shoreham. This commanding headland consists of alternate strata of chalk and flint; though the latter is only seen in thin layers or veins. "It is esteemed," says Camden, "the highest cliff of all the south coast of England;" and on its south side is a large semicircular intrenchment. It is divided into seven cliffs, and so called by France. The coast round this head is very dangerous in stormy weather, particularly when the wind sets in from S.S.E. or S.W. From this promontory to Arundel, the country along the coast rises into high hills, which are known by the name of South-downs, and celebrated for their sheep walks. Beachy-head is memorable for the defeat of the English and Dutch fleets near it by a superior force of the French, June 30th, 1690. N. lat. 50° 44' 30". E. long. 0° 19' 40". See EASTBOURNE.

BEACHY-HEAD, lies also on the eastern coast of South America, in Patagonia, about S.S.W. from Port Julian, and N.N.E. from cape Fairweather. S. lat. 50° 21'. W. long. 67° 40'.

BEACON, a signal for the better securing of the kingdom against foreign invasion.

Different methods have been taken in different countries, both anciently and of later ages, to convey the notice of any impending danger to distant places with the greatest expedition. But no kind of signals has more generally prevailed than that of fires in the night. That this was practised among the Jews we learn from the sacred writers. Hence the prophet Isaiah, in allusion to that custom, threatens them that they should be left "as a Beacon upon the top of a mountain, and as a sign on a hill." (chap. xxx. 17.) And in the like manner Jeremiah alarms them by saying, "Set up a sign of fire in Beth-haecem, for evil appeareth out of the north, and great destruction;" (chap. vi. 1.) And as to other countries, Aristotle de Mundo informs us, that these signals were so disposed on towers through all the territories of the kings of Persia, that in the space of twenty-four hours he could receive advice at Susa and Ecbatana, his two capital cities, of any contrivance or disturbance that might be raised in the most distant parts of his dominions. But the Greeks, as Theophrastus relates, made use of torches for fire, which by a different management served either to give notice of the approach of an enemy, or the arrival of a friend to their assistance. For as the scholiast says, in the former case "the torches were struck by those who held them, and in the latter they were kept steady." (lib. xi. c. v. lib. ii. c. xxii.) Among the Greeks they were called *πύρα*; and their use is particularly described in the Agamemnon of Æschylus. The like custom of nocturnal fires obtained also among the Romans, as appears from Cicero, when, speaking of the misfortune of Verres, when governor of Sicily, he says, "Non enim facta antea consuetudo erat prædiorum ad certum ignem, sed ignis e specula sublatum; sed statim ex ipso incendio navium, et calamitatem accipiant, et periculum iniqui-

um nuntiabat: (lib. v. in Verrem, § 91.) Wherefore signals of this sort are called by Pliny "ignes prænuntiativi" Nat. Hist. lib. xi. § 73.) which he distinguishes from the Phari, or light houses, that were placed upon the coasts for the direction of ships; the latter of which were constant, but the former only occasional.

Established signals were repeated, says Charnock, in his "Mine Architecture," by means of beacons or light-houses erected in proper positions, from mountain to mountain, through a chain of stations, which are said to have commanded an extent of more than 500 miles: so that even the inhabitants of Constantinople were capable of being informed, within the short space of a few hours, of any motions that might be attempted by their Saracen enemies in Parus.

In our own country, the name of beacon is derived from the Anglo-Saxon *becman*, to shew by sign or beckon. It was usually placed upon a high ground, and sometimes on a tumulus. From lord Coke we learn (Fourth Instit. c. xxv. p. 184.) that before the reign of Edward the third, beacons were but stacks of wood set up on high places, which were fired when the coming of an enemy was desiered; but in his reign pitched boxes were set up instead of them. In time of danger a watch was kept at them, and horsemen called hobbelars were stationed by most of them to give notice of an enemy's approach.

BEACONS are also marks and signs erected on the coasts, for the guidance and preservation of mariners at sea by night as well as by day. The erection of beacons, light-houses, and sea-marks, both for alarming the country in case of the approach of an enemy, and for the direction and safety of ships, is a branch of the royal prerogative. For this purpose the king hath the exclusive power, by commission under his great seal, to cause them to be erected in fit and convenient places, as well as upon the lands of the subject as upon the demesnes of the crown; which power is usually vested by letters patent in the office of lord high admiral.

Nevertheless it must be understood that the power of erecting beacons was occasionally given to individuals, and limited by grants from the crown, whence, or for some achievements performed in times of danger, the beacon is worn as a crest in the arms of several families, as Belknap, Butler, Mountford, Sudley, and Shelly of Michell Grove, one or two of whom obtained especial grants which empowered them to erect and maintain beacons at their own expence.

The care of these, when erected by the crown, was committed to one or more of the adjacent hundreds; and the money due or payable for their maintenance, called *beconagium*, was levied by the Sheriff of the county upon each hundred. (Archæologia, vol. i. part 1. Hutches's, Hist. of Dorset. vol. i. p. lix. Camd. Brit. Edit. 1609. p. 196.)

By stat. 8 Eliz. c. 13. the corporation of the Trinity house are empowered to set up any beacons or sea-marks wherever they shall think them necessary; and if the owner of the land or any other person shall destroy them, or shall take down any steeple, tree, or other known sea-mark, he shall be at 100*l.* or in case of inability to pay it, shall be ipso facto outlawed.

BEACONAGE, money paid towards the maintenance of a *beacon*. A suit for the recovery of a beacon standing on a rock in the sea may be brought in the court of admiralty, the admiral having an original jurisdiction over beacons. 1 Sid. 158.

BEACON HILL, in Geography. See HARWICH.
BEACONFIELD, a small market town of Buckinghamshire, in England, at the distance of 23 miles N.W. from London. The town is built on high ground, whence some antiquaries have observed, that it derived its name from a beacon formerly occupying the spot. The *lobstratum* no

which it stands is chiefly gravel, and the houses are built with flints or brick, there being no stone quarries in this part of the county. Beaconsfield has little claim to popular attention, there being no particular historical events or antiquities attached to it. Here are a small weekly market on Wednesdays, and two annual fairs. Seated on the great public road between London and Oxford, it derives some advantages from travellers; but it has been particularly noted in the literary annals of this country, by the contiguous residences of Edmund Waller the poet, and Edmund Burke the politician, both of whom possessed estates near Beaconsfield, and the memories of both are commemorated by inscriptions at the parish church. See WALLER, and BURKE.

About three miles east of Beaconsfield is *Bulstrode*, a seat of the duke of Portland. This ducal residence was formerly in the possession of the Bullstrode family, but reverting to the crown, was given by king William III. to William Bentinck, who had long been the constant attendant and faithful servant of that monarch, and who was created by him earl of Portland in 1689. From him it descended to the present nobleman, who has made considerable additions and improvements to the house and grounds. The former is a large irregular brick building, seated on a high knoll, in the centre of a fine park which abounds with venerable trees, and is diversified with that variety of surface, which constitutes the foundation of the picturesque. This park contains about 800 acres, and in the eastern part of it is a large circular entrenchment enclosing an area of twenty acres. See Beauties of England and Wales, vol. i. 1801.

BEAD, BAGUETTE, Fr. in *Architecture*, a little round moulding, the diminutive, or rather the vulgar name of astragal. This moulding is generally found in the cornices of antique buildings, where it is uniformly carved with ornaments, sometimes in the shape of a string of beads, sometimes a twisted ribbon or a rope. See *Plate XXI.* of *Architecture*. Plain beads are very much used in modern joiners' and plasterers' work, as the mouldings of doors, shutters, skirtings, imposts, and cornices.

BEAD, in *Assaying*, the small lump or mass of pure metal separated from the *scoria*, and seen distinct and pure in the middle of the coppel while in the fire.

Thus, in separating silver from its ore by means of lead, the silver remains in form of a bead, when the lead, that had before assisted in the operation, is reduced to *scoria*. In this process, the bead of silver must be taken out of the coppel as soon as it is seen pure and fine, lest growing cold, it should be conglutinated to the coppel or litharge. This bead, when rightly made, is always porous underneath. Cramer.

BEADS are more particularly used among us for a sort of glass necklace, made in imitation of the colour and figure of pearl.

BEADS are also used in speaking of those glass globules vended to the savages on the coast of Africa, thus denominated, because they are strung together for the convenience of traffic.

The common black glass of which beads are made for necklaces, &c. is coloured with manganese only; one part of manganese is sufficient to give a black colour to near twenty of glass. Lewis's Comm. Phil. p. 422. See **ARTIFICIAL PEARLS**.

BEADS, in a religious sense. See **CHAPLET**.

BEAD-ROLL, among the Romish priests, a list or catalogue of such persons, for the rest of whose souls they are obliged to rehearse a certain number of prayers, &c. which are told by means of their beads.

BEAD-MAKERS, called by the French *paternostriers*, are those employed in the making, stringing, and selling of beads. At Paris there are three companies of *paternostriers*,

or *bead-makers*; one who make them of glass or crystal; another in wood and horn; and a third in amber, coral, jet, &c.

BEAD PROOF, or *Double Proof*, terms used by our distillers, to express that sort of proof of the standard strength of spirituous liquors, which consists in their having, when shaken in a phial, or poured from on high into a glass, a crown of bubbles, which stand on the surface some time after. This is esteemed a proof that the spirit consists of equal parts of rectified spirits and phlegm.

This is a fallacious rule as to the degree of strength in the liquor; because any thing that will increase the tenacity of the spirit, will give it this proof though it be under the due strength. Our malt distillers spoil the greater part of their goods, by leaving too much of the stinking oil of the malt in their spirit, in order to give it this proof, when somewhat under the standard strength. But this is a great deceit on the purchasers of malt spirits, as they have them by this means not only weaker than they ought to be, but stinking with an oil, which they are not easily cleared of afterwards.

On the other hand, the dealers in brandy, who usually have the art of sophisticating it to a great nicety, are in the right when they buy it by the strongest bead proof, as the grand mark of the best; for being a proof of the brandy containing a large quantity of its oil, it is, at the same time, a token of its high flavour, and of its being capable of bearing a very large addition of the common spirits of our own produce, without betraying their flavour or losing its own.

We value the French brandy for the quantity of this essential oil of the grape which it contains, and that with good reason; as it is with us principally used for drinking as an agreeably flavoured cordial: but the French themselves, when they want it for any curious purposes, are as careful in the rectification of it, and take as much pains to clear it from this oil, as we do to free our malt spirit from that nauseous and fetid oil, which it originally contains.

No judgment can be formed of brandies by the bead proof as to their mixed or adulterated, or their pure state, farther than that they are likely to be most pure when they have the greatest proportion of this oil, in regard to mixtures of other spirits. There are many occasions where we want spirit, merely as spirit, and where any oil, whether sweet or stinking, must be equally improper. Shaw's Ess. on Distillery.

BEAD TREE, in *Botany*. See **MELIA**.

BEADLE, or **BEDELL**, *Bedellus*, signifies a messenger or apparitor of a court, who cites men to appear and answer in the court to what is alledged against them.

BEADLE is also used for an officer in universities, whose place it is to walk before the masters at all public processions, &c. with a mace. The office of church and parish beadles is well known.

Spelman, Vossius, and Somner, derive *beadle* from the Saxon *bidel*, a public crier; in which sense bishops, in some ancient Saxon manuscripts, are called *beadles of God*, *Dei bedelli*. The translator of the Saxon New Testament renders *exactor* by *bidele*; and the word is used in the same sense in the laws of Scotland.

BEADLE of the Forest, is an officer, that warns all the comits of the forests, and executes process, makes all proclamations, &c. 4 Inst. 313.

BEAGLE, in *Zoology*. See **CANIS FAMILIARIS**, and **DOG**.

Beagles are of divers kinds; as the *southern beagle*, something less and shorter, but thicker than the deep-mouthed hound; the *fleet northern*, or *cat beagle*, small and of a finer shape than the southern, and a harder runner. From the

two, by crossing the strains, is bred a third sort held preferable to either.

To these may be added a still smaller sort of beagles scarce bigger than lap-dogs, which make pretty diversion in hunting the coney, or even small hare in dry weather: but otherwise unserviceable, by reason of their size. Beagles, both rough and smooth, have their admirers among sportsmen: their tongues are musical, and they go faster than the southern hounds; they run so close to the ground, as to enjoy the scent better than taller dogs, especially when the atmosphere is low. In an inclosed country they are said to do best, as they are good at trailing or default, and for hedge-rows; but they require a clever huntsman, for out of eighty couple in the field, during a winter's sport, scarcely so many are to be depended upon. Of the two sorts, the wire-haired, as having good shoulders and being well filleted, are preferred. Smooth haired beagles are commonly deep hung, thick-lipped, with large nostrils, but often so fat and bad quartered, as to be shoulder-shook and crippled the first season they hunt; among them are frequently seen crooked legs, like the Bathturnspit; and after two hours running many of them are disabled. Their form and shape sufficiently denote them not designed for hard exercise. Daniel's Rural Sports, vol. i. p. 378.

BEAK, *Rostrum*, in Ornithology, the bill of a bird; from the form and structure of which, Linnæus divides this whole family or general class of animals into six orders. See BIRD and ORNITHOLOGY.

BEAK, in Architecture, a little fillet left on the edge of a lannier, which forms a canal, and makes a kind of pendant chin, answering to what Vitruvius calls the *mentum*.

BEAK, or Beak-Head of a Ship, is that part without the ship before the fore-castle, which is fastened to the stem, and is supported by the main knee: this is usually carved and painted, and, besides its use, makes the becoming part, or grace of a ship.

The beak was anciently made of wood, but fortified with brass, and fastened to the prow, serving to annoy the enemies' vessels. Its invention is attributed to Pifæus, an Italian. The first beaks were made long and high; but afterwards a Corinthian, named Aristo, contrived to make them short and strong, and placed so low as to pierce the enemies' vessels under water. By the help of these, great havoc was made by the Syracusans in the Athenian fleet. Pett. Archæol. lib. iii. c. 17.

BEAK was also used for one of the ancient battalia, or forms of ranging an army for battle, particularly used by the Macedonians.

BEAK is also applied to the slender crooked prominences of divers bodies, bearing some analogy or resemblance to the beaks of birds.

In this sense we meet with beaks of shoes, *rostra calceorum*, for long peaked toes, in use of old. Du-Cange.

Among *Farrriers* beak denotes a little horse-shoe, turned up, and fastened in upon the forepart of the hoof.

It is usual to keep the shoes fast, and not liable to be struck off by the horse, when by reason of any itch, or being much disturbed by the flies in hot weather, he stamps his feet violently on the ground.

BEAKED, *Bequé*, in Heraldry, is used when the beak or bill of a fowl is of a different tincture from the body.

In this case, they say *beaked* and membered of such a tincture.

BEAKING, in Cock-fighting, expresses the fighting of these birds with their bills, or holding with the bill, and striking with the heels.

BEAL, in Geography, a river of Ireland, which runs into the Shannon near Aikeaton, in the county of Limerick.

BEALE, MARY, in Biography, a female portrait painter in the reign of king Charles II., was the daughter of Mr. Cradock, minister of Walton upon Thames, and was born in Suffolk in 1632. Although she was not instructed in the rudiments of painting by sir Peter Lely, as some have supposed, she diligently copied the works of that great master, as well as those of Vandyke. She painted in oil, water-colours and crayons; and by copying some pictures of Italian masters, improved her taste and pencil, and acquired much of their air and style, which appear in her portraits. She was little inferior to any of her contemporaries with respect to colouring, strength, force, or life; and she worked with a great body of colours. Her performances were held in high estimation by sir Peter Lely. Amiable in her conduct, and assiduous in her profession, she was very much encouraged and employed, both by the clergy and by several persons of rank, whose portraits she painted. It appears, that in one year she received for pictures 429 l., and that she and her husband devoted about two shillings in the pound of their income to charitable purposes. In the MSS. of Mr. Oldys, Mrs. Beale is celebrated for her poetry as well as her painting. She died Dec. 28, 1697; and left two sons, Charles and Bartholomew, both of whom exercised the art of painting; but the latter relinquished painting, and studied physic under Dr. Sydenham, and practised at Coventry, where he and his father died. Walpole's Anecdotes of Painting, vol. iii. Biog. Brit. Pilkington.

BEALNABRUCII, in Geography, the name of a river in the county of Galway, province of Connaught, Ireland, which rises in Joyces country near the Killeries, north of the mountain of Beannebola or the twelve pins, and flows through a mountainous country into Lough Corrib, near the base of the stupendous Ben Levagh. The valley through which it runs is pretty well peopled. A great error is committed in Roque's and all the old maps, in representing this river as flowing into Roundstone bay, and affording a second outlet to Lough Corrib, instead of carrying into it a large supply of water. Dr. Beaufort's Map and Memoirs.

BEALSTURG, a small town of America, in Nelson county, Kentucky, on the east bank of Rolling fork, containing twenty houses, and also a tobacco warehouse: 15 miles W.S.W. from Bairdstown, and 890 from Philadelphia. N. lat 37 42'. W. long. 85 50'.

BEALT. See BUILTH.

BEAM, in Architecture, is any piece of timber of a rectangular section of equal depth and thickness throughout its length, applied in an horizontal position in various situations in a building, for the purpose of resisting some strain either in a longitudinal or transverse direction, such as to prevent the rafters of roofs from pushing out adjacent walls upon which they rest, or to sustain a superincumbent part of a wall instead of an arch. This word, however, is not much used technically, and only in combination with other words, which denote its position or use. When a beam is placed at the bottom of a pair of rafters it is called "a Tie-beam;" but if placed in a higher situation it is called "a Collar-beam." When a beam is placed over piers of masonry or wooden posts to support a superincumbent wall, it is called a "breast-lummer," or "summer-beam." When a beam is placed across a floor to support the ends of joists and shorten their bearings, it is called a "girder," or "girding-beam." See CARPENTRY.

Some of the best authors have considered the force or strength of beams, and brought their resistance to a precise calculation; particularly M. Varignon and M. Parent. See STRENGTH of TIMBER.

BEAM of a Plough, in Agriculture, a name given by our farmers

farmers to the great timber of the plough, in which all the other parts of the plough-tail are fixed.

This is usually made of ash, and is straight, and eight feet long in the common plough: but in the four-coultured plough, it is ten feet long, and its upper part arched. The head of this beam lies on the pillow of the plough, and is raised higher, or sunk lower, as that pillow is elevated or depressed by being slipped along the crow-staves. Near the middle, it has an iron collar, which receives the tow-chain from the box, and the bridle-chain from the stake or gallows of the plough is fixed in it a little below the collar. Some inches below this, there is a hole, which lets through the counter; and below that there are two other small ones, through which the heads of the retches pass. These are the irons which support the sheat, and with it the share. Farther backward still is a larger perforation, through which the body of the sheat passes; and behind that, very near the extremity, is another hole through which the piece called the hinder-sheat passes. See PLOUGH.

BEAMS of a ship, are the large, main, cross timbers, stretching from side to side, which hold the sides of a ship from falling together, and which also support the decks and orlops of the ship.

The main beam is that next the main mast; and from it they are reckoned by *first, second, and third beam*. The great beam of all is called the *midship-beam*.

There are usually twenty-four beams on the lower deck of a ship of 74 guns, and on the other decks additional ones in proportion, as the ship lengthens above.

BEAM, *on the*, in *Sea Language*, denotes any distance from the ship on a line with the beams, or at right angles with the keel. Any object that lies east or west, when the ship steers northward, is said to be on the starboard or larboard beam.

BEAM, *before the*, signifies an arch of the horizon comprehended between the line of the beam, and that point of the compass which she stems. See ABAFT.

BEAM, *on the Weather*, signifies on the weather side of the ship.

BEAM, *Camber*. See CAMBER-BEAM.

BEAM of an Anchor. See ANCHOR.

BEAM of a balance, is that piece of iron or wood, somewhat bigger towards the middle than at the ends, where there are holes through which run the ropes or strings which hold the scales: the beam is divided into two equal parts, by a needle placed over it perpendicularly: and the centre of motion must be placed a little above the centre of gravity, that the beam may rest exactly in an horizontal position. See BALANCE.

BEAM, or Roller, among Weavers, is a long and thick wooden cylinder placed lengthways on the back part of the loom of those who work with the shuttle. The threads of the warp, of linen or woollen cloth, serges, on other woollen stuffs, are rolled upon the beam, and unrolled as the work goes on. That cylinder on which the stuff is rolled as it is weaved is also called the beam or roller, and is placed on the fore part of the loom.

BEAM, in *Heraldry*, is used to express the main horn of a hart or buck.

BEAM, among Hunters, denotes the main stem of a deer's head; or that part which bears the antlers, royals, and tops; the little streaks of which are called circles.

BEAM is also used for a fiery meteor in the shape of a pillar; and for a ray of the sun.

BEAM compasses. See COMPASSES.

BEAM feathers, in *Falconry*, the longest feathers of a hawk's wing.

BEAM-filling, in *Building*, the filling up the vacant space

between the rising plate and roof, with stones, or bricks, laid between the rafters on the raising plate, and plaistered on with loam; this is frequent where the garrets are not partitioned, or plaistered.

BEAM tree. See CRATÆGUS *Aria*.

BEAMINSTER. See BEMINSTER.

BEAN, in *Botany*. See VICIA *Faba*.

BEAN, *fabā*. The medicinal and dietetic qualities of beans are said to be nutritive, but flatulent: the pods yield a water held good against the gripes in children. Some have used the horse bean as a succedaneum to coffee; which in principles it much resembles; only that it contains but half the quantity of oil. Mr. Boyle has several experiments of beans treated pneumatically to shew the great plenty of air they afford, on which their flatulency depends. This air, which beans contain in a fixed state, is extricated during their digestion in the stomach, in greater quantity than can be again absorbed, and upon that account these, and other legumina, have been at all times noted for occasioning flatulency, and sometimes colic pains. The expansion of beans in growing, Mr. Boyle also found so considerable that it would raise a plug clogged with above a hundred pounds weight. Boyle's Works abr. tom. i. p. 285. tom. ii. p. 615, &c.

Beans with proper management make one of the finest of all baits for fish. The method of preparing them for this purpose is this: take a new earthen pot glazed on the inside; boil some beans in it, suppose a quarter of a peck: they must be boiled in river water, and should be previously steeped in some warm water for six or seven hours. When they are about half boiled, put in three or four ounces of honey, and two or three grains of musk: let them boil a little on, then take them off the fire, and use them in this manner: seek out a clean place, where there are no weeds, that the fish may see and take the beans at the bottom of the water. Throw in some beans at five or six in the morning, and in the evening for some days. This will draw them together, and they may be taken in a casting net in great numbers.

The ancients made use of beans in gathering the votes of the people, and for the election of magistrates. A white bean signified absolution, and a black one condemnation. Beans had a mysterious use in the *lemuralia* and *parentalia*; where the master of the family, after washing, was to throw a sort of black beans over his head, still repeating the words, "I redeem myself and family by these beans." Ovid gives a lively description of the whole ceremony in his *Fasts*, lib. v. ver. 435. Abstinence from beans is said to have been enjoined by Pythagoras, for which prohibition various reasons have been assigned. Some have supposed that it was intended to restrain his disciples from intermeddling in trials and verdicts which were decided by throwing beans into an urn. Others founding their opinion on the double sense of the word *vovus*, which signified both a bean and the common testicle, explain it by abstaining from venery. Clemens Alexandrinus grounds the abstinence from beans on their tendency to render women barren; which property is confirmed by Theophrastus, who extends the same effect even to plants. Cicero suggests another reason; viz. that beans are very injurious to mental tranquillity. Hence Amphiaras is said to have forborne the use of beans, before Pythagoras, that he might be better prepared for divining by dreams. The Egyptian priests held it a crime to look at beans, judging the very sight unclean. The *flamen dialis* was not permitted even to mention the name. Lucian introduces the same philosopher in hell, saying, that to eat beans, and to eat our father's head, were equal crimes. After all, both the genuineness of the precept, and the reality of any such abstinence among the ancient

cient Pythagoreans have been disputed. Some attribute the precept to Empedocles, a disciple of Pythagoras. Ariloxenus, an ancient writer cited by A. Gellius, (l. iv. c. 11.) introduces Pythagoras saying, that he eat more frequently of beans than of any other pulse, on account of their gentle loosening the belly. Accordingly he is said to have permitted the use of them, because he believed them to be wholesome, but his disciples have forbidden them, because they thought them, as Hippocrates also did, productive of flatulency, and otherwise prejudicial to health. Thus, a prohibition, which was at first a civil regulation, or salutary advice, assumed the authority of a sacred law.

BEAN, *Bog*. See MENYANTHES.

BEAN-*caper*. See ZYGOPHYLLUM.

BEAN-*cod*, in *Navigation*, a small fishing vessel or pilot boat, used by the Portuguese, which rigs with one mast, similar to the *Tartan*; which see.

BEAN-*flour*, in *Antiquity*, called by the Romans *lomentum*, was of some repute among the ancient ladies as a cosmetic, wherewith to smooth the skin, and take away wrinkles.

BEAN-*fly*, in *Natural History*, the name given by authors to a very beautiful fly, of a very beautiful purple colour, frequently found on bean-flowers. It is produced from the worm or maggot called by authors *mida*.

BEAN, in *Agriculture*, a sort of pulse, of which there are several kinds: but those best adapted to field culture are the small sorts, such as the common *horse-bean*, and the *tick-bean*. The large sorts, or garden-beans, as the *Windfor*, *Long-pod*, and *Mazagon*, have also been occasionally employed in the field, with success, in some of the southern districts.

Beans constantly prefer a strong moist soil, and on such, where proper culture is given, they mostly afford an abundant produce. Tick-beans are supposed by some farmers to be more productive than horse beans; but the latter grow higher in the stem, and produce a more stagnated state of the air, or smother the land more, consequently are the most suitable for the stronger sorts of soil.

The author of the *Agricultural Survey of Middlesex* observes, that beans are a crop which thrive well in almost any soil that is rather strong, such as medium-loams, sandy-loams, clayey-loam, and chalky-loams; on clay, marl, chalk, and such like cool subsoils. And the author of the *Synopsis of Husbandry* remarks that the proper time for planting beans is towards the latter end of January, or early in the following month; though this business may be continued to advantage till the middle or latter end of March, if the weather had prevented their being got in at an earlier season; but in general it is best to embrace the first opportunity of sowing them after Candlemas, as they often miscarry if the season be procrastinated beyond that time, especially if a dry summer should succeed. In purchasing beans for seed, care should be taken to choose such as are hard and bright, without being shrivelled in their appearance.

Mr. Donaldson, in his view of the present state of husbandry, observes, that the ordinary mode of preparing land for a crop of beans, is to give one ploughing only, which is generally performed in the spring, immediately before the seed is sown.

Beans are for the most part sown broad-cast, either on the stubble, before ploughing, or on the new turned-up furrow. Sometimes beans are sown or planted in the bottom of every second or third furrow, and afterwards horse and hand-hoed. In a few districts they are sown with a drill machine, and at such distances in the rows as to have sufficient space, either for hand-hoeing, when that only is intended, or for horse and hand-hoeing, when it is purposed that both these operations should be performed. It will at once appear obvious,

he thinks, that either of these last-mentioned methods is preferable to sowing the seeds broad-cast, as a better opportunity is not only afforded of cleaning the ground properly, but a more abundant return, and a produce of superior quality insured.

The spring seed time in general commences with the sowing of beans. In the southern districts, they are sown in ordinary seasons so early as the middle or towards the end of February; and in the northern parts of Scotland so late as the beginning of April. The month of March may, however, as has been observed, be considered as the general bean seed season.

The first of the above writers thinks, that on land which is inclined to moisture the preparation for this crop should be as follows: Early in autumn lay on the manure, and immediately plough the land into ridglets of two feet six inches wide; in which state let it lie until the season for planting, when the seed may be dibbled in, one row of beans into the middle of each ridglet, at the distance of about three inches from bean to bean. They should be immediately covered; which may be done by children, with a garden rake or hoe, or, should the surface of the land be dry and crumbly, a horse and a bush harrow would do as well. In most places, he observes, it is adviseable to set a boy with a rattle to frighten away the rooks until the beans have attained some growth. The distance between the rows will not prevent the crop from completely covering the ground, especially if the land was manured for them, as they will branch out sideways, three or four stout stems from each root. They should be early planted, in order to their getting sufficient root-hold of the land, and procuring shade against the hot weather sets in. It is also some security against the *black-dolphin*, which is the greatest enemy the bean is ever attacked by. They require a soil that can seldom be worked without damage during the winter and spring; consequently it ought to be manured and gathered into one bout ridges in the autumn. The shape of these ridges keeps the land more dry through the winter than any other, and prevents excessive rains from washing away the manure, which had been previously folded by the plough into the centre of such ridges; in which state it should lie, as has been already observed, until the season for sowing; when the land thus prepared will be so dry as to admit of dibbling every fair day; which secures to the farmer the advantage of choosing his season. He dunged, he says, about ten acres in September 1793, and ploughed the land into ridges of two feet and a half wide, burying the dung in the middle of them. The land lay dry through the winter, and he dibbled one row of beans into the middle of each ridge during the first week of February 1794. My neighbours, says he, on a similar soil, who ploughed into flat ridges of about fifteen feet wide, could not get their feed in till March. The ensuing summer was uncommonly dry: my beans being so unusually wide apart, admitted the plough and hoe to work as freely between the rows as a stubborn soil would allow. The plants tillered or branched till they completely covered the intervals, and the field appeared as completely cropped as though it had been sown broad-cast. When my neighbours' plants, says he, were beginning to pod, mine were half set. The whole were alike attacked by the black-fly, which reduced their crops to a bushel or two per acre, while I had twenty.

Mr. Young, however, remarks in the *Survey of Suffolk*, that it is there uncommon to give more than one earth for beans, and generally improper, as they love a whole firm furrow, and never thrive better than on a layer.

There are many different methods, Mr. Bannister says, of raising crops of beans. In some counties they sow this pulse by broad-cast, which is by no means an eligible way, since

much of the seed will be left above ground, and a great part of that which is covered by the harrow will not be covered to a proper depth; and many other objections might, he thinks, be urged against this method of sowing beans at random, of which it is not one of the least, that such irregular sown crops are in great danger of being injured by weeds, which cannot so easily be extricated when the beans are sown at random as when they are planted regularly in drills.

In some districts, as Middlesex, Surrey, &c. the method is, to plant this pulse in rows stricken out by a line, by which a great saving is made in the article of seed, a circumstance which is thought to compensate for the extraordinary charge of this mode of husbandry; and thus far it may be fairly acknowledged, that the method of planting beans by the dibble is greatly to be preferred to that of sowing the seed at random. The economy of this agricultural process he thus explains: the rows are marked out one foot asunder, and the seed planted in holes made two inches apart; the lines are stretched across the lands, which are formed about six feet over, so that when one row is planted, the sticks to which the line is fastened are moved by a regular measurement to the distance required, and the same method pursued till the field is completed. The usual price for this work is 9d. per peck, and the allowance two bushels per acre. Great confidence must necessarily be reposed in the people who transact the business of planting beans by the dibble, who, if inclined to fraud, have it in their power to deceive their employer by throwing great part of the seed into the hedge, from which their daily profits are considerably enhanced, their own labour spared, and every discovery effectually precluded, till the appearance of the crop, when the frequent chafms in the rows will give sufficient indications of the fraud; and by this time perhaps the villainous authors of the mischief may have escaped all possibility of detection, by having conveyed themselves from the scene of their iniquity. Such is the method of planting beans by the dibble; but the neatest and most expeditious way of sowing this pulse, especially the field bean, is, he observes, that pursued by the Kentish farmers. The usual course in that county, is to plough up the oat or barley grattens, which are designed for beans, soon after the wheat season is finished, in which condition the fallows are to lie till towards Candlemas, or later, as the state of the weather, or the farmer's occasion may require, and then to strike out the furrows.

About eleven furrows to a row's breadth is the usual width of setting out the rows, though some prefer a wider space, whilst others strike them still narrower; and this difference in the width of the rows is the cause why the farmers vary so essentially in respect to the quantity of seed to be sown on the same given space of ground; for, whilst some will content themselves with an allowance of two bushels per acre, others will throw a sack of beans upon the same compass of land. When the furrows are struck at the distance mentioned before, two bushels and a half of middle-sized tick-beans are sufficient to seed an acre, and on good land (for if the ground be not either rich in itself, or rendered fertile by art, it is of little consequence to attempt the cultivation of this crop,) a person, in his opinion, stands a much fairer chance for a crop when the beans are thinly planted, than when a more liberal quantity of seed is allowed; for, when beans stand so very thick in the rows, they never pod so kindly as when the stalks are less crowded; and although the crop of haulm may be more abundant, the increase will not be adequate to the large bulk of straw.

In Suffolk, according to Mr. Young, beans have been dibbled by some a row on every flag; by others, on every other flag. He has found it more advantageous to plant in clusters four or five beans in every hole; and eight or nine

inches from hole to hole, which admits of much better hoeing than when more thickly set. Dibbling, says he, is the best and most effective method of cultivating beans. In the Synopsis of Husbandry it is further observed, that in Kent some people make use of a drill plough at bean seed time; but as this pulse, especially the larger ticks, are very unequal in size, they cannot be let out of the hopper with sufficient regularity; for by this inequality in size, many yards of ground in the length of a furrow will be left vacant from the casual obstruction of a large bean, and when this is removed, numbers of a smaller size crowd to the chasm, and shoot out of the hopper for a considerable space, till another large bean intervenes to obstruct the passage, and thus the crop makes a very unsightly appearance in the rows, and at the time of harvest is very unequal; the injury in large fields being not inconsiderable: for, in those parts of the furrows, where no beans had been sown, an increase cannot be expected; and those which are huddled together by a quart or more in a spot, will, from the thickness of their growth, in course come to little. Some farmers are so nice as to pick and cull their seed before it goes into the hopper, in order to render the beans more even, and prevent the injury above mentioned: but this is a very tedious practice, and after all, he believes, very seldom answers the expence. The best method of sowing this crop, according to this writer, is from an instrument called a box, which is held by a man who follows the striking plough, and who, by shaking the box filled with beans, drops them with regularity in the furrow, keeping even pace with it; so that by two men, and two or three horses to the striking plough, a man to box, and a boy and two horses to harrow down the ground after the plough, three acres may be finished off in a day, and the whole conducted with regularity.

The writer of the Agricultural Survey of Middlesex thinks that beans should be manured for, and kept perfectly clean while growing, by ploughing, horse or hand-hoeing, and hand-weeding; and that where they are so managed, they are an excellent preparation for either wheat or oats. They have a tap root, and hence they are more likely to succeed after crops that have fibrous roots; though he never heard that they would not grow after any crop. They are generally sown after wheat, barley, or oats; and ought, as has been already observed, to be planted on ridglets, especially on wet and thin-skinned soils.

In the Synopsis of Husbandry it is recommended as a good method to roll and harrow beans in the latter end of March. By the roll, says this writer, the clods are broken so as to afford fresh nourishment to the roots; and the harrows following this operation pulverize and loosen the surface, which had been flattened and baked down by the rains in the preceding month, by which the beans are considerably assisted in the future progress of their growth. Soon after this the crop should be edge-hoed, and afterwards braked; which method of braking is a piece of husbandry peculiar to the county of Kent, and in every respect claims the preference to that of hoeing the whole space between the rows; not only because the braking is performed at an inferior expence, but it is likewise more efficacious, as well for extirpating the weeds that may have sprung up between the rows, as in furthering the advances of the beans in growth, by loosening the soil, and conveying fresh earth to the stalks. This operation of braking may be continued at the interval of three weeks or a month, from the beginning of May till the crop becomes in bloom. When it is proposed to earth up the beans, this may be effected with great facility by fixing a small block of wood on the *brig* of the brake; the manner of doing which is familiar to every Kentish ploughman; and according to the diameter of this block, the earth may be thrown

thrown to different heights on the bean stalks, as they advance in growth.

In dry summers when easterly winds prevail, beans are very apt to be stricken with the *Dolphin* fly, an insect which in a very short space of time will destroy the produce of a whole field. In this case it has been found very beneficial to take off the tops with a scythe, as the dolphin generally effects its first lodgment in the upper part of the stalk. Where this pulse is sown broad-cast, there remains no other way of cleaning the field, than by cutting up the weeds with a hook, or by turning in a flock of sheep in May, where the ground is very foul, as this animal will devour the weeds, and leave the beans untouched. From this very partial method of weeding, it may fairly be concluded that the best method is to graze, and that the gratten will be abundantly stocked with weeds at harvest, and the ground be totally unfit for sowing with wheat: and, indeed, the practice of sowing bean grattens with wheat is now attempted in those countries where this method of sowing beans at random prevails; and here, therefore, the bean and pea grattens generally come in course the next year for a fallow. This is a practice that cannot be recommended.

It is remarked in the Survey of Middlesex, that beans are seldom ripe enough to cut till the latter end of August, and the proper time is when the *kids* are turning black, about ten days before they would begin to open at the ends. Though in some parts of the field the kids may not be so black as in others, this should not prevent their being cut; for they will ripen and harden after that is done, by setting the sheaves upright, and leaving them in the field for a week or ten days. If they are cut long before they are ripe, they will shrink and shrivel; and if too ripe, they will shed considerably; though there is much less danger in reaping them too early, than in letting them stand too long. Those that are over-ripe should be cut with the dew on them, and carried to the barn in the same state; the green parts of the crop being cut in the middle of the day. When the intention is to sow wheat or tares after beans, they ought to be set up so as to occupy as little space as possible, that the vacant ground may be immediately prepared for the next crop. The writer of the Synopsis of Husbandry asserts, that after a growing summer, and on land which is in good heart, there will be many green pods when the crop is upon the whole fit for the hook; for the stalks having run to a great length, and being very replete with moisture, the upper part of the leaves, pods, and stalks, will appear to be in a growing state long after the pods on the lower part of the stalk are fully ripened. To wait the ripening of these upper pods would be very ill-judged, as by this delay great part of the crop would be lost, from the shedding of those which were already come to maturity. The best method, therefore, is to cut the beans when the major part have ripened, and by suffering the stalks to remain in the field, the upper part of the stalks will be sufficiently withered, so as to prevent any ill effects from their humidity, when laid in the barn or stack; nor will the beans from those unripened pods be of any injury to the sward. At harvest time, the same author informs us, that in Kent those beans which were sown broad-cast are mown with a scythe, and carried loose into the barn; a practice which is fraught with many inconveniences; but that in Middlesex, where the beans are planted in rows with a dibbler, as before mentioned, the intervals are carefully cleaned during their growth by means of a hoe; and to this purpose the farmers are under the necessity of employing a number of hands; the Kentish method of cleaning the intervals by the brake not having yet been introduced into that county;

since the whole ground between the rows must be flat-hoed. At harvest, the stalks are cut with a hook, bound into sheaves, and set up four together; and as a substitute for strings, it is usual to sow the headlands with pease, the haulm of which answers the purpose of bands to tie up the sheaves. The Kentish mode of husbandry is greatly to be preferred, he thinks, to that of the Middlesex farmers, as is evident from the consideration of the comparative disadvantages which attend a crop raised and managed according to the latter method, with the superior benefits of the former. At seed-time the planting by a dibbler is infinitely more tedious and expensive than that of dropping the seed into the furrow after the striking plough; and in the course of husbandry required to cleanse the intervals, the several flat-hoings cause a far heavier charge than what attends the braking and edge-hoing; and after all, the ground is not so well prepared for a wheat season at Michaelmas, a method of husbandry generally pursued by the Middlesex farmers. One reason may be assigned, he says, why the Kentish husbandry has not yet been adopted by the Middlesex farmers; and this is from the nature of the land in that county, which in many parts is a deep heavy clay, so that on these adhesive soils the *swing-plough* is generally used, and the ground divided into partitions, or (as they are termed) lands, to guard against the contingency of a wet season. But surely, says he, this soil might be worked with a turn-rest-foot plough, and by proper drains be secured from the ill effects of a moist time; and the field being thus laid on a level, the rows might easily be struck out, and the subsequent brakings be executed to advantage during the summer, as usual with the Kentish farmers. It is added, that in those parts of Kent where the round tith husbandry is pursued, the farmers are particularly attentive to the several operations of hoeing and braking the ground during the growth of the beans; for, as the land in that county is of a nature so fertile as not to require the intervention of a summer fallow, they spare no pains in the cultivation of their bean and pea grounds, in order to render it as clean and well pulverized as possible by means of the hoe and brake, so that this latter instrument is scarcely ever out of the field, from the beginning of May till the time when the beans are advanced to that height, as to obstruct the working of it; by which the ground becomes so intimately divided, that every particle of soil in the interspace is exposed to the beneficial influence of the sun and air, and at harvest scarcely a weed is perceptible throughout the crop. In order to destroy what few weeds may remain in the rows, and to give that part of the ground its due share of pulverization, and to cleanse it from the bean haulm, a plough is set to work soon after harvest to spuddle the gratten; and for this purpose a plate of iron is fixed across the share at about four or five inches from the point, and the same axle-tree and wheels are made use of that were before employed for striking out the furrows; and with this plough and two horses three acres of ground may be spuddled in a day, by setting the share point in the interval, so that the iron or lin may embrace a row on each side; and when the whole field is thus spuddled, the harrows and roller are to succeed, by which the haulm and weeds will be completely extricated at a trilling charge, and the ground be laid in readiness for ploughing the seed furrows, at which time those beans or pease which may have been shed will have vegetated, and are destroyed by the plough; so that the farmer may, from this mode of husbandry, be not less confident of growing a clean sward of wheat, than if his ground had been summer fallowed.

On thin, chalky, or gravelly grounds, notwithstanding what has just been urged of the good effects of spudding, he

observes that it would perhaps be more prudent to omit that work, lest it might contribute towards loosening the soil beyond a due medium; for on these soils the chief aim should be to clothe them as much as possible, that at wheat seed-time the surface may be perfectly tight; and therefore to roll and harrow the bean and pea ground on such soils, in order to rid the field of the haulm, &c. and when it has lain some time, to plough the feed furrows, are the whole process necessary to prepare it for the succeeding crop of wheat: and this shows, he thinks, the necessity of sowing with this grain or with pease that part of the farm which is most free from weeds, and in the best heart; not only that these pulses, both of them (especially beans) require to be sown on good land, and on such as has been improved by art, but likewise that the grattens may be so perfectly clean, as not to require the operation of spuddling. In Kent, they cut their beans with a hook, and bind them into sheaves with rope-yarns. These sheaves are set up in shocks of various forms, either five on each side, in the manner of wheat shocks, or in a circular form, four sheaves to the shock. The expence of cutting, binding, and setting up is from 4s. to 6s. or 7s. per acre, according to the degree of goodness in the crop. Some farmers, in such years when the hops have failed, cut up the bind, and reserve it as a substitute for rope yarns to tie up their bean sheaves. But though this practice may at first sight bear the appearance of frugality, it will be found eventually to be the most expensive: as the cutting the hopvines at that season will be apt to cause them to bleed, to the infinite prejudice of the stocks; and thus the future crops may be hazarded by a premature removal of the binding those years when, from the failure of the hops, it should seem to be of no further use. Mr. Marshall, however, recommends the pulling beans in preference to cutting; for, he says, the benefit the soil receives will more than pay for the extra labour in clearing. Another advantage arising from their being pulled, is the stubbornness of the roots keeping the mow open, and admitting a circulation of air. And he says in another place, that by experience he found pulling up by hand far preferable to cutting with sickles; as they may be pulled up not only much faster, but much cleaner from weeds and grass than when cut, besides leaving the land in a state greatly superior. The waste is also less, so much so as to lose scarcely a bean: and the bean stalks are immediately ready to bind and set up; and by the roots lifting them from the ground, the air acquires a free circulation. The work is also easier to the labourer, who stands more upright, and the power required is much less, especially in dry weather. By striking the roots of each handful against the foot, the mould is almost wholly disengaged from the fibres. The soil in the drills, instead of being bound by the roots, and encumbered by the stubble, is left as loose as a garden, and the surface free from obstructions; and if thoroughly hoed, is as fit as a fallow to be sowed with wheat on one ploughing.

Beans are every where an uncertain crop, consequently the average produce difficult to estimate. In Kent, Mr. Young thinks, they probably exceed four quarters; but in Suffolk he should not estimate them at more than three; yet five or six are not uncommon. According to Mr. Donaldson, a crop of beans, taking the island at large, may be supposed to vary from sixteen to forty bushels; but that a good average crop cannot be reckoned to exceed twenty. And in Middlesex, Mr. Middleton tells us, that bean crops vary from ten to eighty bushels per acre. They are rendered a very precarious crop by the ravages of myriads of small black insects of the same species. The *lady-ticks* are supposed either to generate or feed on them, as they are observed to be much among them. Mr. Foot says,

the average produce is from three and a half to four quarters per acre.

It is asserted, by the author of the Synopsis of Husbandry, that bean straw, if well harvested, forms a very hearty and nutritious diet for cattle in the winter-time; and that both oxen and horses, when not worked, will thrive on it. Sheep are also very fond of browsing on the pods; and the *cavings* are very nutritious manger meat for horses. But in Middlesex the straw is generally employed in bedding the farmer's horses and other cattle, and in littering the farm yards, where it is picked over by young stock; though sometimes a load is sold for 20s. or 25s. delivered in. When the bean-straw and the *caving-chaff* are made use of as a fodder for cattle, they should always be newly threshed, as in that state they are much more nutritious than when they have been kept some length of time.

Crops of this kind are for the most part applied to the purpose of feeding horses, hogs, and other domestic animals. In the county of Middlesex all are given to horses, except what are preserved for seed, and such as are podded while green, and sent to the London markets. When pigs are fed with beans, it is observed that the meat becomes so hard as to make very ordinary pork, but good bacon. It is also supposed that the mealmen grind many horse-beans among wheat, to be manufactured into bread. And Dr. Darwin remarks in his *Phytologia*, that a strike or bushel of oats weighs perhaps forty pounds, and a strike or bushel of peas and beans sixty pounds; and that as the skin of peas and beans is much less in quantity than that of oats, he supposes there may be at least fifteen pounds of flour more in a strike of peas and beans than in a strike of oats. There is also reason to believe, he says, that the flour of beans is more nutritive than that of oats, as appears in the fattening of hogs; whence, according to the respective prices of these two articles, he suspects that peas and beans generally supply a cheaper provender for horses than oats, as well as for other domestic animals. But as the flour of peas and beans is more oily, he believes, than that of oats, it may in general be somewhat more difficult of digestion; hence, when a horse has taken a stomach full of peas and beans alone, he will be less active for an hour or two, as his strength will be more employed in the digestion of them, than when he has taken a stomach full of oats. Hence it may be found advisable to mix the bran of wheat with the peas and beans, a food of less nutriment but of easier digestion; or to let the horses eat before or after them the coarse tustocks of four grass, which remain in moist pastures in the winter; or lastly, to mix finely cut straw with them.

BEAN, in *Gardening*. See VICIA.

BEAN-Goose. See ANAS.

BEAN, *Ignatius's*. See IGNATIUS'S BEAN.

BEAN, *Kidney, or French*, in *Botany*. See PHASEOLUS.

BEAN, *Kidney, Tree*. See GLYCINE.

BEAN, *Malucca*, the *anacardium orientale*, is a fruit of a shining black colour, of the shape of a heart flattened, with a very thick pedicle occupying almost the whole basis. For the characters of the plant that produces it, see AVICENNIA *Tomentosa*; and for its qualities, see ANACARDIUM.

BEAN, *Molucca*, a name given by sir Robert Sibbald in his *Prodromus*, and by Mr. Wallace in his description of the Orkney islands to a sort of fruit frequently cast on shore in the north-west islands of Scotland, especially on the coasts most exposed to the waves of the great ocean. They are called by some Orkney beans, and are not the produce of that island, or indeed of any other part of Europe, but of America. Sir Hans Sloane procured four species of them

little injured by the sea, and found on examination that three of them were the common produce of the island of Jamaica; where he had himself gathered them, and described them in his catalogue and history.

The first sort was a kind of kidney bean, and the plant which produces it is described by sir Hans under the name of the great perential kidney bean, with a great crooked lobe. It is also figured in the Hortus Malabaricus by the name of *perin kalvoni*, and sir Robert Sibbald also calls it *pus Inca ex qua pyxides pro pedale sernario parant*. This is a native of the East and West Indies, and is sometimes found thrown on shore in the county of Kerry in Ireland, and in some other places. A second kind of fruit thrown on shore in the Orkneys, is a very common fruit in Jamaica, known there by the name of the horse-eye bean; it has this name from its resembling the eye of some large animal, by reason of a *hilus* or welt which surrounds it. This is described by many authors, and among the rest by sir Hans Sloane, in his catalogue of Jamaica plants; and is found in many other of the hotter parts, both of the East and West Indies. A third kind of fruit found on these shores, is that called by the people of Jamaica the ash-coloured nickar nut; it has this name from its colour, and from its being perfectly round, of the shape of a nickar, or marble, such as boys play with. This is also common in the East and West Indies. A fourth kind is also a Jamaica fruit, with the history of which we are not yet well acquainted; nobody has seen it growing, but the fruit itself is preserved in many of the collections of the curious, and has been figured and described by Clusius and others under the name of a round exotic fruit rigid with four rising nerves.

These are the principal kinds of fruits thus tossed on shore with us; but how the products of Jamaica, or other parts of America, should be brought to the shores of Scotland and Ireland, seems difficult to determine on any certain foundation. It is easy to conceive, that when they grow by the sides of rivers, they may fall off from the trees into them, and be thence conveyed into the sea. It is likewise easy to see, that when they are thus floating on the surface of the sea, they may be carried about by the winds and currents to a considerable distance; but their motion this way must naturally be stopped by the main continent of America, and they must be forced through the gulf of Florida, or the canal of Bahama, going thence constantly east, and into the North American sea. This is easily conceived by a similar fact which happens every day; which is, that a kind of sea lentil, called *jirgasso*, which grows very plentifully on the rocks about Jamaica, is washed off from thence, and carried by the winds and currents, which for the most part go impetuously the same way, toward the coast of Florida, and thence into the North American ocean, and is there found floating on the surface. Thus far it is easy to trace our fruits from their native soil: but how after this they should be forwarded to us is unaccountable, unless we suppose, that as ships when they go south expect a trade easterly wind, and when they come north expect and generally had a westerly wind, for at least two parts in three of the year; so these fruits being brought north by the current from the gulf of Florida, are put into the way of these westerly winds, and by them conveyed to the coasts of Scotland and Ireland. Philosoph. Transact. N^o 222. p. 300.

By the same means that these beans came to Scotland, it is reasonable to believe that the same winds and currents brought from America those several things towards the Azores and Porto Santo, which are recorded by Ferdinand Columbus in the life of his father; which gave this bold adventurer the first notion that there was such a place as Ame-

rica. Among the things he mentions as washed ashore in this manner, was a piece of wood very ingeniously wrought, but evidently without the help of iron tools. This was taken up by a Portuguese pilot, four hundred and fifty leagues from shore, off cape St. Vincent, after a west wind which had blown violently for many days; after this such another piece of wood was taken up on the shore of Porto Santo, after such another long and violent west wind. Large canes, vastly superior to any of the growth of the then known parts of the world, were also found thrown on the same shores, and the fruits of pines which did not grow in any known part of the world; and finally the bodies of two men appearing to be of a different nation from any of the known people, and two of the canoes, were driven on shore on the island Flores, one of the Azores. All these things having been found only after strong and continued west winds, it appeared very evident, that there must be land somewhere to the west, where fruits and men were to be found; and that these men had no knowledge of our arts, by their want of iron. From these conjectural conclusions sprung the greatest discovery of modern times.

BEAN Stalks. The ashes of bean stalks make good and clear glass.

BEAN Tree, Erythrina. See CORALLODENDRON.

BEAN Tree, linding. See MIMOSA.

BEAN Trefoil. See ANAGYRIS, and CYTISUS.

BEAN is also used by some *Anatomists* to denote the *glans of the penis*, on account of its figure and resemblance to that pulse.

BEAN is also improperly used for a weight, containing the third part of a scruple.

BEANA, in *Ancient Geography*, a town of Asia, placed by Ptolemy in Babylonia.

BEAR, in *Astronomy*, a name given to two constellations called *the Greater* and *the Lesser Bear*, or *Ursa major* and *minor*.

The pole star is said to be in the tail of the *Lesser Bear*; this star is never above two degrees distant from the north pole of the world. See URSA.

BEAR, or **BERE**, in *Agriculture*, is a species of barley cultivated in Scotland and Ireland, and the northern parts of England. It yields a large return, but is not esteemed so good for malting as the common barley.

BEAR, in *Zoology*. See URSUS.

BEAR, Ant. See TAPIR, and ANT-EATER.

BEAR, Polar. See POLAR Bear and URSUS.

BEAR, Sand, is supposed to be a variety of the badger, or URSUS *Meles*, and the same animal which naturalists have described under the name of the "sow-badger." Its colour is a yellowish white; its eyes are small, and its head thicker than that of the common badger; its legs are short, and on each foot are four toes, armed with sharp white claws. It is almost without hair, very sensible of cold, and burrows in the ground.

BEAR, Sea. See SEA-Bear.

BEAR'S Flesh, was much esteemed by the ancients: even at this day the paw of a bear salted and smoked is served up at the tables of princes.

Bear's flesh is reckoned one of the greatest rarities among the Chinese; insomuch that, as Du-Hakle informs us, the emperor will send fifty or a hundred leagues into Tartary, to procure them for a great entertainment. The flesh is reckoned such a dainty among the inhabitants of Kamtschatka, that they seldom eat it alone, but usually invite a number of guests to partake of the delicious repast. The intestines also, when cleansed and properly scraped, are worn by the fair-sex as masks to guard their faces from the sun-beams,

which being reflected from the snow, are generally found to blacken the skin; by which means the Kamtshadale ladies preserve a fine complexion. The Russians of Kamtshatka make window-panes of these intellines, which are as clear and transparent as those made of Muscovy glass. Of the shoulder blades of the bear are made sickles for cutting grass; and the heads and the haunches are hung up by the Kamtshadales, as ornaments or trophies, on the trees about their dwellings.

BEAR's *Grease*, is esteemed by some a sovereign remedy against cold disorders, especially rheumatifins. Some have also employed it with success in the gout, and against tumors and ulcers. To be good, it must be newly melted, greyish, glutinous, of a strong disagreeable smell, and a moderate consistence. That which is too white is adulterated with common tallow. It is now much used by hair-dressers, and is said to be of service in thickening the hair, and for other purposes.

The inhabitants of Kamtshatka hold in high estimation the fat of the bear, as a very savoury and wholesome nourishment; and when melted and thus rendered fluid, it supplies the use of oil.

BEAR's *Skin*, makes a fur in great esteem, and on which depends a considerable article of commerce, being used in housings, on coach-boxes, &c. In some countries, cloaths are made of it, more especially bags wherein to keep the feet warm in severe colds. Of the skins of bears' cubs are made gloves, muffs, and the like. It is used in Russia for beds, covertures, caps, gloves, and collars for their sledge-dogs. Those who traverse the ice for the capture of marine animals make their shoe-soles of bears' skin, which prevents the danger of slipping. A light black bear skin is one of the most comfortable and costly articles of the winter wardrobe of a man of fashion at Petersburg or Moscow; and even the small white hand of a belle is slipped into the large bear muff, which covers the half of her elegant shape. The exportation of bear-skins forms a very considerable article of Russian commerce, independently of those that are used for home consumption.

BEAR *Garden*, a place where bears and other beasts are exposed as a public spectacle to be baited. See BAITING.

BEAR, *hunting and killing of the*. The bear is in a variety of respects so useful an animal in Russia and northern countries, that the inhabitants have devised several ingenious methods of taking and destroying them. The most usual way of killing this animal is with fire arms, and spears or darts. The Laplanders knock them down with clubs, as they can easily overtake them in running with their snow-shoes; but they are generally first shot, and then dispatched with spears. In some parts of Siberia, the hunters erect a scaffold of several balks laid on one another, which falling down, crushes the bear, on his slipping upon the trap placed under it. Another method is to dig pits, in which is fixed a smooth, solid, and very sharp-pointed post, which rises about a foot above the bottom. The pit is carefully covered with sods, and across the track of the bear is stretched a thin rope with an elastic bug-bear. As soon as the bear touches the rope, the wooden bug-bear starts loose; and the scared animal, endeavouring to save himself by flight, falls with violence into the pit, and is killed by the pointed post. If he escape this snare, at a small distance, perhaps, several caltrops (see CALTROP) and other instruments of annoyance await him, amongst which a similar terrific log is erected, and where the persecuted beast, the more he strives to get free, fixes himself more firmly to the spot at which the blood-thirsty hunter lies in ambush for him. The Koriaks find out a crooked tree, which is grown up in the form of a gibbet, and at the

bent summit of it they attach a noose, with a bait suspended to it. The hungry bear, thus allured, eagerly climbs up the tree, and on his moving the branch, the noose draws to gether, and the animal remains suspended to the tree. But the method adopted by the inhabitants of the mountainous parts of Siberia to make this ferocious animal kill himself is more singular and ingenious. They fasten a very heavy block to a rope, terminating at the other end with a loop. This is laid near a steep precipice on the path which the bear usually takes. On having his neck in the noose, and finding that he cannot proceed on account of the clog, he takes it up in a rage, and to free himself from it, throws it down the precipice, which of course pulls him after it, and he is commonly killed by the fall. Should this accidentally not be the case, he drags the block again up the acclivity, and renews his efforts, till with increasing fury he either sinks to the ground, or kills himself by a decisive plunge.

The white or polar bear (*Ursus Maritimus*) lives on the coast of the Frozen ocean, and in some of the eastern and northern isles, where the chase of him is a collateral occupation of the mariners who visit these coasts for the capture of the morie. Black bears are so numerous in Kamtshatka, that they are seen roaming about the plains in troops, and must long since have been exterminated, if they were not here more tame and gentle than in any other part of the world. In spring, they descend from the mountains where they have wintered, to the mouths of the rivers for catching fish, which swarm in all the streams of that peninsula. If the fish are plentiful, they eat only the heads; and when they find nets laid in any place, they dexterously drag them out of the water, and empty them of the fish. Towards autumn, when the fish go up the rivers, they advance with them gradually to the mountains. When a Kamtshadale espies a bear, he endeavours to conciliate his friendship at a distance, accompanying his gestures by courteous words. Indeed they are so familiar, that the women and girls, when they are gathering roots and herbs, or turf for fuel, are never disturbed in their employment, even in the midst of a whole drove of bears; and if one of these animals comes up to one of them, it is merely to take something out of their hands. They have never been known to attack a man, except when they are roused from their sleep, and they seldom turn upon the marksmen whether they be hit or not. Notwithstanding this gentleness of the bear, its utility renders it a valuable object of prey. When the hunter and the bear meet, the contest is generally bloody, but it generally terminates to the advantage of the artful huntsman. Armed with spears and clubs, the Kamtshadale goes in quest of the peaceful bear in his calm retreat; who, thinking only of his defence, takes the faggots brought by his pursuer, and choaks with them the entrance into his den. The mouth of the cavern being closed, the hunter bores a hole through the top, and then with the greatest security spears his defenceless foe. Tooke's View of Russia, vol. ii. p. 442, &c.

Dr. Barton, in his "Fragments of the Natural History of Pennsylvania," informs us, that the bears migrate in great numbers, every autumn across the Mississippi, proceeding south, perhaps to the mountains of New Mexico, in search of a milder climate. In the spring they return again by the same route. This migration of the bears is particularly observed at Manchar, on the Mississippi.

BEAR *leading*, to shew tricks, is an ancient practice, which we find prohibited in the canons of the church. Du-Cange.

BEAR *wards ursarii*, were a kind of servants in great families among the Romans, who had the care of breeding and feeding those animals. Pitisc. Lex. Ant. tom. ii.

p. 1110. Our nobility had formerly officers of this kind. The annual salary of one of them belonging to the fifth earl of Northumberland was twenty shillings. Northumb. Household Book.

BEAR-Tribe, in *Geography*, one of the tribes into which the American Indians of the Six Nations are distributed. See SIX-NATIONS.

BEAR, *Order of the*, was a military order in Switzerland, erected by the emperor Frederic II. in 1213, by way of acknowledgment for the service the Swifs had done him, and in favour of the abbey of St. Gal. To the collar of the order, which was a gold chain interlaced with a chaplet of oak-leaves, hung a medal of gold, on which was represented a bear raised on an eminence of earth; or a bear fable on a ground vert.

BEAR-berry, in *Botany*. See ARBUTUS.

BEAR-blind. See CONVULVUS.

BEAR'S breech. See ACANTHUS.

BEAR'S ears. See PRIMULA *Auricula*.

BEAR'S ears fanile. See VERBASCUM.

BEAR'S foot. See HELLEBORUS.

BEAR-a-hand, a naval term, synonymous with make haste, or dispatch. See BEARING.

BEAR'S Bay, in *Geography*, or *Little Port*, lies at the east end of Anticosti island, at the mouth of the river St. Lawrence, in North America.

BEAR'S Bay, or *Whit-Bear Bay*, is a very deep bay on the south coast of the island of Newfoundland, towards its west end.

BEAR'S Cape, the south-east point of St. John's island, near Nova Scotia, in North America. N. lat. 45° 53'. W. long. 62° 40'.

BEAR Cove, lies on the east side of the south-eastern corner of the island of Newfoundland, at the head of which is the settlement of Formose. It is a good fishing-place for boats. Reneau's rocks are situated between Bear-Cove and Fresh-water bay on the south, 32 miles northerly from cape Race.

BEAR Creek, a water of Tennessee river. See OCCO-CHAPPO.

BEAR'S Graf-Creek, a small creek on the eastern side of Ohio river, north of the town of Louisville, in Kentucky, and near it. A canal is proposed to be cut from this creek to the rapids of the Ohio, which would render the navigation of this river safe and easy. The country on the side of this creek, between Salt river and Kentucky river, is rich and beautiful.

BEAR Island, an island near the entrance of Bantry bay, in the county of Cork, Ireland. It is about six miles long, and is very craggy, mountainous, and rugged, but is of great use in defending the noble bay from the fury of the south-west winds, so that vessels within the land may ride secure. N. lat. 51° 35'. W. long. 9° 45'. The whole bay was formerly called *Bearlawn*; but this name is now confined to that part between the island and the peninsula of *Bear*, on which is the small town of Castleton. South-Cork. Beaufrt. See BANTRY.

BEAR, and BANTRY, the name of a barony in the western part of the county of Cork, Ireland, which is very mountainous, and with the adjacent parts of Carbery and Muskerry, is the forest and best improved part of the county.

BEAR, North, a small island in St. John's bay, Hulfon's bay. N. lat. 54° 40'. W. long. 80°. — Another small island in the same bay is called *South Bear*. N. lat. 54° 35'. W. long. 80°.

BEAR, or Cherry Island, lies on the coast of Greenland, N. lat. 74° 28'. E. long. 17° 53'.

BEAR Lake, Great, is situated in the north-west part of North America, near the Arctic circle, in N. lat. 65°, and W. long. 121°; and a river flows from it in a W. N. W. course, called Great Bear river, which runs into Mackenzie's river.

BEAR Lake, Black, lies in New South Wales, North-west from Cumberland house. N. lat. 53° 30'. W. long. 107° 30'.

BEAR Lake, White, lies due west from another small lake called Bear lake, both in N. lat. 48° 15'; and the former in W. long. 98° 30'. These lakes are said to give rise to the river Mississippi.

BEARS, White, Point of, the east point of St. Peter's river, on the coast of Labrador, in North America, so called from the great number of bears that were seen there. N. lat. 51° 55'. W. long. 55° 30'.

BEAR'S Port, one of the ports on the coast of Nova Scotia, in North America, between port and cape de l'Heve to the north-east, and cape Sable, the south-west point of Nova Scotia.

BEAR River, a river of the north-west part of North America, which runs into the Unjigah, or Peace river, in N. lat. 56° 12'. W. long. 119° 28'.

Great BEAR River. See BEAR Lake.

BEAR Rocks, New, are situated about south by west from the extreme west point of the island of Jamaica. N. lat. 16° 20'. W. long. 78° 55'.

BEAR Sound, or *Barfund*, lies on the west coast of West Greenland. N. lat. 62° 20'. W. long. 49°.

BEAR Town, a town of America, in Caroline county, Maryland, about 7 miles north of Greensburg, and about 15 south-east from Chester-town.

BEAR, to, denotes to bring forth young, or to produce fruit.

BEARALSTON, in *Geography*. See BEERALSTON.

BEARD, JOHN, in *Biography*, an energetic English singer, and an excellent actor, was brought up in the king's chapel. He knew as much of music as was necessary to sing a single part at sight; and with a voice that was more powerful than sweet, he became the most useful and favourite singer of his time, on the stage, at Ranelagh, at all concerts; and in Handel's oratorios he had always a capital part; being by his knowledge of music the most steady support of the chorusses, not only of Handel, but in the odes of Green and Boyce. Having married for his second wife a daughter of Rich, the patentee of Covent-garden theatre, upon the death of his father-in-law, he became manager of that play-house, and discontinued all public singing; which a deafness that had been long increasing rendered necessary. His first marriage was with a lady of quality, a sister of the late Earl of Walgrave, to whom he was a very indulgent and tender husband; and he proved himself to be a man of honour and principle in every transaction of his life. There were so much intelligence and humour in his acting and singing comic parts on the stage, and Scots and Irish ballads in private, as well compensated for deficiencies of voice. He was closely united by friendship to Dr. Boyce, in the performance of whose music he manifested a zeal and even a partiality which were not discoverable for that of any other composer. He died in 1791.

BEARD, in *Geography*, a town of France, in the département of Nièvre, and chief place of a canton in the district of Decize, on the Loire; 10 miles S. E. of Nevers.

BEARD, in *Physiology*, the hair growing on the chin, and adjacent parts of the face; chiefly of adults and males.

Various have been and still are the ceremonies and customs of different nations with regard to the beard: Kingdon assures us, that a considerable branch of the religion of the Tartars consists in the management of their beards; and that they waged

waged a long and bloody war with the Persians, and declared them infidels, though, in other respects, of the same faith with themselves, merely because they would not cut their whiskers after the mode or rite of the Tartars. The Spartans, from the age of 20 years, suffered their hair and beards to grow: the hair being deemed an ornament, which became the freeman and warrior. A Spartan being once asked why he wore so long a beard, replied, "Since it is grown white it incessantly reminds me not to dishonour my old age." Nevertheless, as they were accustomed to obedience, even in things the most indifferent, the ephori, when they entered on office, proclaimed, by sound of trumpet, a decree, commanding the people to shave their upper lips, and to submit to the laws. The Egyptian priests shaved the head, chin, and whole body. Accordingly, most of the Egyptian figures are without beard. However, Herodotus informs us, that in time of calamity, they suffered their beard and hair to grow. The Assyrians had long beards; and Chrysofom observes, that the kings of Persia had their beards woven or matted together with gold thread; and some of the first kings of France had, in the same manner, their beards matted and knotted with gold. The Africans wore long beards, as may be seen on the medals of Juba. The Greeks, if tradition may be credited, wore long beards from their heroic times. Cedrenus informs us, that at Constantinople, in the thermæ of Zeuxippus, there was a statue of Homer with a long beard.

Athenæus, from Chrysofom, observes, that the Greeks always wore their beards till the time of Alexander; and that the first who cut it at Athens ever after bore the addition of *νοστις*, *shaven*, on medals. Plutarch adds, that Alexander commanded the Macedonians to be shaven, lest the length of their beards should give a handle to their enemies: however this be, we find Philip, his father, as well as Amyntas and Archelaus, his predecessors, represented on medals without beards. The Greeks continued to shave the beard till the time of Justinian, under whose empire long beards came again into fashion, and so continued till Constantinople was taken by the Turks. The Greek philosophers distinguished themselves from the vulgar by their long beards. According to Laertius (l. vi.) Antisthenes was the first of the philosophers who suffered his beard to grow. This custom, however, among the philosophers, was not invariable, for the scholiast of Aristophanes (Nub. 120.) pretends, that the ancient philosophers shaved their beards. The Roman philosophers affected to preserve the same distinctive characters of the mantle and long beard.

Thus Horace describes them :

———"Tempore quo me
Solatus jussit sapientem pascere barbam."

Sermon. l. ii. sat. iii. v. 34.

Aulus Gellius and Lucian express themselves in a similar manner. Persius seems to have been so convinced of the beard's being the symbol of wisdom that he thought he could not bestow a greater encomium on Socrates than calling him "Magistrum barbatum." The Sicilians, and the Etruscans, adopted the customs of the Greeks. The latter exhibited all their deities with a beard, except Vulcan, but on the medals of the former their kings appear without a beard.

The Romans for a long time wore beards and long hair. Cicero in his oration for Cælius, (c. 14.) mentions the "barba horrida, quam in statuis antiquis & imaginibus videmus." Livy (v. 51.) speaking of the senators, who remained in Rome, after the entrance of the Gauls, says that they wore a very long beard: "barbam, ut tum omnibus promissa erat." Scipio Africanus appeared with a long beard in his interview with Masinissa. Hence Ovid calls the ancient Romans "intonfi;" thus,

"Hoc apud intonfos nomen habebat avos." Fæst. ii. 26. Juvenal also (Sat. xvi.) describes them in the same manner.

"Et credam dignum barbâ, dignumque capillis
Majorum."

Pliny observes, that the Romans did not begin to shave till the year of Rome 454, when P. Ticinius brought over a number of barbers from Sicily; he adds, that Scipio Africanus was the first who introduced the mode of shaving every day. The philosophers, however, retained the beard; and the military men wore it short and frizzled, as we see it upon the triumphal arches, and other monuments. In time of grief and affliction they suffered their beard and hair to grow, as was the case with M. Livius in his retirement from Rome, and with Augustus after the defeat of Varus. The Greeks, on the contrary, in time of grief, cut their hair and shaved their beards, (Seneca Benef. v. 6.) which was also the custom among some barbarian nations. Accordingly, the custom of letting the beard grow is a token of mourning in some countries, and of shaving it in others. The first fourteen Roman emperors shaved, till the time of the emperor Adrian, who retained the mode of wearing the beard. Plutarch tells us he did it to hide the scars in his face.

Antoninus Pius and Marcus Aurelius wore a beard under the character of philosophers. The successors of Justinian resumed the habit of wearing beards, and the latter Greek emperors had them of an extraordinary length. The ancient Britons in the time of Cæsar shaved the rest of the body, except the head and upper lip: "Capillos ac barbam radere præter caput, et labrum superius." Bell. Gall. l. v. c. 14. Diodorus Siculus and Tacitus inform us, that the ancient Germans shaved the beard, except that on the upper lips; and, among the Catti, a nation of Germany, a young man was not allowed to shave or cut his hair till he had slain an enemy. Tac. de Mem. Germ. 31. Among the Jews it was reckoned ignominious to shave a person's beard. 2 Sam. x. 4. Strabo relates, that the Indian philosophers, the Gymnosophists, took great pains to attract the veneration of the people by the length of their beards. The Goths and Franks wore only a mustache, called by Plutarch *μυστακα*, and by the Latins "crisla." While the Gauls were under their sovereignty, none but the nobles and Christian priests were allowed to wear long beards. When the Franks made themselves masters of Gaul, they assumed the same authority as the Romans; the bondsmen were expressly ordered to shave their chins; and this law continued in force till the entire abolition of servitude in France. In the time of the first race of kings, a long beard was a sign of nobility and freedom; and the kings were emulous to have the largest beards. Eginard, secretary to Charlemagne, speaking of the last kings of the first race, says, they came to the assemblies in the field of Mars, in a carriage drawn by oxen, and sat on the throne with their hair dishevelled, and a very long beard.

It is not easy to fix with precision the time when the beard was first shaven among the young Romans. It was sometimes when the toga virilis was assumed, according to Suetonius (Calig. 10.) Macrobius (Somn. Scip. i. 6.) says, it was about the age of 21. Augustus did not shave before the age of 25. Hence young men with a long down, or "lanugo," upon the chin, were called "juvenes barbati," or "benè barbati." The first growth of the beard was consecrated to some god, usually to the Lares. Nero consecrated his in a golden box, set with pearls, to Jupiter Capitolinus. The day on which the young men, among the Greeks and Romans first shaved the beard, was a festival; visits of ceremony were paid them; and they received presents from their friends. To this purpose, Juvenal says, Sat. iii. 186.

"Ille

"Ille metit barbam, crinem hie deponit amari:
 "Plena domus libis genialibus."

Slaves, among the Romans, wore their beard and hair long; when manumitted they shaved the head in the temple of Teronina, and put on a cap, or "pileus," as a badge of liberty. Those who escaped from shipwreck, shaved their heads; and persons acquitted of capital crime, cut their hair and shaved, and went to the capitol to return thanks to Jupiter.

Persons of quality had their children shaved the first time by one of the same, or greater quality, who by this means became their fathers, or adoptive fathers of the children. Anciently, indeed, a person became god-father of the child by touching his beard; thus historians relate, that one of the articles of the treaty between Alaric and Clovis was, that Alaric should touch the beard of Clovis to become his god-father.

As to ecclesiastics, the discipline has been very different on the article of beards: sometimes they have been enjoined to wear them from a notion of too much effeminacy in shaving, and that a long beard was more suitable to the ecclesiastical gravity; and sometimes again they were forbid it, as imagining pride to lurk beneath a venerable beard. The Greek and Romish churches have long disputed together about their beards; since the time of their separation, the Romanists seem to have given more into the practice of shaving, by way of opposition to the Greeks; and have even made some express constitutions "de radendis barbis." The Greeks, on the contrary, espouse very zealously the cause of long beards, and are extremely scandalized at the beardless images of saints in the Roman churches.

By the statutes of some monasteries, it appears, that the lay-monks were to let their beards grow, and that the priests among them to shave; and that the beards of all that were received into the monasteries were blessed with a great deal of ceremony; and there are still extant the prayers used in the solemnity of consecrating the beard to God, when an ecclesiastic was shaven.

Le Comte observes, that the Chinese affect long beards extravagantly; but nature has balked them, and only give them very little ones, which, however, they cultivate with great care; the Europeans are strangely envied by them on this account.

The Russians wore their beards till within these few years, when the czar Peter enjoined them all to shave; but, notwithstanding his injunction, he was obliged to keep on foot a number of officers to cut off by violence the beard of such as would not otherwise part with them. For enforcing his regulations, which was violently opposed, he laid a tax on long beards, and many submitted to it rather than part with their beard, which was universally held to be an ornament to the person. Superstitious Russians even thought it to be an external characteristic of the orthodox faith; and those who were too poor, or too parsimonious, to pay the tax for retaining the beard, religiously preserved the beard that was shorn off, and had it deposited in the coffin with them on their decease, that they might present it to St. Nicholas, on his refusing to admit them as beardless christians, into the kingdom of heaven. As a proof of the high estimation in which the beard was held in Russia in early times, it is a law in the Novgorod an code, that whoever plucks hair from another's beard shall be indicted four times as much as for cutting off a finger.

In the 10th century, king Robert of France, the rival of Charle the simple, was not more famous for his exploits than for his long white beard, which he suffered to hang down on the outside of his surcoat, to encourage the troops in battle, and to rally them when defeated. Upon the death of the

great Henry IV. of France, who was succeeded by a beardless youth, the beard was proscribed. Louis XIII. ascended the throne of his glorious ancestor without a beard; and his courtiers immediately reduced their beards to whiskers, and a small tuft of hair under the lower lip. The duke of Sully, however, though he encountered ridicule, would never adopt this effeminate custom. Whiskers continued in fashion in the commencement of the reign of Louis XIV. who, as well as his courtiers, were proud of wearing them; so that they were the ornament of Turenne, Coadé, Colbert, Corneille, Moliere, &c.

In Spain, Philip V. ascended the throne with a shaved chin; and the courtiers imitated the prince, and their example was followed by the people. The change, however, produced lamentations and murmur. Hence arose the Spanish proverb, denoting, "Since we have lost our beards, we have lost our souls." The Portuguese, whose national character is much the same, have imitated them in this respect. Accordingly we read, that in the reign of Catherine queen of Portugal, when the brave John de Castro had taken the Calle of Din, in India, he was under the necessity of borrowing from the inhabitants of Goa a thousand pistoles for the maintenance of his fleet; and that as a security for the loan, he left them one of his whiskers, telling them "all the gold in the world cannot equal the value of this national ornament of my valour; and I deposit it in your hands as a security for the money." The inhabitants of Goa, it is said, generously returned both the money and his whiskers.

We have already observed, that the ancient Britons, in the time of Cæsar, shaved the body, except the beard and the upper lip; the hair of which they, as well as the Gauls, allowed to grow to a very inconvenient length. The Anglo-Saxons, on their arrival in Britain, and for a considerable time after, allowed their beards to grow, as well as their near neighbours the Longobards, to whom in every respect they bore a near resemblance. After the introduction of Christianity, their clergy were obliged to shave their beards, in obedience to the laws, and in imitation of all the western churches. This distinction between the clergy and the laity subsisted for some time; and a writer of the seventh century complains, that the manners of the clergy were so corrupted that they could not be distinguished from the laity by their actions, but only by their want of beards. By degrees the English laity began to imitate the clergy so far as to shave all their beards except their upper lips, on each of which they left a lock of hair; by which they were distinguished from the French and Normans, who shaved their whole beards. The Normans had as great an aversion to beards as they had a fondness for long hair. Among them, to allow the beard to grow, was an indication of the deepest distress and misery. They not only shaved their beards themselves, but when they had authority, they obliged others to imitate their example. It is mentioned by some of our ancient historians, as one of the most wanton acts of tyranny in William the Conqueror, that he compelled the English, who had been accustomed to allow the hair of their upper lips to grow, to shave their whole beard. This was to disagreeable to some of that people, that they chose rather to abandon their country than resign their whiskers. In the fourteenth century long beards were in fashion, and continued to the sixteenth century; so that in the reign of Mary I. the beards of bishop Gardiner and cardinal Pole, appear in their portraits to be of a most uncommon size. The lawyers, however, had a regulation imposed upon this important feature. Toward the close of the sixteenth century, the beard was much lessened, and gradually divided into mutton-chin or whiskers; and in process of time the practice of shaving the whole face became universal.

Among

Among the Turks, it is more infamous for any one to have his beard cut off, than among us to be publicly whipt, or branded with a hot iron. They who serve in the seraglio have their beards shaven as a token of servitude; and when they are set at liberty, they permit it to grow. With them and the Persians the beard is a mark of authority and liberty; and the want of mustachios and beards discriminates slaves and women. Hence, it is said, arises the unfavourable idea which they form on the first sight of an European. There are many in that country who would prefer death to this kind of punishment. The Arabs make the preservation of the beard a capital article of religion, because Mahomet never cut his. The Moors of Africa hold by their beards while they swear, in order to give validity to their oath, which after this formality they rarely violate.

The Turkish wives kiss their husbands' beards, and children their fathers', as often as they come to salute them. The men kiss one another's beards reciprocally on both sides, when they salute one another in the streets, or come off from a journey.

The Jews wear a beard on the chin, but not on the upper lip or cheeks. Moses forbids them to cut off entirely the angle or extremity of their beard; that is, to imitate the Egyptian fashion, who left only a small tuft at the extremity of the chin; whence the Jews to this day suffer a little fillet of hair to grow from the lower end of their ears to their chins, where, as well as on their lower lips, their beards form a pretty long bunch. In time of mourning the Jews neglected to trim their beards, that is, to cut off what was superfluous on the upper lips and cheeks. In time of great affliction they also plucked off the hair of their beards.

It has been advanced by several historians and travellers, that the Indians of America differed from other males of the human species in the want of one very characteristic mark of the sex, viz. that of a beard. From this general observation, the Esquimaux have been excepted; and hence it has been supposed, that they had an origin different from that of the other natives of America. Mr. Causland, after ten years residence at Niagara, in the midst of the Six Nations, with frequent opportunities of seeing other nations of Indians, affirms, that they do not differ from the rest of men in this particular more than one European differs from another; and as this imperfection has been attributed to the Indians of North America, equally with those of the rest of the continent, he inclines to think, that the assertion is as void of foundation in one region as it is in the other. All the Indians of North America, says this writer, except a very small number, who, from living among white people, have adopted their custom, pluck out the hairs of the beard; and as they addict themselves to this practice from its first appearance, it may be supposed, that to a superficial observer, their faces will seem smooth and beardless. As farther proofs that they have beards, he alleges that all of them have an instrument which they use for plucking out the hairs; that when they neglect this for some time, hairs sprout up, and are seen upon the chin and face; that many Indians allow tufts of hair to grow upon their chins or upper lip; and that several of the Mohocks, Delawareans, and others, who live among white people, sometimes shave with razors, and sometimes pluck their beards out. Accordingly, colonel Butler affirms, that the men of the Six-Nation Indians have all beards naturally, which is also the case with respect to all other nations of North America, which he has had an opportunity of seeing; but that it is the general practice of the Indians to pluck out the beard by the roots from its earliest appearance; and hence their faces appear smooth. The same fact is confirmed by Captain Brent. Phil. Transf. vol. lxxxvi. p. 229. &c.

BEARD, *anointing the*, with unguents, is an ancient practice both among the Jews and Romans, and still continues in use among the Turks; where one of the principal ceremonies observed in serious visits, is to throw sweet-scented water on the beard of the visitant, and to perfume it afterwards with aloes wood, which sticks to this moisture, and gives it an agreeable smell, &c.

In *Middle age Writers* we meet with *adlentare barbam*, used for stroking and combing it to render it soft and flexible.

The Turks, when they comb their beards, hold a handkerchief on their knees, and gather very carefully the hairs that fall; and when they have got together a certain quantity, they fold them up in a paper, and carry them to the place where they bury the dead.

BEARD, *plucking the*, was practised to Cynics by way of contempt. The Stoics, as well as Cynics, affected to be insensible to injury, and their patience was tried by this practice. Socrates was not exempt from this species of insult and persecution, as we are informed by Diogenes Laertius. Horace says to a person of this description:

“———Vellunt tibi barbam

Laseivi pueri.”

Sermon. Sat. 3, 133.

And Persius (Sat. i. 133.)

“Si Cynico barbam petulans Nonaria vellat.”

The same satyrist represents Jupiter as offering his beard to be plucked by Dionysius the tyrant:

“Idcirco flodiam præbet tibi vellere barbam
Jupiter.”

Some authors also speak of *mortgaging the beard*, *barbam hypothecare*. Du-Cange.

BEARD, *touching the*, was an action anciently used by supplicants, and by those who made vows. An instance of this is found in Homer (Il. κ. 454.): and Pliny (ii. 45.) says, that the ancient Greeks had a custom of touching the chin of a person, whose compassion they wished to excite; the chin being substituted for the beard. Instances of a singular kind occur in the Orestes and Hecuba of Euripides. To touch any one's beard, or cut off a small part of it, was among the ancient French, the most sacred pledge of protection and confidence. For a long time all letters, issuing from the sovereign, had, for greater satisfaction, three hairs of his beard in the seal. A charter of 1121, still extant, concludes with the following words: “Quod ut ratum et stabile perseveret in posterum, presentis scripto sigilli mei robur apposui cum tribus pilis barbæ meæ.”

BEARD, *false*, *barba falsa*, was an artificial one. In a general court of Catalonia, held in 1351, it is expressly enjoined, “Ne quis barbam falsam seu fictam audeat deferre vel fabricare.” Du-Cange.

Hottoman has given an elegant dialogue *de barba*, first printed by Plantin in 1586.

BEARD, or *under-beard*, called also *chuck*, of a horse, is that part under the lower mandible on the outside, and above the chin, which bears the curb of the bridle.

BEARD, *old-man's*, in *Botany*. See CLEMATIS.

BEARD of a Comet, denotes the rays which the comet emits towards that part of the heavens to which its proper motion seems to direct it. Thus, the beard of the comet is distinguished from the *tail*, which is understood of the rays emitted towards that part from which its motion seems to carry it. It is called beard from some fancied resemblance it bears to the beard of a man; or because it is projected before the comet.

BEARD, in *Conchology*, the byssus of the *pinna*, the *muscle*, &c. an assemblage of threads or hairs of a stout texture that hangs from the body of the animal, and by means of which

it fastens itself to stones, or any other heavy substance; the hairs of the beard terminating in a spongy substance, that adheres very tenaciously to the smoothest surfaces. The thread of this kind of byssus is sometimes woven as an object of curiosity into gloves, stockings, &c. and in point of durability at least, cannot be inferior to any other material that could be employed for that purpose. Some notice is taken of this among ancient writers, who speak of it as a kind of silk. See SILK.

BEARDED, *barbutus*, denotes a person or thing with a beard, or some resemblance thereof.

In *Middle Age Writers*, this is sometimes expressed by *malibarbis*, q. d. *barba in malis seu genis*.

The faces on ancient Greek and Roman medals are generally bearded. Some are denominated *pogonati*, as having long beards, e. gr. the Parthian kings. Others have only a *lanugo* about the chin, as the Seleucide family. Adrian was the first of the Roman emperors who nourished his beard: hence all imperial medals before him are beardless: after him, bearded.

The medals of gods, and heroes, in vigorous youth, represent them beardless, except Jupiter, and a few others.

The Romans paid their worship to a bearded Venus, *Terreri barbata*, supposed to have been of both sexes; a statue of whom was also found in the isle of Cyprus. The reason of representing the goddess of beauty with a beard is variously guessed at by the learned.

BEARDED women have been all observed to want the menstrual discharge; and several instances are given by Hippocrates, and other physicians, of grown women, especially widows, in whom, the menses being stopped, beards appeared. Eusebius Nieuembergius mentions a woman, who had a beard reaching to her navel. Bartholin speaks of a bearded woman at Copenhagen, who partly, in virtue thereof, passed for an hermaphrodite.

BEARDED brothers, fratres barbati, in *Ecclesiastical Writers*, are those otherwise called *fratres conversi* in the order of Grammont and the Cistercians. They took this denomination because they were allowed to wear their beards contrary to the rule of the professed monks.

BEARDED hulk, among *Florists*, a hulk which is hairy on the edge, as is that of the rose, &c.

BEARDING, in *Carpentry*, denotes diminishing any piece of timber from a given line on its surface, to make the thickness less on the edge.

BEARDING of wool, in the *Manufacture*. See WOOL.

BEARDSTOWN, in *Geography*. See BAIRDSTOWN.

BEARER, in *Architecture*, any subsidiary or intermediate support in aid of the principal supports, as the small joists or brackets which bear a gutter or the covering board of a cornice, the piers and blockings under the joints of a ground floor: or the joists, &c. which bear any thing independent of or unconnected with the building, as the bearers of a colon, of a vat, of a platform.

BEARERS, gestantes, in *Middle Age Writers*, are sometimes used for a child's godfathers, because they hold the infant in their arms, and present him to the priests in the ceremony of baptism. Du-Cange.

BEARERS of a bill of exchange, denote the persons in whose hands it is, and in favour of whom the last order or indorsement was made. See BILL OF EXCHANGE.

When a bill is said to be payable to bearer, it is understood to be payable to him who first offers himself after it becomes due. To be paid a bill of this kind, there needs neither order nor transfer; yet it is good to know to whom it is paid.

VOL. IV.

BEARERS are more particularly used for those who carry the dead to their graves.

In a sense somewhat different from this, we also say *pull-bearers*, &c.

The ancients had peculiar orders or officers of bearers, called by the Greeks *νεπιταται*; by the Romans, *lecticarii*. The *vespillones*, or *bajuli*, were a lower sort of bearers, appointed for persons of inferior rank.

BEARERS, in *Horticulture*, denote the fruit branches, or such as bear fruit.

The bearers, or bearing branches of an apple-tree, and the like, are found to be rougher, and fuller of asperities in their bark, than the other branches.

BEARERS, in *Heraldry*, see SUPPORTERS.

BEARER, Cross. See CROSS.

BEARERS, in *Law*, denote such as bear down and oppress others, and are said to be the same with maintainers. By stat. 4 Edw. III. c. 11. justices of assize shall enquire of, hear, and determine maintainers, bearers, and conspirators, &c.

BEAR-HAVEN, in *Geography* a commodious harbour formed by the island of Bear, near the mouth of Bantry bay in the county of Cork, Ireland, into which ships of war and merchantmen often put for shelter; but the adjoining village of Castletown affords them few resources, and no accommodation. Beaufort's Memoir.

BEARING, in *Geography* and *Navigation*, the situation of one place from another, with regard to the points of the compass; or the arc of the horizon, that lies between the meridian of a place and a line passing from that place to another; or the angle which a line drawn through the two places makes with the meridians of each.

In other words, the bearing of an object in navigation, is the rhumb on which it is seen; and the bearing of one place from another is reckoned by the name of the rhumb passing through those two places. In every figure relating to any case of plain sailing, the bearing of the line not proceeding from the centre of the circle or horizon, is found by drawing a line parallel to it from the centre and towards the same quarter.

To find the bearing of any two places, e. g. cape Clear, and the island of Saint Michael's, one of the Azores, by the plain chart; lay a ruler by the two places, take the nearest distance between the centre of the compass, and the edge of the ruler; and in this position, slide one point of the compass along the ruler, and the other point will run along the point of the compass, shewing the bearing, which in this case is S.W.; that is, St. Michael's lies to the S.W. of cape Clear, or cape Clear to the N.E. of St. Michael's. See SAILING.

To find the bearing of any two given places on the globe; lay the graduated edge of the quadrant of altitude over both places, the beginning, or 0; being on one of them, and observe, while the quadrant lies in this position, what rhumb of the nearest fly, or compass, runs most parallel to the edge of the quadrant, and that rhumb shews the bearing sought, nearly.

The bearings of places on the ground are usually determined from the magnetic needle: in the managing of these lies the principal part of surveying; since the bearing and distance of a second point from the first being found, the place of that second is determined; or the bearings of a third point from two others, whose distance from each other is known, being found, the place of the third is determined: instrumentally we mean; for to calculate trigonometrically, there must be more data. Mr. Collins gives the solution of a problem in the Philosophical Transactions, where the distances of three objects on the same plane being given, and the bearings from a fourth place in the same plane observed,

I served,

ferred, the distances from the place of observation to the respective objects are required. See SURVEYING.

BEARING, in the *Sea Language*.—When a ship sails towards the shore, she is said to *bear in with the land*.—When a ship that was to windward, comes under another ship's stern, and so gives her the wind, she is said to *bear under her lee*.—If a ship sails into a harbour with the wind large, or before the wind, she is said to *bear in with the harbour*, &c.

In conding they say, *bear up the helm*, that is, let the ship go more large before the wind—*bear up round*, that is, let the ship go between her two sheets, directly before the wind—*bear a hand*, i. e. make haste.

They also say a ship *bears* when, having two slender a quarter, she will sink too deep into the water with an over light freight, and therefore can carry but a small quantity of goods.

BEAR sail well, to, is said of a ship when she is a stiff-guided ship, and will not couch down on a side, with a great deal of sail.

When a ship is said to *bear out her ordnance*, it is meant, that her ordnance lies so high, and she will go so upright, that in reasonable fighting weather, she will be able to keep out her lower tier, and not be forced to shut in her ports.

A ship is said to *overbear* another, when it is able, in a great gale of wind, to carry out more sails, viz. a top-sail, more, or the like.

BEARING off is also used by *Seamen* generally in business belonging to the shipping, for *thrust off*.

Thus, in hoisting any thing into the ship, if it hath hold by any part of the ship or ordnance, or the like, they say, *bear it off from the ship's side*.—So if they would have the breech or mouth of a piece of ordnance, or the like, put from one, they say, *bear off* or *bear about* the breech.

BEARING up, or *bearing away*, is improperly used to denote the act of changing the course of a ship, in order to make her sail before the wind, after she had sailed some time with a side wind or close-hauled.

BEARING also expresses the situation of any distant object, estimated from some part of the ship, according to her position. In this sense, the object must be either a-head, a-stern, on the beam, before the beam, abaft the beam, on the lee or weather bow, and on the lee or weather quarters.

BEARING of a piece of timber, in *Carpentry*, denotes the space either between the two fixed extremes thereof, when it has no other support; which is called *bearing at length*: or between one extreme, and a post, brick wall, or the like, trimmed up between the ends to shorten its bearing.

Joists are not to bear above ten feet length; nor single rafters more than nine feet. 19 Car. II. c. 3.

BEARING of an arch or vault, denotes the effort which the stones make to burst open the piers, or *piedroits*.

This amounts to the same with what the French call *pouffée*.

BEARINGS, in *Heraldry*, a term used to express a coat of arms, or the figures of armories, by which the nobility and gentry are distinguished from the vulgar, and from one another. See ARMS.

BEARING of an organ pipe, denotes an error or variation from the just sound it ought to yield. See TEMPERATURE.

BEARING pains, in *Midwifery*. The pains in labour or child birth are said to be bearing pains when they force the child downward.

BEARING down of the womb, vagina or anus. When the uterus descends from the upper part of the pelvis, and presses upon or passes through the os externum, it is called a bearing down (*procentia*) of the womb. In this case the uterus is included in a duplicature of the vagina, to the

upper part of which it is attached. Women who are troubled with the whites (*fluor albus*) or who have borne children, particularly if the perinaeum was injured, or torn, at the time of the birth of any of them, are most subject to this complaint. It manifests itself at first by a sense of dragging or bearing down of the part; some time after, there is a difficulty in making water, the uterus lying on, and covering the meatus urinarius. In this stage of the complaint, on passing a finger into the vagina, it meets the os uteri, immediately on getting through the os externum. If not now remedied, the uterus continues descending, until it frees the os externum, and hangs down between the thighs; and if still neglected, the part protruded goes on increasing, from the size of a nut to that of a large pear, and in some cases the uterus, covered with the vagina, has been found hanging down beyond the middle of the thighs, and of the size of the body of a Florence flask. When a fold of the vagina only descends, and passes through the os externum, it is called a bearing down (*procentia*) of the vagina. A similar indisposition affects the rectum, a fold of the gut being forced through the sphincter ani, whenever the feces are voided. This complaint is particularly incident to weakly children, though adults are not unfrequently affected with it. As in all these cases there is a relaxed tone of the fibres, the cure is to be effected by the exhibition of such things as strengthen and increase the tone and elasticity of them, by the Peruvian bark and chalybeats, the use of the cold bath, exercise, air, astrigent applications to the parts, as decoctions of oak bark, pomgranate shells, ballastine flowers, red rose leaves, &c. to which a portion of red port wine is to be added, and the medicine so prepared is to be injected into the vagina or rectum, and compressed, soaked in it, applied to the parts externally, taking care in the mean while that the body be kept moderately open. When the womb is the part bearing down, in addition to these remedies, after returning the womb to its proper situation, a pessary is to be introduced into the vagina and worn there to prevent its descending again. See PESSARY; see also PROCENTIA Uteri, *Vaginae, et Ani*.

BEARING claws, among *cock fighters*, denote the foremost toes, on which the bird goes; and if they be hurt or gravelled, he cannot fight.

BEARING of a stag, is used in respect of the state of his head, or the croches which he bears on his horns.

If you be asked what a stag *bears*, you are only to reckon the croches, and never to express an odd number: as, if he have four croches on his near-horn, and five on his far, you must say he bears ten; a false right on his near horn: if but four on the near horn, and six on the far horn, you must say he bears twelve; a double false right on the near horn.

BEARN STONE, see PHOSPHORUS.

BEARN, in *Geography*, was a province of France, before the revolution, at the foot of the Pyrenées, about 16 leagues long and 12 broad; bounded on the east by Bigorre, on the north by Armagnac, Turfan, and Chalosse, on the west by Dax, a part of Soule, and lower Navarre, and on the south by the Pyrenées. The plain country is very fertile, producing flax and Indian corn, and the mountains are covered with fir-trees, and within them are mines of copper, lead, and iron, and the lesser hills are planted with vines, which yield good wine. The Spaniards are supplied from hence with horses and cattle, and also with linen, of which there is in this province a considerable manufactory. The principal rivers which bear the name of Gaves, are the Gave-Bearnais, and the Gave d'Oleron. Bearn forms now the department of the Lower Pyrenées; and its capital is Pau.

BEAST, in *Zoology*, an appellation given to all four-footed

footed animals, fit for food, labour, or sport. See BRUTE, and ZOOLOGY.

Authors make this difference between "beasts of the forest" and "of chase," that the first are "silvestres tantum," the latter "campestres tantum." "Beasts of the forest" make their abode all the day time in the great coverts and secret places of the woods; and in the night season they repair into the lawns, meadows, pastures, and pleasant feeding-places: whence their denomination "silvestres," q. d. beasts of the wood.

"Beasts of the chase" reside all the day time in the fields, and on the mountains afar off, to prevent surprize: but on night's approach, they feed, as the rest, in meadows, &c. whence their appellation "campestres," q. d. beasts of the field.

In our Statute books, "beasts of chase" are five; the buck, doe, fox, martin, and roe. "Beasts of the forest," called beasts of venery, are the black, hind, bear, and wolf; and "beasts and fowls of the warren" are, the hare, coney, pheasant, and partridge. See GAME.

No other, according to MARWOOD, are accounted beasts or fowls of warren, than hares, coney, pheasants, and partridge. Lord Coke is of another opinion, distinguishing birds of the warren, from fowls of the warren. Under the former he includes hares, coney, and roe; the latter he divides into *silvestres*, *campestres*, and *aquaticæ*. To the first belong the pheasant, woodcock, &c. to the second the partridge, quail, rail, &c. to the third the mallard, hern, &c. Coke on Littleton, p. 233.

BEAST *of burden* is understood of all quadrupeds employed in carrying goods on their back. To this class belong elephants, dromedaries, camels, horses, mules, asses, and the sheep of Mexico and Peru.

BEAST, in *Games of Chance*, a game at cards, played thus; the best cards are the king, queen, &c. of which are formed three heaps, denominated the king, the play, and the troilet. Three, four, or five may play; and to every one are dealt five cards. Before the play every one stakes to the three heaps. He that wins most tricks takes up the heap called the play; he that has the king takes up the heap, so called; and he that has three of any sort, as three fours, three fives, three sixes, &c. takes up the troilet heap.

BEAST *at ombre*, is where the player or person that undertakes the game, loses it to the other two; the penalty of which is a forfeiture equal to the stake played for.

BEASTAN, in *Geography*, a town of Persia, in the province of Segestan, 20 miles S.W. of Kin.

BEASTS, *rotter*, see ROTTER.

BEAT, in *Fencing*, denotes a blow or stroke given with the sword. There are two kinds of beats, the first performed with the foible of a man's sword on the foible of his adversary's, which in the school is commonly called *baterie*, from the French *batre*, and is chiefly used in a pursuit, to make an open upon the adversary. The second and best kind of beat is performed with the fort of a man's sword upon the foible of his adversary's, not with a spring, as in boxing, but with a jerk, or dry beat; and is therefore most proper for the parades without or within the sword, because of the rebound a man's sword has thereby from his adversary's, whereby he proceeds to himself the better and surer opportunity of spoiling.

BEAT, *St.*, in *Geography*, a town of France, in the department of the upper Garonne, and chief place of a canton, in the district of St. Gaudes, on the Garonne. All the houses are built of marble, the height thereof supplying no other materials. It is seated between two mountains, close to the town on each side. The place contains 1056 and the canton 958 inhabitants; the territory includes 247½ kilometres and 25 communes. N. lat. 42° 50'. W. long. 1° 6'.

BEAT, *St.*, *mountains of*, are mountains of Switzerland in the canton of Berne, near the lake Thun; the rocks of which are calcareous and rugged, and containing in a few places broken petrifications. Some of these rocks are perpendicular, and even impending, and are marked at different elevations with furrows, occasioned by the waters of the lake, which in former periods was probably several hundred feet above its present level.

BEAT, in *Horology*. See BEATS.

BEAT, in the *Manege*. A horse is said to beat the dust, when, at each stroke or motion, he does not take in ground or way enough with his fore-legs. He is more particularly said to beat the dust at *terra à terra*, when he does not take in ground enough with his shoulders, making his strokes or motions too short, as if he made them all in one place. He beats the dust at curvets, when he does them too precipitantly and too low. He beats upon a walk, when he walks too short, and thus treads but little ground, whether it be in straight lines, rounds, or passages.

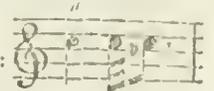

BEAT *upon the hand*, see CHACK.

BEAT *of the Drum*, in the *Military Art*, is differently performed, according to the purposes designed by it. Notice is hereby given of any sudden change; soldiers are summoned to repair to their arms and quarters; and the various movements before and after, and during the engagement, are denoted by different beats of the drum.

The chief beats or beatings on the drum are, the *general*, the *assembly*, the *chamade*, the *march*, the *reveille*, the *retreat*, &c. See DRUM.

BEAT, in *Music*, is a grace marked thus: " or thus . Its effect is just the contrary of a transient shake in rapid movements, where it can neither be prepared nor turn-

ed. It consists merely of three notes:

Beat. Effect.

transient shakes:

Explained.

BEATA, in *Church History*. See MASSES of the *Beata*. BEATA, *Cape*, is at the south point of the island of St. Domingo or Hispaniola. N. lat. 17° 42'. W. long. 72° 2'.

BEATA *Island*, is about 14 leagues S.W. by W. from the cape.

BEATER is applied, in *Matters of Commerce*, to divers sorts of workmen, whose business is to hammer or flatten certain matters, particularly metals. In this case we meet with *plaster-beater*, *cannon-beater*, *millar-beater*, &c.

BEATERS, *gold*, are artificers, who, by beating gold and silver with a hammer on a marble, in moulds of vulcan and bullocks' gut, reduce them to thin leaves fit for gilding or silvering of copper, iron, steel, wood, &c.

Gold-beater differs from flatterer of gold and silver, as the former bring their metals into leaves by the hammer; whereas the latter only flatten it by pressing it through a mill, preparatory to beating. See GOLD-BEATING.

There are also tin-beaters employed in the looking-glass trade, whose business it is to beat tin on large blocks of marble, till it be reduced to thin leaves, fit to be applied with quicksilver behind looking-glasses. See FOLIATING.

BEATER is also used for an instrument wherewith to gravel walks and alleys in gardens even. It is a piece of wood half a yard long, six inches thick, and eight or nine broad, having a handle fixed obliquely in the middle.

BEATIA, in *Ancient Geography*, a town of Spain, in Bætica, south-east of Castulo, and near it.

BEATIFIC VISION. See **VISION**.

BEATIFICATION, in *Electricity*, a term used by professor Boze to denote an electrical experiment, by which he incircled the head of a person strongly electrified, and standing on a large cake of pitch, with a luminous glory, resembling that with which painters ornament the heads of saints. The secret of this experiment, which occasioned many fruitless and expensive trials to the first electricians in Europe, consisted in the use of a suit of armour decked with steel, in various figures; and the glory was produced by rays issuing from the edges of the helmet.

BEATIFICATION, in the *Romish Church*, the act by which the pope declares a person happy after death.

Beatification differs from canonization; in the former, the pope does not act as a judge in determining the state of the beatified, but only grants a privilege to certain persons to honour him by a particular religious worship, without incurring the penalty of superstitious worshippers; but in canonization, the pope speaks as a judge, and determines "*ex cathedra*" upon the state of the canonized.

Beatification was introduced when it was thought proper to delay the canonization of saints, for the greater assurance of the truth and manifestation of the rigorous steps taken in the procedure.

The ceremony of beatification is a previous one to that of canonization; and cannot be performed till 50 years after the death of the person thus honoured. On this occasion, certificates or attestations of the character and miracles of the person for whom this honour is intended, are produced and examined by the congregation of rites. An advocate, called by the people the devil's advocate, is employed to contest the claims of the candidate; and it is the business of an advocate, engaged on the other side, to obviate and refute the cavils of the adversary. As soon as the saint's claim is confirmed, he is admitted into all the privileges of beatification by the pope's decree. His relics, if any such are found, become henceforth entitled to the veneration of all good Christians; his images are crowned with rays, and a particular office is set apart for him; and the day of his beatification is distinguished by the grant of indulgences and remission of sins.

It is remarkable, that particular orders of monks assume to themselves the power of beatification. Thus Octavia Melchiorica was beatified with extraordinary ceremonies by the Dominicans, for a legacy of 7000 dollars to the order.

BEATING, among *Sportsmen*, denotes the noise which hares make in *Rutting-time*.

The hare is said to *beat*, the hart to *bell*, &c.

BEATING, PULSATION, in *Medicine*, is applied to the reciprocal agitation or palpitation of the heart and pulse. See **PULSATION**.

BEATING of the heart. See **PALPITATION**.

BEATING Flax, or Hemp, is an operation in the dressing of these matters, contrived to render them more soft and pliant.

When hemp has been swungled a second time, and the hards laid by, they take the strikes, and dividing them into dozens and half dozens, make them up into large thick rolls, which being broached on long strokes, are set in the chimney corner to dry; after which they lay them in a round trough made for the purpose, and there with beetles, beat them well, till they handle, both without and within, as pliant as possible, without any hardness or roughness to be felt; that done, they take them from the trough, open and divide the strikes as before, and if any be found not suf-

ficiently beaten, they roll them up, and beat them over as before.

Beating hemp is a punishment inflicted on loose and disorderly persons.

BEATING, in *Book-Binding*, denotes the knocking a book in quires on a marble block, with a heavy broad-faced hammer, after folding, and before binding or stitching. On the beating of it properly, the elegance and excellence of the binding, and the easy opening of the book principally depend.

BEATING, in the *Paper Works*, signifies the beating of paper on a stone with a heavy hammer with a large smooth head and short handle, in order to render it more smooth and uniform, and fit for writing.

BEATING the Wind, was a practice in use in the ancient method of trial by combat. If either of the combatants did not appear in the field at the time appointed, the other was to beat the wind, or to make so many flourishes with his weapon; by which he was intitled to all the advantages of a conqueror. Du-Cange.

BEATING the Hands or Feet, by way of praise or approbation. See **APPLAUSE**.

BEATING Time, in *Musick*. See **BATTRE LA MESURE**.

BEATING, in *Navigation*, the operation of making a progress at sea against the wind, in a zig-zag line or traverse, by steering alternately close-hauled on the larboard and starboard tacks. See **TACKING**.

BEATING, Drubbing, or Stripes, make one of the most ancient as well as universal species of punishment. Among the Romans it obtained, under the denomination of *verberare, fustigare, flagellare, pulsare, &c.* In the East it still prevails under the name of *bastinado*.

Some distinguish between *pulsation* and *verberation*, as if the latter imported a beating with pain, the former without; but this distinction is not always observed.

BEATING, in the *English Laws*. See **BATTERY**.

BEATING in the Flanks, a distemper to which black cattle are subject, and is an indication of a great inflammation in the bowels.

BEATING, in *Husbandry*. See **BURNING of Land**.

BEATITUDE, imports the supreme good, or the highest degree of happiness human nature is susceptible of.

In which sense, it amounts to the same with what we otherwise called *blestness* and *sovereign felicity*; by the Greeks called *εὐδαιμονία*; and by the Latins *summum bonum, beatitudo, and beatitas*.

BEATITUDE, among *Divines*, denotes the beatific vision, or the fruition of God in a future life to all eternity.

BEATITUDE is also used in speaking of the *ishes* contained in Christ's sermon on the mount, whereby he pronounces *blest* the poor in spirit, those that mourn, the meek, &c.

BEATITUDE was also a title anciently given to all bishops; but of later days restrained to the pope.

It appears to have been sometimes also given to laymen.

BEATON, BELTON, or BETHUNE, DAVID, in *Biography*, primate of Scotland, and cardinal of Rome, was descended from a family originally of France, and the nephew of archbishop James Beaton, his predecessor in the primacy. He was born in 1494; and having passed through the ordinary discipline of the schools, and of the university of St. Andrew's, he was sent to France by his uncle, for the completion of his education. In the university of Paris he applied with diligence to the study of the civil and canon laws, and also of divinity, in order to qualify himself for the service of the church. At the proper age, he entered into holy orders; but, notwithstanding his clerical character, he

was employed in several affairs of importance by John duke of Albany, regent of Scotland, and appointed resident at the court of France in 1519. In 1523 his uncle, being promoted to the archbishopric of St. Andrew's, resigned the rich abbacy of Arbroath in his favour, and having obtained from the pope a dispensation for holding it two years without taking the habit, he returned to Scotland in 1525, and took his seat in parliament as abbot. Having ingratiated himself with the young king, whom he had served in France during his minority, he was promoted in 1528 to the high office of lord privy-seal. In this capacity he obtained the king's confidence; and in 1533 he was entrusted with an important commission which required his return to France, where he was eminently instrumental in maintaining the attachment of James to the French interest, and where he was employed in negotiating several important concerns between the two courts, and in demanding for his master, Magdalen, the king's daughter, in marriage. During his stay at the French court, he gained the esteem of king Francis I. to such a degree, that he granted him several singular favours; investing him, in 1537, with all the privileges of a native of France, and conferring upon him, in the same year, the valuable bishopric of Mirepoix. King James having espoused the princess Magdalen at Paris in 1537, the abbot of Arbroath accompanied them to Scotland; and after her death, in the same year, he was deputed to negotiate a second marriage for the king with Mary, daughter of the duke of Guise, whom he conducted to Scotland in 1538, where their nuptials were celebrated at St. Andrew's. In this year he was advanced by pope Paul III. who wished to attach the clergy of Scotland and England to the see of Rome, to the dignity of cardinal. Upon the death of his uncle soon after, he succeeded to the primacy, and exercised the singular powers with which he was invested in evincing his attachment to the religion and interests of Rome, in conducting a very severe inquisition into heretical doctrines, and in causing prosecutions to be instituted against several persons, of whom some were men of family and distinction. It is said, that he had presented to the king a roll of 360 of the chief nobility and barons, as suspected of heresy, and if the king's death had not prevented the execution of his sanguinary purposes, these, and perhaps many more, must have fallen sacrifices to his persecuting power, which his ministry did not seem disposed to control. At the dissolution of the cardinal, James undertook the invasion of England, and at Solway Moss the royal army was totally defeated in 1542; but this unexpected disaster proved fatal to the king, and he died soon afterwards. The cardinal was the only person of authority who was present with him in his last moment; and he is accused of having forged a will, in which the king appointed him together with three other noblemen, to the regency of the kingdom, during the minority of queen Mary. This fact is considered as unquestionable by the generality of moderns, as well as the more early historians. But the English interest prevailed, and the earl of Arran was declared to be regent. Upon this Cardinal Beaton was apprehended and confined; but in a little while, he contrived by his political ability and influence not only to be liberated, but to be appointed high-chancellor of the kingdom. The commission of legate "a latere," which he soon afterwards obtained from the court of Rome, empowered him to proceed in his favourite design of extirpating heretics. In the execution of this design, he caused several persons to be condemned and executed; and among the rest, Mr. George Wishart, the most famous protestant preacher in Scotland, who was burnt at St. Andrew's in 1546; the cardinal himself, as it has been related on the authority of Buchanan, being seated at a window as a spectator of the tragedy. This

execution produced great discontent and murmur amongst the adherents of the protestant religion; and as the forms of law had not been duly regarded, they meditated a revenge. The cardinal, himself, however, apprehended no danger; and so prevalent was his interest at this time, that the earl of Crawford was gratified by marrying his eldest son to the cardinal's natural daughter; for notwithstanding his profession and high rank in the church, Beaton, without disguise, kept a concubine, by whom he had several children. In less than three months after the death of Wishart, the event which this good man denounced, and as some have said, without sufficient reasons, predicted, happened to the cardinal. A conspiracy was formed against his life by some persons whom he had disobliged; and they, accompanied by a small number of attendants, surpris'd the castle of St. Andrew's, in which the cardinal lodged, rushed into his chamber, and dispatched him with their swords. One of the conspirators, James Melville, expressly imputed his revenge to the cardinal's persecution of Wishart. This event happened in the latter end of May 1546, and proved fatal to the ancient religion, and to the French interest in Scotland.

Beaton's character is sufficiently marked in the history of his life. Possessed of talents, which qualified him for the high rank to which his ambition aspired, and which he occupied both in the church and the state, he espoused and promoted the interest of Rome, as the most effectual method of securing his advancement. Dr. Robertson, indeed, ascribes his support of the Romish superstition, and his enmity to the reformers, merely to political motives; but there is reason to imagine, more especially when we consider the period in which he lived, that a real bigotry in favour of popery might blend itself with the principles and views of ambition and policy. It is certain, however, that his ambition was unbounded, that he was haughty and violent in his temper, that his insolence was carried to the highest pitch, and that his character, upon the whole, was extremely detestable. His violence, as a persecutor, must ever cause his memory to be held in abhorrence, by those who have any feelings of humanity, or any regard for religious liberty. He appears to have had little learning, being prevented from acquiring it by his early and continued application to public business; and his morals were unbecoming his station. Biog. Brit. Robertson's Hill. of Scotland, vol. i. p. 97, &c.

BEATORUM, INSULA, in *Ancient Geography*, a name given to one of the Oases (See OASIS) of Africa, called an *Island*, because it was surrounded with sand, like an island in the sea, and denominated "insula Beatorum," because, according to Strabo, it abounded with water, wine, and other necessaries of life, though encompassed by vast sandy deserts. Some have supposed that this Oasis was a district of the "Orbite noni," about seven days' journey west of Thebes. Others suppose that it was situated in the "Regno Ammoniacæ," and that it was the site of the temple of Ammon, which was amply supplied with fountains and vegetation, and afforded a very pleasant habitation. Ulpian says, that it was a place of banishment for real or pretended criminals, whence, as it was surrounded by sand, there was no probability of escape.

BEATS, in *Horology*, are the audible strokes which a tooth of the last wheel in a clock or watch movement makes against its pallet, to maintain the vibration of a pendulum, or oscillation of a balance. The interval between two successive beats, in a clock or watch with an ordinary escapement, is equal to one vibration or oscillation, but is not exactly contemporary with it, because the latter is counted as commencing at one of the extremities of its arc; where, as the former begins at such other degree of it, as the nature

nature of the escapement determines. a vibration here implies either one direct or one retrograde passage through the whole arc of a pendulum, and an oscillation one direct or one retrograde motion of a balance through its whole arc. Hence, in a common clock or watch, the words beat, vibration, and oscillation, are synonymous terms, when applied as the measure of the smallest subdivision of time; there being a stroke of the last wheel at some part of every vibration or oscillation: but in those astronomical and marine time-pieces which have detached escapements, there is but one beat in two vibrations or oscillations, the alternate stroke of the piece which unlocks the detent being usually silent; in these machines, therefore, the beats are slower by one half than in ordinary ones, notwithstanding the movements, or mechanism of wheels and pinions, may be the same in both, and the vibrations or oscillations similar. In any horological machine, the number of vibrations or oscillations which it makes in an hour, is the value of its train, which may be thus determined, viz. "Divide double the product of all the wheels, by the exact product of all the pinions, and the quotient will be the train universally;" the great wheel and its pinion, however, being used only to regulate the period of going after winding up, and to communicate motion, are left out of the calculation. The reason why the product of all the wheels is required to be *doubled*, is, that one tooth of the last wheel does not completely escape its pallet in less than two successive vibrations or oscillations in any escapement. The beats of a pocket watch are a very convenient measure of small portions of time, and might be applied to many useful purposes with advantage, particularly if they were each an exact fraction, such as $\frac{1}{4}$ or $\frac{1}{8}$ of the second, which they might as easily be as otherwise. (Vid. Nicholson's Journal, vol. iii. p. 49—and 189. and vol. v. p. 46, 4to. Series.) In the best time-pieces or chronometers for determining the longitude, this circumstance is attended to, and the trains are usually either 14,400 or 18,000, namely, either four or five oscillations; i. e. either two, or two and a half beats per second, by reason of their escapements being detached. If the same attention were paid to the trains of common pocket watches, the frequency of their beats would fit them for nice observations in some of the departments of philosophy, and give them, in this respect, a preference even over more accurate instruments with less frequent beats: but at present, the only attention that is paid by the makers to the value of the train of a common watch is, that, for a small balance, it may be a quick one, and for a large balance a slow one; or, in other words, that the momentum of the balance shall not be too much controlled by the maintaining power, which necessary provision might be equally attended to, if the beat were made an exact fractional portion of a second. In any watch the whole train or vibrations in an hour divided by 3600, the seconds in an hour, will give the vibrations per second of that watch. See CLOCK-MOVEMENT, DEAD-BEAT, ESCAPEMENT, &c.

BEATS, in *Music*, are certain pulsations of two continued sounds, as in an organ, that are out of tune, occasioned by warring vibrations that prevent coincidence in any two concords. This phenomenon, which was first discovered by M. Sauveur, has not only been described by Dr. Smith in his "Harmonics" but made the foundation of a system of temperament. "In tuning musical instruments, (says he, Sect. IV. Prop. X.) especially organs, it is a known thing, that while a consonance is imperfect, it is not smooth and uniform as when perfect, but interrupted with very sensible undulations or *beats*; which, while the two sounds continue at the same pitch, succeed one another in equal times, and in longer and longer times, while either of the sounds approaches gradually to a perfect consonance with

the other; till at last the undulations vanish, and have a smooth, uniform, consonance."

These beats, the same author observes, are of use in tuning an organ to any desired degree of exactness.

The work of Dr. Smith, though excellent, is far too profound for the persons most in want of it; the organ and harpsichord tuners are seldom mathematicians; and to comprehend the doctrines laid down in this book, would require as much science as Newton's "Principia".

The beats of two dissonant organ pipes, resemble the beating of the pulse to the touch: and, like the human pulse in a fever, the more dissonant are the sounds, the quicker they beat, and the slower as they become better in tune; till at length they are lost in the coincident vibrations of the two sounds. See VIBRATION, TEMPERAMENT, and TUNING.

BEATTIE, JAMES, L. L. D., in *Biography*, a celebrated moral philosopher and poet, was born Nov. 5, 1735, in the county of Kincardine, in North-Britain. His father was in a station of life no higher than that of a little farmer, a class of men subject to much hardship and indigence in Scotland. He was, however, possessed with that laudable spirit which so frequently in that country raises native genius from obscurity; and he bestowed upon his son a literary education, first in the parochial school of his neighbourhood, and then in the college of New Aberdeen. The youth was assisted in his progress through the studies of the latter, by the liberality of a brother, (his father having died when he was 7 years of age,) and by one of those small exhibitions which have been annexed to it for the encouragement of learning; and it is supposed that he supported himself in the intervals of the sessions by teaching at a country school. For some considerable portion of his early life, it is known that he acted as a schoolmaster, in Kincardineshire. At length he removed to Aberdeen, and engaged as assistant to the master of the principal grammar-school, whose daughter he married.

The talent which first made him known to the world was that of poetry, which he had cultivated from his youth. In 1761, he published a volume of "Original Poems and Translations," which in 1765 was followed by "The Judgment of Paris." These performances were characterised by richness and elegance of language and melody of versification; but rather denoted a refined taste in poetry, than a powerful and inventive genius. They probably brought the author into notice at the place of his residence, but seem to have excited little attention among readers in general.

One of the fruits of his rising reputation was to obtain for him the patronage of the earl of Errol, who resided in the neighbourhood of Aberdeen. Besides other benefits, the influence of this nobleman acquired for Mr. Beattie the honourable situation of professor of moral philosophy and logic in the marischal college of Aberdeen. In this capacity he next appeared before the public as the author of a philosophical work, entitled "An Essay on the Nature and Immutability of Truth, in Opposition to Sophistry and Scepticism," 8vo. 1760. The progress made about this time by Mr. Hume's principles, especially among his countrymen, could not fail of exciting alarm among the friends of revealed religion. How long Beattie had ranked among these, does not clearly appear. An admired poem of his, "The Hermit," in its first form strongly expresses that doubt of a future existence which could not be banished from heathen philosophy; and in a poem hereafter to be mentioned, he warmly congratulates himself on having *escaped* "From Pyrrho's maze and Epicurus' sty." There is a vein of acrimony and exasperation in all his allusions to the sceptical philosophy, which renders not improbable the report of a personal offence received by him from Hume; though there is

no reason to doubt that when he wrote his book, he was very sincerely impressed with the danger of the tenets he opposed, and that he ever after remained zealously attached to the cause of revelation. The author in this work is regarded as a philosophical disciple of Dr. Reid, admitting an instinctive principle of the perception of truth, and founding it upon that faculty of *common sense*, which acts in a similar manner upon all, or a great majority, of mankind. As he wrote with more eloquence and a more popular manner than Dr. Reid, his performance was much read, and gained him a number of very respectable friends and admirers. It is allowed, that he has successfully detected many of the sophisms of Hume, and has brought together many ingenious and useful thoughts on this subject; but the foundation of its philosophy has by some, especially by Dr. Priestley, been treated as shallow and superficial; and he has been censured for the arrogance which he has displayed towards those of opposite opinions, and for the readiness with which he has imputed to them consequences subversive of morality. Indeed, many parts of his book favour more of the rhetorician than the philosopher. These defects, however, did not render less acceptable an attempt from a layman to serve the cause of religion; and among the friends Beattie acquired on the occasion, were lords Mansfield and Lyttelton, bishops Hurd and Porteus, Dr. Johnson, and Mrs. Montague. The influence of lord Mansfield obtained for him a pension of 200*l.* from his majesty's privy-purse.

In the year 1771, his fame as a poet was extended throughout the Kingdom by the publication of the first part of "The Minstrel." The subject of this piece, is the feigned birth and education of a poet. The term *minstrel* is not very happily applied to the character described; nor are the famed "Gothic days" in which he is placed to be recognized in real history: but there is great beauty in the delineation of the native poetical disposition assigned to him, and in the invention of circumstances by which it is nourished. The stanza is that of Spenser, which is managed with singular dexterity, and made to produce a melody of versification scarcely exceeded in the range of English poetry. The second part of this poem, which appeared in 1774, contains the mature education of the young bard, and enlightens his mind with the lessons of history, philosophy, and science. There are many fine stanzas in this part, which, however, deviates from the original conception; and the work is left a fragment, probably because it was found to involve unavoidable incongruities. The "Minstrel," whatever be its defects, is probably the performance on which Beattie's future fame will chiefly depend; and it may be regarded as having taken the possession of a place and the most approved poetry in the language.

Mr. Beattie visited London in 1771, and was received with great cordiality by his admirers. The degree of L.L.D. was conferred upon him by the college at Aberdeen in 1772, and he departed for London journey in 1773, in consequence of which he obtained the pension above mentioned. A new edition of the "Essay on Truth," was published in 1776, by a private subscription among his friends, conducted on the usual liberal principles, and in the volume was added the "Essay on the Liberty of the Press," a tract which had been read before a private society at Aberdeen. In the "Essay on Truth," some corrections were made, and some further corrections were taken and modified. The other pieces displayed much refined taste, sound judgment, and acquaintance with the best authors, ancient and modern. In 1783, he published a quarto volume consisting of "Dissertation, Moral and Critical." The first are de-

tached essays on various subjects, which formed a part of a course of lectures read by the author in his professional capacity. Many useful and curious topics are discussed in them, without any pretensions to extraordinary subtlety and acuteness, but in a mode calculated to improve the heart as well as the understanding. The work is not free from somewhat of the warm and dogmatical manner which characterises the "Essay on Truth"; and though not unworthy of the writer's fame, it appears to have made little addition to it. The applause given by the bishop of London to a sketch of manuscript lectures to young persons on the evidence of Christianity, induced Dr. Beattie to draw up and publish, in 1785, a work entitled "Evidences of the Christian Religion, briefly and plainly stated," 2 vols. 8vo. This was esteemed a plain, elegant, and popular view of the subject well calculated for its intended purpose. In 1790 he published a summary of his lectures under the title of "Elements of Moral Science." The first volume contains a very accurate examination and arrangement of the perceptive faculties and active powers of man. He has also given a cursory view of what is called Natural Theology. The second volume, published in 1793, comprehends much miscellaneous information in ethics, economics, politics, and logic, including rhetoric, towards the latter part of his life. It was the last publication of the author, whose time was much occupied with the duties of his station, and with social and domestic concerns; of which one of the dearest to his heart was the education of his eldest son, James Hay Beattie, a youth of very extraordinary endowments and uncommon moral excellence. He was so successfully trained by his father, as to be made his assistant in the professorial chair at the age of nineteen; and he was become the most intimate friend and beloved companion of his reverend parent, when he fell into a decline, which carried him off in 1790, at the age of 22. Dr. Beattie had fortitude enough to be the editor of a small volume of the youth's compositions, in verse and prose, to which he prefixed a memoir on his life and character, highly interesting and unaffectedly pathetic. This grievous loss was followed in 1796 by that of his younger son, Montague Beattie, in his eighteenth year. The unhappy father was unable, with all his resources, to bear up under this accumulated sorrow. The latter years of his life were a blank of exile, which terminated at Aberdeen, on August 18, 1803, in the 68th year of his age. Dr. Beattie was amiable and exemplary in every department of private life, and fulfilled the duties of his public station in such a manner as to confer honour and credit upon the university of which he was a professor. He was a fellow of the Royal Society of Edinburgh.

BLATIUS RHIMANUS, a learned man of the 16th century, whose father, Anthony Bilde, assumed the name of Rhimanus from Rhomach, the place of his birth, was born at Seldel in Alface, in 1475. He pursued his studies at Paris and Strasbourg, and from thence proceeded to Basil, where, in 1514, he formed an intimate acquaintance with Erasmus, and applied to the Greek language under J. Conon of Nuremberg; and became a corrector of the press to the celebrated printer. At the age of 35 he returned to Seldel. He next published the works of the "History of Valentinus Petricus," and filled up the works of Tertullian to be printed from two MSS. which he borrowed from two monasteries in Germany. His notes to Tertullian were seized by the Spanish inquisition, and placed in the Index of prohibited books, because they contained some free reflections on the frailty of the clergy in his time. Rhimanus was a man of extensive learning, particularly in the Greek language, church history, and the antiquities of Germany. Scolding city, that he visited and

greatly to revive ancient literature, and Scioppius bears very honourable testimony to his talents as a critic. Towards the close of his life he was afflicted with a diabetes, and obtaining no relief from the baths of Baden in Switzerland, he died at Strasburg in 1547. He was no less distinguished by his integrity and modesty, and his mild and conciliating temper, than by his great learning. He professed great regard for Luther, and detested the tyranny which the clergy exercised at that period; but he never openly declared in favour either of Luther or of any other reformer. Although he was no less displeased than Erasmus with the errors that had blended themselves with religion, he was an enemy to schism, and wished, by prudent reformation, to preserve the unity of the Christian church. Of his works, written in Latin, which were numerous, we shall only mention his "Observations on Pliny's Natural History," his "Notes on Livy," his "Preface and Annotations to Tacitus," his "Epistle prefixed to Erasmus's edition of the Works of Origen," his "Preface to the Works of Erasmus, and his "Origines Gothicæ;" to which we may add his best work, entitled "De rebus Germaniæ libri tres," printed at Ulm in 1693, with the annotations of James Otto. Jortin's Life of Erasmus. Gen. Biog.

BEAU, CHARLES LE, was born at Paris in 1701, and became professor of rhetoric in the college des Grassins, then professor in the college-royal, secretary to the duke of Orleans, and perpetual secretary and pensionary of the academy of inscriptions. Like Rollin, he united the charms of eloquence with profound erudition, and was no less, than this eminent professor, beloved by his pupils. His most considerable work was his "History of the Lower Empire," in French, 22 vols. 12mo., which is written in a correct and elegant style. He also wrote several learned dissertations in the "Memoirs of the Academy of Belles Lettres," and some "Historical Eulogies," on the academicians. His private character was amiable, and he was much esteemed for his worth and generosity. He died at Paris in 1778. His younger brother, JOHN LEWIS LE BEAU, was professor of rhetoric in the college des Grassins, and member of the academy. He published a discourse on the condition of fortune most suitable to a man of letters; and an edition of "Homer, Greek and Latin," 2 vols. 1746, and of "Cicero's Orations," 3 vols. 1750; both with notes. Nouv. Dict. Hist.

BEAU Port, in *Geography*, a spacious and commodious harbour on the S. E. part of the Falkland islands, capable of accommodating a large fleet of ships in perfect safety. It is almost surrounded by the land, has good anchorage, and sufficient depth of water.

BEAUBASSIN BAY. See CHIGNECTO.

BEAUBASSIN Bay, is also a bay on the south coast of the strait of Maghellan, at the S. E. angle of the strait, where it extends to the W. It is nearly opposite to Wallis's harbour on the north coast, is a spacious bay, and has an open entrance.

BEUCAIRE, a town of France, and chief place of a canton in the district of Nîmes and the department of the Gard, on the right bank of the Rhone, opposite to Tarascon, with which it has a communication by a bridge of boats. This town carries on a considerable commerce in wool, silk, stuffs, spices, drugs, leather, cotton, &c.; and it has an annual fair which lasts for six days. The part of the Rhine is well constructed. The principal building is the collegiate church. The place contains 7943 and the canton 10,853 inhabitants; the territory includes 162 kilometres and 4 communes. N. lat. 43° 48'. E. long. 4° 30'.

BEUCAIRE DE PEGUILON, FRANCIS, in *Biography*, a polite scholar of the sixteenth century, was descended from

an ancient family of the Bourbonnois, and born in 1514. In consequence of his literary reputation, he was appointed preceptor to cardinal Lorraine, the second son of the first duke of Guise, and attended him to Rome. On his return, he was promoted to the bishopric of Metz, and attended his patron to the council of Trent, where he distinguished himself by his eloquence. He was likewise of singular service in rescuing the fathers of the council from the perplexity occasioned by different opinions concerning marriage; for he drew up a decree, framed in terms so ambiguous as to be accommodated to the variety of opinions that were held, and by the different senses in which it might be interpreted to satisfy all parties. However, he gave offence to the votaries of the papal power by maintaining the independence of the episcopal order, and his opinion on this point was disavowed by the cardinal of Lorraine. In 1568 he resigned his bishopric to Lewis, cardinal of Lorraine, and retired to his castle of La Chrete in the Bourbonnois. Here he employed himself in composing a "History of his own Times," which was written in Latin, and comprised the events from the year 1462 to 1567. This work was discontinued about three years before his death, which happened in 1591. It remained in MS. for several years, the author having declined the publication of it for fear of giving offence; but being found in his library by Philip Dinet, he printed it at Lyons in 1625, in folio. It is deemed a well-written, and upon the whole, a faithful history; though too favourable to the house of Guise, and very hostile to the Hugonot party. Beaucaire, some time after he had taken possession of his see, engaged in a controversy with the Calvinists upon the future state of children dying unborn. Gen. Dict.

BEAUCE, or BEAUSSE, in *Geography*, the name given before the revolution to a country of France, part of Orleansnois, now the department of Eure and Loire, which was so fertile in every part, as to be called the granary of France. Its capital was Chartres.

BEAUCHENES ISLAND, a small island to the S. of Falkland islands, in S. lat. 53°, and W. long. about 58° 30'.

BEAUCHASTEL, a town of France, in the department of the Ardeche, 2½ leagues S. S. W. of Valence.

BEAUCHIEF ABBEY, was situated in a pleasant valley, on the north side of Derbyshire, in England, within a short distance of the town of Sheffield. This celebrated religious house was founded by Robert Fitz-Ranulph, lord of Alfreton, between the years 1172 and 1176, for regular canons of the premonstratensian order. Since the dissolution of monasteries, 26th of Henry VIII. this abbey has continued to crumble by the decay of time, and only a part of the chapel remains to mark the character of this once proud pile. See Pegg's History of Beauchief Abbey, 4to.

BEAUDUN, a town of France, in the department of the Var, and chief place of a canton, in the district of Barjols; 12 miles N. E. from Barjols.

BEAVER, in *Zoology*, the English name of CASTOR FIBER, *Linnaeus*, which see. Pennant calls SOREX MOSCHATUS of *Pallas*, the *Long nosed beaver*.

BEAVER, BEVER, and in Latin *Fiber*, *Castor* & *Castorius*, JOHN, in *Biography*, a benedictine monk, in Westminster Abbey, flourished about the beginning of the 14th century. He is represented as a person of ingenuity and industry, and a great master of the history and antiquities of England, to the study of which he particularly devoted himself. He wrote, "a Chronicle of the British and English Affairs," from the coming in of Brute to his owntime, which remains in MS. in the Cottonian library; and also a book "De Rebus Cænobii

Cambii Westmoraniensis. He is commended by Leland and Bale, and cited with respect by Stow in his Survey of London and Westminster. *Biog. Brit.*

BEAVER, Creek, in *Geography*, a creek of North America, which runs into lake Erie, at the east end about 7 miles S. E. from Fort Erie.

BEAVER Creek, B. g. falls into the Allegany river, after having received several branches from the north-east, about 28 miles N. W. from Pittsburgh. It rises in the south, runs north about 6 miles, thence 12 more north-east to the Salt Lick town; then by the Mahoning town and Salt Springs, 34 miles south-easterly to the Kish-kush town, from which to its mouth are 22 miles southerly. Its whole course is about 74 miles.

BEAVER Dam, a township in Pennsylvania, on the west side of Susquehannah river.

BEAVER Eater, in *Zoology*. See GLUTTON.

BEAVER Island, in *Geography*, an island in the lake Michigan. N. lat. 45° 26'. W. long. 85° 20'.

BEAVER Indians, nations of North America, situate north of Slave lake, in N. lat. about 62°, and W. long. about 120°.

BEAVER Kill, is a south-east arm of the Popachton branch of the Delaware. Its mouth is 17½ miles east from the Cook House, and 24½ N. W. from Kuschitun Falls.

BEAVER Lake, a lake of North America, forming a part of the Saskatchewan river, in N. lat. 54° 40'. W. long. 102° 50'. To the north of it at a little distance is the source of Churchill river; to the south is Cumberland-house; and not far from it are a number of houses belonging to the Hudson's bay company.

BEAVER River, a river of North America, which rises in a lake called Beaver lake and the adjoining hills, in about N. lat. 54° 40'. W. long. 111° 15', and discharges itself into la Cros lake, in N. lat. 55° 15'. and W. long. 108° 30'.

BEAVER-RAT, in *Zoology*. See MUS CORPUS.

BEAVER skin, the fur or skin of an amphibious animal called the *castor*, or *beaver*, sometimes found in France, Germany, and Poland, but most abundantly in the province of Canada in North America, and the unhabited wilds of Siberia. The skin of the beaver has hair of two kinds: the lower hairs immediately next to the skin are short, imbricated together, and as fine as down; the upper grow more sparingly, and are thicker and longer. The latter is of little value; but the flux or down is wrought into hats, stockings, and caps.

—————"The beaver's flux

Gives kindest warmth to weak enervate limbs,

When the pale blood slow rises through the veins."

Dyer's Fleece.

The merchants distinguish three kinds of castor, though all equally the skins of the same animal; these are *new castor*, *dry castor*, and *fat castor*. The *new castor*, called also *winter castor*, and *Muscovite castor*, because ordinarily reserved to send to Muscovy, is that taken in the winter huntings. This is the best, and most esteemed for rich furs, as having lost none of its hair by moulting. In the year 1794 the importation of beaver skin into the port of St. Peterburg amounted to the value of 322,250 roubles; a circumstance, which, as Mr. Tolke observes, ought to be a matter of concern to every true Russian, as it naturally strikes in with suspicion, that a country so richly stocked with wild animals of every kind should be dependant on foreign industry in this class of its necessaries. *Dry castor*, or *lean castor*, is the result of the summer huntings, when the beast is moulted, and has lost part of its hair; this being much inferior to the former, is little used in furs, but mostly in hats. *Fat castor*, usually called *old-coat*, or *coat-beaver*, is that which has contracted a certain fat, unctuous humour, by sweat exhaled

from the bodies of the savages, who have worn it for some time; this, though better than the dry, is yet only used for hats.

Its chief use is in the composition of hats, furs, &c. Besides this, in 1669, an attempt was made to employ it in other merchandizes; accordingly, a manufactory was settled in the Faubourg St. Antoine near Paris, where they made cloths, flannels, &c. of *castor*, with a mixture of wool. The manufacture flourished for a while, but soon decayed, it being found by experience that the stuffs lost their dye when wet, and that when dry again they were harsh and stiff as felt.

After the hair is cut off the skin to be used in hats, the pelt or skin itself is used in various works, viz. for the covering of mails and trunks, in slippers, &c.

Beaver is chiefly imported by the Hudson's-bay company, from the northern parts of America, where the animal abounds. Beaver skins are also procured in considerable abundance on the western coast of North America. See FUR.

BEAVER'S Town, in *Geography*, lies between Margaret's creek, an upper N. W. branch of Muskingum river, and the north branch of that river; at the head of which north branch there is only a mile's portage to Cayahoga river. Beaver's town is distant about 85 miles N. W. from Pittsburgh.

BEAUFET. See BUFFET.

BEAUFORT, HENRY, in *Biography*, cardinal and bishop of Winchester, was the natural son, legitimated by parliament, of John of Gault, by Catherine Swineford, who afterwards became his third wife. Having been educated at Oxford and Aix la Chapelle, he was advanced, at an early period of his life, to high stations both in the church and the state. In 1397 he became bishop of Lincoln, in 1399 chancellor of the university of Oxford, and dean of Wells, in 1404 lord high chancellor of England, and in 1405 bishop of Winchester. During the reigns of his brother, Henry IV., and of his nephew, Henry V., he does not seem to have possessed much political importance; but he lived in great splendour, and acquired immense wealth, so that he was able to lend Henry V. 20,000*l.* to aid his expedition into France, and thus to divert him from his design of attacking the revenues of the church. Upon the death of Henry V. he was appointed one of the guardians of his son Henry VI. during his minority; and in 1424 he was again made lord chancellor of England. In 1425, the dissensions that subsisted between him and the protector, Humphry duke of Gloucester, rose to such a height, that Beaufort thought it necessary to appeal to his nephew, the duke of Bedford, then regent of France, and to request his presence for bringing about an accommodation. Upon the arrival of the regent an assembly of the nobility was convened at St. Albans; but then interposition proving ineffectual, the decision of the contest was referred to the parliament held at Leicester in 1426. The duke of Gloucester produced six articles of accusation against the bishop, of which he was acquitted; and the defendants being enjoined to cultivate mutual friendship, departed with outward appearances of perfect amity. The regent, however, in order to gratify his brother, the protector, took away the great seal from the bishop. In 1428 the duke of Bedford returned to France, and was accompanied by Beaufort to Calais, where he was invested with the dignity of cardinal, with the title of St. Eusebius, conferred upon him by pope Martin V. He was also honoured by the same pope with the character of legate; but on his return to England, he was forbidden the exercise of it by royal proclamation. As he was likewise appointed the pope's legate in Germany, and general of the crusade against the Hussites, or heretics of Bohemia, he obtained from parliament the grant of a sum of money, and a body of force, for the more successful execution,

education of his office. Having embarked with his troops for France, he was obliged, for some time, with reluctance on his own part, to employ them under the duke of Bedford; and he then proceeded with them to Bohemia, where he remained for some months, till he was recalled by the pope. In 1430 he accompanied King Henry into France, under the title of the king's "principal counsellor," and performed the ceremony of crowning the young monarch in the church of Notre Dame, at Paris. The honours, however, which he received during his absence, were, in his estimation, an inadequate compensation for the mortification resulting from the duke of Gloucester's successful attempts for humbling his pride, and restraining his power. He not only procured an order of council, prohibiting any of the king's subjects from accompanying the cardinal, if he should leave the king without his permission: but he attempted to deprive him of his bishopric, as inconsistent with the dignity of a cardinal. On his return, and for his more effectual security against these hostile attempts, he obtained, by the intercession of the house of commons, letters of pardon for all offences committed by him contrary to the statute of "provifers," and other acts of "præmunire." This pardon was renewed five years after, viz. in 1437, for all crimes whatsoever. Notwithstanding these precautions, the duke of Gloucester, in 1442, drew up fourteen articles of impeachment against him, and presented them with his own hands to the king, who referred the matter to his council. The examination of these articles was attended with such delay, that the protector dropped the prosecution, and the cardinal escaped. The cause of the protector's inveterate enmity against the cardinal is said to have been the part which he had taken in malignating certain persons to accuse and persecute his duchess for treason, witchcraft, and other notorious crimes.

Cardinal Beaufort died in 1447, about a month after the duke of Gloucester, in whose murder, it is supposed, he was concerned. The remorse and horror occasioned by the reflection on this event, in the near approaches of his own death, were "more," says Hume, "than could naturally be expected from a man hardened, during the course of a long life, in falsehood and politics;" and they are exhibited in very impressive characters in the representation of his last scene by Shakespeare, in the last scene of the third act of the "Second Part of King Henry VI."

"If thou be'st death, I'll give thee England's treasure,
Enough to purchase such another island,
So thou wilt let me live, and feel no pain."

Again,

"Bring me unto my trial when you will.
Dy'd he not in his bed? where should he die?
Can I make men live, whether they will or no?
Oh! torture me no more: I will confess—
Alive again? Then, shew me where he is;
I'll give a thousand pounds to look upon him—
He hath no eyes, the dust hath blinded them:
Comb down his hair; look! look! it stands upright,
Like lime-twigs fet to catch my winged soul.
Give me some drink, and bid th' apothecary
Bring the strong poison that I bought of him."

The cardinal was buried at Winchester. He died rich, and left large sums for pious and charitable purposes, in various parts of the kingdom; and he ordered 10,000 masses to be said for his soul. Haughty and turbulent, and fond of pomp and power, he is allowed to have been a faithful and able servant of the crown. Mr. Hume describes him as a prelate of great capacity and experience, but of an intriguing and dangerous character. Hume's Hist. vol. iii. p. 135. 173. Biog. Brit.

BEAUFORT, MARGARET, distinguished by her munificent

encouragement of literature, was the daughter of John Beaufort, duke of Somerset and grandson of John of Gaunt; she was born at Blotthoe, in Bedfordshire, in 1441. Her first husband was Edmund earl of Richmond, by whom she had one son, Henry VII. king of England. Her second husband was Sir Henry Stafford, second son of Henry duke of Buckingham; and her third, Thomas lord Stanley, afterwards earl of Derby, by neither of whom she had any issue. Waving all pretensions to the crown in favour of her son, she devoted her life to exercises of piety and charity, and derived her chief pleasure from relieving the indigent and distressed. She kept constantly in her house twelve poor people, whom she lodged, fed, and clothed. She extended her patronage to the students of both universities, and to men of learning throughout England. In 1502 she instituted two perpetual public lectures in divinity, one at Oxford, and the other at Cambridge, which still subsist under the name of Margaret professorships. At Cambridge she established a perpetual public preacher, whose duty it should be to preach, at least, six sermons every year, at certain churches in the dioceses of London, Ely, and Lincoln; and she also founded a perpetual chantry at Winbourn minister, in Dorsetshire, for teaching grammar. But her noblest institutions were the colleges of Christ and St. John in Cambridge, the former founded in 1505, for one master, twelve fellows, and forty-seven scholars, and the latter in 1508, for a master and fifty fellows and scholars, which being begun just before her death, was finished by her executors. It is, therefore, with justice, that Gray has made this lady the principal object of his eulogy, in his ode on the installation of the duke of Grafton as chancellor of Cambridge.

"Foremost, and leaning from her golden cloud,

"The venerable Margaret see!

"Welcome, my noble son," she cries aloud,

"To this, thy kindred train, and me:

"Pleased in thy lineaments we trace

"A Tudor's fire, and a Beaufort's grace."

Her piety and devotion were no less exemplary, though partaking in a great degree of the superstition of the times, than her charity. She died in June 1509, and was interred in the chapel of her son Henry VII. in Westminster Abbey. She is the reputed author of the translation of two devotional pieces from the French, and also of rules and orders for the prudence and attire of noble ladies at funerals. Biog. Brit.

BEAUFORT, in *Geography*, a town of France, in the department of the Mayne and Loire, and chief place of a canton, in the district of Baugé. The place contains 5990 and the canton 15,125 inhabitants; the territory comprehends 200 kilometres and 7 communes. The castle of Beaufort gives the title of duke to the noble family of Somerset, lineally descended from John of Gaunt, duke of Lancaster, and the house of Lancaster obtained this castle from Blanche of Artois, queen of Navarre, wife to Edmund Crouchback, second son of king Henry III., and first earl of Lancaster. N. lat. 47° 26'. W. long. 0° 3'.

BEAUFORT, a town of France in the department of the Drome, 2 leagues N. E. of Crest.

BEAUFORT, a town of Italy in Savoy, on the river Oron, 30 miles E. N. E. of Chambéry. By the late French arrangement, this is the chief place of a canton in the department of Mont Blanc, and district of Montiers. The place contains 3070 and the canton 7357 inhabitants: the territory includes 182½ kilometres and 4 communes. N. lat. 45° 40'. E. long. 6 48'.

BEAUFORT, a district of the lower country of South Carolina, lying on the sea-coast, between Combahee and Savannah rivers. It is 69 miles long and 37 broad, and divided into four parishes, containing 18,753 inhabitants, of whom only

only 4326 are whites. The northern part of this district abounds with large forests of cypress; but the lands are fit for sugar, rice, indigo, &c. It sends twelve representatives to the first part of the legislature of the state. The amount of tax is 3,022,28. 11d. sterling.

BEAUFORT, the chief town of the above-mentioned district, situated in the island of Port Royal, at the mouth of the great river. It is a pleasant though small town, being only 1000, a distance of 200 inhabitants, distinguished by its regularity and cleanliness. It has a fine harbour, and is otherwise a considerable town. Its situation is healthy, and is distant about 73 miles S. W. from Charleston. N. lat. 32° 26'. W. long. 80° 55'.

BEAUFORT, a sea-port town of North Carolina, in the county of Currituck, and district of Newbern, on the N. E. point of Core bank. There are about 20 houses, a court-house, and jail; and the county-courts are held here. It is distant 35 miles S. E. from Newbern, and about 27 from Core Bank. N. lat. 34° 47'. W. long. 77° 20'.

BEAUFORT, the name of **PORT ROYAL**.

BEAUGENCY, or **BAUGENCY**, a town of France, and chief place of a canton in the district of Orleans and the department of the Loiret, situated on the Loire, over which is a bridge of 22 arches, and trading in wine and brandy; 4½ leagues S. W. from Orleans. The place contains 4842 and 11,784 inhabitants, on a territory of 140 kilometres, or 57 communes. N. lat. 47° 45'. E. long. 1° 46'.

BEAULIEU, a town of France, in the department of the Rhone, and chief place of a canton in the district of Villefranche, situated at the foot of a mountain on the Ardere, formerly the capital of the Beaujolois; 4 leagues N. N. W. of Villefranche, and 7 E. N. E. of Roanne. The place contains 1600, and the canton 12,867 inhabitants, on a territory of 252 kilometres including 11 communes. N. lat. 45° 10'. E. long. 4° 40'.

BEAUJOLAIS, a small but fertile province of France between the rivulets, now forming part of the department of the Rhone, 16 leagues long, and 8 wide, situated between the Loire, Saône, Saône, and Loire.

BEAULIU, a pleasant village in the New Forest, Hampshire, recorded in the noble history of England, in a late abbey, which was founded and endowed here by King John, in 1254, for monks of the Cistercian order. The remains of this abbey are now considerable; and the walls, which formerly inclosed an area of nearly twenty acres, are mostly standing. The abbot's house, now called the Palace, has been fitted up and much modernized by the present Duke of Beaufort. This abbey possessed the privilege of *jurisdiction*, and consequently gave protection to many villans and felons. Among other persons Warbeck, in the year 1498, having rebelled against the king, and retired with his army to Taunton, fled hither to this monastery, where he and several of his companions registered themselves factious-men. Henry VII. was prevented from seizing him by force, but offered him pardon, if he would surrender himself. This he complied with, and was brought to London, where he was executed in the Tower, and afterwards hung at Tyburn for seditious practices. Rogyn's England, vol. i. To a round Southampton, 12.

BEAULIEU, a town of France, in the department of the Charente, and chief place of a canton in the district of Brives, on the Dordogne, 17 miles to the east of Brives. The place contains 1737 and the canton 9661 inhabitants; the territory of 132½ kilometres and 14 communes.—Also, a town of France, in the department of the Indre and Loire, situated on the Indre, opposite Loches, and containing about

1500 inhabitants.—Also, a town of France, in the department of the Loiret, 4 leagues S. E. of Gen.

BEAULIEU *sous la Roche*, a town of France, in the department of the Vendée, and chief place of a canton in the district of Sables d'Olonne, 4½ leagues N. N. E. of Sables d'Olonne.

BLAULON, a town of France, in the department of the Ill and Vilaine, and chief place of a canton in the district of Redon, 4 leagues S. W. of Rennes.

BEAULY, is the name of a river in Invernesshire, Scotland. It is formed by the junction of three small streams, which concentrate near 1000 falls, whence the united waters flow rapidly, and after forming the falls of Kilmorieck and other fine cascades, they are discharged into an arm of the sea. The mouth, or mouth of the river, is 10 miles in length and 20 in breadth. The banks of this river are richly diversified with some fine natural woods, and various exhibitions of bold rocky scenery. At one place, the river divides, forming the little island of Agaitih, which is of an oval figure, about one mile and a half in circumference, and rises gradually about 100 feet above the level of the water. The Beauly is noted for its fish and fishery, whose rents have lately produced 6311. per annum.

BEAUMAN'S, or **BAUMAN'S *Island***, a cluster of three islands, so called from the name of the captain who discovered them, part of Roggewein's archipelago, situated in the great Equinoctial or Pacific Ocean, in about S. lat. 12° W. long. 155° 10'. The discovery of these islands has been ascribed by several geographers to Roggewein; and he named them, in 1721, Beauran's islands. His own words are these: "we discovered three islands at the same time in the 12th degree of latitude, of a very agreeable appearance; we found them stocked with fine fruit-trees, herbs, vegetables, and plants of every description. The islands, who came to meet our vessels, offered us all sorts of fish, coconuts, bananas, and other excellent fruit. These islands must be well-peopled, the beach being on our arrival covered with many thousands of men and women, the greater part of the former carrying bows and arrows. All the inhabitants are white, and only differ from Europeans by some of them being much sun-burnt. They form a good kind of people, lively and gay in conversation, kind and humane towards each other, and nothing of the savage in their manner. Their bodies were not painted like those we had before seen; they were clothed from the waist to the neck with fringes of silken stuff artfully wrought; their heads were covered with hats of the same kind, very fine and broad, to protect them from the heat of the sun. Some of these islands were ten, fourteen, and even twenty miles in circumference. We called them Bauman's islands, from the name of the captain of the ship Tinhover, who first saw them. It must be confessed (adds the author), that this is the most civilized and honest nation we have met with in the island of the South sea. All the coasts of these islands have good anchorage, in from 12 to 20 fathoms water." See the extract from the historical account of Roggewein's voyage, written in French, in 1759, by a German of Mecklenburgh, who was on board Roggewein's fleet, in La Perouse's Voyage round the World, vol. ii. p. 192. Eng. ed. The other cluster of islands of Roggewein's archipelago, marked in the hydrographical charts annexed to M. Richard's Voyage, are Roggewein and Gronow, situated a little to the north of Bauman's islands, and nearly in the same longitude. Some have supposed Bauman's islands to be the same with those which Bougainville has called "Navigator's islands;" but neither the safety of the inhabitants, nor the geographical position of the island, warrant this supposition.

BEAUMARCHEZ, a town of France, in the department of the Gers, 7 leagues west of Auch. N. lat. 43° 35'. W. long. 0° 1'.

BEAUMARIS, or **BEAUMARSH**, the principal and county town of the isle of Anglesea, North Wales, is situated on the western bank of the river Menai, which forms a fine spacious bay opposite the town. The castle, intimately connected with the early history and foundation of this town, owes its origin to Edward I. who, having erected two magnificent fortresses at Caernarvon and Conway, deemed it necessary to raise another at this place, for the purpose of enforcing obedience and subjection among the conquered Britons of Anglesea. The foundation of this structure was laid in 1295, in a place called Bonover Marsh, which afterwards assumed the compound French terms *beau, fair*, and *marais, marsh*. The favourable situation of the castle enabled the engineers to make such a fosse or ditch round it, as might be constantly filled with water from the bay, and a canal was also cut between the river and castle, that small vessels might carry their freightage immediately to the walls of the latter. This fortress being complete, the royal founder appointed sir William Pickmore, a Gascon, the first governor, who was also nominated captain of the town. The same person (one instance excepted) was always appointed to these two offices; and his annual salary was forty pounds as constable, and twelve pounds three shillings and four-pence as captain. The castle and town were guarded by 24 soldiers, at four-pence a day each. Other persons had proportionable pay, yet from every man's salary a certain sum was deducted monthly towards the payment of itinerant preachers and teachers, and for letters and intelligence. The castle becoming very burthenfome to the people, occasioned many contentions between the inhabitants of the town and those of the fortrefs. Battles sometimes ensued. One of them called the black fray, happened on a market-day, in the time of Henry VI. and it produced great slaughter. The history of these fortresses presents a continued series of oppression and irritation; and it seemed a grand policy of the English governors to exclude the Welsh from those strong holds, and their dependant towns, which they had wrested from the subjugated Cambrians. By a rental of the borough property of Beaumaris, taken even so late as 1608, there appear only seven Welsh names, and one burgage in the tenure of a Welshman. The castle was given by Henry IV. to Percy, earl of Northumberland, for life; and Richard III. granted the constablership and captainship of the castle and town to sir Richard Huddleston, knight. From the time of sir Rowland Villeville, alias Brittainne, the reputed base son of Henry VII., and constable of the castle, the garrison was withdrawn till 1642, when Thomas Cheddle, then constable, replenished it with men and ammunition. It was then held for Charles I. whose throne was in danger. The gentlemen of this town and island being warm partisans for the monarchy, determined to oppose the parliamentary forces which had assembled at Conway, and had deputed five commissioners to manage their business. The islanders refusing to surrender on summons, were invaded by about 1500 men, horse and foot, whose superior discipline and courage soon routed and conquered the royalists. On the 2d of October 1648, the town and castle surrendered to general Mytton: colonels Bulkeley and Whitely were made prisoners; and the inhabitants agreed to pay to their conquerors 7000l. within fourteen days. The castle is now the property of the crown. It stands in the grounds of lord Bulkeley, attached to the east end of the town, and covers a considerable space of ground. Though partly in ruins, yet its outer walls, several towers, and many parts remain, to characterise its di-

mensions and architecture. It is surrounded by a fosse, with an entrance to the east between two embattled round and square towers. Within these is the principal body of the castle, which is nearly of a square form, having a round tower at each angle, and another in the centre of each face. The area is an irregular octagon, about 57 yards from north to south, and 60 from east to west. In the middle of the north side is the hall, twenty yards long and twelve wide. What was formerly the porter's lodge is now used as the bridewell. A gallery of communication extended round the buildings of the inner court; and in different recesses of this were square holes, which seemed to have opened into dungeons beneath. The two eastern towers served also as dungeons, the descent to which was dark and narrow. On the eastern side of the castle was a small chapel, some of which remains.

The town of Beaumaris is not very ancient; nor do we find any particular records of it previous to the erection of the castle, soon after which it assumed some consequence, and Edward I. surrounded it with a wall, made it a corporation, and endowed it with certain privileges. In the 27th of Henry VIII. Anglesea, with eleven other counties of Wales were imprivileged and summoned to send members to parliament, but no return was made from this county till the 33d of Henry VIII. when Newborough, now a poor decayed village, sent one member. Since the 2d of Edward VI. Beaumaris has been regularly represented by one member, and the right of voting was vested, in 1729, in a mayor, two bailiffs, and twenty-one capital burgesses. Though this town has not an extensive trade, yet it has a custom house for the casual reception of goods, a large town-hall with assembly-room, a free school, alms-house, and a handsome church or chapel with a lofty square tower. The free school and alms-house were founded by David Hughes; the first in 1603, and the latter in 1613. Here are a weekly market on Saturday, and four annual fairs. It is situated 59 miles W. by N. from Chester, and 252 N. W. of London. N. Lat. 53° 14'. W. long. 4° 15'.

The *Bay* of Beaumaris forms a fine expanse of water before the town, and ships can ride safe at anchor in six or seven fathom water, even when the tide is out. From this to the opposite shore at Aber is a distance of about four miles, yet the channel at low water does not occupy above one mile. The remainder is a uniform bed of sand, called *Traeth-Telavan*, or the *Lavan sands*. These, the Welsh suppose, were anciently quite free from water, and formed a habitable part of Carnarvonshire; which Mr. Pennant admits, and endeavours to prove, by showing that the sea has made great encroachments at Abergeley, and that several bodies and roots of oak trees have been found in a tract of hard loam at a considerable distance from the present shores.

About one mile from Beaumaris stand some shattered remains of *Llanfues*, which Camden called "a famous religious house in times past," and belonged "to the friars minors, unto whom the kings of England shewed themselves very bountiful patrons, as well in regard to the friar's holiness, as also because (that I may speak out of the public records of the kingdom) were buried a daughter of king John, a son of a king of the Danes, the bodies also of the lord Clifford, and other knights and squires, who in the time of the noble and renowned kings of England were slain in the wars against the Welsh." This monastery, erected by Llewelyn ap Iorwerth, was consecrated, in 1240, by Howel, bishop of Bangor; and in a few years afterwards burnt in the insurrection of Madoc. At the dissolution, Henry VIII. sold the convent and its possessions to one of his courtiers. The family of Whyte (now extinct) afterwards became possessed of it, and built a respectable house, which has since been enlarged, modernized, and the grounds much improved. It is

is now one of the seats of Sir Robert Williams, Bart. Near this place a severe battle was fought, in 819, between the Welsh and the Saxons under their leader Egbert, who had invaded the island, and given it then, for the first time, the name of Angle-sea. The Saxons at first proved victorious, but were strongly opposed by Merfyn Frych, the Welsh prince, who after some severe battles expelled the invaders from this island.

Two miles north of Friars are the remains of the priory of *Penmon*, consisting of little more than the ruinous refectory and part of the church. This priory for Benedictine monks was endowed, if not founded, by prince Llewelyn ap Ierwerth before 1221.

Near Penmon is a *well* surrounded with a wall and stone seats, having two doors or entrances. This was a sacred, baptismal, or holy well. About a quarter of a mile distant is an ancient cross, six feet high, the shaft of which is curiously ornamented with sculptured chequered work. At the distance of about one mile from the shore is *Ynis Seiriol*, or Seiriol's island, now called Priest-holme. This was once appendant to the monastery of Penmon; and the remains of a square tower still mark its religious appropriation. This island is sometimes called Puffin island, from its being much frequented by birds of that name. From the beginning of April to the beginning of August, immense numbers of these and other sea-fowl resort to this spot. To the west of Priest-holme are three smaller islands, called Ynis Llygod, or the Mouse islands.

In the channel which waters these islands, the large oysters called the *Penmon* are taken by the dredge, and great quantities are pickled, packed in small casks, and sent to different parts of the kingdom.

Biron-hill, the seat of Lord Bulkeley, is finely seated on an eminence, overlooking the town, castle, &c. The original mansion of this family in Wales was *Court macor*, in Castle-street, Beaumaris. The present mansion was built by Sir Richard Bulkeley, for Prince Henry, son of James I. The house has since been enlarged and greatly improved by its present possessor, under the direction of Mr. S. Wyatt. The grounds of this domain are singularly fine and beautiful, and the various prospects of sea, mountain, and sylvan scenery, are highly grand and interesting.

About seven miles south-west of Beaumaris is *Plas-Nwyll*, an elegant modern mansion, built in a castellated style, belonging to the Earl of Uxbridge. The house is large, commodious, and handsome, and the ancient woods around it give it a venerable character. Close behind the house are two Cromlechs, the largest of which has been long designated by the name of "Cromlech of Mona." See CROMLECH. See an interesting poem called "Beaumaris Bay," with notes: "A Tour round North Wales," by the Rev. W. Bingley; and "Mr. Pennant's Tours in North Wales."

BEAUMEILLE, LAURENT-ANGELVILLÉ DE LA, in *Biography*, a modern French writer, was born in 1727, at Valenciennes, in the diocese of Allais. Having been invited to Denmark to undertake a professorship of French Belles Lettres, he opened his course by a "Discourse," printed in 1751. But the climate being too severe for his constitution, he quitted Denmark with a pension and the title of counsellor. In his return by way of Berlin, he wished to form an acquaintance with Voltaire, of whose writings he was a passionate admirer; but their irritable dispositions produced a quarrel, which admitted of no reconciliation, and which produced personalities equally disreputable to both. On his arrival at Paris, in 1753, his publication, entitled "Mes Pensees," caused him to be confined in the Bastille; and soon

after his liberation he was committed to the same prison on account of his "Memoirs of Maintenon." After his second liberation, he retired into the country; but in 1772, he was called back to Paris to occupy the post of king's librarian, from which death removed him in consequence of a disorder of his breast, in November 1773. The principal of his works are "A Defence of the Spirit of Laws;" "Mes Pensees," a satirical work; "Mem. of Mad. Maintenon," 6 vols. 12mo. soon followed by 9 vols. of her "Letters;" "Letters to M. de Voltaire," 1761, 12mo. upon the perusal of which Voltaire acknowledged, "the rascal has a great deal of wit;" "Thoughts of Seneca," Latin and French; and "Commentary on the Henriade," 1775, 2 vols. 8vo. He left some MSS. He is said to have been of an open and frank temper, but hasty, captious, and addicted to satire. *Nouv. Dict. Hist.*

BEAUMENIL, in *Geography*, a town of France, in the department of the Eure, and chief place of a canton, in the district of Bernay; 2 leagues S. S. E. of Bernay. The place contains 448 and the canton 9330 inhabitants, on a territory of 190 kilometres containing 21 communes.

BEAUMES, a town of France, chief place of a canton in the department of Vaucluse and district of Orange. The place contains 1373 and the canton 5452 inhabitants; the territory includes 122½ kilometres and 9 communes.

BEAUMETZ-LES-LOGES, a town of France, in the department of the Straits of Calais, and chief place of a canton in the district of Arras; 2 leagues S.W. of Arras. The place contains 318 and the canton 10,683 inhabitants; the territory includes 187½ kilometres and 29 communes.

BEAUMONT, ELIE DE, in *Biography*, was born at Charenton, in Normandy, in 1732, and admitted an advocate in 1752, in which profession he did not succeed for want of voice. Upon his retirement from the bar, he became a writer, and addressed a variety of eloquent pieces to the magistrates and to the public. His memoir in behalf of the unfortunate Colas family produced a permanent effect. This was succeeded by many others, no less interelling and pathetic. Beaumont's imagination was lively, but like other persons of the same cast, he was liable to dejection. He was lord of Caen, in Normandy, where he instituted an interesting festival, called "Fête des bons gens," or the good folks' feast. He died at Paris, in 1785.

The wife of the preceding, MADAME ELIE DU BEAUMONT, was born at Caen in 1735, and is known with reputation by her "Letters of the Marquis de Roselle," 12mo. a novel, which exhibits a faithful picture of the manners and characters of the courtiers of the day, and of their sycophants and dependants. In society she was beloved and respected by reason of the amiableness of her disposition, the polite ease of her manners, the soundness of her understanding, and the extent of her knowledge. She died at Paris in 1783. *Nouv. Dict. Hist.*

BEAUMONT, FRANCIS, an eminent dramatic poet, was the son of Francis Beaumont, one of the judges of the common pleas, and born at Grace-Dieu, in Leicestershire, an ancient seat of the family, in 1585 or 1586. He was educated at Cambridge, and afterwards admitted a student in the Inner Temple, where his devotion to the Muses diverted his attention from the study of the law. Beaumont and Fletcher were so intimately connected, and wrote so much in concert, that it is difficult at this distance of time to assign to each his appropriate part in the numerous compositions, tragic and comic, which have been published under their common names. Tradition reports, and probably with truth, that Beaumont was peculiarly distinguished by judgment, which was commonly employed in correcting and retouching the superfluities of Fletcher's wit. It appears, however, from

an examination of Beaumont's distinct productions, and particularly his little Masque of the Inner Temple and Gray's Inn, and also a poem entitled the "Hermaphrodite," that he was by no means destitute of poetic imagination and invention, and that his versification is elegant and harmonious. Beaumont was esteemed for accurate a judge of plays, that Ben Jonson, who expressed his affectionate regard for him in a copy of verses, submitted all his writings to his censure, and is thought to have availed himself of his judgment in correcting, if not in contriving, all his plots. He died before he had attained the age of 30 years, in March, 1615; and left a daughter, who was in possession of several poems of her father's writings, but they were all lost at sea in a voyage from Ireland, where she had lived for some time in the duke of Ormond's family. Besides the plays in which he was jointly concerned with Mr. Fletcher (for an account of which see FLETCHER), he wrote the dramatic piece above mentioned, entitled, "A Masque, &c." "A Poetical Epistle to Ben Jonson," "Verses to his Friend Master John Fletcher upon his Faithful Shepherdes," and other poems, printed together in 1653, 8vo. The elder brother of the preceding, sir John Beaumont, was distinguished by his poetical talents, and was the author of several pieces which had considerable merit. A volume of his miscellaneous poems was published by his son in 1629. Gen. Dict. Biog. Brit.

BEAUMONT, in *Geography*, a town of France, in the department of the Calvados, and chief place of a canton, in the district of Pont l'Évêque, 6 leagues E. N. E. of Caen.—Also, a town of France, in the department of the Côte d'Or, and chief place of a canton, in the district of Is-sur-Tille, 16 miles N. E. of Dijon.—Also, a town of France, in the department of the Channel, and chief place of a canton, in the district of Valognes, 8 miles west of Cherbourg. The place contains 538 and the canton 9493 inhabitants, on a territory of 192½ kilometres, including 20 communes.—Also, a town of France, in the department of Puy-de-Dôme, and chief place of a canton, in the district of Clermont-Terrand, 2 miles south of Clermont.—Also, a town of France, in the department of the Seine and Oise, and chief place of a canton, in the district of Pontoise, on the Oise, 33 miles north of Paris.—Also, a town of France, in the department of the Dordogne, and chief place of a canton, in the district of Bergerac, 3½ leagues west of Belvez. The place contains 1505 and the canton 7124 inhabitants on a territory of 170 kilometres and 14 communes.—Also, a town of France, in the department of the Sarthe, and chief place of a canton, in the district of Mamers, 5 leagues N. E. of Le Mans. The place contains 2402 and the canton 14,720 inhabitants: the territory includes 175 kilometres and 15 communes.

BEAUMONT *en Argonne*, a town of France, in the department of the Ardennes, and chief place of a canton, in the district of Sedan, 3½ leagues S. S. E. of Sedan.

BEAUMONT-*Les-Forges*, a town of France, in the department of the Nievre, and chief place of a canton, in the district of La Charité on the Nievre, 13 miles north of Nevers.

BEAUMONT *on Gatineau*, a town of France, in the department of the Seine and Marne, and chief place of a canton, in the district of Nemours, 4 leagues S. W. of Nemours.

BEAUMONT *de Lomagne*, a town of France, in the department of the Upper Garonne, and chief place of a canton, in the district of Castel-Sarrazin, 5 leagues N. W. of Grenade. The place contains 3700 and the canton 11,177 inhabitants: the territory includes 200 kilometres and 20 communes.

BEAUMONT *Le Roger*, a town of France, in the department of the Eure, and chief place of a canton, in the district of Bernay, 2½ leagues E. of Bernay. The place con-

tains 1406 and the canton 13,685 inhabitants: the territory includes 227½ kilometres and 26 communes. N. lat. 49° 5'. E. long. 0° 41'.

BEAUMONT *sur Vesle*, a town of France, in the department of the Marne, and chief place of a canton, in the district of Reims, seated on the Vesle, 8 miles S. E. of Reims.—Also, a town of France, in the department of Jemappe, and chief place of a canton, in the district of Charleroy. The place contains 1376 and the canton 7458 inhabitants: on a territory of 177½ kilometres, including 10 communes.

BEAUNE, a town of France, in the department of the Mayne and Loire, and chief place of a canton, in the district of Baugé, 3 leagues east of Angers, and 3 west of Baugé.—Also, a town of France, and principal place of a district, in the department of the Côte d'Or, 7 leagues south of Dijon. The place contains 8341 and the canton 23,090 inhabitants: on a territory of 300 kilometres. The northern canton includes 13 and the southern 15 communes. N. lat. 47°. E. long. 4° 50'.—Also, a town of France, in the department of the Loiret, and chief place of a canton, in the district of Pithiviers. The place contains 2057 and the canton 14,845 inhabitants: the territory includes 250 kilometres and 24 communes.

BEAU-PLEADER, or BEW-PLEADER in *Law*, a writ on the statute of Marlbridge, 52 Hen. III. c. 11. whereby it is provided, that no fine shall be taken of any man in any court for *fair-pleading*, i. e. for not pleading aptly and to the purpose. And beau-pleader is as well in respect of vicious pleadings, as of the fair-pleading, by way of amendment. 2 Inst. 122.

BEAUPRE', in *Geography*, an island in the Pacific ocean, so called after the name of Beupré, engineer-geographer to the expedition fitted out for search of La Perouse, lying west of the new Hebrides, in S. lat. 20° 14'. E. long. 161° 27'. It is very low, and about 1500 toises long.

BEAUPREAU, a town of France, in the department of the Mayne and Loire, and chief place of a district, 3 leagues S. of St. Florent. The place contains 1640 and the canton 11,250 inhabitants: the territory includes 260 kilometres and 11 communes.

BEAQUESNE, a town of France, in the department of the Somme, and chief place of a canton, in the district of Doullens, 2 leagues S. E. of Doullens.

BEAURAING, a town of France, in the department of the Sambre and Meuse, and chief place of a canton in the district of Dinant: the place contains 452 and the canton 667 inhabitants: the territory includes 257½ kilometres and 33 communes.

BEAUREGARD, a town of France, in the department of the Dordogne, 4 leagues south of Périgueux.—Also, a town of France, in the department of Puy-de-Dôme, 3 leagues east of Clermont-Ferrand.—Also, a town of France, in the department of Lot, 5 leagues E. S. E. of Cahors.

BEAUREPAIRE, a town of France, in the department of the Saone and Loire, and chief place of a canton, in the district of Louhans, 2½ leagues east of Louhans. The place contains 817 and the canton 8405 inhabitants, on a territory of 122½ kilometres, including 7 communes.—Also, a town of France, in the department of the Isère, and chief place of a canton, in the district of Vienne, 3 leagues S. E. of Vienne. The place contains 1800 and the canton 9850 inhabitants: on a territory of 195 kilometres including 14 communes.

BEAURIEUX, a town of France, in the department of the Aisne, and chief place of a canton, in the district of Laon, 3½ leagues N. W. of Reims.

BEAUSOBRE, ISAAC DE, in *Biography*, a learned French Calvinist minister, was Born at Nior in Switzerland, in

some mind; and, therefore, by absolute beauty he means only that beauty which we perceive in objects without comparison to any thing external, of which the object is supposed to be an imitation or picture; such as that beauty perceived from the works of nature, artificial forms, figures, and theorems. Whereas comparative or relative beauty is that which we perceive in objects, commonly considered as imitations or resemblances of something else. The general source of our ideas of beauty, according to this writer, is uniformity amidst variety; and what we call beautiful in objects seems to be in a compound ratio of uniformity and variety, so that where the uniformity of bodies is equal, the beauty is as the variety, and vice versa. This position he illustrates by a number of examples deduced from different figures, from the works of nature, from the inward structure and outward form of animals, and the proportion of their parts to each other, from the harmony of sound, from theorems or universal truths, and from the works of art. Relative beauty is founded, as he conceives, on a conformity, or a kind of unity between the original and the copy; and for obtaining this sort of beauty it is not necessary that there should be any beauty in the original; for an exact imitation may still be beautiful, though the original is altogether destitute of beauty. A sense of beauty from uniformity amidst variety is, in his opinion, universally prevalent among mankind; and for the truth of the fact, he appeals to experience. The same ingenious writer deduces all our ideas of virtue from an implanted sense, called "Moral sense;" (which see; and he describes moral good and evil by the effects accompanying the perception of them.

Dr. Price, in his inquiry into the origin of our ideas of beauty and deformity of actions, (see "Review of the principal Questions in Morals," ch. i. and ii.) distinguishes between our perception of right and wrong, and our perception of beauty and deformity, in considering the actions of moral agents. He observes that, in contemplating such actions, we have both a perception of the understanding and a feeling of the heart; and that the latter, or the effects in us accompanying our moral perceptions, depend on two causes; partly on the positive constitution of our nature, but principally on the essential congruity or incongruity between moral ideas and our intellectual faculties. "Placet suapte natura-virtus," Seneca. "Etiam si nullo laudetur, natura est laudabile." Tully. He apprehends, that the above-mentioned author was led to derive all our ideas of virtue from an implanted sense, in consequence of not duly considering the difference between the "honestum," and "pulchrum," the "*δικαιον*," and "*καλον*," of actions; or of not carefully distinguishing between the discernment of the mind and the sensations attending it in our moral perceptions. With him the rectitude of an action is the same with its gratefulness to the observer; and wrong, the contrary. But what, says this writer, can be more evident, than that *right* and *pleasure*, *wrong* and *pain*, are as different as a cause and its effect; what is *understood* and what is *felt*; *absolute truth*, and its *agreeableness* to the mind. Mr. Balguy indeed (see his "Tracts on the Foundation of Moral Goodness, p. 61.") is of opinion, that all beauty, whether natural or moral, is a species of absolute truth; as resulting from, or consisting in, the necessary relations and congruities of ideas. As to moral beauty, says Dr. Price, one would think, that the author just cited must mean, though his meaning is not very intelligible, that it denotes a real quality of certain actions. But the word beauty seems always to refer to the reception of pleasure; and therefore the beauty of an action, or character, must signify its being such as pleases us, or having an aptness to please when perceived. Nor can it be just to conceive more in the action itself, or to affirm more of it, than

this *aptness*, or that objective goodness or rectitude on which it depends. Beauty and loveliness are synonymous; but an object *self-lovely* can only mean an object, by its nature, fitted to engage love. It may be added, that the epithets beautiful and amiable are, in common language, confined to actions and characters that please us highly, from the peculiar degree of moral worth and beauty apprehended in them. All virtuous actions must be pleasing to an intelligent observer; but they do not all please to the degree necessary to entitle them to these epithets, as they are generally applied. These observations are applicable, as Dr. Price thinks, with a little variation, to natural beauty; the general sense of which, according to Dr. Hutcheson, is uniformity amidst variety. If we ask, why this pleases? The proper answer is, that by its nature it is adapted to please. There seems, as Dr. P. observes, no more occasion in this case to have recourse to an implanted sense than in the former. Regular objects contribute towards producing the complacency of our minds, and the preference we give them, because they are more easily viewed and comprehended by the mind; because order and symmetry give objects their stability and strength, and subserviency to any valuable purpose; and because regularity and order evidence art and design. Brutes are incapable of the pleasures of beauty, because they proceed from a comparison of objects, and a discernment of analogy, design, and proportion, to which their faculties do not reach.

To Dr. Hutcheson's theory of beauty, which ascribes it to uniformity amidst variety, it has been objected, that, though it accounts in a satisfactory manner for the beauty of many figures, yet when we endeavour to apply this principle to beautiful objects of some other kind, as to colour or motion, it will be found irrelative. And even in external figured objects, it is not just, that their beauty is in proportion to their mixture of variety, with uniformity, as many are highly beautiful and please us much, which have no variety at all, and others which possess variety to a degree of intricacy. With respect to the opinion, that natural beauty is a real quality of objects, it may be observed, that it seems impossible for any one to conceive the objects themselves to possess more than a particular order of parts, and certain powers, or an affinity to our perceptive faculties, thence arising: and if we call this beauty, then it is an absolute inherent quality of certain objects, and equally existing, whether our mind discerns it or not. However, order and regularity are, more properly, the causes of beauty than beauty itself.

Beauty, says another ingenious writer, (see Reid's Essay on the Intellectual Powers of man, ch. iv.) is found in things so various and so very different in nature, that it is difficult to say, wherein it consists, or what can be common to all the objects in which it is found. Of the objects of sense we find beauty in colour, in sound, in form, in motion. There are beauties of speech, and beauties of thought; beauties in the arts, and in the sciences; beauties in actions, in affections, and in characters. In things so different, and so unlike, is there any quality, the same in all, which we may call by the name of beauty? Why then should things so different be called by the same name? They please, and are denominated beautiful, not in virtue of any one quality common to them all, but by means of several different principles in human nature. The agreeable emotion, excited by them, and called beauty, is produced by different causes. However, though there be nothing common in the things themselves, yet the kinds of beauty, which seem to be as various as the objects to which it is ascribed, must have some common relation to us, or to something else, which leads us to give them the same name. All the objects we call beautiful, agree in two things, which seem to concur in our
sense

sense of beauty. First, when they are perceived, or even imagined, they produce a certain agreeable emotion or feeling in the mind; and secondly, this agreeable emotion is accompanied with an opinion or belief of their having some perfection or excellence belonging to them. Whether the pleasure we feel in contemplating beautiful objects may have any necessary connection with the belief of their excellence, or whether that pleasure be combined with this belief, merely by the good pleasure of our Maker, Dr. Reid does not determine. Beautiful objects excite an emotion of a soothing and enlivening kind, that sweetens the temper, allays all angry passions, and promotes every benevolent affection, and disposes to other agreeable emotions, such as those of love, hope, and joy. "There is nothing," says Mr. Addison, "that makes its way more directly to the soul than beauty, which immediately diffuses a secret satisfaction and complacency through the imagination, and gives a shining to any thing that is great and uncommon. The very first discovery of it strikes the mind with an inward joy, and spreads a cheerfulness and delight through all its faculties." This agreeable emotion, produced by beautiful objects, is accompanied with an opinion or judgment of some perfection or excellence of those objects, adapted by its nature for producing that emotion; and this, according to Dr. Reid, is a second ingredient in our sense of beauty. To assert, says this writer, that there is in reality no beauty in those objects, in which all men perceive beauty, is to attribute to man fallacious senses; and thus to think disrespectfully of the Author of our being; who has diffused over all the works of nature a profusion of beauties, which are real, and not fanciful, and thousands of which our faculties are too dull to perceive. This author distinguishes our determinations with regard to the beauty of objects into two kinds, viz. instinctive and rational. In the former case, objects strike us at once, and appear beautiful at first sight, without any reflection, and without our being able to say why we call them beautiful, or being able to specify any perfection which justifies our judgment. Whereas our rational judgment of beauty is grounded on some agreeable quality of the object, which is distinctly conceived, and may be specified. Beauty itself may be distinguished into original, and derived. It is natural and agreeable to the strain of human sentiments and of human language, says Dr. Reid, that in many cases the beauty which originally and properly exists in the things signified, should be transferred to the sign; that which is in the cause to be effect; that which is in the end to the means; and that which is in the agent to the instrument. E. G. The beauty of good breeding is not originally in the external behaviour in which it consists; it is derived from the quality of mind, which it expresses; and though there may be good breeding without the amiable qualities of mind, its beauty is still derived from what it naturally expresses. Good breeding is the picture; these agreeable qualities are the original; and it is the beauty of the original that is reflected to our senses by the picture.

As to the use of the term beauty, some have extended it so as to include every thing that pleases a good taste; and others have restricted it to the objects of sight, when they are either seen, remembered, or imagined. But the latter sense is much too limited, as there are beauties of various kinds, that are not objects of sight, such as those of music, composition, character, affections, and actions; and as persons may be competent judges of several sorts of beauty, who are deprived of the faculty of sight. It may be observed, that as the proper object of admiration is grandeur, beauty is the proper object of love and esteem; and the connection of beauty with real perfection was a capital theme of the Socratic school. It is often ascribed to Socrates in the dialogues of Plato and of Xenophon. We may, therefore, justly

ascribe beauty to those qualities that are the natural objects of love and kind affection: of this kind are those moral virtues, which in a peculiar manner constitute a lovely character; such as innocence, gentleness, condescension, humanity, natural affection, public spirit, and the whole train of the soft and gentle virtues: qualities which are amiable from their very nature, and on account of their intrinsic worth. There are also many intellectual talents, which excite our love and esteem of those who possess them, such are knowledge, good sense, wit, humour, cheerfulness, good taste, excellence in any of the fine arts, eloquence in dramatic action, and also excellence in every art of peace or war that is useful to society. There are likewise talents or accomplishments, which we refer to the body, that have an original beauty and excellencies; such as health, strength, and agility, the usual attendants of youth, skill in bodily exercise, and skill in the mechanic arts. Dr. Reid is of opinion, that beauty originally dwells in the moral and intellectual perfections of mind, and in its active powers, and that from this, as the fountain, all the beauty which we perceive in the visible world is derived. This was the opinion of the ancient philosophers above named; and it has been adopted by lord Shaftsbury and Dr. Akenfide among the moderns.

"Mind, mind alone! bear witness earth and heav'n,
The living fountains in itself contains
Of beauteous and sublime. Here, hand in hand,
Sit paramount the graces. Here, enthron'd,
Celestial Veaus, with divinest airs,
Invites the soul to never-failing joy." AENSING.

But neither mind, nor any one of its qualities or powers, is an immediate object of perception to man. These are perceived through the medium of material objects, on which their signatures are impressed. The signs of these qualities are immediately perceived by the senses, and by them reflected to the understanding; and we are apt to attribute to the sign the beauty which is properly and originally in the thing signified. Thus, the Invisible Creator hath stamped on his works signatures of his divine wisdom, power, and benignity, which are visible to all men. The works of men in science, in the arts of taste, and in the mechanical arts, bear the signatures of those qualities of mind, which were employed in their production. Their external behaviour or conduct in life expresses the good or bad qualities of their minds. In every species of animals we perceive by visible signs their instincts, appetites, affections, or sagacity; and even in the inanimate world, there are many things analogous to the qualities of mind; so that there is hardly any thing belonging to mind, which may not be represented by images taken from the objects of sense; and, on the other hand, every object of sense is beautiful, by borrowing attire from attributes of the mind. Thus, the beauties of mind, though invisible in themselves, are perceived in the objects of sense, on which their beauty is impressed. Thus also, in those qualities of sensible objects to which we ascribe beauty, we discover in them some relation to mind, and the greatest in those that are most beautiful. The qualities of inanimate matter, in which we perceive beauty, are sound, colour, form, and motion: the first being an object of hearing; and the other three of sight. These several qualities are particularly illustrated by Dr. Reid, with a view of evincing the beauty that respectively belongs to them. Every beauty in the vegetable creation, of which we form any rational judgment, expresses some perfection in the object, or some wise contrivance in the author. In the animal kingdom we perceive superior beauties, resulting from life, sense, activity, various instincts and affections, and in many cases, great sagacity; which are attributes of mind, and possess an original beauty. In their manner of life we observe, that they possess powers, outward form, and inward structure, exactly adapted to it;

and the more perfectly any individual is fitted for its end and manner of life, the greater is its beauty. But of all the objects of sense, the most striking and attractive beauty is perceived in the human species, and particularly in the fair sex. In the following well-known passage of Milton, this great poet derives the beauty of the first pair in paradise from those expressions of moral and intellectual qualities, which appeared in their outward form and demeanour.

“Two of far nobler shape, erect and tall,
Godlike erect! with native honour clad,
In naked majesty, seem'd lords of all,
And worthy seem'd, for in their looks divine,
The image of their glorious Maker, shone
Truth, wisdom, sanctitude severe; and pure;
Severe, but in true filial freedom plac'd,
Whence true authority in man; though both
Not equal, as their sex not equal seem'd,
For contemplation he, and valour form'd,
For softness she, and sweet attractive grace.”

The author of “*Crito*,” or “*a Dialogue on Beauty*,” considered in its reference to the human species, and particularly to the female sex, ascribed to the author of “*Polymetis*,” and republished by Doddsley, in his collection of “*Fugitive Pieces*,” reduces this species of beauty to the four heads of colour, form, expression, and grace: the two former of which may be called the body, and the two latter, the soul of beauty. As for the beauty of colour, if we allow for associations and prepossessions arising from difference of climate and peculiarity of constitution, that have great influence on the internal sense, as well as on those senses that are external, and consequently on the judgment, it seems to depend, according to the common estimate of mankind, on that quality, as it expresses perfect health and liveliness, and in the fair sex, softness and delicacy; nor can any thing be called deformity but what indicates disease and decline. The beauty of colour, therefore, is derived from the perfection which it expresses. “*Venustas et pulchritudo corporis fecerunt non potest a valetudine.*” Cicero. The most beautiful form or proportion of parts, according to this author, is that which indicates delicacy and softness in the fair sex; and in the male, either strength or agility; so that the beauty of form lies altogether in expression. With regard to expression, he observes, that this has greater power than either colour or form; and that it is only the expression of the tender and kind passions that gives beauty; that all the cruel and unkind ones add to deformity; and that, on their account, good nature may very properly be said to be the best feature, even in the finest face. Modesty, sensibility, and sweetness, blended together, so as either to enliven or correct each other, give almost as much attraction as the passions are capable of adding to a very pretty face. It is owing to this force of pleasingness, which attends all the kinder passions, says this author, that lovers not only seem, but really are, more beautiful to each other than to the rest of the world; and in their mutual presence and intercourse there is, as a French writer has well expressed it, a soul upon their countenances, which does not appear when they are absent from one another, or even in company that lays a restraint upon their features. The last and noblest part of beauty is grace, which this author thinks to be incapable of an accurate definition (see GRACE). All the ingredients of beauty, enumerated and described by this ingenious author, terminate in expression: they express either some perfection of the body, as a part of the man, and an instrument of the mind, or some amiable quality or attribute of the mind itself.

Dr. Blair (*Lectures*, vol. i. p. 101, &c.), in his enumeration of the separate principles of beauty, in each of those classes of objects, which most remarkably exhibit

it, begins with colour, as affording the simplest instance of beauty. With respect to this he observes, that neither variety, nor uniformity, nor any other principle which he knows, can be assigned as the foundation of beauty; and that it can be referred to no other cause but the structure of the eye, which determines us to receive certain modifications of the rays of light with more pleasure than others. As this organ varies in different persons, they have their different respective favourite colours. In some cases, he thinks it probable, that association of ideas has influence on the pleasure which we receive from colour. Green, for instance, may appear more beautiful, by being connected in our ideas with rural prospects and scenes; white, with innocence; blue, with the serenity of the sky. Independently of such associations, those colours, chosen for beauty, are, generally, delicate, rather than glaring. Figure opens to us forms of beauty more complex and diversified. Under this head, regularity is first noticed as a source of beauty. Thus a circle, a square, a triangle, or a hexagon, please the eye, by their regularity, as beautiful figures. But regularity is not the sole, or the chief foundation of beauty in figure. On the contrary, a certain graceful variety is found to be a much more powerful principle of beauty. Regularity, according to this author, expresses beauty chiefly, if not solely, on account of its suggesting the idea of fitness, propriety, and use, which have always a greater connection with orderly and proportioned forms, than with those which appear not constructed according to any certain rule. Nature, the most graceful artist, hath, in all her ornamental works, pursued variety with an apparent neglect of regularity. Mr. Hogarth, in his “*Analysis of Beauty*,” published about the year 1753, enumerates, as elements of beauty, *fitness, variety, uniformity, simplicity, intricacy, and quantity*; and he observes, that figures bounded by curve lines are, in general, more beautiful than those bounded by straight lines and angles. The beauty of figure principally depends, in his opinion, upon two lines which he has selected. One of them is the “*waving line*,” somewhat in the form of the letter S: and this he calls the “*line of beauty*,” which is found in shells, flowers, and such other ornamental works of nature, and is also common in the figures designed by painters and sculptors for the purpose of decoration. The other line, which he calls the “*line of grace*,” is the former waving curve, twisted round some solid body, and exhibited in twisted pillars and twisted horns, and in the curling worm of a common jack. Variety plainly appears, in the instances which he mentions, to be so material a principle of beauty, that he defines the art of drawing pleasing forms to be the art of varying well; and, according to him, the curve line, which is so much the favourite of painters, derives its chief advantage from its perpetual bending and variation from the stiff regularity of the straight line. Motion, says Dr. Blair, furnishes another source of beauty, distinct from figure; being of itself pleasing, so that bodies in motion are, “*cæteris paribus*,” preferred to those at rest. But the quality of beautiful belongs to gentle motion, such as that of a bird gliding through the air, and that of a smooth running stream. In general, motion in a straight line is less beautiful than that in an undulating direction, and motion upwards is also commonly more agreeable than motion downwards. The easy curling motion of flame and smoke is an object singularly pleasing, and exhibits an instance of Mr. Hogarth’s waving line of beauty. This artist observes, that, as all the common and necessary motions for the business of life are performed in straight or plain lines, all the graceful and ornamental movements are made in waving lines. Dr. Beattie, in his “*Dissertations Moral and Critical*,” has introduced, in his digression on beauty, some ingenious remarks on this subject. After observing that custom has a perpetual influence in determining

terminating our notions of beauty, he proceeds to prove, that from affections founded on habit, many, or perhaps most of those pleasing emotions are derived, which accompany the perception of what in things visible is called beauty. With regard to the beauty or awkwardness of motion, he observes, that the one will be found to please, and the other to displease, chiefly on account of certain disagreeable ideas suggested by the former, and of certain disagreeable ones associated with the latter. Motions, that imply ease, with such an arrangement and proportion of parts in the moving object, as may give reason to expect its continuance without injury, are generally pleasing, at least in animals, especially when they betoken a sort of perfection suited to the nature of the animal. But motions, that betray infirmity, unwieldiness, imperfection, or the appearance of danger, cannot be called beautiful, because they convey unpleasing ideas. These observations are illustrated by a variety of opposite instances. Cicero (*de Off. l. ii. § 36.*) blames every motion that alters the countenance, quickens the breath, or betrays any discomposure. Rousseau observes, that in running, a woman is destitute of that grace which attends her on other occasions. Perhaps, says Beattie, the jutting out of her elbows, the natural effect of her endeavouring with lifted hands to secure the most delicate part of the human frame, may give to her motion the appearance of timidity and constraint. Or, perhaps, she may fail in this exercise, merely because, according to our manners, she cannot be much accustomed to it. See **DANCING.**

It is not easy to convey, in so few words, so many charming ideas of beauty, in its several varieties of colour, shape, attitude, and motion, as Gray has combined in the following image:

“ Slow melting strains their queen’s approach declare ;
 Where’er she turns the graces homage pay ;
 With arms sublime that float upon the air,
 In gliding state she wins her easy way :
 O’er her warm cheek, and rising bosom move
 The bloom of young desire, and purple light of love.”

But to return from this digression. Dr. Blair observes, that though colour, figure, and motion, be separate principles of beauty; yet in many beautiful objects they all meet, and render the beauty both greater, and more complex. Thus, in flowers, trees, animals, we are entertained at once with the delicacy of the colour, with the gracefulness of figure, and sometimes also with the motion of the object. Perhaps, the most complete assemblage of beautiful objects is presented by a rich natural landscape, composed of a sufficient variety of objects; fields in verdure, scattered trees and flowers, running water, animals grazing; to which may be added some productions of art, which suit such a scene, as a bridge with arches over a river, smoke rising from cottages in the midst of trees, and the distant view of a fine building, seen by the rising sun.

The beauty of the human countenance is more complex than any which has yet been considered. It includes the beauty of colour, arising from the delicate shades of the complexion; and the beauty of figure, arising from the lines which form the different features of the face. But its chief beauty depends upon a mysterious expression which it conveys of the qualities of the mind; of good sense, or good humour; of sprightliness, candour, benevolence, sensibility, or other amiable disposition.

Another distinct species of beauty arises from design or art, or from the perception of means being adapted to an end; or the parts of any thing being well fitted to answer the design of the whole. This is altogether different from the perception of beauty produced by colour, figure, variety, or any of the causes already mentioned. This sense of beauty in fitness and design, has an extensive influence over many of our ideas. It is the foundation of the beauty which we

discover in the proportion of doors, windows, arches, pillars, and all the orders of architecture. We shall here observe, that Mr. Perrault distinguishes two kinds of beauty in architecture. The one he calls “positive,” and “convincing,” such as the richness of the materials; grandeur of the structure, neatness of the workmanship, symmetry, &c.; the other he calls “arbitrary,” which depends on the will, and which would admit of having their proportions changed without deformity. These only please by the connection or association of their ideas with others of a different kind, which please of themselves: they owe their beauty to that prepossession of the mind, by which a thing, whose value we do not know, insinuates an esteem for others which we do not know. Thus, he observes, there are many things in architecture, which reason and good sense would judge deformed, which, however, custom has not only made tolerable, but even beautiful, by their being always joined with other beauties that are positive. Being at first pleased with viewing them in company, and merely on that account, we at length become pleased with them alone; and thus we frequently become fond of faults, and fall in love with deformity. Our sense of fitness and design holds so high a rank among our perceptions as to regulate, in a great degree, our other ideas of beauty. In an epic poem, a history, an oration, or any work of genius, we always require, as in other works, a fitness, or adjustment of means, to the end which the author is supposed to have in view.

Beauty, as it is applied to writing or discourse, denotes all that pleases, either in style or sentiment, from whatever principle that pleasure flows; and a beautiful poem or oration means, in common language, no other than a good one, or one well composed. Beauty, besides this indefinite sense of it, is also used to signify a certain grace and amenity in the turn either of style or sentiment, for which some authors have been peculiarly distinguished. In this sense it denotes a manner neither remarkably sublime, nor vehemently passionate, nor uncommonly sparkling; but such as excites in the reader an emotion of the gentle placid kind, similar to what is excited by the contemplation of beautiful objects in nature, which diffuses over the imagination an agreeable and pleasing serenity. Addison was eminently a writer of this character; and it belongs also to Fenelon, the author of the *Adventures of Telemachus*. Virgil, among the ancients, is distinguished, in his general manner, by beauty and grace, rather than sublimity. Among orators, Cicero has more of the beautiful than Demosthenes, whose genius led him wholly towards vehemence and strength.

The ingenious Mr. Burke, in his “*Philosophical Inquiry into the Origin of our Ideas of the Sublime and Beautiful*,” excludes from the number of real causes of beauty, the proportion of parts, fitness, or that idea of utility which consists in a part’s being well adapted to answer its end, and also perfection; and he observes (p. 210.) that beauty is, for the greater part, some quality in bodies, acting mechanically upon the human mind by the intervention of the senses. The qualities of beauty, as they are merely sensible qualities, which he enumerates, are the following: they should be comparatively small, in outline, various in the direction of their constituent parts; these parts should not be angular, but melted, as it were, into each other; they should be of a delicate frame, without any remarkable appearance of strength; the colours should be clear and bright, but not very strong and glaring; and any glaring colour that is introduced should be diversified with others. These are the seven properties upon which, according to this author, beauty depends; properties that operate by nature, and are likely to be altered by caprice, or established by a diversity of tastes, than any others. The physiognomy also, says Mr. Burke, has a considerable share in beauty, especially in that of our own

species. The manners give a certain determination to the countenance, which being observed to correspond pretty regularly with them, is capable of joining the effects of certain agreeable qualities of the mind to those of the body. So that to form a finished human beauty, and to give it its full influence, the face must be expressive of such gentle and amiable qualities as correspond with the softness, smoothness, and delicacy of the outward form. For Mr. Burke's mode of illustrating and confirming his theory of beauty, the reader is referred to his work above cited.

Dr. Sayers, in his "Disquisitions, metaphysical and literary," 8vo. in 1793, has given a new analysis of beauty, conducted on the principles which were applied by Dr. Priestley in his "Lectures on Oratory and Criticism," and by Mr. Allison in his "Essays on Taste," to the explanation of the intellectual pleasures, namely, the doctrines of the Hartleyan school. His argument, summed up in a few words, is as follows: that individual of a class of objects is justly to be esteemed more beautiful than the rest, with the whole of which, or with its component parts (when properly understood), the greater number of the excellencies of its class are universally associated. The same may be asserted of any species of objects, when compared with any other species of its kind; and that object may be justly esteemed a "standard of beauty," with the whole appearance, or with the component parts of which (when properly understood), all the excellencies of its kind are "universally" associated.

BEAUTY, in the *Arts of Design*. Whatever of beauty or perfection becomes an object of contemplation to our minds, whether it be purely mental or perceived through the medium of our senses, must be derived from the beautiful and perfect itself, and may be traced back towards its Divine source. However diversified, it proceeds from this source, and directs us where to seek the principles and perfection of all science and art, of all things metaphysical, physical, and moral, which by their mutual connection and harmony declare their common relation and origin; therefore what is called beauty in the arts of painting and sculpture must be sought for in its principles, metaphysical, physical, and moral. In this research we should do well to take those philosophers for our guides, who were the oracles of Greece, in the times when painting and sculpture attained their highest excellence. In the dialogue between Socrates and the sculptor Clito (Xenophon's Memorabilia,) Socrates concludes "that statuary must represent the actions of the soul by form." And in the former part of the same dialogue Parrhasias and Socrates agree, that the good and evil qualities of the soul may be represented in the figures of man by painting. Plato, in his dialogues, reasons to the same purpose, and declares, that the good and beautiful are one.

Aristotle (*De Mor.* l. iv. c. 7. t. iii. p. 49. *De Poet.* c. 7. t. ii. p. 658.) observes, that beauty is order in grandeur. Order supposes symmetry, fitness, and harmony; and in grandeur are comprised simplicity, unity, and majesty. However, in his catalogue of virtues and their families, as well as of the opposite vices and their families, Aristotle concurs with Plato in acknowledging the relation between beauty and goodness, evil and deformity. Indeed, it has been one of the great objects of philosophy, through all the ancient schools, to trace and demonstrate not only the likeness but the identity of beauty and goodness. Among the Platonists and the Pythagoreans, malignity was abandoned, goodness or the just, and intellect or wisdom cultivated, because by this means, man is elevated to a nearer approach to the divinity. Fortitude and temperance were the virtues of the stoics and early epicureans, because the one raises man above common fears and wants, and the other gives him better health and enjoyment of his faculties. These conclusions are convincing, and their illustrations may be drawn in great abundance from

the history and condition of the human race. Does any one supply the wants of his fellow creatures, and raise them from distress to a state of comfort? In performing these and such good acts his expression is so tender, and his manner so gentle, that all present sympathize in his feelings, and love the benefactor. If any one shews a magnanimous contempt of danger in a good cause, or manfully resists the temptation to an evil act, in so doing his features and manner express dignity and fortitude, which inspire the beholders, with awe and respect. We look with delight on the florid complexion of a person in high health, but with concern and disgust at a pallid colour and flaccid skin, because they are signs of disease and decay. We are pleased to see a stout and well made person, because such a figure bespeaks great strength and agility. We are likewise pleased to see a more slender figure of agreeable and harmonious proportions, because in it sufficient strength is united with varied elegance of attitude. Hence, as almost every circumstance of our existence furnishes examples to the same purpose, might we not define the beauty of the human person in the following terms? "Goodness, or virtue and wisdom, in a human form best suited to their expressions and exertions." It would be as absurd as presumptuous for us to attempt entering the councils of Infinite Wisdom to discover why the figure of a man was made such as it is and no other. We might as well enquire why such a particular number of worlds were made in or out of our system subject to such laws of gravity, motion, and revolution? But taking man as he is, whether we consider the faculties of his soul, the component parts of his body, or the combined operations of both, the mind is overwhelmed with the stupendous and wonderful structure of the parts, and the harmony, beauty, and utility of the whole.

Whilst we are considering beauty in the works of painting and sculpture, it will be proper to remember that the word by which the Greeks expressed this quality was ΚΑΛΟΣ, fair, handsome, beautiful, which applied extensively to almost any being or thing giving pleasure in consequence of its goodness. According, therefore, to this use of the term, we shall investigate human beauty in both sexes, and their several distinctions of character. The human figure is wonderfully suited to its various offices and employments, as well in its internal structure as in its outward form. The mechanical powers, the geometrical figures, the motion and weight of fluids, and the operations of chemistry, are continually engaged in its support and renewal; uniting an accumulation of force with a simplicity of operation truly wonderful, and contributing in their effects and appearances to the beauty of the outward form, which in the present inquiry is to be the object of attention. The head contains the brain, which sends nerves to all parts of the body and limbs, and the organs of four senses; this is the superior member of the figure, and from its elevated station, by means of the understanding and will, directs and determines the acts of all the inferior parts. The body, which contains in its cavity those parts which supply the animal functions, is also a centre from which, and upon which, the five extremities act. The arms are supported on the body in a manner most favourable to all exertions of strength, and with their hands are so formed, that these exertions may be also employed in the most difficult and curious labours. The legs strongly support the superstructure; when closed resembling two pillars, when extended, like the triangular arch, and when necessary, swiftly conveying the person from place to place. It is proper to make these general remarks, because, as we proceed, we shall find how distinguishing an ingredient utility is in the composition of beauty. After this slight view of the advantageous complication of powers and simplicity of operation in the human form, let us consider its beautiful effect, animated by goodness, and informed by wisdom; and as what has been said in this part of the article relates to the arts of design,

design, we shall produce illustrations from the antique sculpture and painting.—The ancients assigned the first class of beauty to the superior divinities, the second to heroes, and the third to fauns. Other divinities and genii seem to have partaken more or less of these classes. Mere portraits cannot be enumerated in either, because they are but faithful representations of ordinary nature. Of the superior gods, the Saturnian family possess the rank of sublimity in the *Kaz*; or beautiful. In the face of Jupiter (lately in the pope's museum, now in the national gallery at Paris,) the hair rises from the forehead, and descends in abundant flowing locks on each side of his face and neck to the shoulders; his forehead is muscular, expressive of great strength; his nose and cheeks are correspondent; his eyes and mouth express benevolence; his wife and serious brow, his placid countenance, and full beard, inspire reverence and awe. His figure is the mightiest of the superior gods. His right arm moderately raised with his thunder-bolt, or leaning on his sceptre, presents the habitual act of governing the universe. Winkelman has judiciously remarked, that the Greek sculptors preferred the family resemblance in the Saturnian race, with as much exactness as if they had been real portraits; therefore Jupiter's brothers strongly partake of the same character, excepting that Neptune's countenance is more severe and his hair more disturbed. Pluto's hair hanging over his forehead gives a gloomy cast to his countenance, which is increased by his more open and starting eyes. Winkelman has observed, that something of the lion may be traced in the nose, forehead, and hair of Jupiter, which adds might and magnanimity to the benevolence, wisdom, and awful majesty of his character. In the youthful beauty of Apollo, Bacchus, and Mercury, the same benevolence and wisdom are expressed, modified by their peculiar characteristics and offices. Apollo is light and strong in his make; Bacchus more soft and luxurious, and Mercury more athletic. The peculiarity of Hercules is magnanimity and unconquerable strength. The heroes have a more simple character throughout, approaching nearer to common nature. The fauns may be placed in the lowest class of beauty expressed in the human figure. Although their persons are youthful, and rather handsome, their proportions are shorter than those of the classes above-mentioned; and sometimes their muscles are turgid and tendinous, accommodated to their sylvan habits and activity; their round faces have a portion of rustic good nature; but their united eye-brows, eyes placed diagonally to the nose, small hollowed noses, and grinning mouths, express some mixture of savage, servile, and mischievous dispositions. The most engaging and captivating species of beauty exists in the female sex; and was represented in perfection by the Greeks in their superior classes of statues. The large eye and full under lip of Juno, give an air of haughtiness to her countenance; her limbs are round and her figure is majestic. Minerva's figure partakes of Juno's majesty; but her face is not so full, and has an expression of abstracted wisdom. Venus is represented as a softer class of female charms; her form is delicate, perfect, and almost in the highest degree; her motion graceful, and her countenance expressive of love and friendship.

The beautiful hands of a tipicity are oval in the front view; in profile, the low forehead and nose form nearly one straight line; the lips are rather full and the chin rounded. Juno has the largest eye of the goddesses, according to Homer's epithet of "Ox-eyed;" the neck is rounded like a column; the chest is high and expanded; in the male subject the abdomen is flat; and, as Winkelman remarks, "such as it appears after sound sleep and good digestion;" the arms, descending from full shoulders, are tapered downward to the wrist with a very gentle flattened hollow towards the inner elbow, to distinguish the bend of the arm; the back

of the hand is one mass; the fingers rather long and tapered, with knuckles indicated in a manner almost imperceptible; the lower limb tapers more sensibly than the arm, because the thigh is larger in its commencement; the knee-pan in youthful statues is nearly oval; and the inner side of the tibia, or principal bone of the leg, is perceptibly marked by a curve of about 30 degrees; the great toe is large, and divided by a considerable space from the lesser toes, which are straight, and not bent over each other like such as have been confined in shoes.

In the female form, the limbs are more round and delicate; the knuckles of the hand and foot are expressed by slight dimples; the fingers are more tapered; and their outline determined by a long curve, a little reversed towards the end. The principal difference of relative proportions is, that the female figure should be about one face shorter than the male; each having eight heads in height. The female figure is also narrower in the shoulders and loins, and somewhat broader from the os pubis to the extremities of the nates. The Greeks represented the goddesses with virgin bosoms. Winkelman, in his "*Monumenti aedificati*," has treated largely on the beauty of the antique statues. Professor Camper, in his "*Principles of Design*," has also given excellent observations and rules on the beauty and proportions of the human head and figure, absolute as well as comparative. For his account of beauty, as exhibited in ancient sculpture and engravings, see his treatise, entitled "*Verhandeling over het natuurlyk verhillder wezenstrikken*," &c. or, on the natural difference of features in persons of various countries and ages, published by his son, at Utrecht, 1792, 4to. In his dissertation on the beauty of forms, subjoined to his "*Lectures*," published by his son at the same place and in the same year, entitled "*Roden Voeringen*," &c. it is his object to prove, that no particular form can, abstractedly considered, constitute beauty; that the real basis of beauty consists in the means being adapted to the end; and that, exclusively of this, our ideas are influenced by customs, national prejudices, implicit confidence in the taste and opinions of others, &c.

Proportion is an essential quality of beauty in the human form; and striking coincidences are afforded in its relation to perfect geometrical figures, and the harmony of sounds and numbers. A man, standing upright, can stretch out his arms to a length equal to his height; consequently his figure may be included in a square; by stretching the arms not so much, and the legs a little, the figure may be contained in a circle, whose centre is the top of the os pubis. The ancients divided the height of the human figure into eight heads, and the face into three parts; five of these parts are the breadth of the loins; three parts, or noses, measure the upper part of the thigh; two, the calf of the leg, and one, the ankle. A well proportioned figure measures three equal parts from the top of the shoulder to the spine of the ilium next the rectus abdominis; from thence to the top of the knee-pan; and from thence to the bottom of the inner ankle.

The term grace, as a quality of beauty, however it may have puzzled the moderns in its definition and application, was clearly understood by the ancients. The graces or graces of the Romans were the *charites* of the Greeks. *XAPIS*, is grace, beauty, fairness, endearing, agreeable, elegant; and the groupes, gems, &c. are comments which are satisfactory and convincing. The graces are three beautiful fillers, whose innocence is their only garment, embracing each other in the gentlest manner. The Greek Christians have preserved the ancient signification of this word in its application to all those endearing duties which preserve happiness to, and bestow it on others; nor is it surprising, that these characteristics are given to women, because all the milder and endearing virtues are still more amiable

amiable in the female sex. If by grace, the succession and variation of undulating lines be intended, it is seen most perfectly in an elegant female figure moving slowly. It is remarkable, that man, of all creatures, presents the most perfect view of his figure in front. Quadrupeds, birds, and fishes, are best seen in profile, and we look on the backs of reptiles and insects. It is necessary, to the most advantageous appearance of man, that we should contemplate the affections of his heart, and operations of his reason continually beaming in his countenance; the waving lines of his body, moving on the centre of gravity, and varied curves and angles formed by his limbs, perfect the whole of his figure, with an union of faculties mental and bodily, which reminds us that "God created Man in his own Image."

The various heads touched upon in the latter part of this article, will be treated of in the several articles of **PAINTING** and **SCULPTURE**.

We cannot forbear subjoining the reflection with which Mr. Thomson, (a late writer on the subject of beauty) closes his detail of the various beauties of the female form. "If we should see a person employ himself with a sledge hammer to dash the enchanting form of the Venus de Medicis to pieces, break her lovely limbs, and deface her beautiful features, we should not hesitate a moment to pronounce him a savage barbarian, without taste, feeling, or sentiment, though his frenzy was employed only on a senseless piece of stone; what then must we think of the diabolical savage, who exercises the worst of all cruelties (because the most lasting and affecting both to body and mind,) on the most beautiful and amiable of all creatures on this side heaven?—made expressly for his happiness, solace, and delight, by first corrupting and betraying her, and then safely abandoning her to perish with want, pain, wretchedness, and misery." The sentiments of mankind, with regard to female beauty, have been very various in different ages and nations; and it is not possible to establish a standard which shall comprehend all, without discrimination; among the ancients, a small forehead and joined eye-brows were charming features in a female countenance; and, in Persia, large joined eye-brows are highly esteemed. In some Indian countries, black teeth and white hair are necessary ingredients in the character of a beauty; and in the Marian Islands, it is a capital object with ladies to blacken their teeth with herbs, and to bleach their hair with certain liquors. Beauty, in China and Japan, is composed of a large countenance, small, and half-concealed eyes, a broad nose, minute feet, and a prominent belly. Some Indians of America and Asia, compress the heads of their children between two wooden planks, with a view to enlarge and beautify the face; others compress them laterally, others depress the crown only, and others make the head as round as possible. Every nation has ideas of beauty peculiar to itself; and almost every individual has his own notions and taste concerning this quality. The empire of beauty, however, amidst these discordant ideas, with respect to the qualities in which it consists, has been very generally acknowledged, and particularly in all civilized countries; and when it is united with other accomplishments that tend to render females amiable, it contributes in no small degree to give them importance and influence, to polish the manners of society, and to contribute to its order and happiness.

BEAUVAIS, **BELLOVACUM**, and **CÆSARONAGUS**, in *Geography*, a city of France, and capital of the department of the Oise, seated on the Therin; and, before the revolution, the capital of the Beauvaisis, and the see of a bishop. The architecture of the cathedral has been much admired, besides which it has several collegiate and parish churches. The manufacture of the city is a beautiful tapestry, which has supplied a considerable branch of trade. It has also

produced great quantities of serge and woollen cloth. This city was unsuccessfully besieged by the English in 1443 and by the duke of Burgundy in 1472, at the head of 80,000 men. On the latter occasion, the women displayed singular courage under the conduct of Jane de Hachett, whose portrait is preserved in the town house; and in commemoration of their brave defence, the women form the first rank of a procession, observed annually on the 10th of July. This place contains in its N. E. and S. E. districts 13,000, and in its two cantons 19,390 inhabitants, on a territory of 22½ kilometres. Its N. E. canton includes 7 and its S. E. canton has 4 communes. N. lat. 49° 26'. E. long. 2° 15'.

BEAUVAISIS, a small fertile district of France, bordered on the north by Picardy, on the west by Vexin-Normand, on the south by Vexin-François, and on the east by Senlis; now forming a part of the department of Oise. See **BEAUVAIS**.

BEAUVAIL, a town of France, in the department of the Somme, and chief place of a canton, in the district of Doullens, one league S. of Doullens.

BEAUVÉRAY, a little town of France, in the district called, before the revolution, Autunois, in the department of the Saône and Loire, seated at the foot of a mountain, and supposed by some to be the ancient *Bibracte*.

BEAUVILLE, a town of France, in the department of the Lot and Garonne, and chief place of a canton, in the district of Agen, 3½ leagues N. of Valence. The place contains 1794, and the canton 7672 inhabitants; the territory includes 122½ kilometres and 11 communes. N. lat. 44° 17'. E. long. 0° 47'.

BEAUVOIR, a town of France, in the department of Vendée, a chief place of a canton, in the district of Les Sables d'Olonne; the place contains 1892 and the canton 8537 inhabitants: the territory includes 230 kilometres and 5 communes.—Also, a town of France, in the department of the Isère, and district of St. Marcelin, 5 leagues S. W. of Grenoble.

BEAUVOIR sur Niort, a town of France, in the department of the two Sevres, and chief place of a canton, in the district of Niort, 2½ leagues S. of Niort. The place contains 301 and the canton 5133 inhabitants; the territory includes 157½ kilometres and 13 communes.

BEAUVOISIN, **PONT DE**, a town of France, in the department of the Isère, and chief place of a canton, in the district of La Tour du Pin, on the borders of Savoy, 11 miles W. of Chambéry. It is seated on the small river Guier le Vif, which runs through it, and divides it into two parts.

BEAUZAT, a town of France, in the department of the Rhone and Loire, 1½ league S. W. of Monistrol.

BEAUZÈRE, a town of France, in the department of the Meuse, and chief place of a canton, in the district of Verdun, 4¼ leagues S. S. W. of Verdun.

BEAUZÉLEY DE LEVEYOU, St. a town of France, in the department of Aveyron, and chief place of a canton, in the district of Milhau, 2 leagues N. W. of Milhau.

BEBE', a large village of Egypt, on the west side of the Nile, distant about 3 leagues from Benisouf; the residence of a kiaschek, and the site of a mosque, and a convent of Copts.

BEBELINGUEN, a town of Germany, in the duchy of Wurtemberg, seated on a lake from which proceeds the river Wonn. N. Lat. 48° 45'. E. long. 9° 8'.

BEBENHAUSEN, a convent in the district of Wurtemberg, called Schonluck, at a small distance N. E. of Tubingen; the manor of which contains 9 parishes. In this convent is an academy, where students are qualified for admission into the seminary at Tubingen.

BEBENOWA, a town of Poland, in the palatinate of Braclaw, 14 miles S. E. of Braclaw.

BEBERACI, in *Ancient Geography*, *Katounich*, a lake of Melopo-

Mesopotamia, between mount Singara, and the river Chaboras.

BÈRRÉ, in *Geography*, a river of France, which runs into the Loire, opposite to Bourbon Lancy.

BEERYCES, in *Ancient Geography*, the first inhabitants of Bithynia. The origin of these people, and the reason of their name, are uncertain. A people of this appellation, mentioned by Silius Italicus, (l. iii. v. 420.) inhabited that part of Gallia Narbonensis, which was situated between Spain and the Volceæ, or near the Pyrenées, and from them called *B.ericæ*.

BEC, **LE**, in *Geography*, a town of France, in the department of the Eure, 9 leagues W. S. W. of Rouen.

BEC CRESSIN, a town of France, in the department of the Lower Seine, 3 leagues east from Havre.

BECABUNGA, **BROOKLINE**, in *Botany*. See **VERONICA**.

BECAH, or **BEKAH**, a Jewish coin, being half a Shekel. In Dr. Arbuthnot's table of reductions, the bekah amounts to $13 \frac{1}{2} d.$; in Dr. Prideaux's computation to 15. 6d.

Every Israélite paid a hundred bekahs a head every year for the support of the temple. Calmet.

BECALMING, in the *Sea Language*, is when any thing keeps the wind off or away from the vessel.

Thus one ship is said to becalm another, when she comes up with her on the weather-side: the like is said of the shore, when it keeps the wind away. A ship is likewise said to becalmed, when there is no wind stirring.

BECANER, in *Geography*, a town of Hindoostan, seated on the Ganges, nearly east of Dehli.

BECARDE, in *Ornithology*, a name under which Buffon describes some birds of the Linnæan genus **LANIUS**: as for example, his *becarde is lanius cayanus*, Gmel. and *becarde à ventre jaune, lanius sulphuratus* of the same author.

BECASSE, **BE'ASSINE**, a generical term in Buffon's Nat. Hist. for some birds of the **SCOLOPAX** genus, in the Linnæan system.

BECASSEAU ou **Cul-blanc**, is also a name given by Buffon to the *tringa ochropus* of Linneus.

BECCA, in the *Materia Medica of the Ancients*, a name given to a fine kind of resin collected from the turpentine and mastich-trees of Greece and Syria, and mixed together for use. It was much esteemed formerly, and not only used in the country where it was produced, but carried in great quantities to Mecca, and other parts of the Turkish dominions, where it was valued at a very great rate.

BECCABUNGÆ, in *Entomology*, a species of **CURCULIO**, of a black colour; wing-cases rufous; entirely bordered with black. Fabricius. In size and appearance it resembles *curculio cerasi*; inhabits Sweden; feeds on the *beccabunga*.

BECCADELLI, **ANTONIO**, in *Biography*, called *Antony of Palermo*, from the place of his birth; was born in 1374, studied the law at Bologna, and entered into the service of the duke of Milan, who allowed him an honourable pension. He also became professor of belles lettres and rhetoric in the university of Pavia, and, in 1432, was honoured by the emperor Sigismund, with the poetic laurel. When Alphonso king of Naples left Milan in 1435, he took Antonio with him to his court; and from this time, he became the inseparable companion of this prince, who conferred upon him many honours and gifts, and intrusted him with many important commissions. In 1451 he was deputed to solicit of the state of Venice, the supposed arm-bones of the historian Livy, which he obtained. Such indeed was his veneration for Livy, that he is said to have sold a farm in order to purchase a copy of Livy, written by the hand of Poggio the Florentine. After the death of Alphonso, Antonio became the secretary and counsellor of his son and successor Ferdinand. He died at Naples in 1471: leaving behind him ample testimonials of his talents as a Latin writer, both in prose and verse. For his work

"De Diètis et factis Alphonfi regis Arragonum," he received the recompence of a thousand gold crowns; which work has been frequently reprinted, with additions. A collection of five books of his epistles, two harangues, and some verses, was printed at Venice in 1453. His "Hermaphroditus," which was a collection of short poems in two books, excited by its obscenity loud clamours against its author; and was publicly burnt in several cities of Italy, together with the writer's own effigy. Gen. Biog.

BECCADELLI, **LUDOVICO**, was born of a noble family at Bologna in 1502, studied at Padua, and accompanied cardinal Pole in his legation to Spain. He assisted at the council of Trent, and was delegated by the papal court to Venice and Augsburg. In recompence of his services, he was promoted to the archbishopric of Ragusa; but being appointed in 1563 to superintend the education of the son of Cosmo I., grand duke of Tuscany, and expecting the archbishopric of Pisa, he renounced that of Ragusa. His expectations, however, were disappointed; and he was obliged to content himself with the provostship of the cathedral of Prato, in which office he died in 1572. He was reckoned eminent as a man of Letters, and wrote in Latin the lives of the cardinals Bembo and Pole, and in Italian a life of Petrarch, esteemed more correct than any other. Nouv. Diè. Hist.

BECCAFICO CANAFINO, in *Ornithology*, a name of *motacilla curruca*, in Olinia.

BECCAFICO, and *Beçfque*, are also names given by Olinia and Buffon to *motacilla fœcedula*. Linn.

BECCAFUMI, **DOMENICO**, in *Biography*, called *Micarrino* and *Mecherino*, was the son of a peasant near Sienna, whose name was Pacio, born in 1484, and employed by his father in keeping sheep. Beccafumi, a citizen of Sienna, whose name he assumed, being prepossessed with a favourable opinion of his talents by observing figures which he drew, with his stick upon the sand, whilst he was surrounded by his flock, took him under his patronage, and placed him under the instruction of a painter, called Cavanna; and after having been, as some say, the disciple of Pietro Perugino, or according to others, after having been employed in copying the pictures of this artist, he went to Rome, and made further improvement by studying the works of Raphael and Michael Angelo. After two years he returned to Sienna, and finished several pieces, not only in oil, but in distemper and fresco, which gained him great reputation. But he was chiefly admired for his performance on the pavement of the great church, which he wrought by combining tones of different colour, with pitch poured in holes for the dark shades, in such a manner as the light and shadow of the object required. This kind of performance is said to have been invented by one Duccio of Sienna in 1356; but it was brought to perfection by Beccafumi: He had a fine invention; his taste was elegant; his expression good; and his colouring beautiful. He was also an excellent engraver on wood and metal, and also a founder. His usual mark on his plates is a B divided in the middle by a horizontal line. This artist died at Genoa in 1549. Pilkington and Strutt.

BECCARIA, **CESAR BONISANA**, marquis of, an eminent Italian writer, was born about the year 1720. To the study of philosophy he was attached from his infancy, and he availed himself of the light and intellectual freedom, which about his time found their way into Italy from France, England, and other countries. At Naples Genovesi taught him the Italian how to think, and Beccaria distinguished him by the title of "his learned and venerable master." At Milan also count Firmian was a distinguished patron of literature and science, and a promoter of every reform, that had philanthropy for its basis. With such enlightened men Beccaria co-operated by writing in 1767

his famous work, "On Crimes and Punishments," which had an extensive spread, and produced a great change in the prevailing ideas on these subjects. Voltaire, in his commentaries on this work, says, that this short treatise is in morals what a simple drug would be in medicine, which should be adequate to the cure of every disease to which the human body is liable. As the principles of government indirectly supported in this work were hostile to absolute power, they incurred the charge of subverting the legitimate sources of authority; and the marquis owed his protection to the influence of count Firmian. Having escaped the danger that threatened him, he diverted his attention from speculations of this nature to metaphysical subjects. Besides some papers, contributed to a periodical work, entitled "The Coffee-House," he published "Disquisitions on the Nature of Style," maintaining that by nature all men possess an equal degree of genius for poetry and elocution, and by the observance of proper rules all would be able to write equally well. Beccaria was much attached to men of letters, a patron to those who needed encouragement, and a cordial friend. He was charged, however, with venality in the exercise of an office of magistracy which he held; and hence his enemies compared him to lord Bacon, with respect both to abilities and corruption. He died November 1794. Month. Mag. 1798. Gen. Biog.

BECCARIA, GIAMBATTISTA, an eminent philosopher of the eighteenth century, and a monk of the Ecoles-Pies, was a native of Mendovi in Piedmont, and became professor of philosophy and mathematics, first at Palermo, and then at Rome. His established reputation occasioned his removal to Turin, where he occupied the chair of experimental philosophy. In consequence of his appointment to the office of preceptor to the princes of Sardinia, he was introduced to the Sardinian court; but neither this employment, nor the honour connected with it, diverted him from the indefatigable prosecution of his studies; and the pecuniary advantages that resulted from the appointment were principally devoted to the increase of his library and the improvement of his philosophical apparatus. Amidst the variety of his philosophical pursuits, his attention was particularly engaged by experiments and investigations in electricity; and in this department of science he acquired singular reputation. For an account of his principal discoveries and observations, see ATMOSPHERE, and ELECTRICITY. His chief works on this subject were "Dell' Eletticismo Artificiale et Naturale," Turin 1753, 4to.; of which an English translation was published, in 1776, 4to. and "Lettere dell' Eletticismo," Bologn. 1758, fol. He also published essays "On the cause of Storms and Tempests." "On the Meridian of Turin," and on other physical and astronomical subjects. Father Beccaria, no less respectable for his virtues than his knowledge, died at Turin in an advanced age, May 22, 1781. Nouv. Dict. Hist.

BECCARIA, JAMES BARTHOLOMEW, born at Bononia, in 1682, received the early part of his education among the Jesuits. Turning his mind to the study of natural philosophy, he soon became distinguished for the variety and depth of his knowledge in physics, and in mathematics, of which he was made public professor, and, in conjunction with Morgagni, and other celebrated characters at Bononia, assisted in forming an academy there for teaching mathematics, natural history, chemistry, anatomy, and medicine. He first gave lectures in natural history, and in 1712, was appointed to the chair of medicine, which he also now practised with great success. On the death of Valsalva, he was made president of the institution, and in that post introduced many useful regulations for the government of the academy, which are still continued. He was a frequent correspondent with the Royal Society of London, of which he was made an honorary member. Among other commu-

nications from Beccaria, which appear in the Philosophical Transactions, are his "Observations on the Weather," "On the Ignis Fatuus," and "On the power some persons have enjoyed of supporting life for a great length of time, without food." This was afterwards published at Padua, under the title of "De jejunii longis Dissertatio," fol. 1748. He died Jan. 1766, being 84 years of age. Among his publications are, "Dissertatio Meteorologica Medica, in qua aeris temperies et morbi Bononiæ grassantes annis, 1729, et sequenti, describuntur." "De quampulurimis phosphoribus nunc primum detectis, Commentarius," Bonon. 4to. 1744. "Scriptura Medico-legalis," 1749. For the titles of his other compositions, and of numerous unedited pieces, see Gen. Biog. and Hal. Bib. Anat.

BECCLES, in Geography, is a market and corporate town of Suffolk, in England, situated on the northern border of that county joining to Norfolk. It is fifteen miles S.W. of Yarmouth, and 108 N.E. from London. Though not a borough town, Beccles has its corporation, consisting of a portreeve, and thirty-six other persons, who are distinguished by the names of *twelves*, and *twenty-fours*. From the twelves, the officer called portreeve is annually elected. The town consists of several streets, which concentrate in a spacious area, where the markets are held every Saturday. Here are a large handsome church, whose tower is detached from it, and the ruins of another called Ligate church, which was formerly the parish church. The church-yard, from its elevated situation, commands many fine and extended views of the adjacent country, and the meandrings of the river Waveney which adjoins this cemetery. Here are a town-hall and gaol; the former is a substantial building, where the quarter sessions are held; and the latter has been lately much enlarged and improved conformably to the Howardian plan. A public grammar school was founded here in 1712, by Dr. Fauconberg, who endowed it with certain lands for the maintenance of a clergyman, and to qualify youth for the university. Sir John Leman, knight, also founded a free English school in 1631, for the education of forty-eight boys; also for a master and usher, who are appointed by trustees, being part of the corporation. On the north-west side of the town is a very large common field, containing nearly 1600 acres, where the inhabitants are allowed, under certain restrictions, to turn a number of horses and cattle. Beccles suffered by a destructive fire, which happened on the 29th of November, 1586, when more than 80 houses were consumed, with property calculated at 20,000*l.* value. It is rather a singular circumstance, that neither mail, nor turnpike roads, communicate with this town: though it was some time since proposed at a public meeting to carry the turnpike road to Yarmouth through this place; but the proposition was negatived by a considerable majority of the inhabitants. Here are three annual fairs. The number of houses in the township is 601; of inhabitants 2788, of which 1245 are males, and 1543 are females. In the vicinity of this town are the following, besides other gentlemen's seats. *Raveningham Hall*, sir Edmund Bacon, bart.—*Langley Park*, sir Thomas Beauchamp Proctor, bart.—*Benacre Hall*, sir Thomas Gooch, bart.—*Sotterly Hall*, Miles Barre, esq.

BEC-D'OISEAU, in Zoology, the name lately given by French naturalists to that most singular Australasian animal *Platypus anatinus* of Vivarium nature; and *Duck-billed platypus* of Dr. Shaw. It is also called *Ornithorhynchus paradoxus*, by M. Blumenbach of Göttingen. See PLATYPUS.

BECEDE, LA, in Geography, a small town of France on the Aude, and chief place of a canton, in the district of Castelnaudary, 1½ league north of Castelnaudary.

BECF-AAL, in Ichthyology, a French name of the *Electrical eel*, anguille électrique.

BECHAN, in Geography, a river of North Wales, which

which runs into the Severn, 3 miles W.S.W. of Montgomerie.

BECHER, JOHN JOACHIM, in *Biography*, an industrious and successful cultivator and improver of chemistry, and an ingenious mechanic, was born at Spires in 1645. After passing through the usual preliminary studies, he was made professor of medicine at Mentz, and soon after physician to the elector there, and to the elector of Bavaria. Acquiring considerable reputation in these honourable posts, he was called to Vienna by the emperor Leopold; where, besides attending to his medical duties, he was instrumental in forming a chamber of commerce, and in improving their manufactures. He is also said to have projected the plan of an East India company there. But getting into disputes with some of the officers about the court, he left his influence, and was obliged to leave Vienna. He then went to Mayence, Munich, and Watzburg. From Watzburg he was driven away, Haller says, on being detected dissecting a human body, with the view probably of prosecuting some chemical experiments on some of the humours, as he did not cultivate anatomy. At Harlem, where he now went, he invented a machine for separating oils; and, as he tells us in his "La folie sage, et le bel art de l'imprimerie," printed at Francfort 1682, made some improvement in the art of printing; in what it consisted, is not however known. In the mean while he was not unmindful of the principal object of his studies, the advancement of the knowledge of chemistry, as appears by a rapid succession of publications on that subject. Getting again involved in disputes with some principal persons at Harlem, and compelled to quit that place, he came to London, where he died in 1685. That he was of a turbulent and restless disposition is evident by his frequent migrations, and by his constantly losing the favour and protection of his patrons, whom he had made his debtors by his abilities and services. Becher gave a new turn to chemistry, which he employed in analysing and finding out the principles of natural bodies, and thence laid the foundation of the great improvements that have been made in that art. But he was fond of mysteries, and employed no small part of his time and labour in his attempts to transmute metals. That he thought this practicable, appears by his "Experimentum chymicum novum, quo artificiali et instantanea metallorum generatio et transmutatio ad oculum demonstratur;" and his "Theses chymicae, veritatem et possibilitatem transmutationis metallorum in aëre et igne;" but he was conscious of having done more in the art than had ever before been done, and therefore probably thought it hardly any thing impossible. He had composed several useful languages, by which all men might be made mutually intelligible to each other: "Character promutabilis generatio utilis." On this subject he published, in 1661, a Latin dissertation; and as he was the first person who published a treatise on this art, since known under the name of pyrotechny, he may therefore be considered as the inventor of *Chymical Character*, and *PYROGRAPHY*. His principal works are his "Phisica sublimis," which has been translated into French editions; "Elevations chymiques," Marburg, 1662; "Paraphrasæ medicæ," Ulm, 1662, &c. See the title of the rest of his works, see Eloy's *Hist. Litt.*

BECK, DAVID, in *Biography*, an eminent portrait painter, was born at Arnheim in Guelderland in 1621, and became a disciple of Vaudeyk, from whom he acquired a fine manner of pencilling, and that sweet style of colouring in which this master excelled, together with that rapidity of execution for which he was so famous. He was appointed portrait painter to Christina queen of Sweden; and by her recommendation, most of the illustrious persons in Europe fat to him for their pictures. In his person and behaviour he was handsome, agreeable, and polite; and though he was much favoured by his royal mistress, he wished to visit his friends in Holland, very much against the queen's inclination; but as he soon after died in Holland, at the early age of 35, it was suspected that he was poisoned. As he travelled through Germany, he was suddenly taken ill at an inn, where he lodged, and the illness terminated in his apparent death, so that he was laid out as a corpse. His valet, who attended, regretted the event, and as they sat by his bedside, relieved their sorrow by drinking freely. One of them, in a state of intoxication, suggested, that their master was fond of a glass while he was alive, and proposed to try, their gratitude by giving him a glass, though he were dead. Accordingly they raised his head, and endeavoured to put some liquor into his mouth. Upon this Beck opened his eyes, and the servant compelled him to swallow what remained in the glass. The painter revived, and, by due attention, not only escaped interment, but perfectly recovered. In the month of June next ensuing, he received from his friend pieces of silver, gold chains, and several necklaces of gold of a large size. Pile a grain.

BECKM, or BECKUM, in *Geography*, a small town in Germany, in the circle of Westphalia and bishopric of Münster, seated on the Weser, 17 miles S.S.E. of Münster. In 1734 it was almost wholly consumed by fire.

BECKER, DANIEL, in *Biography*, was born at Dantzick, in December 1594. He took his degree of doctor in medicine at a Konigsberg, and was made professor of medicine there, and rector of the university. Becker was author of various medical works, but that which principally contributed to raise his name, is his "De cultura toro Prætorio, et de curatione singulari," or the extraordinary cure of the Præ-

BECIHCS, formed of the Greek βεζ, βεζθ, a cough, in the *Materia Medica*, medicines proper for relieving cough, but these being of various kinds, the general term may imitate, and is therefore improper.

BECHIC Pills. See **PILLS**.

BECHIN, in *Geography*, a town of Bohemia, and capital of a circle of the same name. It is seated on the river Lutzenice, and its citadel lies on a steep rock. The circle was miserably ravaged and laid waste in the 30 years' war, and the town was taken and burnt by general Bequoi in 1619. N. lat. 49° 14'. E. long. 15° 12'.

BECHTOLDHEIM, a town of France, in the department of Mont-Tonnere, and chief place of a canton, in the district of Mayence. The place contains 1057 and the canton 13,135 inhabitants: it includes 21 communes.

BECHTOLSHEIM, a market town of Swabia, in the Rhenish circle of nobility, belonging to four co-heirs, two of whom are Roman catholics, and two Lutherans.

BECK, a little river or brook, called also rivulet or rill.

According to Verstegan, the original word is *beke*, which properly imports a small stream of water issuing from some bourn or spring.

Hence, *bell-becks*, little brooks so called, on account of their gullinets and depth, or rather from their being covered, or much concealed. See **HELL**.

Beck is chiefly used among us in the composition of names of places originally situate on rivulets; hence Welbeck, Bournbeck, &c.

The Germans use *beck* in the same manner.

BECK, DAVID, in *Biography*, an eminent portrait painter, was born at Arnheim in Guelderland in 1621, and became a disciple of Vaudeyk, from whom he acquired a fine manner of pencilling, and that sweet style of colouring in which this master excelled, together with that rapidity of execution for which he was so famous. He was appointed portrait painter to Christina queen of Sweden; and by her recommendation, most of the illustrious persons in Europe fat to him for their pictures. In his person and behaviour he was handsome, agreeable, and polite; and though he was much favoured by his royal mistress, he wished to visit his friends in Holland, very much against the queen's inclination; but as he soon after died in Holland, at the early age of 35, it was suspected that he was poisoned. As he travelled through Germany, he was suddenly taken ill at an inn, where he lodged, and the illness terminated in his apparent death, so that he was laid out as a corpse. His valet, who attended, regretted the event, and as they sat by his bedside, relieved their sorrow by drinking freely. One of them, in a state of intoxication, suggested, that their master was fond of a glass while he was alive, and proposed to try, their gratitude by giving him a glass, though he were dead. Accordingly they raised his head, and endeavoured to put some liquor into his mouth. Upon this Beck opened his eyes, and the servant compelled him to swallow what remained in the glass. The painter revived, and, by due attention, not only escaped interment, but perfectly recovered. In the month of June next ensuing, he received from his friend pieces of silver, gold chains, and several necklaces of gold of a large size. Pile a grain.

BECKM, or BECKUM, in *Geography*, a small town in Germany, in the circle of Westphalia and bishopric of Münster, seated on the Weser, 17 miles S.S.E. of Münster. In 1734 it was almost wholly consumed by fire.

BECKER, DANIEL, in *Biography*, was born at Dantzick, in December 1594. He took his degree of doctor in medicine at a Konigsberg, and was made professor of medicine there, and rector of the university. Becker was author of various medical works, but that which principally contributed to raise his name, is his "De cultura toro Prætorio, et de curatione singulari," or the extraordinary cure of the Præ-

lian knife-swallower; first published in 1636, and since frequently reprinted. The subject of the history is a young man, aged 22 years, who endeavoured to excite vomiting by introducing the handle of a knife, ten inches long, into the œsophagus; the knife slipping from his fingers, dropped into his stomach, where it continued, occasioning much pain, about six weeks. No probable means of relieving him, or of obtaining the discharge of the knife occurring, it was determined, by his medical attendants, to make an incision through the integuments of the abdomen into the stomach, and to extract the knife through the wound. The operation was performed, the knife taken out, and the patient recovered in a few days. The author relates several other cases of persons who had received wounds, penetrating into the stomach. In some, the wounds were completely healed; in others, the edges of the wounds becoming callous, left fistulous openings into the stomach, through which the food passed, unless when covered with a compress. This work was translated into English, and published in 4to. by Dan. Lakin, in 1642, under the title of "A miraculous cure of the Prussian swallow knife." Lakin added other cases of wounds penetrating into the stomach, which terminated in the same way, as those related by Becker. To both the Latin and English editions engravings of the subject are added. He died the 14th of October 1655. For the titles of his other works, none of which are of much estimation; see Haller's *Bib. Chirurg. et Anatom.* His son Daniel, who was educated under his father, after visiting the principal schools on the continent of Europe, was made doctor of medicine at Strasbourg, in the year 1652; returning to Königsberg, he was appointed professor in ordinary, and soon after physician to the elector of Brandenburg. He died suddenly Feb. 6th 1670, and was succeeded in his honours by his son Daniel Christopher, but they neither of them left any works deserving notice.

BECKER, BALTHASAR. See BEKER.

BECKET, THOMAS, an English prelate, famous as the occasion of much political contention during his life, and as the object of much superstitious veneration after his death, was born in London in 1119, and prosecuted his studies at Oxford, Paris, Bologna, and Auxerre. During the interval of his residence at Paris and Bologna, he was introduced to Theobald archbishop of Canterbury, who, being captivated with his graceful and winning address, gave him two livings in Kent, and obtained for him two prebends in the cathedrals of London and Lincoln. As at this time he was only in deacon's orders, he probably held these benefices by the pope's dispensation, which his patron might easily have procured. After his return from Auxerre, where he completed his studies, particularly in the civil and canon laws, he was employed by the archbishop as his agent to the pope, in order to solicit the restoration of the legantine powers to the see of Canterbury. Having conducted this negotiation with dexterity and success, he was deputed on another important commission, the object of which was to obtain from the pope those prohibitory letters against the coronation of prince Eustace, by which that design was defeated. Upon his return to England from this successful embassy, the archbishop conferred upon him several new favours, appointing him provost of Beverley and dean of Hastings, with the right of retaining his other benefices, and just before the death of Stephen, investing him with the archdeaconry of Canterbury. Immediately upon the accession of Henry II. to the throne, in 1158, he was appointed chancellor of England at the request of his patron, who thought no dignity or trust above his merit. The chancellor of England, at this time, had no distinct court or judicature in which he presided; but he acted together with the justiciary

and other great officers, in matters of the revenue, at the exchequer, and sometimes in the counties upon circuits. The great seal being in his custody, he supervised and sealed the writs and precepts that issued in proceedings pending in the king's court, and in the exchequer. He also supervised all charters which were to be sealed with that seal. In the council his rank was very high; and he had the principal direction and conduct of all foreign affairs, performing most of that business which is now done by the secretaries of state. Such was the office to which Becket was raised; but the favour of his master made him greater than even the power of that office, great as it was in itself. In this station he paid his court so successfully to his royal master, not only by his dexterity in business, but also by his splendid manner of living and agreeable conversation, that he became his greatest favourite, and his chief companion in his amusements. Employments and trulls of all kinds were heaped upon him without measure or propriety. Besides the office of chancellor, and a scandalous number of ecclesiastical benefices, he had royal castles and forts committed to his custody, the temporalities of vacant prelacies, and the escheats of great baronies belonging to the crown. These revenues he expended without account or controul; and Henry reposed in him such a degree of confidence, that he seemed almost to share the throne with the sovereign. It must indeed be allowed that Becket possessed in a pre-eminent degree all the qualities that could most powerfully engage the affections of a prince, who had a judgment capable of discerning, and a heart formed to love extraordinary merit, but a temper that required some delicacy of address in those who approached him very nearly, and that yielded most to those friends whose character appeared most congenial to his own. The person of Becket was graceful and his countenance pleasing; his wit was lively and facetious, his judgment acute, his eloquence flowing and sweet, and his memory capacious and ready on all occasions. The time he had passed in that school of the most exquisite policy, the court of Rome, had greatly improved and refined his understanding. Nor was his capacity limited to the sphere of business. He made himself the king's perpetual companion in most of his pleasures, and consulted his taste so naturally, and with so much ease, that in paying his court he seemed only to indulge his own inclinations. He occasionally laid aside the ecclesiastical habit and character. In an expedition with the king to France, he assumed the military profession, headed a body of men in his own pay, and commanded at various sieges. In his manners there was a certain inexpressible grace derived from nature and improved by art, which rendered his virtues more amiable, and even his vices agreeable. Thus his profuseness and ostentation appeared like generosity and greatness of spirit; nor indeed was he destitute of these qualities, though he carried them far beyond proper bounds. His expence was enormous, and Henry would have been jealous of it, as intended to acquire too much popularity, if he had not been persuaded, by the address of Becket, that all his magnificence, in which the son of a private citizen surpassed even the greatest and most opulent earls, was only designed to do honour to his bountiful master, whose creature he was, and upon whom his whole fortune must absolutely depend. Yet, amidst the luxury in which he lived for several years, and all the temptations of a court where gallantry reigned, he was, if the writers of his life may be credited, constantly temperate and invincibly chaste.

At the time of the death of archbishop Theobald, Becket's patron, the king, was in Normandy; but as soon as he heard of it, he resolved to raise his chancellor to the primacy, in hopes by his means of governing the church in tranquillity. This advancement however was retarded for about a

year by the opposition of the monks Maud, the king's mother, and of the clergy and bishops of England. But Henry's resolution was fixed, and his conduct for his private overcame all remonstrances; so that Becket, being first ordained priest, was consecrated at Canterbury, June 6, 1162. As soon as Becket found himself seated in the archiepiscopal chair of Canterbury, he suddenly changed his whole mode of life, and from being the gayest and most luxurious courtier, he became the most austere and solemn monk. Without the king's previous knowledge of his intention, and very much to his surprize and dissatisfaction, he resigned the office of chancellor. Before the king's return to England in 1163, he had received so many complaints of the severities of the new primate, that he became sensible, when it was too late, that he had made a wrong choice. In his interview with Becket at Southampton, it was observed by the whole court that his affection was cooled; and he soon after manifested his dissatisfaction with the conduct of the primate, by obliging him, much against his inclination, to resign the archdeaconry of Canterbury. In 1163, Becket attended a council, summoned at Tours by pope Alexander III., where he was treated by the pope and cardinals with particular respect; and where, it is probable, he was animat'd by the pope in his design of becoming the champion of the liberties of the church, and the innumeries of the clergy. It is, however, certain, that soon after his return he began to prosecute this design without his former reserve; and the zeal which he manifested produced an open breach between him and his sovereign. Henry was determin'd to be the sovereign of all his subjects, clergy as well as laity; to oblige them to obey his laws, or to answer for their disobedience in his courts of justice. Becket, on the other hand, maintained, that the clergy were subject only to the laws of the church, and were to be judg'd only in spiritual courts, and to be punished only by ecclesiastical censures. In order to bring this question to a speedy issue, which the licentiousness of the clergy, and the atrocious crimes committed by some of them at this time, rendered absolutely necessary: a council of the clergy and nobility was summoned at Westminster; and at this council the king required that the archbishop and other bishops would consent to deliver to his officers a clerk, who was degraded for any crime, in order to his being punished for it according to the laws of the land. This request was reasonable; but the primate's influence resisted the demand; and the council broke up in confusion. Altho' Becket solemnly promised and swore, in the words of truth, and without reserve, to obey the laws and customs, commonly call'd the "constitutions of Clarendon," which reduced ecclesiastical jurisdiction to a due subjection to the law of their country, and restricted the immunities of the clergy; he soon began to exhibit signs of repugnance, by extraordinary acts of disobedience; and by determining the performance of the sacred office of his function; and he obtained from the pope a full release from the obligation of his oath, and oblig'd him to resume the duties of his sacred office. A part however of the king's judgment, he determin'd to resign the primate's seat out of the kingdom; but being prevent'd from taking his escape by contrary winds, he return'd to Canterbury; and afterwards waited upon the king at Westsack, to supplicate forgiveness for attempting to leave the kingdom without his permission. The king receiv'd him without any other expressions of displeasure, besides asking him, "if he had not indeed break'd he thought it too late to contain the truth?" This interview was followed by fresh negotiations on the part of Becket, which induced the king to summon a parliament at Northampton, Oct. 17, 1164, which

unanimously found the primate guilty of contumacy, in refusing to attend the king's court when he was summoned, and sentenced him to forfeit all his goods and chattels. He was also required to restore a sum of 500*l.* which the king had lent to him when he was chancellor, and to render an account of 250,000 marks, which he had received from vacant benefices. These demands were of so serious a nature, that, though he appeal'd to the pope, many of his episcopal brethren deserted him through fear, and urged him to resign his office, assuring him that if he did not he would be tried for perjury and high treason. The barons likewise became loud and vehement in their clamours against him, so that Becket thought it most prudent to leave the kingdom. Accordingly he left Northampton at midnight, accompanied only by two monks, and travelling on foot and by night, he arriv'd at Lincoln, and from thence he pass'd by water to a solitary island, where he remained till an opportunity offer'd of passing over to Flanders. Some say that he travell'd to Sandwich, and hired a fishing boat to convey him to Beulogne. However that be, he retir'd to the monastery of Saint Bertin. Upon his retreat, the king confiscated the revenues of the archbishopric, and sent ambassadors to the king of France, and the earl of Flanders, dissuading these princes from affording Becket shelter in their dominions. The ambassadors met with a cold reception at the French court at Compeigne, and were told by Lewis, who was a superstitious bigot, and a great admirer of Becket, that he would protect the persecuted prelate with all his power. They then proceeded to Sens, where the pope resided, who, after admitting them to an audience, and consulting his cardinals, inform'd them, that no answer could be given to their petition till the archbishop had been heard. Becket, as soon as he was assur'd of the favour and protection of the king of France, paid him a visit at Soissons, where he was affectionately received, and urg'd to accept an order on the royal treasury for every thing he needed during his stay in France. From Soissons he proceeded with a numerous retinue for Sens, which he enter'd in a kind of triumph, and here the pope treated him with the greatest respect and kindness. At a solemn council of all the cardinals and prelates, he was seated at the pope's right hand, and allowed to keep his seat while he explain'd his cause. Having produced, in the course of an artful speech, a copy of the constitutions of Clarendon, several of which were directly calculated to abridge the power of the pope and cardinals, the whole assembly express'd their abhorrence of them in the strongest terms, and at the same time pass'd the highest encomiums on the archbishop, declar'd that his cause was the cause of God and the church, and that he ought to be supported. Becket, with a view of farthering his suit by an appeal to the pope, resign'd his archbishopric into the hands, which, however, the pope, with the advice of his cardinals, immediately restor'd to him, appointing him a residence in the abbey of Pontigny in Burgundy.

When the ambassadors return'd to England, and made their report, Henry was highly offended both with the pope and the archbishop; and in token of his resentment prohibited the payment of peter-pence, and commanded all clerks who preferr'd to appeal to the pope to be imprisoned. He also command'd all the goods and revenues of the archbishop, and of all the clergy who adhered to him, to be seized; and order'd to confiscate the estate, and to banish the person of all the primate's friends, retainers, and relations, to the number of about 400. Becket, during his residence at Pontigny, employ'd himself in exercises of devotion, and also in writing expostulatory letters to the

king and bishops of England, in issuing excommunications against several officers of the crown, and in threatening even to excommunicate the king himself. Notwithstanding a spirited remonstrance addressed to Becket by the English prelates, he persisted in his purpose; and communicated it to the pope in a letter, which represented Henry as a cruel, impious, unrelenting persecutor, who had tried and condemned Christ at Northampton, in his person. Henry was much alarmed; and called a council of his barons and prelates at Chinon in Touraine, to consider what was to be done for preventing his excommunication, or for guarding against its consequences. After a long deliberation, it was thought the most expedient to appeal to the pope. In the mean while Henry sent orders to England to guard the sea-coasts, and to take other measures of precaution. Although Becket was prevented by the interposition of the king of France from executing his design of excommunicating Henry, he excommunicated his ministers and chief confidants, and declared the impious constitutions of Clarendon null and void, absolved all the bishops of England from the unlawful oath they had taken to obey them, and excommunicated all persons who paid any regard to them. Upon these presumptuous proceedings Henry threatened to expel all the monks of the Cistercian order from his dominions, if they any longer entertained his enemy, the archbishop of Canterbury at Pontigny; upon which he removed to Sens about Martinmas A.D. 1166, where an honourable asylum was provided for him by the king of France. The pertinacity of Becket rendered ineffectual for a long time all the efforts of the English prelates, of the pope, and of the king of France, for terminating the contention between him and the king of England. At length, however, all preliminaries for a reconciliation being adjusted by the papal nuncios, the archbishop was conducted in great state to an audience of his sovereign, July 22, A.D. 1170, in a meadow near Fretville, where the French and English courts, with a prodigious multitude of people of all ranks, were assembled. The conduct of the king on this occasion was singularly condescending; but Becket's lofty and resentful temper was so little impressed by it, that he returned Henry's civility and condescension with complaints and remonstrances. After a promise extorted from the king to repair all the injuries which had been done to the church, the archbishop dismounted, in order to throw himself at his feet; but Henry prevented him, and stooped so low as to hold his stirrup, and assist him in re-mounting. This reconciliation, however, was far from being cordial, on the part either of Henry or Becket, and it was not likely to be permanent. Whilst the archbishop was waiting at Whitfand, a sea-port in Flanders, previously to his return to England, he sent over three bulls, one for suspending the archbishop of York, who had been employed in crowning the young king, and two for excommunicating the bishops of London and Salisbury, who had assisted at this ceremony. This conduct, which was inexcusable at the moment when he pretended to return in peace, excited against him universal indignation, and eventually proved the cause of his ruin. On his reaching the English shore, attempts were made to prevent his landing, and he was insulted by some persons in arms, who commanded him in a threatening tone to absolve the excommunicated bishops. In his way to Canterbury he was accompanied by a great multitude of people, and entered the city in a kind of triumph amidst the acclamations of his attendants. Soon after his arrival, application was made to him for absolving the bishops whom he had suspended and excommunicated; and the young king, who concurred in the application, and who had issued an order for this purpose, was much incensed at his refusal, more especially as the

cessures which he had inflicted on those prelates who had assisted at his coronation seemed to call in question its validity. In his progress from Canterbury to Woodstock, where the young king resided, he was attended on his approach to London by prodigious crowds of people, and conducted to his lodgings in Southwark with loud acclamations; in return for which he scattered among the populace both money and episcopal benedictions. Here his vanity was mortified by a message from the young king, forbidding him to proceed any further, or to enter any royal town or castle, and commanding him to return immediately to Canterbury, and to confine himself within the precincts of his church. After his return to this city, he found himself deserted by many of his friends, and received reports of the insults they suffered, and the depredations that were committed upon his estates, so that he indulged gloomy apprehensions, and said to one of his chief confidants, "that he was now convinced this quarrel would not end without blood, but that he was determined to die for the liberties of the church." When the excommunicated prelates arrived in Normandy, and implored the protection of the king from the disgrace and ruin with which they were threatened by the private, the indignation of Henry was roused, and in the moment of intemperate passion, he exclaimed, "shall this fellow, who came to court on a lame horse, with all his estate in a wallet behind him, trample upon his king, the royal family, and the whole kingdom? Will none of all those lazy cowardly knights, whom I maintain, deliver me from this turbulent priest?" This passionate exclamation made too deep an impression on those who heard it; and particularly on four barons, who formed a resolution, either to terrify the archbishop into submission, or to put him to death. Accordingly, having concerted their plan, they set out for Canterbury by different routes and arrived at a castle about 6 miles from the city on the 28th of December, A. D. 1170; and on the following day they proceeded to the city, and getting admission into the archbishop's apartment, they told him, that they were sent by the king with a command that he should absolve the prelates, and others whom he had excommunicated, and then go to Winchester, and make satisfaction to the young king, whom he had endeavoured to dethrone. Becket, after a violent altercation, in the course of which hints were given that his life was in danger if he did not comply, persisted in his refusal. Upon the departure of the barons, one of them charged his servants not to let him flee; to which Becket, who overheard them, replied with great vehemence; "flee! I will never flee from any man living. I am not come to flee, but to defy the rage of impious assassins." The barons, with their accomplices, finding their threats ineffectual, put on their coats of mail; and taking each a sword in his right hand, and an ax in his left, returned to the palace, but found the gate shut. When they were preparing to break it open, Robert de Broc conducted them up a back stair-case, and let them in through a window. A cry then arose, "they are armed! they are armed!" on which the clergy hurried the archbishop almost by force into the church, hoping that the sacredness of the place would protect him from violence. They would also have shut the door; but he exclaimed "begone, ye cowards: I charge you on your obedience, do not shut the door. What, make a castle of a church!" The conspirators having searched the palace, came to the church, and one of them exclaiming "Where is that traitor? where is the archbishop?" Becket advanced boldly, and replied, "here I am, an archbishop, but no traitor!—I am ready to suffer in the name of him who redeemed me with his blood. God forbid that I should fly for fear of your swords, or recede from

from justice." They once more commanded him to take off the excommunication and fasten on of the bishops. He replied "no satisfaction has yet been made; nor will I absolve them." "Then," said they, "thou shalt instantly die according to thy desert." "I am ready to die," replied Becket, "that the church may obtain liberty and peace in my blood. But in the name of God, I forbid you to hurt any of my people." They now rushed upon him, and endeavoured to drag him out of the chapel, with an intention, as they themselves afterwards declared, to carry him in bonds to the king, or if they could not do that to kill him in a less sacred place. But as he clung fast to one of the pillars of the choir, they could not free him from thence. During the struggle, he struck William de Tracy so roughly, that he almost threw him down; and as Reginald Fitzurfe pressed harder upon him than any of the others, he thrust him away, and called him "pimp." This opprobrious language more enraged that violent man; he lifted up his sword against the head of Becket, who, bowing his neck, and joining his hands together, in a posture of prayer, recommended his own soul, and the cause of the church, to God, and to the saints of that cathedral. But Edward Grime, one of the monks of Canterbury, interposing his arm to ward off the blow, it was almost cut off; and the archbishop also was wounded in the crown of his head. He stood a second stroke, which likewise fell on his head, in the same devout posture, without a motion, word, or groan; but after receiving a third, he fell prostrate on his face; and all the accomplices pressing now to a share in the murder, a piece of his skull was struck off by one of them; upon which another scooped out the brains of the dead archbishop with the point of a sword, and scattered them over the pavement of the church.

Thus was assassinated, in the 53d year of his age, and 9th of his pontificate, A.D. 1170. Dec. 29, Thomas Becket;— "a man," says Lord Lytton, "of great talents, of elevated thoughts, and of invincible courage; but of a most violent and turbulent spirit; excessively passionate, haughty, and vainglorious: in his resolutions inflexible, in his resentments implacable. It cannot be denied that he was guilty of a wilful and premeditated perjury; that he opposed the necessary course of public justice, and acted in defiance of the laws of his country, laws which he had most solemnly acknowledged and confirmed; nor is it less evident, that during the heat of this dispute, he was in the highest degree ungrateful to a very kind master, whose confidence in him had been boundless, and who from a private condition had advanced him to be the second man in his kingdom. On what motives he acted can be certainly judged of by Him alone, *to whom all hearts are open*. He might be misled by the prejudices of a bigotted age, and think he was doing an acceptable service to God, in contending, even to death, for the utmost excess of ecclesiastical and papal authority. Yet the strength of his understanding, his conversation in courts and camps, among persons whose notions were more free and enlarged, the different colour of his former life, and the suddenness of the change which seemed to be wrought in him upon his elevation to Canterbury, would make one suspect, as many did in the times when he lived, that he only became the champion of the church from an ambitious desire of sharing its power; a power more independent on the favour of the king, and therefore more agreeable to the haughtiness of his mind, than that which he had enjoyed as minister of the crown. And this suspicion is increased by the marks of cunning and falseth which are evidently seen in his conduct on some occasions. Neither is it impossible, that when first he assumed his new character, he might act

the part of a zealot, merely or principally from motives of arrogance and ambition; yet afterwards, being engaged and inflamed by the contest, work himself up into a real enthusiasm. The continual praises of those with whom he acted, the honours done him in his exile by all the clergy of France, and the vanity which appears so predominant in his mind, may have conduced to operate such a change. He certainly shewed in the latter part of his life a spirit as fervent as the warmest enthusiasts; such a spirit indeed as constitutes *le royaume*, when it exerts itself in a cause beneficial to mankind. Had he defended the established laws of his country, and the fundamental rules of civil justice, with as much zeal and intrepidity as he opposed them, he would have deserved to be ranked with those great men, whose virtues make one easily forget the alloy of some natural imperfections; but unhappily his good qualities were so misapplied, that they became no less hurtful to the public weal of the kingdom, than the worst of his vices." Mr. Hume closes his account of the assassination of Becket with the following concise sketch of his character. He was "a prelate of the most lofty, intrepid, and inflexible spirit, who was able to cover to the world, and probably to himself, the enterprises of pride and ambition under the disguise of sanctity and of zeal for the interests of piety and religion. An extraordinary personage, truly, if he had been allowed to remain in his first station, and had directed the vehemence of his character to the support of law and justice; instead of being engaged, by the prejudices of the times, to sacrifice all private duties and all public connections to ties which he imagined or represented as superior to every civil or political consideration. But no man, who enters into the genius of that age, can reasonably doubt of this prelate's sincerity." Another judicious historian (Dr. Henry) says of Becket: "He was evidently a man of very great abilities, particularly of consummate cunning, undaunted courage, and invincible constancy in the prosecution of his designs. But his schemes were of a most pernicious tendency, to emancipate the ministers of religion from the restraints of law, and to subject his king and country to a foreign power. He was vain, obstinate, and implacable; as little affected by the entreaties of his friends, as by the threats of his enemies. His ingratitude to his royal master admits of no excuse, and hath fixed an indelible stain upon his character. Though his murderers were highly criminal, his death was very reasonable, and probably prevented much mischief and confusion."

The respect paid to the memory of Becket, after his death, was extravagant beyond all bounds, and remains on record as an evidence of the superstition and credulity which prevailed at the period in which it occurred. The king of England, to whose commands it was generally imputed, was represented as "that horrible persecutor of God, who exceeded Nero in cruelty, Julian in perfidy, and Judas in treachery;" and the pope was loudly called upon by the kings of France and many prelates to draw the sword of St. Peter, and to inflict some exquisite punishment upon him. But none expressed greater grief and horror at this deed than Henry himself, who broke out into the loudest lamentations, refused to see any company, or admit of any consolation for three days. He also dispatched an embassy to Rome to vindicate himself from the imputation of having been the cause of it. All divine offices were suspended for nearly a year in the church where it had happened; and the church itself was, by order of the pope, reconsecrated. In 1173, Becket was canonized by a bull of pope Alexander; and a particular collect was appointed to be used in all the churches of the province of Canterbury, for expiating the guilt of his murder. In
the

the following year, king Henry, on his return to England, went to Canterbury, where he did penance, and underwent a voluntary discipline, walking barefoot to his tomb, prostrating himself before it, and submitting to be scourged by the monks, passing all the day and night without any refreshment, kneeling on the bare stones, and bestowing great benefactions on the church of Canterbury, as a testimony of his regret for the murder. His virtues were the subjects of endless paegyric, and the miracles, operated by his relics, were more numerous, more nonfictitious, and more impudently attested, says Hume, than those which ever filled the legend of any confessor or martyr. Gervase of Canterbury informs us, that two large volumes of them were preserved in that church. In 1221, his body was taken up in the presence of king Henry III. and a vast concourse of the nobility and others, and deposited in a rich shrine erected at the expence of archbishop Stephen Langton. This shrine was enriched with presents from all parts of Christendom; pilgrimages were performed to it for obtaining the martyred prelate's intercession with heaven; and it has been computed that, in one year, above 100,000 pilgrims arrived in Canterbury, for the purpose of paying their devotions at this tomb. "It is indeed," says Hume, "a mortifying reflection to those who are actuated by the love of fame, to justly denominate the last infirmity of noble minds, that the wisest legislator and most exalted genius that ever reformed or enlightened the world, can never expect such tributes of praise as are lavished on the memory of a pretended saint, whose whole conduct was probably, to the last degree, odious or contemptible, and whose industry was entirely devoted to the pursuits of objects pernicious to mankind." Lyttelton's Hist. Henry II. vol. ii. p. 321, &c. vol. iv. p. 361, &c. 8vo. Hume's Hist. of England, vol. i. p. 447, &c. 8vo. Henry's Hist. of Great Britain, vol. v. p. 340, &c. 8vo.

BECKET, WILLIAM, son of Isaac Becket, a surgeon of some eminence at Abingdon, in Berkshire, under whom he received his education, was born in the year 1684. At a proper age, he was sent to London, and was for some years pupil to Mr. Jos. Bateman, surgeon to St. Thomas's hospital in Southwark. That he was diligent in cultivating his profession, appears by the early specimens he gave of the result of what he had seen in practice: for in 1707, he published a collection of chirurgical observations, containing relations of some curious cases that had fallen under his notice; and in 1722, "New discoveries in the Cure of Cancers;" and soon after, a recital of the case of Dr. James Keil, the celebrated physician and mathematician, who died of a cancer in his mouth. Becket had been accused of mismanaging this case, and therefore published the account in vindication of his practice. In his *New Discoveries*, he pretends to have been frequently successful in removing cancerous tumours, by means of a digestive, the manner of preparing which he does not however disclose. In a subsequent edition of this work, he gives the description of a medicine, which had been used successfully, it was said, in eradicating cancers by the family of the Paines of Northampton. It consists of yellow arsenic and bole armenic, mixed to the consistence of a paste with the pulp of an apple. It is called the red caustic. A similar preparation has been since used by Plunket and others. In 1721, he published two letters addressed to sir Hans Sloane, in which he refutes the current opinion of the efficacy of the royal touch in curing the evil, which was perhaps preparatory to his being elected fellow of the Royal Society. About this time he published proposals for printing an account of the lives and writings of the most eminent British writers in medicine, in 2 vols. 8vo. which he

did not however complete. Dr. Milward, who had formed a similar design, is said to have purchased what manuscripts were left by him on this subject, of his executors; but neither did he carry his intention into execution. It is probable that, while making this search after ancient British writers, Becket met with accounts of the disease called a brenning, and conceiving that to be a symptom of the venereal disease, he was induced to publish his three dissertations on the antiquity of that complaint, which was known, he says, before the discovery of the West Indies by Columbus. These were first printed in the *Philosophical Transactions*. Becket died at Abingdon in 1738. His works were collected together, and published in 9 vols. 8vo. in 1740, by the noted Mr. Edmund Curl.

BECKET, ISAAC, a mezzotinto engraver of some eminence, was born in Kent in 1653, was originally an apprentice to a calico-printer, and obtained the secret of scraping mezzotinto from one Loyd, a print-seller, with whom he lived for some time. He afterwards connected himself with an engraver in mezzotinto, with whom he had been acquainted at an earlier period of his life, and who assisted him, as he drew better and more expeditiously than himself. His mezzotintos are often clear and well scraped; but his middle tints are not sufficiently distinguished, so that his shadows appear flat and heavy. One of his best prints is engraved on a middling-sized upright plate, representing Adrian Beverland drawing from a statue, and having in the back ground monuments, pyramids, and several relics of antiquity. The time of his death is not known. Strutt.

BECKET, ST. THOMAS, *Brotherhood of*, in *Commerce*, a name given to the most ancient company of English merchants of which history furnishes any record, which was established about the end of the 13th century, and thus called in honour of Becket. The design of this company was to export the woollen cloth, which about that time began to be manufactured in considerable quantities in England; and as that manufacture increased, the trade of the brotherhood also increased. Henry IV. A. D. 1406, incorporated this society by a charter, regulating their government and their privileges. By this charter, any merchant of England or Ireland, who desired it, was to be admitted into the company on paying a small fine. As this society was composed of the native subjects of the kings of England, it was favoured both by government and by the people, made gradual encroachments on the trade of the merchants of the staple, and at length ruined that company. *Anderf. Comm. vol. i. p. 233, 260, &c. See STAPLE.*

BECKET, in *Geography*, a township of America, in Berkshire county, Massachusetts, containing 751 inhabitants, 10 miles east of Stockbridge, and 130 west from Boston.

BECKETTS, in the *Marine*, signify large hooks, or circular wreaths of rope, or wooden brackets, used to confine ropes, tackles, oars, or spars, in a convenient place, till they are wanted. And to put the tacks and sheets in the beckets, is to hang up the weather-main and fore-sheet, and the lee-main and fore-tack, to a little knot and eye-becket on the fore-mast, main, and fore-shoulders, when the ship is clove-hauled, to prevent them from hanging in the water. Some beckets have an eye spliced in one end, and a small walnut-knot crowned at the other, and some have both ends spliced together like a wreath. The noose made at the breast of a block, to make fast the standing part of a fall-to, is also called a becket.

BECKINGTON, THOMAS, in *Biography*, an English prelate of the 15th century, was born in the parish of Beckington, in Somersetshire, towards the close of the 14th century, educated at Wykeham's school, near Winchester, and

and finished his studies at New College, Oxford, of which he was admitted fellow in 1408. After several ecclesiastical preferments he became dean of the arches about the year 1429, and was employed by a synod held in St. Paul's church, London, in conjunction with two other persons, to draw up a form of law, by which the prosecution of the Wickliffites, or Lollards, was to be conducted. While he was tutor to King Henry VI. he wrote a Book preserved in manuscript in the Cottonian Library, in which he strenuously asserted, in opposition to the vulgar law, the right of the kings of England to the crown of France; and then gaining the special favour and patronage of that prince, he was made secretary of the king, keeper of the great seal, and bishop of Bath and Wells, to which he was consecrated in 1443. He is represented as having been well skilled in polite learning and history, and very conversant in the holy scriptures; as a good preacher, and as a generous patron of ingenious and learned men, for that he was called the Mæcenas of his age. His works of beneficence and charity were numerous. He finished Lincoln college in Oxford; procured an endowment for New College, in 1440; laid out a considerable sum of money in repairing houses belonging to his see; and erected the west side of the cloisters at Wells, and also a conduit in the market place of that city. He died at Wells in 1465. A large collection of his letters is preserved in the library at Lambeth; and a volume of sermons and some other treatises are ascribed to him. Biog. Brit.

BECMARE, in *Entomology*, a genus of insects established by Geoffroy. See RHINOMACER.

BÉCOUYA, in *Geography*. See BEKIA.

BECSANGIL, a name sometimes given to a province of Asia, which is a part of Anatolia, bounded on the north by the Black sea, on the west by the sea of Marmora and the Archipelago, on the south by Natolia Proper, and on the east by the province of Bolli. The capital is Barfa.

BECTIVE, in the county of Meath, Ireland, where are considerable ruins of an abbey which belonged to the Cistercians. It was founded by Murehard O'Malachin, king of Meath, in 1146; and being richly endowed, the abbot had a place among the peers in the assemblies of parliament, and wore a mitre. The cloisters with a tower are almost entire. It was pleasantly situated on the banks of the Boyne, over which river there was a bridge; and at present a little village, called *Beckive-bridge-end*, has two fairs annually. It is 3 miles from Trim, and about 24 from Dublin. Monast. Hibern. Ware's Antiquities.

BECTASSE, a sect among the Turks denominated from their founder Bectash, preacher to Sultan Amurath.

All the Janizaries belonging to the Porte are of the religion of Bectasse, and are said to have derived their origin from the founder of this sect. Their habit is white; on their heads they wear white caps of several pieces, with turbans of wool twisted rope-fashion. They observe constantly the hour of prayer, which they perform in their own assemblies, and they make frequent declarations of the unity of God.

BED, a place prepared to stretch and compose the body on, for rest and sleep; made chiefly of feathers inclosed in a ticken case. Of beds there are several sorts: as a feather-bed, a down-bed, a standing-bed, a settee-bed, a tent-bed, a truckle-bed, &c.

In the first and ruder ages of mankind, it was the universal practice to sleep upon the skins of beasts. This was the custom among the Greeks and Romans, and also among the Celtic nations, and ancient Britons. This custom prevailed till modern times among the common people in some parts of Germany. These skins, some of which

are worn in the day, were spread at night on the floors of their apartments. In process of time, these skins were changed for loose rushes and heath, and afterwards for straw. Pliny (l. viii. c. 48. l. xvi. c. 36.) says, that the beds of the Roman gentry were generally filled with feathers, and those of the commons with the soft down of reeds. Straw was used even in the royal chambers of England, so late as the close of the 13th century. Beds, filled with chaff, heath, or straw, are used by the common people in many parts of Great Britain and Ireland, and also in France and Italy, at this day. Beds were for a long time laid upon the ground; till at length the custom of raising the beds on feet or pedestals, which anciently prevailed in the East, and which was introduced into Italy, was adopted in Britain. But all the materials of which beds are made, and the manner of disposing them, vary among different ranks, and in different nations. By the English statutes, no beds are to be sold, except filled with one sort of stuffing only; e. g. feather beds with only dry pulled feathers; and down beds with clean down alone. No scalded feathers are to be mixed with the former; nor fen-down with the latter, on pain of forfeiture; the mixture of such things being conceived as contagious for man's body to lie on. Stat. 11 Hen. VII. c. 19.

Also bed quilts, mattresses, and cushions stuffed with horse-hair, fen-down, goat's hair, and neat's hair, which are dressed in lime; and which the heat of man's body will cause to exhale, and yield a noxious smell, whereby many of the king's subjects have been destroyed, are prohibited by the same statute.

The ancient Romans had various kinds of beds for repose; as their *lectus culicularis*, or *chamber-bed*, whereon they slept; their *table-bed*, or *lectus discubitorius*, whereon they ate (for they always ate lying, or in a recumbent posture), there being usually three persons to one bed, whereof the middle place was accounted the most honourable, as well as the middle bed. See TRICLINIUM. These beds were unknown before the second Punic war; the Romans, till then, sat down to eat on plain wooden benches, in imitation of the heroes of Homer; or as Varro expresses it, after the manner of the Lacedæmonians and Cretans. An innovation in this practice is ascribed to Scipio Africanus, who brought from Carthage some of those little beds, called "Punicani," or "Archaici," which were of wood, very low, stuffed only with hay or straw, and covered with the skins of sheep or goats, "*lectus pennis strati*." These beds in respect of delicacy differed little from the wooden benches; but when the custom of bathing prevailed, the practice of resting themselves more commodiously by lying along than by sitting down, was adopted. As for the ladies, it did not seem at first consistent with their modesty to adopt the mode of lying; accordingly they kept to the old custom all the time of the commonwealth; but, from the first Cæsars, they ate on their beds. As to the youth, who did not yet put on the *toga virilis*, they were long kept to the ancient discipline. When they were admitted to table, they only sat on the edge of the beds of their several relations. Never, says Suetonius, did the young Cæsars, Cæsar and Lucius, eat at the table of Augustus; but they were set "in medio," or, as Tacitus expresses it, "ad lectularem." From the greatest simplicity, the Romans, by degrees, came to use downy beds to the most surpassing magnificence. Pliny observes, it was no new thing to see them covered over with plates of silver, adorned with the softest mats, and the richest counterpanes. Hist. Nat. lib. xxxiii. cap. 11. Lucius Junius, speaking of Hellogabalus, says, that he had beds of gold silver; and Pompey, in his third triumph, introduced beds of gold. They had also their *lectus lecticosterius*, or what they called;

and a *lectus funebris*, or *emortualis*, on which the dead were carried to the pile. See FUNERAL.

BED of State. See PARADE.

BED of Justice, Lit de Justice, in the French *Laws*, denoted a throne on which the king used to be seated in parliament. In this sense, he was said to hold his *lit de justice*, when he went to the parliament of Paris, and held a solemn session, under a high canopy erected for the purpose. The bed of justice was only held on affairs relating to the state; on which occasion, all the officers of the parliament appeared in red robes; at other times they wore black ones. Several authors have treated expressly on the ceremonies of the bed of justice.

BED of a great Gun, is a piece of plank laid within the cheeks of the carriage, on the middle transom, for the breech of the gun to rest on.

BED, or Stool of a Mortar, is a solid piece of oak, in form of a parallelopiped, bigger or less, according to the dimensions of the mortar, hollowed a little in the middle to receive the breech and half the trunnions. On the sides of the bed are fixed the cheeks or brackets by four bolts of iron.

In ships, when the decks lie too low from the ports, so that the carriages of the pieces, with the trucks, cannot mount the ordnance sufficiently, but that they lie too near the gunwale; the method is to make a false deck for so much as the piece will require for her traversing to raise it higher; and this they call a *bed*.

BED, in *Gardening*, a small elevated plot or compartment of ground, of three, four, or more feet in breadth, which is useful in the culture of many sorts of plants, especially those of the smaller kinds. It is always an eligible practice to sow and prick out different sorts of small plants on beds having narrow alleys between them, for the greater convenience of weeding, watering, gathering, &c. as by this means such operations can be performed without trampling on the crops. Thus the ground intended for asparagus and strawberries should be divided into four feet wide beds, with eighteen inches or two feet alleys between them. Onions are likewise cultivated to the best advantage on four feet wide beds, having ten or twelve inch alleys; the different sorts of lettuce and endive should also be sown and transplanted into separate beds occasionally; and also various sorts of small plants, which can be more conveniently cultivated on beds, or in borders of similar widths. Early radishes are generally sown on beds, or similar compartments, as being more convenient for the purposes of covering them occasionally in frosty nights, and for weeding, thinning, watering, and gathering them.

All sorts of plants that are particularly intended for transplantation, should be sown in beds or narrow borders, so as to admit of standing to weed, water, and draw the plants, without treading upon them; and for the same reason, all plants necessary to be pricked out previously to their final transplanting, should also be put out on such beds; as celery, cabbages, cauliflowers, broccoli, &c. Aromatic and medicinal herbs of all sorts should also, for the greatest part, be disposed in beds with twelve or fifteen inch alleys between, or at least in borders of similar widths; particularly mint, thyme, savory, marjoram, sage, hyssop, balm, penny-royal, tansey, tarragon, feverfew, rue, &c. as this method of bedding all sorts of small plants is not only more commodious for performing the necessary operations without injuring the plants, but has an air of uniformity which is constantly to be observed in garden work.

The most proper dimensions for beds of this sort, as has been observed, is four feet or four feet and a half in width,

the length at pleasure, with intervening shallow alleys of from nine, twelve, or fifteen inches to two feet width, according to the different sorts of plants, so that a person in the alleys may easily reach half across them to do the necessary work without trampling the plants down, or treading the surface of the ground hard.

Where flower gardens are wanted to be distinct from the general pleasure ground, the spaces should be divided into regular parallel beds, of three or four feet in width, with eighteen inches or two feet wide alleys, especially when chiefly intended for the curious sorts of bulbous rooted flowers, such as tulips, hyacinths, ranunculuses, anemones, and other choice sorts, where, by being deposited together in beds, having intervening alleys, they admit of passing between them, to perform the necessary business of culture more easily, as well as to view the plants when in flower. Many sorts likewise appear to greater advantage in this way.

The beds, in these cases, should be neatly edged with box or thurst. See EDGING.

The grounds of nurseries intended for raising all sorts of flowers from seeds, slips, cuttings, parting of roots, &c. should also be divided into beds of three or four feet in width. And in large nurseries for trees, the ground intended for the reception of cuttings of most sorts of hardy trees and shrubs, should also be generally divided into three or four feet beds, having twelve or fifteen inch alleys between them.

Beds in common should only be raised a very little higher than the alleys, unless in cases of too much stagnant moisture, three or four inches higher than the level of the alley is mostly sufficient; for when raised considerably, the alleys assume the appearance of trenches, and have a disagreeable effect.

The earth of all sorts of beds should be well broken down, and laid as even as possible in digging them over, being afterwards raked into neat order on the surface.

Beds for raising melons, mushrooms, and the like, are commonly denominated *ridges*.

BEDS, in speaking of hops, denote the floors whereon they are spread to dry.

BED of Corn, is a heap, flat at top, three or four feet high; otherwise called a *couch*.

BED-algenfe, a name given by the Arab *Astronomers* to a fixed star of the first magnitude in the right shoulder of ORION. *BED-algenfe* is of a ruddy colour, by which it is easily distinguished.

BED, in *Masonry*, denotes a course or range of stones.

BED, Joint of the, is the mortar between two stones placed over each other.

BED, in *Sea Language*, a flat, thick piece of timber laid under the quarters of casks, containing any liquid, and stowed in the ship's hold.

BED of a River, the bottom of the channel in which the stream flows.

BEDS, in speaking of minerals and fossils, signify certain strata, or layers of matter, disposed over each other.

BEDS, in the *New Husbandry*, denote the spaces occupied by the rows of corn, in contradistinction from the open spaces between them, which are called alleys.

BEDALACH, in the *Materia Medica*, a name given by some writers to the gum bdellium; but particularly to that kind of it which was brought from Arabia, and was of a yellowish colour, like wax.

BED-CHAMBER.—*Lords or Gentlemen of the BED-CHAMBER*, are persons of the first rank, fourteen in number, whose office used to be, each in his turn, to attend a week in the king's bed-chamber, lying by the king on a pallet-

pallo del di' night, and to wait on the king when he eats in private. The salary is 1000l. per annum. The first of these is called *grove of the Stork*. There are also twelve groves of the bed-chamber.

BED MOULDING, in *Archit. Aure.* is a term used by workmen to express those members of a cornice which lie below the corona. A bed-moulding usually consists of three or four members, an ogee, a lot, a large bouline, and another lot under the front.

BEDA, or **BEDR**, distinguished by the epithet *Venerabilis*, in *Begeſt. Angl.* a learned monk of the eighth century, and one of the best writers of his time, was born in the neighbourhood of Wearmouth, in the bishopric of Durham, in 672 or 673. At the age of seven years he was brought to the monastery of St. Peter, founded near the place of his nativity about two years after he was born; and the care of his education was intrusted with abbot Benedict, his successor Cuthbert, and John of Beverly, for twelve years. Endowed with an excellent genius, and distinguished by assiduous application, his progress in various branches of learning, during this period, was very considerable. At the close of it, or when he had attained the age of 19 years, he was ordained a deacon by the last mentioned preceptor, then bishop of Hexham, and afterwards archbishop of York. About this time he seems to have removed from the monastery of St. Peter's at Wearmouth, where he was educated, to that of St. Paul at Jarrow, near the mouth of the river Tyne, founded, as the former had been, by the abbot Benedict. Here he was employed in the prosecution of his own studies, and in assisting those of others who resorted to this monastery for instruction. His whole life, which he spent in this retreat, was devoted, as he himself informs us, to the exercises of devotion in the church, and to those of teaching, reading, and writing. At the age of thirty, A.D. 702, he was ordained priest by the same person from whom he had received deacon's orders. Although he lived in retirement, the fame of his learning and character soon spread over Europe; so that pope Sergius addressed a letter to abbot Cuthbert, in which he urged him to send Bede to Rome. The death of the pope, which probably happened soon after this letter was written, prevented Bede from leaving his own country; nor indeed does it appear, with sufficient evidence, that he ever quitted Northumberland, though some have said that he visited the monastery founded at Gracechester or Cambridge, in 720, to see the ark of the covenant, in which he died, and in which he was buried. When in the full vigour of his mind, he was still indefatigable in the acquisition of knowledge, and in the communication of it to others. His genius, from his numerous works on a variety of subjects, that his knowledge comprehended every kind of learning, and from the time he was known at the period in which he lived; and from other collateral evidence of unquestionable authority, that he was justly entitled to the appellations of "the wise man," and of "Venerable Bede," conferred on him by his countrymen, and uniformly retained by posterity. From his superior learning accepted any preferment above the level of a monk or a simple priest, we may infer his singular modesty; his letter addressed to his intimate friend, the learned abbot, a bishop of York, and containing excellent advice, the result of long experience, evinces the purity of his morals, and the liberality of his sentiments; and as he was never censured as a saint, and the beauty of the things he did to be much performed by him, we may reasonably conclude, that he was animated by the spirit of his order, formed to give to his character. He appears indeed, more of a philosopher than of a religious man; "to be a philosopher, the more a religionist of learning, who is

destitute, of devotion with liberality, and of high reputation in the church with voluntary and honourable poverty."

The largest and most popular of Bede's works is his history of the church, intitled, "Ecclesiastice Historie Gentis Anglorum libri quinque," and first published in 731, the year to which he continued his history of Christianity from its first introduction into Britain. In collecting materials for this history, he consulted several chronicles of the English kings before his time; he kept up a correspondence in the several kingdoms of the heptarchy, and he had recourse to various records and archives preserved in several monasteries; and his history has been regarded as containing the most authentic and comprehensive account of the early state of Christianity in this country. The famous Milton, indeed, has objected to this history, that it is deficient with regard to the civil affairs of the country, which are mentioned very cursorily, and which form rather a calendar of dates, than a regular history; but if it be duly considered, that his object was the state of the church, and not the secular transactions of the period which his history comprehends, this objection must appear to be urged against it without sufficient reason. Milton himself confessed, that he travelled with much worse guides after he parted with Bede. The charge that has been alleged against him, of partiality to the Saxons in preference to the Britons, seems to be less exceptionable. But the chief objection to which his history is liable, is the diffuse account which he introduced of legendary miracles and of other trivial and absurd circumstances, extracted without sufficient discrimination and with apparent credulity from the chronicles to which he had access; and yet, when we recollect the period in which he lived, and consider, that the principal transactions of the church upon record consisted of such fooleries and impostures, we may admit some apology for a writer who wished to approve himself a faithful historian. Without adverting to the censures of M. du Pin, which extend to the style and subjects of Bede's works in general, and which are amply stated and satisfactorily obviated in the Biog. Brit., it may not be improper to mention the objection urged by father Pezron against the chronology of Bede. This father, who has taken great pains, after Isaac Vossius and father Morin, to support the chronology of the Septuagint, informs us, that Bede was the first who endeavoured, in the western church, to maintain the shorter chronology of the Hebrew text; and archbishop Usher, in his "Sacred Chronology," observes, that Bede was considered as an heretic on account of this innovation. However, his computation was afterwards received, and scarcely any other was admitted in the west till the three learned men above-mentioned appeared in defence of the contrary opinion. If Bede, therefore, was singular in being an advocate for the Hebrew chronology, this singularity affords evidence of his learning, penetration, and good sense. The author's ecclesiastical history is written in easy, though not very elegant Latin; and as to the faults in his style, which some, and particularly Du Pin, have censured, they will not appear to be very great, if compared with contemporary writers; and to compare him with Homer is certainly unjust. Of the Latin original of the History there have been several editions with notes and commentaries; particularly at Antwerp in 1550, at Heidelberg in 1577, at Cologne in 1601, at Cambridge in 1644, at Paris in 1681, and at Cambridge in 1722. A Saxon version attributed to king Alfred, with learned notes by Abraham Whedde, was printed at Cambridge in 1644; and an English translation by Dr. Stapleton was printed at Antwerp in 1755. The design of the latter translation was to support the popish religion; and of course it is not deemed very valuable; but the history of

Bede, even as he has given it in English, might in many passages be shewn to be far enough from favouring the doctrines of the church of Rome.

The last literary labour of venerable Bede, was "A Translation of the Gospel of St. John into the Saxon Language," which he completed with difficulty on the day and hour of his death, which happened on the 26th of May, A. D. 735. The disorder of which he died was an asthma; and he bore the pain that attended it with exemplary fortitude and patience, discharging the duties of his office, and prosecuting the works in which he was engaged, and which he wished to finish, with unabated assiduity. During many sleepless nights, he is said to have sung praises to Almighty God; and in the prospect of dissolution, he did not dissemble his apprehensions of it, though he expressed the utmost confidence in the divine mercy, and was able, on a review of his conduct, to declare seriously that he had so lived, as not to be ashamed to die. During an act of devotion, and whilst he was pronouncing the last word of it, he expired. It would be easy to cite a great number of testimonies to the extent of Bede's learning, as well as to the excellence of his character. William of Malmesbury, after giving him an extraordinary character, tells us, "that it was much more easy to admire him in thought, than to do him justice in expression." Bale assures us, that he was so well skilled in the writings of Pagan authors, that he had scarcely an equal in that age, and that he learned natural philosophy and mathematics from the purest sources, the Greek and Latin authors themselves. Pits says, that he was so well versed in all the branches of learning, that Europe scarcely ever produced a greater scholar in all respects; that even, while he was living, his writings were of such authority, that it was ordered by a council held in England, and approved afterwards by the catholic church, that they should be publicly read in the churches; that from his earliest years, he was remarkable for his piety and love of learning, alternating without interruption his prayers and his studies; and that his intense application furnished him with a complete knowledge of poetry, rhetoric, natural philosophy, metaphysics, astronomy, arithmetic, music, geometry, cosmography, chronology, history, and the whole circle of the liberal arts, and all parts of inathematics, philosophy, and divinity. Camden represents him as the singular light of our England; and many testimonies in his favour may be found in the works of our historians and antiquarians, such as Hollinshed, Stowe, Speed, Selden, sir Henry Spelman, Stillingfleet, Mabillon, Warton, &c.

Besides the History, the translation of St. John's gospel, and the letter to Egbert already mentioned, there are a great many works, both published and in manuscript, that have been attributed to Bede; some of which, however, are of dubious genuineness. They are enumerated in the *Biographia Britannica*, Cave's *Hist. Lit.* and in the appendix to the fourth volume of Henry's History. They compose a very miscellaneous collection of versions and commentaries upon several books of the Old and New Testament, of legends, and theological dissertations; among which are some of greater value on the scripture chronology, and many elementary compilations, for the use of his scholars, on the subjects of arithmetic, grammar, rhetoric, astronomy, music, and natural philosophy. The first general collection of his works appeared at Paris, in 1544, in 3 vols. folio; and again in 1544, at the same place, in 8 vols.; at Basil, in the same size and number of volumes, in 1563, reprinted at Cologne in 1612, and at the same place in 1688. Several of Bede's works have been separately printed; and those treatises, which are mentioned in his own catalogue of his works, annexed to his ecclesiastical history, were published by the

learned and industrious Mr. Wharton, from three manuscripts in the archiepiscopal palace at Lambeth, London, 1693, 4to. Cave's *Hist. Lit.* vol. i. p. 612, &c. Henry's *Hist.* vol. iv. p. 26, &c. Wharton's *Hist. Poetry*, vol. i. diss. 2. *Biog. Brit. Gen. Dict.*

It is from the *Ecclesiastical History* of this worthy monk, that we know any thing concerning music in our country during the seventh and eighth centuries, the most barbarous period of its annals. In his account of the conversion of the Saxons to Christianity, he speaks of *litanies* and *allelujabs* being sung in the Gregorian manner, according to the Roman ritual, when bishop Stillingfleet thinks that the goodness of the music was the principal incitement to the reception of the mass by the Saxons.

Bede was himself an able musician, and is supposed to have been the author of a short musical tract, "De Musica Theorica, et Practica seu Mensurata." Of the two parts of this treatise ascribed to Bede, the first may have been written by him; the second, however, is manifestly the work of a much more modern author; for we find in it, not only the mention of music in two or three different parts, under the name of *discant*, but of instruments never mentioned in writers contemporary with Bede; such as the *organ*, *viola*, *atola*, &c. A notation too of much later times appears here, in which the *long*, the *breve*, and *semibreve*, are used, and these upon *five lines* and spaces, with equivalent rests and pauses. The word *modus* is also used for *time* in the sense to which the term *mood* was applied after it ceased to mean *key*. Upon the whole it seems as if this last part of the tract attributed to Bede, was written about the twelfth century; that is, between the time of Guido and John de Muris.

Bede, however, informs us that, in 680, John, præcentor of St. Peter's in Rome, was sent over by pope Agatho to instruct the monks of Weremouth in the art of singing, and particularly to acquaint them with the manner of performing the festival services throughout the year, according to that which was practised at Rome. And such was the reputation of his skill, that "the masters of music from all the other monasteries of the north came to hear him; and prevailed on him to open schools for teaching music in other places of the kingdom of Northumberland."

And it is from Bede's information that we have any knowledge of the social and domestic singing to the harp in the Saxon language, upon our island, at the beginning of the eighth century; which is amply detailed in bishop Percy's essay on the ancient English minstrels. *Reliques of Ancient Poetry.*

BEDA, or BEDE, a doctor of divinity in the university of Paris, was a native of Picardy, and flourished in the beginning of the sixteenth century. His temper was violent and impetuous, and he was a great enemy to every kind of innovation and reform. Erasmus and Faber Stapulensis, who were great promoters of literature, were the objects of his vehement attack. Against the scriptural paraphrases of the former he wrote a book, in which Erasmus detected many misrepresentations and calumnies; and yet such was his influence among his brethren, that he induced the faculty of divinity to censure the works of his antagonist. In his opposition to the design of Francis I. for obliging the Sorbonne to concur with the other universities of France in giving a favourable opinion concerning the divorce of Henry VIII. of England, he acted a more justifiable part; but he injured his character, and ruined his cause, by his passionate and turbulent behaviour, and involved himself in the crime of perjury. After having made the *amende honorable*, by publicly acknowledging that he had spoken against truth and the king, before the church of Notre Dame, he was committed to prison in 1535, and afterwards sentenced to

be banished to the abbey of mount St. Michael, where he died in the year 1537. He was a furious persecutor of the protestants, and one of the chief promoters of the punishment of Lewis de Berguin, the protestant martyr. His Latin works were a treatise "De unice Magdalenâ," against Faber, Paris, 1519; "Two books against Faber's Commentaries and Erasmus's Paraphrases," Paris, 1526; "An Apology against the secret Lutherans," Paris; and "An Apology for the Daughters and Grand-children of St. Anne," against Faber. His works in French were "A Restitution of the Benediction of the Paschal taper," and "A Confession of Faith." Gen. Diet. Nouv. Diet. Hist.

BEDA, a sacred book of the religion and law of the Brahmins of Hindoostan, called also *Vedam* and *Viedam*, which see; see also BRACHMANS, and SHASTAH.

BEDALE, in *Geography*, a market town of England. It is situated in that division of the north riding of Yorkshire called Richmondshire, at the distance of 6 miles from North Allerton, and 223 miles north of London. Seated on the bank of a small river, it enjoys a pleasant and fertile situation; but being at some distance from any public road, its principal trade is derived from a weekly market and five annual fairs. These are abundantly supplied with horses; the buying and selling of which are the chief business of many persons in this part of Yorkshire. The rectory of this town is very valuable; and the church, which is a large handsome structure, contains some ancient monuments, one of which commemorates Brian Fitz Alan, the last male heir of that family. A Roman road passed through this town to Barnard castle, &c.; and some Roman encampments are remaining on the high grounds between this town and Ripon. There is a charity school; and the township contains 226 houses, with 1205 inhabitants.

BEDANG, a commentary on the Beda of the Brahmins of Hindoostan, called also *Shyster* or *Shyllab*; which see.

BEDARIDES, in *Geography*, a town of France, in the department of Vaucluse and chief place of a canton, in the district of Avignon. The place contains 1658 and the canton 6206 inhabitants: the territory includes 107½ kilometres and 4 communes.

BEDARIEUX, a town of France, in the department of the Hault, and chief place of a canton, in the district of Beziers, seated on the Orbe, 5½ leagues north of Beziers. The inhabitants carry on a manufacture of druggets and other woollen stuff. The place contains 3338 and the canton 8651 inhabitants: the territory includes 142½ kilometres and 7 communes. N. lat. 43° 27'. E. long. 3° 24'.

BEDAS, BADAË, or VALDAP, a name given to a species of savages, who occupy a small district in the northern part of the island of Ceylon, and who seem to be (says Buffon) of a peculiar race. The spot which they inhabit is entirely covered with wood, where they conceal themselves in such a manner, that it is difficult to discover them. Their complexion is fair, and sometimes red, like that of the Europeans. Their language has no analogy to that of any of the other India languages. They have no villages or houses, and hold no intercourse with the rest of mankind. Their arms are bows and arrows, with which they kill a number of bears, stags, and other animals. They never dress their meat, but season it with honey, of which they have great abundance. The wisest of these woodland wanderers recognize no authority, except that of their own chiefs; but other, without formally acknowledging the sovereignty of the king, furnish him with ivory, wax, and deer. Such of them as visit the European territories, barter their articles with the English for the simple things which their mode of life requires. To prevent themselves from being surprised or robbed by the natives carrying on this traffic, the method

they employ is curious: when they stand in need of cloth, iron, knives, or any other articles of smith's work, they approach by night some town or village, and deposit, in a place where it is likely to be immediately discovered, a certain quantity of their goods, along with a talipot leaf expressive of what they want in return. On a following night they repair again to the same place, and generally find their expected reward awaiting them. For although they are easily satisfied, and readily allow the advantage to the person with whom they deal, yet if their requests are treated with neglect, they will not fail to watch their opportunity of doing him a mischief. The Cinglese, as they can afterward dispose of the articles afforded by the Bedahs, find the traffic profitable; and in some parts frequently go into the woods, carrying with them articles of barter. This trade, however, can only be carried on in the manner already described; for no native of the woods can be more afraid of approaching a stranger than the Bedahs. Few will venture even to converse with other natives; but the wilder class, known by the name of "Ramba-Vaddahs," are more seldom seen even by stealth than the most timid of the wild animals. The origin of this small tribe, who live in detached families, is unknown. These Bedas, as well as the Chaerelas of Java, who are both fair and few in number, appear (says Buffon) to be of European extraction; and he conjectures, that some European men and women have been formerly left on these islands by shipwreck or otherwise, and that, for fear of being maltreated by the natives, they and their descendants confined themselves to the woody and mountainous parts of their country, where they retain a savage life. See CEYLON.

BEDASPES, in *Ancient Geography*, the name given by Ptolemy to the Hydaspes, or modern Behut, a river of Hindoostan. See HYDASPES, and BEHUT.

BEDAT, LE, in *Geography*, a river of France, which runs into the Allier, near Montferand.

BEDBURG, a town of Germany, in the circle of the Lower Rhine, and electorate of Cologne, seated on the Erft, 14 miles west of Cologne. N. lat. 51°. E. long. 6° 20'.

BEDDING, in *History*, in respect of horses and other cattle, denotes straw or litter spread under them to lie on.

Bedding, in speaking of a roe, is used by sportsmen for the lodging of that beast. A roe is said to *bed*; a hart to *harbour*; a fox to *kennel*.

BEDE POINT, in *Geography*, the eastern cape at the mouth of Cook's river, on the north-west coast of North America.

BEDEA, BADAËH, or BAIDEËH, the name of a valley near the Red sea, which, according to Niebuhr, is 6 German miles from Suez, and where the sea (Bruce says) is something less than 4 leagues broad, by 50 feet deep. This valley ends in a pass between two considerable mountains, called Gewoube on the south, and Jibbel Attakah on the north; and opens into the low stripe of country which runs along the Red sea. The mouth of this valley, opening to the flat country and the sea, was called "Pihahiroth;" and through this valley it has been supposed that the Israelites made their passage from the pursuing army of Pharaoh to the Red sea; and it is added, that they encamped in the bay which terminated this valley, at Pihahiroth, opposite to BAAL-ZEPHON (which see), betwixt Migdol and that sea. In these circumstances, says Dr. Shaw, the Egyptians might well imagine, that the Israelites could have no possible way of escape; inasmuch as the mountains of Gewoube would stop their flight or progress towards the south, as those of Attakah would prevent their passing towards the land of the Philistines: the Red sea likewise lay before them to the east; whilst Pharaoh closed up the valley behind them.

them, with his chariots and horsemen. This valley, adds Dr. Shaw, is called "Tiah Beni Israel," i. e. the road of the Israelites, from a tradition, that is still kept up by the Arabs, of their having passed through it. It is also called "Baideah," he says, from the *new* and unheard-of *miracle*, that was wrought near it, by dividing the Red sea, and destroying in it Pharaoh, his chariots, and horsemen. Bruce observes, that Dr. Shaw, by interpreting "Badeah" as the "valley of the miracle," forces an etymology, because there was yet no miracle wrought, nor was there ever any in the valley. But "Badeah," he says, means "barren," and "uninhabited;" such as we may imagine a valley between stony mountains, a desert valley. To his translation of "Jibbel Attakah," as the "mountain of deliverance," Bruce objects, that so far were the Israelites from being delivered, on their arrival at this mountain, that they were then in the greatest distress and danger. Attakah means, according to this traveller, to "arrive," or "come up with;" either because they arrived within sight of the Red sea; or it might more probably derive its name from the arrival of Pharaoh, or his coming in sight of the Israelites, when encamped between Migdol and the Red sea. Shaw's Travels, p. 302. Bruce's Travels in Abyssinia, vol. i. p. 232, &c.

A late writer observes, that this hypothesis of the passage of the Israelites at Bedea, has been given up by our best modern critics; and the "Siuis Heroopolitanus," or gulf of Suez, pitched upon as the scene of action. The idea was first suggested by Le Clerc, and since adopted and defended by Michaelis, Niebuhr, and almost all the German commentators. Mr. Bryant, however (Obs. on the Plagues of Egypt, p. 378.), still contends for Bedea, and calls the arguments of Niebuhr prejudices and misconceptions. The writer, to whom we now refer, who excludes from this event every thing that was miraculous, contends, for the pass at Suez, or not far from Suez, where, he says, at this day there are shallows fordable at low water, and which might, in former times, have been frequently dry. Geddes's Critical Remarks, vol. i. p. 225. See SUEZ.

BEDEC, a town of France, in the department of the Ille and Vilaine, and chief place of a canton, in the district of Montfort, one league N. of Montfort.

BEDEGUAR, in the *Materia Medica*, the name of a fungus, or gall, growing upon the rose plant (*rosa silvestris*), which belongs to the class of astringents, as it is possessed of and celebrated for its astringent power; but it has hardly yet got a place in our dispensaries, and we are quite unacquainted with its powers. Cullen's Mat. Med. vol. ii. p. 36.

BEDEL, or BEDEO, *Bay*, in *Geography*, lies in the gulf of the river of St. Lawrence, on the south-west coast of the island of St. John's, in North America, and is situated S. by E. from Egmont bay, on the same coast of the island.

BEDELL, WILLIAM, in *Biography*, an eminent prelate of the English church in Ireland, was born at Black Notley in Essex in 1570; and being designed for the church, was educated at Emanuel college in the university of Cambridge. Having been chosen fellow of his college in 1593, and taken his degree of bachelor of divinity in 1599, he removed to St. Edmundsbury in Suffolk, where he continued in high estimation for his attention to the duties of his profession till he accompanied sir Henry Wotton to Venice, as his chaplain. Here he became intimately acquainted with father Paul Sarpi, who taught him the Italian language, into which he translated the English common prayer book; and in return for the favour conferred upon him by father Paul, he drew up an English grammar for his use, and assisted him in his studies. During his stay at Venice, he availed himself of the assistance of Rabbi Leo, in acquiring the knowledge of the Hebrew language, and of Rabbinical learning; and by

his means he had an opportunity of purchasing a very fair MS. of the Old Testament, which cost, it is said, its weight in silver, and which he presented to Emanuel college. He also formed an acquaintance with Antonio de Dominis, archbishop of Spalato, and communicated to him several corrections of his book "De Republica Ecclesiastica," afterwards printed in London. Upon his leaving Venice, after a residence of eight years, he received from father Paul, as tokens of his esteem and friendship, his picture, and several valuable books, together with a MS. copy of his famous history of the council of Trent, his histories of the Interdict and Inquisition, and a collection of letters. At Edmundsbury, where he settled upon his return to England, he employed himself in translating the histories of the Interdict and Inquisition, and the two last books of the history of the council of Trent into Latin, the two first having been translated by sir Adam Newton. In 1615, Bedell was presented by sir John Jermyn to the living of Horingheath, in the see of Norwich; but having scruples about paying the fees of induction, which he regarded as a species of simony, he declined accepting it; however, he was afterwards admitted without fees, and lived in this parish for twelve years unnoticed. To such a degree, indeed, was he disregarded, that when Diodati, a famous divine of Geneva, came to England, he discovered his place of abode by mere accident. Bedell was introduced by Diodati to Morton bishop of Durham, as the esteemed friend of father Paul, and was treated by him with peculiar respect. In this obscure retreat he evinced his talents by the publication of some letters which had passed between him and James Wadsworth, formerly his fellow-collegian, but since become a convert to popery, and a pensioner of the inquisition at Seville, concerning the authority of the church of Rome. These letters were dedicated to king Charles I. then prince of Wales, in 1624. In this work there was a passage which justified resistance to tyrannical princes. Whilst the author lived, the passage escaped animadversion; before the treatise was reprinted in 1685, in order to be bound up with bishop Burnet's life of Bedell, it could not obtain the licence of sir Roger l'Estrange, till some words were introduced which made the passage appear like a reference to arguments that were used by others. In 1627, Bedell was elected provost of Trinity college, Dublin, which he was constrained to accept by the king's special command. Upon his return to England, for the purpose of taking over his family, he had serious thoughts of resigning his post; but he was persuaded to retain it by an encouraging letter from the primate, Usher. He then engaged in the discharge of the duties of his station with vigour and activity, and was eminently useful in composing divisions among the fellows, establishing discipline, and promoting religion by weekly sermons on the church catechism, which he formed into learned lectures of divinity and morals. In this employment he continued about two years, when, by the interest of sir Thomas Jermyn, and the application of bishop Laud, he was advanced to the sees of Kilmore and Ardagh. He was consecrated at Drogheda in September 1629, being then in the 59th year of his age. In this new station he had to encounter many difficulties; but he determined to adopt plans of reformation, and to correct the abuses and disorders that had prevailed to a very great degree in his diocese. In order to secure success in his laudable design, and the more effectually to abolish pluralities, he set an example of moderation by separating the see of Ardagh from that of Kilmore, though he had been at a considerable expence in recovering some of its revenues; these fees, however, have been since re-united, and have so continued. After the compromise of a dispute, which had occurred between him and lord Wentworth, afterwards lord Strafford, who was appointed lord deputy of Ireland in 1633,

on account of his having subscribed a petition addressed to him for the redress of certain grievances, Bedell proceeded without interruption in his episcopal duties and reforms. In the exercise of his episcopal functions, he adhered strictly to the rubric; but in cases that depended on his own determination, he appeared to be jealous of all approaches to superstition. He was extremely assiduous in preaching, catechising, and employing all means for disseminating religious knowledge; and though he never persecuted the papists, he was the most formidable opponent they had in Ireland. He converted several of their clergy by argument; and laboured to bring over the natives by dispersing among them the scriptures, with popular tracts in their own language, and by causing the common-prayer in Irish to be read every Sunday in his own cathedral. Bishop Bedell seems to have considered the theological differences that subsisted among Protestants in his time as of little moment; and it was his wish to promote the well-intended project of Mr. Drury for effecting a reconciliation between the Calvinists and Lutherans.

The character of bishop Bedell was held in such high estimation among the Irish, that when the rebellion broke out in 1641, the most barbarous of them were known to declare, that he would be the last Englishman whom they would expel the country. His house in the county of Carra was an unmolested asylum for many Protestants who were driven from their own habitations; and he treated them with hospitality and kindness, exhorting them at the same time by prayers and religious discourses, to prepare for the distress that threatened them. He declared resolution not to dismiss their fugitives from his house, and to share the fate that awaited them, occasioned his being removed, with his two sons and family, to a ruinous castle in the middle of a lake where they suffered much from the severity of the weather. The bishop and his sons were incessant in preaching and praying with their distressed companions; and their piety inspired the bigotted and rude Irish who guarded them with respect, that they never disturbed their devotions. At length they were removed from this place to the house of an Irish nobleman, and a convert to protestantism, where the bishop was seized with a fever, which terminated his life, February 7, 1641-2, in the 71st year of his age. At the funeral of his interment, the Irish attended with great decency, and fired a volley over his grave; exclaiming in Latin, "Requiescat in pace ultimo Anglorum! May the Lord of the English rest in peace!" And a popish priest who attended on the occasion, is said to have paid him a tribute of respect and veneration, in the following wish: "O sit anima mea cum Bedello! May my soul be with that of Bedell!"

The character of Bedell, delineated by Mr. Clogy, who resided in his family, and recorded in bishop Burnet's history of the prelate, appear to have been in a very eminent degree exemplary and amiable: so that in the most appropriate sense of the term, he was a primitive and apostolical bishop. His venerable and simple aspect and habit; his insatiable zeal in discharging his duty through all the vicissitudes of illness; his profound and unobscured hearing, displayed however in various ways, and attended on a particular occasion at the table of the earl of Strafford, which produced the conviction of the prelate archbishop Usher, after the bishop had continued long silent, according to his usual manner, "Touch him, and you will find good liquor in him;" his charity and hospitality, exhibited in the supply afforded by him to many poor Irish families, some of whom he entertained at Christmas at his own table, and in the sensible relief which the persecuted protestants obtained in his house; his detachment from worldly interests, of which an

instance, selected from many more, has been given in the separation of the sees of Kilmore and Ardagh; his integrity and honour, and his pious resignation under all the evils of life, in the obscurity of his humbler station, and amid the persecutions which he suffered after the attainment of a higher rank; all these qualities, which have been amply illustrated in the memoirs of his life, exalted his character to the highest degree of professional excellence. His bequests at his death corresponded to the uniform tenor of his life; for out of his very limited fortune he allotted some legacy to every place to which he had any relation. He thus obtained the esteem of the most bitter enemies of his faith and country, while he lived, and he has also secured the veneration of posterity, and left a model for the imitation of all his successors. He studied and wrote much on the controversy between the papists and protestants, and he had composed a large treatise in answer to the two questions, addressed by the former to the latter with a kind of triumph; "Where was your religion before Luther? and, What became of your ancestors who died in popery?" But this treatise, which the bishop intended to have printed, together with many other MSS., were lost in the confusion of the times. His Hebrew MS. Bible was preserved, and is now deposited in Emmanuel college, Cambridge, to which the author bequeathed it.

As bishop Bedell objected to burial in churches, partly because it indicated superstition and pride, and partly because the putrid effluvia of dead bodies annoyed the living, he gave orders for burying his wife in the least frequented part of the church-yard of Kilmore, and directed by his will that he should be placed near her. By his wife, who was of the ancient and honourable family of L'Estrange, he had one daughter and three sons, of whom two survived him; one provided for by a small benefice of 80*l.* a year, besides the entailed estate of the family in Essex, and the other by a small estate of 60*l.* a year, the only purchase made by the father. Biog. Brit.

BEDLNGIAN, in *Botany*, a name given by Avicenna and Serapion to the *poma amoris*, or *love-apple*, a sort of fruit used in food by the Italians, and some other nations, and seeming to be the third kind of the *strychnos*, or *filicium*, mentioned by Theophrastus. That author first describes two kinds of this plant, the one of which occasioned sleepy disorders, and the other threw people who eat of it into madness. After these, which he properly accounts poisonous kinds, he mentions a third, which was cultivated in gardens, for the sake of the fruit, which, he says, is large and esculent. This is certainly the same with *bedngian*, or *poma amoris*.

BEDER, in *Ancient Geography*. See BEDR.

BEDER, in *Geography*, a fortified city of Hindostan, in the territory of the *Nizam*, about 80 road miles N.W. of Hyderabad; was formerly the capital of a considerable kingdom, and is now celebrated for the number and magnificence of its pagodas. *N.* lat. 18. *E.* long. 78.

BEDFORD, AETHUR, in *Biography*, was the son of Richard Bedford, and was born at Tiddesham in Gloucestershire, 1658. Having received the rudiments of learning from his father, he came, in 1674, at the age of sixteen, admitted a commoner of Brazen Nose college, Oxford, where he acquired some reputation as an orientalist. In 1688 he received holy orders from the bishop of Gloucester. About this time he removed to Bristol, where the mayor and corporation presented him to the vicarage of Temple church. At Bristol he staid a few years, devoting a great portion of his time to the seconding Mr. Collier's attack upon the stage; he was involved, indeed, in a very brisk controversy with several of the greatest wits and ablest writers of the age, but acquitted himself

himself with so much force and vivacity, as actually to produce both repentance and amendment, and was a great cause of that decorum which has for the most part been observed by the modern writers of dramatic poetry. From Bristol he went to a small living in Somersetshire, where he employed himself in a work on scripture chronology, which, in consequence of sir I. Newton's labour, he afterwards relinquished for a time, and was engaged to assist in correcting an Arabic version of the Psalter and New Testament, for the benefit of the poor Christians in Asia. In 1719, he communicated his thoughts to Dr. Charlet, in regard to the foundation of a Syriac professorship at Oxford. The letter which contained them is a most excellent production, and is printed at length in Mr. Ellis's History of Shoreditch, where he became chaplain to Aske's hospital, in 1724. About 1730, he renewed his attack upon the stage, particularly directed against a new playhouse in Goodman's fields, where Garrick made his first appearance. From this period, to the time of his death, we know few particulars of consequence; but the 15th of September, 1745, closed a life that had been very useful. Besides many single sermons, and his tracts upon the playhouse, his chief publications were, "The Temple of Music;" 1706, 8vo. "The abuse of Music;" 1711, 8vo. "Essay on singing David's Psalms;" 1708. "Animadversions on Sir Isaac Newton's Chronology;" 1728, 8vo. "Scripture Chronology;" 1730, fol. "The Doctrine of Justification by Faith, in Nine Questions and Answers;" 1741, 8vo: and "Horæ Mathematicæ vacuæ;" 1743, 8vo.

BEDFORD, in *Geography*, the county town of Bedfordshire, in England, is seated on the banks of the river Ouse, nearly in the centre of the county, at the distance of 51 miles N.W. from London. It is a place of some antiquity, and was called by the Saxons *Bedan-ford*, or Bedician Forda, signifying the fortrefs on the ford. At the time of Offa, that powerful king of the Mercians, Bedford was probably of some note, as this monarch directed his corpse to be interred in a small chapel here, which, being seated on the river Ouse, was carried away by the floods during an inundation. In the year 572, a pitched battle was fought here between Cuthwulf the Saxon, and the Britons; when the latter were defeated, and obliged to deliver up several of their towns to the haughty conqueror. During the Danish wars, this town suffered materially by the ravages of these plundering marauders; but in the year 911, they were severely beaten, and driven from this neighbourhood. A strong Norman castle was erected here by Pagan de Beauchamp, the third baron of Bedford, who fortified it with a deep intrenchment and lofty wall. "While it stood," says Camden, "there was no storm of civil war which did not burst upon it." King Stephen laid siege to, and conquered this castle; and, according to Camden, slaughtered the inhabitants; but other historians assert that he granted them honourable terms. During the contests between king John and his barons, it was seized by the latter, but reconquered again by the forces under Fulco de Brent, to whom it was given by the king as a reward for his services. This rebellious villain occasioned his own destruction with that of the castle, by opposing Henry III. who laid siege to the fortrefs, and after a contest of sixty days, made himself master of this "nursery of sedition." De Brent was sent to London and imprisoned, but his brother and twenty-four other knights were executed on the spot. (For an account of this siege, see *Beauties of England and Wales*, vol. i. p. 6.) The embankments of the castle form a parallelogram; some of which may be easily traced; but the walls are entirely rased to the ground.

The government of the town is vested in a mayor, recorder, deputy recorder, an indefinite number of aldermen, two bailiffs,

and thirteen common councilmen. The bailiffs are lords of the manor, and have the right of fishing in Ouse for an extent of nine miles each way from Bedford. Henry III. granted the *borough* to the burgeses for 40l. yearly: Edward I. seized it for the crown rents, which the burgeses had neglected to discharge. The last renewal of their charter was in the reign of James II. when the mayor and aldermen were removed from their respective offices by a royal mandate, for not electing two burgeses to serve in parliament. The members were in consequence chosen by his majesty's ministers. The right of election is now vested in the burgeses, freemen, and inhabitant householders not receiving alms, amounting to nearly 1400.

This town is seated in a fertile tract of land, called the vale of Bedford, which accompanies the Ouse, and produces abundant crops of wheat, barley, turnips, &c. The land on the north side of the river is a strong clay, that on the south side is much lighter, yet very productive, and its natural fertility is much increased by the overflowing waters of the Ouse. This river flows through, and divides the town, which is connected by a strong old stone bridge. On the centre of this flood the old town gaol, which was taken down about thirty-three years since. The river was made navigable to Lynn in Norfolk, by act of parliament. Bedford contains five distinct parishes, and an equal number of churches, two of which are on the south side of the river, and three on the north side. Of these St. Paul's is the principal for size and architecture, having a handsome octagonal stone spire. It was collegiate before the conquest. Here are four meeting-houses, appropriated to different religious sects, besides one for the Methodists, and another for Moravians. To the latter is attached a dwelling-house for maiden ladies of this sect, called the single sisters' house.

This town is distinguished by many charitable endowments. The hospital of St. John is supposed to have been founded in 980 by Robert Deparis, who was the first master. It now consists of a master, who is rector of St. John's, and ten poor men. St. Leonard's hospital was built and endowed towards the end of the reign of Edward I. The hospital of Grey Friars was founded in the reign of the succeeding monarch: by the lady Mabilia de Paterhall, who was buried in the cemetery. Mr. Thomas Chirly repaired the old town-hall, founded an hospital for eight poor people, and endowed a charity school for forty children. But the most considerable charity of this town, and one whose augmented revenues have been astonishingly great, was bequeathed by Sir *William Harpur*, whose name and benevolence it perpetuates. This gentleman was a native of Bedford, and made lord mayor of London in 1561. He purchased for 180l. thirteen acres and one rood of land lying in the parish of St. Andrew, Holborn, London. This, with his dwelling-house in Bedford, he gave to the corporation of that town, for the endowment of a school and for apportioning young women of the town upon marriage. The annual rent of the above land was only 40l. at first; in 1668 it was leased for forty-one years at the annual rent of 99l. A reversionary lease was granted for a further term of fifty-one years at the increased rent of 150l. A number of streets, rows, and courts, were then built on the leased ground, and the annual rent is now 4000l. which in three or four years is expected to increase at least another thousand. In consequence of this almost unparalleled augmentation of revenue, the trustees have applied to parliament for two different acts, to extend the objects of the charity, and regulate the application of the receipts. The school endowed by it is situated near St. Paul's church, having over the door a statue in white marble of the founder, and a Latin inscription beneath. Besides the above charities a *house of industry* has lately been opened for the reception of all the poor of the

BEDFORD.

five consolidated parishes. A new town gaol has lately been erected, and a county gaol is just finished; towards the completion of which the late Mr. Whitbread left a legacy of 500*l.* This town contains 800 houses and 3948 inhabitants.

Bedford was made a dukedom by Henry the fifth, who constituted John Plantagenet, third son of Henry the fourth, the first duke. After being enjoyed by a Nevil, and a de Hatfield, it was bestowed on John Russell, in whose family it still continues. See RUSSELL.

At Ellow, about one mile from Bedford, was an abbey of benedictine nuns, founded by Judith, niece to the conqueror. At the dissolution its revenues were valued at 28*l.* 12*s.* 11*d.* The church of Ellow is a very fine ancient building, with a detached tower. This place gave birth to John Bunyan in the year 1628. His allegory of the Pilgrim's Progress was written during confinement in the county gaol. See BUNYAN, Beauties of England and Wales, vol. i.

BEDFORD, a township of America, in Hillsborough county, New Hampshire, incorporated in 1750, and containing 898 inhabitants. It lies on the west bank of Merrimack river, 56 miles west of Portsmouth.

BEDFORD, a township in Middlesex county, Massachusetts, containing 523 inhabitants, 13 miles northerly from Boston.

BEDFORD, New, a flourishing town of Bristol county, in Massachusetts, containing 3313 inhabitants, lying at the head of navigation on Accutuck river, 58 miles southward of Bolton. N. lat. 45° 41'. W. long. 70° 52'.

BEDFORD, a township of West Chester county, in the state of New York, containing 2470 inhabitants, including 38 slaves. It lies contiguous to Connecticut, 12 miles N. from Long Island sound, and 35 from the city of New York. In the census of 1796, it appeared to have 32 electors.

BEDFORD, a town on the west end of Long Island in New York, 4 miles N. W. from Jamaica bay, and 6 E. from the city of New York.

BEDFORD, a village near the Georgia side of Savannah river, 4 miles above Augusta.

BEDFORD, a county of Pennsylvania, lying on Juniata river, and having a part of the state of Maryland on the south, and Huntingdon county north and north-east. It contains 12,124 inhabitants, including 46 slaves; half of its lands is settled, and it is divided into three townships. Bedford, the chief town of the county, lies on the south side of Raystown branch of the same river, 25 miles E. of Berlin, and 210 W. of Philadelphia. It is regularly laid out, and has a stone gaol, and a market-house, court-house, and record-office built of brick. It was incorporated in 1795. N. lat. 40° W. long. 78° 50'.

BEDFORD, a county of Virginia, is separated from that of Amherst on the north by James river, and has Campbell on the east, Botetourt on the west, and Franklin county on the south. It is 34 miles long, 25 broad, and contains 10,531 inhabitants, including 2,774 slaves. Its soil is good, and it is agreeably diversified with hills and valleys. In some parts chalk and gypsum have been discovered. The chief town is New London.

BEDFORD'S bay. See TORRINGTON bay.

BEDFORD, Cape, is more than 80 leagues E. by N. from the west entrance of Bassin's straits, and the S. E. point of James' island; its latitude is 11° 30' N. and it forms one of the western limits of Davis' straits.

BEDFORD, Cape, is also the extreme north-east point of the coast of New Holland, opening to the south-west into Endeavour river, in S. lat. 15° 18'. E. long. 145° 15'. The

sea to the east and north is almost every where full of shoals and reefs.

BEDFORD LEVEL, is the name given to a large tract of fenny, boggy land in England, which remained a sterile waste for many ages. It was calculated to contain 400,000 acres, distributed through the several counties of Cambridge, Huntingdon, Northampton, Lincoln, Norfolk, and Suffolk. The chief part of this extensive tract appears, from the various phenomena noticed by different authors, to have been formerly a dry and cultivated land; but either from injudicious embankments, which prevented the waters from the upland issuing at their proper outlets, or from sudden and violent convulsions of nature, it was reduced to the state of a morass; where the waters, stagnating and becoming putrid, filled the air with noxious exhalations; and not only destroyed the health of the inhabitants, but likewise impeded their endeavours to obtain the necessaries of life; the country being almost rendered impassable even to boats, by the fedge, reeds, and slime with which it was covered. The name given to it originated with Francis earl of Bedford, who having large possessions in the fens, mostly granted him by Henry the eighth, upon the dissolution of monasteries, engaged, in conjunction with thirteen other gentlemen, to drain the whole upon the condition of having 95,000 acres in the result of successful accomplishment. These terms were acceded to by the commissioners and the country at large, and in 1634 the king granted these adventurers a charter of incorporation. In the course of three years and a half this Herculean task was completed to the satisfaction of the commissioners, who, with the king's surveyor, set out the allotted land to the corporation. Above 100,000*l.* was expended upon this work. The king, and some persons devoted to his interest, afterwards opposed the right of the earl of Bedford, and dispossessed him of his property. Other persons engaged in the concern, but the civil wars breaking out frustrated all their schemes, and in 1649, William earl of Bedford, the heir and successor of Francis, was restored by the convention-parliament to all the rights of his father. A new act was obtained to repair the decayed works, and extensive operations were adopted. In 1653 the level was adjudged to be fully drained, and after the adventurers had expended 400,000*l.* more, the 95,000 acres were confirmed to them. In 1697 the Bedford level was divided into three districts, called north, middle, and south, having one surveyor for each of the former, and two for the latter. This distribution, intended for its better government, proved a cause of considerable opposition and contention, and it was many years before the whole was settled in a systematic and equitable manner. To pursue the history of those litigations, charters, and laws, originating in, and made for this great concern, would lead us into a narrative too extensive for the limits of our work: we must therefore refer those persons, desirous of further information, to the "Beauties of England and Wales," vol. ii. and to a work recently published, entitled "An historical Account of the Bedford Level," with the law, &c. relating to the same, 8vo.

That this vast tract was at some former period dry habitable land, is evident from the quantity of trees and various other natural and artificial substances that have been dug from different depths in various parts of it. Dugdale, in his "History of Embanking," states that many oak, fir, and other trees, were found in draining the ile of Axholm. These were at the depths of three, four, and five feet from the surface, lying close to the roots, which were in firm earth below the moor. The bodies or holes of the trees appeared to have been burnt asunder (not cut down with saws or axes) the ends of them being *coaled* do manifest. The oaks were lying

lying in multitude, and of an extraordinary size, being five yards in compass, and sixteen yards long; and some smaller of a great length, with a great quantity of acorns and small nuts near them. Other authors relate similar facts; and Mr. Elstob, in his "Historical Account of the Bedford Level," states that in the year 1764 many roots of trees, standing as the trees had grown, were found near Bolton in Lincolnshire at the depth of eighteen feet below the thin pasturage surface. Tacitus, in his life of Agricola, relates, that "the Britons complained of their hands and bodies being worn out and consumed by the Romans, in *clearing the woods and embanking the fens.*" This sentence seems particularly applicable to the forementioned circumstances, and alludes to the period when some great operations of this nature were exacted from the enslaved Britons. The emperor Severus is said to have been the first who intersected the fens with causeways: one of which is described by Dugdale as extending about 24 miles from Denver in Norfolk to Peterborough. It was composed of gravel three feet in depth and sixty feet wide, and about five feet beneath the surface. In 1637 some workmen discovered, at eight feet below the bottom of Wisbech river, a second stony bottom, with seven boats lying in it covered with silt; and at Whittlesea, on digging eight feet beneath the surface, a perfect soil was found with swaths of grass on it: as they lay when first mowed. Near Bolton, at the depth of sixteen feet, were discovered a smith's forge, with many of his tools, some horse shoes and other iron articles. Various other things have been found at different times, and in different places, all tending to prove the extraordinary effects that nature has produced here in one of her revolutions. The cause and time of this event are not recorded. Henry of Huntingdon, who wrote in the time of king Stephen, describes this part of the country as then "very pleasant and agreeable to the eye, watered by many rivers which run through it, diversified with many large and small lakes, and adorned with many woods and islands." William of Malmesbury, living in the first year of Henry II. describes the district in glowing colours, as "a very paradise; for that in pleasure and delight it resembled heaven itself; the very marshes abounding in trees, whose length without knots do emulate the flars. There is not any *wasse* place in it; for in some parts thereof there are apple trees; in others vines, which either spread upon the grounds, or run along the poles." From these testimonies it appears that the *great inundation* of the fens must have occurred after the time of the latter historian. The first attempt at draining them was in the reign of Edward I.; since which time numerous schemes have been proposed, and tried to render this large tract of country subservient to agriculture.

BEDFORDSHIRE, one of the inland counties of England, bounded on the north by Huntingdonshire and Northamptonshire, on the west by Buckinghamshire, on the south by Hertfordshire, and on the east by part of the latter, and Cambridgehire. Its limits are very irregular and artificial, having only two short spaces of the Ouse as natural boundaries on the east and west.

This part of the kingdom, with the districts now called Hertfordshire and Buckinghamshire, were inhabited at the time of the Roman invasion, by a tribe of Britons called Cattiuchlani, whose chief or governor Cassivellaunus, was chosen by unanimous consent to lead them against the arrogant invading Cæsar. In the year 310 the emperor Constantine divided this island into five Roman provinces, when Bedfordshire was included in the third division, called Flavia Cæsariensis. At the establishment of the Mercian kingdom it was made part of that government, and continued so till the year 827, when, with the other divisions of the island, it

became subject to the west Saxons under Egbert. Alfred having subdivided his kingdom into shires, hundreds, and tythings, and marked the limits and name of each division, this was called Bedfordshire, since contracted to its present name. Its length is computed at 35 miles, and breadth at 20. It contains an area of about 260,000 acres, which are divided into nine hundreds, containing ten market towns, 124 parishes, 58 vicarages, 550 villages, about 12,000 houses, and nearly 64,000 inhabitants.

The face of the country, though not characterized by high hills and deep vallies, is considerably diversified with some inequalities of surface, and on the southern side is a range of chalk hills. Beneath these is an extensive tract of cold, steryl land. The western side of the county is mostly sandy and flat, yet, from the improvements adopted and recommended by the duke of Bedford, lord Osborn, &c. the greatest part is appropriated to some species of agriculture. On the north and north-east the soil is a deep loam, famous for the skill employed in its cultivation, for producing large crops of corn, particularly barley. A large proportion of the land in this county had long continued in open or common fields, but within the last five or six years great quantities have been inclosed, and farther inclosures are intended. The chief employment for the lower classes of persons in this county arises from agriculture, making of lace, and the manufacturing of straw hats. In the two latter, numbers of women and children are constantly occupied, and from them derive a bare subsistence. There is no such thing as *bone lace* made in the county, and the *fuller's earth* pits are all in Buckinghamshire. Bedfordshire is watered by the rivers Ouse and Ivel, and some smaller streams. The former enters the county on the western side, and after a devious course through many fine meadows, passes through the town of Bedford, where it becomes navigable. Flowing eastward it leaves the county at St. Neot's, on the confines of Huntingdonshire. (See *Ouse*). The river Ivel rises in Hertfordshire, and passing Baldock and Biggleswade, falls into the Ouse a little above Tempsford.

Bedfordshire is in the Norfolk circuit, in the province of Canterbury, and bishopric of Lincoln. It is crossed by two Roman roads, the Watling-street and the Ichnild-way, and contains some encampments attributed to that people: one at Sandy, near Potton, called Salenæ, and another near Dunstable, called Maiden-bower, supposed to be the magic-vinum of Antoninus. The duke of Bedford has a magnificent seat at Woodburn Abbey in this county. Luton Hoo, the marquis of Bute's; Amptill Park, lord Osborn's; and Wrest-house, lady Lucas's, are very fine seats in the county. Beauties of England and Wales, vol. i.

BEDIRUM, or **BEDERON**, in *Ancient Geography*, a town of Africa, in the interior of Libya. Ptolemy.

BEDKA, in *Geography*, a town of European Turkey, in the Sangiakship of Belgrade, seated on the Kolubra.

BEDNORE, or **BIDDANORE**, a fine province of Hindoostan, lying north-west of the Mysore country, and deriving its name from Beduore, the capital. Hyder Ally took possession of this province about the year 1763; and it was afterwards comprehended within the dominions of his son Tippoo Sultan, who styled himself regent of Mysore, and who retained it till the time of his death in 1799, when, after the capture of Seringapatam by the British troops, his dominions were distributed among the conquerors. Part of Biddanore was assigned to the Malirattas; the sons and relations of Tippoo were removed into the Carnatic; and a descendant of the ancient rajahs of Mysore, about five years old, was placed upon the throne, under certain conditions.

BEDNORE, a city of Hindoostan, and capital of the fore-mentioned province. N. lat. 13° 47'. E. long. 75° 7'.

BEDNORE,

BEDVORE, RANNY, a town of Hindoostan, seated on the Toombuddra river, in the territory belonging, by the treaty of 1792, to the Mahrattas. N. lat. 14° 35'. E. long. 75 42'.

BEDOWEENS or **BENOUENS**, in Arabic *Bedouai*, formed of *bid*, desert, or country without habitations, a denomination given to a wandering tribe of Arabs, who retain the customs and manners of their ancestors, the "Arabs Scimitar," and who are said to be descended from Ishmael. They originate from the deserts of Arabia, where they live in tents, and are separated into distinct tribes, subject to their sheiks, who direct and superintend in every transaction; and they have migrated with their flocks and herds to Egypt and Syria, and other countries both of Asia and Africa, inhabiting the vast deserts which extend from the confines of Persia to Morocco. They select those spots which afford them springs and pasture, and they are in the strict sense a race of rovers or wanderers, without any permanent abode.

Although they are divided into independent communities, or tribes, not infrequently hostile to each other, they may still be considered as forming one nation. The resemblance of their language is a manifest token of this relationship. The only difference that exists between them is, that the African tribes are of a less ancient origin, being posterior to the conquest of these countries by the caliphs or successors of Mahomet; while the tribes of the desert of Arabia, properly so called, have descended by an uninterrupted succession from the remotest ages.

The Arabs, says M. Volney, seem to be especially condemned to a wandering life, by the very nature of their deserts. To paint to himself these deserts, the reader must imagine a sky almost perpetually inflamed, and without clouds, immense and boundless plains, without houses, trees, rivulets, or hills, where the eye frequently meets nothing but an extensive and uniform horizon like the sea, though in some places the ground is uneven and rocky. A moiil invariably naked on every side, the earth presents nothing but a few wild plants thinly scattered, and thicket, whose solitude is rarely disturbed but by antelopes, hares, locusts, and rats. Such is the nature nearly of the whole country, which extends 600 leagues in length, and 300 in breadth, and stretches from Aleppo to the Arabian sea, and from Egypt to the Persian gulf. The soil, however, varies considerably in different places; and this variety in the qualities of the soil is productive of some minute differences in the condition of the Bedouens. In the more fertile countries, or those which produce few plants, the tribes are feeble and very distant; which is the case in the desert of Suez, that of the Red sea, and the interior of the Great Desert, called the Najd. Where the soil is more fruitful, as between Damascus and the Euphrate, the tribes are more numerous and less distant from each other; and in the cultivable districts, such as the parishes of Aleppo, the Hauran, and the neighbourhood of Gaza, the camps are frequent and contiguous. In the former case the Bedouens are merely pastors, and subsist only on the produce of their herds, and on a few dates and fish-ment, which they eat, either fresh, or dried in the sun, and reduced to a powder. In the latter they sow some land, and add cheese, barley, and even rice to their flesh and milk. Such is the situation in which nature has placed the Bedouens, to render them a race of men equally singular in their physical and moral character. This singularity is so striking, that even their neighbours, the Syrians, regard them as extraordinary beings; especially those tribes which dwell in the depths of the desert, such as those of Anaza, Kaibar, Tai, and others, which never approach the towns. In general, the Bedouens are small, meagre, and ravenous; more so, however, in the heart of the desert, than on

the frontiers of the cultivated country; but they are always of a darker complexion than the neighbouring peasants. They also differ among themselves in the same camp: the sheiks, that is, the rich, and their attendants, were always taller, and more corpulent than the common class. Some of them are more than five feet five inches high; though in general they do not exceed five feet two inches. This difference can only be attributed to their food, with which the former are more abundantly supplied than the latter. The Bedouens of the lower class live in a state of habitual wretchedness and famine: and it is an undoubted fact, that the quantity of food consumed by each of them does not exceed six ounces a day. This abstinence is most remarkable among the tribes of the Najd and the Hedjaz. Six or seven dates soaked in melted butter, a little fresh milk, or curds, serve a man a whole day, and he thinks himself happy when he can add a small quantity of coarse flour, or a little ball of rice. Meat is reserved for the greatest festivals, and they never kill a kid but for a marriage or a funeral. A few wealthy and generous sheiks only can kill young camels, and eat baked rice with their victuals. In times of dearth the vulgar, half-starved, eat locusts, rats, lizards, and serpents, which they broil on briars.

It has been already observed, that the Bedouen Arabs are divided into tribes, which constitute so many distinct nations. Each of these tribes appropriates to itself a certain tract of land, and is collected in one or more camps, which are dispersed through the country, and which make a successive progress over the whole, in proportion as it is exhausted by the cattle. Such is the law among them, that if a tribe, or any of its subjects, enter upon a foreign territory, they are treated as enemies and robbers, and a war ensues. Moreover, as all the tribes have affinities to each other by alliances of blood or treaties, leagues are formed which render these wars more or less general. As soon as the offence is made known, they mount their horses, and seek the enemy; when they meet, they enter into a parley, and the dispute is frequently compromised; if not, they attack either in small bodies, or man to man. They encounter each other at full speed with fixed lances, which they sometimes dart, notwithstanding their length, at the flying enemy; the victory is rarely contested; it is decided by the first shock, and the vanquished fly off at full gallop over the naked plain of the desert. The tribe which has been defeated strikes its tents, removes by forced marches to a distance, and seeks an asylum among its allies. The enemy, satisfied with their success, drive their herds further on, and the fugitives soon after return to their former situation. Diffusion, however, are often perpetuated by the slaughter that is made on these occasions; and they have established laws among themselves, that the blood of every man who is slain must be avenged by that of his murderer. This vengeance is called "Tar," or retaliation; and the right of exacting it devolves on the nearest of kin to the deceased. If any one neglects to seek his retaliation, he is for ever disgraced. He therefore watches every opportunity of revenge. If his enemy perishes in any other way, he seeks satisfaction by inflicting vengeance on the nearest relation. These animosities are transmitted, as it were, by inheritance, from father to children, and never cease but by the extinction of one of the families, unless they agree to sacrifice the criminal, or purchase the blood for a stated price, in money or in stock. Such being the condition of society, most of the tribes live in an habitual state of war; and this circumstance, together with their mode of life, renders the Bedouens a military people, though they have made no great progress in war as an art. Their camps are formed in a kind of irregular

BEDOWEENS.

gular circle, composed of a single row of tents, with greater or less intervals. These tents, made of goat's or camel's hair, are black or brown, or striped black and white, and thus differ from those of the Turkmans, which are white. They are stretched on three or four pickets, only five or six feet high, which gives them a very flat appearance; so that at a distance one of these camps appears like a number of black spots. To the colour of these tents, says Dr. Shaw, there is a beautiful allusion, (Cant. i. 5.) "I am black, but comely like the tents of Kedar." For nothing, adds this writer, can afford a more delightful prospect than a large extensive plain, in its verdure, or even scorched up by the sun-beams, with these moveable habitations, situated in circles upon them. These tents are the same with what the ancients called "Mapalia," (Sil. Ital. l. xvii. 90. Lucan. l. iv. 684.) and are represented by Sallust, (Bell. Jug. § 21.) as resembling the bottom of a ship turned upside down. The length of these tents is much greater than their breadth; and they are entirely open on one of their long sides, that is sheltered from the wind, and on that which is exposed they are closed. The tent of the sheik is in some of their encampments distinguished from the others merely by a large plume of black ostrich feathers placed upon its top. Each tent, inhabited by a family, is divided by a curtain into two apartments, one of which is appropriated to the women. In these tents the Bedoween, when they take their rest, lie stretched out upon the ground, without bed, mattress, or pillow; wrapping themselves in their hykes or blankets, and lying upon a mat or carpet, in any part of them, where they can find room. A number of these tents, from 3 to 300, are arranged in a circle, and called Douwar. The empty space within the large circle serves to fold their cattle every evening. As the shade of trees is very agreeable in torrid regions, the Bedoween in the desert take pains in selecting shaded situations for their encampments: but those of Egypt encamp on spots destitute of trees; and when any happen to be there, it is no consideration with them in the pitching of their tents. They never have any entrenchments, their only advanced guards and patrols are dogs: their horses remain saddled and ready for being mounted on the first alarm; but being strangers to all order and discipline, these camps, always open to surprise, afford no defence in case of an attack. Accidents, therefore, frequently happen, and cattle are carried off every day. The tribes which live in the vicinity of the Turks, are still more accustomed to alarms and attacks; for these strangers arrogating to themselves, in right of conquest, the property of the whole country, treat the Arabs as rebel vassals, or as turbulent and dangerous enemies; and on this principle they never cease to wage secret or open war against them. The Arabs, on their side, regarding the Turks as usurpers and treacherous enemies, watch every opportunity to do them injury. On the slightest alarm, the Arabs, confounding the innocent with the guilty, cut their harvests, carry off their flocks, and interrupt their communication and commerce. These depredations produce a misunderstanding between the Bedoween and the inhabitants of the cultivated country, which renders them mutual enemies. Such is the external situation of the Arabs.

As to their internal constitution, each tribe is composed of one or more principal families, the members of which have the title of sheiks, that is, chiefs or lords. One of these sheiks has the supreme command over the others. He is the general of their little army, and sometimes assumes the title of "Emir," which signifies commander and prince. The more relations, children, or allies he has, the greater is his influence. To these he adds other adherents, whom he attaches to himself by supplying their wants. Besides, a

number of small families, who, not being strong enough to maintain their own independence, and needing alliances and protection, range themselves under the banner of this chief. Such an union is called "Kabila," or tribe. These tribes are distinguished by the names of their respective chiefs, or by that of the ruling family; and when they speak of any of the individuals that compose them, they call them the "children" of such a chief; as, e. g. "Beni Temin," "Oulad Tai," the children of Temin and of Tai.

The sheiks and their subjects are born to the life of shepherds and foldiers. The more considerable tribes rear many camels, which they either sell to their neighbours, or employ in the carriage of goods, or in their military expeditions. The smaller tribes keep flocks of sheep. Among those tribes which apply to agriculture, the sheiks live always in tents, and they leave the culture of their ground to their subjects, whose habitations are wretched tents. The peculiar distinctions which characterise their different tribes result from their different modes of living. The genuine Arabs disdain husbandry, as an employment by which they would be degraded. They maintain no domestic animals but sheep and camels, except, perhaps, horses. Those tribes which are of a pure Arab race, live on the flesh of their buffaloes, cows and horses, and on the produce of some little ploughing. The former tribes, distinguished as noble, by their possession of lands, are denominated "Abu el Abaar;" and the second "Moædan," which are esteemed a middle class, between genuine Arabs and peasants. These are sometimes mentioned contemptuously, because they keep buffaloes and cows. The "Moædan," transport their dwellings from one country to another, as pasturage fails; so that a village springs up suddenly in a situation where, on a preceding day, was not to be seen a single tent. The genuine Bedoween, living always in the open air, have a very acute smell; and the fetid exhalations produced by cities are one cause of their dislike of them. So acute is their smell, that, according to Niebuhr, if they are carried to the spot from which a camel has strayed, they will follow the animal by smelling its track, and distinguish the traces of its footsteps from those of other animals that have passed the same way. Those Arabs who wander in the desert will subsist five days without drinking, and discover a pit of water by examining the soil and plants in its environs. Like other people that lead an erratic life, they are addicted to robbery, and of course are formidable enemies to those who traverse the deserts; but they never murder those whom they rob, unless travellers in their own defence should chance to kill a Bedoween, in which case the others are eager to revenge his death. Upon all other occasions they act in a manner consistent with their natural hospitality. Of their hospitality Niebuhr has recorded several very pleasing instances. The pillaging of the caravans, he says, is not always owing merely to their propensity for robbing, but their expeditions for this purpose are commonly considered by themselves as lawful hostilities against enemies, who would defraud the natives of their dues, or against rival tribes, who have undertaken to protect those illegal traders.

The government of the Bedoween is at once republican, aristocratical, and even despotic. It is republican, as the people have great influence, and nothing can be transacted without a majority: it is aristocratical, because the families of the sheiks possess some of the prerogatives which every where accompany power; and it is despotic, because the principal sheik has an indefinite, and almost absolute authority, which he may abuse; though the state of the tribes confines this abuse within very narrow limits; for if he should kill an Arab, it would be almost impossible for him to

escape

BEDOWEENS.

escape punishment, and the law of retaliation would be in force. His subjects, harassed by severity, would abandon him and join another tribe; his own relations would depose him, and advance themselves to his station. The dignity of sheik is hereditary, but not confined to the order of primogeniture; the petty sheiks, who form the hereditary nobility, elude the grand sheik out of the reigning family, without considering his immediate relation to his predecessor. Little or no revenue is paid to the grand sheik. In fact, the principal sheik in every tribe defrays the charges of all who arrive at or leave the camp. His rank subjects him to great expence by the entertainment of his allies, and of the principal men, who assemble to deliberate concerning encampments and removals, peace and war, and the litigation between individuals. To these he must give coffee, bread baked on the ashes, rice, and sometimes roasted kid or camel. In a word, he must keep open table. On his generosity depend his credit and his power. To provide for these expences, the sheik has nothing but his herds, a few spots of cultivated ground, the profits of his plunder, and the tribute he levies on the high roads, the total of which is very inconsiderable. The most powerful sheiks among the Bedowees, though sometimes denominated princes and lords, may be compared to substantial farmers, whose simplicity they resemble in their dress, as well as in their domestic life and manners. A sheik, who has the command of 500 horse, does not disdain to saddle and bridle his own, nor to give him his barley and chopped straw. In his tent, his wife makes the coffee, kneads the dough, and superintends the dressing of the victuals. His daughters and kinswomen wash the linen, and go with pitchers on their heads, and veils over their faces, to draw water from the fountain. These manners agree precisely with the description in Homer, and the history of Abraham in the book of Genesis.

The simplicity, or rather poverty of the lower class of the Bedowees, corresponds to that of their chiefs. The whole wealth of a family consists of moveables, of which the following is a pretty exact inventory. A few male and female camels, some goats and poultry, a mare with her bridle and saddle, a tent, a lance 16 feet long, a crooked sabre, a rusty musket, with a flint or matchlock, a pipe, a portable mill, a pot for cooking, a leathern bucket, a small coffee-roaster, a straw mat, which serves equally for a seat, a table, and a bed, some clothes, which are put up in leather bags hung up in their tents, a mantle of black woollen, and a few glass or silver rings which the women wear upon their legs and arms. But the principal and most important article in the possession of a Bedoween is his mare, which serves in making his excursions against hostile tribes, or seeking plunder in the country or on the highways. The mare is preferred to the horse, because, as Volney, Clémier, and others say, she does not cough, is more docile, and yields milk, which occasionally satisfies the thirst, and even the hunger of her rider.

The Bedoween of the desert preserve their butter in a leathern bag; and their water in goat skins. Their hearth consists of a hole made in the ground, and lid with stones; instead of an oven they use an iron plate in preparing their bread, which is made into small cakes. In their excursions, they carry with them a supply of meal, and their other provisions are dates, milk, cheese, and honey. They are dressed much like their brethren in Egypt, except that they wear shoes of undressed leather, and of a peculiar shape; and that many of them walk bare-footed over the scorching sand, which renders their skin at length

insensible. Their women appear less shy and scrupulous than the other females of the east, converse more freely with strangers, and expose themselves with their faces unveiled.

The arts of the Arabs, whose wants are few, consist in weaving their clumsy tents, and in making mats and butter. Their whole commerce only extends to the exchanging of camel, kids, stallions, and milk, for arms, clothing, a little rice or cotton, and money, which they bury. They are totally ignorant of all science, and have not even any idea of astronomy, geometry, or medicine. They have not a single book; and nothing is so uncommon among the sheiks as to know how to read. Their whole literature consists in reciting tales and histories, in the manner of the Arabian Nights Entertainments. For such stories they have a peculiar passion; and in the evening they seat themselves on the ground, at the door of their tents, or under cover, if it be cold, and there, ranged in a circle, round a small fire of dung, with their pipes in their mouths and their legs crossed, after indulging for some time in silent meditation, they amuse themselves with the recital of tales of this kind. They have likewise, besides their love-stories, their love-songs, which have in them more nature and sentiment than those of the Turks and the inhabitants of the towns.

It has been observed, that the Bedowees, though their condition in the depths of the desert resembles, in many respects, that of the savages of America, have not the same ferocity. So that, accustomed to endure hunger, they have never been addicted to the practice of eating human flesh; and their manners are in general much more sociable and mild. Volney attributes this difference of manners to the difference of their situation. The American savages have been induced by the nature of their country to become hunters rather than shepherds; and their habits have contributed to produce and cherish a ferocity of character. But the Bedowees, whose naked plains, without water or forests, are destitute of fish or game, and possessing the camel, have been determined to a pastoral life, and hence they have acquired manners which have influenced their whole character. Finding at hand a light, but constant and sufficient nourishment, they have acquired the habit of frugality. Content with the milk of the camel and dates, they have not desired flesh; they have shed no blood; their hands are not accustomed to slaughter; nor their ears to the cries of suffering creature; and they have preserved a sensible and humane heart. Nevertheless, when the Arab shepherd became acquainted with the use of the horse, his mode of life was considerably changed. The facility of passing over extensive tracts of country rendered him a wanderer. He became greedy from want, and a robber from greediness: and such is his present character. A plunderer rather than a warrior, the Arab possesses no sanguinary courage; he attacks only to despoil; and if he meets with resistance, never thinks a small booty is to be put in competition with his life. To irritate him, you must shed his blood, and then he is found to be as obdurate in his vengeance as he was cautious in avoiding danger. The spirit of rapine, with which the Arabs have been often reproached, is exercised only towards reputed enemies, and is accordingly founded on the acknowledged laws of almost all nations. Among themselves they are remarkable for a good faith, a disinterestedness, and a generosity, which would do honour to the most civilized people. What can be more noble than the right of asylum so respected among all the tribes? A stranger, nay even an enemy, touches the tent of the Bedoween, and from that instant his person becomes inviolable. It would be reckoned a disgraceful meaness, an indelible shame,

BEDOWEENS.

to satisfy even a just vengeance at the expence of hospitality. Has the Bedoween contented to eat bread and salt with his guest, nothing can induce him to betray him. The power of the sultan himself would not be able to force a refugee from the protection of a tribe but by its total extermination. The Bedoween, so rapacious without his camp, has no sooner set his foot within it, than he becomes liberal and generous. What little he possesses he is even ready to divide; and when he takes his repast, he takes his seat at the door of his tent, in order to invite passengers; and this act of generous hospitality he regards as a matter of duty; and of course he himself takes the same liberty with others. So far does this reciprocal generosity prevail, that one would imagine that Arabs possessed all their goods in common. Nevertheless, they are no strangers to property; but without that selfishness which the increase of the imaginary wants of luxury has given it among polished nations. Among the Arabs there exist a kind of equality in the partition of property, and a variety of conditions, which have appeared, says Volney, to the wisest legislators as the perfection of human policy. From this state of things, it becomes difficult for their sheiks to form a faction for enslaving and impoverishing the body of the nation. Each individual, capable of supplying all his wants, is better able to preserve his character and independence; and private property becomes at once the foundation and bulwark of public liberty. This liberty extends even to matters of religion. Whilst the Arabs of the towns crouch under the double yoke of political and religious despotism, those of the desert, or the Bedoweens, live in a state of perfect freedom from both. On the frontiers of the Turks, indeed, the Bedoweens from policy preserve the appearance of Mahometanism; but so relaxed is their observance of its ceremonies, and so little fervour has their devotion, that they are generally considered as infidels, who have neither law nor prophets. They scruple not to say, that the religion of Mahomet was not made for them; for, they add, "how shall we make ablutions, who have no water? How can we bestow alms, who are not rich? Why should we fast in the Ramadan, since the whole year with us is one continued fast? And what necessity is there for us to make the pilgrimage to Mecca, if God be present every where?" In short, every man acts and thinks as he pleases; and the most perfect toleration is established among them. Volney observes, that there are few polished nations, whose morality is, in general, so much to be esteemed as that of the Bedoween Arabs. If this be the fact, we may reasonably ascribe it to a variety of circumstances altogether independent of that singularity which he mentions in connection with it, and which serve to counteract its effects. Among these Bedoweens, as well as the Turk-mans and Curds, religion is the freest from exterior forms, inasmuch that no man has ever seen among these classes of people either priests, temples, or regular worship. We can scarcely imagine, that even Mr. Volney himself, though we are not unapprized of his mode of thinking on the subject of religion, would presume to ascribe the excellence of the morality of these tribes to their total want or disuse of all the outward means of producing and maintaining it; but he would probably suggest the inefficacy, in a moral view, of those forms and modes of worship which are established and practised among the Mahometans. The manners of these people are preserved pure and simple, and such as are described in their ancient histories, as Sonnini observes, by the absence of luxury and factitious pleasures, bringing immorality in their train, which have made no attempt to fix their abode on the parched and barren sands occupied by the Bedoweens.

The Bedoweens, who live in tents in the desert, have never

been subdued by any conqueror; but those who have settled near towns, and fertile provinces, are reduced, in some measure, to a state of dependence on the sovereigns of those provinces. Such are the Arabs, in the different parts of the Ottoman empire; some of whom pay a rent or tribute for the towns or pasturages which they occupy; and others frequent the banks of the Euphrates only in one season of the year, and in winter return to the desert. These last acknowledge no dependence on the Porte, neither are, properly speaking, subject to the Turks; but the police of the latter occasions frequent, but neither long nor bloody, wars among the Bedoweens. Whenever the Turks interfere in their quarrels, all the tribes combine to repulse the common enemy of the whole nation. Every grand sheik considers himself as absolute lord of his whole territory, and accordingly exacts the same duties upon goods carried through his dominions as are levied by other princes. The Europeans, therefore, are wrong in supposing the sums paid by travellers to the grand sheiks to be merely a ransom to redeem them from pillage. The Turks, who send caravans through the desert to Mecca, have submitted to the payment of these duties, paying a certain sum annually to the tribes who live near the road to Mecca; and these in return keep the wells open, permit the passage of merchandise, and escort the caravans. If the Bedoweens sometimes pillage these caravans, the haughty perfidious conduct of the Turkish officers is always the first cause of such hostilities. The tribes of Bedoweens on the confines of the desert, are those who have preserved the national character in its greatest purity, and who have maintained their liberty unimpaired. Of these, that denominated "Beni Khaled" is one of the most powerful, on account of its conquests and wealth, and the number of other tribes subject to it. It has advanced from the desert of Nedsjed to the sea, and conquered the country of Lachisa. That of the tribe of "Kiab" inhabits north from the Persian gulf, and rarely encamps. These have possessions in the province of Chusistan in Persia, in which province there are five different considerable tribes of independent Bedoweens. Those of the tribe "Beni Lam," inhabiting between Korne and Bagdad, upon the banks of the Tigris, receive duties upon goods carried from Bassora to Bagdad, and sometimes pillage caravans. "The Montefidi," or "Montefik," are the most powerful tribe north from the desert, with respect to extent of territory and number of subaltern tribes, acknowledging their authority. They possess all the country on both sides of the Euphrates, from Korne to Ardje. The Arabs of this tribe often plunder travellers passing between Helle and Bassora, and are frequently chastised by the pacha of Bagdad, who deposes their sheik, and substitutes another in his room. This tribe derives its appellation from one Montefik, who came from Hedjaz, and was descended from a family, illustrious before the days of Mahomet. All these tribes, that live on the confines of the desert, are genuine Arabs, who breed sheep and camels, and live in tents. This, however, is the case with respect to the reigning tribes; though some of the subaltern ones have lost their nobility, by intermixing the practice of agriculture with the habits of pastoral life.

The rich plains of Mesopotamia and Assyria, which were once cultivated by a populous nation, and watered by surprising efforts of human industry, are now inhabited, or rather ravaged, by wandering Arabs. The lands between the Tigris and the Euphrates are occupied by tribes practising agriculture, or "Moædan." All travellers complain of the robberies of the Bedoweens of Assyria. The restless and thievish disposition of these people seems to increase the farther they recede from their native deserts, and to approach

BEDOWEENS.

proach the country inhabited by the plundering Curds and Turkmen. The pachas of Syria are as much interested in guarding against the depredations of the wandering Arabs, as the Turkish governors on the Persian frontier. As it is of great consequence to the cities of Aleppo and Damascus (which see) that their caravans travelling to Bagdad or Balfora should be suffered to pass in safety through the desert, the pachas, in order to protect them from insult and pillage, artfully venture to employ one tribe of Arabs against the rest; and with this view they give the title of Emir to the most powerful sheik in the neighbourhood. To him they pay an annual tax, or the produce of a certain number of villages, for guiding the caravans, for keeping the other Arabs in awe, and for levying the dues from those who feed their cattle on the pacha's grounds. The most powerful tribe near Aleppo, is denominated "Mauali," besides which, there are many other tribes, amounting to twenty, or more, who pay a trifling sum to the Emir for liberty to hire out or sell their camels, and to feed their cattle through the country. Other tribes pay a tax for the privilege of gathering salt in the "Desert of Salt." In the vicinity of Damascus there are numerous tribes, one of which, named "Abu Salibe," it is said, consists solely of Christians. The greatest tribe in the desert of Syria that called "Anæse," which is spread into Nedsjed, and reckoned the most numerous tribe in the heart of Arabia. The caravans of Turkish pilgrims pay the Bedowees of this tribe a considerable duty for their free passage through the country; when dissatisfied, they plunder the caravans, and they often make war on the pacha of Damascus. The Bedowees, who occupy those countries that are usually comprehended under the appellation of "Arabia Petrea," or the deserts that lie between Egypt, Syria, and Arabia, properly so called, are distributed into several tribes which wander among dry sands and rocks, seeking some few interspersed spots, that afford scanty food for their cattle. The Arabs of Palestine seem to be poor neglected hordes, who inhabit that barren and dismal country; and the pilgrims that visit the Holy Land have given exaggerated relations of the molestations and injury which they have suffered from them.

Of the Bedowees, there are several tribes, who arrive every year in Egypt after the inundation, from the heart of Africa, to profit by the fertility of the country, and who in the spring retire into the depths of the desert. Others of them are stationary in Egypt, where they farm lands, which they sow, and annual change. All of them observe a sort of law, but different, which they never pass, or pass in war. They all lead nearly the same kind of life, and have the same manners and customs. Ignorant and poor, they preserve an original character distinct from surrounding nations. Pacific in their camp, they are everywhere also in an habitual state of war. Some of these, dispersed in families, inhabit the rocks, caverns, ruins, and secluded places where there is water; others, united in tribes, encamp under low and flimsy tents, and pass their lives in perpetual roaming, sometimes in the desert, sometimes on the banks of rivers; having no other attachment to the soil, than what arises from their own safety, or the sustenance of their flocks. The husbandmen, whom they pillage, hate them; the travellers whom they despoil, speak ill of them; and the Turks, who dread them, endeavour to destroy and corrupt them. It is calculated that the different tribes of them in Egypt might form a body of 30,000 horsemen; but these are so dispersed and disunited, that they are only considered as robbers and vagabonds. The young women among the Bedowees of Egypt might be

reckoned not destitute of beauty, eyes Soarini; though they have a tawny hue, and indelible compartments, not easily reconcilable to the eyes of an European, which they painfully mark on the lower part of the face with a needle, and a black dye. The men are, in general, very handsome. A simple and uniform mode of life, uninjured by excess, prolongs their existence to the period fixed by nature. They live to be very old, and at an advanced age, they are remarkable for their truly venerable and patriarchal physiognomy. Those, however, who are wandering, predatory, and wretched, are for the most part of a slender make and mean appearance. Some of the Egyptian Bedowees have among them a tradition, that their ancestors were Europeans and Christians, one of whose ships having been wrecked on the coast of Egypt, the crew had been plundered, and reduced to the necessity of living in the desert. The only remnant they have of the supposed Christianity of their forefathers is the sign of the cross, which they traced with their fingers upon the sand. In the plans that have been adopted in Egypt, under Ali Bey, for preventing robbery and establishing public tranquillity, the extermination of the Bedowees has been a principal object. Several hordes fell victims to the policy of the governor; and whole tribes retired into the desert. However, the people of Egypt, far from approving those means of protecting their property, murmured aloud at the scarcity of camels, sheep, and other animals, with which the Bedowees had been accustomed to supply them in great abundance, though it was their practice to steal the property which they had fold. It has since appeared, that the prosperity of Egypt is intimately connected with the preservation of the Bedowees.

To the above accounts of the Bedowees, extracted from modern travellers, we shall subjoin the description given of their ancestors above 1800 years ago by Diodorus Siculus, l. xix.

"The wandering Arabs dwell in the open country, without any roof. They themselves call their country a solitude. They do not chuse for their abode places abounding in rivers and fountains, lest that allurements should draw enemies into their neighbourhood. Their law or their custom forbids them to sow corn, to plant fruit-trees, to make use of wine, or to inhabit houses. He who should violate these usages would be punished infallibly with death, because they are persuaded, that whoever is capable of subjecting himself to such conveniences, would soon submit to matters in order to preserve them. Some lead their camels to graze, some their sheep. The latter are the wealthiest; for, besides the advantages they derive from their flocks, they go to sell in the sea-ports frankincense, myrrh, and other precious aromatics, which they have received in exchange from the inhabitants of Arabia Felix. Extremely jealous of their liberty, at the news of the approach of an army, they take refuge in the depth of the deserts, the extent of which serves them as a rampart. The enemy, in fact, perceiving no water, could not dare to traverse them, whilst the Arabs, being furnished with it by means of vessels concealed in the earth, with which they are acquainted, are in no danger of this want. The whole soil being composed of clayey and soft earth, they find means to dig deep and vast cisterns, of a square form, each side of which is the length of an acre. Having filled them with rain-water, they close up the entrance, which they make uniform with the neighbouring ground, leaving some imperceptible token, known only to themselves. They accustom their flocks to drink only once in three days, so that when they are obliged to fly across these parched sands, they may be habituated to support thirst. As for them-

themselves, they live on flesh and milk, and common and ordinary fruits. They have in their fields the tree which bears pepper; and a great deal of wild honey, which they drink with water. There are other Arabs who cultivate the earth. They are tributary, like the Syrians, and resemble them in other respects, except that they do not dwell in houses. Such are pretty nearly the manners of this people." Volney's Travels in Egypt and Syria, vol. i. Niebuhr's Travels through Arabia, &c. vol. ii. p. 158—183. Sonnini's Travels in Upper and Lower Egypt, p. 303. 317—322. 399. Savary's Letters in Egypt, vol. ii. p. 274, &c. See ARABIA.

BEDR, or BEDDER HOUNEINE, in *Geography*, a place of Arabia, 20 miles from Medina, and 40 from Mecca, lying in the high road of the caravan of Egypt. The fertile vale of Bedr is rendered famous by the battle fought between Mahomet and the Koreish of Mecca, in the second year of the Hegira, A. D. 623. In this vale Mahomet was informed by his scouts of the caravan that approached on one side, and of the Koreish, consisting of 100 horse, and 850 foot, who advanced on the other. After a short debate, the holy prophet sacrificed the prospect of wealth to the pursuit of glory and revenge; and a slight intrenchment was formed to cover his troops, and a stream of fresh water that glided through the valley. "O God," he exclaimed, as the Koreish descended from the hills, "O God, if these are destroyed, by whom wilt thou be worshipped on the earth? Courage, my children, close your ranks; discharge your arrows, and the day is your own." At these words he placed himself, with Abubeker, on a throne or pulpit, and instantly demanded the succour of Gabriel and 3000 angels. His eye was fixed on the field of battle: the Mussulmans fainted and were pressed: in that decisive moment the prophet started from his throne, mounted his horse, and cast a handful of sand into the air: "Let their faces be covered with confusion." Both armies heard the thunder of his voice; their fancy beheld the angelic warriors; the Koreish trembled and fled; seventy of the bravest were slain; and seventy captives adorned the first victory of the faithful. The dead bodies of the Koreish were despoiled and insulted; two of the most obnoxious prisoners were punished with death; and the ransom of the others, 4000 drams of silver, compensated in some degree the escape of the caravan. Herbelot. Bib. Orient. p. 180. Gibbon's Hist. vol. ix. p. 300.

BEDRIACUM, in *Ancient Geography*, a village of Italy, situate, according to Tacitus, between Verona and Cremona, or about 16 miles from the confluence of the Adda and Po. Clavier places it between Cremona and Mantua, and supposes it to have been the present Caneto, a large village on the left of the Oglio. M. d'Anville thinks that it was the place now called Cividale on the right side of that river. It is famous for two battles fought within a month by Romans against Romans, A. D. 69; in the first of which the emperor Galba was defeated by Otho, and in the second Otho was defeated by Vitellius.

BEDRIEGER, GROOTE BEDRIEGER, in *Ichthyology*, a name given by some to the *sparus insidiator* of Pallas and Gmelin. Vide *Russch. theatr.* &c.

BEDRIP, or BEDREPE, or BEDERAPE, the customary service which inferior tenants anciently paid their lord, by cutting down his corn, or doing other work in the field. The word is formed from the Saxon *bidon*, to pray, and *repe*, to reap, or cut corn.

BEDROLA, in *Geography*, a town of Spain, in Arragon; 8 leagues from Sanguesa.

BEDSTRAW, in *Botany*. See GALIUM.

BEDUSTA, in *Ancient Geography*, the ancient Hindoo name of the river Hydaspes, or the modern BEHUT.

BEDWIN, GREAT, in *Geography*, is an ancient borough town situated on the eastern side of the county of Wilts, in England; at the distance of 70 miles west of London, and 17 miles north from Salisbury. It is an ancient borough by prescription, and sent members to all the parliaments of Edward the first. During some parts of the subsequent reigns, it intermitted sending; but from the 9th of Henry V., two members have constantly represented the borough. These are elected by about eighty persons who possess freeholds, or inhabit ancient burghage-houses. The town is governed by a port-reve, assisted by a bailiff, and some inferior officers, all of whom are chosen by the former. Bedwin had formerly a market on Tuesday, but this has been discontinued for some years, in consequence of its proximity to the larger market town of Marlborough.

Dr. Stukely and some other antiquaries have given to this place the honours of a Roman station, and a Saxon city; but there is little proof or probability, that it was ever the former. There are some entrenchments remaining on a hill south of the town, where it is said Cissa erected a castle, and where he seated himself as viceroy of Wiltshire and Berkshire. Towards the end of the seventh century, a severe and destructive battle was fought near this town, between Wulfhere, king of Mercia, and Æseuin, a powerful Saxon nobleman, when, as Mr. Turner in his Anglo-Saxon History, characteristically observes, "mutual destruction was more conspicuous, than the decision of the battle."

The church of Bedwin is a large ancient structure, built mostly with flints, and shaped in the form of a cross. Among the monuments it contains, is one to sir John Seymour, who was father of the protector, and of the unfortunate lady Jane Seymour. According to the tradition of the neighbourhood, this lady was married to the tyrannic monarch at a place called Wolf-hall, near Bedwin, where sir John Seymour then resided.

Here are two annual fairs. The parish contains 316 houses, and 1632 inhabitants, most of whom are employed in agriculture. The famous Oxonian physician, Dr. Thomas Willis, was born here.

About two miles west of the town is Tottenham park, a seat of the earl of Aylebury. The house was built by the celebrated earl of Burlington, on the site of an ancient palace belonging to the marquis of Hertford, who was afterwards created duke of Somerset. Tottenham-park is part of the forest of Savernake, which is the only private forest in England independently belonging to a subject. It is a large tract of wild ground, profusely wooded, and containing much fine old oak timber.

BEE, APIS, in *Natural History*, a genus of the *Hymenopterous* order, in the Linnæan classification of insects; in *Physiology*, and in *Husbandry*, more commonly expressive of the common honey-bee (*apis mellifica*), although likewise applicable to the various other species of honey-bees; and in a still more general sense to those which do not, as well as those which do, produce honey; those which live in societies, as well as those which lead a life of solitude, or independence from their kindred kinds; all which have a certain appearance and cast of character, which, in the common acceptance of the word, claim the distinctive epithet of *bee*, or *honey-bee*, *humble bee*, *wild bee*, &c.

The bee, or apis tribe, characterised in the Linnæan system as having, in common with other hymenopterous insects, four membranaceous wings, and the female being

armed with a sting. This genus comprehends an amazing number of distinct species, many of which are clearly ascertained; some are doubtful; and many, if we may be allowed to reason by analogy, are most likely yet unknown. Upon the whole, there are scarcely any genera of insects that comprehend a greater number or variety of species than the *apes*. The majority of those correctly known have been already enumerated under the article *APIS*, to which the reader is requested to refer. The principal subdivisions, or natural families of the genus under which they have been described by Linæus, and by various writers before and since the time of that naturalist, will be also found there. Descending from the minutæ of critical inquiry into the complicated characters of those subdivisions, it rests with us in this place to speak of the *apes* in another point of view:—as a race of animals highly entertaining, for their manners, habits, and instinctive properties, to the naturalist; important to the economist in rural life; and familiar to every one by the trivial appellation of “a bee.”

Under this head, the common honey, or domesticated bee, demands the first consideration, as it will serve to elucidate the peculiarities of the whole tribe, at least so far as they are of material consequence in the concerns of human life. By the indiscriminate term of the common honey-bee, we comprehend what are individually named the *queen bee*, or female; *male bee*, or drone; and *working bee*, or neuter. The natural history of the common bee has been more fully and impartially considered than that of any other creature of the insect tribe; with the exception of the silk-worm, and the cocoon employed in dyeing, there appears to be none more deserving of the regard paid to it. As an object of advantage, the honey-bee has been deemed, by the common consent of mankind in all ages, of sufficient consequence to be particularly attended to. We are not to forget the occasional recurrence of classic writers of antiquity to the bee: the pastoral poets celebrate its praise; nor was the cultivation of this useful creature overlooked even by the earliest Britons, of whom we possess any record. Its preservation and its culture were recognized in their laws; the bee itself was considered as a most serviceable domestic, and the honey one of the greatest delicacies the bounty of heaven had granted them. In modern days, the importance of the bee has suffered a very sensible diminution in this country: still it is cultivated, and with advantage, by the thrifty agriculturist. But in the warmer regions of Europe, such as the south of France, Italy, and the neighbouring parts of Asia, its cultivation is attended with more success than with us; the climate of these countries, mild, invigorating, and abundantly productive of luxuriant vegetation, is perfectly congenial with the nature of the bee; there it requires but little care from the hand of culture, and amply repays that little bestowed with the spontaneous produce of its industry.

Whilst we are speaking on this particular topic, it will not be thought superfluous to advert to a few remarks that have lately fallen from the pen of M. Latroille, an ingenious French naturalist, in an introductory discourse to the study of bees published last year in Paris. “Dans la grande série des animaux appelés insectes (says that writer), il n’en est pas dont l’histoire présente une aussi grande richesse de faits, et une aussi prodigieuse fécondité de merveilles, que celle des abeilles. Sous les rapports de l’industrie, ces insectes font le chef d’œuvre de la toute-puissance du Créateur; et l’homme lui-même, si fier de ses dons naturels, est, en quelque sorte, humilié à la vue de l’intérieur d’une ruche. Cessons de nous extasier sur la cabane singulière du castor, sur la construction ingénieuse du nid de quelques oiseaux; tout cela est oublié, lorsqu’on voit les travaux de l’abeille. Quoi!

un animal, qui échappe presque à la vue, dont l’organisation, comparée avec celle des êtres des classes supérieures, est si imparfaite, se réunit en société pour fonder une ville, s’y gouverner par des loix invariables, y vivre dans une harmonie que ni une population excessive, ni la diversité d’humeurs et de caractères des individus qui la composent, ne sauroient altérer! Quoi! une insecte si vil en apparence, travaillera sans relâche pour rassembler atomes par atomes, les matériaux de son habitation, les pétrira, les façonnera avec tant d’art, élèvera ces superbes édifices, dont l’architecture a été le sujet des méditations des plus grandes géomètres, recueillera avec tant de peine cette liqueur si agréable, cette espèce de nectar connu sous le nom de miel; et votre ame ne seroit pas ravie d’étonnement! vous ne seriez pas en contemplation! L’abeille n’a pas seulement des droits à votre admiration, elle en a aussi sur votre cœur. Si elle travaille avec tant de zèle, c’est moins pour la conservation de sa frêle existence, que pour celle de ses semblables, pour la prospérité de l’état.” In pursuing this lofty strain of comment, we are less inclined to admit the accuracy of his reasoning, than the energy of diction with which it is advanced. The philosophy of his arguments is lost in emphasis; and that which requires coolness to disarm us of prejudices, is placed in a most flattering and glowing light, more likely to mislead than to inform. We may reply to nearly all that he has said in this respect, in the precise words of the late Mr. John Hunter, who, after a patient investigation of the bee, its operations, and mode of life, has given his opinion, in the Philosophical Transactions, upon this point to the following effect.—“From these animals forming colonies, and from a vast variety of effects being produced, and with a degree of attention and nicety that seem even to vie with man; man, not being in the least jealous, viz. a reasoning faculty; while every action is only instinctive, and what they cannot avoid or alter, except from necessity, not from fancy. They have been supposed to be legislators, even mathematicians: indeed, on a superficial view, there is some shew of reason for such suppositions: but people have gone much farther, and have filled up from their own imagination every blank, but in so unnatural a way, that one reads it as if it were the description of a monster.” The prevailing sentiments of this latter writer precisely corresponding with those of a well-known moralizing poet, may be still more elegantly enforced;—

* * * * * The realm of bees
 * * * * *
 * * these, for ever, though a monarch reign,
 Their separate cells and properties maintain.
 Mark what unvaried laws preserve each state;
 Laws wise as nature, and as fix’d as fate.”

POPE.

To a certain extent this opinion is inadmissible. The unerring laws by which the bee are governed, imply rather the instinctive compliance of the creature with the appointed ordinance of the Creator, than the result of any reasoning faculty. We are “to look through nature, up to nature’s God.” We admire, we are wrapt in astonishment at the wonderful order preserved amidst such a vast society of contemptible animals: their skill is worthy of our contemplation, their industry of our imitation; but when we hear of the prudence, the sagacity, or wisdom of a bee, compared, nay analysed, by the same criterion as the stupendous powers of intellect in man, the wild conjectures of the enthusiastic observer sink into contempt beneath the calm reflection of the mind, and beneath the pen of criticism. Much as we are amazed with the perfection of its works, with the prevailing order, the policy, and assiduity of the bee, in its social

mode of life, we cannot perceive the benefit likely to result to the architect, the geometrician, or the statesman, by making these the subjects of their contemplation.

Thus far we have proceeded only in a general manner; in descending to particulars, the subject before us naturally divides itself into a variety of distinct branches, under every one of which it is necessary the BEE should be considered. The line of discrimination is to be first drawn between those which herd in societies, and are most conducive to the interest of mankind: those which, living in societies, are rather injurious than of utility; and those which are solitary, and of course, like the latter, live in a state of wildness. Bees of the first description consist only of a few species; the species of wild associated bees are rather more numerous; but the far greater number are solitary.

While we are speaking of those included in the first class, our attention again reverts with much propriety to the common bee, between which, and the other sorts of honey-bees, the line of parallel is so intimately connected, that they cannot easily, and need not necessarily be regarded separately. Of the common bee we are to consider the queen bee, male bee, and working bee; their structure and anatomy; their economy, generation, preservation, and varieties; the other analogous species productive of honey; the general habits of those bees which live in societies; and of those which are of a solitary disposition. The *architecture* of BEES, so far as it relates to the common honey-bee, will fall under notice in the article HONEY-COMB;—*Colonies* of BEES, under HIVE and HIVING;—the *swarming* of BEES, their WAX and HONEY, under their respective articles.

BEES, *Sexes of*. There are in every hive or colony three sorts of bees, which Linnæus calls *regina* (fœmina), *fuci* (mares), and *operariæ* (spadones). The first is the *queen*, or female; the second the *drones*, or males; and the last the *working* bees, or neuters. The queen is larger than the others; she is armed with a sting, and has thirteen joints in the antennæ, including the radicle; those of the male have one joint more in the antennæ; the eyes in this sex are large, and it is destitute of a sting; the working bees are armed with a powerful sting, and have fifteen joints in the antennæ. And here it will be proper to observe, that the circumstance of the antennæ in the female and neuter bee, containing the same number of articulations, were not observed till lately. Linnæus tells us the antennæ of the female has ten joints, the male eleven, and the working bee fifteen; the discovery to the contrary is due to Mr. Kirby, who, to use his own language, says; “In every one of these assertions, with due deference to a name to great be it spoken, Linnæus is mistaken.”

BEES, *Structure and Anatomy of*. There is nothing particularly striking in the structure of the bee. In their form they vary in different species, and in different sexes, but generally speaking they are uniformly bulky animals, having the head large, the eyes oval and conspicuous, the thorax broad and thick, as well as the body, and most are commonly covered with hair or down; the sexes distinguishable by the number of articulations in the antennæ (being one more in those of the male than the female), and the mouth furnished with strong *instrumenta cibaria*. The jaws and lip of the *apis mellifica* are membranaceous at the tip, the former bidentated; as in other bees, the jaws open to the right and left, and serve to carry out of the hives any thing that incommodes them. To those which have no sting, the teeth of these jaws are of essential service in their wars with such as possess that formidable weapon; and it is believed, but on what foundation is uncertain, that the wounds inflicted by means of these teeth inevitably prove mortal to

the other, or stinging bees, when they bite. The tongue in different kinds of bees is very different in shape. It has been observed, that in the more industrious species, this instrument, when stretched out, is shorter than in the others: be this as it may, the tongue of the common honey-bee is long, inflected, and extremely pliant; by means of this, the bee not only procures itself necessary subsistence, but it is also employed by the animal to collect the honey, which we appropriate to ourselves. The parts of which the tongue consists in different bees are not uniformly distinguished by the same terms in the works of entomological writers. Proboscis is that by which Mr. Kirby, after the example of Linnæus, when defining the *Apis* genus, calls the tongue, together with all the machinery that belongs to it, inclusive of the sheath or vagina. This is more fully illustrated in his dissections of the proboscis of the male, the female, and the neuter of the common honey-bee, wherein the structure of this instrument, and the several parts of which it consists, are correctly discriminated. It may not be altogether irrelevant to our purpose to follow this agreeable writer, in some degree, whilst explaining the structure of the proboscis or tongue. This part of the bee is said to consist of seven pieces; Mr. Kirby speaks of more, *viz.* the fulcrum, tubus, valvulæ, cardo, lora, palpi exteriores, palpi interiores, lacinia exteriores, lacinia interiores, and lingua. The *fulcrum* is that part upon which the tube is seated, and has been noticed both by Swammerdam and Reaumur; the latter of whom calls it le pivot. *Tubus* is that part called by Fabricius the base of the tongue, and by Swammerdam and others the sheath of the tongue, including the base of that organ; and in a certain measure answering the same purpose as the valvulæ. The latter, or *valvula*, form the exterior sheath of the tongue. As to the *cardo*, cardines intervene between the valvulæ and the lora, and seem to perform the office of hinges. Reaumur mentions these as “filets tendineux par les quels les tiges sont attachées a leurs appuis.” *Lora* are so named by Mr. Kirby from their use, which seems to be to let out or pull in the proboscis, being those parts which Reaumur calls “les leviers;” when the proboscis is extended, the angle on which the fulcrum of the tube sits, is observed to point towards the breast, but when retracted, its position changes, and it points towards the mouth. *Palpi exteriores* are organs noticed in the rude sketch of the proboscis of the hive bee by Swammerdam, who does not, however, speak of them. In this kind they are small, and consisting only of a single joint, escaped the observation of Reaumur; in some bees they are large, and contain from one to six joints. *Palpi interiores* are those parts of the proboscis which Reaumur distinguishes by the term “barbes;” in the common bee, these consist only of two articulations; in other species they are known to contain a greater number. De Geer calls these little organs, “les petit barbillons.” *Lacinia exteriores* are to be met with in almost every family of the *apis* genus. *Lacinia interiores* are peculiar to the *apis*, and embrace and defend the tongue where it enters the tube; these are called by Swammerdam the third pair of joints or the proboscis; Reaumur mentions them as “pièces qui embrassent et fortifient la trompe;” Latreille, in his *Nomada* family, names them “soies laterales.” *Lingua*, or the true tongue, called sometimes by De Geer “le levre inferieur,” or inferior lip, is occasionally mentioned by Fabricius under the term of labium, or lip. Roemer, in a work entitled “Genera Insectorum, &c.” lays down the character of *apis* thus:—“Jaws dentated, with an inflected proboscis, with two bivalve shells, in which the tongue is included.” Latreille, in a work recently published, divides the *apis* genus into two families. the first, corresponding

corresponding with the *melita* of Kirby, has these characters: "Machoirs et langue tres alongées, deux ou trois fois plus longues que la tête, dirigées en avant dans l'innation, et dont la base refort inférieurement de la cavité ou elles sont logées. Partie saillant de la langue évasee, a trois divisions plus courte que la gaine: celle-ci longue et cylindrique." The two Fabrician genera, *hyleus* and *andrena*, are arranged under this family; the tongue in *hyleus* is thus described, "langue large; divisions du milieu échancree, dentelée, ciliée." In *andrena*, "langue oblongue; division au milieu en point renfendue." La gaine, or sheath of the tongue, is not invariably cylindrical in this division (*melita*) of *apis*; it is sometimes conical.

In the family which includes the true *apis* of Kirby, the tongue is thus described by Latreille: "langue tres prolongee, étroite, lineaire presque, cylindrique, un peu coriace, a papilles vers l'extremite, flechie à la sortie de la gaine." *Nomada*, *apis*, and *euera* of Latreille are included under this head. His *nomada* is thus characterized still further: "langue d'une piece avec deux tres petites foies laterales." *Apis*, "langue de trois pieces (organes de la nutrition plus petits dans les males)." *Euera*, "langue de cinq pieces." We have deemed it requisite to be thus minute in following the observations of Kirby, Latreille, and others, who have dissected and examined the structure of the proboscis in different bees, with the aid of microscopic glasses, for the purpose of shewing the fallacy of the commonly received opinion, that in all bees the structure of this organ must be the same. For instance, we see that in one family the tongue is very long, more than twice or thrice the length of the head, with the extremity opening into three divisions, the whole of which is contained within a sheath of a cylindrical form; in others this part is conical. Some have a large tongue, with the middle division of it sloping, jagged, and ciliated, and the end truncate; again, others have an oblong tongue, the middle piece of which is cleft or lacerated at the tip. In many, the tongue is very long, straight or linear, almost cylindrical and papillous at the extremity; while the tongue in others consists of a single piece, having two lateral lacinie of a small size; and sometime, on the contrary, the tongue is formed of five pieces; in the *hyleus*, *andrena*, and *nomada* families, the tongue is three-cleft, in *apis* five-cleft, and in *euera* seven-cleft.

In the formation of the proboscis, the purpose for which nature has designed this curious instrument is very apparent. That of the common bee has been examined with attention. First, the sheath or external parts are observed to protect and strengthen the organs of nutrition which they contain; the valves of the sheath are disposed on each side of the tongue in pairs; with the tongue itself, which is pervious, the bee extracts and gathers the nectarous juices from flowers, which are shortly after converted into honey. The two pieces of the exterior sheath are horny or membranaceous; those of the inner sheath are placed higher above the base than the exterior ones. The proboscis is partly membranaceous, and partly of a gristly nature, and the lower part formed in such a manner that it is capable of considerable distension, by means of which the internal cavity may be prodigiously enlarged, and rendered capacious enough to receive a great quantity of native honey. When the proboscis is shut up, and inactive, it is very much flattened, and broader than it is thick. The lower and membranaceous part of the trunk at the base have no hair upon them, but are covered with little transparent protuberances that are placed in regular order, and at equal distances from each other; these are supposed to be glands, and may have a considerable share in changing or preparing the honey that is swallowed or

taken up by the proboscis. Down the middle of the proboscis there is a tube of a much harder nature than the sides which becomes rather tapering towards the apex, where the proboscis is very thick set with small hairs, which may serve to keep it in a proper situation when in use.

The proboscis is not cylindrical, but rather a kind of convex blade, terminating to all appearance in a point; and the sheaths are so contrived as to cover little more than the upper part of it. These exterior sheaths lap over each other on the upper part, so that the outside of the proboscis is protected by a very strong double case; a covering that was unnecessary for the under part, because, when this instrument is in use, the sheaths are opened, but when inactive, it is so folded, that the under part is protected by the body of the bee. Within the exterior sheath, and near the bottom, are two levers, which are fixed to the end of the proboscis, and by the motion of which it is raised or lowered. If a bee is attentively observed when it alights upon a full blown flower, the activity and address with which it employs this apparatus will prove highly entertaining. The tongue is first protruded, then lengthened, then shortened, and continually kept in motion, bending and turning in every possible direction to adapt itself to the form of the flower.

The *sting* of the BEE is a curious weapon, adapted to the industrious habits of its life, which exposes it to a multitude of dangers. It is truly an instrument in every manner calculated for offensive or defensive operations in the annoyance of its enemies. The wound which the bee inflicts with its sting is severe, to its little antagonists it oftentimes proves mortal, because it not only strikes deeply into their bodies, but conveys at the same time a powerful poison into the wound which it occasions. In the queen or female bee, the sting is longer as well as stouter than in the working bee, and is bent a little under the belly. The female and the working bees are those only which are furnished with a sting; for the male, as before observed, has none. The sting in both is put in motion by means of certain muscles attached to its base, and contained within the abdomen, where also the glands for the secretion of the poison is concealed. This internal apparatus for the preparation of the poison has been misconceived: every writer, except the late Mr. Hunter, considers it as a single receptacle; whereas it appears, from the observations of that judicious anatomist, to consist not of one, but of two small ducts, although those two seem to unite into one: these are situated in the region of the abdomen among the air vessels, and when pressed, inject into the passage of the sting the poisonous fluid drop by drop. The sting is apparently thick and solid at the base, and at the extremity remarkably acute; such is its appearance to the common observer: but strictly speaking, this is nothing more than the sheath or case in which the genuine sting is contained; the latter is an apparatus consisting of two extremely slender bearded darts, each of which has five or six recurved teeth or barbs placed near their extremity, or, according to Derham, they amount to eight recurved teeth on each dart. The sheath is of an horny substance, round at the base, and on the sides grooved, ending in a sharp point, and has an opening near the tip, through which the two bearded darts are protruded beyond the sheath, when the bee is in the act of stinging. When the two bearded darts, of which the true sting consists, are united, they easily enter the flesh, and then opening a little, become for a moment most securely fixed by means of the teeth with which they are beset. Some say one of these darts is rather longer than the other, and fixes its beard, or teeth, first; and the other instantly following, they penetrate alternately deeper and deeper, holding themselves hardy in the flesh with their beards,

till the whole sting is buried in the wound, and the poison injected. When once the bee has completely transfixed its sting into the flesh, the acrid caustic liquor, called the poison, is pressed from the glands in which it is secreted, and passing down the channels of the darts, discharges its malignant contents into the wound, occasioning an acute pain and swelling of the part, the inflammation of which continues not unfrequently for several days after. Dr. Hunter, being desirous of ascertaining the force of this poisonous fluid, dipped needles into it, with which he pricked the back of his hand; the like experiment he tried on the same part with needles that were not dipped into it, and found that the punctures occasioned by the former grew sore and inflamed, while the others did not.

But if the wound which the bee inflicts be painful to those who receive it, to the bee it is attended often with more serious harm, for it inevitably proves fatal if by any accident the sting is broken off in the act of inflicting it. When the creature strikes its sting deep into the flesh, and the person starts, and decomposes the bee before it can disengage itself, the sting is almost certain of being broken off, and left sticking in the wound. On the contrary, if he has patience to stand quiet, the bee will bring the two slender darts close together, and withdraw the whole, in which case the wound is always less painful. A wasp is not so liable to leave its sting in the wound as a bee; the beads of the darts being shorter, and the insect more nimble and vigorous in its operations. When the bee means to sting, it flies about the object of its anger very quickly, and by the velocity of its motions, seems to evade being struck or attacked to advantage, while preparing for the assault. The sound emitted at this time is also peculiar, and to those accustomed to bees, is perfectly well understood. "The danger of being stung by bees (it has been said), may be in a great measure prevented by a quiet composed behaviour. A thousand bees will fly and buzz about a person without hurting him, if he will but stand still and forbear disturbing them, even when near his face; in which case he may observe them for hours together without danger; but if he molests or beats them away, he usually suffers for it." In the "Edinburgh Medical Commentaries" it has been affirmed, that a person is in perfect safety in the midst of myriads of bees, if he were to keep his mouth carefully shut, and breathe gently through the nostrils only; the human breath, it would seem, being peculiarly offensive to their delicate organs: and merely with this precaution, it is said, the lives may be turned up, and even part of the comb cut out while the bees are at work.

Reaumur made use of no other remedy for the sting of the bee than to bathe the part affected with cold water, a remedy which in most cases will allay the pain and inflammation only during the time of its application. Oil of olives, or sweet almonds, applied to it alleviates the pain. Lombard, a late French writer, in his "Manuel nécessaire au villageois pour soigner les abeilles," prescribes a better remedy. He recommends that the wound be pressed, to cleanse it as much as possible from the venomous fluid, and then rubbed with alkali, or with a little diluted quick lime, by means of which the properties of the poison will be neutralized; the wounded part, after the application of this remedy, must be well washed with cold water, when both the pain and swelling will be found to have received considerable relief.

BEES, Voice of. The bee is capable of emitting either by the mouth or motion of the wings, a variety of sounds, expressive of its anger, fear, contentment, and other passions; a circumstance hitherto but very slightly regarded by those

writers who have, in other respects, entered most minutely into the history of this animal. Mr. Hunter, in his paper on the honey-bee, inserted in the Philosophical Transactions, says a few words on this subject. Bees, he tells us, may be said to have a voice; or at least, that they are able to form several distinct sounds. They give a sound when flying, which they can vary according to circumstances. One accustomed to bees can immediately tell when a bee intends to make an attack by the sound, most likely of the wings, but that is not certain; it may issue from the mouth. The bees may be seen standing at the door of their hive, with the belly rather raised, and moving their wings, by which means a noise is occasioned. But they produce a noise independent of that made by the wings; for if a bee be smeared all over with honey, so as to cause the wings to adhere together, the bee will be perceived to make a shrill and peevish sound while the wings remain motionless. To ascertain this matter with a still greater degree of accuracy, Mr. Hunter held a bee by the leg with a pair of pincers, and very clearly observed that the creature made the same peevish noise while the wings were perfectly still. After this, he even cut the wings off, when the poor bee continued to make the same noise as before. He immersed the bee in water, but it did not then produce any noise, till it was much teized, when the same sound was heard as in the former instance: during this experiment, he could observe the water, or rather the surface of contact of the water with the air, vibrating at the orifice of an air-hole situated at the root of the wing. The same writer remarks, that the bees, or some kinds of them at least, make a noise the evening before they swarm, which is a kind of ring or sound resembling that of a small trumpet; and by comparing it with the notes of the piano-forte, it seemed to be the same with the lower *A* of the treble.—When the bees return from their daily excursions in the fields, to their hives at evening, loaded with farina and honey, they are well known to sing or hum a soft melodious tone expressive of their contentment. Entomologists are well aware that the sound emitted by the bee is susceptible of certain modulations. Some of these proceed undoubtedly from the motion of the wings, and vary in tone as they are moved with greater or less velocity, just as we observe in other insects furnished with transparent wings; and in some degree throughout the whole of the insect race, with the exception of those which have very small wings, or are entirely destitute of them. From the observation of Mr. Hunter on the emission of air from the lateral trachea, or air vessel in the side, it would seem, that a certain sound may be caused by means of these little organs: the remark of this anatomist deserves more consideration than he appeared to be himself persuaded of, since we know that the singing of the *cicada*, a noisy tribe of insects, proceeds not from the mouth, but from two lateral openings, one on each side of the abdomen; the sound being produced by means of a most singular internal organization, and transmitted through those openings at the pleasure of the creature. It is not unlikely, that many insects may be furnished with lateral organs for the purpose of making a certain noise, although not exactly of the same structure in the *cicada*, and certainly upon a much smaller scale. That a bee emits a sound from the mouth, is also believed. A gentleman within our knowledge, who has made the manners of bees his particular study, can with the utmost facility declare the sex of any bee that may chauce to pass near him, by attending only to the motion and sound emitted by it whilst in flight.

BEES, Age of. Writers are not agreed as to the duration of the term of life in the honey-bee. Among the ancients

It was thought to extend to nine or ten years. Virgil and Pliny limit it to five. Some suppose that they are annual; others, that they live many years, but the latter idea is almost exploded at this time. Of the other kind, although they may be considered as annual, a few of the females certainly live through the winter, and lay the foundation for a new society in the ensuing season. In the month of August, Mr. Hunter imagines the queen, or queens, to be impregnated by the males, and as the males do not provide for themselves, they become burdensome to the working bees, and are therefore destroyed as useless, and thrown out of the hives. When the bees sit about the business of providing their winter store, every operation ceases, excepting that of collecting honey and bee-bread for the future subsistence of the colony. At this particular crisis, it would seem as if the males were conscious of their approaching danger, for they do not rest as before on the mouth of the hive either when going in or coming out; activity is apparent in all their actions. But this avails them little, nor does it avert, though it may protract, their fate, for a short time: they are commonly attacked by the labouring bees, one, two, or three together, and seeming to be incapable of making any resistance, or anxious to avoid the contest, attempt only to ensure their safety by halting out of the way of their cruel enemies as speedily as possible. The labourers do not sting the males, Mr. Hunter tells us, but only pinch, torment, and pull them about, as if to wear them out, and hinder, by such violent treatment, the death of these hapless creatures, who would die naturally in the space of a little time after.

BEES, Economy of. When we speak in a familiar manner of the economy of bees, such as the secreting of wax, the constructing of honey-combs, ranging the fields and gardens to collect farina and nectareous juices for the preparation of wax and honey; attending, nurturing, and feeding the maggots or larvæ, covering in the chrysalides or pupæ, &c. the labouring bee alone is meant, for the females and the males are only implicated in the conduct of each, so far as relates to the well government of the colony, and generation of the future brood. Among those who have minutely treated on this subject, (the economy of bees,) many have related very wonderful and incredible circumstances; the moral virtues (as it has well been said) have, at one time or other, been attributed to the bees. They have been celebrated for their prudence, industry, mutual affection, unity, loyalty to their lovers or kings, public spirit, liberality, and chastity. The sagacity of bees in following rain, or cold has been often mentioned; this is (to say the least) idle: for a short time, at least, before we are sensible of the alteration in the state of the weather, their conduct proves that they are not ignorant of it. Mr. Hunter first properly ordered their return home in great numbers, before rain or cold was coming on, without any long stay upon the field; all some time after, the clouds in the horizon, and the stormy sky, but require a considerable degree of heat; the degree must be kept warm, and as the bees are circumspect, it must be cold, with a cold wind blowing. "Does" (says our author) seem to be the sound of the appearance of bad weather, by some particular noise. It is sometimes kept, and when they are very still, and cold, that they or a sudden cease from their work: not a single one flies out; and those that are already busy, return to each particular crowd, that the doors of their habitations are too close to admit them. On this occasion, according to the sky, and you will find a silver film of thick black clouds, which denote impending rain. Whether they feel the clouds gathering for it, as some imagine, or whether (as is much

more probable) they feel some other effects of it upon their bodies, is not yet determined; but it is alleged, that no bee is ever caught even in what we call a sudden shower, unless it have been at a very great distance from the hive, or have been injured by some accident, or been sickly, and unable to fly so fast as the rest. Cold is a great enemy to them. To defend themselves against its effects during a hard winter, they crowd together in the middle of the hive, and buzz about, and thereby excite a warmth that is often perceptible by laying the hand upon the glass window of the hive. They seem to understand one another by the motion of their wings: when the queen wants to quit the hive, she gives a little buzz; and all the others immediately follow her example, and retire along with her."

Although many of the accounts that have been given of the bee are fabulous, an intimate acquaintance with them in their domestic operations, has furnished many real facts that are as surprising as those which are apparently, or perhaps wholly, groundless. It is not to be disputed, that at certain times, when they think their stores likely to fall short, they make no scruple to kill and throw out of the hives their own offspring; the larvæ and young bees of the male or drone kind, scarcely extricated from their pupa state, have been carried away and left to perish. They may be just in some respects in their own kingdom, and to those who are to be considered as their fellow subjects, but they rob and plunder strangers whenever they have power and opportunity; and they have frequently battles in committing depredations on neighbouring colonies and hives, or in repelling the aggressions of other invaders, in their own defence, which always terminate fatally to many of their number. This indeed does not often happen, except early in the spring, or late in autumn, when honey is scarce in their hive, and there are no flowers abroad to furnish them with more. In this case, when they have ranged the fields without success, they endeavour to supply themselves at the hazard of their lives, from the stores of other hives. However, in all these conflicts, if the queen of either hive that happens to be engaged is killed, the battle ceases, and both parties unite under the survivor.

The industry and activity of bees in their domestic labour, afford a very instructive and amusing spectacle; all are busy, engaged in their several departments. While some are employed in gathering honey and wax, others repair the rotten comb; others carry out the dead, and cleanse the hive; others keep guard, placing themselves in five or six files (eight or ten deep upon the floor of the hives, so that all the bees when they enter must pass between them; some are even said to serve for bridges or ladders for others to pass over; and when they are tired with labour, they rest themselves with rest. For this purpose, they form larger or smaller clusters in the following manner: each bee with its two fore-legs, lay hold of the hinder legs of the bee that is next above it, and thus a chain is formed by the successive application of one to another, and the fifth bee supports the weight of all the rest to the bottom of the comb. The larger clusters are only a multitude of these chains, of which there are four times an hundred together. The bees, it is said, never lay hold of any part of one another, except the legs. In this way, they likewise guard themselves from the effects of cold, and continue for several weeks together in a state of torpidity.

Bees, we are told, when they begin to work in their hives, divide themselves into four companies; one of which roves in the fields in search of farina for the wax; another is employed in laying out the bottom and partitions of the cells; a third in making the food for both from the a gl; and

and corners; and the fourth in collecting and bringing food for the support of the rest, or in relieving those who return heavily laden. Neither of these four companies is kept constantly to one employment; they often change the tasks assigned them: those that have been at work, for example, in the construction of the cells, are permitted to go abroad, and those which have been in the fields already, are allowed to take their places in the hive. They are believed, and not without reason, to have certain signs, by means of which they understand each other, and one striking instance is adduced in proof of this: when any one of the bees is in want of food, the creature bends down its trunk to the bee from whom it is expected, the latter immediately opens its honey-bag, and lets some drops of honey fall into the mouth of the other, which is at that time observed open to receive it. Many other circumstances might be likewise mentioned, were they necessary to confirm this idea. These particulars relate almost exclusively to the operations of the neuter or labouring bee: the males answering no other purpose than simply that of males in their sexual capacity; and the queen or female breeder only attending to the discharge of her more important duties, the laying of eggs, and influencing, by her presence, the working bees, to persevere in their respective labours.

BEES, Generation of. These insects begin to breed in the upper part of the hive, in the cells adjoining to those which are filled with honey, and they descend gradually into the lower parts, as the flowers which furnish them with wax increase in plenty. The cells designed for the working bees, are commonly half an inch deep; those for the drones, three quarters of an inch; and those intended to contain the honey only, still deeper. The queen bee is generally concealed in the most secret part of the hive, and is never visible, except when she happens to lay her eggs in such combs as are exposed to sight. When she does appear, she is always attended by ten or a dozen of the common sort, who form a kind of retinue, to follow and guard her wherever she goes. Before she lays her eggs, she examines the cells where she designs to lay them; and if she finds they contain neither honey, wax, nor embryo, she introduces the posterior part of her body into the cell, and fixes to the bottom of it a small white egg, which is composed of a thin membrane, filled with a whitish liquor. In this manner she proceeds on, till she fills as many cells as she has eggs to lay, which are generally many thousands. Sometimes more than one egg has been deposited in the same cell; when this is the case, the working bees remove the super-numerary eggs, and leave only one in each cell. On the first or second day after the eggs are lodged in the cells, the drone bee is supposed by many to inject a small quantity of whitish liquid, which in about the course of a day is absorbed by the egg. On the third or fourth day is produced a maggot, which, when it is grown so as to touch the opposite angle of the cell, coils itself up in the shape of a semicircle, and floats in a certain liquid whereby it is nourished, and enlarged in its dimensions: this liquid is of a whitish colour, of the thickness of cream, and of an insipid taste, like flour and water. The origin and qualities of this liquid are not correctly explained: some have supposed that it consists of some generative matter injected by the male or drone bee into each cell, in order to give fecundity to the egg: a more probable opinion is, that it is the same with what several writers call the *bee-bread*; and that it is a mixture of water with the juices of plants and flowers, collected merely for the nutrition of the young while they are in a weak and helpless state. Whatever may be the nature of this aliment, it is certain the bees are very industrious in supplying the worms with it. The larva, or

maggot, is fed by the working bees for about eight or ten days, till one end touches the other in the form of a ring, and when it begins to find itself uneasy in its first posture, it ceases to eat, and begins to unroll itself, thrusting the head forwards towards the mouth of the cell. The attendant bees, observing these symptoms of approaching transformation, desist from their labours in carrying food, and employ themselves in fastening up the top of the cell with a lid of wax formed in concentric circles, and by their natural heat assist in cherishing the brood, and hastening the birth. In this state, the larva extends itself at full length, and prepares a kind of silky covering, which forms a complete lining for the cell, and affords a convenient receptacle for the transformation of the larva to the pupa state. Some naturalists suppose, that as each cell is destined to the successive breeding of several larvæ, the whole web, which is composed of many crusts or doubles, is, in reality, a collection of as many webs as there have been larvæ. M. Maraldi apprehends, that this lining is formed of the skin of the larva, thrown off at its entrance into the nymph or pupa state; but it is urged by others, that if the cells are opened when recently covered by the bees, the larva within will be found in its own form, and detected in the act of spinning its web; and by means of glasses, it will be found composed of fine threads, regularly woven together, like those of other spinning animals.

In the space of eighteen or twenty days, the whole process of transformation is finished, and the bee endeavours to discharge itself from confinement, by forcing an aperture with its jaws through the covering of the cell; the passage is gradually dilated; so that one of the maxillæ or jaws appears first; then the head, and afterwards the whole body; this is usually the work of three hours, and sometimes of half a day. The bee, after it has disengaged itself, stands on the surface of the comb, till it has acquired its natural complexion, and full maturity and strength, so as to become fit for labour. The rest of the bees gather round it in this state, congratulate its birth, and offer it honey out of their own mouths. The exuviae, and scattered pieces of wax which are left in the cell, are removed by the working bees; and the cavity is no sooner cleaned, and fit for new fecundation, but the queen deposits another egg in it; inasmuch, that M. Maraldi says, he has seen five bees produced in the same cell, in the space of three months. The young bees, it is said, are easily distinguished from the others by their colour: they are grey instead of the yellow brown of the common bees, the reason of which is, that their body is black, and the hairs that grow upon it are white; from the mixture of these that are seen together, results a grey; but this colour forms itself into brownish by degrees; the rings of the body becoming more brown, and the hairs yellower.

Reaumur supposed, before the time of Linnæus, the queen bee to be the only female in the hive, and consequently, the mother of the next generation: that the drones are the males by which she is fecundated; and that the working bees, or those which collect wax on the flowers that knead it, and form the combs and cells, and afterwards fill them with honey, are the neuters.

Schirach, in his "Histoire Naturelle de la Reine des Abeilles, &c." published in 1772, has advanced a different opinion upon this subject. He supposes, that all the common, or honey bees, are females in disguise, in which the organs that distinguish the sex, and particularly the ovaria, are obliterated, or at least from their extreme minuteness, have escaped the observer's eye; that every one of these bees, in the earlier period of existence, is capable of becoming a queen bee, if the whole community should think proper to nurse it in a particular manner, and raise it to that rank;

B E E S.

rank; in short, that the queen bee lays only two kinds of eggs, those which are to produce the drones, and those from which the working bees are to proceed. This author made his experiments not only in the spring months, but even as late as November. He cut off from an old hive a piece of the brood comb, taking care that it contained larvæ (or worms as they are termed) which had been hatched about three days. This he fixed in an empty hive, together with a piece of honey-comb for food to his bees, and then introduced a number of common bees into the hive. As soon as the bees found themselves deprived of their queen, and liberty, a dreadful uproar took place, which lasted twenty-four hours. On the cessation of this tumult, they took themselves to work, full proceeding to construct a royal cell, and then taking the proper measures for feeding and hatching the brood inclosed within them; sometimes, even on the second day, the foundations of one or more royal cells were to be perceived, which proved a certain indication that they had elected one of the inclosed larvæ to the sovereignty.

The final result of these experiments seemed to be, that the colony of working bees being thus shut up with a piece of brood comb, not only hatch, but at the end of eighteen or twenty days, produce from thence one or two queens, which, it was supposed, proceeded from the larvæ of the common working bee, and which had been converted by the colony into a queen, merely because they wanted one. — From these, and other experiments repeated, Mr. Schirach concluded, that all the common working bees must be originally of the female sex; although, if they are not fed, lodged, and brought up in a particular manner while in the larva state, their organs are not developed; and that it is this circumstance attending the bringing up of the queen, that allows the full extension in the female organs in the first instance, and produced afterwards that difference in her size and aspect, so dissimilar to that of the working bee.

Mr. Debraw, an ingenious apothecary of Cambridge, made many experimental remarks on bees, which are inserted in the Philosophical Transactions for 1776. He professes to have detected the impregnation of the eggs by the males, as well as to have discovered the difference in size among the drones or males, of which Maraldi and Reaumur, besides some others, had conceived there might be two distinct kinds. Mr. Debraw says, he watched the glass hives with indefatigable attention from the moment the bees (among which he took care there should be a large number of drones) were put into them, to the time of the queen's laying her eggs, which generally happens the fourth or fifth day. He observed, that on the first or second days, (always before the third) from the time the eggs are placed in the cells, a great number of bees fastening themselves to one another, hung down in the form of a curtain from the top to the bottom of the hive. They had done the same at the time the queen bee deposited her eggs, an operation which seems contrived on purpose to conceal what is transacting; however, through some parts of the veil he was enabled to see some of the bees inserting the posterior part of their bodies, each into a cell, but continuing there only a short time. When they had retired, it was easy to discover a whitish liquor left in the angle of the basis of each cell which contained an egg. In a day or two this liquor was absorbed into the embryo, which, on the fourth day, assumes its larva state, and is attended by the working bee, who brings it a little honey for nourishment, and continues to feed it for the space of eight or ten days after its birth. When the bees find that the larva has attained its full size, they desist from bringing any more food,

knowing that the larva has no more occasion for it while in that state; but they have still another service to bestow upon it, in which they never fail to perform their duty: this is to shut up the top of the cell in which the larva is enclosed; for eight days longer it remains within the cell after being thus immured, during which time a further change takes place; the larva, which was before idle, begins to work as soon as the bees commence their operation of closing up the cell; while the latter are employed in making the covering of wax, the larva is at work within the cell, which it lines with a fine silk. The larva thus concealed, voids its excrements, quits its skin, and assumes the pupa form; at the end of some days, the young bee acquires sufficient strength to quit the covering of the pupa, tear through the waxy enclosure of its cell, and proceed from thence a perfect winged insect.

To prove still further that the eggs are fecundated by the males, and that their presence is necessary at the time of breeding, Mr. Debraw made the following experiments: he left in the hive the queen, with only the common or working bees, without any drones, to see whether the eggs she laid would be prolific: for this purpose, he took a swarm, and shook all the bees into a tub of water, leaving them there till they were quite senseless, by which means he was able to discover the drones without any fear of being stung by the others; he then restored the queen and working bees to their former state by spreading them on a brown paper in the sun, after which he placed them in a glass hive, and they began very soon to work as usual. The queen laid eggs, which to his great surprise were impregnated; for he imagined he had separated all the drones, or males, and therefore omitted watching them. At the end of twenty days, he found several of the eggs had, in the usual course of changes, produced bees, while some had withered away and others were covered with honey. Hence he inferred that some of the males had escaped his notice, and impregnated part of the eggs. To convince himself of this, he took away all the brood comb that was in the hive, in order to compel the bees to provide a fresh quantity, being determined to watch narrowly their motions after the new eggs should be laid in the cells. On the second day after the eggs were placed in the cells, he perceived the same operation that was mentioned before, namely, that of the bees hanging down in the form of a curtain, while others thrust their posterior end of the body into the hive. He broke off a piece of the comb in which were two of these insects, and found in neither of them any sting; (a circumstance peculiar to the drones;) upon dissection, with the assistance of a microscope, he discovered the four cylindrical bodies which contain the glutinous liquor, of a whitish colour, as observed by Maraldi in the large drones. He was therefore now under the necessity of repeating his experiments, after destroying the males, and even those which might be suspected to be such.

He once more immersed the same bees in water, and when they appeared to be in a senseless state, he gently pressed every one, in order to distinguish those armed with a sting from those which had none, and which of course he supposed to be males. He replaced the same swarm in a glass hive, where they immediately applied themselves again to the work of making cells, and on the fourth and fifth day, very early in the morning, he had the pleasure to see the queen bee deposit her eggs in those cells; he continued watching most part of the ensuing days, but could discover nothing of what he had seen before.

The eggs, after the fourth day, were found in the same state as on the first day, except that some of them were covered with honey. A singular event happened next day

about noon; all the bees left their hive, and were seen attempting to get into a neighbouring one, on the stool of which the queen bee was found dead, being, no doubt, slain in an engagement. This event Mr. Debraw supposes to have arisen from the desire of the bees to perpetuate their species, to the concurrence of which the males were necessary, and that this consideration alone induced them to desert their habitation where no males were left, and to fix their residence in a new one, where there was a stock of them.

To be more fully satisfied in this respect, Mr. Debraw took the brood comb which had been impregnated, and divided it into two parts; one of which he placed under a bell glass with honey-comb, for the food of the bees, taking care to leave a queen, but no drones among the bees confined in it; the other piece of brood-comb, he placed in another bell glass with a few drones, a queen, and proportionable number of common bees. The result was, that in the piece put into the first glass there was no impregnation, the eggs remaining in the same state as they were when first placed in it, and on giving the bees their liberty on the seventh day they all flew away; whereas in the other glass, which contained the second piece of brood-comb, the very day after the bees had been put into it, the eggs were impregnated by the drones, and the bees did not shew the least inclination to abandon their new habitation when the glass was left open to allow them to escape.

Such are briefly the different opinions of those experienced observers of the bee, Reaumur, Maraldi, Schirach, and Debraw, whose several ideas founded, as it must appear, upon the most laborious, indefatigable, and minute investigation, have met with many advocates. On a subject of this interest we ought not to assume any opinion hastily, or in an affair so mysterious, obtrude our own without a considerable degree of caution. Some writers of no mean celebrity have treated, since the time of these observers, upon the same topic, whose remarks deserve to be impartially considered. To the foregoing observations, and some others made by Schirach in particular, the late Mr. Hunter has replied, in a paper written by him expressly on bees, and inserted in the *Philosophical Transactions* for 1792, of which we are to avail ourselves. The experiments performed by Schirach, Mr. Hunter is disposed to think inaccurate, and the result inferred from them of course unworthy of credit: how far the arguments of the latter are likely to refute the observations of Schirach, remains to be decided, when we have considered them in his own words. The criticisms of this anatomist are introduced to notice, in speaking of the queen bee. "The queen bee, as she is termed, (says Mr. Hunter) has excited more curiosity than all the others, although much more belongs to the labourers. From the number of these, and from their exposing themselves, they have their history much better made out; but as there is only one queen, and she is scarcely ever seen, it being only the effect of her labour we can come at, an opportunity has been given to the ingenuity of conjecture, and more has been said than can well be proved. She is allowed to be bred in the common way, only there is a peculiar cell for her in her first stage, and Reaumur says, "her food is different when in the maggot state;" but there is probably but one queen, and that the whole might not depend on one life, it is asserted that the labourers have a power of forming a common maggot into a queen. If authors had given this as an opinion only, we might have passed it over as improbable, but they have endeavoured to prove it by experiments, which require to be examined; and for that purpose I shall give what they say on that head, with my remarks upon it."

Abstracts from Schirach — "In twelve wooden boxes

were placed twelve pieces of the comb; in each box was shut up a handful of working bees. Knowing that when bees are forming a queen, they should be confined, the boxes were kept shut for two days. When examined at the end of that period," (six boxes only were opened) "in all of them royal cells were begun, one, two, or three in each, all of these containing maggots four days old. In four days, the other six boxes were opened, and royal cells were found in each containing maggots five days old, surrounded by a large provision of jelly, and one of these maggots, examined in the microscope, in every respect resembled a working bee."

"This experiment was repeated, and the maggots selected to be made queens were three days old; and in seventeen days there were found in twelve boxes fifteen lively handsome queens. These experiments were made in May, and the bees were allowed to work great part of the summer. The bees were examined one by one, but no drone could be discovered, and yet the queens were impregnated, and laid their eggs." [Here is a wonder! queens laying eggs, (which we must suppose Mr. Schirach meant we should believe) and they hatched without the influence of the male.]

"The above experiment was repeated with pieces of comb, containing eggs only, in six boxes, but no preparation was made towards producing a queen.

"The experiment of producing a queen bee from a maggot was repeated every month of the year, even in November."

"A maggot of three days old was procured from a friend enclosed in an ordinary cell, and shut up with a piece of comb containing eggs and maggots. That, three days old, was formed into a queen, and all the other maggots and eggs were destroyed.

"In above a hundred experiments a queen bee has been formed from maggots three days old. [The working bees, as all females, although the ovaria is too small for examination," &c. Vide *Phil. Trans.*]

Mr. Hunter next proceeds to speak of another author who repeated the experiments of Schirach. "Wilhelmi (he says) observes that a queen cell, which is made while the bees are shut up, is formed by breaking down three common cells into one, when the sides are repaired."—"A young queen was put into a hive which had been previously ascertained to contain no drones, and whose queen was removed, and yet the young queen laid eggs." [Probable.] In repeating Mr. Schirach's experiment, he shut up four pieces of comb with one maggot in each: after two days the maggots were all dead, and the bees had desisted from labour. [There is no mystery in this: but did they hatch?—"A piece of comb, from which all the eggs and maggots had been removed, was shut up with some honey, and a certain number of workers: in a short time they became very busy, and upon the evening of the second day 300 eggs were found in the cells. [This would shew that labourers can be changed into queens at will, and that neither they nor their eggs require to be impregnated; if this was the case, there would be no occasion for all the push in making a queen or a male.] He repeated this experiment with the same result, and the bees were left to themselves: they placed the queen maggots in the queen cells newly constructed, and others in male cells, the rest was left undisturbed. He again took two pieces of comb, which contained neither eggs nor maggots, and shut them up with a certain number of workers, and carried the box into a stove; next evening one of the pieces of comb contained several eggs, and the beginning of a royal cell was empty."

Besides these short observations contained in the brackets, Mr. Hunter tells us he has his doubts respecting the whole

of these experiments of Schirach, &c. from several circumstances that occurred in the course of his experiments. The three following facts appear in his mind, much against their probability. First, a summer's evening in England is commonly too cold for so small a parcel of bees to be lively, so as to let about new operators; they get so benumbed that they could hardly recover in the day, and he suspects, where these experiments were made, it also was too cold; and indeed some even are said to have been tried in this country. Secondly, if the weather should be so warm as to prevent this effect, then they are so restless that they commonly destroy themselves, or weary themselves out; at least, after a few days confinement we find them mostly dead; and, thirdly, the account given of the formation of a royal cell, without mentioning the above inconvenience, which is natural to the experiment, leads him to surmise the whole to be fabricated. To obviate the first objection, which he found from experiment would prevent a success that might otherwise arise, he put parcels of bees with their comb, in which were eggs and maggots, (and in some trials chrysalises besides) into a warmer place, such as a glass frame over tan, the surface of which was covered with mould to prevent the ill effects of the unwholesome effluvia arising from it; but from knowing that the maggot was fed with bee-bread, or farina, he took care to introduce a cell or two with this substance, and also the flowers of plants that produce a great deal of farina, together with some honey for the old bees. In this manner his bees were preserved from the cold, and also provided with necessaries; but after being confined for several days, upon opening the doors of the hive, those which remained alive came to the door-way, walked and flew about, but gradually left it, and on examining the combs, &c. he found the maggots dead, and nothing like an operation going on. He chose to have some chrysalises in the comb, supposing that if the bees died or flew away, those newly hatched afterwards from those chrysalises, which would happen in a few days, not knowing where to go, might stay and take care of the maggots that would be hatched from the eggs; but to his surprize he found on opening the box that neither the eggs hatched; nor the chrysalises came forth, all died; from which he began to suspect that the presence of the bees was necessary for both. "The queen, the mother of all, (he concludes) with saying in whatever manner produced, is a true female, and distinct from the labourers and the male." He describes the difference between the female and the male, observing that he believes a hive has only one queen; and mentions Rees, who asserts that there are many numerous queens, which he has seen killed both by labourers and the male.

With due respect to the memory of so great a man, we had expected better reasoning, and a more copious and extensive investigation of this mysterious affair, from the pen of Mr. John Hunter. After following him through his various remarks, we are almost at a point to lose to conceive their tendency. He sets forward with expressing his doubts as to the accuracy of Schirach's experiments, who had, it seems, endeavoured to prove, that a queen bee might be reared from the humble condition of the larva of a common worker; the suggestion meets his ridicule, a strong vein of which is apparent throughout his notes; and in the true spirit of critical analysis, he proceeds to examine the experiments by which this suggestion has been supported. Some few inadvertencies of expression in the statement of particulars, are mentioned by him, and after relating two or three unsatisfactory experiments, made in order to rival late the observations of Schirach, he tells us, that "the queen bee, the mother of all, in whatever manner produced, is a true female," an inference so logical, that no one would be inclined, we may presume,

to dispute it; but surely it could require no matter of argument, nor criticism, nor series of experiments, to prove, that the mother of all must be a female; nay, still less was it incumbent upon him to support, by the use of many words, that this female was produced in some manner or another; this is apparent enough; we need not be therefore solicitous to enquire whether she is produced, but to know in what manner that production is accomplished; and here we are left in uncertainty. If Mr. Hunter was convinced that the observations of Schirach were erroneous, he could not, we apprehend, be ignorant of the manner in which she is produced; or, if he was, he must have been unauthorized to censure Schirach. In a word, it ought to be acknowledged in candour, between the two parties, that we had expected, in the outset, Mr. Hunter would have fairly controverted the arguments of his opponent, but in the conclusion perceive, too evidently, that he is content to contradict them only.

But the experiments of Schirach have been found in many respects consistent with the discoveries of later naturalists; experience has proved that in many points he is correct. It is almost enough to say that they are in part confirmed by Huber. The latter writer, after professing his opinion, that there are no such creatures as mules or neuters in the society of bees, endeavours to shew that the working bees are all originally of the female sex; and that each is consequently provided with an *ovaria*, or womb, which neither Swammerdam, Reaumur, and perhaps no other before him, had ever seen, although they had conjectured it must be so. He cites in proof of the position that they must be females, the discovery of Schirach; who, although he had not detected the ovaries, had seen the larvæ of the working bees converted into queen's, when the necessities of the state required it; a fact of which Huber had been occasionally himself a witness. Huber is persuaded, that however strange it may appear, it depends entirely on the manner in which the larva is treated while remaining in the comb, whether the individual will become a perfect female, fitted for the purpose of perpetuating the race, the mother of the future swarm; and of being invested with the powers of sovereignty; or be doomed to a life of labour as a common working bee. If the larva be intended for the latter condition, the egg is lodged within the confines of a narrow cell; which, when the larva hatched from it attains a certain size, effectually prevents the distension of those organs of the ovaria that are necessary to the great purpose of rendering the creature prolific in the last stage of being. Thus it happens, that unless the larva be allowed sufficient room for these organs to expand, they continue to be crippled, compressed, and afterwards incapable of that expansion which is absolutely requisite in impregnation. Hence we perceive the motives for that special care which the working bees bestow on the enlargement of the cell of those larvae which as a fortuitous accident may induce them to adopt for the female parent of the future brood. If the larva of a working bee is to be converted into a prolific female, the cell in which it has been lodged is broken into a wide more capacious than before; this permits the creature to attain its full and proper size; the ovaria, no longer straggled by the compression of its cell, assume a new and more expanded form; and when the insect comes forth in the winged state, the sexual organs are found to have acquired that degree of maturity which can alone render it capable of fulfilling the ordinary function for which they were designed. There is also another cause to which the labourers of the working bee is attributed, the quantity of aliment which it receives in the larva form. At this time the creature is kept up within its narrow cell, and is allowed only a certain portion of the

palette

paste destined for food; the queens, on the contrary, are more liberally supported; they are cherished with the utmost care, and their growth is promoted by every means possible. There are sometimes several worms, or at any rate two or three reared in every comb for queens; and for the reception of which, if the royal chambers had not been before constructed, several common cells are broken down to effect an enlargement suitable for the purpose. These larvæ are supplied with what is called by some the royal jelly, the powerful properties of which are sometimes observed to operate on the larvæ of the common workers; for when it happens that the eggs and worms of such, contained within the cells adjacent to the royal chambers, receive by accident a quantity of this jelly, we are told they produce prolific working bees, although such are very rarely observed; but the reason of which is obvious; the queen bees are no sooner hatched than they attack these prolific workers without mercy, and destroy them. The same fate, as is well known, attends all the queen bees, with the exception of the queen bee elect, who must support her claim in the first instance by conquering and destroying her rivals, who would aspire to the same honours.

There have been many very strange conceits indulged respecting the impregnation of the eggs of bees by the drones, or male bees. Among the ancients, as well as the moderns, it was, and is still believed, that the eggs are fecundated like those of fishes by the males diffusing a prolific fluid over them, corresponding with the milt in the finny tribe. Butler, Swammerdam, Maraldi, &c. carried matters to a much higher pitch of extravagance; they imagined even that it was sufficient for the female to be for some short time in the company of the males to become fruitful, conceiving that the fumes she would imbibe from them would vivify the eggs within her womb. Reaumur thought he discovered the union of the drone with the female, as in most other animals; his observations are not however completely satisfactory on this head, although his conjecture has received at length the sanction of indubitable authority. The discoveries of Huber prove him to have been in the right. Huber, dissenting from the absurd conceptions of some preceding writers, affirms that the intimate assistance of the male is required in this affair. He tells us, that the eggs are impregnated by the male, while in the ovaria of the female bees: and gives as a reason why this connection of the sexes has not been observed before, that it never takes place within the hive. For this purpose the bees resort into the fields, first the female escapes from the hive upon a certain signal, and the swarm immediately follows. If in the first flight the female be not impregnated by some one of the male attendants, she returns to the hive, and takes a second flight precisely in the same manner, but does not afterwards return without being fecundated. Huber supposes that this single consummation of its desire is sufficient to vivify all the eggs she may lay for the space of two years after, or even of those laid by her during life, which must amount to many millions, since she lays four or five thousand at once, or even ten thousand in a month. But the male, who contributes his assistance to give life to this numerous brood, has never the pleasure of seeing his posterity, for he dies in the accomplishment of the duty imposed on him by nature; the sexual organs remaining too firmly fixed in the body of the female to be withdrawn, he is deprived of them in his separation from her, and left to perish miserably.

One of the most persuasive arguments in favour of Huber's idea respecting the working-bees being originally of the female sex, and not neuters, as is almost universally believed, may be drawn from the recent discovery of Mr.

Kirby, who found that the antennæ in both the female and the neuter contain the same number of joints. While we tacitly admitted the assertion of Linnæus, that there were no less than five articulations more in the antennæ of the neuter than the female bee, it required no small share of credulity to believe that such an astonishing difference in the formation of these organs could be produced by the mere effect of feeding the creature under the larva form in one particular manner instead of another; but this mistake being ascertained, removes one difficulty most certainly, namely, the impossibility of the working bee having been transformed into a queen, if it does not go very far to prove the fact itself. There are, it must be owned, however, some other objections of a similar nature, which still remain to be removed. Mr. Kirby, than whom we know no firmer advocate for the opinion of the working bees being strictly neuter from their origin, does not appear to have been aware, when he corrected this misstatement of Linnæus, that his remark would tend, in one material point, to support an idea so contrary to that which he entertains himself in this respect.

Mr. Wildman, who, from his constant habit of rearing bees, was perfectly conversant with their attachment to the female, or queen bee, relates one curious particular; the manner in which he could cause a swarm of bees to follow him, and alight in any particular spot he might think proper. "Long experience," says this writer, "has taught me, that as soon as I turn up the hive, and give it some taps on the sides and bottom, the queen immediately appears to know the cause of this alarm, but soon retires again among her people. Being accustomed to see her so often, I readily perceive her at first glance; and long practice has enabled me to seize her instantly with a tenderness that does not in the least endanger her person; this is of the utmost importance; for the least injury done to her brings immediate destruction to the hive, if you have not a spare queen to put in her place, as I have too often experienced in my first attempts. When possessed of her, I can, without injury to her, or exciting that degree of resentment that may tempt her to sting me, slip her into my other hand, and returning the hive to its place, hold her there, till the bees, missing her, are all on wing, and in the utmost confusion. When the bees are thus distressed, I place the queen wherever I would have the bees to settle. The moment a few of them discover her, they give notice to those near them, and these to the rest; the knowledge of which soon becomes so general, that in a few minutes they all collect themselves around her, and are so happy in having recovered this sole support of their state, that they will long remain quiet in their situation. Nay, the scent of her body is so attractive to them that the slightest touch of her along any place or substance, will attach the bees to it, and induce them to take any path she takes."

BEES, Preservation of. The preservation of these industrious and useful creatures deserves every consideration. This depends chiefly on supplying them with a sufficient quantity of food, guarding them from their enemies, and despoiling them of the produce of their labour without destroying them. Besides the attention which should be bestowed upon the necessities of bees, in the choice of an eligible situation for the *APIARY*, it may be necessary to feed them towards the close of autumn, in the winter, or in the spring, when they have consumed their winter stock. This should be done, especially in cloudy, misty weather, when they go abroad but little, and when several days of bad weather immediately follow their swarming. Mr. Thorley directs, that no hive should be kept which does not weigh twenty pounds; and that the supply should be given in quantities of honey, which

which is their proper food, not less than a pound and a half or two pounds at a time. The honey should be first diluted with water, or small beer, and then poured into an empty comb. A drone comb is the strongest and best for the purpose; and in the evening, when the bees are quiet, the hive should be gently raised on one side, and the comb put under it, the contents of which will be conveyed away the next day into the several magazines.

Reaumur recommends a plate of liquid honey unmix'd with water, cross'd with straws, and cover'd with a paper full of holes, through which the bees will suck the honey without disturbing themselves. But care should be taken that the hive be well guarded from robbers, whenever it is provided with a fresh supply. The winter quarters of the bees should likewise be well secured, both against the weather and the enemies that would annoy them. Mild winters, as well as severe cold, are injurious; sunshine in winter tempts them to go abroad, and expos's them to the fatal effects of sudden changes either of cold or rain. Bees are most likely to survive in cold winters, because they are then in a torpid state, and require very little nourishment, provided the apiary be well secured from the keen effects of northerly and easterly winds; whereas a small degree of warmth enlivens them, when they too often consume their winter stock, and are left destitute of food in a wet unfavourable spring. When bees are chilled with cold, and to all appearance dying with cold, and the clusters of them are broken, so that they drop down in the hive, they may be recover'd oftentimes by the means of heat. Some have advis'd the application of hot or warm ashes to be laid about the hives, or sprinkled over the clusters of bees which lie seemingly dead at the bottom of the hive. A sufficient warmth may be given them by putting them into an handkerchief, and breathing upon them, or by laying them before a fire. This precaution should be taken immediately when the symptoms of disease are shewn, otherwise their vitals may be impaired, and the bees be irrecoverably lost. Reaumur made many attempts to preserve the bees from the ill effects of cold in the winter without removing the hives out of the places where they stand in the summer. With this view, he cover'd some of the hives with straw, by means of sticks fix'd round them, and reaching a few inches above the top; but the most successful method he found to be that of preserving them in large tubs, with earth or hay, covering at the same time to convey air to them through a square tube of wood two inches in width, and half an inch in diameter, which pass'd through the side of the tub, and was of such a length as to reach the mouth of the hive, projecting at the same time three or four inches beyond the sides of the tub. In the time of Reaumur many ingenious contrivances have been advis'd to obviate this, and other objections, against the hives that were formerly in use. A new kind of hive contriv'd by M. Hubert de Goxxa, found to be most obtain'd success upon, or the most contented this time. There are also others contriv'd by Peltan, Missie, Benjagat, Blacq, Barbet, Foy, Raveil, &c. well deserving the attention of the farmer. The agricultural committee in Paris has been recently employ'd in the examination of the best most economical and advantag'ous kinds of hives, when M. Larcher, a gentleman near that city, presented one for their inspection on a plate entirely new, under the name of "*cube villigerose*," the construction of which was very much improv'd. For the sake of preserving the bees, due attention should be paid to the situation in which the hives are plac'd; they ought not to be plac'd in gardens stor'd with sweet-scented plants, fruit trees, and the like. The hives should not be plac'd too near to these, because they harbour vermin injurious to the bees, and still more, weeds must not be allow'd

to flourish close to the hives, since they nourish others far more detrimental to the bees than the former.

It is no unusual circumstance for one colony of bees to attack and plunder the hive of another. This happens chiefly in the spring and autumn. The most effectual way to guard against their incursions, is to lessen the entrance into the hive, so as to leave room for only two or three bees to pass a-breast, or to stop up the hives that are attacked, till the robbers disappear; or if strangers have gain'd admittance, the proper inhabitants of the hive may be rous'd to self-defence by disturbing them with a bunch of stinking madder fasten'd to the end of a small stick, which will instantly raise their resentment, and make them seize upon the robbers. This is indeed needless while the queen of the hive attacked is safe.

BEES, Enemies of. In the domestic state the bee has many enemies; but in a state of nature these are far more numerous. While in the apiary, wasps and hornets are among the most formidable of those enemies; they will often contrive to enter the hive, and build their nests in it, and harass the bees without mercy, till they leave their habitation, unless proper care be taken to prevent such encroachments. The fox is a dangerous enemy in the winter, as he is able to make a passage into the hive, and devour the honey. Rats are equally injurious; the house and field-mice should also be guarded against, by diminishing the entrance into the hive, as the cold comes on, when the bees become less able to defend themselves. The hives may be placed in such a manner that it will be impossible for the mice to reach them. Birds are bitter enemies to the bees; the sparrow, house-lark, and swallows in particular. Toads and frogs will place themselves at the entrance of the hive, and devour many. Spiders will expand their snares near the hive, and destroy numbers. The species *aranea calcina* lies in ambush for the bees in the corolla of flowers, and fastens upon them when they come to sip the nectareous fluids. Ants of almost every kind penetrate into the hive, attack the young brood, and plunder the combs of the honey. The stink of certain species of ants is so offensive to bees, that they will quit their hives to avoid it, or if they remain, become sickly. Some larvae, or caterpillars, are likewise exceedingly injurious to the bees, the honey, the comb, and hive. *Phalena melibonella*, or honey moth, too frequently secures its residence in the hive, and deposits its eggs; which hatching produces a larva of a pale flesh colour, that subsists entirely on the honey. The eggs of another phalena, the wax moth, *P. caryofagata*, hatch sooner and produce larvae than the former; for these do not emerge from the eggs, than their operation commences; they attack the comb, which they perforate in a variety of intricate passages, burrowing and feeding as they proceed, till they reach the bottom of the cells in which they are bred, here they remain in security, and do not uncommonly compel the colony of bees to leave their residence. The old combs are those that are generally infested by these insects. A third sort of moth, *phalena sociella*, breeds likewise in the honey-combs of some bees. Hives of bees that have swarmed more than once, and such also as contain but little honey, are most expos'd to the depredations of these insects; for the half-draught combs serve to shelter them, and the scanty store of honey or wax supplies them at least with food to the detriment of the colony. Bees are subject also to a peculiar species of pediculus, called the bee-louse. Hives of bees that have swarmed more than once, and such as contain but little honey, are most expos'd to these troublesome vermin. The hive in this case should be clean'd at the farthest once every week, and the stools on which they stand every morning, for the latter are likely to harbour the larvae and moths, or other insects, as well as the hive.

hive. But these obnoxious creatures cannot be entirely extirpated without taking away the infected hive, removing the bees, and cleaning it, before it is restored to the former situation. The lice of bees are of a slender shape, or filiform, and of a ferruginous colour, and may be destroyed by strewing tobacco over the bees. In a wild state the common honey-bee inhabits the cavities of hollow trees, where they are unavoidably exposed to a prodigious host of enemies, especially field and wood-mice of every description, rats, and birds. Of the bird tribe in particular, some species are supposed to feed exclusively on bees, such as the honey-buzzard (*falco apivorus*), the European bee-eater (*merops apivora*), &c. woodpeckers, the kingfisher, and many others: they do not feed, indeed, exclusively on them, as is imagined, but they are formidable enemies to the bees in a wild state. The animals and birds which prey upon exotic honey-bees are numerous likewise; of this kind we might instance the various species of ant-eaters (*myrmecophaga*), the black bear (*ursus arctos*), the honey cuckoo (*cuculus indicator*), peacocks, &c.

BEES, Maladies of. In the spring the bees are subject to a kind of dysentery, which proves often fatal. The matter which they void at this time, when so affected, instead of being of a reddish yellow colour, is of a muddy black, and has an intolerable smell. Columella supposed this annual distemper to be occasioned by the bees extracting too freely the juices from the blossoms of the spurge and elm trees, or, as others believe, from the lime tree. There are writers who, dissenting from this opinion, attribute it to the quantity of new honey, of which they are known to eat to excess at that season of the year. Again, others imagine that it is caused only by their long stay in the hive during the winter, when they are constrained to feed on the coarse wax, if their honey fails to afford them a sufficient quantity of food. Madame Vicat, in the "Memoires, &c." of the Berne Society for 1764, ascribes this distemper to the honey which the cold has candied in the hive during winter. The true cause of this distemper seems to be unknown; but it is certainly contagious and very destructive. A good remedy for it was long unknown. Aristomachus recommends the removal of the vitiated combs. For the recovery of the bees affected with this distemper, a new remedy has been adopted upon the continent: they prepare a syrup composed with an equal quantity of good wine and sugar, which is administered to the bees in every hive, either by pouring it into the cells, or placing it within the hive in a saucer, or any other shallow vessel; this has been found an excellent restorative.

About the end of the spring, another disorder sometimes makes its appearance, which Du Carne de Blangy calls a "vertige," or vertigo. This is supposed to be occasioned by the venomous properties of certain plants on which they feed. The symptoms are manifested by a dizzy manner of flight, by their involuntary startings, falls, and other gestures, in attempting to perform their usual operations, or in approaching the hive, and by the lassitude that succeeds these symptoms. This distemper has been hitherto found incurable.

Bees are liable to a third distemper, the symptoms of which are a swelling at the extremity of the antennæ, which becomes also much inflamed, and of a yellow colour; the head assuming shortly after the same tint, the bees lose their vivacity, and languish till they die, unless a proper remedy be applied. In France, they give them Spanish wine for this disorder.

There is still another distemper which sometimes makes its appearance among bees, for which the continental agriculturalists administer Spanish wine, as in the former cases. This is a kind of pestilence by which many bees are cut off. It happens when the queen bee has placed the eggs carelessly in the comb, so that the larvæ perish in the cells, or that

they are killed by the cold, or bad management in nourishing and feeding them; when numbers die, and infect the rest. The only attention requisite in this case is to take away the infected combs, scent the hive with the perfume of aromatic plants, and give them the wine to sip, as above mentioned, in order to strengthen and restore them from their sickness.

For the methods of preserving bees in hives and boxes, and for collecting the produce of their labour, see HIVE, HONEY, and WAX.

HONEY-BEES, Varieties and Species of. The cultivation of the common honey-bee, in the warmer countries of Europe, being an object of the utmost consequence to the farmer, every means that ingenuity could devise to improve the breed and management of these profitable creatures have been adopted, and with success. They distinguish three kinds or varieties of the common bee (*apis mellifica*). The first is large, and of a deep brown colour; the second is smaller and blackish: those of the third sort called "the little Flemings," or "little Hollanders," are much smaller than either, and of a fine glossy yellow colour. It is the latter that is very generally cultivated on the continent at this time. *Apis mellifica* is an European insect. Mr. Hunter supposes it an inhabitant of Asia and Africa also; its appearance in America may be accounted for on the presumption that it was originally introduced there from Europe, and in the course of time has become completely habituated to that climate. It is said to have been originally peculiar to the continent of Europe, but this will admit of doubt. In those parts of Asia and Africa nearest to the south of Europe, they cultivate the same kind as ourselves. There are some other species of bees domesticated like the common bee with us, in different parts of the world; and others again, whose wax and honey are sought after by the natives, who do not care to take the charge and trouble of domesticating them. In Cayenne and Surinam, the species called by Olivier *amalthæa*, is an abundant and most profitable creature. This little bee is of a black colour, with white wings and long posterior feet. They build their nest, in the shape of a bag-pipe, upon the tops of the highest trees. The honey is very sweet and agreeable, and thin, and of a reddish colour. From the latter the Indians extract a spirituous liquor, of which they are passionately fond; of the wax they make candles. This is supposed to be the small black innocuous wood-bee of Barrère, which is called *ovano* in Cayenne. M. Latreille mentions this species, and also another, which he calls "l'abeille sociale" (*apis socialis*), among his "apiaries domestiques," an insect rather smaller than the common honey-bee (*mellifica*), that is found in India. Specimens of it, he tells us, were received at the museum of natural history in Paris, among a collection of other insects from Bengal. If we are not mistaken in the species, the same kind was likewise introduced into the cabinets of the curious in this country, about twelve months since by Mr. Fichtell, who found it to be very commonly cultivated by the inhabitants in the vicinity of Bengal.

WILD BEES. Except those species of the bee tribe which are subservient to the purposes of human life, mankind has shewn a manifest degree of inattention to this curious race of creatures. Some few naturalists have regarded them as objects of amusement: and what the common observer is content to name a wild bee, without further inquiry, is discriminated by them as forming many distinct families; each of which have their peculiar manners and mode of life, and display a greater or less proportion of economy, skill, industry, &c. by no means unworthy of being more minutely attended to. Of the wild bees there are certain natural families, whose distinctive characters, in a scientific point of view, have been described already; they are distinguished also by their man-

ners of life, the formation of their nests, and manner of particular cells. Some are called leaf-cutters, others wood-piercers, masons, earth-diggers, &c. corresponding with what the French call "abeilles coupeuses, abeilles perce-bois, abeilles maçons, abeilles qui creusent la terre," &c. Under each of these families many species are arranged by entomologists. A similar mode of nomenclature (it has been well remarked) may be adopted very often as the characteristic of a family, or that of a species; thus the cells of the different species of *Anthophora* are composed of similar materials, and resemble each other in form; and the various genuine species of the genus *Vespa* (*Harpes*) construct cells, for the most part, of the same figure, and employ the same kind of material, according to Reaumur; the mode of construction, therefore, should never be assumed as characteristic of a species, but after the most mature consideration, and the closest investigation of its history; for it generally happens that these insects which agree together in habit, and belong to the same natural divisions or subdivisions of a genus, are connected likewise by their mode of life.

Of the leaf-cutters there are several species; these are so named because they cut the leaves of trees, chiefly those of the rose, into pieces of a convenient size, compose their little cells, in which the eggs of the future brood are deposited. This description of bees is injurious; the female perforates the solid timber of trees in a surprising manner in order to place her eggs (which are carefully wrapped up in these cylindrical pellets, if they may be so termed, of leaves), within the cavity. The hollow or pipe which the bores for their reception is usually about the thickness of a small finger, but the depth is very various, being from a few inches to a foot or more; the whole cavity is filled with those little pellets, each of which contains an egg, with a provision of honey for the larva when hatched; so nicely are these pellets formed that they precisely fit the cavity in diameter, and are placed one above the other from the opening to the very bottom of the cavity. *Apis centuncularis* is one of the species belonging to this natural family. There are others which belong to the same, that construct their cells in the same manner, but place them in cylindrical cavities in the earth, instead of timber. Some line or envelop their nidus with a downy substance collected from the woolly leaves of particular plants; the tapestry bee employs the tender petals of the rose to line its cells, &c. The mason bees are also singular in their mode of construction which they adopt. Reaumur has described at length in his history, a brief account of which will suffice for general remarks upon the subject for the present, and these must be again repeated when speaking of other species, &c., or of the families to which they belong are peculiar.—"The female of these bees, for the most part, like the drone of the hive-bee, do not work, and therefore they have only two females, undertake the whole labour of the building; and at the same time both architect and mason. Her first step is to fix upon an hole, formed by any process, on the inside of a stone wall. Sometimes she content herself with a more exposed part of the surface, where the light happens to be usual, and if for her purpose. Having chosen a spot proper to form the foundation of the future mansion of her offspring, her next care is to provide materials. As her habit is to be built entirely of a kind of mortar, the basis of which must be found; she is very curious in her choice of it, she searches for a shell, or grain, from such as contains some mixture of earth. To shorten her labour, she first transports the upper part of a kind of tithy, which is very soft, from the bottom of a stream, or the contrary into a little hole, about the size of a small nail. Taking this up with her tongue, she conveys it to the spot she has fixed upon for the base of her cell.

A circular plume, composed of many of these little masses, forms the basis on which it is to be erected; it contains from three to eight cells, which are similar to each other in their form, and equal in dimensions. Each cell is about an inch in length, and six lines in diameter; and, before its orifice is closed, in form resembles a thimble. When its walls are raised to a sufficient height, our little mason lays up in it a store of pollen seasoned with honey, for the sustenance of its future inhabitants; sometimes the proportion of honey is so great that this provision is entirely liquid. This business settled, she deposits her egg, finishes and covers in the cell, and then proceeds to the erection of a second, which she finishes and finishes in the same manner, and so on with respect to the whole nest. These cells are not placed in a line, or any regular order; some are parallel with the wall, others are perpendicular to it, and others are inclined to it at different angles; this occasions some empty spaces between the cells, which this labouring insect fills up with the same kind of cement, and then blows on the whole group a common covering, made with coarser grains of sand; so that at length the nest becomes a mass of mortar, very hard, and not easily penetrated, even by the blade of a knife; its form is more or less oblong; its colour depends on the colour of the sand employed in its construction."—Another species forms its nidus, with earth intermixed with chalk, upon stone walls; and a third for the sake of greater security prefers the hollows and cavities in the stone itself for this purpose.

BEES, WILD HONEY, *Hunting of.* In the Philosophical Transactions, No. 376, Mr. Dudley speaks of a method of hunting bees in order to discover the spot in which their nests are secreted, as practised some years ago in the woods of New England in America. It consists merely in catching a bee, then letting it fly, and daily observing the way to which it directs its course; this points out to the hunter the direction in which the nest is to be sought after. To find the distance, he takes an off-set of an hundred perches, and then lets fly another bee, but which must be of the same nest; and it is asserted, that the angle or point where these two courses intersect, is the spot in which the nest is concealed.

BEES, Swarming of. See SWARM.

BEES, Writers on. Many authors have written on bees. Among the ancients, Aristomachus is said to have studied them sixty years. Phyllisus retired into a desert wood, that he might have the opportunity of observing them to better advantage; Aristotle made a great number of curious observations on this insect, which Virgil has put into Latin verse: they have been enlarged and confirmed by Pliny and others. Theophrastus has a fragment of a treatise, *De apibus, & meretricibus*; or, as it is titled in Latin, *De vita, & moribus, & generibus*.

Among the moderns, the number of writers who have treated on bees is very great, a few only of which it will be expected in this place to mention. Ponce Frederic Cetti, instructor of the Roman Academy of Science, wrote expressly on bees; did also Swammerdam, Marston, and Reaumur, each of whom have treated minutely of them. Schiwenk is a distinguished writer on this subject. Hutton's description of bees. Among the English, Pehr, Grew, Mill, Lest, Thoms, Southey, Remond, Rotten, Ward, White, Williams, Dobson, Hunter, and others, have published discourses, or treatises, on the subject of bees, &c. Various observations are to be found in the papers in their natural history works, are such as Linnaeus, Fabricius, Geoffroy, Schiffer, Villier, Poda, Rühl, De Geer, Fourcroy, Donovan, Coccetti, &c. A monograph of bees has lately appeared in this country by Kirby, and another in France about the same time by Latreille. Nor should we omit to mention several works of reputation on this subject that have

been published on the continent within the last few years : of this description are the work of Huber of Geneva ; "Le Mémoire de Bernard sur l'Education des Abeilles ;" "Le cours d'Agriculture," by Rozier ; "Abregé de l'Histoire des Insectes pour servir l'Histoire Naturelle des Abeilles," by Bazin Gilles Augustin, first published in 1747 ; "Le Manuel Nécessaire au Villageois pour soigner les Abeilles," by Lombard ; and the works of Berthaud, Duchet, Ducarne, Blangy, Della Rocca, &c.

BEE, in *Astronomy*. See APIS.

BEE is also used figuratively to denote sweetness, industry, &c. Thus Xenophon is called the Attic bee, on account of the great sweetness of his style. Antonius got the denomination *melissa*, or bee, on account of his collection of common places.

Leo Allatius gave the appellation of *apes urbanae* to the illustrious men at Rome, from the year 1630 to the year 1632.

BEE-bird, in *Ornithology*. See TROCHILUS MINIMUS ; the bee humming bird, or *le plus petit Oiseau mouche* of Buffon. Some refer this name likewise to *Trochilus Bicolor* of Gmelin, the *Colibri* of *Ferm.* Surin. N. 2.

BEE, *Black*. See ÆTHIOPS.

BEE-Blocks. See BLOCKS.

BEE-boxes. See HIVE.

BEES-bread. See BEE BREAD, FARINA, and BEE *supra*.

BEE-eater, in *Ornithology*. See FALCO APIVORUS, *Honey Buzzard*.

BEE-flower, or Orchys, in *Botany*. See OPHRYS.

BEE-glue, a soft unctuous matter employed by bees to cement the combs to the hives, and to close up the cells.

BEE-hive. See HIVE.

BEE-humble, *humming bee*, wild bee, synonymous with the Bourdon family of bees, adopted by French writers.

BEE-humble fly. See BOMBYLIUS.

BEE, *Order of*, was instituted at Sceaux in France, for men and women, in 1703, by Louise, wife of Louis of Bourbon. The ensign is a medal of gold, bearing on one side the portrait of the foundress, and on the other a bee, with this motto, "Je suis petite, mais mes pictures sont profondes."

BEE-rocks, in *Geography*, lie on the coast of France, a little to the west of North from the point of St. Maloes. They are called the Great and Little Bee ; the latter of which is west of the other, and lies N. W. from the town about a gun-shot. On each of the bee-rocks is a little house. Ships may fail within a cable's length of the outermost or Little Bee, and anchor on the south of it in 5 or 6 fathoms at low-water, when Bore tower, on the south of St. Maloes, is a little east of the small tower on the point to the south of the town.

BEECH-TREE, in *Botany*. See FAGUS.

BEECH galls, in *Natural History*, the name of a species of galls or protuberances found on the beech-tree, and serving for the lodgment of insects.

These galls are found on the leaves of the beech, and are sometimes only one upon a leaf, sometimes more ; they always grow from the same point, owing, no doubt, to the fly's having laid so many eggs in the same spot.

These galls are of an oblong figure, and somewhat flattened. They resemble the stone of a plum in shape, and are so hard that they are not to be broken between the fingers ; their substance seems of the same nature with that of a nut shell. In each gall there is only one cavity, inhabited by a white worm, which in time passes through the nymph state into that of the fly, to which it owed its origin.

BEECH-mast, the fruit of the beech-tree. It fattens hogs and deer, and has sometimes supplied men instead of bread. Chios is said to have endured a memorable siege by means of it.

BEECH, *Oil of*, *Huile de Faine*, the fruit of this tree, the beech-mast, is an oily farinaceous nut highly nutritious to hogs, poultry, and other animals, and like the other fruits

of this description may be made to yield a very large quantity of pure oil by pressure. This oil has long been prepared in several districts in the south of France. An interesting account of this manufacture is published in the *Journal de Physique* for 1781, by Mr. Verdier.

The taste of the beech-mast is mild, unctuous, and somewhat astringent. About the month of October it falls spontaneously from the tree, and is collected in this and the succeeding month. When gathered and picked it is slowly dried in the shade, or with the heat of a very gentle stove ; after which it is at any time fit to be pressed for the oil. The very finest oil is made with the best nuts picked out by hand, but for the larger quantity the mast is sifted and winnowed like corn. It is then ground by a machine similar to a stamping mill, formed of upright beams of wood alternately rising and falling, set on motion by a large wheel, and when the fruit gets too dry a little water is added. When ground sufficiently fine, it is wrapped up in a coarse hair cloth once doubled, and submitted to the same kind of press which is employed for colseed, and other oils.

The beech oil, when well made, and from the best selected fruit, is equal to the best olive oil, and with this advantage, that it will keep much longer ; olive oil beginning to grow rancid in about a year and a half, whereas the other improves by keeping, to the sixth or eighth year. It is fit for use a month after it is made. To obtain the finest oil, besides the perfection of the fruit, it is necessary that the working of the mill in which it is ground, should be very moderate, so as not to overheat it.

The water used to give the fruit a proper consistence in grinding, mixes with the oil when pressed, so that it requires some weeks repose to allow them to separate. In general the oil stands about three months to clarify, after which it is drawn off clear from the water and dregs, and packed up either in bottles or in very close casks. The general yield of oil is about ten pounds from $4\frac{1}{2}$ bushels, Paris measure.

The uses to which it is applied are all those of the common fixed vegetable oil. The best sorts are equally grateful for the table as the best olive oil. The inferior are used for lamps, for preparing leather, and other purposes of economy and manufacture.

The cakes that remain after the oil is pressed out are particularly useful in the fabrication of the oil from nuts, as this latter fruit is not alone of a proper consistence for the press, but must be mixed with some more solid substance to make it work well. Besides this, the cakes of beech-mast are proper for fattening animals, or make a very good fuel.

An attempt was made in the beginning of the last century to introduce the preparation of beech mast oil in this country. The poet and speculator, Aaron Hill, obtained a patent for this manufacture, and went to some expence in establishing it in England about the year 1714. It would appear from a letter of his to the earl of Chesterfield (in the Harleian Collection, and inserted in the *Monthly Magazine* for 1803, p. 339,) that he had formed very sanguine hopes of the success of this plan. However he was obliged soon to abandon it, probably in part from a want of a proper supply of the fruit, and certainly in a considerable degree from the very limited use of oil as an article of food in this country.

BEEF, in *Domestic Economy*, the flesh of black cattle prepared for food. The flesh of the *bos* or ox hind, says Dr. Cullen (*Mat. Med.* vol. i. p. 369,) is the most dense of all the quadrupeds ; and how far that density goes in preventing solubility, we have an instance in the bull, whose flesh is seldom chosen as a part of our diet. The flesh of the female sex is of a more soluble nature, and sufficiently fit for nourishment ; but we commonly prefer the castrated ox, in which the fat is better mixed, and as more alkalescent, the flesh is more

fapid ;

sap'le; and, unless it be from a very old animal, is generally to be preferred. The chief difference of aliment in the ox kind is that which appears between the old and young. This author observes, that beef, though of a more firm texture, is less sabbile than mutton, is equally alkaliescent, palatable and nutritious. See FOOD.

BEEF-EATER, in *Ornithology*, the English name of *Bufo Africana*, a bird found on the banks of the rivers in Senegal, and the only species of the genus known. See BUPHAGA.

BEEF-ISLAND, in *Geography*, a small island near the coast of America, in the south-east angle of the bay of Campeachy, the west end of which is washed by the eastward opening of St. Peter and Paul river. It lies close to Trieth's island, is 7 leagues long, and from 3 to 4 broad, and has a fine sandy bay, where ships may ride in 7 or 8 fathoms and be well sheltered. N. lat. 18° 30'. W. long. 91° 30'.

BEEF-ISLAND is also one of the smaller Virginian islands in the West Indies, situate between Dog island on the west, and Tortola on the east, in Sir Francis Drake's bay. It is about five miles long, and one broad. N. lat. 18° 23'. W. long. 63° 2'.

BEEHMAN, a considerable township of America in Dutchess county, New York, containing 3,597 inhabitants, including 106 slaves. In the State census of 1796, there appear to be 52 electors in this township.

BEELE, in *Mining*, an instrument used by the workmen to break and pick out the ore from the rocks in which it lies. This instrument is called by the tinmen in Cornwall a "tubber." It is an iron instrument of eight or ten pounds weight, made sharp, and steel'd at both ends, and having a hole in the middle, where the handle is fixed in. When the ore lies in hard rock, this instrument wears out so fast, that it must have new points made to it every fortnight. The miners who dig up the ore in the mines, are, from the use of this instrument, called beele-men; and those who attend them, and whose business it is to take up the matter the others loose or break up, are, from their instrument, which is a broad and hollow iron shovel, or a wooden one, with a very strong iron lip, called the "shovellers." In Cornwall, when the ore lies in a hard bed, they allow two shovellers to three beele-men; and when it lies in a soft and earthy matter, two beele-men and three shovellers are the proportion. Phil. Trans. N. 69. p. 2104.

BEELIKE, in *Geography*, a town of Germany, in the circle of the Lower Rhine, and duchy of Westphalia, 4 miles west of Rhiden, and 10 E.N.E. of Arelberg.

BEELEZEBUB, or **BAALZEBUB**, i. e. *the lord of a fly*, in *Ancient Mythology*, was a god of the Philistines, and had a temple and oracle at Ekron. (2 Kings, i. 2.) From this passage it is evident, that the name was not given to this object of idolatrous worship by way of contempt; because it was used by Achish at the very time when he was acknowledging his divinity, and desirous of consulting him concerning his recovery. This is farther evident, from the meaning of the appellation, and the reason of it being given. History informs us, that those who lived in hot climates, and where the soil was moist, which was the case with the Ekronites, who bordered upon the sea, were exceedingly infested with flies; and these insects were thought to occasion contagious distempers. Pliny (N. H. l. x. c. 28. § 40.) mentions a people who stopped a pestilence which had been their calamity, by sacrificing to the "fly-hunting-god." It is not improbable that some magical cure of this kind, or a general persuasion of his power of driving away flies from the places they frequented, might be the reason why the god of Ekron was called Beelzebub. For it was customary with the heathens, to call their gods by the name of those insects, from which they were believed to deliver their worshippers. The "god of flies," *Muzza*, and

the "fly-hunter," *Muzza*, were titles ascribed to Jupiter as well as to Hercules. Indeed, some of the Greek fathers thought, that this "fly-god" was worshipped under the form of a fly; and it is observed by Mr. Young (on Idolatry, vol. ii. p. 91, 92.) that it was customary with the heathens to represent their gods by insect creatures that were sacred to them. However, the supposed power of this god over that noxious insect, the fly, seems to be the most probable reason of the name of Beelzebub. Beelzebub, therefore, being a title of honour, and as such applied by his worshippers to the god of Ekron, there is no reason for doubting, that it was in use among the Philistines, as well as among the Jews. (Bochart, vol. ii. p. 36, &c. Op. vol. iii. p. 500. Selden de Dus. Syr. Swaug. i. c. 6. p. 227. ed. Amd. 1680.) Among the Jews, the appellation Beelzebub, notwithstanding its seeming reproaches, could not be used as a term of derision. For the Jews had learned of the heathens to regard a power of driving away flies, as a divine prerogative: and availing to persuade men, that the temple of Jerusalem, though so many sacrifices were daily offered there, never had a fly upon it: thus copying, rather than deriding, what the heathens fabled concerning some of their temples, into which, according to Pliny, Solinus, and others, no fly could enter. It has been said, indeed, that the Greek word used in the New Testament, is not "Beelzebub," but "Beelzeboul," which signifies the "lord of a dunghill;" and hence it has been inferred, that this name could not have been used by the heathens; but must have been given by the Jews in derision. Jerom, however, not understanding the common idiom, changed *Beelzeboul* into *Beelzebub*; and this substitution has been approved by several critics, has been adopted in the vulgate, and thence transferred into Luther's translation. In the ancient language it was not uncommon to change *b* into *l* (see letter B;) and, on this supposition, the Greek word will agree with the Hebrew, (2 Kings, i. 2.) But if Beelzeboul be used as a different name from Beelzebub, there will be no reason for supposing that it was used by the Jews as an expression of contempt. The Hebrew word *Beelzeboul*, properly signifies "a habitation," and as Stockius observes, is applied to the heavens, the mansion of the deity. In this sense it will agree with the title of Beelshamin, or Beelshamen, "the lord of heaven," which the Ekronites, and other Phoenicians, gave to their supreme nomen. Whether, therefore, Beelzebub and Beelzeboul be different names, or the same name with different terminations, they describe the person whom the heathens regarded as their chief deity.

Beelzebub, in the New Testament, (Matt. xii. 24. Mark, iii. 22.) is called *the prince of devils*, the prince of demons, (prince of the devil, Engl. Transl.); and it has been commonly apprehended, that demons and the prince are the same spirit as the devil and his angels. Satan and Beelzebub, say those that adopt this opinion, (See Doddridge on Matt. xii. 25. Fan. Lect. vol. i. p. 291, not 30. and Pegge's Answer to Sykes) are names for the same person, for when Christ was reproach'd with calling out demons by the assistance of the prince of devils, he replied, "How can Satan cast out Satan?" (Matt. xii. 26. Mark, iii. 23. Luke, xi. 17.) Now if Satan, who is considered as the same person with the devil (Rev. ix. 12. Matt. iv. i. compared with Mark, i. 12.), was the prince of these devils who were cast out by Christ; then demons are the same spirit as the devil's angels. And in this supposition, there can be no other difference between a demon and the devil than that which distinguishes between a prince and his subjects, who both partake of one common nature, though the prince, as presiding over the rest, hath a peculiar name of his own. Dr. Lardner (Case of Demons, p. 42. Works, vol. i. p. 448.)

p. 448.) admits, that the devil, who is supposed to be the chief or prince of the fallen angels, is often called Satan and Beelzebub. Mr. Farmer is of opinion (Essay on the Demoniacs of the N. T. p. 16.) that it doth not follow from the above cited passage, that the devil is ever called Beelzebub. The term "Satan," he says, is not appropriated to one particular person or spirit, but signifies "an adversary" or opponent, in general. The Jews called every demon by this name, and used it in the plural number; and the words of our Saviour, "How can Satan cast out Satan," taken in their strictest sense, imply that there were several Satans: so that our Lord might only mean, "that it was unreasonable to suppose that one demon would cast out another." Or if you understand him to the following purpose: "were Beelzebub, whom you regard as the chief of the *possessing* demons, to expel himself, which would in effect be the case were he to expel his agents and instruments, he would act against his own interest, and defeat his own schemes;" it will not follow, that Beelzebub was considered as the same person with the devil. There seems to be no reference to the latter. He and Beelzebub might be regarded as two distinct persons; and yet each be called "Satan," an adversary, or opponent. "If Beelzebub and his demons were, in our Saviour's time, conceived to be the very same persons as the devil and his angels, is it not very surprising," says this author, "that the New Testament, in its original language, should always speak of the diseased persons under consideration as possessed by a "demon" or "demons," and never by "the devil" or "devils?" a word, as all must allow, that is never there applied to evil spirits in the plural number, whatever its use may be in the singular. He adds, "inasmuch as Christ is here replying to the Pharisees, and reasoning with them on their own principles, he cannot be supposed to speak of a different order of beings from what they did. Satan, therefore, must be equivalent to demon, in the sense in which demon was used by them." See DEMON. "Should it then appear," says Mr. Farmer, "that by demons and their prince they understood human spirits, it will from hence follow, that Christ cannot be speaking of spirits of a celestial origin." If by the devil, we are to understand a fallen angel, this writer thinks that he could not be the same with Beelzebub. The Jews, in their ancient writings, were not accustomed to call the devil by this name, but by that of Asmodeus, or Samael; as Bochart, (Oper. vol. iii. p. 501.) Selden, (ubi supra, p. 231.) and others allow. Beelzebub, in the estimation of the Pharisees, was the prince of the "possessing demons," and therefore, as Mr. Farmer supposes, he was, in their estimation, a human spirit; and in proof of this he alleges the testimony of Josephus (De Bell. Jud. l. vii. c. 6. § 3). Besides Beelzebub was, as we have already stated, a heathen deity; expressly denominated in the Old Testament, the god of Ekron; and represented by the Pharisees under the same title and character as the heathens themselves ascribed to their gods. "If Beelzebub," subjoins Mr. Farmer, "was a heathen demon, or deity, he was no other than a deified human spirit: for such were all the heathen demons, who were the more immediate objects of the public established worship; and those in particular to whom divination and oracles were ascribed. And if the prince of demons was of human extract, no doubt his subjects were so likewise.

BEELZEBUL, in *Entomology*, a species of SCARABÆUS that inhabits America. On the thorax is a triple prominence; and three horns on the head, the middle one larger than the others. Fabricius.

BEELZEBUL, in *Zoology*, a species of SIMIA that inhabits South America; and is tailed, bearded, and black; tail prehensile; tip, with the feet, brown. Linnæus. This

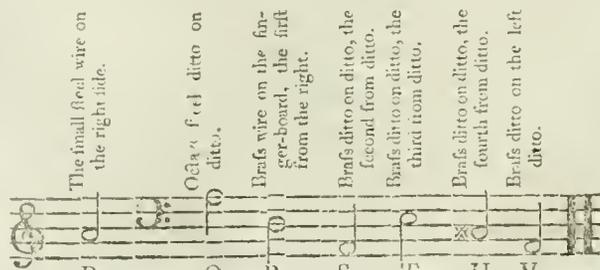

appears to be the *guariba* of Maregrave; *howling baboon* of Bancroft; *preacher monkey* of Pennant; and *Pouarine* of Buffon. It is said to be about the size of a fox, of a black colour, and the hair of its fur long, glossy, and remarkably smooth. This is a fierce animal, and inhabits the woods of Brasil, and Guiana, in vast numbers; wanders in large flocks in the night time, and howls hideously. Dr. Shaw observes, that this howling faculty is owing to the conformation of the os hyoides, or throat bone, which is dilated into a bottle-shaped cavity. Maregrave, in speaking of the *guariba*, acquaints us that one sometimes mounts the top of a branch, and assembles a multitude below; he then sets up a howl so loud and horrible, that a person at a distance would imagine that a hundred joined in the cry; after a certain space, he gives a signal with his hand, when the whole assembly join in chorus, but on another signal, a sudden silence prevails, and then the orator finishes his harangue. Virey calls this animal Beelzebub, retaining however at the same time the name *Pouarine*, under which it is described by Buffon.

BEEMAH, in *Geography*, a river of Hindoostan, which is a principal branch of the Kistnah, joining it near Edghir, rises in the mountains, on the north of Poonah, probably not far from the sources of the Godavery, and passes within 30 miles of the east side of Poonah, where it is named Bewrah as well as Beemah. It forms the eastern boundary of Vishapour, and passes about 80 or 82 geographical miles to the west of Golconda, crossing the road from it to Ralicote. The Beemah, according to Mr. Orme, possesses virtues similar to those of the rivers esteemed sacred by the Hindoos: that is, ablutions performed in its stream have a religious efficacy superior to those performed in ordinary streams. Rennell's Memoir, p. 244, &c.

BEEMEN, or **SHEEMEN**, in *Astronomy*, seven stars of the fourth magnitude, following each other, in the fourth flexure of the constellation Eridanus.

BEEMSTER, in *Geography*, a large drained lake or marsh of North Holland. It was formerly a lake, covering a great extent of country, which, by the industry of the Hollanders, who, by means of various canals, have drained the waters, is converted into an excellent pasture ground. It has neither towns nor villages, but a great number of houses, which are dispersed along the sides of the canals and roads.

BEEN, in *Musie*, the name of an Indian fretted instrument of the guitar kind. The finger-board is 21 $\frac{1}{2}$ inches long. A little beyond each end of the finger-board are two gourds, and beyond these are the pegs and tail-piece which hold the wires. The whole length of the instrument is three feet seven inches. The first gourd is fixed at ten inches from the top, and the second at about two feet 11 $\frac{1}{2}$. The gourds are very large, about fourteen inches diameter, and have a round piece cut out of the bottom, about five inches diameter. The finger-board is about two inches wide. The wires are seven in number, and consist of two steel ones, very close together, in the right side; four brass ones on the finger-board; and one brass one on the left side. They are tuned in the following manner.

The

The great singularity of this instrument is the height of the frets: that nearest the nut is one inch $\frac{1}{2}$, and that at the other extremity about $\frac{2}{3}$ ths of an inch, and the decrease is pretty gradual. By this means the finger never touches the finger-board itself. The frets are fixed on with wax by the performer himself, which he does entirely by ear.

The frets are nineteen in number. On the wires R and S, which are those principally used, there is an extent of two octaves, a whole note with all the half notes complete in the first octave, but the g \sharp , and b b wanting in the second. The performer's apology for this was, that he could easily get those notes by pressing the string a little hard upon the frets; but he asserted that this was no defect in his particular instrument, but that all beers were made so. The wires, T, U, are seldom used, except open.

The beer is held over the left shoulder, the upper gourd resting on that shoulder, and the lower one on the right knee.

The frets are stopped with the left-hand; the first and second fingers are principally used. The little finger of this hand is sometimes used to strike the note V. The third finger is seldom used, the hand shifting up and down the finger-board with great rapidity. The fingers of the right hand are used to strike the strings of this hand; the third finger is never used. The two first fingers strike the wires on the finger-board, and the little finger strikes the two wires. The two first fingers of this hand are defended by a piece of wire put on the tops of them in the manner of a thimble: when the performer plays strong, this causes a very jarring disagreeable sound; whereas, when he plays softly, the tone of the instrument is remarkably pleasing.

The style of music on this instrument is in general that of great execution. I could hardly ever discover, says Mr. Fowke, any regular air or subject. The music seems to consist of a number of detached passages, some very regular in their ascent and descent: and those that are played softly, are most of them both uncommon and pleasing. Asiatic Researches, vol. i. p. 295, &c. See *Plates of Music*.

BEER, a spirituous liquor, made from any farinaceous grain; but generally from barley. Accordingly, it is a liquor of very ancient and general use. See ALE.

The word is Saxon, formed from the German *bier*, of the Latin *bibere*.

Several authors have maintained, that there was no malt liquor known by the appellation of beer, as distinguished from the ancient liquor called ale, till the use of hops was introduced. See HOPS. However, we find, by a statute of the twelfth parliament of the 23d year of king James III. of Scotland, (c. 88.) that it was enacted, that no persons should mix wine or "beer," under pain of death. Besides this instance, occurring in 1472, many others might be produced confuting the vulgar tradition, that beer, as a liquor, distinct from ale, was not known in England till the reign of Henry VIII. In the year 1492, we find a licence from king Henry VII. to a Fleming (cited in the 12th volume of the "Fœdera," p. 471.) for exporting fifty tons of it, called "beer" or "br." and in the same year one of the king's attendants into France was a beer-brewer of Greenwich in Kent. Although it may probably be true, that beer, brewed with hops, was not known in England till after this time; yet other materials were used, before hops were known, for making the liquor that was called "beer," such as wormwood, and other plants, which served instead of hops, for preserving malt-liquor, either by sea or land.

Beer is made from malt by extraction with water and fermentation. With this view, a quantity of malt, freed from its germs, and sufficient for one intended brewing, is coarsely bruised by grinding, and in the mash-tub, first well mixed with some cold, then scalded with hot water drawn upon it from the boiler. It is afterwards strongly and uniformly stirred. When the whole mass has stood quietly for a certain time, the extract (mash), or sweet-wort, is brought into the boiler; and the malt remaining in the tub is once more extracted by infusion with hot water. This second extract, treated in like manner, is added to the first, and both are boiled together. This clear decoction is now drawn off, and called boiled wort. To make the beer more fit for digestion, and at the same time to deprive it of its too great and unpleasant sweetness, the wort is mixed with a decoction of hops, or else these are boiled with it. After which it ought to be quickly cooled, to prevent its transition into acetous fermentation, which would ensue, if it were kept too long in a high temperature. On this account, the wort is transferred into the cooler; where it is exposed with a large surface to cold air, and from this to the fermenting tub, that by addition of a sufficient portion of recent yeast it may begin to ferment. When this fermentation has proceeded to a due degree, and the yeast ceases to rise, the beer is conveyed into casks, placed in cool cellars, where it finishes its fermentation, and where it is well kept and preserved under the name of "barrelled beer," with the precaution of occasionally filling up the vacancy caused in the vessels by evaporation. Or, the beer is bottled before it has done fermenting; and the bottles are stopped a little before the fermentation is completely over. By so doing, the bottled beer is rendered sparkling. In this state it frequently bursts the bottles, by the disengagement of the carbonic acid gas which it contains: and it strongly froths, like champagne, when brought into contact with air on being poured into another vessel. Gren's Chymistry, vol. ii. p. 63. For the process of brewing, particularly according to the English mode; see BREWING.

Beer, well prepared, should be limpid and clear, possess a due quantity of spirit, excite no disagreeable sweet taste, and contain no disengaged acid. By these properties, it is a species of vinous beverage, and is distinguished from wine, in the strict sense, and other liquors of that kind, by the much greater quantity of mucilaginous matter which it has received by extraction from the melted grains; but which also renders it more nourishing. "Brown beer" derives its colour from malt strongly roasted in the kiln, and its bitterish taste from the hops. "Pale beer" is brewed from malt dried in the air, or but slightly roasted, with but little or no hops at all.

Tacitus, in speaking of the ancient Germans, as also Dioscorides, Galen, &c. condemn beer, as prejudicial to the head, nerves, and membranous parts, as occasioning a more lasting and more uneasy drunkness than wine, and as promoting a suppression of urine, and sometimes a leprosy.

Mess. Perrault, Raoussant, and others, defend the modern beer: urging, that the hops used with us, and which the ancients were strangers to, having a faculty of purifying the blood, and removing obstructions, serve as a corrective, and free our drink from the inconveniences objected to that of the ancients. For the qualities of beer, see MALT-LIQUOR.

In new England they make beer from maize, or even the bread made thereof. Some physicians recommend beer made of oats and birch-water, as preferable, in nephritic cases,

cafes, to that made of barley. Phil. Trans. N^o 97. p. 6135. N^o 138.

Mr. Park, in the account of his travels through Africa, informs us, that the negroes make excellent beer of one species of their corn, by malting the feeds nearly in the same manner as barley is malted in England; and he says, that the beer, thus made, was to his taste equal to the best strong beer he had ever tasted in his native country.

Sour or decayed beer may be restored divers ways; as by salt made of the ashes of barley-straw, put into the vessel, and stirred; or by three or four handfuls of beech-ashes thrown into the vessel, and stirred; or, where the liquor is not very sour, by a little put into a bag, without stirring; chalk calcined, oyster-shells, egg-shells burnt, sea-shells, crabs eyes, alkalized coral, &c. do the same, as they imbibe the acidity, and unite with it into a sweetness. Beer, it is said, may be kept from turning sour in summer by hanging into the vessel a bag containing a new-laid egg, pricked full of little pin-holes, some laurel-berries, and a few barley-grains; or by a new-laid egg and walnut-tree leaves. Laurel berries alone, their skin being peeled off, will keep beer from deadness; and the throwing fixed air into it will restore it. Glauber commends his sal mirabile and fixed nitre, put into a linen bag, and hung on the top of the cask, so as to reach the liquor, not only for recovering sour beer, but for preserving and strengthening it. See ALE.

Beer tasting of the cask, may be freed from it, by putting a handful of wheat in a bag, and hanging it to the vessel. The grounds of beer form a very rich manure.

BEER *Poffet*. See ZYTHOGALA.

BEER, *Eager*, is used by calico-printers, chemists, lapidaries, scarlet-dyers, vinegar merchants, white-lead-men, &c.

BEER-*Measure*. See MEASURE.

BEER-*Vinegar*. See VINEGAR.

BEER-*Haven*, in *Geography*. See BEAR-HAVEN.

BEERING, BEHRING, or BERING, VITUS, in *Biography*, an eminent navigator, was a native of Denmark, and born towards the conclusion of the 17th century. After having made two voyages to India, he entered in 1704, as a lieutenant in the Russian navy, in which he afterwards rose to the rank of captain and commodore. In pursuance of a plan conceived by Peter I., and communicated on his death-bed to Beering, for making discoveries in that tempestuous sea which lies between Kamtschatka and America, this adventurous navigator set sail in 1728, accompanied by Tschirikof, from the mouth of the Kamtschatka river, with a view of ascertaining whether the two continents of Asia and America were separated, according to the instructions prepared by Peter I. on his death-bed for this purpose. Coasting along the eastern shore of Siberia, he arrived at the latitude of 67° 18', but made no discovery of the opposite continent. In 1729, soon after his return, he sailed again in prosecution of the same design, but without success. A third expedition was planned in 1741, and the conduct of it was entrusted with Beering and Tschirikof, who encountered many disasters, and paved the way to all the important discoveries afterwards made by the Russians. Two vessels, named the St. Peter, and St. Paul, were destined for this enterprise: the former was commanded by capt. Beering, and had on board 76 persons, including officers, and the latter by capt. Tschirikof, accompanied by Delile, professor of astronomy, and the same number of mariners. From the bay of Awatscha, which they left on the 4th of June, they proceeded northwards; and the vessels parted in a storm, and never more saw one another during the voyage. Beering steered in a southern direction from the 50th to the 46th degree of latitude in

search of Tschirikof, but finding the search to be fruitless he directed his course eastwards, and at the end of six weeks from the time of first sailing, discovered land in the latitude of 59° and some minutes, and in the longitude of 40° from Awatscha. On the 20th of July they anchored among some islands, on one of which they landed; but they neglected to accomplish the main object of their mission, which was the discovery of the American coast, which afterwards appeared to be so near their present station. This, however, seems to have been owing to the discontent and insubordination that prevailed among the crew and officers of the ship. Having observed several islands in the course of their voyage, they, at length, viz. on the 5th of November, found themselves, as they apprehended, on the coast of Kamtschatka, near the bay of Awatscha; but the land which they perceived proved to be an island, on which the ship was wrecked, and where the commander, and several of the crew, died soon after their landing, of the scurvy, famine, and fatigue. Steller, who accompanied Beering, and wrote a journal of the voyage, observes, in justice to the commodore, that he exerted himself to the utmost of his ability in executing the design of his mission, but that he was himself conscious of his unfitness for the arduous task on account of his age and irresolution. His temper was too mild for the government of a disorderly crew: and his deference to his officers led them to presume on their own importance, and to despise his authority. Worn out at last with hunger, thirst, cold, weakness, and anxiety, the oedematous tumours in his feet, from which he had long suffered, increased by the severity of the weather, and a mortification of the belly taking place, he breathed his last on the 8th of December, and was buried between his adjutant commissary and two grenadiers. "On our departure from the island," says Steller, "we erected over the grave a wooden cross to serve as a monument, and at the same time to be a testimony of our having taken possession of the country." Steller alleges several arguments to prove that Beering discovered the continent of America, at cape St. Elias, lying, according to his estimation, in N. lat. 58° 28', and in longitude from Ferro 236°; and that the coast touched at by Tschirikof was situated in lat. 56°. long. 241°. The coasts, says Steller, were bold, projecting chains of high mountains, some of which were covered with snow, and their sides clothed from the bottom to the top with large trunks of thick and fine wood. Steller went on shore and observed several species of birds not known in Siberia, and one in particular, described by Catesby under the name of the blue jay, peculiar to North America. The soil was different from that of Kamtschatka, and of the neighbouring islands, and he found several plants which botanists deem peculiar to America. Besides, it has been alleged that they must at least have approached very near that continent; as the natives of the islands on which they touched, presented to them the "calumet" or pipe of peace, which is a symbol of friendship universal among the people of North America, and an usage of arbitrary institution peculiar to them. Soon after the return of Beering's crew from the island, where he was shipwrecked and died, the inhabitants of Kamtschatka ventured over to that island, to which the sea-otters and other sea-animals were accustomed to resort in great numbers. Steller's Journal apud Pallas. Coxe's Russian Discoveries, p. 20. p. 277, &c. Tooke's View of the Russian Empire, vol. i. p. 156. vol. iii. p. 40. p. 499. See ASIA, and the following articles, BEERING'S *basin*, &c.

BEERING'S *Basin*, in *Geography*, a name given in honour of commodore Beering, to that part of the North Pacific Ocean, compre-

comprehending about 1200 leagues incircuit, which is formed by the Archipelago, called the Aleutian or Aleoutikie islands, with the north-west coast of America, and the north-east coast of Asia, and which communicates towards the south with the great Boreal ocean by as many straits as the islands form channels between them, and towards the north, under the 66th parallel, with the Arctic Frozen ocean, by Beering's Straits alone. See ALEUTIAN.

BEERING'S, or BERRING'S *Bay*, a bay on the north-west coast of America, situated between cape Suckling and cape Fair-weather, and so called in honour of commodore Beering, who, in 1741, discovered this bay, and anchored in it. The extreme points of this bay, in Vancouver's chart, are port Manby and port Turner; cape Phipps lies to the south of it, and port Mulgrave, formed by islands, and affording a convenient anchoring place secure from all winds, is situated within the bay. In this part of the bay, Beering is supposed to have anchored. Beering's mount, St. Elias, lies at a small distance to the north of this bay. Mr. Dixon called it Admiralty bay. La Perouse describes it under the denomination of Behring's river. According to captain Cook, the opening of this bay was in N. lat. $59^{\circ} 18'$; and La Perouse makes it $59^{\circ} 20'$. Cook's longitude was $220^{\circ} 19' E.$ or $139^{\circ} 41' W.$ $142^{\circ} 1' W.$ from the meridian of Paris. La Perouse fixes his longitude at $142^{\circ} 2'$, making only a difference of 1' from that of Cook. Vancouver, who reconnoitred this coast more accurately than capt. Cook had an opportunity of doing, as he passed it at some distance from the shore, places it further to the north and west, its opening being about $59^{\circ} 32'$, and E. long. $220 35$.

BEERING'S *Island*, an island in the north Pacific ocean on the north-east of Kamtschatka, which some have considered as one of the groups, called the Aleutian isles, (see ALEUTIAN) and others have separated from it. This island was discovered by Beering in 1741. This adventurous navigator, having been for some time in a state of indisposition and decay, was unable to concern himself about the management of his ship, and his crew were generally attacked by the scurvy, and in a sickly, enfeebled condition. Pursuing their navigation, they were at length driven by the winds and seas on this island, with the position of which, with regard to the two continents, they were unacquainted, and here the ship was cast away. On the 8th of December, Beering died on this island, which has very properly assumed the name of the first navigator who ventured into these seas, and who discovered the west continent of America, in a latitude which, before him, no known voyager had attained. In the following year, the surviving crew contrived, with great trouble, to construct a boat, which conveyed them to Kamtschatka. This island is situated between the north latitude of 55° and 56° , and E. long. $167^{\circ} 20'$, about 50 league from the east of Kamtschatka. It is 165 miles in length, and of various breadths, the greatest breadth being 23 miles; and it consists of a range of bold cliffs and hills, which, separated by several very narrow valleys, rise to the north and south, seem to rise from the sea like a single rock. The highest of these mountains are elevated perpendicularly, not above a thousand fathoms, covered with a yellow clay, and much exposed by winds and weather. The mountains consist of granite, these rocks excepted that stand nearest the sea, which are commonly of sandstone, and form, not unfrequently, steep walls, that are very steep. In these mountains there are many caverns. In the year 1741, three smart shocks of earthquakes were perceived in this island; the sea about it is not covered with ice, and the cold is very temperate moderate; although there are mountains on a volcano flow out of the sea. Neither thunder nor the

aurora borealis has been observed here. The island has springs of excellent water, and beautiful cataracts. Of animals there are only ice foxes, seals, sea-bears, sea-lions, sea-cows, &c. No wood grows upon this island; but several kinds of plants are found upon it. It is uninhabited. The ships which have been accustomed to navigate these seas have frequently wintered on this island, in order to procure a stock of salted provisions from the sea-cows and other amphibious animals, that are found here in great abundance. Tooke's View of the Russian Empire, vol. i. p. 156, &c. Marchand's Voyage, vol. i. Intro. p. 33.

BEERING'S *Straits*, separate Asia from America, being bounded on the American side, by cape Prince of Wales, in N. lat. $65^{\circ} 50'$. E. long. $191^{\circ} 50'$, and on the side of Asia, by the east cape in N. lat. $66^{\circ} 6'$ and E. long. $190^{\circ} 22'$. The breadth of this strait is about 13 leagues, or near 40 miles, its depth is from 12 to 30 fathoms. It was discovered first by Beering, and afterwards by captain Cook. Beering, in his voyage of 1718, is said to have proceeded as far north as $67^{\circ} 18'$, and therefore must have reached a latitude more northerly by about a degree and a quarter than that of the most eastern part of the old continent. He had, therefore, entered the Frozen Ocean, and must have actually passed this strait, probably in the usual fogs of the climate, without discovering land to the east; however, our great navigator, captain Cook, gave the name of the Danish adventurer to these straits, when with his usual accuracy, he afterwards explored them. To the north of these straits the Asiatic shore leads rapidly to the westward; but the American proceeds nearly in a northern direction, till, at the distance of about 4 or 5 degrees, the continents are joined by solid and impenetrable bonds of ice. The sea from the south of these straits to the crescent of isles between Asia and America, is very shallow, and deepens from these straits till foundings are lost in the Pacific ocean, south of these isles. Between them and the straits there is said to be an increase from 12 to 54 fathoms, excepting off cape Thaddeus, where the channel is of greater depth. From this, and other circumstances, it has been thought not improbable that a separation of the continents may have taken place in some unknown period, at these straits, and that the whole space from the isles to that small opening might once have been dry land; and that the fury of the watery element, actuated by that of fire, might have subverted and overwhelmed the tract, and left the islands as volcanic remains of this great eruption. The famous Japanese map places some islands apparently within these straits, denominated "Ya Zue," or the kingdom of the dwarfs. Hence it has been imagined, that America was not unknown to the Japanese, and that they had, as Kiepmper and Charlevoix have suggested, made voyages of discovery; and according to the last writer, that they had actually wintered upon the continent, where probably meeting with the Esquimaux, they might, in comparison with themselves, justly distinguish them by the name of dwarfs. See ASIA.

BEERO, a Moorish kingdom of Africa, lying to the north of Bambara, and north-west of a Foulah state, called Massina. Its capital is Walet, situated, according to Mr. Park's information, about 240 geographical miles to the east of Benowm. In Rennel's map of North Africa, Wallet is in N. lat. $15^{\circ} 45'$, and W. long. $2^{\circ} 45'$. The kingdom of Beero borders on Sahara, or the Great Desert.

BEEROTH, in *Ancient Geography*, a city of the Gadenites, afterwards of the tribe of Benjamin, Josh. ix. 17. According to Eusebius, it was distant 7 miles from Jerusalem, in the way towards Nicopolis.

BEEROTH, of the children of Juakan, was a station of the

Israelites (Deut. x. 6.), placed by Eusebius 10 miles from the city of Petra.

BEER-SHEBA, called also **BERSABE** and **BARSHEBA**, a city given by Joshua to the tribe of Judah, and afterwards transferred to Simeon. Josh. xv. 28. It derived its name from **באר-שבע** *beer-sheba*, the well of an oath, from the well on which Abraham and Isaac ratified their alliance by an oath with Abimelech. It was distant south from Hebron 20 miles, and had a Roman garrison in the time of Eusebius and Jerom. The limits of the Holy Land are often expressed in Scripture by the terms "from Dan to Beer-sheba" (2 Sam. xvii. 11. &c.); Dan being the northern and Beer-sheba the southern extremities of the land. It is now a poor village, adjoining a large, sandy, barren desert, altogether uninhabited, except towards the sea-coast.

BEEES, in *Naval Architecture*, denote pieces of elm-plank bolted to the outer ends of bowsprits.

BEESENSTADT, in *Geography*, a town of Germany, in the circle of Upper Saxony, and county of Mansfield, 6 miles east of Eifzleben.

BEEES-HEAD, *Str.* a cape of England, in the western extremity of the county of Cumberland, in the Irish sea, about 10 leagues E. by N. from the Isle of Man, and 2 S. of Whitehaven. It has a light-house, and is a noted promontory for sea-fowl. N. lat. 54° 31'. W. long. 30° 43'.

BEEESHEN, a town in Germany, in the circle of Westphalia, and county of Lingen.

BEEESKOW, a town of Germany, in the circle of Upper Saxony and Uckermark of Brandenburg, and capital of a lordship, to which it gives name, seated on the Spree; 16 miles S. W. of Frankfort on the Oder, and 34 E. S. E. of Berlin. A cloth manufacture is carried on in this town.

BEEES-WAX. See **WAX**.

BEEESTINGS, or **BREASTINGS**, denote the finest milk taken from a cow after calving.

The beestings are of a thick consistence and yellow colour, seemingly impregnated with sulphur. Dr. Morgan imagines them peculiarly fitted and intended by nature to cleanse the young animal from the recrimens gathered in its stomach and intestines during its long habitation *in utero*. The like quality and virtues he supposes in women's first milk after delivery; and hence infers the necessity of the mother's suckling her own child, rather than committing it to a nurse, whose first milk is gone.

BHEET, in *Botany*. See **BETA**.

BHEET, *her's*, *beta leporina*, a name given by some of the old Latin writers to a small green plant of an acrid taste.

BHEET-gall-infest. See **GALL-infest.**

BEEETLE, in *Entomology*, a common English name for all insects that are furnished with shelly-wing-cases: those which have them divided by a straight suture are properly beetles, and belong to the coleoptera order; but the blattæ, or cock-roaches, are also called beetles, though the suture is oblique, or in other words one wing-case crosses the other; and therefore it belongs to the hemiptera order. See **COLEOPTERA**. The scarabæi are beetles in the strictest sense of the word.

BEEETLES, *water*, is likewise a common name for most insects that have wing-cases that inhabit the water including the dytisci, and some other aquatic insects, that are truly beetles, with such as are not of the same order, such as the nepæ, notonectæ, &c. See **HEMIPTERA**.

BEEETLE, in a *Mechanical Sense*, denotes a large wooden instrument, formed after the manner of the mallet, having each face bound with a strong iron hoop, to keep it from spreading, and used for driving piles, flakes, palisades, wedges, and the like.

In this sense, the word is corruptly written in some places

boyle. Skinner derives it from the English *beating*. For the military use, beetles called also stampers, are thick round pieces of wood, a foot and a half long, and eight or ten inches in diameter, having a handle of about four feet long. Their use is for beating or settling the earth of a parapet, or about palisades; which is done by lifting up the beetle a foot or two, and letting it fall with its own weight. The name beetle is also given to the paviour's rammer, or instrument wherewith the stones are beaten down, and fastened.

BEEEVES, a general name for oxen.

BEFARIA, in *Botany*. See **BEJARIA**.

BEFORT, in *Geography*, a town of France, and principal place of a district, in the department of the Upper Rhine, ceded to France by the house of Austria in the year 1648, at the treaty of Westphalia. It was fortified by Vauban. In this town several forges are employed in the manufacture of iron. The place contains 4,400, and the canton 11,439 inhabitants; the country includes 152½ kilometres and 32 communes. N. lat. 47° 9'. E. long. 6° 46'.

BEFROI, **GRAND BEFROI**, and **PETIT BEFROI**, in *Ornithology*, the names of the two species of **TURDUS**, called *tinnius* and *lineatus* by Gmelin, in Buffon's Hist. Birds.

BEG, or **BEY**, in the *Turkish Government*. See **BEY**.

BEG, *Lough*, in *Geography*, or the Little Lough, in the province of Ulster, Ireland, a small lake into which the waters from Lough Neagh again expand, after a course of about a mile, through a very narrow channel. The form of Lough-beg, its islands, some wooded points of land with intervening lawns and rocks, a magnificent rotunda at Ballyscullen, and the beautiful lightness of Toome-bridge, produce the most happy effect. It is situated between the counties of Armagh and Londonderry.

BEGA, or **BEGEYN**, **CORNELIUS**, in *Biography*, a painter and engraver, was born at Haerlem in 1620, and became the disciple of Adrian Ostade, whose manner he imitated, and by whose instructions he profited, so as to acquire considerable reputation as a painter. But contracting habits of dissipation and licentiousness, he was disowned by his father, and resenting the indignity, he assumed the name of Bega instead of Begeyn, which was that of his family. He had a fine pencil, and a delicate mode of handling his colours, so as to give them a neat and transparent appearance; and his performances are so much esteemed in the Low Countries, as to be placed among the works of the best artists. He also etched several drolleries, and a set of 34 prints, representing ale-house scenes, &c. His death, which happened in 1664, was occasioned by the plague, which he caught from a favourite female, to whom he was so strongly attached that he visited her, against the remonstrances of his friends and physicians, to the last moments of her life; and he outlived her only a few days. Pilkington and Strutt.

BEGA, or *Vega*, in *Geography*, a river in Germany, which runs into the Werra, 4 miles N. W. of Lemgo, in the circle of Westphalia.

BEGANNA, in *Ancient Geography*, a town of Arabia Deserta, in the neighbourhood of Mesopotamia. Ptolemy.

BEGARD, in *Geography*, a town of France, in the department of the Northern coasts, and chief place of a canton in the district of Guingamp; the place contains 2394 and the canton 7864 inhabitants: the territory includes 102½ kilometres, and 7 communes.

BEGARMEE, or **BACHERMI**, supposed to be the "Begama" of Edrifi, and the "Gorham" of D'Anville, an extensive kingdom of Africa, situate S. E. of Bornou, at the distance of about 20 days' travelling, or allowing, with major Rennell, 15 miles for a day's journey, 300 miles, and separated from it by several small deserts. The extent, according to Browne's Travels in Africa, p. 468, is from

from E. to W. 12 days, and from N. to S. 15 days, allowing $12\frac{1}{2}$ geographical miles per day. The inhabitants are rigid Mahometans, and though perfectly black in their complexions are not of the Negro cast. Beyond this kingdom to the east, (see Proceedings of the Association for promoting the discovery of the Interior Parts of Africa, p. 155.) are several tribes of Negroes, idolaters in their religion, savage in their manners, and accustomed, it is said, to feed on human flesh. They are called the Kardee, the Serrowah, the Showah, the Battah, and the Mulgui. These nations, the Bergameese, who fight on horseback, and are great warriors, annually invade; and when they have taken as many prisoners as opportunity affords, or their purpose may require, they drive the captives like cattle to Bergamee. It is said, that if any of them, weakened by age, or exhausted by fatigue, happen to linger in their pace, one of the horsemen seizes on the oldest, and cutting off his arm, uses it as a club to drive on the rest. From Bergamee they are sent to Borrou, where they are sold at a low price; and from thence many of them are conveyed to Fezzai, where they generally embrace the Mussulman faith, and are afterwards exported by the way of Tripoli to different parts of the Levant. Bergamee, the capital of the kingdom, lies in N. lat. 15. E. long. $26^{\circ} 30'$; according to Rennell's Map; but according to Browne, N. lat. $16^{\circ} 40'$. E. long. $22^{\circ} 25'$.

BEGARRA, a town of Spain in New Castile, 4 leagues from Alcaez.

BEGEMDER, a province of Abyssinia, north-east of Tigre, bordering upon Angot, and separated from Amhara, which runs parallel to it on the south, by the river Bahilo. Both these provinces are bounded by the river Nile on the west. The greatest length of Begemder is about 180 miles, and its breadth 60; and it comprehends "Lalta," a mountainous province, sometimes depending upon Begemder, and often in rebellion. The inhabitants are esteemed the best soldiers in Abyssinia, being men of great strength and stature, but cruel and uncivilized; so that they are called, in common conversation and writing, the peasants or barbarians of Lalta. They pay to the king 1000 ounces of gold.

Several small provinces are now dismembered from Begemder, such as Foggora, a small stripe of land reaching south and north about 35 miles between Emfras and Dara, and about 12 miles broad from east to west, from the mountains of Begemder to the lake Tzana. On the north end of this are two small governments, Dreedra and Karoota, the only territory in Abyssinia that produces wine; the merchants trade to Caffa and Narea, in the country of the Galla.

Begemder is the strength of Abyssinia in horsemen. It is said that, with Lalta, it can bring out 45,000 men; but this account Bruce thinks to be much exaggerated. It is well stocked with cattle of every kind, that are very beautiful. The mountains are full of iron mine; they are not so steep and rocky as in other provinces, if we except Lalta, and abound in all sorts of wild fowl and game. The south end of the province near Nefas Musa is cut into prodigious gulches, apparently by floods, of which no history remains. It is the great barrier against the encroachments of the Galla, who have made many attempts to obtain a settlement here, but without success; and they have lost whole tribes in these ineffectual efforts. Begemder is a province of such consequence to the state, reaching so near the metropolis, and regularly supplying it with all sorts of provisions, that none but noblemen of rank, family, and character, able to maintain a large number of troops always on foot, and in good order, are trusted with its government. It lies in about N. lat. $11^{\circ} 45'$, and from $37^{\circ} 30'$ to $38^{\circ} 30'$ E. long.

BEGER, LAURENCE, in Biography, a German antiquarian, was the son of a tanner at Heidelberg, and born in 1653. At the request of his father he first studied theo-

logy, and afterwards gratified his own inclination by the study of the law. Devoting himself to classical literature and antiquities, he acquired such reputation that, in 1677, he was appointed librarian and keeper of the cabinet of antiquities by Charles Lewis, elector Palatine; and he retained the same office under Frederick William, elector of Brandenburg, to whom the cabinet was transferred in 1685. He was a member of the Society of Berlin from its institution, and died there in 1705. He was the author of various learned works. His "Considerations on Marriage, by Daphneus Arcuarius," was written in German, as a defence of polygamy, to gratify the elector Palatine, who wished to marry another lady, to whom he was attached, whilst his wife was living. He afterwards gratified the son by composing a refutation of this work, which was never printed. The principal of his other works, which relate to history and antiquities, are "Thesaurus ex Thesauris Palatino Selectus," 1685, fol.; "Thesaurus Reg. elect. Brandenburgicus Selectus," 3 vols. fol.; "Regum et Imperator. Roman. Numismata," 1700, fol.; "De Nummis Cretensium serpenteferis," 1702, fol.; "Lucerne Veterum sepulchrales," 1702; "Numismata Pontif. Roman. aliorumque rariora," 1703, fol.; "Melagrades et Ætolia," 1696, 4to.; "Crææ insula Laconica," 1696, 4to.; "Bellum et Excidium, Trojannum illust." 1699, 4to.; Moreri.

Laurentius Beger, the nephew of this famous antiquarian, was an engraver of some eminence at Berlin about the year 1700.

BEGER, in Geography, a town of Spain, in the country of Seville, 14 leagues from Medina Sidonia.

BEGGA, in Entomology, a species of *Phalena*, (Bombyx) with white wings, having a black rib. This kind inhabits Surinam. The body is white; antennæ and legs yellow, black at the tips. Fabricius, Gmelin, &c.

BEGGAR. Beggars pretending to be blind, lame, &c. found begging in the streets, are to be removed by the constables; and refusing to be removed, shall be whipped, &c. stat. 12 Anne; and our statutes have been formerly so strict for punishing of beggars, that in the reign of king Henry VIII. a law was enacted, that sturdy beggars convicted of a second offence should be executed as felons. But this statute was afterwards repealed. See ROGUE and VAGABOND.

BEGGING ORDER. See MENDICANT.

BEGHARDI, BEGUARDI, or BEGGHARDI, in Ecclesiastical History, called also in Italy *bizochi*, and in France *beguins*, derive their name from the old German word *beggen*, *beggeren*, which signifies "to seek any thing with zeal and importunity." Accordingly persons of this description were called *Beghardi*, whence probably the English word *beggar* is derived; and *Begutte* denoted female beggars. This was a general appellation, and given to no less than thirty sects or orders, that sprung up in the thirteenth century, which differed widely from each other in their opinions, their discipline, and manner of living. It was at first indiscriminately applied to all persons who embraced, with resignation and free choice, the horrors of absolute poverty; begging their daily bread from door to door, and renouncing all their worldly possessions and occupations. It was afterwards restricted to those who distinguished themselves by an extraordinary appearance of devotion, and was used much in the same sense with the term *Methodist* among us. These persons formed a sort of intermediate order between the monks and citizens, resembling the former in their manner of living, without assuming their name, or contracting their obligations. They were divided into two classes, which derived their different denominations of *perfect* and *imperfect* from the different degrees of austerity that they discovered in their manner of living. The *perfect* lived upon alms, abstained from wedlock, and had no fixed habitations. The *imperfect* conformed to the customs of the rest of their fellow-citizens.

in these respects. The name was at first honourable, but by degrees it sunk into reproach, being adopted by many, who, under the mask of religion, concealed the most abominable principles, and committed the most enormous crimes.

The Beghards of Germany, deprived of the protection of the emperor Lewis, suffered extreme misery under Charles IV. who was advanced, by the interest of the pope, to the imperial throne in 1345. Desirous of gratifying the desires of the court of Rome, he supported by his edicts and by his arms the papal inquisitors, and allowed them to apprehend and put to death all those that were deemed enemies; and among others the Beghards were victims to their persecuting power. The emperor himself, who resided at Lucca in Italy, not only approved these violent measures, but issued out in 1369 severe edicts, commanding all the German princes to extirpate out of their dominions the Beghards and Beguines, or, as he himself interpreted the name, "the voluntary beggars," as enemies of the church and of the Roman empire, and to assist the inquisitors in their proceedings against them. By another edict, published not long after, he gave the houses of the Beghards to the tribunal of the inquisition, ordering them to be converted into prisons for heretics; and at the same time ordered all the effects of the Beguines to be publicly sold, and the profits arising from them to be equally divided between the inquisitors, the magistrates, and the poor of those towns and cities where such sale should be made. The Beghards, being reduced to great straits by this and other mandates of the emperor, and by the constitutions of the popes, sought a refuge in those provinces of Switzerland that border upon the Rhine, and also in Holland, Brabant, and Pomerania. But the edicts and mandates of the emperor, together with the papal bulls and inquisitors, followed them wherever they went, and distressed them in their most distant retreats, so that, during the reign of Charles IV., the greatest part of Germany (Switzerland, and those provinces that are contiguous to it, excepted) was thoroughly purged of the Beghards, or rebellious Franciscans, both perfect and imperfect.

The Beghards of Flanders are a denomination by which certain unmarried persons, both bachelors and widowers, are distinguished, who formed themselves into communities of the same kind with those of the female *Beguines*, reserving to themselves the liberty of returning to their former method of life. The first society of those Beghards was established at Antwerp in the year 1228, and continues still; though the brethren of which it is composed have long since departed from their primitive rule of discipline and manners. This first establishment was succeeded by many others in Germany, France, Holland, and Flanders. These fraternities long enjoyed the toleration of the Roman pontiffs; but most of the convents are now either demolished or converted to other uses. See *BRETHREN of the Free Spirit*, *FRATRICELLI*, and *TERTIARIES*. Mosheim's *Eccl. Hist.* vol. iii. p. 86. 8vo. 1758.

BEGIA, in *Geography*. See BAYJAH.

BEGIS, in *Ancient Geography*, a town of Illyria, which belonged to the Trallians. Steph. Byz.

BEGKAWE, in *Geography*, a town of Bohemia, in the circle of Breslaw; 3 miles west of Melnik.

BEGLAISEH, a town of Asiatic Turkey, in the province of Caramania, 8 miles north of Kirshehr.

BEGLERBEG, a Turkish title for the chief governor of a province, who has under him several *bey*s or *sangiacs*, thatis, subgovernors. The word is also written "beylerbey," "beglerbey," "beghelerbeghi," and "beylerbeg." It is compounded of "begler," lords; the plural of "beg," lord, with the word "beg," subjoined; importing as much as *lord of lords*.

The next to the visier *azem*, or the first visier, are the

beglerbeks in Turkey, who, according to Rycaut, may be compared to archdukes in some other countries, being the next ministers below the prime vizier, and having under their jurisdiction many sangiacs, or provinces, and their begs, agas, &c. To every beglerbeg the grand signior gives three ensigus or staves, trimmed with a horse-tail, to distinguish them from the bashaws, who have but two, and from simple begs, or sangiac-begs, who have but one. See BASHAW.

The province or government of a beglerbeg is called "beglerbeglik," or "beglierbeglik." These are of two sorts; the first is called "basile beglerbeglik," which has a certain rent assigned out of the cities, countries, and seignories allotted to the principality; the second called "salianæ beglerbeglik," for maintenance of which is annexed a certain salary or rent, collected by the grand signior's officers with the treasure of the empire. The beglerbeks of the first sort are in number twenty-two, viz. those of Anatolia, Caramania, Diarbekir, Damascus, Aleppo, Tripoli, Trebizond, Buda, Temeswar, &c. The beglerbeks of the second sort are in number six, viz. those of Cairo, Babylon, &c. Five of the beglerbeks have the titles of visiers, viz. those of Anatolia, Babylon, Cairo, Romania, and Buda. The beglerbeks appear with great state, and a large retinue, especially in the camp, being obliged to bring a soldier for every five thousand aspers rent which they enjoy.

The beglerbeks of Romania brought ten thousand effective men into the field.

BEGLERBEG is also a title given to the chief governors of provinces in the Persian empire, having the command over all khans, sultans, &c. in their respective districts.

BEGON, MICHAEL, in *Biography*, was born of a good family at Blois, in 1638. After having occupied some law offices in his native province, he was introduced by his kinsman, the marquis de Seignelai, into the marine department, and became successively intendant of Havre, of the French colonies in America, and of the gallies. In 1688, he removed to Rochefort, and possessed the intendance of that post till his death, which happened in 1710. His leisure hours were assiduously devoted to the cultivation of literature, and he was owner of a valuable library, which was free of public access. In most of his books was written "Michaelis Begon et amicorum," i. e. the property of Begon and his friends; and when he was once cautioned by his librarian against lending his books for fear of losing them, he replied, "I would rather lose them, than seem to distrust any honest man." His cabinet was richly stored with medals, antiques, prints, and various curiosities, collected from all parts of the world. Having procured engravings of several eminent Frenchmen of the seventeenth century, he collected memoirs of their lives, which furnished materials for Perrault's "Hommes Illustres." Of his botanical researches in the American colonies father Plumier availed himself in his publication. *Nouv. Dict. Hist.*

BEGONIA, so named by Plumier after Monf. Begon. in *Botany*. Lin. gen. n. 1156. Schreb. 1442. Dryander in Linn. *Transf.* t. 158. Gartn. *fruct.* t. 31. Juss. gen. 436. Class and order, *monoecia polyandria*. Nat. Ord. *holoracæ*. *Incertæ*, Juss. Gen. Char. * Male flowers. *Cal.* none. *Cor.* petals four (in *B. oïtopetala* six to nine), of which two opposite ones are larger, commonly roundish (in *B. ferruginea* all nearly equal, oblong.) *Stam.* filaments numerous (15 to 100), inserted into the receptacle, very short, sometimes united at the base; anthers oblong, erect. * Female flowers. *Cal.* none. *Cor.* petals in most species five, in some six, in others perhaps four, commonly unequal. *Pist.* germ inferior, three-sided, in very many winged; styles in most three, bifid; stigmas six. *Per.* capsule in most three-cornered, winged, three-celled, opening at the base of the wings; some are two-celled, and others perhaps one-celled. *Essent.*

B E G O N I A.

Difent. Char. Males. Cal. none. Cor. many-petaled. Stam. numerous. Female. Cal. none. Cor. many-petaled, superior. Caps. winged, many-seeded.

Species, 1. *B. nitida*. Dryander. in Lin. Transf. 1. 159. Ait. Hort. Kew. 3. 52. *B. obliqua*. L'Herit. Stirp. Nov. 1. 95. t. 46. *B. minor*, Jacq. Collect. 1. 128. n. 3. *B. purpurea*, Swartz. prodr. 86. "Shrubby, erect; leaves very smooth, unequally cordate, obscurely toothed; largest wing of the capsule roundish." This elegant shrub, which is now a common ornament to our hot-houses, was introduced here in 1777 by William Brown, M. D. A native of Jamaica; flowering here from May to December. 2. *B. isoptera*. Dryand. ubi supra. Smith. ic. ined. 2. t. 43. "Cauliscent; leaves smooth, semicordate, obscurely toothed; wings of the capsule almost equal, parallel." A native of Java, where it was observed by Thouin. 3. *B. reniformis*. Dryand. "Cauliscent; leaves kidney-shaped, angular, toothed; the largest wing of the capsule acute-angled, the others parallel, very small." A native of Brasil, near Rio de Janeiro, in shady clefts of rocks; observed there by Sir Joseph Banks. 4. *B. erminia*. Dryander. L'Herit. Stirp. Nov. 1. 97. t. 47. "Cauliscent; leaves cordate, acuminate, serrate, the largest wing of the capsule sickle-shaped, the rest obliterated." A native of Madagascar, on stones and rocks by brooks, collected there by J. G. Brugniere, M. D. who considers the appendices to the leaves, resembling the galls on lime-tree leaves, or the tails in ermine, as belonging to the leaves themselves, and not occasioned by punctures of insects. 5. *B. crenata*. Dryander. "Cauliscent; leaves unequally cordate, roundish, obtuse, crenate-toothed; capsules two-celled. A native of the East Indies, in the island Salfette, and near fort Victory, on walls and rocks. Found there by Ant. Pantaleon Hove. 6. *B. tenuifolia*. Dryander. "Cauliscent; leaves unequally cordate, ovate, acute-angular, obscurely toothed; capsules two-celled." A native of Pulo Pontangh, or Prince's Island, near Java. Found there by Sir Joseph Banks. 7. *B. ferruginea*. Dryander. Smith. Linn. Supp. 419. Lamarck Encycl. 1. 395. n. 9. Jacq. Coll. 1. 128. n. 1. "Cauliscent; leaves unequally cordate, toothed; petals of the male flower oblong, nearly equal." Distinguished from the other species hitherto known by the long and narrow petals of the male flower, all of the same breadth, and very little differing in length. Gathered in New Canada by Mutis. 8. *B. granata*. Dryander. *B. obliqua*. Thunb. Jap. 231. Kämpf. ic. select. t. 20. Sjukaido. Kämpf. Amœn. 888. "Cauliscent; leaves unequally cordate, angular, serrate; wings of the capsule a little unequal." This and the next species have by far the largest leaves of any in the genus; but in this the flowers are twice as large as in *macrophylla*. A native of Japan. 9. *B. macrophylla*. Dryander. Lamarck Encycl. 1. 394. n. 6. *B. grandifolia*. Jacq. Collect. 1. 128. n. 2. *B. purpurea et nivea maxima, folio auro*. Plum. ic. 34. t. 45. f. 1. "Two feet high, entirely smooth; female flowers five-petaled." A native of the islands in the West Indies. 10. *B. acutifolia*. Dryander. Jacq. Collect. 1. 128. n. 4. Sloan. Jam. t. 127. f. 1, 2. "Cauliscent; leaves semicordate, angular, toothed; the largest wing of the capsule obtuse-angled, the others acute-angled." A native of Jamaica, observed there by Sir H. Sloane, and since by Masson. 11. *B. acuminata*. Dryander. "Cauliscent; leaves hispid, semicordate, acuminate, unequally toothed; the largest wing of the capsule obtuse-angled; the others acute-angled." A native of Jamaica, on the Blue Mountains; introduced into Kew garden in 1790. 12. *B. lumilis*. Dryander. Ait. Hort. Kew. "Cauliscent, upright; leaves hispid, semicordate, doubly serrate; wings of the capsule rounded, a little unequal." A native of the island of

Trinidad in the East Indies; found there by Alex. Anderson. Supposed, on its first introduction to Mr. Lee's garden at Hammer-smith, in 1788, to be annual; it was then very low, and was called *lumilis*; but it has since stood over the winter, and grown much taller. 13. *B. hirsuta*. Dryander. Aubl. Guian. 913. t. 348. Lamarck. Encycl. 1. 393. n. 3. Jacq. Collect. 1. 129. n. 8. "Cauliscent; leaves hispid, semicordate, doubly serrate; the largest wing of the capsule obtuse-angled, the others parallel and very small." Observed by M. F. Aublet, on the rocks of Guiana. 14. *B. urtica*. Dryander. Linn. Supp. 420. Lamarck Encycl. 1. 394. n. 8. Jacq. Collect. 1. 129. n. 7. *B. urticaefolia*. Smith. ic. ined. 2. t. 45. "Cauliscent, radicans; leaves hispid on both sides, unequally ovate, doubly serrate; capsules three-horned at the base." Gathered by Mutis in New Granada. 15. *B. scandens*. Dryander. Swartz. Prodr. 86. *B. glabra*. Aubl. Guian. 916. Lamarck. Encycl. 1. 394. n. 4. Jacq. Collect. 1. 129. n. 5. "Scandent; radicans; leaves ovate-roundish, obscurely toothed; the largest wing of the capsule obtuse-angled, the others parallel and very small." Perennial: a native of Guiana, the isle of France, and Jamaica. 16. *B. tuberosa*. Dryander. Lamarck Encycl. Empetrum acetosum. Rumph. Amb. 5. 457. t. 169. f. 2. "Creeping; leaves unequally cordate, angular, toothed; wings of the capsule parallel." A native of Amboina, the Molucca islands, and Celebes. 17. *B. rotundifolia*. Dryander. Lamarck. *B. obliqua* Linn. Spec. 1498. *B. roseo flore, folio orbiculari*. Tournes. Inst. 660. Plum. Cat. Amer. 20. ic. 33. t. 45. "Creeping; leaves reniform, roundish, crenate." A native of South America, on rocks and trees; found there by Plumier. 18. *B. nana*. Dryander. L'Herit. Stirp. Nov. 1. 99. t. 48. "Stemless; leaves lanceolate; scape with about two flowers." A native of Madagascar, on rocks and trunks of trees; found by Brugniere. 19. *B. tenera*. Dryander. *Falkea tenera*. Koenig. "Stemless; leaves unequally cordate; flowers umbelled." A native of Ceylon, found there by Koenig. 20. *B. diptera*. Dryander. *B. capensis*. Linn. Supp. 420. Jacq. Coll. 1. 130. n. 9. Linn. Mant. 502. "Stemless; leaves unequally cordate; peduncles dichotomous; one wing of the capsule very large, another narrow, and the third obscure." A native of the island of Joanna, in shady places, by the sides of mountains; found there by Koenig. 21. *B. oöpetala*. Dryander. L'Herit. Stirp. Nov. 1. 101. "Stemless; leaves cordate, five-lobed; peduncles dichotomous." Found on the mountains of Lima by Dombey, who sent the seeds to the Paris garden, where it has grown some years, but not flowered. 22. *B. malabarica*. Dryander. Lamarck. Jacq. Collect. Rheed. Malab. 9. 167. t. 86. "Stems herbaceous; peduncles axillary, short, subtriflorous; fruits berried." A native of Malabar. 23. *B. repens*. Dryander. Lamarck. *B. obliqua* 7. Linn. Spec. 1498. Plum. Amer. 20. ic. 34. t. 45. f. 2. "Stems creeping, rooting at the joints; leaves one-cared; peduncles axillary, long, many-flowered." A native of St. Domingo. Mr. Dryander denominates the two last obscure species; and has added also some others.

The whole plant in the Begonias is fleshy; the stem in most of the species is herbaceous, but some are stemless. The leaves are petioled, in the caulescent species alternate. At the base of the petioles is a pair of stipules. The peduncles in the greater part are dichotomous; and in the caulescent species axillary. They are natives of Asia and America within the tropics. Three species have been found on the islands near the coast of Africa, but one on that continent. To Mr. Dryander botanists are principally indebted for their knowledge of this genus. Linn. Transf. vol. i. p. 159.

Propagation and Culture. These plants increase readily by cuttings; and if kept in the bark-love prove highly ornamental,

mental, being much esteemed, both for the beauty of the flowers, and the singularity of the leaves. Where a bark-stove is wanting, they will do very well over the flue of the dry stove. *Martyn's Miller's Dict.*

BEGRAS, in *Geography*, a town of Asiatic Turkey, in Syria, at the foot of the Black Mountain, between Alexandria and Antioch.

BEGUE, **ACHILLES WILLIAM**, in *Biography*, born in the district of Orleans, was admitted doctor in medicine by the university of Paris the 30th of September 1760. He is known principally by his translations into French of Dr. Whytt's Treatise on Nervous Affections; Dr. Monroe's Observations on the Diseases of the Army; Baron Stork's Essays on the virtues of hemlock, the thorn-apple, henbane, and other poisonous vegetables; and Baron Van Swieten's account of the use of the corrosive sublimate in curing the venereal disease. His original compositions are "Le Conservateur de la Santé," et "Etrennes salutaires," both published in 12mo. in 1763; the idea of which seems to have been borrowed from Tissot's "Avis au Peuple sur sa Santé," of which he published an edition at Paris, 1762, in 2 vols. 12mo. *Eloy. Dict. Hist.*

BEGUINS, in *Ecclesiastical History*, were, as well as the Beghards, a kind of half-monks, called Tertiaries, who attached themselves to the genuine followers of St. Francis. In Italy they were denominated "Bizoeli," and "Boeasoti;" in France, "Beguins;" and in Germany, "Beghards," or "Beguards," which last was the denomination by which they were commonly known in almost all places. If we except their fordid habit, and certain observances and maxims which they followed in consequence of the injunctions of the famous saint now mentioned, they lived after the manner of other men, and were therefore considered in no other light than as seculars and laymen. See **BEGHARDS**, and **TERTIARIES**.

We must not confound, says Mosheim, these Beguins and Beguines, who derived their origin from an austere branch of the Franciscan order, with the German and Belgic Beguines, who crept out of their obscurity in the 13th century, and multiplied prodigiously in a very short space of time. Their origin was of an earlier date than this century; but they now acquired a name, and made a noise in the world. It appears from authentic and unexceptionable records, that, so early as the 11th and 12th centuries, there had been several societies of Beguines established in Holland and Flanders. However, the only convent of Beguines that existed before the 13th century, was that of Vilvorden, in Brabant, where they were settled, as appears by public acts, in the years 1065, 1129, and 1151. Their primitive establishment was undoubtedly the result of virtuous dispositions and upright intentions. A certain number of pious women, both virgins and widows, in order to maintain their integrity, and preserve their principles from the contagion of a vicious and corrupt age, formed themselves into societies, each of which had a fixed place of residence, and was under the inspection and government of a female head. Here they divided their time between exercises of devotion, and works of honest industry, reserving to themselves the liberty of entering into the state of matrimony, as also of quitting the convent, whenever they thought proper. And as all those among the female sex, who make extraordinary professions of piety and devotion, were distinguished by the title of Beguines, i. e. persons who were uncommonly "assiduous in prayer," as the name imports (see **BEGHARDS**); that title was given to the women now mentioned. All the Beghards and Beguines that yet remain in Flanders and Holland, where their convents have almost entirely changed their primitive form, affirm unanimously, that both their name and institution derive their origin from St. Beghe, duchess of Brabant,

and daughter of Pepin, mayor of the palace to the king of Austrasia, who lived in the seventh century. This lady, therefore, they consider as their patroness, and honour her as a kind of tutelary divinity with the deepest sentiments of veneration and respect. Those, on the other hand, who are no well wishers to the cause of the Beguines, deduce their origin from Lambert de Begue, a priest and native of Liege, who lived in the twelfth century, and was much esteemed on account of his eminent piety.

The first society of this kind, of which record remains, was formed at Nivelles in Brabant, in the year 1226; or, according to other historians, in 1207; and was followed by so many institutions of a like nature in France, Germany, Holland, and Flanders, that, towards the middle of the thirteenth century, there was scarcely a city of any note that had not its "beguinage," or vineyard, as it was sometimes called in conformity to the style of the "Song of Songs." All these female societies were not governed by the same laws; but in the greatest part of them, the hours that were not devoted to prayer, meditation, or other religious exercises, were employed in weaving, embroidering, and other manual labours of various kinds. The poor, sick, and disabled Beguines were supported by the pious liberality of such opulent persons as were friends to the order. In the 14th century these societies were more numerous in various parts of Germany; but, adopting some of the extravagant opinions of the "Mystic Brethren and Sisters of the Free Spirit," they shared with them in the persecution which they suffered. The "Clementina," or constitution of the council of Vienne, A. D. 1311, against the Beguines, gave rise to a persecution of these persons, which lasted till the reformation by Luther, and ruined the cause of the Beguines and Beghards in many places. From this Clementina, many took occasion to molest the Beguines in their houses, to seize and destroy their goods, to offer them many other insults, and to involve also the Beghards in the like persecution. In the year 1324, however, they obtained some relief by a special constitution of the Roman pontiff, John XXII. in which he explained the Clementina, and ordered that the goods, chattels, habitations, and societies of the innocent Beguines should be preserved from every kind of violence and insult; and this example of clemency and moderation was afterwards followed by other popes. The Beguines, on the other hand, in hopes of disappointing the malice of their enemies, and avoiding their snares, embraced, in many places, the third rule of St. Francis, and of the Augustines. But this measure was unavailing; for from this time they were oppressed in several provinces by the magistrates, the clergy, and the monks, who cast a greedy eye on their treasures, and were extremely eager to divide the spoil. *Mosheim's Eccl. Hist. vol. iii. p. 232, 377, &c.*

Communities of Beguines, or Beguinages, still subsist in Holland, Flanders, and Germany. In Brussels, there is a singular part of it, which is in fact a little town, inclosed by a wall and ditch, and divided into streets. It is called the Beguinage. The number of Beguines is near a thousand, governed by matrons, and under the spiritual direction of the bishop of Antwerp. There are also Beguinages at Amsterdam, Antwerp, and Malines.

BEGZAM, in *Geography*, a town of Africa, in the country of Agadez, south of Agad or Agades, the capital of the country, and at a greater distance south of Afonda, and west of the desert of Iazr. N. lat. 19° 28'. E. long. 12° 50'.

BEHAIRAT-EL-MARDJ, or *Lake of the Meadow*, a morass of Syria, about 3 leagues from Damascus to the south-east, into which flow the rivulets that fertilize the gardens in the neighbourhood of the city. See **DAMASCUS**.

BEHAM, **HANS**, or **JOAN SEBALD**, in *Biography*, an eminent

eminent engraver, flourished about the year 1540. Like Henry Aldegrever and Albert Durer, whose works were the sources from which he derived his greatest improvement, he engraved in wood, and also on copper, and etched some few plates. He was also a painter of reputation, and celebrated by the poets of that age under the name of Bohemus. He was a man of good genius, and distinguished by fertility of invention. But the Gothic taste which prevailed in Germany in his time, is too apparent in all his works. His brother Bartolomeo Beham flourished as an engraver about the same time. He is said to have studied under Marc Antonio Raimondi, whose manner he imitated. His chief residence was at Rome, where he died. Strutt.

BEHAMBERG, in *Geography*, a town of Germany, in the archduchy of Austria, 3 miles east of Steyr.

BEHAMKIRCHER, a town of Germany, in the archduchy of Austria, 6 miles south-east of St. Polten.

BEHAVIOUR, Good, in *Law*. See *Good Alearing*.

BEHBEHAN, a town of Persia, in the province of Fars.

BEHDUROO, a country of Hindoostan, in the northern parts of Lahore, near the Imaus mountains, where one branch of the river Rauvee springs.

BEHEADING, a capital punishment, wherein the head is severed from the body by the stroke of an ax, sword, or other cutting instrument.

Behading was a military punishment among the Romans, known by the name of *decollatio*. Among them the head was laid on a *cipus*, or block, placed in a pit dug for the purpose; in the army, without the *vallum*; in the city, without the walls, at a place near the *porta decumana*. Preparatory to the stroke, the criminal was tied to a stake, and whipped with rods. In the early ages the blow was given with an ax; but in after-times with a sword, which was thought the more reputable manner of dying. The execution was but clumsily performed in the first times; but afterwards they grew more expert, and took the head off clean with one circular stroke.

In England and France, beheading is the punishment of nobles; being reputed not to derogate from nobility, as hanging does.

Beheading is part of the punishment of high-treason, affecting the king's person or government. The king may, and often does, discharge all the punishment, except beheading, especially when any of noble blood are attained. For, beheading being part of the judgment, that may be executed, though all the rest be omitted by the king's command.

In Scotland they do not behead with an ax, as in England; nor with a sword, as in Holland and formerly in France, where they now use the guillotine; but with an edged instrument called the maiden.

BEHEM, BEHEIM, BEHEN, BOHEM, MARTIN, in *Biography*, supposed to be the same with Martin Behemra, to whom Garcilasso de la Vega ascribes the first discovery of America, was a famous geographer and navigator of the 15th century. The christian name, says M. Otto, (*ubi infra*) is the same with that of Garcilasso, and the syllable, "ira" he conceives, were added to his name in consequence of his receiving the honour of knighthood from John II., king of Portugal. Behem was born of a noble family, of which some branches still remain at Nuremberg, an imperial city in the circle of Franconia. Addicted from his infancy to the study of geography, astronomy, and navigation, and having enjoyed the advantage of Regiomontanus's instruction, he entertained the thought, at more mature age, of the possibility of the existence of the antipodes, and of a western continent. Under the influence of this imagination, he paid a visit, in 1459, to Isabella, daughter of John I., king of Portugal, and regent

of the duchy of Burgundy and Flanders; and having informed her of his designs, he procured a vessel, in which he discovered the island of Fayal in 1460. Here he established a colony of Flemings, whose descendants are said still to exist in the Azores, which for some time were called the "Flemish islands." For the proof of this fact M. Otto refers to the records of Nuremberg, and to the testimony of Wagenfeil, one of the most learned men of the last century, in his "Universal History and Geography." Having obtained a grant of Fayal from the regent Isabella, and after having resided there 20 years, Behem applied, in 1484, eight years before the expedition of Columbus, to John II. king of Portugal, for the means of undertaking a great expedition towards the south-west. In the prosecution of this undertaking he discovered that part of America, which is now called Brazil, and sailed to the straits of Magellan, or to the country of some savage tribes, whom he called Patagonians, because the extremities of their bodies were covered with a skin more like a bear's paws than human hands and feet. One of the records, preserved in the archives of Nuremberg, and containing this fact, asserts, that "Martin Behem, traversing the Atlantic ocean for several years, examined the American islands, and discovered the strait, which bears the name of Magellan, before either Christopher Columbus or Magellan sailed those seas; and even mathematically delineated, on a geographical chart, for the king of Lusitania, the situation of the coast, around every part of that famous and renowned strait." This assertion is supported by Behem's own letters, written in German, and preserved in the same archives; which letters are dated in 1486. The discovery of Behem is also noticed by contemporary writers. In the chronicle of Hartman Schedl, or Herman Schedel, entitled "Chronicon Mundi," and of which a German translation was published at Nuremberg in 1493, we have the following passage to this purpose: "In the year 1485, John II., king of Portugal, a man of a magnanimous spirit, furnished some galleys with provisions, and sent them to the southward beyond the straits of Gibraltar. He gave the command of his Squadron to James Canus, a Portuguese, and Martin Behem, a German of Nuremberg in Upper Germany, descended of the family of Bonna, a man very well acquainted with the situation of the globe, blessed with a constitution able to bear the fatigues of the sea, and who, by actual experiments and long sailing, had made himself perfectly master with regard to the longitudes and latitudes of Ptolemy, in the west. These two, by the bounty of Heaven, coasting along the southern ocean, and having crossed the equator, got into the other hemisphere, where, facing to the eastward, their shadows projected to the south and right hand. Thus, by their industry, they may be said to have opened to us another world hitherto unknown, and for many years attempted by none but the Genoese, and by them in vain. Having finished this cruise in the space of 26 months, they returned to Portugal, with the loss of many of their seamen, by the violence of the climate." This passage was cited by the publishers of the works of Æneas Sylvius, afterwards pope Pius II. Two years before the expedition of Columbus, Petrus Matæus, a writer on the canon law, remarks, that "the first Christian voyages to the newly discovered islands became frequent, under the reign of Henry, son of John king of Lusitania. After his death, Alphonsus V. prosecuted the design; and John, who succeeded him, followed the plan of Alphonsus, by the assistance of Martin Behem, a very experienced navigator; so that, in a short time, the name of Lusitania became famous over the whole world." Cellarius also says expressly, "Behem did not think it enough to survey the island of Fayal, which he first discovered, or the other adjacent islands which

which the Lusitanians call Azores, and we, after the example of Behem's companions, call Flemish islands, but advanced still farther and farther south, until he arrived at the remotest strait, beyond which Ferdinand Magellan, following his tract, afterwards sailed, and called it after his own name." Magellan, it is said, saw a chart of the coast of America, drawn by Behem, and preserved in the archives of Nuremberg, and hence conceived the project of following the steps of this great navigator. Riccioli, in his *Geo. Reform.* l. iii. p. 90, says, "Christopher Columbus never thought of an expedition to the West Indies, until some time before, while in the island of Madeira, where, amusing himself in forming and delineating geographical charts, he obtained information from Martin Bœhm, or, as the Spaniards say, from Alphonfus Sanchez de Huelva, a pilot, who, by mere chance, had fallen in with the island afterwards called Dominica." In another place he says, "Let Bœhm and Columbus have each their praise; they were both excellent navigators; but Columbus would never have thought of his expedition to America, had not Bœhm gone there before him. His name is not so much celebrated as that of Columbus, Americus, or Magellan, although he is superior to them all." Martin Behem, in consideration of his great services to the crown of Portugal, was knighted by king John in 1485, in the presence of his whole court. In 1492, the chevalier Behem, crowned with honours and riches, undertook a journey to Nuremberg, to visit his native country and his family; and there he made a terrestrial globe of curious construction, which is still preserved in the library of that city. On this globe is marked the tract of his discoveries, under the appellation of the western lands; and from their situation it cannot be doubted, that they are the present coasts of Brazil, and the environs of the straits of Magellan. This globe was made in the same year when Columbus set out on his expedition; and hence it is inferred, that Behem could not have profited by the observations of this navigator. After having performed several other interesting voyages, the chevalier Behem died at Lisbon in July 1506, universally regretted, and leaving behind him no other work besides the globe already mentioned, which was constructed from the writings of Ptolemy, Pliny, Strabo, and especially from the account of Mark Paul the Venetian, a celebrated traveller of the 13th century, and of John Mandeville, an Englishman, who, about the middle of the 14th century, published an account of a journey of 33 years in Africa and Asia. He has also added the important discoveries made by himself on the coast of Africa and America.

Dr. Robertson treats the history of Behem as a fiction of some German authors, who were inclined to attribute to one of their countrymen a discovery which has produced so great a revolution in the commerce of Europe. Nevertheless, he acknowledges with Herrera, that Behem had settled in the island of Fayal; that he was the intimate friend of Columbus, and that Magellan had a globe made by Behem, by the help of which he undertook his voyage to the south sea. He also relates, that in 1492 this geographer visited his family at Nuremberg, and left there a map drawn by himself, a copy of which was procured for him by Dr. Reinhold Foster, and which, in his opinion, partakes of the imperfection of the cosmographical knowledge of the 15th century; as he found in it, under the name of the island of St. Brandon, land which appears to be the present coast of Guiana, and which lies in the same latitude with the cape Verd isles; and he conceives that this is an imaginary island, which has been admitted into some ancient maps, on no better authority than the legend of the Irish St. Brandon or Brendan, whose story is so childishly fabulous as to be unworthy of any no-

tice. He adds, that hardly any one place is laid down in its true situation. M. Otto thinks that Dr. Robertson furnishes, in his own history, means of refuting his objections against the truth of Behem's history. This learned historian allows, that Behem was very intimate with Columbus, that he was the greatest geographer of his time, and that he had been the disciple of the celebrated John Muller or Regiomontanus; that he had discovered, in 1483, the kingdom of Congo on the coast of Africa; that he constructed a globe, used by Magellan; that he drew a map at Nuremberg, containing the particulars of his discoveries; and that he placed in this chart land, which is found to be in the latitude of Guiana. Whilst Dr. Robertson asserts, without any proof, that this land was but a fabulous island, we may suppose, says M. Otto, upon the same foundation, that the chevalier Behem, engaged in an expedition to the kingdom of Congo, was driven by the winds to Fernambouc, and from thence by the currents, very common in these latitudes, towards the coast of Guiana; and that he took for an island the first land which he discovered. The course which Christopher Columbus afterwards steered, makes this supposition still more probable; for if he knew only of the coast of Brazil, which they believe to have been discovered by Behem, he would have laid his course rather to the south-west. The expedition took place in 1483; it is then possible that, at his returning, Behem proposed a voyage to the coasts of Brazil and Patagonia, and that he requested the assistance of his sovereign, which has been already mentioned. "It is certain," says M. Otto, "that we cannot have too much deference for the opinion of so eminent a writer as Robertson, but this learned man not having it in his power to consult the German pieces in the original, which we have quoted, we may be allowed to form a different opinion, without being too presumptuous." For a farther discussion of this subject, see M. Otto's *Memoir on the discovery of America*, in the *Transactions of the American Society at Philadelphia*, vol. ii. p. 263, &c. Robertson's *Hist. of America*, vol. i. p. 371, &c.

BEHEME, or RAMSEY, SAND, in *Geography*. See RAMSEY.

BEHEMOTH, in *Zoology*, a huge animal mentioned in Scripture, concerning which interpreters are much divided. The strength of this creature, his manner of life, and some other particulars, we find admirably pourtrayed in the forty-first chapter of the book of Job, and from that description some have thought it could apply only to the elephant, but it certainly more fully agrees with the hippopotamus, or river horse; and this is now pretty generally believed to be the animal in question. Bochart, Franzius, and others, who have endeavoured to ascertain all the animals mentioned in the Old Testament, entertain this opinion. See HIPPOPOTAMUS and MAMMOTH.

BEHEN, in *Botany*. See CENTAUREA and CUCUBALUS. BEHERUS, in *Geography*, a town of Asia, in the Arabian Irak, 20 miles N.N.E. of Bagdat.

BEHIRE, in *Geography*, a lake of Lower Egypt, 7 leagues in compass, near Aboukir. This is also the name of a district called Bahira, which see.

BEHIU, a town of Egypt, near the Nile, 17 miles S. of Abu Girgê.

BEHKER, or BHAKOR, a district of India, in the southern part of the country of Moultan, confined chiefly to the east side of the Indus. This is also the name of a town, which is the capital of the country to which it gives name, about 215 geographical miles distant from Moultan to the south, and supposed in the Ayin Acbaree to be the ancient Manfurah. N. lat. 27° 12'. E long. 70° 1'.

BEHLULIA,

BEHLULIA, a town of Syria, 40 miles south-west of Aleppo.

BEHMEN, or BOEHM, JACOB, in *Biography*, commonly called by his admirers, the "German Theosophist," was born of poor parents at a village near Gorkitz, in Upper Lusatia, in 1575. Having been taught to read and write, at the age of 10 years, he was apprenticed to a shoe-maker, or taylor, and in 1594 became a master and was married. Although he never entirely forsook his occupation, his eccentric genius soon carried him "ultra crepidam," beyond his task. Engaging in those theological controversies, which were spreading in his time through Germany, among the lower classes of the people, he was much perplexed concerning many articles of faith, and prayed earnestly for divine illumination. In this state of mind he fell into a trance or extacy in 1600, which lasted for seven days, and afforded him an intuitive vision of God. Soon afterwards he had a second extacy, in which he found himself surrounded on a sudden with celestial irradiations, his spirit being carried to the inmost world of nature, and enabled to penetrate through the external forms, lineaments and colours of bodies, into the recesses of their essences. In a third vision of the same kind, other more sublime mysteries were revealed to him, concerning the origin of nature, and the formation of all things, and even concerning divine principles and intelligent natures. These wonderful communications he committed to writing in 1612; and published a book, entitled "Aurora," the principles and style of which are so mysterious and obscure, that it is not easy to understand or explain them. Indeed the author himself declares that the mysteries of this book are incomprehensible to flesh and blood, and that though the words be read, their meaning will lie concealed, till the reader has by prayer obtained illumination from that heavenly spirit, which is in God, and in all nature, and from which all things proceed. Gregorius Richter, a clergyman of Gorkitz, having seen this work, reproved the author from the pulpit, and procured an order from the senate of the city for suppressing it; and Behmen was required to discontinue his attempts for enlightening the world by his writings. Behmen acquiesced, and refrained from writing for 7 years. A copy of the work, however, found its way to the press at Amsterdam, in 1619; and in the same year he wrote another book on the three principles, to which in the course of a few years he added several others. In 1624 he travelled to Dresden, where he was examined by a body of divines and dismissed without censure. He died in the same year, after having received the sacrament from the hands of Elias Dietrich, and was honourably interred at Gorkitz. His other works are "Of the Three-fold Life of Man;" "Answer to the Forty Questions of the Soul;" "Of the Incarnation of Christ, his Sufferings, Death, and Resurrection;" "A Book on the Six Points;" "On Celestial and Terrestrial Mysteries;" "De Scriptura Rerum;" "On the Four Complexions;" "On True Repentance;" "On True Resignation;" "On the Second Birth;" "Mysterium Magnum;" "On the First Book of Moses;" "On Spiritual Life," &c. These treatises appeared separately, and were afterwards collected and printed together. The best edition is said to be that in 12mo. published in German, at Amsterdam, in 1682. An English edition of his works was given by Mr. William Law, in 2 vols. 4to.

In Jacob Behmen, a warm imagination, united with a gloomy temper, produced that kind of enthusiasm, which in its paroxysms disturbs the natural faculties of perception and understanding, and produces a preternatural agitation of the nervous system, during which the mind is filled with wild and wonderful conceptions, which pass for visions and revelations. Every page of his works, and even the hieroglyphic figures

prefixed to his works, manifest a disordered imagination, and it is in vain to attempt to derive his "Theosophia," from any other source; unless we incline to admit his own account, in which he boasts that he was neither indebted to human learning, nor was to be ranked among ordinary philosophers. He says that he wrote "not from an external view of nature, but from the dictates of the spirit: and that what he delivered concerning the nature of things, and concerning the works and creature of God, had been laid open before his mind by God himself." The conceptions of this enthusiast, sufficiently obscure in themselves, are often rendered more obscure by being clothed under allegorical symbols, derived from the chemical art. As he frequently uses the same terms with Paracelsus, he was probably conversant with his writings. He also appears to have acquired some knowledge of the doctrine of Robert Fludd, a native of England, and the Rosicrucians, which was propagated in Germany with great ostentation during the 17th century. However, he seems, upon the whole, to have followed no other guides than his own inventive genius and enthusiastic imagination; and every attempt which has been made by his followers to explain his system has been only raising a fresh ignis fatuus, to lead the bewildered traveller farther astray. Among other tenets, equally inexplicable, this mystic makes God the essence of essences, and he supposes a long series of spiritual natures, and even matter itself to have flowed from the fountain of the divine nature. Upon these subjects his language resembles that of the Jewish cabbala. The whole Divine Trinity, he says, spreading forth bodily forms, produces an image of itself, "as a God in miniature." If any one name the heavens, the earth, the stars, the elements, and whatever is beneath or above the heavens, he herein names the whole deity, who, by a power proceeding from himself, thus makes his own essence corporeal. There is a great darkness, he says, among the stars, where the devil holds his principality; all arts and sciences flow from the sidereal spirit of this world; the seven liberal arts proceed from seven spirits of nature; and all human things are composed of the four first properties, bitter, sour, heat, and pain. The divine grace, says this chimerical writer, operates by the same rules, and follows the same methods that the divine Providence observes in the natural world; and the minds of men are purged from their vices and corruptions in the same way that metals are purged from their dross; and this maxim was the principle of his fire-theology. But it is needless to give any farther account of a system which exhibits a motley mixture of chemical terms, crude visions, and mystic jargon. The elements of Behmen's theology may be collected from his "Aurora," and his treatise "on three principles."

Some have bestowed high praises on this enthusiast, on account of the wisdom which they pretend is contained in his writings, and also of his piety, integrity, and sincere love of truth and virtue. Others have accused him of the most dangerous errors, and have written volumes in opposition to his doctrines. Amongst the most eminent of his followers and admirers, we may reckon John Lewis, Giftthiel, John Angelus, Werdenhagen, Abraham Franckenberg, who wrote his life, Theodore Tschetch, a Silesian nobleman, Paul Felgenhaver, Quirinus Kuhlman, who was burnt at Moscow in 1684, John Jacob Zimmermann, and our visionary countryman William Law, author of "Christian Perfection." Among Behmen's numerous followers, no one rendered himself more conspicuous than John Pordage, a physician and naturalist, and member of the "Philadelphian Society," who pretended to divine revelation, and declared that he was thus convinced of the truth of Behmen's doctrines. He published a book entitled "Divine and True Metaphysics," with other similar works in favour of Behmen's opinions, which

being soon spread throughout Germany became, together with his other writings, the standard books of all enthusiasts. To the class of his adversaries we may refer Gilbert Ischeffels, who published an admonition against his works in 1643, which was answered by Tschetsch, Gerrard Antagnossius, who refuted Tschetsch, and who endeavoured to shew that Behmen entertained the same opinions as the Manichæans and Gnostics; Tobias Wagner, and Dr. Henry More, who wrote a treatise against Behmenism, entitled "Censura Philosophiæ Teutonicæ," printed in his works, p. 520. Some persons have attempted to prove from Behmen's writings, that he did not acknowledge a deity; and particularly Von Muller, in a work entitled "The Fanatic Atheist." Brucker's Hist. Phil. by Enfield, vol. ii. p. 494, &c. Moheim's Eccl. Hist. vol. v. p. 310, &c.

BEHMENISTS, or BORMENISTS, in *Ecclesiastical History*, the denomination of a class of mystic philosophers, who were the followers of Jacob Behmen, commonly called the Teutonic philosopher. See the preceding article.

BEHN, APHARA, in *Biography*, a writer of novels and plays, was descended of a good family of the name of Johnson in Canterbury, and born in the reign of king Charles I. Her father died at sea in a voyage for Surinam, of which he was appointed lieutenant-governor by the interest of lord Willoughby, to whom he was related; but his daughter, with the rest of the family, arrived thither. Here she became acquainted with the story and person of the American prince Oroonoko, whose adventures she described in a novel under this title. After her return to England she married Mr. Behn, a merchant in London, of Dutch extraction. During the Dutch war in the reign of Charles II. she was employed for gaining intelligence on the continent, and with this view she resided at Antwerp. By her intrigues, it is said, she discovered the design, formed by the Dutch, of sailing up the river Thames, and burning the English ships in their harbours; but her intelligence was slighted by the English court, to which it was imparted. On her return to England she narrowly escaped shipwreck. Her future life was devoted to pleasure and poetry; and by writing she gained a subsistence. With a good person, and distinguished talents for conversation, she formed an intimate acquaintance with several poets and wits of her time, as well as men of pleasure. Her compositions, in verse and prose, were numerous; and she published three volumes of miscellaneous poems, seventeen plays, and a collection of histories and novels, besides some translations and letters. She borrowed much from other writers, and the merit, that was properly her own, consisted in a fluent easy style, occasionally glowing with the ardour of love, when this subject was the topic, and in some sprightly thoughts and facility of invention. Many of her plays succeeded on the stage, at a period when gross indecency of plot and language was no impediment to their reception. Her poetical appellation was *Astrea*; and her dramatic compositions are characterized by Mr. Pope in the following lines:

"The stage how loosely does *Astrea* tread,
Who fairly puts all characters to bed."

None of her dramatic pieces are now acted; her poetry has been long forgotten; but her novels, which were once popular, are now occasionally read. Her death, which was hastened by an injudicious physician, happened in 1689, when she was between the age of 40 and 50; and she was buried in the cloisters of Westminster Abbey. Biog. Brit. Gen. Dict.

BEHNESE, or BAHNASAA, in *Geography*, a town of Egypt, 10 miles north of Abu Girgê.

BEHRENS, CONRAD, BERTHOLD, in *Biography*, was

born at Hilderheim, in Lower Saxony, August 26th 1660. After passing through the usual course of studies in the classics and philosophy, in his own country, and residing for some time at Strasburg and Leyden, he took the degree of Doctor in Medicine at Helmstadt, was made physician to the army of the duke of Brunswick, and in 1712 to the court of Brunswick Lunenburg, and member of the Academy Nature Curioforum, to the Memoirs of which he was a considerable contributor. His principal works are, "De Constitutione Artis Medicæ," Helmst. 1691, 8vo. "Medicus Legalis," 1696, 8vo. published in German. In this he treats of the duties and office of physicians, surgeons, apothecaries, and midwives, of alchemy, of magnetism applied to medicine, and of the causes of sudden death, on which he has some judicious observations. "Selecta Dietetica, five de recta ad sanitatem vivendi ratione tractatus," Francf. 1710, 4to. He died October 4th 1738. His son Rodolph Augustus Behrens, who succeeded to his honours and practice, published "De Felicitate Medicorum Aucta in terris Brunvicenlibus," 1747, 4to. occasioned by some additional privileges accorded to the physicians there. In this work he takes occasion to comment on, and refute the opinion of Middleton, as to the servile condition of physicians among the Romans.

BEHUT, called also BETUH, IHYLUM, or CHELUM, in *Geography*, a river of Hindooistan, is the westernmost of the five rivers that water the Panjab; and its general course is east, and nearly parallel to that of the Attock, but it is of a less bulk. This is the famous Hydaspes of Alexander, on the banks of which he was opposed by Porus, a powerful monarch of the country, at the head of a numerous army. By the Ayin Acbaree, it is said to be anciently called *Beldulta*. The Behut issues from the spring of *Wair*, or *Wair Naig*, in the south-east part of *Cashmere*, and after a north-west course through that valley, enters the mountains at *Barehmoolch*. During this short course it receives abundance of rivulets and streams from some large lakes, and becomes navigable at a few miles below its remotest spring. After entering the mountains it pursues the direction of the Panjab by a very crooked course, being pent up in a deep winding valley, whilst escaping from the wide base of the *Cashmerian* mountains, and rushing with such rapidity and violence that even the stoutest elephant cannot preserve his footing in it. It emerges from the mountains in the district of *Puckhohi*, and is afterwards joined by two small but celebrated rivers named *Kiskengonga* and *Nainfook*. After this it traverses the territory of the *Glickers*, still holding its course through a hilly country, until it crosses the upper or great road leading from *Lahore* to *Attock*, where the hilly tract is confined to the western bank. Here stood, not long since, a city of the name of *Ihylum*, which communicated its name to the river, during the remaining part of its course; and hence it is as commonly named *Ihylum* as *Behut*. From *Ihylum* it pursues its course along the eastern borders of the *Joud* mountains, and unites with the *Chunaub* at about 50 geographical miles above *Moultan*; losing its name in that of the *Chunaub*, as heretofore it lost its name of *Hydaspes* in that of *Acefines*, the ancient name of the *Chunaub*. The interval between the *Behut* and the *Indus*, in the widest part, is about 94 geographical miles. Pliny allows only 120 Roman miles between the *Indus* and the *Hydaspes*. Rennell's Mem. p. 99. Robertson's India, p. 18.

BEIA, PAX JULIA, an ancient city of Portugal, in the province of *Alentejo*, near a lake of the same name. It is mentioned by *Pliny*, *Ptolemy*, and *Antoninus*. Several Roman coins and inscriptions have been found near this place.

Its situation is on a gentle hill in a fertile country rich in corn, and it is surrounded with walls and gates; and it is the
see

for of a boy, a corregidor, and a governor. It is taken from the Moors in 1162. N. lat. 27° 58'. W. long. 100° 30'.

BEJA, a large extent of country in Abyssinia, lying between the northern tropic and the mountains of Abyssinia, reaching from Mahala along the coast of the Red Sea to Saken; then turning westward, and continuing in that direction, with the Nile on the south, the tropic on the north, to the deserts of Selima, and the confines of Libya on the west. See ABYSSINIA.

BEJA of THE. See BAY-JAH.

BÉJAD, a village of Egypt, opposite to Beisouef, partly inhabited by Copts.

BÉJAPOUR, or VISIAPOUR, a considerable city of Hindoostan, and once the capital of a large kingdom of the same name. It is now in the hands of the Poonah Mahrattas; distant 234 miles from Bombay, from Calcutta by the Circars, 1183, and by Aurungabad 1216, from Delhi 916, from Hydrabad 269, from Madras 534, from Poonah 136, from Serangapatam 405, from Betares 876, and from Agra 825 miles. N. lat. 17° 28'. E. long. 75° 27'.

BELAR, a small town of Spain, in the province of Extremadura, situated in the midst of a pleasant valley between high mountains, whose tops are continually covered with snow. It is famous for its baths, and in its vicinity is a lake, which is said to preface bad weather by an unusual agitation. It was raised into a duchy in 1448.

BEJAR de Malina, or Bejer, a town of Spain, in Andalusia, near the Straits of Gibraltar, 8 leagues south of Cadix.

BELARIA, so called by Mutis, in honour of Bejar, a Spanish botanist, in *Botany*. Lin. Gen. Reich. n. 648. Schreb. 811. Juss. 159. Class and order, *doliceandria monogynia*. Nat. Ord. *Bicornes*. *Rhododendra*, Juss. Gen. Char. Cal. perianth one-lobed, gibbous downwards, subventricose, seven-cleft; divisions subequal, ovate, acute, converging, small; the outer ones broader, permanent. Cor. petals seven, oblong, broader above, obtuse, patulous, inserted into the receptacle. Stam. filaments fourteen, subulate, rather shorter than the corolla, alternately less; anther oblong, incumbent. Pyl. germ superior; style columnar, middle-sized, permanent; stigma thickish, seven-lobed. Per. berry juiceless, five-cornered, depressed, umbilicate, seven-celled. Seeds numerous, columnar-oblong, imbricate.

Plant. Char. Cal. seven-cleft. Petals seven. Stam. fourteen. Berry five-celled, many seeded.

Species, 1. *B. glabra*. Mutis Amer. i. t. 7. "Leaves bipinnate, flowers in racemes." A shrub twelve feet high, with round spreading branches. A native of Mexico. Found in New Granada by Mutis. 2. *B. rufinosa*. Mutis Amer. i. t. 8. "Leaves ovate, flowers large." A tree with profuse branches, and an irregular, tender, subpubescent bark; corolla purple, very resinous or viscid. Found in New Granada by Mutis. These have a peculiar bitter flavour, and are allied to the rhododendron. The name was erroneously made "Befaria" by Lamarck.

BEIBENIE *Stella*, in *Astroonomy*, a name given by some astronomers to the principal fixed stars in each constellation.

The appellation is more particularly given to the stars of the first magnitude, otherwise called the heart, *cordis*, of the several constellations; though some would distinguish between *cordis*, and *bebenie stelle*, reserving the former to stars only of the first magnitude, and extending the latter to several of the second, or even third.

Hermes had a treatise express De Stellis Bebenie, published by Junctius, in his *Speculum Astrologicum*, and also in his *Commentaries* upon Jo. de Sacrobosco's book De Sphaera.

BEILHINGEN, in *Geography*, a town of Germany, in the circle of Upper Saxony, and country of Thuringia, 6 miles S. W. of Wuche. N. lat. 51° 23'. E. long. 11° 50'.

BEILA, a town of Italy, in Piedmont. N. lat. 51° 41'. E. long. 7° 35'.

BEILAM, a town of Syria, S. E. of Beasideron in Mesopotamia. N. lat. 36° 26'. E. long. 35° 11'.

BELINGRIEL, a town of Germany, in the circle of Franconia, and bishopric of Bamberg, at the confluence of the Aegard, and the Soule, 10 miles north of Bamberg.

BELSTEIN, a small town and fief of Germany, in the Rhine circle, and capital of a lordship, which it gives name, comprehending about thirty villages, in the principality of Nassau-Dillenburg; 5 miles south of Dillenburg. The lordship belongs to the prince-bishop of Nassau-Orange. D. 17, which enjoys, in consequence of it, a seat and vote at the diets of the electoral Rhine circle. N. lat. 50° 31'. E. long. 8° 11'.—Also, a small town of Germany, in the duchy of Wurtemberg. In 1693, it was burnt by the French. Its district comprehends several villages.

BELLUL, a town of Abyssinia, situate on the Red Sea north of Affab. N. lat. 14°. E. long. 41° 58'.

BEINA, a river of Norway, in the government of Christiania, which runs into the lake of Sperdillon; and serves for exporting timber.

BEINAC, a town of France, in the department of Correze, and chief place of a canton, in the district of Brive, 8 miles south of Tulle.

BEINASCHI, GIOVANNI BATTISTA, in *Biography*, an historical painter, was born in Piedmont in 1634, and studied at Rome under Pietro del Po, and as some say, was afterwards a disciple of Lanfranco. He died in 1688. Beinascchi was an admirable designer, of a lively invention, and not only expeditious, but correct. As an acknowledgment of his merit, he received the honour of knighthood.

BEINASCO, in *Geography*, a town of Piedmont, 4½ miles S. S. W. of Turin.

BEINDGHURA, a town of Hindoostan, in the district of Benapour, part of the territory of the Mahrattas. N. lat. 15° 15'. E. long. 75° 11'.

BEINE, a town of France, in the department of the Marne, and chief place of a canton, in the district of Reims; the place contains 675, and the canton 8474 inhabitants; the territory includes 352½ kilometres and 19 communes.

BEING, in *Metaphysics*, includes not only whatsoever actually is, but whatsoever can be. It is the first and most obvious, the most simple and natural conception that we can frame of any thing which we see, hear, feel, or know. It is in some sense comprehended in all our other conceptions of things, and is therefore the most general or universal of all our ideas. By the affections of being, are meant all powers, properties, accidents, relations, passions, dispositions, internal qualities, external adjuncts, considerations, conditions, or circumstances whatsoever; or, in a word, all those modes which belong to things, either as they are in themselves, or as they stand in relation to other things, or as they are represented or modified by our ideas and conceptions. The various kinds of beings have been referred by writers on this subject into three distinct classes, and they have been considered as either substances or modes, finite or infinite, and natural, artificial, or moral. For the two former classes, see SUBSTANCE, MODE, FINITE, and INFINITE. Natural beings are all those things that have a real and proper existence in the universe, and are considered as formed and ordained by God the creator; such are bodies, spirits, men, beasts, trees, fruit, countenance, sense, reason, fire, air, light, &c. Artificial beings are made by the contrivance or operation of men, whether they are of a more corporeal nature, such as houses, windows, pictures, statues, arms, garments, writing, music, and the various utensils of life; or whether they relate more to intellectual matters, as words, sciences,

rules, arguments, propositions, verse, prose, &c. Moral beings are those which belong to the conduct and government of intelligent creatures, or creatures endowed with understanding and volition, considered as lying under obligations to particular actions or abstinences: but these considered as moral are only modal; such are law, duty, virtue, vice, sin, righteousness, judgment, condemnation, reward, punishment. These distinctions however might, perhaps, be more properly referred to the separate classes of different ideas than different beings. Being is the subject of Ontology. See ONTOLOGY. See also ESSENCE and EXISTENCE.

BEINHEIM, in *Geography*, a town of Germany, in the circle of Swabia, seated on the west side of the Rhine, and belonging to the marquisate of Baden; 6 leagues N.N.E. of Strathburg.

BEINIGKEMEN, a town of Lithuania, 12 miles north of Pilkallen.

BEIRA, a large and fertile province of Portugal, bounded on the north by the province of Entre Duero a Minho, from which it is separated by the river Duero or Douro, and by Tralos Montes; on the west by the ocean and part of Estremadura; on the south by another part of that province and by the Tagus; and on the east by the Spanish Estremadura, and the kingdom of Leon. It is divided into Upper and Lower Beira; the former being the northern part, and lying on the sea-coast; the latter lying towards Spain and Estremadura. Its extent from east to west is generally computed at betwixt 33 and 36 Portuguese miles; and from north to south about as many. It was erected into a principality by John V. in honour of his grandson, the eldest son of the prince of Brasil. It produces wheat, rye, and millet; and, in several parts, excellent wine and oil in such abundance, that considerable quantities of each are exported. Beira comprehends eight jurisdictions, and its principal cities and towns are Coimbra, Lamego, Guarda, Viseu, Miranda do Corvo, Tentugal, Aveiro, Ovar, Pinhel, Alameda, Francofo, Meda, Castello Branco, Penamacor, and Covilha; the four first are episcopal cities. The militia of this province consist of eight regiments, each regiment including about 1000 men.

BEIRAGUR, a town of Hindoostan, on the west of Boad, and near the Mahanuddy river, noted in the Ayin Achbaree, as having a diamond mine in its neighbourhood.

BEIRAM. See BAIRAM.

BEIRUT. See BAIRUT and BERYTUS.

BEISCH, JOACHIM FRANCIS, in *Biography*, a painter of landscapes and battles, was born at Ravensburg, in Swabia, in 1665; and having received the first rudiments of the art of painting from his father, who employed himself in this way for his amusement, he became a good artist by the force of his own genius and by assiduous practice. He was engaged at the court of Munich, and painted the battles fought in Hungary by the elector Maximilian Emanuel. During the absence of the emperor on some of his expeditions, Beisch visited Italy, and there, with a view to his further improvement, studied and copied the famous models to which he had access. Before his journey to Italy, his manner was true, but too dark; his second had more clearness and more truth; and his last was more clear but more weak. The scenes of his landscapes are agreeably picturesque; his touch is light, tender, and full of spirit; and his style of composition frequently resembled that of Gaspar Poussin, or Salvator Rosa. He died in 1748. Pilkington.

BEISHEHIA, or BISHEHRI, in *Geography*, a town of Asiatic Turkey, in Caramania, seated near a lake. N. lat. $37^{\circ} 45'$. E. long. $32^{\circ} 11'$.

BEISSKER, in *Ichthyology*. See BEYSSKER, or BEYZKER, and COBITIS FOSSILIS. Linn.

BEISSONS, in *Geography*, a place of Africa, in the kingdom of Tunis, situate between Taberfoke and Dugga, at which there are found some antique remains and inscriptions.

BEISTEN, a town of Prussia, in the province of Natan-gen, 26 miles south of Konigsberg.

BEIT ABUFARRA, a town of Arabia, 24 miles N.N.E. of Wadeij.

BEIT *el Adham*, a town of Arabia, 24 miles S.W. of Sanaa.

BEIT *Elam*, a town of Syria, south of Antakia. N. lat. $36^{\circ} 5'$. E. long. $36^{\circ} 32'$.

BEIT *el Fakih*, a city of Arabia, in the country of Yemen, situated on a plain, which, though far from being naturally fertile, is industriously cultivated. The houses, many of which are of stone, are separated from one another; and the city has a citadel, which is thought of the utmost importance in a country where armies are destitute of artillery. The town is much molested by a species of ants, called by the Arabs, "Ard." Beit el Fakih is not very ancient: though it has existed for some centuries. It owes its origin to a saint, called "Achmed iba Mufa," from whom it has derived its name; Beit el Fakih denoting the "house or dwelling of the sage." Near the city is shewn the tomb of the saint, upon a sandy hill, where a fine mosque has been erected, and where several devout persons have built cottages round the tomb. When the harbour of Ghalefka was choked up, the inhabitants of that city, for the convenience of trade, removed their effects to the vicinity of this tomb, and settled about it. When it became a considerable city, the lord of the territory erected a citadel for its defence, in the place where water had been found. This city is very favourably situated for trade; being only half a day's journey from the hills in which coffee grows, and but a few days' journey from the harbours of Loheia, Hodeida, and Mocha, from which this commodity is exported. This trade brings hither merchants from Egypt, Syria, Barbary, Persia, Habbesch, India, and often from Europe. Beit el Fakih is the residence of a Dola, whose jurisdiction extends over a large district. Niebuhr mentions a singular instance, which occurred at this place, and which strikingly indicates the coolness of temper and firmness of mind, that distinguish the Arab character. The southern end of a house caught fire; and as the wind blew strong from the south, a great part of the city was soon burnt down. The inhabitants, however, retained their usual tranquillity. No cries nor complaints were heard in the streets; and when the people were addressed with expressions of condolence, upon their misfortune, they calmly replied, "It is the will of God." N. lat. $14^{\circ} 31'$. E. long. $43^{\circ} 12'$. Niebuhr's Trav. vol. i. p. 311.

BEIT *el Kadi*, a town of Arabia, in the country of Yemen, 34 miles north of Chamir.

BEIT *el Naum*, a town of Arabia, in Yemen, 24 miles south-east of Sanaa.

BEIT *Ebn Safan*, a town of Arabia, in Yemen, 28 miles S.S.E. of Saade.

BEIT *Ebn Meri*, a town of Arabia, in Yemen, 38 miles N. of Chamir.

BEIT *Ebn Nafr*, a town of Arabia, in Yemen, 34 miles N. of Chamir.

BEIT *Rodsje*, a town of Arabia, in Yemen, 24 miles S.E. of Sanaa.

BEIT *Il Tola*, a town of Arabia, in Yemen, 28 miles S. of Saade.

BEIT *Ebn Shemshar*, a town of Arabia, in Yemen, 28 miles E. of Abu-Arifch.

BEIT *El Weil*, a town of Arabia, in Yemen, 3 miles N. of Demn.

BEITH, a town of Scotland, in the district of Cunningham,

ham, and county of Ayr. It is seated on a small eminence, and the streets are pretty regularly laid out. A linen manufactory gives employment to many of its inhabitants, and others are occupied in making silk-gauze and cotton. Some considerable manufacturers reside in the town, and though it is said to have consisted of only a few inhabitants at the commencement of the last century, yet the population now amounts to about 1800. The parish, extending about five miles in length, by four in breadth, consists principally of arable land; but some farms, with others at Dunlop, are appropriated to the dairy system, and have long been famous for a particular cheese called the *Dunlop cheese*. Within the boundary of the parish is a small loch, containing abundance of fish, and near it is plenty of peat moss. Coal is found in many places; freestone is abundant, and the limestone quarries are almost inexhaustible. In the latter substance are frequently found various petrifications of shells, and other marine exuvia; also many other silicious petrifications of woods, mosses, &c. The population of the parish and town in 1792, was 2872. Sinclair's Statistical Account of Scotland.

BLITHAR, BES, in *Biography*, a learned Arabian botanist, called *Azhar*, the botanist, from his skill in the science of plants, was born in Spain; and after visiting Africa, travelled into the Levant, Asia, and even as far as the Indies to improve his knowledge. After his return he was patronised by Saladin at Cairo, and died in 1248. He wrote "A General History of Simples, or of Plants, arranged in alphabetical order;" in which he gives the Greek, Arabic, and vernacular names, with the descriptions of each, and particularly in a more detailed manner, those not described by Dioscorides and Pliny. Beithar's work is extant in the Parisian, Escorial, and other libraries. Herbelot. Pulteney's Hist. and Biog. Sketches, &c. vol. i. p. 19.

BEITSTÄDT, in *Geography*, a lake in the northern part of Norway.

BEIUCO, in *Botany*. See HIPPOCRATEA.

BEJWARA, called also *Hofbearpour*, in *Geography*, a town of Hindoostan, in the country of Lahore, about 3 journaes or 36 coffes from Sirhind, 16 coffes N.E. of Jallindhar, and about 25 geographical miles north of Rahoo, and about 30 such miles from Hurepour.

BEIZA, or BEZIATH, a Hebrew word, signifying an egg, in Jewish *Antiquity*, a certain measure in use among the Jews; they say that the beiza contains the sixth part of a log.

The beiza is also a sort of gold coin common among the Persians; it weighs forty drachmas, and from this word, not from the city of Byzantium, the bezant was formed. A bezant is worth two dinars, and every dinar twenty or five and twenty drachmas.

BEK, DAVID, in *Biography*. See BECK.

BEKAA, in *Geography*, a valley of Syria, anciently called Cæle-Syria, or the hollow Syria, separates the chain of mountains denominated by the ancients Anti-Libanus, from the Libanus of the Druzes and Maronites, and by being the depository of the water of the mountains that enclose it, is rendered one of the most fertile districts of all Syria; but the heat of the sun, the rays of which are concentrated by the mountains, is in summer not inferior to that of Egypt. The air, however, which is perpetually refreshed by the north wind and by the agitation of the waters, is not unhealthy. Before the earthquake of 1759, this whole country was covered with villages and plantations of the *Motoualis*; but the destruction occasioned by this terrible calamity, and the subsequent wars with the Turks, have occasioned a general desolation. In this vale is situated the famous BALBEC.

BEKAVA, or BEKAWA, a small town of Poland, in the palatinate of Lublin.

BEKES, a town of Upper Hungary, on the river Koros, which gives name to the *Cepeneshaft*.

BEKI, BEG, or BEYE, a river of Hungary, which runs into the Temes, near Temeswar.

BEKIA, BECOVVA, or BOZVIO, a small British and of the West Indies, about 12 leagues in compass, and containing 3,700 acres, being the least of the Grenadilles, called by the French, "Little Martinico;" 35 miles N.E. of Grenada, and 65 leagues from Barbadoes. It has a safe harbour, called "Admiralty-bay," but no fresh water; and is principally visited by the inhabitants of Grenada and St. Vincent's for the purpose of catching turtle. The soil produces wild cotton, and plenty of water-melons. This island is dependant on the government of St. Vincent.

BEKIER, a name given by mariners to Aboukir, which see.

BEKING, a town of France, in the department of the Moselle, and chief place of a canton, in the district of Sar-Louis, on the Sarre, 5 miles N.N.W. of Sar-Louis.

BEKKER, or BECKER, BALTHASAR, in *Biography*, a famous Dutch divine of the 17th century, was born in 1634, at Warhuifen, a village in the province of Groningen, and pursued his studies first in the university of Groningen, and afterwards at Francker, where he became rector of the Latin school. In 1665, he took his degree of doctor of divinity at Francker, and in the following year he was chosen one of the ministers of that city. In 1670, he published a catechism, intended for persons of mature age, in which he maintained some opinions concerning the right of Christian congregations to chuse their own ministers, and concerning the antiquity and usefulness of bishops, archbishops, &c. and in which he introduced some suggestions that implied his doubt of the eternity of hell torments, as inconsistent with the divine goodness, which gave offence to several divines, and which incurred a prosecution before the ecclesiastical assemblies. This catechism, however, was approved and commended by several learned professors; and it appears that the author had not, at the time of its publication, adopted those sentiments which involved him in future difficulties. In 1679, he was elected minister at Amsterdam; and in 1683, he published his "Inquiry concerning Comets," in which he concurred with Mr. Bayle in maintaining that they are not presages of any evil. By this work, as well as his "Exposition upon Daniel," he gained great reputation; but having attached himself from an early period of his life to the Cartesian philosophy, he adopted Descartes's definition of spirit, and he was hence led to deny all those operations of the devil and other infernal agents upon mankind, which are related in the scriptures. His argument, as it is briefly stated by Dr. Maclaine, the translator of Moshem's history, is as follows: "The essence of mind is thought, and the essence of matter is extension. Now, since there is no sort of conformity or connexion between a thought and extension, mind cannot act upon matter, unless these two substances be united as soul and body are in man; and therefore no separate spirits, either good or evil, can act upon mankind. Such acting is *miraculous*; and miracles can be performed by God alone. It follows of consequence, that the scripture accounts of the actions and operations of good and evil spirits must be understood in an allegorical sense." To this argument it is replied, that by proving too much, it proves nothing at all: for if the want of a connexion or conformity between thought and extension renders mind incapable of acting upon matter, it is hard to see how their union should remove this incapacity, since the want of conformity and connexion remains notwithstanding this union; Besides, according to this reasoning, the Supreme Being can, not act upon material beings; and it is in vain that Bekker maintains the affirmative by having recourse to a miracle for

for this would imply, that the whole course of nature was a series of miracles, or in other words, that there are no miracles at all. The author suggested doubts concerning the agency of the devil in several of his sermons; and he alleged, that several were ascribed to the devil, in which this evil spirit had no concern. He was at length, viz. in 1691, persuaded to publish his system at large, in an elaborate work, entitled, "The World Bewitched." This work is divided into four books. The first contains an account of the opinions of the ancient and modern heathens concerning gods and demons, or spirits. In the second book the author examines all the passages of the Holy Scripture, which mention either angels or the devil, and endeavours to make them agree with his opinion, that the devil has not the least power in this world, and to shew that those passages, which ascribe several actions to good as well as bad spirits, or angels, must be explained in an allegorical manner. Accordingly, he denies that our first parents were tempted by the devil; alleging that this temptation is ascribed to the devil, only because it does not agree with the goodness of God, though Moses does not mention the devil, and that the punishment mentioned by Moses doth not suit the devil, but only the serpent. He also urges several objections against the literal sense of our Saviour's temptation; and he maintains that those possessed with evil spirits, which our Lord cast out, were merely sick or lunatic persons whom he cured, and in whose sickness the devil had no concern. (See *DÆMONIAC.*) Bekker's work, though his system was not new, occasioned great commotion not only in all the United Provinces, but in various parts of Germany. The author, persisting in his opinions, was publicly deposed from his pastoral charge in 1692; but the magistrates of Amsterdam continued his salary till his death, which happened in 1698. Bekker not only retained his opinions after his deposition, but strenuously defended them against a multitude of adversaries as long as he lived. He was a man of a warm imagination, of an active mind, and of a firm resolute temper. His character was irreproachable; and he avowed to the last his full conviction of the truth of the Christian religion. In his defences he exhibited a moderation which he did not experience from his antagonists. A satirical medal was struck at his deposition, which exhibited the devil, in the habit of a minister, riding upon an ass, and holding a banner in his hand, as a token of the victory which he had gained in the synods. His opinions found several advocates; and he became the head of a sect which was called after his name. Gen. Dict. Mosheim's *Ecl. Hist.* vol. v. p. 632.

BEKKERANISM, or BEKKERIANISM, in Ecclesiastical History, the system or sentiments of Balth. Bekker, who denied that spirits can act or operate on bodies. See the preceding article.

BEL, MATTHIAS, in Biography, a learned historian of Hungary, was born at Orfowa, in 1684; and after studying divinity at the university of Halle, he became first, viz. in 1708, rector of the evangelical school at Neufohl, and in 1714, rector of the school at Presburg. In 1719, he was chosen preacher by the German evangelical congregation in that city, and died senior minister in 1749. His two most valuable works are his "Apparatus ad Historiam Hungariæ," and his "Notitia Hungariæ Novæ." The latter work was held in such high estimation, that it procured for him from the emperor Charles VI. the appointment of imperial historiographer, and the honour of being admitted into the royal academy of sciences at Berlin, and also into that of Petersburgh. Pope Clement XII. also testified his approbation of it by conferring on the author his portrait and eight gold medals. The emperor, upon receiving the second volume of the work, raised him to the rank of nobility, but this

circumstance Bel studiously concealed. Among his other works are "Prodromus Hungariæ antiquæ et novæ." Novb. 1723, fol.; "Notitia Hungariæ novæ historio-geographica," Viennæ, 1735-1742, 4 vols. fol.; "Apparatus ad Historiam Hungariæ, sive Collectio Miscellæ Monumentorum, &c. dec. 1 & 2," Pofon. 1735-46, fol. He also translated into the Bohemian language the Bible, and some other books.

BEL, CHARLES ANDREW, son of the former, was born at Presburg in 1717, and studied at Jena and Altdorf. In 1741, he became extraordinary professor of philosophy at Leipzig; and in 1756, he was appointed public professor of poetry, and librarian to the university, with the rank of counsellor of state. He died suddenly in 1782. Among his writings are "De vera origine et epocha Hunarum, Ararum, Hungarorum, in Pannonia," Leipf. 1757, 4to. After the death of Menck, he was employed as editor of the *Acta Eruditorum*, and of the Leipzig literary gazette, which he conducted from the year 1754 to 1781.

BEL, JOHN-JAMES, was born at Bourdeaux, in 1693, and having pursued his studies with great assiduity in the college of the fathers of the oratory, and made distinguished acquisitions in belles lettres, and also in metaphysics and morals, he was admitted counsellor of parliament in 1720. After several visits to Paris, he finally settled at Bourdeaux; and in 1735, he was chosen director of the academy; but the excess of his application to a variety of scientific and literary pursuits hastened his death in 1738. To the academy of Bourdeaux he left the house in which it holds its sittings, and his valuable library. Besides several professional works, M. Bel published "An Apology for Mr. Houdart de la Motte," 1724, 8vo. which is an ironical criticism on the works of that author, and particularly his tragedies; "An Examination of the tragedy of Romulus, by la Motte;" "A Dissertation on the Abbé Dubos's opinion concerning the preference to be given to the perceptions of taste above reasoning, in judging of works of genius;" "Letters containing Observations on Voltaire's tragedy of Marianne;" all which are inserted, together with some other papers of M. Bel, in "Memoirs of Literature and History," collected by father des Moletz of the oratory. He was also the author of the "Neological Dictionary," augmented by the abbé des Fontaines, and intended to expose the new words and affected phraseology of several modern writers. *Nouv. Dict. Hist.*

BEL, in Botany, the name of a plant, and also of its fruit, called by some the cucumis cappariss, or caper-cucumber. Avicenna has given the most copious account of this plant, which is imperfectly described by others; and he says, that the fruit, which resembled a caper, was used in medicine, and resembled ginger in the fiery heat of its taste.

BEL, in Geography, a town of France, in the department of the Rhone and Loire, on the Brevenn; $3\frac{1}{2}$ leagues west of Lyons.

BEL, in Mythology. See *BELUS*.

BEL and the DRAGON, History of, in Biblical History, an apocryphal part of the book of Daniel, which, although it was annexed to this book, and formed the 14th and last chapter of it, was uniformly rejected by the Jews, and made no part of their canon of scripture. It occurs neither in the Hebrew or Chaldee text, nor in the Greek version of the Septuagint, but was taken out of the Greek version of Theodotion. Africanus, Eusebius, and Apollinarius, have rejected the narration, not only as uncanonical, but also as fabulous; and Jerom also concurs in their opinion. Origen maintains the truth of the history contained in the 13th (see *SUSANNA*,) and 14th chapters, against Africanus, but does not assert it to be canonical. This history is also cited, as part

of the prophecy of Daniel, by Isidore, Clemens Alex. Tertullian, Origen, Cyprian, Diodorus, Hilary, Basil, Gregory Nazianzen, Ambrose, and Augustin. Salustius Severus, and the author of the Synopsis of St. Athanasius, also mention these histories as part of the sacred text; and Rufinus upbraids Jerom for having cut off from Daniel the fong of the three children, the history of Saffana, and that of Bel and the Dragon. Against the truth of this latter history, allowing it to be apocryphal, it has been alleged, that the ancient title of the LXX. attributed it to Habakkuk, and that Daniel mentioned in this history was a priest; and that therefore he must have been another Daniel to whom this history belongs. To this argument it has been replied, that the character of priest is not given to Daniel in the version of Theodotion, and that the version attributed falsely to the LXX. is of no date. Against the history of the Dragon it has been urged that Habakkuk, who lived in the time of Manasses, was dead when it is supposed that he wrote these things, and was caught up by the spirit to carry provision to the prophet Daniel. To this objection it is answered, that there were two Habakkuks; one, who was the prophet in the time of Manasses, and of the tribe of Simeon; and another, mentioned in this passage of Daniel, of the tribe of Levi. Against this history it has also been objected, that it relates the confinement of Daniel in the lion's den to have lasted six days; whereas in chap. vi. 5. 22, it is said, that he had been confined only one night. The advocates of the history reply, that he was twice cast into the lion's den; under Darius, because he prayed to God against the king's commandment; and under Cyrus, on account of the dragon. Dupin's Canon. b. i. c. 3. § 21. See APOCRYPHA, and DANIEL.

BELA, in *Geography*, a pretty large town of Upper Hungary, seated in a delightful plain, not far from the river Pannone, but much rendered by frequent fires.

BELA, or **BEYLA**, a town of Africa, in the kingdom of Senegal, near the river Belad, or Rahad, between Dender and Teava, in the route from Senegal to Gonder.

BELA-BISSA, i. e. 'the white man,' *D'la*, formerly *Bel-Bissa*, a mean town of Lower Hungary, in the Schemnitz district, and geparshicht of Hont, whose mines being exhausted, the inhabitants applied themselves to tillage.

BELABRE, a town of France, in the department of the Indre, and chief place of a canton, in the district of Le Blanc en Berry, 2 leagues south-east of Le Blanc, and 8½ south-west of Chateauroux. N. lat. 46° 33'. E. long. 1° 3'.

BELALCASAN, a town of Spain, in the province of Andalus, on the frontiers of Badrenadura, 9 leagues from Cordova.

BELAN. See BELTON.

BELANCE ISLAND in *Geography*, one of the small islets or rocks which lie between the island of Ulbair and St. Matthew's point, at the entrance into the Breil harbour.

BELASAMA, formed from *belisama*, the mouth of a river, in *Ancient Geography*, the name given by Ptolemy to the bay near Liverpool, at the mouth of the river Merley.

BELASL, in *Geography*, a town of Germany, in the Tyrol, 8 miles west of Bellano.

BELATUCADRUS, or **BELATUCADROS**, the name of a deity of the Britons, mentioned in several old inscriptions, and supposed by Belin de Belloy, and V. Tu. (de Orig. & Prog. Idol. l. 2. c. 17.) to be the same with Belisagus, which see. Bishop Yttelton and professor Ward supposed him to have been a local deity (see *Archaeologia*, vol. 1. p. 38.) with a festival referred to Apollo, who was worshipped, as they observe, by the Druids. Mr. Pegge, (Id. vol. iii. art. 14.) contends, that it is highly absurd to look out for any other deity in Belatucadros, but the god Mars.

This ingenious antiquary acknowledges, that he was a local deity, peculiar in this island to the Brigantes, but at the same time asserts, that he was equivalent to Mars, and that he was invested with the same powers as that god, and that he had not the least concern with Apollo, or any relation to him. The opinion of Mr. Pegge is approved and confirmed by Mr. Gough. (Id. vol. x.) We may add, that it is rendered unquestionable by the inscription recorded by Muratori (*Inscrip. Theat. 43. 1.*) which is as follows: "DIO MARTI, BELATUCADRO."

BELAY, on board of *Ship*, signifies the same as fatten. Thus they say, belay the sheet or tack, that is, fatten it to the kevel, by winding it several times round a luff, &c.

BELAYE, in *Geography*, a town of France, in the department of the Lot, and chief place of a canton, in the district of Lauzerte, one league south-east of Puy l'Evêque.

BELAYING-CLEARS, in *Naval Language*, are pieces of wood, which have two arms, or horns, and are nailed through the middle to the masts, or elsewhere, for the purpose of belaying ropes to them.

BELAYING-PINS, are turned wooden pins, with a shoulder near the middle: the small end is driven through the rough tree rails, or racks of thin plank made on purpose. Their use is for belaying ropes to them. Iron belaying pins are round, taper from the middle to each end, and are driven in the rails, or racks, to belay the ropes to, by taking several cross-turas about them.

BELBA, in *Geography*, a town of Egypt, on the coast of the Mediterranean, 19 miles east of Tineh.

BELBEIS, a town of Egypt, about 35 miles north-east of Cairo, and 45 north-west of Suez. N. lat. 30° 22'. E. long. 31° 55'.

BELBEK, a river of the Crimea, which falls into the Euxine.

BELBINA, in *Ancient Geography*, an island of Greece, in the Saronic gulf, near the promontory of Saniun, and opposite to the Seyllaan promontory: mentioned by Pliny, Strabo, &c.—Also, a town of the Peloponnesus, in Laconia, near which was a temple of Minerva.

BELBO, in *Geography*, a river of Italy, which rises about 2 miles east of Ceva, and runs into the Tanaro, six miles S.W. of Alexandria.

BELBUCH, a town of Germany, in the circle of Upper Saxony, in Pomerania, one mile N.E. of New Treptow.

BELUCH, and **Zomaluch**, in *Mythology, were regarded among the Vedals as the good and evil genii. The former signified the white god, and the latter the black god. They were objects of divine honours.*

BELCA, in *Ancient Geography*, a place of ancient Gaul, between Briodbrum and Genabum, where was an amphitheatre.

BELCAIRE, in *Geography*, a town of France, in the department of the Aude, and chief place of a canton, in the district of Limoux, 3½ leagues S.W. of Quillan. The place contains 915, and the canton 6757 inhabitants; the territory includes 227½ kilometre and 17 communes.

BELCANIA, a town of Asia, placed by Ptolemy in the greater Armenia.

BELCASTRO, a small episcopal city of Naples, in the province of Calabria Ultra; 10 miles N. E. of St. Severina.

BELCHER, a township of America, in the county of Hampshire, and state of Massachusetts, containing 1485 inhabitants, who subsist chiefly by farming.

BELCHERS, a cluster of islands in Hudson's bay. N. lat. 56° 10'. W. long. 80° 33'.

BELCHIER, JOHN, in *Biography*, a surgeon of eminence in London, was born at Kingston-on-the-Thames in

1706. After receiving a classical education at Eton, he became pupil to Mr. Chefeldon, by whom he was much esteemed. In 1736, he was elected surgeon to Guy's hospital, and soon after fellow of the Royal Society. The following year, he sent to the society the case of a woman who died of a dropfy of the ovarium, attended with some remarkable circumstances, and soon after, an account of the case of a man whose arm had been torn off at the shoulder, by one of the ropes of a mill. The circumstance most deserving attention in this case was, that only a small quantity of blood was lost by the accident, which Belchier very properly attributed to the great distension the arteries had sustained before the limb was separated from the body. The man recovered. His next, and last communication to the society, was the result of a series of experiments and observations on the effect produced on animals, by mixing madder with their food. After continuing this diet for a few days, on killing the animals, the bones were found to be tinged with the madder, but on suffering some of them, that had been so fed, to live a few days longer, the colour induced by the madder became dilute and pale, and at length totally disappeared; a proof, it was observed, that the bones are well supplied with absorbents, as well as with blood vessels. See Philosophical Transactions. Nos. 423, 442, and 449. Belchier died in 1785, in the 80th year of his age, having for several years previously retired from business, and was buried in the chapel of Guy's hospital, to which he had been a zealous friend and patron. Gen. Biog. Dict.

BELCHING. See RUCTATION.

BELCHITE, in *Geography*, a small town of Spain, in the country of Arragon, seated in a fruitful soil, on the river Almonazir; 8 leagues south from Saragossa. N. lat. $41^{\circ} 19'$. W. long. $0^{\circ} 30'$.

BELCIANA, in *Ancient Geography*, a town of Asia, in Assyria. Ptolemy.

BELDEK, in *Geography*, a town of Hungary, 15 miles south of Zatzmor.

BELDIRAN, a town of Asiatic Turkey, in the province of Caramania, 28 miles south of Cogni.

BELEBEV, or **BELEBEIEF**, a town of Russia, in the government of Ufa, on the rivulet falling into the Diema, 60 miles south-west of Ufa. N. lat. 54° . E. long. $54^{\circ} 14'$. This is also the name of one of the nine districts, comprehended by the province of Ufa.

BELÉKIS, a town of Slavonia, 10 miles north-west of Belgrade.

BELEM, a town of Portugal, in the province of Estremadura, or in the vicinity of Lisbon, on the north side of the Tagus, in which are a considerable monastery and a royal palace. In its magnificent church, which suddenly sunk in 1756, many kings and princes of the blood have been interred. Below Belem is a square tower called "Torre de Belem," fortified with cannon, which no vessel must pass till it has been visited. Near this tower, which is near a league west from the city of Lisbon, in N. lat. $38^{\circ} 40'$. W. long. $9^{\circ} 40'$, are several batteries, and a small irregular fort, commonly called San Gíao, built on a rocky point, and covering the entrance of the harbour, and opposite to it is another tower called "Torre velha," or old tower, strengthened by a few cannon and soldiers.

BELEM, a town of North America, in the country of New Navarre, 180 miles north-west of Cinaloa.

BELEM, **BELLEM**, or **BELM**, a town and district of Germany, in the circle of Westphalia, bishopric of Osnabruck, and prefecturate of Iburg; 3 miles east of Osnabruck.

BELEM, or **PARA**, a sea-port town of South America, in the country of Brazil, seated at the north head of the river

Guama, which falls into the river of the Amazons. See **PARA**.

BELEM Cape, a high steep point, on the coast of Galicia, in Spain, about N.N.E. from cape Finisterre, between which is the projecting point of cape de Toriane, bearing south-west four leagues from Belem. The principal rock of this rugged point, appearing like a black tower, is called the Monk, or Munich.

BELEMNITA, in *Natural History*, a species of **NAUTILUS**, in the *testacea* order of *vermes*, with an uniform, smooth, conic, and acute shell, frequent among the fossils of Europe. See the next article.

BELEMNITE, or **THUNDERSTONE**, *Pfeilstein*, *Donnerstein*, Germ. *Belemnite*, *pierre de foudre*, *Daÿyle*, Fr. *Belemnita*, *Lapis Lynceus*, *Ideus Daÿtylus*, *Lapis Ceraunius*, **LAT.**

The belemnite is a fossil, which has obtained its name from the Greek *βελος*, an arrow, on account of its resemblance to an arrow-head. Its lengthened conical or spindle-shaped figure suggested a likeness to the finger, hence the name *daÿtylus*. The ignorant superstition of some of the ancients attributed the origin of this substance to the congealed urine of the *Lynx*, on account of its strong smell when pounded or scraped; by others it was supposed to be one of the materials of the thunderbolt, and it has derived names from both these circumstances.

The form of the belemnite is generally intermediate between a long cylinder and a very acute-angled cone; the apex is a plain rounded point; the base is somewhat concave: at a distance between the base and apex, varying in length from one-third to one-sixth of the whole, the diameter of this fossil begins to increase towards the base in a considerably greater ratio than it did from the apex; the most correct idea, therefore, of its figure, will be formed by imagining a truncated cone terminated by another much longer and more acute-angled, rounded off at the extremity instead of coming to a sharp point. It is by no means common, however, to find belemnites thus perfect, being for the most part broken off at one extremity, and not unfrequently at both. Considerable variations are observed in the form of this fossil: it is sometimes expanded and somewhat flattened at the extremity, or is nearly cylindrical, or enlarged and rounded off at the apex, so as to resemble a club. In the flattened varieties a longitudinal furrow on each side is occasionally observed. The colour of the belemnite is generally brownish yellow, with a transparency resembling alabaster. It usually consists of calcareous spar, mingled however with animal matter; for when exposed to a red heat it gives out an odour like burnt horn: sometimes it occurs converted into flint, at other times is found filled with pyrites, or even according to Volkmann, (*Silesia Subterranean*. § 155.) with galena.

If a longitudinal section is made of a perfect belemnite, it will appear to be composed, like a cow's horn, of a number of elongated conical lamellæ inserted one into the other, covering a core or alveolus, also of a conical shape, but extending never more than a third of the length from the base towards the apex. A cross fracture of this fossil beyond the alveolus exhibits a number of rays converging from the circumference towards the centre, and as many concentric circles as there are conical lamellæ.

The alveolus of the belemnite is a conical body, divided transversely into cells by bony parietes resembling watch glasses; the centre of each of which, according to Platt, Rosinus, Sage, &c. is perforated to receive a tube or siphunculus, which passes from the apex to the base of the alveolus, and thus communicates with all the cells, in the same manner as is observable in the nautilus, the ammonite, and orthocera-
tite:

time: it is remarkable, however, that Deluc (*Journal de Physiq.* vol. 19. p. 360.) altogether denies the existence of this perforation. Every paries in the alveolus serves as the base of a coroidal lamina; the number of these last, therefore, is equal to that of the cells of the alveolus.

It often happens that the alveolus of the belemnite is found detached from the other part of the fossil, and in this state it has been considered as a peculiar species of orthoceratite; while the coroidal case, deprived of this characteristic part, has been supposed to be a mere stalaçtite, or a petrified tooth of the grampus, or a spine of a species of echinus, or even of vegetable origin.

M. Deluc, denying the perforation of the alveolus, considers the belemnite as a bone belonging to an unknown animal analogous to the sepia, or cuttle-fish, apparently, however, without much reason.

The belemnite has never been met with but in a fossil slate; it occurs not unfrequently in marble, limestone, and chalk strata, together with other marine remains; and detached fragments are often found in the gravel beds that cover or adjoin these strata.

The finest English specimens have been procured from the chalk pits of Oxfordshire: the quarries of Meudon near Paris contain many perfect and beautiful varieties; but the largest species come from the Margraviate of Anspach in Prussia. *Philos. Trans.* for 1764. *Journ. de Physique*, vols. li. lii. liii. Schröter's *Lithologisches real und Verballexikon*, &c. vol. i.

BELENUS, or BELINUS, in *Mythology*, a name which the Gauls gave to the sun, which they also called *Mithra*; and as some suppose the same with the *Baal* of Scripture, and the *Belus* of the Assyrians.

Belenus, latinized by the Roman authors, according to Toland, ubi infra from 'Beal' or 'Bealan,' was understood by the Gauls and their colonies to denote the sun; and according to J. Capitolinus (Maximin. c. 22.) and Herodian (l. 8. c. 3.) he was the same deity with the Apollo of the Greeks and Romans. He was actually denominated Apollo in the inscriptions found at Aquleia, where he was honoured with a peculiar worship, under the figure of a young man without beard, with rays about his head, and an open wide mouth for uttering oracles. Tertullian (*Apolog.* c. 23.), informs us, that Belenus was the idol-deity of the Norici, and among the Illyrians, Vopiscus says (Aurelian apud init.) his forms and ornaments were the same with those of the Mithra of the Orientals. The sun, indeed, seems to have been the most ancient and universal object of idolatrous worship; inasmuch that perhaps there never was any nation of idolaters which did not pay some kind of homage to this glorious luminary. Accordingly, he was worshipped by the Gauls and ancient Britons with great devotion under the various appellations of Bel, Belinus, Apollo, Graunius, &c. names which in their language were expressive of the nature and properties of that visible fountain of light and heat. To this illustrious worship, those famous circles of stones, called cairns, or carns, of which there are not a few still remaining, seem to have been chiefly dedicated; where the Druids kept the sacred fire, the symbol of this divinity, and from whence, as they were seated on eminences, they had a full view of the heavenly bodies. The first day of May was, in the Druidical rites of worship, a great annual festival in honour of Belenus, or the sun. On this day prodigious fires were kindled in all their sacred places, and on the tops of all their cairns, and many sacrifices were offered to that glorious luminary, which now began to shine upon them with great warmth and lustre. Of this festival there are still some vestiges remaining, both in Ireland and in the highlands of Scotland, where the first of May, is called "Beltein," i. e. the fire of Bel or Belinus.

Two such fires, says Toland, were kindled near one another on May-eve in every village of the nation, as well throughout Gaul, as in Britain, Ireland, and the adjoining lesser islands, between which fires the men and beasts to be sacrificed were to pass; from whence came the proverb "between Bel's two fires," meaning a person in a great strait, not knowing how to extricate himself. One of the fires was on the cairn; the other on the ground. On the eve of the first day of November there were also such fires kindled, accompanied with sacrifices and feasting. All the people of the country on this eve extinguished their own fires entirely; and every master of a family was religiously obliged to take a portion of the consecrated fire home, and to kindle the fire anew in his house, which for the ensuing year was to be prosperous. The Celtic nations also kindled other fires on Midsummer eve, which are still continued, says Toland, by the Roman catholics of Ireland, making them in all their grounds, and carrying flaming brands about their corn-fields. This is done likewise in France, and in some of the Scottish isles. These Midsummer fires and sacrifices were intended for obtaining a blessing on the fruits of the earth, now ready for gathering; as those of the first of May, that they might prosperously grow; and those of the last of October were a thanksgiving for finishing their harvest. But in all of them regard was had to the several degrees of increase and decrease in the heat of the sun. Toland's *Hist. Druids* in his *Works*, vol. i. p. 69, &c. Henry's *Hist.* vol. i. p. 156, &c.

BELERIUM, (D. od. Sic. l. v. c. 22.) or BOLERIUM, (Ptolem. l. ii. c. 3.) called also by Ptolemy "Antivestæum" in *Ancient Geography*, is the promontory formed by the most western point of Britain, now known by the name of "Land's End."

BELLESME, in *Geography*, a town of France in the department of the Orne, and chief place of a canton in the district of Mortagne, 3 leagues S. from it. The place contains 2708 and the canton 13,022 inhabitants; the territory includes 170 kilometres and 15 communes.

BELESTA, or BELESTAT, a town of France, in the department of the Aude, and chief place of a canton, in the district of Quillan, 10 miles west of Quillan.

BELETTE, in *Zoology*, a name under which Buffon describes the common weevil, *mustella affinis* of Gmelin.

BELEZ, in *Geography*, a town of South America, in Terra Firma, and province of New Grenada.—Also, a river of Spain, which runs into the Mediterranean, between Barcelona and Taragona.

BELFAST, a considerable town of Ireland, in the county of Antrim, and province of Ulster, situate at the mouth of the river Lagan, which separates it from the county of Down. The town, except a small portion of it, is not elevated more than six feet above high water mark at spring tides. Belfast lough, or the bay of Carrickfergus, into which the Lagan flows, is a spacious æstuary, a great part of which is left dry every tide, which is the case likewise with Strangford lough, another great æstuary, the nearest extremity of which is distant about 8 miles S.E. Between Belfast and Lough Neagh, which is about 12 miles west of it, there is a chain of mountains, the highest of which, called Devis, is about 1580 feet high. The roots of these mountains extend to the neighbourhood of the town. Mr. Arthur Young found them to consist of very good loam to their summits, and complains of their being neglected. As tillage, however, is improving in that neighbourhood, it may be supposed that there is no longer cause for such complaint. There was formerly a castle at Belfast, which seems to have been a post of importance, as it was twice taken and destroyed by the earl of Kildare,

lord deputy, in 1503 and 1512. After the complete reduction of Ireland at the beginning of the 17th century, Belfast became the property of Sir Arthur Chichester, afterwards lord deputy, and baron of Belfast, who exerted himself in the settlement of Ulster. Through his influence it was made a borough, and sent two members to the Irish parliament; and an English gentleman, who travelled through part of Ireland in 1635, and whose manuscript journal is in the possession of general Vallancey, mentions that lord Chichester had a stately palace at Belfast, which was the glory and beauty of the town, and which was his chief residence. Through the influence of this nobleman, the custom-house was removed from Carrickfergus to Belfast by the earl of Strafford in 1638, for which a compensation of 2000*l.* was paid to the corporation of Carrickfergus. In 1648, Belfast was taken possession of by colonel (afterwards the celebrated general) Monk, for the parliament of England. So late as 1726, when Boate's Natural History of Ireland was re-published by Dr. Molyneux, it was a small place of little consequence. But situated in the centre of a populous and industrious country, it has since become one of the most interesting objects in Ireland to the political economist. The town is well-built, mostly of brick, and the streets are broad and straight. The bridge over the Lagan is 2560 feet long with 21 arches; it was built about the time of the revolution, at the joint expence of the counties of Antrim and Down, and cost 12,000*l.* Eighteen of the arches are in the former, and three in the latter county. With regard to size it is the fifth, and with respect to commerce, is generally reckoned the third town in Ireland, being next to Dublin and Cork. Vessels of 200 tons halt loaded used to come to the quay, there being about ten feet water at spring tides, but now the water at the quays is from nine to thirteen feet deep according to the time of the moon, having been deepened by the exertions of the ballast corporation. Vessels which cannot come to the quays lie two miles and a half below the town, where there is very good anchorage. The West India trade was considerable before the late war, and has revived since the restoration of peace. The trade in pork and butter has increased very much of late years; and also the American trade. The export of linen both to England and America is very considerable. In 1775, the gross custom, according to Mr. Young, amounted only to 64,800*l.* including the excise upon tobacco and foreign spirits. In 1797, it amounted to 87,016*l.* 6*s.* 2*d.* In the following year it decreased on account of the disturbed state of the country, but it has since gradually risen; and in the year ending 5th April 1802, amounted to 246,890*l.* 9*s.* 4½*d.* The excise of Belfast in 1796 was only 9097*l.* 13*s.* 2*d.* but previous to the stoppage of the distilleries it had risen to 22,165*l.* 3*s.* 6*d.* exclusive of Carrickfergus and Templepatrick, which wards are included in the same district. The duty on licences in 1801, amounted to 4309*l.* Though the increase, as in other places, must be partly attributed to the increase of duties, yet the extension of trade must also have been considerable. The population of Belfast was taken at different periods by a gentleman who filled the office of high constable: but not officially. In 1782, the number of inhabitants appeared to be 13,105, and in 1791, 18,320, exclusive of 1,208 in Ballymacarret, the suburbs on the Down side of the river Lagan. There were in 1791, 695 looms, of which 522 were employed in the cotton manufacture, 129 in that of cambric and linen, 28 of sailcloth, and 16 of flockings. There are also manufactories of glass, sugar, and earthen-ware. The public buildings are not many; the linen hall is large and commodious, and there is a good assembly-room over the Exchange. There is a barrack which contains about 300 men. The church is a

handsome structure, but is too small for the parish. Other places of worship are, four presbyterian meeting-houses, one seceding, and one Methodist meeting house, and one Roman Catholic chapel. The charitable institutions are, a poor-house and infirmary, which maintains and clothes 300 of various ages, and is conducted on the same plan as the Dublin house of industry; a fever-hospital, a dispensary, a lying-in hospital, a charity-school for boarding girls, a day-school for boys and girls, a Sunday-School, and a School of industry for the blind, none of them very extensive, but sufficiently so for such an industrious country. It is probable that the Hamburg plan, described by Mr. Voght, from which such unspeakable benefit has been derived, would succeed better in Belfast than in any other town of Ireland, and from the public spirit and active disposition of the inhabitants, it would, without doubt, be well attended to. In such a town as Belfast, many commercial institutions might be expected; and we accordingly find a chamber of commerce, a ballast office corporation, two insurance offices, &c. There are also a library society, under the title of the *Belfast Society for Promoting Knowledge*: and a literary society, lately established on a plan similar to that of other societies for philosophical and literary purposes. An academy for the education of the higher class in this town, was founded by the inhabitants in 1786, and has been hitherto under the care of a presbyterian minister, but the advantages of it are not confined to any sect. Belfast is situated 80 miles north of Dublin, and sends one member to the imperial legislature. W. long. 5° 49'. N. lat. 54° 43'. Variation W. August 8th, 1789, 11° 15' P. M. 26° 20'. Arthur Young's Tour. Dr. Beaufort's Memoir, &c. &c.

BELFAST, a township and bay of America, in Hancock county and district of Maine, both situate in the Waldo Patent, at the mouth of Penobscot river, and on its western side, 38 miles N. E. by E. from Hallowell, and 246 N. E. from Boston. The town contains 245 inhabitants. The bay, on the north-western part of which the town stands, runs up into the land by three short arms. In the middle of it lies Isleborough island, which forms two channels leading to the mouth of Penobscot river.

BELFORD, a market town of Northumberland, England, is seated on the great post road from London to Edinburgh, at the distance of 322 miles from the former. This town, though small, is particularly neat, and its houses are ranged on the ridge of a hill, which commands a view of the North sea. The church was built in 1700; near it are the ruins of an old chapel, and at a short distance are the foss and vallum of an ancient encampment. Here are a weekly market on Tuesdays, and two annual fairs. The number of houses in the township is 161, and of inhabitants 902.

About four miles east from Belford, is Bamborough castle, the origin of which is attributed to king Ida, who began his reign about the year 559. The present remains are considerable, and appear to be wholly the relics of Norman architecture, though our historians are decidedly of opinion that they occupy the site of a Saxon fortress or palace. This was besieged in the year 642, by Penda, the Pagan king of the Mercians, but without success. In the year 710, king Osred, on the death of Alfred his father, sought refuge here, with Brithric, his tutor or guardian, and after a gallant defence, repulsed Edulph and his partizans. In the reign of Egbert, this castle was made the prison of Kenulph, bishop of Lindisfarne, who was confined here from 750 to 780. In many subsequent periods, it was the scene of repeated sieges, and suffered successively by the Danes, by the Normans, and by the Yorkists.

BELFORTE, a town of Italy, in the duchy of Parma, 19 miles S.S.W. of Parma.

BELFRY, **BELFREDUS**, is used by military writers of the middle age for a fort or tower, erected by besiegers to overlook and command the place besieged.

They were all called *berfridi*, *berfredi*, *verfredi*, and *belfragia*. Their structure and use are described in verse by a poet of those days.

Belfry originally denoted a high tower, whereon sentinels were placed to watch the avenues of a place, and prevent surprize from parties of the enemies, or to give notice of fires by ringing a bell. Du-Cange.

In the cities of Flanders, where there is no belfry on purpose, the tower of the chief church serves the same end. The word belfry is compounded of the Teutonic "bell" and "fried," *peace*, because the bells were hung for preserving the peace.

BELFRY, is also used for that part of a steeple wherein the bells were hung. This is sometimes called by middle-aged writers *campanile*, *clocharia*, and *triflegum*. Du-Cange. This is sometimes used in *Heraldry* as a crest.

BELFRY, is more particularly used for the timber-work, which sustains the bells in a steeple; or that wooden structure, to which the bells in church-steeples are fastened.

BELFRY, *Great*, in *Ornithology*, the alarm thrush of Latham, and turdus tinens of Gmelin, le grand belfroi of Buffon, is so called by this latter naturalist, from the singular sound which it makes in the evenings and mornings, and which resembles the din of an alarm bell. The succession of sounds is as rapid as the quick strokes of a bell, and continues about an hour. See **TURDUS TINNENS**. The "small belfry," is the speckled thrush of Latham, and **TURDUS LINEATUS** of Gmelin, which see.

BELGÆ, in *Ancient Geography*, were Scythians or Goths, who, advancing from Asia, drove the Cimbrî or northern Celts before them; and at a long period preceding the Christian era seized on the north-west part of Gaul, where they acquired the provincial denomination of Belgæ; and from them the country which they inhabited obtained the name of Belgic Gaul. Writers are not agreed as to the etymology of this appellation. As they were a fierce, contentious, and warlike people, and disposed to domineer over all their neighbours, according to the character which Cæsar (Comment. l. ii. c. 4.) has given of them, some have supposed that they were called "Belgæ" on that account; the word "Belgæ" is the old Teutonic signifying "fierce" and "quarrelsome." Others have supposed, that the term "Belgæ" is synonymous with the Celtic "Belighis," and that it signifies, persons who inhabited the *low northern part*. Others again have derived Belgæ from "Belgen" or "Vulgen" signifying stranger. Some time after their settlement in Gaul, but at an unknown period, they penetrated into Britain; and accordingly when Cæsar first explored this island, he informs us (l. v. c. 10.) that the primitive inhabitants were driven into the interior part, while the regions on the south-east were peopled by Belgic colonies. The Belgæ may, therefore, be justly regarded as the chief ancestors of the English nation. On the continent, the Belgæ having taken possession of part of Gaul, and being naturally a ferocious people, waged frequent wars with the Germans; so that these two nations continued in a state of hostility and friendship, sometimes invading each other's territories, and at other times assisting each other against the Romans. In the time of Cæsar, the Belgæ, alarmed at the success of the Romans in their expeditions against the Germans, formed a grand alliance with the Celts, Germans, and Gauls, in order to drive them farther from their neighbourhood. Cæsar, according to his usual manner, found means to sow such dissensions among them, that many of these allies submitted to him; however, the Nervii, Attre-

bates, and Veromandi, stood firm, and though at length defeated, it was one of the dearest victories which Cæsar had ever obtained; and, in consequence of this defeat, the whole Belgic nation was compelled to submit to the Roman yoke. The Belgæ of Britain were seated to the east of the Durotriges, on the same coast, and inhabited the counties now called Hampshire, Wiltshire, and Somersetshire. When Cæsar invaded Britain, some part of this country was possessed by the Segontiaci, whose chief town was Winchester, called by the Britons "Caer-seguent," from the name of these, its ancient inhabitants. But these people seem to have been soon after subdued by and incorporated with the Belgæ, as they are never afterwards mentioned. As to the first introduction of the Belgæ into Britain, history is silent; but with respect to some few of the latest colonies who settled here not very long before the Roman invasion, and who inhabited the south parts of Britain, Cæsar informs us, (l. v. c. 10.) "that the sea-coast of Britain is peopled with Belgians, drawn thither by the love of war and plunder." "These last (he says) passing over from different parts, and settling in the country, still retain the names of the several states from whence they were descended." The latest of these Belgic colonies came into Britain only a few years before Cæsar's invasion. This colony was conducted by Divitiacus, king of the Suetonides, one of the most powerful of the Belgic nations in Gaul; and having obtained a footing on the British coast, he continued to reign over the Belgæ in this island, as well as over his ancient subjects on the continent. In his continental territories, he was succeeded by Galba, and in his British dominions by another of his sons, perhaps Segouax, who attempted to destroy Cæsar's fleet. Although the Segontiaci submitted to Cæsar, we have no account of the submission of the Belgæ to that conqueror. The honour of subduing that British nation was reserved to Vespasian, who, landing an army in these parts, A. D. 49, fought 32 battles, took more than 20 towns, subdued two very powerful nations, one of which was the Belgæ, and the Isle of Wight. After this time, the country of the Belgæ was much frequented by the Romans, who made in it many excellent military ways, and built several beautiful towns, which are mentioned by both Ptolemy and Antoninus. The most remarkable of these towns were Venta Belgarum, Winchester, famous for the imperial weavery which was there established, and Aquæ Solis, Bath, even then renowned for its warm and salutary springs. The country of the Belgæ was included in the Roman province, called Flavia Caesariensis, and governed by the president of that province, and his inferior officers. Henry's Hist. vol. i. p. 246, &c.

BELGARD, or **BELGARUM**, in *Geography*, a town of Germany, in the circle of Upper Saxony, and chief place of a circle to which it gives name, in the duchy of Pomerania, seated on the Perfante, and noted for its market for horses. It was a place of some distinction as early as the 11th century, for its strength and for the number and valour of its inhabitants; but it has suffered much by fire and by war; particularly by the 30 years' war. By the treaty of Westphalia, it devolved to the house of Brandenburg. It has a castle and a provostship, and is the seat of a royal balliage. N. lat. 54° 10'. E. long. 16° 51'.

BELGERN, a town of Germany, in the circle of Upper Saxony, and margraviate of Meissen, seated on the river Elbe, 36 miles N. W. of Dresden, and 24 N. W. of Meissen.

BELGERS, a town of Asiatic Turkey, in the province of Caranania, 78 miles west of Cogia.

BELGEVAN, a town of Asia, in Tartary, in the kingdom of Bucharia, and province of Catland.

BELGICA, in *Conchology*, a species of **SABELLA**, very

briefly described by Gmelin, as having a conic shell "testa conica;" and is said to be found on the shores of Holland.—Obs. This is supposed by some to be the *fabella granulata* of Linnaeus, and *tubiformis* of Pennant; but it is by no means certain that even the two last are of the same species: we think they are not; and it may admit of equal doubt whether either of them be the species Gmelin describes as *belgica*. The last mentioned author seems to be under no small difficulty in this respect himself, for he entirely omits taking the slightest notice of either as species, or even amongst his synonyms. *Sabella tubiformis* of Pennant is undoubtedly different from *fabella belgica* of Gmelin, according to Klein and Martini, to which he refers. Vide *Donov. Brit. Shells*, pl. 133.

BELGICA, in *Ornithology*, a species of *SCOLOPAX*, with a very straight bill, black at the tip: head, neck, and breast ferruginous: abdomen white; back, wings, tail, and legs black. *Nozem. nederl Vogel. t. 27.* A native of Holland, and feeds on worms, &c.

BELGICA GALLIA, in *Ancient Geography*, one of Cæsar's three divisions of Gaul, or Gallia, the other two being Aquitania, and Celtica, or Gallia propria. Gallia Belgica was bounded by the ocean to the north, by the Sequani (Seine) and Matrona (Marne) to the west, by the Rhine to the east, and to the south by various limits, at different times. Cæsar appropriated the Sequani and Helvetii to that part of Gallia Celtica which was afterwards called "Lugdunensis." But Augustus, when he made a new partition of the provinces, transferred the Sequani and Helvetii to Gallia Belgica. According to the distribution of Ptolemy, Gallia comprehended four parts, viz. Aquitania, Lugdunensis, Belgica, and Narbonensis. See *GALLIA*. Mentelle, in the *Encyclopedie Methodique*, divides Gallia Belgica into *Belgica prima*, comprehending the Treveri, Mediomatrici, Verdunenses, and Leuci; and *Belgica secunda*, including the Nervii, Morini, Ambiani, Bellovaci, Silvanectes, Vadicasses, Suesfiones, Veromandui, Atrebatas, Remi, and Catalauni. The capital of the Treveri, viz. Augusta or Treveri, was the metropolis of *Belgica prima*. *Belgica secunda* contained a great number of cities, and comprehended Lorraine and Champagne; whilst *Belgica Prima* contained a portion of the isle of France, Picardy, and Artois. *Belgic Gaul* comprehended those provinces of the Netherlands now called the *Belgic provinces*, which were formerly subject to the house of Austria, but which have been recently annexed to the French dominions. See *NETHERLANDS*.

BELGICA, Balchuyfen, a village of Gallia Belgica, in the country of the Ubii, between the rivers Rhone and Roer, 8 miles from Marcomagum, according to the itinerary of Antonin, in *Germania secunda*, or *Inferior*, south-west of *Colonia Agrippina*.

BELGINUM, BINGEN, or BALDENAU, a place of *Germania prima*, or *Superior*, a province of Gaul, at some distance to the east of *Augusta Trevirorum*.

BELGIUM, a canton of Gallia Belgica, from which it is distinguished by Cæsar (l. v. c. 24.) as a part from the whole; to this canton he assigns the Bellovaci, to whom Hirtius (l. viii. c. 46 and 47.) adds the Atrebatas. And as the Ambiani were feated between the Bellovaci and Atrebatas, these also must be included in Belgium, which must have extended to the sea. These three people, says Cellarius, were the proper and genuine Belgæ, all the rest being adventitious, or foreigners. See *AMBIANI, ATREBATII, and BELLOVACI*.

BELGIUS, a river of Africa in Libya. Hesychius.

BELGNEA, a town of Arabia Deserta. Ptolemy.

BELGOROD, in *Geography*. See *BIELGOROD, and AKERMAN*.

BELGRADE, ALBA GRÆCORUM, a town of European Turkey, the capital of Servia, seated on the side of a hill, at the conflux of the Save and the Danube. It was formerly a very strong place, but is now destitute of fortifications, and it was accounted the barrier and key of Hungary, to which it was first annexed by the emperor Sigismund.

The number of inhabitants is now supposed to amount to about 25,000. The suburbs are extensive, and it has a great resort of Turkish, Jewish, Greek, Hungarian, Armenian, Austrian, and Slavonian merchants. The streets, in which the chief trade is carried on, are covered with wood, as a shelter from the sun and rain; the shops are small, and the commodities that are sold are conveyed out of a window, as the buyers never enter them; the richest merchandize is exposed to sale in two bazars that cross each other; and there are two exchanges constructed with stone, and supported by pillars. There are likewise at Belgrade a caravanserai, or public inn, and a college for young students. Its situation near the rivers renders it convenient for commerce; and as the Danube falls into the Black sea, and affords a passage to Vienna, trade is easily extended to distant countries, so that Belgrade is a staple town in these parts. The Armenians and Jews are employed as factors; the former have a church, and the latter a synagogue in this place. In the environs of Belgrade are several small villages near one another, and almost all of them inhabited by Greeks. The fields present some degree of culture; and the whole adjacent country affords fine clusters or stalk-fruited oaks (*quercus racemosa*, Lamarck) whose wood is very hard and very fit for ship-building. Some few vineyards and gardens are to be seen in the vicinity of Belgrade. The aqueducts, constructed by the emperors of the east for conveying water to Constantinople, attract admiration. See *AQUÆDUCT*. N. lat. 45° 10'. E. long. 21° 12'.

The possession of Belgrade has been repeatedly disputed between the Austrians and Turks. In 1521, it was taken by the Turks, after having been attacked in vain by Amurath II. in the preceding century, but recovered by the Imperial army in 1688. In 1690, it fell again under the Turkish yoke, from which the Austrians unsuccessfully attempted to regain it in 1693. By the treaty of Carlowitz in 1699, the Turks remained in possession of it; but in 1716, it was besieged by prince Eugene, and after a severe contest it was compelled to surrender to the Imperial arms.

Belgrade is chiefly famous in the history of military operations on account of the battle fought in its vicinity in the year 1717, the result of which was the last great victory obtained under the auspices of the celebrated prince Eugene, and which decided the event of the war then depending between the German and Ottoman empires.

The Turks, notwithstanding the losses they had sustained during the campaign of 1716, determined to make the most vigorous efforts for the preservation of their Hungarian acquisitions. The imperialists were equally desirous of terminating the war by some important action. Prince Eugene, having concentrated the Austrian forces in the bannat, on the 15th of June effected the passage of the Danube in boats with 30,000 of his troops without the loss of a man, in presence of some Turkish corps stationed on the southern bank, who, without attempting an opposition, threw themselves into Belgrade. A bridge of boats was immediately constructed for the passage of the rest of the army, the horse, and artillery, and by the 19th of the same month, Belgrade was completely invested.

The first care of prince Eugene, who foresaw that the Turks would venture a battle to relieve the place, was to fortify his camp in such a manner as might enable him to

BELGRADE.

cope with an army much superior in number to his own. He accordingly began to call up lines of circumvallation and contravallation, strengthening them with entrenchments, redoubts, and other field works of the necessary description. Within these lines the army encamped to the south of Belgrade; its front towards the open country, its left resting upon the Danube; its right extending towards the Save. A bridge of boats was thrown across the latter river, and, as well as that already constructed on the Danube, secured by strong *tetes de pont*. The line of contravallation, looking towards Semedria, consisted of a ditch, sixteen feet wide, of proportionable depth, and defended by a strong parapet. The proper openings were left for the troops to issue and form in order of battle without confusion, covered in front by ravelins and redans; and upon the right, a large *fleche*, or redoubt, was erected for the purpose of commanding a hollow ground, which the Turks might otherwise have found serviceable in their approaches. The field pieces of all the different battalions, planted at regular distances along the front of the contravallation, secured it from any sudden insult. As, however, the army was not sufficiently numerous to occupy the whole extent of ground between the two rivers, cross entrenchments were formed, connecting the principal lines on the right and left, and still preserving a communication with the different bridges.

As the Turkish garrison consisted of between twenty and thirty thousand regular troops, and had also a strong flotilla on the Danube, prince Eugene found it absolutely necessary to maintain two flying camps: one of several thousand men at Semlin, to keep up a communication with Peterwaradin, from whence the Imperialists derived their supplies of provisions, under Count de Hauben; and another of five battalions and some cavalry to cover the head of the bridge over the Danube. Four ships of war protected the navigation of that river, and watched the motions of the Turkish flotilla. But a violent storm which happened on the 13th of July, had nearly rendered abortive the projects of the besiegers. The bridges of the Danube and Save were broken by the force of the tempest. Several vessels, detached from the rest, were carried floating at random down the stream, and the Turks took advantage of this accident to make a sally across the Save, and attack the redoubt which covered the head of the bridge. The gallant defence of a captain and 64 men, who alone garrisoned the post, preserved it, together with that part of the bridge which remained on the north side of the river, from falling into the hands of the enemy. To prevent such forties in future, the camp of Semlin was strongly reinforced, and the command entrusted to count Marigny. More serious operations commenced; and during the night of the 18th, trenches were opened against Belgrade to the north of the Save by 1,200 pioneers, covered by a large detachment under general Marsigli. The Turks, however, the following morning, opened a dreadful fire upon them from all the batteries of the place, the flotilla on the Danube, and the islands in that river, and making a sortie with 4000 men in boats, assaulted so furiously the guard of the trenches, that if prince Eugene had not animated the troops by his personal presence and bravery, in repulsing the attack, a total defeat must have ensued. As it was, general Marsigli, with twenty other officers of note, and 400 soldiers, perished in this affair. It became necessary to augment the guard of the trenches to nine battalions, and construct new lines. In six days a complete chain of works was established from the bridge along the Save to its influx with the Danube, and from thence ascending the course of the latter river to the camp of Semlin, defended with redoubts, and well provided with artillery: inasmuch,

that from the moment of their completion, the garrison attempted no farther sallies.

On the 23d of July, the cannonade and bombardment commenced from all the Austrian batteries, with dreadful effect, and by the 30th, Belgrade resembled, towards the water, a heap of ruins. But the excellent state of their fortifications on the side of the besieging camp, and expectations of approaching succours, animated the garrison to maintain a most vigorous resistance. Their expectations were not delusive. The grand vizier, having drained the Turkish provinces of soldiers to complete his army, had already begun his march, and on the 28th his advanced parties appeared in fight, and began to skirmish with the Austrian out-posts. The number of these marauders daily increased, and on the last of July, the vizir with his whole army arrived in presence of the Imperialists. But instead of attacking prince Eugene as the latter expected, he encamped upon the heights above the Austrian camp with all his forces, supporting his right flank by the Danube and stretching his left towards the Save. The following days were spent in preparing batteries, throwing up entrenchments, and making approaches against the works of the Imperialists, as if they had literally been a town besieged. Eugene found himself compelled, by this mode of attack, to adopt new dispositions. He instituted additional artillery on his own lines, defended all the avenues with chevaux de frize, mined the ground before the *fleche* already mentioned, and called in part of his troops from the opposite bank of the Save. Nevertheless, the Turks, pursuing their projected plan of operations, pushed their approaches in spite of the dreadful havoc which the Austrian bombs and grenades incessantly made among them to within musket shot of the contravallation. Their army amounted to upwards of 200,000 men. Their works were mounted with 140 pieces of cannon and mortars. The garrison, who now sustained some respite from the fire of the Austrian batteries, directed their own upon the tents of the besiegers, and thus situated, between two hostile armies, who from their situation commanded more or less every part of his position, Eugene found himself enfiladed by the fire of upwards of 250 pieces of artillery. His situation became every day more precarious. The dysentery, which for the last month had done great mischief in his camp, now raged to such a degree that hundreds were buried in a day. A mortality prevailed among the horses, in consequence of which half of the cavalry were dismounted; and an army which, at the opening of the campaign, amounted to above 80,000 men, could not now muster 60,000 effective. Though no immediate scarcity of provisions or ammunition was experienced, yet the disappointment of the expectations prince Eugene had conceived, that the Turks would be obliged to retire for want of provisions, obliged him to determine without delay on some decisive measure; especially as the vizier had occupied an eminence adjoining the Save, with a considerable body of troops, and might, by sending 20 or 30,000 men across the river, have rendered a retreat, in case of defeat, impracticable to the Austrians. Under these circumstances, it was resolved, in a general council of war held on the 15th of August, to be beforehand with the enemy, by making a decisive attack on their camp. The detachments beyond the Save were immediately called in, except about 1,400 foot, and 300 horse. Seven regiments of cavalry and ten battalions with all the dismounted horse and dragoons, were left in the lines to observe the garrison. Eleven regiments of cavalry, commanded by field marshal count Palfi, and general count Merzi, composed two lines on the right, and marched out before midnight. The left wing, consisting of 12 regi-

BELGRADE.

ments, marched out at the same time, commanded by general Montecuculi and Martigny. The infantry, under prince Alexander of Wirtemberg, in chief, was drawn up in the centre; the first line of 22 battalions, conducted by count Maximilian of Staremberg, and count Harrach; the second, of 18 battalions, by the prince of Bevern. The corps de reserve, with which marshal Seckendorf remained in the lines, ready to act as occasion should require, was composed of nine battalions. The effective force of the two lines, on whom the success of the day in a great measure depended, did not amount to more than 40,000 men; yet, notwithstanding this immense inferiority, the confidence of the soldiers in their commander was such, that they received the orders to prepare for action with the greatest cheerfulness, and marched out, as if inspired with a certainty of victory.

At one in the morning the Imperialists, favoured by a thick fog, quitted their trenches: The right advancing towards the *fleche*, which was assigned as its point of formation, and the left over the open ground adjoining the Danube. Two hours were spent in making the necessary preparatory movements; but the fog, which had hitherto favoured the Imperialists, increased to such a degree as to become productive of serious inconvenience. The right wing, missing its way, tumbled, instead of the *fleche*, upon one of the Turkish advanced works. The surprise was equal on both sides; but a discharge which immediately opened upon the Austrian cavalry from the guard of the trenches, spread the alarm throughout the whole of the grand vizier's army. His troops hastily rushed from every part of the camp towards the scene of action, and in a few minutes count Palfi became hotly engaged. The Austrians, formed in a hurry, and their battalions, through fear of losing the support of the cavalry, inclining successively to the right flank, a wide vacancy was left in the centre, and afforded the Turks an advantage of which they did not fail to profit. Meantime, the combat, once engaged on the right, quickly commenced on the opposite flank. Prince Eugene had intended to begin the attack with both wings at the same time; but convinced by the heavy firing he heard towards the Save, that Palfi had already begun the battle, he was himself obliged to come to blows, before the battalions of his left wing were completely formed. It was now between four and five o'clock in the morning. The fog continued so thick as to prevent the combatants from discerning each other, till they arrived almost close to the muzzles of their adversaries' pieces; and owing to this obscurity several small detachments of Austrians, whom a desire to signalize themselves carried unawares into the thickest of the enemy, were entirely cut off. The assailants nevertheless gained ground. As the darkness obliged them to march with their firelocks always presented, the fire they poured in, the moment they perceived their enemies, was so close, well directed, and did such prodigious execution, that the Turkish battalions, as they advanced in succession, were broken, dismayed, and precipitated headlong into their trenches, where the bayonet and sabre made dreadful havoc among them. The cavalry were not equally successful; the broken nature of the ground obliged them to perform frequent evolutions in order to find some passages of easier access, and the Turks, who lined the trenches, galled them with severe and incessant firings. The centre of the enemy's army too finding nothing to oppose them, threw several battalions into the void space between the flanks of the Imperialists, and completely intercepting all communication, opened a heavy fire to right and left upon the divided forces. The battle, under the present circumstances, seemed irrecoverably lost, but the fog, at this critical mo-

ment clearing up, discovered to prince Eugene the disposition of both armies, and his own perilous situation. The advance of the second line prevented his total defeat. The prince of Bevern, who commanded it, marched up to the Turks, whose success had thrown them into disorder, and charged with such fury, that the infidels, unable to sustain the shock, fled in disorder, and were pursued up to their very trenches, leaving the space where they had been defeated covered with their dead. This success gave a new turn to affairs. No time was lost in filling up the interval that had been so unwarily left, and in forming the two wings of the imperialists for a new effort. The impatience of the soldiers to engage prognosticated success. The right began the attack; carried with irresistible impetuosity the batteries whose fire they had hitherto sustained, and turned the cannon against the entrenchments which protected the Turkish camp. The left experienced more opposition. The enemy had their principal forces on that side, and these, reinforced by several corps whom the success of count Palfi had driven from the right, constituted an immense superiority. The janizaries defended themselves with great bravery, and repulsed the Austrians in their first attack; but these rallying, returned to the charge, beat the Turks from their outermost entrenchment, and pushing their advantage, advanced regularly up to the second, without firing a musket till they came within ten paces of the enemy. This work was carried in less time than the first: the Turkish entrenchments were forced one after another, as well as several *coupures* with which their camp was defended; and notwithstanding resistance was attempted at each of them, and the Austrians experienced every where a terrible fire, yet the courage and conduct of prince Eugene surmounted every obstacle, and obliged victory, after a struggle of six hours, to declare in his favour. The last serious stand made by the infidels, was at a grand battery mounted with 18 pieces of cannon, and defended by 20,000 janizaries, sustained by 10,000 spahis, the bravest troops in the Turkish army. It was necessary to halt and form the troops anew for this perilous attempt; but when the word to charge was given, they rushed forward with an impetus nothing was capable of resisting. The Imperial grenadiers, in defiance of the fire from the battery, bore down all opposition, mounted through the embrasures, and drove the Turks from their guns; while the rest of the army made such slaughter, that the bodies of the slain rose in heaps round the redoubt. The routed forces, driven on all sides from their entrenchments, retired into the plain, as if to form once more for the defence of their camp; but observing the Imperialists, after having gained the heights, advancing towards them in good order, they betook themselves to flight in every direction, leaving their camp, baggage, and ammunition, at the mercy of the conquerors. The victory was complete by 9 o'clock in the morning. The plunder of the infidels' camp, which resembled a large city, was given to the soldiers.

This battle, fought on the 16th of August 1717, cost the Turks 10,000 of their best troops killed in the action, and 3,000 in the pursuit. About 5,000 were wounded, and nearly the same number made prisoners. In the Turkish camp and lines were found 131 pieces of brass cannon, 30 mortars, and an immense quantity of powder, bullets, bombs, and grenades. There were also taken 52 colours, 9 horse-tails, and other military trophies. The loss on the German side, by reason of the fog, was not in proportion to the length of the fight. Their killed amounted to nearly 3,000 men, among whom were the generals count Hauben and Dalberg; and about 4,500 were wounded. Of the latter, however, only about 2,000 recovered. In consequence of this great victory,

viſion. Belgrade ſurrendered on the 19th; the gariſon ſtill conſiſting of more than 25,000 men, being allowed to march out with all their effects. Its fortifications towards the land were in a moſt excellent ſtate, and more than 400 pieces of cannon and mortars found on the works in the arsenals, and on board the ſtella on the Danube.

Belgrade, which the prince of Paſarowitz left in poſſeſſion of the Auſtrians, was ſucceſsfully attacked by the Turks in 1739; but by the treaty concluded that year under the mediation of France, was reſtored to the Porte. Its fortifications were, however, previously demolished. In 1789, it was beſieged (Sept. 12.) by an Auſtrian army under marſhal Laudon, who in his approaches made uſe of the old lines of circumvallation conſtructed by prince Eugene, and which the Turks, from an unaccountable negligence, had neglected to fill up. The marſhal, aſſiſted by a numerous and well-ſerved train of artillery, proceeded with ſuch rapidity in his attacks, that after all the ſuburbs and outworks had been carried ſword in hand, the gariſon, apprehenſive of a ſtorm, ſurrendered (Oct. 8.) upon honourable terms. Immeaſurable ſtores, with about 300 pieces of artillery, were found in the place. Belgrade was, however, anew given up to the Turk in 1791, at the peace of Siſtova, ſince which time it has continued quietly in their poſſeſſion.

BELGRADE, a townſhip of America, in the county of Lincoln and diſtrict of Maine, incorporated in 1796; formerly called Walington-plantation. It lies weſt of Sidney, and between Androſcoggin and Kennebeck rivers.

BELGRADO, a town of the Venetian ſtates of Italy, in Friuli, ſituate near the river Tagliamento. N. lat. 46°. E. long. 13° 51'.

BELHAVEN, the former name of Alexandria, in Fairfax county, Virginia. See ALEXANDRIA.

BELIA, in *Entomology*, a ſpecies of PAPILIO, with entire white wings; the lower ones yellow, and ſlightly ſcaſated with grey beneath. A native of Barbary. Fabricius.

BELIA, in *Ancient Geography*, a town of Hiſpania Terraſotenſis, in the country of the Hedetani (Ptol.), eaſt of Bilbilis, and nearly ſouth-eaſt of Cæſar-Auguſta (D'Anville); now *Bellevic*, which ſee.

BELIAL, formed of בל *non*, nothing, and יל, denoting in Hebrew, to profit, q. d. unprofitable; in *Scripture Hiſtory*, ſignifieth a wicked, worthless perſon, who is ſubjected to eternal ſubjection. Thus the inhabitants of Gibeon, who abuſed the Levite's wiſe, are ſigmatiſed by the name of Belial. (Judges, xix. 22.) Hophni and Phineas Eli's ſons, are called ſons of Belial in Sam. ii. 12, on account of the ſeveral crimes they had committed, and their indecorous behaviour in the temple of the Lord. Sometimes, ſays Calaneo, the name Belial is uſed to denote the devil. To this purpoſe, he cites 2 Cor. vi. 15, where the apoſtle Paul ſays, "What concord hath Chriſt with Belial?" whence it appears, as he ſuppoſes, that in the apoſtle's time, the Jews, under the name of Belial, commonly underſtood the devil in the places where this term occurs in the Old Teſtament. Others are of opinion, that the heathen demon might be called "Belial," either becauſe they were of no uſe, or becauſe ſo much wickedneſs entered into the idea which the Pagans entertained of them. However, it has been ſuggeſted, that there may be no reference to the heathen gods at all, whether they were deified ghoſts or not; the word Belial being often applied to living men; and it being the general deſign of the apoſtle in this place to diſſuade Chriſtians from ſuffering themſelves to be drawn into any thing criminal by the heathens. Grot. in loc. Farmer's *Demonſtrac.*, p. 201.

The learned Bryant (*Analysis Anc. Mythol.* vol. ii.

p. 163.) conſiders Belial as the title of the chief Syrian god, called Bel and Baal, and rendered by the Greeks Βελία, Beliar. Hence, Clemens Alex. (l. v. p. 680.) inſtead of ſaying, what agreement can there be between Chriſt and Belial, ſays, Τις ἐς οὐρανὸν ἀναβήσας πρὸς Βελία. This Belial, or Beliar, was the ſame as Belorus and Oôris, who were worſhipped under the ſymbol of a ſerpent. Hence Hieronymus explains the term Beliar by a ſerpent.

BELIUS, in *Ancient Geography*, a river of Aſia, which ſprung in Davana, and diſcharged itſelf into the Euphrates. Ammian. Marcell.

BELICA, an epiſcopal town of the Gauls, in the diſtrict Lugdunenſis.

BELICENA, a town of Spain, in Grenada, 11 leagues from Grenada.

BELICL, a river of Suſſy, which empties itſelf into the ſea near Bigai, in the Val de Mazara. It reſembles (ſays Swiſburne, vol. iii. p. 374.) the Mole in Surry in ſize and colour; and winds very agreeably between high banks overgrown with elms, willows and tamarisks. The vale on both ſides is wide and well laid out in corn-fields, and paſtures crowded with horſes and horned cattle.

BELIDA. See BLEIDA.

BELIDES, in *Antiquity*. See DANAIDES.

BELIDOR, BERNARD FOREST DE, in *Biography*, a French mathematician and engineer, was born in Catalonia, about the year 1698, and became profeſſor-royal at the artillery ſchool of la Fere, and provincial commiſſary of artillery. By various exploits, he firſt diſcovered that the proportion of gun-powder in the loading of cannon might be reduced to two-thirds of the quantity, without leſſening its effect: but as he communicated this economical idea to cardinal Fleury, without previously conſulting the grand-maſter of artillery, he loſt both his places. Upon this the prince of Conti took him to Italy, and by his patronage, Belidor was again brought into notice at court. Marſhal Belleiſle, the war-miniſter, appointed him inſpector of artillery, and allotted to him apartments at the arſenal of Paris, in which he died, Sept. 8, 1761. Belidor was choſen an aſſociate of the academy of ſciences in 1751; and was the author of ſeveral uſeful works on civil and military architecture, hydraulics, fortification, and engineering: viz. "Sommaire d'un cours d'Architecture Militaire, civile et hydraulique," 1720, 12mo.; "Nouveau cours de Mathematiques, &c." 1725, 4to.; "La Science des Ingenieurs," 1729, 4to.; "Le Bombardier François," 1734, 4to.; "Architecture Hydraulique," 1737—1761, 4 vols. 4to.; "Dictionnaire portatif de l'Ingenieur," 8vo.; and "Traite des Fortifications," 4 vols. 4to. Several of his pieces are alſo inſerted in the memoirs of the academy of ſciences for the years 1737, 1750, 1753, and 1756. Nouv. Diet. Hiſtor. Huttois's Math. Diet.

BELIEF, in its general and natural ſenſe, denotes a perſuaſion, or a ſtrong aſſent of the mind to the truth of any propoſition. In which ſenſe, belief has no relation to any particular kind of means or arguments, but may be produced by any means whatever.—Thus we are ſaid to believe our ſenſes, to believe our reaſon, to believe a witneſs, &c. And hence, in rhetoric, all ſorts of proofs, from whatever topics deduced, are called *arses*, becauſe apt to produce belief, or perſuaſion touching the matter in hand.

BELIEF, in its more reſtrained and technical ſenſe, invented by the ſchoolmen, denotes that kind of aſſent which is grounded only on the authority or teſtimony of ſome perſon or perſons, aſſerting or attelling the truth of any matter propoſed. In this ſenſe belief ſtands oppoſed to knowledge and ſcience. We do not ſay we believe that ſnow is white, or that

that the whole is equal to its parts; but we see and know them to be so: that the three angles of a triangle are equal to two right angles, or that all motion is naturally rectilinear, are not said to be things credible, but scientific; and the comprehension of such truths is not belief, but science. But when a thing propounded to us is neither apparent to our sense, nor evident to our understanding; neither certainly to be collected from any clear and necessary connection with the cause from whence it proceeds, nor with the effects which it naturally produces; nor is taken up upon any real arguments, or relation thereof to other acknowledged truths; and yet, notwithstanding, appears as true, not by a manifestation, but by an attestation of the truth, and moves us to assent, not of itself, but in virtue of a testimony given to it—this is said to be properly credible: and an assent to this is the proper notion of belief or faith.

A judicious writer (Price's Review of the principal questions in Morals, p. 158.) is of opinion, that all the general grounds of belief or assent, may be comprehended under the three following heads: viz. 1st. Immediate consciousness (which see), or feeling; whence we acquire the knowledge of our own existence, and of the several operations, passions, and sensations of our own minds; and to this head may be referred the information we derive from our powers of recollection and memory; 2dly, Intuition (which see); and to this we owe our belief of all self-evident truths, our ideas of the general, abstract affections and relations of things, our moral ideas, and whatsoever else we discover, without making use of any process of reasoning; and 3dly, Argumentation or Induction. See these articles. See also ASSENT and FAITH.

BELIENE, in *Geography*, a village of Egypt, depending on the grand seikeh, and agreeably situated between two canals; 12 miles south of Girgê.

BELIEVERS, in *Ecclesiastical History*, an appellation given towards the close of the first century to those Christians who had been admitted into the church by baptism, and instructed in all the mysteries of religion: they had also access to all the parts of divine worship, and were authorized to vote in the ecclesiastical assemblies. They were thus called in contradistinction to the *catechumens*, who had not been baptized, and were debarred from these privileges.

BELILLA, in *Botany*. See MUSSËNDA.

BELIM, in *Geography*. See BELEM and PARA.

BELIN, a town of France, in the department of Girônde, and chief place of a canton in the district of Bourdeaux. The place contains 1212, and the cantons 7008 inhabitants: the territory includes 585 kilometres and 6 communes.

BELINA, a town of European Turkey, in Bosnia, about midway between Banjaluka and Belgrade.

BELION, a name given to a river of Lusitania, called also Limias, Limæus, Lethe, and the river Oblivion, in *Ancient Geography*, was the boundary of the expedition of Decimus Brutus. His soldiers, when they arrived at this river, refused, from motives of superstition, to cross it; upon which he snatched an ensign out of the hand of the bearer, and passed over, by which his army was encouraged to follow (Livy). He was the first Roman who ever proceeded so far, and ventured to cross. The appellation, according to Strabo, took its rise from a sedition that occurred in a military expedition between the Celtici and Turduli after crossing this river, in which the general was slain, so that they remained dispersed there; and from this circumstance it was called the river of Lethe, or Oblivion. (Cellarius.) It is now called "El Lima," and runs westward into the Atlantic, to the south of the Minho.

BELISAMA, or BELIZANA, in *Mythology*, a name

given by the Gauls to their Minerva, or to the goddesses who was the inventress of the arts. She was represented with a helmet adorned with a plume, clothed in a tunic, without sleeves, and covered with a mantle called "peplum." Her attitude, with her head leaning on her right hand, was that of a person in a profound reverie. Human victims were sacrificed on her altars.

BELISAME. See BELASAMA.

BELISARIUS, in *Biography*, the *Africanus* of New Rome, was born, and probably educated, among the Thracian peasants; and advanced from the humble station of one of the private guards of Justinian, then general of the Roman forces, and afterwards emperor, in which he had served with valour and reputation, to distinguished military command. Under the new title of General of the East, he encountered the Persian army near the fortresses of Dara, on the confines of Persia, with a much inferior force, both as to the number and quality of his troops, and obtained a decisive victory. In the next campaign, A.D. 530, he hastened from Dara to the relief of Syria, which was invaded by the Persians; and though he was defeated in an engagement which the impatience of his troops had precipitated, he saved his army from the consequences of their own rashness, and the victory of the Persian commander was so dearly purchased, that it was soon followed by peace. Belisarius, on his return to Constantinople, rendered essential service to the emperor Justinian, by quelling a dangerous sedition. In 533, the supreme command of the fleet and army, destined for the African war, was delegated to Belisarius, with an unlimited power of acting according to his own discretion, as if the emperor himself were present. After a voyage of three months, in which he had repeated opportunities of exercising his talents as a commander, he disembarked his troops on the African coast. Immediately upon their landing an instance of pillage occurred, which gave him occasion for inculcating the maxims of justice, moderation, and genuine policy. "When I first accepted the commission of subduing Africa, I depended much less," said the general, "on the numbers, or even the bravery of my troops, than upon the friendly disposition of the natives, and their immortal hatred to the Vandals. You alone can deprive me of this hope; if you continue to extort by rapine, what might be purchased for a little money, such acts of violence will reconcile these implacable enemies, and unite them in a just and holy league against the invaders of their country." His exhortations, accompanied by rigid discipline, produced the most salutary effect. The inhabitants, instead of deserting their houses, or hiding their corn, supplied the Romans with a fair and liberal market; the civil officers of the province continued to exercise their functions in the name of Justinian; and the clergy, from motives of conscience and interest, assiduously laboured to promote the cause of a catholic emperor. In his progress towards Carthage, he defeated, with great slaughter, the formidable army collected by Gelimer, and entrusted to the conduct of his brother and nephew, and reduced the king himself to the necessity of seeking his safety by a precipitate flight.

Belisarius, having taken possession of the city, restored, with incredible dispatch, its walls and ditches, which the heedlessness and indolence of the Vandals had suffered to decay. The defeat of Zano, the brother of Gelimer, and the pusillanimous flight of the king himself, terminated the conquest of Africa in the manner already related under the article Africa, which see. Belisarius, on his return to Constantinople in 534, obtained a splendid triumph, and was created sole consul for the ensuing year. The day of his inauguration resembled the pomp of a second triumph; his curule

BELISARIUS.

carle chair was borne aloft on the shoulders of captive Vandal; and the spoils of war, gold cups, and precious jewels, were profusely scattered among the populace. His most distinguished recompence, however, consisted in the faithful execution of a treaty, for which he had pledged his honour to the king of the Vandal, who received from the emperor an ample estate in the province of Calabria, whither he retired with his family and friends to a life of peace, of affluence, and perhaps of content.

The next object to which the attention of Belisarius was directed was that of terminating the dominion of the Ostrogoths in Italy. With this view he invaded Sicily A. D. 535, and having laid siege to Palermo, which was soon reduced, and which was the only place where he met with any resistance, he soon after entered Syracuse in triumph. In the spring of the following year he was diverted from the prosecution of his designs by a dangerous revolt of the African forces, which demanded his presence at Carthage. By an easy victory he would have restored the peace of Africa; if he had not been hastily recalled to Sicily, for the purpose of appeasing a sedition which had broken out in his own camp. Having effected this object, and sufficiently garrisoned Palermo and Syracuse, he embarked his troops at Messina, A. D. 537, and landed them, without resistance, on the opposite shores of Rhegium. From Rhegium to Naples, his fleet and army, almost always in view of each other, advanced nearly 300 miles along the sea-coast; and he received the submission of the inhabitants of the several countries of Bruttium, Lucania, and Campania, through which he passed. The capture of Naples, to which he laid siege both by sea and land, was for some time delayed; and he had reconciled himself to the disgrace of abandoning it, that he might march, before the winter season, against Rome and the Gothic king. But in the moment of anxious suspense a stratagem occurred of introducing, by means of the dry channel of an aqueduct, a file of soldiers into the heart of the city, who gained admittance to their companions, by whom the walls were scaled on all sides and the gates burst open. Belisarius, having succeeded in this enterprise, restrained the cruelty and ferocity of the Huns; and, for this purpose, he appeared alone in the streets and churches of Naples, and exerted himself in moderating the calamities of the inhabitants. "The gold and silver," he repeatedly exclaimed, "are the just rewards of your valour. Spare the inhabitants; they are Christians; they are supplicants, they are now your fellow-subjects. Restore the children to their parents, the wives to their husbands; and show them, by your generosity, of what minds they have obstinately deprived themselves." The city was thus saved by the virtue and authority of the conqueror. From Naples, Belisarius proceeded to Rome; which, on his approach, was evacuated by the Gothic garrison, and which, after sixty years' servitude, was delivered from the yoke of the Barbarians, and surrendered, without opposition, Dec. 10, A. D. 536. The Gothic chief, who bore himself a trophy of the victory, was sent with the keys of Rome to the throne of the emperor Justinian. In the following spring Vitiges, who had been elected by the Goths at the funeral of the feeble and deposed Theodatus, collected an army of 150,000 men, and attempted to recover the capital. On the approach of the Barbarians, Belisarius called forth to survey their camp; but being surrounded by the enemy, he extricated himself by singular exertions of strength and valor. When the whole army of the Goths, having passed the Tiber, formed the siege of the city, which was continued above a year, before their final departure. Belisarius, aided by his wife Antonia, his constant companion in every expedition, made many efforts for the re-

lieve of its distressed inhabitants, and for repelling the barbarians, which at length, in concurrence with a force sent by the emperor, were crowned with success; so that Rome was released from the hostile attacks of the Gothic army, which raised the siege, and, after attempting the recovery of Rimini, took shelter within the walls of Ravenna. Upon the arrival of an army from Constantinople, under the command of Narfes, a dissention arose between the two generals, whose respective authority was not accurately defined; but Belisarius was appointed, by the emperor's special commission, to the supreme command. He incurred, however, considerable odium by the hasty execution of Constantine, governor of Spoleto, who had committed an act of robbery, and in consequence of this measure the two armies separated, and Narfes was exalted by the leader of the discontented faction to assume an independent and supreme command. Belisarius, by his prudence and perseverance, regained his reputation and influence, and procured the recall of Narfes, and the establishment of military subordination. In the interval of discord, the Goths, aided by the Franks, captured Milan, with circumstances of aggravated cruelty. In 539, the destruction of Milan was succeeded by the invasion of Theodobert of Austrasia, the most powerful and warlike of the Merovingian kings, who, behind the favour which he afforded to the Goths, invaded the plains of Italy with an army of 100,000 barbarians, and marked his way by ruin and slaughter. The clamours of his conquering army, diminished by famine and disease, at length induced Theodobert to listen with respect to the mild exhortations of Belisarius; who, as soon as he was delivered from his foreign and domestic enemies, seriously employed his forces in the final reduction of Italy. Having redeemed Ostia and Esula, he proceeded to invest Ravenna; and whilst he was engaged in the blockade of this city, he received from Justinian a treaty of peace, which he had actually signed without deigning to ask his counsel and concurrence. By this disgraceful and precarious treaty, Italy and the Gothic territories were divided, and the provinces beyond the Po were left with the legal title to Vitiges. Belisarius rejected the treaty of partition, and declared his firm resolution of leading Vitiges in chains to the feet of Justinian. Upon this the Goths retired with doubt and dismay, and perceiving their own distressed and perilous estate, offered their arms, their treasure, and the fortifications of Ravenna to Belisarius, if he would disclaim the authority of a master, accept their choice, and assume, as he had deserved, the kingdom of Italy. The Roman general, seeming to acquiesce in their proposal, stipulated the surrender of Ravenna at an appointed day; and in December 539, he entered the city without opposition, secured the royal treasures, and placed Vitiges under a guard in the royal palace. The submission of the capital was followed by that of the towns and villages in Italy; and the independent Goths, who still remained in arms at Pavia and Verona, were ambitious only to become the subjects of Belisarius. But his inflexible loyalty rejected, except as the substitute of Justinian, their oaths of allegiance: nor was he offended by the reproach of their deputies, that he rather chose to be a slave than a king. Justinian, listening to the suggestions of envy and jealousy, recalled Belisarius; who obeyed the summons, and departed for Constantinople, carrying with him the treasures of Ravenna, and the persons of Vitiges, his wife, and chief robbers. The emperor received him with seeming cordiality, but without granting him the well-earned honours of a second triumph. Belisarius, however, was the object of universal admiration and applause among the people; and by the number of soldiers in his private pay, and the attachment of the army, whose affection he secured by his justice and liberality, he

might well be reckoned the second person in the empire. To the husbandmen he was endeared by the peace and plenty which they enjoyed under the shadow of his standard. Such had been the rigid discipline of his camp, that the country, instead of being injured by the march of the Roman armies, had been enriched by them; and not so much as an apple was gathered from a tree, nor could a path be traced in the corn fields. As to his personal conduct, he was sober and chaste to so great a degree, that, in the licence of a military life, none could boast that they had seen him intoxicated with wine, and that he was never suspected of violating the laws of conjugal fidelity. "The spectator and historian of his exploits," says Gibbon, "has observed, that amidst the perils of war, he was daring without rashness, prudent without fear, slow or rapid according to the exigencies of the moment; that in the deepest distress he was animated by real or apparent hope; but that he was modest and humble in the most prosperous fortune. By these virtues he equalled or excelled the ancient masters of the military art. Victory, by sea and land, attended his arms. He subdued Africa, Italy, and the adjacent islands; led away captives the successors of Genferic and Theodoric; filled Constantinople with the spoils of their palaces; and in the space of six years recovered half the provinces of the western empire. In his fame and merit, in wealth and power, he remained, without a rival, the first of the Roman subjects; the voice of envy could only magnify his dangerous importance; and the emperor might applaud his own discerning spirit, which had discovered and raised the genius of Belisarius." Nevertheless, the fame, and even the virtue of Belisarius, were polluted by the lust and cruelty of his wife Antonina. This profligate woman was the daughter of a theatrical prostitute; and in the various situations of the fortune of her parents, she became the companion, the enemy, the servant, and the favourite of the empress Theodora. Before her marriage with Belisarius, she had one husband and many lovers; and after their connubial union, she contrived to gratify her licentious passions, and to impose on the credulity of her husband, whom she dishonoured, and whom by her influence she illigat- ed to transactions that fix an indehble stain on his memory.

When Syria was invaded by Chosroes king of Persia, in the year 540, and Antioch, its rich capital, destroyed, Belisarius, the conqueror of Italy, was appointed to the defence of the east. Accordingly, in the year 541, he encamped beyond the Euphrates, within six miles of Nisibis, in order to restrain the progress of the Persian monarch on the coast of the Euxine. Having succeeded, without the support which he had reason to expect, in forcing Chosroes to return with loss and precipitation, he was recalled, at the close of the campaign, to Constantinople, by an ungrateful court; but the dangers of the ensuing spring restored his confidence and command; and the hero, almost alone, was dispatched with the speed of post-horses, to repel by his name and presence the invasion of Syria. On the banks of the Euphrates his firm attitude restrained Chosroes from advancing towards Palestine, and compelled him to repair to the river: thus accomplishing his purpose by a safe and bloodless victory, more glorious than his African and Gothic triumphs, in which neither fortune, nor the valour of his soldiers, can subtract any part of the general's renown. But the danger threatened to Italy by the rapid conquests of Totila, who had been advanced to the Gothic throne, required the presence of Belisarius; and accordingly he was again recalled from the east, and in 544, he arrived at the port of Ravenna with an inconsiderable number of ill-provided recruits. Thus supported, he was unable to impede the progress of Totila, and to prevent his laying siege even to Rome. When the city was reduced to extreme distress by the want of provisions,

the supply of which had been long obstructed by the besieging army, Belisarius made a bold attempt for its relief. But his enterprise for this purpose having failed, Rome was obliged to submit to the Gothic yoke; and Belisarius could only prevail by his interposition to prevent its threatened destruction. Totila, having demolished its walls, and removed most of its inhabitants, marched into the south of Italy; upon which Belisarius took possession of it, and hastily fortified himself within its circuit; so that he was able thrice to repulse the Gothic army which Totila brought against it. But whilst he was engaged in its defence, he was commanded by the emperor to leave a sufficient garrison at Rome, and to transport himself into Lucania, in order to suppress a revolt which had taken place in that province. In this warfare he was basely vanquished by the delay, disobedience, and cowardice of his officers; and having reposed in his winter-quarters at Crotona, he was obliged by the rapid march of the Goths to make his escape to the coast of Sicily. At length Antonina, who had been sent to Constantinople to solicit succours, obtained, after the death of the empress, permission for Belisarius to return. Accordingly, after failing to deliver Italy from the Goths, and wandering like a fugitive along the coast, without daring to march into the country, or to accept the bold and repeated challenge of Totila, he was recalled in September 548. The subsequent success of Narses in recovering Italy, threw a shade over the military reputation of Belisarius; though about 10 years afterwards he distinguished himself by saving the capital from an incursion of the Bulgarians, who had advanced to its long walls, about 40 miles from the city, and occasioned an universal alarm. The enemy were put to flight by the military veteran at the head of a tumultuary band; though it was necessary to purchase their return into their own country by a heavy ransom. This was the last exploit of Belisarius; and his remaining days were doomed to misfortune and disgrace. The jealousy of the emperor, increasing with his years, led him to suspect Belisarius of being concerned in a conspiracy against his crown and his life; and the veteran general, after forty years' service, and on incompetent testimony, was judged guilty, Dec. 5, A. D. 563. His life, indeed, was spared, but his fortunes were sequestered, and he was guarded for several months, as a prisoner, in his own house. At length, July 19, A. D. 564, his innocence was acknowledged; his freedom and honour were restored; and death, which might be hastened by resentment and grief, removed him from the world about eight months after his deliverance, March 13, A. D. 565. "The name of Belisarius," says Gibbon, "can never die; but instead of the funeral, the monuments, the statues, so justly due to his memory, I only read, that his treasures, the spoils of the Goths and Vandals, were immediately confiscated by the emperor. Some decent portion, however, was reserved for the use of his widow; and as Antonina had much to repent, she devoted the last remains of her life and fortune to the foundation of a convent. Such is the simple and genuine narrative of the fall of Belisarius and the ingratitude of Justinian. That he was deprived of his eyes, and reduced by envy to beg his bread, *Give a penny to Belisarius the general*, is a fiction of later times, which has obtained credit, or rather favour, as a strange example of the vicissitudes of fortune."

The source of this idle fable may be derived from a miscellaneous work of the twelfth century, the *Chiliads* of John Tzetzes, a monk, who relates the blindness and beggary of Belisarius in ten vulgar or political verses. (Vid. Corp. Poet. Grec. tom. ii. p. 311.)

“Εκπωμα ζυλινον κρηνον εβρα τω μελω
Βελισαριω εβρολεν δεξ τω στρατηλατη
Ον τυχη μεν εδοξασαι, απιστηφλοι δ' ο φθονος.”

This metal or romantic tale was imported into Italy with the language and manuscripts of Greece; repeated before the end of the fifteenth century by Crinitus, Pontanus, and Volaterranus; attacked by Aheat for the honour of the law, and defended by Baronius for the honour of the church. Yet Tzetzes himself had read in other chronicles, that Bellarius did not lose his sight, and that he recovered his fame and fortune. Gibbon's Hist. Decl. and Fall of the Rom. Emp. vol. vii.

The statue in the villa Borghese at Rome, in a sitting posture, with an open hand for the right arm, is now only attributed to Bellarius; but it may be supposed with great propriety to Augustus, represented under the character of a man of war, propitiating the anger of Nemesis. See Olaus Roem. Hist. lib. vi. c. 10. that on a certain day every year, he humbled himself to the condition of a beggar, extended his open hand, and soliciting alms from the people. Val. schlegel, tom. iii. p. 265.

BELLUSO, in *Antient Geography*, a town of Spain, near Alcala de la Rin. *Ant. Itin.*

BELLIFANI, a people of Spain, according to Pliny.

BELLITZ, in *Geography*, a town of Germany, in a prefecture of the same name, in the circle of Saxe, and a country of the Elector of Brandenburg, seated on the river Nieperitz, or Belitz, which has repeatedly suffered from fire. It is defended by old ramparts and ditches, and has a manufacture of cloth; 28 miles south-west of Berlin, and 12 south-west of Pitzdam.

BELITZY, a town and district of the Russian empire, in the government of Mohilef, seated on a rivulet falling into the S. fl.

BELKANI, a town of Asiatic Turkey, in the province of Natolia, 14 miles north of Satalia.

BELKIN, a town of Egypt, 45 miles south-west of Damietta, and 54 south-west of Cairo.

BELKOVA, a river of Russia, in the government of Archangel, which runs into the Frozen sea. N. lat. 68° 30'. E. long. 58° 34'.

BELL, a popular machine, ranked by musicians among the number of musical instruments of percussion. The music of bells is altogether melody; but the pleasure arising from it consists in the variety of interchanges, and the various successions and general predominance of the consonances in the sounds produced.

The parts of a bell are the body or *barrel*, the *clapper* which strikes, and the ear or *campan*, whereby it is hung to a large bar of wood.—Its usual matter is a kind of compound metal, called *bell-metal*. The thickness of its edges is usually $\frac{1}{4}$ of the diameter, and its height twelve times its thickness. The bell-founders have a diapason, or bell-scale, with which they measure the size, thickness, weight, and tone of their bells. For the method of casting bells, see *FOUNDRY*.

The sound of a bell arises from a vibratory motion of the parts thereof, much like that of a musical chord. The stroke of the clapper, it is supposed, must change the figure of the bell, and of round make it oval; but the metal having a great degree of elasticity, that part which the stroke drove farthest from the centre, will fly back again, and thus even somewhat return to the circle than before; for at the two points, which before were the extremities of the longer diameter, now become those of the shorter. Thus, the circumference of the bell undergoes alternate changes of figure, and by reason thereof gives that tremulous motion to the air, in which a sound is formed.

M. Perrault maintains, that the sound of the same bell or chord is a compound of the sound of the several parts thereof; so that when the parts are homogeneous, and the

dimensions of the figure uniform, there is such a perfect mixture of all these sounds, as constitutes one uniform, smooth, even sound; and the contrary circumstances produce harshness. This he proves from the bell's differing in tune according to the part you strike, and yet strike it at any where, there is a motion of all the parts. He therefore considers bells as composed of an infinite number of rings; which, according to their different dimensions, have different tones, as chords of different lengths have; and when struck, the vibrations of the parts immediately struck determine the tone; being supported by a sufficient number of consonant tones in the other parts. Mr. Hawksbee, and others, have found by experiment, that the sound of a bell struck under water, is a fourth deeper than in the air; though Merfennus says, it is of the same pitch in both elements. This writer has treated largely of the different metals of which bells are formed, of their figure, castitude, and degrees of ponderosity, as they respect each other in a given series.

Bells are observed to be heard farther, placed on plains, than on hills; and still farther, in valleys, than on plains: the reason of which it will not be difficult to assign, if we consider, that the higher the sonorous body is, the rarer is its medium; consequently the less impulse it receives, and the less proper vehicle it has to convey it to a distance. There is a curious observation in a paper of M. Reaumur's in the Memoirs of the Paris Academy, relating to the shape most proper for bells, to give them the loudest and clearest sound. He observes, that as pots, and other vessels more immediately necessary for the service of life, were doubtless made before bells, it probably happened, that the observing these vessels to have a sound when struck, gave occasion to making bells, intended only for sound, in that form: but that it does not appear that this is the most eligible figure; for lead, a metal which is, in its common state, not at all sonorous, yet becomes greatly so on being cast into a particular form, and that very different from the common shape of bells. In melting lead for the common occasions of casting in small quantities, it is usually done in an iron ladle; and as the whole is seldom poured out, the remainder, which falls to the bottom of the ladle, runs into a mass of the shape of that bottom. This is consequently a segment of a sphere, thickened in the middle, and thinner towards the edges: nor is the ladle any necessary part of the operation, since, if a mass of lead be cast in that form in a mould of earth or sand, in any of these cases it is found to be very sonorous. Now, if this shape alone can give sound to a metal, which in other forms is perfectly mute, how much more must it necessarily give it to other metals naturally sonorous in whatever form. It should seem that bells would much better perform their office in this than any other form, and that it must particularly be a thing of great advantage to the small bell of common house-clocks, which are required to have a shrill note, and yet are not allowed any great size. M. Reaumur very judiciously observes, that if our fore-fathers had opportunities of being acquainted with the sound of metal in this shape, we should probably have had all our bells of present of this form. Mem. Acad. Par. 1726.

With regard to the origin of bells, those of a small size are very ancient; but those of a large bulk, hung in towers and hung by ropes, were introduced at a much later period. Among the Jews, it was decreed by Moses, that the silver part of the blue robe, which was worn by the high priest in religious ceremonies, should be adorned with four granaries and gold bells intermixed at equal distances. (see Ex. lxxv. 33, 34.) The king of Persia is said to have had the hem of his robe adorned, like that of the Jewish high-priests, with pearls, rubies and gold bells. The Arabian princes wear on their legs large hollow gold rings, which

with small flints, which sound like bells, when they walk ; and these, with several appurtenances, give notice that the mistress of the house is passing, so that the servants of the family may behave with respect, and strangers may retire to avoid seeing the person who advances. Cabinet supposes, that it was with some such design of giving notice that the high priest was passing, that he wore little bells at the hem of his robe ; and it was also a kind of public notice that he was about to enter into the sanctuary. In the court of the king of Persia, no one entered the apartments without some warning ; and thus the high priest, when he entered the sanctuary, desired permission to enter by the sound of his bells, and in so doing he escaped the punishment of death annexed to an indecent intrusion. The prophet Zachary (ch. xiv. 20.) speaks of the bells of the horses, which were probably hung to the bridles or foreheads of war-horses, that they might thus be accustomed to noise. Calmet.

Among the Greeks, those who went the nightly watch rounds in camps or garrisons, carried with them a little bell, which they rang at each centry-box to keep the soldiers appointed to watch awake. A bell-man also walked in funeral processions, at a distance before the corpse, not only to keep off the crowd, but to advertise the flamen dialis to keep out of the way, lest he should be polluted by the sight, or by the funeral music. The priest of Proserpine at Athens, called "hierophantus," rung a bell to call the people to sacrifice. The hour of bathing, at Rome, was announced by the sound of a bell, and hence it has been supposed they were used to mark the hours of devotion, and summon people to church. Servants in the houses of great men were called up in a morning by the sound of bells. Zonaras informs us, that bells were hung with whips on the triumphal chariots of their victorious generals, in order to remind them that they were still amenable to public justice. Bells were affixed to the necks of criminals going to execution, to warn persons to avoid so ill an omen as the sight of the executioner or condemned criminal, who was devoted and about to be sacrificed to the "dii manes." To this superstition some persons have attributed the custom in England of ringing parish bells, while a malefactor is on his way to the gallows ; though others have generally supposed it was intended as a signal to all who heard it, admonishing them to pray for the passing soul. Phædrus mentions bells annexed to the necks of brutes : "Celsa cervicæ eminent, clarumque, collo jactans tintinnabulum." Taking these bells away was construed by the civil law to be theft ; and if the beast was thus lost, the person who took away the bells was to make satisfaction. Sheep had them tied about their necks, to frighten away wolves, or rather by way of amulet, or to direct shepherds where to find their flocks ; and since the practice of blessing them has been introduced, they have been thought to preserve animals from epidemical disorders.

The uses of bells are summed up in the Latin distich :

"Laudo Deum verum, plebem voco, congrego clerum,
Defunctos ploro, pestem fugo, festa decoro."

To the same purpose is the following inscription on bells, mentioned by Weever, in his "Funeral Monuments," p. 122.

"Funera plango, fulgura frango, sabbata pango,
Excito lentos, dissipos ventos, paco cruentos."

The first bells are said to have been made about the year 400, at Nola, in Campania, whereof St. Paulinus was made bishop in 409 ; at least it is asserted, he was the first who brought them into use in the church. Before his time Christians made use of rattles, "sacra ligna," to call the congregation together ; no bells being allowed by government to a proscribed sect. Hence, it is added, they had their Latin names, *Nolæ*, first used by Quintilian, and

Campanæ, a term which was adopted in the time of St. Jerom. But others say, they take these names, not from their being invented in Campania, but because it was here the manner of hanging and balancing them in steeples, now in use, was first practised ; at least, that they were hung on the model of a sort of balance invented or used in Campania. For in Latin writers we find *Campana slatera*, for a steel-yard ; and in the Greek *κρητάνηζον*, for ponderare, to weigh. At first they were called *saints* ; and hence are derived a *toefaint*, or *toefin*.

Polydore Virgil ascribes the invention of church bells to pope Sabinian, St. Gregory's successor ; but this is a mistake ; for St. Jerom, contemporary with Paulinus, makes mention of one. Pope Sabinian did not invent bells ; but he was the first who appointed the canonical hours to be distinguished by them.

We even find mention made of bells in Ovid, Tibullus, Martial, Statius, Manilius, and the Greek authors, under the appellations of *tintinnabula*, and *sounding brass*. Suetonius, Dion, Strabo, Polybius, Josephus, and others, mention them under the names of *petasus*, *tintinnabulum*, *aramentum*, *croतालum*, *signum*, &c. But these appear to have been no more than baubles, and not like the huge bells in use among us.

Hieronymus Magius, who has a treatise on bells (written when in chains in Turkey, and which is accounted very remarkable, purely from his memory, without the assistance of any book), makes large bells a modern invention. Indeed, we do not hear of any before the sixth century, when they were applied to ecclesiastical purposes in some of the monastic societies of Caledonia, as they were in those of Northumbria before the conclusion of the 7th century ; and they seem to have been used from the first erection of parish churches in this kingdom. In 610, we are told, Lupus, bishop of Orleans, being at Sens, then besieged by the army of Clotharius, frightened away the besiegers by ringing the bells of St. Stephen's. The first large bells in England are mentioned by Bede, towards the latter end of that century, or about the year 670. They seem to have been pretty common in the year 816. Ingulphus mentions that Turketulus, abbot of Croyland, who died about the year 870, gave a great bell to the church of that abbey, which he named Guthlac, and afterwards six others, all which rang together ; and not long after this time, Kinfeus, archbishop of York, built a tower of stone to the church of St. John at Beverly, and placed in it two great bells, and at the same time provided that other churches in his diocese should be furnished with bells. J. Stubbz. Act. Pont. Ebor. fol. 1700. Mention is also made by St. Aldhelm, and William of Malmesbury, of bells given by St. Dunstan to the churches in the west. See Spelm. Gloss. voc. *Campana* ; and Bingham's Ant. Christ. Church, book viii. ch. vii. § 15.

The Greeks are usually said to have been unacquainted with bells till the ninth century, or about the year 865, when their construction was first taught them by a Venetian.

Indeed it is not true, that the use of bells was entirely unknown in the ancient eastern churches, and that they called the people to church, as at present, with wooden mallets. Leo Allatius, in his Dissertation on the Greek temples, proves the contrary from several ancient writers. It is his opinion, that bells first began to be disused among them, after the taking of Constantinople by the Turks ; who, it seems, prohibited them, lest their sound should disturb the repose of souls, which, according to them, wandered in the air. He adds, that they still retain the use of bells in places remote from the intercourse of the Turks ; particularly, very ancient ones in mount Athos. F. Simon thinks the Turks rather prohibited the Christians the use of bells out

of political than religious reasons; inasmuch as the ringing of bells might serve as a signal for the execution of revolts, &c. The city of Bourdeaux was deprived of its bells for rebellion; and when it was offered to have them restored, the people refused it, after having tasted the ease and convenience of being freed "from the constant din and jangling of bells."

Matthew Paris observes, that anciently the use of bells was prohibited in the time of mourning; though, at present, they make one of the principal ceremonies of mourning. Mabillon adds, that it was an ancient custom to ring the bells for persons about to expire, to advertise the people to pray for them; whence our passing-bells. The passing-bell anciently served two purposes: one of which was engaging the prayers of all good people for departing souls; and the other was, driving away the evil spirits which haunted the bed and house, and which were ready to seize their prey, or to terrify and molest the soul in its passage; but by the ringing of this bell, it is said they were kept at a distance. To this circumstance we may probably ascribe the high price demanded for tolling the largest bell of the church; which being louder, and heard at a greater distance, might keep these evil spirits more remote, and also procure for the dying man a greater number of prayers.

Lobineau observes, that the custom of ringing bells at the approach of thunder is of some antiquity; but that the design was not so much to shake the air, and so dissipate the thunder, as to call the people to church, to pray that the parish might be preserved from mischief by it.

Whatever occasion some catholics may have given for the reproach, that they attribute to bells the power of driving away demons, and dispelling storms; it is certain the ancient canons of the church only ascribe this power very remotely to bells. Their meaning seems to be this: Satan fears and flies from the bells, because he knows that bells summoned good people to church to pray, and he dreads their prayers. It was therefore to prayer, occasioned by the ringing of bells, and not to the bells, that such good effects were ascribed.

The custom of christening or blessing bells is very ancient. The charge of baptizing bells, alleged by protestants against the Roman catholics, has been denied by the latter; but they allow that they bless bells with certain ceremonies, as they do all other church utensils; and that one of the ceremonies is the giving of a name to the bell, in order to distinguish it from others, or in honour of some saint. It seems reasonable, therefore, to acquit them of the blame of prostituting baptism in this case, and to charge them merely with consecration and benediction. Before bells were hung, they were washed, crossed, blessed, and named by the bishop. This is what some protestants have called baptizing of them; but others say, it might be denominated the illustration of them, resembling the illustration of trumpets among the Romans. Cardinal Bona observes (Rer. Liturg. l. ii. c. 22.), that the name of some saint is given to a bell at the time of its consecration, that the people may think themselves summoned to divine service by the voice of the saint whose name the bell bears. Some say that this custom was introduced by pope John XIII. who occupied the pontifical chair from 965 to 972, and who first consecrated a bell in the Lateran church, and gave it the name of John the Baptist. But it is evidently of an older standing; there being an express prohibition of the practice in a capitular of Charlemagne in 789: "ut cloce non baptizetur." See *Hospinian de Origine Templorum*, p. 113. where there is a particular account of all the ridiculous ceremonies practised about bells. See Dr. Franklin's *Observations on consecrated Bells*, and the Form in consecrating them, *Experiments, Observations, &c.* p. 487, ed. 1769.

Nankin, a city of China, was anciently famous for the largeness of its bells; but their enormous weight having brought down the tower in which they were hung, the whole building fell to ruin, and the bells have ever since been disregarded. One of these bells is nearly twelve English feet high, the diameter seven and a half, and its circumference twenty-three; its figure almost cylindrical, except for a swelling in the middle, and the thickness of the metal about the edges, seven inches. From the dimensions of this bell, its weight is computed at 50,000 pounds, which is more than double the weight of that at Erfurt, said by father Kueher to be the greatest bell in the world. These bells were cast by the first emperor of the preceding dynasty, above three hundred years ago. They have each their name, the hanger *tehoui*, the eater *ch.*, the sleeper *choui*, the will *fi*. Father le Compte adds, that there are seven other bells in Peking, cast in the reign of Youlo, each of which weighs 120,000 pounds. But the founds even of their biggest bells are very poor; being struck with a wooden instead of an iron clapper.

The Egyptians have none but wooden bells, except one brought by the Franks into the monastery of St. Anthony.

In the churches of Russia their bells are numerous, and distinguished by their enormous size. They are hung, particularly at Moscow, in belfreys or steeples detached from the churches, with gilt or silver cupolas or crosses; and they do not swing like our bells, but are fixed immovably to the beams, and rung by a rope tied to the clapper, and pulled sideways. One of these bells in the belfrey of St. Ivan's church at Moscow, weighs 127,836 English pounds. It has always been esteemed a meritorious act of religion to present a church with bells, and the piety of the donor has been estimated by their magnitude. According to this mode of estimation, Boris Godunof, who gave a bell of 288,000 pounds to the cathedral of Moscow, was the most pious sovereign of Russia, until he was surpassed by the empress Anne, at whose expence a bell was cast, weighing 432,000 pounds, which exceeds in size every bell in the known world. Its dimensions, as ascertained by Mr. Cox (*Travels in Russia*, vol. i. p. 322.), are as follow: the height is 19 feet, the circumference at the bottom 63 feet 11 inches, and its greatest thickness 23 inches. The beam to which this vast machine was fastened, being accidentally burnt by a fire in 1737, the bell fell down, and a fragment was broken off towards the bottom, which left an aperture large enough to admit two persons abreast without stooping.

The ringing or striking of the bells, though it forms no part of divine worship, as some writers have asserted, serves, however, by the number of strokes, to inform any person without the church, what part of the religious service is beginning within it. Thus, several strokes are struck just before the mass; and this is called "blagovell," i. e. the agreeable sound, as a summons to the praises of God. Before the commencement of the liturgy, it sounds three; and in the middle of it, a few strokes are given to the bell, to let the people without know that the hymn to the holy virgin is now beginning to be sung. All persons, on hearing this throw aside their work, bow, and cross themselves, repeating silently the verse then singing in the church. In the same manner is regulated the fixed number of strokes at the several periods of the vespers and the matins. On some holidays they are sounded through the whole day. *Tooke's Hist. of Russia*, vol. i. p. 128.

The same writer also informs us, that ringing the bells on church and court holidays, is a species of exercise of which the Russians are very fond: but they produce nothing like harmony from them. The sole excellency consists in striking the clapper the oftenest.

For further particulars relating to bells, see *CHANGES in a given*

a given number of bells, TINTINNALOGIA, CARILLONS, and RING.

BELL Bay, in *Geography*, a harbour on the south-west coast of East Greenland, to the north of Horn Sound.

BELL Sound, is situated on the west coast of Spitzbergen, in the icy sea. N. lat. 77° 12'. E. long. 12° 40'.

BELL, *hearing the*. See RACING.

BELL, *foundry of*. See FOUNDRY.

BELL, *diving*. See DIVING.

BELLS, *electrical*, are used in a variety of entertaining experiments by electricians. The apparatus, which is originally of German invention, consists of three small bells suspended from a narrow plate of metal (*Plate, Electricity*;) the two outermost by chains, and that in the middle, from which a chain passes to the floor, by a silken string. Two small knobs of brass are also hung by silken strings, one on each side of the bell in the middle, which serve for clappers. When this apparatus is connected with an electrified conductor, the outermost bells suspended by the chains will be charged, attract the clappers, and be struck by them. The clappers becoming electrified likewise, will be repelled by these bells, and attracted by the middle bell; and discharge themselves upon it by means of the chain extending to the floor. After this, they will be again attracted by the outermost bells, and thus, by striking the bells alternately, occasion a ringing, which may be continued at pleasure. Flashes of light will be seen in the dark between the bells and the clappers; and if the electrification be strong, the discharge will be made without actual contact, and the ringing will cease. An apparatus of this kind, connected with one of the conductors that are erected for securing buildings from lightning, will serve to give notice of the approach and passage of an electrical cloud.

BELL-glass, in *Chemistry*, a convenient vessel for many chemical operations, particularly upon gaseous bodies. It has the advantage of not being easily overturned, and is readily manageable by the knob of glass at the top. When used, it is always inverted or standing with the open end downwards. See *Plates in Chemistry*.

Chemical bells are a sort of receptacles chiefly used in preparing the oil or spirit of sulphur, for gathering and condensing fumes into a liquor.

BELL, in *Building*, is used to denote the body of the Corinthian and Composite capital, by reason of its resemblance to the figure of a bell inverted. In this sense, bell is the same with what we otherwise call *vase* and *tambour*, sometimes also *corbel*. The neck of the bell is always to be even and perpendicular with the bottom of the flutings of the column.

BELL flower, in *Botany*. See CAMPANULA.

BELLS, *hair*. See HYACINTH.

BELL-metal, an important alloy, composed principally of copper and zinc. See COPPER.

BELL-animal, in *Zoology*, a name given by some of the early writers on microscopical discoveries, to creatures of the Hydra genus. The bodies of these animals are shaped like bells, and they have very long and slender tails, by which they fasten themselves to the roots of little plants. They are usually found in great numbers together, in a sort of clusters or bunches; and all of the same bunch have always the same motion, very frequently contracting themselves, and afterwards expanding all together to the full length of their tails. They usually contract instantaneously; but are more slow in the expanding themselves again. Baker's *Microsc.* p. 98. See HYDRA.

BELL-muskus, in *Botany*, a name given by some authors to the plant called *hamia moschata*, and mosch-seed.

BELL-pepper. See CAPSICUM.

BELL-polype, in *Zoology*, is the name applied to one par-

ticular species, the extremities of whose branches resemble bells, and which is now called *Vorticella Umbellaria*.

BELL-weed, an English name used by some authors for the *Jacea-nigra*, or common knap-weed, called also by many English writers *Maiselon*.

BELLA, STEFANO DE LA, in *Biography*, an eminent engraver, was born at Florence in 1610, and after having been for some time employed in the business of his father, who was a goldsmith, applied to the study of engraving, and became the disciple of Costa Galvani. At first he imitated the manner of Callot, who had been a disciple of the same master; but acquiring a facility in handling the point, he adopted a manner of his own, which is said to have surpassed, in freedom and spirit, that of Callot. At Paris, whither he removed in 1642, he formed an acquaintance with Israel Silvestre, and was much employed by Henriette, the uncle of Silvestre. Upon his return to Florence, he obtained a pension from the grand duke, and was appointed to instruct the prince Cosimo, his son, in the art of design. But being habitually subject to violent pains in the head, they at length terminated his life in 1664. The free and masterly etchings of this excellent artist are well known; and his distinguishing excellence consists in the freedom of his point, and the lightness and elegance of his figures. He drew correctly, and with great taste; and his works display much genius and great fertility of invention. Their slightness is compensated by their fire and animation. He is said to have engraved 1400 plates; among which are, "Six Views of Livourne;" several sets of "Shipping;" "A Holy Family;" several "Madonas;" a "View of Pont-neuf, at Paris;" "St. Prosper;" a scarce print; five small ovals, in which is represented "Death carrying away persons of various ages;" "Death mounted on the skeleton of a horse;" "Panassus;" and the "Rock," both scarce; "Animals;" "Beggars;" and various sets of "Hunting;" "Shipping;" "Landscapes;" "Ornaments;" &c. Strutt.

BELLA POLLÀ, or TERRA POLLÀ, in *Geography*, a small high island, resembling two islands with lofty round hills, 10 leagues N. E. by N. from cape Angelo, and 4 leagues N. N. W. from Grava island; situate on the coast of the Morea in the Archipelago.

BELLA, in *Entomology*, a species of PHALÆNA (*bombyx*;) found in North America. The wings are yellow, with six rows of black dots; posterior wings red, with black tips. *Linn. Mus. Lud. Ulr.*

BELLABRÉ, in *Geography*, a town of France, in the department of the Indre, and chief place of a canton, in the district of Le Blanc. The place contains 895, and the canton 6672 inhabitants: the territory includes 300 kilometres and 11 communes.

BELLAC, a town of France, and principal place of a district, in the department of the Upper Vienne, seated on the Vincon. It derives its name from an old fortified castle, erected in the 10th century, and contains about 2500 inhabitants. The place contains 3901, and the canton 10,854 inhabitants: the territory includes 255 kilometres and 9 communes. N. lat. 46. 7'. E. long. 0° 57'.

BELLADAC, a town of Asia, in the province of Diarbekir, 45 miles west of Rabba.

BELLADONNA lily, in *Botany*. See AMARYLLIS.

BELLADONNA, a name given by the Italians to the *deadly nightshade*, because the ladies make a cosmetic of the juice, or distilled water, which they use to make their complexion fair and white. Ray.

Others derive the name from the intoxicating quality of this plant: "Quod insomnis pulchras offendat virgines feminasque." *Bod. Comment. in Theophrast.* 10, 8. See ΑΤΡΟΦΑ.

BELLADONNA, in *Entomology*: *Papilio Cardui*, is described under the name in the *Fauna Suecica*. Lin. i. n. 778.

BELLAIRF, in *Geography*, a post town of America, near the centre of Harford county in Maryland, and the chief town of the country. It contains a court-house and jail, and has but few inhabitants. Distance from Harford 6 miles, N. W. 22. N. E. from Baltimore, and 86 W. S. W. from Philadelphia.

BELLANO, a town of Italy, in the Milanese, 17 miles north of Como. It is situated at the foot of a lofty precipice; rent from top to bottom by a chasm, through which a furious torrent forces its way. A bridge is thrown across the chasm, from which the spectator looks down into a deep gulf, and an aqueduct is conducted along the steep sides of the rock.

BELLARGUS, in *Entomology*, a species of **PAPILIO** (P.L.B. rur.) described by Eiper; and is *Papilio Adonis*, Guel. &c.

BELLARMIN, **ROBERT**, in *Biography*, a cardinal of Rome, and one of the most famous controversial writers of his time, was born at Monte Pulciano, a town of Tuscany, in 1542, and entered into the society of the Jesuits in 1560. He was ordained priest by Julius in 1569, and in the following year advanced to the theological chair in the university of Louvain. Having remained seven years in the Low Countries, he returned to Italy, and in 1576, began to read lectures at Rome on controversial subjects; and having been honoured by three successive popes with important commissions, he was, in 1578, nominated to the cardinalate by Clement VIII. with this striking eulogium: "We choose him because the church of God does not possess his equal in learning." In 1602, he was created archbishop of Capua; and it is supposed he would have been raised to the papal chair, if he had not been a Jesuit. In about four years he resigned his archbishopric, upon being recalled to Rome by pope Paul III. and here he continued his services to the church, till the year 1621, when he retired from the Vatican to a house of his order, in which he died the same year, at the age of 79. When he was visited in his last illness by pope Gregory XV. he expressed his profound veneration for the apostle, and Christ's wear on earth, by saying him on his entrance with the words of the ecsternion to Christ: "Lord, I am not worthy that thou shouldst come under my roof." On the day of his funeral it was necessary to keep off the populace by a military guard, as they pressed on, either to touch his body or to procure some relic of his garments, as if he had been a saint.

Bellarmin was a very strenuous defender of the catholic religion against the reformers; and his numerous arguments were collected by protestant divines as specified objects of satirical attacks. He has written a "A Path of Controversy," which, in Italy, was requested by pope Paul V. to be the chief edition of that of Bellarmine in 1621, &c. &c. The chief of his works, which are printed in several volumes, is his *De controversiis*, printed in four volumes in 1619. He has also written several treatises; and a treatise of the immortality of the soul, in which he has distinguished himself by his own pen, and which has been translated by several learned hands into all the principal languages of Europe, has been translated into English, and is published in several editions, and is one of the most famous and useful books in the world. He has also written several other treatises, and a great number of sermons, and a great number of letters, and a great number of other works, which are all of great value and use to the church and world.

chief work, he wrote "A Commentary on the Psalms," "Sermons;" "A Treatise on Ecclesiastical Histories;" "A Treatise on the Temporal Authority of the Pope," against Barclay; "The Groans of the Dove;" "On the Obligations of Bishops;" and "A Hebrew Grammar." Some of his works, and particularly his book on the temporal authority of the pope, raised adversaries against him in his own communion, whilst his declaration of the right of the pontiffs to depose princes, caused it to be condemned by the parliament of Paris; his assertion of the indirect power of the popes in temporal matters, so offended the court of Rome, that Sixtus V. caused it to be inscribed in the Index of the Inquisition. Some protestants, by excess of zeal, injured their own cause, by circulating unfounded and malignant calumnies against his morals, &c. Joseph Scaliger has even asserted, that he did not believe a word of the doctrines he defended, whereas it is most probable that he inclined to superstition in fact, and to scrupulosity in practice. At his death he bequeathed one half of his soul to the Virgin Mary, and the other half to Jesus Christ; and it is said, that he would not allow the vermin that infested his body to be mollied; under the plea, that these animals had no other paradise than their present existence, of which it was cruel to deprive them. His right to canonization was strongly urged; and the popes were prevented from allowing his claim merely by the fear of giving offence to those foreigners whose temporal rights he had opposed. Gen. Dict. Nouv. D. G. Hill. Mosheim. Eccl. Hist. vol. iv. p. 221, &c.

BELLAS, in *Geography*, a small town of Portugal, in Estremadura, containing about 1240 inhabitants.

BELLATOR, in *Entomology*, a species of **CIMEX** (spinolas). It is brown above, beneath yellowish; antennae black annulated with white. Gmelin. A native of Cayenne. This is *Corix B. lator* of Fabricius.

BELLATRIX, in *Astronomy*, a ruddy, glittering star of the second magnitude, in the left shoulder of ORION.

It takes its name from *bellum*, a-belligerently supposed to have great influence in kindling wars, and forming warriors.

BELLAY, **WILLIAM DU**, in *Biography*, a French general, signalized himself in the service of Francis I. by his valour as an officer, and by his talents as a negociator. He was a diligent and successful in his efforts for inducing some of the universities of France to pronounce judgment in favour of the divorce of king Henry VIII. from his queen Catharine; and he was employed in several embassies to Germany for the purpose of conciliating the princes of the protestant league, and dividing their objections against the king's master's severity in punishing heretics. Bellay was eminently distinguished for his skill in penetrating, by his spies and intrigues, into the designs of the enemy; he succeeded in the point, with the worst in quality of victory, and to have well known from the Emperor's. In the division of command, after some important battles, he came to the king, and by his skill, he obtained a pardon for his conversion; but he was confined the moderation of Charan, between France and the Emperor, under a necessity of stopping at St. Zeno, where he died January 1607, 1613. He was buried in the church of Marly; and a noble monument was erected to his memory. He wrote several other works; of which the principal are "The History of the seven Years," "The Grand Treaty," which he is said to be led to, or directed part, each consisting of eight books. Of this work the first four are now extant, and were by the late Mr. D. Bellay, in his "Memoirs" from 1513 to 1513." They are written in a simple and lively manner, but are somewhat partial in favour of Francis I.

Bellay was one of the first French writers who expressed a doubt of the miraculous facts recorded of Joan of Arc. Gen. Dict.

BELLAY, *John du*, a cardinal, younger brother of the preceding, was born in 1492; and having made considerable proficiency in literature, was highly esteemed by Francis I. By him he was employed in several embassies, particularly in negotiating a reconciliation between Henry VIII. of England and the see of Rome; and he was advanced by him to several considerable preferments. Bellay, in the business of king Henry, visited the pope at Rome, where he continued, and in 1535, he was made cardinal by Paul III. As soon as he received intelligence of the hostile designs of Charles V. he returned to France, and resisted that prince's invasion of Provence in 1536, as the lieutenant-general of Francis, with as much military vigour as prudence, and he exerted himself in putting the metropolis, and other places in Picardy and Champagne in a formidable state of defence. After the death of Francis I. his credit declined by the intrigues of the cardinal of Lorraine, and retiring to Rome, he resigned his preferments to France, and was made bishop of Ostia. He was so much respected by his brother cardinals, that they had thoughts of raising him to the pontificate, when he died in 1560 at Rome, aged 68 years. Bellay was distinguished as a patron of literature; and by his advice, in concurrence with that of Budæus, Francis I. founded the royal college in 1529. He was an elegant writer, both in Latin and in French. In the Latin language he wrote some harangues, and an apology for Francis I. and in the latter three books of poems, consisting of elegies, odes, and epigrams, published by R. Stephens, in 1546. Gen. Dict.

BELLAY, *Joachim du*, a French poet, was born at Lire in Anjou, about the year 1524; and amidst various domestic misfortunes, which marked his earlier years, he directed his attention to the study of the ancient and modern poets. At length his own performances in verse made him known at court, and he became the delight of Francis I. Henry II. and Margaret queen of Navarre. He was characterized by the appellation of the "French Ovid," which seemed to have not improperly been bestowed upon him, on account, partly, of the sweetness and facility of his muse, and partly of the licentiousness of some of his pieces. In the sonnet he particularly excelled, and a rank has been assigned to him as a poet next to that of Ronsard. He followed his relation the cardinal to Rome; and on returning with him to France as his agent, he lost his favour in consequence of charges of irreligion and immorality that were alleged against him. But another relation, who was bishop of Paris, gave him a canonry in his church in 1555, and he had the prospect of further preferment; but was carried off by an apoplexy, January 1, 1561. His French poems were published in 1561, and his Latin ones in 1561. Nouv. Dict. Hist.

BELLE DE NUIT, in *Botany*, a name which the French give to the flower of the Jalap.

BELLE bay, in *Geography*, a harbour on the N. E. part of the great bay, called Fortune bay, on the south coast of the island of Newfoundland, in the Atlantic ocean.—Also, another bay on the N. W. side of the same island, 6 or 8 leagues N. W. from the bay of Isles, and about as much S. W. from the small bay of Higournachet.

BELLE Dune, *La*, or *Handsome Town*, a long projecting barren point, on the south side of Chaleur bay in North America, about 8 leagues N. N. W. of Nipisiguit, where temporary cod and herring fisheries are carried on by different people; no trade being established at the place.

BELLE isle, *Belleisle-en-Mer*, or *Belliste*, an island in the bay of Biscay, near the W. coast of France; about 9 miles long,

and from 2 to 4 broad, surrounded by steep rocks, which together with the fortifications, render the conquest of it difficult. It was taken by the English in 1761, but restored at the peace in 1763. The soil is various, rocky, with salt marshes, and some fertile grounds. Besides Palais, the capital, it contains three other small towns, and about twenty villages. N. lat. 47° 17' 30". W. long. 3° 6' 30".

BELLE-isle-*sur-Mer*, in the department of Morbihan, and chief place of a canton, in the district of L'Orient, by the late French arrangement, contains 2496, and the canton 5569 inhabitants: the territory includes 105 kilometres and 5 communes.—Also, a small island of France, in the river Loire, in the department of the Mayenne, half a league west of St. Mathurin.—Also, an island on the east side of the northern part of Newfoundland, east of Canada-head between 50° 4' and 50° 50'. N. lat. and between 55° 39' and 55° 46'. W. long.—Also, an island of North America, at the mouth of the straits of this name, between the country of the Esquimaux, or New Britain, and the north end of Newfoundland. The island is about 7 leagues in circuit, and lies 16 miles from the nearest land on the coast of Labrador, or New Britain. On the north-west side it has a harbour for fishing vessels, or small craft, called "Lark harbour;" and, on the E. point, it has another small harbour or cove, which will admit shallows. The narrow channel betwixt Newfoundland and the coast of Labrador, called the "Straits of Belle Isle," receive several rivers from the coast of Labrador. These straits lead into the gulf of St. Lawrence from the N. E. and are distant 5 leagues N. from Newfoundland. The north point of the island is in N. lat. 51° 57' and the south point in N. lat. 51° 48' and W. long. 55° 40'.—Also, an island of Ireland in lough Erice, in the county of Fermanagh, 6 miles S. E. of Enniskillen.

BELLE-isle-*en-Terre*, a town of France, in the department of the Northern coast, and chief place of a canton, in the district of Guingamp. Seated on an island in the river Guer; 3 leagues west of Guingamp. The place contains 812, and the canton 9118 inhabitants: the territory includes 152½ kilometres and 6 communes.

BELLE plaine, a valley of Piedmont, in the Alps, situate partly in the county of Nice, partly in the county of Tenda, a few miles N. W. of Saorgio.

BELLEFENSE, a town of France, in the department of Côte-d'or, and chief place of a canton, in the district of Beaune. The place contains 1717, and the canton 10,324 inhabitants: the territory includes 215 kilometres and 17 communes.

BELLEFOREST, *Francis du*, in *Biography*, was born at a village called Sarzan, in the province of Guienne in 1530, and after an early education in the court of Navarre, was sent to study the law at Toulouse. But employing himself in writing panegyrics in bad verses, on all the noblesse in and about Toulouse, by whom he was rewarded with praise and entertainment, he removed to the capital: and by attention and industry attained to some reputation in the reigns of Charles IX. and Henry III. so that he gained the post of historiographer-royal, which he afterwards lost for want of paying due regard to fact in his productions. He is said to have composed more than 50 works on different subjects, during a life of 53 years, as he died at Paris in 1583. It is related of him, that there was neither tongue nor science which he did not profane. His most fertile topic was history; and he published compilations of "Tragical Histories;" and "Wonderful Histories." The only two works worth recording are, "The History of the nine Kings of France, of the Name of Charies," folio; and "The Annals of general History of France,"

France," Par. 162, 2 vols. folio, in which last work are 4 veracious facts, intermixed with fables, and therefore having no authority. *Gen. Dict. Nouv. Dict. Hist.*

BELLEGRARDE, *Jouis-Baptiste Merleand*, usually called the "Abbe," was born of a family of rank in the diocese of Nantes in 1638, and entered into the society of the Jesuits. His talents and labours were formed by Father Le Cour, under whom he ranked as a disciple. Attached to the principles of Descartes, which were opposed by the Jesuits, he abandoned the society of Jesuits, after continuing in it 16 or 17 years, and taking priest's orders; and entered into the world, preaching occasionally with applause, but devoting himself chiefly to the profession of an author. Under this character he wrote many books, and supported himself chiefly by the profits accruing from them, distributing to the poor every thing that exceeded a bare maintenance. Some time before his death he distilled from his library 1500 vols., sold his books, and retired to the community of St. Francis de Sales at Paris, established for the support of poor priests, and here he died in 1724. His voluminous publications consist chiefly of translations from the works of St. John Chrysostom, St. Paul, St. Gregory Nazianzen, St. Ambrose, Thomas a Kempis, &c. and also from Ovid, Virgil, and other profane writers. His style is pure and elegant; but he often mistakes the sense of his authors, especially of the Greek fathers. The subjects of his original works are, in general, morals, and matters of taste. Those that have been most favourably received are, "Reflections on Rhetoric;" "Reflections on what may please and displease in the Commerce of the World;" and "Reflections on Eloquence and Poeticks of Style." These, and some other pieces, form a collection of 14 final volumes. *Nouv. Dict. Hist.*

BELLEGRARDE, in *Geography*, a fortified town of France, in the department of the Aveyron; it was taken by the Spaniards in 1744, and retaken the following year by marshal Schomberg. After the peace of Nimwegen, Louis XIV. built a regular fortress with five bastions, to defend the Pyrenees; 5 leagues S. of Perpignan.—Also, a town of France, in the department of the Loiret, and chief place of a canton, in the district of Montargis. The place contains 754, and the canton 5991 inhabitants: the territory includes 172½ kilometres, and 12 communes.—Also, a town of France, in the department of the Creuse, and chief place of a canton, in the district of Aubusson; 2 leagues east of Aubusson. The place contains 1027, and the canton 7638 inhabitants: the territory includes 165½ kilometres, and 9 communes.

BELLEGRAY, a village or village of Germany, in the county of Upper Rhine, and the principality of Bala, with a rich soil of Barrenness. It is distant about 20 miles from Paris, and is a very agreeable situation, surrounded by mountains and sheltered by forests. In this place is instituted a military academy for young nobility and gentry.

BELLEM. See **BELM.**

BELLEN, a town of Scotland, in the canton of Schottland, or the N. E. of Zetland.

BELLENAVE, a town of France, in the department of the Aisne, and chief place of a canton, in the district of Guise, 3 leagues N. W. of Guise.

BELLENOUMBE, a town of France, in the department of the Loiret, and chief place of a canton, in the district of Dreux, 3 leagues west of Neufchâtel, and 5 S. S. E. of Dreux. The place contains 212, and the canton 5144 inhabitants: the territory includes 162½ kilometres, and 127 communes.

BELLI-NDIEN, *William*, (*Bellinensis*, Lat.) in *Biography*, a son of one of the most eminent scholars, was born in Scotland, and spent the greater part of the 17th century. He was professor of the Belles Lettres in the uni-

versity of Paris in 1662, and continued for a considerable time in that office, even after he was made master of the university, and taking James I. of England. At Paris he published, in 1658, his "Cicero Principis," containing a body of extracts from Cicero's writings, relative to the maxims of a monarch's government, and the duties of a prince. This work was dedicated to Henry, prince of Wales, and he prefixed to it a treatise "De Processu et Semperitua Reipublice," in which there is a rich vein of maturing sense and fervent piety. The origin of our errors in religion, and of our defects in policy and morals, is traced out with considerable accuracy and learning. But while the author condemns the monstrous tenets of ancient idolatry, and the gross corruption of philosophy, he bestows many just encomiums on the wisdom and the patriotism of some ancient legislators. In 1662, the author published a work similar to the former, under the title of "Cicero Consul, Senator Senatuturpe Romanus;" on the nature of the consular office, and the constitution of the Roman senate. Encouraged by the reception given by the public to these works, he conceived the plan of a third work, "De Statu imperii Orbis," which was to contain a history of the projects of government and philosophy from the antediluvian times to their various degrees of improvement under the Hebrews, Greeks, and Romans. This work was dedicated to Charles, prince of Scotland and Wales; but when he had proceeded so far as to print a few copies of this work, in the year 1665, it was suggested to him, that his three treatises, "De Statu Principis;" "De Statu Reipublice;" and "De Statu Orbis;" being on similar and connected subjects, might be united in one work; accordingly they were republished in this form under the title of "Bellendenus de Statu," in 1666. Bellenden afterward projected a more extensive work, "De Tribus Lumibus Romanorum," in which Seneca and Pliny were to be joined to Cicero; but death prevented the execution of his whole plan. He was an elegant writer, and a man of extensive knowledge and sound judgment. His Latin style is formed upon that of Cicero; and he embraces every opportunity of interweaving the most choice and proper phraseology from the Roman orator, even whilst he is expressing his own sentiments, so that it is not always easy to distinguish sentences cited from Cicero, from his own language. The book "De Statu," was reprinted in London in 1787, 8vo. by an anonymous editor, (supposed to be the learned Dr. Parr,) with a Latin preface by the editor, relating to the politics and public characters of that period, and beautiful engravings of Mr. Burke, lord North, and Mr. Fox, to whom the three treatises are respectively dedicated. To preserve the memory of every composition which flowed from the pen of Bellendenus, the editor has inserted an epithalamium on the marriage of Charles I. and a "panegyricum carmen" on the embassy to Spain. These verses were found in the British Museum.

The editor owns his firm conviction that Dr. Middleton, in his celebrated history of Cicero, was much indebted to the writings of Bellendenus, although he has never mentioned his name. Pref. to Bellendenus de Statu. Monthly Review, vol. lxxvi. p. 491, &c. vol. lxxvii. p. 54, &c.

BELLEREAU, in *Geography*, a town of France, in the department of the Meurthe, and chief place of a canton, in the district of Nancy, 2 leagues S. E. of Port-a-Mousson.

BELLEROPHON, in *Fables* or *History*, the son of Glaucus, king of Ephyrus or Corinth, was contemporary with Jason. Under a charge of homicide, at some say, on his own brother, he was forced to retire to the court of Prætus, king of Argos, where he was accused by Sthenobara, or a Homer says, Antia, the wife of Prætus, of an attempt upon her chastity. For this insult Prætus sent him to Jobates, his

father-in-law, king of Lycia, with private instructions to put him to death. Jobates demurring against the execution of these orders, employed him in several dangerous expeditions against the Solymi, and against the Amazons, from which he returned victorious. Having thus ingratiated himself with Jobates, he obtained his daughter in marriage, and a settlement in a fertile part of Lycia, where he reigned and brought up his family. From Homer's account, which represents him as "hated by the gods, and wandering in the Aleian plain, a prey to melancholy, and avoiding all commerce with men," he seems to have become insane, and to have died in that state. To his various exploits Homer and other writers have annexed the story of his killing the triform monster called the Chimæra, by the assistance of the flying horse Pegasus, granted him by Minerva and trained for his use. Of the numerous conjectures that have been offered for the explication of this fable, we shall only mention that of Bochart, (Phaleg. l. i. c. 6.) who suggests, that in his expedition against the Solymi, he overcame them, and also their three gods, which they painted on their ensigns, in the several forms of a lion, a goat, and a dragon; and which he probably joined together on his own, in memory of his conquest; and this gave birth to the fable of his killing the monster Chimæra. Homer. Iliad. vi. Anc. Univ. Hist. vol. v. p. 97, &c.

BELLES LETTRES, considered as synonymous with *polite literature*, however vaguely and indefinitely these terms have been often used, properly comprehend those subjects that relate to man as a being endowed with senses of taste and imagination, which were intended to embellish his mind, and to supply him with rational and useful entertainment. In this restricted sense they include the origin, structure, and various kinds of language, or grammar, universal and particular, criticism, rhetoric in its whole extent of composition, style, and elocution; history, in its several departments, ancient and modern, general and special, and all the different kinds of poetry. In the distribution of the Lyceum of Arts, established at Paris in 1792, the belles lettres comprehend general grammar, languages, rhetoric, geography, history, antiquities, and numismatography; whereas, those parts of learning that are of a more grave, sublime, or abstruse kind, and that are more immediately the objects of the understanding, such as logic, metaphysics, ethics, and the various branches of the mathematics and natural philosophy, are usually referred, by way of distinction, to the class of sciences. This distinction, however, is not rigidly observed, even by Rollin and others, who professedly treat of the belles lettres. In their confined and appropriate meaning, they open a field of investigation peculiar to themselves. Their province comprehends every thing that relates to beauty, harmony, grandeur, and elegance; every thing that can soothe the mind, gratify the fancy, or move the affections. They present human nature under a different aspect from that which it assumes, when viewed by other sciences. They bring to light various springs of action, which, without their aid, might have passed unobserved; and which, though of a delicate nature, frequently exert a powerful influence on several departments of human life. Such studies have also this peculiar advantage, that they exercise our reason without fatiguing it. They lead to enquiries acute, but not painful; profound, but not dry or abstruse. They strew flowers in the path of science; and while they keep the mind bent, in some degree, and active, they relieve it at the same time from that more toilsome labour to which it must submit in the acquisition of necessary erudition, or the investigation of abstract truth. Besides, the study of polite literature furnishes an agreeable amusement for those intervals of leisure which occur in every man's life; and thus pre-

vents his being a burden to himself, or recurring to the indulgence of pernicious passions, and the pursuit of licentious pleasures. The satisfactions which this study imparts, occupy a kind of middle station between those of mere sense and those of pure intellect: they refresh the mind after the toils of intellect, and the labours of abstract study; and they gradually raise it above the attachments of sense, and prepare it for the enjoyments of virtue. Of those, whose minds in early life incline to polite literature, good hopes may be entertained, as this liberal and elegant turn is favourable to many virtues; whereas, to be entirely void of relish for eloquence, poetry, or any of the fine arts, is an unpromising symptom of youth, and furnishes suspicions of their being prone to low gratifications, or destined to drudge in the more vulgar and illiberal pursuits of life. A cultivated taste increases sensibility to all the tender and humane passions, by giving them frequent exercise, while it tends to weaken the more violent and fierce emotions:

"— Ingennas didicisse fideliter artes,
Emollit mores, nec sinit esse feros."

"These polish'd arts have humaniz'd mankind,

Soften'd the rude, and calm'd the boist'rous mind."

The elevated sentiments and high examples which poetry, eloquence, and history, are often bringing under our view, naturally tend to nourish in our minds public spirit, the love of glory, contempt of external fortune, and the admiration of what is truly illustrious and great. Although it should not be said that the improvement of taste and virtue are the same, or that they may be always expected to co-exist in an equal degree; yet it must be allowed, that the exercise of taste is, in its native tendency, moral and purifying. From reading the most admired productions of genius, in poetry or in prose, almost every one rises with some good impression left on his mind; and though these may not always be durable, they are at least to be ranked among the means of disposing the heart to virtue. Indeed, without possessing the virtuous affections in a strong degree, no man can attain eminence in the sublime parts of eloquence. He must feel what a good man feels, if he expects greatly to move, or to interest mankind. They are the ardent sentiments of honour, virtue, magnanimity, and public spirit, that only can kindle that fire of genius, and call up into the mind those high ideas, which attract the admiration of ages; and if this spirit be necessary to produce the most distinguished efforts of eloquence, it must be necessary also to relish them with proper taste and feeling. Blair's Lectures on Rhetoric, and Belles Lettres, vol. i. lect. 1. Rollin's Method of treating and studying the Belles Lettres, vol. i. p. 3, &c. M. de Rosenstein's Oration, delivered before the Swedish Academy, translated by N. G. Agander.

BELLESME, in *Geography*. See BELESME.

BELLEVILLE, a town of France, in the department of Paris, and chief place of a canton, in the district of St. Denis, half a league east of Paris.—Also, a town of France, in the department of the Rhone, and chief place of a canton, in the district of Villefranche, 2½ leagues north of Villefranche.—The place contains 2039, and the canton 11,528 inhabitants: the territory includes 145 kilometres and 12 communes.—Also, a town of France, in the department of Vendée, and the district of Montaigne, one league north of La Roche-sur-Yon.

BELLEVOIS, in *Biography*, a painter of sea pieces, known through all parts of Europe as a good painter, died in 1684. His subjects are views of havens, sea-ports, shores, calms, and storms at sea; but in his calms he shows his peculiar excellence. Histouch is light, and his colouring clear; the perspective of his sea-ports and buildings is true, and has an agreeable effect; his skies are generally bright, and judiciously

judiciously managed; and his colouring is transparent. His figures are indifferent, and without much expression. His pictures occur in public sales, and some of his best style fetch a tolerable price. Pilkington.

BELLEVEUE, or *St. Belin*, in *Geography*, a town of France, in the department of the Saone and Loire, and chief place of a canton, in the district of Charolles. The place contains 2800 and the canton 9406 inhabitants: the territory includes 322½ kilometres and 13 communes.

BELLEVEY. Lat. BELICA, a town of France, and principal place of a district in the department of the Ain, before the revolution the capital of Le Buguey, and the seat of a bishop, seated among hills and small eminences, about 2 miles from the Rhone, and twelve miles east of Lyons. The place contains 3727 and the canton 12,118 inhabitants: the territory comprehends 195 kilometres and 22 communes. N. lat. 45° 45'. E. long. 5° 35'.

BELLEGROVE, a town of America, in Bergen county, New Jersey, on the road to Albany, within half a mile of the line that separates New York from New Jersey, which extends from Delaware river to that of Hudson; distant 24 miles N. by W. from the city of New York.

BELLI, in *Modern History*, the name of a society or sect among the Negroes of Africa, in the interior kingdoms of Sierra Leona, which is properly a school or seminary for the education of children, renewable every 25th year by order of the king, who is visitor or superior of the college. Here the young men learn to dance, fight, fish, hunt, and above all, to chant a certain hymn, which, in the language of the college, they call "bellidog," or the praises of belli: these songs consist only of a repetition of the same lowly expressions, enforced by the most indecent and lascivious postures. When a young negro is become an adept in this practice, he is admitted a fellow of the college, deemed to be qualified for all employments, temporal and spiritual, and entitled to a number of important privileges.

BELLICA *columna*, in *Antiquity*, a column near the temple of Bellona, from which the consuls or sceiales cast javelins towards the enemy's country, by way of declaration of war.

BELLICOSUS, in *Etymology*, a species of CAMEL, (*oblongus*), that inhabits Africa. It is of a brown colour; posterior thighs arched, and dentated; and four spires on the abdomen. Fabricius. Gmelin.

BELLICULI, or BELLIFORM *Murini*, among *Naturalists*, denote a species of sea-shells of an umbilical figure, sometimes of a white colour, spotted with yellow; and sometimes of a yellow, streaked with black lines, after the snail fashion.

BELLIDIASTRUM, in *Botany*. See DORONICUM.

BELLIDIODES. See CHRYSANTHEMUM.

BELLEVEUE, POMPONE DA, in *Biography*, chancellor of France, was born at Lyons in 1529, studied at Toulouse and Padua, and in 1575 became superintendent of the finances, and in 1579 president of the parliament of Paris. Having been employed in several important embassies by Charles IX. and Henry III. and IV. he was created chancellor by the latter in 1599, as a recompence for his services at the peace of Vervin. In the execution of his office he was enlightened, inflexible, inclined to austerly, and, by the warmth of his temper, to occasional precipitance. He was distinguished by his learning and eloquence, as well as by his talents for business. In 1604, he lost the seals, but continued in the posts of chancellor and president of the council; however, he used to say, regretting his loss, "that a chancellor without the seals was a body without soul." He died in 1607; and several eulogies were bestowed on his memory, in honour of the regard which he always testified to learning and its professors. The grandson of the former was distinguished, in the reigns of Louis XIV. and XV. by

his legal and diplomatic talents; and was founder of the general hospital at Paris. Nouv. Dict. Hist.

BELLIMO, in *Modern History*, a mode of trial, or a kind of purgation, practised by the Negroes in the interior countries of Africa, when persons are accused of murder or theft, and consisting of a composition of certain herbs or barks of trees, which they oblige the accused to hold in his hand, under a full persuasion, that, if he be guilty, blisters will immediately rise upon the skin. Sometimes the bellimo consists in obliging the accused to swallow a large glass of a liquor compsed from the bark of the neno and quoni trees, which the negroes believe to be virulently poisonous. The innocent immediately reject it by vomit; but the guilty siew a froth about the mouth, and are accordingly judged worthy of death.

BELLING *of Hops*, denotes their opening and expanding to their customary shape, supposed to bear some relation to that of a bell. Hops blow towards the end of July, and bell the latter end of August or the beginning of September.

BELLINGHAM, in *Geography*, a small town of Northumberland, England. It has a market on Tuesday, one fair annually, and is 300 miles north of London. In 1780, this town was nearly consumed by fire, and its houses now only amount to 70, and inhabitants to 337. About four miles to the south is the village of Wark, where are the keep and some ruins of an ancient castle.

BELLINGHAM, a small farming township of America, in Norfolk county, Massachusetts, containing 735 inhabitants, 20 miles N. from Providence, and 34 S. from Boston.

BELLINI, LAURENCE, in *Biography*, a learned and ingenious physician, was born at Florence in 1647. He had the advantage of being educated under Manchetti, Redi, and Borelli, and profited so well by their instructions, that he was made professor in mathematics and philosophy at Pisa, when he was only twenty years of age. He was also no mean proficient in oratory, poetry, and music, but proposing to practise medicine, he was soon advanced to the chair of professor in anatomy, a post he continued to fill with reputation for near thirty years. He was one of the principal supporters of the medico-mathematic school, who attempted to explain the functions of the body, the causes of diseases, and the operations of medicines on mechanical principles. In this he was followed by Archibald Pitcairne, who read his works at the schools in Edinburgh during the life-time of Bellini, and dedicated one of his own works to him. When he was fifty years of age, he was called to Florence, by Cosmo III. who appointed him his physician, and about the same time, on the recommendation of Lancisi, he was made honorary, or consulting physician to pope Clement XI. but having more imagination than judgment, and endeavouring to square his practice to his theory, he was generally unsuccessful in his treatment of diseases, and thus soon forfeited the favour, Haller says, both of his prince and the public. In his anatomical researches he was more successful, as he was the first who accurately described the nervous papillæ of the tongue, and discovered them to be the organ of taste, of which he gave an account in his "Gustus Organum novissimè Deprehensum;" Bonon. 1665, 1660.; and he had before, viz. in 1662, published "De Structura Renum," Florent. 4to. which had been well received, as containing additional information on the anatomy of that organ. These works have been frequently reprinted, though now, from the great improvements that have been made in anatomy, but little noticed. In 1683, he published "De Urinis et Pulsibus;" De Missione Sanguinis;" "De Morbis Capitis et Pectoris;" being in all, distinct treatises on those subjects, 4to. Bonon. This is a work of much research and observation, though often obscure and too theoretical.

It was much celebrated in its time; and Boerhaave, who published an edition of it in 1717, accompanied it with a commendatory preface. For the titles of the remainder of Bellini's productions, see Haller's *Bib. Med. et Anatom.* He died in 1704. *Gen. Biog.*

BELLINI, GENTILE, a painter of history and portrait, was born at Venice in 1421, and instructed by his father Giacomo, who was himself an artist in the art of painting, both in distemper and in oil. He was employed by the doge to paint the hall of the great council, and he executed several considerable works for others of the nobility. His reputation reaching to the Ottoman court, he was invited by Mahomet II. to Constantinople, where he was honorably entertained, and employed in painting the portrait of the emperor, and in various other performances. It is said, however, that the emperor ordered the head of a slave to be cut off in the presence of Bellini, in order to convince him of the incorrectness of a picture which he had painted, of the decollation of St. John the Baptist; but the sight affected his mind to such a degree, that he was never easy till he obtained leave to return to his own country. Mahomet, before his departure, put a gold chain about his neck, and dismissed him with letters of recommendation to the senate of Venice, which procured for him a pension for life, and an admission into the order of St. Mark. Vasari mentions a sea-fight, painted by this master, which had extraordinary merit. He died in 1501. Pilkington.

BELLINI, GIOVANNI, the brother of the former, was born at Venice in 1422, and surpassed both his father and brother in every branch of painting. He is accounted the founder of the Venetian school, by introducing the practice of painting in oil, which had been communicated to his father by Domenico and Andrea del Castagno, as some say; or which, according to De Piles, he obtained from Antonia of Messina: and by teaching his scholars to paint after nature, the school of Giovanni produced two memorable disciples, Titian, and Giorgione, who brought the art of colouring to its highest perfection; and Giovanni himself, by observing the works of these famous artists, improved his own manner very considerably; so that in his latter pictures the colouring is much better, and the airs of his head are noble, although his design is somewhat gothic, and his attitudes not well chosen. He died in 1512. Pilkington.

BELLINO, *Str. in Geography*, a town of Italy, in the Polesino di Rovigno, 10 miles W. S. W. of Rovigno.

BELLINZONE, or BELLENZ, one of the Italian bailliages of Switzerland, on the east side of the river Tesino, north of the lake Maggiore, or lake of Locarno, and on the confines of the Milanese, which, together with the two bailliages of Riviera or Poleso, and Val di Blenzo, Bregno or Brenna, comprehend 110 square geographical miles, and 33,000 inhabitants, and before the French revolution belonged to the cantons of Uri, Schweiz, and Underwalden. In the 15th century, this country belonged to the counts of Sax, who sold it in 1422 to the original cantons; but Philip Maria, duke of Milan, opposing this sale or exchange, exerted himself to prevent from falling into their hands a town like Bellinzone, so important from its situation and natural strength, to check their inroads and cover his dominions. Having therefore taken possession of it by force of arms, a body of 8000 Swifs passed the Alps. The force of both nations met; the Italians were led on by Carnagnola; a bloody battle ensued, of which both sides claimed the victory: but the Swifs retired with a standard taken from the enemy, and they remained masters of the town. In 1500, however, the three cantons obtained what they long contended for; the inhabitants of Bellinzone, vexed by the frequent changes in

the Milanese, submitted to them. The French, when they had conquered the duchy, in vain reclaimed it; the Swifs retained possession; and the seven Italian bailliages, and this amongst the rest, were formerly ceded to them by Maximilian Sforza, in gratitude for their having reinstated him in the ducal seat. It was likewise made an article of the perpetual peace concluded between Francis I. king of France, and the cantons. The bailiff remains in office two years; he is nominated alternately by the three cantons, and is generally removed from Riviera the poorest, to Bellinzone, the most lucrative of the three governments. An appeal lies from his decision to the syndicate, and from that court to the three cantons: in ecclesiastical affairs, the inhabitants are cognizable to the bishop of Como, excepting three parishes. The inhabitants are catholics; and most of the natives understand Italian, but the language is a corrupt German. After the French revolution, Bellinzone, according to the division of 1798, became a distinct department or canton, including the bailliages of Bellinzone, Riviera, and Val Leventina, of which the chief town was Bellinzone. By the constitution of 1801, the Italian bailliages formed the 17th department or canton of Switzerland, and was empowered to send five representatives to the diet. The riches of this district consist in its pastures and cattle; the deficiency of corn is supplied by the Milanese; and the plain near Bellinzone produces good wine.

BELLINZONE, or BELLINZ, *Lat. Bilitio, Bilitiana, Bellinona, or Berinzona*, the capital of the above bailliage or department, is a beautiful town, situate at the foot of mount Cenero, on a delightful plain on the east side of the Tesino, a little below its junction with the Moesa or Mufa, and about $5\frac{1}{2}$ British miles above the northern extremity of the lake Maggiore. The town is encircled with ancient walls and battlements in good repair; on the right are seen the majestic ruins of an ancient castle, and on the left, separately embosomed in trees, are the castles of the bailiffs of the three regent cantons, Uri, Schweiz, and Underwalden. The interior of Bellinzone is far from corresponding with its external beauty and situation; the streets being narrow, and the houses ill-built. It is, however, rich in fine churches, dedicated to St. Peter, St. Stephen, St. Blaise, and St. Rock; and it has numerous convents of Augustines, Ursulines, and Recollects. There is also a convent, or seminary, called the "Residence," lately founded for the education of youth. The valley that lies between this town and the lake is level, and laid waste by numerous torrents: the road runs along the sides of the hills through continued vineyards bounded on the west, and also on the east, by ridges which are clothed to their summits with woods of chestnuts and walnut trees, half concealing frequent spires and numerous hamlets. N. lat. 46° 4' E. long. 8° 43'.

BELLIS, formed from *bellus*, pretty or handsome, *Eng. daisy*, *Fr. paquerette*, in *Botany*. *Lin. gen. n.* 962. *Reich.* 1042. *Schreb.* 1300. *Tournef.* 280. *Juss.* 183. *Gærtn. t.* 168. *Clafs* and order, *syngenesia polygamia superflua*. *Nat. P. minor. Mart. Valer. v. 2. 213. *Pranula veris*. Frag. Hist. 161. 3. *B. hortensis*, double or garden daisy. Mill. Dict. r. 3. Curtis Magaz. t. 225. Rell. Hist. 350. n. 4. 4. *B. multifida*, quilled daisy. 5. *B. prolifera*, proliferous or hen and chicken daisy. "Scape naked." The common daisy is readily distinguished by its creeping, ramose, and long fibrous roots; by its radical, depressed, obovate, crenate, and pointed leaves; by its erect, simple, single-severed, round, and naked scape; by its beautiful flower, with a conic, golden disk, and white, or more frequently reddish ray; by its linear-obovate, plane, emarginate, very numerous, potent fibrous rays; by its compressed, hairy seeds; and by its concave, acute, punctated, concave receptacle. Smith. Flor. Brit. v. 2. 298. A native of most parts of Europe in meadows and pastures; it grows almost all the year, and shutting up close every night and in wet weather. The taste of the leaves is somewhat acrid, but in some countries used as a pot-herb. The roots have a penetrating pungency. It is injurious to cattle, and even to geese. It occupies a large share of pasture land, to the exclusion of grass and profitable herbs. It has been much recommended for fresh wounds externally, and against inflammatory disorders internally; but it is now totally out of use. The varieties of the garden daisy are double-white, red, white, and red striped, variegated, scarlet and pied; double quilled, or with singular flowers; double cock's-comb shaped, white red and speckled; proliferous, chiding or hen chicken daisy. 2. *B. annua*, annual daisy. Lin. Spec. 1249. Syst. 570. "Stem four what leafy." A low annual plant, seldom rising more than three inches high, with an upright stem having leaves on the lower part, and its upper part naked, the latter a single row like that of the common double smaller. A native of Sicily, Spain, about Montpellier, Verona, and Nice. Cultivated in 1759 by Miller.

Propagation and Culture. The garden daisies flower in April and May, and make a pretty variety when intermixed with plants of the same growth; they should be planted in a shady border and a heavy soil without dung, on which they may be preserved without varying, provided the roots are preserved, and parted every autumn. They should be kept in flower beds. They were formerly planted for edging to borders; but for this purpose they are unfit, because when fully exposed to the sun, they frequently die in large patches. Mr. Curtis, however, thinks they appear to most advantage when used to border, as they serve to soften them and to add brilliancy to the gaiety of the garden. He recommends the roots to be taken up in the last week of September, or the first of October, to be divided into single plants, and to be preserved in a dry place in a trench, spreading out the fibres, and preventing the earth from drying them, as they will continue to grow, and be drawn out of the ground by worms. Such daisies should be replanted every autumn; otherwise they will spread too wide. Martyn's Miller's Dict. According to Mr. Curtis, the plants that remain undisturbed in the flower beds, will recur to their natural state, and become broad; but Mr. Miller says that he never observed them to do so.

BELLIS. See ANTHEMIS, ASTER, ATHANASIA, BELLIDONIA, CALTAPULA, CHRYSANTHEMUM, COLUMBA, LOKONICUM, ECLIPSA, OSMITIS, and GYRONARIA.

BELLIS major. See CHRYSANTHEMUM.

BELLIS annua. See GLOUGERIA.

BELLIS, in *Natural History*, a species of HYDRA, resembling the calyx of a flower, warted; tuberculate, and variegated. This is a *B. bellis* of Schlander and Ellis; and is found on the coast of Cornwall.

BELLIS, a species of VERTICILLATA, of a simple hemispherical form, with a contractile margin. Mill. Hist. Vertic. Found in stagnant ditch water; sometimes resembles the flower of a daisy, but small, yellowish; peduncle long, pedicel, very thin, fixed at the end; moves with a rotatory motion.

BELLISLU, in *Geography*. See BELLE ISLE.

BELLIUM, in *Botany*. Lin. gen. Reich. n. 1043. Schreb. 1571. Juss. 182. Class and order, *Synonyma perigania superflua* Nat. Ord. *Compositae Dissoideae. Compositae*. Juss. Gen. Char. Cal. common simple, with very many, equal, boat-shaped leaflets. Cor. compound radiated; in the ray female ten or twelve; in the disk hermaphrodite very many;—proper of the hermaphrodite female-shaped, quadrifid, erect; of the females elliptic, emarginate, ligulate. Stam. in the hermaphrodite filaments four, short; another cylindrical. Pist. in the hermaphrodite germ turbinate; style filiform; stigma bifid, oblong; in the females germ turbinate; style very short; stigma bifid, minute. Perianth. Calyx rather gland. Seeds turbinate; crown chaffy, eight-leaved, rounded; down with eight simple awns. Rec. naked conic. Cls. Different from *Bellis* and *Pectis*, on account of the down and five-lobed corollules.

Fl. Char. Cal. with equal leaflets. Seeds conic, with a chaffy eight-leaved crown, and awned down. Rec. pt. naked.

Species, 1. *B. bellidondy*. Lin. Syst. 770. *B. droserifolia*. Gouan. illust. 69. 2. *B. annua minima*. Triumf. Obs. t. 82. *B. maritima* min. &c. Boec. Mus. 149. t. 167. "Scares naked, filiform." This has the habit of a daisy, but differs essentially from it in having a down to the seed. A native of Italy, about Rome, and in the island of Majorca. 2. *B. minutum*. Linn. Syst. 770. *Pectis minuta*. Linn. Spec. 1250. Schreb. Act. Ups. Nov. 1. 84. t. 5. f. 2. *Bellis cretica* for the common *minima*. Tournef. cor. 37. Vaill. Act. 547. "Stem leafy." One of the minutest of plants; stem capillary, an inch long; the whole plant smooth and ascending; examined with a glass it appears to have hairs scattered over it. A native of the Levant. Introduced in 1722 by M. Richard.

BELLIO, in *Geography*, a town of Italy, in the kingdom of Naples, and province of Basilicata; 2 miles S. W. of Muro.

BELLOI, PIER LAURENCE BRETTE DE, in *Biography*, a French dramatic writer, was born at St. Flour, in Auvergne, in 1727, and educated for the bar at Paris. But quitting the profession for which he was designed, he left his country, and went to Russia in the capacity of actor. After having exercised his literary talents in the composition of various favorite pieces, he returned to Paris in 1758, and brought on the stage, first his "Tito," and next his "Zelmira." But his tragedy of the "Sage of Calais," exhibited in 1755, was the most popular, and contributed in the greatest degree to establish his reputation. For this performance the king presented him with a gold medal and a considerable pecuniary reward; and the magistrates of the town sent him the freedom of the town in a gold box, and placed his portrait in the hall among their principal benefactors. Voltaire also wrote a complimentary

letter to the author, though after Belloi's death he retracted his praises. This piece was succeeded by his "Bayard," "Peter the Cruel," and "Gabrielle de Vergey." But the failure of the second of these hastened his death in 1755, to the regret of numerous friends, who were attached to him by the goodness of his heart. As a dramatic writer his distinguishing excellence consisted in his knowledge of stage effect, and of the method of producing it by new and uncommon situations; but in pursuing these he quitted the true and natural pathetic, and aided in degrading the modern theatre. His versification is often negligent, and his style hard and inflated. M. Gaillard of the French academy, published a collection of his works in 6 vols. 8vo. 1779, with a life of the author prefixed. *Nouv. Dict. Hist.*

BELLON, or **BELLAND**, in *Medicine*, a distemper very common in Derbyshire and other counties, where they smelt lead ore, to which beasts, and even poultry, as well as men, are subject; and for this reason a certain space round the smelting-houses is called bellon-ground, where it is dangerous for any animal to feed. This disorder is attended with languors, weakness, and intolerable pains, sensation of gripings in the belly, and generally costiveness. It frequently proves fatal.

The method of cure which has been found most successful in this distemper, is, to give *cremor*, or crystals of tartar, in small doses, and to repeat them frequently, as two or three times a day.

BELLONA, in *Mythology*, the goddess of war, sister or wife to Mars.

Hyginus (fab. 274.) says, that Bellona was the inventress of the needle, called in Greek *βελονη*, and hence her name has been fancifully derived. Others with greater probability, deduce it a *bello*, war; and Bryant (*Anal. Anc. Mythol.* vol. i. p. 45.) supposes it to be formed from Bel-on, a compound of Bel, Bal, or Baal, the original Babylonish title appropriated to the sun. This goddess was of a savage disposition, and delighted in slaughter and blood; and she was not only represented as the attendant of Mars, who prepared his chariot and horses for war, but as taking pleasure in sharing his dangers. She is commonly represented in an attitude expressive of fury and distraction, her hair being composed of snakes clotted with gore, and her garments stained with blood. She is generally exhibited driving the chariot of Mars, with a bloody whip in her hand, and sometimes as holding a lighted torch or brand, and at other times a trumpet. Bellona had a temple at Rome, near the Porta Carmentalis, in which the senate gave audience to ambassadors; and before it stood the pillar or column of war, against which a lance was thrown whenever war was declared. She was also worshipped at two places called Comana, one of which was in Cappadocia, and the other in the kingdom of Pontus; and Camden observes, that in the time of Severus, there was a temple of Bellona in the city of York. Poets and artists have often confounded Bellona with Pallas.

BELLONA, in *Entomology*. Under this name Cramer describes *papilio brassolis* of Fabricius. The species *bellona* of Fabricius and Gmelin is a native of North America, has denotated fulvous wings, spotted with black; posterior ones, beneath silvery at the tip, with six ocellar fulvous spots. A variety of it β is figured by Cramer under the trivial name of *hegestia*.

BELLONARII, in *Antiquity*, priests of Bellona, the goddess of war and battles.

The Bellonarii cut and mangled their bodies with knives and daggers in a cruel manner, to pacify the deity. In this they are singular, that they offered their own blood, not

that of other creatures, in sacrifice. In the fury and enthusiasm with which they were seized on these occasions, they ran about raging, uttering prophecies, and foretelling blood and slaughter, devastations of cities, revolutions of state, and the like: whence Martial calls them "turba entheata Bellonæ." *Lactant.* *Inst.* lib. i. cap. i. *Lucian.* lib. i. *Tertul.* *Apol.* cap. 9. *Minut.* *Felix*, p. 298. In after-times they seem to have abated much of their zeal and transport, and to have turned the whole into a kind of farce, contenting themselves with making signs and appearances of cutting and wounds. *Lampridius* tells us, the emperor *Commodus*, out of a spirit of cruelty, turned the farce again into a tragedy, obliging them actually to cut and mangle their bodies. *Lamp.* in *Commod.* cap. 9.

The Bellonarii celebrated feasts on the eve of the nones of June, and the ninth of the calends of April, on which occasion they chewed a plant called Bellonaria, which produced a kind of fury, and disposed them to mangle their bodies in the manner which characterised these feasts.

BELLONIA, so called by Plumier, after the name of M. Bellon, a physician of Caen, in *Botany*. *Lin.* gen. 226. *Reich.* 242. *Schreb.* 298. *Plum.* 31. *Juss.* 200. Class and order, *pentandria monogynia*. *Nat. Ord.* *Rubiacea*. *Juss.* *Gen. Char.* *Cal.* perianth, one-leaved, superior, semiquinquesid, permanent; divisions lanceolate, acute. *Cor.* monopetalous, wheel-shaped; tube very short; border flat, semiquinquesid, obtuse, large. *Stam.* filaments five, subulate, erect, very short; anthers erect, converging, short. *Pist.* germ inferior; style subulate, straight, longer than the stamens; stigma acute. *Per.* capsule turbinate-ovate, wrapped up in the calyx, and beaked with its converging divisions, one-celled. *Seeds* numerous, roundish, small.

Ess. Char. *Cor.* wheel-shaped. *Caps.* one celled, inferior, many-seeded, beaked with the calyx.

Species, 1. *B. aspera*. *Lin.* *Spec.* 244. *Plum.* gen. 19. *ic.* 47. *Swartz.* *Prodrom.* 42. 2. *Obf.* 69. "Leaves ovate-ferrate, flowered corymbed terminating." A shrub ten or twelve feet high, from which issue many lateral branches. This species is said to rest wholly upon the authority of Plumier. Mr. Miller says, that it is very common in several of the warm islands of America, whence he has received the seeds. 2. *B. spinosa*. *Swartz.* *Prodr.* 42. "Thorny; leaves ovate, angular, tooth-ferrate, peduncles axillary, one-flowered."

Propagation and Culture. It is propagated by seeds which should be sown early in the spring, in a pot filled with light fresh earth, and plunged into a hot-bed of tanner's bark, and frequently watered. When the plants are come up half an inch high, they should be transplanted into pots filled with light fresh earth, and plunged again into the hot-bed, watered and shaded till they have taken root; then air should be admitted to them every day in warm weather, and they should be frequently watered. When the plants have filled these pots with their roots, they should be carefully shaken out of them, and their roots trimmed, and put into larger pots filled with light fresh earth, and put into the hot-bed again. In warm weather fresh air should be admitted to them every day; but in autumn they must be plunged into the bark-stove, and treated like other tender exotic plants. These plants will sometimes flower in the second year, but they rarely produce good seeds in this climate. Nevertheless, they may be propagated by cuttings in the summer months, provided they are planted in light earth on a moderate hot-bed, and carefully watered and shaded till they have taken root. They must be constantly kept in the stove, and have a large share of free

air in warm weather; but if they are set abroad, they will not thrive in this climate. *Martyn's Miller's Dict.*

BELLORI, JOHN PETER, in *Biography*, a celebrated antiquary, was a native of Rome, and derived from his uncle Francis Angeloni, under whose care he was placed, his taste for antiquities. He was appointed by Christina, queen of Sweden, the keeper of her library and cabinet of curiosities; and by pope Clement X. antiquary of Rome. He died in 1676, above 80 years of age. His valuable cabinet was afterwards annexed to that of the king of Prussia at Berlin. Of his various works, relating to his favourite pursuit, the principal are the following: viz. "Notæ in Numismatibus Episcopatus aliarum urbium apud Italiam," 1658, 2to.; "Fragmenta Vestigii veteris Romæ," 1672, fol.; "La Colonna Trajana," fol.; "Le Pitture Antiche del Sepolcro de' Nasoni," 1680, fol.; "Le Antiche lucerne sepolcrali figurate," 1691, fol.; "Gli antichi sepolcri del Mausoleo Romano & Etrusco," 1699, fol.; "Veteres Arcus Augustorum," 1690, fol.; "Vite de Pittori, Scultori, et Architelli Moderni," 1692, 4to.; "Imagines veterum Philosophorum," 1685, fol. Several treatises of this author are inserted in the 7th volume of Gronovius's Greek Antiquities. He also reprinted, in 1685, with large additions, Angeloni's "Historia Augusta," illustrated by Medals. *Moreri. Gen. Biog.*

BELLOSTE, AUGUSTIN, a surgeon of eminence in his time, inventor of a mercurial composition, called after his name, "Belloste's pill," by which he is supposed to have acquired a considerable fortune. After practising several years at Paris, where he was born in 1654, and as an army surgeon, he was invited to Sardinia, and made principal surgeon to the queen's mother, and continued to reside at Turin to the time of his death, which happened July 15th, 1730. The work by which he is principally known, is his "Chirurgien de l'Hospital," published 1695. It has passed through numerous editions, and been translated into all the European languages. In 1725, he published a continuation of it, under the title of "La suite du Chirurgien de l'Hospital." Among other useful observations, he recommends piercing carious bones, with the view of accelerating exhalation, a practice advised by Celsus, though long discontinued. He reproves the custom of frequently removing the dressings of wounds, as tending to retard the cure. The work has much merit, though now little noticed, being superseded by later publications. *Haller Bib. Med. Pract. et Chir.*

BELLOTTI, PIERRO, a painter of history and portrait, was born at Venice in 1625, and learned the art of colouring from Michael Forabosco, whose disciple he was. As a portrait painter, he attained the first rank, but was less eminent in the composition of his historical subjects. In the imitation of nature he was peculiarly happy; the colouring of his portraits appears to be real flesh, and the variety in the cast of his head is inconceivable; in all his attitude there is much grace, and the disposition of his figures is natural and becoming. He died in 1700. *Pilkington.*

BELLOVACI, in *Ancient Geography*, a people of Gaul, considered in the nation of the Belgæ, and seated south of the Ambiani. Their country was particularly distinguished by the name of Belgium, and corresponded to the modern Brabant; their chief city was called by the Latins Caesaroborgus; and Cæsar speaks with commendation of their valour and their number.

BELLOWING, among *Sportsmen*, is used for the noise which does make in rutting-time.

BELLOWS, a machine used to give a brisk agitation to the air, by enlarging and contracting its capacity, and thus expiring and inspiring the air by turns.

This machine is used in chambers and kitchens, in forges, furnaces, and founderies, for blowing up the fire; and it is annexed to organs and other pneumatic instruments, in order to supply them with a due degree of air. They are constructed of various forms, and furnished with different kinds of apparatus for giving them motion, and for discharging their air, according to the purposes which they are intended to serve. However, they are in general composed of two flat boards, sometimes of an oval and sometimes of a triangular figure; between these boards are placed two or more hoops, bent so as to suit their figure; on the edges of the boards is nailed a piece of leather, broad in the middle and narrow at the ends, which unite them together, and it is also affixed to the hoops of the boards, that the leather may the more easily open and fold again; to the undermost board is fastened a pipe of iron, brass, or copper; and within is a valve, which covers the holes in the under board so as to keep in the air. Strabo informs us (*Geog. l. viii. vol. i. p. 464.*), from an old historian, that Anacharsis, the Scythian philosopher, who lived in the time of Solon, about 600 years before Christ, invented the bellows, as well as the anchor and potter's wheel; but this account is very doubtful, as Pliny, Seneca, Diogenes Laertius, and Suidas, who likewise speak of the inventions ascribed to that philosopher, mention only the two last, and not the bellows. It appears, however, that they were known in ancient times to the Greeks; and Virgil mentions them in the following passage (*Georg. iv. 170.*):

“— Alii taurinis follibus auras
Accipiunt, redduntque.”—

Upon which it may be remarked, that bull's leather is unfit for bellows, and ox and cow's leather only can be used for that purpose; but accuracy, in the description of a mechanical engine, is not to be expected in a poet. In more modern times, wooden bellows have been introduced in metallurgical operations, instead of those of leather. The latter require careful management: the repairs of them are expensive; and they seldom last more than six or seven years. When thin leather is employed, it suffers a great deal of air to escape through it; and this evil must be guarded against by continually besmearing it with train oil, or other fat substances; and this is even necessary when thick leather is used, to prevent it from cracking in the folds. Whenever they are repaired, it is necessary again to soften the leather with oil, and this occasions a considerable loss of time. To obviate these, and similar inconveniences, and with a view to some peculiar advantages, wooden bellows have been invented in modern times, of which we shall give some account in the sequel of this article. In the oldest smelting-houses, the bellows were moved by a handle, like those of the smith's forge, or by the pressure of the foot upon a treadle, or by other means, requiring the strength of man. But since the force of water has been employed to move them, the quantity of ore run down has not only been far greater, but the separation of the metal more complete; inasmuch, that great part of the iron now prepared at some considerable works, particularly in the county of Gloucester, has been no other than what had been left in the slag of cinders, for want of sufficient force of air.

The action and effect of bellows of every kind, whether leathern or wooden, wrought by water or man, depend on this, that the air which enters them, and which they contain when raised, is again compressed into a narrower space when they are closed. And as the air, like all other fluids, flows to that place where it meets the least resistance, it must of consequence fly out of the pipe or aperture with a velocity propor-

proportional to the force by which it is compressed, and must therefore blow stronger or weaker, as the velocity with which the top and bottom of the bellows meet is greater or lesser. The blast also will last in proportion to the quantity of air that was drawn into the bellows through the valve or wind-clap.

The action of bellows bears a near affinity to that of the lungs; and what we call blowing in the latter, affords a pertinent illustration of what is called respiring in the former. Accordingly, bellows have been employed in restoring suspended animation; and Dr. Hooke found, by renewing the interrupted action of the lungs by blowing air into them, by cutting away the ribs and diaphragm, and pericardium, &c. and laying the thorax of a dog bare, and having cut off the *aspera arteria* below the epiglottis, and bound it on the nose of a bellows, that as he blowed the dog recovered, and as he ceased, became convulsive: and thus the animal remained alternately alive and dead above the space of an hour. See the methods of recovering suspended animation, under the article DROWNING.

The bellows of smiths and founders, whether single or double, are wrought by means of a rocker, with a string or chain fastened to it, and pulled by the workman. The bellows-pipe is fitted into that of the tewel. One of the boards is fixed, so as not to play at all. By drawing down the handle of the rocker, the moveable board rises, and by means of a weight on the top of the upper board, sinks again.

The bellows of the Chinese smiths is of a very simple kind, and is composed of a square pipe of wood ABCDE (*Plate XIII. Pneumatics, fig. 107.*) with a square board G, which exactly fits it, moved by the handle FG. At the farther end is the blast pipe HK, and on each side of it a valve in the end of the square pipe, opening inwards. The piston is sufficiently tight for their purposes without any leathering.

The bellows of forges and furnaces of mines usually receive their motion from the wheels of a water-mill, or in our large furnaces they are worked by a steam-engine. Others, as the bellows of enamellers, are wrought by means of one or more steps or treadles under the workman's feet.

The bellows of an organ are six feet long, and four broad; each having an aperture of four inches, that the valve may play easy. There should likewise be a valve at the nose of the bellows, that one may not take the air from the other. To blow an organ of sixteen feet, there are required four pair of these bellows.

The bellows of organs are wrought by a man called the blower; and, in small organs, by the foot of the player. See ORGAN.

The method of constructing wooden bellows for the purposes of metallurgy, was an important and useful invention, for which we are indebted to the Germans. This is expressly affirmed by Grignon in his "*Memoires sur l'art de fabriquer le fer,*" Paris, 1775; and in the time of Becher, they were to be found in Germany, but not in England. Geoffrains, in his "*Traité de la fonte des mines par le feu du charbon de terre,*" Paris, 1770, erroneously ascribes the invention to the Swils; being probably led into this error in consequence of a Swils having first made known these bellows in France. The name of the real inventor, however, has not been ascertained. From a catalogue of machines given to the magistrates of Nuremberg in 1550, by an artist, called Hans Lobfingler, Doppelmayr concludes, that he understood the art of making small and large bellows without leather, and entirely of wood, which could be used in smelting-houses and for organs, and likewise copper-bellows, that always emitted a like degree of wind. As

Lobfingler made organs, Beckman (*Hist. Inventions, vol. i. p. 109.*) suggests, that this invention might occur to him; but he has not been able to learn in what it actually consisted, or whether it might not die with him. Agricola, who died in 1555, makes no mention of wooden bellows. Samuel Reyher, formerly professor at Kiel, in the improved edition of his dissertation on air, printed there in 1669, reprinted with additions at Hamburg in 1725, and entitled "*De Pneumatica, sive de Aere et Aerometria,*" informs us, that "about 80 years ago a new kind of bellows, which ought to be called the pneumatic chests, was invented in the village of Schmalebuche, in the principality of Cobourg, in Franconia," by two brothers, Martin and Nicholas Schlhoru, who were millers in that village. These brothers kept the invention secret, but not so concealed as to elude conjecture. Reyher relates, how he himself formed an idea of it. Schluter, who has given a complete description and figure of these bellows in his "*Unterricht von Hütten-Werken,*" Brunswick, 1738, fol. ascribes the invention of them to a bishop of Bamberg; and according to his account they were employed so early as the year 1620, in the forest of Hartz, to which they were first brought by some persons from Bamberg. "What Calvor says (according to Beckman, *ubi supra*) respecting the introduction of these bellows into the forest of Hartz, is much more probable; that in 1621 Lewis Pfannenuschmid, from Thuringia, settled at Orsfeld near Goslar, and begun to make wooden bellows. The bellows-makers of that place conspired therefore against him, and swore they would put him to death; but he was protected by the government. He would disclose his art to no one but his son, who, as well as his grandson, a few years ago had the making of all the bellows in the forest." From Germany, the art of making these bellows was introduced into some parts of France, and into Sweden, and became general though various parts of Europe. This kind of bellows consists of two boxes placed upon one another; the uppermost of which may be moved up and down upon the lower one, in the same manner as the lid of a snuff-box, which has a hinge, moves up and down, when it is opened or shut: but the sides of the uppermost box are so broad as to contain the lower one between them, when it is raised to its utmost extent. Both boxes are bound together, at the smallest end, where the pipe is, by a strong iron bolt. It may be readily comprehended, that when both boxes fit each other exactly, and the upper one is raised over the under one which is at rest, the space contained by both will be enlarged; and consequently more air will rush in through the valve in the bottom of the lower one; and when the upper box is again forced down, this air will be expelled through the pipe. The only difficulty is to prevent the air, which forces its way in, from escaping any where else than through the pipe; for it is not to be expected, that the boxes will fit each other so closely as entirely to prevent the air from making its way between them. This difficulty, however, is obviated by the following simple and ingenious method. On the inner sides of the uppermost box there are placed moveable slips of wood, which, by means of metal springs, are pressed to the sides of the other box, and fill up the space between them. As these long slips of wood might not be sufficiently pliable to suffer themselves to be pressed close enough; and as, though planed perfectly straight at first, they would, in time, become warped in various directions, incisions are made in them across their whole length, at the distance of from 15 to 18 inches from each other, so as to leave only a small space in their thickness, by which means they acquire sufficient pliability to be every where pressed close enough to the sides. This description may be illus-

B E L L O W S.

illustrated by a figure, (see *Plate XIII. Pneumatics. fig. 108.*) in which the outer box ABCPFE has its top and two sides flat or straight, and the end BAEe formed into an arched or cylindrical surface, of which the line FP at the other end is the axis. This box is open below, and receives within it the shallow box KIIIGNML (*fig. 109.*) which exactly fills it. The line FP of the one coincides with FP of the other, and along this line is a set of hinges on which the upper box turns, as it rises and sinks. The lower box is fastened to a frame fixed in the ground. A pipe OQ proceeds from the end of it, and terminates at the furnace, in a small pipe called the "tewer," or "tuyere." This lower box is open above, and has in its bottom two large valves V, V, opening inwards. (See *fig. 110.*) The conducting pipe is sometimes furnished with a valve opening outwards, to prevent burning coals from being sucked into the bellows, when the upper box is drawn up. The joint along PF is made tight by thin leather nailed along it. The sides and ends of the fixed box are made to fit the sides and curved end of the upper box, so that this last can be raised and lowered round the joint FP without sensible friction, and yet without suffering much air to escape; but as this would not be sufficiently air-tight by reason of the swelling and warping of the wood, a further contrivance is adopted. A slender lath of wood, divided into several joints, and covered on the outer edge with very soft leather, is laid along the upper edges of the sides and ends of the lower box. This lath is so broad, that when its inner edge is even with the inside of the box, its outer edge projects about an inch. It is kept in this position by a number of steel wires, which are driven into the bottom of the box, and stand up, touching the sides, as represented in *fig. 111*, where *abc* are the wires, and *e* the lath, projecting over the outside of the box. By this contrivance, the laths are pressed close to the sides and curved end of the moveable box, and the spring wires yield to all their inequalities. A bar of wood RS (*fig. 108.*) is fixed to the upper board, by which it is either raised by machinery, to sink again by its own weight, having an additional load on it, or it is forced downward by a crank or wiper of the machinery, and afterwards raised. The operation, in this case, is exactly similar to that of blowing with the chamber bellows. When the board is lifted up, the air enters by the valves V, V, (*fig. 110.*) and is expelled at the pipe OQ, by depressing the boards. These bellows are made of a very great size, AD (*fig. 108.*) being 16 feet, AB 5 feet, and the circular end also 5 feet. The rise, however, is but about 3 or 3½ feet. They expel at each stroke about 90 cubic feet of air, and make about 8 strokes per minute. The advantages of these wooden bellows are very considerable. When they are made of clean fir wood without knots, they will last 30 or 40 years, and even longer, though continually kept in action 45 or 43 weeks every year. Some have said, that, when properly made, they will last a century. The effect produced by them is stronger, as well as more uniform, and can be moderated according to circumstances. They are worked also with greater facility. The slips of wood on their sides are apt to be damaged; but they can soon and easily be repaired. Every three or four months, however, the outer sides only of the inner box, and the bolt which keeps the boxes together, must be smeared with oil. If we calculate the price of such bellows, and the yearly expence, they will, according to Grignon's account (*ubi supra*) be only a fifth part of those of the old leather bellows. They have, indeed, their defects, though they are less expensive and more durable than those of leather, for it is scarcely possible to make the joints so tight as to allow no exit to the compressed air, and the friction must necessarily be very great. Some, therefore, have had recourse to water, for performing

the office of the lower board of the bellows. A bellows on this principle is described by Mr. Treiwald, engineer to his Swedish majesty, in the Philosophical Transactions, under the name of a "water bellows." Of bellows of wood we have one preserved in the repository of the Royal Society; and Dr. Plot describes another, that was used at the copper-works at Ellaston in Staffordshire. *Nat. Hist. Staff. ch. iv. § 18.* Such are the bellows in general use on the continent. In this kingdom, a different, and a preferable form is adopted; for an account of which and other contrivances for animating the large fires of furnaces, &c. see BLOWING MACHINE. See also FURNACE.

BELLOWS. *Apodopnic*, so called by the inventor M. Gorcey, physician to the military hospital at Neufbrissack, and denoting "reformer of respiration," an instrument used for inflating the lungs. It is described in the "Journal de Médecine" for June 1789; and consists of a double pair of bellows BCLM (*Plate XIII. Pneumatics. fig. 112.*) the two different parts of which have no communication with each other. In the lower side BM is an aperture A for a valve, constructed on the principles of those of Mr. Nairne's air-pump. It consists of a rim of copper, closed at one end by a plate of the same metal, in which plate are seven small holes placed at equal distances. This plate is covered with a piece of silk coated with elastic gum, in which are six transverse incisions of two or three lines in length. Each incision is so made as to be situated between two of the holes, and at an equal distance from each, as represented at D, (*fig. 113.*) The silk must be made very secure, by a thread passing several times round the rim. It is obvious, that a stream of air applied to that side of the plate which is opposite the silk, will pass through the holes, and, lifting up the silk, escape through the incisions. On the contrary, a stream of air applied to the other side will press the silk upon the plate, and thus close the holes, so that it will be impossible for it to pass through them. This valve opens internally, so as to admit the air from without. At B is another valve, upon the same construction, but opening in a contrary direction, thus permitting the air to escape out of the lower part into the tube EF, but preventing its entrance. At C is another valve, opening internally to admit the air from the tube EF; and at D there is a fourth, opening externally to discharge the air from the upper part. The flexible tube EF, screwed on at the end CB, being introduced into one of the nostrils, whilst the mouth and the other nostril are closed by an assistant, if we separate the two handles L, M, which were close together at the introduction of the tube, it is evident, that the air in the lungs will rush into the upper part through the valve C, whilst the external air will fill the lower part through the valve A. The two handles being again brought into contact, the atmospheric air will be forced into the lungs through the valve B, and at the same time the air in the upper part will be discharged at the valve D. Thus, by the alternate play of the double bellows, the lungs will be alternately filled and emptied as in respiration. In using the instrument, care should be taken not to be too violent; as the more perfectly the natural motion of respiration is imitated, the better. To prevent any substances from without injuring the valves A, D, (*fig. 112.*) the rim is made with a screw B, (*fig. 114.*) in order to receive a cap A, A, (*fig. 114.*) full of small holes. This screw has also another use. If de-phlogisticated air be preferred, a bladder filled with it (*fig. 115.*) may, by means of the screw A, be fastened to the valve A, (*fig. 112.*); and to prevent waste, as this air may serve several times, a flexible tube may be screwed in the valve D, (*fig. 112.*) communicating with the bladder by means of the opening *d*, (*fig. 115.*) Thus it may be employed as

often as the operator thinks proper. There is a handle K to the partition in the middle, in order that, if it be at any time necessary to use either of the divisions alone, the other may be confined from acting. *c. b.* (*fig.* 116.) represent the two valves to be applied at the end of the instrument CB. (*fig.* 112); and (*fig.* 117.) is a section of the end CB, shewing the valves in their proper places. It is proper to add, that the capacity of the instrument should be proportioned to the quantity of air received into the lungs by inspiration, which Dr. Goodwin has ascertained to be twelve cubical inches, or somewhat more. Each division of the instrument, therefore, should be capable of containing that quantity. (See Analytical Review, vol. iv. p. 437.) Roul-land presented, and described at a meeting of the Lyceum of Arts at Paris, in 1797, the model of a pair of bellows, constructed on this plan, intended to restore life to persons drowned and in a swoon, by drawing out the vitiated air seated in their lungs, and replacing it with ordinary air, or even with oxygen, or vital air, if necessary: at the same time producing the motion of the lungs, independently of the concurrence of the patient, to the very instant when his strength shall return. The experiment was submitted to public inspection; a bladder being made up to represent the lungs.

BELLOWS, *Bone*, *φυστήρες σφυαί*, occur in Herodotus for those applied by the Scythians to the genitals of mares, in order to distend the uterus, and by this compression, make them yield a greater quantity of milk.

BELLOWS, *Hessian*, a contrivance for driving air into a mine for the respiration of the miners. This was improved by M. Papin, who changed its cylindrical into a spiral form; and with this, by working it only with his foot, he could produce a wind to raise a weight of two pounds.

BELLOWS *Hydrostatic*. See HYDROSTATIC.

BELLOWS, or *Trumpet-fish* in *Ichthyology*, a name given by Ray, Willughby, &c. to the species of CENTRISCUS SCOLOPAX. Gmelin.

BELLOWS *Rocks*, in *Geography*, rocks that lie in the Atlantic, near the west coast of Ireland, and county of Galway. N. lat. 53° 10'. W. long. 10° 4'.

BELLS, *Canterbury*, and *Coventry*, in *Botany*. See CAMPANULA.

BELLS, *Hair*. See HYACINTHUS.

BELLS *Mill*, in *Geography*, a settlement in North Carolina, near the Moravian settlements, at the source of Deep river, the north-westermost branch of the north-west branch of Cape Fear, and about 50 miles west of Hillsborough.

BELLS, in *Heraldry*, are represented as round, when fixed to the legs of a hawk; in which case the hawk is said to be *belled*.

BELLUÆ, in *Zoology*, a name of the sixth order of animals in the Linnæan system, including the genera of the *equus*, or *horse*, the *hippopotamus*, the *tapir*, and *jus*. These have obtuse-truncated fore teeth, and hoofs of feet.

BELLUCCI, ANTONIO, in *Biography*, a painter of portrait and history, was born at Venice in 1654, and manifesting an early inclination to painting, became the disciple of Domenico Definico, from whose instructions he acquired a good manner of handling and colouring, an elegant taste of historical composition, and an expertness in painting portraits with grace and resemblance. Having established, by a variety of performances, his reputation for invention, elegance and spirit, he was invited by the emperor Joseph to his court, and appointed his principal painter. But after remaining some years at Vienna, he entered into the service of the prince palatine, in which he long lived, much respected for his personal accomplishments as well as for his excellence in his profession. Pilkington.

BELLUDGE, in *Geography*, a tribe of Arabs, inhabiting that part of Persia which lies on the coast of the entrance into the Persian gulf, between Minau and cape Jalke. They are masters of several vessels, and carry on a considerable trade with Bassora, and even venture as far as the coasts of India. These Arabs are Sunnites; and unity of religious sentiments has occasioned their joining the party of the Afghans in the late revolutions of Persia. Some geographers represent these Belludges as inhabiting all along the Persian coast to the mouth of the Indus, and have described them as a warlike people addicted to piracy. Niebuhr is not able to ascertain whether they are to be considered as independent, or as tributary to Persia. He thinks it probable, however, that they acknowledge no sovereign authority but that of their own schieks.

BELLUGA, in *Ichthyology*. See BELUGA.

BELLULA Bos, a name given by Paulus Jovius to that species of RAJA called by the old Greek and Latin writers *bos marinus*; the same kind which Linnæus, and other later naturalists, name specifically OXYRINCHUS.

BELLUNESE, in *Geography*, a small mountainous territory of Italy, but rich in iron mines, forms a part of the marquisate of Treviso, and belongs to the republic of Venice. It is bounded on the north by the Cadorn and part of Friuli, on the east by a large forest, which separates it from Friuli, on the south by the Trevisan and Feltrin, and on the west by the bishopric of Trent.

BELLUNO, the capital of the Bellunese, and see of a bishop, suffragan of the archbishop of Udina, seated on the Piava, between the town Cadore and Treviso; 43 miles N. of Venice, and 48 E. of Trent. N. lat. 46° 10'. E. long. 12° 15'.

BELLY, in a general sense, denotes the whole abdomen, or that region of the body contained between the *septum transversum*, the *hypochondria*, and *pubes*.

BELLY is also used, in a more confined sense, for the intestines alone, as containing the *faces*. In this sense we speak of the looseness or tightness of the belly, &c.

BELLY is also sometimes used for a pregnant woman. In this sense we are to understand the phrase among *Civil Lawyers*, to put the belly in possession of an estate.

BELLY is also used in speaking of the bodies of animals; is synonymous with abdomen, and may be separately considered. It is variously characterized, according to their food and habits. In those which feed on vegetables, it is in general capacious, and hanging low; in the carnivorous, light, and drawn up at the flanks. In a horse, a barrel-shaped or cylindrical belly is most admired; if hanging low, he is said to be cow-bellied; if two much contracted, he is said to be tucked up at the flanks. Grass, too much water, broken wind, and in mares the gravid uterus, occasion the belly to relax and become pendulous; dry food, as oats, beans, and hay, &c. and also acute pain, contract the volume of the belly. The slow moving ruminant animals, as oxen, &c. have the belly the most capacious and pendulous of all quadrupeds. This increased volume of the intestines and stomach appears to be designed for the purpose of enlarging the surface for digestion and chylicification, and extracting more completely all the nutritious particles, so that a lesser quantity of food will suffice: this circumstance is particularly remarkable in the sheep, which can fatten on the shortest grass, and almost barren glebe.

In the abdomen of the horse, and other gramivorous quadrupeds, whilst its vast surface exposes it more to be acted upon by changes of weather, as cold, rain, wind, &c. than in the carnivorous animals, so it has appeared to us to be also provided with a thinner and less fatty membrane, or mesentery, to cover the intestines from their influence. Hence appears

appears to be a cause for the frequent indigestions in these animals, often speedily terminating in death, to which their capacity also greatly contributes by receiving too large a quantity of food at once. See the article *GRASSES of Horses*.

The abdomen of the horse and ox, and other quadrupeds of this description, from its vast size, hangs below the patella or knee, which occasions the thigh of the horse to be mostly overlooked or taken for some other part; the patella or knee being the real termination of the thigh in these animals.

In the horse, the volume of the abdomen is formed by the vast magnitude and length of the intestines, and a four-stomach not very large; in the cow, on the contrary, the feeding bulk of the abdomen is occasioned by four large stomachs, and the intestinal canal is proportionably small and short. The sheep with four stomachs possesses also a vast length of intestine.

BELLY *of a Muscle*, in *Anatomy*, denotes the body thereof, as contrarily distinguished from the two extremities, or tendons. From the condition of this, muscles are divided into monogastric, or single-bellied; and digastric, or double-bellied. *Phil. Trans. N. 58.*

Lower will have all the muscles to be digastric, or double-bellied; in which he is seconded by Hoffman and others.

BELLY-*ash-tree*, a name given in America to a species of the Jatropha.

BELLY, *Draconis, venter draconis*, is used by some *Astronomers* to denote the point in a planet's orbit, wherein it has its greatest latitude, or is farthest distant from the ecliptic; more frequently called its limit.

BELMONT, in *Geography*, a town of France, in the department of the Loire, a chief place of a canton, in the district of Roanne, 14 miles north-east of Roanne. The place contains 1716, and the canton 7244 inhabitants; the territory includes 115 kilometres and 86 communes.—Also, a town of France, in the department of the Aveyron, and chief place of a canton, in the district of St. Afrique, nine leagues east of Alby. The place contains 1561, and the canton 2522 inhabitants; the territory includes 220 kilometres and nine communes.

BELMONTÉ, a town of Italy, in the kingdom of Naples, and province of Calabria Citra, having a castle on an eminence near the sea, 11 miles W.S.W. of Cosenza. N. lat. 39° 23'. E. long. 16° 52'.—Also, a small town of Portugal, in the province of Beira, and jurisdiction of Correiço de Castello Branco, containing about 1140 inhabitants, two churches, and a district of two parishes.

BELO, or BELON, in *Ancient Geography*. See BÆLOS.

BELOAR, a name given by some to a stone, otherwise called WIDURIS.

BELOMANCY, BELLOMANTIA, a kind of divination by means of arrows, practised in the East, but chiefly among the Arabians, among whom it continued till Malometanism prevailed, which absolutely forbade it. The word is of Greek origin; computed of *βέλος, arrow*, and *μαντιν, divination*. Belomancy has been performed in different ways; one was, to mark a parcel of arrows, and put eleven, or more of them, into a bag; these were afterward drawn out; and according as they were marked, or not, they judged of futurity. These arrows resembled those with which they cast lots, being without heads or feathers, and were kept in the temple of some god, in whose presence they were consulted. Seven such arrows were kept in the temple of Mecca. Another way was to have three arrows, upon one of which was written, "My lord hath nominated me;" on another, "My lord hath rejected me;" and upon the third, nothing at all. These were put into a quiver,

out of which they drew one of the three at random; if it happened to be that with the first inscription, the thing they consulted about was to be done; if it chanced to be that with the second inscription, it was let alone; and if it proved to be that without inscription, they drew over again. These divining arrows were generally consulted before any thing of moment was undertaken; as when a man was about to marry, or to go a journey, or the like.

Belomancy is an ancient practice, and probably that which Ezekiel mentions, chap. xxi. ver. 21. At least St. Jerom understands it so, and observes, that the practice was frequent among the Assyrians and Babylonians. Something like it also is mentioned in Hosea, chap. iv. only that it was a little distinguished instead of arrows, which is rather the Belomancy than Belomancy. Grotius, as well as Jerom, contends for the two together, and shews that they prevailed much among the Hæb, Chaldeans, and Sythians, whence they passed to the Scythians, and thence to the Germans; who, as Tacitus observes, made use of Belomancy.

BELON, PETER, in *Biography*, born in the province of Meurane in the year 1518, was an industrious and ingenious naturalist, esteemed for his learning and talents by Henry II. and Charles IX. of France, and patronised by the cardinal de Tournon, at whose expence he travelled over Italy and Greece, a great part of Germany, France, England, Palestine, and Egypt, collecting and examining every where the plants, animals, and minerals proper to the places through which he journeyed. On his return, he published, in succession, the results of his observations and inquiries. The principal of his works are, "Les Observations de plusieurs singularités, et choses memorables trouvées en Grece, en Asie, Judée, Egypte, Arabie, &c." Paris, 1553. 4to.: an excellent work, Haller says, and the first of the kind that had been published from actual observation; no one before him having travelled so extensively for the purpose of improving natural history. It has been frequently reprinted, and a Latin version of it given by Clusius, in 1589. "De arboribus confertis, resiniferis, aliisque nonnullis temperatâ fronde vitentibus, &c." Paris, 1558. The descriptions are in general just; the engravings indifferent. He had seen the true cedar of Lebanon. He also gave a treatise "On the Method of embalming practised by the ancients;" "On the Defects in Agriculture;" "On the Management of Gardens," and recommends the introduction of many foreign trees into them, pointing out those most congenial to the climate of France; "On Birds;" and "On Fishes;" with their figures. More he had done; but he was stabbed by a robber in 1563, being only about 45 years of age. Haller. Bb. Botan.

BELONE, in *Ichthyology*, a species of Esox, having both jaw long and subulate. Linn. This is *acus piscis* of Salmo; *acus vulgare*, Ray; and *sea-pike*, or *gar-fish*, of the Po fish. It is sometimes called also the *sea-mole*.

The sea-pike inhabits all great seas, and was known both to the Greek and Romans. It keeps in deep water part of the year, and ventures out only in moderate shoals in the beginning of the summer, just before the mackerel makes their appearance. The sea-pike is a fish usually from 3 feet and a half to three feet; but its relation of Rorid may be depend'd upon, they are found of the length of eight feet in the eastern part of the world. A fish of this species has been taken in the Mediterranean, on the coast of Judea, upon the river Jordan. In some countries they prey to the bottom of the sea very considerable; in England they are not much esteemed, so much the fish is rarely inferior to that of the mackerel. The line of the back, when the sun is low, is of a bright green colour, from

which many people conclude, though very unjustly, that it cannot be a wholesome food.

All the upper part of the back and head of this fish is of a beautiful green colour; sides and belly silvery. The number of rays in the dorsal fin are about sixteen; pectoral thirteen; ventral eight; anal twenty-two; and in the tail twenty-two; but these are liable to vary in number, as in other fishes.

BELOW, or **BELAN**, in *Geography*, a river of England, which runs into the Eden, 2 miles north of Kirby-Stephen, in the county of Westmoreland.

BELOZÉRO. See **BIÉLO-OZÉRO**.

BELPBERG, a mountain of Switzerland, about 7 or 8 miles from Bern, being part of the chain of the Alps; the strata of which are full of different species of chamites, ostracites, globolites, splenites, strombites, and other similar petrifications.

BELPECH, a town of France, in the department of the Aude, and chief place of a canton, in the district of Castelnaudary, $3\frac{2}{3}$ miles south-west of Castelnaudary. The place contains 2081, and the canton 5318 inhabitants; the territory includes 140 kilometres and 12 communes. N. lat. $43^{\circ} 12'$. E. long. $1^{\circ} 39'$.

BELPRE, a post town and small settlement of America, in the territory north-west of the Ohio, on the north-west bank of Ohio river, between the Hockhocking and Muskingum rivers, and opposite the mouth of the little Kanaway; about 14 miles below Marietta, and 480 miles S.W. by W from Philadelphia.

BELSHAZZAR, in *Scripture History*. See **BABYLONIA**.

BELSINUM, in *Ancient Geography*, a town of Hispania Tarragonensis, in the country of the Celtiberians. Ptolemy.

BELSUNCE, **HENRY-FRANCIS-XAVIER DE**, in *Bio-graphy*, denominated, by way of honourable distinction, "the good bishop of Marseilles," was the son of the marquis of Belfunce, a nobleman of Guienne. After quitting the society of the Jesuits, into which he first entered, he was in 1709 nominated to the bishopric of Marseilles; where he distinguished himself by his fortitude and charity, during the dreadful plague which afflicted that city in 1720 and 1721. Such was the effect produced by his attention and liberality on occasion of this calamity, such the attachment cemented between him and his diocessans, by their gratitude and his own sympathy, that he declined accepting the bishopric of Laon, to which are annexed a peerage and a dukedom, which was offered to him by the king in 1723. He died in 1755. *Nouv. Dict. Hist.*

BELT, **BALTHÉUS**, and among the ancient and middle age writers, *zona*, *cingulum*, *remniculum*, *rinca*, or *ringa*, and *baldrilius*, in *Armour*, a kind of military girdle, in which a sword or some other weapon is commonly hung.

That the belt, or girdle, formed a material part of the Hebrew armour, may be gathered from the expressions frequently repeated in the sacred scriptures. *The Almighty girding himself*, imported not only his giving notable displays of power, but his readiness to act; and his girding others expressed the ability he had bestowed upon them to perform magnificent exploits.

The belts of the Hebrew soldiers, with which they girded on their arms, went not about their shoulders but their loins, and were supposed to strengthen them. (See *Neh. iv. 18. Ezek. xxiii. 15.*) They were generally valuable, especially those of commanders, and were sometimes given as rewards to soldiers. Jonathan presented his to David (*1 Sam. xviii. 4.*); and Joab tells the person, who had seen Absalom hanging from the tree, that if he had smitten him to the ground, he would have given him ten shekels of silver and a *girdle*.

The Greeks called it ζώνη, or ζώνη, and they thought it so essential to a warrior, that ζωνοβαί became a general term for clothing themselves in armour. Whence Agamemnon is described by Homer

“*Ἀργεῖος δὲ θόρον, ἰδὲ ζωνοβαί ἀνδρῶν;*”

and which no doubt occasioned Pausanias to suppose that ζώνη had a reference to the whole armour. So Herodotus, relating the flight of Xerxes to Athens, describes him, when arrived at Abdera, and believing himself free from danger, *λευσὲν τὴν ζώνην, τὸ ἔχειν διαρμηθῆναι*. (Urania. cxx.)

Among the Greeks, the belt was worn very differently fr. in the manner already described, and reached even to the thigh, whence Homer's hero, (*Odyss. λ.*)

—“*Φοσγῆαι οὐ ἐξοπαμῆος παρὰ μηρῶν;*”

and Virgil's *Æneas* (*l. x. l. 86.*)

—“*ocycus ensem*

Eripit a femore.”

Foot soldiers, we are told, wore their swords on the left; horsemen, on the right side. Josephus, describing the downfall of Jerusalem (*l. iii.*), expressly mentions horsemen with their swords on the right. But whether this was constantly the case, or frequently varied, as Lipsius has observed of the Roman sword, cannot easily be determined.

Herodotus, mentioning the military habits of the Persians, says, they had daggers suspended to the right thigh by a belt.

Beger has given a bust of Scipio, copied by Montfaucon (*vol. iv. pl. vi. f. 4.*), which has an embroidered belt hanging from the right; while a soldier on the arch of Constantine is represented in scale armour, with a belt suspended from the left shoulder. Montfaucon, *vol. iv. pl. xx. f. 2.*

In our own country, like those of ancient times, it was frequently ornamented in the richest style; and it is worthy of observation, that in some of the most magnificent illuminations of our ancient manuscripts, even in the same picture, the sword is represented as indiscriminately belted on the right side or the left. In later ages, the belt was given to a person when he was raised to knighthood; whence it has also been used as a badge of the knightly order.

BELT is also a denomination applied to a sort of bandages in use among surgeons, &c. Thus we meet with quicksilver belts, used for the itch. A later writer describes a belt for keeping the belly tight, and discharging the water in the operation of tapping. *Medic. Ed. Edinb. tom. i. p. 218.*

BELT, or **BELTIS**, in *Ecclesiastical Writers of the Middle Age*, denotes a sort of string of beads.

BELT is also a frequent disease in sheep, cured by cutting their tails off, and laying the fore bare; then casting mould on it, and applying tar and goose-grease.

BEL-TEIN, in *Mythology*, a superstitious custom, formerly observed in Scotland and Ireland; and according to Dr. Ledwich, on the authority of Wormius, in Scandinavia. Dr. O'Brien, in his Irish Dictionary, explains it *ignis Belii Dei Asiatici*; and mentions, that on the first of May the Druids were used to light large fires on the summits of hills, into which they drove four-footed beasts, using at the same time certain ceremonies, to expiate the sins of the people. This pagan ceremony of lighting these fires in honour of Belus, or the sun, gave its name to the month of May, which is called *Beal-tine*, and *May-day la Bealtine*. On this day all the inhabitants of Ireland quenched their fires, and kindled them again out of some part of the sacred fire. That celebrated Irish antiquarian, general Vallancey, infers from the name of this custom, that it was derived from the Persian-Scythians, or Phœnicians, by whom the sun was worshipped under the same name of Belus, or Bel, and on the tops of hills also, as appears from the *high places* mentioned in scripture.

scripture. In Gaul also there are traces of the same supposed deity being worshipped under the name Belinus. The Irish still preserve the custom; and to this day in many places fires are lighted on the first of May in the milking yards, which the men, women, and children pass through or leap over, and the cattle are driven through the flames of the burning straw. In the western isles of Scotland, Mr. Martin found a like ceremony called by the same name; and Mr. Pennant thus particularly describes it. "It is a kind of rural sacrifice, performed by the herdsmen of every village on the first of May. They cut a square trench on the ground, leaving a turf in the middle; on that they make a fire of wood, on which they dress a large caudle of eggs, butter, oatmeal, and milk; and bring, besides the ingredients of the caudle, plenty of beer and whiskey; for each of the company must contribute something. The rites begin with spilling some of the caudle on the ground by way of libation: on that every one takes a cake of oatmeal, upon which are raised nine square knobs, each dedicated to some particular being, the supposed preserver of their flocks and herds, or to some particular animal the real destroyer of them. Each person then turns his face to the fire, breaks off a knob, and flinging it over his shoulder, says, *This I give to thee, preserve thou my horses; this to thee, preserve thou my sheep; and so on.* After that, they use the same ceremony to the noxious animals. *This I give to thee, O fox! spare thou my lambs; this to thee, O hooded crow! this to thee, O eagle!* When the ceremony is over, they dine on the caudle; and after the feast is finished, what is left is hid by two persons deputed for the purpose; but on the next Sunday they reassemble, and finish the reliques of the first entertainment." That fire was adored in Ireland, is sufficiently proved from this celebrated festival, independently of other circumstances; but whether it can be urged in proof of the colonization of Ireland by the southern Scythians or Persians is not equally clear. Dr. Ledwich says, that fire was adored by the Celtes and Northern Scythians, and mentions from Wormius the manner of kindling it. On the other hand, the name bears a striking resemblance to that of the Asiatic deity; and the early naval expeditions of the Phœnicians render its having been communicated by themselves improbable. The writer of this article has not, however, yet met with any account of a similar practice amongst the nations in the south of Asia, or with any attempt to explain the name from those languages which are undoubtedly of Celtic origin. The circumstance, indeed, of all languages having had one common source, lessens the force of those arguments which are derived from a resemblance in words denoting the same thing; and yet great stress is laid on such resemblance in the arguments for the Persian colonization of Ireland. *Collectanea de rebus Hibernicis passim.* Pennant's *Tour in Scotland*, vol. iii. O'Brien's *Irish Dictionary*. Ledwich's *Antiquities of Ireland*. See BELINUS.

BELTS. *Fajcie*, in *Astronomy*, two zones or girdles surrounding Jupiter's body, more broad than the rest, and terminated by parallel lines; being sometimes broader, and sometime narrower, nor constantly taking up the same places in his disk. Dark spots have been frequently observed on Jupiter's belts. Cassini has also discovered a permanent one in the most northern part of the most southern belt; by this he has determined the length of Jupiter's day, that is, the time of his revolution on his axis, which is finished in nine hours and fifty-six minutes. *Phil. Trans.* N^o 10. and vol. lxxiii. part. 1. N^o 11. p. 73. Some astronomers take the belts to be seas, which alternately cover and leave bare large countries of the planet; and that the spots are gulfs in those seas, perhaps as big as our ocean, and sometimes

full, sometimes dry. M. Azout rather imagined the spots to be protuberances of the belts. *Hist. Acad. Sc.* 1708. 1692. *Phil. Trans.* No. 34. 1. 15. But other astronomers take the spots, which are transparent and moveable, for the shadows of Jupiter's satellites. The belts of Jupiter were first observed, and described by Huygens in his *Syst. Saturnin.* p. 7. See JUPITER.

Cassini also speaks of belts of Saturn; being three dark, straight, parallel bands, or *fajcie*, on the disk of that planet. Saturn's belts do not appear to be inherent on his globe, as those of Jupiter's are; but rather to be large dark rings at a distance from the planet, and surrounding his body. Some imagine them to be clouds in his atmosphere. The middlemost seems to be the shadow of Saturn's ring. *Hist. Acad. Sc.* 1715. See SATURN.

BELTS, in *Geography and Navigation*, denote certain straits near the Sound, through which ships pass from the Baltic to the German ocean. They belong to the king of Denmark, who exacts a toll, varying in its amount, and in some circumstances attending the collection of it, from all ships that pass through them as well as the Sound. (See SOUND.) They are divided into the *greater* and the *lesser*. The *greater belt* forms a communication between the Scaggerack or Cattegat sea and the Baltic, separating the islands of Zealand and Funen. The *lesser* or *little belt* forms a communication between the Cattegat and Baltic, and separates the isle of Funen from the continent. The passage from Affens to Arroë Sound, in the duchy of Sleswick, across the little belt, is 9 miles.

BELTURBET, a market and post town of Ireland, in the county of Cavan, situate on the river Erne, 81 Irish miles north-west of Dublin. It has a navigation through Lough Erne to Bellech, within three miles of Ballyshannon, where it is interrupted by considerable falls. The navigation from Lough Erne is open to the town, with water enough in winter, and by reducing a few flats might be made completely so in all seasons. No place indeed can be better situated for trade or for improvement; the beautiful expansion of water and picturesque views are highly engaging, and the land is a sound limestone. Yet the market is indifferently supplied, which may in great measure be attributed to the customs being taken in kind, without any lawful standard or measure, so that it is more advantageous for the buyers and sellers to go to other markets. These customs are individual property, and set for tool, per annum.

The town was regularly divided into compartments, termed *homesteads*; each of which contains 36 square yards, to which is annexed a proportionate quantity of bog. Every householder has also a right to graze on an extensive common belonging to the town, which was given by the Lancborough family, to which it formerly belonged, and which seems to have spared no expence for its improvement. Another grant of two hundred acres has become the property of the burgesses, who divided it, and have transmitted it down in their respective families. There are some neat houses, especially those lately erected on the part now belonging to lord Farnham; but in general they are mean and thatched. There are an excellent flour-mill, a brewery, distillery, and malt-houses in the town; and some yarn is brought to market, but no webs. Cultivation is improved in the neighbourhood; but is yet very defective. The manures used are ashes, marl, and dung; though there is good limestone, and much of the soil consists of deep clays which could be so well reclaimed with lime, yet this is never used, but sent by the lake to the county of Fermanagh. In the church-yard is the vestige of a great fortification, inclosing an extensive plot of ground, the bastions and salient angles of which are yet perfect; they were admirably planned and

of great strength. Belturbet was a borough town, and previous to the union, sent two members to parliament.

BELTZ, or BELZ, a palatinate of that part of Poland which was formerly called Little or Red Russia, and which included three districts, viz. Busk, Horodla, and Hrabowiec. Its capital, bearing the same name, is a large town, seated among marshes in the confines of Volhynia. N. lat. $50^{\circ} 15'$. E. long. $23^{\circ} 50'$.

BELTZ, a town of Croatia, 12 miles S. S. W. of Varadin.

BELVEDERE, or BELVIDERE, a town of European Turkey, and capital of a province of the same name, in the Morea, which province lies on the western coast, and is the richest and most fertile in the Morea. From this province the raisins called "Belvederes," derive their name. The town lies 20 miles south of Chiarenza. N. lat. $35^{\circ} 5'$. E. long. $22^{\circ} 0'$.

BELVEDERE, in *Architecture*. See BELVIDERE.

BELVEZ, in *Geography*, a town of France, and chief place of a canton, in the department of the Dordogne, and the district of Sarlat, $9\frac{1}{2}$ leagues S.S.E. of Perigueux. The place contains 2099, and the canton 7987 inhabitants, the territory includes $147\frac{1}{2}$ kilometres, and 15 communes. N. lat. $44^{\circ} 46'$. E. long. $0^{\circ} 54'$.

BELUGA, in *Zoology*, the name of DELPHINUS LEUCAS in Pennant's *Quadrupeds*.

BELUGA stone, in *Natural History*, the name of a calculus or stone found in the beluga fish. This stone is found in fish of both sexes, but most frequently in the male; and in those of all ages and sizes. It occurs, however, but seldom; whence it is inferred, that these stones are no natural part of the fish, but mere morbid concretions, like the bezoar stones in the animals which produce them, or like the stone in human bladders. It is of various shapes and sizes; but its most usual figure is either globular or oval. It is of a yellowish-white colour, and of a smooth and naturally polished surface, and in size it is between a pigeon's egg and that of a goose. It is usually compact, ponderous, and solid, not friable, but requiring a strong blow to break it; however, it yields easily to the saw, which defaces its internal structure, that is naturally very elegant and regular. It consists of several concentric coats, adhering firmly to one another, and form \cup about a nucleus, which generally appears to be some heterogeneous substance. It differs from all other stones of the same kind in its radiated structure, as it is composed of a number of regular and even striz proceeding from the centre to the circumference, and representing, both in colour and form, the flakes of the "terra foliata tartari," or the striated spiculae of antimony. If the stone be scraped to powder and sprinkled upon a hot iron, it gives a faint urinous smell, and calcines into a light, insipid, greyish earth. The people about the Volga hold it in high estimation, and ascribe to it great virtues. They say, it promotes delivery; and they give it in cases of the stone, and disorders of the urinary parts, in doses of from 10 grains to a dram. Phil. Transf. vol. xlv. p. 2. n. 4.

BELVIDERE, or BELVEDERE, in *Architecture*. This word meaning *beautiful view* is used in Italy, to denote those edifices built for the purpose of enjoying a fine prospect; these are of two kinds, either detached buildings, or little cupolas (or, to use the expressive English term, *look-outs*;) raised on the tops of houses which terminate them ornamentally, and where one may enjoy the freshness of the evening and the beauties of nature.

Almost all the houses in Rome have belvederes of the last kind, the others generally belong to the palaces and pleasure grounds of the great. The most celebrated and remarkable of all is the Belvedere of the Vatican. This large edifice was originally built by Bramante, detached from the pontifical palace, to which it has since been united by two long

galleries. It commands the view of the rich champaign, which surrounds the town on this side; the chain of the Apennines forms the magnificent distance of the picture, while the foreground is occupied by the city itself, which is seen in its whole extent. It is from thence that one may say with Martial:

"Hinc septem dominos videre montes
Et totum licet estimare Romanum."

Belvederes are common in France; they are generally single saloons open to the air, or enclosed with doors and windows. They are, however, sometimes composed of various apartments, vestibules, saloons, cabinets, &c. such is the Belvedere in the menagerie of Seaux. When, however, these buildings are at a considerable distance from the mansion, and contain several apartments for the purpose of entertainment, they are called *Triarons*.

In England, though the name of Belvedere is not used, it may be properly applied to many of our garden buildings. The old mansions were very commonly gloomy both in situation and in construction, but they generally possessed a *summer-house*, which was built in an elevated and agreeable part of the garden, where in the most genial months of the year the family might enjoy the air, the prospect, and the social pleasures, without the ceremony of the drawing-room. In our modern villas the beauties of situation are consulted, and every idea of gloom is banished by the long windows, the fresh doors, and the wide extended lawn; the substantial summer-house is, therefore, unnecessary; but of the temples, cottages, objects which adorn the modern grounds, while some are merely the ornaments of the landscape, others very exactly answer the description of the Belvedere.

BELVIDERE, or *Belvedere*, in *Botany*. See SCOPARIA.

BELVIDERE, in *Geography*, a new township of America, in Franklin county, and state of Vermont.—Also, a village in New Jersey, in the Sussex county, on the Delaware river, and at the mouth of Pequett river, 11 miles above Eatton, in Pennsylvania.

BELVIS, a small town of Spain, in Estremadura, with a castle, seated between two mountains.

BELULCUM, a surgical instrument of various figures, contrived for extracting darts, arrows, or the like from wounds. Hence also the denomination *belulcum*; *quasi το βελος; ειχαλν*.

BELUNUM, in *Ancient Geography*, a town of Italy, in Rhaetia, and the country of the Veneti, now *Belmo*.

BELUR, in *Geography*, the general name given to the Alpine region, which divides the southern parts of the ancient Scythia, or Great Bucharía, from Little Bucharía, lying in about N. lat. 37° , and E. long. 71° , between Kotlan to the north, and Kilan to the south, and Badakshan in Great Bucharía on the west, and Balsistan, or Little Thibet on the south-east. Strahlenberg has introduced a town of the same name into his map, but its existence is dubious. Rennell places it at the foot of the mountain, in N. lat. 37° , and E. long. 71° . He has also marked a lake near it, from whence flows the Amu, which, after its junction with several others, proceeds to Badakshan.

BELUR Tag, denoting, in the Mungl language, "the dark or cloudy mountains," part of that ridge of mountains which, in a nearly meridional course, terminates Great Bucharía on the east, and divides it from Little Bucharía. These mountains are covered with perpetual snow. They form a chain, supposed to be the ancient Imaus, which proceeds nearly north and south, and is continued by the mountains of Alakor Alak Oola, on the north of Little Bucharía, which join the Bogdo, and on the south is more intimately connected with the Hindoo Koh than with the northern ridges of Thibet. Those who live at the foot of these mountains gather a great quantity of gold and silver dust in the spring,

Spring, which is brought down by torrents when the snow melts.

BELUS, in *Entomology*, a species of **PAPILIO**, that inhabits Syria. The wings are greenish; inner margin of the posterior pair rather pale; beneath brown, with red lunar marks. Fabricius and Jablonsky.

BELUS, in *Ancient Geography*, a town of Spain, situate near the columns of Hercules. Steph. Byz. This was probably the same with Belo or Belon.

BELUS, now *Kardanab* a river of Persia, which flowed at the distance of two stadia south from Ptolemais. It had its source in mount Carmel, about 4 miles to the east of the Kithon, in the lake called by Pomy Cendevia. The sand of this river and its vicinity was peculiarly excellent, according to Strabo, for the manufacture of glass; and here, according to Pliny, the manufacture of glais was first discovered.

BELUS, in *Ancient History and Mythology*, is supposed by some to have been the Pul of scripture; and the founder of the Assyrian monarchy; and they add, that he left his kingdom to his son Nimus, or Tylath-Pileser, who caused him to be worshipped after his death, and erected to his honour the famous tower of Babel, or Belus, in the city of Babylon. Others conceive Babel to have been the Nimrod of Scripture, and more ancient than the Assyrian kingdom. (See **ASSYRIA** and **BABYLON**). The tower of Belus was afterwards used by the Chaldeans as an astronomical observatory; and it is said, that Belus himself promoted the study of astronomy, in order to encourage that faith in astrological predictions, which he knew how to apply to political purposes. Hence, as Belus was honoured with a place among the divinites, some have traced the origin of those fables that are found concerning him in the Grecian mythology, to this circumstance.

Belus, considered as the founder of the Assyrian and Babylonian empires, became the principal object of veneration and worship among the later Babylonians, Paomerians, and others, over whom the descendants of his family extended the dominion he had founded. Accordingly, a temple was erected to him in the city of Babylon, and also a tower; though it is not improbable, that the honour of this temple and tower was meant to be divided between him and the true God. This building (see **BABYLON**) consisted of eight towers raised above one another; and in the apartments was placed a magnificent bed, with a golden table near it, but without any image; nor was any person suffered to lie here in the night, except a particular woman, who, as the priests reported, was preferred by the god to all others. In this place, according to their account, he used to come and repeat himself; so that they must have regarded him as the Supreme god, who either could not be repelled, or not bear the presumption in them of attempting his residence. Beneath this there was another temple, in which was a gigantic image of Jupiter or Belus, made of solid gold, with a table and a throne of the same metal. This Jupiter, supposed to be the great Pul, or Belus, by some placed below the gods, and in some god seem to have supposed, that Belus, or Pul, divided the empire of the monarchs with him, and that as the former was the god of heaven, the other was at least a delegated god on earth, and was the visible power of the invisible appointment of the invisible monarch on thron. Some have supposed, that the Babylonians, by their worship of Belus, used to pay homage to the sun, which was undoubtedly very common, and a very general object of worship; and the appellation of Belus itself might be synonymous with that of Bel, which denoted god or lord. (See **BAAL**). In the Babylonian temples there were a set of altars, one of stone, of a moderate size, and another much larger; on the one were sacrificed

none but sucking victims, and on the other none but those that were full grown. The former seemed to have been devoted to the Supreme god; and the other to his subordinate, Jupiter. They had also sacrifices that were offered to both. Upon the whole, it seems not improbable, that by Bel, Baal, or Belus, the Babylonians understood either the sun or their deified founder Pul; but whether they transferred him into the sun, or kept the worship of this luminary, and that of their hero distinct, so as never to confound them together, is a question not easily decided. For a description of the temple of Belus, see Herodotus lib. 1. c. 81. **BABYLON**.

BELUTTA, in *Botany*. See **CELOLARIUM** and **CRINUM**.

BELY BOGUE, in *Mythology*. See **BEL** and **POGUE**.

BELZ, in *Geography*, a town of France, in the department of Morbihan, and chief place of a canton, in the district of L'Orient. The place contains 1321 and the canton 5820 inhabitants; the territory includes 147½ kilometres and 5 communes.

BELZICA, a town of Poland, in the palatinate of Lublin, 14 miles S. W. of Lublin.

BELZIG, a town of Germany, in the circle of Upper Saxony, and electorate of Saxony, seated on the Weiler, 30 miles E. of Magdeburg. The prefecture of which this is the chief town bears the same name.

BEMA, *ἔμαξ*, in *Antiquity*, denotes a step or pace.

The bema made a kind of itinerary measure among the Greeks, whose length was equivalent to one cubit, and two thirds, or ten palms.

Whence also the term *βημαζέω*, to measure a road.

BEMA, in *Ecclesiastical Writers*, denotes the altar-part, or sanctuary, in the ancient churches. In which sense, bema made the third or innermost part of the church, answering to the chancel among us.

BEMA was also used for the bishop's chair, seat, or throne, placed in the sanctuary. It was called bema, from the steps by which it was to be ascended.

BEMA was also used for the reader's desk.

This in the Greek church was denominated *βημα γλωσσῶν*, in the Latin church **AMBO**.

BEMA is more peculiarly used for the *Manichees'* altar, which was in a different place from that of the catholics.

BEMA was also a denomination given by this sect to the anniversary of the day when *Manes* was killed, which with them was a solemn feast, and a day of rejoicing.

One of the chief ceremonies of the Mass consisted in setting out and adorning their bema, or altar, with great magnificence.

BEMBEEA, or **BESINI**, in *Geography*, a province of the kingdom of Angola in Africa, which is divided into Higher and Lower, extending on one side along the sea, and on the other dividing the kingdom of Angola from the other foreign states on the south. The country is populous and abounds with large and small cattle, with the fat of which the inhabitants anoint their heads and bodies; and they also clothe themselves with the hide, coated with dressed. They are addicted to the same idolatrous superstitions, with other parts of the kingdom, but speak a quite different language. The great river Luabo, or San Francisco, waters and fertilizes most part of the province; but swarms with crocodile, alligators and men from serpents, which not only destroy much of its fish, but do great mischief to the adjacent grounds.

BEMBER, a town of Hindostan, in the district of Ladak, in the province of Cashmere; at the distance of 33 Zabbari cades (each cad being 4757 yards) on a bearing of N. a little W. from Lahore. N. lat. 33° E. long. 73° 30'.

BIMBLEX, in *Entomology*, one of the Fabrician genera of **PHYLLA**, and formerly in the Linnæan system, a section in the **VESPA** genus; they are distinguished by having the tongue

tongue inflected, and five cleft; lip advanced, mouth involved. See VESPA.

BEMBO, PETER, *Cardinal*, in *Biography*, an eminent restorer of literature, was the son of Bernardo Bembo, a Venetian nobleman, and born at Venice in 1470. Having studied Latin and polite literature, in his early youth, under Urticio, he went to Messina in 1492, to pursue the study of the Greek language, under Constantine Lascaris. At Padua, whither he removed in 1495, he received instructions in philosophy from Nicholas Leonico Tomeo. Upon his father's settlement at Ferrara in 1498, he had an opportunity of forming an intimate friendship with Leonicens, Tebaldeo, Sadoletto, and Hercules Strozzi, and he soon afterwards began to distinguish himself as a writer. His "Azolani," which were discourses on love, written in the Italian language, and so named from the castle of Azoli, where they were composed, became very popular throughout Italy. At this time he was also one of the principal ornaments of the academy, founded by Aldus Manutius in his native city. In 1512 he visited Rome, and was well received by pope Julius II. and by his successor Leo X. he was appointed secretary, with an ample salary. Although, in conformity to the licentiousness of the papal court at this time, he kept a mistress, by whom he had three children, he discharged the duties of his office, to the pope's satisfaction, and was employed by him in various important embassies. In 1520, he removed to Padua, for the recovery of his health, where, upon the death of the pope, he fixed his residence, passing a tranquil life in the prosecution of his studies, and in the conversation of men of letters. To his house, which was richly furnished with books and MSS. a select collection of medals and antiquaries, and a botanical garden, men of science resorted as to a literary academy. In 1539, he was nominated to the dignity of cardinal by pope Paul III. which with some reluctance he accepted, and he then removed to Rome. He was previously ordained priest; and, it is said, that he altogether changed his mode of life, and sedulously devoted himself to the duties of his ecclesiastical functions. Although he was nominated to the bishopric of Gubbio in 1541, and in 1544 translated to that of Bergamo, he resided at Rome, and was much honoured by the pope, as well as respected by persons of the first character in the court. He died Jan. 18, 1547, and was buried in the Dominican church, called St. Maria Alla Minerva. As a writer of Italian verse, cardinal Bembo formed himself upon the model of Petrarch, and contributed to reform and polish the poetry of his own country. His prose compositions are written with elegance and purity of expression, but without any distinguishing traces of genius. In his Latin style, he was "Ciceronian," to the extreme of affectation; and on this account he was censured and ridiculed for applying the terms "heros" to Christ, and "dea" to the Virgin Mary; and for using "persuasio" for faith, and for denoting Leo's election by "deorum immortalium beneficiis." Like many others of the Italian literati of that age, he seems to have thought lightly of his religious creed; and to have been more afraid of transgressing with regard to his Latinity than with respect to the decorum which religion required. To this purpose, he dissuaded a friend from reading St. Paul's epistles, lest he should injure his style; and it is said that he would never read the briefs or breviary for fear of corrupting his own Latinity. Nevertheless his own epistles have been charged with gross faults, and even solecisms. Some compositions of his early days were licentious and obscene. His "History of Venice," written in classical Latin, in 12 books, was undertaken in 1530, by the order of the council of ten, and is more admired for elegance of diction than for profundity and accuracy. His principal works are, "Epistolæ, nomine Leonis pont. Max. lib. xvi." Venet. 1536;

"Epist. Familiarum," lib. vi. Venet. 1552; "Le Rime," comprehending his poetical verses, in one volume, Rom. and Venet. 1548; "Le Prose," held in high estimation by the Italians, in allusion to which Apostolo Zeno says, that "Bembo was the first who explained to his countrymen the mechanism and construction of their native language." "Historia Rerum Venetarum, lib. xii." Venet. 1551. All his works, both in Italian and Latin, were collected and published in 4 vols. fol. Venice, 1729. Gen. Dict. Gen. Biog.

BEMBRIDGE POINT, in *Geography*, lies at the eastern extremity of the isle of Wight, in N. lat. 50° 40' 15", and W. long. 1° 4' 45", and is well known to seamen as a ledge that runs more than two miles into the sea, E. N. E.

BEM-CURINI, in *Botany*. See JUSTICIA.

BEMELS, in *Geography*, a town of the Netherlands, in the duchy of Luxemburg, seated on the east side of the Moselle; 2 miles N. E. of Graven Macheren.

BEMICARY POINT and BAY, are situate between Dry and Milk river, about N. W. by W. from the pitch of Portland, the southern extremity of the island of Jamaica. The point or eastern limit of the bay is in N. lat. 17° 55'. and W. long. 77° 17'.

BEMILUCIUS, in *Mythology*, a surname of Jupiter, represented young and beardless.

BEMINSTER, or BEAMINSTER, in *Geography*, a town of considerable antiquity in the county of Dorset, England. It is seated on the small river Birt, which rises near the town, and running southward falls into the British channel at Bridport harbour. This manor, and two others connected with it, belong to two of the prebends of Salisbury cathedral. Though of remote origin, Beminster does not contain any particular object of antiquity, and its chapel, a handsome large pile of building, is dependant on the parish church of Netherbury, which is nearly two miles distant. The town is large and respectable, having many manufacturers settled in it, and most of its inhabitants employed in making sail-cloth, locks, copper goods, leather, &c.: and some of these trades are greatly facilitated by the water of the river Birt, and the machinery operated on by it. Beminster has suffered repeatedly and materially by fire, and the destructive sword of civil war. These two were united on the 14th of April 1644, when prince Maurice was quartered in the town, but forced to quit it on that day, as the enemy had fired it in five places. From the report of a person who visited it soon after, we are informed it was "the pityfullest spectacle that man can behold, hardly a house left not consumed by fire. There were sevenscore and four dwelling-houses, besides barns and stables burnt," and the loss sustained was estimated at above twenty-one thousand pounds. The inhabitants soon afterwards received from the parliament 2000l. with which, and other sums, they rebuilt the town; but in June 1664, it was again consumed, when the loss amounted to nearly 10,000l. In March 1781, another fire occurred here, and in a few hours upwards of fifty dwelling-houses, with several barns, stables, outbuildings, &c. were reduced to ruins. In spite of these calamitous events, Beminster is now a populous and flourishing town, consisting of 337 houses, and 2140 inhabitants. Its principal public buildings are the chapel, a free-school, an alms-house, and a market-house. The first stands on high ground at the southern side of the town, and consists of a body, two aisles, a chancel, a chantry, and a high tower. On the western front of the latter are some emblematical statues in niches. Within the chapel are some handsome monuments to the Strodes, and other families. The free-school was founded by Mrs. Frances Tucker, in 1684, for the education of twenty of the poorest boys of the town. The Rev. Samuel Hood, father of the lords Hood and Bridport, was master of this school in 1777.

The almshouse was built and amply endowed by Sir John Suck of Parham, bart.

In this town are one annual fair, a weekly market on Thursday, and two annual public sales for cattle, cheese, &c.

About one mile south of Benlister is Parham, an ancient town belonging to Sir William Oyster, bart. At Ben-Axoller, 1st of the neighbourhood, is a hill of the same name, whence issue three springs, which are the fountains of the rivers Ax, Dal, and Simons. Hutchins's History of Dorsetshire, vol. 1.

BENMILL, WILLIAM VAN, in *Biography*, a painter of the Netherlands, was born at Utrecht in 1630, and after having been a pupil of Herman Saftleven, visited Rome for the improvement of his taste and knowledge. His colouring is lively and natural, but sometimes including too much to green; his subjects, such as boats, barges, and other vessels, are to be seen on the rivers or stationed near the banks, and well disposed, and touched with spirit. The lights and shadows of his landscapes are directed with singular skill, and his colouring is clear, warm, and natural. He died in 1703. *Pittsburgh*.

BEMNASIR, in *Geography*, a town of Persia, in the province of Kerman; 140 miles S. E. of Shiraz.

BEMOL, FR. L-MOLLE, *M.* in GUIDO'S SCALE of *Mus.*, implies B flat, the 4th of the key of F natural, and the molle hexachord.

In early times of counterpoint, before transposed keys were used, i. e. keys different from the authentic and plagal modes, (the ECCLESIASTICAL MODES,) the 4th of a major key, descending, and 6th of a minor key, were understood to be flat, and the 7th, ascending, sharp, without being marked. And though two of the modes are in the key of D minor, and two in F major, all which require one flat at the clef, and two in E minor, and two in G major, each requiring a sharp at the clef, they were left to the divination of the finger, without characters of indication. See HEXACHORD and MODE.

The Abbe Feytaud, in speaking of these mysteries, must be allowed to have exercised science and ingenuity, yet, it is to be feared, that the young student will be more puzzled and perplexed than enlightened by his subtilties in this art.

BEM-POSTA, in *Geography*, a small town of Portugal, in the province of Trás-os-Montes, containing about 400 inhabitants.

BEN, BEES, or BEHEN, *Oil of*, is a fine inodorous and rapid dried oil, prepared from the Ben nut. (Glauc. Unguentaria, Balaos Mireptiki) the fruit of the GUILLANDIA *Morinda*.

The oil of Ben is prepared in the Levant, in Egypt, Syria, and also in Italy, by expression of the nut. Geoffroy gives the quantity of oil pressed to be 30^l ounces from about 8 pounds of the nut. The oil is valuable on account of its great purity, and freedom from smell and taste; hence it may be kept for a long time without altering, or becoming in any degree rancid and acrimonious. On this account it is not disposed to become drying, like so many of the other fixed oils. It is used very largely in perfumery as a basis or vehicle to which the art of the perfumer is able to give the fine fragrant scent of various delicate flowers, that do not of themselves retain a sufficient basis in which to fix their scent. Thus a great proportion of the only essences of the East are of the perfumed oil of Ben, and the scent in the oil which is probably a very minute quantity of essential oil may be more separated from the oil of Ben, by means of alcohol. The method of preparing this perfumed oil we have described under the article ALOE.

The medicinal utility of this oil would render it the most valuable.

uable substitute for cerates or liniments in pharmacy, were it sufficiently common. It is actually employed for this purpose in many parts of Italy.

BEN DUBH, in *Geography*, a mountain of Ireland, situate partly in King's county, and partly in the county of Tipperary; 16 miles west of Kilkenny.

BEN CREACHAN, a solitary mountain of Scotland, in Argyshire, the elevation of which is 3300 feet above the sea.

BEN LEEACH, a mountain of Ireland, in the county of Galway; 4 miles S. W. of Ross.

BEN L. SOWS, Ben Lely, Ben Lomond, Ben More, Ben Venck. See GRAMPIAN HILLS.

BEN NEVIS, or BENEVIS, a mountain of Scotland, in the Highlands, reckoned to be the highest mountain in Great Britain, being estimated at 4370 feet above the level of the sea, and yet not much above the quarter of the height of Mount Blanc. It is situated in the parish of Kilmalie, Inverness-shire. This extraordinary mountain has never been sufficiently investigated by any mineralogist: but Mr. Williams says, that it consists mostly of porphyry "of a reddish cast, in which the pale rose, the blackish, and yellowish white colours are finely blended, and shaded through the body of the stone." Many specimens of green porphyry are also intermixed, with angular specks of white quartz. A red granite also prevails, which contains a vein of lead ore impregnated with silver. On the north-east side this mountain presents a precipice nearly perpendicular, and of a prodigious height, being by some accounts 1500 feet. The view from the summit is grand, exhibiting most of the western islands, from the paps of Jura to the hills of Cullen in Skey; on the east it extends to Ben Lawres in Perthshire, and the river Neffs; and the extent of view is about 80 miles. The superior half of the mountain is almost destitute of vegetation. The summit is flat, with a gentle acclivity. Snow remains in the crevices throughout the year; but here are no glaciers, nor other magnificent Alpine features. Drumalban, the "Dorsum Britannicæ," of the old writers, seems to be Ben Nevis, with the high desert moor of Rannul, extending 20 miles to the east of that mountain. To the north-west of Ben-nevis is the long mountain of Corriarok, near Fort Augustus, over which a military road has been formed in a zigzag direction. Near the foot of this mountain arises the rapid river Spey, and various other streams, all running to the west. Sinclair's Account of Scotland, vol. viii. Williams's Natural History of the Mineral Kingdom.

BEN WEA, a mountain of Scotland in the Highlands, on the west of Ross-shire, estimated at 3720 feet in height.

Several other mountains of Scotland are distinguished by the appellation *Ben*, in conjunction with some other word.

BENABARRI, or BENSABARRI, a valley, and a place of the same name, situate among the Pyrenees, in the province of Aragon, in Spain, on the frontiers of Catalonia. N. lat. 41° 55'. E. long. 0° 40'.

BENAC, a town of France, in the department of the Ille and Villaine, and chief place of a canton in the district of Redon; 8^l leagues S. of Rennes.

BEN-ALD, a populous town of Egypt, between Memphis and Assut, or Sioat. These three places, with Gizeh, constitute the chief mart of the trade of Upper Egypt.

BENAMENIL, a town of France, in the department of the Meuse, and chief place of a canton in the district of Louvillè; 2^l leagues east of Lunéville.

BENARUS, a city or province of Hindoostan, bounded on the north and north-west by Oude, on the east by Bahar, and on the south and west by Allahabad. The district is about 120 miles long, and 100 broad; and contains, with its dependencies, 12,791,190 British males; its soil is fertile, and

the country populous. The Zemindary of Benares, which includes all the circars of Gazypour and Chunar, constituted a part of the dominions of Oude, until the year 1775, when its tribute or quit-rent of 24 lacks, since increased to 40, was transferred to the English, on occasion of the cession of the province to the India Company. This Zemindary, lately in the hands of Chhet Sing, occupies the principal part of the space between Bahar and Oude, so that only a small part of the territory of the latter touches Bahar on the north-west. In 1786 the clear revenue of Benares amounted to 380,000*l*. Almost in every village of this province, which is in a very prosperous state, a person is employed in teaching the youth to read and write; and they have a singular method of teaching reading and writing at the same time. The boys are collected upon a smooth flat of sand, and with a finger or a small reed form the letters there, which they pronounce at the same time. As often as the space before each scholar is filled up with writing, it is effaced, and prepared for a new lesson: thus the expence of pens, ink, paper, and even a house is avoided. The education at Benares is chiefly instituted for the Brahmins.

BENARES, the chief city of the forementioned district, is very rich, and the most completely built of any. It occupies the north bank of the Ganges, and is distant from Calcutta by the road, about 460 miles, and by Moorshedabad 563 miles. Its ancient name was Kasi; but there are no notices concerning it in the works of the ancient geographers. If it had existed during the time of the Syrian ambassadors, Pliny would have noticed it, as he has done Methora or Matura, and Clisobara, which lay near the Jumna river. The city is about six miles long and four wide; and may be viewed in its utmost extent from the tops of the Minarets of the mosque, erected by Aurungzebe on the foundation of an ancient Hindoo temple, and lately repaired by Mr. Hallings. It abounds in costly structures; but Mr. Forster, in his "Journey from Bengal to England," says, that the irregular and compressed manner which has been invariably adopted in forming the streets, destroys the effect which symmetry and arrangement would have bestowed on a city, entitled, from its valuable buildings, to a preference of any capital, seen by him in India; and it is also very injurious to the salubrity of the town. At Benares the number of Europeans is very small; a judge, register, collector, with a few civil servants, constitute the whole of the company's establishment there; and a few private merchants and planters make up the whole society. Of natives, however, the number is great; and many of the bankers are the principal creditors of the India Company, and possess immense fortunes. The poor in Benares are still more numerous, owing to the crowd of pilgrims, who come from all parts to visit so sacred a place. Mr. Hodges, in his "Travels in India," informs us, that in examining one of the temples of Benares, he was surprized to find most of the ornamental parts of Grecian architecture in a building erected on the plains of Hindoostan. Benares has been from time immemorial the Athens of India, the residence of the most learned Brahmins, and the seat both of science and literature. Here, it is probable, whatever remains of the ancient astronomical knowledge and discoveries of the Brahmins is still preserved. M. Bernier (*Voy. ii. p. 148.*) saw, in the year 1668, a large hall in this city filled with the works of the Indian philosophers, physicians, and poets. Sir Robert Chambers has described the observatory at Benares, which he visited in 1772. (See OBSERVATORY.) He has more lately discovered in this city the "Surya Siddhanta," on the principles of which the whole Indian astronomy is founded. Several considerable extracts of this work have been trans-

lated by Samuel Davis, esq. to whom this valuable work was communicated. It is composed in the Sanskreet language, and professes to be a divine revelation, communicated to mankind more than two millions of years ago, towards the close of the Satty or Satya Jogue, the first of the four fabulous ages, into which the Hindoo mythologists divide the period during which they suppose the world to have existed. It appears from what is already known of this book, that independently of the fiction and romance which are blended in the account of its origin, it contains a very rational and elaborate system of astronomical calculation, and several rules and tables, for the calculation of eclipses, &c. which seem very much to favour the hypothesis adopted by M. Bailly, Dr. Robertson, and others, that ascribes a very high antiquity to the astronomy of the Brahmins. In the rules contained in this work, is included a system of trigonometry, founded on certain geometrical theorems, with which, though unknown to Ptolemy and the Greek geometricians, modern mathematicians are well acquainted. For an account of the astronomical computations of the Hindoos, by Samuel Davis, esq. see *Asiatic Researches, vol. ii. p. 225.* &c. 8vo. and for remarks on the astronomy of the Brahmins, and for an account of the principles on which the Hindoo system of trigonometry is founded, by professor Playfair, see *Edinb. Trans. vol. ii. p. 135.* It appears, however, from an elaborate dissertation on the antiquity of the Surya Siddhanta, by Mr. J. Bentley, published in the *Asiatic Researches, vol. vi. p. 540,* &c. that the system, so eagerly applauded and referred to by the above mentioned writers to such remote antiquity, cannot be of a greater age than 731 years; or that it was composed about A.D. 1068.

Notwithstanding the science and literature that have been cultivated by the Brahmins at Benares, we discover traces of superstition, and even of inhumanity, in some of their customs, which, it is hoped, the interference of the court of justice, established there in 1783, will gradually restrain and reform. As the person of a Brahmin is inviolate, no atonement can expiate the crime of occasioning his death. Hence originated a practice, which was formerly frequent at Benares, and which in its effects approaches the nearest to our caption, or arrest. The Brahmin, who adopts this expedient, in order to procure redress, proceeds, armed with a dagger or poison, to the door of his adversary's house: where he deliberately sets himself down, and threatens to commit suicide, if the offender should attempt to pass or molest him. He falls with inflexible rigour, to which the other party likewise submits, and perseveres in his resolution until satisfaction is obtained. This practice, called sitting in "Dherma," is not confined to the male Brahmins only; for an instance occurred at Benares in 1789, of a widow's recurring to this expedient, in order to obtain, in a litigation with her brother-in-law, that justice, which neither the award of arbitration nor the decision of the court had granted her. Both failed pertinaciously during thirteen days, when, worn out with hunger, her antagonist at last yielded the contest. Another instance occurred in 1794. An inhabitant of a district in the province of Benares sat in Dherma before the house of some Rajepoots, for the purpose of obtaining the payment of "Birt," or a charitable subsistence, to which he had a claim; and in this situation destroyed himself by swallowing poison. Some of the relations of the deceased retained his corpse for two days before the house of the Rajepoots, who were thus compelled to forego taking sustenance, in order to induce them to settle the Birt on the heirs of the deceased Brahmin. This practice is not specifically pointed out by the shaster, but depends merely on the sanction of usage. Another practice of the Brahmins,

equally

equally frequent, and more cruel, is called a "Koor." Having contrived a circular pile of wood, and placed upon it a cone, or an old woman, they are to continue the wood burning. The object of this practice is to intimidate the officers of government, or others, from urging importunate demands, or levying grievous exactions, as the effect of the sacrifice is supposed to induce in great guilt the person whose conduct obliges the constructor of the Koor to adopt this expedient. The only case of setting up a Koor, that occurred for many years, happened near Benares in 1783; but the sacrifice was prevented by the timely interposition of authority. There are still influences of still more atrocious acts, by which the Brahmans seek to repel injuries, or to wreak their feeble vengeance; as by murdering, with mutual consent, their nearest and most beloved relations, from a persuasion that horror of the deed will redound on the head of their oppressor. Sir John Shore (*ubi infra*) relates three shocking cases of that nature, which, so late as the years 1791 and 1793, came under his cognizance in the province of Benares. It further appears by Sir John Shore's report, that a whole tribe of Hindoos, denominated "Rajekoomars," and resident on the frontiers of Jaunpore, a district of the province of Benares, adjoining to the country of Oude, have been long accustomed to the savage practice of causing mothers to starve to death their female offspring; and that the only reason assigned for this inhuman custom was the great expence of procuring suitable matches for their daughters, if they suffered them to grow up. Measures have been taken and rigidly enforced for abolishing this barbarous practice, to which, however, there are some few exceptions; as certain families among the Rajekoomars allow, at least, one female child to be reared, and one village furnishes a complete exception to the general custom. Among the superstitions prevailing in the province of Benares, we may mention the following circumstance relating to the sugar-cane. If any of the old cane remains unemployed in the new plantation, the proprietor repairs to the spot previously to the 25th of June, or 11th of July, and having sacrificed to Nagbele, the tutelary deity of that plant, he carefully sets fire to the whole; it being firmly believed by the "ryots," or husbandmen, that if a single cane should flower after that term, it would portend the most dreadful calamities to themselves and their families. We shall here add, that faith in charms, amulets, sorcery, fascination, and astrology, still prevails in the east. See SOONTAAR, Asiatic Researches, vol. iv. p. 329, &c. 8vo. The Hindoo observatory at Benares is situated in N. lat. 25° 15' 36". E. long. 83° 10'.

BENARU, a town of Persia, in the province of Farissan, 108 miles S. S. E. of Schiras.

BENARVILLE, a town of France, in the department of the Lower Seine, 5 leagues N. E. of Montivilliers.

BENASCIII, JOHN BAPTIST, in *Biography*, a painter and engraver, was born in Piedmont, A. D. 1636, and became a disciple of Pietro del Po. He imitated the works of Lanfranchi so successfully, that his pictures have been mistaken for the performances of that master. He is represented as a man of great genius, and the freedom and facility, which appear in his pictures, are highly commended. He died at Rome in 1690. He etched for his amusement "A holy family," from Dominicus Cerini, his intimate friend. Strutt.

BENATKY, or **BENATEK**, in *Geography*, a small town of Bohemia, with a citadel, in the circle of Bolestaw, seated on the Elbe, 22 miles N. E. of Prague.

BENAVARRI. See **BENABARRI**.

BENAVENTE, a town of Spain, in the country of Leon,

seated on the Ulla, and containing about 3,000 inhabitants; 13 leagues W. of Leon.

BENAVIDIO, MARCUS MANTUA BENAVIDIUS, in *Biography*, a celebrated civilian, was born at Padua in 1490, and taught the civil and canon law in his native city for 60 years, with high reputation. He there received the honour of knighthood, viz. from the emperors Charles V. and Ferdinand I. and from pope Pius IV. He died in 1582, and was the author of several works in his own profession; among which are "Collectanea super jus Cæsareum;" "Observationum Legalium," lib. x. and "De Illustribus Jurisconsultis." Moseri.

BENBECULA, in *Geography*, is the name of one of those islands of Scotland called the Hebrides. It lies between the isles of N. and S. Uid, from the last of which it is separated by a narrow channel, nearly dry at low water. This island is rather flat, and measures only about nine miles in transverse diameter. Its soil is sandy and barren; but the quantity of seaweed constantly driven on shore, is appropriated to meliorate some portions of the land. In one part of the island is an ancient fort called Elvine Neau Ruarie, and several stone monuments are found in different parts of it. It has a harbour for small fishing vessels, and several fresh water lakes, floored with fish and fowl.

BENBRICK, a mountain of Scotland, in the county of Perth; 12 miles N. N. W. of Crieff.

BENBALBEN, mountains of Ireland, in the county of Sligo; 7 miles N. of Sligo.

BENCH. See **BANC**, **BANK**, &c.

BENCH, *Amicable*. See **AMICABLE**.

BENCH, *King's*. See **COURT of King's Bench**.

BENCH, *Free*. See **FREE-BENCH**.

BENCH island, in *Geography*, lies within the south-east point of what is called South-east bay, in the southern part of New Zealand.

BENCH-widow. See **WIDOW**.

BENCHIERS, in the *Inns of Court*, the senior members of the house, who have the government and direction thereof; and out of whom is yearly chosen a treasurer, &c.

BENCOOLEN, in *Geography*, a sea-port town and fort on the south-west coast of the island of Sumatra, where the English have a settlement and a factory. This is one of the four English presidencies, or governments, to which all the other factories are subordinate; the other three are Madras, Bengal, and Bombay. Bencoolen, which is about 2 miles in compass, is known at sea by a high slender mountain, called the "Sugar Loaf," and rising 20 miles beyond it in the country. Before the town lies an island, within which the ships usually ride, and with this, the point of Sillebar, extending 2 or 3 leagues southward of it, forms a large and commodious bay. A convenient river on its north-west side brings the pepper, of which the trade of the town chiefly consists, from the inland country: but it is shipped with inconvenience, on account of a dangerous bar at the mouth of the river. It is principally inhabited by natives, who build their houses on pillars of ben-beo wood. The English, Portuguese, and Chinese, have each a separate quarter. The adjacent country is mountainous and woody, and there are many volcanos in the island. As the town stands upon a morass, the air is loaded with vapours, and the mountains are covered with thick clouds, that produce lightning, thunder, and rain. The climate of Bencoolen has proved more sickly and fatal than that of any of the other British settlements, not only to the English, but to all who have been accustomed to live in a pure air. In 1763, upon the cession of Manilla to the Spaniards, and the restoration of Bencoolen to the English, many Chinese merchants, with

their families, quitted Manilla in order to settle under the English government at this place; but the air of this country proved so fatal, that most of those Chinese and their families died soon after their arrival. Many English have also fallen a sacrifice to the intemperature of this climate; and, indeed, few of them survived until they built a fort on a dry elevated situation, at the distance of about 3 miles from the town. This is called "Fort Marlborough," where, during the rage of sickness at Bencoolen, the garrison is sometimes very healthy. Tame buffaloes may here be had in great plenty; but fish and poultry are scarce and dear. The soil is a fertile clay, producing high grass; but near the sea it is a morass. N. lat. 3° 49' 3". E. long. 102. See SUMATRA.

BEND, a town of Persia, in the province of Farsistan, 100 miles N. E. of Schiras.

BEND Dexter, in *Heraldry*. The bend was a sash worn across the shoulder from the Italian *la benda*; it is one of the nine ordinaries in heraldry, and occupies one-third part of the escutcheon when charged, and one-fifth when plain; it consists of two equal lines drawn diagonally from the dexter chief to the sinister base of the shield. This ordinary hath more subdivisions or diminutives than any of the others, viz. the bend-let, gortier, cottise, and ribbon, none of which diminutives can properly be charged.

BEND Sinister, denotes lines drawn diagonally from the sinister chief, to the dexter base of the shield; it hath not the same diminutives as those of the bend dexter; but according to some heraldic writers, is subdivided into a scarf, or scarf, which is in breadth half that of the bend sinister; and a batton, or siffure, as Upton and Holme call it, containing half the breadth of the scarf. Here, however, arises an objection to the admitting the batton to be a diminutive of the bend sinister, or as any part of one of the ordinaries. According to many years practice, the batton doth not touch the extremities of the shield, nor the extremities of the quarter where the paternal arms are placed, as all the ordinaries and their diminutives constantly do; but on the contrary, is coupé, that is, cut short, and so borne as a mark of illegitimacy, and not as an ordinary or charge, or any part of the coat: for, although some instances are to be met with of ancient arms, where a batton sinister is passed from the sinister chief to the dexter base, over all; and others, where it passes from corner to corner, over the paternal quarter, and not over the other quarters; yet, in every one of those instances, the batton is used as a mark of bastardy, and not either as an ordinary or charge. Hence, therefore, we may fairly conclude, that the batton is not to be deemed as any part diminutive of the bend, but as a mark of illegitimacy; which mark or batton, when granted by princes to their illegitimate children, may be of metal or fur, or both; but, when granted to any under their degree, must be of colour only.

BENDA, in *Architecture*. See FASCIA.

BENDA, *Francis*, in *Biography*, concert-master to the late Frederick II. king of Prussia, from the year 1738 to the time of his death. He was one of the most touching and expressive players on the violin in Europe, during the last century. He was a native of Alt Benatzky in Bohemia 1709, and a chorister at Prague and Dresden, till he lost his treble voice. There is a very natural and amusing life of this excellent musician, composed from his own materials, by M. Hiller of Leipzig; but as we have no room for stories of mere amusement, we must adhere to matters of fact.

It was not, till he was dismissed as a singer, that he seriously applied to the fiddle to procure him a subsistence; but he knew not when or under what master; but remembered that, as soon as he was able, he joined a company of strolling

Jews, in playing dances about the country; in which, however, there was a blind Hebrew of the name of Löbel, who, in his way, was an extraordinary player. He drew a good tone from his instrument, and composed his own pieces, which were wild, but pretty: some of his dances went up to A in *altissimo*; however, he played them with the utmost purity and neatness.

The performance of this man excited in Benda so much emulation, that he redoubled his diligence in trying to equal him; and not to be inferior in any part of his trade, he composed dances for his own hand, which were far from easy. He often speaks of his obligations to the old Jew for stimulating him to excel on the violin.

It has often excited our wonder, that in the principal capitals of Europe, wherever there is a synagogue, we generally found a vocal performer or two, who sung in the Italian manner, and in exquisite taste, though the rest of the singing in the service of religion, was to the last degree incoherent, rude, and barbarous. Where it was acquired, or by what kind demon this taste was inspired exclusively, is not easy to conjecture; but so it was at Paris, Amsterdam, Milan, Venice, Rome, and Naples; and we have had instances at home of exquisite Hebrew singing in our own country.

After various adventures, our young violinist entered into the band of count Uhlefeld at Vienna, with whom he had frequently the advantage of hearing the famous Francischello, who taught the count, and of playing trios with this great musician and his scholar.

Francischello was the most exquisite performer on the base-viol of his time. Gemisiani related of him, that in accompanying Nicolini, at Rome, in a cantata composed by Alessandro Scarlatti, for the violoncello, the author, who was at the harpsichord, would not believe that a mortal could play so divinely; but said, that it was an angel who had assumed the figure of Francischello; so far did his performance surpass all that Scarlatti had conceived in composing the cantata, or imagined possible for man to express.

At length, Benda was invited by Quantz, the German flute master to the late Frederick II. king of Prussia, during the time when he was only prince of Prussia, and resided at Ruppin, before his accession to the throne.

It was by stealth, that this prince indulged his passion for music, during the life of his father, the late king, who had forbidden him not only to study and practice music, but to hear it. M. Quantz told us afterwards, that it was the late queen-mother, who at this time encouraged the prince in his favourite amusement, and who engaged musicians for his service; but so necessary was secrecy in all these negotiations, that if the king his father had discovered that he was disobeyed, all these sons of Apollo would have incurred the danger of being hanged. The prince frequently took occasion to meet his musicians a hunting, and had his concerts either in a forest or cavern.

Benda still, in 1772, led the king of Prussia's band at the opera, and at his concerts; and could boast of having had the honour of accompanying his majesty, during the 40 years which he had been in his service, in nearly 50,000 different concerts. What an excellent economist of time must his late Prussian majesty have been; who, though his own minister, could spare two hours every day, when he was not in the field, for music!

When we heard the admirable Benda perform, it was an excellent composition of his own, which he played *con sordino*; his hand, he said, wanted force sufficient to play without. The gout had long enfeebled his fingers, and age, perhaps, still more. There were, however, fine remains of a great hand, though he was probably always more remarkable

able for feeling than force. His style was so truly simple, that scarcely a passage could be found in his compositions, which it would not have been in the power of the lowly artist to form; and when he was at his best, he was so very affecting, that even the most insensible of the general professors declared that the tears drew from them in profusion. How he acquired this style of writing and painting may be ascribed to musical students to trace and develop. His style was not that of Tasso, Somis, Veracini, or that of the head of any one schooler noticed, of which we have the least knowledge; it was his own, and formed from that model which should be ever studied by all instrumental performers, *and singing*.

BENDALIA, in *Geography*, a town of Africa, lying between the confines of Dar-fur and Wera, the capital of Bergoo. It is inhabited by the slaves of the sultan of Bergoo. The people are idolaters.

BENDALI, a town of Persia, in the province of Ker-man, 125 miles S. of Sirgjan.

BENDARMALANKA, a town of Hindoostan, in the circuit of Rajamundry, situate between the branches of the river Bris, at their outlet into the ocean, 55 miles S. of Rajamundry, 50 N. E. of Masulpatan, and 358 miles N. E. of Madras. N. lat. 16° 30'. E. long. 82° 30'.

BENDEIRG, a mountain of Scotland, in the county of Perth, 7 miles N. of Blair Athol.

BENDER, formerly called *Uzin*, and denoting in the Turkish language "a pass," a fortified town of European Turkey, in Bithynia, seated on the Dniester. It is celebrated as the place of retreat and residence of Charles XII. of Sweden, when he put himself under the protection of the Turks, after being defeated by the Russians at the battle of Poltowa in 1709; but upon refusing to leave their territory, he was attacked, taken prisoner, and removed to Adrianople, where, after a year's confinement, he returned freely to his own dominions. It was besieged by the Persians in 1770, and after a resistance of nearly three months, surrendered to Panin, the Russian general; and the capture of the fortress was effected by the submission of the Tartar of Bulzjak and Otchakof to the Russian sceptre. The loss which Bender, in 1770, sustained from the Russians was remarkable, on account of the desperate defence made by the garrison, the carnage which attended its reduction, and the adoption on the part of the besiegers, of that dreadful instrument of modern warfare, the globe of compression. The Russian army, commanded by count Panin, opened their trenches on both sides of the river, the 30th July, after which, a furious cannonade and bombardment were begun from all quarters, and vigorously returned from the town. The garrison and inhabitants defended themselves with the utmost bravery: in sixteen days they made seven fortifications, with little advantage, but great loss on both sides, and held out for more than two months with unabated courage, even when the defeat of the main army by the Russian general Romanzow seemed to deprive them of every hope of relief. The besiegers in the mean time pushed forward their mines (See *MINE*) with industry, particularly one of an improved construction lately invented by a French engineer, and which has been since denominated the globe of compression. In this labyrinth of mine, interwoven and included one within another, it was maintained, that a certain quantity of gunpowder would cause a greater explosion, and throw up a greater portion of earth than in any other method. The globe of compression being brought to perfection, was charged with the amazing quantity of 16,000 lb. of powder, and the garrison continuing obstinately to refuse every proposal of surrender, count Panin prepared for a

general assault to take place on the night of the 27th of Sept. The firing of the mine was to be the signal of attack, and it was hoped, that besides ruining the outworks, it might make a breach in some of the principal walls of the town, and bury the defenders in the ruins. The Russians themselves were apprehensive of the consequences, as it was not easy to define how far the effects of such an enormous mass of powder might extend, and the troops declined to make the assault in that quarter were stationed at a considerable distance. In fact, the globe of compression, which was blown up at 10 o'clock at night, with a most horrible concussion, shook the whole adjacent country, and amidst the astonishment and confusion excited by this dreadful phenomenon, the attack began in three places with great fury. Nothing could restrain the impetuosity of the Russian soldiers, who pushed forward at the main point of assault. The double ditches before the glacis were passed and filled up; the double row of pallisades before the covered way destroyed; the main ditch surmounted, and all the outworks carried in succession. The body of the place could not oppose an effectual resistance to enemies who had already overcome such difficulties: the Russians got over the walls in every quarter, and a new and dreadful contest commenced in the dark, as well among the fortifications, as in the streets, lanes, and passages, and from the houses. The desperate resistance of the garrison and inhabitants obliged the Russians to set fire to the town, which they did in several places at the same time, but the contest nevertheless continued, amidst the ruins and the blazing houses, for the whole of the night, nor seemed decided, but by the almost total extermination of the Turks. At eight in the morning, the seraskier, with most of those that survived, retired to the citadel, which the flames had already reached. A select body of 1500 cavalry and 500 infantry, attempting to cut their way through the besiegers, were surrounded and cut off to a man. As for the seraskier, after demanding in vain an honourable capitulation, the fury of the flames, which had now reached every part of the citadel, obliged him to surrender with his followers, as prisoners of war. The fire raged for three days, and could not be restrained till it had consumed the whole city. The total number of prisoners, including the inhabitants of all ages, amounted to 11,749, of whom 5,554 were janisaries and spahis, with their commanders, besides the seraskier and two bahaws. The residue of a population of 30,000 souls, of whom one half were soldiers, perished in the storm. The Russians found in the place a vast quantity of arms, bombs, grenades, gun-powder, and other military stores, besides above 200 pieces of brass cannon, and 85 mortars. They also took 4 horse-tails, 14 batons of command, and 40 pair of colours.

Bender, hardly recovered from this blow, was again taken, but not till after a long siege, by prince Potemkin, in November 1789. It was, however, restored to Turkey by the subsequent treaty of peace in 1792. Bender is reckoned to contain between 10 and 12,000 inhabitants; and its governor is a bashaw. It is distant 100 miles W. of Otchakof or Oczakow, and as many miles S. E. of Jaffy. N. lat. 47°. E. long. 29° 20'.

BENDER-Abassi. See *GOMBRON*.

BENDER-Congo. See *CONGO*.

BENDER-Delem, a town of Persia, in the province of Farsistan, on the north coast of the Persian gulf; 130 miles W. of Schiras.

BENDER du Ser, a town of Persia, in the province of Ker-man, 160 miles S. of Sirgjan.

BENDER Ibrahim, a town of Persia, at the mouth of the river Ibrahim, in the Persian gulf.

BENDER *Maffin*, or *Benjar-Maffin*, the capital of a kingdom of the same name in the southern part of the island of Borneo, possessing a good harbour, formed by the river Benjar, flowing from the centre of the country almost due south. S. lat. $2^{\circ} 40'$. E. long. $113^{\circ} 50'$.

BENDER *Rieber*, a town of Persia, on the north coast of the Persian gulf, in the province of Farfutan; 160 miles S.S.W. of Schiras.

BENDER *Rigk*, a city of Persia, in the province of Kerman, on the north-east coast of the Persian gulf. It is encompassed with walls in an indifferent state, and lies north from Abuschæhr or Busheer. The petty state, of which this is the capital, comprehends several other places in Kermefir, which render its sovereign in some measure dependent upon Kerim Khan. The Arabs of this principality are chiefly addicted to a sea-faring life; the Persians inhabiting its back parts are husbandmen. The reigning family of Bender Rigk is of the Arabian tribe of Beni Saab, and proceeds originally from Oman; but the grandfather of one of its princes, having become a Shiite, and married a Persian lady, this family is no longer reckoned by the Arabs among their genuine nobility. A late reigning prince of Bender Rigk, Mir Mahenna, was notorious through the country for his vices and cruelties, as one of the most execrable tyrants that ever existed. He caused his servants to murder his father in his own presence, because the old man had a predilection for his eldest son. He killed his mother, because she reproached him for his crimes. He caused his brother, and sixteen other relations, to be assassinated, that he might establish himself in the undisturbed possession of the throne. He drowned two of his sisters, because a neighbouring prince had asked one of them in marriage. He exposes all the children that happen to be born to him. In 1765, this detestable monster was under the age of thirty years. After having been twice captured by Kerim Khan, he recovered his liberty, and immediately upon his return to his own dominions began to pillage the caravans which travelled between Schiras and Abuschæhr, and to practise piracy. Kerim Khan laid unsuccessful siege to his capital; and when he sent in 1765, to demand payment of the tribute due for his possessions in Kermefir, Mir Mahenna maltreated the officer deputed for this purpose, and caused his beard to be shaven. Upon which Kerim Khan sent against him a powerful army, which conquered Bender Rigk and all its territories. Mir Mahenna, however, had previously retired with all his troops, and some of his subjects, into a desert isle called Khoueri, where he waited till the Persian army retired from his country. As soon as they were gone, he left the island, expelled the garrison from Bender Rigk, and regained possession of his dominions. The tyrant had abandoned himself to drunkenness; and had begun to exercise such cruelties upon his troops, that he cut off the noses and ears of some of the principal officers; and yet so attached to him were his soldiers, that, in the period of his exile, he took the isle of Karek from the Dutch. Bender Rigk is distant 132 miles W.S.W. from Schiras. N. lat. $29^{\circ} 26'$. E. long. $51^{\circ} 20'$.

BENDIDIA, *Βενδιδα*, in *Antiquity*, solemn feasts held by the Athenians on the twenty-first day of the month Thargelion, in honour of the goddess Diana. The word is formed of *βενδι*, a denomination of Diana, according to Strabo, or of the moon, according to Suidas, which amounts to the same. The bendidia were held in the Piræus, and bore some resemblance to the bacchanalia.

BENDING, in a general sense, denotes the reduction of a straight body into a curve, or giving it a crooked form. M. Bernouilli has a discourse on the bending of springs, or

elastic bodies. (See *SPRING*.) M. Amontons gives several experiments concerning the bending of ropes. (See *ROPE*.) The friction of a rope, bent or wound round an immovable cylinder, is sufficient, with a very small power, to sustain very great weights. Mem. Acad. Sc. 1703. 1705. 1699. Divers methods have been contrived for bending timber, in order to supply crooked planks, and pieces for building ships. M. Daleme ingeniously enough proposed to have the young trees bent, while growing in the forest. The method of bending planks by a sand-heat, now used in the king's yards at Deptford, was invented by captain Cumberland. Phil. Trans. N^o 371. p. 75.

The bending of boards, and other pieces of timber for curved works in joinery, is effected by holding them to the fire, then giving them the figure required, and keeping them in this figure by tools for the purpose.

A method has been lately invented and practised for bending pieces of timber, so as to make the wheels of carriages without joints. See *WHEELS*.

The use of steaming wood for the purpose of bending it is evidently to supple it, so as to make it capable of being brought the more easily into the form required, as well as to adapt it for retaining that form, after the pressure by which it was originally reduced to that figure has been removed. By means of steaming, heat and moisture are applied to it. If it has already moisture enough, as in the case of green wood, heating in any other way, without the application of steam, may be sufficient; or the effect may be produced by heating and wetting at the same time. These arts of suppling by heat and moisture, have been practised from time immemorial in Russia, and applied to wheels, and some other sorts of wood-work. In England these, or similar modes, have been applied for a long time in the dock-yards, and also, under a patent granted to Messrs. Jacob and Viny, but now expired, in the construction of wheels; and by Mr. Bevan, under a patent still in force, to circular wooden fashies, fossits, fan-lights, door mouldings, and hand-rails for stairs; and, without patent, by cabinet and chair-makers in general. When the thickness required, compared with the sharpness of the curvature, is such as to render it impracticable to bend the piece entire, it may be divided for this purpose into different thicknesses, in the manner proposed by Mr. Samuel Bentham, under a patent obtained in 1793, for methods of working wood, metals, &c. with very little, if any, loss of strength; and if the strata are connected by proper fastenings, with a degree of strength far superior to what a piece of the same dimensions would possess, if grain-cut. In this mode, curvature may be given to the wood-work of all sorts of engines, and of carriages of all sorts; to all timbers designed for receiving a curved shape and employed in buildings; and to any of the timbers, that may be used in the construction of boats or vessels, not excepting the ribs of the largest class. Thus, it is said, a very considerable saving with respect to quantity and value might be obtained, whilst at the same time the strength would be augmented.

In the operation of bending, care should be taken that, as fast as you force any piece to adapt itself to the curvature of the mould to which you are bending it, you apply a pressure, by means of screws or wedges, &c. to that part, and along the whole piece, particularly at its sharpest convexities; so that the piece may not only be kept to its proper curvature, but the exterior fibres be prevented from starting out. In forming ship-ribs of all shapes and sizes, so as to supersede the use of crooked-grown timber, where that which is straight would be cheaper, Mr. Bentham proposes to use one or other of the two following methods, which, he says, would effectually answer the purpose. First, having

Bevel is a mould or block to the shape of the rib in question, comprising the whole of its extent from top to bottom; that is, on the ribs of the keel, bend the component parts of the ribs according to the shape of the block, and fasten them together; then, to confine the wood-rib in its curvature, apply a bar or cross-bar, in those parts where the ribs would be subject to change, and to convey the rib, together with its rays, and it has been sufficiently confined to its curvature, by the connection given to it with the planks, beams, and other parts of the ship. Or, secondly, you may form the shell of the ship first, without timbers, beginning to build as it were by the planks, using only a set of temporary moulds or false ribs, to determine the position of, and give a temporary support to, the planks. When this is done, insert the timbers afterwards, pressing and binding the component parts successively into their places and removing the false ribs, in proportion as the real ones are put together and secured. Or, thirdly, instead of the false ribs, you may insert a sufficient number of real ribs, put together as in the first method; and then proceed with the planks and the rest of the ribs, as in the second method. As to bending, it may, in this case, be performed with or without the assistance of steaming, and with or without the use of the expedient of dividing into thickness according as the degree of curvature may require. In cliker-work built boats, the ribs have been sometimes inserted by bending them to the planks, but this is only done in boats of the slightest class. See SHIP.

BENDING, in the *Sea Language*, denotes fastening one rope to another, or to different objects, and fastening a sail to its yard.—*To lay bend the cable*, when it is to be made fast to the ring of the anchor.—*To lend two cables*, signifies to tie them together with a knot, which, though less sure than splicing, is looser &c.—*To unbend the cable*, is to loosen it from the ring of the anchor; which is done when a ship is directed to be long at sea.—*To bend a main sail*, is to make it fast to its proper yard or stay.

BENDLET, in *Heraldry*, is the first diminutive of the bend, and possesses one half of the breadth of the bend.

BENDOAN, in *Geography*, a small island, 5 leagues S.W. from cape St. Martin's, on the coast of Spain, in the Mediterranean, which lies to the south of west from Yvica island. It is north-east from Alca, and forms the limit of the bay of Calvi, or Cargi, of which the mount so called is the southern end.

BENDORAN, a mountain of Scotland, in the county of Argyre.

BENDORF, a town of Germany, in the circle of Westphalia, and county of Sayn, and in a prefecture of the same name, but not far from the Rhine, into which the river Sayn empties itself at this place. It is inhabited by Roman catholics and Lutherans, each of whom enjoy the public exercise of their religion; 5 miles N. of Coblenz.

BENDORF Road, lies on the west coast of Ireland, and is the eastern end of the roads between Ballyshannon and the island of Mull, or Eastmurry, as Bundary is the more western. In both, ships may ride with safety.

BENDS, in a ship, are the same with *swales*, or *swales*, which are the outermost timbers of a ship, on which men set their feet in climbing up.

They are reckoned from the water, the *first*, *second*, and *third bend*: they help much to strengthen the ship, and have the beam, knees, and foothooks bolted into them.

BENDS denote also the small ropes used to confine the clutch of a cable. For a *common or fleet bend*, pass the end of a rope through the bight of another rope, then round and underneath the standing part; but, to prevent its jam-

ing, pass it round again under the standing part. The sheet of a sail has the end passed up through the clew, then round the clew, and down beneath the standing part. The rope of a buoy is passed as a sheet, and has the end stopped. Bends of cable-ends are passed as a seizing. For a *carriack bend*, lay the end of a rope, or hawser, across its standing part; then take the end of another rope, or hawser, and lay it under the first standing part, at the cross, and over the end: then through the bight, under the standing part; then over its own standing part, and underneath the bight again: it is often used in haste to form a greater length, or to warp or tow with. For a *fisherman's bend*, take a round turn with the end of a rope, or hawser, through the ring of an anchor, &c. and a half hitch through both parts, and another half hitch round the standing part; then stop the end. *Hawser bend* is a hitch, with a throat and end seizing made on one end, and the end of another hawser reeved through the bight, and hitched with a throat and end seizing. *Temporary bend* is commonly made to reeve through large blocks, thus: lay three fathoms of the end of two hawsers together, and put on a round seizing in the middle; then reverse the ends to each standing part, and put on a throat seizing between each end and the middle, and a round seizing on each end. See *Plate of Ship-Rigging*.

BEND-WAYS, or in *Bend*, in *Heraldry*, is such charges as are placed so as to occupy that part of the escutcheon to which the bend is allotted; or such as are placed obliquely, resembling a bend.

BENDY, a term used in *Heraldry*, when the escutcheon is divided bendways into an equal number of partitions: the field may be bendy of eight, ten, twelve, or more.

Counter-BENDY. See COUNTER.

Paly-BENDY. See PALY.

BENE. See *De Bene Eff.*

BENE, in *Geography*, a town of Italy, in the principality of Piedmont, and district of Mondovi, defended by an ancient castle, and containing about 4000 inhabitants; 28 miles south of Turin.

BENEAPED, in the *Sea Language*, is said of a ship, when the water does not flow high enough to bring her off the ground, out of the dock, or over the bar.

BENCARLO, **BENCALON**, or **BENCARDO**, in *Geography*, lies north-west from Peniscola point, on the coast of Valencia, in Spain, in the Mediterranean, seated on a bay to the north-east of the gulf of Valencia. It has no good road; so that ships usually lie at Peniscola.

BENEDETTO, in *Biography*. See CASTIGLIONE.

BENEDETTO, Sr., a town of Italy, in the duchy of Mantua, 15 miles S.S.E. of Mantua.—Also, a town of Italy, in the marquise of Gorzegno, 12 miles east of Bene.

BENEDICITE, in *Ecclesiastical History*, is a name given to the hymn, or song of the three children in the fiery furnace; by reason of its beginning with the words, "benedicite omnia opera Domini." The use of the benedicite is very ancient; it appearing to have been sung in all the Christian churches as early as St. Chrysostom's time.

BENEDICT, Sr., in *Biography*, founder of the monastic order of Benedictines, was born in the province of Nursia, in Italy, about the year 480. After having been educated at Rome, he retired, at the age of fourteen, to Subiaco, about 40 miles from that city, where he secluded himself from the world in a cavern for several years, till at length he was discovered by the monks of a neighbouring monastery, and chosen for their abbot. Dissatisfied, however, with their manners, he withdrew from their society to his solitude,

solitude, and by means of the multitude of persons that associated with him, he was enabled to build twelve monasteries, and to place in each of them twelve monks. In 528 or 529, he retired to Monte Cassino, and having cut down the grove sacred to Apollo, built a monastery, and founded his order. Being summoned to the council at Rome by pope Boniface II. he was carried, by his own desire, at the approach of death, into the oratory of St. John the Baptist, where, during his attention to the service, he expired, in the year 542 or 543, according to Cave, or, according to others, in 547. His extraordinary miracles are recorded in the "Dialogues" of St. Gregory the Great; and by the church of Rome, he is honoured as a saint. The only genuine work of St. Benedict, according to Dupin, is the "Regula Monachorum;" but other works have been ascribed to him, and they are published together in the 9th volume of the "Bibliotheca Patrum." Cave's Hist. Lit. t. i. p. 52. Dupin. Eccl. Hist. vol. iii. p. 44.

BENEDICT, abbot of Aniane in Languedoc, was born in 751, and educated at the court of king Pepin. Having served this prince and his successor Charlemagne, he retired to a monastery in Languedoc, where he distinguished himself by his mortifications. He afterwards built a hermitage on the rivulet called Anian, which, in process of time, became a considerable monastery. Lewis the Meek employed this monk in reforming the monasteries, first in Aquitaine, and afterwards through the whole kingdom of France, and in restoring, by new and salutary laws, the monastic discipline which had been neglected and fallen into decay. In 817, he presided in the council of Aix-la-Chapelle, and subjected, by the authority of the emperor, all the monks to the rule of Benedict of Monte Cassino, prescribed to them all one uniform mode of living, and thus united the various orders into one general body or society. Hence he was regarded as the second father of the western monks. He died in 821. His collection of rules for the eastern and western monks, intitled, "Codex Regularum," and his concordance of monastic rules, and also a collection of homilies of the fathers, were published by Hollstenius at Rome. This abbot has been beatified by the church of Rome. Moreri. Mosheim's Eccl. Hist. vol. ii. p. 310.

BENEDICT, BISHOP, an English abbot of the seventh century, was born of a noble family among the English Saxons, and in the 25th year of his age devoted himself wholly to religion. Accordingly, in 653, he took a journey, in order to acquaint himself with the ecclesiastical discipline, and on his return he laboured to establish it in Britain. Upon his return from a second journey to Rome, in the course of which he received the tonsure, he assumed the government of the monastery of Canterbury, to which he had been elected during his absence. After a third journey to Rome, whence he brought back a large collection of valuable books, he resorted to the court of Egfrid, king of Northumberland, who had succeeded Oswy. On a tract of land, given to him by that prince, he erected a monastery, which, from its situation on the river Were, was called "Weremouth;" in which he is said to have placed 300 Benedictine monks. The church of this convent was built of stone by artificers fetched from France, in 674; and both the church and convent were dedicated to St. Peter. From a fourth excursion to Rome, in 678, he returned laden with books, relics of the apostles and martyrs, images, and pictures. In 682, he built another monastery on the banks of the Tyne, four miles from Newcastle, called "Girwy," or "Jarron," and dedicated to St. Paul. Soon after this establishment, he took a fifth journey to Rome, and came back enriched with a further supply of ecclesiastical orna-

ments. Soon after his return he was seized with a palsy; and at length closed his life in a truly Christian and exemplary manner, in the year 690, and was buried in his monastery of Weremouth. He wrote some works on monastic discipline and the church ritual. He was a celebrated singer; and in one of his expeditions to Rome, brought with him a chorister who introduced the Roman method of singing mass. Biog. Brit.

BENEDICT, abbot of Peterborough, in the twelfth century, was educated at Oxford, and became a monk in the monastery of Canterbury, and afterwards prior. By the influence of Henry II. he was elected abbot of Peterborough in 1177. He assisted at the coronation of Richard I. in 1189, and was advanced to be keeper of the great seal in 1191. But death deprived him of this dignity in 1193. Bishop Nelson says, that he died in 1200. Besides his "Life and Miracles of Archbishop Becket," characterised by Leland as an elegant performance, but treated by Bale as a mere heap of lies and forgeries, he composed a "History of Henry II. and Richard I. from 1170 to 1192," which, says Dr. Henry, hath been much and justly esteemed by many of our greatest antiquaries, as containing one of the best accounts of the transactions of those times. A beautiful edition of this work was published at Oxford, in 2 vol. by Mr. Hearne, A. D. 1735. Henry's Hist. vol. vi. p. 143.

BENEDICT, ALEXANDER, one of the early cultivators and restorers of anatomy, was born at Verona about the middle of the 14th century. After travelling over various parts of Greece, he returned to Italy, and was appointed teacher of anatomy at Padua, where his lectures were numerous attended. In 1497, he published "Anatomicon, five historiam corporis humani." The first edition was dedicated to the emperor Maximilian, with whom he appears to have been in great favour. It is principally copied from Galen, but with some observations from his own practice. He is the first, Haller says, that described the concretions called gallstones. The language used by Benedict, is much purer than is found in any of the early anatomical writers. "De omnium a vertice ad plantam morborum signis, causis, &c." fol. 1500, taken principally from Galen, Paulus Ægin. & Oribasius, whose works he appears to have read in their own language. He also wrote, "De Peitilentia," "De Medici Officio," and other smaller pieces. The whole of his works were collected, and published under the title of "Opera Omnia," fol. Venet. 1533. Haller. Bib. Anat. Eloy. Dict. Hist.

BENEDICT, a name assumed by several of the popes. The first of this name, called by the Greeks *Bonifus*, was advanced to the pontifical chair in 574, at the period when the Lombards overran Italy, and fixed their seat in it under Alboin; and he is said to have died after four years, in consequence of the grief occasioned by their ravages. *Benedict II.* was elected in 683, and distinguished by his learning and virtues. He died in 685, and obtained the honour of canonization. *Benedict III.* was advanced to the pontificate in 855, and by the firmness of the Roman clergy, supported on the papal throne in opposition to Anastasius, which he occupied with mildness, piety, and charity. In his time, Ethelwolf, king of the west Saxons, visited Rome with his son Alfred. Two epistles of this pope are extant. *Benedict IV.* was raised to the papal chair about the year 900; and died with a good character in 903. *Benedict V.* was elected pope in 964, and although he was a man of extraordinary learning and sanctity, he was stripped of the pontifical and priestly dignity by the authority of the emperor Otho, and sentenced to exile; upon which he retired to Hamburgh, where he

B E N E D I C T.

died in 965 or 966. *Benedict VI.* was elevated to the papacy in 972; and being seized by a faction which attacked the Lateran palace, he was imprisoned in the castle of St. Angelo, where he was either strangled or starved in 974. *Benedict VII.* was elected in 975, and after a prudent government of nine years, died in 984. *Benedict VIII.* was made pope in 1012, but displaced by Gregory an anti-pope, and afterwards restored. Under his pontificate Henry, king of Germany, marched to Rome; and Benedict crowned him emperor under the title of Henry II., and his queen Cunegunda, empress. In 1016, this pope, collecting his dependents, defeated the Saracens, who made a descent at Luna in Tuscany, and put them all to the sword. He also waged war with the Greeks, who ravaged Puglia. In 1019, the emperor bestowed on him and his successors the newly erected see of Bamberg. He died, after having approved himself a great friend to the monks, and zealous for the order and discipline of the church, in 1024. *Benedict IX.* succeeded his uncle John XIX. in 1023, in his 18th year; was expelled from his see on account of his vices, but restored by the emperor Conrad; and after a life of various expulsions and restorations, sold or resigned the pontificate in 1045. He resumed it, however, occasionally under succeeding pontificates, and finished his scandalous career in 1054. *Benedict X.* was elected to the popedom by a party in 1058, and after holding the see nine months and twenty days, was deposed and excommunicated. *Benedict XI.* was the son of a shepherd, or of a notary, at Trevigi, in the state of Venice, became a schoolmaster, general of the Dominicans, and cardinal bishop, first of Sabina, and afterwards of Ostia, and succeeded pope Boniface VIII. in 1303. He exerted himself by various efforts for the good of the church, but death terminated his labours on the ninth month of his pontificate, A.D. 1304. This pope conducted himself with moderation, and behaved with singular respect to his mother and relations; but would not suffer any interference on their part in public affairs. He wrote commentaries on the books of Job, the Psalms, St. Matthew, and the Revelations, as well as a ritual, and some sermons. *Benedict XII.* was the son of a miller in the county of Foix, and after several subordinate ecclesiastical promotions, was advanced to the papal see in 1324. He was skilful in law and theology, and distinguished by his probity, but little versed in politics. Wishing to restore the apostolic see to Italy, but obliged by the circumstances of the times to remain at Avignon, he laid the foundation of a magnificent and strongly fortified palace, which, however, he did not live to finish. He observed a laudable caution in the creation of cardinals, and the appointment of benefices; and he exercised singular self-denial with respect to his own relations, observing, that "James Fournier (his family name) has relations, but pope Benedict none." As he was industrious and active in restoring discipline and moral among several religious orders that were become corrupt, he incurred the ill-will and enmity of the monks. During his efforts for reconciling the kings of England and France, he was seized with an illness, which terminated his life in 1342. Among his printed works are his "Decretum de animalibus separatis," and his "Constitutions for the reforms of various religious orders." He left also sermons for the chief festivals of the year, commentaries on the Psalms, letters, and poems. *Benedict XIII.* was of a noble family, being the eldest son of the duke of Gravina, in the kingdom of Naples, and born at Rome in 1649. Against the views and wishes of his family, he took the habit of the Dominican order in 1667, and applied with diligence to the studies and duties of his office, preferring the humble life of a monk to that of a superior station. However, by the alliance of his family with

that of the pope Clement X. he was promoted, against his inclination, to the cardinalate in 1672; and after several successive advancements to different sees, in which he maintained the character of an exemplary pastor, he was elected to the papacy in 1724, and constrained to accept it against his own remonstrances. In the exercise of his office, he laboured incessantly in repressing the luxury of the pontifical court, and in correcting the licentiousness of the clergy; but he was thwarted in his projects by the Jesuits, on account of his attachment to the Dominican doctrine concerning grace and predestination, which less resembled theirs than that of the Jansenists. His well-meant attempt to unite all Christian saints in one church and faith, manifested a greater degree of charity, than of discernment and knowledge of the world. Avoiding all the pomp connected with its high station, and restricting the expences of his own table to 6d. per day, in the disuse of wine and animal food, he lived in the Vatican like a monk in his cloister. Nevertheless, the doors of his palace were always open to the poor, and he was ever ready to hear their complaints, and to the utmost of his power to relieve their distress. Divesting himself of all the marks of sovereignty, and wishing even to dismiss his guards, he frequently went out in the evening in the most private manner, for the purpose of visiting the sick. He closed his pontificate of six years, in 1730, at the age of 80 years. His sermons, poems, and other writings, together with his bulls, were published at Rome in 3 vols. fol. in 1728. *Benedict XIV.* was descended of the noble family of Lambertini, at Bologna, and born in that city in 1675. After several previous promotions, he received a cardinal's hat in 1728; and from the archbishopric of Bologna, to which he was nominated by Clement XII. in 1731, he was advanced in 1740 to the papal see. Possessing a quietness of temper, united with profound learning, an elegant taste, liberal sentiments, and great goodness of heart, he was singularly amiable; and as he diminished the number of festivals, abolished idle ceremonies, and manifested a dislike of superstitious practices and pious frauds, he was calumniated by some of his enemies as a "protestant pope." As a munificent patron of literature, he founded academies at Rome, bestowed benefactions on that of Bologna, corresponded with, and rewarded learned men at home and abroad, caused a meridian line to be drawn, retired from the dust the celebrated Egyptian obelisk, called that of Sesostris, and adorned Rome with various other monuments of antiquity. Fond of the pleasures of literary retirement, and of occasionally enjoying the mirth of the lower classes, his aversion to business was invincible, and he frequently lamented the drudgery and fatigue of his official situation. Attached to life, he dreaded the symptoms of dissolution; and, as it were, confiding in the prayers of the Jesuits for his life, he would not consent to sign the bull for the reform of their order in Portugal, till he was absolutely given over. On the king of Portugal he conferred the title of "his most faithful vassal." He governed the church with great mildness, and manifested on all occasions a strong desire of reconciling those differences with regard to doctrine by which it was divided. After a pontificate of 28 years, he died in 1758, at the age of 83 years. His works have been published at Rome in 12 vols. 4to.; and they display a greater degree of professional knowledge and of application, than his levity and factious disposition would lead one to expect. Bower's Hist. of the Popes. Mosheim's Eccl. Hist. Nov. Test. III.

BENEDICT, St. in *Geography*, a town of Hungary, seated on the Gran, with a fortified castle; 30 miles north of Gran.

BENEDICT, a town of America, in Charles county, Maryland,

ryland, on Patuxent river; opposite Mackall's ferry; 30 miles south-east from the Federal city.

BENEDICTINS, or **BENEDICTIN Order**, in *Ecclesiastical History*, is an order of monks, who profess to follow the rule of St. Benedict, which he formed only for the Cenobites, or for those who live in a monastery under the direction of an abbot.

Having given instructions as to the qualifications and duty of the abbot, he proceeds to recommend to the monks obedience, silence, and humility; to note the hours for divine service by day and night, as well as the order and manner of performing it; and to specify the punishments that were to be inflicted on offenders. These punishments were to be excommunication or a separation from the fellowship of the brethren, at table or at prayers; the chastisement of the more disorderly with rods; and expulsion from the monastery. He further states the mode of their admission, the dress they were to wear, and the labour in which they were to be employed. From his rule, which is still extant, we learn that it was not his intention to impose it upon all the monastic societies; for he expressly excludes the Anachorets, who, having learned the exercises of a monastic life in a convent, retired separately into deserts, the Sarabaites, who live two or three together in a cell, and the Gyrovagi, who removed from one monastery to another without fixing anywhere. It was his purpose to form an order, whose discipline should be milder, their establishment more solid, and their manners more regular, than those of other monastic bodies; and whose members, during the course of a holy and peaceful life, were to divide their time between prayer, reading, the education of youth, and other pious and learned labours. However, in process of time, the followers of this celebrated ecclesiastical d^egenerated very lamentably from the piety of their founder, and lost sight of the duties of their station, and the great end of their establishment. Having acquired immense riches from the devout liberality of the benevolent, they sunk into luxury, intemperance, and sloth, abandoned themselves to all sorts of vices, extended their zeal and attention to worldly affairs, took part in political cabals and court factions, made a vast augmentation of superfluous rites and ceremonies in their order, to blind the multitude, and supply the place of their expiring virtue; and among other meritorious enterprises, laboured most ardently to swell the arrogance, by enlarging the power and authority of the Roman pontiff.

This new order made a very rapid progress in the west, and, in a short interval of time, arrived at the most flourishing state. In Gaul, its interests were promoted by Maurus; in Sicily and Sardinia, by Placidus; in England, by Augustin and Mellitus; in Italy, and other countries, by Gregory the Great, who himself is reported to have been for some time a member of this society; and in Germany it was afterwards received by the instrumentality of Boniface. This sudden and amazing progress of the new order was ascribed by the Benedictins to the wisdom and sanctity of their discipline, and to the miracles wrought by their founder and his followers. But upon a more attentive view, the impartial observer will be convinced, that the protection of the Roman pontiffs, to the advancement of whose grandeur and authority the Benedictins were most fervently devoted, contributed much more to the lustre and influence of their order than any circumstances, nay, than all other considerations united together.

The Benedictins are those properly called *monachi*, monks; the other orders are better denominated *friars*, or *religious*. In the canon law, the Benedictins are called *Black Monks*; being distinguished from the other orders by the colour of

their habit, and not by the name of their patriarch St. Benedict. Among us they were formerly also denominated *Black Friars*. The Benedictins wear a loose black gown, with large wide sleeves, and a capuche on their heads, ending in a point behind. The list of saints of the Benedictin order is very ample; but they are accused by Baronius, and many other writers, of putting many in the list who were never of the order. For six hundred years after the erection of the Benedictin order, most of the European monks were followers of this rule: whatever other names they went by, Carthusians, Cistercians, Grandmonteneses, Premonstratenses, Cluniacs, &c. they were but different branches of the Benedictins, till about the year 1220, when the Dominicans and Franciscans took new rules. Hospinian reckons no less than twenty-three religious orders that sprang from this one. According to the Benedictin computation, there have been of this order 24 popes, 200 cardinals, 7000 archbishops, 15,000 bishops, 15,700 abbots, 4000 saints, 40,000 confessors, above 3000 martyrs and apostles, who have converted 30 provinces to the Christian faith, besides emperors, kings, &c. This order has produced a great number of eminent writers and learned men.

The Benedictins, though but one order, are divided into several congregations, which have their peculiar customs and observances different from the rest. Each of these is subdivided into provinces, which have their general chapters. This order is said to have been brought into England about the year 596. The English congregation, which had subsisted from the time of the mission of St. Aulin, was destroyed under Henry VIII. and by degrees reduced to one single man, father Buckley; who, in 1607, procured a re-establishment of the congregation at Doway, in the Netherlands, where it still subsists in a kind of dependency on that of St. Valladolid in Spain. At the general chapters, they chuse provincials, with their assistants, for each of the provinces of Canterbury and York, who have jurisdiction over the missionaries employed therein. They are governed by a president-general, and three definitors, chosen every three years. At their admission they make a fourth vow, *viz.* that they will go to the mission in England, and return when their superiors think fit.

BENEDICTIN Nuns, are religious women, who embrace the rule of St. Benedict.

BENEDICTION, in a general sense, the act of blessing, or giving praise to God, or returning thanks for his favours. Hence also benediction is still applied to the act of laying grace before or after meals. Neither the ancient Jews, nor Christians, ever ate without a short prayer. The Jews are obliged to rehearse a hundred benedictions per day; of which, eighty are to be spoken in the morning. Vitring. de Synag. Vet. lib. iii. Rabbi Nehemiah Baruch, in 1688, published a discourse on the manner wherein the sacerdotal benediction is to be pronounced. In the synagogue of Ferrara, it is rather sung than spoken. Among the ancient Jews, as well as Christians, benedictions were attended with the imposition of hands; and Christians, in process of time, added the sign of the cross, which was made with the same hand, elevated or extended. Hence, in the Romish church, benediction was used to denote the sign of the cross, made by a bishop or prelate, from an idea that it conferred some grace on the people. The custom of receiving benediction by bowing the head before the bishops, is very ancient, and was so universal, that emperors themselves did not decline this mark of submission. Under the name benediction the Hebrews also frequently understand the presents which friends make to one another, in all probability because they are generally attended with blessings and

and compliments, both from those who give and those who receive them.

BENEDICTION, Nuptial, the external ceremony performed by the priest in the office of matrimony. The nuptial benediction is not essential to, but the confirmation of a marriage in the civil law.

BENEDICTION, beatic, benedictio beatica, is the *viaticum* given to dying persons. The pope begins all his bulls with this form: "Salutem et apostolicam benedictionem."

BENEDICTION, regular, that conferred by abbots on their monks, or by a senior monk on a junior.

BENEDICTIONE privati, to be deprived of benediction, was a kind of punishment inflicted on monks, whereby, when the next received the abbot's blessing, the offenders were dismissed without it.

BENEDICTION is also used for an ecclesiastical ceremony, whereby a thing is rendered sacred or venerable. In this sense benediction differs from consecration, as in the latter unctio is applied, which is not in the former. Thus the chalice is consecrated, and the pix blessed, as the former, not the latter, is anointed; though in the common usage these two words are applied promiscuously. The spirit of piety, or rather of superstition, has introduced into the Romish church benedictions for almost every thing. We read of forms of benedictions for wax-candles, for boughs, for ashes, for church-vessels, and ornaments; for flags or ensigns, arms, first-fruits, houses, ships, paschal eggs, *cilicium*, or the hair-cloth of penitents, church-yards, horses, moles, &c. which are sprinkled with holy water.

BENEDICTION of Arms, was a sort of public consecration of the weapons and ensigns, before the entering on a war, by a *formula* of words, and ceremonies appointed for that purpose.

BENEDICTIONALIS LIBER, an ancient church book, containing the forms of the divers sorts of benedictions given by bishops, priests, &c. Such was the *benedictionalis liber* of Gregory the Great, described by Lambecius.

BENEDICTUM, an epithet, formerly given to lenient or gentle operating medicines, more especially rhubarb. In this sense we find, in some dispensatory writers, *benedictum laxativum* used for lenitive electuary. Though in others, *benedicta laxativa*, or the *blest laxative*, denotes another easy purge, made up of turbit, diagyridium, spurges, hermodactyls, anise-seeds, funnel-seeds, sal gemma, and honey. Schroder also gives the appellation *aqua benedicta* to his emetic; and Myrsicht does the same to his *aqua serpenti*, or water of wild thyme. Some have called the philosopher's stone *lapis benedictus*.

BENEDICTUM VINUM. See VINUM.

BENEDICTUS CARDUS. See THISTLE.

BENEDITTO SACCO. See SAN BENITO.

BENEFACA, in *Geography*, a town of Spain, in the province of Valencia, 10 leagues from Valencia.

BENEFICE, BENEFICIUM, in the *Feudal System*, is a term applied to those portions of land which the kings and christians bestowed on their adherents. As long as they had no fixed property in land, they could only bestow an horse, a suit of armour, or such like recompence, on those who in peace or war were attached to their person, and devoted to their service. But upon their settling in the country which they conquered, and when the value of property came to be understood among them, they conferred upon their followers the more substantial recompence of land. Accordingly the term *benefice* was the primitive name, and most simple form of the feudal possession. These grants were called "beneficia," because they were gratuitous donations; and they were also called "honores," because they were regarded

as marks of distinction. What were the services originally exacted in return for these "beneficia," cannot be determined with absolute precision; because there are no records so ancient. M. de Montesquieu (*Sp. of Laws*, b. iii. c. 3. & 16.) considers these "beneficia" as fiefs, which originally subjected those who held them to military tenure. M. de Mably (*Observ. sur l'Histoire de France*, i. 356.) contends, that such as held them were at first subjected to no other service than what was incumbent on every free man. But when it is considered, that allodial property subjected those who possessed it to serve the community, it is reasonable to conclude, that "beneficia" subjected such as held them to personal service and fidelity to him from whom they received these lands. They were granted originally only during pleasure. (See Montesquieu, *ubi supra*, and Du-Cange voc. *Beneficium* and *Feudum*.) But the possession of benefices did not continue long in this state. A precarious tenure during pleasure was not sufficient to satisfy those who held it, and to attach them to their superior lord; and, therefore, they soon obtained the confirmation of their benefices during life. (Du-Cange Gloss. voc. *Beneficium*.) After this it was easy to obtain or extort charters rendering "beneficia" hereditary, first in the direct line, then in the collateral, and at last in the female line. Leg. Longob. lib. iii. tit. viii. Du-Cange.

It is not easy to ascertain the precise period when each of these changes took place. M. de Mably (*ubi supra*, tom. i. p. 103—160. 429.) conjectures, with some probability, that Charles Martel first introduced the practice of granting "beneficia" for life; and that Louis le Debonnaire was among the first who rendered them hereditary. Mabillon, however, (*De Re Diplomatica*, l. vi. p. 353.) has published a placitum of Louis le Debonnaire, A. D. 860, by which it appears, that he still continued to grant some "beneficia" only during life. And in 889, Odo, king of France, granted lands to Ricabodo "fideli suo jure beneficiario et fructuario," during his own life; and if he should die, and a son were born to him, that right was to continue during the life of his son. This was an intermediate step between fiefs merely during life, and fiefs hereditary to perpetuity. While "beneficia" continued under their first form, and were held only during pleasure, he who granted them not only exercised the "dominium," or prerogative of superior lord, but he retained the property, giving his vassal only the usufruct. But under the latter form, when they became hereditary, although feudal lawyers continued to define a "beneficium" agreeably to its original nature, the property was in effect taken out of the hands of the superior lord, and lodged in those of the vassal. At length the word "feudum" came to be substituted in the room of "beneficium;" but Muratori observes (*Antiq. Med. Aevi*, v. 1. p. 594.) that no instance of this kind occurs in any authentic charter previous to the eleventh century; and Dr. Robertson (*Hist. Ch. V. vol. i. p. 269.*) informs us, that a charter of king Robert of France, A. D. 1008, is the earliest deed in which he has met with the word "feudum."

BENEFICE, Beneficium, in an *Ecclesiastical Sense*, a church endowed with a revenue for the performance of divine service; or the revenue itself, assigned to an ecclesiastical person for life, in return for his performing the service of the church.

All church preferments, except bishoprics, are called *benefices*; but they must be given for life, not for years, or at will; and all benefices are, by the canonists, sometimes called *divinites*. But we now ordinarily distinguish between benefice and dignity, by applying the word *dignity* to bishop-

rics, deaneries, archdeaconries, and prebends; and benefice to parsonages, vicarages, and donatives.

There is an obvious reference in the term benefice to the feudal system, which was incorporated in all the governments of Europe. As the lands of all private proprietors were holden of the prince, and because they were originally gratuitous donations, denominated "*beneficia*," the pope assumed the privilege of a feudal lord, and claimed the authority of distributing the preferments of the church at pleasure, which commenced first in Italy, and gradually extended itself to England; and hence the care of the souls of a parish came to be called a benefice. Blackstone's Comm. vol. iv. p. 106.

Hence, doubtless, came the term benefice to be applied to church livings; for, beside that the ecclesiastics held for life like the soldiers, the riches of the church arose from the beneficence of princes.

In all Christian churches, the benefices of the clergy are a sort of freeholds, which they enjoy, not during pleasure, but during life or good behaviour. If they held them by a more precarious tenure, and were liable to be turned out upon every slight disobligation either of the sovereign or of his ministers, it would perhaps be impossible for them to maintain their authority with the people, who would then consider them as mercenary dependants upon the court, in the sincerity of whose instructions they could no longer have any confidence.

As to the origin of ecclesiastical benefices, it is hard to determine when the revenues of the church were first divided: it is certain that, till the fourth century, all the revenues were in the hands of the bishops, who distributed them by their economy; they consisted principally in alms, and voluntary contributions. As the church came to have lands, parts thereof were assigned for the subsistence of the clerks, and called benefices; of which we find some traces in the fifth and sixth century: but then there does not appear to have been any certain partition, nor any precise quota allotted to each particular; but the allotments were absolutely discretionary till about the twelfth century.

At first, each was contented with a single benefice, but pluralities were by degrees introduced on pretence of equity: for a single benefice being sometimes scarce thought a competency, the priest was allowed two; as his quality or occasions increased, so the number of benefices that were to support him were increased too. Hence some, affecting to equal princes in quality, pretend to revenues answerable to it.

The canonists distinguish three ways of vacating a benefice, viz. *de jure*, *de facto*, and *by the sentence of a judge*. A benefice is vacated "*de jure*," when the person enjoying it is guilty of certain crimes, expressed in laws, as heresy, simony, &c. A benefice is vacated "*de facto*," as well as "*de jure*," by the natural death, or the resignation of the incumbent: which resignation may be either express or tacit; as when he engages in a state, &c. inconsistent with it; as among the Romanists, by marrying, entering a religious order, or the like. A benefice becomes vacant "*by the sentence of a judge*," by way of punishment for certain crimes, as concubinage, perjury, forcery, &c. See DEGRADATION.

Benefices are divided by the canonists into *simple* and *sacerdotal*. In the first there is no obligation but to read prayers, sing, &c.: such are canonries, chaplainships, chantries, &c. The second are charged with the cure of souls, or the direction and guidance of consciences: such are the vicarages, rectories, &c.

The Romanists, again, distinguish benefices into *regular*

and *secular*. *Regular* or *titular* benefices are those held by a religious, or a regular, who has made profession of some religious order: such are abbeys, priories conventual, &c. Or rather, regular benefice is that which cannot be conferred on any but a religious; either by its foundation, by the institution of some superior, or by prescription. For prescription, forty years possession by a religious makes the benefice regular. *Secular* benefices are those which are only to be given to secular priests, i. e. to such as live in the world, and are not engaged in any monastic order. All benefices are reputed secular, till the contrary is made appear. They are called "*secular benefices*," because held by seculars; of which kind are almost all cures. Some benefices, regular in themselves, have been secularised by the pope's bull.

A *BENEFICE in commendam*, is that, the direction and management whereof, upon a vacancy, is given or recommended to an ecclesiastic for a certain time, till it may be conveniently provided for. See COMMENDAM.

BENEFICE, Possession of a. See POSSESSION.

BENEFICIARII, in *Roman Antiquity*, denote soldiers who attended the chief officers of the army, being exempted from other duty. *Beneficarii* were also soldiers discharged from the military service or duty, and provided with "*beneficia*" to subsist on. These were probably the same with the former, and both might be comprised in the same definition. They were old experienced soldiers, who, having served out their legal time, or received a discharge, as a particular mark of honour, were invited again to the service, where they were held in great esteem, exempted from all military drudgery, and appointed to guard the standard, &c. These, when thus recalled to service, were also denominated *evocati*; and before their recall, *emeriti*.

BENEFICIARI was also used for those raised to a higher rank by the favour of the tribunes, or other magistrates. The word "*beneficiarius*" frequently occurs in the Roman inscriptions found in Britain, where *consulis* is always joined with it; but besides *beneficiarius consulis*, we find in Gruter *beneficiarius tribuni, pretorii, legati, præfetti, proconsuls, &c.*

BENEFICIARY, in a general sense, something that relates to benefices.

BENEFICIARY, beneficiarius, is more particularly used for a beneficed person, or him who receives and enjoys one or more benefices.

BENEFICIARY is more particularly used among *Roman Writers*, for a person exempt from public offices. In which sense, *beneficarii* stand contradistinguished from *municipes*: It also denotes, in *Middle Age Writers*, a feudatory or vassal; and it is also used for a clerk or officer, who kept the account of the *beneficia*, and made the writings necessary for it. The same denomination was likewise given to the officers who collected the rents and duties belonging to the *sficus*.

BENEFICIO. See DEPRIVATION à *Beneficio*.

BENEFICIO, Suspendo à. See SUSPENSION.

BENEFICIO primo ecclesiastico habendo. See PRIMO.

BENEFIELD, SEBASTIAN, in *Biography*, an eminent English divine, was born at Prestonbury, in Gloucestershire, in 1559, and educated at the university of Oxford, where he occupied the chair of Margaret professor of divinity for 14 years with great reputation. Towards the close of his life he retired to his rectory of Meysey-Hampton, near Fairford, in his native country, and there died in 1630. Dr. Benefield was so eminent a scholar, disputant and divine, and particularly so well versed in the fathers and schoolmen, that he had not his equal in the university. In his theological opinions he was a rigid Calvinist; and in his general conduct he was remarkable for strictness of life and sincerity.

His

His works, consisting of commentaries on the 1st, 2d, and 3d chapters of Amos, sermons and lectures in divinity, are now sunk into oblivion.

BENEFIT, is used for a privilege granted to some person, as of an immunity, or the like.

BENEFIT of Clergy. See **CLERGY**.

BENENAIM, BENENATH, BENENASCH, or BENENAT, in *Astronomy*, the outermost star, of the second magnitude, in the tail of the *Ursa major*.

This is sometimes also called *ataloth*.

BENENCASA, Count. a Venetian nobleman, born in 1745, not more distinguished by his birth than talents, taste, and knowledge in literature, is confessed, by M. Laborde, in his "Essai sur la Musique," in 4 vols. 4to. published at Paris in 1780, to have furnished him with the chief part of his information concerning the poets, composers, musicians, and authors of Italy; and for enriching his researches. M. Laborde acknowledges with gratitude his obligations. See vol. iii. of "Essai sur la Mus." where there are many articles concerning Italian composers and singers with which count Benencasa has furnished the editor, that breathe the true spirit of taste, sensibility, and knowledge. This acknowledgment had escaped us in the first perusal of M. Laborde's work; but we always thought the articles concerning the Italian composers and singers in this work, of a different colour from the rest of the book: more liberal, more enthusiastic for genius and talents, and a taste more discriminative and refined, than either that of M. Laborde, or his guide, the Abbé Roussier.

When the account of the commemoration of Handel was writing, the editor being very desirous to know what judicious foreigners thought of those exhibitions, particularly Italians, accustomed to good music in their churches, as well as theatres, he applied to count Benencasa, who was then in London, and had been present at the performance of the Messiah in Westminster-abbey, for information concerning the comparative grandeur and excellence of the band, with any other which he had heard, or of which history or tradition had preserved the memory in his own country. As they had not time for a full discussion of the subject, when it was first proposed, *viva voce*, signor Benencasa was so obliging as to honour him with his opinion in a letter, which, before his departure from England, he entreated his permission to publish, and it will not only serve as an honourable record of this stupendous exhibition, but must have been the more flattering to the projectors of the plan, as the count is an excellent judge of music; having heard, read, meditated, and written on the subject, with a degree of feeling and intelligence, that is equally honourable to himself and the art. For this letter, see the commemoration of Handel, p. 115.

PENEPLACITO, Ital. a music term, implying a pleasure; equivalent to *ad libitum, ad suo piacere*; which see.

BLNERMOID, in *Geography*, a mountain of Scotland, in the county of Sutherland.

BENESCHAU, a town of Silesia, in the province of Oppau, 8 miles east of Troppau.

BENESSOW, a town of Bohemia, in the circle of Kaurzim, in which fairs are held.

BENESSOW, Benfen, Penfen, or Panzen, a town of Bohemia, in the circle of Leutmeritz, 6 miles S. S. W. of Kamantz; famous for the manufacture of the best paper that is made in Bohemia.

BENET, a town of France, in the department of Vendée, and chief place of a canton, in the district of Fontenay le Comte, 3 leagues south-east of Fontenay.

BENET Cape, a bay, lying on the south-side of the western peninsula of the island of St. Domingo, and forming with

the line to Petit Goave on the north side, the narrowest part or isthmus. N. lat. 18° 20'. W. long. 72° 47'. The cape is the west point of the bay, and cape Jacquemel the east point, nearly east and west from each other.

BENETTO, a river in the island of Ceylon, 2 miles south from Barberain island, having on the south side a small fort upon a hill, under which is a good road in 15 fathoms.

BENEVEN, a mountain of Scotland, in the county of Inverness, 21 miles east of Fort William. See **BEN N'vie**.

BENEVENTE, a town of France, in the department of the Creute, and chief place of a canton, in the district of Bourgaueuf; 10 miles N. N. W. of Bourgaueuf. The place contains 1141, and the canton 8378 inhabitants: the territory includes 225 kilometres and 12 communes.—Also, a town of Spain, in the province of Leon, seated on the river Eda. N. lat. 42° 4'. W. long. 5° 5'.

BENEVENTO, a city of Italy, in the kingdom of Naples, in a duchy of the same name, comprehending, besides the city, a district of some miles. This capital of the Principato Ultra, or principality of Benevento, and see of an archbishop belonging to the pope, is situated at the point of a hill, between two narrow vallies, in one of which runs the river Sabato, and in the other the Calore, near the confluence of these two streams. N. lat. 41° 6'. E. long. 14° 57'.

One of the entrances into the city is through the arch of Trajan, now called the "Porta Aurea," which is in tolerable preservation, and one of the most magnificent remains of Roman grandeur out of Rome. The architecture and sculpture are both singularly beautiful. This elegant monument was erected in the year of Christ 114, about the commencement of the Parthian war, and after the submission of Decebalus had entitled Trajan to the name of Dacicus. The order is composite; the materials, white marble; the height, 60 palms; length, 37½; and depth, 24. It consists of a single arch, the space of which is 20 palms, and the height 35. On each side of it, two fluted columns, upon a joint pedestal, support an entablement and an attic. The intercolumniations and frieze are covered with basso-relievos, representing the battles and triumph of the Dacian war. In the attic is the inscription. As the sixth year of Trajan's consulate, marked on this arch, is also to be seen on all the military columns erected by him along his new road to Brundisium, it is probable, the arch was built to commemorate so beneficial an undertaking. No city in Italy, Rome excepted, can boast of so many remains of ancient sculpture, as are to be found in Benevento. Scarcely a wall is built of any thing but altars, tombs, columns, and remains of entablatures. The most considerable are in the upper town, supposed by Swinburne (Travels in the two Sicilies, vol. ii. p. 336.) to be the site of the old one.

The cathedral is a clumsy edifice, in a style of Gothic, or rather Lombard, architecture. This church, dedicated to the Virgin Mary, was built in the sixth century, enlarged in the eleventh, and altered considerably in the thirteenth, when archbishop Roger adorned it with a new front. In the court stands a small Egyptian obelisk, of red granite, crowded with hieroglyphics. In the adjoining square, are a fountain, and a very indifferent statue of Benedict XIII., long archbishop of Benevento.

The writers of the Benedictine history fix its origin in the years immediately succeeding the Trojan war, and claim Diomed, the Etolian chief, as its founder. Others assign it to the Samnites, who made it one of their chief towns, whither they frequently resorted for refuge, when worsted by the Romans. In their time, its name was "Maleventum," of uncertain etymology, but after the conquest of Samnium, changed by the Romans into "Beneventum," in order to introduce their colony under fortunate auspices. Near this place,

place, in the 479th year of Rome, Pyrrhus was defeated by Curius Dentatus. In the war against Hannibal, Beneventum signalized its attachment to Rome, by liberal tenders of succour, and by real services. Its reception of Gracchus after his defeat of Hanno, is extolled by Livy, and from the gratitude of the senate, many solid advantages accrued to the Beneventines. However, it shared the devastations of the Roman empire, attending the irruption of the northern nations. When the Lombards invaded Italy, they fixed the seat of their empire at Pavia, and sent a detachment to take possession of the southern provinces. In 571, Zotto was appointed duke of Benevento, as a feudatory to the king of Lombardy, and seems to have confined his government to the city alone, from which he occasionally sallied forth to seek for booty. The second duke, called Arechis, conquered almost the whole country that now constitutes the kingdom of Naples. Upon the fall of Desiderius, last king of the Lombards, the state of Benevento was not materially affected. Arechis the second kept possession, and availing himself of this favourable conjuncture, asserted his independence; threw off all feudal submission; assumed the title of prince; and coined money with his own image upon it; a prerogative exercised by none of his predecessors, as dukes of Benevento. Afterwards, when Radelchis and Siconulph aspired to the principality, each of them invited the Saracens to his aid. For the termination of these fatal dissensions, the dominions of these competitors were divided into two distinct sovereignties. In 851, Radelchis reigned as prince at Benevento; and his adversary fixed his court, with the same title at Salerno. From this treaty of partition, the ruin of the Lombards became inevitable; and the erection of Capua into a third principality was another destructive operation. From this time the inroads of the Saracens, and the attacks of the eastern and western emperors, together with anarchy and animosity at home, reduced the Lombards to such wretchedness, that they were able to make a very feeble resistance to the Norman arms. Benevento, however, was chiefly governed by its own dukes and sovereigns, till in the year 1053, the emperor Henry III. transferred it conditionally to pope Leo IX. From the year 1054, to this day, the Roman see, with some short interruptions of possession, has exercised temporal dominion over this city. In a plain near the city a bloody battle was fought in 1266, when Charles of Anjou defeated and killed Manfred, his competitor for the sovereignty of the two Sicilies. In 1703, this city suffered greatly from an earthquake.

BENEVIS. See **BEN NEVIS**.

BENEVOLENCE, in *Ethics*, denotes a hearty desire of the good of mankind, evidencing itself, as ability and opportunity offer, in the cheerful and diligent practice of whatever may promote the well-being of all. Some have traced the origin of this affection in self-love: others again in some "instinct" or determination of our nature, antecedent to all reason from interest, which influences us to the love of others, and they have accordingly made it the foundation of universal "virtue:" others ascribe it to the intelligent constitution of human nature, and observe, that it arises not from instinct, but from the natures and necessity of things. Hutcheson's Inquiry concerning Moral Good and Evil, p. 140, &c. Price's Review, &c. chap. iii.

BENEVOLENCE OF God, in *Theology*, denotes his disposition to do good and to communicate happiness. This perfection of the deity has been referred to the class of moral attributes. (See **ATTRIBUTES**.) For the illustration and proof of divine benevolence; see **GOODNESS**.

BENEVOLENCE is used, both in our *Statutes* and *Chronicles*, for a voluntary gratuity given by the subjects to their sove-

reign, to which each person contributes in proportion to his estate. Stow (*Annals*, p. 701.) says, that it grew from the days of Edward IV. It may be found also Anno 11, Henry VII. c. 10. yielded to that prince in regard of his great expences in war, and otherwise. (12 Rep. 19.) But as benevolences had been extorted under many succeeding princes, without a real and voluntary consent, it was made an article in the petition of right, (3 Car. I.) that no man shall be compelled to yield any gift, loan, or benevolence, &c. without common consent by act of parliament.

Nevertheless, by act of parliament, (13 Car. 2. c. 4.) it was given to his majesty king Charles II. with a proviso that it should not be drawn into future example. It was, therefore, declared by the statute 1 W. & M. st. 2. c. 2. that levying money for or to the use of the crown, by pretence of prerogative, without grant of parliament; or for longer time, or in other manner, than the same is or shall be granted, is illegal. See **AID** and **TAX**.

In this sense, benevolence amounts to much the same with what in other nations is called "subsidium charitativum," given sometimes by tenants to their lords, by the clergy to their bishops, &c.—In France it is called *free gift*, excepting that this latter is restrained to the act of the clergy.

BENEVOLENT Affections, in *Ethics*. See **AFFECTION**.

BENEVOLENTIA Regis Habenda, in *Law*, the form of purchasing the king's pardon and favour, in ancient times and submissions, to be restored to estate, title, or place. Paroch. Antiq. p. 72.

BENEVOLI, ORAZIO, in *Biography*, maestro di capella to the pope in 1650, and extremely applauded by his contemporaries for *poliphonic* compositions. Antonio Liberati, his disciple, in a letter which he published at Rome in 1684, in which he characterises all the eminent contrapuntists of that school, speaking of Benevoli, says: that he surpassed all the matters of his time in writing for four and even six choirs, in which, by the construction and order of the parts, the imitations of beautiful passages, inverted fugues, double counterpoint, new contrivances, ligatures, preparations and resolutions of discords, the texture, connection, and fluidity of the whole, which, like a river, *crescit eundo*; in short, with the wonderful richness and beauty of his harmony, he so completely vanquished envy herself, as to obtain the applause of great masters, while he excited no other wish in the rest, than to imitate his powers in the management of ecclesiastical harmony; by uniting numerous choruses, without dulcness, confusion, or breach of rule. He was many years maestro di capella of the Basilica of St. Peter at Rome, and composed his famous mass for six choirs of four parts each, for that cathedral, on the cessation of the plague. It was performed by a band of more than 200 singers, arranged in different circles of the duomo, the sixth choir occupying the summit of the eupola. Besides this mass in 24 parts, there is extant a motet by the same author, for twelve sopranos, or treble voices of equal extent. There can be little melody in any of these multiplied parts; but to make them move at all, without violation of rule, requires great meditation and experience. No author of poliphonic compositions, perhaps, ever equalled Benevoli in this kind of science, except the Netherlander, Okenhem, the master of Jusquin, and our countrymen Tallis and Bull, of whose faculties and invincible patience in such achievements, there will be further occasion to speak elsewhere. The effect of such multiplied parts can so seldom be tried, that it seems an experiment which never can be fairly made, and is only amusing to the imagination. If there had been more frequent rehearsals of the *miserere* in eight:

eight real parts by Leo, which Anfani had performed in 1781 at the Pantheon by more than forty voices, it may be supposed, from such movements as were correctly executed, that the effect of the whole would have been wonderful! but L. n lived in a more polished age, and was gifted, not only with patience, but with taste and genius.

BENYE', in *Geography*, a small island of Africa, on the river Sierra Leone, where the English had formerly a factory and a small fort, which was taken by the French in 1704, and razed to the ground.

BENFIELD, or **BENFELDEN**, a town of France, and principal place of a canton, in the district of Barr, and in the department of the Lower Rhine, seated on the Ill; $4\frac{1}{2}$ league south of Strasburg. The place contains 1220, and the canton 10,240 inhabitants; the territory includes 180 kilometres and 15 communes. N. lat. $48^{\circ} 14'$. E. long. $7^{\circ} 45'$.

BENFIOL, a mountain of Scotland, in the island of Coll.

BENG, a name given among the Mahomedans to the leaves of hemp formed into pills or conserve; the use of which, as well as opium, the more rigid Mussulmen esteem to be unlawful, though not mentioned in the Koran, because they intoxicate and disturb the understanding, as wine does, and in a more extraordinary manner. These drugs, however, are now commonly taken in the East; but those who are addicted to them are generally regarded as debauchees.

BENGAL, in *Geography*, the most eastern province of the empire of Hindoostan, lying on each side of the Ganges, and bounded by Afam, Booran, and Bahar on the north, by Bahar, Berar, and Orissa on the west, by Orissa and the bay of Bengal on the south, and by the mountains that separate it from Cassay, Aracan, and the Birman dominions on the east and south-east. It extends from about $21^{\circ} 30'$, to about $26^{\circ} 40'$ N. lat.; and from about 86° , to about $92^{\circ} 30'$ E. long. but its boundaries are not accurately ascertained. About 50 miles beyond Tacriagully, which is the termination of a stupendous range of mountains, that accompanies the course of the Ganges from the west, these mountains begin to form the northern boundary of Bengal on the western side of the Ganges; and from hence another range of mountains strikes from the south, but in a curve swelling westward, which terminates within sight of the sea, about 30 miles from Ballasore. To the north these mountains divide Bengal from the southern division of Bahar; and to the south they seem to be the natural separation of Bengal from Orissa. Eastward the province of Bengal extends as far as Ramnatty, a town belonging to the king of Afam, and seated on the river Burampooter. The sea-coast of Bengal, between the mouth of the river Hoogly and that of the Ganges, extends from east to west 100 miles; and the whole is a dangerous inhospitable shore, which sand and whirlpools render inaccessible to ships of burden. For several miles within land the country is intersected by numerous channels, through which both rivers discharge their waters, by many mouths, into the ocean; and the islands formed by these channels are covered with thickets, and excepted chiefly by light of day. According to Achar's division, Bengal is one of the eleven soubahs, or provinces, of Hindoostan proper; and its government extended to Cattaek or Cattaek, and along the river Mahanuddy, as the soubah of Orissa appears not to have been formed at that time. The British nation possess in full sovereignty, the whole soubah of Bengal, the greatest part of Bahar, and certain districts of Orissa, comprehending 149,217 square British mile, and, with the addition of Berar, 162,000 square miles, or 30,000 more than are contained in Great Britain and Ireland; and the number of inhabitants

has been estimated at nearly eleven millions. But by some later computations the number has been found to be much more considerable. From actual surveys in different districts, in which the land occupied in tillage has been distinguished, from that occupied by water or waste, and for which latter an allowance has been made of one-fourth of the whole surface, it appears, that the uncultivated land in Bengal amounts to about 31,331,499 acres; and that these cultivated acres require 5,265,432 tenants; adding to these the artificers and manufacturers, in the proportion of about 11 to 40, we shall have 6,718,514 heads of families, at five persons each; whence the whole number of inhabitants will be 33,590,770. By other estimates the population has been computed at more than 30 millions. If to these be added about 18 or 20 millions for the population of the British possessions in the Myfore and Carnatic, the dominions of the East India Company, will contain a number amounting, probably, to not less than 50 millions. With a due encouragement of industry, the present population is thought sufficient to bring into tillage the whole of the waste lands of Bengal and Bahar. The country of Bengal, independent of Bahar and Orissa, is somewhat larger than Great Britain. The revenue of Bengal is rated in the *Ayin Acbari*, towards the close of the 16th century, at 149 $\frac{1}{2}$ lacks of rupees; under Aurungzebe it is stated by Mr. Frazer, in his "Life of Nadir Shah," at 131 lacks; in Sujah Cawn's nabobship, A. D. 1727, it amounted to 142 $\frac{1}{2}$ lacks; in 1778 to 197 lacks, net-revenue. The total revenue of Bengal, Bahar, Orissa, and Benares, belonging to Great Britain, together with the subsidy from the nabob of Oude, is computed by Mr. Rennell at 4,210,000*l.* sterling; the expence of collection, military and civil charges, &c. amounts to 2,540,000*l.*; whence he infers that the clear revenue is 1,670,000*l.* The natural situation of Bengal is singularly happy with respect to security from the attacks of foreign enemies. On the north and east it has no warlike neighbours; but it is guarded by a formidable barrier of mountains, rivers, or extensive walls, towards those quarters, if such an enemy should start up. On the south is a sea-coast guarded by shallows and impenetrable woods, and with only one port, and even that of difficult access, in an extent of 300 miles. It is only on the west that any enemy is to be apprehended; and even there the natural barrier is strong; and with its population and resource, aided by the usual proportion of British troops, in addition to the Sepoy establishment, Bengal might bid defiance to all that part of Hindoostan, which might be disposed to become its enemy.

The English established a commercial intercourse with this country at an early period; and the English East India company (see *COMPANY*) made a settlement on the river Ganges, in the kingdom of Bengal, probably in the former part of the 17th century. Their first factory in that kingdom was at the town of Hoogly, on a river of the same name, about 26 miles above Calcutta. About the year 1699, the company, for their greater convenience, removed to Calcutta, on the same river, where they built the fort, named Fort William, which they still possess. Their fort and garrison were designed for the protection of their vessels that came down from Patna, laden with piece good, raw silk, and saltpetre, which were the principal staple commodities of Bengal; otherwise the rajahs, whose dominions lay on that river, and who were either tributaries to, or powerful governors under, the Mogul, were apt to make, and sometimes did actually make, arbitrary demands of duties for passing that way. However, it was in the reign of Ferokiere, great-grandson of Aurungzebe, who was deposed in 1717, that the English East India company obtained the famous "firman," or grant, by which

their

their goods of export or import were exempted from duties or customs; and this was regarded as the company's commercial charter in India, while they stood in need of protection from the princes of the country. In the years 1742 and 1743, Bengal was invaded by both the Mahratta states, with armies consisting, as it is said, of 30,000 horsemen each; nor did they depart out of the provinces until the year 1744, when they had collected a vast mass of plunder, and had established the claim of the "Chout," or a fourth part of the net revenues of the provinces, as this proportion was called in the language of Hindoostan. In 1753, the Berar Mahrattas obtained possession of the province of Orissa, partly by conquest and partly by cession from Aliverdy, the nabob of Bengal; and their proximity to Bengal, from which they were separated only by a shallow river, afforded them frequent opportunities of plundering its frontier provinces; and it was not till the year 1761, when Cossim Ally, nabob of Bengal, ceded the provinces of Burdwan and Midnapour to the English, that the Mahrattas ceased to plunder them. In 1756, Aliverdy Cawn, nabob of Bengal, was succeeded by his grandson Surajah Dowlah, who, pretending to be irritated at the conduct of the English within his dominions and really jealous of the rising power of Europeans in general, in other parts of India, determined to expel the English from Bengal, and accordingly took their fort at Calcutta, the chief British settlement in the province, upon which their trade depended, and compelled those among them, who were not made prisoners, to retire, and others he caused to perish by confining them in a small chamber called the "black-hole" of Calcutta. In the following year, however, an armament from Madras, under admiral Watson and colonel Clive, not only recovered Calcutta, but brought the nabob to terms. With a view to permanent security for the future, they negotiated with Jaffier Ally Cawn, an omrah in high trust and favour with the nabob; and he engaged, on condition of their assisting him in his views towards the throne, to be their future ally and confederate. The famous battle of Plassey, fought in June 1757, and in which Jaffier aided the accomplishment of their wishes, by remaining neuter, laid the foundation of the future power of the British nation, not only in Bengal, but in Hindoostan. From that time they became the arbiters of the succession of the nabobship of Bengal, which speedily led to the possession of the powers of government; for Cossim Ally, who had been placed in the room of Jaffier, disliking his situation, resolved at all events to hazard a change. This brought on a war, which terminated in the expulsion of Cossim, and left the Bengal provinces in the possession of the English, who restored Jaffier to the nabobship. Lord Clive, assuming the government of Bengal in 1765, seized the opportunity, afforded by the recent death of nabob Jaffier Ally, of taking possession of the Bengal provinces; and obtained from the nominal Mogul, Shah Aulum, a grant of the duanny, or administration of the revenues of Bengal, Bahar, and Orissa; on condition of paying the Mogul 26 lacks of rupees (260,000*l.*) *per annum*. Thus a territory producing at that time at least a million sterling *per annum*, after every expence was defrayed, and containing at least ten millions of inhabitants, was gained to the company, on the side of Bengal; together with the northern circars, valued at near half a million more, and for which a grant was also obtained. The Bengal provinces, which have been in our actual possession from the year 1765, have, during that whole period, enjoyed a greater share of tranquillity than any other part of India; or indeed, than those provinces had ever experienced since the days of Aurungzebe. Previous to the establishment of our influence, invasions were frequent, particularly by the Mahrattas, and one province or other was ever in rebellion;

owing to a want of energy in the ruling power, an ill-paid and mutinous army, and an excess of delegated power.

The government of Bengal, and its extensive dependencies, was first vested in a governor-general and a supreme council, consisting of a president and eleven counsellors; but in 1773, these were restricted to four, with Warren Hastings, the governor-general, who were to direct all affairs, civil and military, in the provinces of Bengal, Bahar, and Orissa; and to control the inferior governments of Madras on the east, and Bombay on the west, with Bencoolen, in the island of Sumatra. The court of judicature consists of a chief justice, and three other judges, with civil, criminal, naval, and ecclesiastical jurisdiction. The Hindoos are governed by their own laws, nor would it be easy, if practicable, to extinguish the influence of the Brahmins, or totally to abolish the castes, to whatever degree they may countenance and maintain fanaticism and superstition. The military establishment in Bengal is always respectable, but varies according to the situation of affairs. The British troops are supported by the Sepoys, a native militia, who are accustomed to have numerous idle followers, so that the effective men seldom constitute more than a quarter of the nominal army. A force of 20,000 British soldiers might probably encounter and vanquish 200,000 blacks or Hindoos. The decisive battle of Plassey, which secured to us the possession of these opulent provinces, was gained with an army of about 3000 men, of whom 900 only were Europeans; and at the battle of Buxar, in 1764, the whole number of combatants on the side of the British did not exceed 7000, and of these 1200 only might be Europeans.

The climate of Bengal is reckoned by Dr. Lind, in his "Essay on diseases incident to Europeans in hot climates, &c." the most insalubrious and fatal to Europeans of any of the British settlements in India, that of Bencoolen excepted. This is owing partly to the heat of the air, and more especially to that of the land wind, which, passing over a tract of country much heated by the season, and consisting in various districts of extensive sandy deserts, becomes so hot and suffocating that it can scarcely be endured. These hot winds, occasionally loaded with sand, are so pernicious, particularly to persons exposed to them whilst sleeping, that they produce a kind of paralytic distemper, called the "barbiers," which is attended with a total loss of the use of the limbs, and for which no relief can be obtained but by removing to some other climate. But the unhealthiness of this climate is principally owing to the inundations of its rivers, and to its level or flat surface, so that the waters stagnate; and of course when, in the month of October, the stagnated waters begin to be exhale by the heat of the sun, the air is greatly polluted by the vapours that arise from the slime and mud that are cast by the rivers, and by the putrefaction of dead fish, and other animals. Although the salubrity of the climate of Bengal has been considerably improved by clearing the country of trees and jungle, by canals, and by draining the marshes, yet fogs are at this time common, very thick and very unhealthy; and excessive fogs also prevail at other seasons, and they often occur in the months of January and February. In Bengal, the hot, or dry season, begins with March, and continues to the end of May. the thermometer sometimes rising to 110°; and this intense heat is occasionally interrupted by violent thunderstorms from the north-west. The rainy season continues from June to September or October; but the three last months of the year are generally pleasant. The cold season commences in November, and lasts till the beginning of February; northerly winds are then prevalent, and the mornings, especially before sun-rise, are cold. It is also frequently very

foggy, but about 8 or 9 o'clock, when the sun begins to be powerful, the thick mist is dissipated. For the remainder of the day the sky is perfectly clear, so that no clouds appear in the air for several days together. In the months of September and October diseases rage, and chiefly attack those that are lately arrived; but here, as in all other places, sickness is more frequent and fatal in some years than in others. The most prevalent disorders are fevers, of the remitting or intermitting kind; for though sometimes they may continue for several days without any perceptible remission, yet they have in general a great tendency to it, and are commonly accompanied with violent paroxysms of rigors or shiverings, and with discharges of bile upwards and downwards. If the season be very sickly, some are seized with a malignant fever, of which they soon die. The body is covered with blotches of a livid colour, and the corpse in a few hours becomes quite black and corrupted. At this time fluxes prevail, which may be called bilious, or putrid, the better to distinguish them from others, which are accompanied with an inflammation of the bowels. In all these diseases at Bengal, the lancet is cautiously to be used. The mode of treating fevers and bilious complaints being now well understood, they are less alarming and fatal. Dr. Lind says it is a common observation, both at Bengal and Bencoolen, that the moon or tides have a remarkable influence on intermitting fevers; and he informs us, on the testimony of a gentleman of undoubted veracity, and of great knowledge in medicine, that at Bengal he could foretel the precise time when the patient would expire; it being generally about the hour of low water. From these and other observations, the doctor deduces an useful hint, which is, to take doses of bark at the full and change of the moon, as being the seasons most liable to an attack or relapse in these intermitting fevers.

Although the rainy season does not commence in the flat countries of Bengal till the latter end of the month of June, the Ganges and other rivers begin to swell in the mountains of Thibet early in April, and by the latter end of that month, when the rain-water has reached Bengal, the rivers rise here. This circumstance is accounted for partly by the melting of the snow on the mountains, but principally, as Mr. Rennell observes, by the vast collection of vapours wafted from the sea by the southerly or south-west monsoon, and suddenly stopped by the lofty ridge of mountains that runs from east to west through Thibet. Hence it appears that the rainy season must commence sooner in places that lie near the mountains than in those that are more remote. In Bengal the rivers rise by slow degrees; the increase being only about an inch per day for the first fortnight. It then gradually augments to two and three inches, before any quantity of rain falls in the flat countries; and when the rain becomes general, the mean increase is about five inches per day. By the latter end of July, all the lower parts of Bengal, contiguous to the Ganges and Burramooter, are overflowed, and form an inundation more than 100 miles wide; nothing appearing but villages and trees, excepting, very rarely, the top of an elevated spot, the artificial mound of some deserted village, appearing like an island. The inundations in Bengal are as much occasioned by the rain that falls there, as by the waters of the Ganges; in proof of which it is alleged, that the lands in general are overflowed to a considerable height long before the bed of the river is filled. It ought to be observed, that the ground adjacent to the bank of the river, to the extent of some miles, is higher than that which is at a greater distance, and thus it serves to separate the waters of the inundation from those of the river, until it overflows. This high ground is, in some seasons, covered a foot or more; but the height of the inundation within varies, of course, ac-

ording to the irregularities of the ground; and is in some places 12 feet. When the inundation becomes general, the river appears, as well by the grass and reeds on its banks, as by its rapid and muddy stream; for the water of the inundation acquires a blackish hue, by remaining long stagnant among grass and other vegetables; nor does it ever lose this tinge, which shews the predominancy of the rain water over that of the river; and the slow rate of the motion of the inundation, which does not exceed half a mile per hour, indicates the remarkable flatness of the country.

In order to guard those tracts of land, which, by the nature of their culture and productions, and by the lowness of their situation, would be injured by too long an inundation, dikes or dams are raised at an enormous expence, extending in the whole of their length to more than a thousand English miles. Some of these are at the base equal to the thickness of an ordinary rampart, and yet, on account of the want of tenacity in the soil of which they are composed, they are often found ineffectual, and need frequent repairs. One particular branch of the Ganges, navigable only during the rainy season, and then equal to the Thames at Chelsea, is conducted between two of these dykes, through an interval of 50 miles; and when it is full, the passengers in the boats look down, as from an eminence, on the adjacent country. During the whole state of the river, the tide becomes incapable of counteracting the stream, and in a great measure of ebbing and flowing, except near the sea. At such a season, a strong wind, that blows up the river for any continuance, swells the waters two feet above their ordinary level; and such accidents have occasioned the loss of whole crops of rice. This rice is of a particular kind, for the growth of its stalk keeps pace with the increase of the flood at ordinary times, but is destroyed by too sudden a rise of the water. The harvest is often reaped in boats. There is also a kind of grass which overtops the flood in the same manner, and at a small distance has the appearance of a field of the richest verdure. Mr. Rennell informs us, that in the year 1763, a tragical event happened at Luckipour, about 50 miles from the sea, by a strong gale of wind, conspiring with a high spring-tide, at a season when the periodical flood was within 1½ foot of its highest pitch. The waters then rose 6 feet above the ordinary level. On this occasion the inhabitants of a considerable district, with their houses and cattle, were totally swept away; and the calamity was aggravated by its happening in a part of the country which scarcely produces a single tree, to which a drowning man might escape. These inundations are traversed by every kind of embarkation; such as are bound upwards taking advantage of a direct course and still water, at a season when every stream rushes like a torrent. The wind too, which at this season blows regularly from the south-east, although in the gulf or bay of Bengal the monsoon blows from the S.S.W. and S.W., favours their progress in the eastern and northern parts of Bengal, where it blows from the S.E. or E.S.E.; so that a voyage which would take up nine or ten days by the course of the river, when confined within its banks, may be performed in six days. Husbandry and grazing are at this time both suspended; and the peasant travels in his boat those fields which, in another season, he was used to plough; happy, however, that the elevated site of the river-banks places within his reach the herbage which they afford; without which his cattle must perish. Towards the middle of August, the inundation begins to subside; for though great quantities of rain fall in the flat countries in August and September, yet, by a partial cessation of the rains in the mountains, the supplies fail that are necessary to keep up the inundation. However, the decrease of the inundation does

not always keep pace with that of the river, on account of the height of the banks; but after the beginning of October, when the rain has nearly ceased, the remaining inundation goes off quickly by evaporation; and the lands are left highly manured, and in a state fit for receiving the seed, after the simple operation of ploughing. For an account of the "bore," to which the rivers of Bengal are subject; see the article BORE.

From the time of the change of the monsoon in October, to the middle of March, the rivers are in a tranquil state; and then the "north-westers" begin in the eastern parts of Bengal, and later as we advance westwards: and they may be expected once in three or four days, until the commencement of the rainy season. These "north-westers," so called from the quarter in which they usually originate, are the most formidable enemies to the inland navigation of Bengal. They are sudden and violent squalls of wind, and though they are of no long duration, they are often attended with fatal effects, and have caused whole fleets of trading boats to sink almost instantaneously. They are more frequent in the eastern than in the western part of Bengal; and happen oftener towards the close of the day than at any other time. For some hours before they arrive, they are indicated by the rising and singular appearance of the clouds; and thus the traveller is warned to seek shelter. But in the great rivers they are truly formidable; more especially about the latter end of May, and beginning of June, when the rivers are much increased in width. After the commencement of the rainy season, which period varies, in different parts, from the middle to the end of June, tempestuous weather must be occasionally expected; but at this season places of shelter are more common by the filling of the creeks and inlets, as the river increases, and, on the other hand, the bad weather is of longer continuance, than during the season of the "north-westers." The inland navigation of Bengal is performed with safety, with respect to the weather, during the long interval between the end of the rainy season, and the beginning of the "north-westers." At this latter season peculiar attention and care are necessary. For an account of the boats that are used in this inland navigation, see BUDGE-ROW.

Bengal is a low flat country, fertilized by numerous rivers and streams, and interspersed with a few ranges of hills. The triangle formed by the Cossimbazar and Hoogly rivers to the west, by the Ganges to the east, and by the sea-coast to the south, as well as a large tract on each hand to the north of this Delta (see DELTA), is as level as the lower Egypt. Such parts of this extensive plain as are not watered by the Ganges or its branches, are fertilized by many other streams from the mountains; and for the space of three months, when the sun is mostly vertical, heavy rains fall every day. The periodical rains and intense heats produce a luxuriance of vegetation, almost unknown to any other country in the globe; and therefore Aurungzebe emphatically denominated Bengal "the paradise of nations," and it has been peculiarly styled "the paradise of India." The soil is a stratum of black vegetable mould, rich and loamy, extending to the depth of six feet, and in some places fourteen, and even twenty feet, lying on a deep sand, and interspersed with shells and rotten wood, which indicate the land to have been overflowed, and to have been formed by materials deposited by the rivers. It is easily cultivated without manure, and bad harvests seldom occur. In this country they have two harvests; one in April, called the "little harvest," which consists of the smaller grain; and the second, called the "grand harvest," is only of rice. The chief grain is rice, on which the natives chiefly subsist, and which is exported from hence into other countries. Bengal produces also very good wheat; and it

furnishes the inhabitants of the mountains of Cassimere, and of the elevated plains of Thibet, with both rice and wheat, in return for their shawls, gold, and musk. Upon the failure of their crop of rice, a grievous famine ensues. Of this many melancholy instances have occurred, both in Bengal and in other parts of India. One of the most deplorable of this kind occurred in the year 1770. On this occasion, the nabob, and great men of the country, distributed rice gratis to the poor; but when their own stocks began to fail, they withdrew their donations, and Calcutta was crowded with multitudes of persons who came thither to solicit relief. But the whole stock being expended, the famine prevailed, and many thousands fell down as victims to hunger in the streets and fields; so that their bodies, mangled by dogs and vultures, corrupted the air, and seemed to threaten a plague. Many persons were employed daily, on the company's account, in throwing dead carcases into the river, so that the waters were contaminated, and the fish could not be eaten without danger. Hogs, ducks, and geese, fed chiefly on the dead bodies; and the only meat which could be procured was mutton, which, on account of the dryness of the season, was so small, that a quarter of it would scarcely weigh a pound and a half. This dreadful famine was occasioned by a preternatural drought, which caused both the great harvest of 1769, and the little one of 1770, to fail. As a preservative from the miseries attending a dry season, and as a source of supply of water for domestic purposes, the inhabited part of the country is furnished with numerous reservoirs of an oblong square shape, and of various sizes, frequently more than an acre in extent, dug in the earth, and called "tanks." These are filled with water in the rainy season, and afford the inhabitants, during the dry months, a supply of water of a better quality and appearance than that of the Ganges, which is always thick and muddy. In these tanks is bred a sort of fish, in taste resembling our carp. Among the other vegetable productions of Bengal, the most important of which are tobacco, sugar, indigo, cotton, mulberry, and poppy, we may enumerate the banian tree, the cocoa-nut palm, which supplies a manufacture of cordage, called "coir," (see COIR), guavas, plantains, pomelos, potatoes, lime trees, and orange trees. They have also the pisang, or banana; the furi tree, which affords, by incision of the stem, a clear and sweet juice, of an intoxicating quality, and when turned sour is used as vinegar; and the mango tree, the fruit of which is preferred to all others in the country, except very fine pine apples, and which is much used in the hot months. Mr. Ives (Voyage from India to England, &c. 4to. 1773) mentions a beautiful tree, called "chulta," which has a flower that is at first a hard green ball, on footstalks about four inches long. When this opens, the calyx appears to be composed of five round, thick, and succulent leaves, and the corolla of the same number of fine beautiful white petals. After one day the corolla falls off, and the ball closes again; of these there is a succession for several months. In the walks of Bengal they have a tall tree, called the "tatoon;" and near Calcutta a spreading tree, called the "russa," making a fine appearance when in full bloom. In their gardens they cultivate most of the vegetables that are natives of other climates, and fit for culinary purposes. Among the animals of Bengal, we might mention the elephant, tiger, wild buffaloes, jackals, dogs, snakes, scorpions, &c. and a kind of birds, named "argill," or "hurgill," a species of ARDEA, which are very large and ravenous, and held in great veneration by the Brahmins. Game, poultry, fish, and water-fowl of all kinds, are very plentiful in Bengal. The horses used by the Europeans in this province are either of Persian or Arabian extraction,

tradition, and consequently sell at a high price. The native mode of Bengal is thin, limpid, and contemptible, and even inferior to that of the Welsh or Highland pease, or the finest of the animals. The cattle principally used for the service of Bengal are bullocks; and the most common vehicle among the peasants is a *HATKERY*; which ferret Bengal is more numerous in it, than in any other part of India. The size of its sheep is small; their figure lank and thin; and the colour of three-fourths of a flock is black or dark grey. The quality of a fleece of wool in this country is worse, if possible, than its colour; as it is remarkably soft, thin, and hairy.

The inland commerce of Bengal is very considerable; and it is carried on by means of these rivers and canals that intersect the country, and along the banks of which are many towns and villages, with plentiful fields of arable and pasture land, which diversifies the face of the country, and renders it very beautiful. Some of the canals, formed either by the hands of men, or by the operations of nature, are wide and deep enough to be navigated by large ships. One of the most considerable of these is the "Hazi," or "Hare" channel, that runs straight through the country into the arm of the river that flows by *Dacca*. The chief articles of commerce which the country yields are silk, muslin, calicoes, cotton, and other piece-goods; opium, satapetre, gum-lac, and indigo. Rice, wheat, &c. can only be reckoned casual branches of trade. Bengal has an inland trade with *Thibet*, which it supplies with cottons, besides some wine and cloths of European manufacture, receiving in exchange musk and rhubarb; and a much more extensive commerce with *Agra*, *Delhi*, and their adjacent provinces, in salt, sugar, opium, silk, silk-stuffs, and an immense quantity of cottons and muslins. The maritime trade of Bengal, managed by the natives of the country, has been divided into two branches, *viz.* that of *Cattack* by means of its port *Balafore* with the *Maldives*, whither they transmit rice, coarse cottons, and fine silk stuffs, and where they receive in exchange cowries, used for money at Bengal, and sold to the Europeans. The inhabitants of *Cattack* also carry on a considerable trade with the country of *Afani*, which they supply with salt in great quantities, receiving in payment a small quantity of gold and silver, ivory, musk, eagle-wood, gum-lac, and a large quantity of silk. A more considerable branch of trade, which the Europeans carry on with the rest of India, is that of opium, which is cultivated at *Patna*. The Dutch send rice and sugar to the coast of *Coromandel*, for which they are usually paid in specie. They have also formerly supplied *Ceylon* with rice, *Malabar* with cottons, and *Burat* with silk, whence they brought back cotton, usually employed in the coarse manufacture of Bengal. Some ships laden with rice, gum-lac, and cotton stuffs, are sent to *Balafora*, and return with dried fruits, rose-water, and gold. The rich merchandise carried to *Arabia* is paid for entirely in gold and silver.

The articles that are disposed of to advantage in Bengal, are all kinds of spices, japan copper, sandal wood, and japan wood, and also tin, lead, pewter, and other European commodities, of various kinds. See *EAST INDIA COMPANY*, and *CALCUTTA*.

Bengal is peopled by various nations, but the principal are the *Moguls*, or *Moors*, and the *Gentoos*, *Hindoos*, or *Bengalese*; and both the *Bengalese* and *Moors* have each a distinct language.

The *Moguls*, or *Moors*, are descendants of those who between two and three centuries ago reduced this kingdom, and the whole empire of *Hindustan*, under their dominion. They were originally natives of *Tartary*. They nearly re-

semble the Europeans in traits and features; but differ more or less from them in colour. The *Moguls* are called *Moog* in the Indian language, *Mogul* signifies white. The women are very handsome, and much use bathing; like the men, they are of an olive colour, and differ in form from the women of Europe. Their legs and thighs are long, and their bodies short. According to *Tavernier*, the *Mogul* women are chaste, very fruitful, and bring forth with so much ease, that they frequently walk the streets the very next day after delivery. *Stovonius* says, that their morals are indubitably bad, and that they are addicted to the most unnatural vices. The *Moguls* are more courageous than the *Bengalese*; and their "Sepahs" form good soldiers, when they are trained and commanded by European officers. Their religion is that of *Mahomet*; and consequently they hold in abhorrence the idolatry of the *Gentoos*.

The *Bengalese*, who are much more numerous than the *Moors*, do not differ much from the Europeans in stature; their colour is dark brown; the complexion of some of them approaches to yellow; their hair black and uncurled; and they are generally handsome and well made. They are indolent, lascivious, and pusillanimous; and nothing but hunger or thirst rouses their activity. Some of them, however, are intelligent and ingenious; and though most of them are poor, some of their banyans, or merchants, are very wealthy, and very expert in matters of trade. Their women are said to be uncommonly wanton and intriguing; prostitution is not thought by them a disgrace; and they have licensed places, in which the law allows them, under a certain assessment, to distribute their favours. Their artificers in gold and silver are very ingenious, and imitate any model that is set before them with great exactness. Europeans are often surpris'd to observe the perfection to which they have arriv'd in those branches of spinning cotton, and of repairing muslins that are torn, and in almost all the handicraft operations in which they are employ'd. The common people go almost naked. They wear nothing but a piece of linen, wrapped round the waist, and pass'd between the legs. Those of a higher rank have a dress of white cotton, which doubles over before as high as the shoulders, and is fasten'd with strings round the middle, and which hangs down to their feet. Most of them shave their heads, and eradicate the hair from all parts of the body. Rich people wear turbands, and many of them wear small ear rings. The dress of the women consists of a piece of cotton cloth thrown over the shoulders, under which they wear a kind of coat and drawers. Those who can afford it adorn their hair with gold bodkins, and their arms, legs, and toes with gold and silver rings and bands, and also their ears, and the cartilage of the nose. The inferior women wear similar ornaments, made of a sort of cowries, and call'd "chandelos." Their heads are bare, and their hair turn'd up, and fasten'd at the back of the head. Rice is the chief article of their food, the remainder of which consists of vegetables and milk. They eat no fish, flesh of animals, nor any thing that has had life. Their beverage is pure water.

Both the *Moors* and *Bengalese* are fond of the amusement of dancing; and for this purpose they employ young women, who are trained up from their infancy to this diversion, and who are richly decorated whenever they are engag'd to perform. Dancing is accompanied with music, both vocal and instrumental. For an account of the other inhabitants of Bengal, see *GENTOOS* and *HINDOOS*. See also *BRAMHINS* and *FAQUIRS*. Besides these, several of the eastern nations, *Persians*, *Armenians*, and others, resort to Bengal, allur'd by the advantageous trade which they are enabled to pursue there.

Four European nations have established themselves in Bengal

B E N G A L.

gal for the purpose of commerce, *viz.* the English, the Dutch, the French, and the Danes. The English are the principal, and their chief settlement is at Calcutta, the present capital of the country. (See CALCUTTA.) Europeans lead, in Bengal, a very easy life. The men, who are almost all in the service of the company, devote a part of the morning to business, and persons of fortune keep in daily employment a black writer, for which he receives 20 or 25 rupees per month. They spend the remainder of their time in personal improvement or recreation. Besides the black writers, most Europeans have also one or two banyans, who note down all payments and receipts, and who adjust all pecuniary matters in buying and selling. Moorish domestics are kept for the menial services of the house, and "peons," to run before the palankeens, and to carry an umbrella, or parasol, over the head of their master, when he goes out; and every house has likewise a porter, whose sole occupation is to answer the door; and one or two sets of "berras," or palankeen bearers, together with a "harrymaid," or "matarani," who carries out the dirt; and a great number of slaves, both male and female.

The current coin in Bengal, and in the whole extent of Hindostan, are gold and silver RUPEES; which see. See also MOHUR. Copper coin is not seen in Bengal. For change they make use of cowries, 80 of which make a "poni," and 60 or 65 ponis, according to the scarcity or plenty of cowries in the country, make a rupee. However, there is great variation in the value of cowries in Bengal. Weights are calculated by the Sar, answering nearly to two pounds avoirdupoise, of which 40 make a maund; which see. The measures of length are cobidos, and gels or gofs, which see. Distances between places are measured by coss. See COSS. The vessels used for inland navigation are burs, budgerows, and pulwhas, which see. The general conveyance of passengers by land is on a sort of litters, called palankeens, which see. For an account of the manners and customs of the inhabitants of Bengal, and various other particulars; see CALCUTTA, HINDOSTAN, and INDIA. See also GENTOOS, HINDOOS, and BRAHMINS.

BENGAL, *bay of*, is a large gulf in the Indian ocean, between the two peninsulas of India; bounded on the north by the coast of the province of Bengal, on the east by the kingdoms of Aracar, Pegu, Siam, the peninsula of Malacca, or Malaya, and part of the island of Sumatra; on the south by the great Indian ocean; and on the west by the coasts of Orissa, Coromandel, and the island of Ceylon. The Ganges and several other rivers, discharge themselves into this gulf; it contains many islands; and it abounds with bays, harbours, and port towns. Its widest extent is about 86 leagues, and its length about 72 leagues. In a more confined view it may be said to begin at cape Palmiras.

BENGAL, *Language of*, or BENGALISE, is derived from the Shanferit (which see), and distinct from the Persian, Moors, and Hindostannic, which are spoken in several parts of this province, and each of which has its peculiar department in the business of the country. Its alphabet, like that of the Shanferit, consists of 50 letters, of the form, sound, and arrangement of which Halhed has given a very particular and detailed account in his "Grammar of the Bengal Language," printed at Hoogly in Bengal in 1778. The only impediments in acquiring the knowledge of this language are the great number of letters in its alphabet, the intricate variety of their combinations, and the difficulty of pronunciation; but the grammatical part is simple, though diffuse, and complete without being complex. Its rules are plain, and its anomalies few. The vowels are distributed into long and short, the latter of which are often omitted in

writing, and they are invariably subjoined to the consonant with which they are uttered, and never precede them. As every consonant, therefore, inherently possesses the short vowel on which its utterance depends, it is plain that no two consonants could have been joined together, and successively pronounced in the same syllable, but that a vowel must necessarily have intervened. In order to remedy this inconvenience, a set of distinct characters was invented, called "P,holaa's," or adjuncts. These are certain subordinate and subsidiary figures, eleven in number, that may be attached to each of the consonants in the alphabet respectively, and thus provide against the too frequent recurrence of the internal vowel. Exclusively of these "P,holaa's," almost any two or three consonants may be blended together, for supplying the omission of the internal vowel. The compound letters may be formed by placing one letter immediately under another; or by blending two letters together, so as by their union to make one character; or by making the first of the two consonants much smaller than the other letters, which latter mode is the most common. The genders of this language are three, and the terminations usually distinguishing the masculine are *aa*, and those of the feminine are *ee*; but it is not necessary that every noun comprehending sex should be distinguished by a particular termination, or mode of formation, expressly to denote its gender. The Bengalese has four cases besides the vocative, and in this respect it is much inferior to the Shanferit, which comprehends eight different cases. The Bengal nouns have neither dual nor plural numbers; and the same form of noun serves for the singular or plural. In compositions of this language, though the first and second persons occur very frequently, the use of the pronoun of the third is very rare; and in order to avoid the application of the words *he* and *they*, the names of persons are repeated in a manner that is very tiresome and disgusting. The second person is always ranked before the first, and the third before the second. The personal pronouns have seven cases, which are very irregularly varied. The indefinite pronouns are all aptotes in Bengalese, as they are in Latin and Greek. The Shanferit, which is the parent of the Bengalese, as well as the Arabic, Greek, and Latin verbs, are furnished with a set of inflections and terminations, so comprehensive and so complete, that by their mere form they can express all the distinctions both of person and time. By their root they denote a particular act, and by their inflection they express the time when it takes place, and the number of the agents; and thus their separate qualities are perfectly united. Every Shanferit verb has a form equivalent to the middle voice of the Greek, used through all the tenses with a reflexive sense, and the former is the most extensive of the two in its use and office; because in Greek the reflexive can only be adopted intransitively when the action of the verb descends to no extraneous subject; but in Shanferit, the verb is at the same time both reciprocal and transitive. Neither the Shanferit, nor the Bengalese, nor the Hindostannic, have any word corresponding to the sense of the verb *I have*, and therefore the idea is always expressed by *est mihi*; and of course there is no auxiliary form in the Bengalese verb answering to *I have written*, but the sense is conveyed by another mode. As the verb substantive *to be* in all languages is defective and irregular, it is called in Shanferit a "semi-verb;" and it is observed, by the ingenious writer above cited, that the present tense of this verb, both in Greek and Latin, and also in the Persian, appears evidently to be derived from the Shanferit. In the Bengalese, this verb has only two distinctions of time, the present and the past; and the terminations of the several persons of these serve as a model for those of the same tense in all other verbs

verbs respectively. The Bengalese verbs may be distributed into three classes, which are distinguished by their penultimate letter. The simple and most common form has an open consonant immediately preceding the final letter of the infinitive. The second is composed of those words whose final letter is preceded by another vowel or open consonant going before it. The third consists entirely of causals, derived from verbs of the first and second conjugation. The Greek verbs in $\mu\alpha$ are formed exactly upon the same principle with the Sanscrit conjugations, even in the minutest particular; of which instances occur in many verbs, which form from a root a new verb by adding the syllable *mi*, and doubling the first consonant. In forming the past tense, the Sanscrit applies a syllabic augment, like the Greek; and the future is characterised by a letter analogous to that of the same tense in the Greek, omitting the reduplication of the first consonant. Nor, indeed, is the reduplication of the first consonant always applied to the present tenses of the Sanscrit, any more than to those of the Greek. It is observed, that the natural simplicity and elegance of many of the Asiatic languages are very much debased and corrupted by the continual abuse of auxiliary verbs; and this inconvenience has evidently affected the Persian, the Hindostan, and the Bengal idioms. The infinitives of verbs, in the Sanscrit and Bengalese, are always used as substantive nouns; and a similar mode of signification often occurs in the Greek. In the Sanscrit language, as well as in the Greek, certain forms of infinitives and of participles comprehend time; and there are also other branches of the verb that seem to resemble the gerunds and supines of the Latin. All the terms which serve to qualify, to distinguish or to augment, either "substance" or "action," are classed by the Sanscrit grammarians under one head; and the word used to express it literally signifies increase or addition. According to their arrangement, a simple sentence consists of three members, viz. the agent, the action, and the subject: which, in a grammatical sense, are reduced to two, viz. the noun and the verb. They use a particular word for specifying such terms as amplify the noun, which imports quality, and corresponds to our adjectives or epithets. Such as are applied to denote relation or connection, are expressed by another term, which may be translated "preposition." The simple adjectives in Bengalese have no variation of gender, case, or number; neither is the adjective subject to inflection, but the sign of the case is confined to the substantive, with which it agrees; and its form is confined to the singular number, even when joined to a plural noun. But those derivative attributes, which are alternately adjectives and concrete nouns, generally preserve the distinctions of gender, which they all possess in the Sanscrit. Prepositions are substitutes for cases, which could not have been extended to the number necessary for expressing all the several relations and predicaments in which a noun may be found, without occasioning too much embarrassment in the form of a declension; these in the Greek language are too few, and hence results great inconvenience. The Latin, which is less polished than the Greek, bears a nearer resemblance to the Sanscrit, in words, inflections, and terminations.

The Bengalese method of computation, among the merchants, for the largest sums is by "fours," derived probably from the original mode of numbering by the fingers.

To this day the Bengalese reckon by the joints of their fingers, beginning with the lower joint of the little finger, and proceeding to the thumb, the value of which is also included as a joint; and thus the whole hand contains 15. From this method of performing numeration on the joints, arises that well known custom among the Indian merchants of settling all matters of purchase and sale by joining their

hands beneath a cloth, and then touching the different joints, as they would increase or diminish their demand. See BANSIANS.

It is peculiarly in the Bengalese computation, that the ninth numeral of every series of ten is not specified by the term of nine, in the common order of progression, but takes its appellation from the series immediately above it, as twenty-nine is not expressed in our manner, or by what we should conceive to be its proper denomination, but by a term denoting one less than thirty.

The Sanscrit language, besides other advantages, has a great variety in the mode of arrangement; and the words are so compacted together, that every sentence appears like one complete word. When two or more words come together "in regimine," the last of them only has the termination of a case; the others are known by their position; and the whole sentence, so connected, forms but one compound word, which is called a "foot."

For further particulars relating to the language of Bengal, its grammatical construction, and the method of acquiring it, we must refer to Halked, *ubi supra*.

The verses of the Bengalese are regulated by accent, and by the number of syllables in a line; no regard whatever being paid to quantity, but as it coincides with accent. Their poems, like those of the Arabians and Persians, are in rhyme; and the Bengal poets have many rules for contracting such words as are too long, and for extending those that are too short, for their metre. The Bengal measures are altogether borrowed from the Sanscrit, and may be divided into three species; viz. heroic, lyric, and elegiac.

In music, the Bengalese always use the minor key, and their gamut proceeds by the very smallest intervals of the chromatic scale. They have no idea of counterpoint, and always play or sing in unison or octaves.

The natives of Bengal write with a slender and tough reed, very common in all the east, which they shape almost like an European pen. They write with the hand closed, in which they hold the pen as the Chinese do their writing-pen-cil, pressing it against the ball of the thumb with the tip of the middle finger. The nib or point of the pen is turned downwards towards the writ; while the thumb pointing upwards, and lying on the pen with its whole length, keeps it firm against the middle joint of the fore-finger. As they have neither chairs nor tables, they sit upon their heels, or sometimes on their hams, whilst they are writing; and their left hand, held open, serves as a desk on which to lay the paper on which they write, which is kept in its place by the thumb.

BENGALENSIS, in *Conchology*, a species of *Venus*, described by Lister. The shell is orbicular, somewhat equilateral, with thick perpendicular stræ; and the beaks turned back. Inhabits Bengal.

BENGALENSIS, in *Ornithology*, a species of *VULTUR*, found in Bengal. It is of a brown colour, with the head and fore-part of the neck bare of feathers, and pale chestnut; bill lead colour, black at the tip. Latham. Gmelin.

BENGALENSIS, a species of *ORIS*, called by G. Edwards the *Indian Bustard*. The colour is black; space round the eyes brown; back, rump, and tail, shining black. Gmelin. Inhabits Bengal, and is about twenty-three inches in length. Brisson calls this *Pluvialis Bengaleensis major*; and Bullon, *Charge on outarde moyenne des Indes*. The beak and legs are whitish, tail streaked, and spotted with black. Edwards copied this bird from a drawing, and it does not appear that a specimen of it is known in any cabinet.

BENGALENSIS, a species of *RALLUS*, of a white colour, with the head and neck black; wings and back greenish, primary quill feathers spotted with red. Gmelin. This is

the Bengal water-rail of Albin; *Totanus Banghalensis* of Brisson; and Chevalier vert of Buffon. The bill, irides, and legs are yellow; crown, area of the eyes, lower part of the back and body beneath white, temples and throat black brown; primary quill feathers purple, secondaries green; tail purple, with fulvous spots.

BENGALLA, in *Geography*, a city of Hindostan, which existed during the early part of the 17th century, near the eastern mouth of the Ganges, but of which no traces now remain.

BENGASI, or **BERNICHE**, a sea-port town on the coast of Africa, in the Mediterranean. The merchants of this place usually join the caravan from Cairo at Augela in their way to Mourzouk, the capital of Fezzan, and import tobacco, manufactured for chewing, and snuff, and sundry wares fabricated in Turkey. N. lat. $32^{\circ} 10'$. E. long. 20° . This town is said to be the ancient Berenice, built by Ptolemy Philadelphus.

BENGEVAI, a town of Persia, in the province of Segestan, 75 miles south of Zareng.

BENGHUR, a town of Persia, in the province of Cabul; 32 miles north of Cabul.

BENGLO, a mountain of Scotland, in the county of Perth, the highest point of which is said to be 3724 feet above the level of the sea; 5 miles N. E. of Blair Athol.

BENGO, or **BENGA**, a province of the kingdom of Angola in Africa, situate along the river of its name, but more commonly known by that of Zenza. It has the sea on the west, and the province of Mofche on the east. The Portuguese have cultivated large tracts of land in this province, which now abounds with maize and manioc root, with which they make their bread. It produces also plenty of banana and cocoa trees. It is divided into several districts, of which the chiefs are natives, though tributary to Portugal. The inhabitants are Christians, and have eight churches.

BENGORE HEAD, a cape of Ireland, on the north coast of the county of Antrim, 10 miles N. E. of Coleraine. N. lat. $55^{\circ} 15'$. W. long. $6^{\circ} 19'$.

BENGUELA, a province of Angola in Africa, retaining the name of a kingdom, bounded on the east by the river Rimba, or Cumani, on the north by the Coanza, and Culogi, at about $10^{\circ} 51'$. S. lat. and reaching westward quite to cape Negro, according to the generality of geographers. But M. de Lisle extends it no farther north than Old Benguela, in $9^{\circ} 54'$. and according to him, it is bounded on the east by the Giaga Cafangi, or Giagan chief, and on the south he places the province of Ohila, between the Hottentots and Benguelas, which tract is mostly inhabited by such savage nations as the Caffres and Giagas. Benguela was formerly governed by its own kings; and most parts of the kingdom were fertile and populous; but it suffered so much from the incursions of the Giagas, and its wars with neighbouring states, that, with the protection of the Portuguese, they have not been able to recover their importance. Its valuable productions are similar to those of Angola and Congo: and from the humidity of the soil they have two fruit seasons in the year. It furnishes likewise a considerable quantity of salt, though of inferior quality to that of Chissama. The Zinbis, whose shells are current as money through several parts of Africa, are caught upon its coast, and paid in payment either by weight or measure. The country, being mostly mountainous, swarms with wild beasts, such as rhinoceroses, elephants, and wild mules. The lions, tigers, crocodiles, and other carnivorous animals, destroy great numbers of their cattle. Their fertile plains towards the sea-side formerly produced numerous herds of cattle, both small and great, but they are now become very scarce. The air of the

country is so unwholesome as to affect its produce, and taint even its waters. Few Europeans have, therefore, ventured to visit it, so that it remains in a great degree unknown. The chief towns are Old Bengueia, St. Philip, or New Bengueia, Mankikondo, and Katchul. The commerce of slaves is so prevalent in this province, that the natives will sell their relations or children from mere wantonness.

BENGUELA, *Old*, a town of Africa, in a province so called, south of a bay of the same name, near the Atlantic ocean. The town is seated on a high mountain, where large beeves, sheep, poultry, and other provisions, have been sold in great plenty, together with elephants' teeth; all which the inhabitants have bartered for muskets, and other fire-arms. S. lat. $11^{\circ} 5'$. E. long. $11^{\circ} 30'$.

BENGUELA, *New*, or *St. Philip*, a town in the province of Benguela, seated on the south of a large bay, about 2 leagues long and 1 broad, called by the Portuguese "Bahias-das-Vaceas," where they have a settlement and a fort, with a small garrison. S. lat. $12^{\circ} 8'$. E. long. $12^{\circ} 20'$.

BENHADAD, or the Son of ADAD, in *Scripture History*, the name of several kings of Syria. *Benhadad I.* was the son of Tabrimon, and began his reign about the year 940 B. C. He was induced by costly presents to assist Asa, king of Judah, against Baasha, king of Israel, whom he obliged to return to the succour of his own country, and to abandon Ramah, which he had undertaken to fortify. 1 Kings, xv. 18, &c. *Benhadad II.* was the son of the preceding, and his accession to the throne of Syria is stated to have taken place about the year 901 B. C. In his war against Ahab, king of Israel, he was totally defeated; and in the following year, renewing his attack upon the Israelites, in the plain of Aphek, he lost a great part of his army, and was reduced to the necessity of submitting to the mercy of Ahab, by whom he was treated kindly, and allowed to return peaceably into his own country. In a new war for the recovery of Ramoth-Gilead, the possession of which was retained by Benhadad, Ahab, joined by Jehoshaphat, king of Judah, marched against the Syrians, and a battle ensued, in which Naaman was the general of the Syrian army, and Ahab lost his life. Benhadad having afterwards laid siege to Samaria, and failing in his attempts to reduce it, fell sick, and sent Hazael his minister, to the prophet Elisha, with presents, in order to consult him concerning the issue of his disorder. Hazael, on his return to Damascus, informed Benhadad that his health would be restored; but Elisha having predicted that Hazael would succeed to the throne of Israel, the minister accomplished the prediction by striking Benhadad with a wet towel. Benhadad was reckoned a great prince, who contributed to advance the glory of his country, and his memory received divine honours in Syria. 1 and 2 Kings. Josephus Ant. l. viii. and ix. *Benhadad III.* succeeded his father Hazael on the throne of Syria, in the year 836 B. C. After having been several times defeated by Joash, king of Israel, he was expelled from all his father's conquests. 2 Kings. Jos. Ant. l. ix.

BEN-HINNON, or **GEH-HINNON**, the valley of the children of Hinnon, lay in the south-east suburbs of Jerusalem. See **GEHENNA**.

BENI, PAUL, in *Biography*, a learned writer, was born in Candia, about the year 1552, and educated at Eugubio in the duchy of Urbino. In early life he entered among the Jesuits, but afterwards quitted them. He was for some time professor of theology at the college of Sapienza at Rome; of philosophy, at Perugia; and of rhetoric and belles lettres, in the university of Padua, from 1599 to the time of his death in 1625. He was more lively than judicious;

cious; fond of maintaining singular opinions, and much engaged in literary controversies. He attacked the dictionary of La Crusca, in a work entitled "Anti-Crusca, &c." and defended Tasso, whom, with Ariosto, he preferred to Horace and Virgil. He also wrote on the pastor-fido of Guarini. All these works were written in Italian. The most considerable of his Latin productions are, "Commentaries on the poetry and rhetoric of Aristotle," Venice, 161, 1625; "A poetic and rhetoric, extracted from the works of Plato;" "Commentaries on the six first books of Virgil, and on Sallust;" "Disput. de annal. Eccl. Card. Baronii;" and "De Historia Scribenda," lib. iv. Ven. 1611, 4to. All his works were printed at Venice, in 5 vols. fol. Gen. Dict. Nouv. Dict. Hist.

BENI ANWER, in *Geography*, a district of the western province of Algiers, about N. lat. 35° 45'. E. long. 0° 50'.

BENI ANZIL, one of the eighteen provinces into which the Turks divided Algiers, so called from its capital.

BENI AFR, a town of Upper Egypt, on the east side of the Nile; 2 miles north of Aina, or Esneh.

BENI HAFIN, a town of Egypt, on the east side of the Nile, remarkable for its grottoes, dug in the mountains, which were formerly temples; 6 miles north of Achmounain.

BENI HABAT, called by Leo Africanus *Habat*, a province of Morocco, bounded to the north by the river Mamora, and extending south to that of Sarrat: 4 leagues from Rabat, to the east, are the provinces of Fez and Teda, and to the west the ocean. This province is very extensive, rich, and commercial; and produces wool of a very excellent quality.

BENI JEBIE a town of Egypt, on the west side of the Nile, 12 miles south of Achmounain.

BENI HEADJAH, and **BENI HORWAH**, two districts of the western province of Algiers, bordering on the Mediterranean, about N. lat. 36° 30'. and E. long. 2° 12'.

BENI JUBAR, mountains of Algiers, lying about 20 miles south of Bejeyah, or Bugia, and extending a considerable way along the coast, both in length and width, being parts of the little Atlas. They are steep and rugged, and furnish a great number of streams. They abound with fruit-trees, especially walnuts and figs, and produce plenty of barley, with which the inhabitants feed their numerous herds. The people are warlike, and have a chief of their own; and among them are excellent archers; and the whole ridge hath several villages, inhabited by the tribe or people whose name it bears.

BENI MARAN, a town of Egypt, 9 miles south of Achmounain.

BENI MASSIF, a district of the western province of Algiers, about N. lat. 36° 30'. and E. long. 2° 42'.

BENI MEZZAB, a district of the eastern province of Algiers, between 32° and 33° N. lat., and from 7° to 7° 10' E. long. This district is destitute of water, except that which they draw from wells.

BENI MIDA, a district of the western province of Algiers, N. lat. 35° 30'. E. long. 2° 12'.

BENI MISUR, a town of Egypt, on the west side of the Nile, 3 miles south of Abu Gerge.

BENI MOHAMMAD IL KIFUR, a town of Egypt, west of the Nile, and 9 miles south of Abu Gerge.

BENI RAJLID, a town of the western province of Algiers, north of the river Sheliff and near it. N. lat. 36° 10'. E. long. 2° 10'.

BENI SALIR, a town of Egypt: 6 miles N.W. of Manselout.

BENI SMAIL, and **BENI SNAUSE**, two adjoining districts of

the western province of Algiers, on the confines of the Tell, about 35° N. lat. and between 0° and 1° E. long.

BENI ZANESSI anciently *Hephaleni*, a district of the western province of Algiers, to the north of the Montes Chalkorygii, and east of the river Malva, or Mulloofah, about 34° 54' N. lat. and 0° 30' W. long.

BENI ZENAL, a branch of mount Atlas, in the western province of Algiers.

BENJA, a river on the coast of Africa, 3 leagues E.N.E. from Anperie, and E. from Commenda.

BENJAMIN, in *Biography*, the youngest son of Jacob by Rachel, and one of the twelve patriarchs of Israel. He was the object of his father's peculiar affection, and reluctantly permitted to accompany his brethren to Egypt, when his return with them was made by Joseph the condition of their receiving a supply of corn. Joseph, who was his only brother by both parents, treated him kindly, and contrived a pretext for detaining him in Egypt, but he afterwards, when he disclosed himself, permitted him to return to his aged father. The tribe of Benjamin, which formed part of Judea, properly so called, lay between the tribes of Judah and Joseph, contiguous to Samaria on the north, to Judah on the south, and to Dan on the west, which last parted it from the Mediterranean. It had not many cities and towns, but this defect was supplied by its possessing the most considerable, and the metropolis of all, the celebrated city of Jerusalem. The other cities were Jericho, Gibcon, Bethel, Gibeah, Hai, Gilgal, Anathoth, Nebo; to which may be added the two noted villages of Bethany and Gethsemane. This tribe was at length almost exterminated by the others, in revenge of the violence offered to the concubine of a Levite, in the city of Gibeah. Genesis, Joshua, Judges.

BENJAMIN OF TUDLA, a city of Navarre, a Jewish rabbi, flourished in the 12th century. Possessed of a superstitious veneration for the law of Moses, and solicitous to visit his countrymen in the east, whom he hoped to find in such a state of power and opulence as might redound to the honour of his sect, he set out from Spain in the year 1160, and travelling by land to Constantinople, proceeded through the countries to the north of the Euxine and Caspian seas, as far as Chinese Tartary. From thence he took his route towards the south, and after traversing various provinces of the farther India, he embarked on the Indian ocean, visited several of its islands, and returned, at the end of 13 years, by the way of Egypt, to Europe, with much information concerning a large district of the globe, altogether unknown at that time to the western world. He died in 1173, not long after his return from his travels. His "Itinerary" contains a narration of his travels, intermixed with many fabulous accounts, that serve to raise the credit of his nation. Caspar Oudin, however, (Comment de Script. Eccl. tom. ii. col. 1524. Loph. 1722.) represents him as a man of sagacity and judgment, and well-versed in the sacred laws; and says that his observations and accounts have been found upon examination to be generally exact, and that the author was remarkable for his love of truth. The first edition of the Itinerary appeared at Constantinople in 1543, with a translation from the Hebrew into Latin, by Benedict Arias Montanus; and it was printed by Plantin, at Antwerp, in 1575, 8vo. It was afterwards translated by the emperor Constantine, and his version was printed at Leyden, by Elzevir, in 1635, 8vo. A French translation of it was published by John Philip Barater, in 1734, 2 vol. 8vo. Robertson's America, vol. i. p. 45. Gen. Dict.

BENJAMIN TREE, in *Botany*. See LAURUS.

BENJAMIN, in *Pharmacy*. See BENZOIN.

BLNJAR RIVER, in *Geography*. See BENDERMASSIV.

BENI.

BENIBOURD, a mountain of the Highlands of Scotland, probably higher than Caringorm, which is 4060 feet.

BENICARLOS, a town of Spain, in Valencia, celebrated for the wine made in its neighbourhood; 3 miles north of Penniscola.

BENIDORME, *Mount and Cape*, lie about S.S.W. from cape St. Martin, on the south point of Altea bay, projecting eastward from the town, which gives it name; to the south of which is the island Benidorme, 2 miles off; at the north-east end of Alicante bay, on the east coast of Spain, in the Mediterranean.

BENIFAJO, a town of Spain in Valencia; 5 leagues from Valencia.

BENILET, a town of Asia, in the Arabian Irak; 145 miles N.W. of Bassora.

BENIMERINI, the denomination of an African dynasty, which succeeded that of the Almohedes, which see.

BENIN, an extensive kingdom of west Africa, comprehending the slave coast, bounded on the west by Guinea proper, or, more particularly, the Gold coast; on the north by Gago, Nigritia, and a chain of mountains; on the east by Mujaac and Makoko, and part of Congo, with the Ethiopic ocean, on the south, where it extends about one degree beyond the equinoctial line. It is commonly divided into three parts, *viz.* Whydah and Ardrah, containing the Slave coast, and Benin proper, which has the same boundaries with the former on the north, east, and south, and is terminated on the west by part of the gulf of Guinea and the Slave coast. Its extent from west to east is about 600 miles, but from north to south it is not ascertained. From the river Lagos, where it commences, its coast forms a gulf or bight, ending at cape Lopez, in which are the trading places, or villages, seated on several rivers, of Benin, Bonny, Old and New Calabar, Camaron, and Gabon. Benin is watered by several streams, of which some are considerable rivers. Towards the sea-coast the land is low and marshy, and of course the climate unhealthy; but at a greater distance from the sea the land rises, and the air is more pure. In some districts of the country, water is so scarce, that travellers are often supplied with it for money by officers, to whose department it belongs. The rivers teem with crocodiles, sea-horses, a particular species of torpedo, and various kinds of excellent fish. The country abounds with elephants, tigers, leopards, wild boars, asses, civet and mountain-cats, horses, hares, and hairy sheep; and among its birds the principal are parquets, pigeons, partridges, storks, and ostriches. The soil is generally fertile, and produces a great variety of trees and plants, such as orange, lemon, and cotton trees. The pepper of this country is not so plentiful nor so good as that of the East Indies. The native negroes are in general mild and good humoured, civil to strangers, and yet reserved, easily wrought upon by gentle means, but inflexible and resolute in resisting harsh treatment. In the conduct of business they are expert; but attached to their ancient customs and manners, which renders them slow and tedious in their negotiations. Honest and faithful in their dealings, they seldom or ever disappoint the confidence that is reposed in them. Their trade is carried on by a kind of brokers, called mercadors, or fiadors, who treat with strangers about all merchandize; but all their contracts are made with great secrecy, through fear of exciting the jealousy or avarice of their governors; and the richest persons exhibit the appearance of poverty, in order to escape the rapacious hands of their superiors.

The population of Benin is distributed into three classes of persons. The first is composed of three persons, called great lords, who attend the king, and present petitions to

him. Such is the influence of these, that the supreme government may be said to be lodged with them. The next class consists of those petty princes called "ares de roe," or street kings, of whom some preside over the commerce, others over the slaves; some over military affairs, and others over every thing pertaining to cattle and the fruits of the earth. Out of this class are chosen the viceroys and governors of provinces, who are responsible to the three great lords, to whose recommendation they owe their appointment. Each of them is presented by the king with a string of coral as a badge of office, which he is obliged always to wear about his neck, under the penalty of degradation, and even death. The third order consist of the fiadors, the mercadors, or merchants; the fulladers, or pleaders, and the veilles, or elders, all of whom are respectively distinguished by some peculiar mode of wearing the coral chain. The lowest class is formed by the plebeians, who are generally indolent and poor. The whole burden of labour, such as tilling the ground, spinning cotton, weaving cloth, and even cleaning the streets, is devolved upon the women. The chief workmen are smiths, carpenters, and leather-dressers; but in every occupation of this kind they are extremely awkward and artless. The common diet of the natives is beef, mutton, or fowls, and their bread is made of yams, beaten into a sort of cake. The meaner persons subsist on smoked or dried fish, and bread made of yams, bananas, and beans, mixed together. The drink of the poor is water, and that of the richer, water mixed with European brandy. The king, and persons of rank, support a certain number of poor, selected from the blind, lame, and infirm; the lazy, who will not labour, are suffered to starve; and by this excellent police, not a beggar or vagrant is to be seen. The natives of Benin are distinguished by their liberality; but in the exercise of it they are extravagantly vain and ostentatious. The dress of the natives is neat and ornamental; that of the rich, in which they appear in public, consisting of white calico, or cotton drawers, covered with another fine piece of calico plaited in the middle, and bound under a scarf, the ends of which are adorned with a handsome lace or fringe. The upper part of the body is mostly naked. The ladies of better fashion wear fine calico, beautifully chequered with various colours. The face and upper part of the body is covered with a thin veil, and the neck adorned with a string and chain of coral. Upon their arms and legs they wear bright copper or iron bracelets, meanly wrought. The persons of the women are not disagreeable. The children go naked till the age of ten or twelve years; their whole dress, before this period, consisting of a few strings of coral tied round the waist. The men neither curl nor adorn their hair; but they form part of it into locks, to which they suspend a bunch of coral. The women dress their hair with great art in a variety of forms, and occasionally apply to it a kind of nut-oil, which destroys its black colour, and in time changes it into green or yellow.

The men marry as many women as their circumstances allow; but they have scarcely any nuptial ceremony. Jealousy is very prevalent, and adultery is severely punished; but the violation of the marriage-bed is less known in Benin than in any other country. Male infants, as soon as they are born, are presented to the king, as rightfully belonging to him; but the females, being deemed the property of the father, are left wholly to his care and disposal. Both male and female children are circumcised, when they are about a fortnight old; and they are marked over their bodies with various incisions, that express certain figures. In some parts of Benin twin births are reckoned a happy omen; but at Aerbo, they are reputed a bad omen, and both the twins and their mother

mother are put to death. The inhabitants of Benin are less afraid of death than the other natives of the same coast. Such is their attachment to their own country, that those who die in other provinces are preserved for years, till they can be conveyed for burial to their native soil. On occasions of mourning, which is usually limited to 14 or 15 days, some shave their hair, others their beard, and others but half of either. The last obsequies of their kings are performed with some very extraordinary ceremonies. When the tomb stone is laid, they crown it with a banquet of the most delicate wines and sweetmeats, of which all are allowed to partake; and the mob, intoxicated with liquor, are guilty of the wildest excesses and riots. Those who obstruct them, as men, women, children, and even brute animals, are put to death; and having cut off their heads, they carry them to the royal sepulchre, and throw them in as offerings to the deceased king, together with all the cloaths and effects of those whom they have sacrificed to his manes. Nevertheless, amidst these barbarous customs, the kingdom of Benin is governed by laws, which breathe nothing but humanity, and sympathy for misfortune and distress.

As to the religion of this country, it is a strange mixture of good sense and absurdity. With some just notions of a Supreme Being they blend many absurd and idolatrous ceremonies. The "Fetisso" is worshipped here, as well as in all the other countries on the western coast of Africa. To every evil they give the name of devil, and worship him from fear, and to prevent his doing them injury; and they honour both God the Creator, and the evil spirit, by sacrifices and offerings. They are believers in apparitions; and they conceive that the ghosts of their deceased ancestors walk on the earth, and occasionally appear to them in their sleep to warn them of their danger, which they endeavour to elude by sacrifices. All their houses are full of idols, and they have particular huts or temples for the residence of their gods. Their priests also are numerous; and the grand, or high priest of Loebo, a town seated at the mouth of the river Formosa, is particularly famous for his skill in magic, and is never approached without the most profound veneration and awe. Besides their sabbath, a day of repose which occurs every fifth day, they have many other days appropriated to religious purposes. At some of their festivals they sacrifice not only a great variety of brutes, but likewise a number of human victims, who are usually condemned criminals, reserved for this purpose. They have one annual feast in commemoration of their ancestors; but their greatest festival is that called the coral feast, on which day alone the king appears to his people in great pomp, attended by 600 of his women. Wine and provisions are distributed on this occasion among the people, and the day ends in gluttony, drunkenness, and riot.

The government of Benin is despotic. The empire is divided into a great number of petty royalties, all of which are subject to the king of Benin, whose authority is absolute, and commands the most blind and servile obedience. The reigning monarch, when he apprehends his dissolution to be approaching, commands one of his sons to fill the throne, with an injunction, under pain of death, not to reveal the secret till after his death. When this happens, the destined sovereign is removed to the town of Ofsebo, a few miles from Benin, the capital, where he remains for some time to be instructed in the art of government, and the duties of a king. Upon his return, his first care, for securing his future tranquillity, is to murder his brothers, and thus to remove every rival to the crown. The royal revenues are very considerable; to these every governor contributes a large sum; and the inferior officers pay their taxes in cattle, fowls, cloth, and other commodities. Certain duties are also laid

upon foreign trade; besides the annual taxes paid to the governor for the privilege of commerce, a sixth of which belongs to the king. It is said that the sovereign of Benin is so powerful a prince, that, in one day, he can assemble an army of 20,000 men, and in a few days more 100,000. His troops, however, are destitute of courage and conduct, and observe neither order nor discipline; and, indeed, are merely a cowardly tumultuous rabble, which leave him exposed to the incursions of pirates and robbers, that are suffered to pillage and destroy, and sometimes to advance even to the capital. The arms used by them are swords, poniards, javelins, bows, and poisoned arrows.

The capital of this kingdom is Benin. The other principal towns, or rather villages, are Bododo, Arebo, Agatton, Awerri, and Meberg.

All the slaves purchased on this part of the African coast, except a tribe distinguished by the name of "Mocoos," are called in the West Indies "Eboes," probably from Arebo, on the river Benin. In language they differ both from the Gold Coast negroes, and those of Whydah, and in some respects from each other; and in complexion they are much more yellow than the others; but their colour is a sickly hue, and their eyes appear as if suffused with bile, even when they are in perfect health. These Eboes appear, in general, to be the lowest and most wretched of all the nations of Africa. The great objection to them as slaves is, their constitutional timidity, and dependency of mind; which lead them very frequently to seek, in a voluntary death, a refuge from their own melancholy reflections. They require, therefore, the gentlest and mildest treatment to reconcile them to their situation; but if their confidence be once gained, they manifest as great fidelity, affection, and gratitude, as can reasonably be expected from men in a state of slavery. The females of this nation are better labourers than the men, probably from having been more hardily treated in Africa. These Eboes, notwithstanding the depression and timidity which they manifest, on their first arrival in the West Indies, and which give them an air of softness and submission, forming a striking contrast to the frank and fearless temper of the Koromantyn Negroes, are in reality more savage than the people of the Gold Coast; inasmuch, that many tribes among them, and especially the Mocoos tribe, have been accustomed to the shocking practice of feeding on human flesh. In their religious worship, they adore certain reptiles, of which the guana, a species of lizard, is in the highest estimation, and in the worship of this animal, it is said, that they offer human sacrifices. *Mod. Un. Hist.* vol. xiii. p. 272, &c. *Edward's Hist. West. Ind.* vol. ii. p. 75.

BENIN, a city of Africa, and capital of the kingdom above described. It is pleasantly seated on the river Benin, or Formosa, about 69 miles from Agatton, at the mouth of the river, and is said to be 4 miles in circumference, and to contain 30 long, broad, and straight streets of low houses. The streets are adorned with a variety of shops filled with European wares, as well as the commodities of the country, such as cattle, cotton, and elephant's teeth. In their markets they expose to sale, for food, dogs, of which the Negroes are fond; and also roasted monkeys, apes, and baboons. Bats, rats, lizards, dried in the sun, palm-wine, and fruit, form the most luxurious entertainment, and stand always exposed to sale in the streets. As the country affords no stone, the houses are built with mud and clay, covered with reeds or straw: and they are separated from one another by chasms and ruins, that indicate its decay. The entrance into the city is by a gate of wood, which is defended by a bastion of mud and earth: and it is surrounded by a deep ditch 40 feet wide. A guard is stationed at this gate to receive the tolls, duties, and imposts collected from the merchandize. None but natives are permitted

permitted to live in the city; and of these some are wealthy, and carry on an extensive trade, which is committed to their wives, who go to all the circumjacent villages, and traffick in all sorts of merchandize, and who are obliged to bring the greatest part of their gains to their husbands. A principal part of the city is occupied by the royal palace, which is more distinguished by the extent of its dimensions than by the commodiousness or elegance of the structure. All the male slaves in this town are foreigners; for the inhabitants cannot be sold for slaves, and only bear the name of the king's slaves. This is one of the European marts for the purchase of slaves. N. lat. $6^{\circ} 10'$. E. long. $5^{\circ} 5'$.

BENIN, *River of*, called by Juan Alphonso de Aveiro, a Portuguese, who is said to have first discovered the country, *Formosa*, on account of the verdure and beauty of its banks; a considerable river of Africa, in the kingdom of Benin. It divides itself into several branches; and has some towns or villages on its banks, in which Europeans, and particularly the Dutch, carry on a commerce. Notwithstanding the beauty of its adjacent scenery, the air is noxious and pestilential, on account of the vapours exhaled by the sun's heat from its marshy banks; and it is much infested by the mosquito flies. The entrance into this river is in N. lat. $6^{\circ} 38'$, and E. long. $4^{\circ} 47'$.

BENIN-Daxx, *St.* a town of France, in the department of Nièvre, and chief place of a canton, in the district of Nevers. The place contains 1583, and the canton 10,565 inhabitants: the territory includes 350 kilometres, and 21 communes.

BENISH DAYS, among the Egyptians, a term for three days of the week, which are days of less ceremony in religion than the other four, and have their name from the *benish*, a garment of common use, not of ceremony. In Cairo, on Sundays, Tuesdays, and Thursdays, they go to the bashaw's divan; and these are the general days of business. Fridays they stay at home, and go to their mosques at noon; but though this is their day of devotion, they never abstain from business. The three other days of the week are the benish days, in which they throw off all business and ceremony, and go to their little summer-houses in the country.

BENISOUEF, in *Geography*, a town of Egypt, on the west side of the Nile. According to Savary, it is half a league in circumference; and Sonnini says, that of all the places situated along the Nile, from Cairo, or for the space of more than 30 leagues, this is the largest, as well as the most affluent. The houses are only cottages of brick and earth, coarsely constructed; but the lofty minarets, vying in height with the surrounding date-trees, and discovered through their highest branches, present an agreeable object to the view. A manufacture of coarse carpets renders this a commercial town; and the adjacent plains are fertile and productive, so that the people who cultivate them appear less distressed and wretched than those who live near the capital. Benisouef is the residence of a bey, or, in his absence, of a kiaschef, who levies with an armed force his arbitrary tributes. Over against Benisouef stands the village of "Baird," partly inhabited by Copts; and on the same side of the river, and at the distance of 3 leagues, is "Bebé," a large village, the residence of a kiaschef, where are a mosque and a convent of Copts. Benisouef lies in N. lat. $29^{\circ} 14'$. E. long. $30^{\circ} 58'$.

BENITO, *St.* a small island of the north Pacific Ocean, on the north-west coast of America, surrounded with rocks and islets. N. lat. $27^{\circ} 41'$. E. long. $242^{\circ} 38'$.

BENITO, *St.* or *St. Bennet*, a river of Benin, in Africa, that discharges itself 7 leagues S. by W. from the bight of Biafra, and on the fourth side of the river Campo, into the gulf of Guinea. On the north side of this river stands a great hill, called the Hayburn. N. lat. $1^{\circ} 45'$. E. long. $8^{\circ} 10'$.

BENVIVENI, GIROLAMO, in *Biography*, was born at Florence, in 1452, and contributed under the auspices of Lorenzo de Medici, to reclaim the Italian poetry from its mean and trivial state, and to renew the style and manner of Dante and Petrarch. The principal topic of Benivieni was divine love, which he clothed with the sentiments of Platonism, and thus obscured the poetical beauties of his works by mysticism. He was esteemed on account of his integrity and virtue, and employed by Pico, prince of Mirandola, as his almoner. He died at Florence in 1512, and was buried in the same tomb with his friend Pico. His works were printed at Florence in 1500, and again with additions in 1519. Nonv. Dict. Hist.

BENLAVERS, in *Geography*, a lofty mountain, being the chief summit of the Grampian chain, near Kenmore, in Perthshire, Scotland. One of its sides rises from the banks of the Tay, and, assuming a conical shape, elevates its summit about 4015 feet above the level of the sea.

BENLOJA, in *Ichthyology*, the name by which the Swedes call the common bleak, *cyprinus alburnus* of Linnaeus.

BENLOMOND, in *Geography*, a mountain of Scotland, situated in the parish of Buchanan, in Dumbartonshire. Though not so lofty as Bennevis or Benlawers, yet its intiated situation, with respect to the neighbouring hills, and broad lake of Loch Lomond spreading at its base, give it great magnitude and grandeur. It is computed to be 3260 feet above the level of the sea, and 3240 from the surface of the lake. The form it assumes nearly resembles a truncated cone, and its sides, particularly towards the lake, are finely mantled with natural woods. Its north side is exceedingly steep, but on the south-west it may be easily ascended. On the north-east side is the source of the river Forth, which, like most mountain streams, soon becomes a rapid river, and is alternately seen expanding into a lake, or darting over some craggy precipices. Benlomond is mostly composed of granite, interspersed with large masses of quartz, and near the base are large strata of micaceous schistus, some of which is also found at the top of the mountain. Sinclair's Statistical Account of Scotland.

BENNA, in *British Antiquity*, a kind of carriage, which was used for travelling rather than for war. It contained two or more persons, who were called "Combeannones," from their sitting together in this machine. The name was probably derived from the British word "Ben," or pen, which signifies head, or chief; and these carriages might, perhaps, have got this appellation from the high rank of the persons who used them.

BENNAVENNA, or **BANNAVANTO**, in *Ancient Geography*, a town of Britain, in the Itinerary of Antonine, placed by Camden, Gale, and Stukely, at Weedon, a village six miles west of Northampton, but by Mr. Horsley, for reasons which he has stated, and which seem to be satisfactory, at or near Daventry.

BENNECKSTEIN, a town of Germany, in the circle of Upper Saxony, and county of Klettenberg; 22 miles S.S.W. of Halberstadt.

BENNECUM, in *Geography*, a town of Guelderland, 2 miles north of Wageningen.

BENNET, CHRISTOPHER, in *Biography*, was born at Raynton, in Somersetshire, about the year 1617. After the usual school education, he was entered at Lincoln college, Oxford, in the year 1632, where he proceeded bachelor, and then master of arts, but seems to have acquired his knowledge of medicine at Leyden, or some other university, where he took his degree of doctor. He then came to London, was admitted fellow of the college of physicians, and appears to have had a considerable share of reputation and practice. In

1656, he published "Theatrum tabularum, seu plithifcos, an pliaz, et heticos, xenodichim," ovo. London: a work of learning and ingenuity, but abstruse and theoretical. He made a number of curious experiments to discover the qualities of the blood in plithifical patients. He had seen diseases of the breast, he says, removed by discharges from the legs; and on the other hand, plithifical complaints occasioned by suppressing theorrhage from the nostrils. He observes, that consumption not infrequently occurs in England, unattended with affections of the lungs. The work has been translated into most of the modern languages, and passed through numerous editions, though now almost forgotten. He also republished, with observations, Morf's treatise, call'd "Health's Invention." He died tabid, in April 1677, and probably had been induced to employ so much of his time and labour in acquiring a knowledge of the disease from his own sufferings. Haller. Bib. Med. Pract.

BENNET, HENRY, earl of Arlington, an eminent statesman, and favourite minister of king Charles II. was born of a good family in the county of Middlesex, in 1618, educated at Christ-church college, in the university of Oxford, where he distinguished himself by his application, and by his turn for English poetry; and upon the king's coming to Oxford, at the breaking out of the civil war, entered himself into his service, both as a volunteer in the royal army, and as private secretary to lord Digby, secretary of state. Upon the failure of the royal cause, he went over to the continent, and became secretary to the duke of York, and possessed the full confidence and esteem of the royal family. In 1658, he received the honour of knighthood from Charles II. and was sent by him in the quality of his minister to the court of Madrid. Soon after the king's restoration, sir Henry Bennet was recalled from Madrid, and in 1662, promoted to the office of secretary of state. In 1664, he was created baron of Arlington, and at that time was considered as the king's chief minister and favoured servant. He is supposed to have been at the head of the party who procured the fall of the chancellor Clarendon. The conduct of foreign affairs was chiefly entrusted to him; and he had a great share in the first Dutch war. About this time he introduced Mr. (afterwards sir) Wm. Temple, into public employment. He formed one of the principal characters in the ministry of that period, distinguished by the appellation of the *cabal*. From the execution of a treaty published by John Dalrymple it appears, that lord Arlington was one of the commissioners, who, in 1675, concluded and signed at Dover, with Monsieur de French ambassador, a secret league between Charles II. of England, and Lewis XIV. of France; by which Charles agreed to declare himself a Roman catholic, and to engage in a war for the destruction of the United Provinces. By execution of this treaty it would appear, that the small Christian ministry was to furnish the king of England, before he declared himself a catholic, with the sum of 200,000 *l.* salary. In consideration probably of the service he ever performed to procure and conclude it, and in regard to the king's return after, and in a reasonable manner for other reasons, lord Arlington was rewarded in 1672, to the dignity of earl of Arlington, and Viscount Stafford, and decorated with the order of the garter. In 1674, he succeeded, and most of his charges in office, fell under the suspicion of the court; and as a punishment was moved against him, when he was reprieved by a full parliament. In that year he exchanged the office of secretary of state for the less responsible, and more honorary office of lord chamberlain: and soon after he was distinguished, with two other commissioners, on business of importance to the private of Orange; but not succeeding in the conduct of it, his interest at court

declined. This was partly owing to his affected zeal against popery, though he had been always regarded as a secret friend to the popish party, and was in reality a convert to that religion. He retained however, in outward appearance, the favour of the king; and after the accession of James II. who had no affection for him, he retained the office of chamberlain. He died in July, 1685, having previously, on his death-bed, as it is said, reconciled himself to the church of Rome. By his wife, who was daughter of Lewis de Nassau, lord of Beverwaert in Holland, he left one daughter, married to the earl of Lulston, afterwards duke of Grafton, natural son of Charles II.

"The character of lord Arlington seems to have been that of a thorough courtier; accommodating, easy, and, with the habits of public business, rather than extensive abilities, and the moderation of timidity rather than the restraint of principle. He had little knowledge of the English constitution, and less regard to it; but he wanted firmness and resolution to take the lead in arbitrary measures. His public letters, when secretary, were published in 1701, 2 vols. 8vo." *Biog. Brit. Gen. Biog.*

BENNET, THOMAS, an eminent divine of the church of England, was born in the city of Salisbury in 1673, and sent for completing his education to St. John's college, Cambridge, in the beginning of the year 1688. Before he had attained the age of 21 years, he took the degrees of bachelor and master of arts; and he was chosen fellow of his college. In 1695, he wrote a copy of Hebrew verses on the death of queen Mary, printed in the Cambridge edition of verses on that occasion. In 1699, he entered into the controversy between the church and the dissenters, and published "An Answer to the dissenters' pleas for separation, or an abridgement of the London cases." In the year 1700, he was presented to the rectory of St. James's at Colchester, where he became a very popular preacher. During his residence in this place, he published "A confutation of Popery," several tracts of controversy with the dissenters on the subject of "Schism," and also "A confutation of Quakerism." He also published "A Paraphrase, with Annotations upon the book of Common Prayer," with two letters relating to the same subject; and "The Rights of the Clergy of the Christian Church." About the year 1711, he took the degree of doctor in divinity. As his popularity declined at Colchester, and his salary, which partly depended on voluntary subscriptions, was reduced from 300 *l.* to 60 *l.* a year, he determined to remove to London, and accordingly accepted the office of deputy chaplain to Chelsea hospital; and this appointment was succeeded by the two lectureships of St. Olave's, Southwark, and St. Lawrence Jewry. Before his removal to London in 1716, he published, in 1714, an ovoid treatise, intitled "Directions for studying;" and in the following year, his "Essay on the thirty-nine articles of Religion, &c. and the case of the subscription to the articles considered in point of law, history, and conscience, with a prefatory epistle to Anthony Collins, Esq." supposed to be the author of "Puederft in P. lectum," published in London in 1719. In 1716, he published a pamphlet, entitled "The Nonjurors' separation from the church of England examined, and found to be schismatical on their own principles," and a sermon on "The case of the Reformed Episcopal churches in Great Poland, and Polish Prussia." Soon after, he was preferred by the dean and chapter of St. Paul's to the vicarage of St. Giles, Cripplegate, which afforded him a liberal income, amounting after several deductions, to 400 *l.* a year. For this preferment he was indebted to the private interference and recommendation of bishop Hoody. After his settlement in this parish, in 1717, his tranquillity was inter-

interrupted by some law-suits in which he was engaged for recovering dues that belonged to the church. However, he published, in the same year "A Spital Sermon;" and in 1718, "A Discourse of the ever-blest Trinity in Unity, with an examination of Dr. Clarke's Scripture Doctrine of the Trinity." From this time the harassed state of his mind, and the weight of parochial duties, prevented his undertaking any new work, except "An Hebrew Grammar," published at London, in 1716, 8vo. and intended for the use of such as want to learn Hebrew without the assistance of a master. He died at London of an apoplexy, in the 56th year of his age, on the ninth of October 1728, and was buried in his own church. Dr. Bennet, though a man of strong passions, and not altogether exempt from the charge of haughtiness, was distinguished by his piety and integrity, by the diligence and zeal with which he devoted himself to the studies and duties of his profession, and by his extensive learning, more especially by his skill in the oriental and other learned languages. As an acute reasoner and accurate textuary, he had few equals. His talents for controversial writing, which perhaps he indulged to excess, gave him a decided advantage, particularly in his disputes with dissenters, over incompetent antagonists; but on some occasions they led him to recur to distinctions and refinements, which would not always bear examination, and which laid him open to the attacks of his adversaries. Several of his writings, as they related to temporary controversies, have been consigned to oblivion. Those which have excited attention in modern times, are his "Discourse of the trinity," and his "Case of Subscription to the Articles of the Church of England." His explication of the Trinity has been charged with inclining to that herodoxy which he wished to avoid, and which, without doubt, he sincerely abhorred: and his defence of subscription has undergone some severe strictures by the acute and learned author of the "Confessional." It redounds much to the honour both of Dr. Bennet and bishop Hoadly, when we consider the disparity of their opinions, that the latter contributed to the preferment of the former. Gen. Dict. Biog. Brit.

BENNET, *Herb.* in *Botany*. See GEUM.

BENNEVENAGH, in *Geography*, a large mountain in the northern part of the county of Londonderry, province of Ulster, Ireland, about 8 miles west of Coleraine.

BEN-NEVIS. See BEN-NEVIS.

BENNI, in *Ichthyology*, a name given by Bosc after Sonnini, to the species of CYPRINUS which inhabits the river Nile, and is described by Forkal under the specific name of *lynni*. See BYNNI.

BENNINGTON, in *Geography*, a county of America, in the south-west corner of Vermont, bounded by Windham county on the east, the state of New York on the west, Rutland county on the north, and the state of Massachusetts on the south. It contains 19 townships, of which Bennington and Manchester are the chief. It has 12,254 inhabitants, including 16 slaves. The mountains abound with iron ore, which employs already a furnace and two forges.

BENNINGTON, the shire town of the above county, and the principal town in Vermont, including in the compact part of the town about 160 houses, is situated near the foot of the green mountain, near the south-west corner of the state, 24 miles easterly from the junction of Hudson and Mohawk rivers, and about 52 miles from the south end of lake Champlain, at the confluence of the east and south bays; 55 miles from Rutland, 202 north-easterly from New York, and 300 in the same direction from Philadelphia. N. lat. 42° 42'. W. long. 74° 10'. It has a number of elegant houses, and is a flourishing town, containing 2400 inhabit-

ants. Its public buildings are a congregational church, a court-house, and gaol. It is the oldest town in the state, having been first settled in 1764. Within the township is mount Anthony, which rises to a great height in a conical form. The defeat of the British in two battles fought near this town, in 1777, contributed in a great measure to the subsequent surrender of general Burgoyne's army.

BENNISCH, a town of Silesia, in the principality of Jagerndorf.

BENOIST, ST. a town of France, in the department of the Loiret, and chief place of a canton in the district of Gien; 6 leagues south-east of Orleans.

BENOIST, ST. *du Sault*, a town of France, in the department of the Indre, and chief place of a canton, in the district of Argenton; 3¼ leagues S.S.W. of Argenton. N. lat. 46° 27'. E. long. 1° 17'.

BENOIST, ST. *de Seyffieu*, a town of France, in the department of the Ain, and chief place of a canton, in the district of Belley, 1¼ league south-west of Belley.

BENOIT, or BENEDICTUS, RENATUS, in *Biography*, a famous doctor of the Sorbonne, and curate of St. Eustathius at Paris, was born at Sevenieres near Angers; and being a secret favourer of the protestant religion, he published, for the benefit of the people, a French translation of the Bible, which had been made by the reformed ministers of Geneva; but as soon as it was published, it was condemned. Benoit was appointed by Henry III. in 1587, regius professor of divinity in the college of Navarre at Paris; and some time before the death of this prince, he published a book, entitled "The Catholic Apology," the design of which was to shew that the protestant religion, professed by Henry, was no just reason for depriving him of his right of succession to the crown of France. This was followed, in 1590, by a defence of the same book. Benoit afterwards assisted at the assembly in which Henry IV. abjured the reformed religion; and he was promoted by the king, in 1597, to the bishopric of Troyes in Champagne; but he was so obnoxious to the pope, on account of his translation of the Bible, his favour to the protestants, and his strenuous assertion of the liberties of the Gallican church, that he could never obtain his bull, to be installed: however, he retained the temporalities till the year 1604, when he resigned the bishopric. He died at Paris in 1608. He was the author of several treatises, which are now not worth mentioning. Gen. Dict.

BENOIT, ELIAS, a learned French protestant minister, was born at Paris in 1640. After the revocation of the edict of Nantes, he sought refuge in Holland, and became pastor in the church at Delft, where he died in 1728. He was patient, timid, submissive, and laborious, and in his domestic connection he found ample occasion for the exercise of the virtues that distinguished his character. Of his wife he gives the following account: "I married a wife possessed of all the faults that could torment a peaceable husband; covetous, pert, peevish, and capricious; by her unwearied spirit of contradiction, she plagued, in every possible way, her wretched mate for the space of 47 years." His only relief was incessant study, the fruits of which were the following publications, written in French, viz. "A History of and Apology for the Retreat of the Pastors on account of the Persecution in France," 12mo. 1688; "A History of the edict of Nantes," 5 vols. 4to. Delft. 1693; and "Miscellaneous Remarks, critical and historical, on Toland's two Dissertations," 8vo. 1712. Nouv. Dict. Hist.

BENOIT, FATHER, a learned Maronite, whose Arabic name was *Ambarach*, was born at Gulta, in Phoenicia, of a noble family, in 1663. Having studied from the age of nine years to twenty-two, in the Maronite college at Rome, he returned

returned to the east, and was ordained priest by the Maronite patriarch of Antioch, and from thence he was sent to Rome, in order to transact some affairs relating to the church at Antioch. Previously to his proposed return, he was invited to Florence by the grand duke Cosimo III. where he was employed in arranging the types which Ferdinand de Medici had caused to be founded for printing books in the oriental languages. Under his inspection several eastern manuscripts were printed. Cosimo, in order to retain Benoit in his service, appointed him Hebrew professor at the university of Pisa, where he acquired great reputation for his character and learning among the literati of Italy. At the age of 44, he entered into the society of Jesuits, and was employed by Clement XI. as one of the correctors of the editions of the Greek fathers; and on the solicitation of cardinal Quirini, whom he had assisted in his studies, he published, at an advanced age, an edition of "Ephrem Syrus;" the two first volumes of which, begun in 1730, were, after twelve years' labour, given to the public; but in 1742, whilst he was prosecuting the third, and after he had advanced through one half of it, he was carried off by a severe illness in his 80th year. This volume was completed by Assenanni, in 1743. Benoit also translated part of the Greek Menology, and wrote some dissertations relating to the works of Ephrem Syrus. *Moreri. Gen. Biog.*

BENOIT, du Sault, St. in *Geography*, a town of France, in the department of the Indre, and chief place of a canton in the district of La Blanc. The place contains 1081, and the canton 10516 inhabitants; the territory includes 355 kilometres, and 14 communes.

BENON, a town of France, in the department of the Lower Charente, and chief place of a canton, in the district of Rochefort; $5\frac{1}{2}$ leagues N.N.E. from Rochefort.

BENOU, a town of Arabia, 110 miles south-east from El Catit.

BENOWN, the capital of Ludamar, an interior kingdom of Africa, placed by Rennell in N. lat. $15^{\circ} 6'$. W. long. $6^{\circ} 58'$. See **LUDAMAR**.

BENKAD, a town of Germany, in the circle of Westphalia, and duchy of Berg; 7 miles S.S.E. of Duffeldorp.

BENSEN. See **BENESLOW**.

BENSBERG, a town of Germany, in the circle of Westphalia, and duchy of Berg; 7 miles east of Mülheim.

BENSERADE, ISAAC DE, in *Biography*, a celebrated French poet, was born at Lions, near Roan, in Normandy, in 1612. The vivacity of his genius, and the pleasantry of his conversation, were well calculated to secure his reception at court, and to promote his advancement under the patronage of cardinals de Richelieu and Mazarin, who provided for him in a liberal manner by gifts and pensions. The poetry in which he excelled was that of the gallant and satirical kind, composed for the court-ballets; before operas came into vogue; and in these he ingeniously adapted to the personages of antiquity the known characters and adventures of those who represented their parts in fiction. His success in this way induced him to make an attempt for turning all Ovid's Metamorphoses into romances; but this work, though favoured by the king, and set off by all the ornaments of engraving, was ridiculed from its first appearance. As he aimed at point and conceit, the prevalence of a better taste in the age of Lewis XIV. took him into neglect. In 1674, he was chosen a member of the French academy. Towards the close of his life, he abandoned the court, and retired to Gentilly, where he embellished his house and gardens with a variety of ornaments that indicated his poetical genius. He was much afflicted with the stone, the excruciating pain of which he is said to have endured with fortitude and resignation. His later years were consecrated to works of piety

and devotion; and he translated almost all the Psalms. He died in 1691; and after his death his works were printed in two volumes. *Gen. Dict. Nouv. Dict. Hist.*

BENSHAUSEN, in *Geography*, a town of Germany, in the circle of Francunia, and county of Henneburg; 7 miles south-east of Smalkalden.

BENSHEIM, a town of Germany, in the circle of the Upper Rhine, and archbishopric of Mayence; 20 miles north of Heidelberg.

BENSON, GEORGE, in *Biography*, a dissenting divine of considerable reputation for biblical learning, was born at Great Salkeld in Cumberland, on the 1st of September 1699. When he had finished his preparatory studies, he completed his education for the ministry at the university of Glasgow. At Abingdon in Berkshire, where he first settled as pastor in the year 1723, he continued for about seven years; and besides a sedulous attention to the duties of his office, he employed his time in a critical study of the sacred writings. His first work, published during his residence in this town, was "A Defence of the Reasonableness of Prayer," accompanied with a translation of a discourse of Maximus Tyrius, on the same subject, together with remarks upon it. A new edition of this, and of his piece on predestination, was published in 1737, under the title of "Two Letters to a Friend, &c." In 1729, he left Abingdon, and removed to the charge of a congregation in Southwark, with which he continued for eleven years. In 1731, he published "A Paraphrase and Notes on St. Paul's Epistle to Philemon," in imitation of the manner of Mr. Locke; and to this he added "An Appendix, shewing that St. Paul could neither be an enthusiast nor an impostor, and consequently the Christian religion must be, as he has represented it, heavenly and divine." This argument was afterwards illustrated and improved in the most masterly manner by lord Lyttelton. This work, being favourably received by the public, was succeeded by Paraphrases and Notes, after the same manner, on the two epistles to the Thessalonians, the first and second epistles of Timothy, and the epistle to Titus; together with dissertations on several important subjects, particularly on inspiration. In 1735, he published, in three thin volumes, 4to. "The History of the first planting of the Christian religion, taken from the Acts of the Apostles, and their Epistles, &c." A second edition of this work, commonly bound up in one large volume, was published in 1756. In 1740, Mr. Benson was chosen pastor of the congregation of protestant dissenters, in Crouched Friars, London, in the room of Dr. Harris; and in this connection, with the learned and candid Dr. Lardner as his assistant for some years, he continued till his death, which happened on the 6th of April, 1762. In 1743, he published his treatise "On the Reasonableness of the Christian Religion, as delivered in the Scriptures;" and in consideration of his great abilities and learning, the university of Aberdeen conferred upon him the degree of doctor in divinity. Dr. Benson, having finished those epistles of St. Paul, on which he intended to write Paraphrases and Notes, proceeded to explain, after the same manner, the seven catholic epistles, viz. that of St. James, the two epistles of St. Peter, that of St. Jude, and the three epistles of St. John. A volume of miscellaneous sermons, in 1747, was the last of his public works. His posthumous writings, edited by Dr. Amory, appeared two years after his death, containing a life of Christ, and other theological essays. The labours of Dr. Benson in sacred literature met with a very favourable reception in foreign countries, as well as in Great Britain and Ireland, from the truly inquisitive and learned, and introduced him to a friendly acquaintance and correspondence with many persons, eminent for their literature and rank in the established church, as well as among the dissenters. Of these

these we may enumerate Sir Peter King, lord chancellor of England; lord Barrington; archbishop Herring; bishops Hoaday, Butler, and Conybearc; Dr. Leland, and Dr. Duchal of Ireland; Dr. Jonathan Mayhew of New England; professor Michaelis of Gottingen; Dr. Wishart of Edinburgh; Dr. Watts of London; Dr. Taylor of Norwich; and Mr. Bourn of Birmingham. His commentaries and notes on the epistles are deservedly held in high estimation. The learned John David Michaelis, one of the professors in the university of Gottingen, proposed translating them into Latin, and in 1746, published his paraphrase on the epistle of St. James, with additional notes. Several of his other tracts were translated into German by M. Bamberger, a protestant divine at Berlin. As a zealous friend to religious toleration and free inquiry, and with a view of vindicating and recommending them, he published a defence of Serretus, and an account of archbishop Laud's persecution of Dr. Leighton. Biog. Brit.

BENSON, in *Geography*, the north-westernmost township of Rutland county, in the state of Vermont, North America, is situated on the east side of lake Champlain, 57 miles N.N.W. of Bennington, and has 658 inhabitants.

BENTAVEO, in *Ornithology*, the French name of that species of SHRIKE, called *Lanius pitangua*, by Linnæus.

BENTENDORF JEPLITZA, in *Geography*, a town of Hungary, 4 miles north east of Rosenberg.

BENT-GRASS, in *Botany*. See *AGROSTIS*.

BENTHAM, JAMES, in *Biography*, was born at Ely in 1708, and educated for the church at Trinity college, Cambridge. After having held in succession several livings in the counties of Cambridge and Norfolk, he obtained, in 1779, a prebendal stall in the church of Ely, where he had an opportunity of cultivating his natural taste for church architecture and antiquities. The result of his observation and research was published under the title of "The History and Antiquities of the conventual and cathedral church of Ely, from the foundation of the monastery, A. D. 675, to the year 1771, illustrated with copper-plates," Cambr. 1771, 4to. The introduction to this work contains an account of Saxon, Norman, and Gothic architecture, and has been frequently cited as authority by later writers on these subjects. The grand repair of this church, entrusted to the superintendance of Mr. Bentham, afforded him an opportunity of investigating the principles upon which edifices of this kind were constructed, and suggested to him the idea of a general history of ancient architecture in this kingdom; and for this purpose he occasionally employed himself in collecting materials almost to the close of his life. He also interested himself in the improvement of his native country, by planning turnpike roads, and proposing the drainage and inclosure of parts of the Ely Fens; and some of his schemes were beneficially executed. In such useful occupations, and the faithful discharge of his professional duties, he protracted his life, by a course of temperance which his naturally tender constitution required, to his 86th year. He died Nov. 17, 1794. G. u. Biog.

BENTHEIM, in *Geography*, a county of Germany, in the circle of Westphalia, about 40 miles long, and from 12 to 15 broad. It is surrounded by the province of Overijssel and the bishopric of Munster, and abounds with wood, quarries of stone, game, and venison. The chief part of this territory is distributed into fertile corn-fields and beautiful meadows, which feed a great number of sheep and cattle; furnishing the inhabitants with an ample supply of the necessaries of life, and enabling them to make profitable exports. The principal river is the Vechte, which traverses the whole country. It is inhabited by Lutherans, Calvinists, and Roman catholics; and its traffic consists in linen, thread, wool, yarn, stone, wood,

cattle, and honey. Its towns are Bentheim, Schutteroff, Northhorn, and Nienhus. In 1753, count Frederic Charles Philip, mortgaged this county to the house of Hanover, for an advance of money. The count of Bentheim or Benthein, has a seat and voice in the college of the Westphalian courts of the empire, and at the diets of the circle.

BENTHEIM, a town of Germany, and capital of the above county, is seated partly on an eminence, and partly on a river of the same name. It contains one Calvinist, and one Roman Catholic church. The castle or palace stands on a high rock north of the town, and is surrounded with towers. Bentheim is distant 26 miles N.N.W. from Munster, N. lat. 52° 21'. E. long. 7° 1'.

BENTHOORN, a town of Holland, 6 miles S.S.E. of Leiden.

BENTHULUD, a town of Africa, in the kingdom of Fez, at the foot of Mount Atlas.

BENTHUYSEN, a town of Holland; 6 miles south of Leiden.

BENTINCK, WILLIAM, earl of Portland, in *Biography*, a favourite minister of king William III. was born in Holland, and descended from an ancient and noble family in the province of Guelderland. He accompanied the prince of Orange to England in 1670, as gentleman of his bedchamber; and when the prince became stadtholder, he was promoted to the command of the favourite regiment of Dutch guards. In 1675, he manifested his attachment to this prince, by sleeping in the same bed with him when he had the small pox, in consequence of medical advice; and by thus exposing himself to the infection of a distemper with which he was actually seized, he laid the prince under an obligation, of which he was never unmindful. He took an active part in the preparations for the revolution in 1688, and in the progress of that event; and upon the prince of Orange's accession to the throne, he received many marks of royal favour. Sustaining several high offices near the king's person, he was naturalized, and in 1689, he was advanced to the rank of an English nobleman, with the title of baron of Cirencester, viscount Woodstock, and earl of Portland. In the following year, he acted as envoy to king William at the grand congress held at the Hague. The royal favour, however, by which he was distinguished, and particularly the grant of several lordships in Denbighshire, which were part of the demesnes of the principality of Wales, occasioned, in 1695, a warm opposition in the house of commons; but though this grant was revoked, in consequence of an address to the king, the earl was recompensed by other liberal grants from the crown, which constitute a great part of the present ample possessions of the family. This nobleman attended king William in his campaigns in Ireland and Flanders, and distinguished himself, as a military officer, on various occasions. After the conclusion of the peace of Ryswick, in the negotiation of which he had a principal concern, he was nominated ambassador-extraordinary to the court of France, where he received the highest distinctions. On occasion of a jealousy, excited by the royal favour to a young Dutchman, named Keppel, afterwards earl of Albemarle, the earl of Portland resigned his posts in the king's household, and withdrew from affairs of state; but he still retained some portion of the king's esteem and confidence, and was entrusted with the administration of Scotland, and with the negotiation of the famous treaty for the succession to the crown of Spain, called the "partition-treaty," which was afterwards the subject of an impeachment of the earl by the house of commons. The king's death, in 1701, terminated the earl of Portland's public life, and all hostilities against him. Of the attachment of his royal master, however, he had the most satisfactory evidence; when, on his death-bed, with his last words he inquired

inquired for him, and on his approach, laid hold of his hand and pressed it to his heart. The close of the earl's life was spent in retirement at Baldrode, where he employed himself in acts of charity, and in the improvement of his fine gardens. He died Nov. 23, 1709, in the 61st year of his age, and was buried in Westminster Abbey. He left children of both sexes by his two wives, Anne, daughter of sir Edward Viliherst, and Jane, daughter of sir John Tempie.

His temper was, like that of his royal master, grave, sedate, and inclined to reserve; and his demeanour somewhat lofty, without pride. Although he was an object of jealousy and enmity, these were more national and political than personal; and his general character was that of an able and upright statesman, combined with private virtue. *Biog. Brit.*

BENTIVOGLIO, GUIDO, *Cardinal*, was born of a noble family at Ferrara in 1579; and after having studied at Padua with great reputation, he returned, in 1597, to his own country, where he displayed much dexterity in reconciling his brother, the marquis Hippolito, with cardinal Aldobrandini, the general of the church, and in concluding peace between the pope and Cæsar. Having finished these transactions, he was appointed by pope Clement VIII. his private chamberlain, and allowed to complete his studies at Padua. He then settled at Rome, and by his prudence and integrity acquired general esteem. After having performed, from 1607 to 1609, the office of nuncio in Flanders; and also in France till the year 1621, he was raised to the dignity of cardinal by pope Paul V. He was also appointed by Lewis XIII. protector of the French nation in Rome; which office he declined on becoming bishop of Terracina in 1641. On the death of Urban VIII. in 1644, he was thought to be the most proper person for the honour of succeeding him; but when he entered the conclave, in the hottest and most unhappy season of the year, he was seized with a fever, which terminated in his death on the 7th of September, at the age of 65. The principal of his works, which are held in high estimation, are his "History of the Civil Wars in Flanders," written in Italian, and first published at Cologne in 1634, and since translated into foreign languages; "Memoirs" of himself, an "Account of Flanders," and a collection of "Letters," reckoned the most approved specimens of epistolary writing in the Italian language. *Moreri. Gen. Biog.*

BENTIVOGLIO, in *Geography*, a small town and fortified palace of Italy, in the states of the church; 10 miles north of Bologna.

BENTLEY, RICHARD, in *Biography*, a very eminent critic, was born at Oulton, near Wakefield in Yorkshire, on the 27th of January 1691-2, and after receiving the rudiments of classical learning at the free school of Wakefield, was entered in his 15th year at St. John's college, Cambridge. In 1691, he left the university, and became a school-master at Spalding. From this situation he was soon removed to be preceptor to the son of Dr. Stillington, dean of St. Paul's, who appointed him to be his domestic chaplain. In February 1691-2, he published his first work, which was a Latin epistle to Dr. Meibomius, containing "Critical Observations on Mada's Chronicle;" and about the same time he had the honour of being selected as the first person to preach Boyle's lecture, founded for the vindication of natural and revealed religion. The subject of the eighth discourse, which he delivered on this occasion, and which were afterwards published and translated into most of the modern languages of Europe, was the loss of atheism, or the confutation of this absurd and joyless system, from the faculties of the soul, from the structure and origin of human bodies, and the origin and frame of the world itself. Whilst

he carried on this lecture, he maintained a philosophical correspondence with sir Isaac Newton, whose friendship he ardently cultivated, nor did he write any thing on this occasion without this illustrious philosopher's approbation. In 1692, he was installed by bishop Stillington a proband of Worcester; and in the following year he was appointed keeper of the royal library at St. James's. In 1695, he was admitted to the degree of doctor of divinity; and he delivered a discourse on the day of the public commencement from 1 Pet. iii. 15. It is said, that he was soon after admitted, "ad eundem," in the university of Oxford. His "Annotations on Callimachus," were inserted in an edition of that poet, published in 1697, by Gravins; and in the same year Dr. Bentley himself published, at the end of Wotton's Reflections on ancient and modern learning, his "Dissertations on the Epistles of Themistocles, Socrates, Euripides, Phalaris, and the fables of Æsop." This publication was succeeded by a literary controversy, which engaged at the time a great degree of public attention. The immediate subject of this controversy was the genuineness of the epistles of Phalaris. In order to give our readers some notion of its rise, progress, and issue, we shall detail the following particulars. Soon after Dr. Bentley was made royal librarian, the honourable Mr. Boyle, who was about to publish an edition of the supposed epistles of Phalaris, applied, by means of a bookfeller in London, to Dr. Bentley for the use of a MS. in the king's library, which, after much solicitation and delay, was at length obtained; but before the collation could be completed, and indeed, about six days after the manuscript had been delivered, it was redemanded by Dr. Bentley, with many striking and disparaging expressions, both of Mr. Boyle, and the work. This conduct, Mr. Boyle, in the preface to his edition of Phalaris, publicly revented; and in return, Dr. Bentley, in the above-mentioned dissertation, endeavoured to evince the spuriousness of the epistles that had been published, adding some reflections on Mr. Boyle's edition and version. In 1698, Mr. Boyle retorted, with effusions of wit and personal abuse, in a treatise entitled "Dr. Bentley's Dissertation on the epistles of Phalaris, and the fables of Æsop examined," and commonly known by the title of "Boyle against Bentley," a second edition of which was published in 1742. In 1699, Bentley recriminated in the same style, in a piece usually denominated "Bentley against Boyle," reprinted in 1777, by Messrs. Bowyer and Nichols, with several notes and observations, collected from, or communicated by, bishops Warburton and Lowth, Mr. Upton, Mr. W. Clarke, Mr. Markland, Dr. Salter, Dr. Owen, and Mr. Toup. Among the wits and critics, who united as auxiliaries of Boyle, were Swift, Pope, Garth, and Malletton; and it must be allowed, that they proceeded with an unwarrantable severity in attacking the moral character and literary acquirements of their adversary. Bentley, however, though wounded, sustained the contest with unyielding firmness, and in the event with full success, so far as the authenticity of the epistles ascribed to Phalaris is concerned. Since prejudice and passion have subsided, it has been very generally acknowledged that Bentley had not only the evident advantage with respect to learning and argument, but that he is little, if at all, inferior to his antagonist in point of wit and smartness. The reputation of Dr. Bentley, during the progress of this literary dispute, was not very materially affected; for before its complete termination, he was presented by the crown, in 1703, with the honourable and lucrative office of master of Trinity college, Cambridge; and in the following year collated archdeacon of Ely. In the former station, he introduced reform, and curtailed salaries, and thus incurred

BENTLEY.

the ill will of some of the senior members of the college; but as he appeared to have exercised an undue authority, and to have consulted his own advantage more than the public, a charge was exhibited against him in 1709, by the vice-master, thirty of the senior fellows, and other members of the college, for peculation, breach of the statutes, and other acts of mal-administration. The charge was presented to the bishop of Ely, as visitor of the college. But Dr. Bentley contended, that the crown was the visitor; and upon this a law-suit commenced, which was not terminated till the year 1731, when the crown asserted its visitorial power, but declined interfering in the present instance. It appeared afterwards, that, upon the whole, the charges against the matter were well founded.

In 1710, Dr. Bentley published at Amsterdam his critical annotations on the two first comedies of Aristophanes; and, about the same time, at Rheims, his emendations of the fragments of Menander and Philemon, under the feigned name of "Phileleutherus Liptienfis." This latter was undertaken with the view of disparaging a similar performance of Le Clerc, and thus by degrading his literary character in the public estimation, to set aside a scheme, which was then in agitation, for inviting him to England, by the offer of some considerable church preferment. In the year 1711, he published his long expected and much commended edition of "Horace." This correct and elegant edition of Horace, which was pronounced by Dr. Hare to be the completest work produced by criticism since the restoration of learning, was printed in 4to. and dedicated to the earl of Oxford. It was succeeded, in 1713, by some excellent remarks on Collins's discourse of free-thinking, published under the former name of "Phileleutherus Liptienfis," and dedicated to Dr. Hare. In 1716, Dr. Bentley was appointed regius professor of divinity; and in the same year he circulated proposals for a new edition of the Greek Testament, with St. Jerom's latin version. These proposals were the subject of severe animadversion by Dr. Middleton, who professed a serious conviction, that Dr. Bentley had neither talents nor materials proper for the work, and that religion was much more likely to receive detriment than service from it. Several pamphlets were published on the occasion; and it is much to be regretted, that a work of such importance to sacred literature and biblical criticism was abandoned. The completion of this noble undertaking was the principal employment of the latter part of Dr. Bentley's life. In the prosecution of it he had collected and collated all the MSS. of Europe to which access could be obtained; and for this purpose, his nephew, Thomas Bentley, L.L.D. well known in the republic of letters, had travelled through Europe at his uncle's expence; the whole was completed for publication; but when he determined not to let it appear during his own life, the sum of 2000*l.* which he had received in part of the subscriptions, was returned to the subscribers. A circumstance occurred in 1717, which materially affected the doctor's reputation, and which was attended, at least for a time, with detrimental consequences to himself. Upon the creation, by royal mandate, of several doctors in divinity, Dr. Bentley demanded from each of them, besides the customary perquisite, an extraordinary fee of four guineas. In this demand they acquiesced, on condition that the money should be restored, if it should appear that Dr. Bentley had no right to enforce it. Dr. Middleton, however, some time after, obtained a decree for the repayment of the money; and in consequence of this decree, Dr. Bentley was arrested, and appeared by his proctor before the court of the vice-chancellor. On this occasion, the beadle testified on oath, that Dr. Bentley had declared, "I will not be concluded by what the

vice-chancellor and two or three of his friends shall determine over a bottle;" and for this expression he was suspended by the vice-chancellor, without a citation or hearing, from all his degrees, and afterwards by the caput deprived of all his privileges and honours, as well as degrees, in the university. Dr. Bentley appealed to the king, and after successive references to the council and to a committee of council, and to the court of king's bench, and many delays, the university received a mandamus in February 1718, which reversed all their proceedings, and required a restoration of Dr. Bentley to all degrees, honours, &c. of which he had been deprived. In 1726, he published an edition of "Terence and Phædrus;" and in 1732, the last of his works, which was his edition of "Milton's Paradise Lost;" and which made no addition to his reputation, though it has been said that many of his corrections of that poet have been unreasonably objected to by bishops Pearce and Newton. This work was undertaken at the request of queen Caroline. Dr. Bentley died on the 14th of July 1742, in the 81st year of his age, and was buried in the chapel of Trinity college. When we consider the unquestionable abilities and erudition of Dr. Bentley, it may excite some degree of surprize, that his literary character should have been held in much higher estimation by foreigners, than by his own countrymen. This may be partly owing to that pride, petulance, and irritability of temper, with which he, in common with many others who have excelled in verbal criticism, seems to have been chargeable; to the personal disputes in which he was engaged; and to the political differences that disquieted the period in which he lived. But, perhaps, it arose principally from his having, in the class of his adversaries, the poets and wits of the age, and from their having made him the object of their satire and ridicule. The asperity of Mr. Pope, who attacked him in the character of Aristarchus (works, vol. iii. p. 207—211.) has, however, been ascribed to personal resentment. Whilst they were both together at dinner with bishop Atterbury, Dr. Bentley was questioned as to his opinion of the English Homer; and, after some demur, being urged to speak out, he said "the verses are good verses, but the work is not Homer; it is Spondanus." Another circumstance, which contributed to degrade Dr. Bentley in the estimation of some of his contemporaries was that love of money, which he seems to have unduly indulged, and which involved him in disputes that were dishonourable to him. As to the charge of scepticism, with respect to revelation, alleged against him by Mr. Whiston, it does not appear to have been well founded. Dr. Salter describes him as having been a very amiable and pleasant man in private life, and as possessing much good nature, though he has been otherwise represented. Against the disparaging judgment of the learned bishop Lowth, who allows him to rank only among grammatical and verbal critics, may be contrasted the encomium of Dr. Samuel Clarke, eminently distinguished by his literature and critical discernment, who, in the preface to his edition of Cæsar's Commentaries, speaks of him as "vir in hujusmodi rebus peritâ plane incredibili et criticos omnes longè longéque judicio et sagacitate antecellens." The judgment of posterity, more impartial than that of his contemporaries, has allowed Dr. Bentley's profound skill in the idiom of the Latin and Greek languages; and though, as a verbal critic, many of his emendations are unsanctioned by the authority of ancient MSS. they frequently approve themselves as just and reasonable, and are regarded as real improvements. It must be acknowledged, however, that those corrections of ancient and modern authors, which depend upon mere conjecture, and which suggest what might, or ought to have been written, rather than what

what they really did write, extend the province of criticism beyond its just limits; and whilst they afford scope for the unwarrantable exercise of fancy or judgment, they should be very cautiously admitted. In this way doctor Bentley is said to have incurred the charge of temerity and presumption. The son of Dr. Bentley, who was called after his own name, was a gentleman of acknowledged ingenuity, taste, and learning, and known as the author of several publications, and particularly of a tragedy, entitled "Philodamus," published by D. Foy in 1767, and esteemed by the late eminent poet M. Gray, as one of the most capital poems in the English language. His youngest daughter married a grandson of the learned Dr. Cumberland, Bishop of Peterborough, whose famous book, "De Legibus Naturæ," Dr. Bentley is said to have corrected upon a visit to his forsaken, who was Bishop of Kilmore in Ireland. The son of this bishop, Richard Cumberland, esq. is well known by his ingenious writings, and especially by his judly applauded dramatic pieces. D. G. B. U.

BENTON in *Geography*. See **CULTURA**.

BENVORLICH, a mountain of Scotland, in the county of Perth; 5520 feet high. See **GRAMPIAN MOUNTAINS**.

BENY, a town of France, in the department of the Calvados, and the district of Caen, 2½ leagues N. N. W. of Caen.

BENY-BOURGE, Le, a town of France, in the department of the Calvados, and chief place of a canton, in the district of Vire, 7½ leagues S. W. of Caen. The place contains 704, and the canton 13,941 inhabitants; the territory includes 175 kilometres and 21 communes.

BENY, a small town of Hungary, in the county of Zemping, seated on the river Bodrog, and noted for its excellent wine, not inferior to Tokay.

BENYOWSKY, MAURITIUS AUGUSTUS, *Count de*, in *Biography*, magnate of the kingdoms of Hungary and Poland, a singular adventurer, was born at Verbowa, in the county of Nitria, in Hungary, in the year 1741, and educated for military service, to which he devoted himself from his youth. Being wronged in his paternal inheritance by his family, he seized by force the cattle which was his father's residence; in consequence of which he was deprived of his whole property by a decree of the chancery at Vienna, and was obliged to fly for refuge into Poland. Here he engaged, in 1767, in the conspiracy against king Stanislaus, and in the course of this irregular service he was taken prisoner, first in 1768, and afterwards in 1769, by the Russians, who treated him with severity, because he had violated his parole, and because he was forming plans for the liberation of himself and his companion. The Russians conveyed him to Casaf, where he was allowed to live at large, under the notice of the garrison, as a state-prisoner; but here his enterprising disposition recommended him to a party, which was then forming a conspiracy against the Russian government, in the execution of which he was invited to associate. But the plot being discovered, he was exiled to Sberna; and after a tedious journey and voyage of twelve months, during which the count made some unsuccessful efforts for escaping, he arrived on the 2d of December 1770, at Kamtschatka, and was conducted to the town called Boloretzkoy Odrog, or Bolcheretse, where he and his companions in exile were informed that they must provide for themselves, and where they were furnished for that purpose with the necessary arms and implements. Dissatisfied with the prescribed mode of savage life, the count soon began to concert measures with his fellow-prisoners for their escape; and in the mean time, he improved his circumstances by opening a school, in which he educated the son and three

daughters of the governor, M. Nilow, or Niloff, and by his knowledge of the game of chess, at which he played with some merchants, on behalf of the Hattman of the Cossacks, who allowed him a certain proportion of the furs which he won. Having gained the confidence of the governor and the affections of Aphanasia, one of his daughters, he proceeded in maturing and accomplishing his plan of liberation; but before its execution, the secret was discovered, and the force of the settlement was employed in reducing the malcontents. In the conflict on this occasion, the governor was killed; but the exiles at last succeeded, secured a vessel, and, accompanied by Aphanasia, who chose to follow the count, took their final leave of Kamtschatka. Their whole number, including the exiles, women, and the ship's crew, amounted to 96 persons. After enduring many naval hardships at sea, the vessel arrived at Japan; and on the 14th of August 1771, he anchored on the island of Uimby Ligon, which he places in N. lat. 29°, and which must consequently lie between Japan and the island of Lekeio. This island, according to his account, is absolutely independent both of China and Japan; its inhabitants are mild, virtuous, and in a high state of civilization; and they are said to have been converted to Christianity by a Portuguese missionary Jesuit, Ignatio Salis, who arrived in the island in 1749. Upon quitting this island, whither he promised to return, he sailed for Formosa, and arrived there on the 27th of August; but meeting with an opposition on his landing, he made a great slaughter among the natives. At length he opened, by means of a Spaniard, who resided on the island, a more friendly intercourse with the inhabitants of another canton, and assisted Huapo, their prince, in a war against one of his neighbours. After a stay of about sixteen days on this island, he departed and steered for Macao, in the harbour of Canton, in China. Here his female companion, Aphanasia Nilow, died. During his stay in this place, he made some attempts for procuring leave to go to Canton; but when these proved ineffectual, he determined to sail for Europe. Accordingly, in his way thither, he arrived at the isle of France, March 16th 1772, and having touched at the isle of Madagascar, he landed in France in July, and was well received by the French ministry.

Of the proposals made to the ministers of France by this adventurer, we have no documents; but he seems to have been regarded by them as a fit person to be employed in establishing a settlement in the island of Madagascar. With this view they furnished him with a body of troops, in 1773; and in his way thither he touched at the isle of France, in order to solicit the co-operation of the chiefs of that island. Jealousy, and the dread of a rival settlement, prevented his obtaining their concurrence; and therefore, after some delay, he proceeded to Madagascar, and landed there in February, 1774; forming his settlement at the bottom of the bay of Antongill, at the mouth of the river Finghalle. The count made little progress in accomplishing the object of his mission, although he expended on account of the French government a sum amounting to 50,000*l.* and therefore, towards the end of the year 1776, commissioners were deputed to examine the state of the settlement, and to convey the count to France. In the mean time, this enterprising adventurer had contrived to raise himself to consequence in the island by a curious stratagem. The Sanbarives, constituting one of the distinct nations of Madagascar, had been formerly governed by a chief, whose name was Kamini; and as he had left only one daughter, who had been taken prisoner and sold to foreigners, his family was supposed to be extinct. Of this circumstance the count artfully availed himself; and obtaining the testimony of an old negroe woman whom he had brought with him from the

isle of France, who declared that she knew him to be the son of Ramini's daughter, her own companion in slavery, he succeeded in his views of being publicly acknowledged as the heir of Ramini. Under this character he was vested with sovereignty, formed alliances with other tribes, made war and peace, and received submissions from the vanquished. But as his European resources were withheld, he renounced the service of France, and persuaded his subjects to permit him to return to Europe, for the purpose of forming an alliance with France, or some other power, and for making commercial arrangements with a view to the improvement of a settlement on the island. Accordingly, he departed for Europe in November 1776, on board a brig which he had freighted to the Cape of Good Hope. With this event his own narrative terminates. Among his state papers, however, we find his proposal to the king of Great Britain, dated Dec. 25, 1783; of which the preliminary article is his being acknowledged sovereign of the island of Madagascar; under which character he offers terms for an offensive and defensive alliance with this country. But it appears, from a declaration prefixed to this paper, that he had previously applied, probably with similar views, to the emperor of Germany. The application to the British ministry, if it was ever made, and if it was ever the subject of discussion, as some have asserted, was not attended with success. The count, therefore, determined to return to Madagascar with such supplies as he could obtain from individuals; and having procured goods and merchandize in London to the amount of 4000*l.* and finding it difficult to get the flag of any European power to sail beyond the Cape of Good Hope, he departed for Maryland in America, in April 1784. A respectable commercial house engaged in his undertaking, and supplied him with a vessel and goods to a considerable amount. In this vessel he sailed for Madagascar; and after eluding the hazard of shipwreck on the lee shore of America, and doubling the Cape of Good Hope, he touched at Sofala, and on the 7th of July 1785, anchored in Antangara bay, 10 leagues S.W. of cape St. Sebastian, in Madagascar, where the cargo was landed. Under an apprehension that the count had been cut off by the natives, the party on board the ship set sail for the island of Joanna, and at Oibo, on the opposite continent, sold the ship. The count heading a body of natives, commenced hostilities against the French by seizing their store-house at Angoutzi. Here he began to build a town after the manner of the country, and from thence he detached 100 men to seize their factory at Foul Point, who desisted on seeing a frigate at anchor. In consequence of these transactions, M. de Scullac, governor of the isle of France, sent a ship with sixty regulars, who landed, and attacked the count on the 23d of May 1786, in a redoubt which he had constructed, mounting two cannon, and in which he, with two Europeans, and thirty natives, waited their approach. The blacks fled, and Benyowsky, receiving a ball in his breast, fell behind the parapet, whence he was dragged by the hair, and soon expired.

Whilst none can question the ability and bravery of count Benyowsky, the principles of his conduct are not easily ascertained. His enemies represent him as a tyrant and a robber; and his friends, on the contrary, exhibit him as distinguished by a noble, humane, and generous disposition. Mr. Nicholson, the editor of his "Memoirs and Travels," who had all the letters and documents before him, declares, that he has "not yet seen any thing against the count, which will not bear two interpretations, or which has not been written by men who contradict each other, and had an interest in traducing him." "His conduct in Madagascar," says Wadstrom, in his "Essay on Colonization," "deserves no small portion of admiration, and even of respect; and, all

things duly considered, I see no reason, why a monument might not be erected to his memory, inscribed "MAGNIS TAMEN EXCIDIT AUSIS." A very different character is given of him by M. de Lessops, in his "Travels in Kamtschatka;" who represents him as perfidious and cruel, and by the Abbé Rochon, in his "Voyage a Madagascar, &c." who says, "that he aimed at the conquest of Madagascar by fire and sword, and treated the natives with such cruelty, that he was called by no other name by them than the "Wicked White." Memoirs and Travels of count Benyowsky, written by himself, 2 vols. 4to. 1750.

BENZELIUS, ERIC, a learned Swedish divine, was born in 1642, in Westro-Gothland, and educated under the patronage of a rich uncle at Upsal. He was first preceptor to the sons of the count de la Gardie, chancellor of Sweden; and having completed their education, he travelled through various parts of Europe, cultivating an acquaintance with the learned, and consulting the principal libraries. Upon his return to Upsal in 1665, he was appointed professor of history and morality in the university, and afterwards promoted to the theological chair, and to a seat in the consistory. In 1675, he was made doctor in theology; in 1677, bishop of Strengnes; and, in 1700, archbishop of Upsal, occupying also the vice-chancellorship of the university. He died in 1709; and was the author of several dissertations on the lives of the patriarchs, and other parts of ecclesiastical history. He wrote also various theological works, and translated the whole Bible into the Swedish language. *Moreri.*

BENZELIUS, ERIC, son of the former, was born at Upsal in 1673, where he began and completed his studies. Having travelled into Germany, England, and France, he returned to Upsal in 1702, and was appointed librarian to the university, an office which he held for 22 years. In 1724, he was nominated professor of divinity; and afterwards successively created bishop of Gotheborg, Lindkiöping, and archbishop of Upsal. He died in 1743. Benzelius undertook, in conjunction with other learned men, a review, as well of all books published in Sweden, or by Swedes abroad, as of those works printed in other countries, which had any relation to this kingdom. This publication, containing, besides reviews, some few original acts, was denominated "Acta Literaria Suecicæ," and conducted for 10 years on this plan by a society of gentlemen, who afterwards formed the royal society of Upsal. See SOCIETY.

BENZIE ISLAND, in *Geography*, lies on a river of the same name, within Sierra Leone, on the coast of Africa.

BENZOE, in *Botany*. See CROTONA.

BENZOIN. See LAURUS.

BENZOIN, *Benjamin Gum*, and *Benzoic Acid*, in *Chemistry* and *Pharmacy*.

The resin benzöin or benzöe, by some called also *Asia Dulcis*, is a very fragrant resin, procured from a large tree found in many parts of the East Indies, Sumatra, Arabia, Persia, &c. See STYRAX *Benzöe*.

The resin is brought in large brittle masses of a light yellow, interspersed with white nodules, which last are considered as the finest, and called by some *Benzöe Amygdaloides*. The smell of Benzoïn is extremely fragrant, especially when rubbed or heated: it has scarcely any taste, except previously dissolved in spirit of wine, which it does with ease, into a yellowish tincture. On adding water to this tincture, the resin again separates into a white pulverulent mass, which has received the singular name of *Lac Virginale*, and also *Magistery of Benzoïn*. When gently dried, it forms a white powder, formerly in great request as a cosmetic. It is at least innocent, and its scent is one of the most agreeable. But the most striking ingredient of this resin is the

Benzoic Acid, which is of sufficient importance to require being

B E N Z O I N.

being described more at large. If benzoin is gently heated a little above the degree of boiling water, it melts into an adhesive mass, and at the same time sends out a very copious, dense, white fume, of an extremely fragrant, diffusive, penetrating smell, and so acrid as irresistibly to excite coughing and tears in those who are in any degree exposed to it. This fume soon condenses on the first cool body, and then appears in the form of very beautiful spicular crystals, which gradually collect into a bulky feathery mass extremely light, and of remarkable elegance and lustre. This crystalline mass is the benzoic acid, and its acid property is proved by reddening litmus, neutralizing alkalies, and forming with them peculiar salts: in modern chemical nomenclature called *Benzoates*. After the greater part of the acid has risen by sublimation, or before it, if the heat be at all increased, a thin yellowish oil rises slightly empyreumatic, but strongly imbued with the fragrance of the resin. On further heating, an acidulous liquor comes over, together with a thick bituminous matter: still, however, containing some of the crystallizable acid, which is not totally expelled till the end of the process.

This acid is readily soluble in alcohol, and in hot water, but so sparingly in cold water that a hot saturated solution will deposit in crystals almost its saline contents by cooling.

Several methods have been devised for obtaining the benzoic acid. The oldest and most expeditious is by simple sublimation. To procure any quantities of it, put benzoin in an earthen pipkin; apply to the vessel a large cone of clean white paper, patted down to the edges of the pot, and set it over an extremely slow charcoal, or other fire, just sufficient to melt the benzoin. The acid will rise and crystallize upon the inside of the paper cone. However, as in this method the vapour has hardly room to condense, instead of the paper cone, another vessel inverted over that which contains the resin, and with a small hole drilled through its bottom, may be substituted; and when full, it may be gently shaken, to detach the acid, and again applied. From nine to twelve drachms may be thus obtained from sixteen ounces of benzoin. The remaining resin is still very aromatic, and should not be lost.

Another method has been recommended by Scheele, who in his excellent practical observations upon this salt, has treated it with that precision and ingenuity which so eminently distinguish this chemist in every subject, of greater or less importance and difficulty, which he has illustrated by his labours.

He observes, that besides sublimation, the acid may be extracted by lixiviation, and with the advantage of obtaining it free from any admixture of oil, which is apt to impair its whiteness and lustre. If benzoin is boiled with water, and the solution strained while hot, and filtered to cool, most of the acid taken up by the hot water deposits when cold, and may then be collected pure. This method, however, is imperfect; for as the water does not mix with and divide the gum, this last soon softens, and sinks down, closely adhering to the bottom of the vessel, and does not allow the water easily to penetrate it. Hence the solution takes place only at the surface of the benzoin.

The same chemist boiled powdered chalk and benzoin in water, and filtered the liquor. No crystals were now deposited on cooling, for the acid had dissolved part of the chalk into a benzoate of lime, which, being very soluble, remained in the liquor. But on adding some drops of vitriolic acid, the benzoic acid was again separated from the lime, and fell to the bottom in a powdery form. Substituting alkali for the chalk, the same effect took place, and the benzoic acid, as before, was precipitated by the vitriolic. But this method

was still attended with the inconvenience of the benzoic acid concreting together, which floated on the surface during the boiling. But on substituting quick-lime this inconvenience was avoided; and it is therefore in the following method that the benzoic acid may be procured the most copiously and the purest. Upon four ounces of unslacked lime pour twelve ounces of water, and after the ebullition is over, add six pounds more of water; then put a pound of benzoin, finely powdered, into a tin pan; pour on it at first about six ounces of the above lime water; mix them well together, and then successively the rest of the lime water. By this method the resin will be prevented from running together into one mass. Boil the mixture for half an hour, with constant stirring, then let it stand, and pour off the clear liquor. On the remainder in the pan, pour more lime water, and proceed as before, adding the clear liquor to that first obtained, and also filter the residue, to exhaust the liquor, which is now a weak solution of benzoic acid, with the lime of the lime water. Boil down this liquor (which is of a light yellow) to two pounds, and strain. When cold, add to the liquor muriatic acid gradually, which will produce a white crystalline deposition, and continue to add the acid till the liquor is supersaturated, and tastes sourish. The stronger acid thus unites with the lime, and the benzoic acid, now free, being of itself scarcely soluble in cold water, falls down as a white coagulum, which should be washed with more cold water, and gently dried. To give it a crystalline appearance, dissolve it in boiling water, filter it through a cloth, and by cooling it will separate in the form of spicular crystals, but with some loss of the acid.

The above process of Scheele's may however be a little shortened, if the lime in substance be mixed with the lime water, previous to the addition of the benzoin; for by this method the solution may be at once made more concentrated, and less of the liquid will suffice, so that much of the evaporation will be saved. Any of the stronger acids will displace the benzoic from lime, but the muriatic is the most convenient.

Scheele obtained from 12 to 14 drachms of the concrete acid from a pound of benzoin by this process.

The benzoic acid, when pure, is quite white; for if yellow, it is mixed with a small portion of the oil of the resin. Though crystallized, it is considerably elastic, and difficult to be reduced to powder. Its taste is sharp, pungent, and acidulous. It reddens tincture of litmus. When cold, it is without smell, but on applying heat it sends forth the peculiar grateful odour by which it is characterized. Heated by itself, it chiefly sublimes, but a part is decomposed, giving an acid phlegm, much oil, and carburcted hydrogen gas. It is not alterable in the air, and does not evaporate by keeping in a moderate temperature. Cold water dissolves only about $\frac{1}{20}$ of its weight, but boiling water $\frac{1}{10}$; and hence the copious crystallization from a hot water solution. It unites readily to most of the alkalies and earths forming benzoates, the properties of which have been but little examined.

The benzoate of lime is almost the only salt of this kind found native. It is contained in the urine of some animals, particularly the herbivorous quadrupeds, and is ascertained by adding to this secretion some muriatic acid, by which the benzoic acid is made perceptible.

With potash this acid forms a readily crystallizable salt, decomposable, like the rest of the benzoates, by a strong acid. Most of the metallic oxides are dissolved by this acid, but not the pure metals.

Mr. Hermbstadt, in a series of experiments on the action of nitrous acid on the benzoic, found that the latter regularly assumed in the process a smell like that of water distilled over bitter almonds, but on the whole, this acid is but with diffi-

culty altered in its nature by the nitrous. Distilling the nitro-benzoic acid with pure alcohol, he obtained ethereal liquor, part of which was nitrous ether, but the remainder appeared, by the smell of almonds, to be a dulcified, or ethereal benzoic acid. But these experiments require to be repeated with accuracy, as the powerful operation of the nitric acid on vegetable matter, though highly instructive, is often not a little embarrassing.

Several other substances, besides the resin of benzoin, contain more or less of this acid. The balsam of Peru, and of Styrax, appear to owe to this acid much of their fragrant smell. Ambergris, vanilla, and some of the aromatic barks, and even urine, contain a small quantity of it. When uncombined with an alkaline or earthy base, it is generally known by a pungent fragrant smell, and dense white smoke, on applying a heat less than is necessary to burn or decompose the substance with which it is united. When kept down by an alkali or an earth (as in the case of urine), it is separated by a strong acid. It has been supposed, with probability, that the fragrant scent is not proper to the acid, but is owing to the presence of a portion of resin or essential oil, combined with it so intimately as to be inseparable by any means hitherto known, without entire decomposition of the acid; and hence too may be explained the very weak affinity of this acid for all bases, which is generally superior to no acid but the carbonic.

Gum benzoin is almost diffused in medicine, though still retained in a few preparations of the London and Edinburgh pharmacopœias. The compound tincture *Tinctura Benzœis Composita*, formerly *Balsamum Traumaticum*, contains gum benzoin, balsam of Tolu, and aloes; and the benzoic acid enters into the Edinburgh *Tinctura Opii Ammoniata*, and in some other compounds of foreign dispensaries.

The fragrance of this resin has caused it to be used in fumigations of various kinds. Where the object is merely to produce a penetrating agreeable scent, it may be of considerable use; but as a *corrective* of foul or contagious air, its powers are very small, by no means comparable to those of the mineral acid vapours, while the irritation which it gives to the lungs is more intolerable. Scheele's Essays. Fourcroy, *Hermstadt in J. Phys.* tom. 34, &c.

BEOLIPA GULF, in *Geography*, lies on the east side of the strait of Dardanelles, near the opening into the sea of Marmora.

BEORI ANIMAL (*Laët. Amer.*), in *Zoology*, the *Tapir Americanus* of Gmelin, &c.

BEOSTER ISLAND, in *Geography*, one of the Shetland islands, between which and Green island, at the north end of Brassa, or Brassy sound, is a good channel, that runs out into the sea.

BEOTIA, CAPE, lies within the island of Negropont, to the north of Corinth, on the north side of the peninsula, stretching south-east from Corinth.

BEQUIA, a small island of the West Indies, dependent on the government of St. Vincent, and containing 3,700 acres. It is chiefly valuable from the commodiousness of its fine harbour, called "Admiralty bay."

BER, a district of Switzerland, in the government of Aëlen and canton of Beru, comprehending two parochial villages.

BER. See BERBICE.

BERA. See BOELE-COMBA.

BERABZAN, a long lake in New North Wales, lying N. and S. and running gradually from its north end, till it mixes with the waters of Schecharas lake, at the south end, and where these waters form Seal river, which empties into Hudson's bay, at Churchill fort. The north end of Berabzan lies in about 60° 30' N. lat. and 93° 50' W. long.

BERÆA, in *Ancient Geography*. See BERØFA.

BERAMS, in *Commerce*, a coarse cloth, made altogether of cotton thread, which is brought from the East Indies, and particularly from Surat.

BERAMUN, in *Geography*, a town of Egypt, on the Nile; 3 miles north-east of Mansora.

BERAR, a soubah, or kingdom of Hindoostan, bounded on the north by Allahabad and Matwa; on the west by Candeish and Amednagar; on the south by Tellengana and Golconda; and on the east by Oriss. It contains 13 circars, divided into 42 pergunnahs. The western parts of this province were reduced by Acbar; and its revenue under Aurungzebe, as stated by Mr. Fraser, in his "Life of Nadir Shah," amounted to 153½ lacks of rupees. The principal part of this province is possessed by the Berar or Nagpour rajah; and the remainder is held by the Nizam, or soubah of the Decan, who pays to the rajah a "chout," or fourth part of its clear revenues. The interior parts of Berar are less known than most other countries in Hindoostan; but it is thought to be neither populous nor rich. Its present capital is Nagpour, about midway between Bengal and Bombay. This province produces wheat, rice, poppies, and many sorts of legumes. In the southern part is found the deer, which yields the Bezoar stone; and the sheep of this province differ from the common species, their neck being lengthened, their tail very short, their ears long, and their wool not curled.

BERARDI, ANGELO, in *Biography*, an Italian writer on music, who published at Bologna a considerable number of musical tracts, between the years 1681 and 1693, which, with a large portion of pedantry and common-place information, contain much curious and useful knowledge. Their titles are: "Ragionamenti Musicali, Musical Dissertations;" "Documenti Armonici, Harmonical Documents;" "Miscellanea Musicale, a Musical Miscellany;" "Arcani Musicali, Dialogo, Musical Arcana, a Dialogue;" and the "Perche Musicale, Musical Definitions." If the whole had been compressed, methodised, and digested into a single treatise, and all the musical information dispersed through these several tracts arranged in a regular and gradual order, a more useful and practical didactic work might have been produced, than Italy seems to have furnished during the 17th century.

BERASTEGUE, in *Geography*, a mountain of Spain, in the province of Guipuscoa, 3 leagues from Tolosa.

BERAULT, NICHOLAS, in Latin *Beraldus*, in *Biography*, one of the learned men of the sixteenth century, was either a native of Orleans, or for a long time resident in this place, where he was professor of the civil law. He was tutor to admiral de Coligni; and well acquainted with Erasmus, who, in his "Ciceronians," speaks with commendation of his easy and flowing elocution, and who, in 1522, dedicated to him his treatise, "De Conserbendis Epitolis." Among the Latin works of Berault, were "A Græco-Latin Dictionary," Paris, 1521; an "Oration on the Peace of Cambray," Paris, 1528; another "On ancient and modern jurisprudence," Lyons, 1533; and "A Dialogue on the faculty of speaking extempore," Lyons, 1534. He also wrote paraphrases on the Politics and Economics of Aristotle, and notes on the Rusticus of Politian. His comments on the Natural History of Pliny, though not mentioned by Hardouin, are much commended by Erasmus. He was esteemed for his integrity, and greatly regarded by Poncher, archbishop of Sens, a prelate distinguished in France by his patronage of literature.

BERAUN, in *Geography*, a royal borough of Bohemia, in a circle of the same name. The chief produce of the circle is wood and corn, and in some parts are found mines of iron.

iron. The town is seated on the river Mies or Miza: 14 miles S.W. of Prague. N. lat. 50° 2'. E. long. 14° 25'.

BERBECZ, a river of European Turkey, which runs into the Borlet, near Tecuczi, in the province of Moldavia.

BERBEGAL, a town of Spain, in Aragon 3 leagues from Balbastro.

BERBERES. See BREBES.

BERBERINA, in *Entomology*, a species of TIPULA, with forty, incumbent wings, having the base and marginal spot white. Schrank. This insect has the thorax and abdomen red; its seeds on the berries, and forms small trunks as excrescences on the branches.

BERBERINA, in *Natural History*, a species of VORTICELLA, of a simple oval form, with a branched rigid stem, and white granulations. Gmelin. This is Vorticella compita, fluitans ovalibus muticis, filipe ramosa of Linn. Syst. Nat. edit. 12. It is also Bactenus berberiformis of Pallas; and Pludopolypus berberiformis of Rœsel. Found in fresh water in Europe; usually in clusters.

BERBERIS, *Barberry*, or *Pipperidge Rub.* in *Botany*. Linn. gen. n. 442. Schreb 565. Rech 4, 6. Juss. 256. Gœrt. t. 242. Tournef. 385. Smith 181. Class and Order. *Hexandria Monogynia*. Gen. Char. Cal. perianth six-leaved, patulous; teeth ovate, with a narrower base, concave, alternately smaller, coloured, deciduous. Cor. petals six, roundish, concave, erect-expanding, scarcely larger than the calyx; nectary two, small, roundish, coloured bodies, fastened to the base of each petal. Stam. filaments six, erect, compressed, obtuse; anthers two, fastened on each side to the top of the filaments. Pist. germ cylindrical, the length of the stamens; style none; stigma orbiculate, broader than the germ, surrounded with a sharp edge. Per. berry cylindrical, obtuse, umbilicated with a point, one celled. Seeds two, oblong, cylindrical, obtuse. *B. cretica* has three seeds. Reich.

Ess. Char. Cal. six-leaved; pet. six, with two glands at the claws; style none; berry two-seeded.

Species. 1. *B. vulgaris*, common barberry; *B. dumetorum*. Ray, Sin. 465. Spina acida or oxycantha. Ger-Em. 1325. 2. *B. vulgata*, purple-fruited barberry. 3. *B. canadensis*, Canada barberry. "Petioles racemed, spines triple." A shrub rising to the height of 8 or 10 feet; with stems upright and branched, smooth, and slightly grooved, brittle, with a large white pith, and covered with a whitish or ash-coloured bark, yellow on the inside; stems and branches are armed with sharp thorns, commonly growing by threes; first leaves obovate, serrate ciliate, not jointed; stem-leaves alternate; secondary leaves in pairs, oblong, and serrate, with smaller leaves concealed between the lowermost leaves and the thorns; flowers toward the ends of the branches in pendulous racemes, with a bract to each pedicel; corolla yellow; petals frequently serrate about the edge, and at the base of each are two orange-coloured dots, which are probably the nectaries; anthers roundish, yellow; stigma greenish; berries at first green, and, when ripe, changing to a fine red colour; seeds two, rarely three, fastened at bottom to a minute tubercle, oblong, smooth, of a pale yellowish colour, and hard; the seed-cases of an elliptic form. A native of the eastern countries, and now of most parts of Europe in woods, coppices, and hedges; in England, especially in a country soil, as particularly about Suffern Wood in Essex. The flowers appear in May and June, and the fruit ripens in September. Miller mentions three varieties of this shrub, viz. *B. sine nucleis*; Bauh. pin. 457, 2, or without stone, occasioned by the age of the plant; *B. with white fruit*, having leaves of a lighter green colour, and the bark whiter than the common sort; and *B. orientalis procerior fructu nigro suavisimo*,

Tournef. cor. diffinendo only in the colour and flavour of the fruit. He makes the Canadian barberry a distinct species, and says that the leaves are much broader and shorter than those of the common sort, and that the fruit is black when ripe. It has been long observed by Linnaeus, that when bees in search of honey touch the filaments of this shrub, the anthers approximate to the stigma, and explode the pollen. This irritability is so remarkable, that if the filaments are touched near the base with the point of a pin, a sudden contraction is produced, and this may be repeated several times. Dr. Smith, who has made this property the subject of particular examination, observes (see Phil. Trans. vol. lxxviii. p. 158.) that neither the outside of the filament, nor the anther has any irritability; and that the spring of the filaments is owing to an high degree of irritability in the side of the filament next the germ, by which, when touched, it contracts, that side becoming shorter than the other, and consequently the filament being bent towards the germ. After irritation, the filaments will return to their original place, and on being again touched, they will contract as easily as before. The purpose which this curious contrivance of nature is designed to answer is evident. When the stamens stand in their original position, their anthers are effectually sheltered from rain by the concavity of the petals. Thus they probably remain till some insect, in order to extract honey from the base of the flower, thrusts itself between their filaments, and almost unavoidably touches them in the most irritable part; in this way the impregnation of the germ is performed; and as it is chiefly in fine sunny weather that insects are on the wing, the pollen is also in such weather most fit for the purpose of impregnation. Another peculiarity ascribed to this shrub is, that ears of corn growing near it constantly prove abortive, and that it extends this sterile influence over them to the distance of 3 or 400 yards across a field. Dabamel long since looked upon the milderew power of barberry as totally void of foundation, and M. Broussonet assured Dr. Smith, from his own observations, that the opinion, though very prevalent, was altogether groundless. Young's Annals, vol. vii. p. 183. Eng. Bot. p. 49. Withering's Bot. Arrang. vol. ii. p. 351.

The leaves of barberry are gratefully acid; the flowers are offensive to the smell when near; but at a proper distance their odour is extremely agreeable. The berries are so acid that birds will not eat them. The barberry however is cultivated for the sake of the seed, which are pickled and used for garnishing dishes; and being boiled with sugar, they form an agreeable rob or jelly; they are used also as a dry sweet-meat, and in sugar-plumbs or comfits. They are moderately refrigerant, and are said to be of great use in bilious fluxes, and in all cases where leucorrhœa, acrimony, and putridity of the humours prevail. On the authority of Prosper Alpinus (Med. Egypt. l. iv. c. 1.) we are informed, that the Egyptians employ the berries in peevishness, fevers, and fluxes with great success; and Simon Paulli relates, that he was cured of a malignant fever, accompanied with a bilious diarrhoea, by using these berries according to the Egyptian practice; that is, macerating the fruit for a day and a night in twelve times its quantity of water, with the addition of a little fennel seed; and then straining and sweetening the liquor, and using it as a common drink. Dr. Woodville observes, (Med. Bot. vol. iv. p. 62.) that these berries are well calculated to allay heat and thirst, and to correct a peevish tenderness in the fluids; but that in this respect they seem to possess no peculiar advantage over most of the other acid fruits; hence the colleges of London and Edinburgh have excluded this fruit from the Materia Medica, and retained only that of the currant. The bark is said to be purgative, and Ray experienced its good effects taken

taken as a decoction in the jaundice. The roots boiled in lye dye wood yellow. In Poland they dye leather of a most beautiful yellow with the bark of the root: and the inner bark of the stem dyes linen of a fine yellow, with the assistance of alum. Withering, *ubi supra*. Kine, sheep, and goats, are said to eat this shrub, and horses and swine to refuse it.

2. *B. cretica*, Cretan, or box-leaved barberry; *Lycium Creticum*, Alp. Exot. 21. t. 20. Pon. Ital. 137. "Peduncles sub-umbelled, spines triple." A shrub that never rises more than 3 or 4 feet high in England, where the flowers are not succeeded by fruit. A native of the island of Candia, or Crete, and also of Japan. Cultivated in 1759, by Mr. Miller: flowering in April and May. 3. *B. ilicifolia*, holm-leaved barberry. Lin. Syst. 343. Suppl. 210. "Leaves obovate, ferrate-spinous, pedicels elongated cymose, spines digitate." Found in the Terra del Fuego by Sparman, where the inhabitants used the wood for bows, on account of its great elasticity. 4. *B. sibirica*, Siberian barberry. Linn. Syst. 343. Murr. in com. got. 1784. 37. t. 6. Pall. It. 2. 737. t. P. f. 2. "Peduncles one-flowered, solitary, nodding; spines palmate." A small shrub, scarcely a span in height. A native of Siberia, where it was observed by Pallas.

Propagation and Culture. The common sort is generally propagated by suckers; but as the plants thus propagated send out suckers in greater abundance than those which are propagated by layers, the latter method should be preferred. The best time for laying down the branches is autumn, and the young shoots of the same year are the best; which will be well rooted by the next autumn, when they may be taken off and planted where they are to remain. When this plant is cultivated for its fruit, it should be planted single, and not in hedges; and the suckers taken away every autumn, and all the gross shoots pruned out; by this method the fruit will be fairer and more abundant. A few of these shrubs will make an agreeable variety in wildernesses or plantations of shrubs; and the fruit will be food for birds; but they should not be planted in too great quantities, or near walks that are much frequented, because their flowers emit a very strong disagreeable odour. The Canada fort may be propagated in the same way as the common sort, and is equally hardy. The box-leaved sort, which is now very rare in England, may be propagated by laying down the branches in the same manner as the first; but the young plants should be set in pots, or sheltered under a frame in the winter; and when they have acquired strength, they may be turned out of the pots, and planted in a warm situation. Martyn's Millar's Bot.

BERBI, in *Geography*, a town of Africa, on the Ivory coast, N. E. of cape Palmas. N. lat. 4° 30'. W. long. 5° 34'.

BERBICE, the seat of a colony of Guiana in South America, formerly belonging to the Dutch, on a river of the same name, about 25 leagues N. W. by W. $\frac{1}{2}$ N. distant from Surinam, which runs from N. to S. and discharges itself into the Atlantic ocean. The coast on each side of the river forms a bay at its entrance, nearly a mile broad, in the middle of which is a small island, called "Crab island." Opposite to this island, on the eastern shore, is a fort, with several pieces of artillery, and some soldiers; but the channel on the other side, which is navigable for ships of any burden, is undefended, and covered by the island from the guns on the opposite shore. Without the entrance of the river is a bar, which, at high tide, has seldom more than 16 feet of water; but within the water is of sufficient depth, and the river is navigable for ships of burden 200 miles from its mouth.

The plantations are situated on each side of the river, and extend nearly 300 miles from its entrance at fort Nassau, which was formerly the seat of government, and contiguous to which were the public offices and houses of the civil and military officers, about 100 miles from the mouth of the river. But the seat of government is now fixed at a point of land on the eastern shore of Berbice, about a mile from its entrance, which is formed between Berbice and the river Conya, which there discharges itself into the former. This is a narrow, but deep river, running from south to north, but diverging somewhat easterly from Berbice. On the sides of this river are several plantations, which form a part of the colony of Berbice. The produce of these plantations consists chiefly of sugar, coffee, cotton, and cocoa, and other articles, such as are furnished by Surinam. Bancroft's Nat. Hist. of Guiana, p. 350, &c. The colony of Berbice surrendered to the British arms in September 1803. The river Berbice discharges itself into the Atlantic in N. lat. 6° 30', and W. long. 57° 20'.

BERBUDA. See BARBUDA.

BERBURG, a town of the Netherlands, in the duchy of Luxemburg; 12 miles N. E. of Luxemburg.

BERCAD, a town of Poland, in the palatinate of Braclaw, near the Bog; 52 miles S. S. E. of Braclaw.

BERCARIA, BERQUERIA, or BERKERIA, in *Middle Age Writers*, denotes a sheep-fold, sheep-cote, sheep-pen, or other inclosure, for the safe keeping of a flock of sheep.

The word is abbreviated from *berbicaria*; of *berbex*, deformed from *vervex*. Hence also a shepherd was denominated *berbicarius*, and *berquarius*.

BERCHEM, or BERGHEM, NICHOLAS, in *Biography*, an eminent painter of landscapes and cattle, was born at Haerlem in 1624; and formed for the practice of his art under some of the best masters of his time. In his manner of painting he was easy and expeditious, and though he selected a very great variety and beauty of sites for his landscapes, he executed them with a surprising degree of neatness and truth. He possessed a clear and strong judgment, and a facility in expressing his ideas; and, therefore, in the lower kind of subjects to which he directed his attention, his choice of nature was judicious, and he gave to every subject as much beauty and elegance as it would admit. The leafing of his tree is exquisitely and freely touched; his skies are clear; and his clouds float lightly, as if supported by air. The distinguishing characters of the pictures of Berchem are the breadth and just distribution of the lights; the grandeur of his masses of light and shadow; the natural ease and simplicity in the attitudes of his figures; the just degradation of his distances; the brilliancy and harmony, as well as transparency, of his colouring; the correctness and true perspective of his design; and the elegance of his composition. He painted every part of his subject so well, as to render it difficult to determine in which he excelled most; his trees, buildings, water, rocks, hills, cattle, and figures, being all equally admirable. One of the most capital pictures of this master was painted for the principal magistrate of Dort, in whose family it is preserved; it exhibits the prospect of a mountainous country, enriched with a great variety of sheep, oxen, goats, and figures, excellently pencilled, and most beautifully coloured. Berchem was indefatigable, partly from his love of labour, and partly to gratify the avaricious disposition of his wife, who never allowed him to relax; and he painted, in the summer months, from four in the morning till day light failed: in consequence of this close application, his pictures are very numerous; and yet at this day they are rarely to be purchased, and always afford a very

very high price. Berchem died in 1683. We have several etchings by this master, that are executed in a fine, bold, mallery style; and from these John Wither seems to have formed that admirable style in which he engraved the copies from Berchem's pictures. Pilkington and Strutt.

BERCHEM, in *Geography*, a town of Brabant: 4 miles S. W. of Ravestein.

BERCHEM, or *Pergen*, a town of Germany, in the circle of Westphalia, and duchy of Juliers; 9 miles east of Juliers.

BERCHEROIT, or **BERKCOITS**, in *Commerce*, a weight used at Archangel, and in all the Russian dominions. It is equal to about 164 pounds English avoirdupois.

BERCHET, **PETER**, in *Biography*, an historical painter, was born in France, in 1650, and placed, at the age of 15, under the care of La Fosse, so that in 3 years he was qualified to be employed in the royal palaces. In 1681, he came over to England, and worked under Rambour, a French painter of architecture. Berchet painted the ceiling in the chapel of Trinity college, Oxford, the staircase at the duke of Schomberg's house in London, and the summer-house at Ranelagh. His drawings in the Academy were much approved. Towards the close of life he only painted small historical pieces, the subjects of which were taken from fabulous history; and his last performance was a Bacchanalian picture, to which he affixed his name the day before he died, in the year 1721. He occasionally amused himself with the point. Pilkington and Strutt.

BERCHING, in *Geography*, a small town of Germany, in the bishopric of Eichstett, or Aichstadt, seated on the river Sulz.

BERCHORIUS, **BERCHEUR**, **PETER**, in *Biography*, a learned divine and voluminous writer of the 14th century, was born at the village of St. Pierre du Chemin, 3 leagues from Poitiers in France, and was constituted grammatical preceptor to the novices of the Benedictine monastery at Clugni, in the year 1340. He died prior of the Benedict convent of St. Eloi at Paris, probably at an advanced age, in the year 1362, as we learn from his epitaph in that monastery. Berchorius was one of those writers who affected to interpret allegorically, not only texts of Scripture, but also poetical fables and profane histories, which they arbitrarily applied to the explication or confirmation of the mysteries of Christianity. His three grand printed works are, "Reductorium Morale super totam Bibliam," in 26 books, first printed Argentorat. 1473, fol. and containing all the incidents and stories in the Bible, reduced into allegories, "Repertorium, or Reductorium, Morale," in 14 books, which is a dictionary of things, persons, and places, all which are supposed to be mystical, and are therefore explained in their moral and practical sense; and "Dictionarium Morale," in two parts, and seeming to be principally designed as a moral repertory for students in theology. These pieces were all printed at a very early period; and a folio edition of them was printed, in 3 volumes, at Venice, in 1583. Berchorius was also the author of a comment on a profody, called "Doctrinae Metricae," which was used as a school-book in France. Glassius, in his "Philologia Sacra," written about the year 1623, and of which a third edition was printed at Francof. and Hamb. in 1657, ascribes to this author the famous work entitled "Gesta Romanorum;" the writer of which has for a long time remained unknown to the most diligent inquiries into Gothic literature. The learned Mr. Thomas Warton concurs in this opinion, and thinks it amply confirmed by the general coincidence of the plan, manner, method, and execution between the "Gesta Romanorum," and the three works of Berchorius above-mentioned. He supposes it was written about the year 1340,

with a view of rendering the exercises of his scholars, in the monastery at Clugni, in Latinity, more agreeable and easy, by means of an entertaining Latin story-book, capable of being readily applied to lessons of religion. This piece operated powerfully on the general body of our old poetry, and afforded a variety of inventions, not only to Chaucer, Gower, and Lydgate, but to their distant successors. It was first printed in the Gothic letter without date, and as it is supposed, before or about the year 1473, in folio; and contains 152 chapters. The second edition was printed in the same or following year at Louvain, in 4to, and contains 185 chapters. Another edition was printed in folio, in 1488. At the commencement of typography in England, a translation of it in English was printed by Wynkin de Worde, and it was afterwards frequently reprinted. This work is compiled from the obsolete Latin chronicles of the later Roman, or rather German story, heightened by romantic inventions, from legends of the saints, oriental apologies, and many of the shorter fictitious narratives, which came into Europe with the Arabian literature, and were familiar in the ages of ignorance and imagination. The classics are sometimes cited for authorities; but these are of the lower order, such as Valerius Maximus, Macrobius, Aulus Gellius, Seneca, Pliny, and Boethius. To every title is subjoined a moralisation, reducing it into a Christian or moral lesson. Warton's Hist. Eng. Poetry, vol. iii.

BERCHTOLDSDORF, or **PETERSDORF**, in *Geography*, a town of Germany, in the archduchy of Austria, 6 miles south-west of Vienna.

BERCHTOLSGADEN, or **BERGTOLSGADEN**, a proventuship and principality of Germany, in the circle of Bavaria, environed by the archbishopric of Salzburg, but exempt from the jurisdiction of that see. It is wholly mountainous, and contains two towns and a few villages, and also several lakes. At Bergtolsgraden, as well as at Hallein, in the principality of Salzburg, salt is found in its fossil state. In order to obtain it, large cavities, or chambers, are dug in the mines, and filled with fresh water. Some of these are so large that the water must stand in them during two years before it is sufficiently impregnated with salt; in others, this process does not require more than a few weeks. When the water is saturated, it is carried through the mount in by pipes into a reservoir, whence it is conveyed to the cauldrons. Of these there are four at Hallein, and two at Bergtolsgraden, which are not above four leagues distant from each other. The salt annually made at the former of these places, amounts to 400,000 quintals, and at the latter to 160,000. Count Razenmowlski supposes (Hist. et Mem. de la Societe des Sciences Physiques de Lausanne, vol. iii. for 1787 and 1788), that the mines at Hallein, and those at Bergtolsgraden, are parts of the same bank of salt, which, in his opinion, is a continuation of that of Grund in Austria, about 8 leagues from Hallein; and the irregularity of the strata seems to indicate that the connexion between the two mines must have been broken by some violent convulsion.

BERCKEL, a town of Holland, 5 miles east of Delft. — Also, a river of Germany, which rises in the bishopric of Munster, and runs into the Rhel at Zutphen.

BERCKSENBROECK, a town of Holland, 6 miles north of Rotterdam.

BERD, a river of Siberia, which runs into the Oby, near Beiskoi.

BERDA, in *Ichthyology*, a species of *SPARUS*, that inhabits the Red sea. It is of a whitish grey; lateral scales marked in the middle with a single transverse brown band dorsal spines recumbent. Forsk. F. n. Arab. The body of this fish is oval; back gibbous, with pale bands; beneath white; scales

feales broad, rounded, entire. The crown is naked, convex, flosing; iris white; nostrils large, linear, with a conic cirrus; four long, conic, subulate, incisive teeth; grinders numerous, hemispherical, those behind largest; upper lip long, protractile; gill-covers entire; lateral line nearest the back; fins brown, pectoral ones transparent and lanceolate; tail two-lobed. Gmelin.

BERDA, *Cape*, or BERDINSKAYA, in *Geography*, the east point of a large bay of the sea of Azoph; cape Wisarionova, or Besarionova, being the west point. Several rivers empty themselves into this bay. N. lat. $46^{\circ} 42'$. E. long. $56^{\circ} 24'$.

BERDAA, a town of Asia, in Armenia, 160 miles east of Erivan.

BERDANIEH, a town of Asiatic Turkey, in the province of Caramania; 32 miles north of Alameh.

BERDASCHIR. See BARSIR.

BERDASH, in *Antiquity*, was a name formerly used in England for a certain kind of neck-dress; and hence a person who made or sold such neckcloths was called a *berdasher*, from which is derived our word *haberdasher*.

BERDICZOW, in *Geography*, a decayed town of Poland, in the palatinate of Volhynia, 148 miles E.S.E. of Lucko, and 324 S.W. of Warsaw.

BERDIN, or BERLIN, in *Conchology*, the name by which the *limpet*, or paper-shells, *patella* of Linn., is known on the coast of Normandy. It is also called in some places *beracle*, or *hernicle*.

BERDOA, in *Geography*, a province of Africa, in the eastern division of the great desert or Sahara, constituting one of the Oases or fertile islands, which forms a part of that extensive desert that separates Egypt from Fezzan, and contains the wandering tribe of Lebeta or Levata. It is situated to the north-east of Agadez, and has Kuar or Kawar to the south and east, to the north Augela, and the desert of Barca, and to the west Fezzan. It extends northward from N. lat. 25° , and lies between 20° and 25° E. long.; but its exact boundaries are not ascertained. Berdoa, its capital, lies north of the mountains of Tibelli; and, according to Rennell's map, is placed in N. lat. $26^{\circ} 32'$. E. long. $21^{\circ} 35'$.

BERE-ALSTON, though only a small inconsiderable hamlet, in the parish of Bero-Ferris, Devonshire, has the privilege of returning two members to the English parliament. The right of election is vested in those persons who possess land in the borough, and pay three-pence acknowledgment to the lord of the manor, who varies the number of electors at pleasure, by granting burgage tenures to his own partizans only. The first return of members for this borough was in the 27th of Elizabeth. In the vicinity of this place are several lead mines; but none of them produce much ore, though in the time of Edward I. they were not only very rich in this metal, but yielded a great quantity of silver. It is said that 1600 weight of the latter was obtained in the course of three years.

BERECYNTHUS, in *Entomology*, a species of PAPILO, with entire wings, black above, with a yellow marginal band; six ocellar spots on the underside of the posterior pair. Fabricius. This is *papilio berecynthia* of Cramer, is of a large size, and inhabits Surinam.

BERECYNTIA, in *Ancient Geography*, a town of Asia Minor, in Phrygia. Steph. Byz.

BERECYNTIA *Regio*, a country of Asia, towards the river Sangar. Steph. Byz.

BERECYNTIUS TRACTUS, a canton of Asia Minor, in Caria. Pliny.

BERECYNTUS, a mountain of Asia Minor, in Phrygia, consecrated to the mother of the gods.

BERECZINA, in *Geography*, a river of Lithuania, which rises in the palatinate of Vilna, and runs into the Niemen, 16 miles north-east of Novogrodek.

BEREFIORD, a trading place and port of the island of Iceland.

BEREGRA, or BERETRA, in *Ancient Geography*, a town of Italy, in Picenum, at a small distance north from Interamna.

BEREGSZAZ, in *Geography*, a town of Hungary, 24 miles north of Zatmar. It gives name to a county, and derives its appellation from a Saxon colony established there; but its present inhabitants are Hungarians.

BEREIA, a town of Africa, north of Sierra Leone, at a small distance from the coast. N. lat. $8^{\circ} 58'$. W. long. $12^{\circ} 28'$.

BEREILLY, or BARELLY, a city of Hindoostan; is the capital of Rohileund, which was added to the dominions of Oude in 1774. It lies about half way between Lucknow and Delhi. N. lat. $28^{\circ} 27'$. E. long. $79^{\circ} 45'$. See BARELLY.

BERELOS, a lake of Egypt, between Damietta and Rosetta; about 32 miles long and ten broad in the middle, but gradually contracting towards each end. It has within it several islands.—Also, a town of Egypt, 30 miles west of Damietta.

BEREN, an island of Asia, 40 leagues west from Congo island in the gulf of Bassora.

BEREN, or BIERON, a town of Silesia, in the province of Ratibor; 34 miles east of Ratibor.

BERENBORG, called also Joan Main island, an island in the north seas, near the coast of East or Old Greenland. N. lat. $71^{\circ} 10'$. W. long. $6^{\circ} 19'$.

BERENGARIANS, in *Ecclesiastical History*, a religious sect, adhering to the opinions of Berengarius, who, in the latter part of the eleventh century, a considerable time before Luther, opposed the doctrine of transubstantiation, and the real presence, strenuously maintained by Lanfranc and Anselm. See BERENGER.

He is farther charged by the Romanists with decrying marriage, and maintaining the common use of all sorts of women, and asserting baptism of no effect.

His followers were divided on the head of the eucharist: though they all agreed, that the bread and wine were not essentially changed, yet some allowed, that the body and blood of Christ were contained in them, though concealed under an impanation: others denied any change at all, and resolved the whole into figure: others again allowed a change in part; and others an entire change, with this restriction, that to those who presented themselves unworthily it was changed back again.

Mabillon has an express dissertation on the manifold condemnations of Berengarius, his retractions, relapses, and repentance.

BERENGER, JAMES, in *Biography*, a native of Carpi, in Modena, from whence he took his name, being much more known by the name of Carpus, than by that of his family, Berengarius; one of the restorers and improvers of anatomy, was born about the end of the fifteenth century. He was initiated into the knowledge of surgery by his father, who practised that art, and had for his instructor in languages and philosophy, the celebrated Albertus Minutius. At a proper age he went to Bologna, and afterwards to Padua, where he filled for some time the office of professor of anatomy. Returning in 1518 to Bologna, he was there raised to the same office, which he continued to fill until about the year 1525. While teaching here, he is said to have dissected upwards of an hundred human bodies: a prodigious

prodigious number for the time, when the prejudice against handling or disturbing the dead was so strong. To that circumstance, aided by his known antipathy to the Spaniards, perhaps may be attributed the story of his having dissected two of the natives of that country alive, with the view of feeling the motion of the bowels, and of his being on that account obliged to fly his country. A similar story had been told of Herophilus, and was afterwards told of Vesalius. That this, however, had been done by some anatomists, or that he was accused of it, seems probable by his speaking of such a practice in his commentary on the works of Mundinus, with disgust and horror. He is with more reason said to have offended the ministers of religion by the levity and indecency of his conversation on the subject of his dissections, and by the profligacy of his life; and on that account to have been obliged to quit Bononia.

By his numerous dissections, he was enabled to correct many erroneous opinions as to the structure of the interior parts of the body, which prevailed to his time, and thence to pave the way for the further improvements made by Vesalius, his immediate successor. If he was not the inventor, as Douglas calls him, he was one of the first who used mercurial frictions in curing the venereal disease, by which he is said to have acquired a large fortune, which he left, at his death, to the duke of Ferrara, to whose territory he retired, and where he died, about the year 1527. His works are, "Commentaria, cum amplissimis additionibus, supra anatomiam Mundini, cum textu ejus in pristinum nitorem restituta," Bononia, 1521, 4to., containing, besides numerous corrections of Mundinus, a prodigious number of anatomical facts, which bear abundant testimony to his diligence and ingenuity. "Ea omnia enarrare, quæ recte videt (Haller says, inimitabile foret;)" and further on, "Invenio apud hunc virum, testimonium irrefragabile pro antiquo more, quo cardinales testes pontificis, nuper electi, contraerant." There are several rude engravings of the muscles of the abdomen, and of other parts, in this volume. "Hæcogæ breves, periculis et uberrimæ in anatomiam humani corporis ad fidem Galenicorum præces in lucem editæ," Bonon. 1522, 4to. also with plates. Both these works have passed through numerous editions. In 1664, it was published in London, with the title, "A Description of the Body of Man, being a practical Anatomy." He also published, in 1518, 4to. Venet. "De Cruri Fractura." Douglas. Bib. Anat. Haller. Biblioth. Chirurg.

BERENGER, BERENGARIUS, an eminent logician and controversialist, was a native of Tours in the eleventh century, and having studied under Fulbert at Chartres, he returned to Tours, where he was made principal of the school of St. Martin, and treasurer of the church. From Tours he removed to Angers, and became archdeacon of the city. Distinguished by his acute and subtil genius, by his extensive learning, and by his peculiar talents for controversy, as well as by the exemplary tenor of his life and manners, he was held in very high estimation. At length, however, he found reason to deviate from the doctrines of the church concerning the eucharist; and in 1045, he began to maintain publicly the doctrine of Scotus, in opposition to the opinion of Radbert; and he persisted in teaching that the bread and wine were not changed into the body and blood of Christ in the eucharist, but preserved their natural and essential qualities, and were merely figures and external symbols of the body and blood of our Saviour. Although the church of Rome had not, in this century, adopted any settled and decided opinion concerning the nature and manner of Christ's presence in the eucharist, the doctrine of Berenger was not only opposed by several doctors in France and Ger-

many, but attacked with peculiar vehemence and fury by the Roman pontiff Leo IX. who, in 1050, convened two councils, one at Rome, and the other at Verceili, in which it was solemnly condemned; and the book of Scotus, from which it was deduced, was committed to the flames. The council of Paris, summoned in the same year by Henry I., concurred in its condemnation, and menaced Berenger, and his numerous adherents, with all sorts of evils, both spiritual and temporal. The heresiarch was deprived by Henry of all his revenues; but he continued for some time afterwards firm and resolute in his adherence to the doctrine he had embraced, and enjoyed unmolested tranquillity. The prevalence of his doctrine, notwithstanding the opposition with which it encountered from the writings of its antagonists, and particularly from those of Anselm and Lanfranc, archbishops of Canterbury, alarmed the church; and two councils were summoned by Victor II. at Tours, in 1054, to examine anew this dangerous doctrine. In one of these councils, Hildebrand, afterwards pope Gregory VII. appeared as the pope's legate, and took the lead in opposing this new heresy. Berenger, who was present, was at length overpowered by threats, and not only abandoned his opinions, but solemnly abjured them, and made his peace with the church. This abjuration, however, was only an act of timidity and dissimulation; for he soon after taught the opinions he had formerly professed, though the dread of danger rendered him more circumspect and cautious. As soon as Berenger's perfidy was announced to Nicholas II., the exasperated pontiff summoned him to Rome in 1058, and in a council held there the following year, he was so terrified, that he declared his readiness to embrace and adhere to the doctrines which that venerable assembly should think proper to enjoin. Accordingly, Humbert was employed by the pope and council to draw up a confession of faith, which Berenger publicly signed, and to which, by a solemn oath, he avowed his adherence. As soon as Berenger returned to France, and found himself countenanced and protected by his ancient patrons, he expressed his detestation of the doctrines which he had been obliged to profess at Rome, abjured them solemnly both in his discourses and writings, and zealously inculcated his former opinion. Pope Alexander II. attempted by soothing and friendly expostulations to regain the apostate; but his remonstrances were ineffectual; the controversy was prolonged for many years, and the followers of Berenger continually increased. As soon as Hildebrand was advanced to the papal chair, he undertook to terminate the controversy; and with this view required Berenger, in 1078, to repair to Rome. Towards the conclusion of this year, a council was held in this city, and Berenger was permitted to draw up a new confession of his faith, and to renounce that which had been composed by Humbert, and approved by Nicholas II. and a Roman council. On this occasion the persecuted prelate made a declaration, confirmed by an oath, that he would for the future adhere to the following proposition: viz. "that the bread laid on the altar becomes, after consecration, the true body of Christ, which was born of the Virgin, suffered on the cross, and now sits at the right hand of the father; and that the wine placed upon the altar becomes, after consecration, the true blood which flowed from the side of Christ." This declaration satisfied the pontiff, but was thought by the enemies of Berenger to be too vague and equivocal. Gregory yielded to their clamours; and at a council held at Rome, in 1079, a new confession of faith was drawn up, to which Berenger, after reading and subscribing it, declared his assent by a solemn oath. This confession expressed his belief, "that the bread and wine were, by the mysterious influence of the holy

prayer, and the words of our redeemer, substantially changed into the true, proper, and vivifying body and blood of Jesus Christ;" and this was followed by a solemn declaration, "that the bread and wine, after consecration, were converted into the real body and blood of Christ, not only in quality of external signs and sacramental representations, but in their essential properties, and in substantial reality." Gregory dismissed him with the most honourable testimonies of his friendship and liberality, and he returned to his own country. But Berenger, not conceiving himself bound by this declaration, publicly retracted the sentiments which he had solemnly avowed at Rome, and even composed an elaborate refutation of the doctrine to which he had been compelled to profess his assent. Gregory, who seems not to have approved the last confession imposed upon Berenger, when appealed to, declined interfering, and took no measures for molesting him. From this time, Berenger observed a profound silence amidst the clamours of his incensed adversaries, and made no reply to their bitter and repeated invectives. At length, decaying with age, overpowered by the opposition with which he had incessantly struggled, and probably depressed with the reproaches of his own mind for the pusillanimous and dishonest part he had acted, he abandoned all his worldly concerns, and retired to the isle of St. Cosme, in the neighbourhood of Tours, where, in a course of penitential and pious exercises, he passed the short remainder of his life; and in 1088, he was released by death. On the minds of the people, he left behind him a deep impression of his extraordinary sanctity; and an annual service is still performed for him in the church of St. Martin at Tours. His unsteady conduct was unquestionably very disgraceful to him; and there is reason to believe that it embittered the reflections of his retirement and closing scene. It is therefore a question of little importance, whether he abandoned his original opinion before his death, as the Roman catholic writers maintain, or whether he adhered to it in the last period of his life, as the protestants, with greater probability, have asserted. All his works, which were numerous, have been lost; except two letters, his three professions of faith, and part of his treatise against one of them. Cave's Hist. Lit. tom. ii. p. 130. Mosheim's Eccl. Hist. vol. ii. p. 559, &c.

BERENICE, or BERNICE, a Jewish queen, the daughter of Agrippa the elder, and sister of Agrippa the younger, kings of Judæa. She was born about the year of Christ 28, and at the age of 16 married her uncle Herod, king of Chalcis. After her husband's death, A. D. 48, she was suspected of having criminal intercourse with her brother Agrippa; and in order to remove suspicions, and to silence rumours of this kind, she consented to marry Polemon, king of Pontus and part of Cilicia, on condition of his embracing Judaism. She lived with him, however, but a little while, and returned to her brother, with whom she lived on terms of intimacy, which subjected her to reproach. Juvenal refers to this incestuous connection (sat. vi. v. 155):

— "Deinde Adamas notissimus, et Berenices
In digito factus pretiosior; huic dedit olim
Barbarus: incestæ dedit hunc Agrippa forori."

When Agrippa heard the discourse of St. Paul before Festus at Cæsarea of Palestine, Berenice was present with him. After the commencement of the Jewish war in 67, when Agrippa was driven from Jerusalem by the seditious people, she remained for some time after him, and interceded for the Jews with the Roman governor Florus, by whom she was treated with great disrespect. She afterwards accompanied Agrippa to the army of Vespasian in Syria; and contrived, by costly presents, to engage the good will of that avaricious emperor as long as he lived. Her beauty and ad-

dress had also captivated Titus; and on the death of Vespasian she followed him to Rome. The emperor was much attached to her, and disposed to make her his queen; but in deference to the sentiments of the Roman people, who disliked the idea of a foreign queen, and who well knew that her character was not irreproachable, he dismissed her, and sent her away to her own country. What became of her afterwards history does not inform us. Jos. Antiq. l. xix. xx. De Bell. Jud. l. ii. Tacit. Hist. l. ii. Crevier. Gen. Dict.

BERENICE was likewise the name of several Egyptian and eastern queens. One of them, the wife of Ptolemy Evergetes, king of Egypt, under an apprehension of the danger to which he would be exposed in his expedition to Syria, made a vow to consecrate her hair, which was her chief ornament, in case of his safe return. When the prince returned, not only in safety, but crowned with glory and success, she immediately cut off her hair, and dedicated it to the gods in the temple which Ptolemy Philadelphus had built in honour of his beloved Arsinoë, under the name of the Zephyrian Venus, on the promontory of Zephyria in Cyprus; but this hair being lost by the negligence of the priests, Ptolemy was enraged, and threatened to punish them. Upon which Conon of Samos, a flattering courtier, as well as skilful mathematician, with a view to appease the king's anger, and to conciliate his favour, affirmed, that the queen's locks had been conveyed to heaven, and pointed out seven stars near the tail of the lion, which till that time had not belonged to any constellation, declaring that they were the queen's hair. Several other astronomers confirmed the asseveration of Conon; and hence "Coma Berenices," or Berenice's hair, became one of the constellations.

Callimachus, who lived at that time, and had been a great favourite of Philadelphus, wrote a hymn on the hair of Berenice, which was afterwards translated by Catullus, whose version is extant among his other performances. Berenice, according to Plutarch (in Quest. Græc.) and Stephanus Byzantinus (verb. Βερενικη), was formed from Φερενικη, a bearer of victory, by the Macedonians, who exchanged Ph into B.

BERENICE, in *Entomology*, the name under which Cramer figures *papilio crispus* of Fabricius and Gmelin.

BERENICE, in *Ancient Geography*, the name of several cities, of which Ortelius reckons nine. The principal are as follow: viz. a town of Thrace:—another of Asia Minor in Cilicia:—another of Asia, called Pella in Cælo-Syria; all three mentioned by Stephanus Byzantinus:—another of Africa in Cyrenaica, near the mouth of the river Lathon, or Lethon, where it discharges itself into the bay of Syrtis, anciently called Hesperis, and Hesperides, now Berenice: near this town was situated the garden of Hesperides, and a wood still marks its position, in a country destitute of trees:—another, a maritime town of Arabia Petraea, situated at the extremity of the Arabian gulf, or Red sea, the promontory of Heroopolis, and that of Strobilus, according to Pomponius Mela; it is mentioned by Josephus, in his account of Solomon's fleet, who says, it was not far from the city of Ælana, and that it was formerly called Assingaber, or Eziongaber, in which position it M. d'Anville acquiesces:—another, a famous town of Egypt, so named from the mother of Ptolemy Philadelphus, who founded it on the western side of the Red sea, and nearly under the tropic, about 450 miles below Suez, in order to avoid the slow and dangerous navigation of the upper part of the Red sea; this city soon became the staple of the trade with India. From Berenice the goods were transported by land to Coptos, a city three miles distant from the Nile, but which had a communication with that river by a navigable canal, of which there are still some remains, and thence carried down the stream of the Nile,

and its canals, to Alexandria. The distance between Berenice and Coptos, according to Pliny (Nat. Hist. l. vi. c. 29.) confirmed by the Itinerary of Antonine, and approved by M. P. A. Villi, was 258 Roman miles; and the road lay through the desert of Thebais, almost entirely destitute of water. But the attention of a powerful monarch made provision for supplying this want, by searching for springs, and wherever these were found he built inns, or more probably, in the eastern style, caravanseras, for the accommodation of merchants. See Strabo, Geog. l. xvii. p. 1157. D. 1169. In this channel the intercourse between the east and west continued to be carried on during 250 years, as long as Egypt remained an independent kingdom. Berenice continued to be the port of outlet for the Roman East India trade in the time of Pliny (A. D. 79.) who details, in his 6th book, the account of the navigation to India, and who informs us, that it cost 5 millions of sesterces, or about 440,000*l.* every year. From Berenice it was reckoned 30 days' navigation down the Red sea to Ocelis (Galla) just within the strait of Babelmandel. From Ocelis to Muziris, the first port of merchandize in India, was 40 days' sail: so that as they left Berenice about Midsummer, they might arrive in India in the latter end of August, when the violence of the S. W. monsoon was abated, and the sailing navigation safe and easy. These voyages were first made by coasting along the Arabian shore, to the promontory byægrius (now cape Rafalgate,) and thence along the coast of Persia, either directly to Pattala (now Tatta,) at the head of the lower Delta of the Indus, or to some other emporium on the west coast of India. Afterwards, a shorter and safer course was discovered; and from cape Rafalgate vessels sailed in a direct course to Ziveris, which, according to major Rennell, was a port on the northern part of the Malabar coast. In a subsequent period, a direct course was pursued from the outlet of the Red sea to Muziris. It has not been accurately ascertained what were the other ports in India which the merchants from Berenice frequented, when that trade was first opened; but it is probable, that as their vessels were of small burden, and kept near the coast, their voyages were circumscribed within very narrow limits, and that under the Ptolemies, no considerable progress was made in the discovery of India. Rennell's Mem. Intrad. p. 35—37. Robertson's Hist. Disq. concerning India, p. 46, &c.—Another Berenice was a town of Africa, on the Red sea, situate more to the south than the preceding, in the country of the Troglodytes, at the entrance of the Red sea, near the strait of Babel Mandel, known by the epithet of "Epidiria"—another, denominated by Pliny (l. vi. c. 29.) "Panchrybia," from the gold dug in its vicinity; and by Strabo, *περὶ τῆς Ἰνδίας, juxta Sabas*, on the same coast; translated by Hardouin to Arabia Felix, but mentioned by Strabo and Pliny in connection with the country of the Troglodytes.

BERENICE'S HAIR, in *Astronomy*. See *BERENICE* *αἰχμή*, and *COMA Berenice*.

BERENTHA, in *Ancient Geography*, a small town of Peloponnesus in Arcadia, mentioned by Strabo, Byz. and Pausanias.

BERENTHATE, a small river of Peloponnesus in Arcadia, that discharged itself into the Achæan. Pausanias.

BERENTZ, in *Geography*, a town and a part of Hungary; 20 miles N. N. E. of Pestburg.

BERES, in *Ancient Geography*, a town of Thrace. Steph. Byz.

BERESKY, in *Geography*, a town of Poland, in the palatinate of Braclaw; 45 miles S. E. of Pracław.

BERESNA, or **BERESIN**, a district and town of Tchernigof in Russia, situated on the Desna, 24 miles E. N. E. of Tchernigof.

BERESOF or **BERESOW**, a district of the province of Tobolsk in Russia, in the country of the Samoyedes, situated on the river Soffva, which falls into the Oby; and bounded to the north by the straits of Waygats; on the east by the Ural mountains; on the south by the river Konda, and a large bay of the Frozen ocean, which runs into the land toward the south, and separates near the 66th degree of north latitude, into two parts, one of which is called the Obskaia Guba, or bay of Oby, and the other Tazowkaia Guba, or the bay of Tazow. Into the former the river Oby empties itself, and into the latter the Taz; and from these two rivers the bays derive their names. This district was added to the Russian empire by the czar Gabriel, in 1530, long before the other parts of Siberia were conquered. The town of Beresof is situated on the west side of the river Oby, 372 miles N. N. W. of Tobolsk. N. lat. 64. E. long. 65. 14'. This district is famous for its gold mines, in the mineral mountains of Ural, opened in 1754, and affording annually 3, 4, 5, or 6, and in later years 7 or 8 pood of gold. From the commencement of the work, in 1754, till the year 1788, during an interval of 34 years, the quantity of about 120 pood has been generally gained, which, estimated in value, amounts to about 1,198,000 rubles, and after deducting the costs, to above 480,000 net profit. Taking the gold and silver here obtained, according to its standard in coinage, and balancing it with the expenses paid in copper money, according to its true value, a profit accrues of nearly 800,000 rubles. Took's View of Russia, vol. iii. p. 296.

BERESOF is also a town of Russia, in the government of Olonetz. N. lat. 64. 15'. E. long. 30. 34'.

BERETILSKO, a town of Poland, in the palatinate of Volhynia; 24 miles S. S. W. of Lucko.

BERETHALOM, or **BIRTHELEN**, a spacious town of Transylvania, in the district of Weibland, which is the residence of the Protestant bishop. The church is seated on a high rock, and its vicinity produces good wine.

BERETZHAUSEN, a town of Germany, seated on the Laaber, in the circle of Bavaria, and principality of Neuburg; 12 miles W. N. W. of Ratisbon.

BEREWICHA, or **BEREWICA**, in our *Old Writers*, denotes a village or hamlet belonging to some town or manor, situate at a distance from it.

The word frequently occurs in Doomsday-book: *Ipse sunt berewiche ipsidem maneri.*

BEREZA, in *Geography*, a town of Poland, in the palatinate of Kiow; 30 miles W. of Belzetziew.—Also, a town of Lithuania, in the palatinate of Poliss, and territory of Brzsk; 56 miles E. N. E. of Brzsk. In this place the Catholics have a convent.

BEREZEC, a town of Little or Red Russia, in the palatinate of Cheln; 22 miles east of Cheln.

BEREZEN, a river which runs into the Black sea; 20 miles west of Oczakow.

BERLZENE, a town of Poland, in the palatinate of Volhynia. N. lat. 51. 45'. E. long. 25. 30'.

BEREZEUKA, a town of Russia, in the government of Smolensk, on the west side of the Volga; 124 miles S. of Smolensk.

BEREZINA, or **BEREZYNA**, a river of Lithuania, which rises in the palatinate of Poliss, and runs into the Dniester, in N. lat. 52. 10'. E. long. 30. 55'. This river has been erroneously laid down, by some modern geographers, as forming a town which is not mentioned in any of our Authors.

BEREZISA, a town of Lithuania, in the palatinate of Poliss, near the source of the river of the same name; 44 miles N. E. of Minsk. N. lat. 54. 20'. E. long. 25. 35'.

BEREZINSKOI, a town of Siberia, on the north side of the Irtysh; 40 miles E. of Tobolsk.

BEREZNA, a town of Russia, in the district of Kargapol, seated on the river Onega. N. lat. $62^{\circ} 18'$. E. long. $38^{\circ} 5'$.

BEREZNE, a town of Poland, in the palatinate of Vóhlynia, near the river Sluez. N. lat. $51^{\circ} 10'$. E. long. $26^{\circ} 52'$.

BEREZNIKI, a town of Lithuania, in the palatinate of Troki; 40 miles N. N. W. of Troki.

BEREZOF. See **BERESOF**.

BEREZOVOI, a fortress of Asiatic Russia, in the government of Orenburg, on the Uvelka, 240 miles east of Ufa, and 68 S. E. of Tcheliabinsk.

BEREZOVSKOI, a fortress of Asiatic Russia, in the government of Orenburg, on the Ural, 140 miles E. N. E. of Orenburg.

BER-FISCH, in *Ichthyology*, a name given by the Germans to the *common perch*.

BERG, **MATTHYS VANDEN**, in *Biography*, a painter of portrait and history, was born at Ypres in 1615, and, as one of the disciples of Rubens, he obtained some distinction. In his drawing he was correct, and being assiduous in designing after the life, and after the best models, pictures of his own invention are uncommon; although excellent copies after the finished pictures of his master are numerous. He died in 1687. Pilkington.

BERG, in *Geography*, a duchy of Germany, in the circle of Westphalia, called in Latin "Ducatus Montensis," *berg* and *mons* being synonymous, and denoting mountain or hill, is bounded on the west and south by the archbishopric of Cologne, from which it is separated by the Rhine; on the north by the duchy of Cleves; and on the east by Nassau-Siegen, the duchy of Westphalia, and the county of Mark. It is about 72 miles long, and from 10 to 26 in breadth. The country, which upon the whole is mountainous, is, nevertheless, along the Rhine flat, very fertile, and produces corn in abundance; on the hills the inhabitants cultivate vines, and the higher tracts are covered with extensive forests; and the vallies afford excellent pasture. In this duchy there are mines of lead, iron, and coal; its principal manufactures are swords, knives, and other articles of iron and steel; and also those of cloth, ribbands, and handkerchiefs. The principal rivers are the Rhine, which flows to the east of this country, the Wipper, the Sieg, and Ruhr. Its capital is Dusseldorf; and its other principal towns are Elberfeld, Gemark, Lennep, Rattingen, and Solingen. Hoeek computes the number of inhabitants to be 261,504. Rander (Tour, vol. ii. p. 294.) says, that this duchy contains 9 cities, 8 market towns, 35,942 hearths, 202 churches, 44,646 Calvinists, 36,807 Lutherans, and 1,300 Jews: and he adds, that this duchy, and that of Juliers, contain a number of manufacturers, who are computed to be about 150,000. The duchy of Berg belonged to the elector palatine; but in the year 1795, it was entirely over-run by the French. See **JULIERS**.

BERG. See **BERGUES**.

BERG Reichstein, or *Kaschperski Hory*, a royal town of Bohemia, in the circle of Prachalitz, seated on a mountain, in which are mines of silver, 20 miles W. of Prachalitz.

BERGA, a town of Norway, 60 miles E. N. E. of Christiana. N. lat. $59^{\circ} 50'$. E. long. $9^{\circ} 38'$.—Also, a small town of Spain, in Catalonia, seated on the river Llobregat.—Also, a town of Germany, in the circle of Neustadt, and prefecturate of Weyda, seated on the Elster, 5 miles W. of Weyda.

BERGAMASCO, or **BERGAMO**, a country of Italy, being part of Lombardy, and belonging to the states of Venice, is bounded on the north by the Valteline, on the

east by the Bresciano, on the south by the Cremasco, and on the west by the Milanese. It extends about 36 leagues from north to south, and 30 from east to west. Towards the north it is mountainous and uncultivated, but the vicinity of Bergamo, its capital, is fertile. Some of its vallies produce wine and oil; others are barren. In the mountains are mines of iron, and quarries of marble and of stones. The inhabitants are inclined to corpulency, and are subject to the goitre; nevertheless, they are indolent, and intelligent in commerce, and carry on a considerable traffic in iron, wool, carpets, and tapestry, which they manufacture; cattle, marble, and mill-stones. Their language is a very corrupt Italian. Bergamasco now belongs to the Cisalpine republic.

BERGAMO, **JAMES PHILIP DE**, in *Biography*, an Augustin monk, was born at Bergamo in 1434, and wrote a "Chronicle" in Latin, from the creation of the world, to the year 1503, and "Treatise of Illustrious Women." He died at the place of his nativity in 1518. Gen. Dict.

BERGAMO, anciently *Bergomum*, in *Geography*, a fortified city of Italy, and capital of Bergamasco, is seated on several hills, at the bottom of which are some handsome suburbs. Between the city and the strong castle on the mountain, is a subterraneous communication. Bergamo is the see of a bishop, suffragan of Milan, and contains 13 parish churches, 12 convents for men, 10 for women, and about 30,000 inhabitants. The old church, of mingled Gothic and Grecian architecture, contains several valuable pictures, and deserves notice. It is a place of considerable trade, and has a large fair on St. Bartholomew's day, which is resorted to by a great number of merchants from other parts of Italy, Germany, and Switzerland. The principal articles of commerce are wool and silk; and the ferges and tapestry of this place have been celebrated. Their silks equal those of Turin. The inhabitants are diligent and active, and by their industry render fertile the sandy environs of the town. Bergamo is 25 miles N. E. of Milan, and 26 N. W. of Brescia. N. lat. $45^{\circ} 42'$. E. long. $9^{\circ} 38'$.

BERGAMO, a name given by the Turks to the ancient **PERGAMUS**.

BERGAMOT, in *Botany*, *cedrat* or *bergamot citron-tree*, the *CITRUS mella-rosa* of Lamarek, and a variety of the *CITRUS medica* of Linnæus. It is distinguished from the common citron-tree by its leaf, which has the odour of the rose, by its fruit, which is red, and by the pistil of its flower, which is short. The fruit has a fine taste and smell; and its essential oil is in high esteem as a perfume.

BERGAMOT, *Oil*, or *Essence of*, is a fragrant essential oil procured from the outer rind of the bergamot orange, and prepared in a very large quantity for the table and perfumery in the south of France, and especially in Italy and Sicily. There are several other species of oranges used for this purpose, but the bergamot is esteemed the most fragrant.

As the oil exists pure and ready formed in the orange peel, being simply deposited in small cells, the extraction is very easy. There are two methods of procuring it, either by distillation, as with all other essential oils, (for which, see the article *OIL Essential*) or by expression. The latter is in some respect the best, as the oil is not liable to be altered by heat. Sestini relates, that in Sicily, a vast quantity of the oil is procured simply by squeezing the peel in the hand, and holding a small piece of sponge to the surface, which imbibes the oil as fast as it flows out: when the sponge is full, its contents are pressed out into a vessel in which the oil is collected. It is not easy to imagine a more indolent and inartificial method: but in Italy, and the south of France, the orange peels are first torn to pieces on a small machine stuck over with nails, with the points projecting,

like

like a carding mill, whereby they are entirely torn to pieces, from which much of their oil flows out on the small mill, and is conducted away by a channel cut for the purpose, leading to a large bottle, where it is collected. After this, the peel, now in a pulpy state, is strongly compressed between two plates of glass, and the remainder of the oil is forced out. This last being mixed with the other parts of the pulp, is at first turbid, but gets clear by repose.

Their expressed essential oils, or as they have sometimes been distinguished by the term *essences*, are more fragrant than the oils prepared by distillation, but being mixed with a little mucilage, they are somewhat thicker, and do not keep quite so long as the distilled. The Sicilian method of preparing the essence by hand, though attended with great waste of materials, certainly affords a purer oil, than where a mill and press are used.

If the pulp, remaining after pressure, is mixed with spirit of wine and distilled, an addition of water to the distilled spirit separates an additional quantity of the oil, and leaves the liquor highly flavoured with its exquisite scent.

Beaume obtained two ounces of the oil by distillation, from two pounds of the peel of lemons, and probably the bergamot is yielded in somewhat similar proportion. Beaumé. Murray.—*Éncycl. Arts. & Met.* tom. vii.

There is likewise a kind of snuff of the same name, which is only clean tobacco, with a little of the essence rubbed into it.

BERGAMOT, in *Commerce*, is also the denomination of a coarse tapestry, manufactured with flecks of silks, wool, cotton, hemp, ox, cow, or goats' hair, and supposed to be invented by the people of Bergamo in Italy.

BERGANDER, in *Ornithology*, a name by which some have called the *shieldrake* or *burrough duck*, a very beautiful species of duck, common on the Lancashire, and some other coasts of England; but not in much esteem for eating. This is *anas tarda* of Linnæus, which see.

BERGARA, in *Geography*. See VERGURA.

BERGASE, a town of Romania, in European Turkey, seated on the Larissa. N. lat. 41° 22'. E. long. 27° 24'.

BERGBIETHEIM, a large market town of France, in the department of the Lower Rhine, and district of Dachteln.

BERGEN, DIRK VANDEN, in *Biography*, was born at Haarlem, and was reckoned one of the best disciples of Adrian Vandervelde. His colouring is more glowing than that of his master; but his cattle, and other objects, are less correctly drawn. He spent some time in England; but not succeeding, returned to his own country, and for want of economy, died poor in 1689. Pilkington.

BERGEN, CHARLES AUGUSTUS DE, son of George Bergen, professor of medicine in the university of Frankfort on the Oder, was born Aug. 11, 1714. After being initiated by his father into the knowledge of anatomy and medicine, he was sent to Leyden, where he studied under Boerhaave and Albinus, and thence, to complete his education, to Paris and to Strasburg. In 1734, being thought qualified to assist his father, he recalled him to Frankfort, where he was made doctor, and the year following, professor in medicine. On the death of his father in 1738, he was promoted to the chairs of professor of anatomy and botany. With what zeal and ability he filled those offices, his numerous, learned, and ingenious dissertations on those subjects evince. In 1744, he was appointed to succeed Goehelers as reader in therapeutics and pathology, which post he filled to the time of his death, October 7, 1760.

His works, consisting chiefly of academical dissertations, were collected by Haller, and published with his "Theses Anatomica." The titles of a few of them follow. For the remainder, see Bib. Anat. et. Botan. Haller. "De nervo

intercostali," 1731: "Icon nova ventriculorum Cerebri," 1734: "Methodus Cranii Ossis differendi, et machine hunc in finem constructæ per figuras, ligno incisâ, delineatio," 1741; "Flora Francofurtina, facili modo elaborata, &c." 1750.

BERGEN, or *Berghen*, in Latin *Berga*, in *Geography*, the capital of Norway, and of the province of Bergenhuys, was founded in the year 1069 or 1070. It is a sea-port town, seated in the middle of a valley, and forming a kind of semicircle round a small gulf of the sea, called by the inhabitants Waag. On the land side it is defended by high mountains, constantly overhung with clouds, which descend upon the town in frequent rains; and towards the sea by several fortifications. All the churches and public edifices, as well as many of the dwelling-houses, are built of stone. The most remarkable buildings are the castle, and the cathedral school, founded in 1554. This city carries on a large trade in all kinds of fish, fish-oil, tallow, tar, hides, and timber, which are brought from the northern parts of the kingdom, and exported from hence. The returns consist chiefly in corn and foreign commodities. Bergen was formerly connected with the Hans-towns, and enjoyed the privilege of coining till the year 1575. The origin of its commerce was owing to the merchants of the Hanseatic league; fifty-eight store-houses are still to be seen on the quays, which were established by those merchants for the convenience of their exportation of fish. They had also a particular court here, the decisions of which tended to exclude the native inhabitants from all share in the trade; but they were at length entirely expelled, chiefly by the vigour of a bailiff, Walkendorf. This city, being chiefly constructed of wood, has been subject to frequent conflagrations, as in 1428, when eleven parish churches were entirely consumed, and also in 1472, 1623, 1640, 1702, 1756, and 1771, on which last occasion, the flames, it is said, were visible in the isles of Shetland, or at least, the red reflection in the sky. It has now only four parish churches, three Danish, and one German, together with some private chapels. The population is computed at 19 or 20,000. The harbour is reckoned one of the best in Europe. Bergen possesses a very laudable institution for the encouragement of the useful arts. N. lat. 60° 23'. E. long. 5° 33'.

BERGEN, BERGHEN, or BERGENHUYS, the most westerly province of Norway, situate between Aggerhuus and the northern ocean. It is about sixty leagues long, and 7 wide. Its capital is Bergen. This province, or diocese, is very populous, and is remarkable for having 7 marble quarries. It includes 7 vogteys or districts, and the same number of provostships. The vogteys are Hhardanger, Sundhard-Lehn, Nord-hord Lehn, Sogn, or Sygna-Filke, Suardiord, Nordfiord, and Sundmor.

BERGEN, a county of America, in New Jersey, on Hudson river, lies opposite to New York on the east, and was first planted by the Dutch from New York. It is a mountainous country, and its extent is about 30 miles long and 25 broad; forming part of the eastern and northern extremities of the state, and at its north-western extremity meeting the north-eastern part of Sussex county. Bergen contains 6 townships, the chief of which are Bergen and Hackensack, and 12,601 inhabitants, including 2301 slaves. Here are 7 Dutch Calvinist churches, and 2 of Dutch Lutherans.

BERGEN is the shire town of the above county, and lies surrounded by water, except on the north. It is separated by the Hudson river, from New York, at the distance of 3 miles; on the south, a narrow channel lies between it and Staten island; and on the west, it has Hackinsack river. The inhabitants are chiefly descendants of the Dutch settlers.

BERGEN Nech, is the southern extremity of the above township.

BERGEN, a town of Germany, in the circle of the Upper Rhine, and principality of Hanau Munzenberg. The environs produce excellent wine.—Also, a town of Germany, in the circle of Upper Saxony, and capital of the isle of Rugen; its ancient name was *Gora*. It is situated in the centre of the island, where are held the tribunals of Swedish Pomerania. N. lat. $54^{\circ} 28'$. E. long. $13^{\circ} 40'$.

BERGEN *the Dumme*, a town of Germany, in Lower Saxony, and principality of Zell, 12 miles S. W. of Danneberg.

BERGENHUYS. See **BERGEN**, *supra*.

BERGEN-OP-ZOOM, a sea-port town of Dutch Brabant, seated on an eminence, in the middle of a morass, near the eastern shore of Zoom, at its junction with the Scheldt. It was first surrounded by a wall in 1287, by the first lord of the town, and erected into a marquisate by the emperor Charles V. in 1533. The church, which is a beautiful structure, was made collegiate in 1442. The houses are well built, and the market places and squares handsome and spacious. It has a good tract of land under its jurisdiction, with several villages, and some islands in the Scheldt. This place, naturally strong on account of the morasses that secure it, was regularly fortified in 1629, and esteemed nearly impregnable. The fortifications are reckoned the master-piece of that great engineer Coehorn. It was unsuccessfully besieged by the prince of Parma in 1588, and also by the marquis of Spinola in 1622. In 1746, the marechal Saxe deputed count Lowendahl to lay siege to it with 36,000 men; and after persevering attacks, and a vigorous, obstinate defence, in which many lives were lost, it was surrendered to the French, who became masters of the whole navigation of the Scheldt. At the peace of Aix-la-Chapelle, it was restored to the Dutch. It is distant 18 miles N. N. W. from Antwerp. N. lat. $51^{\circ} 30'$. E. long. $4^{\circ} 15'$.

BERGENTE, in *Ornithology*, one of the names of *anas marila*. (Scaup. Duck.) *Bloch, besch derlerl naturf. 3. c.*

BERGERA, so called from Christ. Joh. Berger, professor at Kiel, in *Botany*, Auth. D. Konig. Lin. gen. Schreb. n. 718. Clafs and order, *decandria monogynia*. Gen. Char. *Cal.* perianth, five-parted, very small, acute, spreading, permanent. *Cor.* petals five, oblong, bluntish, spreading. *Stam.* filaments ten, five alternately shorter; anthers round. *Pist.* germ roundish, superior; style filiform, club-shaped; stigma turbinate, shining, with transverse grooves. *Per.* berry subglobular, one-celled. *Seeds* two.

Ess. Char. *Cal.* five-parted. *Pet.* five; *berry* subglobular, one-celled, with two seeds.

Species, 1. *B. Koenigii*. Lin. Mantiss. 563. A leafy tree, with the bark of alder. A native of the East Indies. Martyn.

BERGERAC, in *Geography*, a town of France, and principal place of a district, in the department of the Dordogne; beautifully situate in an extensive plain on the Dordogne, which divides it into two towns, called "St. Martin," and "St. Magdelaine." It is a rich, commercial, and populous town, containing about 8540 inhabitants. In the canton are 14,140. The territorial extent comprehends 175 kilometres, and the number of the communes is 12. Before the revocation of the edict of Nantes, it is said there were 40,000 Protestants in this town and neighbourhood. N. lat. $44^{\circ} 51'$. E. long. $0^{\circ} 37'$.

BERGFINK, in *Ornithology*, the name of *fringilla montifringilla*, in the Hist. Birds. *Frisch, sinder naturf. 3. c.*

BERGGANS, (Kolbe) the mountain goose, *anas montana*. Gmelin.

BERGGIEFZHUBEL, or **BERGGIESHUBEL**, in *Geography*, a town of Germany, in the circle of Upper Saxony,

and margraviate of Meissen, near which are warm medicinal springs, 6 miles south of Pirma.

BERGH, or **BERGLAND**, an island in the Indian sea, north of Nassau island, and south-west of the island of Sumatra. S. lat. $2^{\circ} 50'$. E. long. 100° .

BERGHEIM, a town of Germany, in the circle of the Upper Rhine, and county of Waldeck, and by the new French distribution, the chief place of a canton, in the department of Roer, and district of Cologne, containing 469 inhabitants, and the population of the canton is estimated at 10,365, distributed in 44 communes; 4 miles S. E. of Waldeck.

BERGHEM, in *Biography*. See **BERCHEM**.

BERGHIRI, in *Geography*, a town of Asia, in the province of Kurdistan, 70 miles S. E. of Betlis.

BERGHMOT, or **BERGMOTE**, vulgarly barmote, formed from the Saxon *berg, mons*; and *mote, conventus, assembly*, or *meeting*. See **BARGMOTE**.

BERGLAX, in *Ichthyology*, one of the synonymous names of *corphybena rupestris*. Ström. Söndm.

BERGIA, so called from P. J. Bergius, M. D. professor of natural history at Stockholm, in *Botany*. Lin. gen. Reich. p. 631. Schreb. 791. Juss. 301. Clafs and order, *decandria pentagynia*. Nat. Ord. *Succuente. Caryophyllea*, Juss. Gen. Char. *Cal.* perianth, five-parted, spreading; leaflets lanceolate, permanent. *Cor.* petals five, oblong, spreading, the length of the calyx. *Stam.* filaments ten, brittle-shaped, of middling length; anthers roundish. *Pist.* germ roundish, superior; styles five, very short, approximating; stigmas simple, permanent. *Per.* capsule simple, subglobular, mucronate, with five little swellings, five-celled, five-valved; valves ovate, flat, opening along the furrows, permanent, spreading very widely. *Seeds* numerous, minute.

Ess. Char. *Cal.* five-parted; *Pet.* five; *Capf.* one, globular, with swellings, five-celled, five-valved; valves resembling petals; *Seeds* very many.

Species, 1. *B. caperfsis*. Lin. Syst. 431. Reich. 2. 386. Suppl. 243. Mant. 241. Pola-tsjira, Rheed. Mal. 9. 153. t. 78. "Leaves lanceolate, or elliptic, flowers in whorls." This has the stature of Ammonia. A native of Tranquebar, in the East Indies, and therefore misnamed *Caperfsis*. The valves of the capsule, continuing after it is ripe, form a kind of five-petalled wheel-shaped flower. 2. *B. glomerata*, Lin. Syst. 431. Suppl. 243. "Leaves obovate, crenulate, flowers glomerate." Found at the Cape of Good Hope by Bergius. Martyn.

BERGIER, **NICHOLAS**, in *Biography*, was born at Rheims in 1557, and became professor of the university in his native city, where he was educated for the law, and became syndic. Under this character he visited Paris, and there formed an intimate friendship with Peiresc, and du Puy, by whom he was induced to execute a work which he had projected on the high roads of the empire. M. de Bellievre took him to his house, and procured for him a pension, with the brevet of historiographer. He died in 1623. The principal of his works are his "Histoire des grand chemins de l'Empire Romain," first printed in 1622, 4to. and reprinted, with notes, at Brussels, in 2 vols. 4to. in 1729. This valuable work was translated into Latin by Henninius, and is included in the 10th volume of Grævius's Roman Antiquities. Bergier also wrote in French "A sketch of the History and Antiquities of Rheims, with curious remarks concerning the establishment of the people, and the foundation of the towns of France," 4to. 1635.

BERGIMUS, in *Ancient Mythology*, a deity peculiar to the inhabitants of Breecia, in Italy, where he had a temple, and an order of priests. Gruter, Muratori, and Spon, have recorded many inscriptions relating to this deity. It is thought that he was the god of the mountains, because *berg*, in Celtic, signifies a mountain.

BERGMANN.

BERGMANN, TORBERN, in *Biography*, professor of chemistry at Upsal, was born at Catherineberg, in West Gothland, March 20th 1735; and after having finished the first course of his education, entered at the university of Upsal. His application, particularly to the study of mathematics and natural philosophy, was so intense, that his health was endangered; and as these sciences afford no peculiar prospect of emolument, a relation, who had the charge of him, discouraged his prosecution of them, and rendered it necessary for him to conceal the books which assisted him in his favourite studies. At the close of a year his health was so much impaired, that the restoration of it required an intermission of his application, and a course of exercise, which obliged him to return to his family. His hours of relaxation were, however, occupied in the study of botany and entomology, and his discoveries in the last of these sciences were communicated to Linnæus. As soon as his health was re-established, he returned to the university, with ample permission to pursue those studies which were most agreeable to his inclination. Besides mathematics and natural philosophy, he directed his attention to natural history, under the patronage of Linnæus; and began with a memoir on the nature of the substance found in certain waters, and called coccus aquaticus, which he found to be the egg of a leech, including 10 or 12 young. This was followed by other memoirs on the history of insects which attack fruit-trees, and the means of preventing their ravages; and he proposed a method of classing these insects from the form of the larva, in which state the destruction of noxious insects is most essential. About this time, the famous Swedish naturalist testified his esteem of Bergmann's character and talents, by giving his name to a new species of insects. In 1761, Bergmann was appointed professor of mathematics and natural philosophy in the university of Upsal; and both before and after this time he enriched the volumes of the Swedish act with several papers on philosophical subjects. His paper, containing "A Review of the several explanations which Natural Philosophers have given of the Rainbow," was published in 1759; and in 1760, he published some thoughts "On the origin of those meteors, which are not accompanied by any sensible sound or explosion," and also "On the opinions held by Philosophers relating to the Twilight," to which is prefixed an account of Mairan's "Anti-repusculum," or that of the horizon opposite to the sun. In 1761, and in 1762, professor Bergmann wrote on the subject of electricity, in consequence of a correspondence with Mr. Wilson; and particularly on the electrical quality of Iceland spar, and double refracting spar. His remarks on the tentredo, or saw-fly, showing how to distinguish between the caterpillars of this insect and those of the butterfly and moth, and discovering the feet in the latter to be never more than 16, a discovery that at the day was exceeding that number, were published in 1753; and the same year produced the satisfactory result of some electrical experiments, made with silk of various colours. In 1764, the professor wrote a paper to describe, from a number of observations, the height in the atmosphere at which the aurora borealis exists (see *AURORA BOREALIS*); and in 1765 and 1766, he wrote again on electrical subjects; and principally on the property and laws of electricity in the terrestrial, which had been referred to his examination by the Royal Academy of Sciences at Stockholm. At this time it does not appear that the subject of chemistry had employed much of Mr. Bergmann's attention; however, in 1767, on the resignation of Wollnerus, he was chosen to succeed him as professor of chemistry and metallurgy. This appointment was much opposed by the party of the former professor, united with others who envied Bergmann's rising merit; and their opposition was supported by some severe criticisms on two papers, which the professor

published at this time, relating to the depuration of alum, in which he recommends the use of argillaceous earth, and proposes tobacco-pipe clay, instead of alkali, to free it from the vitriol. But the prince royal of Sweden, who afterwards succeeded to the throne, and who was then chancellor of the university of Upsal, determined the dispute, and fixed him in the professor's chair. With enlarged views of the practical importance and utility of chemistry, of what had already been performed in this department of science by preceding authors, and of what yet remained to be done, Bergmann prosecuted his chemical researches, and by a combination of experimental analysis with mathematical reasoning, he extended and improved this science by a variety of valuable discoveries and observations. In order to pursue his experiments and inquiries with the greater facility, and to communicate the result with advantage to his pupils, he formed, near his laboratory, a cabinet, in which all the mineral substances were ranged in order, together with the products of those experiments which had ascertained their composition. Another collection exhibited all the minerals of Sweden, arranged according to the places where they are found. In a third, were exhibited models of the various machines and apparatus by means of which these substances were converted into useful articles, which articles were placed near the materials from which they were formed. From this systematical arrangement Bergmann derived peculiar advantage in his profession as a teacher. While he excelled as a professor of chemistry and mineralogy, and devoted much of his time to this occupation, he was actively and incessantly employed in making discoveries which have placed him in the first rank of philosophical chemists. He examined the carbonic acid, discovered by Black, and denominated fixed air, in its several properties and habitudes. Nickel, manganese, the magnesian earth, and barytes, which were newly-discovered substances, were particularly investigated by Bergmann, and afforded materials for regular and perspicuous treatises. The acid obtained from fugar, and many other vegetables, by the abstraction of the nitric acid, and those acids which are obtained from arsenic, molybdena, fluor spar, and tungsten, were discovered either by himself or some of his disciples; and to him we are indebted for leading the way in the investigation of their properties, and for ascertaining many interesting phenomena attending their combinations. From him we learn, that iron contains a number of foreign admixtures, chiefly of a metallic nature, and that the three states of crude iron, and malleable iron, and steel, principally depend upon the greater or less abundance of carbon. In his analysis of waters, he added, to the re-agents before used, other substances more effectual, and whilst he evinced the imperfection of this method, he rendered it much more accurate. He also ascertained the quantities of products, without separating them from all their combinations; and in this way he infers the quantity of metal from the weight of precipitate it affords, by the addition of an alkali, or some other known substance, from tables founded on former experiments. He likewise analysed the precious stones, known by the name of gems, and devised peculiar methods for separating them into the known earths in determinable proportions. Professor Bergmann evinced the necessity and utility of performing domestic operations in the humid way, or by analysis, in which liquid solvents are used; and he also exhibited the advantages of the process by fire, applied to materials in minute portions, by means of the blow-pipe, either upon a piece of charcoal, or in a spoon of pure silver. This mode of examining mineral substances, united with that of the habitudes which they exhibit, with a few simple re-agents, facilitated the classification of them, according to their chemical properties; a method adopted by this ingenious chemist, with-

out the exclusion or disparagement of that method of investigation which regards the external character. This appears from his short essay on the forms of crystals. The subject of elective attractions engaged the particular attention of professor Bergmann; and he engaged in the laborious undertaking of improving and extending the tables of Geoffroy, for which he perceived that, according to his views, no less than 30,000 experiments would be necessary. He therefore, under an apprehension that his life would not allow the completion of his plan, contented himself with publishing what appeared to him to be an imperfect work, though it was otherwise regarded by the scientific world. His table of simple affinities is the first, that exhibits the laws of affinities as they are observed in the dry way; and in his scheme it is seen at once whether the operation takes place in the humid or dry way; what are the substances presented to each other; their component parts and proportions; the numerical expressions of their attractions; what new compounds take place; and whether they fall down, or sublime, or remain in solution, and which of them are thus respectively affected. (See AFFINITY.) In this work, as well as in his work on metallic precipitates, Bergmann, not apprised of those effects of oxygen, which have been developed in later times, considers the existence of phlogiston, or a common principle of inflammability, as an acknowledged truth. He also admits of the matter of heat as a self-existent independent principle, and seems not to have apprehended that it may be a distinct modification. Accordingly, these two principles enter into many of his explanations of facts; but in all those explanations, the matter is arranged with such order and perspicuity, that it is extremely easy to substitute the absorption of oxygen instead of the extrication of phlogiston, and the contrary effect wherever the latter imaginary principle, as it is now thought to be, is absorbed. The life of professor Bergmann, like that of other studious and scientific men, admits of little variety. Attentive to the duties of his profession, he resided constantly at Upsal, and had the honour to be elected rector of the university, which in his time was divided into two parties, of theologians and civilians on one side, and of natural philosophers on the other, between whom Bergmann maintained peace and equality. The king of Prussia wished to engage the professor of Upsal to become a member of his academy, and to remove to Berlin; but attached to his office, though exhausted by it, and in a declining state of health, which might have been relieved by a warmer climate, and under obligations of gratitude to Gustavus, king of Sweden, who had been his benefactor, and who had honoured him with the order of Vasa, he declined the proposal, and remained at Upsal. The disciples of his school, of whom the celebrated Scheele sustained a very distinguished rank and character, reflected honour on their master, who never failed to encourage their researches, and to mention their discoveries in terms of approbation and respect. How much fir Torbern Bergmann was esteemed whilst he lived, in every part of Europe, it is needless to say; and of his works it is sufficient to observe, that, notwithstanding the rapid improvements which have taken place since his time in chemical science, they will long remain repositories of facts and reasoning, to which every philosopher must recur. When it is considered that he began this pursuit rather at a late period of life, and that he made his various discoveries in the course of 17 years, and that he died before he attained his 50th year, his death will be regretted as a premature event, by which society sustained a very considerable loss. He died on the 8th of July 1784, at the baths of Medwi in Sweden. His works were very numerous; the principal of them are as follows: viz. "Opuscula physica et chemica, pleraque scorsim antea edita jam ab auctore col-

lecta, revisa et aucta;" published in Latin in 3 vols. 8vo. in 1779, 1780, 1783, and translated by Dr. Cullen of Dublin, in 2 vols. 8vo. with illustrations and notes by the translator. "Meditationes de systemate fossilium naturalium;" printed in the 4th volume of the Transactions at Upsal for 1784, and translated into English in 1788, in 8vo.; "Physick Beskrifning oefver Jordklotet," or physical description of the earth, in 2 vols. in which he has given lucubrations on the structure and form of the earth; "Essay on the usefulness of Chemistry," published in Swedish in 1779, and translated into English in 1783, 8vo.; two academical dissertations on the origin and progress of chemistry, intitled "De Primordiis Chemiæ," in 1777, and "Chemiæ Progressus a medio Sæc. vii. ad medium Sæc. xvii." in 1782; and "Sciagraphia Mineralis," or outlines of Mineralogy, first printed in 1782, at Leipzig and Dessau, and translated into French by M. Mengez, and into English by Dr. Withering in 1783, 8vo. Eloge of Bergmann, inserted in the Acts of the Academy of Sciences at Paris for 1784. Coxe's Travels in Sweden, &c. vol. iv. p. 228, &c. Gen. Biog.

BERGMANNIA, in *Entomology*, a species of PHALÆNA (*Tortrix*), with pale yellow wings, spotted with bright yellow; fasciæ whitish, and the third bifid; found in the gardens of Germany and northerly parts of Europe.

BERGOO, in *Geography*, a district of Abyssinia, situate north of Darfur, and south of Bornou, between 15° and 19° of N. lat. and between about 24° and 27° 31' E. long. Its capital is Wara, in N. lat. 15° 30'. E. long. 25° 30'. Bergoo is said to be 15 days or (allowing 12½ geographical miles per day) 187½ geographical miles in extent, from E. to W. and from N. to S. 20 days, or 250 miles. Within about a day's journey of Wara, are said to be eight large mountains, the inhabitants of each of which use a distinct language. They are Mahometans, zealously attached to the faith; and read the Koran daily. They are said to be brave, and furnish the armies of the sultan of Bergoo with recruits as often as they are required. They make war by sudden incursions, traversing and laying waste a large space in a short time. On these occasions they leave their women behind, and are therefore better adapted to military operations than the people of Darfur, who never march without a host of female attendants. The people of Bergoo seldom make "selatea," i. e. an expedition to procure slaves by force. Some of the idolatrous nations, dependent upon Bergoo, are represented as conducting their wars in a very formidable manner. The combatants never retreat; and the women behind light a fire, in which they heat the heads of the spears, and exchange them for such as are cooled in the combat. They also use poisoned weapons. Mr. Browne informs us, that in a remote part of the pagan country, from which slaves are brought, the inhabitants eat the flesh of prisoners taken in war. They are also habituated to strip off the skin of the hands and faces of their slaughtered foes, which, after undergoing some preparation, is worn as an emblem of triumph. Their arms, which are a spear and a javelin, are formed of iron, wrought by themselves. These they make red-hot, and flick the point in a tree, where they leave them till the juice is dried; and in this manner, according to report, they acquire a most deadly poison. Browne's Travels in Africa, p. 310. 468.

BERGSNYLTRA, in *Ichthyology*, the name under which Linnæus mentions *Labrus fuillus* of Fn. Suec. in Jt. Wgoth. 179.

BERGSPERLING, in *Ornithology*, the name of *Fringilla montana* in Frisch. birds.

BERGSTADT, in *Geography*, a town of Moravia, in the circle of Olmutz, 18 miles north of Olmutz.

BERGSTRASS, a long tract or tongue of land, on the side of the Rhine, between Heidelberg and Darmstadt. It contains

contains a few small places as Bershheim, Oppenheim, and Weinheim. It has in it a highway, commanding prospects of wide extent. The best part of this continued chain of hills is from Heidelberg to Bershheim, where it is about 8 leagues long and four broad. On the right hand it is covered with woods near the top, and nearer the plain with vineyards. The level road is planted with rows of walnut trees, and on each side are fields and meadows that are very fertile. A considerable profit to the country by the wood and the fruit; and the wine produced there is an inexhaustible source of supply to the inhabitants. In one year they have exported 40,000 rough made walnut tree market stools, from these parts to Saxony. From the nuts they make an excellent oil, which serves the common people instead of butter, and the inferior sort is used for lamps. The almond trade, of which great quantities grow along the Bergstrass, is very considerable. The warmth of the climate, and goodness of the soil in the Bergstrass, are such, that after rye-harvest the land may be sown a second time with spelt, buck-wheat, or oats, which are always reaped the same year.

BERGUES, or **BERG**, or **BERGUES St. Vinox**, a town of France, and principal place of a district, in the department of the North; so called from St. Vinox, a Flemish lord, who lived here. It is seated on the river Colme, at the union of several canals, which pass to Dunkirk, Gravelines, St. Omer, Furnes, &c., and contains two parishes. Berg was the last town of West Flanders which held out for the Dutch in the 16th century. It was taken by the French in 1678, and confirmed to them by the peace of the Pyrenées in the following year. Since that time it has been fortified by new works, and the country round it may be laid under water by means of sluices; $\frac{1}{2}$ league south of Dunkirk. It contains 7085 inhabitants, and in the canton are 14,026. The territorial extent comprehends 130 kilometres, and 13 communes. N. lat. $50^{\circ} 57'$ E. long. $2^{\circ} 37'$.

BERGUN, a small town of Switzerland, in the country of the Grisons, near a river which flows from a lake of the same name, and discharges itself into the Albula. It lies between the Albula and the Inn, about 6 miles from the latter, and 12 miles from the former. N. lat. $47^{\circ} 31'$ E. long. $3^{\circ} 55'$.

BERGWERBEN, a town of Germany, in the circle of Upper Saxony, two miles north of Wessenthal.

BERGWERK, a town of Hungary, 13 miles west of Steinam.

BERG-ZABERN, a town of Germany, in the circle of the Upper Rhine, and duchy of Deux-Ponts, seated on the Erlbach, 30 miles south east of Deux-Ponts. By the new arrangement of the French, it is the chief place of a canton in the department of the Lower Rhine, and district of Wissembourg, containing 1947 inhabitants. The canton has 9077; its extent is 130 kilometres, and the communes are 17. N. lat. $49^{\circ} 7'$ E. long. $7^{\circ} 52'$.

BERIA, **BERIE**, **BERRY**, in *Middle Age Writers*, denotes a large open field; and the cities and towns of England, which end with that word, are built in plain and open places, and do not derive their names from borough, as Sir Henry Spelman imagines. That the word "berie," which has been confounded with "bury," and "borough," is a flat wide campaign, is proved from sufficient authorities, by the learned Du Fresne, who observes, that "Beria Sti Edmundi," mentioned by Matt. Par. sub. ann. 1174, is not to be taken for the town, but for the adjoining plain. Besides, many flat wide meads, and other open grounds, are called by the names of "beries," and "berry fields;" thus the spacious meadow between Oxford and Illey was in the reign of king Athelstan called "Bery;" and the largest pasture ground in Quarendon in the county of Buckingham is known by the

name of "Beryfield." And though these meads have been interpreted demesne, or manor meadows, yet they were in reality any flat or open meadows, that lay adjoining to any vill or farm. (Cowel.) Hence also "berras affartare" signifies to dry or plough up heaths and downs; and hence our warrens are called "coney-berries."

BERIBERIA, or **BERIBERI**, in *Medicine*, a barbarous *Beri* Indian. It is called by some British authors, who have written on the diseases of hot climates, *the berrius*. According to Bontius, it comes on with great weariness, trembling, numbness, and peculiar tingling sensation of the limbs, so that the patient is rendered incapable of walking, or otherwise using them. The upper as well as lower limbs are often affected. Sometimes it is accompanied with a halting speech. Its attack is generally sudden. Those whom it afflicts are chiefly the lower class of people, who imprudently get chilled after being heated, by drinking cold water; but more especially by sleeping in the night air, after great fatigue or intoxication. The remedies against this obstinate complaint are strong frictions, aromatic fomentations, warm-bathing, and sudorific decoctions. According to Bontius, the most efficacious topical application is a species of naphtha, or petroleum, from Sumatra, used as a liniment. The natives of India (says Dr. Lind) have a method of putting the patient into a hole dug into the ground, and covering him with sand up to his neck; this is done in the middle of the day, and he remains there as long as he can bear the heat of the sand, which is considerable. Camphire, and a decoction of guaic wood, have sometimes produced a good effect; also the expressed bitter oil of the mergoose, an Indian plant. But notwithstanding the use of the most powerful nervous medicines, the patient generally continues paralytic for some months, unless he is removed into another air.

On the Malabar coast (continues the last mentioned author) this disease is most violent and frequent, and attacks both natives and strangers, especially in the months of December, January, February, and March. During these months, the land winds blow every morning about sun-rise, from the neighbouring mountains, with remarkable coolness; and such as, being tempted by the serenity of the season, sleep exposed to these winds, are often suddenly seized with a very painful sensation in the periosteum of the arms and legs. In persons of a good constitution, this pain abates as the day advances, and as the air becomes warmer; but in others it continues for a considerable time, attended with a weakness of the knees, and uneasy sensations in the calves of the legs and soles of the feet, especially on any attempt to walk. This is scarcely ever cured by medicine, till after the shifting of the monsoon, unless the patients can be removed to the coast of Coromandel, or to any place to the eastward of the Balagat mountains, where, by the change of air, they quickly recover. See Bontius de Med. Indorum; and Lind on Diseases incidental to Europeans in Hot Climates.

BERICARIA. See **BERCARIA**.

BERIEZFN, in *Geography*. See **BIRIESINA**.

BERIGAN, a town of Africa, in the kingdom of Algiers, and capital of the country of Beni-Mezzab. N. lat. $32^{\circ} 15'$ E. long. $2^{\circ} 57'$.

BERINDAL, a town of Egypt, on the west branch of the Nile, 7 miles S. E. of Rosetta.

BERINSCHUL, a rocky island in the Mediterranean, near the coast of Algiers.

BERKELEY.

committed to the flames several letters that had passed in correspondence between her and the dean, not, as he declares, because there was any thing criminal in them, but because he observed a warmth in the lady's style, which delicacy required him to conceal from the public.

On the 18th of May 1724, Dr. Berkeley resigned his fellowship, and was promoted by his patron to the deanery of Derry, worth 1100*l.* *per annum*. Having for some time conceived the benevolent project of converting the savage Americans to Christianity, by means of a college to be erected in the Summer islands, otherwise called the isles of Bermuda, he published a proposal for this purpose at London, in 1725, and offered to resign his own opulent preferment, and to dedicate the remainder of his life to the instruction of youth in America, on the moderate subsistence of 100*l.* a year. Such was the influence of his distinguished example, that three junior fellows of Trinity college, Dublin, concurred with him in his design, and proposed to exchange, for a settlement in the Atlantic ocean, at 400*l.* *per annum*, all their flattering prospects in their own country. The proposal was enforced on the attention of the ministry, not merely by considerations of national honour and a regard to the cause of Christianity, but by the immediate advantage likely to accrue from it to the government. Having, by diligent research, estimated the value of the lands in the island of St. Christopher's, ceded to Great Britain by France at the treaty of Utrecht, he proposed to dispose of them for the public use, and thus to raise a sum of money, part of which was to be applied to the establishment of his college. The scheme was communicated by the intervention of the abbé Gualtieri, or Altieri, to king George I. and by the royal command introduced into the house of commons by sir Robert Walpole. A charter was granted by his majesty for erecting a college, by the name of St. Paul's college in Bermuda, which was to consist of a president and nine fellows, who were obliged to maintain and educate Indian children at the rate of 100*l.* *per annum* for each. The first president, Dr. George Berkeley, and the first three fellows named in the charter, those junior fellows of Dublin college abovementioned, were licensed to hold their preferments in these kingdoms till the expiration of one year and a half after their arrival at Bermuda. The commons, in 1726, voted an address to his majesty, praying a grant of such a sum to effect the above purpose out of the lands of St. Christopher's already mentioned, as his majesty might think proper. The sum of 1000*l.* was furnished by the minister, and several private subscriptions were immediately raised for promoting so pious an undertaking. The dean having, in 1728, married the eldest daughter of the right honorable John Forster, esq. speaker of the Irish house of commons, prepared to set sail for Rhode island, in the execution of his scheme, and took with him a pretty large sum of money of his own property, and a collection of books for the use of his intended library. Upon his arrival at Newport in Rhode island, he contracted for the purchase of lands on the adjoining continent, and fully expected that the purchase money would, according to grant, be immediately paid. His expectations, however, were disappointed; and after various excuses he was at length informed by bishop Gibson, at that time bishop of London, in whose diocese the whole West Indies is included, that on application to sir Robert Walpole, he received the following honest answer:—"If you put this question to me," says sir Robert, "as a minister, I must, and can assure you, that the money will not be paid; but if you ask me as a friend, whether I can contribute to your scheme in America, expecting the present of 1000*l.* I will oblige you, by admitting you to return home to Europe, and to give up his present expectation."

ingly, the dean, after having expended a great part of his private fortune, and more than seven years of his life in the prosecution of a laudable scheme, returned to Europe. Before he left Rhode island, he distributed the books he had brought with him among the clergy of that province, and upon his arrival in London, immediately returned all the private subscriptions that had been advanced for the support of his undertaking. In 1732, he published the "Minute Philosopher," a work consisting of a series of dialogues, on the model of Plato, in which he pursues the free-thinker through the various characters of atheist, libertine, enthusiast, scorner, critic, metaphysician, fatalist, and fanatic, and employs several new arguments from his own system. Of the company, which at this time attended the philosophical conversations that were carried on in the presence of queen Caroline, according to a practice which had commenced when she was princess of Wales, some of the principal persons were doctors Clarke, Hoadly, Berkeley, and Sherlock. The debates that occurred were chiefly conducted by Clarke and Berkeley; and Hoadly adhered to the former, as Sherlock did to the latter. Hoadly affected to consider the philosophy of Berkeley, and his Bermuda project, as the reveries of a visionary. Sherlock, on the other hand, espoused his cause; and on the publication of the "Minute Philosopher," presented a copy of it to the queen, and left it to her majesty to determine, whether such a work could have been the production of a disordered understanding. The queen honoured Berkeley with admitting him to frequent visits, and took pleasure in his conversation on subjects relating to America; and upon a vacancy in the rich deanery of Down in Ireland, procured it for him. But as lord Burlington had neglected to give proper notice of the royal intention to the duke of Dorset, then lord-lieutenant of Ireland, and to obtain his concurrence, the duke was offended, and the appointment was not urged any farther. Upon this, her majesty declared, that since they would not suffer Dr. Berkeley to be a "dean," in Ireland, he should be a "bishop;" and accordingly, upon a vacancy in the see of Cloyne, in 1733, he was promoted by letters patent to that bishopric. In consequence of this appointment, he resided continually at Cloyne, and devoted his time and attention to the faithful discharge of all episcopal duties. He revived in his diocese the useful office of rural dean, visited often parochially, and confirmed in several parts of his see. In the prosecution of his studies, however, his diligence was unabated; and about this time he engaged in a controversy with the mathematicians of Great Britain and Ireland on the subject of Fluxions. He was led to it by the following occurrences: Mr. Addison having visited Dr. Gauth in his last illness, addressed him seriously on the necessity of preparing for his approaching dissolution; but the doctor replied, "Surely, Addison, I have good reason not to believe those trifles, since my friend Dr. Halley, who has dealt so much in demonstration, has assured me, that the doctrines of Christianity are incomprehensible, and the religion itself an imposture." This conversation being reported by Addison to the bishop, he took up arms against this redoubtable dealer in demonstration, and addressed to him "the Analyst," with a view of showing that mysteries in faith were unjustly objected to by mathematicians, who admitted much greater mysteries, and even fallhoods in science, of which he endeavoured to prove that the doctrine of Fluxions furnished an eminent example. See FLUXION. In the course of the controversy on this subject, the bishop, in 1735, published a reply to Pinaltheus, supposed to be by Dr. Johnson, entitled "A Defence of Free-thinking in Mathematics." From this controversy, he diverted his thoughts to subjects of more important utility; and printed, in 1735, his "Queries," for the good of Ireland; in 1736, his "Diss-

ecurse addressed to Magistrates;" and in 1750, his "Maxims concerning Patriotism;" all of which evince his knowledge of mankind, and his zeal for the service of true religion, and of his country. In 1745, during the Scots' rebellion, he addressed a "Letter to the Roman Catholics" of his diocese; and in 1749, another to the clergy of that persuasion in Ireland, under the title of "a Word to the Wise," which was so well received by them, that they returned him their public thanks, with expressions of marked esteem and respect, which describe him as "the good man, the polite gentleman, and the true patriot." That he discovered this character in a very eminent degree, was very generally acknowledged, and particularly by lord Chesterfield, who as soon as he was advanced to the government of Ireland, in 1745, offered him the see of Clogher, then vacant, and the value of which was double that of Cloyne. This offer the bishop, moderate in his views, disinterested in his support of government, and particularly attached to his customary place of residence at Cloyne, and to the connections and duties attending it, respectfully declined. Towards the close of his life, he laboured under a nervous colic, the effect of his sedentary course of living, in which he found considerable relief from the use of tar-water; and he therefore communicated his thoughts on this celebrated medicine to the public, in a treatise entitled "Siris, a Chain of Philosophical Reflections and Enquiries concerning the Virtues of Tar-water," printed a second time in 1747, and followed in 1752, by "Farther Thoughts on Tar-water," which was his last performance.

In 1752, he removed, with his lady and family, to Oxford, for the purpose of superintending the education of one of his sons, who was admitted a student at Christchurch college, in that university: but sensible in a high degree of the impropriety of non-residence, he endeavoured first to procure an exchange of his high preferment for some canonry or headship at Oxford; and failing of success, he afterwards, by a letter to the secretary of state, requested permission to resign his bishopric, worth at that time not less than 1400*l. per annum*. When the petition for this purpose was presented to his majesty, he declared he should die a bishop in spite of himself, and gave him full liberty to reside wherever he pleased. Before he left Cloyne, he signed a lease of the demesne lands in that neighbourhood, renewable yearly at the rate of 200*l.* and directed this sum to be annually distributed, until his return, among poor house-keepers of Cloyne, Youghall, and Aghadda. At Oxford he was highly respected by the members of the university; but his residence among them was of no long duration. On Sunday evening, January 14, 1753, whilst he was surrounded by his family, and his lady was reading to him one of Dr. Sherlock's sermons, and also the lesson in the burial service, taken from 1 Cor. xv. whilst he was commenting upon it, he was suddenly seized with a disorder, called the palsy of the heart, and instantly expired. His remains were interred at Christchurch Oxford, and a marble monument was erected to his memory by his widow, with a Latin inscription, drawn up by Dr. Markham, head master of Westminster school, and now archbishop of York. In this inscription he is said to have been born in 1679, and his age to be 73; whereas his brother, who furnished the particulars of his life, states the year of his birth to have been 1684, and of course he died at the age of 69.

The person of bishop Berkeley was handsome, his countenance expressive and benign, and his constitution robust, till it was impaired by his sedentary life. At Cloyne he constantly rose between three and four in the morning; and often spent the greater part of the day in study; his favourite author, from whom many of his notions were borrowed, was

Plato. The enthusiasm of his private character, which was singularly excellent and amiable, entered into his literary one: and it was manifested in his public works, as well as in his life and conversation. Few persons were ever held, by those who knew his worth, in higher estimation than bishop Berkeley. When bishop Atterbury was introduced to him, he lifted up his hands in astonishment, and exclaimed, "So much understanding, so much knowledge, so much innocence, and such humility, I did not think had been the portion of any but angels, till I saw this gentleman." This testimony serves to remove the air of hyperbole from the well-known line of his friend Mr. Pope:—

"To Berkeley every virtue under heaven."

In matters of speculation, his natural ardour might, possibly, have led him to imbibe some notions that are more fanciful than just. It has been said, that towards the close of his life, he began to doubt the solidity of metaphysical speculations, and that he therefore turned his thoughts to the more beneficial studies of politics and medicine. He has been charged by some considerable persons, and particularly by bishop Hoadly, with corrupting the native simplicity of religion, by blending with it the subtlety and obscurity of metaphysics; and Mr. Hume asserts, that his writings form the best lessons of scepticism which are to be found either among the ancient or modern philosophers, Bayle not excepted; that "all his arguments," against Sceptics, as well as against Atheists and Free thinkers, says Hume, "though otherwise intended, are, in reality, merely sceptical, appear from this, *that they admit of no answer, and produce no conviction.*" That his knowledge extended to the minutest objects, and included the arts and business of common life, is testified by Dr. Blackwell, in his "Court of Augustus." The industry of his research, and the acuteness of his observations, comprehend not only the mechanic arts, but the various departments of trade, agriculture, and navigation; and that he possessed poetical talents in a considerable degree, is evident from the animated letters that are found in the collection of Pope's Works, and also from several compositions in verse, particularly the beautiful stanzas written on the prospect of realizing his noble scheme relating to Bermuda. The classical romance, entitled "The Adventures of Signior Gaudenzio di Lucca," has generally but not truly been attributed to him.

Besides the writings already mentioned, bishop Berkeley published at Dublin, in 1735, a small pamphlet relating to the doctrine of Fluxions, entitled "Reasons for not replying to Mr. Walton's full Answer," &c. His smaller pieces were collected and printed under his inspection at Dublin in 1752, under the title of "Miscellanies." "The works of George Berkeley, D. D. late Bishop of Cloyne; to which is added an account of his life, and several letters, &c." were published in 2 vols. 4to. in 1784. Biog. Brit.

BERKENHOUT, JOHN, son of a respectable merchant of Leeds in Yorkshire, but originally from Holland, was born about the year 1730. Being intended by his father for merchandize, after receiving a school education at Leeds, he was sent to Germany, to acquire a knowledge of that language. Paying a visit to the baron de Bielfeldt, a relation of his father, residing at Berlin, he was, through the influence of that nobleman, first made a cadet, and, in progression, an ensign, and afterwards a captain in the Prussian army; but on the breaking out of a war between England and France, he obtained his dismissal from the Prussian service, and was preferred to the command of a company here. On the return of peace, in 1762, he went to Edinburgh, where he commenced student in medicine, and after a short residence there, he removed to Leyden, and in the year 1765, took his degree

degree of doctor in that faculty. The thesis he wrote on this occasion is intitled, "Dissertatio medica inauguralis de podagra," and is dedicated to his relation the baron de Bielfeldt. On his return to England, he settled at Isleworth, near the Thames; and soon after published his "Pharmacopœia medica," which has been so much approved, as to pass through several editions. But he seems to have been of too active a disposition to remain long in the practice of medicine, in which he never made much progress. In 1778, he was appointed by government one of the commissioners who were sent to America with a view of settling the differences between that country and England, and was the only one of them that was permitted to go to Philadelphia, where the congress was sitting. Here he remained some time, but suspected at length by the congress, and perhaps not without reason, of carrying on a secret correspondence with some of the Americans, who disapproved of their proceedings, he was first sent to prison, but was soon released, and then sent to his brother commissioners at New York. On his return to England, he received a pension from government for the services he had endeavoured to render his country; on which, and his own fortune, he lived as a private gentleman to the time of his death, which happened on the 3d of April 1771.

Dr. Berkenhout was author of various works, besides those mentioned above. In 1772, he published "Outlines of the Natural History of Great Britain and Ireland;" a useful manual for students in that line. In 1788, "First lines of the theory and practice of philosophical chemistry;" which he dedicated to Mr. Eden (lord Auckland), who had been one of the commissioners with him to America. He also wrote "An Essay on the bite of a mad dog;" "An Answer to Dr. Cadogan's Essay on the Gout;" "A Preface to the translation of Pomme's treatise on hyetie diseases." He was also the author of "Lucubrations of ways and means," from which the idea of several of our present taxes is said to be taken; and of "A Translation of count Tessin's letters to the late king of Sweden." New Bog. Dict

BERKER'S CREEK, *Arian*, in *Geography*, a sand which shoots off from the land towards the sea, to the south of Breenk, or the south sand hill, on the coast of Holland. It is situated on the south of the Land Deep channel into the Texel, the coast trending nearly N. and S. from the Maast to the Texel.

BERKHAMPSTEAD, a market town of Hertfordshire, England, is situated in a fertile country, on the southern bank of the small river Bulborne, at the distance of 26 miles N. W. of London. This town and its vicinity have been the seat of war, and noted by historians as the property and residence of some of the Saxon kings, and of the distinguished characters of that nation. After the Norman conquest it was possessed by some princes of the blood, and dukes of Cornwall. On the north side of the town are the embankments, and other remains, of a considerable castle, which Camden supposed was built by Robert Mortimer earl of Cornwall, who was brother to the conqueror, and enjoyed the manor, &c. from him. At this place the conqueror had an interview with the English nobility, after his successful battle against Harold. The castle raised by earl Moreton, was demolished in his son's time, who was accused of rebellion, and the town and manor presented to the crown. Henry II. granted the inhabitants many privileges, among which was the liberty of selling their goods free of tolls and duties, either in that country or in Brittany, Aquitain, or Anjou. In Domestick war he had fifty-two burghesses named in this town, whose merchandise was chiefly wool, which was manufactured into

cloth on the continent. Henry II. kept his court here, as appears from a grant dated at this place, conferring the church of Havering in Essex on the monks of St. Bernard de Monte Jovis, to provide firing for the poor. King John, in the 7th year of his reign, granted this castle and honour to Geoffrey Fitzpeers earl of Essex; but two years after his death, these places were again in the king's hands. The dauphin of France, in concert with the barons, besieged this fortress, which was bravely defended. The besieged made two successful sallies, and held out until the king sent them orders to surrender. Previously to the second year of Henry III. the markets were held here on a Sunday, but in that year they were changed for Monday, which is still the market day. This castle and lordship continued for a long period in the possession of the earls and dukes of Cornwall, and were repeatedly the scene of rendezvous and baronial contentions. The castle was surrounded by a foss and vallum, including about four acres of ground, and the keep, or citadel, was placed on the north side of it: upon the dilapidation of its walls, a large house was constructed with the materials, which was possessed in the rebellion by colonel Axtel.

The town is much reduced from its former consequence, and consists of one long street, having St. Leonard's hospital at one end, and St. James's at the other. The church, dedicated to St. Peter, is a large handsome pile of building, and has several small chapels, or oratories, included within its walls; also some curious old monuments. Here is an alms house for six poor widows, who are jointly allowed 50l. a year towards their maintenance. The town has also a charity-school and a free grammar school; the latter of which was endowed by king Edward VI. for 144 boys, and provided with a master and usher. Besides these charitable foundations, here is another alms-house, which was endowed by John Layer and his wife, with a legacy of 1300l. Berkhampt ad gives the title of marquis to the duke of Cumberland. The chief trade of the place consists in the turning of bowls, of shovels, spoons, and other articles, made of beech wood. Here are three annual fairs, and a statute fair for the hiring of servants, &c. The houses in the parish are 338, and the inhabitants amount to 1650. This town is called Berkhamptead St. Peter's, in contradistinction to another parish a little to the north of it, which was formerly separated from this, and called Northchurch, or Berkhamptead St. Mary's. Salmon's History of Hertfordshire, &c.

BERKI, a town of Asiatic Turkey, in the province of Natolia, near the river Caucis; 35 miles E. of Smyrna. N. lat. 38° 2'. E. long. 25° 15'.

BERKLEY, a county of Virginia in North America, lies west of the Blue ridge, north of Frederick county, and separated from the state of Maryland, on the north and east by Potowmack river. This fertile county, about 40 miles long and 20 broad, has 16,781 free inhabitants, and 2932 slaves. Its chief town is Martinsburg.

BERKLEY, the name of a county and town in Charleston district, South Carolina, lying near Ashley and Cooper rivers. In the census of 1791, it was called St. John's parish, in Berkley county, and contained 75 free persons, and 517 slaves.

BERKLEY, a township of Bristol county in Massachusetts, containing 3500 inhabitants; 50 miles S. of Boston.

BERKLEY, or BERKELLY, an ancient town of Gloucestershire, England, and distinguished in the annals of this country for its small but good castle, and the popular events that have occurred within its walls. The town is scarcely ever noticed in the page of history, whilst the castle is repeatedly mentioned, and referred to from the Norman conquest to the disastrous warfare in the seventeenth century. In some old records

this place is called Berchelai, and is distinguished by the appellation of borough, though it does not appear ever to have sent members to parliament. Formerly the great public road from Bristol to Gloucester, and from the western to the northern counties, passed through the town, and consequently gave it some advantages; but this road is now conducted through Newport, and some other places, to the east of the town. This circumstance, with the powerful attractions of Gloucester and Bristol, have conspired to reduce the size and consequence of this place, which at present consists of one street only. The river Avon skirts the southern side of the castle gardens, and extends a short distance above them. This part of the county is distinguished by its fine pasture land, the rich cheese made in its dairies, and the golden and London-pippin cyder, obtained from its orchards. The cheese mostly made here is distinguished by the double name of Gloucester, the best of which is bought up by the London factors, at high prices. (See CHEESE.) The town is one of the five ancient boroughs of this county, which subsisted in the time of Edward I. and though deprived of most of its ancient privileges, yet a mayor is annually elected.

The manor of Berkley is one of the largest in England, and was taxed in the Domesday book at 160 hides, and 294 plough-tillages and a half. It was possessed, immediately after the Norman conquest, by Roger de Berkeley, who came into England with the conqueror, and was rewarded by him with this manor. It has continued in this noble family without interruption to the present time, and is now enjoyed by Frederick Augustus, the fifth earl of Berkeley, who is the twenty-first in descent from Harding the Dane.

The castle of Berkeley is one of the most perfect of the English baronial edifices, and has suffered less by the scourge of war and injudicious alteration, than any other English castle belonging to a subject. Some parts of the original structure are still perfect, and are interesting examples of the first Norman architecture, which was employed in constructing the baronial castles. The site of this building occupies an area of ground whose outline is nearly circular. It rises from a valley on the south and east, and its other sides are guarded by embattled walls, towers, and fortified gates. The great entrance gate opens into a base court, having the keep on the left, and the domestic apartments on the right, and in front. The keep, whose walls are lofty and massive, resembles the form of a Roman D, and is flanked by three semicircular towers, besides that in which the great stone stairs are contained. This is square, and has a small dark room near the top, where Edward II. was secretly murdered by the machinations of the bishop of Hereford, who invented and directed the execrable deed.

The elegant and energetic poet, Gray, notices this event in the following expressive terms:—

“Mark the year, and mark the night,
When Severn shall re-echo with affright,
The shrieks of death through Berkeley's roof to ring,
Shrieks of an agoazing king.”

The hall, chapel, and most of the apartments, are fitted up and preserved nearly in their ancient style, and in some of them are several curious relics of antiquity. Among them are many fine old historical portraits, and the sofa, chairs, and bedstead, which belonged to the cabin of the circumnavigator sir Francis Drake. The hall, which is 43 feet by 33, was built in the reign of Edward III. and has a fine old raftered roof, with a gallery at one end for the accommodation of minstrels, in “days of yore.” Leland mentions several parks and chaces, as connected with this castle at the time he

visited it; but all, except two, have been converted to the more useful purpose of farming. One of these, called Whitley park, which is inclosed with a wall seven miles in circumference, still remains, and contains much fine forest-timber.

At Purton near this castle, the present earl of Berkeley has made a decoy pool, which is the only one in this county, and where a great number of wild ducks are annually netted. The celebrated Dr. Jenner, the great promoter of the vaccine inoculation, was born in this parish.

To the north of the castle is the parish church, which is a large handsome structure, and contains several handsome and ancient monuments of the Berkeley family. The tower is a modern building, and constructed at a small distance from the church.

In this township are 99 houses, and 658 inhabitants. In the hundred of Berkeley there appear to be, by the late population act, 3,450 inhabited houses, 9,148 males, 10,074 females, 3968 persons employed chiefly in agriculture, 6151 employed in trade, manufactures, and handicraft, and the whole number of persons amounts to 19,222. Rudge's History of Gloucestershire. Rudder's History of ditto.

BERKLEY'S *Point*, lies on the north side of lord Egmont's island, or New Guernsey, the principal of the groupe called Queen Charlotte's islands, in S. lat. 10° 40'. E. long. about 164° 10'.

BERKLEY *Sound*, so called from captain Berkley, who visited it in 1787; an inlet, or bay, on the N. W. coast of North America, being the entrance into the supposed strait of Juan de Fuca, terminated on the south by cape Flattery, and on the north by the southern part of Quadra, or Vancouver's island; about 1° 51' south-east of Nootka sound, N. lat. 48° 30'. E. long. 235° 35'.

BERKS, a county of Pennsylvania in North America, has Northampton county on the N. E. Northumberland on the N. W. part of Luzern on the N. Dauphin and Lancaster on the S. W. and Chester and Montgomery on the S. E. It is watered by Schuylkill river, and is 53 miles long, and near 29 broad, and contains 1,030,400 acres. Iron and coal, which are plentiful, supply several iron works. The northern parts are rough and hilly. Berks contains 30,179 inhabitants, of whom 65 are slaves. It has 29 townships, of which Reading is the chief.

BERKSHIRE, a county of the state of Massachusetts, is bounded on the N. by the state of Vermont, on the S. by that of Connecticut; on the E. by Hampshire county, and on the W. by the state of New York. It runs through the whole extent of the state from N. to S. and contains 26 townships; and the number of inhabitants is 30,291. White and coloured marble is found in several towns, in the rough and hilly parts of this county.

BERKSHIRE, a newly settled township of Franklin county in the state of Vermont.

BERKSHIRE, an inland county of England. Previous to, and at the period of the Roman invasion of Britain, this part of the island was inhabited by three British tribes, respectively termed Attebrates, Bibroces, or Rhemi, and Segontiaci. The first occupied the western part of the county, from the river Loden on the south-east, to the Thames on the north-west; whilst the second possessed the south eastern part of the county; and the Segontiaci inhabited the remaining part on the southern side. When Constantine divided this country into Roman provinces (in 310,) Berkshire was included in the first division, called Britannia Prima. During the Saxon Heptarchy, it constituted part of the kingdom of the west Saxons, which commenced about A. D. 519, and continued till A. D. 828, when Wessex became the only sovereignty,

sovereignty, and its monarch, Egbert, gave the whole country the name of England. Alfred, grandson to Egbert, and a native of Wantage in this county, proceeding on the plan of his grandfather, more firmly cemented the kingdoms which Egbert had united, divided the whole into hundreds, tithings, parishes, &c. and gave this division the name of Berrocshire, which was afterwards contracted and softened into Berkshire.

This county is bounded by the shires of Oxford and Buckingham on the north, having the river Thames running the whole course; on the east by Surry; on the south by Hampshire, and on the west by Wiltshire. In the estimation of its size authors are at variance, but the most accurate statement gives its length from E. to N.W. at 48 miles, and its breadth, in the widest part, at 25 miles; though a narrow part near the centre is little more than 6 miles across. It contains about 530,000 acres of land, and is locally divided into twenty hundreds, containing 12 market towns, 140 parishes, 62 vicarages, about 670 villages and hamlets, 21,195 houses, and 109,515 inhabitants. A range of chalk hills entering this county from Oxfordshire, crosses it in a westerly direction, and forms the southern boundary of the vale of White Horse. Independent of this range of hills, the county is characterized by gentle eminences and valleys; having much rich fertile land, and abounding with picturesque and beautiful scenery. Though almost every kind of grain is cultivated in the county, yet that of barley is raised in greater quantities than either of the other species, and when made into malt, is chiefly sent to London. Many large dairy farms are found in the White Horse vale. Berkshire is well stocked with timber, particularly oak and beech in the western part, and also with numerous deciduous and exotic trees in Windsor forest and park, and in the various ornamental plantations scattered through the county. The open commons and uncultivated fields of Berkshire are supposed to constitute nearly half the county. Of these, Windsor-forest, Maidenhead-thicket, Tyehurst-heath, Wickham-heath, and the numerous commons and marshes, that are found in almost every parish, contain above 40,000 acres. The county derives but little advantage from manufactures, there being only a few clothiers established in the western part of it, and some pin-makers, &c. at Reading. On the banks of the river Kennet, in the vicinity of Newbury, are some large beds of peat, which furnishes the poor with fuel, and the farmer with ashes to meliorate his land.

The principal rivers of Berkshire are the Thames, the Kennet, the Lamborn, the Ock, and the Loddon. The first, though it serves to irrigate and fertilize a great part of this county, does not strictly belong to it, being the natural boundary line between this and the counties of Oxford and Buckingham. It enters Berkshire almost one mile south of Lechlade, and in its progress eastward waters the several towns of Abingdon, Wallingford, Henley, Maidenhead, Windsor, &c. and having received the tributary waters of various streams, leaves the county near Runnymede.

The Kennet enters the county on its western side at Hungerford, and passes through a narrow boggy valley to Newbury. Flowing eastward, in nearly a direct line, it runs through the county town of Reading, and soon afterwards unites with the Thames.

The Lamborn, a tributary stream to the former river, rises near a town of its own name, and after a course of about 11 miles, falls into the Kennet at Newbury. This river has been denoted as a phenomenon, by many topographical writers, some of whom have asserted that its current is more powerful and copious in summer than in winter. To account for this singular occurrence, they have had recourse to various hypotheses, but had they visited the place, and

there made inquiries, they would have found, that the river has no remarkable characteristic different from others, whose course is through a short tract of flat country.

The Ock rises in the vale of White Horse, near Kingston-Lisle, and flowing eastward, receives several other streams before it reaches the town of Abingdon, near which it unites with the Thames.

The Loddon enters the southern side of the county near Swallowfield, and running directly north, forms the western boundary to Windsor forest, and falls into the Thames near Wargrave.

Berkshire is in the diocese of Salisbury, and included in the Oxford circuit. It sends nine members to parliament; two of whom are returned for the county, and two for each of the towns of Reading, Wallingford, and New Windsor. The other member is elected for the borough of Abingdon. The Lent assizes, and the Epiphany county sessions, are constantly held at Reading; the Easter sessions at Newbury; the Summer assizes at Abingdon; and the Michaelmas sessions alternately at the latter town, and at Reading.

Among the objects of antiquity in this county, is the celebrated White Horse; which the most learned antiquaries refer to Saxon origin; and Mr. Wise, who has published two quarto pamphlets on the subject, endeavours to prove that it was designed by Alfred, to commemorate a victory obtained by the Saxons over the Danes. It was formed on the side of a chalk-hill, by the simple process of cutting off all the green turf within a certain line, which resembled the shape of a horse. This trophy is now nearly obliterated by the grass growing on its surface. Near the White Horse is a very large encampment, called Uffington-castle, and about one mile westward of the latter is a Druidical monument, named Wayland-Smith. It is a large cromlech on a barrow, with several smaller stones, which were formerly placed in a circle round it. Another Druidical relic is to be found at Park-place in this county. This was brought from the isle of Jersey, and all its stones were placed here in the exact position, and relative situation in which they were originally found. See HENLEY.

Besides several ancient encampments of different sizes and shapes, this county had two Roman stations, which are named in Antoninus's Itinerary "Spmis," and "Calleva," and are found in the thirteenth Iter of that work. In the seventh Iter is another station, named Pontibus, or Pontis, which antiquaries agree in fixing near the eastern border of the county. The Roman Walling-street passed across the northern corner of Berkshire, entering it near Wallingford, and leaving it on the north-western side. Reading is the county town of Berkshire, and the castle of Windsor its great ornament. Camden's Britannia. Coates's History of Reading. Horley's Britannia Romana. Beauties of England and Wales.

BERKUSSA, a town of Croatia, on the river Kulpa, 11 miles west of Petrenta.

BERLAI, a town of Croatia, on the river Korana, 8 miles south of Sluin.

BERLAMONT, a town of France, in the department of the North, and chief place of a canton, in the district of Avesnes, $2\frac{1}{2}$ leagues E.S.E. of le Quesnoy. It contains 1579 inhabitants, and those of the canton amount to 5,794. The territory includes 15 kilometres, and 14 communes.

BERLASREUT, a town of Germany, in the circle of Bavaria, 12 miles N. of Passau.

BERLEBURG, a town of Germany, in the circle of the Upper Rhine, 56 miles E. of Cologne.

BERLEUX, a town of France, in the department of the Somme, and chief place of a canton, in the district of Peronne, 3 miles S.W. of Peronne.

BERLIN, a city of Germany, in the circle of Upper Saxony.

BERLIN.

Saxony, a capital of the electorate of Brandenburg, and of the whole Prussian dominions, is situated on the banks of the river Spree, and has been reckoned one of the most beautiful cities in Europe, as it is one of the largest and most populous in Germany. Its extent is about $4\frac{1}{2}$ miles in length, from the Muhlenthor on the south-east, to the Oranien-burgerthor on the north-west; and about 3 miles broad from the Berraverthor, on the north-east, to the Potsdamerthor on the south-west: but within this extensive inclosure there are many gardens and corn fields. The streets are disposed with great regularity, and are of a convenient breadth. In the new town they are perfectly straight. Frederick street is reckoned $2\frac{1}{2}$ English miles in length; and others, which intersect this at right angles, are a mile, or a mile and a half long. Some have asserted that it covers as much ground as Paris; but though this be not true, and it be allowed to occupy more than half the extent of the capital of France, its number of inhabitants is much smaller in proportion. The number of houses has been variously estimated. Reisbeck computes them at 6000; count Hertzberg states the number of buildings, public and private, as amounting, in 1790, to 6725; and according to Hoeck, the number of houses is 6950. The number of inhabitants, according to the lowest statement, is 140,000; Hoeck computes them at 142,099; and Hertzberg at 150,803, being, at an average, more than 22 inhabitants to each house. There are a few very magnificent buildings in this town; and the rest are neat houses, built according to a plan prescribed by the late and present king, who have directed their particular attention to the external decorations of the city, either of a fine white free-stone, or of bricks covered with a thin coating of plaster, painted with a light colour, and generally one, or at most two stories high. The situation of the city, in a barren sandy plain, exposes it very much to dust, which, in dry windy weather, is not only inconvenient to the eyes and lungs of the inhabitants, and injurious to their health, but detrimental to the beauty of the buildings, which exhibit a soiled and shabby appearance. The finishing of the houses within by no means corresponds with their external elegance; the rooms are in a ruinous condition, the furniture covered with dust and dirt, and the variety of persons of the meanest condition who inhabit them, altogether incongruous to their outward magnificence and decoration. In these handsome houses, soldiers are quartered even on the ground floor, in rooms looking out to the street; and the lowest mechanics occupy the different stories. The principal edifices are the king's royal palace, and that of the prince-royal. The former is a magnificent structure of free-stone, begun by Frederick I. in 1699; but as it has been constructed at different periods, and by several architects, its fronts are not exactly regular. It consists of four stories, with large apartments, fine ceilings, and superb furniture. The state chambers are decorated with capital paintings and rich tapestry, and furnished with tables, stands, lustres, chandeliers, looking-glass frames, screens, couches, &c. of solid silver. The library, though a mean apartment, is well furnished with books; among which is a collection of 500 Bibles in different languages and editions, particularly the Bible used by our Charles I. when he was beheaded, presented as a kind of relic by Dr. Juxon to the elector of Brandenburg, and also the first Bible printed in America, and one of 1450, the first printed in the German language; and also a koran, in a character so small, and on a paper so thin, as to form only $\frac{1}{2}$ inch in bulk. The arsenal is a noble structure, forming a spacious quadrangle, and containing arms, ranged in excellent order, for 200,000 men. Over the principal gate is a portrait of the elector, William

the Great, in a large model of gilt brass; and the four cardinal virtues, of a gigantic size, are placed on pedestals on each side of the portico, and seem to look towards the picture. The soldiers of the garrison amount to about 30,000. The royal stables are very magnificent, adjoining to which are grand apartments for the master of the horse, and his inferior officers; and in the rooms over the stables, may be seen the rich accoutrements of the horse on which Frederick I. rode, when he made his public entry; all the ornaments of the bridles, the breast-leather and crupper, as well as the bits and stirrups, being of gold, adorned with brilliants. The opera-house is a beautiful structure, and on the front bears this inscription, "Fredericus rex, Apollini et Musis." The king allows the free exercise of religion: and, accordingly, in Berlin are 25 churches, 14 of which are Lutheran, 10 Calvinist, and one Roman Catholic, which is the most elegant in the city. The churches are decorated with Mercuries, Apollos, Minervas, and Cupids, "which might lead a stranger to suspect," says Dr. Moore, "that the Christian religion was exploded from the Prussian dominions, and old Jupiter and his family restored to their ancient honours." Instead of saints and crucifixes, says the same writer, Frederick III. proposed to adorn the church of Berlin with the portraits of men who have been useful to the state; those of the marshals Schwerin, Keith, Winterfield, and some others, were actually placed in the great Lutheran church before his death. We may also reckon among the public buildings and establishments of Berlin, the academy of sciences, (See ACADEMY), another of arts and painting, an anatomical college, 5 gymnasia, 2 public libraries, and many excellent and important fabrics and manufactures of silk, woollen stuffs, and stockings, cotton, linen, lace, porcelain, &c. which supply it with a very considerable and advantageous trade, to the prosperity of which, the unlimited toleration granted to Roman Catholics, Lutherans, Calvinists, and Jews, has very much contributed. In Berlin, there are several large squares, in one of which is an equestrian statue of marshal Schwerin, holding the ensign with which he advanced at the famous battle of Prague, and which he seized from one of his officers when his troops were giving way, exclaiming, "Let all, but cowards, follow me." On the new bridge over the Spree, stands also an equestrian statue of William the Great, which is highly esteemed as a piece of fine workmanship: the man and horse in one piece, cast at the same time, and the statue weighs 3,000 quintals. The suburbs are adorned with the magnificent garden of count Reuffen, the beautiful house and garden called Mombjon, the house and garden of Belvidere, and the stately hospital of invalids, for the maintenance of about a thousand officers and soldiers. In the new Calvinist church of Old Coln, is the burying place of the royal family. At Berlin there are many public walks and gardens. The principal walk is that in the park, on the south side of the Spree, which is upwards of three miles in circuit, and resorted to by the inhabitants of the city in great crowds on a Sunday; and here they are provided with every kind of refreshment, and indulged with any sort of amusement. The most fashionable walk in the city, is that which lies in the middle of one of the streets. Before the houses at Berlin, on each side, is a cause-way, and between these two cause-ways, are fine gravel walks planted with lime-trees. Under these are pitched tents, in which are sold ice, lemonade, and other refreshments. In the summer, the bands of music belonging to the regiments practise in this walk. In all the private houses a very rigid economy is observed; the chief article of expence is that which pertains to the dress of the ladies, who deny themselves common indulgences, for the sake of powder and millinery. The ladies

adies of the court have much of the air of French women. There are some kinds of irregularities that prevail to a great degree in this city. Public courtezans are more numerous here than in any town of Europe, in proportion to the number of its inhabitants. They appear openly at the windows, beckon to passengers as they walk in the streets, and ply for employment in any way they please, without disturbance from the magistrate. Citizens and manufacturers of the better kind live altogether among those of their own rank; and without affecting the manners of the courtiers, or stooping to the mean debauchery of the commonalty, maintain the decency, plainness, and honesty of the German character. Jealousy is held in equal contempt and detestation by the inhabitants of Berlin, and scandal is very little known. The environs of this city are remarkably pleasant, being interspersed with villages, vineyards, canals, pleasure houses, and gardens. Among the palaces in the neighbourhood belonging to the royal family, Schonhausen and Charlottenburg are the most worthy of notice. The former is situated about two miles from Berlin, on the Pankow, which supplies the pond in the sumptuous garden of this palace with water. Charlottenburg also, one of the royal or electoral palaces, seated on the river Spree, was only a small village, till the electress, consort to Frederick I. being pleased with its situation, began to build in it, and after her death the works were carried on by the elector, who gave it its name in commemoration of his wife Sophia Charlotte. This palace is one of the most considerable structures in Germany, and is adorned with a most beautiful garden.

Berlin is divided into five wards, called Berlin proper, Coln on the Spree, Frederick's Werder, Dorotheenstadt, and Frederickstadt. The proper Berlin was founded in the 12th century, by some colonists invited thither from the Netherlands, and the vicinity of the Rhine, under the margrave Albert, the Bear. The suburbs of this town are frequently called Konigstadt, and by others divided into three vicetels, or quarters. Berlin proper is separated by a principal arm of the Spree from Coln, over which are four bridges, three of timber, and one of stone, called the Pontneuf. Coln was probably built about the same time as Berlin; and it is formed into a kind of island by two branches of the Spree, which environ it. New Coln is now a considerable part of the old town of Coln, from which it is separated by the Spree. The suburbs of Coln were inclosed in 1756, within the outer wall. The Frederickswerder was built by the elector Frederick William, on a swampy werder, or island. This ward is separated by a rampart and ditch from the Dorotheenstadt, or Neustadt, founded by the elector Frederick William, and named after his consort, Dorothy. This new town is the most beautiful part of Berlin, and it is chiefly inhabited by the French. In a street of this town is the walk above mentioned. Frederickstadt, founded by the elector Frederick III. immediately on his accession to the government, communicates with the new town and the Werder, and is the pleasantest ward in the whole city; the streets being spacious, straight, and planted with lime-trees. Behind this is erected a new ward, which ranges to the end of the new town, where many of the nobility have built palaces. In the suburbs, the houses are generally of timber, but so well plastered, that they seem to be of stone, and the streets are broad and straight. From this town there is a free communication, by means of canal, between the Spree and the Oder, and the Spree and the Elbe. Berlin lies in N. lat. 52° 32' 30". E. long 13° 26' 15". The annual average of temperature of Berlin for fifteen years, from 1769, to 1782, was, according to Mr. Beguelin's observations, 49°, nor could he find that the temperature de-

creases. The Baltic, within 120 miles N. of it, tempers the north winds, says Kirwan (see his Estimate of the temperature of different latitudes, p. 71.) and to this is owing the moderate temperature which it enjoys. The influence of the vicinity of the Baltic must be allowed, when it is considered that the temperature of Berlin is higher than that of Dresden, Altenburgh, or Gotha, whose latitude is one degree lower, but more distant from the Baltic. Reissbeck's Travels, vol. iii. Moore's Travels through France, &c. vol. ii.

BERLIN, a neat and flourishing town of America, in York county, and state of Pennsylvania, containing about 100 houses. It is regularly laid out, on the S. W. side of Conewago Creek, 13 miles westerly of York town, and 101 west of Philadelphia. N. lat. 39° 56'.—Also, a township in Orange county, Vermont, on Dog river, a branch of Onion river from the south, which last separates Berlin from Montpelier on the N. N. W. Berlin contains 134 inhabitants, and is about 94 miles north-easterly from Bennington.—Also, a township in Hartford county, Connecticut, 12 miles S. S. W. from Hartford, 42 N. W. from New London, and 26 N. N. E. from New Haven.—Also, a township in Worcester county, Massachusetts, containing 512 inhabitants, 34 miles W. from Bolton, and 15 N. E. from Worcester. Hops have been cultivated here, and promise to be a valuable article of husbandry.—Also, a township of Somerset county, formerly in that of Bedford, Pennsylvania, which lies on a branch of Stoney creek, a south water of Conemaugh river on the west side of the Alleghany mountain; 25 miles W. from Bedford; 23 N. W. from Fort Cumberland, in Virginia, and 200 W. from Philadelphia. Stone creek, the chief source of Kiskeminitas river, rises N. N. E. of Berlin. N. lat. 39° 54'.

BERLIN, a sort of vehicle, of the chariot kind; taking its name from the city of Berlin, in Germany: though some attribute the invention of it to the Italians, and derive the word from *berlina*, the name given by them to a sort of stage, whereon persons are exposed to public shame. In proof of its having derived its origin, as well as its name, from Berlin, it is alleged, that Philip de Chiese, a native of Piedmont, and descended from the Italian family of Chiese, was a colonel and quarter-master in the service of Frederick William, elector of Brandenburg and that he was much esteemed by the elector on account of his skill in architecture. Being once sent to France on his master's business, he caused to be constructed, for the convenience of this journey, a carriage capable of containing two persons; which in France, and every where else, was much approved and called a berlin. This Philip de Chiese died at Berlin in 1673.—Beekman's Hist. of Inventions, vol. i. p. 130.

The berlin is a very convenient machine to travel in, being lighter, and less apt to be overturned, than a chariot. The body of it is hung high, on shafts, by leathern braces; there being a kind of stirrup or footstool, for the convenience of getting into it; instead of side windows, some have screens to let down in bad weather, and draw up in good weather.

BERLIN, in *Natural History*. See BERDIN.

BERLINCHEN, in *Geography*, a town of Germany, in the circle of Upper Saxony, and New Mark of Brandenburg, 80 miles E. N. E. from Berlin, and 39 N. N. E. from Kottin.

BERLINECZ, a town of Poland, in the palatinate of Bracław, 52 miles W. from Bracław.

BERLOCH, a town of Bohemia, in the circle of Czazlan, 9 miles N. E. from Czazlan.

BERME, in *Fortification*, a small space of ground, four or five feet wide, left without the rampart, between its foot

and the side of the moat, to receive the earth that rolls down from the rampart, and prevent its falling into, and filling up, the moat.

This is also called *lisiere, relais, retraite, pas de sources, foreland, &c.*

Sometimes for greater security, the berme is palisadoed.

BERMEJO, in *Geography*, the name of an island and port on the S.W. coast of South America, in about 2 degrees N. lat. a little W. from Lima. It is four leagues distant from Mengon on the north, and 6 from Guarmey port on the south. The island is a small white island, in the middle of which is a bay: the land from hence to Mengon is high, and abounds with hillocks, having large spots of white sand. It has a good harbour and fine fresh water at a small distance from the shore; and the harbour is known at sea by a large high hill with a cleft in it, which runs down southward to the sea-side; on the north it is very steep.

BERMEO, or **VERNEO**, a sea-port town of Spain, in the province of Biscay, near cape Machicaca, 5 leagues N.W. of Bilbao.

BERMUDA HUNDRED, or **CITY POINT**, is a port of entry and post town of America, in Chesterfield county, Virginia, seated on the point of the peninsula formed by the confluence of the Appamattox with James river, 56 miles west-erly from Williamsburg, 64 from Point Comfort, in Chesapeake bay, and 315 S.W. by S. from Philadelphia. City Point, from which it is named, lies on the southern bank of James river, 4 miles S.S.W. from this town. The town has about 40 houses, including some warehouses. It trades chiefly with the West Indies, and the different states. City Point, in James river, lies in N. lat. 37° 16'. W. long. 77° 31' 30".

BERMUDAS, or **SOMERS' ISLANDS**, vulgarly called *Summer Islands*, a cluster of small and rocky islands, forming the figure of a shepherd's crook, and amounting in number to about 400; situated in the Atlantic, and distant from the coast of Carolina about 200 leagues. N. lat. 32° 35'. W. long. 63° 28'.

They derived their first name from John Bermudas, a Spaniard, who discovered them in 1527; and their second appellation they owe to sir George Somers, who was shipwrecked on these rocks in his passage to Virginia in 1609, and lived there nine months. But he and his companions, having built a ship of cedar wood, sailed from thence to Virginia. Sir George Somers, it is said, was driven a second time on these islands, and died there. But his companions returning to England, made so favourable a report of their beauty and fertility, that the Virginia company, who, as the first discoverers, claimed the property, sold them to about 120 persons, to whom king James I. granted a charter. Accordingly, in 1612, they planted the largest of them, viz. St. George's isle, with 160 persons, and in 1619, sent thither 500 persons more; upon which they instituted an assembly, with a governor and council. It is said, that they are much incommoded by want of fresh water, and by the storms, thunder, &c. to which they are subject. Shakspeare has therefore justly described them as ever "vexed" with storms; but the poet Waller, who resided there for some time, on being condemned for a plot against the parliament in 1643, represents them as enjoying a perpetual spring. In 1725, the benevolent bishop Berkeley proposed to erect a college in these islands for the conversion of the savage Americans. See **BERKELEY**.

This group of islands is said to consist of about 400: but the greater number seem to be mere islets and rocks, not of sufficient importance to have received a name. From the chart by Lempriere in 1797, it should seem that the largest island, called "Ber-

muda," resembles a hook, the great found fronting the north. The length is about 35 geographical miles, and the breadth between one and two. The other islands which have received names are St. George's, St. David's, and Sommerfet. The island of St. George's lies eastward of the main land, and has a capital town of the same name, containing about 500 houses. Contiguous to this is St. David's, which supplies the town with provisions. The air is healthy, and a continual spring prevails; so that most of the productions of the West Indies might probably be cultivated in these islands. The houses are built of a soft stone, which is fawn like timber, and seemingly resembling that of Bath; and the stone is much used in the West Indies for filtrating water.

With regard to the supposed fertility and productiveness of these islands, it appears, from the answers of governor Brown to the inquiries of the privy council of England, that they contain from 12 to 13 thousand acres of very poor land, of which 9 parts in 10 are either uncultivated, or reserved in woods for a supply of timber towards building small ships, sloops, and shallops for sale, this being the principal occupation of the inhabitants; and the vessels which they furnish, being built of cedar, are light, buoyant, and unexpensive. Of the land in cultivation, no part was appropriated to any other purpose than that of raising Indian corn, and esculent roots and vegetables, of which a considerable supply is sent to the West Indies, until the year 1785, when the growth of cotton was attempted, but without much success; there not being at present more than 200 acres applied to this species of culture. The number of white people of all ages in Bermudas is 5462, and of black, 4919. The Bermudians are generally seafaring men, and the negroes are expert mariners. In the war between Great Britain and America, there were at one time between 15 and 20 privateers fitted out from hence, which were manned by negroe slaves, who behaved irreproachably; and such is the state of slavery in these islands, and so much are the negroes attached to their masters, that such as were captured always returned when it was in their power. Some part of the trade of the Bermudians consists in carrying the salt which they fetch from Turks island to America, where they sell it for provisions or for cash. These islands are frequented by whale-fishers. The government is conducted by a governor named by the British crown, a council, and a general assembly: the religion is that of the church of England. There are 9 churches under the care of 3 clergymen; and one Presbyterian church. The women of these islands are said to be handsome, and both sexes are fond of dress. Edwards's *Hist. of West. Ind.* vol. i. p. 470.

BERMUDAS Cedar, in *Botany*. See **JUNIPERUS**.

BERMUDIANA. See **SISYRINCHIUM**.

BERN, in *Geography*, was, before the French revolution, one of the thirteen cantons of Swisserland, bounded on the east by the cantons of Uri, Underwalden, Lucern, and the county of Baden; on the north by the Austrian forest-towns and the cantons of Basle and Soleure; on the west by the canton of Soleure, the county of Bienne, and a part of France; and on the south by the lake of Geneva, the Valais, and the duchy of Savoy. In the year 1352, Berne acceded to the Helvetic confederacy; and possessed such power, even at that early period, as to obtain the second rank among the Swiss cantons. Since the acquisition of the Pays de Vaud, the domains of this canton formed nearly the third part of Swisserland, and about the fourth of the actual population. It contained 3840 square miles; its population was estimated at 374,000 persons, and its contingents amounted to 2000. At the introduction of the reformation in 1528, government acquired a large increase of revenue by secularizing the ecclesiastical

ecclesiastical possessions. At the same period the whole canton followed the example of the capital; and the reformed religion was permanently established. This canton was divided into two great portions; the Pays de Vaud, and the German district. The Pays de Vaud having been conquered from the house of Savoy, and the German district from the States of the Empire, justice was administered, and taxes regulated in each by peculiar laws and customs. Each of these divisions had its treasurer and chamber of appeal resident in the capital; the chamber of appeal belonging to the Pays de Vaud judged in the last resort; but the inhabitants of the German district were allowed to appeal to the sovereign council.

The sovereign power of this canton resided in the great council of two hundred, which, when complete, consisted of 299 members chosen from the citizens, from whom they were considered as deriving their power, and as acting by deputation. The authority with which they were invested, was in some respects the most uncontrouled of any among the aristocratical states of Switzerland. The great council of Bern, since the year 1682, when it was declared the sovereign, was restrained by no constitutional check, like some of the others. As a general assembly of the citizens was never convened on any occasion, the executive powers of government were delegated by this sovereign council to the senate, chosen by themselves from their own body; the former ordinarily assembled three times a week, and extraordinarily upon particular occasions; the senate, every day, Sundays and festivals excepted. The senate, comprising the two avoyers, or chiefs of the republic, was composed of 27 members; and from this select body were taken the principal magistrates. On a vacancy in the senate, 26 balls, 3 of which were golden, were put into a box, and drawn by several members; and those who drew the three golden balls, nominated three electors out of their body. In the same manner, seven members were chosen from the great council, who also nominated seven electors out of their own body. These ten electors fixed on a certain number of candidates, not exceeding ten, nor less than six; and such among these candidates as had the fewest votes in the sovereign council, retired till their number was reduced to four; then four balls, two golden and two silver, were drawn by the four remaining candidates; the two who drew the former were put in nomination, and he who had the greatest number of suffrages in the sovereign council was chosen. But the candidate, in order to be eligible, must have been a member of the great council ten years, and must be either a married man or a widower. The greatest excellence of this mode of election consisted, as Mr. Planta observes, in making the chance of lots apply chiefly to the electors, and not to those who might pretend to the succession, by which the dangerous effects of *cahal* were in a great measure obviated, and yet a fair prospect of success was given to the meritorious, while those wholly unqualified could entertain little hopes of being preferred. The selected candidates drew lots only in one stage of the proceeding; and this when their number being reduced to only four, an even chance was given to those few to whom eminent qualifications had secured the marked approbation of their fellow-citizens; and when fortune proved unfavorable in one instance, repeated opportunities would occur, in which, unless they proved singularly unpropitious, the desired object would be ultimately obtained.

The great council was generally filled up every ten years; as within that period there was usually a deficiency of 50 members to complete the whole number of 299. When this deficiency occurred, and not before, a new election was

proposed; nor could it be deferred when there was a deficiency of 100. The time of election being determined by vote, each avoyer nominated two of the new members; each seizenier, and each member of the senate, one; and two or three other officers of state enjoyed the same privilege. Some few persons claimed, by virtue of their office, a right of being elected, which was generally allowed. These several nominations and pretensions generally amounted, on the whole, to about 50; the remaining vacancies were supplied by the suffrages of the senate, and the seizeniers. These seizeniers were sixteen members of the great council, drawn yearly from the abbayes or tribes; and the candidates were generally taken from those who had exercised the office of bailiffs, and were elected by lot. They were invested with an authority similar to that of the Roman censors; and in case of mal-administration, might remove any member from the great council or senate, though they have seldom exercised this power. The principal magistrates were two avoyers, two treasurers, and four bannerets; each chosen by a majority of voices in the sovereign council, and yearly confirmed in their respective offices. The avoyers held their posts for life; the treasurers, six years; and the bannerets, four. The two treasurers, one for the Pays de Vaud, and the other for the German district, formed, in conjunction with the four bannerets, an economical chamber or council of finance, which passed the accounts of the bailiffs, and received the revenues from those who were accountable to the government. The four bannerets, the ex-avoyer, who was the first senator in rank, and president of the secret council, the senior treasurer, and two members of the senate, composed a committee or secret council, in which all state affairs, requiring secrecy, were discussed.

Although the form of this constitution was aristocratical, and the senate possessed a very considerable influence, yet it did not enjoy (says Mr. Coxe) that almost exclusive authority which exists in many aristocratical governments. For, by several wise and well observed regulations, the sovereign council, although it delegated the most important concerns of government to the senate, yet assembled at stated times, and superintended the administration of public affairs. Mr. Burke asserts, that the republic of Berne was one of the happiest, most prosperous, and best governed countries on earth.

The canton of Bern, by its old constitution, was divided into a certain number of districts, called bailiages (see BAILLIAGE), over which bailiffs were chosen from the sovereign council. These were the most profitable posts in the disposal of government, and very eagerly pursued. They were formerly nominated by the bannerets, but the mode of election was altered in 1712, and they were chosen by lot. The bailiffs were representatives of the sovereign power in their respective districts; whose business it was to enforce the edicts of government, to collect the public revenues, to act as justices of the peace, and to be judges in civil and criminal causes, except where there was any local jurisdiction. In civil cases, beyond a certain value, an appeal lay to the courts of Bern: in criminal affairs, the process underwent a revision in the senate, and was referred to the criminal chamber, which inflicted punishments for small misdemeanours; but in capital cases, the sentence was to be confirmed by the senate, and by the sovereign council, if the delinquent was a citizen of Bern. The bailiff delivered his accounts to the economical chamber, to which court an appeal lay in case of exaction on his part, or on the part of his officers. The profits of the bailiff's office arose from the produce of the demesnes, of the tithes, certain duties paid to government in the respective bailiages, and from the fines imposed for

for criminal offences. In some parts of the German division, the bailiff became entitled, upon the death of every peasant, to a determinate part of the inheritance, which proved in some situations an oppressive tax upon the family. The bailiff, being governor and judge in his own district, and having a magnificent chateau for his accommodation, not only possessed great power, but in the course of his administration, which lasted six years, was able to live with proper magnificence, and, to lay up two or three thousand pounds without extortion or unbecoming parsimony.

In Bern, the militia was so well regulated, that government was able to assemble a very considerable body of men at a moment's warning. To this purpose every male at the age of 16 was enrolled, and about a third of the whole number was formed into particular regiments, composed of fusileers and electionaries; the former being bachelors, and the latter married men. Every person thus enrolled was obliged to provide, at his own expence, an uniform, a musquet, and a certain quantity of powder and ball; and no peasant was allowed to marry, unless he produced his uniform and arms. Every year a certain number of officers, called land-majors, were deputed by the council of war, to inspect the arms, to complete the regiments, and to exercise the militia. The regiments were, besides this annual review, occasionally exercised by veteran soldiers appointed for that purpose. Beside the arms in the arsenal of Bern, a certain quantity is also provided in the arsenal of each bailliage, sufficient for the militia of that district, and likewise a sum of money amounting to three months' pay, which is appropriated to the electionaries in case of actual service. The dragons were chosen from the substantial farmers, each of whom provided his horse and accoutrements. In time of peace the avoyer out of office was president of the council of war; but during war, a general in chief was nominated for the forces of the republic. A certain number of regiments being thus always ready, signals are fixed on the highest part of each bailliage, for assembling the militia at a particular place in each district, where they receive orders for marching. As the page of history does not exhibit a greater curiosity than what was called the "exterior state" at Bern, we shall here subjoin a brief account of it. It was a model of the sovereign council, and composed of those burghers who had not attained the age requisite for entering into that council. It had a great council, a senate, two avoyers, treasurers, bannerets, and seizeniers; all of whom were chosen in the usual manner, and with the accustomed ceremonies. The post of avoyer in this mimic legislative community was solicited with great assiduity, and sometimes obtained at a considerable expence, as the successful candidate was always admitted into the great council without any farther recommendation. This body possessed 66 bailliaiges, consisting of several ruined castles dispersed throughout the country, among which Hapsburg was the principal. It had also its common treasure, and its debts; differing in this latter respect from the actual government of Bern, which was not only free from debts, but possessed of a very considerable fund in reserve. Great honours were paid to this singular institution, as it was in fact a kind of political seminary for the youth of the canton, who were likely to arrive in some future period at the highest offices in the state. Its badge, or coat of arms, which was an ape sitting on a lobster, and viewing itself in a mirror, was no bad emblem of its mock consequence.

The revenues of Bern, out of which were paid the salaries of the principal magistrates, which were extremely moderate, the reigning avoyer being allowed 400l., each of the senators 150l., and the banneret 230l., and which were ap-

plied to the expences of the government, were derived principally from the public demesnes appropriated at the time of the reformation; the tithes, sequestered at the same period, and assigned to the maintenance of the clergy, public seminaries, and charitable institutions; quit-rents, and monopoly of salt and gun-powder; produce of the post-office; customs and tolls; duty on wine imported into the capital; and fines imposed for misdemeanors; also a tax on the alienation of landed property in the French district; the interest of money accumulated from a regular progression of savings, of which nearly 500,000l. were lodged in the English funds. The whole revenue has been stated by the best authorities as not exceeding 300,000 crowns, which were always more than sufficient to supply the expediture, and to construct and support the magnificent public works. A large treasure was always reserved in a vault of the capital for sudden emergencies, and the care of this vault entrusted to the principal magistrates, each of whom had a separate key, and without their concurrence, and a special order from the sovereign council, the door could not be opened. The amount of this treasure could not be accurately ascertained, but it must have been very considerable, as not less than 160,000l. sterling was deposited in the mountains of Hasli and Oberland. The pillage of this treasure was one of the principal objects of the French directory, to defray the expences of their armament against Egypt. In the plunder of Bern, it is said that the French did not acquire less than 400,000l. in specie.

When the directory of France determined to revolutionize Switzerland, it directed its whole force against the canton of Bern, on the conquest or submission of which the reduction of the country at large depended. Its hostilities were preceded, in 1797, by requiring Bern, and the other Helvetic cantons, to dismiss the British minister, who withdrew, and voluntarily announced the termination of his embassy in a dignified note addressed to the rulers of Bern. France, having accomplished the first part of its plan, which was that of dividing the confederate states, proceeded to the attainment of their second object, which was the subjection of Bern. With this view they secured the passes which facilitated the invasion of the Berne territory, by seizing the Erguel and the town of Bienne. The subsequent attempt to detach the Pays de Vaud from Berne, and to erect it into a republic, under the auspices of France, was equally successful, from the pusillanimity and infatuation of the Berne government. Bern, after some feeble and ineffectual remonstrances, relinquished its claims on the Pays de Vaud, and made overtures of conciliation to the French directory, and to Mengaud, their agent, in Switzerland. But these degrading measures served only to hasten the fall of the republic. At length, after some fruitless negotiations, they had recourse to arms; and the forces of Soleure and Friburgh ranged themselves under the standard of Bern; and the chief command was entrusted to general d'Erlach, a member of the sovereign council, who was a veteran distinguished for military skill and undaunted courage. The combined forces of Bern, Soleure, and Friburgh, amounted at this time to 25,000 men, and extended from the northern frontiers of the canton of Soleure beyond Friburgh; occupied the strong position of Vailly, between the lakes of Morat and Neuchâtel, and pushed their advanced corps as far as the valleys of Ormond, towards the south-eastern extremity of the lake of Geneva. By this position they covered the towns of Soleure, Bern, and Friburgh, and prevented all communication between the two French armies, in the Pays de Vaud, and the bishopric of Basle. Erlach, having arranged his plan of offensive operations in a masterly manner, was confident of success, and his troops were eager for the combat. In

this state of preparation, and whilst he was employed in distributing his instructions previously to an engagement, he received orders from Bern, which revoked the powers with which he had been intrusted, and commanded him to suspend hostilities, as a negotiation was opened with the commander in chief of the French forces, general Brune. He immediately repaired to Bern, and there found the fatal ascendancy of the French party. Dissatisfied with Brune's ultimatum, the magistrates issued their orders to general Erlach to renew his plan of attack. But still timid and wavering, they renewed their negotiations, which seemed merely to subject them to fresh insult. In the mean while a spirit of disaffection was spread among the troops, which Erlach, by his reasonable interposition, suppressed; and they again prepared for attacking the enemy. But no sooner was the order issued to this purpose, than it was again revoked, and a new conference was opened with the French general. These contradictory orders roused the indignation of the troops, ardent for an engagement; and they withdrew all confidence from their officers, whom they regarded as accomplices in the destruction of their country; and many of them indignantly quitted their standards. The army of Bern, thus dispirited by counter-orders, pretended negotiations, and the gradual advances of the enemy from one advantageous post to another, and reduced to the number of 14,000 men, determined, however, under the command of their valiant leader Erlach, to make a final effort for expiring liberty, and to encounter 40,000 veterans, flushed with conquest, and in a high state of discipline. After four desperate engagements, Erlach resisted a fifth assault under the walls of Bern, nor did he finally abandon the contest, till his little army, diminished to 7000 men, had lost 2000 of their number, and the troops of the two French generals, Brune and Schawembourg, were on the point of uniting, while the capital was unprepared for a siege. Bern surrendered to the first summons of general Brune, and a tree of liberty was planted in his presence. Erlach, having wonderfully escaped from the repeated assaults of the enemy, was hastening towards the mountains of Oberland, with hopes of collecting his scattered forces for another effort; but being recognized upon the high road between Bern and Thun by some straggling soldiers, he was seized, bound, and placed in a cart, in order to be conveyed to the capital; but another desperate band assaulted him, and, amidst reproaches and execrations, massacred him with their bayonets and hatchets. The subjugation of Bern speedily decided the fate of Switzerland. Upon the dissolution of the Helvetic confederacy, in 1798, Geneva, Mulhausen, Bienne, and the bishopric of Basle, were annexed to France; the remainder of the country, except the Grisons, was modelled into a republic, one and indivisible, divided into 18 departments, and governed by a senate, a great council, and five directors, who first assembled at Aarau, and were afterwards transferred to Lucern. By the constitution now established, Bern, including the central and western part of the ancient canton, with the district of Schwarzenburgh, was made one of the 18 departments, and Bern was its capital. According to this distribution, the canton of Bern is bounded on the north by that of Solothurn, on the east by that of Lucern, on the south by that of Oberland, and on the west by that of Sarine and Broie. During the campaign of 1799, part of Switzerland experienced a momentary deliverance; but from the unfortunate misunderstanding between the courts of Petersburg and Vienna, the directorial government was re-established. This was succeeded by a provisional government, which was first seated at Lucern, and on the progress of the Austrians in 1799, removed to Bern. When peace was established with the emperor by the treaty of Lunéville, the French ambassador

transmitted the plan of a new constitution; according to which, Switzerland, including the Gisons, was divided into 17 cantons. Accordingly, by this constitution of 1801, Bern, in its former extent, except the Pays de Vaud and Argovie, was the first of the 17 departments, or cantons, and the number of its representatives deputed to the diet was nine. The whole body consisted of 77 members, chosen by the representatives of each district, and assembled at Bern, to organize the new constitution. The legislative authority was vested in the senate, composed of two landammans and twenty-three counsellors. The executive power was lodged in a little council of four senators, in which each of the landammans presided in turn. The landamman in office was to receive a salary of 50,000 French livres, and the other landamman and four counsellors 10,000 each. The salaries of the senators were not to exceed 6000 livres. Each canton was governed by a prefect, nominated by the landamman, and was provided with its interior administration, which approved or rejected the projects of laws presented by the senate. By the conditions of eligibility, universal suffrage was abolished; and no person admitted to any public office, unless he was proprietor of land, or exercised an independent profession, and paid a contribution to the public burdens, the amount of which was regulated by each canton. A counter-revolution afterwards took place, by which the diet was dissolved, and the provisional government established as it existed before the 29th of May 1801. But the fate of Switzerland is not yet decided. For a further account of the alterations that have taken place from this period in the constitution and government of the Swiss cantons, see *HELVETIA*. Coxe's *Travels*, vol. i. & ii. Pianta's *Hist. of the Helvetic Confederacy*, vol. ii.

The canton of Bern is fertile and well cultivated; the plains produce corn and fruit; and the Alpine eminences afford excellent pasture, which supports herds of cattle and flocks of sheep, from whose milk they make butter and cheese. The inhabitants of the district of Sanenland in this canton, are principally herdsmen and shepherds, who hold a middle rank between that of cultivators and wandering Tartars or Arabians. Each family changes its habitation five or six times in a year; and every week it is customary to meet the father of his household, with his wife and children, and preceding them, herds, a cheese, kettle, and some wooden utensils, travelling, like an ancient patriarch, in search of a new residence. The country abounds with cots and houses, most of which are constructed of wood, and in such a manner as to be easily taken to pieces and removed for the convenience of their migration. In some of the valleys, the meadows are sometimes twice mowed, and thus fed. The mountain herbage for the cattle continues ten or twenty weeks, according to its height and situation. When their winter forage is finished, they remove to the lower parts of the mountains, and having contained their whole flock, proceed with their flocks towards the summits. Their progress is regular and majestic. The most beautiful cow of the herd, adorned with a magnificent collar and bell, takes the lead, accompanied by the master of the family. Then follow his attendants, with the rest of the flocks. Shepherds and cattle are all bedecked with garlands of flowers; and every part resounds with the jingling of bells, lowing of cows, and cheerful notes of the herdsmen. The smaller flocks bring up the rear, and the procession is closed with the wife and children. Towards the end of August they again descend toward the lower parts, pasture the last grass in the valleys, and at last retire to their warm retreats in the vale, to wait the return of spring and the same pleasing migration. In this part of the country no attention is paid to the culture of the meadow land; for though they

contrive to water their meadows without any fixed rules, and dung them in winter, they never drain those that are marshy, and water is left to stagnate on the sides of slopes and declivities. In the cold vallies, where in April the snow remains at the depth of some feet, they frequently strew mould on its surface, which soon melts it, and thus various gardens are cultivated in the midst of large tracts of snow. Potatoes have been lately planted, and are become a favourite food of the people, and in many cases have been substituted for bread instead of corn. The Alpine bean, ground into flour, serves the same purpose; whilst its leaves supply fodder for the sheep, and its stalk litter for the pens. Since the introduction of the commerce of cheese, the cultivation of corn has been annually decreasing. Some few spots of ground are, however, sown with wheat and barley, and others with hemp and flax, which are very thriving. The operations of the dairy render them negligent in the culture of fruit-trees; nevertheless, plum, cherry, pear, and apple-trees, are scattered here and there, but are nowhere collected into an orchard. In the German parts of Sanenland, they boil cherries with cloves and cinnamons into a kind of paste, which is preserved good for thirty years. Mixed with a few grains of mustard-seed, and other spices, they use it as a sweet mustard; and beaten together with spices and juniper berries, they allow it to ferment, and drink it as a red beer. For want of some regulation about their woods, whole forests are cut for palings to inclose their meadows, which soon become rotten, and useless even for fuel. Maddar grows in this district wild and high. The most beautiful and most fertile spots of the canton of Bern are on the sides of the lakes of Geneva and Neufchatel, where grow the most excellent fruits, and where are made the most valuable wines. In this canton are found a variety of coloured earths and clays, some of which are used for pottery, and stones of different sorts, plaster of Paris, crystal, salt springs, coal, sulphur, mines of iron, copper, lead, and silver, and medicinal baths. They count in this canton 39 towns, great and small, and 1300 villages. The rivers that water it, are the Aar, the Emmat, the Wigger, the Reusz, the Limmat, the Sanen, and the Kandel. The principal lake is that of Geneva; besides which there are those of Neufchatel, Biel, Murat, or Murten, Thun, Brientz, and Halwyl, all which abound in fish. The part of the chain of the Alps seen from Bern, is distinguished by the different names of Wetterhorn, Schreckhorn, Finster Aar-horn, Viecherhorn, Exterior and Interior Eger, Eungfrace horn, Gletcher horn, Ebenschuh, Mittaghorn, Briethorn, Lauterbrunen, Blumli Alp, and Neils; and it forms an amphitheatre, gradually rising from the environs of the city to elevated peaks, covered with eternal snow, and hitherto inaccessible. The Jungfrau, or Virgin, is one of the highest and most beautiful mountains in the canton of Bern.

The following table exhibits the height of the principal Alps in this canton.

	Eng. Feet.
Finsterarhorn, - - - -	14,116

The prevailing language is the German; but the people of fashion speak either French or Italian; and the common people in the Pays de Vaud, and in those parts that border on France and Italy, use a corrupt French or Italian, or a jargon, founded on both. The established religion is Calvinism; and the ministers are divided into deaneries and classes, and hold yearly chapters or synods. They are more independent of the civil power than in the other cantons, and are forbidden to interfere in matters of state. The nobility of Bern are accused of an extraordinary degree of pride and stateliness, and affect to keep the citizens and persons of lower rank at a great distance. As the whole power of government, and all the honourable offices of state, are in their hands, they are not permitted to engage in trade; and without the places and pensions which they enjoy, they must be poor and wretched. The lucrative offices being thus in the hands of the nobility, it might be imagined that people of the middle and lower ranks are indigent and oppressed. This, however, is by no means the case; for the citizens, i. e. the merchants and trades people, seem in general to enjoy all the comforts and conveniences of life; and the peasantry is uncommonly wealthy throughout the whole canton of Bern. They possess the privilege of bearing arms, and form a very respectable body of military, that have been usually attached to the existing government, and particularly favoured by it. The manufacturer, in this respect, less docile than the peasant, is less regarded; and the government of Bern has been charged with discouraging, or at least not zealously promoting, manufacture and commerce. Mr. Coxe informs us, that, in his first visit to Swisserland, he found the people of Bern much less informed, and more indifferent about the encouragement of literature, than those of the other cantons; their academical studies being principally directed to those branches of knowledge that fitted them for the church; and the society for the encouragement of agriculture, which was almost the only establishment tending to promote the arts and sciences, obtained little countenance from government. However, in his second journey, after an interval of about ten years, viz. in 1786, he says, that the government, roused from its former lethargy, had begun to perceive that it is the interest of every wise state to esteem and protect the sciences; and that the magistrates had lately purchased and appropriated at Bern a large mansion for the public library, increased the collection of books, and procured from England an extensive apparatus for experimental philosophy. A literary society had also been instituted for the promotion of physics, and natural history in general, and that of Swisserland in particular. In January 1788, this society consisted of ten members resident at Bern, of whom several possessed, and others were forming, collections agreeable to the plan of the institution. A regular correspondence was also established in various parts of Europe; and the members have been disposed to satisfy the inquiries of foreign naturalists relating to the natural history of this country. The principal articles of exportation from this canton are horses, cheese, linen cloth, coarse cloth and canvas made of hemp, cloth of cotton, and woollen stuffs. It is said that 10,000 pieces of linen have been sent annually from this canton; the principal part of which has been conveyed to Lyons. At Bern they have manufactures of silk, chiefly stuffs, and coloured stockings. In the western part of the mountains, the principal employment is clock-making, and the polishing of false stones.

BERN, a city of Swisserland, and capital of the canton of that name above described, derives its name, as it has been said, from a "bear," which was found there when its foundations were laid; "bern" in German signifying bears; and

and accordingly, it bears this animal in its arms, and always maintains one. It was built by Berchtold the 5th. duke of Züringer, and was, from its foundation, an imperial city. Upon his death in 1218, the emperor Frederick II. conferred upon the inhabitants considerable privileges, and compiled a code which forms the basis of their present civil law. The liberty which this city enjoyed attracted many persons from the adjacent country, who found a sure asylum from the oppression of the nobles. Although Bern, from its foundation, was engaged in perpetual wars with its neighbours, and for some time with the house of Austria, yet it continued to aggrandise itself by degrees, and considerably enlarged its territory.

This is a regular well-built town, with some air of magnificence. The principal streets are broad and long, not straight, but gently curved; the houses are built of a greyish stone upon arcades, and are mostly uniform, and of the same height. On each side are piazzas, with a wall raised four feet above the level of the street, which are very commodious in wet weather. A stream of the Aar runs in a clear current, and along a stone channel, through the middle of the streets, which furnishes several fountains not less ornamental to the place than beneficial to the inhabitants. The river Aar almost surrounds the town; winding its course over a rocky bed much below the level of the streets, and forming by its steep and craggy banks a kind of natural rampart. The stream that passes through the town serves to keep the streets always clean; for which purpose criminals are also employed in removing rubbish, both from the streets and public walks. The more atrocious delinquents are chained to waggons, while those who are condemned for smaller crimes are employed in sweeping the light rubbish into the rivulet, and throwing the heavier into the carts or waggons, which their more culpable companions are obliged to push or draw along. These wretches have collars of iron round their necks, with a projecting handle in the form of a hook to each, by which, on the slightest offence or mutiny, they may be seized, and are entirely at the command of the guard, whose duty it is to see them perform their work. People of both sexes are condemned to this labour for months, years, or life, according to the nature of their crimes. The public buildings at Bern, as the hospital, the granary, the guard-house, the arsenal, and the churches, are magnificent, and announce the riches and grandeur of the republic. The cathedral is a noble pile of Gothic architecture, standing upon a platform raised from the bed of the river, and commanding a most extensive view. The arsenal contains arms for 60,000 men, and a considerable quantity of cannon, which is cast in the town. The Bernese value themselves on the trophies contained in it, as well as upon the quantity, good condition, and orderly arrangement of the arms. Here is exhibited the statue of William Tell, who, with an arrow, is said to have struck off the apple placed upon his son's head by the governor Grissler, and by that means saved his life, which occasioned the beginning of the Swiss republic. The granary always contains a large provision of corn, supplied in consequence of particular treaties by France and Holland. The charitable institutions in this town are numerous, and well regulated. The hospitals are in general large, clean, and airy; and in the alms-house for the reception of 50 poor citizens, is a curious establishment similar to one at Basle, which provides for the reception of distressed travellers, who are accommodated with a meal and lodging at night, and each receives expence on their departure; if sick or wounded, they are maintained till their recovery. The house of correction is

conducted partly on the plan of the benevolent Mr. Howard, and in consequence of his suggestion. The delinquents are separated and distributed in two houses: one called the house of correction for greater crimes, and the other the house of labour for misdemeanors. The prisoners are also discriminated by the appellations of "brown" and "blue," from the colour of their clothes; the former being appropriated to the house of correction, and the latter to the house of labour. The men and women occupy separate apartments; and both are constantly employed in cleaning the streets and other servile occupations, and at other times in learning to read and write, and in acquiring the knowledge of various trades, which may enable them to gain a maintenance when their time of confinement expires. By these means the expence of the establishment is nearly supported, and an honest livelihood assured to those who would otherwise prove useless or pernicious members of society. There are four tables, at which the respective seats are made of distinction appropriated to good behaviour, and a larger or lesser share is distributed to each in proportion to their industry. After earning their food, the prisoners in the house of labour receive 10 per cent., those in the house of correction 8 per cent., for their extra-work. The torture at Bern is now formally abolished, by a public act of government; and justice is wisely and impartially administered. The solemnity used in passing capital sentence on a criminal deserves to be mentioned. When the trial is finished, the prisoner is informed of his condemnation by the "grand sautier," or lieutenant of the police, and attended by two clergymen to prepare him for death. On the day appointed for execution, a large scaffold, covered with a black canopy, is constructed in the middle of the principal street. The avoyer, with a sceptre in his hand, is seated on an elevated kind of throne between two senators, and attended by the chancellor and lieutenant of the police, holding an iron stick, called "the rod of blood," all habited in their official robes. The criminal, being brought to the foot of the scaffold, without chains, receives the sentence of condemnation, which is read aloud by the chancellor, at the close of which the avoyer commands the executioner to approach, who instantly binds the arms of the culprit, and leads him away to the place of execution.

The public library is a small, but well-chosen collection, containing 20,000 volumes, to which additions have been made by purchase, and by the liberality of private contributors; to this belong also a few antiques, a cabinet of Swiss coins and medals, some curious manuscripts, particularly of the thirteenth century, consisting of several songs and romances of the Troubadours, written in that and the preceding ages, and some other curiosities. The small figure of the priest pouring wine between the horns of a bull, is merely valuable, because it illustrates a passage of Virgil, and has been mentioned by Addison.

To the account of the public buildings of Bern, we may add that of an elegant edifice, built by the voluntary subscription of the nobility, furnished with accommodations for many public amusements, such as balls, concerts, and theatrical entertainments, which latter are seldom permitted in this city. The walk by the great church was formerly the only public walk, and much admired on account of the view from it, and the peculiarity of its situation; being on one side on a level with the streets, and on the other some hundred feet of perpendicular height above them. Besides this, there is now another walk on a high bank on the side of the Aar, and at some distance from the town. This walk is singularly magnificent, commands a view of the river, the town of

Bern, the country about it, and the glaciers of Swisserland. The adjacent country is richly cultivated, and agreeably diversified with hills, lawns, wood, and water; the river flows rapidly below, and an abrupt chain of rugged and snow-capt Alps bounds the distant horizon.

The population of Bern is estimated at about 13,000; the society is extremely agreeable; and foreigners are received with great ease and politeness. The men do not meet in separate societies; and the women are the life and ornament of their daily assemblies, which begin about four or five in the afternoon, and continue till eight, when the parties usually retire to their respective houses. The inhabitants are particularly fond of dancing, which of course is a frequent amusement; and this diversion commences at the early hour of five in the afternoon, on account of a standing order of government, which prohibits their continuance after eleven. There is but little trade in the capital. Some few manufactures, chiefly of linen and silk, have been established; but they are carried on only by those who have no prospect of being admitted into the sovereign council, and who would think themselves degraded by commerce. But as offices of the state, those of the bailliages excepted, are neither numerous nor very profitable, many enter, as their sole resource, into foreign armies. As for the peasants, who have acquired opulence either by manufactures or commerce, they seldom quit their station, but retain the habits acquired in early life, and, however wealthy, never give their daughters in marriage to any but persons of their own description. Of the burghers of Bern, those only are qualified for the magistracy and government of the city, who are the descendants of such as were made burghers before the year 1635; and, besides, they must not be under 30 years of age, and must be enrolled in one of the twelve companies. The British envoy to the Swiss cantons usually resides at Bern. N. lat. $46^{\circ} 55'$. E. long. $7^{\circ} 20'$. Coxe's Travels, vol. ii. Moore's View of Society, &c. in France, Switzerland, &c.

BERN-Machine, in *Agriculture*, the name of an engine for rooting up trees, invented by Peter Sommer, a native of Bern in Swisserland. This machine, of which there is a model in the machine-room of the Society for the encouragement of Arts, is represented in *Plate III. Agriculture*; and consists of three parts, the beam, the ram, and the lever. The beam ABC (N^o 1.) of which only one side is seen in the figure, is composed of two stout planks of oak, three inches thick at least, and separated by two transverse pieces of the same wood, at A and C, about three inches thick. These planks are bored through with corresponding holes, as represented in the figure, to receive iron pins, upon which the lever acts between the two sides of the beam, and which is shifted higher and higher as the tree is raised, or rather pushed out of its place. The sides are well secured at the top and bottom by strong iron hoops. The iron pins on which the lever rests should be an inch and a quarter, and the holes through which they pass, an inch and a half in diameter. The position of these holes is sufficiently indicated by the figure. The foot of the beam, when the machine is in action, is secured by stakes represented at G, driven into the earth. The ram D, which is made of oak, elm, or some other strong wood, is capped with three strong iron spikes, represented at *f*, which take fast hold of the tree. This ram is six or eight inches square; and a slit is cut lengthwise through the middle of it, from its lower end at K to the first serif *a* in order to allow room for the chain *gh* to play round the pulley K, which should be four inches thick, and nine inches in diameter. This ram is raised by means of the chain *gh*, which should be about ten feet long, with links four inches and three quarters in length, and an inch thick. One end of this chain is fastened to the

top of the beam at C, while the other, after passing through the lower part of the ram, and over the pulley K, terminates in a ring or link, represented N^o 3, the two ears *mn* of which serve to keep it in a true position between the two planks of the beam. In this ring the hook P is inserted. The hook is represented in profile N^o 2, where F is the part that takes hold of the ring. But it must be observed, that the parts of this machine, represented in N^o 2, 3, are drawn on a scale twice as large as the whole engine. The hook F, N^o 2, should be made of very tough iron, as well as the handle D, and the arch Ec. This handle should be two inches thick at *z*, where it joins to the hook, and the thickness gradually lessens by degrees up to the arch, which need not be more than half an inch thick. On each side of the pin *z*, is a semicircular notch, *x*, *y*, which rests alternately on the pins when the machine is worked. The hole D, and the arch Ec, serve to fix a long lever of wood EF, N^o 1, by means of two iron pins; and by this contrivance the lever is either raised or depressed at pleasure, in order to render the working of the machine easy in whatever part of the beam the lever may be placed; for without this contrivance the extremity of the lever EF, would, when the handle is near the top of the beam, be much higher than men standing upon the ground could reach. It must however be remembered, that the lever is often shortened by this contrivance, and consequently its power lessened.

The machine is worked in the following manner: It is placed against a tree, in the manner represented in the figure, so that the iron spikes at *f* may have hold of the tree, and the end of the beam A be supported by stakes represented at G. The iron handle N^o 2, is placed in the opening between the two planks of the beam, and the wooden lever fixed to it, by means of the iron pins already mentioned. The hook F takes hold of the chain, and one of the iron pins is thrust into the outer row of holes, by which means the outer notch *x* will rest on the pin, which will be now the centre of motion; and the end of the lever E, N^o 1, being pressed downwards, the other notch *y*, N^o 2, will be raised, and at the same time the chain, and consequently the ram. The other iron pin is now to be thrust into the hole in the inner row, next above that which was before the centre of motion, and the end of the lever E elevated or pushed upwards, the latter pin on which the notch *y* rests now becoming the centre of motion. By this alternate motion of the lever, and shifting the pins, the chain is drawn upwards over the pulley K, and consequently the whole force of the engine exerted against the tree. There is a small wheel at L, in order to lessen the friction of that part of the machine.

From this account the reader will very easily perceive that the machine is nothing more than a single pulley compounded with a lever of the first and second order. It must, however, be remembered, that as the push of the engine is given in an oblique direction, it will exert a greater or lesser force against the horizontal roots of the tree in proportion to the angle formed by the machine with the plane of the horizon; and that the angle of 45° is the maximum, or that when the machine will exert its greatest force against the horizontal roots of the tree.

BERNABEI, ERCOLE, in *Musical Biography*, the scholar and successor of Benevoli at St. Peter's, and instructor of the abate Steffani, may be ranked among the greatest masters of harmony, in the ancient ecclesiastical style, or the 17th century. This composer being invited by the elector of Bavaria to Munich, about the year 1650, entered into the service of that court, where he continued the rest of his life. His son, Giuseppe Ant. Barnabei, after following his father's steps in the study of ecclesiastical harmony, surpassed him considerably

considerably in melody and modulation, as he lived long enough to see a great relaxation in the rigour of ancient rules. There is a canon by this composer in the first volume of Paolucci, page 158, and an excellent Agnus Dei, in P. Martini Saggi. di Contrap. II. 127, extracted from his mass, for four voices, intitled, "Laudate eum letitia, qui fuitis in tristitia." After succeeding his father as maestro di capella to the elector of Bavaria, by whom he was honoured with the title of counsellor antique, and publishing several compositions for the church, replete with musical science of the first class, he lived till the year 1732, extending his existence to the great age of eighty-nine.

Their successors, with many other good harmonists, in the style of the 17th century, supplied the churches of Italy with innumerable compositions, in which the chief merit consisted in pure harmony, and the contrivance of canon, figure, and imitation on simple and often insipid subjects; but to these excellencies the best moderns have added melody, a more varied modulation, and not only an attention to long and short syllables, but to the expression of words. In the 15th century almost every mass was composed upon the subject of some well-known song or ballad; but these airs being psalmodic, and a little more lively or varied than canto fermo, admitted of no greater variety of modulation than the ancient chants of the church, upon fragments of which, during the 16th and part of the 17th centuries, it was thought necessary to construct the chief part of choral music. Though the present students in counterpoint at Naples, and other parts of Italy, still exercise themselves in harmonizing canto fermo, the writing masses or motets on the subjects of these chants is seldom done but in pure pedantry, and to give an air of antiquity to dry and fanciless compositions.

The church style of composition was, however, much altered during the 17th century, not only by the imitation of dramatic music, and the introduction of instruments, but by writing in transposed keys, and supplying the deficiencies in the scales, which too strict an adherence to the species of octave, and modes of the church, had occasioned. Indeed, before this time, there was no decision of keys, either in sacred or secular music, according to our present rules of beginning and ending upon the chord major or minor, of the key note, or of some determinate note in the scale. The prohibitions were so numerous in the writings of the old theorists, that if the most regular modern compositions were tried by such rules as substituted at the beginning of the 17th century, they would appear extremely licentious. No part was to be extended above or below the staff, or five regular lines, on which it was written; the combination of chords was never to be broken by moving to an unrelative harmony; and the intervals of the sharp seventh, the tritonus, or sharp fourth, false fifth, sharp second, and even the major sixth, were prohibited. Indeed, an excellent composition might now be produced, merely from ancient disallowances.

BERNACCHI, ANTONIO, an eminent opera singer, who first arrived in England in 1716, as a second man, while Nicola was the first. Bernacchi's voice seems to have been flexible and flexible, but he supplied the defects of nature by force of art, that his performance was always much more admired by professors than by the public in general. He died here at that time but one year, after which he went back to Italy; but returned in 1729. After quitting the stage, Bernacchi established a school for singing at Bologna, where he had himself been educated, under the celebrated Padovani, and where he formed several admirable scholars, who rendered his name and school famous. He came to England a second time in 1729, when he was paid his meridian; his voice was never good, but now little was left, except a refined taste, and an artificial manner of singing, which only

professors, and a few of the most intelligent part of an audience, could feel or comprehend. After he quitted the stage, he retired to Bologna, where he formed so many great vocal performers by his instructions, that to have been of Bernacchi's school was almost sufficient to establish the reputation of a young singer.

BERNADIA, or BERNALDA, in *Geography*, a town of Italy, in the kingdom of Naples, and province of Calabria Ultra, 5 miles west of St. Severina.

BERNAGORE, a town of Hindoostan, in the country of Bengal, on the eastern bank of the Ganges, 10 or 12 leagues below Chinsurah, and 5 miles N.W. of Moorshedabad. The coast is fertile of blue handkerchiefs are made here. It is famous on account of the great number of ladies of pleasure, who reside there, and who pay a monthly recognition to the sirdar of Chinsurah, for the free exercise of their profession. It belonged to the Dutch; but was taken by the British forces in October, 1803.

BERNAL, a hill on the west coast of New Mexico, near the coast, and 4 leagues W.S.W. of the burning mountain of San Salvador. N. lat. about 13°. W. long. about 93°.

BERNARD, in *Biography*, abbot of Clairvaux, and a saint of the Romish church, was born of a noble family at Fontaine in Burgundy, in 1091, and educated at the church of Chatillon, where he manifested at an early period an ardent spirit of devotion. At the age of 23, he, and 30 of his companions, entered into the abbey of Citeaux, lately founded by St. Robert. Here he acquired such reputation, that, within two years, viz. A.D. 1115, he was deputed, with a colony of monks, to found the abbey of Clairvaux in the diocese of Langres, of which he was created the first abbot, and where he continued, without seeking or accepting any higher preferment. In a short time he found himself at the head of 700 novices; and, by his eloquence and zeal, Clairvaux became a seminary of the most distinguished reputation, so that, during the life of the founder, it produced one pope, six cardinals, and thirty prelates. In this retreat the influence of Bernard was greater than if he had occupied the throne of St. Peter; he was consulted as an oracle; his censures were regarded with awe in the remotest parts of Europe; and the Cistercians, by his example, became so powerful, that he lived to see the establishment of 160 convents, which acknowledged him as their head. Having exerted himself in restoring peace to the church, which had been interrupted by the schism that had happened between the years 1131 and 1138, he engaged in combating the supposed heresy of Abaelard, who had propagated some opinions that were thought to militate against the doctrines of the church, and succeeded in procuring his condemnation by the council of Sens, in 1140. He also refuted the errors of Peter de Bruys (see PETER BRUSSIAS); combated the fanaticism of the APOSTOLICS; reformed the monk Raoul, who recommended the extermination of the Jews; contended against the followers of Arnold of Brescia; and caused Gilbert de la Porree, and Eon de Pétit, to be condemned by the council of Rheims, in 1148. But his influence was much more signally exerted in promoting the second crusade against the Saracens. In this romantic expedition, he engaged, by his eloquence, Lewis VII. of France, with his principal nobles, and the emperor Conrad; and he boasts, that from Combrance to Cologne, he emptied cities and castles of their inhabitants, and visited the production of only one man being left to seven women. Miracles of various kind were reported to have attended his mission, and he obtained the appellation of "Thaumaturgus," or wonder-worker of the world. The enterprise which he had undertaken with Conrad and Lewis proved unfortunate; and the abbot, who had predicted their success, incurred a variety of censures and reproaches on account of the calamities which he had

been instrumental in bringing upon Europe. He attributed its failure to the sins of the croises, which had hindered the accomplishment of his prophecies. How far he was affected by the discomfiture and general distress in which this expedition terminated, or by the accusations he suffered, it is impossible to say. However, it is certain that he did not long survive that disastrous event; for he died at Clairvaux, in 1153, in the 63d year of his age.

Few men possessed a more extensive and uncontrollable command over the minds of men than St. Bernard: and his influence was wholly owing to his personal qualifications. But though he had an absolute command by his eloquence and writings, he seems to have been more an enthusiast than a politician, and to have wanted worldly wisdom to direct and manage the various engines which he put into motion. With good intentions he blended passion and prejudice, and the love of power. He was, without doubt, a man of distinguished piety, as well as integrity; and, considering the time in which he lived, an elegant and learned scholar. Erasmus gives the following character of him: "Christianè doctus, et sanctè facundus, et piè festivus." As a writer, he was copious; his style was characterized by force, vivacity, elevation, and sweetness; and his imagination furnished him with figures of comparison and strong antitheses in great variety and abundance; so that he has been regarded as the last of the fathers formed upon the models of St. Ambrose and St. Augustin. The best edition of Bernard's works is that of the learned Benedictine Mabillon, in 2 vols. fol. first printed at Paris in 1666, 1667, and reprinted in 1690 and 1719. A Latin impression of this edition was made at Venice, in 6 vols. fol. Cave's Hist. Lit. ii. p. 186. Gen. Dict. Nouv. Dict. Hist. Mosheim's Eccl. Hist. vol. iii. p. 66.

BERNARD of *Menthon*, the founder of a religious community, was born in the Genevoisin 903, and descended from one of the most illustrious houses of Savoy. Having dedicated himself to the ecclesiastical profession, he retired to Aosta, a small town at the foot of the Alps, and became arch-deacon of its church. Here he employed himself in missions among the unconverted Pagans, who inhabited the mountains, and profelyted them to Christianity. Having witnessed the hardships and dangers encountered by the French and German pilgrims, in their passage to Rome over the Alps, which Hannibal had anciently traversed with singular fortitude and perseverance, this benevolent monk founded two monasteries, or hospitia, for their relief, on Mont-joux, called from him "Great and Little St. Bernard." These were peopled with canons-regular of St. Augustin, and Bernard himself became their first provost. He obtained several important privileges for his establishment from successive popes, and it acquired great popularity and large possessions. Bernard died at Novara, at the age of 85, and was canonized by the Romish church. His institution has undergone a variety of vicissitudes, and lost great part of its riches; but it still subsists, and is eminently useful. There are ordinarily between twenty and thirty monks belonging to the convent; eight of whom are usually dispersed among the Alpine parish churches, under their patronage; and ten or twelve constantly reside, being such as, from their age and health, are able to bear the keen atmosphere of the mountain. The few others, who can no longer bear it, are permitted to reside with the aged provost of the whole, in a house belonging to the convent, and situated at Martigny below. The monks of the mountain are industriously employed in the prosecution of their private studies, in the instruction of their novices, in the education of some scholars who are sent to board and lodge with them, and in managing the temporal economy of the whole. They have a prior, the deputy of the provost, and governor of the convent in his absence; a sacristan, who takes

care of their chapels; a cellarer, serving as purveyor, comptroller of the kitchen, and managing all the exterior concerns of the monastery. a clavandeer, who keeps the keys, and dispenses the requisite articles to the monks and to the travellers; and an infirmier, who takes care of the sick in the apartment appropriated to them. The cellarer keeps twenty horses constantly employed during the summer in fetching the magazines of flour, bread, cheese, liquors, and dried fruits, for themselves and their guests; and forage for the milch cows and fattening cattle, during winter. Their firewood, of which they expend a great quantity, is brought to them on the backs of mules, from the distance of four leagues, and by a steep path, that is passable only for six months in the whole year. Before the winter sets in, they send down their horses for the season to a farm which they have on the northern side of the Rhone. To a sympathizing and compassionate mind it is peculiarly pleasing to observe the solicitude of these amiable monks on such days as the pass is most frequented, in personally receiving, warming, and recovering travellers, that are exhausted by their excess of fatigue, or indisposed from the severity of the air. With equal attention they relieve both their own countrymen and foreigners. They make no distinction of state, sex, or religion; and ask no questions concerning the country or the creed of the wretched. In winter and in spring, their solicitude has a larger range of attention and activity. From that very time nearly, in which Hannibal conducted an army over Great St. Bernard, and at which the Romans reckoned the general winter of Italy to commence, from the 1st of November, through the winter, to the 1st of May, a trusty Alpine servant, who, as an Alpine, is denominated a Maronnier, and one or two dogs of an extraordinary size accompanying him, are constantly engaged in going to meet travellers a considerable way down the descent towards the Vallais. These dogs possess an instinct, and receive a training, which fit them to be peculiarly useful in their employment. They point out the road to the guide and the travellers, through fogs, tempests, and snows; they have also the sagacity to discover travellers that have lost their way, that have fallen amidst the drifts of snow, and that are lying upon them, wearied and exhausted. The monks themselves often accompany the guide, and aid him in administering necessary relief. Apprized of the benumbing and stupifying effect of extreme cold, they rouse the sleeping travellers, and exert themselves in a variety of ways in preserving and recovering them from approaching or apparent death; and in doing this, they expose themselves to great danger. In order to avoid the numbness occasioned by the cold, they carry with them short thick staves, armed at the ends with iron, and with these they continually strike their hands and feet. About three miles below the convent, on the road of Hannibal's ascent, they have built a small vaulted room, called the hospita, which is intended for the casual refreshment of travellers benumbed, and unable to reach the convent. The trusty Maronnier visits it frequently, in order to meet the traveller; but principally at the approach of night, and on his return leaves bread, cheese, and wine. On extraordinary occasions, when a storm subsides, he sallies forth to this building, with his flock of wine and meat, and assists all whom he finds distressed. The monks themselves are often seen on the tops of their rocks, watching opportunities for the exercise of their humanity. When the snow just fallen is deep on the ground, they employ themselves in making roads through it, and thus by timely vigilance prevent many fatal accidents. But notwithstanding all their charitable efforts, scarcely a winter passes in which some traveller is not brought to the convent with his limbs benumbed and frozen. The traveller is sometimes overwhelmed at once, and plunged into the body of descending snow. When he is not very deep, the dogs discover

BERNARD.

discover him by the scent, and when they fail, the monk engage in the laborious office. They range upon the snow, and found it with long poles: and they have thus rescued many from imminent danger of being lost. *Nouv. Dict. Hist. Sacrific. Voy. des Alpes*, vol. ii. Whitaker on the Courir of Hannibal over the Alps, &c. 1794. See BERNARD, in *Geography*.

BERNARD, ANDREW, a Latin scholar, and successively poet-laureat to Henry VII. and Henry VIII., was a native of Thoulouse, and an Augustin monk. He was not only the king's poet-laureat, as it is supposed, but his historiographer, and preceptor in grammar to prince Arthur. He obtained many ecclesiastical preferments in England. The pieces which he wrote under the character of poet-laureat, are in Latin. These are, "An Address to Henry VIII. for the most auspicious beginning of the 10th year of his reign," with an "Epithalamium on the marriage of Francis, the dauphin of France, with the king's daughter;" "A new year's gift," for the year 1515; and "Verses," wishing prosperity to his majesty's 13th year. He has left some Latin hymns; and many of his prose pieces in Latin, written as historiographer to both monarchs, are extant. *Warton's Hist. Eng. Poetry*, vol. ii. p. 132.

BERNARD, EDWARD, learned English astronomer and linguist, was born at Perry St. Paul, near Towcester, in Northamptonshire, in 1638, and educated at Merchant-Taylors' school in London, whence he was removed, in 1655, to St. John's college in Oxford. Here he applied himself with the utmost diligence to the study of history, philology, and philosophy: and acquired an accurate knowledge, not only of the Greek and Latin languages, but of Hebrew, Syriac, Arabic, and Coptic: he also directed his attention to the mathematics, which he studied under the celebrated Dr. Wallis. Having taken several academical degrees at Oxford, and engaged the esteem of all who knew him, by his distinguished talents and learning, and no less amiable temper, he removed in 1668 to Leyden, with a view of examining several oriental MSS., and particularly the Arabic version of the three lost Greek books of Apollonius Pergæus's conic sections, brought from the east by James Golius. These books he translated, with an intention of publishing them at Oxford, but his design was never executed. Upon his return to Oxford, he resumed his studies with fresh vigour, and by his collation of the most valuable MSS. in the Bodleian library, the result of which he was always ready to communicate, he was engaged in a very extensive correspondence with learned men of most countries. About the year 1669, he was recommended by the famous Dr. (afterwards sir Christopher) Wren, Cassilian professor of astronomy at Oxford, to be his deputy, and he succeeded this eminent professor, on his resignation in 1673. He had been previously inducted to the rectory of Cheame in Surry, and appointed chaplain to Dr. Mace, bishop of Bath and Wells. A scheme having been proposed in the university of Oxford, which was chiefly promoted and encouraged by bishop Fell, for collecting and publishing all the ancient mathematicians, Bernard, who first formed the project, assiduously engaged in accomplishing it, by collecting all the old books and MSS. in the public libraries, and drawing up a synopsis of their contents. He also printed, at his own expence, as a specimen of this noble design, a few sheets of Euclid in folio, containing the Greek text and a Latin version, with Proclus's commentary in Greek and Latin, and learned scholia and corollaries. With a view of promoting the study of astronomy, he also undertook an edition of the "Parva Syntaxis Alexandrina," or "*Met. Axioms*," of which there is an account in the "*Veterum Mathematicorum Synopsis*," and in which, besides Euclid, are contained the small treatises of Theodorus, Au-

tolycus, Menelaus, Aristarchus, and Hypsicles; but this was never published. In 1676, he was sent to France by king Charles II. as tutor to his two natural sons, by the duchess of Cleveland; but his disposition and habits not being adapted to this situation, he returned, after a year's absence, to his studious retirement at Oxford. During his stay at Paris, however, he cultivated an acquaintance with several learned persons, collated various ancient and valuable MSS., and bought many scarce and curious books for his own library. At Oxford he pursued his studies with renewed alacrity: and besides mathematics, to which he applied according to the duty of his professorship, he devoted himself from inclination to the prosecution of history, chronology, and antiquities. At this time he undertook a new edition of Josephus, which he never completed. In 1683, he visited Holland, for the purpose of attending the sale of Nicholas Heinsius's library, where he purchased many valuable books; and on this occasion he renewed, or contracted an acquaintance with several persons of eminent learning. As he experienced many civilities from the Dutch, and found that in Holland he should enjoy favourable opportunities for making great improvement in oriental learning, he seemed much inclined to settle at Leyden; but disappointed in his expectation of being chosen professor of the oriental tongues in that university, he returned to Oxford. In 1684, he took his degree of doctor in divinity; and in 1691, he was presented to the rich rectory of Brightwell in Berkshire, which, being at the distance of about 9 miles from Oxford, allowed of his occasional residence in this city. Soon after he resigned his professorship of astronomy, which had been for some time irksome and unpleasant to him, in favour of Dr. David Gregory, professor of mathematics at Edinburgh. In 1692, he superintended the preparation of a catalogue of the MSS. in the libraries of Great Britain and Ireland, and in some foreign libraries; and in the following year he married an agreeable lady in the bloom of youth, with whom he lived very happily. In 1696, he attended the sale of Golius's MSS. in Holland; and not long after his return fell into a constitutional decline, of which he died in January 1697; and he was interred in St. John's college chapel. His widow erected a monument of white marble, in the middle of which there is carved the figure of a "heart," circumscribed, according to his own direction, by these words; "Habemus Cor Bernardi." The publications of Dr. Bernard, were some astronomical papers in the *Philosophical Transactions*, N^o 158. p. 567. N^o 163. p. 721. and N^o 164. p. 747; "A Treatise on the ancient weights and measures," first printed at the end of Dr. Pococke's *Commentary on Hosea*, and afterwards reprinted in Latin, with great additions and alterations, Oxon. 1688, 8vo.; "Private Devotions, &c." Oxford, 1689, 12mo. "Orbis eruditi literatura, a characterè Samaritico deducta," in a large sheet of engraving, exhibiting at one view the alphabets of many nations, together with the abbreviations used by the Greeks, physicians, mathematicians, and chemists; "Etymologicum Britannicum," Oxon. 1689, printed at the end of Dr. Hicke's *Grammatica Anglo-Saxonica*, &c.; "Chronologia Samaritana Synopsis," published in the "*Acta Eruditorum Lipsiensia*," April, 1691. He was also the author of some notes and commentaries, printed in editions of learned works. He likewise assisted several learned persons in their editions of books, and collated MSS. for them. Among his papers were found many MSS. of his own composition, with very large collections; which, together with several of his books, were purchased by the curators of the Bodleian library. The rest of his books were sold by auction. Of his great and extensive learning, his work are a sufficient evidence. Dr. Smith, his biographer, represents him as a man of a meek, mild, and conciliating disposition,averse from contels of

BERNARD.

every kind, modest in delivering his own opinions on disputed subjects, caudid in his judgment of other men's performances, steadily attached to the established church, and at the same time liberal in his sentiments with regard to dissenters of all denominations, and desirous of peace and union. His piety was sincere and unaffected; and his devotions, both public and private, were regular and exemplary. The learned Huetius, in his "Comm. de rebus suis," bears this concise but very honourable testimony to his memory. "Edwardus Bernardus Anglus, quem pauci hac setate equiparabant eruditiois laude, modestiã vero pene nulli;" i. e. Edward Bernard, an Englishman, whom few in this age equalled in erudition, in modesty scarcely any. *Biog. Brit. Gen. Dict.*

BERNARD, JAMES, was born in 1658 at Nions, in Dauphiné, studied at Geneva, and became pastor of the church in his native province. But being driven from France by persecution, he sought refuge first at Geneva, then at Lausanne, and afterwards in Holland, where he was employed as a pensionary minister at Gouda. In 1705, he was chosen pastor of the Walloon church at Leyden, and soon after was appointed professor of philosophy and mathematics in that university, and received a doctor's degree. He closed his life of literary labour in 1718. He was the author of several political and historical works; in 1699, he undertook the continuation of Bayle's "Nouvelles de la republique des lettres;" which he continued till 1710, and resuming it in 1716, continued it till his death. He also wrote a great part of the 20th to the 25th vols. of Le Clerc's "Bibliotheque Universelle;" and a "Supplement to Moreri's Dictionary," in 1 vol. fol. Amst. 1714. He also published several theological and historical treatises, in the composition of which he has displayed more learning and industry than genius and skill. *Nouv. Dict. Hist.*

BERNARD, PETER-JOSEPH, a French poet, was the son of a sculptor at Grenoble, and born in 1708. Having been educated in the college of the Jesuits at Lyons, where he made rapid progress in literature, he rambled to Paris in pursuit of pleasure and liberty, and for two years employed himself as clerk to a notary; but here he published some light poems which attracted notice, and in 1734 he was taken to the campaign in Italy by the marquis de Pezay, and acquitted himself with honour at the battles of Parma and Gualtalla. The commander in chief, the marshal de Coigne, pleased with his talents, appointed him his secretary, and procured him the post of secretary-general to the dragoons. He continued with the marshal till his death in 1756. He afterwards lived in the circle of fashion and pleasure at Paris, till the year 1771, when the loss of his memory reduced him to a mere state of vegetation, in which he continued till his death in 1776. His works are all in the easy, elegant, and voluptuous kind. His first performances consist of anacreontics and songs, in short and playful measures, from which he obtained the appellation of "le gentil Bernard." He afterwards wrote the opera of "Castor and Pollux;" and a ballet called "Les Surprises de l'amour." His principal poem is "L'art d'aimer," in three cantos, in which are several tender passages, but in point of style negligently written. His poetical tale, intitled "Phrosine et Melidore," is of similar character. A collection of his works has been published, and the following lines of Voltaire are prefixed:

"Les trois Bernards."

"Dans ce pays trois Bernards sont connus :—
L'un est ce saint, ambitieux reclus ;
Prêcher adroit, fabricant d'oracles ;
L'autre Bernard est l'enfant de Plutus,
Bien plus grand saint, faisant plus grands miracles :
Et le troisième est l'enfant de Phébus,
Gentil Bernard, dont la muse féconde

Doit faire encor les délices du monde,
Quand de premiers on ne parlera plus."

The second, "Bernard" above mentioned is "Samuel," the famous financier under Lewis XIV., called the Lucullus of the age. *Nouv. Dict. Hist.*

BERNARD of *Brussels*, a painter of animals and hunting-pieces, in which he excelled, by giving to his wild animals a strong and spirited expression. He was patronised by Margaret, countess of the Netherlands, for whom he designed subjects for tapestry, and in the service of the emperor Charles V. he painted hunting pieces, in which he introduced the portraits of the emperor and of all his attendants. In a picture of the last judgment, he covered the panel with leaf-gold, before he laid on his colours, and thus preserved them from changing, and gave to his tints a heightened lustre. This method is said to have produced a happy effect, particularly in the sky. He died in 1540; the time of his birth is not known. *Pilkington.*

BERNARD, SOLOMON, an ingenious engraver, was a native of France, and resided chiefly at Lyons. He worked chiefly for the bookseilers, and his engravings were designed with spirit, and executed in a clear, neat style. He appears by his works to be a man of great genius, and fertile invention. His most esteemed performance is a set of prints for the Bible. He flourished from 1550 to 1580. *Strutt.*

BERNARD, FRANCIS, doctor in medicine, was principal physician to King James II., and in considerable practice. He left a large collection of scarce and valuable books, which was sold in 1698, the year after his death, for 1600*l.* His brother Charles, who was surgeon to the princess Anne, and who had the same passion for collecting books, left also a curious library, which was sold by auction in 1711. The "Specchio della Bestia trionfante," by Jordano Bruno, an Italian atheist, which was in this collection, was sold, as we learn from the *Spectator*, N^o 389, for 30*l.* This book was printed, Ames says, in England in 1584, by Thomas Vantrollier. An English edition of it was printed in 1713. *New Gen. Biog. Dict.*

BERNARD, CHRISTOPHER. This surgeon, who lived in the beginning of the 18th century, is only known as the author of two books, very popular in their time, though now in little request. "The present state of surgery, with some remarks on the abuses committed in it," London, 4to. 1703. "The crafts and frauds of physick exploded, discovering the low prices of the best medicines," 8vo. 1703. *Halker. Bib. Med.*

BERNARD, *St.* in *Geography*, a town of Germany, in the archduchy of Austria, 2 miles N. W. of Horn.—Also, an island of North America, in the lake of Nicaragua.

BERNARD, south end of a small sand between Southwold and Leostoff, on the coast of Suffolk, the north end of which is called "Newcomb," about a mile from the shore, within which small vessels may pass in good weather and a full sea.

BERNARD *River*, a river on the west coast of France, which falls into the bay within the island of Belleisle.

BERNARD'S *Bay*, lies on the N. W. side of the gulf of Mexico. The passage into it, between several islands, is called Pasco de Cavallo. N. lat. 28° 30'. W. long. 96° 16'.

BERNARD, *Great St.*, a mountain which is a branch of the Alps (the Alpes Penninæ of ancient writers), that separates the Lower Vallais from Savoy, and particularly from the duchy of Aosta, in the principality of Piedmont, and from which flows into the former country the river Drance, and into the latter, the Doire. On the summit of this mountain is the monastery of St. Bernard (see BERNARD), supposed to be 8006 feet above the level of the Mediterranean. N. lat. 45° 48'. E. long. 7° 2'. It was by this track that Hannibal is supposed to have conducted the Carthaginian army into Italy;

Italy; and it was in the same direction that Bonaparte, the consul of France, led his army of reserve over the Alps, previously to the battle of Marengo, in the year 1800.

BERNARD, *Little St.*, a part of the Alps, anciently *Alpes Graia*, separating the duchy of Aosta from Savoy, and lying to the south-west of the former. Over this lies a road into Savoy, and upon it is a monastery or hospitalium for the convenience of travellers.

BERNARD the Hermit, in *Entomology*, the name by which *Cancer hermitus* is very commonly known. This creature is also called the hermit crab; a name indiscriminately applied to all the parasitical species of the cancer genus; or, in other words, to all those which, having no shells covering to protect the body, inhabit the shells of whelks, or other testaceous animals. See *PAGARUS Fabr.*

BERNARDI, STEFFANO, in *Biography*, was a learned theorist in *Music*, as well as composer of madrigals and madrigals of a most laborate and correct kind. He flourished from 1611 to about 1634, and in 1623 was maestro di cappella of the *Duomo* at Verona. He published a didactic work, called "Porta Musicale," the first part of which appeared at Verona, 1615, in quarto; and, as an elementary tract, it has the merit of clearness and brevity.

BERNARDIA, in *Botany*. See **ADELIA**.

BERNARDIN, in *Biography*, a Romish saint, denominated *St. Bernard*, was born at Massa, in Tuscany, in 1380, according to Mr. Warton, but in 1383, according to M. Du Pin. After studying at Siena, he entered into the confraternity of the hospitallers of la Scala, and distinguished himself by his attendance on those who were afflicted with the plague. In 1404 or 1405, he became a member of the Franciscan order, and afterwards an eminent preacher. Besides the natural and acquired talents which he possessed, the power of working miracles was ascribed to him both during his life and after his death. He visited Jerusalem under the character of commissary of the Holy Land, and after his return visited several cities of Italy, where he preached with great applause. Being accused to pope Martin V. for maintaining some erroneous opinions, he explained himself to the satisfaction of the pontiff, and was absolved. Such were his humility and self-denial that he refused several bishoprics, and contented himself with the office of vicar-general of the observance of St. Francis in Italy, and as such, reformed, or newly founded 200 monasteries. He died at Avignone in Abruzzo in 1444, and was canonized in 1450 by pope Nicholas V. He left several works, which were printed at Venice in 1593, 4 vols. 4to.; and at Paris in 1636, 2 vols. fol. They consist of religious treatises, sermons, commentaries on the Apocrypha, &c. *Du Pin. Gen. D. t.*

BERNARDIN, or *Bernardin*, in *Geography*, a mountain of Switzerland, being part of the Alps, separating the district of Rhodwalden from the valleys of Calanca and Misox. In the mountain springs the river Musia, which flows down the Val Misox. It Horna is a town with the *Castello*, *low Bernardin*.

BERNARDINI, or **BERNARDITES**, in *Theology*, a sect of Heretics, the name of a religious order, differing very little from the Cistercians. They derived their name and order from St. Bernard, abbot of Clairvaux, who was considered as the second parent and founder of the Cistercians (see **BERNARD**). Their usual habit is a white gown, with a black scapulary; but when they officiate, they put on a large white hood with great sleeves, and a hood of the same colour.

BERNARDO, St., in *Geography*, an island, or rather group of islands in the South sea, called *St. Bernardo* of Mendana, and supposed by M. Fleureau, in his "Description of the French in 1768 and 1769, &c." to be Mr. Byron's "Isles of Danger." Mendana says, that St. Bernardo is in S. lat. 10° 30', and 1400 (Spanish) leagues from Lima, i. e. allowing

Lima to be in W. long. 77° 50', and 1400 leagues in the latitude of 10° 30' to make 81° 30' of longitude, the longitude of St. Bernardo will be about 159° 20'. But the situation of St. Bernardo may be more accurately determined from that of the Marquesas, placed by Capt. Cook, in his second voyage, in W. long. 139° 9'; for Figueroa says, that Mendana sailed west 400 (Spanish) leagues from the Marquesas, before he made St. Bernardo; and 400 Spanish leagues in the lat. of 10°, making 23° 13' difference of longitude; if this be added to 139° 9', we shall have 162° 22' W. for the longitude of St. Bernardo. Com. Byron places the Islands of Danger in S. lat. 10° 58', and W. long. 160° 53'; but Mr. Wales, who collated and published the astronomical observations which were made in Hawke's worth's voyages for the Board of Longitude, reduces this longitude to 165° 59' W., exceeding that of Mendana only by 3° 37'. Mr. Fleureau joins M. Pingré (see "Memoire sur le Transit de Venus," Paris 1767, p. 51.) in thinking that this island is not the same with that which Quiros saw, and called St. Bernardo, in 1605; but Mr. Dairymple thinks that they are the same; and it is probable that Quiros thought so; for in enumerating *his own* discoveries to that monarch (see "Dairymple's collection," vol. i. p. 145.) he omitted this island, whence it may be inferred, that he thought it to be a discovery which belonged to another person.

BERNARDO, *St. de Tarijah*, a town of South America, and principal of the district of Chicas, or Tarijah.

BERNARDSTOWN, a township in Somerset county, New Jersey, America, containing 2377 inhabitants, including 93 slaves.—Also, a township in Hampshire county, Massachusetts, containing 691 inhabitants; distant 110 miles W. from Boston.

BERNASCONI, ANDREA, in *Biography*, born at Verona, but who resided chiefly at Venice, was a pleasing and graceful composer. He flourished at the same time as Haffé, and though inferior to him in force and resources, it is said that Faustina, the wife of Haffé, used to prefer the melodies of Bernasconi. He resided long at Munich, in the service of the elector of Bavaria, where he died about the middle of the 17th century.

BERNASCONI, La Signora, daughter of the composer of that name, arrived in England, 1778, as first woman at our lyric theatre, when Pacchiorotti appeared there for the first time. She had gained considerable reputation as an actress at Vienna, in the part of Eurydice, when she sang with Mallico in Gluck's *Orfeo*, which had such great success from its novelty of style; that after being part of this success to the Bernasconi's vocal powers, we expected more than we found. And little is to be said of her as a performer, except that she had a neat and elegant manner of singing, though with a voice that was feeble, and indistinct.

BERNAU, in *Geography*, a town of Germany, in the archduchy of Austria, 5 miles South of Wels.—Also, a town of Germany, in the circle of Upper Saxony, and middle mark of Brandenburg, surrounded with walls, ramparts, and outworks, containing three churches; the principal manufacture of which is beer, of which large quantities are brewed in this town; 14 miles N. N. E. of Berlin.

BERNAVILLE, a town of France, in the department of the Somme, and chief place of a canton, in the district of Doullens, 2 leagues south-west of Doullens. The population of this town consists of 984, and that of the canton of 9994 persons. The territorial extent contains 1851 hectares, and 27 communes.

BERNAY, a town of France, and principal place of a district, in the department of the Eure; 7½ leagues west of Evreux. Its population amounts to 6142, and that of the canton to 14,957 persons. Its extent in kilometres is 107½, and

and it contains 21 communes. N. lat. 49° 6'. E. long. 0° 50'.

BERNBURG, in Latin *Bernburgum*, *Arctopolis*, and *Ursopolis*, a town of Germany, in the circle of Upper Saxony, the capital of Anhalt Bernburg, and the residence of the prince, seated on the Sala. It is divided into the Old and New Town, which had each its own magistracy, till they were united in 1560; besides which, there is a third part, called "Vordenburg," seated on a hill on the other side of the Sala, under a distinct magistracy. The church in this part serves for the castle and the court. The castle is one of the most ancient and most celebrated fortresses in the principality of Anhalt; 20 miles west of Dessau. N. lat. 51° 55'. E. long. 12° 36'.

BERNCASTEL, a town of Germany, in the circle of the Lower Rhine, and electorate of Treves, and chief place of a canton, in the district of Treves, and department of the Sarre, seated on the Moselle, and owing its privileges to the emperor Rodolphus I.; 8 miles E.N.E. of Treves. Its population includes 1263, and that of the canton 11,718 persons. It contains 34 communes. N. lat. 50° 1'. E. long. 6° 36'.

BERNE, a township of America, in Albany county, New York. According to the state census of 1796, there appear to be 477 electors.

BERNECK, a town of Germany, in the circle of Franconia, and principality of Bayreuth.

BERNECOURT, a town of France, in the department of the Meurte, and chief place of a canton in the district of Pont-a-Mousson, 3 leagues S. W. of Pont-a-Mousson.

BERNERA, or **BERNERAY**, one of the western islands of Scotland, is only about four miles in length, and one and a half in breadth. The soil of it is sandy, but when well manured proves extremely fertile, and produces some fine corn and clover pastures. It has a freshwater lake, called Lochbruis, which has some small islands, and abounds with eels. These are frequently caught in great numbers by the inhabitants, who resort in the night, with lights, to a small rivulet, where the eels are found going towards the sea. They are often caught twisted together in heaps. The tides of the sea often produce very singular effects round this island. In their ordinary course the flood runs east in the Frith, where Bernera lies, and the ebb runs west; the sea ebbing and flowing regularly for four days before, and as long after the full and change of the moon. The spring tides commonly rise to the height of 14 feet perpendicular, and the others proportionably; but for four days before and after the quarter moons, there is a singular variation; at those times the tide runs eastward for twelve hours successively, from nine o'clock in the morning till nine at night, when the current turns, and runs westward for the twelve following hours. Thus the reciprocations continue; one flood and ebb running eastward, and another westward, till within four days of the full and change of the moon, when they resume their ordinary course, running east during the six hours of flood, and west during the six hours of ebb. There is another phenomenon in these tides equally remarkable. Between the vernal and autumnal equinoxes, the tides about the quarter moons run all day to the east, and all night to the west; and during the other six months, their course is reversed, being westward in the day, and eastward in the night. The number of inhabitants in Bernera and the isle of Pabbay, which lies between the former and Harris, was 494 in the year 1792. W. long. 7° 30'. N. lat. 67° 45'. The Rev. Mr. McLeod's Account in Sir J. Sinclair's Statistical History of Scotland.—Also, a town of Scotland, in the county of Inverness, in which are barracks; 32 miles N.W. of Fort William.

BERNESSO, a town of Piedmont, in the district of Coni, 4½ miles W. N. W. of Coni.

BERNEVILLE, a town of France, in the department of the Straits of Calais, and chief place of a canton, in the district of Arras, 4 miles S. W. of Arras.

BERNEUT BAY, lies at the point of Quiberon, on the coast of France.

BERNEX, a town of Savoy, 2½ miles N. N. E. of St. Julien.

BERNHARDUS, in *Entomology*, a species of **CANCER**, with heart-shaped, muriated hand claws; that on the right side largest. Inhabits whelks, &c. common on most sea-shores. See **BERNARD the Hermit**.

BERNHARTS, in *Geography*, a town of Germany, in the archduchy of Austria, 7 miles E. S. E. of Feldsburg.

BERNI, or **BERNIA**, **FRANCIS**, in *Biography*, an Italian poet, was a descendant of a noble but indigent family of Bibiena, in Tuscany, and born at Campovecchio about the close of the 15th century. He passed the first 19 years of his life in poverty at Florence; and though he was afterwards patronized by cardinal Bernardo of Bibiena, Angelo, and Giberti, bishops of Verona, his love of unrestrained liberty, and inclination to pleasure and raillery, prevented his deriving any permanent advantage from their patronage. At Rome, however, he was greatly esteemed by the literati, and was one of the most illustrious members of the famous academy "De Vignajuoli." At length, he retired to Florence, and subsisted on a canonry in the cathedral, under the protection of cardinal Hippolito de' Medici, and duke Alexander. It has been said, that he was taken off by poison, because in a quarrel between these two princes, he refused to comply with the desire of one of them, who requested him to administer poison to the other. The æra of his death, as well as the truth of this story, are uncertain: it has been fixed by some to the year 1536; but others have supposed that he lived to a later period. Mr. Roscoe, in his "Life of Lorenzo de Medici," says, that he cultivated a branch of poetry (a kind of burlesque) with so much success, that it has from him obtained the name of "Bernesche." The characteristic of this species of poetry is an extreme simplicity, which the Italians denominate "ideotismo." The most extravagant sentiments, the most severe strokes of satire, are expressed in a manner so natural and easy, that the author himself seems scarcely to be conscious of the effect of his own work. Perhaps the only indication, says Mr. Roscoe, of a similar taste in this country, appears in the writings of the facetious Peter Pindar. Berni, though he seems to have blotted and corrected much, has nevertheless not been sufficiently careful in expunging licentious images, and free equivoque; and his wit is often mere buffoonery. One of his principal performances, was the recomposition of Boiardo's "Orlando Innamorato," which he has rendered much more pure and poetical. The best edition of it is that of Venice, in 1545. His other poems were collected and published, with those of other burlesque writers, in 1548, in 2 vols. 8vo. and reprinted at London in 1721 and 1724, after the edition of Venice. Berni was a caustic satirist, and the avowed enemy of Peter Aretin, whose life he wrote in a strain of bitter invective. He excelled in Latin poetry, and imitated the style of Catullus with success. Gen. Biog.

BERNICIA, in *British Geography*, one of the kingdoms of the Saxon heptarchy. Although the Saxons, soon after the landing of Hengist, had been planted in Northumberland, their progress was slow in overcoming the obstinate resistance with which they were opposed, and none of their princes for a long time assumed the appellation of king. At last, in 547, Ida, a Saxon prince of great valour, who claimed a descent, as did all the other princes of that nation, from Woden, brought over a reinforcement from Germany, in

ships, which arrived at Flamborough, and enabled the Northumbrians to carry on their conquests over the Britons. He entirely subdued the country, now called Northumberland, the bishopric of Durham, as well as the counties of the Merse and the three Lothians, or the whole eastern coast of the ancient Roman province of Valentia; and assumed the crown under the title of king of Bernicia. About the same time, Ælla, another Saxon prince, having conquered Lancashire, and the greater part of Yorkshire, or all the country between the Humber and the Tyne, founded another little state in these parts, which was called the kingdom of "Deira," or "Deiri." These two kingdoms were united, not long after, in the person of Ethelfrid, grandson of Ida, who married Acca, the daughter of Ælla; and expelling his brother Edwin, established one of the most powerful of the Saxon kingdoms, by the title of *Northumberland*, which see. See also *HEPTARCHY*.

BERNICLE, in *Cornology*. See **BARNACLE**.

BERNICLE, in *Ornithology*. See **BARNACLE** *supra*.

BERNIER, FRANCIS, in *Biography*, called the *Mogul*, from his long residence in the court of that prince, was born at Angers in France, about the year 1630. After receiving a liberal education, and taking his degree of doctor in medicine at Montpellier, he went, in 1654, to Palestine, and thence to Egypt. At Cairo he resided about twelve months, and having examined the pyramids, and every thing there deserving attention, he embarked at Suez for the kingdom of the Mogul, and was engaged by Aurengzebe as his physician, in which office he continued, attending that prince in his expeditions for the space of 12 years. Desirous at length of revisiting his native country, and obtaining leave of the Mogul, he returned to France in 1670. He now employed himself in digesting and arranging the observations he had made in his travels, and published in succession, in French, the history of the last revolution of the states of the great Mogul, a letter on the state of Hindoostan, and memoirs and particular observations. These were collected and published together, in 1699, at Amsterdam, under the title of "Voyages de Francois Bernier, contenant la Description des etats du grand Mogul, de l'Hindoustan, du royaume de Kachemire, &c." 2 vols. 12mo. They are esteemed the most perfect account of those countries extant. Captive princes here, says he, destined to die, were compelled to take daily a preparation of poppy, which kept them in a constant state of drowsiness, until life was gradually and quietly extinguished.

To the abolition of the life of the Indians, he attributes their freedom from gout, stone, catarrh, and quartan fever. Even the lues venereal is here, he says, less malignant than in Europe.

He also published an abridgment of the philosophy of Cassand, and other tracts, contained in various periodical publications. In 1685, he came to England, and after a short residence here, returned to Paris, where he died, Sept. 23, 1688. Haller. Bib. Med. New Gen. Bog. Dict.

BERNIER, JOHN, born at Blois, received the degree of doctor in medicine at Montpellier, in 1647. Not succeeding in his practice, and finding persons whom he esteemed less qualified, in full employment, his writings are filled with satirical reflections on his more fortunate brethren. His principal work is, "Essais de Medecine, ou d'un traite de l'Histoire de Medecine, et des Medecins, &c." Paris, 1699, 4to, to which he added a supplement in 1695. He also published "Histoire de Blois," which is not much esteemed. Also, "Antiquarum, de Romanorum, Pictura, Bonis Mot., et Anecdote," which he filled by the name of Poppejan-court, and a criticism on the works of Rabala, whom he severely censures. Elph. Dict. Hist.

BERNIER, NICHOLAS, an eminent French musician, was

born at Mantes-sur-Seine, and became music-master of the holy chapel at Paris, and afterwards of the chapel royal. He was much esteemed and patronized by the duke of Orleans, who submitted his own compositions to his judgment. By his five books of cantatas, for one and two voices, with the words in part by Rousseau and Fuzelier, he acquired great reputation. He also published "Les Nuits des Sceaux," and a number of motets, which are still admired. He died in 1734. Nouv. Dict. Hist.

BERNIN, in *Geography*, a town of France, in the department of the Here, and chief place of a canton, in the district of Grenoble, 8 miles north of Grenoble.

BERNINI, JOHN LAWRENCE, in *Biography*, a celebrated sculptor and architect, was the son of a sculptor, and born at Naples in 1598. At a very early age, he manifested the inclination of his genius; for upon the removal of his family to Rome, when he had attained only the age of 10 years, he shut himself up from morning till night in the Vatican, for the purpose of copying the master-pieces which it contained. Having about this period wrought a head in marble, that excited great admiration, he was sent for by pope Paul V. who desired him to sketch with a pen the head of St. Paul, in his presence; upon which the young artist designed it so well, that the pontiff recommended him to the care of cardinal Maffei Barberini, as one who might become the Michael Angelo of his age. Stimulated by the encouragement he had received, his application was indefatigable, and his perseverance invincible. To this purpose, it is related concerning him, that after having finished with much attention and assiduity a bust of Scipio Borgheze, the pope's nephew, he discovered a defect of the marble, in the forehead. Upon this he immediately procured another block, and in the interval of 15 nights he executed another to his satisfaction. When the first was exhibited to Borgheze, he could not avoid manifesting his chagrin; but he was agreeably surprised when the second was exposed to his view. Both these are preserved in the villa Borgheze. Among the productions of his youth, we may mention his statues of St. Laurence, and of Æneas carrying off his father at the siege of Troy; and more particularly his David and Goliath, which some have reckoned among his best works. His group of Apollo and Daphne, cut from a single block of marble, and the second not more than half a foot from the first, executed for cardinal Borgheze, at the age of 18 years, has been regarded as the chef d'œuvre of sculpture. It is said, that when Bernini saw these performances of his youth 40 years afterwards, he lamented the little improvement he had made in sculpture during this long course of years. In the pontificate of Gregory XV. Bernini was created a knight of the order of Christ; whence he has been commonly distinguished by the appellation of the "Chevalier Bernini." Upon the accession of his patron Barberini to the pontifical chair, under the title of Urban VIII. Bernini was engaged in executing the project, which he had formed for the embellishment of Rome. The decoration of the place called the "Confession," in St. Peter's, employed him for 9 years, and for this exercise of his art he was liberally rewarded. He also constructed a fountain, displaying the richness of his invention, in the piazza d'Europa; and decorated the great niches of the pillars, which support the dome of St. Peter's; and constructed a grand mausoleum for the pope, which is one of the finest ornaments of that cathedral. So much did this pope inter himself in the welfare of Bernini, that he urged him to marry; accordingly, in 1639, he commenced a matrimonial union, which lasted 35 years, and produced a numerous family. Bernini's reputation was not confined to Rome; but Charles I. of England, hearing of his fame, sent

ever fine picture of Vandyke, from which he made three busts of the king in different aspects, which gave great satisfaction, and were munificently rewarded. A bust of the queen was intended, but on account of the troubles which occurred in England, was never executed. Bernini was invited to Paris by Lewis XIII. just before the death of Urban VIII., and allured by very lucrative proposals; but the pope upon being consulted, said, "that he was made for Rome, and Rome for him;" and this determined his stay. The grand fountain of the piazza Navona, constructed under the pontificate of Innocent X. is reckoned among his master-pieces. The fine portico of St. Peter's was erected by this artist, under the pontificate of Alexander VII. and about this time queen Christina visited Rome, and treated him with singular respect. In 1664, he was consulted by Lewis XIV. of France, in consequence of the recommendation of Colbert, concerning the improvement of the Louvre, and at the age of 68 years yielded to an urgent invitation to visit Paris for this purpose. In his journey thither, he was honoured in various places through which he passed, by the most respectful attention; and after his arrival, he began with making a bust of the king, and while he was sketching his portrait, turned back his curls for a better discovery of his forehead, observing at the same time, with the politeness of a courtier, "that he was a king who might freely shew his face to the whole world." This, it is said, gave rise to a French fashion, denominated "frisure à la Bernini." His design for the completion of the Louvre was not executed. He returned to Rome before winter, and as an acknowledgment of his obligations, for the civility and munificence with which he was treated by Lewis, formed a colossal equestrian statue, representing the king as supported by a rock. Upon its removal to Paris, Girarden changed it, on account of its want of sufficient resemblance to the monarch, into a Curtius leaping into the fiery gulf. Among the remaining works in which he employed himself, the most considerable was the tomb of Alexander VII. in St. Peter's. Whilst he was repairing the old chancery palace, by order of Innocent XI. he was seized with a fever, which terminated in an apoplexy, that closed his life in 1680, in the 82d year of his age. His funeral procession to the church of St. Maria Maggiore was attended by all the nobility of Rome.

The genius of Bernini was singularly fertile and comprehensive; and on a medal struck in honour of him by Lewis XIV. he is characterized as "singularis in singulis, in omnibus unicus," i. e. singular in each, sole in all. Several of his pictures, painted for his amusement, amidst his other occupations, and sufficiently indicating his talents in this department of the arts, are preserved in the Florentine gallery, and the Barberini and Chigi palaces. In architecture he displayed a fine taste and rich imagination, though he is said to have departed from the rules and proportions observed by the ancients. But he owed his highest and most distinguishing reputation to sculpture. D'Argenville, however, observes, in his "Vies des Architectes et des Sculpteurs," that, whilst he wrought marble with a surprising suppleness, admirable taste, and singular graces, he often deviated from truth, and was much of a mannerist; that he abandoned the simple drapery of the Grecian statuary; and that he enveloped his figures with such an assemblage of folds and doublings as to disguise and partly conceal them by the flutter and seeming agitation of their dress. Some of his single busts, or portraits after nature, are much admired, and are said to retain the whole spirit and character of the original. His St. Theresa in ecstasy is thought to surpass all his other works for expression. His own talents he estimated with modesty; but by an enthusiastic attachment to his art, and unwearied

assiduity in the exercise of it, he arrived at that eminence for which he was distinguished, and multiplied his works to such a degree as to occasion its being said, that posterity would be apt to suppose as many Bernini's as Hercules. Encyclop. Beaux Arts, t. ii. p. 1. p. 282. Gen. Biog.

BERNINO, in *Geography*, a mountain of Switzerland, being a branch of the Rhetian Alps, about 26 miles N. E. of Chiavenna.

BERNO, in *Biography*, abbot of Richenon, in the diocese of Constance, flourished about the year 1008, and is celebrated as a poet, rhetorician, musician, philosopher, and divine. Of his works, the principal are his treatises "De Instrumentis Musicalibus;" "De Mensura Monochordi;" and "De Musica seu Tonis;" containing a summary of the doctrines of Boethius, an explanation of the ecclesiastical tones, intermixed with pious exhortations, and the application of the music to religious purposes. His learning and piety recommended him to the special favour of the emperor Henry II. and his endeavours to promote literature were so much encouraged, that his abbey of Richenon was as famous in his time as those of St. Gal, or Cluni, then the most celebrated in France. He died in 1048, and was buried in the church of his monastery.

BERNON, in *Geography*, a town of France, in the department of the Aube, and chief place of a canton, in the district of Ervy; 4 miles S. E. of Ervy.

BERNOULLI, JAMES, in *Biography*, a celebrated mathematician, was born at Basil, December 27, 1654. His father, who was a man of rank and learning, intended him for the profession of a minister, and paid great attention to his education. Having passed through the usual course of preparatory studies, and taken his degrees in the university of Basil, he applied, in deference to his father's wishes, to divinity; but his inclination leading him to mathematics, he made great proficiency in geometry, without any collateral assistance either of teachers or of books, from the use of which his father rigorously restrained him. In reference to this restraint, he took for his device Phaeton driving the chariot of the sun, with this motto, "Invito patre sidera verso," i. e. I traverse the stars against my father's inclination. Notwithstanding the disadvantages under which he laboured, he made such progress in mathematical studies, that he was able, before the age of 18 years, to solve a difficult problem in chronology, or to find the year of the Julian period, when the year of the cycle of the sun, the golden number, and the indiction, are given. In 1676, he began his travels. and at Geneva taught a blind girl to write; and at Bourdeaux composed universal gnomonic tables. Upon his return to his own country, in 1680, he derived great pleasure from the perusal of Malbranche's "Search after Truth;" and Descartes's philosophy: and predicted the return of a comet, of which he gave an account, in a short treatise written in his own language. He soon afterwards travelled into Holland, Flanders, and England; and having completed his peregrinations, he settled at Basil in 1682, and commenced a course of public experiments in natural philosophy and mathematics. In this year he published, at Amsterdam, in Latin, his "Essay of a New System of Comets, in order to calculate their Motions and to foretel their Appearances," 8vo. and in the following year, at the same place, his "Dissertations upon the Weight of the Air;" Lat. 8vo. In 1684, he accepted the professorship of mathematics at Heidelberg, and devoting himself to the assiduous study of these sciences, he took occasion about this time to investigate the analytical system of Leibnitz, contained in some essays on the "Calculus differentialis," or "Infinimens petits;" published in the "Acta Eruditorum;" the extent and
leauty

BERNOULLI.

beauty of which he admired, the principles of which he developed, and the utility of which he discovered, and promoted to such a degree, that this great philosopher, whilst he claimed the honour of the original invention, acknowledged that J. Bernoulli and his brother had a great share in the advantage which the public derived from it, and that no person had made a greater use of this invention than they, and the marquis de l'Hospital. In 1687, he was unanimously chosen to succeed Peter Mejerli, as professor of mathematics at Basil, and he discharged the duties of his office with great reputation, that he greatly contributed to the credit of the university, and to the increase of the number of students. In 1699, he was elected a foreign member of the academy of sciences at Paris, and in 1701, of the academy of Berlin. The memoirs of both these societies were enriched by many of his communications. Several of his pieces were also published in the *Acta Eruditorum*, and the *Journal des Savans*. The gout, brought on by unremitting application, produced a fever, which terminated his life, August 16, 1705, in the 51st year of his age. He ordered a logarithmic spiral to be engraved on his tomb, with this motto, "Eadem mutata retergo," I rise the same, though changed. He was married at the age of 30; and left one son and a daughter. By the exercise of extraordinary powers of invention, and persevering application, he made many valuable discoveries, which improved the method of analysis, the doctrine of infinite series, and the higher department of mathematical investigation; such as the quadrature of the parabola, and the geometry of curve lines, of spirals, cycloids and epicycloids. His works, with their respective titles, are enumerated in the General Dictionary, to which we refer; and they were collected and published in 2 vols. 4to. at Geneva, in 1744. The "*Ars conjectandi*," or the art of forming probable conjectures concerning events that depend on chance, in which he was engaged at the time of his death, and which is not included in the above collection, was printed at Basil in 1713, 4to. To this is added a treatise concerning infinite series. An extract from this valuable treatise, containing the foundation of a proof that has yet been given of sir Isaac Newton's famous binomial theorem, in the first and simplest case of it, or that of the integral and affirmative powers of the binomial quantity $a + b$, left by its great inventor without a demonstration, is included in the 3d volume of the "*Scripturae Logarithmici*," for which we are indebted to baron Niclaus.

BERNOULLI, JOHN, the brother of the preceding, and also celebrated as a mathematician, was born at Basil, July 27, 1667. At the age of 15, he commenced the study of philosophy, and soon after he was sent to Neuchâtel to learn the French language, and the principles of commerce; but preferring intellectual pursuits to a mercantile profession, he returned home at the close of the year, for the prosecution of his studies, and received the degree of doctor in philosophy, by 1685. Instructed by his elder brother in the first rudiments of mathematics, he afterwards, viz. in 1684, when he was only 17 years of age, concurred with him in investigating and explaining the principles of Leibnitz's differential calculus. He also was one of the three mathematicians, the two others being Huygens and Leibnitz, who solved the problem of the catenary curve, proposed by his brother James. In 1690, he set out on his travels; and in the progress of them communicated the discoveries of the new analysis to Daniel Cleric, and Patrice de Duillier, at Geneva, and to the marquis de l'Hospital at Paris. On his return to his own country, in 1692, he commenced a correspondence with Leibnitz, which lasted during the life of the latter. Having declined the professorship of mathematics at

Wolfenbuttle, which was offered him in 1693, he undertook, in 1695, a course of philosophical experiments at Groningen, and was furnished by the curators of the university with the necessary apparatus. About this time he discovered, what has been called the mercurial phosphorus, occasioned, as it is now known, by the friction of mercury against glass, in a partial vacuum; for which Frederic I. king of Prussia, honoured him with a gold medal, and with the rank of member of the academy of sciences at Berlin. He was also a member of the royal society of London, and of other learned bodies. He succeeded his brother James at Basil, in 1705, on which occasion he delivered a discourse, "*De Fatis Nova Analytico et Geometrico Sublimis*," and continued till his death in this situation, though he was solicited to remove to Leyden, Padua, and Groningen. He collected his works in 1713, and printed them at Lausanne, in 4 vols. 4to. His correspondence was extensive, and he was much engaged in a controversy with the English mathematicians concerning the invention of fluxions; in another with Renau, concerning the manœuvring of ships; and in another on mathematical subjects, with Jurin, Brook Taylor, Keil, Pemberton, Herman, and Riccati. In 1730, he gained a prize of the academy of sciences for a memoir on the elliptic figure of the planets, and the motion of their apellia; and in 1734, he received the half prize, jointly with his son Daniel, from the same academy, for a memoir on the physical cause of the inclination of the planetary orbits. Bernoulli died January 1, 1748, in the 81st year of his age, and left four daughters and five sons, three of whom were mathematicians. Fontenelle's *Eloges*. Moreri.

BERNOULLI, JOHN, son of the preceding, was born at Basil, January 17, 1695, and died at Petersburg, July 26, 1726. He was licentiate of law, professor of law at Berne; afterwards professor of mathematics at Petersburg, and member of the institute of Bologna.

BERNOULLI, NICHOLAS, nephew of the two preceding, professor of mathematics at Padua, afterwards of logic, and then of law at Basil, member of the academy of sciences and belles lettres at Berlin, and also of the royal society of London, and of the institute at Bologna, was born at Basil, October 10, 1687, and died there, November 29, 1759.

BERNOULLI, DANIEL, M.D. son of John Bernoulli, was born at Groningen, Feb. 9, 1700. Preferring mathematical to commercial pursuits, he passed the earlier part of his life in Italy, and at the age of 24, declined the presidency of an academy about to be established at Genoa, and in the following year accepted an invitation to Petersburg, where he spent several years. On his return to Basil, in 1733, he was successively professor of anatomy and botany, and of natural and experimental philosophy; and had the honour of being a member of the academies of Petersburg, Paris, and Berlin, and of the royal society of London. In 1724, he published his "*Exercitationes Mathematicae*;" and, in 1738, his "*Hydronamica*." Many other pieces have been published in the memoirs of the academy of sciences at Paris, and in those of other societies. He gained and divided ten prizes from the Parisian academy; and on the division of the prize respecting the inclination of the planetary orbits, his father expressed dissatisfaction; more especially as Daniel had embraced the Newtonian philosophy in preference to that of Descartes, to which he himself maintained his attachment so long as he lived. In 1740, he divided the prize on the tides with Euler and Maclaurin. At Basil he was much respected, not only as a man of distinguished talents, but for his simple and modest manners. Although he paid external respect to the religion of his country, he was charged by his pastors with an excessive freedom of opinion.

which he incautiously divulged. At the age of 80, he retained his mental powers in their full vigour; but from this time they began to decay. He died March 17, 1782. *Nouv. Dict. Hist.*

BERNOUILLI, JOHN, L. L. D. brother of the preceding, was born at Basil, May 18, 1710, and died there, July 17, 1790. He was professor of eloquence, and afterwards of mathematics at Basil, and member of the academies of Paris and Berlin.

BERNOUILLI, JAMES, licentiate of law, member of the physical society at Basil, and correspondent of the royal academy of sciences at Turin, was the son of John Bernouilli last mentioned, and born at Basil, October 17, 1759. His natural talents, for which he was distinguished at an early period, were improved by long assiduous application. On his return from Neufchatel, whither he was sent to study the French language, he was admitted to the degree of master of arts, and devoted himself to the study of the law. In 1780, he made the tour of several cantons of Switzerland, of which an account was published in the third volume of the collection of travels, published at Berlin by John Bernouilli. The study of the law, however, did not divert his hereditary inclination for the mathematics; and in these sciences he made such rapid progress, that in 1780, he was thought qualified to supply the place of his uncle, whose age and infirmities rendered him incapable of continuing his lectures on experimental philosophy, though he did not succeed him in the vacant chair of professor after his death. He had also experienced a similar disappointment in his views with regard to the chair of eloquence in 1780; on which occasion he published his "Theses on the Sublime." After these disappointments, he determined to indulge his taste for travelling, and accepted the office of secretary to count de Breuner, minister of the imperial court of Vienna to the republic of Venice. He still retained his attachment to the mathematical sciences, of which he exhibited proofs to the public in the memoirs of the royal academy of sciences and belles lettres at Berlin, and in those of the royal society of Turin; and as he wished to occupy a station in which he might make use of the knowledge he had acquired, he was recommended by his countryman Mr. Fufs to the princess of Dashkof; and by her influence he was elected adjunct in the academy at Petersburg, with a salary of 600 rubles, and the promise of being promoted in the course of a year. Accordingly, he quitted Venice in 1786, and removed to Petersburg. Here he applied with unintermitting activity to physical mathematics, and was soon honoured with the title of ordinary academician. In the interval of about 2 years, he presented eight memoirs, which were inserted in the six first volumes of the "Nova Acta Academiæ Scientiarum Imperialis Petropolitanae;" which display singular acuteness in analytical calculations. In 1788, he was appointed one of the professors, who instructed the imperial corps of noble land cadets, and to the office of teaching algebra to the two first classes he devoted himself with great zeal and assiduity. In 1789, he married the youngest daughter of Mr. John Albert Euler; but being always of a weak and delicate constitution, he was seized with a fit of the apoplexy whilst he was bathing, on the 3d of July in the same year, which speedily terminated his life, in the 29th year of his age, very much to the regret of those who knew and valued him on account of his scientific talents, and modest, amiable disposition. Besides a variety of mathematical and philosophical pieces, which were published in the "Nova Acta, &c." "Rozier's Journal;" "Mem. de l'Acad. Royale, de Berlin, Ann. 1781;" "Mem. des Corresp. de l'Acad. Royale de Turin, Ann. 1784, 1785;"

"Nova Acta Helvetica, tom. i." and "Leipstick Magaz, &c. Part 1, 1786;" and some distinct treatises; he also translated "Merian's Philosophical Memoirs," from the French into German, 2 vols. *Nova Acta Acad. Scient. Imper. Petropol.* vol. x.

BERNOVITZKOE, in *Geography*, a town of Russia, in the government of Smolensko; 40 miles north of Smolensko.

BERNSTADT, a town of Silesia, in the principality of Oels, on the river Weyda.

BERNSTEIN, a town of Germany, in the circle of Upper Saxony, and new mark of Brandenburg; 4 miles N. E. of Berlinchen.—Also, a town and castle of Germany, in the circle of Bavaria; 2 miles W. S. W. of Gravenau.

BERNSTORF, JOHN HARTWIG ERNEST, COUNT VON, in *Biography*, an eminent statesman, was born at Hanover, May 13, 1712, and possessed distinguished talents, which were cultivated by study at the high school of Tubingen, which he entered in 1727, and by travelling through various parts of Europe, under the learned Keyser. Upon paying a visit to Denmark, Bernstorf was taken into the service of Christian VI. and employed in affairs of state from the year 1732 till the year 1737. In 1742, he was envoy to the diet of that year, and to the court of the emperor Charles VII. and from the year 1744 to 1750, he was ambassador to France. In November 1736, he received the chamberlain's key; in June 1746, he was made a knight of the order of Dannebrog; and in October 1749, he was appointed a privy-counsellor. After his recall from France, in 1750, he formed an intimacy with the prince of Wales at Hanover, who wished him to employ his talents in his service; but by the death of the prince, in 1751, he was released from his engagements; and upon this event he was immediately introduced into the privy-council, and entered on the office of minister for foreign affairs, and first secretary of the German chancery, and in 1752, was admitted into the order of the elephant. To Bernstorf were owing the conduct and execution of those beneficial measures which distinguished the reign of Frederick V. Upon a plan suggested by him, was established, in 1753, the hospital in Copenhagen, for the education of poor boys; and he was appointed president and governor of this patriotic and useful institution, to which he gave a donation of 4000 rix-dollars.

In 1754, he advised the crown to purchase from the East-India company all their possessions, privileges, and merchandize; and by this act he promoted the prosperity of the Danish West India islands, which had suffered from the exclusive right of the company. He also distinguished himself by his activity and zeal in promoting the manufactures of the kingdom, which the king entrusted to his management in 1752, and he thus contributed to increase the population, and to excite a spirit of industry and emulation. He concurred in the designs that were formed for the abolition of slavery in Denmark, by the extinction of commons, and by freeing the farmers from the burthen of personal service. He was also one of the first persons in Denmark who counteracted the general prejudice against inoculation for the small-pox, and who endeavoured to reconcile the people to the practice. Bernstorf was likewise indefatigable in his exertions for promoting the instruction of the poor; and he projected a fund for the encouragement and recompence of meritorious, but poor, schoolmasters; nor was he less solicitous to extend the benefits of education, so as to furnish a supply of competent teachers, for which purpose he proposed to establish a seminary at Altona, in connection with the orphan-house of that city; but adverse circumstances prevented the completion of his design. He also distinguished himself by the protection which he afforded to science, and

BERNSTORF.

to men of letters. With this view, having been one of the first who discovered the beauties of the "Messiah," he invited the young author, Klopstock, who then resided in Switzerland, to Denmark, and for several years entertained him in his own house. By his influence, Oeder was appointed professor of botany; a botanical garden was established, and the professor was sent on a tour through the Danish provinces, the result of which, was the "Flora Danica," published at the king's expence. Cramer, Mallet, Schlegel, and Pafedow, were also much indebted to his patronage. To Bernstorff Denmark owes the establishment of two useful societies; one, the society of the Danish language and fine arts, founded in 1760; and the other, the royal agricultural and economical society, established in 1769, of which the count himself was president. To him it was principally owing, that a society of learned men were sent, in 1761, to travel in Arabia and the east, at the king's expence, for the purpose of making useful discoveries. In consequence of the important services which he rendered, in various ways, to his sovereign and the state, he was created, in 1767, a Danish count; and he was the only minister who had the honour of attending the king, in 1768, on his tour to England. After their return, however, the count was obliged to resign all his employments, in January 1770, and the king, in acknowledgment of his past services, settled on him an annual pension of 6000 rix-dollars. On this occasion he found it necessary to leave a country to which he had devoted the service of 38 years of his life; and, accompanied by his counsellors and Mr. Klopstock, he repaired, in October 1771, to Hamburg, where he spent the winter. Here he spent his time in social intercourse with his friends, but in the beginning of the year 1772, some rheumatic affections, under which he had laboured for several years, returned with an alarming violence, and terminated in a threatening fever. This fever was succeeded by a fit of apoplexy, which carried him off in a few minutes, on the 18th of February. His remains were interred, without pomp, agreeably to the instructions of his will, at the church of Siebeneiche, on one of his paternal estates. Two medals were afterwards struck in honour of him, by two societies of patriots. Bernstorff possessed a retentive memory, great penetration, and a sound judgment. Learned and accomplished himself, he was the liberal patron of literature and the arts. He was well acquainted with the Italian, French, and English languages; intimately conversant with the laws of nations in general, and attached to the rights of mankind; well informed in the ancient and modern history of different states; and not uninterested in the concerns of religion and the church. He corresponded with many learned men of different countries, and collected a valuable library of select books. His political measures were founded on truth and justice; in his transactions with foreign states he was upright and sincere; and he combined, with a vigilant attention to the privileges of the crown, a constant regard to the rights and liberty of the subject. Gen. Bie.

BERNSTORFF, ANDREW PETER, COUNT VON, the nephew of the former, was born at Gartzow in Lauenburg, August 28, 1735, and at an early period acquired the knowledge of ancient and modern history, as well as of geography, mathematics, natural history, and the ancient languages. His studies were completed at Göttingen. Several of his juvenile years were spent in travelling through England, Switzerland, France, and Italy. Having occupied, after his return, some subordinate stations, he was made a member of the privy-council in 1769; but soon dismissed along with his uncle. Towards the end of the year 1771, after the fall of Struensee, he was recalled; and about the close of

the following year he obtained the foreign department, and was at the same time appointed minister of state, and negotiator of the German chancery; and he was employed in negotiating with Russia the exchange of the Gottorf part of Holstein for Oldenburg and Delmenhorst. In 1776, he was made a knight of the order of the elephant; and in 1780, during the American war, when an order was issued by the British government for intercepting all vessels belonging to neutral powers, laden with naval stores, and bound to any of the enemy's ports, he had an opportunity of exercising his diplomatic talents; and in a note submitted by him to the courts of the belligerent powers, the Baltic was declared a mare clausum; and it was further stated, that the king of Denmark had determined not to grant a passage through the Sound to armed ships belonging to the powers at war. It was also added, that the other northern powers had adopted and professed the same system. In a subsequent note, transmitted to the three belligerent powers, England, France, and Spain, Bernstorff expressed himself in the following terms: "An independent and neutral power never loses, by others being at war, the rights which it had before that war, since peace exists for it with all the belligerent powers without its having to receive or follow the laws of any of them. It is authorized to carry on trade, contraband excepted, in all places, where it would have a right to do so, if peace existed throughout all Europe, as it actually exists in regard to it." Soon after, Denmark and Russia entered into a treaty for the protection of their trade, to which Sweden, Prussia, and other states acceded; and the result was that league formed against Great Britain, known under the title of the "armed neutrality." Towards the end of the year 1780, Bernstorff resigned all his employments, and retired to his estates in Mecklenburg, where he resided till 1784, when he was recalled, and resumed his diplomatic functions: and to his exercise of these, Denmark owed the preservation of peace, when hostilities broke out between Sweden and Russia, in 1788. In 1791, Bernstorff interposed his mediation when the British ministry were preparing to assist the Turks against the Russians, to restore and promote tranquillity. In consequence of the French revolution, his Danish majesty was invited by the courts of Prussia and Vienna to join in the treaty which had been concluded between them. To this proposal Bernstorff replied, in 1792, with considerable address; and in 1793, when his Britannic majesty's envoy extraordinary at Copenhagen presented a note to that court, in consequence of the plan concerted by the allied powers for blockading the ports of France, Bernstorff returned an answer, which was alluded to by the marquis of Lansdowne in the house of lords, February 17, 1794, in the following terms: "The reply of count Bernstorff to our remonstrances, was one of the bold, wise, and most honourable replies I have ever read. It is a state paper, which should be kept as a model by every cabinet of Europe." The conduct of Bernstorff was highly satisfactory to his fellow citizens; various institutions were distinguished by his name; and medals were struck to perpetuate the remembrance of his services. At length, he fell a victim to the gout, to which he had been subject for many years, and which baffled all remedies, on the 21st of July, 1797; and his remains were interred with great pomp, and amidst numerous attendants, who lamented the loss of him, in Frederic's church at Christian Haven.

His figure was agreeable, and his countenance engaging, his disposition lively, and his conversation natural. In business he was active and indefatigable; in conversation communicative and concise; aversive from flattery, and yet respectful in his behaviour; sparing of professions and promises, and

punctual in performing them; prudent in his plans, and firm and zealous in executing them. His memory was tenacious, his benevolence extensive, his reverence of the Deity unfeigned, and his attachment to the Christian religion unwavering. Gen. Biog.

BERNUS, in *Geography*, a mountain of European Turkey in Macedonia; 10 miles S.E. of Saloniki.

BERNY, a town of France, two leagues south of Paris.

BEROALDO, PHILIP, the *Elder*, in *Biography*, was born at Bologna in 1453, and at the age of 19, became professor of the belles lettres in his native city. He also read lectures at Parma, Milan, and Paris, and at the latter place, or, as some suppose, Perugia, he held a public school of eloquence. But, recalled by his countrymen, he renewed his scholastic labours at Bologna with such reputation, that he had 600 hearers at a time. To the study of polite literature, he added those of philosophy, medicine, and jurisprudence; and he also engaged in public employments assigned to him by his country. His disposition was convivial, and his conduct not exempt from the charge of licentiousness, before his marriage in 1498. By his good humour he escaped or conciliated literary contests, and maintained an uninterrupted intercourse with the greatest number of learned persons of the age in which he lived. He died in 1505. His commentaries and notes extended to all the Latin writers of eminence; and are more distinguished by their erudition, than their elegant taste and sound criticism. With the more obscure authors of antiquity he was particularly conversant, and he took pleasure in reviving the use of words that were barbarous or obsolete. Besides his commentary on the "Golden Ass of Apuleius," printed in 1501, and affording a specimen of his manner, he published a great number of his own orations, letters, poems, and other works, of which a collection was printed at Basil in 1513. Most of his observations on authors are contained in Gruter's *Thesaurus Criticus*. Moreri. Gen. Biog.

BEROALDO, PHILIP, the *Younger*, nephew of the former, was a native of Bologna, and professor of belles lettres in the university of that city, and afterwards at the Sapienza in Rome. In 1516, he was appointed librarian of the Vatican by Leo X., but about two years after, before he took regular possession of the office, with its emoluments, he died at the age of about 40 years. His Latin poems, by which he acquired great reputation, are published with those of his uncle, to which they are prefixed, in the first volume of the "Deliciae Poetarum Italarum." A collection of his elegies and epigrams, in 3 books, was published at Rome in 1530. His Latin version of an oration of Licoerates, and notes on the first five books of the *Annals* of Tacitus, were published by order of Leo X. Nouv. Dict. Hist.

BEROE, in *Entomology*, the name assigned by Cramer, to the species of *PAPILIO Europa* of Fabricius and Gmelin.

BEROS, in *Natural History*, the name of a species, *MEDUSA (Pileus)* in Aët. Helv. Berœ with an octagonal body, and very long tentacula, Gronovius.—Berœ is also the name under which *medusa infundibulum* (Müll. and Fabr.) is figured and described in Brown's *Hist. Jam.*—Linnaeus, in the tenth edition of his "Systema Naturæ," calls it *medusa berœ*, and in the twelfth, *volvox (Berœ) ovatus, angulis ciliatis novem*.

BEROE, in *Mythology*, one of the nymphs, who, according to Virgil, was companion to Cyrene, the mother of Aristæus. Berœ was also the name of the nurse of Semele.

BERŒA, BERRHOÏA, or BERÆA, in *Ancient Geography*, *Cera-ventia*, a large and populous city of Macedonia, south-west of Ægæ or Edeffa, north-west of Pella, and east of Cyrhus, at the foot of mount Bermius. Under the Greek Chris-

tian empires, it became the see of a bishop. This was the city to which Paul and Silas fled from Thessalonica, where they found a synagogue of Jews and proselytes, who are commended for their unprejudiced and impartial investigation of divine truth, and where, in consequence of this disposition, they gained many converts to Christianity. Acts, xvii. The medals of this city are bronze, gold, and silver.—Also, a town of Syria, between Antioch and Hierapolis, which some have supposed to be the modern Aleppo, anciently called Chalep. (See ALEPPO.) In the collection of Dr. Hunter, there was a bronze medal of this city, with a legend and a dolphin twisted about a trident. At this city there were struck Imperial Greek medals in honour of Trajan, Antoninus, and Adrian.

BEROLHEIM, in *Geography*, a town of Germany, in the circle of Franconia, and principality of Anspach, seated on the Airmuhl, with 2 churches, 5 miles west of Weissenburg.

BEROLINENSIS, in *Entomology*, a species of *CANTHARIS*, of a black colour: base of the antennæ, and wing-cases yellowish; tip of the last black; legs ferruginous. Herbit.

BEROLINENSIS, a species of *CURCULIO* that inhabits Europe. It is whitish, varied beneath; thorax rugose, black, sides variegated; on the wing-cases, two undulated black bands. Herbit.

BEROLINENSIS, a species of *CRYPTOCEPHALUS*, (*Crioceris*) found in the vicinity of Berlin. The head and thorax are scarlet and glossy; wing-cases granulated, black; eyes of the same colour; legs fulvous. Herbit.

BEROSUS, in *Biography*, a famous ancient historian, was a native of Babylon, and priest of the temple of Belus, and flourished about the time of Alexander. Tatian informs us, that he dedicated his work to Antiochus Theos, the third king after Alexander. While the Macedonians were masters of Babylon, he learned of them the Greek language, and passing from Babylon to Greece, settled in the island of Cos, and there opened a school, in which he taught astronomy, and astrology. From Cos he removed to Athens, where he acquired such reputation by his astrological predictions, that the Athenians erected to him a statue in their gymnasium, with a golden tongue. (Vitruvius, lib. ix. c. 7.) The ancients cite three books of his history of the Chaldeans of Babylon, of which Josephus, Alexander Polyhistor, and Eusebius, have preserved some fragments, that are useful in forming the series of Babylonian kings. Josephus says, that he agreed with Moses in his accounts of the deluge, the fall of man, and the ark, in which the restorer of mankind was saved: and adds, that he mentions the descendants of Noah and their respective ages, to Nabulasser, king of Babylon; and that, relating the actions of that prince, he speaks of the taking and burning of Jerusalem by his son Nebuchadonosor, on which occasion, says he, the Jews were carried captives to Babylon, whence ensued the desolation of that city for 70 years, till the time of Cyrus. He is quoted by Pliny, Tatian, Clement of Alexandria, Tertullian, Vitruvius, and Eusebius; whence we may infer, that he was esteemed a writer of authority. In the series he gives us of the ten kings, whom he supposes to have reigned at Babylon before the flood, there are some small variations in the authors who have transcribed that historian. These ten successions exactly answer to the ten generations from the creation to the flood: the first king, by name Olorus or Alones, has been supposed by some to be the same with Adam, by others Nimrod, as Xisuthrus, the last in the series, plainly appears to be Noah. Pliny (H. N. l. vi. c. 55. l. vii. c. 31 and 37.) informs us, that his book contained the astronomical observations of 480 years, commencing from the

ria of Nabonassar. Annius, a monk of Viterbo, published a work under the name of this historian, full of fables, which obtained some credit among the learned, but was soon recognized to be a forgery. Berofus is said to have had a daughter who uttered predictions like himself, and became the Cunean sibyl. Brucker's Hist. Phil. by Ersfeld, vol. i. p. 34. Bryant's Analysis, vol. iii. p. 25, &c. Fabricius, Bib. Græc. vol. xiv. p. 175.

BEROSUS, in *Ancient Geography*, a mountain of the Tauric Chersonesus, south of mount Trapæzus. This chain of mountains comprehends, according to M. Pnyssonnel, the mountains now called "Tehadir-dagi," the highest of the whole peninsula, and those of "Balyklava," and "Cabarta."

BEROTH. See BEROETH.

BEROTHA, or BEROETH, a city situated on the northern frontiers of Palestine: supposed to be the same with "Berotlai," one of the cities of Hadadezer, which David took, and in which he found much brass. (2 Sam. viii. 8.) According to some, this was Berœe of Syria, according to others, Berytus of Phenicia, or the same that is mentioned by Ezekiel (ch. xlvii. 16.) between Hethalon and Emefa.

BÉRQUET, in *Commerce*, a weight of 173 pounds, by which hemp and other goods are sold in Russia.

BERQUIN, LOUIS DE, in *Biography*, was born in Artois about 1490, and was much esteemed at the court of France, where he obtained the title of king's counsellor. Although he does not appear to have left the Catholic church, or joined the Lutherans, he followed the example of Erasmus, in declaiming against the ignorance and superstition of the clergy. Having incurred the charge of heresy by his publications, which were chiefly books of Erasmus, and extracts from his works and those of others, with his own notes, he was twice prosecuted; but in the first instance acquitted, and in the second condemned, unless he retracted his errors, and gave satisfaction, to be burnt. His spirit was resolute, and he demurred against submission; his judges, however, desirous of saving him, deferred the execution of the sentence; and upon the return of Francis I. from Spain, he was set at liberty. But Berquin, though dissuaded from it by Erasmus, publicly accused his enemies, Noel, Beda, and others, of irreligion; and upon a third prosecution, he was sentenced to make a public recantation, and to suffer perpetual imprisonment. Refusing to acquiesce in this sentence, because it implied an acknowledgment on his part, that his sentiments were erroneous, he was condemned as an obstinate heretic, and accordingly strangled on the Grève, a public place near the Seine, appropriated to bonfires and the execution of criminals, and afterwards burnt. He suffered death with great constancy in April 1529; and though the monk who attended him intimated that he discovered some signs of abjuration at the stake, Erasmus ascribes the suggestion to the fraud and falsehood usually practised on such occasions. Berquin was a person of great abilities, invincible fortitude, and irreproachable character. Gen. Dict. Jortin's Life of Erasmus, vol. ii. p. 476-478.

BERRA. See BERIA.

BERRÉ, in *Geography*, a town of France, in the department of the mouths of the Rhone, and chief place of a canton, in the district of Aix, situated at the mouth of a river, running into the lake of Martigues, called "the lake of Berré," in an island of the channel. It was formerly one of the strongest towns of Provence. It was taken after a long siege, in 1511, by Charles Emanuel, duke of Savoy, during the wars of the League; and when the rest of the province submitted to Henry IV., he could not drive the Savoyards from Berré, till it was given up in 1593, in consequence of the peace of Vervins; 41 leagues S.W. of Aix. The po-

pulation of the town is estimated at 1800, and of the canton at 6769 persons. The territory comprehends 257½ kilometres, and six communes.

BERRĒA, in *Ancient Geography*, Bra, a town of Bulgaria, 10 or 12 leagues from Philippopolis, upon the river Braea.

BERRĒTINI, PETER, commonly called *Pietro da Cortona*, in *Biography*, an eminent painter of history and landscape, was born at Cortona, in Tuscany, in 1596; and acquired the first rudiments of his art under Andrea Commedi, and Baccio Ciarpi. At Rome, whither he went in his youth, he studied the antiques, in the works of Raphael, Buonarroti, and Polidoro, with such diligence, that he attained to great excellence as an artist. At this early period, he was patronized and employed by the marquis Sacchetti; and in his palace, he painted the "rape of the Sabines," and the "battle of Alexander," which were much admired for invention, disposition, elevation of thought, and an excellent tone of colour, and deemed to be equal to the performances of the best masters. His fame was completely established at Rome, by the saloon of the Barberini palace, and by several works in the Vatican, and in some of the principal churches of the city. For further improvement, he travelled through Lombardy and Venice; and returning by way of Florence, he was employed by the grand duke Ferdinand II. in decorating some rooms in the Pitti palace, with pictures of virtuous and heroic actions from ancient history. At Rome, where he afterwards resided, he adorned the gallery of the palace of Innocent X. on the piazza Navona, with various subjects from the *Æneid*; and as an architect, in which profession he excelled, he gave designs for a number of churches, palaces, chapels, and monuments. To the church of St. Martina, which was of his own construction, he left a large sum for the erection of a grand altar-piece of bronze, and of his own mausoleum. Pope Alexander VII. was so well satisfied with the portico he built for the church of Peace, that he made him a knight of the golden spur, and gave him a rich cross, appendant to a gold chain. In his more affluent and more humble condition, Berretini displayed the same equanimity, and uniformly maintained a respectable character. The gout, to which he was subject, disabled him, towards the close of life, from undertaking any great works, and at length confined him to his bed. He died at Rome in 1661. "As an artist, his character was richness of invention, with grace, beauty, and facility of execution. His dispositions are fine, his management of lights good, and his ornaments and back-grounds charming; but his drawing is incorrect, his figures defective in expression, and too much alike. His fresco paintings were uncommonly brilliant and clear. He succeeded better in great compositions than in small. An Italian writer has said of him, that "he had fire in his colours, vehemence in his hands, and fury in his pencil." Besides his capital works in the palazzo Sacchetti, the Barberini palace, and the palazzo Pitti at Florence, there is, in the palace of the king of Sardinia at Turin, a small sketch representing the "Annunciation of the Virgin," which is touched with exquisite skill and spirit, and in the palace of the prince della Torre, at Naples, there is an incomparable picture of the "Flight into Egypt." The design is correct; the heads are wonderfully graceful; the composition is extremely fine, and the colouring is excellent. Many of his works have been engraved by the best artists. D'Argenville Vies des Peintres. P. d'Argenton.

BERRĒTONI, NICOLÒ, an historical painter, was born at Macerata in 1617, and under Carlo Maratta, whose disciple he was, he studied design and colouring for some years, and became so distinguished as a painter, that he was called the

slavouty

jealousy and envy even of his master. His early works, after he quitted the school of Maratti, were in the style and taste of Guido; a circumstance which, of itself, highly recommends them. He died in 1682. Pilkington.

BERRHŒA, in *Ancient Geography*. See **BERŒA**.

BERRHŒA, a town of Thrace, between Nicopolis of Mœsia, and Philippopolis of Thrace. Ammianus Marcellinus speaks of it as a large city.

BERRIMAN, **WILLIAM**, in *Biography*, a learned English divine, was born in London in 1683, and from Merchant Taylors' school was removed, at the age of 13, to Oriel college, Oxford, where he prosecuted his studies with great assiduity and success. With a view to the critical examination of the Scriptures, he combined with skill, in the Greek tongue, the study of the Hebrew, together with the Chaldee, Syriac, and Arabic; and in explaining the sacred writings, he had recourse to the rules of grammar, criticism, logic, and the analogy of faith. The articles of doctrine and discipline, which he deduced from the scriptures, he traced through the primitive church, and confirmed by the evidence of the fathers, and the decisions of the more generally received councils. After he left the university, where he was graduated M.A. in 1711, he served two churches in London. His first appearance in print, was on occasion of the Trinitarian controversy, in 1719, when he published "A reasonable Review of Mr. Whitton's Account of Primitive Doxologies," which was followed in the same year by "A second Review." These performances recommended him to the patronage of Dr. Robinson, bishop of London, who, besides conferring upon him a living in the city, and appointing him his chaplain, left him at his death the fifth part of his large and valuable library. In 1722, he accumulated, at Oxford, the degrees of bachelor and doctor in divinity. In the years 1723 and 1724, he was appointed to preach lady Moyer's lecture in defence of the commonly received doctrine of the Trinity, and his eight sermons, delivered on this occasion, were published, in 1725, under the title of "An Historical Account of the Trinitarian Controversy." In consequence of this service, he was elected, in 1727, a fellow of Eton college. His "Historical Account" contained some observations relating to miracles, and drew upon him the animadversions of Dr. Conyers Middleton; in answer to which, he published, in 1731, "A Defence of some passages in the Historical Account." By his "Brief Remarks on Mr. Chandler's Introduction to the History of the Inquisition," printed in 1733, and followed by a "Review of the Remarks," he incurred the charge of favouring the principles of intolerance, and in this controversy he incurred the severe strictures of that acute and learned nonconformist. His next publication was his course of sermons at Boyle's lecture, preached in the years 1730, 1731, and 1732, and given to the world in 2 vols. 8vo. in 1733. In this work he states the evidence of our religion from the O. T.; vindicates the Christian interpretation of the ancient prophecies; and points out the historical chain and connection of these prophecies. In the preface, he asserts the authority of Moses, as an inspired historian and law-giver. Besides the writings already enumerated, Dr. Berri-man printed a number of occasional sermons. He departed this life at his house in London, on the 5th of February 1749—50, in the 62d year of his age, and in his funeral sermon, preached by Mr. Ridley, a great character is given of him, both as a minister of his parish, and as a private Christian. His piety was unaffected and sincere; and his benevolence extensive. In the year of his decease, two volumes of his sermons were published in 8vo., under the title of "Christian Doctrines and Duties explained and recommended;" and in 1763, 19 sermons appeared in one volume,

under the same title. "With respect to Dr. Berri-man's practical discourses, it is allowed that they are grave, weighty, and useful, and well fitted to promote pious and virtuous dispositions; but when he treats on the power, rights, and dignity of the priesthood, or on doctrines which have been greatly disputed, different opinions will be formed, according to the different sentiments of his readers." *Biog. Brit.*

BERRINGEN, in *Geography*, a town of France, in the department of the Lower Meuse, and chief place of a canton, in the district of Hasselt. The place contains 646, and the canton 10,360 inhabitants: the territory includes 232; kilometres and 9 communes.

BERRY, *Bacca*, a grain, fruit, or seed, produced by several herbs, trees, and shrubs, thence called "bacciferous," for the conservation and reproduction of their kind. Some define berries as a fruit smaller than apples, growing in bunches, but not so thick or close as grapes. Others, a soft, fleshy, succulent fruit, having stones or kernels within them. Such are the fruits of laurels, olives, currants, and the like. The berry, or bacca, in a strict sense, denotes a pulpy pericardium without valves, in which the seeds are naked. See **BACCA**.

Berries are of various sizes, forms, properties, and uses, according to the plants whereon they grow.—Some are used in medicine, as juniper-berries, buckthorn-berries, &c. Others in dyeing, as French or yellow berries, &c. The yellow berry-wash may be thus prepared: take a pound of the French berries, and put them to a gallon of water, with half an ounce of alum; boil them an hour in a pewter vessel, and filter off the fluid; put them again into the boiler, and evaporate the fluid till the colour appear of the required strength.

BERRY-Bearing Alder. See **RHAMNUS FRANGULA**.

BERRY, Avignon. See **AVIGNON**.

BERRY, Ale. See **ALE**.

BERRY, in *Geography, a province of France, before the revolution, now comprehended under the departments of Indre and Cher, of which Bourges was the capital; bounded on the north by Orleannois, on the south by Bourbonnois and Marche, on the east by Nivernois, and on the west by Poitou. Berry was divided into the Upper and the Lower, and extended about 90 miles from north to south, and 73 from east to west; it is watered by several rivers, as the Loire, Creuse, Cher, Indre, &c. enjoys a temperate air; is fertile in corn, fruit, wine, hemp, flax, and pasturage; and contains several stone quarries, and some mines of silver, iron, and ochre. Besides the trade in wine, carried on at Bourges, the principal commerce of this province consists in fat cattle sent to Paris, and the great number of sheep, which produce fine wool, manufactured in this and other parts of the kingdom. In Berry there are two kinds of manufactures; one for cloths and serges, and the other for knit and wove stockings.*

BERRY Haven, lies about a mile south of the entrance into Donnegal haven, on the west coast of Ireland, and 5 miles N. N. E. from the haven of Ballyshannon.

BERRY Head, a noted promontory on the south coast of Devon, being the south-west limit of Torbay, and running far out south into the sea. Off this head, out of the way of the entrance into the bay, is a rock, called Berry-rock.

BERRY'S Islands, a small cluster of islands on the north-west point of the great Bahama bank, in the channel of Providence. N. lat. 25° 30'. W. long. 75° 40'.

BERSABA, in *Ancient Geography*. See **BEER-SHEBA**.

BERSABORA, a large, strong, and populous town of Persia.

BERSARII, in *Writers of the Middle Age*, a kind of hunters, or sportsmen, who pursued wild beasts in forests and chafes. The word seems derived from the barbarous Latin *bersarc*,

bersare, "to shoot with a bow." On which principle it should properly denote archers only, or bowmen. Or it might be derived from *berfa*, the "fence or pales of a park." In which view it should primarily import those who hunt or poach in parks or forests.

Hincmar speaks of a kind of inferior officers in the court of Charlemagne, under the denomination of *berfarii, vebararii*, and *beverarii*. Spelman takes the first to denote those who hunted the wolf; the second, those who had the superintendency of the hounds for that use; and the third, those who hunted the beaver.

BERSCHETZ, or BERSCHESZ, in *Geography*, a little town of Carniola, seated on a high rock near the Adriatic sea, and containing a small harbour. In this place is produced a thick and sweet wine, of a black red colour.

BERSELLIO, or BRISELLO, a town of Italy, in the duchy of Modena, seated on the Po. It was taken by the imperial troops under prince Eugene in 1702, and by the French under the duke of Vendome in the following year. The emperor Otho died here, after his defeat by the army of Vitellius. The town is small, but fortified; 27 miles north-west of Modena. N. lat. 44° 55'. E. long. 10° 30'.

BERSHEK, a mountain of Persia, on the north-west side of the lake of Zurra, noted for a fire-temple, the resort of the Guebres.

BERSIMA, in *Ancient Geography*, a town of Asia, in Mesopotamia, seated on the left bank of the Euphrates, north-west of Nicephorium.

BERSKOI, in *Geography*, a town of Siberia, 20 miles north-east of Kojivan.

BERSTADT, a small town of Moravia, in the circle of Olmutz.

BERT. See BRIT.

BERTAUT, JOHN, in *Biography*, an early French poet of reputation, was born either at Creil, or at Condé, in Perche, in 1552; and being known at court by his wit, was appointed first almoner to Catherine de Medicis, private secretary and reader to Henry III. and was much esteemed by Henry IV. in whose conversion he was eminently instrumental. In 1594, he was made abbot of Aulnai, and, in 1626, Bishop of Senec. After his advancement to this see, his conduct was irreproachable, though some blame attached to him, because, instead of suppressing the free poems of his youth, he published them with the pious poems of his advanced age. He died in 1711. As a poet, he is rated to have been more natural and clear than Ronsard, more forcible than Desportes, and more ingenious and polished than either of his contemporaries. Some of his stanzas are said to possess the cast and elegance of a more refined period. His fondness for poetry, with which his piety abounded, he seems to have derived from his attachment to Senec. His "Poetic Works" were printed in 1620, Paris, 8vo. He left also a translation of some books of St. Ambrose, controversial sermons, and a funeral oration for Henry IV. *Nonv. Dict. Hist. Gen. Hist.*

BERTH, in *Sea Language*. See BRITH.

BERTHEAU, CHARLES, in *Biography*, an eminent French protestant divine, was born at Montpellier, in 1660, and after having studied philosophy and divinity, partly in France, and partly in Holland, was admitted a minister in the Synod of Vigan in 1681. His first settlement was as pastor to the church at Montpellier, whence he removed to be minister of the church at Paris, which met at Clarenton. Upon the revocation of the edict of Nantes, he came over to England, and in 1686, was chosen one of the ministers of the Walloon church in Threadneedle-street, London, in which capacity he officiated, with very general applause, for

44 years. He died, much regretted, in December 1737. He was distinguished by sound judgment, by a retentive memory, so that he is said never to have forgotten any thing which he had seen, read, or heard, by his accurate and extensive acquaintance with ecclesiastical history, and by his eloquence as a preacher. Two volumes of his sermons have been printed in French; the first in 1712, and the second at Amsterdam, where the former was reprinted, 1730. *Gen. Dict.*

BERTHEAUME POINT, in *Geography*, the west limit of the bay so called about 1½ league east from St. Matthew's point, without the entrance into the road of Brest. Within the point, on the west side of the bay, are the castle and rock of Bertheaume.

BERTHEVIN, St., a town of France, in the department of the Mayenne, and chief place of a canton, in the district of Laval, $\frac{2}{3}$ of a league west of Laval.

BERTHING, in the *Sea Language*, denotes the raising or bringing up of ship-sides. Thus they say, a clinker hath her sides berthed up before any beam is put into her.

BERTHOLZ, in *Geography*, a town of Germany, in the archduchy of Austria, 5 miles W. N. W. of Zvelt.

BERTHONCELLES, a town of France, in the department of the Orne, and chief place of a canton, in the district of Belleme, 13 miles north-east of Belleme.

BERTI, JOHN-LAURENCE, in *Biography*, an Augustin monk, was born in 1696 at Seravezza, a village in Tuscany, and upon being called to Rome by his superiors, was appointed assistant general of his order in Italy, and prefect of the angelic library. In a great work, entitled "De Disciplinis Theologicis," printed at Rome, in 8 vols. 4to. he appears to have adopted the sentiments of St. Augustin, which involved him in a controversy with the Jesuits, and caused him to be denounced to pope Benedict XIV. as a disciple of Baius and Janfenius. Against this charge he defended himself in a learned apology, comprehending 2 vols. 4to. He afterwards composed in Latin an "Ecclesiastical History," in 7 vols. 4to., which was afterwards abridged in one volume, 8vo. In this work he represents the pope as supreme monarch and arbiter of all kingdoms and empires. He also wrote many other works, some of which are Italian poems, all of which were published together at Venice in folio. He was invited by Francis I. grand-duke of Tuscany, to Pisa, and received a considerable pension, with a professorship in the university, under the title of "Imperial theologian," and here he died, in 1766, much lamented by his colleagues. *Nonv. Dict. Hist.*

BERTILL, in *Geography*, a maritime county of America, in North Carolina, and Edenton district, having for its south boundary the Roanoke, and on the east Albemarle sound. In this county is situated the ancient Indian tower of Tuticwora. It contains 12,626 persons, of whom 5141 are slaves.

BERTIERA, in *Botany*, derives its name from M. Bertier of France, and was so called in honour of him, by M. Aublet. *Lin. gen. Schreb. n. 304. Aubl. 69. Juss. 200. Clair. and ord. v. part. india nonogynia. Nat. Ord. Contorta, Lin. Rabinia, Juss. Gen. Char. Calyx, perianth turbinate, five-toothed. Cor. one petalled; tube short; mouth villose; border five-clift; lobes ovate, acute, spreading. Stam. filaments five, very short, inserted into the tube beneath the orifice; anthers linear, erect. Pist. germ roundish, inferior, crowned by a gland; style filiform; stigma two-plaited. Per. berry globose, crowned by the tooth of the calyx two-celled. Seeds very many, roundish, adfixed to the disseminium.*

Ess. Char. Cal. turbinate, five-toothed. Cor. tube short, with a villose mouth; berry globose, inferior, two celled, many-seeded.

Species, 1. B. guianensis. Aublet. Guian. 180. t. 69. This is a shrub six or seven feet high, and the thickness of the human arm; branches opposite, knotty, tomentose; leaves opposite, ovate, acuminate, and tomentose underneath; petioles short, convex beneath, channelled above; stipules stem-clasping, two-lobed; flowers in terminating racemes; corolla white. Found by Aublet in the wood of Aroura, in Guiana, flowering and fruiting in the month of June. Martyn.

BERTIN, NICHOLAS, in *Biography*, an historical painter, was born at Paris in 1667; and after studying under some of the principal artists, and gaining, at the age of 18 years, the prize of merit in the academy, was sent to Rome for further improvement, where he acquired a good taste for composition, and in Lombardy he completed his knowledge of colouring. Some time after his return to Paris, he was made academician in 1703, and professor in 1705. His drawing was correct; his invention ready in all sorts of subjects; and he painted in a strong, pleasing, and finished style. He was much employed by Louis XIV.; and his performances were valued and sought after by foreigners. He excelled more in small works than great ones; and from this circumstance, and some others, he was referred only to the second rank of artists. Among his most considerable performances we may reckon the ceiling at the chateau of Pleffis St. Pierre, the subject of which was the adoration of the Magi, and an historical composition, representing the baptism of the eunuch of the queen of Candace, by St. Philip. He temper was reserved, and he was much addicted to religion. He died at Paris in 1736. Pilkington. Gen. Biog.

BERTIN, JOSEPH, EXUPERE, was born at Tremblay, in the department of Rennes, June 28th, 1712. Having gone through the usual course of study, in anatomy, physiology, and therapeutics, he was created doctor in medicine at Paris, in 1740. The following year he published "Non datur imaginatiois maternæ in fœtum actio," combating an opinion, which had long prevailed, that the imagination of the mother had the power of marking and disfiguring the fœtus in utero. His next production, which is much commended by Haller, is a treatise on "Osteology," in 4 vols. 12mo. The bones of the head are described more exactly and minutely, Haller says, than in any other work extant. About the same time, he had a long, but not very interesting dispute, with Monf. Ferrein, on the formation of the voice. In the year 1764, he joined Meürs. Le Bas, Petit, and others, in defending the cause of Madame Renné, who had been delivered of a male child ten months and twenty days after the decease of her husband, and who wished to get the child acknowledged as his. Bertin, with his coadjutors, endeavoured to establish as a principle, that there is no fixed term for the birth of the child, and that, according as the constitution of the parents was more or less vigorous, a greater or less portion of time might be required for the perfection of the fœtus. A child might be ripe, and fit for the birth, they maintained, at the end of the seventh month, if the parties enjoyed great strength of constitution; or in an opposite state of them, it might require ten, eleven, twelve, or more months, to fit it for exclusion. This doctrine was attempted to be established by recurring to a great number of cases and observations, and to the decisions of the courts, of which they produced several, legitimate children, supposed to have been born in the eleventh or twelfth month after conception. Recourse was also had to the histories of monstrous births, to shew the aberrations of nature. These arguments and cases were ably and judiciously opposed by M. Louis. The cases adduced by his antagonists were shewn to be defective in evi-

dence, and though he admitted that the time of gestation in women, as well as in animals, might be protracted for a few days, yet he much doubted whether, in any instance, it had been extended to the end of the tenth month, or at the most to more than two or three days beyond that term. In support of this opinion, he cited the authority of some of the ablest philosophers, physicians, and lawyers; and the court, according to this determination, declared the child to be illegitimate. Though the court in this decision were probably influenced by the peculiar circumstances of the case, the husband being 76 years of age at the time of his death, and for the last month in such a state as to be incapable of performing the conjugal rites, yet the arguments and authorities adduced by M. Louis, must have had great weight with them, and well deserve to be had recourse to in deciding on general principles, what is the utmost term to which a woman may carry a living child. M. Bertin was author of several dissertations, principally on anatomical subjects, which were published in the Memoirs of the Royal Academy of Sciences, and other philosophical and medical journals and transactions; the titles and accounts of which are given by Haller, in his *Bib. Anatom.*

BERTINCOURT, in *Geography*, a town of France, in the department of the Straits of Calais, and chief place of a canton, in the district of Arras. The place contains 1275, and the canton 13,035 inhabitants; the territory includes 112½ kilometres and 17 communes.

BERTINORO, a town of Italy, in the state of the church, the see of a bishop, suffragan of Ravenna; seated on a hill, and defended by a citadel, 15 miles south of Ravenna.

BERTIUS, PETER, in *Biography*, an eminent geographer, was born at Beveren, a village in Flanders, in 1565, and acquired the knowledge of the learned languages in England. Having travelled through Germany, and other countries, he settled at Leyden, where he became professor of philosophy; but after occupying this post for 26 years, he was expelled for joining the Arminian party. Upon his expulsion he migrated to Paris, where he abjured the protestant religion in 1620, and was made cosmographer to the king, and professor-royal extraordinary of mathematics. He died in 1629. His principal works are "Theatrum Geographiæ Veteris," Amst. 2 vols. fol. 1618, 1619; which is a collection of the works of almost all the ancient geographers, illustrated by notes, and esteemed a valuable publication; "Introductio in universam Geographiam;" "Comment. Rerum Germanic. lib. iii." Amst. 12mo. 1635, containing a good description of Germany, and a map of the empire of Charlemagne; "Notitia Episcopatum Galliæ," Par. fol. 1625; "De Aggeribus et Pontibus," Par. 8vo. 1629. The works above enumerated are held in high estimation by geographers. We may add "Illustr. Virorum. Epist. select. superiori sæculo script. vel a Belgis vel ad Belgas," 8vo. 1617. Bertius also wrote several pieces in the controversy between the Gomarists and Arminians, and published discourses on various occasions. Nouv. Dict. Hist.

BERTON ROAD, in *Geography*, lies within Dalkey island, at the south point of the entrance into Dublin bay, Ireland.

BERTONA, BERTONIA, BERTHONA, BARTON, or BERTON, properly denotes that part of a country farm where the barns and other inferior offices stand, and wherein the cattle are foddered, and other business is managed. *Berton* is also used to signify a farm, as distinct from a manor. Du-Caoge. In some parts of the west of England, they call a great farm a *berton*, and a small one a *living*. Hence also *bertonarii* was anciently used for those we now call farmers, or tenants of bertonns.

BERTONCOURT, in *Geography*, a town of France, in the department of the Moselle, and chief place of a canton, in the district of Boulay, 10 miles north-east of Metz.

BERTRAM, **COLLEUS BONAVENTURE**, in *Biography*, a learned orientalist, was born at Thouars, in Poitou, in 1531, and became professor of Hebrew at Geneva, and afterwards at Lausanne, where he died in 1594. His works are "A Dissertation on the Republic of the Hebrews," 8vo. Geneva, 1580, and Leyd. 1641; "A Revision of the French Bible of Geneva," Gen. 1588, which is more correct and liberal than the other, and is used by the Calvinists at the present time; "A new edition of Pagnin's Treasure of the Sacred Tongue;" "Parallel of the Hebrew and Syriac Languages;" and "Lucebrationes Frankendaleses," Frank. 1586. He contributed also to the edition of Mercerus's comment on the book of Job. Gen. Dict. Nouv. Dict. Hist.

BERTRAND, **GABRIEL**, a surgeon of eminence at Paris, published, in 1610, in 8vo. "A Refutation of the Errors contained in Guillemeau's Description of the Muscles of the Human Body," which is much commended by Portal; also "Les Verités Anatomiques et Chirurgicales des Organes de la Respiration, et des artificieux moyens dont la nature se fert pour la preparation de l'air," Paris, 1629, 12mo. He had observed pus formed in the chest to be absorbed and conveyed out of the body with the urine. Haller. Bib. Anatom.

BERTRAND, **JOHN BAPTIST**, born at Antignes, July 12th 1670, was member of the academy at Marseilles, where he also practised medicine with reputation and success. He published "An Historical Account of the Plague," which desolated that city in the year 1719, of which he was witness; also "Letters addressed to M. Deidier on the Causes of Muscular Motion;" and "Dissertations on the Effects of Sea Air." He died September 10, 1752, aged 82 years. Eloy. Dict. Histor.

BERTRAND de Comminges, *St. in Geography*, a town of France, in the department of the Upper Garonne, and chief place of a canton, in the district of St. Gaudens. Before the revolution, it was the see of the bishop of Comminges; distant 3 miles south-west of St. Gaudens. Its population is estimated at 639, and that of the canton at 8165 persons. Its territory comprehends 137½ kilometres, and 18 communes.

BERTRANDI, **AMEROSI**, in *Biography*, a celebrated anatomist and surgeon of Turin, where he was born, October 8, 1733. Showing early marks of an uncommon genius and talent for his profession, he was sent by his sovereign to Paris, and afterwards to London, to acquire a knowledge of the improvements making in these places. At London, he was for six months under the direction of Mr. Bromfield, then at the head of his profession. Having employed three years in his travels, in 1754 he returned to Turin, where he was preferred to the offices of professor extraordinary, and principal surgeon to the king. In 1748, he published, in 8vo. "Dissertationes duæ anatomice, de hepate, et de oculo," which have considerable merit. But his principal work was published at Nice in 1763, 8vo. under the title of "Trattato della operazione di chirurgia," in which he has described the manner of performing the principal operation in surgery. The work was translated into French by M. Soler, and published at Paris, in 1769, with engravings. He died in 1765, in the 32d year of his age. Hall. Bib. Clur. Eloy. Dict. Hist.

BERTRONMONTIER, in *Geography*, a town of France, in the department of the Vosges, and chief place of a canton, in the district of St. Dié, 4 miles east of St. Dié.

BERVA, a district of Africa, in the south part of the

country called "Kiaferak" by the Arabians, and by us "Cassaria." See **BRAYA**.

BERVAN, a town of Asia, in Tartary, in the kingdom of Thibet, near the lake Bervan, which lake is said to be 40 leagues long and between 30 and 34 broad.

BERVIE, or **INVERBERVIE**, a royal burgh in the county of Kincardine, Scotland. N. lat. 56° 44'. W. long. 2° 4'. It is seated on the eastern coast, at the mouth of the river Bervie, called *Bervie bay*, which forms a small harbour for fishing-boats. This town was constituted a royal burgh in 1342, by charter from king David, who, being at sea, was forced in here by stress of weather, and kindly received and entertained by the inhabitants. The place where he landed is still called *craig David*. In 1595, James VI. renewed the charter, with all its former privileges and immunities. This town has lost nearly the whole of its trade and commerce, and many of its houses are fallen to decay. Most of the fishermen who frequented this port are removed to Gourdon, a village about two miles south, where they enjoy a more eligible situation. Fresh water has lately been brought into the town by means of pipes, and a new bridge has been recently thrown across the river Bervie. The population of the borough is about 607 persons.

BERVINE, a river of the Netherlands, which passes by Dalem, and runs into the Menfe, near Vifet.

BERVISCH, in *Ichthyology*, the name by which the Hollanders call the lump-fish; *cyclopterus lumpus* of Linnaeus.

BERULLE, **PETER DE**, in *Biography*, cardinal and founder of the congregation of the fathers of the oratory in France, was born at Serilly near Troyes, in 1575, and educated with a view to the ecclesiastical profession, first among the Jesuits, and afterwards in the university of Paris, where he was distinguished by his proficiency in literature, and by the amiableness of his disposition. Such were his attainments in doctrinal and controversial divinity, that he bore a principal part in the conference at Fontainebleau, in 1600, between cardinal du Perron on behalf of the catholics, and du Plessis Mornay on the side of the protestants. At this time he was almoner to king Henry IV.; and in 1604, he was employed in bringing over a colony of Carmelites from Spain, and settling them at Paris; of this order he was constituted superior-general. The first foundations of the congregation of the oratory of Jesus were laid by him in 1611, and from this institution he derived the greatest honour. **St. ORATORY.** After the death of Henry IV., Berulle was chief of the council of the queen-mother, Mary of Medicis, and he took an active part in promoting conciliatory measures between the contending parties during the minority of Lewis XIII. In 1624, he was deputed on a commission to Rome, to solicit a dispensation for the marriage of the princess Henrietta Maria, to Charles I. of England; he was appointed her confessor, and accompanied her to take possession of the throne. But as he strenuously and inflexibly maintained her stipulated rights, he contributed in some measure to the mischief that resulted from this impolitic union, and at length incurred the reproach of a dissembler. The duke of Buckingham, as he says, complained of him to the king of having conspired against his life and fortune. On his return to France, he was active in urging the proceedings against the Calvinists at Rochelle. Having refused several rich benefices and bishoprics, he was nominated cardinal by Urban VIII., without his knowledge, in 1627; but he continued his abstemious and mortified mode of living; and at length, exhausted by his labours and austerities, he died during the celebration of mass, Oct. 2, 1629. His numerous pieces on controversial theology were collected and published in one volume folio, in 1644, and have since appeared in two other editions. Gen. Dict.

BERUS, in *Geography*, a town of France, in the department of the Moselle, and chief place of a canton, in the district of Sar-Louis, 4 miles S.S.W. of Sar-Louis.

BERUS, in *Zoology*. *Coluber berus* is the common European viper. Linnæus, who, in describing the *amphibia serpentes*, conceived it quite sufficient to distinguish all the species of the several genera included in that order, by the number of abdominal scuta, or plates on the belly, and the scales on the tail, states them at 146—39. Fn. Suec. Amoen. Acad. &c. The opinion entertained in this respect by that eminent naturalist, we perceive from later observations on the species he describes, was not perfectly correct. This is exemplified for instance in the common viper, in which both the abdominal plates and caudal scales are liable to vary in point of number; one writer speaks of the viper having 148—42, Weigel, &c.; another (Scopoli) mentions 177—68, &c. Notwithstanding therefore the example of Linnæus to the contrary, we cannot but approve of characters taken rather from the various marks, spots, and other striking particulars in the general appearance of the species in this order, as Linnæus has done himself in the reptile tribe. Dr. Shaw seems also to prefer the latter, considering the number of plates on the belly, and scales on the tail, in a secondary point of view. He thus describes the common viper: *Coluber cinereus*, maculis capitis biloba, vitta dorsali atra dentato repanda. *Cinereus viper*, with a bilobate spot, and a black flexuous zigzag bend down the back.

Gmelin, in the *Sytema Naturæ*, has four varieties of *coluber berus*; namely, (2.) a native of India, in which the spots along the back are roundish and confluent, so as to form almost one continued stripe; those spots near the tail are disposed transversely. In the island of St. Eustace, another variety (γ.) is also found, of a sordid colour, with the head variegated, and the neck slender. (δ.) This inhabits India, and is distinguished by having the arch of the occiput, or hind head, intercepting a white spot. The fourth sort (ε.) has an aggregated spot of many parts on the head; and is a native of the Celebes. Figures of all these varieties of *coluber berus* are to be found in the magnificent work of Seba.

The common viper of Europe and northern Asia is the same as that found in this country. With us, the viper seldom exceeds the length of eighteen inches or two feet. Pennant tells us, he once saw a female viper almost three feet in length, observing at the same time, that the females are usually one third larger than the males. The colour, generally speaking, is of a silvery greyish, or tawny brown, paler or more vivid in different individuals, and sometimes blackish all over; but in all these varieties the spots are pretty nearly the same, the back being marked with a chain or series of rhomboidal spots connected with each other, and forming one continued indented stripe from the head to the extremity of the tail. A series of dark or dusky spots extends likewise along each side of the body; other spots appear again on the belly, which in most specimens is almost entirely black, and finely glossed with purple. The situation of the fangs proves the viper to be one of the poisonous kinds of serpents; they are situated on each side of the fore-part of the upper jaw, and are commonly two in number, with a few smaller ones near them. Petiver describes a black viper, *vipera Anglica nigrans*, which is thought to be nothing more than a dark variety of the common kind, *berus*. This, however, is not certain, and we should hesitate in admitting it as a variety only, since Linnæus considered it, from the description which Petiver has given, as the *coluber pfeffer* of his *Fauna Suecica*. For a further account of *coluber berus*, see VIPER.

BERWICK, NORTH, in *Geography*, a royal borough of East Lothian, in the county of Haddington, in Scotland. This town is of very remote antiquity, and has been a scene of considerable manufacture and commerce, but is now reduced to poverty, its harbour being in ruins, and a few cargoes of grain are the only exports from its quay. Its original charter was lost or destroyed, and James VI. granted it a new one, under which it has since been governed. The parish extends about three miles along the sea-coast, and consists wholly of arable land, except a fine conical hill called *North Berwick Law*. This rises immediately above the town, and forms a conspicuous landmark to the sailors who navigate the Frith of Forth. The ancient castle of Tantallan stands about two miles from this town, and is elevated on a high rock, three of whose sides are laved by the surge of the sea, and the fourth guarded by a deep fosse and drawbridge. See BASS. N. lat. 56° 40'. W. long. 2°.

BERWICK, commonly called *Berwick-upon-Tweed*, is a large respectable town, situated between England and Scotland. From its having been a frontier garrison town, long before the glorious æra of the union, and from its situation on the shore of the ocean and on the bank of an unfordable river, it was considered, when in possession of the English, as a key to England, and when in possession of the Scots, as a key to their own country. This peculiarity of situation rendered it a scene of repeated siege and devastation. Berwick is pleasantly situated on the northern bank of the river Tweed, within half a mile of the German ocean; 336 miles north-west from London; and 54 miles south-east from Edinburgh. N. lat. 55° 48'. W. long. 1° 45'. The ground, on which the town stands, rises gently from the river, and from its southern aspect, is rendered cheerful by the sun. Its circumference, within the present walls, is about one mile and three quarters, but the circumference of the old walls extended two miles two hundred and eighty-two yards. The town of Berwick is mentioned as a place of strength in the reign of Osbert, one of the last kings of Northumberland, who died in the beginning of the ninth century. It was successively conquered and possessed by the Saxons and Danes, until the Scottish king Gregory, who was cotemporary with Alfred the Great, took it by assault. It continued part of the Scotch dominions till about the year 1098, when it was given by Edgar to the see of Durham, but was again restored to the Scots. During the repeated wars between England and Scotland, this town and its castle were frequently taken and retaken by the armies of each kingdom, and in each direful conflict suffered materially. In one of these, between Alexander of Scotland and John of England, the greater part was destroyed by the latter, who made it a practice to consume the house every morning in which he had lodged the preceding night. On the 2d of August 1291, the states of England and Scotland, with Edward I., assembled at Berwick, to settle the claims of Robert Bruce and John Baliol to the Scottish crown, when the latter was appointed on the 17th of the following November. During these reigns Berwick was besieged and conquered by Edward I.; and the conflict was so great, that Matthew of Westminster states the loss of the Scots to amount to 60,000 persons. An English parliament was summoned here in 1296, when the Scotch nobility paid homage to king Edward. In the following reign, Robert Bruce collected an army of 30,000 combatants, with which he entirely routed and discomfited Edward II. and his army near Stirling castle. This battle, commencing on Midsummer day, 1314, continued several days, and it is acknowledged by most authors, that the English suffered more in this contest than in any other since the time of William the Conqueror. It was in this battle

that the privy seal was lost; and Edward issued a proclamation from Berwick, informing his subjects of the circumstances. Berwick was afterwards a scene of great revelry and rejoicings. The marriage of Joan, sister to Edward III., with David of Scotland, was performed at this place with great pomp and ostentatious solemnity. In spite of this family alliance, the two kingdoms soon returned to their former hostilities, and Berwick became the seat of many battles and destructive sieges. It was several times afterwards in the possession of each country, and never relinquished by either without a vigorous and obstinate resistance. In the reign of Richard III. of England, and James III. of Scotland, commissioners were appointed by each crown to ascertain the limits of Berwick; and it was agreed, that the ground in dispute should remain uncultivated, uninhabited, and uninhabited. But in 1502, this agreement was annulled by another, which stipulated that the town and castle should be "preserved in perpetual peace, friendship, league, and confederacy." In the same year was solemnized the marriage of Margaret, eldest daughter of Henry VII., with James IV. king of Scotland; but this circumstance did not terminate the jealousies and animosities between the two kingdoms, as Edward VI. marched to Berwick with a large force, which was augmented by a fleet of 34 ships, 30 transports, and a galley. These lay encamped here for some time, and were destined to invade Scotland. This monarch, and Mary queen of Scotland, by treaty, made Berwick a county town, and declared it independent of both states. Queen Elizabeth fortified and invested it with a strong and expensive military establishment, consisting of 980 men, whose annual salaries amounted to 12,734*l.* 19*s.* 2*d.* All this was abrogated, and the place rendered peaceable by James VI. of Scotland, who was proclaimed at Berwick, in the year 1603, king of England, France, and Ireland. The union of the two kingdoms, in 1707, terminated the long series of hostilities, which had proved so destructive to the commerce, population, and agriculture of the borders, and to this place in particular.

Berwick, though originally a Scots town, was erected into an English borough, at a very early period, and its last charter was granted by James I.; under which the burghesses claim their various privileges, immunities, &c. as well as some large territorial possessions and domains. It has an exempt jurisdiction, and is independent of the adjoining counties of Durham and Northumberland, yet it is not a county in itself. Since the union, it has been partly subject to the English laws, but is locally regulated by its own code. The town is governed by a mayor, recorder, four bailiffs, and an indefinite number of aldermen. The first is annually elected, and receives 100*l.* during his mayoralty. Two members of parliament are returned from this town, and the number of electors amounts to nearly one thousand, though not more than seven hundred have been known to vote at one election. Several manufactures are established here; the principal of which are for making damask and diaper, lacing, sail-cloth, cotton and muslin, stockings, carpets, felts, hats, boots, shoes; besides several others connected with the shipping. The coasting trade and foreign commerce of Berwick are very considerable, though about sixty years since, only two small vessels of fifty tons each were employed between this place and London. Now about 400 vessels belong to this port, whose principal lading consists of salmon and eggs. The first are mostly caught in the river Tweed, whose fisheries afford a great revenue to the proprietors, and give employ to about 300 men. The salmon fishing continues from the 10th of January till the 10th of October, during which time above 40,000 kits of these fish,

besides a vast quantity of salmon trout, have been sent to London. The latter are often conveyed alive in the bellies of the vessels. About 80 boats are employed on the Tweed; and the yearly rentals of all the fishing waters amount to nearly 10,000*l.* The article of eggs is also a curious and lucrative branch of trade: they are brought to this town in carts and panniers from all parts of the adjoining country, and mostly parted for grocery goods. From the 10th of October 1797 to the 10th of October 1798, 5284 chests of eggs were sent hence to London. The vast increase of trade at this port may be estimated from the custom-house revenue, which has risen in the last 20 years from 1000*l.* to 6000*l.* a year.

It was the universal practice, till within these few years, to boil all the salmon before it was packed up in the kits; but in 1788, a new mode was adopted, and has continued ever since. This consists in packing it with ice, which being wanted in great quantities, induced the merchants to construct several ice-houses near the town. In the year 1798, the two companies of Berwick had in 7600 cart loads, which cost them about 450*l.* There are 32 salmon coopers in this town. Four modes of catching salmon are practised here; the sweep, the still, the hobbs, and the hanging nets. (See SALMON.) Besides the salmon-fishery, the herring and lobster fishery employs several hands. The latter are caught in cruives, which are three feet in length and one and a half in height. These have a hole at each end, where the lobsters are tempted to enter for the enclosed baits.

The *Public Buildings* are the governor's house, the barracks, the ordnance-house, the main-guard, the town-hall, reservoir, church vicar's house, and the bridge; all these are constructed with stone, and the two first were built in 1719. The town hall is a handsome building of three stories, with an ornamental tower and spire at one end. It was built from the designs of Joseph Dodds, and finished in 1754. The church was built, in 1652, under the direction of colonel George Fenwick; but it has neither tower nor bells: these are annexed to the town hall. The bridge over the Tweed is constructed with fine hewn stone, and has fifteen spacious arches. It extends 1164 feet in length, and 17 in width, and was finished building October 12, 1634, after a period of 24 years 4 months and 4 days, from the commencement.

Here are a charity-school, and six free-schools, also a custom-house and excise-office. Berwick is still surrounded with fortified walls, which are mounted with 54 guns. It has four principal gates, and has a complete garrison establishment, to which Holy island is an appendage. Among the antiquities of the town, are the remains of its ancient castle, and a pentagonal bell tower near it, a square fort of Magdalene field, entrenchments on the top of Hallydown hill, and an old pier called queen Elizabeth's pier.

Here is one weekly market on Saturdays, and one annual fair; but the corporation has established three annual markets, called High markets, for the hiring of servants, and selling of horse, cattle, &c. Fuller's History of Berwick-upon-Tweed, 8vo. 1799.

BERWICK, or *Alboston*, a neat town of America, in York county, Pennsylvania, at the head of Conowingo creek, 123 miles W. by S. of Philadelphia, 23 miles W. of York, and 26 miles S. S. W. of Harrisburg. The town is regularly laid out, and contains about 100 houses, and a German Lutheran, and Calvinist church. N. lat. 39° 54'.

BERWICK, or *New Berwick*, a small town of Northumberland county, in Pennsylvania, on the north-western side of the east branch of Susquehanna river, opposite Nescopeck falls and Nescopeck creek, 32½ miles north-east from Northumberland

thumberland and Sunbury, at the junction of the east with the west branch of the Susquehanna, and 160 north-west of Philadelphia. N. lat. $41^{\circ} 3'$.

BERWICK, a township of York county, and district of Maine, containing 3894 inhabitants. It has an incorporated academy, and lies on the east side of Salmon Fall river, 7 miles N. W. of York, and 86 E. by N. from Boston.

BERWICKSHIRE, a county of Scotland, famous in the historical annals of Britain for the many desperate battles fought between the English and Scots within its boundaries. This county formerly constituted about half of the earldom of Dunbar or March, and is generally called by the country people *Merse*. It is nominally divided into three districts, respectively called Lauderdale, Lammermuir, and Merse, or Marsh. The latter comprehends the most beautiful subdivision, and follows the course of the Tweed, from the foot of the Eldon hills to within a few miles of Berwick. Lauderdale is the valley which accompanies the river Leader, or Lauder, whose waters are celebrated in Scottish song. Lammermuir comprehends the ridge of hills, which separates this county from east Lothian, and is chiefly appropriated to the feeding of sheep and black cattle. This county is bounded on the north by Haddingtonshire, on the east by the German ocean, on the south by the river Tweed, which divides it from Northumberland in England, and on the west by the counties of Roxbury, Peebles, and Midlothian. Its length is estimated at 32 miles, and breadth at 17 miles. It is divided into 32 parochial districts; and besides the royal borough of Lauder, has the towns of Greenlaw, Dunse, Coldstream, Coldingham, Ayton, and Eyemouth, within its limits. The chief rivers of the county are the Tweed, the Leader, the Eye, the Whiteadder, and the Blackadder. The state of agriculture in this county is highly improved within the last twenty years; and many parts that were then uncultivated, are now inclosed and rendered profitable to the landlord and the husbandman. By way of agricultural pre-eminence, this county is often called the Norfolk of Scotland. Many farms now let at 300l. and 400l. per annum, which at no very distant period were scarcely deserving of notice. This increase of prosperity enables the county to export from the ports of Berwick and Eyemouth "above 80,000 bolls of victual annually;" and nearly the same quantity is conveyed to the markets of Edinburgh, Dalkeith, Haddington, and Dunbar. The minerals of this district hitherto discovered are few, and these not very valuable. Coal is found in small quantities near Eyemouth; freestone is abundant; and rock and shell marl are found in different places. Copper has been obtained in the vicinity of Lauder; and some few years past a mine of the same ore was discovered in the parish of Bonkle. A small quantity of iron stone is found in the parish of Mordington. The rocks, which compose the Lammermuir hills, are mostly schistus, with alternate strata of sandstone. At Eyemouth is a rock of Puddingstone, which is found to contain fragments of porphyry, granite, and limestone. In the parish of Chirnside, is a species of gypsum, which is advantageously used to manure certain lands. Near Dunse is a celebrated mineral spring, which is much resorted to. Its water, somewhat similar to that of Tunbridge Wells, contains iron dissolved in fixed air, with a little sea salt and bittern; and its effects prove rather diuretic and corroborant. Among the gentlemen's mansions of the county, those of Hirsfel, the seat of the earl of Home, and of Marchmont, the seat of the earl of Marchmont, are the most considerable; though there are some other handsome mansions. Besides the castle and fortifications of Berwick, there are several others in dif-

ferent parts of the county, particularly at Lauder, Cockburn path, Home, and Chapel on Beach. There were also seven nunneries, two hospitals, and one Dominican convent. Among the eminent natives of this county, the following names occur; James Thomson, the poet; John Scott, or Duns Scotus, who was born at Dunse. Of the same place, was John Brown, author of the Brunonian system of physic: Thomas the Rhymer, or sir Thomas Lermont, is distinguished in the history of metrical romance. The real land-rent of this county is estimated at 118,800l. sterling. Home's Agricultural Report of Berwickshire. Sir John Sinclair's Statistical Account of Scotland. Fuller's History of Berwick.

BERWIN, or **BEROUIN**, a considerable range of mountains, which passes through parts of the counties of Montgomery, Merioneth, and Denbigh, in North Wales. The prospect from different spots on the summit of this ridge strikes the mind with awful astonishment. "Nature," says lord Lyttelton (*Works*, vol. iii. p. 337.), "is in all her majesty there; but it is the majesty of a tyrant frowning over the ruins and desolation of a country. The enormous mountains, or rather rocks, of Merionethshire, inclosed us all around. There is not upon these mountains a tree, or shrub, or blade of grass; nor did we see any marks of habitations or culture in the whole place. Between them is a solitude fit for despair to inhabit; whereas all we had seen before in Wales seemed to inspire the meditations of love."

BERY, **BERIA**, or **BERIE**, was anciently the name of the vill or site of the habitation of a nobleman, or of a dwelling or mansion-house, being the chief of a manor; formed of the Saxon "beorg," which denotes a hill or castle; for noblemen's seats were formerly castles, situate on hills, of which there are still some remains. It was anciently taken for a sanctuary. See **BERIA**.

BERYL, or **BERYLL**, *βερύλλος*, *Aquamarine of Siberia*, *Berill*, Germ.; *Emeraude, vert bleuâtre*, Haüy; *silex smaragdus beryllus*, Werner.

The colour of the beryll is a blueish green, passing into mountain apple, or alparagus green, and honey yellow on one side, and light sky blue on the other. It is almost always found crystallized in rectangular six-sided prisms, sometimes truncated on the edges and angles; the sides of the prism are occasionally alternately broad and narrow, and sometimes convex, which gives the whole crystal a cylindrical form. It is not unfrequent for the prisms to have the appearance of having been broken across and imperfectly cemented together. Sometimes, instead of having plane surfaces at their extremities, they are convex or concave, like articulated basaltites. The size of the crystals varies considerably, the smallest being always the longest in proportion to their diameter; some are of no greater magnitude than a hair, while others have been found a foot long and three or four inches in diameter. The beryll has many points of resemblance with the emerald; and in particular the crystals of both are divisible parallel to the sides and extremities of a regular hexahedral prism; on which account M. Haüy has comprehended them both under one species.

The beryll is externally shining, or little-shining, with a vitreous lustre. Its parallel fracture is minute-conchoidal; the cross fracture is completely conchoidal. It is generally transparent, but sometimes is only semi-transparent or translucent. It is sufficiently hard to scratch quartz, though with some difficulty. Specific gravity of the light blue variety 2.67; of the blueish green 2.75; of the mountain green 2.65.

This mineral appears to have been first analysed by Vauquelin, and afterwards by Rose and Schaub, with the following results:

	Vau.	R.	S.
Silex,	69	69.5	66.5
Aluminc,	13	14	16.75
Glucine,	16	14	15
Lime,	0.5		
Oxyd of iron,	1	1	1
	99.5	98.5	99.25

In a common fire the beryll undergoes scarcely any change of colour, but it loses its transparency, and flies to pieces. At a more intense heat it becomes opaque and milk white, but shows no signs of fusion; by the assistance, however, of oxygen gas, it melts without much difficulty. Borax is a perfect flux for it.

The beryll is found in Daouria, upon the borders of China, near Nertschink, also in the granitic ridge between the rivers Onon and Ononborfa. It is found in rivers, accompanying rock-crystal, indurated clay, mica, fluor, wolfram, and arsenical pyrites.

The beryll, when cut and polished, has a considerable lustre; but its colour is for the most part but indifferent. It is ranked among the gems, but its value is trifling when compared with the ruby, sapphire, topaz, &c. Haüy. Emmerling. Widenmann.

BERYLL, *Oriental*. See CORUNDUM.

BERYLL, *Beryllian*. See TOURMALIN.

BERYLL, BERYLLUS, is also a name given to a kind of crystal looking-glass, superstitiously consecrated to the purposes of conjuring and divination. Hence also the term *beryllifica*, used for the mysterious art of seeing future or distant events in such glasses.

BERYLLINA, in *Entomology*, a species of CHRYSIS, found in Europe. The head is greenish blue; thorax blue, greenish in front, behind bidentated; abdomengreen, changeable to rufous and blue; legs blue, with testaceous dots. Linnæus, &c.

BERYLLINUS, a species of CIMEX (*Spinosus*); thorax obtusely spined, and dentated on the sides; tips of the spines and bifid shield of the head greenish blue. Linn.

BERYLLUS, in *Biography*, a learned and pious bishop of Bostra, or Bozrah, in Arabia, flourished about the year 230, and taught that Christ had no proper subsistence or divinity distinct from that of the father, before his birth of Mary; or that Christ did not exist before Mary, but that a spirit issuing from God himself, and therefore superior to all human souls, as being a portion of the divine nature, was united to him at the time of his birth. Many conferences were held with Beryllus on this opinion; and at last it was so completely refuted by Origen, and so much to the satisfaction of Beryllus himself, that he gave up the cause, and returned into the bosom of the church. The acts of these conferences were long preserved, and the dialogue between Origen and Beryllus was extant in the time of Jerom. Eusebius also refers to them. Eccl. Hist. l. vi. c. 33. Cave's Hist. Lit. vol. i. p. 122. Mosh. Eccl. Hist. vol. i. p. 306.

BERYLLUS, in *Entomology*, a species of CIMEX (*Rotundatus*), that inhabits India. It is of the middle size; pale; border of the thorax orange; wing-cases with a ferruginous spot, and marginal black lines. Fabricius.

BERYTIS, in *Ancient Geography*, a town of Asia Minor, in the Troade. Steph. Byz.

BERYTUS, BAIROUT, BEROT, or BEIRUT, a town of Phœnicia, situated about 24 miles south of Byblus. Stephanus Byz. says, that it was so called on account of its waters. Others deduce its name from Beroc, as it was sometimes called by the poets, who was a nymph of the

ocean, and the nurse of Semele. Bryant supposes it to have been derived from Baris, Barit, or Barith, the ancient name of the ark, but properly signifying a covenant; and that it was the city of the ark, where the Canaanit or Phœnician deity Baal-Berith had a temple, and where the rites of his worship were performed. This city is not much inferior to Byblus in antiquity, since it is said to have existed in the time of Cronus. The kings of Egypt had possession of it; but when Antiochus the Great subdued this province, it became subject to the kings of Syria, and remained under the successors of this prince till the time of Diodotus, denominated "Tryphon," who entirely destroyed it about 140 years before the Christian æra. The Romans, after the conquest of Syria, rebuilt it near the spot where the ancient city had stood. Agrippa, the grandson of Herod the Great, decorated it at an immense expence with a theatre and amphitheatre, baths, and porticoes, and established in it magnificent games, mentioned by Josephus in his "Antiquities." It was in this city that Herod the Great, by permission of Augustus, held an assembly which condemned to death his sons Alexander and Aristobulus, under the false accusation of Antipater, their eldest brother, for having conspired against the life of their father. Titus, the son of Vespasian, came to Berytus, after the capture of Jerusalem, to celebrate the feast of the birth of his father; according to Josephus "De Bello." Berytus enjoyed the privilege of the "jus Italicum," according to a law of the Digest. Pliny (H. N. l. v. c. 20.) and Josephus (De Bell. Jud.) inform us, that it was a Roman colony. Under the Roman emperors, Berytus was no less famous for the study of the law in the east, than Rome was in the west; and hence it was styled by the emperor Justinian "the mother and nurse of the laws." The civil law was taught here in Greek, as it was at Rome in Latin. It is not certainly known by whom the academy was founded; but that it flourished long before the reign of the emperor Dioclesian, is manifest from a decree of that prince. According to Heineccius (Jur. Rom. Hist. p. 351—356.), the splendor of this school may be computed to have lasted from the third to the middle of the sixth century; and its institution has been ascribed to Alexander Severus. From this academy the two famous civilians Dorotheus and Anatolius were called by Justinian, that they, in concurrence with others, might be employed in comparing the Digests; and that prince would allow of no other academies, but those of Rome, Berytus, and Constantinople, to explain the laws. This city was overthrown by an earthquake in the 25th year of Justinian, A. D. 551, July 9; and as the schools of Berytus were filled with the rising spirits of the age, many youths were probably lost on this disastrous occasion, who might have lived to be the scourges or guardians of their country. The metals of this city are bronze, gold, and silver. After it became a Roman colony, its medals had a legend, COL. FIL. BER. i. e. "Colonia Felix Berytus," and were struck in honour of Cæsar, Augustus, Tiberius, Claudius, and other Roman emperors. For the present state of Berytus, see BAIROUT. The suburbs are almost as large as the city itself, consisting of gardens, with a house for the owner in each; and these, interspersed among the numerous fruit trees, particularly olives and figs, which this fertile soil supports, give the whole a picturesque and beautiful appearance. European vessels, in the summer, anchor near a small point of land, which runs into the sea before the city, and is called "Berith point;" but in the winter, they call anchor to the north, in a kind of gulf, which is sheltered from the north and east winds by the mountain, and is said to be very serene. The staple commodity of the country is raw silk, which is carried to Cairo, Damascus, and

and Aleppo, and part of it to Europe. They also fabricate a kind of jars and jugs of earthen ware, which, from the peculiar nature of the clay in the adjacent country, are highly esteemed, and carried to all parts of the coast. Brown's Travels in Africa, p. 377.

BERYTUS, a town of Arabia, formerly called Diofpolis. Steph. Byz.

BERZETIN, in *Geography*, a town of Hungary, in the district of Gomor, not far from the river Sajo, and formerly noted as the residence of many noble families.

BERZETTO, a town and abbey of Italy, in the duchy of Parma.

BERZOWITZ, a town of Hungary, 12 miles N.N.E. of Leutsch.

BES, or BESSIS, an ancient Roman weight, containing two-thirds of the *as*, that is, eight *uncie*. See *As*.

The bes originally weighed two asses; whence the origin of the word *quasi binus as*. Though Scaliger conjectures it to have been formed from *dues*; as *bellum* from *duellum*, or *bonum* from *duonum*. *Bes* was also a linear measure of the ancient Romans. *Bes* was also a measure of capacity.

BES was also used in the mensuration of lands, to denote two-thirds of a *jugerum*, or acre. See *MEASURE*.

BES was also a money of account, and a current coin among the ancient Romans. See *COIN*, and *MONEY*.

BESA, in *Ancient Geography*, an ancient city of the Thebaide upon the Nile, consecrated to a god of that name, but formed into a new city by Adrian, who built a temple in it in honour of Antinous, and called it *Antinoe* or *Antinopolis*; which see.

BESA, in *Mythology*, a deity belonging to the city of Abydus in the Thebaide, mentioned by Ammianus Marcellinus in his History, lib. xix. The mode of consulting the oracle of this deity was by writing the subjects of inquiry on sealed billets, which the priests carried into the sanctuary of the god, and to which they brought back the answers. Isaac Casaubon has suggested, in consequence of a passage occurring in the Bibliotheca of Photius (Cod. 279.), that this deity was adored at *Antinoe*, or *Antinopolis*; which see.

BESAILLE, or BESAYLE, Fr. denoting the father of the grandfather, in the *Common Law*, a writ that lies where the great-grandfather or great-grandmother was seized the day that he or she died, of any lands or tenements in fee-simple; and after his or her death, a stranger entered the same day upon him or her, and keeps out the heir.

BESALU, in *Geography*, a town of Spain, in Catalonia, at the foot of the Pyrenées, erected by pope Benedict VIII. into an archbishopric, but soon after suppressed; 7 leagues from the Mediterranean, and 5 north from Gerona.

BESANCON, a city of France, and before the revolution the see of an archbishop, and capital of Franche Compte, now of the department of the Doubs. This city is surrounded by mountains, and seated on the river Doubs, which divides it into the upper and lower town, joined by a handsome bridge. Of the former, nothing remains except the castle, or citadel, which is a long square built on a sharp rock, and commanding the city, which is defended by a wall flanked with eight towers like bastions. The latter has three long and handsome streets, which are adorned with houses built of free stone, and covered with slate; chiefly about the square called "Battan," which is ornamented with a fountain, whose water proceeds from the statue of Bacchus. The metropolitan church is built at the bottom of St. Stephen's hill, and is a handsome structure, with a high tower steeple. In the middle of the choir is the great altar, on which they expose at certain times, relics in silver shrines enriched with gold and jewels. Near the church of

Notre Dame is a triumphal arch, erected in honour of the emperor Aurelian, on which are seen several mutilated figures of men and animals. This serves as a gate to the cloister of St. John the Great. The great hospital of the order of St. Esprit, for foundlings, is a structure worthy of notice. The prison is remarkable for its excellent economy, and the humane attention paid to its unhappy occupiers. The town-house is a large edifice with four wings, having in its front the statue of Charles V. in bronze, with a globe in one hand, and a sword in the other. The imperial eagle is raised over a large basin, and spouts out water by both its beaks. The governor's palace is magnificent; and beyond it is a fountain, adorned with the figure of a naked woman discharging water at her nipples. Under the Romans, this was one of the most magnificent places which they had in Gaul, and many remains of their superb buildings are yet visible. After the death of Julian, it was almost destroyed by the Germans, and a second time by Attila. It afterwards became an imperial city, till the time of Lewis XIV., who, in 1674, made himself master of it, repaired its fortifications, and united it to France. The university of this city is an ancient and celebrated foundation; and in the year 1752 a literary and military society was instituted in this place. It contains 8 parishes; and the number of inhabitants, which was formerly estimated at 40,000, is now supposed to be reduced to 30,000. The canton of north Befançon is said to contain 15,618, and that of south Befançon 16,662 persons. The territorial extent of Befançon comprehends 97½ kilometres; the former canton includes 3, and the latter 4 communes. N. lat. 47° 13 45". E. long. 6 2 40".

About 20 miles from Befançon, near the abbey of "Grace Dieu," there is a natural ice-cellar, in a very romantic situation. On the highest part of a mountain, covered with a thick grove of lofty trees, is the opening of the cavern, which resembles by its depth, said to be above 220 feet, and by the solemn gloom of the surrounding wood, what poets have feigned of the descent into the infernal regions. The cavern itself is 60 feet in length and height, and 40 in breadth; the bottom is covered with ice, of which vast pyramids rise from it, while others appears suspended from the arched roof, with their points opposite to those of the former. Within the cave is a hole or well, always full of water, and never frozen; and, at the entrance, some mould, which seems to have been accidentally thrown there, and adorned with primroses and other wild flowers. The ice, which in the cavern appears of a beautiful azure, is, when seen by daylight, remarkably white. From this natural repository, the ice-houses in Befançon are supplied, when the winters are too mild to freeze water in the open air. This cavern has been the subject of repeated investigation, the result of which may be seen in the "Memoirs of the Academy," for 1712 and 1726.

BESANT, or BEZANT, BIZANT, or BYZANT, a sort of coin, struck at Byzantium, in the time of the Christian emperors, and well known in England, and indeed all over Europe, for some ages before the Norman conquest. Few coins ever had a longer or more universal currency than these besants or byzantines; having been current from the very beginning to the end of the eastern empire, not only in all its provinces, but also in all those countries which had been provinces of the western empire, and amongst others in Britain. With us gold and silver besants were received in payments. But though they are frequently mentioned by all the historians of the crusades, they are rarely spoken of by ours. Neither are they named in Domesday book, nor in the public acts of Henry I. or Stephen, nor in the last will of king Henry II. However, some mention is made of them in private deeds and leases, and also in the Exchequer rolls under Henry

Henry II. The gold besant was pure, or twenty-four carats fine; but writers are not generally agreed with respect to its value. Out of the Greek pound of gold, which was the same with our Tower pound, 72 Lyzaatines were coined, each weighing 73 troy grains, and worth 40 Saxon pennies, 8 Saxon shillings, and 9 shillings and four-pence halfpenny of our present money. (Henry's Hist. vol. iv. p. 275.) The silver besant, in the 12th century, was rated at two shillings English. (Lytelton's Hist. of Henry II. vol. i. p. 411.) Hence the gold offered by the king at the altar, or festivals, is still called besant, or bisant. Thirteen besants, or bisantines, were presented at the mass at the coronation of the kings of France. Henry II. had that number coined on purpose.

BEZANTS, in *Heraldry*. See BEZANTS.

BESARABA, in *Geography*, a town of European Turkey, in the province of Bulgaria, 48 miles north of Turnova.

BESBICUS, in *Ancient Geography*, a small island of the Propontis, now the sea of Marmora, situate between Cyzicum and the mouth of the Rhyndacus. This, according to Pliny (N. H. l. ii. c. 8.), is one of those islands which, being first joined to the continent, were separated from it by the violence of the sea, or by earthquakes.

BESBOROUGH, in *Geography*, an island in Norton Sound, on the west coast of North America. N. lat. 64° 10'. W. long. 161° 15'.

BESBRE, a river of France, in Nivernois.

BESERG HENLY, a town of Asiatic Turkey, in the province of Carmania; 24 miles north of Akserai.

BESHARRAI, a village of Syria, situate among the mountains in the pachalic of Tripoli, on the road to the Cedars, and distant from them 3 leagues, which is frequented by the Europeans, and where the missionaries have a house. During the winter, many of the inhabitants leave their houses under the snow, with some person to guard them, and remove to the sea-coast.

BESHETZK, or BEZETZK, a district in the government of Tver in the Russian empire, situate on the Mologa. N. lat. 58° 30'. E. long. 34° 24'.

BESITZERS, and BESITGED, in the *Military Art*, denote those who fly to a fortified place, and those who defend it. See *SIEGE*.

BEITHHEIM, in *Geography*. See BEISEHEIM.

BESILLUS, in *Ancient Geography*, a river of Spain, in Bætica.

BESISTAN, or BESESTAN, a name given to those places as Cassia, India, Adria, &c. and some other; viz. to the dominions of the Grand Seigneur, where the people have their shops, and expose their goods to sell. A particular besistan belongs to each class of merchants and workmen. These besistans are commonly large galleries vaulted over, whose gates are shut very tight. The vendors, or keepers, sell for hire, for a few farthings for the purchase of, or being put under a moderate price for each shop. See *BARBANS*.

BL. J. F. IRON, in *Bio-graphy*, born at New-Bury, Sept. 27th, 1766, and created doctor in medicine at Halle in 1792, was a high reputation for his learning, and industry in his profession; that he was seven times appointed dean of the college of New-Bury, and inspector of the medicines of that college, &c. there. He died November, 1822.

BLESER, BASIL, brother to Jerom, was born at Nuremberg in 1561, where he studied as an apothecary. Applying to the study of botany, he soon became conspicuous in that science of several authors. In 1613, he published "Hortus cysletensis, seu delineatio accurata omnium plantarum ex variis orbibus, terræ partibus, singulari studio collectarum, quarum

celeberrimis viridariis artem episcopalem ibidem cingentibus, hoc tempore conficiuntur, delineatio, et a vivum representatio," Nurem. b. 1613, in 4 vols. Atlas folio. The most splendid botanical work, Haller says, that had then appeared. The plates, 356 in number, and delineating 1533 plants were engraved at the expense of Conrad, bishop of the see. The work is unequal to its execution, as besides the errors committed in the description of many of the plants, some of the delineations are fictitious, taken from fancy, or from the rude accounts of ignorant travellers. But the far greater part of them are correctly drawn, and beautifully executed. As Basil was ignorant of the Latin language, his brother Jerom furnished the preface. He also published "Fasciculus rariorum, et ad ipsa dignorum varii generis, quæ ceteri incidi curavit," Norib. 1616. 4to. Max. containing some marine plants and fruits; also, "Icones florum et herbarum, &c." fol. 1622. It is a continuation of the hortus cysletensis, which have been several times reprinted. The time of his death is not known. Haller Bib. Bot.

BESLER, MICHAEL RUPPERT, son of Basil, was born in 1607. Having passed some years at Altdorf, where he was admitted doctor in medicine, he returned to Nuremberg, and was advanced to the same offices that had been enjoyed by his uncle. In 1631, he published, in 4to. "De sanguine secundum et præter naturam;" and in 1640, folio, "Admiranda fabricæ humane muliebris partium generationis potissimum intervientium, et sætus fidelis quinque tabulis hactenus nunquam visa delineatio." The work is ingenious, but the plates, which are copied from Fabricius, are ill executed. This work was followed, in 1642, by "Gazophylacium rerum naturalium ex regno vegetabili, animali et minerali de promptario fidelis representatio," fol. and the same year, by "Observatio medica singularis, mulieris tres filios emaxæ," 4to.

BESLERIA, in *Botany*, so named by Plumier after Basil Besler, an apothecary at Nuremberg, editor, with the assistance of Jungermann, of a sumptuous work, entitled "Hortus cysletensis," 1613. Lin. Gen. n. 755. Reich. 813. Schreb. 1012. Plum. 5. Jacq. Amer. 187. Juss. 121. Gærtn. t. 52. Class and order, *didynamia angiospermia*. Nat. Ord. *Polymoniae*. *Scrophulariæ*, Juss. Genia. Cal. Perianth one-lipped, five-parted, acuminate, erect, loose, with reflected tops. Cor. monopetalous, rugent; tube the length of the calyx, roundish, gibbous on one side at the base, and at the top; border five-lobed, division roundish, the lowermost largest, and the two upper lobes divided. Stam. Filaments four, within the tube of the corolla, of which two are a little shorter; anthers oblong, twin, hanging down on each side. Pist. Germ. globular, sitting on a glandulous body, which embraces it, and is permanent, cordate where the corolla is gibbous; styl. subulate, erect; stigma bifid, obtuse. Per. Berry subglobular, one-celled; partition, two opposite semi-ovate laminae, not coherent. G. Seeds numerous, round, very small, nestling, fixed to the inner surface of the berry.

Ess. Char. Cal. five-parted; berry subglobular, many-seeded.

Species, 1. *B. melitifolia*. "Peduncle branching; leaves ovate." It has a smooth, woody, jointed stalk; with two ovate terve leaves opposite at each joint, which are crenate at their edges; the flowers proceeding from the wings of the leaves upon short branching footstalks, each sustaining six or eight flowers. A native of South America. 2. *B. lutea*. L. n. l. a. Brown, Jan. 27. f. l. &c. fl. luteo, major, Plum. Gen. 29. "Peduncles simple, or wided; leaves lanceolate." Rising with a lignous stem, six or seven feet high, divided towards the top into many irregular branches, with spear-shaped serrate leaves, having many transverse veins; the flowers issuing at the wings of the leaves in large clusters, each

on a separate foot-stalk, and small, tubulous, of a pale yellow colour." A native of Martinico, Jamaica, &c. 3. *B. cristata*. "Peduncles simple, solitary; calyxes ferrate-crested." A shrubby plant, differing in its habit from the foregoing, climbing up trees, and adhering to them by roots issuing from the joints; the twigs round, hirsute, and long; the leaves ovate, acute, ferrate, hirsute, wrinkled, veined, petioled, opposite, two inches long; peduncles one-flowered, axillary, bent down, almost as long as the leaves; calyx bright scarlet; corolla yellow; stamens proceeding from a common membrane, fastened to the tube of the corolla, and cleft longitudinally at its gibbous part. Before the dispersion of the pollen, the filaments are upright; afterwards interwoven as in *Martynia*. A yellow conspicuous gland embraces the germ. A native of Martinico, in moist mountainous woods. 4. *B. bivalvis*. "Calyxes bivalve, torn." Stem herbaceous, long, creeping, hairy, round; leaves opposite petioled, veined, hairy, nerved, a hand's breadth long; peduncles lateral, opposite, shorter than the leaves, two from each axil, one-flowered; berry oval, with a hard two-celled nucleus; resembling the third species in the leaves and calyx, but very different in the fruit, and in wanting the five-leaved perianth. Observed at Surinam by Dahlberg. 5. *B. biflora*. *Cyrtandra biflora*, Forst. gen. 3. n. 1. "Peduncles two-flowered; involucre caducous, inflated; leaves ovate, quite entire." A native of the island of Otaheite. 6. *B. cymosa*. "Peduncles cymed; pedicels with little bractes; leaves ovate, crenate." A native of the island of Tanna.

Propagation and Culture.—These plants grow naturally in the warm parts of America. The seeds should be sown on a hot-bed early in the spring, and the plants, when half an inch high, transplanted each into a small pot filled with light fresh earth, and plunged into a hot-bed of tanner's bark, watered and shaded till they have taken root; afterwards according to the warmth of the season, and of the bed in which they are placed. When the plants have filled these small pots with their roots, they should be shaken out, and their roots trimmed and put into large pots filled with light fresh earth, and plunged again into the hot-bed, where they should have much air in warm weather, and be frequently watered. Thus managed, the plants will thrive in summer, but in winter they must be removed into the stove, and often, but sparingly, watered. In the second year these plants will flower; they sometimes perfect their seeds in this country; but as they will not live in the open air, they must be constantly preserved in the stove. *Martyn*.

BESONS ROCKS, in *Geography*, are two small rocks off the western point of Cornwall, bearing W.S.W. from cape Cornwall, and N.N.E. from the Long ships. Ships may sail within them without danger.

BESORCH, in *Commerce*, a coin of tin, or of some alloyed metal, current at Ormus, at the rate of about $\frac{3}{4}$ parts of a farthing sterling.

BESOS, or **BERULUS**, in *Geography*, a river of Spain in Catalonia, which runs into the sea not far from Barcelona.

BESSAPARA, in *Ancient Geography*, a town of Thrace, situate 12 miles from Philippopolis.

BESSARA, a town of Asia in Assyria, seated near the Tigris. *Ptolemy*.

BESSARABIA, **BUDZIAC**, or **BOODJAK**, in *Geography*, is a small country of Turkey in Europe, situate between the north branch of the Danube and the river Dneister, and bounded on the west by Moldavia, on the south by the Danube, on the east by the Black sea, and on the north by Russia. It was anciently the country of the Getæ and Peucini; but it is now inhabited by the independent Tartars, of whom some have fixed habitations in their villages, and others lead a

kind of wandering life, subsisting on the flesh of their oxen and horses, and on the milk of mares, and the cheese which is made of it. In their religion, manners, and customs, they resemble the Crim Tartars. When an army is sent to attack them, they retire into inaccessible mountains, on the coast of the Black sea, whence it is impossible to expel them, on account of the morasses and defiles. The chief towns are Bender, Akerman, Kilia, and Ismail. This country, and also Walachia, on which it borders towards the south-west, contain some lakes of considerable extent, as those round Ismail, and that to the east of Surza, which communicates with the Danube, and forms a part of that river.

BESSARION, **CARDINAL**, in *Biography*, was born at Trebifond in 1395, and educated at Constantinople, under some of the most learned Greeks of that period. In the course of his education, he adopted the principles of the Platonic philosophy, and was more confirmed in them by the lectures of George Gemistus Pletho, on whom he attended in the Morea. These principles he combined with his system of Christian theology. Having taken the religious habit of St. Basil, he was soon advanced to the bishopric of Nicæa, and employed by the Greek church to attend on their behalf at the council held under pope Eugenius IV. first at Ferrara, and afterwards at Florence, in 1439; with a view of effecting an union between the Latin and Greek churches. But he incurred the displeasure of the Greeks by inclining to the party of the Latins, and proposing an union of the two nations, to the prejudice of the former, who were required unequivocally to declare that the Roman pontiff was the supreme head of the universal church. Bessarion became unpopular in his own country, nor could he venture to revisit Constantinople; but remaining at Rome, and subscribing the articles of the Latin church, he was recompensed, in 1439, by a cardinal's hat, and he was also created titular patriarch of Constantinople. Having perfected himself in an acquaintance with the Latin language, he was from this time employed by the popes in several concurus of moment. Nicholas V. after naming him to the bishopric, first of Sabina, and afterwards of Frascati, sent him as legate to Bologna, where he resided from the year 1450 to 1455, and contributed to revive and increase the reputation of the university. Upon the death of Nicholas, the cardinals had an intention of advancing him to the papal see; but when they waited upon him with this view, they were prevented from seeing him by one of his attendants, who would not allow him to be disturbed in his studies; upon which Bessarion, when he was informed of the fact, said to him, "Perot, thy incivility has cost thee a hat, and me the tiara." Bessarion was employed by the popes Calixtus III. and Pius II. in negotiating the wished-for league against the Turks, and deputed for this purpose to Alphonso, king of Naples, and the emperor Frederic. During the pontificate of Paul II. he lived at Rome, and distinguished himself in the promotion of literature, by opening an academy in his palace for the study of philosophy, and for gaining a critical knowledge of the Greek and Latin languages: nor was he less liberal and active in encouraging every other branch of science, by countenancing with his presence and patronage those assemblies that were frequented by the Greeks and Italians for the purpose of mental improvement. His library, which contained many Greek MSS., is said to have cost him 30,000 crowns; and this he presented, in 1468, to the republic of Venice, where it became the chief foundation of the library of St. Mark. Having received from pope Sixtus IV. the appointment of legate to France for the purpose of reconciling king Lewis XI. and the duke of Burgundy, he paid his first visit to the duke, and thus offended Lewis to such a degree, that he treated him with rudeness, and dismissed him without

without entering on the business for which he was deputed. This kind of reception affected him so much, that on his return he fell sick at Turin, and died at Ravenna in 1472. He was regarded as a person of unparalleled genius and erudition; and he was the author of many works, both in Greek and Latin, some of which were printed, and others left in MS. The chief of these was his defence of Plato, against George of Trebizond, in a treatise entitled "In calumniatorem Platonis, lib. iv.," first printed without a date at Rome in 1470, and re-edited at Venice in 1503 and 1516, folio. In this publication he examines Plato's opinions, particularly with regard to morals, and shews that they approach much nearer to the doctrines of Christianity than those of Aristotle. Others of his printed works are letters, orations, and translations of Xenophon's Memorabilia, the metaphysic of Aristotle, and that, falsely ascribed to Theophrastus. According to Brucker, these translations are very obscure; but Huet commends Bessarion as the model of all good translators. Brucker's Hist. Philos. by Ensfield, vol. ii. p. 407. Fabr. Bib. Græc. l. v. c. 43. § 9. tom. 10. p. 401.

BESSARIONOVA CAPE, in *Geography*, is the west point of a bay in the sea of Azof, of which the east point is cape Berdinskaya. N. lat. 46° 35' E. long. 36° 46'.

BESSA-STÄDER, or **BASSE-STED**, a place of Iceland, (N. lat. 64° 6') the residence of the king's prefect. In this place is a woollen manufactory, with a fulling mill belonging to it.

BESSAY, a town of France, in the department of the Allier, and chief place of a canton in the district of Moulins, 8 miles south of Moulins.

BESSE, **JOHN**, in *Biography*, of Peyruffe, in the Rouergue, was educated under M. Chirac, at Montpellier, whose theory of fermentation he adopted. He then went to Paris, where he published, in 1702, "Recherches analytiques sur la structure du corps humain," 8vo. He derives all the functions of the body, and even the formation of the fœtus, from a due mixture of acid and alkali. He does not allow the imagination of the mother to have the power of marking or disfiguring the fœtus in utero. The following year he was created doctor of physic by the faculty at Paris, and soon after was made physician to the queen dowager of Spain. In 1723, he published "Lettre critique, contre l'idée générale de l'économie animale, et les observations sur la petite vérole," in 12mo. In this work, the first part of which was written to oppose the principles laid down by Helvetius, he gives an account of a malignant species of small-pox, which raged in the year 1716, and speaks of the benefit accruing in these cases from bleeding, and administering purges, on the attack of the secondary fever, a doctrine approved by Drs. Mead and Friend. He commends the dissection of dead bodies, with the view of discovering the causes of disease, which he frequently practised, and mentions his having found 13 calculi in the gall-bladder of a person who died of jaundice. For other smaller pieces by this writer, see Haller's Bib. Med. Præc. He died, we are told, at Paris, at an advanced age.

BESSE, in *Commerce*, a Persian copper coin, in value 1½ d sterling.

BESSE, in *Geography*, a town of France, and principal place of a district, in the department of the Puy-de-Dôme, 6 leagues south of Clermont. The town contains 1913, and the canton 11,016 persons. Its extent comprehends 445 kilometres and 12 communes. N. lat. 45° 31'. E. long. 2° 52'.—Also, a town of France, in the department of the Var, and chief place of a canton in the district of Brignols, 6 miles S. E. of Brignols. The town includes 1578, and the canton 8165 persons. The territory contains 317½ kilometres and 7 communes.—Also, a town of France, in the department of the

Sarte, and chief place of a canton in the district of St. Calais, on the river Braye, 5 miles south of St. Calais.

BESSENAVY, a town of France, in the department of the Rhone, and the district of Lyon, 4 leagues west of Lyons.

BESSENBACH, a town of Germany, in the circle of the Lower Rhine, and archbishopric of Mentz; 6 miles east of Achenhausenburg.

BESSERNE, a small island of Denmark, 2 miles S. E. of Veyeroe.

BESSI, in *Ancient Geography, a people who inhabited a district of Thrace, near mount Hæmus, called *Bessica*. They lived in huts, and maintained themselves by plundering their neighbours. They were the most savage and inhuman of all the Thracians, according to the account given of them by St. Jerom, Paulinus of Nola, Eutropius, and Ovid. Their chief city, Uteudama, is now known by the name of Adrianople. They lived under their own kings, undisturbed by the neighbouring princes, till the consulate of M. Licinius Lucullus and C. Cassius Varus. Lucullus invaded their country; after a signal victory took possession of it, and subjected the whole nation to the Roman laws. The Romans afterwards allowed them to live under their own kings; but Piso, while he governed Macedon as proconsul, having treacherously seized Raboecentus, whom Strabo calls prince of the Bessi, caused him to be publicly beheaded; and this affront so exasperated the whole nation, that they shook off the Roman yoke; however, they were vanquished in a considerable battle by Octavius, the father of Augustus. During the civil wars of Rome, they again attempted to recover their liberty, but were subdued by the famous M. Brutus, junior. In the reign of Augustus, one Vologeses, a native of the country and priest of Bacchus, having, under pretence of religion, assembled a numerous body of people, made himself master of the whole country, and entering the Chersonesus, committed most dreadful ravages; but was at last overcome by L. Piso, who obliged the savage inhabitants to lay down their arms, and submit to such conditions as he was pleased to impose. From this time the Bessi continued subject to the Romans, without making any further attempts to recover their ancient liberty. Eutrop. l. ii. Oros. l. iv. c. 3. Flor. l. iv. c. 12. Sueton. in Octav. BESSIERES, in *Geography*, a town of France, in the department of the Upper Garonne, 5 leagues N. E. of Toulouse.

BESSIGBEIM, a town of Germany, in the circle of Swabia, and duchy of Wurtemberg, near the conflux of the Ens and Necker, 8 miles south of the Heilbron, and 13 north of Stuttgart. The district of the same name is a good wine country.

BESSIN, the name, before the revolution, of a small country of France, in Lower Normandy, near the sea-coast.

BESSINES, a town of France, in the department of the Upper Vienne, and chief place of a canton in the district of Bellac, situate in a deep, narrow, rocky valley, 6 leagues north of Limoges. The town contains 2511, and the canton 9372 persons. Its territory includes 180 kilometres, and 7 communes.

BESSIS. See **BIS**.

BESSIS Centesima, denotes two-thirds of centesimal interest, or usury at eight per cent.

BESSONIE, **L. A.** in *Geography*, a town of France, in the department of the Tarn, and chief place of a canton in the district of Castres, 3 leagues N. N. E. of Castres.

BESSY BELL, a mountain of Ireland, in the county of Tyrone, 10 miles south of Strabane.

BESTAAD, a town of Norway, 36 miles N. N. E. of Drontheim.

BESTAGNO, a town of Italy, in the duchy of Monteferrat, on the Bormida, 18 miles East of Alba.

BESTAIL, or **BESTIAL**, in *Ancient Statutes*, is used for all kinds of cattle. 4 Edw. III. c. 3. It has been appropriated more, in former times, particularly to those that were purveyed for the king's provision.

BESTARCHA, a dignity in the courts of the emperor of Constantople, supposed to answer to that of the *master of the wardrobe* among us.

The word *bestarcha* seems to have been formed from *vestarcha*, by a change of the *v* into *b*.

BESTERTZE. See **BISTRITZ**.

BESTIARI, among the *Ancient Romans*, those who were hired to combat with beasts, or those who were exposed to them, by sentence of law.

We usually distinguish two kinds of *bestiarii*: the first were those condemned to the beasts; either as being enemies taken prisoners, or as being slaves, and guilty of some enormous crime.—These were all exposed naked, and without defence, to the beasts; nor did it aught avail to conquer and kill the beast, fresh ones being continually let loose on them, till they were dead. But it seldom happened that two were required for the same man; on the contrary, one beast frequently dispatched several men. Cicero mentions a lion, which alone dispatched two hundred *bestiarii*.—Those who succeeded the first were called *επίδροι*, and the last *εσχάτοι*; among the Romans, *meridiani*.

The Christians were *bestiarii* of this kind, even some of them who were Roman citizens; though it was the legal right of such to be exempt from it.

The second kind of *bestiarii*, Seneca observes, consisted of young men, who, to become expert in managing their arms, fought sometimes against beasts, and sometimes against one another; and of bravoës, who, to shew their courage and dexterity, exposed themselves to this dangerous combat. Augustus encouraged this practice in young men of the first rank; Nero exposed himself to it; and it was for the killing beasts in the amphitheatre, that Commodus acquired the title of the Roman Hercules.

Vigenero to these adds two kinds of *bestiarii* more: the first were those who made a trade of it, and fought for money; the second was where several *bestiarii*, armed, were let loose at once, against a number of beasts.

BESTOROZIN, or **BESZERMEY**, in *Geography*, a town of Hungary, 8 miles N. N. W. of Debreczin.

BESTRITZA, or **BISTRICRA**, a large town of Lower Hungary, on the Wag, with a castle facing it, seated on a high rock on the opposite side of the river.

BETA, deriving its name from the form of the letter *BETA*, which it has when swelled with seed, in *Botany*. Lin. gen. 310. Reich. 338. Schreb. 436. Tourn. 286. Gærtn. t. 75. Juss. 85. Class and order, *pentandria digynia*. Nat. Ord. *Holoraceæ. Atriplices*, Juss. Gen. Char. *Cal.* perianth five-leaved, concave, permanent; divisions ovate-oblong, obtuse. *Cor.* none. *Stam.* filaments five, subulate, opposite to the leaves of the calyx, and of the same length with them; anthers roundish. *Pist.* germ. in a manner below the receptacle; styles two, very short, erect; stigmas acute. *Per.* capsule within the bottom of the calyx, one-celled, deciduous. *Seed* single, kidney-form, compressed, involved in the calyx.

Ess. Char. *Cal.* five-leaved. *Cor.* none. *Seed* kidney-form, within the substance of the base of the calyx.

Species, 1. *B. vulgaris*, red garden beet. Varieties *α. B. rubra vulgaris*, Bauh. pin. 118. Raii hist. 204. n. 2. Ger. emac. 318. n. 2. Park. theatr. 751. f. 3. Common red beet. *β. B. rubra major*. Bauh. pin. 118. Blackw. t. 235. Ger. 251. n. 3. emac. 392. *B. italica*. Park. par. 490. Raii hist. 205. Great red beet. *γ. B. rubra, radice rapæ*, Bauh. pin. 118. Raii hist. 204. n. 4.—*romana rubra, ra-*

posfa dicta. Park. par. 489. Turnep-rooted red beet. *δ. B. lutea major*. Bauh. pin. 118. Raii hist. 204. n. 5.—*fyriaca*. Park. theatr. 752. n. 3. Yellow-rooted beet. *ε. B. pallide virens major*. Bauh. pin. 118. Green-leaved red beet. “Flowers heaped; leaflets of the calyx toothed at the base.” This species has large, thick, succulent leaves, generally of a dark red or purple colour. The roots are large and deep red, on which their goodness depends; for the larger they grow, the more tender they will be, and the deeper their colour, the more are they esteemed. A native of the sea-coast of the southern parts of Europe. The variety *α.* has the leaves shorter than in the white beet, more or less red, and sometimes so dark, as to be called black beet; its root white. *β.* has leaves large and red, as is the whole of the plant, as well root as stalk, and flowers full of a purple juice, tending to redness; the midribs of the leaves are very broad and thick, like the cabbage leaf, and equal in goodness when boiled. Gerard says, that it grew with him in 1596, to the height of eight cubits, and brought forth its rough seeds very plentifully. These, though taken from a plant of one colour, produce plants of many and valuable colours. *γ.* Stem higher than the common red beet; root thick, within and without of a high blood colour. *δ.* Leaves paler than those of the white beet, of a greenish yellow colour; the root of a fine high yellow, sweet and well tasted. All these are mere feminal varieties. The beet is subject to change, and to degenerate, at least in our climate. It has been supposed, that the *B. cicla* is not specifically different from the *vulgaris*, and that both are derived from the *maritima*, cultivated on a rich soil, in southern climes. The beet is said to be prejudicial to the stomach, and to yield little nourishment. Taken in quantity, it tends to loosen the belly. The juice of the root and leaves is said to be a powerful emetic, and to occasion a copious discharge of mucus, without provoking sneezing. A good sugar may be obtained from the juice of the fresh roots. This species was cultivated in 1656 by Mr. John Tradescant, jun. 2. *B. cicla*, white garden beet. *B. hortensis*. Mill. Dict. n. 2. *B. vulgaris*, *ζ. η.* Lin. Spec. 322. *B. alba*. Ger. 251. n. 1. emac. 318. n. 1. Raii hist. 204. *B. communis alba*. Park. par. 489. 1. *B. alba vel pallescens, que cicla offic.* Bauh. pin. 118. and *B. communis viridis ejusd.* “Flowers three-fold; leaflets of the calyx unarmed at the base.” The root of this sort seldom grows larger than a man's thumb; the stalks grow erect, and have oblong, spear-shaped leaves growing close to the stalk; the spikes of flowers are axillary, long, and have narrow leaves placed between the flowers; the lower leaves are thick and succulent, and their footstalks broad; and for the sake of these it is cultivated. A large variety of this has been lately introduced from abroad, under the titles of “*Racine de disette*,” “*Root of Scarcity*,” and “*Mangel Wurzel*.” The ancients called the white beet *Cicla*, or rather *Sicla*, by contraction from *Sicula*, Sicilian beet; as we call the Savoy-cabbage, *Savoys*. Mr. Miller mentions three varieties of this, viz. the white, the green, and the Swiss or chard beet; by the last of which he probably intended the same as the modern “*Mangel Wurzel*.” He says that they vary from one to another in culture, but that they never alter to the first or the third. 3. *B. maritima*, sea-beet. Lin. spec. 322. sylf. 262. Reich. 623. Hudf. 108. Wither. 277. Eng. Bot. t. 285. Smith. Flor. Brit. 115. *B. sylvestris maritima*. Bauh. pin. 118. Park. theatr. 750. 2. Raii syn. 157. hist. 204. Ger. emac. 318. 2. Sea-Beet. Pet. H. Brit. t. 8. f. 9. “Flowers double or twin; stalks decumbent; leaflets of the calyx even, not toothed.” It differs from the others, according to Linnæus, in flowering the first year; in having oblique or vertical leaves; and in the leaflets of the calyx being equal, not toothed; accord-

ing to Ray, in having a perennial root. This is probably the original parent of all the garden beets. A native of Holland and Great Britain, on the sea-coast, and in salt marshes: it is also found plentifully about Nottingham. It is perennial, and flowers in August. 4. *B. patula*, spreading beet. Ait. hort. kew. i. 315. "Flowers heaped; all the leaves linear-lanceolate; branches divaricated. "Stem short, hardly a foot high, very branching; branches long, divaricate; calycine leathers at the base, but not toothed." Flowers in August. A native of the island of Madeira. Introduced in 1788. Martyn.

BETA, in *Gardening*, comprehends several different useful esculent roots and culinary herbs of the hardy kind, as the *B. cicla*, or common culinary beet, which has a small, oblong, white root, producing from its crown many large, oblong, succulent leaves, on broad footstalks, and erect branching feed; stems two or three feet high, garnished with close-setting leaves, and long spikes of greenish flowers, which are succeeded by plenty of ripe seed in autumn. The varieties of which are the *common green-leaved beet*; *large white beet*; *chard*, or *great Swiss beet*, having very broad leaves, with thick foot-stalks and ribs. These often vary from one to the other, the seed of one frequently producing some of each sort, though by proper care in sowing it, the difference may be preserved.

The *B. major*, or *great German beet*, commonly called *mangel wurzel*, has a large, long, reddish, or sometimes whitish red root; and very large, oblong, thick, succulent leaves. The varieties of which are—the *dark-green leaved*—*light green-leaved*—*red-veined leaved*. This species has been very much recommended, on account of its vast growth and great utility both in its root and leaves; experience has, however, shewn the former to have little claim to esteem for domestic uses, as it is of an insipid and unpalatable taste; but the leaves being large and succulent, are good to use occasionally, in the manner of common beet, and particularly to boil as spinach, or put into soups; and the stalks and midrib of the leaf to be stewed and eaten as asparagus. Dr. Lettson, who took much pains to introduce the mangel wurzel, informs us, that on his own land, which was not favourable to its growth, the roots, upon an average, weighed full ten pounds; and if the leaves were calculated at half that weight, the whole product would be fifteen pounds of nutritious aliment, upon every square of 18 inches.

The *B. rubra*, or *red beet*, has a large, red, eatable root, crowned by many large, oblong, reddish-dark-purple leaves; and when it shoots, sends up erect stalks and branches, terminated by long spikes, of flowers and seed. The varieties of which are *common red beet*, with a large, longish, dark-red root; *turnep-rooted red beet*, with a short, large, dark-red root; with a red root and green leaves; with a yellow root; but the first of these varieties is mostly preferred for general culture, though the second is equally good, but the root is not of so good a shape as that of the former; the other two are not proper to cultivate for a crop.

Methods of Culture of the common Beet. All the varieties are propagated by seed sown annually in the spring, in February, March, or April, in the place where the plants are to remain, in order to attain proper growth for use in summer and autumn. They will continue till spring, when they shoot for seed. If the sowing be neglected in the spring, some seed may occasionally be sown in summer, any time till the beginning of August, in a moist situation, but the spring is the most eligible season for obtaining a good crop. They may be sown in any common soil, allowing each sort a

separate plat or bed. The ground should be dug one spat-deep in the usual way; the seed then either sown broadcast on the surface, and raked in; or, as it is a large seed, shallow drills may be drawn, at the distance of six inches for the common green and white varieties, but almost double that for the large white and chard beet, sowing the seeds thickly, and raking the earth over them, about an inch deep; then trimming the surface smooth. The plants come up in about a month, and when they have leaves an inch or two broad, they should be hoed, to thin and destroy weeds, cutting out the common green and white sorts to about six inches distance; but the chard beet should be allowed ten or twelve inches room every way, that their large succulent leaves may have full scope to spread. They are commonly in perfection in June and July, and it is necessary to observe, in gathering them, to take the large outward leaves, the others coming in for use in their turn, an abundant successive supply rising from the root. A succession crop must be raised every year from seed in the spring, &c. for although the same crop might be occasionally continued two years, by cutting down the seed-stems of the year-old plants, according as they advance in spring and summer; the roots abiding, produce a supply of leaves, but which are much inferior in substance to those of the annually-raised seedling plants; it is better, therefore, to sow every year, in order to have a good production. The large white and great chard beet are in much esteem, for the stalks and ribs of the large leaves, being divided of the leafy part and peeled, are great improvers of soup, and useful also for stewing, and to be dressed and eaten like asparagus, and the leaves themselves are fine pot-herbs; for all which uses, the several varieties of this species may, as has been seen, be obtained almost the year round.

The Mangel Wurzel Beet. This sort has generally been reckoned a variety of the *B. cicla*; but some botanists have made it a distinct species, under the title of *B. altissima*. It is raised from seed sown annually in the spring, the same as the other sorts, in any open situation, but should generally be sown thinner, either in drills one or two feet asunder, or broadcast on the general surface, and raked in; and when the plants are come up one, two, or three inches in growth, they should be thinned to a proportionable distance, to give room for the full expansion of their large leaves. Some, however, advise transplanting, when the young plants are of two or three inches in growth, setting them in rows one or two feet asunder; this seems, however, unnecessary; especially, as they have long, downright, tap roots, which generally are the most successful when they remain where sown; the method may, nevertheless, be practised occasionally by way of experiment. The plants generally continue to produce leaves the greatest part of the year, and the roots attain perfection for use in autumn and winter, till spring; but when it is required to have a principal crop of full-sized roots, some should be allotted for that purpose, without cutting or gathering the leaves. This sort is valued most generally for its leaves, for which it principally merits culture in the gardens; as we cannot much recommend the root, which, although it grows very large, sometimes of several pound weight, is greatly inferior in use, both to the red beet, and that of most others of our esculent roots, for any domestic purpose. It is sometimes dressed in the manner of carrots, and parsneps, &c. sliced, and kersed up with butter, but is generally of a mawkish, unpalatable relish.

The leaves, however, which, if the plants have large scope of room, grow twelve or fifteen inches broad or more, and of proportionable length, are exceedingly good, when young, to use as the common white and green beet; and the young, thick, fleshy stalks, divided of the leafy part, peeled or

scraped, then boiled and served up with butter, are tender and agreeably tasted; also the leaves to boil occasionally as spinach and other small greens; and of which the root is remarkably productive in quick growth, to afford frequent successive gatherings all summer and autumn, either cutting them off close, or gathering only the larger outward ones, as in either method they soon shoot up again in plentiful succession.

The Red Beet. This is raised from seed sown annually in March or April, in the place where the plants are to remain, being careful to procure that of the best dark red sort. It should be allowed a light, rich, deep soil, in an open exposure. The market gardeners often sow this sort thinly among their crops of onions, carrots, &c. that are to be drawn off while young; so that when these are gone, the beet commences a full crop.

It is, however, a better practice to sow the principal crop separate. The ground should be dug one spade deep at least, and well broken, the seed sown directly, which may either be broad-cast on the surface, or raked well into the ground; or, as observed of the first sort, in drills drawn an inch deep, and at the distance of ten or twelve inches; or you may dot or prick it, as is often practised, with a blunt dibber, in lines at the above distance, making the holes an inch deep, and eight or ten asunder in the rows, dropping two or three seeds in each hole, though only one good plant should be left in each place. In May or June, when the plants have leaves an inch or two broad, they require thinning and cleaning from weeds, which may be performed either by hand-weeding or small hoeing; the latter is the most expeditious for large crops, and it loosens the surface of the earth, to the great advantage of the young plants; carefully eradicate all weeds, and thin the plants to ten or twelve inches distance. Some of the roots will be fit to take up for use about the end of August, though they will not attain full perfection until October. In November, a quantity of the roots should be taken up, their tops trimmed off, not too close, and then laid in sand or dry earth, under shelter, to be ready for winter use.

This sort of beet is highly valued for its large red root, which in the common variety, often grows twelve or fifteen inches long, and three or four inches thick or more; but that of the turnep-rooted sort is much shorter, and generally thicker, and of equal goodness in every respect for use; and in both of which, those that are of the largest growth and darkest red colour, are the most valuable: these roots being tender, sweet, and palatable, are boiled, sliced, and eaten cold, &c. are also sliced and scraped in sallads, both as an eatable ingredient, and by way of garnish; slices of the root are also in request not only as garnish to dishes, but as a pickle: the other varieties are never cultivated for any principal crop.

Saving of Seed. In order to save seed from any of the varieties, either mark some of the best plants in spring, to be left to run up, or transplant some of them in February or March into a convenient place, to have shelter from winds; they shoot up stalks in May; in June they must be supported with stakes; and the seed will ripen in September.

That a great quantity of sugar might be obtained from white beet, has been long known. The famous chemist Margraaf made some experiments, half a century ago (published in the year 1747) for determining the quantity of sugar contained in various European plants. He found that the white beet produced a much greater quantity than any of the other plants. The beet has of late been much cultivated, particularly in Germany, with a view to the sugar that is obtained from the root. M. Achard of Berlin, first in-

roduced this subject into general notice, and recommended that the sugar should be procured by boiling the beet-roots, when taken out of the earth; that they be sliced when cold; that afterwards the saccharine juice be pressed out; and that it be filtered, evaporated, and, after evaporation, the sugar be procured by crystallization and pressure. He has published his method at full length, in "Ausführliche Beschreibung," Berlin 1799. 8vo. He lays much stress on the mode of culture, and observes, that crude sugar can be produced at about three-pence a pound. His peculiar mode of culture consists chiefly in planting the seeds at a certain distance from each other, and in not transplanting the roots. M. Achard reckons three varieties of the beet-root; but he prefers that which has the skin of a reddish colour, and the flesh white. The kinds of beets which have been used for this purpose, are varieties of the *B. vulgaris*. Mr. John Taylor of Leipsig has given a particular account of the method of cultivating the common beet, and of preparing sugar from its root, in a letter addressed to his father, the secretary of the society for the Encouragement of Arts, &c. and published in the 18th volume of their Transactions. He observes, that the soil should be a good black earth, not too moist; and that it should be prepared, like that designed for cabbages, by dunging it in autumn with short rotten dung, and ploughing it, and by turning it again in spring, and ploughing it a third time to a greater depth than before. After the third ploughing, says M. Achard, it should be carefully harrowed, to render it smooth and even, and to brake all the lumps of earth which may happen to be in it. The seeds are usually placed at the distance of from 12 to 18 inches from one another, from 9 to 12 inches according to M. Achard, and at the depth of one inch in the earth. One seed is laid in each hole, and immediately covered with earth. In four or five weeks time the ground must be weeded, and afterward shod. Some prefer transplanting the roots, to sowing the seed in the ground where the plants are intended to remain. M. Achard forbids all transplanting; and one of his reasons for this prohibition is, that the lower part or points of the roots are liable to be thus broken off, which part, he says, gives more sugar than the upper part. After they have been some time in the ground, the earth should be loosened with a hoe, and the weeds destroyed. The method invented by professor Gottling for separating the sugar from the beet-roots, is easily practicable, and adapted to this country. It is as follows:—He recommends the taking of the beet-roots out of the ground from the middle of September to the middle of October, that the weather may be favourable for drying them, which should be done carefully, lest, as M. Achard observes, they should be damaged, and any of the juice which oozes out be lost; and washing them as speedily as possible from the earth that adheres to them, and cutting off their small fibres as well as such part of the root as had arisen, whilst they were growing, above the surface of the earth. The roots are afterwards wiped with a cloth, and laid upon a dry floor; the heads are cut off and given to the cattle; and the roots are sliced lengthways, along the middle, each half being cut again into slices, and loosely hung, not too near each other, lest they should spoil, on strong thread, suspended on nails, in an airy chamber or place secure from the rain. In the course of two or three weeks, with proper attention, they will be sufficiently dry for the extraction of their sugar. If the drying season is far advanced, or a frost expected, the beet-roots should not be exposed to the outward air; they should be dried in the kitchen or warm rooms, either on strings or netted frames, resembling the flakes used in Yorkshire for drying oat-cakes; or they may be dried in stove-rooms by artificial

artificial heat, taking care to prevent their being smoked or burnt. If an opportunity does not occur for slicing the roots immediately after being taken out of the earth, they should be placed in cellars, and covered with straw, or put into holes in dry sandy earth, and preserved till they are wanted.

M. Achard says, that after the roots are washed and cleaned, they should be sliced by means of a machine, or ground in a sort of mill, consisting of a cylinder furnished with points, like a rasp, which turns round in a box. The roots are put in this box, and pressed, by means of a weight against the cylinder, which, upon being turned round, soon reduces them to a kind of pulp. When the beet-roots are dry, they are ready for the extraction of their sugar. For this purpose, three wooden tubs, wide, but not deep, made of oak, ash, or willow, should be provided, or, for family use, earthen mugs. Near the bottom of the tubs, cocks or spigots should be fixed, and the tubs should be placed in a cool situation of about 52° of Fahrenheit, upon a stillage near each other, and at such a height from the ground that smaller vessels may stand below them for receiving the liquor when drawn off, and clear water should be at hand so as to be pumped into the higher vessels. When the beet-roots, thoroughly dried, have been sifted, so as to be free from the dust and loose fibres, one of the higher tubs should be half filled with them, and clear cold water poured upon them, about one-third in height above the roots. In this state they should remain for about three hours, stirring them at different times with a wooden paddle. At the end of this time, the same number of clean dried roots should be put into the second tub; and the sweet liquor drawn from the first tub into the vessel under it, should be poured upon the roots in the second; and the first tub should be supplied with fresh water in such quantity as just to cover the roots, and the tubs should remain three hours more, and the roots be repeatedly stirred, as before. The liquor which had been poured from the first tub to the second, will be now much absorbed by the roots in the latter tub. After standing again for three hours, the sweet liquor from the second tub must be drawn off, which, if the roots were of the red and white sort, will be of an agreeable red colour. It must then be passed through a sieve, or filtered through a flannel, and thus be rendered fit for boiling down for sugar. After this, draw the liquor from the first tub, pour it on the second, and put into the first tub more fresh water, and let it stand three hours longer. Then put into the third tub the usual quantity of dry roots, and pour on them the liquor drawn from the second tub; remove the liquor from the first to the second; and the roots in the first tub being now deprived of their saccharine matter, may be used for feeding hogs or cattle. After three hours more, the liquor should be drawn from the third tub and filtered as before, and then boiled down for sugar. Then draw off the liquor of the second vessel, and pour it into the third; add fresh water to the second vessel, and let it remain three hours more, the roots being occasionally stirred. During this time cleanse out the first tub, and add fresh roots, as before. After three hours, draw the liquor from the third tub, and pour it upon the fresh roots in the first; then draw the liquor from the second tub, and pour it on the third. The roots of the second tub will be now exhausted, and may be given to the cattle. After three hours draw off the liquor from the first tub, filter it, and it will be ready for boiling down. On the contents of the first, pour the liquor of the third, and put fresh water in the third tub; let it remain three hours, and stirred as usual; during which time cleanse out the second tub, and let the roots be given to the cattle. In

the second tub place again fresh roots; and proceed by extracting the saccharine matter, as before; and continue the operation, till all the dried roots have been thus freed from their sugar. By this management, the liquor becomes more charged with saccharine matter, than when the juice is pressed out of the roots, and a considerable quantity of fuel is spared. The roots from which the liquor has been extracted will have swelled much in the operation, and have lost their sweetness: their farinaceous residuum will, however, afford good food for cattle. Whenever there is a sufficient quantity of dried roots ready, the process of extracting the saccharine liquor should be continued day and night, as it is not proper to let the liquor remain longer than three, or at most four hours, before you boil it, lest a dissolution of the mucilaginous particles of the roots should take place. If it be not convenient to boil down all the saccharine liquor at once to a state of crystallization, yet it should be daily boiled down to the consistence of a syrup, in order to prevent its fermentation. In boiling the liquor, the scum that arises should be carefully taken off.

The process of boiling, crystallizing, &c. the beet sugars is as follows. First boil the extracted saccharine liquors down to the consistence of a syrup; then put it into a copper, of which one-third at least is empty, and let it boil away by a moderate fire, until a phial, which holds one ounce of water, will contain eleven drams of the syrup, or until the syrup pours somewhat broad from the ladle. The scum or froth should be taken off as it arises. When the syrup is arrived at the state above mentioned, by gentle boiling, the fire must be removed from underneath the copper, and the syrup gradually run through a clean woollen cloth, placed over a wooden or stone vessel. The syrup must not cool too much before this filtration, or else it becomes ropy. When the filtered syrup is somewhat cool, it should be laded into shallow wooden or stone vessels, to crystallize; for this purpose, shallow earthen vessels, such as are used to produce cream, or vessels made of tin, are proper. These vessels, filled with syrup, must be placed in a room heated to about 68° of Fahrenheit, and care must be taken to keep them free from flies and dust. If the syrup has been of a proper consistence, crystals will soon begin to form at the bottom of the vessels; and in an interval of 18 or 21 days the crystallization will be completed. The mass must then be put into a strong linen sack, well secured, and placed under a press, to squeeze out the liquid from the sugar which remains in the bag. The liquid matter may be set to crystallize a second or third time, and will yield sugar of a coarser quality. A cheese-press, or long lever, will serve for the purpose of pressure. The sugar first obtained, may be rendered purer by mixing with it a small quantity of clear spring water, and placing it again under the press; the coloured syrup will then run out, and leave the sugar in the bag in a much purer state than before. By repeating the operation, it is so far improved, that, when dried and rubbed, it becomes a fine white powder sugar. The separated syrups should be again carefully boiled, and more sugar will be obtained from them by crystallization. If the sugar procured by the first pressure be dissolved in as much clear water as will form a syrup, and placed again in a warm room to crystallize, it will yield a much purer and harder sugar: the syrup may then be separated without pressure from the sugar, merely by inclining the vessel, and allowing the syrup to run off from the crystals. All the syrups thus prepared, are fit for family use, and are much superior in taste to those prepared from the pressure of the raw or boiled roots. The remaining thick syrups may be used as treacle or molasses, and will serve to distil forrum or spirits. From the experiments

of professor Lampadius of Freyberg, near Dresden, it appears, that beet-roots contain water, fibrous matter, sugar, mucilage, glair, starch, colouring matter, scented matter, and a bitter substance. The water is in the proportion of from one-half to two-thirds of the weight of the roots; the fibrous matter of the roots differs, and it is considerably more in poor than in rich land; the saccharine particles vary from two to five per cent.; the mucilage is from three to five per cent.; and the glair, or matter resembling white of egg, is about one per cent.; the starch is in very small quantity, being only about two or three ounces in a hundred weight; the colouring matter undergoes several changes by exposure to the air, as yellowish, brown, and red, and may be precipitated by acetite of lead; the scented matter is volatile, rising in distillation of the root with water, combining closely with spirits of wine, and occasioning a peculiar contraction in the organs of taste. By boiling the beet roots, the smell and taste are very much lessened. The bitter substance is soluble in water, and remains behind in the first syrup after the crystallization of the sugar. From other experiments of the same professor, it appears, that 110 lbs. of beet-roots, the beta cicla of Linnaeus, or white English beet, washed, peeled, cleaned, and then grated, gave a mass which weighed 87 pounds; out of which were pressed $41\frac{1}{2}$ pounds of juice, which was boiled with $20\frac{1}{2}$ ounces of charcoal powder. This, when filtered and evaporated down until crystallized, produced full five pounds of a brownish yellow-grained sugar, and also five ounces of brown syrup. The above brown sugar, after being dissolved in six pounds of lime-water, mixed with one pound of blood, then boiled, filtered, and afterwards evaporated, yielded four pounds $5\frac{1}{2}$ ounces of purified brown sugar, and $6\frac{1}{2}$ ounces of syrup. The four pounds $5\frac{1}{2}$ ounces of sugar, thus prepared, were again dissolved in six pounds of lime-water, mixed with one pound of milk, and then boiled for a quarter of an hour; during the boiling, a small quantity of white wine vinegar, and a little more milk, were added; the saccharine matter was filtered, and treated as before; the product was four pounds of well-grained white powder sugar. The residuum after pressure, the brown syrups of the two first processes, and the remains of the filtrations, weighed, when collected, 40 pounds; they were mixed with one quart of yeast, and 80 quarts of water, heated to 112° of Fahrenheit's, and after fermenting 48 hours, were distilled. They furnished, at the first distillation, 15 quarts of weak spirit, which, on a second distillation, gave eight quarts of a better; from which, when rectified, were produced $3\frac{1}{2}$ quarts of spirits resembling rum. From the result of this series of experiments it appeared, that after paying the farmer for the roots, and discharging all incidental expences whatever, a profit was yielded of nearly cent. per cent. on valuing the four pounds of white powder sugar at one shilling per pound, and the three quarts and a half of rum at one shilling per quart. The produce of beet-roots and their quality for yielding sugar, have, however, been variable; and of course the profit accruing from them. From M. Achard's account we learn, that 24 measures of roots, each of which weighs about 90 pounds, (in all 2160 pounds) and costs about 6d. English, produce 100 pounds of raw sugar; that is, 20 pounds of roots produce nearly one pound of sugar. One hundred pounds of raw sugar give 55 pounds of refined sugar, and 25 pounds of molasses. Another statement informs us, that 14 pounds of raw sugar gave $1\frac{3}{4}$ pound of lump-sugar, $1\frac{1}{2}$ pound of white powder sugar, and $1\frac{1}{2}$ of darker-coloured powder sugar, and eight pounds of brown syrup; from which more sugar might have been obtained. It is computed, in M. Achard's account, that a German square mile of land, (that is, 16

square miles, English), properly cultivated, would produce white beet sufficient to furnish the whole Prussian dominions with sugar.

BELANCOS, BETANZOS, or BITANZE, in *Geography*, a town of Spain, in Galicia, $\frac{3}{4}$ leagues from Coruna, 9 from Compostella, and 7 from Ferrol. It has a good harbour in the mouth of the river Mandeo. N. lat. $43^{\circ} 15'$. W. long. $7^{\circ} 55'$.

BETEL, in *Botany*, an Indian plant, in great use and esteem throughout the East, where it makes a considerable article of commerce. See PIPER.

The betel bears some resemblance to the pepper-tree. It grows like ivy, and twists round other trees. Its leaves are long and sharp-pointed, but broad towards the stalk, and of a pale green colour. They are like those of ivy, only softer, and full of red juice, which, among the Orientals, is reputed of wonderful virtue for fortifying the teeth, and rendering the breath sweet. The Indians are continually chewing these leaves, which renders their lips so red, and teeth black, a colour by them vastly preferred to the whiteness affected by the Europeans.

The consumption of betel leaves is incredible; no body, rich or poor, being without their box of betel, which they present to each other by way of civility, as we do snuff. In many places they chew the areca nut, either alone or mixt with the betel leaf and lime, and the leaves of this plant are sometimes chewed alone; but they are too sharp, and usually injure the teeth, and it is not uncommon to find men of 25 wholly toothless in this part of the world, merely from their having chewed this plant to an excessive degree. The prepared betel is a very common present among the poorer sort; and on taking leave of a friend, it is always the custom to make him a present of a purse of the leaves prepared for use. When the poorer sort are to appear before the rich, they always chew a large quantity of betel to give them a sweet breath; and the women, on certain occasions, never fail to take largely of it as a provocative. On all visits, the company is regaled with prepared betel. The principal time of using it is after dinner, at which time, they say, it prevents sickness at the stomach; and they never abstain from it, except on the solemn occasions of the funerals of their relations, and their days of fasting. Moderately used, it is said to strengthen the gums, corroborate the heart and stomach, discuss flatulencies, purge both the stomach and brain, and prevent the scurvy. If chewed after breakfast it makes the breath sweet for the whole day. The Portuguese women are as fond of the betel as the Indians themselves, and cannot live a day without it. It is said, however, that few Europeans can accustom themselves to the use of it. On many occasions it produces sickness, and sometimes intoxication, of no long continuance. The Chinese also use the leaves of betel, covered with quicklime, and wrapped round the nut areca, which in shape much resembles a nutmeg. They chew these leaves continually, and pretend that they strengthen the gums, comfort the brain, expel bile, nourish the glands of the throat, and serve as a preservative against the asthma; a disease which, from the heat of the climate, is very common in the southern provinces. They carry betel and areca (see ARECA) in boxes, and present it when they meet one another.

BETELGEULE, or BEDELGAEZF, in *Astronomy*, a fixed star of the first magnitude in Orion's hind shoulder.

BETESKOE, in *Geography*, a town of Siberia, on the west side of the Irtysh, 230 miles S.E. of Tobolsk.

BETH, in *Literary History*, makes the title of a multitude of books in the Hebrew language; *e. gr.* "beth avoth," or, the house of the fathers; "beth Elohim," or, the house of God; "beth Israel," or, the house of Israel, &c.

BETHABARA, *i. e.* the *House of Passage*, in *Ancient Geography*, is supposed by many to be the place at which men passed over Jordan, over against Jericho, at the common ford of this river where the Israelites passed it under Joshua. Ch. iii. 16. Lightfoot refers it to the passage at Scythopolis, out of the precincts of Judæa, where the Jews dwelt among the Syro-Grecians, over against Galilee. Cellarius places it between these two, observing that there were many passages over Jordan. At this place, beyond Jordan, John is said to have baptized. Chap. i. 28. Origen found, as he tells us, in almost all his MSS., or, if we may judge from what follows, in every one of them, without exception, this verse thus written, "These things were done in Bethany beyond Jordan, where John was baptizing." But he rejects this reading for the following reason: "As I have been in that country, in order to trace the footsteps of Christ and his apostles, I am persuaded that we ought not to read Bethany in this passage, but Bethabara. For Bethany, as the evangelist himself relates, was the birth-place of Lazarus, Martha, and Mary, and only 15 stadia from Jerusalem; but the Jordan was at least, to speak in round numbers, 190 stadia from that city. Nor is there any city whatsoever of the name of Bethany near to that river. But there is a city of the name of Bethabara on the banks of the Jordan, where, it is said, John baptized." To this alteration it has been objected, that Origen grounds the reading, which he has substituted for Bethany, on no other authority than the relation of such persons as conduct travellers to the places in Palestine, which are mentioned in the sacred writings. These persons either had no inclination to conduct Origen to the Bethany, which lay on the other side of the Jordan, as the journey might have been attended with danger, on account of the tribes of wandering Arabs, who infest that country; or they were wholly ignorant of the place. Not to lose, therefore, their profits arising from conducting strangers, they shewed Bethabara to Origen, as the place where John baptized, and the learned father was credulous enough to believe them. Besides, if the text itself be examined, Origen's objections to the common reading will vanish. He says, that Bethany lay near to Jerusalem, and therefore at a distance from the Jordan. But it may be asked, whether there was not more than one city of that name, and whether we must necessarily suppose, that the city in question was the place where Lazarus resided. It appears, even from the expression used by St. John, that, whether we read Bethany, or Bethabara, there was more than one city of the name, which he mentioned. St. John mentions a circumstance by way of distinguishing it, and when he speaks of Bethany beyond Jordan, we are led to suppose, that there were two cities of that name, and that the city which he meant was different from that which was situate on the mount of Olives. But Origen says, that there was no town of the name of Bethany on any part of the Jordan. To this it might be replied, that Origen hardly visited all the towns on the bank of the Jordan, as he probably took the route pointed out by his guides, or that the wars between the Jews and the Romans had so desolated, or altered the face of the country, that many towns might have existed in the time of John the Baptist, of which no traces remained in the days of Origen. But this mode of reply is needless, because the evangelist uses a very indeterminate expression, when he says, that the place, where John baptized, was on

the other side of the Jordan; an expression which by no means implies that the town lay on the banks of that river: for it might have been situated either on the Jabbok, or on some other stream considerably to the eastward, where John had a sufficient supply of water for the purpose of baptizing. The alteration, therefore, made by Origen, and which upon his authority, and that of Chryostom and Epiphanius, is introduced into our copies, was wholly without foundation. See Michaelis's *Introd. to the N. T.* by Marsh, vol. ii. p. 400.

BETHABARA, in *Geography*, the first settlement of the Moravians in America, in the lands of Wachovia, in North Carolina, begun in 1753, 6 miles N. of Salem, situate on the west side of Grassy creek, which unites with the Gargales, and several others, and falls into the Yaokin, and containing a church of the United Brethren, and about 50 dwelling houses.

BETH-ACHARA, or **BETH-HACCERIM**, (Jer. vi. 1.) *i. e.* *house of the vineyard*, a city seated on an eminence, between Jerusalem and Tekoa. See Nehem. iii. 14.

BETHAGLA, or **BETH-HAGLA**, a town of the tribe of Benjamin, (Josh. xviii. 21.) on the northern boundary of the tribe of Judah. In the time of Jerome and Eusebius there was a village in this situation of the name of Agla, distant 10 miles from Eleutheropolis, towards Gaza.

BETHA-GABRIS, now **BAIT-DJIBRIM**, a village of Syria, about $\frac{1}{2}$ of a league to the south of El-Tell; situated between Jerusalem and Ascalon.

BETH-ANATH, *House of a Song*, of an *Answer*, or of *Affidition*, a city of Naphtali. Josh. xix. 38.

BETHANO, **CAPE**, in *Geography*, lies on the coast of China, or Quinan, off which is Pulo, or Island Canton, which is about 9 or 10 miles from the coast. N. lat. 16°. E. long. 108° 30'.

BETHANY, in *Ancient Geography*, a village at the foot of the mount of Olives, east of Jerusalem, in the way to Jericho. It took its name from a part of ground so called from "Athene," which signifies the dates of palm-trees, which grew there plentifully. The town of Bethany, where Lazarus and his sisters dwelt (John xi. 1.) and where he was raised from the dead, was 15 furlongs, or about 2 miles distant from Jerusalem (John xi. 18.); but the district, or tract of ground, that bore that name, reached within 8 furlongs from Jerusalem, it being only a sabbath-day's journey from it (John xxiv. 50. Acts i. 12.); and then commenced the tract called "Bethphage," from the "phagi," *i. e.* the green figs which grow upon it, extending to near to Jerusalem, that the outermost street within the walls was called by that name. A charge of self-contradiction has been alleged against the evangelist Luke, from the passage above cited. In the Gospel he tells us, that Jesus ascended into heaven from Bethany, and in the Acts of the Apostles, of which he is the reputed author, he informs us, that he ascended from Mount Olivet. This charge is founded on an ignorance of ancient geography, or must proceed from an unwarrantable prejudice against Christianity; because Bethany, as we have above observed, was not only the name of a town, but of a district of Mount Olivet adjoining to the town. See **BETHABARA**.

BETHANY, or *Bethania*, in *Geography*, a Moravian settlement and post town of America, in the lands of Wachovia, in North Carolina, begun in 1760, 9 miles N.W. of Salem; containing about 60 houses and a church.

BETH-ARABAH, in *Ancient Geography*, a city of Judah (Josh. xv. 6.), afterwards given to Benjamin (Josh. xviii. 22.)

BETHARAMPITHA, a town of Galilee, on the right bank

bank of the Jordan, on the western side of the lake Gennesareth, at the influx of the Jordan into that lake. Lightfoot places it on the left bank of the Jordan in Perea. It was fortified and ornamented by Herod the tetrarch, and called "Julias," in honour of Julia, the daughter of Augustus, and wife of Tiberius. See BETHSAIDA.

BETHARAN, or BETHARA, a town of the Peræa beyond Jordan, called also by the Syrians "Betharamphtha," and by Herod "Libias," or "Livias," in honour of Livia, the wife of Augustus. Josephus calls it Julias, and confounds it with the Betharamphtha of the preceding article: but it lay more to the south, nearly, according to Ptolemy, in the same latitude with Jerusalem, in the vicinity of the Dead sea, and of the mountains Abarim, Nebo, and Pisgab, and of the city Heshbon.

BETHAVEN, *the House of Iniquity*, a name given to "Bethel," by way of derision, after the introduction of idolatry into it by Jeroboam. (Hosea iv. 15. x. 5.) Bethaven was also the name of a distinct town near Bethel, and south-east of it, belonging to the tribe of Benjamin. Josh. vii. 2. xviii. 12. 1 Sam. xiii. 5.

BETH-BASI, a city of Judah, fortified by the two Maccabees, Simon and Jonathan. 1 Maccab. ix. 62. 64.

BETH-DAGON, a city of Asher (Josh. xix. 27.)—Also, a city of Judah (Josh. xv. 51.) so called, because it had probably a temple of Dagon, before the Israelites took possession of it.

BETHEL, *the House of God*, a name given to that town, which was before called Luz, on account of Jacob's vision. (Gen. xxviii. 19.) They seem, however, to be distinguished in Joshua xvi. 2. though they were contiguous places; and the name Luz might probably be lost in that of Bethel. It was a city of Samaria, on the confines of the tribes of Benjamin and Ephraim. Eusebius says, that it was 12 miles from Jerusalem in the way to Sichem. It obtained among the prophets the name of Bethaven, on account of its idolatry.

The Mahometans believe their temple of Mecca to be founded on the stone, on which the patriarch Jacob slept at Bethel, and hold it in great veneration. Some have supposed that the superstitious respect manifested by the ancients to their Bætyli, or stones anointed and consecrated to great men, after their death, derived its origin from Jacob's pouring oil on the stone of Bethel. See BÆTYLOS.

BETHEL, in *Geography*, a small Moravian settlement in America, on the Swetara river, in Pennsylvania, 14 miles from Mount Joy.—A township in Dauphin county.—Also, a township in Windsor county, Vermont, containing 473 inhabitants, N.N.W. of, and bounded by Stockbridge, and about 67 miles N.N. easterly of Bennington. Hence rises a small branch of White-river.—Also, a township in Delaware county, Pennsylvania.

BETHENCOURT, JOHN DE, in *Biography*, a Norman baron, in the beginning of the 15th century, obtained a grant from Henry III. of Castile, of the Canary islands, erected into a kingdom in 1344, by pope Clement VI. Having visited these islands in 1402, Bethencourt returned to them, and by assistance from Henry, conquered them, held them under the title of king, as a fief of the crown of Castile, and transmitted the possession of them to his family for some generations. His posterity settled in Spain. Although his conquest of these islands was not complete, Bethencourt is reckoned the first Christian who subdued the Canary isles, which before his time had been occasionally visited by freebooters. Robertson's Hist. Amer. vol. i. p. 54.

BETHENCOURT, JAMES DE, physician at Rouen, where he practised with much reputation, towards the end of the 15th

and the beginning of the 16th centuries, is now only known by his treatise on the venereal disease, published in the year 1527, under the singular title of "Nova Penitentialis Quadragesima, nec non Purgatorium, in Morbum Gallicum, feu Venereum, una cum Dialogo aquæ argenti, et ligni guiaci luctantium super dicti morbi prelatura. Opus fructiferum." Paris, 8vo. By his penitence, he means the strict regimen enjoined those who underwent the guaiacum, or sweating process, for the cure of the lues, and by the purgatory, the pains and torments endured while under the salivation by mercury, for the same purpose. Though he treats of the method of curing by the guaiacum, as well as that of mercury, yet he manifestly gives the preference to the latter mode, which is laid down by him, Astruc says, in a more judicious manner, than it had been by any preceding writer. He says the disease was unknown to the ancients, and that it made its first appearance, or was first noticed in Europe, about the year 1495. He does not consider it as imported from America, or the West Indies, by the Spaniards, but as procured from causes similar to those that occasion the plague, and other infectious diseases. Astruc commends the work, but it has not obtained a place in Lufinus's collection of treatises on the complaint. Astruc de Morb. Gall. Haller. Bib. Med.

BETHENNABRIS, in *Ancient Geography*, a town of Peræa, into which the Jews, who fled from Gadara after it was taken by Vespasian, retired, and which was forced by the tribune Placidus, before his complete reduction of Peræa.

BETHER, MOUNTAINS OF, are mentioned in the Song of Solomon, ch. viii. 14. Some suppose Bether to be Bethoron, called Bether by Eusebius, and Bethara by Josephus. Bether was taken by the emperor Adrian, in the rebellion of Barchochebas. (See BARCHOCHÉBAS.) Others will have it to be Betharis, between Cæsarea and Diospolis; and others again Bether, mentioned in the LXX. (Jof. xv. 60.) among the cities of Judah. Calmet supposes it to be Upper Bethoron, or Bethora, between Diospolis and Cæsarea. Eusebius speaks of Betharim near Diospolis, and when he mentions Bether, which was taken by Adrian, he says, it was in the neighbourhood of Jerusalem. Ec. Hist. l. iv. c. 6.

BETHESDA, the name of a pool at Jerusalem, of which we have an account in the Gospel by St. John, ch. v. 1—7. It was called in the Greek *καλυμβήθρα προβατικῆς*, and in the vulgate "Piscina probatica," because, as some have supposed, the sheep of the sacrifices, called in Greek *προβατα*, were washed in it; or, according to others, because the blood of the sacrifices ran into it. But neither of these suppositions is satisfactorily proved. The sheep were probably washed as soon as they were bought in the adjoining market, from which they were driven into this pool, which always contained a sufficient quantity of water for this purpose. The latter supposition could not possibly have been realized; since, in that case, the blood must first have descended, and afterwards ascended to this pool, as there was a drain or ditch between the pool and the temple, and a bridge over it for passing into the temple. Hence Dr. Pococke, who adopted the idea of the blood's running into the pool, was obliged to seek for lower ground on the other side of the temple, and to place it in a situation where it did not exist, as any one may satisfy himself by adverting to the plan of the temple at Jerusalem. The situation of the sheep-gate, near which this pool, or bath, stood, was on the south-east wall of Jerusalem, and therefore a great part of the city lay between that and the temple, as the accurate Dr. Lightfoot has shewn in his "Harmony of the Evangelists," p. 666. The appellation "Bethesda" has therefore been erroneously derived from *בית השפון*, *domus effusionis*, the sink-house, or drain.

The

The etymology, therefore, of those who derive "Bethesda" from בֵּית הַמֵּרְיָה, the *house of mercy*, is much more just and appropriate; because it expressed the kind design with which this bath was contracted, and the salutary purposes to which it was applied. The history informs us, that this pool had five porches, porticoes, or cloysters, which might very reasonably have been the case, notwithstanding its oblong figure, one being on each hand of the entrance in the middle of one side, and three on the other sides. Dr. Lightfoot suggests, that the basin itself might be in the form of a pentagon, and that these cloysters might correspond to its five sides. Mr. Maundrell (*Journey*, p. 107.) who took a view of this pool, in 1696, informs us, that it is 120 paces long, 40 broad, and 8 deep; but without water; and that at the west end he found some old arches, then decayed up, which, though only three in number, were supposed to be the five porches, in which sat the lame, halt, and blind. This pool, he adds, is contiguous, on one side, to St. Stephen's gate, and on the other to the area of the temple. In these porticoes diseased and debilitated persons lay, "waiting for the moving of the water;" for at the time of a certain feast, which some have supposed to be the passover, and others the pentecost, or rather, according to the season, i. e. occasionally, at certain intervals of time, "an angel descended into the pool, and troubled the water; whosoever then first, after the troubling of the water, stepped in, was made whole of whatever disease he had." Some have supposed that the miraculous cure, recorded in this history, was restricted to the season of the particular feast mentioned in the first verse of the chapter; and thus they account for the silence of Philo and Josephus with regard to this miracle. But those, who imagine that these waters had a sanative quality on other occasions, think the silence of these Jewish writers to be of little importance; as they have omitted the mention of other more important occurrences in our Lord's history, which they had an opportunity of knowing; such as the variety and multitude of signal miracles which he performed in the course of his ministry. The majority of writers have regarded the cures wrought at this place as a standing miracle among the Jews, and yet they have been surprised that Josephus, in particular, should omit to mention a fact so honourable to his nation. Others have, therefore, conceived, that the miraculous healing quality of these waters was a peculiar honour conferred on the personal appearance of the Son of God upon earth. To this purpose Dr. Doddridge (in loc.) after Calvin, observes, that God, to add the greater lustre to his Son's miracles, as well as to shew that his ancient people were not entirely forgotten by him, had been pleased of late to perform some supernatural cures at this place. With respect to the descent of the angel into the pool, and the effect produced by his stirring the water, different hypotheses have been proposed. Grotius thinks, that the angel is said to have descended, not because he was ever seen to do so, but because the Jews were persuaded that God brought such things to pass by the ministrations of angels; so that from the violent motion of the water, and the effect produced by it, the presence of an angel was reasonably supposed. Dr. Hammond (in loc.) supposes, that the blood of the great number of sacrifices, washed in this pool, communicated a salutary efficacy to the water, upon its being stirred up by an angel, or messenger, deputed for this purpose by the high-priest; which hypothesis Dr. Doddridge represents to be a unphilosophical, as it is unsupported by history and antiquity. Mr. Fleming (*Christology*, vol. i. p. 13—15.) in order to avoid the apparent difficulties of the literal interpretation, rejects the latter part of the *third* and the whole of the *fourth* verse, as a spurious addition of some

ignorant monk in the 5th or 6th century; because that part is wanting in the Cambridge, or Beza's MS. and is written by a later hand in the margin of that in the French king's library, highly extolled by Lamy in his "Harmony." But this passage is found in all the other most celebrated MSS., in the Syriac version, and in the other versions of the Polyglott. Kuster's observations, relating to the genuineness of this text, in the preface to his edition of Mill's New Testament, deserve to be considered. But with regard to the subject in dispute, it should be recollected, that the *fourth* verse, which none question, implies, that the water, after being troubled, had a miraculous virtue, which extended only to the first that went in, and cured his disease, whatever might be its nature. Dr. Doddridge suggests the following solution of this difficulty; the greatest, as he acknowledges, that occurs in the history of the evangelists, and with respect to which none of the numerous writers who have replied to Mr. Woolston had given him satisfaction. He supposes this pool might be remarkable for some miserably attending the water; and this circumstance, together with its being so near the temple, where a bath was so much needed for religious purposes, may account for the stately cloysters erected around it. Some time before this passover, an extraordinary commotion had been probably observed in the water; and Providence so ordered it, that the next person who accidentally bathed here, being under some great disorder, experienced an immediate and unexpected cure. The like phenomenon, in some other desperate case, was probably observed in a second commotion. These commotions and cures might happen periodically, perhaps every sabbath, for some weeks or months. This the Jews would naturally ascribe to some angelic power, as they did afterwards the voice from heaven, (*John* xii. 29.) though no angel appeared. On account of their ingratitude to Christ for this miracle, and those wrought at the former passover, and in the intermediate space, this celestial visitant probably returned no more; and therefore, it may be observed, that though the evangelist speaks of the pool as still at Jerusalem, when he wrote, yet he mentions the descent of the angel, as a thing which had been, but not as still continuing. This may account for the silence of Josephus, who was not born when it happened; and who, if he heard the report of it, would oppose speculation and hypothesis to fact, and recur to some indigested and unmeaning harangues on the unknown force of imagination; or if he secretly suspected it to be true, his dread of the marvellous, and his fear of disgusting his Pagan readers with it, might as well lead him to suppress this, as to disguise the passage through the Red Sea, and the Divine Voice from mount Sinai, in so mean and foolish a manner, as it is known he does. Besides, the relation which this fact bore to the history of Jesus, would make him peculiarly cautious in treating upon it, as it would have been difficult to handle it at once with decency and safety. The ingenious and learned bishop Pearce, in his excellent "Vindication of Christ's Miracles," p. 68, &c. agrees with Dr. Doddridge in the most material circumstances of his hypothesis.

BETH-GANUL, the *house of the camel*, or of the *camel*, a city of the Moabites, in the tribe of Ruben. *Jer.* xlvi. 27.

BETH-JESHIMOTH, the *house of desolation*, or, of *desolation*, or, of *devotion*, a city of Reuben (*Josh.* xiii. 20.) afterwards possessed by the Moabites. *Ezek.* xxv. 9.

BETH-LEBAOTH, the *house of leprosy*, a city of Simeon, (*Josh.* xix. 6.) sometimes called *Lebath*. *John.* xv. 32.

BETHLEHEM, the *house of bread*, a city of Judah, (*Josh.* xvii. 7.) generally called "Bethlehem of Judah,"

BETHLEHEM.

to distinguish it from another of the same name in Zebulun. It is seated on the declivity of a hill, 6 miles south from Jerusalem, according to Eusebius and Jerom. It is likewise called "Ephrath," (Gen. xlviii. 7. Mic. v. 2.) This city was not very considerable either for its extent or riches; but it has acquired peculiar distinction on account of its having been the place of our Saviour's nativity. It was also the city of David's nativity. In and near this city travellers are shewn the place where our Saviour was born, which is said to have been a cave south of the city, and belonging to the inn, or caravanserai, whither Joseph and Mary retired. Jerom informs us, that Adrian, in order to erase the remembrance of the place where Christ was born, planted over the cave a grove of tall trees in honour of Adonis, so that when the festivals of this infamous deity were celebrated, the holy grotto echoed with the lamentations made in commemoration of Venus's lover. Here is also seen a large church built by St. Helena, in the form of a cross, and so lofty as to command an extensive prospect of the adjacent country. The roof is elevated, flat, and composed of cedar within, and leaded without. The nave is supported on both sides by two rows of marble pillars, each made of one piece, and 11 in a row, forming as it were five naves, separated from each other by those rows of pillars, on each of which is the picture of some saint. Over the pillars the wall is covered with mosaic work, on a gold ground. The marble which formerly overlaid the walls has been removed by the Turks for adorning their mosques. The three upper ends of the cross terminate in three semicircles, having in each an altar. Over the chancel is a stately cupola, covered on the outside with lead, and within adorned with mosaic work. Adjoining to the church is the monastery of the Franciscans. The gardens are defended with strong walls; and through the chapel is a passage to a square cave, in which they say the Innocents were buried. Beyond this are passages to the tombs of St. Jerom, St. Paula, and Eustochium, and of Eusebius of Cremona; and beyond these is a grotto or cell, called the school of St. Jerom, where he is said to have lodged when he translated the Bible. At the end of another vault or chapel, 12 feet wide and 40 long, whose floor is paved and sides lined with white marble, and roof adorned with mosaic work, now much decayed, is an arched cavity, with an altar, having over it the picture of the nativity, and under it a vault, in the middle of which is a star formed of many coloured stones, marking the place where they say our Saviour was born; and near this is the manger where they pretend he was laid, which is hewn out of a rock, and new flagged with white marble. See MOUNT CALVARY, and JERUSALEM.

Bethlehem is now called *Bait-el-labam*; which see. The country in which it is situated is happy with respect to soil, air, and water. With the latter it is supplied by a low aqueduct, or stone channel, which formerly passed to Jerusalem. The "fons signatus" is an exuberant spring: it is received successively by three large cisterns, one of which is well preserved. In coming from the cisterns, and at a small distance, is seen what is termed the "deliciæ Solomonis," a beautiful rivulet, which flows murmuring down the valley, and waters in its course some gardens of excellent soil. The brinks of this brook are adorned with a variety of herbage. The convent at this place contains, under the same roof, the different tenets of Latins, Armenians, and Greeks. Brown's *Travels in Africa*, &c. p. 363.

We shall here observe, that no inconsiderable pains and ingenuity have been exercised to reconcile the quotation of the evangelist Matthew, ch. ii. 6. relating to Bethlehem, with the original text of the prophet Micah, ch. v. 2. The dif-

ficulty may be obviated, says an ingenious writer, or at least the appearance of inconsistency removed, by a proper translation of the latter text. "*And thou, Bethlehem Ephrath, art little in being among the thousands of Judah; for out of thee will come forth unto me a ruler over Israel. That is, thou hast but little honour in being among the thousands of Judah, compared with that which will accrue to thee from giving birth to the Messiah.*" Thus the LXX seem to have understood it. Forms of speech similar to this, *ἑδραμὸς ἰλαχίστη*, by no means the least for the greatest, are not uncommon. (See Homer. *Il. A.* 277. Callim. *Hym. Di.* 33. *Hym. Ap.* 31. Eurip. *Androm.* 81, &c.) This mode of interpretation is confirmed by Lightfoot from the Chaldee paraphrast; and seems to be preferable to that of St. Jerom, or of Dr. Poocke. The former, who has been followed by some others, is of opinion, that Matthew produced the passage in Micah historically, not as it was written by the prophet, but as it had been proposed by the priests to Herod, so that they should be accused of false reading, if that were the case. The latter, in his notes on the *Porta Mosis* of Maimonides, thinks, that *יְעִי*, in Micah, rendered *little* in the English translation, has the contrary signification to its usual one of *mean* or *little*, viz. that of *noble* or *illustrious*, and for countenancing this conjecture he cites Jer. xlviii. 4. and the Chaldee paraphrase upon that passage. Grotius, Olearius, and others, have proposed that the Hebrew text and the Greek LXX version should be read and translated by way of interrogation. Heb. "*Art thou, Bethlehem Ephrath, the least among the thousands of Judah? No: out of thee shall he come forth to me, &c. i. e. I will raise up him, &c.* Greek LXX. *Art thou, Bethlehem, the house of Ephrath, the least to be among the thousands of Judah? No: out of thee, &c.*" The learned bishop Pearce has adopted this mode of translation; and in favour of it he urges, that the Hebrew word *יְעִי*, in Micah, rendered *little*, may be rendered *the least*, as it actually is in Judges, vi. 15. 1 Sam. ix. 21. Jerem. xlix. 26. and l. 45. He also observes, that both in the Hebrew and in the Greek of the O. and N. Test. it is not unusual for a sentence to be understood by way of interrogation, though there is no mark placed at the beginning of the sentence, used in either of the languages for a mark of interrogation. To this purpose he refers for the Hebrew to 2 Sam. xviii. 29. 1 Kings, xxi. 7. Job ii. 10. xli. 1. Zech. viii. 6. and for the Greek to 2 Sam. xviii. 29. Matt. xi. 3. Mark xiv. 61. He adds further, that when words are thus used interrogatively, there is often at the end of them an answer of *Yes*, or *No*, to be supplied in the sense, though it is not expressed in the words. This is very common with those who write in the Hebrew language, or with those, who, being Hebrews, write in Greek. In the N. T. the word, *No*, is to be supplied in 1 Cor. x. 19, 20. The same mode of speaking is found in 1 Cor. xii. 31. Acts viii. 31. and an instance, where *Yes* is to be supplied, is to be found in 1 Cor. ix. 20: From these remarks the learned prelate concludes, that, if this be the case, an interrogation with a *No* to be supplied as an answer to it, is the same as a negative not put in interrogation; or, in other words, to ask whether any thing is *the least*, and to answer *No*, as the Hebrew text and LXX version do, is the same as to affirm, that it is *not the least*, as Matthew does. Either of the above interpretations will effectually supersede the perplexity of St. Jerom, and the objections of Dr. Middleton, in his "*Works*," vol. ii. p. 59. See Wakefield's "*New Translation of the Gospel of St. Matthew*," p. 26. "*Pearce's Commentary*," vol. i. p. 10.

BETHLEHEM, a town of the tribe of Zebulun, (Josh. xix. 15.) of obscure and unknown situation.

BETHLEHEM,

BETHLEHEM, in *Geography*, a town of the Netherlands, in Brabant. N. lat. $51^{\circ} 2'$. E. long. $4^{\circ} 40'$.

BETHLEHEM. See **BELEM**.

BETHLEHEM, a town of America, in Albany county, New York, fruitful in pastures, and affording large quantities of excellent butter. By the late census of 1796, 388 of the inhabitants are electors.—Also, a township in Berkshire county, Massachusetts, containing 261 inhabitants. It lies about 10 miles S. of E. from Stockbridge, and 130 from Boston, and borders on the Tyringham and Loudon.—Also, a township in Hunterdon county, New Jersey, situate at the head of the south branch of Rariton river, and containing 1335 inhabitants, including 31 slaves.—Also, a township in Litchfield county, Connecticut, joining Litchfield county on the north, and Woodbury on the south.—Also, a post town in Northampton county, Pennsylvania, which is a celebrated settlement of the United Brethren of the Protestant episcopal church, as they term themselves. It is situate on Lehigh river, a western branch of the Delaware, 53 miles northerly from Philadelphia, and 18 southerly from the Wind Gap. The town stands partly on the lower banks of the Manakes, a fine creek, which affords trout, and other fish, in a healthful and pleasant situation, and in summer is much frequented by gentry from different parts. In 1787, there were 60 dwelling-houses of stone, well built, and 600 inhabitants. Besides the meeting-house, this place has three other public buildings, which are spacious; one for the single brethren, one for the single sisters, and the other for the widows. In a house adjoining the church is a school for females, and since 1787, a boarding-school for young ladies, under the direction of the minister of the place, who also superintends the boys' school, kept in a separate house. Both these schools are in high repute, and much frequented. At the lower part of the town there is an hydraulic machine of simple construction, that raises the water from a spring to a reservoir, at the height of 100 feet, whence it is conducted by pipes into the several streets of the town. In this town are also a store, with a general assortment of goods, a large tan-yard, a grist-mill, a fulling-mill, an oil-mill, and a saw-mill, and on the banks of the Lehigh, a brewery. N. lat. $40^{\circ} 37'$. W. long. $75^{\circ} 14'$.

BETHLEHEM, *Star of*, in *Botany*. See **ORNITHOGALUM**.

BETHLEHEMITES, or **BETHLEMITES**, in *Church History*, a sort of monks introduced into England in the year 1257, habited like the Dominicans, except that, on their breast, they wore a star with five rays, in memory of the star or comet which appeared over Bethlehem at the nativity of our Saviour. They were celled at Cambridge, and had only one house in England.
