There is also an order of Bethlehemites still subsisting in Peru, who have convents at Lima; one called of the incurables, the other of our Lady of mount Carmel. These Bethlehemites came originally from the city of Guatimala in Mexico, where they were instituted by the venerable Peter Joseph of Betanear, a native of the town of Chafna, or Villa Fuerte, on the island of Teneriff, in 1626, for the service of the poor. After his death, which happened in 1667, his congregation was approved of by a bull of Clement X. in 1672, and in 1674. Innocent XI. in 1687, created it into a community of regulars. Before this time it had passed from Guatimala to Mexico, and from thence, in 1671, to Lima. In the city of St. Miguel de Piura, they took possession of the hospital of St. Ann, in 1678, and of that of St. Sebastian, in Truxillo, in 1680. Their probity and diligence in discharging these trusts induced other places to select them as directors of their hospitals, and among the rest, the city of Quito. The fathers of their order go bare-footed,

and wear a habit of dark brown colour, nearly resembling that of the capuchins, whose order they also imitate, in not shaving their beards. On one side of their cloak is an image of our Lady of Bethlehem. Every sixth year they meet to choose a general, which ceremony is performed alternately at Mexico and Lima.

The Bethlehemites, though outwardly of great simplicity, pass for the most refined politicians; in so much as to be called the quintessence of the Carmelites and Jesuits. They are all friars. For their almoner they choose a secular priest, whom they hire, and who has no vote in the chapter.

BETHLEM, GABOR, in *Biography*, prince of Transylvania, was a descendant of a family of rank, but very small property, and attached to the reformed religion. By his valour he obtained the favour of Gabriel Battori; but having ingratiated himself with the Porte, in a visit to Constantinople, he obtained a force which enabled him to expel Battori, and to establish himself as prince or waiwode, in 1613. He was afterwards led by ambition to extend his dominions, and under the advantage of an alliance with Frederic, the elector palatine, and newly declared king of Bohemia, he made an irruption into Upper Hungary, in 1619. Having reduced this country, he received the submission of Lower Hungary, and in his march towards Vienna he took Presburg, and was acknowledged prince of Hungary. The assistance which was afforded him by the oppressed protestants, induced him to establish liberty of conscience throughout Hungary. At an assembly of the states, he was declared king; but in consequence of a treaty concluded between him and the emperor, he renounced the title and dignity of king of Hungary, and was made in return prince of the empire, with the possession of two duchies in Silesia, and several castles and districts in Hungary. His restless disposition however led him to violate the treaty, and, in 1624, he overran Hungary, till he was defeated by the imperial general, and obliged to take refuge in Cassovia. Upon this a treaty of peace was negotiated, by which he renounced all pretensions to Hungary, and all connections with the enemies of the house of Austria, and was invested with several lordships in Silesia, and with authority over Transylvania during life. After this period he remained quiet; and falling into a dropsy, died in 1629. He left legacies both to the emperor and grand seignor. Gaber married the daughter of John Sigismund, elector of Brandenburg. Mod. Univ. Hist. vol. xxvii. p. 2, &c.

BETH-MAON, the *house of habitation*, or, of *iniquity*, in *Ancient Geography*, a city of the Moabites, in the tribe of Reuben. Jer. xlviii. 23.

BETH-MARCIABOTH, the *house of chariots*, or, of *bitternes's extinct*, a city in the tribe of Simeon.

BETH-MAUS, a village of Galilee, between Saphris and Tiberias, distant, according to Josephus, 4 stadia from the latter. Lightfoot supposes it to be the Beth-maon of the Talmud.

BETH-NIMRAH, the *house of the leopard*, or, of *rebellion*, or, of *bitternes's*, a city in the tribe of Gad. Numb. xxxii. 36.

BETHOANNABA, or **BETH-HANNABAH**, a town, according to Eusebius, 4 miles east from Diospolis. The name preserves some remains of the word Nob, where the tabernacle continued for some time, in the reign of Saul. 1 Sam. xxi. 1. According to Jerom, Nob was not far from Diospolis.

BETHIOGLA, the *house of the f. fl or d m e*, the name of two places: one fixed by Eusebius, 8 miles from Gaza; the other by Jerom, 2 miles from Jordan. The Bethogla of Eusebius is probably part of the tribe of Judah. Josh. xv. 6. The Bethogla of Jerom belong to that of Benjamin. Josh. xviii. 21.

BETHOME, or **BETHORA**, was otherwise called *Julias*, and was the birth-place of the prophet Joel. The inhabitants of Bethome rebelled against Alexander Jannæus. The town was taken, and they were sent captives to Jerusalem.

BETHONEA, or **BETH-ONAEA**, was situated 15 miles east from Caesarea, and was famous, according to Eusebius and Jerom, for its beneficial hot baths.

BETHORON, a town of Samaria. The Scriptures mention two cities of this name, the *Upper* and *Lower*, both belonging to the tribe of Ephraim, (Josh. xvi. 3, 5.) and given by this tribe to the Levites, (Josh. xxi. 22.) They were both built by Sherah, grand-daughter of Ephraim (1 Chron. vii. 24) and restored by Solomon after they had fallen to decay (1 Kings ix. 17. 2 Chron. viii. 5). Their distance from one another was almost the whole breadth of the tribe of Ephraim; the *Upper* being in the north, and the *Lower* in the south of that tribe. The former was situated in the road from Constantinople to Antioch, and the same with *Betaron* of Antonine's itinerary; or *Betoro*, placed between Caesarea and Diospolis. The latter was situated on a mountain, on the public road to Lydda and Caesarea, distant 100 stadia, or about 12 miles from Jerusalem; and hence it has been allotted by some to the tribe of Benjamin. Jerom says, that Paula passed through both the Bethorons in her way from Naplouse to Jerusalem. See **BITHER**.

BETH-PALATH, or **BETH-PELETH**, *the house of deliverance*, or *of expulsion*, a city in the most southern part of the tribe of Judah. Josh. xv. 27. Nehem. xi. 26. This city was surrendered to the tribe of Simeon.

BETH-PAZZEZ, *the house of division*, a city in the tribe of Issachar. Josh. xix. 21.

BETH-PEOR, or **BETH-PHAGOR**, *the temple of Peor*, a city of Moab given to the tribe of Reuben, (Deut. iv. 46.) where the idol Baal-Peor was worshipped. Numb. xxv. 3. It was situated on the other side of Jordan, opposite to mount Peor, or Phagor.

BETHPHAGE, a village at the foot of mount Olivet, between Bethany and Jerusalem, and about 15 furlongs from the latter. See **BETHANY**.

BETHSAIDA, a city of the half tribe of Manasseh, near the desert of the same name. It was situated, according to Pliny, on the east, or on the Arabian shore of the lake of Gennesareth, in Batanea, and the lower Gaulonites, according to Josephus, at the beginning of the mountainous country. It was a place of fishing, according to Bochart, and a place of hunting, says Dr. Lightfoot, so called because it stood near Naphtali, where were many deer. Gen. xlix. 21. It was raised by Philip, the brother of Herod the tetrarch, from the rank of a village to the honour of a city, and called *Julias*, in honour of the emperor's daughter. It seems to have been different from Betharamphtha, called also Bethsaida Julias. See **BETHARAMPHTHA**. This latter Bethsaida, which was on the western shore of the lake of Gennesareth (Mark vi. 45. viii. 22.) was one of the cities against which Christ denounced a woe (Matt. xi. 21.) on account of its impotence and infidelity, after the mighty works which he had performed in it. It was also the city where three apostles dwelt, viz. Philip, Andrew, and Peter. John i. 45.

BETH-SHALISHA, or **BAAL-SALISA**, a town of Palestine, in the canton of Thamna, 15 miles north of Diospolis, according to Eusebius, and south-east of Antipatris.

BETHSAN, or **BETHSEAN**, a town of Samaria in the half tribe of Manasseh, upon the borders of Galilee, on this side Jordan, and about half a league from it. It was the capital of a district of the same name, extending to Peræa. In

2 Maccabees xii. 29, it is placed 600 stadia, or 75 miles from Jerusalem. Josephus says, that it was the largest town of the Decapolis, and that it was 120 stadia, or 15 miles from Tiberias. It was upon the walls of this city that the Philistines, after the battle of Gilboa, hung the bodies of Saul and Jonathan, which were removed in the night by the inhabitants of Jabesh-Gilead, and honourably interred, under a grove of oaks near the city. (1 Sam. xxxi. 10, &c.) In process of time it was called *Scythopolis*, which name it derived from the Scythians, who, in the reign of Josiah, king of Judah, about 635 years before Christ, made an irruption into Palestine, and left a colony at Bethsan. Steph. Byz. and Pliny call it *Nysa*. Bryant (Anal. Myth. vol. ii. p. 415.) deduces its name Bethsan, from beth, house, or temple, and san, or shan, an ancient denomination of the sun, under which he was worshipped; and he supposes, that he had a temple in this city, to the walls of which the body of Saul was fastened. Images of the sun, under the appellation of Zanes, were peculiar to Sparta. This city, according to him, was built by the Cuthite Ophitæ, or Hivites, some of whom settled in that part of Canaan, called Galilee. As Ophitæ, they worshipped the sun under the figure of a serpent, and they were supposed to be Heliadæ, or offspring of the sun. The serpent they styled san or shan; but as the Hebrew *shan* signified also a tooth, the Grecians instead of saying that the Sparti had their origin from the serpent deity, the sun, made them take their rise from the teeth of a serpent.

BETH-SHEMESH, *the house of the sun*, or *of service*, a Levitical city in the tribe of Dan, or of Judah, for it is assigned to the one and to the other; distant, according to Eusebius, 10 miles from Eleutheropolis, in the way to Nicopolis, or Emmaus. 1 Sam. vi. 12. Josh. xiv. 41. 1 Kings iv. 5.—Also, a city of the tribe of Issachar. Josh. xix. 38.—Also, a city of the tribe of Naphtali. Josh. xix. 38. Judg. i. 33.

BETH-SUR, or **BETH-ZUR**, *the house of the rock*, or *of the band*, a city with a strong fortress, seated on a high rock, in the tribe of Judah (Josh. xv. 38.) distant, according to Eusebius, 20 miles from Jerusalem, on the road to Hebron. It was fortified by Rehoboam, to keep the Danites in awe. (2 Chron. xi. 7.) When it was besieged by Lysias, under Antiochus, the son of Antiochus Epiphanes, with an army of 60,000 foot, and 5000 horse, Judas Maccabæus came with 10,000 men to its succour, and obliged Lysias to raise the siege, and defeated his army. B. C. 165. 1 Maccab. iv. 28. vi. 7. Bryant derives the name of this city from beth, temple, and sur, a name given to the sun, under which appellation he had temples and worship.

BETH-TAPPUA, *the apple or orchard house*, a city of Judah (Josh. xv. 53.) said, by Eusebius, to be the last city of Palestine in the way to Egypt; 14 miles from Raphia.

BETHUL, or **BETHUEL**, a city of Galilee, belonging to the tribe of Simeon, (Josh. xix. 4.) probably the same with *Bethelia*, represented by Sozomen in his history, as belonging to the inhabitants of Gaza, well-peopled, and adorned with several temples remarkable for their structure and antiquity; particularly a pantheon, or temple, dedicated to all the gods, seated on an eminence made of earth, which commanded the whole city. Jerom, speaking of Bethelia, says, that from thence to Pelusium was a short journey of five days. Among the bishops of Palestine, we find one of Bethelia. Reland, l. i. c. 35. p. 208. This was probably the same with *Bethulin*, celebrated on account of its siege by Holofernes, at which he was killed by Judith. Judith, vi. 7.

BETHUNE, in *Biography*. See SULLY.

BETHEUNE, in *Geography*, a town of France, and principal place of a district, in the department of the Prants of Cédais, seated on a rock in the little river Bièvre. The number of inhabitants in the town is estimated at 5000, and in the canton at 15,956. Its territory contains 125 kilometres, and 17 communes. It formerly belonged to the counts of Flanders, but being taken by Gaston, duke of Orleans, in 1645, it was united to France by the peace of the Pyrenees, and the fortifications were repaired under the direction of M. Vauban. In 1710, it was captured by the allied army, under Prince Eugene and the duke of Marlborough, and restored to France in 1713, at the peace of Utrecht. This city and the castle are together of a triangular figure; but the castle itself is an irregular building. The houses are mean, and the streets are ill paved, but it contains several churches and convents, and a large handsome square. In the marshy lands near the city, several canals are cut for the convenience of whitening linen. N. lat. 50° 32'. E. long. 2° 48'.

BETHUNES, a river of France, in Upper Normandy, in the county of Caude.

BETHURIA, in *Ancient Geography*, a town of Asia, in Assyria Proper.

BETHULIA, in *Geography*, a town of Poland, in Sarmatia, 10 miles S. S. E. of Reszenie.

BETHUQA, a town of Africa, in the kingdom of Congo.

BETITLO, a town of European Turkey, in the Morea, 22 miles S. W. of Missina.

BETLIS, a town of Asia, in Kurdistan, situated between two high mountains, at a cannon shot's distance from each other; the residence of a bey, who is subject neither to the king of Persia nor the Turkish emperor, and who commands an army of 20,000 or 25,000 horsemen, besides infantry. It lies on the road from Tauris to Aleppo, and the passage is so narrow, that the prince can stop caravans whenever he pleases. The castle is on an eminence between the mountains, resembling a sugar-loaf, and so steep that it can only be ascended by winding round it. The people is and near the town are shepherds, and are ready to take up arms at the command of their prince. It is distant about 110 miles E. of Diarbekir, and 100 N. of Mosul. N. lat. 37° 20'. E. long. 42° 40'.

BETOLA, a town of Italy, 16 miles S. of Piacenza.

BETON, in *Architecture*. See CONCRETE, CONCRETE.

BETONICA, *Beton*, corrupted from *Betonis*, which is derived from the Vettore, an ancient people of Spain, in *Betonis*. Linn. gen. 179. Reich. 776. Schreb. 973. Tournef. 96. Juss. 114. Smith, Flor. Brit. 267. Curt. and Ordet. *Phytologia* var. *sp. 1*. Nat. Ord. *Urticaceae*, or *Labiata*. Gen. Char. Cor. 5-parted, tubular, cylindrical, five-toothed, with 5-partite lobes; upper lip 2-lobed, imbricate; tube bell-shaped; middle division broader, roundish, or a quarter. Stam. filament 5-toothed, the length of the throat; two longer, reaching to the upper lip; anthers roundish. *Petal.* germ four-parted; lobes, four, filiform, and five of the lobes; stigma bilobed. *Per.* none; calyx fostering the seeds round the stem. *Seed* four, ovate.

Ess. Char. Cor. awned. Cor. upper lip ascending, flattened; tube cylindrical.

Species, 1. *B. officinalis*, wood betony. Linn. Sp. p. 810. Hudb. 271. Wain. 530. R. H. 229. Sibth. 785. Curt. Bot. Bot. 2. t. 3. Pl. Dan. t. 726. Woodw. 50; pl. t. 241. Varetos, *B.* B. alba. Bauh. pin. 235. Hall. s. Light. t. 2. *B. micrantha* a helvetic. Tournef. Hall. s. Light. t. 2. Mor. f. 4. Park. 614. f. 3. Ran. Hort. 550. "Spike interrupted; helmet of the corolla entire; middle

division of the lower lip emarginate; calyxes fringed."

The common wood betony has an upright stem, a foot high or more, not branched, or very little in its wild state. hairy, channelled, the corners rounded; root-leaves on long petioles, oblong-heart-shaped, obtuse, wrinkled, crenate, with few hairs, but dotted with small hollow points; the edge ciliate; stem-leaves sessile, lanceolate, serrate; bracts numerous, lanceolate, ciliate, shorter than the calyx; flowers in spikes, composed of several whorls; calyx coloured, sessile, almost upright, villous within, having long hairs between the five long-pointed segments; the two upper teeth recurved; corolla purple, varying to flesh and rarely white; tube downy, longer than the calyx, upper lip commonly entire, sometimes cloven at the end, lower scalloped or crenulate; filaments villous; anthers blackish. A native of woods, heaths, and pastures, among hedges; perennial, flowering in July and August. The dried leaves, by their rough hairs, excite sneezing; and it has accordingly been made an ingredient in the sternutatory powders. But Dr. Callen observes, that this, as well as marjoram, seems to be only useful, by diffusing and giving an agreeable odour to the other essences. Sheep eat it, but goats refuse it. This plant dyes wool of a very fine dark yellow colour. The leaves and tops of the betony have an agreeable but weak smell; to the taste they discover a slight warmth, accompanied with some degree of astringency and bitterness. They yield very little essential oil. This, like many other plants formerly in great medical estimation, is at this time almost entirely disregarded. Antonius Musa, physician to the emperor Augustus, filled a whole volume with an enumeration of its virtues, stating it as a remedy for no less than 47 disorders; and hence in Italy arose the proverbial compliments, "tu hai piu di vertu che non ha betonica," i. e. you have more virtues than betony; and "vende la tunica et compra la betonica," i. e. sell your coat and buy betony. Simon Paulli also ascribes to it powers, which may be considered as rather miraculous than natural, and which did not seem to require contradiction, from the experiments of Alton. Modern writers, however, do not allow the betony to possess any considerable efficacy, and it is omitted in the catalogues of the British dispensatories. Scopoli indeed says, that he experienced its cephalic and corroborant effects; but its sensible qualities shew it to be more inert than most of the other verticillatae. The roots and leaves are said to be very different in quality from the other parts of the plant; and to be nauseous, bitter, purgative, and astringent. Both this plant and eyebright enter into the composition of Rowley's British herb tobacco and snuff. The variety *B.* is not uncommon with a white flower, in subalpine pasture. Gerard remarked it near Hampstead; and Mr. Miller says, that he often found it in Kent. The small iron-tanaceous variety *B.* is not unfrequent with a spike, nearly globular; the leaves and flowers are smaller; but all these differences are owing to situation.

2. *B. orientalis*, oriental betony. "Spike entire, middle division of the lip of the corolla quite entire." The flowers are larger, and of a lighter purple than those of the common sort. It was first discovered by Tournefort in the Levant, and was cultivated in Kew garden by Mr. Miller in 1739. 3. *B. alpestris*, fox-tail betony. *Sideritis alpestris*. Scop. Carn. n. 711. t. 28. *Hormium alpinum* lotum, *betonica spica*. Rai. hist. 547.—*minus allua*, &c. Bauh. pin. 239. prodr. 114. "Spike leafy at the base, helmet of the corolla bilobed." The leaves are altogether heart-shaped, hirsute, and serrate; the flowers small like elder; the corolla are pale yellow; the filaments linguiform; and the germs smooth and shining. A native of the mountains of Savoy, Piedmont, Austria, Carniola, Silesia, and Provence; cultivated

vated, in 1759, in Kew garden, by Mr. Miller. 4. *B. hirsuta*, hairy betony. *B. Alpina*. Miller. Dict. n. 3. *B. Monierii*. Obf. 146. *B. Alpina incana purpurea*. Barr. ic. 340. *B. fol. hirsut. flor. purpur. amplifsimis*. Mentz. pug. zanon. t. 30. p. 46. "Spikes leafy at the base, helmet of the corolla entire." Resembling the foregoing, but more stout and hairy, with a shorter, thicker spike; a native of the Alps, Apennines, and Pyrenées, and cultivated in Kew garden by Mr. Miller, in 1739. 5. *B. heraclea*. "Spike with woolly calyxes, teeth filiform; leaves lanceolate naked." A native of the Levant. 6. *B. sriida*, Danish betony. Ait. Hort. Kew. 2. 291. *B. Danica*. Miller. Dict. n. 2. "Spike oblong; helmet of the corolla entire, middle division of the lower lip notch-waved; calyxes hairy." A native of Denmark, cultivated by Mr. Miller in Kew garden, in 1759. 7. *B. incana*, hoary betony. Mill. Dict. n. 5. Ait. Hort. Kew. 2. 229. "Spike interrupted; helmet of the corolla bifid, middle division of the lower lip notched; tube tomentose bent in." A native of Italy; cultivated in Kew garden by Mr. Miller in 1759. All the species of this genus are herbaceous, fibrous-rooted, hardy, perennial plants. The stems are simple, or but little branched. The flowers are in whorls, forming a terminating spike.

Propagation and Culture. All the sorts may be propagated by seeds, or parting the roots; they require a shady situation and a moist stiff soil. The best time for transplanting and separating the roots is in autumn, but the seeds should be sown in the spring upon a shady border; and they will need no other care besides keeping them from weeds, and thinning them when they are too close. Martyn's Miller. Woodville Med. Bot. vol. ii. p. 79.

BETONICA Aquatica. See SCROPHULARIA.

BETONICA Pauli. See VERONICA.

BETONIM, in *Ancient Geography*, a city of Gad, towards the north of this tribe, bordering on Manasseh. Josh. xiii. 26.

BETO-POULO, in *Geography*, a small island in the Grecian Archipelago. N. lat. 37° 2'. E. long. 23° 33'.

BETOWKY, a town of Poland, in Samogitia, 16 miles west of Rofieme.

BETSCHKOW, a town of Bohemia, in the circle of Czaflau, 9 miles N. W. of Czaflau.

BETSE, or *BETSETEK*, a town of Hungary, in the county of Beth, seated on the Theis, near its influx into the Danube.

BETROTHMENT, in *Law*, a mutual promise or compact between two parties for a future marriage. The word imports as much as giving one's troth; that is, true faith, or promise. Betrothment amounts to the same with what is called by civilians and canonists *sponsalia*, or *esponsals*; sometimes *desponsation*; and by the French *fiançailles*. Betrothment is either solemn, made in the face of the church, or private, made before witnesses out of the church. *To betroth by giving arrha*, or earnest, is called, by *Middle Age Writers*, *jubbarrare*. In Russia, the betrothing is performed with ecclesiastical rites, generally eight days previous to the marriage, and is indissoluble. During this interval, the bride is only visited by the bridegroom, and the girls of her acquaintance, who amuse her with singing. On the last evening, the young women bring the bride into the hot bath, where they plait and tie up her hair, singing at the same time ballads descriptive of her future happiness. Among the ancient Jews, the betrothing was performed, either by a writing, or by a piece of silver given to the bride, or by cohabitation and consummation. This latter engagement, according to the Rabbins, was allowed by the law (Deut. xxiv. 1.), but it has been wisely forbidden by the ancients, on account of the abuses that might happen, and for preventing clandestine

marriages. After the marriage was contracted, the young people had the liberty of seeing each other, which was not allowed them before. If during this time the bride should trespass against that fidelity she owed to her bridegroom, she was treated as an adulteress. (Seld. Uxor. Heb. l. ii. c. 1.) The nuns of the Annunciada hold an annual feast, in honour of the desponsation, or betrothment of the Virgin Mary to Joseph.

BETTA, in *Geography*, a town of Asiatic Turkey, 70 miles S.S.W. of Erzerum.

BETTEMBOURG, the chief place of the canton, in the district of Luxemburg, and department of Forêts; containing 812 persons: the number in the canton amounts to 10,139. The territory comprehends 290 kilometres, and 12 communes.

BETTERTON, THOMAS, in *Biography*, a famous actor, the English Roscius of his time, was the son of an under cook in the household of king Charles I., born in 1635, and after a tolerably liberal education, apprenticed to a bookfeller. This bookfeller, being the publisher of fir William d'Avenant, introduced Betterton into an acquaintance with him, and by this means he was brought upon the stage, under his patronage, about the year 1656 or 1657. After the restoration, he engaged in the company called the Duke's company, formed in virtue of a patent granted to fir William d'Avenant, which acted at the theatre in Lincoln's-inn fields. Betterton, whose talents had attracted notice, was sent to Paris, by command of Charles I., that he might acquaint himself with the French stage, and contribute on his return to the improvement of the English theatre. A new theatre was accordingly built for d'Avenant's company, in Dorset gardens, and the exhibitions conducted in it were attended with great success. In 1670, Betterton married a Mrs. Sanderfon, who excelled as an actress on the same stage, and who contributed, in concurrence with his own exertions, to procure for them not only a comfortable subsistence, but such a surplus as might have served to maintain them in their advanced age. After the coalition of the two companies above mentioned, which took place about the year 1685 or 1686, the merit of Betterton shone with unrivalled lustre; and he acquired the honour of being at the head of his profession. From the account which Cibber has given of his dramatic talents, it appears that no actor entered with a more discriminating judgment into his part, or possessed a greater command over his audience. The leading style of his acting was the grave, dignified, and forcible. His voice, person, and aspect concurred in giving more spirit to terror than to the softer passions; and Cibber adds, in bearing ample testimony to his merit; "I never heard a line in tragedy come from Betterton, wherein my judgment, my ears, and my imagination were not fully satisfied." His powers, however, seem to have been restricted to a particular walk in tragedy; and Othello, Hamlet Brutus, and Hotspur, are enumerated among his striking parts, "and in these the range is from calm dignity to fiery impetuosity."

With respect to his private character, we are told that it was, like his theatrical, manly, decent, and elevated. Having acquired a moderate property, he embarked it, by the advice of a friend, in a commercial project, in which it was lost; and yet that friend's daughter, when she became an orphan, was maintained by him as if she had been his own. In consequence of some disputes which occurred, he was compelled by stage-tyranny, to quit the company, with which he had been long engaged; and a new play-house was opened by his efforts in Lincoln's-inn-fields, in 1695. The growing infirmities of advanced age made it necessary for him to withdraw from the stage, and to acquiesce, which he did with self-possession and serenity of mind, in the narrow circumstances of

his declining life. In 1709, a benefit was allowed him; and on this occasion two eminent actresses, Mrs. Bracegirdle and Mrs. Barry, who had quitted the stage, assisted him by their appearance before the public, and Mr. Rowe contributed an excellent epilogue. In April 1710, he performed again at his own benefit; but the means to which he had recourse for repelling the gout from his feet for this purpose, proved fatal to him on the 28th of that month. He was buried in Westminster abbey; and sir Richard Steele devoted a paper of the *Tatler* (N 167.) to record the event, and to honour his memory. His veneration for Shakespeare resembled that of his great successor, Mr. Garrick; and, like him, he derived his principal renown from an exhibition of the characters of that famous dramatic writer. The few pieces which Betterton wrote for the stage, owe their chief excellence to his accurate and expressive knowledge of theatrical effect. His widow, with whom he had lived in uninterrupted harmony, did not survive him more than six months; nor, indeed, did she live long enough to enjoy the benefit of that pension which was settled upon her by queen Anne just before her death. We shall close this article with the relation of an anecdote recorded by Motraye in his *Travels*. When Betterton was one day at dinner with the archbishop of Canterbury, his grace expressed to him his astonishment, that the representation of fables on the stage should make a greater impression upon the mind than that of truth in the sermons of the clergy; to which the actor, having obtained leave to reply, said "May it please your grace, It is because the clergy, in reading their sermons, pronounce them as if they were reading fables: and we, in acting our parts, and using in them a proper gesture, represent them like matters of fact." *Biog. Brit.*

BETTINGEN, in *Geography*, a town of Germany, in the circle of Westphalia, and county of Blankenheim, three miles north of Geroldstein.

BETTINI, DOMENICO, in *Biography*, a painter, was born at Florence in 1644, and studied at Rome the works of Mario da Fiori, whose paintings he industriously copied, and whose style and manner he acquired. He painted fruit, flowers, insects, animals, and still life; his objects were well disposed, and skilfully grouped, and had a strong character of truth and nature. This artist died in 1705. *Pilkington.*

BETTON, in *Geography*, a town of France, in the department of the Ille and Villaine, and chief place of a canton in the district of Rennes; $1\frac{1}{4}$ league north of Rennes.

BETTS, JOHN, in *Biography*, born at Winchester, where he received the rudiments of his education, was elected one of the scholars of Christ-Church Oxford, in 1642. Being of the king's party, he was ejected the house, in that season of confusion and trouble, but permitted, after a time, to return, and was made doctor in medicine, in 1654. Coming to London, he was in much request, particularly by those of the Romish church, of which he was a member. He was also elected one of the fellows of the college of physicians; and on the restoration of king Charles II. was made one of his physicians. Betts published, in 1669, "De ortu et natura sanguinis," which was censured by Dr. Thompson in his *True Way of preserving the blood in its integrity*. He also published an account of the dissection of Thomas Parr, who lived to the great age of 152 years and 9 months. This account was afterwards inserted in the works of Dr. Harvey, who is supposed to have drawn it up. *Wood's Athen. Ox.*

BETTYAR, in *Geography*, a town of Hindoostan, and the capital of a province, in the country of Bahar, 80 miles N.N.W. of Patna, and 124 N.E. of Benares.

Ord. amentacee.* *Gen. Ch. * Male flowers* in a cylindrical ament. *Cal.* ament imbricate on every side, loose, cylindrical, consisting of three-flowered scales, in each of which are two very minute scales, placed at the sides; three equal stamules fixed to the disk of each scale of the calyx. *Perianth* in each one-leaved, small, entire, three or four-parted; divisions ovate, obtuse. *Cor.* none. *Stam.* filaments to each four (or three, or two), very small; anthers twin. ** Female flowers* in an ament of the same plant. *Cal.* ament cylindrical or roundish, imbricate; with two-flowered scales. *C r.* none. *Pyl.* germ proper, ovate, compressed, very small, two-seeded; styles two, setaceous; stigmas simple. *Per.* none; ament under each side cherishing the seeds of two florets. *Seeds* solitary, ovate. *Obf. Betula T.* has the fruits in cylindrical aments; scales three-forked; seeds with a double lateral wing. *Alnus T.* has them in a roundish strobile; scales roundish; seeds angular, without wings.

Ess. Char. Male. Cal. one-leaved, three-cleft, three-flowered. *Cor.* four-parted. *Fem. Cal.* one-leaved, subtrifid, two-flowered. *Seed,* with a winged membrane on each side.

Species, 1. B. alba, common birch-tree. *Lin. Spec.* 1393. *Hudf. Angl.* 416. *Wither.* 1065. *Ger.* 1295. *Emac.* 1478. *Park.* 1408. *Raii hist.* 1440. *Hunt. Evelyn.* 218. *Varieties, 2. B. pendula*, weeping-birch. *3. B. alba dalecarlica.* *Lin. Suppl.* 416. "Leaves ovate, acuminate, ferrate." The common birch-tree is known at first sight by the silvery colour of its bark, epidermis, or thin outer covering of the bark; the smallness of the leaves in comparison with other timber-trees; and the lightness and airiness of its whole appearance. The branches are alternate, very flexible, covered with a reddish brown or russet, and smooth bark, generally dotted with white; the leaves alternate, bright green, smooth, shining beneath, with veins crossing like the meshes of a net; the petioles about half an inch long, grooved above, and having at the base ovate green glands; the male aments or catkins, which have their scales tipped with brown, appear in autumn at the ends of the twigs, abide in winter, and unfold their flowers, when the female catkins appear in spring at the ends of the shorter branches, on pedicels near a quarter of an inch long; the blossom is egg-shaped, concave, and green; the germs, two or more, are compressed; and the styles and stigmas are reddish. A native of Europe, from Lapland to the subalpine parts of Italy; and of Asia, chiefly in mountainous situations; found with us in woods and moist hedges, and flowering in April and May.

Evelyn observes, that although the timber of birch is the worst of any, it has its various uses; as for the farmer's ox-yokes, for hoops, small serews, paniers, brooms, wands, bavin-bands and wythes for faggots, and formerly for arrows, bolts, and shafts. It served also for dishes, bowls, ladles, and other domestic utensils. In New England, he says, our Northern Americans made canoes, boxes, buckets, baskets, kettles, dishes, &c. of this wood, which they curiously joined with threads made of cedar-roots; and out of an extractance from the bole, boiled, beaten, and dried in an oven, they made excellent spunk or touchwood, and balls for playing. They also constructed of it pinnaces, which they ribbed with white cedar, and covered with large flakes of birch-bark, sewed with threads of spruce roots, and pitched; to which use it was anciently applied even in Britain. It served also for fuel; birch-trees having been dug in many of the moors of the west riding of Yorkshire, which burn and flame like fir and candle-wood; and *Pliny* says (*N. H. l. xvi.*

c. 18.) that the Gauls extracted a kind of bitumen out of birch. The inner white cuticle and silken bark, which strips off of itself almost yearly, was anciently used for writing tables, before the invention of paper; and with the outward, thicker, and coarser part are covered divers houses in Russia, Poland, and other northern tracts, instead of slates and tile; and in Sweden, the poor have even ground the bark to mingle with their bread corn. From the accounts of more modern writers we learn, that the wood of birch; which is very white, is used for women's shoe-heels and pattens, and for packing-cases. It is planted along with hazle to make charcoal for forges; and in the northern parts of Lancashire, and in the vicinity of London, besoms are made with its twigs, for home consumption, and also for exportation. The twigs smeared with birdlime are also used by the fowlers; and in Norway they are given to horses, when fodder is scarce. The bark is serviceable in dyeing wool yellow, and in fixing fugacious colours; for which purpose it should be used dry, and trees of 18 or 20 years growth should be disbarked at the time when the sap is flowing. The Highlanders of Scotland use the bark for tanning leather, and for making ropes; and they sometimes burn the outer rind instead of candles. In Norway it is dried, ground, and mixed with meal, and boiled up with other food for swine, who thrive much upon it. The outer bark, as it escapes putrefaction in the dampest places, is employed for covering the roofs of houses, used on a layer of turf three or four inches thick. The inner bark is applied by the Norwegians for tanning hides, for fishing-nets, and for sails. With the fragments dexterously braided the Laplanders make shoes and baskets, and they use large pieces of it for outer garments to keep off the rain. In Kamtschatka, they convert it into hats and drinking cups. The wood was formerly used by the Scots Highlanders for their arrows, but it is now employed by the hoop-benders and wheelwrights, and for a variety of rustic implements. The turner uses it for trenchers, bowls, ladles, &c.; and that which is of a proper size serves for gates, rails, &c. In France it is generally used for wooden shoes. It also affords good fuel, and some of the best charcoal; and the soot is a good lamp-black for printer's ink. The small branches serve the Highlanders for hurdles, and for side-fences to their houses. Moxa is made of the yellow fungous excrescences of the wood, which sometimes swell out from the fissures. The leaves afford good fodder to horses, kine, sheep, and goats. The seeds are the favourite food of the fishkin; and the tree supplies a variety of insects with food.

The vernal sap of the birch-tree possesses a saccharine quality, and has been used both in a fermented and unfermented state, as a wholesome diuretic wine. It was formerly in great repute against all nephritic disorders; but has been discarded from the modern practice. Van Helmont extols a drink prepared with this juice, daucus-seeds, and brook-lime. Mr. Boyle says (Work, Abr. vol. i. p. 51. vol. iii. p. 338.), that he has seen extraordinary medicinal effects of the juice itself, even when other remedies failed; and accordingly he provided himself with a quantity of it every spring. He says, it may be easily preserved by pouring a little oil on the top of it, or by distillation; but the best way is to impregnate it with the fumes of sulphur. The juice has been used for wine, and also for brewing, being in the latter case employed in lieu of water; and it is said Phil. Trans. N. 46. p. 963., that a barrel of malt will afford as much, and as good ale, as four with common water. In order to obtain this juice, let holes be bored in the bodies of the larger trees, about the beginning of March, while the sap is rising, and before the leaves shoot out, and in these holes fix sockets of elder sticks, cleared of their pith, placing

vessels under them to receive the liquor. A large tree may be tapped in four or five places at a time; and from several trees may be drawn in this way several gallons of juice in a day. If a sufficient quantity be not obtained in the day, what has been gained may be reserved by bottling it up closely till more be procured; but the sooner it is boiled the better. It has been observed, that in the space of 12 or 14 days as much juice may be obtained from one tree, as will outweigh the whole tree, body, and roots. And Evelyn, in his "Sylva," (Hunter's edition, p. 234.) informs us, that a great difference is found between the efficacy of that liquor which distils from the bole, or parts of the tree nearer the roots, and that part which flows from the higher branches; the former being more crude and watery, and the latter more pure and refined. When the sap is obtained, boil it as long as any scum arises, and well skim it during the operation. To every gallon of liquor add four pounds of sugar, and boil it afterwards half an hour, well skimming it; then put it into an open tub to cool, and when cold turn it into a cask. When it has done working, hung it up close, and keep it three months; then either bottle it off, or draw it out of the cask, when it is a year old.

The birch, independently of the uses to which its various parts have been applied, merits culture in parks and ornamental woods for the sake of variety; its straight stem, smooth and white bark, and neat foliage, exhibit a picturesque appearance, when properly placed here and there in the openings, so as to shew the foliage and hanging down of the twigs, or within to display its silvery bark through the gloom: and, besides, its fragrant smell after rain, jolly entitles it to a place in the wilderness. Moreover, the birch-tree deserves cultivation, because it will grow to advantage upon barren land, where better trees will not thrive. It will flourish in moist spongy land, in dry gravel and sand, where the surface is shallow; and upon ground, producing only moss, these trees have succeeded so well, as to be fit for cutting in ten years after planting, and to yield a considerable profit at a small expence. Of this species there are several varieties. In the variety β , the twigs of young trees are erect, but being slender and pliant, they are apt to become pendent with age; and hence proceeds a variety no less beautiful than the weeping willow. γ , is a remarkable variety found in Dalecarlia, and described as having leaves almost palmate, with the segments toothed. Other varieties of a trifling nature, with slight differences in the shape of the leaves, are mentioned by Linnæus in his Flora suecica.

2. *B. nigra*, black Virginia birch-tree. Lin. Spec. 1394. Reich. 4. 126. Gærtn. fruct. 2. 54. t. 90. Gron. Virg. 188. 146. Raii Dendr. 12. n. 2. Ait. Hort. Kew. 3. 336. "Leaves rhomb-ovate, acute, doubly serrate, pubescent underneath, entire at the base; scales of the strobiles villose, segments linear, equal." This species being of foreign growth, is propagated for wilderness and ornamental plantations; but as it now begins to be more common, it is to be hoped that it will soon make a figure among our forest trees. It is equally hardy with our common birch, and attains to a much greater magnitude, as it grows to upwards of 60 feet in height. The branches are spotted, and more sparingly set on the trees than those of the common sort. The leaves have their larger serratures more deep and remote, besides several very small, fine, crowded ones; they are broader, grow on long foot-stalks, and add a dignity to the appearance of the tree. The twigs are pubescent, and the petioles villose. A native of Virginia and Canada; and introduced into Kew gardens in 1736, by Peter Collinson, Esq.

It is very desirable in pleasure-grounds, as it is the first tree in the spring which presents us with leaves, which are of a light

light and lively green. Its white bark makes a beautiful variety, when intermixed with other trees. It is said to be the most useful tree in North America for building both of houses and boats; and will grow fast in any soil or situation, whether wet or dry; and it may therefore be planted in places where few other trees will thrive, and much deserves cultivation. There are several varieties of this species, differing in the colour, size of the leaves, and shoots; such as the broad-leaved Virginian birch, the poplar-leaved-Virginian birch, the paper birch, brown birch, &c.

3. *B. lenta*, Canada birch. Lin. Spec. 1394. Reich. 4. 126. Groen. Virg. 115. 146. "Leaves cordate, oblong, acuminate, serrate." The leaves are smooth, very finely and sharply serrate. The female catkins are ovate, sessile, with acuminate entire scales. This species grows to more than 60 feet in height. The liquor flowing from its wounds is used by the inhabitants of Kamtschatka without previous fermentation; with the wood, and also with the bark, which is very light, tough, and durable, they construct sledges and canoes; and they convert the latter into food by stripping it off when green, and cutting it into long narrow pieces, like vermicelli, drying it, and stewing it with their caviar. It was cultivated by Mr. Miller in Kew garden in 1759. The varieties differ in colour, and are distinguished by the names of dusky Canada birch, white paper birch, poplar-leaved Canada birch, low growing Canada birch, &c.

4. *B. nana*, smooth dwarf birch. Lin. Spec. 1394. Reich. 4. 127. Hudf. Angl. 416. Wither. 2. 207. Hall. Helv. n. 1629. Fl. Dan. t. 91. Pallas Ross. 63. t. 40. D.—G. Fl. Lapp t. 4. Lightf. Scot. 575. t. 25. "Leaves orbiculate, crenate, or circular, feoloped." An upright shrub, seldom rising above two or three feet high; with a hard, stiff trunk, and hewy, roughish bark, resembling that of the *ulmus campestris*; branches expanding, straight, scattered, tapering, woolly, somewhat gummy at the end; leaves rather broader than they are long, commonly three from each bud, but frequently single and alternate, generally entire at the base, scollops often pointed; catkins about half an inch long; styles purple. A native of the northern parts of Europe, and of the Alps; grows on mountains and wet heaths in Scotland; and flowers in May. Here it is planted for the sake of variety, but is of no use; however, Linnaeus says, that it is very serviceable in the economy of the Laplanders, affording them in summer, when they live on the mountains, fuel for their fires, which they are obliged to keep constantly in their houses to defend them from the frost; and, covered with the bark of the remainder, forming their beds. The seeds are the food of the ptarmigan, which supplies a considerable part of their subsistence. The moxa is also prepared from it, which they count as an efficacious remedy in all painful diseases. The leaves, according to Linnaeus, dye a fair yellow than that afforded by the *B. alba*.

5. *B. pumila*, America, or hairy dwarf birch. Lin. Syst. 849. Reich. 4. 127. Mant. 124. Jacq. Hort. 2. 122. B. rana. Kalm. n. 2. 263. "Leaves obovate, crenate." Resembling the foregoing. A native of North America, and introduced into Kew garden, in 1762, by Mr. James Gordon.

6. *B. alba*, alder. Lin. Spec. 1394. Reich. 4. 127. Hudf. Angl. 416. Wither. 2. 206. Lightf. Scot. 576. Pallas Ross. 64. A. Hort. Kew. 3. 334. Alnus. Lin. Lap. 340. Hort. C. 5. 441. Gært. fruct. 2. 51. t. 90. Hall. Helv. n. 1630. Hort. Lvelv. n. 240. Groen. 1294. t. 11. 477. Park. 1409. Panh. t. 149. Cum. epit. 68. Varietas, 1. *glaberrima*, common alder, "leaves undivided." 2. *laciniata*, cleft-leaved alder. Ait. Hort. Kew. 3. 8. 10. 2. Duham. Arb. 42. 1. 4. "L. v. pinnatifid." "Peduncles branched; leaves 101. Lin.

wedge-form, very obtuse, glutinous; axils of the veins villose underneath." The common alder, which appears generally as a shrub, sometimes grows to the height of 35 or 40 feet. The bark is blackish, and in old trees full of clefts; the wood is red and brittle; the leaves are of a dark green colour, and roundish figure, crenate, smooth, viscid to the touch; the petioles grooved above and near an inch long, with lanceolate blunt stipules at their base; the male catkins are cylindrical, appear in autumn, and continue to the spring; the females are of a short conical form, like a small fir cone. Many botanists have separated the alder from the birch; but Linnaeus, in his latter works, has joined them in the same genus, Gærtner preserves them distinct, alleging that they differ not only in the fruit, but in the flower. A native of Europe, from Lapland to Gibraltar; and of Asia from the White sea to mount Caucasus, in wet and boggy grounds, and on the banks of rivers; flowering with us in February, March, and April. The varieties of this tree are the long-leaved American alder, the white alder, the black alder, and the dwarf alder. The last with a round serrate leaf, grows naturally on the Alps and Apennines; it is a very humble shrub, seldom rising more than a foot high, with its branches always trailing on the ground. The first, or long-leaved alder from America, grows to 30 feet in height, and deserves a place in all plantations. The branches are slender, smooth, numerous, and dark brown or purple; the leaves are long, and free from the clamminess of the common sort; and sometimes continue on the tree even in December, so as to give it the appearance of an ever-green.

The wood of the alder is valuable for piles, pumps, sluices, and in general for all works intended to be constantly under water. It is said to have been used under the Rialto at Venice; and we are told that the morasses about Ravenna were piled with this timber, in order to serve as the foundations of buildings. For this purpose it has been much cultivated in Flanders and Holland. It serves also for many domestic and rural uses, as for cart-wheels, spinning-wheels, milk-vessels, bowls, spoons, small trays, trenchers, and other turnery ware, troughs, handles of tools, clogs, pattens, and wooden heels. The roots and knots furnish a beautiful veined wood for cabinets; and the Scots Highlanders often make chairs of it, which are very handsome, and of the colour of mahogany. The wood that has lain in hogs is black like ebony. It is generally planted for coppice wood, to be cut down every ninth or tenth year for poles. The branches make good charcoal.

The bark is used by tanners and leather-dressers, and also by fishermen for staining their nets. This and also the young shoots dye yellow, and with a little copperas a yellowish grey, useful in the demi-tints and shadows of flesh in tapestry. The shoots cut in March dye a cinnamon colour, and a fine tawny, when dried and powdered. The fresh wood yields a dye of the colour of rappee-fruit. The catkins dye green. The bark is used as a basis for blacks; an ounce of it dried and powdered, and boiled in three quarters of a pint of water, with an equal quantity of log-wood, with solution of copper, tin, and bismuth, six grains of each, and two drops of solution of iron vitriol, will dye a strong deep "l'olive de Paris." The leaves have been sometimes employed in tanning leather. The Laplanders chew the bark, and dye their leathern garments red with their saliva. The whole tree is very astringent.

The alder is used for hedges by the side of streams and ditches, and in all wet and morassy soils, and keeps up the bank; but if it be planted in a low meadow, it is said that the ground about it will become boggy; whereas, if it be planted, the root, of which penetrate a great way, and run

BETULA.

near the surface, the ground will become firm and dry. The growth of grass is not materially obstructed by the shade of alder. In the highlands of Scotland, near Dunderdonald, Mr. Pennant says, the boughs cut in the summer spread over the fields, and left during the winter to rot, are found to answer the purpose of a manure. In March the ground is cleared of the undecayed parts, and then ploughed. The fresh gathered leaves are covered with a glutinous liquor, which some people strew upon their floors to destroy fleas; the fleas entangling themselves in the tenacious liquor, as birds do in bird-lime. This tree affords food to many kinds of moths, and other insects. Horses, cows, goats, and sheep, eat it; but swine refuse it. The tongues of horses who feed upon it are turned black; and some persons suppose that it is not wholesome for them.

7. *B. incana*, hoary alder. Linn. Syst. 849. Suppl. 417. Hall. Helv. n. 1631. Villars Dauph. 2. 790. Pallas Rofs. 64. Du Roy Harbec. 1. 109. Gmelin. Sib. 1. 171. n. 24. 2. *B. alnus incana*. Lin. Spec. 1394. Reich. 4. 127. *B. viridis*. Villars Dauph. 2. 789. *Alnus folio incano*. Bauh. pin. 428. Raii hist. 1410. *A. incana et hirsuta*. Bauh. Hist. 1. P. 2. p. 154. Varieties. α . *B. glauca*, glaucous-leaved alder. "Leaves glaucous beneath; petioles red." β . *B. angulata*, elm-leaved alder. "Leaves green beneath; petioles green." "Peduncles branched; leaves roundish, elliptic, acute, pubescent underneath; axils of the veins naked; stipules lanceolate." This species is totally distinct from the common alder, both in the structure of its parts, and its economical uses. It never attains the size of that, and is commonly shrubby; the trunk is scarcely thicker than a man's arm; the wood is white, and of a closer texture. A native of the Alpine and Subalpine parts of Switzerland, Dauphiné, in eastern Siberia, in the islands beyond Kamtschatka, &c. Introduced into the Kew garden, in 1780, by Mr. John Bush. The varieties of the hoary alder are the cut-leaved, the dwarf Alpine, the long-leaved, and the rose-flowered, with petal-like bractes produced from the male catkin.

8. *B. populifolia*, poplar-leaved birch. Ait. Hort. Kew. 3. 336. "Leaves deltoid, drawn out to a long point, unequally ferrate, very smooth; the scales of the strobiles having roundish side lobes; petioles smooth."

9. *B. papyracea*, paper birch. Ait. Hort. Kew. 3. 337. "Leaves ovate, acuminate, doubly ferrate; veins hirsute underneath. Both these last species are natives of North America. Cultivated in 1750 by Archibald, duke of Argyle.

10. *B. excelsa*, tall birch. Ait. Hort. Kew. 3. 337. "Leaves ovate, acute, ferrate; scales of the strobiles having the side lobes rounded; petioles pubescent, shorter than the peduncle." A native of North America. Introduced into Kew garden, about the year 1767, by Mr. James Gordon.

11. *B. oblongata*, Turkey alder. Ait. Hort. Kew. 3. 338. Miller. Dict. ed. 7. n. 2. *A. fol. oblongo viridi*. Bauh. pin. 428. Varieties. α . *foliis oblongis*, oblong-leaved Turkey alder. β . *foliis ellipticis*, oval-leaved Turkey alder. "Peduncles branched; leaves oval, obtusifish, glutinous; the axils of the veins naked underneath." Common in Austria and Hungary, whence Mr. Miller received the seeds. Cultivated by him in Kew garden in 1759.

12. *B. ferrulata*, notch leaved alder. Ait. Hort. Kew. 3. 338. "Peduncles branched; leaves obovate, acute; veins and their axils villose underneath; stipules oval, obtuse." A native of Pennsylvania. Cultivated in Kew garden in 1759 by Peter Collinson, esq.

13. *B. crispa*, curled-leaved alder. Ait. Hort. Kew. 3. 339. "Peduncles branched; leaves ovate, acute, somewhat waved; veins hairy underneath; axils naked; stipules round-

ish-ovate." A native of Newfoundland and Hudson's bay. Introduced into Kew garden, in 1782, by the Hudson's bay company.

14. *B. dawrica*. Pallas it. 3. 224. t. kk. f. 4. ab. fl. rofs. 60. t. 39. Gmel. Sib. 1. 167. & 2. "Leaves ovate, acuminate, ferrate, hairy on the nerve." Scarcely distinguishable, when young, from the common birch, except by the leaves, not growing so tall, and the trunk not exceeding a foot in diameter; bark gray, cleft longitudinally, and dividing into brown scales, as if burnt; branches more subdivided and upright; leaves harder, commonly smaller, on shorter petioles; stipules lanceolate, gray, subpubescent, deciduous; male catkins at the end of the twigs of the preceding year, two or three together, larger than those of the common birch; females from the same twigs lateral, thicker, with larger, and more rounded scales; the seed larger, surrounded by a narrower membrane; differing from the black American birch by having smaller stipules, and leaves less frequently and never doubly ferrate. The wood is hard, yellower than that of the common sort, and in old trees marbled with brown and gray towards the middle; tougher, and therefore more fit for cart-timber and the use of the wheelwright; also employed in making charcoal. A native of Dauria.

15. *B. fruticosa*. Pallas it. 3. App. 758. n. 133. t. kk. f. 1, 2, 3. fl. rofs. 6. 2. t. 40. A. B. C. Gmel. Sib. 1. 167. var. 3. t. 36. f. 2. "Leaves rhomboid-ovate, equally ferrate, smooth." Always shrubby, rising with several stems from the same root, in boggy places not an inch thick, nor higher than a man's stature, but on mountains attaining the thickness of the human arm, and growing to a much loftier height; much branched from top to bottom, and of a very different habit from the common birch; the cuticle ash-coloured with transverse stripes; the wood not so white, and waved transversely; the twigs almost covered with little resinous dots found more or less in the other species; buds more copious and always alternate; two leaves commonly from the same bud, softer than those of the common sort, and decaying sooner; having three seeds to each scale, of the same size and form with those of the *B. nana*. Abundant in marshes and on rocky mountains, and in the cold subalpine regions of eastern Siberia, especially towards the lake Baikal.

Propagation and Culture. The birch-tree may be cultivated either by young plants procured from the woods where they naturally grow, or by seeds carefully gathered in autumn, as soon as the scales begin to open, otherwise they will drop and be lost. As these seeds are small, they should not be buried above a quarter of an inch deep in the ground. Mr. Miller recommends autumn as the best season for sowing them; but Mr. Boutecher directs to spread the seeds thin on a floor till dry, to mix them with loose sand, and to keep them in an airy place till the beginning of March, when they should be sown on fresh light land, trenched or dug the preceding autumn, made very loose, raked fine, and divided into beds three feet and a half wide. It is needless to throw any earth over them; but in dry and frosty weather, a small quantity of pease haulm may be thrown over them for three or four weeks, till the seeds begin to vegetate. The ground should then be kept clean, and three or four gentle waterings may be given at noon in April, and repeated to the middle of June in mild evenings. In the following March they may be removed into the nursery, and planted in rows two feet and a half distant, and ten, or twelve, or eighteen inches asunder. Here they may remain two years, or, in cases where they make little progress, three years; cutting after the second year's growth such as are least thriving or crooked, close to the ground in March. Mr. Miller recommends

B E T U L A.

to sow the seeds in the shade, alleging that they will thus thrive better than when exposed to the full sun. In all places where are large trees, their seeds fall, and the plants spring up without any previous care. If these wild plants are taken up without any injury to the roots, they may be transplanted into any ground, with little or no preparation; where the land will admit of the plough, it will be best prepared by a crop of corn. In the spots where they are to stand, it will be sufficient to loose the soil with a spade or mattock; and they may then be set into holes capable of receiving their roots, which should be covered with earth attached closely to them. After they have taken root, they require no other care, besides being kept clear of weeds, which may be cut down two or three times in a summer for the first two years; and afterwards the plants will be strong enough to keep the weeds down, so that they can receive no injury from them. These plants may be set any time from the middle of October till the middle of March, when the ground is free from frost; but in dry land autumn is the best season, and for a moist soil the spring is preferable. The distance at which they should be placed is six feet square, that they may soon cover the ground, and that by standing close, they may draw each other up; for in situations that are much exposed, if they are not pretty close, they will not thrive well. If the plants take kindly to the ground, they will be fit for cutting in about ten years; and afterwards they may be cut every seventh or eighth year, if they are merely designed for timber-making; but if they are intended for hoops, they should be cut sooner than every twelfth year.

As the birch is a native of Britain, it suits itself to all sorts of soil. It will thrive extremely well on barren land, whether it be wet or dry, sandy or stony, marshy or boggy. It sows itself, and will come up in places where hardly any other tree will grow. It may be cultivated at a moderate expence; and being easily disposed of to the broom-makers, hoop-bender, turner, and for purposes of husbandry, it will yield a considerable profit.

The second and third species, or the American sorts of birch, may be propagated by seed in the same manner as the first, and are equally hardy. Seeds sown in beds of fine mould, and covered about a quarter of an inch deep, will generally grow. They should be constantly weeded and watered in dry weather; and at the age of one or two years, according to their strength, they should be planted in rows in the nursery, in the usual manner. In summer, weeding should be observed, and in winter, digging between the rows; and when they are about three or four feet high, they will be of a good size for being transplanted into the wilderness-quarters. As these American sorts grow with greater vigour than the common sort, and thrive on the most barren ground, they may be cultivated in England to great advantage. The varieties of the different species may be propagated by layers. For this purpose a sufficient number of plants should be procured, and set on a spot of double dug ground, at the distance of three yards from each other. In the following year, if they have made so young shoots, they should be headed to within half a foot of the ground, to form the stool, when all the shoots vigorously the following summer; and in autumn, the young shoots should be splashed round the stool, and the top part of the layers near their ends. They should then be taken root, and become good plants in the following winter; and fresh twigs will have sprung up from the stools to be ready for the same operation. The layers should be headed up, and the operation performed afresh. If the plants designed for stools, have made good shoots the first year, they should not be headed down, but splashed near the ground, and all the young twigs layered. An immediate

crop may thus be raised; whilst young shoots will spring out in great plenty below the splashed part, for the purpose of layering in the succeeding year. This work may be repeated every autumn or winter; when some of the strongest layers may be planted out, if they are immediately wanted; whilst the other may be removed into the nursery, in order to become stronger plants, before they are removed to their destined habitations. Cuttings also, if set in a moist shady border in the beginning of October, will frequently grow; but as this is not a sure method, and as these trees are so easily propagated by layers, it hardly deserves to be practised.

In Sweden, the budding and leafing of the birch-tree is considered as a directory for sowing barley. See FOLIATION.

The fourth and fifth species, being of no use with us, are not cultivated, except in botanic gardens.

The sixth species, or alder-tree, delights in a very moist soil, where few other trees will thrive, and greatly improves such lands. It may be propagated by layers, cuttings, or truncheons about three feet long. The best time for planting truncheons, which is the less eligible, though perhaps the least expence method, is in February or the beginning of March. These should be sharpened at one end, and the ground loosened with an iron crow, that when they are thrust in, the bark may not be torn off. They must be planted at least two feet deep, that they may not be disturbed by strong winds, and set at the distance of three feet. The plantations should at first be cleared of all weeds; and after every fall, in the following winter, the stools ought to be looked over, and all the weak side-branches taken off. This will strengthen those which are already the strongest, and will enable them to shoot up more vigorously for poles. Many of the truncheons will not grow; and Hunter, in his edition of Evelyn's Sylva, says, that he has never seen a coppice, raised in this way, so luxuriant and beautiful, as when raised from regular plant. If the alder be raised by layers, this operation must be performed in October, and in the following October they will have taken sufficient root for transplantation. They should then be set at least one foot and a half deep in the ground, and their tops should be cut off to about nine inches above the surface, which will occasion their shooting out many branches. The method of raising these trees by seeds, is practised abroad, and, says Hunter, (*ubi supra*) is greatly to be commended. If these trees are designed for coppices, they should be placed at the distance of six feet square, or they may be planted at first a yard square, and at the end of seven years, when they are felled for poles, every other stool may be taken away; and if the small lateral shoots be taken off in the spring, it will very much strengthen the upright poles, provided a few small shoots be left at certain distees upon the body to detain the sap for the increase of its bulk. In planting alders for coppices, Hunter (*ubi supra*) says, it is much better to raise them from young trees than from truncheons. To obtain these in sufficient quantity, plant suckers, taken out of the meadows where the alder-trees grow, on a prepared piece of ground, and afterwards head them down for stools; by the shoots in the succeeding autumn, and in twelve months they will have taken root, when they should be removed and planted in rows, and in one or two years they may be transplanted where they are to remain. If the coppice is situated upon boggy or watery ground, they may be removed from the nursery, and planted three feet asunder, in holes previously prepared for receiving them. Here they may stand for six or seven years, when every other tree should be taken away, and the rest cut down for stools. Every ninth or tenth year will afford a fall of these trees for

poles; which should be taken off smooth and fine, so that the stool may not be damaged, or hindered from producing a fresh crop.

These trees will thrive exceedingly on the sides of brooks, and may be cut for poles every fifth or sixth year. They may be also planted for hedges in moist ground, and trained into such as are very close and thick, to the height of twenty feet and upwards. The banks of rivers may be secured by planting truncheons very close, and cross-wise. As the leaves are large and of a deep green colour; these trees, if the beauty of aquatic plantations be regarded, should be preferred to others usually planted in swampy grounds.

The seventh species, or hoary alder, growing naturally in dry sandy soils, may perhaps be cultivated with the birch, where land is of little value, as an underwood, and may be propagated either by layers or cuttings, as well as by seeds, where they can be obtained. Martyn's Miller. Hunter's Evelyn's Silva, p. 225. 240. Withering's Bot. Arr. vol. ii. p. 206.

BETULA Americana. See *BURSERIA*.

BETULÆ, in *Entomology*, a species of *CURCULIO*, entirely of a golden-green colour in one sex, and blue in the other, with a spine on each side of the anterior part of the thorax of the latter. A native of Europe. Linnæus. *Donov. Brit. Inf. &c.*

BETULÆ, a species of *CRYPTOCEPHALUS*, that inhabits Berlin. The colour is black; thorax somewhat orbicular and hairy; wing-cases brownish with obscure streaks. Herbit.

BETULÆ, a species of *ATTELATUS*, of a black colour, with legs formed for leaping. Linn. *Fn. Suec.* This is *Curculio exscoriato-niger* of Degeer.

BETULÆ, a species of *CIMEX* (*Acanthia membranaceus*), that lives on the white alder in the north of Europe. The thorax is denticulated; head mucicated; anterior part of the wing-cases dilated. Linn. Degeer, &c.

BETULÆ, a species of *PAPILIO* (*Pleb. Rur.*), found in Europe. The wings are somewhat tailed, brown, yellowish beneath; posterior ones with two white streaks. Fabricius. *Donov. Brit. Inf. &c.* The larva is green, with pale oblique lines, and white on the sides; pupa glossy, and ferruginous. Feeds on the alder. The male distinguished by a fulvous spot on the upper wings.

BETULÆ, a species of *TENTHREDO*, with the body red; thorax, vent, and eyes black; wings behind brown. Linn. *Fn. Suec.* This is *tenthredo ferruginea* of Degeer. Inhabits Europe.

BETULÆ, a species of *COCCUS*, found on the white alder. It is round, and of a bay colour. Gmel. &c.

BETULEIUS, SIXTUS, in *Biography*, whose true name was *Birch*, was born at Memmingen, in the year 1500, and obtained the reputation of an able grammarian, as well as a good Latin poet and philosopher. He taught the belles lettres and philosophy; and became principal of the college of Augsburgh, where he died June 16th 155. He published several works in prose; and his dramatic pieces of Joseph, Susannah, and Judith, have been esteemed.

BETULINUS, in *Ornithology*, a species of *TETRAO*, described by Scopoli. The tail is black, varied with transverse rufous spots; rump whitish, fasciated with black. Scop. *Ann. Latham.* This is the *urogallus minor* of Aldrovandus; and *birch grouse* of Latham. The body is varied with black and rufous; bill and legs black; breast greyish; quill-feathers white at the tip; eyebrows not red.

BETULUS, in *Botany*. See *CARPINUS*.

BETUWE, BETAW, or BATAVIA, in *Geography*, a tract of land, in the duchy of Guelderland, in the United Netherlands, situated betwixt the Rhine and the Waal, and

forming part of the "Insula Batavorum," where the Batavians settled on their migration out of Germany. It has been divided into two bailliages, viz. the eastern or upper, and the western or lower Betuwe. The former, by a change in the course of the Rhine, has been separated from Betuwe, and removed into the duchy of Cleve, where the fortifications of the Schenken-Schanze, erected in 1586, by general Martin Schenk, have been gradually washed away by the water. The bailliage of lower Betuwe comprehends a number of villages that lie on the Rhine. See *BATAVI*.

BETWEEN DECKS, in *Sea Language*, denotes the space contained between any two decks of a ship.

BETWHA, in *Geography*, a river of Hindoostan, which runs into the Junnah, 25 miles south-east of Calpy. This river, from its source south of Bopal, to its confluence with the Junnah, describes a course of 340 miles in a north-easterly direction.

BETZ, the principal place of a canton, in the district of Senlis and department of the Oise, containing 352 persons; the number of the canton being 9364. Its territory comprehends 22½ kilometres, and 29 communes.

BETZALEEL, JEHUDAH, or Leo Pragensis, in *Biography*, a Jewish doctor of Prague, in Bohemia, flourished about the middle of the 16th century, and was chief of the Moravian academies, and judge of the nation in that country. He left several learned works, among which is that entitled "The Redemption and Eternity of Israel," in which he assures the Jews of the certainty of the Messiah's advent, and of his settling them in a state of permanent prosperity.

BETZANDORFF, in *Geography*, a small town or borough of Germany, in the old mark of Brandenburg.

BETZDORF, the principal place of a canton, in the district of Luxembourg, and department of Forêts, containing 1082 inhabitants; those of the canton being 8101. Its territory comprehends 212½ kilometres and 7 communes.

BETZKO, a town of Hungary, 18 miles west of Tolpoltzan.

BETZIRVAN, or BARSAN, a town of Persia, in the province of Aiderbeitzan; 100 miles north-east of Tauris.

BEVAGNA, the ancient *Mevania*, a small town of Italy, in the duchy of Spoleto, seated on the river Tina, or Timia.

BEVECUM, a town of Brabant, 8 miles south-east of Louvain. N. lat. 50° 45'. E. long. 4° 50'.

BEVEL, in *Masonry*, and among *Joiners*, a kind of square, one leg whereof is frequently straight, and the other crooked, according to the sweep of an arch or vault; being also moveable on a point, or centre, so that it may be set to any angle. The make and use of the bevel are pretty much the same as those of the common square or mitre, except that these latter are fixed; the first at an angle of ninety degrees, and the second at forty-five; whereas the bevel, being moveable, may, in some measure, supply the office of both, and yet, which it is chiefly intended for, supply the deficiencies of both, serving to set off or transfer angles, either greater or less than ninety or forty-five degrees.

Bricklayers have also a bevel, by which they cut the under sides of the bricks of arches straight or circular, to such oblique angles as the arches require, and also for other uses.

BEVEL, Graduated, is that which has about the centre of one of its arms a semicircle graven, and divided into 180 degrees, whose diameter stands square with the sides of the same arm; so that the end of the other arm, being divided at right angles, almost to the centre, shews by its motion the number of degrees contained in the angle to be measured. This is also called *recipiangle*, and *pantameter*.

BEVEL angle is used among the workmen, to denote any other angle beside those of ninety or forty-five degrees.

B E V E L.

The *simple Bevel* (see *Plate II. Geometry, fig. 35.*) consists of two rulers movable on a common centre, like a carpenter's rule, with a contrivance to keep them fixed, at any required angle. The centre C must move on a very fine axis, so as to lie in a line with the fiducial edges CB, CD of the rulers, and project as little as possible before them. The fiducial edges of the legs represent the sides of any given angle, and their intersection or centre C, its angular point. A pin, fixed in the lower ruler, and passing through a semicircular groove in the upper, serves, by a nut A, which screws upon it, to fix the rulers, or legs, when they are placed at the desired angle.

The use of this instrument may be illustrated in the following examples:

1. Let three points, A, B, C, be in the circumference of a circle, which is too large to be described by a pair of compasses; and let it be required to find any other number of points in the same circumference. Bring the centre of the bevel to B (*fig. 36.*), the middle point of the three given ones A, B, and C, and holding it there, open or shut the instrument till the fiducial edges of the legs lie upon the other two points, and fix them there by means of the screw A (*fig. 35.*): this operation is called *setting* the bevel to the given points. Then removing the centre of the bevel to any part between B and A or C, the legs being at the same time kept upon A and C, that centre will describe, or be always found in, the arc which passes through the given points, and will thus ascertain as many others as may be required between the limits of A and C. In order to find points without those limits, proceed in the following manner: the bevel being *set*, bring the centre to C, and mark the distance CB upon the left leg; remove the centre to B, and mark the distance BA upon the same leg; then placing the centre on A, bring the right leg upon B, and the first mark will fall upon *a*, a point in the circumference of the circle, passing through A, B, and C, whose distance from A is equal to the distance BC. Removing the centre of the bevel to the point *a* last found, and bringing the right leg to A, the second mark will find another point *a''* in the same circumference, whose distance *aa''* is equal to AB. By proceeding in this manner, any number of points may be found, whose distances on the circumference are alternately BC and BA. In the same manner, by making similar marks on the right leg, points on the other side, as *c'* and *c''* are found, whose distances *Cc'*, *Cc''*, are equal to BA, BC respectively. Intermediate points between any of the above are given by the bevel in the same manner with those between the original points.

2. Three points, A, B, and C, being given, to draw a line from any one of them, tending to the centre of the circle, which passes through them all. Set the bevel to the three given points A, B, and C (*fig. 37.*); lay the centre on A, and the right leg to the point C, and the other leg will give the tangent AG'. Draw AD perpendicular to AG' for the line required. For BAE being = BCA, the angle EAC is the supplement to the angle ABC, or that to which the bevel is set; hence, when one leg is applied to C, and the centre brought to A, the direction of the other leg must be in that of the tangent G'E.

3. Three points being given as before, let it be required to draw from a fourth given point D, a line tending to the centre of a circle passing through the first three points. On D (*fig. 38.*), with the radius DA describe an arc AK; set the bevel to the three given points A, B, and C, and bring its centre, always keeping the legs on A and C, to fall on the arc AK, as at H; on A and H severally, with any convenient radius, strike two arcs, crossing each other at I; and the required line DI will pass through the points

I and D. For a line drawn from A to H will be a common chord to the circles AHK and ABC; and the line ID bisecting it at right angles, must pass through both their centres.

4. Three points being given as before, together with a fourth point, to find two other points, such, that a circle passing through them and the fourth point, shall be concentric to that passing through three given points. Draw Ac and Cc tending to the centre, by a former problem; let the bevel to the three given points A, B, and C; bring the centre of the bevel to D, and move it upon that point till its legs cut off equal parts AN, CQ, of the lines Ac and Cc; and N and Q will be the points required. For, supposing lines drawn from A to C, and from N to Q, the segments ABC and NDQ will be similar ones; and consequently, the angles contained in them will be equal.

5. Two lines tending to a distant point being given, and also a point in one of them; to find two other points (one of which must be in the other given line), such, that a circle passing through these three points may have its centre at the point of intersection of the given lines. Draw EH (*fig. 39.*) at right angles to AB, and make FH = FE; let the bevel to the angle GDO, and keeping its legs on the points H and E, bring its centre to the line AB, which will give the point I.

An improved bevel is exhibited in *fig. 40.* by which the arcs of circles of any radius, without the limits attainable by a common pair of compasses, may be described. It consists of a ruler AB, composed of two pieces rivetted together near C, the centre or axis, and of a triangular part CFED. The axis is a hollow socket fixed to the triangular part, about which another socket, fixed to the arm CB of the ruler AB, turns. These sockets are open in the front for part of their length upwards, as represented in the section at I, which shews the point of a tracer, or pin, fitted for sliding in the socket. The triangular part is furnished with a graduated arc DE, by which the vernier at B, the angle DCB may be determined to a minute. In this arc is a groove, by means of which, as well as by the nut and screw at B, or some similar contrivance, the ruler AB may be fixed in any required position. A scale of radii is put on the arm CB, by which the instrument may be set to describe arcs of given circles, not less than 20 inches in diameter. In order to set the instrument to any given radius, the number expressing it in inches on CB, is brought to cut a fine line drawn on CD, parallel and near to the fiducial edge of it, and the arms are fastened in that position by the screw at B. Two heavy pieces of lead or brass G, G', made in form of the sector of a circle, the angular parts being of steel, and wrought to a true upright edge, as shewn at H, are used with this instrument, whose arms are made to bear against those edges when the arcs are drawn. The under sides of these sectors are furnished with five short points to prevent them from sliding. The fiducial edges of the arms CA and CD, are each divided from the centre C into 200 equal parts. This instrument might be furnished with small castors, like the pentagraph; but little buttons, fixed on its under side, near A, E, and D, will enable it to slide with sufficient ease.

The use of this instrument may be exemplified in the following problems:

1. To describe an arc, which shall pass through three given points.—Place the sectors G, G', with their angular edges over the two extreme points; apply the arms of the bevel to them, and bring at the same time its centre C, that is, the point of the tracer, or pen, put into the socket, to the third point, and there fix the arm CB; then, bringing the tracer to the left-hand sector, slide the bevel, keeping the

arms constantly bearing against the two sectors; till it comes to the right-hand sector, by which the required arc will be described by the motion of its centre C. If the arc be wanted in some part of the drawing *without* the given points, find by case 1. under *simple bevel*, other points in those parts where the arc is required; and thus a given arc may be lengthened as far as is necessary.

2. To describe an arc of a given radius, not less than 10 inches.—Fix the arm CB so that the part of its edge, corresponding to the given radius, always reckoned in inches, may lie over the fine line drawn on CD for that purpose; being the centre to the point through which the arc is required to pass, and dispose the bevel in the direction in which it is intended to be drawn; place the sectors G, G, exactly to the divisions 100 in each arm, and strike the arc as above described.

3. The bevel being set to strike arcs of a given radius, as in the last instance, let it be required to draw other arcs, whose radii shall have a given proportion to that of the first arc. Suppose the bevel to be set for describing arcs of 50 inches radius, and it be required to draw arcs of 60 inches radius, with the bevel so set. Say, as 50 is to 60, so is the constant number 100 to 120, the number on the arms CA and CD, to which the sectors must be placed, in order to describe arcs of 60 inches radius. When it is said that the bevel is set to draw arcs of a particular radius, it is always understood that the sectors G, G, are to be placed at N° 100 on CA and CD, when those arcs are drawn.

4. An arc ACB (*fig. 41.*) being given, let it be required to draw other arcs concentric to it, which shall pass through given points, e. g. P. Through the extremities A and B of the given arc, draw lines Ap, Bp, tending to its centre, by case 3. under *simple bevel*. Take the nearest distance of the given point P from the arc, and set it from A to P, and from B to P. Hold the centre of the bevel on C, any point near the middle of the given arc, and bring its arms to pass through A and B at the same time, and fix them there. Place the sectors to the points P and P, and with the bevel, set as before directed, draw an arc, which will pass through P the given point, and be concentric to the given arc ACB.

5. Through a given point A (*fig. 42.*) in the given line, to strike an arc of a given radius, and whose centre shall lie in that line, produced if necessary. Set the bevel to the given radius, by case 2. Through A, at right angles to AB, draw CD; lay the centre of the bevel, set as above, on A, and the arm CA on the line AC, and draw a line AE along the edge CD of the other arm. Divide the angle DAE into two equal parts by the line AF, and place the bevel so that, its centre being at A, the arm CD shall lie on AF; while in this situation, place the sectors at N° 100 in each arm, and then strike the arc.

6. An arc being given, to find the length of its radius.—Place the centre of the bevel on the middle of the arc, and open or shut the arms till N° 100 on CA and CD, fall upon the arc on each side of the centre; the radius will be found on CB (in inches) at that point of it, where it is cut by the line drawn on CD. If the extent of the arc be not equal to that between the two Nos. 100, make use of the N° 50, in which case the radius found on CB, will be double of that sought; or the arc may be lengthened by prop. 1. till it be of a sufficient extent to admit the two Nos. 100. Adams's Geometrical and Graphical Essays, by Jones, 1757.

BEVELAND, in *Geography*, the name of two islands, formed by the separate branches of the Scheldt, belonging to the state of Zealand; the one, called *North Beveland*, is about 2 leagues long, and $1\frac{1}{2}$ broad; it is south of Schoonen island, and on the south side of the channel of the east Scheldt, that here runs into the sea; the other, called *South*

Beveland, or *Zuid*, is near 8 leagues long, and $2\frac{1}{2}$ wide, and comprehends the town of Goes and several villages; it divides the east from the west Scheldt, and the two points of its west end approach to the channels opposite to the ports of Armpuyd and Flushing. Both these islands have suffered much from inundations.

BEVELLING, in *Ship Building*, the art of hewing timber with a proper and regular curve, according to a mould which is laid on one side of its surface.

In order to hew any piece of timber to its proper bevel, it will be very expedient to make one side fair, and out of wadding; a term used to signify that the side of the timber should be a plane. Now if this side be uppermost, and placed horizontally, or upon a level; it is plain, if the timber is to be hewed square, it may be done by a plummet and line; but if the timber is not hewn square, the line will not touch both the upper and lower edge of the piece, or if a square be applied to it, there will be wood wanting either at the upper or lower side. This is called *within* or *without* a square. When the wood is deficient at the under side, it is called *under-bevelling*; and when it is deficient in the upper side, it is called *standing bevelling*; and this deficiency will be more or less according to the depth of the piece: so that before the proper bevellings of the timbers are found, it will be sometimes very convenient to assign the breadth of the timber; nay, in most cases, it will be absolutely necessary, especially afore and abaft: though the breadth of two timbers, or the timber and room, which includes the two timbers, and the space betwixt them, may be taken without any sensible error, as far as the square body goes. For as one line represents the moulding side of two timbers, the fore-side of the one being supposed to unite with the aft side of the other, the two may be considered as one entire piece of timber. For further observations on this subject, and particular instructions with respect to the mode of bevelling by ribband lines, and by water-lines, see Murray's Treatise on Ship-building, p. 166, &c. See SHIP.

BEVENSEN, commonly called *Bahnfen*, a town of Germany, in the principality of Luneburgh-Zell, seated on the Elmenau, not far from Medingen.

BEVER, a river of Germany, which runs into the Weser near Beverungen, in the circle of Westphalia.

BEVER Head, a cape on the south-east coast of Nova Scotia. N. lat. $44^{\circ} 42'$. W. long. $62^{\circ} 20'$.

BEVERA, a river of Italy, which passes by Sospello, in the county of Nice, and runs into the Roia, two miles north of Vintimiglia.

BEVERAGE, in a general sense, signifies *drink*. Hence *nectar* is said to be the beverage of the gods. In *Writers of the Middle Age*, *beverage*, *beveragium*, or *biberagium*, denotes money given to an artificer or other person, to drink, over and above his hire or wages. Du Cange.

BEVEREN, in *Geography*, a town of France, in the department of the Escaut, and chief place of a canton in the district of Termonde. The place contains 4927 and the canton 15,749 inhabitants; the territory includes 167 $\frac{1}{2}$ kilometres and eight communes.

BEVERGERN, a small town of Germany, in the circle of Westphalia, and bishopric of Munster, situate in the midst of a morals, and having near it a salt spring; 21 miles north of Munster.

BEVERIDGE, WILLIAM, in *Biography*, a learned and pious prelate of the English church, was born at Barrow in Leicestershire, in 1638, and admitted in 1653 into St. John's college Cambridge, where he took his degrees of bachelor of arts in 1656, of master of arts in 1660, and of doctor of divinity in 1679. At the university he distinguished himself by his application to the learned languages, and particularly to oriental

oriental literature, in which he so much excelled, that at the age of 18 he wrote a treatise on the excellency and use of the oriental tongues, with a Syriac grammar. He was no less distinguished at college by his early piety and exemplary sobriety and integrity. Having taken orders in 1661, he was collated by Dr. Sheldon, bishop of London, to the vicarage of Ealing in Middlesex, which he resigned in 1672, upon being chosen rector of St. Peter's Cornhill, by the lord mayor and aldermen of London. In this situation, such were his zeal and assiduity in the discharge of the duties of his office, not only in the pulpit but out of it, and such was the success that attended his labours, that he was denominated "the great reviver and restorer of primitive piety." His singular merit recommended him to the favour of his diocesan, bishop Henchman, who, in 1674, collated him to one of the prebends of St. Paul's; and in 1681, bishop Compton promoted him to the archdeaconry of Colchester, every parish of which he visited in person. In 1684, he was installed prebendary of Canterbury, and he also became chaplain to king William and queen Mary. Declining to accept the see of Bath and Wells, which was offered to him in 1691, he was consecrated, in 1704, bishop of St. Asaph. In this elevated station he prosecuted, with his accustomed zeal and diligence, every practicable measure for advancing the honour and interest of religion, both among the clergy and laity; recommending to the former the "duty of catechising and instructing the people committed to their charge, in the principles of the Christian religion, to the end that they might know what they were to do, in order to salvation," and furnishing them with a plain and easy "Exposition upon the Church Catechism." After having possessed this new dignity for between three and four years, he died March 5th, 1708, in the 71st year of his age, and was buried in St. Paul's cathedral. He left the greatest part of his estate to the societies for propagating the gospel, and for promoting Christian knowledge. Of his numerous works, those published by himself were, 1. "De Linguarum Orientalium, præsertim Hebræicæ, Chaldaicæ, Syriacæ, Arabicæ, et Samaritanæ, præstantiâ et usu, cum Grammaticâ Syriacâ tribus libris traditâ," Lond. 1658, 8vo.; 2. "Institutionum Chronologicarum libri duo, unâ cum totidem Arithmetices Chronologicæ libellis," Lond. 1669, 4to., 1705, 4to., and 1721, 8vo.; 3. "Συνοδικα, five Παιδικα Canonum S. S. Apostolorum, et Conciliorum ab Ecclesiâ Græca receptorum; necnon Canonicarum S. S. Patrum Epistoliarum: unâ cum Scholiis Antiquiorum singulis eorum annexis, et scriptis aliis hæc spectantibus; quorum plurima et Bibliothecæ Bodlianiæ aliarumque MSS. codicibus nunc primum edita; reliqua cum iisdem MSS. summâ fide et diligentia collata, &c.," Oxon. 2 vols. fol. 1672; 4. "Codex Canonum Ecclesiæ primitivæ vindicatus et illustratus," Lond. 1679, 4to. (See CANONS.) 5. "The Church Catechism explained, for the use of the diocess of St. Asaph," Lond. 1704, 4to.; several times reprinted in a smaller volume. After his death, several of the bishop's works, not intended by himself for publication, and in various respects injurious to his memory, were published by his executor. These consist of devotional tracts, among which are his "Private Thoughts upon Religion," a great number of sermons, a system of divinity, or "The Sure Theological," an "Exposition of the 39 articles, &c." In his "Private Thoughts" the bishop has incurred animadversion; particularly with respect to his meditation upon the Trinity, in which he unsparingly adopts the famous maxim of Tertullian, "credo, quia impossibile est." The theology of bishop Beveridge was Calvinistical; his extensive learning has been universally allowed; his devotion inclined to mysticism; and as a reader and writer, he has been extravagantly extolled by his admirers and panegyrists, and no less severely censured

ed by others, for the quaintness and puerility of his style, the fallaciousness and inconclusiveness of his reasoning, and his avowed opposition to rational sentiments of religion. These reflections, however, result from a perusal of his posthumous writings, the publication of which has been ascribed to avarice or want of judgment on the part of his executor. All have concurred in allowing him the praise of the strictest integrity, of sincere piety, of exemplary clarity, and of great zeal for religion. Biog. Brit. Gen. Dict.

BEVERLACKE, in *Geography*, a river of Germany, which runs into the Aland, 3 miles south of Seelhausen, in the old mark of Brandenburg.

BEVERLAND, ADRIAN, in *Biography*, a man of genius and learning, who prostituted his talents in the composition of several obnoxious books, was a native of Middleburgh in Zealand, about the middle of the 17th century, and studied polite literature under Vossius; and for this purpose he visited Oxford in 1672. Devoting himself to the study of the law, he became a doctor and a counsellor; and as a philologist, he made himself known to the learned world. But the subjects of his selection, both for study and discussion, were principally of the impure and loose kind; and of his licentious taste, he gave some specimens in his work, entitled "De jure stolatæ virginitatis, lucubratiõ academica," Leyd. 1680, 4to.; and in a treatise "De prostibulis veterum," (on the brothels of the ancients), part of which was inserted by Isaac Vossius in his commentary upon Catullus; but which he was dissuaded by his friends from publishing. Before this time, viz. in 1678, he had rendered himself obnoxious by his book on original sin, entitled "Peccatum originale xxi' εἰρηστικῆ νουσηπιου φιλολογικῆ problematicos elucubratiõ a 'Themidis alumno, &c.;" in which work he revived the notion of Cornelius Agrippa, that Adam's sin consisted entirely in the commerce with his wife, and that original sin is nothing but the inclination of the sexes to each other. This book was condemned to be burnt by the magistrates at the Hague, and the author was committed to prison, whence he was not liberated without paying a pecuniary fine, and taking an oath that he would never write again upon such subjects. He then removed to Utrecht, where his debauched manners exposed him to fresh odium, and obliged him to withdraw to Leyden. Here he wrote a bitter satire against the magistrates and professors under the title of "Vox clamantis in deserto;" and at length finding himself insecure in Holland, he sought an asylum in England, where Isaac Vossius is said to have procured for him a pension upon the ecclesiastical revenues, which he expended in the purchase of scarce books and medals, and of obscene pictures and prints, till he was reclaimed from his culpable mode of life by an acquaintance with the learned and worthy Dr. Edward Bernard. In token of his regret on account of his past conduct, and of the sincerity of his reformation, he wrote a treatise "De Fomicatione cavenda admonitiõ, &c." published, probably, first at London in 1690, with a dedicatory epistle to Dr. Bernard, and afterwards in 1698, 8vo.; in which, notwithstanding his pretended, or real reformation, some other five passages occur. After the death of Vossius, he fell into a state of poverty, and into a state of mental derangement; and probably died after the year 1712, when he was buried three in England, under an appellation that does not seem to be celebrated together to immortalize him, he died. Gen. Dict.

BEVERLEY, or BEVERLY, in *Geography*, is a large corporate borough, and principal town in the county of York; situated on the east bank of the river Hull, which is rendered navigable, by means of a short canal, up to the town. This place appears to have been of some note previous to the time

of Bede, whose preceptor, John of Beverley, archbishop of York, founded and erected a monastery here, to which he retired, and wherein he died in 721. King Athelstan having made a vow, before he proceeded against the Scots, instituted a college of secular canons, on his return to this town in 930, and also granted the freemen many immunities and privileges, which were allowed and confirmed by Henry I. and most of the succeeding monarchs to queen Elizabeth. By the last charter, which contains the heads of those previously granted, the government of the town is vested in a mayor, recorder, aldermen, and other subordinate officers. Though within eight miles of Hull, this town preserves great respectability and commercial consequence, from its fairs, markets, and trade. The sessions for the east riding of Yorkshire are held here in a handsome hall, called the Hallgarth, which contains a register office for deeds and wills, that relate to any lands in this part of the county. Beverley has sent two members to parliament from the 26th of Edward I., except a few intermissions in the reigns of Edwards II. and III.

Here were formerly four churches, but only two remain; one of which is a large handsome edifice, and is called the Minster. King Edward VI. and queen Elizabeth granted certain revenues for the support and repairs of this edifice; but those revenues being improperly applied, a Mr. Moyser, M. P. for the town, procured a brief for the repair of it in 1708. His own contributions, with those from his friends, amounted to 1500l.; which, with 800l. raised by the brief, were placed in the funds, and by the rise of the South sea stock, in the year 1720, he was enabled to complete the reparation and adornment of the church in his life-time. King George I. not only encouraged this work by a liberal donation of money, but gave the stone of the dissolved monastery of St. Mary's in York towards the building; sir Michael Warton also gave 500l. and bequeathed 4000l. more as a perpetual fund towards keeping it in repair. The east window contains some fine painted glass; and the screen between the nave and choir is much admired for its ornamental workmanship. The north wall of the great cross-aisle was at one period inclined from its perpendicular, but Mr. Thornton of York invented a machine, which, by means of screws, &c. restored it to its original position. The ancient fabric was consumed by fire in September 1788. Here are several monuments for the Piercys, earls of Northumberland, who built a private chapel in the choir.

The principal trade of Beverley consists in making of malt, oatmeal, and in the tanning of leather. The cloathing trade was, at a former period, an object of much consequence here, but at the time of Leland it was falling fast to decay. Connected with the borough, are four large common fields, containing nearly 1000 acres, in which every burghers or freeman is allowed to pasture a certain number of cattle. In one of these fields is a mineral spa, which has proved serviceable in some cutaneous disorders. There are seven alms-houses in the town, and legacies left for erecting two more. Here is also a free-school, whose scholars are allowed two fellowships in St. John's college Cambridge, also three scholarships and three exhibitions. Beverley is 183 miles north from London. It has weekly markets on Wednesdays and Saturdays; five fairs in the year; and five annual great markets for hogs, &c. This town consists of three parishes, called St. Martin's, St. Nicholas's, and St. Mary's; and according to the official population report in 1800, included 1220 houses, and 5401 inhabitants.

BEVERLY, JOHN OF, in *Biography*, archbishop of York in the eighth century, was born at Harpham in Northumberland, and having embraced the monastic life, he became afterwards abbot of the monastery of St. Hilda. He was instructed in the learned languages by Theodore, archbishop

of Canterbury, and was justly esteemed one of the best scholars of his time. Some say that he studied at Oxford, and took there the degree of master of arts; but as no degrees were then conferred in this university, this fact has been disputed. By Alfred, king of Northumberland, to whom his merit recommended him, he was advanced, in 685, to the see of Haguftald, or Hexham, and in 687, translated to that of York. Beverley was tutor to the venerable Bede, and intimate with Acca and other famous Saxon doctors, several of whom he engaged in writing comments upon the Scriptures. In 704, he founded a college for secular priests at Beverley, which, in honour of his memory, was endowed by our kings, and particularly by Athelstane, with considerable immunities, so that it became an asylum, or sanctuary, for debtors and persons suspected of capital crimes. After he had governed the see of York 34 years, being tired with the tumults and confusions of the church, he divested himself of the episcopal character, and retired to Beverley, and four years after died in *the odour of sanctity*, on the 7th of May 721; and the day of his death was appointed a festival by a synod held at London in 1416. Bede, and other monkish writers, ascribe to him several miracles. Between three and four hundred years after his death, his body was taken up by Alfric, archbishop of York, and richly enshrined. He was the author of several homilies, and other religious pieces. *Biog. Brit.*

BEVERLY, in *Geography*, a township, and post-town of America, in Essex county, Massachusetts, separated from Salem by a handsome bridge, and distant about 20 miles east of north from Boston, and 22 south-west from Newbury port. It has two parishes, containing 3290 inhabitants. Those of the parish next the harbour are devoted to the fishery, and the other branches of navigation. In the other part of the town, which is chiefly agricultural, is a cotton manufactory. N. lat. 42° 31'. W. long. 7° 50'.

BEVERLY'S *Manor*, or *Irish tract*, is a tract of land, in Virginia, in N. lat. 38° 10', at the head of Massanutten's river, a western branch of the Shenandoah, which rises here by three branches, viz. Middle river, Lewis, and Christian creeks, and lying between the Blue and the North ridge.

BEVERN, a town of Germany, in the circle of Upper Saxony, and duchy of Brunswick, seated on the Weser, 20 miles west of Einbeck.

BEVERON, a river of Savoy, which runs into the Drance, 4 miles south-west of Evian.

BEVER'S, LITTLE, lies to the west of point de la Hune, on the southern coast of Newfoundland island, in North America, between cape de la Hune on the east, and cape Raye on the west, being the south-west point of the island.

BEVERSTADT, a town of Germany, in the circle of Lower Saxony, and duchy of Bremen, 24 miles north of Bremen.

BEVERSTONE, a village of Gloucestershire, England, is situated about two miles west of the town of Tetbury, and is noted for the stately remains of its ancient castle. This fortress is of uncertain foundation, but was undoubtedly a strong place prior to the conquest. Earls Godwin, Swane, and Harald here met under the pretence of assisting Edward the confessor against the Welsh in 1048. Maurice, lord Berkeley, or de Gaunt, fortified and repaired it, and in 1227 was prosecuted by the king for doing so, without royal permission. It was purchased by Thomas lord Berkely soon after the return of Edward III. from the battle of Poitiers. Many of the spoils and ransoms from that battle were appropriated to enlarge and beautify this castle, which was used as a mansion till the great rebellion, when it was strengthened, and held for the king, but besieged by, and surrendered to Col. Masie. Great part of the castle, with a dwelling-house within its walls, was soon afterwards destroyed

stroyed by fire. It was originally a square building, with a tower at each corner, one of which still remains, with fragments of walls, and the greater part of a chapel. This has a beautiful arched roof, and on the right side of the altar is a shrine of tabernacle work, with a lavatory, a closet in which is a confessional, and over it a prison. The moat surrounding the whole, was about 200 yard in circumference. At a short distance north of the castle, the parish church, which is a small plain building. Rudge's History of the County of Gloucester.

BEVERUNGEN, a town of Germany, in the circle of Westphalia, and bishopric of Paderborn, at the conflux of the Bever and the Weich, near which are springs of salt water, 26 miles south-east of Paderborn.

BEVERWYCK, JOHN VAN, or BEVEROVICIUS, in *Biography*, not more known and esteemed as a physician than as a magistrate, and member of the administration in his country, having attained to high honours in both those capacities, was born at Dordrecht in Holland, in 1594. Being of a distinguished family, he had the advantage of receiving instructions in classical literature from Gerard John Vossius, and afterwards of studying the different branches of medicine under the ablest masters in France and Italy. Returning to his own country, he took the degree of doctor in medicine at Padua, about the year 1624. His works are numerous. Those most deserving notice are, "Epistolica questio, de termino vite fatali an mobili, cum doctorum responsis;" 8vo. 1634, Dord. Whether there is a fixed term, beyond which life cannot be extended, he determines in the negative. "Montanus, Refutatio argumentorum, quibus medicine necessitatem impugnat;" 8vo. 1634, Dord.; in which he answers the cavils of the sieur Montagne against physicians, and shews the necessity of the art. "Idea Medicinæ veterum," 8vo. 1637, Leiden. A compendium of the practice of medicine, taken from the most valuable writers on the subject. "Epistolica questiones cum doctorum responsis." 8vo. 1644, Rotter. A collection of letters on subjects pertaining to medicine, to which are added, the Elogia of Medicine by Erasmus, Cardan, and Melancthon. His works, of which Haller has given a complete list, were published together in 4to. at Amsterdam, 1651. They have most of them passed through several editions. He died Jan. 19th 1647, and was honoured with an epitaph by his friend Heinsius. Haller Bib. Med. Gen. Biog.

BEVERWYCK, in *Geography*, a town of North Holland, with a small harbour in the Wyckenmeer, which is a continuation of the Yc, 3 leagues north of Haerlem.

BEUF, JOHN LE, in *Biography*, a learned and laborious French writer, was born at Auxerre in 1687, and educated at Paris. After his return to his native town, he was made canon of its cathedral in 1711, and during his residence there frequently attended the deputies of the clergy at Sens, to assist them in reforming the liturgies of that diocese. In 1721, he was engaged by the archbishop of Paris in the re-arrangement of the chant in the new breviary and missal of that city; and from this time he chiefly resided at Paris. He was admitted an associate of the academy of belles lettres and inscriptions in 1740, and twice obtained the prize of that academy, and for times that of the French academy at Soissons. He was one of the most indefatigable, intelligent, and satisfactory ecclesiastical antiquaries of France. The catalogue of his works from 1716 to 1741, fills 12 pages in folio in the Burgundy library; and his subsequent productions for the 14 volumes of his life, are nearly as numerous. His "Traité sur le chant ecclésiastique" is full of curious researches, and, perhaps, the safest guide on the subject which a musical labourer of the first age of the church can consult. This journey of learning died in 1760.

The best known of his numerous works, besides that al-

ready mentioned, are "A Collection of various writings, tending to illustrate the history of France," 2 vols. 12mo. 1738; "Dissertations on the ecclesiastical and civil history of Paris," 3 vols. 12mo; "Mémoire on the history of Auxerre," 2 vols. 4to. 1743; "History of the city and of all the diocese of Paris," 15 vols. 12mo.; more than 200 "Memoirs," or "Historical Dissertations," inserted in the journals of the times; and a variety of dissertations printed in the Memoirs of the Academy of Inscriptions. He also liberally communicated a number of original pieces, which he found in his assiduous research, to learned men engaged in different works. Nouv. Dict. Hist.

BEUF, *Riviere en*, in *Geography*, a river of America, that discharges itself easterlyward into Mississippi river, in N. lat. 39° 4'; about 48 miles by the course of the river, above the mouth of the Illinois, and 7 miles south from Riviere Oahaha.

BEUF, *Small Le.* See *Le Boruf*.

BEVIEUX, a village of Switzerland, in the government of Aigle, in that part of the Valais which belongs to the republic of Berne. Bevioux is distant about 5 miles from the small town of Bex, and is famous for its salt springs. Mr. Coxe informs us, that he went into the mountain about 3000 feet, almost horizontally. The gallery is 6 feet high, and 4 broad, and nicely hewn and hollowed in a black rock, veined in some places with white gypsum. The salt is procured from springs, which are found within a solid rock, perforated at a great expence; the richest source yields 28 pounds of salt per cent. and the poorest but half a pound. Near these springs are several warm sources, which contain a mixture of salt, but are so strongly impregnated with sulphur, as to flame when a lighted candle is put into the pipe through which they flow. No solid salt, except a few cubes, has been yet discovered: but the mountain is replete with its particles. Rocks of white gypsum, or alabaster, mixed with bluish clay, are common near the springs, in the same manner as may be observed in the pits of Northwich in Cheshire. After travelling in this subterraneous passage near three quarters of a mile, Mr. Coxe observed a great wheel, 35 feet in diameter, which raises the brine from the depth of about 70 feet. From this place is a shaft 300 feet high, which is cut through the mountain to the surface, for the purpose of introducing fresh air. He noticed two reservoirs hollowed in the solid rock for holding the brine; one was 160 feet square, and 9 deep. In process of time, the workmen pierced the rock 25 feet deeper, and cut a gallery 100 feet long, and they formed a third reservoir, containing 5500 cubic feet. The brine deposited in these reservoirs is conveyed by means of 2000 pipes, about a league to Bevioux, where the salt is extracted. The brine pits near Aigle contain only from two to one half per cent. and yield annually about a third as much as those of Bevioux, or about 5000 quintals. The salt is much whiter and heavier than that of Bex, and consequently bears a higher price. These, which are the only salt-works in Switzerland, scarcely yield a net yearly profit of more than 30000, and furnish only one-twelfth of the annual consumption of the canton. The remainder is procured chiefly from France, at a moderate price, stipulated by treaty. Coxe's Travels, vol. ii. p. 105.

BEUIL, in *Geography*, the chief place of a canton, in the district of Faucigny, and department of the Maritime Alps, containing 468 inhabitants; those of the canton amount to 2133. Its territory comprehends 225 kilowattres and 60000000.

BEVILLE, in *Heraldry*, denotes a thing broken, or open, as the case of a capstan's rule.—Thus he beareth argent a chief belevy, by the name of *Beverly*.

BEVIN, ELWAY, in *Biography*, among our ecclesiastical composers in the time of James I., justly deserves to be ranked

racked with the musical luminaries of that reign. He was a scholar of Tallis, which is discoverable by his works; but it is not quite so easy to discover how it could have been at the recommendation of his master, who died 1585, that he was sworn gentleman extraordinary of the chapel royal, in 1589, as has been said. His service in D minor, printed in Boyce's collection, has the true ancient cast of modulation, the *fer-rugo pretiosa* upon it, which gives a dignity to its effects, for which we can now hardly account. The accents, as usual with old masters, are often erroneously placed; but if that imperfection be removed, or regarded with indulgence, the composition must be allowed, in point of harmony and modulation, to be admirable. And there are some grand effects produced by pauses and long notes without changing or infringing the original measure, that afforded us very pleasing sensations. Elway Bevin was, indeed, a man of genius; and it is to be lamented that more of his compositions have not been preserved. Besides his appointment in the chapel royal, he was organist of Bristol cathedral, and the master of Dr. Child. But notwithstanding his abilities and great age, he was dismissed from all his employments, in 1636, on being discovered to adhere to the Romish communion.

In 1631, he published a work replete with harmonical erudition, entitled "A Briefe and short instruction of the art of musicke, to teach how to make discant of all proportions that are in use: very necessary for all such as are desirous to attaine to knowledge in the art; and may by practice, if they can sing, soone be able to compose three, foure and five parts: and also to compose all sorts of canons that are usual, by these directions of two or three parts in one, upon a plain-song;" by Elway Bevin. thin 4to. of 52 pages.

This work, however useless it may be deemed now, must have been of singular service to young students in times when canons were regarded as the greatest efforts of human intellect, and the solution of these enigmas was equally difficult with that of the most abstruse and complicated problems in Euclid. Micheli Romano published a similar work at Venice, 1615, and Valentini another at Rome, 1655. See MICHELI and VALENTINI.

BEVIO, in *Geography*, a small village of Swisserland, seated near the Julian Alps, upon the Little Rhine, in the high road leading to Coire. Bevio and Valmorara form one community, governed by 11 magistrates; though the number of voters, who appoint these magistrates, scarcely exceeds 40. The chief is called "Ministrale," and is confirmed every year, for which each voter receives a florin. About one-third of the merchandize from Como to Coire passes by Bevio; the greater part is sent by Splugen.

BEUNTERSHEIM, a town of Germany, in the circle of the Upper Rhine, and bishopric of Worms, 6 miles south of Worms.

BEURATH, a town of Bohemia, in the county of Glatz.

BEURERIA, and BEURRERIA, in *Botany*. See CALYCANTHUS and EHRETIA.

BEURRE, in *Geography*, a town of France, in the department of the Doubs, and chief place of a canton in the district of Besançon, 2 miles south of Besançon.

BEURRY, a town of France, in the department of the Meuse, and chief place of a canton in the district of Bar-le-Duc, $\frac{1}{2}$ league west of Bar-le-Duc.

BEURS, WILLIAM, in *Biography*, a painter, was born at Dort in 1656, and discovering a natural genius for drawing and designing, he was placed, at the age of 18, under the instruction of William Drilenburg. He painted in the style and manner of his master, almost equalling him in the freedom of his hand, and the clearness of his colouring, and surpassing him in the correctness of his design. Addicting himself to

a dissolute life, he obtained neither the reputation nor the wealth which his talents, diligently exercised, might have enabled him to acquire. He painted portraits, landscapes, and flowers. Pilkington.

BEUS, in *Ancient Geography*, a river of Macedonia, mentioned by Livy and Steph. Byz., near which was a town called BEV, *Beuc*, according to the latter.

BEUTHEN, or NIEDER BEUTHEN, in *Geography*, a town of Germany, in the circle of Upper Saxony, and principality of Carolath, on the Oder, containing two churches; 3 miles S. W. of Ziegenbruck.

BEUTHEN, *Nieder*, a town of Silesia on the Oder, in the duchy of Glogau. It has suffered much by war and fire; distant 13 miles W. N. W. from Ober Glogau. N. lat. $51^{\circ} 42'$. E. long. $15^{\circ} 51'$.

BEUTHEN, *Ober*, a town of Silesia, formerly belonging to the principality of Jagerndorf, but since to the principality of Oppeln. It had anciently a productive mine of silver; distant 40 miles E. S. E. from Oppeln. N. lat. $50^{\circ} 16'$. E. long. $18^{\circ} 53'$.

BEUTSCHEN, a town of Poland, in the palatinate of Posen, 44 miles west of Posen.

BEUVRON, a town of France, in the department of the Calvados, and chief place of a canton in the district of Pont l'Évêque, 12 miles south of Caen.—Also, a river of France, which runs into the Loire, 2 leagues below Blois.

BEUVRY, a town of France, in the department of the Straits of Calais, and chief place of a canton in the district of Bethune, half a league east of Bethune.

BEVY, among *Sporisimen*, is used to signify a brood of quails. Thus also we say, a *covey* of partridges, a *nide* of pheasants, and a *pack* of grouse. *Bevy* is sometimes used among foresters to express a herd of deer, though it is much less frequently used in this sense than in the former.

BEUZEVILLE, in *Geography*, a town of France, in the department of the Eure, and chief place of a canton in the district of Pont-Audemer; $2\frac{1}{2}$ leagues west of Pont-Audemer. It contains 2457 persons, and the population of the canton amounts to 12,254. Its territory includes $192\frac{1}{2}$ kilometres and 20 communes.

BEWCASTLE, a parish and village of Cumberland, England, is rendered interesting to the topographer and antiquary from the Roman relics that have been discovered within its limits, and from the singular obelisk in the churchyard. This parish is supposed to have included the Roman station where part of the Legio-*Secunda* Augusta was garri-fused to guard the workmen employed in erecting the famous Roman wall that separated England from Scotland. Many vestiges of ancient buildings are yet remaining; and numerous Roman coins, and some inscribed stones, have been found here. The obelisk, which has furnished a theme for much dissertation, contains various sculptured ornaments, with a Roman inscription, and some figures in basso-relievo. The church, with the castle, are included within an entrenchment. The latter, now in ruins, appears to have been of a squarish form, and was battered down by the parliament's forces in 1641. In this parish are two schools supported by subscription, whose masters have about ten pounds each per annum, with the privilege of a whittle gate. This was a peculiar custom, formerly very common in Cumberland, and the neighbouring counties, and now prevails in some villages. It is a privilege given to the master of applying to his pupils' parents in rotation, for provisions. Several thousand sheep and black cattle are fed on the hills and waste parish. Hutchinson's History of Cumberland.

BEWDLEY, a market and borough town of Worcestershire in England, is pleasantly situated on the banks of the river Severn, whose navigable stream has given prosperity to the place.

It was formerly included within the marshes of Wales, but by a statute of Henry VIII. was annexed to the county of Worcester. Leland describes this place as remarkable for the "wonderful height of the trees in the adjacent forest of Worcester," for its "beautiful situation," and for the palace of Tichen-hall, which Henry VII. built to be a place of retirement for prince Arthur. The ceremony of this prince's marriage in person, with Catharine of Arragon, by proxy, was performed here on the 19th of May, 1499. King Henry VI. gave all the stone for building the bridge across the Severn, which was erected by Edward IV. On the middle pier of this, stands a gate-house, part of which is for the corporation's prison.

The town is in the parish of Ribbesford, where there is an ancient walled house, in which was found the manuscript copy of the life of lord Herbert of Cherbury. Here is a chapel, which was built on the site of an ancient wood structure in 1748. A new set of stables was also erected in 1783; and the town partakes of the benefits of a free grammar school, which was founded in the latter part of queen Elizabeth's reign; almshouses, and a charity school. The manufacturers and trades of this town were formerly very considerable, but they are now principally confined to tanning, horrow-work, matting, and a few others. Bewdley seems to have been first incorporated by king Edward IV. whose charter grants the freemen great privileges and immunities by sea and land. These were confirmed by Henry VIII. and again by James I. This charter was surrendered in the time of Charles II.; but in the next reign another was granted, which on a trial in 1707, was determined to be void. A new one was therefore obtained from queen Anne, but this produced some litigation, which at length was determined in its favour. This empowers the bailiff and 12 capital burgessees to return one member to parliament. Here were formerly two weekly markets, on Wednesdays and Saturdays; but the latter is only continued: which, with three fairs, annually attract much company and trade to the town.

Bewdley is 129 miles N.W. from London. It contains 840 houses, and 3671 inhabitants. Nash's History of Worcester-shire.

BEWITS, in *Falconry*, denotes a piece of leather to which a hawk's bells are fastened, and buttoned to his legs.

BEX, in *Geography*, a small town of Switzerland, in the canton of Berne, about 4 miles S.S.E. of Aigle, and 5 miles from the salt-works at Bevioux. (See BEX, *supra*.) Between Aigle and Bex is a picturesque view of the castle of St. Triphon, on the summit of an insulated rock in the middle of the plain; it is quite surrounded with wood, and realises Milton's description of an enchanted hill,

"Bom'd high in turrets crown'd."

It is said to be built of marble, and probably of a beautiful black species in the vicinity. St. Triphon was a Phrygian, and is said to have suffered martyrdom at Nice in the year 251, under the persecution of the emperor Diocletian.

BEXUQUILLO, is the *Materia Medica* name given to the white *ipocucurbita*, which the Spaniards bring from Peru, and the Portuguese from the brown from Brazil.

BEY, or Beg, denotes a governor of a country, or town, in the Turkish empire.

The Turkish word is *be* or *led*, but they pronounce it *bye*; so that *beg* is *lord*, but is particularly applied to a *lord of a tower*, whom in the Turkish tongue they call *fangi-beg*, or *beg*; *fangi-beg*, which among them signifies a *castle-governor*, because the badge of his jurisdiction is a castle; and that of the province, because under him is a considerable number of fortified castles.

Each province in Turkey is divided into seven of these

fangiaks, or *lawyers*, each of which qualifies a bey; and these are all commanded by the governor of the province, whom they also call *beg-biler-beghi*, or *begler-beg*, i. e. *lord of the lords*, or *heys* of the province.

These beys are, in a great measure, the same that *bannerets* formerly were in England.

It has already been observed, under the article *BASHAW*, that when the military aristocracy of the Mamlouks in Egypt was abolished by Selim, sultan of the Ottomans in 1507, he established a form of government, which was calculated to preserve all the different members of the state in a condition of dependence upon himself. With this view, he appointed, besides a pacha, a divan, or council of regency, composed of the pacha and the chief of the seven military corps. At the time of this appointment it was agreed, that the 24 governors, or beys of the provinces, should be chosen from the Mamlouks; and to them were entrusted the care of restraining the Arabs; superintending the collection of the tributes, and the whole civil government of the country; but their authority was purely passive, and they were to be considered merely as the instruments of the determinations of the council. By this institution, which is still observed in some instances, it was ordained, that the pacha should be contented to share the power of the beys, and that the duration of his authority should depend on their collective will. The power of the pacha was very extensive; but it has been gradually diminished, and almost annihilated by the intrigues and ambition of the beys. His jurisdiction was rather civil than military. He was always president of the divan, which was held in the castle where he resided. But that council has, in later times, commonly assembled in the palace of one of the chief beys, except when a firman or mandate is received from Constantinople, when the beys are summoned to the castle to hear the commands of the Porte. The few who attend, as soon as the reading is finished, answer, as is usual, "Esmâna wa taâna," "we have heard, and we obey;" but on leaving the castle, their general voice is "Esmâna wa awfêna," "we have heard, and shall disobey." All these beys had been Mamlouks, or military slaves, who were not natives of Egypt, but imported when very young from Georgia, Circassia, and Mingrelia, and purchased for 50, or not more than 100 sequins. Many of these are descended from Christian parents, and have been slaves from their youth. Some few have been prisoners, taken from the Austrian and Russian, who have exchanged their religion for an establishment. When the supply obtained in this way proves insufficient, or many have been expended, black slaves from Nubia, and other interior parts of Africa, are substituted in the room of the others, and are found docile, are armed and accoutred like the rest. The Mamelotans in general, and the Egyptians in particular, treat their slaves with great kindness. A Cairo, when a slave is legally purchased in the market, if he feel discontented with his master, he has only to say, "carry me to the market," and the master is legally compelled to order him for sale. The child of a female slave, begotten by her master, is "ipso facto" free, and a slave may authorize a free person to purchase his emancipation. The Christian children, bought by the bey, and the principal inhabitants of Cairo, are educated with the same care as their own children, in every thing necessary to accord with the character of a Mamelotan lord. They are instructed in every necessary exercise of agility and dexterity, and they are generally distinguished by the degree and beauty of their persons. Some of them are excellent sailors; but many can neither read nor write. When their education is finished, they procure employment in the army; and after emancipation, their loyalty and service merit the most lively gratitude and

affection to the generous masters, to whom they owe their fortunes, and both their political and moral existence; nor do they ever quit them in the hour of danger. Thus it often happens, that a master, when he finds any of his slaves possessed of extraordinary talents, and tried fidelity, spares no pains or expence to raise him to a more considerable employment than that which he himself occupies; and thus he at length acquires sovereign power. In order to attain this power, it is necessary to be a Mamlouk, that is, the native of a foreign country, as even the children of slaves, who rise to offices of state, do not enjoy the right of succession. Hence it happens, that as the son of a bey is not honoured with any particular consideration, the women, perhaps, procure abortions. Of 18 beys, whose history was known to Mr. Browne, only two had any children living. Volney observes, that during 550 years Mamlouks have been in Egypt, and that not one of them has left subsisting issue; but all their children perish in the first or second descent. Hence he infers, that those who are transferred from the vicinity of mount Caucasus, to the banks of the Nile, are incapable, by the influence of the climate, of perpetuating their progeny. To this circumstance it is owing, that the Mamlouks are replaced by slaves brought from their original country. From the time of the Moguls, this commerce has been continued on the confines of the Cuban and the Phasis, in the same manner as it is carried on in Africa, by the wars among the numerous tribes, and by the misery of the inhabitants, who sell their own children for a subsistence.

Distinguished by favouritism or merit, the Mamlouk becomes a cashef, or kiaschef, and in time a bey. The chief cause of preference arises from political adherence to some powerful leader. The number of these beys has seldom or ever been complete; and the revenues of the vacant places were probably shared among the rest, who were actual occupants of their office. Each of these beys is nominally chosen by those that remain; but in fact appointed by one of the most powerful.

The "Yenk-tchery Aga," and several other officers, are enumerated among the 24 beys. Besides being governors of certain districts of Egypt, several of the beys receive other dignities from the Porte. Such are the "Scheik-el-belled," or governor of the city, which is an office merely civil, unaccompanied with any military power; the "Defterdar," or accountant-general; the "Emir el Hadj," or leader of the sacred caravan; and the "Emir el Said," or governor of the Upper Egypt; which last two offices are annual. These officers have also revenues allotted them by the Porte, ill-defined, and liable to much abuse. Of the other beys, each appoints all officers and governors within his district, putting into it some slave of his own, who is compelled to render an account of the receipts; of which a part is appropriated to support the grandeur of his master. An opulent bey may have from 600 to 1000 purses annually; the revenue of Murad Bey more than double that sum. The inferior beys may have 300 purses, or 15,000*l.* The revenues of the beys are raised by a land-tax and the produce of the customs, amounting together to near two millions sterling, of which but a small proportion reaches the coffers of the Porte. Every bey sits in judgment on cases of equity. These personages are very observant of their respective jurisdictions; and no bey will imprison a man liberated by another. Although sometimes too impetuous, they nevertheless display great acuteness and knowledge of characters. This government possesses at least every advantage of publicity, as every bey is a magistrate. But the justice of the rulers is ever liable to the omnipotent influence of gold. Each bey appoints his cas-

hefs, or lieutenants. These officers preside each over a town or village, collecting the revenues, and judging small causes; but an appeal lies to the bey. The beys and the cashefs are, from their ignorance, constrained to employ Copts as accountants in adjusting and receiving the revenues, that duty being of an intricate nature, and requiring great local knowledge. The authority of a cashef is as arbitrary as that of a bey.

The beys in Egypt have been gradually acquiring an increase of authority and influence, and reducing the power of the Ottoman Porte to a feeble and degraded state. To this several circumstances have contributed; such as the unrestrained traffic of slaves; the neglect of the affairs of this province on the part of the Ottoman Porte; the extension of the power of the divan, and the restraint of that of the pachas, and the consequent uncontrollable influence of the janizaries and Arabs. To which may be added the change that took place in the condition of the soldiers, by their becoming citizens, and by the marriages they contracted, and the change also introduced into their discipline; and, more especially, the permission granted to the chiefs of possessing distinct property, lands, and villages, dependent on the Mamlouk governors, whom it became necessary to conciliate, in order to prevent their oppression; and the ascendancy acquired from that moment by the beys over the soldiers, and increased by the great riches accruing from their governments. These riches they employed in multiplying their slaves; and, after emancipating them, advancing them in the army, and promoting them to various employments. By such means Ibrahim, one of the kiayas or veteran colonels of the janizaries, rendered himself, in 1746, master of Egypt; for he had so multiplied and advanced his freedmen, that, of the 24 beys, which should be their number, no less than eight were of his household. His influence was also the more certain, as the pacha always left vacancies in the number, in order to receive the emoluments. On the other hand, the largesses he bestowed on the officers and soldiers of his corps, attached them to his interest, and Rodvan, the most powerful of the Arab colonels, uniting with him, completed his power. The pacha became a phantom, and the orders of the sultan vanished before those of Ibrahim. At length, about the year 1766, Ali Bey gained a decided ascendancy over his rivals, and under the titles of "Emir Hadj," and "Scheik el Belled," rendered himself absolute master of the country. (See ALI BEY.) Mohammed Bey, surnamed "Aboudahab," or father of gold, from the luxury of his tent and caparisons, who succeeded him in 1773, during a reign of two years, displayed nothing but the ferocity of a robber, and the baseness of a traitor. Upon his death in 1776, Murad, a favourite of Mohammed, was advanced to the dignity of bey; but he had a formidable competitor in Ibrahim, who had been a slave of Ali Bey the Great. The two rivals, however, adopted conciliatory measures, and entered into an agreement to divide the authority, on condition that Ibrahim should retain the title of "Scheik el Belled. This union was a prudential measure, and necessary to their safety; for since the death of Ali Bey, the beys and cashefs, who owed their promotion to his house, repined at seeing all the authority transferred to a new faction; and after several intrigues and cabals, formed a confederacy, under the denomination of the house of Ali Bey. The chiefs of this confederacy were Hassan Bey, formerly governor of Djedda, and Ismael, the only remaining bey of those created by Ibrahim Kiaya; and they conducted their plot so well, as to oblige Murad and Ibrahim to abandon Cairo, and retire as exiles into the Said. These exiles, being reinforced by the refugees, returned, and compelled the confederates, Ismael and Hassan, to make their escape

escape into the Said. Ibrahim and Murad have since ruled Egypt, the former as "Scheik el Belled," and the latter as "Dester-dâr," though not without mutual jealousies and attempts to destroy each other. They, however, conspire together to recruit the number of the Mamlouks, and to collect treasure from all quarters. In the year 1791, Salah Aga, a slave of Murad Bey, was deputed, from the government of Egypt, to negotiate their peace with the Porte. He carried with him presents of horses, rich stuffs, &c. He was well received, and was afterwards appointed "Wakil el Sultan," i. e. agent or attorney to the sultan in Cairo. This office was probably given him to engage him in seconding the efforts of the court for disinfranchising the beys; but it was ineffectual. These had formerly experienced the evils of division, and were now united by common interest, grown rich, and well provided with slaves. It is said, that no tribute has since that time found its way to Constantinople. Ibrahim and Murad are considered as usurpers by the beys of Upper Egypt, who are favoured by the Porte. The most powerful house is that of Ibrahim, who has about 600 according to Volney, but about 1000, says Mr. Browne, Mamlouks. Next to him is Murad, who has not above 400 Mamlouks, says Volney; but according to Browne, they amounted, in 1796, to about 1700. He was originally a slave of Mohammed Bey, and succeeded in defeating and taking prisoner Ali Bey the Great. He is detested by the Porte. He is described by Sonnini, as handsome and martial in his appearance; his chin is covered with a bushy black beard; his thick eye-brows describe arches of ebony over his large eyes, which sparkle with vivacity and fire. A long scar in one of his cheeks adds to the fierce cast of his countenance. To great bravery, he joins singular address and extraordinary strength. He has been known, when riding by an ox, to cut off its head with one stroke of his scimitar. An intrepid warrior, capable of enduring the severest hardships, an excellent horseman, dexterous and powerful in the use of the sabre, courageous in adversity, bold in enterprise, cool in action, but terrible in onset. Murad, with instruction, might have become a great general. His proud deportment, and magnificent disposition, give him the dignified appearance of a sovereign; but injustice, ignorance, and cruelty, have rendered him a ferocious tyrant. Murad, says Mr. Browne, is one of those beys who can neither read nor write. Of the profusion of this bey, Sonnini has given the following account. In his camp were erected immense tents, divided into several apartments, for the accommodation of himself and his principal officers. The floors were covered with the most beautiful carpets, and the interior decorations consisted of the richest gold and silver stuffs that the manufactures of Lyons could afford. Nothing could equal the magnificence of his cavalry. Gold and silver ornaments, with the choicest embroidery on Morocco leather, glittered with a dazzling lustre in the rays of a burning sun; and the housings of the saddles, trimmed with a broad gold lace, were made of those handsome velvets, the small and delicate patterns of which display the elegant taste that prevails in the productions of the manufacturers of Lyons. His profusion is supplied by his rapacity. He is accustomed to have from the mint daily, for his pocket expences, 500 half mahbûbs, and his wife the same. This amounts to 1500 piastres, and is only a small part of his disbursements. He is married to the widow of his maker, the daughter of the celebrated Ali Bey. Next in power to Murad, is Mohammed Bey Elî, whose name imports that he was bought for 1000 patackes. His master was Murad Bey, just mentioned. He is represented as quick in apprehension, and impetuous in action. His power is great and increasing; he has 800 Mamlouks. Ibrahim Bey, "el Uah," a name derived from the second

military magistracy in the city of Cairo, is a young man about the same age with the last mentioned, of a sedate, but firm character, married to the daughter of the elder Ibrahim, and attached to his interests. He has 6 or 700 Mamlouks. Aiûb Bey, "al Zogheir," or junior, is another powerful leader, distinguished by his superior capacity, and on all occasions consulted by the rest. He has not many Mamlouks; he is prudent and economical, and rarely accused of extortion. Fâtme, now the aged daughter of the famous Ali, is held in much respect by all the beys. Even Murad, her husband, treats her with reverence. When a bey is appointed to a government, he never fails to pay a visit to this old lady, who lectures him on his duties, and will say to him, "Do not pillage the people; they were always spared by my father."

Of the systematic rapacity of the beys, the following instance is mentioned. Ibrahim Bey, at a festival occasioned by the marriage of his daughter to another powerful bey in 1792, invited to his house a famous singer, who had been employed, during the preceding day and night, in the exercise of her profession, and who had received considerable donations. She readily complied, expecting employment, and liberal recompence. The bey asked her "How many half sequins did you collect yesterday?" She replied, "about ten thousand." "Pay me eight thousand then," said the bey, "and I will give you a note of credit on Ibrahim Jeahari, my secretary." The money was paid, but the woman was turned out of the house without receiving any security whatever; and is said to have died of the disappointment. Volney's Travels through Syria and Egypt, vol. i. Sonnini's Travels in Upper and Lower Egypt, p. 424, &c. Browne's Travels in Africa, &c. p. 47, &c. See BASHAW, and MAMLOUK.

BEY of Tunis, denotes a *prince*, or *king* thereof; answering to what at Algiers is called the *dey*. He is chosen out of the army; each order, even the most inferior, having an equal right and title to that dignity with the highest.

In the kingdom of Algiers, each province is governed by a bey or vice-roy; who is appointed and removed at pleasure by the bey; but has a despotic power within his jurisdiction; and at the season for collecting the tribute from the Arabs, is assisted by a body of troops from Algiers.

The kingdom of Tunis is not divided into provinces, like that of Algiers, and governed by provincial beys, or vice-roys; but the whole is under the immediate inspection of the bey himself, who collects the tribute in person. For this purpose, he visits, with a flying camp, once every year, the principal parts of it; traversing, in the summer season, the fertile country in the neighbourhood of Keff and Baijah; and in the winter, the several districts betwixt Kairwan and the Jered.

BEYAH, in *Geography*, anciently called *Beypassa*, and the *Hyphasis*, or *Huphasis* of Alexander, a river of Hindoostan, that rises in the great chain of snowy mountains, extending from Sirinagur, to the north of Cashmere, or the ancient Imaus; and after traversing the Panjab, it joins the Setlege at Ferozpour; about 24 miles below the conflux, a separation again takes place, and four different streams are formed; the northernmost and most considerable of which recovers the name of Beyah, and is a deep and rapid river. The others are named Herari, Dond, and Noorney; and near Moultan they unite again, and bear the name of Setlege, until both the substance and the name are lost in the Indus, about 80 miles, or three days' sailing, by the course of the river, below the mouth of the Chinamb. Remond's Men. p. 102.

BEYENBERG, or BIENBERG, a town of Germany, in the

the circle of Westphalia, and duchy of Berg, on the Wipper, 3 miles north of Lennep.

BEYERLAND, an island belonging to Holland, situated on the Meuse, with a town of the same name; 4 leagues west of Dort.

BEYERN, a town of Germany, in the circle of Swabia, and county of Fustenberg, situated on the Danube, 4 leagues from Durlingen.

BEYHARTING, a town of Germany, in the circle of Bavaria, 24 miles E. S. E. of Munich.

BEYKE. See BEKI.

BEYLA, a town and district of Abyssinia, in Sennar, about 11 miles west of Teawa, and 31½ miles due south, in N. lat. 31° 42' 4". Between Teawa and Beyla there is no water. Imgededema, and a number of villages, were supplied with water from wells, and had large crops of Indian corn sown about their possessions. But the Arabs Daveina have destroyed these places, filled up their wells, burnt their crops, and exposed all the inhabitants to die by famine.

BEYMONT, or BEYWORT, a town of Germany, in the bishopric of Liege, 8 miles south of Liege.

BEYNAT, the chief place of a canton, in the district of Brives, and department of Correze, containing 1462 inhabitants; those of the canton being 5488. The territory comprehends 135 kilometres and 6 communes.

BEYS, GILLES, in *Biography*, a printer at Paris, in the 16th century, who first introduced into his editions the distinction suggested by Ramus in his grammar between *j* and *v* consonants, and the vowels *i* and *u*. He died in 1595.

BEYSZKER, (*Gesn. Thierb.*) in *Ichthyology*, a name of the *cobitis fissilis*. Gmelin.

BEZA, THEODORE, or THEODORE DE BEZE, in *Biography*, an eminent divine among the first reformers in Geneva, was born of parents nobly descended, in 1519, at Vezelai in Burgundy, and sent by his uncle, who was a counsellor in the parliament of Paris, to Orleans, in 1528, to be educated by Melehiour Wolmar, a protestant and an excellent teacher. Having continued seven years under his tuition, he commenced the study of the law at Orleans; but his taste led him to the cultivation of polite literature, and he composed several Latin poems, which were considered by the learned as a promising specimen of his talents. After taking a law-degree, he returned, in 1539, to Paris, where his parents, who had intended him for the ecclesiastical profession, had procured for him a valuable abbacy. Addicted to the delights of an easy and voluptuous life, he remained for some years at Paris; but under the influence of sentiments imbibed in his youth from his protestant preceptor, he determined sooner or later to break his fetters. A marriage contracted from conscientious motives rendered it necessary for him to resign his benefices, and hastened in the execution of his purpose by the reflections attending a severe illness, he and his female companion fled, in 1548, to Geneva. In the following year he accepted the offer of a Greek professorship at Laufanne, in the exercise of which he continued with reputation for nine or ten years. Here he read lectures in French on the New Testament, and published several books; one of which was a tragi-comedy, in French, entitled "Abraham's Sacrifice," which passed through several impressions. Having frequent opportunities of visiting Calvin at Geneva, he was induced by his persuasion to finish the version of the Psalms, which had been begun by Marot. During his residence at Laufanne, he published a treatise, "De Hereticis a Magistratu puniendis," in reply to a book written by Castalio, after the execution of Servetus; and in this treatise he maintained a doctrine no less dangerous in its tendency than inconsistent with his principles as a reformer and protestant, that it was the

duty of the civil magistrate to punish heresy. He also wrote on predestination, and the eucharist, in opposition to the Lutherans, and others, and in a style of raillery which a maturer judgment and after-reflection led him to correct. In 1558, he was selected as one of the deputies commissioned by the protestants, to engage the German princes in favour of their brethren imprisoned at Paris, and of the persecuted inhabitants of the vallies of Piedmont. In the following year he removed to Geneva, where he became the colleague of Calvin, both in the church and university, and where by his abilities, learning, and zeal, he co-operated with him in advancing the reformation. In 1561, he distinguished himself by his eloquence on behalf of the protestant party, at the conference of Poissy; although he gave offence by his declared opposition to the doctrine of the real presence. Continuing in France, he attended the prince of Condé as a minister, when the civil war broke out, and accompanied him to the battle of Dreux. Upon his return to Geneva, in 1563, he wrote several books in theological controversy, with an acrimony that cannot be justified by persons of moderation and candour. In 1571, he officiated as moderator in the national synod of Rochelle, and in the following year assisted in that of Nismes. In 1586, he held a disputation with Andreas, a Lutheran divine of Tubingen; and through the whole course of his life, the party to which he belonged availed itself, on many occasions, of his talents and reputation. Having lost his first wife in 1588, he soon married another. Although the infirmities of his advanced age required his withdrawing from the duties of public instruction, the ardour of his genius remained to the close of his life, and he wrote Latin verses a few years before his death, which happened in October 1605, after he had passed his 86th year. Of his singular natural talents and literary acquirements no doubt can be entertained; nor need we wonder that bigotted Catholics should have calumniated him whilst he lived, and reviled his memory after his death. He has indeed, by his enemies, been unjustly traduced as a hypocrite, and a person of lax morals; but charges of this kind are refuted by the uniform tenour of his life. His partial advocates, however, must regret that, as a disputant, he was violent, impetuous, and dogmatical, and deficient in candour and charity. His juvenile pieces, in Latin poetry, in which critics have detected many numerous deviations from classical purity, were first printed in 1548. Some of these, with corrections, together with others of a more serious cast, were printed by the Stephenses at Paris, in 1597, 4to. under the title of "Theod. Bezæ Poemata varia." His French works are of an inferior kind. His theological works are numerous. Of these, the most generally read, and the most highly esteemed, is his "Latin version of the New Testament," with critical and theological remarks. For an account of the MS. in his possession, see CAMBRIDGE MS. Gen. Dict.

BEZABA, in *Geography*, a river of Spain, which runs into Orïo, in the province of Guipuscoa.

BEZABDA, or GOZERTA, *Geziret ebn-Omar*, in *Ancient Geography*, a town of Asia, on the right bank of the Tigris, south-west of Tigranocerta, in the country called Zabdicana.

BEZANT, represents, in *Heraldry*, round flat pieces of gold. They were first borne by the soldiers of the holy wars, being the current coin of Byzantium (the modern Constantinople), with which the stipends of the army were discharged, and from whence they took their name. They are always emblazoned gold, but the foreign heralds make them both gold and silver.

BEZANTIE, is when the field is powdered with bezants, or when supporters, or crests, are strewed with them. The proper heraldic term is bezantie. When a

border is charged with eight bezants, that being the limited number, you need not express the number, but say, a border *solis bezantie*.

BEZANTLIER signifies the second branch of the horn of an hart or buck, that shoots from the main beam, and is the next above the brow-antler.

BEZARA, in *Ancient Geography*, a town of Galilee near the sea, south of Ptolemais.

BEZDELKINO, in *Geography*, a town of Siberia, 80 miles north of Balaganskoi.

BEZDZIEZ, a town of Lithuania, in the palatinate of Brzesc, 24 miles west of Pnisk.

BEZE, a town of France, situate near the source of a river of the same name, in the department of the Côte d'Or, and chief place of a canton, in the district of Is-sur-Tille, 2½ leagues E. S. E. of it.

BEZEK, or BEZAKA, in *Ancient Geography*, the place where Saul reviewed his army, before he marched against Jabesh-Gilead. 1 Sam. xi. 8. Eusebius mentions two cities of this name, near one another, 7 miles from Sichem, in the way to Scythopolis.

BEZENSTEIN, or PETZENSTEIN, in *Geography*, a town of Germany, in the circle of Bavaria, and territory of Nuremberg, 19 miles N. E. of Nuremberg.

BEZER, in *Ancient Geography*, a city beyond Jordan, over-against Jericho, in the wilderness, assigned by Moses to the tribe of Reuben, intended by Joshua to be a city of refuge, and given to the Levites of Gershom's family. Deut. iv. 47. Josh. xx. 8. The vulgate in both places denominates it *Ezer*. Eusebius confounds it with Bozra of Arabia, which lay much farther to the east. See BOSTRA.

BEZETH, a city of Palestine, on this side Jordan, in the vicinity of Jerusalem, which Bacchides surprised, and the inhabitants of which he threw into a pit; probably the same with Bezecath. 1 Maccab. vii. 19.

BLZETHA, or BETZETA, a division or part of Jerusalem, situated on a mountain, and encompassed with walls, being, as Josephus says, a new city attached to the old one, and called in Greek *Κατω πόλις*, Cainopolis. It lay north of Jerusalem and the temple.

BEZETZ, in *Geography*. See BESHETSK.

BEZILLN, a town of Transylvania, 12 miles N. N. E. of Sibiu.

BEZIERES, a city of France, and principal place of a department, in the department of the Hérault, situate on the left bank of the Orbe, not far from the grand canal. Before the revolution, it was the residence of a governor, and a see of a bishop, suffragan of Narbonne; its cathedral was small, but beautiful; it had beside a collegiate church, several religious houses, two hospitals, a college founded by the inhabitants in 1597, and an academy of sciences and belles lettres. It is surrounded by a wall, flanked with old towers, and decayed battlements. The number of inhabitants in both its sections is estimated at 14,211, and the population is small in proportion to its extent. The canton of the first section has 11,300, and that of the second 13,147 persons. The former canton has 9, and the latter 7 communes. The territorial extent of both comprehends 365 kilometres. The situation is beautiful, and it commands a view of several cities of the grand canal of La guedou. In the Not. I. 3. 11. it is called "Civitas Biterrensis, Biterra Septimanorum." In the 5th century it was ravaged by the Vandals; by the Saracens, in 720; by Charlemagne, in 737; and by the Moors, in 1209; when, in the course of a year, the Albigensians took it by assault, and put more than 50,000 of the inhabitants to the sword. Since this time it has not recovered its ancient lustre. It was re-annexed to the crown by S. Louis, in 1247.

Its territory is fertile in corn, oil, and wine. It has also mineral waters. N. lat. 43° 20' 41". E. long. 3° 12' 35".

BEZIRA. See BAIRA.
BEZOAR, BEZARD, primarily denotes an antidote, or counter-poison. The word is formed from the Persian *pā-zabar*, which denotes the same, *pā* signifying *again*; and *zabar*, *poison*.

BEZOAR, *Lapis Bezoardicus*, is a term applied in a general way to various substances found in the stomach, intestines, and other internal cavities of the bodies of quadrupeds.

The true bezoar, however, is a calculous concretion, usually formed in the stomach of some of those animals which ruminates, or chews the cud. There are two sorts of the bezoar stone; one is brought from the East Indies, and Persia, and thence known under the name of *Oriental* bezoar. The other kind comes from the Spanish West Indies, or South America, and is called *Occidental* bezoar. The Oriental is considered by far the more valuable kind, and is exceedingly scarce, even in India. The larger the stone the more highly it is esteemed; its price increasing, like that of the diamond, in proportion to its size. A stone of one ounce has been sold in India for 100 livres, and one of four ounces and a quarter for 2000 livres. The price of the smaller stones, in Germany, in the year 1600, was from 16 to 32 ducats the ounce; but it had then much declined. The larger bezoars had no regular price, being often enormously dear. As long as it retained its fancied reputation, as an antidote to every kind of poison, and as a cordial for the support of life under the most trying circumstances of disease, its price was advanced beyond its weight in gold, and it found a high place for many centuries among the most costly collections of precious stones. The size varied from that of a pea to a hen's egg, or even larger. Boetius relates, that in his time, the emperor Rodolph II. possessed one of the size of a goose's egg, which he ordered to be hollowed out into a cup, when the nucleus was found to be a small mass of herbs still strongly aromatic. The most anciently known bezoar stones were procured from the stomachs of goats feeding in the mountains of Persia, and those from the mountain goat were in such high request, that the emperor Shah-Abbas (who died in 1628,) claimed all above a certain standard as a royalty, and appointed collectors for the purpose. The Oriental bezoars passed through the hands of the Armenian and Persian merchants, and were formerly brought to Europe in considerable quantities. In the east, the most esteemed that were obtained from goats feeding in the mountains, as the aromatic herbs found there were supposed to add much to the virtues of the calculus.

Authors disagree with respect to the animal in which the genuine Oriental bezoar is found; some attribute it to a species of goat, others to the antelope genus. Most naturalists allow this substance to belong to the gazelle, (*Antilope Gazella*, Gmel.) Aldrovandus calls this species of antelope, *hircus bezoardicus*; Linnæus, *capra bezoardica*; and Pennant, the *leopard antelope*. Pallas, however, in his *Spicilegium Zoologiae*, gives the same name to the Egyptian antelope, (*Antilope Oryx*, Gmel.) Cuvier describes the Oriental bezoar as being found in the intestines of the *capra asperus* of the Linnæan system, and Gmelin ascribes it to the *capricorne* goat. By the account of Clavius, the animal furnishing this concretion would seem to be larger than the goat, and more resembling the Nylghau. There can be little question but that similar substances have been occasionally met with in each of these animals, and in several other species.

The bezoar stone, when genuine, varies much in its form; the depending upon the figure of the nucleus, upon which the calculous matter is deposited, there being generally some foreign

foreign body in the centre of the bezoar. The substances which usually serve for nuclei to these concretions are straw, hair, small pebbles, nuts, hard seeds, stones of fruit, &c. but the most frequent nucleus of the real oriental bezoar, is the pod of a fruit, much like that of the *Acacia vera Egyptiaca*: though it at first sight resembles a *caffia*, or tamarind stone. In some of the bezoar stones formed on this fruit, the outer membrane of the bean having perished, and the bean shrunk in drying, there remains a vacuity between it and the inner surface of the bezoar, so that it rattles within it, when shaken, in the manner of an *aites*, or *eagle stone*. It is of little moment what the figure or nature of the body may be, which is to serve the purpose of a nucleus, as it cannot, in the slightest degree, affect the quality of the calculous substance which is to be collected on its surface; any extraneous matter will suffice for this purpose, which may happen by any accident to be long enough detained in the stomach or intestines. The formation of bezoars appears to be effected in a manner similar to that observed in the production of the calculi of the urinary bladder of the human subject. We may presume that the bezoar is only formed when there is a tendency in the animal to generate an extraordinary quantity of calculous matter; for if it were otherwise, as that these substances were produced by any combination of the ordinary contents of the stomach and intestines, what animal, that is liable to such collections, could ever be without them? whereas, on the contrary, they are so scarce in the East Indies, that those which are brought into this country are supposed to be in general artificial compositions; nay, some have doubted if we ever meet with a genuine oriental bezoar in this country.

The season of the year also appears to influence their production. Camerarius remarks, that these bodies begin to form towards the month of November: and when the Parisian anatomists discovered a bezoar in the stomach of the *Chamois (Antelope Rupicapra)*, it was the month of December.

The number of bezoar stones varies, in different animals, from one to six; hence, it is said to be customary, previous to purchasing a bezoar animal, to reckon the number of stones it contains, which can be ascertained by feeling externally, and by this the price of the animal is regulated.

Velchius asserts, that the bezoar is only found in the first or second stomachs of ruminant animals, but the anatomists of the French academy state, that they met with it in the third stomach; and others have mentioned its being sometimes situated in the intestines.

All bezoars are made of concentric layers, or by stratum super stratum, after the manner of the common urinary calculus. This proves their formation to be gradual; and as this mode of increase cannot be easily imitated, it is probably one of the best marks for distinguishing the genuine bezoar from that which is counterfeited.

The Oriental bezoar is smooth and glossy on the surface, the colour a dark green or olive; on removing the outer coat, that which lies next it appears likewise smooth and shining; it is generally less than a walnut; it is most esteemed for its medicinal properties, and is the only sort retained by the London college. The Edinburgh college, in some of the former editions of their pharmacopœia, directed both this and the occidental bezoar, but they now seem to allow them to be used promiscuously, retaining in their catalogue only the name of *lapis bezoar*.

The imitations of this stone have been carried to such perfection, that as far as respects form, colour, or other external characters, the deception cannot well be detected. Mr. Neumann supposed that those which come nearest the genuine bezoar, are a composition of plaster of Paris, chalk, or

other earths stained of the proper colour by some vegetable tincture. Those which are palpably counterfeited, are composed chiefly of some resinous substance, and may be easily discovered by their liquefying in the fire, and being soluble in spirits of wine; he never could discover any mark of an animal nature in any of these. Chemical works, by Dr. Lewis, p. 533, &c.

The modes of trying if bezoar be genuine are, 1st. To immerse a portion of it, for some hours, in moderately warm water, when the water ought to remain untinged, and the stone undiminished in its weight: 2d. to apply to it a sharp red hot iron, which it should resist without frying or shrivelling: 3d. which is considered the most certain experiment, is to rub the bezoar over a paper which has been previously smeared with chalk or quicklime: if it leave a yellow tint on the former, or a green one on the latter, there is no doubt of its being genuine.

The *occidental bezoar* is uneven on the surface; of a dirty green colour; it is heavier and more brittle than the oriental, to which it is considered much inferior in value; it is of a looser texture, and when fractured, the layers appear thicker, and exhibit a number of striz curiously interwoven. It is also found of a much greater size; sometimes being as large as a goose's egg.

The occidental bezoar has been found in some of the camel tribe, especially the *guanaco*, *Camelus Huanaeus* and the *Vicuna (Camelus Vicugna)* which are inhabitants of South America.

This kind of bezoar, Mr. Neumann apprehends, is more likely to be an animal production than the other, because it yielded, on distillation, a small portion of volatile urinous matter. Chem. Works, p. 537.

The analysis of bezoar stones, as related by different chemists, is very contradictory, which has given rise to the opinion of the specimens which they submitted to experiment, being spurious. Those stones examined by Stare, as oriental bezoar, did not dissolve in acids. Those which Grew and Boyle made trial of, did. Those employed by Geoffroy (in some experiments related in the French Memoirs, 1710,) did not seem to be acted on by spirits of wine, whilst those specimens examined by Neumann, at Berlin, almost entirely dissolved in spirits. For an account of the analysis and chemical properties of the bezoar and similar substances; see CALCULUS.

In the early ages, when a knowledge of diseases was considered an occult and mysterious science, rare and unknown plants, or unusual, and what were considered wonderful animal productions, were chiefly employed in the way of medicines; at this period we accordingly find the bezoaric stone possessed great reputation as a remedy for many diseases; it owed, no doubt, much of its fame to the fabulous accounts which were related with respect to its origin.

It was not known to the Greeks. The first person who has mentioned it was *Avenzoar*, an Arabian physician. He describes it to be generated of the tears, or gum, of the eyes of flags, who, after eating serpents, were accustomed to run into the water up to the nose, where they stood till their eyes began to ooze a humour, which collecting under their eye-lids, gradually thickened and coagulated, and when it became quite hard was thrown off by the animal rubbing itself against the trees. Other stories concerning the history of the bezoar, equally wonderful and ludicrous, were credited, until the time of Garcias al Horto, physician to the Portuguese viceroy of the Indies, who gave the first true account of the origin of this substance. Kempfer afterwards gave a description of it with some new particulars.

The bezoar was first employed to prevent the fatal consequences of poison. This is expressed by the very name which

which is derived from the Persian word *badzcher*, or *bazcher*, an *antidote*, or from *paralar*, of which *pa* signifies *against*, and *alar*, a *poison*. Others derive the term bezoar from the Persian *pazar*, a goat.

It was afterwards given in vertiges, epilepsies, palpitations of the heart, jaundice, colic, and a great many other diseases; so that if its real virtues were answerable to its reputed ones, it was doubtless a *panacea*. Even later writers have bestowed extraordinary commendations on it, as a sudorific and alexipharmic; but there is every reason to doubt its possessing any such virtues. It is an earthy substance, devoid of taste or smell. The history of its formation proves that it is not digestible, or otherwise affected by the juices of the intestinal canal. If it can ever be employed as a medicine, it should be on account of its absorbent quality, which, however, it appears to possess but in a very slight degree. It has been administered to patients in the quantity of half a drachm, and in some instances a drachm has been taken, without producing any sensible effect: the dose has been generally stated at a few grains, which was probably on account of its scarcity and great price. While it retained its medical reputation, it was said to act as an antidote to every poison, vegetable or mineral, and to the bite or sting of all poisonous animals, in the dose of about 3 grains; but it would equally prove a counter-poison when taken regularly in the quantity of two grains daily, in a glass of wine, or especially of distilled water of *carduus benedictus*. To preserve an youthful constitution and vigour, an oriental's recipe is to take twice a year (purging being premised) ten grains of bezoar daily, for five successive days, with a cup of rose-water. Bezoartic productions are at present so little regarded for their medicinal properties, that few druggists now think it necessary to have them in their possession.

BEZOAR, *Equinum*, is the name given to the calculous concretions occasionally met with in horses. They appear to be formed in the same manner as the bezoar of the antelope or camel genus. They grow to a considerable size; have usually an irregular form, something between a compressed sphere and a rhomboidal figure; when divided, they exhibit the usual succession of strata, of which they are composed, but which are not so distinct as in the other bezoars; each layer is formed of excentric striz, which are in many places more evident than the division into strata; consequently the section of the bezoar gives the appearance of its having been made of radiated, rather than concentric layers. The surface of the calculus bears great resemblance to a piece of polished lime-stone.

BEZOAR, *German*, is called by some *cow's egg*, from the circumstance of its being occasionally found in the stomachs of cows, but the animal from which it is most commonly obtained is the chamois (*Antelope Rupicapra*).

The nucleus of the German bezoar is either the hair which the animal may have swallowed, when licking itself, or the fibres of undigested vegetables, which are rolled into a round smooth ball. The quantity of calculous substance which is collected upon this ball is in general very trifling, often being merely a thin pellicle.

The bezoar which was found in the chamois by the Parisian academicians, was made up of the woody fibres of the plants the animal had eaten; it was smooth and beset with mucus on the surface; and was broken at one end, exposing a cavity in the centre of the ball, which had formerly, no doubt, been occupied by some solid substance, such as a pellicle, or stone of some fruit.

German bezoars have been found, according to Bartholin, and others, in horses and sheep, in which last they are chiefly composed of wool, which these animals accidentally swallow.

From these species of bezoar having little, if any, calculous matter in their composition, they have been called by some writers, with propriety, *Agagrepilz*; which see, and BALLS.

Besides what have been already described, there are concretions found in the gall bladder of animals, to which the term *bezoar* has been applied; these appear to be no other than biliary calculi.

The *Hog* or *Boar* BEZOAR, called by the Dutch *Pedro de porco*, and by the Portuguese, who first brought it into Europe, *Pedro de vaparis*, is found in the gall bag of an East India boar; in form and magnitude it resembles a filbert, though more irregular; it is most commonly white, with a tinge of green; the surface is smooth and shining, and is valued at ten times its weight in gold.

The Indians attribute extraordinary medicinal powers to this bezoar. They call it *Mastica de sobo*, and prefer it to that obtained from the Gazelle; they consider it a sovereign remedy for the *mordoxé*, a disease to which they are liable, and which is not less dangerous than the plague in Europe. They allow it to have great efficacy also in malignant fevers, small-pox, and most diseases of women not with child, it being supposed to produce abortion in those who are pregnant, if they use it indifferently. When it is to be used as a medicine, it is infused in water or wine, until it has communicated a little bitterness to it. To facilitate the infusion, and at the same time preserve so precious a stone, they usually inclose it in a gold case, which is pierced with holes.

The *Porcupine* and *Monkey* BEZOARS, are also the biliary calculi of these animals. Tavernier asserts, that they are not taken from the gall bladder, but the heads of the ape and the porcupine, which is highly improbable, and contrary to general analysis; he calls them *Malacca stones*, and says that they are held in such estimation by the inhabitants of Malacca, that they never part with them, except as presents to ambassadors, or the greatest princes of the East.

According to Neumann, single stones, taken from the porcupine or monkey, have been sold for sixty and eighty pounds sterling.

It is not impossible but that those bezoars which are formed in the gall bladder may possess some power as medicines; perhaps also solutions might be employed with advantage in surgery, but their great reputation amongst the Indians seems to arise altogether from ignorance and superstition.

BEZOAR, *bovinum*, is a yellowish stone, found in the gall bags of the ox. It has been used by miniature-painters in several calls of yellow.

BEZOAR, in *Conchology*, a species of BUCCINUM, that inhabits China. This shell is subrotund and rugose: anterior part of the whorls lamellated; pillar perforated. Gmelin. The colour is dirty ochraceous, varied with brown: within yellow; coarse, decussated with wrinkles, or striz; tail folded, bent, rugose with imbricated scales: spire angular with straight sides: anterior part flattish, plaited, or dentated above.

BEZOARA, or BUZWARA, in *Geography*, a town with a fort in the peninsula of India, situate on the north side of the Kistna river, distant 403 geographical miles from Masulipatam. N. lat. 16° 33'. E. long. 80° 39'. In the town is a magnificent pagoda, and another stands on an eminence without it; which attract a great number of pilgrims, whose contributions are distributed in alms to the poor.

BEZOARDICS. The peculiar virtue of the bezoar being that of resisting and expelling poisons; the term *bezoardic* (now, however, nearly obsolete,) has come to be almost synonymous with *antidote*. Thus, when a bezoardic medicine is mentioned, it implies, with the older writers, either a

medicine into which bezoar enters, or one that resembles the bezoar in its supposed power of counteracting poisons, or afterwards, simply, a cordial. A few metallic preparations have had this appellation.

BEZOARDICA CAPRA, Syst. Nat. *Hircus bezoardicus*, Alér. *Animal bezoardicum*, Rej. *Bezoar Antelope*, Pennant, &c. names of the *Antelope Gazella*. Gmelin.

BEZOARDICA terra, a name used by some authors for a medical earth dug in the pope's territories, and more frequently called *TERRA noceriana*.

BEZOARDICUM MINERALF, or *Mineral Bezoar*, is a perfect oxyd of antimony, made by adding nitrous acid to the butter of antimony, and described under the article **ANTIMONY**.

BEZOARDICUM Foviale, is a mixed oxyd of antimony and tin, formed by fusing together these metals, distilling with corrosive sublimate to convert both metals of the alloy into a *butter*, or muriated oxyd, and adding nitrous acid to reduce them both to a perfect simple oxyd. It is entirely disused.

BEZOLA, in *Ichthyology*, the name of a kind of *Salmo*, called by Gesner *Albula cærulea*, and supposed to be in no respect different from *Salmo Lavaretus*.

BEZOUT, STEPHEN, in *Biography*, a celebrated mathematician of France, was born at Nemours, March 19, 1736, O. S. and notwithstanding opposition on the part of his father, devoted himself to the assiduous prosecution of the mathematical sciences, to which his taste strongly inclined him. In 1758, he was appointed adjunct mechanic to the Paris academy of sciences, after having communicated two memoirs on the integral calculus, and affording other proofs of his proficiency in the mathematics; in 1763, he was nominated examiner to the marine; associate to the academy in 1768; and, in the same year, member of the academy of marine affairs, and examiner of the pupils of the royal corps of artillery; and, in 1776, royal censor. His particular attention was directed to the solution of algebraic equations, and he had the honour of first discovering a method of resolving a particular class of equations of all degrees. In this work of investigating the roots of such equations, he was occasionally engaged from 1762 till 1779, when he published his treatise on the subject. To distinguished talents, and elaborate researches in the abstruser parts of mathematics, Bezout added an assiduous discharge of the duties of the public stations which he occupied, and a private character which was deservedly esteemed. The following anecdote furnishes a pleasing specimen of his regard to justice in the exercise of his office, and at the same time of the benignity and consideration of his temper. When two of his pupils were confined by the small-pox, and incapable of attending for the purpose of an examination, the want of which would have delayed their advancement for a whole year, he ventured, though he had never had that disorder, to visit them in person, and to ascertain their proficiency, by which he was enabled to make a report in their favour. His constitution was at length impaired by his unremitting application, the fatigues of his various offices, and some personal chagrins; and he fell a sacrifice to a malignant fever, September 27, 1783, in the 54th year of his age. His publications were "A Course of Mathematics for the Use of the Marine, with a Treatise on Navigation," 6 vols. 8vo. Paris, 1764; a "Course of Mathematics for the Corps of Artillery," 4 vols. 8vo. 1770; "General Theory of Algebraic Equations," 4to. 1779; with a considerable number of Memoirs, chiefly mathematical, in the volumes of the French Academy. Montucla, Hist. des Mathem. vol. iii. p. 47. 298. Hutton's Math. Dict. Art. BEZOUT.

BEZOZZI, ALEXANDER and JEROM, brothers in the

service of the king of Sardinia, at Turin, the most celebrated performers of their time; the one on the hautbois, and the other on the bassoon. These kindred instruments were rendered famous all over Italy during the middle of the last century, not only by the exquisite performance, but by the amiably singular character of these two brothers. Their long and uninterrupted affection and residence together, were as remarkable as their performance.

The eldest, when we heard them in 1770, was 70, and the youngest 60. The *idem velle et idem nolle* were as perfectly in tune as their instruments: so that they had always lived together in the utmost harmony, carrying their similarity of taste to their very dress, which was the same in every particular, even to buckles and buttons. They had lived so long, and in such a cordial manner together, that it was taught, whenever one of them died, the other would not long survive him; which was exactly the case, both dying in 1780, within a few months of each other.

The composition of these exquisite performers generally consisted of select and detached passages, yet so highly polished, that like apophthegms or maxims in literature, each was not a fragment but a whole; their pieces being in a peculiar manner contrived to display the genius of their several instruments and powers of performance. The eldest played the hautbois, and the youngest the bassoon; but it is difficult to describe their peculiarities of expression. Their composition, when printed, gave but an imperfect idea of their sweetness and delicacy: there were such a perfect acquiescence and agreement together, that many of the passages seemed heart-felt sighs breathed through the same reed. No brilliancy of execution was aimed at; all were notes of meaning. The imitations were exact; the melody equally divided between the two instruments; each *forte*, *piano*, *crescendo*, *diminuendo*, and *appoggiatura* (see all these terms in their places), were observed with a minute exactness that could be attained only by a long residence and study together. The eldest brother had lost his under front-teeth, and complained of age; and it was natural to suppose that the performance of each had been better: however, to me (says Dr. Burney), who heard them now, for the first time, it was delightful! If there was any thing to lament in so exquisite a performance, it arose from the *equal perfection of the two parts*; which distracted the attention, except when in dialogue, so much as to render it impossible to listen to both, when both had dissimilar melodies equally pleasing.

They were born at Parma, and had been upwards of 40 years in the service of his Sardinian majesty, without ever quitting Italy, (except one short excursion to Paris, in 1755,) or even Turin, but for that journey, and another to visit the place of their nativity. They were men of a sober, regular, and moral character; in easy circumstances; had a town and country house, and in the former many good pictures by the first masters.

The Bezozzi family has furnished many admirable musicians to Italy, and other parts of Europe. Gæetano Bezozzi, a celebrated performer on the hautbois in the king of France's service, was born at Parma in 1727, entered into the service of the king of Naples in 1736, and into that of the king of France in 1765. We heard him perform a concerto at the *concert spirituel* at Paris in 1774, with great pleasure; and thought him superior to all whom we had then heard on the hautbois, except Fischer. His father, Joseph Bezozzi, had taught the celebrated brothers at Turin, Alexander and Jerom, his brothers, to play on the hautbois and bassoon. "M. Bezozzi of Paris," says Laherde, "in 1780, had during 25 years merited and enjoyed the highest reputation, as well as the esteem of all who knew him. His son

was then lately received into the king's band, and his brother, Anthony Beozzi, attached to the court of the king of Poland, had also a son in the service of that of Dresden, where we heard him perform in 1772, and found him a truly great performer. His *mezza di voce*, or swell, was prodigious; indeed he continued to augment the force of a tone so much, and so long, that it was hardly possible not to fear for his lungs. His taste and ear were exceedingly delicate and refined; and he seemed to possess a happy and peculiar faculty of tempering a continued tone to different bases, according to their several relations: upon the whole, his performance was so capital, that a hearer must be extremely fatigued not to receive from it a great degree of pleasure.

BLZZAMA, MARCELLA, in *Geography*, a town of Italy, in the kingdom of Naples, and country of Otranto, 10 miles N.E. of Tarento.

BHAGNAGUR, a name formerly given to Hydrabad, which see.

BHAKOR. See *BEHNER*.

BHARATA, a name given in the Sanskreet language to Hindoostan.

BHATGAN, a city of Asia, in the kingdom of Nepal; the capital of an independent kingdom. It contains about 12,000 families, extends towards the east to the distance of five or six days' journey, and borders upon another nation, also independent, called "Ciratas," who profess no religion. See *NEPAL*.

BHAVANI, the name of an ancient festival, annually celebrated on the first of May by the Gopas, and all other Hindus who keep horned cattle for use or profit. On this day, they visit gardens, erect a pole in the fields, and adorn it with peonies and garlands. Similar rites are performed by the same class of people in England, where it is known to be a relic of ancient superstition in that country. Hence it should seem, says colonel Pearse, that the religion of the East, and the old religion of Britain, had a strong affinity. *Astic Res.* vol. ii. p. 333.

BIHERAH, a place in Hindoostan, on the east side of the Behat river, where is a pass over it, a little to the N. of W. from Lashore, about 11 minutes north of its parallel, and distant from it 85½ geographical miles. N. lat. 32° 5'. E. long. 72° 12'.

BI, or BIRA, a river of Russia, which, by uniting with the Katcha, forms the river Ob.

BIA, in *Cochin*, a name given by the Siamese to a sort of little white shell, brought in vast numbers from the Malive Islands, and used throughout most part of the East Indies for small money. Nine of these are equal to the French denier; they are called *cori*, or cowries, and belong to the *CYPRÆA* genus of Linnæus.

BIABANA, in *Ancient Geography*, a town placed by Ptolemy in the interior part of Arabia Felix.

BIACULLATUS, in *Ichthyology*, a species of *BALISTE*, having two ventral spines. Bloch. *Genl. &c.* This is *piscis cornutus* of Willughby. It inhabits India, and is of an elongated form, white, cicercous above, and rough to the touch, being covered with very short, luscate, or bushy hairs. It is a native of the East Indies, and, from the structure of the mouth, is a voracious kind, feeding probably on marine worms and crabs. The Dutch call it *Pleom-sich*; and the French, *Balje à dix piquans*, in allusion to the two ventral spines, which constitute the specific character of the fish.

BIÆUM, from *βæz*, *apposition*, in *Rhetoric*, denote a kind of counter-argument, whereby something alleged for the adversary is retorted against him, and made to conclude a different way; for instance, "Occidisti, quia addidisti inter-

fecisti.—Immo quia addidisti interfecto non occidisti; nam si id esset, in fugam me coniecissim." "You killed the person, because you were found standing by his body." (*Bæum.*) "Rather I did not kill him, because I was found standing by his body; since, in the other case, I should have fled away."

BIÆUM, in the *Grecian Læva*, was an action brought against those who ravished women, or used violence to any man's person. Potter, *Archæol.* lib. i. c. 24.

BIÆUM also denotes a kind of saline or sea-wine, used by the ancient Greeks in various disorders. It was made of grapes gathered a little before ripe, and dried in the sun; then pressed, the juice put up in casks, and mixed with a large proportion of sea-water; though Dioscorides seems to describe it as made of grapes steeped in sea-water, and then pressed. Gorr. *Def. Med.* p. 75.

BIÆFAR, or BIAFRA, in *Geography*, a populous and powerful kingdom of Africa, situate west of Medina and east and south-east of Benin, from which it is separated by a chain of mountains; and extending beyond the fourth degree of north latitude, to the coast of the gulf of Guicena. It has a capital of the same name; and the bay on its coast is called the bight of Biafra. The natives of this country, the interior of which is little known, are idolaters, and much addicted to magic. They are said to be zealous in their worship, and to sacrifice their children to the devil. Biafra is also a small district of Africa, extending along the sea-coast, S.S.E. of the river Gambia, over-against the islands of Bislagos.

BIÆFORA, in the *Customs of the Middle Age*, a form of cry, or alarm to arms; on the hearing whereof, the inhabitants of towns or villages were to issue forth, and attend their prince. The word seems originally from Gascony; and the Italians even now, on a sudden insurrection of the people, commonly cry, *Via fora*, by an usual change of the letter B into V.

BIÆGIO, ST., in *Geography*, a town of Italy, in the kingdom of Naples, and province of Calabria Ultra, 3½ miles W.S.W. of Nicastro.—Also, a town in the same kingdom, in the county of Molise, 8 miles N.E. of Molise.

BIÆJOS, the name by which the inhabitants of the island of Borneo are distinguished. They are said to offer sacrifices of sweet-scented wood to one supreme beneficent deity, and these sentiments of piety are accompanied by laudable morals. See *BANJERMASSING* and *BORNEO*.

BIÆLA, a part of Prussian Silesia, in the circle of Zulz.—Also, a small town in the duchy of Lituania, belonging to Prussia, seated on the government of Johanneburg, which obtained its privileges in 1722.—Also, a town and river of Poland, which runs into the Vistula, S.W. of Cracow. N. lat. 49 52'. E. long. 19 20'.

BIÆLACERKIEW, a small town of Poland, in the Ukraine, seated on the Rofe, a river of the palatinate of Kiof, which discharges itself into the Dnieper; distant 60 miles S.S.W. from Kiof. Here the Tatars were entirely defeated in 1626.

BIÆLAGRODKO, a small town of Poland, in the palatinate of Kiof, seated on the Iupian, 14 miles S.W. of Kiof.

BIÆALLA, or BIAŁA, a town of Poland, in the palatinate of Brzeck or Białystok, 16 miles S.W. of Brzeck or Białystok. N. lat. 52° 10'. E. long. 23 25'.

BIÆALLISTOCK, or BIAŁYSTOK, a great and well-built town of Poland, in the palatinate of Podlachia, north of Bialle, in N. lat. 53°. E. long. 23 32'. The streets are broad, and the house, which are in general plastered, stand detached at uniform distances. The superior neatness

of this town is owing to the illustrious family of Braniski, whose palace adjoins the town, and who have contributed to ornament their place of residence. This palace is a large building, in the Italian taste, and, on account of its magnificence, generally called the Versailles of Poland. It was formerly only a royal hunting seat, but given by John Casimir, together with Ballistock, and other estates, to Czarniecki, a general highly distinguished by his victories over the Swedes, when Poland was nearly crushed by her enemies. Czarniecki left one daughter, who married Braniski, the father of the late great general, and conveyed the estate into that family.

BIALOBOKY, a town of Poland, in the palatinate of Lemberg, 48 miles S.W. of Lemberg.

BIANA, a town of Hindoostan, 20 leagues from Agra, which was formerly a large city, and included Agra among its dependencies. The town is still considerable, and contains many large stone houses. It was formerly the residence of a powerful rajah; but his principal city and fort were seated on the top of an adjoining hill, and the present town was only a suburb. The whole ridge of the hill is covered with the remains of large buildings, among which, the most remarkable is a fort, called "Bijey-Munder," containing a lofty pillar of stone, called "Bleemlat," or the Tealer or oilman's lat or staff. This pillar is conspicuous at a great distance. The town and district now belong to "Ramjath Sing," the rajah of Bhirtpoor. This place is famous for its excellent indigo. N. lat. 26° 20'. E. long. 77°.

BIANCA, LA, a town of Italy, in the kingdom of Naples, and province of Calabria Ultra, 12 miles N.E. of Bova.

BIANCA, Ital. for the note in music, which we denominate a *minim*: and the Fr. *une blanche*. This, though now almost the longest note in use, three or four hundred years ago, was the shortest. See **TIME-TABLE**, and **MUSICAL CHARACTERS**.

BIANCHI, FRANCISCO, called *Il Frari*, in *Biography*, an historical painter, was born at Modena, and was the disciple of the celebrated Antonio Correggio. His colouring was delicately fine, his attitudes graceful, and his invention very grand. His works possessed an astonishing beauty, and are prized as highly as even those of Correggio. He died in 150. Pilkington.

BIANCHI, PETER, a painter of the Roman school, was born in Rome in 1694, and united with his talents as a painter the accomplishments of literature. He painted historical subjects, portraits, rural and naval scenes, animals, plants, and flowers, in fresco, oil, and distemper. His reputation caused him to be employed in painting a picture in the church of St. Peter. He is said to have been a severe judge of his own performances, and to have destroyed many of his works after they were finished, because they did not please him. He died at Rome in 1739. *Encyclopedie*.

BIANCHI, JOHN BAPTIST, born at Turin, Sept. 12th, 1681, of an ancient and respectable family. After being educated with the greatest care, and under the ablest masters at home, he was sent early to the university, and made such progress in his studies, that at the age of 17 he was admitted doctor in medicine, and was soon after made physician to the hospital, a situation for which he was peculiarly qualified; for being fond of anatomical pursuits, he had here opportunity, from the number of subjects a large establishment of that kind necessarily furnished, of dissecting and examining the human body at every age, and labouring under every species of disease or deformity. He had the happiness also of finding his talents properly estimated by his brethren,

and his labours rewarded, as he was advanced to be public teacher of anatomy at Turin, where his sovereign built for him, in the year 1715, a spacious and convenient amphitheatre. He also read lectures in philosophy, in pharmacy, chemistry, and on the practice of medicine. These honours were not however entirely without alloy, as he had the mortification to find his doctrines censured by Morgagni, and by Haller, and even the existence of some parts he supposed he had discovered, disputed. The principal of his works are "Historia hepatica, seu de hepatis structura, usibus, et morbis," 1710, 8vo. Morgagni has published some severe strictures on this work, in his "Adverbia Anatomica." It has passed, however, through several editions, and in 1725, was republished in two vols. 4to. with figures "Ductus lacrymales novi, eorum usus, morbi, curationes," 4to. 1715, also censured by Morgagni. "Storia de monstro, di due corpi," 8vo. 1749, the most laboured and perfect, Haller says, of all his works. He wrote also an history of the generation of man, with figures, in which he attempts to delineate the fetus in its different stages, but the figures, Haller says, are principally factitious. Many of his dissertations are inserted by Mangeti in his "Theatrum Anatomicum." Haller. Bib. Anat. et Chirurg. Eloy. Dict. Hist.

BIANCHI, JOHN, born at Rimini, Jan. 3, 1693. After receiving a liberal education, he went to Bologna, where, in 1719, he was admitted doctor in medicine. Returning the following year to Rimini, he practiced medicine there with success for many years. He revived the academy of Lynxes, a philosophical society, collecting the members together at first at his own house. In gratitude for this, a medal was struck, with his figure on the face, and on the reverse, a lynx, with the motto "Linceis rellituis." His works are various, of which the principal are "A Treatise on the Cataract," 4to. 1720, in Italian. "Epistola anatomica, ad Josephum Putæum," 4to. 1726. "De monstris, et rebus monstrosis," 4to. 1749, and in 1751, an account of an imposture of the right hemisphere of the brain, occasioning paralysis on the opposite side of the body. Eloy. Dict. Hist.

BIANCHINI, FRANCIS, a mathematician and philosopher, was born at Verona, Dec. 13, 1662, and devoting himself to the church, became a doctor in theology, and distinguished by his unfeigned piety. But his principal celebrity was acquired by his literary and scientific performances. In early life he contributed to the establishment of the academy of the "Aletofoli," or the lovers of truth, and in the progress of his studies rendered it considerable service. His literary reputation attracted that notice to which the rank of his family also in some measure entitled him. Cardinal Ottoboni, afterwards pope Alexander VIII., appointed him his librarian; and he was promoted first to the dignity of canon in the church of Santa Maria della Rotunda, and also to that of St. Laurence, in Damasco. He was also secretary to the congregation for the reform of the calendar, to which office he was nominated by pope Clement XI. The senate created him one of the nobility of Rome, and after his death the citizens of Verona placed his bust in their cathedral. He died of the dropsy, March 2, 1729, with a character distinguished for the benevolence and candour of his manners, as well as for his piety and universal learning. Fontenelle honoured his memory with an eulogy, as one of the foreign members of the academy of sciences at Paris. His first work was "An Universal History," on a new plan, serving to give perspicuity to the chronological distribution. The first part of this work was published in 1697, under the title of "La Istoria Universale provata con monumenti et figurata con Simboli de gli Antichi." It extends, from the creation

creation of the world, to the destruction of the great Assyrian empire, and is held in high estimation for industry of research, and ingenuity of disquisition with regard to the genuine monuments of antiquity. The succeeding parts were never written. On occasion of the reform of the calendar, Bianchini wrote two learned and scientific treatises published in 1703, and entitled "De Calendario et Cyclo Cæsaris ac de canone Paschali Sancti Hippolyti Martyris, Dissertationes duæ." Of his astronomical skill and labour in tracing the meridian line, in the church of the Chartreux at Rome, he published an account in a dissertation "De nummo et gnomone Clementino." In 1727, he published "Camera ed Inscrizioni Sepolcrati di Libert, Servied Officiali della Casa di Augusto, &c." on occasion of the discovery of a subterraneous sepulchral building, in 1726, on the Appian way. His observations on Venus were published in 1728, under the title of "Hesperii et Phosphori Nova Phenomena, sive Observationes circa Planetam Veneris." The results of his observations on the rotation of Venus, and the position of its axes, though very interesting to astronomers at the time of their publication, have not, however, been confirmed by those of a later date, made by Herschel and Schroeter, with instruments of much greater power than any which were known in his time, and inserted in the Philosophical Transactions. The cause of this difference has not yet been ascertained, and deserves investigation. (See VENUS.) Bianchini was employed for eight years in preparatory measures for tracing a meridian line through the whole extent of Italy, but his death prevented the commencement of this enterprize. His edition of "Anastasius's Lives of the Popes," in 4 vols. folio, with notes, dissertations, prefaces, &c. displays much genius and erudition; but it is said to abound with typographical errors. He left an unedited dissertation in Latin, on the three kinds of musical instruments of the ancients, which was published at Rome 1742, in 4to., under the following title: "Francisci Bianchini Veronenfis utriusque signaturæ referendarii, & prelati domesticæ, de tribus generibus instrumentorum musicæ veterum organicæ dissertatio." In dividing ancient musical instruments into three classes, namely, wind instruments, stringed instruments, and instruments of percussion, the first class includes flutes, trumpets, horns, the syrinx, and hydraulicon; the second, the monochord, the lyra trichordis, tetrachordum, the seven-stringed lyre, the chelys, the cithara, psaltery, harp, &c.; the third class comprises the tympanum, cymbalum, erotalum, sitrum, and the tintinnabulum. Of all these, the author has given descriptions and representations well engraven on plates. Fontenelle Eloge des Academiciens. Nouv. Dict. Hist.

BIANDRATE, in *Geography*, a town of Piedmont, in the Novarese, 6 miles N.W. of Novara.

BIANDRONA, a town of Italy, in the duchy of Milan, 15 miles W.S.W. of Como.

BIANOR, in *Entomology*, a species of *PAPILIO*, nearly allied to *P. Paris*, and a native also of the East Indies. The wings are above and beneath of the same black colour, with five rufous lunules on the posterior pair. Fabricius, &c. It may be doubted whether this is a distinct species from *Paris*; perhaps only a sexual difference.

BIAR, a small town of Valencia, in Spain, seated on a river which runs into the Ebro, on the confines of New Castile. It is chiefly remarkable for its honey, which is distinguished by its whiteness and solidity, unaltered by any change of weather; distant two leagues east of Villena.

BIARCHUS, formed from *βία*, *annona*, *vitruoli*, and *αρχη*, chief, an officer in the court of the emperors of Con-

stantinople, intrusted with the care and inspection of the provisions of the soldiery. The biarchus was the same with what the Latins call *prefectus annonæ*. His function was called *biarchia*; by the Latins *prefectura rei cibaria*. He belonged to the *scholia agantium in rebus*. See AGENTES.

BLARMIA, in *Geography*, a name given by the Scandinavian navigators, in the middle ages, to the whole country between the White sea and the Ural. See PERMIA.

BLARUM, in *Botany*, a name by which the people of Egypt at this time call the root of the *nilufar*, or *jaba Ægyptia*, growing on the Nile.

BIAS, or BIASS, in a general sense, denotes the tendency or propensity of a thing towards one side more than the other; particularly the deviation of a body, or a plane, from its rectilinear course, or its level. See INCLINATION. It signifies also the inclination of a person's mind to one thing more than to another. The word is French, *biais*, which signifies the same.

BIAS of a *bocul*, is a piece of lead put into one side, to load and make it incline towards that side.

BIAS, in *Biography*, one of the seven wise men of Greece, was a native of Priene, in Ionia, and flourished in the reign of Alyattes II. king of Lydia, about 608, according to some, but according to Blair's tables, about 565 years before Christ. He was eminently distinguished not only by his wisdom, but by his generosity and public spirit, and for these qualities held in the highest veneration by his countrymen. Alyattes was obliged by a stratagem of his contrivance to raise the siege of his native town, when it was reduced to the utmost distress by famine. He first sent two fattened mules into the enemy's camp; and the king, observing with astonishment their good condition, sent deputies into the city under a pretence of offering terms of peace, but with a real intention of observing the state of the town and of the people. Bias, suspecting their design, ordered the granaries to be filled with large heaps of sand, and these heaps to be covered with corn; upon which, when the deputies returned, and reported the plenty of provision with which the city was furnished, the king no longer demurred, but concluded a treaty, and raised the siege. As an instance of his generosity, it is related of him, that when several young female captives were brought from Messene to Priene, he redeemed them, educated them as his own daughters, and then restored them with a dowry to their parents. As an evidence of the low estimation in which he held the gifts of fortune, compared with the endowments of the mind, it is said, that when Priene was once threatened with a siege, and the inhabitants were leaving it, loaded with their most valuable effects, Bias took no pains to preserve any part of his property, alleging as a reason of his conduct to one who expressed his surprise at it, "I carry all my treasures with me." The following maxims of wisdom are ascribed to him. "It is a proof of a weak and disordered mind to desire impossibilities." "The greatest infelicity is not to be able to endure misfortunes patiently." "Great minds alone can support a sudden reverse of fortune." "The most pleasant state is to be always gaining." "Be not unmindful of the miseries of others." "If you are handsome, do handsome things; if deformed, supply the defects of nature by your virtues." "Be slow in undertaking, but resolute in executing." "Praise not a worthy man for the sake of his wealth." "Whatever good you do, or do all the good you can, and ascribe the glory of it to the gods." "Lay in wisdom as the store for your journey from youth to old age, for it is the most certain possession." "Many men are dishonest; therefore love your friend with caution, for

he may hereafter become your enemy." Bias is asserted to have written more than 2000 verses concerning Ionia. His death was no less honourable than affecting; for he expired in the arms of a grandson, while he was pleading a cause for a friend. Diog. Laert. l. i. c. 82. Val. Max. l. iii. c. 2. vii. 2. Aul. Gell. l. v. c. 11. Cicer. de Amicit. c. 60. Plut. Conv. vii. Aristot. Rhet. l. ii. c. 13. Stobæus Serm. 28. Brucker's Phil. by Enf. vol. i. p. 136.

BIAS, in *Entomology*, a species of PAPILIO (*Pleb. Rur.*), that inhabits Cayenne. The wings are entire black, glossed with blue; beneath brown, with a white posterior margin. Fabricius.

BIASI, ST. in *Geography*, a town of Italy, in the kingdom of Naples, and province of Principato Citra, 15 miles W. N. W. of Policastro.

BIATHANATI, *βιθανάτι*, from *βίαι*, violence, and *θάνατος*, death; the fame with suicides, or those who kill themselves.

BIB, in *Ichthyology*, the English name of a fish of the GADUS tribe, called *luscus* by Linnæus.

BIBAN, in *Geography*, a town of Egypt, in Bahira, the residence of a kiaschef. Once a week, on Monday, a fair for camels and other cattle is held in the fields adjoining to this place.

BIBBONA, a town of Italy, in the duchy of Tuscany, 50 miles north of Arezzo.

BIBBS, BIBS, or BRACKETS, in *Naval Architecture*, are made of elm plank, and bolted to the hounds of masts, as supporters to the trestle trees. They are from three to five inches thick, and nine elevenths of the hounds in length, and in breadth six fifteenths their length. The after edge is first lined straight, and the upper part square from that, and the fore part tapered by a moulding to four or six inches of breadth at the lower ends. The after edge is fayed on the cheeks, and the upper part against the under side of the trestle trees on the fore side of the mast: viz. In the middle of the after edge, set up one inch and a half, and line straight from that to nothing at the lower end, which makes a butt in the middle; then place the bibbs on the mast, their thickness within the sides of the cheeks, and their upper parts to the outside of the trestle trees; then let one inch and a half be riced by the lower edge of the bibbs upon the cheeks, and the wood taken out to that depth, and the thickness of the bibbs, that they may bed firm therein; they are then bolted edgeways through the cheeks with four bolts driven from the fore side and clenched on a ring on the aft-side. The bolts are to be in diameter from one inch to seven eighths, or three quarters in small ships' masts, and only three in number. The lower end of the bibb is rounded off to the surface of the cheek, and the edges chamfered.

BIBEN, in *Geography*, a town of Persia, in the Irak Agemî, 140 miles east of Ispahan.

BIBEN, otherwise called *Pitschem*, and in Latin *Pedena*, or *Petina*, a town of Carniola, seated in a very fertile spot, on a high mountain; and the see of a bishop, to whose jurisdiction belong two towns and eleven villages, in which are fourteen parishes, suffragan to the prelate of Gorz.

BIBER, a town or village of Germany, in the circle of the lower Rhine, the electorate of Mentz, and prefecturate of Steinheim, 5 miles E. S. E. of Francfort on the Main. This is one of eleven villages which are possessed in common of a wood named the "Biber Mark." At Biber, all things relating to it are managed by the sheriffs of the Mark: and before the village, under a great lime-tree, lies the sheriff's bench, where the Mark court is fenced in, and transgressors are openly cited and punished.

BIBER, in *Zoology*, a name given by Ridinger, &c. to the *beaver*, *castor fiber*. Linnæus.

BIBER, HENRY JOHN FRANCIS, in *Biography*, vice-chapel-master to the archbishop of Salzburg, seems to have been the greatest performer on the violin of the 17th century. Baltzar from Lubeck, about the middle of that century, had so astonished the Oxonians by his execution on the violin, that according to Ant. Wood, Dr. Wilson, the music professor, after hearing him, stooped down to examine his feet, whether they were not cloven; that is, "whether he was a devil, or not, because his performance was beyond the faculties of man." But if we may now judge of his performance by his compositions that are still extant, it was very inferior to that of Biber, who published in 1681, solos for a violin and bafe, the most difficult and the most fanciful of any music of the same period. One of the solos is written on three separate staves, as if a score for two violins and a bafe; but the trebles are to be played in double stops. Others are played in different tunings of fourths and fifths, as for a treble viol. A second work by this musician, intitled *fidicium sacro profanum*, consists of twelve sonatas in four and five parts, to be played on three instruments; and a third, *harmonia artificioso ariosa*, published at Nuremberg, consisting of pieces in seven parts, to be played on three instruments. In this last work he is styled *Depifer*. In knowledge of the finger-board, double stops, and use of the bow, as well as composition, he seems to have surpassed all preceding violinists.

BIBERACH, in *Geography*, an imperial city of Germany, in the circle of Swabia, situate in a valley, watered by the Riefs, near the Danube. The magistrates and people are partly protestants and partly catholics; and the church, as well as the hospital, are common to both. The treaty of Westphalia requires that it should have as many catholics as Lutherans in the senate. It is governed, as to its offices, like the city of Augsburg. It has a large manufacture of fuslians. The number of houses is estimated at 900, of inhabitants at 6,600, and of burghers at 900. This city is very ancient, and was known in the year 751, under Pepin. By the plan of indemnities agreed upon by France and Russia, this imperial town was conceded to the margrave of Baden. N. lat. 48° 4'. E. long. 10° 2'.

BIBERSTEIN, a small town of Swisserland, in the canton of Bern, seated on the north-west side of the Aar. N. lat. 47° 17'. E. long. 7° 56'.—Also, a bailliwick, with a castle, in the circle of the Upper Rhine, and bishopric of Fulda, 8 miles east of Fulda.

BIBIENA, BERNARDO DA, *Cardinal*, whose proper name was *Dovizi*, or *Divizio*, was born of an obscure family at Bibiena, in the Cesentine, in 1470, and entered into the service of the family of Lorenzo di Medici. He attached himself to cardinal John, afterwards pope Leo X., whom he accompanied in his exile and served with affection and fidelity. At Rome he ingratiated himself with pope Julius II., by whom he was employed in some concerns of importance, and by whom his services were approved. On the death of Julius, he artfully persuaded the cardinals, that his master, though only 36 years of age, was not likely to live long, and by this artifice obtained his election. Leo was not insensible of his obligations, and made him his first treasurer, and in 1513, cardinal. In the direction of the works of the holy house of Loretto, in which he was employed, he encouraged men of literature, and engaged the best artists, particularly Raphael. Leo also deputed him as legate to the pontifical army against the duke of Urbino, then to the emperor Maximilian, and afterwards, in 1518, to Fran-
cis I.

ois I. King of France, for the purpose of forming a crusade against the Turks. On this occasion he was received with very marked distinction at Paris, though the event of the journey proved fatal to him. It has been generally supposed, that having a view to succeed Leo in the papal see, he had obtained the promise of Francis's support; and that Leo, being apprized of his ambition, took him off by poison; or perhaps, the displeasure of the pope might so much affect him as to occasion a fit of illness, which proved mortal in November 1520.

Bibiensia is distinguished in the history of literature as a polite writer, and particularly as the author of a celebrated comedy called "Calandra." This was the first comedy written in prose in the Italian language, or at least the first that obtained any considerable degree of popularity; and it is still esteemed as one of the best productions of the age, though the wit is not free from indelicacy, and many passages of it are copied from Plautus. It was represented in a very magnificent manner at Urbino, and afterwards at Rome. The actors were young men of rank, and the author is said to have taken great pains in training the courtiers to dramatic exercises, which were performed under the occasional inspection of Leo, in the chambers of the Vatican. Gen. B'og.

BIBIENI, FERDINANDO GALLI, a celebrated painter and architect, was born at Bologna in 1657; and losing his father when very young, was placed under the direction of Carlo Cignani, who, observing his taste for architecture, obtained for him the instruction of Paradossio, Aldrovandini, and Mauri, the best masters of that period for perspective and architecture. In consequence of the recommendation of Cignani, he was patronized by the prince of Parma, who employed him in executing a variety of decorations, and settled upon him an annual pension. For the dukes of Parma, he painted the scenes for *Hiero*, tyrant of Syracuse, in 1685; for *The Libris* in love with Alexander, 1693; for *Demosthenes*, 1694; for *Fractus*, 700; and for *Irrivali generis*, in 1701. From Parma he went to Milan, where, in 1704, he painted the scenes for *L'Anazzone Corsari*, and thence went to Vienna, and was appointed painter and architect to the emperor Charles VI., by whom he was highly honoured and rewarded. He was the inventor of those wonderful and magnificent scenes which still decorate many theatres in Italy; and published a book of instruction for the conduct of the theatre in general. He architected several palaces, and designed a great number of edifices; and he discovered and corrected the false form of machinery exhibited for the benefit of the students of Anatomy, exhibited at *La Favorita*, near Vienna.

He had a brother, Francis, of equal genius and fame, and two fine sons worthy of such a father. It was Ferdinando Bibieni a Gall, who, quitting mythology and fantastic forms, gave true representations of nature; rapidity of execution; intelligent disposition of light, and above all, that great help to nature, the leaving something to the spectator's imagination. Although he lost his sight by cataracts in his eyes, and obtained leave to return to Italy, where he composed two volumes of his architectural treatise for the instruction of young painters. He had several children, whom he educated to be concertists, and a considerable number of scholars. Bibieni died at Bologna, as some say, in 1741, and according to others, in 1743. His earl pictures exhibit a noble and elegant ordonnance, and an extremely beautiful tone of colour. His perspectives have a softening effect by judicious masses of light and shadow; and the vigour of imagination in his pictures, which he happily introduces in his compositions, add a richness and grandeur to all his performances.

BIBIENA, in *Geography*, a market-town of Italy, in the duchy of Tuscany, and district of Casentino.

BIBIG, a town of Egypt, two miles south of Feium.

BIBIO, in *Entomology*, one of the Fabrician genera of *ASPLIATA*, and which in the Linnaean system forms a section of the *MUSCA* genus. Fabricius defines the generic character of *Bibio* from the sucker, feelers, and antennae. The sucker consists of three bristles and a sheath of a single valve; feelers very short; antennae connected at the base, and pointed at the tip. Ent. Syst. See *MUSCA*.

BIBITORY MUSCLE. See *ABDUCTOR Oculi*.

BIBLE, a book by way of eminence so called, containing the Scriptures, i. e. the writings of the Old and New Testament; or the whole collection of those which are received among Christians as of divine authority.

The word Bible comes from the Greek *βιβλίον*, or *βιβλίον*, used to denote any book; but, by way of eminence, applied to the book of Scripture, which is "the book," or "book of books," as being superior in excellence to all other books. *βιβλίον* again comes from *βύβλος*, the Egyptian reed, from which the ancient paper was procured. See *BIBLUS*.

The word Bible seems to be used in the sense now specified by Chrysostom (In Col. H. 9. tom. xi. p. 39.): "I therefore exhort all of you to procure to yourselves Bibles." (*βιβλία*). If you have nothing else, take care to have the New Testament, particularly the Acts of the Apostles, and the Gospels for your constant instructors. And Jerom says (In Is. c. 29. tom. iii. p. 246.), "that the Scriptures being all written by one spirit, are one book." Augastine also informs us (Enarr. in Ps. il. n. 2. tom. iv.), "that some called all the canonical Scriptures one book, on account of their wonderful harmony and unity of design throughout." It is not improbable, that this mode of speaking gradually introduced the general use of the word "Bible" for the whole collection of the Scriptures, or the books of the Old and New Testament.

The Bible is known by various other appellations, as the "Sacred Books," the "Inspired Writing," "Holy Writ," "Sacred Text," &c. By the Jews the Bible, i. e. the Old Testament, is called "Mikra," that is, Lecture, or reading; by the Christians the Bible, comprehending the Old and New Testament, is usually denominated "Scripture," q. d. writing; sometimes also the "Book of God," the "Canon," "Rule of Faith," &c. These, and similar appellations, are derived from the opinion that has been entertained, in successive ages, of the divine original and authority of the Bible, and of its importance and utility as a rule of faith and directory of conduct. As it contains an authentic and connected history of the divine dispensations with regard to mankind; as it lays claim to divine inspiration; as its chief subject is religion; and as the doctrines it teaches, and the duties it inculcates, pertain to the conduct of men, as rational, moral, and accountable beings, and conduce by their natural influence, as well as by a divine constitution and promise, to their present and future happiness; the Bible deserves to be held in high estimation, and amply justifies the sentiments of veneration with which it has been regarded, and the peculiar and honourable appellation by which it has been denominated. See the sequel of this article.

The list of the books contained in the Bible, is called the canon of Scripture. See *CANON*. Those books that are contained in the catalogue to which the name of canon has been appropriated, are called canonical, by way of contradistinction from others called hetero-canonical, apocryphal, pseudo-apocryphal, &c., which either are not acknowledged as divine books, or are rejected as heretical and spurious. See *APOCRYPHAL*.

B I B L E.

The first canon or catalogue of the sacred books was made by the Jews; but the original author of it is not satisfactorily ascertained. It is certain, however that the five books of Moses, called the Pentateuch, were collected into one body within a short time after his death; since Deuteronomy, which is, as it were, the abridgment and recapitulation of the other four, was laid in the tabernacle near the ark, according to the order which he gave to the Levites (ch. xxxi. v. 24.) Hence it appears that the first canon of the sacred writings consisted only of the five books of Moses; for a further account of which, see PENTATEUCH. It does not appear that any other books were added to these, till the division of the ten tribes, as the Samaritans acknowledged no others. However, after the time of Moses, several prophets, and other writers divinely inspired, composed either the history of their own times, or prophetic books and divine writings, or psalms appropriated to the praise of God. But these books do not seem to have been collected into one body, or comprised under one and the same canon, before the Babylonish captivity. This was not done till after their return from the captivity, about which time the Jews had a certain number of books digested into a canon, which comprehended none of those books that were written since the time of Nehemiah. The book of Ecclesiasticus affords sufficient evidence, that the canon of the sacred books was completed when that tract was composed; for that author, in chap. xlix. having mentioned among the famous men and sacred writers, Isaiah, Jeremiah, Ezekiel, adds the twelve minor prophets, who follow those three in the Jewish canon; and from this circumstance we may infer, that the prophecies of these twelve were already collected and digested into one body. It is farther evident, that in the time of our Saviour the canon of the holy Scriptures was drawn up, since he cites the Law of Moses, the Prophets, and the Psalms, which are the three kinds of books of which that canon is composed, and which he often styles "the Scripture," or "the Holy Scripture." Matt. xxi. 42. xxii. 29. xxvi. 54. John, v. 39. This shews that they were distinguished from others, and formed a separate body. The person who compiled this canon is generally allowed to be Ezra. According to the invariable tradition of Jews and Christians, the honour is ascribed to him of having collected together and perfected a complete edition of the Holy Scriptures. The original of the Pentateuch had been carefully preserved in the side of the ark, and had been probably introduced with the ark into the temple at Jerusalem. After having been concealed in the dangerous days of the idolatrous kings of Judah, and particularly in the impious reigns of Manasseh and Amon, it was found in the days of Josiah, the succeeding prince, by Hilkiah the priest, in the temple. Prideaux says, that during the preceding reigns, the book of the Law was so destroyed and lost, that, besides this copy of it, there was then no other to be obtained. To this purpose he adds, that the surprize manifested by Hilkiah, on the discovery of it, and the grief expressed by Josiah when he heard it read, plainly shew that neither of them had seen it before. Upon this, the pious king ordered copies to be written out from this original, and to be dispersed among the people. 2 Kings, xxii. 8—13. 2 Chron. xxxiv. On the other hand, Dr. Kennicott supposes, that long before this time, there were several copies of the Law in Israel, during the separation of the ten tribes, and that there were some copies of it likewise among the tribes of Judah and Benjamin, particularly in the hands of the prophets, priests, and Levites; and that by the instruction and authority of these MSS., the various services in the temple were regulated, during the reigns of the good kings of Judah. He adds,

that the surprize expressed by Josiah and the people, at his reading the copy found by Hilkiah, may be accounted for by adverting to the history of the preceding reigns, and by recollecting what a very idolatrous king Manasseh had been for 55 years, and that he wanted neither power nor inclination to destroy the copies of the Law, if they had not been secreted by the servants of God. The Law, after being so long concealed, would be unknown almost to all the Jews; and thus the solemn reading of it by Josiah would awaken his own and the people's earnest attention; more especially, as the copy produced was probably the original written by Moses. From this time copies of the Law were extensively multiplied among the people; and though within a few years, the autograph, or original copy of the Law, was burnt with the city and temple by the Babylonians, yet many copies of the Law and the Prophets, and of all the other sacred writings, were circulated in the hands of private persons, who carried them with them into their captivity. It is certain that Daniel had a copy of the Holy Scriptures with him at Babylon; for he quotes the Law, and mentions the prophecies of Jeremiah. Dan. ix. 11. 13. ix. 2. It appears also, from the sixth chapter of Ezra, and from the ninth chapter of Nehemiah, that copies of the Law were dispersed among the people. It is unnecessary, therefore, to suppose, with some of the ancient fathers, such as Tertullian, Clemens Alexandrinus, Basil, &c. that Ezra restored the Scriptures by a divine revelation, after they had been lost and destroyed in the Babylonish captivity. For this opinion they had no other authority than the fabulous relation which occurs in the 14th chapter of the second apocryphal book of Esdras; a book too absurd for the Romanists themselves to admit into their canon. The whole which Ezra did may be comprized in the following particulars. He collected as many copies of the sacred writings as he could find, and compared them together, and out of them all, formed one complete copy, adjusted the various readings, corrected the errors of transcribers, and as some say, annexed the "Keri chetibs," which are found in the margins of the ancient MSS. He likewise made additions in several parts of the different books which appeared to be necessary for the illustration, correction, and completion of them. To this class of additions, we may refer the last chapter of Deuteronomy, which, as it gives an account of the death and burial of Moses, and of the succession of Joshua after him, could not have been written by Moses himself. Under the same head have also been included many other interpolations in the Bible, which create difficulties that can never be solved without allowing them; as in Gen. xii. 6. xxii. 14. xxxvi. 3. Exod. xvi. 35. Deut. ii. 12. iii. 11. 14. Prov. xxv. 1. The interpolations in these passages are ascribed by Prideaux to Ezra; and others which were afterwards added he attributes to Simon the Just. Ezra also changed the old names of several places that were become obsolete, putting instead of them the new names by which they were at that time called; instances of which occur in Gen. xiv. 4, where Dan is substituted for Laish, and in several places in Genesis, and also in Numbers, where Hebron is put for Kirjath Arba, &c. He likewise wrote out the whole in the Chaldee character, changing for it the old Hebrew character, which hath since that time been retained only by the Samaritans, and among whom it is preserved even to this day. In the church of Dominic, in Bononia, there is said to be a copy of the Hebrew Scriptures, preserved with great care, which they pretend to be the original copy written by Ezra himself, and for which great sums have been occasionally borrowed by the Bononians upon the pledge of it, and which have again been paid for its redemption. This copy is written in a
very

very fair character upon a sort of leather, and made up in a roll, according to the ancient manner; but as it has the vowel points annexed, and the writing is fresh and fair, without any visible decay, its antiquity is very justly derived, and its novelty is unquestionable. Bishop Pocock, in his *Travels*, vol. i. p. 28. mentions a MS. Bible, preserved at Cairo, in Egypt, which is said to be written by Ezra.

Dapin says, that Nehemiah had a great hand in compiling this canon; for proof of which he refers to the letter of the Jews of Jerusalem written to the Jews of Egypt, mentioned in the beginning of the second book of Maccabees, in which, it is said, that Nehemiah had collected the books of the Kings, of the Prophets, and of David. It is said that this canon was then approved by the grand sanhedrim, the great synagogue or council of seventy, and published by its authority. It is, however, says Dapin, more apparent that about that time the number of the sacred books was fixed among the Jews by a canon, which the whole Jewish nation received and followed; so that they looked no longer upon such books as sacred and divinely inspired, which were not contained in this canon. The canon of the whole Hebrew bible seems, says Kennicott, to have been closed by Malachi, the latest of the Jewish prophets; at about 50 years after Ezra had collected together all the sacred books which had been composed before and during his time. Prideaux supposes the canon was closed by Simon the Just, about 150 years after Malachi. But, as his opinion is founded merely on a few proper names at the end of two genealogies (1 Chron. iii. 19. and Neh. xii. 22.), which few names might very easily be added by a transcriber afterwards; it is more probable, as Kennicott thinks, that the canon was finished by the last of the prophets, about 400 years before Christ. The books of the Old Testament having been settled by Ezra, Nehemiah, Haggai, Zephaniah, and Malachi, were probably left perfect; completely repaired after the injuries of time during the captivity; and corrected from such errors as might have crept in from want of care in the transcriber. But the Hebrew text, thus left to posterity, does not seem to have continued long in the same condition. For the celebrated text, relative to mount Gerizim, was without doubt altered soon after the temple upon Gerizim was built. And as that corruption has been proved upon the Jews, the Jews therefore corrupted their Pentateuch, in this instance, probably between the years 400 and 300 before Christ. See PENTATEUCH.

It is an enquiry of considerable importance, in its relation to the subject of this article, what books were contained in the canon of the Jews. In the arrangement of Ezra these books were divided into three parts; 1st. The Law; 2dly. The Prophets; and 3dly. The *Cantabim*, or Hagiographa, i. e. the Holy writings; which division our Saviour himself has taken notice of (Luke xiv. 34.); meaning by the Psalms the whole third part, called the Hagiographa. In conformity to this division, Josephus (*Contra Apocriphos*, tom. ii. p. 441. distributis) the canonical books of the Jews into three classes. The first contained the five books of Moses; the second, thirteen historical and prophetic books, written from the time of the death of Moses to Artaxerxes; and the third, ten books of hymns and of morals; the whole number amounting to twenty-two. The first class comprehended Genesis, Exodus, Leviticus, Numbers, and Deuteronomy; the second in itself Job, Judges, Ruth, Samuel, Kings, Chronicles, Ezra with Nehemiah, Esther, Haggai, Jeremiah with Lamentations, Ezekiel, Daniel, and the 12 minor prophets; and the third class contained Job, the Psalms, Proverbs, and Ecclesiastes. It appears that the name of Solomon had no place in the list of the sacred writings drawn

up by Josephus. Others, however, have joined Ruth with Judges, referred Job to the second class, and introduced the Song of Solomon into the third class. Origen, Athanasius, Hilary, Gregory Nazianzen, Epiphanius, and Jerom, speaking of the books that are allowed by the Jews as sacred and canonical, agree in saying, that they are the same in number with the letters in the Hebrew alphabet, i. e. twenty-two, and reckon particularly those books which we have already mentioned; with respect to which they all concur, except in relation to the book of Esther. All of them place the book of Job and the Lamentations among the books contained in the canon of the Jews; but Athanasius and Gregory Nazianzen do not reckon the book of Esther among them, and distinguish Ruth from the book of Judges; whereas Origen, Hilary, Epiphanius, and Jerom, make only one volume of Ruth and Judges, and introduce the book of Esther into the number of the twenty-two books reckoned by the Jews as canonical. They who distinguished Ruth from the book of Judges, and the Lamentations from the prophecy of Jeremiah, reckoned up twenty-four of them. These books are disposed of in the following order: viz. 1st. The Law, containing, Genesis, Exodus, Leviticus, Numbers, Deuteronomy; 2dly. The writings of the prophets, divided into the former prophets and the latter prophets; those of the former being Joshua, Judges, Samuel, Kings, and the latter Isaiah, Jeremiah, Ezekiel, and the twelve minor prophets; 3dly. The Hagiographa, which are the Psalms, the Proverbs, Job, the Song of Solomon, or Song of Songs, or Canticles, Ruth, the Lamentations, Ecclesiastes, Esther, Daniel, Ezra, and the Chronicles. Under the name of Ezra is comprehended Nehemiah. However, this order hath not always been observed among the Jews, neither is it so now in all places; for in this respect there has been a great variety, not only among the Jews, but also among the Christians, Greeks as well as Latins. All these books were not received into the canon of the Holy Scriptures in the time of Ezra, for Malachi lived after him, and mention is made in Nehemiah of Jaddua as high priest, and of Darius Codomannus as king of Persia, who lived at least 100 years after his time; and in the third chapter of the first book of Chronicles, the genealogy of the sons of Zerubbabel is extended to as many generations as will bring it to the time of Alexander the Great, so that this book could not have been inserted in the canon till after his time. Accordingly, Prideaux supposes, that the two books of Chronicles, Ezra, Nehemiah, and Esther, as well as Malachi, were added in the time of Simon the Just, when he conceived the canon of the holy Scriptures was completed. (See above).

The five books of the Law are divided into 54 sections, which division is attributed to Ezra, and was intended for the use of their synagogues, and for the better instruction of the people in the law of God. For every sabbath one of these sections was read in their synagogues. They ended the sabbath with the last words of Deuteronomy on the sabbath of the feast of the tabernacles, and then began anew with the first section from the beginning of Genesis the next sabbath after, and so went round in this circle every year. The number of these sections was 54, because in their intercalated year (a month being then added), there were 54 sabbaths. On other years they reduced them to the number of the months which were in those years, by joining two months several times into one. For they held themselves obliged to have the whole law thus read over in their synagogues every year. Till the time of the persecution of Antiochus Epiphanius, they read only the Law; but being then prohibited from reading any more, they substituted in the room of the 54 sections of the Law, 54 sections out of

the Prophets, the reading of which they ever after continued. Thus, when the reading of the Law was restored by the Maccabees, the section which was read every sabbath out of the Law served for their first lesson, and the section out of the Prophets for their second lesson; and this practice was continued in the time of the apostles. Acts, xiii. 15. xiii. 27. These sections were divided into verses, called by the Jews "Pefukim," and they are marked out in the Hebrew Bible by two great points at the end of them, called from hence "Soph-Pafuk," *i. e.* the end of the verse. This division, if not made by Ezra, is very ancient; for when the Chaldee came into use in the room of the Hebrew language, after the return of the Jews from their captivity in Babylon, the Law was read to the people first in the Hebrew language, and then rendered by an interpreter into the Chaldee language; and this was done period by period. To distinguish these periods was an object of importance; and hence arose the division into verses, which was first applied to the Law, and afterwards to the Prophets and Hagiographa. The manner by which these divisions, or verses, are now distinguished is by the "Soph-Pafuk;" but it is not certain that this was the ancient method. Prideaux apprehends, that the Pefukim, or verses of the Hebrew Bibles, were anciently distinguished in the same manner as the "Stichi" afterwards were in the Greek Bibles. The manner of their writing these stichi at first was to allow a line to every stichus, and there to end the writing, where they ended the stichus, leaving the rest of the line a void break. But this mode occasioning a waste of parchment, on which their books were written, and making their bulk too heavy; in order to avoid these inconveniences, they afterwards put a point at the end of every stichus, and continued the writing without leaving any blank. In the Hebrew Bibles they adopted the same mode, and put the two points, called "Soph-Pafuk," at the place where one verse ended, and continued the writing of the next verse in the same line, without leaving any void space. The division of the holy Scriptures into chapters is of a much later date. The Psalms, indeed, appear to have been always divided as they are at present. Acts, xiii. 33. But as to the rest of the Bible, the present division into chapters was unknown to the ancients. See CHAPTER AND CONCORDANCE.

Besides those books which were received into the canons of the books of the Old Testament, and those that have been deemed apocryphal, there are several others which are cited in the Old, and also in the New Testament, which seem either to have been lost, or excluded by Ezra from his canon. Of such books are the books "of the wars of the Lord," cited Numb. xxi. 4. but it does not appear that in this place any book is mentioned, "of the Covenant," of which it is said mention is made Exod. xxiv. 7. but evidently referring to the laws received by Moses from the hand of God, related in the preceding chapters; the "book of the Lord," mentioned II. xxxiv. 16. which does not seem to be any particular book; "the book of Jasher, or the upright," cited in Joshua, x. 13. and 2 Sam. i. 18. supposed by some to be an historical book, but more probably consisting of hymns and songs; and "the books of Nathan (1 Chron. xxix. 29. 2 Chron. ix. 29.) of Gad, (1 Chron. xxix. 29.) of Shemaiah, (2 Chron. xii. 15.) of Iddo, (2 Chron. ix. 29. xii. 15. xiii. 22.) of Abijah, (2 Chron. ix. 29.) and of Jehu," (2 Chron. xx. 34.), which were memoirs composed by those prophets, or rather prophecies, which contained a part of the history. The same may be said of the book of the "Journals or Chronicles" of the kings of Judah or of Israel; which are different from the Paralipomena, or Chronicles; the book of "Samuel the Seer," cited in the

last chapter of the first book of Chronicles; the discourses of Hoseah, cited 2 Chron. xxxiii. 18, 19. the "Acts of Uzziah," mentioned 2 Chron. xxvi. 22. the "three thousand and Proverbs, written by Solomon," (see 1 Kings, iv. 32.); "a thousand and five Songs," &c. composed by the same author, and mentioned in the same place. Jeremiah speaks of a volume of prophecies which he had dictated to Baruch, supposed by some to be the Lamentations. (See BARUCH). Besides these books that are lost, there are others, not included in the canon of the Old Testament, which are still extant; such as the "Prayer of king Manasseh, when captive at Babylon," cited 2 Chron. ch. xxxiii. "the third and fourth books of Esdras;" "the third and fourth books of the Maccabees;" "the genealogy of Job," and "a speech of Job's wife," annexed to the Greek edition of the book of Job; "a Psalm," affixed to the Greek edition of the Psalms; "the book of Enoch," not entire, cited by several of the fathers, and regarded by them as apocryphal, and referred to by Jude, v. 14. the book of the "Assumption of Moses," and his "Testament," placed by St. Athanasius among the apocryphal books; "the Assumption, Apocalypse, or Secrets of Elijah," cited by Origen; and a number of others forged by the Jews, and fathered on the Patriarchs. See NEW TESTAMENT.

It may not be improper to refer, in one view, the books of the Old and New Testaments to their proper authors. We may suppose then, without ascending to the region of conjecture, and tracing the origin of any books, or parts of books of the Bible to patriarchal times, that the Pentateuch consists of the writings of Moses, put together, perhaps, by Samuel, with a very few additions; that the books of Joshua and Judges were, in like manner, collected by him; and the book of Ruth, with the first part of the first book of Samuel, written by him; that the latter part of the first book of Samuel, and the second book, were written by the prophets who succeeded Samuel, *viz.* Nathan and Gad; that the books of Kings and Chronicles are extracts from the records of the succeeding prophets, concerning their own times, and from the public genealogical tables, made by Ezra; that the books of Ezra and Nehemiah are collections of like records, some written by Ezra and Nehemiah, and some by their predecessors; that the book of Esther was written by some eminent Jew, in or near the times of the transactions there recorded, perhaps Mordecai; the book of Job by Moses, or a Jew of an uncertain period; the Psalms by David, and other pious persons; the books of Proverbs and Canticles by Solomon; the book of Ecclesiastes by Solomon, or perhaps by a Jew of later times, speaking in his person, but not with an intention to make him pass for the author; the Prophecies by the prophets, whose names they bear; and the books of the New Testament by the persons to whom they are usually ascribed. See NEW TESTAMENT. There are many internal evidences, and in the case of the New Testament, many external evidences also, by which these books may be known to belong to the authors here named. Or, if there be any doubts, they are merely of a critical nature, and do not at all affect the genuineness of the books, or not alter, at least materially, the arguments that may be adduced in favour of their authenticity and authority. It is readily allowed, that objections have been made to the alleged authors of several of these books. Abenezra, followed by Hobbes, Pereira, Spinoza, and some others, deny the first five books to have been written by Moses. F. Simon, in particular, asserts, that the books, as we now have them, are not the originals, written by the inspired penmen, but abridgments of them, made in after-times by a kind of college, or order of public actuaries, or scribes,

scribes, appointed for that purpose. See PENTATEUCH, and each of the books of the Bible, under its proper title. See also NEW TESTAMENT.

The original language of the Old Testament was, without doubt, the old Hebrew, at least the greatest part of it; for all the books do not appear to have been written in the same language. Some chapters of Ezra and Daniel, (see EZRA and DANIEL,) are judged to have been composed in Chaldee; and it has been supposed, that other chapters of this latter writer, and also the apocryphal books of Maccabees, Wisdom, &c. were written in Greek; Tobit and Ecclesiasticus, either in Greek or Syriac. As for the New Testament, it was written in Greek, except the Gospel of St. Matthew, which is thought by some to have been composed in Hebrew. Some few have thought that the Gospel of St. Mark was written in Latin, and also the epistle to the Hebrews. See the Title of each Book, and TESTAMENT.

With regard to the style of the several writers of the Old and New Testament, there is a very considerable diversity. The style of Paul may be easily distinguished by its peculiarity from that of any other writer. A discerning reader will not easily confound the style of Luke with that of either of the evangelists, who preceded him, Matthew or Mark; nor would he be in any danger of mistaking the apostle John's diction for that of any other penman of the New Testament. The same difference of style will be discovered by one who is but moderately conversant with the Hebrew, in the writers of the Old Testament. In this we have a greater variety than in the New. Some of the books are written in prose, and some in verse; and in each the differences between one book and another are considerable. In the book of Job, for instance, the character of the style is remarkably peculiar. What can be more dissimilar in this respect, though both are excellent in their kind, than the towering flights of the sublime Isaiah, and the plaintive strains of the pathetic Jeremiah? In the several books of Scripture we can specify the concise style and the copious, the elevated and the simple, the aphoristic and the diffuse. This diversity in the diction of the sacred penmen is perfectly reconcileable with the idea of their inspiration; and in speaking on this subject, we should duly advert to the difference between the expression and the sentiment, and avoid confounding these two, as if they were the same, whereas they are widely different. The truths implied in the sentiments are essential, immutable, and have an intrinsic value; the words which compose the expression are in their nature circumstantial, changeable, and have no other value than what they derive from the arbitrary conventions of men. That the Holy Spirit would guide the minds of the sacred penmen in such a manner as to prevent their adopting terms unsuitable to his design, or which might obstruct his purpose; and that in other respects he would accommodate himself to their manner and diction, is both reasonable in itself, and rendered unquestionable by the works themselves, which have the like characteristic differences of style which we find in their composition. Can it be accounted more strange that the Holy Spirit should, by the prophet Amos, address us in the style of a shepherd, and by Daniel, in that of a courtier, than that by the one he should speak to us in Hebrew, and by the other in Chaldee? It is as reasonable to think that the Spirit of God would accommodate himself to the pronunciation and diction, as to the tone of voice and pronunciation of those whom he was pleased to enlighten; for it cannot be denied, that the pronunciation of one person in uttering a prophecy, might be more articulate, more audible, and more affecting than that of another; and in like manner, as one style has more harmony, elegance, and perspicuity than another. Castalio says justly, (Def. cont. Bezam.)

“Res dicat Spiritus, verba quidem et linguam loquenti aut scribenti liberam permittit; i. e. the Spirit dictates the things, leaving the words or language free to the speaker or writer. Jerom also observed a thousand years before, (Comment. in Epist. ad Gal. cap. i.) “Nec putemus in verbis Scripturarum evangelium esse, sed in sensu;” i. e. let us not imagine that the Gospel consists in the words of Scripture, but in the sense. To the same purpose is the observation of the ingenious and learned bishop Lowth, De Sacra Poesi, H. b. Præl. xvi.) “Hoc ita facis vatis tribuimus, ut nihil derogemus Divini Spiritus afflatui; etsi suam interea vim propriam cujusque Scriptoris natura atque ingenio concedamus; neque enim instinctu divino ita concitatur vatis animus, ut protinus obruatur hominis indoles: attolluntur et eriguntur, non extinguuntur aut occultantur naturalis ingenii facultates; et quamquam Mosis, Davidis, et Isaia, scripta semper spirant quiddam tam excelsum tamque caeleste, ut plane videantur divinitus edita, nihilo tamen minus in iis Mosem, Davidem, Isaian, semper agnoscimus;” i. e. we shall detract nothing from the dignity of that inspiration, which proceeds from higher causes, while we allow to the genius of each writer his own peculiar excellence and accomplishments. The Divine Spirit by no means takes such an entire possession of the mind of the prophet as to subdue or extinguish the character and genius of the man; the natural powers of the mind are in general elevated and refined; they are neither eradicated, nor totally obscured; and though the writings of Moses, of David, and of Isaiah, always bear the marks of a divine and celestial impulse, we may nevertheless plainly discover in them the particular characters of their respective authors. See INSPIRATION.

It must be allowed, that many circumstances concur to render the style both of the New Testament and of the Old; of the historical books, as well as of the prophetic and argumentative, generally obscure, and often ambiguous; although we ought not to admit the exaggerated representation of father Simon, (Hist. Crit. des V. T. liv. iii. c. 2.) with regard to the greater part of the Hebrew words, which, he says, are equivocal, and of course their signification altogether uncertain. The origin of this kind of statement must be sought in the author's attachment to tradition, rather than to that kind of scepticism with which he is charged by Bossuet, bishop of Meaux, and which tended to undermine Christianity itself. To any person who duly reflects, this father's representation must appear to be unfounded, or beyond all bounds hyperbolic. It is not just in its reference to the prophetic writings; and as to the historical books, they are, in general, remarkable for perspicuity. The first quality by which the sacred history is distinguished is simplicity, which arises from this property of the Hebrew language, the verbs of which have not, like Greek and Latin, a variety of moods and tenses, nor do they abound, like the modern languages, in auxiliaries and conjunctions. This quality very much conduces to the perspicuity of its style. Of this simplicity we have an example in the first paragraph of Genesis, consisting of five, not long, verses, and containing not fewer than eleven sentences, which are singularly simple; the substantives not being attended by adjectives, nor the verbs by adverbs, without synonyms, or superlatives, or any effort towards expressing things in a bold, emphatical, or uncommon manner. In the Pentateuch, there is also a simplicity of sentiment, arising from the very nature of the early and uncultivated state of society, about which its books are conversant, and this renders the narrative, in general, extremely clear and engaging. Besides the simplicity of structure, and the simplicity of sentiment, there is another species of simplicity, for which Scripture history is more remarkable than any other

other compositions of any language. This may be denominated simplicity of design. The subject of the narrative engrosses the attention of the writer, that he disappears, as it were, from the view of the reader. He introduces nothing as from himself; no opinions of his own, no remarks, conjectures, doubts, or inferences; no reasoning about the cause or the effects of what is related. He never interrupts his reader with the display, either of his talents or his passions: he makes no digressions; he draws no characters: he supplies us merely with naked facts, from which we are left to collect the character. We observe no attempt to shine by means of the expression, composition, or sentiments. Plainness of language is always preferred, because it is the most natural, the most obvious, and the best adapted to all capacities. In this last sort of singularity, for which Xenophon among the Greeks, and Cæsar among the Latins, have been recommended, our Lord's biographers particularly excel. With respect to the first species of simplicity, or that of structure, the difference of the genius of the Greek language from that of the Hebrew must, without doubt, occasion some difference in the manner of Matthew, Mark, Luke, and John, from that of Moses; but the identity of idiom still occasions a strong resemblance between them. If Genesis, therefore, may be justly said to possess the *first* rank for simplicity of composition in the sentences, the Gospels are certainly entitled to the *second*: and John and Matthew have it in a higher degree than Mark and Luke. As to the second species, or simplicity of sentiment, the change of times, which is very great, as well as the difference of subjects, would necessarily confer the first degree of it upon the former. But in simplicity of object or design, the evangelists, of all writers, sacred and profane, appear the foremost. Their manner is indeed, in some respects, peculiar and unrivalled. If we divert our attention from the historical, or narrative parts of the Bible, to the writings of the poets and prophets, we shall discover the animated, elegant, and sublime intermixed, as the subjects suggest, and the occasions require, with the simple and perspicuous. But for other particulars, in reference to this subject, see *STYLE and TESTAMENT*. See also the titles of the several books of the Bible, for the distinguishing character of their writers.

Having considered the appellations by which the Bible is distinguished, the books of which it consists, the time, and manner in which they were collected, their respective authors, and the language and style in which they were written, it may not be improper to subjoin a few observations on the genuineness and authenticity of the Scriptures, on their high original and divine authority, and on their great importance and utility.

It should here be considered, that the genuineness of the Scriptures proves the truth of the principal facts contained in them; to which purpose we may observe, that it is very rare to meet with any genuine writings of the historical kind, in which the principal facts are not true, unless it be in instances where both the motives which engaged the author to falsify, and the circumstances which gave some plausibility to the fiction, are apparent; neither of which can be alleged in the present case with any colour of reason. As this is rare in general, it is more rare, when the writer treats of things that happened in his own time, and under his own cognizance and direction, and communicates his history to persons under the same circumstances; all which may be said of the writers of the Scripture history. Besides, the great importance of the facts mentioned in the Scriptures makes it more improbable, that the several authors should either have attempted to falsify, or have succeeded in such an attempt. This is an argument for the truth of the facts, which proves

the genuineness of the books at the same time. However, the truth of the facts is inferred more directly from their importance, if the genuineness of the Scriptures be previously allowed. The same observation may be applied to the great number of particular circumstances of time, place, persons, &c. mentioned in the Scriptures, and to the harmony of the books with themselves, and with each other. These are arguments both for the genuineness of the books, and truth of the facts distinctly considered, and also arguments for deducing the truth from the genuineness. Moreover, if the books of the Old and New Testaments were written by the persons to whom they have been ascribed, i. e. if they be genuine, the moral characters of these writers afford the strongest assurance, that the facts asserted by them are true. The sufferings which several of the writers underwent both in life and in death, in attestation of the facts delivered by them, furnish a particular argument in favour of these facts. Again, the arguments here alleged for proving the truth of the Scripture history from the genuineness of the books, are as conclusive in respect of the miraculous facts, as of the common ones. It may also be observed, that if we allow the genuineness of the books to be a sufficient evidence of the common facts which they record, the miraculous facts must also be allowed, from their close connection with the others. It is necessary to admit both or neither. We cannot conceive, that Moses should have delivered the Israelites from their slavery in Egypt, or conducted them through the wilderness for forty years, at all, in such manner as the common history represents, unless we suppose the miraculous facts intermixed with it to be true also. In like manner, the fame of Christ's miracles, the multitudes which followed him, the adherence of his disciples, the jealousy and hatred of the chief priests, scribes and pharisees, with many other facts of a common nature, are impossible to be accounted for, unless we allow, that he did really work miracles. And the same observations hold, in general, of the other parts of the Scripture history. We might urge a particular argument in favour of the miraculous part of the Scripture history, that may be deduced from the reluctance of mankind to receive miraculous facts; which would put the writers and readers very much upon their guard, and would operate as a strong check upon the publication of a miraculous history at or near the time when the miracles were said to be performed; and thus it would serve as a strong confirmation of such an history, if its genuineness be previously granted. The converse of the proposition, now stated and explained, is also true: i. e. if the principal facts mentioned in the Scriptures be true, they must be genuine writings.

In connection with the preceding proposition we may observe, that the genuineness of the Scriptures proves their divine authority. Porphyry in effect acknowledges the truth of this proposition, in its reference to the book of Daniel, by being unable to devise a method of invalidating its divine authority implied in the accomplishment of the prophecies which it contains, without asserting, that they were written after the event, or that they were forgeries. Many of the other books of the O. and N. Testaments have unquestionable evidences of the divine foreknowledge, if they be allowed genuine: such are those supplied by Moses's prophecy concerning the captivity of the Israelites, or of a state not yet erected; Isaiah's concerning Cyrus; Jeremiah's concerning the duration of the Babylonish captivity; Christ's concerning the destruction of Jerusalem, and the captivity that was to follow; St. John's concerning the great corruption of the Christian church; and Daniel's concerning the fourth empire in its declension; which last was extant in the time of Porphyry, at least, that is, before the events which

it represents. The truth of the proposition might also be argued from the sublimity and excellence of the doctrines contained in the Scriptures; in no respect suiting the supposed authors, or the ages in which they lived, their education or occupation; so that, if they were the real authors, we are under the necessity of admitting the divine assistance. The converse of this proposition, viz. that the divine authority of the Scriptures infers their genuineness, will be readily and universally acknowledged. And there are several evidences for the Divine authority of the Scriptures, which are direct and immediate, and prior to the consideration both of their genuineness, and of the truth of the facts contained in them. Moreover, the truth of the principal facts contained in the Scriptures proves their divine authority. Such is the frame of the human mind, that the Scripture history, allowed to be true, must convince us that Christ, the prophets, and the apostles, were endued with a power greater than human, and acted by the authority of a Being of the highest wisdom and goodness. But if natural religion be previously established, the truth of the principal facts of the Scriptures proves their divine authority in a more easy and more convincing manner: for the knowledge and power manifested by Christ, the prophet, and apostles, and also their good moral characters, shew them to be in an eminent manner the children, servants, and messengers of him, who is previously acknowledged to be infinite in power, knowledge, and goodness; and they actually lay claim to a divine mission, which claim cannot be thought a fiction, if we admit their credentials: or, in other words, the truth of the principal facts mentioned in the Scriptures proves the divine mission of Christ, the prophets, and apostles, that is, the divine authority of the Scriptures.

By such mode of reasoning it is shewn, that the genuineness of the Scripture, the truth of the principal facts contained in them, and their divine authority, appear to be so connected with each other, that any one being established upon independent principles, the other two may be inferred from it. On the subject of the inspiration of the Scriptures, see INSPIRATION.

Another argument in proof of the genuineness of the books of the Old and New Testaments, and of the truth of the principal facts contained in them, may be deduced from the manner in which they have been transmitted down from one age to another; in such a manner, in which all other genuine books and true histories have been conveyed down to posterity. As the writings of the Greek and Roman writers were commonly transmitted to be translated to them by their scholars in a constant succession, from the times when the respective authors lived, to have the books of the Old Testament by the Jewish nation, and those of the New by the Christian; and that an additional evidence in the last case, that the primitive Christians were not a distinct nation, but a great multitude of people spread through all the nations of the Roman empire, and even extending itself beyond the bounds of that empire. As the Greek and Roman always believed the principal facts of their historical books, so the Jews and Christians believed, and never ceased to have doubted of the truth of any part of them. In short, whatever can be said of the traditional authority due to the Greek and Roman writers, for their writings, and for the reputation of greater wisdom, may be said for the Jewish and Christian. Now, as all historians perform about the book usually ascribed to the Greek and Roman historians, philosophers, &c. to be genuine, and the principal facts related or alluded to in them to be true, and that one chief evidence for this is the general traditionary authority; they ought, therefore, to pay the same regard to the books of the Old and New Testaments, since there are the same,

or greater reasons for it. Besides, these traditionary evidences are sufficient, and we thus obtain a real argument, as well as one "ad hominem," for receiving books thus handed down to us. For it is not conceivable, that whole nations should either be imposed upon themselves, or concur to deceive others, by forgeries of books or of facts. These books and facts null, therefore, in general, be genuine and true; and it is a strong additional evidence of this, that all nations must be jealous of forgeries for the same reasons that we are. On the conclusiveness of this argument, as it relates to miracles; see MIRACLE.

We may proceed to observe further, that the great importance of the histories, precepts, promises, threatenings, and prophecies contained in the Scriptures, are evidences both of their genuineness, and of the truth of the principal facts mentioned in them. The history of the creation, fall, deluge, longevity of the patriarchs, dispersion of mankind, calling of Abraham, descent of Jacob with his family into Egypt, and the precepts of abstaining from blood, and of circumcision, were of such concern, either to mankind in general, or to the Israelites in particular, and some of them of so extraordinary a nature, as that it could not be a matter of indifference to the people amongst whom the account given of them in Genesis was first published, whether they received them or not. On the supposition that this account was first published amongst the Israelites by Moses, and then confirmed by clear, universal, uninterrupted tradition, it will be easy to conceive, how it should be handed down from age to age amongst the Jews, and received by them as indubitable. But supposing the account to be false, or that there were no such vestiges and evidences of these histories and precepts, it will be difficult to conceive how this could have happened, let the time of publication be what it may. If early, the people would reject at once the account for want of a clear tradition; if late, it would be natural to enquire how the author was informed of things never known before to others. If the account was delivered, as having been communicated to Moses by divine revelation, which is not very consistent with the numerous references that occur in Genesis to the existing vestiges of the things related, his fictitious credentials would thus be embarrassed, and his contemporaries would be induced very particularly to examine them. As to other cosmogonies and theogonies current among Pagans, which are evident fictions; they furnish no just objection against the Mosaic history; because they were generally regarded merely as amusing fictions; and yet they concealed in figures, or expressed in plain words some truths, which agree with the book of Genesis, and afford a strong presumptive evidence in favour of this book. With respect to the law of Moses, this was extremely burdensome, expensive, and severe, particularly in its reference to the crime of idolatry, to which mankind were then extravagantly prone; and it was absurd, according to human judgment, in the instances of prohibiting their furnishing themselves with horses for war, and commanding all the males of the whole nation to appear at Jerusalem three times a year. Nevertheless, it claims a divine authority, and applies to facts of the most notorious kind, and to customs, and ceremonies of the most peculiar nature, as the memorials of these facts. Can we then conceive, that any nation, with such motives to reject, and such opportunities of detecting, the forgery of the books of Leviticus, Numbers, and Deuteronomy, should yet receive them, and submit to this heavy yoke? That the Jews did submit to the law of Moses in these circumstances, is evident from the books of the Old and New Testaments, if we allow them the least truth and genuineness, or even from profane writers; and from the present de-

servance of it by the Jews scattered through all the kingdoms of the world. Should it be said, that other nations have ascribed divine authority to their lawgivers, and submitted to very severe laws, it may be alleged in reply, that the pretences of lawgivers amongst the Pagans to inspiration, and the submission of the people, may be accounted for from their peculiar circumstances at the time, without recurring to real inspiration; and more especially, if we admit the patriarchal revelations related by Moses, and his own divine legation, as heathen lawgivers copied after these, and hence we derive a strong argument in their favour. Besides, no instance occurs among the Pagans, of a body of laws framed at once and remaining invariable; whereas the body politic of the Israelites assumed a complete form at once, and has preserved it with little variation, to the present time, and under many external disadvantages; thus supplying us with an instance altogether without parallel, and shewing the high opinion which they entertained of the great importance of their law. In short, of all the fictions or forgeries, that can happen among any people, the most improbable is that of the Jewish body of civil laws, and it seems to be utterly impossible in the case of the law of Moses.

If we further examine the history contained in the books of Joshua, Judges, Ruth, Samuel, Kings, Chronicles, Ezra, and Nehemiah, and extending from the death of Moses to the re-establishment of the Jews after the Babylonish captivity by Ezra and Nehemiah, we shall find a variety of important facts, most of which must be supposed to leave such vestiges of themselves, either external and visible, or internal in the minds and memories of the people, as would verify them if true, or cause them to be rejected, if false. The conquest of the land of Canaan, the division of it, and the appointment of cities for the priests and Levites by Joshua; the frequent slaveries of the Israelites to the neighbouring kings, and their deliverance by the judges; the creation of a kingdom by Samuel; the translation of this kingdom from Saul's family to David, with his conquests; the glory of Solomon's kingdom; the building of the temple; the division of the kingdom; the idolatrous worship set up at Dan and Bethel; the captivity of the Israelites by the kings of Assyria; the captivity of the Jews by Nebuchadnezzar; the destruction of their temple; their return under Cyrus, rebuilding the temple under Darius Hystaspis, and re-establishment under Artaxerxes Longimanus, by Ezra and Nehemiah;—these events are some of them the most glorious, and some of them the most reproachful, that can happen to any people. How can we reconcile forgeries of such opposite kinds, and especially as they are interwoven together by various complicated and necessary connections, which do not admit of separation? The facts, indeed, are of such importance, notoriety, and permanency in their effects, that no particular persons among the Israelites could first project the design of feigning them, that their own people would not concur with such a design, and that neighbouring nations would not permit the fiction to pass. Nothing but the invincible evidence of the facts, here alleged, could induce a jealous multitude amongst the Israelites or neighbouring nations to acquiesce. This must be acknowledged upon the supposition that the several books were published in or near the times when the facts that are recorded in them happened. But suppose all these historical books forged by Ezra;—the hypothesis is evidently impossible. Things so important and notorious, so honourable and so reproachful to the people, for whose sake they were forged, would have been rejected with the utmost indignation, unless there were the strongest and most genuine traces of these things already amongst the people. They must therefore, in part at least, be true. If it be said

that additions were made by Ezra; these additions must have been either of important or trivial matters. On the first supposition, the difficulty already stated recurs; and if the important facts are true, what possible motive could have induced Ezra to make additions of no importance? Besides, if any ancient writings were extant, Ezra must either copy after them, which destroys the present supposition; or differ from and oppose them, which would betray him. If there were no such ancient writings, the people would be led to enquire with regard to matters of importance, for what reason Ezra was so particular in things of which there was neither any memory, nor account in writing. Should it be said, that the people did not regard what Ezra had thus forged, this reduces the subject in question to matters of small, or of no importance. Besides, why should Ezra write, if no one would read, or regard? Farther, Ezra must have had, like other men, friends, enemies, and rivals; and some, or all of these, would have been a check upon him, and a security against him in matters of importance. If we suppose these books, instead of having been forged at once, to have been forged successively, at the interval of one, two, or three centuries after the facts related, we shall involve ourselves in the same or similar difficulties. Upon the whole, then, we may conclude, that the forgery of the annals of the Israelites appears to be impossible, as well as that of the body of their civil laws. It is needless to examine the books of Esther, Job, the Psalms, Proverbs, Ecclesiastes, and Canticles; and we might proceed to the Prophecies. But this subject will be resumed under the article PROPHECY. For the importance of the subjects, comprehended in the books of the New Testament; see TESTAMENT, and CHRISTIANITY.

We shall here subjoin some general evidences in attestation to the importance of the books of Scripture. That Jews and Christians have thought their sacred books very highly important, most genuine, and true, appears from the persecutions and sufferings which they have undergone on account of their attachment to them, and because they would not be prevailed upon to surrender them. The preservation of the law of Moses, probably the first book written in any language, whilst many others of a later date have been lost, shews the great regard that has been paid to it; and from this circumstance we may infer, that this and the other books of the Old Testament have been preserved on account of their importance, or from some other cause, equally evincing their genuineness and truth. The great importance of these books appears also from the many early translations and paraphrases of them; and these translations and paraphrases seem to correct errors that are unavoidable in the lapse of time, and to secure their integrity and purity. The hesitation and difficulty with which some few books of the New Testament were received into the canon, shew the great care and concern of the primitive Christians about the canon, and the high importance of the books admitted into it; and afford a strong evidence of their genuineness and truth. The same observation is in a degree applicable to the Jewish canon. Moreover, the religious hatred and animosity which subsisted between the Jews and Samaritans, and between several of the ancient sects among the Christians, convince us of what importance they all thought their sacred books, and disposed them to watch over one another with a jealous eye.

Farther, the genuineness of the books of the Old and New Testaments may be evinced from the language, style, and manner of writing used in them. The Hebrew language, in which the Old Testament was written, being the language of an ancient people, who had little intercourse with their neighbours, would not change so fast as modern languages have

have done, since different nations have been variously blended with one another by the extension of trade, arts, and sciences; and yet some changes must have occurred in the interval that elapsed between the time of Moses and that of Malachi. The Biblical Hebrew corresponds so exactly to this criterion, as to afford a considerable argument in favour of the genuineness of the books of the Old Testament. Besides, these books have too great a diversity of style to be the work of either one Jew, or of any set of contemporary Jews. If they be forgeries, there must have been a succession of impostors in different ages, who concurred in the same iniquitous design. Again, the Hebrew language ceased to be spoken, as a living language, soon after the time of the Babylonish captivity; and it would be difficult or impossible to forge any thing in it, after it became a dead language. Hence it appears, that all the books of the Old Testament must be nearly as ancient as the Babylonish captivity; and as they could not all be written in the same age, some must be much more ancient, and this would reduce us to the necessity of supposing a succession of conspiring impostors. Moreover, there is, as we have already observed, a simplicity of style, and an unaffected manner of writing, in all the books of the Old Testament, which is a strong evidence of their genuineness. The style of the New Testament, in particular, is not only simple and unaffected, but perfectly adapted to the time, places, and persons. To which we may add, that the narrations and precepts of both the Old and New Testament are delivered without hesitation; the writers teaching as having authority; and this circumstance is peculiar to those, who unite with a clear knowledge of what they deliver, a perfect integrity of heart.

Another argument for the genuineness and truth of the Scriptures, is supplied by the very great number of particular circumstances of time, place, persons, &c. mentioned in them. It is needless to recount these; but they are incompatible with forged and false accounts, which do not abound in such particularities, and the want of which furnishes a suspicion to their discredit. Compare, in this respect, Manetho's account of the dynasties of Egypt, Ctesias's of the Assyrian Kings, and those which the classical chronologers have given of the ancient kingdoms of Greece, which are defective in such particulars, with Thucydides's history of the Peloponnesian war, and Caesar's of the war in Gaul, in which they occur, and the difference will be sufficiently apparent. Dr. Paley's admirable treatise, entitled "Horæ Paulinæ," affords very valuable illustrations of this argument as it respects the genuineness of the books of the New Testament.

The agreement of the Scriptures with history, natural and civil, is a farther proof of their genuineness and truth. The history of the fall agrees in an eminent manner both with the obvious facts of labour, sorrow, pain, and death, with what we see and feel every day, and with all our philosophical enquiries into the frame of the human mind, the nature of social life, and the origin of evil. Natural history bears a strong testimony to Moses's account of the deluge. Civil history affords many evidences, which corroborate the same account. (See DELUGE.) The Mosaic account of the confusion of languages, of the dispersion of Noah's sons, and of the state of religion in the ancient world, is not only rendered probable, but in a very high degree established, by many collateral arguments. See *CONFUSION of Languages, DISPERSION of Mankind, IDOLATRY, SACRIFICE, &c.*

The agreement of the books of the Old and New Testaments, with themselves and with each other, affords an argument both of their genuineness and truth. The laws of the Israelites are contained in the Pentateuch, and referred to, in

a great variety of ways, direct and indirect, in the historical books, in the Psalms, and in the Prophecies. The historical facts also in the preceding books are often referred to in those that succeed, and in the Psalms and Prophecies. In like manner, the gospels have the greatest harmony with each other, and the epistles of St. Paul with the Acts of the Apostles; and, indeed, there is scarcely any book of either the Old or New Testament, which may not be shewn to refer to many of the rest, in one way or other. For the illustration of this argument, let us suppose that no more remained of the Roman writers than Livy, Tully, and Horace, would they not by their references to the same facts and customs, by the sameness of style in the same writer, and difference in the different ones, and numberless other such like circumstances of critical consideration, prove themselves, and one another to be genuine, and the principal facts related, or alluded to, to be true? Whoever will apply this reasoning to the present case will perceive, that the numberless minute, direct, and indirect agreements and coincidences, that present themselves to all diligent readers of the Scriptures, prove their truth and genuineness beyond all contradiction. See *ACTS, EPISTLES, and TESTAMENT.*

The harmony and agreement of the several writers of the Old and New Testament appear the more remarkable, when it is considered that their various parts were penned by several hands in very different conditions of life, from the throne and sceptre down to the lowest degree, and in very distant ages, through a long interval of time; which would naturally have led a spirit of imposture to have varied its schemes, and to have adapted them to different stations in the world, and to the different vicissitudes of every age. David wrote about 400 years after Moses, and Isaiah about 250 after David, and Matthew more than 700 years after Isaiah. And yet these authors, with all the other prophets and apostles, write in perfect harmony, confirming the authority of their predecessors, labouring to reduce the people to the observance of their instructions, and loudly exclaiming against the neglect and contempt of them, and denouncing the severest judgments against such as continued disobedient. Consequently, as the writers of the Holy Scriptures, though they all claim a divine authority, yet write in perfect connection and harmony, mutually confirming the doctrine and testimony of each other, and concurring to establish the very same religious truths and principles, it is a strong proof that they all derived their instructions from the same fountain, the wisdom of God, and were indeed under the direction and illumination of the same spirit. This leads us to add, that the unity of design, which appears in the dispensations recorded in the Scriptures, is an argument not only of their truth and genuineness, but also of their divine authority. In order to perceive the force of this argument, it is only necessary to inquire what this design is, and how it is pursued by the series of events and divine interpositions, recorded in the Scriptures. (See *DISPENSATION.*) We may further add, that divine communications, miracles, and prophecies, recorded in Scripture, are agreeable to natural religion, and even seem to be necessary in the infancy of the world. (See *MIRACLE, PROPHECY, and REVELATION.*) It should also be considered, that the historical evidences in favour of the genuineness, truth, and divine authority of the Scriptures, do not become less from age to age; but, on the contrary, it may rather be presumed, that they increase. See the three great concurring events of printing, the reformation of religion in these western parts, and the restoration of letters, so many more evidences and coincidences have been discovered in favour of the Jewish and Christian histories, as may serve, in some measure, to supply the want of these

those that have been lost in the preceding times; and as this improvement of the historical evidences is likely to continue, there is great reason to hope, that they will grow every day more and more irresistible to all candid, serious inquirers.

The moral characters of Christ, the prophets, and the apostles, prove the truth and divine authority of the Scriptures. The characters of the persons who are said in the Scriptures to have had divine communications, and a divine mission, are so much superior to the characters that occur in common life, that we can scarcely account for the more eminent single ones, and much less so for so large a succession of them, continued through so many ages, without allowing the divine communications and assistance, which they allege. Notwithstanding considerable imperfections that pertained to many of these eminent persons, and the heinous occasional offences chargeable upon some of them, yet the impartial reader should consider, whether the prophets, apostles, &c. were not so much superior, not only to mankind at an average, but even to the best men among the Greeks and Romans, as is not fairly to be accounted for by the mere powers of human nature. If this statement should be disputed, their characters, however, are too good to allow the supposition of an impious fraud and imposture, which must have been the case if they had not divine authority. Besides, it should be recollected, that the undisguised and impartial manner in which the imperfections and faults of the eminent persons mentioned in Scripture are related, furnishes a remarkable additional evidence for the truth of such parts of the Scripture history in which such relations occur, besides such evidences as extend to the whole.

The excellence of the doctrine contained in the Scriptures is an additional evidence of their authority. This argument has great force independently of all other considerations. Suppose, for instance, that the author of the gospel, which goes under the name of St. Matthew, was not known, and that it was unsupported by the writers of the primitive times; yet such are the unaffected simplicity of the narrations; the purity of the doctrine, and the sincere piety and goodness of the sentiments, that it carries its own authority with it. The same observation is applicable in general to all the books of the Old and New Testaments: so that if there was no other book in the world besides the Bible, a man could not reasonably doubt of the truth of revealed religion. If all other arguments were set aside, we may conclude from this single consideration, that the authors of the books of the Old and New Testaments, whoever they were, cannot have made a false claim to divine authority. The Scriptures contain doctrines concerning God, Providence, a future state, the duty of man, &c. far more pure and sublime than can in any way be accounted for from the natural powers of men, so circumstanced as the sacred writers were. Let the reader consider whether it can be reasonably supposed, that Jewish shepherds, fishermen, &c. should, both before and after the rise of the heathen philosophy, so far exceed men of the greatest abilities and accomplishments in other nations, by any other means than divine communications. Indeed, no writers, from the invention of letters to the present times, are equal to the penmen of the books of the Old and New Testaments in true excellence, utility, and dignity; and this is surely such an internal criterion of their divine authority, as ought not to be resisted.

The many and great advantages which have accrued to the world from the Patriarchal, Judaical, and Christian relations, prove the divine authority of the Scriptures. These advantages relate partly to the knowledge, and partly to the practice of religion. The internal worth and excellence of the Scriptures, as containing the best principles of know-

ledge, holiness, consolation and hope, and their consequent utility and importance in a moral and practical view, fully and directly demonstrate their divine original. The wonderful nature, and superior excellence, of the attempt made by Christ and his apostles, for reforming mankind, and making them happy in a future state, are evidences of their divine authority; which is farther illustrated and confirmed by the manner in which the love of God and of our neighbour is taught and inculcated in the Scriptures. This may also be inferred from the doctrine of the necessary subserviency of pain to pleasure, and from the mutual instrumentality of beings to the happiness and misery of each other, unfolded in the Scriptures. The divine authority of the Scriptures may be farther deduced from the superior wisdom of the Jewish laws, considered in a political light, and from the exquisite workmanship manifested in the tabernacle and the temple. The time and manner in which the Scriptures were written and delivered to the world, furnish arguments for their divine authority; nor is the want of universality in the publication of revealed religion any just objection to it. The exclusion of all great degrees of enthusiasm and imposture from the characters of Christ, the prophets, and apostles, prove their divine authority; and it may be also inferred, from the reception which Christ, his forerunners and followers, with their doctrines, have met with in all ages. See these arguments stated, illustrated, and applied at large in Hartley's *Observations on Man*, p. 350—421. See also on the subject of this article, *Prideaux's Conn.* vol. ii. 475—497, 8vo. Dupin's *Hist. of the Canon.* ch. i. and ii. Kenicott's state of the printed Hebrew text of the Old Testament, *diff.* ii. p. 295, &c. and *Dissertatio Generalis*, annexed to the second volume of his *Hebrew Bible*. Taylor's *Scheme of Scripture Divinity*, ch. 39. ch. 40.

The Jews, at first, were very reserved in communicating their Scriptures to strangers: despising and shunning the Gentiles, they would not disclose to them any of the treasures concealed in the Bible. We may add, that the people bordering on the Jews, as the Egyptians, Phœnicians, Arabs, &c. were not very curious to know the laws or history of a people, whom in their turn they hated and despised. Their first acquaintance with these books was not till after the several captivities of the Jews, when the singularity of the Hebrew laws and ceremonies induced several to desire a more particular knowledge of them. Josephus (*Contr. Apion.* p. 1033.) seems surpris'd to find such slight footsteps of the Scripture history interspersed in the Egyptian, Chaldean, Phœnician, and Grecian histories; and accounts for it from this circumstance, that the sacred books were not as yet translated into Greek, or other languages, and consequently not known to the writers of those nations. The first version of the Bible was that of the LXX. into Greek, in the time of Ptolemy Philadelphus, about 280 years before Christ; though some maintain that the whole was not then translated, but only the Pentateuch; between which and the other books in the version of the LXX. critics find a great diversity in point of style and expression, as well as of accuracy. See SEPTUAGINT.

Various kinds of books have been composed on the Bible, either to explain the sense, or make its doctrine more obvious, to facilitate the remembrance of it, or to establish particular opinions from it; such as Introductions, Apparatuses, Summaries, Manuals, Histories, Expositions, Commentaries, Harmonies, &c.

Bibles are distinguished, according to their language, into Hebrew, Greek, Latin, Chaldee, Syriac, Arabic, Coptic, &c.: some account of each, and their several editions, &c. we shall here subjoin.

BIBLES, *Hebrew*, are either manuscript or printed. The best *manuscripts*: Bibles are those copied by the Jews of Spain. Those copied by the Jews of Germany are less exact, but more common. The two kinds are easily distinguished from each other; the former being in beautiful characters, like the Hebrew Bibles of Bomberg, Stephens, and Plantin; the latter in characters, like those of Maister, and Gryphus. F. Simon observes, that the oldest manuscript Hebrew Bibles are not above six or seven hundred years old; nor does rabbi Menaham, who quotes a vast number of them, pretend that any of them exceed six hundred years.

Dr. Kennicott, in his *Dissertatio Generalis*, annexed to his Hebrew Bible, p. 21. observes, that the most ancient MSS. were written between the years 900 and 1100; but though those that are the most ancient are not more than 800 or 900 years old, they were transcribed from others of a much more ancient date. The MS. preserved in the Bodleian library is no less than 800 years old. Another MS. not less ancient, is preserved in the Casarean library at Vienna. The same learned writer informs us, that almost all the Hebrew MSS. of the Old Testament, which are known at present, were written between the years 1000 and 1457; and hence infers, that all the MSS. written before the year 700 or 800, were destroyed by some decree of the Jewish senate, on account of their many differences from the copies then declared genuine. This circumstance is also alleged by Walton (*Prolegomena*, 4, 8.) as the reason why we have so few copies of the age of 500 years, and why even the copies of 700 or 800 years are very rare.

The Hebrew distinctions and denominations of the various parts of the Hebrew Bible, as they occur in the titles of the ancient MSS. will be easily understood by the following table of distribution.

		PENTATEUCH,	
P R O P H E T S,	Prior	}	Joshua
			Judges
	Posterior	}	Samuel
			Kings.

			Lamentations
		}	Solomon's Song.
			Chronicle.

Dr. Kennicott, by the industry of his research, has formed a catalogue of the titles and places of above 440 different MSS. of the whole, or of parts of the Hebrew Bible: a number about three times as great as that of the Greek MSS. of the New Testament, which have been collected at a vast expence, and collated with a truly laudable zeal. (See TESTAMENT.) Of these MSS. 54 are preserved in the Bodleian library at Oxford, and 13 in different colleges of the university; 4 are deposited in the public library at Cambridge, and 3 in different colleges; 27 are found in the British Museum; one in the Lambeth library; and one in the library of the Royal Society. The preceding MSS., with 7 copies of the Samaritan Pentateuch, amount to 110 copies, making 125 volumes. Other MS. copies are preserved at Alcalá, or Complutum in Spain, Altorf in Swabia, Amsterdam, Arshalt-Dessau, Augsburg, Baden,

Berlin, Berne, Besançon, Bologna, Brno in Silesia, Cnialong-fou in China, Cairo in Egypt, Cesena in Italy, Copenhagen, Dresden, Erfarth, Florence, Furth in Franconia, Hague, Hall, Hamburgh, Hanover, Heidelberg, Helmstadt, Hesse-Cassel, Holsa near Damascus, Iena, Königsberg, Leipzig, Leyden, Lyons, Mechlin in Flanders, Milan, Modena, Nuremberg, Padua, Paris, Pekin, Rome, Schaffhausen in Swisserland, Stralsburgh, Toledo, Trevigio near Venice, Turin, Venice, Vienna, Ulm in Swabia, Upsal, Utrecht, Wratislaw, Zerbst in Saxony, and Zurich. Besides these, there are others at Fez in Africa, Thessalonica in Greece, and Constantinople, Ethiopia, Malabar, and Cochinchina, at a small distance south of Cranganore, where are about 4000 Jews, who have a synagogue, in which are carefully kept their records, engraven on copper plates, and where, it is said, they can shew their history from Nebuchadnezzar to the present time. See the sequel of this article.

The most ancient printed Hebrew Bibles are those published by the Jews of Italy, especially of Pelaro and Bressa. Those of Portugal, also, printed some parts of the Bible at Lisbon before their expulsion.—This may be observed in the general, that the best Hebrew Bibles are those printed under the inspection of the Jews; there being so many minutiae to be observed, that it is scarcely possible for any other to succeed in it.

The first printed edition of the Hebrew Bible, or at least of that part of it, comprehending the prior prophets, was printed at Soncinum in 1486, according to Le Long (*Biblioth. Sacra.*); it contained also the posterior prophets, according to Wolfius (*Bib. Heb.* ii. 397.); and it seems to have made a first or a second part to the next we shall mention, or Dr. Pellet's, which is regularly the third. The edition presented by Dr. Pellet, in 1735, to the library of Eton college, being that of a third part of the Hebrew Bible, comprehending the Cethubim or Hagiographa, was printed at Naples in 1487. This whole edition was burnt by the Jews, excepting this copy, which had the singular good fortune of escaping the flames. It is printed on vellum, in two folio volumes, and has many readings different from all the other printed copies, and contrary to the Masora, which probably was one of the reasons for which the whole edition was destroyed. This edition is mentioned by Wolfius in his "*Bibliotheca Hebraea*," as formerly belonging to Schröder of Gluckstadt. The antiquity of this edition is argued from its being printed on vellum, as was the case with the first printed books, and from its having variations in the text, which are not found in any later edition. The first edition of the whole Hebrew Bible was printed at Soncinum in 1488, and is mentioned by Le Long, who says that it was printed by Abraham, the son of Rabbi Ithaim, or Chaim. Le Long and Wolfius affirm, that they saw an Hebrew Bible in 8vo. printed at Brescia in 1494.

In the beginning of the 16th century, Dan. Bomberg printed several Hebrew Bibles in folio and quarto, at Venice, most of which are esteemed both by the Jews and Christians: the first in 1518, (the dedication being dated in 1517 which is the least exact, and generally goes by the name of Felix Pratensis, the person who revised it, and who, as Hody says, (p. 461.) was "ex Judo Monachus." This edition contains the Hebrew text, the targum, and the commentaries of several rabbins. It is not known from what particular MSS. the Hebrew text of this edition was taken; but it agrees most with very late MSS. and such as were corrected according to the Masora. The editor, in his dedication to pope Leo, complains of the very corrupt state of the Hebrew MSS., and speaks of his having collated and corrected (probably by means of the Masora) many MSS. which were

used for this edition. At the same time that this edition of the Hebrew Bible was preparing at Venice, another edition of equal fame was preparing by cardinal Ximenes, at Complutum in Spain; and as these two capital editions were thus in the press at once, neither of them could be printed from the other. But as they were both printed by men who either were, or had been Jews, (see Wolfius, tom. ii. p. 339.) from such MSS. as were uniformly corrected by the same Masora, they would exhibit almost universally the same text. And that the Hebrew MSS. here used, had suffered this Masoretical castigation, is plain from the words of Ximenes in his dedication to pope Leo. This famous Bible was begun in 1502, and finished in 1517; but not published till 1522, and not sold publicly, says Michaelis, (Leet. New Test. § 33.) till 1524. In 1526 or 1528, the same Bomberg printed the folio Bible of the celebrated Rabbi Jacob Ben Chaim, with his preface, the Masoretical divisions, a preface of Aben Ezra, a double Masora, and several various readings. No one who duly considers the preface of this editor (printed by Kennicott, Diss. vol. ii. p. 229.) can possibly doubt his having published it, according to the copies most exactly corrected by that Masora, which he profoundly revered. In 1549, was published the second edition of B. Chaim's Bible, with the famous preface at the beginning; and of this edition Le Long says, "prestantissima est et omnium optima, juxta quam præsertim sequentes prodierunt." Wolfius gives it precisely the same character; but adds, that Conrade Zeltner blames B. Chaim for being so excessively devoted to the Masora. In 1572, was published the Royal, or Spanish Polyglott, in 8 volumes, printed at Antwerp; principally under the direction of Arias Montanus. It is not pretended, that the least correction was made in this edition of the Hebrew text; nor could it be expected from an editor who believed the perfection of the Hebrew text. The third edition of B. Chaim's Bible was printed in 1618; it is the same with the second, but much more correct. From the former editions it was, that Buxtorf, the father, printed his rabbinical Hebrew Bible at Basil, in 1619; which, though there are many faults in it, is more correct than any of the former. This was the fifth edition of B. Chaim's Bible, in which the Hebrew text was copied exactly from B. Chaim's second edition. In 1534, Sebastian Münster published a Hebrew and Latin Bible, in 2 vols. fol. at Basil, with the commentaries of the Rabbins, and some notes; and Elias Hutter printed a Hebrew Bible in large letters, at Hamburg, in 1587, fol. Robert Stephens's Hebrew Bible, with the Greek version from the Complutensian edition, the Latin vulgate, and another new Latin version, commonly called Vatablus's Bible, was printed in 1545. In 1623, appeared at Venice a new edition of the rabbinical Bible, by Leo of Modena, a rabbin of that city, who pretended to have corrected a great number of faults in the former edition; but, besides that it is much inferior to the other Hebrew Bibles of Venice with regard to paper and print, it has passed through the hands of the inquisitors, who have altered many passages in the commentaries of the rabbins. The rabbinical Bible of Bomberg and Buxtorf has been superseded by that of rabbi Moses, published at Amsterdam in 4 volumes folio, in 1724—1727. In 1641, was published, in 10 folio volumes, the Paris Polyglott, which, though it claims no merit from correcting the Hebrew text, will ever be honoured by men of true learning, for containing (besides the Syriac and Arabic versions) the first edition of the Samaritan pentateuch and its version, printed from MSS. brought into Europe between the years 1620 and 1630, and published by the learned Morinus, to whom the world is also indebted for many excellent remarks on the

Hebrew text, as well as on the Samaritan pentateuch. In 1657, was published the London Polyglott, under the direction of the eminently learned Brian Walton, in which, however, the Hebrew text is printed Masoretically; almost in an absolute agreement with the many former editions, and with the latest and worst MSS. Although the editor has shewn clearly, that the Jewish transcribers have made many mistakes, and that the MSS. have many true readings, where the printed text is erroneous; and though he speaks (Proleg. 4. 12.) of having supplied some things which were not in the Venice or Basil editions, yet the only supplement which he has made is restoring the two verses in Joshua, which had been arbitrarily expell'd by Masoretic authority. See POLY-GLOTT.

As to Hebrew Bibles in 4to. that of R. Stephens, in 4 vols. Paris, 1539—1544, is esteemed for the beauty of the characters; but it is very incorrect. Plantin also printed several beautiful Hebrew Bibles at Antwerp: one in eight columns, with a preface by Arias Montanus, in 1571, which far exceeds the Complutensian in paper and print, and contents; this is called the Royal Bible, *Biblia Regia*, because it was printed at the expence of Philip II. of Spain; another at Geneva, in 1619; besides many more of different sizes, with and without points. Manasseh Ben Israel, a learned Portuguese Jew, published two editions of the Hebrew Bible at Amsterdam; the one in 4to. in 1635, who tells us in the preface, that he had altered a few letters; and where the most corrected copies differed, he took refuge in grammar rules and the Masora; the other in 8vo. in 1639; the first has two columns, and for that reason is commodious for the reader. It is printed with points, in an elegant type, and has the Keri and Chetib in the margin. The 8vo. edition has vowel points and accents, and the marginal notes. In 1639, R. Jac. Lombroso published a new edition in 4to. at Venice, with small literal notes at the bottom of each page, where he explains the Hebrew words by Spanish words. This Bible is much esteemed by the Jews at Constantinople: in the text they have distinguished between words where the point *kamets* is to be read with a *kamets-katoph*, that is, by *o*, a *d* not an *a*.

Of all the editions of the Hebrew Bible in 8vo. the most beautiful and correct are the two of Jo. Athias, a Jew of Amsterdam. The first, of 1661, is the best paper, which, notwithstanding its being corrected according to ancient MSS. is certainly so far as letters and words are concerned) agreeable only to the latest, as the other printed copies were before it: but that of 1667 is the most exact. This was published by Leusden, who tells the reader, "Tibi damus *Biblia*, impressa per Athiam, quibus correctiora nunquam sol aspexit." And yet, though the sun never saw so much implicit obedience paid to the Masora before, the Rabbins assure us, in their prefatory recommendation, that some whole words were here corrected "ex Masora & a Masoreticis, qui sepem legis fecerunt." This supremely Masoretical edition appeared to their high mightinesses the States-general, so particularly meritorious, that Athias, the typographer, was presented with a chain of gold, and a gold medal pendant. But it is somewhat extraordinary, that a Jew should thus be rewarded for an edition, in which Leusden (though a Christian) confesses, that he permitted the Latin contents, here added in the margin, to explain away some of the prophecies relating to the Messiah. Le Long, in loc.

Leusden's last edition of Athias was followed, in 1705, by Vander Hooght's very elegant edition. No corrections can be expected from this editor, who considered every letter in his book, howsoever it was introduced, as absolutely genuine, and maintained the Masora to be infallible.

After Athias, three H-braizing protestants engaged in printing and publishing the Hebrew Bible; viz. Clodius, Jablonki, and Opitius.—Clodius's edition was published at Frankfurt in 1677, in 4to. At the bottom of the page it has the various readings of the former editions; but the editor does not appear sufficiently versed in the accenting, especially in the poetical books; besides, as it was not published under his eye, many faults have crept in. That of Daniel Leff Jablonki in 1699, in 4to. at Berlin, is very beautiful as to letter and print; but, though the editor pretends he made use of the editions of Athias and Clodius, in reality he did it scarcely in any thing different from the 2d. edition of Bomberg. For this man of eminent learning was intended to lay the foundation for a reformation of the printed Hebrew text. This he has done in the preface, by making several excellent observations on the nature of the printed Hebrew MSS.; with the proper marks of their antiquity, and the great advantages to be derived from them. He has also factually shown, that the Jewish transcribers have committed many mistakes; that the Keris are various readings arising from the mistakes of transcribers; that the older MSS. have them in the text, but the later in the margin; and consequently, that the Masora, which considers the Keris in the margin, must be founded on the later copies; that one of the Hebrew MSS. at Berlin contains some thousands of various readings, and that the other old Hebrew MSS. have numerous differences from the printed text; and that these old MSS. have suffered many alterations from the late correcting Masorets. He also states the possibility of procuring, by due zeal and exertion, very ancient MSS. from such of the Jews as have been settled for many ages in China, Ethiopia, Constantinople, Thessalonica, and other distant parts of the world. Jablonki is the first author, who, after announcing the actual existence of many various readings in the Hebrew MSS., has recommended both an accurate examination of those MSS. now known, and a diligent search after others, at present unknown, through the several quarters of the world. To him, therefore, belongs the honour of having planned the noble scheme for correcting the many corruptions of the printed Hebrew text of the Old Testament; and yet not daring to practise what he recommended, he published the Hebrew text almost the same as it was added to M. Leusden's edition of 1667. His corrections have been confined almost entirely to the vowel-points and accents. The edition of Opitius was published in 4to. at Kiel, in 1709; the character is large and good, but the paper bad; it is done with a great deal of care; but the editor made use of no manuscripts but those of the German libraries; neglecting the French ones, which is a common error to all times. Opitius copied from Leusden's Athias, though, he says, he collated several MSS. in Berlin, and other places; but he neglected the Masora, and he falls into a gross error with respect to the various readings of the Hebrew MSS., in forming a conjecture. Hence it follows, that in this edition will be found many alterations suggested by the Masora, the former editions, and other MSS. collated by Opitius. Vol. F. Bib. Heb. p. 335. The same has been done in the edition of 1709, viz. the 2d. edition of the Hebrew Bible, published by the same author, and printed by the same printer, at Frankfurt, in 1709; the character is large and good, but the paper bad; it is done with a great deal of care; but the editor made use of no manuscripts but those of the German libraries; neglecting the French ones, which is a common error to all times. Opitius copied from Leusden's Athias, though, he says, he collated several MSS. in Berlin, and other places; but he neglected the Masora, and he falls into a gross error with respect to the various readings of the Hebrew MSS., in forming a conjecture. Hence it follows, that in this edition will be found many alterations suggested by the Masora, the former editions, and other MSS. collated by Opitius. Vol. F. Bib. Heb. p. 335.

The little Bible of R. Stephens in 16to. is very much prized for the beauty of the character. It was printed in 7 vols. at Paris, in 1544—1546. Care, however, must be taken; there being another edition of Geneva, exceedingly like it, excepting that the print is worse, and the text less correct. To these may be added some other Hebrew Bibles without points, in 8vo. and 24to. which are much coveted by the Jews; not that they are more exact, but more portable than the rest; and are used in their synagogues and schools; of these there are two beautiful editions, the one of Plantin, in 8vo. with two columns, and the other in 24to. reprinted by Raphaleugius at Leyden, in 1610. There is also an edition of them by Laurentius at Amsterdam, in 1631, in a larger character; and another in 12mo. at Frankfort, in 1694, full of faults, with a preface of M. Leusden at the head of it.

In 1720, an Hebrew Bible was published at Hall, by the learned professor John Henry Michaelis; being the first edition, which contained many various readings, collected from Hebrew MSS. by a Christian editor. The text is taken from Jablonki's edition, with some few emendations. There were collated for this Bible most of the best printed editions, and also five Hebrew MSS. belonging to the library at Erfurth. The propriety of selecting various readings from Hebrew MSS. and ancient versions, is set forth in the preface; and the editor has inserted here and there some variations of words and letters; but the variations, chiefly noted, relate to the minutiae of criticism, consisting only in points and accents.

Charles Francis Houbigant, one of the fathers of the oratory at Paris, published an elegant edition of the Hebrew Bible at Paris, in 1753, contained in four volumes, folio. The text is that of Van der Hooght, without points, to which he has added marginal notes, correcting that text by the Samaritan pentateuch, Hebrew MSS. and ancient versions; and also a new Latin version made by himself, expressive of such a text as his critical emendations appeared to justify and recommend. This celebrated edition, (says Dr. Kennicott, than whom there could not be a more competent judge) seems to proceed upon so just a plan, as to its main principles, and to be executed (in the general) with so much skill and judgment, as to claim for its worthy author the applause of all the friends of religion and learning. He expresses, however, a wish, that the author had spared some of his bolder criticisms, when they are unsupported by MSS., parallel places, or ancient versions; especially, where the proposed emendations are not clearly and strongly recommended by the text. Some learned men have wished, that, instead of inserting only a few select various readings from the Hebrew MSS., all the various readings had been noted by the author after each chapter. But the labour of such a work would have been immense; and would have been almost to be detested with what the learned and excellent editor has actually done. It has, indeed, been objected by Dr. Hody, in his preface to the work, entitled "The History of the Jews," that Houbigant had not done the Hebrew text, to make it conformable to the Vulgate; whereas, in the edition, printed in 1753, he has done the Vulgate, conformably and not otherwise; he proposes, and has proposed, a Latin version of the same. Dr. Houbigant obtained from the pope two hundred livres, as a reward for his publication of the Bible. Dr. Kennicott, in his preface to the edition of 1753, mentions that he had seen a copy, in manuscript, of which about 60000 M. S. either of the whole or parts, were kept of the Bible; and in the year 1754, he printed the Hebrew MSS., and the Vulgate collated by him, published in 1776, the full volume of the Hebrew Bible, in folio.

entitled "Vetus Testamentum Hebraicum, cum variis Lectionibus" The second volume, with the general dissertation, was published in 1780. The text is that of Everard Van der Hooght, in 1705, already mentioned, which is very correctly printed, with the similar Hebrew letters, remarkably sharp and well defined; differing from it only in the disposition of the poetical parts, which Dr. Kennicott has printed in hemistichs, into which they naturally divide themselves; however, the words follow one another in the same order as they do in the edition of Van der Hooght; so that any person may read these passages as prose, if he is so inclined; or may divide the hemistichs differently, according to his own judgment. This edition is printed on an excellent type; the Samaritan text, according to the copy in the London Polyglott, is exhibited in a column parallel with the Hebrew text; those parts of it only being introduced, in which it differs from the Hebrew: and the rest of the Samaritan column being left blank, so that the eye perceives at once, with the utmost ease, the variations of the Hebrew and Samaritan texts. The numerous variations, both of the Samaritan manuscripts from the printed copy of the Samaritan text, and of the Hebrew manuscripts from the printed text of Vander Hooght, are placed separately at the bottom of the page, and marked with numbers referring to the copies from which they are taken.

We shall subjoin to this article a brief account of the rise and progress of that highly interesting and meritorious undertaking, for the completion of which we are indebted to the indefatigable industry and perseverance of the late Dr. Kennicott. A very general opinion seemed to have prevailed among learned men, till about the middle of the last century, in favour of the integrity of the Hebrew text: and Dr. Kennicott ingenuously confesses, that he was misled by the common error. The Rabbins boldly asserted, and the Christians implicitly believed, that the Hebrew text was free from error, and that in all the MSS. of it, no instance of any various reading of importance could be produced. The first person, who seems to have combated this notion in the way of a regular attack, was Ludovicus Capellus. From the differences he observed between the Hebrew text and the version of the LXX. and between the Hebrew pentateuch and the Samaritan pentateuch, from the palpable and manifest corruptions, which he thought he saw in the text itself, and from the many reasons which induced him to suppose that the vowel points and the Masora were both a modern and an useless invention, he was led to question the general integrity of the text; and his enemies allowed, that in his attack upon it, he discovered much learning and ingenuity. Still, however, he acquiesced and admitted the uniformity of the MSS. But the matter was not brought to the test of an actual collation of any number of MSS. and versions, and little was done, till Dr. Kennicott's attention was directed in 1748, by the late learned Dr. Lowth, bishop of London, to an examination of 2 Sam. xxiii. 8. This circumstance convinced him of his former error, and he was soon satisfied that the Hebrew text was far from being perfect, and that it was impossible to undertake this single verse, without allowing that there were in it four corruptions. Kennicott's explanation of this verse having been approved by Dr. Lowth, he was requested to examine the subsequent parts of the same chapter; which was likewise performed, and the whole was published in 1753. He proceeded to examine two parallel chapters in the first book of Chronicles, and the second book of Samuel, and found an omission in the former of no less than 34 Hebrew words. Although such great corruptions were proved from the printed text itself, and from the ancient versions, yet it had not at that time been suspected, that there were now

extant any Hebrew MSS. which would at all assist in correcting the faulty passages of the Old Testament. In the sequel, however, this was found to be actually the case, for Dr. Kennicott, on examining some of the Hebrew MSS. in the Bodleian library, found that they contained, in the chapters above cited, several of the readings which he had recommended as genuine, before he had inspected these MSS. A discovery so important to sacred literature being thus begun in 1753, and extended to 70 Hebrew and Samaritan MSS. in Oxford, it was soon much improved by consulting a number of others at Cambridge, and in London. The inquiry was promoted by means of a catalogue of all the other Hebrew and Samaritan MSS. which were then known to exist in different parts of the world, published by Dr. Kennicott in 1760, in a second dissertation on the Hebrew text. In this work he endeavoured to produce a general conviction, as to the certainty of the Hebrew printed copies being much corrupted, and the great advantages to be derived from MSS., by furnishing many various readings of consequence, which are the true ones; and by confirming the ancient version in a multitude of instances of little moment in themselves, and therefore not likely to have originated from design. It was also proved, that the Samaritan Pentateuch was of great importance; that its MSS. would serve to correct a variety of typographical errors, which disgraced the two printed editions; and that the Samaritan copies were frequently confirmed even by the Hebrew MSS.

In consequence of these interesting discoveries, Dr. Kennicott was solicited by the late archbishop Secker, and many other learned persons, and by several societies of literary men, particularly by the university of Oxford, to whose countenance and encouragement the undertaking was recommended by the late Dr. Hunt, professor of Hebrew and Arabic in that university, to undertake a collation of all the Hebrew and Samaritan MSS. in our own country. Discouraged at first by the prospect of so arduous an undertaking, he at last, in 1760, consented to engage in it. Of his progress, and the circumstances that attended it, we have a detailed account in the "Dissertatio Generalis," published with the second volume of his Bible. Having proposed ten years as the time which, he thought, would be necessary for collating the Hebrew and Samaritan MSS., he was enabled by his singular assiduity to fulfil his own expectations and those of the public. Patronized by his majesty, and by a great number of liberal friends and well-wishers to the undertaking, both at home and in foreign countries, in the list of whom are no fewer than seven crowned heads, several princes, cardinals, archbishops, and bishops, besides universities, public libraries, and many of the most eminent literati in various parts of Europe; Dr. Kennicott instituted various and extensive inquiries after MSS. at Constantinople, Warsaw, Venice, Bologna, Mantua, Pavia, Genoa, Lisbon, Geneva, Utrecht, Erfurt, Berlin, Stockholm, and Hamburg. The numerous Hebrew MSS. of the latter place were collated by the celebrated Reimarus, who not only concurred in, but applauded the undertaking. In the prosecution of this work, it was discovered, that the printed editions of the Hebrew Bible, which had been supposed to agree, and on the agreement of which the notion of the integrity of that text had been founded, very much differed from one another; and particularly, that the *oldest* editions agreed most with the oldest and best MSS., and the *modern* editions with the latest and worst MSS. As one proof of this, it is alleged, that the variations in the first edition (in 1488) from Van der Hooght (in 1705) amount to twelve thousand. In the year 1767, Dr. Kennicott derived great advantage from his own examination of the Paris MSS., both Hebrew and Samaritan, and from

B I B L E.

Dr. Gill's collation of all the passages quoted in the Talmud. An Hebrew MS., which once belonged to a synagogue at Jerusalem, was at this time purchased by his Britannic majesty; and our author himself, hoping to obtain other treasures from the East, first to Canton, and had nearly succeeded in procuring a MS. from the Jews at Cal-fong-fu, in the province of Honan. But though he failed in China, he succeeded in America, and procured a complete Hebrew MS. from a Jew at New York. During the tenth and last year of this collation, eight Danish MSS. were sent to Oxford for the author's own examination, as were also six others from Toledo, by Dr. Bayer. Collations of other MSS. were furnished, at the same time, from Silesia, Cologne, Strasburg, Königsburgh, Upsal, Leyden, and Ireland. The indefatigable author, having thus collected materials for his noble undertaking, an undertaking no less honourable to his country than to himself, proceeded to digest the variations, with which he was furnished, under their several books, chapters, and verses. During this operation, he formed a plan for a more complete scrutiny of the best MSS. through Europe, by sending some well-qualified person to re-examine the MSS. already collated, and to examine the rest in passages of greater moment, and where success seemed at all probable. Mr. (afterwards Dr.) Bruns, a learned German, was selected for this embassy; and he was honoured with letters from the secretaries of state here, to all our foreign ambassadors, as well as from the rulers of the two synagogues in London. The places in which he thus examined MSS., during a tour of three years, were Paris, Louvain, Cologne, Mantz, Worms, Maheim, Nuremburgh, Augsburgh, Stuttgart, Carlsruhe, Strasburgh, Basle, Zurich, Berne, Geneva, Turin, Casale, Verulli, Milan, Genoa, Leghorn, Sienna, Rome, Florence, Bologna, Casena, Modena, Reggio, Parma, Mantua, Palua, Venice, Udine, Gorizia, Gradisca, Trieste, Vienna, Dresden, Lipsic, Erfurt, Jena, Dessau, Berlin, Hamburgh, Helmsstadt, Cassel, Amsterdamb, Utrecht, Leyden, and the Hague.

The variations contained in nearly 700 bundles of papers, being at last digested, including the collections made by Dr. Bruns; and the whole, when put together, being corrected by the original collations, and then fairly transcribed into 20 folio volumes, the work was put to the press in 1773; and both volumes (as we have already said, with the general disquisitions, were finished in July 1770.

In order to evince the necessity as well as the utility of this work, Dr. Kennicott has prefixed in with a surprising detail of testimonies, which exhibit the opinions both of the Jews and Christians, as to the Hebrew text, from the earliest times down to the present. The Jewish testimonies are arranged under five distinct periods, viz. from the time of Malachi, about 420 years before the birth of Christ, to the commencement of the Christian era; from Christ to the year 500 after Christ; from the year 500 after Christ to the year 1000; from this year to the invention of printing, about 1450; and from the invention of printing to the year 1780. The first Jewish testimonies are those of Josephus and Philo, who speak of the Greek version as perfectly agreeing with the Hebrew text in their time; whereas Dr. Kennicott asserts the corruption of the Hebrew text before the time of these Jews, and also the very great importance of the Greek version. For the pentateuch of this version being made about 280 years before Christ, and the other books being also translated into Greek about 100 years before Christ (as is inferred from the prologue to Ecclesiasticus), this version must have had many true readings, where the Hebrew was afterwards corrupted. Although in Pl. xvii. 10. the word for "thy holy one," which is now plural in the text of

every copy expressed Masoretically, yet in the Greek version it is singular, which is the case in no less than 180 copies, agreeably to the quotations of St. Peter and St. Paul. And because the argument of these apostles urged upon the Jews, just after the resurrection of Christ, depends on this word's being truly singular, Dr. Kennicott considers this various reading as of greater moment than any other which was ever drawn forth from MSS. He observes, that as the Greek version thus helps to prove the Hebrew text corrupted when it differs from it, so where the Hebrew text is corrupted, and that version agrees, it proves the corruption to be older than the version, unless the version has since been assimilated to the Hebrew. Such very early corruptions occur, as he conceives, in Deut. x. 6. Gen. xi. 32. and Gen. xxxvi. 31—43. The third instance contains 13 verses, which, not being written by Moses, were probably inserted from 1 Chronicles, i. 43—54. in some MS. of Genesis, into the margin, and thence taken into the text. This interpolation is so old as to be found in all the versions, and likewise in the Samaritan text. In the first instance, many words are omitted in the Hebrew text, and in all the versions, which are preserved only in the Samaritan text. In the second instance, the number 145 is corrupted into 205 in the Hebrew text, and in all the versions, and it is right only in the Samaritan text. Dr. Kennicott afterwards specifies two great corruptions: one, where the Greek version has been assimilated to the Hebrew, by addition; and another, in which the Syriac version has been thus accommodated, by change. The first relates to 20 verses, probably interpolated in 1 Sam. xvii.; and the second, to the word for *body* altered to the word for *ears*, in Psalm xl. 7.; on which word, *body*, the argument is grounded, in the 10th chapter of the epistle to the Hebrews: and a very old Syriac MS. in the royal library of Paris, translated from the Hebrew, has preserved the true word for *body*; and another has proved, that the Jews have altered their ancient copies, wilfully, from the Hebrew text and Greek version of Isaiah, xix. 18. respecting the temple at Heliopolis; and also from their turning Moses into Manasses, in Judges xviii. 30. Many other instances occur in the period now under consideration.

In the interval between the birth of our Saviour and the year 500, Dr. Kennicott remarks, that though the present Masora separates our tenth commandment into two, agreeable to the division now made by the Roman Catholics; yet the unity of this commandment, as made by Protestants, is expressly confirmed by Philo and Josephus; and the Masoretic mark of separation (at Exodus, xii. 17.) is absent from at least 234 Hebrew copies. Josephus is further cited, as confirming the ancient chronology in the Greek version against that now in the Hebrew text; and likewise, as having a number much more credible as to the gold and silver hit by David. The same historian also confirms the reading in the epistle to the Hebrews, chap. vii. 4. from Genesis xiv. 20. He confirms, too, the Syriac version, and the edition of Sixtus, reading four in 2 Sam. xv. 7, and the Vatican MS. reading four in 1 Sam. xvii. 4. And though the later Jews have taken Daniel out of their prophetic book, yet Josephus calls him a prophet, in the strongest terms. It appears further under this period, that the Hebrew MSS. differed at the time of the composition of the Talmud; and that some of the true readings may still be found in this work. This fact is confirmed by several instances, and particularly by Psalm xvi.

Under the third period Dr. Kennicott considers the subject of the *Keri*, which see. This period also includes a collection of 216 variations between the oriental and occidental MSS. Proofs of differences are likewise deduced from the old Jewish books,

books, Rabboth, Pirke Eliezer, and Cozri. Saadias, who flourished about the year 1000, is also referred to as having read differently from the printed text; and Hai, about the same period, is shewn to have followed those MSS., which were defective in Joshua, chap. xxi., where two whole verses, absolutely necessary, though expelled by the Masora, have been found in 149 Hebrew copies. At the end of this period, Dr. Kennicott introduces the Arabic version, generally ascribed to R. Saadias, which has hitherto been reputed only secondary, as if it had been always taken from the Greek or the Syriac; whereas it is honoured with the title of a primary version in several places: because it is found to agree with the Hebrew MSS. where both Greek and Syriac differ from it. This Arabic version has some very important readings, particularly in preserving that word which expresses the cause of God's anger against Balaam, Num. b. xxii. 22. It is also important where it is only secondary; because it helps to determine the true reading of the Greek version, where the Greek MSS. are now at variance; as in Psalm xviii. 14. lxxviii. 9. Micah v. 1. and Zechariah xiii. 7. To the close of this period, Dr. Kennicott refers the two oldest and best Hebrew MSS. now extant, one at Oxford, and the other at Vienna. Of the Bodleian MS., supposed to be 800 years old, he observes, that it contains about 14,000 variations. In the pentateuch of this MS. the Greek version is confirmed by 109 various readings; the Syriac, by 98; the Arabic, by 82; the Vulgate, by 88; and the Chaldee paraphrase, by 42. It also agrees with the Samaritan text, against the Hebrew, in 700 instances. This, it is added, is the only one which has preserved a word of great importance for understanding, 2 Sam. xxiii. 3—7; which word is confirmed by the Greek version, and recovers to us a prophecy of the Messiah.

The fourth period, from 1000 to 1450, is introduced with an observation, that the oldest Hebrew MS. which has a certain date (1106), though containing only 9120 verses, has above 6000 variations. The testimonies of Aben-Ezra, Jarchi, Maimonides, and Kimchi, who all flourished between 1150 and 1250, belong to this period. After taking notice of several true readings preserved by these four Rabbies, Dr. Kennicott introduces Meir Hallevi, who died in 1244, with his pathetic lamentation over the many variations in the Hebrew MSS.

Under the fifth and last period, from 1450 to 1780, including the printed Hebrew text, Dr. Kennicott takes particular notice of the five first editions of different parts, and of the first edition of the whole together. He adds, that the Psalms, as first printed in 1477, contain about 600 variations; and that the Hebrew Bible, as first printed in 1488, contains above 12,000. These, and some other very early editions, agree with the older MSS. much more than the editions after the year 1500, but still more than that by Jacob Ben Chaim, in 1526, which has been in general the standard down to the present time. About the year 1500, began the superstitious regard for the Masora; and such MSS. as had been masoretically corrected, were preferred for the editions of Cardinal Ximenes and Felix Pratensis. But the Masora being highly venerated by Ben Chaim, he chose for his text such MSS. as had the Masora most perfect; which MSS. were the latest and the worst: and yet, unfortunately, this text became the general standard for the Antwerp, Paris, and London Polyglotts, as well as for other editions of less note afterwards. The Jews have not, however, been satisfied with the correctness of Chaim's edition. For Rabbi Lonzano was afterwards encouraged to visit many countries, and to collate ten MSS. in order to render the text more perfect; and yet this complaint of errors was

again renewed in 1635, by Manasseh Ben Israel. These testimonies are concluded with the Mantuan edition, called Minchath Shai, in which are about 2000 various readings, collected from MSS. and early editions, by Solomon Menorzi, in the last century: but it was not printed till 1744. So that, at the time when Christians were generally insiting on the perfection of the Hebrew text, the Jews were labouring to correct it, and lamenting its great imperfection in the following terms: "Quis restituet decus? Quis ejiciet raphanos et ipinas? Horror confredit me: quum viderem multitudinem variantium, quæ ceciderunt in libros! Editores enim obsecrati, neque lax est eis; neque est qui quærit cessationem hujus diversitatis! Ecce nos palpantes tanquam cæci, in obsecrante diversitatum! Deus auferat tenebras nostras!"

On examining the testimonies of Christian writers with regard to the state of the Hebrew text, Dr. Kennicott begins with the Evangelists and Apostles; and here he adverts to the quotations made in the New Testament from the Old: on which subject, see QUOTATION. It appears, by unquestionable evidence, that the Old Testament has been corrupted, in many instances: and that a just correction of the Hebrew text, grounded on the authorities of Hebrew MSS., the Samaritan pentateuch, and the ancient versions, will, in many places, restore to the Old Testament that harmony with the New which it has long wanted. Instances occur in Gen. ii. 24.: Psalm xvi. xxxiv. 22. compared with John xix. 36, 37. and xi. compared with Hebrews x.; Jeremiah xxxi. compared with Hebrews viii.; Amos ix. compared with Acts xv.: Isaiah vii. 14. liii. 4. Psalm lxviii. 19. Hof. xiii. 14. Amos v. 26. Deut. xxxii. 5. and Habakkuk ii. 4. Many arguments are adduced by Dr. Kennicott to shew, that the Jews have corrupted the chronology, from the creation to Abraham, either by subtracting or by adding 1300 years; and this great corruption is not in the Greek version, but in the Hebrew text; and that it was introduced in the second century. As it was a very ancient tradition, that the Messiah was to come in the sixth chiliad, because he was to come in "the last days," (founded on a mythical application of the six days' creation), it was contrived to shorten the age of the world from about 5500 to 3760, and thence to prove that Jesus could not be the Messiah, because at the æra of his birth the time for the advent of the Messiah was not yet come. The time of this grand corruption is shewn to have been between the years 175 and 200. The old Italic version, made from the Greek about the year 100, is adduced to confirm some ancient readings of the Greek version, particularly as to the more extended chronology. Dr. Kennicott, after various pertinent quotations from Ignatius, Justin Martyr, and Irenæus, refers more particularly to Tertullian, with a view of proving that, in his time, the passage in Isaiah liii. 4. expressed the sense ascribed to it in the 8th chapter of St. Matthew, where the Evangelist quotes it as foretelling, that "the Messiah should heal bodily diseases." The Hebrew words, it is shewn, admit this sense: Tertullian so expresses them; and so did the old Greek version, which has been strangely altered in this place, out of opposition to the gospel. Origen is cited, as affording many interesting particulars, with regard to the differences in the Hebrew copies, and the true readings of the Greek versions; and Eusebius, Theophilus Antiochenus, Ephraim Syrus, Jerom, Epiphanius, Augustin, and Salpicius Severus, are quoted to the same purpose. The first period of the Christian writers terminates with the oldest MSS. of the Greek version, particularly the Vatican and Alexandrian MSS. written about the year 400, which see. Dr. Kennicott proceeds to the period that elapsed between the years 500 and 1000, and avails himself

of the Syriac versions (see SYRIAC) for introducing some useful observations on several passages, particularly Psalm xl. 6, 7. 9. and 2 Kings viii. 16.; in which last passage three words are now interpolated in the Hebrew text, which, though they are also found in the Vatican and Alexandrian MSS. are not in the Complutensian and Aldine editions; nor are they in an ancient manuscript of Kings, nor in some of the best MSS. and earliest editions of the Vulgate. See VULGATE. From the year 1000 to 1450, the testimonies of Christians are very few. Yet soon after the Jews fled from the East to Europe in 1040, the Hebrew language was studied by several Christians, particularly by Lanfranc and Anselm, Grossthead and Roger Bacon; and this last learned man, with his Franciscan brethren at Oxford, bought many Hebrew MSS. when the Jews were expelled from England in 1290. In the 13th century, Raymond Martini accused the Jews of corrupting the Hebrew text; and he speaks of MSS. differing in Zeck. xii. 10. with respect to which Dr. Kennicott observes, that forty copies have here the reading expressed in John xix. 37. Dr. Kennicott also cites Nic. Lyranus, Radulphus Armachanus, Tolatus, Perez de Valentin, and Marilianus Ficinus.

Under the last period, from 1450 to 1780, Zuinglius takes the lead; and he extends the Greek version, and remarks the corrupt addition of Jer. chap. li. Luther is also mentioned; and Bibliander is celebrated on account of his excellent criticism on Ez. xl. xiii. 21. As it is very improbable that the news of the capture of Jerusalem should be nearly eighteen months in reaching Babylon, it will be satisfactory to know, on the authority of the Syriac version and eight Hebrew MSS., that this period was not more than six months. Having described the editions of Sixtus and Clement, Dr. Kennicott observes, that the present English version frequently expresses, not what the translators found in their Hebrew text, but what they thought should have been there; and that the 14th psalm, inserted in the liturgy of the Church of England, contains three verses not found at present in the Hebrew text of that psalm, but which are probably genuine. We have already mentioned Capellus's opinion on this subject; and yet though he proved the corruption of the Hebrew text, by every argument except that of MSS., Buxtorf, the son, following his father, who asserted the absolute agreement of all the ancient MSS., affirmed that no Hebrew MS. in the world contained a variation differing which agreed with either of the ancient versions. It is needless to recite the opinion of Mede, Mericurius, Beveridge, Walton, Hammond, Bochart, Heortus, Pocock, Le Clere, &c. on this subject. We shall here only observe, with Dr. Kennicott, that Jablonski was the first editor of an Hebrew Bible, who spoke of any Hebrew MSS.; and he takes care, by the help of which he made a few corrections. Nevertheless, he cited the two references from Joshua, chap. 21. though Dr. Kennicott has established them, in consequence of the correction of 149 copies. Oudin declares that his 11th edition, which obeyed the Maluta, in defiance of all the MSS. and editions of the world in that. Vitruvius also flows, according to Dr. Kennicott, how a still keener MS. may be found and have been introduced into ours, from the practice of consulting many MSS. by one of their standards. The second general edition of the Hebrew Bible by the eminent biblical critic, in 2 Chron. xxvi. 5. is corrected by fifty copies; and the reading of Haneh x. 18. is established by the Talmud and fifteen Hebrew copies. J. H. Michaelis, although he published four various readings, omitted our various of great number, probably from an undue deference to the advocates of the purity of the Hebrew text. Among these advocates we

may reckon Wolfius, who maintained that mistakes might exist in some MS. copies, but not in all; because some one MS., or some one edition, always had the true reading. Carpzovius contended, that the Hebrew text has descended to us in the same state of purity in which it was first found; not indeed in all the copies, but in those of the better sort; nor in these separately, but in such altogether; and he thought it needless to collect these from every quarter of the world, because, in his opinion, those which are near at hand will be sufficient; a concession which abolishes his former doctrine. The learned Hallet, in his notes on the Holy Scriptures, published in 1729, alleges as a reason why the quotations in the New Testament differ from those of the Old, that the Hebrew copies have been altered since the days of the apostles. Bishop Hare, with whose testimonies Dr. Kennicott concludes his catalogue of Christian writers, contends earnestly for admitting the corruption of the Hebrew text. He rejects the titles of many of the psalms as not given by the authors of these psalms. He condemns the practice of varnishing over, instead of correcting, the corrupted readings; and he laments that Hebrew MSS., the chief support of criticism, were wanting.

Dr. Kennicott closes his account of his laudable undertaking, with evincing the great use to be derived from the Hebrew MSS. and ancient versions, for amending the printed Hebrew text; and with exhorting persons in power to render such corrections subservient to the public good, by procuring a more correct and a more intelligible English translation, or rather a revival of the present English translation of the Old Testament. These MSS., he says, strongly confirm the ancient versions, and enable us to ascend to the times of Jerom, of the Apostles, and even of Ptolemy Philadelphus; and, he adds, it now remains to be seen in what kingdom or country through Europe, will be manifested the greater zeal, for correcting the modern translations of the Old Testament.

The work of which, for the gratification of our readers, and with a view of recording and transmitting the honour of our country, where it was undertaken, and of the age in which we live, we have given a copious account, will appear in its pre-eminent importance and utility, whenever it shall be applied to the desirable purpose of aiding a public and authoritative new translation of the Bible, or at least, an effectual revision of the common version. In the translation of particular books of Scripture, by bishops Lowth and Newcome, and by others of inferior rank in the church, &c. we observe the advantage resulting from Dr. Kennicott's labours; but the full benefit can only be enjoyed, when the translation is complete, and authentically introduced into common use. It has contributed eminently to the honour of the king of Sweden, that he has been the first prince in Europe, who has issued his royal commands for executing a purpose of this kind; and Dr. Kennicott thinks, it would be criminal to suppose that Great Britain, which has enjoyed such distinguished blessings of Providence, will be backward to possess a similar sign. No persons, whatever be their rank either in the church or state, can more laudably testify their veneration for the Holy Scriptures, and their concern for the reformation and benefit of the world, than by adopting and accomplishing a measure of this kind. It would serve also to obviate every objection against the truth and authority of divine revelation. It has been urged by lord Bolingbroke, and by other writers on the side of freethinking or infidelity, "that if the Scriptures had been from God, they would always have been preserved in their primitive purity." Dr. Kennicott shews, that neither the freedom nor

the goodness of the Supreme Being can be justly impeached, from the supposition that many errors have crept into the present text; because the most important matters are still secure and certain, and men have always been able to derive from the Bible a rule both of faith and practice. For the illustration of this position, he appeals to the ancient churches, both Greek and Italian, and the modern churches of both Protestants and Roman Catholics; since, amongst all these, their sacred books taught them "what they must do to be saved;" though they contained many errors, the correction of which was very desirable. Indeed, the integrity of the sacred books could not have been preserved without a "miracle," perpetual as to time and universal as to place, which would consequently be a greater miracle than any in the Bible: nevertheless as many corruptions, in transcripts made from transcripts, ever since the year 400 before Christ, were unavoidable, it is happy that several versions, made 1500 or 2000 years ago, will correct some of these corruptions; and that the Hebrew MSS. still extant, will correct others. Upon the whole, it is of great importance, that the effect of these corrections should appear in its whole extent, and as speedily as possible, not only to Christians in particular, but to the world in general.

The learned Dr. John Bernard Rossi, professor of divinity and the oriental languages in the Royal Academy of Parma, undertook to make a collection of the various readings of the Old Testament, in imitation of that of Oxford; and for this purpose he examined by himself, or his friends, 1470 MSS. or printed copies. Of foreign MSS. 210, which had been omitted by Dr. Kennicott, were collated in the most important passages; and of ancient editions, either in his own possession, or to which he had access, the number amounted to 288, of which 230 are such as had not been collated by Dr. Kennicott. M. de Rossi announced his design in a tract, entitled, "Apparatus Hebræo-Biblicus," and published at Parma in 1782, 8vo.; and he proposed to comprize the result of his labours in 4 vols. 4to. The first volume was published at Parma in 1784, under the title of "Variæ Lectiones Veteris Testamenti, &c." or the various readings of the Old Testament, drawn from an immense number of MSS. and printed editions, compared with the Samaritan text and the ancient versions, and examined and appreciated by the most accurate rules and principles of sacred criticism. This volume contains the "Prolegomena," and a clavis of the books of Genesis, Exodus, and Leviticus. In the introduction we have several curious critical discussions, from which we learn that this collection ascertains, as Dr. Kennicott's valuable and judicious labours had before done, instead of invalidating the integrity of the sacred text in matters of the greatest importance; as all the MSS. notwithstanding the diversity of their dates, and of the places where they were transcribed, agree with respect to that which constitutes the proper essence and substance of divine revelation, namely, its doctrines, moral precepts, and historical relations. M. Rossi charges the variations not merely on the copyists, but on the ignorance and temerity of the critics, who have, in all ages, been too ambitious of dictating to their authors, and who, instead of correcting the pretended errors of others, frequently substitute in their place real errors of their own. This author is of opinion, that the common reading of an ancient text ought never to be changed but by the authority of MSS.; and if there be any exceptions to this general rule, they are very rare: and the conjectural alterations of critics should be thrown into the notes. M. Rossi, however, observes, that we must not confound the alterations introduced into the sacred text by the injuries of time, the negligence of transcribers, or the boldness of critics, with

those which have been made by public authority. The sacred writers of ancient times left, as he says, their records to other writers, who were often their disciples, as also to public scribes, and to magistrates, who revised them. In this revision, which was executed either by sacred authors, or by the public authority of the synagogue, corrections and retrenchments were made, where they were judged necessary. This, M. de Rossi thinks, appears evident from the present state of the sacred writings; and in confirmation of his opinion, he quotes the Syriac Interpreter, who, in a note placed at the end of the Pentateuch, says, that this work was composed by Moses, but was afterwards digested and finished by Joshua. He also conjectures that Moses himself made use of ancient records, both in his history of the creation, and in that of the deluge. He thinks that the frequent repetitions and anachronisms, which are discernible in the book of Genesis, ought rather to be attributed to a writer anterior to Moses, than to scribes in after-times; or to the confusion of the ancient records themselves, as some have imagined. This opinion was proposed and maintained with singular ingenuity and erudition, before the time of Rossi, in a French work published at Brussels in 1753, and entitled "Conjectures concerning the original memoirs, which Moses appears to have made use of in composing the book of Genesis, together with remarks designed to confirm or illustrate the several conjectures." The revision, says Rossi, which Ezra made of the sacred writings, with the assistance of MSS. and according to the rules of criticism, both on his own authority as a sacred writer, and that of the council of which he was a member, did not annul the MSS. that were anterior to his time, either in the hands of the Samaritans, or in those of the Jews, from which those of the Cushites or Samaritans had been taken, or in the hands of the Egyptians, or in those of the Babylonian Jews, who did not return to the holy land. The edition of Ezra remained entire till the destruction of Jerusalem; but it underwent several alterations before the time of the Masorites, whose critical labours or attempts with a view of securing the sacred code against future injuries are well known. Yet, notwithstanding these attempts and labours, some faults, which were anterior to their time, still remained; and others, though of little consequence, afterwards crept into the sacred text. The only sources from which we can derive warrantable corrections of these faults are, according to this author, the MSS., the ancient editions, the Samaritan text, the ancient versions, the parallel places, the analogy of the text or of the history, the testimonies of ancient writers, critical conjectures, and the Masora, which De Rossi treats with more respect than Dr. Kennicott, of whom he complains on that account. He subjoins many learned and judicious observations on the various sources, from which materials are to be derived for the necessary corrections. As to the MSS. he lays down rules for ascertaining their age, of which the most obvious is the date; and in order to understand their dates, he takes notice of the various methods of computing time employed by the Jews, and the different eras from which they reckon. When the dates are wanting, it becomes difficult to ascertain the time of a MS., if it be anterior to the thirteenth century. Those which are anterior to the twelfth century are very rare; and the author minutely indicates the marks that distinguish them. The rarity of the ancient Hebrew MSS. has been occasioned by the Jewish custom of depositing their books and phylacteries in public places, from whence, to make place for others, they have been taken and buried in wells, or under ground, where they soon rot. Those of a very remote antiquity, which are no longer extant,

tant, are often restored, in part, by copies which still subsist. With regard to ancient editions, De Rossi distinguishes the Masoretic from those editions without the Masora, which are anterior to the year 1525, when the rabbinical Bible of Jacob Ben Chaim was published. Of 242 which he has collected, he reckons 30 which belong to the sixteenth century, and above 60 which are anterior to the first Masoretic Bible. The ancient versions enumerated by the author are the Greek, Chaldaic, Syriac, Arabic, and Persian; and among these, the Greek version of the Pentateuch, yet unpublished, which is in the library of St. Mark at Venice, and which he supposes to have been made in the twelfth or thirteenth century, by an Hellenist, from the Hebrew of Ezra or of Palestine; and not as the Septuagint, from the Egyptian or Israelitish text. The differences that are found in these versions must not be considered as various readings; since many of these diversities are to be attributed, says De Rossi, to the translators themselves, who have sometimes taken great liberties with the original text, by altering it in their versions. For other particulars, we refer the learned reader to the work itself. The second volume was published at Parma, in 1785, and contains the books of Numbers, Deuteronomy, Joshua, Judges, Samuel, and Kings. The third comprehends Isaiah, Jeremiah, Ezekiel, the twelve lesser prophets, with the Song of Solomon, Ruth, Lamentations, Ecclesiastes, and Esther. And in the fourth, or last, are the Psalms, Proverbs, Job, Daniel, Ezra, Nehemiah, and Chronicles. Paris, 1786. The high price of Kennicott's and De Rossi's very valuable works, induced M. Breitkopf to employ Dr. Doederlein and Professor Meisner, to collect the most interesting various readings from the above works, and to print them under the text of his new edition of Reineccius's bible, printed at Leipzig in 1725, and again in 1739, under the title of "Biblia Hebraica, olim a Christiano Reineccio edita, nunc denuo, cum variis lectionibus, ex ingenti codicum copia, a B. Kennicotto & J. B. de Rossi collatorum," Lipsia, 8vo. 1793.

BIBLES, Greek. The most ancient Greek version is the Septuagint; for an account of which, the manner in which it was found, the collation of its MSS., and other circumstances relating to it, see SEPTUAGINT; see also ALEXANDRIAN, and VATICAN. The number of editions of the Bible in Greek is very considerable; but they may be all reduced to three or four principal ones, namely, that of Complutum or Alcalá de Henares, that of Venice, that of Rome, and that of Oxford. The first or Complutensian edition was undertaken by the divines of Complutum, under the direction and at the expense of cardinal Ximenes, and finished in 1514, but not allowed by Leo to be published till 1520; nor were the copies of it distributed to the world at large before the year 1522. It was inserted in the Polyglott Bible, usually called the "Complutensian Bible." In this edition the Greek of the LXX. is said to be altered in many places, in order to accommodate it to the Hebrew text, and to the Vulgate. For a more particular account of it, see COMPLUTENSIAN, and POLYGLOTT. It has been reprinted in the Polyglott Bible of Antwerp, called "Biblia Regia," by Arias Montanus, in 1572; in that of the Commenes, commonly called "Vatablus's Bible," in 1599; and in De Jay's Polyglott of Paris, in 1645. See POLYGLOTT.

The second Greek Bible is that of Venice, formed from many ancient copies by Andrea Fulanus, and printed by Aldus Manutius in 1518, and hence called the "Aldine edition." This edition approaches nearly to the Roman, and is said to be purer than the Complutensian. Masius says of it, that it is a copy of the simple interpretation of

the ancient LXX.; but not pure, nor free from all intermixture of the words of Theodotion. Usher observes, that it sometimes deviates from the LXX. and adopts the readings of Aquila; and that various glosses have crept into it. From this Aldine edition all the German copies have been derived, which generally adopt the words of it, but differ from it in the order of the books, chapters, and some verses. The apocryphal books are printed separately after the rest. This edition was reprinted, with the Complutensian Latin version, in 1520, by And. Cratandrus: and again, in 1550, by Rich. Brylingerus; at Strasburg, in 1526; at Hamburg, in 1596; at Frankfurt, by the Wechliani, in 1597; and in other places, with some alterations, to bring it nearer to the Hebrew. The most commodious is that of Frankfurt, in which are published, from the Complutensian edition, the four last chapters of Exodus, and a great part of the 24th chapter of the Proverbs. There are also added little Scholia, which shew the different interpretations of the old Greek translation. The author of this collection has not annexed his name, but it is commonly ascribed to Francis Junius.

The third Greek Bible is that of Rome, or the Vatican (see VATICAN), formed from the Vatican copy by cardinal Carassa, and other learned persons, who were employed in this work for nine years, by the order and under the auspices of pope Sixtus V. It was printed at Rome in 1587, with the Greek Scholia, collected from the MSS. in the Roman libraries. It was afterwards printed in Latin, with learned and useful notes, by Flaminius Nobilius, at Rome, in 1588. The Greek edition, with the Latin annexed, the distinction of verses, according to the Vulgate, the Greek Scholia, and the Notes of Nobilius, was printed at Paris, in 1628, by J. Morin, priest of the Oratory. In forming this edition, Carassa made use of several ancient MSS. besides the Vatican, and particularly one procured from the library of Cardinal Bessarion, written in large letters, and another from Magna Græcia, agreeing with the Vatican; and Carassa professes that it was his design, not to accommodate this edition to the Latin Vulgate, or the Hebrew, but to the ancient LXX. Notwithstanding some few trivial objections, this edition has been extolled for its purity, its freedom from any material corruptions, and its superiority to all other editions. From this all the English editions have been derived. The Greek edition of Rome, or as Græbe says in his Prolegomena, that of Paris, has been printed in the Polyglott Bible of London, in 1657; to which Walton has added, at bottom, the various readings of the Aldine and Complutensian editions, and of the Alexandrian MS., as well as of Marchialanus's and Card. Barberini's. It was printed at London in 1653, in 8vo. with some deviations with regard to the order of the books, the number of the psalms, &c.; at Cambridge, in 2 vols. 12mo., with a preface by the learned Pearson, in 1665; at Amsterdam, with the same preface, in 1683, by Leusden, 8vo.; and at Leipzig, in 1697, 8vo. with the Greek Scholia of the Roman edition, the parallel places and various readings, and a preface by J. Trinius of Ulm. Another Greek Bible was published at Francfort, in 1723, by Lambert Bos, who professes to adhere to the Roman edition of the Vatican copy, and to subjoin at the bottom of the page, besides the Scholia of the Roman edition, all the various readings he could find, together with fragments of the versions of Aquila, Symmachus, and Theodotion. Breitinger, however, observes, that Bos, instead of adhering to the Roman edition, has followed that of Paris by Morinus, or the text in Walton's polyglott. This edition of Bos has been long the common text-book of biblical scholars,

scholars, who cannot easily purchase the Roman edition; although it is far from being a correct copy of its prototype.

The fourth Greek Bible is that done from the Alexandrian MS., begun at Oxford by Dr. Grabe, in 1707. An edition of a similar kind had been undertaken by Patrius Junius, or Patrick Young, who proceeded no farther than the 17th chapter of the book of Numbers, and also proposed by Vossius, but not undertaken. In Grabe's edition, the Alexandrian manuscript is not printed such as it is, but such as it was thought it should be; i. e. it is altered wherever there appeared any fault of the copyists, or any word inserted from any particular dialect. This some think an excellence, but others a fault; urging, that the manuscript should have been given absolutely and entirely of itself, and all conjectures, as to the reading, should have been thrown into the notes. For the plan of this work, and the mode of its execution, we refer to the author's Prolegomena. A valuable edition of this work, enriched with various readings from the Vatican copy, and other manuscripts, and illustrated by critical dissertations, was published by Jos. Jac. Breitinger, in 4 vols. 4to. in 1730. Tigur. Helvet. A collection of the MSS. of the most ancient Greek version of the Septuagint has, within these few years past, been undertaken by Dr. Holmes, canon of Christchurch, Oxford; and the first volume was published at Oxford in 1798, folio; for an account of which, see SEPTUAGINT. Walton's Prolegomena. IX. Grabe's Prolegom. Hodii de Bibliorum Textibus originalibus, &c. p. 638, &c. Fabr. Bib. Græc. l. iii. c. xi. § 6. Tom. II. p. 324, &c. See SEPTUAGINT, and TESTAMENT.

BIBLES, *Latin*, how numerous soever, may be all reduced to three classes; the ancient *Vulgate*, called also "the old Italic," or "Vulgar Latin," (see *ITALIC Version*), translated from the Greek Septuagint, for the use of the Latins, soon after their conversion to Christianity: which version was allowed to be superior to all the rest, being, as St. Austin calls it, "tenacior verborum cum perspicuitate sententiæ:" which version being corrupted, Jerom, between the years 370 and 380, made a new Latin version from the Hexaplar Greek; the *modern Vulgate*, the greatest part of which is done from the Hebrew text; and the *new Latin translations*, done also from the Hebrew text in the sixteenth century. We have nothing remaining of the *ancient Vulgate*, used in the primitive times in the Western churches, but the Psalms, Wisdom, and Ecclesiastes. Nobilius has endeavoured to retrieve it from the works of the ancient Latin fathers; but it was impossible to do it exactly, because most of the fathers did not keep close to it in their citations.

As to the *modern Vulgate*, there are numerous editions very different from each other. Cardinal Ximenes has inserted one in the *Bible of Complutum*, corrected and altered in many places. R. Stephens, and the doctors of Louvain, have taken great pains in correcting the modern Vulgate. See VULGATE.

The best edition of Stephens's Latin Bible is that of 1540, reprinted in 1545, in which are added, on the margin, the various readings of several Latin manuscripts, which he had consulted. The doctors of Louvain revised the modern Vulgate after R. Stephens; and added the various readings of several Latin manuscripts. The best of the Louvain editions are those, at the end of which are added the critical notes of Francis Lucas of Bruges.

All these reformations of the Latin Bible were made before the time of pope Sixtus V. and Clement VIII. since which people have not dared to make any alterations, ex-

cepting in comments, and separate notes. Sixtus V. who was advanced to the papal see in 1585, although the Latin Bible of Gregory XIII. was declared to have been restored to its primitive integrity, formed, by the assistance of learned persons, another edition; and issued a bull in 1589, resolving and declaring that this was to be deemed, without doubt or controversy, that which was acknowledged as authentic by the council of Trent, and to be maintained as true, legitimate, authentic, and unquestionable; forbidding the alteration, addition, or subtraction of the least tittle of it, and declaring such a mutilated edition destitute of credit or authority. Nevertheless, after the death of Sixtus V. this edition was suppressed by succeeding popes, as inaccurate and imperfect. A new edition was undertaken by pope Gregory XIV. and completed and announced by Clement VIII. in 1592, which, though different from that of Sixtus, and even repugnant to it, is received as authentic, under the name of Sixtus V.; and it is now the standard throughout all the Romish churches. That pontiff made two reformations; but it is the first of them that is followed. See VULGATE. From this the Bibles of Plantin were done, and from those of Plantin all the rest; so that the common Bibles have none of the after-corrections of the same Clement VIII. It is a heavy charge that lies on the editions of pope Clement, viz. that they have some new texts added, and many old ones altered, to countenance and confirm what they call the Catholic doctrine; witnesses that celebrated passage of St. John, *tres sunt*, &c. Mr. James, an English protestant, has collected above 2000 articles, some of which are indeed of no great consequence, in which Clement's edition differs from that of Sixtus. Clement has adhered more closely to the Hebrew text; and his edition, says Dupin, is much more correct than that of Sixtus. He adds, though the vulgar version be not altogether free from errors and defects, it must nevertheless be confessed that the council of Trent had sufficient reason to prefer this before all the other Latin versions, as Theodore Beza, P. Fagius, L. de Dieu, Casaubon, Grotius, Walton, and some other protestants, have allowed. This version was the most ancient of all that were extant at the time of this council; the greater part of it was done by Jerom, a very exact and faithful interpreter. It had been used for many ages in the Latin church: it was written in a simple and natural style, and yet occasionally heightened by noble expressions; and upon the whole, says Dupin, it was the best and most perfect version.

There is a great number of Latin Bibles of the third class, comprehending the versions from the originals of the sacred books made within three hundred years. The first is that of Sanctus Pagninus, a Dominican, under the patronage of pope Leo X. printed at Lyons, in 4to. in 1528, authorized by two letters of pope Adrian VI. and pope Clement VII. prefixed to it, the former dated in 1523, and the latter in 1526, and much esteemed by the Jews. He employed 25 years in the execution of this work, and finished it before the year 1518. This the author improved in a second edition. In 1542, there was a beautiful edition of the same at Lyons, in folio, with *scholia*, published under the name of Michael Villanovanus, i. e. Michael Servetus, author of the *scholia*. Those of Zurich have likewise published an edition of Pagninus's Bible in 4to. And R. Stephens reprinted it in folio, with the Vulgate, in 1557, pretending to give it more correct than the former editions. There is also another edition in 1586, in four columns, under the name of *Vatablus*: and we find it again in the Hamburgh edition of the Bible in four languages.

In the number of Latin Bibles is also usually ranked the version of the same Pagninus corrected, or rather rendered literal, by Aria Montanus; which correction being approved of by the doctors of Louvain, &c. was inserted in the Polyglot Bible of Philip II. and since in that of London. The chief aim of Montanus has been to translate the Hebrew words by the same number of Latin ones; so that he has accommodated his whole translation to the most scrupulous rules of grammar, without duly adverting to his latitude; and therefore this version may be considered rather as a grammatical commentary than a true version, and adapted to instruct young beginners in the Hebrew, rather than to be read separately. There have been various editions of this in folio, quarto, and octavo; to which have been added the Hebrew text of the Old Testament, and the Greek of the New. The best of them all is the first, which is in folio, 1571. The translation of Thomas Malvenda, a Spanish Dominican, is more grammatical and barbarous than that of Montanus, and not much esteemed.

Since the Reformation, there have been several Latin versions of the Bible from the original Hebrew by Protestants. The most esteemed are those of Munster, Leo Juda, Castalio, and Tremellius: the three last of which have been reprinted various times. Munster published his version at Basil in 1534, which he afterwards revised; he published a correct edition in 1546. Without rigidly adhering to the grammatical signification of the words, like Pagninus and Montanus, he has given a more free and intelligible version: but by not deviating from the sense of the Hebrew text, he has retained some of its idiotism. He has also availed himself of the commentaries of the best Rabbins. Huetius gives him the character of a translator well versed in the Hebrew language, whose style is very exact and conformable to the original. Castalio's fine Latin pleases most people; but there are some who think it too much affected, and destitute of that noble simplicity and natural grandeur, and of that inexpressible energy of style, belonging to the originals, and some other versions: the best edition of it is that in 1573. Leo Juda's version, altered a little by the divines of Salamanca, was added to the ancient Latin edition, as published by R. Stephens, with notes under the name of "Vatablus's Bible," in 1545. It was printed at Zurich in 1543, and is more elegantly written than Munster's, but sometimes recedes too far from the literal sense. It was condemned by the Parisian divines, but printed, with some alterations, by the Spanish divines of Salamanca. That of Junius and Tremellius is preferred, especially by the Calvinists, and has undergone a great number of editions. It possess much more of the true natural simplicity. The chief Hebraisms are preserved, and the whole is exactly conformable to the Hebrew text, without the least obscurity or barbarity. Nevertheless, it is not without defect; relative pronouns are introduced, without attention to the Hebrew text, and they are charged with adding some words to express their own sense.

We may add a fourth class of Latin Bibles, comprehending the *Vulgate* edition, corrected from the originals. The Bible of Hieronimus Clarius is of this number: that author, not being contented with restoring the ancient Latin copy, has corrected the translator in a great number of places, which he thought ill rendered, so as to make them conformable to the Hebrew text. Although he corrected above 8000 passages, he has omitted some to avoid giving offence to the Catholics, by making too many alterations in the vulgar version. Some Protestants have followed the same method, and, among others, Andrew and Luke Oshander, who have each published a new edition of the "*Vulgate*," corrected from the originals, according to the Hebrew text. They have inserted their emendations in a character different from the

text of the vulgar version, instead of throwing them into the margin, and thus they have occasioned some confusion.

BIBLES, Oriental. At the head of the Oriental versions of the Bible, must be placed the Samaritan, as being the most ancient of all, though neither its age nor author have been yet ascertained, and admitting no more for Scripture but the Pentateuch, or five books of Moses. This translation is made from the Samaritan Hebrew text, which is a little different from the Hebrew text of the Jews. This version has never been printed alone; nor any where but in the Polyglotts of London and Paris. See **PENTATEUCH**, and **SAMARITANS**.

BIBLES, Chaldee, are only the glosses or expositions made by the Jews in the time when they spoke the Chaldee tongue. These they call by the name of *Targumim*, or *paraphrases*, as not being any strict versions of the Scripture. They have been inserted entire in the large Hebrew Bibles of Venice and Basil; but are read more commodiously in the Polyglott, being there attended with a Latin translation. See **Chaldee PARAPHRASE**.

BIBLES, Syriac. There are extant two versions of the Old Testament in the Syriac language; one from the Septuagint, which is ancient, and made probably about the time of Constantine; the other, called *antiqua & simplex*, made from the Hebrew, as some suppose, about the time of the apostles. This version is printed in the Polyglotte of London and Paris.

In the year 1555, Widmanstadius printed the whole New Testament in Syriac, at Vienna, in a beautiful character. After him there were several other editions; and it was inserted in the Bible of Philip II. with a Latin translation. The best edition of the Syriac New Testament is unquestionably that of Leyden, published by Schaaf in 1708, and reprinted, much improved, at Leyden, in 1717. A new Syriac and Arabic Testament was printed at Rome, in 1703, by the Propaganda, for the use of the Maronite Christians in Syria. Gabriel Sionita also published a beautiful Syriac edition of the Psalms, at Paris, in 1525, with a Latin interpretation. See **SYRIAC Version**.

BIBLES, Arabic. Although the Christian religion was preached in Arabia, as well as in other countries of the East, at an early period, it never was the established religion of the country, as in Syria and in Egypt; for even the temple of Mecca was a heathen temple till the time of Mahomet. A translation of the Bible into Arabic was therefore wholly unnecessary before the conquests of the Saracens, when the Arabic became the vernacular language of Christian countries. Historical evidence on this subject extends no further than the tenth century, when Rabbi Saadas Gaon published an Arabic version of the Pentateuch; and if conjecture may be allowed (says Marsh, in his edition of Michaelis's Introduction, vol. iii. p. 599.), we may suppose that most of the Arabic versions were made during the period that elapsed between the conquests of the Saracens in the 7th century, and the crusades in the 11th, especially about the middle of this period, when the Syriac and the Coptic, though they had ceased to be living languages, were still understood by men of education; and Arabic literature, under the patronage of Almamon and his successors, arrived at its highest pitch. The age in which the Arabic printed version, or versions of the New Testament, were written, is wholly undecided, for we have no knowledge of the MSS. from which the Roman edition of the four Gospels (mentioned below) was printed; and all that we know of the MSS. used by Gabriel Sionita in his edition of the Paris Polyglott, and by Erpenius in his edition of the Arabic New Testament, is, that the former used a MS. brought from Aleppo, and written in Egypt in the 14th century, and the latter a manu-

script brought from Egypt, in which the gospels were written in the 13th, and the Acts, Epistles, and Revelation in the 14th century. But we are left wholly in the dark with respect to the century in which the versions themselves were made. The Arabic versions may be divided into four classes; viz. those taken immediately from the Syriac, from the Coptic, from the Greek, and from the Latin. That various Arabic versions have been made from the Latin in modern times by oriental monks residing at Rome, who being instructed by the Romish clergy to regard the Vulgate as the standard by which all other versions should be regulated, proposed essentially to serve their brethren in the East, by translating it into their native language, is evident from what is related by professor Adler in his *Biblical and Critical Journey to Rome*, p. 178; and an Arabic version of this kind was actually published at Rome, in 1752, by Raphael Tuki, bishop of Arsan. As for those versions which are written in parallel columns with the Syriac and Coptic, of which copies exist in the royal library at Paris, it is reasonable to suppose that they were not made from the Greek, but immediately from the ancient versions with which they are connected, as the means of understanding them, after the languages in which they were written had ceased to be spoken. For the same reason, those annexed to the Greek text were probably taken immediately from the Greek; but of these Greek Arabic MSS. only one has been discovered, namely, that in the university library at Leyden. Walton (*Prolegomena*, p. 96.) says, that there are two kinds of Arabic versions in use among the eastern Christians; one called the Syriac, and the other the Egyptian, from the countries in which they are used. Both these versions, according to Aug. Justinian, bishop of Nebo, were translated from the Greek. In the year 1516, Aug. Justinian printed at Genoa an Arabic version of the Psalter, with the Hebrew text and Chaldee paraphrase, adding Latin interpretations, which, he says, were taken from the Syrian or Antiochian version. There are also Arabic versions of the whole Scriptures in the Polyglotts of London and Paris, said by Justinian to be taken from the Egyptian or Alexandrian versions; and we have an edition of the Old Testament entire, printed at Rome in 1671, by order of the congregation *de propaganda fide*; but it is of little esteem, as having been altered agreeably to the Vulgate edition. The Arabic Bibles among us are not the same with those used by the Christians in the East. Some learned men take the Arabic version of the Old Testament, printed in the Polyglotts, to be, at least in the main, that of Saadias, who died in the year 942, and who translated the whole Old Testament from the Hebrew into the Arabic, expressing the Arabic in Hebrew characters. Their reason is, that Aben Ezra, a great antagonist of Saadias, quotes some passages of his version, which are the same with those in the Arabic version of the Polyglotts; yet others are of opinion that Saadias's version is not extant. For though the whole Hebrew Bible was thus translated by him, the Pentateuch only has been, as yet, published from his version. The other books, now in Arabic, in the Paris and London Polyglotts, were translated at different times by different authors; partly from the Greek, and partly from the Syriac versions; and few parts, if any, excepting the Pentateuch, were translated from the Hebrew text. The Arabic version is the latest of all the ancient versions of the Old Testament; however, that part of it which has been translated from the Hebrew, will assist in detecting some corruptions that have crept into the Hebrew text since, and those parts that are made from the ancient versions will assist in establishing the true readings of those versions. In 1622, Erpenius printed an Arabic Pentateuch, called also the Pentateuch of Mauritania, as being made by the Jews of Barbary, and

for their use. This version is very literal, and esteemed very exact. The four evangelists have also been published in Arabic, without and with a Latin version, at Rome, in 1591, folio. The Latin translation is printed under each line of the Arabic text, and is taken from the Vulgate, though the Latin text is in some measure altered, so as to make it correspond to the Arabic. In a representation of the baptism of Christ, annexed to it, the rite appears to be performed, not according to the oriental custom of immersion, but according to the northern practice of aspersion; for our Saviour is placed, not in Jordan, but at the brink of the river, with his feet only immersed, while John the Baptist, kneeling on a rock, pours water on his head. The MS. from which this edition princeps of the Arabic gospels is taken, is wholly unknown. Michaelis observes, that upon comparing it with the catechism of the Druses, the passages there quoted from the gospels coincide with this edition; whence he infers that this version must have been long and generally known in Asia. But from this coincidence no other inference can be justly drawn, except that the Arabic version of the gospels, printed at Rome in 1591, was made before the 11th century; for to that age the origin of the Druses is referred. Erpenius observes, in the preface to his Arabic New Testament, that this edition bears a great resemblance to the MS. from which he printed the four gospels, except the first thirteen chapters of St. Matthew. The version, says Michaelis, was certainly taken from the Greek: but father Simon (*Hist. Crit. des Versions du N.T.* ch. 18.) says, that upon comparing the Arabic version of the four gospels printed at Rome, and afterwards reprinted in the Polyglotts, with an Arabic translation of the Coptic version, he found them dissimilar; but that on comparing it with an Arabic translation of the Syriac version, he perceived a great resemblance. Hence he concluded, that it was taken, not from the Greek, but from the Syriac text. This version has been since reprinted in the Polyglotts of London and Paris, with some little alteration of Gabriel Sionita. This Gabriel Sionita, a Maronite by birth, from the neighbourhood of Libanus, and one of the principal editors of the Paris Polyglott, relates, that he made use of a manuscript written in Egypt in the 14th century; but he seems to have been unacquainted both with the name of the author, and with the age in which he lived. Le Loag relates, that it was brought immediately from Aleppo to Paris. From this MS. the Arabic version of the Acts and of the Epistles was taken, which was first in the Paris, and reprinted with additions in the London Polyglott. But this version of the Acts and Epistles can lay no claim to high antiquity; and though it was probably not taken from the Syriac, yet it is not certain whether it was taken from the Greek or the Coptic. Erpenius published an Arabic New Testament entire, as he found it in his manuscript copy, at Leyden, in 1616, from a manuscript written in the Upper Egypt, in 1342. From two dates, which Erpenius seems to have confounded, it is probable, that the manuscript used by him was a compound of two different manuscripts, one written in the 13th, and the other in the 14th century; and this is very consistent with the opinion, that the gospels in this manuscript were translated either from the Coptic or from the Greek, and the Acts and Epistles from the Syriac.

There are some other Arabic versions of late date mentioned by Walton in his *Prolegomena*; particularly a version of the Psalms preserved in Sion College, London, and another of the prophets at Oxford; neither of which has been published.

The English society for promoting Christian knowledge published, in 1727, an Arabic New Testament, for the use of the Christians in Asia. Ten thousand copies were printed, but none sold in Europe, so that this edition is very scarce.

Two copies are preserved at Cambridge, one in the university library, and another in the library of St. John's college. The text is taken from the Polyglotts; but the editor Solomon Negri, by order of the society, altered it in those passages which vary from the reading of our present Greek text. The editor, says Michaelis, has taken the liberty of inserting 1 John v. 7. without cautioning the reader that it was not taken from any MS.

An Arabic Bible is said to have been printed at Bukarest, in 1700, and the gospels at Aleppo, in 1706. Of these, as well as of the complete editions of the Arabic version, a description is given in Le Long's *Bibl. Sacr.* ed. Masch. P. ii. vol. i. p. 110—137. For an account of the MSS. of the Arabic version of the N. T. preserved in the different libraries of Europe, see Boerner's edition of Le Long's *Bibl. Sacr.* P. i. p. 234—240. or vol. i. p. 120—122. Paris ed. 1723; Uri's Catalogue, N. 22—34 of the Arabic MSS.; and Note 11 to § 3. ch. vii. in Marsh's edition of Michaelis's Introduction to the N. T. In the university library are two Arabic manuscripts of the gospels, which formerly belonged to Cyrilus Lucaris.

BIBLES, Coptic. There are several manuscript copies of the Coptic Bible in some of the great libraries, especially in the library of Paris. The Coptic version of the New Testament must be regarded as a principal version of considerable antiquity, because it has given birth to several others in the Arabic language; for since Egypt was invaded by the Saracens, who extirpated the old language, the Egyptians have generally annexed to the Coptic N. T. an Arabic translation, which has almost superseded the original. Niebuhr, in his Description of Arabia (p. 86), relates, that though the gospels are still read in the Coptic version in the public service, it is not understood even by the priests; and that immediately after the lessons have been read in Coptic, the same are read in Arabic, which is the present language both of the Upper and the Lower Egypt. Thomas Marshall had once intended to print the Coptic version, and had even prepared the four gospels for the press, but he died before they were printed. Upon which the publication was referred for Dr. D. Wilkins, a native of Memel in Prussia, who, after having studied the Coptic, made a journey to Amsterdam with this view; but induced by several advantageous circumstances, he removed to Oxford, where his Coptic New Testament was printed in 1716, at the expence of the university. Besides a long preface, he added a Latin translation of the Coptic text, which Jablonski and La Croze have criticised with some severity. It is said, however, that Wilkins took great pains to present the world with a faithful copy, and that his endeavours were not unsuccessful. He also printed the Pentateuch, with a Latin translation, in 1731. Since his time a great variety of MSS. have been collated; and if Woide had undertaken the task, a more complete edition of the Coptic version might have been expected. The title of Wilkins's edition is "*Novum Testamentum Aegyptium vulgo Copticum, ex MSS. Bodleianis descriptis, cum Vaticanis et Parisiensibus collatis, et in Latinum sermoem convertit, David Wilkins, Bachel. Anglicanæ Presbyter.*" Oxon. 1716, 4to. Maj. Montfaucon, in his *Palaographia Græca* (l. iv. c. 7. p. 31.), says that the Coptic MSS. which remain, are not very ancient, and that he has not seen any older than 500 years. Wilkins, in his preface, supports the antiquity of the Coptic version by several arguments, the chief of which is drawn from Antoninus, who began to lead an ascetic life about the year 271, and who, though an Egyptian, and ignorant of Greek, read the New Testament. To the same purpose Woide (p. 97. of his Essay, mentioned below) maintains, that the Egyptian version used by Antoninus in the third century, was written in Coptic,

because he actually read an Egyptian version of the Bible, and as he understood only the dialect of his own country, he concludes that the Coptic version existed before the middle of the third century. Ludovicus Pickins, or Louis Picques, who was acquainted with the Coptic language, refers this version to the fifth century. See Mill's Prolegomena, § 1509.

The readings of the Coptic have a striking affinity with those of the Latin version, and sometimes with those of the Codex Cantabrigiensis. The story of the adulteress is found in some copies, and omitted in others; but 1 John v. 7. is omitted in all. Wetstein has also observed, that the Coptic New Testament has a very great similarity to the quotations of Origen, Eusebius, Cyril, and to the Alexandrine manuscripts. The best accounts of the Coptic version are given in Simon's *Histoire Critique des Versions du Nouveau Testament*, ed. 16.; in the Preface to Wilkins's edition of the Coptic New Testament; in Le Long's *Bibl. Sacr.* ed. Masch. P. ii. vol. i. § 10; and particularly by the learned Woide, in a German Essay printed in 1778, in vol. iii. of the *Kielische Beytrage*, p. 1—10. See **COPTIC**.

BIBLES, Sahidic. The Sahidic version of the Old and New Testament, or that of Upper Egypt, existed only till of late in MS.; but in 1778, the learned Woide published proposals for an edition of several fragments of this version, comprehending about a third part of the New Testament, under the following title, "*Fragmenta Novi Testamenti juxta interpretationem dialecti superioris Aegypti, quæ Thebaidica seu Sahidica appellatur, MSS. Oxoniensibus descripta quæ Latinè reddet, et simul etiam de antiquitate et variis lectionibus hujus interpretationis disseret, C. G. Woide.*" The learned editor lived to continue the work so far as to print the fragments of St. Luke's gospel, and to prepare for the press the manuscript of the fragments of St. John's gospel, but he died in May 1780. After his decease, the delegates of the Clarendon press entrusted the completion of the work to Dr. Ford; and under his care it made its appearance, entitled "*Fragmenta Novi Testamenti, e versione Aegyptiaca Dialecti Thebaidicæ, Sahidicæ, seu Superioris Aegypti,*" Oxon. large folio. In an elaborate dissertation prefixed to this work, Dr. Woide treats of the Coptic version of the Old Testament; of the Sahidic version of the Old Testament; and of the original texts from which those versions were made. In his opinion both the versions were made from the Greek; they express the phrases of the version of the LXX.; and most of the additions, omissions, and transpositions, which distinguish the LXX. from the Hebrew, are discoverable in both the Coptic and the Sahidic version. In a second section the author treats of the Coptic version of the New Testament, and Wilkins's edition of it; of the Sahidic version of the New Testament; and of the antiquity of the versions of the Old and New Testament in both dialects. And in a third section, Dr. Woide gives an account of the versions, in both dialects, of the apocryphal books of the Old and New Testament. From his observations and account, we may conclude, that the Coptic and Sahidic are distinct and independent versions; that the Coptic inclines more to the Alexandrian or Western edition, than the Sahidic; that no remarkable coincidence is to be found between the Coptic or Sahidic version and the Vulgate; and that we have no reason to suspect the former to have been altered or made to conform to the latter; and that the age of the Sahidic version is not yet ascertained. Dr. Woide supposes, that it was made in the second century; and in proof of this opinion, he alleges three arguments. The first argument, deduced from the use made of an Egyptian version by St. Anthony, who is said by St. Athanasius to have been ignorant of the Greek language, and yet to have constantly read the Scripture, has been mentioned under the preceding article.

article. His second argument is deduced from a Sahidic MS. which is probably of the second century, and which contains various passages both of the Old and New Testaments, coinciding with some of the fragments of the Sahidic versions. His third argument is founded on an apparent coincidence of some passages in the fragments, with a manuscript containing two books of the fabrication of the Gnostics, and evidently written in the second century. It appears then, if no objections can be made to these arguments, that proofs may be alleged of a higher antiquity in favour of the Sahidic version than can be produced in favour of any other version of the New Testament: and it must of course be of the greatest importance in the criticism of the Greek Testament. At the same time it must be acknowledged, that the oldest historical evidence for the high antiquity of an Egyptian version is that of Epiphanius and Theodoret; the former quoted by Semler in his "Apparatus ad Novi Testamenti interpretationem," p. 64.; the latter by Wilkins, in the "Prolegomena" to his Coptic New Testament, p. 6. From an examination of the various readings furnished by the above-mentioned fragments, it appears, that the story of the adulteress, John viii. 1—12. is not among them; in the Acts of the Apostles, ch. xx. 28. the Sahidic version coincides with those Greek MSS. which have *απερου*, not *θεις*, in 1 Tim. iii. 16. they coincide with those which read *O* instead of *θεος*: and 1 John ch. v. has the sixth and eighth verses; but the seventh, which contains the testimony of the three heavenly witnesses, is absent. We have an account of the Sahidic version of the New Testament in "Friderici Münter Commentatio de indole versionis N. T. Sahidicæ, &c." Hafniæ, 1789, 4to. to which are annexed some fragments of the New Testament from manuscripts in the possession of cardinal Borgia. Some fragments of the Sahidic version of the gospels of St. Matthew and St. John have been likewise published by Mingarelli in his "Ægyptiorum codicum reliquæ, Venetiis in bibliotheca Namiana asservatæ," Bonon. 1785, 4to. MSS. or rather fragments of MSS. of the Sahidic version of the New Testament are preserved in the libraries of Rome, Paris, Oxford, Berlin, and Venice.

BIBLES, Ethiopic. The Ethiopians have also translated the Bible into their language. Chrysolom, cited by Michaelis, says, that the Ethiopians had in his time a version of the Bible; but his evidence is unsatisfactory. Ludolf, in his history of Ethiopia, relates, that the Scripture was translated into that idiom of the Ethiopic language, which was at that time more peculiar to the inhabitants of Tigré, from the Greek version of the LXX, according to a certain copy used in the church of Alexandria, which the innumerable various readings that are inserted in the English Polyglott Bible from one of the same copies, plainly prove. As for the author, and time of the translation, he is unable to ascertain either; but thinks it most probable that it was begun at the time when the Habeshines, or Abyssinians, were converted, or soon after, and that it was gradually perfected. Mr. Bruce, in his "Travels," vol. i. p. 490, says, that the Abyssinian copy of the Holy Scriptures was, in Mr. Ludolf's opinion, translated by Frumentius, a bishop in the 4th century, who first preached Christianity in Ethiopia; but Ludolf has left the matter undecided. See Hist. of Ethiopia, p. 262 ed. 1682. Mr. Bruce himself inclines to this opinion. They divide the Old Testament, says Ludolf, containing 46 books, into four principal parts, and mix the apocrypha with the canonical. Walton, (Proleg. xv. p. 100.) says, that Gaulmin had an ancient MS. of the whole Ethiopic Old Testament, which was deposited in the royal library of Sweden. Mr. Bruce informs us, (vol. i. p. 489.) that he brought with him a copy of the Ethiopic

version of the O. T. which he has deposited in the British Museum: but it does not appear that he brought a copy of any part of the New. Indeed, he says, (vol. i. p. 493.) that copies of the whole N. T. are in that country very scarce; that, except in the churches, he had never seen a single MS. which comprehended all the parts of it; and that even the transcripts of the Gospels were in the hands only of men of the first distinction. The Ethiopic version of the N. T. contains the whole of it, divided, according to Ludolf, into four separate parts, viz. the Gospels, the Acts, the fourteen Epistles of St. Paul, and the seven Catholic Epistles. The Apocalypse is added as an appendix, and entitled "Abukalamis." Scaliger refers the Ethiopic version to the time of Justinian, at which period he dates the conversion of the Abyssinians: but Walton refers it to a much earlier period, and not far distant from the times of the Apostles. Whoever was the translator of it, it appears to have been taken immediately from the Greek: from the frequent confusion of words which found alike in the Greek, but which have not been confounded by any other translator, and from its agreement in many of its readings with the Alexandrine MS. and with the quotations of Origen. Neither of these circumstances can appear extraordinary, as it was natural for the inhabitants of Abyssinia to procure their copies of the Greek Testament from Egypt. The translation of the Gospels is much superior to that of the Epistles. This version was first published at Rome, in 1548 and 1549, under the pontificate of Paul III. but the editors, who were natives of Ethiopia, had a very imperfect MS. of the Acts, the chafms of which they were obliged to supply from the Vulgate. To this purpose, Ludolf observes, that the Acts of the Apostles, for the most part, were translated at Rome, out of the Latin and Greek, for want of the Ethiopic original. This original seems to have been the source from which our editions of the Ethiopic version of the N. T. have flowed; and it is probably preserved in the Vatican, though it has not yet been described. Walton reprinted this Roman edition in the London Polyglott; but his copy, being in some places illegible, the editors filled up the deficiencies according to their own judgment, so that the Roman edition retains the same value, as if no other were extant. The Latin translation was made by Dudley Loftus, and corrected by Castell; but it is of little worth, and has led Mill, and other collectors of various readings, into error. A more accurate Latin translation of the Ethiopic version has been published by professor Bode, under the following title, "Novum Testamentum ex versione Ethiopici interpretis in Bibliis polyglottis Anglicanis editum ex Ethiopicâ lingua in Latinum translatum," Brunsvigie. 1752, 1755. 2 toms. 4to. The best extracts from the Ethiopic version, says Michaelis, are and must be uncertain, because we have no accurate impression of the version itself; however, his editor (Dr. Marsh) observes, that if the Ethiopic version was made immediately from the Greek, and in an early age; if its readings coincide with the quotations of Origen, and the Greek MSS. of the Alexandrine edition, it seems to be entitled to the same privileges, as other versions of equal antiquity. The principal objection applies not so much to the version itself, as to our printed text, which is probably incorrect, as not being the result of a collation of different MSS. But the same objection may be made to the old Syriac version, in which, though various MSS. have been used since the original edition of Widmanstad, the alterations that have been made deserve rather the name of corruptions than of improvements. Of all the books of the O. T. there never was any printed, but the Psalms and the Song of Solomon, in the Ethiopic language at Rome, in 1513; at Cologne, in 1518, and since that time,

with corrections and emendations, by Walton, in the London Polyglott.

BIBLES, Armenian. There is a very ancient Armenian version of the whole Bible, done from the Greek of the LXX. by some of their doctors, about the time of St. Chrysostom. See *ARMENIAN version*. The first printed edition of the Armenian version was published in the 17th century by Uscan, bishop of Erivan; because the Bible was at that time become so scarce in Armenia, that a single copy cost 1200 livres. Hence a council of Armenian bishops assembled in 1662, ordered the Bible to be printed in Europe. Accordingly, three distinct editions were printed at Amsterdam; the first in 1665, containing both the O. and N. T. in 4to. a second, in 1668, including only the N. T. in 8vo., and a third, in 1698, in 12mo. The two first were printed under the direction of Uscan; but the last is the most beautiful edition. A complete description, particularly of the first of these editions, is given in *Le Long. Bib. sacra*, ed. Mafel, P. II. vol. i. p. 173—176. 180. A list of Armenian MSS. of the N. T. is given in Dr. Boerner's edition of this work, P. i. p. 20, or vol. i. p. 138, of the Paris edition of 1723; see also vol. i. p. 76, of the *Catalogus MSS. Bib. Regiæ*, and note 11 to p. 3. chap. vii. of *Marli's Michaelis*. La Croze and G. Whiston have accused the editor of the above-mentioned edition of having corrupted, in some places, the Armenian text. It is certain, however, says Michaelis, that John v. 7. was not in his MS.; for Sandius declares that he had seen the MS. from which the Amsterdam edition was printed, and that it wanted that verse. Sandius, in the place referred to by Michaelis, speaks of one ancient MS. which he had seen, in possession of the bishop of the Armenian church, and which had been collated at Amsterdam, in which this passage did not occur. It is possible, however, and even probable, that Uscan had more than one MS. and the words of Sandius do not imply the contrary. Nevertheless, we have positive evidence, that Armenian MSS. written before the time of the council at Cis, in 1307, have not this verse. In like manner, John v. 4. is wanting in the Armenian MS. but inserted in Uscan's edition; and La Croze observes, that Uscan himself acknowledges, in his preface, that he had altered some passages from the Vulgate; not, as he candidly allows, with an intention to deceive, but from ignorance and superstitition.

BIBLE, Georgian. The Georgian version was first printed at Moscow, in 1743, fol. and a description of it is given by the learned Michaelis, in his "Allgemeine Bibliothek," or Universal History of Biblical Literature, vol. i. p. 153—160. From the description it appears, that the Georgian text was altered from the Slavonian, in the edition of Moscow, and it would therefore be of little value, the criticism of the N. T. Two MSS. of the Georgian version of the Gospels are preserved in the Vatican. See *Le Long. Bib. Sacr. tom. i. p. 140. ed. Paris, 1723.*

BIBLE, Persian. Some of the Fathers seem to say, that all the Scripture was formerly translated into the language of the Persians; but we have nothing now remaining of the ancient version, which was, certainly, done from the Septuagint. The Persian Pentateuch, printed in the London Polyglott is, without doubt, the work of Rabbi Jacob, a Persian Jew, surnamed Tavosht, Tavulus, or Tufus, from the city Tus, where the Jews had a famous academy. It was translated from the Hebrew text, for the use of the Jews, who lived in Persia, and printed in the Hebrew character, with the Hebrew text, and with the version of O. Kelai and Saadiah, at Constantinople, in 1751. From the collation of this, with other versions, we may deduce a satisfactory explanation of the famous prophecy of Jacob concerning the advent

of the Messiah, unperverted by the glosses of the Rabbins. We have likewise two Persian versions of the four Gospels, of which the most ancient, and that which is of course the most valued by the learned, is printed in the London Polyglott, accompanied with a Latin translation by Dr. Sam. Clarke, and notes by Dr. Thomas Greaves, contained in the appendix. This Persian version of the four Gospels, which is the only part of the N. T. hitherto printed, was taken from a MS. in the possession of Dr. Pococke, and written in the year 1341, as appears by a declaration annexed to it. A new Latin translation has been published by professor Bode, at Helmstadt, in 1750, 1751, with a preface containing historical and critical remarks on the Persian version. Dr. Greaves has very justly observed, that the Persian is a translation of the Syriac, for it sometimes retains even Syriac words, and subjoins a Persian interpretation; and in other places confounds the meaning of words, that have a similar sound only in the Syriac. This is likewise probable in itself; for the Christians, who lived scattered in the Persian empire, made use of Syriac as the language of the church, and as the language of literature; and it was common for the Persians to study in the schools of Syria, especially at Edessa. The principal use then of the Persian version is in discovering the false readings that have crept, since that period, into the Syriac. It might be added, that the Persian omits passages, that are wanting in no MS. or version except the Syriac; as *Matth. xxvii. 46. Mark. vii. 34.* There is another Persian version of the Gospels, which Abraham Wheeloe began to print in 1653, and which was finished after his death by Pierfon, in 1657. It was published in London, and three MSS. were used by the editors. Walton, in his "Prolegomena," xvi. 9. p. 102, informs us, that he knew of only three MSS. of the Persian Gospels, one in the possession of Dr. Pococke, which he used, and the other two in the libraries of Oxford and Cambridge, different from the other, and less ancient. If this be the case, Wheeloe must have used MSS. containing distinct versions, and his text must be of a mixed nature, and of less value in that respect, as well as in point of antiquity, than that of the Polyglott. Wheeloe, or rather Pierfon, whose name is prefixed to the second title page, was of opinion, that this Persian version was made from the Greek; but Renaudot believed it to have been taken from the Syriac. Walton mentions two Persian versions of the Psalms, that were made in the 17th century from the vulgar Latin.

BIBLES, Gothic. It is generally said, that Ulphilas, a Gothic bishop, who lived in the fourth century, made a version of the whole Bible, for the use of his countrymen. Philoborgius (*Hist. Eccles. l. ii. c. 5.*) asserts, that Ulphilas omitted the book of Kings, from an apprehension, that the martial spirit of his nation might be roused by the relation of the Jewish wars; yet this opinion has been confuted by Kaitel, in his learned commentary, s. 255. Michaelis, who was once a strenuous advocate for the opinion, that this was a Frankish version, has since changed his mind, and in the last edition of his *Int. to N. T.* vol. ii. p. 130. ed. Marli, expresses his conviction, that it was Gothic. For an account of the author, see *ULPHILAS*; and to the account already given of this version under the article *ARGENTINUS Codex*, we shall here subjoin the following particulars. From the martyrology of Nicetas, preserved by Simeon Metaphrastes, it appears, that this version was made immediately from the Greek. Besides, independently of this evidence, it is natural to conclude, that a native Cappadocian, who was bishop of a nation in the neighbourhood of Constantinople, and was sent ambassador to the Greek emperor, would translate from the original Greek, with which he was much better

ter acquainted than with the Latin version, from which some writers have erroneously supposed his version was taken. Moreover, from a passage quoted by Blanchini in the "Prolegomena," to the first volume of his "Evangelium quadruplex," p. 8. from a MS. preserved at Brascia, containing the old Latin version of the Gospels, we may infer, that the Gothic version was known in Italy, and that a distinction was made between it and the Italian. Of this important version we have few remains. The principal of these are contained in the *Codex ARGENTÆUS*; which has the four Gospels, though not without considerable chasms. It was first printed in Gothic letters, at Dort, in 1665, 4to.; and reprinted at Amsterdam, in 1684, (Michaelis); and another edition was printed in Latin letters, at Stockholm, accompanied with the Islandish, Swedish, and Latin vulgate. In 1750, it was printed at Oxford, by Lye, after the corrections and emendations of archbishop Beazel; and in 1752 and 1755, the learned Ibre published two small essays, under the title of "Ulphilas illustratus," in which the erroneous passages of the former editions are correctly printed in Latin letters, accompanied with a Latin translation, and notes.

BIBLES, *Muscovite, Russian, or Slavonian.* The Russian or Slavonian version was taken from the Greek by two brothers, Methodius and Cyril, natives of Thessalonica, and apostles of the Slavonians, who lived in the 9th century. According to the account given by Poletika, a learned person of Russia, and formerly Greek translator to the holy synod, in answer to inquiries proposed by Michaelis, it appears, that the holy synod ordered a complete copy of the Bible to be taken, in 1499, which is preserved in the library of that synod; but from the same testimony it appears, that MSS. of the New Testament are extant from the 11th to the 14th century, some on vellum, others on paper, which are also preserved at Moscow, in the library of the holy synod. The oldest known edition is that of Prague, published by Francis Scorina, in 1519; but Poletika is not certain whether it contains the Bible complete. It was revised in 1570, altered in several passages from an ancient MS. written in the time of the grand duke Wladimir, given to Garabunda, secretary to the duchy of Lithuania, and used in the edition of the Bible, printed at Ostrog, in 1581, at the expence of Con. Basil, duke of Ostrog, for the common service of all Christians who spoke the Slavonic language. Other editions were printed at Moscow, in 1663, 1751, 1756, 1757, and 1766, in folio, in 1759 in large 8vo. and in 1783, in 4to. It was also printed at Kiow, in 1758, folio; and at Suprasl in Poland, in small folio. A copy of the edition of 1581, and another of that of 1663, both which are scarce, are preserved in the university library of Göttingen. A particular edition of the Acts of the Apostles, and the Epistles, was printed in 1653. The passage 1 John v. 7. is found neither in the Ostrog edition, the ancient MSS. nor in those editions of the Acts and Epistles, which are prior to 1653. That of 1653 contains it; that of 1663 has it in the margin, and that of 1751, and other modern editions, in the text. Poletika thinks this interpolation was made in the time of the patriarch Nikon, in 1653, when an edition was published of the Acts and Epistles. A very excellent description of the Slavonian version has been communicated to the public by Dobrowsky, a very learned critic in the "Neue Orientalische Bibliothek," vol. vii. p. 153—167. From this work the following particulars, relating to this version, are extracted, by Marsh, in his edition of Michaelis' notes to ch. vii. § 37. The Slavonian version is very literally translated from the Greek, the Greek construction being frequently retained where it is contrary to the genius of the Slavonian; and resembles, in general, the most ancient

MSS. In the Gospels it agrees with the Codex Stephani more frequently than with any other Greek MS. In the catholic epistles it agrees, in general, with the Codex Alexandrinus, and frequently in the Revelation. In the Acts and in the Epistles of St. Paul, it agrees, in general, with the most ancient MSS. but sometimes with one, sometimes with another, yet most frequently with Wettstein's Codex E. Of the readings adopted by Griesbach in the text of his Greek Testament, the Slavonian version has at least three-fourths. Where the united evidence of ancient MSS. is against the common printed reading, the Slavonian version agrees with the ancient MSS. It has not been altered from the Vulgate, as some have supposed, though the fact is in itself almost incredible. It varies from the text of Theophylact, in as many instances as they agree; and their coincidence is to be ascribed, not to an alteration from Theophylact, but to the circumstance, that both Theophylact and the authors of the Slavonian version used the Greek edition. The Slavonian version has few or no readings peculiar to itself, or what the critics call "lectiones singulares."

BIBLES, *Spanish.* There are two translations of the Bible into this language; one done by the Jews, from the Hebrew, and first printed at Ferrara, in 1553, and at Amsterdam, in 1661; the other by Cassiodore Reyna, printed at Basil, in 1569. A corrected edition of it was printed at Amsterdam, in 1602, and at Frankfurt, in 1622. This translation was made from the Hebrew, or rather from the version of Pagninus, and the New Testament from the Greek. There is a translation of the N. T. in Spanish done by Francis Enzinas, and dedicated to Charles V. of which there are several editions; and another different Spanish translation of the N. T. printed in 1596.

BIBLES, *Italian.* There are four Italian versions: the first towards the close of the 13th century, by James de Voragine, archbishop of Genoa, who translated the whole Bible into Italian, from the Vulgate; which ancient version is quite lost; the second by Bruccioli, in 1530, who translated the Bible from the Hebrew, or rather from the version of Pagninus, and dedicated it to Francis I. king of France; the third by Malhermi, a Venetian and Benedictine monk, abbot of St. Michael de Lemo, translated from the vulgar Latin towards the end of the 15th century; the first edition of which was published in 1471; one of them, in 1477, revised by friar Martin, a Dominican; and afterwards printed at Venice in 1541; and the 4th by Diodati, a Protestant, which is much esteemed, and has been often printed. This edition, which was conformable to the French edition of Geneva, was first published in 1607, and again a second time in 1641. The New Testament was translated by father Zachary, a Dominican friar of Florence, and printed apart at Venice, in 1542. An Italian edition of the Epistles and Gospels was printed in 1583.

BIBLES, *French.* The most ancient translation of the Bible into French is that of Guiars de Moulins, a canon of St. Peter d'Aire, in the diocese of Touraine, who was employed in translating the historical books of the O. and N. T. from the year 1291 till 1294. Of this translation there are several editions in the Paris library. Some historians affirm, that Charles V. king of France, caused the Bible to be translated into French by Nicholas Oresme, superior of the house of Navarre, and doctor of Paris. These, and some other translations of parts of the Bible, are extant in MS. in the Paris library. The first French Bible was printed by order of Charles VIII. and dedicated to him, and consequently before the year 1498; being the translation of Guiars de Moulins. The New Testament was printed in French by Colins, printer of Paris, in 1523. But the

same language were read in their religious assemblies. The whole scripture is said by some to have been translated into the Anglo-Saxon by Bede, about the year 701; though others contend that he only translated the Gospels; and others ascribe to him only the gospel of St. John.

We have certain books, or parts of the Bible, by several other translators; as, 1. The Psalms, by Adelm, bishop of Shireborn, contemporary with Bede, about the year 706; though by others this version is attributed to king Alfred, who lived near two hundred years after, and who is said by Mr. Fox to have translated both the Old and New Testament into his native language; and by others to have translated the greatest part of the New Testament: but the authority on which these assertions is founded is too precarious to claim any great degree of confidence. On equally uncertain authority it has been said, that the whole Bible was translated into the Saxon language in the reign of Athelstan. Bale, however, "Script. Brit." cent. 2. c. 27, cites the testimony of Malmesbury to this purpose; and archbishop Usher refers this to the year 930. Some books of the Bible were translated by Eadfried, or Egbert, bishop of Lindisfarne, about the year 680, according to the conjecture of Mr. Selden. A celebrated version of the four Gospels in the Saxon language, said to be made by one Aldred, a priest, is reported to have been found in the celebrated code of bishop Eadfried. Adelm is said to have written a letter to Eadfried, extant in "Wharton's Auctarium Hist. Dogm. Ufferii," p. 351; in which he exhorts him, for the common benefit and use of all people, to put the scriptures into the vulgar language, which Butler, in his book against the vulgar translation, says he did. And archbishop Usher, in his "Hist. Dogm." c. 5. informs us, that the Saxon translation of the Evangelists, done by Eadfried, without distribution of chapters, was in the possession of Mr. Rob. Bowyer. In the Cotton library is a book of the four Gospels, said by Wharton, in his "Anglia Sacra," part. i. p. 695, to be written by bishop Eadfried himself, and which had been adorned with pictures, gold, and jewels, by Ethelwold, bishop of Winchester. Eadfried, or Egbert, died in 721. But some have doubted the existence of such an Anglo-Saxon MS. A version of the Psalms in Anglo-Saxon was published by Spelman in 1640. 2. The Evangelists, still extant, done from the ancient Vulgate, before it was revised by St. Jerom, by an author unknown, and published by Matth. Parker in 1571. This was printed from a MS. now in the Bodleian library, under the direction of archbishop Parker, by John Fox the martyrologist, with the following title, "the Gospels of the fowre Evangelists, translated in the olde Saxons' tyme out of the Latin into the vulgare toung of the Saxons, and now published for testimonie of the same;" at London, by John Daye, 1571. This edition has a preface by John Fox, and is dedicated to queen Elizabeth. Another edition of this version was published at Dort in 1665, by Dr. Thomas Marshall, who tells us that he could ascertain neither its author nor age. An old Saxon version of several books of the Bible, was made by Elfric, abbot of Malmesbury, and afterwards, viz. in 995, archbishop of Caeterbury; several fragments of it were published by Will. Lilly, or W. L'Isle, in 1638, the genuine copy by Edm. Thwaites, in 1699, at Oxford.

Wm. L'Isle observes, on occasion of this publication, that if that good ordinance first enacted by God, Deut. x. 5. for the preservation of the book of the law, by keeping a copy of it in the ark, had been continued, and standard Bibles had been preserved in our cathedral churches, as it has been since appointed by king Alfred, we might now have shewed the whole book of God, or the entire Old and New Testament in Saxon, which was the English of those times,

translated both by that king, and the archbishop of Canterbury, Elfric. Elfric translated the Pentateuch, Joshua, Judges, Ruth, four books of Samuel, entitled in Latin, liber regum, a fifth book called Verba Dierum, or Chronicles, the Psalter, three books of Solomon, viz. Proverbs, Ecclesiastes, the chief of all songs, the books of Wisdom and Ecclesiasticus, the prophets Isaiah, Jeremiah, Ezekiel, Daniel, the twelve Prophets, Ezra, Job, Tobias, Esther, Judith, and Maccabees. Hence we may conclude, with little doubt, that the books of the New Testament were before translated into Saxon, and commonly read in that language. The Pentateuch, Joshua, and Judges, of Elfric's translation, are preserved, says Usher, in Cotton's library; where is also a Psalter, with several hymns of the Old and New Testament, with the Apostles' and Athanasian creed, with an English interlineary translation. The book appears, by a note at the end of it, to have been written in the year 1049. The Anglo-Saxon version, above-mentioned, is divided into sections, over each of which is placed a rubric, directing when it should be read; and this circumstance shews, that at this time the Holy Scriptures were read in the public service of the church in a language which the people understood. Various readings from this version of the four Gospels were first quoted by Mill (Proleg. § 1462.), who took them from the papers of Marshall. With respect to its antiquity, the learned are not agreed: some have referred it to the sixth or seventh century, since Bede died A. D. 735, but others, more generally, to some part of the eighth century. For an account of the MSS. of the Anglo-Saxon version, see Le Long, Bibl. Sacr. tom. i. p. 422, 423. ed. 1723; and for a complete catalogue of Anglo-Saxon MSS. in general, Wanley's Appendix to Hickes's Thesaurus, published at Oxford in 1705, folio. Lewis's Hist. Eng. Transl. of the Bible, p. 5. &c.

BIBLES, *English*. The first English Bible we read of was that translated by J. Wickliffe, about the year 1370, according to some, and 1380, according to others: but never printed, though there are MS. copies of it in several public and private libraries. The MS. of the Old Testament ending with the second book of the Maccabees, in St. John's college Oxford, is said to have been written by Wickliffe himself. This circumstance, though expressed on the top of the leaf before Genesis, is very doubtful. This translation was made from the Latin Bibles then in common use, not because Wickliffe thought the Latin to be the original, or of the same authority with the Hebrew and Greek text, but because he did not understand those languages well enough, to translate from them. He likewise chose to translate word for word, as had been before done in the Anglo-Saxon translation, without observing the idioms of the several languages, so that this translation is in some places not very intelligible to those who do not understand Latin. Before the invention of printing, transcripts were obtained with difficulty, and copies were so rare, that the price of one of Wickliffe's English New Testaments appears, from the registry of William Alnewick, bishop of Norwich, in 1429, to have been four marks and forty pence, or 2l. 16s. 8d. This translation gave such offence, that a bill was brought into the house of lords, 13 Ric. II. A. D. 1390, for suppressing it. But by the opposition of the duke of Lancaster, the king's uncle, the bill was thrown out of the house. Wickliffe's followers were encouraged, by this favourable circumstance, to revise the translation of their master, or rather to make another not so strict and verbal, but more free and accommodated to the sense. The MS. copies of this translation are more rare than those of the other; but they are found in the Bodleian library, and in other libraries both of Oxford and Cambridge. J. de Trevisa, vicar of Berkley in Gloucestershire, who died

about the year 1398, is also said to have translated the whole Bible; but if this be true, it does not appear that any copies of his translation are now remaining. It is probable, that Trevisa merely translated certain sentences of the Bible, that occur in his writings, and some of which are said to have been painted upon the walls of the chapel in Berkley castle. Another English translation has been erroneously ascribed to Reginald Peacock, bishop of Chichester, A.D. 1450, in consequence of his having translated some passages of Scripture, cited in his works. Roile, an hermit of Hampol in Yorkshire, who translated the Psalms about the year 1340, is supposed by Weever, in his "Funeral Monuments," p. 151, to have been the translator of the New Testament, which translation was in reality Wickliffe's. Richard Fitz-Ralph, archbishop of Armagh, is said to have translated the Bible into Irish. He died in 1360. Dr. James, relying on a vague declaration of sir Thomas More, in his account of the constitutions of Arundel, asserts, that the Bible hath been twice translated into English; and that one of these translations is much more ancient (some hundred years) than Wickliffe's. But Lewis has shown this to be a mistake. (Hist. Eng. Transf. p. 43.) The zealots of those times were alarmed by these English translations; and in order to prevent their increase, they urged the necessity of restoring the use of Latin Bibles; and to this purpose Chaucer represents the religious as collecting and depositing them in their libraries, and thus withdrawing them from secular priests and curates, and thus hindering them from preaching the gospel to the people. In 1357, when some secular priests were sent from the diocese of Armagh in Ireland, to study divinity at Oxford, they were obliged soon to return, because they were not able to purchase a Bible. Aeneas Sylvius, afterwards pope Pius II. observed in 1458, concerning the Italian priests, that they did not seem to have ever so much as read the New Testament; and Robert Stephens, speaking of the Sorbonists, says, that when they are asked in what place of the New Testament any thing was written, they replied, that they had read it in Jerom, or in the Decrees, but what the New Testament was they did not know. (See Hody de Bibl. Textibus, p. 464.) Indeed, at that time, if copies of the Bible had been more frequent, the clergy were generally so ignorant as not to be able to read or understand Latin. The Latin Bibles were not only scarce, but much corrupted by the carelessness of transcribers, and the interference of prelatry was critics. In 1457, Wickliffe's followers were become so numerous, and copies of his English translation of the New Testament so common, that an English Bible was sold for 20s., whereas the price of a portulife, or breviary, was 6 marks. After the art of printing was introduced into England, Latin, Hebrew, and Greek Bibles, and particularly copies of the New Testament, became much more common; and accordingly a vicar of Croydon in Surry, is said to have expressed himself to this purpose, in a sermon preached at Paul's cross about this time: "We must root out printing, or printing will root out us."

BIBLE, Tindal's. For the first printed English translation of the Scriptures we are indebted to William Tindal, who, having formed a design of translating the New Testament from the original Greek into English, removed to Antwerp in Flanders, for that purpose. Here, with the assistance of the learned John Fry, or Fryth, burnt for heresy in Smithfield, in 1553, and a friar, called William Roye, who suffered death on the same account in Portugal, he finished it, and in the year 1526, it was printed either at Antwerp or Hanburgh, without a title, in a middle sized 8vo. volume, and without either colophon, concordances in the margin, or table at the end. Tindal annexed a preface at the close of it, in which he

defyred them that were learned to amende if ought were found amysse." Le Long calls this "the New Testament translated into English, from the German version of Luther;" but for this degrading appellation he seems to have no other authority besides a story related by one Cochläus (in Actis Martini Lutheri ad an. 1526, p. 132.), with a view of depreciating Tindal's translation. Many copies of this translation found their way into England; and to prevent their dispersion among the people, and the more effectually to enforce the prohibition published in all the dioceses against reading them, Tostall, bishop of London, purchased all the remaining copies of this edition, and all which he could collect from private hands, and committed them to the flames at St. Paul's cross. The first impression of Tindal's translation being thus disposed of, several other numerous editions were published in Holland, before the year 1530, in which Tindal seems to have had no interest, but which found a ready sale, and those which were imported into England, were ordered to be burned. On one of these occasions, sir Thomas More, who was then chancellor, and who concurred with the bishop in the execution of this measure, inquired of a person, who stood accused of heresy, and to whom he promised indemnity on consideration of an explicit and satisfactory answer, how Tindal subsisted abroad, and who were the persons in London that abetted and supported him; to which inquiry the heretical convert replied, "It was the bishop of London who maintained him, by sending a sum of money to buy up the impression of his Testament." The chancellor smiled, admitted the truth of the declaration, and suffered the accused person to escape. The people formed a very unfavourable opinion of those who ordered the word of God to be burned, and concluded, that there must be an obvious repugnance between the New Testament, and the doctrines of those who treated it with this indignity. Those who were suspected of importing and concealing any of these books, were adjudged by sir T. More, to ride with their faces to the tails of their horses, with papers on their heads, and the New Testaments, and other books which they had dispersed, hung about their cloaks, and at the standard in Cheapside to throw them into a fire prepared for that purpose, and to be fined at the king's pleasure.

When Tostall's purchase served only to benefit Tindal, and those who were employed in printing and selling successive editions of his Testament, and other measures for restraining their dispersion seemed to have little or no effect, the pen of the witty, eloquent, and learned sir Thomas More, was employed against the translator; and the bishop granted him a licence, or faculty, dated March 7, 1527, to have aid to read the several books which Tindal and others published; and at his desire sir Thomas composed a dialogue, written with much humour, and designed to expose Tindal's translation, which was published in 1529. In this dialogwe he alleges, among other charges, that Tindal had mistranslated three words of great importance, viz. the words *prist*, *church*, and *charity*; calling the first seniors, the second congregation, and the third love. He also charges him with changing commonly the term *grace* into *favour*, *confession* into *knowledging*, *penance* into *repentance*, and a *contrite heart* into a *troubled heart*. The bishop of London had, indeed, in a sermon, declared, that he had found in it no less than 2000 errors, or mis-translations; and sir Thomas More discovered above 1000 texts by tale, falsely translated. In 1530, a royal proclamation was issued, by the advice of the prelates and clerks, and of the universities, for totally suppressing the translation of the scripture, corrupted by William Tindal. The proclamation set forth, that it was not necessary to have the scriptures in the English tongue, and in the hands of the common

people; that the distribution of them, as to allowing or denying it, depended on the discretion of their superiors; and that, considering the malignity of the time, an English translation of the Bible would rather occasion the continuance, or increase of errors, than any benefit to their souls. However, the proclamation announced the king's intention, if the present translation were abandoned, at a proper season, to provide that the Holy Scriptures should be by great, learned, and catholic persons, translated into the English tongue, if it should then seem convenient. In the mean time, Tindal was busily employed in translating from the Hebrew into the English the five books of Moses, in which he was assisted by Miles Coverdale. But his papers being lost by shipwreck in his voyage to Hamburg, where he designed to print it, a delay occurred, and it was not put to press till the year 1530. It is a small 8vo. printed at different presses, and with different types. In the preface he complained, that there was not so much as one *i* in his New Testament, if it lacked a tittle over its head, but it had been noted, and numbered to the ignorant people for a heresy, who were made to believe, that there were many thousand heresies in it, and that it was so faulty as to be incapable of amendment or correction. In this year he published an answer to sir Thomas More's dialogue, containing his reason for the changes which he had introduced into his translation. The three former editions of Tindal's English New Testament being all sold off, the Dutch booksellers printed a fourth in this year, in a smaller volume and letter. In 1531, Tindal published an English version of the prophet Jonah, with a prologue, full of invective against the church of Rome. Strype supposes that before his death he finished all the Bible but the Apocrypha, which was translated by Rogers; but it seems more probable that he translated only the historical parts. In 1534, was published a fourth Dutch edition, or the fifth in all, of Tindal's New Testament, in 12mo. In this same year, Tindal printed his own edition of the New Testament in English, which he had diligently revised and corrected; to which is prefixed a prologue; and at the end are the pistils of the Old Testament, closing with the following advertisement, "Imprinted at Antwerp, by Marten Emperour, anno M. D. XXXIV." Another edition was published this year, in 16to. and printed in a German letter. Hall says, in his Chronicle, printed during the reign of Henry VIII. by Richard Grafton, the benefactor and friend of Tindal; "William Tindal translated the New Testament, and first put it into print; and he likewise translated the five books of Moses, Joshua, Judicum, Ruth, the books of Kings, and books of Paralipomenon, Nehemiah, and the first of Esdras, and the prophet Jonas; and no more of the Holy Scriptures." Upon his return to Antwerp, in 1531, king Henry VIII. and his council, contrived means to have him seized and imprisoned. After long confinement he was condemned to death by the emperor's decree in an assembly at Augsberg; and in 1536, he was strangled at Villefort, near Brussels, the place of his imprisonment, after which his body was reduced to ashes. He expired, praying repeatedly and earnestly, "Lord, open the king of England's eyes." Several editions of his Testament were printed in the year of his death. Tindal had little or no skill in the Hebrew, and therefore he probably translated the Old Testament from the Latin. The knowledge of languages was in its infancy; nor was our English tongue arrived at that degree of improvement, which it has since attained; it is not, therefore, surprising, that there should be many faults in this translation which need amendment. This, indeed, was a task, not for a single person, but requiring the concurrence of many, in circumstances much more favourable for the execution of it than

those of an exile. Nevertheless, although this translation is far from being perfect, few just translations, says Dr. Geddes (Prospectus, p. 88.), will be found preferable to it. It is astonishing, says this writer, how little obsolete the language of it is, even at this day; and in point of perspicuity, and noble simplicity, propriety of idiom, and purity of style, no English version has yet surpassed it.

BIBLE, Coverdale's. In 1535 the whole Bible, translated into English, was printed in folio, and dedicated to the king by Miles Coverdale, a man greatly esteemed for piety, knowledge of the Scriptures, and diligent preaching; on account of which qualities king Edward VI. advanced him to the see of Exeter. In his dedication and preface, he observes to this purpose, that, as to the present translation, it was neither his labour nor his desire to have this work put into his hand; but "when others were moved by the Holy Ghost to undertake the cost of it," he was the more bold to engage in the execution of it. Agreeably, therefore, to desire, he set forth this "special" translation, not in contempt of other men's translations, or by way of reproving them, but humbly and faithfully following his interpreters, and that under correction. Of these, he said, he used five different ones, who had translated the Scriptures not only into Latin, but also into Dutch. He further declared, that he had neither wrestled nor altered so much as one word for the maintenance of any manner of sect, but had with a clear conscience purely and faithfully translated out of the foregoing interpreters, having only before his eyes the manifest truth of the Scripture. But because such different translations, he saw, were apt to offend weak minds, he added, that there came more understanding and knowledge of the Scripture by these sundry translations, than by all the glosses of sophistical doctors; and he therefore desires, that offence might not be taken, because one translated "scribe," and another "lawyer," one "repentance," and another "penance," or "amendment." This is the first English Bible allowed by royal authority; and also the first translation of the whole Bible printed in our language. It was called a "special" translation, because it was different from the former English translations; as Lewis has shewn (Hist. Eng. Transl. p. 98.) by comparing it with Tindal's. It is divided into six tomes, adorned with wooden cuts, and furnished with Scripture references in the margin. The last page has these words: "Printed in the year of our Lorde M.D. XXXV. and fynished the fourth day of October." Of this Bible there was another edition in a large 4to. 1550, which was re-published, with a new title, 1553; and these, according to Lewis, were all the editions of it. Coverdale, in this edition of the English Bible, prefixed to every book the contents of the several chapters, and not to the particular chapters, which was afterwards the case; and he likewise omitted all Tindal's prologues and notes. Soon after this Bible was finished, in 1536, lord Cromwell, keeper of the privy-seal, and the king's vicar-general and vicegerent in ecclesiastical matters, published injunctions to the clergy by the king's authority, the seventh of which was, that every parson, or proprietary of any parish church within this realm, should, before the first of August, provide a book of the whole Bible, both in Latin and in English, and lay it in the choir, for every man that would, to look and read therein; and should discourage no man from reading any part of the Bible either in Latin or English, but rather comfort, exhort, and admonish every man, to read it, as the very word of God, and the spiritual food of a man's soul, &c.

BIBLE, Matthew's, or Matthews's. In 1537, another edition of the English Bible was printed by Grafton and Whit-

With much, at Hamburg, as some think, or, as others suppose, at Milbrow, or Marpang in Hesse, or Marbeck in the duchy of Wittenberg, where Rogers was superintendent. It bore the name of Thomas Matthewe, and it was first sent with the king's most gracious licence. Mr. Wadley is of opinion, that, to the end of the book of Chronicles, this edition is Tindal's translation; and from thence to the end of the apocrypha, Coverdale's: but Lewis (p. 107.) thinks it probable that the prophecy of Jonah should be excepted, which Tindal finished in his life-time, and which is the same in this edition, and in Coverdale's Bible of 1535. Mr. Wadley also observes, that the whole New Testament was Tindal's. Bale says, Rogers translated the Bible into English, from Genesis to the end of Revelation, with the use of the Hebrew, Greek, Latin, German, and English (i. e. Tindal's) copies. This book contained Tindal's prologue and notes; and, as Heylin says (Hist. Ref. fol. 20.), it was no other than the translation of Tindal and Coverdale somewhat altered. The name of Matthewe is allowed to have been fictitious, for reasons of prudence; one of which was, that the memory of Tindal had become odious to many. It may well be admitted that John Rogers, a learned academic, and the first who was consigned to the flames in the reign of queen Mary, was employed by Crammer to superintend this edition, and to furnish the few emendations and additions that were thought necessary. This must have been the general period in 1535, as the condemning sentence preserved by Fox (Act, &c. vol. iii. 125.), is "against Rogers, priest, alias called Matthewe." Crammer presented a copy of the book to lord Cromwell, joining his intercession with the king for the royal licence, that it might be purchased and used by all. There are extant two letters, Strype's life of Crammer, p. 511 from the archbishop, on the subject of lord Cromwell's intercession, expressing warm approbation and acknowledgements. "I doubt not," says he, "but that hereby such fruit of good knowledge shall ensue, that it shall well appear hereafter what high and excellent service you have done unto God and the king; which shall so much redound to your honour, that, besides God's reward, you shall obtain perpetual memory for the same within this realm."—"Tindal you shall hear of at the great day, when all things shall be opened and made manifest." In the year 1533, an injunction was published by the vicar-general of the kingdom, obliging the clergy to provide, before a certain festival, one book of the whole Bible, of the largest volume in English, and to set it up in some convenient place within their churches, where their parishioners might not commodiously resort to read it. A royal declaration was also published, which the curates were to read in their several churches, informing the people, that it pleased the king's majesty to permit and command the Bible, being translated into their mother tongue, to be publicly taught by them, and to be openly read in every parish church. But the curates were very cold in this affair (say Lewis, p. 106.), and read the king's injunctions and declarations with such a manner, that scarcely any body could know or discern what they read. Johnsa (Hist. Account, &c. i. fol. p. Wadley's Collection, p. 94.) adds, that they did not read the word of God sincerely; and that they did thus pervert, notwithstanding how well they read, which they were commanded to read, "to do as they and in times past, and to live as their fathers, the old fathers of the land." Fox observes (Act, &c. vol. iii. 516.), that the first success of this book much offended Gardiner and his fellow bishops, both for the prologue, and especially because there was a table in the book chiefly about the

Lord's supper, the marriage of virgins, and the mass, which there was said not to be found in scripture. Strype, however, says, (Life of Crammer, p. 64.), it was wonderful to see with what joy this book was received, not only among the more learned, and those who were noted lovers of the reformation, but generally all over England, among all the common people; and with what greediness God's word was read, and what resort there was to the places appointed for reading it. Every one that could, bought the book, and busily read it, or heard it read: and many elderly persons learned to read on purpose. During a vacancy in the see of Hereford it was visited by Crammer, who enjoined the clergy to procure, by the 1st of August, a whole Bible in Latin and English, or, at least, a New Testament in these languages; to study every day one chapter of these books, conferring the Latin and English together, from the beginning to the end; and not to discourage any layman from reading them, but encourage them to it, and to read them for the reformation of their lives and knowledge of their duty. In the course of the year 1538, a quarto edition of the New Testament, in the vulgate Latin and Coverdale's English, bearing the name of Hollybush, was printed, with the king's licence, by James Nicolson. Of this, another more correct edition was published in 1539, in 8vo., and dedicated to lord Cromwell. In 1538, an edition in octavo of the New Testament, in English, with Erasmus's Latin translation, was printed, with the king's licence, by Romain. In this year it was resolved to revise Matthewe's Bible, and to print a correct edition of it. With this view Grafton went to France, where the workmen were more skilful, and the paper was both better and cheaper than in England, and obtained permission from Francis I. at the request of king Henry VIII. to print his Bible at Paris. But, notwithstanding the royal licence, the Inquisition interposed, and issued an order, dated December 17, 1538, commanding the French printers, their English employers, and Coverdale the corrector of the work, and prohibiting them to proceed; and the impression, consisting of 2500 copies, was seized, confiscated, and condemned to the flames. Some sheets, however, of these books, escaped the fire, by the avarice of the person who was appointed to superintend the burning of them; and the English proprietor, who had fled on the first alarm, returned to Paris, as soon as it subsided, and not only recovered some of these copies, but brought with them to London the presses, types, and printers, and, refining the work, finished it in the following year.

BIBLE, Crammer's, or the Great. As soon as the papal power was abolished in England, and the king's supremacy settled by parliament in 1534, Crammer was very assiduous in promoting translations of the Holy Scriptures into the vulgar tongue; well knowing how much the progress of the reformation depended upon this measure. Accordingly, he moved in convocation, that a petition should be presented to the king for leave to procure a new translation of the Bible. The motion was vigorously opposed by Gardiner, bishop of Winchester, and his party: but Crammer prevailed. The arguments for a new translation, urged by Crammer, and supported by queen Anne Bullen, who had then great interest in the king's affections, were so much considered by him, that, notwithstanding the opposition, public and private, on the part of Gardiner and his adherents, Henry gave orders for setting about it immediately. To prevent any revocation of the order, Crammer, whose mind was intent on introducing a free use of the English Scriptures by faithful and able translators, proceeded without delay to divide an old English translation of the New Testament into

nine or ten parts, which he caused to be transcribed into paper-books, and to be distributed among the most learned bishops, and others; requiring that they would perfectly correct their respective portions, and return them to him at a limited time. When the assigned day came, every man sent his appropriate portion to Lambeth, except Stokesly, bishop of London. This laudable design of the archbishop failed; but the business was executed by other persons, whom he countenanced and encouraged, as we have already stated in the preceding articles. In April 1539, Grafton and Whitchurch printed the Bible (called the "Great Bible,") in large folio, "cum privilegio ad imprimendum solum." A beautiful frontispiece, designed by Holben, and particularly described and exhibited in an engraving by Lewis, p. 122, &c. was prefixed to it: and in the text, those parts of the Latin version, which are not found in the Hebrew or Greek, are inserted in a smaller letter; such, for instance, as the three verses of the 14th psalm, which are the 5th, 6th, and 7th, in the translation of the English liturgy, and the controverted words, 1 John v. 7, 8.; and a mark is used to denote a difference of reading between the Hebrew and Chaldee, afterwards explained in a separate treatise. In this edition Matthew's Bible was revised, and several alterations and corrections were made in the translation, especially in the book of Psalms. Tindal's prologues and notes, and the notes added by others, in the edition of 1537, were wholly omitted. Pointing hands, placed in the margin and in the text, shew the passages on which these notes were to have been written. Johnson (*ubi supra*, p. 76.) calls this third edition of the Scriptures the Bible in the large or great volume, ascribes it to the year 1539, and supposes it to have been the same which Grafton obtained leave to print at Paris. He says, that Miles Coverdale compared the translation with the Hebrew, mended it in many places, and was the chief director of the work. Agreeably to this, Coverdale, in a sermon at Paul's cross, defended his translation from some slanderous reports which were then raised against it, confessing "that he himself now saw some faults, which, if he might review the book once again, as he had twice before, he doubted not he should amend; but for any hereby, he was sure that there was none maintained in his translation." This is related by Dr. Fulk, who was one of Coverdale's auditors. A second edition of this Bible seems to have been printed either this or the next year, by Edward Whitchurch; but the copy is imperfect and has no date.

In the course of the year 1539, another Bible was printed by John Byddell, called "Taverner's Bible," from the name of its conductor, Richard Taverner, who was educated at Christchurch, Oxford, patronised by lord Cromwell, and probably encouraged by him to undertake the work, on account of his skill in the Greek tongue. This is neither a bare revival of the English Bible just described, nor a new version; but a kind of intermediate work, being a correction of what is called "Matthew's Bible," many of whose marginal notes are adopted, and many omitted, and others inserted by the editors. It is dedicated to the king. After his patron's death, Taverner was imprisoned in the Tower for this work; but he had the address to reinstate himself in the king's favour. Wood (*Hist. et Ant. Univ. Oxon. fol. 1674, l. ii. p. 264.*) gives a particular account of Taverner; attributes his imprisonment to the influence of those bishops who were addicted to the Romish religion; and informs us, that his version was read in churches by royal authority. In November 1539, the king, at the intercession of Cranmer, appointed lord Cromwell to take special care that no person, within the realm, should attempt to print any English Bible

for five years, but such as should be admitted by lord Cromwell; and assigns this reason for the prohibition, that the Bible should be considered and perused in one translation in order to avoid the manifold inconveniences to which human frailty might be subject from a diversity of translations, and the ill use that might be made of it. In the year 1540, two privileged editions of the Bible, which had been printed in the preceding year, issued from the presses of Edward Whitchurch. Lewis mentions three other impressions of the "Great Bible," which appeared in the course of this year; two printed by Whitchurch, and one by Petyt and Redman. Cranmer wrote a preface for the editions of the year 1540, from which we learn the opinions and practice of those times. In May of this year, the curates and parishioners of every parish were required, by royal proclamation, to provide themselves with the Bible of the largest volume before the feast of All-Saints, under the penalty of 40s. for every month during which they should be without it. The king charged all ordinaries to enforce the observance of this proclamation; and he apprized the people, that his allowing them the Scriptures in their mother-tongue was not his duty, but an evidence of his goodness and liberality to them, of which he exhorted them not to make any ill use. In May 1541, one edition of Cranmer's Bible was finished by Richard Grafton; who, in the November following, completed also another Bible of the largest volume, which was superintended, at the king's command, by Tonstal, bishop of Durham, and Heath, bishop of Rochester.

In consequence of the king's settled judgment, "that his subjects should be nursed in Christ by reading the Scriptures," he again, on the 7th of May, published a brief, or decree, for setting up the Bible of the great volume in every parish church throughout England. However, this decree appears to have been very partially and reluctantly observed; and the bishops were charged, by a writer in 1546, with attempting to suppress the Bible, under pretence of preparing a version of it for publication within seven years. After the death of Cromwell in 1540, the bishops inclined to popery gained strength; and the English translation was represented to the king as very erroneous and heretical, and destructive of the harmony and peace of the kingdom. In the convocation, assembled in Feb. 1542, the archbishop, in the king's name, required the bishops and clergy to revise the translation of the New Testament, which, for that purpose, was divided into fourteen parts, and portioned out to fifteen bishops; the Apocalypse, on account of its difficulty, being assigned to two. Gardiner clogged this business with embarrassing instructions; and Cranmer clearly perceiving the resolution of the bishops to defeat the proposed translation, procured the king's consent to refer the matter to the two universities, against which the bishops protested; but the archbishop declared his purpose to adhere to the will of the king his master. With this contest the business terminated; and the convocation was soon after dissolved. The Romish party prevailed also in parliament, which enacted a law that condemned and abolished Tindal's translation, and allowed other translations to remain in force, under certain restrictions. After the passing of this act, Grafton, the king's printer, was imprisoned; nor was he released without giving a bond of 300l. neither to print nor sell any more English Bibles, till the king and the clergy should agree on a translation. In 1544, the Pentateuch was printed by John Day and William Seres; and in 1546, the king prohibited by proclamation having and reading Wickliffe's, Tindal's, and Coverdale's translations, and forbade the use of any other than what was allowed by parliament.

liament. From the history of English translations, during the reign of Henry VIII. we learn, that the friends to the reformation conducted themselves with zeal and prudence in the great work of introducing and improving English translations of the Bible; that they encountered many difficulties from the dangerous inconstancy of a despotic prince, and from the inveterate prejudices of a strong Romish party; and that the English scriptures were sought after and read with avidity by the bulk of the people.

Upon the accession of Edward VI. the severe stat. 34 & 35 Henry VIII. c. 1. was repealed, and a royal injunction was published, that not only the whole English Bible should be placed in churches, but also the paraphrase of Erasmus in English to the end of the four Evangelists. It was likewise ordered by this injunction, that every parson, vicar, curate, &c. under the degree of a bachelor of divinity, should possess the New Testament, both in Latin and English, with the paraphrase of Erasmus upon it: and that the bishops, &c. in their visitations and synods should examine them, how they had profited in the study of the Holy Scriptures. It was also appointed that the epistle and gospel of the mass should be read in English; and that on every Sunday and holiday, one chapter of the New Testament in English should be plainly and distinctly read at mass, and one chapter of the Old Testament at even-song. But, in the year 1549, when the book of common prayer, &c. was finished, what nearly resembles our present custom was enjoined, that after reading the Psalms in order at morning and evening prayer, two lessons, the first from the Old Testament, and the second from the New Testament, should be read distinctly with a loud voice. During the course of this reign—that is, in less than 7 years and 6 months, eleven impressions of the whole English Bible were published, and six of the English New Testament; besides an English translation of the whole New Testament, paraphrased by Erasmus. The Bibles were reprinted, according to the preceding editions, whether Tindal's, Coverdale's, Matthew's, Cramer's, or Taverner's; that is, with a different text, and different notes. But it is doubted by the writer of the preface to king James's translation, whether there were any translation, or correction of a translation, in the course of this reign.

In 1562, the "Great Bible," viz. that of Coverdale's translation, that had been printed in the time of Henry VIII. and also in the time of king Edward, was reviewed by archbishop Parker, and reprinted for the use of the church; and this was to serve till 1568, when by his grace was ready for publication. See *Dissert.* p. 5 BIBLE.

BIBLE, Geneva. Many of the principal reformers having been driven to Geneva, during the persecutions of queen Mary's reign; they published, in 1557, an English New Testament, printed by Conrad Balus; the first in our language which contained the distinctions of verses by numerical figures, after the manner of the Greek Testament, which had been published by Robert Stephens in 1551. R. Stephens indeed, published his figures in the margin; whereas the Geneva editors placed them at the beginning of minute subdivisions with breaks, after our present manner. When queen Elizabeth passed through London for the Tower to her coronation, a pageant was erected in Cheapside, representing Time coming out of a cave, and leading a person clothed in white silk, who represented Truth, his daughter. Truth had the English Bible on her back, on which was written "Verbum veritatis." Truth addressed the queen, and presented her with the book. She kissed it, held it in her hands, laid it on her breast, greatly thanked the city for their present, and added, that she would often and diligently read it. Upon a royal visitation in 1559, the Bible, and

Erasmus's paraphrase, were restored to churches; and articles of enquiry were exhibited whether the clergy discouraged any from reading any part of the Scriptures. "Ministers were also enjoined to read every day one chapter of the Bible at least; and all who were admitted readers in the church were daily to read one chapter at least of the Old Testament, and another of the New, with good advisement, to the increase of their knowledge."

During this year, the exiles at Geneva published the book of Psalms in English, with marginal notes, and with a dedication to the queen, dated February 10. In 1560, the whole Bible in 4to. was printed at Geneva by Rowland Hare; some of the refugees from England continuing in that city for this purpose. The translators were bishop Coverdale, Anthony Gilby, William Whittingham, Christopher Woodman, Thomas Sampson, and Thomas Cole; to whom some add John Knox, John Beldigh, and John Pulkain; all zealous Calvinists, both in doctrine and discipline: but the chief and the most learned of them were the three first. Professing to observe the sense, and to adhere as much as possible to the words of the original, and in many places to preserve the Hebrew phraseology, after the labour and study of two years and more, day and night, they finished their translation, and published it; with an epistle dedicatory to the queen, and another, by way of preface, to their brethren of England, Scotland, and Ireland. Besides the translation, the editors of the Geneva Bible noted in the margin the diversities of speech and reading, especially according to the Hebrew; they inserted in the text, with another kind of letter, every word that seemed to be necessary for explaining any particular sentence; in the division of the verses, they followed the Hebrew examples, and added the number to each verse; they also noted the principal matters, and the arguments, both for each book and each chapter; they set over the head of every page some remarkable word or sentence, for helping the memory; they introduced brief annotations for ascertaining the text, and explaining obscure words; they set forth with figures certain places in the books of Moses, of the Kings, and Ezekiel, which could not be made intelligible by any other description; they added maps of divers places and countries, mentioned in the Old and New Testament; and they annexed two tables, one for the interpretation of Hebrew names, and the other containing all the chief matters of the whole Bible. Of this translation, there were above 30 editions in folio, 4to., or 8vo., mostly printed by the queen's and king's printer, from the year 1560 to 1616. Editions of it were likewise printed at Geneva, Edinburgh, and Amsterdam. To some editions of the Geneva Bible, e. g. to those of 1599 and of 1611, is subjoined Beza's translation of the New Testament, Englished by L. Tompson. (See *Rhemish Bible*.) Dr. Geddes (*Gen. Answer*, &c. p. 4.) gives an honourable testimony to the Geneva translation; and hesitates not in declaring, that he thinks it in general better than that of king James's translators.

BIBLE, Bishop's. In the year 1568, the Bible, proposed by archbishop Parker three years before, was completed. This edition, according to Le Long, was undertaken by royal command; and it is mentioned by Strype, to the honour of the archbishop, that he had resolution to perform what Cramer, as opposed by the bishops of his days, had in vain endeavoured to accomplish. In this performance, distinct portions of the Bible, at least 15 in number, were allotted to select men of learning and abilities, appointed, as Fuller says, by the queen's commission; and, accordingly, at the conclusion of each part, the custom of 1568 has the initial letter of each man's name to the end of the Pentateuch.

W. E. for William, bishop of Exeter, whose allotment ended there; at the end of Ruth, R. M. for Richard Menvenis, or bishop of St. David's, to whom pertained the second allotment; and so of the rest. But it still remains uncertain, who, and whether one or more, revised the rest of the N. T. Eight of the persons employed were bishops; whence the book was called the "Bishop's Bible," and the "Great English Bible." The archbishop employed other critics to compare this Bible with the original languages, and with the former translations; one of whom was Laurence, a man famous in those times for his knowledge of Greek, whose castigations the bishop's Bible followed exactly. His grace also sent instructions concerning the method which his translators were to observe; and recommended the addition of some short marginal notes, for the illustration or correction of the text. But the particulars of these instructions are not known. The archbishop, however, directed, and finished the whole; which was printed and published in 1568, in a large folio size, and with a beautiful English letter, on royal paper; and embellished with several cuts of the most remarkable things in the O. and N. T. and Apocrypha, maps cut in wood, and other draughts engraven on copper. It has many marginal references and notes, and many useful tables. It has numerous insertions between brackets, and in a smaller character; which are equivalent to the italics afterwards used by James's translators. Dr. Geddes is of opinion, (Letter to the bishop of London, p. 33.) that italic supplements were first used by Arias Montanus, who died in 1598. The several additions from the vulgar Latin, inserted in the "Great Bible," are omitted; and verse 7 of 1 John v. which was before distinguished by its being printed in a different letter, is here printed without any distinction; and the chapters are divided into verses. In the following year, 1569, it was again published in large 8vo. for the use of private families. This Bible was reprinted in 1572, in large folio, with several corrections and amendments, and several prolegomena; this is called "Matthew Packer's Bible." With regard to this Bible, Lewis (p. 61.) observes, that the editions of it are mostly in folio and 4to., and that he never heard but of one in 8vo.; for which he supposes this to be the reason, that it was principally designed for the use of churches. In the convocation of the province of Canterbury, which met in April, 1571, a canon was made, enjoining the church-wardens to see, that the Holy Bible be in every church in the largest volumes, if convenient; and it was likewise ordered, that every archbishop and bishop, every dean and chief rectiditary, and every archdeacon, should have one of these Bibles in their cathedrals and families. This translation was used in the churches for forty years; though the Geneva Bible was more read in private houses. For king James's opinion of it, see *King James's Bible*.

BIBLE, Rhemish. After the translation of the Bible by the bishops, two other private versions had been made of the New Testament; the first by Laur. Tomson, undersecretary to sir Francis Walsingham, made from Beza's Latin edition, together with the notes of Beza, published in 1576, in 8vo. and afterwards in 1599, varying very little from the Geneva Bible; the second, by the papists at Rhems, in 1582, in 4to. called the "Rhemish Bible;" or "Rhemish Testament." These finding it impossible to keep the people from having the scriptures in the vulgar tongue, resolved to give a version of their own, as favourable to their cause as might be. It was printed on a large paper, with a fair letter and margin. One complaint against it was, its being translated from the vulgate Latin, and retaining a multitude of Hebrew and Greek words untranslated,

for want, as the editors express it, of proper and adequate terms in the English to render them by; as the words *azymes, tunike, rational, holocaust, prepuce, pasche,* &c. whence Fuller called it, in his quaint manner, "a translation which needed to be translated," and Fuller says that "by all means they laboured to suppress the light of truth, under one pretence or other." They added large annotations, to shew, as they say, the studious reader, in most places, pertaining to the controversies of those times, both the heretical corruptions, and false deductions, and also the apostolic traditions, the expositions of the holy fathers, the decrees of the Catholic church, and most ancient councils. Some have said, that it was printed in a most costly manner, in order to put it out of the power of common people to purchase it; but if any of the laity secretly procured one of these Rhemish Testaments, he durst not own that he had read it, without previously obtaining from his superior a licence for this purpose. Many of the copies were seized by the queen's searchers, and confiscated; and Th. Cartwright was solicited by secretary Walsingham to refute it; but after a good progress made therein, archbishop Whitgift prohibited his farther proceedings therein, as judging it improper the doctrine of the church of England should be committed to the defence of a puritan, and appointed Dr. Fulk in his place, who refuted the Rheimists with great spirit and learning. Cartwright's refutation was also afterwards published in 1618, under archbishop Abbot, together with the Rhemish translation. This procedure was much more agreeable to the true spirit of protestantism, than the act of seizing and burning the copies; "argument being the only weapon (says the truly excellent primate Newcome), which should be wielded to defend Christianity, or any mode of professing it." Other editions were printed at Antwerp, in 1600, and in 12mo. at the same place, in 1630, and at Paris, in 4to. in 1633. Within 30 years after their New Testament, the Roman Catholics published a translation of the Old, at Doway, hence called the "Doway Bible," in two 4to. volumes, the former in 1609, the other in 1610, from the Vulgate, with annotations. It is said that the translators were William Allyn, afterwards cardinal, Gregory Martin, and Richard Brislow; and that the annotator was Thomas Worthington. But some (Le Long. 418.) ascribe the version of the New Testament chiefly to William Raynold.

BIBLE, King James's. The last English Bible was that which proceeded from the Hampton-court conference, in 1603, where many exceptions being made to the Bishop's Bible, king James gave order for a new one; not as the preface expresses it, for a translation altogether new, nor yet to make of a bad one a good one, but to make a good one better, or of many good one best. On the second day of this conference, Dr. Reynolds, the speaker of the Puritans, moved his majesty, that a new translation of the Bible might be undertaken; because those which were allowed in the reigns of Henry VIII. and Edward VI. were corrupt, and such versions as were extant were not answerable to the truth of the original. It has been observed by learned men with regard to the translators in the reign of Henry VIII. that they followed Erasmus and Sebastian Munster too closely; of the Geneva version, that it was formed too faithfully on the model of Beza; and of the Bishop's Bible, that it was not sufficiently exact, but full of errors, because its conductors departed from the Hebrew, and trod too exactly in the footsteps of the Greek. In reply to Dr. Reynolds, the king laid, that he had never yet seen a Bible well translated into English; though he considered the Geneva translations as the worst. On the suggestion of Bancroft, bishop of London, he forbade marginal notes; some of the Geneva

notes having been, in his opinion, "very partial, untrusty, and favouring too much of dangerous and traitorous opinions." In 1604, the king commissioned fifty-four learned men of the two universities, and of other places, to confer together, that nothing should pass without a general consent, in order to make a new and more correct translation of the Bible. Such of these as survived till the completion of the work were divided into six classes. Ten were to meet at Westminster, and to translate from the Pentateuch to the end of the second book of Kings. Eight, appointed at Cambridge, were to finish the rest of the historical books, and the Hagiographa. At Oxford, seven were to undertake the four greater prophets, with the lamentations of Jeremiah, and the twelve minor prophets. The epistles of St. Paul, and the remaining canonical epistles, were allotted to another company of seven, at Westminster. Another company of eight, at Oxford, were to translate the four gospels, the Acts of the Apostles, and the Apocalypse. Lastly, a fourth company of seven, at Cambridge, had assigned to them the Apocrypha, including the prayer of Manasse. The king prescribed certain rules, which the translators were required carefully to observe. The Bishop's Bible was to be the standard, from which as few deviations as possible were to be allowed; the names of the prophets, and the holy writers, with the other names in the text, were to be retained as near as possible to their vulgar use; the old ecclesiastical words were to be retained, as the word "church," which was not to be translated "congregation," &c.; of various other words, if significations, those were to be retained which had been most commonly used by the ancients, or most ancient fathers, being agreeable to the propriety of the place, and the analogy of faith; the divisions of the chapters were to remain without alteration as possible; no marginal notes were to be added, except for the explanation of Hebrew or Greek words, which should not without circumspection be lightly supplied; quotations were to be annexed in the margin, for the purpose of referring from one scripture to another; every particular person of each company was to take the same chapter or chapter, and having separately translated his appropriate part, all were to meet, to compare what they had done, and to agree as to that which should remain; when any part was finished by the company, it was to be referred to a superior authority, and judicious consideration; if any doubt or difference occurred, it was to be settled at a general meeting; with respect to places of special obscurity, the opinion of learned persons was to be obtained by letters addressed to them for that purpose; and skilled persons were required to translate any observations that might be of use to the company, either at Westminster, Cambridge, or Oxford; the directors in each company were to be the deans of Westminster and Chester, for that place, and the king's professors in the Hebrew and Greek, in each university; and the following translations, if they agreed better with the text than the Bishop's Bible, were to be used, viz. Theodotus, Metastew's, Coverdale's, Wicliffe's, or the Great Bible, printed in 1539 and 1540, by Wicliffe and Grafton; and the Geneva Bible. The king also intended his pleasure, that three or four of the most eminent and grave divines of the university, assisted by the vice-chancellor, upon conference with the rest of the heads, should be overseers of the translations, as well Hebrew as Greek. The translation was begun in the spring of 1607, and the completion of it occupied almost three years. When the whole was finished, and three copies of it were sent to London, one from Cambridge, a second from Oxford, and a third from Westminster, two were chosen from the joint companies which had assembled at those places, to review and polish it.

The two from the Cambridge companies were Mr. John Bois, fellow of St. John's college, and Mr. Andrew Downes, professor of Greek. These daily met their fellow-labourers in Stationers' hall, London; where, in nine months, they completed their task, and received, each of them, by the week 3*l.* from the Company of Stationers, whereas, "before they had nothing." The whole was, at first, reviewed by Bilson, bishop of Winchester, and Dr. Myles Smyth, afterwards bishop of Gloucester, who prefixed arguments to the several books; and the latter was ordered to write the preface. This edition of the Bible, with the preface and a dedication to the king, was first published in London, in the year 1611; and is commonly called "King James's Bible." Several editions of it were published in 4*to.* and in 8*vo.*; and particularly one by R. Barker, in 1613. In some editions of this Bible, betwixt 1638 and 1685, an alteration is introduced in Acts vi. 3. where, instead of "We may appoint," is inserted "Ye may appoint," which has been charged on the Independents. But as the first Bible in which it was observed is that printed at Cambridge by Buck and Daniel, in 1638, it is probably an error of the press, without any design to favour any particular party. In 1660, a beautiful edition of this Bible in folio, with chorographical cuts, engraved by Ogilby, was printed at Cambridge, by John Field; and another edition was printed in 8*vo.* at Amsterdam, in 1664, by John Canne, a leader of the English Brownists, with marginal notes, shewing Scripture to be the best interpreter of Scripture. The editor has prefixed a preface; and the Apocrypha is omitted. A very fine edition of this Bible was published in a large folio, in 1701, under the direction of Dr. Tenison, archbishop of Canterbury, with chronological dates, and an index, by bishop Lloyd, and tables of scripture measures by bishop Cumberland; but this edition abounds with typographical errors. After this translation, all the other versions dropped, and fell into disuse, except the Epistles and Gospels in the Common Prayer Book, which were still continued, according to the Bishop's translation, till the alteration of the liturgy in 1661, and the Psalms and Hymns, which are to this day as in the old version.

About the time when king James resolved on a new translation of the Bible, another translation was finished by Mr. Ambrose Uther, elder brother of the learned printer of Armagh of the same name. It was never printed; but is preserved in MS. in 3 vols. 4*to.* in the library of Trinity college at Dublin. In 1764, Mr. Anthony Purver published a new translation of the Bible, at London, in 2 vols. folio. We have also had several translations of the New Testament, (THE TESTAMENT) and of particular books and parts of the Old and New Testament, the principal of which will be noticed in their proper places.

Learned persons have entertained very different opinions concerning the accuracy and value of the translation, made by order of king James, and now in common use. Bishop Newcomen, the late much respected printer of Ireland, has given an abstract of these opinions. Bidden recommends it as the "best translation in the world." The committee for religion in the time of Cromwell, A.D. 1656, whilst they pretended to discover some mistakes in it, allowed it to be the "best extant;" Walton, in his "Prolegomena," highly commends it; and Poole, in his "Synopsis, &c." says, that "in this royal version occur very numerous specimens of great learning and skill in the original language, and of an uncommon accuracy and judgment." In the "Bibliotheca Lætararia," A.D. 1723, it is observed, that "it made its way by general consent and approbation, without the interposition of authority to enforce it. A true argument that it is generally esteemed the best we have; though it has still many con-

siderable faults, and very much needs another review." Dr. Wells, in his general preface to the O. T. professes to correct it, "either where it does not give the true sense of the original, or where the true sense is not well expressed," according to the modern idiom. The author of an "Essay for a New Translation of the Bible, &c." 1727, after speaking in praise of this version, recommends the attempt to give a more exact translation than any that has hitherto appeared; and he adds, "it were indeed to be wished, that those who are to power did employ men of true learning, and solid piety, free from bigotry and blind zeal, in so noble and necessary a work." "Innumerable instances," says Blackwall in his "Sacred Classics," might be made (in the English Bible) of faulty translations of the divine original; which either weaken its sense, or debase and tarnish the beauty of its language." He also observes, that "a new translation can give no offence to people of sound judgment and consideration; because every body, conversant in these matters, and unprejudiced, must acknowledge, that there was less occasion to change the old version into the present, than to change the present into a new one."—"Such an accurate and admirable translation, proved and supported by sound criticism, would quasi and silence most of the objections of pert and profane cavillers, which chiefly proceed from their want of penetration and discernment of the connection of the argument, and their ignorance of the manner and phrase, of the divine writings. It would likewise remove the scruples of many pious and conscientious Christians."—"A new division of the sacred books into chapters, sections, and periods, might be so contrived and managed as to make a new edition very commodious and beautiful; which would overbalance all inconveniences which superstition and weakness could pretend might arise from alterations, and make a victorious and speedy way to the favour and full approbation of the world." There is hardly one chapter in the N. T., says this author, that is not faultily divided, in consequence of which, the connection and meaning of particular passages are rendered confused and obscure; whilst the style is materially injured. "It is, with pleasure and just veneration," he continues, "to the memory of our learned and judicious translators, that I acknowledge their version in the main, to be faithful, clear, and solid. But no man can be so superstitiously devoted to them, but must own that a considerable number of passages are weakly and imperfectly, and not a few falsely, rendered. And no wonder; for since their time there have been great improvements in the knowledge of antiquity, and advancements in critical learning, &c." "If ever" (says Dr. Waterland, *Scripture Vindicated*), "a proper time should come for revising and correcting our last English translation, which, though a very good one, and upon the whole scarce inferior to any, yet is undoubtedly capable of very great improvements, &c." Doddridge, Wesley, Wynne, Pilkington, Purver, Worsey, Priestley, &c. &c. express themselves to the same purpose. "To confirm and illustrate the holy scriptures," says the eminently ingenious and learned bishop Lowth (*Visitation Sermon at Durham, 1758*), "to evince their truth, to shew their consistence, to explain their meaning, to make them more generally known and studied, more easily and perfectly understood by all; to remove the difficulties, that discourage the honest endeavours of the unlearned, and provoke the malicious cavils of the half-learned: this is the most worthy object that can engage our attention; the most important end to which our labours in the search of truth can be directed. And here I cannot but mention that nothing would more effectually conduce to this end, than the exhibiting of the holy scriptures themselves to the people in a more advantageous and just light, by an accu-

rate revival of our vulgar translation by public authority. This hath often been represented; and, I hope, will not always be represented in vain." The late archbishop Secker delivers similar sentiments in his "Latin speech intended to have been made at the opening of the Convocation in 1761, printed at the end of his charges;" London, 1769, p. 363. To the same purpose are the declarations of Dr. Durell, in his "Critical Remarks on Job, &c." Oxf. 1772. pref. p. 6.; of bishop Lowth, in his "Prelim. Diss. on Isaiah," 4to. Lond. 1778, p. 69.; of Dr. White, in his "Revival of the English Translation of the O. T. recommended," Oxf. 1779, p. 8, 9, &c. &c. Dr. Kennicott, Green, and Blayney, excellent judges on this subject, have concurred in the same opinion, of the necessity and utility of either a new translation or a revival of the old one. The late Dr. Geddes, in his "Prospectus of a new Translation of the Holy Bible," 4to. Glasg. 1786, p. 2. expresses himself in the following language. "The highest eulogiums have been made on the translation of James I., both by our own writers, and by foreigners; and indeed, if accuracy, fidelity, and the strictest attention to the letter of the text, be supposed to constitute the qualities of an excellent version, this, of all versions, must, in general, be accounted the most excellent. Every sentence, every word, every syllable, every letter and point, seem to have been weighed with the nicest exactitude, and expressed, either in the text or the margin, with the greatest precision. Pagninus himself is hardly more literal; and it was well remarked by Robertson, above 100 years ago, that it may serve for a lexicon of the Hebrew language, as well as for a translation. It is, however, confessedly, not without its faults. Besides those that are common to it with every version of that age, arising from faulty originals, and Masoretic prepositions:" it has its own intrinsic and peculiar blemishes, which Dr. Geddes enumerates. From a superstitious attention to render the Hebrew and Greek into literal English, its authors adopted modes of expression which are abhorrent from the English idiom; and perhaps from that of all other modern tongues. There is also a manifest want of uniformity in the mode of translating, which is owing to the variety of persons employed. The books called apocrypha are, in Dr. Geddes's opinion, generally translated better than the rest of the Bible; for which one reason may be, that the translators of them were not cramped by the fetters of the Masora. The translators of this version mistook the true meaning of a great many words and sentences by depending too much on modern lexicons, and by paying too little attention to the ancient versions. For various reasons they incumbered their version with a load of useless Italics; often without the least necessity, and almost always to the detriment of the text. Like other translators of their day, they were too much guided by theological systems, and seem, on some occasions, to have allowed their religious prejudices to have gotten the better of their judgment. Besides, through the constant fluctuation and progress of living languages, there are many words and phrases, in the vulgar version, now become obsolete, of which modern writers have selected a great variety. The construction also is less grammatical than the present state of our language seems to allow; and the arrangement of the words and sentences is often such as produces obscurity and ambiguity. Dr. Campbell, in his preface to "The Four Gospels translated;" Dr. Symonds, in his "Observations on the Expediency of revising the present English version of the Four Gospels, and of the Acts of the Apostles;" Mr. Wakefield, in his "Translation of the N. T.;" and Mr. Ormerod, in his "Short Specimen for an Improvement in some parts of the present Translation of the O. T.;" unite in recommend-

ing a revival of our present translation. Dr. Symonds, in particular, examines the grounds of an opinion advanced by Lowth, in his "English Grammar," p. 93, and also by many others, which is, that the vulgar translation of the Bible is the best standard of the English language. Distinguishing between the terms *one* of the standards, and the *best* standard, which are very different, he allows that the plain and simple turn of expression, resulting from the choice of old English words, may entitle our version to the former appellation, and yet many other circumstances must be united to confirm its claim to the latter. Accordingly, he suggests the following inquiries: "Are the words and phrases, employed by our translators, generally placed in their proper order? Are they so arranged as to preclude all obscurity and ambiguity? Do we always find the antecedent to which the relatives refer? Hath a right attention been paid to the tense and times of verbs? And is there a due propriety observed in the use of particles, upon which the clearness of a sentence chiefly depends?" The want of conformity to these rules, or to the greater part of them, will not allow our version of the Bible to lay claim to the appellation of the *best* standard of our language. Many other opinions of very respectable writers, decidedly in favour of an improved version of the Bible, might be added to those that are above cited. Objections, however, have been urged against it, by Dr. Vicinus Knox, in his "Essays Moral and Literary," and also by others; and they have been examined and obviated by the late primate of Ireland, Dr. Newcome, who avows his opinion, that nothing would be more beneficial to the cause of religion, or more honourable to the reign and age in which it was patronised and executed, than an improved English version of the Scriptures.

It has been said, that a new version of the Bible is quite unnecessary. But although our English translation, or any translation extant, contains all things necessary to salvation, yet in common language a measure is said to be necessary, when it is highly expedient. Let any competent scholar study the Bible in the original languages, and then pronounce whether our authorisation is not capable of amendment and improvement, in numberless places, many of which must be considered as very important. If every part of Scripture be intended to answer some important purpose, as it certainly is, or it would not have been given to us, every part ought to be put into the hands of Christians as free as possible from obscurity and error. Some mistake, among many that may be deemed small, are so considerable as to deprive Christianity of much solid evidence, and furnish the Sceptic with his most formidable weapons. What if it is acknowledged that our present version contains every thing necessary to salvation, it may be alleged that if this be a sufficient reason for not correcting those faulty passages which admit of correction, it would be a sufficient reason for throwing them out of it altogether. But as our heavenly Father has been pleased to favour his creatures with additional light, it would ill become us to permit any of this light to be obscured, or to pretend that it is not wanted. It, according to the confession of some of the objectors to a new version, the faith and practice of illiterate persons are sometimes affected by the present version, and if, in some instances, its obscurity would be removed; religion is a matter of such great concern as to demand from those who watch over its interests, that even the smallest faults should be remedied. It is dangerous to retain any known errors in our national version; they operate differently on different minds; nor is it easy to estimate their degree or effects. The opinions and conduct not only of the unlearned, but of the learned themselves, who do not carefully examine the Scriptures, have in fact been

strongly influenced in matters of acknowledged importance, by corrupt readings or mistranslations of a very few texts.

It has again been objected, that a new translation is an extremely dangerous attempt; that nothing would more immediately tend to shake the basis of the establishment; and that it would be imprudent to shock the minds of some very devout and well-meaning people, by an innovation which they could not help considering as an insult on heaven. A measure of this kind would tend to shake the faith of thousands, to whom it were impossible to demonstrate the necessity of a change, or the principles on which it was conducted. Persons of this class would lose their veneration for the old version, without acquiring sufficient confidence in the new: and the benefits must be great indeed, that can compensate even for the remotest possibility of such an evil. To this mode of objecting it has been replied, that it does not immediately affect the merits of the question, but it arranges the prudence of introducing a correct version, as a measure: from which dangerous effects, and not solid advantages, will be apt to arise on the whole. Whatever tends, it has been said, to the perfection of an establishment, would not shake it, but give it splendour, strength, and security. An accurate version would reflect the highest honour on our national church, and may be ranked in an eminent degree among those measures, which would fix it on a basis as firm as truth, virtue, and Christianity. Such a work would be as natural a subject for the praise of all Protestant countries, as king James's Bible was for the honourable testimony born to it by the synod of Dort. It ought also to be recollected, that after Coverdale's translation had received the sanction of authority, the Bibles of Matthewe, Cramer, Taverner, archbishop Parker, and James I. were all *innovations* in their day; and yet that, considered as different versions, they produced no civil or ecclesiastical commotion, no violent agitation in the minds of men, resembling those which are now apprehended and predicted. Besides, a translation by authority ought to supersede all others from its intrinsic excellence; and it would of course supersede them by the frequency, correctness, and cheapness of its editions, as king James's did that of Geneva, notwithstanding the preference given to it by the Calvinists. Moreover, it is hard to conceive, how the faith of thousands can be shaken by removing stumbling-blocks, instead of retaining them. Absurd belief and corrupt practice arise from an ignorance of the Scriptures; not from the best human inducement and assistance to search and understand them. It is the nature of truth, and especially of divine truth, to captivate those who contemplate it, in proportion as the veil is withdrawn, and its genuine features appear. If ill-founded prejudices should exist among the people, their teachers should seriously labour to remove them. These prejudices are such, as far as they exist, which might be easily removed, or which would not deserve to be regarded. Besides, the public mind might be prepared for it, and disposed to acquiesce in it by previous and frequent recommendation of it on the part of ecclesiastics, who derive weight from their rank, and, which is the highest of all rank, by a private of Ireland, from their reputation. A repeated discussion of the topic, that involved the necessity, expediency, and utility of a new version, in discourse, in the pulpit, and from the press, and the concurrence of the best, the wisest, the most learned, and the greatest in the recommendation, patronage, and conduct of an amended version, would give the bulk of the community as great a confidence in it as they ever possessed in any preceding one.

Some, indeed, may say, "Let us introduce no change; for we cannot tell what further change may be required of us." Had this kind of lukewarm and timid reasoning been

B I B L E.

regarded, neither the reformation, nor the revolution, could have taken place; and we should have been still subject to Romish superstition, and to despotic power. It is certainly not less the part of wisdom and magnanimity to give up what is wrong, than resolutely to maintain what is right.

It has been further argued, that the present translation derives an advantage from its antiquity, greatly superior to any which could arise from a correction of its inaccuracies. Hence it would follow, that the versions of Tindal, Wickliffe, and Jerom, rise in excellence. But no age or prescription can authorise error; and it is obstinacy to defend in any version, however ancient or venerable, what cannot be rationally defended. Although it be desirable that the grave ancient cast should prevail in an English translation of the Bible, a translation may nevertheless become too antiquated; and in fact our own Bible retains words and forms of such remote use, that some of them are not understood, even by intelligent readers, and many of them are rather harsh and uncouth, than venerable and majestic.

But it has been said, that the present translation ought to be retained in our churches, on account of its intrinsic beauty and excellence. The language, though simple and natural, is rich and expressive. Even in the literal translation of the Psalms, there are passages exquisitely beautiful and irresistibly transporting; and where the sense is not clear, nor the connection of ideas obvious at first sight, the mind is soothed, and the ear ravished with the powerful yet unaffected charms of the style. These beauties, it is alleged, on the other hand, are found, in an equal, or partly in a superior degree, in our first version; and must be more or less found in every version of the Hebrew Scriptures, that is not a mere paraphrase. King James's translators found it in their prototype; the diction and phraseology they borrowed from their predecessors in translation. What is beautiful, what is excellent, what is melodious and ravishing in the present version, should unquestionably be retained by all future translators; but is there any reason for retaining its corruptions, its mistranslations, its obscurities, and its other acknowledged imperfections?

The correcting translators, it will be again urged, differ among themselves. Differences must necessarily arise among interpreters of the Scriptures. King James's translators often disagreed as individuals; and adopted in a body what seemed to be most agreeable to the sound rules of interpretation. Let a like number of able judges decide, on the same principles, between biblical critics of the present age. But the new translators recede too far from the common version. This, however, in a new version, is not necessary, nor would it be proper; whilst they recede from its errors and imperfections; they should retain its general diction and manner, nor ever allow themselves to deviate from it without a satisfactory reason.

It has been further intimated, by those who are averse from a new version, that such as wish for additional information may have recourse to those authors, who have explained obscure and erroneous passages. But have all Christians, who meet with difficulties, time and ability to consult these writers? Or if they had, is it in any respect decent or fit that the public Scriptures, confessed to want assistance, should be suffered to depend for support on these extraneous props? The national Bible is the great record of our religion; it is this which the Deist attacks, and this must supply us with our defence.

The objectors proceed with observing, that no translation, even of a single book, has yet appeared, preferable on the whole, to the received one. Let it be considered, however, that the attempts of individuals necessarily labour under great

comparative imperfections; and yet these should be promoted by the natural patrons of sacred learning, and parts of the Scriptures should be assigned to such as are best qualified for the honourable task of translating and explaining them; because these private versions and expositions will form a most useful ground-work for a revised version of the whole Bible by public authority.

After all, it will be said by some, who are convinced that our present Bible should be revised, that this is not a proper time for the undertaking; and that we should wait till, by the further increase of light, and progress of improvement, we shall be able to carry the work to a greater degree of perfection, and, if possible, make future revisions unnecessary. This argument may be always urged; because religious knowledge will increase in proportion as human learning improves, and as new light is obtained from versions and MSS. that are already known, and that may yet be discovered, duly examined, and compared. "But shall we, in the mean time, prolong the difficulties of the Christian, and the fancied triumph of the Infidel? The mistakes already discovered are well worthy of correction. Should others of importance be brought to light in the next or subsequent generation, let them also be corrected. The true rule in this case is, to revise as often as revision is necessary. To defer this longer is an injury to religion; to put it off till it can be done in such a way as to preclude the necessity of future revisions, is in fact to put it off for ever." "The taste of the age for sound logic, sound criticism, and sound philosophy, has acquired sufficient strength to triumph over their opposers."

In favour of an improved version of the Bible, for national use, it has been argued, that such a translation becomes necessary by the unavoidable fluctuation of living languages. The style of Wickliffe's version, and of Tindal's, very widely differs in the course of 148 years; and the English language underwent also a great change between the publication of Tindal's Bible and that of King James's, in an interval of 81 years. Since the year 1611, when the present version first appeared, our language has acquired a great degree of copiousness, of elegance, of accuracy, and perhaps of stability. Many words and phrases which occur in the revised version are become unintelligible to the generality of readers; and many, which are intelligible, are so antiquated and debased, as to excite disgust among the serious, and contempt and derision among libertines. Pilkington (*Remarks on several passages of Scripture*, Camb. 8vo. 1759); Purver (*Translation of the Bible*); Dr. Synonds (*Observations on the expediency of revising the present English version, &c.* Camb. 4to. 1789); Dr. Wells (*Pref. to Comment on the O. T.*); Dr. Campbell (*Four Gospels translated from the Greek*, 4to. Lond. 1789); and Dr. Geddes (*Prospectus*); have selected many words and phrases that require correction, and that admit of obvious improvement. The style of a biblical version is a matter of importance; both as it invites the perusal of a book which the Spirit of God inspired, and as it influences the national language and taste. Whatever merit be allowed to the version now in use, with regard both to its interpretations as well as its style, it must be allowed that, since the period in which it was executed, the biblical apparatus has been much enriched by the publications of polyglotts; of the Samaritan pentateuch; of ancient and modern versions; of lexicons, concordances, critical dissertations, and sermons; books of eastern travels; disquisitions on the geography, customs, and natural history of the East; accurate tables of chronology, coins, weights, and measures. Many Hebrew and Samaritan MSS.; many early printed editions of the Hebrew Scriptures, have been collated by Kennicott and

and De Rossi; the eastern languages, which have so close an affinity with the Hebrew, have been industriously cultivated at home and abroad; the Masoretic punctuation is now ranked among useful assistances, but no longer implicitly followed; and the Hebrew text itself is generally allowed to be corrupt in many places, and therefore capable of emendation by the same methods which are used in restoring the integrity of all other ancient books. With such an accession of helps, with light poured in from every part of the literary world, with such important principles, and with the advancement of critical skill to apply them, it is natural to conclude that many mistakes and absurdities may be removed from the present version, and that the precision, beauty, and emphasis of the original, may be communicated to it in various places. The present state of the Hebrew text in its reference to a new version of the O. T. has been already represented in the commencement of this article: and that of the text of the New Testament will be the subject of a future article; see TESTAMENT.

Dr. Newcome, in his "Attempt towards an improved version, &c. of the Minor Prophets," published in 1785, proposed a variety of rules for conducting a new translation of the Bible. These have been since corrected and enlarged (*ubi infra*); and in order to render this article, the subject of which is highly important and interesting, as complete and as satisfactory to biblical readers as our limits will allow, we shall here subjoin the most material parts of them. The learned prelate proposes, in the first place, that a plan, resembling the regulations prescribed to king James's translators, should be deliberately adjusted by a large committee of judicious and learned men. A more select committee, well acquainted with the original tongues in which the Bible is written, should then be appointed by proper authority, who should invite every scholar to contribute his remarks; who should have their respective parts assigned them; and who, after the performance of their allotted tasks, should amicably unite in advancing the whole to its proper degree of perfection. The *first* of his rules is, that a translation of the Bible should express every word in the original by a literal, verbal, or close rendering, where the English idiom admits of it. This rule admits of some few exceptions; but it excludes unnecessary deviation from the grammatical form of the original words; unnecessary paraphrase, which enervates the force of the original, disguises its manner, and sometimes suggests a wrong idea; sentential renderings; and such as are defective. The *second* rule directs the translator, where the English idiom requires a paraphrase, to endeavour so to form it as to comprehend the original word or phrase; and to express the supplemental part in Italics, except where harshness of language results from the adoption of this method. The *third* rule recommends, in cases where a verbal translation cannot thus be interwoven, the substitution of one equivalent to it, and which implies the rendering in the original, but the idiom in the text should be literally rendered in the margin. By observing the second and third rules, the utmost fidelity to the original will be shown, which is the primary duty of a biblical translator; the customs and manners of the eastern nations will be explained; the peculiar genius of the original language will be exhibited; and the reader unskilled in them will be enabled to interpret for himself. The *fourth* rule requires, that the language of a biblical translation should be pure, or conformable to the rules of grammar. The *fifth* rule directs, that propriety should be a prevailing character in the words and phrases of a biblical translation; that is, they should have the sanction of use and the sanction given to them should be warranted by the best speakers and writers. In order to preserve the ve-

nerable turn of our present version, some few exceptions may be allowed under this general rule. The *sixth* rule enjoins the translators to retain the simplicity of the present version; for which purpose they should exclude foreign words, and the pomp and elegance of modernised diction. The *seventh* rule inculcates perspicuity. The *eighth* rule recommends the same original word, and its derivatives, according to the different leading senses, and also the same phrase, to be respectively translated by the same corresponding English word or phrase; except where a distinct representation of a general idea, or the nature of the English language, or the avoiding of an ambiguity, or elegance of style, or harmony of sound, requires a different mode of expression. In conformity to this rule, it is proposed, that translators should previously agree on the rendering of certain words and phrases. Accordingly, the original word "Jehovah," which expresses the self-existence of the deity, and which, so far from being barbarous, is a grand and magnificent term, should be retained:—that it should be considered, by the help of concordances, whether the same word can always be rendered in the same manner; and that when an English word suits every place, it should invariably be used:—that if the original word cannot always admit of the same rendering, of which many examples occur, the different renderings may be reduced to as few as possible, and those the fittest which the English language affords:—that different words, which have the same, or nearly the same sense, should be distinguished in translating them, when the English tongue furnishes distinct and proper terms:—and that parallel passages should be rendered in the same words. The *ninth* rule requires that the collocation of words should never be harsh and unsuited to an English ear. The *tenth* rule recommends to translators of the Bible a suitable degree of beauty and elegance. This beauty, in its prevailing character, must be easy and natural, simple and severe; free from laboured ornament and artful variety of phrase. The style, like that of the original, must be raised in the poetical parts, but not inflated, and plain in the historical parts, but not abject. "Let nothing," says Dr. Symonds (*ubi supra*) "be admitted into the text, which we cannot read with pleasure, as well as with advantage." In the *eleventh* rule it is required, that dignity should characterize a version of the Bible. The opposite extreme results from the introduction of debased and offensive terms or phrases; of which some are degraded by familiar use, others are colloquial and vulgar Anglicisms; and modern phraseology, as such, is undignified in a translation of the Bible. The *twelfth* rule prescribes energy as another characteristic of a biblical translation. This quality is obtained, in a great degree, by simplicity and propriety in the terms that are selected to represent the peculiar notions conveyed by the sacred writer, and by expressing the senses contained in the original with due conciseness. The forcible style of the Scriptures is enfeebled by epithets and participles; nor does their majesty more disdain the defect of ornament, than the excess of it. A version of the Bible will derive much force by retaining those Hebraisms which the English language easily admits, or to which an English ear is now accustomed. Obscure Hebraisms, such as weaken the signification of the original, and those which misrepresent its meaning, should be avoided. In the *thirteenth* rule it is recommended to continue the old ecclesiastical terms, such as *pontance*, *mystery*, *elect*, *predestinated*, &c. which are now part of our theological language, and of which explanations perpetually occur. Rule *fourteenth*. Metaphors are, in general, to be retained. By observing this rule, the genius of a language, and the nature and customs of a country, will often appear.

Rule *fifteenth*. Proper names should remain as they are now written in those places where they are most correctly represented. Rule *sixteenth*. The best known geographical terms should be inserted in the text; and those of the original in the margin; e. g. Syria, marg. Aram; Ethiopia, marg. Cush. Rule *seventeenth*. The language, sense, and punctuation of our present version should be retained, unless when a sufficient reason can be assigned for departing from them. Rule *eighteenth*. The critical sense of passages should be considered, and not the opinions of any denomination of Christians whatever; so that the translators should be philologists, and not controversialists. Rule *nineteenth*. Passages already admitted into the common version, but which are allowed to be marginal glosses, or about the authenticity of which critics have reason to be doubtful, should be placed in the text between brackets. Rule *twentieth*. In the best editions of the Bible, the poetical parts should be divided into lines answering to the metre of the original; or some other method should be used to distinguish them from prose. But if it should be thought advisable to exclude the poetical distribution from our Bibles, and confine it to the productions of the scholar, some proper mark of distinction for metrical pause, as the Hebrew Rebhiang or two horizontal points placed over a word, may be admitted into the authorized impressions of the Old Testament; or, at least, the contents prefixed may advertise the reader of the passages generally allowed to assume the tone and form of poetry. Rule *twenty-first*. Of dark passages, which exhibit no meaning as they stand in our present version, an intelligible rendering should be made on the principles of sound criticism. Under this head of sound criticism, Newcome includes that which is conjectural, the sober use of which he frequently recommends. But it admits of doubt, whether conjecture can ever be authorized in a translation which is intended for general use; for if it be exercised on slight occasions, it must be in some degree superfluous; if on material ones, it must ever be indecisive. The learned prelate, however, lays down the following canons for this kind of criticism. Never suppose that the text is corrupted without the most cogent and convincing reasons. Never have recourse to conjectural criticism, unless every other source has been tried and exhausted. Let all corrections be consistent with the text, and with one another. Insert no correction, however plausible or even certain, in the text, without warning the reader, and distinguishing it by a proper note. For other instructions, more immediately designed for the editor of such a new version, we refer to the author himself; as well as to his appendix, for a list of the various editions of the Bible, together with an account of the libraries public or private, in which they are to be found. Another more complete list of this kind is prefixed to bishop Wilson's Bible. See Lewis's Translations of the Bible, 8vo. 1739. Johnson's Historical Account of the several English translations of the Bible, in bishop Watson's Collection of Theological tracts, vol. iii. p. 60—100. Newcome's Historical View of the English Biblical Transactions, &c. 8vo. Dublin, 1792.

BIBLES, Welch. There was a Welch translation of the Bible made from the original in the time of queen Elizabeth, in consequence of a bill brought into the house of commons for this purpose in 1563. The act 5 Eliz. c. 28. reciting, that in Wales the people were popishly inclined, and very ignorant, put the direction of this work into the hands of the bishops of Hereford, St. David, Bangor, Landaff, and St. Asaph, who were to inspect the translation, and take care that such a number should be printed as would provide every cathedral, collegiate, and parish-church, and chapel of ease,

within their respective dioceses, where Welch was commonly spoken, with one copy. It was printed in folio, in 1588. Another version, which is the standard translation for that language, was printed in 1620. It is called Parry's Bible. An impression of this was printed in 1690, called Bishop Lloyd's Bible. These were in folio. The first octavo impression of the Welch Bible was made in 1630.

BIBLES, Irish. The New Testament having been translated into Irish by William Daniel, archbishop of Tuam, Bedell, who was advanced to the see of Kilmore and Ardagh, in 1629, first procured the Old Testament to be translated by one King; but the translator being ignorant of the original languages, and having done it from the English, the bishop himself revised and compared it with the Hebrew, the Septuagint, and the Italian version of Diodati. He supported Mr. King to the utmost of his ability, whilst he was engaged in this work; and when the translation was finished, he would have printed it in his own house, and at his own charge, if the troubles in Ireland had not prevented it. The execution of his benevolent design was also impeded in consequence of the notice that was given of it to the lord lieutenant and the archbishop of Canterbury, who thought it disgraceful for a nation to have a Bible published, which had been translated by such a despicable person as King. However, the translation escaped the hands of the rebels, and it was afterwards, viz. in 1685, printed at the expence of the Hon. Robert Boyle.

BIBLES, Gaelic. The Bible was translated and published by the Society in Scotland for promoting Christian knowledge, in the Gaelic language, for the use of their schools, and of the people in the Highlands, at different periods, and in detached portions, as the funds of the society allowed. In 1767, the New Testament in Gaelic was published by itself; and in various successive years, and in separate volumes, the several books of the Old Testament were published. In 1796, the first edition of the New Testament being exhausted, the society published another, consisting of 20,000 copies. And as some of the first printed volumes of the Old Testament have been so much reduced in number, as to be insufficient to supply the urgent demands of the Highlands in general, and of the Society's own school in particular, a new edition of 20,000 copies has been lately undertaken (in 1803), at an expence of 2284l. 16s. defrayed by voluntary subscription. An act of charity, highly important and laudable, as the persons, for whose accommodation it is designed, amount to no less than 335,000; of whom, it is computed, that 300,000 understand no other language than the Gaelic, or at least cannot comprehend a book written, or a continued discourse spoken, in any other.

BIBLE-DOCTORS, in Ecclesiastical History, a denomination by which the Schoolmen of the twelfth and thirteenth centuries were distinguished, who made the Scriptures the chief subject of their studies, and text of their lectures. However, in the course of the thirteenth century, the holy Scriptures, together with those who studied and explained them, fell into great neglect and even contempt. The Bible-Doctors were slighted as men of little learning or acumen; they had few scholars, and were not allowed an apartment, or a servant to attend them, or even a stated time for reading their lectures, in any of the famous universities of Europe. The illustrious Roger Bacon inveighed very bitterly against this abuse; and his excellent friend, Robert Grossethead, bishop of Lincoln, wrote a pathetic letter to the regents in theology in the university of Oxford, on this subject; earnestly intreating them to lay the foundations of theological learning in the study of the Scriptures, and to devote the morning hours to lectures on the Old and New Testaments.

But all these remonstrances and exhortations had little or no effect.

BIBLIA, or **BIBLIA petraria**, in a military sense, denotes a machine used by the ancients for throwing stones or darts.

BIBLIANDER, **THEODORE**. in *Biography*, whose true name was *B. Schramm*, a learned protestant divine, was born in 1504, at Büchzell near St. Gall, in Switzerland. He officiated as professor of divinity at Zurich from 1532 to 1562, when he was declared emeritus, or past service, not because he was incapable of executing his office, but because he had advanced opinions that deviated from the standard of orthodoxy with regard to the doctrine of predestination. He died of the plague, at Zurich, in 1564. He was well acquainted with the oriental languages, and published, in 1550, an edition of the Koran; the text of which, Bayle says, he corrected by a collation of the Arabic and Latin copies; and he added marginal notes, pointing out and refuting its absurdities. But others say, that this edition is faulty, and dispute Bibliander's skill in the oriental languages. To this edition he joined the lives of Mahomet and his successors, and prefixed an apology, by way of preface, which gave great offence by maintaining the lawfulness and utility of a free perusal of books adverse to true religion. He also wrote several other books on theological subjects, some of which are printed, and others remain in MS. in the library at Zurich. He likewise finished the Bible of Leo Juda, called the "Zurich Bible," and printed in 1543, and translated from the Hebrew into Latin the last chapters of Ezekiel, Daniel, Job, Ecclesiastes, the Canticles, and the last 48 Psalms. Gen. Dict.

BIBLIOGRAPHIA, a branch of *archæographia*, employed in the judging and perusing of ancient manuscripts, whether written in book, paper, or parchment. The sense of it is now extended, and it signifies a work intended to give information concerning the first, or best editions of books; and the ways of selecting and distinguishing them properly. In short, it is used for a *notitia*, or description of printed books, either in the order of the alphabet of the times when printed, or of the subject-matters. In which sense, bibliographia amounts to much the same with what is otherwise called *libraria*.

Literary journals afford also a kind of bibliographia.

BIBLIOMANCY, a kind of divination performed by means of the Bible. This amounts to much the same with what is otherwise called *sortes biblicæ*, or *sortes sanctorum*. See **SORTES**. It consisted in taking passages of Scripture at hazard, and drawing indications thence concerning things future; as in Augustin's *tolle et lege*. It was much used at the consecration of bishops. F. J. Davidius, a Jesuit, has published a bibliomancy, under the borrowed name of *Verridius Christianus*.

BIBLIOMANIA, an extravagant passion for books, to a degree of madness; or a desire of accumulating them beyond all reason and necessity.

BIBLIOTHECA, from *βιβλίον*, *book*, and *θησαυρος*, *repository*, from *θησ*, *I lay up*, properly signifies a library, or repository of books. See **LIBRARY**. It is also used for a compilation of all that has been written on a certain subject; or a digest of all the authors who have treated of it. In this sense, we have historical bibliothecæ, as that of Diodorus Siculus; metaphysical bibliothecæ, as that of Apollodorus; theological and sacred bibliothecæ, as those of Ravallius, &c. It is also used for a catalogue of the books in a library; such are the *libraria Caroliniana*, *libraria Caroliniana*, *libraria Thiburtina*, *libraria Bignoniana*, *libraria de Bysana*, &c.

L'Abbe has published a *libraria* of bibliothecæ, or a catalogue of the names of those who have written bibliothecæ,

which has since been continued and improved under another title by Tessier, from 800 writers to the number of no less than 2500. Schrammius has also published a *programmata* on the writers of theological bibliothecæ.

BIBLIOTHECA is a name given to the books of the Old and New Testament, in respect of their excellency, and sufficiency for the uses of the Christian life; and it is also a title given to divers journals, or periodical accounts in French of new books.

BIBLIOTHECA Patrum, or of the *Fathers*, is a collection of the writings of the lesser fathers, printed in one or more volumes. The first of this kind was published at Paris by Marg. de la Bigne in 1576.

BIBLIOTHECARIAN, a library keeper, otherwise called *librarian*.

The word is also used for the author of a bibliotheca, or a catalogue of books.

In this sense, P. L'Abbe has given a bibliotheca, or catalogue of bibliothecarians. Gesner, Lipenius, Struvius, Fabricius, &c. are celebrated bibliothecarians.

BIBLIOTHEQUE MUSICALE. See **MUSICAL Library**.

BIBLIS, in *Entomology*, a species of **PAPILIO**, with black dentated wings, and a band of sanguineous spots on the posterior ones. It is a native of America, and called *papilio hyperia* by Cramer. Gmelin. *Obs.* This must not be confounded with *papilio biblis* of Cramer, which is a very different insect, and seems to be a variety of *papilio penthesilea* of Fabricius.

BIBLIS Fons, in *Ancient Geography*, a celebrated fountain of Ionia, situate E. S. E. of Miletus. It is mentioned by Pausanias and Ovid.

BIBLISTS, *bibliste*, an appellation given by some Romish writers to those who profess to adhere to Scripture alone as the sole rule of faith, exclusive of all tradition and the supposed authority of the church. In which sense, all protestants are, or ought to be, biblists. Biblists, among Christians, answer nearly to Caraites or Textuaries among the Jews. The Christian doctors were divided, towards the close of the twelfth century, into two classes; viz. the *biblici*, and the *scholastici*: the former were called *doctors of the sacred page*, because they explained the doctrines of Christianity in their manner by the sacred writings; however, their reputation declined, and the scholastic theology prevailed in all the European colleges till the time of Luther. See **BIBLE-DOCTORS**.

BIBLUS, in *Botany*, an aquatic plant in Egypt, called also *papyrus*; of the skin whereof the ancient Egyptians made their paper. See **PAPYRUS**, and **PAPER**.

Hence also the Greeks gave the denomination βιβλος to books made of it. See **BIBLE**.

BIBLUS, in *Ancient Geography*, a river in the island of Naxia.

BIBONA, a place of Gallia Aquitanica, in the route from Burdigala to Segodum.

BIBORA RIVER and **BAY**, in *Geography*, lie to the east of Cartago bay, on the main land of Honduras, about N. lat. 14 20. W. long. 83 45.

BIBRA, **BEBRA**, or **BIEBRA**, a town of Germany, in the circle of Upper Saxony, in Thuringia, 10 miles west of Naumburg, and 8 south of Querfurt.

BIBRACTE, in *Ancient Geography*, a citadel of the *Adri*, according to Strabo, but according to Cæsar, a fortified town of Gaul, the capital of which was large and populous, now desolate; about 4 miles to the north-west of Autun, and called *Beurect*, *Bevray*, and *Bray*.

BIBRAX, **PIEVRE**, a town of Belgica, in Gaul, in the country of the *Ruemi*, north-west of *Durocortorum*. This town was attacked with great fury by the other Belgic nations, because it had declared for Cæsar. Cæsar. P. l. Gal. l. 2. c. 7.

BIBRICH, in *Geography*, a town of Germany, in the circle of the Upper Rhine, and principality of Nassau Saarbruck Ufingen, 3 miles S.S.W. of Wisbaden.

BIBROCI, in *Ancient Geography*, an ancient people of Britain, who are supposed to have occupied the south-eastern part of Berkshire, from the Lodden on the west to the Thames on the east. These people undoubtedly came from that part of Gaul, where the town Bibrax was situated, and their name leads us to the discovery of their origin, as well as of the place of their residence in this island. It is not certainly known when this colony of the Bibroci left their native country, and settled in Britain, though it is probable that it was not long before Cæsar's invasion, to whom, perhaps, they were engaged to submit by the influence and example of their friends and countrymen in Gaul. As the Bibroci were but a small nation, they seem to have been subdued by some of their neighbours before the invasion of Claudius, and therefore they are no further mentioned in history. The name of the hundred of Bray, on the Thames, near Maidenhead, is evidently derived from the name of these ancient inhabitants; as the ancient Bibracte, in France, now bears the name of Bray.

BICALCARATUS, in *Zoology*, a species of *PAVO*, of a brown colour, with the head slightly crested, and two spurs on each leg. Gmelin. This is *pavo Chinenfis* of Brisson; *P. eperonnier* of Buffon; *petit paon de Malacca* of Sonnerat; *peacock pheasant* of Edwards; and *iris peacock* of Latham.

This splendid bird is a native of China; in point of size it rather exceeds the common pheasant, and has a blackish bill, with the base of the upper mandible red from the nostrils; the irides are yellow; crest small, though composed of some pretty long feathers, and of a dull brown colour; the face is naked; sides of the head white; neck brown, striated across with dusky; upper parts of the back, scapulars, and wing-coverts dull brown, dotted with pale brown, and yellowish; and near the end of each feather a rich and glossy purple spot, changeable to green, to blue, or gold, in different points of view; lower part of the back and rump brown, spotted with white, and body beneath brown, striated transversely with black; upper tail coverts longer than the tail, and each marked with a fine purple spot near the end, encircled with black and orange; legs and claws brown. This is the description of the male. The female is one third smaller; head, neck, and upper parts brown; head smooth; feathers on the upper parts marked with a dull blue spot, encircled with dull orange; and the legs have no spurs.

BICARI, in *Geography*, a river of Sicily, which runs into the Termini, 2 miles west of Scalfani.

BICARINATA, in *Zoology*, a species of *LACERTA*, with compressed tail of moderate length, and carinated above; on the back four rows of carinated scales. This is of a greyish colour, and inhabits South America and India. Gmel. &c.

BICAUDALIS, in *Anatomy*, an appellation given by some anatomists to a muscle of the external ear, usually denominated the *retrahens*, or *retrahentes auris*, which see.

BICAUDALIS, in *Ichthyology*, a species of *OSTRACION*, of a triangular form, with two sub-caudal spines, and ten rays in the dorsal fin. Gmelin. There is a supposed variety of this fish found in India, and described by Artedi, in which the body is entirely covered with spots and tubercles.

BICE, or **BISE**, among *Painters*, a blue colour, prepared from the *lapis Armenus*, formerly brought from Armenia, but now from the silver mines in Germany. Phil. Trans. N^o 179. p. 26. Doffie, v. i. p. 95. Bice is finally reduced to a fine powder by levigation. See *SMALT*.

The word comes from the barbarous Latin *bifus*, or *bifus*; and that, perhaps, from the French *bis*, *grey*, *grisus*; whence

bifus panis. Vide Du-Cange, Gloss. Lat. tom. i. p. 565. Skin. Etym. in voc.

Bice bears the best body of all bright blues, used in common work; but is the palest in colour. It works indifferently well; but inclines a little to be sandy, and therefore requires good grinding on a very hard stone, and should be washed before it is used. It lies best near the eye of any blue now in use, except ultramarine. Its goodness lies in the brightness and coolness. It was formerly used in oil, and more frequently in water colours; but it is now much out of use. We have also a green bice, made of the blue, with the addition of orpiment; and several compositions of indigo and verditer, with chalk and other cheap substances, are sold under the name of bice.

BICE, in the *Mythology of the Hindoos*, the name of one of their Casts, proceeding from Brahma, the immediate agent of the creation, under the supreme power. It derives its appellation from the belly or thighs, and denotes nourishment, and it was destined by its founder to provide the necessaries of life by agriculture and traffic.

BICEPS, from *bis* and *caput*, in *Anatomy*, is a name common to several muscles, which consist of two distinct portions, called heads. Those which are commonly known at present by that appellation are the following.

BICEPS flexor cubiti. The longer portion, or head, of this muscle, arises by a tendon from the upper part of the glenoid cavity of the scapula; it then passes through the shoulder joint, and descends into the groove in the upper part of the os brachii, afterwards the fleshy fibres begin to be attached to it. The shorter portion arises tendinous and fleshy from the coracoid process of the scapula, in common with the coraco-brachialis muscle; a little below the middle of the os brachii, the heads unite and form a bulky muscle, the fibres of which terminate below in a strong roundish tendon, which is inserted into a tubercle, at the upper end of the radius, at that part which is next to the ulna. At the commencement of the lower tendon of this muscle, an aponeurosis is sent off from it, which soon expands into the fascia of the fore-arm.

The uses of this muscle are numerous, and the consideration of them affords a good demonstration of the impropriety of denominating a muscle from any single office which it may serve, as it tends to limit our ideas of its utility. The action of this muscle tightens the fascia of the fore-arm; it turns the hand supine; it bends the joint of the elbow; it raises the arm towards the shoulder; and occasionally it brings the bones of the shoulder to the arm.

BICEPS flexor cruris. The long portion, or head, of this muscle arises, in common with the semi-tendinosus, from the upper and back part of the tuberosity of the os ischium; the short portion arises from the linea aspera on the back part of the thigh-bone. These two portions having conjoined, produce a strong tendon a little above the external condyle of the os femoris, which forms the outer ham string, and which is attached to the upper part or head of the fibula. The chief use of this muscle is to bend the leg upon the thigh, and when it is brought into that situation, to turn the leg outwards.

BICESTER, in *Geography*, a market-town of Oxfordshire, England, is situated in a valley on the banks of a small river, which falls into the Charwell, at Islip. It is a large respectable town, divided into two parts, called Market-end, a parish, and King's-end, a hamlet. This place and its vicinity have been possessed by the Romans, as its name implies; and many Roman coins, and other memorials of that people, have been discovered here and at Alcester, or Old Chester, at different times. The embankments at the latter place are nearly obliterated by the plough; but from the name, and the antiquities that have been found, it seems evidently

dearly to have been a Roman station. "Alcifer, Alcifer, or Alcifer, the name of a city in Dacia, was a walled town that stood in the north-east parts of Oxfordshire, built, as may be collected from many probabilities, by Caius Allctus, one of the thirty tyrants, who, by favouring his dear friend and emperor Caracalla, obtained the sole government of Britain."

The Oxford canal passes through Lower Reyford, near this town, and carries many articles of trade to and from it. Hence is a large weekly market on Fridays, and six fairs annually; besides two annual markets in spring and autumn for the sale of sheep and cattle. The town has a well-established charity school for 30 boys; and a church, called the fontines. This is endowed with lands, of about 120*l.* yearly rent, which is applied towards the relief of the aged tradesmen. The principal manufactory of this town is cotton shppers; and it is supposed that there are more made here than in any other town in England. Many hands are employed in lace-making. The church is a large handsome building, with a lofty tower, and ornamented with many costly monuments. There is a handsome meeting-house for the dissenters. The parishes of Market-end, and hamlet of Kings-end, contain 470 houses and 1756 inhabitants. Plott's History of Oxfordshire. Camden's Britannia.

BICHE, *Biche de Guene*, in *Zoology*, a name assigned by one French writer (des March. Voy.) to the *Bresilian* wood of Peccant. *myrtus Americanus* of Gmelin.

BICHE *de Bis* is also the name of *cervus Mexicanus* (Gmel.) in Barrer. Fr. equin. 151.

BICHET, a corn measure, containing about a Paris *minot*, chiefly used in Burgundy and the Lyonnais.

BICHET denotes also a certain quantity of land, as much as may be sown by a bichet of corn.

BICHINI, in *Geography*, a town of Persia, in the province of Erivan, 30 miles N.N.E. of Erivan.

BICHON, in *Zoology*, the name given by Buffon to *canis melitans* of Ray.

BICHONNOWY, in *Geography*, a town of Russia, in the government of Mohilef, seated on the Dnieper, 32 miles south of Mohilef. N. lat. 53° 20'. E. long. 30° 50'. This is one of the districts of the government, called also Staroi Bykhof, or Biechow Starov.

BICINCTA, in *Entomology*, a species of *APIS*, described by Schrank Inf. Austr. It is black and villous; mouth and abdomen glossy, with two white belts on the latter. Inhabits Upper Austria.

BICINCTA, a species of *VESPA*, of a black colour, with a spotted thorax, and two yellow bands on the abdomen. A small insect, and inhabits the Cape of Good Hope. Fabricius.

BICINCTA, a species of *TENTHREDO*, with a black body; belts on the abdomen, vent, mouth, and shanks yellow. A native of Europe. Fabricius. Abdominal yellow belts two, from which it is specifically named *bicincta*.

BICINCTA, a species of *MUSCA* (*Syrphus*), found in the north of Europe. It is black; antennæ elongated; sides, dots, and two abdominal belts yellow. Linn. Fn. Succ. &c.

BICINCTA, a species of *SCOTIA*, of a black colour, and hairy; abdomen with two yellow bands; wings bluish black. A native of America. Fabr. Gmel. &c. This insect is *sphex radula* of Sulzer.

BICINIUM, from *bis* and *cano*, *I fig.*, in *Church Music*, the singing of two, either together or alternately. In which sense, the word stands opposed to *monody*.

BICKAGER, in *Geography*, a town of Norway, 70 miles S. S. W. of Dronthem.

BICKANEER, **BICANEER**, or **BEYZANZER**, a town of

Hindoostan, the capital of a circar or district of the same name in Marwar, the north division of Agimere. This country is sandy and desert, and in great want of water. Of this country little is known; it is governed by a rajah, and inhabited by Rajpoots. The town is situated about 42 miles west of Nagore, and 80 W. N. W. of Agimere. N. lat. 27° 12'. E. long. 74° 0'.

BICKERN of an *Anvil*, the pike, or beak-iron.

BICLINIUM, from *bis* and *clinor, bed*, in *Antiquity*, two beds about a table; or, as some say, rather a bed whereon two persons lay to eat.

BICKERTON'S ISLAND, in *Geography*, a name given by Capt. Edwards, in 1791, to an island in the South sea, near the Friendly islands, called by the natives Lattai, and discovered by Maurelle in 1781. It consists chiefly of a vast conical mountain, the summit of which appeared to be burnt, but the sides were covered with trees; and it is surrounded with a lower border, which is very fertile, and affords fresh water. This island supplies cocoa-nuts and bananas. S. lat. 18° 47' 20". W. long. 174° 48'.

BICOCCA, a town of Italy, in the duchy of Milan, near which the French were defeated by the Imperialists in 1552; 2 miles N. E. of Milan.

BICOLOR, in *Conchology*, a species of *Donax*, with an ovate shell marked with elevated stria, which decussate a few transverse ones; rufous, with a white ray on one side. Gualt. Gmel. &c.

BICOLOR, a species of *PINNA* found in the Red sea. This kind is thin, inflected at the lateral margin; yellowish, with black brown rays, and a few longitudinal striae. Chemnitz. This shell is thorny, elongated, with curved striae at the curved margin; and the largest end rotundated.

BICOLOR, in *Entomology*, a species of *APIS* that inhabits Denmark. The thorax villous and ferruginous; abdomen black and immaculate. Fabricius.

BICOLOR, is also an Indian species of *APIS*, of a black colour, with the abdomen hairy; fulvous above, and snowy-white beneath. Fabricius. This bears some resemblance to *apis centuncularis*, but is larger.

BICOLOR, a species of *ATHELABUS* found in Europe. It is of a black colour, with the thorax and wing-cases reddish; scutell, thighs, and shanks at the base, and tip black. Linnæus Fn. Succ.

BICOLOR, a species of *BUPRESTIS*, with pointed wing-cases, of a brassy-green colour, with a yellow spot; breast and abdomen yellow. Fabricius. Inhabits South America.

BICOLOR, a species of *CANTHARIS*, of a yellow colour, with half of the wing-cases blue. Thunberg. Inhabits the Cape of Good Hope.

BICOLOR, a species of *CARABUS* that inhabits North America. It is black above, and ferruginous beneath. Fabricius.

BICOLOR, a species of *CERAMBYX* that inhabits Cayenne. This is ferruginous; thorax with two spines and tubercles; wing-cases beyond the middle, with the abdomen black. Fabricius.

BICOLOR, a species of *CHRYSOMELA*, of a brassy-green above, and violaceous beneath. Fabricius. Inhabits Alexandria.

BICOLOR, a species of *CICADA* (*Cercopis*), of a griseous colour, with the upper part of the thorax sanguineous. Linn. Mus. Lesh. A native of Europe.

BICOLOR, a species of *CRYPTOCEPHALUS* (*Erotylus*). This insect is of a black colour, and brassy above. Fabricius. A native of New Holland.

BICOLOR, a species of *CURCULIO* found in America.

This is of a black colour, with a rufous thorax and wing-cafes. Fabricius.

BICOLOR, a species of DERMESTES, of an oblong form and black colour; beneath testaceous; wing-cafes striated. Fabricius. Inhabits Germany.

BICOLOR, a species of ELATER, of a brownish ferruginous colour; head and thorax brown; wing-cafes striated. Inhabits Europe. Linn. Mus. Lesh.

BICOLOR, a species of GRYLLOUS (*Jocusta*), described by Linnaeus. It is griseous, apterous, with the hinder thighs rufous beneath.

BICOLOR, an African species of ICHNEUMON, of a ferruginous colour; tip of the abdomen, breast, and end of the upper wings black. Gmelin.

BICOLOR, a species of LAMPYRIS (*Pyrochroa*), of a sanguinous colour, with the posterior end violaceous. Fabricius. This is *Cambaris bicolor* of Arago. It inhabits America, and has the antennae flate.

BICOLOR, a species of LEPIDOPTERA, of a pale ferruginous colour, with the eyes, wing-cafes, wings, and upper part of the vent black. Swedens Nov. Act. Stockh.

BICOLOR, a species of LEPIDOPTERA (*Danaus*) that inhabits Europe. It is of a golden colour, with the upper part of the thorax, and the wing-cafes green; the latter striated with imprinted dots; posterior thighs dentred. Gmelin, &c.

BICOLOR, a species of LYTTEA, of a testaceous colour; wing-cafes black at the tip. Geoffroy. Inhabits France.

BICOLOR, a species of MORDELLA, described by Forster (Nov. Inf.). It is of a black colour; wing-cafes testaceous, with the tip and band in the middle black. Very small. Inhabits England.

BICOLOR, a species of NITIDULA found in Europe. This insect is ferruginous, with black wing-cafes, having a ferruginous band at the base, and a spot of the same colour near the apex. Fabricius.

BICOLOR, a species of PHALÆNA (*Bombyx*) found in Saxony. The wings are white, with a large yellow spot, with black marks. Fabricius.

BICOLOR, a species of SCARABÆUS, with the thorax very slightly arched, and on the head a single tubercle; wing-cafes black; abdomen rufous. Fabricius.

BICOLOR, a species of SILPHA, of a brown colour, with rufous legs. Linn. &c. A native of Europe.

BICOLOR, a species of SPHEX that inhabits New Holland. This is of a black colour; head, abdomen at the tip, and wings yellow; the latter brown at the tip. Gmel. This insect was first described by Fabricius from a specimen in the collection of sir Joseph Banks, under the specific name *bicolorata*.

BICOLOR, a species of STAPHYLINUS, of a black colour, with the antennæ, wing-cafes, and legs ferruginous. Linn. A native of Europe.

BICOLOR, a species of TENTHREDO, of a bluish black, with the abdomen and base of the wings yellow; a band of black. Schrank. Inhabits Austria.

BICOLOR, a species of VESPA that inhabits China; and in size and appearance resembles the common wasp. It is yellowish; antennæ above, crown, thorax, and vent brown. Fabricius, &c.

BICOLOR, in *Ichthyology*, a species of GobiUS, found in the Mediterranean sea. It is of a brown colour, with all the fins black. Brün. pisc.

BICOLOR, in *Ornithology*, a species of ALCEDO, of a green colour, and golden rufous beneath; a black and white waved band on the breast; wings and tail spotted with white. Gmelin. This bird is a native of Cayenne. Buffon calls it *Martin pêcheur vert et roux de Cayenne*; pl. enl.; and Latham

the *rufus and green kingfisher*. Length eight inches; bill black; legs reddish; breast of the female not banded.

BICOLOR, a species of FRINGILLA, that inhabits the woods of Jamaica and Bahama islands, and is called by English writers the *Bahama sparrow*. The head and breast are black; back, wings, and tail, greenish. Gmelin. The length of this bird is four inches; its note very monotonous. Buffon calls it *Chloris Bahamensis*; and Buffon *Verdinere*.

BICOLOR, a species of LANIUS, of a blue colour; white beneath; frontlet black. Linn. &c. This is *Lanius Madagascariensis* of Linn. Syst. Nat. edit. 12; *Lanius Madagascariensis caruleus* of Buffon; *Pic-grieffe bleue de Madagascar* of Buffon; and *Blue shrike* of Latham. It is about six inches and a half in length, and, as the synonyms imply, is a native of Madagascar.

The bill, head, margin of the quill-feathers, two middle tail-feathers, and exterior margin of the four next blue; legs and claws black. Female, torrid white beneath.

BICOLOR, a species of LOXIA found in the East Indies. Gmelin very briefly describes it as being of a fuscous colour, and red beneath. This is *Fringilla rubra minor* of Buffon; *Brunor* of Buffon; *Little brown bulfinch* of Edwards; and *Orange-breasted greyfinch* of Latham. There is likewise a variety of this kind of a brownish colour, white beneath, and chin inclining to brownish. About three inches and a quarter in length; bill whitish; legs fuscous.

BICOLOR, a species of MUSCICAPA, of a black colour; front, space round the eyes, throat, rump, superior wings, band on the greater wing-coverts, tip of the tail, and under parts of the body, white. Gmelin. Buffon calls this *Cobe mouche à ventre blanc de Cayenne*; and Edwards and Latham *Black and white fly-catcher*. A variety of this bird is white, except the hind part of the head, and neck, rump, wings, and tail, bill, and legs, which are black. The female is of an uniform grey colour. Inhabits the moist meadows of Guiana.

BICOLOR, a species of PICUS, called by Latham, after Buffon, the *Erceada woodpecker*; *Epiche ou pic varié de Encennadi*, Buffon. This is varied with greyish and white; head crested, white on the sides; quill-feathers brown, spotted with white. Gmelin, &c.

The length of this beautiful bird is about six inches; bill lead colour; irides white; plumage brownish-grey and white finely blended; above, the colours are intermixed transversely, and beneath in a perpendicular direction; crest on the sides intermixed with crimson; sides of the head white, verging to brown; legs lead colour. The female has no crest, and is entirely brown.

BICOLOR, a species of TROCHILUS, of a smaragdine-golden colour, with the head and throat blue. Gmelin. This is of the middle size, and inhabits Guadalupe. It is *Colibri* Nr. 2. of Fermin. Surin.; *Saphir-emer aude* of Buffon; and *Sapphire and emerald humming-bird* of Latham.

BICOLOR, a species of TURBUS, of a brown colour, tinged with green; abdomen and vent white. This inhabits the Cape of Good Hope; and is ten inches long. Buffon calls it *Merle brun du cap de Bonne espérance*; and Latham the *White-rumped thrush*.

BICOLORA, in *Entomology*, an African species of PHALÆNA (*Noctua*). Wings yellow, with a broad brown posterior margin.

BICOLORATA, a species of PHALÆNA (*Geometra*) with the wings bluish and striated; anterior black at the tip, and spotted with white. Inhabits Surinam. Cramer, &c.

BICOLORATA, a species of SCARABÆUS (*Nelobantha*) found at the Cape of Good Hope. It is glabrous green, beneath

charter of Edward I. and afterwards represented in several parliaments, seems to have been greatly reduced at the time when Leland visited it, for he merely mentions the river and the bridge. Camden, however, speaks of it as "remarkable for its populousness." At the time of the latter antiquary, Biddeford assumed a commercial consequence, and carried on some trade with America and Newfoundland. Queen Elizabeth granted it a charter of incorporation, which vested the government in a mayor, five aldermen, seven capital burgeses, a recorder, town-clerk, and two sergeants at mace. By this charter the inhabitants are empowered to hold a weekly market, and three annual fairs. Another charter was however obtained in 1610, which confirmed the former, and granted the townsmen some additional powers and liberties. The patronage and residence of sir Richard Granville and sir Walter Raleigh proved highly favourable to Biddeford; for after these worthy knights had discovered Virginia and Carolina, they returned to, and settled here. In the time of the civil wars, the inhabitants of this place declared themselves very early in favour of the parliament; but their success did not prove equal to their zeal, for in attempting to relieve Exeter, they experienced a severe and total defeat, and immediately resigned Biddeford, Barnstaple, and their appendages, to the royalists.

In the year 1646, Biddeford was ravaged by a plague, which appears to have been occasioned by the landing of a cargo of Spanish wool: an article which at that period constituted a principal part of the trade of the town. The credulity and superstition that characterized the English in the seventeenth century are strikingly exemplified by an occurrence which happened here in 1682. Three poor females were accused of witchcraft, and so direct and positive was the evidence adduced against them, at several examinations before the magistrates, that they were committed to Exeter gaol, and soon afterwards tried, and executed for their alleged crime.

About the middle of the last century, the export trade of Biddeford to Newfoundland was so considerable, that only two other ports in the kingdom employed an equal number of vessels, and in the export trade only one port excelled it. During the unwise administration, and injurious wars of queen Anne's reign, these commercial transactions materially suffered, and the French privateers obtained so many valuable prizes from Biddeford bay, that it was emphatically termed the *Golden bay*. The number of vessels now belonging to this port is almost one hundred; these vary in burthen from twenty to two hundred and fifty tons, and are chiefly employed in the conveyance of coal and culm; in the exportation of oak bark to Ireland and Scotland; in the herring trade, and in the importation of fish from Newfoundland. The quay is conveniently situated near the centre of the town, and the body of the water at high tides will bring up vessels of 500 tons burthen. The chief manufacture of this place is that of coarse brown earthenware, which is made with clay brought from Fremington near Barnstaple. The price of this is only two shillings and sixpence per ton. The bridge at Biddeford, built of stone, consists of twenty-four irregular arches, and was constructed about the middle of the fourteenth century. It is 677 feet in length, and was constructed at the expence of sir Theobald Granville, kn. and at the instigation of the bishop of the diocese, who granted indulgences to such persons as gave money in aid of the work. The church, a spacious building, was erected in the form of a cross about the middle of the fourteenth century. A house of industry has lately been erected here; and a free school, and free grammar school are ranked among the charitable foundations of the town. The market-place is spacious, and

the town-hall is a large convenient building with two prisons beneath it. In the parish of Biddeford are 606 houses and 2987 inhabitants. This town is 211 miles S.W. from London.

Thomas Stucley, a descendant of the celebrated chaplain to Oliver Cromwell, was a native of Biddeford, and was distinguished for many eccentricities of character. John Shebbear M.D. an author of some eminence, was also born here in the year 1709.

About five miles east of this town is Tawstock, the seat of sir Bouchier Wrey, Bart. This place is mentioned by different authors as remarkable for embracing at one view "the best manor, best mansion, finest church, and richest rectory in the county." Bishop's Tawton, near Tawstock, is said to have been the first seat of the bishop of this diocese. Watkins's History of Biddeford. Maton's Tour through the western Counties. Prince's Worthies of Devonshire. Beauties of England and Wales, vol. iv.

BIDDEFORD, a port of entry and post-town of America, in York county, and district of Maine, on the south-west side of Saco river, on the sea-coast, 14 miles S. W. from Portland, 24 N.E. from York, and 105 from Boston. It contains 1018 inhabitants, and the county-courts are held here and at York. N. lat 43° 26'. W. long. 70° 25'. The bay of Biddeford lies at the mouth of the river Saco, and has Black point for the N.E. point, and cape Porpoise for the S.W. point.

BIDDING, is used for proclaiming or notifying; also for offering a price for goods put up by auction.

BIDDING of the beads, a charge or warning which the parish priest gave to his parishioners at certain special times, to say so many pater-nosters, &c. on their beads.

Bishop Burnet (Hist. Ref. vol. ii. p. 20.) has preserved the form, as it was in use before the reformation, which was this: after the preacher had named and opened his text, he called on the people to go to their prayers, telling them what they were to pray for; "Ye shall pray (says he) for the king, for the pope, for the holy catholic church, &c." When this was done, all the people laid their heads in a general silence, and the minister kneeled down and likewise said his: they were to say a pater-noster, an ave-maria, Deus misereatur nostri, domine salva fac regem, gloria patri, &c., and then the sermon proceeded.

BIDDLE, JOHN, in *Biography*, a distinguished person among the Socinians, and reckoned the father of the English sect bearing this denomination, and lately assuming that of Unitarians, was born at Wotton-under-Edge in Gloucestershire, in 1615; and after a previous grammatical education, in the course of which he exhibited specimens of his talents and improvement, admitted, in 1632, a student of Magdalen-Hall, in the university of Oxford. Here he acquired great reputation for learning and prudence, both as a student and a tutor: and having taken his degrees of bachelor of arts in 1638, and of master of arts in 1641, he was, in this latter year, recommended by the principal persons in the university to the magistrates of Gloucester, and appointed by them master of the free school of St. Mary de Crypt, in that city. In this office he completely answered the expectations of his constituents, and gave great satisfaction to the parents of the young persons who were entrusted to his care. But he did not long enjoy, without molestation, the advantages of this situation; for he was led, by a diligent study of the scriptures, to adopt notions that were deemed heretical, concerning the Trinity, and more particularly to deny the deity of the Holy Spirit. Failing to give satisfaction to the magistrates, before whom he was summoned, by his confession in 1644, he drew up a more explicit account and defence

defence of his sentiments on this subject in a tract, entitled "Twelve arguments, drawn out of the scriptures, wherein the commonly received opinion touching the deity of the Holy Spirit is clearly and fully refuted." A copy of this treatise, which he had shewn to some of his friends, having been, by the treachery of an acquaintance, delivered to the magistrates of the city, and to the parliament committee then residing there, he was committed, in December 1645, to the common gaol. He was released, however, on giving security for his appearance when called for. Six months after he had obtained his liberty, he was summoned to appear before the parliament at Westminster, and examined by a committee. As he freely professed his disbelief of the commonly received opinion concerning the divinity of the Holy Spirit, he was committed to the custody of one of the officers, and kept in that state of restraint for five years. In the mean while, his book, entitled "Twelve arguments, &c." was published, and being declared blasphemous against the divinity of Christ, the house, in 1647, ordered it to be burnt by the common hangman. In the following year, the author, persisting in his opinions, and avowing his sense of their importance, published two other tracts of a similar nature; one entitled, "A confession of Faith touching the holy Trinity, according to the scripture;" and another entitled, "The testimonies of Irenæus, Justin Martyr, Tertullian," and of several other early writers, relating to the same subject. These books excited an alarm, and were the means of procuring a severe ordinance of parliament, issued in May 1648, at the solicitation of the Assembly of divines, who acted in this instance in a manner that entails disgrace on their memory, and denouncing the penalty of death against those who held opinions contrary to those that were established respecting the Trinity, and some other doctrines, accounted blasphemies and heresies; and severe penalties on those who differed in lesser matters. By this infamous and execrable decree the fate of Biddle seemed to be inevitable. But he escaped in consequence of a dissension in parliament, supported by a party in the army, to whose case this ordinance would have extended. After the death of the king, the Independents acquired influence, and introduced a kind of general toleration, under which Biddle was allowed to go to Staffordshire, where he was hospitably received by a justice of the peace, who, at his death, left him a legacy. From this retired asylum, however, he was removed by general Bradshaw to closer confinement, in which state he continued for several years, under an imputation of blasphemy and heresy, which deprived him of all society, and reduced him to such lamentable indigence, that his whole support for a considerable time was a draught of milk morning and evening. The only divine who visited him, during this period, was Mr. Peter Gunning, afterwards bishop of Ely. In these circumstances he obtained temporary relief by being employed in correcting the press for a Greek Septuagint, printed in London by Roger Daniel; and in 1651, he regained his liberty by the general act of oblivion, published by the parliament in this year. Of this liberty he availed himself, by instituting a Sunday's lecture for reading and expounding the scripture, and thus propagating his opinion. The Presbyterian ministers were rendered uneasy by his zeal and success, more especially as they could derive no assistance for restraining him from the secular power. Not satisfied with the opportunities he enjoyed of disseminating his sentiments from the pulpit, and in the intercourse of private friendship, he had again recourse to the press, and in 1654, published his "Twofold Scripture catechism;" one larger and more comprehensive, and the other more brief, for the use of children. For this publication he was called

to the bar of Cromwell's parliament, and committed to the Gaol-house, where he was debarred the use of pen and ink, and the access of any visitor; and his books were also ordered to be burnt. Although a bill was brought in to parliament for punishing him, he obtained his liberty after six months' confinement, by due course of law. Some time after, he had a dispute with a baptist teacher; in the course of which he made use of some expressions, for which he was thrown into Newgate, and tried for his life at the next sessions, on the ordinance above-mentioned. On this occasion, counsel was at first denied him, but afterwards granted, and the trial deferred. In the mean while Cromwell interfered, and disapproving of this kind of intolerance, contented himself at first with retaining him in prison; but afterwards, in order to silence the clamours and petitions that were preferred against him, banished him for life to St. Mary's castle in the island of Scilly, assigning him an annual subsistence of 100 crowns. In this place of exile Biddle continued three years, applying himself to close study, and particularly to that of the Apocalypse. His friends at length prevailed with Cromwell to recall him; and in 1658, as no charge appeared against him, he was liberated. He then became pastor of an independent society in London, and propagated his opinions without molestation, till the fear of the presbyterian parliament assembled by Richard Cromwell, and the advice of his friends, induced him to retire into the country. On the dissolution of that parliament, he returned to his former station. After the restoration of Charles II. he withdrew from public service, and exercised his ministry in private assemblies with his select friends. However, in June 1662, their meeting was discovered, and both he and his friends were apprehended and committed to prison; and at length, by process of law, each of his hearers was fined 20l. and Biddle himself 100l.; and they were ordered to remain in prison till these fines were paid. The close confinement and foul air of a prison, within five weeks, brought upon him a distemper, which terminated his life, September 22, 1662, in the 47th year of his age: and thus was his death hastened by the intolerance which persecuted him during the greatest part of his life. Mr. Biddle possessed a considerable degree of learning; and with the Scriptures he was so conversant, that he could repeat the New Testament from memory, both in English and in Greek, as far as the 4th chapter of the revelation of St. John. He possessed also, with this retentiveness of memory, powers of reasoning, which eminently qualified him for disseminating his peculiar opinions, and gaining proselytes. In his private character he was distinguished by his piety and devotion, by his moderation and temperance, by his condescension and benevolence, and by his irreproachable virtue. As he differed in some respects from Socinus and the foreign Unitarians, his followers were for some time denominated "Liddellians;" but the name did not subsist after his death. Biog. Brit. Toulmin's Life of Biddle, in Unitarian tracts, vol. iv. 1791. Neal's Hist. of the Puritans, vol. ii. p. 470, 471.

BIDDLES, in *Geography*, a settlement on a branch of Licking river, in Bourbon county, Kentucky, about 6 miles N.W. from Millers on the N.E. side of the same branch, and 32 miles N.N.E. from Lexington.

BIDENS, so named from the seed being terminated with two teeth or awns, in *Botany*. Lin. gen. n. 932. Reich. n. 1012. Schneb. 1267. Tournef. t. 262. Juss. 188. Dill. Elth. 43. 47. Gærtn. t. 167. *Ceratoccephalus*. Vaill. Act. Gall. 1720. f. 47, 48, 49. Class. *syngenesia polygamia equalis*. Nat. Ord. *compositæ oppositifoliae*. *Corymbifera*, Juss. Gen. Char. *Calyx* common, imbricate, erect; leaflets often equal,

B I D E N S.

equal, oblong, channelled, concave. *Cor.* compound, uniform, tubular; corollules hermaphrodite, tubular. Preper. one-petalled, funnel-form; border five-cleft, erect. *Stam.* filaments five, capillary, very short; anther cylindrical, tubular. *Pist.* germ oblong; style simple, the length of the stamens; stigmas two, oblong, reflex. *Per.* none: calyx unchanged. *Seeds* solitary, obtuse, angular; down with two or more awns, oblong, straight, acute, rough-hooked & downwards. *Rec.* flat, chaffy; chaffs deciduous, flattish. *Obj.* In most of the species an expanding five-leaved calycole surrounds the compound flowers. *Verbena* differs from *Bidens* only in having a ray. Sometimes the corolla has one or two radial florets. Reich.

Ess. char. *Cal.* imbricate. *Cor.* sometimes but seldom with a floret or two in the ray. — *Seed* crowned with erect, scabrous awns. *Recept.* chaffy.

Species 1. *B. tripartita*, trifid water-hemp-agrimony, or bur-marygold. Lin. sp. pl. 1165. Hudf. 355. With. 706. Full. 181. Relh. 308. Sibth. 248. Abbot. 177. Curt. Lond. fasc. 4. t. 57. Smith. Fl. Brit. 357. 1. *Verbena* seu *cannabinum aquatica*, flore minus pulchro, elatio: et magis frequens. Raii Synop. 18. *Eupatorium cannabinum femina*. Ger. em. 711. *B. Conyza palustris*, fol. tripartito divisis. Loes. pruff. 53. ic. 10. "Leaves trifid, calyxes somewhat leafy, seeds erect." Root annual; stem from one to three feet high, with opposite, reddish branches, patent, leafy, obtusely quadrangular, furrowed and smooth; leaves opposite, smooth, deep serrate, trifid or quinquefid: flowers terminating, solitary, somewhat erect, with undivided patent leaves; leaflets of the calyx unequal, plane, smooth, streaked with brown; the floscules uniform, tubulose, yellow; seeds compressed, two or three angled, the angles backward rough, two or three awns, terminating, somewhat erect, yellow, three-cornered, prickly backward; the chaffs of the receptacle resembling the leaflets of the calyx, but narrower. It is frequent in places inundated, and on the banks of ditches: flowers in August and September. This plant dyes a deep yellow; for which purpose the thread or yarn must be first steeped in alum water, then dried and steeped in a decoction of the plant, and afterwards boiled in the decoction. As by a chemical analysis it is found to possess much the same qualities as *verbena acemella*, it may probably have the same good effects in expelling the stone and gravel. 2. *B. minima*, nodding bur-marygold. Lin. sp. pl. 1165. Reich. 3. 703. Hudf. ed. 1. 310. Fl. Dan. t. 312. Abbot. 178. With. 883. v. Curt. Lond. 3. 55. *B. tripartita*. β . Hudf. 355. *B. Cernua*. γ . Smith. Fl. Br. 357. *Verbena minima*. Dill. in Rai Syn. 188. t. 7. f. 2. Giff. 167. App. 66. "Leaves lanceolate sessile; flowers and seeds erect." This was first marked by Dillenius for a distinct species. Haller thought it to be no more than a variety of the *cernua*, in which he has been followed by all our British botanists. Found in dried marshes. 3. *B. nodiflora*, sessile-flowered bidens. Lin. spec. 1165. Dill. elth. t. 44. f. 52. Reich. 3. 704. "Leaves oblong, quite entire, one-toothed, stem dichotomous, flowers solitary, sessile." An annual plant, rising with stems eight or nine inches high, round, rough, with white hairs, purple at the base. A native of the East Indies; cultivated at Eltham by Dr. Sherard, in 1732. 4. *B. tenella*. Lin. Spec. 1166. Reich. 3. 704. Amoen. 6. afr. 47. "Leaves linear, peduncles capillary, calyxes mostly four-leaved, seeds erect, five-fold." Stem filiform, purplish, subtrichotomous, six or seven inches in height. An annual, and a native of the Cape of Good Hope. 5. *B. cernua*, drooping water-hemp-agrimony, or bur-marygold. Sp. pl. 1165. Hudf. 356. With. 705.

Hall 180. Relh. 309. Sibth. 248. Abbot. 177. Curt. Lond. fasc. 3. t. 55. Fl. Dan. t. 841. Smith. Fl. Brit. 357. 2. Pet. herb. t. 20. f. 6. Raii list. 361. n. 2. 3. *Verbena pulchrior* flore luteo. Raii syn. 187. Bauh. hist. v. 2. 1074. *Conyza bidens*. Sp. pl. 1281. *Chrysanthemum cannabinum bidens*, foliis integris. Morif. hist. t. 6. t. 5. f. 22. *Eupatorium cannabinum chrysanthemum*. Barrel. ic. t. 1209. *Conyza palustris*, foliis ferratis. Lous. pruff. 54. t. 11. "Leaves lanceolate, stem clasping, flowers nodding, seeds erect." Root annual; stem from one to two feet high, or more, upright, branched, a little hairy, purplish, dotted with red, round at bottom, striated at top, with branches opposite, nearly upright, leaves opposite, moderately coarsete, undivided, or with distant serratures, spreading, smooth on both sides; peduncles striated; flowers yellowish-green, finally drooping, generally radiate; calyx consisting of about seven leaves, finely serrate at the edge, ribbed, turning back, and longer than the corolla; with eight corolllets in the circumference, hermaphrodite, like the central ones, but with the tube more tumid and depressed. In places overflowed for a long time, they change into ligulate neutral corolllets; receptacle pyramidal, four-cornered; seeds with four awns, two of which are larger; the prickles pointing downwards. This flowers a month later than the *tripartita*; and in this state has a strong smell, not very disagreeable. A native of most parts of Europe. Haller observes, that *cernua bidens* of Linnæus differs in no respect from *B. cernua*, except in having radiate florets in the circumference: hence Dr. Stokes concludes, that *bidens* and *cernua* form one genus. Found at Ditchingham in Norfolk, and Tarpley in Cheshire; frequent in Ireland. 6. *B. frondosa*, smooth-stalked bidens. Linn. Spec. 1166. Gartn. fruct. 2. 412. Reich. 3. 704. Berkh. diff. 1. 5. f. 5. *Chrysanthemum*, &c. Mor. list. 3. 17. f. 6. t. 5. f. 20. "Leaves pinnate, serrate, marked with lines, smooth; seeds erect; calyxes leafy; stem polished." The stem rises about three feet high, sending out many horizontal branches, from the ends of which are produced clusters of yellow flowers. It grows naturally in Virginia, Maryland, and Canada, where it is often a troublesome weed. It was cultivated by Mr. Miller in 1752. 7. *B. pilosa*, hairy bidens. Lin. Spec. 1166. Syst. 732. Reich. 3. 705. Dill. elth. t. 43. f. 51. Thunb. jap. 307. Lour. cochinch. 488. Gartn. fruct. 2. 42. β . *B. Chinensis*. *Agrimonia Molluca*. Rumph. Amb. 6. 38. t. 15. f. 2. "Leaves pinnate, somewhat hairy, stem with bearded joints, calyxes with a simple involucre, seeds diverging." A native of America, and of Tongataboo in the South Seas. *B.* of China resembles the American; but in the latter the leaflets are united, in the former they are distinct; and the seeds of the American have from two to five awns, and in the Chinese always four. The American form was cultivated in 1732 by Dr. Sherard. 8. *B. bipinnata*, hemlock-leaved bidens. Lin. Spec. 1166. Reich. 3. 705. Lour. cochinch. 488. *Chrysanthemum*. Herm. par. t. 123. Mor. list. 17. n. 24. f. 6. t. 7. f. 23. "Leaves bipinnate, gashed, calyxes involucred, corollas half-radiated, seeds diverging." An annual plant; a native of Virginia; cultivated in Kew garden in 1699. Loureiro says it is a native of China and Cochinchina. 9. *B. nivea*, snowy bidens. Lin. Spec. 1167. Reich. 3. 706. Dill. elth. t. 47. f. 55. Swartz obs. 296. β . Dill. elth. t. 47. f. 55. 3. γ . Dill. elth. t. 46. f. 54. "Leaves simple, cordate-ovate, acuminate, branches trichotomous, serrate, flowers hemispherical, peduncles elongated." A native of Jamaica, in elevated pastures, and on the sea-coast of the southern parts. Mr. Miller says, it grows naturally in South Carolina, and also at Casapachy; cultivated at Eltham in

that inhabits America. The abdomen is brown, with five whitish belts; vent bidentated. Fabricius.

BIDENTATA, a species of *PHALÆNA* (*Noctua*). This is a native of Europe, and has brown wings; stigmatè spot on the first wings, and inner margin white; a bidentated streak in the middle. Lin. Mus. Lelk.

BIDENTATA, a species of *CHRYSIS*, that inhabits Europe. This insect is glabrous; shining blue; thorax armed with two teeth, and with the two first segments of the abdomen golden. Fabricius. At the vent are three very short teeth.

BIDENTATUS, a species of *BOSTRICHUS*, described by Fabricius, Herbit, &c. It is black, and testaceous, retuse at the extremity, and armed with two hooked spines.

BIDENTATUS, a species of *CRYPTOCEPHALUS* (*Crioceris*), of a yellow colour; wing-cases black, yellowish at the tip. Fabricius. Inhabits Africa.

BIDENTATUS, a species of *CERAMBYX*, that inhabits South America. The thorax is slightly spinous; wing-cases bidentated, rough, cinereous, and brown. Fabricius.

BIDENTATUS, a species of *ICHNEUMON*, that inhabits Europe. It is black, scutel, and posterior part of the thorax yellow; on the latter two teeth, and the two first segments of the abdomen ferruginous. Linn. &c. The four anterior legs are rufous brown; rest black; tips white.

BIDENTATUS, a species of *CIMEX* (*Spinosus*), found in France. This is long and brown; snout bent; thorax beneath armed with two teeth on the anterior part. Geoffroy, Gmelin.

BIDENTATUS, a species of *TABANUS*, that inhabits Austria. This is of a ferruginous colour, with two yellow spots on each side, and front bidentated. Fabricius.

BIDENTES, in *Middle Age Writers*, denote two yearlings, or sheep of the second year. The wool of these bidentes, or two year old sheep, being the first sheering, was sometimes claimed as a heriot to the king, on the death of an abbot. Among the ancient Romans, the word was extended farther to any sort of beasts used for victuals, especially those of that age, whence we meet with *jues bidentes*.

BIDENTI *Similis*, in *Botany*. See *SIEGESBECKIA*.

BIDET, a nag, or little horse, formerly allowed each trooper and dragoon, for his baggage, and other occasions. Bidets are now disused, on account of the expences of them, and the disorders frequently arising from those who attended on them, &c.

BIDETTO, in *Geography*, a town of Italy, in the kingdom of Naples, and country of Bari, the see of a bishop, suffragan of Bari; 118 miles east of Naples.

BIDGOST, or **BIGDSEZ**, a town of Prussia, in Pomerelia, 64 miles south of Dantzick.

BIDLÆI, in *Antiquity*, an order of magistrates at Sparta, five in number, whose business it was to superintend the *ephebi*, and be present at their exercises, wrestlings, &c.

BIDI-BIDI, in *Ornithology*, one of the synonymous names of the Jamaica rail, *rallus Jamaicensis* of Latham.

BIDJIGUR, in *Geography*, a town of Hindoostan, in the country of Benares, seated on the river Soane, 45 miles south of Benares, and 128 S.W. of Patna. N. lat. 24° 30'. E. long. 83° 26'.

BIDIN. See **WIDIN**.

BIDIS, in *Ancient Geography*, now *S. Giovanni de Bidini*, a town of Sicily, south-west of Syracuse, and about 25 miles from it. It is mentioned by Cicero, and also by Steph. Byz. who calls it *Bidos*. The people who inhabited the eastern part of the island, at some distance from Syracuse, were hence called *Bidini*.

BIDLOO, **GODFREY**, in *Biography*, a celebrated Dutch anatomist, born at Amsterdam, 1649, applied early to the study of surgery, which he practised several years at his native city; he was also surgeon to the army, and at length physician to William III. with whom he continued in great favour to the time of his death, which happened in 1702. In 1694, he was made professor of anatomy and surgery at Leyden. He was a man of considerable learning, Haller says, but more attached to the pleasures of the table than to study, to which he attributes the numerous errors and inaccuracies in his otherwise splendid and valuable anatomical tables, which were criticised, perhaps, with too much severity by Ruysch, who had been his pupil. Our countryman, William Cowper, purchased 300 copies of the plates, in the life-time of Bidloo, and published them as his own, only giving new explanations, of which our author, with reason, complained in his "Guilielmus Cowper citatus coram tribunal," Leyden, 1700, 4to. Besides his great anatomical work, consisting of 105 tables, with explanations, fol. 1685, and his controversial papers, he published, "Observationes de animalculis in hepate ovillo detectis," 1698, 4to. "De oculis et visu variorum animalium," 1712, 4to. "Exercitationes anatomico-chirurgicæ," 1780, 4to. These, with various other dissertations, were collected, and published in 1715, 4to. two years after his death. Haller. Bib. Anat. Chirurg. et Med. His nephew, Nicholas Bidloo, was physician to the great czar Peter I.

BIDON, a liquid measure of about five quarts English measure; seldom used except among ship's crews.

BIDOURLE, in *Geography*, a river of France, which passes by S. Hippolyte, Sauve, Sommieres, &c. and runs into the lake of Peraut, 3 leagues east of Montpellier.

BIDOUZE, a river of France, which runs into the Adour, near the junction of that river with the gaves of Pace and Oleron.

BIDUMI, a country of Asiatic Turkey, the south part of Syria, bounded on the north by Palestine, on the west by Egypt, and on the east and south by Arabia; it is nearly desert, and has only a few scattered villages.

BIE, **ADRIAN DE**, in *Biography*, a painter of portraits and ornamental architecture, was born at Liere, in 1594, and after being initiated in the rudiments of his art by Wouter Abts, became the disciple of Rodolph Schoof, a painter of considerable reputation at Paris. He perfected himself at Rome, where he spent six years in the study of the best masters, and received great encouragement from persons of the first distinction. He so much excelled in the neatness of his pencilling, and in the delicacy of his touch and colouring, that he was frequently employed to paint on jasper, agate, porphyry, and other precious materials. The place and time of his death are not ascertained. Pilkington. See **BYE**.

BIEBER, in *Geography*, a town of Germany, in the circle of the Upper Rhine, and county of Hanau Munzenberg, 16 miles east of Hanau. Near this town are a mine of copper and silver, and some works of iron and cobalt, in which the latter is prepared into a beautiful smalt.

BIEBERICH, a small but handsome town of Germany, seated on the borders of the Rhine, and in the vicinity of Mentz. It belongs to a prince of the same name.

BIEBERSBACH, a town of Germany, in the circle of Franconia, and principality of Bayreuth.

BIEBRA, a river of Poland, which runs into the Narew, near Wiezna, in Masovia.

BIECZ, a town of Poland, in the palatinate of Cracow, seated on the river Wafaloke, and famous for its mines of vitriol. N. lat. 49° 50'. E. long. 21° 40'.

BIEDA, a town of Italy, in the state of the church, and province of Patrimonio, 10 miles W. of Sutri.

BIEDBURG, anciently *Beda*, a small town of Germany, in the circle of Burgundy, and duchy of Luxemburg, which was flourishing till the year 1663, but soon afterwards laid waste by the French.

BIEDENKOPF, or **BIEDENCAP**, a small town of Germany, in the circle of the Upper Rhine, and principality of Upper Hesse, seated on the Ahills, 16 miles N.W. of Marburg, and formerly famous for its iron works and foundery.

BIEFVERSKOW, a district of Zealand, belonging to Denmark, including 12 churches.

BIEKA, **BIEQUE**, **BORIQUEN**, or **CRAB'S ISLAND**, one of the Virgin Islands in the West Indies, about 23 miles in length, and not 6 in breadth, where it is widest. It is distant about 6 miles S.S.E. from Porto Rico. The soil is rich, and it has a good road on the south side, called Great Harbour. It is claimed by the Spaniards, whose interest it is to let it remain desolate. N. lat. 18° 2'. W. long. 64°. See *VIRGIN ISLANDS*.

BIEKOW, or **JEZOW**, a town of Poland, in the palatinate of Lenczicz, 24 miles S.E. of Lenczicz.

BIEL, a town of Spain, in Aragon, 6 leagues S.W. of Jaca.—Also, a river of Spain, which joins the Ores at Exea. See *BIENNE*.

BIELA, a town of Bohemia, in the circle of Czaflau, 6 miles N.E. of Teutsch Brod.

BIELA, or **BIELLA**, a town of Italy, in Piedmont; the capital of a small country, bounded on the north by the Alps, on the west by the duchy of Aosta, on the east by the Vercellois and the Mafferan, and on the south by the Canaveze; the town is rich and populous, containing about 7000 inhabitants, and is divided into the Upper and Lower, and has four churches and four monasteries. It is famous for an image of the Virgin Mary; distant 13 miles N. from Ivrea, and 24 N. W. from Vercelli. N. lat. 45° 22'. E. long. 8° 3'.

BIELACH, a river of Germany, in the archduchy of Austria, which runs into the Danube, near Melck.

BIELAIA, a river of Russia, which rises in the Uralian mountains, and after traversing the government of Ufa, discharges itself into the Kama, on the borders of the government of Casan.

BIELASTENA, a town of Croatia, 10 miles north of Bihacs.

BIELAY, a town of Bohemia, in the circle of Koniggratz, 4 miles S. W. of Branau.

BIELSKOI, a town of Siberia, 40 miles south of Eniseisk.

BIELCOPOL, a town of Poland, in the palatinate of Kiof, 48 miles west of Bialacerkiew.

BIELEF, a town and district of Russia, in the government of Tula, seated on the Oeca, 50 miles W.S.W. of Tula.

BIELEFELD, a town of Germany, in the circle of Westphalia, and county of Ravensberg, divided by the Lutterbach into the old and new town, seated at the foot of a mountain, and containing about 800 houses. The inhabitants are partly Lutherans, and partly Roman Catholics. The old town has two churches, the new a convent and a chapel. This town received municipal privileges in 1287, and was formerly Hanseatic; it is distant 22 miles north from Lippstadt.

BIELGOROD, a town formerly called *Sarkel*, and district of Russia, in the government of Kurfk, seated on the Donetz; 50 miles S.S.W. from Kurfk. N. lat. 50° 55'. E. long. 36°. This town was built in 990, by the great

duke Wladimir, and is an archbishop's see; it submitted to the arms of Potemkin, in 1790.

BIELGOROD. See *AREKMAN* and *MOSCOW*.

BIELGRAD, a town of Croatia, 40 miles S. E. of Bihacs.

BIELIAN, a town of Russian Tartary. N. lat. 43° 20'. E. long. 66° 4'.

BIELICA, or **BILIZIN**, a town of Lithuania, in the province of Vilna, seated on the Niemen, 10 miles south of Lida. N. lat. 53° 35'. E. long. 25° 40'.

BIELISKI, a town of Poland, in the palatinate of Kiof, 41 miles S.W. of Kiof.

BIELITZY. See *BELITZY*.

BIELLA. See *BIELA*.

BIELLE, a town of France, in the department of the Upper Marne, and chief place of a canton, in the district of Chaumont, 6 miles E.S.E. of Chaumont.—Also, a town of France, in the department of the Lower Pyrenées, and chief place of a canton, in the district of Oleron, 14 miles south of Oleron.

BIELOI, a town and district of Russia, in the government of Smolensko, on the small river Vobisna, falling into the Melsa or Meza, which discharges itself into the Duna; 50 miles N.N.E. of Smolensko. N. lat. 55° 40'. E. long. 34°.—Also, an island in the Karfko sea, about 70 miles in circumference, 20 miles from the continent of Russia. N. lat. 73° 40'. E. long. 69° 14'.

BIELOKAMESKOI, a fortress of Russia, in Siberia, on the east side of the Irtysh, 12 miles S.E. of Semipolatoi.

BIELO-OZERO, or **WHITE LAKE**, a lake of Russia, in the government of Novgorod, about 50 versts long, and 30 broad, which receives into it several small streams. The only one that flows out of it, is the Shekna, which falls into the Volga. The water of this lake is clear, having a bottom partly of clay, and partly of stone. The clay is generally of a white colour, and in stormy weather causes a strong white foam upon the surface of the water. From this circumstance, the lake first obtained its name *Bielo*, or *White*. It contains plenty of fish and crabs. N. lat. 59° 42' to 60° 20'. E. long. 36° 30' to 37° 18'.

BIELOPOLIE, a town and district of Russia, in the government of Karkof, seated on a rivulet falling into the Seim, 85 miles N.N.W. of Karkof.

BIELOVITZ, a town of Croatia, 11 miles S.W. of Damianovitz.

BIELOVODSK, a town and district of Russia, in the government of Voronetz, seated on the Derkul, which falls into the Donec, 130 miles south of Voronetz. N. lat. 49° 42'. E. long. 39° 10'.

BIELOW, a town of Poland, in the palatinate of Volhinia, 36 miles east of Lucko.

BIELOZERSK, a town and district of Russia, in the government of Novgorod, on the south side of the lake Bielo-Ozero, near the efflux of the river Shekna, 64 miles N.E. of Vologda. N. lat. 59° 40'. E. long. 37° 10'.

BIELSA, a town of Spain, in Aragon, 6 leagues from Ainsa.

BIELSK, a town of Poland, and capital of the palatinate of Podlachia, where the dietine for the district is held. It is little better than a miserable village, though called in the geographical descriptions of Poland, a large town. N. lat. 52° 48'. E. long. 23° 28'.—Also, a town of Poland, in the palatinate of Ploczko, 10 miles N. E. of Ploczko.

BIELT'SCH, a town of Bohemia, in the circle of Chrudim, 16 miles north of Chrudim.

BIELUGA, in *Zoology*, *Delphinus Leucas* (*Gmelin*) in Steller's *Kamptschatka*, &c.

BIENAISE, **JOHN**, in *Biography*, born in 1601 at Mazerès,

Mazeris, a city in France, where he practised surgery with such success, as to attract the notice of his sovereign, Lewis XIV., by whom he was made surgeon to the army in Flanders. He acquired great reputation, Haller says, by introducing the future of the tendon, and by curing a puncture of the brachial artery in a young nobleman. He gives excellent cautions, on taking up the artery, after amputating a limb, to avoid including the nerve in the ligature. He performed the paracentesis of the thorax successfully, and appears to have been a bold and expert operator, and to have made considerable improvements in his art. He died 1681, aged 80 years. A few years after his death, viz. in 1688, a posthumous work was published, containing an account of these operations, under the title of "Operations de Chirurgie, par une methode courte et facile," 12mo. Paris. Haller Bib. Anat. Eloy. Dict. Hist.

BIENENBUTTEL, in *Geography*, a town of Germany, in the circle of Lower Saxony, and principality of Lunenburg, 10 miles S.S.E. of Lunenburg.

BIENNE, a small district of Swisserland, lies between a lake of the same name and a chain of the Jura mountains. It is surrounded by the cantons of Berne and Soleure, the bishopric of Basle, and the principality of Neufchatel. The bishop of Basle is the sovereign of this little state, but his power, even before the French revolution, was exceedingly limited; and its constitution was neither a limited monarchy nor an independent republic, but a kind of mixed government, partaking in some degree of both. The bishop of Basle, upon his promotion to the see, received the homage of the citizens and militia of the town of Bienne, with attendant tokens of absolute submission, but at the same time he confirmed, in the strongest manner, all their privileges and franchises. The mayor appointed by him was his representative, to whom it belonged to convoke and preside in the little council, as the chief court of justice, to collect the suffrages, and to declare the sentence; but without giving any vote himself. Although justice was carried on, and executed in the name of the bishop, yet neither that prince, nor the mayor, had the prerogative of pardoning criminals, or of mitigating the sentence. All causes, civil and criminal, were brought before the council in the first instance; and in more important proceedings, an appeal lay to the sovereign council. In both cases, each party chose a member of the council to act as his advocate, which office he discharged without fee or recompence. The sovereign's revenue amounted only to about 300l. a year, nor did he possess the least share in the administration. The legislative authority resided in the great and little councils combined: the former consisting of 40 members, and the latter, to which the executive power belonged, being composed of 24; and it was required that the members of each council should be married men. Both councils elected their respective members; and therefore the constitution was altogether aristocratical. The burgo-master, or chief of the regency, was chosen by the two councils, and presided at their meeting, and retained his office during life; but it was necessary that he, as well as the several magistrates, should be confirmed annually by the two councils. The salaries annexed to these posts were small, and the general expences of government so inconsiderable, that the revenues of the state were sufficiently ample.

This republic, though a Protestant one, under the sovereignty of a Catholic bishop, enjoyed in the fullest extent the power of imposing taxes, contracting alliances, declaring war and peace; and, in short, of exercising every other act of absolute and independent legislation. Its singular constitution was guaranteed by Berne, Friburg, and Soleure, with which the town was closely allied, having connected itself with the former in 1352, with the second in 1496, and

with the latter in 1382; in consequence of which union it became a member of the Helvetic confederacy. This alliance between the cantons and the town of Bienne was paramount to that of the same cantons with the bishop of Basle: for the town enjoyed the right of sending deputies to every general diet, ordinary or extraordinary, a privilege not possessed by the bishop. The language of the country is a provincial German; but, as the territory borders on the principality of Neufchatel, the inhabitants speak also a corrupt French. The extent of the town and territory of Bienne is estimated at 144 square geographical miles, and its population at 5,500, or nearly 6000 persons; the people are very active and industrious. Bienne forms an important pass into the Swiss territories; accordingly, it was occupied by the French on the 8th of February 1798, and annexed to France as subject to the bishop of Basle, whose rights they assumed in consequence of having seized his territories.

BIENNE, called by the Germans *Biel*, the capital of the above district, is situated at the foot of mount Jura, and at a little distance from the lake of the same name. Between the town and the lake is a plain, which the sovereign council, by a kind of Agrarian law, that was honourable to the legislature, allotted, by distinct portions, to each burgher for his own distinct use: and it is entirely laid out in small kitchen gardens. Several manufactures have been established in the town, which, considering its size, carries on a tolerable trade. The government, by adopting the liberal policy of conferring the burghership at an easy rate, has contributed to increase the population of the town, and to extend its commerce. N. lat. 47° 8'. E. long. 1° 4'.

BIENNE, *lake of*, lies to the north-east of that of Neufchatel, with which it is connected by the Thielle, which separates the country of Neufchatel from the canton of Berne. It is about 9 miles long, and 4 broad; its borders are pleasing and picturesque, as it is skirted with agreeable walks and country houses; and the town of Nidau forms a very beautiful object upon its eastern side. Towards the southern extremity of this lake is the island of St. Peter, sometimes called the island of La Motte, and sometimes Rousseau's island, from its having been the place of Rousseau's retirement and residence, when by the violence of the populace he was obliged to withdraw from Moitier, where Frederic king of Prussia had ensured to him protection. Mr. Coxe, when he visited this island, landed on the south side of it, and passed through an agreeable meadow, skirted with vineyards, to a large farm house, formerly a convent, and secularised at the reformation, but inhabited, at the time of Mr. Coxe's visit, by the steward of the general hospital at Berne, to which the island belongs. "The island," says Mr. Coxe, "is about 2 miles in circumference, and richly wooded with various shrubs and trees, particularly with large oaks, beech, and Spanish chestnuts. Its surface is gently undulating; the southern shore, covered with herbage, forms a gradual slope to the lake; the remaining borders are steep and rocky; in a few places their summits are thinly fringed with shrubs; in others their perpendicular sides are clothed to the water's edge with hanging woods. The views from the different parts of the island are beautiful and diversified; that to the north is the most extensive and pleasing. It commands the lake of Bienne, which is of an oval form: its cultivated borders spotted with villages and castles, with the towns of Nidau and Bienne standing on the further extremity. Agreeable walks are carried through the woods, and terminate at a circular pavilion placed in the centre of the island. During vintage, particularly, and on Sunday, which is the usual day of festivity, the island is filled with parties, who take refreshment at the farm-house, stray about the woods, or dance in the circular building, and animate these romantic but solitary scenes."

cees." "Rousseau occupied an apartment in the farmhouse, the only dwelling in the island. He lived with the steward and his family, who are the present inhabitants (1785). The woman informed me, that he paid for his board and lodgings 40 shillings a month; that he usually rose at six, dined with the family at twelve, and after a slight supper retired to rest at nine. She added, he was extremely cheerful and agreeable; conversed with the family with the greatest ease and complacency, and conformed to their hours and manner of living; he amused himself entirely in wandering about the woods, and searching for plants, which he used to explain to them with singular satisfaction. Rousseau mentions his residence in this delightful island with the highest terms of rapture, and with his usual proneness to exaggeration." "I was permitted," says he, "to remain only two months in this delightful island; but I could have passed there two years, two centuries, all eternity, without suffering a moment's ennui, although my whole society consisted of the steward and family, good, but plain people. I esteem those two months the most happy period of my life; and so happy, that I could have passed my whole existence without even a momentary wish for another situation." *Coxe's Travels in Switzerland, &c.* vol. ii. p. 152, &c.

BIENNIAL PLANTS, in *Botany*, denote such, as the epithet imports, that are of two years' duration. Of this tribe there are numerous plants, which, being raised one year from seed, generally attain perfection in the same year, or within about twelve months, shooting up stalks, producing flowers, and perfecting seeds in the following spring or summer; and soon after commonly perish, or apparently decay and dwindle, so that they soon die off. Biennials are, therefore, always in their prime the first or second summer. They consist both of esculent and flower plants. Those of the former sort are the cabbage, fenny, carrot, parsnip, beet, onion, leek, &c.; and those of the latter are the Canterbury bell, French honey-suckle, wall-flower, stock-july-flower, sweet-william, China-pink, common-pink, matted-pink, carnation, scabious, holly-hock, tree-mallow, vervain-mallow, tree-primrose, honesty, or moon-wort, &c.

BIENTINA, in *Geography*, a town of Italy, in the duchy of Tuscany, on the side of a lake, called the "lake of Bientina," or the "lake of Seffo;" which lake is about 6 miles long, and 5 wide; 12 miles east of Pisa, and 28 west of Florence. The territory of Bientina lies in the middle of a marsh, in the centre of a valley, not very spacious, bounded by the high mountains of Pisa, and by those of Lucca and Valdinievole, which interrupt the wind, and prevent a renewal of air; and it is, therefore, as one would imagine by its situation, peculiarly unwholesome and unfavourable for inhabitants. It is nevertheless very populous, and sufficiently healthful even in summer. The principal causes of this salubrity are said to be, the numerous population, the extensive commerce, and the extreme attention that is paid to the continual discharge of the rain-waters, but, above all, the advantage of an abundant spring, which descends from the hills of St. Colombe, by means of long aqueducts, and supplies the inhabitants with excellent water. The situation of Bientina, therefore, duly examined, shews how far the art of man is capable of rendering habitable, and even salubrious, places naturally pestilential.

BIENVILLE, D. T. DE, M. D. in *Biography*, born in France, practised medicine many years at the Hague, and is only known by the following works, which bear his name: "La Nymphomanie, ou Traité de la fureur uterine," Amst. 1771, 8vo.; "Recherches theoriques et pratiques sur la Petite verole," 1772, 8vo.; "Traité des erreurs populaires, sur la santé," La Haye, 1775, 8vo.

BIER, a kind of wooden carriage, on which the bodies of the dead are borne to their grave. The word comes from

the French *biere*, which signifies the same. It is called in Latin *feretrum*, a *ferendo*. Among the Romans the common bier, upon which the poorer sort were carried, was called *sandapila*; that used for the richer sort, *lectica*, *lectica funebri*, sometimes *lectus*. The former was only a sort of wooden chest, *villus arca*, which was burnt with the body: the latter was enriched and gilded for pomp. It was carried bare, or uncovered, when the person died a natural and easy death; when he was much disfigured or distorted, it was veiled or covered over.

BIER, is more particularly used for that on which the bodies of saints are placed in the church to rest, and exposed to the veneration of the devout. This was often enriched with gold, silver, and precious stones; and furnished temptations, in many instances, to pillage.

BIERG, in *Geography*, a herred, or district, of the diocese of Funen in Denmark, including 12 churches, and several noblemen's seats.

BIERLING, GASPAN THEOPHILUS, in *Biography*, took his degree of doctor in medicine at Padua, about the middle of the 17th century, whence he returned to Magdeburg, his native city, where he was in considerable estimation. He published "Adversariorum curiosorum Centuria prima," June, 1679, 4to. He describes the effects of eating the hyoscyamus (henbane), drowsiness, and delirium, which are cured, he says, by taking the extract of castor, and the effects from the bite of a viper, cured by eating the flesh of one of those reptiles. He had the merit of recommending the cool treatment; and even bleeding, in the small-pox, contrary to the then generally received opinion. For the remainder of his works, which are numerous, but in little estimation; see Haller's Bib. Med. Eloy. Dict. Hist.

BIERNE', in *Geography*, a town of France, in the department of Mayenne, and chief place of a canton, in the district of Chateau-Gonthier. The place contains 810, and the canton 8225 inhabitants: the territory includes 205 kilometres and 12 communes.

BIERVLIET, a small town of Flanders, on the west side of the Scheldt, which has been much reduced by frequent inundations, and the fortifications of which were destroyed in 1688. William Beukelzoon, or, as others have written his name, Beukelings, who taught the Dutch the art of curing herrings, was a native of this place, and died here in 1397. The town is 7 leagues north of Ghent, and 4 E. N. E. of Sluys. N. lat. 51° 25'. E. long. 3° 42'.

BIESBOS, a large lake in the Merwe, between Dort and Gertudenburg, formed by the irruption of the banks or dykes.

BIESE, a river of Germany, which rises 8 miles south-west from Stendal, in the Old Mark of Brandenburg, and pursuing its course to Seehaufen, changes its name to Aland.

BIESENTHAL, a town of Germany, in the circle of Upper Saxony, and Middle Mark of Brandenburg, 20 miles N. E. of Berlin.

BIESIUS, NICHOLAS, in *Biography*, born at Ghent in Flanders, March 27, 1516, studied medicine at Louvain; thence he went to Valencia in Spain, and afterwards to Sienna, in Italy, where he took his degree of doctor. Returning to Louvain he was advanced to the chair of professor in medicine, which he filled with credit several years, expounding to his pupils, as the custom then was, the works of Galen. He was thence called by the emperor Maximilian II. to Vienna, and appointed his physician, which post he held until April 1572, when he was suddenly cut off by a fit of apoplexy. His works are, "Theoreticæ Medicinæ libri sex," Ant. 1558, 4to.; "In Artem medicam Galeni Commentarii," 1560, 8vo.; "De Methodo Medicinæ," 1564, 8vo.; "De Natura libri quinque," 1573, 8vo.; the two last works have been several times reprinted.

BIESMES, in *Geography*, a place of France, where is a pass across the Aine, from the department of the Meuse to that of the Marne; 3 miles from St. Menehold, and 12 from Grand Pre.

BIESNIN, a town of Poland, in the palatinate of Ploczko. N. lat. 53°. E. long. 20° 8'.

BIETIGHEIM, a town of Germany, in the duchy of Wurtemberg, at the conflux of the Ens and Metterbach; 10 miles N. of Stuttgart, and 30 S. S. E. of Heidelberg.

BIEVRE, a river of France, which rises a little to the south of Versailles, and passing towards Paris, changes its name for that of Gobelins, on account of its water being used in that manufacture, and soon after it joins the Seine.

BIEUZI, a town of France, in the department of Morbihan, and chief place of a canton, in the district of Pontivy; 2 leagues S. S. W. of Pontivy.

BIEZOW, or **BIDSCHOW**, a town of Bohemia, in the circle of Koningingratz; 3 miles east of Koningingratz.

BIFARIA, FOLIA, in *Botany*, denote leaves that point two ways.

BIFASCIANA, in *Entomology*, a species of **PHALÆNA** (*Toxix*). The anterior wings are testaceous; two oblique bands, spot, and arched mark at the apex brown. Linn. Mus. Lesk. &c. Inhabits Europe.

BIFASCIATA, in *Conchology*, a species of **BULLA**, the shell of which is somewhat tapering, erect, and white, with two broad reddish bands at the aperture. Lister. Gmelin. Native place unknown.

BIFASCIATA, a species of **VOLUTA**, described by Lister and Martini. This shell is thin, transversely striated, and flesh coloured, with two white bands and a single tooth on the pillar. It is rather less than an inch in length; and has a long narrow aperture. Native country unknown.

BIFASCIATA, a species of **CYPRÆA**, of an oblong form and purplish, with a straw-coloured band, and a narrower white one, a brown border. Gmelin. Length nearly four inches. Country unknown.

BIFASCIATA, a species of **NÉRITA**, of a blackish colour, with two hoary bands and white tip. A native of India. Gmelin. Chemnitz, &c.

BIFASCIATA, in *Entomology*, a species of **SILPHA**, found in Saxony. This is black, with two bands and a spot at the apex of ferruginous colour. Fabricius. This is a small insect.

BIFASCIATA, a species of **CASSIDA**, that inhabits South America. It is pale with two brown bands. Gmelin.

BIFASCIATA, a species of **COCCINELLA**, of a ferruginous colour, with two bands and four dots of black. Fabricius. This insect inhabits the cape of Good Hope; and is *Coccinella flexuosa* of Thunberg.

BIFASCIATA, a species of **CHRYSOMELA** of a large size, that is found at Cayenne. It is testaceous: wing-cases brassy and shining: two spots and two bands of yellow. Fabricius, &c.

BIFASCIATA, a species of **CICADA** (*Cercopis*), of a yellowish colour, with brown wing-cases, and two white bands. Fabricius. This is *Cicada fusca, fasciis alarum binis albis*, of Linn. Syst. Nat. XII. and *Cicada trifasciata*, of Degeer. Inhabits the north of Europe.

BIFASCIATA, a species of **PHALÆNA** (*Geometra*), described by Linnæus as a native of Europe. The anterior wings are cinereous, clouded, with two bands; posterior pair white.

BIFASCIATA, a species of **LIBELLULA**, that inhabits America. The wings are hyaline, with a brown spot at the base, and two bands of the same colour. Fabricius. Obi. This is *Libellula trimaculata* of Degeer; and *Libellula pulchella* of Drury.

BIFASCIATA, a species of **TENTHREDO**, that inhabits Eu-

rope. The general colour is brown; thorax black; mouth scutell, and four spots white: on the abdomen two interrupted yellow bands; margin of the wings and legs yellow. Linnæus. Mus. Lesk.

BIFASCIATA, a species of **MUTILLA**, that inhabits New York. The colour is black; upper part of the head and thorax, and two bands on the abdomen red: wing violaceous-black. Swederus. Nov. Act. Stockh. Entirely downy, and twice the size of *M. Europæa*.

BIFASCIATA, a species of **TIPULA**, of a yellowish colour, with transparent wings palely fasciated with brown. Schranck Inf. Austr. Of the middle size, with the eyes black.

BIFASCIATA, a species of **MUSCA**, that inhabits South America. It is rufous, with two golden bands on the abdomen. Fabricius, &c.

BIFASCIATA, a species of **SCOLIA**, that inhabits New York. This insect is of a black colour; two dots on the anterior part of the thorax, scutell, and two interrupted bands on the abdomen ferruginous. Swederus. Nov. Act. Stockh.

BIFASCIATUS, in *Conchology*, a species of **CONUS**, figured by Born. This kind is white with angulated chestnut lines, and two orange bands: spire rather prominent: base surrounded with orange lines, and the intermediate spaces with tessellated spots. Country unknown.

BIFASCIATUS, in *Entomology*, a species of **SCARABÆUS**, that inhabits Coromandel: on the thorax is a triple protuberance, with an erect horn on the head; wing-cases black, with two rufous bands. Fabricius.

BIFASCIATUS, a species of **DERMESTES**, of a black colour, with two waved yellow bands: thorax tessellated with cinereous colour. Thunberg. A native of the Cape of Good Hope.

BIFASCIATUS, a species of **BOSTRICHUS**, found in Siberia. It is of a black colour: wing-cases yellow, with two blueish-black denticulated bands. Gmelin. This is *Dermestes bifasciatus* of Lepech. it.

BIFASCIATUS, a species of **CRYPTOCEPHALUS**, that inhabits Africa. It is rufous, with two spots on the thorax, and two bands on the wing-cases of black. Fabricius.

BIFASCIATUS, a species of **CERAMBYX** (*Prionus*), found in South America. The thorax is denticulated: body black: wing-cases red, with two black bands: antennæ short. Gronovius, Fabricius, &c.

BIFASCIATUS, a species of **ATTELABUS** (*Clerus*), of a brassy-green and downy: wing-cases blue, with two scarlet lines. Fabricius. A native of Siberia.

BIFASCIATUS, a species of **GRYLLUS** (*Bulla-Acridium*), of a fuscous brown with white spots, and two lateral ochreous-bands. *Herbst apud Fuestli*. Inhabits sandy places.

BIFASCIELLA, a species of **PHALÆNA** (*Tinea*), with fuscous glossy wings; with two bands of white, the hinder one interrupted: head rufous. Fabricius. Inhabits Denmark.

BIFERÆ, in *Botany*, denote plants that flower twice a year, or in spring and autumn.

BIFERNO, in *Geography*, a river of Italy, which runs into the Adriatic, not far from Termini.

BIFFA, in *Middle Age Writers*, a machine for casting stones and darts, having a moveable counterpoise, which turned round its yard.

BIFID LEAF, in *Botany*. See **LEAF**.

BIFIDUS, in *Entomology*, a species of **CIMEX** (*Reduvius*), of a black colour: wing-cases with a rufous band; an erect bifid spine on the scutell. Inhabits China, and is of a large size. Fabricius. Donov. Inf. China.

BIFOLIUM, in *Botany*. See **OPHRYS**.

BIFORIS, in *Natural History*, a species of **ECHINUS**, having at the base five furrows, and ten flexuous radiated lines;

lines; and near the vent two oblong perforations. *Leske apud Klein.* Its habitation unknown.

BIFORMIS, an appellation given to Bacchus, either because he is represented sometimes as a young man, sometimes as old; sometimes with a beard, and sometimes without one; or because wine, of which he is the symbol, renders men sorrowful and frantic, or gay and pleasant.

BIFRONS, a person doubled-fronted, or two faced.

BIFRONS is more peculiarly an appellation of Janus, who was represented by the ancients with two faces, as being supposed to look both backwards and forwards; though other reasons for it are recited by Plutarch. Sometimes he was painted with four-faces, *quadrifrons*, as representing the four seasons.

BIFRONS, in *Entomology*, a species of **BRENTUS**, that inhabits Cayenne. This insect is black, with striated wing-cases, having glabrous yellow spots. Fabricius.

BIFRONS, a species of **ICHNEUMON**, described by Linnaeus: it is an European insect of a black colour, with the front white, with a black spot beneath the antennæ: tip of the petiole, and two first segments of the abdomen, with the legs reddish. *Muf. Lesc.*

BIFRONS, in *Natural History*, a species of **NEREIS**, described by O. Fabricius, and Müll. as a native of the north sea. It is depressed; peduncles with a simple fetigerous papilla, cirrated above; those in the middle also branched. This creature is continually in motion; about an inch long, and of a fulvous or brownish colour: head white: eyes four: cirri seven: body attenuated at both ends, and consisting of fifty-six joints.

BIFURCATUS, in *Entomology*, a species of **CIMEX** (*Oblongus*), that inhabits Germany. It is blackish: abdomen pale yellow, and bifurcated. Schæffer. Antennæ consist of four joints.

BIGA, a chariot for racing, drawn by two horses abreast. The word ought rather to be written *bigæ*, in the plural; q. d. *bijugæ*, two horses being joined by a *jugum*, or yoke. *Bigæ* stands contradistinguished from *trigæ*, *quadrigæ*, &c. *Bigæ* are of very ancient standing: all the heroes in Homer, Hesiod, Virgil, &c. fought in them. The invention of *bigæ* is attributed by Pliny (N. H. vii. 56.) to the Phrygians; by Isidore, (xvii. 35.) to Cyritenes of Sicily, who first yoked two horses together. They were first introduced into the olympic games in the 93d olympiad, or about the year 468 B. C. It appears, however, that the Greek heroes who celebrated the first Nemean games in honour of Archemorus, were borne on *bigæ*. *Bigæ* were the chariots first used in the Circensian games; then *trigæ*, and afterwards *quadrigæ*. The moon, night, and the morning, are by mythologists supposed to be carried in *bigæ*, the sun in *quadrigæ*. Statues in *bigæ* were at first only allowed to the gods, then to conquerors in the Grecian games; under the Roman emperors, the like statues, with *bigæ*, were decreed and granted to great and well-deserving men, as a kind of half triumph, being erected in most public places of the city. Figures of *bigæ* were also struck on their coins, and those on which were a *bigæ*, and a Janus with a double face, were termed *Bigati nummi*.

The drivers of *bigæ* were called *bigarii*; a marble bust of one Florus, a *bigarius*, is still seen at Rome.

BIGA, or *Bigata*, in *Writers of the Middle and Barbarous Age*, a cart with two wheels, drawn often with one horse. It was more frequently called *birra*.

BIGA, in *Geography*, a town of Asiatic Turkey, in the province of Natolia, 16 miles S. of Artaki.

BIGA, a river of North Wales, which joins the Severn in the county of Montgomery.

BIGAMY, a double marriage, or the possession of two

wives at the same time. Among the ancient Romans, those convicted of bigamy were branded with a note of ignominy; and, in France, they were anciently punished with death. See **POLYGAMY**.

BIGAMY, in the *Canon Law*, is where a person either marries two virgins successively; or once marries a widow. The former kind of bigamy they call *real*, and the latter *interpretative*. Each of these the canonists account impediments to be a clerk, or to hold a bishopric without a dispensation: a point of discipline founded on that of St. Paul, "Let a bishop be the husband of one wife," 1 Tim. ch. iii. ver. 2. Apost. Const. 17, 18. By a canon of the council of Lyons, A. D. 1274, held under pope Gregory X. such were esteemed "omni privilegio clericali nudati et coercioni fori secularis addicti." 6 Decretal, i. 12. This canon was adopted and explained in England by stat. 4 Edw. I. st. 3. c. 5; and bigamy, in consequence of it, became no uncommon counter-plea to the claim of the benefit of clergy. M. 40 Edw. III. 42. M. 11 Hen. IV. 11. 48. M. 13 Hen. IV. 6. Staunf. P. C. 134. The cognizance of the plea of bigamy was declared by stat. 18 Edw. III. st. 3. c. 2. to belong to the court Christian, like that of bastardy. But by stat. 1 Edw. VI. c. 12. §. 6. bigamy was declared to be no longer any impediment to the claim of clergy. See Dal. 21. Dyer, 201.

The Romanists make a third kind of bigamy, by *interpretation*; as, when a person in holy orders, or that has taken on him some monastic order, marries.—This the bishop can dispense withal, at least on some occasions.

There is also a kind of spiritual bigamy; as when a person holds two incompatible benefices, v. gr. two bishoprics, two vicarages, two canonries *sub eodem teſto*, &c.

By the ecclesiastical law of England, a second marriage, while the former husband or wife is living, is simply void, and a mere nullity; nevertheless, the legislature has thought it just to make it felony, by reason of its being so great a violation of the public economy and decency of a well-ordered state. For the circumstances attending this crime, and the punishment of it, see **POLYGAMY**.

BIGARELLA, in *Botany*. See **PRUNUS**.

BIGARELLA, in *Geography*, a town of Italy, in the duchy of Mantua, 7 miles E.N.E. of Mantua.

BIGATI, in *Antiquity*, a kind of ancient Roman silver coins, on one side whereof was represented a *biga*, or chariot drawn by two horses. The *bigatus* was properly the Roman *denarius*, whose impression, during the times of the common-wealth, was a chariot driven by Victory, and drawn either by two horses, or four, according to which it was either denominated *bigatus*, or *quadrigatus*. *Bigati* therefore were of different values, according to the species of *denarii*, &c. Several of those called consular medals are also *bigati*. In lieu of horses, the chariot is represented on some *bigati*, as drawn by two deers, especially in the medals of the family of Aſſia: on those of the family of Crepereia, by two *hipopotami*, who draw, or rather bear Neptune on their tails.

BIGBERRY, or *BIGBURY bay*, in *Geography*, lies on the south coast of Devon, and is formed by the Bolt Tail on the east, and Stoke-point on the west, in the direction nearly of N.W. by W. The entrance into Plymouth found is round Stoke-point to the N.W.

BIG-BONE CREEK, an American creek in Woodford county, Kentucky, which falls into the Ohio from the east, in about N. lat. 39° 17'. W. long. 85° 54'. It is small, but has three branches; the north-westernmost interlocks with Bank Lick creek, which falls into Licking river. It is noticed on account of the large bones and salt licks in its vicinity.

BIG-BONE Licks lie on each side of the above-mentioned creek,

creek, a little below the junction of the two eastern branches, about 8 miles from the mouth of the creek. These, and also the other salt springs, in the western country, are called *licks*, because the earth about them is furrowed up in a very curious manner, by the buffaloes and deer which lick the earth, on account of the saline particles with which it is impregnated. A stream of brackish water runs through these licks, the soil of which is of a soft clay. The large bones found here, and in several other places near salt licks, and in low soft grounds, thought to belong to the Mammoth, have perplexed naturalists, in their investigation of the animals to which they belong. See *BONES fossile*, and *MAMMOTH*.

BIGEMINATE LEAF, in *Botany*. See *LEAF*.

BIGERRA, in *Ancient Geography*, a town of Spain, which, according to Livy, was attacked by the Carthaginians, because it was allied to the Romans, but it was succoured by Scipio. Ptolemy assigns it to the Bastitani, in *Tarragorensis*.

BIGERRONES, a people of Gaul, so called by Cæsar, and denominated by Pliny, *Bigerri*; and by Aufonius, *Beheritani*. M. d'Anville places them at the foot of the Pyrenæes, to the west of the Convenæ. Their name exists in that of Bigorre.

BIGGAR, the name of a town and parish of Lanarkshire, in Scotland. The parish includes an area of land, measuring about 6 miles, by $3\frac{1}{2}$, in transverse diameter. The surface is partly hilly, and is appropriated, in nearly equal parts, to pasture and arable. The population of the parish in 1790 was 937, but this was 161 less than when a return was made 36 years anterior. From the improved state of the roads, and of agriculture, it was found to contain 1216 persons in the year 1800. The town of Biggar has 389 inhabitants. Here are three annual fairs. At the west end of the parish are the vestiges of a large tumulus, and three encampments. Tradition says, that a desperate battle was fought here between the Scots under Sir William Wallace, and the English army, when the slaughter was very great. Sir John Sinclair's *Statistical History of Scotland*.

BIGGE, a river of Germany, which runs into the Lene, 3 miles north of Allendorf, in the duchy of Westphalia.

BIGGEL, in *Zoology*, *Antelope Tragocamelus* of Gmelin, in *Mandell's* it.

BIGGLESWADE, in *Geography*, is a large improving town of Bedfordshire, England, pleasantly situated in a fertile valley, on the eastern bank of the river Ivel. This has been rendered navigable to the town by act of parliament, and considerable quantities of coals, timber, corn, and some other commodities, are brought by this channel. An extensive weekly market, and four annual fairs, also attract various merchandize to the town. The manor belongs to the king, and the parish includes, besides the town, the small hamlets of Stretton and Holme. These together contain a population of 1650 persons, who occupy 301 houses. The church, an ancient and strong edifice, was partly built in the year 1230, and was formerly collegiate. The inhabitants, being free tenants, have all equal rights in the church. In this town are two charity-schools; also a Baptist meeting-house; and being seated on a great public road, it contains several large inns. Biggleswade suffered very materially by fire, which happened on the 16th of June 1785. In a few hours 150 dwelling-houses were reduced to ashes, besides some malt houses, corn-chambers, &c. which were situated round the market-place, near the centre of the town. The damages sustained by this fire were estimated at 24,000*l*. Since the conflagration several new houses have been erected, and the town has assumed a more modern and

improved appearance. On the 25th of February 1792, a shock of an earthquake greatly alarmed the inhabitants of this place, and its concussion was so powerful as to throw down some old houses. It lasted several seconds, and was found to extend northward into Yorkshire, and towards the sea-coast of Lincolnshire. In the manor of Stretton, at a short distance south-east of Biggleswade, as a carter was ploughing the land, he discovered a yellow earthen pot, which was found to contain about 300 gold coins of Henry VI. They were nearly the size of half crown pieces each, but being very thin did not equal the weight of a guinea.

About 4 miles west of Biggleswade, are the remains of Warden-abbey, which was formerly a very extensive and considerable foundation. It was founded in 1135, by Walter Espec, for Cistercian monks; and at the dissolution its revenues were valued at 38*l*. 16*s*. 6*d*. per annum. *Lealand's Itinerary*. *Camden's Britannia*. *Beauties of England and Wales*, vol. i.

BIGGS BAY, lies on the south side of Jamaica, and to the east of north from Portland-point, which is the most southerly point of the island.

BIG-HILL CREEK, an American creek, which runs west into the Kaskaskias river, 25 miles below Beaver creek, 17 above Blind creek, and 26 northerly from the mouth of Kaskaskias.

BIGGIN SWAMP. See *Santee River*.

BIGHT, in the *Sea Language*, denotes any part of a rope, as it is taken compassing, coiled up; or the double part of a rope, when it is folded, in contradistinction to the end. It signifies also a small bay between two points of land.

BIGINI, in *Geography*, a town of Sicily, in the valley of Mazara, 10 miles east of Mazara.

BIGIS, in *Ancient Geography*, a town of Asia, placed by Ptolemy in Drangiana.

BIGLA, in *Geography*, a town of Lithuania, in the palatinate of Wilna, 40 miles E. N. E. of Wilcomirz, near a lake from which the river Drisna issues. N. lat. 55° 26'. E. long. 20° 24'.

BIGLOBATUS, in *Entomology*, a species of *CUREULIO*, found at the Cape of Good Hope. This is of a black colour, with a canaliculated snout; thorax globose, very rough with punctured dots; wing-cases with scabrous dots, and two rows of tubercles on each side. *Sparrm. Nov. Act. Stockh.*

BIGLUMIS, a species of *VESPA*, with four dots on the scutellum; margin of the abdominal segments white, with two white dots on the second. Gmelin. *Vespa Rupestris* of Linn. *Syst. Nat.* is deemed a variety of this kind.

BIGNAN, in *Geography*, a town of France, in the department of Morbihan, and chief place of a canton in the district of Josselin, 3 leagues S.W. of Josselin.

BIGNI, in *Conchology*, a name under which Adanson describes *Voluta Tringa* of Gmelin.

BIGNON, JEROM, in *Biography*, was born at Paris in 1590, and educated by his father, who was an advocate in the parliament of Paris, and distinguished by his learning and character. Having made a surprising progress under his father's tuition, he was placed, about the age of ten years, near the person of the young prince of Condé, and about this period published, "A Description of the Holy Land," more accurate than any extant. In 1604, he composed for the use of the young duke of Vendome, a "Treatise on Roman Antiquities." These works were compilations; but his work on the "Election of the Popes," said to be composed in his fourteenth year, but not published till 1608, was of a more original kind, and displayed a degree of erudition that surprised the most learned men of the age. *Bign*

non was regarded by Scaliger, Casaubon, Grotius, Pithou, de Thou, Le Fevie, and other eminent scholars, as a prodigy of literature, and his acquaintance was eagerly cultivated. By Henry IV., who knew his extraordinary talents and attainments, he was appointed page of honour to the dauphin, afterwards Lewis XIII.; and at court his manners were distinguished by an easy politeness, though he unremittently prosecuted his literary studies. His next treatise was a refutation of Valdez, a Spanish writer, who published a folio volume to establish the precedence of the kings of Spain over the other sovereigns; it was entitled "On the Excellence of the Kings and Kingdom of France," dedicated to Henry IV. and published in 1610, 8vo. Upon the death of Henry, he withdrew from court, and acquired an additional reputation by a new edition of "The Formularies of Marculphus," published with learned notes, in 1613. In the following year he took a journey to Italy, where he was honourably received by pope Paul V., Father Paul at Venice, and other persons, who had already heard of his fame. Upon his return he devoted himself to the bar, and, in 1620, was appointed advocate-general to the great council; and having acquitted himself with credit in this office, he was nominated by the king a counsellor of state; and, in 1626, created advocate-general to the parliament. In this high station he maintained the parliamentary rights with firmness and vigour, and manifested the most ardent zeal for justice. In 1641, he resigned this honourable office to his son-in-law, Stephen Briquet; nor did he resume it till after his death in 1645. In 1642, cardinal Richelieu, though far from being his friend, appointed him royal librarian, which his taste for literature induced him to accept, whilst he declined the lucrative post of superintendent of the finances. Queen Anne of Austria, during her regency, availed herself of his advice on many interesting occasions, and he was employed in many delicate negotiations. Having through life maintained a character, which was universally respected and esteemed, he terminated his course of useful service in the exercise of those sentiments of piety by which his conduct had been governed, in the 67th year of his age, April 7, 1656. Amongst his papers were found some fragments of notes on Gregory of Tours, and of a work on the origin of the French law, which he had not leisure to finish. The abbé Perrault has given a good account of his life, in one volume; 2mo. 1757. *Nouv. Dict. Hist. Gen. Dict.*

BIGNONIA, so named by Tournefort, in honour of the abbé Bignon, Eng. *trumpet flower*, or *scarlet jasmine*, in *Botany*. Lin. gen. n. 759. Reich. 817. Schreb. 1018. Tourn. 72. Juss. 139. Gærtn. t. 52. Clafs and Order, *didynamia angiospermia*. Nat. Ord. *Personate. Bigoniæ*. Juss. Gen. char. *Cal.* perianth one-leaved, erect, cup-form, five-cleft. *Cor.* monopetalous, campanulate; tube very small, the length of the calyx; throat very long, ventricose beneath, oblong-campanulate; border five-parted, the two upper divisions reflex, lower patulous. *Stam.* filaments four, subulate, shorter than the corolla; two longer than the other two; another reflex, oblong, as it were doubled. *Pist.* germ oblong; style filiform, situation and form of the stamens; stigma capitate. *Per.* Siliqua two-celled, two-valved; partition membranaceous, parallel, thickened at the futures. *Seeds* very many, imbricate, compressed, membrane-winged on both sides. *Obs.* *Catalpa* has only two perfect stamens, and three very small rudiments of stamens, with a five-leaved calyx. Four, however, and even all five perfect, have been observed by Cyrilli. The form of the siliqua in this genus is indeterminate. The seeds are always winged, though some on one side only.

Ess. Char. *Cal.* five-cleft, cup-form. *Cor.* throat bell-

form, five-cleft, ventricose beneath. *Siliqua* two-celled. *Seeds* membrane-winged.

Species, 1. *B. Catalpa*, common Catalpa tree. Lin. *Spec.* 868. Reich. 3. 155. hort. cliff. 317. 1. Ait. hort. Kew. 2. 346. Duham. Arb. t. 104. t. 41. Catefb. Car. t. 49. t. 29. "Leaves simple, cordate; stem erect; seeds winged with membranes." A deciduous tree, with an upright stem, covered with a smooth brown bark, 30 or 40 feet high; with lateral branches, ovate leaves placed opposite at every joint, flowers in branching panicles towards the end of the branches, of a dirty white colour, with a few purple spots, and faint stripes of yellow on their inside, which flowers are succeeded by long taper pods not yet produced in England. Found by Mr. Catesby growing naturally on the back of South Carolina, brought into England about the year 1726, and now not uncommon in our nurseries and plantations. In our climate the leaves come out very late; and the tree requires a sheltered situation. It flowers in August, and is known in the nurseries by its Indian name "Catalpa." The branches dye wool a kind of cinnamon colour. Thunberg mentions that the Japanese lay the leaves on parts of the body affected with pains, on a supposition that they are beneficial to the nerves; and that a decoction of the pods is serviceable in the asthma. 2. *B. tomentosa*. Lin. Syst. 563. Thunb. Jap. 252. "Leaves simple, cordate, tomentose beneath; flowers axillary, panicled." A native of Japan. 3. *B. sempervirens*, Carolina yellow jasmine, Lin. *Spec.* 869. Reich. 3. 155. Gelseminum. Park. 1465. n. 5. Raii hist. 1769. Catefb. Car. 1. t. 53. Syringa. Pluk. Alm. t. 112. f. 5. "Leaves simple, lanceolate, stem twining." Rising with slender stalks, that twist themselves round the neighbouring plants, and mount to a considerable height, with single opposite leaves at every joint, that remain green throughout the year; growing naturally in South Carolina, where it spreads over the edges, and, at the season of flowering, perfuming the air to a great distance; and also found in some parts of Virginia: called yellow jasmine, probably from the sweet odour of its flowers. Cultivated in 1640, in Kew garden, by Parkinson. 4. *B. unguis*. Lin. *Spec.* 869. Reich. 3. 156. Apocyno affine. Sloan. jam. 1. 268. Clematis. Plum. Amer. t. 94. Pluk. Alm. t. 163. f. 2. "Leaves conjugate; tendril very short, bowed, three-parted." A native of the West Indies. 5. *B. aquinoëialis*. Lin. *Spec.* 869. Reich. 3. 156. Sabb. hort. 2. t. 85. Plum. *Spec.* 5. ic. 55. f. 1. "Leaves conjugate, cirrhose; leaflets ovate and lanceolate; peduncles two-flowered; filiques linear." Received by Mr. Millar from La Vera Cruz, in New Spain. 6. *B. paniculata*. Lin. *Spec.* 869. in Kew garden in 1730. 9. *B. pubescens*. Lin. Spec. 870. Reich. 3. 157. "Leaves conjugate, cirrhose; leaflets cordate-ovate, pubescent beneath." Growing naturally in Virginia, and several other parts of America. 10. *B. triphylla*, three-leaved trumpet-flower. Lin. Spec. 870. Reich. 3. 157. "Leaves ternate; leaflets ovate, acuminate; stem shrubby, erect." Sent to Mr. Miller from La Vera Cruz, by Dr. Houffoun. 11. *B. pentaphylla*, hairy five-leaved trumpet-flower. Lin. Spec. 870. Reich. 3. 158. Hort. cliff. 497. 0. "Leaves digitate; leaflets quite entire, obovate." Sent to Mr. Miller from Jamaica, by Dr. Houffoun; and introduced into Kew garden before 1733. 12. *B. Leucoxydon*, smooth five-leaved trumpet-flower, white-wood, or tulip-flower. Lin. Spec. 870. Reich. 3. 158. Swartz obs. 233. Pluk. alm. t. 200. f. 4. Brown jam. 263. n. 1. Sloan. jam. 2. 62. n. 47. Raii dendr. 114. 2. "Leaves digitate; leaflets quite entire, ovate, acuminate." According to Sir Hans Sloane, this tree is as large as any in the island of Jamaica, having a large straight trunk covered with a smooth whitish bark, and a very hard white wood. According to Browne, it grows in a kind soil to a large size, and is considered as good timber-wood; but when its growth is not luxuriant, fit only for smaller and subordinate implements. Its juice and tender buds are said to be an antidote to the poisonous juice of the manchineel. Mr. Miller says, that it rises with an upright stem to the height of 40 feet, in the natural country of its growth; and that the seeds, dispersed by the winds to neighbouring lands, supply plants in great plenty. Cultivated by Mr. Miller in Kew garden, in 1759; and received by him from Barbadoes under the denomination of "white wood." 13. *B. radiata*, ray-leaved trumpet-flower. Lin. Spec. 871. Reich. 3. 158. Feu. peruv. 2. 731. t. 22. "Leaves digitate; leaflets pinnatifid." Stem three inches high; corolla pale yellow, with red dots. A native of Peru, in very dry sand. 14. *B. radicans*, rooting or ash-leaved trumpet-flower. Lin. Spec. 871. Reich. 3. 158. Hort. cliff. 317. 4. Upf. 178. Gron. virg. 73. 94. Duham. arb. 1. 103. 1. Sabb. hort. 2. t. 84. Pseudo gelsemium siliquosum. Riv. mon. 101. Pseudo-Apocynum. Mor. hist. 3. 612. n. 1. f. 15. t. 3. f. 1. Park. 1679. and 385. n. 6. Gelsemium hederaceum Indicum. Corn. can. t. 103. Raii hist. 1768. β . B. fraxini fol. cocineo fl. minore. Catesb. car. 1. t. 65. Mill. fig. 43. t. 65. Duham. arb. 103. 2. "Leaves pinnate; leaflets gashed; stem with rooting joints." Stems rough, branches trailing, fastening by the roots, issuing from their joints, to the trees in their natural place of growth, and climbing to a great height; in Europe, where it is generally planted against walls, striking into the mortar of the joints, so as to support the branches, and rising to the height of 40 or 50 feet: flowers produced at the ends of the shoots of the same year, in large bunches, with long swelling tubes, shaped somewhat like a trumpet, whence the plant has the appellation of "trumpet-flower;" corolla of an orange colour, and opening at the beginning of August. Cultivated in Kew garden in 1640. The seeds of β . were sent from Carolina in 1724, by Mr. Catesby; and since that time many plants have been raised in England, by seeds sent from that country. 15. *B. flans*, branching-flowered trumpet-flower. Lin. Spec. 871. Reich. 3. 159. Jacq. Amer. pict. 91. t. 176. Brown. jam. 264. 3. Plum. Spec. 5. ic. 54. Sloan. jam. 2. 63. n. 49. *B. frutescens*. Mill. dict. n. 3. "Leaves pinnate; leaflets ferrate; stem erect, firm; flowers racemed." An upright shrub from four to eight feet in height; flowers yellow, with red lines on the inside of the tube; siliques half a foot long, with winged seeds. A native of all the sugar islands in the West Indies, chiefly in a dry, rocky, or gravelly soil. Mr.

Miller says, that he received this sort first in 1729, from La Vera Cruz, where Dr. Houffoun found it in great plenty; since which time he obtained the seed from the island of Bermuda, by the title of "candle-wood." 16. *B. grandiflora*. Lin. Syst. 564. Thunb. jap. 253. Kæmpf. ic. fol. 21. "Leaves pinnate; leaflets ovate, acuminate, ferrate; stem twining; calyx femiquinquefid." Stem shrubby, climbing, four-cornered; calyx five-cornered; corollas purple, the size of a rose: differing from the *radicans* in having a stem not at all rooting, a larger flower, and a femiquinquefid calyx. A native of Japan. 17. *B. chelonoides*. Lin. Syst. 564. Suppl. 282. Padri. Rheed. Mal. 6. 47. t. 26. "Leaves unequally pinnate; leaflets ovate, quite entire, acuminate, pubescent; corollas bearded, with the rudiment of a fifth stamen." A large tree, with a whitish ash-coloured bark; leaves spreading, petioled; panicle terminating; pedicels opposite, dichotomous; flowers solitary, from the divisions; calyx hoary; border of the corolla a little arched, rough with hairs, red, five-cleft; the two upper segments yellow, with red dots; lower segments rough with hairs, curled at the edge, disk waved, white, veins red, throat rough with hairs; the rudiment of a fifth stamen, inserted into the tube of the corolla, barren; siliques linear, flat, bent, streaked. The fresh flowers, immersed in water, give it a pleasant odour; and in the East Indies, of which it is a native, they sprinkle it over the temples in a morning, to correct the stagnant air. 18. *B. spatulacea*. Lin. Syst. 564. Suppl. 283. Nür Pongelion. Rheed. Mal. 6. 53. t. 29. "Leaves unequally pinnate; leaflets ovate, rough with hairs; calyx one-leaved, spotted; corolla salver-shaped." A large tree, differing in the structure of the flower from the other species, but having didynamous stamens, and a pod filled with winged seeds. It is evidently of this genus. The timber is ash-coloured, or red, smooth, and much used for a variety of utensils in India. A native of Malabar, Java, and Ceylon, in woods near waters. 19. *B. peruviana*. Lin. Spec. 871. Reich. 3. 159. Hort. cliff. 317. 5. "Leaves decomposed; leaflets gashed; stem with tendrils at the joints." A native of America. 20. *B. indica*, Indian trumpet-flower. Lin. Spec. 871. Reich. 3. 159. fl. zeyl. 236. Lour. cochinch. 379. Palega pajaneli. Rheed. Mal. 1. p. 77. t. 43. Raii hist. 1741. β . Pajaneli. Rheed. 79. t. 44. Raii hist. 1741. n. 2. "Leaves bipinnate; leaflets quite entire, ovate, acuminate." A large tree with ascending branches. A native of the East Indies, and Cochinchina. Introduced in 1795 by Dr. Solander. A variety occurs near Mozambique, in Africa. 21. *B. caerulea*. Lin. Spec. 872. Reich. 3. 160. Catesb. car. 1. t. 42. "Leaves bipinnate; leaflets lanceolate, entire." Grows naturally in the Bahama islands, whence Mr. Catesby sent the seeds, in 1724; and many of the plants were raised in the gardens near London. In the country where it grows naturally, it rises to the height of 20 feet. 22. *B. longissima*, wave-leaved trumpet-flower. Ait. Hort. Kew. 2. 347. Jacq. Amer. 182. t. 176. f. 78. Swartz Prodr. 91. Brown. jam. 264. 2. Plum. ic. 47. t. 57. *B. Quercus Lamarck* Encycl. 1. 417. "Leaves simple, oblong, acuminate; stem erect; seeds woolly." An elegant, upright tree, 40 feet high and upwards. A native of the West Indies; cultivated and growing luxuriantly in many parts of Jamaica, especially in the low lands and favannahs, where it grows to a considerable size, and is considered as an excellent timber-tree. Its numerous flowers, and slender siliques, add a peculiar grace to its growth. In Jamaica it is known by the name of "French oak;" and in the French West India islands it is called "Chêne noir." 23. *B. echinata*. Gærtn. fruct. 1. 240. t. 52. Jacq. Amer. 183. t. 176. f. 52. Aublet. Guian. 2. 648, t. 263, 264.

Swartz prodr. 91. "Climbing; lower leaves ternate; upper bijugous, cuneate; fruit echinate." A rambling shrub climbing to the tops of trees by its very long and numerous branches. A native of the West Indies, Carthage, and Guiana. 24. *B. pentandra*, Lour. Cochinch. 379. "Leaves bipinnate; ramens five, with two anthers in each; calyx flesh-coloured, five-toothed." A middle-sized tree, with ascending branches. A native of Cochinchina, near rivers. Loureiro has another species under the name of *B. longissima*, which is a native of Cochinchina, by rivers, and which is not the *B. longissima* of Jacquin (N^o 22.); agreeing, according to Loureiro, with the "lignum equinum" of Rumphius (vol. iii. p. 73. t. 46.), or *B. spathacea* of the younger Linnæus in the length and form of the corolla, but not in the spathaceous calyx and pinnate leaves. But Retzius observes, that Rumphius's plant is not the same with Linnæus's, and it is very different from the "Nur-Pongelion" of the Hortus Malabaricus. Loureiro also remarks, that the three Asiatic species which he has described can by no means be adapted to the generic character formed by Linnæus from the American species, except in the fruit; and even that is not always two-celled in the Asiatic species. 25. *B. allacea*. Swartz prodr. 91. Aubl. guian. 659. 14. Barr. gall. aquin. 23. "Leaves conjugate; leaflets elliptic, entire, coriaceous; peduncles five-flowered, axillary; calyxes entire." This plant has a strong smell of garlic, whence its trivial title, and its French name "Liane à l'Ail." A native of the West Indian islands, and the forests of Cayenne and Guiana. 26. *B. cassinoides*. Vahl. Symb. 2. 68. Lamarck. Encycl. "Leaves simple, elliptic, coriaceous; raceme terminating." A native of Rio Janeiro, having the appearance of an "Echites." 27. *B. bijuga*. Vahl. Symb. 2. 69. "Leaves abruptly pinnate, bijugous; leaflets elliptic, quite entire." A native of Madagascar.

The *Bignonias* are trees or shrubs, inhabitants of the hot climates, of the East and West Indies, and eminently beautiful. The leaves are opposite; in some species unequally pinnate or ternate; in others, conjugate, with a two-leaved petiole between the leaflets, frequently furnished with a tendril for climbing. Flowers in panicles, large and handsome, of various colours, red, blue, yellow, or white. The calyx should be observed, whether it be simple or double; the corolla, whether it be regular or irregular; the stamens, whether they be fertile or barren; the fruit, whether it be bony or capsular, in form of a siliqua, or ovate. There are many species, particularly from Brazil, not yet sufficiently known to admit of arrangement under this genus. *B. sempervirens* does not belong to this genus, says Mr. Martyn, but to that of *lisanthus*.

Propagation and Culture.—These are exotic trees or shrubs, and may be raised from seeds sown on a moderate hot-bed in the spring. They should be soon aired to the open air, to prevent their being drawn up weak. They may be also increased by cuttings, and some of them by layers. The seeds of the common Catalpa tree are annually brought over from South Carolina. The seedling plants should be placed abroad in the beginning of June, in a sheltered situation, till autumn, and then placed under a summer frame, to guard them from the winter frost; exposing them in mild weather to the open air. In the following spring they should be taken out of the pots, and planted in a nursery-bed in a warm situation, where they may remain two years, and then planted where they are to remain. This tree may be also propagated by cuttings which, in the spring, should be planted in pots, and plunged into a moderate hot-bed, shading them from the mid-day sun, and occasionally, but sparingly, refreshing them with water. In about six weeks,

when they have taken root, and made shoots above, they should have plenty of air, and accustommed to bear being exposed to the open air; and afterwards treated like the seedling plants. The Catalpa delights in a rich moist soil, where, in a few years, it will produce flowers. The plants of the third species, not bearing cold, when young, should be sheltered in winter, planted against a warm wall, and protected from frost by coverings of mats, and by tan covering the soil about their roots. The fourth and fifth species will live in the open air, when planted against a wall with a south aspect, and sheltered in a very severe frost. The sixth, seventh, eighth, tenth, eleventh, and twelfth sorts, are tender, and will not thrive in this country out of the bark-love. If the ninth species be planted in the full ground against a wall, the roots should be covered in the autumn with some old tanners' bark, to keep out the frost in winter; and in very severe frost they should be covered with mat. The twelfth sort will take root from cuttings planted during summer in pots, or plunged into a bark-bed: it has flowered several years in the Chelsea garden, in August. The fourteenth sort is so hardy as to thrive in the open air; but the trailing branches should be supported; and as they spread much and rise to a great height, they will serve to cover un-fightly buildings; and also trained against the stems of trees, they make a fine appearance when in flower. It is propagated by seeds, but the young plants thus obtained will not flower in less than seven or eight years; and therefore those propagated by cuttings or layers are most esteemed, because they will flower in two or three years after planting. The necessary culture for these plants, after they are established, is to cut away all the small weak shoots of the former year in winter, and shorten the strong ones to the length of about two feet; and thus young shoots will be obtained for flowering in the following summer. These plants are of long duration: some of them remain vigorous after 60 years, and produce plenty of flowers every season. The fifteenth species is propagated by seeds sown on a hot-bed, and by transplanting the plants into separate small pots, filled with light fresh earth, and plunged into a fresh hot-bed; by removing them in autumn into the bark-love, giving them but little water during winter, and in summer refreshing them with it sparingly; and they should remain constantly in the bark-love, and be treated like other tender plants from the hot countries. The third year from seed they will flower; but they do not produce seeds in England. The other sorts have not been cultivated in England. Martyn.

BIGORNO, in *Geography*, a town of Corsica.

BIGORRE, a country of France, in the province of Guyenne before the revolution, but now forming a part of the department of the Upper Pyrenées. Its capital was Tarbes. It is bounded on the N.E. by Armagnac and the country of the four vallies, Nebouzan and Astarac; on the south, by the Pyrenées; and by Bearn, on the west. It has been sometimes divided into the country of Ruffin, the Plain, and the Vallies; and estimated at 16 leagues in length from north to south; and in its greatest breadth at 7 leagues. From its general situation, this country might be expected to enjoy the same mild climate that is experienced in the neighbouring provinces, under the same latitude; but from local circumstances the case is very different. The Pyrenées intercept the warmth of the more southern country of Spain; while, from its elevated situation, it is exposed to the chilling blasts of the north. On this account Bigorre is deprived of many fruits and vegetables, such as the orange and olive; however, the laurel, fig-tree, and myrtle, are not injured by the climate. The air of the mountains is cold and chilling, but that of the plains and

vallies more mild and salubrious. This country produces wood in considerable quantities, excellent wine, rye, barley, and millet; but not much wheat. It has good pastures, quarries of marble, and medicinal springs. The mountains of Bigorre consist of schist, marble, and granite. See PYRENEES. The inhabitants of this district possess a peculiar and characteristic physiognomy, in which they all resemble one another; they are healthy and active, lively and cheerful, and unite impetuous courage with strength and agility. The impetuosity of their temper renders their language rapid, passionate, and full of protestations; and they sometimes sink the voice an octave below the natural key, that they may suddenly raise it to the sharpest note. Their ideas abound with imagery; and their gestures are quick and violent. They are distinguished by their generosity and beneficence. They practise the sling from their infancy, and can draw a bow before they speak; and those persons are regarded as the most accomplished, who are most skilled in leaping, riding, and throwing the bar. The education of the Bigorrese, who are not husbandmen, is conducted with a view to the church; and they boast of many eminent persons in science and literature.

BIGOT, a person foolishly obstinate, or perversely attached to an opinion. The word is formed from the German *hey*, and *Got*, or the English *by-God*. Camden relates that the Normans were first called *Bigots*, on occasion of their duke Rollo; who receiving Gissa, daughter of king Charles, in marriage, and with her the investiture of the dukedom, refused to kiss the king's foot in token of subjection, unless he would hold it out for that purpose; and being urged to it by those present, answered hastily, "No, by God;" whereupon the king, turning about, called him *Bigot*; which name has passed from him to his people.

BIGOT, EMERIC, in *Biography*, an eminent promoter of literature, was born at Rouen in 1626; and forming an early attachment to literature, he declined all public business, and employed himself in augmenting a large library bequeathed to him by his father, and in correspondence and conversation with persons of learning. Few persons conciliated, by the modesty of his temper, by the friendship and suavity of his manners, and by his love of peace and endeavours to maintain it, a greater number of friends, who respected and esteemed him. In various parts of Europe, through which he travelled, he formed connections with literary men; but his most intimate friends of this description were Menage and Nicholas Heinsius. Although he distinguished himself by aiding others in their literary performances, the only work he published in his own name was the Greek text of Palladius's life of St. Chrysostom, found in the grand duke's library at Florence, to which he annexed a Latin translation. Having entailed his valuable library on his family, in order to prevent its dispersion, he died at Rouen in 1689. However, notwithstanding his precaution, his library was publicly sold at Paris in 1706. Gen. Dict.

BIGOT, in Italian *bigontia*, in *Commerce*, is used to denote a Venetian liquid measure, containing the fourth part of the *amphora*, or half the *boot*.

BIG ROCK, in *Geography*, a large rock on the S. E. bank of Au Vaze river in America; about 3 miles N. E. from its mouth in the Mississippi, and about 8 miles S. E. from cape St. Antonio on that river.

BIG ROCK BRANCH, the north-eastern head branch of Alleghany river. The branch called Big Hole Town joins it, and forms the Alleghany, 85 miles N. E. from and above Venango fort.

BIG SALT LICK, a garrison in the state of Tennessee, near the Salt lick, on Cumberland river, 115 miles from Knoxville; 80 from S. W. point on Clinch river, 32 from Bledsoe lick, and 68 from Nashville.

BIG SANDY RIVER, or *Totterwy*, rises near the source of Cumberland river, and separating Virginia from Kentucky, discharges itself into the Ohio, opposite to the French purchase of Galiopolis, in about N. lat. 33° 30'. Vancouver's and Harmar's forts stand on this river. On its banks are several salt licks and springs. *Little Sandy* is a short small river, which falls into the Ohio, about 20 miles west of Big Sandy river, in the county of Mason, Kentucky.

BIGUBA, a town of North Africa, seated on the river Rio Grande. N. lat. 11° 15'. W. long. 13° 35'.

BIGUTTATA, in *Entomology*, a species of *SILPHA*, met with at Upsal. This is totally ferruginous, with a pale line and spot on the wing-veins. Thunberg. Nov. Act. Stockh.

BIGUTTATA, a species of *CASSIDA*, with a yellow thorax; reddish wing-veins; black margin, and two yellow spots. Fabricius. This insect inhabits Cayenne.

BIGUTTATA, a species of *COCCINELLA*, described by Fabricius. It is rufous, with two yellow spots. The country is unknown. Size small; thorax glossy and black, with the sides yellow.

BIGUTTATA, a species of *CANTHARIS*, found in gardens in Europe. The thorax is black in the middle; wing-veins short, black, and yellow at the tip. Linn. Fn. Suec. Fabricius. This is *Telephorus niger*, *femoribus flavis*, *elytris apice luteis* of Degeer.

BIGUTTATA, a species of *BUPRESTIS*, with very entire, linear, green wing-veins, with a white dot; abdomen blue, with three white dots. Fabricius, &c. Inhabits England.

BIGUTTATA, a species of *CICADA* (*Cercopis*), of a black colour, spotted with yellow; wing-veins brown, with a white marginal spot. Inhabits Germany. Fabricius.

BIGUTTATA, a species of *CICADA* (*Ranatra* Fabr.) that is found in Europe. It is black, with a patch of sanguineous red on each side of the thorax. Fabricius.

BIGUTTATA, a species of *VESPA*, of the small size, that inhabits China. It is black, and spotted with yellow; margin of the segments, and two dots of yellow on the second one. Fabricius.

BIGUTTATA, a species of *SCOLIA*, of a black colour, with two transverse white dots on the abdomen; wings black. A small species, and inhabits Spain. Fabricius.

BIGUTTATOR, a species of *ICHNEUMON*, described by Thunberg. It is black, with two dots on the scutellum. Found at Upsal.

BIGUTTATUS, a species of *CURCULIO*, that is found in Germany. It is black, with elevated dots on the wing-veins; abdomen and posterior legs yellow. Fabricius.

BIGUTTATUS, a species of *CRYPTOCEPHALUS*, of a black colour, with the head, tip of the wing-veins, and legs yellow. Gmelin. A native of Austria.

BIGUTTATUS, a species of *CARABUS*, that lives under the bark of trees in Sweden, and is described by Thunberg. The head is roundish and brassy; wing-veins black, with a pale spot at the apex.

BIGUTTATUS, a species of *DYTISCUS*, described by Linnæus as a native of Europe. This is black; legs, end of the abdomen, antennæ, mouth, two dots between the eyes, thorax, and wing-veins testaceous, the latter spotted with brown; in the middle of the thorax two black spots.

BIGUTTATUS, a species of *STAPHYLINUS*, that inhabits some shores of the Baltic sea. It is of a black colour, with a fulvous spot on each of the wing-cases. Linn. Fabr. &c.

BIGUTTATUS, a species of *CIMEX* (*Rotundatus*), described by Linnæus in his *Fauna Suecica*, by Scopoli, &c. It is black, with all the margins white, and a white spot on the wing-cases.

BIGUTTULUS, a species of *GRYLLUS* (*Locusta*), with a cruciate thorax; wing-cases clouded, and marked with an oblong white spot near the tip. Linn. Fn. Suec. &c. This is *Acrydium biguttulum* of Degeer. Very common on some barren lands in the north of Europe.

BIHACS, **BIHATZ**, **BIHITZ**, or **VIHITZ**, in *Geography*, a town of Croatia, seated on the river Unna, belonging to the Turks; 60 miles south of Carlstadt, and 180 west of Belgrade. N. lat. 44° 42'. E. long. 16° 20'.

BIHAL, in *Botany*. See *STRELITZIA*.

BIHAMATA, in *Entomology*, a species of *HISPA*, of an oblong, depressed shape, that inhabits India. It is specifically described as being unarmed, black, spotted with red; shells truncated and hooked. Gmelin.

BIHAMATA, a species of *FORMICA*, found in the island of Joanna, having four spines on the thorax, and two curved ones on the petiole scale. Fabricius, &c.

BIHAR, in *Geography*, an ancient town of Hungary, giving name to a district, in which are also Debretzen, Great Varadein, &c.

BIHOREAU, in *Ornithology*, the name of *Ardea nycticorax*, or *Night heron*, in Buffon's Hist. Birds. *Femelle de Bihoreau* of Buffon, is *Ardea grisea*; and *Bihoreau de Cayenne* of Buff. is *Ardea cayennensis* of Gmelin.

BIHRI, in *Geography*, a town of Persia, in the country of Larissan, in the route from Ispahan to Ormus, 30 miles N.W. of Lar.

BIJINAGUR. See *BISNAGUR*.

BIJORE, called also *Bejour* and *Bajour*, the *Bazira* of Alexander, a province of Hindoostan, bounded on the south by Paishawur, on the north by Kuttore, on the east by Sewad and Beneer, which are separated from it by the Penjekoreh river, and on the west by Guznoorgul. This province, according to the dimensions stated in the *Ayen Acharee* (vol. ii. p. 192, &c.) extends 25 cosses north and south, and 10 east and west; distant about 20 cosses beyond the Cabul river, and on its western extreme about 30 cosses from the Indus. Bijore, as well as Sewad, is very mountainous, and abounds with passes and strong situations; so that their inhabitants have not only held themselves generally independent of the Mogul emperors, but have occasionally made very serious inroads into their territories. In this province there is at this day a tribe of Afghans, denominated Yuzuf-zyes, which traces its origin to certain persons left there by Alexander the Great, when he passed through this country. Both Abul Fazil, the author of the *Ayen Acharee*, and Soojan Rae, an eastern historian of good reputation, report this tradition without any material alteration. The latter, indeed, adds that these Europeans, if we may call them so, continued to preserve that ascendancy over their neighbours which their ancestors may be supposed to have possessed, when they first settled here. Although we should reject this pedigree as fabulous, yet the bare claim argues the belief of the natives, for which there must have been some foundation, that Alexander not only conquered Bijore, but also transferred that conquest to some of his own countrymen. The people of Bijore had likewise an high idea of Alexander's extensive authority; and they denominated him the "Two-horned," agreeably to the striking emblem of power in all the eastern

languages. (*Ayen Acharee*, xi. 194.) These Yuzuf-zyes, says Mahomed Cazim, quitted their ancient habitations between Ghizni and Candahar, and after various unsuccessful attempts to obtain a settlement in Cabul, at the time when Mirza Ulug Beig, surnamed Cabulee, ruled that kingdom, finally established themselves in Sewad and Bijore; which at this period were governed by a dynasty of princes styled "Sultani," who derived their lineage from Alexander the Great. The Yuzuf-zyes possess, in addition to Sewad and Bijore, the tracts situated between those provinces, and the rivers of Cabul and Indus; the greatest part of which is described as a desert in the *Ayen Acharee*, but by Bernouilli as a forest. In the time of Achar, Zine Khan was sent to chastise them; and he overran their whole territory, and even penetrated to the borders of Cashgar, and took the strong fort of Kushal, or Gushal, seated on a mountain 17 marches north of Bijore. About the year 1670, Aurungzebe found it necessary to chastise these Yuzuf-zyes; since which period the return of Nadir-Shah, in 1739, again brought them into notice. To him they appeared formidable; but he reduced them to submission; and if they really engaged to supply his army with 30,000 men, the tribe must have increased since the time of Achar, when Bijore contained only 39,000 and Sewad 40,000 families. Rennell's Mem. p. 159, &c.

BIJORE, the capital of the above-described province, situated about 6 marches, or about 66 geographical miles, from Nilab or Attock, and at 50 of the same miles, north a little east from Paishawur, and at the same distance east a little north from Lalalabad. N. lat. 34° 7'. E. long. 70° 44'.

BIJORE, the name of a river which rises in the mountains, N.E. of Bijore, and passing by it, forms a junction with the Penjekoreh, Sewad, and Kamelo, and falls into the Nilab, or Sinde, at Attock.

BIISK, a town and district of Siberia, in the government of Kolyvan, seated on the river Bi, or Bia, which, by uniting with the Katunia, forms the river Oby; 150 miles S.S.E. of Kolyvan. N. lat. 53° 31'. E. long. 84° 14'.

BIJUGUM, FOLIUM, in *Botany*, denotes a winged leaf, bearing two pair of *foliola*.

BIKBUŁAKOVA, in *Geography*, a town of Russia, in the government of Ufa, on the river Ik, 80 miles N.E. of Orenburg.

BIKILLAM, or **BECKALEN**, a small island in the Red sea, 8 leagues from the coast of Arabia. N. lat. 16°. E. long. 42° 25'.

BIKOU, a town of Poland, in the palatinate of Braclaw, 50 miles north of Braclaw.

BILA, a river of Bohemia, which runs into the Moldav near Auffig.

BILA, Alt, a town of Bohemia, in the circle of Leitmeritz, 10 miles W.S.W. of Kamniz.

BILÆNA, or **BILBANA**, in *Ancient Geography*, a town of Arabia Felix. Ptolemy.

BILAN, in *Geography*, a town of Bohemia, in the circle of Chrudim, 5 miles west of Chrudim.

BILANCIIS DEFERENDIS, in *Law*, a writ directed to a corporation, for the carrying of weights to such a haven, there to weigh the wool, which persons by our ancient laws were licensed to transport. Reg. Orig. 270.

BILANDER, in *Navigation*, a small merchant-ship with two masts: distinguished from other vessels of the same kind by the form of the main-sail, which resembles a fettee-sail. The head is bent to a yard, similar to the mizen-yard of a ship, and hangs to the main-mast, as a ship's does to the mizen-mast. This method of rigging has proved inconvenient, and is now seldom used, except by the Dutch.

BILANUS, in *Botany*. See CRATÆVA.

BILARIUS, PORUS. See BILIARI *Pori*.

BILATERAL COGNATION, denotes kinship, or kindred, on both sides; that of the father as well as mother.

Such is the relation of brothers, sisters. Bilateral stands contradistinguished to unilateral.

BILBA, in *Ancient Geography*, a town of Asia, in Babylonia. Ptolemy.

BILBAO, sometimes called *Bilboa*, in *Geography*, a port-town of Spain, in the province of Biscay, seated on the banks of the river Ybaizabal, about 6 miles from the sea. On the water-side is a large square, well shaded with pleasant walks, extending to the outlets on the banks of the river, and containing a number of houses and gardens, which form an agreeable prospect, particularly in sailing up the river. The number of houses in this town is about 800, some of which are built on piles; they are solid and lofty; the streets are well paved and level; and as they may be washed at pleasure, Bilboa is one of the neatest towns in Europe. The tide that flows into the river forms a secure and much frequented harbour; and a considerable commerce is thus carried on in iron, wool, of which, it is said, 60,000 bags are annually exported to Great Britain, France, and Holland, saffron, and chestnuts. Towards the close of the 10th century, the people of Biscay, having maintained their independence, together with their profession of Christianity, even when the Moors gained possession of the other parts of Spain, and having about this time obtained some advantages over them, began to direct their attention to the manufacture of their own excellent iron, not only for their own use, but for the supply of other nations; and their port of Bilboa began to have shipping, and to engage in foreign trade, perhaps before any other nation to the west of the Mediterranean sea, at least in a very considerable degree. In the last year of the 13th century, this town was refounded, or new built, by Didacus Lopez, then prince, or lord of the province; and as it was the staple port for the iron and wool of Spain, its commerce rapidly increased; and it appears from Rymer's *Fœdera*, that in the reign of king Edward IV. A.D. 1474, the merchants of Guipulcoa carried on, probably by the port of Bilboa, a considerable trade with England. It appears, also, that the Biscayners, availing themselves of the advantage of their shipping and port, were concerned in the whale-fishery at an earlier period than any other nation of Europe, Norway excepted. The town is supplied with flesh and poultry, and also with fish of various kinds, and particularly with a sort of eels in winter, which are small, of a pale colour, about three inches long, and without a back bone, caught in prodigious quantities at low tides, and in summer with the cuttle-fish. The shambles are a Tuscan building, in the centre of the town, with an open court, and a fountain in the middle, by means of which it is kept clean, and free from offensive offals and scents. The environs abound in gardens, which are fertile in legumes and fruits. This town has five churches, and several religious houses; and in its police it has one law of a peculiar kind, which renders ingratitude criminal, and subject to a penalty. Although the air is generally damp, the town is remarkably healthy, and the inhabitants are robust, cheerful, and long-lived; so that the hospital is frequently without a patient. The women are capable of enduring labour as well as the men, and are employed in unloading the ships, carrying burdens, and performing the business of porters. At the close of the day they return to their habitations, without any appearance of lassitude, dancing and singing to the pipe and tabor. Their music is defrayed at the expence of the town; and on holidays it is performed in the midst of a great concourse of persons under the trees

in the great square. The women of Bilbao, though constantly exposed to the air, have good complexions, lively eyes, and fine black hair, which they curiously braid, and which they reckon peculiarly ornamental. Married women wrap a white handkerchief round their heads, so knotted as to fall down in three plaits behind, and over this they wear the Montera cap. Those who understand their language say it is very soft and harmonious, as well as energetic. N. lat. 43° 15'. W. long. 2° 45'. See BISCAY.

BILBERRY, in *Botany*. See VACCINIUM.

BILBILINÆ AQUÆ, in *Ancient Geography*, Alhama, mineral and medicinal waters of Spain, 24 miles from Bilbilis, according to the Itinerary of Antonine. The name Alhama, given by the Arabians to this place, has the same meaning with the aquæ calidæ of the Latins. See ALHAMA.

BILBILIS, BAMBOLA, a town of Hispania Tarragonensis, belonging to the Celtiberi, south of Turiasco; seated on a mountain surrounded by the waters of Salo or Xalon. Bilbilis was a municipal town, and bore the title of Augusta, which is found on several medals. The poet Martial was of this city, called by Ptolemy *Bilbis*.

“Municipes Augusta mihi quos Bilbilis acri
Monte creat, rapidis quos Salo cingit aquis.”

Martial, l. 10, epig. 103.

On most of the medals of Bilbilis, we perceive, on one side a head of Augustus, and, on the other, a cavalier, armed with a lance and a helmet.—Also, a river of Spain, the waters of which were famous for tempering iron; called also *Salo*.

BILBOWS, in *Sea-phrases*, a punishment answering to the stocks at land.

They consist of long bars, or bolts of iron, with shackles sliding on them, and a lock at the end, used to confine the feet of prisoners, in a manner similar to the confinement of the hands in handcuffs. See STOCKS.

BILCOCK, in *Ornithology*, one of the synonymous English names of *Rallus aquaticus*, or water-rail.

BILDERWERTSCHEN, in *Geography*, a town of Prussia, in the province of Lithuania, 4 miles W.N.W. of Stalluponen.

BILDESTON. See BILSTON.

BILDGE, or BILGE of a *Ship*, denotes the bottom of her floor; or the breadth of that part which she rests on, when she is a-ground.

Hence, when a ship receives a fracture in this place, by striking on a rock, or otherwise, she is said to be *bilged*, or *bilged*.

BILGE-WATER, is that which, by reason of the flatness of the ship's bottom, lies on her floor, and cannot go to the well of the pump. This water is always, if the ship does not leak, of a dirty colour, and disagreeable smell.

The Dutch, whose ships are often of this form, use a sort of pumps, called “bildge-pumps,” or, as we call them “burr-pumps,” to carry off the bildge-water.

BILE, in *Physiology*, is the fluid prepared from the blood by the liver of animals. The colour of healthy bile in the human subject is probably of a deep yellow brown. In oxen, it is frequently of a yellowish green. In the gall bladder, it is of a thickish consistence, of an unctuous feel, or like that of mucus, of a bitter taste, and peculiar smell. Its specific gravity is about 1.027. It readily mixes with water, but will not incorporate with oil, yet it takes grease out of cloths. Albumen may be precipitated from it by alcohol and acids; and Cadet ascertained its proportion in 100 parts of ox bile to be about 0.52. (Cadet, Mem. Par. 1767.) If a solution of bile in muriatic acid be concentrated by heat, a copious precipitate takes place, and the solution changes its colour from a
grass

grate green to a brown. This precipitate has the properties of a resin. From 100 parts of bile, 1.87 of crystallized soda has been obtained, and some was probably lost in the process. Cadet also obtained from bile a salt of a sweetish taste. There are other substances found in bile in small quantities: sulphuretted hydrogen gas, which is emitted on the addition of muriatic acid; a little muriate of soda, phosphate of lime, and phosphate of soda and of iron. Of course water is the vehicle for all these substances, and forms the largest share of the ingredients in the composition of bile. For an account of the secretion of bile, see the article LIVER, *functions of*.

BILE, in Chemistry. This fluid may justly be considered as equally important to the chemist as to the physiologist; and accordingly it has been examined with extreme minuteness by a great number of eminent chemists, in various countries, with a general parity of result which is highly satisfactory. Indeed the analysis of bile, as far as relates to the detection of its leading constituent parts, is neither very complicated nor remarkably difficult.

Chemists have not been able to detect any considerable difference between the bile immediately secreted from the liver, and that which is found in the gall-bladder, excepting that the latter appears on the whole to be somewhat less watery, more bitter and more viscid than the former. The age of the animal makes a greater difference, the bile or gall of oxen being more viscid than that of calves. On account of the ease with which ox-gall is procured in considerable quantity, this has generally been selected for experiment; but its analysis does not essentially differ from that of the bile of any other animal.

Bile is a homogeneous fluid, in some animals of a deep yellowish brown, in others of various shades of green, so viscid as not to pour by drops; of a peculiar faint smell, but not ungrateful when fresh, and not from a diseased animal; intensely bitter to the taste, even when very largely diluted with water, and somewhat pungent. It is considerably heavier than water; its specific gravity being from about 1.02 to 1.025, varying according to the age and health of the animal, and probably to the time that it has remained within the gall-bladder. When agitated, bile lathers like soap water.

When bile is gently heated, an aqueous vapour arises, which, when condensed, appears by the most delicate reagents to be nothing but water, strongly impregnated however with the odorous part of this fluid, and somewhat fetid. Bile loses about seven eighths of its bulk of mere water by this evaporation; and the residue gradually thickens into the consistence of a tenacious extract, which, on carefully drying, becomes a hard brittle shining resin-like mass, of a dark colour, and intensely bitter.

If this extract of bile be slowly heated in a retort to decomposition, the products are, a watery fluid fetid with sulphuretted hydrogen gas, a brown fetid liquor containing ammonia, a tenacious stinking empyreumatic oil, with more carbonated ammonia, and a copious emission of carbonic acid, and carburetted with sulphuretted hydrogen. The mass in the retort swells up prodigiously in the process, and leaves a puffy coal easy to incinerate, the ashes of which contain a notable quantity of carbonated soda, with some muriated soda, phosphate of soda and lime, and a little iron. Fontana obtained from a pound of ox-gall 43 grains of carbonated soda, and 6 grains of common salt.

The residue, therefore, of calcined bile contains alkali in excess; and hence water, with which it has been lixiviated, readily turns syrup of violets green. The same test of an

alkali is given with fresh bile, diluted with water, that the change of colour may be more apparent.

The action of acids on bile throws much light on its composition. Muriatic acid, strong or dilute, added to bile, immediately produces a coagulation, and, at the same time, renders the whole liquor of a fine light green. The coagulum, however, is partly redissolved, if the acid is concentrated. Examined chemically, it is found to be albumen, but intensely bitter. In the clear green liquor, though retaining the muriatic acid, the bitter taste also strongly predominates. Evaporated slowly, it deposits in about an hour's time another precipitate, very green, intensely bitter, and soft and tenacious like turpentine. The clear liquor is now yellowish, and, on further evaporation, yields a number of cubical crystals of muriated soda, formed chiefly, if not entirely, by the soda originally contained in the bile and the acid added. As a proof that this is the case, if the experiment is made with nitrous or sulphuric acid, instead of the muriatic, the salt will be nitrated or sulphated soda. The above decomposition is more perfect, if bile and dilute muriatic acid are at first boiled together for a few minutes; the result then is a total separation of a dark green glutinous bitter mass, and a liquid now colourless and scarcely bitter, from which the muriated soda may be procured by evaporation.

This glutinous coagulum, when dry, burns like a resin. Alcohol heated upon it dissolves one part, and leaves another untouched, thus entirely separating it into two distinct principles: the insoluble, which is albumen; and the soluble, which retains the colour and taste of bile, is totally precipitated from the spirit by water, is highly inflammable, insoluble in water, and has been considered as a species of resin or concrete oil, and is termed by some the *resin of bile*. Fourcroy, however, supposes it to be more of the nature of *adipocire*.

Alcohol alone is another important re-agent for the analysis of bile. When these two fluids are mixed together, a coagulum is immediately formed of a whitish tenacious substance, scarcely bitter when well washed, and exhibiting all the properties of albumen. The remaining liquor is green, and contains, mixed with the alcohol, the resinous, saline, and colouring matter of the bile. Alcohol equally separates albumen from bile, inspissated by evaporation, and dissolves the remainder. The alcoholic solution of bile, not previously treated by an acid, differs considerably from that which has undergone this treatment. In the latter case, as before mentioned, the solution is decomposable by mere water, and by evaporation is converted into a very resinous product. In the former case, the solution mixes uniformly with water, yields by evaporation a transparent extract like gum-arabic, of a sweetish taste, a little mixed with the natural bitterness of bile, and easily soluble in water. The reason of this difference is doubtless owing to the separation of the soda from the resin of bile by the oxyd in one instance, whereas in the other they remain united in the form of a natural soap. Hence it is that the affusion of an acid upon the latter alcoholic solution decomposes it, and separates an unctuous substance, which again dissolved in alcohol is *now* precipitable from this solvent by simple water, and resembles a pure resinous solution.

Some chemists have thought that they could also detect a saccharine matter in bile, but the experiments to this purpose are not conclusive.

The oxygenized muriatic acid gas passed through bile diluted with a little water, soon destroys its yellow green colour, and precipitates the albumen in white flocculi; the saponaceous

resin continues in solution without colour or smell; but the bitterness remains. A further quantity of this acid separates the resinous oil as the muriatic acid does, but white and concrete. Any acid poured upon bile already bleached by the oxymuriatic acid, separates unctuous white concrete matter much resembling *adipocire*, but the precise nature of the change produced by the oxymuriatic acid has not been properly ascertained.

Bile therefore may be inferred from the present state of chemical analysis to contain,

1. A large proportion of water,
2. A substance closely resembling animal albumen.
3. A peculiar resinous inflammable matter, naturally and intimately with
4. Soda, into a kind of soap, or saponaceous extract.
5. Some neutral salts.
6. A small quantity of oxyd of iron.

Besides these constituents, there is a colouring and odorant matter, but it is not yet ascertained whether these are properties of any of the above-mentioned ingredients, or whether they belong to a peculiar substance.

Some chemists have also supposed a kind of saccharine mucilage, resembling the sugar of milk, but the existence of this, in recent unaltered bile, is very doubtful.

Bile has been supposed to be a powerful antiseptic, and its effects in the animal economy have been attributed to this quality, but without much foundation. Bile, left to itself in a moderate temperature soon becomes putrid (though not so speedily as blood); it then exhales a very fetid odour, but after this point it decomposes but very slowly, and at last assumes a strong, not very unpleasant mulky smell. This partial resistance to putrefaction is probably owing to the resinous ingredient, which last, when separated by acids and alcohol, in the way already mentioned, is absolutely incapable of putrefaction. M. Cadet asserts, that at no time during this process is any acid generated.

The *saponaceous* quality of bile, which is very characteristic, and is owing to the intimate union of its resin with soda, renders it miscible with milk, with oil, myrrh, aloe, and other gum-resins, by trituration, without curling, or ready decomposition. It is also owing to an intimate mixture with this natural soap that the albumen which bile contains is not coagulable by heat; even if an additional quantity of albumen (white of egg for example) is mixed with bile, heat will not coagulate it. Hence too, alcohol on y part ally separates the albumen, unless an acid is previously applied to engage the soda, and the alcoholic solution of the resin retains the soda so as to render the resin not separable by mere water.

Bile, or ox-gall, is employed in various ways as a cleanser of wool, cloth, &c. to get out grease-spots, to take off the greasiness of ivory in preparing it for receiving colours; and in China it is mixed with some of their varnishes. Gall a little putrid may be preserved a long time from further alteration by being boiled for a few minutes.

M. Fourcroy asserts, that he has obtained a substance, resembling bile in every property, by mixing blood with a third of water, coagulating it by heat, and slowly evaporating the serum. This experiment has, however, been repeated by others without success. See Cadet in the Mem. de l'Acad. des Sciences, for 1767 and 1769. Van Bochante, Professor at Louvian, in the Jour. de Phys. tom. 13. Suppl. An. Chim. tom. 4, 5, and 6. Fourcroy Systeme de Conn. Chim. &c.

BILE, in *Medicine*, a yellowish-green fluid, more or less viscid, and of a bitter taste, secreted in the liver, and conveyed from

that viscus, by the so called *ductus communis choledochus*, into the duodenum. It is a very compound fluid, being resolved by chemical analysis into a variety of ingredients: such as water, albumen, resin, soda, muriate of soda, phosphate of soda, phosphate of lime and iron, besides a sweetish matter analogous to sugar of milk. In its general properties, it may be said to partake of the nature of a soap, although it will not intimately mix with oil. The cystic bile, or that which is contained in the gall bladder, possesses more viscosity and bitterness, (i. e. is more concentrated) than that which flows directly from the biliary ducts into the duodenum, and which is termed hepatic bile.

When we see an organ of such magnitude as the liver, appropriated to the secretion of the bile, we are naturally led to infer that the fluid so secreted, must answer some useful purposes in the animal economy; but respecting the number and kind of purposes which it answers, physiologists do not exactly agree. It may, perhaps, concur with the pancreatic juice, to the separation of the refuse part of the alimentary pulp (chyme) from the proper chyle; but, as Dr. G. Fordyce has remarked, in his treatise on the digestion of food, the bile does not unite with the chyle itself, and pass along with it, through the lacteals into the blood. Mixed with the feculent matter, and colouring it, the bile seems to prevent that matter from running into fermentation, by virtue of its alkaline nature; and perhaps, also, in consequence of the bitter principle which it contains, it may, in some degree, resist putrefaction; but its principal and most obvious use is, as a stimulus to the intestines, serving to keep up a due degree of peristaltic action, and thereby to produce a regular and natural evacuation of their contents. Hence a diminished secretion, or obstructed passage of the bile, is always accompanied with costiveness.

From this view of the nature and composition of the biliary secretion, and of its action upon the living body in a state of health; we proceed to the consideration of its morbid conditions, which may be reduced to four heads; viz.

1. *Deficiency.* 2. *Obstruction.* 3. *Excess.* 4. *Vitiation.*
 1. *A deficiency of Bile.* This is known by a pale and languid habit of body, indigestion, flatulency, acidity, costiveness, and pale or clay-coloured stools. It is occasioned by a sedentary mode of life, by intemperance, and by depressing passions of the mind. It occurs in chlorosis, hypochondriasis, and chronic hepatitis. (See what is said of these diseases under their respective titles.) To whatsoever cause it may be owing, it is always attended with indigestion and costiveness; two symptoms which should be especially attended to in the cure. A well regulated diet should be prescribed, wherein spirituous drinks, high-seasoned meats, flatulent vegetables, and crude and acid fruits, should be forbidden. Much stress should at the same time be laid on a plan of regular exercise; and the injurious effects of cold and damp upon the gastric and hepatic systems, should be counteracted by suitable cloathing. As a further aid to digestion bitters and chalybeates (especially the chalybeate mineral waters), should be prescribed; and costiveness should be remedied by occasional doses of rhubarb, neutral salts, and aloetics; and sometimes by the stronger cathartics. Acidity should be counteracted by alkalies, among which soda or natron præparatum answers best. Where the diminished secretion of bile has appeared to be connected with a diseased structure of the liver, and particularly where such a change of structure has arisen from inflammation, mercury (Dr. Saunders observes), has been found useful, even carried to the degree of producing a slight salivation; moderating the violence, however, of its operations by plentiful dilution,

with gum arabic, and other vegetable demulcents. In these cases, the same author has found a tepid bath, of 90 degrees of Fahrenheit, to produce manifest good effects.

2. *Obstruction of Bile.* After it is secreted, the bile is sometimes prevented from passing into the duodenum. This may happen from various causes; viz. from an obliteration of the cavities of the biliary ducts, either by a thickening of their coats, or by a tuberculous state of the liver, the consequences of inflammation; from pressure produced by enlargements of the neighbouring parts; and from a too viscid and consistent state of the bile itself; but, more than all, from gall-stones impacted in the common duct. Whenever in any of these ways, the bile, after being secreted, is hindered from passing into the duodenum, it is either taken into the circulating system by what is termed *regurgitation*, or by absorption; producing great languor and oppression, together with a yellowness of the skin, and tunica conjunctiva of the eyes, &c. i. e. giving rise to *jaundice*. (See GALL-STONES and JAUNDICE.) The treatment must be varied, according to the variety of conditions on which the obstruction depends. In this place, it will be sufficient to remark, that saline purgatives, mercurials, saponaceous and alkaline medicines, with tepid dilution, and warm bathing, will be found suited to the majority of these cases.

3. *Excess, or redundancy of Bile*, is a morbid affection, of very frequent occurrence. Among its exciting causes may be mentioned intemperance in living, the summer and autumnal heats of our own latitudes, and more especially the high temperatures of the tropical climates; in a word, whatever produces a hurried circulation, or irritates the vascular and secreting system of the liver. A redundancy of bile makes itself known by "a general languor of the body, together with nausea, foul tongue, loss of appetite, and indigestion: or, by being directed to the intestines, excites a painful diarrhoea, ultimately tending to weaken their tone, and disturb their regular peristaltic motion. It generally happens, that, during the excess and prevalence of bile in the first passages, some absorption of it takes place into the habit, so that the skin becomes yellow, and the urine is sensibly impregnated with it. The pulse is quicker than natural, and there is a considerable degree of thirst, with an increase of heat; the usual symptoms of fever. The body becomes emaciated, and the general aspect of the patient is extremely unhealthy." It may be added, that most of the fevers of hot climates, whether intermittent, remittent, or continued, are accompanied by an overflow of bile. (See FEVERS.) When the increased secretion of bile affects the stomach and bowels in such manner as to excite both vomiting and purging to a violent degree, it gives rise to that form of disease which is termed *cholera*; of which a particular description will be found under that title; when it produces vomiting, joined with constipation and acute pains about the umbilical region, the disease is termed *bilious colic* (see COLIC); and lastly, when the evacuation of bile is frequent and copious by stool only, without frequent vomiting, it constitutes *bilious diarrhoea*. (See DIARRHOEA.) It is the remark of that judicious writer, to whose work we have more than once referred in this account of bilious disorders, that it is more difficult to supply a deficiency of bile, than to carry off its excess. In fact, little more is required for the fulfilment of this last intention, than to promote the discharge of the redundant bile by gentle saline evacuants, (for the bile has generally of itself a purgative tendency), and to prevent fresh accumulations, by diluting freely with water heated to a proper temperature. For this purpose, the patient should drink every morning (according to the excellent directions of Dr. Saunders), from half a pint to a pint of

water, of a temperature from 50° to 114° of Fahrenheit's thermometer, and use moderate exercise before breakfast. With the same view; the Bath and Buxton waters, (provided their use be not contra-indicated by visceral disease), and the Cheltenham water also may be recommended. At the same time, a proper diet should be prescribed, consisting of food that is easy of digestion, not over-stimulating, and free from flatulency; and spirituous drinks and malt liquors should be forbidden. Pastry is particularly improper. Water, or wine and water, will be the best beverage. When the bile has been sufficiently evacuated, bitters and chalybeates may be given with advantage. But where these complaints are the consequence of residing in the tropical regions, the only effectual remedy is to remove to a temperate climate. People, who have suffered in these respects from the heat of climate, and to whom it is necessary to return to this country for the recovery of their health, should endeavour (as Dr. Lind has suggested), to arrive in the beginning of summer, as they will find the winters of Great Britain, on their first arrival, too piercing and severe for their constitutions.

4. *Vitiation of the Bile.* In almost all cases wherein the secretion of bile exceeds the natural quantity, it is at the same time vitiated in its quality. Thus in bilious fevers, bilious diarrhoeas, bilious colic, and cholera morbus, it is often vitiated both in colour and taste, appearing wholly of a pure green colour, and possessing a sharpness or acidity which sets the teeth on edge, and produces a burning and corroding sensation in the stomach, oesophagus and fauces, and at the same time violent twitchings in the intestinal canal. Such vitiations of the bile are common to infants, as well as to adults. The remedial treatment consists in evacuating the offending biles by the means specified under the preceding division (3), and correcting its vitiated qualities by the employment of alkalies, and by copious dilution with aqueous and mucilaginous liquors. After due evacuations, the stomach and bowels may be protected from the irritating action of the remaining bile by opiate medicines. Lind, Clark, Winterbottom, and other writers on the diseases of hot climates, may be referred to for many excellent observations on bilious disorders; but the best and most comprehensive treatise on this subject is that of Dr. Saunders.

BILEDGIK, in *Geography*, a town of Asiatic Turkey, in the province of Natolia, 32 miles N.W. of Erki-Shehr.

BILEDULGERID, a country of Africa, comprehending, according to some geographers, the southern part of Algiers, together with the whole tract of land that lies in this direction between the Atlantic ocean and Egypt, and in this extent, including eight large tracts or provinces, viz. Barca, Biledulgerid proper, Segelmessa, or Sijlmissa, Tasslet, Tigoarin, Zeb or Zab, Darka or Darah, and Tessel, beside several inferior districts, mentioned under the names of Oguela, or Augela, Fassan or Fenzan, and Gadamis or Gadamis, &c. It was known to the ancients under the name of *Numidia*. But in a more confined and proper sense, according to the arrangement of De Lisle, and several modern geographers, Biledulgerid includes that tract of land which lies south of Algiers and Tunis, and is bounded on the east by a ridge of lofty mountains, which separates it from Tripoli and part of Gadamis, on the west by the countries of Zibard Mezzab, and on the south by the province of Verghela, or Weigela. Its dimensions are not accurately ascertained; but it is somewhat of a square form, supposed to extend about 60 or 80 leagues every way, or from about 31° 15' to 34° 15' N. lat.; and from 5° 30' to 10° E. long. Some have derived the appellation Biledulgerid from *Beld el gerid*, or the "land of dates," under which denomination it is distinguished in Rennell's map of North Africa; but others, with

Dr. Shaw, deduce it from *Blaid el Jeride*, or the "dry country." The whole province of Biledulgerid, bordering to the south on Sahara, or the Great Desert, is mountainous, sandy, and barren, producing little or no sustenance but dates, which grow in such abundance, that various parts of it are covered with palm-trees bearing this fruit. The climate is hot and unhealthy; the people are meagre, swarthy, and shrivelled in their complexions, and their eyes are inflamed by the reflection of the sun-beams, from the white hard soil, and by clouds of dust and sand driven by the high winds at some seasons in such abundance, as to bury men and cattle under their collected masses. They are also subject to a scorbutic complaint, of which they can assign no probable cause, but so inveterate, that their teeth drop out, and their bodies become loathsome. In other respects they are healthy and vigorous, and live without sickness or disease to a great age. The plague of Barbary is scarcely ever heard of in this province, notwithstanding the contiguity of the two countries, and the frequent intercourse of their inhabitants. Biledulgerid, properly so called, has few rivers and towns. The natives of Biledulgerid are represented as a lewd, treacherous, thievish, and savage people, that delight in murder, blood, and rapine. They are, in general, a mixture of old Africans and wild Arabs; the former of whom lived with some degree of regularity and civil order, in a kind of villages composed of a number of little huts, whilst the latter inhabited moveable tents, and ranged from place to place in quest of food and plunder. These Arabs value themselves on their superiority with regard to birth and talents above the primitive inhabitants; and whilst they are wholly independent and free, they occasionally hire themselves to serve in the wars of the neighbouring princes, and hence arises the chief part of their public revenue; the rest pursue no other occupations besides plundering and hunting, and particularly hunting ostriches, the flesh of which they dress for food, and the feathers they barter for corn, pulse, and other necessaries. The other parts of these birds they use in their religious rites, as ornaments of dress, or as pouches and knapsacks. Besides dates and ostriches, they likewise subsist on the flesh of goats and camels; and for their drink, they use either the broth in which the flesh is boiled, or the milk of their camels, for they seldom taste water, which is not only scarce, but brackish and unwholesome. For the character and manners of those who inhabit that part of Biledulgerid, taken in its former extent, and bordering on the Atlantic ocean; see **MONSELEMINES** and **MONGEARTS**.

BILEFELD. See **BIELFELD**.

BILGE. See **BILDGE**.

BILGUER, **JOHN ULRICK**, in *Biography*, born at Coire, in the country of the Grisons, in Swisserland; after passing through the usual course of education, practised surgery at Berlin, where he soon acquired such reputation, as to engage the attention of king Frederic the Great, who made him surgeon to one of his regiments, and, in progression, surgeon-general to the Prussian army. In the course of an extensive practice in this post, he had an opportunity of observing how very small a proportion of the men recovered from fractures, where the lost parts were greatly bruised, and the bones shattered, when the limb had been amputated, which in such cases was the general practice. This induced him to try more lenient methods, which he practised with such success, as to enable him to reduce the cases in which amputation should be declared to be necessary to a very small number. In 1761, he was admitted to the degree of doctor in medicine, by the university of Hall, in Saxony, when he read for his thesis "De membrorum amputatione

rarissime administranda, aut quasi abroganda." This work was translated into French, and highly commended by Tissot, then in the zenith of his reputation, which gave the work such credit, and so quick a circulation, that it was soon naturalized in every country of Europe, and its diffusion has been attended with the most beneficial consequences. The methods recommended by the author for preserving fractured limbs, even in cases that have been before thought hopeless, succeeded so often, as very much to diminish the frequency of the operation. He also published at Glogau, in 1763, "Instructions for Surgeons of Hospitals," in German. In this work, he further defends and illustrates the doctrine contained in the thesis. In cases where amputation cannot be avoided, he advises leaving a portion of the integuments, a practice now become general. There are also other works published by this author on the practice of surgery, for the titles and accounts of which, see Haller's *Bib. Chirurg. Eloy. Dict. Hist.*

BILGHY, in *Geography*, a town of Hindoostan, in the Myfore country, and in that district ceded to Britain in 1799, 58 miles W.S.W. from Harponully, and 35 N.N.W. from Bednore. N. lat. 14° 8'. E. long. 74° 50'.

BILIARY Calculi. Some of the concretions found in the gall bladder or ducts, and which are generally of an oval form, are composed of a white substance like spermaceti, crystallized in brilliant plates or stræ. These concretions float in water, and are inflammable. They dissolve in heated alcohol, in oil of turpentine, and in alkalies; in the latter case, the solution has the properties of a soap.

Other biliary concretions are of a polygonal form, and generally very numerous; they are of a brownish colour, and are formed of concentric layers, of a substance resembling inspissated bile.

In some biliary concretions, there is a mixture of both the substances above described.

There are also sometimes found in the gall bladder dark-coloured small brittle concretions, which are insoluble in alcohol, or oil of turpentine, and which are not inflammable. (See **GALL-STONES**.) For a detail of experiments relative to Bile and these calculi, consult Cadet, *Mem. Par.* 1797. Fourcroy, *Ann. de Chimie*. Gren & Vauquelin, *ibid.* Ramsay in the *Theaur. Med. Edin.* and MacLurg. See **CALCULI, Biliary**.

BILIARII Pori, the excretory ducts of the liver, now commonly termed *vasa biliaria*. See **LIVER**.

BILICH, a town of Siberia, 8 miles S.E. of Vercholenst.

BILIHAN, a town of Persia, in the province of Irac, 100 miles S.S.W. of Amadan.

BILIKOWKN, a town of Poland, in the palatinate of Kiev, 50 miles west of Kiev.

BILIMBI, in *Botany*, a species of the *Averrhoa* (see **AVERRHOA**); which is carefully cultivated in the gardens of the East Indies, where it flowers throughout the year. The juice of the root is drank as a cure for fevers. The leaves boiled, and made into a cataplasm with rice, are famed in all sorts of tumors, and the juice of the fruit is used in almost all external heats, dipping linen rags in it, and applying them to the parts. It is drank, mixed with arrack, to cure diarrhœas; and the dried leaves, mixed with betel leaves, and given in arrack, are said to promote delivery. The fruit is pleasant to the taste when fully ripe, and is commonly eaten; when smaller, and unripe, it makes a very pleasant pickle.

BILIN, in *Geography*, a town of Bohemia, in the circle of Leitmeritz, 14 miles west of Leitmeritz. This place has a fine citadel, and a spring of acid water; and holds annual fairs.

BILINEATA, in *Entomology*, a species of **LEPTURA**, of a blackish-brown, with two lines on the thorax, and scattered dots on the wing-cafes yellowish. Scopoli, Gmelin. Inhabits Carniola.

BILINEATA, a species of **CANTHARIS**, with a yellow thorax, with a spot, and four brown dots: wing-cafes yellow, with a fuscous line. Thunberg, &c. This is a native of the cape of Good Hope.

BILINEATA, a species of **CHRYSOMELA**, that inhabits Scandinavia. It is green, glossed with gold; anterior part of the thorax excavated; and a double blue line on the wing-cafes. Gmelin.

BILINEATA, a species of **PHALÆNA** (*Geometra*), with yellowish testaceous wings, waved with a broad stripe across, having a brown and a white margin. Linn. Fr. Succ. &c. A very common insect in hedges during the summer months; and is called in England sometimes the *elm moth*.

BILINEATA, a species of **PHRYGANEÆ**, of a blackish colour, with brown wings, and two white lines on each margin. Inhabits the north of Europe.

BILINEATUM, in *Conchology*, a species of **BUCCINUM**, described by Lister. The shell is transversely striated; spire obtuse; the whorls with a spotted band and two lines. Its native country is unknown.

BILINEATUM, in *Entomology*, a species of **PHALANGIUM**, of a pale colour, with two dorsal lines and black dots. Fabricius. Inhabits Norway.

BILINEATUS, a species of **CURCULIO**. This insect is brown, with two white lines on the wing-cafes. Inhabits Germany.

BILINEATUS, a species of **CERAMBYX** (*Prionus*), with crenated thorax, marked with two white-lines; wing-cafes ferruginous, speckled with white, and bordered with yellow. Inhabits America. Fabricius, &c.

BILINEATUS, a species of **CRYPTOCEPHALUS**, of a minute size, that is found in Europe. This insect is black, with two yellowish lines on the wing-cafes, and ferruginous legs. Gmelin. A native of Europe, and described by Linnæus as *chrysomela bilineata*.

BILINEATUS, a species of **ICHNEUMON**. It is black, with two yellow lines in front; abdomen depressed; legs red; tips of the posterior ones brown. Linn. Mus. Lesh.

BILINEATUS, in *Insectology*, a species of **PLEURONECTES**, found in China. It is thin, long, above yellow, with a brown margin; beneath reddish-white; entirely covered with very small scales. This is specifically distinguished by having the lateral line double. Bloch.

BILINEATUS, in *Zoology*, a species of **COLUBER**, of a rufous colour, with two yellowish stripes: *la double-raie* of count de Ceppe, and *bilineated snake* of Dr. Shaw. This kind, according to the former writer, measures two feet one inch in length, of which the tail is six inches and a half; colour rufous, each scale bordered with yellow; and from the back of the head are two bright golden-yellow stripes extending to the end of the tail; scales on the head large, those on the body smooth; native country unknown; abdominal scuta 205, subcaudal scales 99.

BILINGUIS, in *Law*. See **MEDISTAS Lingue**.

BILINGUIS, properly denotes a person who has two tongues in his mouth; an instance of which is given by Doleus. It is also used for a person who speaks two languages.

BILIOUS Complexion. See **COMPLEXION**, and **TEMPERAMENT**.

BILIOUS Colic. See **COLIC**.

BILIOUS Diarrhœa. See **DIARRHœA**.

VOL. IV.

BILIOUS Fever. See **FEVER**.

BILIRIANS, in *Geography*, a denomination given to a class of inhabitants of the southern parts of Russia. In their origin they are Sarmates, who settled in their present habitations, and now exist under the name of Tschuvatches. See **BOLGARIANS**.

BILITZ, a town of Silesia, in the principality of Teschen, separated from Biala by the river of the same name, and at a small distance from it. N. lat. 49° 51'. E. long. 19 6'.

BILIZIN, a town of Poland, in the palatinate of Novogrodek, about 18 miles N.E. of Novogrodek. N. lat. 53° 55'. E. long. 25° 45'.

BILL, in *Agriculture*, denotes an edge-tool, of the ax kind, with a hooked point, fitted to a handle, and used to lop boughs of trees, &c. When short, it is called a "hand-bill;" when long, a "hedge-bill."

BILL, in *Common Language*, denotes a written or printed paper posted up in some public place, for the purpose of advertising the sale of any merchandize, ship, &c. or the sailing of any vessel, &c.

BILL is also used among tradesmen and workmen for an account of goods sold and delivered, or of work done, with the charge annexed.

BILL, in *Commerce*, denotes a security for money under the hand, and sometimes seal of the debtor, without any condition or forfeiture, in case of non-performance.—In which it is distinguished from a bond or obligation. See **BOND**.

It has been usually defined a writing, wherein one man is bound to another to pay a sum of money, on a day that is future, or presently on demand, according to the agreement of the parties at the time when it is drawn, and the dealings between them.

BILL, in *Law*, denotes a declaration in writing, expressing a wrong or grievance, which the complainant hath suffered by the party complained of; or else some offence committed by him against some law or statute of the realm. This bill is commonly addressed to the lord chancellor, especially for unconscionable wrongs done to the complainant; and sometimes to others having jurisdiction, according as the law directs. It contains the fact complained of, the damages sustained, and the petition of process against the defendant for redress. This is used as well in criminal as in civil matters. In criminal cases, when the grand jury upon a presentment or indictment find the same to be true, they indorse on it "billa vera;" upon which the offender is said to stand indicted of the crime, and is bound to make answer to it; and if the crime touch the life of the person indicted, it is then referred to the jury of life or death, viz. the petty jury, by whom, if he be found guilty, then he shall stand convicted of the crime, and is by the judge condemned to death.

Many of the proceedings in the king's bench are by bill; it is the ancient form of proceeding, and was, and yet should be, filed in parchment, in all suits, not by original. The declaration is a transcript of it, or supposed to be. See **AMENDMENT**.

In Scots law, every summary application in writing, by way of petition to the court of session, is called a "bill."

BILL of Appeal. See **APPEAL**.

BILL of Attainder. See **ATTAINDER**.

BILL, Cross. See **CROSS-BILL**, and **SUIT in Equity**.

BILL in Equity, is a kind of petition addressed to the lord chancellor, with which a suit in chancery commences. This, in the nature of a declaration at common law, or a bill and allegation in the spiritual courts, sets forth the circumstances of the case at length, "in consideration of which," (to this is the usual language of the bill) "and for that your orator

is wholly without remedy at the common law," relief is therefore prayed at the chancellor's hands, and also process of subpoena against the defendant, to compel him to answer upon oath to all the matter charged in the bill. See *SUIT in Equity*.

BILL of Exception to Evidence. See *EXCEPTION*.

BILL of Exchange, in Commerce and Law, a short note, or writing, ordering the payment of a sum of money in one place, to some person assigned by the drawer, or remitter, in consideration of the like value paid to him in another place. (See *REMITTANCE*.) Or, it is an open letter of request from one man to another, desiring him to pay a sum of money named in it to a third person on his account, or to any other to whom that third person shall order it to be paid; or it may be made payable to bearer. This kind of negotiable security for money, invented among merchants in different countries, serves to facilitate the remittance of money from the one to the other, and of course the conduct of commercial transactions; so that, since its first introduction, it has extended itself to almost all pecuniary negotiations.

Bills of exchange were unknown in the ancient Roman commerce, as well as jurisprudence. According to the common opinion, they are said to have been brought into general use by the Jews and Lombards, when banished for their usury and other vices; who found means to withdraw their effects, which they had lodged in the hands of friends, both in France and England, by secret letters and bills conceived in short precise terms, like the modern bills of exchange, which they negotiated by the assistance of merchants and travellers. The Jews were banished out of France by Philip Augustus, in 1143, and out of England, in 1290; but the use of paper credit was introduced in the Mogul empire in China, in 1236. It further appears, that bills of exchange were negotiated at Hamburgh, in 1188; and it has been said, that the faction of the Gibellins, being expelled Italy by the Guelphs, towards the close of the 13th century, retired to Amsterdam, and used the same means for the recovery of their effects in Italy as the Jews had done; and hence, as some have thought, the Dutch merchants took the hint of negotiating bills of exchange, and soon spread the practice throughout Europe. The same Gibellins are said to be the inventors of the re-change, or re-exchange, on account of damages, charges, and interest, when bills of exchange, which they called "polizzo di cambio," are not paid, but returned on protest. In 1307, bills of exchange seem to have been in use in England, though their nature was not well understood at a much later period; and the first reference to them in an act of parliament, occurs in 1381, when they were forbidden to be used without the king's licence. In 1394, an ordinance was issued by the city of Barcelona, that bills of exchange should be accepted within twenty-four hours after they were presented, and that the acceptance should be written on the back of the bill. Moreover, in 1404, the magistrates of Bruges requested those of Barcelona to inform them what was the common practice, in regard to bills of exchange, when the person who presented a bill raised money on it in an unusual manner, in the case of its not being paid, and by these means increased the expences so much, that the drawer would not consent to sustain the loss. The term of the bill, such as is now used, is seen in the memorial, which also speaks of usance; and it also appears, that first and second bills were at that time drawn, and that when bills were not accepted, it was customary to protest them. Anderson's Hist. Com. vol. i. Beckman's Hist. of Invent. vol. iii. p. 462.

In common speech, a bill of exchange is frequently called a "draught;" but the former is the more legal, as well as

mercantile expression. The person who makes or draws the bill is called the "drawer," and he to whom it is addressed is denominated the "drawee;" and when he undertakes to pay the amount, he is called the "acceptor." The person to whom it is ordered to be paid is called the "payee;" and if he appoint another to receive the money, this other is called the "indorsee," as the payee is, with respect to him, the "indorser;" and any one who happens for the time to be in possession of the bill is called the "holder" of it. The time at which the payment is limited to be made is various, according to the circumstances of the parties, and the distance of their respective places of residence. Sometimes the amount is made payable at sight; sometimes at so many days after sight; at other times at a certain interval from the date. See *USANCE*.

Where the time of payment is limited by months, it must be computed by calendar, not lunar months; and where one month is longer than the succeeding, it is a rule not to go in the computation into a third. Thus on a bill dated the 28th, 29th, 30th, or 31st of January, and payable one month after date, the time expires on the 28th of February, in common years, and in the three latter cases, in leap year, on the 29th; to which are to be added the "days of grace." Where a bill is payable at so many days after sight, or from the date, the day of presentment, or of the date, is excluded. Thus, where a bill payable 10 days after sight is presented on the first day of a month, the 10 days expire on the 11th; where it is dated the first, and payable 20 days after date, these expire on the 21st. (Ld. Raym. 281. Stra. 829.) It is a custom among merchants, that a person to whom a bill is addressed, shall be allowed a few days for payment, beyond the time mentioned in the bill, called "days of grace." In Great Britain and Ireland, three days are allowed; in other places more. If the last of these three days happens to be Sunday, the bill is to be paid on Saturday; but these days of grace are not allowed on bills payable at sight. If bills become due on Sunday, or on such holidays, when the law forbids business to be done, payment must be demanded or protest made for non-payment on the preceding day.

Bills of exchange are either "foreign" or "inland;" the first being those which pass from one country to another, and the latter such as pass between parties residing in the same country: and by the consent of merchants, certain customs are established with regard to foreign bills, which have been adopted as part of the law in every commercial state. Inland bills of exchange do not seem to have been very frequent in England before the reign of Charles II. (6 Mod. 29); and foreign bills were much more regarded by the law than inland ones, as being thought of more public concern in the advancement of commerce. But at length the legislature, by two statutes, viz. 9 & 10 W. 3. c. 17. and 3 & 4 Ann. c. 9. has set both sorts of bills nearly on the same footing; so that what was the law and custom of merchants, with regard to the one, is now, in most respects, the established law of the country, with regard to the other.

Promissory notes, or notes of hand, are a plain and direct engagement in writing to pay a sum specified at the time limited in it, to a person therein named, or to his order, or to the bearer at large. These notes were at first considered merely as evidence of a debt; and it was held that a promissory note was not assignable or indorsible, within the custom of merchants; and that if such a note had been indorsed or assigned over, the person to whom it was so indorsed or assigned, could not maintain an action within the custom against the drawer of the note; nor could even the person, to whom it was in the first instance made payable, bring such an action.

action. (1 Salk. 120. 2 L.J. Raym. 757, 9.) But at length the legislature took notice of them and put them upon the same footing with bills of exchange; by statute 3 & 4 Ann. c. 9. made perpetual by stat. 7 Ann. c. 25. § 3; which enacts that promissory notes, payable to order or bearer, may be assigned and indorsed, and action maintained on them, as on bills of exchange. By stats. 15 Geo. III. c. 51. and 17 Geo. III. c. 30. made perpetual by stat. 27 Geo. III. c. 16. all negotiable notes and bills for less than 20s. are declared to be null and void; and notes or bills between that sum and 5l. must be made payable within 21 days after date, must particularize the name and description of the payees, must bear date at the time and place in which they are made, must be attested by a subscribing witness, and the indorsement of them must be attended with the same strictness in all respects, and made before the notes or bills become due. The omission of any one of these regulations and formalities vacates the security, and is penal to him that utters it. Bills of exchange and promissory notes must now be drawn on stamped paper; and the stamp is proportioned under stat. 31 Geo. III. c. 25. 37 G. III. and 41 G. III. c. 10. to the amount of the bill from sixpence to three shillings for such as are payable on demand; and for those payable after date from one shilling to four shillings. If foreign bills are drawn here, the whole set must be stamped; but bills drawn abroad are not liable to any stamp duty.

As bills of exchange were first introduced for the convenience of commerce, it was formerly thought that they could neither be drawn nor negotiated by any person who was not actually a merchant; but it has been since decided, that any person capable of binding himself by a contract, may draw or accept, or negotiate a bill of exchange, and by stat. 3 & 4 Ann. c. 9. be a party to a promissory note. However, an infant cannot be sued on a bill of exchange, nor a feme-covert, except in such cases as she is allowed to act in as a feme-sole. If a bill is drawn on two joint traders, the acceptance of one binds the other, if it concern the joint trade; but it is otherwise, if the bill concern the acceptor only, in a distinct interest and respect. On the subject of procurator with regard to bills; see PROCURATOR.

A promissory note, when indorsed, begins to resemble a bill of exchange, for the indorser of the note corresponds to the drawer of the bill; the maker to the drawee or acceptor, and the indorsee to the payee; and this resemblance being fixed, the law is precisely the same in bills of exchange and promissory notes. It is now a decided point of law, that bills and notes made payable to bearer are equally transferable with those payable to order; and the transfer in both cases equally confers the right of action on the *bona fide* holder. But the mode of transfer is different; as bills and notes payable to bearer are transferred by mere delivery, the others by indorsement.

There are other bills and notes which differ from those already described, and which are securities for money, because they are considered as money itself. These are "Banker's notes," "Banker's cash-notes," and "drafts on Bankers," payable on demand. Bank-notes are regarded in ordinary transactions by common consent as cash, and they have the credit and currency of money to every effectual purpose, and seem to be as lawful a tender. (Stat. 5 W. & M. c. 20. § 28. 3 Term. Rep. 554.) Banker's cash-notes, and drafts on bankers, are considered among merchants as money, and received in payment as ready cash; and if the party receiving them do not, within a reasonable time, demand the money, he must bear the loss in case of the banker's failure. The precise time is not absolutely determined; but it is held most advisable to carry such drafts on

bankers, as are payable on demand, for payment on the day in which they are received, if the situation of the parties admit of it.

Bills of exchange and promissory notes, which, according to the general principles of law, are to be considered only as evidences of a simple contract, are however in one respect regarded as specialties, and on the same footing with bonds; for they are presumed, unless the contrary be shewn by the defendant, to have been made on a good consideration; nor is it incumbent on the plaintiff either to shew a consideration in his declaration, or to prove it at the trial.

Bills of exchange, and also notes, are assignable or negotiable without any fiction; and every person to whom they are transferred may maintain an action in his own name against any one, who has before him in the course of their negotiations rendered himself responsible for the payment of them. But the instrument, or writing, which constitutes a good bill or note, must have certain essential qualities. One of these is, that the bill or note should be for the payment of money *only*, and not for the payment of money *and* the doing of some other act. Another requisite quality is, that the instrument must carry with it a *personal* and certain credit, given to the drawer or maker, not confined to credit on any particular fund. But in the application of this principle, there is a material distinction between bills and notes. With regard to the former, where the fund is supposed to be in the hands of the drawee, the objection holds in its full force, not only because the productiveness of the fund is contingent and precarious, but because the credit is not given to the *person* of the drawer; but where the fund, on account of which the money is payable, either is in the hands of the drawer, or he is accountable for it, the objection will not hold, because the credit is personal to him, and the fund is only the consideration of his giving the bill. With respect to a note, if the drawer promise to pay out of a particular fund, then within his power, the note will be good under the statute; the payment does not depend on the circumstance of the fund's proving unproductive, or not, but there is an obligation upon his *personal* credit; the bare making of the note being an acknowledgment that he has money in his hands. Another essential quality of a good bill or note is, that it must be absolutely payable at all events, and not depend on any particular circumstances which may or may not happen in the common course of things. No precise form of words is necessary to make a bill of exchange or a note under the statute; any order, which cannot be complied with, or promise, which cannot be performed, without the payment of money, will make a good bill or note. As the words "value received," have been usually inserted in bills or notes, some doubt has occurred, whether they are essential. It is now understood, as a decided point, that these words are not necessary; for instruments of this kind are presumed to have been made on a valuable consideration; and therefore words, which import no more, cannot be essential. It has been queried, whether it be essential to the constitution of a bill of exchange, that it should contain words which render it negotiable, as "to order," or "to bearer;" and the point has not yet received a judicial decision. With regard to notes that have not these words, the person to whom they are made payable, may maintain an action on them, within the statute, against the maker. With regard to the acceptance of bills of exchange. See ACCEPTANCE. Forging the acceptance of any such bill, or the number or principal sum of any accountable receipt, is made felony by stat. 7 Geo. 2. c. 22.

The mode of transferring bills and notes is different according to the expressions which render them negotiable. Such as are payable to bearer, are transferred by de-

B I L L.

bearer; if payable to A. B. or bearer, they are payable to bearer, as if A. B. were not mentioned. But to the transfer of those payable to order, it is necessary, in addition to delivery, there should be something, by which the payee may appear to express his order. This additional circumstance is called an "indorsement." See **INDORSEMENT.**

By the very act of drawing a bill, the drawer comes under an implied engagement to the payee, and to every subsequent holder, fairly entitled to the possession, that the person on whom he draws is capable of binding himself by his acceptance; that he is to be found at the place where he is described to be, if that description be mentioned in the bill; that if the bill be duly presented to him, he will accept in writing on the bill itself, according to its tenor; and that he will pay it when it becomes due, if presented in proper time for that purpose. In default of any of these particulars, the drawer is liable to an action at the suit of any of the parties before-mentioned, on due diligence being exercised on their parts, not only for the payment of the original sum mentioned in the bill, but also in some cases for damages, interest, and costs; and he is equally answerable, whether the bill was drawn on his own account, or on that of a third person; for the holder of the bill is not to be affected by the circumstances that may exist between the drawer and another; the personal credit of the drawer being pledged for the due honour of the bill. If a man write his name on a blank piece of paper, and deliver it to another, with authority to draw on it a bill of exchange to any amount, at any distance of time, he renders himself liable to be called on as the drawer of any bill so formed by the person to whom he has given the authority. If acceptance be refused, and the bill returned, this is notice to the drawer of the refusal of the drawee; and then the period, when the debt of the former is to be considered as contracted, is the moment when he draws the bill; and an action may be immediately commenced against him, though the regular time of payment, according to the tenor of the bill, be not arrived; for the drawee, not having given credit, which was the ground of the contract, what the drawer had undertaken has not been performed. When a bill of exchange is indorsed by the person to whom it was made payable, as between the indorser and indorsee, it is a new bill of exchange; as it is also between every subsequent indorser and indorsee; the indorser, therefore, with respect to all the parties subsequent to him, stands in the place of the drawer, being a collateral security for the acceptance and payment of the bill by the drawee; his indorsement imposes on him the same engagement that the drawing of the bill does on the drawer; and the period when that engagement attaches, is the time of the indorsement. Nor will any thing discharge the indorser from his engagement, but the absolute payment of the money; not even a judgment recovered against the drawer or any previous indorser, neither is his engagement discharged by an ineffectual execution against the drawer, or any prior or subsequent indorser. The engagement of the drawer and indorsers depends on certain conditions to be performed by the holder of the bill, and without the performance of which he has no remedy against them.

When the payment of the bill is limited to a certain time after sight, the holder must present it for acceptance, otherwise the time of payment will never come. Although it has never been directly determined, whether the holder of a bill, payable at a certain time after date, be bound to present it for acceptance immediately on receiving it, or whether he may wait till it become due, and then present it for payment; yet in practice it often happens that a bill is negotiated and transferred through many hands, with-

out acceptance, and not presented to the drawee till the time of payment; and no objection is ever made on that account. If, however, on the holder presenting the bill for acceptance, this be refused, he is bound to give regular notice to all the preceding parties to whom he intends to resort for non-payment; and if, on account of the holder's delay, any loss be incurred by the failure of any of these parties, he must bear this loss. It is also the duty of the holder of a bill, whether accepted or not, to present it for payment within a limited time; otherwise the law will imply that payment has been made, and it would be prejudicial to commerce, if a bill might be produced to charge the drawer at any distance of time, when all accounts might be adjusted between him and the drawee. A presentment either for payment or acceptance must be made at reasonable hours, which are the common hours of business in the place where the party, to whom the bill is presented, resides. If acceptance or payment be refused, or the drawee of the bill, or the maker of the note, has become insolvent, or has absconded, notice from the holder himself must be given to the preceding parties, and in this notice it must be added, that the holder does not intend to give him credit. What may be considered as a reasonable time, within which notice should be given, either of non-acceptance or non-payment, has been subject to much doubt and uncertainty. It was once held, that a fortnight was a reasonable time; but that period is now much contracted. With respect to acceptance, it is usual to leave a bill for that purpose with the drawee till the next day; but if he, when called upon the next day, delay or refuse to accept according to the tenor of the bill, it is now an established rule, where the parties, to whom notice is to be given, reside at a different place from the holder and drawee, that notice should be sent by the next post; and the same rule obtains in case of non-payment. Also in case of the drawee of the bill, or maker of the note, having absconded, or not being found, notice of these circumstances, in case either of non-acceptance or non-payment, must be sent by the first post. Considerable difficulty has occurred in establishing a general rule in this respect, where the party entitled to notice resides in or near the place in which the holder lives. The court, however, has on several occasions laid it down as a principle, that what shall be considered as a reasonable time in case of notice, and also of demand of payment, is a question of law; and this seems to have been fully established, and it is understood generally, that a demand must be made, and notice given, as soon as under all the circumstances it is possible to do so. As to the manner in which notice is given, either of non-acceptance or non-payment, there is a remarkable difference between inland and foreign bills. In the former no particular form of words is necessary to entitle the holder to recover against the drawer or indorsers, the amount of the bill, on failure of the drawee or acceptor; it is sufficient if it appear that the holder means to give no credit to the latter, but to hold the former to their responsibility. But in foreign bills, other formalities are required. If the person to whom the bill is addressed, on presentment, will not accept it, the holder is to carry it to a person vested with a public character, who is to go to the drawee and demand acceptance; and if he then refuse, the officer is there to make a minute on the bill itself, consisting of his initials, the month, the day, and the year, with his charges for minuting. He must afterwards draw up a solemn declaration, that the bill has been presented for acceptance, which was refused, and that the holder intends to recover all damages which he, or the deliverer of the money to the drawer, or any other, may sustain on account of the non-accept-

acceptance. This minute, in common language, is termed the "notice" of the bill; the solemn declaration, the "protest;" and the person whose office it is to do these acts called a "public notary;" and to his protestation all foreign courts give credit. If no such notary be resident in the place where the bill is negotiated, protest may be made by any substantial inhabitant in the presence of two credible witnesses. For the circumstances attending this protest, and the difference in this respect between inland and foreign bills, see *PROTEST*.

When a bill is once accepted absolutely, it cannot in any case be revoked, and the acceptor is at all events bound, though he hear of the drawer's having failed the next moment, even if the failure was before the acceptance. The acceptor may however be discharged by an express declaration of the holder, or by something equivalent to such declaration. But no circumstances of indulgence shewn to the acceptor by the holder, nor an attempt on his part to recover of the drawer, will amount to an express declaration of discharge. Neither will any length of time short of the statute of limitations, nor the receipt of part of the money from the drawer or indorser, nor a promise by indorsement on the bill by the drawer to pay the residue, discharge the holder's remedy against the acceptor. Although the receipt of part from the drawer or indorser be no discharge to the acceptor, yet the receipt of part from the acceptor of a bill, or the maker of a note, is a discharge to the drawer and indorsers in the one case, and to the indorsers in the other, unless due notice be given of the non-payment of the residue; but where due notice is given, that the bill is not duly paid, the receipt of part of the money from an acceptor, or maker, will not discharge the drawer or indorsers; because it is for their advantage, that as much should be received from others as may be. So the receipt of part from an indorser is no discharge of the drawer or preceding indorser. If the drawer of a note, or the acceptor of a bill, be sued by the indorsee, and the bail pay the debt and costs, this absolutely discharges the indorser as much as if the principal had paid the note or bill; and the bail cannot afterwards recover against the indorser in the name of the indorsee. On the principles of several cases it has been finally settled, that to entitle the indorsee to recover against the indorser of an inland bill of exchange, it is not necessary to demand the money of the first drawer.

By the stat. 3 & 4 Ann. c. 9. § 7. it is enacted, that if any person accept a bill of exchange for and in satisfaction of any former debt or sum of money formerly due to him, this shall be accounted and esteemed a full and complete payment of such debt; if such person, accepting any such bill for his debt, do not take his due course to obtain payment of it, by endeavouring to get the same accepted and paid, and make his protest according to the directions of the act, either for non-acceptance or non-payment.

Where a privity exists between the parties in a bill of exchange, an action of debt, or of "indebitatus assumpsit," may be maintained; but where it does not exist, neither of these actions will lie. A privity exists between the payee and the drawer of a bill of exchange; the payee and drawer of a promissory note; the indorsee and his immediate indorser of either the one or the other; and perhaps between the drawer and acceptor of a bill; provided that, in all these cases, a consideration passed respectively between the parties. But no privity is supposed to exist between the indorsee and acceptor of a bill, or the maker of a note, or between an indorsee and a remote indorser of either.

The action which is now brought on a bill of exchange, is a special action on the case, founded on the custom of merchants. This custom was not at first recognized by the court, unless

it was specially set forth; but when this custom was recognized by the judges as part of the law of the land, and they declared they would take notice of it "ex officio," it became unnecessary to recite the custom at full length; a simple allegation that "the drawer, mentioning him by his name, according to the custom of merchants, drew his bill of exchange, &c." was sufficient. If the plaintiff, adhering to former precedents, thought proper to recite the custom in general terms, and did not bring his case within the custom so set forth; yet if by the law of merchants, as recognized by the court, the case as stated, entitled him to his action, he might recover; and the setting forth of the custom was reckoned surplusage, and rejected. Whether the drawer of a bill, or the indorser of a bill or of a note, receiving the bill or note in the regular course of negotiation before it has become due, can maintain an action on it against the acceptor or maker, in the character of indorsee, seems undecided; but there is a case which clearly shews that a drawer or indorser cannot maintain an action in the character of indorsee, "where the indorsement is after the refusal of payment;" because when a bill is returned unpaid, either on the drawer or indorser, its negotiability is at an end. The action, therefore, in which the drawer or indorser, after payment of the money in default of the acceptor, may recover, the first against the acceptor, and the latter against any of the preceding parties, must be brought in their original capacity as drawer or indorser, and not as indorsee. If the drawee, without having effects of the drawer, accept and duly pay the bill without having it protested, he may recover back the money in action for money paid, laid out, and expended to the use of the drawer. Instead of bringing an action on the custom, or on the statute, the plaintiff may in many cases use a bill or note only as evidence in another action; and if the instrument want some of the requisites for making it a good bill or note, the only use he can make of it is to give it in evidence.

The holder of the bill or note may sue all the parties who are liable to pay the money; either at the same time, or in succession; and he may recover judgment against all, if satisfaction be not made by the payment of the money before judgment obtained against all; and proceedings will not be staid in any one action, but on payment of the debt and costs in that action, and the costs in all the others in which he has not obtained judgment. But though he may have judgment against all, yet he can recover but one satisfaction; and though he be paid by one, he may sue out execution for the costs in the several actions against the others. To this action the defendant may plead the statute of limitations; and by the express provision of the statute of queen Anne, all actions on promissory notes must be brought within the same time as is limited by the statute of James, with respect to actions on the case. And to this plea it is no good replication, that it was on account between merchants, where it appears to be for value received.

As the action on a bill of exchange is founded on the custom of merchants, so that on a promissory note is founded on the statute 3 & 4 Ann. c. 9. In both cases, however, it is necessary, that all those circumstances should be expressly stated, or clearly and inevitably implied, which, according to the characters of the parties to the action, must necessarily concur, in order to entitle the plaintiff to recover. In stating the bill or note, regard must be had to the legal operation of each respectively. It has been decided, that the legal operation of a bill or of a note, payable to a fictitious payee, is, that it is payable to the *bearer*; and therefore it is proper in the statement of such a bill, to allege that the drawer thereby requested the drawee to pay so much money to the bearer;

bearer; and in the statement of such a *note*, that the maker thereby promised to pay such a sum to the bearer.

As to the *proof* that is necessary in actions on bills or notes, we may observe, that the plaintiff must, in all cases, prove so much of what is necessary to entitle him to his action, and of what must be stated in his declaration, as is not, from the nature of the thing, and the situation of the parties, necessarily admitted. In an action against the acceptor, it is a general rule that the drawer's hand-writing is admitted; that of the acceptor must of course be proved; and that of every person, through whom the plaintiff, from the nature of the transaction, must necessarily derive his title. On a bill payable to *bearer*, in an action against the acceptor, he has only to prove the hand-writing of the acceptor himself; but in case of a bill payable to *order*, the plaintiff must prove the hand-writing of the very payee who must be the first indorser. In case of a transfer by delivery, the plaintiff may be called upon to prove that he gave a good consideration for the bill or note, without the knowledge of its having been stolen, or of any of the names of the blank indorsers having been forged. In an action by the indorsee against the drawer, the same rules obtain with respect to proof of the hand-writing of the indorsers, as in an action against the acceptors. That of the drawer himself must of course be proved; and it must also be proved that the plaintiff has used due diligence. From the rule, that in an action against the drawer or acceptor of a bill payable to order, there must be proof of the signature of the payee, first indorser, and all those to whom an indorsement has been specially made, arose the question, which long and greatly agitated the commercial world, on the subject of indorsements in the name of "fictitious payees." A bill, payable to the order of a fictitious person, and indorsed in a fictitious name, is not a novelty among merchants and traders. But in the years 1786, 7, and 8, two or three houses, having connection in trade, and entering into engagements far beyond their capital, under an apprehension that the credit of their own names would not be sufficient to procure currency to their bills, adopted, to a very extensive degree, a practice which had before been found convenient on a smaller scale. For a considerable time, whilst money could be procured for the payment of these bills by the acceptors or drawers, and they had sufficient credit with the holder to have them renewed, the subject of these fictitious indorsements was not questioned. But when credit failed, and a commission of bankruptcy became necessary, the other creditors felt it their interest to resist the claims of the holders of these bills, and insisted that they should not be allowed to prove their debts, because they could not conform to the general rule of law, requiring proof of the hand-writing of the first indorser. The chancellor, when the question came before him by petition, directed trials at law. From the decisions in consequence of these trials, the principal of which was affirmed in the House of Lords, and which have settled that such bills are to be considered as payable to *bearer*, it follows, that proof of the acceptor's hand only is sufficient to entitle the holder to recover on the bill; and in a particular case, where the bill was drawn by the defendant and others on the defendant, it was determined that a *bonâ fide* holder for a valuable consideration might recover the amount against the acceptor in an action for *money paid, or money had and received*. The effect of the determination of the judges in the House of Lords, with respect to the principal case above alluded to, is as follows. If a bill of exchange be drawn in favour of a fictitious payee, with the knowledge as well of the acceptor as the drawer; and the name of such payee be indorsed on it by the drawer, with the knowledge of the acceptor, which fictitious indorsement

purports to be to the drawer himself or his order; and then the drawer indorses the bill to an innocent indorser for a valuable consideration, and afterwards the bill is accepted; but it does not appear that there was an intent to defraud any particular person; such innocent indorsee for a valuable consideration may recover against the acceptor, as on a bill payable to bearer. Perhaps also, in such case, the innocent indorsee might recover against the acceptor, as on a bill payable to the order of the drawee, or on a count stating the special circumstances. On other cases, afterwards brought before the House of Lords on demurrers to evidence, the judges gave their opinion, that it was not competent to the defendants to demur; and that on the record, as stated, no judgment could be given. The whole disclosed a system of bill-negotiation to the amount of a *million a year*, on fictitious credit, which ended in the bankruptcy of many; but which had at least the good effect of shewing that the obligations of law are not so easily eluded as those of honour and conscience.

In an action by an indorsee against an indorser, it is not necessary to prove either the hand of the drawer or of the acceptor, or of any indorser before him against whom the action is brought, every indorser being, with respect to subsequent indorsees or holders, a new drawer. Where an action is by one indorser, who has paid the money, proof must be given of the payment. In an action by the drawer against the acceptor, where the bill has been paid away and returned, it is necessary to prove the hand-writing of the latter, demand of payment by him, and refusal, the return of the bill, and payment by the plaintiff. In an action on the case by the acceptor against the drawer, the plaintiff must prove the hand-writing of the defendant, and payment of the money by himself; or something equivalent, as his being in prison on execution. Where a bill is accepted, or a bill or note is drawn or indorsed, by one of two or more partners, on the partnership's account, proof of the signature of the party accepting, drawing or indorsing, is sufficient to bind all the rest. When a servant has a general authority to draw, accept, or indorse bills or notes, proof of his signature is sufficient against the master; but his authority must be proved, as that it was a general custom for him to do so, &c. An action on a bill of exchange being by an executor, and upon a debt laid to be due to testator, it was held necessary to prove that the acceptance was in the life-time of the testator. Where the defendant suffers judgment by default, and the plaintiff executes a writ of inquiry, it is sufficient for the latter to produce the note or bill, without any proof of the defendant's hand; and on such judgment, a writ of inquiry seems now to be unnecessary.

As to the different subjects of *defence*, with regard to bills of exchange and notes, the most usual are those which arise either from the total want of consideration, or from the illegality of the consideration for which the bill or note was given. See *CONSIDERATION*.

If a bank-bill, payable to A. B. or bearer, be lost, and it is found by a stranger, payment to him would indemnify the bank; yet A. B. may have trover against the finder, though not against his assignee for valuable consideration, which creates a property. If the possessor of a bill accidentally loses it, he must cause intimation to be made by a notary public before witnesses, that the bill is lost or mislaid, and requiring that payment be not made of the same to any person without his privity. And by stat. 9 & 10 W. III. c. 17. if any inland bill of exchange for 5l. or upwards shall be lost, the drawer of the bill shall give another of the same tenor, security being given to indemnify him, in case the bill so lost be found again. If a bill lost by the possessor should

should afterwards come into the possession of any person, who pays a full and valuable consideration for it, without knowledge of its having been lost, the drawer and acceptor, if the bill was accepted, must pay it when due to such fair possessor, so that the provisions of the statute may, in many cases, be useless to the loser of the bill. But against the person who finds the bill, the real owner may maintain an action of trover. Stealing bills of exchange, notes, &c. is felony in the same degree as if the offender had robbed the owner of so much money, &c. And the forging of bills of exchange, or notes of money, indorsements, &c. is felony, by stat. 2 Geo. II. c. 25. 9 Geo. II. c. 18. See also stat. 31 Geo. II. c. 22. § 78. Blackst. Com. vol. ii. p. 466. Jacob's Law Dictionary, by Tomlins, vol. i. art. *BILL*.

BILL of Indictment. See *BILL* above, and *INDICTMENT*.

BILL of Interpleader. See *INTERPLEADER*, and *SUIT in Equity*.

BILL of Middlesex, which was formerly always founded on a "plaint" of trespass *quare clausum fregit*, entered on the records of the court, is a kind of "capias," directed to the sheriff of that county, and commanding him to take the defendant, and have him before our lord the king, at Westminster, on a day prefixed, to answer to the plaintiff of a plea of trespass. This bill of Middlesex must be served on the defendant by the sheriff, if he finds him in that county; but if he returns "non est inventus," then there issues out a writ of "latitat" to the sheriff of another county, as Berks; which, in the court of king's bench, is similar to the "testatum capias" in the common pleas, and recites the writ of Middlesex, and the proceedings thereon; and that it is testified, that the defendant "latitat et discerit," lurks and wanders about in Berks; and therefore commands the sheriff to take him, and have his body in court on the day of the return. But, as in the common pleas, the "testatum capias" may be sued out upon only a supposed, and not an actual, preceding "capias;" so, in the king's bench, a "latitat" is usually sued out upon only a supposed, and not an actual, "bill of Middlesex:" so that, in fact, a "latitat" may be called the first process in the court of king's bench, as the "testatum capias" is in the common pleas. Yet, as in the common pleas, if the defendant lives in the county wherein the action is laid, a common "capias" suffices; so, in the king's bench likewise, if he lives in Middlesex, the process must still be by "bill of Middlesex" only.

BILL, Navy. See *NAVY*.

BILL, in *Parliament*, denotes a paper containing propositions offered to the houses, to be passed by them, and then to be presented to the king to pass into an act or law: for the mode of presenting and conducting of which, see *PARLIAMENT*.

BILLS, Lombard, are instruments of an uncommon kind and figure, used in Italy and Flanders, and also in France; consisting of a piece of parchment, cut to an acute angle about an inch broad at top, and terminating in a point at bottom; chiefly given where private persons are concerned in the fitting out a ship for any long voyage.

The manner is this: the party who is desirous to be concerned in the cargo or venture, carries his money to the merchant, who fits out the ship, where it is entered down in a register. At the same time, the merchant writes down on a piece of parchment, upwards of an inch broad, and seven or eight inches long, the name of the lender, and the sum lent, which being cut diagonal-wise, or from corner to corner, each party retains his half. On the return of the vessel, the lender brings his moiety to the merchant, which

being compared with the other, he receives his dividend accordingly. Much the same is practised in Holland by those who lend money on pledges: the name of the borrower, and the sum, are written on a like slip of parchment, which is cut in two, and half given to the borrower, and the other half stitched to the pledge; that, upon comparing them together again, the borrower may receive his goods, on paying the money stipulated.

BILL, to note a. See *NOTE*, and *BILL of Exchange*.

BILL, to protest a. See *PROTEST*, and *BILL of Exchange*.

BILLS, bank, are notes or obligations signed in behalf of the company of the bank, by one of their cashiers, for value received. See *NOTE*, and *BILL of Exchange*.

BILL of credit. See *CREDIT*.

BILL of entry, an account of goods entered at the custom-house, both inward and outward; in which are expressed, the name of the merchant importing or exporting, the quantity, number, and mark of the goods, and place from or to which they are imported, or to be exported.

BILL of lading, an instrument signed by the master of a ship, acknowledging the receipt of a merchant's goods, and obliging himself to deliver them at the place to which they are consigned, in good condition. Of such bills there are usually three: the *first*, kept by the merchant; the *second*, sent to the factor to whom the goods are consigned; and the *third*, kept by the master of the ship. See *CHARTER-PARTY*.

BILLS of mortality, are weekly lists compiled by the parish-clerks in and about London, containing the numbers of such as die of each disease, as well as of those that are born every week. See *MORTALITY*.

BILL of parcels, an account of the particular sorts and prices of goods bought, given by the seller to the buyer.

BILL of rights. See *RIGHTS*.

BILL of sale, is an instrument or writing which a person, wanting a sum of money, and delivering goods as a security to the lender, gives to him, empowering him to sell the said goods, in case the sum borrowed is not repaid, with interest, at the time appointed. See *SALE*.

BILL of store, a licence granted at the custom-house to merchants, to carry such stores and provisions as are necessary for their voyage, custom-free.

BILL of sufferance, a licence granted at the custom-house to a merchant, to suffer him to trade from one English port to another, without paying custom.

BILL, or *BEAK, rostrum*, in *Ornithology*, the elongated horny processes or mandibles of birds. The form of the bill varies so greatly in different kinds of birds, that they afford the most permanent character by which these creatures may be arranged. In the distribution of families, Linnaeus first notices the structure of the bill, the tongue, and nostrils; and these parts constitute almost exclusively (with the legs) the distinction of the genera likewise. See *ORNITHOLOGY*, and *Anatomy of BIRDS*.

The *PHOENICOPTER's* bill is a true *hyperbola*, pointed at the end like a sword; and what is remarkable, the upper bill of this bird moves in eating, the lower being fixed, which is the contrary of what is found in all other kinds. The wood-pecker's bill is strong, and sharp enough to dig holes, and build in the heart of the hardest timber. See *PHOENICOPTERUS* and *PICUS*. Phil. Trans. N^o 211, p. 155. N^o 350, p. 509.

In the island of Ferro, a fixed reward is given for the bills of ravenous birds. All watermen are obliged to bring a certain number yearly to the country courts, at the feast of St. Olaus; when they are thrown into a heap, and burnt in triumph. Plott gives divers instances of monstrous irregularities

gularities in the bills of birds; particularly of a raven, whose mandibles crossed each other, the lower chap turning upwards, and the upper downwards. Plott's Nat. Hist. Stafford. ch. vii. § 4.

BILLA VERA, *the bill is true*. The grand jury indorsing a bill whereby any crime punishable in that court, is presented to them, with the words *billā vera*, signify thereby, that the presenter has furnished his presentment with probable evidence, and worthy of farther consideration; whereupon the party presented is said to stand indicted of the crime, and bound to make answer thereto, either by confessing or traversing the indictment. See **BILL** in *Law*, *supra*.

BILLANCOURT, in *Geography*, a town of France, 4 miles S.W. from Paris.

BILLARD, or **BILLET**, in *Ichthyology*, an English name, in some places, for the young coal-fish, *gadus carbonarius*, when a year old; measuring at that time from 8 to 10 or 15 inches in length.

BILLAU, in *Geography*, a river of Silesia, which runs into the Neys, near the town of Neys.

BILLE, a town of France, in the department of the Ille and Vilaine, and the chief place of a canton; in the district of Fougères, 1½ league south of Fougères.

BILLEKA, a town of Poland, in the palatinate of Lemberg, 10 miles east of Lemberg.

BILLERBEECK, a town of Germany, in the circle of Westphalia, and bishopric of Münster, 5 miles N.N.E. from Coesfeld.

BILLERICA, a township in Middlesex county, Massachusetts, in America, incorporated in 1655, containing 1200 inhabitants, lying 20 miles north of Boston, and watered by Concord and Shawheen rivers, which run north-easterly into Merrimack river.

BILLERICAY, in *Geography*, a market-town of Essex, England; is built on a fine eminence, commanding a view of a rich vale between the town and the river Thames. Though enjoying the advantage of a weekly market on Tuesdays, it is only a hamlet in the parish of Great Burstead, the church of which is situate about one mile and a half south of this place. For the accommodation of the inhabitants, a chapel is endowed and supported in the town. Here are two annual fairs: and the whole parish contains 250 houses, and 1472 inhabitants. Billericay is 23 miles N.E. from London. Morant's history of Essex.

BILLESDON. See **BILSTON**.

BILLET. See **HEADBOROUGH**.

BILLET, or **BILLETTE**, in *Heraldry*, signifies a figure whose length exceeds its breadth: when the arms are charged with several of them, they are then called *Billettee*. The royal arms of Nassau, prince of Orange, is *Jupiter Billettee sol, a lion rampant of the last*. Authors differ much in regard to the antiquity of the billet, which was evidently a piece of wood cut in the form of a parallelogram, and retains that name and shape to this day.

BILLET, *Billette*, in the *French Customs*, a little sign in form of a cast, hung up at places where toll is to be paid, to advertise passengers and carriages, that before they advance farther, the dues are to be paid to the king, or the lord who is charged with the care of repairing the high-ways.

BILLETS for fuel, are small pieces of wood, which must be 3 feet 4 inches long, and 7½ in compass, &c. Justices of peace shall enquire, by the oaths of six men, of the affize of billets; and those which are under size are forfeited to the poor. Stat 43 Eliz. c. 14. 9 Ann. c. 15. 10 Ann. c. 6. See **FUEL**.

BILLETS of gold, denote wedges or ingots of gold, mentioned in the ita. 27 Ed. 3. c. 27.

BILLETING of soldiers, in *Military Language*, is the lodging or quartering of them in the houses of the inhabitants of a place. This is done by a ticket, called a *billet*, which entitles each soldier, by act of parliament, to candles, vinegar, salt, and either small beer or cyder, not exceeding five pints per day, gratis; with the use of fire, and the necessary utensils for dressing and eating their meat.

BILLETING, among *Sportsmen*, denotes the ordure and dung of a fox.

BILLETINS. See **BROTHERS of Charity**.

BILLI, JAMES DE, in *Biography*, a French Jesuit, was born in Compiègne in 1602, and entered the society of Jesuits in 1619. He taught philosophy for three years, and was a preacher for more than twenty years. He was rector of Chalons, Langres, and Sens; but he is best known by his mathematical writings, which are as follow: "Nova Geometriæ Clavis Algebra," Paris, 1643, 4to.; "Tabulæ Lodoicæ de doctrina eclipsion," Dijon, 1658, 4to.; "Tumulus Astrologiæ Judiciariæ," Paris, 1659, 4to.; "Diophantus Geometra," Paris, 1660, 4to.; "Opus Astronomicum, &c." Dijon, 1661, 4to.; "Décours de la Comete qui a paru l'an 1665, au mois d'Avril," Paris, 1665, 4to.; "Crisis Astronomica de motu Cometarum," Dijon, 1666, 8vo.; "Doctrinæ analyticæ inventum novum," Toulouse, fol. Moreri.

BILLIARDS, an ingenious kind of game played with two small ivory balls, on an oblong table, covered with green cloth, and placed exactly level; which balls are driven, by sticks made on purpose, alternately against each other, with a view to push the passive ball into hazards, or holes, on the edges and corners, according to certain laws or conditions of the game.

The word comes from the French *billiard*, of *bile*, the ball made use of; and that from the Latin *pila*, a ball.

This game was invented by the French, and practised by the Germans, Dutch, and Italians; and is now a favourite diversion among persons of the first rank in many parts of England. The table on which it is played is about 12 feet long, and 6 wide; and not only covered with green cloth, but surrounded with cushions to prevent the balls from rolling off, and to make them rebound. It has six holes, nets, or pockets, which are fixed on the four corners, and in the middle, opposite to each other, for receiving the balls, which, when put into these holes, are called hazards. The making of a hazard, or putting the adversary's ball into the hole at the usual game, is reckoned for two in favour of the player.

The game is played with sticks, called maces, or with cues. The mace is a long straight stick, with a head at the end, and is the most powerful instrument of the two: the cue is a thick stick decreasing gradually to a point of about half an inch in diameter: this instrument is played over the left hand, and supported by the forefinger and thumb. This is the only instrument in vogue abroad, and is used with astonishing address by the Italians, and some of the Dutch; but in England the mace is the prevailing instrument, though regarded with some degree of contempt by foreigners, as the use of it does not require so much address as the cue; however, the mace is used for the peculiar advantage of "trailing," as it is called; or of following the ball with it to such a convenient distance from the other ball as to make it an easy hazard. The several degrees of trailing are variously denominated by the connoisseurs; e. g. the shove, the sweep, the long stroke, the trail, and the dead

trail

BILLIARDS.

trail or turn up, all which secure certain advantages to a good player; and even the butt-end of the cue becomes very powerful, when it is made use of by a good trailer. The varieties of this game are denominated the "white winning game," the "white losing game," the "red or carambole winning game," and the "red losing game." The game usually played is the first of these, and 12 is the number. The rules for this game are as follow: 1. String for the lead and choice of balls; the person who does this must stand within the limits of the corner of the table, and not place his ball beyond the stringing nails or spots: the lead is won by him who brings his ball nearest the cushion. 2. If after the first person has strung for the lead, the adversary should make his ball touch the other, he loses the lead; and if the player holes his own ball in stringing or leading, he loses the lead. 3. If the leader follows his ball with either mace or cue beyond the middle hole, it is no lead; and it is at the option of his adversary to make him lead again. 4. The striker who plays at the lead must stand with both his feet within the limits of the corner of the table, and not place his ball beyond the stringing nails; and his adversary (only) is bound to see that he stands and plays fair; otherwise the striker wins all the points he made by the stroke. 5. When a hazard has been lost in either of the corner holes, the leader is obliged, if his adversary require it, to lead from the end of the table, where the hazard was lost; but if the hazard was lost in either of the middle holes, it is at the leader's option to lead from either end of the table. 6. If the striker does not hit his adversary's ball, he loses one point; and if by the said stroke his ball should go into a hole, over the table, or on a cushion, he loses three points; and he also loses the lead. 7. If the striker holes his adversary's ball, or forces it over the table, or on a cushion; or if he holes both balls, or forces them over the table, or on a cushion; in either case he loses two points. 8. No person has a right to take up his ball without permission from his adversary. 9. If the striker should touch or move his own ball, without intending to make a stroke, it is deemed an accident; and his adversary, if he require it, may put the ball back in the place where it stood. 10. If the striker force his adversary's ball over the table, and his adversary should chance to stop it, so as to make it come on the table again, the striker wins two points, if the striker should force his own ball over the table, and his adversary should chance to stop it so as to make it come on the table again, the striker loses nothing by the stroke, and has the lead; but if the striker misses the ball and forces it over the table, and it should be stopped by his adversary, he loses one point, and has the lead, if he chuses. 11. If the striker, in playing from a cushion or otherwise, by touching the ball, makes his mace or cue go over or beyond it, he loses one point; and, if his adversary require it, he may put the ball back, and make him pass the ball. 12. If the striker, in attempting to make a stroke, doth not touch his ball, it is no stroke; and he must make another trial; but if when the balls are near each other, the striker should accidentally make his ball touch the other, it is a stroke, though not intended. 13. If the striker who plays the stroke should make his adversary's ball go so near the brink of a hole, as to be judged to stand still, and afterwards fall into it, the striker wins nothing; and the ball must be put upon the same brink where it stood, for his adversary to play from the next stroke. 14. If the striker's ball should stand on the brink or edge of a hole, and if in playing it off he should make the ball go in, he loses three points. 15. If a ball should stand on the brink or on the edge of a hole, and should fall into the hole, before or when the striker has delivered his ball from the mace or cue,

so as to have no chance for his stroke, in that case the striker and his adversary's ball must be placed in the same position, as nearly as possible, and the striker must play again. 16. The striker is obliged to pass his adversary's ball, more especially if he misses the ball on purpose; and it is at the option of his adversary to oblige him to place the ball where it stood, and play until he has passed. 17. If the striker plays both balls from his mace or cue, so that they touch at the same time, it is deemed a foul stroke; or if the adversary discover it, and a dispute should arise, an appeal may be made to the company present; and the marker, if required, must go round the table to each person separately, and ask if he has any bet depending, and if he understands the game and the disputed subject; and if the company and marker determine it to be a foul stroke, it is at the adversary's option (if not holed) either to play at the ball, or to take the lead; but if the adversary doth not discover it to be a foul stroke, the striker may reckon all the points he made by the said stroke, and the marker is obliged to mark them: and no person has a right to discover to the player whether a stroke be fair or foul, unless he is asked. 18. If by a foul stroke the striker should hole his adversary's ball, he loses the lead; but if by such a stroke he holes his own or both balls, or forces his own or both over the table, or on a cushion, he loses two points. 19. If the striker plays on a ball when it is running or moving, it is deemed a foul stroke; and if he plays with both feet off the ground, without leave of his adversary, it is a foul stroke: if he plays with a wrong ball, he loses the lead, if his adversary require it. 20. If the ball should be changed in a hazard, or on a game, and it is not known by which party, the hazard must be played by each party with their different balls and then changed. 21. If the striker plays with his adversary's ball, and hole, or forces the ball at which he played over the table, &c. it is deemed a foul stroke. 22. If the striker plays with his adversary's ball and holes, or forces the ball with which he played over the table, &c. he loses two points; and if he missed the ball, three points. 23. If the striker plays with his adversary's ball and misses it, he loses one point; and if his adversary discovers that he hath played with the wrong ball, he may part the balls, and take the lead if he pleases. 24. In all these cases of the striker's playing with the wrong ball (if discovered), his adversary must play with the ball, at which the striker played throughout the hazard, or part the balls and take the lead. 25. Whoever stops a ball when running with hand, stick, or otherwise, loses the lead, if his adversary does not like the ball he has to play at the next stroke. 26. Whoever retains his adversary's stick when playing, it is deemed foul. 27. If the striker stops or puts his ball out of its course, when running towards either of the holes, and, if adjudged by the marker and company to be going into a pocket, if he misses the ball he loses one point, and if going into a hole by the same stroke, three points. 28. If the striker stops or puts his adversary's ball out of the course, when running towards or into a hole, or puts it into a hole, it is deemed a foul stroke. If the adversary does the same, as in the foregoing cases, he is subject to the same penalties as the striker. 29. He who shakes the table when the ball is running, or throws his stick across the table, so as to occasion any detriment to his adversary, or blows on the ball when running, makes in either case a foul stroke; and if his own ball was running towards or near the hole, when he blows on it, he loses two points. 30. He who leaves the game before it is finished, and will not play it out, loses the game. 31. Any person, whilst playing, may change his mace or cue; and neither party has a right to object to either mace or cue being played within the said game; but when the parties agree to play mace against

BILLIARDS.

cue, the mace-player hath no right to use a cue, and vice versa, without leave of the adversary. 32. When a person agrees to play with the cue, he must play every ball within his reach with its point, and if he agrees to play with the butt of the cue, he must not use the point, without permission; when the parties agree to play point and point of the cue, neither has a right to use a butt during the match, without permission; but they have a right to play with a long cue over a mace, &c. and when they agree to play all points with the same cue, they have no right to use any other during the game. 33. If it be proposed to part the balls, the proposer, if the adversary agree to it, loses the lead. 34. Two missings do not make a hazard, unless the contrary is previously settled. 35. The betters are to abide by the players on the determination of the hazard, or on the game; and they have a right to demand their money, when their game is over, to prevent disputes. 36. The striker has a right to command his adversary not to stand facing him, or near him, so as to annoy or molest him in the stroke. 37. Each person is to attend to his own game, without asking questions. 38. No person in the room has a right to lay more than the odds on a hazard or game; and in questionable cases appeal should be made to the marker, or to the table of odds hung up in the room. 39. When four persons play, the game is fifteen in number; and each party has a right to consult with and direct his partner in any matter respecting the game, &c.

The "white losing-game" is the common winning-game, and twelve is the number. This depends entirely upon the defence, and the knowledge of the degree of strength with which each stroke should be played, either to defend or make a hazard; for if a person who has a competent knowledge of the game should not have a hazard to play at, he must endeavour to lay his own ball in such a position, that his adversary may not have one to play at the next stroke. In this game, if the striker misses the ball, he loses one, and if by the same stroke his ball goes into a hole, he loses three points; if he strikes his adversary's ball he loses two points; if either or both balls be forced over the table, or on a cushion, nothing is reckoned, and the striker loses the lead, but if he misses his adversary's ball, and forces his own over the table, &c. he loses one point and the lead; if either of the parties forces either or both balls over the tables, he reckons nothing, and the striker loses the lead; if the striker holes his own ball, he wins two points; if he holes both balls, he wins four points; if he holes either ball, and forces the other over the table, &c. he only loses the lead. The "winning and losing game" is a combination of both games; in which all balls that are put in by striking first the adversary's ball, reckon towards game; and holing both balls reckons four. At this game and the losing, knocking over, or forcing the balls over the cushion, goes for nothing; the striker only losing the lead. The "choice of balls" is choosing each time which ball the player pleases, which is without doubt a great advantage, and is generally played against losing and winning.

"Bricole," is being obliged to hit a cushion, and make the ball rebound or return to hit the adversary's ball, otherwise the player loses a point. This is a great disadvantage, and is reckoned between even players to be equal to receiving about eight or nine points.

"Caranbole," is a game newly introduced from France. It is played with three balls, one being red, which is neutral, and is placed upon a spot on a line with the stringing nail, (*i. e.* that part of the table from whence the player strikes his ball at first setting off, and which is generally marked with two brass nails). Each antagonist, at the first stroke of a hazard, plays from a mark which is upon a line with it at

the other end of the table. The chief object at this game is, for the player to hit with his own ball the two other balls: which is called a *caranbole*, and by which the player wins two. If he puts in the red ball he gets three, and when he holes his adversary's ball he gets two; so that seven may be made at one stroke, by caranboling and putting in both balls. This game resembles the losing, depending chiefly upon particular strengths, and is generally played with the cue. The game is fifteen up; nevertheless it is reckoned to be sorer over than the common game. The next object of this game, after making what we have distinguished by the *caranbole*, is the *lank*; that is, making the white ball, and bringing the player's own ball and the red one below the stringing nail, from whence the adversaries begin. By this means the opponent is obliged to play bricole from the opposite cushion; and it often happens that the game is determined by this situation.

"The Russian caranbole," is a game that has still more lately been introduced from abroad, and is played in the following manner: The red ball is placed as usual on the spot made for that purpose; but the player, when he begins, or after having been holed, never places his ball on any particular place or spot; being at liberty to put it where he pleases. When he begins to play, instead of striking at the red ball, he leads his own gently behind it, and his antagonist is to play at which he thinks proper; if he plays at the red ball and holes it, he scores three as usual towards the game, which is twenty-four instead of sixteen points; and the red ball is put upon the spot again: at which he may strike again, or take his choice which of the two balls to push at, always following his stroke till both balls are off the table. He is entitled to two points each time that he caranboles, the same as at the other game; but if he caranboles and puts his own ball into any hole, he loses as many as he might have got had he not holed himself; for example, if he strikes at the red ball, which he holes, and at the same time caranboles and holes himself, he loses five points; and if he holes both balls when he caranboles, and likewise his own, he loses seven, which he would have got if he had not holed his own ball. In other respects it is played like the common caranbole game.

"The Bar-hole," is so called from the hole being barred which the ball should be played for, and the player striking for another hole; when this game is played against the common game, the advantage for the latter, between equal players, is reckoned to be about six.

The player at the *one-hole*, though it seems to those who are not judges of the game to be a great disadvantage, has in fact the best of it; for as all balls that go into the one-hole reckon, the player endeavours to lay his ball constantly before that hole, and his antagonist frequently finds it very difficult to keep one or other ball out, particularly on the leads, when the one player lays his ball (which he does as often as he can) on the brink of the hole; leading for that purpose from the opposite end, which in reality he has no right to do; for the lead should be given from the end of the table at which the hazard is made; but when a person happens to be a novice, this advantage is often taken.

"The four game," consists of two partners on each side, as the common winning game; who play by succession after each hazard, or two points lost. The game is fifteen up; so that the point or hazard is an odd number, which makes a miss at this game of more consequence than it is at another; being as much at four, six, or eight, as it is at five, seven, or nine, at the single game.

"Hazards," are so called because they depend entirely upon the making of hazards, there being no account kept

of any game. Any number of persons may play by having balls that are numbered; but the number seldom exceeds six, to avoid confusion. The person whose ball is put in, pays so much to the player according to what is agreed to be played for each hazard; and the person who misses, pays half the price of a hazard to him whose ball he played at. The only general rule is, not to lay any ball a hazard for the next player, which may be in a great measure avoided, by always playing upon the next player, and either bringing him close to the cushion, or putting him at a distance from the rest of the balls. The table, when hazards are played, is always paid for by the hour.

BILLIAT, in *Geography*, a town of France, in the department of the Ain, and chief place of a canton, in the district of Nantua, $2\frac{1}{2}$ leagues S. E. of Nantua.

BILLICHA, in *Ancient Geography*, a river of Asia in Mesopotamia, which rises in the mountains of Ofroene, south of Edessa, and pursuing a south-easterly course, discharges itself into the Euphrates, at the town of Nicephorum.

BILLIGHEIM, in *Geography*, a town of Germany, in the palatinate of the Rhine, $\frac{1}{2}$ miles S. of Landau, and 16 S. W. of Spire.

BILLIGRATZ, a town of Germany, in the duchy of Carniola, $\frac{1}{2}$ leagues N. of Laubach.

BILLINGEN, a town of the Netherlands, in the duchy of Luxemburg, 20 miles E. of Spa.

BILLINGSGATE, a fish-market of London, kept every day, and the toll of which is appointed by statute. All persons buying fish in this market may sell the same in any other market by retail, but none but fishmongers are allowed to sell it in shops: and if any person shall buy any quantity of fish at Billingsgate for others, or any fishmonger shall engross in the market, they incur a penalty of 20*l*. Fish imported by foreigners shall be forfeited, and the vessel &c. 10 & 11 Wil. III. c. 24. 1 Geo. I. stat. 2. c. 18. § 1. &c.

BILLINGSPOURT, a place on the river Delaware, in America, situate 12 miles below Philadelphia, which was fortified in the late war, for the defence of the channel, and opposite to which were sunk frames of timber, headed with iron spikes, called chevaux-de-frize, in order to prevent the British ships from passing. After the war they were raised by a curious machine, invented at Philadelphia for this purpose.

BILLIS, in *Ancient Geography*, a small river of Asia Minor, on the frontiers of Paphlagonia, on the borders of which was seated the town of Teium, mentioned by Sallust.

BILLITON, in *Geography*, one of the Sunda islands in the Indian ocean, N. E. of the lower part of Sumatra, and E. of Banca. (See *Straits of BANCA*.) S. lat. between $2^{\circ} 30'$. and $3^{\circ} 30'$. E. long. between $107^{\circ} 45'$. and $108^{\circ} 26'$.

BILLOM, a town of France, and principal place of a canton, in the district of Clermont, and department of Puy-de-Dome, $\frac{1}{2}$ leagues E.S.E. from Clermont. The town contains 5,110 inhabitants, and the canton 13,711. The territorial extent comprehends 115 kilometres, and 10 communes. N. lat. $45^{\circ} 43'$. E. long. $3^{\circ} 14'$.

BILLON. **BILLIO**, in *Coinage*, a kind of base metal, either of gold or silver, in whose mixture copper predominates.

The word is French, formed, according to Menage, from the Latin *bullia*, or *bullo*, *bullion*. According to M. Bouteroue, billon of gold is any gold beneath standard, or twenty-one carats; and billon of silver, all below ten penny-weights. But, according to others, and among the rest, M. Bonard,

gold and silver beneath the standard, as far as twelve carats, and six penny-weights, are properly base gold and silver, and all under those billon of gold, and billon of silver, because copper is the prevailing metal. The writers on numismatic science appropriate the term billon to signify metals of copper alloyed with a very small quantity of silver.

BILLS, in *Geography*, a rock in the Atlantic, near the west coast of Ireland, 6 miles N.W. from the island of Clare, and 6 S. S. E. from Achill-head.

BILLY, **JAMES DE**, in *Biography*, was born in 1535, at Guise in Picardy, and devoting himself to study, he entered the church, in which he possessed some benefices. After suffering considerably in the civil wars, he retired to Paris, and died in the house of his friend Gilbert Genebrard, in 1581. His works, both in prose and verse, were numerous; but the most valuable are his Latin translations of the Greek fathers: such are, "S. Gregorii Nazianzeni opera omnia," fol. 1569 and 1583; "Interpretatio Latina 18 priorum libri S. Irenæi adv. Hæres. capitum," fol. 1577; "S. Joh. Damasceni opera," fol. 1577; "Isidori Pelusiote: Epistolæ, Gr. & Lat. (3 first books,) fol. 1587;" and translations of some pieces of St. Chrysostom, inserted in the Paris editions of his works, in 1581, &c. Moreri.

BILLY, in *Geography*, a town of France, in the department of the Allier; $\frac{1}{2}$ leagues N. E. from Gannat.

BILMA, a desert country in the north of Africa, being a part of the Great Desert, or Sahara, and a prolongation of the Libyan desert to the S. W. bounded on the N. by the Tibesti mountains, and the desert of Berdoa, on the E. by Kaware or Kuar, on the S. by Bornou, and on the W. by Zegzeg, Agades, Afouda, Ganat, &c. N. lat. about 23° to 25° . W. long. about 20° . The salt lake of Dumboo, the Chelonides Palus of Ptolemy, is said to be situated in the desert of Bilma.

BILOBUS, in *Entomology*, a species of *SCARABÆUS*, with two prominent lobes on the thorax; a simple horn on the head, and wing-cases striated. Inhabits the south of Europe. Fabricius.

BILOBUS, a species of *DYTISCUS*, of an oblong-ovate form and black; mouth, vertical two-lobed spot, thorax, sutural line, base, and margin of the wing-cases yellow. Linn. Mus. Lestk.

BILOBUS, a species of *CINEX* (*Spinifus*), with an obtusely-dentated thorax; wing-cases greyish or reddish; vent with two lobes. Linn. Mus. Lestk. A native of Europe.

BILOBUS, in *Ornithology*, a species of *CHARADRIUS*, called the *Wattled Plover*, by Latham. It is an inhabitant of the coast of the Malabar. The bill and legs are yellow; frontal skin naked, and pendulous in two pointed lobes; body above yellowish grey: beneath white. Gmelin, &c. The crown, band on the tail, and quill-feathers are black; band across the eyes, greater wing-coverts, and some of the tail-feathers at the end white. This is *Pluvier à l'ombreau* of Buff. Hist. Ois. and *Pluvier de la côte de Malabar* of Pl. enl. of the same author. Length nine inches and a half.

BILOCULAR, in *Botany*, a term applied to a *capsule*, having two cells.

BILOIYAR, in *Geography*, a town of Russia, in the government of Simbirsk, on the east side of the Volga, 10 miles S. E. of Simbirsk.

BILLS, or **BILSIUS**, **LOUIS DE**, of Rotterdam, in Holland, in *Biography*, acquired much fame for a time, about the middle of the 17th century, for a supposed new method of preserving bodies from putrefaction, and of dissecting them without occasioning an effusion of blood. By his method of preparing the bodies, they were said to preserve their flexibility as well as freedom from putridity for ages; so that they

they might be dissected during the summer, and remain under the demonstrator's hands for weeks, months, or years, if necessary, without emitting any offensive smell. De Bils had the art of gaining so much credit to his professions, that he is said, by Haller, to have sold his secret to the university of Louvain for 22,000 florins. He had demanded a much larger sum, and certainly had his preparations answered the high elogia bestowed on them by his favourers, the secret would have deserved it. Prior to the sale he had sent one of his bodies to the theatre at Leyden, at which Deusingius, one of his warmest admirers says, "sed fidem superat omnem, exsiccatum hominis cadaver, recenter mortuum diceret, tanto theatro dignissimum opus." De admiranda anatome, nobilissimi viri L. D. Bils, p. 362. But not contented with the fame and money acquired by his secret, for he sold his prepared bodies at high prices, he pretended to have made discoveries in the structure of the liver, and in the lymphatics, by which he exposed himself to deserved contempt, it appearing that he was totally ignorant of the art of anatomy, in which he affected to be a master. He is said to have died phthisical from the effects of the putrid air inhaled while preparing his bodies, and in a few years his preparations, which were to have lasted for ages, were totally destroyed. His productions, which were numerous, and excited much interest at the time, were collected and published in 1692, in 4to. under the title of, "De Bils inventa anatomica antiquo-nova cum clarissimorum virorum epistolis, et testimoniis, ubi annotationes Joannis ab Hoorne, et Pauli Barbette, refutantur, interprete Gedeone Buenio. Amst.

BILSAH, in *Geography*, a city of Hindoostan, and capital of a circar in the Malwa country; 416 miles S. W. of Benares, 867 N. W. of Calcutta, by Gurry Mundlah, 560 N. W. of Hyderabad, 367 S. W. of Lucknow, 249 N. W. of Nagpour, 140 nearly E. of Ougein, and 496 N. E. of Poonah. Bilshah, which is almost in the heart of India, affords tobacco of the most fragrant and delicious kind throughout that whole region, and which is distributed accordingly. N. lat. 23° 30'. E. long. 77° 53'.

BILSEN, a town of Germany, in the circle of Westphalia, and bishopric of Liege, chief place of a canton in the district of Maestricht, and department of the Lower Meuse, seated on the Demer, possessing the privileges of a city, but of no great consideration, 14 miles N. of Liege. The town contains 1925 persons, and the population of the canton includes 9388. The territory comprehends 170 kilometres, and 16 communes.

BILSKOI, a town of Siberia, on the Bilaia, 90 miles N. W. of Irkutsk.

BILSON, THOMAS, in *Biography*, a learned prelate of the English church, was born at Winchester, and educated at Wykeham's school near his native city. In 1565, he was admitted fellow of New College, Oxford, after having served two years of probation. He took in due course his several degrees of bachelor and master of arts, and also of bachelor and doctor of divinity; the last of which was conferred on him in 1580. In his earlier years he was fond of poetry, philosophy, and physic; but after having entered into orders he confined himself wholly to divinity, and became an excellent preacher. His first preferment was the mastership of Winchester school; and he afterwards became prebendary of Winchester, and at length warden of the college, in which office he was instrumental in preserving the revenues of it, when they were likely to have been lost by forgery. In 1585, he published a treatise entitled "The true Difference between Christian Subjection and unchristian Rebellion," dedicated to queen Elizabeth, and composed for the purpose

of confuting those catholic writers who attacked her right to the throne, and to the allegiance of her subjects. In this treatise passages occur that are favourable to resistance in certain cases, and which have not escaped the censures of later advocates of passive obedience. This was succeeded, in 1593, by his "Perpetual Government of Christ's church, &c." designed to shew, that from the Mosaic institution to the modern ages of Christianity, the church has been governed by pastors and teachers of different ranks, superior and subordinate, and esteemed one of the best books in favour of episcopacy. In consequence of this publication he was promoted to the see of Worcester in 1596, from which he was translated in 1597 to that of Winchester, when he was also appointed a privy counsellor. About this time he delivered a course of sermons at Paul's cross, against some of the tenets of the Puritans, on the subject of redemption, and the descent of Christ into hell, which occasioned a controversy with the leaders of that sect. In the course of this controversy the bishop maintained the actual descent of Christ into hell, or the place of the damned, an opinion which was then deemed orthodox, but which has since been rejected by the best expositors of the 39 articles, and by every rational divine. This prelate took a lead in the Hampton-court conference, where he was distinguished by his learning; and in general he was one of the most able advocates in favour of the church of England. To him, in conjunction with Dr. Smith, afterwards bishop of Gloucester, was committed the care of revising and finishing the new version of the Scriptures, called king James's Bible. He was also one of the delegates who pronounced the sentence of divorce between the earl of Essex and his countess. This learned bishop, whose life was a course of incessant labour for the public good, and whose private character uniformly corresponded with his high station, died in 1616, and was buried in Westminster Abbey. Biog. Brit.

BILSTEIN, in *Geography*, a town of Germany, in the circle of the Lower Rhine, and capital of a bailiwick, in the duchy of Westphalia, seated on a mountain; 42 miles E. of Cologne.

BILSTON, a large village, or chapelry, of Staffordshire, England, is remarkable for the number of its houses and inhabitants, without having the advantage of a chartered market or fair. From its proximity to Birmingham and Wolverhampton, and having the advantage of a navigable canal near it, Bilston abounds with manufactures, among which those for japanned and enamelled goods are the principal. Furnaces for smelting iron ore, forges and slitting mills, mostly worked by steam engines, also abound here. In the vicinity of the town are several coal mines, which produce great quantities of that fossil. An orange coloured sand is also abundant, and is in much request by the artizans, as a sand to cast metals in. Here is a quarry of remarkable stones, lying horizontally in twelve strata, each progressively increasing in thickness from the top downwards. The stone is mostly appropriated to the making of cisterns, troughs, &c. Bilston is in the parish of Wolverhampton, but is a distinct township for all parochial proceedings. There is a chapel of modern erection; also two meeting-houses, and a free-school. This chapelry is within the exempt jurisdiction of the dean of Wolverhampton, and is a perpetual curacy. Bilston is 127 miles N. W. from London: it contains 1305 houses, and 6914 inhabitants. Shaw's History of Staffordshire.

BILSTON, or BILDSTON, is a small manufacturing town of Suffolk, England. The making of blue cloths, blankets, and yarn, give employ to most of the inhabitants. Here was formerly a considerable market on Wednesdays, but it

is nearly deserted, and the whole town is much reduced. Here are two annual fairs. The parish contains 121 houses, and 744 inhabitants.

BILUR, in *Natural History*, a name given by many of the Arabian writers to a gem, which though they often mention, yet they have no where given us a description of. Some have imagined it the *onyx*, and others the *beryl*; but it appears more probable to have been a species of crystal; probably the pebble-crystal of the East Indies, which is considerably finer than the common frigid-crystal, and is often fold under the name of the white sapphire; though considerably inferior, both in lustre and hardness, to the true white sapphire.

BIMA, in *Geography*, a river of Hindoostan, so called by Mr. Pennant. See **BEEMAH**.

BIMACULARIS, in *Entomology*, a species of **PHALÆNA** (*Pyralis*, Gmel.), found in Europe. The anterior wings are griseous brown, with two brown spots. Linn.

BIMACULATA, in *Conchology*, a species of **TELLINA**, found in the European and American seas. This shell is of a somewhat rotundated triangular shape, rather broad, smooth, whitish, with two sanguineous spots within. It is a small shell, being usually half an inch in length, and sometimes, though rarely, of a yellowish colour. Linnæus, Donovan Brit. Shells, &c. On the English coasts this is a scarce species.

BIMACULATA, in *Entomology*, a species of **STILPHA**, found in Barbary. It is ovate and black; head of the antennæ, globose; legs ferruginous. Gmelin. The margin of the thorax is rather ferruginous, and the middle of each wing-case is marked with a red spot.

BIMACULATA, a species of **CHRYSOMELA**, of an oblong shape, and black; wing-cases testaceous, with a black spot on each. Inhabits America. Fabricius.

BIMACULATA, a species of **LEPTURA**, of a rufous colour, with cylindrical thorax; wing-cases dotted, with a spot and undulated streak of white on each. Schæffer, &c.

BIMACULATA, a North American species of **CANTHARIS**, with a ferruginous thorax; having a black spot, wing-cases testaceous, with a black spot at the tip. Fabricius.

BIMACULATA, a species of **MORDELLA**, of a large size, that is found in Hungary. It is ferruginous, with the breast black; wing-cases testaceous, with a black spot on each. Fabricius. Mant. Inf.

BIMACULATA, a species of **BUPRÆSTIS**, that inhabits India. The wings are very entire, striated, with a red spot; body brownish, green. Linn. Fabr. &c.

BIMACULATA, a species of **SPHINX** (*Zygana*), of the middle size, that inhabits America. The wings are above and beneath black, with two yellow spots on the anterior wings. Gmel. Fabr. &c.

BIMACULATA, a species of **PHRYGÆNEA**, described by Degeer. The wings are brown, with a double yellow lateral spot. Linn. &c.

BIMACULATA, a species of **TIPULA**, found in Europe. The wings are hyaline, with two brown spots; abdomen spotted, with ferruginous in the middle; antennæ feathered. Linn. Fr. Suec. Obs. This specific character is liable to some exception, for it is only the female which has the abdomen spotted with ferruginous; that of the male is immaculate.

BIMACULATA, a species of **MUSCA**, found in New Holland, and described by Swederus, Nov. Act. Stockh. The colour is light blue, with a whitish spot on each side of the breast; abdomen green, and blue at the base.

BIMACULATA, a species of **SCOLIA**, described by Fabricius. It is black, hairy, with two pale yellow spots, au-

tenes yellow. A variety of this insect with fulvous, instead of yellow spots, is mentioned by Pelagn. Inf. Calabr. The former inhabits North America.

BIMACULATA, a species of **ARANEÆ**, of a small size, that is found in Europe. The abdomen is subrotund, chestnut with two white spots. Gmelin. Abdomen rather depressed.

BIMACULATA, a species of **TENTHREDO**, of a pale colour, with the eyes, base of the abdomen above, and two spots on the breast, black. Linnæus Mus. Lesk.

BIMACULATA, in *Zoology*, a species of **LACERTA**, described by Sparmann. Nov. Act. Stockh. The tail is carinated, toothed, and twice the length of the body; all the toes lobated. Inhabits the woods of St. Eastace and Pennsylvania, living under ground, or in the hollows of trees, and depositing its eggs in the earth. The body is blue, tinged with green, and thickly spotted with black, but having two larger than the rest on the shoulders, from whence it is specifically named *bimaculata*; on each foot are five toes.

BIMACULATUM, in *Entomology*, a species of **PHALANGIUM**, with the abdomen black, and two white spots. A native of England and Norway. Gmelin.

BIMACULATUS, a species of **SCARABÆUS**, with three slight tubercles on the head; wing-cases striated, with two red spots at the base. Inhabits Germany. Fabricius.

BIMACULATUS, a species of **HISTER**, of a black colour, with the posterior end of the wing-cases red. Linn. Fr. Suec. Found in the dung of oxen. This is *Hister fimetarius* of Scopoli; and *Attelabus totus niger*; *elytris lævis nonnihil striatis*; *l'escarbot noir* of Geoffroy.

BIMACULATUS, a species of **CURCULIO**, of a brown colour; wing-cases dotted with cinereous; snout and legs black. Inhabits Saxony; and resembles *Curculio colon*, but is rather smaller.

BIMACULATUS, a species of **CRYPTOCEPHALUS**, of a dusky black, with fulvous thorax, and testaceous wing-cases, with two spots of black. Fabricius. Obs. This is *Chrysmela melanocephala* of Schaller, &c. A native of Italy and Saxony.

BIMACULATUS, a species of **CARABUS**, of a black colour, with a common interrupted band; antennæ and feet testaceous. Mant. p. 532. Gmel. Inhabits India. The thorax of this insect is yellow, or black, and sometimes spotted in different specimens.

BIMACULATUS, a species of **DYTISCUS**, of a testaceous colour, with a blackish spot on the wing-cases. Inhabits France. Size of a grain of rice. Gouan. Gmelin, &c.

BIMACULATUS, a species of **GRYLLUS** (*Bulla acridium*) found in Europe, and described by Herbit. The thorax is brown, with an ochraceous lunule on each side.

BIMACULATUS, a species of **ICHNEUMON**. Colour black; front, legs, antennæ beneath, anterior part of the thorax, two spots on the wings, and posterior margin of the abdominal segments, except the second, yellow. Linn. Mus. Lesk. Breeds in the larva of *phalæna fimbria*. Scutel raised behind. Inhabits Europe.

BIMACULATUS, is also a species of **ICHNEUMON**, that inhabits Austria, and is described by Schranck. It is black, with a yellowish scutel; two last segments of the abdomen with a single gypticous spot on each above.

BIMACULATUS, in *Ichthyology*, a species of **SALMO**, the body of which is compressed, and marked with two spots; anal fin with thirty-two rays. Gmelin. This is a native of South America. Seba calls it *Titragonopterus*; and Artedi *Coregonoides Amboinensis*.

BIMACULATUS, a species of **IABRUS**, found in the Mediterranean

diterranean sea. The dorsal fin is filamentous, body marked with a brown spot in the middle, and another near the tail. Gmel. &c.

BIMACULOSA, in *Entomology*, a species of *Coccinella*, with fulvous wing-cases, having two obsolete white feminar patches. Herbit. apud Fuesli, &c.

BIMACULOSA, a species of *PHALÆNA*, that inhabits Germany. Colour whitish grey; anterior wings rather clouded; posterior ones with two black spots. Fabricius, &c.

BIMATRA, in *Ancient Geography*, a town of Asia in Mesopotamia. Ptolemy.

BIMBELE ou *fausse Linotte*, in *Ornithology*, a name given by Buffon to a species of motacilla, since called by Latham the *palm warbler*, and *motacilla palmarum* by Gmel n.

BIMEDIAL, in *Mathematics*. When two medial lines, as AB and BC, commensurable only in power, and containing a rational B C rectangle, are compounded; the A | ——— | ——— | whole AC shall be irrational, with respect to either of the two, and is called a *first bimedral* line.

But if two medial lines, commensurable only in power, and containing a medial rectangle, be compounded, the whole will be irrational, and is called a *second bimedral* line. Eucl. lib. x. prop. 38 and 39.

BIMINI, in *Geography*, one of the Bahama islands on the west side of the great Bahama bank, near the gulf of Florida. Its compass is about twenty miles, and it has a good harbour. N. lat. 25°. W. long. 79° 34'.

BIMPLEPATAM, or *BIMLIPATAN*, a sea-port town of Hindoostan, on the western side of the bay of Bengal, in the circar of Cicacole, 35 miles S.S.W. of Cicacole. N. lat. 18° 10'. E. long. 83° 15'.

BIMUCRONATUS, in *Entomology*, a species of *SCARABÆUS*, that inhabits Amboyna. It is testaceous; shanks of the anterior legs large, and bearded; shield of the head mucronated on both sides, and bordered with fine hairs.

BINA, in *Geography*, a town of Italy, in the Cremonese, 10 miles N.E. from Cremona.

BINACLE, in *Sea-Language*. See *BITTACLE*.
BINAGARA, in *Ancient Geography*, a town of India, on this side the Ganges. Ptolemy.

BINARD ISLAND, in *Geography*, a long and narrow island on the north coast of France, to the east of Roteneuf point, having entrances at both the east and west end, and within it a sound or bay. It lies to the east of St. Maloes, towards Cancale.

BINAROS, or *VINAROS*, a town of Spain in Valencia, on the confines of Catalonia, near the coast of the Mediterranean, at the mouth of a river, which forms a small harbour, with anchorage at about a cannon-shot from the town, in 6 to 9 fathoms. It is surrounded with walls, and defended by some cannon; 5 miles north of Penniscola, and 20 south of Tortosa.

BINARY NUMBER, that which is composed of two units.

BINARY Arithmetic, a method of computation first proposed by M. Leibnitz; wherein, in lieu of the ten figures in the common arithmetic, and the progression from 10 to 10, he has only two figures, and uses the simple progression from two to two.

Jof. Pelican, of Prague, has more largely explained the principles and practice of the binary arithmetic, in a book entitled, "Arithmeticus perfectus, qui tria numerare nescit," 1712.

All his characters used in this arithmetic are 0 and 1; and the cipher, here, multiplies every thing by 2, as it does in the common arithmetic by 10. Thus, 1 is one; 10,

two; 11, three; 100, four; 101, five; 110, six; 111, seven; 1000, eight; 1001, nine; 1010, ten, &c. being founded on the same principles with the common arithmetic. Hence immediately appears the reason of the celebrated property of the duplicate geometrical proportion in whole numbers; viz. that one number of each degree being had, we may thence compose all the other whole numbers above the double of the highest degree. It being here, v. gr. as if one should say 111 is the sum of 4, 2, and 1, which property may serve assayers to weigh all kinds of masses with a little weight; and may be used in coins, to give several values with small pieces. This method of expressing numbers once established, all the operations will be easy: in multiplication particularly, there will be no need for a table, or getting any thing by heart. The author, however, does not recommend this method for common use, because of the great number of figures required to express a number; adding, that if the common progression were from 12 to 12, or from 16 to 16, it would be still more expeditious: but its use is in discovering the properties of numbers, in constructing tables, &c. What makes the binary arithmetic the more remarkable is, that it appears to have been the same with that used 4000 years ago among the Chinese, and left an *enigma* by Fohi, the founder of their empire, as well as of their sciences. M. Laguy has proposed a new system of logarithms, on the plan of the binary arithmetic; which he finds shorter, more easy, and natural than the common ones.

BINARY, a time in *Music*, consisting of two crotchets, or two minims in a bar.

BINASCO, in *Geography*, a town of Italy, in the Milanese, 10 miles south of Milan.

BINATED LEAF, in *Botany*. See *LEAF*.

BINCHE, in *Geography*, a town of the Netherlands, in the county of Hainaut, situated in a fertile country on the river Hainne; and, according to the French distribution, a place and canton in the district of Charleroy and department of Jemappe. The town contains 3798 persons, and the population of the canton is estimated at 13,908. The extent of the territory comprehends 125 kilometres and 16 communes. Binche was burned by Henry II. of France in 1554, and soon after rebuilt. In 1578, it was taken by John duke of Austria, and retaken in the same year by the duke of Alençon. The Spaniards regained possession of it, and ceded it to France at the peace of Aix-la-Chapelle, but the peace of Nimwegen restored it, together with its jurisdiction, including 51 towns and villages, to Spain. It is distant 8 miles E. S. E. from Mons.

BIND, in *Commerce*, contains 10 strikes of eels, each strike including 25.

BIND-Weed, in *Botany*. See *CONVOLVULUS*.

BIND-Weed, black. See *TAMUS*.

BIND-Weed, rough. See *SMILAX*.

BIND-With. See *CLEMATIS*.

BINDEN, in *Geography*, a town of Switzerland in the Valais, near the river Binna. N. lat. 46° 13'. E. long. 7° 58'.

BINDER-OOZE, the weakest kind of tan-ooze. See *TANNING*.

BINDING JOISTS, in *Architecture*. See *JOISTS*.

BINDING, in the *Art of Defence*, a method of securing or crossing the adversary's sword with a pressure, accompanied with a spring from the wrist. See *BEATING*.

Unless a man, by some kind of cross, secure, as it were, or render his adversary's sword incapable to find him during the time of his performing a lesson upon him, it is impossible for him to be certain, but that he may receive from his adversary, either a fortuitous *contretemps*, or an exchanged thrust,

thrust, before the recovery of his body, or going off after a thrust.

The great objection made by some people, particularly those time-catchers, against the frequent use of *Binding*, is, that when a man, in performing it, cleaves too much to his adversary's sword, he is liable to his adversary's slipping of him, and consequently of receiving either a plain thrust, or one from a feint.

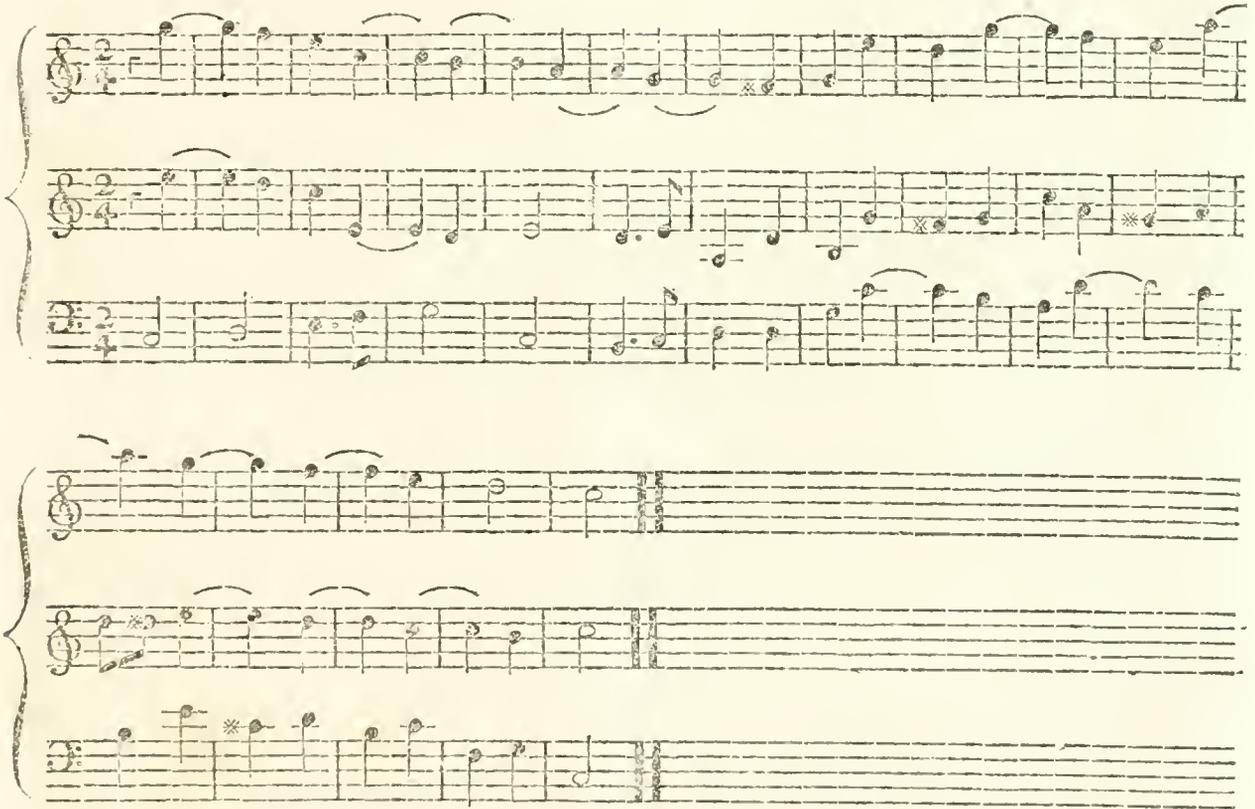

BINDING is a term in *Falconry*, which implies tiring, or when a hawk seizes.

BINDING Books. See *BOOK-Binding*.

BINDING-Notes, in *Music*, imply two or more sounds on the same line or space, that are linked together by a semi-circle; and which, though written or printed twice, are not to be separated, but sustained like a single sound.

The first of these tied or binding-notes, as in preparing discords, is usually struck on the unaccented part of a bar, and continued on the accented part. See *LIGATURE*, and *SYNCOPE*.

Example.

BINETTA, in *Geography*, a town of Italy, in the kingdom of Naples, and country of Bari, 4 miles W.S.W. of Biddetto.

BINGAZI. See BENGASI.

BINGE, a town of France, in the department of the Cote d'Or, and chief place of a canton in the district of Dijon, 10 miles east of Dijon.

BINGEN, a town of Germany, in the circle of the Lower Rhine, and electorate of Mentz or Mayence, and by the French arrangement, the principal place of a canton, in the district of Mayence, and department of Mont-Tonnerre. The town is said to contain 2663 inhabitants, and the canton 5638. It includes 10 communes. The town is seated at the conflux of the Nahe and Rhine. The stone bridge over the former is a noble structure, and the adjoining country is delightful. Bingen is a very ancient town, and was once imperial. The fortifications were destroyed by Lewis XIV. in 1689. A great part of the corn, which is carried into the Rhinegau, the neighbouring palatinate, comes through this place, which, on the other hand, supplies the palatinate with drugs, and various foreign commodities. Besides this

traffic, it has in its vicinity very fruitful vineyards, which produce excellent wine. Near this town the Rhine is compressed into a narrow channel, between two rocks; about a mile and a half below it is a kind of whirl-pool, called the "Bingen-loch," the passage of which is dangerous. At a small distance is also an island on the Rhine, denominated "Maus-turm," or tower of rats; from a tradition, that an archbishop of Mentz was there devoured by these animals, in the tenth century, as a judgment executed on him for his cruelty to the poor, whom he compared to rats eating up the substance of the rich. Bingen is 19 miles W. of Mentz, 30 S. of Coblenz, and 54 E. of Treves. N. lat 49° 54'. E. long. 7° 33'.

BINGENHEIM, a town of Germany, in the circle of the Upper Rhine, and principality of Hesse, 16 miles N.N.E. from Frankfort on the Mayne.

BINGHAM, JOSEPH, in *Biography*, a learned English divine, was born at Wakefield, in Yorkshire, in 1668. Having acquired the rudiments of classical learning at a school in his native town, he was admitted, in 1683, into University-college at Oxford, and in 1687 became fellow. Having taken

taken his master's degree in 1690, he was soon after presented by Dr. Radcliffe, the celebrated physician, to the rectory of Headbourn-Worthy, near Winchester; a preferment which, though not exceeding in value 100*l.* a year, afforded him access to the valuable library at Winchester, and enabled him to prosecute the arduous undertaking, to which, in this retirement, he devoted much of his time and labour. Accordingly, the first volume of his learned work, entitled "Origines Ecclesiasticæ, or the Antiquities of the Christian Church," appeared in 1708. It was completed in ten volumes, 8vo. and contains a judicious and candid, as well as ample account of the Christian clergy and churches from the earliest times. Besides this work, which was the result of much reading and indefatigable application, he published, in 1706, "The French Church's Apology for the Church of England; or the objections of the Dissenters against the Articles, Homilies, Liturgy, and Canons of the English Church, considered and answered upon the principles of the Reformed Church of France, &c." 8vo. His avowed design in this work was to reason Dissenters "into union upon such principles as are common to all the churches of the reformation." However laudable the design, uniformity of sentiment is not likely to be produced by any reasoning, as long as men are allowed to exercise the right of private judgment, and the only practicable union seems to be that which results from mutual forbearance and benevolence. Mr. Bingham likewise published "A Scholastic History of Lay-Baptism," in two parts, 1712, 8vo.; and "A Discourse concerning the Mercy of God to Penitent Sinners." All his works were collected and published in 2 vols. fol. Lond, 1725. Notwithstanding the acknowledged learning and meritorious services of Mr. Bingham, he had no other preferment besides that above-mentioned, till the year 1712, when he was collated to the rectory of Havant near Portsmouth. He died in 1723, and was buried in the church-yard of Headbourn-Worthy, without any monument, of which he declared his dislike in his last will. Biog. Brit.

BINGHAM, in *Geography*, a town of Nottinghamshire, in England, stands nearly in the centre of the vale of Belvoir. It consists principally of two streets, running nearly parallel to each other, with some smaller streets branching from them. Near the centre of the town is a spacious market-place, where a weekly market is held every Thursday; it has also three annual fairs, and a large statute fair yearly for hiring of servants. Bingham is stated by Thoroton to be much reduced since the reformation, as, previously to that event, it contained three chapels, exclusive of the parish church. The latter was collegiate, and is still a large handsome structure, with a tower and spire, side aisles and chancel. It contains numerous monuments, among which is a plain one inscribed to the memory of Robert White, a native of this place, where he died, in 1773, at the advanced age of eighty. He was author of an annual publication, entitled "The celestial Atlas, or New Ephemeris." The rectory of Bingham is esteemed one of the most valuable in the county of Nottingham, and is in the gift of lord Chesterfield, who is lord of the manor. This town is 124 miles north from London. It contains 220 houses, and 1082 inhabitants.

At Aslaston, about two miles east from Bingham, archbishop Craumer was born. About two miles north from Bingham is East-Bridgeford, where are the remains of an entrenchment, and where some coins, urns, &c. have been found. Horsley places the Roman station, Margidunum, "near East-Bridgeford," from its situation near the fens, and from the agreement of distances, between this and

the other stations named in the Itinerary. Thoroton's History of Nottinghamshire.

BINGIUM, in *Ancient Geography*, a town of Gaul, in Germania Prima, west of Mogontiacum; now *Bingen*, which see.

BINGLESTEIN, in *Geography*, a town of Germany, in the circle of Westphalia, and bishopric of Paderborn, 3 miles south of Buren.

BINGO, a small country of Japan, in the island of Nipon, situate in N. lat. about 34° 30'. E. long. 134°.

BINGUM, a town of Germany, in the circle of Westphalia, and county of East Friesland, one mile north-west of Ort.

BINGUT CAPE and BAY, lie about E. by N. from Algiers, on the coast of Africa, in the Mediterranean. The town of Bingut is at the bottom of the bay of its name, about 12 or 13 leagues from Algiers.

BINIESZKY, a town of Lithuania, in the palatinate of Wilna, 44 miles S. E. of Wilna.

BINN, *binna*, a sort of chest or cupboard, wherein to lock up bread, meat, or other provisions.

The word is also used for a place boarded up to put corn in. The pease and oatmeal, used at sea, are apt to spoil in casks. Dr. Hales proposes to prevent this by putting them into large bins, with false bottoms of hair-cloth laid on bars, whereby fresh air may be blown upwards through them, at proper times, with small ventilators.

BINNA, in *Ancient Geography*, a town of Assyria, according to Ptolemy.

BINNINGER, JOHN NICHOLAS, in *Biography*, born at Montbelliard, in 1628, studied medicine at Padua, and then went to Basle, where he was admitted to the degree of doctor in that art in 1652. Returning to his own country, he soon acquired so much fame for his skill in his profession, that he was appointed professor of medicine, and physician to the family of the duke, his sovereign. He left "Observationum et Curationum medicinalium, centuriæ quinque," 8vo. 1673, Montb. containing some curious and valuable observations. Haller. Bib. Med. Eloy. Dict. Hist.

BINNIGUET, in *Geography*, a small island near the west coast of France, about a league south-west of Le Conquet, and $\frac{2}{3}$ west of St. Matthew's point. N. lat. 48° 19'. E. long. 1° 5'.

BINN-NA-BAIRD, and BINN-NA-MUICK-DUIDH; are the names of two lofty mountains, in the parish of Crathy, Aberdeenshire, in Scotland. These eminences are constantly covered with snow, and extending in the same ridge with the Cairngoram mountain, contain the same species of topaz, which bears the name of Cairngoram stones. Emeralds have been sometimes discovered here; also a species of brown silicious stone, which bears a very fine polish.

BINOCLE, or BINOCULAR *Telescope*, from *binus*, double, and *oculus*, eye, in *Optics*, that to which both the eyes may be applied, and consequently the same object be observed at the same time by both. It consists of two tubes, with two sets of glasses of the same power, and adjusted to the same axis; and some have pretended that it represents objects much larger and clearer than a single or monocular glass. But this is perhaps only an illusion, occasioned by the stronger impression, which two equal images alike illuminated make upon the eyes. This method of construction was invented by father Rheita, and brought into use by father Cherubin of Orleans. There are also microscopes of the same kind, but very seldom used.

BINODIS, in *Entomology*, a species of FORMICA, described by Fabricius as a native of Egypt. It is black; head

Head large and rufous; with two tubercles on the pe-
tiole.

BINOMINAL, or **BINOMIAL**, from *bis*, twice, and *nomen*, name, in *Algebra*, a quantity confisting of two terms or members, connected by the sign *plus*, or *minus*.

Thus $a + b$ and $5 - 3$ are binomials, confisting of the sum or difference of those quantities; though the latter is often called *residual*, and by Euclid, *apotome*.

The terms binomial and residual are said to have been first introduced by Robert Recorde. See *ALGEBRA*.

The powers of a binomial are found by a continual multiplication of it by itself, as often as an unit is contained in the index of the power required. Those of a residual, $a - b$, are obtained in the same manner, only with this difference in the result, that the terms in which the exponent of b is an odd number, will be negative.

If a root have three parts, as $a + b + c$, it is called a trinomial; if more, a multinomial.

BINOMIAL, *impossible*, or *imaginary*, in *Algebra*, is used for a binomial, one of the terms of which is an impossible or imaginary quantity: as $a \pm \sqrt{-bb}$ is an impossible binomial.

Dr. Maskelyne, the astronomer royal, has given (in his Introduction to "Taylor's Tables of Logarithms," p. 56.) the following method of finding any power of an impossible binomial, by another similar binomial. The logarithms of a and b being given, it is required to find the power of the

impossible binomial $a \pm \sqrt{-b^2}$ whose index is $\frac{m}{n}$, that is

to find $(a \pm \sqrt{-b^2})^{\frac{m}{n}}$ by another impossible binomial; and

thence the value of $(a + \sqrt{-b^2})^{\frac{m}{n}} + (a - \sqrt{-b^2})^{\frac{m}{n}}$, which is always possible, whether a or b be the greater of the two.

Solution. Put $\frac{b}{a} = \text{tang. } z$. Then

$$(a \pm \sqrt{-b^2})^{\frac{m}{n}} = (a^2 + b^2)^{\frac{m}{2n}} \times (\text{cof. } \frac{m}{n} z \pm \sqrt{-\text{fin. } \frac{2m}{n} z}).$$

Hence $(a + \sqrt{-b^2})^{\frac{m}{n}} + (a - \sqrt{-b^2})^{\frac{m}{n}} = (a^2 + b^2)^{\frac{m}{n}} \times 2$

$$\text{cof. } \frac{m}{n} z = a \times \text{fec. } z)^{\frac{m}{n}} \times 2 \text{ cofin. } \frac{m}{n} z = (b \times \text{cofec. } z)^{\frac{m}{n}}$$

$$\times 2 \text{ cofin. } \frac{m}{n} z, \text{ where the first or second of these two last}$$

expressions is to be used, according as z is an extreme or mean arc; or rather, because $\frac{b}{a}$ is not only the tangent of z but also of $z + 360^\circ$, $z + 720^\circ$, &c.; therefore the factor in the answer will have several values, viz.

$$2 \text{ cof. } \frac{m}{n} z; 2 \text{ cof. } \frac{m}{n} (z + 360^\circ); 2 \text{ cof. } \frac{m}{n} (z + 720^\circ);$$

&c.; the number of which, if m and n be whole numbers, and the fraction $\frac{m}{n}$ be in its least terms, will be equal to the

denominator n ; otherwise infinite.

By *Logarithms*. Put $\log. b + 10 - \log. a = \log. \text{tan. } z$.

$$\text{Then } \log. \left((a + \sqrt{-b^2})^{\frac{m}{n}} + (a - \sqrt{-b^2})^{\frac{m}{n}} \right) = \frac{m}{n}$$

$$\times (10 + 10 - \text{l. cof. } z) + \text{l. } 2 + \text{l. cof. } \frac{m}{n} z - 10 = \frac{m}{n}$$

$$\times (\text{l. } b + 10 - \text{l. fin. } z) + \text{l. } 2 + \text{l. cof. } \frac{m}{n} z - 10; \text{ where}$$

the first or second expression is to be used, according as z is

an extreme or mean arc. Moreover, by taking successively,

$$\text{l. cof. } \frac{m}{n} z; \text{l. cof. } \frac{m}{n} (z + 360^\circ); \text{l. cof. } \frac{m}{n} (z + 720^\circ), \&c.$$

there will arise several distinct answers to the question, agreeable to the remark above

BINOMIAL furd, is used for a binomial, the terms of which are furds; as $\sqrt{a} + \sqrt{b}$, or $a^m + b^n$, if m and n be fractions. The term binomial furd is also applied to any quantity having a rational part and a furd part, as $25 + \sqrt{968}$. Euclid enumerates six kinds of binomial lines or furds in the 10th book of his "Elements," which are exactly similar to the six residuals or apotomes, of which he has also treated in the same place. See *APOTOME*. These apotomes become binomials by merely changing the sign of the latter term from *minus* to *plus*, and they are as follow: 1st. $3 + \sqrt{5}$; 2d. $\sqrt{18} + 4$; 3d. $\sqrt{24} + \sqrt{18}$; 4th. $4 + \sqrt{3}$; 5th. $\sqrt{6} + 2$; 6th. $\sqrt{6} + \sqrt{2}$.

For the extraction of roots of binomial furds, see Newton's *Arithmetica Universalis*; St. Gravesande's *Commentary*; and Mac Laurin's *Algebra*, p. 114—130. See *SURD*.

BINOMIAL Curve, is used for a curve, the ordinate of which is expressed by a binomial. Thus, if the ordinate of a

curve be of this form $x + e + \sqrt{ax}$, the curve is called a binomial curve. Stirling's *Method. Diff.* p. 58.

BINOMIAL Theorem, is a general algebraical expression, or formula, by which any power or root of a quantity, consisting of two terms, is expanded into a series.

It is also frequently called the Newtonian theorem, or Newton's binomial theorem, on account of his being commonly considered as the inventor of it, as he undoubtedly was, at least in the case of fractional indices, which includes all the other particular cases of powers, divisions, &c.

This celebrated theorem, as proposed in its most general form, may be exhibited in a manner nearly similar to that of Newton, as follows:

$$\begin{aligned} a + x^{\frac{m}{n}} &= a^{\frac{m}{n}} \times \left(1 + \frac{m}{n} \left(\frac{x}{a} \right) + \frac{m}{n} \cdot \frac{m-n}{2n} \left(\frac{x}{a} \right)^2 + \right. \\ &\frac{m}{n} \cdot \frac{m-n}{2n} \cdot \frac{m-2}{3n} \left(\frac{x}{a} \right)^3 + \&c. \text{ Or, } a + x^{\frac{m}{n}} = a^{\frac{m}{n}} \times \\ &: 1 + \frac{m}{n} A \left(\frac{x}{a} \right) + \frac{m-n}{2n} B \left(\frac{x}{a} \right) + \frac{m-2n}{3n} C \left(\frac{x}{a} \right) + \\ &\left. \frac{m-3n}{4n} D \left(\frac{x}{a} \right) + \&c. \right. \end{aligned}$$

Where a, x , are the two terms of the binomial, $\frac{m}{n}$ the index, and A, B, C, D, &c. each preceding term, including their signs $+$ or $-$, the terms of the series being all positive when x is positive, and alternately positive and negative when x is negative, independently however of the effect of the coefficients made up of m and n , which may be any numbers whatever, positive or negative.

A few easy examples, in the extraction of roots, will be sufficient to shew the application of the theorem in all similar cases. For this purpose, let it be required to find the

square root of $a + b$, or $a + b^{\frac{1}{2}}$, and the cube root of $a - b$,

or $a - b^{\frac{1}{3}}$; in the first of which $\frac{m}{n} = \frac{1}{2}$ and in the se-

cond $\frac{m}{n} = \frac{1}{3}$.

$$\begin{aligned} \text{Then } a + b^{\frac{1}{2}} &= a^{\frac{1}{2}} \left[1 + \frac{1}{2} \left(\frac{b}{a} \right) - \frac{1}{2 \cdot 4} \left(\frac{b}{a} \right)^2 + \frac{3}{2 \cdot 4 \cdot 6} \right. \\ &\left. \left(\frac{b}{a} \right)^3 - \frac{3 \cdot 5}{2 \cdot 4 \cdot 6 \cdot 8} \left(\frac{b}{a} \right)^4, \&c. \right. \end{aligned}$$

BINOMIAL.

And $\overline{a-b}^{\frac{1}{3}} = a^{\frac{1}{3}} \left[1 - \frac{1}{3} \left(\frac{b}{a}\right) - \frac{1}{3^2} \left(\frac{b}{a}\right)^2 - \frac{5}{3^3} \left(\frac{b}{a}\right)^3 - \frac{5 \cdot 8}{4 \cdot 3^4} \left(\frac{b}{a}\right)^4, \&c. \right]$

And, in the same manner, if 1, divided by the cube root of the square of $a \pm b$, be converted into a series, we shall

have $\frac{1}{a \pm b^{\frac{2}{3}}} = \frac{1}{a^{\frac{2}{3}}} \left[1 \mp \frac{2}{3} \left(\frac{b}{a}\right) + \frac{2 \cdot 5}{2 \cdot 3^2} \left(\frac{b}{a}\right)^2 \mp \frac{2 \cdot 5 \cdot 7}{2 \cdot 3^3} \left(\frac{b}{a}\right)^3, \&c. \right]$

But these series are only comedious in calculation, in proportion to their degree of convergency. For if N be made to represent the rank which any term holds in the series arising from the binomial $a - b$ being raised to the m th power, then that term will be to the following one as 1 to $\frac{b}{a} \times \frac{m - N + 1}{N}$; from which it is evident, that for the terms of the series to go on decreasing, $b \times m - N + 1$, taken positively, must be always less than aN .

With respect to the history of this theorem, the prevailing opinion, till within these few years, has been, that it was not only invented by Newton, but first given by him in that state of perfection, in which the terms of the series, for any assigned power whatever, can be found, independently of the terms of the preceding powers: viz. the second term from the first, the third from the second, the fourth from the third, and so on, by a general rule. But it has since been found, that in the case of integral powers, the theorem had been described by Briggs, in his "Trigonometrica Britannica," long before Newton was born; and that, by the general law of the terms, independently of those of the preceding powers. For, as far as regards the generation of the coefficients of the terms of one power from those of the former ones, successively one after another, it was remarked by Vieta, Oughtred, and many others; and was not unknown to much more early writers on arithmetic and algebra, as will be manifest by a slight inspection of their works, as well as the gradual advance the property made, both in extent and perspicuity, under the hands of the latter authors, most of whom added something more towards its perfection.

The knowledge, indeed, of this property of the coefficients of the terms of the integral powers of a binomial, is, at least, as old as the practice of the extraction of roots, of which it is both the foundation and principle. And as the writers on arithmetic became acquainted with the nature of the coefficients in the higher powers, they extended the extraction of roots accordingly, still making use of this property. At first, they appear to have been only acquainted with the nature of the square, the coefficients of which are the three terms, 1, 2, 1; and, by their means, extracted the square roots of numbers, but went no farther. The nature of the cube next presented itself, which consists of the coefficients, 1, 3, 3, 1; and, by means of these, they extracted the cube roots of numbers, in the same way as is practised at present. And this was the extent of their extractions, in the time of Lucas de Burgo, who, from 1470 to 1500, wrote several tracts on arithmetic, containing the substance of what was then known of this science.

It was not long, however, before the nature of the coefficients of all the higher powers became known, and tables formed for constructing them indefinitely. For, in the year 1543, Michael Stifelius, a German, published an excellent work on arithmetic and algebra, under the title of *Arithmetica Integra*, in which he gives the following table, for

constructing both figurate numbers and the coefficients of the terms of the various powers of a binomial, which, since his time, has been often used for these and other purposes; and, more than a century after, was, by Pascal, otherwise called the arithmetical triangle, and of which he has commonly been called the inventor, though he only mentioned some of its additional properties.

In this table Stifelius observes, that the horizontal lines furnish the coefficients of the terms of the correspondent powers of a binomial; and teaches how to use them in extracting the roots of all powers whatever. The same table was also used, for a similar purpose, by Cardan, Stevin, and other writers on arithmetic; and it is highly probable that it was known much earlier than the time of Stifelius, at least as far as regards the progressions of figurate numbers, which had been amply treated of by Nicomachus, who lived, according to some, before Euclid, but not till long after him, according to others; and whose work on arithmetic was published at Paris in 1538, and is supposed to have been chiefly copied in the treatise on the same subject by Boethius.

The contemplation of this table has also, probably, been attended with the invention and extension of some of our most curious discoveries in mathematics, both with respect to the powers of a binomial, the consequent extraction of roots, the doctrine of angular sections by Vieta, and the differential method of Briggs, and others. For a few of the powers or sections being once known, the table would be of the greatest use in discovering and constructing the rest; and accordingly it appears to have been used, on many occasions of this kind, by Stifelius, Cardan, Stevin, Vieta, Briggs, Oughtred, Mercator, Pascal, &c.

But although the nature and construction of this table were thus early known, and employed in raising powers and extracting roots, it was yet only by raising the numbers from one another, by continual additions, and taking them from the table for use when wanted; till Briggs first pointed out the way of raising any horizontal line in the table, by itself, without any of the preceding lines; and thus teaching to raise the terms of any integral powers of a binomial independently of any other powers; which was, in fact, giving the substance of the binomial theorem in words, but wanting the notation in symbols.

It may, however, be fairly questioned, whether Briggs knew how, even in the case of an integral exponent, to exhibit the law of the formation of the coefficients, under the form $\frac{m(m-1) \cdot (m-2) \dots (m-n+1)}{1 \cdot 2 \cdot 3 \dots n}$; for, though his method of forming the successive coefficients amounts to nearly

BINOMIAL.

nearly the same thing, yet the advancement in analysis depended on the circumstance of the law which they observe, being expressed by means of a general symbol (m); without which, its extension would never have been made to those cases in which the index is negative or fractional: so that Briggs, even in the case of integral powers, does not appear to be fully entitled to the invention of the binomial theorem, properly so called.

But however this may be, it is universally agreed that no one before Newton had ever thought of extracting roots by means of infinite series. He was the first who happily discovered, that, by considering roots as powers having fractional exponents, the same binomial series would equally serve for them all, whether the index should be fractional or integral, or the series finite or infinite; and from this extension of the theorem, some of the most important improvements, in the higher departments of mathematics, have arisen; particularly in the construction of logarithms, and the doctrine of series in general, which have since been carried to a great degree of perfection, and now form some of the most curious and interesting branches of analytics.

It may also be farther observed, with respect to the claim of Newton as an original inventor of this highly useful theorem, that he had probably never seen the *Arithmetica Logarithmica* of Briggs; for it is well known that he was not an extensive reader of mathematical works, depending more on the powers of his own genius than upon any helps of this kind: so that there can be but little doubt of his having made the discovery himself, without receiving any light from what had been done by Briggs; and that he conceived the theorem to be new for all powers in general, as it was for roots and quantities with fractional indices.

But though this appears to be the case with respect to Newton, it is yet surprising that Dr. Wallis, who was a general reader of most mathematical works, and who had actually seen Briggs's *Arithmetica Logarithmica*, as he mentions it in page 60, chap. xii. of his *Algebra*, should not have attended enough to this curious treatise, to know that it contained such a new and excellent theorem, as it fully appears he did not; since, in the 85th chapter of the above-mentioned work, he ascribes the invention entirely to Newton; and adds, that he himself had fought after such a rule, but without success. It is also no less singular, that John Bernoulli, not half a century since, should first dispute the invention of this theorem with Newton, and afterwards give the discovery of it to Pascal, who was not born till long after it had been taught by Briggs. (See Bernoulli's works, vol. iv. p. 173).

Dr. Wallis's *Algebra* was published in the year 1685; and it was here, for the first time after Newton's discovery of it, that the binomial theorem, according to his general manner of expressing it, appeared in print, and was made known to the learned world; though Leibnitz, and probably Dr. Barrow (who was Newton's great friend and patron in his youth), as well as some other mathematicians of that time, had seen it, in a letter addressed to Mr. Oldenburgh, of October 24th 1676, (which was given in the *Commercium Epistolicum*), soon after the said letter was written. But he no where tells us his manner of investigating it; nor is any demonstration of it to be found, even in the case where the index is a whole number, in any part of his works. He says, indeed, in his next letter to Oldenburgh, to be found in the same work, that the occasion of its discovery was as follows:

"Not long (he observes) after I had ventured upon the study of the mathematics, whilst I was perusing the works of the celebrated Dr. Wallis, and considering the series of

universal roots, by the interpolation of which we exhibit the area of the circle and hyperbola: for instance, in this series of curves, whose common base or axis is x , and the respective ordinates $\sqrt{1-x^2}$, $\sqrt{1-x^2}$, $\sqrt{1-x^2}$, $\sqrt{1-x^2}$, $\sqrt{1-x^2}$, $\sqrt{1-x^2}$, &c. I observed that if the areas of the alternate curves, which are x , $x - \frac{1}{3}x^3$, $x - \frac{2}{3}x^3 + \frac{1}{5}x^5$, $x - \frac{3}{3}x^3$

$+ \frac{3}{5}x^5 - \frac{1}{7}x^7$, &c. could be interpolated, we should, by this means, obtain the areas of the intermediate ones, the first of which $\sqrt{1-x^2}$ is the area of the circle. In order to this it was evident, that in each of these series the first term was x , and that the second terms $\frac{0}{3}x^3$, $\frac{1}{3}x^3$, $\frac{2}{3}x^3$, $\frac{3}{3}x^3$, &c. were in arithmetical progression; and consequently the first three terms of the series to be interpolated must be $x - \frac{1}{3}\left(\frac{1}{2}x^3\right)$, $x - \frac{1}{3}\left(\frac{3}{2}x^3\right)$, $x - \frac{1}{3}\left(\frac{5}{2}x^3\right)$, &c.

"Now, for the interpolation of the rest, I considered that the denominators 1, 3, 5, 7, &c. were, in all of them, in arithmetical progression; and consequently the whole difficulty consisted in discovering the numeral coefficients: but these, in the alternate areas which are given, I observed were the same with the figures of which the several ascending powers of the number 11 consist, viz. 11², 11¹, 11⁰, 11¹, 11², &c. that is, the first, 1; the second, 1, 1; the third, 1, 2, 1; the fourth, 1, 3, 3, 1; the fifth, 1, 4, 6, 4, 1, &c.

"I applied myself, therefore, to discover a method by which the first two figures of this series might be derived from the rest; and I found, that if for the second figure, or numeral term, I put m , the rest of the terms would be produced by the continual multiplication of the terms of this series, $\frac{m-0}{1} \times \frac{m-1}{2} \times \frac{m-2}{3} \times \frac{m-3}{4} \times \frac{m-4}{5}$, &c.

"For instance, if the second term be put for 4, there will arise $4 \times \frac{m-1}{2}$, that is 6, which is the third term; the fourth term will be $6 \times \frac{m-2}{3}$, that is 4; the fifth term will be $4 \times \frac{m-3}{4}$, that is 1; and the sixth term will be $4 \times \frac{m-4}{5}$, that is 0, which shews the series is here terminated, in this case.

"This being found, I applied it, as a rule, to interpolate the above-mentioned series. And since, in the series which expresses the circle, the second term was found to be $\frac{1}{3}\left(\frac{1}{2}x^3\right)$, I therefore put $m = \frac{1}{2}$; and there was produced the terms $\frac{1}{2} \times \frac{1}{2}\left(\frac{1}{2} - 1\right)$ or $-\frac{1}{8}$; $-\frac{1}{8} \times \frac{1}{3}\left(\frac{1}{2} - 2\right)$ or $+\frac{1}{16}$; $\frac{1}{16} \times \frac{1}{4}\left(\frac{1}{2} - 3\right)$ or $-\frac{5}{128}$, and so on *ad infinitum*. Hence I found that the area of the segment of the circle sought is $x - \frac{1}{2}\left(\frac{1}{3}x^3\right) - \frac{1}{8}\left(\frac{1}{5}x^5\right) - \frac{1}{16}\left(\frac{1}{7}x^7\right) - \frac{5}{128}\left(\frac{1}{9}x^9\right)$ &c.

"In the same manner, the areas to be interpolated of the other curves might be produced; as also the area of the hyperbola,

BINOMIAL.

hyperbola, and the rest of the alternate curves in the series $1+x^2$, $1+x^2$, $1+x^2$, $1+x^2$, &c.; and in a similar way might other series be likewise interpolated, and that even if they should be taken at two more intervals.

"This was the way by which I first opened an entrance into these speculations, which I should not have remembered, but that, in turning over my papers, a few weeks ago, I, by chance, cast my eyes upon those relating to this matter.

"After I had proceeded so far, it immediately occurred to me that the terms $1-x^2$, $1-x^2$, $1-x^2$, $1-x^2$, &c. that is, 1 , $1-x^2$, $1-2x^2+x^4$, $1-3x^2+3x^4-x^6$, &c. might be interpolated in the same manner as I had done in the case of the areas generated by them: and for this, there required nothing more than to leave out the denominators, 1 , 3 , 5 , 7 , &c. in the terms that express the areas; then the coefficients of the terms to be interpolated ($1-x^2$, $1-x^2$, or univ ersally $1-x^2$) will be had by the continual multiplication of the terms of the series $m \times \frac{m-1}{2} \times \frac{m-2}{3} \times \frac{m-3}{4}$ &c.

"Thus, for example, $1-x^2 = 1 - \frac{1}{2}x^2 - \frac{1}{8}x^4 - \frac{1}{16}x^6$ &c.; and $1-x^2 = 1 - \frac{3}{2}x^2 - \frac{3}{8}x^4 - \frac{3}{16}x^6$ &c.; and $1-x^2 = 1 - \frac{1}{3}x^2 - \frac{1}{9}x^4 - \frac{5}{31}x^6$ &c.

"Thus, I discovered a general method of reducing radical quantities into infinite series, by the binomial theorem, which I sent in my last letter, before I observed that the same thing might be obtained by the extraction of roots.

"But after I had discovered this method, the other way could not long remain unknown; for, in order to prove the truth of these operations, I multiplied $1 - \frac{1}{2}x^2 - \frac{1}{8}x^4 - \frac{1}{16}x^6$ &c. by itself, and found the product to be $1-x^2$, all the terms after these *ad infinitum* vanishing: in like manner $1 - \frac{2}{3}x^2 - \frac{1}{9}x^4 - \frac{5}{81}x^6$ &c. being twice multiplied into itself, produced $1-x^2$. And as this was a certain proof of the truth of these conclusions, I was thereby naturally led to try the converse of it, viz. whether these series, that were now known to be the roots of the quantity $1-x^2$, might not be produced by the rule for extraction of roots in arithmetic; and, upon trial, I found it succeed to my wishes.

"This being found, I laid aside the method of interpolation, and assumed these operations, as a more genuine foundation to proceed upon. In the mean time, I was not ignorant of the way of reduction by division, which was so much easier."

From this account, as given by Newton himself, it appears that his discovery of the law for the areas, with irrational ordinates, preceded that of the law for the expansion of those ordinates; although the latter, as Montucla observes, might have been expected to precede the former, if inventive genius always pursued the most easy method. But, in tracing the progress of the human mind, it may generally be observed, that a collection of discoveries in any branch of science, is seldom found to be a series of regular deductions; but, on the contrary, we often discern therein many

anticipations, and sometimes even a reversion of the natural and logical order of ideas.

It is worth while here to remark, that Newton had made these discoveries, as well as many others, several years before Mercator had published his "Logarithmotechnia," which contains a particular case of this theory; but, from an excess of modesty and indifference for these fruits of his genius, he delayed making them known to the world: and, even after the above-mentioned work had appeared, which would have operated as a powerful motive with most other men, in exciting them to share in the glory of these brilliant inventions, he was still more confirmed in the resolution he had taken, of not making himself known as an author till he was of a more mature age. He conceived, that Mercator having discovered, as it was said, the series for the hyperbola, would not be long before he extended his method to the circle, and other curves; or, if this should not be done by him, the invention would be readily perceived by others. In short, it appears rather singular, that as Mercator had

converted the expression $\frac{1}{1+x}$ into an infinite series, by the ordinary method of division, he should not have tried to discover the series for $\sqrt{1 \pm x^2}$ by the known method of extracting the square root; but this, though extremely obvious, escaped his notice: and many circumstances, of a similar kind, are to be found in the history of the sciences.

Newton, as has been already observed, left no demonstration of this theorem; but appears to have formed it merely from an induction of particular cases; and though no doubt can be entertained of its truth, having been found to succeed in all the instances in which it has been applied; yet, agreeably to the rigour that ought to be observed in the establishment of every mathematical theory, and especially in a fundamental theorem of such general use and application, it is necessary that as regular and strict a proof should be given of it as the nature of the subject, and the state of analysis, can afford.

One of the first demonstrations of this kind that appears to have been given, is that of James Bernoulli, which is to be found, among several other curious things, in a small treatise of his, entitled "Ars Conjectandi," which has been very improperly omitted in the collection of his works, published by his nephew, Nicholas Bernoulli. But this is only applied to the case of integral and affirmative powers, and is nearly the same with that which was afterwards given by Mr. John Stewart, in his commentary on sir Isaac Newton's quadrature of curves. It is founded on the doctrine of combinations, and the properties of figurate numbers, which are there shewn to involve in them the generation of these coefficients; and in the instance before mentioned, where the index of the binomial is a whole positive number, it is clearly and satisfactorily explained.

Since that time, many attempts have been made to demonstrate the general case, or that where the index of the binomial is either a whole number or a fraction, positive or negative; but most of these demonstrations having been conducted, either by the method of increments, the multinomial theorem of De Moivre, or by fluxions, are commonly thought to be unsatisfactory and imperfect; and it should seem not without reason; as, independently of other objections, it appears contrary to the principles of science, as well as to just reasoning, to employ, in a matter purely algebraical, notions and doctrines derived from other branches, or from an analysis which is in some sort transcendental.

For these reasons, several eminent mathematicians have endeavoured to investigate this formula on pure analytical principles,

BINOMIAL.

iples, in a more natural and obvious way; one of the first of these attempts being that of Landen, in his "Discourse concerning the residual analysis," and the next that of Epinus, in the eighth volume of the "New Petersburg Memoirs." But the legitimacy of the former may be objected to, as depending upon vanishing fractions, and other considerations of too difficult and abstract a nature to be regarded as sufficiently convincing; and the latter, though very ingenious, is not less difficult and embarrassing: at least, such is the opinion of Euler, who having himself first given a demonstration of this theorem, in which, like Maclaurin, he employed the differential calculus, or method of fluxions, was afterwards led to deduce it from the principles of algebra alone: though he does not appear to have been much more successful than either of the former.

S. Lhuillier of Geneva, perceiving the defects and obscurity of these methods, has made a new demonstration of this formula in one of the preliminary articles of his excellent work, entitled, "Principiorum calculi differentialis et integralis, &c." which is purely elementary; and abating from its length, and a fatiguing detail of particulars, which the nature of the subject does not seem to require, he appears to have accomplished his object; at least as far as the method he adopted would allow; for it must be confessed, that neither this, nor any other investigation that had hitherto appeared, have been attended with the simplicity and strictness which could be desired.

The reason of this, as Dr. Woodhouse properly observes, in his "Principles of Analytical Calculation," seems to be, that most mathematicians appear to have sought for some high origin of this theorem, distinct from the simple operations of multiplication, division, extracting of roots, &c.: and instead of considering the nature of the operations it was known to comprehend, hoped to supersede them by deductions drawn from abstruse and fine theories: whereas it is clear that whatever imperfections these fundamental operations are attended with, are also attached to the binomial theorem, which, in a certain sense, may be said to be a method of trial and conjecture. For, as this formula is only meant to express, in general terms, the algebraical rules above mentioned, it cannot possess a greater degree of certainty than is possessed by the simple operations themselves.

To avoid entering into a too prolix investigation of the well known and simple elements upon which the general formula depends, it is sufficient to observe that it is clearly manifest from some of the first and most common rules of algebra, that whatever is the operation which the index (m) in $(a+x)^m$ directs to be performed upon the binomial $a+x$, whether of continued multiplication, or elevation, or of division, or of extraction of roots, the terms of the resulting series will necessarily arise by regular and whole positive powers of x ; and that the two first terms of this series will always be $a^m + ma^{m-1}x$; so that the entire expansion of it may be represented under the form $a^m + ma^{m-1}x + px^2 + qx^3 + rx^4$, &c.

For, omitting the practical part of the process, which is taught by the above mentioned rules, it will constantly be found, by performing the operations at length in the usual way, that

$$\begin{aligned} \overline{a+x}^2 &= a^2 \pm 2ax + x^2 \\ \overline{a+x}^3 &= a^3 \pm 3a^2x + 3a^2x^2 \pm x^3 \\ \overline{a+x}^4 &= a^4 \pm 4a^3x + 6a^2x^2 \pm 4ax^3 + x^4 \\ &\quad \&c. \&c. \end{aligned}$$

$$\frac{1}{\overline{a+x}} = a^{-1} \mp a^{-2}x + a^{-3}x^2 \mp a^{-4}x^3, \&c.$$

$$\begin{aligned} \frac{1}{\overline{a+x}^2} &= a^{-2} \mp 2a^{-3}x + 3a^{-4}x^2 \mp 4a^{-5}x^3, \&c. \\ \frac{1}{\overline{a+x}^3} &= a^{-3} \pm 3a^{-4}x + 6a^{-5}x^2 \pm 10a^{-6}x^3, \&c. \\ &\quad \&c. \&c. \end{aligned}$$

$$\begin{aligned} \overline{a+x}^{\frac{1}{2}} &= a^{\frac{1}{2}} \pm \frac{1}{2}a^{-\frac{1}{2}}x - \frac{1}{8}a^{-\frac{3}{2}}x^2 \pm \frac{1}{16}a^{-\frac{5}{2}}x^3, \&c. \\ \overline{a+x}^{\frac{1}{3}} &= a^{\frac{1}{3}} \pm \frac{1}{3}a^{-\frac{2}{3}}x - \frac{1}{9}a^{-\frac{4}{3}}x^2 \pm \frac{5}{81}a^{-\frac{8}{3}}x^3, \&c. \\ \overline{a+x}^{\frac{2}{3}} &= a^{\frac{2}{3}} \pm \frac{2}{3}a^{\frac{1}{3}}x - \frac{1}{9}a^{-\frac{1}{3}}x^2 \pm \frac{2}{81}a^{-\frac{5}{3}}x^3, \&c. \\ &\quad \&c. \&c. \end{aligned}$$

$$\begin{aligned} \frac{1}{\overline{a+x}^{\frac{1}{2}}} &= a^{-\frac{1}{2}} \pm \frac{1}{3}a^{-\frac{3}{2}}x + \frac{2}{9}a^{-\frac{5}{2}}x^2 \pm \frac{7}{81}a^{-\frac{7}{2}}x^3 \&c. \\ \frac{1}{\overline{a+x}^{\frac{1}{3}}} &= a^{-\frac{1}{3}} \pm \frac{2}{3}a^{-\frac{4}{3}}x + \frac{5}{9}a^{-\frac{5}{3}}x^2 \mp \frac{20}{81}a^{-\frac{11}{3}}x^3, \&c. \\ &\quad \&c. \&c. \end{aligned}$$

In all the instances here given, it is apparent, that the first term of the series, in each of them, is the same as the power or root of the first term of the binomial quantity to which it belongs; and that the coefficient of x in the second term is always had by multiplying the index of the first term into that term, having its index diminished by 1; and as these cases are of the same kind with those that are designed to be expressed, in universal terms, by the general formula, it is in vain, as far as regards the two first terms of the expansion, to look for any other origin of them, than what may be derived from these and similar operations.

Assuming therefore, $\overline{a+x}^m = a^m + ma^{m-1}x + px^2 + qx^3 + rx^4$, &c. it only remains to determine the value of the coefficients p, q, r , &c. and to shew the law of their dependence on the index (m) of the operation by which they are produced.

For this purpose, let m denote any number whatever, integral or fractional, positive or negative; and let the coefficients of the 3d, 4th, 5th, &c. terms of the m th power of any binomial be denoted by p', q', r' , &c.

Then for x , in the above form, put $y+z$, and there will arise $\overline{a+y+z}^m = \overline{a+y+z}^m = \overline{a+y+z}^m$; which are all identical expressions; and when expanded according to the proper forms, must be equal to each other.

But $\overline{a+y+z}^m = a^m + ma^{m-1}(y+z) + p(y^2 + 2yz, \&c.) + q(y^3 + 3y^2z, \&c.)$ &c. (omitting to set down the higher powers of z , which are not wanted in the demonstration) $= a^m + ma^{m-1}y + py^2 + qy^3$ &c. $+ ma^{m-1}z + 2pyz + 3qyz$, &c.

And $\overline{a+y+z}^m = \overline{a+y}^m + m.a^{m-1}y^{m-1}z$, &c. $= \overline{a+y}^m + mz(a^{m-1} + m-1.a^{m-2}y + p'y^2 + q'y^3, \&c.) = a^m + ma^{m-1}y + py^2 + qy^3$, &c. $+ ma^{m-1}z + m.m-1.a^{m-2}yz + mp'y^2z + mq'y^3z$, &c. Hence the two series being identical, $a^m + ma^{m-1}y + py^2 + qy^3$ &c. $+ ma^{m-1}z + 2pyz + 3qyz$, &c. $= a^m + ma^{m-1}y + py^2 + qy^3$ &c. $+ ma^{m-1}z + m.m-1.a^{m-2}yz + mp'y^2z + mq'y^3z$, &c. or, leaving out the terms common to each, $2pyz + 3qyz$ &c. $= m.m-1.a^{m-2}yz + mp'y^2z$, &c.

And since the coefficients of the terms involving the same powers of the arbitrary quantities y and z must be the same, we shall have $2p = m.m-1.a^{m-2}$, or $p = \frac{m.m-1}{2} a^{m-2}$;

and hence $p' = \frac{m-1.m-2}{2} a^{m-3}$. Also $3q = mp' =$

$$\frac{m \cdot m - 1 \cdot m - 2}{2} a^{m-3}, \text{ or } q = \frac{m \cdot m - 1 \cdot m - 2}{2 \cdot 3} a^{m-3}; \text{ and fo}$$

on.
From which it follows, that $(a+x)^m = a^m + m \cdot a^{m-1} x + \frac{m \cdot m - 1}{2} a^{m-2} x^2 + \frac{m \cdot m - 1 \cdot m - 2}{2 \cdot 3} a^{m-3} x^3$ &c. univerfally, whatever may be the value of m , whether integral or fractional, positive or negative, as was to be fhewn.

The demonftration here given (which is fimilar to that in vol. ii. of Manning's Algebra) is founded upon the principles firft laid down by la Grange, in his "Theorie des Fonctions Analytiques;" to which admirable work the reader is referred for farther information on this fubject, as well as for whatever regards the doctrine of expanded functions in general, which is there treated of in a way worthy the genius of the author.

BINOMIUS, from *bis* and *nomen, name*, in *Middle Age Writers*, denotes a perfon with two names.

Moft Christians anciently were called binomii, as having had other names in their heathen ftate, which they changed at their converfion. Befides, it was an ancient cuftom for parents to give names to their children immediately after they were born, and fometimes other different ones afterwards at their baptifm; one of which frequently became a *cognomen*, or furname. In reality, it was a conftant practice to affume a new name at baptifm, as the religious ftill do in the Romifh church, on their reception into the monaftic ftate; or the Jewifh profelytes at their circumcifion.

BINOTATA, in *Entomology*, a fpecies of **CHRYSOMELA**, found in Denmark. This is teftaceous, with the wing-cafes ferruginous at the bafe. Gmelin.

BINOTATA, a fpecies of **CICADA** (*Membracis Foliacea*). This infect inhabits New Holland; the thorax is flightly armed, and produced behind; abdomen fhort and teftaceous; with a black fpot at the bafe of the wing-cafes. Fabricius, &c.

BINOTATUS, an European fpecies of **CARABUS**, of a black colour, with two red fspots in front of the head, and the antennæ yellow at the bafe. Fabricius.

BINOTATUS, a fpecies of **CIMEX** (*Reduvius*), found in Surinam. It is black above, with a rufous dot at the apex of each of the wing-cafes. Fabricius.

BINTAM, in *Geography*, one of the chief towns of the kingdom of Yhor or Jor. See **MALACCA**.

BINTAN, one of the fmall iflands at the fouth end of the ftraits of Malacca, and nearly north from Lingan ifland.

BINTHA, in *Ancient Geography*, a town of Libya interior, near the Niger, according to Ptolemy.—Alfo, a place in Afta, in Ofrhoenè, according to the Notitia Imperii.

BINTSCHAY, in *Geography*, a town of Bohemia, in the circle of Boheflaw. 7 miles north-eaft of Turnau.

BINWY HEAD, a cape of Ireland, on the north-weft coaft of the county of Mayo. N. lat. 54° 20'. W. long. 9° 36'.

BIOBIO, or **VIOVIO**, a river of Chili, in South America. Its fource is among the filver mines, in the mountains called *Sierra belluda*; it receives the fstreams of the Huequen and Tolpan, before it reaches Santa Fee, where it firft becomes navigable, and from whence, to its mouth, for the diftance of 33 leagues, its courfe is nearly from eaft to weft.

The new city of Mocha, peopled by inhabitants who removed from Conception twelve years ago, is fituated on its north bank, about twelve miles from the fea, and is a depot for the filver from the mines of Nimino, and for the gold with which its fands abound.

The mouth of this river is in S. lat. 36° 45'. W. long. 73° 28'; and its entrance known by two remarkable hills, called the Teats of Biobio, which are fituated at the north, betwixt it and the bay of Conception, and ferve to both as land-marks for navigators.

The river is about one mile acrofs at the mouth, has good depth of water in the middle, and the tide riles about feven feet and a half at the full and change of the moon.

BIOCOLYTÆ, in the *Byzantine Empire*, an order of officers appointed to prevent the violences frequently committed by the foldiers. The word is compounded of βία, *vis, violence*, and κολύω, *I hinder*; and fhould rather be written *biacolyte*.

The biocolytæ appear to have been much the fame with the French archers of the Marfhalsea. They were fuppreffed by the emperor Juftinian.

BIOCULATA, in *Entomology*, a fpecies of **EPHEMERA**, defcribed by Geoffroy, Linnæus, &c. The wings are white, reticulated; on the head two yellow tubercles. Fabr. Inhabits wet places in Europe. The tail of this kind is furnifhed with two briftles as long as the body.

BIOCULATA, in *Natural Hiftory*, a fpecies of **HIRUDO**, of an elongated form and cinereous colour, with two eyes. Gmel. Müll: This is *hirudo flagnalis* of Linnæus. Fn. Suec. &c. Found in wet hollows and rivulets very common. Length of this creature is nine lines. The female bears about forty eggs at a time, which are furrounded by a pellucid circle; at firft thefe are cinereous, afterwards brown; and the young, after excludion, adhere by their tails to the belly of the female. Gmel.

BIOCULATUS, in *Entomology*, a fpecies of **CRYPTOCEPHALUS** (*Crioceris*), found at the Cape of Good Hope. It is teftaceous; thorax immaculate; on the wing-cafes two ocellar white fspots. Fabricius.

BIO CZ, in *Geography*, a town of Poland, in the palatinate of Cracow, north of the Carpathian mountains. N. lat. 49° 48'. E. long. 21° 40'.

BIOEA, in *Ancient Geography*, a fea-port in the fouthern part of the ifland of Sardinia, according to Ptolemy.

BIOGLIO, in *Geography*, a town of Italy, in the lordfhip of Vercelli, 23 miles N.W. of Vercelli.

BIOGRAPHER, formed from the Greek βίος, *life*, and γράφω, *I defcribe*, an author who writes a hiftory, or life, of one or more perfons. Such were Plutarch, Corn. Nepos, &c.

BIOGRAPHY, the art of defcribing or writing lives, is a branch or fpecies of hiftory more entertaining, as well as more ufeful in many refpects, than general hiftory, as it reprefents great men more diftinctly, unincumbered with a crowd of other aactors, and defcending into the detail of their aactions and character, their virtues and failings, gives more light into human nature, and leads to a more intimate acquaintance with particular perfons than general hiftory allows. A writer of lives may defcend, with propriety, to minute circumftances and familiar incidents. From him it is expected to give the private as well as the public life of thofe whofe aactions he records; and it is from private life, from familiar, domeftic, and feemingly trivial occurrences, that we often derive the moft accurate knowledge of the real character. The fubjects of biography are not only the lives of public or private perfons, who have been eminent and beneficial to the world in their refpective ftations, but thofe alfo of perfons notorious for their vice and profligacy; which may ferve, when juftly characterized, as warnings to others, by exhibiting the fatal confequences which, fooner or later, generally follow licentious practices. As for thofe, who expofed their lives, or otherwife employed their time and labours for the
service

service of their fellow-creatures, it seems but a just debt, that their memories should be perpetuated after them, and that posterity should be made acquainted with their benefactors. This was no small incentive to virtue in the pagan world; and no one can be ignorant, on due reflection, how natural this passion is to mankind in general. For this reason, as Dr. Ward presumes (*Orat.* vol. ii. p. 252.), Virgil has placed not only his heroes, but also the inventors of useful arts and sciences, and other persons of distinguished merit, in the Elysian fields, where he describes them (*Æn.* l. vi. v. 661.):

“Here patriots live, who, for their country’s good,
In fighting fields were prodigal of blood;
Priests of unblemished lives here make abode,
And poets worthy their inspiring god;
And searching wits of more mechanic parts,
Who grac’d their age with new-invented arts;
Those who to worth their bounty did extend,
And those who knew that bounty to command:
The heads of these with holy fillets bound,
And all their temples were with garlands crown’d.”

In the lives of public persons, their public characters are principally, but not solely, to be regarded. The world is inquisitive to know the conduct of princes and other great men, as well in private as in public: and both may be of service, considering the influence of their examples. But to be over-inquisitive in searching into the weaknesses and failings of the greatest or best men, is, to say no more of it, a needless curiosity.

In this species of writing Plutarch has no inconsiderable merit; and to him we are indebted for much of the knowledge which we possess concerning several of the most eminent personages of antiquity. His matter, however, is better than his manner; as he cannot lay claim to any peculiar beauty or elegance. His judgment too, and his accuracy, have sometimes been taxed; but whatever may be his defects of this kind, his lives of eminent men will always be considered as a valuable treasure of instruction. He is remarkable for being one of the most humane writers of all antiquity; less dazzled than many of them are, with the exploits of valour and ambition; and fond of displaying his great men to us, in the more gentle lights of retirement and private life.

It has been a matter of dispute among the learned, whether any one ought to write his own history. No one, it may be said, can be so much master of the subject as the person himself; and besides, there are many instances, both ancient and modern, to justify this practice. But, on the other hand, it must be owned, that it is attended with many inconveniences, some of which are mentioned by Cicero: “If,” says he, (*Ad. Famil. l. v. epist. 12.*) “there is any thing commendable, persons are obliged to speak of themselves with greater modesty, and to omit what is blameable in others. Besides, what is said is not so soon credited, and has less authority; and after all, many will not hesitate in censuring it.” To the same purpose it is well observed by Pliny (*l. viii. ep. 1.*): “Those who proclaim their own virtues, are thought not so much to proclaim them, because they did them, as to have done them, that they might proclaim them. Hence, what would appear great, if told by another, is lost, when related by the party himself. For when men cannot deny the fact, they reflect upon the vanity of its author. Wherefore, if you do things not worth mentioning, the actions themselves are blamed; and if the things you do are commendable, you are blamed for mentioning them.” The justice of these reflections will be allowed; and yet, considering how natural it is for men to love them-

selves, and to be inclined in their own favour, it seems to be a very difficult task for any one to write an impartial history of his own actions. There is scarcely any treatise of this kind that is more celebrated than Cæsar’s “Commentaries;” and yet Suetonius tells us (*In Vit. c. 56.*), that “Afinius Pollio, who lived at that time, thought that they were written neither with due care nor integrity; that Cæsar was too often credulous in his accounts of what was done by other persons, and misrepresented his own actions, either designedly, or through forgetfulness; and therefore he supposes he would have revised and corrected them.” At some times, however, it may without doubt be justifiable for a person to be his own historian. Plutarch mentions two cases, in which it is allowable for a man to commend himself, and to be the publisher of his own merits. These are, “when the doing of it may be of considerable advantage, either to himself, or to others.” “Anciently,” says Tacitus (*Vit. Agric. c. 1.*), “many wrote their own lives, rather as a testimony of their conduct, than from pride;” remarking, “that the more virtue abounds, the sooner are reports of it are credited.” But the ancient writers had a method of diverting the reader’s attention from themselves, when they had occasion to record their own actions, and of thus rendering what they said less invidious, which was by speaking of themselves in the third person: thus Cæsar never says, “I did,” or “I said this or that,” but always “Cæsar did,” or “said, so and so.” Dr. Johnson has given an excellent paper on the subject of biography in the collection of papers called the “*Idler.*” Volney, in his “*Lectures on History,*” remarks, that biography is the only kind of history that is proper for young people. See *HISTORY*.

Dr. Priestley has constructed and published a “*Biographical Chart,*” which is very useful to students in chronology, history, and biography. This chart, which is about three feet in length, and two feet in breadth, represents the interval of time between the year 1200 before the Christian era and 1800 after Christ, divided by an equal scale into centuries. It contains about 2000 names of persons the most distinguished in the annals of fame, the length of whose lives is here represented by lines drawn in proportion to their real duration, and terminated in such a manner as to correspond to the dates of their births and deaths in universal time. These names are distinguished into several classes by lines running the whole length of the chart, the contents of each division being expressed at the end of it. The chronology is noted in the margin on the upper side, by the year before and after Christ, and on the lower by the same era, and also by the succession of such kings as were the most distinguished in the whole period.

BIOLLE, LA, in *Geography*, the chief place of a canton, in the district of Chambery, and department of Mont Blanc. The population of the place is estimated at 1038, and of the canton at 5625 persons; the territorial extent contains 92½ kilometres, and 10 communes.

BIOLYCHNIUM, formed of *βίος*, *life*, and *λυχνία*, *light*, a name given by some physicians to a supposed principle of vitality inherent in the heart, or blood, and remaining there as long as life continues. Of this principle, or innate heat, different accounts have been given by different writers; as Gasp. Hoffman, Courgius, &c.

Beguinus has described a process for preparing from human blood a vital balsam under this denomination; and J. Ern. Burgravius has written a treatise upon it.

BION, in *Biography*, a native of Proconnesus, was contemporary with Pherecydes, and flourished about the 59th olympiad, or 544 years B. C. Clemens Alexandrinus informs us, that he copied the titles, and abridged the works of

of Cadmus the Milesian, who is said to have been the first writer of history in prose, and to have lived before the Trojan war.

BION, the *Philosopher*, was a native of Borysthenes, and flourished in the reign of Antigonus Gonatas, king of Macedonia, and died about the last year of the 134th olympiad, or the 231st year B.C. He was a person of mean extraction, being the son of a Lacedæmonian harlot; and when young, was sold as a slave to an orator, who afterwards gave him his freedom, and left him large possessions. Thus endowed, he went to Athens, and devoted himself to the study of philosophy. He was first the disciple of Crates, then of the Cynics, afterwards of Theodorus, and last of all of Theophrastus; but he adopted and maintained the opinions of Theodorus, called the atheist. He was skilled in geometry and music, and also in poetry and rhetoric; and went about from one city to another, displaying his talents. Several of his repartees, for which he was famous, are preserved; and Horace is supposed to allude to him in his

“Ille Bioneis sermonibus, et sale nigro.” Epist. 2. lib. ii. To a great talker, who asked him a favour, he said, “If you would have me grant it, let some other person ask it for you.” Being on board a ship belonging to pirates, which was chased by another, the pirates exclaimed, “We are undone, if they discover who we are;” “and I,” says Bion, “if they discover who I am.” He ridiculed the contradiction of burning the dead as if they were insensible, and lamenting them as if they were still sensible. Some of his jests were offensive to morals and decency; for to neither of these did he pay much regard. Notwithstanding his avowed irreligion, he recurred, when sick, to the practice of puerile superstitions, and submitted to death with great reluctance. Brucker’s Hist. Phil. by Enfield, vol. i. p. 189. Gen. Dict. Laertius, lib. iv. tom. i. Ed. Meib. p. 253, &c.

BION, a celebrated Bucolic poet, was a native of Smyrna, and a contemporary of Ptolemy Philadelphus, about 280 years B.C. In Sicily or Magna Græcia, where he is supposed to have spent the last part of his life, Moschus was his pupil; and from the beautiful elegy of this poet, we are led to infer, that he lost his life in prison, and that the perpetrators of this deed did not escape just punishment. As a poet he was highly esteemed; and his performances that are extant, though inconsiderable, serve as examples of the excellence to which the Greeks had attained in similar compositions. Nothing can be more sweet and tender than his “Elegy on the death of Adonis,” nor any thing more elegantly ingenious than his “Cupid instructed.” The works of Bion are usually printed with those of Moschus; and the best editions are those of Paris, in 1686; of Venice, in 1746; Heskin’s, at Oxford, in 1748; Scheir’s, at Leiptic, in 1752; and Wakefield’s, Lond. 1795. Gen. Dict. Gen. Biog.

BION, M. mathematical instrument maker to the French king, died at Paris, in 1733, at the age of 78 years, and is known to mathematicians as the author of two works; one, “On the construction and principal uses of mathematical instruments,” translated into English with additions, by Mr. Edmund Stone; and another, “On the Use of the Globes;” the fifth edition of which was published at Paris, in 1728.

BIONCOURT, in *Geography*, a town of France, in the department of the Meurthe, and the chief place of a canton, in the district of Chateau-Salins, 2 leagues W. S. W. of Chateau-Salins.

BJÖRKNA, in *Ichthyology*, a species of *CYPRINUS*, having thirty-five rays in the anal fin. Found in the lakes of Sweden. Linnæus. This is *Cyprinus quincuncialis*, pinna ani officulorum 25, of Ardeti.

BIONDO, FLAVIO, (Lat. *Blondus*), in *Biography*, an antiquary and historian, and one of the first who illustrated

the Roman antiquities, was born at Forli in 1388, and studied at Cremona. Being deputed in his youth on public business to Milan, he there made the first copy of Cicero’s treatise on famous orators. At Rome he became secretary to pope Eugenius IV., and served the three succeeding popes in the same office. He was employed in various delegations to Venice, where he had an opportunity of cultivating an acquaintance and friendship with many learned persons in that republic. Debarred by his marriage from enjoying any church preferments, and devoted to study more than to the pursuit of wealth and honour, he preferred retirement to any public station, and prosecuted his literary labours till his death in 1463. His long residence at Rome enabled him accurately to describe its chief relics of antiquity in 3 books entitled “Roma instaurata;” which were followed by 10 books on the laws, government, customs, religion, &c. of the Romans, under the title of “De Roma Triumphante.” Another work, on its history, antiquities, and geography, was intitled “Italia Illustrata.” All these works display great reading and diligent research, though they are not free from many errors to which his ignorance of Greek literature must have contributed. Having undertaken to write a general history from the decline of the Roman empire to his own time, he finished three decads of it, and the first book of the fourth. He also wrote a book “De Origine et Gestis Venetorum,” and had planned an entire history of the Venetian republic; but he afterwards chose to insert the substance of it in his general history. He left several other writings in MS., which it is needless to mention. His style wants purity and elegance, and his judgment in collecting materials was superior to his taste in using them. A collection of his works was published at Basil, in 1531, fol. Nouv. Dict. Hist. Gen. Biog.

BJORKO, in *Geography*, a town of Sweden, in the province of Upland.

BIORNEBORG, a town of Finland, on the east side of the gulf of Bothnia, seated on a lake, 80 miles north of Abo. N. lat. 62° 6’. E. long. 22° 35’.

BIORNSE, a small island of Denmark, near the south coast of the island of Funen.

BIÖRNSTAHL, JAMES JONAS, in *Biography*, a learned Swedish traveller, was born at Rotarbo in 1731, and having finished his education in the university of Upsal, he became, in 1766, tutor to the son of baron Rudbec, with whom he travelled for eight years through France, Italy, part of Germany, Holland, and England. At Paris, where he improved himself in the Oriental languages, he was elected, in 1770, a member of the academy of sciences, and upon the baron’s return to Sweden, in 1775, Biörnstaahl received orders from the king to travel at his expence through the Ottoman empire, Syria, Egypt, and the northern part of Africa, and in the same year he was appointed extraordinary professor of philosophy at Upsal. In the following year he commenced his travels; and having arrived at Constantinople, he continued there two years, improving himself in the eastern languages. In 1779, he was appointed professor of the Oriental languages at Lund; but he died this year of a putrid fever at Salonichi. The result of his observations in the course of his travels was communicated in a series of letters to C. C. Giörwell, librarian to the king at Stockholm; and a complete collection of them appeared at Stockholm, in 1778, in three volumes, 8vo. under the title of “J. J. Biörnstaahl’s Bref rörande des utländska Resa till utgifvaren C. C. Giörwell.” A German translation of this work was published at Stralsund and Rostock, in 1783, in six volumes, 8vo. The principal object of Biörnstaahl’s research was Oriental MSS. from which he made many important and useful extracts. Gen. Biog.

BIOT, in *Geography*, a town of France, in the department of the Var, and chief place of a canton, in the district of Grasse, 3 miles north of Antibes.

BIOTA, in *Zoology*, a name introduced by Dr. Hill for the *Polypterus* genus called *Hydra*, by Linnæus, as it is believed from the reproduction or regeneration of the parts when cut off; and this name *biota* is likewise given it on the same account, being derived from *bio*, *life*. See **HYDRA**.

BIO THANATI, from *bio*, *with life*, and *thanos*, *death*, in some *Medical Writers*, denote those who die a violent death. The word is also written, and with more propriety, *biothanati*; sometimes *biothanati*.

In a more particular sense, it denotes those who kill themselves, more properly called *autothanati*. See **SUICIDE**. In this sense it is that the word is used both by Greek and Latin writers. By the ancient discipline of the church, they were punished by denying them burial, and refusing all commemoration of them in the prayers and offices of the church.

BIO THANATI, supposed by some to be derived from *bio*, *life*, and *thanos*, *death*, and alluding to the belief of a future life after death, was also a name of reproach given by the heathens to the primitive Christians, for their constancy and forwardness to lay down their lives in martyrdom.

BIO THANATOS is also used in some writers of the barbarous age for wicked, damnable, or accursed. Du-Cange.

BIOUAC, *Βιουακ*, or *Βιουακ*, in the *Military Art*, a nightly guard performed by the whole army, when there is an apprehension of danger from the enemy. The word is formed by corruption from the German *weywach*, a *double watch*, or *guard*. See **GUARD**.

BIOLLE, in *Geography*, a town of France, in the department of the Lot, and chief place of a canton, in the district of Montauban, 3 leagues N.E. of Montauban.

BIPARTIENT, in *Arithmetic*, is a number that divides another into two equal parts without a remainder. Thus 2 is a bipartient to 4, &c.

BIPARTITA, in *Entomology*, a species of **LEPTURA**, that inhabits Upper Austria. It is of a black colour; thorax ferruginous, with a longitudinal black line; a common ferruginous spot on the wing-cases.

BIPARTITE LEAF, in *Botany*. See **LEAF**.

BIPARTITION, signifies a division into two equal parts.

BIPED, in *Zoology*, an animal furnished with only two legs. Men and birds are bipeds. Apes occasionally walk on their hind legs, and seem to be of this tribe, but that is not a natural position for them, and they rest upon all their leg-like other quadrupeds. The jerboas are also of the latter description, jumping and leaping on their hind legs, but resting on the fore legs likewise.

Plato, we are told, once described a man to be a biped without fathers; and Diogenes, in order to shew what he deemed the absurdity of this definition, plucked all the feathers off a cock, and placing it in the midst of the Academic school, exclaimed, "there is one of Plato's men!"

BIPED, **BIFEDE**, **BIPES**, a genus of reptiles that belongs to the lizard family, in the system of La Cépède. These have, according to the character established by that author, a very long body covered with scales; and the toes of the two little feet, which are placed anteriorly, are armed with nails. La Cépède describes only one species of this genus, which he calls *le cannelle*; it is a native of Mexico, and preserved in the museum at Paris. La Cépède, it appears, was the first writer who described this creature; but Dr. Shaw noticed it afterwards in the Naturalist's Mis-

cellany, under the name of *lacerta umbrioides*, *umbrioides* lizard, which see; and a specimen of it, about half the size of that in the museum at Paris, is preserved in the British museum. This must not be confounded with *lacerta bipes* of Linnæus. Pallas has described another kind of biped lizard, which is called *lacerta apus*, but in that the legs are very small, monodactylous, and placed far behind: some have almost doubted whether these may not rather be part of the organs of generation than legs; and in general appearance the creature approaches rather to the snake than lizard tribe. It is a native of the southern part of Siberia, and also of Greece, and is of a ferruginous colour.

BIPENNIS, in *Roman Antiquity*, a two-edged ax, used anciently by the Amazons in fight: as also by the heathen, to cut asunder the ropes and cordage of the enemy's vessels. The bipennis was a weapon chiefly of the oriental nations, made like a double ax, or two axes joined back to back, with a short handle. Some compare it to a figure of a pen, and suppose it hence to have acquired the name *bipennis*; the tube or barrel of the pen representing the handle, and the point or nib the head. Modern writers usually compare it to our halbard, or partizan; from which it differed in that it had no point, and that its shaft or handle was much shorter. See **HALBARD**.

BIPES, in *Zoology*, a species of **LACERTA**, with the body subequal, round, imbricated, and pale; on each scale a brown dot; no anterior feet; posterior feet with two toes unarmed. Gmelin. *Anguis bipes*, with 100 abdominal, and 60 subcaudal plates. Linn. Mus. Ad. Frid. A native of South America and India. Length about six inches; body cylindrical and slender; colour pale yellow. Biped Lizard.

BIPES, a species of **COLUBER**, described by Gmelin on the authority of Scopoli, as an inhabitant of the Tyrolese waters, where it is said to feed on frogs and fishes; it has two feet, fulvous eyes, whitish under-jaw, elliptic, marginate, dorsal scales; sides spotted with white; abdominal plates whitish, with a brown spot in the middle. Gmelin describes it specifically as having 116 plates on the belly, and 58 subcaudal scales.

BIPINNULA, in *Botany*. See **ARETHUSA**.

BIPLICATA, in *Conchology*, a species of **VOLUTA**, figured by Martini only. It is of a tapering shape, smooth, white spotted with yellow, and dotted with black; lip acute; pillar with two pluts.

BIPUNCTARIA, in *Entomology*, a species of **PHALÆNA** (*Geometra*), the anterior wings of which are cinereous, undulated with brown; a dusky band in the middle, and two black dots. Fabricius, &c.

BIPUNCTATA, a species of **APIS**, that inhabits Siberia. This insect is hairy and black, with two yellow belts; the first with two lateral black dots. Lepechin. it. Gmel.

BIPUNCTATA, a species of **ARANEA**, with a black, globose abdomen, marked with two excavated dots. Linn. Fa. Suec.

BIPUNCTATA, a species of **CANTHARIS**, with two black spots on the thorax; wing-cases black at the tip. Fabricius. Inhabits Leipzig.

BIPUNCTATA, a species of **CASSIDA**, of a yellowish colour, with two black dots on the wing-cases. This is a native of India. Fabricius, &c.

BIPUNCTATA, a species of **CHRYSOMELA**, described by Fabricius as a native of the Cape of Good Hope. It is testaceous, with a brown spot on each of the wing-cases.

BIPUNCTATA, a species of **CICADA**, described by Linnæus. It is yellow, with two brown spots in front; wing-cases white, veined with yellow. A native of Europe.

BIPUNCTATA is also a species of **CICADA** (*Deflexa*), found in South America. The colour is whitish; wing-cases deflected, and griseous, with two impressed dots on the anterior part of the margin of the thorax. Fabricius, &c.

BIPUNCTATA, a species of **COCCINELLA**, of a red colour, with two black dots. Linn. Fn. Succ. &c.

BIPUNCTATA, a species of **FORFICULA**, that inhabits Italy. This is black; hind part of the head and legs rufous; a white spot on the wing-cases. Fabricius. It has eleven joints in the antennæ.

BIPUNCTATA, a species of **LEPTURA**, of a black colour, and villous; wing-cases livid; scutellum, spot in the middle, and tip black. Inhabits Siberia.

BIPUNCTATA, a species of **NITIDULA**, of a testaceous colour, with five black spots. Gmelin.

BIPUNCTATA, a species of **TENTHredo**, with somewhat fetaceous antennæ, of nine joints; black; scutellum black, and marked with two white dots. Inhabits the woods of Lufice.

BIPUNCTATA, a species of **VESPA**, with a spotted thorax; abdomen with four yellow bands, and two dots of the same colour on the first segment. Fabricius. Inhabits Germany.

BIPUNCTATUM, a species of **OPATRUM**, of a brown colour, with somewhat cylindrical, immarginate thorax, with two hollows; two extreme joints of the antennæ distant and larger. Herbst. Gmel. &c.

BIPUNCTATUS, a species of **BRUCHUS**, that inhabits Helvetia. It is cinereous; wing-cases brown with an ocular, black dot at the base of each. Fabricius.

BIPUNCTATUS, a species of **CARABUS**, of a somewhat brassy colour, with two impressed dots on the wing-cases. Linn. Fn. Succ. This is described by Fabricius as being brassy, with black antennæ, and pale shanks. This inhabits Europe.

BIPUNCTATUS, a species of **CIMEX** (*Rotundatus*), of a pale griseous colour, with a white dot on each side of the scutellum near the base. Linnæus. Inhabits Syria.

BIPUNCTATUS, a species of **CRYPTOCEPHALUS**, of a glossy black; wing-cases red with two black dots; antennæ length of the body. Fabricius. Gmelin, &c. *Chrysomela punctata*. Linn. Inhabits the northern parts of Europe; on the Nut.

BIPUNCTATUS, a species of **CURCULIO**, found in Europe. This is cinereous, with a black spot on the wing-cases; shanks yellowish. Linnæus. Fn. Succ.

BIPUNCTATUS is likewise a species of **CURCULIO**, with the thorax scabrous; wing-cases clouded, with two glossy black spots near the apex. Lepech. it. A native of Siberia.

BIPUNCTATUS, a species of **GRYLLUS** (*Acrida. Truxalis*), of a brownish colour; scutellum as long as the abdomen. A native of Europe.

BIPUNCTATUS, a species of **HEMOROBIVS**, found in Europe. It is variegated with yellow and brown, and has two black spots on the wings. Fabricius.

BIPUNCTATUS, a species of **ICHNEUMON**, found in Europe. This insect is black; base of the antennæ brown; thighs at the base, and face yellow, with two black marks on the latter; abdomen, shanks, and tips of the posterior feet ferruginous. Linn. Mus. Lesh.

BIPUNCTATUS, a species of **PAPILIO** (*Plib. Urli*). The wings are entire, brown; on both sides of the first pair an oblique band, and two dots of silvery; at the base of the posterior ones beneath a band and stripe of yellowish.

BIPUNCTATUS, a species of **SCARABÆUS**, having a black thorax, bordered with red; and red wing-cases

with a black spot on each. Lepech. it. Fabricius. This is the insect which Pallas names *Scarabæus coccinilloides*; it is found in the southern parts of Russia under horse dung.

BIPUNCTATUS, in *Inhibiology*, a species of **CYRINUS**, described by Bloch. The lateral line is red, with a double series of black spots; and sixteen rays in the anal fin. This kind is found in the sandy rivers of Germany.

BIPUNCTELLA, in *Entomology*, a species of **PHALÆNA** (*Tinea*), wings cinereous brown, with a marginal white spot. Fabricius.

BIPUNCTELLA, a species of **PHALÆNA** (*Tinea*), with fuscous wings, with a common dentated white stripe; thorax snowy-white with two black spots. Fabricius. This is *Tinea cchiella* of Schmettler.

BIPUSTULATA, a species of **CANTHARIS** (*Malachius*), of a brassy green colour with the apex of the wing-cases red. Linn. Fn. Succ. Geoffroy. This is *Thelephorus viridellanus nitidus* of Degeer. A very common insect in most parts of Europe.

BIPUSTULATA, a species of **CASSIDA**, of a green colour; wing-cases with two lateral sanguineous spots. Inhabits Cayenne. Linn. Fabr. &c.

BIPUSTULATA, a species of **CHRYSOMELA**, described as a Swedish insect by Thunberg. The wing-cases are black, spot at the tip, head and sides of the thorax yellow.

BIPUSTULATA, a species of **COCCINELLA**, of a black colour, with red spots, and sanguineous abdomen. Linn. Fn. Succ.

BIPUSTULATA, a species of **HISPA**, with ferrated antennæ; black and hairy, with a rufous spot at the base of the wing-cases. This kind inhabits Italy. Fabricius.

BIPUSTULATA, a species of **LEPTURA**, that inhabits Upsal. The wing-cases are black, striated with dots, and two testaceous spots. Thunberg, &c.

BIPUSTULATA, a species of **NITIDULA**, of an ovate form, and black colour, with a red spot on each of the wing-cases. Fabricius and Gmelin. This is *Silpha oblonga nigra*, &c. of Linn. Fn. Succ. and Syst. Nat. *Silpha*, of Degeer; *Dermestes*, of Geoffroy; and *Ostoma bipustulata*, of Laichart. Inhabits Europe, and feeds on carcasses, meat, bacon, &c.

BIPUSTULATUM, a species of **OPATRUM**, that inhabits Pomerania, and is about the sixth part of an inch in length. Its form is narrow and elongated; colour ferruginous; wing-cases slightly grooved.

BIPUSTULATUS, a species of **ATTELABUS**, met with in North America. It is black, with a rufous spot at the base of each of the wing-cases. Fabricius.

BIPUSTULATUS, an insect of the genus **CARABUS**, in Gmelin's edition of the *Systema nature*. This is the true *Carabus crux major* of Linnæus, which Fabricius misconceiving, describes as a new species, in his work entitled "Species Insectorum," under the name of *Bipustulatus*. By retaining at the same time the Linnæan character of *Carabus crux major* under the proper name, he constitutes two species of the same insect. In the *Entomologia systematica* of Fabricius, this error is continued, and Gmelin, resting on the authority of this writer, describes them also as distinct species. See **CRUX MAJOR** (*Carabus*.)

BIPUSTULATUS, a species of **CIMEX**, the general colour of which is black; thorax spinous; wing-cases livid; and two scarlet dots on the head. Fabricius, Gmelin, &c. *Cimex balteatus* of Degeer. Inhabits South America.

BIPUSTULATUS, a species of **CRYPTOCEPHALUS**, described by Fabricius as being of a black colour, with a rufous spot at the tip of the wing-cases. Obs. The figure referred to in Schæffer *Vierzehender Fälskåfer*, is not black, but of a

light or azure blue, rufous at the apex of the wing-cases; a little anterior of the same colour. It is an European insect, and inhabits the flowers of the chr; fauthemum. Gmelin considers it as *Cryptophylus* of Lachart.

BIPUSULATUS, a species of **DERMESTES**, that is black and glossy, with the head, thorax, and spot at the base of the wing-cases red. Thu.berg. This is *Ips humeralis* of Fabricius. Country unknown.

BIPUSULATUS, a species of **DYTISCUS**, described by Fabricius. It is smooth and black, with two red spots on the posterior part of the head. This inhabits the north of Europe.

BIPUSULATUS, a species of **DYTISCUS**, that inhabits Germany. This kind is black; thorax yellow, with two black spots; wing-cases yellow, varied with brown. Fabricius.

BIPUSULATUS, a small species of **ELATER**, found in woods in England and other parts of Europe; the colour is black and shining, with a red spot at the base of each of the wing-cases. Linn. Marsh, &c. Gsf. By mistake, this insect is thus described by Gmelin, *N. or. n. l. m. elytra puncta ligata*, &c. with reference to the Fabrician Species, *El. scutum*, in which the dot at the base of the wing-cases is said to be black. This is *Elater punctatus* of Parzer; and *Le. Imp. nigr. & tr. l. m. g.* of Geoffroy.

BIPUSULATUS, a species of **CAYLUS**, in the section *loc. m.* of a pale brown colour; sword at the extremity of the abdomen, and two spots on the thorax black; wing-cases yellowish, suffused with black, and shorter than the wings. Gmelin, &c. This insect is rather less than an inch in length according to Schaeffer's figure, exclusive of the antennae, which are rather longer than the body. Inhabits Europe.

BIPUSULATUS, a species of **SCARABÆUS**, of a black colour, with a rufous spot on each of the wing-cases. A native of New Holland. Fabricius.

BIPUSULATUS, a species of **STAPHYLINUS**, that inhabits the northern parts of Europe. Colour black, with a ferruginous dot on each of the wing-cases. Linn.

BIQUADRATE, or **BIQUADRATIC power**, in *Algebra* and *Arithmet.* is the next power above the cube, or the square multiplied by itself. Thus, 16 is the biquadrate, or 4th power of 2, or it is the square of 4, which is the second power of 2: for $2 \times 2 = 4$, and $4 \times 4 = 16$.

BIQUADRATIC Equation, an equation raised to the fourth power, or where the unknown quantity of one of the terms has four dimensions: thus, $x^4 + ax^3 + bx^2 + cx + d = 0$ is a biquadratic equation. See **EQUATION**.

BIQUADRATIC parabola, in *Geometry, a curve line of the third order, having two infinite legs tending the same way. See **INFINITELY**.*

BIQUADRATIC root of any number, is the square root of the square root of that number: thus, the biquadratic root of 81 is 3: for the square root of 81 is 9, and the square root of 9 is 3: the biquadratic root of 16 is 2.

BIQUADRAT, in the *Customs of the Algerines*, a cook of the army. The *J. m. l.* is, where the *Algerines* collect, after the great battles at certain feasts, are preferred to be biquadrats, or cooks of the division, which is the first step towards arriving at higher preferment. Biquadrats lay the care of furnishing the officers and commandants of the Algerine army with meat and drink in the camp, in garrison, &c. From biquadrat they are called *absolut*; that is, commandants of companies, or companies of square-rows.

BIQUINTILE, an aspect of the planets, when they are 144 degrees distant from each other. It is thus called, because they are distant from each other by twice the fifth part of the 360 degrees. See **ASPECT**.

BIR, or **BIRAD CRIB**, in *Geography, a town of Asiatic Turkey in Mesopotamia, seated on a mountain near the east*

coast of the Tigris, in a very fertile country, the residence of a bey; 100 miles S. W. of Diarbeck.

BIRABETANE, in the *Botanical Writings of the Ancients, a name given to *verbena*, or vervain, and to other herbs used in sacrifices. It is only the word *hierobotane*, as altered by the Æolic manner of writing and speaking it. Hierobotane is the common Greek name of vervain, and other sacrificial herbs, and it is probable that the Latin name *verbena* came from the Æolic manner of speaking this word. All those herbs, which were laid upon the altars on solemn occasions, such as making of peace, and other solemn contracts, and were to be taken up by the contracting parties as part of the ceremony, were called by the Greeks *hierobotane*, that is, sacred plants, and *vervaine*; but as the plant was now particularly known by the name *vervaine*, was more frequent in use than any other on this occasion, it was afterwards distinguished by that name. See **VERBENA**.*

BIR-AL-CADHI, in *Geography, a town of Persia, in the province of Segistan, 80 miles west of Zareg.*

BIRBOOM, a town of Hindostan in Bengal, 56 miles W. S. W. of Moorshedabad, 100 N. N. W. of Calcutta. N. lat. 24. E. long. 87° 40'.

BIRBUSCA. See **BIRUSCA**.

BIRCH, THOMAS, in *Biography*, an English historical and biographical writer of exact, free and industrious research, was born in London, November 23, 1735. His parents were Quakers; and he was intended for his father's trade, which was that of a coffee-mill maker; but so strong was his inclination to literature, that he requested leave to indulge it on the condition of providing for himself. Accordingly he became assistant to the master of a school belonging to the Quakers at Hemel Hempsted; and after a similar employment in other situations, he at length deserted the profession of his parents, and though he had not enjoyed the advantage of an university education, took orders in the church of England. In 1732, having been ordained deacon in 1730, and priest in 1731, he was preferred under the patronage of lord chancellor Hardwicke, who was then attorney general, to the living of Ulting, in the county of Essex. Some time before he took orders, he married the daughter of a clergyman; but she died within 12 months after their marriage. In 1735, he was admitted into the royal society, and also into the society of antiquaries; and of the former society he became secretary in 1752, which office his declining health obliged him to resign in 1765. In 1753, the degree of doctor in divinity was conferred upon him by the Marischal college of Aberdeen, and in the same year he received the same honour from Dr. Herring, bishop of Exeter and Canterbury. He was also a director of the Society of Antiquaries, and a trustee of the British museum. His preferments were various, and rapid in their progress; the last of these was the rectory of Dunstable, which he held, together with the united rectories of Dunstable, Pateus, and St. Gabriel, Fechurch-st. This melancholy event happened in consequence of his horse betwixt London and Ham, being killed in 1766. Having, in the course of his rations, bequeathed his library to the British museum, and the amounting to little more than 1000*l.* including the salaries of the clerical officers.

Dr. Birch was distinguished by his talents, and the friendship and esteem of the great. He was eminently active and diligent in his various and laudable undertakings, of which he devoted much of his time and labour. In his private life, he gained leisure by ear-

in the pleasures of social intercourse with persons the most distinguished for their attachment to letters and science. With respect to theological subjects, his sentiments were rational and liberal, and he was a zealous friend to religious and civil liberty. In this respect his views and principles were conformable to those of the truly excellent bishop Hoadly.

In literary labour few persons have been more diligent and indefatigable than Dr. Birch. The first great work in which he engaged was, "The General Dictionary, Historical and Critical," comprehending a new translation of that of Mr. Bayle, and several thousand new lives, never before published. This valuable work was completed, principally by himself, with the co-operation of the reverend Mr. John Peter Bernard, Mr. John Lockman, and Mr. George Sale, in 10 volumes, folio. The first volume appeared in 1734, and the last in 1741. In 1737, he published "Professor Greaves's Miscellaneous Works," 2 vols. 8vo.; and in 1742, "Thurloe's State Papers," in 7 vols. folio, with a dedication to lord chancellor Hardwicke. In 1743, he edited "Cudworth's Intellectual System," his "Discourse on the Lord's Supper," and "Two Sermons," with a life of the writer, in 2 vols. 4to. His "Life of the Hon. Robert Boyle," 8vo. which has been since prefixed to the 4to. edition of that eminent philosopher's works, appeared in 1744; and in the same year he began a series of biographical sketches of distinguished persons, designed to accompany their engraved portraits by Howbraken and Vertue. The first volume of this work was completed in 1747, and the second in 1752. In 1747, he published in 8vo. "An Inquiry into the share which King Charles I. had in the Transactions of the Earl of Glamorgan, &c." a fact which, however overlooked, or disputed by some of our historians, was confirmed by the evidence adduced in this interesting publication, and has been since further corroborated by the Charendon state papers. In 1748, Dr. Birch was the editor, in 2 vols. 8vo. of the "Miscellaneous Works of Sir Walter Raleigh," to which is prefixed a life of the author. His next publication was "An Historical view of the Negotiations between the Courts of England, France, and Brussels, from the year 1592 to 1617; extracted chiefly from the MS. state papers of sir Thomas Edmondes, and of Anthony Bacon, esq.; to which is added, a relation of the state of France, with the character of Henry IV. and the principal persons of his court, by sir George Carew," 8vo. 1749. To this volume Dr. Birch has prefixed a discourse on the utility of deducing history from the original letters and papers of the persons who were the principal actors in public affairs, followed by a biographical account of the three negotiations above-mentioned. Mrs. Cockburn's "Theological, moral, dramatic, and poetical works," 2 vols. 8vo. with the life of that ingenious lady, were edited by Dr. Birch in 1751; and he also published an edition of "Spenser's Fairy Queen," in 3 vols. 4to. One of his most popular works, which was "The Life of Archbishop Tillotson, compiled chiefly from his original papers and letters," and dedicated to archbishop Herring, in one volume, 8vo. appeared in 1752; and in the following year he revised an edition of "Milton's Prose Works," in 2 vols. 4to. to which is prefixed a new life of the author. In 1754, he published in 2 vols. 4to. "Memoirs of the reign of Queen Elizabeth, from the year 1581 till her death, &c. from the papers of Anthony Bacon, esq. and other MSS. never before published;" in which, besides a full display of the temper and actions of the earl of Essex, much light is thrown on the characters of the Cecils, Bacons, and other eminent persons of that period. Dr. Birch's next publication was "The History of the Royal Society of London, from its

first rise; in which the most considerable of those Papers communicated to the Society, which have hitherto not been published, are inserted in their proper order, as a Supplement to the Philosophical Transactions." The two first volumes of this work appeared in 1756, and the other two volumes in 1757; and they bring down the history to the end of the year 1687. This is unquestionably an useful book of reference, and contains many particulars which may be of occasional service both to the philosopher and the biographer. In 1760, Dr. Birch published "Letters between Colonel Robert Hammond, Governor of the Isle of Wight, and the Committee of Lords and Commons at Derby-house, &c. concerning the King's department at Hampton Court, and in the Isle of Wight," 8vo.; and he closed his voluminous labours with "Letters, Speeches, Charges, Advices, &c. of Francis Bacon, lord viscount St. Alban's, &c. in one volume, 8vo." Soon after his death, Dr. Maty published, "The life of Dr. Ward," which he had just lived to finish; and he had also prepared for the press, "Historical Letters, written in the reign of James I. and Charles I." which Mr. Ayscough proposed to publish. In the list of his printed works we might also comprehend some papers communicated to the Royal Society, and some accounts of books in the works of the learned; but besides these, such was his unwearied assiduity in collecting every fragment pertaining to literature, and deemed by him of importance, that he left behind him 24 volumes 4to. of various papers copied by himself from the Lambeth library. Upon the whole, whatever may be thought of Dr. Birch's judgment in his selection of materials, of the minuteness of his researches, of the justice and sagacity of his inferences from the facts which he produces, and of the want of elegance and animation in his style, it must be allowed, that literature has already derived, and may yet further derive, great benefit from his labours. Biog. Brit.

BIRCH tree, in Botany. See BETULA.

BIRCH, bark, fungus, leaves, twigs, wine of. See BETULA.

BIRCH bay, in Geography, a bay on the coast of New Albion, situate in N. lat. 48° 53' 30". E. long. 257° 33'.

BIRCK, a town of Germany, in the circle of Westphalia, and duchy of Berg; 3 miles N. E. of Siegburg.

BIRD, BIRDS, *Aves*, in Ornithology. See AVIS, and ORNITHOLOGY.

BIRD, or fowl-mead grass, in Agriculture, a species of grass, which has been lately cultivated with particular attention. It is a fine, sweet, silky grass, with a durable verdure; throws out a great crop, and produces a large quantity of seed. One rood of ground yielded a hundred weight of seed, and a very large load of hay. It is most proper for upland meadow: the seed should be left uncovered on the ground.

BIRDS, *Anatomy of*. The regard which has been bestowed upon this tribe of animals, by different descriptions of mankind, renders their organization one of the most interesting branches of general anatomy. The immense catalogue of the species of birds, and the variety and beauty of their external characters, have made them favourite objects of investigation with the natural historian. The extraordinary degree of instinct displayed in all their habits and economy, more especially in the attachment of the sexes, the construction of their nests, the care of their young, and the conduct of their migrations, has called forth the admiration of the philosopher and the lover of nature. The splendid colouring of their plumage, the powers of melody, and the liveliness and docility of many species, have given them value as objects of beauty or entertainment; whilst others

are as highly prized from furnishing occupation to the sportsman, or a delicacy to the epicure.

The anatomical characters of this class of animals are not less deserving of attention than their other properties. In the scale of animated existence, birds can scarcely be considered inferior to mammalia; and yet many of their functions are exercised upon a very dissimilar plan, and almost constantly by organs differently constituted. It is in birds that we perceive the first general deviations from the scheme of organization pursued in the human subject: this will be found most remarkably exemplified in the apparatus for the preparation and digestion of food, the secretion of urine, the mode of generation, and the growth and economy of the young animal, the anatomy of the brain, the structure of the eye and ear, the mechanism of the organs of sound, and the construction of the instruments of loco-motion.

The anatomy of birds has been much prosecuted both by the older authors and in modern times, as the means of physiological knowledge, and in aid of the several purposes for which these animals are so much estimated. The information, however, communicated in this way, falls far short of a systematic account of the subject; to supply which, therefore, much original matter is necessarily introduced into the present article, more particularly in the descriptions of the blood-vessels, of the organs of motion, and of the minute structure and uses of parts. Many errors of the older writers are also corrected; and wherever the descriptions of others are followed, they have been, as far as it has been practicable, revised by a comparison with the recent subject or authentic preparations.

ORGANS CONCERNED IN THE EXERCISE OF THE VITAL FUNCTIONS.

The Mouth and its contained Parts.

In the other classes of animals, these parts are constructed to effect the division of the food previous to its passage into the stomach, but in birds the process of mastication is either imperfectly performed, or carried on by a peculiar mechanism to be afterwards described. Birds are unprovided with those soft and flexible parts called lips; the aperture of their mouth is made by the prolongation of the two jaws, which are covered with a hard and horny substance. These are named the upper and the lower *mandibles*, and together form the *beak* or *bill*. The bones which enter into the composition of the bill, will be considered along with the other parts of the skeleton. The external or horny part is produced, like other similar substances, from a vascular and spongy membrane, which is interposed between it and the bones; it corresponds exactly in shape with the jaws, which serve it as a mould.

The bill is designed for many different purposes, and consequently is subject to great variety in its conformation. In the birds of prey it is strong, hooked, sharp, and furnished with a tooth-like process on its edge, to enable them the better to seize and lacerate their prey; those birds which subsist on small grain, are provided with short, pointed, sharp-edged bills for picking up and breaking their food; the parrots also use their bills for dividing their meat; in those instances, therefore, the bill may be considered analogous to the teeth of other animals; but it is only the incisors with which it can be compared, as it is incapable both from its thin edges, and from the nature of the articulation of the lower jaw, of performing any thing like the grinding motion in which properly mastication consists.

The *piscivorous* birds have commonly large and extended bills, which become necessary to them, in order to secure their prey; these birds almost always swallow their food without dividing it.

Swallows and *goat-suckers* have short bills, but opening very wide, suitable to their mode of procuring their food, which consists in taking flies while the bird is on the wing.

The *wood-peckers*, *corn-necks*, *nuthatches*, &c. use the bill as an instrument for perforating the bark of trees, and breaking nuts; for which purpose it is constructed like a wedge.

It may, in fine, be given as a general observation, that the form and structure of the bill indicate the proper habits and economy of the birds; they have therefore been always employed by naturalists as classic distinctions, and to their works we refer the reader for a more detailed account of the peculiarities observed in the bills of birds.

In consequence of a particular mechanism, arising from two additional bones, the upper jaw of birds is capable of a certain degree of motion. In general this is very confined, but the *parrot* tribe are able to move the upper jaw with considerable freedom. The bones and muscles upon which this peculiarity depends, will be described with the organs of motion.

The *cavity of the mouth* is lined with a thick vascular membrane, behind which are placed a great number of follicular glands, which discharge a mucous liquor upon every part of the surface of the mouth. They are, however, most abundant in those parts which sustain most friction, as the commencement of the oesophagus, and surrounding the aperture of the nares, in the upper and back part of the mouth.

A cuticular tunic is spread over the glandular membrane, which is as usual so soft and delicate, that it cannot without difficulty be detected.

The *tongue of birds* can hardly be considered an instrument of mastication; its motions are very limited, in consequence of its containing a bone which runs through its whole length, and the lingual bone being articulated behind with the os hyoides, which determines the extent of its movements. The only birds, in which the tongue is immediately concerned in the division of the food, are those *passeres* living upon seeds that are enclosed by a shell. In such the tongue is employed to convey the seed between the edges of the bill, and secure it there until it is broken, which is not unlike the action of the tongue of mammalia during mastication.

The tongue of the *wood-peckers* and *corn-necks* is an organ of curious structure, and enables these birds to trash their prey at some distance from the mouth; the mechanism by which this is accomplished, and the bones and muscles which belong to the tongue in general, will be particularly described with the other organs of motion. The varieties in external form, and the structure and integuments of the substance of the tongue, will be considered under the head of the organ of taste.

Salivary glands have been ascribed by most authors to birds; but, as it would appear, without duly considering the uses of these parts. Birds, as already observed, do not comminute their food by mastication in the mouth, for which purpose the saliva is employed by other animals; and the glandular bodies, which have been described as salivary, appear to yield a fluid rather a mucous than an aqueous nature. The internal surface of the mouth of birds is besmeared with mucus, in order to facilitate the passage of the food, which would not be necessary, if the aliments were softened by saliva.

The reputed salivary glands of birds are situated within the angle formed by the anterior part of the lower jaw, and between the skin and the inner membrane of the mouth. They are two in number, and appear to be composed of granular masses, or follicles, closely connected to each other. They discharge their secretion into the lower part of the mouth, by means of some foramina arranged on each side of

the tongue. They would seem to be of the greatest size in proportion to the bird, where the food is hard and dry grain; they are larger in the *common fowl* than in the *goose*.

The Parisian academicians observed these glands in almost every bird they dissected. In the *ostrich* they describe them as being situated towards the pharynx; and in the *bustard*, they found several glandular bodies.

Oesophagus.

The tube, which conveys the food into the stomach of birds, is not situated exactly on the fore part of the neck, but a little on the right side. It is partially covered by the trachea, and it is connected to all the neighbouring parts by loose cellular substance; in consequence of which, and its inclination to one side, when the neck is much bent, it does not take the same degree of flexure, but falls a little off to the right side. This effect is best observ'd in some of the birds which have long and flexible necks, as the *gallie* and *water birds*.

The form of the oesophagus varies according to the habits of the bird, and the nature of its food. In the rapacious birds, and those which subsist on fish, it is of great capacity throughout its whole length, generally exceeding in width the stomach itself. The magnitude of the oesophagus not only enables those birds to swallow their prey whole, but answers the purpose of a repository for their food, and thus counterbalances the disadvantages arising from their precarious means of subsistence.

Hurons, the *cormorant*, the *spoon-bill*, &c. will devour as much fish at once as will be sufficient to support them for a considerable time; and an *osel* is often obliged to exist for days or weeks upon a rat or mouse, which being swallowed, is conveyed by degrees into the stomach, until the whole is digested.

All the *piscivorous* birds have the oesophagus most capacious at its commencement, or next the fauces, for the more convenient swallowing of their prey, which is always gulped down.

The *pelican* furnishes a most remarkable instance of a dilatation of the fauces, in the pouch which is placed beneath the lower jaw. This bag, if full, is very conspicuous externally; but when it is empty, the bird has the power of contracting it very considerably; when completely distended, it is said to be capable of containing ten quarts of water. The internal part of the pouch appears to possess the same structure as the rest of the oesophagus; the skin covering it externally, is clothed with a short down, smooth and soft, like silk.

The *pelican* derives a double advantage from this enlargement of the fauces; it enables it to provide a supply of food and water for future necessity, and to transport nourishment to its young, until they can acquire it for themselves: in disgorging the food for her family, the parent presses the bottom of the sack against her breast, and thus discharges its contents; from which probably arose the absurd fable of her opening her breast, and feeding her young with her blood.

A very remarkable provision of this kind has been described in the *bustard*, by Dr. James Douglas. In this animal there is a membranous bag, extending for some way down the fore part of the neck, capable of containing seven quarts of water; it communicates with the mouth by an aperture beneath the tongue. See *Plat. I. fig. 1.* in the *Anatomy of Birds*, in which this part is represented, as it has been figured in Edwards's *Natural History of Birds*, vol. ii. p. 73. *a* the pouch, upon which a ligature is fastened near its connexion with the mouth, *b* the trachea, and *c* the oesophagus.

The pouch of the *bustard* is confined to the male bird, according to most authors; some have, however, ascribed it

to the female, and others have doubted its existence altogether. The Parisian academicians dissected six *bustards*, and do not describe the throat sac, although all their subjects were males.

The *bustard* is said to use the pouch as a temporary reservoir of water, from which it supplies the female during the period of incubation, and likewise the young brood, until they can move from the nest. It has been also occasionally employed as the means of defence. Barrington relates in his *Miscellanies*, p. 553. that at Morocco, where it is usual to fly the hawk at the *bustard*, the latter has been known to eject the water contained in the sack against his assailant, who is not uncommonly by this means baffled in the pursuit.

The *crop*, or *craw*, is a term applied to another species of dilatation of the oesophagus of birds.

When this enlargement is single, it is situated upon the right side of the oesophagus, and placed so low on the neck, that a portion of the bag is accommodated in the space left at the upper part of the thorax, within the fork-shaped bone. Its form is in general globular, but rendered somewhat irregular, from its connexion with the oesophagus, which enters at the superior part, and appears again on the middle, by which means the greater part of the crop is formed into a cul de sac.

It is obvious, that the effect of this structure is not only to receive a greater quantity of food than can be digested, but also to detain it in the *craw* until it has suffered some change.

The birds in which the *craw* is found of the figure just described, feed usually upon grain or other hard substances, which require to be softened by maceration in the mucous secretion of the oesophagus. Of these we may mention as instances, the *pheasants*, the *common fowl*, the *pintado*, the *turkey*, the *Indian cock*, the *pea-fowl*, &c.

Fig. 2. of *Plate I.* in the *Anatomy of Birds*, exhibits the *crop* of the *pheasant*, *a* the oesophagus above the *craw*, *b* the same going on to the stomach, *c* the dilated part forming the *crop*.

The Parisian anatomists found the oesophagus very much enlarged in the *ostrich*, but so close to the gizzard that these two parts appeared to be confounded with each other; so that it was difficult to mark the superior orifice of the ventricle; the situation of the bag also was very unusual, being lower than the gizzard, into which the entrance was by the bottom, and thus what is commonly called the superior orifice, was really the inferior.

It is somewhat remarkable, that the *bustard*, which is a graminivorous bird, and in most respects resembles those which have crops, should be quite without this provision, its oesophagus consisting of an equal and regular tube.

The *parrot* has a dilatation of the lower part of the oesophagus, which is commonly reckoned to be a crop, though perhaps improperly, as the enlargement is neither so suddenly produced, nor in such a degree, as to obstruct the passage of the food into the stomach; the *craw* of the *parrot* is only calculated, therefore, to afford a temporary accommodation to its food.

Some *carnivorous* birds are furnished with a *craw*, which only serves the purpose of a reservoir, as their food does not stand in need of maceration to soften it, which is so necessary with hard and dry grain.

The most singular kind of crop is that found in the *pigeon* genus. The oesophagus in these birds is of great capacity, from its very commencement, and at its lower part it swells out into two large sacks, between which and the stomach it suffers a considerable contraction. See *Plate I.* of the *Anatomy of Birds*, *fig. 3.* *a* the upper portion of the oesophagus,

b, b, the two crops, *c* the contracted part of the œsophagus.

In some species, as the *pouter pigeon*, the œsophagus above the crops, is of such great dimensions, that the latter are hardly discernible; these birds also have the power of distending their œsophagus with air, which gives them that grotesque appearance from whence they derive their name. A capacious crop is more necessary to the pigeon than other birds, both because its food requires long maceration, and because the young, and even, on some occasions, the female, draw their subsistence from this repository. The extraordinary change which occurs in the structure of the inner membrane of the crops of the pigeon, by which a milky fluid is secreted, for the nourishment of the young birds, will be described in its proper place.

Although there is all the variety in the form of the œsophagus we have described, the internal structure appears to be the same in all birds. Beside the external cellular covering, by which it is connected to the adjacent parts, it possesses a muscular coat, an internal vascular tunic, and a cuticular lining. The muscular coat consists of two layers of fibres; in the external layer these are transverse, or more properly circular; the other stratum is composed of longitudinal fibres. The muscular coat is most strongly marked at the top of the tube, where the actions of deglutition commence, and upon the crops, where support and motion are required. The internal coat resembles in structure that which is usually met with upon the inner parts of cavities; with this difference, that it is provided in birds with an extraordinary number of follicular glands, which pour out their fluid through numerous foramina, resembling pin-holes, upon the internal surface. These glands secrete a quantity of mucus, which is employed in macerating the food, while it is detained in the œsophagus, or crop. This secretion is remarkably copious. Spallanzani introduced a piece of sponge into the crop of a *pigeon*; and after it had remained there twelve hours, he expressed from it above an ounce of mucus, and the quantity obtained from a *turkey*, amounted to seven ounces in ten hours. The follicular glands are most numerous at the commencement of the œsophagus, and towards the termination of this tube in the stomach, the internal surface of the crop is but sparingly supplied with them. See *Plat. I. of the Anatomy of Birds, fig. 2.* in which the œsophagus and crop are inverted, for the purpose of exhibiting the orifice of the mucous follicles, and in *fig. 3.* they assume beautiful and regular appearance below the dilated parts of the œsophagus. It is very common for the mucous glands to be assembled in a regular and marked manner round the very termination of the œsophagus, as a in *Plat. II. fig. 2. of the Anatomy of Birds.*

The cuticle, which it vests the œsophagus, is generally so thin and tender, that it might escape observation. It is, however, sufficiently plain in many large birds, and almost always visible, upon the inside of the crop or the other dilated parts, which are more exposed to friction from extraneous substances. The inflexible lining of the œsophagus terminates abruptly at the zone of gastric glands.

It may be remarked with respect to the œsophagus of birds, that its chief peculiarities consist in the great size of the fore enlargement, and number of mucous glands. These circumstances are attended with the very singular structure of the stomach, which we shall next describe.

Stomach.

The organ of digestion in birds consists of two parts; one for producing the digestive fluid; the other the receptacle in which the conversion of the food is effected. The apparatus for the secretion of the gastric juice is called,

The *Bullus glandulosus*, or the Zone of Gastric Glands.—

This part is situated at the termination of the œsophagus, and appears in most instances to be the continuation of that tube. It has the same cellular and muscular coats, which obscure its real structure, when perceived externally, especially in the granivorous birds, which have strong muscles upon the œsophagus. When the outer tunics are removed, a number of small glandular bodies are exposed, arranged with the most perfect regularity, and closely applied to each other. They assume an indistinct granular appearance in small birds generally, and even still more so in those which subsist on animal food, as the *aviparine* and *fishivorous* birds; but in the *ratites*, and the large *granivorous water* birds, as the *falcon*, the *osprey*, &c. the gastric glands, when divested of their coats, are readily discovered, by the naked eye, to be small cylinders, or tubes, placed horizontally with respect to the pariete of the stomach; the external end is close and of a round figure; the internal extremity of the tube is somewhat concave, and contains a small foramen, which is applied to a corresponding hole in the internal membrane of the *bulbus glandulosus*. See *Plat. II. in the Anatomy of Birds, fig. 1.* *a* represents a number of the gastric glands, with their external extremity exposed, by a portion of the muscular coat being removed; and in *fig. 2. b* shows the orifices of these glands upon the internal coat of the stomach, and *c* the cut edge of the *bulbus*, with the cylinders as they are placed between the muscular and internal coats. The subject of both the figures is the *wild swan*.

The gastric glands commonly encircle the beginning of the stomach as a perfect and equal zone. In some instances, however, where they are not large, as in the *vapacious* and *fishivorous* birds, they are more numerous at one part of the stomach than another; see *Plat. III. fig. 2.* which exhibits the stomach of the *heron*, *bb* the gastric glands.

The form of the *bulbus* is not quite regular in the *ostrich*; the structure of the glands also is not the same as in other birds: instead of being placed in regular and close order, they are disposed in masses of an unequal form and size, separated for some distance from each other. On making a section of the masses, they are found divided, or interrupted by processes of strong white cellular substance; from which it would seem, that they are composed of several glands, although there is but one foramen belonging to each mass on the internal tunic of the *bulbus*. The magnitude of the orifices of the gastric glands, even exceeds the proportion to be expected from the size of the bird; being capable of receiving the head of a large pin, they stand at the distance of about the 1/10th of an inch asunder, and do not open with perfect regularity upon the internal surface of the stomach, being most crowded towards the centre, where also their apertures are largest; the internal tunic of the *ostrich*, from these circumstances, exhibits a worm-eaten appearance.

The gastric glands in all birds like other parts, which produce an important secretion, are endowed with an extreme degree of vascularity.

Some authors have described a cuticular coat, on the internal surface of the *bulbus glandulosus*, which they have compared to velvet on account of its soft and spongy texture; it appears, however, very doubtful, whether this covering should be considered a tunic or not; we have observed that it is readily detached, and soluble in water; it certainly does not resemble the epidermis of the œsophagus, and still less to the substance which invests the remaining portion of the stomach, or gizzard.

No very satisfactory experiments have yet been made upon the nature of the digestive fluid of birds. When it is expressed from the gastric glands, which is the only mode of obtain-

obtaining it pure, it is observed to be of an ash or pale yellow colour, turbid, and of a tenacious consistence, like mucus. Spallanzani found it in several birds to have a bitter and salt taste, which he attributed to admixture with some of the fluids contained in the intestines; he discovered also, that the turbidity and the colour were produced by the existence of a number of yellow particles, too minute to be distinctly seen without the aid of the microscope, and which in a few hours subsiding to the bottom, left the supernatant liquor as transparent as water. He has remarked the yellow tinge to vary in intensity, according to the species; in the eagle, for instance, it is caieritious, and in the crow a reddish yellow colour, like the yolk of an egg.

A number of the experiments performed by Spallanzani, although in some instances he failed, shew that the gastric fluid of *carnivorous birds* will act upon vegetable matters; and upon the other hand, that *graminivorous birds* can digest animal food: but his most interesting and important experiment on the properties of the gastric fluid, is that made to determine its powers of resisting the operation of cold. "On a very cold day in winter," he says, "I exposed a small quantity (of the gastric juice of the eagle) in a glass, on a window, along with two other glasses containing water, in one of which was dissolved a quantity of common salt, sufficient to give it a stronger taste than the gastric fluid had. The thermometers set beside the glasses stood at five degrees below 0 (twenty and three-fourths, Faren.). Of the three liquors, the first that was frozen, was the common water, the next was the salt water, and the last was the gastric fluid. When I carried them into my apartment, where the temperature was three and an half deg. above 0. the first that thawed was the gastric fluid, next the brine, and lastly the water." The conclusion which necessarily results from this experiment is, that the gastric juice of birds, and from analogy, that of other animals, is capable of resisting the effects of cold more than common fluids, or even those impregnated with a great quantity of salt; and therefore it may be considered as possessing some degree of vitality. If this supposition be admitted, it determines the nature of the digestive process, so long a question in physiology.

The gastric fluid of the *crow* has been submitted to chemical examination by Scopoli, by which he discovered that it contained a quantity of gelatine and saponaceous substance, some muriate of ammonia, and phosphate of lime, with a large proportion of water.

The second part of the organ of digestion of birds, is not less singular than the structure just described; it immediately succeeds the zone of gastric glands, and when in the natural situation, occupies the left region of the abdominal cavity, in which position it is retained by the several reflexions of peritoneum, which constitute the air cells. From being the part into which the food is received in order to undergo the process of digestion, it has commonly received the distinctive appellation of *Stomach*: but it would seem more consistent, not only with the form of the digestive organ in some birds, and with its functions in other animals, to apply the term *Stomach*, both to the gastric glands, and to the muscular bag which immediately receives their secretion, and the food; or for the greater convenience and clearness of description, the lower portion of the stomach might be distinguished from the *bulbus glandulosus*, by the name of *ventricle*.

The greatest variety exists with respect to the structure of this part of the organ of digestion in birds: when it possesses a certain degree of muscularity, it is well known under the name of the *gizzard*; and when its muscles are so thin as to give it the appearance of a simple bag, it is commonly, though erroneously, called a membranous stomach.

Fourcroy attempted to establish two classes of birds, according to the formation of their stomachs, calling the one *myogastriques*, and the other *hymnogastriques*, but these terms were only applicable to the two extremes.

Vic d'Azir has admitted three distinctions in the structure of the ventricle; the first that of the true gizzard, of which he gives instances in the *galline*, the *swan*, the *goose*, &c.; the second where the muscles which compose the gizzard are not distinct from the other parts, nor very strongly marked, as in the *thrush* and *jay*; the third is the membranous stomach as it is called, which is found in the *heron*, *eagle*, *cormorant*, &c. See the introduction to Vic d'Azir's great System of Anatomy.

These distinctions are not, however, just; the gradation from the most muscular gizzard to the thinnest ventricle, is regular and uninterrupted; in order to understand which, and the other variations in structure, it is necessary that the true gizzard, or muscular stomach, be first described.

The external form of this organ is usually an irregular oval, the two ends of which are made of the great *lateral or digastric muscle*.

This muscle constitutes the principal mass of the gizzard; its attitude with respect to the *bulbus glandulosus* is oblique. The two fleshy portions are united by means of a strong flat tendon, on each side of the gizzard, which in the centre is distinct from the parietes of the ventricle.

The portion of the stomach, which appears between the two fleshy masses of the digastric muscle, and which is crossed by the tendon, belongs to the cavity of the ventricle; it is composed of fleshy fibres, passing in several directions, as may be most convenient for diminishing the cavity. Many of these fibres are continued into the substance of the digastric muscle, and others run in its outer margin, thus giving integrity and connexion to these two portions of the ventricle. See *Plate II. fig. 1.* in the *Anatomy of Birds*, which represents the external appearance of the stomach of the *wild swan*, *bb*, the fleshy parts of the digastric muscle, *c*, the tendon connecting them to each other, *d*, the parietes of the ventricle on the superior part, *e*, the same, inferiorly, *f*, the margins of the digastric muscle, with fibres passing along them.

The disposition of the fibres in the interior of the digastric muscle is exceedingly curious. They appear, upon a superficial view, to be arranged in thin concentric laminae, separated from each other by the most delicate tendon. These layers pass to the lateral tendons on the circumference, so that their force is exerted upon them. See *Plate III. fig. 1.* which is the section of the gizzard of the *goose*, *aa*, the two great masses of the muscular substance, *bb*, the tendons by which they are connected to each other. But if another section be made, parallel to the sides of the gizzard, or across the concentric layers, we have found each of the laminae to be divided by a great number of delicate tendinous processes which form with each other squares and triangles of various shapes, producing a reticulation, not unlike a honeycomb. The extraordinary multiplication of muscular fasciculi, which arises from the lamellated and reticulated structure of the gizzard, creates a force which almost surpasses calculation.

On laying the gizzard open by cutting through the tendon, which is the thinnest part, it is observed to be covered internally with a rude, callous substance, of a dark brown colour; this is thin and pliable upon the portion of the ventricle, not inclosed by the digastric muscle, and partakes of the motions of the cavity; but when it covers that muscle, it becomes as tough and inflexible as the hoof of a quadruped; two oval surfaces are seen to project beyond the other parts; they are raised upon the interior of the thickest portions of the digastric muscle, and the horny integument

when passing over them acquires nearly the thickness of an eighth of an inch. *Plate II. fig. 2.* in the *Anatomy of Birds*, shews the gizzard of the *wild swan* laid open, *d* the divided tendon, *e* the cuticular or horny covering of the gizzard, ending decidedly at the commencement of the intestine, and below the zone of gastric glands; at the latter place the edge is shewn detached, *ff* the two prominent oval surfaces, *g g* the origin of the intestine, which being cut off short on the outside permits the light to appear through it.

The cavity of the gizzard differs very much in shape and extent from what might be expected, from the external figure of that organ. When all foreign matters have been expelled, the two prominent oval surfaces approach each other, leaving only a slit between them: any thing that deserves the name of a cavity, is situated above and below the place where the tendons cross (see *Plate II. fig. 2.*), for just within the tendon there is not cavity sufficient to contain the end of a finger. See *Plate III. fig. 1.* which shews a section in which the two oval surfaces are applied to each other, leaving at either end the appearance of a round hole, by means of which the superior and inferior cavities of the ventricle have communication.

When the horny or insensible lining is removed, there appears another coat to the gizzard. This is soft, somewhat spongy, and endowed with vascularity; it is intimately united to the muscular substance of the ventricle, on one side, and on the other affords a surface for the adhesion of the horny coat; the connexion with which appears to depend upon the mutual insertion of villous processes, too fine to be distinctly perceived by the naked eye.

Such is the description of the muscular ventricle, or *true gizzard*, as it exists in the *swan*, the *goose*, the *duck*, the *pheasant*, and *common fowl*, the *piutado*, the *turkey*, and a few others. In by far the greater number of birds, there is a deviation from the structure of the gizzard. The digastric muscle is less powerful, its tendon is incorporated with the parietes of the ventricle; the oval, or grinding surfaces, are little or not all distinguishable from the rest of the cavity, which is therefore of larger capacity; and, lastly, the substance lining the ventricle is less tough, thick, and hard, approaching more to the nature of cuticle. It would be endless to enumerate all the different instances of intermediate structure, which we and others have observed; suffice it to say, that it exists in almost all the *passeres*, or small birds which subsist upon a mixed food, such as grain, worms, insects, and fruits; also in most of the order *scansores*, and in many of the *gralle* and *anseris*, which are pursued as game. In all which instances the deviation from the true structure of the gizzard varies in degree according to the nature of the food used by the bird; nay, differs from this cause in the same individual. Thus the *gull* has a strong muscular ventricle, when fed upon grain, which, if the bird be supported by fish, becomes so thin as to approach the membranous stomach.

It is remarkable, that many birds which live upon grain and hard substances, have neither a very muscular ventricle, nor the horny integument very thick. This is the case with all the *struthious* birds, and some *gallinae*, as the *bullard*.

The stomach of the *ostrich* is capacious; the digastric muscle is thin, considering the size of the bird, and the nature of its food; and the cuticular coat is so soft, that it has been aptly compared by several authors to flannel. The Parisian anatomists describe the stomach of the *casowary* as being thinner than that of the *ostrich*, and divided into two parts by a valvular projection of the inner coat.

When the digastric muscle becomes so thin as to form a mere layer of fibres, in close union with the other coats of the stomach, and its tendons only fine aponeuroses, expanded

on each side, the ventricle is termed *membranous*; an improper appellation, inasmuch as the very same parts exist, which belong to the powerful and massy gizzard, although in a disguised and diminished form, and unequal to the same functions; affording thus a curious example of the uniformity with which nature copies her own works.

This species of stomach is almost confined to the *accipitrius*, or rapacious birds, and those amongst the *gralle* and *anseris*, which feed on fish. The *woodpeckers* also possess it, and probably it may be found in some foreign birds, which live on insects and soft fruits.

The substance lining the membranous stomach is much thicker than common cuticle. It is occasionally soft, and almost of a gelatinous consistence, and easily detached from the internal coat of the ventricle.

The shape of this kind of stomach is usually a semi-oval, or the section of an egg. Several of the *piscivorous* birds, as the *heron*, *bittern*, *pelican*, &c. have, however, a second chamber, through which the food passes in its way to the intestine. See *Plate III.* in the *Anatomy of Birds. Fig. 2.* is the stomach of the *heron*; *a* the lower part of the oesophagus, appearing smaller than it really is, from being thrown into folds; *b* the zone of gastric glands, distinctly seen through the coats of the stomach, in consequence of the cavity being distended with a transparent fluid, and afterwards placed against the light. If Spallanzani had employed the same expedient, he could not have denied the existence of a distinct glandular structure to the *heron*; *c* the inferior part of the stomach, chiefly composed of muscular fibres, spreading in a radiated manner from the lateral aponeurosis; *d*, which supplies the place of the great tendons of the digastric muscle; *e* the second stomach, furnished with circular muscular fibres; *f* the first intestine arising from the additional ventricle. The communication between the two stomachs is very straight in the *pelican*.

Having described the structure of the digestive organ of birds, it remains to consider its functions. In those cases where the muscular power of the stomach is inconsiderable, and the cuticular coat thin and soft, digestion is carried on in the same way as in man and other animals, with this difference only, that the gastric fluid is furnished by a distinct apparatus of glands, instead of being secreted by the whole surface of the cavity. In the true gizzard, however, we perceive an extraordinary departure from the common structure of the organs of digestion. This part supplies the place of the teeth of other graminivorous animals. In its mechanic powers and action it resembles a mill: the upper part serves as the receptacle for the grain; the two internal projecting oval surfaces correspond to the mill stones, and the first intestine receives the substances in the ground or divided state. The experiments made at the academy of Cimento, and those of Reaumur, Spallanzani, and others, shew that the gizzard is a machine of no ordinary powers. These experiments consisted in compelling birds to swallow hard and unyielding substances, and, after some hours, examining what were the effects produced upon them.

When balls of glass, or other brittle substances, were employed, they were speedily reduced to powder: metals and precious stones were indented or abraded. Spallanzani introduced into the gizzard of the turkey, and common fowl, leaden balls, armed in one instance with twelve sharp needles, one quarter of an inch long; and in another, set with as many lancet points. Upon destroying the bird: 18 hours afterwards, the needles and lancets were found broken off, and marks of impression appeared even upon the balls themselves; and, what he considered more extraordinary, the coats of the gizzard were perfectly unharmed. When we con-

sider the immense strength which is obtained by the arrangement of the muscular fibres in the gizzard, and the horny consistence of its inner coat, there appears nothing incredible in these effects. And there is still another circumstance, not before mentioned, which fully accounts for such extraordinary powers of trituration: every muscular stomach or gizzard contains a number of small stones or pebbles; the size of the stones is proportioned to that of the bird. Their number is subject to vary from many accidental causes. Two hundred have been reckoned in a *turk-y-ben*, and above a thousand have been taken from the gizzard of one *goose*.

Spallanzani denied that these stones were at all required for the comminution of the food. He has endeavoured to support his opinion by several experiments, which are, however, not clear or consistent with each other, and in contradiction to general observation; for it is well known, that birds do not thrive when they cannot obtain small stones, and that it is part of the duty of the parent to provide them for their young, before they leave the nest. Spallanzani acknowledges that he could not procure any bird to young, that it had not some stones in its gizzard; and therefore he was obliged to rear pigeons and turkeys even from the shell, before he was able to succeed. Birds, so far from swallowing stones from keeness of appetite, or in mistake for food, seek out and select those most suitable to their purpose, which are almost all bits of quartz, of an equal size, and a roundish figure, with many small sharp angles.

Large birds, as the *strubious* kind, the *bustard*, &c. are in the habit of swallowing coins and pieces of metal, which necessarily suffer a reduction by the friction to which they are exposed; and hence has arisen the ridiculous notion of the *ostrich* digesting iron.

We have no hesitation in deciding, that the extraneous bodies found in the gizzard are absolutely required for the perfect division of the food used by those birds that employ them. In further proof of which opinion it may be mentioned, that they are proportioned in quantity to the degree of muscularity possessed by the ventricle, and the nutritive quality of the food; and that those birds which have thin stomachs, and live upon animal food, never designedly swallow stones, or other indigestible substances.

In order to ascertain the mode of operation of the gizzard in the living body, Reaumur opened several fowls during the process of digestion. One instance alone shewed any motion in the part, which consisted in alternate contractions and dilatations, slowly and gradually performed. Spallanzani instituted similar experiments upon several birds, with no better success, being seldom able to detect the least motion; and when he did perceive any, it was irregular, partial, and indistinct. This he attributed to the violence committed by opening the animal's body, which no doubt causes the motions to be less strong and regular; but the gizzard's exhibiting externally so little action, depends upon the disposition of the fibres in the interior of the digastric muscle, which are calculated, not for performing extensive motions, but for exerting an immense concentrated force upon whatever may come within their influence.

The most satisfactory, as well as convenient, mode of examining the actions of the living gizzard is, to provide a very lean, young bird, which has thin parietes to the abdomen. The side of the belly being deprived of feathers, all the motions of the gizzard can be both felt and seen. We have thus ascertained them to consist in alternate contractions of the digastric muscle, and of the intermediate parts of the ventricle. When the muscle acts, its figure is not perceptibly changed, but it feels as hard as a stone: upon its relaxation, the parietes of the ventricle urge their

contents again between the two grinding surfaces, when the muscle repeats its powerful contraction, by which the substances interposed are submitted to a pressure like that of a vice, accompanied by a slight rolling motion of the surfaces upon each other. These alternate actions succeed each other very slowly, but with regularity.

When the food and stones roll under the pressure of the digastric muscle, a sound is heard exactly like what is produced by the tide coming upon a shore, where there are many loose stones. This occurs with the same intervals of time, also, which are observed between the flux and reflux of the tide; and if the ear be applied to the body of the bird, during the time that the gizzard is in action, the sound of the ebbing and flowing of the tide is imitated so perfectly in loudness, and every other respect, that it is difficult to conceive it is occasioned by any other cause.

During the time that the food is undergoing a very minute division, in the manner described, the gastric juice is distilled from the *bulbus glandulosus* in greater quantity than usual, and a more intimate mixture is formed of the digestive fluid and the triturated food, than could be accomplished under any other circumstances; and therefore we may look upon the process of digestion in graminivorous birds, as not only more complicated, but more perfect than it is in animals in general.

Intestines.

These are divided in birds, as in other animals, into great and small, although the terms are not very appropriate; there not being in general any material difference in the magnitude of each.

The *small intestines* exceed the large very much in length; they are situated chiefly in the anterior and right side of the abdomen, where they are strictly confined by the processes of peritoneum, which form the air-cells. The convolutions of the intestines are very regular, and consist in successive doublings one shorter than another, which give the appearance, on opening the abdomen, of a coil of rope, particularly in those birds which have the small intestines of considerable length. This effect depends upon the figure of the mesentery, which is not composed in quite the same manner as in mammalia.

The distinction of the small intestines into duodenum, jejunum, and ileum, is at all times to a certain degree arbitrary, and is still less allowable in birds. The only portion which deserves to be distinguished from the rest of the tube, is the first coil; which ascends on the right side of the stomach, including in its reflection the pancreas, and receives the biliary and pancreatic ducts.

The length of the intestines is determined usually according to the nature of the food upon which the bird lives; they are longest in the *graminivorous*, and very short in the *accipitres*. Many birds, however, which use a mixed food, or even live altogether upon fish, have the small intestines of great length; this is the case with the *heron*, and several others. The whole of the intestines of the *cormorant*, according to the Parisian anatomists, measured seven feet long; and what is difficult to explain, those of the *bustard* and *cas-sowary*, although large and graminivorous birds, were only four feet in length. The different *ostriches* dissected by the Academy, varied materially with respect to the length of the intestinal canal, one subject measuring fifty feet, another forty-two, a third thirty-three, and a fourth twenty-nine feet.

There is very little peculiar to be noticed in the structure of the small intestines. They are, as in other animals, covered externally by peritoneum, have two layers of muscular fibres, and their internal surface is furnished with those innumerable fine vascular processes called *villi*. The *graminivo-*

vous birds have commonly the longest villi; in the *goose* and *swan* they are singularly beautiful, floating a considerable way into the cavity of the intestine. The birds of prey, and those which feed on fish, have the villi in general so small and indistinct, that on a slight inspection, the inner surface of the intestine appears quite smooth. The *owl*, however, forms a remarkable exception to this observation in having long and pendulous villi.

The vascular processes upon the internal surface of the small intestines of the *ostrich* do not possess the usual villous or hair-like form, but consist of very thin plates, or lamellæ. These are short, with the edges somewhat round, and placed not in succession, but alternately one with respect to another, so that each lamella stands opposite to the interspace of the two adjoining, by which means the surface of the intestine puts on very exactly the appearance of twilled cloth. The structure producing this effect cannot be seen completely, as may be supposed, without a magnifying glass.

We have not observed in birds any thing analogous to those projections of the internal coat of the small intestines, which in other animals are called *valvule conniventes*. The Academicians, however, relate that they found in the *buffard* the inner tunic of the ilium folded longitudinally, in the manner of the last stomach of ruminating animals, and that towards the extremity of this intestine there were some transverse wrinkles, which supplied the place of the valve of the colon.

Throughout the tract of the intestinal tube, we have discovered several clusters of mucous glands: where these are situated, the internal coat appears as if slightly ulcerated, or not unlike a dysenteric intestine, instead of that regular dotted figure which the mucous glands commonly exhibit in mammalia.

The *great intestines*, as they are called, bear no sort of proportion to the small, in point of length: in many instances, even where the latter are of considerable extent, they do not exceed a few inches. They only admit of division into two parts; the cæcal appendages, and the continuation of the tube until it terminates at the anus. The first correspond with the intestinum cæcum of mammalia; and the other takes the place of the colon and rectum; but which from its extreme shortness and direct course to the anus, would appear to deserve only the name of rectum.

The *cæcal appendages* are subject to as much variety as perhaps any other part of the structure of birds. Generally, they are two in number; in which case, they arise rather abruptly from opposite sides of the intestinal tube, about the place where the convolutions cease, and the intestine becomes straight.

It may be received as a general rule, to which, however, there are some striking exceptions, that the magnitude of the cæca is in proportion to the muscularity of the stomach; we accordingly meet with this organ of the greatest size, and the strongest characters in the *gallina* and other *graminivorous* birds, from which it will be found most convenient first to take the description.

The cæca in these birds commonly ascend for some way quite close to each side of the intestine, from which they arise; during which they are less than the other parts of the intestinal canal; they then make a slight curve outwards, and become somewhat enlarged, and towards the superior extremity they again diminish before their termination in the cul de sac. These parts reach up in the abdomen to near the liver, and often make a slight curve round the spleen; they are connected to each other, and to the intestine between them, and also retained in their relative situation in the abdomen, by reflections of peritoneum, of which some are analogous to the meso-colon and meso-rectum, and others con-

tribute to the formation of the air-cells. See *Plate III.* in the *Anatomy of Birds*. *Fig. 3.* represents those parts in the *pintado*, or *guinea-hen*; *a* the tail portion of the small intestine placed between the two cæca, *b b* the cæca, *c* the rectum, *d d d* the peritoneum connecting those parts, *e* a process of peritoneum passing across from the top of one cæcum to another. If the cæca be slit open, it is found that they communicate with the rectum by an aperture which is smaller than their own cavity at the place; and consequently, any substance will pass with difficulty into them from the other intestines, and likewise be obstructed in its return.

Just within the entrance of each cæcum, there is a cluster of mucous glands, which appear like two spots of ulceration. These are particularly useful in this situation to smooth the passage of substances in and out of the cæca.

The contracted parts of the cæca are in some degree villous on the inner surface, and resemble in structure the rest of the intestinal canal; but the dilated parts are deprived of villi, possess very little vascularity, appear to have few, if any, muscular fibres, are without mucous glands, and are little better than simple membranous tubes. These parts contain the exuvie of the food.

All the uses which the cæca serve to animals are certainly not yet known; and the functions of these organs in birds are amongst the least understood. The magnitude of their cæca is not always in proportion to the apparent necessity for such reservoirs; often, where they might be expected large, they are small, or absent altogether, and sometimes, where the nature of the food would not seem to need these repositories, they are of considerable size. With the view of determining their uses, they were removed from the living hen, and the consequence is said to have been, that the animal would not admit any food from the crop into the gizzard, from which it might be inferred, that these organs serve other and more important purposes in the animal economy, than mere reservoirs of excrement; that, however, they are employed as a sort of temporary sewers, to receive the undigested parts of the food, is obviously true; and that in doing so, they answer an useful purpose, appears to be proved, in despite of many exceptions, by the more numerous instances of their bearing a decided relation to the digestive organs, and the quality of the food.

The same structure which has been described in the *guinea hen*, or *pintado*, is to be found with little variation in all the *gallina* except the pigeon, and in the *herbivorous anseres*, such as the *swan*, the *goose*, &c.

Daudin describes the cæca of the *beath-cock* (*tetrao urogallus*), and of the *white grouse* (*tetrao lagopus*), as grooved or fluted longitudinally.

The cæca of the *ostrich* are different from those of other birds; they are large where they commence, and diminish gradually towards their termination; they suffer many convolutions in consequence of a longitudinal band upon the posterior side, which is only two-thirds of their length; they are sacculated, or divided into loculi, throughout their whole extent, by means of a valvular projection of the internal coat, which winds in a spiral manner, similar to the valve of the cæcum in the *hare* and *rabbit* in mammalia, or the *ray* and *hark* kind amongst fish.

The spiral lamina is about five lines in breadth, but becomes somewhat less towards the extremities of the cæca. This lamellated structure is continued for some way into the other great intestine, and even into the small intestines; not, however, as one spiral valve, but in several transverse projections, which have a femilunar figure, and are placed alternately, so that one lamella is received between two others, in the manner of the *denticuli* of the bivalve shells. *Plate III. fig. 4.* is a portion of the first part of the great intestine

or colon of the *ostrich*, represented of the natural size and cut across to shew the femicircular lamina on the inside.

The effect of this structure is obviously the retention of the excrementitious part of the food for a longer time in the cæca; which is accomplished in other instances by the smallness of the aperture through which these parts communicate with the other intestines. This organ is not similar in the other *struthion* birds. According to the Parisian dissectors, the *casowary* is not provided with any cæcum. In the *casowary*, or (with more propriety) *ostrich*, of New Holland, we have found two cæcal appendages, which opened into the rectum by orifices not much larger than pin-holes. The internal surfaces had none of the laminae, or valvular projections, but were furnished with fine vascular flocculi, similar to those of the small intestines of the *ostrich*; with this difference, that in the New Holland bird, they are placed longitudinally, and are more loose and pendulous, looking somewhat like lacerated portions or shreds of the inner coat of the intestine.

In by far the greater number of birds the cæcal appendages are too small to serve any purpose, and appear only as useless imitations of the structure described in the *graminivorous* kinds. Many, that live on a mixed food, and whose stomachs are of an intermediate strength, amongst the larger *passeres*, the *picæ* of Linnæus, the *gralle*, and the *anseres*, have two cæca measuring in length usually about twice or thrice the width of the intestine from which they take their origin. See *Plate III. fig. 5.* which exhibits these parts in the *gull*. Cæca of this size have hardly any cavity, and seldom receive any of the contents of the other intestines; in the small *passeres*, which feed upon seeds, as the *sparrow* and *finch* tribes, the cæca bear a still less proportion to the size of the rest of the intestinal canal; see *fig. 6. of Plate III.* in which the cæca are represented as they are commonly found in those birds.

In the *pigeon* the cæcal processes are so small, that they escaped the notice of so accurate an anatomist as Severinus, who described the pigeon as wanting them altogether. *Fig. 7. of Plate III.* exhibits their appearance in the *dove*.

The carnivorous birds of all others have the cæca of the smallest dimensions; so much so, in many instances, that their existence has been often denied. *Fig. 8. of Plate III.* is copied from the Memoirs of the Royal Academy of Paris; it shews the slight dilatation which was found in the *bold buzzard* (*falco halietus*, Linn.) in place of the cæcal processes. On the internal side, however, this enlargement was furnished with a valvular membrane, by which a pouch was formed on each side.

The *owl* appears a very remarkable exception to the common structure of the *accipitres*, which respect to the formation of the cæca, which both in figure and magnitude are similar to those parts in the *gallina*. It is difficult to account for this singularity, unless it be supposed necessary to receive the indigestible parts of the animals, which this bird swallows entire.

Some of the *piscivorous* birds, as the *heron*, &c. have only one cæcal process; it is very short, and in the *heron* terminates in a pointed manner. See *Plate III. fig. 9.*

There are instances of the cæcal appendages being altogether wanting. They have not been found in the *casowary*, the *cormorant*, the *bittern* (*ardea stellaris*), the *parrot*, and the *wood-pecker*.

That portion of the intestinal canal which corresponds to the colon and rectum of mammalia, as already observed, is very short in birds. In its external characters, it resembles the rest of the intestinal canal, of which it appears to be simply the continuation. The internal surface is provided with villi, which, however, are not so long and delicate as

those of the small intestines. They are rather very minute eminences than villous processes, especially towards the termination of the rectum, at which place they often assume a decided granular appearance. The inner surface of the rectum in the *New Holland ostrich*, however, presents an exception to this observation; it is covered with fine and truly hair-like processes; in this bird also the internal coat of the great intestine is slightly folded or wrinkled transversely, in a manner somewhat similar to the valvula conniventes of the small intestines of the human subject.

The termination of the rectum in birds is very usually called the *cloaca*, on account of its receiving, as a common sink or sewer, both the excrements of the intestines and the urine. There is at this place a dilatation of the gut, which is often only a slight and gradual enlargement just within the margin of the anus; but sometimes it swells out suddenly into a pouch or sack. A remarkable example of which occurs in the parrot; see *Plate IV. in the Anatomy of Birds, fig. 1. a* the rectum, *b* the pouch.

The cloaca of the *buffard* has been found large enough to contain an egg. It is of an oval form; it is situated about an inch from the anus, and the rectum again experiences a contraction previous to its termination in the vent. See *fig. 2. of Plate IV. in the Anatomy of Birds; a*, the rectum before it enters the pouch; *bb*, the pouch laid open to expose its interior; *c*, the contraction within the anus.

In the *ostrich*, this dilatation is of great size; being capable of receiving one's two fists, according to the report both of the anatomists of the French academy, and of Mr. Warren, who published a dissection of this bird, in the *Philosophical Transactions*, see N^o 394. p. 113.

The use which the anal pouch answers is almost too obvious to be mentioned, which is that of a temporary accommodation to the excrements of the bird, by which their ejection is rendered less frequent.

The cloaca is furnished with somewhat stronger muscular fibres than the rest of the intestine, and is invested with a reflection of cuticle, which in the larger birds is very palpable. Connected with the cloaca, there is a bag, or purse, which, taking the name of the anatomist who first described it, is called *bursa Fabricii*.

The *purse of Fabricius* is usually of an oval or round figure, depressed on the anterior and posterior sides, and thence always appearing empty. It is furnished with a narrow process, or neck, which is most contracted about its middle. Its situation is on the back part of the cloaca, to which it is closely connected, being inclosed in the same reflection of peritoneum which envelops the rectum. When the peritoneum is dissected off, it is found to be a distinct bag or sack, united only to the rectum by means of its neck, which passing obliquely in the coats of the cloaca, opens into the intestine by a slit-shaped aperture. The internal coat of the cloaca projects over the opening like a penthouse, and performs the office of a valve, readily allowing the contents of the bag to pass out, but standing in the way of any regurgitation from the intestine. See *Plate IV. of fig. 2.* and the *purse of Fabricius* in the *buffard* which is of an oblong shape in this bird; *c*, the slit by which it communicates with the cloaca.

The size of this bag is in general fairly proportioned to that of the bird in which it is found. In the *buffard* it has been stated to be two inches long; in the *goose*, it measures about an inch and a quarter in length, and half an inch in breadth; and in the *sparrow*, it is about a quarter of an inch long, and half as broad.

The external side of the bursa is smooth and equal, but the internal part is thrown into deep rugæ. The folds are disposed in an arborescent form, and branch off with great regu-

B I R D.

regularity from a stem which is lodged in the neck of the bag. See *Plate IV. fig. 3.* in which the purse of the *goose* is delineated, with its cavity laid open, to exhibit the folds upon the inner surface.

When more closely examined, the structure of this part is very curious. Under the peritoneal covering, it is surrounded by a very delicate expansion of muscle, the fibres of which take a transverse direction. The internal tunic of the purse is made of a thin pellucid membrane, and the folds which have been described, consist entirely of glandular bodies, which are too minute to be distinguished with the naked eye. By employing a lens of common magnifying powers, we have discovered them to bear a great resemblance to the gastric glands, being, like them, little cylinders, which are perforated at one extremity to give passage to their secreted fluid; indeed, the only difference which appears between them, is, that the glands of the purse are shorter, being so much compressed in some instances, that they are nearly of an annular form. *Fig. 4. of Plate IV.* exhibits a portion of the bursa of the *goose*, highly magnified; *a, a,* the glands composing the folds; *b, b,* the spaces left between the folds, which consist only of the tunics of the purse.

The fluid produced by these glands, and of which the purse always contains a greater or less quantity, appears to differ in no respect from common mucus. The necessity, however, for so ample a supply of mucus, as these glands are capable of furnishing, does not seem very plain, especially when it is considered that the purse of Fabricius is not met with in all birds. Amongst others, the *parrot* is without it, as appears by *fig. 1. of Plate IV.* in the *Anatomy of Birds*; and yet the parrot has a very large cloaca, and might thence be supposed to need this glandular apparatus, even more than many birds, admitting its use to be the secretion of a mucous fluid, to sheath the cloaca against the acrimony of the excrement and urine.

Although the functions of the purse of Fabricius cannot be stated with certainty, it may be conjectured that they are not unimportant, from the delicacy of its organization, and its being so rarely wanting. There are a number of black points to be seen within the anus of the *parrot*, which appear like the orifices of mucous glands: may not these supersede the necessity of the purse in this bird?

The excrements of birds have been ascertained by Vauquelin and others, to possess an acid. This is increased by fermentation, into which feculent matters rapidly tend, and as it proceeds, the acid gives place to ammonia, which is evolved, towards the end of the process, in great abundance. The dung of the *pigeon* is found to contain an acid of a peculiar kind, which is increased by the mixture of the feces with water. It is from its chemical properties that the dung of pigeons becomes so serviceable as a manure, and that it is employed in the process of some manufactures, and for domestic purposes, such as cleansing clothes, &c.

Vauquelin has also analysed the fixed parts of the excrements of fowls, which being compared with those of the food, afforded some very singular and important results.

For this purpose he fed a *hen* for ten days upon oats, of which she consumed during that time 11,111,843 grains troy weight; these contained

136,509 grains of phosphate of lime,
219,548 silica,

—————
356,057.

In the course of these ten days the hen laid four eggs; the shells of which yielded 98,776 grains of phosphate of lime, and 453,417 grains of carbonate of lime. The whole

quantity of excrement ejected during the ten days contained 175,529 grains of phosphate of lime, 58,494 grains of carbonate of lime, and 185,266 grains of silica. The amount, therefore, of the fixed parts discharged from the system during this period were as follows:

274,305 grains of phosphate of lime,
511,911 grains of carbonate of lime,
185,266 silica,

Given out 971,482
Taken in 356,057

—————
Surplus 615,425

Hence it appears, that the quantity of solid matter parted with by the system during ten days, exceeded the quantity taken in by 615,425 grains.

The amount of the silica received was 219,548 grains,
The quantity given out was only 185,266 grains,

Deficient 34,282 grains.

Consequently there disappeared, during ten days, 34,282 grains of silica.

The quantity of phosphate of lime
taken in was - - - 136,509 grains,
That given out was - - - 274,305 grains, -

—————
137,796

There must have been formed, by digestion in this fowl, no less than 137,796 grains of phosphate of lime, as well as 511,911 grains of the carbonate of lime. It may thence be presumed, that lime (and perhaps phosphorus) is not a simple substance, but compounded of ingredients which exist in oats, water, and air, which were the only matters that could be introduced into the body of this fowl; as a quantity of silica had disappeared, it might be supposed, that it had contributed to the formation of the additional products; but if so, it must have entered into combination with a great quantity of some other substance. See *Annal. de Chim.* xxix. 16.

Notwithstanding these experiments were conducted by the ablest chemist of the age, they ought not perhaps to be ascribed to without being repeated under every circumstance which could lead to the detection of any error that might possibly arise.

This is not only necessary on account of the extraordinary nature of the results, which could only be produced by a creative power in the assimilating organs of the animal; but from other analogous experiments yielding results of a contrary kind. Dr. Fordyce, for instance, found that a certain quantity of calcareous matter was required by birds during the period of laying; and if the bird was deprived of this, the shell never was formed, and the bird frequently died from the eggs not coming properly forward. The method he adopted to prove this was simple and satisfactory: he took a number of canary birds, when about to lay; some he inclosed, so that they could have no access to any calcareous matter; and to others he gave a piece of old mortar, which they swallowed with avidity, and they laid their eggs as usual; whilst, on the other hand, those birds he had not furnished with the mortar were unable to produce eggs, and in several instances died. See *Fordyce on Digestion*, p. 25 & 26.

Liver.

This viscus is situated about the middle of the common cavity of birds. Its form, as in other animals, is much influenced by the shape of the parts which are immediately adjacent. The left side lies on the stomach, the right covers the

the intestines, and the apex of the heart is accommodated in the middle, and wherever the liver comes into contact with these parts, it receives in a degree an impression of their form.

Vic d'Azir, in his great system of anatomy, says, that the liver of birds is divided into only two lobes; and Cuvier has repeated the assertion in his *Tableau Elementaire de l'Histoire Naturelle*. The observation, nevertheless, is not in all cases strictly true. In many birds there is a third lobe, situated at the back of the liver, between the right and left lobes: this appears to be analogous to the lobulus *spigelii* of the human subject, both from its most usual figure, and from its position. See *Plate IV.* of the *Anatomy of Birds.* *Fig. 5.* represents the liver, &c. of the *goose* reviewed on the posterior or reverse side; *a* the right lobe reaching lower down than the other, and exhibiting impressions corresponding to the convolutions of the intestines; *b* the left lobe, with two prominent parts, and a depression extending along the lobe between them; *c* the third, or intermediate lobe. In the *common fowl*, the left lobe is cleft on the anterior part so deeply as almost to form two lobes on the left side. The French academicians allow three lobes to the liver of the *cormorant*; they are all very small. A third lobe has been described also in the *pigeon* by Borrichius, and in the *swan* by Bartholine. The liver of the *ostrich* consists of four imperfect lobes.

There is considerable variety in the shape and relative size of the two principal lobes; generally the right lobe much exceeds the other in bulk, and is somewhat longer. This character of the lobes is to be seen in the liver of the *goose*, *Plate IV.* *fig. 5.* but is more remarkable in the *casorvatory*, and even still more so in the *bustard*, in which the right lobe descends to the bottom of the belly; both lobes are short in the *eagle*, the *Indian cock*, the *parrot*, the *owl*, and many others; and in the *eagle* the left lobe has the greater bulk.

The two lobes are nearly of equal size in the *heron* kind, and both long-shaped. However much the livers of birds may differ in external forms, the internal structure is the same in all cases, as we have proved by numerous observations. The secretory vessel is produced from the veins of the neighbouring viscera, as in mammalia, and after entering the liver by the depression or fissure on the lower surface, which corresponds to the *porta* or *gates* of the human liver, it is distributed throughout the substance of the organ, and terminates in the same manner as the *vena porta*, i. e. in five radii, or penicilli towards the surface of the liver.

As there is no muscular septum between the thorax and abdomen of birds, their liver has not the advantage of that mode of connection, which is called in mammalia the coronary ligament: it is however amply supplied by the duplicature of peritoneum, which corresponds to the falciform ligament; this process divides the two principal lobes, passing deeply between them; it is connected to the peritoneum, which forms the air cells, in the sides and back part of the abdomen, is incorporated with the pericardium, and joins the sternum and the linea alba on the fore part of the abdomen, and then becomes reflected on each side of the common cavity, which is thus divided almost for its whole extent, in the same manner as the mediastinum divides the thorax in mammalia. The extended attachment, which is in this way procured for the liver, renders this viscous more steady in its situation than it is in other animals, which birds require on account of the rapid and violent motions of their bodies during the act of flying. As the falciform ligament goes on to the fore part of the cavity, the margin which forms the round ligament is necessarily wanting, but the remains of the umbilical vein

may be traced running between the duplicature of the peritoneum.

The *gall-bag*, or reservoir of the secreted fluid of the liver, in almost every instance where it exists, is situated upon the lower surface of the right lobe, somewhat nearer its central than its external edge. It is commonly received into a slight depression of the liver, so that about one-half of the bag is brought into contact with that viscous, nothing being interposed between them but the connecting cellular substance. The surface of attachment is occasionally less extensive; thus in the *eagle*, *bustard*, and *cormorant*, the bag stands out from the liver being only united to it by one end.

The form of this bag is commonly that of an egg, or a globe, or often something between these two figures. In a few instances it is elongated, as in the *bustard* and *casorvatory*; it measured in the latter bird only one inch in diameter, although it is seven inches in length.

The structure of the *gall-bag* appears to differ in no respect from that described in mammalia; its coats discover no trace of muscular fibres, and its internal surface exhibits the same kind of reticulation or net-work which is found in the gall-bladder of the human subject. See *Plate IV.* and *fig. 5.* in the *Anatomy of Birds*; the letter *d* indicates the *gall-bag* of the *goose* viewed particularly in its natural position; the reticulated structure is visible on the outside, but to bring it more perfectly into view the cavity is exposed by the removal of a portion of the bag.

The bile does not flow into the *gall-bag* by regurgitation from the common duct, but is conveyed directly thither by means of a particular tube designed for that purpose. This duct arises from the right lobe, passes on the side of the bag, which is in contact with the liver, then becomes involved in the coats of the cyst, which it perforates about the distance of one-third from the posterior end.

The orifice by which the duct opens into the cavity of the bag, is very small, and is surrounded by a smooth projection of the inner membrane, which added to the obliquity of the duct, affords the effect of a valve, and entirely prevents any return of the fluid upon the liver; for the more the cyst is distended, the more pressure will be laid upon the duct, in its passage.

It would seem that the cysto-hepatic duct is situated nearly in the same way in all birds, where it exists, but the present description is taken from the *goose*. See *Plate IV.* and *fig. 5.* in which *e* points out the termination of the duct in the *gall-bag*, upon the papilla above-mentioned, and the course of the duct also is to be indistinctly seen behind the tunics of the cyst.

The *ducts* which carry the bile to the intestines, are two in number, the *hepatic* and the *cystic*. The first arises by two branches, generally from the right and left lobes of the liver, and while within the fissure or *porta* of the liver, they unite to form the trunk which proceeds to its insertion into the intestine, and usually crosses the duct of the *gall-bag* in its way thither.

The *cystic duct* comes forth abruptly from the most posterior part of the *gall-bag*, which is not prolonged into a neck, as in other animals. The duct makes a turn round the end of the bag, along the side of which it then proceeds so closely applied, that upon a slight examination it might be supposed to commence from that part, or even from the anterior end of the cyst.

The cystic and hepatic ducts never unite to form the ductus *coarumis*, as in many animals; but proceed distinctly to the intestine, into which they always enter separately; sometimes very near each other, and at others removed to a little distance. Two hepatic ducts have been found

found in the *Indian cock* or *curassow*, which also had a distinct insertion in the intestine.

The part of the intestines where the biliary ducts penetrate, is commonly at the conclusion of the first doubling or convolution, which occurs after the origin of the intestine from the stomach; or, in other words, it might be said to be at the termination of the duodenum. The bile duct of the *ostrich* is very large and enters the intestine near the stomach.

As in mammalia, the passage of the ducts through the coats of the duodenum is somewhat oblique, and they open upon a papilla or prominence of the internal coat, thus gaining the effect of a valve, and preventing the regurgitation of their fluid. In addition to which, the *buffard* is described as having a fold of the inner coat of the intestine projecting over the orifices of the biliary and pancreatic ducts.

Plate IV. and fig. 5. in the *Anatomy of Birds*, exhibits the origin, course, and termination of the biliary ducts in the *goose*; *f* the hepatic duct, formed of two branches in the fissure of the liver: *g* the origin of the cystic duct from the end of the bag, appearing internally like a puckered hole; *h* its course behind the hepatic duct, beyond which it terminates in the intestine; *ii* the first convolution of the intestine; *k* the portion from which the gizzard has been cut away; *l* the commencement of the second fold of the intestines, or the beginning of the jejunum.

Both the cystic and hepatic ducts of the *gull* become slightly enlarged just at their insertion in the intestine, which is produced not so much from a dilatation of their cavity as a thickening of their coats. The more minute structure and the functions of the bile ducts are in every respect analogous most probably to those of the same parts in other animals. A very curious observation has been made on this subject by Borrichius, which deserves to be mentioned. He opened a pigeon while yet alive, and discovered in the hepatic duct a pulsatory motion, by which it was alternately distended and emptied of its contents, the intervals between each contraction were somewhat longer than they occur between the systole and diastole of the heart. If this had been related by a less accurate anatomist than Borrichius, one would be led to suspect that a blood-vessel had been mistaken for the biliary duct; but he watched the moment that the action of the heart subsided, and still the duct was alternately emptied and distended with a green fluid as before.

The gall-bag is occasionally wanting in birds, and it should be remarked, that this irregularity is not governed by any general rules of structure, as two species which agree in every other respect, are observed to differ in this; nay, according to the French academicians, the gall-bag is not constantly found even amongst the individuals of the same species; thus in dissecting six *demoiselles of Numidia* (*ardea virgo*), it was absent in two of them, and the others had it very small. Amongst ten *pintados*, also, they only met with the gall-bag twice, and differing very much both in size and shape; and in these instances where the bag was absent the hepatic duct was found very large.

The species known to be deprived of the gall-bag, are the *ostrich*, the *parrot*, the *pigeon*, the *bittern*, the *crane*, and the *cuckoo*; in some of these, dilatations of the ducts have been observed which may be supposed to supply in a degree the office of the gall-bag, which appears from this, as well as other circumstances, to be simply a reservoir for the bile, and not an organ for working any change in the properties of that fluid. Being, therefore, a convenient, rather than a necessary structure, its absence need not be expected to be marked with any clear relation to the other functions of the animal economy.

No experiments have yet been instituted with the design of procuring a chemical analysis of the bile of birds; it is most probable, however, that these would discover nothing peculiar, as in sensible properties such as colour, taste, &c. it perfectly resembles the bile of mammalia.

The Pancreas

Consists of two distinct glands, for the most part, in birds. Their common situation is between the coil of the first intestines, to which they are very firmly bound by their peritoneal coat; they have a very elongated figure, furnished with decided sides, angles and edges, which are irregularly notched or indented. These clefts mark out imperfectly the original lobules of which the glands are composed. They appear to possess the same internal structure which is described in mammalia, though not so palpably as to be discovered without some pains; to a slight observation their substance seems to be a white homogeneous mass, instead of that congeries of lobules, cells, blood-vessels, and ducts, which really enter into its composition. Each of the glands produces a principal duct, which separately runs in the reflection of peritoneum, into which intestine they are inserted, at a variable distance from each other, in the manner of the two biliary ducts. Their entrance is, with scarce an exception, adjacent to that of the bile ducts, and often so near that one projection of the internal coat of the intestine serves for the termination of all the ducts.

See Plate IV. in the *Anatomy of Birds*, in fig. 5. the letters *nm* indicate the two pancreatic glands of the *goose*, a little separated from each other, and their other peritoneal connections, to exhibit more clearly their figure; *nn* the ducts from each gently curved in their passage to the intestine. The pancreatic and biliary ducts are at a considerable distance in the *ostrich* and the *gull*. In the first, as already mentioned, the hepatic duct enters the intestine near the stomach; but the pancreatic duct passes as usual into the last portion of the duodenum. The pancreatic ducts of the *gull* penetrate the duodenum at its commencement, whilst the biliary prefer nearly the common situation. It is not very unusual for these ducts to enter the intestine alternately, or for the two pancreatic to pass between the two biliary; this may be observed in the *eagle*, the *heron*, &c.

Considerable varieties have been described in the number, external figure, and magnitude, &c. of the pancreas in different birds. The French academicians have represented it as a single gland, with only one duct in the *ostrich* and *curassowary*. In the latter it was extremely small in proportion to the size of the bird, being only two inches long, and its duct a line and a half in length. In the *eagle* it appeared to be single, although in one instance it sent forth two ducts, and in another three; it was enlarged and round at the head, at which place it was perforated by the hepatic duct in its way to the intestine. They also describe that this gland varies in different individuals of the same species; thus in one *curassow* they found the pancreas double, and in another single. De Graef in most *fowl* found three pancreatic ducts, and also in the *pigeon*, and Bartholin observed only one pancreatic duct in the *peacock*.

The Spleen

Has been described as occupying different situations by different authors. Thus Cuvier, and other anatomists, have stated its common position to be the middle of the mesentery. The French academicians found it closely adhering to the side of the ventricle, in one species of eagle (*falco chrysaetos*) and in another (*falco haliaetos*), it was met with under the right lobe of the liver; and Severinus mentions the spleen of the *crow* being situated upon the first intestine. In every bird, however, which we have examined with the view of

ascertaining the situation of the spleen, it has been uniformly discovered underneath the left lobe of the liver, placed a good deal backwards, and on the right side of the zone of gastric glands. Its peritoneal connections to the neighbouring parts are loose and permit it to be displaced, when the other viscera are removed from their situations, which circumstance may have occasioned some difference in the observations made upon the subject. The situation we have described is the most convenient for its being supplied with blood, which it receives from the gastric artery, and is besides consistent with general analogy.

The figure of the spleen is most commonly round; it is, however, in some birds, a little different in form. The most usual deviation is the oval or kidney shape, which has been observed in the *cormorant*, the *eagle*, the *pintado*, the *common foral*, &c. In the *ostrich* it is cylindrical, and in the *casowary* it has been likened in figure to a foal fish. In the *gull* it is much elongated and pointed at both ends, as it is shewn in *Plate IV.* in the *Anatomy of Birds*, and *fig. 6.*

The spleen assumes rather an irregular form in the *goose*; it is slightly compressed and round on the one side, and flat on the other. The outline presented on either side is triangular, and one of the angles is prolonged as a mamillary process, which is distinguished from the rest of the spleen by a slight cleft or fissure. This is represented in *fig. 7.* of *Plate IV.* of the *Anatomy of Birds*; *a* the body of the spleen viewed on the flat surface; *b* the papilla-shaped process; *c* the entrance of the splenic artery, upon the edge; *d* the vein penetrating the flat surface.

The texture of the spleen is so much more close and firm in birds than in mammalia, that one might be easily led to suppose its structure was different; but when prepared by being injected with coloured substances, and submitted to examination through a lens, we have discovered, as in mammalia, the splenic artery to terminate in numerous minute branches, and the veins to take their rise from cells. The only difference which exists, is with respect to the magnitude of the cells which are extremely minute; and thence arise the peculiar compactness and density of the spleen of birds.

The structure of this organ being so very similar to that of the spleen in mammalia, it is fair to conclude that their functions are also analogous. The situation of the viscus in birds might be considered, therefore, as affording an objection to that theory, which supposes this organ was designed to regulate the quantity of blood employed by the arteries of the stomach during the secretion of the gastric fluid; for, in birds, the spleen receives no pressure as occurs in mammalia by the introduction of food into the stomach, and consequently, cannot affect the distribution of the blood in the collateral arteries, more under the circumstance of a full stomach than an empty one. In order to put the spleen of birds in the same conditions to which it is subject in man and quadrupeds, it should be placed under the crop in the graminivorous tribe, or between the ventricle and the ribs in the other kinds.

Although it would be often wrong to determine the uses of an organ in one class of animals, from the circumstances in which it may be placed in another; yet no theory can be considered as well founded, unless it be framed in the contemplation of all the varieties of comparative structure.

Absorbents.

One of the most remarkable and inexplicable circumstances in the anatomy of birds is, that the nutritious fluid of the intestines, or the chyle, is as transparent as the lymph which is taken up from the common interstices, or the surface of the body. The absorbents of the intei-

lines, therefore, do not deserve to be called *lacteals*, an appellation they have received in man and quadrupeds, in consequence of the opacity and milky appearance of their contents.

The discovery of the lymphatic system in birds may be reckoned amongst the modern improvements in anatomy. Before Mr. Hunter, about the middle of the last century, described the absorbents of the neck, it was generally supposed that the office of these vessels was fulfilled in birds by the minute branches of veins. This opinion was rendered the more probable as several able anatomists had sought in vain for those white vessels, and their glands, which are so easily detected in the mesentery of the smallest quadruped. It was not then known, however, that the lymphatic vessels of the intestines were always pellucid in birds, and unprovided with glands, and accordingly Mr. Hunter's discovery was not generally admitted as decisive on the question, until some years afterwards the whole of the lymphatic system had been described by Mr. Hewson; he employed for this purpose a young and very lean goose, which had been recently fed, and having secured it upon a table, he opened the abdomen whilst the bird was yet alive, and passing a ligature round its mesenteric vessels, as near to the root of the mesentery as possible, the lymphatics of this part became apparent in a few minutes. The same method also was pursued to expose the absorbents of the neck. A ligature was placed round the jugular vein at the lower part of the neck; and to be more certain of inclosing the lymphatics which are near it, a sufficient quantity of the surrounding substance was included by the ligature. In this way he succeeded in tracing the lymphatic system, in more instances than one, after having filled the vessels with quicksilver. He published a description of the absorbents, illustrated by two drawings, in the *Philosophical Transactions* for the year 1748, and in his *Experimental Inquiries into the lymphatic system.*

As no accounts or figures of the absorbents of birds have been offered to the public since Mr. Hewson's time, we cannot do better than adopt the description, and copy the representation left to us by that indefatigable anatomist; in doing which, we shall transcribe his own words.

“ This system consists in birds, as it does in the human subject, of three parts, viz. the lacteals, the lymphatic vessels, and their common trunk, the thoracic duct. The lacteals indeed, in their strictest sense, are in birds, the lymphatics of the intestines, and like the other lymphatics, carry only a transparent lymph; and instead of one thoracic duct there are two, which go to the two jugular veins. In these circumstances, it would seem, that birds differ from the human subject, so far at least as I may judge from the dissection of a goose, which was the bird I chose as most proper for this inquiry, and from which I took the following description, after previously injecting its lymphatic system with quicksilver.

“ The lacteals run from the intestines upon the mesenteric vessels. Those of the duodenum pass by the side of the pancreas, and probably receive its lymphatics: afterwards they get upon the cœliac artery. Whilst they are upon this artery they are joined by lymphatics from the liver. Here they form a plexus which surrounds the cœliac artery: at this part they receive a lymphatic from the gizzard; and a little farther, another from the lower part of the œsophagus (or zone of gastric glands). Having now got to the root of the cœliac artery, they are joined by the lymphatics from the glandulæ renales, or renal capsules; and near the same part, by the lacteals from the other small intestines, which vessels accompany

“ the mesenteric artery. These last mentioned lacteals, before they join those from the duodenum, receive from the rectum a lymphatic, which runs with the blood-vessels of that gut. Into this lymphatic some small branches from the kidneys seem to enter, which, coming from those glands upon the mesentery of the rectum, at last open into its lymphatics. At the root of the cœliac artery, the lymphatics of the lower extremities probably join those from the intestines. The former,” he says, “ I have not yet traced to their termination, though I have distinctly seen them on the blood-vessels of the thigh; and in one subject which I injected, some vessels were filled, contrary to the course of the lymph, from the network near the root of the cœliac artery. These vessels ran behind the cava, and down upon the aorta, near to the origin of the crural arteries; and I presume they were the trunks of those branches which I had seen in the thigh. At the root of the cœliac artery, and upon the contiguous part of the aorta, a net-work is formed by the lacteals and lymphatics above-described. This net-work consists of three or four transverse branches, which make a communication between those which are lateral. In the subject from which this description was taken there were four. From this net-work arise the two thoracic ducts, of which one lies on each side of the spine, and runs upon the lungs obliquely up towards the jugular vein, into which it opens, not indeed into the angle between the jugular and subclavian vein, as in the human subject, but into the inside of the jugular vein, nearly opposite to the angle. The thoracic duct of the left side is joined by a large lymphatic which runs upon the œsophagus, and can be traced as far as the lower or glandular part of that canal, from which part, or from the gizzard, it seems to issue. The thoracic ducts are joined by the lymphatics of the neck (and probably by those of the wings), just where they open into the jugular veins.

“ The lymphatics of the neck generally consist of two pretty large branches on each side of the neck, accompanying the blood-vessels. Those two branches join near the lower part of the neck; and the trunk is in general as small, if not smaller, than either of the branches. This trunk runs close to the jugular vein, gets on its inside, and then opens into a lymphatic gland. From the opposite side of this gland a lymphatic comes out, which pours the lymph into the jugular vein. On the left side, the whole of this lymphatic joins the thoracic duct of the same side; but, on the right, one part of it goes into the inside of the jugular vein a little above the angle, whilst another joins the thoracic duct, and with that duct, forms a common trunk, which opens into the inside of the jugular vein, a little below the angle which that vein makes with the subclavian.

“ To this description it may be necessary to add, that though it be taken from one subject, yet in three others of the same species, which I examined carefully, I saw nothing which disagreed with it. I particularly attended to the number of the thoracic ducts, suspecting that possibly in this subject the two that I had seen might be only a variety, which is a circumstance that, as we are told, has occurred even in the human body. But in three others of this species, which I likewise successfully injected, I still saw two ducts; and therefore I am inclined to believe, that this is the constant number. I likewise carefully attended to the vessels coming from the gland on the right side; and in the only two subjects in which the lymphatics of the neck were properly filled,

“ I observed that one part of it opened immediately into the vein, and the other joined the thoracic duct. In all the four subjects I evidently saw that the thoracic ducts opened into the inside of the jugular veins.

“ This system in birds differs most from that of quadrupeds. 1st, In the chyle being transparent and colourless; 2dly, In there being no visible lymphatic glands, neither in the course of the lacteals, nor in that of the lymphatics of the abdomen, nor near the thoracic ducts; 3dly, In the several parts of this system in birds being more frequently enlarged, or varicose, than in quadrupeds. In particular, this appears to be the case of the vessels which constitute the net-work at the root of the cœliac artery, in that subject from which the drawing was taken. The lacteals are frequently enlarged in some places; so are the thoracic ducts; and the lymphatics on each side of the neck are commonly, when taken together, larger than their trunk, which opens into the lymphatic gland. In one subject, when, instead of two lymphatics on the left side, I found only one, that vessel was as large as a crow quill, whilst the lower part of it, which entered the gland, was much smaller.”

The figures which explain the foregoing description are to be found in *Plate V.* of the *Anatomy of Birds.* *Fig. 1.* shews the absorbents in their natural situation, with respect to the other parts of the body; A, the neck; B, B, the clavicle divided near its middle; C, the left subclavian artery; D, D, the jugular veins; E, E, the pulmonary arteries; F, F, the two branches of the trachea; G, G, the lungs; H, the aorta; I, the cœliac artery; L, the œsophagus turned to one side; M, M, the renal capsules; N, a small part of the liver fixed to a rib by a thread; O, O, O, intestines; P, the duodenum; Q, the pancreas fixed to a rib by a thread; R, the gizzard. *Fig. 2.* exhibits the absorbents, and their more immediate connexion with the vessels, in outlines: *a*, the lacteal, or more properly lymphatic, which come from the *duodenum*; *b*, the lymphatics of the liver; N; *c, c*, a plexus formed by the above-mentioned lacteals and lymphatics, which surrounds the cœliac artery; I; *d*, a lymphatic from the gizzard; *e*, a lymphatic from the lower part of the *œsophagus*; *f, f*, a net work formed by the lymphatics upon the *aorta*; H; *g, g*, the two thoracic ducts; *i, i*, the trunks of the lymphatics of the neck; *k, k*, the glands through which the lymphatic vessels of the neck pass: that of the left side is oblong, and could not well be represented in a Figure; *l*, the thoracic duct of the left side, and the lymphatic vessel of the neck, opening together into the inside of the jugular vein; *m*, a part of the lymphatic of the right side of the neck, opening into the jugular vein; D; *n*, the thoracic duct of the right side, joined by a part of the lymphatic vessel of the right side, and then opening into the inside of the jugular vein.

Heart.

This organ occupies the centre of the superior portion of the common cavity of birds. It is placed usually in the line of the body, as in quadrupeds; the heart, however, is inclined in the slightest degree to the left side in some instances, and in others a little to the right side. The apex of the heart is commonly received between the two chief lobes of the liver, which are hollowed out for its accommodation.

The membranous bag, which contains the heart, is formed like the pericardium of other animals, and is reflected in the common manner upon the origin of the great vessels, and the heart. The pericardium of birds is generally considerably larger than the heart, and especially at the lower part,

which is often prolonged for some way between the lobes of the liver. It deserves remark, that notwithstanding the great size of the pericardium, the air, which pervades almost all the cavities of birds, is not admitted into this. The Parisian academicians, it is true, observed the pericardium to swell when they inflated the lungs and air-cells of the *pintado*, and thence concluded that the air had admission to the heart, for which they assigned some curious reasons; such as the heart requiring compression and evaporation from its surface. They appear, however, to have been equally in error with respect to the fact and the reasoning; for, in a great number of species we have examined for the purpose, the pericardium was uniformly found to contain a certain quantity of water, and had not the least communication with either the lungs or air-cells. The Parisian anatomists must have been led into this mistake by the distension of the air-cells around the pericardium.

The heart is of a longer figure in birds than in other animals; and the outline of the right side is slightly concave, in consequence of the parietes of the right ventricle being relatively thin. In the *ostrich*, the heart has been described as nearly round; measuring six inches from the base to the apex, and five inches across.

Birds have, like mammalia, four distinct cavities in the heart, which bear the usual proportions in magnitude with respect to each other. The auricles however, and especially the right, are commonly more muscular than in other animals; and the left ventricle is always much stronger than the right.

The internal surface of the auricles is very irregular, in consequence of the shape and size of the muscular fasciculi. There is one very strong portion of muscle, which enters into the composition of the auricular part of both cavities, from which other fasciculi proceed in a regular and radiated manner, at least in the right auricle. See *Plate V.* in the *Anatomy of Birds. Fig. 3.* shews the heart of the *goose*, with the auricle and ventricle of the right side laid open, *e* the principal muscular fasciculus of the auricular portion of the cavity passing backwards towards the left auricle; *f* the lesser fasciculi, which depart from the other as branches from a trunk; *g g* the deep fossæ which exist on each side of the large fasciculus.

The blood of the viscera and lower limbs is conveyed into the right auricle by a vein corresponding to the inferior vena cava of mammalia. There is, however, no vein strictly analogous to the superior cava, the veins of the right wing and that side of the head and neck, form a distinct trunk, which enters the upper part of the auricle; while those of the opposite side also produce another trunk, which passes along the posterior surface of the left auricle, to which it is closely united, and opens into the right auricle beside the inferior cava.

The anatomists of the French academy observed, in most of the birds they dissected, a valvular projection of the inner membrane of the heart, over the entrance of the inferior vena cava into the right auricle. This valve resembles in form that of the coronary vein of the human heart, and by its means, the orifice of the cava, which is really very large, puts on the appearance of a narrow slit. A similar valve hangs over the entrance of the veins which return the blood of the wings and head to the auricle. See *Plate V.* in the *Anatomy of Birds, fig. 3.* *a a* a point out the veins, which terminate in the right auricle with their valvular orifices, into each of which a bristle has been introduced.

The analogy between the valves of the veins entering the right auricle of birds, and the Eustachian valve of the human

heart, is very obvious, and demonstrates, as far as analogous structure can, that the latter serves the purpose of a valve to the vena cava in the human subject.

There are commonly two or three orifices for the coronary veins in birds, one is always larger than the rest, and transmits the blood of the principal vein of the heart. They are each provided with a slight projection of the inner membrane, which acts imperfectly as a valve.

The right ventricle is of a triangular figure, and is quite smooth on the internal surface; there being none of those processes of muscle which are called *carneæ columnæ*.

The valve, which is placed at the mouth of the right ventricle, is of a peculiar shape and structure in birds. Instead of those thin and membranous folds, which usually surround the orifice of the ventricle, and are moved by means of their connexion with the *carneæ columnæ*, and which from their figure in the human subject are called the *tricuspid valve*; there is a single projection of the flesh of the heart, of a triangular figure, and nearly as thick as the parietes of the cavity in which it is contained. The triangular valve is joined by its superior edge to the margin of the orifice of the ventricle, and is united by another of its edges to the right side of the cavity almost to the bottom. The third edge is unconnected, except by a small process, which goes off near one of the superior angles to the parietes of the ventricle on the left side. See *Plate V.* in the *Anatomy of Birds, fig. 3.* *b* the triangular valve, exposed by means of the anterior parietes of the right ventricle being cut off, a bristle is passed under the valve from the auricle; *d d d* the external surface of the heart; *e* the process connecting the floating edge of the valve to the parietes of the ventricle, with a bristle lying under it.

The triangular valve, from its thickness and muscularity, would seem to operate chiefly by means of the contraction of its own fibres changing its figure, and thus obstructing the return of the blood into the auricle. Borrichius discovered a foramen in the septum of the heart of the *pigeon*, large enough to admit a bristle, by which the two ventricles had a direct communication with each other. See *Act. Dan. anni 1. observ. 96.*; and we have observed the same foramen at the upper part of the septum of the heart of the *goose* in one instance; it was of sufficient size to receive a crow quill. Such a communication does not appear, however, to be an uniform or natural structure, as we failed to discover it in other *geese*, and in different species of birds examined for the purpose. Indeed, a ready communication between the ventricles of an adult bird, would be inconsistent with the mode in which the functions of respiration and circulation are carried on in this class of animals.

The pulmonary artery is provided with three semicircular valves, as in mammalia. It divides also, as usual, into a vessel for each lung, and that of the right side passes under the arch of the descending aorta.

The blood is returned from the lungs by two pulmonary veins, which open very near each other into the upper and posterior part of the left auricle.

The mechanism of the cavities of the left side of the heart more nearly resembles that which exists in mammalia. The sinus, or membranous part of the left auricle, is however very small, and of an oblong shape; and at the place where the pulmonary veins enter into the auricle, there appears to be a projection of the internal membrane, which performs the office of a valve to their orifices.

The valve of the left ventricle is thin and membranous, and resembles so much the *mitral* valve of the human heart, that the same name might with propriety be given to it.

The tendinous cords, however, which are attached to the margins of the valve, are not moved by distinct muscular fasciculi, or *carinae columnae*, but proceed immediately to be lost in the sides of the ventricle. The lower part of the cavity is fasciculated, although not so remarkably as the internal surface of the ventricle of man or quadruped.

The aortic or bicuspid valves are to be found at the origin of the great arterial trunk from the left ventricle.

The above account of the mechanism of the heart of birds shows that this organ is calculated to exercise its functions precisely in the same manner in these animals as in mammalia; and that the pulmonary and general circulations are maintained by different chambers of the heart; consequently every particle of blood is exposed to the influence of the air in the lungs, previous to its distribution throughout the system for the purposes of nutrition, excretion, &c. Before the description of the vessels of general circulation is entered upon, it is in order therefore to treat of the organs of respiration, or the

Lungs.

These bodies are situated on each side of the dorsal spine, upon the surface of the ribs and intercostal spaces, usually reaching in length from the second rib to the last intercostal space but one, and extending in breadth from the spine to about that part of the ribs, where the processes are sent from one to the other. In the *strich*, the lungs were found to measure ten inches long, and three and an half broad, and were one inch and an half in thickness.

The lungs of birds never move from their position, as they adhere to the inside of the chest, and are covered over by a strong membrane or aponeurosis.

They are smooth and even on the anterior part; but their figure posteriorly exactly corresponds with that of the parts upon which they are laid. The ribs and intercostal spaces serve as a mould, of which the lungs are the perfect cast, presenting a remarkable projection for each depression between the ribs. These eminences are of course most striking next the spine; and towards the anterior edge of the lungs, which is very thin, they are scarcely visible.

The lungs have two coverings; one is somewhat analogous to the *pleura*, though not exactly similar to it in structure, being more like condensed cellular substance. It closely invests each lung, and appears to be flocculent on some parts of its surface, and to adhere to the parietes of the chest. The other coat is common to both lungs; it is extended from each side of the chest to the dorsal spine across the anterior surface of the lungs. It is connected in a degree to the fore part of the spine, and inclines at this place the trunk of the descending aorta, forming the *costal* artery to pass through it. It has no intimate union with the proper tunic of the lungs except at the openings of the air-cells, and around the entrance of the great vessels of the lung. The texture of this coat appears to be tendinous; its fibres all run in the transverse direction; and in large birds they are evidently white. This aponeurosis is not equally strong upon every part of the lungs; at the upper part, and especially above where the vessel enters, it is so weak as often to be hardly visible.

In all birds there would appear to be some muscular fibres passing from the side of the chest upon the aponeurosis of the lungs. These are very distinctly to be seen in the larger species, in some of which the muscles of the lungs are of considerable strength. The anatomist of the French academy observed six strong slips of muscle on each side of the body in the *strich* and *caffowary*. They arose from the ribs which come from the spine, near their junction with

those which belong to the sternum, and terminated in the aponeurosis which covered the lungs. Mr. Remy discovered eight muscular fasciculi to each lung of the *strich*. See *Phil. Trans.* N^o 586, p. 223. We have noticed only four broad thin slips of muscle in the *strich*, which proceed from the articulation of its many vertebral ribs with the sternum; in the common *fowl*, the muscles of the lungs do not present the appearance of distinct slips, as in other instances, but are spread as a single layer upon each lung.

It is difficult to speak with certainty of the uses of the pulmonary muscles. The effect of their contraction appears to be the tension of the aponeurosis, and consequently the deviation of it into a flat surface which is ordinarily concave or depressed. This would necessarily produce some dilatation of the lungs; and therefore these muscles might be reckoned amongst the agents of inspiration, although their operation in this way would be very trifling.

The Parisian anatomists attributed several uses to them; they supposed that these muscles had the power of depressing the anterior part of the thorax, in consequence of their attachment to the movable angle of the ribs, and their oblique course upward to the spine. If they be allowed to perform this effect, they must be considered as muscles of expiration.

They imagined also that they caused, when in action, a constriction of the foramina through which the air is admitted into the great air-cells of the thorax or upper part of the body, and thus enabled the bird to maintain a continued dilatation of these cells, in order to diminish the specific gravity of its body during the time it remained on wing; or (what the academicians thought more probable) furnished the bird with a supply of common air to carry with it into the regions of the atmosphere, in which the air would be too thin and light for respiration; in the last conjecture, however, they seem to have forgotten the effect that the temperature of the bird's body would produce in the rarefaction of the air contained in the cells.

When the lungs of birds are stripped of their coverings, they are still found to be a connected, uniform substance, and not reducible into lobes or lobules as in mammalia; they appear, to a superficial view, solid and fleshy, but if examined more clearly, are seen to be made up of the ramifications of the great blood-vessels, the bronchiæ, and very minute air-cells.

When the bronchiæ enter the lungs, their chief branches, instead of being regularly and equally distributed, pass directly to certain points upon the surface of the lungs, and there terminate in several foramina, which communicate with the great air-cells of the body; these branches also of the bronchiæ retain in their structure, almost throughout their extent, some cartilaginous rings. The ramification of the air tube which really supply the substance of the lungs, are but branches of those which go to the cells. They are comparatively small, and entirely composed of membranes. This structure accounts for the fleshy appearance and solid feel of the lungs, and explains why birds are able to fill their air-cells with so much ease and rapidity.

Air-Cells.

Although physiologists are not agreed with respect to the uses which these parts serve in birds, yet as they are immediately connected with the lungs, it seems most proper to describe them in this place. It is one of the most remarkable and peculiar circumstances in the anatomy of birds, that the atmospheric air has a ready passage to almost every part of the interior of their bodies.

The air-cells, according to their situation, may be divided

into three kinds. 1. Those of the great cavity of their body which takes the place of the thorax and abdomen. 2. Those situated amongst the muscles; and lastly, those in the interior of their bones.

It has been already stated, that the body of birds is not divided into two parts by a transverse muscular partition or diaphragm. This common cavity is intersected by a great number of membranes, some of which simply enclose the several viscera, but the greater number form cells, which are filled from openings upon the surface of the lungs.

These membranes are in most birds extremely fine and delicate, often so much so, that the viscera are perfectly visible through them; they are almost impossible to be dissected unless when kept continually inflated, by blowing into the trachea; it is said, however, that in the *ostrich* and *casowary*, they are as strong as a hog's bladder.

The anatomists of the academy describe the heart and liver of the *ostrich* as contained in one cavity, which was unfurnished with air, and was separated from the air-cells on the side by two longitudinal membranes, and from the stomach and intestines below, by a transverse membrane, situated like the diaphragm of mammalia, and covered on its inferior surface by a layer of fat, of the thickness of a finger; in all the birds, however, which we have examined, we have found a membrane inclosing the pericardium, in the manner of the mediastinum, and afterwards reflected upon the liver, and then forming two sacks, of which one contained the right lobe of the liver, and the other inclosed the left lobe, along with the anterior surface of the gizzard; and in the *goose*, and some other birds, the membranous sack of the left side of the liver only admitted into it the upper half of the anterior part of the gizzard; in general, no air is found in the cells which enclose the liver and the anterior part of the gizzard; we, however, once inflated them from the trachea in the *goose*, in which they had a communication with the cells of the abdomen, by means of three large holes; but it is probable, that this was from mal-conformation of the membrane.

The *air-cells of the great cavity* of birds, according to the academicians, who take their description from the *ostrich* and the *casowary*, are five on each side of the body. The four superior cells are immediately next the aponeurosis of the lungs, and are separated from the rest of the cavity by a strong membrane which descends from the top of the thorax upon each side to be joined to the transverse membrane which divides the heart and liver from the stomach and intestines. The inferior cells are by much the largest, and are kept distinct from the intestines by a strong membrane, similar to the other partitions of the cavity; they come in contact with the aponeurosis of the lungs, only at their superior part, where they receive their air. The uppermost cell is the smallest, and derives its air from an opening at the superior part of the lungs. The next cell is of a square figure, and is filled by means of two foramina situated upon the external edge of the lungs. The third cell of each side is not a regular square, being of greater extent where it joins the lungs than at the opposite; it has but one communication with the bronchia, which is placed upon the internal margin of the lungs. The fourth cell is of a very irregular elongated form, reaching down to the bones of the pelvis; it is less extensive in the *casowary* than in other birds. The air hole of this cell is situated at the lowest part of the lungs. The last or inferior cells are long, and somewhat of an oval shape; they communicate with the most inferior point of the lungs.

The Parisian anatomists describe all these cells as being formed of distinct tunics, so that each is a separate bag, instead of being made by continuous and reflected membranes. They represent the bags to be distinct also from the great membranous partitions of the cavity. See *Plate V.* in the *Anatomy of Birds*; *fig. 4.* is copied from the memoirs of the French academy, and exhibits the air-cells, &c. of the *ostrich*; *a* the trachea; *bb* the two bronchiæ passing to the lungs; *c* the heart; and *dd* the liver, seen in the superior division of the cavity; *e* the transverse membrane which separates, like the diaphragm, the common cavity into two parts; *f* the stomach; and *ggg* the convolutions of the intestine, seen in the lower or abdominal portion of the cavity, *bbbb* the lateral partitions which inclose the four superior cells; *12345* indicate the different cells; the air-holes are apparent in each, except the inferior or abdominal cells, which cannot be brought into view, as they lie behind the fourth cells.

The air-cells of birds in general do not exactly accord with the description given of the *ostrich* and *casowary*, by the members of the Royal Academy; we shall therefore proceed to give an account of what we have observed on this part of the anatomy of birds in the *goose*, *duck*, *common fowl*, *pigeon*, &c.; and in order to make this description more intelligible, we shall take the liberty of naming the cells according to their situation with respect to other parts, although some of the terms must be adopted upon the strength of analogy, as the distinctions of thorax and abdomen do not with strictness belong to birds.

The first is the *superior thoracic*, or *jugular air-cell*. When it is distended with air, it becomes evident upon the outside of the thorax, between the two branches of the fork; it is large enough in the *goose* to contain an apple in its anterior part, and posteriorly it extends on each side of the basis of the heart, over the lungs. This cell contains the divisions of the trachea into the bronchiæ and the trunks and primary branches of the blood-vessels which supply the wings and head. A great number of membranous septa pass through it in various directions, which serve to connect and keep steady the different vessels, and also divide this cell into several chambers, which, however, have all a free communication with each other. The air is transmitted from the superior part of each lung by two openings which are placed in the posterior chambers of this cell. These chambers do not appear to extend so far upon the lungs in other birds as they do in the *goose*; it is from this cell that the air passes into the cells of the axilla, and under the fork-shaped bone, into the deep seated cells of the neck, and to those about the shoulder.

The next cells may be called the *intermediate thoracic*. They are generally two in number, one to each side; they lie immediately upon the lungs, and are in a degree covered by the anterior thoracic cell. That of the right side is usually larger than the one on the left; the latter is particularly small in the *goose*, being almost concealed by the two adjoining cells, and extending under the posterior part of the liver. The cell of the right side is of an oblong square figure, and is prolonged under the termination of the inferior vena cava in the right auricle, as far as the left side of the bulbus glandulosus. The intermediate thoracic cells receive their air through a large foramen, situated upon the inner edge of each lung, just at the basis of the heart. At the upper and inner angle of these cells also there is an opening which appears to lead to some small cells under the pericardium and œsophagus, and to communicate indirectly with the anterior thoracic cell.

The *lateral thoracic cells* are amongst the largest of the body. They are of a pyramidal figure, their basis being applied to the intermediate thoracic cells, and their point reaching as far down as the bones of the pelvis; they cover the inferior portion of the lungs, and occupy a space between the ribs and the lobes of the liver. They have a very free communication with the branches of the bronchizæ, at the external edge of the lungs.

As the intermediate thoracic cells are small on the left, and large on the right side, these cells are larger on the left side than on the right: this disproportion is most observable in the *goose*, and very trifling in the *duck*, in which the two intermediate thoracic cells are nearly of an equal magnitude.

The air-cells, which are found in the lower or abdominal portion of the cavity of birds, are composed of thinner membranes than the others; in some parts they are so tender, that they are ruptured with the slightest touch, from which they become very difficult to examine.

Underneath the lateral thoracic cells, at the very lowest part of the lungs, on each side of the spine, the branches of the bronchizæ open into the cavity of the abdomen, by which means air is conveyed directly into the two great *lateral abdominal cells*, and from these it would appear that it passes into the others.

The *lateral abdominal cell* of the right side is by much the largest in the body; it reaches from the last ribs to the anus, and lies over and includes almost all the small intestines, the renal capsule, and the kidney. It appears in the *goose* to be divided from the opposite cell by a membrane which passes obliquely from the right side of the anus to the lower part of the gizzard.

The *left lateral abdominal cell* contains the intestines of that side; it is attached to the margin of the gizzard, under which it is prolonged as far as the lungs, where it is supplied with air, as already mentioned.

The lateral abdominal cells transmit air to the inguinal cells, and to several chambers formed by the most delicate membrane, amongst the intestines. One of these being somewhat stronger than the others, there was an opportunity of observing it more distinctly. It makes a circuit around the right side of the gizzard to which it is attached, and incloses the duodenum and pancreas; it might thence receive the name of the *duodenal cell*.

Interposed between the parietes of the belly and the lateral cells there is frequently found a considerable quantity of tender fat; especially in aquatic birds, such as the *goose*, &c. By this means a soft cushion is provided for the small intestines to press and move upon, thus supplying the use of the *omentum*, which is a part not met with in birds.

The structure of the air-cells of birds in general does not appear to be the same described in the *ostrich* and *casowary* by the academicians. The membranes composing them, instead of being distinct bags, as they relate, resemble rather the pleura or the peritoneum, and like them, seem to produce all the different cavities by the means of reflection. It must be confessed, however, that the membranes of the cells, especially in the abdomen, are very easily separable into different lamina, or layers, which, it might be supposed, could be ultimately resolved into distinct sacks.

It deserves to be mentioned, that each of the air-holes in the surface of the lungs opens obliquely into the air-cells; there being a slight projection of thin membrane over the aperture. The Parisian anatomists ascribed a valvular effect to this structure, which they supposed of great consequence, as it would serve to continue the distension of the air-bags, after they were once inflated. The projection of the mem-

brane over the air-holes does not however appear to be sufficient to cause any obstruction to the regress of the air from the cells; nor would it seem necessary or convenient to interrupt in the least degree the expulsion of the air contained in the cells.

The membranes of which the air-cells are composed, are reflected into the apertures of the air-holes, and are there perforated by a great number of small foramina, which correspond to the termination of the ramification of the bronchizæ, through which the air has a ready passage. When these foramina are brought into view, by dissecting of the coverings of the lungs, they give the anterior surface an appearance of being pricked by pins.

The air-cells which are found amongst the muscles and integuments of the external parts of the body, vary in number and magnitude, according to the structure and economy of the bird. In every instance, perhaps, the anterior thoracic or jugular cell is continued along with the vessels and nerves into the axilla, making what may be called an *axillary cell*, and in most birds others go off from this anteriorly under the pectoral muscle, and backwards under the muscles of the scapula, forming *pectoral* and *subscapular cells*. In the *eagle*, *hawk*, *stork*, *lark*, and other high flying birds, these cells are very large, and in many of these birds there are still larger cells, ascending under the integuments of the neck, and passing beneath the skin of the inside of the arm, and the back of the shoulder. In the *stork* we found these cells large enough to admit the finger to pass a considerable way down upon the inside and the back of the wing. They are also large in the *osol* and other birds of prey.

Most birds of flight have a number of cells placed under the lateral muscles of the neck. These are opposite to the bodies of the cervical vertebræ, and communicate with one another. It is from the different cells about the axilla and neck, that the bones of the shoulder, the humerus, and the vertebræ, receive the air which they contain.

The *inguinal* and *gluteal cells* are filled from the great lateral cells of the abdomen, with which they have a communication, where the blood vessels of the lower extremities pass out of the pelvis. The inguinal and gluteal cells surround the neck of the femur; they are in most birds very small, but in those which are much employed in flight, especially if the thigh bones receive air, they are larger, extending for some way amongst the muscles behind the joint. Camper observed two air bags between the glutæi muscles of the genus *spoonbill* (*ptaralea*), although no air was transmitted into the femur.

The subcutaneous air-cells of the *pelican* are very large, and were described long ago by Mery, in the early Memoirs of the Academy of Sciences of Paris.

Several means have been employed to prove that the air is permitted to enter the cavity of the bones in birds. The air-cells and the lungs have been inflated from the bones, and injection being thrown into the trachea, was found, after distending the air-cells, to have passed into the interior of the bones. A still more decisive experiment (although a cruel one) is to cut the humerus across in a living bird, and introduce the extremity of the divided bone into water, in which some soap has been dissolved, when it is perceived that bubbles are produced by the exit of the air from the end of the bone. This expedient not only ascertains the existence of air in the bone, but shews that there is a motion or circulation of it, which is the effect of the actions of inspiration and expiration.

This subject has been very extensively investigated by Camper;

per; he discovered the communications between the cavities of the bones and the air-cells of the soft parts, and ascertained in a great number of species what bones were filled with air.

The result of both his observations and our own tends to shew, that the bones of birds are supplied with air, according as they are employed in the locomotion of the animal's body. In birds of flight, therefore, almost all the bones are hollow, and receive air; thus in the *eagle* Camper found the air-cells communicated with the thigh bones, those of the pelvis and coxyx, all the vertebræ, the sternum, clavicles, scapulae, and fork-shaped bone, and the bones of the wing. The air was also admitted into the bones of the head from the cavity of the tympanum. We have observed the bones in the *hawk* and *stork* to want marrow in the same manner as those of the *eagle*. Most of the bones are hollow in the *owl*; but the os femoris is filled with marrow. The *pigeon* kind in general also have no air in their thigh bones, although the *crozen pigeon* has been observed by Camper to possess it.

Birds even of moderate powers of flight, receive some air into the sternum and other bones of the trunk, and between the plates of their cranium; and all birds, whose wings are not incapable of flight, have the humerus filled with air, with the exception of the *woodcock*, which has been observed to possess marrow in the humerus; but to counterbalance this impediment to the velocity of its motion, it is provided with pectoral muscles of unusual strength.

Those birds which are unable to transport themselves for any distance by the effort of their wings, are deprived of air in the humerus; of these may be instanced all the *struthious* kind, the *penguin*, the *puffin*, &c. It is worthy of remark, however, that the *struthious* birds, which run with great rapidity, have most of their other bones hollow; Camper discovered the air to pass into the thigh bones and lower jaw of the *ostrich*, and we have observed that it fills not only these bones, but the sternum, the ribs, the vertebræ, and the bones of the pelvis, in both the common *ostrich* and that from New Holland.

The internal surfaces of those bones which contain air have been described by Camper as being in some cases lined with periosteum, and in others entirely deprived of it; thus he states the internal part of the femur of the *eagle* to be cancellated and furnished with a periosteum, upon which several blood-vessels are ramified, and the humerus of the same bird to be a simple ossific tube, without membrane, vessels, or cancelli. It appears to us, however, that the membranes of which the air-cells are composed, are continued in every instance into the interior of the bone, to which they may serve, it is true, the purpose of a periosteum, although in structure they are much more fine and delicate, and when these membranes cease to be vascular, they become dry, and adhere so closely to the surface of the bone, that they are not easily perceived.

The internal parts of the bones of birds which are filled with air consist of cells, like those of other animals; the only difference that can be observed is, that the cancellated structure is less close, and that the tube of the cylindrical bodies, such as the humerus and femur, is larger than usual.

It has been already mentioned, that the bones derive their air in general from those cells which are placed next them amongst the muscles. Some, however, are filled immediately from the lungs, or the large internal air-cells, and the bones of the head and jaws have communications with the Eustachian tube, the cavity of the tympanum, and the sinuses of the nose.

The humerus is supplied with air by the axillary cell, by means of an opening situated at the inner and back part of the head of the bone. See *Plate VI.* in the *Anatomy of Birds*; *fig. 1.* represents the superior half of the humerus of the *American turkey (melagris)*; *a* the air-hole, which like the air-holes of the lungs does not open immediately into the cavity of the bone, but contains a number of smaller foramina, that are produced by the cancelli, and have a direct communication with the internal part of the humerus.

The fork-shaped bone is filled from the jugular air-cell, from which also the superior dorsal, and the lowest cervical vertebræ, receive some air, through several small holes scattered upon their lateral and anterior parts. The air-hole of the fork is placed upon the side of its scapular extremity, next the spine. See *Plate VI.* in the *Anatomy of Birds*; *fig. 2.* is the one half of the fork-shaped bone of the *stork* viewed upon the inside, *a* the air-hole.

The clavicle appears to obtain its chief supply of air from the cells which are continued from the jugular air-cells backwards upon the shoulder joint.

The principal foramen is found on the inside of the clavicle, where that bone is connected to the branch of the fork. There are, besides this, some very minute holes upon the outside of the clavicle, immediately above the shoulder joint; and on each side of the sternal extremity of the bone, there is a hole large enough to admit a bristle. See *Plat. VI.* in the *Anatomy of Birds*. *Fig. 3.* shews an internal view of the clavicle of the *stork*; *a*, the larger air-hole at the joint of the shoulder; *b*, one of the small foramina which opens into the chest containing a bristle.

The scapula derives air also from the process of the jugular cell behind the joint. It is transmitted through several holes upon the very extremity of the bone. See *fig. 4.* of *Plate VI.* of the *Anatomy of Birds*, *a* the air-holes.

We have discovered the openings by which the air is conveyed into the sternum, to be exceedingly numerous. The principal foramina are situated all along the middle line of the bone, upon the internal surface, which appears reticulated, or made of cancelli. Towards the anterior part there is one hole much larger than any of the rest; and in addition to those of the middle of the bone there are many others passing into the edges of the sternum to which the ribs are articulated. All these foramina would appear to communicate with the thoracic cells. See *Plate VI.* in the *Anatomy of Birds*; *fig. 5.* exhibits the internal surface of the sternum of the *stork*; *aaa* the small foramina in the middle of the bone, *b* the principal air-hole near the top of the sternum, *cccc* many little foramina seen between the sternal ribs which lead to the lateral parts of the bone.

The vertebræ of the back seem to procure air immediately from the lungs; the foramina are numerous, and placed along the sides of the bodies of the vertebræ and at the roots of their transverse processes. The foramina which conduct the air into the cervical vertebræ, occur with as little regularity; the three first have their largest holes upon the sides of their bodies, and in the rest they are to be found within the canal of the transverse process for lodging the vertebral artery, and along the course of the spinal canal, at least so they have appeared in the *stork*. See *Plate VI.* in the *Anatomy of Birds*. *Fig. 6.* shews one of the cervical vertebræ of that bird, *a* the body of the bone, *b* the spinous process, *c c* the transverse processes forming a portion of the vertebral canal, on the inside of which are perceived several foramina leading into the substance of the bone, *d* the tube behind the body of the vertebra for containing the spinal marrow, exhibiting many small holes upon its internal

nal surface. The foramina of the cervical vertebræ have communication with the lateral air-cells of the neck.

The air-holes of the anterior ribs are placed upon the ends of these bones, where they are joined to the sternum. They are supplied from the intermediate and lateral thoracic air-cells. See *Plate VI.* in the *Anatomy of Birds*, *fig. 5.* *dddd* refer to the opening upon the internal ribs.

The air passes into the posterior or vertebral ribs by a number of foramina, situated upon the internal surface of their extremities next the spine. These foramina appear to have from their situation a direct communication with the posterior surface of the lungs. See *Plate VI.* in the *Anatomy of Birds*. *Fig. 7.* is a vertebral rib of the *stork* seen upon its inner side, *a* the process which articulates with the bodies of the dorsal vertebræ, *b* the part joined to the transverse processes, *c c* the several air-holes.

The air-holes of the bones of the pelvis are so numerous, and occur with so much irregularity, that they do not admit of a particular description. They are all situated upon the internal surface of the bones, and appear to be confined to that space covered by the kidneys, under which the air must insinuate itself from the abdominal cells, in order to reach them.

The passage of the air into the femur of the *eagle* and *stork* is through an opening upon the fore part of the bone, just within the process corresponding to the great trochanter. It is a round depression, under the edge of which the apertures leading to the cavity of the bone are situated. See *Plate VI.* and *fig. 8.* of the *Anatomy of Birds*, which represents the femur of the *eagle* seen upon the anterior side; *a* the air hole, *bb* the cavity of the bone laid open, exhibiting a number of osseous processes, passing in all directions, dividing the bone on the inside into many irregular cells; these are most numerous towards the extremities of the femur, and are hardly to be seen in the centre; *c* an artery distributing its branches to the membrane which lines the internal part of the bone. The air-hole of the femur in these birds communicates with the gluteal cells.

In the *struthious* birds the air-holes of the femur are placed upon the posterior part, and are found upon both the upper and lower portions of the bone. See *Plate VI.* in the *Anatomy of Birds*. *Fig. 9.* shows the posterior surface of the femur of a *young ostrich*; *a* a depression on the upper part of the bone, containing a number of air-holes, *b* the inferior depression with only three foramina.

The air-holes of the lower jaw have been observed in the *African* and *New Holland ostrich*, the *stork*, the *buceros nasutus* and *buceros rhinoceros*, and the *crow*; and in all these they consist of two holes situated upon the two extremities of the jaw behind the articulation. See *Plate VI.* in the *Anatomy of Birds*. *Fig. 10.* is the lower jaw of the *crow*; *aa* the two air-holes. These foramina communicate by a tube with the cavity of the ear.

The air does not penetrate the bones of the head and jaws in *water-fowls*.

Having described the distribution of air, which takes place throughout the bodies of birds, it remains to assign an use to this most curious and peculiar circumstance in their anatomy. It has been already stated, that the opinions of anatomists upon this subject are different. The members of the French academy supposed that the air-cells were necessary to carry on the actions of respiration in birds. Camper thought that air was admitted into the bodies of birds for the purpose of diminishing their gravity in relation to their bulk, and thus facilitate their motion; while Mr. Hunter, the greatest physiologist of this or any other country, felt unwilling to confine the functions of the air-cells

to any one purpose, and suspected they might be useful in giving tone and strength to the lungs of birds.

The observations of the academicians appear to us perfectly satisfactory with respect to the connection between the existence of the air-cells, and the office of the lungs. They have related, that during the act of inspiration the sternum was elevated, and the thoracic air-cells distended at the same moment with the lungs, and that when the air was expelled from the lungs and thoracic cells, by the depression of the sternum, one portion of it was expired by the trachea in the usual way, and the rest was urged into the cells of the abdomen, the two parts of the cavity thus becoming alternately enlarged and diminished. In order to ascertain with the more certainty the condition of the air-cells during respiration, the academicians subjected several large birds, such as the *turkey*, *goose*, &c. to the experiment, of having the parietes of the belly dissected off without injuring the air-cells, while the animal was still alive, by which they had an opportunity of observing, that the air-cells below the sternum were rendered tense during the time the thorax was diminished for expiration, and that as soon as the sternum was raised to increase the capacity of the thorax, the abdominal air-bags become flaccid. We have made an experiment of a similar kind, with the same result; the abdomen of a living *goose* was laid open, from which no air proceeded during inspiration, but while the air was discharged from the lungs, it passed into the abdominal cells and through the opening of the belly with so much force as to blow out a candle. The necessity of having the cavity filled with air in birds, obviously arises from the circumstance of the lungs being confined to the posterior part of the thorax, and consequently not capable of suffering any compression from the contraction of the chest, but by the interposition of some other parts.

Many have supposed that the air-cells were not only mechanically subservient to the actions of respiration, but answered another important purpose by collecting a quantity of air, which in repassing the lungs effected a further change upon the blood, thus producing a sort of double respiration; but the free communication which exists between the lungs and the cells, renders it probable that the air on its return passes directly by the air-holes into the branches of the bronchiæ, and, consequently, is never brought into contact with the blood. It would therefore appear that the only part the cells perform in the process of respiration is to supply an elastic medium, by means of which the motion of the sternum and ribs, equally and regularly affect every part of the lungs.

The air-cells making part of the mechanism of the organs of respiration, does not preclude them from answering other purposes in the animal economy. It is plain to demonstration that the bodies of birds lose much of their relative weight by containing air in their cavities, and still more from its admission into the external parts and the bones; the advantages of which in transporting themselves through so light a medium as the air, or even in locomotion upon a solid surface, are too obvious to be mislaid upon.

The air, while it remains in the body, necessarily acquires the temperature of the living bird, which renders it much lighter even than atmospheric air, and therefore it acts like that contained in the swimming-bladder of fishes.

A comparison of the structure of one bird with another proves that the quantity of air is in proportion to the rapidity and continuance of the animal's motion, all other circumstances being the same; and that the air is distributed always in preference to those members which are most employed in locomotion, as has been already pointed out.

It might be offered in objection to this opinion of the use of the air-cells in birds, that the *bat*, which is an animal very remarkable for the velocity of its flight, and its long continuance on the wing, is unfurnished with any apparatus except its lungs for containing air. The answer to this, however, is very easy; the extent of the wing of the *bat* is singularly large for the animal, and its membranous structure enables it to give impulse to a larger volume of air than could be produced by a wing composed of feathers, even of an equal extent; and farther, the pectoral muscles of the *bat* are larger in proportion to the animal than they are found in any species of birds, even those of the highest flight; so that the structure of the *bat*, instead of proving any objection to the use assigned to the air-cells in birds, affords the strongest confirmation of the theory.

Notwithstanding the respect which is due to every physiological opinion of Mr. Hunter, we cannot perceive that there is the least relation between the air-cells and the organs of voice in birds. With a view of determining this, we have compared the structure of different birds, and have not found the air-cells larger in singing birds, than others. The *nightingale*, so eminent for its loud and protracted notes, is formed, with respect to the air-cells, exactly like the *common sparrow*.

Animal Heat.

Although it is not yet proved that the vital temperature of animals is the result of that process which is called respiration; yet, as it is generally supposed to be so, it would appear most proper to notice the animal heat of birds, immediately after the description of the lungs and their appendages. It is remarkable, that birds possess a higher standard of vital temperature than all other animals. Camper states it to vary from 104 to 107 degrees of Fahrenheit's scale. Mr. Hunter found the rectum of the *common fowl* to be 103, 103½, and 104 degrees; and in a young *goose*, we observed the thermometer to stand at 103 degrees in the rectum, and when inserted into the cavity of the body, to rise and remain at 104 degrees. It is difficult to explain either the cause or the necessity of the high temperature of birds. It has been accounted for by their respiration being more perfect than the air passing twice through their lungs; but even supposing this would alter their degree of animal heat, the occasion does not seem to exist, as birds have not that double respiration which is supposed, as has been already shewn.

It is to be presumed, that the warmth of birds may depend in a degree, upon the structure of their skin, and the nature of their coverings, which are not designed to admit of much evaporation from the surface of their bodies; but it can hardly be supposed, that this, of itself, would be sufficient to produce a temperature so much higher than is found in other animals, and maintain it so uniformly and permanently as it exists throughout the whole class of birds.

No experiments have yet been made to determine the powers which birds possess of resisting the influence of external temperature; but it is to be inferred from analogy, that they can sustain greater extremes of both heat and cold than other animals, without suffering an alteration in their proper degree of temperature; but that, at the same time, birds would soonest yield to dissolution upon any material change in their natural standard, it being found that animals generally enjoy independence of temperature, in proportion as it exceeds that to which they are commonly exposed, and that the higher their natural standard, the more inconvenience arises from any alteration of it.

Blood Vessels.

The organs of circulation in birds have obtained but little of the attention of comparative anatomists. The larger branches of the arteries and veins, which lie near some of the viscera, have alone received any description: and that rather from being involved in the account of other parts, than for their own sake. The distribution of the blood vessels of birds, notwithstanding this, is not the least interesting part of their anatomy, as will appear from the ensuing description, which has been taken chiefly from the *swan*, *goose*, *duck*, *stork*, and *common fowl*, in which it was found to be much alike, that it may be presumed the same arrangement of the blood vessels prevails with little variety in all birds.

The Arteries

Proceed from a single trunk which arises from the left ventricle of the heart. This trunk is so short, that it is concealed by the other parts on the basis of the heart, and is only brought into view after the reflections of the pericardium, and the adjoining vessels are detached by dissection. It is from thence, that as the parts are commonly beheld, there appear to be three great arteries issuing together from the middle of the heart, which are the primary branches into which the aorta is divided. The first branch is to the left side, and after it is sent off, the trunk affects to turn over the auricle, before it gives the branch of the right side; these two branches pass in a curved manner from the heart towards the axillæ, in the form of horns, and each is analogous to the *arteria innominata* of the human subject, so that instead of one, there may be reckoned two *arterie innominatæ* in birds. After these branches are parted with, the arterial trunk is continued over the auricles, and on reaching the back part of the heart, becomes the *descending aorta*.

The *arteria innominata* first sends off the common trunk of the carotid and vertebral arteries, which before its division gives off one or two small branches; one of these runs down upon the lungs in company with the *par vagum*, and appears to supply branches to the aponeurosis of the lungs, and the air-cells at the upper part of the thorax; the other branch, after supplying the lymphatic gland of the neck with several small arteries, ascends upon the side of the œsophagus, to which, and the inferior larynx, the divisions of the trachea, and to the parts and integuments of the side of the neck, its branches are distributed, anastomosing with the superior œsophageal and tracheal arteries. This branch is often sent off until the trunk divides into the vertebral and carotid, in which case it comes from the latter artery. Sometimes in the *duck*, the *supra-scapular* artery, which is usually derived from the vertebral, is a branch of the common trunk.

The *carotid* artery, after parting from the vertebral, proceeds to the middle of the neck, and soon disappears; being covered by the muscles of the anterior part of the neck, under which it lies hidden, and in close contact with its fellow of the other side, to very near the head. If, during its course in this situation, it gives any branches, they are too insignificant to be noticed.

The *carotid* artery emerges from between the muscles of the neck, at about the third or fourth vertebra from the head; and after giving a branch downwards, amongst the lateral muscles of the neck, it runs along the outer edge of the *rectus major anticus* muscle, to behind the angle of the jaw, where it divides into its several branches.

An artery first goes off posteriorly, which passes a little forwards under the branch of the *os hyoides*, and after send-

ing some blood to the muscles of the neck, makes a turn backwards, enters the foramen in the transverse process of the second vertebra, and terminates by a singular anastomosis in the vertebral artery.

The next branch is analogous to the *internal carotid*; it goes forward also under the os hyoides, and passes behind the muscles of the jaws close upon the lower part of the skull, at which place it sends a branch upwards, which appears to penetrate the bones on the outside of the ear, and supply the organ of hearing, sends a branch into the skull, and another through the articulation of the jaw, to unite with the ophthalmic, and contribute to the plexus at the back of the orbit. The internal carotid then enters an osseous canal, which runs along the basis of the cranium, between the tables of the bone, and at the lower and back part of the orbit, the artery receives a remarkable anastomosing branch of the internal maxillary, which almost equals in size the carotid itself; and these two vessels produce by their union, one, which passes almost directly into the cranium at the usual place for the entrance of the carotid artery. This vessel forms within the skull an anastomosis similar to the circle of Willis; but the branch which occupies the place of the *basilar artery*, is very small, and appears to be furnished entirely from the anastomosis of the carotids, and designed only to supply the medulla oblongata and spinal marrow. The branches of the internal carotid are thickly spread in an arborescent form upon the surfaces of the brain; some on the outside, and others on the internal superficies of the ventricles, and the fissure between the two hemispheres. The carotid also, as usual, sends off the *ophthalmic* artery, which, besides supplying the eye and the parts in the orbit, produces several anastomoses with the branches of the external carotid, which will be noticed hereafter. After the trunk of the carotid has parted with the two branches just described, it passes for a little way downwards and forwards behind the angle of the jaw, and divides at once into different branches, corresponding to those of the external carotid in mammalia, the first of which might be called the *oesophageal* or *laryngeal* artery. This vessel sends a branch to the muscles upon the horn of the os hyoides, and then turns downwards and divides into two branches, one to the trachea, and the other to the oesophagus, upon the side of which parts they descend to near the thorax, where they anastomose with the tracheal and oesophageal branches of the common trunk of the carotid and vertebral arteries.

The *external maxillary artery* dips in between the pterygoid muscle, and that which is situated at the back of the lower jaw for opening the mouth; it then passes behind the articular bone, and gives twigs upwards to the muscles of the jaws, and to the plexus at the back of the orbit: upon emerging from behind the articular bone, it lies under the zygomatic process of the jaw, and sends an artery upwards, which is distributed to the temporal and masseter muscles; and proceeding under the triangular tendon that comes from the inferior margin of the orbit to the lower jaw, it divides into two principal branches: one of these passes along the side of the upper jaw, gives a branch upwards to the fore part of the orbit which unites with the ophthalmic artery, and is lost at the top of the head. This branch is very large in birds with combs, as in conjunction with the ophthalmic, it furnishes numerous vessels to these vascular parts. The artery then goes on and supplies branches to the sides of the head before the orbits, and to the integuments and substance of the upper mandible, anastomosing with the palatine branches of the internal maxillary artery. The second portion of the external maxillary proceeds to the lower jaw, to which, and the lower part of the masseter

muscle, it is distributed. The external maxillary supplies the place of the *temporal, labial, angular, nasal, and mental* arteries of mammalia.

The *laryngeal*, or *posterior palatine* artery is a little branch of the external carotid, which is sent off posteriorly opposite to the external maxillary artery. Its branches are exhausted upon the back part of the fauces, the muscles for moving the upper jaw, and posterior nares.

The *lingual*, or *sub-maxillary* artery passes under the muscles which connect the os hyoides to the lower jaw, and close upon the back of the membrane of the lower part of the mouth, it sends a branch to the oesophagus and trachea, supplies the muscles of the os hyoides, the tongue, the lower surface of the mouth, and furnishes the artery which enters the substance of the lower jaw.

Just at the origin of the sub maxillary artery, there is another little branch of the carotid, which is lost upon the muscles of the os hyoides.

The *internal maxillary* artery is, as usual, the continuation of the trunk of the external carotid; it runs forwards between the pterygoid muscle, and the lining of the mouth, upon the side of the long muscle for moving the upper jaw, and divides into two principal branches; one of them proceeds under the tendon of the long muscle to get upon the palate, where it forms two branches, of which one runs along the external side of the palate, between the membrane and the bone of the mandible to the extremity of the bill, where it becomes united to the same branch of the opposite side, as also to the middle artery of the palate. The other branch lies also superficially under the membrane which lines the mouth. It passes onwards to meet its corresponding vessel of the opposite side with which it becomes actually incorporated, and by their union a single artery is generated, which runs along the middle line of the palate to the end of the mandible, where it unites with the lateral branches as already mentioned. At the junction of the vessel of each side to form the middle palatine artery, two branches go off, which are lost upon the lining of the mouth, and the interior of the organ of smell.

The other branch of the internal maxillary artery is reflected upwards towards the orbit, below which it divides and unites again forming a triangle, through which the vein passes; at this place it produces a remarkable plexus of vessels, like the rete mirabile of the carotid artery of quadrupeds, which is increased by branches from the ophthalmic and the palatine arteries, and from which the back part of the organ of smell receives its supply of blood.

The internal maxillary artery then runs directly backwards below the orbit, passes between the radiated or fan-shaped muscle which moves the upper jaw, and the pterygoid process; and turning inwards round the basis of the cranium becomes incorporated with the *internal carotid* artery just as it enters the bony canal, which conducts it to the brain.

The *vertebral artery*, soon after it parts from the carotid, sends off a branch backwards, which passes over the neck of the scapula and is lost among the muscles on the posterior part of the shoulder, anastomosing with the articular and other arteries about the joint; this branch might be called the *supra-scapular*. In the *duck* we have observed it before it makes the turn over the scapula to send an artery upwards along the muscles of the neck.

The trunk of the vertebral artery proceeds obliquely upwards, and having entered the foramen in the transverse process of the second cervical vertebra, give off a large branch downwards, which is distributed between the vertebrae, and to the spinal canal in the manner of the intercostal arteries, with which it anastomoses upon arising in the thorax.

B I R D.

The remainder of the vertebral artery is continued upwards in the canal formed in the transverse processes of the cervical vertebrae, diminishing gradually in consequence of branches it sends off between each vertebra to the spinal marrow and the muscles of the neck. Near the head, the artery is found considerably reduced; and within the last foramen in the transverse processes, terminates entirely by inosculation with the reflected branch of the carotid, as before noticed.

The extraordinary anastomoses and the plexuses which are to be observed in the arteries of the head in birds are not easily accounted for. It seems possible that they may be required in consequence of the great length of the neck in these animals; it being well known that frequent communication amongst the vessels, although it diminishes the impetus of the circulation, insures a free and uninterrupted motion of the blood.

After the common trunk of the carotid and vertebral is detached from the *arteria innominata*, this vessel may assume the name of the *subclavian*. While passing under the clavicle, it sends off some important branches: the first might be called a *pectoral artery*, it proceeds upwards upon the internal surface of the pectoralis minimus muscle, which it supplies; and then dividing into two branches, one passes over the anterior edge of the clavicle, and under the pectoralis medius, between which and the sternum it runs, detaching its branches to the muscle; the other sends first along the under side of the clavicle a branch which is again subdivided and distributed to the outside of the shoulder joint and to the deltoid muscle, in which it inosculates with the articular artery. The vessel then passes between the clavicle and the fork-shaped bone, and on a ligament which connects the head of the clavicle to that of the scapula, and disperses its branches upon the upper part of the shoulder joint forming anastomoses with the neighbouring arteries.

The next branch of the subclavian is the *humeral artery*; it arises from the upper side of the vessel, and make a slight curve to reach its situation on the inside of the arm, in order to dispense its branches in the manner hereafter described.

The *internal mammary artery* is given off just as the subclavian leaves the chest. It divides into three branches, one ramifies upon the inner surface of the sternum; another upon the sternal ribs, and the intercostal muscles; and the third runs along the anterior extremities of the vertebral ribs, supplying the intercostal muscles, &c.

The chief peculiarity of the arteries of the superior extremity in birds, consists in the great magnitude of the vessels which supply the pectoral muscles; these, instead of being inconsiderable branches of the axillary artery, are the continuations of the trunk of the subclavian, of which the humeral is only a branch.

The *great pectoral or thoracic artery* passes out of the chest over the first rib, and close to the sternum, and immediately divides into two branches. One of them ramifies in the superior part of the pectoralis major, and the other is exhausted in the lower part of the muscle, and sends off a branch analogous to the long thoracic artery of mammalia.

The *humeral artery*, while within the axilla, gives a small branch backwards to the muscles, under the scapula, and upon reaching the inside of the arm produces an artery, that soon divides into the articular and the profunda humeri. The *articular artery* passes round the head of the humerus, underneath the extensors; its branches penetrate the deltoid muscle, and anastomose with the other small arteries around the joint.

The *profunda humeri* as usual turns under the extensor muscles, to reach the back of the bone, at which place, in birds, it separates into two branches, of which one descends

upon the inside, and the other upon the outside of the articulation of the humerus with the radius and ulna, and there inosculates with the recurrent branches of the arteries of the fore arm.

After the humeral artery has sent off the profunda, it descends along the inner edge of the biceps muscle, detaching some branches to the neighbouring parts; upon arriving at the fold of the wing it divides into two branches, one of these is analogous to the ulnar artery, and the other from its position deserves to be called rather the interosseous than the radial artery.

At the place where the humeral produces the two arteries of the fore arm a small branch is sent off, which is lost upon the fore part of the joint, and it anastomoses with the recurrent of the ulnar, and the profunda humeri.

The *ulnar artery* is the principal division of the humeral; it proceeds superficially over the muscles which are analogous to the pronator, sends a large recurrent branch under the flexor ulnaris to the back of the joint upon which it ramifies and forms anastomoses with the profunda humeri. The artery then proceeds along the inner edge of the ulnar muscles, to which it distributes branches. It is afterwards seen passing over the carpal bone of the ulnar side, and under the annular ligament, at which place it sends off some branches which spread upon the joint and inosculate with similar ones of the interosseous artery. Very soon after the ulnar artery gets upon the metacarpus it dips in between the bones and re-appears upon the opposite side lying under the roots of the quills, to each of which it sends an artery; it preserves this situation to the end of the metacarpal bones, where it passes between the style analogous to the little finger and the principal or fore finger, and pursues its course along the edge of the latter, to the extremity of the wing, supplying each of the true quills with an artery and sending at each joint of the finger, a cross branch to communicate with the anastomosing branches on the opposite side.

The *interosseous artery* detaches first a branch of some size to the membrane which is spread in the fold of the wing, upon which it forms several ramifications. After this the artery dips down behind the pronator muscles to get into the space between the ulna and radius. It here gives a branch backwards to communicate with the others about the joint, and proceeds in the interosseous space as far as the carpal joint, during which course they become much diminished from giving off several branches which are distributed to the integuments and the quills placed upon the outside of the ulna. The remainder of the interosseous artery is expended in small branches upon the back of the carpal joint, the bastard quills, and along the radial edge of the metacarpus and bones of the fore finger, where it forms communications with the cross branches of the ulnar artery already mentioned.

From this description it will be perceived, that no artery exists in birds strictly analogous to the radial; that there are no palmar arches; and that the size of the interosseous artery, and the course of the ulnar along the outside of the metacarpus are peculiarities which arise from the necessity of affording a large supply of blood to the quills during their growth.

The *descending aorta* makes a curve round the right auricle in order to get upon the posterior surface of the heart, after which its course is close along the spine, in which situation it is bound down by cellular substance, and the strong membrane or aponeurosis, which covers the lungs on their anterior part. The first branches which this vessel appears to send off are *bronchial arteries*; they arise from the fore part of the aorta just when it arrives upon the spine; and having entered

entered the lungs, their ramifications accompany those of the pulmonary arteries. They appear also to send branches to the spine, and the spaces between the ribs.

The *intercostal arteries* do not take their origin from the aorta in numerous and regular branches as in mammalia, but consist originally of but few vessels, which are multiplied by anastomosis with each other, and with the arteries which come out of the spinal canal. An arterial plexus is thus formed round the heads of the ribs, from which a vessel is sent to each of the intercostal spaces. Many of these branches, besides supplying the intercostal muscles and ribs, are continued into the muscles upon the outside of the body and the integuments. The anastomosis of the intercostal arteries round the ribs is very similar to the plexus which is produced by the great sympathetic nerve in the same situation.

The aorta produces no branch which deserves the name of the *phrenic artery*, as birds do not possess that muscular septum of the body, to which the artery of this name is distributed in other animals.

The *coeliac artery* is a very large single trunk, and arises from the fore part of the aorta, even higher than the zone of gastric glands. It descends obliquely for a short way and then gives off a branch which soon divides into two or three others that are spread upon the lower parts of the œsophagus, and the side of the zone of gastric glands, uniting with the other arteries of the œsophagus above, and extending downwards upon the posterior side of the ventricle, and anastomosing with the anterior gastric artery. The trunk of the coeliac now divides into two very large branches, which from their distribution we have chosen to call the posterior and the anterior gastric arteries.

The *posterior gastric artery*, almost as soon as it is formed, detaches the *splanchnic artery*; and very soon after, it furnishes from the posterior side of the vessel, the *right hepatic artery*. This branch proceeds to the right lobe of the liver, which it enters on the side of the hepatic duct; after having divided into two or three minute arteries on its way to the liver, it supplies the hepatic duct with a branch which accompanies the duct to the intestine, and is there lost. The posterior gastric artery then runs down upon the back of the gizzard, and opposite to the origin of the first intestine it sends off an artery which proceeds directly to one of the cæca, upon which and the side of the next intestine it is expanded, insensuating at the end of the cæcum, with branches of the mesenteric artery, which are distributed to the adjoining portion of the small intestine. The posterior gastric then furnishes a large vessel which runs upon the gizzard and divides into two chief branches, which penetrate the substance of the digastric muscle, in which they are lost.

The next branch of the posterior gastric artery is the *pancreatic*. It runs between the two pancreatic glands, dispensing branches to each, and to the duodenum. After this the trunk of the posterior gastric divides into two branches which furnish twigs to the muscular parietals of the ventricle, and run along the margins of the upper and lower portions of the digastric muscle, supplying them with numerous twigs, and anastomosing with the ramifications of the other gastric arteries.

The *anterior gastric artery* descends to the angle formed by the bulbous glandulous and the gizzard, and there sends off a small branch which spreads upon the zone of gastric glands, and insensuates with the first ramifications of the coeliac, and immediately afterwards it detaches a large artery, which runs round the superior margin of the digastric muscle, which it furnishes with many twigs, and communicates freely with the corresponding branch of the posterior gastric artery.

Three small *hepatic arteries* take their origin from this

branch of the anterior gastric, just as it passes over the highest part of the margin of the gizzard; these vessels enter the fissure in the left lobe of the liver. The anterior gastric artery now proceeds along the fore part of the gizzard, sending one or two branches into the muscular substance, and near the tendon it terminates in two large vessels, one of which is distributed upon the left side of the digastric muscle and the other passes a little over the tendon and then divides into two arteries; which produce several branches that disappear in the substance of the gizzard, and between the digastric muscles and the parietals of the ventricle, anastomosing with the vessels of the posterior side.

The *superior mesenteric artery* takes its origin from the fore part of the aorta a little below the coeliac, and proceeds for some way without detaching any branches; after which it experiences the same kind of division and subdivision that takes place in mammalia; and the numerous arteries which are thus ultimately produced are spent upon the small intestines. One of the first and largest branches of the superior mesenteric, however, is allotted to supply one of the cæca, and establish a communication with the inferior mesenteric, and gastric arteries. This branch, soon after it leaves the trunk of the superior mesenteric, divides into two. One descends upon the rectum, where it meets with the inferior mesenteric artery, with which it produces a very remarkable anastomosis, similar to the mesenteric arch in the human subject: this united artery supplies the rectum and origin of the cæca. The second portion of this branch of the superior mesenteric, runs in the space between the last part of the small intestine, and the cæcum of one side, sending numerous branches to each, and at the end of the cæcum, communicates in a palpable manner with another branch of the superior mesenteric artery, which runs upon the adjoining part of the small intestine.

A branch arises from the anterior part of the aorta, just below the lungs; it is designed for the nutrition of the organs of generation, and except in the season for propagation, is so small as to be discovered with difficulty; but when the testicles become enlarged, it is considerably increased in size in the male bird, and much more so in the female, when the ovary and oviduct are developed for producing eggs. It nearly equals the superior mesenteric artery during the period of laying, in which state we shall describe it. It is a single artery like the coeliac and the mesenteric, proceeds at a right angle from the aorta, and soon sends off a branch which goes into the kidney of the left side, to which it gives some twigs, and afterwards emerging from the kidney, it runs in the membrane of the oviduct, upon which it is distributed. After this branch is detached, the artery projects a little farther forwards into the cavity and divides into two branches. One of these goes to the ovary, in which it ramifies, and furnishes an artery of some size to each of the cysts containing the ova. The other is distributed in numerous branches to the membrane and superior parts of the oviduct, and insensuates with the other arteries of the oviduct. It deserves to be remarked, that this and all the other arteries which are furnished to the oviduct, have a tortuous or undulating course, in the same manner as the vessels of the uterus of the human subject.

There are no regular emulgent arteries in birds; the kidneys deriving their blood from various sources, which will be pointed out as they occur.

The inferior extremity is supplied with two arteries, which have a separate origin from the aorta. One corresponds with the *femoral artery*, and the other deserves the name of *ischialic artery*.

The *femoral artery* is a small trunk which takes its origin from the side of the aorta, opposite to the notch in the bones of the pelvis immediately under the last rib. This notch is formed into a round hole in the recent subject, by a ligament which is extended from it to the rib; and it is through this hole that the femoral artery makes its exit from the pelvis; just before it passes out upon the thigh, it sends off a long branch which runs backwards the whole length of the margin of the pelvis dispensing arteries to the abdominal muscles on one side, and the obturator internus on the other. This branch also appears to supply one to the oviduct. The femoral artery, immediately after leaving the pelvis, separates into two branches; one goes upwards and outwards, ramifying amongst the muscles in that situation; the other turns downwards, and is distributed to the flexors of the limb, and round the joint, and sends an artery to the edge of the vastus internus, which can be traced as far as the knee. The kidneys appear to derive some irregular inconsiderable branches from the femoral artery while it is within the pelvis.

The *ischiodiac artery* is the principal trunk of the lower extremity, exceeding very much in size the femoral. When it is produced by the aorta, it appears to be the continuation of that trunk; the remaining part of the aorta becomes so much and so suddenly diminished, and seems as it were to proceed as a branch from the back part of the vessel.

The ischiadic artery, while in the pelvis, is concealed by the kidneys, in which situation it gives a branch from its lower side, which divides into three others that are distributed to the substance of the kidneys: one of these on the left side is continued out of the kidney to be lost upon the oviduct. The artery leaves the pelvis by the ischiadic foramen, in company with the great nerve; while within the foramen, it gives a branch obliquely downwards under the biceps to the muscles lying on the pelvis; and as it passes over the adductor, it sends off another along the lower edge of that muscle, which is chiefly lost in the femimembranosus. It then detaches several small branches to the muscles on the outer and fore part of the thigh, some of which anastomose round the joint with the branches of the femoral artery. Just as the ischiadic arrives in the ham, it furnishes a very large branch downwards, which divides into two; one goes under the gastrocnemius, to which and the deep seated flexors its branches are distributed as far as the heel; the other is analogous to the *peroneal artery*; it goes to the outside of the leg, supplies the peroneal muscles posteriorly, and passes along the outer edge of the flexors of the toes to the heel, above which, and behind the flexor tendon, it divides, running on each side of the heel, and forming several articular arteries around the joint, and communicating with the other branch, and with the anterior tibial, and the metatarsal branch of the plantar artery.

The *articular arteries* go off next from the artery in the ham; the two principal ones are deep seated. One proceeds under the vastus internus to the external part of the joint; the other is large, and situated upon the inside. It forms two vessels, one is the true articular artery, and spreads upon the ligaments of the joint, the other is distributed in the substance of the flexor of the heel, which is placed upon the inside and fore part of the leg, and comes out upon the edge of this muscle to be lost in the integuments.

The *posterior tibial artery* is extremely small; it only supplies muscular branches to the internal head of the gastrocnemius, and some of the flexors of the toes; it is lost on the inside of the heel in anastomoses with the peroneal artery, and other small superficial branches.

The trunk of the artery of the leg now gets upon the posterior surface of the tibia, and sends off through the deficiency left between the tibia and fibula at the superior part, a branch, which is distributed to all the muscles upon the fore part of the leg. The artery then creeps along the back of the bones for some way, and passing between them above, where the fibula is ankylosed with the tibia, it re-appears on the anterior part of the leg in the situation of the *anterior tibial artery*; at this place it detaches some very small branches, which frequently divide and unite again, to produce a most singular reticulation or plexus of vessels, which closely adheres to the trunk of the artery, and is continued with it as far as the articulation of the tibia with the metatarsal bone, where it disappears without seeming to answer any useful design. This plexus resembles in appearance exactly the division of the arteries of the extremities, which has been described by Mr. Carlisle in the tardigrade quadrupeds, but differs from it in this circumstance, that the trunk of the artery is preserved behind it, without suffering any material diminution of its size.

The anterior tibial artery furnishes no branch of any importance during the time it is proceeding along the fore part of the leg. It passes under the strong ligament which binds down the tendons of the anterior muscles of the leg, and over the fore part of the joint on the inside of the tendon of the tibialis anticus; at which place it distributes some branches which inosculate with the other arteries round the joint; it then pursues its course in the groove along the anterior surface of the metatarsal bone, and covered by the tendon of the flexor digitorum. On coming near the foot, it sends off an artery, which divides, behind the joint of the internal toe, into two branches; one goes between the internal and middle toes, ramifies upon both their joints, and unites with the artery in the sole of the foot; the other is distributed between the internal toe and the pollex or toe which occupies the place of the great toe; the main artery now passes to the sole of the foot through a hole in the metatarsal bone left for the purpose, when the original parts of this bone were united by ossification. In this situation the artery might receive the name of the *plantar*. It has scarcely passed through the bone, when it divides into six branches; three of these are distributed to the tendons and ligaments, &c. on the outside of the foot and the back of the metatarsus, anastomosing with the descending branches of the peroneal artery; the fourth branch supplies the pollex, and also sends a branch upon the metatarsus. The remaining branches are designed for the three principal toes; one dips in between the internal and middle toe, unites with the anterior branch of the metatarsal artery, and is distributed to the sides of these toes as far as their extremity. The other divides, between the external and middle toe, into two branches, which run upon the opposite side of each of these toes to the end.

When the feet are webbed, the digital arteries send off numerous branches, which ramifying in the membrane between the toes, establish a communication with each other. The present description has been taken from birds which possess three principal toes, and the back toe, or pollex; but no material difference can be expected in those with a greater number of toes.

After the trunk of the aorta has detached the ischiadic arteries, it is continued along the spine, sending small branches analogous to the *lumbar arteries*, one of which ascends upon the rectum, supplies the place of the *inferior mesenteric*, and unites with the superior mesenteric, as already mentioned. The aorta separates above the coxal vertebræ into three branches; two of these proceed

terally, and are distributed to the neighbouring parts, and to the kidneys and oviduct; the third branch descends to the very point of the tail, upon the muscles and quills of which its branches are exhausted.

The arterial system of birds differs from that of other animals chiefly in the frequent anastomoses, which exist more especially amongst the arteries of the head and the viscera. Similar communications occur between the veins, which are even in some instances more singular and unaccountable, as will be perceived by the following description, which has been taken principally from the *goose, duck, and common fowl*.

Veins.

The venous system returns the blood to the heart by means of three trunks; two of these, for the convenience of description, we shall call the subclavian veins, although they do not correspond in every respect with the veins of this name in mammalia; the other trunk is analogous to the inferior vena cava.

The *subclavian vein* is composed of the jugular and vertebral, and the veins which belong to the superior extremity or wing.

The *vertebral vein* is lodged in the same canal with the vertebral artery; it anastomoses between the vertebrae with the veins upon the sheath of the medulla spinalis, which are the continuation of the sinuses of the brain; in conjunction with these, therefore, the vertebral vein may be considered as answering the purpose of the internal jugular of mammalia. It appears also to form at the basis of the cranium a free communication with the jugular vein, and to receive by occasional branches, blood from the muscles of the neck.

The *jugular vein* is a single trunk in birds, and does not admit of the distinction into external and internal; it proceeds superficially along the side of the neck in company with the par vagum nerve. The vein of the right side exceeds the other in size; it is often twice as large. The jugular vein receives several lateral branches from the muscles and integuments of the neck, the œsophagus, &c.; one of those near the head is much larger than the rest; it lies deep amongst the muscles, and appears to communicate with the vertebral vein. There is a branch of the jugular which goes amongst the muscles of the tongue and of the os hyoides, and another for the muscles within the jaws and the integuments in the back of the mouth; these might be called the *lingual and submaxillary veins*.

The two jugular veins form a most remarkable communication with each other immediately below the cranium, by means of a cross branch, generally of an equal size with the trunks themselves. From each side of the arch thus formed there issues a large vessel, which is made up of the veins of the external part of the head; one of these passes round the articular bone, and apparently penetrates the joint of that bone with the lower jaw; it appears in several branches upon the side of the cheek, and spreading from the ear, in the manner of the portio dura nerve of the human subject, and contributes to form a plexus of veins below the posterior part of the orbit, similar to the arterial plexus already described in that situation. The principal branch of the veins of the head passes obliquely round the inter-articular bone, and below the orbit divides into several large vessels; one of which belongs to the back part of the palate; another ascends in the orbit, and unites with the ophthalmic vein; and a third is distributed to the anterior of the organ of smell, the palate, and the external parts of the upper and lower jaws. These branches produce plexuses along the base of the orbit and the external edge of the palate,

which correspond to those of the arteries before described.

In all the subjects we dissected for the veins we failed to discover any direct communication between the jugular vein and the sinuses of the brain; and in every instance the external veins of the head appeared to be sufficiently large of themselves to produce the trunk of the jugular. It may therefore be presumed, that if any branch analogous to the internal jugular vein passes through the posterior foramen lacerum, it is very inconsiderable, and incapable of transmitting the blood of the brain.

The *sinuses of the brain* seem to discharge their contents principally into some veins, which lie in the membrane forming the sheath of the spinal canal, and these appear to dispose of their blood gradually, as they descend in the neck, by means of lateral communication with the vertebral veins. The sinuses, which immediately open into the spinal veins, are situated upon the back of the cerebellum, and produce by anastomoses with each other, with the superior longitudinal sinus, and with others along the sides of the brain, an union of vessels, of a diamond shape.

The sinuses of the brain in birds generally are irregular in their form, and consist of flattened canals; and not only the sinuses on the back of the cerebellum, but the spinal veins appear so like extravasation, that accurate and repeated observations are necessary to discover them to be real vessels.

The principal sinuses, besides those upon the cerebellum, are the superior longitudinal, and one which runs along the lower edge of each hemisphere of the cerebrum; there appears to be also one upon the side of the cerebellum, corresponding to the lateral sinus. All these sinuses communicate with each other on the back of the cerebellum as already mentioned. The superior longitudinal sinus is continued at its anterior part under the frontal and nasal bones, and anastomoses with the ophthalmic and nasal veins. There are other sinuses in the several duplicatures of the dura mater, which are too small to be easily traced, or to deserve much regard.

The *veins of the wing*, or superior extremity, have a less curious distribution than those of the head. The branches which are derived from the parts within the chest, the muscles about the scapula, and the pectoral muscles, accompany the arteries of the same parts, so regularly that their course does not require description.

The vein lies considerably lower in the axilla than the artery, but still continues to receive corresponding branches. The trunk of the vein descends in the course of the humeral artery, but more superficially; in this situation it may be called the *basilic*, or more properly the *humeral vein*. There is no vein in birds which deserves the name of the *cephalic*; there are branches of the humeral vein, accompanying the articular and profunda arteries, and at the middle of the humerus, a large branch of the vein enters the bone; there are also two very small branches which lie in close contact with the humeral artery, which they accompany nearly its whole length.

The principal vein of the wing divides into two, opposite to the joint of the humerus with the fore arm. One of these branches belongs to the sides of the radius; it receives blood from the muscles and skin on the upper part of the fore arm, but its chief vessels lie between the integuments of the fold of the wing. The other branch of the humeral vein crosses the fore arm, just below the articulation, in company with the nerve, and running along the inferior edge of the ulna, receives a branch from between the basis of each quill, is continued along the ligament which sustains the rest of the

the quills to the extremity of the wing, receiving many veins of the joints from the opposite side of the fingers. Besides these large superficial veins of the fore arm, there appears to be one, and sometimes two, small accompanying veins to the ulnar and interosseous arteries.

The *inferior vena cava*, before it enters the auricle, receives as usual the hepatic veins; these are numerous, and open into the cava, as it passes behind the liver, or more frequently within the substance of that viscus in that back part. We have reckoned in the *cock* two large and two small hepatic veins from the right lobe, and one large branch from the left lobe, besides six minute veins, which came indifferently from both lobes.

The trunk of the vena cava is very short in the abdomen; it separates into two great branches analogous to the *primary iliac veins*, opposite to the renal capsules; these turn to each side, and experience a very singular distribution. On coming near the edge of the pelvis each of these two veins forms two branches; one of which collects the blood of the lower extremity, as hereafter described; the other passes straight downwards unbedded in the substance of the kidney, and admits the several emulgent veins, which are very large, and are seen to pass for some way obliquely in the kidney, before their termination. The descending branch of the iliac also receives the ovarian veins, and when arrived at the lower end of the kidney, divides into three branches; one transmits the blood of the muscles of the tail and parts adjacent; another accompanies the ureter to the side of the rectum, and is distributed about the anus and parts of generation, answering to the *hemorrhoidal veins*; the third passes inwards to the middle line between the kidneys, and there unites with the corresponding branch of the opposite side. The vessel which is in this manner produced, receives all the blood of the rectum from the anus to the origina of the cæca, anastomosing below with the branches of the hemorrhoidal veins; and at the upper part of the rectum, it becomes continuous with the trunk of the veins of the small intestines, forming the most remarkable anastomosis in the body, both on account of its consequences and the size of the vessels by which it is effected. By means of this communication, the blood of the viscera, and the external parts of the body, flows almost indifferently into the vena cava and vena portæ; for the anastomosing vessels are sufficiently large to admit the ready passage of a considerable column of blood in proportion to the whole mass which circulates in the body of the bird: for instance, in the *goose*, the communicating veins of the pelvis are equal in size to a goose quill, and in the *ostrich* and *casowary* they are as thick as a finger. The advantage which appears to result from this remarkable union of vessels, is the prevention of congestion, or the overloading either the heart or liver with blood, as the one organ has the power of relieving the other. It would seem from this, as well as several other provisions of the same kind, that the circulation would be more liable to obstruction in birds than other animals. It is difficult to say, however, to what cause such an effect ought to be ascribed. Is it from the compression sustained by the heart and other viscera, by means of the air-cells during respiration? Or, is the mode of progression by flight capable of impeding the motion of the blood?

The anastomosis of the pelvic veins, in being the means of conveying common venous blood into the liver, goes to prove, that the blood of the vena portæ does not require any peculiar preparation by circulation in the spleen or other viscera, which has been conceived as necessary by some physiologists to fit it for the secretion of bile.

The *vena portæ* belongs almost exclusively to the right or

principal lobe of the liver. It is formed by three branches. The *splenic vein* is the smallest, and is added to the vena portæ, just as it penetrates the liver on the side of the hepatic duct. The next is made of two branches; of which one returns the blood of the posterior gastric artery, and therefore may be called the *posterior gastric vein*; and the other is furnished by the pancreas and duodenum, and therefore is the *pancreatic vein*. The third and largest branch of the vena portæ is the *mesenteric vein*, which not only collects the blood from all the small intestines, but likewise receives the *inferior mesenteric*, or vein of the rectum, which forms the communication that has been described with the pelvic veins.

The *veins of the left lobe of the liver*, are furnished in the *goose* by those which accompany the anterior gastric artery, and some branches from the head of the duodenum.

The *anterior gastric veins* produce two small trunks, which enter at the two extremities of the fissure, in the concave surface of the left lobe of the liver, as it lies upon the edge of the gizzard; the veins from the head of the duodenum furnish a small vessel which passes backwards to penetrate the posterior part of the fissure in the left lobe.

In the *cock*, the veins that the left lobe of the liver derives from the anterior gastric, are more numerous than in the *goose*.

The veins of the zone of gastric glands, and of the lower portion of the œsophagus, do not contribute to the secretory vessels of the liver, but proceed to the superior part of that viscus, to terminate in the vena cava; as does also the umbilical vein.

The vein which returns the blood of the inferior extremities, is divided in the pelvis into two branches, which correspond with the femoral and ischiadic arteries; the one passes through the ischiadic foramen, and the other through the hole upon the anterior margin of the pelvis; but the proportion they bear to each other in magnitude, is the very reverse of what occurs in the arteries; for the anterior vein is the principal one, whilst the other is not a very considerable vessel, and receives its supply of blood from the muscles at the posterior part of the joint.

The *femoral vein*, immediately without the pelvis, gives branches on both sides, which receive the blood of the extensor and adductor muscles at their superior part: the trunk passes obliquely under the accessory muscle of the flexor digitorum, and over the os femoris, where it lies superficially; it then winds under the adductor muscles, and gets into the ham, where it receives many muscular branches, and comes into company with the artery and nerve. It here divides into the *tibial* and *peroneal* veins. The first is joined by some branches from the surface of the joint answering to the articular arteries; it also receives the *anterior tibial vein* which accompanies the artery of the same name. The tibial vein proceeds down the leg along with the artery on the inside of the deep-seated flexors of the heel: it turns over the fore part of the articulation of the tibia with the metatarsal bone, in order to get upon the inner side of the metatarsus; above the origin of the pollex, it receives a communicating branch from the peroneal vein, and immediately after, two branches from the toes; one of them comes from the inside of the internal toe; the other arises from the inside of the external and middle toes, unites at the root of the toes in the sole of the foot, and is joined by a branch from the pollex, before its termination in the internal vein of the metatarsus.

The *peroneal vein* derives its principal branches, along with those of the peroneal artery, from the muscles on the outside of the leg. The trunk of the vein comes out from the

peroneal muscles, and passes superficially over the joint at the heel, and along the outside of the metatarsus: near the pollex, or great toe, it sends a branch round the back of the leg, to communicate with the tibial vein; after which, it is continued upon the outside of the external toe to the extremity, receiving anastomosing branches from the tibial vein.

Where the veins run superficially upon the upper and lower extremities, they seem to supply the place of the branches of the *cephalic*, *basilic*, and the two *sapheneæ*; but the analogy is lost upon the upper arm and thigh: these branches forming deep-seated trunks: this constitutes the greatest peculiarity in the distribution of the veins in the extremities of birds.

Kidnies.

These organs occupy the posterior part of the common cavity of birds, from the last rib to near the coxigeal vertebrae: they fill all the cavities and depressions of the bones of the pelvis; the posterior surface, therefore, of the kidneys is extremely irregular; their anterior part is rather flat, and they are notched upon the external edge, which gives usually the appearance of their being composed of three lobes; but the inequalities of the edge seem to arise rather from the kidneys being larger at one place than at another, than from an original division into lobes: the prominences correspond to the most depressed parts on the pelvis; accordingly, the kidneys are observed to form a projection at the upper end, where they lye on the depression of the *ossa ilia*, again opposite to the hollow on the inside of the *ischiac foramen*, and lastly, at the lower part of the kidney, where it fills the concavity of the *ischium*.

The kidneys have a covering of thin peritoneum, and under this, they seem to possess another thin membranous tunic, which closely invests them, as well where they are applied to the bones, as anteriorly; this coat also appears to be reflected into the substance of the kidneys, and to form the cellular connections of the different parts which compose these organs. According to the academicians, the kidneys of the *corvina* are separated from the other parts of the lower belly, by a distinct membrane, and instead of being divided into three lobes, are toothed like a cock's comb on their gibbous part.

The texture of the kidneys is very fragile; readily giving way under the slightest injury. They yield to the pressure of the finger a granular feel, as if composed of a number of minute bodies, easily separable from each other: the surface of the kidneys, also, presents the appearance of an aggregation of small glands.

The trunks and larger branches of the blood-vessels of the kidneys have been already described. The termination of the minute ramifications of the artery cannot be so clearly perceived as in mammalia. When coloured fluids are thrown in by the artery, the whole substance of the kidney appears to equally admit the injection: the minute branches of the blood vessels are too numerous, therefore, to allow of a distinct view of the figure assumed by the secretory extremity of the artery; but it is probable, from the structure of the kidney differing in other circumstances, that it is not wound into a coil, as in man and quadrupeds.

The kidneys of birds, in general, do not possess any cavity for collecting the urine, previous to its expulsion by the excretory duct: each of the little masses which form the original glands, produces a duct; these are joined by the neighbouring ducts, and thus others are generated, which terminate in the *ureter* or common excretory duct of

each kidney. The ureter lies upon the anterior surface of the kidney, partially embedded in its substance, so that it is visible along the whole gland, except at the upper part.

The members of the academy describe the kidneys of the *ostrich* as being evidently composed of distinct glands, and that the ureter did not lie as in other birds, superficially, but was concealed in the glandular substance; in which situation it suffered a degree of dilatation, forming as it were, a *pelvis*, the whole length of the kidney, into which the different excretory ducts discharged their contents; not, however, from *papille*, as in mammalia, but by open and plain orifices. Mr. Ranby, in his account of the anatomy of the *ostrich*, states, that he found the ureters occupy their usual situation on the middle line of the anterior surface of the kidney; but that the superior branch of the ureter was very conspicuous, and entered the middle of the kidney, where it formed a very large *pelvis*.

The structure of the ureters appears to be exactly the same which these ducts possess in the human subject.

The course of the ureters, after leaving the kidneys, is behind the rectum, to which they become connected by the peritoneum covering the intestine: they proceed, for a very little way, involved in the coats of the back of the rectum, and open usually upon two little papillæ, which project into the cloaca, or termination of the rectum. The orifices of the ureters in the cloaca, are much less than the width of tubes to which they belong; this, therefore, added to the obliquity with which they perforate the cloaca, answers all the purposes of a valve, and prevents any regurgitation of the urine back upon the kidneys.

The Parisian dissectors observed in the *castor* and *demoiselle of Numidia* (*ardea virgo*), that the ureters became united to the excretory duct of the testicle, at the lower part of the kidney; the common duct produced by their union terminated, as usual, in the back of the cloaca. This structure certainly does not exist in the generality of birds.

The above description anticipates the observation, that birds are unprovided with any distinct reservoir for urine; analogous to the *bladder*: it is the case throughout the whole class, without an exception, that the feces and urine are expelled together; but the dilatation of the end of the rectum or cloaca, in some species, supplies the want of the urinary bladder in a great degree, and renders the ejections of both the urine and feces less frequent than they would otherwise be, by affording a temporary accommodation to a considerable quantity of excrement. These dilatations are remarkably large in the *ostrich*, *parrot*, &c. See that part of the article which treats of the great intestine of birds.

It is a matter of common observation, that the excrements of birds are of a white colour, and appear as if they contained some cretaceous substances: this effect is universally attributed to an admixture with the urine, which is supposed to be of this colour and consistence; it deserves to be mentioned, however, that if the urine be expressed from the kidneys, or examined before it has passed into the rectum, it is neither white, nor of a chalky consistence, but a limpid aqueous fluid, which exhales an innoxious smell, that is very perceptible in the larger birds, from which some quantity of the urine may be obtained, by compressing the kidneys. It would seem more probable, that the white and chalky appearance of the excrements of birds, depended upon the quantity of calcareous matter contained in the solid parts of the feces, than that it is derived from the urine. In proof of this supposition, it may be remarked,

that

that upon one occasion, where we fed a fowl with madder for a different purpose, the cretaceous part of the excrement lost its usual whiteness, and became of the pale pink colour which madder is well known to communicate to calcareous earths.

Renal Capsules.

These bodies hold the same situation in birds as in mammalia; they also usually possess an irregularly triangular figure. The proportion which they bear in size to the kidney, is perhaps less than generally occurs in quadrupeds. In the *goose*, they are each about as large as a pea. The colour of the renal capsules is in every instance more or less yellow. Several of the older anatomists have described a single renal capsule in some species of birds: the mistake seems to have arisen from their being occasionally so closely applied to each other, that they appear as one body.

The renal capsules of birds do not possess any cavity or dilated part for venous blood, which renders it probable that the enlargement of the capsular vein, which has attracted so much attention in the human subject, is no way concerned with the function of these bodies.

Having discussed the structure and operations of those organs which are more immediately concerned in supporting the life of the individual, we shall proceed to consider those which are subservient to the second order of functions.

ORGANS EMPLOYED IN THE EXERCISE OF THE GENERATIVE FUNCTIONS.

Male Parts of Generation.

The *testicles* of birds are always two in number; they are situated on the inside of the body, high up in the loins, upon the superior edge of the kidneys; from which position they never descend at any period of life, as in mammalia. Consequently, birds are not provided with a *scrotum*, or any external pouch for the accommodation of those glands. The figure of the testicles is most commonly oval; occasionally they are of an elongated form, as in the *casowary*. See *Plate VII.* in the *Anatomy of Birds*; *fig. 1.* Sometimes the testicles are nearly round, as in the *curassow*, and other instances.

The testicles appear to receive a covering from the peritoneum; but their proper tunic is remarkably strong, dense, and inelastic.

It will always be a matter of great difficulty, to exhibit satisfactorily, the intimate structure of the testes of birds, as a successful injection from the *vas deferens* is nearly impossible. The seminiferous tubes are so tender, that they do not sustain the least force without being ruptured; and at the period when the testes are fully developed, they are loaded with their own secretion, a circumstance highly unfavourable to the exposition of the structure of these organs by the means of injection. The blood-vessels of the testicle are easily traced; some of them pass in the usual manner directly from the back part, through the glandular substance, to the surface, where they unite with others which spread in an arborescent form, under the capsules of the testes. The great mass of these glands is evidently made up of tubes, which are convoluted in all directions, and are separated into bundles or packets, by very thin cellular membranes. Their connection with the secretory extremities of the spermatric arteries, and their termination in the excretory duct, are, however, involved in obscurity, for the reasons already given.

The testicles of birds differ very much in size at different seasons of the year. When these organs are not exercised in the act of generation, they become remarkably diminished; but, during the period in which the female lays her eggs,

they acquire a bulk even beyond what might be expected, from the size of the bird to which they belong. This subject has been strikingly illustrated by Mr. Hunter, in a series of figures representing the variation of bulk which takes place every spring in the testicles of the *common sparrow*; by which it is shewn, that the testicles of this bird are ordinarily about the size of pin-heads, but, during the season of propagation, acquire nearly the bulk of pistol balls. See *Plate VII.* in the *Anatomy of Birds*; N^o 1. exhibits the testes as they exist in the month of January; N^o 2. as they are in the middle of February; N^o 3. as they are found in the beginning of March; N^o 4. their size in the latter end of March; and N^o 5. the bulk they assume in the middle of April.

The *vas deferens*, or excretory duct, arises usually from the posterior part of the testicle, and probably always suffers a certain degree of convolution or coiling upon itself, corresponding to the *epididymis*, which generally differs more or less in colour from the body of the gland. In the *curassow* and *bustard*, it has been observed to be black; in the *casowary* yellow; and in the *ardea virgo*, a green colour. The academicians represent the *epididymis* of the *casowary* as being extended for some way above the testicle, and considerably enlarged at the top. See *Plate VII.* in the *Anatomy of Birds*. *Fig. 1.* *aa* the two testes; *bb* the *epididymis* of each side; *cc* the *vasa deferentia*; *dd* the ureters coming from the kidney to unite with the *vasa deferentia*; *ee* the excretory ducts common to both the kidneys and the testicles.

In the *ostrich*, the *epididymis* turns up on the side of the testicle; and in the *ardea virgo*, it is pendulous from it, and only connected by one end. The *vas deferens* also in this bird, appears to arise from the body of the testis, instead of the *epididymis*; and at its lower part, the duct unites with the ureters, in the same way as is represented in the *casowary*. In the *casowary*, the *epididymis* is situated below the testicle, which it almost equals in size.

In most birds the *vasa deferentia* proceed to their termination, without undergoing any remarkable degree of convolution, or experiencing any dilatation analogous to the *vesiculae seminales*; but in the *cock*, these ducts are composed of convolutions or reflections of a tube from side to side, which are so closely applied to each other, that a longitudinal section of the duct presents the appearance of a series of cells, which seem to communicate with each other in the middle. These become larger and more numerous towards the lower part of the *vas deferens*, and are capable of containing a considerable quantity of semen. It may be presumed, therefore, that the *cock*, and other falacious birds, are provided with these receptacles of semen to enable them to meet the exigency of frequent copulation; and it is also to be observed, that those birds which have the *vasa deferentia* more simply formed, do not perform the act of coition so rapidly as the gallinaceous fowl. See *Plate VII.* in the *Anatomy of Birds*. *Fig. 2.* exhibits the genital or organs of the *common cock*; *aa* the testicles of an oval shape; *bb* the *epididymis* at the posterior part of each; *cc* the *vasa deferentia*, one of which is cut open to expose the loculated appearance it presents internally.

The *penis*, in those birds where it has been observed to exist, is fixed upon the end of the rectum, immediately within the verge of the anus; it is usually of a pyramidal figure, and in its ordinary state is twisted like a screw; its external tunic is derived from the intestine, and is formed into a number of little rugæ, or processes, giving the edges of the penis, in its contracted state, a jagged or notched appearance. The body of the penis is composed of a white liga-

erentous substance, which supplies the place of the *corpora cavernosa*, but does not seem to contain any cells or cavity internally.

There is a groove, corresponding to the *urethra*, along the side of the white ligament; it takes the spiral course of the penis, and in no instance could we discover that it formed a distinct canal, the external coat of the penis appearing always to dip into the groove, so that it was visible externally; and hence it might be said that the *urethra* of birds is situated upon the outside of the penis. See *Plate VII.* in the *Anatomy of Birds*, *fig. 3.* represents these parts as they are found in the *gander*; *a* the penis, shaped like a screw, with the edges denticulate and notched by the folding of the external coat; *b* the *urethra*, commencing upon the left side of the penis, and continued upon the same side around the spine or screw; and at the end of the penis the sulcus gradually disappears.

The form of the *ostrich's* penis is not spiral; it is also smooth upon the surface, and in shape it has been likened to a calf's tongue. The *Panilian* anatomists describe it as being composed of white thick membranes, and of two strong hard ligamentous substances. They appeared to consist of very compact transverse fibres; one of the membranes was thicker than the other, and afforded a covering to the penis; the other enveloped immediately each of the two ligaments, which were separated from each other, and united about two fingers from the extremity. One was longer than the other, and measured two inches. The origin of the penis was at the cartilaginous swelling, which is situated at the junction of the bones of the penis; from thence it was turned downward, and contained in a little pouch, which was placed at the lower part of the cloaca, in which the penis was continued to the anus. This small pouch can be distinctly separated from the large bag of the cloaca, by the contraction of the margin of its foramen. The lesser pouch only permits the excrements to pass from the other occasionally, and when it is closed, forms a sort of sheath for the penis.

The penis of birds receives some distinct muscular fasciculi from the rectum, which are inserted into the root of the ligamentous body; they appear to have the power of retracting it, or rolling it into the spiral form, and may perhaps render it more steady during coition.

The muscles of the penis are large in the *ostrich*. The academicians describe four of them, two on each side. The two first took their origin from the internal part of the os sacrum, and descended along the pouch of the rectum, for the space of two lines, which they penetrated near the extremity, and passing under the sphincter ani, were inserted at the base of the penis. The two other muscles went from the internal part of the os ilium toward the bottom of the kidneys, and descended by the sides of the ureters, and after perforating the rectum, were attached to the lateral parts of the penis.

The penis of birds is unfurnished with any structure similar to the *glans* or *prepuce*; from which it might be questioned whether it is capable of receiving any peculiar sensations during the act of copulation. It would seem probable, however, that the penis is the chief seat of pleasure in birds as well as mammalia, because it changes its form during coition, and experiences a great degree of relaxation afterwards. The penis of the *drake* is protruded some inches out of the anus during the performance of the venereal act; and after the orgasm is concluded, it is so much relaxed, that the animal has not the power of retracting it for some minutes; in which condition the penis hangs from the anus, and so much resembles an earthworm, that the ducks mistake it for one, and attempt to swallow it. It is remarkable,

however, that the greater number of birds are either unprovided with a penis, or have merely a rudiment of it, which is incapable of conducting the semen into the organs of the female.

In those birds which want the penis, it is very easy to perceive the manner in which the vasa deferentia terminate; thus, in the *common cock* they can be readily traced passing along the sides of the ureters to the back of the cloaca, into which they open a little lower than the ureters upon two papillæ, which are elevated upon a ridge formed by the internal coat of the intestine, just within the verge of the anus. These papillæ are prominent and sharp pointed; and although the ducts are of some size immediately behind, the aperture on the point of the papillæ is so extremely small, that it is difficult to pass through it. See *Plate VII.* in the *Anatomy of Birds*, *fig. 2.* *c* the two sharp papillæ, upon the point of which the vasa deferentia terminate in the *cock*. A bistul is introduced into one of them, and above them, and nearer the centre of the intestine are seen the orifices of the ureters designated by the letters *d* *d*.

As these birds have no means of conveying the semen into the body of the female, a natural eversion of the extremity of the intestine always takes place during the copulation of fowls.

The termination of the excretory ducts of the testicle are difficult to discover in most of the birds which are furnished with a penis. This arises partly from the coats of the ducts becoming extremely thin and delicate near the extremity, and partly from the papillæ upon which they open into the gut, being in those cases so small as very easily to escape observation.

The academicians did not succeed in tracing the vasa deferentia; their termination in any of the birds they dissected. They relate, however, that the penis of the *ostrich* and *casowary* had no communication with the ducts, nor did they contain any tube in the internal part by which they could give passage to the semen. In all the birds we have examined, we could not perceive the least appearance of a canal in the interior part of the penis, or any means of communication between it and the vasa deferentia.

In the *gander* we have been able to discover the mode in which the semen is discharged from the excretory ducts. At some distance behind the root of the penis there are two papillæ, surrounded by a number of small follicular glands; they are not so far asunder as those of the *cock*, and so little prominent, that unless minutely examined, they are not distinguishable from the glandular parts of the surface of the intestine which lie next them, and might easily be mistaken for a prominent edge of one of the follicles: from the point of these papillæ a duct can be traced, as in the *cock*, to the back of the intestine; but furnished with coats so thin that it is perfectly transparent. See *Plate VII.* in the *Anatomy of Birds*, *fig. 3.* *c* the small papillæ on which the vasa deferentia terminate in the *gander*. Some small follicular glands are seen around them, and farther within the intestine the ureters open, as indicated by the letters *d* *d*; at these points also there are some small mucous glands.

Mr. Hone has described the penis of the *drake* as possessing a distinct canal analogous to the urethra of mammalia, into which the vasa deferentia enter close to its origin at the verge of the anus. He states the penis to measure, when pulled out to its full extent, six inches long, but that when left to itself it disappears within the verge of the anus, in consequence of the contractile power of the urethra. (See *Phil. Transact.* vol. xcii. p. 361.) The representation of the penis of the *drake* is copied in *Plate VII.* of the *Anatomy*

of Birds, fig. 4, *aa* the verge of the fundament surrounded by feathers; *bb* the urethra, or feminal canal laid open throughout its whole extent; *cc* the orifices of the vasa deferentia; *dd* the external tunic of the penis laid open, and from its elasticity thrown into serpentine folds.

It deserves to be mentioned, that Blasius also supposed the vasa deferentia of the *drake* terminated in the penis, although he spoke doubtfully, not having actually traced them thither. See *Anatome animalium Gerardi Blasii*.

In the *gander*, *swan*, *castrary*, and other birds which we have examined, the channel that runs upon the external part of the penis supplies the place of the urethra, and appears fully competent to answer the purpose of a conduit to the femens, when it is introduced into the organs of the female.

Besides the mucous follicles surrounding the termination of the ureters and feminal ducts, there are some others much larger upon the margin of the anus, on each side of the base of the penis. In the *gander* we have noticed twelve of these, six on each side. They appear like masses of fat lying under the inner membrane of the intestine. The three outer glands have wide orifices which lead to a cavity within of some size; they furnish specimens of simple mucous follicles, a greater size than are almost ever met with, even amongst the largest animals. See *Plate VII. in the Anatomy of Birds, fig. 3, ecc* the large follicular glands on the margin of the anus of the *gander*; *fff* the three smaller glands next the penis. The anal glands are very remarkable in the *castrary*.

No chemical analysis of the femens of birds has yet been attempted. The undertaking will be attended with some difficulty, from the small quantity which can be collected for investigation.

Female Parts of Generation.

There are no parts of the structure of birds which deviate, more from that of mammalia, than the female organs of generation: not only their construction, but their functions, differ so much, that the same names cannot be applied to each, without extending analogy beyond what is justifiable. The genital organs of the female bird strictly consist but of two parts, an *ovary* and *ovarian tube*; for the different portions of the latter, which have received the names of *uterus* and *vagina*, perform very different functions from the same parts in other animals.

The *ovary* of birds is always single, which is a peculiarity of structure hardly ever met with in the other classes of animals. It is situated over the descending aorta, above the kidneys. Instead of the ova being imbedded in a solid mass, as in mammalia, they are contained in membranous cysts, which are prolonged into peduncles, or footstalks, that are attached to the basis of the ovary, thus presenting the appearance of a cluster, or bunch of fruit, from whence the older anatomists were in the habit of calling the ovary of birds, the *racemus vitellorum*. Before the ovary, however, is developed, the rudiments of the eggs do not project beyond the surface, but lie in close contact with each other, and are inclosed by the external membrane of the ovary, something in the manner of the ova of fish, or amphibia. The capsules which invest the ova of birds in the mature state, appear therefore to be formed by the extension of the outer membrane of the ovary, just as the contents of a hernia obtain during their protrusion a covering of peritoneum. The membranous bags, in which the ova are included, adhere to the proper tunic of the egg at the anterior part only; for posteriorly they are quite distinct, being prolonged into a funnel, or tube, which forms the peduncle to each ovum.

The blood-vessels are transmitted through this funnel, and ramify in the space left between the capsule and the back part of the ovum, distributing their branches in a similar way to the central artery of the eye upon the back of the crystalline lens in mammalia. The capsules are extremely vascular at every part, except a certain portion of the anterior surface, which appears like a white streak, or broad line. When the eruption of the ovum takes place, this part of the capsule gives way, after which the cyst appears like the cup of an acorn, when the nut has been shed. The older anatomists almost universally believed that the capsules of the ova were imperfect at their anterior part, and that the white streak was owing to the proper tunic of the ovum being actually exposed at this place; they describe the capsule as being extended upon the ova in a manner similar to the internal coats of the eye, and, like them, terminating by a defined line at the anterior part. The celebrated Harvey, however, observed that the membrane composing the capsules was continued over the anterior part of the ovum, at which place it became very thin. The observations we have made on this subject confirm the assertion of Harvey; we have always been able to detect a very fine pellucid membrane extended over the white line, which has all the appearance of being the continuation of the capsule. The coat of the capsule consists of several indistinct layers; and it is one of these only which appears to pass over the white line. The separation of the tunic of the capsules into layers is probably not an original formation, but is produced by the increase which takes place in the number and size of the blood vessels, and therefore the part which lies over the white streak might be considered as more nearly resembling the membrane of the capsule as it first existed. There are many instances of parts, on changing their position, either acquiring or losing vascularity, and becoming so much altered in their structure and appearance, that separately they could not be recognized for the same. The tunica conjunctiva of the eye affords a well known example of this sort.

The portion of the capsule corresponding to the white line, from being bereft of blood-vessels, becomes thin, is easily ruptured, and is incapable of supporting any internal actions, in consequence of injury; we accordingly find, that this part suffers laceration when the ovum is shed, without the least inflammation succeeding, or any process similar to that which arises upon the rupture of the ovary in mammalia. There is no deposition of new substance in the cavity of the cyst, or *corpus luteum*, formed. The lacerated portions of the membrane disappear (probably by absorption), and the edges assume the appearance of being cut, the capsules become contracted and thickened, and remain hollow, presenting very exactly the resemblance of cups or the calyces of flowers, and thence they have been often called the *calyces*.

The base of the ovary, in which all the pedicles of the ova terminate, is of a peculiar texture. It is porous and tough, and seems to be composed of an intermixture of vessels and strong cellular substance; it adheres firmly to the parts upon which it is placed.

The *ova*, during the time they remain in the ovary, possess only the yolk and the cicatricula; the whites and the shell being added to them during their passage through the oviduct. Many of the blood-vessels which are distributed between the capsule and the ovum, penetrate the membrane of the latter, in order to supply blood for the nutrition of the egg during its growth. But when the ovum arrives at maturity, these branches degenerate, and disappear entirely before the ovum is expelled from its cyst.

For the illustration of the structure of these parts, see *Plate*

Plate VII. of the *Anatomy of Birds*. Fig. 5. exhibits the genital organs of the *hen* during the season for laying eggs; at the superior part is seen the ovary, or *racemus ovarum*, or *vitellarium*. The ova are arranged according to their state of growth. The largest are most external and pendent from their footstalks; those less advanced are close upon the matrix or basis of the ovary; many of them are as yet but imperfect rudiments of the ova, and appear but as white specks in the matrix. The capsules of the ova, near maturity, display a very beautiful and luxuriant distribution of blood-vessels upon every part of their surface, except where the ova are to come out; *aa* point out the stripe on the anterior part of each capsule, which is devoid of blood vessels; *b* a capsule which has shed its ovum, exhibiting the appearance of a cup or calyx.

The *ovarian tube*, or *oviduct*, during the season of laying, fills the greater part of the lower belly; it forms a number of curves or convolutions similar to the intestines, which, however, are not permitted the same latitude of motion amongst each other, because the prolongation of peritoneum, which includes the oviduct, is remarkably strong, and is not so long as the parts it contains, and therefore the convolutions are coiled close together, and even some of them are doubled up within the peritoneum. The disproportion between the oviduct and peritoneum, which invests it, arises from the additional bulk the ovary acquires when its functions are exercised, whilst the peritoneum must preserve at its back part its original extent, i. e. the length of the left kidney, from the middle of which it is reflected.

There is no decided muscular coat belonging to the oviduct; there are, however, muscular fibres between the peritoneal and internal coats of those parts, which have received the names of uterus and vagina; upon the former they are transverse, and upon the vagina the course of the fibres appears to be longitudinal.

The internal coat of the oviduct is the most remarkable part of its structure; and upon it chiefly depends the distinctions which have been made of the tube into *infundibulum*, *Fallopian tube*, *uterus*, and *vagina*.

The *infundibulum* is the extreme part of the tube next the ovary; it is composed apparently of a single thin membrane; the peritoneum and the internal tunic becoming both delicately fine, and so closely united to each other, at this place, that they seem to be but one. This membrane is expanded beneath the ovary in a loose manner, like the folds of a garment, and is fastened by its superior edge to the basis or matrix of the ovary; and inferiorly it is connected to the uterus: by which means the folds of the membrane are always kept spread out, ready to catch the ova as they are discharged from the racemus or vitellarium. The passage from the membranous expansion of the tube into the oviduct is contracted, and thence occurs the similitude of this part to a funnel, and the application of the term *infundibulum*.

The next portion of the oviduct, or *Fallopian tube*, is of considerable length, being several times coiled backwards and forwards upon itself. It is very nearly of the same width at every part; and the inner membrane is singularly soft, and forms numerous thick folds, which take an oblique or spiral course. The internal surface of this part of the tube resembles very much that of the digestive stomach in ruminating animals.

Where the part termed the *uterus* commences, there is a contraction of the tube, to which succeeds a dilatation of an oval or egg shape; in this the internal membrane acquires more firmness, and instead of the soft white spiral plicæ, produces an immense number of strong vascular processes or

flocculi, which give the internal part of the uterus the appearance of being fringed or foliated.

The tube again becomes diminished in capacity, and its structure changed, to form the portion considered analogous to the *vagina*. At the origin of this part from the oval dilatation there are several annular contractions; after which, the canal undergoes some degree of convolution, which is concealed by the peritoneal coat. The internal membrane produces longitudinal rugæ, or folds, which do not project far into the cavity of the tube.

The oviduct finally opens into the cloaca on the left side, not by a simple aperture, but the extremity of the vagina is protruded for some way into the cavity of the intestine, appearing as if a portion of the oviduct were turned inside out; and to the puckered foramen thus produced, the old anatomists, who were always desirous of comparing the structure of other animals with that of the human subject, gave the name of *velva*. See Plate VII. in the *Anatomy of Birds*, fig. 5; see the membranous expansion of the oviduct, *aa* its attachments to the ovary and the uterus, *e* the aperture leading from the infundibulum to the interior of the oviduct; *ffff* the convoluted part of the oviduct, which is supposed to be analogous to the Fallopian tube, and a part of it laid open to exhibit the spiral folds of the internal membrane; *bb* the oval cavity or uterus cut open, and a portion of it turned backward to expose the foliated structure of the internal membrane; *ii* the vagina detached in a degree from its peritoneal covering to bring it more into view; *k* the cavity exposed, shewing the longitudinal folds; *l* the projection of the end of the oviduct into the cloaca, with the corrugated foramen by which it opens into the gut; *m* a portion of the rectum, left to explain the connection these parts have to each other; *nn* the ureters, through which a bristle is introduced.

The uses which the several parts of the oviduct of birds serve, are very peculiar, and can hardly be compared with the functions of the genital organs of other animals. When the ovum is shed from the vitellarium, it is but imperfectly formed; and in passing along that portion of the oviduct which has been called the Fallopian tube, it meets with an albuminous fluid, which is secreted in abundance from the plicated membrane; a certain quantity of this fluid attaches itself to the ovum, and constitutes the whites and the chalyzes. The egg now assumes an oval figure, and while still soft, descends into the dilated part of the oviduct, in which it is detained for some time, and obtains the calcareous covering or shell; after which, the lower portion of the duct, or the vagina, suffers itself to be enlarged, and the egg is expelled from the body of the bird. For the further history of the formation of the ovum, we refer the reader to the article *EGG*. In birds, and all animals strictly oviparous, the evolution of the embryo, and the growth of the fœtus, is carried on without the body of the parent, and therefore the functions of the organs of generation in these animals are confined to the development and perfection of the ovum, which, as already observed, is partly accomplished in birds, while the egg remains in the ovary, and partly while it traverses the ovarian tube. It therefore seems improper to borrow the terms applied to the organs of viviparous animals in the description of those which only minister to the formation and support of the ova. The progress of the fœtus in birds; its mode of existence while in the egg, and the provisions for its subsistence afterward, will be treated of under the head of *INCUBATION*, which see.

It is not easy to determine how far the male semen is conveyed into the organs of birds during copulation. The older anatomists asserted, that the two papillæ on which the vasa

deferentia terminate, were introduced into the orifice of the oviduct within the cloaca; and it has been observed, that the hen, before coition, everts the intestine so much, that the orifice of the vagina is visible on the outside of the body, which would render the insertion of the male organ very practicable, especially in those birds which are provided with a penis. The impregnating liquor must be transmitted as far at least as the part in which the egg is clothed with the shell; for afterwards it would be incapable of exerting any influence upon it: and it is probable that it reaches the ovum even before it acquires the whites, otherwise the stimulus could not be immediately communicated to the *cicatricula*. Many have supposed, that the semen produced a vapour which was propagated to the ovary itself; but the existence and operation of the *aura seminalis* are now generally disbelieved.

Upon the margin of the anus of birds there is usually observed a projection which has been considered analogous to *clitoris*. The academicians observed, that it possessed in the *female ostrich* the same muscles which belonged to the penis. This part, from its situation, is little exposed to agitation or friction in venereal congress, and from its covering, which is the common integument of the anus, cannot be endowed with peculiar or delicate sensation. It may therefore be looked upon as one of the examples of uniformity of plan which are so often displayed in the works of nature, without the accomplishment of any immediate or obvious effect.

The female organs of generation of birds suffer even a greater alteration than the male parts, in consequence of the cessation of their functions. Before and after the period of laying has commenced, the ovary and oviduct, which in their developed condition are the largest of the viscera, are so diminutive, that they are hardly to be seen; the ovary is a very small mass, which appears to be composed of an aggregation of minute pale yellow grains; the oviduct is a mere membranous substance, with scarcely any cavity, like a degenerated blood-vessel; and the aperture, which at one period permits the egg to pass through it, is so nearly obliterated, that it is perceived with difficulty, and is so close that it does not suffer the smallest instrument, or even air, to escape from it into the intestine.

Mr. Hunter, and others, have observed, that even the sexual characters of some female birds have entirely changed, after the time they ceased to lay. This phenomenon has been remarked most frequently in the *praefowl*. Several hens of this genus have assumed the manners and plumage of the cock so nearly, that their real sex could only be decided by anatomical inspection.

ORGANS SUBSERVIENT TO THE PERFORMANCE OF THE ANIMAL FUNCTIONS.

Bones.

The osseous fabric of the bodies of birds constitutes one of the most curious and characteristic parts in the anatomy of this class of animals; being in many respects so curiously formed, that the analogy between them and the same organs of other animals can scarcely be traced.

The bones of birds have been observed to vary in their colour. The water birds have them of a duller white than the other species, in consequence of their abounding with marrow. The bones which contain air, are always of the finest colour, much exceeding in whiteness the bones of any quadruped: they are also of a harder and closer texture. Becmann, in the voyage of Dampier, has observed that the *black fowl* of the isles of Cape-Verd, and other birds of these islands, had black bones, and Daubenton reared some hens of this kind. The same peculiarity has been noticed in the

pintado; but some preparations, which were preserved by Mr. Hunter to illustrate this subject, shew that it is the periosteum in which the blackness resides.

The chemical principles of the bones of birds, do not differ from those of mammalia, except in there being a greater proportion of the calcareous phosphat in the long bones, filled with air. The arrangement of the osseous particles appears to be in layers, rather than fibres, successively formed, and closely applied to each other.

The *bones of the head*, as in the other animals with vertebræ, consist of those of the *cranium*, or brain-case; and those which contain the organs of sense, or, as they are commonly termed, bones of the *face*.

The *external form of the cranium* differs according to the species: a longitudinal and vertical section of it usually exhibits the cavity to be somewhat of an ovular shape, of which the end next the face is rather pointed. In the *owl*, the cavity of the cranium is an oval, with the axis nearly vertical. The same bones enter into the composition of the cranium in birds, as in mammalia: but the sutures are obliterated at so early an age in the former, that their cranium commonly appears as a single bone, and therefore, in order to examine the bones of the head separately, a very young subject must be chosen.

The *os frontis* is originally made of two portions: they form the principal parts of the roof of the orbits, and a portion of the septum, which divides one orbit from the other. They send down, on each side, a pointed process, almost to the base of the bill. The prominences which are seen upon the heads of the *casowary*, *hornbill*, *pintado*, and the *curassow*, &c. are attached to the os frontis, but were originally formed by distinct ossifications, in the same manner as the bones on the tarsus, which serve as the mould for the *spurs*. The casque of the *casowary's* head is filled with numerous cells: in the *pintado*, the texture is more like that of the other bones.

The *parietal* bones are also in two pieces at one period, although the distinction is but rarely seen. They resemble two semi-spheres, hollowed out on the inside, to receive the brain.

The *temporal* bones compose the posterior parts of the orbits, and exhibit a remarkable depression between two projecting processes, for lodging the muscles employed in the motions of the lower jaw. The zygoma is not joined to the temporal bone.

The *occipital* bone originally consists of four portions; one placed superiorly, another below, and two laterally. When these are united, the bone has an annular figure, incircling the foramen magnum. The surface by which it articulates with the first cervical vertebræ, is a single spherical protuberance, which is placed upon the anterior edge of the great foramen, and is received into a corresponding depression of the atlas. The mobility of the head is much encreased by this mode of articulation.

The *sphenoidal* bone forms the greater part of the base of the cranium, its processes are less evident in general, than in mammalia, although it furnishes a remarkable one which proceeds anteriorly like a silet, and receives upon its edge the ends of the inter-articular bones, and the palatine bones and vomer, which are each adapted to fit this process, and to slip along it, as the upper jaw is moved. The sphenoid bone wants the pterygoid processes, these belonging to the palatine bones in birds.

The *internal surface of the cranium* exhibits a sharp ridge, which divides the cavity into two principal fossæ. The one contains the hemispheres of the cerebrum, the other, which is situated in the posterior and inferior part of the cranium, accom-

accommodates the two thalami nervorum opticorum, the cerebellum, and medulla oblongata, &c. On the surface of the superior fossa there are two slight projections, produced by the back of the orbits, and a small spinous ridge along the top of the cranium, which marks the division of the hemispheres; the inferior fossa displays a number of depressions, corresponding to the several parts it contains. There are also two irregular projections on the side, formed by the internal organ of hearing, and anteriorly the eminence called the *fella turcica*, is to be seen, with a deep round cell for lodging the pituitary gland. The depressions on the internal part of the cranium are deepest in the *parrot* and *accipitri* birds.

The *foramina of the cranium* vary in many respects from what occurs in mammalia.

The foramina through which the olfactory nerves are transmitted are only two in number; they proceed from a little depression at the anterior part of the skull, and open upon the upper and posterior surface of the orbit, along the superior part of which they are continued, as a deep groove, or rather more than a semi-canal, to the upper and back part of the nose, where there is another foramen or slit, formed by the ethmoidal bone.

The *optic foramina* arise close together on the inside of the cranium, being only separated from each other by the thin partition of the orbits; this is frequently found deficient at the posterior part, and in that case the two optic foramina are thrown into one.

The *spheno-orbital* fissure does not exist in birds. The parts which are transmitted through it in mammalia, pass by distinct holes: some of these are arranged round the optic foramina, and one is found on the basis of the skull.

The *foramen rotundum* and *foramen ovale*, are supplied by a single hole. It is seen on the line dividing the optic and basilar fossæ.

The *canalis carotideus* appears to commence far back, on the outside of the cranium, and just as it turns up to open upon the *fella turcica*, there is a small foramen for the transmission of the communicating branch of the internal maxillary artery.

The *foramen lacerum anterius* does not exist, and the *posterior foramen lacerum* is small, and placed within and under the external meatus auditorius.

The *meatus auditorius internus* is a very palpable foramen in birds.

The *bones of the face* in birds, although they differ extremely in form from those of mammalia, still preserve in general a distant analogy, by which they can be distinguished and compared.

The *sphenum* of the orbits, notwithstanding its structure is so dissimilar, must be considered as analogous to the *ethmoid bone*. It is united to the *os frontis* superiorly, and to the sphenoidal bone below; it is at best but a lamina, or plate of bone, so thin that it is nearly transparent, and in numerous instances is in part membranous. At the back of the organ of smell there is occasionally a process, which projects a little from the septum, and then turns down forming a slit, through which the olfactory nerve passes. This process may be compared to the *os planum*, and the septum itself, although it is not continued far into the nose, may perhaps be thought analogous to the *nasal lamella* of the ethmoid bone.

There is a bone usually of a triangular shape, which is attached to the anterior, and outer angle of the *os frontis*. This bone Cuvier has called the *lacrymal*, and others the *superciliary*. It is in a certain degree moveable on the

os frontis. Its two posterior angles form the superciliary or anterior edge of the orbits. The superior of them is continued further backwards in the *diurnal birds of prey* than others, giving a considerable prominence to the upper edge of the orbit. In the *accipitri*, the superciliary arch is made of a number of small bones, which are continued from the lacrymal bone, and are distinct from the *os frontis*. The lower of the posterior angles of the lacrymal bone is prolonged considerably in the *duck*, but much more in the *parrot*, in which it goes so far back as to join the projection of the temporal bones, and thus completes the frame of the orbit.

The remaining bones of the face either enter into the composition of the mandibles, or are provided for the motion of these parts. The superior mandible is made up of the *ossæ nasi*, *ossæ maxillaria*, and *inter-maxillaria*, the *vomer*, the *malar*, and *palatine* bones; the extremity of the mandible appears to be formed originally by a distinct bone, which is added, as it were, to all the rest. The separate parts of the mandible are not to be distinguished in the adult bird, but in young subjects they come easily asunder.

The *palatine* bones are so thin at their connection with the posterior part of the mandible, that they readily bend. At the back part, they spread out into two wings or the *pterygoid process*, leaving a slit-shaped aperture for the posterior nares, in which is seen the vomer; where the palatine bones are joined above, there is a groove or gutter formed, which receives the inferior edge of the septum of the orbits, and on which the palatine bones have a degree of motion when the upper mandible is raised.

The *zygoma* is one of the most remarkable parts of the head of birds. It is a very long delicate bone, extended in a straight line from the inferior and back part of the upper mandible to the outside of the articular bone immediately above the articulation of the lower jaw. It is, as in mammalia, originally composed of two pieces, which in large birds are always visible. The anterior portion has been commonly described as a process of the palatine bones, but it is really produced from the part of the mandible that corresponds to the *os mala* or *jugale*, as it ought, in order to be consistent with analogy. The junction of the zygoma to the articular bone, is in a degree moveable; this, added to its general slenderness and flexibility, allows it to yield to all the motions of the superior mandible.

There are two bones belonging to the head of birds, to which there are none analogous in mammalia. One of these has been called by Dumeril the *square bone*, but improperly, as it is in no instance exactly square, and when its processes are eminent, it is rather of a triangular form. We have chosen, both from its office and situation, to call it the *articular bone*.

This bone is interposed between the articulation of the lower jaw, and the *os temporis*: with both of these it produces a true joint. The articular surface it presents to the temporal bone, is like the two condyles of the occiput of mammalia, and between these the end of the bone contributes to the formation of the cavity of the tympanum. The articular surface next the lower jaw is made of two irregular eminences, placed obliquely across, forming a double pulley. On the outside of this the temporal extremity of the zygoma is attached, and on the inside there is articulated another slender bone, which, from its situation, deserves to be named the *inter-articular bone*. There is a process from the anterior part of the articular bone, which passes up into the orbit, and receives the attachments of muscles.

The *inter-articular bone* is connected by a moveable joint to the articular. It is a small, straight, three-sided bone, slightly

slightly enlarged at the extremities. It is directed forwards and inwards, and at the anterior extremity touches the inter-articular bone of the opposite side: at this place the ends of both are placed against the posterior extremity of the palatine bones, and are hollowed so as to encompass the lower edge of the septum of the orbits, along which they have some degree of motion, when urged forwards by the articular bones.

The effect of this mechanism is, that whenever the inferior end of the articular bone is brought forwards, which is accomplished in a degree by the opening of the lower jaw, but still more by particular muscles, to be hereafter described, the inter-articular bones press against the extremity of the palatine bones, and they communicate the impulse to the whole superior mandible, which being very thin at its junction with the os frontis, suffers itself to be pushed up or elevated from the line it commonly holds, and in this manner the mouth of birds is dilated in part by the motion of the upper as well as the lower jaw.

The *parrot* is remarkable for having a great degree of motion in the upper mandible; in this bird the superior mandible is at all times separate from the frontal bone, they being only connected to each other by a very flexible ligament.

The *inferior mandible* appears to be formed originally of four pieces; two of these correspond with the bones of the inferior maxilla, and the others produce the mould on which the lower part of the bill grows. The formation of the inferior jaw, independent of its connection with the bill, differs very much from that of mammalia. There are no *condyles*, nor any process deserving the name of *coronoid*, and the angle of the jaw is the thickest and lowest part of it. The articulation is made by two depressed surfaces placed on the side of a cavity, into which the posterior pulley of the articular bone slips in the motions of the jaw.

The form of the bones of the mandibles is precisely the same of the horny bill, with which they are covered; except in some *water birds*, the bill assumes more or less of a conic figure; sometimes compressed, sometimes arched, in some cases elongated, in others short, and varying in the degree of sharpness, strength, and solidity. As the diversity, however, which occurs in the mandibles of birds, is an external appearance, and belongs rather to the science of natural history, than to comparative anatomy, it would be improper to discuss the subject in the present article.

The peculiarities of the *fossæ* and *foramina of the face* in birds, depend chiefly upon the form and proportions of the bones.

The *orbital fossæ* are so large, that they appear to occupy the greatest part of the profile of the head of birds. They extend in the skeleton from the roof of the skull to the palate, and communicate with the posterior part of the organ of smell. Cuvier very aptly compares them to the impression which one would conceive might be left by pinching the skull between two fingers, provided it were in a soft state.

The *nasal fossæ* are continuous with the orbital. They open upwards by the two external nares, or nostrils, and below by the posterior nares. The septum nasi proceeds so short a way in the nose, that the nasal fossæ make but one cavity. The external apertures of the nares are found in the bone, at the base of the convex surface of the bill.

The *temporal fossæ* are not crossed by the zygoma. They vary in depth according to the strength of the muscles employed in raising the lower jaw; they are therefore most plain in the rapacious birds, and those with long or heavy bills.

The *spheno-maxillary fissure* can have no existence in birds from the figure and extent of their orbits; neither have they the *internal orbital*, and *sub-orbital foramina*, or the *spheno-palatine canal*.

The *incisive foramina* are small and numerous in the *heron*, *flamingo*, *eagle*, &c. There is but one of a moderate size placed near the base of the bill in the *duck*, the *curassow*, the *cormorant*, and the *spoon-bill*, &c. In the *casowary*, the foramen incisivum is small, and near the end of the mandible, but in the *ostrich* it is of great size. The *stork* has a long slit, into which open an immense number of minute holes.

The *os hyoides* possesses a singular conformation in birds. The body of the bone is in general of a short round figure, somewhat enlarged at its posterior extremity, at which place it is articulated with the two *cornua*. These resemble horns exactly, both in their shape and direction; they are terminated by additional pieces, which form a sort of joint with the principal part of the horn, and generally consist entirely of cartilage. To the posterior end of the body or middle bone of the hyoides, there is articulated a small styloid or dagger-shaped bone, which proceeds directly backwards, and soon terminates in a point. There is also a bone articulated with the anterior extremity of the body of the hyoides, which penetrates the substance of the tongue, and partakes in a certain degree of the form of that organ: it is commonly terminated by a pointed cartilage, which is attached to it by a moveable joint, and is continued to near the tip of the tongue. This bone we should choose to call the *lingual*.

The *os hyoides* and *lingual bone* are singularly formed in those birds which have the power of protruding their tongue to take their food. In the *woodpeckers*, for instance, the cartilaginous extremities of the horns of the hyoides are immensely long, and when the tongue is not projected, are lodged in a groove or furrow, which runs over the whole head, and terminates only at the root of the bill. The *lingual bone* in these birds also is not cartilaginous at its extremity, but is covered with a hard or horny substance, which protrudes beyond the soft parts of the tongue for the distance of about the quarter of an inch, ending in a point, and furnished with a number of sharp barbs, or spiculae, which are moveable in the posterior direction only; so that, like the teeth of some fish, they suffer the insects on which the bird preys to be easily perforated by the end of this instrument, but render it impossible for them afterwards to retreat.

The vertebræ of the different regions of the spine of birds do not bear the same proportion to each other with respect to number that is usual in other animals. The cervical portion in this class is generally composed of a much greater number of vertebræ than any other division of the spine. The length of the neck is in most birds determined by the height of the legs. Those *water birds*, however, which procure their subsistence by fishing, are provided with long necks, and at the same time short limbs, as in the *cormorant*, *divers*, &c. The dorsal vertebræ are usually less numerous than in quadrupeds. The vertebræ of the loins become ankylosed with the bones of the pelvis, and with each other at an early period, and consequently it is difficult to reckon them. The caudal vertebræ are most numerous in those birds which make the greatest use of the tail, such as the *swallow*, *woodpecker*, *ostrich*, &c.

The following table, which is extracted from Cuvier's Lectures on Comparative Anatomy, exhibits the variety which exists with respect to the number of the vertebræ in many species.

B I R D.

TABLE of the Number of the Vertebra in Birds.

SPECIES.	Ver. of the neck.	Ver. of the back.	Ver. of the sacrum.	Ver. of the coccygis.
Vulture	13	7	11	7
Eagle	13	8	11	8
Bald-Buzzard	14	8	11	7
Sparrow-Hawk	11	8	11	8
Common-Buzzard	11	7	10	8
Kite	12	8	11	8
Great-Horned-Owl	13	7	12	8
Common-Owl	11	8	11	8
Fly-Catcher	10	8	10	8
Black-bird	11	8	10	7
Tanager	10	8	9	8
Crow	13	8	13	7
Magpie	13	8	13	8
Jay	12	7	11	8
Starling	10	8	10	9
Gros-beak	10	7	12	7
Bullfinch	10	6	11	6
Sparrow	9	9	10	
Gold-finch	11	8	11	8
Titmouse	11	8	11	7
Lark	11	9	10	7
Red-breast	10	8	10	8
Swallow	11	8	11	9
Goat-sucker	11	8	11	8
Humming-bird	12	9	9	8
Hoopoe	12	7	10	7
King's-fisher	12	7	8	7
Wood-pecker	12	8	10	9
Toucan	12	8	12	more than 7
Parrot	11	9	11	8
Pigeon	13	7	13	7
Peacock	14	7	12	8
Pheasant	13	7	15	5
Turkey	15	7	10	5

Scoter, or Black Diver	1	9	14	7
Merganser	15	8	13	7
Grebe	14	10	13	7

The *cervical vertebrae* are joined to each other by a mode of articulation which admits of very free motion in two directions;—laterally, and backwards or forwards. This depends upon the form of the articular surfaces of the bodies of the vertebrae, which consist of two portions of a cylinder applied crossways with respect to each other, and both a little hollowed for their mutual accommodation. The cylinder on the inferior part of the vertebrae, performs by its revolution the motion to either side; and when that of the superior part revolves, the neck is bent either backwards or forwards. The cylinders at the top of the neck admit of motion forwards; but those of the middle and inferior part of the cervical spine are incapable of performing a free motion forwards; as one contains a slight depression on its anterior part, which receives the edge of the other. The neck of birds, therefore, possesses in the contracted state, or when at rest, somewhat of the figure of an S, which is accompanied with several advantages to these animals. They are enabled by it to throw the weight of the neck and the head more over their centre of gravity, without which some species would be unable to preserve their equilibrium; and by combining the S like motion with that to each side, birds acquire a greater degree of flexibility in the neck than is possessed by other animals; they can touch every point of their own body with the bill, and thus supply the want of the prehensile faculty of the superior extremity or the tail, of which they are deprived by their peculiar mode of progression.

The surfaces of the articular processes lie nearly in the direction of the bodies of the vertebrae, but in some parts have a degree of obliquity conformable to the S like shape of the neck.

The spinous processes are only to be observed on the superior and inferior portions of the cervical spine, where they exit both on the anterior and posterior parts of the vertebrae. In birds with long necks there is a fossa on each side of the posterior spinous processes, for the attachment of the cervical ligament, or *ligamentum nuchæ*. This substance is to be observed perhaps in all birds, but is very remarkable in the *stork*, *swan*, *cassowary* and *ostrich*. In the last bird it is nearly as strong as it exists in the larger quadrupeds: the same kind of ligament is also interpolated between the spinous processes of the dorsal vertebrae.

The transverse processes of the vertebrae of the middle of the neck spread forwards, and send down a styloid process of some length. These give attachment to muscles, and form in some birds a sort of canal on the anterior part of the neck, which contains the two carotid arteries. The anterior styloid processes are little observable in the *raptacious* and *passerine* tribes, the *parrot*, &c.; but are usually very marked in the long-necked birds.

The *dorsal vertebrae* of birds have scarcely any motion, in order

order that the trunk of the body may not be affected by the motions of the wings in flight.

Their spinous processes are commonly ankylosed with each other, which sometimes occurs also with respect to the transverse processes. In the *ostrich* and *casowary*, the processes of the dorsal vertebrae are distinct, and possess a degree of motion from which, however, these birds cannot suffer any inconvenience, as they do not fly.

The *caudal vertebrae* have spinous processes on both the anterior and posterior surfaces; and the transverse processes are usually very prominent. The last bone of the tail, is, in most birds, of a plough-share shape for the attachment of the quills. It is small and conic in the *new holland ostrich*, and *casowary*; and in the *peacock*, it is thin, oval, and situated horizontally. It is wanting in a variety of the domestic cock found in America.

The *sternum* forms one of the most characteristic bones in the skeleton of birds. It is a very broad thin bone, covers the anterior part of the common cavity, like a buckler, and produces from its middle line, in every bird which is capable of flying, a thin plate of bone, which resembles very much the keel of a ship; but it is most prominent at its anterior part. The upper edge of the sternum presents two narrow depressions, which receive the ends of the two clavicles; and to the most anterior point of the keel the fork-shaped bone is commonly attached. The posterior edge is thin, and in most species, contains a space on each side, which is filled with membranes. In the *accipitres*, *parrot*, and most *aquatic* birds, this is an oval hole; but in the *gallinae* it is an oblong vacancy. The keel appears to be added to the sternum, merely for the attachment of the great pectoral muscle. Accordingly, we find its projection is proportioned to the necessity there is for using this muscle during flight; and in the *ostrich* and *casowary*, which do not employ their wings as organs of locomotion, the keel is absent, and the sternum is round and smooth on the external surface, and is very small in proportion to the magnitude of these birds.

The *ribs* of birds have been divided, like those of mammalia, into true and false, or as Vic d'azir has termed them the *sterno-vertebral* and *vertebral*. The true ribs are made of two pieces, which are each composed of bone: the posterior portion is affixed to the spine by means of two branches, of which one is articulated with the body, and the other with the transverse process of the same dorsal vertebra. The anterior piece is articulated by one end, with the lateral edge of the sternum; and by the other, to the end of the vertebral portion. The internal extremities of the ribs, being distinct bones, deserve to be called *sternal ribs*, which term we have employed in other parts of this article. Most of the true ribs are furnished about their middle, with a thin osseous process, which proceeds obliquely backwards from the posterior edge of one rib, and overlaps the one next behind it, and sometimes even goes on to cover two ribs, as in the *colymbus cristatus*. The sternal and vertebral portions of the true ribs form, at their junction, an angle which points backwards, and is very acute in the first ribs, which proves that the thorax of birds is chiefly dilated by the anterior part of the sternum, being carried forwards from the dorsal spine; at which time, the moveable angles of all the ribs become very obtuse. These angles are scarcely observable in the *struthious* birds. Their ribs assume very much the figure of those of mammalia.

The number of the sterno-vertebral ribs is liable to vary. There are, on each side, four in the *cuckoo* and the *casowary*; five in the *crow*, *african ostrich*, and *stork*; six in the *bittern*;

seven in the *eagle*, the *buzzard*, the *owl*, the *crane*, and the *duck*; eight in the *crested grebe*, and several other water-fowl; and nine in the *swan*.

The *vertebral*, or *false ribs*, are in most birds placed at the anterior part of the thorax, which is the reverse of what is observed in mammalia. When there are any of these ribs situated posteriorly, they are only one or two pair, and imperfectly formed; there are two pair in the *struthious* birds, which do not project far from the spine.

The *bones of the pelvis* become consolidated together at a very early period. Their original parts are therefore very difficult to distinguish. The portion corresponding to the *os ilium* bears some resemblance to that bone in mammalia; but the ischium and pubis cannot be recognised by their figure, and are only to be known by their relation to the different foramina. There is a very long, slender bone, originally connected to the ilium, on the fore-part of the acetabulum, which supplies the place of the *pubis*. This bone runs parallel to the anterior part of the ischium, with which it is occasionally joined towards its extremity, but never unites with the bone of the opposite side, except in the *ostrich*, in which bird the bones of the pubis are broad at their symphysis, and stand a little forwards, producing something of the appearance of the pelvis of mammalia. The pubis unites with the ischium in the *accipitres* for a considerable way, and leaves a distinct hole analogous to the *foramen ovale*; and the space between these bones possesses in all birds, at the anterior part, the traces of this foramen.

The *ischium* is commonly united to the sacrum and back of the ilium, by the part which corresponds to the ischiadic spine; consequently the ischiadic foramen is complete in the skeleton of birds. In the *ostrich* and *casowary*, however, the ischium is separate from the sacrum, and is a long, slender styloid bone, like the pubis. There is no tuberosity to the ischium, that part being thin and extended, except in the *ostrich*, where it becomes somewhat enlarged. The ischium appears to be joined to the pubis in the *new holland ostrich*, by the intervention of another short bone.

The *bones of the shoulder* are very peculiar in birds; besides the clavicles and scapulae, there is an additional single bone, called the *fork*; it usually possesses the figure of a V; the point is attached to the most anterior part of the keel of the sternum, and the ends of the branches are secured by a ligament on the inside of the dorsal extremities of the clavicles, and also to the posterior process of the scapulae, which is analogous to the acromion. The fork frequently approaches more to the figure of an U than a V. Its angle is also often at some distance from the sternum, to which it is bound by a ligament. In the *gallinae* it terminates in a thin plate, from which a ligament is extended to the keel of the sternum. As a general observation, it may be stated, that the fork is strong and elastic, and its branches wide, arched, and carried forwards upon the body, in proportion as the bird possesses strength and rapidity of flight; and accordingly, the *struthious* birds, which are incapable of this mode of progression, have the fork very imperfectly formed. The two branches are very short, and never unite in the *african ostrich*, but are ankylosed with the scapulae and clavicle. The *casowary* has merely two little processes from the side of the clavicle which are the rudiments of the branches of the fork. In the *new holland ostrich*, there are two very small thin bones, which are attached to the anterior edge of the dorsal end of the clavicles, by ligament; they are directed upwards towards the neck, where they are fastened to each

other by means of a ligament, and have no connection whatever with the sternum.

The *clavicle* is a straight bone in birds; it does not lie in a transverse direction with respect to the trunk of the body, but proceeds upwards and forwards towards the lower part of the cervical spine; and in proportion to the length and projection of the clavicle, the bird possesses strength of wing and activity of flight. The clavicle at its articulation with the sternum is thin and broad; but the rest of the bone is of a round shape; it produces a process from the posterior part of its dorsal extremity, which is united to the head of the scapula, and in conjunction with it forms a depression analogous to the glenoid cavity, although not of the same figure. The inside of the extreme part of the dorsal end of the bone, is joined by ligament with the branch of the fork, as already mentioned.

The clavicles of the *struthio* are remarkably short, and are ankylosed with the scapulae at least.

The *scapulae* are two long, plain bones, with sharp edges, resembling, in a great degree, the blade of a knife; they lie parallel to the dorsal spine, and have no processes, except the one which contributes with the clavicle to form the cavity for lodging the head of the humerus; and a little eminence opposite to this, which seems analogous to the *acromion*, and is joined to the end of the branch of the fork. The scapulae, like all the other bones of the shoulder, are very short in the *struthio*, not passing beyond the first two or three ribs; although in many other birds these bones reach as far as the pelvis.

The *humerus* is a round, smooth bone, more or less enlarged, and flattened at the extremities; the surface by which it articulates with the fossa in the scapula and clavicle, is at the very end of the bone, and is formed of a portion of a cylinder, instead of a sphere, which is most suitable to the motions of the humerus in birds, they being almost confined to the elevation and depression of the wing. The external tuberosity of the humerus is very small; but the spine which leads from it is greatly elevated in most species of birds. The internal tuberosity is, on the other hand, remarkably large, and furnishes a process at its upper part, which corresponds, in some respects, with the coracoid process of the scapula in mammalia. The humerus is long, in proportion to the other bones of the wing in the *African ostrich*, and takes the curvature of the bird's body. It is extremely short and small, and without processes, in the *Neco Holland ostrich*, and *casuvaria*.

The humerus is connected with the bones of the fore arm by an articular surface, similar to that of the human subject.

The *radius* is usually a much more slender bone than the ulna, with which it is never observed to be ankylosed.

The *ulna* exhibits no remarkable processes; it forms a pulley on its lower end. These two bones are flat in the *manchot* (*apterositta*), and are joined by an articulation which permits motion in several directions, with two tubercles, one above, and the other below the anterior edge of the humerus. The wing of this bird, both in its structure and offices, resembles a fin. The ulna and radius are nearly of an equal size in the *struthio*; they are both very small, and have but little motion on the humerus.

There are but two *carpal* bones in birds; one is applied to the end of the radius, and prevents the motion of the lower part of the wing beyond the line of the radius; the other moves a little upon the end of the ulna, to which its form is adapted. It has often a little process from its lower edge, which is analogous to the *os pisiforme*. The carpal bones are obliterated in the *struthious* bird.

The *metacarpus* consists of two bones, which are united at their superior part by ankylosis for some way. At this

place there are some eminences which appear like the remains of the second row of carpal bones folded together. The articulation of the metacarpus with the carpus is the segment of more than the half of a pulley, which is grooved in the middle, and revolves within a corresponding surface of the lower carpal bone. This motion, for the convenience of description, is called flexion and extension; but it is in strictness a lateral movement back upon the ulna, and accompanied with a degree of rotation, by which the concave figure of the wing is lost in the very action of folding it. There is a styloid process on the upper part of the radial side of the metacarpus, which gives attachment to a small pointed bone, supplying the place of the *third*. A similar bone is affixed to the extreme end of the small branch of the metacarpus, and corresponds to the *little finger*. The *principal*, or *fore finger*, which furnishes the wing, is articulated with the large or radial branch of the metacarpus. It consists of two phalanges, and the first exhibits marks of having been originally two bones. The two pieces of the metacarpus are to be seen in the *African ostrich*, as also the three fingers; each of which is furnished with a hook, which is covered with a horn, like a claw; but in the *Neco Holland ostrich* the metacarpus is a single bone, and there is but one finger, which is also terminated with a claw. All the bones of the hand are compressed into thin plates in the *manchot*.

The *thigh-bone* of birds has nothing very peculiar in its form; it wants the small trochanter; it is singularly short, in proportion to the other parts of the limb, in such birds as have long legs; it is longest in the *accipitres*, and shortest in some water-birds. The femur is strong in all the *gallinae*; and in the *struthio* it is of an immense thickness; it is bent in the *cormorant* and the *little grebe*.

There is a certain portion of the ligament of the extensor muscles of the leg converted very early into bone; and this seems in general to supply the place of the *patella*; it is usually preserved in skeletons.

The *tibia* resembles in its form the same bone in mammalia. There are several prominent edges on the fore part of its head for the attachment of muscles. The lower end of the tibia forms a pulley with a groove along the middle. The head of the tibia is prolonged in a remarkable manner upon the thigh, in the *grebes* and the *diver*.

The *fibula* is a very small bone, and is soon ankylosed to the side of the tibia.

The *tarsus* and *metatarsus* consist, in the adult bird, but of one bone; it exhibits, however, grooves corresponding to the divisions which existed between its several pieces when it was first formed. These are strongly marked in the long-legged birds, and shew that the metatarsus contained originally as many bones as there are principal toes. There is usually also a prominence on the posterior part of the head of the bone which represents the *os calcis*. The inferior extremity of the metatarsal bone produces a process shaped like a pulley for the articulation with each of the principal toes.

There are three bones in the composition of the tarsus and metatarsus of the *manchot* separate from each other in the middle; and therefore these birds are plantigrade, or walk upon the metatarsus as well as the toes.

The extraordinary length of limb which belongs to some kinds, as the *struthions* and *swallowing birds*, depends upon the extent of the tibia and metatarsal bone.

The *fork*, and some others of the *grolle*, which sleep standing on one foot, possess a curious mechanism for preserving the leg in a state of extension, without any, or at least with little muscular effort. There arises from the fore part of the head of the metatarsal bone a round eminence, which passes up between the projections of the pulley on the

anterior part of the end of the tibia. This eminence affords a sufficient degree of resistance to the flexion of the leg to counteract the effect of the oscillations of the body, and would prove an insurmountable obstruction to the motion of the joint, if there were not a socket within the upper part of the pulley of the tibia, to receive it when the leg is in the bent position. The lower edge of the socket is prominent and sharp, and presents a sort of barrier to the admission of the eminence, that requires a voluntary muscular exertion of the bird to overcome, which being accomplished, it slips in with some force like the end of a dislocated bone. Dumeril and Cuvier have described a similar apparatus to this in the knee of the *stork*; but they must have confounded, in an unaccountable manner, the one joint with the other; for the articulation of the femur with the bones of the leg in the common *stork* (*ardea alba*), certainly exhibits nothing peculiar in its structure. See Plate VIII. in the *Anatomy of Birds*. Fig. 1. represents the anterior part of the articulation of the tibia with the metatarsus in the *stork*; *a* the tibia, *b* the metatarsal bone, *cc* the prominent edges of the pulley on the end of the tibia, *d* the round eminence of the head of the metatarsus, *e* the socket in the tibia, which receives the eminence during the flexion of the joint.

The bones of the toes vary in number, increasing from the inner to the external toes. Birds with four toes have the number of the phalanges in the following order, 2, 3, 4, 5; those with three toes have them, 3, 4, 5, except the *casowary* and the *New Holland ostrich*, which have four joints to each toe. The *African ostrich* has only two toes, and four phalanges to both. Most birds have the three principal toes situated before, and the pollex attached to the inner and back part of the metatarsal bone near its extremity. The *lustard*, *casowary*, *New Holland ostrich*, the *plover*, the *oyster catcher*, and the *long legged plover*, have but three toes; and the *albatross*, *petrel*, and *penguin*, want the pollex. All the *scansores* have their toes opposed to each other, two behind and two before.

It would have rendered the description of the bones tedious and confused, to have given frequent references to the plates which represent them; the reader, therefore, will have occasion to contemplate the relation the different figures bear to each other; and to facilitate such comparison, similar letters are employed to indicate similar parts in each of the skeletons chosen to illustrate the subject.

When birds transport themselves from one place to another, it is most commonly by the act of flying; which consists in the successive elevation and depression of the wings; the latter motion being performed with so much force and velocity, as to compress a volume of air, the re-action of which is sufficient to impel forwards the whole body of the bird. The various kinds of flight depend upon the different ways of employing the wings, and the habits and œconomy of the individual, which it is the business of the naturalist to point out. Many birds are capable of using other modes of locomotion besides flying, for which their structure is equally well adapted; for instance, some tribes almost constantly inhabit the water, and swim with the greatest ease; others walk or run with the greatest rapidity; and others transport themselves chiefly by the effort of climbing. We have, therefore, selected a skeleton to exhibit the organs employed in each of these species of locomotion. See Plate VIII. in the *Anatomy of Birds*. Fig. 2. represents a skeleton of the *New Holland ostrich*, which was brought into this country by an ingenious young surgeon, Mr. Langstaff. It seems to partake of the structure of both the *casowary* and *African ostrich*, but it bears the greatest likeness to the latter; and therefore we have called the bird an ostrich, although it

has hitherto been considered by some naturalists as a *casowary*. This skeleton affords the best example of a *running* bird, which is at the same time incapable of flight. The sternum and bones of the wing are small; the centre of gravity is thrown fairly between the legs; and the inferior extremities are long, and of an immense disproportionate strength. Fig. 3. of the same plate exhibits the skeleton of the *lark*, which, as being a bird of high flight, forms a striking contrast with fig. 2.

Plate IX. of the *Anatomy of Birds*, contains the skeletons of a *climbing* and a *swimming* bird. Fig. 1. is the skeleton of the *parrot*. The body is round and contracted; the neck short, strong, and flexible in different directions; the sternum and bones of the shoulder rather small; but its chief characters are the long thigh, and very short metatarsus, furnished with the climbing toes; by which means the bird can grasp any foreign substance, and apply the feet to any part of its own body, after the manner of the prehensile members of other animals.

Fig. 2. of Plate IX. shews the skeleton of the *crested grebe* (*colymbus cristatus*). The neck is much bent; the parts of the upper extremity rather small; the ribs strong, and reaching far back; the sternum long; and the body possesses very much the form of a boat; the inferior extremity situated far behind, and the thigh bone very short, and the toes long and expanded; all which circumstances are necessary to the performance of the actions of swimming and diving with facility.

The separate parts of the skeletons, in Plates VIII. and IX. in the *Anatomy of Birds*, are indicated as follows.

Parts composing the head; *a* the occiput, *b* parietal bone, *c* os frontis, *d* temporal bone, *e* os lacrymale, or superciliary bone, *f* nasal bone, *g* superior maxilla, *h* malar bone, *i* bone of the upper mandible, *k* palatine bone, *l* septum of the orbits, *m* articular bone, *n* inter-articular bone, *o* zygoma, *p* inferior maxilla, *q* bone of the lower mandible, *r* external nares, *s* deficiency in the septum of the orbits where the optic foramina open, *t* temporal fossa, *u* spongy bone in the organ of smell.

Parts of the spine and trunk: *a* cervical vertebræ, *b* their transverse processes, *c* the styles which descend on the fore-part, *d* articular processes, *e* posterior spinous processes, *f* spines on the anterior part of the bodies of some of the vertebræ, *g* dorsal vertebræ, *h* sacral vertebræ, *i* vertebræ of the tail, *k* the last, or caudal bone, *l* os ilium, *m* ischium, *n* pubis, *o* foramen ovale, *p* ischiadic foramen, *q* vertebral or false ribs, *r* the true ribs, *s* the sternal portions, *t* intercostal processes, *u* the part of the sternum next the body, *v* the keel, or projecting part, *x* deficiency at the lower part of the sternal bone.

Parts belonging to the wing; *a* the fork, *b* the clavicle, *c* the scapula, *d* the humerus, *e* its inner tuberosity, *f* the external tuberosity, *g* the spine for the attachment of the deltoid and pectoral muscles, *h* the ulna, *i* the radius, *k* the carpal bone on the radial side, *l* the ulna carpal bone, *m* the head of the metacarpus, *n* the large branch, *o* the smaller one, *p* the style of the metacarpus, *q* the pollex or thumb, *r* the little finger, *s* the principal or fore finger.

The parts of which the lower extremity consists; *a* the femur, *b* its single trochanter, *c* the tibia, *d* the elongation of the head of the tibia which occurs in the *grebe*, &c. *e* the fibula, *f* the metatarsus, *g* the prominence at the heel, *h* the pollex, or back toe, *i* the principal or anterior toes.

Muscles.

When the writing of the present article was begun, it was intended to give a full description of the muscles of birds; but as the subject has already extended beyond the length

length that was expected, and if this were done, would exceed the bounds usually allotted to a single article, we shall only point out the most striking peculiarities in the muscular system, and correct some errors into which other writers have fallen in their accounts of this part of the anatomy of birds.

The muscles which move the lower jaw, do not differ essentially from those of mammalia. There is no marked distinction between the *masseter* and *temporal muscles*; they form one mass which arises from the temporal fossa and inferior part of the orbit, passes under the zygoma, and covers the side of the lower jaw from the joint to the commencement of the bill.

There is a tendon which lies over the muscles on the side of the jaws, usually of a triangular figure; it is attached to the inferior bony portions of the orbit, connects them to each other, and thus completes the margin of the orbit. It is affixed to the protuberance on the outside of the lower jaw near the joint, and seems to prevent the mouth opening beyond a certain distance.

Birds have none of the *muscles of the face*, as they have no soft parts for them to move.

The lower jaw is depressed by a muscle which arises by two portions, one from the hollow behind the side of the occiput, the other from the surface behind and below the external meatus auditorius; both are inserted upon the back of the lower jaw. This muscle, although so unlike the *digestivus*, supplies its place, and fulfils its office.

There are three muscles for moving the upper jaw, which are quite peculiar to birds. The *first* is of a radiated or fan shape; it arises from the septum of the orbit, and passing obliquely backwards, is inserted by tendon into the external surface of the end of the inter-articular bone, just when it becomes joined to the articular. By pulling the posterior end of the inter-articular bone upwards, the opposite end is pushed forwards, which produces the elevation of the upper jaw in the manner already described.

The *second* is a short thick muscle, arising from below the posterior part of the orbit, and before the external meatus auditorius, and inserted into the inner surface of the body of the articular bone and its anterior process, where it joins the inter-articular bone; it elevates the posterior end of the inter-articular bone, and thus raises the upper jaw.

The *third* muscle is for depressing the superior jaw; it is of a long taper shape, has one attachment to the inside of the lower jaw, and then becomes affixed to the inside of the inter-articular bone, the internal part of the pterygoid process, and sends a small tendon to the integument of the palate, just where the horny covering of the mandible commences. It is difficult to distinguish it from the pterygoid muscle, which appears to aid it in the depression of the superior mandible.

The tongue enjoys much less variety of motion in birds than in mammalia; it is only capable of being protruded, retracted, turned to each side either directly or obliquely, slightly rotated, and depressed at the point. There are a great many muscles however employed in the performance of these motions; some of these act upon the os hyoides, and others upon the lingual bone.

The *first* is analogous to the *stylo-hyoideus*; arises from the upper and back part of the lower jaw, divides into two slips; one goes to the styloid bone of the os hyoides, where it meets its fellow: the other slip passes to the inner part of the middle bone or body of the hyoides; it retracts the tongue.

The *second* corresponds to the *mylo-hyoideus*; it is a broad thin muscle, proceeds from the inside of the lower jaw, ex-

cept its posterior edge, which comes from the outer part of the jaw; it is inserted upon the concave side of the cartilaginous extremity of the horn of the os hyoides, around which it forms a muscular sheath; its use is to protrude the tongue.

The third muscle appears to answer to the *genio-hyoideus*; it comes from the superior edge of the lower jaw internally, and becomes attached to its fellow on the other side upon the styloid bone of the hyoides; protrudes the tongue a little from the obliquity of its direction, and seems to commence the actions of deglutition by elevating the parts in the bottom of the mouth. We did not observe this muscle in the *cock*.

The fourth muscle of the tongue is extended from the horn of the os hyoides at its root, to the styloid bone, where it joins the muscle of the opposite side. They approximate the horns of the hyoides, during the protrusion of the tongue.

The fifth is a very small muscle, lying along the internal surface of the horn of the os hyoides; it sends a delicate tendon to the under surface of the lingual bone, depresses the point of the tongue, and if it acts singly, turns the tongue.

The sixth is a little short muscle, which arises from the end of the middle bone of the hyoides, and is affixed to the under part of the lingual bone; depresses the tip of the tongue, and raises the base. This is a single muscle.

The seventh muscle lies along with its fellow upon the anterior surface of the superior larynx; it is attached to the root of the lingual bone. Its uses are to depress the base of the tongue, and thus elevate the point, and to retract the tongue while in the mouth.

The eighth is short; arises from the junction of all the bones of the os hyoides on the lower surface, and is inserted into the upper and outer corner of the base of the lingual bone. It brings the tongue into a straight line, after the other muscles have depressed the tip.

The ninth muscle is the last; it is very minute, and passes from the base of the lingual bone to the very tip of the cartilage; depresses the point of the tongue without elevating its root.

The muscles which protrude and retract the tongue, are remarkably large in the *woodpeckers* and *wrynecks*.

The *muscles which move the head and neck* are even more complicated in birds than in other animals. Most of them have their attachments so numerous and intermixed, that no description can convey an adequate idea of them.

The *longus colli* begins in the thorax on the anterior spines of the dorsal vertebrae; its fasciculi go from the anterior part or the cervical vertebrae to the ilyles and transverse processes; and their tendons are longest at the superior and inferior part of the neck.

The *rectus capitis major anticus* is continued from the head as low as the fifth vertebra of the cervical spine.

On the posterior part of the spine there is a small muscle which seems to represent the superior part of the *trapezius*; it is extended from the transverse processes of the four first cervical vertebrae to the back of the occiput; it brings the head backwards and to one side.

There are a great number of fasciculi interposed between the transverse and articular processes at the back of the neck. These tendons pass over several vertebrae before they are inserted on the middle of the neck, which is the part most bent backwards.

A muscle which has been considered analogous to the *cervicalis descendens*, is the chief extensor of the neck of birds. It arises from the spine of the back, opposite to the se-

cond rib by tendon, which, on coming upon the neck, receives seven slips of muscle, which descend from the spines of the seven inferior cervical vertebræ. The muscle then proceeds on the neck as a distinct slip, and at the upper part produces three tendons, which go to the back of the articular processes of the second, third, and fourth cervical vertebræ. These tendons receive muscular slips from the back of the spine as low as the seventh vertebra, or where the other slip began to descend. The ascending fasciculi furnish the tendons to the fifth and sixth vertebræ, and to the atlas. This muscle is enabled, on account of its descending and ascending fasciculi, to extend the neck even while the head is erected. Cuvier describes the muscle somewhat differently in the *heron* and *buzzard*. The above account is from the *goose*.

There is a curious shaped muscle along the inside of the preceding, which Cuvier compares to the *bivont r cervicis*. It commences by a slender tendon from the spinous process of the first dorsal vertebra, becomes fleshy at the lower part, tendinous along the middle, and again fleshy near the head, and is inserted into the occiput. Although it extends the whole length of the neck, it is so slender that its tendon is not thicker than a-piece of twine or thread. It affords in the extension of the neck and elevation of the head.

The *trachelo-mastoideus* arises in birds from the anterior part of the second, third, and fourth cervical vertebræ, and is inserted upon the side of the occiput.

The *complexus* proceeds from but a few of the articular processes of the neck; and the *splenius* does not exist in birds.

Cuvier describes three *recti capitis posteriori*; but these muscles do not deserve to be so called.

The first, which he names the *rectus maximus*, arises from the spine of the dentata, and is inserted into the side and back of the occiput. It brings the head backwards, and to one side, and resembles in figure and office the *splenius capitis*.

The second, or *rectus major posterior*, proceeds obliquely from the spine of the dentata, under the preceding, to the depression on the back of the occiput.

The third, or *rectus minor*, is only a few fibres mixed with the ligament which connects the head with the spine.

The *muscles of the back* consist of a few fleshy fibres intermixed with portion of tendon, which are mostly ossified in full grown birds; they lie on each side of the dorsal spine, which they strengthen but cannot move.

The *muscles of the tail* are distinct, and generally large; some are calculated to raise the tail, some to depress it, others to move it laterally, and others again to unfold the quills of this part.

The first is the *levator coccygis* of Vic d'Azir; it arises from the back of the sacrum and the transverse and spinous processes of the first caudal vertebra, and sends distinct tendons to each of the spinous processes of the tail and the caudal bone. There is a fleshy slip also accompanying the last tendon. This muscle, as its name implies, elevates the tail.

The second, or *depressor coccygis* of Vic d'Azir, is situated within the pelvis, and arises from the end of the sacrum and the ischium, where they join; also from the transverse processes of the bones of the tail. It is inserted by tendons into the spinous processes of the under surface of the caudal vertebræ, and distributes a number of muscular fibres in different directions on the basis of the lateral quills. This muscle depresses the tail, and appears also, from its attachment to the ligament of the quills, to be capable of converging them.

The third arises from the posterior edge of the anterior part of the pubis, and the tendon covering the lower part of the belly, and is inserted on the base of the ligament which sustains the lateral quills. When this muscle acts singly, it brings the tail downwards and to one side; if, with its fellow, it depresses the tail directly; but at all times it tends to spread the quills of the tail.

The fourth is the *motor lateralis coccygis* of Vic d'Azir, who describes its origin different from what we have observed it to be. It arises from the last transverse process of the sacrum and the first of the coccyx, and it turns round to be inserted in common with the preceding muscle upon the root of the ligamentous substance which connects the lateral quills. It moves, when acting alone, the tail to one side; but combined with its fellow and other muscles, unfolds the quills of the tail in the manner of the sticks of a fan.

The fifth muscle is in part covered by the third; it is attached to the whole of the posterior margin of the pelvis, except the extreme portion of the pelvis, and in the *goose* spreads even upon the parietes of the belly round the anus; it then proceeds to be inserted, along with the depressor coccygis, on the under part of the caudal or last bone of the tail. Its office is, with its fellow and the depressor, to lower the tail.

The sixth is the *cruro-coccygeus* of Vic d'Azir; it arises by thin tendon from the inner and back part of the thigh bone, where it is conjoined with one of the muscles of the thigh. It is inserted, along with the other muscles of the tail, into the under part of the caudal bone. This muscle draws the tail to one side; but when its action is combined with its fellow, it is the most powerful flexor or depressor of the tail.

The *muscles of the trunk* deviate more from the structure of mammalia than the muscles of birds do in general, and have been but very imperfectly described by Cuvier and others.

The *scaleni* are merely two slips of muscle, which descend from the next transverse process upon the first and second ribs.

The *triangularis sterni* takes its origin from the superior corner of the sternum and the four superior ribs, where they join this bone, and is inserted into the moveable angles of the four superior ribs after the first. It compresses the superior part of the thorax, and thus brings forwards the lower end of the sternum; it is, therefore, a muscle of expiration.

The abdominal muscles consist of three layers.

The first represents the *obliquus externus*, although its fibres are arranged transversely. It arises from the edge of the ilium and pubis by a very thin tendon, and from the lower edges of the ribs, by distinct tendinous processes, and is inserted into the side and lower edge of the sternum, and the middle line of the belly, to unite with the muscle of the opposite side. From this muscle passing over the moveable angles of the ribs, its action influences the whole cavity of the body; for at the same time that it compresses the abdomen, it raises the anterior part of the sternum, by drawing the posterior part backwards, and thus dilates the thorax, and becomes a muscle of inspiration, explaining by this means the effect we have already represented in inspiration to produce upon the abdominal air-cells.

The second is the *obliquus ascendens*; it is made of two portions, the one a little overlapping the other; the anterior is analogous to the *rectus abdominis*, and arises from the pubis and middle line of the belly; the other portion arises from the edge of the ilium and lowest rib. The fibres of each portion ascend in their proper directions to be inserted on the lower edge of the sternum, and the tendon filling the

the space between the ribs and the sternum. This muscle, like the preceding, diminishes the abdomen, and dilates the anterior part of the thorax.

The third layer answers to the *transversalis abdominis*. It proceeds from the osseous margin of the abdomen to the middle line, where it meets its fellow. They consist of separate fasciculi at the superior part; and the fibres are collected round a point in the centre, where the yolk passed into the belly of the chick.

There is a very thin slip of muscle, which crosses the lowest part of the belly; it is situated superficially, and lies over several of the muscles of the tail. In the *goose* it arises from the ischium, where that bone joins the pubis; and in the *fowl* it is only attached by cellular membrane to the surface of the muscles of the thigh. It is inserted, in both cases, on the side of the anus, which it seems designed to dilate.

We have observed in the *fowl* two very slender fasciculi of muscle to descend from the side of the rectum, one to the ligament supporting the quills of the tail, the other to the inside of the pelvis. They are both probably intended to produce the eversion of the intestine during coition.

The muscles belonging to the wing do not differ in their arrangement and structure from those of the anterior extremity of mammalia so much as might be supposed, considering how little these members resemble each other in their functions.

The *latissimus dorsi* arises only from the spines of the dorsal vertebrae; it resembles, however, the muscle of the same name in mammalia.

A muscle, analogous to the inferior portion of the *trapezius*, is observed at the shoulder. It comes from the spinous processes of the three last cervical and all the dorsal vertebrae, and is inserted into the inner and back part of the fork and posterior edge of the scapula. We have not perceived the distinction of this muscle into two parts on the shoulder, as stated by Cuvier.

The *ferratus major anticus* is only inserted into the point of the scapula. This muscle has been called by Vic d'Azir the *subscapularis*.

The *costo-scapularis* of Vic d'Azir goes from the first ribs to the neck of the scapula. It appears to be analogous to the *pectoralis minor* of the human subject.

The *rhomboides* is not divisible into *major* and *minor*. It arises, as usual, from the spine, and is inserted in the posterior edge of the scapula.

A muscle, analogous to *levator scapulae*, arises by three slips from the transverse process of the last cervical vertebra and the first and second ribs. It is inserted into the middle of the scapula, which it elevates and draws backwards. The motions of the scapula are necessarily very limited from its mode of connexion with the neighbouring bones; and its rotation is restrained by a ligament which joins the point of the scapula with the dorsal spine. It is requisite the bones of the shoulder should be kept very steady during flight.

There are three pectoral muscles.

The *pectoralis maximus* of Vic d'Azir might be called, with more propriety, the *depressor ale magnus*. It arises from the whole of the body and keel of the sternum, except a certain portion of the anterior surface occupied by the next muscle over which it lies, and from the side of the fork and the last ribs, and is inserted into the spine on the outside of the humerus, where it is connected by ligament with the deltoid muscle. The *pectoralis maximus* has commonly more strength than all the other muscles of the body united, which is required to accomplish the depression of the wing in opposition to the whole weight of the bird during flight.

The *pectoralis medius* of Vic d'Azir might be called the *levator ale*. It is affixed to the fore part of the body and keel of the sternum, the side of the clavicle, and the membrane which fills the interspace between that bone and the fork. It sends its tendon over the head of the scapula through the pulley formed by all the bones of the shoulder, to be inserted on the external tuberosity of the head of the humerus. By means of the pulley it elevates the humerus, and consequently the wing; and from occupying the lower part of the chest, the weight is kept in the situation most convenient for the bird during flight.

The *pectoralis minimus* of Vic d'Azir, or *depressor ale minor*, arises from a portion of the sternum behind the articulation of the clavicle, and from the inside of the internal extremity of the clavicle. It is inserted under the head of the humerus; depresses the wing, and brings it close to the body.

The *subclavius* is extended from the inside of the sternal extremity of the clavicle to the adjoining part of the internal surface of the sternum. It is impossible to conceive the use of this muscle, unless it be to strengthen the joint, as its attachments are incapable of motion towards each other. There are muscles analogous, as much as the form of the bones will permit, to the *subscapularis*, *teres major* and *minor*, *supra spinatus*, and *infra spinatus*.

Cuvier describes two little muscles which come from the inside of the clavicle to the head of the humerus. We have observed a muscle in the *fowl* which appears to correspond to one of these; it arises from the inner surface of the clavicle, and its joint with the sternum, passes over the first rib, and is affixed to the top of the inner tubercle of the head of the humerus. It rotates the wing inwards, when it has been spread in flight. The lower edge of this muscle, and the inside of the *teres major*, produce a most delicate tendinous cord, or fibre, which descends on the back of the upper arm, and is lost amongst the ligaments of the quills below the elbow. The effect of this, if any, is to bring the wing nearer the body, and perhaps spread the quills.

The *deltoides* is small, and of two portions. One arises from the fork at the top of the shoulder, and sends a small tendon to the aponeurotic expansion of the fold of the wing. This tendon, as it proceeds along the edge of the expansion, requires exactly the structure and the elasticity of the *ligamentum nuchae*; it then becomes like common tendon, passes over the end of the radius, and is inserted into the stylo of the metacarpal bone. It bends the fore arm, extends the hand, and, in consequence of the elasticity of the tendon, contracts the soft part of the fold of the wing. This portion of the deltoid has escaped the observation of Cuvier and other writers, although the structure of the tendon is one of the most extraordinary circumstances in the anatomy of birds. The remaining portion of the deltoid is analogous to the same muscle of the human subject, and brings the wing upwards and backwards in flight.

The muscle which represents the *biceps flexor cubiti*, takes its origin from the end of the clavicle, where it joins the fork; and from the sharp tubercle of the humerus, which is analogous to the coracoid process, the chief part of the muscle proceeds to be inserted into the inside of the neck of the radius; but as it descends, a small portion goes off, and is expanded in the fold of the wing, and attached to the outer side of the arm. This expansion of tendon corresponds to the aponeurosis of the biceps muscle of the human subject; but instead of lying close to the fore arm, it is spread out and covered with the common integuments.

The *brachialis internus* is very small, being only attached

to the fore part of the end of the humerus between the condyles.

There is a short muscle which arises from the ligament that conjoins the clavicle and the head of the humerus, and is inserted upon the flat external surface between the two tubercles. It is an *elevator* of the wing. It is peculiar to birds, and has not yet been described.

The *extensor cubiti* consists of two portions: the one, called by Vic d'Azir the *extensor longus*, comes from the junction of the fork and scapula; the other arises in a forked manner from the posterior surface of the humerus, and is the *extensor brevis*.

The *anconaeus minor* of Cuvier is the external and lower part of the *extensor brevis*. It is a distinct muscle in the *fovea*, though not in the *goose*.

Although the bones of the fore arm do not admit of *pronation* and *supination*, the muscles which perform these motions in other animals, exist in birds, and answer different purposes.

The *supinators* resemble those of the human subject. The *longus* terminates on the style of the metacarpal bone, and serves both to bend the arm on the humerus, and extend the metacarpus, or lower part of the wing. The *supinator brevis* bends the fore arm. The place of the *pronator teres* is supplied by two muscles very much like it in shape; they act as flexors of the fore arm. There is a triangular muscle which in some degree fills the situation of the *pronator quadratus*; it arises from the end of the ulna, and sends a broad tendon over the carpus to the highest scabrous surface on the metacarpal bone. It extends the hand, or lower part of the wing, giving it at the same time a degree of pronation, which the carpal joint permits, in order to render the wing concave when it is extended.

The *flexors and extensors*, situated on the fore arm of birds, resemble in shape and arrangement generally those of the human subject, but commonly have their uses changed, and often even reversed, in consequence of the difference in the figure of the bones and the plan of their articulations.

The muscle which corresponds in situation to the *extensor carpi ulnaris*, performs the motion which is called flexion of the lower part of the wing.

There is a strong muscle arising from the external condyle of the humerus, and implanted into the side of the ulna opposite the radius, for almost its whole length. It raises the fore arm on the radius, and seems to be the muscle called by Vic d'Azir *flexor profundus*.

The muscle analogous to the *extensor pollicis longus*, has its tendon inserted into the style of the metacarpus, and into the short abductor. It extends the hand on the fore arm.

The *ulnar flexor* bends the parts of the wing.

The *flexor sublimis* comes from the internal condyle, is attached to the lower carpal bone, and sends a tendon to the base of the first joint of the principal finger, bends the hand, but extends the finger.

The *flexor digitorum profundus* arises from the inner surface of the ulna; its tendon passes over a little pulley on the metacarpal bone, and terminates on the end of the last joint of the principal finger, which it extends, but bends the wing.

The *extensor communis digitorum* and *indicator* arise from the external condyle and inside of the radius. They send tendons to the first and last joints of the principal finger, which they extend.

The fingers of birds are furnished with many short muscles; and notwithstanding they are very palpable, seem to

have escaped the observation of Cuvier and other anatomists.

The *flexor brevis pollicis* comes from the inside of the head of the metacarpal bone to the flat surface of the bone of the thumb. The *extensor brevis pollicis* proceeds from the triangular surface of the metacarpus, behind the joint, to the base of the thumb. The *abductor pollicis* is extended between the style of the metacarpal bone and the outer edge of the bone of the pollex. The *adductor pollicis* is expanded between the branch of the metacarpus and the bone of the thumb. The *abductor*, or *extensor brevis indicis*, is extended all along the radial edge of the metacarpal bone, and is spread upon the root of the first joint of the principal finger. It brings the finger into a line with the metacarpus. The *adductor indicis* comes from the ulnar side of the large branch of the metacarpus to the root of the first joint of the fore finger. The *abductor minimi digiti* lies along the ulnar edge of the small branch of the metacarpus; and as the little finger is tied to the other by ligament, this muscle produces the lateral flexion or abduction of both. The last is the *interosseus*; it fills the space between the branches of the metacarpus, and its tendon passes along the back of the principal finger to the extremity; it bends the first joint laterally, and extends the rest of the finger.

The *muscles of the lower extremity* are very numerous in birds, and possess several peculiarities, notwithstanding the motions of this member are so simple. The articulation of the femur with the pelvis permits the thigh to move freely forwards and backwards, but does not allow it to be carried under the body, or far outwards. The motions of all the other joints of the inferior extremity are merely flexion and extension.

In consequence of the form of the pelvis, the *iliacus*, the *psoas magnus* and *parvus*, the *obturator externus* and *quadratus lumborum*, do not exist in birds. Cuvier also states the *pyriformis* and *gemini* to be wanting; but we have seen a little muscle which passes from the projection above the acetabulum to the trochanter, which appears to supply the place of the *pyriformis*.

The *obturator internus* is generally a large muscle, and passes over a pulley at the fore part of the foramen ovale, where it receives two little slips analogous to the *gemini*: they are inserted into the outer part of the trochanter.

There are three *gluteal muscles*, as in quadrupeds. The *gluteus maximus* is attached by a broad thin tendon to the prominence along the dorsum of the ilium, covers the outside of the thigh, and contributes to form the extensor tendon on the side of the knee. The anterior part of this muscle corresponds to the *tensor vagina femoris*. The *gluteus medius* occupies its usual situation. The *gluteus minimus* is a massy muscle, so much placed on the anterior edge of the ilium, that Vic d'Azir considered it (perhaps not improperly) as the *iliacus*. It brings the thigh directly forwards, and rotates the knee inwards.

The muscle analogous to the *quadratus femoris* is large and of a pyramidal shape. It retracts the thigh.

The *extensor muscles* of the leg resemble those of mammalia. The *vastus internus* sends its tendon to be distinctly attached to the head of the tibia. The *sartorius* also is an extensor of the leg on the thigh.

There are three *flexors* of the leg: one, which, although single, is, from its insertion into the back of the fibula, analogous to the *biceps* of the human subject; another, on the inside, is attached to the tendon of the extensors of the heel, as well as to the tibia. This muscle might be called either *gracilis* or *femimembranosus*, for it resembles both. The third flexor is in the middle. It comes from the ischium; and as

it descends, it receives a broad slip of muscle from the back of the femur. It is inserted on the back of the tibia, and the tendon covering the extensors of the heel.

There is a large muscle on the inside of the thigh, which supplies the place of the *triceps*. It performs adduction, but it is also employed in carrying the limb backwards.

A muscle, which Cuvier appears to reckon as the *second adductor*, arises from the back of the ischium, and is inserted into the middle of the femur in company with the *cruro-coxigenus* muscle. It retracts the limb.

The muscles for extending the heel, and consequently the lower part of the leg of birds, differ in many respects from the *gastrocnemii* of mammalia. The tendo achillis is produced by three portions of muscle; and, after passing over a moveable cartilaginous pulley which is placed on the heel, it spreads on the sides of the metatarsal bone. The first portion arises from the inner and fore part of the joint of the knee, and is connected for some way with another muscle, which lies on the outside of the joint. The second portion is small, and from the back of the internal condyle of the femur. The third is a very strong muscle arising by tendon from the outside of the thigh bone, just above the condyle. These three heads appear to be the *external gastrocnemius*.

The *soleus* is represented by a muscle which arises from the outer part of the knee joint, from the upper part of the tibia, and from the fore part of the fibula. It is inserted into the pulley on the heel, and sends a tendon to join that of the flexor of the first phalanx of the toes; and therefore it bends the toes; while it acts on the heel.

There is also a muscle which appears to supply the place of the *plantaris*. It comes from the back of the head of the tibia, and affixes its delicate tendon to the inside of the moveable pulley of the heel.

The *tibialis anticus* arises by two heads, and is inserted into the fore part of the upper end of the metatarsal bone. It bends the joint of the heel.

The *tibialis posticus* is not found in birds.

There is a short *peroneal* muscle which is inserted into the outside of the metatarsal bone. It merely bends the joint.

The other muscles situated along the legs, are for the flexion and extension of the toes. The *extensor longus digitorum* exhibits no peculiarity, except that its tendon goes through a hole in the end of the tibia. There is no long *extensor* for the back toe.

The *flexors* of the toes are very complicated: they may be divided into the *flexor sublimis* and *flexor profundus*. The first is composed of several portions; two of these are *peroneal* muscles, and send their tendons to the first joint of the internal toe and the second phalanx of the middle toe; the two other portions of the *flexor sublimis* arise, one from the outside of the fibula, and the other from the back of the joint and internal condyle of the femur. The one on the fibular side is joined by the tendon of the *accessorius femoralis flexorum*: a muscle, which arises from the spine of the pabis, runs along the thigh, and sends its tendon through a sheath that runs over the ligament of the patella, to arrive on the fibular side of the leg. The two portions of the *flexor*, after this, unite, separate, and unite again, and at last produce three tendons, of which two go to the first phalanges of the internal and middle toes, and the third to all the joints of the outer toe except the last. Those tendons which pass beyond the first joint, are *perforating* as well as *perforated*.

The *flexor profundus* arises as two distinct muscles; the one from the back of the femur, and the other from the

back of the bones of the leg. The two tendons unite on the back of the metatarsal bone, and send off tendons to the last phalanges of the toes, which perforate those of the *flexor sublimis*.

All the flexor tendons are inclosed in a tendinous sheath, as they pass along the back of the metatarsus; and some of them go through the moveable cartilaginous pulley of the heel, and others run in sheaths formed in the cartilage which covers the top of the metatarsal bone.

The circumstance of the flexion of the toes accompanying that of the other joints of the lower extremity of birds, was long ago observed by Borelli, and attributed by him to the connexion the flexors of the toes have with the upper parts of the limb, by which they are mechanically directed when the knee is bent. This explanation has been controverted by Vic d'Azir and others, who have referred the effect to the irritability of the muscles. The opinion of Borelli appears, notwithstanding, to be well founded; for not only the tendon of the accessory flexor passing round the knee, but the course of the flexor tendons over the heel and along the metatarsus, must necessarily cause the contraction of the toes, when either of these joints are bent; and if the phenomenon was not produced on mechanic principles, it would be impossible for birds to exhibit it during sleep, which they do, or to prove the effect on the limb of a dead bird, than which nothing is more easy. The utility of this contrivance is great in all birds, but particularly so to the rapacious tribe, which by this means grasp their prey in the very act of pouncing on it; and it is still more necessary to those birds which perch or roost during their sleep, as they could not otherwise preserve their position when all their voluntary powers are suspended.

There are six long small muscles lying on the metatarsal bone; they are largest and best marked in those birds which walk most. Two of these are on the posterior surface; one goes to the base of the external toe, which it *abducts*; the other is inserted into the root of the back toe, which it *bends*. On the anterior part of the metatarsus there are four muscles: the first *extends* the back toe; the second goes to the base of the first toe, and *abducts* it; the third is spread on the root of the middle toe, which it *extends*; the fourth lies along the outside of the metatarsus, perforates the end of the bone, and is implanted into the inside of the external toe, and *adducts* it.

Brain.

This organ exhibits several deviations from the structure of the brain of mammalia, which afterwards appear in a more marked manner in the inferior classes of animals. Accordingly, in the scale of existence, or with respect to sensitive or mental faculties, the rank of birds is clearly fixed below that of mammalia, and above that of other animals. The rules which have been established to determine the degree of intelligence possessed by species or individuals, according to the proportion the brain bears to the whole body, or other parts of the nervous system, do not appear so applicable in birds as in mammalia. It is, however, very difficult to appreciate the capacity of birds, as they are so much the slaves of instinct, that it is often impossible to discover whether their actions arise from the impulse of this principle, or depend upon the recollection and association of external sensations. The largest birds generally have the smallest proportion of brain to the whole body; and some of the small birds have the proportion of brain so great, that they would, agreeable to the rules laid down, excel in mental endowments man himself: for instance, the brain of the *canary bird* is equal to the one-fourth of the whole body; and in the human subject it is only the one-twenty-fifth part. The diameter of the

the brain, in relation to the medulla oblongata, has been ascertained only in a few species of birds, in which it has been observed as follows :

	Medulla oblongata.	Brain.
Falcon	13	34
Owl	14	35
Duck	10	27
Turkey	12	38
Sparrow	7	18

The brain of birds is invested with the same coverings which are described in mammalia.

The form of the cerebral mass is very different from that of the human brain, which chiefly arises from the optic thalami being visible externally. The hemispheres are therefore proportionately diminished. They assume the shape of a heart with the point turned forwards. On the lower part of the side of the hemisphere there is a depression which corresponds to the *fossa* of *Sylvius*, and is the only appearance of a division into lobes. Underneath the hemispheres the *thalami nervorum opticorum* are found, as two distinct tubercles, each equalling in magnitude a lobe or division of the brain. They unite before the infundibulum, and send off the optic nerves; there are, therefore, six parts, or principal eminences, of the brain of birds, visible externally; the two hemispheres, the two thalami, the cerebellum, and the medulla oblongata. There are no convolutions, or winding impressions, on the surface of any of these parts, except the cerebellum, which is transversely furrowed, but not divided into two lobes. The medulla oblongata is round, and smooth on the under surface, being unfurnished with the eminences called *pons Varolii*, *corpora pyramidalia*, and *corpora olivaria*.

On separating the hemispheres a little, it is perceived that they are united at their lower part, or over the third ventricle. The junction is effected by white medullary substance, which afterwards spreads in a radiated manner, on the surfaces of the hemispheres that are opposed or applied to each other, almost as high as the top of the cerebrum. In reality, this medullary union of the hemispheres corresponds to the *fornix*, and can, like it, be traced to the anterior commissure in the third ventricle; but instead of being connected to the *septum lucidum* and *corpus callosum*, as these parts do not exist in birds, it spreads on the inner surfaces of the hemispheres, and thus contributes to form the internal parietes of the lateral ventricles.

Behind the radiated partition of the hemispheres, and without the third ventricle, the *posterior commissure* presents itself, and consists usually of more than one white line connected together by a white fibre, like a nerve passing obliquely across. The vault of the *canalis medius* is also visible, and is composed in part of a white medullary band; and behind this, another white cord runs across, which is the fourth pair of nerves at their origin.

The lateral ventricles are not prolonged posteriorly, nor possess what is called the *retroëd horn*; the *great* and *lesser hippocampus* have therefore no existence.

The *corpus striatum* fills the ventricle almost entirely, projecting from the external side of it in the shape of a kidney. It does not exhibit on a section regular or strong marked striæ.

There are no *tubercula quadrigemina*.

The *pineal gland* rests upon a flat surface; it is very small, and enveloped in pia mater, and covered by a large vein. The plexus choroides also at this place divides into two tufts, or bunches, which pass into the lateral ventricles by two foramina in the back of the internal parietes.

The *third ventricle* possesses its usual situation between the thalami and its fl t-like shape, and communicates with the *canalis medius* under the posterior commissure, and with the infundibulum behind the anterior commissure.

The *infundibulum* and *pituitary gland* are both large in proportion to the other parts.

The *thalami nervorum opticorum* contain each a ventricle, which opens into the *canalis medius*; therefore, there may be six ventricles reckoned in the brain of birds.

The *fourth ventricle* exhibits no peculiarity.

There are no eminences corresponding to the *corpora candicantia*; Cuvier has described four round eminences between the thalami and corpora striata, which are particularly plain in the *ostrich*. These are analogous to the tubercles of the brain of fishes.

The olfactory nerves arise, in birds, from the very points of the hemispheres, and often have a degree of enlargement at their origin, which resembles the olfactory tubercles of fishes. There are eight other pair of cerebral nerves, which have nothing very peculiar in their origin.

See *Plate X. of the Anatomy of Birds*. *Fig. 1* presents a lateral view of the brain of the *goose* abstracted from the head; *a* the hemisphere, *b* the depression analogous to the *fissura Sylvii*, *c* the optic thalamus, *d* the cerebellum, *e* the medulla oblongata, *f* the beginning of the medulla spinalis, *g* the infundibulum, *h* the pituitary gland. The different nerves are indicated by numbers, as they arise, from 1 to 9. N^o 1. the olfactory nerve, N^o 2. the optic, N^o 3. the oculo-muscular nerve, N^o 4. the patheticus, N^o 5. the trifacial nerves, N^o 6. the nervus abducens. N^o 7. the seventh pair, or auditory, N^o 8. the eighth pair, N^o 9. the hypoglossal nerve.

Fig. 2. of the same plate, shews the internal parts of the brain, as they are exposed without dissection, simply by pushing the hemispheres to each side, and drawing the cerebellum a little back: *aa* the two hemispheres, *b* the cerebellum, *c* the medulla oblongata, *ee* the radiated white lines seen arising from the junction of the hemispheres, and forming part of the parietes of the lateral ventricles, *f* the transverse medullary cords corresponding to the posterior commissure, *g* the white band of the roof of the *canalis medius*, *h* the fourth pair of nerves crossing behind it, *i* the pineal gland obscured by the *vena galeni* and the plexus choroides, *k* the latter passing into the ventricle.

The third figure of the tenth plate of the *Anatomy of Birds*, gives a view of the interior of the ventricles of the thalami nervorum opticorum, and the third ventricle; *aa* the hemispheres laid down very much to each side, by which the white partition is ruptured, and the third ventricle brought into view, they are also pulled forwards to expose the thalami; *b* the cerebellum; *c* the medulla oblongata; *dd* the two optic thalami, that on the right side is cut open to shew the ventricle and its communication with the *canalis medius*; *e* the tract of the third ventricle and *canalis medius*, along which a bristle is passed into the fourth ventricle; *f* the anterior commissure, which seems to produce the medullary radii that unite the hemispheres.

Nerves.

The *olfactory nerve* has been already mentioned to pass along a canal, or groove, in the upper and inner part of the orbit, to reach the nasal cavity; in which its distribution will be pointed out in describing the organ of smell.

The *optic nerves* pursue their ordinary course, as in other animals.

The distribution of the *third, fourth, and sixth* pair of nerves, is almost the same as in mammalia.

The branches of the *fifth* pair bear great resemblance to the

the same nerves in quadrupeds. They are distributed to the bill, and are therefore the nerves of the organ of touch in birds, under which head they will be farther noticed.

The *portio dura* of the seventh pair, or the *facial* nerve, is so small in birds, that it can hardly be discovered. Its offices are not required, in consequence of the structure of the parts of the face in these animals.

The *portio mollis* is remarkably soft; when it arises from the brain, it is a tender pulp, of a reddish colour.

The *par vagum*, or *pneumo-gastric* nerve of the eighth pair, sometimes passes out of the cranium in two or three filaments, which afterwards rejoin. On leaving the skull, this nerve communicates with the lingual and glosso-pharyngeal nerves. The *par vagum*, after this, passes as a distinct strong cord along the neck, in company with the jugular vein, and descending into the chest, forms the *cardiac* and *pulmonary plexuses*, as in mammalia. The two nerves unite behind the heart, and proceed along the œsophagus, to terminate in anastomoses with the great sympathetic nerve. We have not observed the *recurrent* branch of the eighth pair.

The *glosso-pharyngeal* nerve of the eighth pair makes its exit from the cranium through the posterior foramen lacerum in two filaments, which immediately unite to form a quadrangular ganglion, which sends off a small nerve to the anterior muscles of the neck, and another branch to anastomose with the *par vagum*; the nerve then descends along the œsophagus, and divides into two branches, of which one passes upwards to the muscles of the os hyoides, which include it between them, and the other furnishes a branch to the lingual nerve, and afterwards is expanded upon the œsophagus.

The *hypoglossal nerve* is small where it passes through the condyloid foramen of the cranium; it crosses and partly unites with the *par vagum*, at which place it detaches a filament towards the thorax, which seems analogous to the *descendens noni*. The trunk of the hypoglossus goes forwards under the horn of the os hyoides, and divides into two principal branches, which are distributed to the tongue.

The *cervical, dorsal, lumbar, and sacral* nerves, arise from the medulla spinalis exactly as they do in quadrupeds, and only vary in their number, which is determined by the number of vertebræ belonging to each region of the spine.

The *phrenic nerve* is not found in birds, in consequence of the absence of the diaphragm.

The *intercostal, or great sympathetic nerve*, is described as entering the cranium by the foramen lacerum posterius. It unites with the fifth and sixth pairs, and produces a lenticular ganglion below the skull, which communicates with the eighth and ninth pair of nerves. The appearance of the sympathetic nerve is, however, soon lost on the neck; for the cervical nerves form their anastomoses with each other in the vertebral canal, from which a nerve is sent out between each vertebra to supply the muscles and integuments of the neck. These nerves are remarkably large. On coming into the thorax the great sympathetic sends a branch to the pulmonary plexus of the *par vagum*; it anastomoses also with the brachial plexus; and below the second rib, the sympathetic commences a series of ganglia, which are very conspicuous between each of the succeeding ribs, but become less visible along the remaining part of the spine. These ganglia are central points for the union of a number of nerves. They receive filaments from each other, which pass over the heads of the ribs; they communicate backwards with the spinal nerves; they detach on the outside the intercostal nerves, which are large, and besides supplying the intercostal spaces, give branches to the muscles and

integuments upon the sides of the body; they lastly send off filaments anteriorly, which anastomose with each other on the side of the dorsal spine, and form cords, which become the splanchnic nerves. In this manner there is produced on each side of the dorsal spine a reticulation of nerves which incloses in its meshes the heads of the ribs, and has a striking effect. The first dorsal ganglion unites with the brachial plexus and the cardiac plexus of the *par vagum*.

The *splanchnic* nerves, after being formed by the anterior branches of the sympathetic, pass to the roots of the principal arteries of the viscera. Those of the cœliac artery produce a plexus round the trunk of this vessel, and where the artery is divided, there are one, two, or three enlargements, which are analogous to the *scillunar ganglia*; and the nerves which depart from these, inclose the arteries in a reticulated manner, and represent the *solar plexus*.

There are similar plexuses on the other chief arteries of the trunk, which correspond to the *superior and inferior mesenteric* and *renal* plexuses, &c.

The nerves of the solar plexus accompany the branches of the cœliac artery to the stomach, spleen, liver, and pancreas, around which they continue to form numerous anastomoses, that may be compared to the *stomachic, splenic, hepatic, and pancreatic plexuses*.

The *nerves of the wing* more nearly resemble those of the superior extremity in mammalia, than Cuvier has represented. The *brachial plexus* is produced by the two last cervical and first dorsal, and not, as he has stated, by the last cervical and two first dorsal nerves. The union of these three branches gives rise to three others, which are distributed in the following manner:—The first is a very fine filament, which runs down on the inside of the arm, and is lost about the internal part of the elbow. This is analogous to the *internal cutaneous* nerve. The second is a large cord; it gives off a very large branch, which divides into many others, for the supply of the pectoral muscles; it sends several smaller branches to the muscles under the clavicle, and about the joint, and then proceeds to the inner edge of the biceps muscle, along which it descends to the fold of the arm, after giving some large muscular branches. Before it reaches the joint, it divides into two branches; one of which is analogous to the *ulnar* nerve, and the other soon divides again into nerves which are similar to the *median* and *musculo-cutaneous*. The *median* dips down amongst the muscles on the middle of the fore arm, to which it gives branches, and afterwards runs along the interosseous space, passes under the annular ligament of the carpus, and is distributed to the short muscles of the digiti. The branch analogous to the *musculo-cutaneous* nerve, is expanded upon the muscles on the upper edge of the radius.

The *ulnar* nerve, although it appears to be incorporated with the *median* on the upper arm, can be easily separated from it and traced to its proper origin in the brachial plexus. After this nerve leaves the median, it turns over the end of the foramen to get upon the edge of the ulna. It gives filaments to the muscles in this situation; but its chief branch runs down superficially upon the ligaments of the quills in company with the vein, and goes ultimately to be lost upon the ulnar edge of the hand.

The third cord furnished by the brachial plexus, supplies the place of the *radial* nerve. It detaches several filaments to the muscles on the inside and back of the scapula. It gives off also the *articular nerve*, and then winds round the humerus between the extensor muscles, to which it furnishes some large filaments. On coming to the outside of the humerus, it sends a branch between the integuments of the

fold of the wing. The nerve now turns round the neck of the radius, beneath the muscles, and forms two branches; of which one passes under the muscles to the outer side of the ulna, along which it runs superficially to the hand; the other branch passes on the radial side, but more deeply amongst the muscles, goes under the annular ligament of the carpus, proceeds between the branches of the metacarpus, and is finally lost on the back of the digiti.

Although Cuvier has given a more accurate description of the nerves of the lower extremity, than of those of the wing, it nevertheless needs correction in several particulars, which we have supplied.

The *obturator* and *femoral* nerves arise from the same plexus which is formed by the two last lumbar nerves, by a communicating branch from the first sacral pair. The obturator nerve passes through the upper part of the foramen ovale, and is distributed to the muscles around the hip joint, especially the adductor. The femoral nerve passes out of the pelvis in company with the artery, over the upper edge of the ilium. It divides into three branches, which are dispersed amongst the muscles and integuments on the anterior and inner part of the thigh. Some of these filaments are long, and descend superficially for a considerable way upon the limb.

The *ischiodic* nerve is composed of the five superior sacral nerves; and as soon as it departs from the plexus, even within the pelvis, is easily separable into its primary branches. Immediately after it passes through the ischiadic foramen, it sends filaments to the muscles on the outer part of the thigh; it then proceeds under the biceps muscle, along the back of the thigh, about the middle of which it becomes divided into the *tibial* and the *peroneal* nerves.

The *tibial* nerve, even before it arrives in the ham, separates into several branches, which pass on each side of the blood-vessels, and are chiefly distributed to the muscles on the back of the leg. Two of these branches, however, are differently disposed of: the one accompanies the posterior tibial artery down the leg, passes over the internal part of the pulley, and is lost in small filaments, and anastomoses with a branch of the peroneal nerve, on the inner side of the metatarsus; the other branch runs down on the peroneal side of the leg, along the deep seated flexors of the toes, passes in a sheath formed for it on the outer edge of the moveable pulley of the heel, and proceeds under the flexor tendons along the metatarsal bone, to be distributed to the internal part of the two external toes.

The *peroneal* nerve is directed to the outer part of the leg; it dips in above the gastrocnemii muscles, and runs through the same ligamentous pulley that transmits the tendon of the biceps muscle; it then detaches some large filaments to the muscles on the anterior part of the leg, under which it divides into two branches, which proceed close together, in company with the anterior tibial artery, to the fore part of the ankle joint, at which place they separate; one passes superficially over the outer part of the joint; the other goes first under the transverse ligament which binds down the tendon of the tibialis anticus muscle on the tibia, and then over the inner part of the joint, below which it divides into two branches, the one is distributed to the inner side of the metatarsus and the tibial side of the pollex and to the next toe; the other turns towards the centre of the metatarsal bone, and penetrates the tendon of the tibialis anticus just at its insertion, and then rejoins the branch of the peroneal nerve it accompanied down the leg. They continue their course together again in the anterior furrow of the metatarsal bone; and at the root of the toes, separate once more, and proceed to the interspaces of the three anterior

toes, and each divides into two filaments, which run along the sides of the toes to the nail.

Organs of Touch.

As the sense of touch is bestowed upon animals to enable them to discern the forms and states of aggregation of external matter, it resides more especially in the extreme parts of their bodies, and when most perfect, exists in some member which is constructed for including or taking hold of extraneous substances. There is no part of the body of birds capable of conveying an accurate impression of touch, but the feet and the bills; their upper extremities and tail being simply instruments of motion. Different species enjoy this in different degrees, and possess it more or less in the bill or feet, in proportion as they employ these parts in the pursuit or examination of their food; these being the only occasions on which birds exercise their functions of touch. The *scansores*, *accipitres*, and *passerine* tribe have most sensation in their feet, while the *gralle* and *anseræ*, especially those that have long or broad bills for feeling out their food, like the *snipe*, or *duck*, possess a very great susceptibility of impression in their bills.

The organization of the feet of birds, as far as concerns their offices as instruments of touch, is similar to that of the digitated mammalia and reptiles. The skin on their lower surfaces is endowed with more than common vascularity, is largely supplied with nerves, and is elevated into those little regular eminences called *papilla*, in which the sense of touch more immediately resides.

The structure, on which the sensibility of the bill depends, is different from the preceding. It consists in the magnitude and distribution of the fifth pair of nerves. These are divided, as in mammalia, into three branches, the *ophthalmic*, the *superior maxillary*, and the *inferior maxillary*.

The *ophthalmic* enters the orbit by a hole beside the optic foramen, passes for some way in an osseous canal before it arrives in the nasal cavity, where it distributes some branches to the septum and turbinata, and to the external nares, and then goes on as two branches; one runs in the substance of the upper jaw, which it perforates at the end in many filaments, to terminate under the horny integument of the bill; the other passes between the membrane of the palate and the bill, and is lost in a number of fibrils at the apex of the bill.

The *superior* and *inferior maxillary* nerves come out of the cranium by the same hole. The *superior*, after dispensing branches to the muscles in its course, is finally distributed to the lateral parts of the bill, which, if notched along the edge, as in some water birds, each denticulation receives several filaments. The *inferior maxillary* descends to the lower jaw, which it penetrates, after sending a branch to the integuments of the side of the bill; and running in the maxillary canal, sends filaments to the edge of the bill, and terminates, like the ophthalmic, on the apex of the lower mandible.

These nerves are of great size in the *goose*, *duck*, &c. in which they render the bill a very delicate organ of touch. See Plate X. in the *Anatomy of Birds*. Fig. 4. is the section of the head of a *duck*, made by dividing the organ of smell longitudinally, and by removing the bill and bone of the mandible, in order to bring into view the distribution of the fifth pair of nerves: *a a* the ophthalmic nerve coming from the upper part of the orbit, and proceeding along the septum nasi; *b* the branch which passes in the substance of the mandible, to be lost on the point of the bill, *c* the branch that runs on the membrane of the palate to the end of the bill; *d* the superior maxillary nerve dividing on the membrane of the palate, and sending its filaments to the denticuli on the side of the bill; *e* the inferior maxillary run-
ning

ning in the canal of the lower jaw, and sending filaments to the denticuli on the edge of the mouth, and ending on the point of the bill; *f* the nasal branch of the ophthalmic distributed to the septum.

External Parts, or Integuments.

The *feathers* with which the bodies of birds are clothed, render them less capable of receiving the more simple impressions of touch, than most other animals. They also serve to defend them against the excesses of temperature. The structure and mode of growth of these substances are considered in another part of the dictionary. See FEATHERS.

The *cuticle* of birds is remarkably thin, but resembles in structure the epidermis of mammalia. It is fixed generally along with the feathers.

The *rete mucosum* is not observable, except in those parts which are uncovered by feathers, and possess peculiar colours, as the ceres and caruncles of the head, the feet, and bills; where it is of course found to vary in colour as those parts do.

The *cutis* is in most birds extremely thin and delicate in its texture, appearing often like a fine single lamina, instead of an intermixture of fibres as in mammalia. It is, however, of some strength in the *swain birds* and the *accipitres*; it is thinnest in the *passeres*. The external part of the cutis is never *papillated*, but when it covers the under surfaces of the toes which are designed to receive the impressions of external bodies.

The *muscles of the skin*, in consequence of the size of the external coverings, are in general very evident, and particularly in those birds which move the feathers of the crest, neck, or tail, as the *braptes*, *cockatoo*, *herons*, &c.

The following cutaneous muscles are common to all birds. Two fleshy slips, which arise from behind each side of the head behind the meatus auditorius, and go backwards to be lost in the integuments. A thin expansion of muscle along the anterior and lateral parts of the neck; it takes a longitudinal course, but is connected with some transverse fibres between the jaws; this muscle corresponds with the *platysma myoides*. There is a muscle, arising in a serrated manner from two or three of the lower ribs, and extending upwards to the axilla and outside of the shoulder. We have perceived, in the *goose*, a very thin slip of muscle proceeding from the posterior part of the branch of the pubis to the skin on the inside of the knee; and Cuvier considers the red granular appearance under the skin on the back of the pelvis as muscular substance.

The functions of the skin of birds, as an organ of absorption and excretion, appear to be very imperfect. The clothing of feathers alone disqualifies it in a great degree for the performance of these processes. The thinness and simple organization of the skin itself render it probable that its secretory powers are but inconsiderable. It does not also possess those various glands which are so abundantly bestowed upon the skin of other animals for its preservation and defence against the operation of external substances. Birds are, however, provided with two peculiar glands for the purpose of furnishing an oily fluid, to keep the feathers in order and defend them against the effects of moisture.

The *oil glands* are two oblong or oval-shaped bodies, with one end more pointed than the other, and situated under the skin on each side of the spinous processes of the caudal vertebrae. They approach each other, and touch at their points, which are directed backwards, and thus produce very commonly between them the figure of a heart. They are covered by a strong dense white tunic, and their interior structure consists of a number of small tubes arranged in a radi-

ated manner around a vacancy, or canal, which runs nearly in the middle of the gland, into which they all open and discharge their contents, in the same way as the tubuli uriniferi do into the pelvis of the kidney. The middle canal leads to a papilla on the skin of the rump, and terminates in a simple foramen. It deserves remark, that the tubes towards the circumference of the glands are soft and indistinct, and their contents are liquid and pale coloured; but before their termination, the tubes acquire more firmness, are a little separated into packets, their secretion becomes an opaque yellow, and of more consistence; thus affording an obvious and interesting view of the change which may be wrought upon secreted fluids after their formation, while they are passing through their glands. The fluid produced by the glands on the rump of birds, although of an unctuous nature, is still not pure animal oil. It has more consistence, and is less affected by heat; which properties it principally acquires in the ends of the tubes, before they open into the common duct, as already mentioned. It is, however, sufficiently oleaginous to prevent the adhesion of moisture to the surface of the feathers. When birds make use of it, they turn their head round to the rump, and compress the glands with the bill, when a quantity of oily matter exudes, with which they beset their feathers, arranging the barbs upon their shafts at the same time by means of the bill. These glands, as might be presumed from their use, are particularly large in the *swimming birds*. See Plate X. in the *Anatomy of Birds*. Fig. 5. shews the oil glands of the *duck* of their natural size: *a a* the two glands; *bb* their foramina on the papilla, into each of which a bristle is introduced; *cc* the integuments reflected on each side to bring the glands into view. Fig. 6. of the same plate is a section of one of the oil glands somewhat magnified; *a* the canal in the centre into which the radiated tubes open; *bb* the external portion of the tubes; *cc* the interior extremities more distinct, and of a deeper colour.

Organ of Smell.

The shape and situation of the *nostrils* are used by naturalists as classic characters of birds; and therefore do not require particular consideration here. They consist of two slits, varying in the length and width, commonly placed on each side behind the base of the bill. There are no muscles provided for dilating and contracting their aperture, as in mammalia.

The interior of the organ of smell is formed by a septum and three turbinated bodies, over which the pituitary membrane is spread.

The *superior turbinatum* assumes in general the shape of a bell; it is formed of cartilage, and is attached to the os frontis and lacrymale; it is hollow within, and divided by a slight prominence into two apartments, which are continued for a little way in a tubular form; the external ends by a blind extremity behind the middle turbinatum; the internal opens into the cavity of the nose. The superior turbinatum is small in the *passeres* and *gallina*, somewhat larger in the *scenobates*, increases in bulk in the *accipitres*, and still more in the *anser*, and in the *gralle* it is greatest of all. According to the observations of Scarpa, the acuteness of smell is exactly proportioned to the magnitude of this part of the organ, as it is upon it only and the septum that the olfactory nerve is spread.

The *middle turbinatum* has been likened by Scarpa to a cucurbit. It is connected on the external part to the cartilaginous pinna of the nares and the bony process of the upper jaw, and inferiorly it is attached to the cartilaginous septum of the nose. It is composed of a cartilaginous lamina, which in the *goose* makes two folds and an half; but in the *gralle* it is compressed, and forms only one turn and an

half. Harwood has stated these turbinata to be membranous in the *casuary* and *albatross*; and Cuvier has observed them to be composed of bone in the *toucan* and *hornbill*.

The *inferior turbinatum* is an osseous fold, continued from the pinna of the nares, and united on the other side to the septum. See Plate X. in the *Anatomy of Birds*. Fig. 7. exhibits the interior of the nasal cavity of the *goose*, the septum being removed; *a* the canal through which the olfactory nerve passes to the nose; *b* the cavity of the superior turbinatum; *c* its internal tube; *d* the external tube; *e* the middle turbinatum; *f* its deep or first winding; *g* the second; *b b* two pins passed from the windings into the nasal cavity; *i* the inferior turbinated bone; *k* its junction with the septum; *l* the cartilaginous appendix of the middle turbinatum; *m* a pin introduced through the external naris; *n* the posterior naris.

The *pituitary membrane* is fine where it invests the superior turbinatum, and thicker and more villous over the middle one; it is covered with pores, which discharge mucus on its surface. The blood vessels on the interior of the nose are beautifully reticulated.

The *olfactory nerve*, as already described, arises from the point of the hemisphere of the cerebrum, and passes through an osseous canal to the superior part of the nasal cavity. On arriving there it breaks into a great number of filaments, some of which are spread upon the superior turbinatum, and others run about as far on the septum nasi. See Plate X. in the *Anatomy of Birds*, fig. 4. *g* the nerve proceeding along the canal above the orbit; *b* the appearance of the nerve on the septum of the *duck*; and fig. 8. of the same plate exhibits a section of the head of the *beron*, a bird with an acute sense of smell; *a* the trunk of the olfactory nerve; *b* its distribution on the superior turbinatum, which is very large; *c c* the middle turbinatum proportionably reduced in size; *d* inferior turbinatum; *e* its connection with the septum; *f* the aperture of the external naris.

Scarpa made a number of experiments with different species of birds, in order to determine their capacity for discerning odours. He mixed various strong smelling substances with their ordinary food, which in some were taken with indifference, but in others the repugnance to the scented food was so great, that the birds perished rather than eat it. He was thus enabled to form a scale of the different degrees of perfection in which birds enjoy the sense of smell, which accorded exactly with the extent of the surface allowed for the distribution of the olfactory nerves. The scale he has laid is as follows: *gallinæ, passeræ, picæ, anseres, accipitres, and grallæ*.

Organ of Taste.

The sense of taste is so imperfect in most birds, that it might be doubted whether it existed at all or not. The form and motions of the tongue unfit it for being applied to the superficies of substances; the glairy tenacious fluid, with which the surfaces of their mouths are besmeared, is not calculated for the solution of sapid bodies; and the shape and structure of the papillæ of the tongue seem to render them nearly incapable of impression; and further it may be observed, that birds commonly swallow their food without examination, or a minute division of its parts.

The motions and internal formation of the tongue have been already discussed; it only remains, therefore, to notice the figure and integuments; but as these have been described by natural historians in almost every genus, it is only necessary to speak of them in a very general way at present.

The *form* of the tongue may be commonly guessed at from the shape of the bill, with which it corresponds in a certain degree. In the *gallinæ* and *passeræ* it is an elongated trian-

gle, the point being turned forwards; in the *grallæ* it is generally of the same figure, the triangle being however lengthened in proportion to the bill; the broad-billed birds, as the *swan, goose, &c.* have the tongue broad and round at the end.

The *parrot* has a thick round fleshy tongue, not unlike that of mammalia.

Several birds have the tongue bifid at the point.

The *African ostrich* has a broad tongue, but so short, that its existence has been often doubted. The *New Holland ostrich* has a very thin small tongue, and nearly an equilateral triangle.

The *papillæ*, or projecting points of the integument of the tongue are very various in their shape and arrangement. In most instances the tongue is smooth, except at its base, where it is furnished with sharp reflex papillæ, which are commonly cartilaginous, and often covered with bone. In many birds there are processes along the upper surface or the edge of the tongue, which are invested with a horny or osseous substance. The *vulture* has cartilaginous ferræ along the edges of the tongue. The *toucans* have fine horny bristles along the sides, which give their tongue a resemblance to a feather.

On the lateral parts of the back of the tongue of the *flamingo*, there are two rows of bony processes, shaped like hooks, with their points turned backwards.

The *duck, goose, swan, &c.* have, besides sharp bristles and denticulations, some rows of little osseous plates with their thin edges turned toward the fauces.

Birds have frequently the edges of the posterior nares, and other prominent parts of the fauces furnished with reflected spiculæ, similar to those on the tongue; from which it is probable, that both are intended to assist in the action of swallowing the food, rather than to receive the impressions of sapid substances.

The *parrot* is the only bird which appears to taste its food, and hence it possesses soft papillæ, of which some are really *fungiform*.

It is probable, that the *humming* birds possess the sensation of taste, as their tongue is flexible and tubulated, through which they suck, like insects, their fluid aliment.

Organ of Hearing.

Birds are unprovided with the *concha*, or that external projection of the ear which is observed in man and quadrupeds, for collecting the rays of sound; but to compensate for the want of it, some of the internal parts of the organ are formed upon a larger scale. The feathers are arranged in some species, however, around the meatus auditorius in such a way as to produce, in a degree, the effect of the *concha*. This is most observable in the *owls*, in which also the *membrana tympani* lies at the bottom of a cavity, which is lined by a reflection of the common integuments that forms folds something analogous to the projections of the human *concha*; and in the *white owl*, there is a square membrane, which serves as an operculum to the anterior part of the cavity.

The *frame* of the *membrana tympani*, or the bone which surrounds it, is more prominent in some birds than in others; but generally it does not project sufficiently to deserve the name of a canal. It is imperfect anteriorly, where the articular bone is situated, to which the *membrana tympani* is in part attached. In the *white owl*, however, the osseous frame of the meatus is completed by the bones of the head alone.

The *membrana tympani* is always more or less of an oval figure. It possesses the same structure as in mammalia, but is very thin; the convex, or conic surface, is external,

external, instead of pointing inwards, as in man and quadrupeds.

The *cavity of the tympanum* is irregular on the internal surface, and is widest at its outer part. Besides the usual foramina leading to the labyrinth and Eustachian tube, it contains three others which communicate with the cells of the bones of the cranium. These are widened into something like canals, where the holes open into them. The largest of the foramina is in the back of the tympanum, and leads to the posterior cells, and communicates above the foramen magnum with the cellular canal of the other side. The second opening is placed at the anterior part of the tympanum, and conducts to the cells on the lower and anterior part of the cranium. The third foramen is continued amongst the cells which surround the labyrinth. Thus the cavities of each tympanum have a communication with the interior of all parts of the cranium, and with each other, from which they might be reckoned as making only one cavity. The end of the articular bone also, where it contributes to form the parietes of the tympanum, has a foramen, by which it derives its supply of air. The *auditory cells of the cranium of birds* are analogous to the mastoid of the human subject; but from their extent, multiply found much more. They are of the greatest magnitude in the *nocturnal birds of prey*, and especially in the *white owl*; the *goat sucker (caprimulgus)* has them also very large. They diminish in the other birds, in which the posterior canals have no direct communication with each other. They are little observable in the *struthio*; and the *parrot* appears to want them altogether, but in their place the cavity of the tympanum is enlarged posteriorly.

The *Eustachian tube* is very large in birds; it is an osseous canal, and terminates by a small aperture close to the one of the other side, within the fissure of the posterior nares.

The foramina, which lead into the labyrinth, are situated within a fossa. They do not merit the distinctions of *foramen ovale* and *foramen rotundum*, being both oval, and only separated by a small bony process.

The *officula auditus* are supplied by a single bone and some cartilaginous processes. The ossiculum consists of a stalk or pedicle, crowned by an oval plate, which is applied to the foramen that leads into the vestibule of the labyrinth. At the other extremity it becomes extended and united to two or three cartilaginous processes, which form a triangle that is attached to the membrana tympani.

The pediculated bone of the tympanum is moved by *one muscle*, which comes from the occiput behind the ear, and penetrating the cavity, is affixed to the triangle that is connected to the membrana tympani. This muscle is a *tensor*, and draws the membrana tympani outwards. It is counteracted by two small tendinous cords that are extended to the internal parietes of the tympanum.

The *labyrinth of the ear of birds* consists only of the *vestibule* and *three semicircular canals*, and the rudiment of the *cochlea*.

The *vestibule* is small in proportion to the other parts.

The *canals* have been termed by Scarpa, from their gradation in bulk, *canales major, minor* and *minimus*. The largest is most superior, and has a vertical position. The smallest is situated horizontally. The canalis minor ascends upon the major, and opens into its side. They contain corresponding tubes of vascular membrane; and they also possess the *ampulla*, on which the nerves are distributed in the same manner as in mammalia.

The place of the *cochlea* is supplied by a short osseous tube, very slightly bent, and either blunt or enlarged at the extremity. Its interior is occupied by two small cylinders

of fine cartilage, each a little twisted, and united at their origin and termination. They proceed from the osseous bar, which separates the two foramina that correspond to the foramen ovale and rotundum. The sulcus, which is left between the cartilages, is dilated near the point, and accommodates the same branch of the auditory nerve which is sent to the cochlea in mammalia. This nerve spreads in fine filaments upon the united extremity of the cartilaginous cylinders. The tube is divided by the presence of the cartilages into two *scalæ*, which communicate with the vestibule and the foramen rotundum.

The *struthious birds* have the tube corresponding to the cochlea, very small in proportion to the other parts.

The *auditory nerve* is received into a fossa, and there breaks into five branches; one is the *facial*, or *portio dura*, and the others are sent to the semicircular canals and the tube. The facial nerve receives a filament from the par vagum, which traverses the ear, and is afterwards distributed to the palate.

Comparetti has described two canals leading from the labyrinth of birds, which correspond with the *aqueducts* of the ear of mammalia.

For the illustration of the organ of hearing, see *Plate X.* in the *Anatomy of Birds.* *Fig. 9.* represents a dissection of the posterior portion of the skull of the *white owl (Strix flammea)*, which exposes both the parts of the tympanum and the labyrinth: *a* the membrana tympani, which is inclosed in a perfect frame of bone in this bird; *b* the cavity of the tympanum laid open on the other side of the head; *c* the pediculated bone, or ossiculum, in situ; *d d d* the semicircular canals; *e* the tube analogous to the cochlea; *f f* the air-cells exposed by the division of the cranium. *Fig. 10.* shews the ossiculum and the membrana tympani abstracted from their situation and magnified; *a a* the membrane; *b* the flat head or disk of the ossiculum; *c* the pedicle; *d* the extremity which unites with the cartilages, and forms the triangle that is connected to the membrana tympani. *Fig. 11.* exhibits a magnified view of a dissection of the labyrinth of the *goose*, in which the membranous parts and the distribution of the nerves are displayed; *a* the trunk of the auditory nerve; *b* the portio dura; *c c c* the three branches of the portio mollis going to the semicircular canals; *d* the nerve of the cochlea running in the sulcus, and ramifying on the apex of the cartilages; *e* the osseous part of the tube analogous to the cochlea; *f* the inferior cartilaginous cylinder; *g* the sulcus between it and the superior, which is concealed from view by the nerve; *h h h* the three ampullæ of the membranous semicircular canals; *i* the canalis major; *k* the canalis minor; *l* its communication with the major; *m* the canalis minimus; *n* the hole which corresponds to the foramen ovale. *Fig. 12.* is the cartilaginous body removed from the osseous tube; *a* the superior cylinder; *b* the inferior; *c* their junction where they commence; *d* the cavity at the apex of the cylinders laid open; *e* the nerve of the cochlea; *f* its expansion in the cavity of the apex of the cartilaginous body.

Organ of Sight.

The peculiarities in the structure of the eyes of birds are chiefly intended to facilitate the perception of objects through a rare medium, and accommodate vision to different distances.

The *form of the eye* is admirably adapted in most species to promote both these effects. The anterior circle of the globe of the eye always projects more than in other animals; and in many species it is prolonged in a tubular form, and in those cases the cornea also is remarkably gibbous. The *owl* furnishes the most striking example of the disproportion between the anterior and posterior spheres of the eye. The

axis of the anterior portion being twice as great as that of the other. The obvious consequence of this figure of the globe of the eye is to allow room for a greater proportion of the aqueous fluid, and for the removal of the crystalline lens from the seat of the sensation, and thus produce a greater convergence of the rays of light, by which the animal is enabled to discern the objects placed near it, and to see with a weaker light; and hence *owls*, which require this sort of vision so much, possess the structure fitted to effect it in so remarkable a degree.

The *sclerotic coat* of the eye in birds is thin and flexible on the posterior part, but anteriorly its form is maintained by the interposition of a number of bony plates between its layers. These vary from thirteen to twenty, and are arranged in a circle immediately behind the cornea, with their edges overlapping each other. They are commonly flat thin scales, and nearly of a square figure, but become elongated from before backwards in proportion as the bird possesses the power of changing the convexity of the cornea. In the *owls* the scales compose not only all the projection of the eye (the cornea excepted), but contribute to form the posterior sphere. The scales are capable of a degree of motion upon each other, which is, however, restrained within certain limits by the attachments of their anterior and posterior edges to the sclerotic coat; and by their being bound together with a tough ligamentous substance, which seems to be the continuation of the sclerotic between the edges that overlap each other.

The *cornea* possesses the same structure as in mammalia, but differs with respect to form. When the posterior part of the eye is compressed by the muscles, the humours are urged forwards and distend the cornea; which, at that time, becomes much more prominent in most birds than it is ever observed in mammalia; and under such circumstances, the eye is in a state for perceiving near objects. When the muscles are quite relaxed, the contents of the eye-ball retire to the posterior part, and the cornea becomes flat, or even depressed; this is the condition in which we always find the eye of a dead bird, but we can have no opportunity of perceiving it during life. It is only practised for the purpose of rendering objects visible that are placed at an extreme distance. From the well known effects of form upon refracting media, it must be presumed, that the cornea possesses very little, if any, convexity, when a bird, which is soaring in the higher regions of the air, and invisible to us, discerns its prey upon the earth, and descends with unerring flight to the spot, as is customary with many of the rapacious tribe.

There are other circumstances in the anatomy of the eye of birds, which have been supposed to concur with the extraordinary variation in the figure of the cornea, in producing its capacity for the perception of remote objects: these will be mentioned in their proper place.

The *choroid coat* differs in no material point from that of the human subject. The *ciliary processes* of the choroides are very small and short; being merely serrated striæ. There appears to be no *tapetum*.

The *iris* is sometimes of brilliant colours, which are employed by naturalists as distinguishing specific characters of birds. *Parrots* have the power of voluntarily producing a great degree of motion in the iris. It does not appear, however, that other birds are capable of commanding the motions of this part.

The *pecten*, or *plicated membrane*, is the most singular part of the structure of the eye of birds. It appears to grow from the choroides where the optic nerve penetrates that coat; but on closer inspection it is found to have no inti-

mate connexion with it. In structure, however, it is perfectly similar to the choroides. The form of this part varies in different species; in general, it consists of a membrane folded backwards and forwards on itself, like the plaits of a garment, and presenting, when viewed on the side, something of the appearance of the teeth of a comb; on which account the name of *pecten* has been applied to it. In the *struthious birds*, the folds of the pecten are larger, and collected towards the point, giving it a resemblance to a purse. The Parisian academicians therefore, in taking their description of this part from the *ostrich*, called it the *marjubarium nigrum*, by which name it is still very commonly known. The plicated membrane proceeds into the substance of the vitreous humour, and usually becomes attached to the posterior part of the capsule of the crystalline lens a little to one side. In some instances it does not come into immediate contact with the capsule of the lens, but ends a very short way behind it amongst the cells of the vitreous humour: such is the case in the *turkey*, *jackdaw*, and several other birds. The number of the folds of the pecten vary. There are sixteen in the *stork*, fifteen in the *ostrich*, and seven in the great *horned owl*.

The functions of the plicated membrane have been often discussed, but still remain involved in some degree of doubt. Haller, and others, consider it as the medium through which the vessels are conducted to the crystalline lens; but there appears no reason for such a provision to exist in birds. Petit was of opinion that it absorbed the lateral rays of light, in order that objects placed immediately before the eye might be more distinctly seen; which is highly improbable, as the scope of vision is full as extensive in birds as in other animals. The best supported theory on this subject is Mr. Home's. The plicated membrane, according to his experiments, possesses a contractile power, and affords the means of withdrawing the lens from the anterior part of the eye, when the organ is adapted to the perception of remote objects; thus acting in concert with the change of figure in the cornea. Experiments, however, upon the operations of the eye are so delicate in their nature, that they are seldom to be relied upon, and accordingly in different hands they have afforded very different results; but the doctrine of the muscularity of the plicated membrane is almost proved by its seeming necessity for the explanation of the powers of adaptation of the eyes to different distances, which birds possess in a degree far superior to all other animals; and it seems fair to infer that if the accommodation of vision depends upon the motion of the cornea, and the recession of the lens in those animals which are so eminently endowed with it, similar means are employed for the same purpose in the other classes which possess the faculty in a less degree. For the more ample discussion of this subject, see Mr. Home's lectures on muscular motion, published in the Philosophical Transactions for the years 1794, 1795, and 1796; Dr. Olbers' "De oculi mutationibus internis," Gotting. 1780; "The Essays of Petit, Mem. de l'Acad." 1735, p. 163. 1736, p. 166; "Observations on the Eyes of Birds," by Mr. Pierce Smith, Phil. Trans. for 1795; and "Dr. Young's Lecture on the Mechanism of the Eye," Phil. Trans. 1801.

The *optic nerve* passes through an oblique sheath in the back of the sclerotic coat, during which it changes from a round to a flattened shape, and as such, enters the eye, presenting on the inside an elongated white line, instead of a round disk, from which the retina is produced. The origin of the plicated membrane covers the entrance of the optic nerve.

The *humours* as well as the shape of the eye and the structure

ture of its coats, indicate the peculiar vision of birds and the kind of medium they inhabit. The *aqueous humour*, as already observed, is extremely abundant. It possesses considerable refractive powers especially in the higher regions of the atmosphere. The *crystalline* is remarkably flat and soft, as its offices can be so well supplied by the aqueous fluid in a rare medium. Both the form and the proportions of the humours in the eyes of all birds derive great illustration from being compared with those of *fishes*, which, in consequence of their continual residence in so dense a medium as water, have these parts formed upon a plan the very reverse.—Their eye is flat anteriorly; the aqueous fluid small in quantity, and of considerable consistence; and the lens spherical and hard, more especially in the centre. The *cormorant* has the crystalline more spherical than other birds, from being obliged to seek its food under the water.

The *muscles* for the motion of the eye-ball are six in birds, as in the human subject; the four straight and two oblique. The tendons of the recti cannot be traced farther than the circle of imbricated bones. The operation of the straight muscles, when acting together upon the figure of the eye (which, as already observed, is so striking in birds), depends upon the bony scales of the anterior part of the sclerotic, and the thinness and pliability of that tunic posteriorly. The superior-oblique muscle does not pass through a pulley.

The *external eye-lids* are chiefly closed in birds by the elevation of the lower one, although there is an orbicular muscle which surrounds both. The inferior eye-lid is larger and thicker than the other, and contains internally an oval cartilaginous plate, under which the fibres of the orbicularis palpebrarum pass. There is also a peculiar muscle, which comes from the floor of the orbit, and acts as a *depressor* of the inferior eye-lid.

The *internal eye-lid*, or *membrana nictitans*, is a thin semi-transparent membrane, which lies close to the globe of the eye. It has a vertical position, and, when not employed, is folded back by virtue of its own elasticity, and remains concealed from view in the corner of the eye next the nose. It is, however, capable of being spread over the whole of the anterior part of the organ, by means of the combined action of two curiously contrived muscles. One of them is of a square figure, and thence called *quadratus*; it arises from the upper and back part of the eye-ball, and approaching the optic nerve, terminates abruptly in a circular edge, which contains a pulley for the passage of the tendon of the *pyramidalis*. This muscle arises from the side of the sclerotic next the nose a little inferiorly, and produces a fine tendon, which runs through the pulley formed in the free edge of the quadratus, and afterwards returns in a cellular sheath on the lower surface of the sclerotic, and becomes attached to the margin of the membrana nictitans, along which it is continued for some way, and gradually lost.

The *lacrimal gland* is small in most birds. The *glandula lacrimalis* exists, and is larger than the lacrimal. Cuvier describes it as being generally situated between the adductor and levator muscles, and as having a single excretory duct, which perforates the membrana nictitans, and discharges upon its inner surface a yellow tenacious fluid. Many *water-birds* have a hard granular body placed at the superior part of the orbit, which seems to perform the office of a lacrimal gland; and although its excretory ducts have not been yet seen, it probably furnishes a fluid of a peculiar nature, for the defence of the eye against the effects of the water and other accidents to which aquatic birds are exposed.

The figures, which serve to explain the organization of the eye, are found in *Plate XI. of the Anatomy of Birds. Fig. 1.*

shews the cornea and imbricated bony scales of the *goose*, as an example of the figure these parts commonly assume in birds. *Fig. 2.* represents the same parts in the *horned owl*, in which the cornea will be seen very prominent, and the scales greatly elongated, forming the fore part of the eye into a tube. *Fig. 3.* exhibits a lateral view of the crystalline lens and the plicated membrane in the *goose's* eye; *a* the pecten attached to the posterior part of the lens a little to one side; *b* the edge of the lens marked by the ciliary processes; *c* the anterior part, which is particularly flat in birds. *Fig. 4.* shews the pecten and the lens in the relative situation they hold in the eye of the *turkey*; *a* the plicated membrane; *b* the lens; *c* the outline of the eye; *d* the optic nerve. *Fig. 5.* is a section of the eye of the *emou*; *a a* the cut edges of the sclerotic coat; *b b* the edges of the choroides; *c* the retina; *d* the plicated membrane formed like a purse. *Fig. 6.* presents the anterior part of the eye of the *casowary*, with the membrana nictitans partially drawn over it, which is so fine a film that the parts of the eye are seen through it. *Fig. 7.* is the posterior view of the *casowary's* eye, all the muscles, &c. being removed, but those for moving the membrana nictitans: *a* the musculus quadratus; *b* the pyramidalis at its origin; *c* its tendon passing through the pulley in the edge of the quadratus; *d* the tendon proceeding on the sclerotic coat.

Organ of Voice.

Until within these late years this part of the anatomy of birds has been involved in obscurity. Although several of the older anatomists described the structure by which birds produce sound, they were ignorant of its uses, from being misled by analogy, and supposing that this organ occupied the same situation in all animals. Even some of the descriptions of the ablest of the modern anatomists have been erroneous or imperfect. The subject has been most laboriously and ingeniously investigated by Cuvier. He dissected the organs of voice of more than one hundred and sixty species of birds, and published the result of his inquiries in two memoirs; the principal one will be found in the *Magazin Encyclopedique*, tom. 2, to which we would refer the reader for numerous and minute details, that would be burdensome to introduce into the present work.

The true seat of the organ of voice in birds is at the bifurcation of the trachea, and not, as general analogy would dictate, at the superior larynx, which is in birds little more than a simple rima, or slit, formed, however, with somewhat differently shaped cartilages than belong to the rest of the trachea, and furnished with muscles for opening and closing the aperture. The mechanism of the inferior larynx, which fits it for the production of sound, depends upon the figure of its cartilages, and the expansion of its membranous parts.

The two branches of the bronchiæ are composed of semi-rings of cartilage; the internal surfaces, or those opposed to each other, being membranous. The semi-rings next the trachea are often large, and always less curved than those near the lungs. The consequence of which is, that the membranous part of the bronchiæ becomes expanded in proportion to its distance from the lungs, and towards the bifurcation usually assumes an oval figure, to which Cuvier has given the name of the *tympaniform membrane*.

Where the bronchiæ open into the trachea, there is the appearance internally of the reed of a musical instrument. This is produced by a thin and elastic fold of the inner membrane, which projects upwards from each side. The aperture is divided into two, sometimes by an osseous bar extended across from before backwards, and sometimes merely by the angle produced by the union of the two bronchiæ.

When the air is expelled from the lungs and air-cells with
force

force through the bronchiæ, a lively vibration is excited in the tympaniform membrane and the reed shaped aperture, or glottis, upon which the production of the voice essentially depends.

The magnitude, figure, and proportions of the inferior larynx vary more or less in almost every species, which Cuvier has taken great pains to point out.

The trachea is commonly enlarged, at its bifurcation, by the expansion and union of its last cartilaginous rings, which is designed to afford strength to the voice.

In the *stare* and the *singing birds* the last rings of the trachea are united into a single piece, of which the base is wide, and furnished with two points that are joined by a transverse osseous bar in such a way, that the trachea communicates by two openings with each of the bronchiæ.

In the *parrot*, the last rings of the trachea are united, and form a tube a little compressed on the sides. The very last ring is almost square; it is also flattened before and behind, and furnished posteriorly with two points. There is no partition within. The sides of the bronchiæ, opposite to each other, are membranous. The first semi-ring is large, flat, and shaped like a crescent; the second, third, and fourth semi-rings unite in one piece; and the fifth, sixth, and seventh are consolidated into a similar plate. The edges of both, however, present the marks of their original parts.

In the *nocturnal birds of prey*, the last ring of the trachea is divided by a bone.

In the *scolopax rusticola*, the four last cartilaginous rings of the trachea are incomplete posteriorly, and the tympaniform membrane is continued up between them.

The male birds of the *duck* kind, and the genus *mergus*, have the last rings of the trachea united, and forming a cartilaginous or bony sack, called by authors the *ampulla*, or the *labyrinth*. This part, in the *mallard*, forms two dilatations; the one on the right is small, and resembles a truncated cone, with a prominence from the base behind. The left is a large vesicle irregularly rounded, and produces at the lower part a pyramidal projection. Its right surface is a little flattened below, and its inferior border is indented. The cavity is interrupted by projections, or septa, in such a manner, that the air cannot pass from the left bronchia into the trachea, but through the capsule, although on the right side it may. The entrance to the bronchiæ is provided with a thick membrane, under which there are some glands resembling the *synovial*, that secrete a mucous fluid.

The form and internal partitions of the ampullæ of the *drakes* of other species and the *mergansers*, are different in every instance. Their deviations are described at length by Cuvier. See *Memoire sur le larynx inferieur des oiseaux*, *Magazin Encycopdique*, tom. 2d.

Two species of *vulture* (*V. papa* and *V. aura*) were observed by Cuvier to be deprived of the organ of voice, there being neither the tympaniform membrane, nor any contraction, or projecting elastic parts at the entrance of the bronchiæ into the trachea.

The voice of birds is modified, and the tones rendered more acute or grave, by means of two descriptions of muscles. The first are common to all species, and have been long known and described. They were called by Vic d'Azir the *inferior* or *external laryngeal*. They are two fleshy cords, and arise from the triangular processes of the sternum, to which the superior ribs are joined within the chest, and proceed to the side of the trachea, above the bifurcation, along which they ascend for its greatest length. Their effect is to depress the inferior larynx, and contract the bronchia, and thereby relax the tympaniform membrane, and deepen the tone of voice, and in some circumstances they

may also bring the trachea forwards. These were the only muscles observed by Cuvier in the *gallina*, and most of the *anferes*. It is probable, that no others are to be found also in the *struthious* birds.

The second kind of muscles are confined to the inferior larynx; they are short, and situated upon each side of the bifurcation of the trachea; and, except in the *parrot* tribe, are all constrictors, or intended to render the tympaniform membrane tense, and thus exalt the tones of voice.

In most birds, which do not sing, there is but a single pair of constrictors, one on each side, which arises from some of the last rings of the trachea, and is inserted into some of the first semi-rings of the bronchia. These muscles are longest in the *nocturnal birds of prey*, extending from the base of the trachea to the seventh semi-ring. The constrictor is attached to the fifth semi-ring in the *cuckoo*, the *heron*, and *bittern*. The latter birds owe their strength of voice to the elasticity of the semi-rings, and the extent of the tympaniform membrane. The *goat-sucker*, *king-fisher*, and *pelican*, have the constrictor muscle affixed to the second semi-ring of the bronchia; and the *woodcock*, *phalarope*, *coots*, and the *plowers*, and *recurvirostra*, and probably all the weak billed *gralla*, have it inserted into the first semi-ring.

The larynx of *singing birds*, and some others, is provided with five constrictors on each side, which Cuvier has named, according to their situation and direction.

1. The *anterior longitudinal constrictor*.
2. The *posterior longitudinal constrictor*.
3. The *small longitudinal constrictor*.
4. The *oblique constrictor*.
5. The *transverse constrictor*.

These almost surround the bifurcation of the trachea, to which they have all the same attachments, as near as may be. The two first are inserted into the third semi-ring; the two next into the second semi-ring; and the last is affixed to the first semi-ring, and particularly to a little cartilage that is joined to it.

Cuvier has observed the five pair of constrictors in all the *singing birds*, in the *stare*, in all the *passeres*, except the *swallow* and *goat-sucker*, and in the *crow*, *raven*, *jay* and many of the *pie* kind.

The most complicated instrument of voice amongst birds, is that of the *parrot* tribe. It possesses three pair of muscles; but one pair is intended to relax the opening of the glottis.

The *principal constrictor* arises from the last ring but one of the trachea, descends almost perpendicularly upon the laxator, and then goes on to be inserted into the union of the fifth, sixth, and seventh semi-rings of the bronchia. Its attachment being joined to the semicircular plate, it urges the upper part of the plate inwards, and thus contracts the glottis.

The *auxiliary constrictor* occupies, for a certain distance, the anterior part of the trachea, and sends off a tendon, which is lost in the preceding muscle; its operation therefore, is exactly the same.

The *laxator* is placed under the two other muscles; it arises along the side of the trachea, and expands upon the inferior concave edge of the last ring; in drawing which outwards, the muscle enlarges the glottis.

See *Plate XI. in the Anatomy of Birds. Fig. 8.* shews the external appearance of the inferior larynx in the *owl*; *a* the lower part of the trachea; *b* the two bronchiæ; *c* the external laryngeal muscles, which are common to all birds; *d* the constrictor. *Fig. 9.* of the same plate exhibits the organ of voice in the *thrush*; *a* the anterior longitudinal constrictor; *b* the transverse constrictor partially exposed under

under it; *c* the posterior longitudinal constrictor, detached at one extremity, and turned outward: and *Fig. 10.* affords another view of the same subject: the posterior longitudinal constrictor is turned down to expose those that lie behind it; *a* the little longitudinal constrictor; *b* the oblique constrictor. *Fig. 11.* of *Plate X.* represents the anterior part of the organ of voice in the *parrot*; *a* the principal constrictor; *b* the auxiliary one; *c* the laxator: and *Fig. 12.* gives a lateral view of the same parts, which are indicated by corresponding letters.

The *trachea*, in several birds, is found to assume singular forms, and to suffer enlargements at particular places. These have long attracted the attention of naturalists. Some of the best observations on the subject have been made by Dr. Bloch of Berlin, and by Pallas, Silberfeld, Beckmann, and Otto, who have each published in the Berlin Transactions, *See Besch. des Berl. Nat. F. i. ii. iii. & iv.* But by far the most copious account of the peculiarities of the trachea of birds, has been given by Dr. Latham in the Linnæan Transactions, vol. iv. p. 90.

The deviations from the common structure of the trachea, have been divided by Dr. Latham into two kinds. In one the windpipe does not alter its capacity, but possesses an unusual length, which is disposed of either in convolutions on the outer part of the body underneath the integuments, or in a cavity formed within the sternum for the purpose. The other kind of deviation consists in dilatations occurring either at the bifurcation of the trachea, or both there and in the middle of the tube.

The trachea of the *wood grouse*, when arrived at the crop, takes a bend upwards for a little way, and again turns down, and pursues its course to the lungs. There has been no peculiarity observed in the other birds of this genus which visit this kingdom.

In the *marail turkey* (*penelope marail.*) the trachea makes a round turn on the outside of the top of the sternum, and then enters the chest.

In the *male parrake pheasant*, the wind-pipe descends under the skin more than half the length of the body, before it returns to enter the thorax.

The *guan* (*penelope cristata*) has the trachea still longer than the preceding. It passes to the very bottom of the belly, and then turns up again, before it makes the double. See *Plate XI.* in the *Anatomy of Birds*, *fig. 13.*

The *Indian cock* was observed by the academicians to have a degree of convolution in the trachea, which varies somewhat in different individuals.

The *cassero curaffow* has the most remarkable convolutions of the trachea. It first descends upon the right pectoral muscle to the end of the sternum, where it makes a convolution to the left, something in the shape of a ring, after which it returns to the right pectoral muscle, and goes over the clavicle into the thorax.

The *semi-palmated goose* of *New Holland* has an extensive convolution of the trachea under the skin. Its note is said to be very musical.

The *ardea virgo*, the *wild* or *whistling swan*, and the *crane*, have the winding of the trachea accommodated in the keel of the sternum. It is singular that this structure does not exist in the *tame swan*, which in other respects so much resembles the wild bird. See *Plate XI.* in the *Anatomy of Birds*. *Fig. 14.* shews those parts in the *wild swan*; *aaa* the sternum cut open to expose the cavity which lodges the trachea; *bbb* the trachea; *cc* the fork; *dd* the clavicles. The above structure belongs to both sexes.

The dilatations of the trachea are confined to two genera,

anas and *mergus*; and, as already observed, are only to be met with in the male birds.

The bony enlargements at the bifurcation into the bronchia, which are called *ampulle*, or *labyrinths*, exist in every species of duck and merganser. They consist of two cells, one in general much larger than the other. In some instances the parietes of the cells are in a great measure formed by a membrane spread across it, like the head of a drum. There is also a bony arch turned across to give it length. This is the case in the *scamp duck*, the *poehard*, *tufted duck*, the *smew*, &c. See *Plate XI.* *Fig. 15.* is the end of the wind-pipe of the *poehard* (*anas ferina*).

The trachea of the *golden eye duck* is very curious. The labyrinth is more complicated than usual; and there is a singular enlargement in the middle, which is formed by cartilaginous joints, or plaits, placed obliquely, and folding over each other, so that the part admits of being contracted and lengthened, as the motions of the neck may require.

The *velvet duck* is distinguished by two very remarkable osseous enlargements, one is situated immediately below the superior larynx, and another in the middle of the wind-pipe. The lower part does not form the usual ampulla, but the bronchiæ become for a little way bony canals. See *Plate XI.* in the *Anatomy of Birds*. *Fig. 16.* represents the trachea of the *velvet duck*; *a* the superior, or laryngeal osseous cell; *b* the bony cavity of the middle; *cc* the osseous parts of the bronchiæ.

The *red-breasted merganser* has the middle of the trachea formed like that of the *golden eye duck*, only the plaits are made of bone, and curiously furrowed; indeed all the trachea of the mergansers, as Dr. Latham observes, consists of little else than bone.

A very little comparison of the mechanism of wind musical instruments with the organs of voice in birds, will shew how nearly they are allied to each other; and it may be observed, that the sound produced by some of the larger birds is exactly similar to the notes that proceed from a *clarionet* or *hautboy* in the hands of an untutored musician. The inferior glottis exactly corresponds to the reed, and produces the tone or simple sound. The superior larynx gives it utterance as the holes of the instrument; but the strength and body of the note depend upon the extent and capacity of the trachea, and the hardness and elasticity of its parts. The convolution and bony cells of the wind-pipe, therefore, may be compared to the turns of a *French horn*, and the divisions of a *basoon*; and they produce the proper effects of these parts in the voices of those birds in which they are found.

BIRD, in *Astronomy*, *Avis Indica*. See *AVUS*.

BIRD of *Phœbus*, the *Raven*, one of the southern constellations. See *CORVUS*.

BIRDS, in *Ancient Augury*. Prescience, or knowledge of futurity, was supposed, among the ancients, a natural faculty of birds, owing, perhaps, to their nearer intercourse with heaven, or their breathing a purer and more celestial air than other animals. Hence it was, that divination by birds obtained among the ancient Greeks and Romans, being performed by observing, and interpreting the flight, chirping and feeding of divers birds. (See *AUGURY*.) Birds, with regard to augury and divination, were of divers kinds, viz. *Aves auspicate*, or *felices*, those which naturally portended good: such were the dove, swan, &c. *Aves inauspicate*, or *diræ*, *ominose*, those which boded some evil or mischief: such were the kite, raven, crow, and owl, every where, except at Athens. *Admissiva*, that which excites and encourages the consulter to execute what he has in view. *Arcina* or *arcula*, that which forbid a thing to be done; otherwise called

called *clivia*, *clamatoria*, and *prohibitoria*, *inebra*, and *inhiba*. *Incendiaria*, that which gave omen of a fire, or other calamity; or which is seen carrying a firebrand from the funeral pile to a house. *Remora*, that which stays or delays an action. *Sinistra*, that on the left hand, denoted a happy or prosperous omen; and was also called *secunda*, *prospera*. *Alites*, those which gave omens by their wings and flight. *Ofcines*, those by their singing or chirping. *Pulli*, by their pecking. *Præpætes*, those which by their flight, or perching, gave happy omens. *Inferæ*, or *inebræ*, those which in like manner gave ill omens.

BIRD, WILLIAM, in *Musical Biography*. This worthy and admirable scholar of the profound Tallis, is supposed to have been the son of Thomas Bird, one of the gentlemen of Edward the sixth's chapel, in which he was himself a singing-boy. By the great number of his ecclesiastical compositions to Latin words, and the several portions of the Romish ritual which he so frequently set to music, and published late in life, he seems to have been long a zealous adherent to that religion. He must, however, have conformed to the church establishments of queen Elizabeth's reign; for, in 1563, he was chosen organist of Lincoln cathedral, where he continued till 1569, when, upon the accidental death of Robert Parsons, who was drowned at Newark-upon-Trent, he was appointed gentleman of the chapel royal. Notwithstanding which office, he seems to have composed the chief part of his Choral Music to Latin words, and to have published it in that language, as late as the middle of the reign of king James I.

In 1575, it appears by the title-page of the "Cantiones Sacræ," and the patent annexed to that work, that he and Tallis were not only gentlemen of the royal chapel, but organists to her majesty queen Elizabeth. Indeed both must have been great performers on the organ, to have been able to play such of their pieces for that instrument as are still preserved; in which the passages, though awkward to performers who are only accustomed to modern music, must have been suggested by persons that were habituated to the complicated, and now, almost, invincible difficulties of the sixteenth century. And though the compositions for keyed-instruments by these great masters of harmony, are totally unimpassioned, and without grace, it is impossible not to regard their ingenuity and contrivance in the texture of the parts, with respect and wonder!

If we consider the elaborate style of composition which prevailed, particularly in the church, during the time of Bird, and that he, like his master Tallis, was not only ambitious of vanquishing its usual difficulties in the construction of fugues and canons, but sought new complications, perplexities, and involutions in the motion and arrangement of the parts, the following list of his works will not only manifest diligence, but fecundity.

Besides the great share he had in the "Cantiones Sacræ," published in conjunction with his master Tallis, in 1575, when his name first appears as an author; and without enumerating many admirable compositions for the church and chamber, still subsisting, but which were never printed, or, at least, not till after his decease, he published "Psalms, Sonnets, and Songs of Sadness and Piety," of five parts, 1588; "Liber primus sacrarum Cantionum, quinque vocum," 1589; "Songs of sundrie Natures, some of Gravitie, and others of Myrth, fit for all Companies and Voyces," 1589; "Gradualia ac Cantiones Sacræ, Lib. primus et secundus," 1607 and 1610. The last work published by himself, was entitled, "Psalms, Songs, and Sonnets: some solemn, others joyful, framed to the Life of the Words, fit for Voyces or Viol, of three, four, five, and six partes,"

1611. Dr. Tudway's collection, in the British Museum, contains a whole service in D minor, by Bird, with responses, and the anthems, "Sing joyful unto God,"—"O Lord, turn thy Wrath,"—(all published in the second and third volumes of Dr. Boyce's Cathedral Music.)—"O Lord, make thy Servant;" "Save me, O God;" "Prevent us, O Lord;" "Civitas sancti tuo." one of his Sacrarum Cantionum, or Sacred Songs, published 1589, has been long sung in our cathedrals to the English words, "Bow thine ear, O Lord," and is one of the admirable pieces of harmony in the second volume of Boyce's printed collection.

Dr. Aldrich, who was a great admirer and collector of the works of Bird, and who adapted English words to most of his compositions which have been used in our cathedrals, and that were originally set to parts of the Romish service, in Latin, has bequeathed to Christ Church, Oxon, beautiful and correct copies of most of his productions, in a set of books, small 4to. In this library near forty of his compositions are preserved; and in another set, many more, with those of Tallis, Taverner, Tye, White, Redford, both the Mundys, Shepherd, Bull, and other contemporary English masters.

Bird's pieces for the organ and virginals are almost innumerable. In a magnificent folio manuscript, curiously bound in red morocco, formerly in Dr. Pepusch's collection, which is generally known by the name of "Queen Elizabeth's Virginal Book," there are near 70 of his compositions.

The first piece by Bird, in this book, and the eighth in the collection, is a Fantasia, which generally implies a Fugue, in which the subject is as frequently changed as in ancient Choral Music, where new words require new accents and intervals; for as yet, it was not the custom in composing fugues to confine a whole movement to one theme: and here Bird introduces five or six, wholly different and unconnected with each other.

The subject of the second composition, by Bird, in the Royal Virginal Book, is the tune of an old ballad, "John come kiss me now;" of which, with great labour and ingenuity, he has varied the accompaniments sixteen different ways; for while the treble, base, or some inward part, is always playing the original air, three other parts are moving in fugue, or running rapid and difficult divisions. No. 52, is another Fancie; and 56, a Pavan, by Bird; which implied a grave majestic dance, in common time, similar to the movement of the peacock. This strain was usually followed by the Galliard; which, on the contrary, was a gay and lively dance, in triple time, but on the same strain as the preceding Pavan. No. 58, is entitled, "The Peacock's Whistle." From No. 58 to 69, the compositions are all by Bird; consisting chiefly of old tunes, with variations; among which is "Fortune," a plaintive and expressive melody, to which the ballad, called "Titus Andronicus's Complaint," inserted in Reliques of ancient English Poetry, vol. i. p. 204, was originally written. It has been imagined that the rage for variations, that is, multiplying notes, and disguising the melody of an easy, and, generally, well-known air, by every means that a *spacca nota*, or note splitter, sees possible, was the contagion of the last century; but it appears from the Virginal Book, that this species of influenza, or corruption of air, was more excessive in the sixteenth century, than at any other period of musical history.

Crowded and elaborate as is the harmony, and uncouth and antiquated the melody, of all the pieces in this collection by various composers, there is a manifest superiority in those of Bird over all the rest, both in texture and design. In a later age his genius would have expanded in works of invention, taste, and elegance; but, at the period in which

he flourished, nothing seems to have been thought necessary for keyed-instruments, except variations to old tunes, in which all the harmony was crowded, which the fingers could grasp, and all the rapid divisions of the times, which they could execute. Even nominal fancies were without fancy, and confined to the repetition of a few dry and unmeaning notes in fugue, or imitation. Invention was so young and feeble, as to be unable to go alone; and old chants of the church, or tunes of the street, were its leading-strings and guides.

Though the reformation had banished superstition from the land, fragments of *canto fermo*, like rags of popery, still remained in our old secular tunes, and continued to have admission in the new. Indeed the melodies of all the rest of Europe had no other model than the chants of the church, till the cultivation of the musical drama; whence all the rhythm, accent, and grace of modern music, have manifestly been derived.

Besides the great number of Bird's compositions for keyed-instruments, which are preserved in the Virginal Book of queen Elizabeth, another manuscript collection of his pieces still subsists, under the title of "Lady Nevil's Music Book." It is a thick quarto, very splendidly bound and gilt, with the family arms beautifully emblazoned and illuminated on the first page, and the initials HN at the lowest left hand corner. The music is all written in large, bold characters, with great neatness, on four staved paper, of six lines, by Jo. Baldwin, a singing-man at Windsor, and a celebrated copyist of queen Elizabeth's time. The pieces contained in this collection, sixteen of which are entered in that queen's virginal book, amount to forty-two, with variations to many of them, of the most laboured and difficult kind. The notes, both white and black, are of the lozenge form, like those of the printed music of the same period.

Lady Nevil seems to have been the scholar of Bird, who professedly composed several of the pieces for her ladyship's use.

None of Bird's pieces for keyed-instruments seem to have been printed, except eight movements in a thin folio book of lessons that was engraved on copper, and published in the reign of king James I. under the following title: "Parthenia, or the Maidenhead of the Musicke that ever was printed for the Virginals. Composed by three famous masters: William Bird, Dr. John Bull, and Orlando Gibbons, gentlemen of his majesty's most illustrious chappel." These lessons, though not equally difficult with some of those in the Virginal Books of queen Elizabeth and lady Nevil, are rather more dry and ungraceful.

The canon, *Non nobis Domine*, appears in none of his works published by himself, or collected by others, before the year 1652; when Hilton inserted, and prefixed the name of Bird to it, in a collection of catches, rounds, and canons. But as no claim was laid to it by, or in favour of, any other composer, before or since that time, till about the middle of the last century, when it was given to Palestrina by Carlo Ricciotti, who published, in Holland, among his concertos, a fugue in eight parts, on the same subject, there seems no doubt remaining of our countryman Bird having been the author of that pleasing and popular composition.

Bird died in 1623, surviving his master Tallis thirty-eight years; and if we suppose him to have been twenty in the year 1563, when he was chosen organist of Lincoln, he must have been eighty at his decease. Peacham, in his *Complete Gentleman*, speaks of him with great reverence; "For

Motets and Musicke of piety and devotion, as well for the honour of our nation, as the merit of the man, I preferre above all others our Phœnix, Master William Byrd, whom in that kind I know not whether any may equal. I am sure none excell, even by the judgement of France and Italy, who are very sparing in their commendation of strangers, in regard of that conceipt they hold of themselves. His Cantiones Sacræ, as also his Gradualia, are meere angelicall and divine; and being of himselfe naturally disposed to gravity and piety, his veine is not so much for light madrigals or canzonets; yet his Virginella, and some others in his first set, cannot be mended by the first Italian of them all." *Second Impression*, p. 100. His pupil, Morley, in his *Introduction*, every professor and musical writer of his own and later times, never mention him but with the highest respect. At this remote period but little, however, can be known of his private life, which was too studious and sedentary to have furnished history, at any time, with events of general interest. With respect to what Ant. Wood asserts in his *Fasti*, that "Bird was excellent in mathematics," it is, in his usual way, supported by no proof: and indeed mathematics have so little to do with practical music, either in composition or performance, that those musicians, who are most ignorant of the ratio or philosophy of sounds, seem constantly to have arrived at the highest degree of excellence in the selection, combination, and refinement of them in practice, by the mere assistance of experience, and the gift of good ears and powerful voices. That he was a diligent cultivator of his art appears from his numerous works, which are more the productions of meditation and study than of haste and enthusiasm. That he was pious, the words he selected, and the solemnity and gravity of style with which he set them, sufficiently evince. Of his moral character, and natural disposition, there can, perhaps, be no testimonies more favourable, or less subject to suspicion, than those of rival professors, with whom he appears to have lived during a long life with cordiality and friendship. And, of the goodness of his heart, it is, to us, no trivial proof, that he loved, and was beloved, by his master, Tallis, and scholar, Morley; who, from their intimate connexion with him, must have seen him *en robe de chambre*, and been spectators of all the operations of temper, in the opposite situations of subjection and dominion.

Indeed, the best memorials of a professional man's existence are his surviving works; which, from their having been thought worthy of preservation by posterity, entitle him to a niche in the Temple of Fame, among the benefactors of mankind. The physician who heals the diseases, and alleviates the anguish of the body, certainly merits a more conspicuous and honourable place there; but the musician, who eminently fooths our sorrows, and innocently diverts the mind from its cares during health, renders his memory dear to the grateful and refined part of mankind, in every civilized nation.

BIRD cherry, in Botany. See PRUNUS Padus.

BIRD'S eye. See ADONIS.

BIRD'S foot. See ORNITHOPUS.

BIRD'S foot trefoil. See LOTUS.

BIRD'S nest, a name used by some for the daucus, or carrot; and by others for ophrys.

BIRD'S nest purple. See ORCHIS.

BIRD pepper. See CAPSICUM.

BIRD'S tongue. See SENECIO.

BIRDS, Canary. See CANARY birds.

BIRD of the wise, among Alchemists, is the philosophical mercury; and, in general, sublimate or substances spiritualized by the separation of their terrestrial part.

BIRD, golden, the hermetic matter partly matured.

BIRD, green, the philosopher's stone, at the time when its green colour appears.

BIRDS, Cyprian, aves Cypricae, or aviculae Cypricae, is a denomination given to a kind of odorous candles, made of the matter of troches, and burnt for the sake of their fumes, called also, from their figure, *laculi*, or *flicks*.

BIRD of Hermes, avis, or avicula Hermetica. Alchemists speak much of that which flies in the night without wings. Some will have the *avicula Hermetica* to be an universal salt prepared from dew.—It also denotes red-lead.

BIRDS, decoy, are those which are trained up to call and allure others into the fowler's nets, snares, lime-twigs, or the like. See **DECOY**.

BIRDS, Humming. See **HUMMING-bird**.

BIRDS, in Domestic Economy, and in reference to their use as aliments. See **FOWL**.

BIRD, in Falconry, denotes a hawk, or falcon. See **FALCON**. *Nides birds, aves nidularia*, denote those taken while in the nest. *Ramage birds, arborariae aves*, are those only arrived at strength sufficient to fly from branch to branch. *Hazard bird*, is that which has lived at liberty, and is thence more wild and untractable. *Bird of the fist*, is that which having been reclaimed, returns to, and perches on the hand, without the help of a lure. *Bird of lure*, signifies that which comes to the lure, and by that means to the hand. *Bastard bird*, a hawk, for instance, bred of a hawk and a lanier; or a faker, bred of a faker and a lanier. *Coward birds*, those which only pursue their game for their own belly, and which are not to be reduced to just sport; as ravens, kites, &c.

BIRD, in Geography, the name of a small island in Dunmannus bay, in the county of Cork, Ireland.—Also, another small island in Strangford lough, and county of Down.—Also, one of the Bermudas islands.—Also, a small island in the gulf of St. Lawrence, 21 leagues W. of cape Anguilla on the island of Newfoundland. N. lat. 47° 55'. W. long. 60° 45'.—Also, an island in the southern Pacific Ocean, discovered by capt. Cook, in 1769, in his voyage from Cape Horn to Otaheite, covered with verdure, and inhabited. S. lat. 17° 48'. E. long. 216° 24'.—Also, an island in the southern Pacific Ocean, near the north-west coast of the island of New Georgia, discovered by capt. Cook in 1775. S. lat. 54°. W. long. 38° 22'.—Also, an island of the same ocean, discovered, in 1788, by the commander of the Prince of Wales, and so called from its being the resort of many birds. This solitary island, or rather single rock, rising out of the immense ocean, was particularly examined by Vancouver in 1794. Its greatest extent, in a direction S. 74 W. and N. 74 E. did not exceed one mile; and its northern, eastern, and western extremities, against which the sea broke with great violence, presented a very awful appearance, rising perpendicularly from the ocean in lofty rugged cliffs, inaccessible except to its winged inhabitants; on its southern side the ascent is not so steep and abrupt; and near its western extremity is a small sandy beach, where, in fine weather, and with a smooth sea, a landing might probably be effected. At this place was the appearance of a little verdure, though it was destitute of tree or shrub; every other part was apparently without soil, and consisted only of the naked rock. The whole circumference does not exceed a league, and it is situated in N. lat. 23° 6'. E. long. 198° 8'. It lies from Onehow, one of the Sandwich islands, N. 51 W. at the distance of 39 leagues; it is recognized by the natives of those islands under the appellation of "Modoo Mannoo," that is, bird island; and from its great distance from all other islands, and its proximity to their islands, it seems to claim some pretensions to be ranked in the group of the Sandwich islands;

which see.—Also, a small island near the north-east coast of New Holland, lying low and almost covered with birds; 4 leagues N. W. from cape Grenville. For other islands under this denomination; see **AVES**.

BIRD fort, an American fort on Monongahela river; 40 miles south of Fort Pitt.

BIRDS-Key, or Round island, a small island, or rock, among the Virgin islands, in the West Indies; 2 leagues S. of St. John's island; and 3 N. E. from St. Croix, or Santa Cruz. N. lat. 17° 55'. W. long. 64° 36'.

BIRDS, Message, aves internunciae, denote those that are employed to convey letters or other dispatches, either for the sake of expedition or safety. See **CARRIER PIGEON** and **ALEPPO**.

BIRD, mocking, the *turdus polyglottus*; which see. See also **MOCK bird**.

BIRD bolt, in *Heraldry*, is a small arrow with a blunt head, and often represented in armory, with two and sometimes three heads rounded, but in that case the number of heads must be noticed.

BIRD call, a small stick cleft at one end, in which is put a leaf of some plant, that serves to counterfeit the call of several birds, and to bring them to the net, snare, &c. by which they are taken. A laurel leaf fitted on the bird-call counterfeits the voice of lapwings, a leek that of the nightingale, &c. See **CALL** and **BIRD-catching**.

BIRD Catching, in its most comprehensive sense, denotes the art of taking birds or wild-fowl, either for food, or for enjoying the pleasure of their song in cages, or for preventing the destruction which some species of them occasion to the husbandman. Some recur to it as an amusing pastime, and others practise it as a profitable employment; and with a view to one or other of these objects, various modes of taking birds have been adopted, and the practice is in some places reduced to a kind of system. One of these methods is denominated **BAT-FOWLING**, or, as some term it, *Bat-folding*. For this purpose, five or six persons commonly provide themselves with a large net, expanding, when open, to the extent of a man's arms, and about three yards high, and formed of meshes so small as not to allow the escape of the smallest bird. The extremities of the net are attached to two poles, held one in each hand of the person who has the management of it. With this, and a large lantern affixed to a pole, the party proceeds to corn-fields, out-houses, yew-hedges, thatched buildings, &c. The cords of the net being separated to their utmost extent, it is placed before any spot where birds are supposed to roost, and the light being held before the centre of the net, the assistants in this operation beat the hedges, ricks, eaves, &c. with poles; and the birds, thus alarmed, fly towards the light, upon which the person who holds the net claps its poles together, and encloses the birds. From the latter circumstance, the net is called a *clap net*. Sparrows, larks, thrushes, and the other small birds, are thus caught in great numbers in dark nights. Another method of bat-fowling, is performed by means of a long net drawn over the ground, followed by a person bearing a light; and this net, in its passage, encloses and confines any birds that happen to be under it. But one of the most ingenious and systematic methods of bird-catching, is practised principally in the vicinity of London, by persons who find a ready market for birds used as food, or who deal in song-birds, which, at certain seasons of the year, change their situation, and are hence denominated birds of flight, in the language of this art. The birds usually taken on such occasions, are wood-larks, titlarks, linnets, aberdavines, gold-finches, and green-finches. They are principally

pally taken during what is called their flight, or while they congregate for the purpose of propagating their species. The wild birds begin to fly in the month of October, and part of the preceding and following months; and the flight in March is much less considerable than that of Michaelmas. It is to be noted also, that the several species of birds of flight do not appear exactly at the same time, but follow one another in succession. The pipit, which is a small species of lark, inferior in its song to other birds of that genus, begins his flight, every year, about Michaelmas; and then the wood-lark, linnet, gold-finch, chaffinch, green-finch, and other birds of flight succeed; all of which are not easily to be caught, or in any numbers, at any other time, particularly the pipit and the wood-lark. These birds, during the Michaelmas and March flights, are chiefly on the wing from day-break to noon, though there is afterwards a small flight from two till night; but this is so inconsiderable, that the bird-catchers always take up their nets at noon. Another circumstance worthy of notice is, that, during their sitting, they always fly against the wind; hence the bird-catchers eagerly contend for that point; so that if it be westerly, the bird-catcher, who lays his nets most to the east, is sure almost of catching every thing, provided that his call-birds are good: a gentle wind to the south-west generally produces the best sport. The nets used by the bird-catchers are about 12 yards long, and 2½ wide; which are known in most parts of England by the name of "day-nets," or "clap-nets," but the best are those that are used in the neighbourhood of London. These nets are spread upon the ground parallel to one another, and at such a distance, that when turned over, they shall coincide. The remaining apparatus consists of lines so fastened to the nets that the bird-catcher is able, by a sudden pull, to draw the net over the birds that may have alighted in the space between their parallel sides. These birds are enticed to alight by others usually denominated "call-birds," of which there are generally five or six linnets, two gold-finches, two green-finches, one woodlark, one red-pole, a yellow hammer, a titlark, and an aberdavine, and perhaps a bull-finch. These are placed at small distances from the nets in little cages. Besides these, the bird-catcher has others called "flur-birds," which are placed within the nets, raised upon the flur, and gently let down at the time the wild birds approach them. This "flur" is a moveable perch to which the bird is tied, and which the bird-catcher can raise or depress at pleasure, by means of a long string fastened to it. These flur-birds generally consist of the linnet, the gold-finch, and the green-finch, which are attached to the flur by what is called a "brace," which secures the birds without injuring their plumage. This brace is a sort of bandage, formed of a slender silken string, that is fastened round the body of the bird, and under the wings in such a manner as to prevent the bird's being hurt, however it may flutter when it is raised. The call-birds are particularly trained for the service to which they are appropriated. Accordingly, the bird-catchers contrive to improve the song of these birds, by causing them to moult before the usual time. For this purpose, they put them, in June and July, into a close box, under two or three folds of blankets, and leave their dung in the cage to increase their heat; and in this state they continue, being, perhaps, examined once a week to have fresh water. The air of the cage is so putrid, that they want little or no food, as they eat scarcely any thing during the whole period of their confinement, which is about a month. The birds frequently die under this operation; and on this account the "stopped bird," as it is called, is the more valuable. When the bird hath thus prematurely moulted, he is "in song," while the wild

birds are "out of song;" and his note is louder and more piercing than that of a wild one; and his plumage is by this process equally improved. The black and yellow in the wings of the gold-finch, for example, become deeper and more vivid, and acquire a very beautiful gloss, which is not to be seen in the wild bird. The bill, which in the latter is likewise black at the end, becomes in the "stopped bird" white and more taper, as are also its legs; and, in short, there is as much difference between a wild and a stopped bird, as there is between a horse, which is kept in bodycloths, and one at grass. When the bird-catcher hath laid his nets, he disposes of his "call-birds" at proper intervals; and Pennant observes, that a malicious joy appears in these call-birds, to bring the wild ones into the same state of captivity; and this is also the case with regard to the decoy ducks. After they have seen or heard the approach of the wild birds, which they observe long before it is perceived by the bird-catchers, the intelligence is announced from cage to cage, with the utmost ecstacy and joy. The note, by which they invite them down, is not a continued song, like what the bird uses in a chamber; but "short jerks," as they are called by the bird-catchers, which are heard at a great distance. So powerful is the ascendancy of this call over the wild birds, that the moment they hear it, they alight on a spot, within twenty yards of three or four bird-catchers, which otherwise would never have attracted their notice. It also frequently happens, that if, by pulling the string, half a flock only should be caught, the others who have escaped, will immediately return to the nets, and share the fate of their companions; and if only one bird should escape, that bird will still venture into the scene of danger, till it be caught; such is the fascinating power which the call-birds possess with regard to the others. A bird, acquainted with the nets, is by the bird-catchers termed a "sharper;" and this bird they endeavour to drive away, as they can have no sport, while it continues with them. These sportsmen frequently lay considerable wagers, whose call-bird can "jerk" the longest, as this circumstance determines their superiority. With this view, they place them opposite to each other, near an inch of candle, and the bird that jerks the oftent, before the candle is burnt out, wins the wager. Some birds have given 175 jerks in a quarter of an hour, and a finch has been known, in such a trial, to persevere in its emulation, till it swooned from the perch; thus, as Piny (l. x. c. 29.) says of the nightingale, "*victra morte finit sepe vitam, spiritu prius decedente quam cantu.*"

It is observable, that bird catchers immediately kill the hms of every species of birds they take, as they are incapable of singing, and inferior in plumage. The pipits, likewise, are indiscriminately destroyed, as the cock does not sing well. The dead birds are commonly sold for three-pence or four pence a dozen. The flesh of these is regarded as a delicate acquisition at the tables of the luxurious; and yet the taste for small birds is far from being so prevalent in England as it is in Italy, where they are eaten under the name of "beccaficos." However, the luxury of the modern Italians will appear to be parsimonious, when compared with the extravagance of their predecessors the Romans. (See *Clodius Aesop.*) The highest price given for singing birds in London, Mr. Pennant informs us, is about five guineas; this sum having been paid for a chaffinch, that had a particular and uncommon note, under which it was intended to train others, and five pounds ten shillings have been given for a call-bird linnet.

Mr. Pennant informs us, that when the titlarks are caught in the beginning of the season, it frequently happens, that 40 are taken without one female; the case is the same with the wheatear, and probably with respect to other birds: and this

this circumstance confirms the observation of Linnæus, that the male chaffinches fly by themselves, and the flight precedes the females; and the fact extends to other birds. Such birds as breed twice a year have generally in their first brood a majority of males, and in their second of females.

As the bull-finch, though it is not properly either a singing bird, or a bird of flight, its range being merely from hedge to hedge, fetches a good price on account of its learning to whistle tunes, and as it sometimes flies over the fields where the bird-catchers lay their nets, they have often a call-bird to ensnare it, though most of them can imitate the call with their mouths. It is a peculiarity with regard to this bird, that the female answers the purpose of a call-bird, as well as the male, which is not to be experienced in any other bird taken by the London bird-catcher. The nightingale, though distinguished as a singing-bird, moves only from hedge to hedge, and does not take the periodical flights of other birds in October and March; and therefore it is not classed by the bird-catchers among the birds of flight. The persons who catch these birds, make use of small trap-nets, without call-birds, and are considered inferior in dignity to other bird-catchers, who will not rank with them. The arrival of the nightingale is expected by the trappers in the neighbourhood of London the first week in April; at first, none but cocks are taken, but in a few days the hens make their appearance, generally by themselves, though sometimes a few males come along with them. They are caught in a net-trap, the bottom of which is surrounded with an ironing; and the net itself is somewhat larger than a cabbage-net. When the trappers hear or see them, they strew some fresh mould under the place, and bait the trap with a meal-worm from the baker's shop. In this way ten or twelve nightingales have been caught in a day. Pennant's Zool. vol. ii. Append.

Birds are caught in traps of various kinds; and frequently by nooses of hairs. In this way, great numbers of wheat-eaters are annually taken on the various downs of England. Small holes are dug by the shepherds in the ground, in each of which is placed a noose. Whenever a cloud obscures the sun, these timid birds seek for shelter under a stone, or creep into any holes that present themselves; and they are thus ensnared by the nooses which fasten around their necks. Woodcocks and snipes are taken likewise by nooses of horse-hair placed along their paths, in marshes and moist grounds. Wild ducks in all their varieties are taken in vast numbers every winter on our coasts by means of decoys. (See DECOY.) Grouse and partridges are taken by means of nets, either at night when resting on the ground, by observing where they alight, and when settled, drawing a net over that part of the field; or, in the day, a very steady dog is used to point at them. The attention of the birds being thus fixed, two persons, drawing the two extremities of a large net, pass it over them, and thus secure a whole pack of grouse, or covey of partridges at once. Pheasants are sometimes taken by night, by holding flaming sulphur under the trees on which they are observed to perch, the suffocating effluvia of which make them fall senseless. Mons. Pratty informs us, that, during his travels in North America, he took great numbers of the passenger-pigeon in a similar manner. For various methods of taking larks; see ALAUDA. For the use of bird-lime among bird-catchers; see BIRD-LIME.

In various parts of the world, peculiar modes are adopted for ensnaring and taking birds, some of which, whilst they are hazardous to those who practise them, excite no inconsiderable degree of surprise, and even of anxiety, in the spectators. Thus, in the Orkney islands, where the birds that

inhabit the rocks, and the eggs which they deposit among the cliffs, supply the principal food of many among the poorer inhabitants, the intrepid and adventurous fowlers climb rocky precipices more than fifty fathoms above the sea, and pass from one shelf or ledge to another, whose breadth is barely sufficient for resting places to the birds, which deposit their eggs upon them. In this hazardous employment, the adventurers are commonly lowered from above by means of a rope, formed often of brittle materials, and held by a single assistant. Fastened to this rope, the intrepid peasant descends, and searches all the cavities for eggs, springing from one projecting ledge to another, by the help of a pole, whilst the assistant, upon receiving the necessary signals, shifts the rope from one part of the rocky precipice to another. If the weight of the fowler and of his booty should, in these perilous circumstances, overpower his associate above, or the craggy rock cut the rope, inevitable destruction must await the adventurer; for he will either be dashed against the projecting rock, or drowned in the subjacent sea. But the most singular species of bird-catching is in the holm of Nofs, which is a huge rock severed from the isle of Nofs by some unknown convulsion, and distant from it about 16 fathoms. The opposite cliffs are separated by the raging sea. The adventurer, having reached the rock in a boat, and ascended to the top of it, fastens several stakes in the shallow soil that is found on the surface of the rock; and similar stakes are also attached to the edge of the corresponding and opposite cliff. A rope is then fixed to the stakes on both sides, upon which a machine, called a cradle, is contrived to slide; and by the help of a small parallel cord fastened in like manner, the daring adventurer wafts himself over, and returns with his booty.

In the Feroe islands the method of bird-catching is more extraordinary and hazardous than any which has already been recited. The cliffs, to which the fowlers recur, are in many cases 200 fathoms high; and they are traversed both from above and below. In the first case, the fowlers provide themselves with a rope 80 or 100 fathoms long; and the adventurer fastens one end about his waist and between his legs, and having recommended himself to the protection of the Almighty, he is lowered down by six associates, who place a piece of wood in the margin of the rock, that the rope may be preserved from being fretted and broken by its sharp edge. To his body is fastened a small line, which serves for enabling him to give the necessary signals, when he wishes to be raised or lowered, or shifted from one place to another. In changing his situation, he is exposed to the hazard of injury from loosened and falling stones, which, falling on the head, must inevitably destroy him, if he were not in some degree protected by a strong thick cap. The fowlers, by their astonishing dexterity, contrive to place their feet against the front of the precipice, and to dart themselves some fathoms from it, for the purpose of surveying the roosting places of the birds, and projecting themselves into the deep recesses, where they lodge. There the fowler alights; and disengaging himself from the rope, which he fixes to a stone, collects the booty at his leisure, attaches it to his girdle, and when this is done, resumes his suspended posture. He will also, when occasions require it, spring from the rock, and in this attitude, by means of a fowling net, fixed to the end of a staff, catch the old birds which are flying to and from their retreats. When this hazardous operation is finished, he gives a signal to his companions above, who pull him up, and divide the booty. The feathers are preserved for exportation; the flesh is partly eaten fresh, and the greater

greater part is dried for winter's provision. In fowling from below, the party have recourse to a boat, and when they have arrived at the base of the precipice, one of the most intrepid of them fastens a rope about his waist, and being furnished with a long pole, with an iron hook at one end, either climbs, or is thrust up by his companions, who place a pole under him, to the next footing spot within his reach. By means of the rope he hoists up one of the boat's crew; and the rest are drawn up in the same manner, each of them being furnished with his rope and fowling-staff. They then pursue their journey upwards till they arrive at the region of birds; and they wander about the cliff in search of them. They next act in pairs; one fastens himself to the end of his associate's rope, and, in places where birds have nested beneath his footing, he suffers himself to be lowered down, depending for safety on the strength of his companion, by whom he is again hauled up; but it sometimes happens, that the person above is overpowered by the weight, and in this case, both inevitably perish. The fowl is slung into the boat, which attends their operations, for the purpose of receiving the booty. The fowlers often pass seven or eight days in this perilous occupation, and lodge in the crannies which they find in various parts of the precipice.

In some remote parts of Russia there is practised a singular invention for taking great quantities of gelinottes or grouse. They choose the most open places in the birch woods; and there they plant long forks in the earth opposite the larger trees. On these forks is laid a horizontal stick, galloway-wise, to which are tied small bundles of ears of corn. At a small distance from this part of the contrivance, is a kind of large funnel, or inverted cone, made with long birch twigs, thin and flexible, the lower extremities of which are stuck in the earth, very near to one another; but by spreading towards the top, form there an opening of above a yard in diameter. In this opening is placed a wheel made of two circles that intersect each other, and are surrounded with straw and ears of corn. This wheel turns on an axis fastened to the sides of the funnel in such a manner, that there is room enough between the sticks of the cone, and the circles, to admit of the wheel's turning freely about. The birds first perch upon the transverse stick near the tree; and when they have a mind to fall upon the corn tied to the wheel, they must necessarily stand upon one of the projecting parts of the circles of which it is composed. At that instant the wheel turns, and the gelinotte falls, head foremost, to the bottom of the trap, which is there so contracted that he cannot get out. They sometimes find the machine half full of gelinottes.

The following method of netting or catching of wild pigeons is eagerly pursued as a diversion in different parts of Italy, particularly by the inhabitants of Cava, in the Hither Principato, and is thus described by Mr. Swinburne. The people "assemble in parties; and if any stranger chances to stray to their rendezvous, give him a most cordial welcome. I am not in the least surpris'd (says Mr. Swinburne), at their passionate fondness for this sport, as I found it extremely bewitching, keeping the attention constantly alive, and the springs of the mind pleasingly agitated by expectation; the situations where the toils are spread are incomparably beautiful, the air is pure and balsamic, and every thing around breathes health and satisfaction. When the periodical flights of stock-doves return from the northern and western parts of Europe, to gain warmer regions for their winter abode, the fowler repairs to the mountain, and spreads his nets across the intermediate hollows, the passes through which the birds direct their course, to avoid

unnecessary elevation in their flight. These nets are hung upon a row of large trees planted for the purpose. The branches being very thick and close at top, and the bore lofty and bare, a great opening is left below for the toils, which reach to the ground; and, by means of pulleys, fall in a heap with the least effort. Sometimes they are extended upon poles that exceed the height of the trees. At a small distance is a lofty circular turret, like a column with a little capital or cap, upon which a man is stationed to watch the approach of the game. As he commands a free view over all the country, and practice has made his sight as acute as that of the lynx, he descends the bird, at a wonderful distance. The doves advance with great velocity; but the alert watchman is prepared for them; and just as they approach his post, hurls a stone above them with a sling; upon this the whole flock, whose fears have birds of prey for their great object, supposing the stone to be an enemy of that kind ready to pounce them, dart down like lightning to avoid the blow by passing under the trees; but there they rush into the jaws of death, by dashing against the net, which instantly drops, and so entangles them that not one of them can escape the active hands of the fowler. These birds are sometimes taken by dozens at one fall, and are accounted fine eating. The dexterity with which the slingers manage their weapon is very remarkable; they throw the stone to a great height without any violent effort, and even without whirling the sling round before they discharge the pellet. In the Pyrenean mountains, where the same diversion is followed, the watchmen use a bow and arrow, trimmed with the feathers of a hawk."

The following simple but ingenious method of catching aquatic birds is used in Mexico by the natives. The lakes of the Mexican vale, as well as others of the kingdom, are frequented by a prodigious multitude of ducks, geese, and other water-birds. The Mexicans leave some empty gourds to float upon the water, where those birds resort, that they may be accustomed to see and approach them without fear. The bird catcher goes into the water so deep as to hide his body, and covers his head with a gourd; the ducks come to peck at it; and then he pulls them by the feet under water, and in this manner secures as many as he pleases.

Sir George Staunton, in his "Embassy to China," (vol. ii. p. 400.) informs us, that water-fowl are taken upon the Wei-Chaung hoo lake in that country by a similar device. Empty jars or gourds are suffered to float about upon the water, that such objects may become familiar to the birds. The fisherman then wades into the lake with one of those empty vessels upon his head, and walks gently towards a bird; and sitting up his arm, draws it down below the surface of the water, without any disturbance or giving alarm to the rest, several of which he treats in the same manner, until he fills the bag which he had brought to hold his prey. This contrivance is not so singular as it is that the same device should have occurred in the New Continent, as Ulloa asserts, to the natives of Carthage, upon the lake Cicnega de T-las.

Birds *feeding with*, is a singular mode of fishing practised in some of the lakes of China, and particularly described in the account of the late embassy. Upon a lake near the imperial canal were observed thousands of small boats and rafts, constructed for this singular kind of fishing. On each boat or raft were ten or twelve birds, which, at a signal from the owner, plunged into the water; and it was astonishing to observe the enormous size of the fish with which they returned, grasped within their bills. These birds appeared to be so well trained, that it did not require clanking or cord about their throats, to prevent their swallowing

any portion of their prey, except what the master was pleased to return to them for encouragement and food. The boat used by these fishermen is of a remarkable light make: and is often carried to the lake, together with the fishing birds, by the men who are there to be supported by it. The bird trained for this purpose is a species of pelican, described by Dr. Shaw, from a specimen submitted to his inspection, as "the brown pelican or corvorant, with white throat, the body whitish beneath and spotted with brown, the tail rounded, the irides blue, the bill yellow." Staunton's embassy to China, vol. ii. p. 388.

BIRD lime, a viscid substance, prepared various ways, and from various materials, for the catching of birds, mice, and other vermin.

The bird lime ordinarily used among us is made from holly-bark, boiled ten or twelve hours. When the green coat is separated from the other, it is covered up a fortnight in a moist place, then pounded into a rough paste, so that no fibres of the wood be left, and washed in a running stream till no notes appear, put up to ferment four or five days, skimmed as often as any thing arises, and laid up for use. To use it, a third part of nut oil, or any thin grease, is incorporated with it over the fire.

The mistletoe affords a juice even superior to that of the holly; and if a young shoot of the common elder be cut through, a stringy juice will draw out in threads, and follow the knife like bird-lime, or the juice of holly. It seems in this tree to be lodged, not in the bark, but in certain veins just within the circle of the wood. The roots of all the hyacinths also afford a tough and stringy juice of the same kind, and so do the asphodel, the narcissus, and the black bryony root, in a surprising quantity.

The bird lime brought from Damascus is supposed to be made of sebastins, their kernels being frequently found in it: but this does not endure either frost or wet. That brought from Spain is of an ill smell: that of the Italians is made of the berries of mistletoe, heated, mixed with oil, as before; to make it bear the water, they add turpentine. It is said, the bark of our *viburnum* or wayfaring shrub makes bird-lime as good as the best.

Bird-lime is a substance very apt to be congealed, and rendered unserviceable by frosts; to prevent which it is proper, at the cold seasons, to incorporate some petroleum with it, before it is used. The method of using it is to make it hot, and dip the ends of a bundle of rods in it; then to turn them about and play them together, till a sufficient quantity is extended over them all. If strings or cords are to be limed, they are to be dipped into the bird-lime, while very hot. The cords may be put in cold, but the rods should be warmed a little. Straws are to be limed while the matter is very hot: a large bundle of them should be put in at once, and worked about in it, till they are well befouled. When thus prepared, they should be preserved in a leather bag till they are used. When the twigs or cords are to be put in places subject to wet, the common bird-lime is apt to have its force soon taken away: it is necessary, therefore, to have recourse to a particular sort, which, from its property of bearing water unhurt, is called *water-bird lime*; and is prepared thus: Take a pound of strong and good bird-lime, wash it thoroughly in spring-water, till the hardness is entirely removed; and then beat it well, that the water may be separated from it; then dry it well, and put it into an earthen pot; add to it as much capon's grease as will make it run. Then add two spoonfuls of strong vinegar, one spoonful of oil, and a small quantity of Venice turpentine. Let the whole boil for some minutes over a moderate fire, stirring it all the time. Then

take it off; and when there is occasion to use it, warm it, and cover the sticks well with it. This is the best sort of bird-lime for snipes, and other birds that love wet places.

In order to use the common bird-lime, cut down the main branch or bough of any bushy tree, whose twigs are thick, straight, long, and smooth, and have neither knots nor prickles. The willow and the birch trees will best answer the purpose. Trim off all the superfluous shoots; and when the twigs are made neat and clean, let them be well covered with the bird-lime, within four inches of the bottom, but without touching the main bough from which they proceed. Some art is necessary to lay on the bird-lime properly; so that it be neither too thick, which would give the birds a distaste, and prevent their approaching it; nor too thin, so that it would not hold them when they touch it. Having prepared the bush, let it be placed in some dead hedge, or among growing bushes, near the outskirts of a town, a farmer's yard, or such situation, if it be in the spring, when the birds resort to such places. If it be used in summer, let the bush be fixed in the midst of a quick-set hedge, or in groves, bushes, or white-thorn trees, near fields of corn, hemp, flax, and the like; and in the winter, near stacks of corn, hovels, barns, and such places. When the lime-bush is thus planted, the sportsman must stand as near it as he can, without being discovered, and contrive to make such sorts of notes as the birds do when they call to one another. Bird-calls may be used for this purpose; but the most expert method is to imitate with the voice the notes of call of the several birds. When a single bird is thus enticed to the bush, and fastened to it, the sportsman is to wait till, by struggling to release itself, it becomes more securely attached, and by its fluttering it has brought other birds to the bush; so that in this way several may be caught at once. The time of the day for this sport is from sun-rise to 10 o'clock, and from one till sun-set. Another mode of bringing the birds together is by a snare; such as, a bat fastened in sight at a distance, or an owl, which is followed by several small birds, which, alighting on the lime-bush, will be entangled. The skin of an owl stuffed, or even the image of an owl carved on wood and painted in its natural colours, has been successfully used for the same purpose.

M. Barrera, physician at Perpignan, discovered an animal bird lime, prepared of the boils of a sort of caterpillars, by putrifying them in the earth, steeping them in water, and then pounding and mixing them with olive oil. Fontenel. Hist. Acad. Scienc. 1720, p. 12.

BIRDS, migration of. See MIGRATION.

BIRDS' nests, in Cookery. the nests of a small Indian swallow, very delicately tasted, and frequently mixed among soups. Mr. Marsden, in his account of Sumatra, sir George Staunton in his embassy to China, and many other travellers of more ancient and modern date, have recited several particulars concerning these edible nests. But we have a more minute and ample description of them, as well as of the birds by which they are formed, in the *third* volume of the "Transactions of the Batavian Society in the Island of Java, for promoting the arts and sciences." The birds that construct them are of a blackish grey colour, somewhat inclining to green, but gradually changing on the back to the tail, and on the belly into a mouse colour. The length of the bird, from the bill to the tail, is about $4\frac{1}{2}$ inches; and its height, from the bill to the extremity of the middle toe, $3\frac{1}{4}$ inches. The distance from the tip of one wing to that of the other, when extended, is $10\frac{1}{4}$ inches; the largest feathers of the wings are about 4 inches in length. The head is flat; but, on account of the thickness of the feathers, appears round, and large in proportion to the size of the rest

rest of the body. The bill is broad, terminating in a sharp extremity, and incurved like an awl. Its width is increased by a naked piece of skin, resembling parchment, which, when the bill is shut, is folded together; but when open, is considerably extended, and enables the bird, while on wing, to catch with greater ease the insects that serve it for food. The eyes are black and large; the tongue is shaped like an arrow, and not forked; the ears are flat, round, naked spots, with small oblong openings, and are wholly concealed under the feathers of the head; the neck is very short, as well as the legs and bones of the wings; the thighs are wholly covered with feathers; and the very tender lower parts of the legs, and the feet, are covered with a skin like black parchment. Each foot has four toes; three before, and one turned backwards. The toes are separate to their roots; and the middle one, together with the claw, is as long as the lower part of the leg. Each toe is furnished with a black, sharp, crooked claw, considerably long, by which the bird can easily attach itself to crags of rocks. The tail is as long as the body, together with the neck and head: when extended it has the form of a wedge, and consists of ten large feathers; the four first of which on each side are long, and, when the tail is closed, extend almost an inch beyond the rest. The other feathers decrease towards the middle of the tail, and are equal to about the length of the body. The whole bird is very light and tender; ten of them together weighed little more than $2\frac{1}{2}$ ounces. The Javanese call it "lawit;" but those who live in the mountains, "berongdage," or "waled;" *ucrong*, in the Malay language, signifying in general a bird.

There are two places in particular, near Batavia, where these birds are found in great numbers. The first, Calappa Nengal, lies about 10 miles south of the city; and the other, Sampia, is somewhat more distant to the south-west; but both are in that range of high land extending towards the sea, and apparently different from the large ridge that extends over the whole island. Besides these there are also other places in the same district, or at a greater distance from the coast, which either produce a few, or are carefully concealed by the Javanese, to whom they are known. The two bird mountains above-mentioned, called by the Javanese (goa) caverns, are insulated rocks, hollow within, and pierced with numerous openings of different sizes; but some so small, that they seem to be peculiarly adapted to the security of these little animals. On the outside, these rocks are covered with various kinds of tall trees; and within, they consist of grey calcareous stone and white marble. To the sides of these caverns the birds affix their small nests in horizontal rows, and so close as almost to adhere together. They are constructed at different heights, from 50 to 300 feet; and no cavity that is dry and clean is left unoccupied; but if the sides of the caverns be in the least wet or moist, the birds desert them. At day-break these birds fly abroad from their holes, with a loud fluttering noise; and in dry weather rise instantaneously to such a height in the atmosphere, for the purpose of seeking their food in distant parts, that they are soon out of sight. In the rainy season they never wander far from their holes, particularly in Java, where some rocks are situated near the shore. About 4 in the afternoon they return, and confine themselves so closely to their retired habitations, that none of them are seen to fly either out or in, except those that are hatching. They feed upon all sorts of insects that hover over the stagnated water; and these, by the easy extension of their bills, they readily catch. Their most destructive enemy is a kind of hawk, which seizes many of them as they issue from their holes, and which the people frighten away by shooting at them. Their nests are prepared, says this

writer, from the strongest remains of the food which they use, and not of the foam of the sea, or of sea-plants, as some have asserted. On this subject, however, there have been different opinions. Kæmpfer says, that the substance with which they form their nests is the mullusca or sea-worm; according to Le Peivre, fish-spawn; according to Dalrymple, sea-weeds; and according to Linnæus, the animal substance often found on the sea-beach, and called by fishermen blubbers or jellies. In proof of his opinion, this author suggests, that it is known from experience, that those birds, which build their nests in the two rocks before-mentioned, have never been found on the sea coast, and could not possibly fly thither and return again in so few hours, on account of the high intervening mountains, and the stormy winds that often prevail among them. The great difference in the colour and value of these nests proves, that their goodness depends merely on the superabundance and quality of the insects on which they feed, and perhaps on the greater or less solitude of the place where they seek nourishment. Those found in the territory of Calappa Nengal and Goa-gadja are exceedingly grey, and worth one third less than those produced in the territory of Sampia; and these latter are not to be compared with an excellent sort which is every year imported from Terate and Passier, or which is to be found on the surrounding islands, particularly to the east of Borneo. These birds occupy two months in preparing their nests: they then lay their eggs (two in number), on which they sit for 15 or 16 days. As soon as the young are fledged, people begin to collect the nests, which is regularly done every four months; and this forms the harvest of those who are the proprietors of the rocks. The business of taking down the nests is performed by persons accustomed from their youth to climb these rocks. For this purpose they construct ladders of reeds and bamboos, by which they ascend to the holes; or, if the caverns are too deep, they employ ship-ropes. When they have descended to the bottom of the caverns, they place bamboos with notches in them against the sides, if these be sufficient, in order to get up to the nests; but if they cannot thus reach them, they ascend the ladders, and pull down the nests with poles of bamboo made for that purpose. There are also certain holes to which people can ascend by means of steps made of bamboos; but these are very few. This employment is very dangerous: many lose their lives in pursuing it, and more particularly those who attempt to rob these caverns at improper seasons; for guarding against whose depredations, there are small watch-houses constructed in their vicinity. The mountaineers who engage in this occupation, never undertake their labour till they have slaughtered or sacrificed a buffalo; which custom is continually observed by the Javanese, at the commencement of any extraordinary enterprise. On such occasions they mutter over a few prayers, anoint themselves with aromatic oil, and fumigate the holes with odoriferous substances. At the chief of these caverns, in the island of Java, a particular protecting female deity is worshipped, under the name of "Raton Lawi Ridul," or Princess of the South Sea. She is provided with a small hut, and a covered sleeping place, together with various elegant articles of dress, which no one but a princess must approach. On every Friday, when the nests are taken down, incense is continually burnt; and the body and clothes of every one who intends to ascend the rocks must be exposed to it. In order to have light in the caverns, they use torches made of the resinous gum of a large tree called "caret," and the inner bark of the arek tree.

The gathering of the nests continues no longer than a month, and may be repeated three times a year. Some say it may be done a fourth time; but the most experienced say

that a nest, as long as it remains entire, is continually enlarged or made thicker, until it is entirely deserted by the bird, when it has become dry or hairy in the inside. When the nests have been collected, they require only to be dried and cleansed, and then they are packed in baskets and sold to the Chinese. Their price varies, and depends on their whiteness and fineness. Some of them have a grey, and others a reddish appearance: those of the best sort are exceedingly scarce. They are sold at the rate of from 800 to 1400 rix-dollars per 125 pounds. This high price, and the insatiable avarice of the Chinese, give rise to much dishonesty and thieving, especially as the Chinese make no scruple of bribing the watchmen with money, opium, and clothes; nor can any vigilance prevent this fraud. Calappa Nongal and Sampia formerly belonged to the Dutch East-India company; but, in 1778, the government resolved to sell them by auction to the highest bidder, and received for them almost 100,000 rix dollars. Besides these, there are several other places of a like kind, though less important, in the same range of mountains; and there are also two or three in the high land, in the interior parts of the country, and several small ones, which are carefully concealed. Three considerable bird-mountains, Goa Daher, Gede, and Nangafari, are situated in the government of Samarang, in Java; and these are washed by the sea, which forms its way so deep into the latter that fish may be caught in it. In these places the nests are of an excellent quality; but the steepness of the rocks, and the violence of the surf, render it very dangerous to collect them; and, therefore, a suspended apparatus of bamboos is employed for this purpose. The quantity of these nests, collected annually in the island of Java, amounts to 2500 pounds in weight. There are also bird caverns in Bantam, and the island of Sumatra, in the Andaman and Nicobar islands, in the island of Borneo, and also in Cochin-China. The young birds are eaten both by the Javanese and the Europeans in India; but it is difficult to procure them. They are considered as very heating: but the nests, on the other hand, when they have been boiled to a slimy kind of soup, exposed in the night-time to the dew, and mixed with sugar, are very cooling. The Javanese, therefore, use them in violent fevers; and they are said to be prescribed with good success for sore throats and hoarseness. This latter use of them has probably been derived from the Chinese, who carry on a great trade by these nests, and eat many of them in the winter, because sore throats are then very common in the northern part of the kingdom, in consequence of the people accustoming themselves to sit very much over the fire. But the author of the paper, from which these particulars are extracted, was not able to discover this nourishing and strengthening quality that has been so much extolled, though he used a considerable number of these nests, prepared in various ways, in order to convince himself of the fact. He caused them to be examined by able chemists; but nothing more could be observed than that the solution presented a weak gum with a disagreeable taste, which perhaps might be of some use in slight indispositions of the breast.

These nests are, therefore, a mere article of luxury to adorn the tables of the rich. The Chinese are remarkably fond of them. After being soaked and well cleansed, they put them, along with a fat capon or a duck, into an earthen pot closely covered, and suffer them to boil for 24 hours over a slow fire, which they call "tinmen;" and, on account of this addition, the whole dish acquires a more delicious taste. The trade in these nests has of late much increased. The high and advancing price of them in China makes Batavia the principal mart of this commodity, which is employed, since the company have surrendered it, very

advantageously by the inhabitants, to lessen the prejudicial exportation of specie.

The species of swallow that forms these nests is not to be found in China. Linnæus gives, as a distinguishing mark of the *hirundo fuculenta*, that it has white spots only on the feathers of the tail. But the small birds in Java that construct the nests, have spots neither on the tail nor on any other place. The tail feathers are entirely of one colour, blackish grey above, and a little brighter below. Rumphius says of his *capodes marina*, that the feathers of the tail were spotted, and that the breast also was speckled black and white. Valentin, in his description of the small swallow which constructs edible nests, mentions neither spots nor speckles; and only says, that the belly was undulated black and white. If these are to be considered as essential differences, it will follow that there are two kinds of these swallows: one with a speckled breast, and white spots on the tail feathers; and the other, without spots or speckles. A third kind of these swallows would be those called "momos," or "boerongitams." These also prepare their nests of eatable substances; but on account of the number of small feathers, and other impurities mixed with them, they are not fit to be used; and people, therefore, endeavour, as much as possible, to exterminate them, as they spoil the habitations of the better kinds. They are distinguished from the others merely by being larger, and having their legs down to the feet covered with small feathers.

BIRDS, *pictures of, prepared by means of their own feathers.* For this purpose, procure a thin board of deal or waincoat, well seasoned, that it may not warp. On this paste white paper, and let it dry: then get any bird which you would wish to represent, and draw its outline on the paper, in the desired attitude, and in its natural size, with the addition of any landscape or back-ground, &c. which you may think best. This outline so drawn is afterwards to be filled up with the feathers from the bird, placing each feather in that part of the drawing corresponding to the part of the bird from which it was taken. To do this, cover the outline representation with several coats of strong gum-water, allowing it to dry between each coat, till it is of about the thickness of a shilling. When the ground is thus prepared, take the feathers off from the bird, beginning at the tail or points of the wings, and work upwards towards the head. These feathers must be prepared by clipping off all the downy part; and the large feathers must have the insides of their shafts pared off, so that they may lie flat. In laying them on, hold them by a pair of small pliers, and, moistening the gummed ground with water, place each feather in its natural and proper situation. Keep each feather down, by placing upon it a small leaden weight, till you have another ready to be laid on. Care must be taken not to let the gum pass through the feathers, so as to linear them or to adhere to the bottom of the weight, and thus pull off or disorder the position of the feathers. When all the feathers are put on, cut a piece of round paper, and colour it to resemble the eye of the bird, and then stick it in its proper place; but the best substitutions for this purpose are small eyes made of glass. The bill, legs, and feet, must be drawn and coloured from nature. When it is finished and adjusted to your mind, lay a sheet of paper upon it, and upon that a heavy weight to press it down; and after it has remained in that position till it is quite dry, it may be preserved in a glass-frame.

BIRDS, *preservation of.* Many methods have been used by naturalists for preserving dead birds from corruption, in their natural form and colour. Some have taken off the skin, with all the feathers upon it, from the body and thighs, leaving the tail, legs and wings, with the whole neck and the bill, and filled it with some soft stuff, such as hay,
wool,

wool, or flax. Mr. Kuckahn (ubi infra), and Dr. Lettson (*Naturalist's Companion*, p. 12, &c.), who approve of this method as one of the most compleat and least troublesome, direct, that after opening the bird by a longitudinal incision from the breast to the vent, separating the fleshy parts from the bones, and removing the entrails, eyes, brain, and tongue, the cavities and the inside of the skin should be sprinkled with the powders (as below); the eyes to be inserted, for which purpose wax may be used, or glass-eyes of any size or colour may be cheaply procured; and the head to be stuffed with cotton or tow. When this is done, a wire should be made to pass down the throat, through one of the nostrils, and fixed into the breast-bone. Wires should also be introduced through the feet up the legs and thighs, and inserted into the same bone; and then the body should be filled with cotton to its natural size, and the skin sewed over it. The attitude should also be regarded; for in whatever position the subject is placed to dry, the same position will be afterwards retained. The powder which he recommends is composed of $\frac{1}{2}$ lb. of corrosive sublimate, $\frac{1}{2}$ lb. of prepared or burnt sulphur, $\frac{1}{4}$ lb. of burnt alum, $\frac{1}{2}$ lb. of flowers of sulphur, $\frac{1}{4}$ lb. of camphor or musk, 1 lb. of black pepper, and 1 lb. of tobacco ground coarse. The whole should be mixed together, and kept in a glass vessel stopp'd close.

This method is particularly described by Mr. Kuckahn, *Phil. Trans.* vol. ix. p. 311, &c. When the above-mentioned process is finished in the manner which he has minutely detailed, he advises to bake the birds intended for preservation in an oven of a due degree of heat; and he observes, that baking is not only useful in such preservations, but will also be of very great service to old ones, as it destroys the eggs of insects. And it should be, he says, a constant practice once in two or three years to bake them over again, and to fresh wash the cases with a liquid made by dissolving one pound of camphor in half a gallon of spirit of turpentine.

Others have put them into vessels full of spirit of wine, or strong brandy; against which it has been objected that spirituous liquors change the colours of the feathers; but M. Reaumur concludes from many experiments, that this objection is groundless; and he has given several minute directions for preserving and conveying them in this way. Others again, especially in countries where spices are cheap, have embalmed dead birds. Reaumur observes, that powdered alum or lime will serve the same purpose. Another method which has been sometimes practised, is that of drying birds for preservation in a heated oven. It is of importance, however, that dried birds should be secured in boxes or barrels sufficiently closed, that insects may not slip in during the voyage or journey; and all the empty spaces left in the barrel should be filled up with hemp, flax, cotton, &c. The same ingenious naturalist informs us, that quadrupeds, fishes, reptiles, and insects, may be preserved in the same manner with birds. For Reaumur's directions to this purpose, see *Phil. Trans. Abr.* vol. xi. page 891, &c.

Mr. Chaptal recommends the following method of preparing all kinds of animals for cabinets as exceedingly simple, and so certain in its effect that he never found it to fail in a single instance. The matter contained in the bowels of the animal must be evacuated, either by gradually pressing the body towards the rectum, or by injecting some liquid which may remove every thing that stands in its way. After this operation, the end of the rectum should be tied with a thread, and ether should be injected with a proper instrument into the body, through the mouth or bill; and when the bowels have been filled with it, the animal is to be hung

up by the head. One of the eyes must then be scooped out, and the brain extracted; after which the head is also filled with ether, which must be prevented from escaping by plugging up the eye hole. On the second or third day the injection of ether is to be repeated; and this process is to be continued till the animal is completely dried. While it is gradually drying, care must be taken to give the body its proper position; and as soon as it is completely desiccated, it may be put up without further care or any other preparation. Ether is preferable to spirits of wine, because, by its evaporation, it carries with it not only its own aqueous particles, but those also which it absorbs from the body. Besides, this method neither destroys the form of the animal, nor tarries the splendour of the feathers or hair, and is very cheap: one ounce of ether being in general sufficient for a small bird. The process of drying, says Mr. Chaptal, might perhaps be a little shortened by the application of artificial heat. The theory of this process, as this ingenious chemist thinks, is, that the ether, while it evaporates, volatilises the moisture in the animal body, and by these means effects a gradual desiccation, and thus removes the only cause of corruption.

The method of preserving birds in Guiana, described by Bancroft (p. 184.), is as follows: The birds intended for preservation, and for being conveyed to the cabinets of Europe, are deposited in a proper vessel, and covered with high wines, or the first running of the distillation of rum. In this spirit they remain for 24 or 48 hours, or longer, according to their size, till it has penetrated every part of their bodies. When this is done, the birds are taken out, and the feathers, which are not at all changed by this immersion, are placed smooth and regular. They are then put into a machine, made for the purpose; and the head, feet, wings, tail, &c. are placed exactly agreeable to life. In this position they are put into an oven, very moderately heated, where they are slowly dried; and they will ever after retain their natural position, without danger of putrefaction.

BIRDS, *singing*, are the nightingale, blackbird, starling, thrush, linnet, lark, throstle, canary bird, bullfinch, goldfinch, &c. See *SONG of birds*.

BIRDAMA, in *Ancient Geography*, a town of India, on this side the Ganges, which, according to Ptolemy, was the capital of a people called Porvari.

BIREMIS, from *bis*, double, and *remus*, oar, in *Antiquity*, a vessel with one or more rows of oars, ranged, as some think, in two stages over each other; or a vessel, having two ranks or rows of oars placed over, and aside of each other. But the particular fabric of these vessels seems far from being a settled point among the learned. The Roman *biremis* is the same with what the Greeks call *διεξαρά*, and stands contradistinguished from *triremis*, *quadriremis*, &c.

BIRINGOCCIO, or BIRINGUCCI, VANNUCCIO, in *Biography*, a mathematician of Siena, was descended of a noble family, and flourished about the 16th century. After having been employed by the dukes of Parma and Ferrara, he entered into the service of the Venetians. He is said to have been the first Italian author who wrote on the art of fusing and casting metals; particularly for the purpose of making cannon. His work, entitled, "*Pirotechnia*, &c.?" was printed at Venice in 1540, 4to; at Bologna, in 1678, 8vo; and at the same place in 1550, 1558, and 1559, 4to. A Latin translation of it appeared at Paris in 1572, 4to; and at Cologne, 1658, 4to. A French translation by Jacob Vincent, was published at Paris in 1556, and 1559, 4to; and at Rouen in 1627. As a metallurgic writer, who detailed his own observations and experiments, and gave a clear and connected account of the chief processes in metallurgy, Biringoccio is highly commended by professor Beckman. *Gen. Biog.*

BIRKAN, in *Geography*, a town of Arabia, 24 miles south of Saade.

BIRKENFELD, a town of Germany, in the circle of the Upper Rhine, and county of Sponheim, the seat of a bailiwick, including 32 villages and two iron foundries. It was taken by the French in 1794; and in their new arrangement, it is the principal place of a district of the same name, in the department of Sarre. The town contains 1061, and the canton 5892 persons. This district comprehends 38 communes, and its whole territorial extent includes 1615 kilometres. It is situated 30 miles E. N. E. of Treves, and 30 N. N. W. of Deux Ponts.

BIRKENHEAD, or **BERKENHEAD**, **SIR JOHN**, in *Biography*, a political writer of some celebrity, was meanly descended, and born at Northwich, in the county of Chester, about the year 1615. In 1632 he was entered as a servitor in Oriel college, Oxford, and afterwards became amanuensis to archbishop Laud, who recommended him in 1640 to be chosen probationer fellow of All-Souls' College. When Oxford became the head-quarters of king Charles I. in the time of the civil war, Birkenhead was selected as a proper person to write a kind of journal in support of the royal cause; which office he discharged to the satisfaction of his employers, and with reputation and advantage to himself. The king appointed him reader in moral philoosophy; and this post, more honourable than lucrative, he retained till the year 1648, when he was expelled by the parliament visitors. From hence he removed to London, where he wrote several poetical pieces, chiefly of a satirical kind, levelled against the republicans in power; and on account of his steady attachment to the royal cause, he was called the "loyal poet," and suffered several imprisonments. Upon the restoration of Charles II. he was rewarded for his loyalty. In 1661, he was created doctor of the civil law, by the university of Oxford; and about the same time, was returned to serve in parliament for the borough of Wilton. He was knighted in 1662, and succeeded sir Richard Fanshawe as master of requests. The favours which he received from the court exposed him to many severe attacks from those who opposed it; but he was esteemed by the learned persons of his time, and elected a fellow of the Royal Society; and his memory has been transmitted with honour to posterity by Dryden, Langbaine, and Winstanley, notwithstanding the reproaches of Anthony Wood. He died in Westminster, in 1679. *Biog. Brit.*

BIRKESTORFF, in *Geography*, a town of Germany, in the circle of Westphalia and duchy of Juliers, one mile north of Dueren.

BIRKET EL HADJIS, or *Lake of Pilgrims*, a lake of Egypt, communicating with the Nile, and situate 10 miles E. N. E. of Cairo, near which the companies which form the caravan to Mecca assemble.

BIRKET EL KERUN, or **CAROUN**, a lake of Egypt, 30 miles long and 6 broad in the middle, but of an irregular form, and narrowing towards each end; 40 miles S. W. of Cairo. See **MOERIS**.

BIRKHEHER, **BLAUER RAKER**, in *Ornithology*, the name of the garrulous roller, *coracias garrula* in Frisch. *Av.*

BIRKIN, in *Geography*, a river of England, which runs into the Bollin, one mile south of Altringham in the county of Chester.

BIRKOZOWKA, a town of Poland, in the palatinate of Kiow, 40 miles S. E. of Bialacerkiew.

BIRLAB, a town of Egypt, in the route from Catich to El Arish, 17 miles E. N. E. of Catich, and at a small distance east of the lake of Sebaket Bardoil, or king Baldwin's lake.

BIRLAT, a town of European Turkey, seated on a river of the same name, in the province of Moldavia, 60 miles N. W. of Galate, and 116 S. W. of Bender.—**Alio**, a river which runs into the Siret at Dubravitzza, in Moldavia.

BIRMAN, or **BURMAN Empire**, comprizes the kingdoms of Ava and Pegu, and derives its name from the Birmanis or Burmahs, who have been long known as a warlike nation, in the country formerly called "India beyond the Ganges;" its capital being Ava or Aungwa. The boundaries of this empire are not easily ascertained. Burmah, considered as distinct from Pegu, and sometimes erroneously denominated Ava from its capital, borders on Pegu to the north, and occupies both banks of the river Ava, as far as the frontiers of China. On the north-west is Meckley, and on the West Aracan and Roshaan. On the east it has the kingdom or country of Upper Siam, which begins at a small distance eastward from the city of Ava; a ridge of mountains separating it from Burmah and Pegu. But the king of Burmah is now said to possess not only the country of Meckley, in addition to those of Pegu and Burmah, but also the whole tract which lies on the north of it, between China, Thibet, and Afam. According to colonel Symes, to whom we are much indebted for our knowledge of the Birman empire, it appears to include the space between the 9th and 26th degrees of north latitude, and between the 92d and 107th degrees of east longitude, about 1050 geographical miles in length, and 600 in breadth. Such are the ascertainable limits from the Birman accounts; but it is probable that their dominions stretch still farther to the north. The breadth, however, often varies, and is in many places very inconsiderable, on what is called the eastern peninsula. To the north this empire is separated by mountains from Afam, and further to the east it borders on Thibet and China. On the west it is divided from the British dominions in Bengal by a range of mountains, and the little river Naaf; and the limit is continued by the sea. But the southern and eastern boundaries are somewhat obscure. If it be extended to the ninth degree of latitude, it must include a considerable portion of the Malayan peninsula, or the province of Tenasserim, and city of Mergui, formerly regarded as part of Siam; and if, on the east, it be extended to the 107th degree of longitude, it might be said to comprehend almost the whole of the country called India beyond the Ganges, as far as the mouths of the Japanese river in Cambodia. But it does not appear that Siam is regarded as a portion of the Birman empire, and even in this case it would only extend to 103 degrees. In this state of uncertainty, however, we must satisfy ourselves with observing, that this empire constitutes the fifth grand native power in India, since Hindoostan and Persia have been divided, and may probably extend its authority over Laos and Cambodia, while it remains separated by deserts and ranges of lofty mountains from the united kingdoms of Cochiachina and Tonquin.

Of the ancient state of the countries which now constitute this empire, our knowledge is very imperfect. (See **CHERSONESUS**.) With regard to their modern history, Col. Symes observes, that we are indebted for our first information, principally to the Portuguese, who made themselves masters of Malacca early in the 16th century. Accordingly the Portuguese historians inform us, that in the middle of this century four powerful states divided among them the regions that lie between the south-east province of British India, Yunan in China, and the eastern sea; and that their territories, besides some intervening lands belonging to petty independent princes, extended from Cassay and Afam on the N. W. as far to the S. E. as the island of Junkfeylon. These nations

rations were known to Europeans by the names of Aracan, Ava, Pegu, and Siam; which see respectively. The empire of Ava, as it was called, is situated eastward of Aracan, and separated from it by a ridge of lofty mountains. (See ARACAN.) On the N.W. it is divided from the kingdom of Caffay by the river Keen-duem; on the north it is bounded by mountains, and petty independent principalities, that lie contiguous to Afam; on the north-east and east it touches on China and North Siam; and on the south its limits have been so variable, that it is not easy to define them. The city of Prome, or Pee, seems to be the original and natural boundary of the Birman empire, though by conquests it has been extended much farther to the south. Pegu is the country southward of Ava, which occupies the sea-coast as far as Martaban. (See PEGU.) The kingdom of Siam extended to the south as far as Junkseylon, east to Cambodia and Laos, and north to Ozemee, probably the Chiamce of Loubere, and Yunan in China. (See SIAM.) These boundaries, however, may be considered more as the claim than the actual possession of each state; whilst alternate victory and defeat have occasionally extended and contracted their dominions. From the Portuguese we learn, that the Birmans, though formerly subject to the king of Pegu, became afterwards masters of Ava, and caused a revolution in Pegu about the middle of the 16th century; extending their kingdom from Muravi, probably Mergui, near Tenasserem, to the province of Yunan in China, about 800 miles from north to south, and 250 from east to west. The influence of the Portuguese, which was for some time very considerable in the Birman and Pegu countries, was supplanted by the Dutch; and it appears that, in the beginning of the 17th century, both the English and Dutch had obtained settlements in various parts of the Birman dominions, which were forfeited by the misconduct of the latter; so that Europeans of all nations were banished from Ava. The English, however, several years after this expulsion, were reinstated in their factories at Syrian and Ava, where they traded more as private merchants than on the part of the India company, in whose service they were not regularly enrolled. The supremacy of the Birmans over the Peguers continued till about the year 1740, when the latter, inhabiting the provinces of Dalla, Martaban, Tongo, and Prome, revolted, and a civil war ensued. In 1744, the British factory at Syrian was destroyed by the contending parties. At length the Peguers, by the assistance of some Europeans, who traded to their ports, gained several victories over the Birmans, particularly in the years 1750 and 1751; and in 1752 the capital of Ava was invested, and the Birmans, after a short siege, compelled to surrender at discretion. The last of a long line of Birman kings was taken prisoner; but two of his sons were fortunate enough to make their escape to the Siamese, where they were kindly received, and assured of security and success. Upon this conquest the principal inhabitants of the country about Ava acknowledged themselves vassals to the victorious king of Pegu, and accepted the prescribed oath. After some time, Alompra, a Birman of low extraction, who had been continued by the conqueror in the possession of a small village called Moachaboo, determined to emancipate himself from the yoke of oppression. Accordingly, having assembled 100 followers, on whose fidelity and courage he could rely, he attacked a band of 50 Pegu soldiers, who had been stationed in Moachaboo, and put every one of them to the sword; and after several previous encounters with the Pegu force dispatched against him, he gained possession of Ava in 1753. The contest was obstinate and bloody; but Alompra, pursuing his conquests, founded the town of Rangoon, or Dzangoon, signifying "victory achieved;" and soon after chastised the people of Caffay, who had revolted

from the Birman authority. In 1756 he blockaded the town of Syrian, which yielded to his arms; and having deprived the capital of any foreign aid by water, he advanced against the city of Pegu, invested it in January 1757, and in about three months took possession of it. He then proceeded to subdue the countries to the east of the city, as far as the Three Pagodas, which were the ancient boundary between Pegu and Siam. Tavoy, which was once an independent principality, and recognized as such by the English in 1753, has been since added to the Birman possessions in this quarter. Alompra, triumphing in his success, determined to chastise the Siamese, who had afforded an asylum to his rebellious subjects; and for this purpose he ordered a fleet to sail to Mergui, a sea-port belonging to the Siamese, which soon surrendered; and the capture of Mergui was followed by the conquest of Tenasserem. The next object of Alompra was the reduction of the capital of Siam; but whilst he was prosecuting the siege, he was seized with a disorder which proved fatal, and saved the Siamese from destruction. Alompra, apprised of his approaching end, gave orders for a retreat; when he had arrived within two days' march of Martaban, on the 15th of May 1760, he expired, very much to the regret and sorrow of his subjects, who regarded him as their deliverer, and as a wife, powerful, and victorious sovereign. By the prudence of his counsels he secured what his valour had acquired; he was not more eager for conquest than attentive to the improvement of his territories, and the prosperity of his people; he issued a severe edict against gambling, and prohibited the use of spirituous liquors throughout his dominions; he reformed the courts of justice; he abridged the power of magistrates, and forbade them to decide at their private houses on criminal causes, or on property where the amount exceeded a specified sum; every process of importance was decided in public, and every decree registered. His reign was short but vigorous; and if his life had been prolonged, it is probable that his country would at this day have been farther advanced in national refinement and the liberal arts. He did not live to complete his 50th year; his person, strong and well proportioned, exceeded the middle size; and though his features were coarse, his complexion dark, and his countenance saturnine, there was a dignity in his deportment that became his high station. Alompra, the founder of the Birman empire, was succeeded by his son Namdogee Praw, who, after suppressing several insurrections, died in 1764, and left an infant son, Momiem; whose uncle Shembuan, second son of Alompra, assumed first the regency, and afterwards the diadem. Shembuan, having usurped the royal power, diverted the national attention from his conduct, by declaring war against Siam; and two armies entered the country from the north and south, which, being united, defeated the Siamese about seven or eight days' journey from their capital. The consequence of this defeat was the immediate investiture of Siam by the Birmans; and after a siege of two months, the capitulation of the city. The king having withdrawn during the progress of the siege, a Siamese governor was appointed, who took an oath of allegiance to the Birman monarchy, and engaged to pay an annual tribute. The Chinese, having planned the subjugation of the Birman empire, and concerted measures for adding the dominion of the Jerawaddy and the fertile plains of Ava to their empire, advanced in the beginning of the year 1767, from the western frontiers of Yunan, with an army of 50,000 men, to accomplish their object; but they were met by the Birmans, and after a conflict which lasted three days, totally routed with very dreadful carnage. The lives of the captives were spared for the benefit of the country; various employments were assigned them; and they were encouraged to marry Birman wives, and to consider them-

selves as natives of the country. The Siamese, however, though vanquished, remained unsubdued; and the inherent enmity that subsists between these two nations will probably prevent either servitude or alliance on the part of the one to the other, unless they are broken by such repeated defeats as must nearly amount to extirpation. As soon as it was known that the Birman had withdrawn into their own territories, a Siamese prince assumed the monarchy, and in 1771 defeated the Birman. The king, who had pusillanimously abandoned his throne and people, is said to have perished in the woods, probably by the dagger of the usurper. Shembuan, the Birman sovereign, who had rebuilt ancient Ava, the metropolis of the empire, which had fallen to ruin during the late commotions, pursued his favourite scheme of extending his conquests towards the west, and having advanced within two days' march of Cospore, the capital of Cachar, forced the raja of the province to submit to his power, by the most unequivocal proofs of vassalage, according to the custom of the country. Shembuan died at Ava in 1776, and was succeeded by his son Chenguza, whose tyrannical conduct occasioned a conspiracy, at the head of which was Shembuan Minderagee Praw, the younger brother of the deceased Shembuan, and the present monarch. Chenguza was slain in 1781, and fell unlamented, as he had lived despised. Among other acts of savage cruelty, with which he is charged, one is his conduct towards his second wife, the daughter of one of the Attawoons, or privy-counsellors, of his court, a young woman endowed with virtue, beauty, and various accomplishments. Under the impulse of sudden rage, he accused her of infidelity, and without allowing time for cool judgment, pronounced sentence of immediate death. Accordingly the trembling and innocent victim was dragged from the palace, and inclosed in a sack of scarlet cloth, richly ornamented; thus confined, she was put on board a boat, when the sack being suspended between the narrow necks of two earthen jars, the whole was sunk in the deepest part of the river Jerawaddy. Her afflicted father, overwhelmed with anguish and deprived of all his offices, retired in despair to the city of Chagaing; and waited the opportunity that soon after occurred, of being avenged. When Chenguza was forcing his way towards the royal palace, the Attawoon snatched a sabre from an attendant officer, and at one stroke cut him through the bowels, and laid him breathless at his feet; nor did any person offer to prevent or avenge the cruel tyrant's death. Shembuan Minderagee withdrew the seat of government from Ava, and founded a new city called Ummerapoora; which see. The Birman conquests having already been extended as far as Mergui to the south, and several of the northern provinces which formerly belonged to Siam, having been reduced to subjection, and tribute, Shembuan Minderagee, observing the supineness of the rajah of Arracan, and the unwarlike disposition of his subjects, and allured by the fertility of its soil, and its aptitude for commerce, determined to invade the country, and to annex it as an appendage to the Birman crown. Accordingly, in 1783, this conquest was effected. (See ARRACAN.) The Birman arms were next directed towards Siam. Although the Birman could not retain possession of its inland parts, they maintained their dominion over the sea-coast; so that all the ports on the western shore of the peninsula, as far as Mergui, in N. lat. 12° 20', continued subject to them. But they still wished to obtain the island of Junkfeylon, which would give them the entire dominion of the western coast, as far as the territories of the Malay prince of Queedah, and not only enable them to monopolize the commerce of the peninsula, but prevent the Siamese from a communication with India by any other channel than that of the gulf of Siam. A fleet was fitted out in 1785 for subduing this island; but the enterprise

failed. The Birman monarch, mortified by the disappointment of his views, resolved as speedily as possible to repair the disgrace; and for this purpose he marched in the spring of 1786, from his capital at the head of 30,000 men, with a train of 20 field-pieces, which army was supported by a fleet of 16 ships, that blocked up the harbour of Junkfeylon. The sovereign, sanguine in his expectations, had scarcely entered the Siamese territories, before he was opposed by the king of Siam, and, after a furious engagement, completely routed. In the commencement of the ensuing year, the Siamese invaded the vicereignty of Martaban, which comprehends within its jurisdiction Tavoy, Mergui, and all the Birman possessions towards the south; but having laid unsuccessful siege to Tavoy, they were obliged to retreat and abandon the enterprise. In 1793 overtures for peace were made on the part of the Siamese; and they were followed by a negotiation, which speedily terminated in the ratification of a treaty highly favourable to the Birman interests. By this compact, the Siamese ceded to the Birman the western maritime towns as far as Mergui; thus yielding to them entire possession of the coast of Tenasserim, and the two important ports of Mergui and Tavoy; which were acquisitions of great moment, considered either in a political or commercial light. From this statement it appears, that the Birman empire can scarcely be computed to extend beyond the 102d degree of longitude, and that only in the part to the north of Siam. The Birman are indisputably pre-eminent among the nations which inhabit the vast peninsula that separates the gulf of Bengal from the Chinese sea; they possess a territory equal in extent to the German empire; and they are blessed with a salubrious climate, and a soil capable of producing almost every article of luxury, convenience, and commerce, which the east can supply. After their treaty with the Siamese, they enjoyed the pleasing prospect of a long exemption from the miseries of war; but their pride and resentment embroiled them in fresh troubles before they had time to profit by the advantages of peace, and threatened to excite against them a foe more formidable than the Chinese, Arracaners, Peguers, Siamese, and Cassayers. The Birman monarch, conceiving that the piratical banditti who infest the Broken islands, and commit various depredations to the injury of trade, were protected by the British flag, and that they sought refuge in the British districts, ordered a body of 5000 men to enter the territories of the company, in order to seize the delinquent fugitives, and he stationed an army of 20,000 men at Arracan for the purpose of supporting this detachment. As the Birman had made no previous application for redress in a pacific way, a strong detachment was formed at the presidency, and entrusted to the conduct of major-general Erskine, for resisting this aggression. On the approach of the British general, the Birman chief proposed terms of accommodation, stipulating for the surrender of the fugitives as the basis of the agreement. The general declined all treaty whilst the Birman continued on English ground; but after a representation of the case made in person by the Birman chief, he gave hopes, that if the Birman peaceably retired, the governor-general would institute a regular inquiry into the grievance which was the subject of complaint. The Birman chief, professing his reliance on the declaration of general Erskine, agreed to withdraw his troops, and conducted his retreat in the most orderly manner. The matter was afterwards investigated, and the guilt of the delinquents being satisfactorily proved, they were delivered over to their own laws, by whose sentence two out of the three that had been accused underwent capital punishment. The amicable termination of this difference afforded favourable opportunity for acquiring a more accurate knowledge than had hitherto been obtained, of a people, whose situation, extent of terri-

tory, and commercial connexions with British India, rendered a liberal intercourse with them highly desirable. The trade between Calcutta, Madras, and Rangoon, the principal Birman port, had of late years so rapidly increased, as to become an object of national importance: more particularly on account of the teak timber, the produce of Ava and Pegu, whence Calcutta and Madras draw all their supplies of wood for ship building and for various other purposes. A commerce in one article so essential, and on a general scale so extensive, as to require an annual return of Indian commodities to the amount of 200,000*l.* was an object well worth cultivating. With this view Sir John Shore (now Lord Teignmouth) thought proper, in 1795, to send a formal deputation to the Birman court. The particulars of this embassy are described by Col. Symes, with whom the conduct of it was entrusted. "The Birmans," says this writer, "under their present monarch, are certainly rising fast in the scale of oriental nations; and it is to be hoped, that a long respite from foreign wars will give them leisure to improve their natural advantages. Knowledge increases with commerce; and as they are not shackled by any prejudices of caste, restricted to hereditary occupations, or forbidden from participating with strangers in every social bond, their advancement will, in all probability, be rapid. At present, so far from being in a state of intellectual darkness, although they have not explored the depths of science, nor reached to excellence in the finer arts, they yet have an undeniable claim to the character of a civilized and well instructed people. Their laws are wise, and pregnant with sound morality; their police is better regulated than in most European countries; their natural disposition is friendly and hospitable to strangers; and their manners rather expressive of manly candour, than courteous dissimulation: the gradations of rank, and the respect due to station, are maintained with a scrupulosity which never relaxes. A knowledge of letters is so widely diffused, that there are no mechanics, few of the peasantry, or even the common watermen (usually the most illiterate class), who cannot read and write in the vulgar tongue. Few, however, are versed in the more erudite volumes of science, which, containing many Sanscrit terms, and often written in the Pali text, are (like the Hindoo Shasters) above the comprehension of the multitude; but the feudal system, which cherishes ignorance, and renders man the property of man, still operates as a check to civilization and improvement. This is a bar which gradually weakens, as their acquaintance with the customs and manners of other nations extends: and unless the rage of civil discord be again excited, or some foreign power impose an alien yoke, the Birmans bid fair to be a prosperous, wealthy, and enlightened people."

The present capital of the Birman empire is Ummerrapoora, and one of its chief ports is Rangoon; which see respectively. Its other principal towns will occur in the course of this work. See Arracan, Ava, Chagaing, Martaban, Merghi, Monchaboo, Muntipoora, Pagahm, Pegu, Persaim, Promé, Syrian, Tenasserem, Tavoy, &c. The chief rivers of this country are Irawaddy, or the river of Ava (see *AVA*), whose numerous mouths and streams very amply provide the means of inland navigation, Krendnem, Mayguc, Pitang, and Thalan. Its lakes are numerous; among which one of the principal is Tounzamahe. The highest range of mountains is probably that which lies on the frontiers of Thibet. The other ranges pass north and south, except a small range running east and west, which supplies the sources of the river of Pegu; but their names are not known, except that of Anouper, between Ava and Arracan. The forests are large and numerous: and supply almost every description of timber that is known in Hin-

doostan; and about four days' journey to the north of the capital firs grow in abundance; but the principal tree of these forests is the teak, which flourishes in many parts of the empire, to the north as well as to the south of the capital. The forests, as well as the mountains, of the interior, and, in general, of the whole northern frontier, remain unexplored: and the tigers that infest them, prevent their being particularly examined.

The present sovereign of the Birman empire assumes the title of "Boa," or emperor; and though the form of government be despotic, yet he is accustomed to consult a council of ancient nobles. There is no country of the East in which the royal establishment is arranged with more minute attention than in the Birman court; it is splendid without being wasteful, and numerous without confusion. The queen and princes have the title of "Praw," which is both a sovereign and a sacerdotal appellation; and is frequently used by an inferior when addressing his superior. In the application of this term, it has been suggested, that there is an obvious analogy between the Birmans and the ancient Egyptians. "Phra," it is said, was the proper name under which the Egyptians first adored the sun, before it received the allegorical appellation of Osiris, and they conferred this title on their kings and on their priests. It has been further conjectured, that the title of "Pharaoh," given to successive kings of Egypt, is a corruption of the word "Phraw," or "Praw," in its original sense signifying the sun, and applied to the sovereign and priesthood, as the representatives on earth of that splendid luminary. However this be, "Praw" is a princely title in the Birman empire. The elder son of the king is denominated "Engy Teekien," or "Engy Praw," or prince royal; and as the crown descends to the male heirs in a direct line, the son takes precedence of his uncles. Next in rank to the princes of the blood royal are the "Woongees," i. e. bearers of the great burthen, who are the chief ministers of state. Their established number is four, and they constitute the great council of the nation. They sit in the "Lstoo," or imperial hall of consultation, every day, except the Birman sabbath; they issue mandates to the "Maywoons," or viceroys of the different provinces; they controul every department of the state, and govern the empire in subordination to the king, whose will is absolute, and whose power is undefined. With these are associated, for the purposes of deliberation, and of the execution of public business, four other officers, called "Woondocks," whose authority is very inferior and limited. The views and wishes of the Woongees are frequently counteracted by the interference of the four "Attawoons," or ministers of the interior, who are selected by the king to be his privy-counsellors, from an opinion of their talents and integrity, and who have access to him at all times, which is a privilege which even the principal Woongee does not enjoy. There are several other subordinate officers, by whom the affairs of government, in its various departments, are transacted. There are also Woons of the queen's household, and of that of the prince-royal; and each of the junior princes has a distinct establishment. The Birman government has no hereditary dignities or employments; for on the demise of the possessor, all honours and offices revert to the crown. The order of nobility has different degrees, distinguished by the number of strings, or small chains, that compose the "tsaloe," or chain, which is the badge of the order. No subject is ever honoured with a higher degree than 12; and the king alone wears 24. Rank among the Birmans is indicated by every article of use and of ornament; the shape of the beetle-box, which is carried by an attendant after a person of distinction wherever he goes, his ear-rings, cap of ceremony, horse-furniture, and even the metal of which his spit

ring-pot and drinking cup are made, specify and distinguish the several gradations of society; and a person who assumes the insignia of a degree, which is not his legitimate right, is subject to certain penalties. The court dress of the Birman nobility consists of a long robe, of flowered satin or velvet reaching to the ancles, with an open collar and loose sleeves; over this hangs from the shoulders a scarf, or flowing mantle; and on the head is worn a high cap of velvet, either plain, or of silk embroidered with flowers of gold, according to the rank of the wearer. Ear-rings are also a part of male dress; persons of condition use tubes of gold about three inches long, and of the thickness of a large quill, expanding at the end like the mouth of a speaking trumpet; others wear a heavy mass of gold, beaten into a plate, and rolled up, which forms a large orifice in the lobe of the ear, and by its weight drags it down to the extent sometimes of two inches. The rank of the females is also distinguished by their dress. The hair, which is tied in a bunch at the top of the head, and bound round with a fillet, has its peculiar and discriminating embroidery and ornaments. Over a short shift, which reaches to the pit of the stomach, and is drawn tight by strings, so as to support the breasts, is a loose jacket with close sleeves; and round the waist is rolled a long piece of silk or cloth, reaching to the feet, and sometimes trailing to the ground. When women of condition go abroad, they put on a silk sash, resembling a long shawl, which crosses their bosom, and is thrown over the shoulders, gracefully flowing on each side. Women in full dress, stain the palms of their hands and their nails of a red colour, for which they use a vegetable juice, and strew on their bosoms powder of sandal wood, or of a bark called *funneka*, with which some rub their faces. Both men and women tinge the edges of their eyelids and their teeth with black. Men of rank wear, in common dress, a tight coat with long sleeves, made of muslin or of very fine nankeen, which is manufactured in the country; also a silk wrapper that encircles the waist; but the working class are naked to the middle, except that in the cold season they use a mantle or vest of European broad cloth, which is highly prized.

With regard to *religion*, the Birmans are Hindoos, not as votaries of Brahma, but sectaries of Boodh; which see. The latter contend with the former for the honour of antiquity, and are undoubtedly far more numerous. The Cingleze in Ceylon are Boodhists of the purer class; and the Birmans acknowledge that they originally received their religion from that island, which they call "Zehoo." It was brought, say the Rhahaans, first from Zehoo to Arracan about 600 years ago, and thence was introduced into Ava, and probably into China; for the Birmans confidently assert, that the Chinese are Boodhists. However this be, it is allowed, that the bonzes of China, like the Rhahaans of Ava, wear yellow as the sacerdotal colour, and that in many of their customs and ceremonies we may trace a very striking similitude. Whatever may be the antiquity of the worship of Boodh, the wide extent of its reception is unquestionable. The Birmans believe in the metempsychosis, and that, after having undergone a certain number of transigrations, their souls will at last be received into their paradise on the mountain of Meru, which is the celestial north pole of the Hindoos, round which they place the garden of Indra, and which they describe as the seat of delights. The Birmans regard mercy as the chief attribute of the deity; and they worship God by extending mercy to all his creatures. Of the religious buildings appropriate to the Birman worship, the temple of Shoedagon, or Dagoung, near Rangoon, that of Shoemadoo at Pegu, and that of Syriam, are the most considerable. (See RANGOON, PEGU, and SYRIAM.) Their priests are denominated Rhahaans; and they have numerous kioums

or convents which differ in their structure from common houses, and much resemble the architecture of the Chinese. They are made entirely of wood; the roof is composed of different stages, supported by strong pillars; the inside comprehends one large hall; the whole house is open at the sides; some of them are curiously carved with various symbolic representations of the divinity. They have no apartments for the private recreation of the Rhahaans; publicity being the prevailing system of the conduct of the Birmans, who admit of no secrets either in church or state. The convents in the neighbourhood of Rangoon are very numerous; and hence it appears that the number of Rhahaans, and of Phonghis, priests of an inferior order, vulgarly called Tallapoins, must be very considerable, amounting to 1500. Like the Carmelites, they go barefooted, and have their heads shaven, on which they never wear any covering. The only colour of the garments worn by the priesthood is yellow: the greatest part of their bodies is covered with a long loose cloke, that is wrapped round them; they profess celibacy, and abstinence from every sensual gratification. The prescribed punishment for a Rhahaan detected in an act of incontinence, is expulsion and public disgrace. The delinquent is seated on an ass, and his face is daubed with black paint interspersed with spots of white; and he is thus led through the streets, with a drum beating before him, and afterwards turned out of the city. But such instances of degradation rarely occur. The juniors are restricted from wandering about licentiously, either by day or night; nor can any go abroad without permission from the prior of the convent. The Rhahaans never perform any of the common functions of life, which would tend to divert them from the abstract contemplation of the divine essence. They perambulate the town at the dawn of the morn in order to collect supplies for the day: and these usually consist of boiled rice mixed with oil, dried and pickled fish, sweetmeats, fruit, &c. In their walks they never raise their eyes from the ground, nor do they even stop to solicit donations, and seldom even look at their benefactors, who are more desirous to bestow than they are to receive. The Rhahaans eat only once a day, at the hour of noon; and their superfluous provisions they distribute among the indigent strangers, or the poor scholars, who daily attend them to be instructed in letters, and taught their religious and moral duties. The Rhahaans are never known to take any public and active part in politics or in war; and as the Birmans and Peguers profess the same religion, the conquerors, whoever they were, equally respected the ministers of their faith. The head of the Rhahaans at Rangoon, or the "Seredaw," lives in a handsome monastery about half a mile from the town; and values himself very much on the sacerdotal titles, conferred on him by the present and late king, and which he ostentatiously displays engraven on iron plates. There were formerly numeries of virgin priestesses, who, like the Rhahaans, wore yellow garments, cut off their hair, and devoted themselves to chastity and religion; but these societies have been long since abolished, as being injurious to the population of the state.

The *laws* of the Birmans are inseparable from their religion: and, like the latter, of Hindoo extraction. They profess to have derived them from Menu, the grandson of ramah, the first of created kings, who received the sacred Principles on which they are founded by divine revelation, and who promulgated the code. Numerous commentaries on Menu were composed by the Munis, or old philosophers, whose treatises constitute the "Dherma Saltra," or body of law. The code of Gentoo laws, translated by Mr. Halhed is said to be a compilation from the different commentaries on Menu. These laws, as well as the religion of the Birmans, found their way into the Ava country from Arracan,

and came originally from Ceylon, about 600 years ago. The Birman system of jurisprudence is replete with sound morality; and is distinguished above any other Hindoo commentary for perspicuity and good sense. It provides specifically for almost every kind of crime that can be committed, and adds an ample chapter of precedents and decisions to guide the inexperienced in cases of doubt and difficulty. The trial by ordeal, however, is disgraceful to this code; but it prevails in all countries where the Hindoo religion is professed, and is as ancient as their records. An instance of the exercise of this mode of trial is mentioned by colonel Symes. Two women having litigated a small property in a court of justice; and the judges finding it difficult to decide the question of right, it was agreed to refer the matter to the issue of an ordeal. The parties, attended by the officers of the court, the Rhahaans, and a multitude of people, repaired to a tank, or pond. After certain prayers and ceremonials of a purifying nature, the two litigants entered the pond and waded in it, till the water reached as high as their breasts; they were accompanied by two or three men, one of whom placed them close to each other, and put a board on their heads, which he pressed down till they were both immersed at the same instant. After continuing out of sight for about one minute and a half, one of them being nearly suffocated, raised her head, whilst the other continued to sit upon her hams at the bottom, but was immediately lifted up by the man; after which an officer of the court pronounced judgment in her favour, and of the equity of the decision none of the bye-standers seemed to entertain the smallest doubt. This practice, however, and that of imprecation, are now losing ground, and have of late years been discountenanced by the judicial courts both of India and Ava. Laws dictated by religion are in general conscientiously administered. The criminal jurisprudence of the Birman is lenient in particular cases, but rigorous in others. Whoever is found guilty of an undue assumption of power, or of any crime that indicates a treasonable intent, is punished by the severest tortures. The first commission of theft does not incur the penalty of death, unless the amount stolen be above 800 kiat, or tackal, *i. e.* about 100 l., or attended with circumstances of atrocity, such as murder, or mutilation. In the former case, the culprit has a round mark imprinted on each cheek by gunpowder and punctuation, and on his breast the word thief, with the article stolen; for the second offence he is deprived of an arm; but the third inevitably produces capital punishment. Decapitation is the mode by which criminals suffer, and in the performance of it the Birman executioners are exceedingly skilful. The official hall of justice, where the members of provincial governments, and all municipal officers, are accustomed to assemble for the transaction of public business, in various parts of the Birman empire, is denominated Rhoom. Every man of high rank in the empire is a magistrate, and has a place of this description and name contiguous to his dwelling; but it is always on the outside of the inclosure of his court-yard, and not surrounded by any fence or railing, in order to manifest publicity, and shew that it is the seat of majesty and justice, to which all mankind may have free access.

The population of the Birman dominions is not easily ascertained with accuracy; but Col. Symes was informed, by a person on whose testimony he could rely, that the number of cities, towns, and villages in the empire amounts to 5000, without including the recent addition of Arracan. Supposing, therefore, each town, on an average, to contain 300 houses, and each house 6 persons, the result will give a population of 14,400,000. Few of the inhabitants, he says, live in solitary habitations, but mostly form themselves into

small societies; so that their dwellings thus collected compose their Ruas, or villages; and therefore he concludes that if their number, including Arracan, be reckoned at 17 millions, it will not exceed the truth.

With regard to the *military* and *naval* force of the Birman, we may observe, that though every man in the kingdom is liable to military service, and war is deemed the most honourable occupation, the regular military establishment is very inconsiderable. When an army is to be raised, a mandate issues from the golden palace to all viceroys of provinces, and miongees of districts, requiring a certain number of men at an appointed day; and the levy is proportioned to the population of the province or district, estimated by the number of its registered houses. Every two, three, or four, houses are required to furnish one recruit, or to pay 300 tackal, or about 40 l. or 45 l. in money. This recruit is supplied by government with arms and ammunition, but has no pay. The families of these conscripts are retained in the district which they inhabit as hostages for the good conduct of the soldier; and in case of desertion, or treachery, his wife, children, or parents are dragged forth to execution; nay, cowardice subjects the family of the delinquent to capital punishment. The infantry and cavalry compose the regular guards of the king; the former are armed with muskets and sabres, and the latter with a spear about seven or eight feet long, which they manage on horseback with great dexterity. The royal magazines are said to contain 20,000 firelocks, which are of a very indifferent kind. The most respectable part of the Birman military force is their establishment of war-boats. The king can command, at a very short notice, 500 of these vessels, which are formed out of the solid trunk of the teak tree, excavated partly by fire, and partly by cutting; the largest of them are from 80 to 100 feet long, and 8 feet broad, and they carry from 50 to 60 rowers. The prow is solid, and has a flat surface, on which is mounted a piece of ordnance. Each rower is provided with a sword and a lance; and besides the boatmen, there are usually 30 soldiers, who are armed with muskets. The attack of these gun-boats is very impetuous; and those who conduct them advance to action with a war-song, by which they regulate the strokes of their oars, encourage one another, and daunt their adversaries; and when they grapple, the action becomes very severe, as these people possess singular courage, strength, and activity. As the vessels lie low in the water, their principal danger is that of being run down by a larger boat striking on their broadside. The largest of these war-boats, which are managed with surprising dexterity, both in advancing and retreating, as well as in the time of action, do not draw more than three feet of water. The proper weapons of the country are the spear, the javelin, which is thrown from the hand, the cross-bow, and the sabre; the latter of which is used by the Birman, not only as an implement of war, but for various purposes of manual labour.

The *revenue* of the Birman empire arises from one-fourth of all produce, and of all foreign goods imported into the country. However, as grants to princes of the blood, great officers of state, and provincial governors, are made in provinces, cities, villages, and farms, the rent of which they collect for their own benefit, and money is seldom disbursed from the royal coffer, the Birman sovereign possesses immense treasures.

The *climate* of every part of the Birman empire appears to be distinguished by its salubrity; and the natives are healthy and vigorous. In this respect they possess a decided pre-eminence over the enervated natives of the East; nor are the inhabitants of any country capable of greater bodily exertions

tions than the Birman. The seasons are regular, and the extremes of heat and cold are seldom experienced; at least, the duration of that intense heat, which immediately precedes the commencement of the rainy season, is so short, that the inconvenience of it is very little felt. The forests, however, like some other woody and uncultivated parts of India, are extremely pestiferous; and an inhabitant of the champaign country considers a journey thither as inevitable destruction. The wood-cutters, who are a particular class of men, born and bred in the hills, are said to be unhealthy, and seldom attain longevity.

The soil of the southern provinces of the Birman empire is remarkable fertile, and produces as luxuriant crops of rice as are to be found in the finest parts of Bengal. Towards the north the face of the country is irregular and mountainous; but the plains and vallies, particularly near the river, are exceedingly fruitful; they yield good wheat and the various kinds of small grain which grow in Hindoostan, together with most of the esculent legumes and vegetables of India. Sugar-canes, tobacco of a superior quality, indigo, cotton, and the different tropical fruits, in perfection, are all indigenous products of this country. Besides the teak-tree, which grows in many parts of the Birman empire, as well to the north of Ummerapoora, as in the southern country, there is almost every description of timber that is known in India. The kingdom of Ava abounds in minerals; six days journey from Bamoo, which is a province near the frontiers of China, there are mines of gold and silver, called "Badouem;" there are also mines of gold, silver, rubies, and sapphires, at present open on a mountain near the Keenduem, called "Wobolootaun;" but the most valuable, and those which produce the finest jewels, are in the vicinity of the capital nearly opposite to Keoum-meoum. Precious stones are found in several other parts of the empire. The inferior minerals, such as contain iron, tin, lead, antimony, arsenic, sulphur, &c. occur in great abundance: amber, of a consistence unusually pure and pellucid, is dug up in large quantities near the river: gold likewise is discovered in the sandy beds of streams which descend from the mountains. Between the Keenduem and the Irrawaddy, to the northward, there is a small river called "Shoe Lien Kioup," or the stream of golden sand. Although the Ava empire produces no diamonds and emeralds, it affords amethysts, garnets, very beautiful chrysoites, jasper, loadstone, and marble: the quarries of the latter lie a few miles from Ummerapoora; and it is equal in quality to the finest marble of Italy, and admits of a polish that renders it almost transparent. The sale of marble is prohibited; but great quantities are consumed in the manufacture of the images of Gaudma, which are fabricated in the city and district of Chagain; however, the exportation of these marble divinities out of the kingdom is strictly forbidden.

The commerce of the Birman empire is very considerable. An extensive trade is carried on between the capital and Yunnan in China. The principal article of export from Ava is cotton, of which, it is said, there are two kinds, one of a brown colour, of which nankeens are made, the other white, like the cotton of India. This commodity is transported up the Irrawaddy in large boats as far as Bamoo, where it is bartered at the common "jee," or mart, with Chinese merchants, and conveyed by the latter, partly by land, and partly by water, into the Chinese dominions. Amber, ivory, precious stones, beetle nut, and the edible nests brought from the eastern archipelago, are also articles of commerce; in return for which the Birman procure raw and wrought silks, velvets, gold leaf, preserves, paper, and some utensils of hardware. The commerce between the capital and the

southern parts of the empire is facilitated by the noble river that waters the country. Several thousand boats are annually employed in transporting rice from the lower provinces to Ummerapoora and the northern districts. Salt, and gnapee, a kind of fish-sauce used with rice, are also articles of internal commerce. Articles of foreign importation are mostly conveyed up the Irrawaddy; and some few are introduced by way of Arracan. See ARRACAN. Among the articles of foreign trade, which have found their way into the Birman country, nothing is held in higher estimation than the European glass-ware imported into Rangoon from the British settlements in India. The Birman are so sensible of the advantages of commerce, and so desirous of improving it, and of thus increasing population, which they consider as much more essential to the strength of a state than the extent of its territory, that they have, of late years, tolerated all sects, Pagans and Jews, Mussulmen and Christians, the disciples of Confucius, and the worshippers of fire, and invited strangers of every nation to resort to their ports; and being themselves free from those prejudices of cast, which shackle their Indian neighbours, they have permitted foreigners to intermarry and settle among them. The children of strangers, whatever be the sect to which they belong, born of a Birman woman, equally become subjects of the state, and are entitled to the same protection and privileges, as if they had sprung from a line of Birman ancestry. To British India commercial intercourse with that part of the Birman empire called Pegu is of great importance. This interest involves three distinct objects; that of securing from this quarter regular supplies of timber for ship-building; that of introducing into the country as many of our manufactures as its consumption may require, and of endeavouring to explore a mart in the south-west dominions of China, by means of the great river Ava; and that of guarding with vigilance against every incroachment, or advance, which may be made by foreign nations to divert the trade into other channels, and to obtain a permanent settlement in a country so contiguous to the capital of our possessions. The teak timber for the construction of our ships in that part of the world is an article peculiarly interesting in a political and commercial point of view. Some of the finest merchant ships at Calcutta have been lately built of this timber. Madras is also supplied from Rangoon with timber for all the common purposes of domestic use; and even Bombay, although the coast of Bombay is its principal storehouse, finds it worth while annually to import a large quantity of planks from Pegu. It is also of importance, not only to promote the exportation of timber from the maritime towns of Pegu, but to discourage the building of ships in the Rangoon river, in which the Birman are making rapid progress. National security and commercial advantage demand peculiar attention to both these circumstances. The imports into Rangoon from the British settlements, in the year 1794-5, amounted, it is said, to more than 12 lacks of rupees, or about 135,000*l.*; and these consisted chiefly of coarse piece goods, glass, hardware, and broad cloth; and the returns were made almost wholly in timber. The maritime parts of this great empire are commodious for shipping, and better situated for Indian commerce than those of any other power. Great Britain possesses the western side of the bay of Bengal; the government of Ava, the eastern. From the mouth of the Ganges to cape Comorin, the whole range of our continental territory, there is not a single harbour capable of affording shelter to a vessel of 500 tons burthen; but Ava comprehends, within her extent of coast, three excellent ports; Negrais, the most secure harbour in the bay: Rangoon, and Mergui, each of which is equally convenient and

much

much more accessible than the river of Bengal, which is the only port in our possession within the bay. The entrance into this is an intricate and dangerous channel; but from the harbour of Negrais a ship launches at once into the open bay, and may work to the southward without any impediment besides that which is occasioned by the monsoon. The Birman empire possesses such a variety of advantages resulting from situation, extent, produce, and climate, that it may be reckoned, among eastern nations, second in importance to China alone; whilst, from its contiguity to British India, it is to us of much greater consequence. To preserve a good correspondence and a good understanding with the court of Ava is therefore essential to our prosperity. It is our interest to maintain the independence of the Birmans, and to guard it from foreign encroachment; and then the Birman government will be united to ours in bonds of reciprocal amity and confidence. The result of the embassy of Col. Symes, sent by our governor-general of India to the kingdom of Ava in 1795, has been the establishment of this kind of amity and friendship. To the memorial presented on this occasion, the Birman monarch replied: "I, the king immortal, whose philanthropy is universal, whose anxiety for the benefit and welfare of all mankind never ceases, direct, that all merchant ships of the English nation, who resort to Birman ports, shall pay customs, charges, warehouse hire, searachers, &c. agreeably to former established usage. English merchants are to be permitted to go to whatever part of the Birman dominions they think proper, either to buy or to sell, and they are on no account to be stopped, molested, or oppressed; and they shall have liberty to go to whatever part of the Birman dominions they choose, for the purpose of buying, selling, or bartering, &c. by themselves or their agents; and it is further commanded, that they shall be at liberty to fix a resident at Rangoon, &c. and that English ships driven into Birman ports by stress of weather shall be supplied with all necessaries, &c. at the current rates of the country; and that the enemies of England, European as well as Indian, shall not be allowed to purchase warlike weapons, lead, and powder, which restriction is extended to all nations."

The *manufactures* of the Birmans consist of cotton and silk, saltpetre and gunpowder, various kinds of pottery, and marble statues; they also excel in gilding, to which purpose the greatest part of their gold is applied, and several other ornamental manufactures. Their edifices and barges are constructed with singular oriental taste and elegance; the most remarkable edifice is the Shomadoo at Pegu. Their kiosms and temples, which are numerous, exhibit a very rich and fantastic kind of architecture; and their grand hall of audience, or Lotoo, at Ummerapoora, is as splendid an edifice as can be well executed in wood. Many of their houses are very simple in their structure, and are erected in a day, or even in a few hours. The requisite materials are bamboos, grass for thatching, and the ground rattan. The whole edifice is constructed without a single nail; a row of strong bamboos, from eight to ten feet high, are fixed firm in the ground, which form the outline, and are the supporters of the building; smaller bamboos are then tied horizontally, by strips of the ground rattan, to these upright posts; the walls, composed of bamboo mats, are fastened to the sides with similar ligatures; bamboo rafters are quickly raised, and a roof formed, over which thatch is spread in regular layers, and bound to the wood by filaments of rattan; a floor of bamboo is next laid in the inside, elevated two or three feet above the ground; this grating is supported on bamboos, and covered with mats and carpets. A house of this kind, simple and expeditious in its structure,

is nevertheless a security against very inclement weather; and if it should chauce to be blown down by a tempest, the inhabitants might escape without injury. They have other buildings, however, of a superior kind; and they were formerly constructed of various figures, pyramidal, triangular, or four-sided, surrounded with walls, and adorned with flowers and figures carved in wood, and built with arches. But the art of constructing arches has been lost among the Birmans. From many buildings that now remain, it appears, that they could formerly construct excellent brick arches, both circular and gothic; but now no one in the empire can be found sufficiently skilful to arch over the opening of a window. Masonry has fallen into neglect; the jealousy of the late princes having prohibited to private individuals the use of brick or stone houses. The Birmans have of late years made rapid progress in the art of building boats and ships; and these may be constructed in the Rangoon river for one third less than in the Ganges, and for nearly one half what they would cost at Bombay. It is said, however, that the ships of Pegu are not so firmly constructed as those in our ports. The Birmans, like the Chinese, have no coin; silver in bullion, and lead, are the current money of the country. What foreigners call a tackal, properly kiat, is the most general piece of silver in circulation; it weighs ten pennyweights ten grains and three fourths; its subdivisions are the tubbee, two of which make one moo; two moo one math; four math one tackal; and 100 tackal amount to one viss. Rice is sold by a measure called Tayndaung, or basket, weighing 16 viss, or about 56 pounds; and of measurement there are several subdivisions. The average price of rice at the capital is one tackal, rather more than half a crown, for a basket and a half. At Rangoon and Martaban, one tackal will purchase four or five baskets. The Birman measures of length are a paul-gaut, or inch, 18 of which compose the taim, or cubit. The saundaung, or royal cubit (varying according to the will of the monarch), is equal to 22 inches; the dha, or bamboo, consists of seven royal cubits; 1000 dha make one Birman league, or dau, nearly equal to two British miles and two furlongs; the league is also subdivided into tenths. The Birmans divide their time as follows. The interval in which the finger can be raised or depressed, is called charazi; 10 charazi make one piaan; 6 piaan one bizana, or about a minute. The day of 24 hours, commencing at noon, is divided into 8 portions, or yettee, of 3 hours each. These divisions of time are ascertained by a machine resembling the hour-glass, and sometimes by a perforated pan placed in a tub of water. They are announced by a stroke on an oblong drum, which is always kept near the dwelling of the chief magistrate of the city, town, or village; it is commonly raised on a high bamboo stage, under a roof of mats to protect it from the weather. The Birmans, whatever way they acquired it, have the knowledge of a solar year, consisting of 365 days, and commencing on the 18th day of April. But the common Birman year is lunar, and of course 11 days shorter than the solar year; it is divided into 12 months; but the Birman lunations consist alternately of 29 and 30 days, occasioning a difference between the Newtonian and Birman lunar account of 8 hours and 48 minutes. In order to complete a solar revolution, they intercalate in every third year a month of 30 days; in this third year the first and third months have each 30 days instead of 29; they likewise suppress or pass over a day, and by these the number of days in three solar years amounts to 1095. But every fourth year will occasion the difference of a day on account of our leap-year. This, and some other defects in their mode of computation, are sources of confusion; in order to remedy which, their style, or mode of calculation,

B I R M A N.

has frequently been altered by arbitrary authority. The manner in which the Birman month is subdivided is peculiar to their nation. Instead of reckoning the days progressively from the commencement to the close of the month, they advance no farther than the full moon, from which they recede by retrograde enumeration until the month is finished. The Birman month is divided into 4 weeks of 7 days each. The 8th day of the increasing moon, the 15th or full moon, the 8th of the decreasing moon, and the last day of the full moon, are religiously observed by the Birmans as sacred festivals. On these hebdominal holidays no public business is transacted in the Rhoom; mercantile dealings are suspended; handicraft is forbidden; and the strictly pious take no suitance between the rising and the setting of the sun. The Birman era is said to commence in our year 638, and it is that which is used by the philosophers at Siam; and from them, as a more polished nation, it has passed to the Birmans.

The Birmans are very fond of poetry and music; the former they call yeddoo; when repeated by a scholar, it flows soft and measured to the ear; sometimes in successive, and often in alternate rhymes. They have epic as well as religious poems of high celebrity, and they are fond of writing in heroic numbers the exploits of their kings and generals.

Music is a science which is held in considerable estimation throughout the Birman empire; and the royal library of Ummerapoora is said to contain many valuable treatises on the art. Some of the professional musicians display considerable skill and execution, and the softer airs are pleasing even to an ear unaccustomed to such melody. The principal instruments are a foun, or harp, made of light wood, hollowed and varnished, resembling a canoe with a deck; at the extremity a piece of hard wood is neatly fastened, which tapers to the end, and rises in a kind of curvature over the body of the harp; from this curvature, the strings, usually made of wire, are extended to a bridge on the belly of the instrument; it has two sounding holes, one on each side of the bridge. The size of the foun varies from two to five feet in length. The turr resembles our violin; it has only three strings, and is played on with a bow. It is said to be an original instrument of the country. The pullaway is a common flageolet. The kyzzoup is a collection of cymbals, suspended in a bamboo frame. The patola, or guitar, is a curious instrument, of the form of a crocodile in miniature; the body is hollow, with sounding holes on the back; three strings of wire extend from the shoulder to the tail, and are supported on bridges at each extremity; the strings are tuned by means of pegs in the tail, to which they are fastened; it is played on by the finger, and is generally used to accompany the voice. The boundaw is a collection of drums, of oblong form and different size, which are suspended perpendicularly in a wooden frame by leathern thongs. The whole machine is about five feet in diameter, and four feet high. The performer stands in the centre, and beats on the drums with a small stick. This instrument is always introduced in a full band, and much used in processions. The heem is the pipe of Pan, formed of several reeds neatly joined and sounded by a common mouth-piece, and producing, when skilfully played on, a very plaintive melody. The Birmans are fond of singing and dancing; and the three last days of the solar year are commonly devoted to mirth and festivity. At Pegu they have a theatre, which is an open court, splendidly illuminated by lamps and torches, and in which dramatic performances are exhibited. Indeed, at all festivals they have dramatic entertainments, consisting of music, dancing, and action, with a dialogue in recitative. The subject is

generally taken from the legends of their heroes, especially of Rama. The best actors are said to be natives of Siam; and in one of these we are told that the dialogue was spirited without cant, and the action animated without being extravagant; the dresses of the principal performers were also showy and becoming. By way of interlude between the acts, a clownish buffoon entertained the audience with a recital of different passages, and by grimace and frequent alterations of tone and countenance, extorted loud peals of laughter from the spectators. The Birmans delight in mimicking, and are very expert in the practice, possessing uncommon versatility of countenance. By pantomimic looks and gestures, they exhibit a masterly display of the passions, making sudden transitions from pain to pleasure, from joy to despair, from rage to mildness, from laughter to tears, and of varying the expression of terror and of idiotism, with surprising effect. On the last day of the Birman year, the 17th of April, there is a kind of sport that is universally practised throughout the Birman dominions, to wash away the impurities of the past year, and to commence the new year free from stain. Women on this day are accustomed to throw water on every man they meet, which the men have the privilege of returning. This pastime is conducted with great decorum; and a woman who declines taking a part in it, is considered as avowing her pregnancy, and passes without molestation. At the close of Lent, or during the whole seventh month, called Sadeen-guit, there are illuminations; every house has erected by it a kind of mast, from which are suspended one or more lamps. In the royal palace, a pyramid of lamps, at least 150 feet high, is supported by a bamboo scaffolding. At this time the nobles from all parts of the empire resort to court to pay their homage to the king. During the principal days and nights of these festivals, there is almost a constant succession of wrestling, dancing, music, processions, fire-works, and theatrical entertainments.

The Birman alphabet consists of 33 characters, having as many distinct sounds, exclusive of various marks and contractions, that supply the place of long and short vowels, diphthongs, &c. like the other alphabets of the Hindoo class. It has no representation of the vowel corresponding with our short *a*; this is nevertheless to be pronounced after every simple sound or consonant not supplied with another vowel, unless it be forbidden by a mark of elision placed over the letter, or excluded by the junction of two or more consonants. The Birmans write from left to right; and though they have no distinguishing interval between their words, they mark the pauses of a sentence and the full stops. Their letters are distinct, and their MSS. are in general very beautiful. It has been the opinion of some of the most enlightened writers on the languages of the East, that the "Pali," or sacred language of the priests of Boodh, is nearly allied to the Sanscrit of the Bramins. The character in common use throughout Ava and Pegu is a round Nagari, derived from the square Pali, or religious text; it is formed of circles and segments of circles, variously disposed and combined, whilst the Pali, which is solely applied to purposes of religion, is a square letter, chiefly consisting of right angles. Their common books, like those of the Hindoos in the southern parts of India, are composed of the palmyra leaf, on which the letters are engraved with a stylus. In their more elegant books, the Birmans write on sheets of ivory, or on very fine white palmyra leaves. The ivory is stained black, and the margins are ornamented with gilding, while the characters are enamelled or gilded. On the palmyra leaves the characters are in general of black enamel; and the ends of the leaves, and the margins, are painted

painted with flowers in various bright colours. A hole through both ends of each leaf, serves to connect the whole into a volume, by means of two strings, which also pass through the two wooden boards that serve for binding. In the finer binding of books of this kind, the boards are lacquered, the edges of the leaves cut smooth and gilded, and the title written on the upper board; the two ends are by a knot or jewel secured at a little distance from the boards, so as to prevent the book from falling to pieces, but sufficiently distant to admit of the upper leaves being turned back, while the lower ones are read. The more elegant books are in general wrapped up in silk cloth, and bound round by a garter, on which the Birmans have the art to weave the title of the book. In every Kioum or monastery, there is a library or repository of books, usually kept in lacquered chests. In the royal library the number of these chests was not less than 100. The books were regularly classed, and the contents of each chest were written in gold letters on the lid. Some of these books exhibited very beautiful writing on thin leaves of ivory, the margins of which were ornamented with flowers of gold, neatly executed. The library contained books upon various subjects; more on divinity than any other; but history, music, medicine, painting, and romance, had their separate treatises. Col. Symes thinks it not improbable, from the chests which he inspected, that his Birman majesty may possess a more numerous library than any potentate from the banks of the Danube to the borders of China. Books in the Pali text are sometimes composed of thin stripes of bamboo, delicately plaited, and varnished over in such a manner as to form a smooth and hard surface upon a leaf of any dimensions: this surface is afterwards gilded, and the sacred letters are traced upon it in black and shining japan. The margin is illumined by wreaths and figures of gold, on a red, green, or black ground. As most of the Birmans are taught to read and write, they carry with them a sheet of thick and strong blackened paper, called a parawaik, or paruvek, in which they enter their accounts, copy songs, till they can repeat them from memory, and take memorandums of any things that are curious. On these parawaiks the zares, or writers, in all courts and public offices, take down the proceedings and orders of the superior officers. It is about 8 feet long, and 18 inches wide, and folds up like a fan; each fold being about six inches, and in length the whole breadth of the sheet. They write on this with a pencil of flatites; and the characters are effaced by rubbing them over with charcoal, and the leaves of a species of dolichos.

In the recitation of poetry, the language is exceedingly melodious; even the prose of common conversation appears to be measured, and the concluding word of each sentence is lengthened by a musical cadence, that marks the period to the ear of a person wholly unacquainted with the meaning.

Of the *cosmography* and *astronomy* of the Birmans, deduced from their most ancient writings, the following particulars will be sufficient. They conceive that the universe, called logha, which signifies successive destruction and reproduction, after it had been destroyed by fire, water, or wind, is again, of itself, restored to its ancient form. The earth, they suppose to be a plane, somewhat elevated in the centre, and surrounded by a chain of very lofty mountains. Its diameter is 1,203,400 juzana, each juzana being 44,800 cubits, or nearly 12 miles; its circumference is three times its diameter; and its thickness 240,000 juzana, of which one half is dull, and the other half a solid rock, and the whole supported by a double thickness of water, resting on twice its thickness of air, below which is a vacuum. Besides our earth, there are 10,100,000 others, mutually touching in three points, and

forming a similar number of equilateral spaces, which, not being penetrated by the sun's rays, are filled with water intensely cold. In the middle of the most elevated part of our earth, the Birman writings place Mienmo, the largest of all mountains, elevated above the surface of the sea 84,000 juzana, and descending as far below it, supported by three feet of carbuncles, having its eastern face silver, the western glass, the northern gold, and the southern pale-coloured carbuncle, and surrounded by seven chains of hills. In the middle of the ocean, opposite to the four cardinal points of this mountain, are placed four large islands, the habitations of men and other animals; and besides these, the Birman writers allow 2000 of a smaller size, 500 belonging to each of the larger ones. The ocean is in various parts of very different depths. All living beings are distributed into three classes; generating beings; those which are material, but do not generate; and immaterial beings, or spirits, each of which is subdivided into several distinct species. The Birman writings admit of transmigration, alleging, that in death, whether of man, beast, or any living being, the soul perishes with the body, and after this dissolution, out of the same materials another being arises, which, according to the good or bad actions of the former, becomes either a man, or an animal, &c. and they teach, that all beings are revolving in these changes, till they become entitled by their actions to Nieban, the most perfect of all states, in which they are free from change, misery, death, sickness, or old age. The Birman writings also announce the opinion of an infinite number of worlds in constant succession, without beginning and without end. These writings mention eight planets, viz. the Sun, Moon, Mercury, Venus, Mars, Jupiter, Saturn, and another named Rahu, which is invisible. The Sun is 50 juzana in diameter, the Moon 49, Mars 12, Mercury 15, Jupiter 17, Venus 19, and Saturn 13; and their circumferences are triple their respective diameters. They suppose that the sun, moon, and stars revolve round the great mountain Mienmo in a circle, the plane of which is parallel to the earth. The stars, according to them, pursue a constant course, without declining to the north or south; but the sun, moon, and other planets have a declination; and the sun, in proceeding from the north to the south, and from the south to the north, always touches the twelve constellations, which we call the twelve signs of the zodiac, and in the space of one year returns to the same place in the heavens from which he set out. This same revolution is performed by the moon in a month. The sun's motion, they say, is quicker than that of the moon; and by his diurnal revolution, when he is in the southern island it is mid-day, in the northern it is mid-night, in the eastern island the sun sets, in the western it rises. Although the sun, moon, and stars appear to us round, we are not to suppose them to be spheres, but this is a fallacy of vision. The invisible planet Rahu serves the purpose of explaining eclipses; for, being a huge monster, he takes the sun and moon either in his mouth or under his chin, and thus causes either total or partial eclipses. As to the heat and cold which are experienced at different seasons of the year, the Birmans say, that, from the vernal equinox to autumn, the sun is always tending to the north, and the moon inclining to the south; the season is then hot, because the sun's rays, which are naturally hot, then prevail; but from the autumnal equinox to the vernal, the sun inclines to the south, and the moon to the north, and the moon's rays, which are by nature cold, predominate, and produce cold. They assign seven causes of rain, of which some are physical, and some moral. These astronomical and physical ideas of the Birman writings were probably brought from Hindoostan, together with their religion and laws; but

for a more particular account of them we shall refer to the Asiatic Researches (*ubi infra*).

Among the Birmanians there are several histories, containing an account of the lives and actions performed by the different families of their princes; which histories are very fabulous, and abound with the recital of omens and prodigies. Indeed, the Birmanians are much attached to divination. No person will commence the building of a house, a journey, or the most trivial undertaking, without consulting some person of skill, in order to find a fortunate day or hour. Friday is a most unlucky day, on which no business ought to be commenced. On medicine the Birmanians have several books, containing a description of 96 genera of diseases, with various recipes for their cure. Mummy is with them a favourite medicine, and they are not unacquainted with the use of mercury in the cure of lues venerea; but their mode of administering it is neither certain nor safe. Most of their remedies, however, are taken from the vegetable kingdom; and they are chiefly of the aromatic kind, nutmegs being one of their most favourite medicines. Although they are well acquainted with the plants of their country, the practice of their physicians is almost altogether empirical, and they possess certain recipes and nostrums, the efficacy of which they extol, and which have been transmitted from their ancestors for several generations. They combine with their medical practice great faith in amulets and charms. In surgery, they proceed no further than dressing wounds and setting bones. Of late the inoculation for the small-pox has been introduced into Arracan.

The state of *agriculture* in the Birman empire is not particularly illustrated by Col. Symes. It seems, however, to be pursued with considerable avidity; and the soil in many parts is capable of cultivation, and its productions, which are naturally numerous, admit of further improvement. The cattle used in some parts of the country for tillage and draft are remarkably good; they put only a pair of them to the plough, which is little different from the plough of India, and turns up the soil very superficially. In their large carts they yoke four stout oxen, which proceed with the speed of a hand-gallop, and are driven by a country-girl standing up in her vehicle, who manages the reins and a long whip with ease and dexterity. Many of the rising grounds are planted with indigo; but the natives suffer the hills for the most part to remain uncultivated, and only plough the rich levels. They every where burn the rank grass once a year to improve the pasture. The Birmanians will not take much pains; they leave half the work to nature, which has been very bountiful to them. In the neighbourhood of Loonghee, many fields are planted with cotton, which thrives well; sesamum is also cultivated in this soil, and is found to answer better than rice, which is most productive in low and moist grounds. In the suburbs of Pagahm, there are at least 200 mills employed in expressing oil from the sesamum seed. In this operation the grain is put into a deep wooden trough, and pressed by an upright timber fixed in a frame: the force is increased by a long lever, on the extremity of which a man sits and guides a bullock that moves in a circle; thus turning and pressing the seed at the same time. The machine is simple, and yet effectually answers the purpose. Waggon's form a caravan for travelling from the southern country towards the capital. Of these there are sometimes as many as 18, each of which is drawn by six bullocks, and is covered with a tilted roof of bamboo, overlaid with painted cloth, for throwing off the rain. They contain not only merchandize, but also whole families, the wives, children, monkeys, cats, parroquets, and all the worldly substance of the wag-

goners. Each bullock has a bell under his throat. They travel slowly, from 10 to 15 miles a day. At night they are disposed in a circle, and form a barrier, within which the carriers feed their cattle, light fires, and dress their victuals, secure from the attacks of tygers, which much infest the less populous parts of the empire.

We shall close this article with a brief account of the *persons, disposition, and manners* of the inhabitants of the Birman empire, and of some of their singular *customs*. The Birmanians, in their features, bear a nearer resemblance to the Chinese than to the natives of Hindoostan. The women, particularly in the northern part of the country, are fairer than the Hindoo females, but less delicately formed; they are, however, well made, and in general inclined to corpulence; their hair is black, coarse, and long. The men are not tall in stature, but active and athletic: their appearance is youthful from the prevalent custom of plucking their beards instead of using the razor; they tattoo their thighs and arms into various fantastic shapes and figures, which in their opinion operate as a charm against the weapons of their enemies. Neither the men nor women are so cleanly in their persons as the Hindoos of India, among whom diurnal ablution is a religious as well as a moral duty. Girls are taught, at an early age, to turn their arms in a manner which makes them appear distorted: when the arm is extended, the elbow is inverted, the inside of the joint being protruded, and the external part bending inwards. The general disposition of the Birmanians is strikingly contrasted with that of the natives of India, from whom they are separated by a narrow range of mountains, which in many places admit of an easy intercourse. Nevertheless, the physical difference between the nations could scarcely be greater, if they had been situated at the opposite extremities of the globe. The Birmanians are a lively, inquisitive race, active, irascible, and impatient. As the passion of jealousy seems to have no influence among them, their wives and daughters are not concealed from the sight of men; and they are allowed as free intercourse with each other as the rules of European society admit; but in other respects women have just reason to complain of their treatment. They are considered as very inferior and subordinate; and even the law stamps a degrading distinction between the sexes; the evidence of a woman not being received as of equal weight with that of a man, and a woman not being suffered to ascend the steps of a court of justice, but being obliged to deliver her testimony on the outside of the roof. The custom of selling their daughters, and even their wives, to strangers, though confined to the lowest classes of society, and frequently the consequence of pecuniary embarrassment, is not regarded as shameful, nor is the female dishonoured by it; and hence it is that women surrender themselves the victims of this barbarous custom with apparent resignation. But no man, who leaves the country, is permitted to carry his temporary wife along with him. Every attempt of this kind is watched and guarded; and a ship, in which any females are conveyed away, can never return to a Birman port but under penalty of confiscation of the property, and the infliction of a heavy fine and imprisonment on the master. Men are allowed to emigrate; but the exportation of women, would, in the opinion of the Birmanians, impoverish the state, by diminishing the sources of its population. The females, who are reduced to the necessity of pursuing a course of prostitution, are not at their own disposal, nor are they allowed to receive the earnings of their unhappy profession. They are slaves sold by creditors to a licensed pander, for debts more frequently contracted by others than themselves. According to the laws of Pegu, he, who

B I R M A N.

who incurs a debt which he cannot pay, becomes the property of the creditor, who may claim him as a slave, and oblige him to perform menial service until he liquidates the debt. His immediate relations are also liable to be attached; and innocent women are often dragged from domestic comfort, and are sold to the licensed superintendant of the tackally, who, if they possess attractions, pays a high price for them, and reimburses himself by the wages of their prostitution. On the banks of a small creek, between the town of Maindu and Bassien, is a village called Mima-Shun-Rua, or the village of prostitutes, which is inhabited altogether by women of this description. Birman wives are said to be in general chaste and faithful; their sedulous employment affording no leisure for the corruption of their minds. A woman of the highest rank seldom sits in idleness at home; her female servants, under her direction and superintendance, like those of the Grecian dames of antiquity, ply the various labours of the loom. Weaving is chiefly a female occupation; and most Birman families manufacture all the cotton and silk that are required for their domestic consumption. The women in this country manage also the most important mercantile concerns of their husbands, and attend to their interests in all out-door manufactures; they are to the greatest degree industrious, and are said to be good mothers; and they therefore merit a higher rank than that which is assigned them, and better treatment than they experience. The Birmans, in some respects, particularly towards their enemies and invaders, display the severity of barbarians, but in others all the humanity and tenderness of polished life. At home they manifest an amiable benevolence, administering aid to the infirm, the aged, and the sick; filial piety is inculcated as a sacred precept, and its duties are religiously observed. A common beggar is no where to be seen; every individual is certain of receiving assistance, which, if he is unable to procure it by his own labour, is provided for him by others.

Among the Birmans, marriages are not contracted till the parties attain the age of puberty; the contract is purely civil; and the ecclesiastical jurisdiction has no concern with it. The law prohibits polygamy, and recognizes only one wife; however, concubinage is admitted to an unlimited extent. Concubines, who live in the same house with the legitimate wife, are obliged by law to perform menial services for her; and when the husband dies, they become the property of the surviving widow, unless he shall have emancipated them by a specific act previous to his decease. When a young man is desirous of espousing a girl, his mother, or nearest female relation, first makes the proposal in private; if the suit be well received, a party of his friends proceed to the house of the parents of the young woman, with whom they adjust the dotal portion. On the morning of the bridal day, the bridegroom sends to the maiden three loongues, or lower garments; three tubbeeks, or sashes; and three pieces of white muslin; such jewels also, ear-rings, and bracelets, as his circumstances will admit: a feast is prepared by the parents of the bride, and formal writings are executed: the new-married couple eat out of the same dish: the bridegroom presents the bride with some lèpæk, or pickled tea, which she accepts, and returns the compliment; and thus the ceremony ends.

When a man dies intestate, three-fourths of his property go to his children born in wedlock; and one-fourth to the widow, who is the guardian both of the property and the children, until the latter attain the age of maturity. A Birman funeral is solemnized with much religious parade and external demonstration of grief; besides the mourning relations, the attendants, who follow the corpse, which is car-

ried on a bier, are women hired for the occasion, who precede the body, and chant a dirge-like air. The Birmans burn their dead; but as the ceremony of burning is expensive, the bodies of paupers are either buried or cast into the river. The mode of burning is as follows: the bier is placed on a funeral pile six or eight feet high, made of billets of dried wood laid over one another, with intervals for admitting a free circulation of air, so as to increase the flame. The Rhahaans walk round the pile, reciting prayers to Gaudma, until the fire reaches the body, when the whole is quickly reduced to ashes, which are gathered and deposited in a grave. Persons of high distinction are embalmed, and their bodies are preserved in some kioum, or religious building, six or eight weeks before they are committed to the funeral pile. Honey is said to be the principal ingredient used for preserving the body from putrefaction.

As to their food, the Birmans, compared with the Indians, are gross and uncleanly. Although their religion forbids the slaughter of animals in general, yet they apply the interdiction only to those that are domesticated. All game is eagerly sought after, and in many places publicly sold; reptiles also, such as lizards, guanas, and snakes, constitute a part of the subsistence of the lower classes. They are also extremely fond of vegetables.

Among the vegetable productions of this country we may enumerate the white sandal-tree, and the aloexylum verum, much valued for the grateful odour of their smoke; the teak-tree (*tectonatheca*) already mentioned; the ebnoxylum verum, producing the true jet black ebony wood; the sycamore fig, Indian fig, and banyan tree; the *bigonia indica*, *nauclea orientalis*, *corypha feribus*, one of the loftiest of the palm-trees, and *excoecaria Cochinchinensis*, remarkable for the crimson under-surface of its leaves. To the class of plants used in medicine and the arts, we may refer the ginger and cardamum, found wild on the sides of rivers, and cultivated in great abundance; the turmeric, used by the natives of the coast to tinge and flavour their rice and other food; the betel pepper, *fagara pipenta*, and 3 or 4 kinds of capicum; the *jullicia tinctoria*, yielding a beautiful green tinge; *morinda umbellata*, gamboge, and earthamus, furnishing yellow dyes; the red wood of the *lawsonia spinosa*, and *Cisalpina japonica*, and the indigo. The bark of the *nerium antidysentericum*, called *codagapala*, and that of the *laurus culivava*, the fruit of the *strychnos nux vomica*, the *castia fitula*, the tamarind, and the *croton tiglium*, the inspissated juice of the aloe, the resin of the camphor-tree, and the oil of the ricinus, are occasionally imported from this country for the European dispensaries. The cinnamon laurel, sometimes accompanied by the nutmeg, the sugarcane, bamboo, and spikenard, are found throughout the whole country; the last on dry hills; and the bamboo and sugar cane in rich swamps. The sweet potatoe, *ipomæa tuberosa*, mad-apple and love-apple (*solanum melongena* and *lycoperficon*), *nymphæa nelumbo*, gourds, melons, water-melons, and various other excellent plants, enrich, by cultivation, this country; and the plantain, coco-nut, and sago palm, are produced more spontaneously. The vine grows wild in the forests, but its fruit is much inferior for want of cultivation, and through excess of heat, to that of the south of Europe; but this country is amply supplied with the mango, pine-apple, *sapiodous edulis*, mangosteen plum, *averrhoa carambola*, cullard-apple, papaw-fig, orange, lemon, and lime, and many other exquisite fruits. The animals of the Birman empire correspond with those of Hindoostan. The wild elephants of Pegu are very numerous; and, allured by the early crops of rice, commit great devastation among the plantations that are exposed to their ravages. The king

is the proprietor of these animals; and one of his Birman majesty's titles is "lord of the white elephant, and of all the elephants in the world." The forests abound with tigers. Their horses are small, but handsome and spirited, hardy and active; and are frequently exported in timber-ships bound for Madras and other parts of the coast, where they are disposed of to considerable advantage. Their cows are diminutive, resembling the breed on the coast of Coromandel; but their buffaloes are noble animals, much superior to those of India, and are used for draft and agriculture; some of them are of a light cream colour, and are almost as fierce as tigers who dare not molest them. The ichneumon or rat of Pharaoh, called by the natives Ounbaili, is found in this country; but there is no such animal as the jackal in the Ava dominions, though they are very numerous in the adjoining country. Among the birds, which are the same with those of other parts of India, is one called the Henza, the symbol of the Birman nation, as the eagle was of the Roman empire; it is a species of wild fowl called in India the Braminy goose; but the natives of Ava do not deify this bird.

The Birman seem to be in possession of several small islands in the gulf of Martaban, the Magnus Sinus of antiquity, and of others to the south and west. Symes's Embassy to the Kingdom of Ava, 3 vols. 8vo. passim. Asiatic Researches, vol. vi. p. 163—308. See ARRACAN, AVA, and PEGU.

BIRMINGHAM, is justly esteemed the greatest manufacturing town in England, and we may safely assert, that in the quantity, variety, elegance, and utility of its manufactured articles, it surpasses any town in Europe. To enable the stranger and foreigner to appreciate the general character of this place, with its various subordinate features, we will endeavour to depict them to the fancy, in a concise and perspicuous narrative. Its distinguishing characteristic is appropriately displayed in the following lines by Mr. Jago, in his poem of "Edge-hill."

" 'Tis noise, and hurry all,—the throng'd street,
The close pil'd warehouse, and the busy shop.
With nimble stroke the tinkling hammers move;
While slow and weighty the vast sledge descends,
In solemn base responsive, or apart,
Or socially conjoined in tuneful peal.—
How the coarse metal brightens into fame,
Shap'd by their plastic hands! what ornament!
What various use!—Nor this alone thy praise,
Thine too of graceful form, the letter'd type!
The friend of learning, and the poet's pride."

The etymology of the name of this town is not readily attained, as it has been written Brumwycheham, Bromwychem, and various other ways; indeed, in common conversation, it is frequently pronounced Bromidgham. The town lies near the centre of the island, in the north-western extremity of the county of Warwick. It is in the diocese of Lichfield and Coventry, in the deanery of Arden, and in the hundred of Hemlingford. The superficial contents of the parish are 2864 acres. In 1800 here were 16,403 houses, 1875 of which were uninhabited. The whole population was 73,670, of whom 34,576 were males, and 38,954 were females.

In the scale of national importance, Birmingham bears an exalted situation: without recurring to its ancient history, the modern inhabitants have, by laudable industry, raised it perhaps to the acme of manufacturing and commercial fame. The sagacious and elegant Burke emphatically pronounces Birmingham the "Toy Shop of Europe." This designation must not, however, be taken in its literal

sense, as the articles of utility made in this town far exceed those intended only for show and ornament. Many of our cities are attractive for their venerable ruins and grand cathedrals, but of those Birmingham is destitute. The traveller, who delights in seeing the human race profitably employed to their own, and their country's advantage, will disregard the smoke which sometimes envelops the town, and discern through the veil the bright beams of industry enlightening vast piles of riches: justice, however, will compel him to acknowledge, that profligacy has contrived to insinuate itself within too many dwellings of the labouring classes, producing idleness, discontent, drunkenness, and riots, of which several instances might be cited, exclusive of that grand convulsion which attended the commencement of that revolution in France, which in its consequences has so severely oppressed this, and almost every other nation. The Ikenild-street, one of the great Roman military roads, comes within a mile of Birmingham, and in Sutton park and Coldfield, four miles from the town, it remains nearly as perfect as it just completed; one of the principal evidences of the antiquity of Birmingham is, that it is contiguous to two Roman roads, the Ikenild, and Shirley streets.

The family of Birmingham were lords of this manor till 1537, at which period it is said to have been obtained by the duke of Northumberland, through the success of a deep-planned scheme. Having endeavoured in vain to purchase it, he contrived to make Edward Birmingham appear as an accomplice in a highway robbery, and offered him his interest to save a forfeited life, on condition of selling him the manor. The manor-house, which is now called the mote, still remains, though the site has been converted into a manufactory, and an apartment is shewn, where the ancient lords held their court-leets.

The parish of Birmingham is smaller than any in its neighbourhood. Mr. Hutton observes, that when Alfred founded a town, he allotted a much smaller space of land to it, than when he portioned a village, obviously intending the former for trade and commerce, and the latter for agriculture; this circumstance seems to prove that Alfred found Birmingham a town. "The buildings occupy the south-east part of the parish, which, with their appendages, are about 800 acres. This part being insufficient for the extraordinary increase of the inhabitants, she has of late extended her buildings along the Bromsgrove road, near the boundaries of Edgbaston, and on the other side planted some of her streets in the parish of Aston."

"The situation is elevated, and the soil one solid mass of dry, reddish sand, through which the water descends freely, thus making even the cellars comfortable habitations;" the same author adds facetiously, that though metals of various sorts are found in great plenty above the surface, we know of nothing below except sand, gravel, stone, and water. All the riches of the place, like those of an empiric in laced clothes, appear on the outside. "There is not any natural river in the parish, but in the lower parts of the town are two excellent springs of soft water, suitable for most purposes, one at the top of Digbeth, the other Lady well; and at the latter place are seven of the most complete baths in the kingdom. They cost 2000*l.* in erecting, and are ever ready for the accommodation of hot or cold bathing, for immersion or amusement, with conveniency for sweating. That appropriated to swimming is 18 yards by 36, situate in the centre of a garden, in which are 24 private undressing houses, and the whole surrounded by a wall ten feet high."

Mr. Hutton mentions several instances of longevity, which seem to demonstrate either that the air is too pure to be rendered unwholesome by the smoke of the town, or that

BIRMINGHAM.

smoke and steam are not so prejudicial to health as have been imagined: his instances are one person aged 100, a second 103, a third 104, and a fourth 107, four upwards of 90, and 13 upwards of 80.

Birmingham is not a place a gentleman would chuse to make a residence. Its continual noise and smoke prevent it from being desirable in that respect.

Many ancient families who once flourished at and near Birmingham, are mentioned by Mr. Hutton to have fallen into irretrievable decay; one instance is worth transcribing. "We have among us a family of the name of Middlemore, of great antiquity, deducible from the conquest; who held the chief possessions, and the chief offices in the county, and who matched into the first families in the kingdom, but fell with the interest of Charles I., and are now in that low ebb of fortune, that I have frequently, with a gloomy pleasure, relieved them at the common charity board of the town."

It appears upon record, that in 1251, William de Birmingham, lord of the manor, procured an additional charter from Edward III. reviving some decayed privileges, and granting others; among the last was that of the Whitfuntide fair, to begin on the eve of Ho'y Thursday, and to continue for four days. At the alteration of the style in 1752, it was prudently changed to the Thursday in Whitsun week, that less time might be lost to the injury of the manufacturers and their workmen. The same person also procured another fair, to begin on the eve of St. Michael, (which is commonly called the Onion fair, on account of the great quantity of onions sold at the time) both of which are at this day in great repute. The horse fair, which formerly was kept in Edgbalton-street, was, in 1777, removed to Brick-kiln-lane; and that for beasts, which used to be in the High-street, into Dale-end, in 1769.

Near Birmingham, on the London road, is Camp-hill, where the army of prince Rupert were encamped, during the siege in 1643. The inhabitants are accused of disloyalty by lord Clarendon, for seizing the carriages which contained the royal plate and furniture. The prince, with 2000 men, had been commanded by the king to open a communication between Oxford and York, but the hardy and imprudent inhabitants of this town dared to oppose this force, with only a company of foot, and a troop of horse. Though they had thrown up some slight works, and blockaded the streets, yet the king's army forced through these trifling obstructions, and entered the town sword in hand. The earl of Denbigh, a royalist, was killed in this affair, as was a clergyman, who acted as governor for the parliament, and who refused quarter. Birmingham had a narrow escape from destruction, for the exasperated commander ordered the place to be burnt, but some favourable circumstance confined the conflagration to a few houses in Bull-street.

The plague of 1665, was imported into the town in a box of cloaths brought to the White Hart inn. Hence the fatal poison insinuated itself through the streets and houses, destroying great numbers of the inhabitants, whose bodies soon filled the church-yard, and also an acre of land at Ladywood-green, which was afterwards called the Pest-ground.

Although some degree of eminence attached to Birmingham previously to the reign of Charles II., yet it is from that period that its rapid increase must be dated. Building leases then became common, and numbers of houses arose to accommodate the increasing population which assembled, in consequence of the cultivation of the mechanical arts.

About the year 1700, the number of streets in Birmingham

was only 30, but now there are nearly 250; besides, several of the oldest are considerably improved and augmented. This will, in some measure, assist the imagination in comprehending the amazing increase of the town in size, wealth, and manufactures, during that time; and it is no presumption to suppose, that it has not yet arrived at its zenith: one instance of increase will be sufficient to point out the general improvement. Between the roads to Wolverhampton and Dudley, there were only three houses March 14, 1779. By that day twelve months they increased to 55, and March 14, 1781, there were 144. The same day in 1791, there was an addition of 833.

Thomas Sherlock, bishop of London, purchased of the ladies of the manor in 1730, land worth 400l. per annum; in 1758, the income was doubled. He always refused to let it on building leases, alleging, that his successor would be compelled to remove the rubbish at the expiration of the terms; sir Thomas Gooch, who held the land after the above prelate, procured an act about 1766, for setting aside the prohibitory clauses of the bishop's will; immediately let the ground, and improved the rents to 2400l. per annum; it appears from the books of the poor-rates, that less than 5000 houses pay the parochial dues, and more than 8000 houses are exempt; this fact denotes the prevailing description of population.

Manufactures, &c. The extraordinary increase in the size, population, and prosperity of Birmingham, arises principally from its proximity to the coal mines, from the nature of the soil, from its canals, from the successful exertions of a few individuals in some manufacturing speculations, and from its being exempt from borough, and corporate laws and restrictions. To investigate and detail the whole of these causes, with their effects, would occupy more space than we can consistently appropriate. The most prominent characteristics, however, shall be narrated. To the late John Taylor, esq. a man of great industry and ingenuity, the public are indebted for the gilt button, the japanned and gilt snuff-box, with the numerous class of enamels; also the painted snuff-box, at which employ, one servant earned 3l. 10s. per week, by paisting them at a farthing each. In his shops were weekly manufactured buttons to the amount of 800l. exclusive of other valuable productions, and eighty guineas have been given him for a single toy made at his shop. He died in 1775, at the age of 64, after acquiring a fortune of 200,000l. His son is now partner in one of the largest provincial banking houses in England.

The greatest and most noted manufactory of this place, and perhaps in Europe, is that at Soho, about two miles from Birmingham. This is the property of Messrs. Boulton and Watt, who have advanced certain pieces of mechanism and productions of art to a state of excellence, that have excited the astonishment and admiration of nations. The large warehouses, work-shops, and the elegant mansion of the former gentleman, cover the declivities of a hill, which a few years back was a barren heath, tenanted only by rabbits, and a warraner's hut; now this once desolated scene is converted into an emporium of arts and beauties. Such are the wonderful powers of human ingenuity and industry. In 1757, this spot, with some contiguous land, was leased for 99 years, to Messrs. Ruston and Evans, who erected a house and a mill for rolling metal, &c. At Lady day, 1762, Mr. Boulton bought the whole, and removing to it soon afterwards from Birmingham, commenced the present extensive premises, which were nearly completed in 1765, at an expence of 9000l. He now admitted a partner, Mr. Fothergill, into the concern, and

BIRMINGHAM.

established an extensive correspondence throughout Europe. To obtain and support a reputation, every encouragement was afforded to men of genius in drawing, modelling, and other branches of the arts. An imitation of or molu in vases, tripods, and candelabras, was adopted, accompanied by so much skill and elegance, that universal approbation followed; this led to the manufacture of wrought silver, and an application was made to parliament in 1773, for an assay office, to be established at Birmingham. The poly-graphic art had its origin at Soho. This method of copying pictures in oil, by a mechanical process, was conducted by F. Epinton, who has since executed a great number of fine specimens of painting, or staining of glass. The encaustic mode of staining glass, or fixing the vivid and fine graduating colours upon that transparent material, was supposed to be lost, but it has been revived and brought to great perfection by this gentleman. Since 1784, he has executed several large windows for various cathedrals, churches, and gentlemen's mansions. (See GLASS-PAINTING.) Among the various machines, &c. invented and constructed at Soho, there is one entitled to distinguished notice for its great national utility and importance. This is the *steam engine*, which has acquired extraordinary force and improvements by Mr. James Watt, one of the proprietors of the Soho firm. To him the scientific world is much indebted for various other inventions and improvements in mechanics. With a vigorous comprehensiveness of mind, he embraces every mathematical and mechanical subject from the simplest to the most complex and profound. He procured a patent for the steam engine in 1768, and seven years afterwards, entering into partnership with Mr. Boulton, began to construct those machines at Soho. Since that period, they have been generally adopted in the mines and manufactories all over the kingdom. (See STEAM ENGINE.) The following list of curious and useful articles are manufactured at these works, which, when fully employed, give support to upwards of 600 labourers. Buttons of all kinds; polished steel, and jettina steel-toys; polished steel watch chains; patent cork-screws, &c. Buckles and satchets of all sorts; plated and silver goods for the dining and tea-table, side-board, &c.; medals and coins of various sizes and metals. The late beautiful new coinage of copper, and also the re-stamped dollars; all come from the Soho mint. The coining mill or engine first erected here in 1783, has been much improved since that period, and is now adapted to work eight machines at once, each of which will strike from 70 to 84 pieces per minute, the size of a guinea; or between 4,000 and 5,000 per hour. Thus the eight machines will work between 30,000 and 40,000 coins in one hour. These machines are operated on by the steam-engine, and perform the following processes: 1st, rolling the masses of copper into sheets; 2nd, fine rolling of the same cold, through cylindrical steel rollers; 3rd, clipping the blank pieces of copper for the die; 4th, shaking the coin in bags; 5th, striking both sides of the coin, and milling it, at the same time displacing it, and placing another for the same operation. To its other properties, this ingenious machine adds the almost magical one of preventing fraud, by keeping an accurate account of every coin which passes through it. Dr. Darwin has described this singular apparatus in the following apposite poetical lines:

—“Now his hard hands on Mona's refted creft,
Bofom'd in rocks, her azure ores areft;
With iron lips his rapid rollers feize
The lengthened bars in their expanfive fqueeze;
Defcending fcrews with pond'rous fly-wheels wound

The tawny plates, the new medallion's round;
Hard dies of steel, the cupreous circles cramp,
And with quick fall, his mafsy hammers ftamp.
The harp, the lily, and the lion join,
And George and Britain guard the fplendid coin.”

Rolled metals of all kinds of mixtures, are prepared here; besides pneumatical apparatus, large and portable; also copying machines, and in short, almost every sort of article for use or ornament.

Besides the manufactories already named, Birmingham contains several others, which are entitled to our consideration; and although we cannot allow space for particulars, yet we must not pass them altogether unnoticed.

Messrs. Richards's in High-street, is styled the toy-shop of Birmingham; the elegance and variety of the articles are not to be equalled, with the exception of the show-room at Soho. Mr. Clay's japan manufactory is not less celebrated, particularly when it is considered that the japan is fixed on common brown paper. To those may be added Clarke and Ashmore's manufactory of whips. Gill's gun, bayonet, and sword manufactory, supposed to be one of the best in the world; and Galton's for sporting guns. Previous to the reign of William III. guns were mostly imported from Holland; but that monarch having once expressed some regret at this circumstance, and deplored the necessity of sending abroad for the article, Sir Richard Newdigate, M.P. for Warwickshire, being present, assured the king that his constituents would undertake to supply the demands of government. An order was given, and being readily and correctly executed, Birmingham has continued from that period to be the great and principal place of manufacture for this destructive weapon. See GUN.

Leather appears to have been manufactured here in great quantities in the early periods of the history of Birmingham; but in 1795, there was but one tanner in the place.

Within the last century, the manufacture of steel into almost every kind of toy and ornament took its rise: a large street bears the name of Steel-house-lane, from the extensive works carried on there. Here are also very large brass works erected on the banks of the canal, on the road to the five ways, near which stand the ruins of the mansion built by the late John Baskerville, who made great improvements in the art of printing. See BASKERVILLE.

Places of Amusement and Curiosity. In New-street is a museum, or repository of natural and artificial curiosities, the property of J. Bisset, a gentleman who has published some ingenious poems and useful books. His “Magnificent Directory,” is a novel, handsome, and useful work, in which are contained elegantly engraved, emblematical cards of address of a great number of the merchants, manufacturers, tradesmen, &c. throughout England.

The first *Theatre* established at Birmingham was situated in Moor-street about 1740; that in King-street was erected 1765, and enlarged 1774; in the same year it was transferred to a religious society; and another built in New-street, at an expence of 5660l. and managed with great success by Mr. Yates. In 1791, it was burnt by some incendiaries, who have never been discovered; since that period, the proprietors have rebuilt it in a very splendid manner for 14,000l. with an assembly room and a tavern annexed to it. Mr. Macready of Covent Garden theatre, is the present manager, who generally presents his audiences with the best London performers during the summer months. Concerts and musical parties are held weekly during winter; and the summer produces a variety of public gardens, the principal of which are Vauxhall and Spring-gardens.

BIRMINGHAM.

Government. Birmingham is governed by three acting magistrates; the officers chosen annually are the high-bailiff, who inspects weights and dry-measures, and the markets; the low-bailiff, who summons juries, and chuses all the other officers; two constables and one headborough; two high tasters, who examine the quality of beer and its measure; two low tasters or meat conners, who inspect the meat exposed to sale, and cause that to be destroyed which is unfit for use; two assurers, and two leather-fellers, whose offices are now only nominal.

Deritend, a hamlet of Birmingham, sends its inhabitants to the court leet of that town, where all the above officers are chosen and sworn, in the name of the lord of the manor.

An act of parliament passed in 1752, which established a *Court of Requests*, consisting of 72 commissioners, three of whom are a quorum; they sit every Friday morning in a room of the Red Lion inn; the clerks attend to give judicial assistance, who are always professors of the common law, and chosen by the lord of the manor and the commissioners for life: ten of the commissioners are ballotted out every other year, and ten others elected from among the inhabitants. The beneficial effects of a humane society for the recovery of suspended animation were first extended to Birmingham in 1790. About the same period a committee of respectable inhabitants was established to watch over the common interests, under the title of the "Commercial Committee."

In 1791, W. Villars, esq. then high bailiff, opened a market for hay, straw, &c.

A public library was founded in 1779, which has flourished greatly, and contains nearly 10,000 volumes, supported by upwards of 500 subscribers. An elegant pile of building was erected in Withering-street for the purposes of the institution in 1797. A rival made its appearance in 1796, with every prospect of success; besides these, there are medical and law libraries, and many reading societies. Birmingham contains two churches, and four chapels; besides several meeting-houses.

Churches. St. Martin's church, denominated the Old church, was raised previously to the year 1300. It is of stone, and occupies the site of, or is the first sacred building belonging to the place. In 1690, it was thought necessary to case the church and tower with brick. The walls support the arms and monuments of several titled and ancient families. Under the south window are two of white marble, one of which is supposed to have been erected for William de Birmingham, who was captured by the French at the siege of B-legard in 1297. He wears a short mantle, &c. and bears a shield with the bend lozenge. This church was repaired and altered in 1786, at an expence of 4000*l.* The patronage belonged to the family of Birmingham till 1537, since which period it has been possessed by the Dudleys, the crown, the Marrows, the Smiths, and finally the Tenants. The rectory was valued in the king's books 1291, at 5*l.* per annum, and in 1536, at 19*l.* 3*s.* 6*d.* The income is now upwards of 1000*l.* and expected to be 2000*l.* after the expiration of certain leases.

St. Philip's, or the *New* church, is a handsome pile of building, but how Mr. Hutton or any other person could fancy and say that the steeple is erected after "the model of St. Paul's in London, but without its weight," is to us inconceivable, as there is not a line of it that reminds the spectator either of the dome or turrets of the metropolitan edifice. It must be allowed that the tower of St. Philip's finishes with an attic and a diminutive cupola, but there ends the resemblance. This church is advantageously situated on an eminence, and the site was given by Robert Philips, esq.

It was begun by act of parliament in 1711, under a commission consisting of 20 of the neighbouring gentry appointed by the bishop of the diocese under his episcopal seal. In 1715, it was consecrated, and finished in 1719, at the real cost of only 5012*l.* though the estimated value was nearly 20,000*l.* This circumstance arose from the gift of materials, &c. The church-yard consists of four acres, and is intersected by handsome walks, shaded by trees in double and treble rows, and is surrounded by elegant buildings. Two thousand persons may be conveniently accommodated in St. Philip's church, which has contained nearly 3000. William Higgs, first rector, founded a theological library for the use of the neighbouring clergy, and bequeathed 200*l.* to augment it. The Rev. Spencer Madan erected a room in 1792, adjoining the parsonage, and termed it the parochial library. The rectory is worth about 300*l.* per annum.

St. Bartholomew's Chapel, capable of containing 800 persons, was erected in 1749, on a site given by John Jennens, esq. an opulent land-holder of Birmingham. Mrs. Jennens, through the good offices of Mrs. Weaman, added 1000*l.* and the remaining sum was received in contributions from pious inhabitants. The chapel and tower are handsome, and the former presents a line north and south. The altar-piece is the gift of Basil, earl of Denbigh, and the communion plate that of Mary Carless.

St. Mary's Chapel was erected in 1774; on a spot of ground given by Mary Weaman, whose family has the patronage. The incumbency is valued at 200*l.* per annum.

St. Paul's Chapel is a stone building erected in 1779, by virtue of the same act which founded St. Mary's. Charles Colmore, esq. gave the ground; a steeple is intended, and the east window was decorated in 1791, with painted glass, representing the conversion of St. Paul, by Francis Eginton, who received 400 guineas for the same.

The house of a celebrated physician of Birmingham, Dr. Ash, was purchased in 1789 by an attorney, who converted it into an elegant chapel, at the expence of his own ruin, where he caused the service of the church to be chanted by a numerous choir, accompanied by an organ. Dr. Croft, and some other clergymen, afterwards purchased it, and engaged to officiate there regularly. The congregation chiefly consists of soldiers from the neighbouring barracks.

Dissenting Meeting Houses. *Old Meeting-street* received its name from the old meeting erected in the reign of William III. which was destroyed in 1791 by the mob. The trustees recovered 1390*l.* 7*s.* 5*d.* damages, and rebuilt the present building, at an expence of 5000*l.*

The *New Meeting* built 1730, shared the fate of its parent in 1791, and has never been rebuilt. The celebrated Dr. Priestley presided over the spiritual concerns of this place of worship at the period of its destruction, and narrowly escaped personal injury, or perhaps death, from the furious populace. He fled, and finally retired into exile, within the state of Pennsylvania, where he died 1804, with the fame of an excellent philosopher and experimentalist. (See PRIESTLEY.) The trustees having lost their licence, could not recover damages, but the king granted his warrant upon the treasury for 2000*l.*

The *Union Meeting* in Livery-street, originally an amphitheatre for the exhibition of equestrian exercises, being unoccupied at the period of the riots, the congregations of the two meetings hired, and converted it into a place of worship. After the re-erection of the old meeting, they separated, resigning the Union meeting to the new meeting

BIRMINGHAM.

assembly, who occupy it till their place of worship is re-built.

Carrs-Lane Meeting, a kind of chapel to the old meeting, was erected in 1748. This society has 800*l.* bequeathed by John England in 1771, and 40*l.* 18*s.* per annum, termed Scot's trust.

A *Baptist Meeting* in Canon-street, was founded in 1738, and has continued prosperously to the present period.

The *Quakers* have a meeting in Bull-street, frequented by a large, peaceable, and rich congregation; behind it is a spacious burial-ground. The methodists are now very numerous; previous to 1782, there was but one congregation, whose place of worship had been a theatre; whence they removed to a splendid meeting in Cherry-street, erected at an expence of 1200*l.* John Westley, their chief priest, preached in it for the first time July 7, in the above year; three others have since been erected and purchased in Colchill-street, Deritend, and Newhall-street. The last was erected as a new Jerusalem temple, for the Swedenborgians, but in too magnificent a style for their revenues. The methodists bought it, and the original possessors built a smaller temple.

A small *Roman Catholic Chapel* is situated at Easy-hill, in the place of one destroyed during the destructive riots. A Jewish synagogue, a baptist's meeting, and an independent meeting, lady Huntingdon's meeting, and some other places of worship, are found in this town, which, like most manufacturing places, is distinguished for its number of dissenters of different sects.

Charities. Some of the streets of Birmingham are kept in repair by emoluments arising from small estates. William Lench, who lived in the reign of Henry VIII. bequeathed certain estates to the town, in trust to sixteen inhabitants, for repairing the streets. This person founded the almshouses in Steel-house lane for poor widows. Fentham's trust is 100*l.* per annum, and applied to teaching poor children reading, and for cloathing ten poor widows. The date of the donation is 1712. Mr. Crowley gave in 1733, six houses for the support of a school for ten girls.

The *Free School* was erected on the site of the guild of the holy cross, which had an endowment of lands for the maintenance of two priests, worth twenty marks per annum, given by Thomas de Sheldon, John Colshill, John Goldsmith, and William Attflowe. In 1593, the bailiff and inhabitants obtained a patent for augmenting the foundation, and adding a brotherhood, which flourished till the general dissolution, and was then valued at 31*l.* 2*s.* 10*d.* per annum. Edward VI. granted the lands belonging to the guild in 1552. at the suit of the inhabitants to nineteen persons, as bailiff and governors of the free grammar school of king Edward VI., to hold in common socage at a rent of 20*s.* per annum. Their successors erected the present building in 1707, which is large and handsome, has a neat tower in the centre, and a statue of Edward VI. in front. The chief master's salary is 120*l.* the second 60*l.* two ushers 40*l.* each for writing and drawing, and a librarian 10*l.* There are seven exhibitions of 25*l.* per annum each for the university of Oxford, and the possessions are valued at 1200*l.* per annum.

The *Blue Coat School* was erected 1724. but enlarged and improved in 1794, at an expence of 2500*l.* The revenues are 1327*l.* and 150 boys and 40 girls receive the benefits of the institution.

The *Dissenter's Charity School* was held at the old meeting, but after that was destroyed, a building was purchased in Park street, and has been much improved. The children received are 40 boys and 20 girls.

The *Work-house* erected 1733, cost 1173*l.* a wing was added for an infirmary 1766, and another in 1779, at an expence

of 1100*l.* The inhabitants pay a rate of 6*d.* in the pound, which raises 17,000*l.* per annum, and relief is afforded to 7000 persons. There are twelve overseers.

The *General Hospital* was erected 1766, and two wings were added 1791. It is supported by voluntary contributions, and many large bequests; the physicians generally give their assistance gratis.

The *Prisons* in Peck-lane and Deritend are disagreeable and unwholesome, and both are licensed as public houses.

The *Canal* between this place and Wednesbury, was made in consequence of an act obtained in 1767. It is twenty-two miles in length, uniting with the Staffordshire canal; the shares were 140*l.* each, and the expence 70,000*l.*; they sold in 1782 for 370*l.* each, and in 1792 for 1170*l.* Sir Thomas Gooch leased the proprietors six acres of land at 47*l.* per annum, which they converted into a wharf, and erected a handsome office on it. The boats are drawn by one horse, and are about twenty-five tons burthen. Coals are little more than half the price they were before this canal was made. Several other canals, equally beneficial, have since been completed, opening a communication between this town, and almost every principal town in the kingdom.

The *Barracks* stand on five acres of land, held by government at one penny per yard. They were erected in 1793 for 13,000*l.*, and will accommodate 162 men.

There are three extensive Breweries near Birmingham, Richards's in Deritend for ale, Giles and Forrests, Worton-lane, for ale and porter, and the Britannia, Walmer-lane, belonging to Clay and co.

The riots, already alluded to, constitute an unpleasant feature in the history of this town, and whilst they serve to characterize the folly and insatiation of the lower classes of society, will, we trust, operate as a warning example to the rising generation. A few persons assembled at the hotel Birmingham, July 14, 1791, to celebrate the anniversary of the French revolution. A mob collected round the house, broke the windows, and immediately proceeded to Dr. Prichley's new meeting. This, and the old meeting, were soon burnt to ashes, and the doctor's house and furniture, with his valuable library, apparatus, and MSS. shared the same devastating fate. On July 15, the mansions of John Ryland, esq. at Easy-hill, and Bordesley-hall, the seat of John Taylor, esq. together with the house, stock in trade, books, furniture, &c. of Mr. Hutton, author of the "History of Birmingham," were destroyed. Saturday the 16th witnessed the destruction of Mr. Hutton's house at Saktley, the residences of George Humphreys, William Ruffel, and John Taylor, esqrs. The latter, Bordesley-hall, was occupied by lady Carhampton, mother to the duchess of Cumberland, but neither her blindness through age, nor connection with the king, could prevent the mandate of removing her furniture from the mob, who frantically offered to assist: "She was therefore, like Lot, hastened away before the flames arose, but not by Angels." The reverend Mr. Hobson's and Mr. Herwood's houses were next burnt; those of the Rev. Mr. Coates, Mr. Hawkes, and Thomas Ruffel, esqrs. were plundered. On Sunday the 17th, Kingwood meeting perished in flames, the parsonage-house, and that of Mr. Cox, licensed for public worship. The mob this day plundered Edgbaston-hall, Dr. Withering's, and attacked Mr. Male's house, but hearing in the evening, that a troop of horse approached, they gradually dispersed, after destroying property to the amount of 60,000*l.* To reimburse the sufferers, an act was obtained in 1793. The war succeeding, greatly injured Birmingham, and this cannot be more

clearly proved than by referring to the 1875 uninhabited houses in the year 1800. There are two morning papers published at Birmingham; Aris's Birmingham Gazette, and Swinney's Birmingham Chronicle, &c. Mr. Swinney also carries on a considerable type foundery, which is the only provincial one in the kingdom. "This neighbourhood," says Mr. Hutton, "may justly be deemed the seat of the arts, but not the seat of the gentry. None of the nobility are near us, except William Legge, earl of Dartmouth, at Sandwell, four miles from Birmingham. The principal houses in our environs are those of the late sir Charles Holte at Alfton; sir Henry Gough Calthorpe at Edgoston; George Birch, esq. at Handsworth; John Gough, esq. at Perry; and John Taylor, esq. at Bordesley and at Mofely, all adjoining the manor of Birmingham; exclusive of these, there are many retreats of our first inhabitants, acquired by commercial success." Hockley Abbey, near Soke, is the residence of Mr. Richard Ford, an ingenious smith, who had the honour of presenting his majesty with an iron carriage made by himself. It is a modern curious building, with the upper part representing a ruin, and is surrounded by beautiful grounds and walks, interspersed with fanciful curiosities. The most considerable seats in the vicinity of Birmingham, are Hagley, 12 miles distant; Eville, 18 miles distant; and the Leafowes, six miles distant. The latter will long be preserved in the memory of every reader of Shenstone, whose creation it was, and whose taste it displayed in an eminent degree. It now belongs to Charles Hamilton, esq. who has judiciously restored the neglected beauties of the place. Hagley, the seat of lord Littelton, has been particularly celebrated in the writings of Pope, Thomson, Hammond, and other poets. Eville, the seat of the earl of Stanford, is a scene of great natural beauty. For further particulars relating to Birmingham, its manufactures and neighbourhood, see Hutton's "Hist. of Birmingham," 8vo. Shaw's "Hist. of Staffordshire," fol. "A companion to the Leafowes, Hagley, and Eville," 12mo. Bisset's "Poetic Survey round Birmingham," 8vo. Phillips's "History of Inland Navigation," 4to. &c.

BIRON, ARMAND, DE GONTAULT, baron of, in *Biography*, was born about the year 1524, and rose gradually from the condition of a page to Margaret queen of Navarre, to the rank of marshal of France, which he obtained from Henry III. in 1577. After the death of this king, he was one of the first to acknowledge Henry IV. as lawful possessor of the crown, and served him with advantage at the battles of Argues and Ivry. At the close of the action, to the victorious issue of which he contributed, by his command of the reserve, though he was not engaged, he said to Henry, who had much exposed himself, "You, sire, have acted the part of Biron to day, and he has acted yours." Under Henry III. he occupied the post of lieutenant-general of Guenne, in which he gained great advantages over the Calvinists; and he also reduced part of Normandy to the obedience of Henry IV. To his son, who solicited a small force for the purpose, and with the promise of ruining the army of the dukes of Parma and Mavenne, he replied; "I believe you may; but then we shall have nothing farther to do but to plant cabbages at Biron." Soon after, in 1592, he lost his life by a cannon ball at the siege of Epernai. In his military character, he was a rigid disciplinarian, and required prompt obedience. When an officer, whom he had commanded to burn a house, desired an order to this effect, under his own hand, Biron instantly discharged him, alleging "he would have nothing to do with people who were afraid of justice; and that every soldier who dreaded a pen, must tremble at a sword."

He was a polite scholar, but of a mercenary and intemperate disposition. He wrote "Commentaries" of his transactions, which were lost. Gen. Dict. Nouv. Dict. Hist. Mod. Un. Hist. vol. xxi. p. 54, &c.

BIRON, CHARLES DE GONTAULT, duke of, the eldest son of the preceding, was born in 1562; and having served under his father, he distinguished himself in several battles and sieges. Henry IV. distinguished him by tokens of forbearance and favour, on account of his faithful and active services. He created him admiral of France in 1592, marshal and governor of Burgundy in 1594, and honoured him with erecting the barony of Biron into a dukedom and peerage. He also employed him in several important diplomatic embassies: but his pride and ambition rendered him incapable of gratitude. Allured by flattering prospects, he engaged with Spain and Savoy in a conspiracy against his master; and at length his haughty conduct caused him to be arrested for his treasons, tried, and condemned to lose his head; and the sentence was executed in the court of the bastille, July 31, 1602. He submitted with reluctance, and betrayed cowardice at the time of his death. He was vain, arrogant, and malicious; he changed his religion twice before he attained the age of 16 years, and manifested a total want of principle and integrity. His passion for gaming reduced him, notwithstanding his rapacity, to various difficulties; and he was only estimable when he was actively employed. Although the king incurred some blame for sacrificing the life of a servant who had been eminently useful, and honoured with his peculiar friendship, Biron deserved to suffer as a traitor. Gen. Dict. Nouv. Dict. Hist. Mod. Un. Hist. vol. xxi. p. 99, &c.

BIRON, in *Geography*, a town of France, in the department of the Dordogne, $3\frac{1}{2}$ leagues south of Belvez.—Also, an island in the gulf of St. Lawrence, 26 leagues west of cape Anzeilla. N. lat. $47^{\circ} 50'$. W. long $61^{\circ} 5'$.

BIROSTRIS, in *Conchology*, a species of BULLA, that inhabits Java. The shell has two beaks, which are elongated and smooth; margin thickened outwardly. Gmelin, Litter. This species is not unlike *Bulla velva*, but is smaller, being only about the size of a horsebean; and it is also narrower; smooth, whitish, flesh-coloured; beaks unequal, obliquely truncated, and one of them a little ascending; aperture nearly equal, but widest at one end.

BIROTA, *Bivotum*, from *bis* and *rota*, *wheel*, a kind of vehicle denominated from the two wheels whereon it moved. The birota, by the constitution of Constantine, was drawn by three mules, and carried 200 pounds weight; by which it was distinguished from the *rheda*, which carried 1000 pounds, and was drawn by eight, and in winter by ten mules.

BIRR, in *Geography*, or, as it is called by act of parliament, *Parsons Town*, the largest post and market town in the King's county, Ireland, situated on the river called the *Little Brosna*, which divides the King's county from the county of Tipperary, on the south west. This town has breweries, distilleries, malt-houses, cloth and serge manufactories, a bank, an excellent market, and a barrack for two companies of foot. The castle at the western extremity of the town, belonging to the family of Parsons, was besieged by Sarsfield, lord Lucan, general of the Irish, in the war of the revolution of 1688, and relieved by general Kirk. There is a statue of William, duke of Cumberland, standing on a stone pillar of the Doric order, erected in 1747, in honour of the victory at Culloden. Birr is 65 miles west by south from Dublin, 6 south from Banagher on the Shannon, and near 12 from Portanna.

N. lat.

N. lat. 53° 4'. W. long. 7° 52'. Beaufort.—Coote's Survey of King's County.

BIRRETUM, or **BIRETUM**, in *Writers of the Middle and Lower Ages*, a thin black cap or cover for the head, made of linen, fitted close to the head, and pointed by a pyramid, anciently worn by priests, soldiers, doctors, &c. Du-Cange. The word *birretum*, sometimes written *birretum* and *biretum*, is also applied to a cap or coif of a judge, or serjeant at law. The birretum also denotes the cap worn by the novices in the Jesuit's order, formerly of a square, now a round figure. The birret was the ordinary cover of the head in France 500 years ago. It took its denomination from *birrus* or *birrum*, the coat anciently used by ecclesiastics; with which the cap was then of a piece, and made part of it; so that the whole covered, not only the head, but the shoulders. Afterwards, when they began to retrench the lower part, still retaining the upper, it was no longer called *birrus*, or *birrum*, but diminutively *birret*, or *birretum*.

BIRRUS, an ancient habit worn by the Christians in Africa. The word is also written *byrrus*, supposed to be formed from *πυρρος*, on account of its red colour. Some will have the birrus an episcopal habit. Others extend it to all the clergy. Others, on juster grounds, make it the common coat of all the Christians in that quarter.

BIRS, or **BIRSH**, in *Geography*, a river of Swisserland, which runs into the Rhine near Basle. Near this river, and not far from the town of Basle, are the hospital and burying ground of St. James, famous in the history of Swisserland for a desperate combat in 1444, between the Swiss and the dauphin of France, afterwards Lewis XI. in which Swiss valour and intrepidity were very signally displayed. Upon this occasion 1500 Swiss charged 8000 of the enemy's cavalry with such determined and well conducted valour, as to drive them back; and when the enemy received reinforcement, the Swiss renewed the assault, and forced them to repass the river Birs, and join the main body of the army. The Swiss, encouraged by this success, and also exasperated with the most spirited indignation against the invaders of their country, rashly attempted, against the remonstrances of their officers, to force their passage over a bridge guarded by a large body of the enemy; but this gallant effort not succeeding, they threw themselves into the river, and gained the opposite shore, in the face of a battery of cannon, that was playing against them. But they were now opposed to an army of 30,000 men advantageously posted in an open plain. In these desperate circumstances they had no alternative, but to throw down their arms, or gloriously expire. They bravely preferred death; 500 took possession of a small island near the bridge, and after resolutely defending themselves to the last extremity, were cut to pieces. A like number forced their way through the ranks of the enemy, and marched towards Basle; when they were opposed by a large party of horse posted to prevent the inhabitants of the town from sallying forth to the relief of their countrymen. Being now surrounded on all sides, they threw themselves into the hospital of St. James; and, lining the walls of the burying-ground, resisted for some time the united assaults of the French army. At length the hospital being set on fire, and the cannon having battered down the walls of the burying-ground, they no longer fought in hopes of victory; but still resolving to sell their lives as dearly as possible, they continued to defend themselves to the last gasp.

Æneas Sylvius (afterwards pope Pius II.) relates, among other actions of singular valour excited by this heroic troop, the following instance, that deserves to be recorded. Four

French foldiers assaulted a single Swiss, and having killed and stripped him, proceeded to insult the corpse; one of his companions, incensed at this brutal action, seized a battle-axe, rushed upon the four, slew two of them, and drove the others to flight; then flinging the dead body of his friend upon his shoulders, carried it to a place of security; and, returning to the attack, fell by the hand of the enemy. Of the whole number, only 15 escaped from the field of battle; and these, agreeably to the old Spartan discipline, were branded with infamy, for not having sacrificed their lives in defence of their country. Among those who were desperately wounded and left upon the field, only 32 were found alive. The names of many of these glorious combatants were registered, and still remain upon records. The loss of the enemy was great; and they were effectually prevented from prosecuting their designs upon Swisserland, and compelled to retire in a shattered state into Alsace. Lewis himself declared that such another victory would ruin his army. This combat may be considered as forming a remarkable era in the history of the Swiss; for it gave rise to their treaty with Charles VII.; being the first alliance which they contracted with France. The Swiss still talk of this famous action with the warmest enthusiasm; and the inhabitants of Basle form parties every year, and go to an inn situated near the hospital and burying-ground, in order to commemorate, in a red wine produced from some vineyards planted on the field of battle, the heroic deeds of their countrymen, who so gloriously sacrificed their lives. This wine is highly prized by the Basileans, and called "the blood of the Swiss."

By the side of the Birs there is a fertile plain, on which are several pleasant villages; and the extremity of the plain is closed by a rock, through which opens the celebrated pass called "Pierre Pertuis," which see. At the bottom of this rock, the Birs bursts from the ground in several copious springs, and turns two mills within a few paces of its principal source.

BIRSK. See **BORSK**.

BIRSKA, a river of Siberia, which runs into the Lena, 28 miles south-west of Olekminsk.

BIRSTEIN, a town of Germany, in the circle of the Upper Rhine, and county of Henberg; 26 miles E. N. E. of Frankfurt on the Mayne.

BIRTERBURY, or **BITTERBUI Bay**, a considerable bay on the west coast of Ireland, in the county of Galway, open to the Atlantic. It is capacious and well sheltered, has good ground, and will admit the largest ships, which may ride here from four to eight fathoms water; yet it is probably never visited, except by fishermen and smugglers. N. lat. 53° 20'. W. long. 9° 53' 30" from Greenwich. M^cKenzie.

BIRTH, in a general sense. The word is of Saxon origin, and is used to denote both the act of coming into life, which is called child-birth, and the offspring or thing born, and in these senses we meet with it in our best writers.

But thou art fair, and at thy birth coming into the world.
Shakepear's King John.
Others hatch their eggs, and tend the birth, (young ones) until they are able to shift for themselves. Addison.
Cicero says, "Ferae diligunt partus suos," beasts love their offspring.

BIRTH, in *Midwifery*, is used as synonymous to labour, or the power by which the fœtus is excluded from the uterus, and in this sense we say, the birth (labour) was easy, expeditious, tedious, difficult, &c. It is also, though not very properly, used by midwives, to signify the external orifice of the vagina; thus when in labour, the head of the child begins

to dilate the external orifice, or to emerge, it is said to be in the birth.

BIRTH, Natural, when the head of the fœtus presenting to the uterine orifice, the labour is completely effected by the pains, without the interference of art. See **LABOUR, Natural**.

BIRTH, Premature, when by any accident or derangement of the health of the woman, or of the fœtus, pains are excited, and the fœtus is expelled before it has attained its maturity. See **ABORTION**, and also **LABOUR, Premature**.

BIRTH, Preternatural, or **across**, when, in labour, the arm, shoulder, side, breech, or any other part than the head of the fœtus present to the uterine orifice. See **LABOUR, Preternatural**, and **CROSS birth**.

BIRTH, Laborious, when in labour the head of the fœtus presenting, yet on account of the straightness of the pelvis, the pains are insufficient for its expulsion, whence recourse is necessarily had to the assistance of the lacer, forceps, crotchet, &c. See **LABORIOUS Birth**, or **LABOUR**.

BIRTH, Monstrous, when the fœtus is deformed or misshaped, and has more or fewer organs than is natural. See **MONSTER**.

BIRTHS, Seven Months, *partus septimestris*, children born at the end of the seventh month, or 210 days from the time of conception, being now complete in all their members, and having acquired a certain degree of strength, and firmness of constitution, are not unfrequently reared or brought up.

BIRTHS, Eight Months, *partus octimestris*, that is, children born at the end of the eighth month, or after completing 240 or 242 days in the womb. These were supposed by the ancients, but erroneously, to be less vivacious, and consequently less likely to be preserved alive, and to grow up to manhood, than seven months children. This opinion, founded on a mistaken idea of the upright position of the fœtus in utero during the former months of pregnancy, and of the necessity of its making an evolution, about the end of the seventh month, to prepare it for the birth, is considered under the article *Position of the fœtus in Utero*, which see.

For the number of births, see **MARRIAGE**, under which the proportion of *births* to marriages, of *births* to burials, and of male *births* to females is computed. See also **MORTALITY**.

BIRTH, After. See **PLACENTA**.

BIRTH is also used for a person's descent; and it is either high or low according to the circumstances of his ancestry.

BIRTH, BERTH, or **BIRTHING**, among *Seamen*, denotes the due distance observed between ships lying at an anchor, or under sail. A convenient place a-board for a mess to put their chests, sleep, &c. is also called a *birth*.—There is usually one of these in ships of war between every two guns. And a proper place to moor a ship in is called by the same name, as is also the station in which a ship rides at anchor. To *take a good birth*, is to remove to some distance off any point, rock, or other thing which the seamen would avoid or go clear of.

BIRTH, Exposition of, among the *Ancients*, was where a new-born infant was exposed or cast away, and left to the mercy of the first comer, who might either take and bring it up, or suffer it to perish. See **EXPOSING of Children**.

BIRTH, Supposition of, *partus suppositio*, in the *Civil Law*, is a crime for which accusation may be intended by those who have interest therein, and is punished with death, like the *crimen falsi*, or forgery.

BIRTH, Suppression of, *partus suppositio*. See **ABORTION**.

BIRTH-Day, the anniversary return of the day on which a person was born. This answers to what the ancients called γενέθλιον, *genethlion*, *natalitius dies*, *natalitia*, and, in the middle age, *genetivus*. The ancients made much of their religion to consist in the celebration of birth-days, and took omens from the force of the felicity of the coming year. We meet with birth-days of the gods, emperors, great men, poets, and even private persons; and besides, the birth-days of cities, as Rome and Constantinople, were celebrated with great pomp by the inhabitants. Virgil's birth-day was held very strictly by the wits and poets who succeeded him. Pliny (Epist. lib. iii. ep. 7.) assures us, that Silius kept it with more solemnity than he did his own.

The manner of celebrating birth-days was by a splendid dress; wearing a sort of rings peculiar to that day; offering sacrifices, the men to their genius, of wine, frankincense; the women to Juno; giving suppers, and treating their friends and clients; who, in return, made them presents, wrote and sung their panegyrics, and offered vows and good wishes for the frequent happy returns of the same day. The birth-days of emperors were also celebrated with public sports, feasts, vows, and medals struck on the occasion. But the ancients, it is to be observed, had other sorts of birth-days besides the days on which they were born. The day of their adoption was always reputed as a birth-day, and celebrated accordingly.

The emperor Adrian, we are told, observed three birth-days; viz. the day of his nativity, of his adoption, and of his inauguration. (Fab. Bib. Græc. tom. xii. lib. vi. cap. 6.) In whose times it was held, that men were not born only on those days when they first came into the world, but on those also when they arrived at their chief honours and command in the commonwealth, e. gr. the consulate. Hence that of Cicero in his oration Ad Quirites, after his return from exile: "A parentibus id quod necesse erat, parvus sum procreatus, a vobis natus sum consularis." Besides, those who returned from banishment were also considered as being born again, *renati*, and ever after called the day of their return their birth-day. Thus Cicero to Atticus: "Diemque natalem reditus mei cura ù in tuis ædibus amantissimis agam tecum, & cum meis." Censorinus has a treatise *De Die Natali*, addressed to Q. Cæcilius, as a compliment on his birth-day.

BIRTH-Days of the Saints and Martyrs, *natales sanctorum*, denote the days of their deaths.

In reality, *natalis*, among the ancients, was not restrained to birth-days, but extended to all feast-days.

Hence it is we meet with *natalis solis*, *natalis calicis*, *natalis ecclesie*, *natalis reliquiarum*, &c.

BIRTH-fin, in *Theology*, the same with *original sin*, which see.

BIRTH-Wort, in *Botany*. See **ARISTOLOCHIA**.

BIRTHA, in *Ancient Geography*, *Tekrit*, a town of Asia, in Mesopotamia, on the Tigris, south of the confluence of the Zabus Minor with this river.—Also, a town of Arabia Deserta, seated on the Euphrates, according to Ptolemy.

BIRTHAMA, or **BITHABA**, a town of Asia, in Assyria, according to Ptolemy.

BIRTHIN, in *Geography*, a river of Monmouthshire, which runs into the Usk, near the town of Usk.

BIRU, a town of South America, in the empire of Peru, distant 10 leagues from Truxillo, and inhabited by about 70 families of Spaniards, Indians, Mulattoes, and Mestizos. About half a league to the north of it is a rivulet, from which are cut several trenches for watering the grounds, which of course are equally fertile with those in the vicinity of Truxillo. S. lat. 8° 24' 59". W. long. 66° 17'.

BIRUCKPOUR, a fortress of Hindocstan, in Malva country,

country, and circar of Chanderee; 55 miles east of Chanderee.

BIRVIESCA, **BRIBUSCA**, or **BRIEIESCA**, a mean and wretched town of Spain, in Old Castile; 15 miles N. E. of Burgos.

BIRUISA, a river of Siberia, which runs into the Tchiuna. N. lat. $57^{\circ} 35'$. E. long. $95^{\circ} 14'$.

BIRUTCH, or **BIRUITSCH**, a town and district of Russia, in the government of Voronetz, seated on the river Sofna, which falls into the Don; 50 miles south of Voronetz.

BIRZA, or **BIRZ**, a town of Poland, in the palatinate of Troki. N. lat. 56° . E. long. $24^{\circ} 40'$.

BIS, in *Botany*, a name given by some old writers to the napellus, or monk's-hood, and by others to the cicuta or hemlock.

Bis, *Lat. twice*. In *Music*, when a passage which ought to be repeated, has, through mistake, or to save room, been omitted, the word *bis* placed over such passage, with dots at the beginning and end, implies that the whole is to be repeated.

Example.

Bis-annua, a name given by *Botanists* to those plants which ordinarily do not flower till the second year.

BISA, or **BIZA**, a coin in Pegu, current there for half a ducat. The denomination is also given to a kind of weight used in the same country, equivalent to two Venetian pounds five ounces, or to three pounds nine ounces of the smaller weight of that city.

BISACCIO, in *Geography*, a town of Italy, in the kingdom of Naples; 12 miles N.N.E. of Conza. N. lat. $41^{\circ} 3'$. E. long. $15^{\circ} 35'$.

BISACUTA, in *Middle Age Writers*, an axe with two edges, or which cuts either way; or a missile weapon pointed at both ends. Walsingham represents the *securis bifacuta* as peculiar to the Scottish nation. See **BATTLE-Axe**.

BISALTÆ, in *Ancient Geography*, the name of a people who inhabited a small country bordering on the Sinus Strymonicus, in the northern part of Macedonia. Their chief cities were Eporia, Ossa, and Calitera.

BISALTIDE, in *Entomology*, a species of **PAPILIO** (*Dan. Fesl.*) that inhabits Surinam. The wings are slightly tailed, fulvous, black at the tips; beneath, two ocellar dots on the anterior pair, and three on the posterior ones. Fabricius, &c.

BISAMRAZE, in *Zoology*, *Sorex moschatus*, Gmelin, and *long nosed beaver* of S. G. Gmelin. it. &c.

BISANTHIER, *Moschus moschiferus*, or *Thibet musk* in Gesn. Quadr.

BISANTHE, or **RÆDISTUS**, in *Ancient Geography*, a town of Thrace, on the confines of the Propontis, at the bottom of a kind of gulf, and at a small distance S.W. from Perinthe.

BISANT. See **BESANT**.

BISBÆA, a feast celebrated by the Messapii, after the pruning of their vines, to obtain of the gods that they might grow again the better. The word is formed from *βισσῶν*, used by some for a vine.

BISCAINO, **BARTOLOMEO**, in *Biography*, an eminent

artist, was born at Genoa in 1632, and instructed in the first principles of painting and design by his father Giovanni Biscaino, a landscape painter of reputation. He afterwards perfected himself, particularly in the art of colouring, under Valerio Castelli. By his early death, at the age of 25 years, the expectations of those who admired his talents and performances were disappointed. Some of his etchings are executed in a bold style, resembling those of Castiglione, but all more finished. His figures are elegant, firmly composed, and drawn in a very masterly manner; he has given beauty and character to the heads; and the other extremities are peculiarly correct, and marked with great spirit. Some of the principal are the following: "Moses in the ark of bulrushes;" "A Nativity, with angels;" "The wife-men's offering;" "The Circumcision of Christ;" and a "Bacchanalian." Strutt.

BISCARA, or **BESCARA**, in *Geography*, a decayed city of Africa, in the kingdom of Algiers, the capital of the district of Zaab or Zeb, belonging to the province of Constantine. It is the residence of a Turkish garrison, and has a small castle, built by Hassan, the bey of Constantine, and chiefly defended by six small pieces of ordnance, and a few unwieldy muskets, mounted on carriages. It is a place of great antiquity, built by the Romans, and destroyed by the Arabs, who afterwards rebuilt it. It is at present as indifferently peopled as it is weakly defended; the houses being infested by swarms of scorpions, vipers, and poisonous reptiles, and the inhabitants being obliged to desert the city and retire into the country in the summer, when these noxious animals are intolerable. The inhabitants of this place, and its adjacent district, called "Biscaris," lead a kind of wandering life, and live in tents. Few of them can be employed in agriculture and pasturage from the nature of the country; but those of the superior class carry on some commerce, notwithstanding their poverty and indigence, in negroes and ostrich feathers. The poorest of them migrate every year to the city of Algiers, and other towns of the kingdom, and are employed in the meanest and most subordinate offices, such as cleansing of streets, emptying vaults, sweeping chimneys, and carrying burdens. Having in the course of two or three years accumulated a capital of from six to ten zechins, they return home, and on account of the scarcity of coin among them are reckoned among the wealthy of the land. In the capital, they constitute a kind of corporation, and have even a common treasury for the purpose of mutually relieving one another. They are the only class of free servants, and are highly esteemed for their fidelity. In winter, as well as in summer, they sleep wrapped up in rags, on a kind of benches before the shops, and others place themselves at the gates of the different roads, for the convenience of opening them to passengers. They are not only deserving of the confidence that is reposed in them, but their disposition is placid and obliging, and their perseverance in labour is indefatigable. Those among them who are guilty of any breach of trust, are punished by their chiefs. They are employed by the Europeans as servants, and as they can speak, besides the language of the country, the "lingua Francia," are found singularly useful. The villages which they inhabit in their own country are small, and remarkable only for their meanness and poverty. N. lat. $34^{\circ} 30'$. E. long. $5^{\circ} 15'$.

BISCARGIS, or **BISSANGIS**, in *Ancient Geography*, a town of Spain, on the right side of the Iberus, N.W. of Dertosa.

BISCAY, in *Geography*, a province of Spain, called, "the lordship of Biscay," is, in its most appropriate and restricted sense, bounded on the north by the Bay of Biscay, on the south

south by a chain of the Pyrenées, which separates it from Old Castile and Alava, on the west by Asturias, and on the east by Guipuscoa; and in extent its length is about 116 miles, and breadth much less, the greatest breadth being 80 miles, but very unequal. In its more general and comprehensive sense, Biscay is divided into three parts; viz. Biscay, properly so called, Guipuscoa, and Alava; and, accordingly, it is bounded on the west by that narrow tract of Old Castile which reaches to the sea and Asturias; parted from Old Castile on the south-east by the ridge of the Asturian mountains branching from the Pyrenées, and by the same mountains from Navarre, and by the river Cidaris from France, on the east; and washed on the north side by the Cantabrian sea, now commonly called the bay of Biscay. The country is for the most part mountainous and barren; but its vallies produce corn sufficient for the supply of the inhabitants, and a small quantity of flax. Apples are very plentiful, of which is made cyder, the common beverage of the people. They have also a weak wine, called "Chacolino," which is pleasant, though it will not keep long, and is used instead of small beer. They have also citrons and oranges in great abundance. The adjacent sea supplies excellent fish, and the forests yield great quantities of timber for shipping. But the most valuable treasure of this country consists of its inexhaustible mines of excellent iron, which is transported from hence into all parts of the world. The country has been long famous for its iron-works, and especially for its manufacture of swords and knives. Some have computed the amount of its annual manufacture of iron and steel into arms, nails, iron tools, bars, &c. at 300,000 quintals. The air of this province is mild, pure, and more temperate than that of the other provinces of Spain; and the inhabitants have been distinguished by their attachment to liberty, and resistance to oppression. Their ancestors the Cantabri, were but imperfectly subdued by Augustus, and their mountains have, in every succeeding age, afforded them a retreat from the encroachments of arbitrary power. The Biscayners are said to be of Celtic or Gothic extract; and have preserved more of their ancient genius, laws, government, and language than perhaps any other people in Europe, except the Welsh, Scots Highlanders, and wild Irish, who are probably of the same origin, and whose language much resembles the Biscayan. They have always maintained a distinguished reputation for valour; and the best soldiers and sailors of Spain have been the natives of this country. They essentially differ from the other Spaniards in the openness of their temper, and animation of their manner; and though they are choleric even to a proverb, and not destitute of pride and vanity, they are obliging, polite, and friendly. Their females are beautiful, lively, and cheerful. Their dress is neat and pastoral; their hair falling down their backs in long plaits, with a handkerchief twisted round it. The most singular part of the dress of the men is the covering of their legs, round which they wrap a piece of coarse grey or woollen cloth, fastening it with many folds of tape. The three provinces of Biscay, Alava, and Guipuscoa, have been the asylum of liberty and industry, and to these causes their prosperity may be ascribed. When the king, who is styled merely "lord of Biscay," wants a supply either of men or money, he announces his will to the province; which furnishes its contingency of both; the latter being levied upon the different cities and communities, according to a certain register, so that in effect Biscay may be said to tax itself. In this province are no bishops. Its privileges, which are extensive, it has watched over with a jealous eye. The language of Biscay is accounted aboriginal; it is said to be the Cantabrian, or ancient language of Spain, which was a branch of the

Celtic, and first gave way to the Roman; which see. It is so totally different from the Castilian, that the peasants scarcely understand a single word of Spanish. The capital of Biscay is Bilboa, which see. Its other chief towns are Orduna, Durango, Fontarabia, St. Sebastian, Tolosa, and Vittoria.

BISCAY, *Bay of*, that part of the Atlantic which lies north of the province of Biscay, between the projecting coasts of France and Spain, and extends from Cape Ortegal to Breil. It advances farthest to the land between Bayonne and St. Sebastian; and it likewise advances considerably at Rochelle and Rochefort.—Also, a large bay on the coast of Newfoundland, between cape Race and cape Pine. It lies in the N.E. corner of Trepassey bay, on the S.E. part of the island. N. lat. $46^{\circ} 50'$. W. long $53^{\circ} 6'$.

BISCAY, *New*, a province of Mexico in North America in the audience of Guadalajara, bounded on the north by New Mexico, on the east by New Leon and the river Bravo, on the south by Cinaloa and Culiacan, and on the west by Navarre, Sonora, and Haqui, on the borders of the gulf of California. It is computed to be about 300 miles from east to west, and 360 from north to south. The country is mountainous, but well watered, fruitful, and moderately temperate, rich in corn, cattle, and other productions; and also in mines of silver and lead. The original inhabitants have four large towns in the morasses, which are difficult of access, and by means of which they avoid total subjection; and therefore the Spaniards have built three small fortified and well inhabited towns for the defence of their silver mines. The capital is Durango. This province lies between the latitudes of 27° and 33° N. and between 105° and 108° W. long.

BISCEGLIA, a town of Naples, in the province of Bari, having the see of a bishop, suffragan of Trani; it is pleasantly situated on an eminence in the midst of orchards and villas. The walls are of stone and very lofty; and it has hundreds of subterraneous reservoirs and cisterns, cut in the solid rock, and arched over with stones and stucco, in order to collect and preserve the rain water, which is the only sort with which they are supplied in a district, so totally destitute of springs. Bisceglia is 4 miles distant from Trani.

BISCHBURG, or BISCHOFBURG, a town of Prussia, in the county of Ermeland, 54 miles south of Konigsberg.

BISCHEIM, a town of Germany, in the circle of the Upper Rhine, and county of Lichtenberg, on a small river which runs into the Rhine, 8 miles N.E. of Strasburg.

BISCHOFFLACK, or SCHOFIA KOLOKA, a town of Germany, in the duchy of Carniola, 27 miles N.N.E. of Trieste.

BISCHOFFSHEIM, a town of Germany seated on the Tauber, in the circle of Franconia, but belonging to the electorate of Mentz; 64 miles S. E. of Mentz.

BISCHOFFSTORF, a town of Germany, in the duchy of Stiria, 13 miles E.N.E. of Gratz.

BISCHOFSSHEIM, a town of Germany, in the circle of Franconia, and bishopric of Wurzburg, seated on the Rhom, 32 miles north of Wurzburg.—Also, a town of Germany, in the circle of the Upper Rhine, and county of Hanau-Munzenburg, 3 miles W.N.W. of Hanau.

BISCHOFSTEIN, or BISTEIN, a town of Prussia, in the county of Ermeland, 42 miles south of Konigsberg.

BISCHOFSWERDA, a town of Germany, in the circle of Upper Saxony, and margraviate of Meissen, seated on

an island in the river Wefenitz, the principal commerce of which is in white thread; it has two churches; 20 miles east of Dresden.

BISCHOWSWERDER, a town of Prussia, in the province of Oberland, 80 miles S.S.W. of Königsberg.

BISCHOFZELL, a town of Switzerland, in the Thurgaw, seated at the confluence of the rivers Sitter and Thur, 11 miles south of Constance. This town has a castle, in which resides the bailiff of the bishop of Constance, who exercises jurisdiction over the Catholics, and receives a moiety of the fines. N. lat. 47° 25'. E. long. 9° 13'.

BISCHOP, or **BISKOP**, **JOHN DE**, in *Biography*, an excellent artist, was born at the Hague in 1646, and is much commended as a painter; and his drawings, in which he imitated with great exactness the style of the best masters, are much esteemed and fought after by the curious. But he is most generally known as an engraver. His works are chiefly etchings, harmonized with the graver; and though slight, yet free, spirited, and pleasing. He gives a richness to the colour, and a roundness to the figures, far beyond what is usually done with the point, so little assisted by the graver. His figures are generally well drawn, more in a mannered than a correct style; but his extremities are not always well marked, nor his heads equally expressive and beautiful. His excellence was owing chiefly to his own genius, as he never studied under any master. He worked chiefly at Amsterdam, and died in 1686. The following prints are worthy of notice: viz. "Christ and the Samaritan woman" from Annibale Caracci; "Joseph distributing corn to the Egyptians," from B. Breenberge; "the Martyrdom of St. Laurence," from the same. Strutt.

BISCHOP, or **BISKOP**, **CORNELIUS**, a painter of portrait and history, was born at Antwerp, say some, or according to others, at Dort, in 1630; and was the disciple of Ferdinand Bol, whose pencil, tint of colouring, style, and manner, he resembled, and to whom he has been thought by some competent judges not to be inferior. He died in 1674. A painting by this master, consisting of a few figures by candle-light was so much admired by Louis XIV., that he purchased it at a high price, and placed it in the royal collection. The king of Denmark also admitted his works among those of the best masters. It is observed, however, that they are not worthy of that high commendation which is bestowed upon them by the Flemish writers. Pilkington.

BISCHWILER, in *Geography*, a town of France, in the department of the Lower Rhine, and chief place of a canton in the district of Strasburg, seated on the Motte near the Rhine, and defended by a castle, flanked with towers, and guarded by ditches; 10 miles north of Strasburg. The town contains 3449 inhabitants, and the canton 13,968. Its territorial extent comprehends 265 kilometres, and 21 communes.

BISCIA, in *Ichthyology*, one of the synonymous names among old writers for the pipe-fish, tobacco-pipe-fish, needle-fish, or trumpet-fish; and *syngnathus acus* of Linnæus and Gmelin.

BISCOPSVAARE, in *Geography*, a town of Norway; 48 miles east of Bergen.

BISCROMA, Ital. for a demifemiquaver, in *Music*. If

single, it has three hooks ; if two or more, they have

three ties . See **TIME-TABLE**.

BISCUIT. See **BISKET**.

BISCUIT, in *Pottery*, a name given to porcelain, when baked and not glazed; and this is more or less beautiful, according to the nature of its composition. See **PORCELAIN** and **POTTERY**.

BISCUTA, in *Entomology*, a species of **FORMICA**, with a bidentated thorax; and a double petiole scale. Inhabits Cayenne. Fabricius Spec. Inf.

BISCUTELLA, formed of *bis*, and the diminutive of *scutum*, the fruit resembling a double shield, in *Botany*, *Buckler-mustard*, or *bastard Mitridate mustard*. Linn. gen. 808. Reich. 872. Schreb. 1084. Juss. 239. Gært. t. 141. Thlaspidium. Tournef. 101. Class and order, *Tetradynamia Siliculosa*. Nat. Ord. *Siliquose, cruciformes, or cruciferae*. Gen. Char. *Cal.* perianth four-leaved; leaflets ovate, acuminate, gibbous at the base, coloured, deciduous. *Cor.* four-petalled, cruciform; petals oblong, obtuse, spreading. *Stam.* filaments six, the length of the tube of the corolla; two opposite shorter; anthers simple. *Pist.* germ compressed, orbiculate, emarginate; style simple, permanent; stigma obtuse. *Per.* silicle erect, compressed, flat, semibifid, with roundish lobes, two-celled; partition lanceolate, ending in a rigid style; cells two-valved, affixed to the partition on its straight margin. *Seeds* solitary, roundish, compressed, in the middle of the cell. *Obf.* The two outer leaflets of the calyx in some species have a tubular-concave melliferous prominent base.

Ess. Char. *Silicle* compressed, flat, rounded above, and below two-lobed. *Cal.* leaflets gibbous at the base.

Species, 1. *B. auriculata*, ear-podded buckler-mustard. Thlaspi. Bauh. pin. 107. n. 3. prodr. 49. n. 8. Raii hist. 837. n. 4. *Leucium montanum* fl. pedato. Col. ecphr. 2. 59. t. 61. Jondraba Barr. ic. 230. "Calyxes gibbous on each side with the nectary, filicles running into the style." In a wild state this plant rises about a foot in height, but in gardens nearly two feet, dividing into several branches; the flowers are produced at the ends of the branches, in loose panicles, and are of a pale yellow colour. The nectarious gland is very large, and the calyx bagged out very much at the bottom. A native of the south of France and Italy. Cultivated in Kew garden by Mr. J. Sutherland in 1683, and flowering in June and July. 2. *B. apula*, spear-leaved buckler-mustard. *B. didyma*. Lin. spec. 911. Hort. Cliff. 329. 2. Upl. 185. Thlaspi. Raii hist. 837. n. 3. Clypeola didyma. Cluf. Hist. 2. 133. Jondraba. Col. ecphr. 1. 283. t. 285. f. 1. "Silicles scabrous; leaves lanceolate, sessile, ferrate." A native of Italy. Cultivated in 1759, by Mr. Miller. Flowering in June and July. 3. *B. lyrata*. Thlaspi bifcutatum, &c. Bocc. sic. 45. t. 23. Raii hist. 837. n. 6. "Silicles scabrous; leaves lyrate." A native of Spain and Sicily. 4. *B. coronopifolia*. "Silicles smooth; leaves toothed, rough with hairs." Allioni thinks this a variety of the second, proceeding from a dryness of soil; for it is found in very dry barren places in Spain, Italy, and Germany. Gouan is of opinion that this and the second, third, and fourth are one species. 5. *B. levigata*, smooth buckler-mustard. *B. didyma*. Scop. Carn. n. 804. Clypeola didyma. Crantz. Austr. 20. *Leucium*. Col. ecphr. 1. 283. t. 285. f. 2. Raii hist. 836. n. 2. "Silicles smooth; leaves lanceolate, ferrate." The whole plant is acrid; the root perennial, according to Jacquin, but, according to others, annual. A native of Italy and Austria. Found at very different heights in the mountains, with variation of stature, from half a foot to a foot and a half. Flowering in lower situations in April and May; in higher ones in July and August; in our gardens in June and July. Introduced here in 1777 by M. Thouin. 6. *B. sempervirens*, shrubby buckler-mustard.

mustard. *Thlaspi bifcutellatum*, &c. Bar. ic. t. 841. Boec. mus. 197. t. 122. "Silicles somewhat scabrous; leaves lanceolate tomentose." A native of Spain. Introduced into Kew garden in 1784, by Messrs. Lee and Kennedy.

Propagation and Culture. These are all annual plants, except the last, and perish soon after they have perfected their seeds. They should be sown in spring or autumn, upon a border of light earth, in an open situation, where they are to remain. Those sown in autumn will come up about three weeks, live through the winter, and flower early in the following summer, and thus good seeds may be always obtained; but those that are sown in the spring decay in bad seasons before the seeds are ripe. The autumnal plants flower in June, and the spring plants in July, and their seeds ripen in about six weeks, and if they are permitted to scatter, young plants will be produced without any care. They require only to be kept free from weeds, and to be thinned where they are too close, leaving them eight or nine inches asunder. They have no great beauty to recommend them. Martyn's Miller.

BISDORF, in *Geography*, a town of Germany, in the circle of Upper Saxony, and principality of Anhalt-Cothen, 3 miles north of Cothen.

BISECTION. See BISSECTION.

BISELLIARI, or BISELLIARI, in *Antiquity*, those who enjoyed the honour or privilege of the bisellium.

The word occurs in ancient inscriptions. CN. PLAE-TORIO VIVIRO AUGUSTALI BISELLIARIO. Gruter. Inscr. p. 1099.

The honor *bisellii* appears to have been much the same with what in France is called *droit de fauteuil*; and the bisellarii those who in public assemblies enjoy this distinction of the *fauteuil*, while other persons are obliged to stand, or sit on benches, stools, or ordinary chairs. Scaliger, in his index to Gruter, mistook the bisellarii for artificers who made these seats.

BISELLIUM, from *bis* and *sellu*, a chair, a kind of seat or chair, larger and richer than ordinary, big enough to hold two persons, wherein to sit in courts, theatres, and other public assemblies.

BISEPTENGUTTATA, in *Entomology*, a species of COCCINELLA, of a pale yellow colour, with fourteen white spots. Schaller. Country unknown.

BIS-ERGOT, in *Ornithology*, a name given by Buffon to the Gmelinian *tetrao biclearatus*.

BISERRULA, so named from the fruit "biserrato fructu," in *Botany*. Lin. Gen. 893. Reich. 966. Schreb. 1209. Juss. 358. Gaertn. t. 154. Pelecinus, Tournef. 234. Class and order, *Diadelphia Decandria*. Nat. Ord. *Papilionaceae* or *leguminosae*. Gen. Char. Cal. perianth, one-leaved, tubular, erect, semiquinquefid; teeth subulate, equal, the two upper ones more remote. Cor. papilionaceous; banner larger, reflected on the sides, ascending, roundish; wings ovate-oblong, free, shorter than the banner; keel the length of the wings, obtuse, ascending. Stam. filaments diadelphous (simple and nine-cleft), ascending at their tips, inclosed within the keel; anthers small. Pist. germ. oblong, compressed; style tubulate, ascending; stigma simple. Per. legume large, linear, flat, two-celled; partition contrary to the valves. Seeds very many, kidney-form, compressed.

Ess. Char. legume two-celled, flat; partition contrary.

Species. 1. *B. Pelecinus*, bastard hatchet-vetch. Astragalus. Mor. hist. 2. 107. f. 2. t. 9, f. 6. Securidaca. Bauh. Pia. 349. 3. Clus. hist. 2. 238. Ger. enac. 1234. f. 6. Park. Theatr. 1089. f. 5. Raii hist. 939, n. 16. Lunaria radiata Robini. Bauh. hist. 2. 348. f. 2. An annual

plant growing naturally in Italy, Sicily, Spain, and the south of France. Cultivated in Kew garden in 1640.

Propagation and Culture. It is propagated by seeds, sown in this country in autumn, on a bed of light earth, where the plants will come up in about three weeks, and live well in the open air. They should either be sown where they are to remain, or transplanted when very young. After the plants are come up, they will only require to be kept free from weeds, and to be thinned to the distance of a foot from one another. They flower in June, and the seeds ripen in September. They may be also sown in spring, and treated in the same manner. Two or three of these plants may be cultivated for the sake of variety, but they have not much beauty. Martyn's Miller.

BISERT, in *Geography*, a town of Russia, seated on a small river which runs into the Upha, in the government of Perm, 80 miles S. E. of Perm.

BISERTA, or BIZERTA, a sea-port town of Africa, in the kingdom of Tunis, pleasantly situated upon a canal betwixt an extensive lake and the sea, at the bottom of a large gulf, about 8 miles to the southward of Cape Blanco. N. lat. 37° 5'. E. long. 10° 15'. It is about a mile in circuit, defended by several castles and batteries, the principal of which are towards the sea. Bizerta is a corruption of the "Hippo-Diarrhytus" or "Zaritus" of the ancients; though the present inhabitants derive its name from their own language, and suppose it to be the same with "Bensherd," i. e. the offspring of a canal or rivulet. The lake upon which Bizerta is seated has an open communication with the sea; and, according to an observation of the younger Pliny (Ep. xxxiii. l. 9.), is either continually receiving a fresh stream from the sea, or else discharging one into it; so that the water lost by the lake by exhalations is soon supplied by the sea, which in hot seasons runs into it with a very brisk current, in order to maintain the equilibrium, in the same manner as is observed between the Atlantic ocean and the Mediterranean. The mullets of this lake are reckoned the best in Barbary. Great quantities of their roes are dried and made into "Botargo," and sent from hence to the Levant, where they are esteemed a great dainty. The channel of communication betwixt the lake and the sea is the port of "Hippo-Diarrhytus," which still receives small vessels; though it must have been formerly the safest as well as the most beautiful haven of this part of Africa. There are still remaining the traces of a large pier, that was carried out into the sea, to break off the N. E. winds; the want of which, together with the disinclination of the Turks to repair it, will in a short time make the haven useless, which, in any other country, would be inestimable. Scylax calls it only "Hippo," and Diodorus Siculus gives it the name of "Hippouacra." By the direction of Scipio's marches it seems to have been the rich anonymous town mentioned by Livy (l. xxix. 28.) If the Turks encouraged trade and industry it would deserve this appellation, because, besides fish and fruit of all kinds, it abounds with corn, pulse, oil, cotton, and a variety of other valuable productions. The gulph of Bizerta, the "Sinus Hipponensis" of the ancients, is a beautiful sandy inlet, nearly four leagues in breadth. As its bottom is low, it affords a delightful prospect through a variety of groves and plantations of olive trees, to a great distance into the country; but to the eastward the view is bounded by a high rocky shore, extending as far as cape Zibeeb. Bizerta was formerly a large town, and is said to have contained 6000 houses; whereas now the town, and its dependent villages, scarcely contain the same number of inhabitants. It has, nevertheless, two capacious prisons for slaves, a large

magazine for merchandize, and two towers, with some other out-works to defend the entrance of the haven. It is well supplied with fresh water from the surrounding springs, and with great variety of fish from the adjacent lake. Most of the inhabitants are employed in the fishing-trade, which begins about the end of October, and ends in the beginning of May. The people are poor, and reckoned proud, ill-natured, and treacherous; insomuch that Muley Hafun Bey, one of their sovereigns, used to say of them, that neither fear nor love could keep them faithful. Bizerta has eight villages under its government, a large plain called "Mater," and the territory of Choros, the "Clypea" or "Corobis" of the ancients, which is extensive, and inhabited by a number of persons who are poor, meanly clad, and coarsely fed. Their dress consists merely of a piece of coarse cloth wrapped round their bodies, and another, in the form of a turban, round their heads; and most of them are without covering either to their feet or legs. Those of the poorer class sleep on skins laid on the floor; and the rich lie in narrow couches fixed against the wall, about five or six feet high, to which they ascend by a ladder. Their choicest dainty is their "coufcou," made of flour, eggs, and salt, which they dry and keep through the year. They are expert horsemen, and ride without either saddle or bridle; nor do they ever shoe their horses. They are much exposed to the depredations and oppressions of the neighbouring Arabs. The Bisertines, both of the city and country, are very superstitious, and hang about their own necks, and those of their horses, a number of amulets, which are scraps of paper or parchment, on which strange characters are inscribed, and sewn up in a piece of leather, silk, &c. and thought, when worn about their persons, to be a preservative against all accidents.

BISET, CHARLES EMANUEL, in *Biography*, a painter, of history and conversations, was born at Mechlin, in 1633; and in his early productions manifested a lively and ready invention. He was distinguished by the multitude of figures which he introduced into his designs, and by his variety of drapery, peculiar to every nation. At a distance, his pictures, which consisted chiefly of balls, concerts, and gay assemblies, correctly designed and well-coloured, had a strong effect; but more nearly inspected, they shewed a neatness of pencil, a spirited touch, and a good expression. Pilkington.

BISER, in *Ornithology*, *Columba livia*, or rock dove, in Buffon's Hist. Birds.

BISHOP, in *Ecclesiastical History*, a prelate, or person consecrated for the spiritual government and direction of a diocese. The word comes from the Saxon *bischof*, and that from the Greek *ἐπίσκοπος*, an *overseer* or *inspector*; which was a title the Athenians gave to those whom they sent into the provinces subject to them, to see whether every thing was kept in order; and the Romans gave the same title to those who were inspectors and visitors of the bread and provision. It appears from a letter of Cicero, that he himself had a bishopric; being "episcopus Oræ et Campaniæ."

A bishop differs from an archbishop in this, that an archbishop with bishops consecrates a bishop, as a bishop with priests ordains a priest: that the archbishop visits a province, as the bishop a diocese; that the archbishop convokes a provincial synod, as the bishop a diocesan one; and that the archbishop has canonical authority over all the bishops of his province, as the bishop over the priests in his diocese. It is a long time since bishops have been distinguished from mere priests or presbyters; but whether that distinction be of divine or human right, whether it was settled in the apostolical age, or introduced afterwards, is much controverted.

Those who are advocates for the divine right of episcopacy, and who trace its institution to the times of the apostles, maintain that, in the earliest age of the Christian church, there were three different orders of ministers appointed by the apostles for the discharge of the public offices of religion; viz. bishops, priests, or presbyters, and deacons. In proof of this point they refer us to the testimony of ancient ecclesiastical writers, whence they deduce, as they conceive, the most satisfactory evidence, that bishops were instituted by the apostles, and that they continued afterwards as a distinct order from that of priests. To this purpose they allege, that Irenæus, a father of the second century, says (l. iii. c. 3.), "We are able to enumerate those who by the apostles were made bishops in the several churches, and their successors, to this time." He adds, "Polycarp was not only instructed by the apostles, and acquainted with many of those who saw our Lord, but was also by the apostles made bishop of the church of Smyrna in Asia." Tertullian also, a writer of the same century (*De Præscr. adv. Heræt.* p. 78.), challenges certain heretics to "exhibit the order of their bishops, so succeeding each other from the beginning, that the first bishop had for his author and predecessor some one of the apostles, or of those apostolical men who persevered with the apostles; for in this manner apostolical churches assert their rights: thus, the church of Smyrna has Polycarp, who was placed there by John; the church of Rome has Clement, who was ordained by Peter; and other churches shew other persons, who, by being placed in the bishoprics by the apostles, transmitted the apostolical seed." Cyprian also says (*Ep. 69. ad Flor.*), "that the bishop, who is one and presides over the church, through the proud presumption of certain persons, is despised; and thus the man, who is honoured by the sanction of God, is judged unworthy by men." In an epistle ascribed to Ignatius (*Ad Antioch.* c. 7.), but probably spurious, though very ancient, it is asserted, that Evodius was consecrated a bishop by the apostles. And Chrysostom says (*Hom. 42. in Ignat.*), "that Ignatius conversed familiarly with the apostles, and was perfectly acquainted with their doctrine, and had the hands of apostles laid upon him." In a fragment of an epistle of Dionysius bishop of Corinth in the second century, preserved by Eusebius, (*H. E. l. 4. c. 23.*), it is said, that Dionysius the Areopagite, who was converted by St. Paul, was appointed the first bishop of Athens. Eusebius and Socrates have given us the catalogues of the bishops of many cities, from the times of the apostles; and Epiphanius (*lib. 2. Hær. 66.*) has left us a catalogue of the bishops of Jerusalem, from St. James the apostle to Hilarion, who was bishop in his time. It is further alleged, that bishops, priests, and deacons, are mentioned together as three separate orders. Ignatius, in his Epistle to the Magnesians (§ 2.), mentions Damas as bishop of Magnesia, Bassus and Apollonius as presbyters, and Sotian as deacon, in the same church; and in his epistle to the Philadelphians (§ 7.), he says, "Attend to the bishop, to the presbytery, and to the deacons;" and in his epistle to the Trallians (§ 2.), he says, "Be ye subject to the bishop, as to Jesus Christ; to the presbyters, as the apostles of Jesus Christ; and to the deacons, as to ministers of the mysteries of Jesus Christ;" he then adds, (§ 3.), "without these there is no elect church, no congregation of holy men." The authority of Ignatius, who lived in the beginning of the second century, is considered as decisive. Clement of Alexandria, in the subsequent part of the same century, speaks of the three progressive orders of deacons, priests, and bishops (*Strom. l. 6.*); and there are several early instances of bishops, who had been presbyters and deacons in the same church. Irenæus was first presbyter, then bishop

B I S H O P.

bishop of Lyons; Dionysius first presbyter, then bishop of Rome; and Eleutherius, first deacon, then bishop of Rome; and all these three lived in the second century. "When your captains," says Tertullian (*De Fugâ in Perf.*), "that is to say, the deacons, presbyters, and bishops fly, who shall teach the laity that they must be constant?" And upon another occasion, speaking of baptism, he says (*De Baptism. c. 17.*), "the high-priest, who is the bishop, has the chief right of administering it, then the presbyters and deacons, but not without the authority of the bishop." Origen, in many places, speaks of bishops as superior to presbyters and deacons; and many authors compare the bishops, called by the Greeks *ἐπίσκοποι*, and by the Latin fathers "summi sacerdotes," and "principes sacerdotum," presbyters and deacons of the Christian church to the high-priest, priests, and Levites under the Jewish dispensation; and hence presbyters afterwards obtained the name of priests. Clement, a disciple of the apostle, says (*Ep. ad Cor. § 40.*), "To the high-priest are given his proper duties; to the priests their proper place is assigned; and to the Levites their proper services are appointed;" in which passage this ancient father is speaking of the bishop, presbyters, and deacons of the Christian church; and Tertullian, in the passage just cited, called the bishop the high priest. Jerome, though he is sometimes represented as unfavourable to the cause of episcopacy, is still more express, and denominates (*Epist. ad Evag.*) the order of bishops, priests, and deacons, an apostolical tradition. "To what purpose," says Optatus (*lib. i.*), "should I mention deacons, who are in the third, and presbyters who are in the second degree of priesthood, when the very heads and princes of all, even certain of the bishops themselves, were content to redeem life with the loss of heaven?" In the tenth canon of the council of Sardis, held A. D. 347, it is enjoined that a person should not be rashly and lightly appointed a bishop, a priest, or a deacon. It is further pleaded, that episcopal power was not called in question in the three first centuries; but towards the end of the fourth century, Acrius, an Arian, wrote against it, and maintained that there ought to be no order in the church superior to that of presbyters. Nevertheless, it is alleged that no advocate is found for his opinion in the centuries immediately following; and that even Acrius allowed there had been bishops in the Christian church from the earliest period. From these several testimonies it is inferred, that bishops were appointed by the apostles; that there were three distinct orders of ministers, viz. bishops, priests and deacons, in the primitive church; and that there has been a regular succession of bishops from the apostolic age to the present time; and the enemies of episcopacy are challenged to produce evidence of the existence of a single ancient independent church fairly established, which was not governed by a bishop. While the apostles lived, the churches, it is said, were subject to their authority and government; and to this circumstance it is owing that little is said concerning the distinction and power of ministers, in the Acts and Epistles; but when the gospel was spread into distant parts, and the apostles were under a necessity of discontinuing their visits, or rendering them less frequent, they found it expedient for the better government of the Christians, and in order to put a stop to their schisms and contentions, which began to make their appearance both among the presbyters and their congregations, to place the supreme authority in one person, who, from the superintending care which he was to exercise, was called *ἐπίσκοπος*, a bishop; and this word, which was perhaps at first applied indiscriminately to all who had any spiritual office in the church, was now conferred on him who was its chief governor.

The bishops were at first appointed by the apostles, and

afterwards chosen by the presbyters and the congregations at large; and in both cases they were generally taken from the presbyters of the respective churches, except in those instances in which they were the immediate companions of the apostles. Accordingly Jerome, (*De Eccles. Script.*) where he is speaking, as it is supposed, of the apostolical times in which James was made bishop of Jerusalem by the apostles; Timothy bishop of Ephesus, and Titus bishop of Crete, by St. Paul; and Polycarp bishop of Smyrna, by St. John; observes that "churches were governed by the common advice of presbyters; but when every one began to reckon those whom himself had baptized, his own, and not Christ's, it was decreed in the whole world, that one, chosen out of the presbyters, should be placed over the rest, to whom all care of the church should belong, and so the seeds of schism should be removed." When St. Paul was at Miletus, A. D. 58, and convened the elders of the church at Ephesus, no mention is made of the bishop; and in his address to them he calls them "bishops or overseers of the flock;" hence it is inferred, that the word bishop was not then the appropriate name of the person who held the first office in the church, or rather, that there was as yet no such person in the church at Ephesus. But in the year 64, St. Paul found it necessary to place Timothy in that situation, with power to prevent the preaching of any unsound doctrine, and to ordain and exercise authority over presbyters, that is, with episcopal power; and in his epistle, written to him in that year, he speaks expressly of the "office of a bishop," and gives a detailed account of the qualifications of a bishop. See 1 Tim. i. 3. v. 1. 19. 22. 1 Tim. iii. 1. We have also a similar account in the epistle to Titus, written in the same year; and he was invested with the further power of rejecting heretics from the churches over which he presided. See Titus iii. 10. Hence it is concluded, that in the year 64 there was such an office as that of bishop. St. Paul, addressing his epistle to the Philippians, used the word bishops in the plural number, and does not mention presbyters; whence it is thought by Chrysostom, Theodoret, Jerome, and indeed by almost all commentators, that by bishops we are here to understand presbyters; and it is therefore presumed, that there was then no bishop, in the strict sense of the appellation, at Philippi, A. D. 62. From a comparison of these different passages it has been conjectured, that Paul began to establish episcopacy immediately after his release from his first confinement at Rome. However, it is acknowledged, that at this early period there was not a bishop in every church. Nevertheless, it is inferred from St. Paul's epistles, that he gave the ministers of the churches which he founded, a certain power over their respective congregations, and as St. Paul and the twelve apostles acted equally under the influence of the Holy Ghost, it is presumed that they invested all, whom they appointed to preach the gospel, with a similar degree of power; and thus church authority is derived from the apostles themselves. This power, thus originally given, was not limited to the primitive ages; it is supposed to have been transmitted to those "faithful men who shall be able to teach others also" (2 Tim. ii. 2.), and to remain in the church under different modifications, as essentially necessary for the purposes specified by the apostle, *Ephes. iv. 13, 14.*

At first the jurisdiction of a bishop was confined to the walls of his own city; but afterwards, when the gospel made its way into towns and villages, the concerns of the Christians that inhabited them, would naturally fall under the cognizance and direction of the bishops of the neighbouring cities; and thus dioceses would be gradually formed. See *DIocese*. In process of time, it is supposed, the affairs of the church would require the consultation and

co-ope-

co-operation of different bishops; and therefore, as before, one of the presbyters of a city was raised to be a bishop, and to have authority over other presbyters, so one of the bishops of a province was selected and invested with certain authority over other bishops, and he was called an archbishop; and in the appointment of archbishops, the civil importance of the city seems to have been regarded, for we find the metropolitan bishops were generally archbishops, and hence archbishops were called metropolitans. Archbishops, it has been said, were first appointed in the second century; and they had power to assemble the bishops within their respective provinces, to regulate the election of bishops, to consecrate them, to hear appeals from their decisions, and to take cognizance of their general conduct. See ARCHBISHOP and PATRIARCH.

It is sometimes urged, that bishops, priests, and deacons, are now, in their office and authority, very different from what they formerly were; but this, say the advocates of episcopacy, is no more than a necessary consequence of a change of times and circumstances. They do not contend that the bishops, priests, and deacons of England are at present precisely the same that bishops, presbyters, and deacons, were in Asia Minor, 1700 years ago. They maintain, however, that there have been always bishops, priests, and deacons in the Christian church, since the days of the apostles, with different powers and functions in different countries and at different periods; but the general principles and duties, which have respectively characterized these clerical orders, have been essentially the same at all times and in all places; and the variations which they have undergone, have only been such as have ever belonged to all persons in public situations, whether civil or ecclesiastical, and which are, indeed, inseparable from every thing in which mankind are concerned in this transitory and fluctuating world. A learned prelate, who flatters himself that, by the testimonies and arguments, of which we have above given a general account, he has proved episcopacy to be an apostolical institution, readily acknowledges, however, that there is no precept in the New Testament, which commands that every church should be governed by bishops. As it has not pleased the Almighty to prescribe any particular form of civil government for the security of temporal comforts to his rational creatures; so neither has he prescribed any particular form of ecclesiastical policy as absolutely necessary to the attainment of eternal happiness. And though the Scriptures contain no directions concerning the establishment of a power by which ministers are to be admitted to their sacred office, yet he conceives, that from the apostles, episcopal ordination has been regularly conveyed to us; and the legislature of this kingdom has recognized and confirmed this power to bishops. See ORDINATION. Elements of Christian Theology, by lord bishop of Lincoln, vol. ii. p. 376—401.

Persons, on the other hand, who do not admit episcopacy to be of apostolic and divine institution, contend, that the terms *ἐπίσκοπος* and *πρεσβύτερος*, that is, bishop and presbyter, are used promiscuously in the New Testament, to which they think it necessary to appeal, as to the sole authoritative rule of faith and practice, and that they denote the same, and not a distinct order or office in the Christian church. To this purpose they allege the passage already cited, Acts xx. 17. 28. in which the same persons are denominated presbyters and bishops. Thus also the name, office, and work of a bishop and presbyter appear to be the same, in Titus i. 5. 7.; and unless the apostle be charged with arguing very incoherently, he must mean the same thing by elder, v. 5., and bishop, v. 7. In like manner, presbyters are exhorted (1 Pet. v. 1, 2.) to discharge the office of

bishops. The word *ἐπίσκοπος*, it is said, was properly the name of office, and *πρεσβύτερος* was a title of respect, borrowed from the Jewish custom, which was analogous to that of other nations, of calling not only the members of the Sanhedrim *πρεσβύτεροι*, elders or senators, but also the members of the city council. It has been moreover affirmed, that not a single passage from the apostolical writings has yet been produced, in which it appears from the context, that the two terms *πρεσβύτερος* and *ἐπίσκοπος* mean different offices; and that there is the strongest positive evidence, which the nature of the thing can admit, that in these writings the two terms uniformly mean the same office. The apostle Paul, in the directions he gave to Timothy, about the proper supply of churches with suitable ministers, takes particular notice, merely, of two orders, one called bishops, and the other deacons; and hence, it is argued, that if by bishops be meant, what in modern style is so denominated, those who have the charge of many presbyters, it is astonishing that he should not think it of importance to give any directions about the qualifications of presbyters, whilst he is particular in specifying the qualifications of deacons, who were to occupy an order allowed to be much inferior to the other; and if he here means by bishops only presbyters, as some friends of episcopacy have supposed, it is strange that an office so important as that of bishops, if it was a different and superior office, should have been entirely overlooked. From St. Paul's address to the Philippians, ch. i. 1. it is inferred, that there were but two orders then established, viz. bishops, i. e. ordinary pastors or presbyters, and deacons. If there was a bishop in the modern sense at Philippi, when the apostle wrote that letter, it seems strange that the chief person in the society should be the only person disregarded by the apostle. Moreover, in the epistle written by Polycarp to the same society, about 60 years after this time, we find mention of only these two orders, the presbyters and the deacons; nor is it of any consequence whether we call their pastors bishops with the apostle, or presbyters with Polycarp, as both speak of two orders only among them. In the whole book of Acts, the stated pastors of the churches are denominated presbyters; the collection for the poor Christians is sent to the presbyters; nor do we find a single hint of any different classes of presbyters. The appellation *ἐπίσκοποι*, bishops, occurs but once, and in the passage where it is applied to those that are denominated presbyters. It is urged further, that the imposition of hands, which has been considered by many as a necessary attendant on ordination, is attributed in 1 Tim. iv. 14. to the presbytery; Paul and Barnabas were ordained by certain prophets and teachers in the church of Antioch, and not by any bishop, of whom there is not a word in that whole solemnity, presiding in that city, Acts xiii. 1, 2, 3; and it is alleged, as an acknowledged and incontestible fact, that presbyters, in the church of Alexandria, ordained even their own bishops for more than 200 years in the earliest ages of Christianity. It appears also, from the first epistle of Clemens Romanus to the Corinthians, chap. xlii. that there were two distinct orders, viz. bishops and deacons, established by the apostles in the church; and by bishops he means the same with those who, in the book of Acts, are called *πρεσβύτεροι*, presbyters, or ordinary teachers. Since it must therefore be admitted, that in the New Testament, and also in this work of Clement, the words *ἐπίσκοπος* and *πρεσβύτερος* are, not occasionally, but uniformly, used synonymously, the discovery that there was not any distinctive appellation for such an office as that now called bishop, is adduced as affording a strong presumption, that it did not exist. Another testimony alleged to the same purpose is

that

B I S H O P.

that of Polycarp, who takes notice only of two orders of ministers in the church; for in ch. v. of his epistle to the Philippians, he enjoins the people to be subject to their presbyters and deacons, as to God and Christ; hence it is inferred, that if this ancient father had known of any higher order in the church, such as was that of a bishop in less than 150 years after his time, he would have been the principal, if not the only person, to whom their subjection would have been enjoined by a Christian writer. It is observed further, that though he specifies the duties and qualifications of deacons in ch. v. and those of presbyters in ch. vi. and through the whole of the epistle, those of the people, he nowhere mentions what is proper in the character and conduct of a bishop. Upon the whole, it seems evident that Polycarp knew of no Christian minister superior to the presbyters.

It has been alleged by the advocates of episcopacy, that the bishops are the proper successors of the apostles, not in the general character of teachers, but in their special function as apostles (see Stillingfleet's works, vol. i. p. 371.); whilst the presbyters and deacons were merely the successors of those who were, in the beginning, ordained by the apostles. But that the apostles could not have any proper successors has been evinced by the following considerations. The indispensable requisite in the character of an apostle, which was that of having seen Jesus Christ after his resurrection, demonstrates that their office could be but temporary. Besides, they were distinguished by prerogatives, which did not descend to any after them; of this kind were their having received their mission immediately from Christ, and not by any human ordination or appointment; the power of conferring miraculous gifts by imposition of hands; and the knowledge which they had by inspiration of the whole doctrine of Christ. Moreover, the object of their mission was altogether of a different kind from that of any ordinary pastor; and this was to propagate the gospel throughout the world both among Jews and Pagans, and not to take charge of any particular flock. Further, as a full proof that the matter was thus universally understood, both in their own age, and in the times immediately succeeding, no one, on the death of an apostle, was ever substituted in his room; inasmuch that when that sacred college was extinct, the title became extinct with it. It is alike true also of the evangelists, that their office was temporary, and that their charge extended to the whole church; and their title, like that of an apostle, sunk with those who first enjoyed it. Such were Philip, Timothy, Titus, and probably Mark, and Luke. As to the dates or postscripts subjoined to the epistles in the common bibles, and distinguishing Timothy and Titus by the appellation of bishops, it is now universally agreed among the learned, that they are of no authority. They are not found in some of our best and most ancient MSS.; and they are generally allowed to be the spurious additions of some eastern bishop or monk, at least 500 years after Christ. It is certain, however, that in the three first centuries, neither Timothy nor Titus is styled bishop by any writer. In the island of Crete, of which Titus is said to have been ordained the first bishop, there were no fewer, according to the earliest accounts and catalogues extant, than 11 bishops. Indeed, so little can the instructions given by Paul to Timothy and Titus be made to quadrate with any ordinary ministry that ever obtained in the church, that the learned Dr. Whitby (see his Preface to the epistle to Titus) concludes, that their's was extraordinary as well as temporary, and that they were not succeeded in it by any that came after them. Hence it is inferred, that all the arguments alleged in favour of the distinction between bishops

and presbyters in the early age of the church, by Epiphanius and others, from some passages in the epistles to Timothy and Titus, proceed upon the mistaken notion, that they were properly bishops in the modern acceptation of the term; a notion utterly unknown to that Christian antiquity, which deserves the name of primitive, and also incompatible with the authentic accounts we have concerning these extraordinary ministers, who were not made bishops till about 500 years after their death.

Some have deduced an argument in favour of the apostolical antiquity of episcopacy, from the epistles to the seven churches of Asia mentioned in the Apocalypse, which are addressed to the angels of these separately in the singular number. From the first chapter of that book it appears, that each epistle is intended for the whole church or congregation mentioned in the direction or superscription; and yet one person, called the angel of that church, is addressed in the name of the whole. Hence some have inferred, that the person denominated angel, was an order differing from that of other ministers, and superior to it: whilst others have considered the appellation as descriptive of the whole collective body. An intermediate opinion, advanced by some critics, is more probable. This supposes the necessity, for the sake of order, that in their consistories or congregations one should preside, both in the offices of religion, and in their consultations for the common good; and that this president, or chairman, is here addressed under the name of angel. This interpretation affords us also the most plausible account of the origin of the more considerable distinction, which afterwards obtained between bishop and presbyter. It was the distinction of one pastor in every church, marked by the apostle John, though not made by any who had written before him, which led Tertullian, whose publication first appeared about a century after the apostles, to consider him as the institutor of episcopacy. By those who deny the superiority of bishops to presbyters in the first age of the church, it is alleged, that the first reformers and founders of the church of England, as well as many of its most learned and eminent doctors, have not pretended this distinction to be of divine, but merely of human institution; not grounded upon scripture, but only upon the custom or ordinances of this realm. To this purpose, the declaration made of the functions, &c. of bishops and priests, and signed by more than 37 civilians and divines, among whom were 13 bishops, Cranmer and others, affirms, that in the New Testament there is no mention made of any degrees or distinctions in orders, but only of deacons or ministers, and of priests or bishops. (See Bp. Burnet's Hist. Ref. vol. i. Append. p. 321.) Besides, the book, entitled "The Institution of a Christian Man," subscribed by the clergy in convocation, and confirmed by parliament, owns bishops and presbyters to be the same. Moreover, that the main ground of settling episcopal government in this nation, was not any pretence of divine right, but the convenience of that form of church government to the state and condition of the church at the time of the reformation, the learned Stillingfleet affirms (Irenic. c. 8. Works, vol. ii. p. 396, &c.), and proves it to be the sentiment of archbishop Cranmer and of other reformers, in the reigns of Edward VI. and of queen Elizabeth, such as archbishop Whitgift, bishop Bridges, Loe, Hooker, Sutcliffe, Hales, Chillingworth, &c. It was also the opinion of archbishop Usher, that bishop and presbyter differed only in degree and not in order; and that in places where bishops could not be procured, the ordination of presbyters was valid. See ORDINATION. "As for the notion of distinct offices of bishop and presbyter," says bishop Burnet, in his "Vindication of the church of Scotland," p. 336. "I confess it is not so clear

clear to me, and therefore since I look upon the sacramental actions as the highest of sacred performances, I cannot but acknowledge those who are empowered for them must be of the highest office in the church."

Although, in the apostolic times, bishops and presbyters were synonymous, and co-ordinate with respect to their ministerial powers, and they were ordained to their office by prayer, accompanied with imposition of hands; yet a certain priority, or presidentship, for the sake of order, or in deference either to seniority or to distinguished talents, was allowed to one of their number. But he seems to have been only a kind of moderator in their assemblies, and to have had no more power than that of giving a single vote in common with the rest of his brethren. By those who adopt this reasoning, and who trace the original of the distinct order of bishops, which was introduced in the second and third centuries, to this practice, it is allowed that pastors were from the beginning vested with a superintendency over the congregation or church merely in spiritual matters; and it is alleged, that some of the titles that are thus given them in Scripture, such as ἡγούμενοι, προεταμίνοι, guides and governors, imply this kind of superintendence. But at this time several things relating to the church were conducted in common by the pastors, the deacons, and the whole congregation. To this class we may refer all matters of scandal and offence, and also the election of their pastors and their deacons. Accordingly, Clement, in the fore-cited epistle, ch. xlv. speaking of the pastors, uses this expression: "Those who were constituted by the apostles, and afterwards by other eminent men, with the consent of the whole congregation." It appears also, by the epistles of Cyprian, written about the middle of the third century, that for the first three ages of the church, no final resolution was taken in any affair of moment, without communicating it to the people, and obtaining their approbation. In the second century a settled distinction obtained, in several respects, between the president, chosen by a plurality of votes, and distinguished by the appropriate title of bishop, which had before been common to all the presbyters, and the other presbyters. Many other titles, besides that of bishop, which they had all enjoyed in common, were restricted to him who was regarded as their head, such as ἡγούμενος, προεταμίς, πρεσβυτερός, προεταμίος, ποιμήν, and some others. These titles, independently of the talents, virtues and services that attended them, claimed respect and deference. The concurrence of the president thus honoured, was considered as a necessary sanction to all ecclesiastical resolutions and measures; and by degrees every act became valid which bore the stamp of his authority. Those who presided over churches, which were established in some of the principal cities, were honoured with peculiar pre-eminence, and to this advancement analogy to the civil government did not a little contribute. It is not improbable, that the church of Jerusalem, when it became numerous, and was deprived of the ministry of the apostles, who were gone to instruct the other nations, was the first which chose a president or bishop; nor it is less probable, that the other churches followed by degrees this example.

The first ancient author who mentions bishop, presbyter, and deacon, as three distinct orders in the church, is, as we have already observed, Ignatius, who is supposed to have written about the 16th year of the second century. But as several of the epistles ascribed to him, are spurious, no great stress can be laid upon his authority. However, he seems, with peculiar earnestness, to inculcate obedience and subjection to the bishop, as well as to the presbyters and deacons. Mr. Dodwell accounts for his zeal in establishing the bishop's

authority, by supposing that it was at that time a new thing, totally unknown in the church; and, according to this opinion, he says, that it is in vain to look for any trace of episcopal authority in the New Testament. Irenæus, who is supposed to have written about the middle of the second century, sometimes uses the names bishop and presbyter indiscriminately, and at other times with some kind of distinction; but it is not easy to determine, whether by these two appellations he means the same order, or two different orders. Dr. Pearson admits that these names are often interchanged by this father, and others of his time, even to the end of the century; but he affirms at the same time, that in regard to their own contemporaries, the offices of individuals are never thus confounded, inasmuch that a person who was in their time a bishop, is not called a presbyter, nor is a presbyter called a bishop. It is allowed, that the distinction of these orders began about this time generally to prevail, though the difference was not nearly so considerable as it became afterwards. Another author, by whom the three orders seem to be discriminated, and whose testimony is commonly adduced in support of their apostolical institution, is Pius, bishop of Rome, who is supposed to have written before the middle of the second century, but after Ignatius and Polycarp: he uses an expression, however, which does not indicate any high opinion of the superiority of the bishop in his time; "Let the presbyters and deacons reverence thee (the bishop), not as their superior, but as Christ's minister." Clement of Alexandria, at the close of the second century (see his Strom. l. 1.), strongly marks the distinction between presbyter and deacon; but he seems to intimate, that the distinction between bishop and presbyter was, even in his days, comparatively not worthy of his notice. At this time, however, every church had its own pastor, or bishop, and only one under this appellation, and every bishop had only one congregation or church. Sir Peter, afterwards lord, King (ubi infra) has proved these assertions by a variety of citations from ancient writers; he has also shewn, that a bishop's diocese did not exceed the bounds of a modern parish. See DIOCESE. The presbyters, according to this writer, were the curates and assistants of the bishop, and though inferior to them in degree, yet they had the same inherent right with the bishops, and were equal to them in order. "A bishop" says this author, "preached, baptized, and confirmed, so did a presbyter; a bishop excommunicated, absolved, and ordained, so did a presbyter; whatever a bishop did, the same did a presbyter; the particular acts of their office were the same." In the age of Cyprian, about the middle of the third century, it appears that the presbyters were considered as vested with the power of conferring orders. (Cyp. Epist. 5. and 75.) In the age of Hilary, about the middle of the fourth century, it appears, that the whole distinction of the episcopate is ascribed by him to seniority in the ministry, without either election or special ordination. When the bishop died, the senior colleague succeeded of course. As to ordination it was the same in both; and bishop meant no more than first among the presbyters, or senior presbyter. Jerome, who wrote about the end of the fourth and beginning of the fifth century, says (In Titum. l. 5. Op. vol. x. p. 1700.) that, among the ancients, priests and bishops were the same; but that by degrees the care of a church was assigned to one person, in order to prevent dissension. In another place (Op. vol. vi. p. 198.) he says, "Let the bishops know, that they are above priests more by custom than by the appointment of Christ." He also observes (Anecdotes, p. 24. 54.), that at the beginning, churches were governed by the common council of presbyters, like an aristocracy; but afterwards the superintendency was given to one of the presbyters,

presbyters, who was then called the bishop, and who governed the church, but still with the council of the presbyters. Dr. Hammond (Annot. Acts xi. 50.) has advanced a singular opinion, viz. that the apostles instituted only the offices of bishop and deacon, and that the intermediate office of presbyter was soon afterwards introduced. But that such a middle order should be erected at once, immediately after the times of the apostles, is much more unlikely, than that it arose gradually out of an inconsiderable distinction, which had obtained from the beginning.

At the close of the third century, the ecclesiastical government, which very generally prevailed, was of that kind which might justly be denominated a parochial episcopacy. The bishop, who was properly the pastor, had the charge of a single parish; and the parishioners assembled for the purposes of public worship, and for the celebration of religious institutions, in one place, at which the bishop commonly presided; the bishop was assisted by presbyters, who formed his council in judicial and deliberative matters, and who performed religious functions both public and private. To these were added deacons. See DEACON. The next step was the extension of the oversight of one bishop to many congregations, which branched out of the original church by an accession of converts; and in this stage of the progress of episcopacy, the several presbyters had their separate parishes, and continued in subordination to the bishop, who was acknowledged as their common head. At this period, an order of bishops, called *chorepiscopi*, or rural bishops (see CHOREPISCOPI), held the middle rank between bishops and presbyters, being inferior to the former, and superior to the latter. This state of the church may be denominated diocesan episcopacy.

Though bishops, in the opinion of those whose sentiments we are now representing, were originally no other than presbyters; the manner of their ordination being the same, and the presbyters discharging every part of the office of a bishop; no sooner was the distinction between them established, than the bishops began to appropriate certain functions to themselves. It appears, by the act of the third council of Carthage, A. D. 397, that, whereas, before, priests had the power of assigning the time of public penance, and of giving absolution, as also of consecrating virgins, and of making the chrism, without the advice of the bishop, all these things were forbidden by these canons, and appropriated to the bishops. But the principal circumstance by which the bishops were afterwards distinguished, was the power of confirming the baptized, when that chrism was applied. See CONFIRMATION. After the reign of Adrian, when Jerusalem was utterly destroyed, and the Jews dispersed, an opinion began to prevail among Christians, that their ministers succeeded to the characters, rights, and privileges of the Jewish priesthood; and this was another source of honour and profit to the clergy. Another circumstance, which contributed in no small degree to the progress of episcopal authority, was the constitution of provincial councils, which insensibly superseded the importance of particular churches, and enabled the bishops by an alliance with them to obtain a much larger share of executive and arbitrary power. As soon as they became connected by a sense of their common interest, they were empowered to attack, with united vigour, the original rights of their clergy and people. "The prelates of the third century," says Gibbon (Hist. vol. ii. p. 335, &c.), "imperceptibly changed the language of exhortation into that of command, scattered the seeds of future usurpations, and supplied, by scripture allegories and declamatory rhetoric, their deficiency of force and reason. They exalted the unity and power of the

church, as it was represented in the episcopal office, of which every bishop enjoyed an equal and undivided portion. Princes and magistrates, it was often repeated, might boast an earthly claim to a transitory dominion; it was the episcopal authority alone, which was derived from the deity, and extended itself over this and another world. The bishops were the vicegerents of Christ, the successors of the apostles, and the mystic substitutes of the high priest of the Mosaic law. Their exclusive privilege of conferring the sacerdotal character invaded the freedom of clerical and popular elections; and if, in the administration of the church, they still consulted the judgment of the presbyters, or the inclination of the people, they most carefully inculcated the merit of such a voluntary condescension. The bishops acknowledged the supreme authority which resided in the assembly of their brethren; but in the government of his peculiar diocese, each of them exacted from his *flock*, the same implicit obedience, as if that favourite metaphor had been literally just, and as if the shepherd had been of a more exalted nature than that of his sheep." The same causes, which at first had destroyed the equality of the presbyters, introduced among the bishops a pre-eminence of rank, and from thence a superiority of jurisdiction. In spring and autumn, when they met in provincial synod, the multitude was governed by the wisdom and eloquence of a few; and, besides, the office of perpetual presidents in the councils of each province, was conferred on the bishops of the principal city; and these aspiring prelates, who soon acquired the lofty titles of metropolitans and primates, secretly prepared themselves to usurp over their episcopal brethren the same authority which the bishops had so lately assumed above the college of presbyters. Hence gradually arose the pre-eminence which the ambition of the Roman pontiff gained over the other provinces and churches. King's Constitution, &c. of the Primitive Church, ch. 1.—v. Campbell's Eccl. Hist. vol. ii. Mosh. Eccl. Hist. vol. i. p. 104, &c. Neal's Hist. Purit. vol. i. p. 670, &c. 410. Pierce's Vindication.

It is the opinion of many approved writers on this subject, among whom may be reckoned many episcopalians and dissenters in our own country, and many learned foreigners, that no particular form of church government was authoritatively prescribed either by our Lord or his apostles; but that Christians were left at liberty to choose such as might be best adapted to their circumstances and to the state of society, and most conducive to the edification and tranquillity of the church, and of individuals in future ages. See CHURCH.

When new occasions required new measures, in a little time the functions of the priesthood were divided, and the priests distinguished into degrees; the political part of religion being assigned principally to bishops, and the evangelical to the priests, &c. or rather, as some will have it, the functions of teaching and preaching were reserved to the bishop, and that of ordination superadded; which was their principal distinction, and the mark of their sovereignty in their diocese.

By the ancient discipline, bishops were to be married once, and not to put away their wives on pretence of religion; but a second marriage was a disqualification for this order. If they lived chaste, they were ranked as confessors.

Some bishops in the middle age, on account of their *regalia*, or temporalities, were obliged to a military service called *boffis*, by which they were to lead their vassals into the field, and attend the king in his military expeditions. This Charlemagne excused, and even forbade; but the prohibition was little regarded, since we find the thing often practised afterwards. Du-Cange.

The election of bishops was anciently placed in the clergy

and the people of the parish, province, or diocese, or of the clergy and laity, as they were afterwards called; nor did any church apply to the neighbouring bishops to assist at the ordination. Irenæus was ordained by priests only; and such was the general custom of the church of Alexandria, till the beginning of the fourth century. Cyprian also says, that it belonged to the people chiefly to choose worthy pastors, and to refuse the unworthy. Thus Alexander was chosen bishop of Jerusalem. Fabianus and Cornelius of Rome, and Cyprian of Carthage. When the people had thus elected a bishop, they presented him to the neighbouring bishops for their approbation and consent; because, without their concurrent assent, no bishop could be legally instituted or confirmed. This was the case with regard to Alexander, already mentioned, and Sabinus, bishop of Emerita in Spain. After election and confirmation, the next act was the ordination or instalment of the bishop, which was done in his own church by the neighbouring bishops, who were invited to attend on the occasion. The attendance of the neighbouring bishops, which seems to have been at first voluntary on both sides, became customary, and at length necessary; and it was an established rule, that the concurrence of these was indispensable, one of whom laid his hand on the head of the new bishop, when he was recommended by prayer to the blessing of God. In the third century, this was always done by the metropolitan bishop; or at least it was never done without his consent or order. The second council of Nice ordered that bishops should be chosen by other bishops; but in the west, the people preserved the right of choosing their bishops, till after the reign of Charlemagne and his sons; and it was not taken from them till the council of Avignon, in 1050. *Basnage Hist. Eglises Reformées, vol. iii. p. 24.*

Under the plea of the tumult that attended popular elections, the emperors and other sovereigns of Europe, took the appointment in some degree into their own hands; reserving to themselves the right of confirming these elections, and of granting investiture of the temporalities, without which confirmation and investiture, the elected bishop could neither be consecrated, nor receive any secular profits. This right was acknowledged in the emperor Charlemagne, A. D. 773, by pope Adrian I. and the council of Lateran, and universally exercised by other Christian princes; but the policy of the court of Rome contrived to exclude the laity from any share in these elections, and to confine them wholly to the clergy; but the mere form of election appeared to the people to be of little consequence, while the crown was in possession of an absolute negative, which was almost equivalent to a direct right of nomination. Indeed, princes and magistrates, patriarchs and popes, have usurped the power of electing bishops. The election was to be within three months after the vacancy of the see; and the person to be chosen out of the clergy of that church. Formerly the bishop claimed a share in the election of an archbishop; but this was set aside by the popes.

In England, during the Saxon times, the right of appointing to bishoprics is said to have been in the crown, because the rights of confirmation and investiture were, in effect, though not in form, a right of complete donation. But when, by length of time, the custom of making elections by the clergy was fully established, the popes began to except to the usual method of granting these investitures, which was "per annulum et baculum," by the prince's delivering to the prelate a ring, and pastoral staff, or crozier; pretending that this was an encroachment on the church's authority, and an attempt by these symbols to confer a spiritual jurisdiction: and pope Gregory VII. about the close of the 11th cen-

tury, published a bull of excommunication against all princes who should dare to confer investitures, and all prelates who should venture to receive them. At length, however, when the emperor Henry V. agreed to remove all suspicion of encroachment on the spiritual character by conferring investitures for the future "per sceptrum" and not "per annulum et baculum;" and when the kings of England and France consented also to alter the form in their kingdoms, and receive only homage from the bishops for their temporalities, instead of investing them by the ring and crozier; the court of Rome found it prudent to suspend for a while its other pretensions. This concession was obtained from king Henry I. in England, by means of that obstinate and arrogant prelate archbishop Anselm; but king John, about a century afterwards, in order to obtain the protection of the pope against his discontented barons, was also prevailed upon to give up by a charter, to all the monasteries and cathedrals in the kingdom, the free right of electing their prelates, whether abbots or bishops; reserving only to the crown the custody of the temporalities during the vacancy; the form of granting a licence to elect, which is the original of our "congé d'élire," on refusal whereof the electors might proceed without it; and the right of approbation afterwards, which was not to be denied without a reasonable and lawful cause. This grant was expressly recognized and confirmed in king John's Magna Charta, and was again established by stat. 25 Ed. III. ft. 6. § 3. But by stat. 25 Hen. VIII. cap. 20. the ancient right of nomination was, in effect, restored to the crown. The English succession of protestant bishops stands on this last ground. The king being certified of the death of a bishop by the dean and chapter, and his leave requested to elect another, the *congé d'élire*, or usual licence, is sent to them, with a letter missive, nominating the person whom he would have chosen. The election is to be within twelve days after the receipt of it, otherwise the king by letters patent appoints whom he pleases; and the chapter in case of refusing the person named by the king, incurs a *præmunire*. The election or nomination, if it be of a bishop, must be signified by the king's letters patent to the archbishop of the province; if it be of an archbishop, to the other archbishop and two bishops, or to four bishops; requiring them to confirm, invest, and consecrate the person so elected; which they are bound to perform immediately, without any application to the see of Rome. If such archbishop, or bishops, refuse to confirm, invest, and consecrate such bishop elect, they shall incur all the penalties of a *præmunire*. After election, and its being accepted of by the bishop, the king grants a mandate under the great seal for confirmation, which the archbishop configns to his vicar-general, consisting mostly in a solemn citation of such as have any objections to the bishop elect, a declaration of their contumacy in not appearing, and an administration of the oaths of allegiance and supremacy, of simony, and canonical obedience. Sentence being read by the vicar-general, the bishop is installed in the province of Canterbury by the archdeacon: the fact is recorded by a public notary; and the bishop is invested with full powers to exercise all spiritual jurisdictions, though he cannot sue for his temporalities till after consecration. Then follows the consecration by the archbishop, or some other bishop appointed by lawful commissions, and two assistant bishops: the ceremony of which is much the same as in the Romish church, save that, having put on the episcopal robe, the archbishop and bishops lay their hands on the new prelate's head, and consecrate him with a certain form of words. The fees of the whole process are said to amount to about 600*l.*

The process of the translation of a bishop to another bishopric

B I S H O P.

shopric only differs in this, that there is no consecration. The age of a bishop is to be at least thirty years; and, by the ancient discipline, none were to be chosen but those who had passed through all the inferior orders; but, in some cases of necessity, this was dispensed with, and deacons, nay laymen, were raised *per saltum* to the episcopal dignity.

The form of consecrating a bishop is different in different churches. Ordinarily, at least three bishops are required in the ceremony of consecrating a bishop; but, in some cases, a single one might suffice. In the Greek church, the candidate for the episcopate, who is always an *archimandrite* or *hieromachus*, i. e. an abbot or chief monk in some monastery, being named to the vacant see, and the election being confirmed, repairs, at the time appointed, to the church where the consecration is to be performed. Being arrived, he is introduced by the proto-pope and proto-deacon to the archbishop and bishops, who are arranged in proper order on a temporary theatre or platform erected in the church for the occasion. He there gives an account of his faith; declares solemnly that he has neither given nor promised money, or any bribe-worthy service, for his dignity; and promises to adhere steadily to the traditions and canons of the eastern church, to visit his diocese regularly, and to oppose strenuously all innovations and heresies, particularly the errors of the Latin church. This being done, the archbishop says, "The grace of the Holy Spirit, through my humility, exalts thee N. archimandrite, or hieromachus, beloved of God, to be bishop of the cities N. N. which God preserve." With much ceremony the bishop elect is then conducted from the theatre, within the rails of the holy altar, where he kneels down with the other bishops, who hold open over his head the holy gospel with the letters inverted, the archbishop saying aloud, "The divine grace, which always healeth our infirmities, and supplieth our defects, by my hand conducteth thee N. archimandrite, or hieromachus, beloved of God, bishop elect of the cities of N. N. which God preserve!—Let us pray therefore for him, that the grace of the most Holy Spirit may come upon him." Then the priests say thrice, "Lord have mercy upon us;" and while the bishops continue to hold the gospel, the archbishop signs the newly consecrated bishop thrice with the sign of the cross, saying, "In the name of the Father, and of the Son, and of the holy Ghost, now and for ever, even unto ages of ages. Amen." Then all the bishops putting their right hands on his head, the archbishop prays that he may be confirmed in the office of which they have judged him worthy, that his priesthood may be rendered irreproachable, and that he himself may be made holy and worthy to be heard of God. After this, one of the assisting bishops reads a short litany in a low voice, to be heard only by those within the altar, and the other bishops make the responses. At the end of the litany, the archbishop, laying his hand again upon the head of the newly consecrated bishop, prays in very decent and devout terms, that Christ will render him an imitator of himself, the true shepherd; that he will make him a leader of the blind, a light to those who walk in darkness, and a teacher of infants; that he may shine in the world, and receive at last the great reward prepared for those who contend boldly for the preaching of the gospel. After this the pastoral staff is delivered to the new bishop, with a very proper and solemn exhortation from the archbishop, to feed the flock of Christ committed to his care. King's Rites and Ceremonies of the Greek Church.

In the Romish church, the bishop elect being presented by the elder assistant to the consecration, takes the oath:

he is then examined as to his faith; and after several prayers, the New Testament is drawn over his head, and he receives the chrisom or unction on his head. The pastoral staff, ring, and Gospel, are then given him; and after communion, the mitre is put on his head: each ceremony being accompanied with proper prayers, &c. the consecration ends with *Te Deum*.

These last mentioned ceremonies are laid aside in the consecration of English bishops. Nevertheless, the book of consecration, composed by the bishops, and approved by Edward VI. in the third year of his reign, and two years afterwards, confirmed by act of parliament, in which some of them are enjoined, is declared to be the standard for this purpose by the thirty-sixth article. In queen Mary's reign this act was repealed, and the book of common prayer, and the book of ordination, were by name condemned. When Elizabeth came to the throne, queen Mary's act was repealed, and king Edward's prayer-book was again authorized; but the book of ordination was not expressly named, because it had been a part of the common prayer book; and therefore it was not thought necessary to specify the office of ordination any more than any other office of the common prayer book. But bishop Bonner contended, that as the book of ordination had been by name condemned in queen Mary's reign, and had not been since revived by name, it was still condemned in law; and, consequently, that all ordinations conferred according to that form, were illegal and invalid. To obviate this objection, it was declared in a subsequent session of parliament, that the office of ordination was considered as part of the common prayer book; and it was farther declared, that all ordinations which had been performed according to that office, were valid; and upon the same principle a similar clause was inserted in the 36th article.

The function of a bishop in England may be considered as two-fold; viz. what belongs to his *order*, and what belongs to his *jurisdiction*. To the *episcopal order* belong the ceremonies of dedication, confirmation, and ordination; to the *episcopal jurisdiction*, by the statute law, belong the licensing of physicians, surgeons, and schoolmasters, the uniting small parishes (though this last privilege is now peculiar to the bishop of Norwich), assisting the civil magistrate in the execution of statutes relating to ecclesiastical matters, and compelling the payment of tithes and subsidies due from the clergy.

By the common law, the bishop is to certify the judges, touching legitimate and illegitimate births and marriages; and by that and the ecclesiastical law, he is to take care of the probate of wills, and granting administrations; to collate to benefices, grant institution on the presentation of other patrons, command induction, order the collecting and preserving the profits of vacant benefices for the use of the successors, defend the liberties of the church, and visit his diocese once in three years. To the bishop also belong suspension, deprivation, deposition, degradation, and excommunication.

The bishops of England are all barons: barons in a three-fold manner; viz. *feudal*, in regard of lands and baronies annexed to their bishoprics; by *writ*, as being summoned by writ to parliament; and also by *patent* and *creation*. When William the Conqueror thought proper to change the spiritual tenure of frank-almoign, or free alms, under which the bishops held their lands during the Saxon government, into the feudal or Norman tenure by barony; their estates were subjected to all civil charges and assessments, from which they were before exempt; and, in right of succession to those baronies, which were unalienable from their res-

pective dignities, the bishops and abbots were allowed their seats in the house of lords. But though these lords spiritual are, in the eye of the law, a distinct estate from the lords temporal, and are so distinguished in most of our acts of parliament, yet in practice they are usually blended together under one name of "the lords;" they intermix in their votes; and the majority of such intermixture joins both estates. And from this want of a separate assembly, and separate negative of the prelates, some writers have argued very cogently, that the lords spiritual and temporal are now in reality only one estate; which is unquestionably true in every effectual sense, though the ancient distinction between them still nominally continues. For if a bill should pass their house, there is no doubt of its validity, though every lord spiritual should vote against it, of which Selden and Sir Edward Coke give many instances; as, on the other hand, judge Blackstone presumes it would be equally good, if the lords temporal present were inferior to the bishops in number, and every one of those temporal lords gave his vote to reject the bill; though Sir Edward Coke seems to doubt, whether this would not be an "ordinance," rather than an "act," of parliament. Bl. Com. vol. i. 156. Bishops have the precedence of all other barons, and sit in the upper house as barons. They are twenty-four in number, exclusive of the bishop of Sodor and Man, who has no seat in the house of peers, besides two archbishops. Archbishops are distinguished by the titles of "Grace," and "Most reverend father in God by divine Providence;" and bishops, by those of "Lord," and "Right reverend father in God by divine permission." The former are said to be "in throned," and the latter "installed." See ARCHBISHOP.

With respect to the order of precedency among one another, the archbishop of Canterbury takes the lead, then the archbishop of York, next to him the bishops of London, of Durham, and of Winchester. The other bishops follow according to the seniority of their consecration; excepting only, that a bishop being a privy counsellor, takes place after the bishop of Durham.

Bishops have two special privileges next to regal: the first, that in their courts they sit, and pass sentence, of themselves, and by their own authority; the bishops' courts being not like other courts, but writs are sent out in their own name, *teste* the bishop, not in the king's name, as is done in the king's courts: the second, that, like the king, they can depute their authority to another, as their suffragan, chancellor, commissary, &c.

They have this advantage also over lay-lords, that, in whatever Christian country they are, their episcopal degree and dignity are acknowledged; and they may, *quatenus* bishops, ordain, &c.

They have several immunities, as from arrests, outlawries, distress, &c. liberty to hunt in the king's forests, &c. to have *certain tuns of wine duty free*, &c. Their persons may not be seized, as lay-peers may, upon contempt, but their temporalities alone. They may qualify as many chaplains as a duke, viz. six. But, as they have no right to be tried themselves in the court of the lord high steward, as peers, they ought not to be judges there. For, though they are lords of parliament, and sit there by virtue of the baronies, which they hold "jure ecclesiæ," yet they are not ennobled in blood, and consequently not peers with the nobility, but merely lords of parliament. 3 Inst. 30, 31. Staunf. P. C. 153. In cases of capital offence, the bishops usually withdraw voluntarily, but enter a protest, declaring their right to stay. It is observable, that in the 11th chapter of the constitutions of Clarendon, made in parliament 11 Henry II. they are expressly excused, rather than excluded, from sit-

ting or voting in trials, when they come to concern life or limb. The determination of the house of lords in the earl of Danby's case, (Lords' Journ. 15 May, 1679), which hath ever since been adhered to, is consonant to these constitutions, "that the lords spiritual have a right to stay and sit in court in capital cases, till the court proceeds to the vote of guilty, or not." This resolution, however, extends only to trials in full parliament; for to the court of the lord high steward, in which no vote can be given but merely that of guilty, or not guilty, no bishop, as such, ever was or could be summoned; and though the statute of king William regulates the proceedings in that court, as well as in the court of parliament, yet it never intended to new-model or alter its constitution, and consequently does not give the lords spiritual any right in cases of blood which they had not before; and their exclusion is more reasonable, because having no right to be tried in this court, as we have already said, they ought not to be judges there.

By law, the crime of *episcopicide*, which a clergyman commits by killing his bishop, is petty treason.

In Canada there is a bishop, resident at Quebec; and there are two bishops in America. In Denmark they have no archbishop, but there are six superintendents, or bishops; four in Norway, and two in Iceland. The chief see is that of Zealand, which yields about 1000l. a year; the others are those of Funen, valued at 760l., Aarhus at 600l., Aalborg at 400l., Ripan at 400l.; in Norway, Christiana or Aggerhuus at 400l., Christianland at 600l., Bergben at 400l., and Drontheim at 400l. The bishoprics of Skalholt and Holun, in Iceland, are only valued each at 150l.; but though far inferior in nominal value to the others, they may be considered, on account of the cheapness of living in Iceland, equal in real profit to the largest of the others. The bishop of Zealand, who is first in rank, and the bishop of Aggerhuus, are metropolitans. They have no temporalities; keep no ecclesiastical courts; have no cathedrals or prebends, &c. but are only *primi inter pares*, having the rank above the inferior clergy of the province, and inspection over their doctrine and manners. They are allowed two or three parishes each. Their habit is common with that of the other ministers. In Sweden are fourteen dioceses; the archbishopric of Upsala, and the bishoprics of Lindkoeping, Skara, Strængnæes, Wæstera, Wexio, Abo, Lund, Borgo, Gotheborg, Calmar, Carlstadt, Hermosand, and Wisby, or Gothland. The revenues of Upsala and Wæstera amount to about 1000l. a year; and those of the lowest bishoprics to 300l. There are also three superintendents, who rank as bishops, but do not sit in the house; these are the first chaplain to the king, the rector of St. Nicholas at Stockholm, and the first chaplain of the navy. The bishops are bound to residence, except during the meeting of the diet. A consistory of the clergy of the diocese elects the archbishop and bishops, by presenting them to the king for his nomination. They have also ecclesiastical courts, &c.

BISHOP-*abbot*, *episcopus abbas*, was an abbot invested with the episcopal order; of which we meet with several in the richer and more considerable monasteries.

BISHOP, *acephalous*, he who is immediately subject to the papal see, without any metropolitan over him.

BISHOP, *boy*. It was an ancient custom in such churches as had cathedral service, for the little choristers, on St. Nicholas' day, December the 6th, to elect one of their number to be the *episcopus puerorum*, the bearn, i. e. infant, or chorister bishop; who continued to preside over the rest, with an imitation of all the episcopal functions, till Innocent's day, Dec. 28, and then, after solemn processions and great pageantry, he laid down his office. He was

B I S H O P.

chosen on St. Nicholas' day, because St. Nicholas was the patron saint of children; he having, when an infant, shewn such singular piety, as the legend says, that when he was at his mother's breast, he would not suck on Wednesdays and Fridays, that he might observe the fasts of the church.

The ceremonies attending the investiture of the *episcopos puerorum*, are prescribed by the statutes of the church of Sarum, which contain a title *de episcopo choristarum*; and also by the processional. From these it appears, that he was to bear the name and state of a bishop, habited, with a crozier or pastoral staff in his hand, and a mitre on his head. His fellows, the rest of the children of the choir, were to take upon them the style and office of prebendaries, and yield to the bishop canonical obedience; and farther, the same service as the very bishop himself, with his dean and prebendaries, had they been to officiate, were to have performed, the very same, mafs excepted, was done by the choristers and his canons upon the eve and the holiday. The use of Sarum required also, that upon the eve of Innocent's day, the chorister bishop, with his fellows, should go in solemn procession to the altar of the Holy Trinity, in copes, and with burning tapers in their hands; and that during the procession, three of the boys should sing certain hymns mentioned in the rubric. The procession was made through the great door at the west end of the church, in such order, that the dean and canons went foremost, the chaplain next, and the bishop, with his little prebendaries, last; agreeably to that rule in the ordering of all processions, which assigns the rearward station to the most honourable. In the choir was a seat or throne for the bishop; and as to the rest of the children, they were disposed on each side of the choir, upon the uttermost ascent. And so careful was the church to prevent any disorder which the rude curiosity of the multitude might occasion in the celebration of this singular ceremony, that their statutes forbid all persons whatsoever, under pain of the greater excommunication, to interrupt or press upon the children, either in the procession or during any part of the service directed by the rubric; or any way to hinder or interrupt them in the execution or performance of what it concerned them to do. Farther it appears, that this infant-bishop did, to a certain limit, receive to his own use, rents, capons, and other emoluments of the church. In case the little bishop died within the month, his exequies were solemnized with great pomp; and he was interred, like other bishops, with all his ornaments. The memory of this custom is preserved, not only in the ritual books of the cathedral church of Salisb'ry, but by a monument in the same church, with the sepulchral effigies of a chorister bishop, supposed to have died in the exercise of his pontifical office, and to have been interred with the solemnities above noted.

From what period we are to date the progress of this ridiculous ceremony, it is not easy to discover, but it seems more than probable that it originated with the ancient MYSTERIES. In the wardrobe account of Edward I. published by the society of antiquaries, we find a boy-bishop, Dec. 7, 1290, saying vespers before the king, in his chapel at Heton, near Newcastle upon Tyne, for which he, and the boys who sung with him, received 40s.

This establishment, but with a far greater degree of buffoonery, was common in the collegiate churches of France. (See Dom. Marlot. Histoire de la Metropole de Rheims, tom. ii. p. 769.) A part of the ceremony in the church of Noyon was, that the children of the choir should celebrate the whole service on St. Innocent's day. (Briton. Dictionnaire des Arrets, artic. Noyon. ed. 1727.) In a curious book,

called Voyages Liturgiques de France (Par. 8vo. 1718, p. 53.) is this account of the same practice in the church of Vienne in Dauphiny. "Le jour de Noël après Vêpres, le jour de S. Etienne, et le jour de St. Jean l'Évangéliste, on faisoit des processions solennelles pour les diacres, les pretres, et les enfans de Chœur, comme autrefois à Rouen. Il y avoit aussi le lendemain à la messe solennité pour eux. Les enfans de Chœur y avoient leur PETIT EVEQUE, qui faisoit tout l'office, excepté à la messe." And in the statutes of the archiepiscopal cathedral of Tullies, given in the year 1497, it is said, that during the celebration of the festival of the boy-bishop, "*Moralities* were presented, and shews of *miracles*, with farces and other sports, but compatible with decorum. After dinner they exhibited, without their masks, but in proper dresses, such farces as they were makers of, in different parts of the city." In England too, it appears, that the boy-bishop, with his companions, went about to different parts of the town; at least visited the other religious houses. (See the Computus Rolls of Winchester College, A. 1461.) And Strype records (Eccles. Memorials, iii. 310. ch. xxxix. and p. 387. ch. 1.) that when this, among other ancient ceremonies, was restored by queen Mary, in 1556, "on St. Nicolas' even, St. Nicolas, that is, a boy habited like a bishop in *pontificalibus*, went abroad in most parts of London, singing after the old fashion, and was received with many ignorant but well disposed people into their houses, and had as much good cheer as ever was wont to be had before."

In the statutes of Eton college, given in 1441, the *episcopos puerorum* is ordered to perform divine service on St. Nicholas's day; and in those of Winchester college, 1380, *pueri*, that is, the boy-bishop, and his fellows, are permitted on Innocent's day to execute all the sacred offices in the chapel, according to the use of the church of Sarum. A similar clause to that at Eton occurs in the statutes of King's college, Cambridge; and Mr. Warton observes, in his History of Poetry, that the anniversary custom at Eton, of going *ad montem* originated from the ancient and popular practice here described.

In a small college, for only one provost, five fellows, and six choristers, founded by archbishop Rotherham in 1481, in the obscure village of Rotherham, in Yorkshire, this piece of mummery was not omitted. The founder leaves by will, among other bequests to the college, "a myter for the barne-bishop of cloth of gold, with two knoppes of silver, gilt and enamelled." Hearne's Liber Niger Seacc. Append. 674. 686.

From the passage already quoted from the Voyages Liturgiques de France, it appears that, at least in one church, the *mas* was not allowed to be celebrated by the boy-bishop; and it is also expressly prohibited in the use of Sarum: but other and more frequent instances occur where the buffoonery was carried even to this height. In a fragment of the cellarers *Computus* of Hyde abbey near Winchester, A. D. 1397, we have a charge "pro epulis *pueri* CELEBRANTIS in festo Sancti Nicolai;" and so late even as the reign of Henry VIII., we find the same ceremony at St. Paul's.

It is surprising that Dean Colet, a friend to the purity of religion, and who had the good sense and resolution to censure the superstitions and fopperies of popery in his public sermons, should countenance this idle farce of the boy-bishop in the statutes of his school at St. Paul's, which he founded with a view of establishing the education of youth on a more rational and liberal plan than had yet been known, in the year 1512. He expressly orders, that his scholars "shall every Childermas (that is Innocent's) day, come to Paul's church, and hear the *childe-bishop's* (of St. Paul's cathedral) sermon

fermon And after it be at the hygh masse; and each of them offer a penny to the chylde bishop, and with them the maisters and surveyors of the scole."

This singular custom was, however, prohibited in the council of Sens, A. D. 1485; and, not so much for its superstition as its levity and absurdity, was abrogated in this country by king Henry VIII. in 1542, the words of whose proclamation may be seen in Mr. Warton's History of English Poetry, vol. iii. p. 322. But queen Mary, who with the catholic liturgy restored all the pageantries of popery to their ancient splendour, revived the mummery before us; and on Nov. 13, 1554, an edict was issued by the bishop of London to all the clergy of his diocese, to have a *boy-bishop* in procession.

We need hardly add, that on the accession of Elizabeth, this silly mockery was set aside; but Mr. Warton was inclined to think, that the practice of our plays being acted by the choir boys of St. Paul's church and the chapel royal, which continued till Cromwell's usurpation, might be deduced from the *mysteries and moralities* which attended the ridiculous festival of St. Nicholas. See the Northumberland Household Book, p. 440. Drake's Eboracum, p. 481. Warton's Hist. of Eng. Poetry, i. 248. ii. 375. 389. iii. 302, 303, 324. Processionale Eccl. Sarum, edit. Rothom. 1555. Dugdale's Hist. of St. Paul's, 205, 206. Antis Ord. Gart. ii. 309. Knight's Life of Dean Colet, p. 362. Hawkin's Hist. of Music, ii. 5. Strype's Eccles. Mem. iii. 202. ch. xxv. 205, 206. ch. xxvi. Dugd. Monast. iii. 169, 170. 279.

BISHOP, cardinal, a bishop in chief, or *in capite*. St Gregory sometimes uses the term for a proper bishop. Anciently there were also bishops, who by a peculiar privilege from the holy see, were ranked, and had a seat among the cardinals.

BISHOPS, cathedral, was also a title given to the proper bishops, by way of distinction from the *chorepiscopi*.

BISHOPS, commendatory, or bishops "in commendam," are cardinals not of the order of bishops, or other prelates, who yet hold bishoprics "in commendam." The appellation had its origin during the residence of the papal see at Avignon, whence scarce any cardinal, priest, or deacon, was created, who held not one, two, three, or more bishoprics in commendam. Du-Cange.

BISHOP designed, episcopus designatus, denoted a coadjutor of a bishop, who, in virtue of his office, is to succeed at the incumbent's death.

BISHOP- elect, is he who has the king's nomination, with the function of the chapter: but without consecration.

BISHOPS, exempt, those freed from the jurisdiction of the metropolitan, and immediately subject to the see of Rome alone.

BISHOP of the palace, episcopus palatii, was probably the same with bishop of the king's chapel, a title in the court of Bohemia. Du-Cange. Is was also a title given those bishops, who, by licence of the pope, dwelt in palaces of kings, to be in readiness for spiritual service and council in church matters.

BISHOP of the prime-see, denoted a "primate," otherwise denominated a "senior bishop." See PRIMATE.

BISHOP in partibus infidelium, he who is dignified with the title of a bishopric, whose district or diocese is in the possession of infidels or heretics. By the canon law, a bishop *in partibus* is qualified hereby to be a coadjutor of another bishop. The denomination took its rise from the expulsion of the bishops and clergy out of the Holy Land by the Saracens; when flying into Italy for shelter, coadjutories were given them for their subsistence.

BISHOPS, regionary. See REGIONARY.

BISHOPS, rural. See CHOREPISCOPI.

BISHOPS, suffragan, are coadjutors or assistants of diocesan bishops, authorised by commission from them.

BISHOPS, vague, those without any diocese, sometimes attendant in camps, or in foreign countries, for the conversion of infidels. The like vague bishops were sometimes also granted by popes to monasteries, exempt from the jurisdiction of the diocesan, where they performed all the episcopal functions. Du-Cange.

BISHOP, universal or catholic, is a title given to the patriarch of Armenia.

BISHOP of the catholic or universal church, a title sometimes assumed by the popes.

BISHOP of bishops, was a title anciently given to the prelates of some of the greater and more honourable sees, as Jerusalem and Rome. The first who had the title was James, bishop of Jerusalem. Some will have the appellation to have been common to all bishops.

BISHOPS, in the Lutheran Church, are those more usually called *superintendents*, which see.

The Calvinists allow of no other bishops besides presbyters; but the Lutherans make some distinction, and give a superiority or pre-eminence over the rest of their "bishops," "superintendents," or "overseers."

BISHOP is also a quality sometimes attributed to secular princes, in respect of their supremacy or jurisdiction in matters belonging to religion. See SUPREMACY. In this sense it is that the emperor Constantine, in a letter to the bishops in his dominions, calls himself "common bishop," as being in some respects general bishop of the whole Roman world.

BISHOP of the Jews, the head of that people in England, chosen by themselves, to whom they submitted to be judged and governed according to their law. Prideaux's Connect. part ii. lib. v. p. 478. This office, which subsisted under our Norman kings, and was licensed by them, answered to the *ÆCHMALOTARCHS* in Babylon, and the *ALABARCHS* in Egypt.

BISHOPS at chess, a kind of pieces, the third in rank, below queens, but above knights, distinguished by their cloven heads. In Latin writers of the middle age, the bishop is called *alphibus*; and by the French *le fou*, the *fool* or *madman*. See CHESS.

BISHOP'S Court. See COURT.

BISHOP'S see, or seat, originally denoted the throne or chair in the church where the bishop sat. It was also denominated *APsis*.

BISHOP'S see also denotes the city or place where the residence of the bishop is fixed.

Every bishop's see was anciently called "sedes apostolica;" though the appellation has since been restrained to the see of Rome.

Anciently bishops seem to have had a right in England to sit as judges in the hundred and county-courts. In after-times, they were forbid to sit in secular courts, and had separate courts erected for them; which proved an occasion of much dispute between the two jurisdictions. No church tenant might be sued in any court but the bishop's. There are also traces of a separate court of the bishops much earlier, among our Saxon ancestors in the eighth century. The regard borne to the character of bishops, made them the common arbitrators even of secular causes; they had the cognizance of all causes concerning lands in "frank-almoign;" and for ecclesiastics, were judges even in capital causes.

BISHOP'S weed, in Botany. See AMMI.

B I S H O P.

BISHOP, Bird, in Ornithology. See TANAGRA EPISCOPUS.

BISHOP and his Clerks, in Geography, a cluster of dangerous rocks, near the west coast of South Wales, at the entrance of St. George's channel, four miles west of St. David's. N. lat. 51° 54'. W. long. 5° 20'.

BISHOP'S Auckland. See AUCKLAND.

BISHOP'S Castle, a market and borough town of Shropshire, in England, spreads its scattered houses over the side of a considerable eminence, at the base of which runs the small river Clun. This town is an old corporation, and made its first return to parliament in the 27th of Elizabeth. Previous to that period, it belonged to the see of Hereford, and derived its name from being one of the seats, or castled manor-houses of the bishops. The corporation consists of a bailiff, recorder and fifteen aldermen, who, with about thirty other inhabitants called burgeses, elect two members for the town. Here is a large weekly market on Fridays, which is much frequented by the Welsh, as are its six annual fairs. At some of the latter a great quantity of sheep and pigs are sold. This town was formerly under the protection of a castle, which is entirely destroyed. Bishop's castle is 156 miles N. W. from London. It contains 241 houses, and 1076 inhabitants.

At *Sned*, about two miles and a half N. W. from Bishop's castle, a priory of black canons was founded in the time of Henry III., but was soon afterwards removed to *Cherbury*. This place, seated near the Severn, is supposed to have been built by Ethelreda, and was afterwards possessed by the family of the Herberts, one of whom was created Lord Herbert of Cherbury. This gentleman wrote an account of his own life, which has been published by Horace Walpole at his private press at Strawberry hill. Not far from this town on the borders of Montgomeryshire, is an ancient encampment called *Bishop's Mound*; and at Clun are the remains of an ancient castle, near which is a camp called *Buryditches*. About three miles hence is *Walcot*, the seat of Lord Clive, who is patron of this borough. In the vicinity of Bishop's castle, are three lofty singular hills, respectively named Condon-hill, Church-Stoke-hill, and Squilfar-hill. At *Moor Park*, is a respectable ancient mansion; the grounds are finely diversified, and abound with fine woods.

BISHOP'S Island, a small rocky island in Mal-bay, on the west coast of the county of Clare, in Ireland. N. lat. 52° 38'. W. long. 9° 35'. Beaufort.

BISHOP'S Stortford, a market town of Hertfordshire, in England, is placed on the side of a hill, near the western borders of Essex. Seated in the midst of a corn country, it is remarkable for its number of malt-houses, and for the quantity of malt annually made here; this is distinguished by the name of brown malt, and is disposed of principally to the London brewers. It is conveyed to the metropolis in barges, by a navigable canal, which was cut in 1779, and which joins the river Lee, at about 14 miles distance from this town. Before this navigation was opened, the malt, which is now lodged here, was carried to Ware and Stansted, as the nearest places for water-carriage; but since the above period, Stortford has become the depot for the malt made in this town and the neighbouring villages.

This place was evidently of some note previous to the conquest, as it appears from the Domesday Survey, that the conqueror gave the town and castle to Maurice, bishop of London. From this evidence it appears, that the castle here, which bore the name of Waytemore, was standing prior to the Norman invasion, though some writers assert that it was erected by William. It was probably repaired and strengthened by him, but Mr. Salmon seems justified in

the opinion, that it was constructed by the East Saxons to defend their borders. The lands paying cattle-guard, lie between this place and the Ermine street, one of the great Anglo-Roman roads. The hill, or keep, on which the castle stood, is artificial, being evidently raised with earth brought from some distance. On the top was a well, and a breastwork of stone and mortar. A bank of earth runs from the summit across the moory ground to the north-east. "This castle," says Salmon, "must have been of some consequence in the time of king Stephen, because of the great desire Geoffroy de Magnaville had, either to be master of it, or to have it pulled down; and Maud the empress engaged him to do one or t'other." The security derived from this fortification gave origin to the town, which had increased to some consequence in the time of king John, who created it a borough, and invested the inhabitants with certain corporate privileges. This monarch seized the castle and town from W. de St. Maria, the bishop of London, who was one of the three bishops deputed to execute the pope's interdict upon England. This period was distinguished by the alarming jealousies and animosities between the king and the pope with his prelates; and as Salmon expresses it, "the castle at Stortford, stands yet a monument of king John's power and revenge, and the bishop's lands remain a monument of the pope's entire victory over him." In the time of Edward III. the town and castle, &c. again reverted to the bishop of London, in whose see it still continues, and who appoints a bailiff for this liberty, which includes the town and thirteen contiguous parishes. The bishop's prison was standing in Bishop Booner's time, but that and all the other old buildings have been since demolished.

The streets of the town are disposed in the form of a cross, with two long streets intersecting each other at right angles. Though no particular manufacture is carried on here, yet the town is respectable and populous; it contains 456 houses, and 2305 inhabitants. Here are a very considerable weekly market for grain, &c. on Thursdays, and three annual fairs, which are mostly appropriated to the sale of horses and cattle.

The church, dedicated to St. Michael, is a large lofty structure, and, like most buildings, dedicated to that saint, stands on the highest ground in the neighbourhood. There were anciently three guilds and a chantry endowed here; and in the choir are nine stalls on each side. The interior of this building is decorated with a number of monuments, some of which are ancient. The great tythes of the parish are in the hands of laymen. In the town are some meeting-houses for dissenters, methodists, and quakers, also some almshouses, and a school-house. The latter was built from a subscription among the gentlemen of Hertfordshire and Essex, who were infligated to this act by Dr. Thomas Tooke. This gentleman was zealously indefatigable in promoting and establishing the foundation which has proved beneficial to the town and highly honourable to its founder and patrons. The building stands on arches, beneath which is a space for market and shops. Dr. Tooke revived an annual school-feast here, and charged his own estate with an annual present to the preacher. He also gave a chalice of 20l. value to the church, and was a great benefactor to the school-library, which is a very good one, and was first established by the Rev. Thomas Leigh, who was vicar of the church in 1680, &c. Besides other donations to this library, it is customary for every gentleman to present a book at the time of leaving the school. Bishop's Stortford derives its compound name from being the property of the bishop of London at an early period, and from its situation on the banks of the river Stort, which separates it on the east from the hamlet

hamlet of Hockeill. At a short distance north of this town is Hadham parva, which is noted from being the burial place of the Capels, earls of Essex. Bishop's Stortford is 30 miles north of London. Salmon's History of Hertfordshire.

BISHOP'S *Waltham*, a small town of Hampshire, in England, derives a part of its name from having been a seat of the bishops of Winchester. Some of their palace still remains at a small distance west of the town, and the site now belongs to the sea. Leland describes it as "a right ample and goodly maner place, moted aboute, and a praty brooke running hard by it. It hath been of many bishops' building." The celebrated William of Wykeham, bishop of Winchester, resided here during the last three years of his life, and died in this mansion, A. D. 1404, in the 8th year of his age. The house was partly demolished in the civil wars of Charles I. when bishop Kyri was in possession. Bishop's Waltham is noted for its schools, both for gentlemen and ladies. It contains 191 houses, and 1773 inhabitants, and has three annual fairs.

About five miles south of the town is *Wickham*, a village rendered memorable from being the birth-place of the above-named bishop. See WYKEHAM.

BISHOPING, in *Horsemanship*, is a term probably derived from *Bishop*, the name of a horse-dealer, and denoting a trick of the dealers in horses for making them appear younger than they are, with a view of imposing upon the purchaser.

This is done by excavating the corner tooth of the incisors with a steel graver, or file, and afterwards blackening the cavity with a hot iron. This mark, or excavation, is deemed by many the criterion of age, and that the horse is young while this is preserved.

To avoid being imposed upon, the purchaser should consider the general figure, not only of the corner tooth, but of all the incisor teeth of the upper and lower jaw, for they all undergo a perpetual change of figure by age and wear.

An incisor tooth of the horse, at its first emerging from the jaw, has the visible part of it flat, and covered every where with enamel; the outside sharp and projecting higher than the inside, with a conical cavity in the middle, of various depth in different horses, which renders it of not much value in deciding upon the age; in some it is so short as to be obliterated by the sixth year; in others it is so long as to be found till nine or ten, or later; it is, therefore, not a certain criterion of age: the general figure of the tooth is more to be depended upon in our estimation. The lateral width of the recent tooth, and its flatness, are very remarkable, and can never be imitated; as this wears away the tooth daily increases in its transverse width, that is from front to back, and diminishes in its lateral width, forming, as the wear advances, nearly a triangle; these angles at length by age gradually disappear, and the tooth presents a rounder surface on its upper part, and at length the tooth becomes flattened on the sides, and actually wider from front to back than from side to side. For it should be recollected that the tooth is formed in its whole extent previous to its appearance externally, and that the jaw is absorbed, to allow of its wear; the enamel, like a shell, describing the figure and boundary of the tooth, which hollow shell is afterwards filled up with bone. A transverse section, therefore, of the tooth, or a series of them at different distances from its point, afford the exact figures of the surfaces of the teeth at the various periods of their wear, and allowing for contingencies which occasion the teeth to be worn with more or less rapidity, as in crib biters, &c. will afford the truest criterions of age, and render impolition in this way impracticable.

The teeth also they pretend, in some instances, to excavate on the inside, and to sharpen with a file: these bungling attempts, however, in no way resemble the natural markings or surface of the tooth, nor could impose upon any one the least experienced in observing the teeth. For what we consider the best indications of the age of horses, however, we refer the reader to the article *TEETH of Horses*.

BISHOPRIC, the jurisdiction of a bishop, or the district within which it is comprised, called also "diocese," which see.

There are twenty-four bishoprics, and two archbishoprics, in England and Wales. To the old ones subsisting before the times of the Reformation, Henry VIII., by letters patent added six more bishoprics; viz. those of Westminster, Chester, Gloucester, Peterborough, Bristol, and Oxford, stat. 34 and 35 Hen. VIII., cap. 17. These sees were all founded in the course of the years 1540, 1541 and 1542.

The see of Westminster, having never had but one bishop, was united to that of London, and its bishop translated to Norwich, by Edward VI., in 1550. The remaining bishoprics are comprehended under two provinces, those of Canterbury and York. The province of Canterbury includes the following bishoprics, viz. 1. The bishopric of London, containing Essex, Middlesex, and part of Hertford, and extending its jurisdiction to the West India Islands. 2. Winchester, comprehending Surry, Hampshire, and the isles of Wight, Jersey, Guernsey, and Alderney. 3. Litchfield and Coventry, to which belong Stafford, Derby, and part of Warwick and Shropshire. 4. Lincoln, comprehending Lincoln, Leicester, Huntingdon, Bedford, Buckingham, and part of Hertford. 5. Ely, containing Cambridgeshire. 6. Salisbury, to which belong Wilts and Berkshire. 7. Exeter, including Cornwall and Devon. 8. Bath and Wells, comprehending Somersetshire. 9. Chichester to which belongs Suffex. 10. Norwich containing Norfolk, Suffolk, and a small part of Cambridge. 11. Worcester, comprehending Worcester and part of Warwick. 12. Hereford, including Hereford and part of Shropshire. 13. Rochester, to which belongs part of Kent. 14. Oxford, including Oxfordshire. 15. Peterborough, containing Northampton and Rutland. 16. Gloucester, comprehending Gloucestershire. 17. Bristol, to which belongs the city of Bristol, part of Gloucestershire, and the county of Dorset. 18. Landaff, comprehending Glamorgan, Monmouth, Brecknock, and Radnor. 19. St. David's, including Pembroke, Cardigan, and Caermarthen. 20. St. Asaph, containing the greatest part of Flint, Denbigh, and Montgomery, and some part of Shropshire. 21. Bangor, to which belong the counties of Anglesey, Caernarvon, Merioneth, and part of Denbigh and Montgomery. The province of York, comprehends—22. Durham, containing Durham and Northumberland. 23. Carlisle, including great part of Cumberland and Westmoreland. 24. Chester, to which belong Cheshire, Lancashire, Richmondshire, which is part of York, together with part of Cumberland and Westmoreland. 25. Isle of Man. The value of these sees is not easily ascertained, as it is very different from that which is stated in the king's books. It is a certain fact, whatever may be the primary occasion of it, that the revenues of the bishoprics are very unequal in value, and that there is also a great inequality in the patronage appertaining to the different sees. Adverting to this circumstance, Dr. Watson, the present bishop of Landaff, addressed a "Letter to his Grace the Archbishop of Canterbury," printed in 1783, proposing a scheme for rendering the bishoprics more equal to each other, with respect to both income and patronage, by annexing part of the estates, and part of the preferments, of
the

the richer bishoprics, as they became vacant to the poorer. The advantages, resulting from the accomplishment of this object, and recited by the learned prelate, are such as follow: The poorer bishops would thus be freed from the necessity of holding ecclesiastical preferments "in commendam" with their bishoprics; a practice, which bears hard upon the rights and expectations of the rest of the clergy; which is disagreeable to the bishops themselves; which exposes them to much, perhaps undeserved, obloquy; but which certainly had better not subsist in the church. The bishops would also thus acquire a greater independence in the house of lords; and the measure would contribute to reduce the influence of the crown in that house. This plan would likewise ensure a longer residence of the bishops in their respective dioceses, as temptations to translations would be thus removed, and prelates would of course become more attached to their particular situations, gain a more intimate acquaintance with their clergy, and serve, by their doctrine and example, to produce the best effect in the conduct both of clergy and laity. See AUGMENTATION.

In Ireland there are 18 bishoprics, and 4 archbishoprics. Under the archbishop of Armagh, the primates, are the bishops of Meath, Kilmore and Ardagh, Dromore, Clogher, Raphoe, Down and Connor, and Derry. Under the archbishop of Dublin are Kildare, Feins and Laughlin, and Ossory. Under the archbishop of Cashel are Waterford and Lismore, Limerick, Killaloe, Cork and Ross, and Cloyne. Under the archbishop of Tuam are Elphin, Cloyne, and Killala and Achonry. The primacy is estimated at 8000*l.* a year, Derry at 7000*l.*, and the other bishoprics from 4000*l.* to 2000*l.* The catholics have a hierarchy nearly similar; but the metropolitans and bishops are considered by the protestants as merely titular.

The ancient ecclesiastical establishment of Scotland comprised two archbishoprics, those of St. Andrew's and Glasgow, and eleven bishoprics (that of Edinburgh having been only established by Charles I.), which, in the order of antiquity, maybe thus enumerated; Galloway (St. Andrew's,) Dunkeld, Moray; five founded by David I., Brechin, Dunblane, Aberdeen, Ross (Glasgow); that of Argyle, or Lismore, was founded about the year 1200, because the bishops of Dunkeld did not speak the Irish tongue; the bishops of Orkney and of the western islands date from an earlier period, while their sees were not subject to the Scottish crown. But since the revolution in 1688, the ecclesiastical government of Scotland is of the Presbyterian form; and of course they have no bishoprics.

Bishoprics, as well as archbishoprics, may become void by death, deprivation, and resignation; but a bishop must resign to his metropolitan. See ARCHBISHOPRIC.

BISI, BONAVENTURA, in *Biography*, an eminent painter and engraver, and a monk, as some say, of the order of St. Francis, was born at Bologna, and became a disciple of Lucio Massari. His chief excellence consisted in copying in miniature, the pictures of Corregio, Guido, Titian, and other masters, which he finished with surprising beauty and elegance. Many of his works, which are highly valued, are in the duke's gallery at Modena. He also amused himself by etching some few plates from Parmegiano, Guido, &c. One, probably from his own design, was a "Holy family," with Elizabeth and St. John, dated 1631. He died in 1662; but his age is not known. Strutt and Pilkington.

BISIGNANO, in *Geography*, an inconsiderable town of Naples, in the province of Calabria citra, seated on a hill near the river Crati, surrounded by lofty mountains, and defended by a strong fortress. It gives the title of prince to the last remaining branch of the ancient house of San

Severino, and is a bishop's see, suffragan of Rossano; distant 16 miles W. S. W. from Rossano, and about 18 miles N. from Cosenza. N. lat. 39° 38'. W. long. 168° 22'.

BISK, or BISQUE, in *Cookery*, a rich sort of broth or soup, made of pigeons, chickens, force-meat, mutton-gravy, and other ingredients. The word is French, formed, as some think from *biscotta*; because the *bisque*, consisting of a diversity of ingredients, needs several repeated coctions to bring it to perfection. There is also a *demi-bisque*, made at a low expence, in which only half the ingredients are used; and a *bisque* of fish, made of carps, minced with their roes and lobsters.

BISKET, BISQUET, or BISCUIT, usually denotes a delicate kind of bread prepared by the confectioners, of fine flour, eggs, sugar, and rose or orange water; or of flour, eggs, and sugar, with anise-seeds and citron-peel; baked in the oven, in tin or paper moulds. The word comes from the Latin *bis*, twice, and the French *cuit*, coctus, q. d. baked. We find divers sorts of such biskets, as feed-bisket, fruit-bisket, long bisket, round-bisket, Naples bisket, sponge-bisket, &c.

BISKET, *sea*, is a sort of bread much dried, to make it keep for the service of the sea. It was formerly baked twice or oftener, and prepared six months before the embarkation. It will hold good a whole year. To preserve sea biskets from insects, Dr. Hales advises to make the fumes of burning brimstone pass through the casks full of bread. Bisket may be likewise preserved a long time, by keeping it in casks well calked, and lined with tin.

The ship-bisket is too hard for some teeth; and in this case, it may be softened by toasting. But rusk is better; for being made of good fermented bread, sliced, and baked a second time, the pieces imbibe the water easily, soften immediately, and digest more kindly, and are therefore more wholesome than the unfermented bisket. Rusk, says Dr. Franklin, is the true original bisket, so prepared to keep for sea, being twice baked, as its name imports. See Franklin's Maritime Observations, in Amer. Transf. vol. ii. p. 322.

The ancients had their bisket prepared after the like manner, and for the like use as the moderns. The Greeks called it *αριον βισπιζον*, q. d. "bread put twice to the fire." The Romans gave it the name of "panis nauticus," or "capta." Pliny denominates it "vetus aut nauticus panis tufus atque iterum coctus." By which it appears, that after the first baking, they ground or pounded it down again for a second. In some middle-age writers, it is called "paxinas," "paximus," and "panis paximatus."

Among the Romans, we also meet with a kind of land-bisket for the camp-service, called, "buccellatum," sometimes, "expeditionalis annona," which was baked much, both to make it lighter for carriage, and less liable to corrupt, the coction being continued till the bread was reduced one-fourth of its former weight.

The process of bisket baking for the British navy is as follows: and it is equally simple and ingenious. The meal, and every other article, being supplied with much certainty and simplicity, large lumps of dough, consisting merely of flour and water, are mixed up together; and as the quantity is so immense, as to preclude by any common process a possibility of kneading it, a man manages, or, as it is termed, rides a machine which is called a horse. This machine is a long roller, apparently about four or five inches in diameter, and about seven or eight feet in length. It has a play to a certain extension, by means of a staple in the wall, to which is inserted a kind of eye, making its action like the machine by which they cut chaff for horses. The lump of dough being placed exactly in the centre of a raised platform, the

man sits upon the end of the machine, and literally rides up and down throughout its whole circular direction, till the dough is equally indented; and this is repeated till it is sufficiently kneaded; at which times, by the different positions of the lines, large or small circles are described according as they are near to or distant from the wall, till you have fairly the idea of an immense pentagraph. The dough in this state is handed over to a second workman, who slices it with a prodigious knife; and it is then in a proper state for the use of those bakers who attend the oven. These are five in number; and their different departments are as well calculated for expedition and correctness, as the making of pins, or the working or printing of types. On each side of a large table, where the dough is laid, stands a workman; at a small table near the oven stands another; a fourth stands by the side of the oven, to receive the bread; and a fifth, to supply the peel. By this arrangement the oven is as regularly filled, and the whole exercise performed in as exact time as a military evolution. The man on the further side of the large table moulds the dough, having previously formed it into small pieces, till it has the appearance of muffins, although rather thinner, and which he does two together, with each hand; and as fast as he accomplishes this task, he delivers his work over to the man on the other side of the table, who stamps them with a docker on both sides with a mark, on which are cut the broad \blacktriangle , the letters PLY, and the number of the oven in which the biscuits are to be baked. As he rids himself of this work, he throws the biscuits on the smaller table next the oven, where stands the third workman, whose business is merely to separate the different pieces into two, and place them immediately under the hand of him who supplies the oven, whose work of throwing, or rather chucking, the bread upon the peel, must be so exact, that if he looked round for a single moment, it is impossible he should perform it correctly. The fifth receives the biscuit on the peel, and arranges it in the oven; in which duty he is so very expert, that though the different pieces are thrown at the rate of seventy in a minute, the peel is always disengaged in time to receive them separately. As the oven stands open during the whole time of filling it, the biscuits first thrown in would be first baked, were there not some counteraction to such an inconvenience. The remedy lies in the ingenuity of the man who forms the pieces of dough, and who, by imperceptible degrees, proportionably diminishes their size, till the loss of that time, which is taken up during the filling of the oven, has no more effect to the disadvantage of one of the biscuits than to another.

So much critical exactness and neat activity occur in the exercise of this labour, that it is difficult to decide whether the palm of excellence is due to the moulder, the marker, the splitter, the chucker, or the depositer; all of them, like the wheels of a machine, seeming to be actuated by the same principle. The business is to deposit in the oven seventy biscuits in a minute; and this is accomplished with the regularity of a clock; the clack of the peel, during its motion in the oven, operating like the pendulum.

The biscuits thus baked are kept in repositories, which receive warmth from being placed in drying lofts over the ovens, till they are sufficiently dry to be packed into bags, without danger of getting mouldy; and when in such a state, they are then packed into bags of a hundred weight each, and removed into storehouses for immediate use.

The number of bake-houses, belonging to the Victualling Office at Plymouth, are two; each of which contains four ovens, which are heated twenty times a day; and in

the course of that time bake a sufficient quantity of bread for 16,000 men. The granaries are large, and well constructed; when the wheat is ground, the flour is conveyed into the upper stories of the bake-houses, whence it descends through a trunk in each immediately into the hands of the workmen.

The bake-house, belonging to the Victualling Office at Deptford, consists of two divisions, and has twelve ovens; each of which bakes twenty shoots daily, Sundays excepted; the quantity of flour used for each shoot is two bushels, or 112 pounds, which baked produce 102 pounds of biscuit. Ten pounds are regularly allowed on each shoot for shrinkage, &c.

The allowance of biscuit in the navy is one pound for each man per day, so that one of the ovens at Deptford furnishes bread daily for 2040 men.

BISLÁN, in *Geography*, a town of Egypt on the Nile, 3 miles south of Damietta.

BISLEY, anciently called *Bisfele*, is a small market town, and a very extensive and populous parish of Gloucestershire, in England. The parish includes an area of 6000 acres, the surface of which is diversified with steep hills and narrow valleys. On the sides of the former are some inclosed arable lands, interspersed with copes; and the latter are mostly kept for meadow pasturage. Bisley, Chalford, and some neighbouring hamlets, are chiefly inhabited by persons engaged in the woollen manufactures; and many fulling and dressing mills are erected on the river which runs through this parish. A small weekly market is held here on Thursdays, and here are two considerable fairs yearly. The church is a large handsome building, and, being seated on a high hill, is conspicuous for many miles. Here is a small free school, and an endowment for clothing six widows yearly. The canal, which unites the Thames and Severn, passes through this parish; and near the verge of it, at Sapperton, enters a subterraneous tunnel, which is cut through the earth to an extent of two miles and five furlongs. This tunnel is lined with masonry, and arched over at top, with an inverted arch at the bottom, except at those places where the solid rock rendered it unnecessary. The expence of cutting it was about eight guineas per cubic yard; but the plan of uniting the waters of the two great British rivers induced the proprietors to encounter extraordinary expence and trouble. The connection of the rivers Thames and Severn, by means of this canal, and also with the internal parts of the kingdom, by the Oxford and Coventry canals, which lead to Birmingham, and also to the counties of Stafford, York, Chester, and even to Westmoreland, forms a line of communication with the capital of the greatest importance, and which has proved of great utility to the manufacturing towns through which it passes. On the 29th of April 1789, the acting engineer, Mr. Clowes, passed through the tunnel for the first time, in a vessel of 30 tons burthen; and the junction was completed, and a vessel passed from the Severn into the Thames, for the first time, on the 19th of November in the same year, in the presence of a large concourse of people, who came to witness and rejoice at the sight. In 1788, their majesties went from Cheltenham, on purpose to view this tunnel, which excited their surprise and admiration, more particularly when they learnt it had been conducted and completed by a private gentleman. The canal is 30 miles and 7 chains in length; in which course the water is raised 241 feet 3 inches, and made to fall 130 feet 6 inches. In the parish are 922 houses, and 4227 inhabitants. Rudge's History of the County of Gloucester. Phillips' History of Inland Navigation.

BISLINGUA, *double-tongue*, in *Botany*, a named used by many authors for the narrow-leaved *ruscus*, or *butcher's broom*;

broom; called by many others the Alexandrian bay, or *laurus Alexandria*.

BISMARCK, in *Geography*, a town of Germany, in the circle of Upper Saxony, and Old Mark of Brandenburg; 12 miles west of Stendal.

BISMEO, or BIXNEA, a town of Africa in the kingdom of Algiers, 25 miles west from Algiers.

BISMILLAH, in the *Mahometan Customs*, a solemn form, viz. in the name of the most merciful God, constantly placed at the beginning of their books and writings in general as a peculiar mark or distinguishing characteristic of their religion; it being counted an impiety to omit it.

The Jews, for the same purpose, make use of the form, "in the name of the Lord," or "in the name of the great God." Sale.

BISMILLAH is also used among the Arabs, as a word of invitation to eat. An Arab prince will frequently sit down to eat in the street before his own door, and call all that pass, even beggars, by this word, who do not fail to come and sit down to eat with him; for the Arabs are great levellers, and let every body on a footing with themselves. Pocock's *Egypt*, &c. p. 483.

BISMUTH, *Bismutum*, Wallerius; *Wismuth*, or *Bismuth*, Germ; *Bismuth*, Fr.; *Plumbum cinereum*, *Antimonium seminum*, tin-glass, of the older chemists.

Bismuth is a brittle metal, of a reddish white colour, and foliated fracture, is fusible at nearly the same temperature with lead, soluble with ease in nitric acid, and precipitable from it in the form of a white oxyd by the addition of pure water.

§ 1. Ores of Bismuth.

Sp. 1. Native Bismuth. Gediegen Wismuth.

The colour of this mineral is silver-white, with a slight tinge of red, frequently exhibiting an iridescent appearance on its surface. It occurs very rarely in mass, being generally disseminated, or inveiling; it is also met with feather-shaped, or reticular, or in lamellæ of a rectangular or triangular shape, either solitary, or heaped upon each other. It exhibits a metallic lustre of considerable brilliancy. Its fracture is perfectly foliated, or broad striated. It is semiductile, and breaks with some difficulty into irregular, somewhat blunt-edged fragments. Sp. grav. according to Kirwan = 9.57.

Native Bismuth is fusible at a very moderate temperature, often by the heat of a common candle; when exposed to the action of the blowpipe on charcoal, it volatilizes in the form of a white vapour, not infrequently accompanied with an arsenical smell. It dissolves very easily, and with effervescence, in cold nitric acid; and is precipitable in the form of a white powder, on the addition of pure water.

The only two substances, with which native bismuth is liable to be confounded, are the sulphuret of bismuth and dendritical silver; the former of these, however, is not soluble with effervescence in cold nitric acid; and the latter may be distinguished by its colour and ductility.

Bismuth is one of the most partially diffused metals hitherto known; and it is chiefly found native, accompanied with kufsernickel, white and grey cobalt, black blende, native silver, and rarely galena. Its gangue is quartz, calcareous spar, or barosclenite; and it has hitherto been found only in veins in primitive mountains.

It is found at Joachimsthal, in Bohemia; at Freyberg, Annaberg, &c. in Saxony; in Sweden, Transylvania, and Britany.

Sp. 2. Sulphuretted Bismuth. *Wismuth glanz*, Emmerling. *Bismuth sulphuré*, Haüy.

The colour of this substance is between lead-grey and tin-

white; but on the surface it is usually yellowish or iridescent. It is found either lamellar and in mass, or disseminated, or in small acicular crystals. Its primitive figure, according to Haüy, is that of a quadrangular prism. Its internal lustre is metallic and very brilliant; its fracture is broad or narrow striated, or foliated like galena. Sp. gr. according to Kirwan, = 6.131. It stains the fingers in a slight degree; and when reduced to powder, is of a glittering black.

When exposed to the blowpipe, it melts easily, giving out a sulphureous odour and a blue flame, and is almost entirely volatilized before it can be brought to the metallic state. There has been no very accurate analysis made of this ore; but from the experiments of Sage and La Peyrouse it appears to contain about 60 per cent. of bismuth, 36 of sulphur, and a little iron. There is some external resemblance between the lamellar variety of this mineral and galena; but the superior fusibility of the former is an easy and infallible characteristic.

Sulphuret of bismuth is very rare; and, where it occurs, is always accompanying native bismuth. It is found at Joachimsthal, in Bohemia; Altenberg and Johann-Georgenstadt, in Saxony; and at Bastnas, near Riddarhytta, in Sweden.

Sp. 3. Oxyd of Bismuth, *Bismuth ochre*, Kirw. *Wismuth-ocker*, Emmerling. *Bismuth oxydé*, Haüy.

This mineral is of a greenish yellow colour, passing into ash-grey, or straw-colour. It is sometimes found in mass, but more commonly disseminated or inveiling. It is opaque, and possesses a slight degree of internal lustre. Its fracture is fine-grained, uneven, or earthy. Sp. grav. considerable, but has not yet been accurately ascertained. It is either friable, or of the consistence of chalk, but occasionally gives fire with steel, on account of the particles of quartz with which it is mixed.

When exposed to the action of the blowpipe on charcoal, it is very easily reducible to the metallic state. It is soluble in nitric acid without effervescence, and precipitable for the most part by the addition of water.

Oxyd of bismuth is an extremely rare mineral. It has hitherto only been found at Schneeberg, in Saxony, accompanying native bismuth; in the Black Forest mines, in Swabia; and at Joachimsthal, in Bohemia. It is often confounded with the green earthy iron ore; but may be at once distinguished by its easy reduction before the blowpipe. Emmerling, vol. ii. p. 434, &c. Wiedenmann, p. 887. Brochant, v. 2. p. 434. Haüy, v. 4. p. 184. Kirwan, vol. ii. p. 263.

§ 2. Assay and Analysis of Bismuth Ores.

Sulphur and iron are the only substances that have been as yet detected in combination with this metal, as far as can be inferred from very imperfect analyses of the preceding ores. But Klaproth, in his examination of the bismuthic silver ore from Shappbach (*Analyt. Ess.* vol. i. p. 556.), found it to be a combination of lead, silver iron, copper, and sulphur, with bismuth; and from the experiments of this able chemist is deduced the following general method of analysing the ores of bismuth.

Having reduced the ore to a tolerably fine powder, pour upon it, in a capacious flask, five times its weight of nitric acid previously diluted with one third of water. The acid will begin to act immediately, without the assistance of heat; nitrous gas will be disengaged in great quantity; and the solution will assume a greenish yellow colour. When the acid has taken up as much as it can, or nearly so, pour it off, and digest the undissolved residue in a moderate heat, with equal parts of nitric acid and water, renewing the

menstruum from time to time, till all the soluble parts of the ore are taken up. Add together the solutions, and reduce them by gentle evaporation to about half their bulk (if any crystals are deposited, add a little pure warm water just sufficient to take them up again); then pour the whole into a large quantity of rain water, at least twenty times the bulk of the solution. The liquor will immediately assume a milky appearance, and, by standing a short time, will deposit a white heavy precipitate (*a*), which when carefully lixiviated, is *pure oxyd of bismuth*. Add all the liquors together, and concentrate them by evaporation to one half of their bulk; then drop in a strong solution of muriated ammonia, as long as any precipitate takes place; decant the supernatant fluid as accurately as possible, and, without washing the precipitate, digest it for some time with moderately strong nitric acid; the undissolved part of the precipitate being separated, washed, and dried, is *pure muriat of silver* (*b*). The nitrous solution is now to be diluted with a large quantity of cold water, and a precipitate of oxyd of bismuth (*c*) will be thrown down. The diluted nitrous solution being mixed with the other liquor, the whole must be evaporated, till a considerable number of crystals are deposited; at this time, the addition of sulphuric acid will occasion a white deposit of *sulphat of lead* (*d*). The remainder of the solution is now to be supersaturated with caustic liquid ammonia, by which the *iron* will be deposited in the state of brown oxyd, (*e*), and the copper will form with the ammonia a blue solution; this being saturated slightly to excess with sulphuric acid, will deposit the *copper* (*f*) upon a piece of clean iron. The residue of the ore that was undissolved by nitric acid, being weighed, and exposed to a low red heat, will give out its *sulphur* (*g*), the quantity of which may be estimated with considerable accuracy by the loss of weight. It is now finally to be digested with ten times its weight of boiling muriatic acid, by which some oxyd of lead will be taken up; and this, by evaporation and the addition of sulphuric acid, may be procured in the state of sulphated lead (*h*). The residue being washed and dried is the stony gangue of the ore (*i*).

Hence the ore will be decomposed into

- Oxyd of bismuth (*a*) and (*c*),
- Muriated silver (*b*),
- Sulphated lead (*d*) and (*h*),
- Oxyd of iron (*e*),
- Metallic copper (*f*),
- Sulphur (*g*),
- Stony matrix (*i*).

§ 3. *Reduction of Bismuth Ores.*

The separation of this metal from the substances with which it is found united in the mine, and the reduction of it to a marketable state, is perhaps the easiest of all the metallurgical processes, on account of the ready fusibility of bismuth, and its being found for the most part in the metallic state. The following were the methods practised in the time of Agricola (*De Re Metallica*, p. 349.) A round pit, two or three feet wide, was lined with well rammed clay and charcoal, and covered with billet wood, upon which were laid alternate strata of ore and wood. When the pile was thus built to a sufficient height, fire was applied to the top, and the bismuth, as the heat penetrated through the mass, became melted, and trickled down into the hole beneath, where it collected in an irregular mass; being then withdrawn, and broken into pieces, it was remelted in iron or earthen pots, separated from the impurities that floated on its surface, and finally cast into flat cakes, or loaves, for sale. Another method was to divide a large pine tree longitudinally, and cut out the central part of the wood, thus

forming it into a gutter; this being placed somewhat inclined, the ore was laid in the upper end, on a bed of chips and small wood, sufficient, when set on fire, to liquify the bismuth, which flowing down, was collected in a hole or vessel placed at the end of the trough.

The scarcity of wood, has, however, put an end to these rude and extravagant methods; and the ores of bismuth are now reduced in a common reverberatory furnace, the bed of which is lined with charcoal, whence the melted metal is removed in iron ladles, and cast into masses weighing twenty or thirty pounds, in which state it is brought to market.

§ 4. *External Characters and Physical Properties.*

Bismuth is a white metal with a reddish yellow tinge; is considerably hard, but brittle, exhibiting a broad foliated fracture; has a bright, almost specular metallic lustre; and is somewhat sonorous, when struck. Though brittle, it may be compressed very considerably by judicious hammering, and therefore varies greatly in its specific gravity. According to Muschenbroeck, its sp. gr. when fresh melted, is = 8.716; but when laminated, is = 9.638. Bergman fixes its gravity at 9.67; and other authors make it as high as 9.8, or even 10. The laminæ, of which this metal is composed, have but little adhesion to each other; hence the primitive form of its crystals, which is that of a regular octahedron, may very easily be ascertained by dissection. It is fusible at 460° Fahr., and may be poured into a paper cone without burning it. If, after it has begun to solidify, the fluid part is poured off, a groupe of crystals is obtained in tubes, or rectangular volutes. When exposed in close vessels to a violent heat, it sublimes and attaches itself to the cooler part of the apparatus in the form of brilliant plates.

§ 5. *Oxyds of Bismuth.*

The combined action of air and moisture upon bismuth, at the usual temperature, is very slight; it becomes covered with a reddish grey superficial tarnish, and afterwards appears to undergo no further change. At a melting heat, it shortly becomes covered with an iridescent film, and by exposing fresh substances to the air, is wholly converted into a yellowish brown oxyd, weighing about $\frac{1}{12}$ more than the original metal. This oxyd melts into a yellow glass at a moderate red heat, and soon penetrates through the most compact earthen crucibles, though not quite so easily as glass of lead does. When bismuth is exposed to a strong heat, with free access of air, it burns with a faint blue flame, and throws up at the same time a copious white oxyd, which was formerly called *flowers of bismuth*; towards the end of the process the oxyd acquires somewhat of a yellowish tinge, probably on account of a small portion of sulphur, or other impurities. The glass, or vitreous oxyd of bismuth, is a very active flux for earths and the more difficultly fusible oxyds; on account, however, of the superior cheapness and efficacy of lead, it is seldom used for this purpose.

§ 6. *Action of Acids on Bismuth.*

1. Concentrated sulphuric acid has no action on bismuth, except when boiling hot; in this state, it is rapidly decomposed, giving out sulphureous acid gas, and reducing the metal to a white pulverulent oxyd; by a low red heat the decomposition is so complete, that a quantity of actual sulphur is volatilized. The white mass being washed with a little warm water, parts with nearly the whole of its acid, holding a small portion of bismuth in solution: this fluid by careful evaporation, deposits minute soft crystalline needles of sulphat of bismuth, from which, by the mere affusion of water, the metal may be separated in the form of white oxyd. The sulphated oxyd, produced in the first

B I S M U T H.

part of the process, is remarkably more difficult of reduction than any of the pure oxyds of § 5.

2. Sulphureous acid is incapable of attacking metallic bismuth, but readily combines with its oxyd, forming a white insoluble sulphite of a sulphureous flavour, reducible into metallic globules before the blowpipe, decomposable with effervescence by sulphuric acid, and when distilled, giving out its acid, a mass of pure white oxyd remaining behind.

3. Nitric acid acts upon bismuth in a remarkably violent manner. If the metal is in powder, and the acid somewhat concentrated, at the instant of their mixture, even without the assistance of heat, a rapid decomposition of the acid takes place, accompanied with the production of nitrous gas, azot, and sometimes of ammonia; and the bismuth is converted into a white oxyd. If the acid is previously diluted with an equal weight of water, and the bismuth is added gradually in small pieces, the decomposition goes on more quietly, the metal is dissolved in proportion as it oxydates, and the acid may be made to take up nearly half its weight of bismuth. By cautiously adding to this solution an equal bulk of distilled water (each portion being well mixed with the whole mass by stirring, before the addition of a succeeding portion), a black pulverulent precipitate takes place, which has not yet been analysed, but has been taken for sulphur or charcoal. If the acid made use of is still more dilute, consisting, for example, of four parts of water, and one of nitric acid, the black matter is not dissolved. Nitrat of bismuth, when thus purified, is clear and colourless, and by gentle evaporation crystallizes in the form of flattened rhomboids, or compressed tetrahedral prisms terminated by three sided pyramids. This salt, when exposed to a dry air, is considerably efflorescent; but in a humid air, becomes covered with a white, somewhat moist coating of oxyd. When thrown on hot coals, it detonates feebly, giving out faint red sparks, and leaves behind a greenish yellow oxyd of difficult reduction. If a crystal of nitrated bismuth is thrown into some pure water, it immediately becomes covered with a white opaque oxyd; but the decomposition of this salt is more striking, if a solution of it is made use of. For this purpose, let a jar be nearly filled with clear rain water, and drop into it nitrat of bismuth as long as any precipitation takes place, then mix the whole by agitation, and let it stand for an hour to settle. The bottom of the vessel will now be covered with a fine heavy powder of a dazzling white, which, when repeatedly washed and dried, is pure oxyd of bismuth, formerly called *magistery of bismuth*, and well known as a cosmetic under the name of *blanc de sard*. This preparation, if made with pure nitric acid, and well washed, is of a dead white; but if a little muriatic acid is mixed with the nitric, and the precipitate is washed with a *small* portion of cold water, it will be in the form of minute glittering scales with a beautiful pearly lustre, and is then called by the French *blanc de perles*. In both states it is extensively employed, particularly by the French ladies for whitening the skin, but is subject to turn grey, brown, and even black, by any hydrogenous and sulphureous vapours. This oxyd of bismuth does not appear to retain any nitric acid; and its component parts are fixed by Bergman at 77 of metal, and 23 of oxygen; but, by the more accurate experiments of Klaproth, its contents are ascertained to be 81 of metal to 19 of oxygen. Nitrated bismuth is not, however, totally decomposable by water; for the clear fluid, that is separated by filtration from the oxyd, may still be made to yield a precipitate by a carbonated alkali, muriatic acid, or muriated ammonia. Klaproth found (*Analyt. Ess.* vol. i. p. 557), that 100 grains of bis-

moth, dissolved in nitric acid, yielded with water 88 grains of oxyd, and 35 more were obtained from the diluted solution, by the action of muriatic acid added in drops as long as any precipitate ensued. This oxyd is very easily reduced by fusion in a covered crucible, with a little nitre and tartar.

4. Bismuth in the metallic state is acted upon with difficulty by muriatic acid, even when it is concentrated and assisted by heat. During the digestion, a small quantity of fetid hydrogen gas is given out; and, by slow evaporation, small deliquescent needle-shaped crystals are deposited of muriat of bismuth. This salt, however, may be obtained in much greater quantity, and more easily, by substituting the oxyd of bismuth for the pure metal. If the saline mass, which remains behind after evaporation to dryness, is distilled in a glass retort, nearly the whole of it comes over at a moderate heat, and concretes into a soft white mass, called formerly *butter of bismuth*. Butter of bismuth, like butter of antimony, is intensely caustic to the taste, deliquesces in a moist air, and when dropped into water, is decomposed, a fine white oxyd being precipitated.

5. Liquid oxy-muriatic acid acts upon metallic bismuth with considerably more energy than muriatic acid does: the metal is oxydated without the disengagement of hydrogen, and the result is muriat of bismuth. It is probable, that by substituting the oxyd of bismuth for the pure metal, oxymuriat of bismuth might be produced: this, however, is not as yet confirmed by experiment. If bismuth, previously reduced to fine powder, is poured into oxymuriatic acid gas, the metal is instantly ignited and oxydated, and falls in a shower of fire to the bottom of the vessel.

6. Tincture of galls, or gallic acid, precipitates bismuth of a greenish colour from its solution, as prussiated potash does of a yellowish colour.

7. There is scarcely any thing known concerning the other bismuthic salts. They are formed by digesting the yellow oxyd in the various acids that have not been already mentioned, and are for the most part but little soluble in water. The proportions of their ingredients have not been ascertained with any accuracy, nor are they applied to any use.

§ 7. Action of the Alkalies and Earths on Bismuth.

The fixed alkalies have no effect on metallic bismuth, but unite both in the humid and dry way with its oxyd. Ammonia is said to acquire a greenish yellow colour by digestion with the metal when pulverized, and certainly dissolves its oxyd in considerable proportion. The action of the earths upon bismuth is unknown, except that silic and oxyd of bismuth combine by fusion into a clear greenish yellow glass.

§ 8. Action of the Neutral Salts on Bismuth.

None of the neutral salts in solution appear to exert any affinity on bismuth or its oxyds; but, in a dry heat, many of them are decomposed by it.

Nitre, being mixed with pulverized bismuth, and projected into a red hot crucible, is decomposed with a slight detonation; the bismuth becomes oxydated, and then unites in part with the alkaline base of the nitre.

Muriat of soda, according to Pott, is in some degree decomposable by metallic bismuth. This fact, however, is not confirmed by later chemists; and it is probable, that the salt, which Pott made use of, was not free from muriated magnesia, and that the bismuth was partly oxydated.

Muriated ammonia is totally decomposable by oxyd of bismuth. On the first impression of the fire, very pure ammoniaical gas is disengaged; and by a low red heat, the muriated bismuth rises in the form of a thick white vapour, which concretes, in the receiver and neck of the retort, into *butter of bismuth*; if the oxyd of bismuth is in very small proportion.

proportion to the muriat of ammonia, the greater part of this salt rises entire, but mixed with a little muriat of bismuth, forming the *bismuthic flowers of sal-ammoniac* of the old chemists. When these flowers are thrown into water, the bismuth is deposited in the form of a white oxyd.

Oxymuriat of potash mingled with powdered bismuth, and projected into a hot crucible, is decomposed with great violence, and the metal is completely oxydated. A mixture of three parts of this salt, and one of bismuth, produces a flash and a loud detonation, if laid on an anvil and struck smartly with a hammer.

§ 9. *Bismuth with combustible Bodies.*

If one part of sulphur, and four of bismuth, are triturated together, and afterwards exposed to a full red heat in a covered crucible, a brilliant striated metallic mass of sulphuret of bismuth is obtained, similar in its properties to the native sulphuret mentioned in § 1. It may be made to crystallize, by allowing it to cool very gradually, and pouring off the fluid part as soon as the surface is crufted over. The cavity thus formed will be found to be lined with long tetrahedral prisms crossing each other, and occasionally of a deep iridescent blue and red colour, forming groupes of exquisite beauty. The sulphuret of bismuth is much less fusible than the pure metal; it parts with nearly the whole of its sulphur by long roasting, and is decomposable by nitric acid, which dissolves the bismuth without touching the sulphur.

Sulphuretted hydrogen converts the white oxyd of bismuth into a black mass, of which neither the properties nor proportions have been ascertained.

Phosphorus has very little affinity for this metal. Pelletier tried in vain by several methods to prepare phosphuret of bismuth. In some of his experiments, the metallic globule, when red hot, gave out a faint lambent flame, but exhibited no other proof of combination with phosphorus. Fat oils, by the assistance of heat, dissolve the oxyd of bismuth, and form with it a thick tenacious plaister.

§ 10. *Alloys of Bismuth.*

Bismuth appears to increase remarkably the fusibility of all the metallic compounds into which it enters; but it is to be lamented, that we are greatly in want of accurate experiments on this interesting branch of inquiry.

1. *Bismuth and Gold.* See GOLD.
2. *Bismuth and Silver.* See SILVER.
3. *Bismuth and Iron.* See IRON.
4. *Bismuth and Copper.* See COPPER.
5. *Bismuth and lead.* Equal parts of these two metals unite easily by simple fusion, forming an alloy of a brilliant white colour, considerably harder than lead, and, though not ductile, more malleable than pure bismuth. By diminishing the proportion of bismuth, the malleability of the mass is increased, without sensibly impairing its fusibility, hardness, and lustre.

6. *Bismuth and tin.* A small quantity of bismuth increases the hardness and brilliancy of tin, without rendering it less ductile; hence the best foils for glass mirrors are made of this alloy, as also are some kinds of pewter.

Bismuth with lead and tin. Fusible metal. Plumbers' solder. The fusibility of the alloys of bismuth is in no instance so remarkable as in that discovered by Newton, and thence commonly called Newton's fusible metal. It is made by melting together eight parts of bismuth, five of lead, and three of tin. The mass is very brittle, and when broken exhibits a porcellaneous appearance, with little or no lustre; it is so fusible as to become liquid when held on a piece of stiff paper over a candle, without scorching the paper; and becomes as fluid as quicksilver in boiling water. If the bis-

mut is reduced to one part, the proportions of lead and tin remaining the same, the alloy is plumbers' solder; and it differs from the preceding in being somewhat less fusible and considerably malleable.

7. *Bismuth and Mercury.* See MERCURY.

8. *Bismuth and Iron.* See IRON.

§ 11. *Medical Use of Bismuth.*

The magistery, or white oxyd, is the only form of bismuth which is employed medicinally. It is prescribed with success in spasmodic affections of the stomach. *Gen. System. Handbuch*, v. iii. p. 292. Leonhardi's *Macquer. art. Wisnuth.* Fourcroy *Syst. des Connaiss. Chimiques*, vol. v. *Beaumé Chem. expérimentale*, vol. ii.

BISNAGUR, in *Geography*, an ancient kingdom of Hindoostan, called Narfinga, from the name of one of its rajahs, or sovereigns, was formerly the most extensive, powerful, and rich monarchy in the Indies, and comprehended almost all the countries in the peninsula south of the 16th parallel, or the whole of the Carnatic and some other kingdoms. Some have distinguished between the kingdoms of Bifnagur and Narfinga, but it is not easy to determine, whether they were two successive, or two co-existing kingdoms. It appears, probable, however, that in the 16th century Bifnagur included the greatest part of the peninsula. The inhabitants of this ancient empire, which is said to have continued 800 years, were Pagans, and denominated Badagus; and spoke the Tamul, or Damul language, which is the same with the Malabaric; but the Badagan was used at court. According to the Portuguese writers, the kingdom of Charuataka had no sovereign prince till the year 1200, and the first was Boka, a shepherd, who styled himself rau or rajah, that is emperor; which title has descended to his successors. Boka, it is said, in memory of a victory which he obtained over the king of Delhi, built the famous city of Visfanagur, corruptly called Bifnagur. The crown continued in his line till it was usurped by Narfinga, from whom this kingdom took its name, as it did that of Bifnagur from the city. The king of Bifnagur was a powerful prince about the year 1520; and about the year 1565 the capital was resorted to by merchants from all parts, as being the greatest, if not the only mart for diamonds in the east; and its riches were equal to its extent. At this time it was invaded by the king of Visapour, and other northern princes of the Deccan; and in 1567 the rajah, or king, retired, with his court, first to Penuconda, and at a subsequent period, or about 1597, its existing sovereign removed to Kandegheri, or Chandegheri, an inland city, strong by nature and fortified by art, so as to be deemed impregnable. About the middle of the 17th century, this large monarchy was again invaded and utterly destroyed, by Adel Shah, king of Visapour, who formed a league with the king of Golconda for this purpose. The unfortunate rajah fled into the mountains, where he remained in 1667. About 20 years after, the kingdom of Bifnagur fell under the power of the Moguls, by the conquest which Aurungzebe made of the kingdoms of Visapour and Golconda.

BISNAGUR, rather BIFNAGUR, sometimes written BEEJANUGGUR, the capital of the above kingdom, is situated on the south bank of the Toombuddra river, and according to M. Buffin's map, distant about 30 miles S. E. or S. S. E. from Bancapour. Ferishta says, that it was founded by Belaldeo, king of the Carnatic in 1344, and was then placed in order to guard the northern frontier of his empire. See the preceding article. This city was visited by Cæsar Frederick in 1565, and was then a very large city; its circuit, as he says, being 24 miles, and containing within it a number of hills and pagodas. He reckons it 8 days' journey,

journey, or about 140 geographical miles, from Goa. Its ruins are extensive, several rugged hills and rocks being covered with temples that still appear beautiful; the circumference seems to be about eight miles. N. lat. $15^{\circ} 15'$. E. long. $76^{\circ} 34'$. Bejanuggur lies directly opposite to Annagoandy, seated about 2 miles from the north bank of the river Toombuddra, which is at present the principal town of a small district of the same name; one being the Jaghira, or estate, the other the place of residence of the descendant of the ancient kings of Bejanuggur, who, about 2 $\frac{3}{4}$ centuries ago, ruled the greatest part, if not the whole, of the peninsula, under the title of the empire, or kingdom of Canhara. Lieutenant Emmitt, an English officer, who examined the ruins of Bejanuggur, traced between immense piles of rocks, crowned with pagodas, several streets from 30 to 45 yards wide, some of which now produce fine rice. One street extends about N. E. and S. W. half a mile, and is about 35 yards broad, having colonnades of stone on each side, and a very large pagoda at the S. W. end, in perfect repair. On the west side of the street is a large mango grove, which is bounded by the Toombuddra. Many streams flow through these veins, which have been formerly employed to fill a great number of canals. Comlapour fort is distant about half a mile, and surrounded with hills through which the road winds in ascents and descents, paved with large stones.

BISNEE, a town of Asia, in the country of Bootan, 116 miles S. E. of Tassafudon, and 188 N. E. of Moorshedabad.

BISNOW, or ΒΙΣΗΝΟΥ, a sect among the Indian banians, or cast of merchants. The banian sect consists of two lesser ones; that of *bisnow*, and that of *samarath*. The followers of the former hold one God, whom they call *ram-ram*, and allow of no lieutenants, or deputy-gods, as is done by those of the sect *samarath*; but they allow their god a wife, and have idols, which they dress up with gold chains, and collars of pearl and precious stones, and pay them worship, by singing hymns in their temples, and dancing before them to the sound of flageolets and kettle-drums.

In this sect, the wives do not burn themselves after their husbands' death, as is practised by those of the *samarath* sect; but content themselves with a perpetual widowhood.

BISOMUM, ΔΙΣΟΜΟΝ, compounded of *bis*, twice, and the Greek σῶμα, *body*, or *ashes of a body*, in *Antiquity*, a tomb for two bodies, or the ashes of two. The ancients frequently buried two, three, or four bodies in the same sepulchre, disposed a-side of each other; for it was held an impiety to lay one a-top of another. Hence the sepulchres of the primitive Christians had the words *bisomi*, *trisomi*, *quadrifomi*, &c. inscribed on them, to indicate the number of bodies deposited in them. Du-Cange.

BISON, in *Entomology*, a species of SCARABÆUS, with the anterior part of the thorax pointed; and two lunated horns on the head. Inhabits Spain, and the southern parts of France. Colour black. The female has on the anterior margin of the thorax an elevated or carinated edge.

BISON, in *Zoology*. See BOS FERUS, or *Wild-ox*.

BISPINOSA, in *Entomology*, a species of MANTIS, with a roundish thorax, bidentated in front; wing-cases very short, and bordered with yellow. Fabricius.

BISPINOSA, a species of CICADA (*Mannifera*, *Tettigonia*,) It is of a large size, and inhabits the island of Sumatra. The colour is brown, with a single spine on each side of the thorax; wings dusky, with a streak of black spots. Fabricius Mantif.

BISPINOSUS, a species of CERAMBYX (*Stenocorus*) that inhabits South America. Thorax unarmed, and slightly tuberculated; wing-cases bidentated; joints of the antennæ armed with two spines; and the body testaceous. Fabricius.

BISPINOSUS, a species of CARABUS that inhabits Europe. This is of a black colour; posterior part of the thorax truncated; anterior flanks with two spines. Linnaeus. Mus.

BISPINOSUS, a species of TABANUS, found about Goettingen, and described by Fabricius. The colour is brown; abdomen ferruginous, and black at the base, with two spines on the scutellum.

BISQUET. See BISKET.

BISSA, in *Geography*, a town of Servia on the Danube, 16 miles S. S. E. of Orlova.

BISSACRAMENTALES, in *Ecclesiastical History*, a denomination given by some Romish writers to Protestants, on account of their only holding two sacraments, viz. baptism and the supper.

BISSAG, in *Geography*, a town of Croatia, 16 miles N. E. of Agram.

BISSAGOS, the name of a cluster of islands and shoals, lying off the west coast of Africa, between the mouths of the rivers Rio Grande and Cacheo, and between about $10^{\circ} 30'$ and $11^{\circ} 30'$ N. lat. and $15^{\circ} 10'$ and 17° W. long. The principal of these islands, and that which lies nearest the coast is Boolam, or Bulam, which see. Each of the inhabited islands is governed by a chief, who assumes the title and power of a king. All these petty monarchs are independent, and frequently at war with each other, which they carry on by means of canoes, capable of containing from 25 to 40 men, with their provisions, and also their arms, which are sabres, and bows and arrows. The negroes of these islands are tall, strong, and healthy, though they live only on fish, nuts, and palm-oil; chusing rather to sell the rice, millet, and other produce of the earth to the Europeans, than to restrain their passion for trinkets and ornaments. They are idolaters, and are said to be savage in their disposition, not only to strangers, but to one another, when they happen to quarrel, which is frequently the case; and if they are disappointed in gratifying their revenge, they will drown, or ferociously stab themselves.

BISSAO, an island on the west coast of Africa, separated from the continent by a channel, which connects two bays of the sea, within the Bissagos islands, between $11^{\circ} 15'$ and $11^{\circ} 39'$ N. lat. and $15^{\circ} 11'$ and $16^{\circ} 30'$ W. long. Both the Portuguese and French began to trade at an early period with this island; the former have a fort upon it, and the latter a factory. The Dutch have in vain attempted to obtain a settlement. The island is 35 or 40 miles in circumference, and rises from the sea, of which it has an agreeable prospect, by an easy ascent to an eminence in the centre of the island. Its surface is hilly, and the hills are separated by beautiful and fertile vales, which are watered by small rivulets. The whole, a few groves of palm-trees excepted, is in a state of cultivation, and produces, besides oranges, mangoes, and bananas, and other fruits afforded by the warm climates, wheat and maize, which grow luxuriantly, and resemble, by the size to which the items rise, reeds or lamboos. Their cattle are likewise of an extraordinary size; and are amply supplied with both milk and wine. The importation of swine is prohibited, and the soil does not suit the rearing of horses. The inhabitants, who are in a state of almost perpetual contest with those of the neighbouring islands and continent, live in cottages dispersed over the island, which bears no trace of a town, except where the

French

French and Portuguese have established themselves. The dress of the married women consists of a cotton girdle, and bracelets of glass, coral, and copper; but the virgins are altogether naked; and those of high quality mark their bodies with hideous figures of snakes and other reptiles. The princess of the island is only distinguished from other females by the elegance of these paintings, and the richness of her bracelets. The dress of the men of all ranks is merely a skin fixed before and behind to their girdle. One singular ornament is a large iron ring, upon which they ring changes with a piece of iron, so as to converse as freely with their castanets as if they used the most polished language. This artificial language is used only by persons of rank and fashion. All the Bissans are idolaters, but their system of religion is very confused and unintelligible. Besides their chief idol, called "China," every one creates a divinity according to his own fancy; trees are held sacred by them, and, if they do not adore them as gods, they worship them as the residence of some divinity. Their government is despotic, the will of the emperor being the law to his people; at his death all his women and slaves are sacrificed and buried near their master, in order to attend him in the other world. Although they are at almost perpetual war with some of their neighbours, they have among themselves no civil discord. Before the emperor resolves to invade any adjacent territories, he orders the "bonibalon" to be sounded, which is the general signal to arms, on which all persons in the pay of government assemble at a fixed place, and embark on board their canoes, each of which carries about thirty men, and the whole fleet consists of about 30 canoes. Before the fleet sails, they offer sacrifices in great number to their gods, which are made of wood, and the favourable answer of the priests, when they consult these deities, ensures their success. When they attack any towns or villages, they carry off the inhabitants, and every article of value, and divide the booty between the emperor and those that have been engaged. The slaves are sold to the Europeans, except such as are of quality or fortune, who are restored to their friends on condition of their sending a number of slaves in their room. The emperor is said to allow free commercial intercourse with all strangers. The Portuguese demolished their fort on the island in 1703. See BALONTES, BISSAGOS, and BULAM.

BISSECTION, in *Geometry*, the division of any quantity into two equal parts, otherwise called *bipartition*, which see. See also **DIVISION**, &c.

BISENDORF, in *Geography*, a town of Germany, in the circle of Westphalia, and bishopric of Osnabruck, 5 miles S. E. of Osnabruck.

BISENPOUR, a small district of Bengal in the East Indies, which is governed by a Bramin family of the tribe of Rajpoots, and which has uniformly preserved its independence. In this district, it is said, the purity and equity of the political system of the Indians are found unadulterated. By the singular situation of this country, its inhabitants have been enabled to maintain their primitive happiness, and the gentleness of their character; and they have been secured from the danger of being conquered, or of imbruing their hands in the blood of their fellow-creatures. Nature has surrounded them with water, and they only need to open the sluices of their rivers in order to inundate the whole country. The armies that have been sent to subdue them have been so frequently drowned, that the plan of enslaving them has been laid aside; and the projectors have thought proper to content themselves with an appearance of submission. In Bissenpour, liberty and property are sacred; robbery is unknown; and every stranger, who enters this ter-

ritory is under the protection of the laws, which provide for his security. The guides, to whose conduct he is committed, become responsible for his person and effects; whilst he remains, he is maintained and conveyed with his merchandise at the expence of the state, unless he expresses his desire to stay longer than three days in the same place; and should this be the case, he is obliged to live at his own charge. In this state it is said, probity and honesty are so prevalent, that if any one find a purse, or any other article of value, he hangs it upon the first tree he finds, and informs the nearest guard, who gives notice of it to the public by beat of drum. Out of about 330,000l. annually received at an average by the government, without injury to agriculture or trade, what is not wanted to defray the unavoidable expences of the state, is laid out in improvements. The rajah is enabled to engage in these liberal employments, as he pays the Moguls only such tribute, and at such times, as he thinks proper. Raynal's Hist. Sett. East and West Ind. vol. i. p. 415.

BISENPRAGG, a town of Asia in the country of Siringagur, situated near the base of a mountain, on which stands the famous temple of Buddreenaar. It is a place of some importance, as being the residence of the pundits and principal Hindoos of Buddreenaar. Here they hold their durbahs, exercise their laws and the duties of their religion, in the greatest state of security from foreign intruders, and can at any time seclude themselves from the rest of the world, by a removal of the "joalabs," or rope bridges, which form the communication across the Aluknundra. This river receives at Bissenpraag another river, proceeding from the eastward as large as itself, called "Dood Ganga," or the Milk river, and also "Dhoulee." Near its junction with the Aluknundra, it runs between two villages, called "Gurra" and "Nitty." The town consists of about 800 houses, and is a place of some trade; the inhabitants are all Hindoos. Asiatick. Ref. vol. vi. p. 346.

BISSET, CHARLES, in *Biography*, studied medicine several years at Edinburgh, as he informs us in his Essay on the Medical Constitution of Great Britain, published in 1762, and was then promoted to be second surgeon to the hospital in Jamaica, where he continued from 1740 to 1745, when he returned to England, and purchasing a commission in the army, he served as lieutenant and engineer in Flanders until the peace in 1748. He now resumed the practice of surgery, and settled at Skelton in Cleveland, Yorkshire, and soon after published "A Treatise on the Scurvy," 1755, 8vo. He had before, viz. in 1751, published "An Essay on the Theory and Construction of Fortifications." In 1765 he obtained a diploma from the university of St. Andrew's, constituting him doctor in medicine. He died at Knayton near Thirsk, in May 1791, in the 75th year of his age. New Gen. Biog. Dict.

BISSEXTIALIS, or **BISSEXTIALIS ulla**, an ancient measure or vessel, containing twelve ounces, or two **SEX-TARIES**.

BISSEXTILE, or **LEAP-YEAR**, in *Chronology*, a year consisting of 366 days, happening once each four years, by reason of the addition of a day in the month of February, to recover the six hours which the sun spends in his course each year, beyond the 365 days ordinarily allowed for it.

The day thus added, is also called *bissextile*; Cæsar having appointed it to be introduced by reckoning the 24th of February twice; and as this day, in the old account, was the same as the sixth of the calends of March, which had been long celebrated among the Romans on account of the expulsion of Tarquin, it was called "bis sextas calendas Martii;"

Martii;" and from hence we have derived the name *biflex-*
tile.

By the statute *de anno biflextile*, 21 Hen. III. to prevent misunderstandings, the intercalary day, and that next before it, are to be accounted as one day.

The astronomers concerned in reforming the calendar, by order of pope Gregory XIII. in 1582, observing, that the *biflextile* in four years added 44 minutes more than the sun spent in returning to the same point of the zodiac; and computing that these supernumerary minutes in 133 years would form a day; to prevent any changes being thus insensibly introduced into the seasons, directed, that, in the course of 400 years, there should be three *biflextiles* retrenched; so that every centesimal year, which, according to the Julian account, is *biflextile*, or leap-year, is a common year in the Gregorian account, unless the number of centuries can be divided by 4, without a remainder. Thus 1600 and 2000 are *biflextile*; but 1700, 1800, and 1900 are common.

The Gregorian computation was received in most foreign countries ever since the reforming of the calendar; and by act of parliament, passed anno 1751, it commenced in all the dominions under the crown of Great Britain, in the year following, ordering that the natural day following the second of September, should be accounted the fourteenth; omitting the intermediate eleven days of the common calendar. See *CALENDAR*.

BISSINGEN, in *Geography*, a town of Germany, in the circle of Swabia, and county of Pattingen Wallerstein, 4 miles S. S. W. of Haaburg.

BISSOOLY, a principal fort of Hindoostan, lying at or near the entrance of the hills, 42 cosses S. E. from Jummo. Major Rennell places it in his map on the north bank of the Rauvee, 6 or 7 cosses above Kullanore, or $41\frac{1}{2}$ above Lahore, or, in other words, about 59 geographical miles E. 30° N. from Lahore. N. lat. $32^{\circ} 3'$. E. long. 75° .

BISSOWIE, a town of Hindoostan, in the country of Oude, and circar of Rohilcund, 25 miles west of Bereilly, and 85 E. S. E. of Delhi.

BISTAM, a small city of Persia, in the province of Comis, on the north of the Great Salt Desert, rarely visited by travellers. N. lat. $35^{\circ} 30'$. E. long. $54^{\circ} 30'$.

BISTER, a town of Switzerland, in the Upper Vallais, near the south bank of the Rhone. N. lat. $46^{\circ} 19'$. E. long. $7^{\circ} 52'$.

BISTI, a species of Persian money, valued at sixteen or eighteen French *deniers*. Some represent the *bisti* as an ancient silver coin; others, as Chardin, make it only a money of account, and call it *dinar bisti*.

BISTONES, in *Ancient Geography*, the name of a people who inhabited that part of Thrace, which was bounded on the north by mount Rhodope, on the east by the Hebrus, on the west by the Nessus, and on the south by the Ægean sea. Its capital was Tinda. These people were subdued first by the Macedonians, and at length by the Romans. Xerxes, according to Herodotus, traversed their country in marching against Greece. Hence "*Bistonius tyrannus*" is used by Lucan to denote Diomedes, king of Thrace, who fed his horses with human flesh; and "*Bistonius turbo*;" expressing a wind blowing from Thrace.

BISTONIS, a lake on the southern coast of Thrace, N. E. of Abdera.

BISTORT, or *SNAKEWEED*, in *Botany*. See *POLYCONUM*.

BISTORY, or *BISTOURY*, in *Surgery*, is a cutting instrument, formed like a small knife. It may be either straight or curved, double-edged or with a single edge, sharp

pointed, round pointed, or with a probe point, &c. Sometimes it is made to shut within a handle; at other times the blade is fixed and immoveable. For particular purposes, the blade is concealed, so as to project only at the moment when the instrument is used by the surgeon; on which account it is called by the French *biflouri caché*. On some occasions, it is found convenient to employ a director, or a canule, at the same time we introduce the *bistory*: for example, when it is intended to pass the cutting instrument along a narrow sinus, or under the præpucè, up to a certain spot before we make any incision, (see the articles *PÆRISTOSIS*, and *SINUS*); but wherever there is room for the introduction of a fore-finger, that mode is preferred by modern surgeons as a guide to the *bistory*, being much more convenient and secure than any artificial director. The precise form of a *bistory* must be regulated according to the nature of the operation required, and the end to be obtained. See the article *SCALPEL*, and consult the engravings of chirurgical instruments attached to this Cyclopædia.

BISTRA, in *Geography*, a town of Bohemia, in the circle of Chrudim, 6 miles S. S. E. of Politzka.

BISTRAIA, a town of Russian Tartary, on the west side of the Donetz, 70 miles N. N. E. of Azof.—Also, a river of Russian Tartary, which runs into the Donetz, 64 miles N. E. of Azof.

BISTRE, among *Painters*, a composition made of the most glossy and highest burnt foot, pulverized, and passed through a fine sieve, then baked in a little gum-water, and made into cakes: or it is the burnt oil, extracted from the foot of wood. It is a brown transparent colour, and has much the same effect in water-painting, where alone it is used, as brown pink in oil.

The *bistre* is prepared from the foot of dry beech wood, by grinding it with urine or water, into a smooth paste, and then diluting it with more water; after the grosser substance has subsided, the liquor is poured off into another vessel, and left to settle three or four days; the fine matter that remains is *bistre*.

That the *bistre* of our colour shops has been prepared by a process of this kind, and not, as some have suspected, by evaporating the infusion of foot to an extract, may be presumed, says Dr. Lewis (*Com. Epist. Phil. Techn. p. 340.*), both from its appearance and its qualities. He observes, that different parcels of *bistre* differ considerably in their colour, on account, probably, of the different qualities of the foots from which they were made.

In the *Handmaid to the Arts*, vol. i. p. 126. we have the following recipe for preparing it. Put the foot of dry wood (of beech when it can be procured) into water, in the proportion of 2 pounds, to a gallon, and boil them half an hour. Then, after the fluid has stood some time to settle, but while yet hot, pour off the clearer part from the earthy sediment at the bottom; and if on standing longer it form another earthy sediment, repeat the same method; but this should be done only while the fluid remains hot. Evaporate the fluid to dryness; and what remains will be good *bistre*, if the foot was of the proper kind. That which is good is transparent, when moistened with water, and of a warm, deep brown colour.

Instead of this, some use the latches of a pen, with a little Indian ink, others red chalk, others black lead, &c. See *WASHING*.

BISTRIANKA, in *Geography*, a town of Russian Tartary, on the south side of the Don, 100 miles E. N. E. of Azof.

BISTRIATA, in *Entomology*, a species of *CICADA* (*D-*
fena)

flexa) that inhabits France. This is yellow, with two transverse bands of brown. Geoffroy.

BISTRICZ, or BISTRITZ, in *Geography*, a town of Transylvania, and capital of a county, to which it gives name, situate on the river Bistricz, which runs into the Samos. 4 miles S.W. of Kezovar. The town is 42 miles N.N.E. of Clausenburg, and 256 E. of Vienna. N. lat. 47° 33'. E. long. 25° 3'.

BISTRIGALIS, in *Entomology*, a species of PHALÆNA (*Pyralis*), with cinereous wings, with two ferruginous streaks, and a black dot. Inhabits Europe. Linnæus.

BISTRIGARIA, a species of PHALÆNA (*Geometra*), with cinereous wings, undulated, with two linear streaks. A native of Europe. Linn. &c.

BISTRIGATA, a species of PHALÆNA (*Geometra*). It is griseous, with two whitish streaks. Inhabits Europe.

BISTRITZA, in *Geography*, a town of European Turkey, in Moldavia, on a river of the same name, which runs into the Siret, 6 miles S.E. of Bakeu. The town is 20 miles S.W. of Jassy.—Also, a town of Walachia, 16 miles W.S.W. of Kimmik.

BISTRIZ, a town of Moravia, in the circle of Brunn, 6 miles W.S.W. of Els.

BISTROFF, a town of France, in the department of the Moselle, and chief place of a canton in the district of Morhange, 4 miles N.N.E. of Morhange.

BISTRY, a town of Bohemia, in the circle of Konigin-gratz, 10 miles from Gitschin.

BISUGA, a river of Russian Tartary, which runs into the sea of Azof, 48 miles S.W. of Eiskoi.

BISULCATUS, in *Entomology*, a species of CURCULIO that inhabits Italy. This is black, with a cinereous border all round, and two furrows on the beak. Fabricius.

BISULCUS, a species of ICHNEUMON, of a black colour, with two inflexed lines before; legs rufous; sting short. Linn. Mus. Lesk.

BITS, or BITTS for *Horses*, in the *Manege*, are pieces of iron of various figure and construction which, being placed in the horse's mouth, serve, by the assistance of the reins, to restrain or guide his motions.

The term *bits*, or *bits*, is considered by some as originating from the horse's biting or champing them between the teeth when placed in his mouth; in the French language is used a term also of similar signification, *les mors*, which would seem to corroborate the above etymology of it:—another however, equally natural, presents itself in the common word *bit*, or *bits*, that is *pieces* of iron; this apparatus being always made of one or more pieces of this metal.

The art of biting horses may be said to consist in furnishing the mouth with the most proper mouth-pieces, &c. for obtaining from them an obedience to the will of the rider, and exacting a due performance of all the movements and restraints which may be desired, or at least which are dependent upon the operation of the reins. Rightly understood, and well administered, this art affords the power of communicating to the horse support and confidence, with greater ease and security to the rider. The misapplication of its rules, on the contrary, or an inattention to them, where the mouth is not totally insensible, will produce painful sensations to the horse, with disgust and rebellion, and to the rider uneasiness and perhaps danger.

It is to be lamented that the presumptuous opinions of the uninformed have been too much the guide of the public in their estimation and choice of the proper bits for horses, as also in too many other things respecting these useful animals, tending often to accumulate unnecessary suffering

and misery upon them. The writers on this subject are few and unsatisfactory; we shall, however, except Mr. Berenger, whose work is a noble effort to emancipate this branch of science from barbarity and ignorance; and from him we shall take occasion to make some extracts in the sequel of this article. Here it will be proper to observe, that this author, by the term *bit*, has designated the curbed bit only, but we have ventured, for the sake of pursuing a more connected view of the subject, to include in this term any piece or pieces of metal placed in the horse's mouth, for the purposes of guidance or restraint.

In our account of the different kinds of bits, and their effects, we shall begin, for the sake of order, with the description of a bit of the most easy and simple construction possible, and then proceed to the most complicated.

A short iron rod, made rather wider than the mouth of the horse, and provided with a hook or ring at each extremity for fastening the reins to, affords us an instance perhaps of the greatest possible simplicity in the construction of a bit; and such a one only slightly curved forwards, to allow more liberty for the tongue, is at present in general use for the heavier kind of draft horses, the bearing rein being usually attached to it, passing over the hames of the collar.

A similar rod to the former, broken in two pieces, and connected by a joint in the middle, is the next in point of simplicity, and is in common use for horses of light draft; as in those employed for the curricule, coach, &c. and is attached by the bearing rein to the hook of the saddle, and this kind of bit is mostly termed with us a *bridon*.

The next in point of farther complication of parts, and which scarcely can be said to differ from the former, is the *common snaffle*. This is provided with two cross pieces, which rest against the lips or sides of the mouth; for as the snaffle is intended for the saddle horse, and the reins go to the hands, so the cross pieces are useful in preventing the bits from being drawn through the mouth, which precaution is not so necessary where the bits are affixed to the bearing rein. The *bridon* we may observe, is also made in general smaller than the snaffle, as well as without cross pieces.

The distinction, however, between a *bridon* and snaffle is insignificant and of little consequence; for on all occasions cross pieces are the most convenient; and it will be easily seen that the *bridon* is merely an imperfect snaffle, possessing no peculiar characters which can form a real distinction.

The term, also, when confined to this object is misapplied; for the French, from whom we have borrowed it, by *le bridon* understand the snaffle and its rein, in opposition to *le bride*, by which they denote the *curbed bit* and reins.

In war, and on other occasions, the *bridon* was used as a lesser bridle, or bridle of reserve, in case of the failure of the former from any accident; and hence the origin of its name.

The number of parts of which the mouth-piece of the snaffle is composed, may be increased to any extent, as it may be made with one, two, or several joints; but as it is evident these additions will not essentially alter its properties or effects, it would be useless to pursue a distinct consideration of them.

But the condition of the snaffle admits of being so altered and changed by the variation of its figure, its substance, and its surface, as to acquire new properties and effects which will require particular attention; its gentleness or rigour will depend almost wholly on these conditions. A mouth-piece made of two entirely straight pieces will be more severe than when these are somewhat curved, as the curved bit is more apt to embrace and include the lips between it and the bars than

the straight one. A thin and slender bit or snaffle, it will be easily perceived, will rest with more severity and sharpness upon the bars than a thick and obtuse one; the former, therefore, or the sharp bit, is employed more particularly for restraining such horses as are hard mouthed, and too eager, while the latter is used for such as have a proper feeling of the bars, and especially for breaking in young colts.

The surface may be varied as to roughness or smoothness, producing also different effects. To give the greatest ease possible, a large and highly polished bit is necessary. This is sometimes provided with moveable rollers on the axis of the bit, which turning with every movement of the reins, diminish the friction of the bits, and render them less irritating. These rollers, however, in reality can have but little effect in the snaffle, though of pleasant effect in the mouth-piece of the curb; for this reason, that the snaffle being jointed in the middle, is drawn by the reins to a sharp angle in the mouth, so that these rollers are presented to the bars in an oblique direction, under which position it will be obvious they can have very little or no motion, but, on the contrary, they will tend to render the bits more severe by their irregularity; so that a well polished snaffle is in fact preferable to one of these with rollers of the ordinary construction.

On the other hand, to give the greatest degree of severity to the mouth-piece of the snaffle, it is twisted while hot into a spiral form, and is made to present by this means a sharp, rough, and unequal surface to the jaw, being capable, according to the degree of sharpness to which the edges are wrought, of punishing the bars and lips with greater or less severity. The different degrees of punishment which this kind of bit is capable of inflicting, will perhaps be found sufficient for all the purposes of correction, where recourse may properly be had to actual force and punishment. For it should be always kept in view, that gentle means will produce a good mouth; while harshness and too great severity will tend to destroy it altogether.

Thus far the ancients of the most remote ages of the world, almost as far back as any history extends, were well acquainted with the use of bits. Xenophon, more than 400 years before Christ, had described similar bits as being in common use in his time among the Grecian states. He speaks of a smooth and a sharp kind of bit, the latter, if more severity was requisite, to be armed with points or teeth. In its use, however, he enjoins the greatest tenderness, and observes "that when you would wish to slacken the pace of an eager horse, which hurries on too fast, and to pacify his fury, so as to make him go more temperately, or even oblige him to stop, you should not attempt to do it at once, and with violence, but artfully, and by degrees, gently pulling him in, then yielding the bridle, and playing with his mouth, in such a manner as if you intended rather to win his consent than force his obedience." Chap. 9, 10.

Beyond the changes above described, the snaffle itself does not appear to admit of any alterations worthy of notice. It may, however, be justly observed, that some horse men add a chain to it, extending from cheek to cheek, which resting loosely on the tongue produces irritation and slavering, and, as they imagine, freshens the mouth. Such a bit is known by the name of the *Rockingham snaffle*.

The reins, however, it must be remarked, admit of some alterations in their disposition, which will influence the effects of the bit on the mouth; as whether they are carried higher or lower. At this present time there is a practice more especially in horses of light draft, as in those for carriages, curricles, and chairs, &c. to distort and alter the bearing

reins from their natural direction, and to dispose them more perpendicularly and in a line with the head; so that instead of passing straight from the mouth to the horse's back, they are directed up the sides of the face, as high nearly as the parotid gland, or base of the ear, where they are passed through a ring hanging from the head stall, and from thence to the hook of the saddle. The appearance is ornamental and elegant, and the reins so disposed are considered as more forcibly elevating the head than if they proceeded to the back in the usual direction.

As the disposition of the reins, so the figure of the bits themselves, and the ornamental appendages attached to them, admit of almost endless variety. The manufacturers of these articles, availing themselves of this licence, render their business more lucrative by as frequent changes as possible. These are successively introduced as fashionable novelties, till again for novelty they return to the simplest practice; and this takes place without any alteration in the principal circumstances of their construction, properties, or use.

The next kind of bits in use for horses is the curbed bit; which, as it is an instrument of much greater complication of parts than the snaffle, so it appears to have been of comparatively recent date.

In some of the sculptured equestrian figures of the ancients something like the branches of the curb may be found; but in no instance does there appear any thing resembling the chain, which is absolutely necessary to its effect. Their writings also appear to be silent on this subject. It was probably the invention of Italy or France, which for some centuries past have taken the lead of the other nations of Europe in teaching the arts of the manege. It was first introduced into the English army by a proclamation made in the third year of king Charles I. since which time it has got into universal use for the army, the field, and the road, so that no horseman deems himself perfectly equipped without it. Most of those writers who have treated of it in the last, and in the century preceding that, and who wrote probably soon after the commencement of its use, have been very profuse in their various proposals for the structure of it, especially in rendering it more complicated, severe, and cruel; though it is probable their clumsy figures and representations were never imitated in actual practice. They appear to have been much satisfied with their new invention, imagining it a sure means of reducing horses to immediate obedience, in spite of every obstacle; and true it is, it can punish with extreme severity: but is such a measure most likely to create vice, or to overcome it? Indeed, according to the opinion of one of the ablest writers that has ever considered this subject, and whose opinion we shall take an opportunity of quoting more fully hereafter, little or nothing has been really gained by its adoption; on the contrary, the snaffle possesses more simplicity, power, and perfection.

Stripped of all unnecessary trappings, this instrument consists of the following essential parts: a mouth-piece with two side branches, or inflexible rods of iron, firmly fixed to the former, and a chain passing from side to side, behind the chin, including the jaw; two eyes or rings at the upper extremity of these branches, serve to fasten it to the head stall, and to stay it in the mouth; two other rings at the lower extremity of the above branches receive the reins, passing to the hand, or sometimes in draft horses to the hook of the saddle, as a bearing rein. These are all the parts really necessary to constitute the curb.

The bits thus formed being placed in the mouth, and the chain passed round the lower jaw, the branches, it will be

readily seen, become powerful levers when drawn backwards, acting upon the mouth-piece as a centre, and squeezing, by means of the chain, whatever interposes between it and the mouth-piece, with a force equal to the length of lever afforded by the lower branch.

This force, it will be perceived, is influenced and regulated not only by the length of the lever below the mouth-piece, but also by the greater or lesser distance at which the chain is placed from it. The chain is usually fixed to the eye of the cheek-piece, where the head-stall is fastened; if, therefore, this part is very long, it is evident it must moderate or counteract the power and effect of the lower end of the branch, and render it less severe by bringing the centre of motion nearer to the middle of the lever.

It appears manifest, from the construction of this instrument, that its whole force is exerted upon the jaw itself, and that it has power to pinch the bars with cruel violence, even to the fracture of the bone, and this with very powerful branches has sometimes happened. It can also crush and bruise, and totally destroy the tender covering of the inside of the mouth, and the skin beneath the jaw.

From considering its mode of operating, it might reasonably be doubted whether it does in reality stop the horse by its power and opposed force, as is generally conceived at present, or rather by the severity of the pain it inflicts; as should the horse arm himself against this, it is totally insufficient to arrest his course; of which instances occur in runaway horses every day. And we shall venture to suggest, though contrary to the general opinion, that the snaffle, even in this respect, if the mouth has not been previously hardened and spoiled by the use of the curb, is the most powerful instrument of the two.

The *mouth-piece* of the curb is usually provided with an upset or arch in the middle of it, as it would, if perfectly straight, rest on the tongue, and occasion an unpleasant restraint. This passage for the tongue is often made so narrow and small by the bit makers, that one should apprehend they scarcely had a right idea of its use. From the circumstance of its allowing a passage for the tongue, it has been called by some, the *liberty*; and, for the same reason, by others, the *porte*: hence we have the *porte-mouth* bit, vulgarly called among the bit makers and grooms the *Portsmouth* bit; and by a supposed counter expression to this term, we probably get the *Weymouth-bit*.

In draft horses, especially for the coach, it is a frequent custom to have affixed to the upper part of the upset small chains or polished drops of iron, which hanging loose in the mouth, and falling on the tongue, occasion the horse to champ the bits, and create a copious flow of saliva, so as to slaver the lips with its white froth; and when this happens, it is considered by some a good sign of health and gaiety, and that the horse is well bitted; for, if the bits are disagreeable to him, he never plays with them, or exhibits any froth, say they. These small appendages are termed by the French *les chainettes*, and by the English *players*.

It is farther to be observed, respecting the mouth-piece of the curb, that the straight part which rests upon the bars of the jaw, is termed by the French *le canon*, and by the old English writers the *jeive*; and though a highly convenient and useful word, it is to be regretted it is at present out of use; the French term, which is not so expressive, having superseded it. This part should be well polished, and may be made of any proper figure, as that of a cylinder, cone, oval, globular, pear-shaped, &c.

It is obvious that the effect of the curb, as far as it res-

pects the bars, will be correspondent to the thickness or thinness, smoothness or roughness, of this part; the larger and broader it is, the more surface it covers; and thus the pressure, by being distributed over more points, becomes less felt. This enlargement, however, of the canon or jeive should not be carried to an excess, by making it too heavy, or filling the horse's mouth with more iron than it can conveniently receive, and thus create pain, instead of greater ease.

To render these irons less irritating to the mouth, and to avoid their friction upon the bars, the jeives are provided with loose, moveable rollers of well polished iron, which readily turning on the axis of the bits, very considerably diminish their severity. These moveable pieces are also particularly useful in preventing the horse from catching and holding the bit in his teeth; as the curb, under these circumstances, can still move and act with the same freedom as before.

The jeives are sometimes composed of three or four flat-tish knobs, united by a joint to each other, and with a joint to the upset, which is intended to render it very severe; it is obvious, however, that such an alteration must bring it nearer to the condition of the snaffle: the knobs, however, if they can be drawn transversely across the bars, might produce considerable irritation, but not so much as they would do if not jointed. This bit is not unfrequently used, and is called with us the *Hessian-bit*.

To the curb is often fixed a ring opposite the mouth-piece, which, as it is directly in a line with the axis of the bit, has no other effect when the reins are affixed to it, than a snaffle would have provided with a similar mouth-piece. This is termed putting "the reins to the cheek," and for horses of light draft, whose mouths are not ruined, it is by much the best, as the mouth is less annoyed, and the horse obeys with more alacrity the guidance of the hand from this point, than from the extremity of the branches, which are particularly ill calculated for this purpose: this kind of construction is generally distinguished by the name of the *Pelham* bit.

In the older English writers, as well as those on the continent, on the subject of bits, we find an appendage described, which is not at all, at present, in use; and as it enters the mouth with the mouth-piece, it may, with propriety, be described along with it. It consisted of a chain extending from branch to branch of the banquet, or cheek piece, being placed rather above the mouth-piece, and parallel to it, and was stretched across perfectly straight and tight. This part was called the *water-chain*, and by the French *Trenche-file*: its use is not very evident. Mr. Berenger takes notice of it, and observes "that it might be useful to horses that are apt to drink or swallow the bits, as the expression is, or bury it so deep in their mouths, as to hinder it from having a due and just effect;" from its being laid aside so generally, we presume it has at least been thought useless.

It is a common belief with the grooms, that a great power resides in the upset of the mouth-piece, and that the bits are more powerful as this is longer or shorter; nothing, however, can be more fallacious than this reasoning. In the works of Laurence Reefe, also a French writer, we find, in consonance with this idea, a curb, with an upset of unusual length, being destined to correct the vices "*d'un Rouffin qui à la bouche d'une diable*;" it will be obvious, however, on a moment's reflection, that this part, from being made very lofty, and coming forcibly against the palate, would compel the horse to open his mouth, when it would cease farther to act in any way; with more reason, the same writer proposes, on the other hand, "*pour donner*

grand plait;" to have a bit constructed with a low upset, and sufficiently wide, with large, conical, smooth jeives for the bars.

Of the chain. The chain is the part most essentially necessary to give effect to all the other parts of the curb, and may be placed, as we have already noticed, at any given distance above the mouth-piece; its operation being more powerful, as this distance is exceeded by the length of the branches. This position, though true as a general principle of reasoning, appears to be subject to the operation of other causes in actual practice, which it will be necessary to consider; for, in direct contradiction to this is the assertion of Mr. Berenger, who appears to be almost the only writer who has truly investigated the merits of this particular object. He observes, in regard to this, that the nearer the chain, and the longer the branches, the softer and more indulgent its operation. This, on a first view, would appear to be in direct variance with the rules above laid down, and irreconcilable to the well known laws of the operation of the lever, and even at variance with his own preceding assertions; when, however, we remember the experience and practical knowledge of him who asserts it, it deserves a more particular consideration; let us first admit the truth of the position, as it seems founded on the sure test of actual experience, and then we should venture the following as the most natural explanation of it.

In proportion as the branches are longer, the more extensive is the circuit their extremities perform in their operation; and therefore, the hand that guides them must pass through a greater space to produce the same effect: and now if the chain be placed very near to, or upon the outside of the mouth-piece, and be applied not very tight about the chin, yet, in reality, though there would be an apparent increase of power by the length of the branches, they would have little or no effect, as they would arrive at the utmost extent to which they can be drawn, before the chain would begin to pinch. On this account, the most lively effects would be produced by the chain having more sweep and extent of action, and by the branches being not quite so long, as great length also adds something to their flexibility, though not to a degree to be worth taking into the account. Still, however, the branches must ever obey the common laws of the lever, acting with force proportioned to their length; while shorter branches act with greater quickness, and are more lively in their impression.

The chain is fastened on one side to the eye of the banquet, where the head-stall is fastened; on the other, to a hook hanging from the same part. This chain, as it is at present used, is composed of iron links or rings, so bent or indented, as to form, when put together, one uniform nearly flat surface; and these links, by twisting or untwisting, may be made to present a surface with any degree of roughness to the chin.

When great tenderness is required, this chain may be covered with leather or cloth; or where a still greater delicacy is desirable, the curb may be made wholly of leather, without any chain.

The larger and thicker the rings are, provided they are smooth and well polished, the easier the effect of the chain. In old English, this chain was called the *kirble*; and hence, by contraction, *kirb*; and finally, by an easy transition of the *ki* into *cu*, we apprehend that the modern appellation of this instrument is obtained.

Of the branches. The proportion which the cheek part bears to the lower extremity of the branches, or rather the position of the eye, to which the chain is fixed, determines the degree of power of the bit upon the principle before advanced,

that is, if the chain is fixed to the upper extremity of it as it usually is to the transverse opening or eye of the head-stall.

For the elementary view we are taking of the construction of the bits, it has been only considered as a straight, plain lever of indeterminate length; it is, however, in practice, often varied, as in the army, it is used of enormous length, and frequently curved like the letter S, by which it is conceived to be rendered more powerful, as well as ornamental; at other times the branch of the bit, with a view of increasing its force, is carried forward with a sharp elbow, giving nearly the figure of the letter Z; while by others, with more reason, to prevent the horse from catching the bit in his mouth, it is made with an arch, or semicircle, in the middle of the branch, like the letter C, turned backwards for the same purpose; it will, however, in fact, whether bent into that or any other shape, it is the length of the lever, and its strength, which alone give the power; it is true, however, that a long curved branch, though more powerful, will render the effect somewhat softer, as coming from a greater distance, especially if the branch is at all flexible and yielding, than it would be by the quick and rigid effect of a shorter lever, made perfectly straight and inflexible: these branches may also be turned or bent, not only backward or forward, but also outwards and inwards. At their extremities, those turned outwards, are said to be strongest of any in their operation.

As to the cheek-piece, or banquet, as it is called by the French, for an appropriate name is wanting to this part in the English language; the eye of the banquet, say the horsemen, commands and gives efficiency to the rest of the bit; or, in other words, decides the distance of the chain from the mouth-piece, or centre of motion; as however, in speaking of the other parts, we have had occasion to introduce a sufficient account of this, it will not be necessary farther to give it a separate consideration; nor will it be useful to describe the numerous mongrel herd of bits engendered of the snaffle and curb, which are reducible to the properties of one or the other, or partaking of both.

The most useful bit of the curbed kind, appears to be the *Weymouth-bit*, which is at present in common use for draft horses of light work, as for carriages, coaches, &c. It consists of a strong, plain mouth-piece, of uniform thickness throughout, without any upset or jeives, but is simply curved forwards, to give liberty to the tongue: this kind of construction is the simplest perhaps that the curb admits of.

In concluding, it remains for us to notice the proper application and adjustment of these bits to the horse's mouth, and to treat of their real effects.

By the management of the head-stall, the snaffle bits should be so adjusted as to fall in the middle space between the tushes and grinders, resting upon the bars: the mouth-piece of the curb should also occupy the same situation when, however, it is used along with the snaffle, the bits of the snaffle should be placed highest in the mouth.

If the bits are placed too high in the mouth, the horse carries his head aloft; if too low, he stoops the head, and tries to catch them in his teeth.

The thicker and more fleshy, and the wider or broader the bars of the horse, the rougher may be the mouth-piece for the leaner and more delicate; consequently, the bits should be less severe. Care should also be taken that the mouth-piece be well suited to the size and width of the mouth, and be not too narrow, as this would give pain by squeezing the bars together: if, on the contrary, it is very wide, it rests with more force on the bars, without the interposition

of the lips, as is most usually the case. Where the tongue is large and prominent, the upper should also be in proportion, otherwise the bits could not rest upon the bars, but would press upon the tongue.

In regard to biting the horse, and the consideration of its effects, we can not desire to see any thing more consonant to truth and reason, than what has been given us by Mr. Beenger, and with some useful extracts from his valuable performance, we shall conclude this article.

Of biting horses with the curb. "In the beginning of an undertaking, whose aim is to subdue and reclaim nature, and that at a time when she is wild, ignorant, and even astonished at the attempts which are made upon her, it is evident that she must not be treated but with lenity, instructed with patience, and by small degrees, and that nothing should be offered that may hurt, surprize, or occasion any disgust.

The horseman, therefore, should not act the part of a tyrant, but of a lover; not endeavour to force her to submission, but strive to gain her consent and good will by assiduity, perseverance, and the gentlest attentions; for what prospect of success would rougher manners afford? To what purpose would it be to compel a colt to go forward, or turn from fear of the whip or spur, and to trot and gallop so freely as to supple his limbs, and form his paces; if the novelty of the bit, and the unaccustomed restraint to which it subjects him, should vex and confound him, so as to make him not know what to do, or how to behave in these extremes? It cannot be expected, that he will be guided, and go with ease to himself, or pleasure to the rider, if the instrument, by which he is to be conducted, offends or gives him pain: all habits and acquirements should be attained gradually, and almost imperceptibly: rigour and precipitation would ruin all; and, instead of forming the horse to the execution of what is required, may plunge him into vice and rebellion, so as to occasion much trouble and loss of time before he can be reduced.

He should not therefore, at first, be considered as if he was designed to be formed to all the delicacy and exactness of the bit; and the horseman should be content, if he will endure it in his mouth, so as to grow, by little and little, accustomed to it, till the restraint becomes by habit so familiar and easy, that he not only is not offended, but begins even to delight in it; for this purpose, great care should be taken that the bit be easy and gentle in all its parts; that the mouth-piece be larger than it need be for an horse already bitten; that it in no wise incommodes the bars, squeezes the lips, or galls the tongue.

The mouth-piece, called a cannon, with a joint in the middle, will be the most suitable; the ends of it should be as large and full as the size of the mouth will permit, for the thicker and more blunted they are, the easier they will be for the horse, and the *appui* less strict and severe.

The links of the curb should be big, smooth, and well polished; the curb somewhat long. The branches should be exactly even with a line of the banquet, to make the *appui* moderate and equal; they should likewise be long; nor does it signify of what shape they are, for with most horses they ought to be so weak, as scarcely to have any effect: so requisite it is to guard against every thing that may annoy or disturb the horse in these first trials. In order to reconcile him to this new constraint, the reins should be held in both hands; and the horse, for some time, should only walk under the rider. Above all, upon this, and all other occasions, a firm, a light, and diligent hand, is necessary.

Such are the outlines and general principles upon which

the art of biting horses is established; which art, as far as it reaches, is sure and constant; but which, in spite of all the merits and praise of which it has so long been in possession, will, upon a serious and strict trial, never, I doubt, be found adequate to the views of a sound and intelligent horseman, nor capable of bringing a horse to that degree of suppleness and exactness of carriage, which the truth and perfection of the art require, these attainments seeming to have been reserved for a more simple but powerful machine, called the *snaffle*."

"To perform his business justly and gracefully, the animal must first be made supple in his fore parts, and his head and neck so managed, that one may be raised, and the other arched or bent, more or less to the hand to which he is to turn. The bridle, called the bit, is so impotent in its endeavours to raise the head, that it even produces the opposite effect; nor from the confinement in which it keeps the horse, and the small compass it affords for the action of the rein, does it allow the rider sufficient room to bend him, without pulling down his head, and putting him upon his shoulders, both of which are incompatible with the true and sound principles of the art. The frequent use of cavecons and bridons, fully evinces the want of power in the bit to supple the horse, or raise the fore part.

The figures and representations of horses working upon different lessons, may be appealed to for the confirmation of this assertion; the books of past times abound with them, especially that boasted work of that king of horsemen, the duke of Newcastle, whose horses are all drawn with their heads between their knees; and yet are exhibited to the equestrian world as standards of truth, and models of perfection. The successors of this duke, and of other great masters, as imitators, are generally a blind and servile herd, ran headlong into the errors, and adopted the faults of their predecessors; and always made use of bits, without reflecting upon their effects, or perceiving that they could operate to make the horse carry low, or to put him upon his shoulders, while they thought that he was all the time upon his haunches."

"If ever there was a panacea, or universal medicine, the snaffle is one for the mouths of horses: it suits all, and accommodates itself to all; and either finds them good, or very speedily makes them so; and the mouth once made, will be always faithful to the hand, let it act with what agent it will. This bridle can at once subject the horse to great restraint, or indulge it in ease and freedom: it can place the head exactly as the horseman likes to have it, and work and bend the neck and shoulders to what degree he pleases. He can raise the head, by holding up his hand; by lowering it, it can be brought down; and if he chuses to fix and confine it to a certain degree he must use for this, as well as for the purpose of *bending, double reins*; that is, two on each side, the ends of which must be fastened in a staple near the pommel of the saddle, or to the girths, higher or lower, as the mouth, proportions of the horse, and his manner of going require; and if properly measured and adjusted, they will form and command the horse so effectually, as, in a great degree, to palliate many imperfections of the mouth, and many faults in the mould and figure."

"The reins thus fastened, or even one only, for the sake of working one jaw and one side, will operate more or less, as the branches of a bit: and the snaffle will almost be a bit, a bridon, a cavecon, and martingal, in one. When the horseman would bend the horse, he must pull the rein on that side to which he is going, and lengthen that of the opposite; that they may not counteract each other. No-
thing

thing will awaken a dull mouth, and bring it to life and feeling, so soon as this bridle. If the mouth be hard and callous, the iron should be so twisted as to have a sort of edge, which will search the lips, and when they will permit, the bars also; and if gently moved, or drawn from side to side, keep the mouth fresh and cool. If the twisted, or rough snaffle, be thought too harsh, and the hand not skilful enough to moderate its effects, a smooth snaffle may be used; or if a bit of linen be wrapt round the twisted snaffle, it will make it easy and smooth; and the mouth, once made fine and delicate, will be true to its feelings, will obey the snaffle, and follow the hand with as much exactness and precision as the bit knows to demand, but with more freedom and boldness than it ever can allow."

Such are the properties and merits of the snaffle, which long observation, and not a little experience, have taught the writer of this article to think preferable (generally speaking) to those of the bit; and which he has been therefore induced to point out and recommend with due deference to others, but with a greater deference to truth and justice.

"—Detrahere aufus,

Hærentem capiti multa cum laude coronam."

Brenger's Hist. and Art of Horsemanship, vol. ii. p. 221, &c.

BIT is also used for a little tool, fitted to a stock or handle, for the purpose of boring. In this sense, we say, the bit of a piercer, an augre, or the like; meaning that iron part of those tools wherewith the holes are bored.

The bit used by the block-makers, resembles the shank of a gimblet, from six to twelve inches long, and from half an inch to an inch in diameter, and has at its end either a screw, a sharp point, or edge, for the purpose of cutting or boring holes. The *centre-bit* is a bit, having in the middle of its end, a small steel point, with a sharp edge on one side to cut horizontally, and a sharp tooth on the opposite side to cut vertically. Holes bored with this instrument, are not liable to split. The *counterfunk-bit* is a bit having two cutting edges at the end, reversed to each other, which form an angle from the point. *Gouge-bit* is a bit smaller than a centre-bit, with a hollow edge at its end, like a gouge. *Nose-bit* is a bit similar to a gouge-bit, having a cutting edge on one side of the end.

BIT of a Key, is that part fitted at right angles to the shank of the key, wherein the wards are made. See LOCK, &c.

BIT is also used in Commerce, for a piece of coin current in Jamaica, and valued at $7\frac{1}{2}$ d.

BITTS, or *Bitts*, in a ship denote a frame composed of two upright pieces of timber, called the pins, and a cross piece fastened horizontally on the top of them; used for belaying cables and ropes to. *Bowline and brace-bitts* are situated near the masts; the *fore-jeer*, and *top-sail-jeer bitts* are situated in the fore-castle, and round the fore-mast; the *main-jeer*, and *top-sail-jeer bitts* tenon into the fore-mast beam of the quarter-deck; the *riding bitts* are the largest bitts in the ship, and are those to which the cable is bitted, when the vessel rides at anchor. The *cable is bitted*, or confined to the bitts by one turn under the cross-piece, and another turn round the bitt-head. In this position, it may be either kept fixed, or it may be veered away.

BIT-Stoppers, are those stoppers that are used to check the cable. See STOPPER.

BITAZA, in *Ancient Geography*, a town of Asia, in Aria, according to Ptolemy.

BITBOURG, in *Geography*, a town of the Netherlands, in the duchy of Luxemburg before the revolution, but now a principal place of the canton of the same name, in the department of Forêts, containing 1638 inhabitants; the

population of the canton consisting of 7160 persons. Its territorial extent includes 225 kilometres, and 12 communes. N. lat. $50^{\circ} 0'$. E. long. $6^{\circ} 43'$.

BITCH, in *Zoology*, is the female of the canine species, in contradistinction to dog. (See CANIS.) It is sometimes used in a similar sense with respect to foxes, the female being termed a "bitch-fox;" though the more common appellation among sportsmen is a "vixen." Bitches are sometimes spayed, to prevent their farther propagation; the best time for which operation is about after the heat is gone off.

BITCHE, in *Geography*, a town of France, and principal place of a district, in the department of the Moselle, containing 2310 inhabitants; the number of those in the canton being 10,441. Its territorial extent is $312\frac{1}{2}$ kilometres, and it includes 23 communes. It is seated on a river at the foot of the Vosges mountains, on the frontiers of Deux Ponts. It was taken by Lewis XIV. and fortified by Vauban; afterwards dismantled and restored to the duchy of Loraine. In 1740, it was again fortified. Before the revolution, it was the capital of a country, including 50 villages. N. lat. $49^{\circ} 5'$. E. long. $7^{\circ} 44'$.

BITCHU, or BITSU, a province of Nipon, in the islands of Japan, between about $34^{\circ} 30'$ and 35° N. lat. and about $134^{\circ} 30'$ E. long.

BITCHYS, a tribe of Tartars, visited by La Perouse in 1787. and described by him. See OROCHYS.

BITE is defined to be a solution of the continuity of a soft part, caused by the impression of an animal's teeth.

BITE of *Mad-dog*. See HYDROPHOBIA.

BITE of *Serpents*. See POISON.

BITE of *Rattle-snake*. See POISON.

BITE of the *Tiranula*. See TARANTISM.

BITE is also applied, in a less proper sense, to the impression of other sharp or pungent bodies. Thus a file is said to bite the metal; aqua fortis bites, or eats into copper. An anchor is also said to bite, when it holds fast in the ground.

BITERLAGH, or BITHERLAGE, the ancient Danish military or camp law.

The word is compounded from *bithe*, *mult*, and *lagh*, *läw*; q. d. the law of *mults*, or *rites*.

Among the laws of the Danes, there are two peculiarly eminent; viz. the *bird-straa*, or *court law*; and the *bitherlage racti*, made by Canute the Great, about the year 1035; of which an edition has been given by Resenius.

BITETO, in *Geography*. See BIDETTO.

BITHABA, in *Ancient Geography*, called also *Birbama*, a town of Asia, in Assyria, according to Ptolemy.

BITHER, a city of Judæa, called by St. Jerom, Bethoron, which was the place of retreat of the impostor Barchochebas, fortified by him, and made the capital of his new kingdom. It was besieged by the Romans under Julius Severus, A. D. 134, and after an obstinate resistance, compelled to surrender. See BARCHOCHÉBAS, and BETHORON.

BITHEREMAN, a town of Phœnicia, according to Sozomen, situate at the extremity of the territory of Eleutheropolis.

BITHIA, a town of Asia, placed by Ptolemy in Media.

BITHIAS, a town of Asia, in Mesopotamia, according to Ptolemy.—Also, a river of Thrace, according to Appian.

BITHIGA, a town of Asia, in Mesopotamia. Ptolemy.

BITHYÆ, a people of Thrace, who, according to Steph.

Steph. Byz. derived their name from *Bithyus*, a son of Mars; but more probably from the river Bithys, or Bithias, mentioned by Appian, and denominated Bathynius, by Ptolemy.

BITHYLA, a town of Greece, in the interior parts of Laconia. Ptolemy.

BITHYNIA, a province of that part of Asia, which was commonly called Asia Minor. It was anciently known by the names of Myfia, Mygdonia, Bebrycia, and Mariandynia, as well as Bithynia; and extended from Myfia on the west, to Paphlagonia on the east. It was bounded on the west by the Bosphorus Thracius and part of the Propontis, on the south by the river Rhyndacus and mount Olympus, on the north by the Euxine sea, and on the east by the river Parthenius. Ptolemy enlarged the extent of Bithynia, so as to make it comprehend some provinces belonging, according to other geographers, to Galatia and Paphlagonia. The chief cities of Bithynia on the coast were Myrlea, Dascylos, Cius, and Nicomedia the metropolis. On the Bosphorus stood the famous city of Chalcedon. In the Euxine sea were situated the city and ancient republic of Heraclea. The principal inland cities of Bithynia were Prusa, Libyssa, and Nicæa or Nice. Its chief rivers were the Pissis, Calpas, Sangarius or Sagaris, Hipias, Rhebas, and Lycus; all discharging themselves into the Euxine sea between Chalcedon and Heraclea. As Bithynia lies between 41° and 43° of north latitude, and is watered by many rivers, it once abounded with all the necessaries of life. The ancients compare some of the inland provinces to the fruitful and delicious vales of Tempe; but at present it lies in a great degree neglected and unmanured. Bithynia was anciently inhabited by various nations, differing in their manners, customs, and language; namely, the Bebryces, the Mariandyni, the Caucones, the Dollyones, and the Cimerii. These different nations were anciently governed by their own kings; Bithynia being, in the earliest times, divided into as many kingdoms as nations or tribes. However, in process of time, these petty princes were reduced by the more powerful kings of Bithynia. According to Diodorus Siculus, the Bithynians had kings from the time of Ninus; and, according to Appian, they had 49 sovereigns before the Romans obtained possessions in Asia. But this high antiquity is rendered doubtful by the silence of Homer respecting the Bithynians. Strabo (l. xii.) speaks of one Prusias, who reigned in Bithynia in the time of Cræsus, the last king of Lydia, by whom he was conquered. From this period, the Bithynians continued subject first to the Lydians, and afterwards to the Persians, till the reign of Alexander the Great; for we find them mentioned by Herodotus among the many nations that attended Xerxes in his expedition into Greece. While they were subject to the Persians, they seemed to have been still governed by their own princes. Under Nicomedes I. the Gauls, whom he called to his assistance, first passed into Asia, and obtained a settlement in that part of Asia Minor, which was called from them Gallo-Grecia and Galatia. The last king of Bithynia was Nicomedes IV., who, at his death, in the year before Christ 75, bequeathed his kingdom to the Romans, by whom it was reduced to the form of a province.

BITHYNIA, in *Modern Geography*, forms one of the districts of Anatolia, and is the nearest province to Turkey in Europe, being parted from it only by the small strait called the Thracian Bosphorus. Its principal cities are Prusa, Nice, and Nicomedia.

BYTHINIARCHIA, a sort of superior priesthood in the province of Bithynia, to which belonged the superintendency of the sacred games, and which gave an exemption to

him possessed of it, called bithyniarcha, from the care of tutorage.

BITHYNIUM, in *Ancient Geography*, the ancient name of a city of Bithynia, afterwards called Claudiopolis.

BITIS, in *Zoology*, a species of **COLUBER** that inhabits Brasil. Above, this creature is cinereous, yellow, varied with white and red, and transverse brown bands; beneath, yellowish, with a middle row of very minute scales. *Gmel.* &c. *Vipera bitis* of Laurent. Amph.

BITON, in *Conchology*, the name of the Linnæan *cypræa pediculus* in Adanson's Senegal, &c.

BITON, in *Entomology*, a species of **PAPILIO**, so named by Esper. It is *papilio damon* of Gmelin.

BITONTO, in *Geography*, a town of Naples, in the country of Bari, about 8 miles from the Adriatic, the see of a bishop, suffragan of Bari. This is a fine town, containing 16,000 inhabitants, of more easy fortunes, and more polished manners, than those who dwell in the cities along the coast; its markets are well supplied, and it has an air of affluence. The country between it and Bari, at the distance of 9 miles, is very much inclosed; and though stony, fertile in corn, almonds, olives, wine, and fruit of all kinds. Near this city an obelisk was erected by the king of Spain, with some fulsome inscriptions in praise of himself, his father Philip, his soldiers, and the count of Mortemar, who was honoured with the title of duke of Bitonto, for having defeated the Austrians on this spot in 1734. The monument, however, which records a trivial victory, is crumbling to ruin.

BITTACLE, or **BINACLE**, a square box, or frame of timber, placed in the steerage of a ship, wherein the compass is placed. The word is formed, by contraction, from the French *habituacle*, a *small habitation*, which signifies the same.

Large vessels have two bittacles, a lesser placed before the pilot, and a greater before the steersman.

In the smaller vessels, the bittacle is divided into three spaces or apartments; in large vessels into five. One for the hour-glass; another for the lamp or light; another for the compass, &c.

Great care is to be taken in the disposition, framing, &c. of the bittacle, that it stand true, and that it be not fastened together with iron nails, but with wooden pins, because the former would affect the compass. See **COMPASS**.

BITTENDORF, in *Geography*, a town of Silesia, in the principality of Neysze, 2 miles N. of Otmuchan.

BITTER, in *Sea Language*, denotes the turn of the cable round the bitts.

BITTER almonds. See **ALMOND**.

BITTER apple. See **COLOCYNTHIS**.

BITTER end of a cable, that end which remains on board round the bitts, when the ship is at anchor; the other part of the cable being veered.

BITTER gourd. See **COLOCYNTHIS**.

BITTER place, *locus amarus*, a poor barren soil, by Pliny called *terra amara*, *five maera*.

BITTER purging salt, *sal catharticum amarum*. See **EPSOM Salt**.

BITTER sweet, in *Botany*. See **SOLANUM**.

BITTER vetch. See **OROBUS**.

BITTER waters. See **WATER**.

BITTER wine. See **WINE**.

BITTER wood and ash. See **QUASSIA**.

BITTER wort. See **GENTIANA**.

BITTERFELD, in *Geography*, a town of Germany, in the circle of Upper Saxony, and electorate of Saxony, seated

feated on the Moldau, 16 miles S. of Dessau, and 18 S.S.W. of Wittenberg.

BITTERN, **BITTOUR**, in *Ornithology*, the Linnæan *ardea stellaris*: which see.

BITTERS, is also a name given to the brine swimming upon the first concreted salt in the salt-works; this liquor is lided off, that the salt may be taken out of the vessel, and is afterwards put in again, and affords more salt, which is to be separated like the rest, by lading off the liquor a second time, and so on. The bittern, according to Mr. Boyle, is a very saline, bitter, sharp, pungent liquor, which drains off in the making of salt from sea-water; or which remains in the pans, after the coagulation and granulation of the purer and more saline part by boiling. A bittern also runs, or oozes, from the heaps of fossile salt at Lymington, and Portsea in Hampshire. Phil. Trans. N^o 377. p. 348.

Bittern makes the basis of *jal catharticum amarum*, or **ER-SOM-SALT**.

Bittern is the mother-water which remains after the crystallization of common or marine salt in sea-water, or the water of salt springs. It abounds with Epsom salt, or the combination of vitriolic acid with magnesia, to which its bitterness is owing. It is employed in this country for making a purging bitter salt, which proves similar in quality to the salt obtained from the Epsom waters, and is commonly sold under its name. The ley is boiled down to a certain pitch, then filtered and inspissated; the dry matter is calcined, re-dissolved, and crystallized. If the mother-ley be inspissated and distilled with vitriolic additions, a spirit of salt is obtained. Neumann, p. 212.

BITTERS, in the *Materia Medica*. The quality of bitterness (a simple perception familiar to every one, and which cannot be defined) is much more frequently met with in vegetable matter, than in any other order of natural substances; and in this, it mostly resides in a certain soluble matter, with tolerably uniform chemical properties, which has by some been denominated *bitter extract*. This distinction, though not perfectly accurate, is of considerable use in pharmacy; for whenever a bitter taste is perceived in any part of a vegetable, we may conclude, with much probability, that it resides in this specific part of the vegetable, and especially that it gives certain medicinal properties, which experience has shewn to be in the highest degree important.

The bitter principle is found in combination with a variety of other active substances, which modify, alter, correct, or impair its medicinal powers.

A pure, simple bitter vegetable (of which gentian, or quassia are good examples), is entirely void of smell, has neither acerbities nor astringency to the taste, nor does it excite nausea, unless in excessive quantity. The bitterness is readily extracted by almost every menstruum aqueous, as well as spirituous; and in the simple bitters, little, if any difference, is perceived in the sensible properties of what is extracted, whatever be the medium. The bitter extract is not volatile by heat: hence, in the distillation of bitter plants that yield an essential oil (worm-wood, for example), the distilled oil has none of this taste, the whole remaining in the residuum. A watery, or spirituous infusion of a bitter plant, inspissated nearly to dryness, becomes intensely bitter, often with an empyreumatic, or a somewhat altered taste. This, when further dried, becomes solid and pulverulent. The extract is a convenient form for these substances, but the flavour is not so acceptable to the palate as the simple infusions.

The bitter extract is considerably antiseptic. Experiments have proved that the putridity of animal matters is much retarded by immersion in bitter infusions, even the watery;

and substances already putrid, in some degree, lose their fetor by this addition. The watery infusions of bitter vegetables mould by long keeping, and become sour. This change takes place in summer, in five or six days, when the infusion is not very strong. The newly acquired acid taste in some degree masks the bitterness; but this latter quality remains extremely long, and is hardly ever lost by spontaneous decomposition.

The effect of the simple bitter on the human body, is generally considered as purely TONIC. It does not raise the pulse; nor does it directly, or constantly produce any change in the secretions or excretions of the body. Its chief and most obvious operation is to increase the appetite, and promote the digestive powers; and hence it is with reason supposed, that its virtues depend on stimulating the fibres of the stomach. From this single effect may be derived the well known use of bitters, in giving general tone and vigour to the system, in a vast variety of cases of debility, unconnected with organic disease, in checking acescency of the stomach, heartburn, flatulence, and other symptoms indicating a deficiency of the digestive powers, and in extending its salutary operation through the whole of the alimentary canal, restoring the regular and natural action of the bowels impaired by the original defect of the digestive organ.

Bitters have been supposed by some to increase the intoxicating powers of spirituous liquors. This however, appears to apply only to the narcotic bitters, and to be attributable to the narcotic, and not the bitter principle. On the contrary, the salutary action of bitters on the digestive powers, is well calculated to correct the extreme and peculiar debility of the stomach, induced by habitual drinking.

An anthelmintic virtue (or power of expelling worms from the human body) has been attributed very generally to all bitters indiscriminately. There does not, however, appear to be much foundation for this opinion, unless the bitterness be combined with a purgative property, as in aloes, or possibly a narcotic. The contents of the intestines being always intensely bitter by the natural admixture of bile, it does not appear probable that animals, which live and grow in such a medium, can be much molested by a small addition of this principle, though from a vegetable matter.

An excessive habit of taking bitters, may finally prove detrimental to the stomach, by over-excitement, or by inducing a kind of artificial demand for food in greater quantity than is salutary to the general health. A remarkable example of the danger of these medicines, long persisted in by persons of gouty habits, is afforded by the operation of the *Portland powder* in this disease.

The chief combinations of the bitter principle used in medicine are *Narcotic bitters*, such as opium, fava Sancti Ignatii, bitter almonds, and the kernels of many fruits: *Aromatic bitters*, as orange-peel, cascarilla, and wormwood: *Astringent bitters*, a very large class, and generally combined both with tannin and the gallic acid, of which cinchona, and many other barks are striking examples: *Acid and purgative bitters*; the squill, colocynth, aloe, and some other combinations of less frequency.

For medicinal use, the aromatic is always an useful addition to the bitter, and is generally employed.

The most important of the animal bitters is the bile, the properties of which have been mentioned under that article. In tonic power, it closely resembles the vegetable bitters. Late experiments make it probable, that the *Prussic acid*, a very peculiar animal bitter, possesses properties similar to the vegetable narcotic bitters.

A few of the mineral, or common saline combinations, are distinguished by bitterness of taste; but it is doubtful how

far this principle modifies their medicinal powers. The nitrated silver is of this kind, a salt esteemed to be a very powerful tonic, taken internally in small doses. Some of the saline combinations of magnesia have the same taste, and it is possibly on this account, that the sulphat of magnesia will often be retained by very irritable stomachs, when other saline medicines are rejected. For the pharmaceutical preparations of the several bitters, see the respective articles; as *Gentian*, *Quassia*, *Colombo*, &c. and that of *Bitter Extra*.

BITTOUR, in *Ornithology*. See BITTERN.

BITUBERCULATA, in *Entomology*, a species of *CASSIDA*, of a brown colour, with a white margin; wing-cases spotted with black, and a single tubercle at the base of each. A native of Cayenne. Fabricius.

BITUBERCULATUS, a species of *CURCULIO*, that inhabits New Zealand. This is of a ferruginous colour; thorax length of the wing cases, and dotted, with two tubercles on the back. Fabricius.

BITUBERCULATUS, a species of *CRYPTOCEPHALUS* (*Crisceris*), that inhabits Africa. It is fulvous; wing-cases pale, entirely bordered with fulvous. Fabricius.

BITUMEN, *Bitumén*, Fr. The bitumens, properly so called, form a species of compound mineral inflammables, of which the following are the characters. 1. By exposure to the air, and the application of heat, they burn with a flame more or less vivid, and leave scarcely any residue. 2. By destructive distillation, they yield a liquid acid, but no ammonia, a variable but small proportion of charcoal being left behind in the retort. 3. They are either liquid, or capable of being rendered so by a moderate degree of heat.

Bitumens may be divided into two families, the non-elastic and elastic. To the former belong naphtha, petroleum, mineral tar, mineral pitch, and asphaltum; to the latter belong mineral caoutchou, and suberiform mineral caoutchou.

§ 1. *Non-Elastic Bitumens.*

NAPHTHA, *Bergnaphtha*, *Napthe*, *Bitume liquide blanche*, is a substance of a light brown, or wine yellow colour, perfectly fluid and transparent. It is the lightest of all liquids, its specific gravity being = 0.708 to 0.732: it has a strong penetrating bituminous smell; it takes fire with great readiness, and burns with a bluish yellow flame and copious black smoke, leaving no residue. It may be rectified by distillation with water, in the same manner as the essential oils, and then becomes colourless, and weaker in its odour. It does not combine in any considerable degree with either water or alcohol, but unites easily with ether, with turpentine, with caoutchou, and the essential oils. When rubbed with the caustic fixed alkalies, it forms a kind of Starkey's soap. The concentrated sulphuric and nitric acids are decomposed with vehemence upon it, converting it into a solid resinous substance soluble in alcohol. Even the purest naphtha, when exposed to the air, becomes first of a yellow, and then of a brownish colour, acquires a somewhat viscid consistence, and thus passes into petroleum. Naphtha is procured for the most part from very copious springs of this substance at Baku on the shore of the Caspian sea, where it is burnt in lamps instead of oil, and is used medicinally both externally and internally in rheumatic and other complaints. It is also met with in Calabria and some parts of Italy.

PETROLEUM, or *Rock-oil*. *Erdohl*, *Stein-ohl*. *Petrole*. The colour of petroleum is a blackish or reddish brown; it is fluid, though somewhat viscid; it is almost opaque, is unctuous to the touch, and exhales a strong bituminous odour; its taste is pungent and acid. Sp. gr. 0.747, 0.854. Petroleum may be rectified by distillation with water, in which process, the carbon, which thickens and colours it, is left behind in the

retort, and a colourless fluid comes over, possessed of all the properties of naphtha. When petroleum is distilled *per se*, there first arises some naphtha, then a watery empyreumatic acid, and lastly a thick dark-coloured oil, a spongy coal remaining in the retort. In its combinations with, and chemical actions on other substances, it perfectly resembles the preceding species. It is found wherever naphtha is, and in many other places among stratified mountains, in the vicinity of coal. In England, Coalbrookdale, and Pitchford in Shropshire, are the principal places where petroleum is found; at the latter place extensive strata of sandstone are saturated with petroleum, and the naphtha, procured by distillation of the stone, is sold under the name of Betton's British oil, and is esteemed an active remedy in strains and rheumatism.

MINERAL TAR, BARBADOES TAR, *Bergthier*, *Goudron mineral*. This substance differs from the preceding only in degree; it is more viscid, more opaque, of a darker colour, and, when distilled, leaves a larger carbonaceous residue. It is found native together with petroleum, and may also be procured by the distillation of coal.

MINERAL PITCH, *Maltha*. The external characters of maltha are extremely similar to those of common pitch; when heated, it emits a strong unpleasant odour. In cold weather it may be broken, and exhibits a vitreous lustre; but when warm it is soft and tenacious.

ASPHALTUM, *Schlackiges Erdpech*, *Asphalte*. The colour of this substance is black or brownish black; it is light and brittle; when broken, it displays a conchoidal fracture and vitreous lustre; it has little or no odour, unless it is rubbed or heated. It is considerably inflammable, melts easily, and burns away without leaving any residue. It is principally found on the shores of the Dead Sea, in Syria, and in the Isle of Trinidad in the West Indies.

The principal use of asphaltum is an ingredient in certain varnishes, especially that used by the copper-plate engravers.

§ 2. *Elastic Bitumens.*

MINERAL CAOUTCHOU, *Elastisches Erdpech*, *Poix minérale elastique*. The colour of this substance varies from yellowish brown to olive brown and blackish or reddish brown. The light coloured is often in a semifluid state, and adheres to the fingers; the olive brown is solid and elastic; the blackish and reddish brown are hard and little elastic. It occurs italcritical, or invelting, or in masses. Its sp. grav. in the soft varieties is about = 0.9, and in the hardest and least elastic is = 1.2. It passes into asphaltum.

It is partly soluble in sulphuric ether; but the residue of the solution, after evaporation of the ether, is not elastic; thus forming an essential difference between the vegetable and mineral caoutchou.

This singular mineral has been hitherto only found in the cavities of a lead mine, near Castleton, in Derbyshire, called the Odin mine, accompanied by asphaltum.

SUBERIFORM MINERAL CAOUTCHOU. This substance, when recently cut, exactly resembles fine close cork in its colour and texture; but by exposure for a few days to the air, it becomes of a pale reddish brown colour. It is also sometimes found friable, and passing by decomposition into an ochraceous powder. It has only been found in a rivulet near the Odin mine, whence the preceding is obtained, and appears to differ from it, merely by being penetrated with water. It occurs in nodules of various sizes, some weighing upwards of 13 pounds, the nucleus of which is very commonly the brown perfectly elastic mineral caoutchou. Fourcroy Syst. vol. viii. Brochant. Mineralog. vol. ii. p. 58. D. & D. Hist. Nat. art. *Bitumes*. Gren. Syst. Handbuch. vol. iii. p. i. Hatchet on Bitumens in Linnæan Trans.

BITURIGES CUBI, in *Ancient Geography*, the name of a people who occupied a considerable part of Aquitania Prima, and who had been much more powerful before Cæsar's conquest of Gaul, than they were afterwards. Livy says, that, in the time of Tarquin, they commanded the whole portion of Gaul called Celtic. Their capital was denominated *Avaricum*, which see. In the time of Cæsar, these people lost their power, and became subject to the Ædui, or at least were reduced to the necessity of putting themselves under their protection.

BITURIGES VIVISCI, a people who inhabited the southern part of Aquitania Secunda, and are supposed to have derived their origin from the Bituriges Cubi. Their capital was *Burdigala*; which see.

BITURIS, a town of Hispania Tarragonensis, in the country of the Vaiconcs. Ptolemy.

BITYLA, a town of the Peloponnensus, not far from the Messenian gulf, S.W. of Sparta.

BITZLEER, *Litwa*, in *Biography*, a celebrated Jewish rabbi, who flourished in Bohemia about the close of the sixteenth century. He conversed with the emperor Rodolphus, and he was so famous, that the Jews said of him, that all Israel drank of his waters, and walked by his light. He founded the academy, called *Klaufe*, in 1592, which acquired such reputation in his time, that it drew a vast concourse of disciples to him. He was chosen at last superintendent of all the synagogues in Poland.

BIVALVE, *bivalvæ vel*, in *Conchology*, bivalvix conchæ, one of the three principal sections, into which all testaceous animals are divided. The Linnæan genera of bivalve shells are *mya*, *solen*, *tellina*, *cardium*, *mastra*, *donax*, *venus*, *spondylus*, *chama*, *arca*, *ostrea*, *anomia*, *mytilus*, and *pinna*. The arrangement of bivalves by Cuvier, Lamarck, and other late naturalists differs materially from that of Linnæus and Gmelin. See CONCHOLOGY.

BIVALVE, is also applied, in *Botany*, to the *siliquæ*, or seed-pods, of such plants as open their whole length to discharge their seeds. Such are pea, beans, &c. which the botanists say, have bivalve or bivalvular siliquæ.

BIVAT, in *Conchology*, the name given by Adanson to the shell called by Linnæus (*Syll. Nat. edit. 10.*) *murex scabrifusculus*; and *voluta cancellata*. Gmelin.

BIVENTER, from *bis* and *venter*, in *Anatomy*, a name given to muscles that have two fleshy portions, which were called bellies, and one tendon. Such muscles are also called *digastric*. The term biventer has been applied to a muscle of the lower jaw and os hyoides, which is described under its more common title of *digastricus*. Albinus also denominates a portion of the musculus complexus of the neck, biventer cervicis. See COMPLEXUS.

BIVERI, in *Geography*, a lake of Sicily, near Lentini, which in summer and autumn, renders the situation of this town very unwholesome. The waters of this lake, and of the neighbouring marshes and ponds, abound with eels and tench, of the roes of which the fishermen make a large quantity of botarga, a species of caviar; it is very salt, and has the taste of tar, but is much relished by the Sicilians.

BIVINCO, the principal place of a canton, in the department of Golo, a id island of Corsica, the population of which consists of 1573 persons.

BIVIO. See BÉVIO.

BIVITTATUS, in *Entomology*, a species of *SCARABÆVS* (*Melolontha*), that inhabits Brasil. It is yellow and very glossy; on the head and thorax two common stripes, and many abbreviated green striæ on the wing-cases. Swederus Nov. Act. Stockh.

BIVITTATUS, a species of *CURCULIO*, found in St. Tho-

mas's island. It is black; wing-cases striated with dots; marginal and dorsal interrupted stripe of yellow. Fabricius.

BIUMBRES, from *bir*, *double*, and *umbra*, *shadow*, in *Geography*, an appellation given to the inhabitants of the torrid zone, because at two different seasons of the year, their shadows are projected two different ways.

The biumbres are the same with those otherwise denominated *amphiscii*.

BIUMI, **PAUL JEROM**, in *Biography*, born at Milan in 1663, studied medicine at Padua, where he was admitted to the degree of doctor in 1685. Returning thence to Milan, he soon acquired so much fame for his learning and skill in his profession, that in 1699 he was made professor of anatomy there, in which situation he continued to the time of his death, in 1731. He was author of several works, of which the following are most known: "Encomiasticon lucis, seu lucis encomia in physiologicis medicinæ novæ fundamentis e veterum tenetibus erutis, atque cultro anatomico, antropiæque caractere confirmatis," Mediol. 1701, 4to. "Scrutinio di Notomia e di Chirurgia," Milan, 1712, 8vo. Haller. Bib. Anat. et Méd. Eloy. Dict. Hist.

BIVONA, in *Geography*, a town in the kingdom of Naples, and province of Calabria Ultra, 10 miles N. E. of Nicotera.

BIXA, in *Botany*. Lin. gen. 654. Reich. 710. Schreb. 887. Juss. 293. Gært. t. 6. Class and order, *Polyandria Monogynia*. Nat. Ord. *Columniferae; Tiliaceæ*, Juss. Gen. Char. *Cal.* perianth five-toothed, very small, obtuse, flat, permanent. *Cor.* double; outer with petals five, oblong, equal, large, more rude; inner with five petals like the outer, but thinner. *Stam.* filaments numerous, setaceous, shorter by half than the corolla; anthers erect. *Pist.* germ ovate; style filiform, the length of the stamens; stigma parallelly bifid, compressed. *Per.* capsule ovate-cordate, compressed, fenced with bristles, bivalve, gaping at the angles, one-celled, with an inner bivalve membrane. *Seeds* numerous, turbinate, with a truncated navel, berried. *Rec.* linear, longitudinal, fastened to the middle of the valves.

Ess. Char. *Cor.* ten-petalled. *Cal.* five-toothed. *Capf.* bispid, bivalve.

Species, 1. *B. Orellana*, arnotto, or anotta. Lin. Spec. 74. Reich. 2. 580. Hort. Cliff. 211. Mat. Med. 135. Gært. fruct. 1. 292. Brown. jam. 254. B. Ovioidi, l. 8. c. 6. Bauh. Hist. 1. 44. Cluf. exot. 74. Orleansa f. Orellana. Pluk. phyt. t. 209. f. 4. Comin. Hort. 1. 65. t. 33. Rocu. Merian. furin. t. 44. Urucu. Piso 133. Sloan. jam. 2. 52. t. 181. f. 1. Pigmentaria. Rumph. Amb. 2. 79. t. 19. Arbor Mexiocana, fructu castaneæ, coccifera. Bauh. pin. 419. Raii hist. 1771. Achiotl. Hernandez. Mexic. 74. This shrub rises with an upright stem to the height of eight or ten feet, sending out many branches at top, which form a regular head. These are garnished with heart-shaped leaves, ending in a point, which have long footstalks, and come out without any order. The flowers are produced in loose panicles at the end of the branches, of a pale peach colour, having large petals. A native both of the East and West Indies. Introduced here in 1699 by Mr. Bentick.

Linnæus has adopted the South American vernacular name of *bixa* from Oviedo; and it is known by the same name in Holland, Denmark, and other northern countries. In Holland it is likewise called Orleansa; in German, Anotta, &c. In England this name is adopted, but its orthography is various, as Arnotto, Anotta, Anotta, Anato, Anoto, and Annoto. The French have adopted the Brazilian name. Urubu, or Urucu, spelling it Roucouyer, Roucou, or Rocurier des Indes. The Portuguese have also the same

appellation *Uracu*, or *Urucueira*. In Spanish it is *Anato*, or *Atolle*. In the Mexican language, *Achiotl*. Scaliger calls it *arbor finium reguandorem*, because the Mexicans made plans, and marked the boundaries of their lands on tablets, with the colour prepared from the berries. Tournefort named it *Mitella*, from the resemblance of the capsule, when open, to a mitre. For the preparation of the drug, and its uses, see *Аннотто*. The bark of the *bixa* makes good ropes for common use in the West Indies; and pieces of the wood are used by the Indians to procure fire by friction.

Propagation and Culture. This plant is propagated by seeds, may be easily cultivated, and is planted in many parts of Jamaica, Barbadoes, Cayenne, &c. in rich soils, and shady situations, shooting luxuriantly near rivulets. It is also propagated with us by seeds, which are annually brought in great plenty from the West Indies. These should be sown in a small pot filled with light rich earth, and plunged into a hot-bed of tanners' bark, where, with proper temperature, the plants will appear in about a month; when they are about an inch high, they should be taken out and separated without injuring their roots, and each planted in a pot of light rich earth, and plunged into a fresh hot bed of tanners' bark, shading them every day till they have taken root; afterwards they should be treated like other plants of the same country, by admitting fresh air to them in proportion to the warmth of the season; and when the heat of the tan declines, it should be turned up to the bottom, and, if necessary, fresh tan be added to renew the heat. The plants must be refreshed with water three times a week in summer, but not in great quantities, as with much wet their roots would rot. Plants that are raised early in spring, and properly managed, will be a foot and a half high in autumn, when they should be removed into the bark stove, and plunged into the tan-bed. During the winter, they must have but little water, and while the plants are young, they should be kept warm; otherwise they will cast their leaves, lose their tops, and appear unightly. They must be kept constantly in the bark stove; some of them rise seven or eight feet high, with strong stems and large heads; but seldom produce flowers in Europe. Martyn's Miller.

BIXÆ, in *Entomology*, a species of *PAPILIO* (*Pleb. Urb.*), with roundish, brown wings, greenish at the base, and a milky band on the under side of the posterior wings. Linn. Fabr. &c. Inhabits America.

BIZACIUM, in *Ancient Geography*. See *BYZACIUM*.

BIZAM, *CHAT-BIZAM*, in *Zoology*, the French name of the Linnæan *viverra tigrina*, which see.

BIZAMO, in *Geography*, a kingdom of Abyssinia, situate between the branches of the Nile, called the White and the Blue rivers, about N. lat. 10° 15'. and between 35° and 36° E. long.

BIZANTIA, a town of European Turkey, in the province of Moldavia, 40 miles south-west of Buhah.

BIZARRE, Fr. denoting *capricious*, &c. a term used among *Florists* for a particular kind of carnation, which has its flowers striped or variegated with three or four colours.

BIZE, in *Geography*, a town of France, in the department of the Aude, and district of Narbonne, 10 miles N. W. of Narbonne.

BIZERTA. See *BISERTA*.

BIZES, in *Ancient Geography*, a river of Bithynia, between Pissis and Rhebas. Ammian. Marcell.

BIZOCHI, or *BISOCHI*, in *Ecclesiastical History*, a sect or branch of religious minorites, condemned by several popes.

The *Bizochi* were also called *fratricelli*, or *fratres de pauperum vita*: sometimes *Bichini* or *Biechini*, and *Begvins*. The name is formed from *bisacess*, on account of a double bud-

get, or wallet, wherewith they begged their living. See *BEGHARDI*, and *TERTIARIES*.

BIZONE, in *Ancient Geography*, a city of Lower Mæsia, 80 stadia north of Dionysopolis, mentioned by Pliny (l. iv, c. 12.) as having been destroyed by an earthquake.

BIZONNES, in *Geography*, a town of France in the department of the Here, and chief place of a canton; in the district of La Tour du Pin, 12 miles north-west of Moirans.

BIZU, a town of Africa, in the kingdom of Morocco, seated on a mountain in a fertile country, 25 leagues north of Morocco.

BIZYA, in *Ancient Geography*, a town of Thrace, and capital of the country called *Ætica*, at some distance from the sea, N.W. of Salmydessus.

BIZYA, in *Geography*, a town of European Turkey, in Romania, 50 miles east of Adrianople.

BLACK, something opaque and porous, that imbibes the greatest part of the light that falls on it, reflects little or none, and therefore exhibits no colour. See *BLACKNESS*.

Bodies of a black colour are found more inflammable, because the rays of light falling on them are not reflected outwards, but enter the body, and are often reflected and refracted within it, till they be stifled and lost. They are also found lighter, *cæteris paribus*, than white bodies, being more porous. It may be added, that clothes dyed of this colour wear out faster than those of any other, because their substance is more penetrated and corroded by the vitriol necessary to strike their dye, than other bodies are by the galls and alum which suffice for them.

The inflammability of black bodies, and their disposition to acquire heat, beyond those of other colours, are easily evinced. Some appeal to the experiment of a white and black glove worn in the same sun; the consequence will be a very sensibly greater degree of heat in the one hand than the other. Others allege the phenomena of burning-glasses, by which black bodies are always found to kindle sooner; thus, a burning-glass, too weak to have any visible effect at all upon white paper, will readily kindle the same paper rubbed over with ink. Mr. Boyle gives other proofs still more obvious: he took a large tile, and having whited over one half of its superficies, and blacked the other, exposed it to the sun; where having let it lie a convenient time, he found, that whilst the whited part remained still cool, the black part was grown very hot. For farther satisfaction the same author has sometimes left on the surface of the tile a part retaining its native red, and exposing all to the sun, has found the latter to have contracted a heat in comparison of the white part, but inferior to that of the black. So also on his exposing two pieces of silk, one white, the other black, in the same window to the sun, he often found the latter considerably heated, when the former has remained cool. It is observable likewise, that rooms hung with black are not only darker, but warmer than others. Boyle's Works abridg. tom. i. p. 144. and tom. ii. p. 36. To all which may be added, that a virtuoso of unsuspected credit assured Mr. Boyle, that, in a hot climate, he had, by carefully blackening the shells of eggs, and exposing them to the sun, seen them thereby well roasted in a short time.

Dr. Watson, the present bishop of Landaff, covered the bulb of a thermometer with a black coating of Indian ink, in consequence of which the mercury rose ten degrees. Phil. Trans. vol. lxxiii. part 1. p. 40.

Black clothes heat more, and dry sooner in the sun, than white clothes. Black is therefore a bad colour for clothes in hot climates; but a fit colour for the linings

of ladies' summer hats. Dr. Franklin's Experiments, Observations, &c. 5th edit. p. 483, & seq. He observes also, *ibid.* p. 382, that a chimney painted black, when exposed to the sun, will draw more strongly. We may add, that black mould is a hotter soil for vegetables; and garden-walls, painted black, answer better for the ripening of wall-fruit, than those of lighter colours.

BLACK, in matters of dress, is the distinguishing habit of claustrals and mourners. Some will have it, that the common people among the Romans were clothed in black; whence the denomination given them of *turba pulata*.

BLACK, JOSEPH, in *Biography*, a celebrated teacher of chemistry, was born at Bourdeaux, in France, in the year 1728. His father, who was a native of Belfast, in Ireland, but of a Scotch family, carried on the wine trade at Bourdeaux, and lived in intimacy with the famed baron Montefquieu, who expressed his regret in strong terms on Mr. Black's quitting Bourdeaux, when he retired from business, as appears by several of his letters which are preserved by the family. By his mother, Dr. Black was nearly related to the wives of Dr. Adam Ferguson, and Mr. James Ruffel, professor in natural philosophy at the university of Edinburgh, and owed probably much of his knowledge to the instruction or information he obtained from them. In the year 1740, his father sent him to Belfast, that he might have the education of a British subject; and from his letters, he appears to have been satisfied with the progress he made there. In 1746, he went to Glasgow, where he applied to the study of medicine, but particularly to chemistry, into the knowledge of which he was initiated by Dr. Cullen, who then gave lectures there on that branch of science. Under his direction he made such progress, that, in 1756, when Dr. Cullen removed to Edinburgh, Black, who had previously taken his degree of doctor, succeeded him as professor in medicine, and lecturer in chemistry. That he was qualified to fill this office, he had shewn by an ingenious essay, containing experiments to investigate the nature of magnesia, quicklime, and some other alkaline substances, recommended as solvents of the stone in the bladder. In the course of these experiments he demonstrated the existence of an aerial fluid, which he called fixed air, the presence of which gave mildness, and its absence causticity, to alkalis and calcareous earth; a discovery which laid the foundation of the improvements since made in our knowledge of gases, or aerial bodies, by Priestley, Cavendish, Lavoisier, and other chemists. The essay, containing the account of these experiments, was published in the second volume of "Essays physical and literary," in 1756. The following year he further enriched his favourite science with his experiments on latent heat, which is found to exist in all bodies; explaining in a satisfactory manner the connection of heat and fluidity, by which he so established his reputation, that on Dr. Cullen's being promoted from the chemical to the medical chair at Edinburgh, in 1765, he was unanimously chosen to succeed him as professor in chemistry there. His time was now dedicated, and with increased ardour, to imparting the knowledge he had acquired to his numerous pupils; and as he was perfectly master of the subjects on which he lectured, his doctrines were so clearly explained, as to be easily understood by his auditors, many of whom took complete copies of his lectures. By this means the knowledge of the discoveries he had made, became widely diffused, and his claim to them secured to him, which might otherwise have been assigned to those who improved and extended them. Having thus laid the ground-work for the improvement of the art, he seems to have been contented, without attempting to push his discoveries further. Satisfied with the attention paid

him by his pupils, and the gradual extension of his fame, of which he received daily proofs, he took little notice of what Priestley, Lavoisier, and other philosophical chemists, were doing, or only noticed them when they had neglected making those acknowledgments to him he knew to be his due. Dr. Robison, who had been his pupil, and has lately published his lectures, with an account of his life, attributes this apparent apathy to the ill state of his health, which, for several years before his death, did not permit that degree of application and study, which the farther extension of his discoveries would have required. "The slightest cold," he says (Preface to the Lectures, p. lx.), "the most trifling approach to repletion, immediately affected his breath, occasioned feverishness, and, if continued two or three days, brought on a spitting of blood. In this situation nothing restored him but relaxation from thought, and gentle exercise. The sedentary life, to which study confined him, was manifestly hurtful; and he never allowed himself to indulge in any intense thinking, or puzzling research, without finding these complaints sensibly increased." Hence, though he had the honour of being elected one of the foreign associates of the royal academy of sciences at Paris, and member of the imperial academy at Petersburg, he sent no communications to either of those learned societies. As he ranked high among the teachers of chemistry, and his name and character were extended over Europe, his pupils were numerous, and continued increasing for the whole time he lectured, more than thirty years. In the year 1774, he sent to the Royal Society in London, his observations on the effect of boiling upon water, in disposing it to freeze; and, in 1791, the Royal Society at Edinburgh published his analysis of the waters of some hot springs in Iceland, in the third volume of their Transactions. In this paper, which is drawn up with great accuracy, he treats of the formation of the silicious stone, which is deposited by these springs. His constitution becoming more and more feeble, from the frequent returns of his complaint, he was first obliged to make use of an assistant in his lectures, and at length, to give them up altogether; the smallest exertion bringing on a fit of hæmoptoe. "But he seemed," Dr. Robison says (Preface, p. 73.), "to have his complaint almost under command, so that he never allowed it to proceed far, or to occasion any distressing illness, and so spun his thread of life to the last fibre, guarding against illness by restricting himself to a moderate diet, and meeting his increasing infirmities with a proportional increase of attention and care." On the 26th of November 1799, and in the 71st year of his age, he died suddenly, without any previous warning. Being at table, with his usual fare before him, some bread, a few prunes, with milk and water for his drink, having the cup in his hand, resting on his knees, he expired suddenly in that posture, the cup remaining in his hand, and his countenance so composed and placid, that his servant at first imagined he was fallen asleep. He was of a cheerful and sociable disposition, and, as his mind was well stored with knowledge, an entertaining companion. His company was therefore much courted; and, as his circumstances were affluent, he dedicated as much of his time to the pleasures of society, as was consistent with his avocations. He was never married; he therefore left the principal part of his fortune, which is said to have been considerable, among the children of his brothers and sisters. Gen. Biog. Dict. Lectures of the Elements of Chemistry.

BLACK, in *Heraldic Engravings*, is expressed by cross lines, and in emblazoning, is termed for commoners *sable*, for peers *diamond*, and for sovereigns and princes *saturn*.

BLACK, in the *Manege*. A horse of a deep, shining, and

and lively black is called a *black-more*, or *coal-black*. Horses black all over are commonly reckoned dull and melancholy; but a white foot, or star in the forehead, gives them a degree of sprightliness. The Spanish gravity is said to be best pleased with those entirely black.

BLACK, *blue*, in the *Manufactures and Arts*, is the coal of some kind of wood, or other vegetable matter, burnt in a close heat, where the air can have no access: the best sort is said to be made of vine-stalks and tendrils. The goodness of blue-black consists in the cleanness and blue cast of its black colour, and the perfect degree of its levigation.

That this preparation, which is sold in the colour-shops, is no other than a vegetable coal, appeared from the following experiment of Dr. Lewis. (Comm. Phil. Techn. p. 358.) Laid on a red hot iron, it burned and glowed like powdered charcoal, and turned into white ashes; which ashes, thrown into oil of vitriol diluted with water, very readily dissolved into a bitterish liquor, the characteristic by which the vegetable earth is distinguished. From what particular vegetable matter this blue-black is procured, experiments, he says, cannot discover: but it appears from those which he recites, that it may be obtained from many, and that the choice of the vegetable subject affects rather the softness or hardness than the colour of the coal. Blue-black, perfectly good, may be prepared in the manner directed for *ivory black*, from the vine stalks, or tendrils, or any other twigs of wood, of an acid taste and tough texture; but the soaking in the oil, prescribed for the ivory, must be omitted.

The painters have *blue-blacks*, *brown-blacks*, &c. which may be made by mixing pigments of the respective colours, with simple black ones, in greater or less quantity, according to the shade required. The dyers also have different blacks, and often darken other colours by slightly passing them though the black dyeing liquor; but the term brown-black is in this business unknown, brown and black being here looked upon as opposite to one another. In effect, the colour called brown-black is no other than that which all dyed black clothes change to in wearing; and therefore it is no wonder that it should be excluded from the catalogue of the dyers' colours. The true or simple blacks, mixed with white, form different shades of grey, lighter or darker, according as the white or black ingredient prevails in the mixt. The black pigments, spread thin upon a white ground, have a like effect. Hence the painter, with one true black pigment, can produce on white paper, or on other white bodies, all the shades of grey and black, from the slightest discolouration of the paper up to a full black; and the dyer produces the same effect on white wool, silk, or cloth, by continuing the subjects for a shorter or longer time in the black bath, or making the bath itself weaker or stronger.

M. le Blon, in his "Harmony of Colours," forms black by mixing together the three primitive colours, blue, red, and yellow; and Mr. Castel, in his "Optique des couleurs," published in 1740, says, that this compound black has an advantage in painting above the simple ones, of answering better for the darkening of other colours. Thus if blue, by the addition of black, is to be darkened into a *blue-black*, the simple blacks, if used in sufficient quantity to produce the requisite deepness, conceal the blue, while the compound blacks leave it distinguishable. Le Blon has not mentioned the proportions of the three primitive colours necessary for producing black. Castel directs 15 parts of blue, five of red, and three of yellow; and he observes, that the colours should be the deepest and darkest of their respective kinds, and that a combination should be made to several pigments for each colour; for the greater the contrast

of heterogeneous and discordant drugs, the more true and beautiful will be the black, and the more capable of uniting with all other colours, without suppressing them, and even without making them tawney. Dr. Lewis, in his experiments, has not so far succeeded as to obtain a perfect black by mixing different blue, red, and yellow powders; but he procured very dark colours, such as brown-blacks and grey-blacks.

BLACK, *bone*, is made of the bones of bullocks, cows, &c. well burnt and ground. To be good, it must be soft and friable, of a glossy cast. It is in considerable use, though inferior in goodness to ivory-black.

The invention of bone, or ivory-black, is attributed to Apelles. Plin. Hist. Nat. lib. xxxv. cap. 5.

BLACK *chalk*. See CHALK, and KILLOW.

BLACK *charcoal*. See CHARCOAL, and CRAYONS.

BLACK, *curriers*, signifies a teint or dye laid on tanned leather. Tanned leather is so much impregnated with the astringent parts of oak bark, or with that matter which strikes a black colour with green vitriol, that rubbing it over three or four times with a solution of the vitriol, or with a solution of iron made in vegetable acids, is sufficient for staining it black. Of this we may be convinced by dropping a little of the solution on the unblacked side of common shoe-leather. This operation is performed by the currier, who, after the colouring, gives a gloss to the leather with a solution of gum-arabic and size made in vinegar. Where the previous astringent impregnation is insufficient to give a due colour, and for those sorts of leather which have not been tanned, some galls or other astringents are added to the solution of iron; and in many cases, particularly for the finer sorts of leather, and for renewing the blackness, ivory or lamp-black is used. A mixture of either of these with linseed oil, makes the common oil-blackening. See CURRYING.

BLACK, *dyers*, is one of the five simple and mother colours used in dyeing: and given differently, according to the different quality and value of the stuffs to be dyed. See DYEING.

Green vitriol strikes a black colour with vegetable astringents, and hence it is the basis of the black dye for cloth, leather, hats, &c. And as solutions of iron with galls, &c. produce the same colour, a method is derived from hence of distinguishing the minutest portions of iron in mineral waters, &c. Neumann.

The substances chiefly employed for producing black colour with vitriol are galls. When a decoction or infusion of the galls is dropped into a solution of the vitriol largely diluted with water, the first drops produce bluish or purplish red clouds, which mingling with the liquor tinge it uniformly of their own bluish or reddish colour. This difference of the colour, says Dr. Lewis (Com. Ph. Tech. p. 346.), seems to depend on the quality of the water. With distilled water, or the common spring waters, the mixture is always blue. A minute quantity of alkaline salt previously dissolved in the water, or a small degree of putridity in it, will render the colour of the mixture purple or reddish. Rain-water received from the clouds, in clean glass vessels, gives a blue, but if it be collected from the tops of houses, gives purple with the vitriol and galls. Both the blue and purple liquors, when more of the astringent infusion is added, deepen to a black, more or less intense, according to the degree of dilution; and if the mixture be a deep opaque black, it again becomes bluish or purplish when further diluted. If it be suffered to stand in this dilute state for two or three days, the colouring matter settles to the bottom in form of a fine black mud, which, by slightly shaking

BLACK.

Shaking the vessel, is diffused again through the liquor, and tinges it of its former colour. When the mixture is of a full blackness, this separation does not happen, or in a far less degree, for though a part of the black matter precipitates in standing, yet so much remains dissolved, that the liquor continues black. This suspension of the colouring substance in the black liquid may be attributed in part to the gummy matter of the astringent infusion increasing the consistence of the watery fluid, for the separation is retarded in the diluted mixture by a small addition of gum arabic. If the mixture, either in its black or diluted state, be poured into a filter, the liquor passes through coloured, only a part of the black matter remaining on the paper. The filtered liquor, on standing for some time, becomes turbid, and full of fine black flakes; but being freed from these by a second filtration, it again contracts the same appearance, and thus repeatedly, till all the colouring parts are separated, and the liquor has become colourless. The colouring matter, thus separated from the liquor, being drained on a filter and dried, appeared of a deep black, which did not seem to have suffered any change on being exposed to the air for upwards of four months. When it was made red hot, it glowed and burnt, though without flaming, and became a rusty brown powder, which was readily attracted by a magnetic bar; though in its black state, the magnet had no action upon it. The vitriolic acid, diluted with water, and digested on the black powder, dissolved the greatest part of it, leaving only a very little quantity of whitish matter. Solution of pure fixt alkaline salt dissolved very little of it; the liquor received a reddish brown colour, and the powder became blackish brown. This residuum was attracted by the magnet after being made red-hot, though not before; the alkaline tincture, passed through a filter, and mixed with solution of gum vitriol, struck a deep brownish black colour, nearly the same with that which results from mixing with the vitriolic solution an alkaline tincture of galls. For an account of the result of these experiments, see Lewis, *ubi supra*. See also IRON.

For broad-cloths, ne ratines, and druggets, &c. the dyers use woad and indigo; the goodness of the colour consists in there not being above six pounds of indigo to a ball of woad, when the latter begins to cast its blue flower; and, in its not being heated for use above twice. Thus bleued, the stuff is boiled with alum, or tartar, then maddered; and lastly, the black given with galls, copperas, and sumac. To bind it, and prevent its smearing in use, the stuffs are to be well scoured in the fulling mill, when white, and well washed afterwards.

For stuffs of less value, it is sufficient they be well bleued with woad, and blacked with galls and copperas; but no stuff can be regularly dyed from white into black, without passing through the intermediate blue.

Yet there is a colour called *coal black*, or *Jesuit's black*, prepared of the same ingredients as the former, and sufficient of itself without the blue dye. Here the drugs are dissolved in water that had boiled four hours, and stood to cool till the hand would bear it; then the stuff is dipped in it, and again taken out six or eight times. Some even prefer this black to the other. This method of dyeing black is said to have been invented by the Jesuits, and to have been practised in their houses, where they retained numbers of dyers.

By 23 El. c. 9. nothing of the nature of cloth shall be maddered for a black, except it be first grounded with woad only, or with woad and anele [blue ind.], unless the madder be put in with sumac or galls; on pain of forfeiting the value of the thing dyed; provided it shall be lawful to dye

any manner of gall-black, and sumac-black [*plain black*], wherein no madder shall be used.

Logwood strikes a black with chalybeate solutions and is employed with those liquors for staining wood black, as picture frames, &c. With the addition of galls, it is used for dyeing cloth and hats black. (Neumann's Works, p. 385.) This black colour is not permanent, though beautiful, any more than the natural violet dye of the *logwood*.

Black may be also obtained by a solution of silver in aqua fortis, when the previous matter stained with this liquor is exposed for some time to the sun and air; and also from solutions of lead in acids, when the subjects to which they are applied are exposed to sulphureous vapours, or washed over with alkaline solutions of sulphur. Calces of lead, melted with sulphur, form a bluish or blackish mass, useful in taking casts from medals. (See CASTS.) Besides, when a solution of silver in aqua fortis is added to a solution of sulphur made in alkaline ley, the silver and sulphur unite and precipitate together in the form of a black powder. See DYEING, and STAINING.

BLACK, *earth*, is a kind of coal found in the ground, which, well pounded, is used by painters in fresco. See Pit-COAL, and FRESCO.

There is also a kind of black made of silver and lead, used to fill up the strokes and cavities of things engraved.

BLACK, *German*, or *Frankfort*, is made of the lees of wise burnt, then washed in water, and ground in mills for that purpose, together with ivory or peach stones burnt. Some suppose, that it is the coal of vine-twigs; but this, says Dr. Lewis (Com. Phil. Techn. p. 377.), does not appear to differ, in any great degree, from that of the small branches of other kinds of trees; but the kernels of fruits yield a coal considerably more soft and mellow, easily crumbling between the fingers into a fine meal. That the Frankfort black is no other than a vegetable coal, appeared, from its burning on a red-hot iron, like charcoal powder, into white ashes, and from the ashes, like common vegetable ashes, being plentifully dissoluble by the vitriolic acid into a bitterish liquor, while the ashes of animal substances are very sparingly affected by that acid, and form with it a compound of a different kind of taste.

This black makes the principal ingredient in the roiling-press printers' ink, which see. It is ordinarily brought from Frankfort, Mentz, or Strasbourg, either in lumps or powder. That made in France is more valued than that of Germany.

BLACK *glass*. See GLASS.

BLACK, *harts*, that which remains in the retort after extracting the spirit, salt, and oil of hartshorn. This residuum being ground up with water, makes a black not much inferior to that of ivory.

BLACK, *Indian*. See INDIAN INK.

BLACK, *ivory*, is made of ivory burnt or charred, ordinarily between two crucibles well luted; which, being thus rendered perfectly black, and in scales, is ground in water, and made into troches, or little cakes, used by the painters; as also by the jewellers to blacken the bottom or ground of the collets, wherein they set diamonds to give them their teint or foil. Some recommend soaking the chips or shavings of ivory in hot linseed oil, before it is charred.

There are particular machines and contrivances for burning the ivory for these purposes, by which the colour is rendered more beautiful than that of the coal which remains in the distillation. Neumann.

The goodness of ivory-black, which is the finest of all the charcoal blacks, may be perceived by its fulness, without a blue cast; and by the fineness of the powder.

BLACK.

In the manufacture of this black much imposition is practised, so that what is generally sold under this name is no other than the coal of common bones. Being applied to coarse purposes, and sold at a low price, it is very grossly levigated by the hand or horse-mills which are employed in grinding the bones, and so much adulterated with charcoal dust, which gives it a blue cast, that it is wholly exploded from delicate uses, and lamp-black, though inferior with regard to the purity and clearness of the black colour, substituted for it.

The following recipe is given in the *Handmaid to the Arts* (vol. i. p. 140.) for preparing it in perfection. Take plates, chips, or shavings of ivory, and soak them in hot linseed oil; or, if filings are more easily procured, they may be used moistened with the hot oil. Put them into a vessel, which will bear the fire, covering them with a sort of lid made of clay and sand; which should be dried, and the cracks repaired before the vessel be put into the fire. Let this vessel be placed in a tobacco-pipe maker's or potter's furnace, or any other such fire; and let it remain there during one of their heats. When it is taken out, the ivory will be properly burnt; and must be afterwards thoroughly well levigated on the stone with water, or to have it perfectly good, be also washed over. The ivory may be conveniently burnt in a calcining or subliming furnace.

An opaque deep black for water colours is made by grinding ivory-black with gum-water, or with the liquor which settles from the whites of eggs after they have been suffered to stand a little. Some use gum water and the whites of eggs together, and they say, that a small addition of the latter makes the mixture flow more freely from the pencil, and improves its glossiness. It may be observed, however, that though ivory-black makes the deepest colour in water, as well as in oil-painting, yet it is not on this account always to be preferred to other black pigments. A deep jet-black colour is seldom wanted in painting; and in the lighter shades, whether obtained by diluting the black with white bodies, or by applying it thin on a white ground, the particular beauty of the ivory-black is in a great measure lost.

BLACK, lamp, or lam BLACK, originally perhaps the foot collected from lamps, is generally prepared by melting and purifying resin or pitch in iron vessels; then setting fire to it under a chimney, or other place made for the purpose, lined a-top with sheep-skins, or thick linen cloth, to receive the vapour or smoke, which is the black: in which manner they prepare vast quantities of it at Paris. In England considerable quantities are prepared, particularly at the turpentine-houses, from the dregs and refuse parts of the resinous matters which are there manufactured; but the greatest part is brought from Germany, Sweden, and Norway. Its preparation is described in the *Swedish Transactions* for 1754, as a process dependent on the manufacture of common resin.—The impure resinous juice, collected from incisions made in pines and fir-trees, is boiled down, with a little water, and strained, whilst hot, through a bag; the dregs and pieces of bark, left in the strainer, are burnt in a low oven, from which the smoke is conveyed, through a long passage, into a square chamber, having an opening in the top, in which is fastened a large sack, made of fleasy or thin-woven woolly stuff; the foot, or lamp-black, concretes partly in the chamber, from which it is swept out once in two or three days, and partly in the sack, which is now and then gently struck upon, both for shaking down the foot, and for clearing the interstices between the threads, so as to procure a sufficient draught of air through it. The more curious artists prepare lamp-black for the nicer purposes, by hanging

a large copper pan over the flame of a lamp with a long wick, supplied with more oil than can be perfectly consumed, so as to receive its smoke. Soot collected in like manner from fir and other woods, by burning small pieces of them slowly under a copper pan, is of a deeper black colour than such as is obtained from the same kinds of wood in a common chimney, and little inferior to that of oils. The foot of mineral bitumens, in this close way of burning, appears to be of the same qualities with those of woods, oils, and resins. In some parts of Germany, it is said, great quantities of good lamp-black are prepared from a sort of pit-coal.

The goodness of lamp-black lies in the fulness of the colour, and in its being free from dust or other impurities. The lightness of the substance furnishes the means of discovering any adulteration, if to a great degree; as the bodies with which lamp-black is subject to be sophisticated, are all heavier in a considerable proportion.

This substance is used on various occasions, particularly in the printers' ink; for which it is mixed with oils of turpentine and linseed, all boiled together.

It must be observed, that this black takes fire very readily, and when on fire is very difficultly extinguished: the best method of putting it out is with wet linen, hay, or straw; for water alone will not do it.

A glass tube closely filled with lamp-black has been found to conduct a considerable charge of electricity instantaneously, and with scarce any explosion. But a coating of this substance, mixed with tar or oil, is a perfect non-conductor, and has proved a preservative from lightning, by repelling the electric matter from those parts of the masts of ships which have been covered with it.

Russian lamp-black is prepared from the foot of fir, and is collected at Oclta near St. Petersburg, Moscow, Archangel, and other places, in little wooden huts, from resinous fir wood, and the unctuous bark of birch, by means of an apparatus uncommonly simple, consisting of pots without bottoms, set one upon another, and is sold very cheap. It is three or four times more heavy, thick, and unctuous, than that kind of painters' black which the Germans call "kienrahm," and which is called in Russia "Holland's black." For an account of the spontaneous accension of Russian fir-black, impregnated with hemp-oil, see *Spontaneous INFLAMMATION*.

A mineral lamp-black may be procured from pit-coal, or any kind of mineral or fossil coal, by preserving the blackest particles of the smoke arising from it in ignition. Mr. Wm. Row of Newcastle-upon-Tyne obtained a patent in 1798 for his method of manufacturing this kind of lamp-black. See the specification in the *Repertory of the Arts*, &c. vol. x. p. 81.

BLACK paint. See **PAINT**.

BLACK sand. See **SAND**.

BLACK sealing wax. See **WAX**.

BLACK, foot, or chimney, is a poor colour; but ready for painting black draperies in oil. The foot blacks are in general much softer and of a more yielding texture than those of the charcoal kind, and require much less grinding, for uniting them with oily, watery, or spirituous liquors, into a smooth mass; of some of them a part is dissolved by water, or spirits of wine, while none of the charcoal blacks have been found to contain any thing dissoluble. This soluble matter of foots, however, is not black like the indissoluble parts; and in this particular, as well as in the colour of the entire mass, different sorts of foot differ from one another. Thus the foot of pit-coal collected in common chimneys, of itself rather greyish black than of a full black,
being

being infused separately in rectified spirit of wine, and in water, tinged the former of a transparent reddish colour, and the latter of a paler reddish; while the deeper black font of wood gave, both to spirit and to water, an opaque, dark brown. See SOOT.

BLACK, *Spanish*, so called, because first invented by the Spaniards, and most of it bought from them, is no other than burnt cork used in various works, particularly among painters.

BLACK stains. See STAINING.

BLACK varnish. See VARNISH.

BLACK vegetable juice. See ANACARDIUM.

BLACK *Act Waltham*, in *Laws*, a name commonly distinguishing the statute of 9 Geo. I. c. 22. because it was occasioned by the devastations committed near Waltham in Essex, by persons in disguise, or with their faces *blackened*. By this statute it is enacted, that persons hunting, armed and disguised, and killing or stealing deer, or robbing warrens, or stealing fish out of any river, &c. or any persons unlawfully hunting in his majesty's forests, &c. or breaking down the head of any fish-pond, or killing, &c. of cattle, or cutting down trees, or setting fire to house, barn, or wood, or shooting at any person, or sending letters, either anonymous, or signed with a fictitious name, demanding money, &c. or rescuing such offenders, are guilty of felony, without benefit of clergy. This act is made perpetual by 31 Geo. II. c. 42. See farther 6 Geo. II. c. 37. and 27 Geo. II. c. 15. Blackstone's Comm. vol. iv. p. 144. 208. 232. 244. The milder punishment inflicted by stat. 16 Geo. III. c. 30. against deer-stealers, has been thought a virtual repeal of the punishment of the black act above-recited. Leach's Hawk. P. C. i. c. 49. § 7.

BLACK bay, in *Geography*. a bay on the south-east coast of Labrador. N. lat. 51° 30'. W. long. 56° 20'.

BLACK bear, in *Zoology*. See URSUS ARCTOS.

BLACK-bellied darter, and BLACK-bellied anbinga of Latham, in *Ornithology*, is *Plotos Melanogaster* of Gmelin.

BLACK-bellied grosbeak of Browne's Illustrations, is *Loxia aspera* of Gmelin.

BLACK-bellied green humming-bird of Edwards; BLACK-bellied American humming-bird of Bancroft; and BLACK-bellied humming-bird of Latham, are all the same bird; namely, *Trochilus holosericeus* of Linn. and Gmelin.

BLACK-berry, in *Botany*. See RUEUS.

BLACK billed auk of most English writers, in *Ornithology*, is *Alca pica* of Linn. Syst. Nat. and Fabricius.

BLACK-billed tropic bird, so named in Latham's Synopsis, is *Phaeton melanorhynchus* of Gmelin.

BLACK-billed whistling duck of Sloane and Brown's Jamaica, is called *Anas arborea* by Gmelin.

BLACK-bird. The proper acceptance of this word among the English writers of the present time, is very clearly understood; the *Turdus merula* of Linnæus and other naturalists being alone implied. The earlier ornithologists of this country are much less precise in the application of this word: with them, birds of the same natural order were sometimes called black-birds, because they bear a remote resemblance to the common species most familiarly known by that name, as we find, for instance, in the two kinds of *turdus*, *torquatus*, and *roseus*, both of which are called, in a general manner, black-birds, white-ringed black-birds, rose-coloured black-birds and the like. Thus far, indeed, there existed a striking natural affinity between the species, because they all belong to the same natural order, and were, in reality, of the family they called

merula, which seems to have been considered in certain instances synonymous with black-bird. But all the early writers did not confine themselves to such minute distinctions as the generic character afforded: the *black-bird* (razor-billed) of Catesby, being, for example, of a very dissimilar genus to that of our common black-bird; namely, the *crotophaga* of modern writers. Again, the *black-bird* (red-breasted Indian) of Willughby, is one of the *oriolus*; the *black-bird* (red-breasted) of Edwards, belongs to the *tanagra*; and the *black-bird*, or *Chinese starling* of the same author, is a *gracula*. Birds of the sparrow, titmouse, and other kinds, altogether remote from the former, were also called occasionally black-birds. We may, therefore, easily perceive that the word black-bird was an indefinite term, applied, for the most part, to those birds whose plumage is of a black colour, without regard to the natural order to which they ought to have been referred, although sometimes employed to express only that which we still distinguish by the name of black-bird. See TURDUS MERULA.

BLACK-book of the *Exchequer*, *Eagle*, *Hellebore*, *Money*, *Order*, *Star*. See the several articles.

BLACK-books, a name given to those which treat of necromancy, or, as some call it, nigromancy.

The black-book of the English monasteries, was a detail of the scandalous enormities practised in religious houses, compiled by order of the visitors under king Henry VIII. to blacken them, and thus hasten their dissolution.

BLACK-breasted grebe of Latham, in *Ornithology*, is *Colymbus thomensis* of Gmelin.

BLACK-breasted grosbeak of Latham, is *Loxia Americana* of Gmelin.

BLACK-breasted humming-bird of Latham, is spoken of by Buffon under the name of *Huiffe col vert*; Gmelin calls it *Trochilus gramineus*.

BLACK-breasted Indian plover of Edwards, is a variety of CHARADRIUS SPINOSUS of Gmelin. The female of this bird is called by Edwards the *spur-winged plover*, a name retained by Latham for both sexes. In Ruffell's Aleppo it is called the *lapwing*.

BLACK-breasted thrush. Latham describes *Turdus cinnamomeus* of Gmelin, under this name in the synopsis of birds.

BLACK-breasted titmouse of Latham, is *Parus aser* of Gmelin.

BLACK-breasted wood-pecker of Latham, is *Picus multicolor* of Gmelin.

BLACK-bulfinch of Albin, like *Pyrrhula nigra* of Brisson, and *Bouvreuil noir* of Buffon, is nothing more than an accidental variety of the common bulfinch, or *Loxia pyrrhula* of Latin writers. The bulfinch occurs sometimes of a white colour, as well as black or dusky.

BLACK-bulfinch, (Little) of Catesby and Albin, and BLACK grosbeak of Latham, is *Loxia nigra* of Gmelin.

BLACK-canker, in *Agriculture*, a disease in turnip and other crops, produced by a species of caterpillar destroying their leaves.

It is observed by Mr. Young, in the second volume of the Annals of Agriculture, that "these insects were effectually destroyed by Mr. Coke, at Holkham, in Norfolk, by turning a number of ducks among the turnips when injured by insects. On the 16th of July, says he, they were turned into thirty-three acres, having water at one corner of the field, and, in five days, they cleared the whole most completely, marching at last through the field on the hunt, eyeing the leaves on both sides with great care to devour

B L A C K.

every one they could see, and filling their crops several times in the day. The ducks, after having saved about sixty pounds' worth of turnips, were sent to the poultry yard." With this view, it has been suggested by Mr. Middleton in his "Survey of the county of Middlesex," that this sort of poultry may often be kept with advantage by the farmer.

BLACK-canons, in *Ecclesiastical History*, a name given to the regular canons of St. Augustine, who wore a black mantle over their surplice, by way of distinction from the *Præmonstratenses*.

BLACK-cap of the English, in *Ornithology*, the *Motacilla atricapilla* of Linnæus. The same name is given likewise to the *marsh titmouse*. *Parus palustris* of Linn. and the *black-headed gull*, *Larus atricilla* of Gmelin.

BLACK-cap of Ceylon, or *Ceylon black-cap*, the name of *Motacilla zeylonica* of Gmelin, in Brown's *Illustration of Nat. Hist.*

BLACK capped humming-bird of Latham, and *Long-tailed black-cap humming-bird* of Edwards and Bancroft, are *Trochilus polytmus* of Gmelin.

BLACK-capped king's-fisher of Latham, is *Alcedo atricapilla* of Linn.

BLACK-capped lory, the English name given by Latham to the *Gmelinian psittacus lory*. This is the first black-cap lory of Edwards.

BLACK-capped manakin of Edwards and Latham, is *Pipra manacus* of Gmelin.

BLACK-cape, in *Geography*, lies on the east coast of Newfoundland, S. E. from cape St. Francis.

BLACK-cattle, in *Agriculture*, a small, hardy breed of cattle, mostly of a black colour, occupying the high or more mountainous districts in the northern parts of the island. They are covered with a long close coat of hair, of much the same kind as the polled and long horned breeds. They feed readily in the rich pastures in the southern parts of the kingdom, where large quantities of them are annually driven and fed for sale in the London and other markets. Their beef is generally of a fine grain, well marbled, and of a good flavour; but sometimes not so fine and bright in its external appearance as that of other sorts of cattle, being occasionally, except when made very fat, spotted with black, even upon the choicest parts. From their property of becoming quickly fat, and not being of great weight, they seem well adapted to the low, rich, grazing districts in the southern counties, where the lands are liable to be poached and injured by the heavier breeds of cattle. They seldom weigh more than from twenty to thirty stone each, though some particular ones have become considerably heavier. See **CATTLE** and **LIVE-STOCK**.

BLACK-checked eagle, of Latham's Synopsis, in *Ornithology*, is *Falco Americanus* of Gmelin.

BLACK-checked thrush of Latham, is *Turdus nigerimus* of Gmelin.

BLACK-chin grebe of Pennant, &c. *Colymbus lebrideus* of Gmelin.

BLACK-cock of Pennant, Latham, Donovan, &c. is *Tetrao tetrax* of Linnæus. The same bird is also well known by the name of *black-game*, or *black-grouse*.

BLACK-cockatoo of Latham, and *Great black cockatoo* of Edwards, is called by Buffon *Kakatoë noir*, and by Gmelin *Psittacus aterimus*.

BLACK-collared finch of Latham, is *Fringilla Abyssinica* of Gmelin.

BLACK-crowned bunting of Latham, is *Emberiza atricapilla* of Gmelin.

BLACK-crowned manakin of Latham, is *Pipra atricapilla* of Gmelin.

BLACK-crowned oriole, the English name of *Oriolus Mexicanus* of Linn. in Latham's "Synopsis of Birds."

BLACK-crowned plover of Arct. Zool. is *Charadrius atricapillus* of Gmelin.

BLACK-crowned shrike of South America is *Lanius Americanus* of Gmelin.

BLACK-crowned tanager of Latham, is *Tanagra melaniotera* of Gmelin.

BLACK-Indian-cuckoo of Edwards, is *Cuculus niger* of Linn.

BLACK-diver, or *scoter*, of English ornithologists, is *Anas nigra* of Linn. Fn. Suec.

BLACK-dolphin, in *Agriculture*, a small insect which is frequently very destructive to bean, turnip, and some other crops. Where beans are attacked with these insects, the best remedy probably is, as soon as they are first perceived, to cut off the tops by means of a scythe, as they are found to make their first lodgments, principally in those parts of the plants. See **FLY** and **TURNIPS**.

BLACK duck of Latham and other writers, in *Ornithology*, is called by Edwards the *great black duck* from Hudson's bay. This is a very distinct species from the *black duck* of Ray and Willughby, and *velvet duck* of modern naturalists. Gmelin calls it *Anas perspicillata*.

BLACK-duck, or *Great black duck* of Ray and Willughby, is the *velvet duck* of later English authors, and *Anas fusca* of the Linnæan Fauna Suecica.

BLACK eagle, in *Heraldry*, an order of knighthood instituted in Prussia, by Frederic I. 14th Jan. 1701. The ensign of the order is a gold cross of eight points, enamelled blue; in the centre whereof are the letters F. R. in cypher, and in the four angles the eagle of Prussia, enamelled black. On collar days, it is worn pendant to a rich collar of gold, composed of round pieces of gold, each enamelled with four cyphers of the letters F. R.; in the centre of the piece is set a large diamond, and over each cypher a regal crown, all richly chased, intermixed with eagles displayed, enamelled black alternately, and holding in their claws thunderbolts of gold.

The cross of the order is worn, on ordinary days, pendant to a broad, orange-coloured ribbon, across the left shoulder. The knights have embroidered on the left breast of their coats a star of silver, like that of the ensign of the order, in the centre of which is an eagle displayed black, holding in his dexter claw, a chaplet of laurel, and in the other a thunderbolt, with the motto *Suum cuique* round it. See **PLATE of Heraldry**.

BLACK-eagle of Willughby, in *Ornithology*, is *P. Aigle commune* of Buffon, and *Falco melanætos* of Gmelin.

BLACK-ears, or **BLACK-eared lynx**, in *Zoology*, called also the *Persian lynx*, and *Black-eared cat*, is the *Sigah gush* or *Siyah gush* of Charleton, and *Caracal* of Buffon. Gmelin mentions this animal under the name of *Felis caracal*. See **CARACAL**, and **SIGAH GUSH**.

BLACK-earth, in *Agriculture*, that kind of earth or mould which contains a large portion of carbonaceous or vegetable matter in its composition. Soils of this sort are capable of producing most sorts of grain and other vegetable crops in abundance. See **SOIL**, &c.

BLACK-eunuchs, in the *Custom of Eastern Nations*, are Ethiopians castrated, to whom their princes commonly commit the care of their women. See **EUNUCH**.

BLACK-eye, in *Botany*, a name given to the germ in beans, which the Romans called hilum. See **GERM**.

BLACK-eye, hypsophagma, in *Medicine*, a suffusion of blood on the *tunica adnata*, turning livid, occasioned by a blow. See ECCHYMOISIS.

BLACK-faced bunting of Latham, in *Ornithology*, is *Emberiza quelea* of Gmelin.

BLACK-faced finch of the Arctic Zoology is *Fringilla cristata* of Gmelin.

BLACK-faced ibis of Latham, is *Tantalus melanopsis* of Gmelin.

BLACK-fish, in *Ichthyology*, the name under which *Silurus anguillaris* is described in Russel's "Hist. of Aleppo." This fish has a single dorsal fin containing seventy rays, and eight beards at the mouth, namely, two on the upper lip, four on the lower one, and two on each side of the mouth. There is likewise a kind of perch mentioned by Borlase as being found in the rivers of Cornwall, which he calls the black fish. Pennant speaks of it on the authority of that writer; and Gmelin, after him, gives it as a species with some doubt. This species meant by Borlase is certainly ambiguous. See PERCA NIGRA.

BLACK-fly, in *Agriculture*, an insect of the beetle tribe, that often commits great devastation among turnip and other crops, destroying the young plants, by feeding upon their feed-leaves the moment they are protruded and appear above ground. Different remedies have been proposed for the prevention of the destructive ravages of this insect on turnips, but few of them have been attended with much success. The best method is probably, that of sowing the seed at such a season, and under such circumstances, as that its early vegetation may be quick and uninterrupted, and thereby allow little time for the insects to feed upon the plants, before they become in broad leaf, and capable of resisting its injurious attacks. See FLY and TURNIPS.

BLACK-fly-catcher of Latham, in *Ornithology*, is *Muscicapa luzonienfis* of Gmelin.

BLACK-forest, mountains of, in *Geography*, called in German Schwartzwald, extend from near Neuenburg, in the territories of Wurtemberg, south to the four forest towns on the Rhine. The southern part is called the high, and the northern the lower forest; the length being about 80 British miles. To the east the Necker may be considered as a boundary, and the breadth may be computed at about 20 British miles. The eastern part presents a gradual elevation, while the western exhibits precipitous summits to the inhabitants of Baden and Alsace. The appellation seems to be derived from the thick dark forests with which the ascents are clothed. Besides pasturage, the inhabitants, partly subject to Austria, and partly to Wurtemberg, derive advantage from the resin of the pines, and the timber, of which they make all kinds of utensils. Some parts are cultivated by spreading branches of pine, covered with sod, which, being burnt, affords an excellent manure, that prepares the ground for four abundant harvests. A branch of the black mountains spreads east from near Sulz, on the Necker, towards the county of Oettingen, being more than 60 miles in length. This chain is called the Alb, and sometimes the Suabian Alps. Busching traces this ridge from the north-east, the source of the Brenz, to the west of the Neresheim, by Wisenst-ig, where the mountains are highest. Thence they turn north-west to Guttenberg, and west to Neissen, whence they pass by Hohenzollern to the Necker, then bend south and west between that river and the Danube. Busching adds, that as this chain rises insensibly at Konigsbrown north-east, so it gradually terminates at Ebingen south-west. The principal summits are in the north and west of the ridge; and the forests are

chiefly beech; while the open spaces supply pasturage for numerous flocks of sheep. Of these two extensive ridges of mountains, the Black Forest and the Alb, a considerable portion pervades the duchy of Wurtemberg; and near Stuttgart, the capital, are the mountains of Boyseisteig, Weinsteig, and Hasensteig. The constituent parts of these extensive ridges have been little detailed; but a great part is calcareous, as they supply excellent marbles. Near Frudenstadt, in the black mountains, are mines of silver and copper.

BLACK-footed penguin, or *penguin, lesser penguin, cape penguin*, &c. in *Ornithology*, are different English names of an individual species of APHENODYTA in the works of Edwards, Latham, &c. Gmelin names this bird specifically *demersa*.

BLACK-fox, in *Zoology*. See CANIS LYCAON.

BLACK-fronted fly catcher of Latham, in *Ornithology*, is *Muscicapa nigrifrons* of Gmelin.

BLACK-fryers, in *Ecclesiastical History*, a name given to the Dominican order, called also *Predicants* and *Preaching fryers*; in France, *Jacobins*.

BLACK-game, in *Ornithology*. See BLACK-COCK.

BLACK-grass, in *Agriculture*, a species of American grass, growing in meadows which border on tide-rivers, well supplied also with fresh water; for a mixture both of fresh and salt water seems to be necessary for its prolific vegetation. Its seeds are small, like those of tobacco; its colour a deep green; and it affords from three to four tons of hay by the acre. This kind of grass thrives best on a clay or strong loam; nor is the vicinity of salt water absolutely necessary. The seeds have been lately brought over into England, and distributed for trial in proper soils.

BLACK-grosbeak of Edwards, in *Ornithology*, and the *Angola grosbeak* of Latham are the same; *Loxia augotensis* of Gmelin.—*Obs.* The *black grosbeak* of Latham is another bird; *Loxia nigra* of Gmelin.

BLACK-guillemot of Pennant and other English writers of the present times, is the *Greenland dove*, or *sea-turtle* of Albin, Ray, Willughby, and *Colymbus grylle* of Linnæus.

BLACK-headed bunting of Latham, is *Emberiza melanocephala* of Scopoli.

BLACK-headed creeper of Latham, and the *Green black-cap fly-catcher* of Bancroft, are of the same species, the latter being only a variety of the first. Linnæus calls this kind *Motacilla spiza*.

BLACK-headed duck of Shaw's travels, has been since named the *Damiatta duck* by Latham, and *Anas Damiatina* by Gmelin in the Linn. Syst. Nat.—The variety of *Anas boschas*, or *wild duck*, called *nigra*, from having the head and collar black, might be also called the *black-headed duck*.

BLACK-headed finch of Latham, is *Fringilla melanocephala* of Gmelin.

BLACK-headed fly-catcher, of Arctic Zoology: and *black-cap fly-catcher* of Catelby, is the *Muscicapa fusca* of Gmelin.

BLACK-headed grosbeak of Latham, is *Loxia erythromelas* of Gmelin.

BLACK-headed gull, the English name of *Larus rubicundus*. The same bird is also called the *peewee black-cap*, or *sea crow*, by Ray and Willughby.

BLACK-headed Indian iherus of Albin and Edwards, is *Sturnus luteolus* of the tenth edition of the Linn. Syst. Nat. and *oriolus melanocephalus* of Gmelin.

BLACK-headed nut-hatch, a variety of the common nut-hatch found in Carolina and Jamaica. Buffon and Arct. Zool. *Sitta Europea* of Gmelin.

BLACK-headed plover of Latham, is *Charadrius melanocephalus* of Gmelin.

BLACK.

BLACK-headed strike, a species of *lanius*, so called by Latham: it is the *lanius melanocephalus* of Gmelin.

BLACK and **spotted heath-cock** of Edwards, and **spotted grouse** of Pennant and Latham, are *tetrax canadensis* of Gmelin.

—*Olf.* There is another black and spotted heath-cock figured also by Edwards, pl. 71, which, in the 12th edition of the Linnæan Syst. Nat. is called *tetrax canace*.

BLACK heron of Latham, is the *ardea atra* of Gmelin.

BLACK-headed wheatear of Latham, is *motacilla pileata* of Gmelin.

BLACK-humming-bird; the Linnæan; *trochilus niger* is so named in the Synopsis of Latham.

BLACK jacana; the *jacana armata nigra* of Brisson, and *parra nigra* of Gmelin, bears this name in Latham's Synopsis.

BLACK-jack, or *Blend*, is a mineral, called also false galena and blinde, &c.

BLACK-jawed warbler of Latham, in *Ornithology*, is *motacilla nigrirostris* of Gmelin.

BLACK-Island, in *Geography*, an island near the coast of America, belonging to the state of Rhode island. N. lat. 41° 7'. W. long. 71° 35'.

BLACK islands, islands near the east coast of Labrador. N. lat. 41° 8'. W. long. 56° 30'.

BLACK kite, or *black-gled* of Sibba'd, is *falco ater* of Gmelin, and *milvus niger* of Brisson.—*Olf.* Gmelin mentions a black variety of *falco communis* under the specific name of *ater*; it was previously described by Edwards under the name of *black hawk* or *falcon*.

BLACK land, in *Agriculture*, a name given to a sort of soil which has a greyish black cast. This sort of soil, though pale when dry, always blackens by means of rain; and when ploughed up at such times, it sticks to the plough share; and the more it is wrought the muddier and darker-coloured it appears. These sorts of land, when somewhat rich, yet porous, light but sufficiently tenacious, are good both for corn and grass; but as they are mostly situated in bottoms, the wetness often spoils them for corn; but when they are dry, they are extraordinarily fruitful, especially for barley; they also bear good wheat crops. When they are very rich, they may, if a deep mould, be planted with liquorice, or sown with hemp, woad, cole, or rape, madder, and other similar plants, that best suit such lands; and afterwards with corn, when some of their fertility is expended. They are capable of bearing excellent clover crops. The best manure for these soils is chalk or lime, where it can be procured.

BLACK lark, in *Ornithology*. Albin describes an accidental variety of the common lark, *alauda arvensis*, under this name, in the third volume of his History of Birds.

BLACK lead, in *Mineralogy* &c. See LEAD and PLUMBAGO.

BLACK leather, in the *Manufactures*, is that which has passed the curriers' hands, where from the russet as it was left by the tanners, it is become black, by having been scowered and rubbed three times on the grain-side with copperas-water.

BLACK legs, a name given in Leicestershire to a disease frequent among calves and sheep. It is a kind of jelly, which settles in their legs, and often in the neck, between the skin and flesh.

BLACK legs, an appellation given to those gamblers and sharpers who prey upon the ignorance and credulity of inexperienced and unsuspecting persons of property, with whom they contrive to associate, and who submit in dissipation and luxury on the spoils acquired by deception and fraud, in a variety of games and sports which they frequent for this purpose. They are justly denominated the pest of civilized society, and should be shunned by those who have

any concern for their property or reputation, as the most dangerous and destructive enemies.

BLACK lick, in *Geography*, lies in Westmorland county, Pennsylvania, about 36 miles east of Pittsburg.

BLACK lory, of Latham, in *Ornithology*, is *psittacus novæ Guince* of Gmelin.

BLACK mail, in *English Antiquity*, a certain rate of money, corn, cattle, or other matter, anciently paid by the inhabitants of towns in Westmorland, Cumberland, Northumberland, and Durham, to diverse persons inhabiting on or near the borders, being men of name, and allied with others in those parts, known to be great robbers and spoiltakers; in order to be by them freed and protected from any pillage. Prohibited as felony, by 43 El. c. 13.

The origin of this word is much contested, yet there is ground to hold the word *black* to be here a corruption of *blank* or white, and consequently to signify a rent paid in a small copper coin called *blanks*. This may receive some light from a phrase still used in Picardy, where, speaking of a person who has not a single halfpenny, they say, *il n' a pas une blanche maille*. The term is also used for rents reserved in work, grain, or base money, which were called "reditus nigra" in contradistinction to the blanch farms, "reditus albi."

BLACK martin, or *swift* of the English, in *Ornithology*, is the *hirundo apus* of Latin writers.

BLACK monks, in *Ecclesiastical History*, a denomination given to the Benedictines, called in Latin *nigri monachi*, or *nigromonachi*; sometimes *ordo nigrorum*, the order of *blacks*.

BLACK mountains, in *Geography*. See **BLACK-Forest**. This is also a denomination given to an extensive ridge of mountains in South-Wales, separating the boundaries of the counties of Glamorgan and Brecknock; covered in summer with black-cattle and sheep.

BLACK-necked quail of Latham, in *Ornithology*, is *tetrao nigricollis* of Gmelin.

BLACK-necked swan of Pennant and Latham, stands under the name of *anas nigricollis* in the Gmelinian edition of Syst. Nat.

BLACK-necked thrush of Latham, is *turdus nigricollis* of Gmelin.

BLACK ness, in *Geography*, a foul point on the coast of France, and in the English channel, four leagues W. from Calais.

BLACK oats, in *Agriculture*, a species of oats much cultivated in the northern parts of England, and esteemed a very hearty food for horses. See **OATS**.

BLACK oriole, of the Arctic Zoology, and Latham's Synopsis, in *Ornithology*, is the *iæterus niger* of Brisson, and *oriolus niger* of Linn. and Gmel.

BLACK oriole (Lesser), the English name of *oriolus minor*, in Latham's Synopsis.

BLACK ostrich of Brown's Illustrations, &c. is *struthio camelus* of Scopoli. Gmelin, &c.

BLACK parrot of Latham, and *black parrot* of Madagascar, and of Edwards, are the same; the *psittacus niger* of Gmelin.

BLACK petrel of Latham, and *great black petrel* of Edwards, stands under the name of *procellaria equinoctialis* in Gmelin's edition of the Linn. Syst. Nat.

BLACK poll warbler of Latham, is *motacilla striata* of Gmelin.

BLACK point, and *blue point*, in *Geography*, capes of America, within those of Elizabeth and Porpoise, in the district of Maine.

BLACK point, is also a point on the west coast of Africa, between cape Cavallos, and cape Palmas.—Also, a point

BLACK.

S. E. from cape Chidley, the north point of the Labrador coast. N. lat. about $59^{\circ} 20'$.—Also, a point on the coast of Spitzbergen, or East Greenland. N. lat. $78^{\circ} 30'$. E. long. $11^{\circ} 10'$. Variation $10^{\circ} 42'$. W.

Black pool lies on the coast of Lancashire, about 25 miles S. from Lancaster. The beach is a beautiful level sand, with an extended sea before it. This place is frequented for summer bathing.

Black procession, in *Ecclesiastical Writers*, that which is made in black habits, and with black ensigns and ornaments. See **PROCESSION**.

Antiently at Malta, there was a *black procession* every Friday, where the whole clergy walked with their faces covered with a black veil.

Black rail of Latham, in *Ornithology*, is the *rallus niger* of Gmelin.

Black rat, in *Zoology*. See **MUS RATTUS**, or *Common rat*.

Black red-tail of Latham, in *Ornithology*, is the *motacilla atrata* of Gmelin.

Black vents See **BLACK MAIL**.

Black River, in *Geography*, an appellation applied to two small rivers, in Vermont, America; one falling into Connecticut river, at Springfield, and the other running north into lake Memphremagog.—Also a river in New York, which interlocks with Canada creek, and runs northwest into Iroquois river, navigable with boats 60 miles.—Also, a long river, which rises in Virginia, and passes south-easterly into Nottaway river, in North Carolina.

Black River, a British settlement at the mouth of the Tinto river, 20 leagues to the east of cape Honduras, the only harbour on the coast of Terra Firma, from the island of Rattan to cape Gracias a Dio; and for more than sixty years it was the refuge of the logwood cutters, when the Spaniards drove them from the forest of East Yucatan. This occasioned adventurers of different descriptions to settle here, where the coast is sandy, low, and swampy; but higher up, near the rivers and lagoons, which are full of fish, the soil is more fertile, and produces plantanes, cocoa-trees, maize, yams, potatoes and a variety of vegetables; and the passion for drinking induced them to plant sugar-canes. The forests are full of deer, swine, and game. The shores abound with turtle, and the woods with mahogany, zebra-wood, sarsaparilla, &c.; and the whole settlement flourishes spontaneously without cultivation.

Black River, a river of Jamaica, which passes through a level country, and is the deepest and largest in the island, so as to admit flat-bottomed boats and canoes for about 30 miles.

Black Rock, a rock in the mouth of Sligo harbour, in Ireland, which is covered about high water only, and has a conspicuous tower built on it that serves as a beacon.

Black Rock, a Rock in the bay of Galway, in Ireland, about three miles westward of Galway, which dries with spring-tide only, and requires attention in navigating that bay. M'Kenzie.

Black Rocks, rocks in the Atlantic ocean, near the west coast of Ireland, about six miles N. W. from Saddlehead, in Achil isle, and seven miles W. by S. from Blackford point.—There are rocks called by the same name in Killibeg's bay and Mulroy haven, but they are less objects of attention to the navigator. M'Kenzie.

Black Rock, a rock near the south coast of Wexford, in Ireland, about four miles W. by S. of Carnfore point, which is always above water, and may be sailed round without danger. M'Kenzie. Boate.

Black Rock, a populous village, situate on the river Tawe, about a mile above Swansea, in Glamorganshire, South Wales, where are considerable smelting-houses, and whence are exported coals, &c.

Black Rock lies also near the extreme north point of the island of Antigua, between Humphrey's bay and Boon point. N. lat. $17^{\circ} 5'$. W. long. $61^{\circ} 58'$.

Black-rod. See **GENTLEMAN USHER** *cf.*

Black-row grains, in *Minerology*, a species of iron-stone, or ore, found in the mines about Dudley, in Staffordshire.

Black Sea, in *Geography*. See **EUXINE SEA**.

Black sheep, in *Oriental History*, the ensign or standard of a race of Turkmans settled in Armenia and Mesopotamia, hence called the *dynasty of the black sheep*.

Black strike of Latham, in *Ornithology*, is *lanius niger* of Gmelin.

Black Mexican siskin of Latham, is *fringilla catotol* of Gmelin.

Black skimmer of Latham, *cut-water* of Arct. Zool., *sea crow* of Edwards, are all names of the same bird; the *Rynchops nigra* of Gmelin.

Black squirrel of Catelby, is the *sciurus niger* of Erxleben and Gmelin.

Black stones and *gems*, according to Dr. Woodward, owe their colour to a mixture of tin in their composition.

Black strakes, a range of planks immediately above the wales in a ship's side: they are always covered with a mixture of tar and lamp-black.

Black swallow of Latham, in *Ornithology*, is the *hirundo apus dominicensis* of Brisson, and *hirundo nigra* of Gmelin.

Black swan. A bird of this description inhabits Botany Bay. Its form resembles that of the common white swan; but the prevailing colour of the plumage is black, instead of white; the wings are edged with white; and the bill is red. This species is described by Dr. Shaw (*Nat. Miscel.*) under the name of *anas atrata*. It is the *black swan* of several writers who have lately treated on the history of Botany Bay.

Black tail, a beacon about 3 leagues distant from the Nore in the river Thames.

Black Tanager of Latham, in *Ornithology*, is the *emberiza atra* of the 10th edition of the Linn. Syst. Nat. and *tanagra atrata* of Gmelin.

Black tern of modern writers, is the *searocrow* of the old English ornithologists, and *cloven-footed gull* of Willughby. *Sterna fiffipes* of Brünnich and Gmelin.

Black thorn, in *Botany*, a species of the *prunus*, which see.

Black-thorn, in *Agriculture*, a species of thorn well known, and frequently used in making fences, especially in exposed situations. It is not, however, reckoned so good for fences as the white-thorn, because it is apt to run more into the ground, and is not so certain of growing; but when cut, the bushes are much the best, and most lasting of any, for dead hedges, or to mend gaps with. Cattle are not so apt to crop fences of this kind as those of the white-thorn sort. See **HEDGES**.

Black-throated barbet of Latham, in *Ornithology*, is *bucco niger* of Gmelin.

Black-throated bunting of the Arct. Zool. is *emberiza Americana* of Gmelin.

Black-throated diver of Pennant and others, is the same bird as Edwards calls the *speckled loon*, and Willughby *Wormius's northern duck*; *Colymbus arcticus* of Linnæus.

Black-throated green fly-catcher, of Edwards's Gleanings, and *green warbler* of Latham; the *motacilla virens* of Gmelin.

BLACK.

B L A C K.

BLACK-throated tanager, of Latham, the *tanagra nigricollis* of Gmelin.

BLACK-throated manakin of Latham, the *pipra nigricollis* of Gmelin.

BLACK throated thrush of Latham, is *turdus ater* of Gmelin.

BLACK throated warbler, of the Asiatic Zoology, is *motacilla Canadensis*, of Gmelin.

BLACK tiger, in Zoology. See FELIS DISCOLOR.

BLACK-tin, in Mineralogy, a denomination given to the tin-ore when dressed, stamped, and washed ready for the blowing-house, or to be melted into metal. Phil. Trans. No. 69. p. 2110.

It is prepared into this state by means of beating and washing; and when it has passed through several buddies or washing-troughs, it is taken up in form of a black powder, like fine sand, called *black tin*.

BLACK-toed gull of Pennant, Latham, Walcot, &c. in Ornithology, is the *larus crepidatus* of Hawkesworth and Gmelin.

BLACK-toed petrel. The Gmelinian *procellaria melanopus* is described under this name in Latham's Synopsis of Birds.

BLACK town, in Geography, a settlement of 1200 free negroes, erected in 1783, about a mile from the town of Shelburne, in Nova Scotia.

BLACK twitch, in Agriculture, a noxious weed, probably the *polygonum convolvulus*, which flourishes even in extremely dry seasons, and is very injurious to many crops.

BLACK vomit, in Medicine, a disease to which the inhabitants of Spanish North America are subject, said to be allied to the yellow fever of the United States, and which, at intervals, ravages the country like a pestilence. See FEVER.

BLACK vulture of Willughby and Latham, in Ornithology, is *vultur niger* of Ray, Brisson, and Gmelin.

BLACK vulture (crested) of Edwards, the *vultur monachus* of Gmelin.

BLACK woodpecker, (greatest), Albin, Donovan, &c. the *picus martius* of Linn. Fn. Suec.

BLACK wadd. See WADD.

BLACK-winged parakeet of Brown's Illustrations, in Ornithology, is called by Gmelin *psittacus melanopterus*.

BLACK-winged thrush of Latham, is *turdus lambla* of Gmelin.

BLACK and white butcher-bird. Under this title the Linnæan *lanius doctatus* is described and figured by Edwards in his History of Birds. Latham calls it the *pie'd shrike*.

BLACK and blue creeper of Edwards's Gleanings, the *certhia cyanea* of Gmelin.

BLACK and violet creeper of Latham, is *certhia Brasiliiana* of Gmelin.

BLACK and white creeper of Edwards, and *small black and white bird* of Ray and Sloane, are *motacilla varia* of Gmelin.

BLACK and white king's fisher of Edwards and Latham, is the *alcedo rudis* of Gmelin.

BLACK and white wagtail of Ray, is the *pie'd wagtail* of Latham, *motacilla maderaspatana* of Brisson, and *motacilla maderaspatensis* of Gmelin.

BLACK, white, and red Indian creeper of Edwards, is the *certhia cruentata* of Linn. and Gmel.

BLACK and yellow creeper. *Certhia flaveola* of Gmelin is described under this name both by Edwards and Latham.

BLACK and yellow dove of Brasil. Edwards under this title describes a variety of *oriolus Perficus*. Linn.

BLACK and white diver (small) of Willughby and Edwards, is *alca alca* of Linnæus. This bird is likewise called

the *Greenland dove*, or *sea turtle*, by Albin; and is known among later writers by the name of the *little auk*. Pennant. Donov. Brit. Birds. &c.

BLACK and white dobchick of Edwards, is the *duffy grebe* of later writers; *Colymbus obscurus* of Gmelin.

BLACK and white duck (little) of Edwards, and *spirit of Arct. Zool.*, are *anas albeola* of Gmelin.

BLACK and white Indian falcon, the English name of *falco melanoleucus* (Gmel.) in Pennant's Indian Zoology, and Latham's Birds.

BLACK and orange finch of Latham, and *small black and orange bird* of Sloane and Ray, is *fringilla melaniœra* of Gmelin.

BLACK and white fly-catcher of Edwards's Gleanings, is *muscipapa bicolor* of Gmelin.

BLACK and white gull of Ray, Willughby, and Albin, is the *black-backed gull* of modern ornithologists. Linnæus calls it *larus marinus*.

BLACK and blue humming-bird of Bancroft, is called by Gmelin *trochilus cyanomelas*.

BLACK and yellow manakin of Edwards, is the variety β of the Gmelinian *pipra aureola*.

BLACK and orange-coloured bird (small) of Ray and Sloane, is *motacilla ruticilla* of Linnæus, and *muscipapa ruticilla* of Gmelin. This is likewise the *black-beaded warbler* of Latham, *small American redstart* of Edwards, and *yellow-tailed fly-catcher* of Edwards's Gleanings.

BLACK and white Chinese pheasant of Edwards. This is *phasianus nycthemerus* of Scopoli and Gmelin. It is likewise called the *penicilled pheasant* by Latham and other late writers.

BLACK and yellow frizzled sparrow of Edwards's Gleanings, is the *frizzled finch* of Latham, and *fringilla crispa* of Gmelin.

BLACK and white starling of Willughby, is *sternus leucomelas* of Brisson, which Gmelin gives as a variety of the common stare, or starling, *sternus vulgaris* of Linnæus.

BLACK and white Indian starling of Edwards. This is *sternus contra* of Gmelin.

BLACK and blue tanager of Latham, is the *black and blue tinnoufe* of Edwards, and *tanagra Mexicana* of Gmelin.

BLACK whytlof, in our *Old Writers*, bread of a middle fineness betwixt white and brown, called in some parts *ravel-bread*.

In religious houses, it was the bread made for ordinary guests, and distinguished from their household loaf, or *panis conventualis*, which was pure manchet, or white bread.

BLACK-work, iron wrought by the blacksmith; thus called by way of opposition to that wrought by white-smiths.

BLACKALL, OFFSPRING, in Biography, an English prelate, was born at London, in 1654, and educated at Catherine hall, in the university of Cambridge. Besides several promotions in London, he was appointed one of the chaplains in ordinary to king William, though his principles were adverse to the revolution government, and he refused for two years to take the requisite oaths to king William and queen Mary. On the 30th of January 1699, he preached a sermon before the house of commons, in which he animadverted on a passage in Mr. Toland's life of Milton, who, after stating the proofs that Dr. Gauden, afterwards bishop of Exeter, was the true author of the book entitled "Icon Basilike," and ascribed to Charles I., observes, that many supposititious pieces, under the name of Christ, his apostles, and other great persons, were published and approved in the primitive times. But as Mr. Toland, in his Amyntor, published in the same year, avowed his belief of

the genuineness of the books of the New Testament, Mr. Blackall closed the dispute by the publication of a small pamphlet in 12mo. entitled "Reasons for not replying to a book lately published, entitled *Amyntor*." In 1700 he preached a course of sermons at Boyle's Lecture, published in the first volume of the collection of those sermons. In 1707, he was promoted to the see of Exeter; and in 1709, he was engaged in a controversy with Hoadly, concerning the institution of civil government, and the measures of submission. With respect to this controversy it is sufficient to observe, that the bishop defends the high-church, tory principles, as they are usually called, of the divine institution of magistracy, and unlimited passive obedience, and non-resistance, which Hoadly opposes. This prelate, whose private character, and style of preaching, are highly extolled by sir William Dawes, archbishop of York, in the preface to his Sermons, died at Exeter, Nov. 29th, 1716. His sermons were collected and published in 2 vols. folio, Lond. 1723. Gen. Dict. Biog. Brit.

BLACKAMOR'S HEAD, in *Chemistry*, consists of a conical vessel, surrounded with another of a cylindrical form, filed with cold water, and having a cock to draw it off, when it is become too warm. Both vessels are made of copper. In the figure, one half is left open to shew the cone; the inclination of the sides of which, according to Chaptal, is most proper, when forming an angle of 75 degrees with the base. See *Plate of Chemistry*.

BLACKBALL HEAD, in *Geography*, a cape on the S.W. coast of Ireland, at the north side of the entrance into Bantry bay in the county of Cork. N. lat. 51° 32'. W. long. 9° 55'. M. Kenzie and Beaufort.

BLACKBURN, WILLIAM, in *Biography*, an eminent surveyor and architect, was born in Southwark, Dec. 20, 1750, and having acquired some knowledge of his profession, in the ordinary course of education, he was admitted a student at the Royal academy. By this academy he was presented in 1773, with the medal for the best drawing of the inside of St. Stephen's church in Walbrook; and the delivery of it by the president, sir Joshua Reynolds, was accompanied by a distinguished tribute of respect to his abilities. About this time he entered into business in the place of his nativity; but a circumstance occurred in a few years which served to establish his reputation, and to introduce him into very general notice. In 1779 an act of parliament was passed for the erection of places of confinement, under the denomination of 'penitentiary houses.' Two edifices of this kind were proposed to be constructed; one for the confinement and employment of 600 males, and the other for the accommodation of 300 females. The three supervisors first authorized by his majesty for carrying into effect the provisions of this act, were John Howard esq., George Whatley esq., and Dr. John Fothergill. The death of Dr. Fothergill, and the resignation of Mr. Howard, dissolved this commission; and the charge was devolved, in 1781, on sir Gilbert Elliot, sir Charles Bunbury, and Thomas Bowdler esq. The principal object of the plan proposed was to combine, in the buildings to be erected, solitary confinement, with useful labour and moral reformation. Accordingly premiums were announced to those who should produce the best plans. The highest premium of 100 guineas was unanimously assigned, in 1782, to Mr. Blackburn. In consequence of this distinction, he was appointed by the supervisors to the office of architect and surveyor of the projected buildings. The designs of government, after several preparatory steps had been taken, were never accomplished. However schemes of a similar kind were projected in various parts of the country, and the execution of them was en-

trusted to Mr. Blackburn. Whilst he was busily employed in the completion of various designs of this kind, and whilst he was prosecuting a journey to Scotland, for the purpose of erecting a new gaol at Glasgow, he died suddenly, Oct. 28th, 1790, at Preston in Lancashire; and his remains were removed to London, and interred in the burying ground of Bunhill-fields.

Mr. Blackburn's skill as a draughtsman and an architect, was not confined to prisons and penitentiary houses; but he was occupied, as far as his time would allow, in preparing various designs for churches, houses, villas, &c.; and in his drawings and designs he always manifested a correct taste, and a thorough knowledge of the science to which he was practically devoted. His friends, and the public in general, very justly lamented, that by the corpulence to which he was inclined from his early youth, and the increase, of which no abstinence, nor any mode of regimen, would restrain, he was removed from a scene of usefulness and reputation, at so early a period as the 40th year of his age. As to his religious profession, he was a protestant dissenter of the presbyterian denomination; but he combined with an undisguised and laudable avowal of his own sentiments, the most liberal and candid opinion and conduct with respect to all who differed from him. In his natural temper he was cheerful and lively; in his conversation agreeable, animated, and instructive; in his private character amiable and respectable; and in all the relations and intercourses of domestic and social life, esteemed and honoured. In 1783, he married the daughter of Mr. Joshua Hobson, an eminent builder, of the denomination of quakers, by whom he left four children.

BLACKBURN, in *Geography*, a town of Lancashire, England, is seated in a valley surrounded with hills. It consists of several streets, irregularly laid out, but intermixed with good houses. Besides the parish church, here are a newly erected chapel of the establishment, and five places of worship for as many different sects of dissenters. A free-school was founded by queen Elizabeth, and the necessitous poor of the town are comfortably provided with a poor-house, which has land attached to it for the pasturage of cattle.

The market, on Mondays, is chiefly supplied with provisions from Preston. Besides this, here are a fortnight market for cattle, &c. and an annual fair. The town is approached by four stone bridges crossing the river Derwent, whose water, being of rather a blackish hue, is said, by some writers, to have given name to the town. Blackburn has been noted for its manufactures, particularly for an article called *Blackburn-greys*, which were plains of linen-warp shot with cotton. The prosperity of Manchester, and the great influx of manufacturers to that town and its neighbourhood, have deprived Blackburn of its usual trade; yet some cottons, calicoes, and muslins are still made here, and the fields around the town are frequently covered with materials to bleach.

The church of Blackburn, previous to the reformation, was attached to the abbey of Whalley. It is now a rectory, possessed by the archbishop of Canterbury, who also owns half of the town, which he lets on leases of 21 years. The parish of Blackburn includes 24 townships, and embraces about half the hundred of the same name. The land round the town is mostly a sandy soil, and consequently unpropitious to agriculture. Coal is found in the southern part of the parish, and in great plenty at Darwen, about four miles south of the town. An alum mine was found, and much worked here, in the time of Fuller, but from the depth of the strata, and consequent expence, it was afterwards neglected. Sir George Colebrook, wishing to monopolize all the

alum of the country, purchased this, with other mines; but failing in his unjust speculations, was obliged to relinquish the works at Blackburn. (See ALUM.) Blackburn contains 2352 houses, 11,980 inhabitants, and is 211 miles N.W. from London. Aikin's description of the country round Manchester, 4to. 1795.

BLACKBURN, the name of a river in Scotland celebrated for its romantic cascades, for the bold and picturesque scenery adorning its banks, and for a singular natural bridge which stretches across the stream, in the parish of Caskletown. The latter is deemed one of the greatest curiosities in Scotland. "It is 55 feet long, 10 feet wide, and the thickness of the arch is two feet four inches of solid stone. It is not composed of one entire rock, but has the appearance of many stones of about one foot and a half square, set neatly together. The bridge slopes a little downwards, and the water rushes under the arch, through an opening of 31 feet. Among the cascades, which ornament and enliven this stream, is one of above 37 feet in height, and 20 feet in width; another 31 feet high, and 36 feet broad; and a third 27 feet in height. These waterfalls, combining with the romantic character of the rocks, and the constant roar of the dashing stream, present a great number of highly picturesque and interesting scenes. In this wild and romantic vale, nature appears in various forms, now beautiful, then awful, sometimes sublime, and frequently terrible." Sir John Sinclair's statistical account of Scotland, vol. xvi. communicated by the Rev. Mr. Arkle.

BLACKBURNE, FRANCIS, in *Biography*, a clergyman of the church of England, distinguished by his firm attachment to the cause of civil and religious liberty, and by his zealous exertions in the promotion of it, was born of respectable parents at Richmond, in Yorkshire, on the 9th of June 1705. Having pursued a course of classical education, first at Kendal in Westmorland, and afterwards at the free schools of Hawkshead in Lancashire, and of Sedbergh in Yorkshire, he was admitted, in May 1722, pensioner of Catherine hall, in the university of Cambridge; where he took the degree of bachelor of arts, and was chosen conductor or chaplain-fellow of the society; and on this title he was ordained deacon in March 1728. At this time he flattered himself with the expectation of a foundation-fellowship; but his avowal of sentiments with regard to ecclesiastical and civil liberty, which he had acquired by the perusal of the writings of Locke, Hoadly, &c. rendered him obnoxious to a majority of the fellows, who, being high royalists on the principle of hereditary right, set aside his just claims as the only qualified candidate, and precluded his election, by indulging Mr. Addenbroke with an extraordinary year of grace, and thus keeping the fellowship full. This disappointment induced him to resign his conductship, to quit the university, and to live in retirement with his uncle, Thomas Comber, esq. of East Newton, near Helmsley in Yorkshire, till some church preferment might occur. His views, indeed, were particularly directed to the living of Richmond, the place of his nativity; to which he was inducted upon the death of the incumbent in 1739, having previously qualified himself for it by taking priest's orders. During the interval of his retirement at East Newton, he casually found some old books that had formerly belonged to his great grandfather, an Oliverian justice; and by the perusal of these he was led to entertain favourable sentiments of the manners and principles of many excellent old puritans, to admire their unaffected and disinterested piety, and their zeal for the spiritual good of mankind, and to cherish that moderation and liberality of temper, and that ardent concern for liberty, which distinguished his future conduct. As soon as

he was invested with a parochial cure, he devoted himself with exemplary diligence to the studies and duties appropriate to his pastoral office, which he discharged, during a residence among his parishioners of 48 years, no less to their satisfaction and improvement than to his own honour. His first appearance as an author was in the year 1742, when he published an "Affize Sermon," preached at York. About the same time he wrote two pamphlets concerning the illegal removal of the consistory court and its records from Richmond to Lancaster, which, in consequence of a petition from the mayor and corporation to the bishop of Chester, were restored. In 1748, he employed a young person, who was his curate, to translate Erasmus's preface to his paraphrase on the gospel of St. Matthew; and having written "A Preliminary Discourse addressed to the Roman Catholic gentry and laity of Great Britain," he circulated a cheap edition of it, recommending it to the public, partly as an antidote against popery, but chiefly as an encouragement to the common people to be diligent in reading the scriptures, for the information and improvement of themselves and families in Christian knowledge and Christian piety. It was not, however, till the year 1750, that Mr. Blackburne began to distinguish himself as a writer in defence of Christian liberty. A work had been published in the preceding year, intitled "Free and Candid Disquisitions relating to the Church of England." This work contained many pertinent observations on existing defects and improprieties in the established forms of the church, and proposals for revising the liturgy, and amending such passages, as were liable to reasonable objections. Mr. Blackburne was suspected by many, who were acquainted with his sentiments on the subject of an ecclesiastical reform, to have had a concern in this publication. But though he had corresponded with the compiler and editor of it, and had seen the greatest part of the work in manuscript, he had neither written nor suggested a single line or word. Indeed, he disapproved the style and spirit of it; and thought them by no means adapted to the occasion, nor likely to produce effect. "He was rather, perhaps too much (says his biographer), inclined to look upon those who had in their hands the means and the power of reforming the errors, defects, and abuses in the government, forms of worship, faith and discipline of the established church, as guilty of a criminal negligence, from which they should have been roused by sharp and spirited expostulations." Nevertheless, he thought it his duty to repel the attacks of the adversaries of this work; and accordingly, he published, without the knowledge of its editor, or any of his more confidential associates, an "Apology for the Authors of the Free and Candid Disquisitions," 1750. But though he engaged in this controversy, his attention was not diverted from parochial duties; for his next publication was "A short Discourse on the Nature, Obligation, and Benefits of Family Religion," which he published at his own expence, and distributed among his parishioners. In this same year 1750, notwithstanding the publication of his "Apology," he was collated to the archdeaconry of Cleveland, and also to the prebend of Bilton, by Dr. Matthew Hutton, then archbishop of York, to whom he had been for some years titular chaplain. Towards the close of the year 1752, he had an opportunity of perusing the charge delivered by Dr. Butler, bishop of Durham, to the clergy of his diocese at his primary visitation in 1751; and he found in it some doctrines which were, in his opinion, so diametrically opposite to the principles on which the protestant reformation was founded and supported, as to deserve being exposed and censured, in order to prevent the mischief which they might do under the sanction of his name. Accordingly, he wrote strictures upon them; and, in opposition

to the remonstrances of a friend who dissuaded him from publishing them, lest they might be the means of preventing his further preferment, he committed them to the press under the title of "A serious Enquiry into the Use and Importance of external Religion, &c." This piece, which was afterwards printed by Mr. Laron, in the 4th volume of a collection of tracts, entitled, "The Pillars of Priestcraft, and Orthodoxy shaken," and ascribed to him as its author, gave great offence, particularly to archbishop Secker, and precluded all hopes of preferment in the church, if indeed he had indulged any such hopes, under episcopal patronage. The next subject of importance, which engaged his attention, was the doctrine of an intermediate state. To this he was led by an "Appendix" to Dr. Law's "Considerations on the Theory of Religion," which appeared in 1755, and which inculcated the tenet of the sleep of the soul. This opinion was attacked from several quarters, and particularly by Dr. Goddard, master of Clare-hall, in a sermon preached at St. Edmund's Bury. Mr. Blackburne defended his friend Dr. Law, in a publication entitled "No Proof in the Scriptures of an intermediate state of happiness or misery, between death and the resurrection." He also published several other pieces on the same topic; such as "Remarks on Dr. Warburton's account of the sentiments of the early Jews concerning the soul;" and "A Review of some passages in the last edition of the Divine Legation of Moses demonstrated," which appeared in 1759, and may be considered as a sequel to the "Remarks." He also prepared a reply to Dr. Morton, Mr. John Steffe, and Dr. Caleb Fleming, who had published strictures on Dr. Law's Appendix; and he pursued the discussion of the subject more at large in a work, first published in 1765, and afterwards with considerable additions in 1772, and entitled "A short historical View of the Controversy concerning the intermediate state between death and the resurrection, with a prefatory discourse on the use and importance of theological controversy." In 1756, our author published "Some Sentiments of a country divine concerning the Ordinance of Baptism, &c." occasioned by letters which passed between bishop Clayton and Mr. Penn on that institution. In the correspondence between these writers, a difficulty occurs in the interpretation of the charge given by our Lord to his apostles. Matt. xxviii. 19. Our Lord, it is said, prescribes *one* precise form of words to be used in baptism; the apostles appear, from the Acts and Epistles, to have used *another*; and the evangelists Mark, Luke, and John, do not mention *any precise form* whatever. Various hypotheses have been proposed by Grotius, Lymborch, Lightfoot, Whitby, Clayton, &c. for reconciling the practice of the apostles with the precept of Christ. Mr. Blackburne, dissatisfied with all these, suggests that the words in question contain no baptismal form at all; and that we should rather follow the apostolical form in Acts, as being derived to us by the authority and example of men, who must be perfectly satisfied that the foundation they built upon was sound and good. Accordingly, he proposes that we should read the passage in St. Matthew thus; *Πορευθητε εις παντησους τας εθνας (Βαπτιζοντες αυτους) εις το ονομα του πατρος, και του υιου, και του πνευματος, αγιου;* "Go ye therefore, and disciple all nations (baptizing them) into the name of the Father, and of the Son, and of the Holy Ghost." By construction and parenthesis, the command to baptize refers to no particular form at all, and leaves us to suppose, what was certainly the truth of the matter, that the apostles being already well acquainted with the form used in the baptism of Jesus, it was quite superfluous to enjoin it here.

In 1758, Mr. Blackburne avowed the sentiments which he had for some time entertained concerning subscription to the

liturgy and articles of the church of England, in "Remarks on the Rev. Dr. Powell's sermon in defence of subscriptions, &c." preached in the preceding year before the university of Cambridge, to which is prefixed "An Address to the younger Students in both our universities." The subject of subscription had indeed for some time engaged his attention; and it was not without scruples that he had qualified himself to hold the archdeaconry and prebend in 1750; but when he had reason to expect further advancement in the church, he refused the consideration of the subject, and the result was a determination never to renew his subscription. About this time he began to make collections for his famous work entitled "The Confessional, or a full and free Enquiry into the right, utility, and success of establishing Confessions of faith and doctrine in Protestant churches." This work, in the execution of which he was much encouraged by Dr. Edmund Law, afterwards bishop of Carlisle, lay by him in manuscript for several years, and was at length published in 1766, 8vo. without his name. It excited, as we may naturally imagine, very general attention both among the partizans of reform and the advocates for existing establishments. A second edition appeared in 1767; and the controversy, which it occasioned, lasted for some years, and produced a great number of publications. The third edition, corrected and much enlarged, was published in 1770; and to this edition has been added from the author's manuscript, in the late collection of his works, an appendix, containing a short history of the confessions established in the church of Scotland at different periods. For a further account of the subject of this work, and of the arguments for and against subscription, see SUBSCRIPTION. Soon after the publication of the third edition of the "Confessional," the author was induced by several of his friends to draw up and publish "Proposals for an application to parliament for relief in the matter of subscription to the liturgy and thirty nine articles of the established church of England, humbly submitted to the consideration of the learned and conscientious clergy of the said church." An association was formed for this purpose, for the result of which, see ASSOCIATION.

It was natural to imagine, that the author of such a work as the "Confessional," written with a view of examining and refuting the several pleas that had been urged in favour of subscription, and which had convinced many persons of the insufficiency of these pleas, would have wished to withdraw himself from the established church, which imposed a subscription that appeared to him to be unjustifiable; and accordingly, as the death of Dr. Chandler, in 1766, occasioned a vacancy in the respectable congregation of dissenters at the Old Jewry, in London, some individuals of that society applied to Mr. Blackburne for information, whether such a situation would be agreeable to his views, if it were offered to him. But, with the prospect of a very considerable accession to his income, he declined accepting the proposal, for reasons that were very satisfactory to those who made it. The clear amount of all that he possessed, as a beneficed clergyman, never much exceeded the sum of 150l. a year; whereas, if the removal that had been suggested to him had taken place, his income would have been nearly trebled. Some other circumstances also afterwards occurred, which had a tendency to detach him from the established church. Two very respectable clergymen, immediately connected with his own family, viz. the learned Mr. Theophilus Lindsey, whose excellent character those who are most adverse to his theological opinions concur in applauding, and his son-in-law, Dr. Disney, no less esteemed by all who know him, surrendered their preferments, because they disapproved the doctrine and forms of the established church.

Mr. Blackburne, however, though he agreed with his valued relatives in many of their objections to the liturgy and articles of the church, differed from them with regard to several doctrinal points of importance; and without seeming to advert to his past subscription; in consequence of which he still held his church preferments, he satisfied himself with refusing any further preferment, which was actually offered to him, because he was determined not to renew his subscription. His continuance in the church cannot be justly ascribed to any selfish and interested motives, because he might have left it with advantage, and he remained in it with a fixed purpose of accepting no preferment; and he refused very considerable offers of this kind. But, in order to vindicate his consistency, he thought it right to avow his motives for continuing minister in the church, while he disapproved many things in her doctrine and discipline; and with this view he drew up a short paper containing "An Answer to the question, Why are you not a Socinian?" and also his reasons for officiating in a church, whose forms of faith, worship, and discipline, he thought to be in many things highly exceptionable. Those who wish for satisfaction on these points, are referred to the Appendix annexed to the Memoirs of his Life, p. 120. We shall content ourselves with observing, that Mr. Blackburne was a firm believer of the pre-existence of Christ, and that he also maintained his divinity, with limitations according to his own ideas, which he believed to be founded on the Scriptures; and with regard to the general sentiments of his creed, he is said to have more than once declared himself a moderate Calvinist. Whatever may be the inconsistency which some persons have charged upon his conduct, he manifested his esteem for the church, not only by continuing his own connection with it, but by educating a son for the clerical office, though the condition of performing any duties, or enjoying any emoluments in that church, was subscription, the imposition of which he had strongly reprobated and condemned. On this subject the further discussion of which would lead us beyond our province as biographers, we shall only say, "Let every man be fully persuaded in his own mind; to his own master he standeth or falleth." See SUBSCRIPTION.

Having been accustomed from early life to regard the Roman Catholics as dangerous foes to the government and religion of his country, Mr. Blackburne, notwithstanding the enlarged and liberal sentiments avowed by him on all other occasions, wrote against them with a severity which the friends of freedom have generally condemned. But an alarm with regard to the spread of popery, and the evils to be apprehended from it, prevailed very much at the time; and this induced him, in 1768, to publish a caution against it, under the title of "Considerations on the present state of the controversy between the Protestants and Papists of Great Britain and Ireland, particularly on the question, how far the latter are entitled to toleration upon Protestant principles."

During the intervals of his other professional and literary engagements, he employed himself in collecting materials for the life of Martin Luther, which he proposed to write according to the pattern of Dr. Jortin's life of Erasmus; but he was diverted from accomplishing his design, first by the death of his friend Thomas Hollis, esq. of whom he published "Memoirs" in 2 volumes 4to. in 1780. and afterwards by the loss of his second son Thomas, in 1782, a physician of rising eminence in the city of Durham, which so affected him as to render him incapable of finishing several things which he had undertaken. Soon after his eye-sight failed him, and he was under the necessity of employing an amanuensis. His mind, however, was still enterprising and active; nor

was he prevented by the increasing infirmities of age from prosecuting the object of ecclesiastical reformation, which seems to have occupied his thoughts to the latest period of his life, and from performing his professional duties. Having in the last year of his life prepared a charge for his 38th annual visitation in Cleveland, we caused it to be delivered by his eldest son, who stood by him, and then took leave of his clerical brethren, with an address equally pious and affectionate, that must have deeply impressed the minds of all who heard it. At the close of his visitation circuit, he was taken ill at the house of a friend, and apprehensive of approaching dissolution, hastened to his rectory at Richmond with all the expedition which the state of his health allowed. Within a few weeks after his return, on the morning of August 7th 1787, in his 83d year, he finished the protracted course of a studious and exemplary life, with the sentiment of the amiable Erasmus, and the benevolent Jortin, "I have had enough of every thing in this world." and expired, as he sat in his chair, without a groan. He left a widow, who died August 20th 1799. and four children; viz. Jane, married to the Rev. Dr. Disney, now minister of the Unitarian society in Essex-street, London: the Rev. Francis Blackburne, vicar of Brignal, near Greta bridge, Yorkshire; Sarah, married to the Rev. John Hall, vicar of Chew Magna, and rector of Dundry in Somersetshire; and William Blackburne, M.D. of Cavendish-square, London.

Few persons have ever been more regular and assiduous in the performance of professional duties, whether we consider him as a parish priest, or as an archdeacon, than Mr. Blackburne. Possessing naturally a strong constitution of body, and great firmness of mind, which he preserved by temperance to a very advanced period, he was capable of intense and continued application. He was likewise animated in the discharge of his clerical functions by a conviction of their importance, and by an ardent desire of promoting the best interests of those with whom he was connected. In composing for many years new discourses, whenever he officiated, and also charges for his archidiaconal visitations, and in preparing for the press a variety of publications, a great part of his time must have been spent in study and retirement; and hence he is said to have acquired the appearance of austerity; nevertheless with his intimate friends and associates he was cheerful and unreserved. As a writer he was nervous and animated; and his public discourses were delivered with an unaffected earnestness, which proceeded from conviction of the importance of religious truth and duty, and which interested and impressed those who heard him. In his controversial writings, it must be acknowledged, and he himself lamented it towards the close of his life, that he was occasionally betrayed into precipitance of judgment and asperity of language: but it should be recollected, that he contended with a host of adversaries, whose mode of attack sometimes provoked and justified his resentment; and that his vehemence and ardour were always accompanied with a high sense of integrity and honour, and a laudable solicitude for serving what he conceived to be the cause of truth and liberty. The topics of his numerous publications, the principal of which we have above recited, were chiefly theological or controversial; nevertheless he was an occasional writer on political liberty, and he largely contributed to a collection of letters and essays on this subject, published in 3 vols. 8vo. 1774. A collection of his "Works, theological and miscellaneous, including some pieces not before printed, with some account of the life and writings of the author, by himself, completed by his son Francis Blackburne, L.L.B. and illustrated by an appendix of original papers," has this year (1804) been published in 7 vols. 8vo. The following respectful

specific and just tribute to his memory closes his son's account of his life and writings: "Such was Francis Blackburne; a believer of Christianity, from the deepest conviction of its truth; a Protestant on the genuine principles of the reformation from popery; a strenuous adversary of superstition and intolerance; and of every corruption of the simplicity or the spirit of the gospel; a zealous promoter of civil liberty; a close and perspicacious reasoner; a keen and energetic writer; an attentive, benevolent, and venerable archdeacon; an eloquent and persuasive preacher; a faithful pastor and exemplary guide; of unblemished purity of life, of simple dignity of manners; a sincere and cordial friend; an affectionate husband, and an indulgent father; in short, a just, humane, pious, temperate, and independent man."

BLACKBURNIA, so named by Forster, in honour of John Blackburne, esq. and his daughter Anne, of Orford in Lancashire, in *Botany*. Lin. gen. Schreb. n. 199. Forster gen. 6. Class and order, *Tetrandria Monogynia*. Gen. Char. *Cal.* perianth very short, four-toothed, inferior; teeth short, acute, horizontal. *Cor.* petals four, elliptic. *Stam.* filaments four, subulate, rather shorter than the petals; anthers heart-shaped, erect. *Pist.* germ conic; style filiform, erect, length of the stamens; stigma simple. *Per.* berry. *Seed* single.

Ess. Char. *Cal.* four-toothed; *pet.* four, elliptic; *anth.* heart-shaped; *germ* conic; *stigma* simple. *Per.* berry, with a single seed.

Species 1. *B. pinnata*. Forst. gen. 6. t. 6. fl. Austr. n. 53. *Ptelea pinnata*. Linn. suppl. 126. A native of Norfolk island; found there in 1774. Martyn.

BLACKBURNIÆ, in *Ornithology*, a species of **MOTACILLA**, described in the Arctic Zoology under the name of the blackburnian warbler. The crown is black, with a yellow line in the middle; band through or across the eye black, as are also the lesser wing coverts; greater wing-coverts, vent. and lateral tail-feathers white, the middle ones being dusky black; sides of the neck, chin, and middle of the belly yellow. A native of New York.

BLACKHEAD, in *Geography*, a cape on the east coast of Ireland, at the north entrance into Belfast Lough. N. lat. 54° 45'. W. long. 5° 35'.

BLACKHEAD, a cape on the western coast of Ireland, in the county of Clare, on the south side of the entrance into Galway bay. N. lat. 53° 7'. W. long. 9° 11'.

BLACKHEAD, a cape on the south coast of Ireland, within the old head of Kinsale, and on the west side of Kinsale harbour. N. lat. 51° 38'. W. long. 8° 30'.

BLACKHEAD, a cape on the west coast of Scotland, in the county of Wigton; 6 miles W.S.W. of Stranraer.

BLACKHEAD, a point of land between Falmouth haven and the Lizard point.—Also, one of the peaks between Fermow's harbour on the east coast of Newfoundland, and *Agua fort*; Bald head being the other.—Also, a point on the south coast of Newfoundland, west of cape Race, and half a league further west from cape Pine.—Also, a point on the east coast of the northern island of New Zealand, N.N.E. of cape Turnagain, in about 40° 18' S. lat.

BLACKING, in the *Arts*, &c. is sometimes used for a facitious black, a lamp-black, shoe-black, &c. A mixture of ivory or lamp-black with linseed oil, makes the common oil-blacking. For a shining blacking, small beer or water is used instead of oil, in the proportion of about a pint to an ounce of the ivory black, with the addition of half an ounce of brown sugar, and as much gum Arabic. The white of an egg, substituted for the gum, makes the black

more shining; but is supposed to hurt the leather, and make it apt to crack.

In 1771 a patent was granted to Mr. William Bayley for preparing a composition in cakes, rolls, or balls, which, with the addition of water only, makes an excellent shining liquid blacking for shoes, boots, &c. The recipe for this purpose is as follows: Take one part of the gummy juice that issues, in the months of June, July, and August, from the shrub called the goat's thorn, four parts of river water, two parts of neat's foot, or some other softening lubricating oil, two parts of superfine ivory-black, two parts of deep blue, prepared from iron and copper, and four parts of brown sugar-candy. Evaporate the water; and, when the composition is of a proper consistence, let it be formed into cakes of such a size, that each cake may make a pint of liquid blacking.

BLACKLOCK, THOMAS, in *Biography*, was born in 1721, at Annan in Scotland, of parents, who were natives of Cumberland, and who occupied a humble station. At the age of 6 months he was deprived of his sight by the small-pox; and thus becoming incapable of any mechanical employment, he was in the probable course of nature destined to be a perpetual charge to his parents. His disposition, however, as he advanced towards maturity, engaged the most affectionate attention; and the kindness of his father was such as to impress his youthful mind, and to engage expressions of ardent gratitude. The powers of his mind were no less distinguished than the amiableness of his temper; and he improved the casual opportunities of cultivating them, which were afforded him by the attention of his father and friends, who read to him several passages out of English authors, and particularly from the works of our most approved and popular poets. These he heard with avidity and delight; and at the early period of his 12th year, he began to imitate what he admired. His performances, as he advanced towards maturity, became the subjects of general conversation; and having the misfortune to lose his father in his 19th year, he was invited, at the age of 20, by Dr. Stephenson, physician at Edinburgh, to remove thither and to pursue his studies at the university. Notwithstanding the personal disadvantages under which he laboured, he made very considerable progress in the Latin, Greek, and French languages; but upon the breaking out of the rebellion in 1745, his studies were interrupted, and he retired into the country. On this occasion he was solicited by his friends to publish a small collection of his poems at Glasgow. When the tumult of the rebellion subsided, he returned to Edinburgh, and to the prosecution of his studies for 6 years more, during which period he not only perfected himself in the languages, but made considerable progress in all the sciences, and particularly in polite literature. In 1754, he published a second edition of his poems, much improved and enlarged; and thus gained the patronage of Mr. Spence, who, by an account of his life, character, and poems, brought him into general notice. By means of a subscription to a 4to. edition of his poems, his circumstances were rendered easy and comfortable; and applying himself to the study of theology, he passed the usual trials, and was licensed in 1759 to be a preacher by the presbytery of Dumfries. From the discharge of the duties of his office he derived great satisfaction and reputation. On the alarm of a French invasion in 1761, he published a discourse "On the right improvement of time;" and in the same year he contributed some poems to the first volume of Donaldson's collection of original poems. In 1762 he formed a matrimonial connection, which he regarded as the chief source of the felicity of his future life. About this time he was ordained minister of Kircudbright, on the presentation of the earl of Selkirk; but in consequence of some litigations that ensued, he

thought it most expedient, within two years, to resign this preferment, and to retire upon a moderate annuity. With this slender provision he removed in 1764 to Edinburgh, and opened his house for the accommodation of young persons as boarders and students. In 1766 the marischal college of Aberdeen conferred upon him the degree of doctor in divinity. From this time he continued to maintain his literary character by several publications, which it will be sufficient to enumerate. These were, "Paraclesis, or Consolations deduced from natural and revealed religion," in two dissertations, 8vo. 1767; "Two Discourses on the evidences and spirit of Christianity, translated from the French of Mr. James Armand," 8vo. 1768; "A Panegyric on Great Britain," a satirical piece, 8vo. 1773; "The Graham, an heroic ballad, in four cantos," 4to. 1774; "Remarks on the nature and extent of liberty, &c. and on the justice and policy of the American war, occasioned by perusing the observations of Dr. Price on these subjects," 8vo. 1776; and a valuable article, communicated to the editors of the Encyclopædia Britannica, "On the education of the blind," 1783. A 4to. edition of Dr. Blacklock's poems was printed in 1793. This edition contains an essay on the education of the blind, being a translation of M. Haiiy's celebrated essay on this subject; and prefixed to it we have a new account of the life and writings of the author by Mr. Mackenzie, author of the Man of Feeling, &c. Dr. Blacklock died at the age of 70, in July, 1791. With respect to his talents, Mr. Hume observes, "that he may be regarded as a prodigy;" and to his moral character he bears this honourable testimony, that "his modesty was equal to the goodness of his disposition, and the beauty of his genius." In the depressed circumstances of his early life he was singularly contented and acquiescing; but his loss of sight deeply affected his sensibility, and he deploras it in plaintive accents in one of his poems, written on occasion of his escape from falling into a deep well. At the same time he was distressed by apprehensions of sinking into extreme indigence; however he expresses his trust in Providence, and his hope that the clouds which were gathering over him would be dissipated. Next to his religious principles, were letters, conversation, and music, from which he derived his principal solace. His poetry is easy, elegant, and harmonious; and abounds with images, deduced from visible objects, and aptly applied. He is said to have composed with rapidity, and hence it is owing that his vivacity and animation are often indulged at the expence of correctness and regularity. In sentiment he displays much benevolence and tenderness of disposition, as well as true piety and philosophy. Spence, *ubi supra*. Gen. Biog.

BLACKMORE, SIR RICHARD, M. D. an indefatigable writer, poet, and physician, was born at Corsham in Wiltshire, about the year 1650. After some years spent at a grammar school in the country, he was sent to Westminster school, and in 1668 to Edmund-hall, Oxford. In 1676 he took his degree of master of arts, and continued to reside at college three years after, but apparently without receiving much benefit from his long residence in this seat of the muses, scarcely knowing the names or situations of places, which an intimacy with classical authors must have made familiar to him. At some time in his life, probably immediately on quitting college, he kept a school, but does not seem to have remained long in that station, as he soon after went to Paris, and to other places on the continent, with a view, it is probable, of acquiring or improving his knowledge in medicine, in which faculty he took his degree of doctor at Padua. Returning to England, after a ramble of eighteen months, he came to London, and settled at first in Cheapside, where he acquired so much reputation, that in 1687, he was

admitted a fellow of the college of physicians. In 1697, he received the honour of knighthood from king William, accompanied with a present of a gold chain and medal, which, he intimates, were given him as a reward for some services performed at the revolution. The same year he was made physician ordinary to the king; an office he held afterwards under his successor, queen Anne. He was now in the zenith of his reputation, and having as yet but little exposed himself to the scrutiny of the critics by writing, his merit was probably rated much beyond its real standard. To his popularity as a physician, and his excellent and unimpeached moral character, it was probably owing that his first production, "Prince Arthur," an epic poem, in ten books, published a little before this time, acquired so much celebrity as to pass through three editions in the space of two years. Encouraged by this success, in 1699 he published his "King Arthur," in twelve books, with paraphrases on the book of Job, and on other parts of scripture: and in 1700, his "Satire on Wit," in which he took occasion to retort the sarcasms which had been heaped with no sparing hand on his last poems by Dennis, Dryden, Pope, and most of the wits of the time. Not deterred by their censures, in 1705 he published "Eliza," another heroic poem, in ten books. "This excited," Johnson says, "neither praise nor blame, but seems to have dropped dead born from the press." In 1712, appeared "Creation," a philosophical poem, certainly the best of his productions. It had the honour of being praised by Addison, in the Spectator, and Dr. Johnson has since inserted it in his collection of English poets, with commendation much beyond its merit. This for a time revived its credit, and gave it a degree of celebrity, which seems again to be declining apace. Pleas'd with the reputation procured by this poem, he soon after produced his fourth and last epic poem in twelve books, intended to commemorate the actions of king Alfred, whose name it bore, but like Eliza, it excited little notice; benevolence being ashamed any longer to patronize, and malevolence weary of insulting, such frigid abortions. But as if it was to be the fate of this author to try every species of writing, and to fail in all, on the Spectator ceasing, he produced, in conjunction with Mr. Hughes, the "Lay Monastery;" one paper of which was published three times in the week. This was only continued to the 40th number. Soon after he gave the world two volumes of essays. As these were intended to promote the cause of virtue and religion, they met with some favour. Besides these works, Dr. Blackmore wrote several tracts on different branches of medicine; on the spleen, the gout, the rheumatism, the king's evil, the dropsy, the jaundice, the diabetes, the plague; and as inoculation for the small-pox was making some progress in his time, he thought it incumbent on him to give his decided disapprobation of the practice. But as by this time he began to be esteemed scarcely a better physician than a poet, his opinion had fortunately very little weight with the public. The medical tracts are published together in an 8vo. volume, but are little known or noticed. He died on the 8th of October, 1729. Gen. Biog. Johnson's Lives of the Poets.

BLACKNESS, the quality of a black body; or a colour arising from a texture and situation of the superficial parts of the body, which, as it were, disse, or rather absorb, the light falling on it, without reflecting any, or very little of it, to the eye. In which sense, blackness stands directly opposed to whiteness; which consists in such a texture of parts, as indifferently reflects all the rays thrown upon it, of whatsoever colour they be.

Descartes, says Dr. Priestley (Hist. of Vision, p. 127 and 143, &c.), though mistaken with respect to the nature of light and colours, yet distinguishes justly between black and white, observing, that black suffocates and extinguishes the

rays that fall upon it; but that white reflects them. This, adds the historian of philosophy, is the first distinct account I have met with of this sensible hypothesis. Mr Boyle also made several observations and experiments, which demonstrate his theory in a very satisfactory manner. See BLACK.

Sir Isaac Newton, in his *Optics*, shews, that for the production of black colours, the corpuscles must be less than those which exhibit any other colours; because, where the sizes of the component particles are greater, there is too much light reflected to constitute this colour: but, if they be a little less than is requisite to reflect the white and very faint blue of the first order, they will reflect so little light, as to appear intensely black; and yet may, perhaps, reflect it variously to and fro within them so long, till it happen to be it fled and lost; by which means they will appear black in all positions of the eye, without any transparency.

And hence it appears, why fire and putrefaction, by dividing the particles of substances, turn them black: why small quantities of black substances impart their colours very freely, and intensely, to other substances, to which they are applied; the minute particles of these, by reason of their very great number, easily overspreading the gross particles of others. Hence also appears, why glass, ground very elaborately with sand, on a copper plate, till it be well polished, makes the sand, together with what by rubbing is worn off from the glass and copper, become very black; and why black substances do, sooner of all others, become hot in the sun's light, and burn (which effect may proceed partly from the multitude of refractions in a little room, and partly from the easy commotion of such very small particles): also, why blacks are usually a little inclined towards a blueish colour; for that they are so may be seen by illuminating white paper with light reflected from black substances, where the paper will usually appear of a blueish white; and the reason is, that black borders on the obscure blue of the first order of colours; and therefore reflects more rays of that colour than any other.

BLACKRIE, ALEXANDER, in *Biography*, apothecary, a native of Scotland, published in 1766 a dissertation on medicines that dissolve the stone, in which Dr. Chittick's secret is laid open, 12mo. It was reprinted in 1771, with additions. He found the solvent to be the lixivium saponarium, which may be given, he says, advantageously, mixed with lime water, even when blood is voided with the urine. When the bladder becomes ulcerated, wounded by the asperities of the stone, he recommends the pareira brava and uva ursi. When pain in the reins or pubes is violent, he gives opium; and he has known, he says, persons void stones in their sleep, while taking that drug. Persons who void red sand or gravel with their urine, are never affected, he says, with the stone. Haller. Bib. Chirurg.

BLACKS, *Negroes*: a people so called from the colour of their skin. For the reason of their colour, and the commerce of them, see NEGRO.

BLACKS, is also a name given to an association of disorderly and ill-designing persons, formerly herding chiefly about Waltham, in Essex, who destroyed deer, robbed fish-ponds, ruined timber, &c. See BLACK act.

BLACKSOD BAY, in some old maps erroneously called *Black Harbour*, in *Geography*, a large bay lying between the peninsula of the Mull, and the main land of the county of Mayo, Ireland, to the south of the isthmus. It is well sheltered, the ground in most parts clean, and sufficiently deep for large ships; but the ground being a hard sand, it is not thought that it will hold well in hard gales from the west and south-west, especially in the winter time. It is $2\frac{1}{2}$ miles

wide at its entrance, and runs about 7 miles inland, with several creeks communicating with it, of which those within Barnach isle, and the point of Claggan, are the most remarkable. The south-west point of this bay is in N. lat. $54^{\circ} 6'$. W. long. $9^{\circ} 52'$. M'K nzie, &c.

BLACKSOD Point, the southern point of the Mull, a peninsula in the western part of the county of Mayo, Ireland, which forms the western extremity of Blacksod bay. N. lat. $54^{\circ} 6'$. W. long. $9^{\circ} 52'$.

BLACKSTONE, J. in *Biography*, apothecary, of whom nothing is known, but that he published, in 1737, "Fasciculus Plantarum, circa Harefield, sponte nascentium, cum Appendice ad loci naturam spectante," 8vo. London. Among many common, some very rare plants were discovered by the author, and are described in this volume. He also published, in 1746, "Specimen botanicum, quo plantarum plerumque Angliæ indigenarum, loci naturales illustrantur." 8vo. London, an interesting and useful work. Haller. Bib. Botan.

BLACKSTONE, WILLIAM, SIR, knight and L.L.D. a celebrated English lawyer, was born in London, July 10th 1723, and received the first rudiments of learning at the Charter-house, where he was admitted upon the foundation in 1735, and whence he was removed, in 1738, to Pembroke college, Oxford. At school and in the university he was distinguished by his application and proficiency; and the range of his studies, even at an early period, was so extensive, that he is said to have composed a treatise on the "Elements of Architecture," for his own use at the age of 20. This treatise was never published. As he made choice of the profession of the law, he was entered of the Middle Temple, and quitted Oxford in 1744 to pursue studies, very different from those to which his taste inclined him at the university. This change of his pursuits is feelingly commemorated in the "Lawyer's Farewell to the Muse," composed about this time, and published in the fourth volume of Doddsley's *Miscellanies*. From this period he assiduously applied to his professional studies, residing occasionally in chambers in the Temple, for the convenience of attending the courts, and at other times in the university, to which he was much attached. In 1743 he was elected a fellow of All-Souls college, and on the 24th of November 1746 he was called to the bar, and commenced the practice of the law. Destitute of a ready elocution, and of other talents requisite for a popular advocate, his progress was slow; and he had leisure to discharge the duties of bursar, or steward, of All-Souls, which he did with such skill and diligence, as to improve the revenues of the college, and to aid in completing the magnificent structure of the Codrington library. A treatise which he composed on this occasion is still useful in conducting the pecuniary concerns of this society. In 1749, he was appointed recorder of Wallingford in Berkshire; and desirous of more constant residence at Oxford, he took in the following year the degree of doctor of laws. About this time he published an "Essay on collateral consanguinity," particularly referring to the claim made by the kindred of the founder of All-Souls to a preference in being elected fellows of that society. It was written in defence of the college, which had lately rejected some of these claims; but the reasoning, though supported by great learning and ingenuity, is deemed by some competent judges inconclusive. In 1753, Mr. Blackstone, perceiving, after a trial of seven years, that he had no prospect of success in the courts at Westminster, determined to quit London, and to retire to his fellowship at Oxford. This resolution was eventually very favourable both to himself and the public. As no public provision had been made either by the founders of the English universities, or at any subsequent period

period, for teaching students the laws and constitution of their own country, Mr. Blackstone undertook to supply this defect, and opened a course of public lectures upon this interesting subject. With such reputation and success did he prosecute his plan, from Michaelmas term 1753, when his first course of lectures commenced, during a series of successive years, as probably to suggest the idea to Mr. Viner of founding by his will a very liberal establishment in the university of Oxford for the study of the common law. As soon as the plan of Mr. Viner's institution could be arranged, Mr. Blackstone was very properly elected, in October, 1758, the first Vincian professor; and he introduced the duties of his new office by a well-written lecture, adapted both to the subject and the audience, which was soon afterwards published, and which has been since prefixed to the first volume of his Commentaries.

With his engagements as a lecturer, Mr. Blackstone combined the occasional exercise of his profession as a provincial barrister; and, in 1754, he was employed as counsel in the great contested election for the county of Oxford. The substance of his pleadings on this occasion was published in a pamphlet entitled "Considerations on Copyholders;" with a view to the legislative decision of the point controverted at this election. The argument of this treatise is founded on feudal principles, and excludes copyholders from the right of voting; this right being, by his reasoning, restricted to those who have a freehold or permanent interest in land, which does not belong to copyholders, whom the feudal system considers as mere vassals, and dependent on the will of the lord. But it has been more liberally argued by others, that a series of legal decisions has given to this tenure all the permanence of freehold property, and that as the reason of the distinction between the two species of tenure has ceased, the distinction itself ought no longer to exist. However, in the parliamentary discussion of this question, the technical arguments prevailed; and a declaratory act was soon afterwards passed, in conformity to the principles advanced by the professor's treatise, excluding copyholders from the right of suffrage. In 1759, Blackstone published, besides two tracts of a local and temporary nature, a new edition of the "Great Charter, and Charter of the Forest," introduced by an historical preface, which evinced a considerable knowledge of antiquities. In the same year, the reputation gained by his lectures encouraged him to return to the Temple, and to resume his attendance at Westminster; where he soon acquired professional eminence, and where he was employed for a considerable time in almost all cases that required great learning and deep research. In 1761, he was elected member of parliament for Hindon, and had a patent of precedence to rank as king's counsel, having before declined the office of chief justice of Ireland. In 1762, he collected and republished several of his pieces under the title of "Law Tracts," in 2 vols. 8vo. In 1763, he was appointed solicitor general to the queen, in the establishment of her majesty's household, and barrister of the Middle Temple. Having vacated his fellowship by his marriage, in 1761, he was immediately afterwards appointed principal of New Inn-hall, by lord Westmoreland, then chancellor of the university. But in 1766, he resigned both this office and his Vinerian professorship.

The first volume of his lectures was published in 1765, under the title of "Commentaries on the Laws of England;" a work which sir William Jones has characterized as "the most correct and beautiful outline that was ever exhibited of any human science." In the execution of this undertaking, the author combines the humbler duty of an expositor with the higher character of a philosophical writer on jurisprudence. Under the former character he is entitled to the

highest praise. The style is correct, perspicuous, and elegant; and the author has admirably contrived to connect amusement with instruction, and to render the study of the law as agreeable as it is important and interesting. Notwithstanding the immense mass of materials of which this comprehensive work consists, few errors have been detected in it, and it has been cited as a book of authority.

It has been objected, however, to these Commentaries, excellent as they are in a variety of respects, that in those parts of them where the author examines the reasons and principles of law, he does not investigate them with a truly philosophical spirit, and that he does not rise above the ordinary level of those writers who, in every country and age, have extolled their own municipal institution as "the wisdom of ages," and "the perfection of reason." In discussing the propriety of particular laws, it is said that "his ingenuity is always occupied by the forms of jurisprudence; and instead of referring to public convenience and general utility, the sole standard of all rational legislation, he perpetually appeals to those technical arguments which are dignified with the title of "legal reasons." He is, in all cases, the advocate and the apologist of existing institutions; and it is the constant tendency of his work to justify whatever has been established by antiquity, to discredit the improvements of modern times, and to expose to contempt or indignation all proposals for further change. In his political principles he has been charged with being too much the advocate of prerogative; and his ecclesiastical opinions have been thought to incline towards intolerance. Notwithstanding the undue deference to authority, with which this writer has been charged, there are many passages in his admirable work, in which he expresses a marked disapprobation of standing armies and military barracks, and in which he delineates the progress of the influence of the crown, and the probable effects of a further increase of the national debt. These passages, however, have been attributed, by some of those who have animadverted on his Commentaries, more to the spirit of the times, than to that of the writer. Several obnoxious passages in the ecclesiastical part of this work were pointed out by Dr. Furneaux and Dr. Priestley; but though the author had not magnanimity enough explicitly to acknowledge his errors, these passages were retrenched in subsequent editions. The political principles of the Commentaries were some years afterwards, viz. in 1776, more severely noticed in a treatise entitled "A Fragment on Government," by Jeremy Bentham, esq. To the honour of Mr. Blackstone it should be mentioned, that, notwithstanding the severity of this author's criticism, he afterwards became acquainted with him, and lived with him upon terms of regard and friendship.

Having given his opinion in parliament, on occasion of the debates about the Middlesex election, that an expelled member was not eligible to the same parliament, and this opinion appearing to contradict the language of his Commentaries, he was violently attacked for this inconsistency by the celebrated Junius and others; but, though he defended himself with ingenuity, he inserted the case of expulsion in the next edition of his work, of which he had before taken no notice, as one of the disqualifications for a seat in parliament.

His distinguished talents and meritorious services entitled him, without doubt, to the notice and recompence of government. Accordingly, when he declined the offer of being solicitor-general, on the resignation of Mr. Dunning, in 1770, he was appointed immediately afterwards one of the justices of the common pleas, which office he held, except for a short interval, during which he accommodated Mr. Justice Yates by sitting as one of the justices of the king's

king's bench, till his death. Towards the end of the year 1779, a dropical disease, occasioned chiefly by early application, and by neglect of exercise, made rapid advances, and terminated in his death, Feb. 14th, 1780. in his 56th year. In private life, judge Blackstone was distinguished for mildness and benevolence, and for every domestic and social virtue. In studies and avocations that contributed to establish his own reputation, and to benefit both his contemporaries and posterity, he was eminently assiduous; and the intervals of leisure which he enjoyed in the later period of his life were devoted to schemes of local improvement in the neighbourhood where he resided, or to great public undertakings. The two volumes of Reports, which he left in MS. have been published since his death, in 2 vols. folio, with a preface containing Memoirs of his life; but their merit is said not to correspond with the fame of the author. He also left in MS. several small poetical pieces; and his notes on Shakespear inserted in Mr. Malone's Supplement, shew how well he understood, and how capable he was of appreciating, the excellence of that author. Life prefixed to Blackstone's Reports. Gen. Biog.

BLACKSTONE, in *Geography*, a small river of America, which has its source in Ranshorn pond, in Sutton, Massachusetts; and, passing through Providence, discharges itself into Narraganset bay, at Bristol, receiving in its course several tributary streams.

BLACKSTONIA, in *Botany*. See CHLORA.

BLACKWALL, ANTHONY, in *Biography*, a native of Derbyshire, was admitted a sizar of Emanuel college, in the university of Cambridge, in 1690. Having taken the degree of M. A. in 1698, he became head-master of the free-school at Derby, and lecturer of the parish of All-hallows in that town. In 1706, he excited notice by an edition of the "Moral Sentences of Theognis," with a new Latin version, together with notes and emendations. He also published, in 1718, "An Introduction to the Classics," 12mo. in which he displays their excellence, gives directions for studying them with advantage, and illustrates those rhetorical figures by which language is elevated and adorned. In 1722, he was appointed head-master of the free-school at Market Bosworth, in Leicestershire; and in this situation he prepared for the press his principal work, entitled "The Sacred Classics defended and illustrated; an essay humbly offered towards proving the purity, propriety, and eloquence of the writers of the N. T. in 2 parts 4to." This was published in 1725; and a second edition in Svo. appeared in 1727. After his death, a second volume was published under the title of "The Sacred Classics defended and illustrated, the second and last volume, in 3 parts." Svo. 1731. The design of the author, in this elaborate and learned work, was to vindicate the writers of the New Testament from the charge of barbarism in their language, and to shew that the words and phrases which they have used are to be found in the most approved classical writers. Many of the obscurities and seeming faults he attributes to transpositions and mis-translations, and he urges the necessity of a new version. See BIBLE. This book has been highly valued by biblical scholars; and a Latin translation of it was published at Leipzig, in 1736, by Christopher Wolfius. Nevertheless it has been thought by several very competent judges to be written with more zeal than solidity; and Dr. George Campbell, in his Preliminary Dissertation to his Version of the four Gospels, has attacked the fundamental principle of the work, and made several particular strictures upon it. Mr. Blackwall was eminently distinguished as a schoolmaster, and formed many good scholars, among whom was Richard Dawes, author of the *Miscellanea Critica*. In his school he used a Latin grammar composed by himself, and published

in 1728 without his name. Sir Henry Atkins, bart., who had been one of his scholars, presented him, in 1726, with the valuable rectory of Clapham, in Surrey; but he resigned it in 1729, and returned to Market Bosworth, where he died in 1730.

BLACKWATER, in *Geography*, the name of four rivers in England and Scotland. That of England rises near the middle of the county of Essex, and falls into the mouth of the Thames, where it forms a spacious bay called Blackwater bay. Those of Scotland are, 1st. in Bainsshire, 2d. in Berwickshire, and 3d. in Perthshire.

BLACKWATER, the name of several rivers in Ireland, one of which is very considerable. This rises in the mountains which separate the counties of Limerick and Kerry; and, taking a southern direction, divides the latter county from the county of Cork for about 12 miles. After passing at the foot of *Slieve-logher* mountain, from which it receives a large supply of water, it runs westerly across the northern part of the county of Cork, which is about 45 English miles. In this course it passes the flourishing towns of Malow and Fermoy, to the former of which it was navigable in lord Orrery's time, and receives the rivers Allo, Awbeg, and Funcheon, besides many smaller streams. A few miles below Fermoy, it enters the county of Waterford, and continues in the same direction for 12 miles, when, having passed the ancient city of Lismore, it bends nearly at a right angle to the south at Cappoquin. At this town it becomes navigable, and in its course receiving the river Bride, and opening into two or three spacious loughs, it flows into the sea a little below the town of Youghal, which is situated on its western bank. This river passes for almost the whole of its course, which, without making any allowance for its great windings, is about 90 English miles, through a rich and well-wooded country, "equally remarkable," says Mr. Young, "for beauty of prospect and fertility of soil." The banks are crowded with a number of fine seats, some of which, as Dromana and Lismore castle, may vie with those in any county, and have furnished artists with beautiful landscapes. The cyder made in its neighbourhood is held in great estimation, being preferred to the best imported from England, and of course brings a very high price. The Irish name of this river was *Auniduff*, or *Awin-dubb*, the black river, and also *Awin-more*, the great river, to distinguish it from the *Awebeg*, or *Awin-beg*, which runs into it. The latter is the Mulla of the immortal Spenser, who had an estate on its banks, where he resided for a long time. In his marriage of the Thames, he has mentioned the Blackwater and several of its tributary streams, though not with geographical accuracy, as the Allo does not rise near Slievegher, but has the Blackwater between it and that mountain.

"Swift Auniduff, which of the Englishman
Is called Blackwater, and the Liffar deep,
Sad Trowis that once his people overran,
Strong Allo tumbling from Slievegher sleep,
And Mulla mine, whose waves Iwhilom taught to weep."

Spenser's Fairy queen, b. iv. c. 11.

—2. Another river, called Blackwater, rises in the county of Tyrone, and, for the greater part of its course, divides that county from those of Monaghan and Armagh. The linen manufacture is extensively carried on in its neighbourhood, so that there are many bleach-greens. The flourishing little towns of Aughnacloy, Caledon, Blackwater town, Moy, &c. are on its banks; and its navigation to Lough Neagh, into the south-western angle of which it pours its waters, has been improved at a considerable national expence, on account of the collieries at Drumglass, in the county of Tyrone.—3. A river Blackwater rises in the

the county of Monaghan, and, having passed through Lough Ramor, unites its waters to those of the Boyne at Navan. — There are also small rivers of this name, one in the county of Longford, which joins the Shannon near Lanesborough, and one in the county of Wexford, which flows into St. George's channel at the place where Bannow formerly stood. Smith's Cork. Beaufort's Map. Holmes's Tour in the South, &c.

BLACKWATER Town, a small town in the county of Ar-magh, in Ireland, on the river Blackwater, which has a linen market. Distance from Dublin 66 miles.

BLACKWELL, THOMAS, in *Biography*, was the son of one of the ministers at Aberdeen, and born in that city in the year 1701. He was educated at the grammar school and marischal college of his native place, of which, in 1723, he was appointed Greek professor, and in this office he contributed in no small degree to promote Greek literature, and the study of the classics in general. In 1735, his "Enquiry into the Life and Writings of Homer," 8vo. was published without his name; and by its popularity served to establish his reputation for learning and ingenuity. Of this work, discussing a variety of topics without any very obvious connection, Dr. Bentley is said to have remarked, "that when he had gone through half, he had forgotten the beginning; and that when he had finished the perusal of it, he had forgotten the whole." It is reckoned, however, the author's principal performance, and is both curious and entertaining. His "Letters concerning Mythology," 8vo. were published in 1748; and they were intended to establish a regular system of ancient fable, as an allegorical representation of the religion, laws, and philosophy of early times. The work is learned, fanciful, and desultory. In this year Dr. Blackwell was appointed principal of the Marischal college, and allowed his office of Greek professor. In 1751, he announced to the public his design of publishing a new edition of Plato's works; but this design was never executed. The first volume of "Memoirs of the Court of Augustus," 4to. was published in 1753; the second in 1755; and the third, after the author's death, in 1764. The object of this work is to exhibit, in an elegant and popular form, the principal facts of Roman history, at the commencement and during the period of the public life and reign of Augustus. It is written with vivacity, and was at first well received; but the affected ease and familiarity of the style, united with a considerable degree of that pompous kind of pedantry, which displays not only erudition but a knowledge of the world, has contributed to lower its reputation. This work manifests also a republican spirit, not altogether free from party prejudice. The author's affected mode of writing increased as he advanced in years; and though it must be acknowledged, that he possesses genius and fancy, and had a relish for the beauties of ancient authors, he never acquired that simplicity of taste, which leads to the true ease and elegance of composition. This peculiar style and manner of composition have been attributed to an injudicious imitation of lord Shaftesbury. Some years before his death Dr. Blackwell's health declined; and his disorder being of the consumptive kind, which he is thought to have increased by his abstemious mode of living, he was under a necessity of remitting his studies, and advised to travel: but with this view he could proceed no farther than Edinburgh, where he died in 1757, the 56th year of his age. His temper was singularly mild and equable; and he retained his natural vivacity and cheerfulness through the whole period of his illness, and till the hour of his death. In conversation he was instructive and entertaining; and he blended a considerable knowledge of the world and urbanity of manners with an extensive acquaintance with ancient and modern

authors. But it was his foible, that he was apt to assume the appearance of universal knowledge; and this weakness betrayed him into conversation on philosophical and mathematical subjects, with which his acquaintance was very imperfect. Among his friends and correspondents were many persons of literary eminence; and it is said, that his patrons proposed to introduce him into the professorship of modern history at Cambridge, if he had not died before a vacancy occurred. Biog. Brit.

BLACKWELL, ELIZABETH, widow of Alexander Blackwell, M. D. author of "A New Method of improving cold, wet, and clayey ground," 1741, London, 8vo. Rejecting dung and other manures, he depended entirely on repeated ploughing and turning the ground. He died a miserable death in Sweden. His widow, being left in indigence, undertook, by the advice of her friends, to publish an account of 500 medicinal plants, to be drawn, engraved, and the greater part of them coloured by herself. The plants were furnished by Rand and Miller, from the botanical garden, belonging to the company of apothecaries, at Chelsea. They are, in general, Haller says, faithfully delineated. In some parts, however, she has failed. Not well instructed in the Linnæan system, she has not delineated the fibres or filaments of the flowers with the accuracy now required. A short account is annexed of the medicinal virtues of each of the plants, some of which are extremely rare. The first volume of this work was first published in 1737, and the second in 1739, when the whole was published in 2 vols. fol. under the title of "A curious Herbal, &c.;" and it is creditable to the authoress to say, that this bulky and expensive work passed through several editions. The last, which came out in 1760, in 5 vols. folio, at Nuremberg, is furnished with a preface and considerable additions by James Trew. After his death, in 1769, a supplemental volume, conducted by Ludwig, Bosc, and Boehmer, was printed in 1773. This work has been in a great measure superseded by Dr. Woodville's SS. Medical Botany, in 4 vols. 4to. Haller. Bib. Bot. Pulteney's Hist. and Biog. Sketches of the Progress of Botany in England, vol. ii. p. 254.

BLACKWOOD, ADAM, was born at Dumferline, in Scotland, in 1539, and educated at Paris under Turnebus and Dorat. He was particularly patronized by Mary queen of Scots; and when he had finished his law studies at Toulouse, he obtained the office of counsellor to the presidial of Poitiers, which was Mary's dowry-town. In this place he settled and married; and, during the imprisonment of Mary, took several journeys to England with a view of serving her. He died in 1613. His religious and political sentiments may be deduced from the titles of his works, which were written both in verse and prose. Of these the principal were, "Caroli IX. pompa funebris versibus expressa," Paris, 1754; "De vinculo religionis et imperii, et de conjunctionum in diis, religionis fuco adumbrata," 1575; "Adversus G. Buchanani dialogum de jure regni apud Scotos, &c.;" Poitiers, 1581; "Martyre de Marie Stuart, reine d'Ecosse," &c. &c. His account of the execution of Mary Stuart is a virulent invective against queen Elizabeth, her parentage, her right to the crown, her government, &c. His works were collected and published in a 4to. volume by Gabriel Naudé, in 1644, with an eulogy of the author prefixed. Moreri. Ger. Biog.

BLADDER, in *Anatomy*, is a membranous bag, serving as a reservoir for some secreted fluid. That which is considered as the chief receptacle of this kind, is the urinary bladder. As the anatomy of these parts, in general, will be described with that of the organ which prepares the fluid which they are intended to contain; therefore, for the sake of uniformity of method, the description of the urinary bladder

bladder is given with that of the kidneys and other urinary organs. See KIDNEY.

BLADDER, Diseases of the, in *Surgery*. This viscus being supplied with nerves, blood-vessels, absorbents, and muscular fibres, will be necessarily liable to all the common disorders of soft parts; such as *wounds, inflammation, ulceration, gangrene, palsy, contraction, dilatation, rupture, &c.* But, besides these affections, the bladder is subject to other morbid changes, which occur very rarely or not at all in most other parts of the body. It is sometimes included among the contents of a herniary sac. See HERNIA. Partial bags, or facculi, may likewise form in the coats of the bladder, so as to retain one or more calculous bodies generated in the urine. See CALCULUS, CYSTOTOMY, LITHOTOMY, and STONE. Fungous, painful, and dangerous excrescences arise also on the inner surface of this organ, which are frequently denominated *cancers*, and are perhaps equally fatal in their consequences. These disorders will, in general, produce either a retention or a preternatural evacuation of urine, and require a peculiar plan of treatment adapted to the diversity of symptoms. See URINE, *Retention of,* &c. &c.

BLADDERS, vesiculae, in *Botany*, a kind of air-bags found in some species of fucus.

Vegetable bladders are found every where, in the structure of the bark, the fruit, pith, and parenchyma, or pulp; besides those morbid ones raised on the surface of leaves by the puncture of insects.

BLADDER, swimming. See AIR bladder.

BLADDERS, oil, in the *Anatomy of Plants*. See OIL-bladders.

BLADDER, puceron, in *Entomology*. See CHERMES.

BLADDER-nut, in *Botany*. See STAPHYLĒA.

BLADDER-nut, African. See ROYENA.

BLADDER nut, laurel-leaved. See HOLLY.

BLADDER fena. See COLUTEA.

BLADDER-shaped, inflatus, denotes inflated or distended like a blown bladder; such are the cup of the bladder campion, and the blossom of the fig-wort.

BLADDER-spout. See UTRICULARIA.

BLADDER-wort, common. See UTRICULARIA.

BLADE, in *Agriculture*, a spire of grafs, or green shoot of corn.

BLADE, in *Anatomy*. See SHOULDER-blade.

BLADE of an Anchor, denotes that part of the arm on which the palm is shut.

BLADE, in *Commerce*, a thin slender piece of metal, either forged by the hammer, or run and cast in moulds, to be afterwards sharpened to a point, edge, or the like. Sword-blades are made by the armourers, knife-blades by the cutlers, &c. The English and Damascus blades are most esteemed. Among the French, those of Vienne and Dauphiny have the preference. The conditions of a good blade of a small sword are, that it be light and tough, apter to bend than break. When it will stand in the bend, it is called a *posr man's blade*.

BLADE of a Chissel, is the iron or steel part, as distinguished from the wooden handle.

BLADE of Maee, or cinnamon, among apothecaries, are little slips or slices of those barks.

BLADE of an Oar, is that part which is plunged into the water in rowing. On the length of this do the force and effect of the oar, in a great measure, depend.

BLADE of a Saw, the thin part wherein the teeth are cut, which, to be good, must be stiff, yet bend equally into a regular bow all the way, without yielding more in one place than another.

Vol. IV.

BLADE mill, is that contrived for grinding iron tools, as scythes, reaping hooks, axes, chissels, and the like, to a bright edge.

BLADED, in *Heraldry*, is a term used when the stalk or blade of any kind of grain or corn is borne of a colour different from that of the ear or fruit: thus, *argent an ear of wheat or BLADED vert*.

BLADEN, in *Geography*, a county of North Carolina, in the district of Wilmington; having 6963 inhabitants, including 2278 slaves.

BLADENSBURG, a post town of America, in Prince George county, Maryland, on the eastern bank of the eastern branch of Patowmack river, at the confluence of the N. W. and N. E. branches, 9 miles from its mouth at the Federal city, 38 S. W. from Baltimore, and 12 N. E. from Alexandria, in Virginia. It contains about 160 houses.

BLADHIA, in *Botany*, so named by Thunberg, from Peter John Bladh, a Swede, resident at Canton. Lin. gen. Schreb. n. 370. Thunb. nov. gen. 6. fl. jap. 7. Clafs and order. *Pentandria Monogynia*. Gen. Char. Cal. perianth one-leaved, very short, permanent, five-parted; parts ovate, concave, spreading, torn-subferrate. Cor. one-petaled, wheel-shaped, five-parted; parts ovate, obtuse, spreading. Stam. elements five, very short; anthers heart-shaped, acute, converging into a cone; shorter than the corolla. Pist. germ superior; style filiform, longer than the corolla; stigma simple, acute. Per. berry globose, crowned by the permanent style, one-celled. Seed single, globose, involved in a membrane.

Ess. Char. Cor. wheel-shaped, deciduous. Berry containing one arilled seed.

Species, 1. *B. japonica*. Lin. Syst. 235. Thunb. jap. 95. t. 18. Kœmpf. Amœn. 5. 776. (Quackitz) "Leaves ferrate smooth." 2. *B. rubra*. Lin. Syst. 237. Thunb. jap. 96. t. 19. "Leaves ferrate, villose." 3. *B. crispata*. Lin. Syst. 237. Thunb. jap. 97. Kœmpf. Amœn. 5. 776. 2. ic. select. t. 7. "Leaves oblong, curled, smooth." All these are natives of Japan. Thunberg has another species among his obscure plants, jap. p. 350. Martyn.

BLADUM, in *Middle Age Writers*, is taken for all sorts of standing corn in the blade and ear. The word is also written *blatum, blava,* and *blavium*. In our old charters, the word *bladum* included the whole product of the ground, fruit, corn, flax, grafs, &c. and whatever was opposed to living creatures. The word *bladum* was sometimes also applied to all sorts of grain or corn threshed on the floor: *tria quarteria frumentii, tria quarteria avenarum, & urum quarterium sabaarum, erunt quili de solutione predicti bladi in perpetuum*. But the word was more peculiarly applied to bread-corn, or wheat, called in French *blé*. Thus the Knights Templars are said to have granted to Sir W. de Meriton's wife *duas summas bladi*. Kennet's Paroch. Ant. and Du Cange.

Hence *bladarius* denotes a corn-monger, meal-man, or corn-chandler; and it is used in our records for such a retailer of corn. Pat. 1 Ed. III. par. 3. m. 13. And *bladius* signifies an ingrosser of corn or grain.

BLAE, in *Ornithology*, among French writers, an African bird of the falcon tribe described by Latham under the name of *falco melanopterus*, which see.

BLÆRIA, in *Botany*, so denominated from Patrick Blair, M. D. Lin. gen. n. 139. Reich. 145. Schreb. 183. Juss. 160. Clafs and order, *Tetrandria Monogynia*. Nat. Ord. *Bicornes*. *Ericæ*. Juss. Gen. Char. Cal. perianth four-parted; leaflets linear, erect, a little shorter than the corolla, permanent. Cor. monopetalous, campanulate; tube cylindrical, the length of the calyx, pervious; border small, four-cleft;

divisions ovate, reflex. *Stam.* filaments four, setaceous, the length of the tube, inserted into the receptacle; anthers oblong, compressed, erect, obtuse, emarginate. *Pist.* germ. four-cornered, short; style setaceous, much longer than the corolla; stigma obtuse. *Per.* capsule obtuse, quadrangular, four-celled, gaping at the angles. *Seeds*, some roundish. *Obs.* The anthers are emarginate, but not horned, as in *ericca*, allied to this.

Ess. Char. *Cal.* four-parted. *Cor.* four-cleft. *Stam.* inserted into the receptacle. *Capf.* four-celled, many-seeded.

Species, 1. *B. ericoides*, heath-leaved B. "Anthers awnless, standing out; calyxes four-leaved; bractes the length of the calyx; leaves in fours, oblong-acerose, hairy, imbricate." This has the stature of the common heath. Flowers terminating, white with a tinge of purple; corollas tubulous, erect; anthers two-parted, scabrous; style capillary, longer than the anthers. Introduced into Kew garden in 1774 by Mr. F. Masson. 2. *B. ciliaris*, ciliated B. "Flowers in a head, calyxes ciliate." Resembling the preceding, and readily known by its white calyxes, most distinctly ciliate. 3. *B. articulata*, jointed-leaved B. Penza Sarcocolla. Berg. cap. 25. "Stamens protruded, two-parted; corollas cylindrical." A distorted shrub, of the stature of common heath. Leaves in fours, pressed to the branches; heads of flowers terminating, with white-villose calyxes; corollas flesh-coloured; anthers very narrow, black; differing from the first in having equal stamens, and leaves more imbricated. 4. *B. purpurea*, purple-flowered B. "Stamens included, two-parted; corollas oblong, straight; flowers terminating, aggregate; peduncles erect." Like the third; but the heads are nodding. 5. *B. pusilla*, dwarf B. "Flowers scattered; corollas funnel-form." This has the stature of small heath. Branches pubescent; leaves in fours, rugged, petioled, scored underneath with a line; flowers minute, scattered, shorter than the leaves. 6. *B. muscosa*, moss-leaved B. Ait. Hort. Kew. 1. 150. "Anthers awnless, almost standing out; calyxes one-leaved, hairy; corollas bell-shaped, hairy in the upper part; flowers axillary; stigmas obovate." Found at the Cape of Good Hope by Mr. F. Masson, and introduced in 1774; flowering from June to August.

Propagation and Culture.—These are all shrubs, inhabitants of the Cape of Good Hope, require the same treatment and shelter with other Cape plants in the dry stove, and may be increased by cuttings, like the ericas, or heaths, which they much resemble. Martyn.

BLÆSLING, in *Ornithology*, one of the synonymous names of the greater coot of English writers, and *fulica atririma* of Linnæus. Vide *Günther Nest. und. Eyer*. The common coot, *fulica atra* of Linnæus, is also named by this author *kleiner blasling*.

BLÆSUS, in *Medicine*. See STAMMERING.

BLAGAITZKI, in *Geography*, a town of Croatia; 10 miles N.N.W. of Sluin.

BLAGNAC, a town of France, in the department of the Upper Garonne, and chief place of a canton, in the district of Toulouse, on the Garonne; 3 miles N.W. of Toulouse.

BLAGOVETSCHENSKOI, a town of Russia, in the government of Archangel, near the south-east coast of the White sea; 70 miles S.W. of Archangel.

BLAGRAVE, JOHN, in *Biography*, an English mathematician, was born of an ancient and honourable family at Bulmarsh court near Sunning in Berkshire, towards the middle or close of the 16th century, and educated, first at a school in Reading, and afterwards at St. John's college, Oxford. Before he took any degree he retired from the uni-

versity to his patrimonial seat at South-cote lodge, near Reading, where he diligently pursued his studies, particularly mathematics. His works, of which we have any account, are, "A Mathematical Jewel," shewing the construction and use of an instrument so called, and its application to astronomy, cosmography, geography, &c. Lond. 1585, fol.; "The Construction and Use of the Familiar Staff, &c.," performing the geometrical mensuration of all altitudes, Lond. 1590, 4to.; "Altrabium Uranicum generale," containing the use of an instrument, or astrolabe, Lond. 1596, 4to.; and "The Art of Dalling, in two parts," Lond. 1609, 4to. Mr. Blagrave was distinguished by his benevolence, both during his life, and at his death. Having never been married, he bequeathed 50l. to each of the children of his three brothers, or their posterity, payable at the age of 26; and his bequests in this way were so well adjusted, that near 80 of his nephews and their descendants were thus benefited out of his leasehold estate. He also bequeathed lands for producing an annual donation of 10l. to a maid-servant in the town of Reading, according to the directions of his will. These directions required, that the church-wardens of each of the three parishes should on Good Friday send one virtuous maid, who had lived five years with her master. The three maids were to appear in the town-hall before the mayor and aldermen, and to cast dice. She, whose throw was the greatest, received the ten pounds. The two maids who had lost were to appear the next year, together with a third added to them. Accordingly each maid was to have by his will the chance of three annual throws; but if any failed in three successive years, he orders new persons to be presented. On the same Good Friday, money is distributed to 80 widows in pursuance of his will, who attend a sermon, for which the preacher is to receive ten shillings. Mr. Blagrave died Aug. 9th, 1611, and was buried in the church of St. Lawrence, Reading, where a sumptuous monument is erected to his memory. Biog. Brit.

BLAGRE, in *Ornithology*. Under this name Levaillant describes the African species of eagle called by Latham *falco blagrus*, which see.

BLAIN, a distemper incident to beasts, consisting in a bladder growing on the root of the tongue against the windpipe, which at length swelling stops the breath.

It comes by great chafing and heating of the stomach; whereby, as some judge, it still grows and increases by more heat.

It is perceived by the beast's gaping, holding out his tongue, and foaming at the mouth: to cure it, cast the beast, take forth his tongue, and then slitting the bladder, wash it gently with vinegar and a little salt.

BLAIN, in *Geography*, a town of France, and principal place of a district in the Lower Loire. The population of the place consists of 1897 persons, and of the canton of 10,274; its territorial extent is $34\frac{1}{2}$ kilometres, and it includes 4 communes; 18 miles N.N.W. of Nantes, and 40 S. of Rennes.

BLAINVILLE, in *Biography*, a learned musician of Paris, who proposed, in 1751, a third mode or key, which he called a *mixed mode*, because it participates of the modulations of the two other, or rather from its being compounded of both, a mixture which the author does not regard as an inconvenience, but rather as an advantage and source of variety both in the melody and harmony. Rousseau. Dict. de Musique, published 1768.

BLAINVILLE, a performer on the violoncello, and music-master at Paris, who had many symphonies and motets performed at the Concert Spirituel, in the middle of the last century,

century, without success; but abandoning the *practice* of harmony or composition, in order to try his force in the *theory*, in 1751, he produced "L'Harmonie theorico-practico;" in 1754, "L'Esprit de l'Art Musical;" in 1765, "L'Histoire générale, critique, et philologique de la Musique." These works are no better than his symphonies. They are compilations without taste, which teach nothing new to those who know any thing about music already; and not enough to those who know nothing. In 1751, he had the courage to publish as a discovery a pretended *new mode*, a key different from the major and minor, which, he said, was neither major nor minor, but *mixed* of both. He composed a symphony in this new mode, and had it performed at the Concert Spirituel, which gave birth to many dissertations and discussions, &c. Laborde, *Essai sur la Musique*, tom. iii. p. 577.

"Who shall decide, when doctors disagree?"

The *new mode*, as it was called, was attacked by the ingenious and speculative writer on music, M. Serre, of Geneva, and defended by Rousseau in his Dictionary. Thirty years after, it became the subject of a very long article in M. Laborde's *Essai sur la Musique*, merely to attack Rousseau for having defended it. In this attack of the dead lion, the abbé Roullier was *bottle-holder* to his friend Laborde.

All these gentlemen seem utterly ignorant of the church music of the 15th and 16th century, built on the ancient ecclesiastical modes, in which nothing was more common in the masses of the old masters, than for a movement beginning in A minor to end on the fifth of that key, with a sharp third, which would be called now a *semi cadence*. The melody of the several parts is equally in the scale of C and A natural, which, without accidental flats or sharps, produces nothing but different species of octaves in the key of C natural. But calling E the key note instead of A, it has a peculiarity in the second, which, instead of being a tone major above the key note, is only a major semitone.

Now Dr. Pepusch, who rigidly adhered to the laws of the ecclesiastical modes in his "Treatise on Harmony," so late as 1731, in speaking of the key of E as formed of one of the species of octave in the scale of C natural, has explained the properties of this key with only a major semitone for its second, much better than Blainville, or any of his defenders or opponents, and terminates his remarks on this key, by saying that "it differs from all others; for they are introduced by the semitone major *below* them, but this is by the semitone major *above* it; they by their *seventh* major, but this by its *second*, which happens to be *minor*; that is from F downwards to E. It is because of this difference and peculiarity in its modulation, which makes what is composed in it to be very *solemn*, that this key is as it were appropriated to church-music, and called by the Italians *tuono di chiesa*." p. 65.

But the doctor does not call it a *new key*, for it is as old as counterpoint; and we should suppose that Blainville had either seen Dr. Pepusch's treatise, or found in some old mass a movement that ended on the fifth, instead of the key note, and wished to pass for an *inventor*. But it is plain that all the French gentlemen, who took a part in this controversy, were disputing about the *dent d'or*, before they had ascertained its existence. In examining the masses of Josquin, Palestrina, and the cantions of Tallis and Bird, we find movements of the description of Dr. Pepusch's *tuono di chiesa*. And in Padre Martini's "Saggio di Contrepoint," tom. i. p. 42, he calls this mode *il terzo tuono autentico*, the third authentic mode, which Blainville calls the *new* or *mixed mode*; and P. Martini even calls it *terzo tuono misto del quarto suo plagale*, p. 44. He gives the same natural scale for its intervals as Rousseau and Blainville, EFGABCDc,

p. 51. An example of this *mixed mode* is given from Palestrina, in which no accidental sharps are marked, though it modulates into G major, A minor, C \sharp , and G, a second time. A sharp only is given to G upon the close note, as sharp third to the final E.

In 1756, Blainville published what he called "A general, critical, and philological History of Music;" a work for which the author's materials seem to have been so scanty, that he was reduced to fill two-thirds of his thin quarto with an indigested treatise on composition. See Pepusch, p. 65, and examples 15 and 176.

BLAINVILLE, in *Geography*, a town of France, in the department of La Manche, or the Channel, and chief place of a canton, in the district of Coutances, five miles west of Coutances, and 13 north of Granville.

BLAINVILLE *sur l'Eau*, a town of France, in the department of the Meurte, and chief place of a canton, in the district of Luneville, four miles S. W. of Luneville, and 12 S. E. of Nancy.

BLAIR, JOHN, in *Biography*, a chronologer and geographer, was born in Scotland, and educated at Edinburgh. Upon his first arrival in England, he was usher at a private school; and first appeared with singular advantage before the public by publishing, in 1754, a work intitled "The Chronology and History of the World, from the Creation to the year of Christ 1753, illustrated in 56 tables, of which four are introductory, and contain the centuries prior to the first olympiad; and each of the remaining 52 contains in one expanded view 50 years, or half a century; by the Rev. John Blair, L.L.D." This comprehensive work, on which the author must have bestowed a very great degree of attention and labour, was published by subscription, and dedicated to lord Hardwicke; and the author acknowledges great obligations to the earl of Bath. Dr. Blair appears at this time to have taken orders in the English church; in 1755, he was elected fellow of the Royal Society, as he was of the Antiquarian Society, in 1761. In 1756, he published a second edition of his Tables, and in 1757, he was appointed chaplain to the princess-dowager of Wales, and mathematical tutor to the duke of York. In 1761, he obtained a prebendal stall at Westminster, and several church preferments in very quick succession. From the vicarage of Hinkley, in Leicestershire, which he held, by dispensation, with the rectory of Earton Coggles, in Lincolnshire, he was promoted first to the vicarage of St. Bride's, in London, in 1771, and in 1776, to the rectory of St. John the Evangelist in Westminster, with which he held that of Horton near Colebrooke, in Buckinghamshire. During the years 1763 and 1764, he accompanied the duke of York in his travels on the continent. In 1768, he published an improved edition of his "Chronological Tables," which he dedicated to the princess-dowager; and to this edition he annexed 14 maps of ancient and modern geography, and prefixed a dissertation on the rise and progress of this science, which was also printed separately in 12mo. His death, which happened June 24th 1782, was probably accelerated by the shock that attended the news of his brother, captain Blair's death in the memorable sea-fight of April 12, 1782; more especially as he then was severely afflicted with an epidemic influenza. After his death, in 1785, his "Lectures on the canon of the Scriptures, comprehending a dissertation on the Septuagint version," were published; and a new edition of his "Chronological Tables," extended to the year 1790, appeared in that year. Biog. Dict.

BLAIR, PATRICK, practised physic and surgery at Dundee, in Scotland, where he was probably born. He first became known, in 1706, by his account of the anatomy of an elephant, which he had the opportunity of dissecting there. It was published in the Philosophical Transactions, Nos. 326

and 327, in the year 1710. It contains an accurate description of the proboscis and its muscles, and confirms, Haller says, the opinion formerly given, that the elephant has no gall bladder. In a subsequent number of the Transactions, he gives a description of the ossicula auditus, accompanied with engravings. In the rebellion, in 1715, being suspected, on account of his religious principles, of hostility to government, he was for a small time confined. He came afterwards to London, where he re-published his "Anatomy of the Elephant," in 4to.; and, in 1718, published a volume of "Miscellaneous observations on the practice of physic, anatomy, surgery, and botany," in 8vo. This was followed, in 1720, with "Botanical Essays," in two parts, also 8vo. with figures, in which he treats of the sexes of plants, confirming the arguments adduced in proof of them by sound reasoning, and some new experiments of the manner of fecundation, of the circulation of the sap, &c. This work still retains its credit among botanists, although some of the author's opinions are abandoned. About the same time, he gave an account of the asbestus, found in the county of Angus, in Scotland, printed in the Phil. Trans. N^o 333: and of the dissection of an emaciated child, in which he could find no vestige of the omentum, Id. N^o 353; and also of a boy, who lived a considerable time without food, Id. N^o 354; and in the same number is also a dissertation on the means of discovering the medicinal properties of plants from their external figure. He soon after settled at Boston, and published "Pharmaco-botanologia," or an alphabetical and classical dissertation on all the British indigenous and garden plants of the London Dispensatory, in seven decades, 4to. 1723 and 1728, introducing some plants which he had first discovered growing near Boston. The work only proceeded to the letter H. The time of his death is not known. Haller Bib. Anat. et Botan. Pulteney's Sketches, vol. ii. p. 134, &c.

BLAIR, JAMES, an episcopalian divine, was born and educated in Scotland, where he was ordained and beneficed; but meeting with some discouragements in that country, he quitted his preferments, and removed to England, about the latter end of the reign of king Charles II. Being introduced to Dr. Compton, then bishop of London, he prevailed on him to go, about the year 1685, as a missionary to Virginia, where by his conduct and ministerial labours he was eminently serviceable in promoting the cause of religion. In 1689, he was appointed by the same prelate as his commissary for the province. Intent upon doing good in the office with which he was entrusted, he observed with concern, that the want of proper seminaries for religion and learning obstructed every attempt for propagating the gospel in this colony: and he therefore formed the benevolent design of erecting and endowing a college at Williamsburg, the capital of Virginia, for professors and students in academical learning. With this view he raised a considerable sum of money by voluntary subscription; and, in order the more effectually to accomplish his purpose, he came over into England in 1693, to solicit the concurring aid of government. King William and queen Mary very much approved the design, and accordingly a patent was issued for erecting and endowing a college, which was to be denominated from its founders, "the college of William and Mary." Mr. Blair, who first projected the scheme, was appointed president of the college. (See WILLIAMSBURG.) He was also rector of Williamsburg and president of the council in that colony. Having faithfully and honourably discharged the duties of his office as president of the college for about 50 years, and those of his ministerial function for above 60 years, he finished his course of laborious and useful ser-

vice in the year 1743. His works, comprising "Our Saviour's divine Sermon on the Mount explained, and the practice of it recommended, in divers sermons and discourses, with a recommendatory preface, by the Rev. Dr. Waterland," were published in 1740, 4 vols. 8vo. Waterland's Preface. Burnet's Hist. of his own Times, vol. iii. p. 165. 8vo.

BLAIR, HUGH, a distinguished preacher and writer, the descendant of an ancient family of Ayrshire, in Scotland, and the son of a respectable merchant at Edinburgh, was born in that city, April 7th, 1718. As his views were at an early period directed towards the church, he entered the university of his native place in 1730, and spent eleven years in the assiduous prosecution of those literary and scientific studies which the church of Scotland prescribes to such as profess themselves candidates for the ministerial office. During this period his application and proficiency gained repeated testimonies of approbation from the professors under whom he studied. One of his performances at this time, indicating the bent of his genius towards polite literature, was an essay Περὶ τῆς καλῆς, or "On the Beautiful," which afforded such satisfaction to professor Stevenson, that it was appointed to be publicly read at the conclusion of the session. This honour, without doubt, stimulated his emulation, and proved the earnest of his future fame. The method of study, which he commenced at college, and which he occasionally practised in his maturer years, contributed in a considerable degree to the accuracy and extent of his knowledge. It consisted in making abstracts of the most important works which he read, and in digesting them according to the train of his own thoughts. This was the method in which he studied history in particular; and with this view, aided by some of his youthful associates, he constructed a comprehensive series of chronological tables, in which was inserted every important fact that occurred. In conformity to this plan, his learned friend, Dr. John Blair, formed his valuable work, already noticed under his article. In 1739, Mr. Blair took his degree of master of arts; and on this occasion he printed and defended, in elegant Latin, a thesis, "De Fundamentis et Obligatione Legis Naturæ." Having completed his academical course, he passed through the customary trials before the presbytery of Edinburgh, and, was licensed as a preacher, October 21st, 1741; and in the following year he was presented to the parish of Coleffie, in Fife, where he was ordained Sept. 23d, 1742. Such at this time was his established reputation as an eloquent preacher, that when a vacancy occurred in the Canongate church of Edinburgh, he was chosen at a contested election to supply it; and accordingly he returned to his native city in July 1743. In this situation he continued for eleven years, exhibiting specimens of those talents for pulpit compositions, which have since obtained distinguished testimonies of public approbation. In 1754, he was translated from the Canongate to lady Yester's, one of the city churches; and in 1756, he was promoted to the High Church of Edinburgh, the most important ecclesiastical charge in North Britain. To this honourable rank he was advanced at the request of the lords of council and session, and of other distinguished persons holding public offices, who attend that church; and the wisdom of their choice was amply justified by the prudence, ability, and success, with which his ministerial labours were conducted for a period of more than 40 years. Previously to his advancement to this station of public service, Mr. Blair's attention seems to have been almost wholly devoted to the attainment of professional excellence, and to the regular discharge of his parochial duties. Of the productions of his pen, we have only two sermons, preached on particular occasions; some translations, in verse, of passages of Scripture for the psalmody

psalmody of the church; and a few articles in a periodical publication intitled the "Edinburgh Review." See JOURNAL. From this time he enjoyed greater leisure for directing his views to other important literary objects, besides his weekly preparations for the pulpit; and, accordingly, he commenced, Dec. 11, 1759, with the approbation of the university, a series of lectures on composition. Of his qualifications for an office of this kind, none could entertain the least doubt; they had been in some measure sanctioned by the university of St. Andrew's, which, in June 1757, had conferred on him the degree of doctor in divinity, then very rarely bestowed; and the success that attended his first course, afforded ample evidence of the able manner in which it had been conducted. The patrons of the university determined in the following summer to institute a rhetorical class, under the direction of Dr. Blair, as a permanent part of their ecclesiastical establishment; and on the 7th of April 1762, his majesty was graciously pleased "to erect and endow a professorship of rhetoric and belles lettres in the university of Edinburgh, and to appoint Dr. Blair, in consideration of his approved qualifications, regius professor thereof, with a salary of 701." The lectures which he delivered on this occasion, were published in 1783, under the title of "Lectures on Rhetoric and Belles Lettres," in two volumes. 4to.; and they have been since frequently re-published in 3 vols. 8vo. Of these lectures it will be sufficient to observe, that the general voice of the public not only in our own country, but in other nations on the continent into whose languages they have been translated, has pronounced them to be a most judicious, elegant, and comprehensive system of rules for forming the style, and cultivating the taste of youth. By a happy and singular union of taste and philosophy, the author has supplied a great defect in the science of criticism, and has made a valuable addition to the polite literature of the present age. In the course of this Dictionary we shall have frequent occasions for referring to this excellent work, and availing ourselves of its interesting and useful contents. In 1763, Dr. Blair published "A Critical Dissertation on the poems of Ossian," which for beauty of language, delicacy of taste, and acuteness of critical investigation, has few parallels. As it was partly by his solicitation, that Mr. Macpherson was induced to publish his "Fragments of Ancient Poetry," it is no wonder, that, independently of the test of criticism, he should be a zealous advocate in favour of their authenticity and antiquity; but, notwithstanding his able defence, a degree of scepticism has prevailed on this subject.

Dr. Blair's reputation as a preacher, or rather as a composer of sermons, had been for a long time acknowledged by those who had the pleasure of attending on his ministry; but it was not till the year 1777, that he could be induced to favour the world with a volume of the discourses which had so long furnished instruction and delight to his own congregation. The MS. of this volume, it is said, was received by the bookseller with some hesitation; but it was no sooner published, than he found it his interest to engage the author to furnish him with other volumes. Accordingly five volumes, in the whole, have been published at different intervals; and we may venture to affirm, that liberally as the author was recompensed, no collection of sermons has ever been more profitable to the bookseller, or more acceptable to the public, than Dr. Blair's. The circulation of them was rapid and extensive. They were translated into several foreign languages; and they received a royal reward. A pension of 200l. a year, issuing out of the exchequer in Scotland, was conferred, in 1780, on the author, and it was continued without any alteration till his death. These ser-

mons, though they possess various degrees of comparative excellence, and some must be allowed to be much superior to others, are upon the whole models in their kind; and they will long remain as monuments of the piety, the genius, and sound judgment of the author. Occupying a middle place between the dry metaphysical discussions or controversial speculations of one class of preachers, and the loose incoherent declamations of another, they blend the light of argument with the warmth of exhortation, the elegance of composition with judicious observations on human life, and practical knowledge with important principles of religion and virtue. The last volume was prepared for the press by the author after he had completed his eighty-second year, and delivered to the publishers about six weeks before his death. Although he left many other discourses in manuscript, he explicitly enjoined that they should be destroyed, and thus wisely prevented that injury to his reputation which has sometimes been the result of posthumous publications. The author's fame, as a preacher, depended principally, if not wholly, on the intrinsic excellence of his discourses, with respect to matter and composition; for we are informed, that his delivery, though distinct, serious, and impressive, was not remarkably distinguished by that magic charm of voice and action, which captivates the senses and imagination, and which, in the estimation of superficial hearers, constitutes the chief merit of a preacher. Dr. Blair, in the exercise of his professional duties, as far as they regarded the government of the church, was steadily attached to the cause of moderation. Diffident and unaccustomed to extemporary speaking, he declined interfering in ecclesiastical politics, and never would consent to become moderator of the general assembly of the church of Scotland; nevertheless, his opinion, which was always guided by sound judgment, uniformly commanded deference and respect. Whilst he was anxious to preserve the church from a servile corrupting dependence on the civil power, on the one hand; it was his wish, on the other, to prevent a greater infusion of democratical influence than he thought to be compatible with good order, and the established constitution of the country. His reputation in public life was well sustained by the great respectability of his private character; and he was eminently distinguished through life by the prudence, purity, and dignified propriety of his conduct. With a mind free from envy, and yet not insensible to the estimation in which he himself was held; inflexibly upright, and yet condescending to his friends, and disposed to enjoy the pleasures of social intercourse; few men have passed through life more universally respected by those who knew him, more sincerely esteemed in the circle of his acquaintance, or more tenderly beloved by those who enjoyed the benefit of his private and domestic connection. His wife, to whom he was married in 1748, contributed for almost half a century to his felicity, and was taken from him a few years before his death; and his two children, a son and a daughter, died, the former in infancy, and the latter in her 21st year. His constitution was naturally delicate and feeble; but he enjoyed, upon the whole, a state of good health; and by habitual cheerfulness, temperance, and care, survived the usual term of human life. He retained his faculties to the last stage; and after a short illness of three days, expired on the 27th of December, 1800, with the composure and hope of a Christian pastor; and his funeral sermon was preached by Dr. Finlayson, who has annexed to the fifth volume of his Sermons a short account of the life and character of the author, from which the preceding article is chiefly compiled.

BLAIR, in *Geography*. See ATHOL.

BLAIREAU, in *Zoology*, the common French name of

of *ursus meles*, or badger. A variety of a white colour found in New York is also called in France *Blaireau blanc*.

BLAIREAU *puant du Cap de Bonne Esperance*. Kolbe, and after him Abbé de la Caille, have described under this title a little quadruped found in the interior of Africa, which exhales a most insupportable odour. Whether it be of the badger kind in reality, or not, is uncertain. Sonnini believes it to be of the civet kind, *viverra Capensis*; and on the contrary, Gmelin supposes it to be of the glutton kind, perhaps a variety of *ursus gulo*.

BLAIRIA, in *Botany*. See **VERBENA**.

BLAISE, **ST.**, *Order of*, was founded in Armenia, about the commencement of the twelfth century. The habit of the knights of this order was a sky-blue; and on the breast thereof was embroidered their badge, being a *cross of gold*.

BLAISE. *St. Blaise and the Virgin Mary* was an order ecclesiastical and military. The particular time of its institution is not absolutely ascertained; but it is universally agreed that it took place soon after that of the Knights Templars. The badge of the order was a *red cross, on the centre of which was a medallion with the image of St. Blaise enamelled thereon*. When the knights assembled in chapter, or set out on any military expedition, they wore on their breast the same badge embroidered on a white habit.

BLAISE, in *Geography*, a town of France, in the department of the Upper Marne, and chief place of a canton, in the district of Chaumont, 12 miles N.N.W. of Chaumont. — Also, a river of France, which runs into the Marne near Larzicour, in the department of the Marne.

BLAISE, or **BLAS**, **ST.**, a cape on the coast of West Florida, in the gulf of Mexico. It is a promontory, which separates the bay of Apalache on the east from that of St. Joseph, forming a kind of shepherd's crook. N. lat. 29° 40'. W. long. 86°.

BLAISOIS, a province of France before the revolution, bounded on the east by Orleannois, on the south by Berry, on the west by Touraine, and on the north by Vendomois and Dunois. The capital was **BLOIS**, which see.

BLAISON, a town of France, in the department of the Mayne and Loire, and chief place of a canton, in the district of Angers; 8 miles S.E. of Angers.

BLAKE, **ROBERT**, in *Biography*, a celebrated English admiral, was a descendant of an ancient family of the name in the parish of Spaxton and county of Somerset, and born at Bridgwater, in August, 1589. Having received the rudiments of grammar learning at a free school in his native town, he became a member of St. Alban's hall, Oxford, in 1615, and translated himself from thence to Wadham college, where, in 1617, he took the degree of bachelor of arts. In 1619, he lost a fellowship of Merton college, for which he was a candidate, on account of his low stature; sir Henry Savile, the warden, paying particular respect to personal comeliness. Soon after the year 1623, in which he wrote a copy of verses on the death of Mr. Camden, he left the university, where he had been noticed for his early rising and application to study, and lived privately at Bridgwater. Adopting at an early period republican principles, and prejudiced against the ecclesiastical establishment, by the severity with which Dr. Laud, then bishop of Bath and Wells, enforced uniformity in his diocese, he inclined also to those opinions that were deemed puritanical. Accordingly the puritan party prevailed in procuring his return as a member for his native town, to the parliament of 1640, but for the Long Parliament he lost his election. Upon the breaking out of the war between the king and parliament, he declared for the latter, and entering into military service, was soon

appointed captain of dragoons. In this capacity he exhibited proofs of his talents by an obstinate defence of Brittol against the attack of prince Rupert, which he was at length obliged to surrender. In 1644 he was appointed governor of Taunton, which he had surprized and taken possession of for the parliament, and which he defended with a small but well-disciplined garrison, during a vigorous siege by the king's forces, till he obtained relief. For this service the parliament voted Blake, who was then colonel, a present of 500 pounds. After the murder of the king, which he is said to have disapproved, he cordially joined the republican party, and was reckoned, next to Cromwell, the ablest and most successful officer in the service of the parliament. Without affecting the character of a politician, he thought it his duty to serve his country to the utmost of his power, and to execute any measures that were adopted by the party to which he was attached, and by the existing government for this purpose. Early in the year 1649, he was appointed, in conjunction with Col. Deane and Col. Popham, to the command of the fleet; and his first naval expedition was directed, in 1649, against prince Rupert and prince Maurice, to the harbour of King'sale in Ireland; where he blocked them up for some time, and whence he pursued them to Lisbon, whither they had fled for the protection of the king of Portugal. War being declared on this account against the Portuguese, Blake annoyed their trade, and took several rich prizes; and he afterwards proceeded, first to Carthagen and then to Malaga, in pursuit of prince Rupert. At the latter place he burnt and destroyed his whole fleet, two ships excepted; and in the beginning of the year 1651, he returned with his squadron to Plymouth, where he received the thanks of the parliament, and was appointed warden of the cinque ports. In the following year he was constituted one of the admirals and generals of the fleet, and employed in reducing the isles of Scilly and the island of Guernsey. Having accomplished this service, he was elected one of the council of state; and in 1652, promoted to the rank of sole admiral for nine months, in the prospect of a Dutch war. The States, jealous of the naval power of England, determined to reduce it by a very vigorous effort. With this view they dispatched Van Tromp with 45 sail of men of war into the Downs, who was met by Blake with a much inferior force of 23 ships, and, after a very severe action, which took place May 19th 1652, obliged to retreat. After several skirmishes with the Dutch ships, and the capture of many prizes, during the progress of the summer, Van Tromp appeared again in the Downs, towards the close of the year, with 80 ships, for the purpose of renewing his attack upon Blake. The English admiral, whose force was much inferior, and who had the disadvantage of an unfavourable wind, disdained however to retreat, and engaged the enemy on the 29th of November. Notwithstanding every possible exertion, he lost six ships, and was compelled to retreat into the Thames with his shattered fleet; and Van Tromp was left in triumphant possession of the channel. Blake lost no time in repairing and recruiting his fleet; and in February 1653, he set sail in pursuit of his antagonist. On the 18th day of the month the English admiral, with 80 ships of war, came up off Portland with Van Tromp, who had 70, and a fleet of 300 merchant ships under his convoy. The engagement was such as seldom occurs in the history of naval combats; it lasted three days, and on both sides equal valour was displayed; at length, however, after a running fight up the channel, the Dutch anchored safely in the sands of Calais, having lost 11 men of war, 30 merchant-ships, and 1500 men who fell in the action, whilst the English lost only one ship, but as many lives as the enemy. In this action Blake was wounded in the thigh.

BLAKE.

At this time Cromwell dismissed the parliament, and assumed the supreme power; nevertheless, Blake and his colleagues declared their fixed purpose to serve their country faithfully, and to guard it, by every effort in their power, against foreign injury and insult. "It is not for us," said Blake, "to mind state affairs, but to keep foreigners from fooling us." Accordingly, when generals Monk and Deane, on the 23d day of June, had engaged Van Tromp with a fleet of 120 men of war, with dubious success, and with the loss of several men, among whom was Deane, Blake on the next day came up to their assistance with 18 fresh ships, and gained a victory so complete, that if the Dutch had not again saved themselves on the sands of Calais, their whole fleet must have been sunk or taken. After this engagement, his health being much impaired, he took his seat in the new parliament, summoned by the protector Oliver, as a representative of his native town, and he was constituted one of the commissioners of the admiralty. Cromwell indeed treated him with great respect; but he was not unapprized of the admiral's strong inclination to a commonwealth; and he was therefore the more disposed to send him, in November 1654, with a strong fleet into the Mediterranean, for the purpose of supporting the honours of the English flag, and procuring satisfaction for any injury which the British merchants had suffered. Whilst he lay in the road of Cadiz, he was treated with great respect by the Dutch and French, and even by the Algerines. However on the 10th of March in the following year he appeared before Algiers, and demanded satisfaction for the piracies committed on the English, and a release of all English captives. He then failed to Tunis on the same errand; but the dey, confiding in the strength of the place, treated Blake's message with contempt; "Here," said he, "are our castles of Goletta and Porto Ferino, do your worst; do you think we fear your fleet?" Blake, curling his whiskers, as he was accustomed to do when in a passion, consulted his officers, and then bore into the bay with his heavy ships; demolished the castles, burnt all the shipping in the haven of Tunis, and forced the haughty and obdurate dey to an humble submission, and an advantageous peace. This daring action spread the same terror of his name through Africa and Asia, which had for a long time prevailed in Europe. He also awed the piratical state of Tripoly into a peace with England, and the knights of Malta into a composition for the injuries which they had committed. Such was the effect of these exploits on the princes and states of Italy, that most of them thought fit to pay their compliments to the protector; and the grand duke of Tuscany, and the free state of Venice, in particular, sent magnificent embassies for that purpose. During the war with Spain, which was carried on with great spirit at this time, Blake, in pursuance of the protector's order, exerted himself in razing their maritime force in Europe, and Montague being joined with him, on account of his declining state of health, blockaded up for several months a Spanish squadron in the bay of Cadiz, and detached a part of their fleet to capture the Spanish plate fleet. Montague returned to England with the prizes; but Blake, whose constitution was broken by the dropsy and scurvy, staid behind; and in April 1657 failed with 25 men of war in pursuit of another plate fleet which had put into Santa Cruz in the island of Teneriffe. Upon his arrival, he found that the governor had used every possible precaution for the defence of the harbour; 16 Spanish ships were disposed in a circular form within the bay, and strongly barricadoed; and the entrance was guarded by a castle and 7 forts, connected with one another, and furnished with large cannon. Blake steered boldly into the bay, leaving some of his ships to silence the batteries, while with the rest he at-

tacked the Spanish vessels. Having driven the enemy from all their fortified posts, he set fire to the shipping, which it was impossible for him to remove, and destroyed the whole, to an immense amount. Having accomplished his object, the wind veered about in his favour and brought him out again without the loss of a single ship. This exploit has been censured by some cool politicians as an act of rashness; but such timid reasoners should consider that by such acts of valour the British navy has made the world to tremble. On this occasion the brother of the admiral was found deficient in some service which was expected from him; upon which he was degraded from his command, and sent home to his own country, though afterwards he shared the fraternal regard of Blake, in whose mind genuine patriotism absorbed every selfish and partial interest. This great enterprise was the last act of Blake's public life; and the news of it at home was honoured with a public thanksgiving, with a vote of thanks to all the officers and seamen, and with a diamond ring, of the value of 500*l.* to Blake himself. He lived to receive this welcome tribute of the gratitude and respect of his country, to the prosperity and glory of which he was invariably devoted. As his end approached, he wished to return to his native land; as he drew near, he often anxiously inquired for land; but before he could see it, he died as he was entering Plymouth sound, on board his ship the *St. George*, August the 17th 1657, at the age of about 59 years. His body was embalmed, and interred with singular honours in Henry the Seventh's chapel, Westminster; but after the restoration in 1661, it was removed and interred in *St. Margaret's* church yard. Blake was, with regard to his person, of low stature, of a quick, lively eye, and martial aspect, he was singularly brave, cool in action, and wise in the disposition of those desperate attacks, which men of a colder temperament have judged rather fortunate than expedient. He loved his country, and whatever was the established government, he was solicitous to do his duty; and this duty he performed with the most upright and disinterested views; for notwithstanding the high and lucrative posts which he occupied, and the many rich prizes which he captured, he only added to his own original patrimony about 500 pounds. He was pious without affectation, strictly just, and liberal to the extent of his fortune. His officers he treated with the familiarity of friends, and he was truly a parent to his sailors. Although no epitaph or sculpture monument records his great and good qualities, all parties have been eager to do justice to his memory. Dr. Bates, physician to king Charles I., the protector Oliver, and king Charles II., sums up his character in the following words: "He humbled the pride of France, reduced the Portuguese to submission, broke the strength of the Dutch, and drove their fleets out of the sea, subdued the pirates in the Mediterranean, and twice triumphed over the Spaniards, blamable only in this, that he joined himself with the parricides." Lord Clarendon says of him, that he was the first man that declined the old track, and disregarded ancient established rules, which served merely to keep his ship and his men out of danger; he first taught ships to contain castles on shore; he first infused that courage into seamen, which made them learn by experience what mighty things they could do if they were resolved, and taught them to fight in fire as well as upon water; and though he hath been very well imitated, he was the first that gave the example of that kind of naval courage, and bold, resolute achievements. Bishop Burnet mentions a story that is related of him, well known, but worth again recording. Whilst he lay in the road of Malaga, some of his seamen being on shore, met the host, and treated the procession with neglect and indignity. One of the

the Spanish priests resented this insult, fell upon them, and beat them severely. When they returned to their ship, they complained of this usage; upon which Blake sent to the viceroy demanding the surrender of the offending priest. The viceroy replied that he had no power over the priests; to which Blake returned for answer, that he would not enquire who had the power to deliver up the priest, but if he were not sent within three hours, he would burn their town. The viceroy sent the priest to Blake, who justified himself on account of the petulant behaviour of the seamen. Blake answered, that if complaint had been made to him, he would have inflicted just punishment, for he would not suffer his men to affront the established religion of any place, at which he touched; but he wished to have it known to the whole world, that an Englishman was only to be punished by an Englishman. He then treated the priest civilly, and sent him back. When Cromwell received this intelligence, he was highly delighted, and said he hoped that he should make the name of an Englishman as great as ever that of a Roman had been. It is said, that when Blake was cruising in the Mediterranean he met with a French ship of considerable force, and commanded the captain to come on board, no war having been declared between the French and English. The captain, being asked whether "he was willing to lay down his sword and yield," gallantly refused, though in his enemy's power. Blake, scorning to take the advantage of an artifice, and detesting the appearance of treachery, told him, "that he was at liberty to go back to his ship, and defend it as long as he could." The captain did so, and after an engagement of two hours, confessed himself conquered, kissed his sword and surrendered it. Mr. Granger, speaking of Blake's naval exploits, says, "that the very temerity of his enterprises struck terror into his enemies, and greatly contributed to his success. He not only improved the method of attack, but carried the naval power of Cromwell to a greater height than had been known in any age or nation." "Never man," says Mr. Hume, "so zealous for a faction, was so much respected and esteemed by the opposite factions." He was by principle an inflexible republican; and the late usurpatrons, amidst all the trust and caresses which he received from the ruling powers, were thought to be very little grateful to him. "It is still our duty," he said to the seamen, "to fight for our country, into whatever hands the government may fall." Disinterested, generous, liberal; ambitious only of true glory, dreadful only to his avowed enemies; he forms one of the most perfect characters of that age, and the least stained with those errors and violences, which were then so predominant. The Protector ordered him a pompous funeral at the public charge; but the tears of his countrymen were the most honourable panegyric on his memory. To the above testimonies we shall add the following lines from Mr. Glover's poem entitled "London."

———"Thy name

Was heard in thunder through th' affrighted shores
Of pale Iberia, of submissive Gaul,
And Tagus trembling to his utmost source.
O! ever faithful, vigilant, and brave,
Thou bold asserter of Britannia's fame,
Unconquerable Blake!"

Biog. Brit.

BLAKEA, in *Botany*, so named by Dr. Patrick Browne, from Mr. Martin Blake of Antigua, a great promoter of natural knowledge, and patron of the doctor's natural history of Jamaica. Lin. gen. 593. Reich. 647. Schreb. 810. Brown. t. 35. Juss. 328. Class and order, *Dodecandria Monogynia*. Gen. Char. *Cal.* perianth of the fruit inferior, six-

leaved; leaflets ovate, concave, expanding, the size of the flower:—perianth of the flower superior; margin quite entire, hexangular, membranaceous. *Cor.* petals six, ovate, expanding, equal. *Stam.* filaments twelve, subulate, erect; anthers triangular, depressed, concatenated into a ring. *Pist.* germ inferior, obovate, crowned with the margin of the calyx, style subulate, the length of the flower; stigma acute. *Per.* capsule obovate, six-celled. *Seeds* very many.

Ess. Char. *Cal.* inferior, six-leaved; superior entire. *Pet.* six. *Capf.* six celled, many-seeded.

Species, 1. *B. trinervia*. "Two-calyceled; leaves nerveless, very finely striated acos." Leaves oblong-ovate, petioled, quite entire, coriaceous, opposite; the three nerves underneath protuberant, blackish; flowers opposite, solitary. Generally rising to the height of 10 or 14 feet; one of the most beautiful productions of America; at first a climber, but gradually acquiring a more robust stem, which divides into many weak declining branches, well supplied on all sides with beautiful rosy blossoms. A native of Jamaica, in cool, moist, shady places. 2. *B. triplinervia*. "Uncalyceled; leaves triple nerved." A tree growing to the height of 16 feet; leaves opposite, petioled, six or seven inches long, ribbed underneath, and having a nerve running along the edge; peduncles three-flowered; flowers distinct, without any lower perianth; upper perianth three or five-cleft, coriaceous, permanent; petals about seven; filaments twelve or fifteen; anthers ovate, parallel, flattish at the back, shorter than the corolla, truncated, not concatenated; style club-shaped; stigma capitate, streaked; fruit a roundish, many-celled berry, crowned with the calyx; seeds minute; fruit of a yellow colour, and sapid. A native of Surinam, where it was observed by Dalberg; also of Guiana, where it flowers and fruits in May.

Propagation and Culture.—These trees have not been yet cultivated in Europe. In the West Indies the first species thrives best on the sides of ponds or rivulets; and when planted in gardens, where its appearance is elegant, it ought to be supplied with some supports, whilst it continues young and weakly.

BLAKENEY, in *Geography*, a harbour on the coast of Norfolk, between Cromer at east by south, and Wells at west by north nearly, distant from the former 2 leagues, and from the latter 3 leagues.

BLAMONT, a town of France, and principal place of a district in the department of the Meurthe; containing 1863 inhabitants, and the population of the canton is 10,695. The territory comprehends 212½ kilometres and 30 communes; 4½ leagues east of Luneville. N. lat. 48° 35'. E. long. 6° 44'.—Also, a town of France, in the department of the Doubs, and chief place of a canton; containing 400 persons, and the canton contains 3539; the territory comprehends 107½ kilometres and 14 communes; 1½ league north of St. Hippolyte.

BLAMPIN, THOMAS, in *Biography*, a Benedictine of St. Maur, was born at Noyon in Picardy in 1640, and taught philosophy and theology in his own congregation. He is chiefly known as editor of the works of St. Augustin, in which he displayed much critical erudition and sagacity, and great accuracy in his collation of MSS. Besides other preferments in the church, he was appointed in 1708 visitor of the province of Burgundy, and in consequence of the austerities exercised in this office, he died in 1710. Moreri.

BLANC. See BLANK.

BLANC, FRANCIS LE, in *Biography*, distinguished himself by the study of belles-lettres, history and medals, and was appointed by Louis XIV. to draw up an account of the

monies of France from the establishment of the monarchy. Accordingly he published "A Treatise on the Monies of France," Paris, 1698, 4to. with figures; reprinted at Amsterdam, 4to. 1692. To this is usually annexed his dissertation, published the preceding year, "On the coins of Charlemagne and his successors struck at Rome." He was chosen historical tutor to the royal children; but died before he entered on his office, at Versailles in 1698. *Nouv. Dict. Hist.*

BLANC, JOHN BERNARD LE, ABBE, historiographer of the public buildings, and member of the academies of La Crusca, and of the Arcadi at Rome, was born at Dijon in 1707, and entering in the literary career, wrote a tragedy entitled "Abelaid," which, notwithstanding the harshness of its versification, was at first well received. At Paris, where he settled, he obtained friends and patrons; and in 1746 Maupertuis was empowered by the king of Prussia to offer him a residence, as a man of letters, at his court, which he declined accepting. His "Letters on the English nation," in 3 vols. 12mo. 1758, are the most known of his works, and were occasioned by his visit to England. The style is heavy, and the thoughts trite and vulgar, so that they are now little read. He died in 1781. *Nouv. Dict. Hist.*

BLANC, LEWIS LE, *Sieur de Beaulieu*, a professor of divinity at Sedan in the 17th century, was born at Plessis-Marli, where his father was minister, and in the progress of his life, of which few particulars are recorded, was distinguished by his learning and virtue. He died in 1675, at the age of 60 years and 6 months. His "Theses Theologicæ" were collected into one volume after his death, passed through several editions, and are highly worthy of an attentive perusal. The first edition was printed at Sedan in 4to, and two other editions were printed in England; the third in 1683. He was eminent for the persuasive power of his eloquence, and discovered an uncommon degree of penetration and sagacity in his writings and negotiations. Anxious for a reconciliation and union between the Reformed and Romish churches, he passed in review many of the controversies that divided them, and seemed to prove, with the utmost perspicuity, that some of them were merely disputes about words, and that the others were of much less consequence than was generally imagined. This manner of stating the differences between the two churches drew upon him the indignation of those who regarded all attempts to soften and modify controverted doctrines as dangerous and detrimental to the cause of truth. Among these we may reckon Arnould, Saurin, and Jurieu. On the other hand, the acuteness and dexterity with which he treated this delicate subject, made a considerable impression upon several persons, and procured him disciples who entertained his reconciling sentiments, but either entirely concealed them, or discovered them with caution, as they were known to be displeasing to the greatest part of the members of both communions. Some of Le Blanc's sermons were printed at Sedan in 1675. *Gen. Dict. art. Beaulieu. Moss. Eccl. Hist. vol. v. p. 379.*

BLANC, LEWIS LE, a skilful surgeon and lithotomist of Orleans, published in 1764 "A Discourse on the utility of Anatomy;" and in 1768, "Nouvelle Methode d'operer des Hernies," 8vo. He recommends dilating the ring with the finger, if practicable, which it usually is, he says, in recent cases; in those of long standing, with a pair of forceps he invented for the purpose, instead of using the knife. This doctrine having been opposed by Ant. Louis, he was answered by Le Blanc in a dissertation on the subject, published in the fourth volume of the Memoirs of the Academy of Surgery. After reducing the intestine, by his method, no truss is wanted, as is invariably the case when the ring is

opened by incision. The forceps are introduced into the ring, closed, and open themselves by the force of an elastic spring. He also wrote on the operation for the stone, on the method of extracting small portions of the placenta left in the uterus, and further observations on the cure of hernia. These papers were published in the 30th, 35th, and 39th volumes of the Journal de Médecine. In 1775 he published "Precis d'operations de Chirurgie," 2 vols. 8vo., containing the substance of the above, with some additional observations. *Haller. Bib. Anat. de Chirurg.*

BLANC-manger. Fr. q. d. *white food*, in *Domestic Economy*, is a preparation of dissolved isinglass, milk, sugar, cinnamon, &c., boiled into a thick confistence, and furnished for the table with blanched almonds. It is cooling and strengthening.

BLANCS *manteaux*, in *Ecclesiastical History*, a name originally given to the *Servites*, or servants of the Blessed Virgin, on account of their white cloaks; but since applied to divers sorts of religious, who have successively inhabited the house of the *Servites*, and now to the Benedictines at Paris, though habited in black.
