A late writer (Priestley's Hist. Corrupt. of Christianity, vol. i. p. 147.) thinks that they are all reducible to two classes, *viz.* that of those who believe that there is no proper divinity in Christ, besides that of the Father; and the class of Tritheists, who maintain that there are three equal and distinct Gods. Dr. Waterland and the rest of the Athanasians assert three proper distinct persons, entirely equal to and independent upon each other, yet making up one and the same being. Mr. Howe (Works, vol. ii. p. 560—563.) seems to suppose that there are three distinct eternal spirits, or distinct intelligent hypostases; each having his own distinct, singular, intelligent nature, united in such an inexpressible manner, as that upon account of their perfect harmony, consent, and affection, to which he adds their mutual self-consciousness, they may be called the one God, as properly as the different corporeal, sensitive, and intellectual natures united may be called one man. Bishop Pearson (on the Creed, p. 134, &c. 322, &c.), bishop Bull (Serm. vol. iv. p. 829.), and Dr. Owen (on the Heb. i. 3. p. 53, &c.), are of opinion, that though God the Father is the fountain of the Deity, the whole divine nature is communicated from the Father to the Son, and from both to the Spirit; yet so as that the Father and Son are not separate, or separable from the divinity, but do still exist in it, and are most intimately united to it. Dr. Thomas Burnet (Script. Doctr. p. 173.) maintains one self-existent and two dependent beings; but asserts, that the two latter are so united to and inhabited by the former, that by virtue of that union divine perfections may be ascribed and divine worship paid to them. In this opinion Dr. Doddridge is said to have concurred. Dr. Wallis (Lett. on the Trin.) thought, that the distinction between the three persons was only modal; which seems, says Dr. Doddridge, to have been the opinion of archbishop Tillotson. (Tillotson. Serm. vol. i. p. 492—494.) Dr. Watts (Diff. N^o 7.) maintained one supreme God dwelling in the human nature of Christ, which he supposes to have existed the first of all creatures; and speaks of the divine Logos, as the wisdom of God, and the Holy Spirit, as the divine power, or the influence and effect of it; which, he says, is a scriptural person, *i. e.* spoken of figuratively in scripture under personal characters. Doddridge's Lectures, p. 402, &c.

TRINITARIANS also denote an order of religious, instituted in honour of the Trinity, for the redeeming of Christian captives from the infidels; vulgarly called Mathurins, and brothers of the redemption.

They are clothed in white, and bear on the stomach a cross, partly red and partly blue; by which three colours, white, red, and blue, is supposed to be represented the mystery of the Trinity; but the habit of this order is different in different provinces.

The Trinitarians made it their business to go and ransom Christians held in slavery in the republics of Algiers, Tunis and Tripoli, and the states of Morocco. They have a rule peculiar to themselves; though several historians rank them among the observers of the rule of St. Augustine.

The order had its rise in 1198, under the pontificate of Innocent III. The founders were John de Matha and Felix de Valois; the first of Faucon in Provence; the second, not of the royal family of Valois, as some have imagined, but thus called, in all probability, as being a native of the country Valois.

Gauthier of Chatillon was the first who gave them a place in his lands to build a convent; and afterwards became the chief of the whole order: Honorius III. confirmed their rule; and Urban IV. appointed the bishop of Paris and others to reform them: they did it; and the reform was approved, in 1267, by Clement IV.

This order possesses about 250 convents, divided into thirteen provinces; of which six are in France, three in Spain, one in Italy, and one in Portugal. And formerly there was one in England, another in Scotland, and a third in Ireland.

Broughton, and some other writers, make a distinction between the order of the redemption of captives, and the fraternity of the Holy Trinity.

TRINITARIANS, *Barefooted*, are a reform of this order, made in Spain, in a general chapter held in 1594, where it was resolved, that each province should establish two or three houses, where the primitive rule should be observed, and where the religious should live up to a greater austerity, use coarser clothes, &c. and yet should have the liberty of returning to their ancient convent, when they thought fit.

Don Alvarez Bafan, intending to found a monastery at Valdepegnas, and desiring to have it occupied by barefooted religious, it was agreed to add nudity of feet to the reform, that the Trinitarians might have the benefit of that establishment. The reform afterwards grew into three provinces, and was at length introduced into Poland and Russia, and thence into Germany and Italy.

There are also barefooted Trinitarians in France, established by F. Jerom Hallies, who, being sent to Rome to solicit the first reform mentioned above, not content with this, carried it farther, and obtained a permission of pope Gregory, to add a coarse habit and nudity of feet thereto. He began with the convent of St. Dionysius at Rome, and those of Aix in Provence.

In 1670, there were houses enough of this reform to make a province, and, accordingly, they held their first general chapter the same year.

There are also nuns of the Trinitarian order established in Spain by St. John de Matha himself, who built them a convent in 1201. Those who first took the habit were only oblates, and made no vows; but in 1201, the monastery was filled with real religious, under the direction of the infantia Constantia, daughter of Peter II. king of Aragon, who was the first religious, and the first superior of the order.

There are also barefooted nuns of this order, established at Madrid about the year 1612, by Frances de Romero, daughter of Julian de Romero, a lieutenant-general in the Spanish army.

Lastly, there is a third order of Trinitarians.

TRINITE, LA, in *Geography*, a town of France, in the department of the Stura; 4 miles S.W. of Bene.—Also, a name given to two islands and a rock in the South Atlantic ocean; uninhabited and little known. S. lat. 19° 30'. W. long. 40°.—Also, a town of France, in the department of the Morbihan; 15 miles E. of Pontivy.

TRINITY, TRINITAS, *Trias*, *Triad*, in *Theology*, the ineffable mystery of three persons in one God, Father, Son, and Holy Spirit.

It is an article in some systems of theology, that there

is one God, an unity in nature and essence, and a Trinity of persons. The term Trinity implies the unity of three, the unity of three divine persons really different, and the identity of an indivisible nature: the Trinity is a ternary of divine persons of the same essence, nature, and substance.

Person is defined an individual, reasonable, or intellectual substance; or an intellectual and incommunicable substance.

The hypostasis, or substance, is what constitutes the person. There are then in the Holy Trinity three persons, Father, Son, and Holy Spirit, which have all things in common, except their relations; whence that axiom in theology comes to have place, in the divine persons there is no distinction, where there is no opposition of relation.

The Father is the first person in the Holy Trinity, & by reason the Father alone produces the Word, by the way of *understanding*; and with the Word produces the Holy Spirit, by way of *will*.

Here it is to be observed, that the Holy Spirit is not thus called from his spirituality, that being common and essential to all the three persons; but from the passive spiration (as some popish schoolmen express the manner in which the personality of the Holy Spirit is derived from the Father and Son), which is peculiar to him alone.

Add, that when one person in the Holy Trinity is called *first*, another *second*, and another *third*, it must not be understood of a priority of time, or of nature, which would imply some dependence; but of a priority of origin and emanation, which consists in this, that one person produces the other, in such manner, as that the person which produces cannot be, or be conceived, without that produced.

Those who maintain the doctrine of the Trinity allege, that the same titles, attributes, works, and worship, are ascribed by the sacred writers to the Father, Son, and Holy Spirit: nevertheless they contend, in different ways, for the proper unity of the divine nature. For the sentiments of some of the chief modern Trinitarians, see TRINITARIANS: and for the sentiments of others, who have rejected what has been usually denominated the orthodox doctrine of the Trinity, see ARIANS, MACEDONIANS, NOETIANS, SABELLIANS, SEMI-ARIANS, SOCINIANS, and UNITARIANS. See also TRITHEISM.

It is observed by Dr. Waterland and many other writers, that the term Trinity first occurs in the works of Theophilus, bishop of Antioch, about the year 180. Theoph. ad Autolyc. lib. ii. c. 14. p. 148. 150, ed. Wolfii.

But at this time the words, persons, and substances, were not in use; however, they were introduced on occasion of the disputes with Praxeas, Noetus, and Sabellius, either by Clement of Alexandria, or by Tertullian.

For the punishment inflicted by the English law on those who deny the Trinity, see HERESY.

Many of the heathens are said to have had a notion of a Trinity. Steuch. Eugub. de Peren. Philos. lib. i. c. 3. observes, that there is nothing in all theology more deeply grounded, or more generally allowed by them, than the mystery of the Trinity. The Chaldeans, Phœnicians, Greeks, and Romans, both in their writings, and their oracles, acknowledged that the Supreme Being had begot another Being from all eternity, which they sometimes called the *Son of God*, sometimes the *Word*, sometimes the *Mind*, and sometimes the *Wisdom of God*, and asserted it to be the creator of all things.

Among the sayings of the Magi, the descendants of Zoroaster, this is one, Πάσις ἐξετελεσε πατήρ καινῶν, παρέδωκε δευτέρῳ: *the Father finished all things, and delivered them to the second Mind.*

Mind. The Egyptians called their Trinity, *Hemphba*, and represented it by a globe, a serpent, and a wing, disposed into one hieroglyphic symbol. Kircher, Gale, &c. suppose the Egyptians learned their doctrine of the Trinity from Joseph and the Hebrews.

The philosophers, says St. Cyril, owned three hypostases, or persons; they have extended their divinity to three persons, and even sometimes used the word *Trias*, *Trinity*: they wanted nothing but to admit the consubstantiality of the three hypostases, to signify the unity of the divine nature, in exclusion of all triplicity with regard to difference of nature; and not to hold it necessary to conceive any inferiority of hypostases.

We learn from Dr. Cudworth, that, besides the inferior gods, generally received by all the Pagans, (*viz.* animated stars, dæmons, and heroes,) the more refined of them, who accounted not the world the supreme deity, acknowledged a Trinity of divine hypostases superior to them all. This doctrine, according to Plotinus, is very ancient, and obscurely asserted even by Parmenides. Some have referred its origin to the Pythagoreans, and others to Orpheus, who adopted three principles, called Phanes, Uranus, and Cronus. Dr. Cudworth apprehends, that Pythagoras and Orpheus derived this doctrine from the theology of the Egyptian Hermes; and, as it is not probable that it should have been first discovered by human reason, he concurs with Proclus in affirming, that it was at first a theology of divine tradition, or revelation, imparted first to the Hebrews, and from them communicated to the Egyptians and other nations; among whom it was depraved and adulterated. Cudw. *Intell. System*, book i. c. 4.

Plato, and some of his followers, speak of a Trinity in such terms, that the primitive fathers have been accused of borrowing the very doctrine from the Platonic school; but M. Mourgues, who has examined the point, asserts, that nothing can be more absurd, than to suppose the Platonic Trinity brought into the church; and to have recourse to the Platonism of the fathers to discredit their authority with regard to this dogma.

TRINITY, *Friery or Fraternity of the Holy*, is a society instituted at Rome, by St. Philip Neri, in 1548, to take care of pilgrims coming from all parts of the world to that capital, to visit the tombs of St. Peter and St. Paul.

In 1558, pope Paul IV. gave the fraternity the church of St. Benedict, to which they gave the title of the Holy Trinity. Since that time, they have built close by it a very ample hospital for pilgrims, and persons on the recovery.

The fraternity has since become very considerable, and most of the noblesse of Rome, of either sex, have done it the honour to be members of it.

TRINITY, *Congregation of the Holy*, is a congregation of twelve priests established in the hospital of the fraternity just mentioned, to take care of pilgrims, and others entertained therein.

TRINITY, *Order of the Holy*. See TRINITARIANS.

TRINITY-Sunday, is the next Sunday after Whitunday, thus called, because on that day was anciently held a festival (as it still continues to be in the Romish church) in honour of the Holy Trinity. The observance of this festival was first enjoined by the sixth canon of the council of Arles, in 1260; and John XXII. who distinguished himself so much by his opinion concerning the beatific vision, is said to have fixed the office for this festival in 1334.

TRINITY-*Herb*, in *Botany*. See VIOLET.

TRINITY-*House*, is a kind of college at Deptford, belonging to a society of seafaring persons, founded for the

regulation of seamen, and security and convenience of ships and mariners on our coasts.

This society was incorporated by Henry VIII. in 1515, who confirmed to them not only all the ancient rights and privileges of the mariners of England, but also their several possessions: which, together with various grants of queen Elizabeth and king Charles II. were confirmed by letters patent of the 1st of James II. in 1685; under the name of the master, wardens, and assistants of the guild or fraternity of the most glorious and undivided Trinity, and of St. Clement, in the parish of Deptford Strand, in the county of Kent.

This corporation is governed by a master, four wardens, eight assistants, and eighteen elder brethren: the inferior members of the fraternity, denominated younger brethren, and chosen among the masters and mates expert in navigation, are of an unlimited number, and serve for supplying vacancies among the thirty-one elder brethren. The master, &c. of this corporation, are invested by charter with a power to examine the mathematical children of Christ's Hospital; to examine the masters of his majesty's ships; to appoint pilots for conducting ships in and out of the river Thames; and to amerce such as shall act as masters or pilots without their approbation in a fine of 2*l.*; to settle the several rates of pilotage, and erect light-houses, and other sea-marks, on the several coasts of the kingdom, for the security of navigation; to prevent aliens from serving on board English ships, without their licence, under penalty of 5*l.* for each offence; to punish seamen for desertion or mutiny in the merchant service; to hear and determine the complaints of officers and seamen in this service, under an appeal to the court of admiralty; and to grant licences to poor seamen (non-freemen) to row on the river Thames.

To this company belongs the ballast-office, for cleaning and deepening the river Thames, by taking from it a sufficient quantity of ballast for the supply of all ships that sail out of the river; in which service sixty barges, of the burden of thirty tons, and two men each, are constantly employed: all ships taking in ballast pay to them 12*d.* a ton.

This corporation is empowered by charter to purchase lands, &c. to the amount of 500*l.* per annum, and also to receive charitable benefactions to the like amount. They have also light-houses, to which all ships pay a halpenny per ton.

Out of the income of this corporation, about three thousand poor seamen, their widows and orphans, are annually relieved, at the expence of about 6000*l.*

The house in which the brethren of this corporation usually meet for the dispatch of business, is on Tower-Hill. (See LONDON.) They have three hospitals, two at Deptford, and one at Mile-End, which last is designed for decayed sea-officers, masters of vessels, pilots, and their widows.

TRINITY *Term*. See TERM.

TRINITY, or *La Trinité*, in *Geography*, a sea-port town of the island of Martinico: the harbour is formed on the south-east side by the point Caravelle, which is two leagues in length; and on the other side by a very high hill, about 350 or 400 paces in length, which only joins to the main land by an isthmus not above 200 feet broad. The east side, opposite to the bottom of this bay, is stopped up by a chain of rocks, which appear level with the water when the ebb tide is spent. The town here is a very thriving place, being the residence of several merchants, as well as of the lieutenant-governor of the *Cabes-terre*; and much frequented by shipping, especially from Nantes; the cargoes of which are sure here to meet with a quick sale, the people,

who

who are very numerous in the adjacent parts, choosing rather to buy what they want near at hand, than to send for it from the Basseterre. Besides, during the hurricane season, ships have a safe station in this port: another advantage they have here is, that when they set out for Europe, they are to the windward of all the islands, and save about 300 leagues in their passage, which they would find by the way of St. Domingo, or Porto Rico. N. lat. $14^{\circ} 53'$. W. long. $61^{\circ} 8'$.

TRINITY Bay, a large but not a very deep bay of the South Pacific ocean, on the north-east coast of New Holland, between Cape Grafton and Cape Tribulation.—Also, a large bay on the east coast of Newfoundland. N. lat. 48° . W. long. $53^{\circ} 10'$.

TRINITY Harbour, a cove on the north-west end of Trinity bay, on the east coast of Newfoundland. N. lat. 48° . W. long. $53^{\circ} 10'$.

TRINITY Inlet, a bay of the North Pacific ocean, on the west coast of North America; 30 miles S. of Queen Charlotte's Sound.

TRINITY Island, an island in the North Pacific ocean, discovered by captain Cook. Captain Vancouver passed this coast in the year 1794, and says it appeared to be divided into two islands, with several others of inferior size lying to the north, between them and the land about Cape Trinity. The east point of the easternmost is, according to his observations, situated in N. lat. $56^{\circ} 33'$. E. long. $206^{\circ} 47'$.

TRINIUMGELD, or THRINIUMGILD, a compensation used among our Saxon ancestors for great crimes, which were not absolved but by paying a fine thrice nine times. See GELD.

TRINK, in our *Statutes*, is used for a fishing-net. 2 Hen. VI. cap. 15. Blount.

TRINO, in *Geography*, a town of France, in the department of the Sesia, lately belonging to the duchy of Montferrat, situated in a marshy soil: the country near produces great quantities of corn, rice, and cheese, by some supposed equal to those of Piacenza or Parma. The fortifications are for the most part demolished. It has one collegiate and several parish churches, and religious houses; 10 miles S.S.W. of Vercelli. N. lat. $45^{\circ} 17'$. E. long. $8^{\circ} 16'$.

TRINOBANTES, TRINOANTES, or TRINOVANTES, in *Ancient Geography*, were inhabitants of Britain, situated next to the Cantii northward, and occupied, according to Camden and Baxter, that country which now composes the counties of Essex and Middlesex, and some part of Surrey. But if Ptolemy be not mistaken, their territories were not so extensive in his time, as London did not then belong to them. The name of this British nation seems to be derived from the three following British words; *Tri*, *Now*, *Hant*, which signify the inhabitants of the new city. This name was perhaps given them by their neighbours, on account of their having newly come from the continent into Britain, and having there founded a city called Tri-Now, or the New City, the most ancient name of the renowned metropolis of Britain. The Trinobantes had come so lately from Belgium, that they seem hardly to have been firmly established in Britain, at the time of the first Roman invasion. For their new city, which soon after became so famous, was then so inconsiderable, that it is not mentioned by Cæsar, though he must have been within sight of the place where it was situated. They were then at war with their neighbours, the Cattivellauni, whose king, Cassibelanus, commanded the confederated Britons against the Romans; and, on this account, the Trinobantes were amongst the first of the British states who deserted that confederacy and submitted to Cæsar. They submitted again to the Romans, on their next invasion

in the reign of Claudius, with the same facility, and almost for the same reason. For, in the interval between the invasion of Julius and that of Claudius, the Cattivellauni had reduced them under their obedience; and, in order to emancipate themselves from this subjection to their neighbours, they put themselves under the protection of the Romans. But the Trinobantes soon became weary of their obedience to their new masters. For the Roman colony at Camulodunum, which was within their territories, depriving some of them of their estates, and oppressing them several other ways, they joined in the great revolt of the Britons under Boadicea, and shared very deeply in the miseries of that revolt. From that time the Trinobantes remained in peaceable subjection to the Romans, as long as they continued in Britain. The country of the Trinobantes was greatly valued and much frequented by the Romans, on account of the excellence of its soil and climate, and the many advantages of its situation. That sagacious people soon fixed their eyes on the new town of the Trinobantes; and observing its admirable situation for health, for pleasure, and for trade, great numbers of them settled in it, and giving it the name of Londinium from its situation, and of Augusta from its grandeur, it became in a little time the largest and most opulent city in this island. In the reign of Nero, as Tacitus informs us, London was become a city highly famous for the great conflux of merchants, her extensive commerce, and plenty of all things. No fewer than seven of the fourteen jurnies of Antoninus begin or end at London; a plain proof, among many others, that this city was the capital of Britain in the Roman times, as it is at present the great and flourishing metropolis of the British empire. Camulodunum, now Malden in Essex, was the seat of the first Roman colony in Britain, and a place of great beauty and magnificence in these times; though at present few or no vestiges of its ancient grandeur remain. Cæsaromagus, from its pompous name, was probably a place of some note in the Roman times; but it is now so entirely ruined, that it is difficult to discover the ground where it once stood; some of our antiquaries placing it at Chelmsford, and others at Dunmow. The Colonia of Antoninus was probably Colchester, and Durolytum, as some think, Leicester, but, according to others, Waltham. But though the county of Essex was certainly very much frequented by the Romans, who erected many noble works in it, yet time, cultivation, and various accidents, have made so great a change in the face of that country, that very few vestiges of these works are now remaining. The territories of the Trinobantes were included in that Roman province which was called Britannia Prima. See CAMULODUNUM.

TRINODA NECESSITAS, in our *Ancient Customs*, a threefold necessary tax, to which all lands are liable; viz. *expeditio*, & *reparatio pontis*, & *arcis*; going to the wars, and repairing of bridges and of castles.

These were the three exceptions anciently inserted in the king's grants of land to the church, after the words that freed them from all secular service.

TRINODA, or *Trinodia Terra*, in some *Ancient Writers*, denotes a quantity of land containing three perches.

TRINOMALY, in *Geography*, a town of Hindoostan, in the Carnatic, near which the troops of Hyder Ally were defeated by the British, under colonel Smith in the year 1768, with the loss of the greatest part of their artillery; 45 miles S.S.W. of Arcot. N. lat. $12^{\circ} 13'$. E. long. $79^{\circ} 10'$.

TRINOMIAL or TRINOMINAL Root, in *Mathematics*, is a root consisting of three parts, or monoms, connected together by the signs + or —.

Such is $x + y + z$, or $a + b - c$. See INVOLUTION.

TRIO, in Italian *Terzetto*, a vocal composition in three principal parts, exclusive of the accompaniments. In chamber duets and trios, such as those of Steffani and Clari, in which each part repeats the same words, the great merit was pure harmony, and ingenious subjects of fugue and imitation. But in the dramatic duets and trios of modern times, the several parts have different words and different passions to express. In an opera trio, the several characters are dialogued, and seldom sing together; and in each solo part a beautiful, interesting, and characteristic melody is required. But in moments of passion, where the three parts are united, and expressing with energy and passion their several complaints and accusations, it is that, united with the orchestra, an interest will be produced at once by combinations of poetry, harmony, and stage effects.

There is nothing more difficult, perhaps, for the poet to write, or the composer to set, than a dramatic trio.

TRIOCTILE, in *Astrology*, an aspect, or situation, of two planets with regard to the earth, when they are three octants, or eight parts of a circle, *i. e.* 135 degrees, distant from each other.

This aspect, which some call the *sesquiquadrans*, is one of the new aspects superadded to the old ones by Kepler.

TRIODIA, in *Botany*, from τρεις, τρις, three, and οδους, a tooth, alluding to the three, nearly equal, teeth, of the outer valve of the corolla.—Brown Prodr. Nov. Holl. v. 1. 182. Kunth Nov. Gen. et Sp. v. 1. 126.—Clafs and order, *Triandria Digynia*. Nat. Ord. *Gramina*.

Eff. Ch. Calyx many-flowered, of two nearly equal valves. Outer valve of the corolla with three, nearly equal, teeth; the middle one straight. Nectary of two scales.

A genus of perennial, rather rigid grasses, with panicle flowers, and the habit of a *Poa* or *Festuca*. Mr. Brown suspects *Festuca decumbens* of Linnæus, which is *Poa decumbens* of Sm. Fl. Brit., *Danthonia decumbens* of Decandolle, ought to be removed hither. Our learned friend also has hinted to us, that the two South American species of Humboldt and Bonpland, here subjoined to his own New Holland ones, though they answer to the generic character, are considerably different in appearance from the rest.

1. *T. pungens*. Br. n. 1.—“Panicle rather close, erect; with alternate, mostly simple, branches. Spikelets lanceolate, of about six flowers. Outer valve of the corolla woolly at the edges and keel, in its lower half. Leaves spreading, involute, pungent; sheaths of the lower ones viscid.”—Found by Mr. Brown, in the tropical part of New Holland.

2. *T. procera*. Br. n. 2.—“Panicle loose; its branches undivided, spiked. Spikelets somewhat stalked, of three or four flowers. Calyx roughish. Outer valve of the corolla very smooth at the keel, and nearly so at the edges. Leaves involute, rather lax; their sheath with a silky beard.”—From the same country.

3. *T. parviflora*. Br. n. 3.—“Panicle loose, elongated; its branches undivided, spiked. Spikelets linear, of about six flowers. Outer valve of the corolla naked at the keel; rather downy at the edges. Leaves involute, rather lax. Stipula torn.”—From the same country.

4. *T. microstachya*. Br. n. 4.—“Panicle elongated, rather close; its branches undivided, spiked. Spikelets about three-flowered. Glumes rough. Outer valve of the corolla blunt, with three very short teeth; its keel and edges smooth. Leaves involute; their sheath bearded.”—From the same country as the three foregoing.

5. *T. irritans*. Br. n. 5.—“Panicle close. Spikelets lanceolate, imbricated. Outer valve of the corolla villous

at the base. Leaves involute, spreading, rigid, pungent.”—Native of the southern coast of New Holland.

6. *T. ambigua*. Br. n. 6.—“Panicle lax; its branches half-whorled, undivided, spiked. Spikelets nearly sessile, linear, of eight or ten flowers. Outer valve of the corolla silky at the edges; inner fringed. Leaves involute. Stipula torn.”—Found in the tropical part of New Holland, by Mr. Brown, who doubts whether this be a genuine species of *Triodia*. Its aspect is perfectly that of a *Poa*.

7. *T. pulchella*. Kunth as above, n. 1. t. 47.—Panicle leafy, of about three flowers. Spikelets about seven-flowered. Corolla hairy at the base; its inner valve toothed. Scyons trailing. Leaves rough.—Native of cool dry exposed situations in Mexico, flowering in September. Root fibrous, with trailing runners, taking root as they go, and sending up stems two or three inches high, solitary or aggregate, whose simple panicle is accompanied by many awl-shaped leaves, resembling the radical foliage.

8. *T. avenacea*. Kunth n. 2. t. 48.—Panicle close. Spikelets about six-flowered. Corolla hairy in its lower half; inner valve entire. Scyons trailing. Leaves slightly hairy.—Native of vallies in Mexico, flowering in April. This increases by runners, like the last. But the stems are twice as tall; the panicle leafless, rather compound, resembling a *Festuca*; the leaves flat, bluntish, not unlike *Poa annua*.

TRIODION, the title of an ecclesiastical book in the Greek church, which comprehends the office of a particular part of the year. This book is called Triodion, because it contains the hymns or odes of three strophes. The hymn of two strophes is called “Diodion;” and that of four, “Tetrodion.” Leo Allatius.

TRIOLA, in *Geography*, a town of the Ligurian republic; 18 miles N.E. of Vintimiglia.

TRIOND, a town of European Turkey, in Albania; 12 miles W.N.W. of Alessio.

TRIONDA, a small island in the gulf of Satalia, near the coast of Natolia. N. lat. 36° 36'. E. long. 30° 26'.

TRIONES, in *Astronomy*, a sort of constellation, or assemblage of seven stars in the Urfa Major, popularly called *Charles's Wain*.

From the *Septem Triones*, the north pole takes the denomination *Septentrio*.

TRIONTO, in *Geography*, a river of Naples, which runs into the gulf of Tarento; 10 miles E. of Rossano.—Also, a cape of Italy, on the coast of Calabria Citra, in the gulf of Tarento, at the mouth of the Trionto. N. lat. 39° 46'. E. long. 16° 54'.

TRIONUM, in *Botany*. (See *HIBISCUS*.) There is a τριωνιον in Theophrastus, said to be one of the Mallow tribe; like the *Hibiscus* in question, whose leaves, having three lobes, are supposed to sanction the present application of this name.

TRIOPTHALMUS, formed of τρεις, three, and οφθαλμος, eye, a name given by authors to such pieces of agate, or other semi-pellucid stones, as happen to have three small circular spots, resembling eyes, upon them: these are of the nature of the common agate, &c. The spots are mere accidental varieties in the dispositions of the veins, and do not make a distinct species of stone.

TRIOPIUM, in *Ancient Geography*, a country or town, or, as others say, a promontory of Caria, near the sea, and belonging to the Cnidians. On this promontory was a temple of Apollo, where the Dorians celebrated games in honour of this god. At this temple was held an assembly of the Dorians of Asia, similar to the assemblies of the European Greeks at Thermopylae. See *Cape Curo*.

TRIOPTERIS, in *Botany*, from τρις, *three*, and πτερον, *a wing*, very expressive of the three prominent membranous wings of each capsule, at least in the original species.—Linn. Gen. 228. Schreb. 307. Willd. Sp. Pl. v. 2. 743. Mart. Mill. Dict. v. 4. Juss. 253. Cavan. Diff. 431. Lamarck Illustr. t. 382. Gært. t. 116.—Class and order, *Decandria Trigynia*. Nat. Ord. *Tribilata*, Linn. *Malpighia*, Juss.

Gen. Ch. *Cal.* Perianth inferior, minute, permanent, in five deep segments. *Cor.* Petals five, roundish, with long claws. *Stam.* Filaments ten, capillary, slightly connected at the base, five rather shorter than the intermediate ones; anthers simple, roundish. *Pist.* Germen superior, three-cleft; styles three, erect; stigmas obtuse. *Peric.* Capsules three, oval, not bursting, each with one, three, or four, flat, membranous, divaricated wings. *Seeds* solitary.

Ess. Ch. Calyx in five deep segments. Petals five, roundish, with slender claws. Filaments combined at the base. Capsules three, single-seeded, each with one, three, or four, membranous wings.

1. *T. jamaicensis*. Jamaica Triple-wing. Linn. Sp. Pl. 612. Willd. n. 1. Swartz Obf. 183. (*Banisteria* n. 3; Brown Jam. 231.)—Leaves oblong, pointed, veiny, polished. Clusters terminal, lax. Capsules with three equal wings.—Native of Jamaica and Hispaniola. *Stem* shrubby, twining. *Leaves* stalked, opposite, entire. *Flowers* numerous, small, blue, in compound terminal clusters.

2. *T. indica*. East Indian Triple-wing. Willd. n. 2. Roxb. Coromand. v. 2. 32. t. 160.—Leaves ovate, acute, polished, smooth. Clusters compound, axillary. Wing solitary, undivided, oblong, surrounding the capsule.—Native of forests among the mountains of Hindoostan. *Roxburgh*. A twining shrub, with small whitish flowers. *Fruit* with three vertical parallel wings, each capsule being fixed in the centre of each.

3. *T. ovata*. Ovate Triple-wing. Cavan. Diff. n. 591. t. 259. Willd. n. 3. Lamarck t. 382, copied from Cavanilles.—Leaves ovate, bluntish, somewhat heart-shaped, smooth, with two glands on the footstalk. Clusters compound, terminal. Capsules with three equal wings.—Native of Hispaniola. *Flowers* yellowish.

4. *T. rigida*. Rigid Triple-wing. Swartz Ind. Occ. 859. Willd. n. 4.—Leaves roundish, acute, bordered, striated, coriaceous. Clusters axillary, compound. Capsules with three nearly equal wings.—Native of mountainous thickets in Hispaniola, flowering in May. Nearly akin to the first species, but differing essentially in its rounder, very rigid, striated leaves. *Flowers* blue. *Swartz*.

5. *T. acutifolia*. Sharp-leaved Triple-wing. Willd. n. 5. (*Tetrapteris acutifolia*; Cavan. Diff. n. 595. t. 261.)—Leaves ovato-lanceolate, acute, smooth. Panicle terminal. Capsules with four equal wings.—Found in Cayenne by M. Stoupy. *Flowers* yellow. *Cavanilles*.

6. *T. acuminata*. Pointed-leaved Triple-wing. Willd. n. 6. (*Tetrapteris mucronata*; Cavan. Diff. n. 596. t. 262. f. 2.)—Leaves elliptic-oblong, pointed, smooth. Umbels paniced, terminal. Capsules with four wings; the two lowermost smallest.—Found in Cayenne by M. Stoupy.

7. *T. buxifolia*. Box-leaved Triple-wing. Willd. n. 7. (*Tetrapteris buxifolia*; Cavan. Diff. n. 597. t. 262. f. 1. *Banisteria microphylla*; Jacq. Obs. fasc. 3. 7. t. 56.)—Leaves elliptic-oblong, bluntish, smooth. Umbels solitary, terminal. Capsules with four nearly equal wings.—Native of the Antilles. The leaves are much smaller than any of the foregoing, being hardly above an inch long, and nearly sessile.

8. *T. citrifolia*. Orange-leaved Triple-wing. Swartz Ind. Occ. 857. Willd. n. 8. (*Tetrapteris inæqualis*; Cavan. Diff. n. 594. t. 260. *Acer scandens tricoccus*, foliis citri, flore luteo minore; Plum. Ic. 9. t. 16.)—Leaves ovate, acute, smooth. Umbels axillary, stalked. Capsules with four wings; the two lowermost smallest.—Native of woods on the mountains of Jamaica. The shrubby stem climbs to a great height, with very long, round, flexible, smooth branches. *Leaves* stalked, three or four inches long, flexible, with several lateral ribs. *Flowers* small, yellow, in axillary and terminal paniced umbels.

Dr. Swartz very justly observes, that the *Tetrapteris* of Cavanilles is no distinct genus from *Triopteris*. Our second species, having but three wings to the whole aggregate fruit, or a simple circumambient wing to each capsule, may be thought to answer ill to the idea of this genus.

TRIOPTERIS, in *Gardening*, furnishes a plant of the climbing woody exotic stove kind from the West Indies, of which the species cultivated is the Jamaica triopteris (*T. jamaicensis*).

It is a tender exotic plant, which constantly requires the protection and warmth of a greenhouse or stove in this climate.

Method of Culture.—This plant is propagated and increased by seeds, cuttings of the branches, and layers. In striking roots, the cuttings will be greatly assisted by the use of a hot-bed of tanners' bark. The plants, after they are raised, are always to be kept in pots, which are to be placed amongst those of the greenhouse or stove kinds. They should have occasional waterings during hot weather.

They afford a desirable variety in collections of the above kinds of plants.

TRIORCHIS, a word used by some to express a man who has three testicles.

It is also used as the name of a buzzard; and of a plant, called ladies' traces.

TRIORS, or **TRIEERS**, in *Law*, such as are chosen by the court to examine whether a challenge made to the panel of jurors, or any of them, be just or not.

The triors, in case the first man called be challenged, are two indifferent persons named by the court; and if they try one man and find him indifferent, he shall be sworn; and then he and the two triors shall try the next; and when another is found indifferent and sworn, the two triors shall be superseded, and the two first sworn on the jury shall try the rest.

TRIOSTEUM, in *Botany, from τρις, *three*, and οστέον, *a bone*, because of the three hard seeds.—Linn. Gen. 94. Schreb. 128. Willd. Sp. Pl. v. 1. 990. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 1. 381. Pursh 162. Juss. 211. Lamarck Illustr. t. 150. Gært. t. 26.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Aggregata*, Linn. *Caprifolia*, Juss.*

Gen. Ch. *Cal.* Perianth superior, in five deep, spreading, lanceolate, permanent segments, the length of the corolla. *Cor.* of one petal, tubular; limb shorter than the tube, in five deep, erect, rounded lobes, the lower ones smallest. *Stam.* Filaments five, thread-shaped, the length of the corolla, and inserted into its tube; anthers oblong. *Pist.* Germen inferior, roundish; style cylindrical, the length of the stamens; stigma thickish. *Peric.* Berry obovate, bluntly triangular, of three cells. *Seeds* solitary, bony, bluntly triangular, obtuse, furrowed.

Ess. Ch. Corolla of one petal, scarcely longer than the calyx, nearly regular. Calyx in five deep segments. Berry inferior, of three cells, with solitary seeds.

1. *T. perfoliatum*. Perfoliate Fever-root. Linn. Sp. Pl.

Pl. 250. Willd. n. 1. Ait. n. 1. Pursh n. 1. (Triof-teospermum latiore folio, flore rutilo; Dill. Elth. 394. t. 293.)—Leaves oblong, combined. Flowers sessile, whorled.—In rich rocky grounds, principally on a limestone soil, from New England to Carolina, but rare. Perennial, flowering from June to August. *Flowers and berries* dark purple. *Pursh*. A hardy perennial, sometimes seen in our more curious botanic gardens. The *stem* is two feet high, erect, round, hairy or downy, like the rest of the herbage, and bearing several pairs of connate, oblong, acute, entire *leaves*, three or four inches long, spreading widely, and crossing each other. *Flowers* downy, many in each whorl.

2. *T. angustifolium*. Narrow-leaved Fever-root. Linn. Sp. Pl. 250. Willd. n. 2. Ait. n. 2. Pursh n. 2. (Petriclymenum herbaceum rectum virginianum; Pluk. Phyt. t. 104. f. 2.)—Leaves elliptic-lanceolate, slightly combined. Flowers axillary, solitary.—On the borders of woods, in a sandy soil, in Virginia and Carolina. Perennial, flowering in June and July. *Flowers* downy and berries yellow.

3. *T. triflorum*. Three-flowered Fever-root. Vahl Symb. v. 3. 37. Willd. n. 3.—Leaves stalked. Flower-stalks opposite, three-flowered.—Supposed to be a native of Madagascar. A dried specimen, as it appears, was given to Vahl by Thouin. The *stem* is simple, finely downy, eighteen inches high. *Leaves* two or three inches long; smooth above; downy beneath; but half the breadth of the first species.

TRIP, a sea-term; a ship is said to bear her topmasts *a-trip*, when she carries them twisted up to the highest.

TRIP is also a cant-term, denoting an outward-bound voyage, particularly in the coasting navigation. It also denotes a single board in plying to windward.

TRIP, among *Sheep-Farmers*, is a term which, when applied to collections of these animals, signifies a small flock or stock of them.

TRIPALL, or TRIPPALL, in *Geography*, a river of England, in the county of Northumberland, which runs into the South Tyne, 7 miles W. of Hexham.

TRIPALORE, a town of Hindoostan, in the Carnatic; 24 miles S. of Madras.

TRIPARITY, a town of Hindoostan, in the circar of Cuddapa, with a celebrated pagoda; 28 miles N. of Combam.

TRIPARTITE, TRIPARTITUS, something divided into three parts, or made by three parties; as an indenture tripartite, &c.

TRIPARTITION is a division by three, or the taking of the third part of any number or quantity.

TRIPATORE, in *Geography*, a town of Hindoostan, in Marawar; 20 miles N.E. of Madura. N. lat. 10° 8'. E. long. 79° 39'.—Also, a town of Hindoostan, in Myfore; 40 miles W.N.W. of Pondicherry. N. lat. 12° 21'. E. long. 78° 45'.

TRIPAWANUM, a town of Hindoostan; 10 miles E.S.E. of Madura.

TRIPELA. See TRIPOLI.

TRIPENTAHEDRA, derived from τρίς, *thrice*, πέντε, *five*, and ἑξ, *a side*, in *Natural History*, the name of a genus of spars.

The bodies of this genus are spars, composed of thrice five planes; being made of a pentangular column, terminated at each end by a pentangular pyramid. Of this genus we only know one species; this has a moderately long column, and very short and broad pyramids; it is found in Derbyshire, Yorkshire, and Cornwall, and is very frequent about Gosselaer in Saxony. Hill.

TRIPETALOIDEÆ, in *Botany*, the 5th order among the *Fragmenta* of Linnæus, consists of *Juncus*, *Aphyllanthes*, *Triglochin*, *Scheuchzeria*, *Elegia* and *Ressia* in one section; then *Flagellaria*, *Calamus*, *Butomus*, *Alisma* and *Sagittaria*. Linnæus has hinted, in a manuscript note, that the three last ought probably to be removed to an order near akin to the *Palme*, or a subdivision thereof. The name alludes to the three petals, for so we must call them, though Linnæus, like the French botanists, has spoken of them, sometimes, as petal-like leaves of the calyx.

TRIPETALOUS FLOWERS, in *Botany*, such which consist of three leaves, which are called petals, to distinguish them from the leaves of plants.

TRIPETTY, in *Geography*, a town of Hindoostan, in the Carnatic, where was a celebrated pagoda, resorted to by vast crowds of pilgrims from all parts of Hindoostan; 49 miles S.S.W. of Nellore. N. lat. 13° 45'. E. long. 79° 30'.

TRIPHACA, in *Botany*, was so named by Loureiro, from τρίς, *three*, and φακκ, *a lentil*, or, as he takes the liberty of saying, *a legume*, in allusion to the three leguminous seed-vessels.—Loureir. Cochinch. 577.—Class and order, *Monococcia Polyandria*.

This is a large tree, found on the eastern coast of Africa. Mr. Brown has suggested to us that it is undoubtedly a *STERCULIA*; see that article. In species it seems to come near *S. Balanphas* and its allies. The number of the foli-les doubtless varies.

TRIPHARMACUM, an ointment in the late London Dispensatory, so called from its being composed of three ingredients: the prescription is this: Take common plaster four ounces; oil olive two ounces; vinegar one ounce; set them over a gentle fire, and stir them continually till they become an ointment.

TRIPHASIA, in *Botany*, so named by Loureiro, Cochinch. 152, (omitted in his index,) from τριφασιας, *three-fold*, because of the three leaflets, petals, and calyx-teeth, proves, by his specimens at Sir Joseph Banks's, to be no other than *Limonia trifoliata* of Linnæus.

TRIPHOLINUS MOSS, in *Ancient Geography*, a mountain of Italy, in Campania. Pliny speaks of the vines which grew upon the mountain, and calls the territory which produced them Tripholinus ager. These vines are also mentioned by Martial, lib. 13. epigr. 14.

TRIPHTHONGUE, in *Grammar*, an assemblage, or concurrence, of three vowels in the same syllable; as in *quæ*.

Quintilian, lib. 1. cap. 6. denies the existence of triphthongues; and asserts, that there never was any syllable of three vowels, but that one of them was always turned into a consonant: Scioppius asserts the contrary. However this may be in the Latin and Greek, which were the only languages Quintilian understood, it is certain there are several languages in Europe where triphthongues are in use.

TRIPHYLIA, in *Ancient Geography*, a country of the Peloponnesus, in the Elide. Strabo mentions its maritime town Samicum.

TRIPPI, in *Geography*, a town of Sicily, in the valley of Demona; 8 miles S. of Pati. N. lat. 38° 10'. E. long. 15° 15'.

TRIPINNA, in *Botany*, so denominated from the triply-pinnate leaves.—Loureir. Cochinch. 391.—Class and order, *Didynamia Angiospermia*.

This appears to be a very handsome and large tree, with panicled orange-coloured flowers, a berry of one cell, with few seeds, and smooth, ovate, pointed leaflets. It may be referred to Jussieu's order of *Viticeæ*, but whether to any described genus, we want materials to determine. This

tree is a native of mountainous woods in CochinChina. The name is liable to much objection.

TRIPLARIS, from *triplex*, threefold, because of the prevalence of the number 3, in all the parts of fructification.—Linn. Gen. 41. Schreb. 57, 814. Willd. Sp. Pl. v. 4. 812. Mart. Mill. Dict. v. 4. Juff. 83. Lamarck Illustr. t. 825.—Class and order, *Triandria Trigynia*, Linn. *Diocia Dodecandria*, Schreb. *Diocia Enneandria*, Willd. Nat. Ord. *Polygonae*, Juff.

Gen. Ch. Male. *Cal.* Perianth of one leaf, turbinate, in six ovate, acute, concave segments, externally hairy. *Cor.* none. *Stam.* Filaments nine to twelve, thread-shaped, inserted into the calyx below its divisions, which they exceed in length, behind a crown of very short hairs; anthers heart-shaped, erect.

Female. *Cal.* Perianth of one leaf, inferior, large, permanent; tube ovate, swelling; limb erect, in three deep, lanceolate, membranous, veiny, obtuse segments. *Cor.* Petals three, linear, obtuse, veiny, permanent, closely pressed to the germen. *Stam.* Filaments about twelve, very short, awl-shaped, erect, inserted as in the male, but destitute of anthers, and often altogether wanting. *Pist.* Germen superior, large, triangular; styles three, very short; stigmas awl-shaped, keeled, hairy. *Peric.* none, except the permanent calyx. *Seed.* Nut triangular, pointed, invested with the tube of the calyx.

Eff. Ch. Male. Calyx in three deep segments. Corolla none. Stamens nine or twelve.

Female. Calyx inferior, in three deep segments. Petals three. Styles three. Nut triangular, clothed with the calyx.

1. *T. americana*. Terminal-flowered Triplaris. Linn. Sp. Pl. 130. Læff. It. 256. Willd. n. 1. Aubl. Guian. 910. t. 347. Vahl Symb. v. 2. 100. (*T. pyramidalis*; Jacq. Amer. 13. t. 173. f. 5.)—Clusters terminal as well as axillary, oppositely branched.—Native of woods in South America, flowering in November. A tree, whose trunk is forty feet high; its summit pyramidal and dense; its branches hollow, usually full of small red ants. Leaves elliptic-oblong, alternate, acute, entire, smooth, on short stalks. *Stipula* annular, intrafoliaceous, membranous, short. Spikes hairy; the male flowers green, fragrant; female ones rose-coloured.

2. *T. ramiflora*. Lateral-flowered Triplaris. Jacq. Amer. 14. Vahl Symb. v. 2. 100. Willd. n. 2.—Clusters lateral, simple, mostly solitary.—Native of Carthage.

TRIPLE, *Threefold*. See RATIO and SUB-TRIPLE.

TRIPLE, in *Music*, is one of the species of measure, or time.

Triple time consists of many different species, of which there are in general four, each of which has its varieties. The common name of triple is taken hence, that the whole, or half measure, is divisible into three equal parts, and is beaten accordingly.

The first species is called the *simple* triple, in which the measure is equal to three semi-breves, three minims, three crotchets, three quavers, or three semi-quavers, which are marked thus, $\frac{3}{2}$, or $\frac{3}{4}$, $\frac{3}{8}$, $\frac{3}{16}$; but the last is not much used, except in church music.

In all these the measure is divided into three equal parts, or times, called thence *triple* times, or the measure of three times; of which two are beat down, and the third up.

The second species is the *mixt* triple; its measure is equal to six crotchets, or six quavers, or six semi-quavers, and accordingly it is marked $\frac{6}{4}$, or $\frac{6}{8}$, or $\frac{6}{16}$; but the last is seldom used.

Some authors add other two; *viz.* six semi-breves and six minims, marked $\frac{6}{4}$, or $\frac{6}{8}$; but these are not in use.

The measure here is usually divided into two equal parts, or times, of which one is beat down and one up; but it may also be divided into six times; of which the first two are beat down, and the third up; then the next two down, and the last up; *i. e.* each half of the measure is beat like the simple triple (on which account it may be called *compound* triple), and because it may be thus divided either into two or six times (*i. e.* two triples), it is called *mixed*; and, by some, the *measure of six times*.

The third species is the *compound* triple, consisting of nine crotchets, or quavers, or semi-quavers, and marked $\frac{9}{4}$, $\frac{9}{8}$, $\frac{9}{16}$: the first and last are little used; and also add $\frac{3}{4}$, $\frac{3}{8}$, which are never used.

This measure is divided into three equal parts, or times, of which two are beat down, and one up; or each third part may be divided into three times, and beat like the simple triple; on which account it is called the *measure of nine times*.

The fourth species is a compound of the second species, containing twelve crotchets or quavers, or semi-quavers, marked $\frac{12}{4}$, $\frac{12}{8}$, $\frac{12}{16}$; to which some add $\frac{1}{2}$, and $\frac{1}{4}$, which are never used; nor are the first and third much used, especially the latter.

The measure here may be divided into two times, and beat one down, and one up; or each half may be divided and beat as the second species, either by two or three; in which case it will make in all twelve times, and hence is called the *measure of twelve times*.

The French and Italian authors make a great many more species and divisions of triple time, unknown, or at least unregarded by our English musicians, and therefore not necessary to be dwelt upon here.

While the modes or moods were in use, triple time was the most difficult part of a musician's study; and, indeed, seems not to have been well understood by the masters themselves, as no two writers of elementary tracts on the subject seem to agree. But at present, by the use of bars and points, with the Italian technical terms for the degrees of quick and slow, triple time is so simplified, that young students find it easier, and feel it sooner than common time. (See *Plate Time-Table*, and the article NOTATION.) When every gentleman's child learned to dance a minuet, young musicians found it easier to beat and to keep triple time, though it seems to limp, than common, which is the most simple, natural, and equitable of all measures and motions. See MINUET.

TRIPLE *Progression*, in *Harmonics*, supposed to have been the invention, or rather to have been first applied to musical ratios by Pythagoras. To speak practically of this division of the monochord, or general system of music, it was the guide not only of Pythagoras, but Euclid, and all the Greek and Roman writers on harmonics, except Aristoxenus. It precluded all idea of temperament, by a series of perfect 5ths; nor was a temperament thought of by any of the ancients, except Didymus and Ptolemy; but they seem never to have been implicitly followed.

Nothing but mere melody being in question, and the major 3d being so harsh as to be ranked among discords, temperament was not much wanted till counterpoint had made some progress; and then it was as much opposed by the adherents to the practice of the ancients, as the Copernican system was by the adherents to the Ptolemaean. These prejudices, however, had been nearly annihilated, and the temperament of keyed and wind instruments became so habitual, that the triple progression had had no champion for a long time, till the abbé Rouffier, a Pythagorean

enragé,

enragé, arose, and treated all musicians as ignorant and absurd, who had not opposed temperament, and regarded all music as dissonance which had been composed for tempered scales. But we have heard nothing of the learned abbé since the Revolution; and there seems to be no more true believers left in Pythagoras's doctrine of the triple progression, in Europe at least, than in that of the transmigration of souls.

TRIPLE *Quartan Fever*. See FEVER.

TRIPLE *Incision*. See ENGRAFTING.

TRIPPLICATE RATIO, is the ratio which cubes bear to each other.

This ratio is to be distinguished from triple ratio, and may be thus conceived. In the geometrical proportionals 2, 4, 8, 16, 32, as the ratio of the first term (2) is to the third (8) duplicate of that of the first to the second, or of the second to the third: so the ratio of the first to the fourth is said to be triplicate of the ratio of the first to the second, or of that of the second to the third, or that of the third to the fourth, as being compounded of three equal ratios.

TRIPPLICATIO, TRIPPLICATION, in *Civil Law*, is the same with sur-rejoinder in common law.

TRIPPLICITY, or TRIGON, among *Astrologers*, is a division of the signs, according to the number of the elements; each division consisting of three signs.

Triplicity is frequently confounded with *trine aspect*; though, strictly speaking, the two are very different things: triplicity is only used with regard to the signs, and trine, on the contrary, with regard to the planets.

The signs of triplicity are those which are of the same nature, and not those which are in trine aspect. Thus Leo, Sagittario, and Aries, are signs of triplicity, because those signs are, by these writers, all supposed fiery.

TRIPLO HEATH, in *Geography*, a common of England, remarkable for being the spot where the army formed the council of agitators, and chose Oliver Cromwell for their commander, in 1648; 8 miles S. of Cambridge.

TRIPLOIDES, a surgeon's instrument, with a three-fold basis, used in the restoring of great depressions of the skull. Blanc.

TRIPOD, TRIPPOS, in *Antiquity*, a famed sacred seat or stool, supported by three feet, on which the priest and sibyls were placed to render oracles.

It was on the tripods that the gods inspired the Pythians with that divine fury and enthusiasm with which they were seized at the delivering of their predictions.

M. Spanheim observes, that, on Roman medals, the tripod expresses some priesthood, or sacerdotal dignity. A tripod, with a raven and a dolphin, is also the symbol of the duumvir, deputed for keeping of the sibylline oracles, and for consulting them on occasion.

Athenæus admits only two sorts of tripods, that are reduced to great and small tripods. But Banier distinguishes three kinds. Under the first he includes those used by the Pythia, when she delivered the oracles of Apollo in the temple of Delphos. The second kind comprehends whatever stood upon three feet, such as vases, tables, &c. of which there was a great number. Under the third class are included the votive tripods, which princes or private persons dedicated in the temples of Apollo. Herodotus (lib. ix.) speaks of a golden tripod, which the Greeks, upon their victory over the Persians, sent to Delphos. Most of the tripods found in the cabinets of the curious, are of brass or of bronze.

TRIPOD of *Jafon*. See TRITON.

TRIPODIUM. In the laws of Henry I. occurs this

passage—"In quibus vero causis triplicem ladam haberet, ferat judicium tripodii," *i. e.* 60 solid. The meaning of which, according to some, is, that, as for a small offence the composition was twenty shillings; so for a great offence, which was to be purged *triplici lada*, the composition was three times twenty shillings, and this was called *tripodium*.

TRIPOLDA, in *Geography*, a town of Naples, in Principato Ultra; 16 miles S. of Benevento.

TRIPOLI, a country of Africa, which, though tributary to the grand signior, is called a kingdom or regency; bounded on the N. by the Mediterranean; on the E. by Barca, or, considering Barca as a province of Tripoli, by Egypt; on the S. by the Atlas mountain; and on the W. by Tunis and Biledulgerid; about 600 miles from E. to W. The breadth, from N. to S., is various, from 120 to 250. It has formerly been divided into seven provinces, or with Barca, eight; but it is generally distinguished into Maritime and Inland: the inhabitants of the former generally live upon commerce and piracy; the latter for the most part on plunder and robbery. Each division hath some cities and towns, besides a number of villages, which lie scattered chiefly through the latter; most of them very poor and thinly inhabited; the country being almost every where sandy and barren: as for cities and towns, there are few of consequence, the greater part being either wholly depopulated and gone to ruins, or only inhabited by a few fishermen, lime-burners, potash-makers, and here and there some few labourers: the chief part reduced to the lowest degree of misery and wretchedness, through the cruel exactions of the government, or the frequent depredations of the Arabs. The government, religion, laws, and customs of this kingdom are in a great measure the same with those of Algiers and Tunis. Only with respect to the first of these articles, it will not be amiss to observe, that the beys of Tripoli are not mere titular vassals to the Porte, but really under subjection and tribute. This joined to the other exigencies of the regency, the avarice of the Turkish bashaws sent thither from Constantinople, and the general decay of commerce, obliges them to load the subjects with such heavy taxes and extortions, as hath reduced the greatest part of the kingdom to the lowest degree of indigence and misery. The revenues arise chiefly from their corsairs, which are nevertheless but few, seldom exceeding seven or eight, and of these only one can properly be styled a ship, the rest are small galleys, poorly manned and equipped. The next is the duty on imports and exports; the tax on the Jews, who are here very numerous; on the natives, who, though ever so poor, must yet pay part of the product of their ground, or manufactures; and lastly on the country Moors and Arabs, among whom the bey sends his flying camp of janizaries to levy it; for these last, as well as the Moors, are kept so poor by those heavy taxes, that nothing but force, and sometimes exemplary severity, can extort it from them. The bey, by means of his protection from the Porte, makes shift to keep up a kind of despotic power, as he is besides generalissimo of all the forces. As for their commerce, it chiefly consists in slaves, either such as are taken by their corsairs, or such as they traffic for with their neighbours: the greater part of both they send into Turkey, where they can dispose of them to the best advantage. The next branch is that of ashes, which they buy from the Arabians, and sell to the Europeans, to make glass and soap: the rest of their traffic is not worth mentioning. One circumstance in the conduct of this regency deserves notice: they are more scrupulous observers of their treaties with other nations than any of their neighbours: which punctuality, whether it proceeds from real probity, or a consciousness of their

own weaknefs, is nevertheless of no small advantage to navigation and commerce. This ftate, as well as the reft of Barbary, after being freed from the Roman yoke, paffed fucceffively under the Vandals, Saracens, and the kings of Morocco, Fez, and Tunis; till, weary of their flavery and oppreffion, they refolved to have a monarch of their own, whom they chofe from among themfelves; and the new monarch governed them at firft with great equity and moderation; but he no fooner faw himfelf out of danger, than he began to play the tyrant in his turn to fuch a degree, that the citizens confpired againft him, and he was murdered by his own brother-in-law. They chofe in his room another, named Abubacer, who had been formerly an officer under him, but had fince retired, and turned marabout or hermit; but he had not reigned many months, before Ferdinand, king of Caftile and Aragon, fent thither Peter, count of Navarre, with a powerful fleet and army, which laid fiege to the capital. Abubacer, finding himfelf unequal to fo powerful an enemy, furrendered on honourable terms, and was fent with his wife, two fons, and an uncle, to the emperor Charles V. then at Palermo, who foon after reftored him to his former dignity, on condition that he fhould become his vaffal and tributary. Abubacer rebuilt and re-peopled the city, which he held in the emperor's name, till the knights of Rhodes were driven out of that ifland, and forced to retire into Syracuse, when Charles was pleafed to beftow the ifland of Malta upon them, together with the city and caftle of Tripoli. They fent accordingly, and took poffeffion of both, made one of their order governor, and put a garrifon into it of their own troops. They were fcarcely fettled in this new acquifition, before Barbaroffa made himfelf mafter of it, but it was foon after retaken by the emperor, and reftored to them, who continued in poffeffion of it till the reign of Solyman, who, under pretence that it had been retaken during the truce, fent thither a naval armament, confifting of about 110 royal gallies, and 30 other veffels, under the command of Sinan bafhaw, who had under him the famed Salha Rais, furnamed Devil-driver, and the no lefs famous Dragut; and notwithstanding every means of defence, it was obliged to furrender, and delivered up to the Turks, after it had continued in the poffeffion of the Chriftians a little above forty years, from the time of its being taken by the count of Navarre. Sinan committed the government of it to the aga Morat, upon condition that he fhould hold it under the grand fignior, and refign it whenever he fhould appoint another governor. It was not long, however, before the famed corfair Dragut got poffeffion of this place. He fortified both city and caftle with ftrong walls, and two forts near the fea-fide, well fupplied with artillery and ammunition; by which means it became one of the ftrongeft cities in Africa, and the common retreat of moft of the corfairs that roved under Turkish colours, from whence they infefted the cofts of Italy, Sicily, Naples and Spain, and a fruitlefs attempt was made by the Chriftians to retake it. After the death of Dragut, the Porte continued fending either a fangiac or bafhaw to Tripoli, the caftle being garrifoned with Turks, and the city inhabited by Moors, and the kingdom ftill paying tribute to the grand fignior. The piratic trade went on with fuccefs; the renegadoes met with the ufual encouragement from the Turks, and were promoted to the command of the corfairs, and even of their own fleets, and fometimes to the bafhawfhip; thefe recommending themfelves to the regency, not only by their deperate behaviour, but much more by their peculiar barbarity to the Chriftian prifoners, which often provoked reprisals, that were carried on both fides to fuch excefs as can

hardly be particularized without horror. In this condition the kingdom continued till the Turkish government, becoming more and more intolerable, by the avarice and tyranny of thofe bafhaws, a certain marabout named Sid Hajah, about the clofe of the fixteenth century, found means to raife a general revolt both in the city and country. Unfortunately for him, he did not take care to fecure a foreign affiftance, before he broke out into open rebellion; fo that Hafcen bafhaw, the Turkish admiral, came fuddenly upon him, at the head of fixty gallies, and a number of other fhips and forces, which he had procured from Tunis and Algiers, and defeated him fo often, that he was at length abandoned by his troops, and affaffinated by his own partizans. Hafcen fent the marabout's head to Conftantinople, and had hardly fettled the government on the old footing, when a new governor, fent thither from the Porte, found a much more effectual way to free them from this tyranny. This man was a renegado Greek, of the ancient family of the Justiniani, known by the name of Mahmet Beygh, who, by his intrigues and bribes, had obtained a banner or government from the grand fignior. He failed directly to Tripoli, and having got poffeffion of the caftle, refufed to acknowledge or receive any bafhaw from Conftantinople. He took the reins of government wholly upon himfelf, not indeed as independent, but as vaffal and tributary to the Porte, to whom he obliged himfelf to pay a tribute and homage, as an acknowledgment of his fubjection and dependance.

TRIPOLI, a city and fea-port of Africa, and capital of the country fo called, fituated on the coaft of the Mediterranean. It was formerly divided into two parts, the Old and New; the former, which was the native country of the emperor Severus, is fuppofed to have been built by the Romans, was fince conquered by the Vandals, and at laft deftroyed by the Mahometans, under their caliph Omar II. fince which time it hath never recovered its importance, and is now almoft gone to ruin; the latter, which ftands at a fmall diftance from it, though of no great extent, is populous, and in a flourifhing condition. It ftands on a foundation of rock, by the fea-fide, furrounded with high walls and ftout ramparts, flanked with pyramidal towers, but not kept in good repair. The fea wafhes the town on three fides; and on the fourth a fandy plain, called the Mefsea, joins it to the reft of the country. On the E. it is divided from Egypt by the dreary deferts of Barca, where none refide but occasionally the wandering Arab. It hath but two gates, one towards the inland on the S., and the other to the fea on the N., where it expands itfelf in form of a crefcent, near a fpacious and commodious haven. On entering the harbour, the town manifefts the dilapidations of time, large heaps of rubbifh appearing in various parts of it. The caftle, or royal palace, where the bafhaw refides, is at the E. end of the town within the walls, with a dock-yard adjoining, where the bey (the bafhaw's eldeft fon) builds his cruizers. The caftle is very ancient, and is inclofed by a ftrong wall, that appears impregnable; but within, it is totally deftitute of fymmetry.

New Tripoli is fuppofed to have been built by the natives, who gave it the name of *Tarabilis*, or *Trebiles*, whence the Latins call it *Tripolis*. Some authors pretend that it was once a place of vaft trade, on account of its neighbourhood to Numidia and Tunis, reforted to by veffels from Malta, Venice, Sicily, Marfeilles, and other parts; there being hardly fuch another commodious fea-port along this whole coaft, except Alexandria; by which means it became fo opulent, that it was filled with rich merchants, abounded with fine mofques, hofpitals, and other public buildings,

TRIPOLI.

and excelled Tunis in beauty and wealth. It retains now but few traces of its ancient splendour. The baths form clusters of cupolas, very large, to the number of nine or ten, crowded together in different parts of the town. The mosques have generally a small plantation of Indian figs and dates close to them, which give to the town a novel and pleasing aspect. The houses are low and mean, the streets narrow, dirty, and irregular: there are in it nevertheless some monuments still standing, which evince its former magnificence; particularly a triumphal arch, one half of which now lies buried in the sand, and some remains of Roman pavement. We need not wonder at this extraordinary decay, if we consider the two great inconveniencies which this city labours under: first, the want of sweet water, here being neither rivers, springs, nor wells, nor any other means of supplying it with that useful element but cisterns and reservoirs of rain-water; secondly, the great scarcity of corn, and the other products of the ground, occasioned by the dry sandy soil that surrounds it on the land side for several miles. It produces, however, palm-trees in great plenty, that yield the most delightful dates, which constitute a considerable part of their food: besides these, they have the lotus or lotus, a tree whose fruit is reckoned still finer than the dates, and makes a most excellent wine. That plant serves them for meat and drink, for which reason they have been stiled by the ancients *Lotophagi*. But upon the whole, were it not for the continual supply of provisions brought in by their corsairs, and other trading vessels, Tripoli could never subsist by the products of its own territories; and hence we may infer the cause of its present decay. Adjacent to the walls of the city is a famous burying-ground, in which are found coffins, urns, medals, and other curious relics of antiquity. The Franciscan friars have here a very handsome church, convent, and hospital, the last of which is the more necessary, as the city is so often and so severely visited by the plague. Other orders of monks were here settled, who have been since obliged to abandon it, probably on account of its decay. The country around is adorned with a multiplicity of handsome villas, cultivated chiefly by Christian slaves, and much like those about Algiers and Tunis. The people here carry on a considerable trade in linen cloths, great quantities of which are wrought by the inhabitants; but their chief dependence is on their own corsairs, and those of other nations, which resort to their harbour. Its shops are little better than booths, though they contain pearls, gold, gems, and precious drugs. Here are two covered bazars, one very large, composed of four aisles meeting in a cross, furnished on each side with shops, which contain every kind of merchandize: the other is much smaller, without shops, and destined to the sale of black men and women. (See the preceding article.) A late traveller says, the date-trees, which spread themselves like a forest behind the town, and the hills beyond them, which bound the prospect on the south, are interesting objects; but the town itself is built in too low a situation to compose a part of the general scene: for it is scarcely visible at the distance of a mile. Its scanty limits, though scarcely four miles in circumference, are too great for its present population; and its ancient castle, though once the pride and still the residence of the reigning family, is now a mouldering ruin; 300 miles S.E. of Tunis. N. lat. 32° 54'. E. long. 13° 18'.

TRIPOLI, or *Tarabolos*, a town of Syria, and capital of a pachalic, and residence of the pacha, situated near the mouth of a small river, called *Kadi/ba*, at the foot of Mount Lebanon, which overlooks and surrounds it with its branches to the E. the S. and even a little to the N.W.

The Greek name Tripoli, denoting three cities, is derived from its having been built by three colonies, from Tyre, Sidon, and Arfidus, each of which formed settlements so near each other that they were soon united into one. It is separated from the sea by a small triangular plain, half a league in breadth, at the point of which is the village where the vessels land their goods. The Franks call this village La Marine, the general name given by them to these places in the Levant. There is no harbour, but a simple road, which extends from the shore to shoals, called the Rabbit and Pigeon Islands. The bottom is rocky, and mariners are not fond of remaining here, as the cables are soon worn out, and the vessels exposed to the N.W. winds, which are frequent and violent on all this coast. In the time of the crusades, this road was defended by towers, seven of which are still subsisting from the mouth of the river to the village. They are strong built, but now serve only as a place of resort for birds of prey. All the environs of Tripoli are laid out in orchards, where the nopal grows spontaneously, and the white mulberry is cultivated for the silk-worm; and the pomegranate, the orange, and the lemon-tree, for their fruit, which is of the greatest beauty. The grounds belonging to it extend as far as Mount Lebanon, and abound in vineyards. Each hill produces a different wine; but the golden wine is most admired. But these places, though delightful to the eye, are unhealthy. Every year, from July to September, epidemic fevers, like those of Alexandretta and Cyprus, rage here: these are owing to the artificial inundations with which the mulberry-trees are watered, in order that they may throw out their second leaves. Besides, as the city is open only to the west, the air does not circulate, and the spirits are in a constant state of oppression, which makes health at best but a kind of convalescence. At La Marine the air is more salubrious, its circulation being less impeded. The commerce of Tripoli consists almost wholly in indifferent coarse silks, which are made use of for laces, and is in the hands of the French alone. But they are losing their quality, which is owing to the decay of the mulberry-trees. They have a consul here, and three commercial houses. They export silks, and sponges fished up in the road; these exchange for cloths, cochineal, sugar, and West India coffee; but this factory, both with respect to imports and exports, is inferior to *Latakia*; which see.

The pachalic of Tripoli comprehends the country which stretches along the Mediterranean from Latakia to the Narh-el-Kelb, and is bounded on the W. by that torrent, and the chain of mountains which overlook the Orontes. The principal part of this government is hilly, the sea-coast alone between Tripoli and Latakia being a level country. The numerous rivulets which water it contribute greatly to its fertility; but notwithstanding this advantage, this plain is much less cultivated than the mountains, without even excepting Lebanon, with its numerous rocks and pine-trees. Its chief productions are corn, barley, and cotton. In the territory of Latakia, tobacco and olives are principally cultivated; but in Lebanon and the Kefraouan, white mulberry-trees and vineyards. This pachalic contains several tribes and religions. From Lebanon to above Latakia, the mountains are peopled by the Afsarians, a particular sect of religious, which first rose in the latter end of the ninth century; Lebanon and the Kefraouan are inhabited entirely by the Maronites; and the sea-coast and cities, by schismatic Greeks, and Latins, Turks, and descendants of the Arabs. The pacha of Tripoli enjoys all the privileges of his place. The military and finances are in his hands; he holds the government in quality of a farm from the Porte, on a lease of one year only, at the annual rent of 750 purses (39,000*l.*)

In 1101, this town was taken by the Christians, and held by Bertrand, son of Raymond, count of Toulouse, as a county, in which situation it remained till the year 1288, when it was taken by Melec Messor, sultan of Egypt, who ordered it to be razed to its foundation; 75 miles N.N.W. of Damascus. N. lat. 34° 28'. E. long. 35° 36'. Volney's Travels in Egypt, &c. vol. ii.

TRIPOLI, in *Mineralogy*, a mineral originally brought from Tripoli for the polishing of stones and metals, whence it derives its name. It has a dull argillaceous appearance, but is not compact; it has a fine but hard grain, and does not soften by water, or mix with it. The colours are grey, inclining to red or yellow. From analysis, it proves to be principally composed of siliceous. Tripoli appears to be of two formations; the one by fire, which has hardened slates or sand-stones, and converted them into this substance; the other by water, decomposing beds containing siliceous, clay, and iron. The tripoli from Derbyshire, called rotten-stone, may be referred to the latter formation; it occurs in the upper part of the great shale stratum which covers the mountain lime-stone of that district: it is dug near the surface, and is sold for 60s. per ton. Farey's Derbyshire, vol. i. p. 231.

The tripoli of Poligné, near Rennes, in Brittany, is fusible. It is of a red colour of different shades. Trunks of trees are found changed into tripoli in the middle of the beds, which are covered by beds of sand-stone in an inclined position.

The tripoli of Venice is the most esteemed; it comes from the island of Corfu. It is schistose, and has a yellowish-red colour. Sauffure has remarked in this tripoli, and in the preceding, a multitude of small cylindrical pores.

Tripoli is found at Menal, near Riom, in the department of Puy-de-Dome. It occurs in beds which appear to have been formerly schists changed by the action of volcanic fire. This substance is found in the quarries of chalcidony of Volterra in Tuscany, and is said to be so situated as to appear evidently the result of the decomposition of the chalcidony. It occurs in coal strata at Pöschappel, in Saxony. The tripoli from Billin, in Bohemia, occurs in thin beds, which pass insensibly into pitch-stone. Acids produce no effervescence with it, nor is it melted by the most violent heat, though it is somewhat hardened.

In fact, we sometimes find tripoli in volcanic mountains, or in strata which contain beds of coal in a state of combustion; and sometimes in beds formed evidently by deposition from water. It should appear that certain strata, composed principally of siliceous in a state of extremely minute division, and combined with iron and clay, are decomposed by the agency of water, and the latter materials being in a great part removed, the siliceous is left porous and friable, and coloured by iron; it then forms tripoli; and beds of this mineral may have been so formed, and afterwards covered by streams of lava, where they occur in volcanic mountains. Where siliceous is intermixed with a portion of alumine and iron, as in schists, the alumine by exposure to a great heat may be hardened and contract, and leave the stone in a porous or friable state. The specific gravity of tripoli is stated by Bucholz at 2.202, and its constituent parts

Siliceous	.	.	.	81
Alumine	.	.	.	1.50
Oxyd of iron	.	.	.	8
Sulphuric acid	.	.	.	3.43
Water	.	.	.	4.55

The sulphuric acid and water are considered as accidental.

For the method of imitating gems by means of tripoli, see GEMS.

TRIPOLIS, in *Ancient Geography*, a country of the Peloponnesus, in Arcadia, so called on account of its three towns, according to Pausanias.—Also, a town of Phœnicia, situated about half a league from the sea, and 18 miles from Orthosia. Diodorus and Strabo derive its name from three towns of which it originally consisted, about a stadium from one another.

Alexander the Great subdued this city, which, after his death, passed to Ptolemy Soter, whose successors retained possession of it till the reign of Antiochus the Great, king of Syria, who made himself master of this town and the whole of Phœnicia, towards the year 219 B. C. After its subjugation by Pompey, it passed under the dominion of the Romans, but was allowed the privilege of being a free city, and of being governed by its own laws. Under the empire of Vespasian, Tripoli assumed the epithet of Flavian. The territory of Tripoli was watered by many rivers and streams, which descended from Libanus. About two leagues E. of Tripoli was a tomb formed in a rock, which the Syrian Christians held to be the sepulchre of Canaan, the father of the Phœnicians.

TRIPOLIS, a town or country of the Peloponnesus, in Arcadia, which afforded an ample supply both of men and cattle, according to Pausanias.—Also, a country of Thessaly, in which were the towns of Pythium, Azorum, and Dolieha, according to Livy.—Also, a town of Asia, on the Meander, and capital of Caria.—Also, a town of Asia, on the banks of the Euxine-sea, W. of Trebifond.

TRIPOLITANA REGIO, or *Tripoli*, a country of Africa, bounded N. by the Mediterranean sea, E. by the river Cinyphus or Cinyphus; situated in the midst of Libya Interior, and W. of the river Triton. Procopius says, that Sergius was appointed governor of this province by Justinian, at whose instigation the inhabitants embraced the Christian religion. They were called the "allies of the Romans," because they faithfully maintained peace with them. Some have confounded Pentapolis with Tripolis. See TRIPOLI, in *Geography*.

TRIPOLIZZA, in *Geography*, a town of European Turkey, in the Morea, the capital of a pacha, having about 12,000 inhabitants. In 1770, this town was besieged by the Russians and revolted Greeks, but a numerous detachment of Albanian cavalry coming up, the Greeks fled and left the Russians to the contest alone, of whom hardly one escaped. The Albanians afterwards, under a pretence that the inhabitants had held a correspondence with the enemy, put three thousand of them to the sword in less than two hours, and then plundered and set fire to the town; 18 miles W. of Napoli di Romania.

TRIPONTIO, or TRIPONZO, a town of the Popedom, in the duchy of Spoleto, on the Nera; 12 miles N.W. of Norcia.

TRIPONTIUM, in *Ancient Geography*, a place of Italy, in Latium, on the Appian way; which appears by the military column to be at the 39th mile: it was repaired by the emperor Trajan. The Goths constructed a tower in this place.

TRIPONTIUM, a town of Great Britain, in the sixth Iter of Antonine, supposed to be Rugby. Drs. Gale and Stukeley place it at Dowbridge, and the last of these authors derives its name from *tre*, a town, and *pont*, a little valley, in which Dowbridge is situated. Camden and Baxter fix Tripontium at Towcester, and Camden derives its name from the British words *Tair-ponti*, signifying three

three bridges. But Mr. Horsley supposes it to have been situated where the town of Rugby now stands.

TRIPOOR, in *Geography*, a town of Hindoostan, in Myfore; 25 miles N.E. of Coimbatore.

TRIPPING, in *Heraldry*, denotes the quick motion of all sorts of deer, and of some other creatures, represented with one foot up, as it were, on a trot.

In speaking of lions, they say *passant*, instead of *tripping*.

TRIPPING, in *Sea Language*, denotes the movement by which an anchor is loosened from the bottom by its cable or buoy-ropes. See *ATRIP*.

TRIPSACUM, in *Botany*, was so named by Linnæus, from τριπέδι, a rubbing, or grinding; but whether in allusion to the grain being useful for making flour, or, as we are rather inclined to suspect, to the smooth polished aspect of the glumes, is not explained.—Linn. Gen. 481. Schreb. 622. Willd. Sp. Pl. v. 4. 201. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 5. 236. Pursh 88. Juss. 30. Lamarck Illustr. t. 750. Gært. t. 1.—Class and order, *Monoecia Triandria*. Nat. Ord. *Gramina*.

Gen. Ch. corrected by Schreber. Male flowers in pairs, unilateral, alternate, mostly in the upper part of the spike. *Cal.* Glume two-flowered; the outer floret male; inner neuter; each of two valves: outer valve lanceolate, flattish, obtuse, awnless, cartilaginous, thinner at the edges; embracing the inner valve, which is oblong, triangular, keeled, acute, about the same length. *Cor.* in each floret of two nearly equal valves, membranous, very thin, awnless, smaller than the calyx; the outer valve ovate, boat-like, bluntish; inner lanceolate, cloven at the end. Nectary of two minute, triangular, fleshy, convex, abrupt valves, pointed at each end, thinnest at the upper margin, notched in the middle. *Stam.* in the outer floret, Filaments three, capillary, longer than the calyx; anthers parallelepipedal: in the inner, Filaments three, very slender, somewhat combined; anthers none.

Female flowers in the lower part of the same spike, alternately sunk in the common stalk, at each side. *Cal.* Involucrum ovate, cartilaginous, very thick, tumid below, polished; obscurely bordered at each side externally; blunt and somewhat emarginate at the end; embracing the inner glumes with its thinner margin. Glume of two valves; the outermost oblong, tumid, taper-pointed, thickish, doubled; inner similar, but rather blunt. *Cor.* of two valves, smaller and thinner than the calyx; the outer valve largest, tumid, bluntly three-toothed; inner rather smaller, flat at the back, emarginate. Abortive glume of one valve, oblong, folded in at each margin, furnished with two teeth, and situated at the fore-side of the fertile floret, to which it is much inferior in size. Nectary minute, of two linear, membranous, very thin scales, acutely notched at the summit. *Stam.* Filaments three, minute, at the base of the germen, capillary, dilated below; anthers linear, minute, imperfect. *Pist.* Germen superior, oblong; style one, compressed, longer than the calyx; stigmas two, very long, villous, twisted. *Peric.* none. *Seed* solitary, ovate, a little compressed, pointed with the permanent style.

Obf. At the base of the involucrum, at each side, is an opening, lined internally, on one side, with bristly hairs.

Ess. Ch. Male, Calyx a glume of two flowers, the innermost neuter. Corolla of two membranous valves.

Female, Calyx a single-flowered glume, enclosed in a single-leaved involucrum, pierced at each side. Corolla of two valves. Stigmas two. Seed one.

1. *T. dactyloides*. Rough-seeded Tripfacum. Linn. Sp. Pl. 1378. Willd. n. 1. Ait. n. 1. Pursh n. 1. Mill. Illustr. t. 78. (Coix seminibus angulatis; Linn.

Hort. Cliff. 438. Gramen dactylon maximum americanum; Pluk. Phyt. t. 190. f. 2. *G. dactylon indicum esculentum*, spicâ articulatâ; Ambrosin. Phyt. 546, 547, rude, but expressive. Sefamo perenne indiano, pianta frumentacea; Zanon. Ist. 181. t. 69, not 68.)—Spikes aggregate, about three together, male in the upper part, female at the base.—On the banks of rivers, and along the sea-shore, in Virginia, Carolina, and the country of the Illinois, flowering in August. *Pursh.* Root perennial, thick and woody, with many strong zigzag fibres. Stems numerous, erect, reedy, four or five feet high, round, smooth, as thick as a goose-quill, knotty; leafy below. Leaves long, linear, taper-pointed, an inch broad, smooth. Spikes a span long, smooth, usually three together, often more or fewer; the male flowers very numerous.

T. monostachyon, Willd. n. 2. Hort. Berolin. t. 1, found in salt meadows and ditches, from New York to Carolina, seems, as Pursh remarks, to be but a single-spiked variety of the former; probably such as is represented by Miller above cited.

2. *T. cylindricum*. Cylindrical Tripfacum. Michaux Boreal.-Amer. v. 1. 60. Willd. n. 3. Pursh n. 3.—“Spike solitary, hermaphrodite, cylindrical. Spikelets contiguous, separating by joints.”—Found in sandy fields in Florida. Michaux.

3. *T. hermaphroditum*. United-flowered Tripfacum. Linn. Sp. Pl. 1379. Willd. n. 4. Ait. n. 2. Linn. fil. Dec. 17. t. 9. (Cenchrus n. 2; Browne Jam. 367.)—Spike solitary, tapering, with a wavy stalk, and rather distant spikelets.—Native of grassy pastures in Jamaica, where it is fed on by all sorts of cattle. The root is annual, fibrous. Stem from eighteen to twenty-four inches high, leafy, smooth. Leaves pointed, somewhat rough-edged. Spike tapering, pale, smooth. Sinus at each side of the involucrum destitute of internal hairs, but accompanied by a sort of blunt short spur.

TRIPTERELLA, a diminutive from τρι, three, and πτερον, a wing, used by Michaux to express the character of the three little narrow wings, projecting from the angles of the calyx, or rather corolla; not, as De Theis says, of the capsule.—Michaux Boreal.-Amer. v. 1. 19. Vahl Enum. v. 2. 42. Pursh 28.—Class and order, *Triandria Monogynia*, Nat. Ord. akin to *Burmannia*, and perhaps *Hypoxis*; genera whose place in Jussieu's system is not well settled.

Gen. Ch. *Cal.* none, unless the corolla be taken for such. *Cor.* of one petal, permanent, superior; tube swelling at the base, contracted in the middle, angular, with three slight wings, at the summit; limb shorter than the tube, in six deep segments, the three intermediate ones minute. *Stam.* Filaments three, very short, inserted into the tube below the three smaller segments of the limb; anthers within the tube, of two widely separated lobes. *Pist.* Germen inferior; style the length of the stamens, triangular; stigma in three short, thickish, blunt segments. *Peric.* Capsule membranous, triangular, of three cells, crowned with the withered corolla. *Seeds* numerous, minute, oblong, cylindrical, striated.

Ess. Ch. Calyx none. Corolla superior, of one petal; its tube angular, swelling at the base; limb in six segments, the three intermediate ones minute. Capsule of three cells, with many seeds.

1. *T. capitata*. Capitata Tripterella. Michaux t. 3. Vahl n. 1. Pursh n. 1. (Anonymos capitata; Walt. Carol. 69. Vogelia capitata; Gmel. Syst. Nat. v. 2. 107.)—In wet places, borders of ponds, &c. in Lower Carolina, flowering from May to July. *Pursh.* Found by Richard in Cayenne. *Vahl.* Root small, fibrous, annual.

Stem from nine to eighteen inches high, solitary, simple, erect, slender, smooth, nearly naked. *Leaves* very few and small, scattered, awl-shaped; sheathing at the base. *Flowers* white, several together, in a solitary terminal head the size of a large pea, interspersed with small, awl-shaped, scaly bractes, shorter than the corolla. The wings which proceed from the angles of the latter appear to be very slight.

TRIPHTHONG. See TRIPHTHONGUE.

TRIPTILIUM, in *Botany*, so named in the Flora Peruviana, from τρεις, *three*, and πτερον, *a soft plume, or feather*, which is very descriptive of the five dense, white, stalked tufts, crowning the seed.—Fl. Peruv. Prodr. 102. t. 22. Willd. Sp. Pl. v. 3. 1626. De Candolle Ann. du Mus. d'Hist. Nat. v. 19. 67. t. 3. f. 3.—Class and order, *Syn-genesia Polygamia-aqualis*. Nat. Ord. *Compositæ semistefculosæ*, Linn. *Cimarocephali*, Juss.

Gen. Ch. *Common Calyx* imbricated, nearly cylindrical, of several lanceolate, keeled, spinous-pointed, nearly equal, scales, containing four or five flowers, in a simple series. *Cor.* compound, uniform, radiant; florets all uniform, perfect, fertile, monopetalous, tubular, two-lipped; the lower lip spreading, ovate, three-toothed; upper much smaller, erect, oblong, entire. *Stam.* Filaments five, capillary; anthers united into a tube, shorter than the corolla, swelling in the middle. *Pist.* Germen solitary under each floret, obovate; style thread-shaped, longer than the stamens; stigmas two, oblong, spreading. *Peric.* none, except the permanent calyx. *Seeds* solitary, oblong, angular; down of five equal, linear, channelled scales, the length of the calyx, each terminating in a dense, oblong, pointed, spreading plume, about half as long as the scale. *Recept.* small, clothed with soft shaggy hairs.

Ess. Ch. *Receptacle* villous. *Calyx* imbricated, spinous, about five-flowered. *Florets* two-lipped. *Down* of five channelled scales, feathered at the summit.

1. *T. laciniatum*. Blue and White Triptilium. Willd. n. 1. (*T. spinosum*; Cavan. MSS.)—Native of Peru and Chili. We received a specimen from the late abbé Cavanilles in 1804. Few plants constitute a more distinct genus, or make a more elegant appearance, even after being so many years dried. The root is said to be annual. *Herbage* hard and rigid, besprinkled with fine, long, loose, rather copious, hairs. *Stem* round, slender, branched, corymbose, brown, very leafy. *Leaves* scattered, nearly or quite sessile, spreading, about an inch long, pinnatifid, with three or five spinous-pointed, convex segments; paler, and most hairy, beneath; accompanied by short, axillary, leafy shoots, whose leaves are linear and undivided. *Flowers* numerous, in a dense, compound, level-topped, corymbose, leafy panicle. *Calyx* about one-third of an inch long; its scales slightly hairy, with membranous edges. Lower lip of each floret of a bright permanent blue; upper whitish. The feathery tips of the seed-down, nearly the length of the florets, are snow-white, and, contrasted with their fine blue, make a singularly elegant appearance. We have not heard of this plant in any European garden.

TRIPTIS, in *Geography*, a town of Saxony, in the circle of Neustadt; 4 miles E. of Neustadt. N. lat. 50° 25'. E. long. 11° 50'.

TRIPTOLEMUS, in *Mythology*. See CERES.

TRIPTOTES, compounded of τρεις, *three*, and πτερος, *case*, in *Grammar*, defective nouns, which have only three cases; such is *sors, fortis, forte*; or *dica, dicam, dicas*.

TRIPUDIUM, in *Antiquity*, a species of divination, in which omens were drawn from the rebounding of corn thrown to chickens.

TRIPUNETAIRE, in *Geography*, a town of Hindoostan; 35 miles E.N.E. of Cochin.

TRIPURA, a city often mentioned in the mythological relations of the Hindoos, as having been destroyed, together with its wicked sovereign Tareka, by their god Siva, who is hence called Tripuranteka, or the destroyer of Tripura. See SURA and TAREKA.

TRIPURANTEKA, in *Mythology*, a name of the Hindoo god Siva, so called from a mythological relation of his having destroyed a city and tyrant named Tripura.

TRIPYRAMIDES, derived from τρεις, *thrice*, and πυραμυς, *a pyramid*, in *Natural History*, the name of a genus of spars.

The bodies of this genus are spars composed of single pyramids, each of three sides, standing on no column, but affixed by their bases to some solid body.

Of this genus there are only two known species: 1. A short and thick one, found on the sides of the stacks of stone in Northamptonshire, and elsewhere; but this is not common, and is usually small. 2. A long one with a narrow base: this is not found in England, but is common in the German mines. Hill.

TRIQUETRA OSSA, in *Anatomy*, the small irregular bones occasionally found between the regular bones of the cranium. See CRANIUM.

TRIQUETRUM FOLIUM, among *Botanists*. See LEAF.

TRIRAPHIS, in *Botany*, from τρεις, *three*, and ραφεις, *a needle, or awl*, because of the three straight awns.—Brown Prodr. Nov. Holl. v. 1. 185.—Class and order, *Triandria Digenia*. Nat. Ord. *Gramina*.

Ess. Ch. *Calyx* many-flowered, of two equal, awnless valves. *Spikelet* two-ranked; two, or more, of the lowest florets perfect, the rest male, or neuter. *Outer valve* of the corolla with three terminal straight awns; inner awnless. *Nectary* of two scales. *Stigmas* villous.

A genus of grasses found within the tropics, akin to the TRIODIA and PAPPOPHORUM of Mr. Brown, (see those articles); and therefore to his *Ectrofia*, and the *Chloris* of Swartz, which are said to be very little different from each other. The flowers are panicle. Two New Holland species, gathered by the learned author in the tropical part of that country, are all that occur in his *Prodromus*; nor does this genus find a place in Mr. Kunth's South American work. Probably however there may be East Indian species, unknown to us.

1. *T. pungens*.—“Panicle loose. *Outer valve* of the corolla coriaceous, minutely downy. *Awns* equal; the middle one simple. *Leaves* involute, spreading, straight.”

2. *T. mollis*.—“Panicle close. *Outer valve* of the corolla bearded with spreading hairs. *Middle awn* furnished at each side with a bristle-like appendage.”

TRIREME, or TRIREMIS, in *Antiquity*, a galley with three ranks of oars on a side. See ENNERIS.

TRISACRAMENTARIANS, or TRISSACRAMENTARIANS, an appellation given to a sect in religion, who admit of three sacraments, and no more.

There have been several Trisacramentarians who allowed of baptism, the eucharist, and absolution for sacraments.

The English are often misrepresented by foreigners as Trisacramentarians, from an opinion that they allow ordination to be a sacrament.

TRISACTIS, in *Natural History*, the name of a genus of star-fish, composed of a body and three rays, the more usual number being five.

TRISAGA, in *Geography*, a town of Italy, in the Cadore; 14 miles N.N.E. of Cadore.

TRISAGION, or TRISAGIUM, τρισαγιον, compounded of τρεις, *three*, and ἅγιος, *sanctus, holy*, in *Church History*, a hymn, in which the word *holy* is repeated three times.

The proper Trifagion is those words, *Holy, holy, holy, Lord God of Sabaoth*, which we read in *Isaiah*, vi. 3. and in the *Apocalypse*. From these words the church formed another trifagion, which is rehearsed in Latin and Greek, in the respective churches, to this effect, *Holy God, Holy Mighty, Holy Immortal! have mercy upon us*. Petrus Ful- lenfis to this trifagion added, ο σαυρωθεις δι ημας, *Thou who wast crucified for us — have mercy, &c.* thus attributing the passion, not to the Son alone, but to all the three persons of the Trinity; and he pronounced anathema to all such as would not say the same. See THEOPASCHITE.

The use of the second trifagion (exclusive of the addition of Fullenfis) began in the church of Constantinople, from whence it passed into the other churches of the East, and afterwards into those of the West: and still subsists in its primitive purity, both in Latin, Greek, Ethiopic, and Mozarabic offices.

TRISAKTI, or TRISAKTI-DEVI, in *Hindoo Mythology*, is a name of the goddess Parvati, consort of Siva. It means of triple energy; both god and goddess having various triform characters and potencies, and many names indicative of three-fold properties. Parvati is found to have many attributes and appellations corresponding with those of the Grecian Juno or Diana: among them several derived from their three-fold character. Trivia, for instance; and by the way, the meeting or junction of roads was mysteriously sacred to both. See JUNCTION.

Tritonea, Tergemania, &c. are appellations of the Triple Hecate. See Potter's *Archæol. Græc.* ch. xix.

TRISANTHUS, in *Botany*, from τρεις, *three*, and ανθος, *a flower*, because there are three flowers in one common calyx.—Loureir. *Cochinch.* 175.—Clafs and order, *Pentandria Digynia*. Nat. Ord. *Umbellifera*.

Gen. Ch. Cal. Umbel simple, of three flowers. Involucrum of two lanceolate, permanent leaves. Perianth superior, of five minute deciduous teeth. Cor. none. Stam. Filaments five, awl-shaped, very short; anthers roundish, of two cells. Pist. Germen lenticular, coloured, rather abrupt, crowned by the perianth; styles none, (or very short); stigmas two, oblong, reflexed. Peric. none. Seeds two, kidney-shaped, easily separable.

Eff. Ch. Umbel simple, of three flowers. Involucrum of two leaves. Calyx of five teeth. Petals none. Fruit compressed.

1. *T. cochinchinensis*. *Rau má* of the *Cochinchinese*. The only described species, frequent about hedges in *Cochinchina*, where, though an esculent herb, it is not cultivated. The author thought he had also met with this plant in *China*, as well as other parts of the *East Indies*; and he cites the *Pes equinus* of *Rumphius*, book 9. chap. 69. t. 169. f. 1, which is no other than *Hydrocotyle asiatica* of *Linnæus*. They may be one and the same, as *Loureiro* was most inclined to believe. He describes his *Trisanthus* with a long, trailing, slender, thread-shaped stem, taking root at nearly regular intervals. Leaves from the same points as the roots, roundish, concave, rugose, smooth, crenate, divided half way down, on long, erect footstalks. Germen purple, which *Loureiro* takes for a perianth investing the seed, and becoming a pericarp. The flower-stalks are radical, crowded, rather long.

The whole plant is said to be vulnerary, cleansing, diuretic, and nephritic. *Loureiro* knew a man who, having deprived himself, at a stroke, of parts which most people wish to preserve, healed the wound readily by the applica-

tion of this herb, mixed with a small quantity of powdered lime. A notable cure no doubt! but which few persons will be anxious to verify by experiment, and which still fewer, probably, would try with perfect satisfaction or success.

TRISCÆDECACTIS, in *Natural History*, a name given by *Linkius*, and some other authors, to a kind of branched star-fish, or astrophyte, whose rays are thirteen in number, where they first leave the body, and each divides into many more.

TRIS-DIAPASON, TRIPLE-DIAPASON, in *Musick*, what is otherwise called a *triple eighth*.

TRISE, at *Sea*, the seamen's word for haling up of any thing with a dead-rope, or one that doth not run in a block, but is pulled by hand or by main strength: thus if any cask, chest, or other goods, hath only a rope fastened to it, and fo without a tackle be pulled up into a ship by hand, they say it is *trifed up*.

TRISECTION, or TRISSECTION, the dividing of a thing into three.

The term is chiefly used in *Geometry*, for the division of an angle into three equal parts.

The *trisection of an angle* geometrically, is one of those great problems whose solution has been so much sought by mathematicians for two thousand years; being, in this respect, on a footing with the quadrature of the circle, and the duplicature of the cube angle.

Several late authors have written of the trisection of the angle, and pretend to have found out the demonstration of it; but they have all committed paralogisms.

TRISETÆ, the *three-haired flies*, a term used by the writers in *Natural History*, to express a certain genus of the feticaudæ, or bristle-tailed flies, which are distinguished from the rest, by having three hairs or bristles growing from the tail; there are several kinds of these flies, found frequently among our hedges.

TRISETUM, in *Botany*, apparently so called because the corolla was supposed to have three awns, is a genus of grasses, adopted by *Pursh*, *Fl. Amer. Sept.* 26 and 76, for which he cites *Perfoon's Enchiridion*, v. 1. 97, and gives the following essential character.

Calyx two or three-flowered, pointed, keeled. Corolla with two terminal awns, and a solitary dorsal one, which is straight, not twisted. Florets smooth.

The only species mentioned by *Mr. Pursh*, is called *T. pratense*, and is said to be *Avena flavescens* of former authors. If it be the European plant, so well known under that name, we can most indubitably aver that it does not answer to the above character, the corolla having two taper points, like many other grasses; but nothing like awns except the large solitary dorsal one, which is as certainly twisted as that of all other *Avenæ*.

TRISEUS, in *Ichthyology*, a name given by *Salvian*, *Benedictus Jovius*, and others, to that species of the gadi which we call the *celpout*, and authors in general the *mujlela fluviatilis*. See *GADUS Lota*.

TRISIRAS, in *Hindoo Mythology*, is the name of a dog appertaining to their god *Yama*, the regent of hell.

This reminds us at once of the *Cerberus* of the *Grecian Pluto*, the more particularly as the *Hindoo dog* is represented to be *three-headed*, which indeed is the literal translation of *Trisiras*.

TRISMEGISTUS, formed from τρεις, *thrice*, and μεγιστος, *greatest*, an epithet, or surname, given to one of the two *Hermeses*, or *Mercuries*, kings of *Thebes*, in *Egypt*, who was contemporary with *Moses*.

Mercury, or *Hermes Trismegistus*, is the latter of the

two *Hermeses*; the former having reigned about the time of the Deluge. They are both of them represented as authors of many of the arts and institutions of the Egyptians. See *HERMES*.

TRISMIS, or *TROSMIS*, in *Ancient Geography*, a town of Lower Mæsia, near the Danube. Ptol. This place is marked in Ant. Itin. on the route from Viminacium to Nicomedia, between Biroen and Arrubium.

TRISMOS, *τρισμας*, or *τριγμος*, a convulsion of the muscles of the temples, causing the teeth to gnash.

TRISOLYMPIONICA, *τρισολυμπιονικη*, compounded of *τρις*, *three*, *Ολυμπιας*, *Olympic games*, and *νικη*, *victory*, among the *Ancients*, a person who had thrice borne away the prize at the Olympic games.

The trifolympioniceæ, or trifolympionics, had great privileges and honours allowed them. Statues were erected to them, of the kind called *iconiceæ*, which were modelled to the size and form of their persons.

They were also exempted from all taxes and incumbrances, and could never be marked with infamy.

TRISPAST, *TRISPASTON*, compounded of *τρις*, *three*, and *σπαξ*, *I draw*, in *Mechanics*, a machine with three pullies, or an assemblage of three pullies, for raising great weights.

The *trispaston* is a species of *polyspaston*.

TRISPERMUM, in *Pharmacy*, the name of a cataplasm, or poultice, consisting of three ingredients; these are cummin and opium seed, and bay-berries.

TRISSA, in *Ichthyology*, a name used by some authors for the fish more commonly known by the name of *alaufa*, and called in English *shad*, or the mother of herrings.

TRISSACRAMENTARIANS. See *TRISACRAMENTARIANS*.

TRISSANTON BAY, in *Geography*. See *SOUTHAMPTON*.

TRISSARRI, a town of France, in the department of the Lower Pyrenæes; 9 miles S.W. of St. Palais.

TRISSILD, a town of Norway, in the diocese of *Aggerhuus*; 65 miles N. of *Kongswinger*.

TRISSINO, *GIANGIORGIO*, in *Biography*, an Italian poet, was descended from a noble lineage, and born in 1478 at Vicenza. In his youthful studies he was industrious and ardent. Besides the Latin and Greek languages, the latter of which he acquired under *Demetrius Chalcondylas*, he became a proficient in mathematics, physics, architecture, and other fine arts. He was employed in posts of trust and honour by the popes *Leo X.* and *Clement VII.*, and he also received many tokens of distinction from the Venetian republic and his native city. He was twice married; and with both his wives he lived happily at Vicenza. But a law-suit, in which he engaged with the son of his first wife, obliged him to retire to *Murano*, near *Venice*, and having lost his cause and a great part of his property, he went to *Rome*, where he died in 1550. Ambitious of being a poet, he cultivated an imitation of the ancients; and his tragedy of "*Sofonisa*," formed after the laws and manners of their drama, and the first in which verse without rhyme was employed, has been considered as the first Italian work of that class. This tragedy, framed by the author in 1515, was not printed till the year 1524. His next production was a comedy, intitled "*Similimi*," which was well received. But his great work, in which he was engaged for twenty years, was his epic poem, intitled "*Italia Liberata de Goti*," the subject of which was the deliverance of Italy from the *Goths* in the reign of the emperor *Justinian*. His model in the composition of this work was *Homer*, whom he fervently imitated, inasmuch that, according to *Voltaire*, "he took every thing from him but his genius." The success

of this poem by no means corresponded to his expectations. Of his other works, and his whimsical but ineffectual project of introducing certain Greek letters into the Italian alphabet, we need take no notice. Gen. Biog.

TRISTAN d'Acunha, in *Geography*, the largest of three islands in the South Atlantic ocean, about 1500 miles from any land either to the west or north, very lofty, and about 15 miles in circumference. A part of the island, *fr* *Erasmus Gower* observes, (quoting the author of the Authentic Account of the Embassy to China,) towards the north rises perpendicularly from the sea to a height apparently of 1000 feet, or more. A level then commences, forming what among seamen is termed table land, and extending towards the centre of the island; from whence a conical mountain rises, not unlike in appearance to the Peak of *Teneriffe*, as seen from the bay of *Santa Cruz*. Boats were sent to sound and examine the shore for a convenient place to land and water. In consequence of their report the *Lion* stood in, and came to anchor in the evening on the north side, in 30 fathoms water, one mile from the shore; the bottom black sand with slime; a small rock of the west point bearing south-west by south, just open with the western extremity of the island; a cascade or fall of water emptying itself upon the beach south by east. All the shore from the southern point to the eastern extremity appears to be clear of danger, and steep, except the west point, where there are breakers about two cables' length, or near 500 yards, from the shore. The ship, when anchored, was overshadowed by the dark mass of that portion of the island, whose sides seem to rise like a moss-grown wall immediately from the ocean. On the right the elevation was less rapid, and between the rising part and the sea was a flat of some extent, covered with sedge-grass, interspersed with small shrubs, which being perfectly green, looked from the ship like a pleasant meadow, watered by a stream that fell afterwards from its banks upon the beach. The officers who went ashore reported, that the casks might be filled with fresh water by means of a long hose, without moving them from the boats. The landing-place thereabouts was also described as being safe and superior to any other that had been examined. From the plain the land rose gradually towards the central mountain, in ridges covered with trees of a moderate size and height. The coast abounded with sea-lions and seals, penguins and albatrosses: one of the latter was brought on board, his wings measured ten feet from tip to tip; but others are said to have been found much larger. The coast was covered with a broad seaweed several fathoms long, and deservedly by naturalists termed gigantic fucus. Some good fish was caught with the hook and line. The accident of a sudden gulf, by which the anchor was in a few hours driven from its hold, and the ship forced out to sea, prevented the island from being explored as was intended. It is probable, that if the *Lion* had anchored in twenty instead of thirty fathoms water, the anchor would have held firmly. Some advantage was obtained, however, from coming to this place. The just position of those islands in respect to their longitude was ascertained, by the means of several time-pieces, to be about two degrees more eastwardly than generally laid down in charts. These islands are certainly worthy of a more particular enquiry; for they are not fifty leagues from the general track of vessels bound to *China*, and to the coast of *Coromandel* by the outer passage. In war-time, an excellent rendezvous might be settled there for ships that wanted no other supply than that of water. When circumstances require particular dispatch, it is practicable to come from *England* to *Tristan d'Acunha* without stopping

in the way, and afterwards to the end of the voyage to India or China. These islands are separated by a space of about 1500 miles from any land to the westward or northward of them. They are situated in that part of the southern hemisphere, in the neighbourhood of which a continent, to balance the quantity of land in the northern hemisphere, was once expected to be found; but where it has since been discovered that there is none. The spot where the Lion anchored was determined by good meridional observations, and by accurate time-pieces, to be in S. lat. 37°. W. long. 15° 40'.

TRISTANIA, in *Botany*, from τρις, *three*, and ἵστιαμα, or ἱστιαμα, *to stand*; in allusion, as we presume, to the ternate disposition of the flowers and their stalks; the three-forked inflorescence of this, doubtless very distinct genus, being strikingly different from all to which it is nearest allied in the parts of fructification.—Brown in Ait. Hort. Kew. v. 4. 417.—Class and order, *Polyadelphia Icosandria*. Nat. Ord. *Hesperideæ*, Linn. *Myrti*, Juss.

Gen. Ch. *Cal.* Perianth superior, of one leaf, turbinate, in five deep, triangular, nearly equal segments. *Cor.* Petals five, roundish, inserted into the rim of the calyx between its segments. *Stam.* Filaments numerous, in five sets, opposite to the petals, and about the same length, mostly palmate; anthers roundish, incumbent. *Pist.* Germen inferior, turbinate, somewhat angular; style thread-shaped, about the length of the stamens; stigma obtuse. *Peric.* Capsule roundish, more or less completely coated, of three cells and three valves, the partitions from the centre of each valve. *Seeds* numerous, minute, angular.

Eff. Ch. Calyx superior, in five deep segments. Petals five. Stamens numerous, in five palmate parcels, opposite to the petals, and scarcely longer. Style one. Capsule of three cells.

This genus is selected from *MELALEUCA*, (see that article,) whose character however may stand as it does, distinguished by the great length of its stamens. Our 4th, 5th, and 18th species belong to *Tristania*, with one more already published, and probably several others, known as yet to Mr. Brown alone, destined for the sequel of his *Prodromus*. All the true *Melaleuca* have perfectly sessile, generally crowded, flowers. Having already described the above three species, we shall here merely enumerate them, with the appropriate specific characters of Mr. Brown, as far as he has given any.

1. *T. neriifolia*. Oleander-leaved *Tristania*. Ait. n. 1. (*Melaleuca neriifolia*; Sims in Curt. Mag. t. 1058. *M. salicifolia*; Andr. Repos. t. 485.)—Leaves opposite, lanceolate. Stamens from three to five in each set.—Observed by Mr. Brown, in New South Wales, from whence its seeds were sent to England, about the year 1804, according to Mr. Aiton, who marks it as a greenhouse shrub, flowering from July to September. The stamens are much fewer than in any other species which has come to our knowledge, and their connexion at the base is but slight. The flavour of the plant is said to be bitterish and astringent, scarcely aromatic, in which it differs from the *Melaleuca*.

2. *T. suaveolens*. Sweet-scented *Tristania*. (*M. suaveolens*; Gartn. v. 1. 173. t. 35.)—Leaves alternate, elliptical. Calyx and stalks downy. Capsule entirely inferior.—Native of New Holland, near Endeavour river. Sir J. Banks. Not as yet introduced into our gardens.

3. *T. laurina*. Laurel-leaved *Tristania*. Ait. n. 2. (*Melaleuca laurina*; Sm. Tr. of Linn. Soc. v. 3. 275. Willd. Sp. Pl. v. 3. 1420.)—Leaves alternate, obovato-lanceolate; tapering at the base. Calyx, stalks, and branches downy.

Capsule half superior.—Gathered by admiral Phillip in New South Wales, and introduced, from seed, at Kew in 1798, by Sir Joseph Banks. It is a greenhouse shrub, but has not yet flowered. Aiton.

4. *T. conferta*. Pittosporum-leaved *Tristania*. Brown MSS. Ait. n. 3.—“Leaves alternate, elliptical, or somewhat lanceolate, acute; the terminal ones crowded. Segments of the calyx acute, leafy.”—Found by Mr. Brown in New South Wales, and introduced at Kew in 1805. A greenhouse shrub, flowering from July to September.—We have seen no specimen of this last species, nor have we any account of the colour of its flowers, which are probably white, like those of the two immediately preceding.

TRISTE, in *Geography*, an island near the coast of America, on the south side of the bay of Campeachy, situated on the west of Port Royal island; from which it is separated only by a narrow channel, about 18 miles in circumference. N. lat. 18° 20'.

TRISTE, a name given by the Spaniards to the gulf of *Paria*; which see. This gulf, according to Depons, is twenty-five leagues from E. to W., and fifteen from N. to S., and has anchorage in that whole extent, but its depth varies from eight to thirty fathoms. Upon the coast of *Paria* its soundings are much less. This gulf is, in fact, a real port, which for excellence and extent vies with the handsomest in the world. It has a muddy bottom, except near the coast of Terra Firma, where are shoals and banks of sand. Its waters are as salt as those of the sea, though some have erroneously represented them as fresh. This gulf is difficult of entrance; and the wind must be from the S.E. to enter it with any prospect of safety. The tide is formidable, and has a violence inconceivable by those who are not well acquainted with the great ebbings and flowings of the sea.

TRISTEMMA, in *Botany, from τρις, *three*, and στέμμα, *a crown*, “because the fruit is surmounted by a triple permanent crown;” a genus mentioned by De Theis, but without reference to any author, nor have we met with any indication of it elsewhere.*

TRISTEN, in *Geography*, a town of Germany, in the county of Feldkirch; 11 miles S.S.W. of Feldkirch.

TRISTO, a word used by Paracelsus, to express what he calls the material fire, lodged in the matter of all the four elements, and exerting upon occasion its influence, under the form of the proper effects of each element.

TRISTONBOROUGH, in *Geography*, a town of Strassford county, in the state of New Hampshire, containing 709 inhabitants.

TRISTRA, **TRUSTRA**, or *Trifla*, in our old *Law-Books*, an immunity, by which a man is excused from attending on the lord of the forest, when he is disposed to chace within the forest; so that he cannot be compelled to hold a dog, follow the chace, nor stand at the place appointed, which otherwise he might be, under pain of amercement.

“Sint quieti, &c. de chevagio, hondepenny, buckitel, et tristis, et de omnibus misericordiis, &c.” Privileg. de Semplingham.

TRISULA, in *Hindoo Mythology*, the name of one of the commonest attributes of the Hindoo deity Siva. In pictures of him, it is represented as a tridentated implement, similar to that seen in the hands of the Neptune of the West. The sect of Hindoos who are Saivas, that is, exclusive worshippers of Siva as the deity, maintain that the Trifida is symbolical of his triad of powers: meaning that he comprehends those of creation, preservation, and destruction. Others

expla. a

explain the Trifula as allusive to Siva's supremacy over the three worlds; or earth, heaven, and hell; a mysterious triad, awefully indicated by the compound triverbal phrase *Bhur-bhuwawah*, of which see under the article O'M.

The word Trifula means, in the Sanscrit tongue, three-pointed. In the west of India, it is sometimes called *triphala*; and hence, connected with other coincidences, Mr. Wilford (*As. Res.* vol. iii.) considers "the Jupiter *Triphylus* of the Panchæan islands to be no other than Siva holding a triphala; he being also represented with three eyes, to denote a triple energy; as Vishnu and Prithvi are severally typified by an equilateral triangle, and conjointly, when their powers are supposed to be combined, by two such triangles intersecting each other." The mysterious properties of the triangle, or cone, with its apex upward or downward, and of two intersecting triangles, are noticed in our articles LINGA, O'M, PARVATI, PAVAKA, SIVA, VISHNU, and others thence referred to. The intersected equilateral triangles, mentioned by Mr. Wilford as typical of Vishnu and Prithvi, have an allusion in natural philosophy to the influence of humidity on the earth; Vishnu representing the *aqueous* principle of nature, and Prithvi the *material*, or the earth. (See PRITHU and VISHNU.) Of the resemblance of Jupiter Triphylus, or Triophthalmos, with the three-eyed Siva, see under his name of TRILOKAN, which means with three eyes. Trinetra has also a similar meaning.

TRISULI, a name of the Hindoo deity Siva. He is so called from bearing the symbol Trifula, or trident. See TRISULA.

TRISYLLABLE, TRISSYLLABLE, in *Grammar*, a word consisting of three syllables.

TRITÆA, in *Ancient Geography*, a town of Achaia, in the southern part, on the river Melas; said to be founded by Menalippus, son of Trittia, a priestess of Minerva, in consequence of her amours with the god Mars. The principal temple of this city was that of the greater gods, who were annually honoured by feasts similar to those of Bacchus. The statue of Minerva, which was reckoned beautiful, was transported from hence to Rome. This town was one of those which Augustus put into a state of dependence upon Patras.

TRITÆOPHYES, a word used by the medical writers of the ancients, to express a kind of fever, much of the nature of the tertian, and taking its rise from it.

TRITANY, in *Geography*, a town of Hindoostan, in the Carnatic; 18 miles S. of Bomrauzepollam.

TRITCHINGODE, a town of Hindoostan, in Mysore; 6 miles S. of Sankeridurgam.

TRITCHINOPOLY, a town of Hindoostan, in the Carnatic. It is surrounded with two walls, flanked with towers, and encompassed with a ditch. It was taken by the British under major-general Lawrence and captain (afterwards lord) Clive, in 1751, and since that time it has been made the capital of Madura; 67 miles W. of Tranquebar. N. lat. 10° 48'. E. long. 78° 45'.

TRITE, τριτη, in *Music*, the third musical chord in the system of the ancients.

There are three strings under this denomination in the ancient diagramma, viz. the *trite hyperboleon*, *trite diezeugmenon*, and *trite synemmenon*.

This chord of the ancient tetrachord was so named from its being the third from the nete; and hence we might call it the anti-penultimate. It was otherwise, in some tetrachords, called parypate. See DIAGRAM and INTERVAL.

TRITE *Diezeugmenon*, in the *Greek Music*, was the anti-

penultimate note of the diezeugmenon tetrachord, and answers to Guido's *c*, *sol*, *fa*, *ut*.

TRITE *Hyperboleon*, was the anti-penultimate note of the hyperboleon tetrachord, and answers to Guido's *f*, *fa*, *ut*.

TRITE *Synemmenon*, was the anti-penultimate note of the synemmenon tetrachord, and answers to Guido's *b*, *fa*. Wallis's *Appen.* Ptolem. *Harm.* p. 257. See DIAGRAM.

TRITÆA, or TRITIA, in *Ancient Geography*, a town of Asia, in the Troade.

TRITHEISM, the opinion of the Tritheists, or the heresy of believing three Gods.

Tritheism consists in admitting not only of three persons in the Godhead; but of three substances, three essences or hypostases, and indeed three Gods.

Several people, out of fear of giving into Tritheism, have become Sabellians; and several others, to avoid Sabellianism, have commenced Tritheists; so delicate and subtle is the distinction.

In the famous controversy between Dr. South and Dr. Sherlock, the first is judged to have run into Sabellianism, by a too rigorous assertion of the unity of a Godhead; and the latter into Tritheism, by a too absolute maintaining of the Trinity.

John the Grammarian, surnamed Philoponus, lover of labour, is held the author of the sect of the Tritheists, under the emperor Phocas; at least it appears that he was a zealous advocate of it.

The chief of this sect, according to Mosheim, *Ecl. Hist.* vol. i. was John Asculnige, a Syrian philosopher, and a Monophysite. He imagined in the Deity three natures or substances, absolutely equal in all respects, and joined together by no common essence.

TRITHEITÆ, TRITHEISTS, in *Church History*, a name given to such heretics, as admit not only of three persons, but of three distinct substances and natures, in the Holy Trinity. See TRINITY and TRITHEISM.

TRITHEMIUS, JOHN, *Abbot*, in *Biography*, was born in the year 1442, at the village of Tritenheim, near Treves, whence he took his name. Having finished his course of education in the universities of Treves and Heidelberg, he was chosen abbot of the Benedictine monastery of Spanheim in 1483, which he superintended for twenty-two years, and when he withdrew from it in consequence of a faction of the monks, he was placed by the bishop of Wurtzburg at the head of a monastery in that city, where he died in 1518, at the age of seventy-six. "Trithemius," says one of his biographers, "was a person of vast erudition, a philosopher, mathematician, chemist, poet, historian, and divine, and conversant in the Hebrew, Greek, and Latin languages." His works, written in Latin, are numerous, but those in biography and history are held in the highest estimation. His writings on piety and morality chiefly relate to the monastic and sacerdotal life, miracles of saints, and such topics. His philosophy bore the mystic character of the age in which he lived. His "Steganography, or the Art of writing in Cyphers," containing some singular characters ignorantly taken for talismans, subjected him very unjustly to the charge of magic. Upon the whole, "he appears to have been a person whose great learning was considerably tinged with credulity, and whose industry was superior to his judgment." Dupin. *Gen. Biog.*

TRITHING. See TRITHING.

TRITICUM, in *Botany*, an old Latin name, very satisfactory derived, by Varro himself, from *tritum*, ground or rubbed, because of the manner in which its grain is prepared for the food of mankind. Wheat, or Wheat-grafs.—Linn.

TRITICUM.

Gen. 40. Schreb. 55. Willd. Sp. Pl. v. 1. 476. Mart. Mill. Dict. v. 4. Sm. Fl. Brit. 157. Prodr. Fl. Græc. Sibth. v. 1. 74. Ait. Hort. Kew. v. 1. 180. Brown Prodr. Nov. Holl. v. 1. 178. Schrad. Germ. v. 1. 389. Pursh 90. Juss. 32. Tourn. t. 292, 293. Lamarck Illustr. t. 49. Gærtn. t. 81. Kunth Nov. Gen. et Spec. v. 1. 179.—Class and order, *Triandria Digynia*. Nat. Ord. *Gramina*.

Gen. Ch. *Cal.* Common receptacle zigzag, toothed, elongated into a spike. Glume transverse, containing about three or more flowers, and consisting of two ovate, bluntish, concave valves. *Cor.* of two nearly equal valves, the size of the calyx; the outermost tumid, obtuse with a point, or awn; the inner flat. Nectary of two acute scales, gibbous at the base. *Stam.* Filaments three, capillary; anthers pendulous, oblong, cloven at each end. *Pist.* Germen superior, turbinate; styles two, capillary, reflexed; stigmas feathery. *Peric.* none, the corolla embracing the seed till it is full-grown and ripe, then letting it go. *Seed* solitary, ovate-oblong, blunt at each end, convex at the outer side, marked with a longitudinal furrow on the inner.

Ess. Ch. Calyx of two valves, solitary, transverse, many-flowered, on a zigzag, toothed receptacle.

We have already adverted to the difficulty of distinguishing this genus from *SECALE*; see that article. They both agree in the transverse, or lateral, position of their bivalve calyx, by which position the side of each spikelet is parallel to the common receptacle, not, as in *Lolium*, contrary. The greater number of *florets* in *Triticum*, which are only two in *Secale*, is the only technical distinction. The outer valve of the *corolla* of the present genus is often terminated by a long awn; but this appendage varies, even in the same species.

Section 1. *Root annual.*

1. *T. aestivum*. Summer Wheat. Linn. Sp. Pl. 126. Willd. n. 1. Ait. n. 1. Bauh. Pin. 21. ("T. aristatum; Blackw. Herb. t. 40. f. 4, 5."—"T. locustis quadrifloris, basi subhirsutis, glumis exterioribus floralibus aristatis; Hall. in Com. Nov. Goett. v. 5. t. 1. f. 1.")—Calyx four-flowered, tumid, smooth, imbricated, awned.—Supposed to be a native of Siberia. It is sown in the spring, and produces a speedy but uncertain crop. We have never seen an authentic specimen, nor are we at all certain that what has generally been taken for this species is any thing more than a variety of the following.

2. *T. hybernum*. Winter, or Lammas, Wheat. Common Cultivated Wheat. Linn. Sp. Pl. 126. Willd. n. 2. Ait. n. 2. Ehrh. Pl. Off. n. 151. Gærtn. f. 1. (T. vulgare; Hofst Gram. Austr. v. 3. 18. t. 26. T. hybernum, aristis carens; Tourn. Inst. 512. t. 292. T. spicâ muticâ; Ger. Em. 65. Siligo spicâ muticâ; Lob. Ic. 25.)—Calyx four-flowered, tumid, even, imbricated, abrupt, with a short compressed point.—Native country unknown. Cultivated in various parts of the world; being sown in autumn, it stands the winter, and ripens seed in the following summer, so that it may be reckoned biennial. The *root* consists of downy fibres. *Stems* one or more, erect, straight, from three to five feet high, round, jointed, smooth, leafy. *Leaves* linear, pointed, flat, many-ribbed, rough, entire, rather glaucous. *Stipula* jagged, bearded. *Spike* solitary, two or three inches long, dense, two-ranked, smooth, joints of the common stalk bearded. *Glumes* smooth. *Calyx* in the upper part of the spike with a more elongated point. *Corolla* of the upper spikelets frequently more or less awned.

Under this most important and familiar species are comprehended a great number of varieties, the knowledge and history of which are more peculiarly the province of the

agriculturist, and will be treated of under the article *WHEAT*. By the botanist they have not been sufficiently investigated, either as varieties or species. Some of them appear entitled to the latter denomination; particularly the White Wheat, *T. album*, Gærtn. f. 2, whose less obtuse calyx, and the long awns of its *corolla*, seem to indicate a specific difference. This last character indeed occurs in many of them; see Tourn. t. 293. Some of the reputed species of Linnæus are less decisively marked. The determination of these points, with the respective qualities of each species or variety, might very advantageously occupy the attention of some accurate rustic botanist, continually on the spot, by whose labours the question might be set for ever at rest, and probably a most important service rendered to scientific agriculture. Not to embroil the subject, we shall not, with insufficient materials, enter upon it.

3. *T. compactum*. Many-spiked Wheat. Linn. Suppl. 115. Willd. n. 3. (T. spicâ multiplici; Bauh. Pin. 21. Ger. Em. 66. Morif. sect. 8. t. 1. f. 7.)—Spike compound; spikelets crowded. *Corolla* awned.—Native of Egypt; cultivated at Naples. The *glumes* are smooth. *Awns* three or four inches long. This is probably a variety of the last, rather than, as Linnæus says, of *T. aestivum*.

4. *T. turgidum*. Turgid, or Conc, Wheat. Linn. Sp. Pl. 126. Willd. n. 4. Ait. n. 3. Ehrh. Pl. Select. n. 23. Hofst Gram. Austr. v. 3. 19. t. 28. (T. spicâ villosâ quadratâ, longiore et brevior; Morif. v. 3. 176. sect. 8. t. 1. f. 13, 14.)—Calyx four-flowered, tumid, villous, imbricated, obtuse, with a short point.—Native country unknown. The *corolla* varies with or without long awns. The silky, or villous, *glumes* alone distinguish this from various awned or awnless varieties of *T. hybernum*.

5. *T. polonicum*. Polish Wheat. Linn. Sp. Pl. 127. Willd. n. 5. Ait. n. 4. Hofst Gram. Austr. v. 3. 21. t. 31. Pluk. Phyt. t. 231. f. 6. Morif. sect. 8. t. 1. f. 8.—Calyx three or four-flowered, pointed, naked, lanceolate like the *corolla*, which is compressed, with a long awn.—The native country of this likewise is unknown. It was cultivated here in the latter part of the seventeenth century, for curiosity at least, and is still seen in botanic gardens, though not much regarded by the farmer, being easily laid by rain. That this is a distinct species there can be no doubt. The strength of the whole plant, its large *ears*, and long, narrow, scarcely tumid *glumes*, readily distinguish it at first sight. Linnæus defines this *Triticum* as having a two-flowered calyx, the character of *Secale*; but Haller asserts the presence of one, if not two, imperfect *florets*.

6. *T. Spelta*. Spelt Wheat. Linn. Sp. Pl. 127. Willd. n. 6. Ait. n. 5. Ehrh. Pl. Off. 431. Hofst Gram. Austr. v. 3. 21. t. 30. (*Zea dicoccos* five major; Bauh. Theatr. 412. t. 413. *Z. spicâ muticâ dicoccos*, vel major; Morif. sect. 8. t. 6. f. 1.)—Calyx imperfectly four-flowered, elliptical, obliquely pointed, shorter than the long-awned *corolla*.—The origin of this species is likewise unknown, nor is its specific character satisfactory. The *glumes* are very glaucous. It is chiefly cultivated in the south of Europe, and is given to horses in Spain, when barley is scarce. The bread it makes is of a dry quality, but no kind of flour is better for pastry.

7. *T. monococcum*. Single-grained Wheat, or St. Peter's Corn. Linn. Sp. Pl. 127. Willd. n. 7. Ait. n. 6. Ehrh. Pl. Select. n. 33. Hofst Gram. Austr. v. 3. 22. t. 32. (*Zea spica barbata*, &c.; Morif. sect. 8. t. 6. f. 2. *Briza monococcos*; Ger. Em. 73.)—Calyx angular, strongly toothed, about three-flowered. First floret awned; intermediate one imperfect.—Native country unknown. This species is cultivated in the most mountainous parts of Switzerland.

TRITICUM.

Switzerland. The neat quadrangular form of the ripe ear, as if carved out of ivory, is remarkable. The *straw* is hard and firm, excellent for thatching. Flower rather better than that of the preceding, making good, though not white, bread, and chiefly esteemed for gruel.

8. *T. prostratum*. Trailing Wheat-grafs. Linn. Suppl. 114. Willd. n. 9. Ait. n. 7. (*T. pumilum*; Linn. Suppl. 115. Willd. n. 10. *Sacale prostratum*; Pallas It. v. 1. 485. Jacq. Hort. Vind. v. 3. 25. t. 44.)—Spike ovate, compressed, two-ranked. Glumes of the calyx and corolla strongly keeled, longer than their awns.—Found by Pallas in the most barren sandy deserts near the Caspian sea. M. Thouin, in 1780, sent seeds to Kew garden. A hardy annual, flowering in June. The *spikes* sometimes fall off entire, and vegetate in the sand, producing a tuft of decumbent slender plants, from three to six inches long, with narrow, slightly downy, *leaves*. *Spikes* solitary, terminal, from half to three-quarters of an inch long, smooth, elegantly two-ranked, with ten or twelve closely imbricated, furrowed, incurved *spikelets*. Awns of the *calyx* awl-shaped, nearly as long as those of the *corolla*, being about a quarter the length of the glumes. *T. pumilum* of Linnæus is the very same species, described twice over.

9. *T. tenellum*. Dwarf Wheat-grafs. Linn. Sp. Pl. 127. Willd. n. 15. Ait. n. 11. (*T. n. 1430*; Hall. Hist. v. 2. 212, most certainly according to Mr. Davall. Gramen loliaceum minus, spicâ simplici; Bauh. Pin. 9. Prodr. 19.)—Spike simple, linear. *Spikelets* alternate, elliptic-lanceolate, awnless. Calyx furrowed. Corolla even, emarginate. *Leaves* bristle-shaped.—Native of Switzerland, and the south of France. *Root* annual, of a few woolly fibres. *Stems* one or more, erect, straight, from four to eighteen inches high, scarcely branched, leafy, with several dark-brown joints. *Leaves* short, slender, erect. *Spike* terminal, solitary, erect, very slender. *Spikelets* more or less distant, erect, close-pressed, rather turgid, smooth. *Florets* from four to eight or ten, polished, somewhat cylindrical, pale and blunt at the tip, with slight indications of lateral ribs. We can meet with no certain figure of this very distinct species, under which, as Schrader remarks in Fl. Germ. v. 1. 346, Linnæus has confounded several different things. *Gramen pusillum unicaule, paniculâ loliacâ*; Bocc. Mus. 69. t. 57, quoted by him for the following, is most like *T. tenellum*, and may perhaps be intended for it.

10. *T. unilaterale*. Unilateral Wheat-grafs. Linn. Mant. 35, excluding certainly the first two synonyms, and probably the third; see the preceding species. Willd. n. 18. (*G. loliaceum minus, spicis tenuissimis*; Morif. sect. 8. t. 2. f. 3.)—Spike simple, linear. *Spikelets* alternate, close, turned to one side. Calyx unequal, taper-pointed. Corolla short-awned, smooth. Native of Italy, Syria, and the south of France. *Root* annual, of many capillary fibres, partly downy. *Stems* numerous, a span high, scarcely branched, smooth, leafy. *Leaves* narrow, channelled, ribbed; their sheaths long, furrowed, sometimes clothed with very short, soft, deflexed hairs. *Spikes* solitary, long, slender, a little curved, of numerous, rather close *spikelets*, half the size of the foregoing, and less tumid. *Florets* three or four, awl-shaped, with bristly awns of various lengths, but scarcely above half so long as the glumes.

11. *T. hispanicum*. Little Spanish Wheat-grafs. Reichard Syst. Plant. v. 1. 240. Willd. n. 8. (*T. maritimum*; Linn. Mant. 2. 325. *Festuca maritima*; Linn. Sp. Pl. 110. Loefl. It. 44.)—Spike simple, linear. *Spikelets* alternate, close, turned to one side. Glumes all downy. Calyx unequal, taper-pointed. Corolla with an awn exceeding its own length.—Gathered in Spain by Loefling.

This appears to us a mere variety of the last, with downy glumes, and longer awns to the *florets*. Loefling's specimens are of humbler growth than those of the preceding that have in general fallen under our inspection, but there is no specific difference between them.

12. *T. maritimum*. Sea Wheat-grafs. Linn. Sp. Pl. 128. Willd. n. 14. Vahl Symb. v. 2. 26. (*Gramen loliacâ paniculâ ramosâ, maritimum*; Baul. Theatr. 130. Scheuchz. Agroft. 274. t. 6. f. 5.)—*Spikes* panicled. *Spikelets* many-flowered, compressed. *Florets* linear-lanceolate, ribbed, pointed, awnless. Stem branched.—Native of the sea-coasts of the south of France, Greece, and Egypt. *Root* annual, of many woolly fibres. *Stems* branched from the base, leafy, a foot high, more or less bent at the joints, and partly decumbent; often purplish, as well as the sheaths of the leaves, and branches of the panicle. *Leaves* longish and tapering, narrow, striated, smooth. *Sheaths* broader than the leaves, but much shorter. *Stipula* membranous, torn, decurrent. *Panicle* about three inches long, forked, with many spreading, spiked, triangular, smooth branches. *Spikelets* alternate, slightly stalked, half an inch long, smooth, of about eight crowded *florets*, each strongly keeled, and acutely pointed, smooth, with a strong marginal rib at each side. *Calyx-valves* furrowed, nearly equal. Some synonyms referred to this, belong to the following. That of Boccone, t. 95, is at least doubtful.

13. *T. loliaceum*. Dwarf Sea Wheat-grafs. Fl. Brit. n. 4. Engl. Bot. t. 221. Willd. n. 17. Knapp. t. 114. Gramen pumilum, loliaceo simile; Raii Syn. 295. *G. loliaceum exile durius*; Sm. Rel. Rudb. 13. *G. exile duriusculum maritimum, foliis circumvolutis, veluti junceis, brevisus*; Pluk. Phyt. t. 32. f. 7. *G. parvum marinum, spicâ loliacâ*; Morif. sect. 8. t. 2. f. 6.)—Spike mostly simple, unilateral. *Spikelets* many-flowered, compressed. *Florets* elliptical, obtuse, awnless, with marginal ribs. Stem branched.—Native of the sandy sea-beach, on the east and south coasts of England, as well as in Italy. We have it from a Piedmontese botanist, under the name of *T. unilaterale*. *Root* annual. *Stems* rigid, spreading, smooth, from three to five inches high. *Leaves* tapering; involute when dry. *Spike* erect, mostly simple, linear, rigid, of from nine to twelve alternate, slightly stalked, two-ranked *spikelets*, turned most to one side; in very luxuriant, or cultivated, specimens the lower part of the spike is branched. This plant is very nearly allied to *Poa rigida*, nor is the position of their spikelets dissimilar. It serves however to connect our last species of *Triticum* with the following one.

14. *T. unioides*. Elegant Wheat-grafs. Ait. n. 12. Willd. n. 16. Vahl Symb. v. 2. 26. (*Poa ficula*; Jacq. Ic. Rar. t. 303. *Briza cynosuroides*; Scop. Infubr. v. 2. 21. t. 11. *Cynofurus ficulus*; Jacq. Obs. fasc. 2. 22. t. 43. Gramen filiceum, paniculis integris; Bocc. Sic. 62. t. 33. f. 2. Morif. sect. 8. t. 6. f. 53.)—Spike simple, close. *Spikelets* many-flowered, ovate, compressed. *Florets* closely imbricated, ovate, acute, keeled, awnless, with central lateral ribs. *Stems* mostly simple.—Found on the sea-coasts of Italy, Sicily, and Barbary. Annual. A most elegant grass, remarkable for its large, flat, closely imbricated, sharp-edged *spikelets*, which resemble those of an *Uniola*, or of *Poa Eragrostis*. The *stems* are a span high, sometimes purple. *Leaves* lanceolate, taper-pointed, flat.

Section 2. *Root perennial*.

15. *T. junceum*. Sea Rushy Wheat-grafs. Linn. Sp. Pl. 128. Willd. n. 11. Fl. Brit. n. 1. Engl. Bot. t. 814. Sm. Fl. Græc. Sibth. t. 99. Knapp t. 113. Fl. Dan. t. 916. (*Gramen maritimum, spicâ loliacâ, foliis*

his pungentibus, nostras; Pluk. Phyt. t. 33. f. 4. *G. angustifolium*, spicâ tritici, muticâ simili; Bauh. Prodr. 17. Morif. sect. 8. t. 1. f. 5.)—Calyx abrupt, five-flowered. Leaves involute, sharp-pointed. Root creeping.—Found abundantly on the loose sands of the sea-coast, throughout Europe, flowering in July. The long stringy tough roots, fixed by woolly fibres, co-operate with *Carex arenaria*, *Elymus arenarius*, &c. in fixing the sand, and forming a barrier against the encroachments of the ocean. The whole plant is very glaucous, hard and rigid, with spinous-pointed leaves, strongly furrowed on their upper side. The stems are two feet high, often tinged with violet in the lower part, and very smooth. Spikes solitary, simple, compressed, stiff, of several alternate, flat spikelets, quite smooth and awnless. Calyx many-ribbed. *T. rigidum*, Schrad. Germ. v. 1. 392, is very near indeed to *junceum*.

16. *T. distichum*. Two-ranked Cape Wheat-grafs. Thunb. Prodr. 23. Willd. n. 12.—“Calyx four-flowered, smooth, awnless. Flowers two-ranked. Leaves thread-shaped.”—Found at the Cape of Good Hope, by Thunberg, whose short specific character is all we know of this species.

17. *T. repens*. Creeping Wheat-grafs. Couch-grafs. Linn. Sp. Pl. 128. Willd. n. 13. Fl. Brit. n. 2. Engl. Bot. t. 909. Leers 45. t. 12. f. 3. Knapp t. 111. Mart. Rust. t. 124. Fl. Dan. t. 748. Schreb. Gram. part 2. 24. t. 26. (*Gramen caninum vulgatius*; Morif. sect. 8. t. 1. f. 8.)—Calyx awl-shaped, many-ribbed, five-flowered. Florets pointed. Leaves flat. Root creeping.—But too common throughout Europe, in all kinds of cultivated ground, flowering in summer and autumn. The long and deeply creeping roots are of all things most difficult to extirpate. Yet when collected in sufficient quantity, they afford wholesome nourishment for cattle, and in some countries have been made into bread in times of scarcity. The stems are two feet high, slender. Herbage green, except in a maritime variety, the γ of *Fl. Brit.*, *T. junceum* of Relhan, *T. intermedium* of Host Gram. Austr. v. 2. 23, which is glaucous, with pungent leaves, and possibly deserves to rank as a separate species. The leaves of our common kind spread horizontally, often all to one side, by which this species becomes conspicuous among bushes or hedges in autumn. Spikes two or three inches long, much smaller in every part than those of *T. junceum*. Florets from five to eight, either simply pointed, or furnished with awns, which vary in length, but are scarcely ever equal to the glumes.

18. *T. caninum*. Fibrous, or Bearded, Wheat-grafs. Hudf. 58. Fl. Brit. n. 3. Engl. Bot. t. 1372. Knapp t. 112. Schrad. Germ. v. 1. 389. Host Gram. Austr. v. 2. 20. t. 25. Ehrh. Phytoph. n. 72. (*Elymus caninus*; Linn. Sp. Pl. 124. Willd. Sp. Pl. v. 1. 469. *Gramen caninum arifatum*, radice non repente; Morif. sect. 8. t. 1. f. 2.)—Calyx pointed, about five-ribbed, four-flowered. Florets awned. Leaves flat. Root fibrous.—Native of bushy places in various parts of Europe. In England it prefers a calcareous soil, flowering in July. The root is fibrous, downy, not at all creeping. Herbage light green, not glaucous. Stem two feet high, erect, straight, finely striated, leafy. Leaves rather broad, rough on both sides, sometimes hairy, with a scarcely discernible stipula. Spikes solitary, pale, from two to four inches long, a little drooping when ripe. Awns straight, usually longer than their glumes.

19. *T. cristatum*. Crested Wheat-grafs. Schreb. Gram. fasc. 2. 12. t. 23. f. 2. Sm. Compend. ed. 2. 22. Engl. Bot. t. 2267. (*Bromus cristatus*; Linn. Sp. Pl. 115. Willd. Sp. Pl. v. 1. 439. *Festuca calmo spicata*, spiculis

multifloris; Gmel. Sib. v. 1. 115. t. 23. *Gramen triticeum*, spicâ latiore compactâ; Buxb. Cent. 1. 32. t. 50. f. 3.)—Calyx elliptical, awned, keeled, obscurely ribbed. Florets awned. Spikelets closely imbricated, two-ranked, depressed, straight. Stems simple.—Common in Siberia and Tartary. The late Mr. George Don discovered it on steep banks and rocks, by the sea-side in Scotland, between Arbroath and Montrose, flowering very sparingly. The roots are perennial, with very long, strong, woolly fibres, destined to grow in sand. Stems twelve or eighteen inches high, ascending, slender, rigid, leafy; hairy at the top. Leaves linear, shortish, sometimes hairy; their sheaths long and tight. Spike elliptic-oblong, very close, pale, most resembling *T. prostratum*, n. 8, but longer, and differing essentially in the lateral ribs of the calyx-glumes, which are obsolete, or smoothed away, not turgid and curved. That these two grasses must belong to one and the same genus, is evident to the most casual observer.

20. *T. attenuatum*. Slender American Wheat-grafs. Kunth Nov. Gen. et Sp. v. 1. 180.—Calyx lanceolate, bluntish, five-ribbed, roughish, three-flowered. Florets very slightly awned. Spikelets distant. Root fibrous.—Found in dry open places in Quito, flowering in January. Root perennial. Stems simple, three or four feet high, smooth. Leaves linear, flat, with a short stipula. Spike erect, five or six inches long. Third floret often imperfect. Kunth.

21. *T. scabrum*. Rough New-Holland Wheat-grafs. Brown n. 1. (*Festuca scabra*; Labill. Nov. Holl. v. 1. 22. t. 26.)—Spike elongated, lax. Calyx lanceolate, ribbed, pointed, many-flowered, half the length of the corolla. Florets rough, taper-pointed, shorter than their awns. Leaves flat, rough, with smooth sheaths.—Native of New South Wales, and the Cape of Van Diemen. Root apparently perennial, with thick downy fibres, not creeping. Stems slender, erect, eighteen inches high, smooth. Leaves narrow, hairy. Florets from five to ten, in sessile, alternate, rather distant, upright, oblong spikelets, from an inch to an inch and half in length.

22. *T. pectinatum*. Pectinate New-Holland Wheat-grafs. Brown n. 2. (*Festuca pectinata*; Labill. Nov. Holl. v. 1. 21. t. 25.)—Spikelets two-ranked, horizontally divaricated. Calyx awl-shaped, pointed, about six-flowered. Awns shorter than the florets. Leaves flat, ciliated.—Found by Labillardiere, in the island of Van Diemen. The root is fibrous, presumed to be perennial. Stems numerous, tufted, erect, simple, a foot or more in height; leafy below; downy upwards. Leaves narrow, spreading, hairy and fringed, acutely pointed. Spikes solitary, erect, ovate-oblong, flat, two-ranked, two or three inches in length, of a dozen or more alternate, rather crowded, sessile spikelets, each near an inch long, which in the flowering season spread horizontally, but subsequently become reflexed. The calyx-valves are slender, somewhat unequal, pointed, but not awned, rather shorter than the florets, which are rough, ribbed, and furnished with straight awns, whose length, however, is less than that of each corresponding glume. The inner valve of the corolla is elliptic-lanceolate, fringed with hairs.

TRITNU, or TRIVETNU, in *Hindoo Mythology*, a name of Surya, the Hindoo regent of the sun. The word means three-bodied. See SURYA and TRIMURTI.

TRITOMA, in *Botany*, so named by Mr. Ker, late Gawler, from $\tau\rho\iota\varsigma$, three, and $\tau\rho\iota\mu\alpha$, to cut, whence comes the adjective $\tau\rho\iota\mu\omega\varsigma$, cut, or fit for cutting; in allusion to the three sharp angles of the leaves.—Ker in Curt. Mag.

744. Dryandr. in Ait. Hort. Kew. v. 2. 290.—Class and order, *Hexandria Monogynia*. Nat. Ord. *Coronaria*, Linn. *Aphodeli*, Juss.

Gen. Ch. *Cal.* none. *Cor.* of one petal, inferior, cylindrical, even, with six shallow, regular, marginal teeth. *Stam.* Filaments six, inserted into the receptacle, thread-shaped, simple, straight, projecting beyond the corolla, three alternate ones longer than the rest; anthers roundish, two-lobed. *Pist.* Germen superior, roundish; style of the shape and length of the longer stamens; stigma acute, somewhat downy. *Peric.* Capsule ovate, bluntly triangular, of three rather rigid valves, and three cells. *Seeds* numerous, smooth, crowded, in two rows, angular.

Ess. Ch. Corolla tubular, of one petal, with six marginal teeth. Stamens prominent, straight, inserted into the receptacle; three intermediate ones longest. Capsule ovate, of three cells, with many angular smooth seeds.

The present genus is well distinguished from *ALETRIS*, as well as from the *VELTHEIMIA* of some botanists; being, as its author observes, nearer in character to *ALOE*; from which, however, it differs greatly in its less succulent habit, and more absolutely monopetalous corolla; but especially in the long, prominent, unequal, straight, not ascending, stamens, and more firm, or harder, capsule. The insertion of the stamens into the receptacle, not into any part of the corolla, to say nothing of other characters, or of the different habit, essentially distinguishes this from the two other above-mentioned genera. (See all in their proper places.) When habit sanctions such a division of genera, we must, especially in a very natural order of plants, like the present, be content with technical characters which might otherwise seem too slight. *Blandfordia*, Sm. Exot. Bot. v. 1. 5. t. 4, is distinguished from all the above by its bristly seeds, imbricated upwards, in a prismatic capsule.

1. *T. Uvaria*. Great Orange-flowered Tritoma. Ait. n. 1. Curt. Mag. t. 758. (*Aletris Uvaria*; Linn. Syft. Veg. ed. 14. 337. *Veltheimia Uvaria*; Willd. Sp. Pl. v. 2. 182. *Aloe Uvaria*; Linn. Sp. Pl. 460. *A. africana*, folio triangulari longissimo et angustissimo, floribus luteis foetidis; Commel. Hort. v. 2. 29. t. 15.)—Leaves rough with minute prickles on the edges and keel. Corolla cylindrical-clubshaped.—Native of the Cape of Good Hope. Cultivated in Chelsea garden at the beginning of the 18th century. The plant is almost perfectly hardy in our climate, flowering in the open ground in August or September, only requiring a moderate protection from severe frost. The root is tuberous, perennial, tufted, bearing plenty of long, tapering, deep-green, three-edged leaves. Stems three feet high, round, stout, nearly naked, each bearing a dense cluster of very numerous, but short-lived, drooping flowers, richly coloured with orange and scarlet. Corolla above an inch long. Stamens yellow.

2. *T. media*. Lesser Orange-flowered Tritoma. Curt. Mag. t. 744. Ait. n. 2. Redout. Liliac. t. 161. (*Aletris farmentosa*; Andr. Repof. t. 54.)—Leaves smooth at the edges and keel. Corolla cylindrical-clubshaped.—Native of the Cape of Good Hope, from whence it is said to have been introduced in 1789, by Mr. Williams, nurseryman, of Turnham Green. As hardy as the last, but flowering either in winter or the early spring, so that a frame, or greenhouse, is requisite to have the plant in perfection. It is smaller than the preceding, with a glaucous tinge on the leaves, whose edges and keel are perfectly smooth. Stems a foot and half or two feet high. Flowers sometimes elegantly tipped with green.

3. *T. pumila*. Least Orange-flowered Tritoma. Ait.

n. 3. Curt. Mag. t. 764. (*Veltheimia pumila*; Willd. Sp. Pl. v. 2. 182.)—Leaves two-ranked, roughish at the edges and keel. Corolla cylindrical at the base; bell-shaped above.—Native of the Cape, from whence it was sent by Mr. Masson to Kew, in 1774. It flowers late in autumn, and seems as hardy as the others, but is smaller than even the last. The flowers are of an uniform orange, and distinguished by their bell-shaped, or globose, limb. Leaves not at all glaucous.

TRITOMA, in *Entomology*, a genus of the Coleoptera order of insects; the characters of which are, that the antennæ are clavated or club-shaped, the club being perfoliate, and the anterior palpi or feelers hatchet-formed. It has seven species, as follow.

BIPUSTULATUM. Black, with wing-sheaths marked by a scarlet lateral spot. Found in England.

GLABRUM. Smooth, black, with pitchy antennæ and feet. Found in Sweden.

DUBIUM. Black, with wing-sheaths and feet testaceous.

VITTATUM. Red, with black wing-sheaths; fillet red. Found in India.

MORIO. Black, silky, with antennæ and feet of the same colour.

SERICUM. Blackish, silky, with feet testaceous. Found in Germany.

COLLARE. Black, with the sides of the thorax and abdomen red. Found in New Holland.

TRITON, in *Ancient Geography*, a marsh of Africa Propria, in which is the source of a river of the same name; furnished by Pliny Pallantias. This lake was 20 leagues in length from E. to W., and about six leagues wide; and it contained several islets. The mouth of the river was in the Mediterranean, in the gulf of the Lesser Syrtis. Herodotus mentions this river.—Also, a river of the isle of Crete. Near its source was a temple, dedicated to Minerva Tritogenia.—Also, a town of Africa, in Libya.—Also, a town of Greece, in Bœotia.

TRITON, in *Mythology*, a sea demi-god, held by the ancients to be an officer, or trumpeter, of Neptune, attending on him, and carrying his orders and commands from sea to sea.

The poets and painters represent him as half man, half fish, terminating in a dolphin's tail, and bearing in one hand a sea-shell, which served him as a trumpet.

Some of the ancients make him the son of Neptune, and the nymph Salacia; Hesiod, of Neptune and Amphitrite; Numenius, in his book De Piscationibus, makes him the son of Oceanus and Tethys; and Lycophron, the son of Nereus.

But though Hesiod and the mythologists only speak of one Triton, the poets have imagined several; giving some of them for trumpeters to all the sea-gods, particularly to Neptune and Venus; accordingly they were frequently introduced on the ancient theatre, and in the naumachia.

In effect, the Tritons not only officiated as trumpeters in Neptune's retinue, but were also supposed to draw his chariot, *i. e.* the sea-shell in which he rode over the waters: as we find in Virgil, *Æneid*, x. 209; Ovid, *Metam.* l. 10. 333; and on a medal of Claudius.

The fable of the Tritons, no doubt, took its rise from what are called the sea-men, or mermen; for that there are such things as sea-men has been believed in many ages. See *MERMAID* and *SEA-COW*.

The poets ordinarily attribute to Triton the office of calming the waves, and of making tempests cease. Thus, in the first of the *Metamorphoses*, we read that Neptune, desiring

to recall the waters of the deluge, commanded Triton to found his trumpet, at the noise of which the waters all retired.

Thus Ovid :

“ Cæruleum Tritona vocat, conchaque fonanti
Inspirare jubet, fluctusque et flumina signo
Jam revocare dato, &c.”

And Virgil :

“ Huc venit immanis Triton, et cærulea concha
Exterrens freta : cui laterum tenus hispida nauti
Frons hominem præfert, in Pristini definit alvus.”

Of Triton, as connected with the Argonautic expedition, Herodotus gives the following account. Speaking of the river Triton, which discharged itself into the lake Tritonis, where was an island called Phla, he says it was believed that the island must have been inhabited by the Lacedæmonians ; and he adds, it was reported by tradition, that when Jason had built at the foot of mount Pelion the ship which was called Argo (see ARGONAUTIC), and had stowed in it a hecatomb, and a tripod of brass, he undertook the voyage to Delphi by the tour of Peloponnesus ; and that, taking his route by the promontory of Malea, the north wind drove him upon Libya, where he found his ship run aground in the lake Tritonis ; and while he was endeavouring to extricate himself, a Triton appeared to him, and told him, that if he would give him the tripod he had in his ship, he would shew him how to get clear of this danger ; upon which Jason, agreeing to the proposal, gave him the tripod, which the Triton laid up in his temple, and foretold Jason and his crew, that when one of their descendants should carry off that tripod, it was fixed by fate that there should be one hundred Greek towns built upon the lake Tritonis ; in fine, that the Libyans being informed of this oracle, kept the tripod carefully concealed. The explication given of this fable is, that the Triton who appeared to the voyagers under a human form was a prince who reigned in that place, whom Pindar and his scholiast name Eurypilus. He gave good instructions to the heroes to avoid the sand-banks which lie in and about the Syrtes. This, says Banier, is the whole mystery ; the prediction which they put in his mouth having only been invented after the event ; that is, after the Greeks were settled in that part of Africa, and had built cities there. Our heroes, in gratitude for the signal service done them by Eurypilus, made him a present of the above-mentioned tripod. Diodorus, who also speaks of it, says there was upon the tripod an inscription in very ancient characters, and adds, that it was preserved to the latest times, among the people called Hesperitans, in Cyrenaicum.

TRITON, in the *Linnean System of Natural History*, a genus of the Mollusca order of worms ; the characters of which are, that the body is oblong, the tongue spiral, the tentacula twelve in number, and bipartite, six on each side, and the three hinder ones cheliferous. There is one species, viz. *T. littoreus*, which is found in the clefts of submarine rocks.

TRITON *Avis*, in *Ornithology*, a name under which Nie-remberg has described a bird of the West Indies, famous for its fine singing, and found in Hispaniola : it is said to have three different notes, and to be able to give breath to fowls of all three kinds at the same time : it is also said to be a very beautiful bird. Ray.

TRITONEA, or TRITOGONIA, in *Mythology*, a name given to Minerva, derived from the river Triton, near which she was born, and where she had been seen for the first time.

TRITONIA, in *Botany*, was so named by Mr. Ker, late Gawler, from *triton*, a weather-cock, in allusion to the variable direction of the stamens of the different species.—Ker in Sims and König's *Ann. of Bot.* v. 1. 227. Dryand. in *Ait. Hort. Kew.* v. 1. 90.—Class and order, *Triandria Monogynia*. Nat. Ord. *Enfatae*, Linn. *Irides*, Juss.

Gen. Ch. *Cal.* Spatha inferior, shorter than the corolla, of two oblong, membranous, pointed or toothed valves. *Cor.* of one petal, superior ; tubular at the base ; swelling in the throat ; limb divided to its very bottom into six, nearly regular and equal, segments, each of which, in the lower part, is more or less contracted into a claw. *Stam.* Filaments three, inserted into the tube, unconnected with the throat, variously directed, curved, shorter than the limb ; anthers oblong, curved. *Pist.* Germen roundish ; style thread-shaped, erect ; stigmas three, linear, recurved, spreading. *Peric.* Capsule roundish-ovate, membranous, tumid, of three cells and three valves. *Seeds* numerous, globose, simple, neither winged nor pulpy, rather small.

Eff. Ch. Spatha of two membranous valves. Corolla tubular ; its limb in six deep segments, contracted at the base, nearly regular. Stigmas three, narrow, spreading. Capsule roundish-ovate. Seeds simple, globose.

The characters of this genus are confessedly very difficult to define ; yet its intelligent author considers the species to be easily discernible by their common habit. The *corolla* in some is quite regular, in others more or less irregular, yet never in a very strong or evident degree. “ The *bulb* is solid, ovate and depressed, or roundish with a point ; its coats reticulated ; the outermost spotted. *Leaves* grassy, broadish ; very rarely crisped at the edges. *Flowers* several, bell-shaped, regular, reversed, the segments broad, the tube short, with an inflated spreading throat ; in others the corolla is of a smaller size, with a longer tube, a turbinate throat, the segments oblong, little dilated, disposed so as slightly to imitate a two-lipped flower, one of them broader than the rest ; in others again the segments are linear-oblong, spreading in a wheel-shaped manner, equal, the throat but slightly dilated, and the tube very long. The *stamens* of the two-lipped species are ascending, of the regular reversed ones erect ; *anthers* in the wheel-shaped flowers contiguous, incumbent.”

1. *T. crispa*. Curled-leaved Tritonia. Ait. n. 1. Curt. Mag. t. 678. (*Gladiolus crispus* ; Willd. Sp. Pl. v. 1. 210. Jacq. Ic. Rar. t. 267. Thunb. Diss. n. 7. t. 1. f. 2. Andr. Repof. t. 142.)—Leaves wavy and crisped at the margin. Segments of the corolla flat, shorter than the tube, not quite uniform.—Native of the hills of *Rode Sand* and *Pikelberg* at the Cape of Good Hope, flowering from October to December. *Thunberg*. Sent by Mr. Masson in 1787 to Kew garden. In England it flowers in the spring, or summer. The shortish, many-ribbed, wavy, but not fringed, *leaves* mark this species. The *flowers* are spiked, not numerous, of a tawny flesh-colour ; the tube often red, two inches long, curved ; three lower segments of the limb furnished with a deep-red central stripe.

2. *T. viridis*. Green-flowered Tritonia. Ait. n. 2. Curt. Mag. t. 1275. (*Gladiolus viridis* ; Ait. ed. 1. v. 3. 481. Vahl Enum. v. 2. 96. Ker Ann. of Bot. v. 1. 231.)—Stalk triangular, with membranous angles. Segments of the corolla lanceolate, shorter than the tube ; five of them ascending ; one deflexed.—Found at the Cape by Mr. Masson, who sent it to Kew garden, in 1788, where it blooms in July. The *leaves* are linear-lanceolate, with a strong mid-rib. *Spike* zigzag. *Flowers* not numerous, pale green, with a purplish tinge, especially in the tube, and

TRITONIA.

at the back of the limb. We should suppose these flowers, by their colour, to be fragrant at night.

3. *T. striata*. Straked Tritonia. Ker Ann. of Bot. v. 1. 228. (Gladiolus striatus; Jacq. Ic. Rar. t. 260. Willd. Sp. Pl. v. 1. 210. Vahl Enum. v. 2. 89.)—Leaves wavy, crisped, and fringed. Three alternate segments of the corolla crisped; all lanceolate, with long claws.—Native of the Cape of Good Hope; not as yet known in the English collections. The leaves are alternate, lanceolate, glaucous, many-ribbed, minutely fringed. Flowers light blue, prettily variegated with white, yellow, and crimson; their tube hardly so long as the limb.

4. *T. rosea*. Trumpet-flowered Tritonia. Ait. n. 3. (*T. capensis*; Curt. Mag. t. 618, and t. 1531. Gladiolus roseus; Jacq. Ic. Rar. t. 261. Willd. Sp. Pl. v. 1. 217. Vahl Enum. v. 2. 110.)—Sheath taper-pointed. Upper segment of the corolla broadest; throat funnel-shaped; tube twice the length of the limb.—Native of the Cape. Sent to Kew by Mr. Masson in 1793, where it flowers in June and July. The stem is leafy. Leaves green, many-ribbed, taper-pointed. Flowers spiked, three or four inches long, flesh-coloured, or buff with purplish veins; the three lower segments striped with crimson at the base. The corolla however varies in size as well as colour; see the figures cited.

5. *T. longiflora*. Long-flowered Tritonia. Ait. n. 4. (*Ixia longiflora*; Willd. Sp. Pl. v. 1. 203. Redout. Liliac. t. 34. Curt. Mag. t. 256; and t. 1502, *Tritonia*. Gladiolus longiflorus; Linn. Suppl. 96.)—Segments of the corolla regular, linear-oblong, obtuse; tube thread-shaped, angular and slightly dilated at the top; four times as long as the limb, and six times as long as the nearly equal valves of the spatha.—Native of the Cape. Introduced by Mr. Masson in 1774, and now a general favourite in our greenhouses, flowering in the spring. The very long and slender, regular, buff-coloured flowers, often tinged with a rose-colour, sufficiently discriminate this elegant species. The stalk is very tall and slender, naked except at the lower part.

6. *T. rochenfsis*. Bending-flowered Tritonia. Ker in Curt. Mag. t. 1503. Ait. Epit. 375. (*Ixia paniculata*; De la Roche Diff. 26. t. 1, according to Mr. Ker. Gladiolus longiflorus; Thunb. Diff. n. 22.)—Segments of the corolla regular, elliptical, concave, scarcely twice as long as the slender, deflexed tube. Stamens and style prominent.—Imported from the Cape in 1809, by Messrs. Lee and Kennedy. Nearly akin to the last, to which we should, but for Mr. Ker's authority, have referred the branched variety, figured by De la Roche.

7. *T. lineata*. Pencilled Tritonia. Ker Ann. of Bot. v. 1. 228. Ait. n. 5. (Gladiolus lineatus; Salisb. Prodr. 40. Curt. Mag. t. 487. Redout. Liliac. t. 55. *Ixia squalida* β; Willd. Sp. Pl. v. 1. 206.)—Limb of the corolla thrice the length of the curved tube, bell-shaped; its upper segment largest: outer ones abrupt.—Native of the Cape. Sent to Kew by Mr. Masson in 1774, but more recently introduced into our greenhouses by way of Holland, flowering in May. The stem is two feet high. Leaves green, with a solitary mid-rib. Spike drooping before the flowers open, which are large, of a straw-colour, tinged with orange, and marked with fine, dark, parallel and branching, veins. Each of the three lower segments has a yellow internal spot near the base. The tube, about half an inch long, scarcely equals the length of the spatha.

8. *T. securigera*. Dwarf Copper-coloured Tritonia. Ker Ann. of Bot. v. 1. 228. Ait. n. 6. (Gladiolus securiger; Willd. Sp. Pl. v. 1. 219. Vahl Enum. v. 2. 109. Curt. Mag. t. 383. *Montbretia securigera*; Redout. Liliac. t. 53.)

—Limb of the corolla twice the length of the tube; its upper segment largest; each of the three lower bearing at its base an erect, compressed prominence. Outer valve of the spatha blunt, with three teeth.—Found at the Cape by Mr. Masson, who sent it to Kew in 1774. It flowers freely in May and June, and increases by offsets. The stem is but a span high. Leaves two-ranked. Flowers tawny; the three lower segments yellow at the base, with a deeper hue of red about the middle.

9. *T. flava*. Yellow Tritonia. Ker Ann. of Bot. v. 1. 228. Ait. n. 7. (Gladiolus flavus; Willd. Sp. Pl. v. 1. 218. Vahl Enum. v. 2. 110.)—Limb of the corolla twice the length of the tube; each of the three lower segments bearing at its base an erect, compressed prominence. Outer valve of the spatha pointed.—Found at the Cape by colonel William Paterfon, who sent it to the famous countess of Strathmore in 1780. The somewhat broader leaves, pointed spatha, and uniform deep yellow of the corolla, are said in the first edition of *Hort. Kew.* to distinguish this from the last.

10. *T. refracta*. Bent-spiked Tritonia. Ker Ann. of Bot. v. 1. 228. (Gladiolus refractus; Jacq. Ic. Rar. t. 241. Willd. Sp. Pl. v. 1. 215. Vahl Enum. v. 2. 109.)—Spikes bent backwards. Flowers erect, reverfed. Limb of the corolla thrice the length of the tube, bell-shaped, two-lipped; its three lower segments smallest.—Native of the Cape. We have not heard of it in any English garden. The stem is branched, singularly bent, scarcely rising above the long, erect, two-ranked leaves. Spikes horizontal, of several flowers, whose three upper segments are purplish, lower yellow or orange.

11. *T. squalida*. Sweet-scented Pink Tritonia. Ker in Curt. Mag. t. 581. Ait. n. 8. (*Ixia squalida* α; Willd. Sp. Pl. v. 1. 206. Vahl Enum. v. 2. 73. *I. hyalina*; Redout. Liliac. t. 87.)—Limb of the corolla bell-shaped, regular; its segments rounded, transparent in the margin below, close together; one of them gibbous at the base.—Native of the Cape. Sent to Kew by Mr. Masson, in 1774. The stalk is naked, ascending, much taller than the leaves, which are many-ribbed, equitant; the outer ones bluntish. Spike reclining, of about half a dozen large, very sweet-scented flowers, whose tube is scarcely half the length of their limb, and whose colours are a mixture of dull pink, with a dirty pellucid white, like wet paper. The claw of each segment is red, with a distinctly defined white membranous border, that of the three innermost segments lying over the others. Style longer than the stamens, as in the two following. The depreciating name of *squalida* is surely not suitable to this elegant species.

12. *T. fenestrata*. Open-flowered Orange Tritonia. Ker in Curt. Mag. t. 704. Ait. n. 9. (*Ixia fenestrata*; Jacq. Ic. Rar. t. 289.)—Limb of the corolla funnel-shaped, regular; its segments obovate, distant, transparent in the margin below. Stamens and style reclining.—Native of the Cape, said to have been imported in 1801, by Mr. W. Salisbury, of the Sloane-street Botanic Garden. It blossoms in the spring, and differs from the last in having scentless flowers, of a deep rich orange-colour; the membranous edges of their segments pink. The corolla is also differently shaped, as our specific character expresses. The tube is short, scarcely exceeding the spatha. Stem often branched.

13. *T. crocata*. Saffron-coloured Membranous Tritonia. Ker Ann. of Bot. v. 1. 228. Ait. n. 10. (*Ixia crocata*; Linn. Sp. Pl. 52. Willd. Sp. Pl. v. 1. 205. Vahl Enum. v. 2. 73. Thunb. Diff. n. 20. Curt. Mag. t. 184. Linn. fil. Pl. Rar. 14. t. 7.)—Limb of the corolla funnel-shaped, regular; its segments obovate, close together, transparent

in their lower half.—Native of the Cape, and one of the first of its tribe cultivated in the gardens of Europe, where it has always been a great favourite, flowering in spring. The brilliant orange-colour of its *corolla*, contrasted with the membranous transparency of the lower half of its segments, all close together, has a very striking appearance. We have some doubts whether Miller's t. 239. f. 2. be not rather taken from the foregoing species, which in the shape and disposition of its segments that figure most resembles.

14. *T. deusta*. Tall Copper-coloured Tritonia. Ker in Curt. Mag. t. 622. Ait. n. 11. (*Ixia deusta*; Willd. Sp. Pl. v. 1. 205. Vahl Enum. v. 1. 74. *I. crocata*, nigro maculata; Andr. Repof. t. 134. *I. miniata*, nigro maculata; Redout. Liliac. t. 89.)—Limb of the corolla regular, widely spreading; its segments imbricated, obovate, solid throughout; the three outermost gibbous underneath. Tube rather shorter than the spathe.—Found at the Cape of Good Hope, by Mr. Masson, who sent it to Kew in 1774. Allied to the two last, but taller, with still deeper orange-coloured flowers, whose segments have no marginal transparency. The three outermost have a sort of hollow, or depression, just above the base, marked with a very dark spot, and prominent beneath. Jacquin's *Ixia miniata* is taken by Vahl for a variety of the present, destitute of spots; but the figure more resembles our *fensetrata*, n. 12, in the shape and position of the segments of the *corolla*, though wanting their membranous margin. See the following.

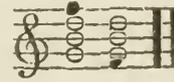

15. *T. miniata*. Tall Late-flowering Tritonia. Ker in Curt. Mag. t. 609. Ait. n. 12. (*Ixia miniata*; Jacq. Hort. Schoenbr. v. 1. 10. t. 24.)—Limb of the corolla funnel-shaped, somewhat two-lipped, reversed; its segments obovate, close, solid throughout. Tube the length of the spathe. Found at the Cape of Good Hope, by Mr. Masson, who sent it to Kew garden in 1795. It flowers in August, and is the tallest and strongest of this genus, having a branched stem, eighteen inches or more in height. The flowers are scentless, of a rather dull orange-colour; their three lower segments, (turned uppermost by the reversed posture of the flower,) marked at the base with an oblong yellow spot, indicating a degree of irregularity in the *corolla*. This circumstance does not appear in Jacquin's figure, above quoted, where all the segments have a similar mark. How far such characters are variable in this difficult tribe, requires a longer experience, and more intimate practical acquaintance with it, than we can boast, to decide with certainty. More has been done by Mr. Ker than any other person, to clear up the subject; but a wider range of practical observations and experiments is still wanted, in order to a correct understanding of what makes a permanent species. In the perception of natural genera, this botanist seems to us to display great abilities, whether their technical limitations be, as yet, perfected or not. With respect to colour, and even proportion of parts, in the flowers of this family, Jacquin's reputed varieties of *Ixia maculata*, in the 1st vol. of his *Hortus Schoenbrunensis*, are sufficient to drive any botanist to despair.

TRITONUS, in *Music*, a dissonant interval, composed of three tones, two major and one minor; and which is, in practice, called the sharp 4th. This interval on keyed instruments is equal in nominal semitones to the false 5th: the numerical ratios, however, are not equal; that of the tritonus being only 32 to 45; which is occasioned by the tritonus having only one tone major instead of two semitones major, which the false 5th contains. See FIFTH.

But the most considerable difference between the false 5th and the sharp 4th is, that the latter is a major discord, and

that the parts are resolved by separation; and whereas the other is a minor discord, and resolved by approximation of the two parts.

The chord of the sharp 4th is only an inversion of the chord of the ♯ to the sharp 7th of the key, by giving the discord to the base.

TRITOPATORIA, τριτοπατορεια, in *Antiquity*, a solemnity in which it was usual to pray for children to the θεοι γενεθλιας, or *gods of generation*, who were sometimes called τριτοπατορες.

TRITORIUM, in *Chemistry*, a vessel generally made of glass, used for the separation of liquors of different densities, as oil and water. Its largest diameter is in the middle, and it terminates with an aperture at each of the two extremities. The lower extremity, the aperture of which is very narrow, is dipped into the mixed liquor, and when it is sufficiently filled, the upper orifice is to be stopped close, by pressing the thumb upon it, by which means the liquor contained will not run out at the lower aperture, when the vessel is raised from the mixed liquor. When the fluids of which this liquor consists have perfectly separated according to their respective densities, by removing the thumb, the heavier fluid will run out at the lower extremity, and the separation will be thus effected. Macquer's Dict. Chem.

TRITTAU, in *Geography*, a town of the duchy of Holstein; 20 miles E. of Hamburg.

TRITTYARCHI, τριττυαρχοι, among the *Athenians*, were magistrates who had the command or government of the third part of a tribe. See PHYLARCHUS.

TRITUM PROMONTORIUM, *Sebba-Rous*, in *Ancient Geography*, a promontory of Africa, at the west entrance of the gulf of Numidia; called by Pomponius Mela *Metagonium*.

TRITURATION, TRITURA, or *Tritus*, formed from *triturare*, to *thrust*, of *tero*, I wear, rub, or grind, in *Pharmacy*; grinding; the act of reducing a solid body into a subtile powder, called also *levigation*, *pulverization*, &c.

The trituration of woods, barks, minerals, and other hard and dry bodies, is performed by the rotatory motion of a pestle in metalline, glass, agate, or Wedgwood-ware mortars; and in mills, by means of large rollers of hard stone.

The same term is also applied to the comminuting, bruising, and dividing of humid matters into little parts. The trituration of moist bodies is performed in marble or stone mortars, with pestles of wood, glass, ivory, &c. The word trituration is generally applied to denote the division that is made of several bodies together, to unite them with each other; as, e.g. the extinction of mercury in the operation of *Æthiops mineral*, and others similar.

Trituration, Boerhaave observes, has a wonderful force to dissolve some bodies, and will render them as fluid as if they were fused by the fire. Thus if you grind the powder of myrrh and salt of tartar together, they will dissolve each other. By rubbing new and bright filings of iron in a mortar, with double their weight of clean sulphur, the iron will be dissolved, so as by diluting it with water to afford the vitriolum Martis.

Gold long ground in a mortar with salt of tartar, will yield a kind of tincture; and rubbed with mercury in a mortar of glass, it entirely dissolves into a purple liquor, and becomes a most powerful medicine.

Dr. Langelotte has written a curious treatise of the great effects of trituration in chemistry, and describes a peculiar way

way he employed to grind gold, by which, he says, he could render it as fluid as the fire does, and make an aurum potable by the bare motion of a mill.

This author, in the *Philosophical Transactions*, mentions his way of grinding gold, and describes two engines, or philosophical mills, for the purpose; with one of which, in the space of fourteen natural days, he reduced a leaf of gold to a dusky powder, and, putting it into a shallow retort, placed in a sand-heat, he thence obtained, by gradually increasing the fire, and giving a strong one at last, a very few red drops, which, digested *per se*, or with tartarized spirit of wine, afforded a pure and genuine aurum potable.

The success of this operation the doctor attributes, in a great measure, to the salt of the air, which, in grinding, plentifully mixes and unites itself with the gold.

It has been observed, that there appears to be an error in reducing vegetable matter to the state of impalpable powder; as in this state, both during the process of grinding and afterwards, the air and light act powerfully upon them, and produce changes, which, although they be not well understood, yet appear to alter the medicinal virtues of the substances.

TRITURATION is also used, in *Medicine*, for the action of the stomach on the food, by which it is fitted for nutriment. See DIGESTION.

TRIVADI, in *Geography*, a town of Hindoostan, in the Carnatic. The pagoda forms a citadel; 23 miles S.W. of Pondicherry. N. lat. 11° 42'. E. long. 79° 45'.

TRIVANDOOR, a town of Hindoostan, in Madura; 16 miles N. of Nattam.

TRIVATOOR, a town of Hindoostan, in Marawar; 20 miles N. of Trumian.

TRIVATORE, a town of Hindoostan, in the Carnatic; 6 miles S.E. of Arcot.

TRIVELAWARY, a town of Hindoostan, in the Carnatic; 12 miles N. of Trichinopoly.

TRIVEMBAR, a town of Hindoostan, in Marawar; 27 miles N. of Ramanadporum.

TRIVENALORE, a town of Hindoostan, in the Carnatic; 13 miles N. of Tiagar.

TRIVENI, a term in the Sanscrit tongue, said to mean a triad of rivers; a junction of three of the most important streams of Hindoostan being pre-eminently distinguished by this appellation. These are the Yamuna or Jumna, the Ganga or Ganges, and the Sarafwati; being, in the mythological mysticisms of the Hindoos, personifications or symbols of their three great goddesses, Lakshmi, Parvati, and Sarafwati.

The Hindoo poets, as indeed all their writing priests or philosophers, and even mathematicians, seem to be, call the Triveni the *three plaited locks*; and elegantly wreath this idea into many pleasing allegories. See RADHA.

The spot of junction of the three river-goddesses in question, near Illahabad in Bengal, is extensively esteemed very sacred; and pilgrims resort thither from distant regions to bathe in the purifying triune stream. Of this we have taken sufficient notice under our article JUNCTIONS; and under that of SUICIDE, an account is given of meritorious self-destruction at this revered spot. See also SATI.

The Triveni has been noticed as a fruitful source of poetical allusion.

We cannot refrain from briefly alluding, in this place, to some supposed coincidences in Irish and Indian mythology, of which see something under our articles SOMA and SURYA. And we allude to them here in view to the opportunity of saying that poetical traditions existed, and perhaps still exist, in Ireland of a mythological origin and junction of three

rivers, reminding us strongly of the Indian Triveni. The Irish rivers appertain to the county of Kilkenny; and our own Spenser has described them so exactly in the style of Eastern hyperbole, that we must invite the reader to turn to our article KILKENNY, where he will find an extract from Spenser descriptive of the mythological origin and junction of the Irish Triveni, that may be almost suspected as of Oriental origin.

TRIVENTO, in *Geography*, a town of Naples, in the county of Molise, the see of a bishop, immediately under the pope; 11 miles N. of Molise.

TRIVERBIAL DAYS, in the *Roman Calendar*, denoted judicial days, or such as were allowed to the prætor for hearing of causes.

They were otherwise called *dies fasti*, in quibus licebat prætori *fari tria verba, do, dico, addico*.

Of these court-days, the Romans had only twenty-eight in the whole year; whereas with us, one-fourth of the year is term-time, in which three courts constantly sit for the dispatch of business; besides the close attendance of the court of chancery for determining suits in equity, and the numerous courts of assize and nisi prius that sit in vacation for the trial of matters of fact.

TRIVESPER, in *Mythology*, one of the epithets of Hercules.

TRIVET, NICHOLAS, in *Biography*, an English historian of the thirteenth century, was the descendant of a respectable family in Norfolk. Having entered among the Dominicans in London, he studied at Oxford and at Paris; and at the latter place collected from books on the history of the Normans and Franks such passages as related to the English nation, and supplied their defects from the best accounts which he could procure in his own country. In this way he composed his "Annals of the Six Kings of England sprung from the Counts of Anjou," introducing a detail of the most remarkable events that occurred under the Roman pontiffs, the emperors, the kings of France, and other contemporary princes, together with an account of learned men, particularly of his own order, and intending that his work should be a continuation of that of William of Malmsbury. He also wrote various other works, partly containing illustrations of ancient authors, but none of them were printed, except his commentary on St. Augustine's book "De Civitate Dei." Soon after his return from France he became prior of a monastery in London, where he died in 1328, at the age of nearly 70 years. His historical work has passed through several editions under different titles, for which we refer to Aikin's Gen. Biog.

TRIVIAL NAMES, *Nomina Trivialia*, in *Botany*, were first used by Linnæus in his dissertation entitled *Pan Suecus*, published at Upsal in 1749. The plants there enumerated, with a view to their economical qualities as the food of domestic cattle, are each designated by its generic and specific name. The same measure was adopted in the first edition of the *Species Plantarum*, published four years after, and was extended subsequently to every department of natural history. Linnæus originally intended his specific definitions to be used as names; but however compendiously such might be constructed, they were soon found totally unmanageable for that purpose. He therefore adopted the method of Rivinus, of mentioning each plant by a sort of appellative, in addition to its generic name; not intending, like Rivinus, that such appellative should comprehend the specific definition of the plant, which Linnæus knew to be impossible. That no such expectation might be formed of these names, and that students might not too-much rely on them, as any thing like definitions, he termed them *nomina trivialia*, as serving for common

common every-day use. They are now however usually called specific names, in contradistinction to generic ones; the original specific names of Linnæus being at present more properly termed specific definitions, or differences. Trivial names may contain the essential characters of the several species, as *Sagina procumbens* and *apetala*, in which case they are but a repetition, or an anticipation, of the specific differences. They more usually serve to express some concomitant circumstance, tolerably certain as a distinctive mark of each species, though not in the specific character, such as *annua*, *perennis*, *fruticosa*; or *alba*, *lutea*, *rubra*, &c. Former appellations of each species, such as *Hydropiper* and *Periscaria*, especially if the plants be remarkable for their medical or economical uses, as *Cinnamomum*, *Rhabarbarum*, *Alyssimum*, *Napus*, *Rapa*, &c. are very commodious, though injudiciously laid aside by some reformers. These must always begin with a capital letter, being proper names, not required to agree in gender with the generic name. In Zoology, such appellations of species as we have last mentioned are peculiarly useful, and generally preferred by Linnæus to all others.

TRIVICARY, in *Geography*, a town of Hindoostan, in the Carnatic; 20 miles S.E. of Gingee.

TRIVICUM, TRIVICO, in *Ancient Geography*, a small town of Italy, on the frontiers of the Hirpini and of Apulia. It lay on the Trajan way, at a distance E. of Benevento.

TRIVIDHA, in *Mythology*, a name of the Hindoo goddess Parvati. The word is said to mean three-fold, the Hindoo goddess corresponding in many points with the triple Hecate of the Greeks.

TRIVIER, in *Geography*, a town of France, in the department of the Sesia; 6 miles N.E. of Biella.

TRIVIGILLO BAY, a bay in the gulf of Honduras, on the coast of Mexico.

TRIVIGNANO, a town of Italy, in the Trevisan; 7 miles W.N.W. of Treviso.

TRIVIKERA, or TRIVIKRAMA, in *Mythology*, a name of the Hindoo god Vishnu. It means the three-stepper, alluding to his having in one of his avatars, or incarnations, deceived a powerful sovereign into a promise of giving him all he could cover in three steps.

TRIVIUM, a term invented in the times of barbarism to express the three sciences that were first learned in the schools, viz. grammar, rhetoric, and logic; and the schools in which these sciences were taught were called *triviales*.

The *quadrivium*, to which the scholar next proceeded in his way to the summit of literary fame, comprehended the four mathematical sciences, viz. arithmetic, music, geometry, and astronomy.

TRIUMFETTA, in *Botany*, named by Plumier, serves to commemorate John Baptist Triumfetti, of Bologna, doctor in medicine and philosophy, and lecturer at the botanic garden of Rome, which was under his direction. He published there, in 1685, a thin quarto volume entitled *Observationes de ortu ac vegetatione plantarum*, including descriptions and engravings of several new species. This is an able work, though more frequently quoted for its figures than its philosophy; a very common case. The author published in 1703 a refutation of some criticisms that had appeared against his book. He died in 1707. His brother, Lælius Triumfetti, likewise professor of botany at Rome, is said to have been well skilled in the knowledge of plants, though he does not appear as an author.—Linn. Gen. 239. Schreb. 321. 832. Willd. Sp. Pl. v. 2. 853. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 3. 145. Plum. Gen. 40. t. 8. Juss. 290. Lamarek Illustr. t. 400. Gært. t. 111. (*Bartramia*; Linn. Gen. ed. 5. 184. Lamarek Illustr. t. 400. Gært.

t. 111.)—Class and order, *Dodecandria Monogynia*. Nat. Ord. *Columniferae*, Linn. *Tiliaceae*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of five lanceolate, deciduous leaves, with a bristly point just below the summit. *Cor.* Petals five, linear, obtuse, erect, concave, bent backward just above the base. *Stam.* Filaments sixteen, equal, ascending, awl-shaped, straight, the length of the corolla; anthers simple, roundish, of two cells. *Pist.* Germen superior, roundish; style the length of the stamens; stigma in two acute divisions. *Peric.* Capsule globose, covered all over with hooked prickles, separating into four cells. *Seeds* one or two in each cell, erect, convex at the outside, angular at the inner.

Eff. Ch. Calyx of five leaves, deciduous. Petals five. Capsule prickly, separating into four parts.

Obs. The supposed want of a calyx in the original *Triumfetta* is a manifest error, subsequently corrected by Linnæus; as is likewise, if we mistake not, the dorsal point attributed to each petal. Yet Gærtner uses the former character to strengthen the difference between *Triumfetta* and the original *Bartramia*, though surely every principle of character and habit proclaim their identity. *BARTRAMIA* therefore, is now retained as the name of a very distinct and elegant genus of Mosses. See *MUSCI*.

1. *T. Lappula*. Bur Triumfetta. Linn. Sp. Pl. 637. Willd. n. 1. Ait. n. 1. (*T. fructu echinato racemoso*; Plum. Ic. 253. t. 255. *Lappula bermudensis althæoides* (spicata, fructu orbiculari majore; Pluk. Phyt. t. 245. f. 7.)—Leaves heart-shaped at the base. Calyx soon deciduous. Flowers in densely whorled aggregate spikes.—Native of the West Indies and South America. A shrub four or five feet high, flowering about July and August in our stoves, where it was cultivated in Miller's time, but is seldom much noticed, the yellow flowers being small and inconspicuous. The leaves are stalked, alternate, several inches broad, roundish, toothed, downy, with three or five shallow acute lobes. Capsules the size of a pea, armed with prominent hooked prickles, which stick to the coats of animals, and are widely dispersed, each capsule splitting when ripe into four parts, lodging solitary seeds. The spikes are terminal, several together, alternate.

2. *T. glandulosa*. Glandular Triumfetta. Fork. Cat. Fl. Arab. Fel. 112. n. 297. Vahl Symb. v. 3. 62. Willd. n. 2.—Leaves ovato-lanceolate; downy and hoary beneath; their lower ferratures more or less glandular. Flowers axillary, from the upper leaves.—Gathered by Forskall in the middle region of the hills of Arabia Felix. Branches woody, round, villous. Leaves on short stalks, numerous, three inches long, gradually smaller upward, clothed on both sides with soft starry hairs, but greenest on the upper; entire at the base, but otherwise ferrated. Stipules awl-shaped.

3. *T. Bartramia*. Currant-leaved Triumfetta. Linn. Sp. Pl. 638. Willd. n. 3. Ait. n. 2. (*Lappago amboinica*; Rumph. Amboin. v. 6. book 10. 59. t. 25. f. 2. *Lappula bengalensis tetraspermos, ribelii folio, echini orbicularibus ad foliorum exortus plurimis simul sessilibus*; Pluk. Phyt. t. 41. f. 5.)—Leaves acutely lobed and toothed; entire at the base; roughish on both sides. Flowers racemose, partly aggregate; the lower ones axillary.—Native of the East Indies. The leaves are roughish to the touch, not downy. We are not certain of having seen authentic specimens, Linnæus having been very superficially acquainted with the species of this genus. Our's has but four seeds in each capsule.

4. *T. velutina*. Velvet-leaved Triumfetta. Vahl Symb. v. 3. 62. Willd. n. 4.—Leaves roundish-ovate, slightly lobed,

lobed, pointed; softly downy on both sides. Stem erect. —Native of the island of Mauritius. We have a specimen from thence, given by Thouin to the younger Linnæus, which we conceive must be Vahl's plant, though, being in seed, the *inflorescence* has a racemose appearance, the floral leaves having perhaps fallen off. The *stem* is round, downy. *Leaves* alternate, stalked, two or three inches long, more or less evidently five-ribbed, unequally ferrated, clothed with soft starry hairs on both sides, but much the most copiously on the under; the base is undivided, not heart-shaped. *Stipulas* lanceolate, tapering, fringed, of a rusty hue. *Flowers* from the bosoms of the upper leaves, according to Vahl. In our specimen, which answers in other respects to his description, the *capsules*, smaller than a pea, form compound, terminal, interrupted *clusters*; their partial stalks aggregate, deflexed, from a quarter to half an inch long. The prickles of each *capsule* are copiously barbed with minute, reflexed, pale hairs.

5. *T. procumbens*. Procumbent Triumphetta. Forst. Prodr. 35. Willd. n. 5. — Leaves roundish-heart-shaped, obtuse, slightly three-lobed; very downy beneath. Stem procumbent.—Native of the Society isles. Our specimen is from Otaheite, gathered by the younger Forster. The *stem* is woody, round, downy and hoary; the younger *branches* leafy. *Leaves* about the size and shape of those of a gooseberry, bluntly ferrated, usually three-lobed, on long downy stalks; their upper side green, nearly even, clothed with feathered, simple, deciduous hairs; the under paler, covered with soft starry hairs, and reticulated with prominent veins. Of the *flowers* or *fruit* nothing is mentioned, nor does the specimen before us shew traces of either.

6. *T. hirta*. Hairy-panicled Triumphetta. Vahl Symb. v. 3. 63. Willd. n. 6. — Leaves three-lobed, acute; smooth above. Panicle terminal, compound, hairy.— Found by Von Rohr, in the West Indian island of St. Martha. *Stem* shrubby. *Leaves* three or four inches in length and breadth, seven-ribbed, unequally ferrated; three or five of the lowermost ferratures glandular; the base rather heart-shaped; the extremity divided into three ovate, distant, pointed lobes: the under side is clothed with very minute starry pubescence, and its ribs with long scattered hairs. *Footstalks* most hairy when young. *Panicle* diffuse, with alternate, twice or thrice forked, branches, most hairy in the lower part. *Flowers* small, stalked, solitary at the forks of the panicle, but otherwise aggregate. *Calyx* hoary. Vahl.

7. *T. semitriloba*. Mallow-leaved Triumphetta. Linn. Mant. 73. Willd. n. 7. Ait. n. 3. Jacq. Amer. 147. Hort. Vind. v. 3. 41. t. 76. (T. n. 2; Browne Jam. 233.) — Leaves divided half way down into three lobes. Panicle terminal, compound, downy.—Native of the West Indies. Introduced at Kew in 1773, by John earl of Bute. It flowers in the stove in July. The *stem* is shrubby, bushy. *Leaves* clothed on both sides with fine, soft, silky hairs. *Flowers* yellow, not many together, in more or less compound terminal *panicles*. Browne says, the leaves, steeped for some time in water, give out a copious clear mucilage; and that the fibres of the bark serve, in the inland parts of Jamaica, to make ropes, &c. We do not by any means understand Linnæus's comparison of this species to *T. Lappula*. He had no authentic specimen of either.

8. *T. grandiflora*. Large-flowered Triumphetta. "Vahl Eclog. v. 2. 34." Willd. n. 8. — "Leaves ovate, undivided, somewhat heart-shaped, ferrated, rather hairy; the floral ones lanceolate. Branches hairy." — Native of the

island of Montserrat. *Corolla* twice or thrice as large as in any other species with which Vahl was acquainted.

9. *T. macrophylla*. Large-leaved Triumphetta. "Vahl Eclog. v. 2. 34." Willd. n. 9. — "Leaves ovate-heart-shaped, undivided, unequally ferrated, pointed, downy; glandular at the base." — Native of South America. Like *T. Lappula*, but having a *calyx*, Vahl judged it to be a different species. We have already expressed our disbelief of the want of a *calyx* in any species of this genus. Plumier distinctly represents one in his generic figures, taken from *T. Lappula* itself. The *macrophylla* is said to differ from what we shall next describe, in the shape, as well as downiness, of its *foliage*.

10. *T. rhombifolia*. Rhomb-leaved Triumphetta. Swartz Ind. Occ. 863. Willd. n. 10, misspelt. (*T. rhomboidea*; Jacq. Amer. 147. t. 90.) — Leaves rhomboid, slightly hairy; the uppermost ovate-lanceolate, nearly sessile. Flowers in axillary tufts. — Native of dry, waste, bushy places in Jamaica, and other parts of the West Indies. The *stem* is shrubby, two or three feet high, erect, branched, downy. *Leaves* contracted and entire at the base; the lower ones rhomboid, and somewhat hexagonal, an inch and half long, on *footstalks* nearly of their own length; all rugose and more or less hairy. *Flowers* pale, in axillary tufts, accompanying most of the upper or smaller leaves, each tuft of about three three-cleft flower-stalks. *Petals* with hairy claws, and five nectariferous glands at their base. *Capsule* of three single-seeded cells. Swartz.

11. *T. annua*. Annual Triumphetta. Linn. Mant. 73. Willd. n. 11. Ait. n. 4. (*T. foliis oblongo-ovatis, obtusè ferratis, petiolis longissimis*; Mill. Ic. v. 2. 199. t. 298.) — Leaves ovate, acute, ferrated, undivided; rarely three-lobed.—Native of the East Indies, flowering with us in August and September. Miller cultivated this for curiosity; but it has nothing to excite popular admiration. The *root* is annual. *Leaves* three or four inches long, on long stalks; but it does not appear from Miller's description, whether they are smooth, downy, or rough. *Flowers* small, deep yellow, in tufts at the ends of the branches; sometimes with only four *petals* and eight *stamens*. *Capsule* of four single-seeded cells.

TRIUMFETTA, in Gardening, furnishes plants of the shrubby and herbaceous kinds; among which the species cultivated are, the prickly-seeded triumphetta (*T. lappula*), and the annual triumphetta (*T. annua*).

Method of Culture.—These plants are increased by seeds, which must be procured from their native places, and be sown on a hot-bed, or in pots plunged in the bark-bed of the stove: when the plants have one or two inches growth, they should be removed into separate pots, re-plunging them in the bark-bed till well re-rooted.

They afterwards require to be kept constantly in the stove, or hot-house, and to have the management of other ligneous plants of the stove kind.

They produce variety in stove collections.

TRIUMPH, TRIUMPHUS, a ceremony, or solemnity, practised among the ancient Romans, to do honour to a victorious general, by affording him a magnificent entry into their city.

The triumph was the most pompous spectacle known among the ancients: authors usually attribute its invention to Bacchus, and derive the term from *θραμβος*, one of his titles; and tell us, that he first triumphed upon the conquest of the Indians; and yet this ceremony was only in use among the Romans.

As long as the ancient discipline of the republic continued, no general could pretend to a triumph who had not extended the

the limits of the empire, and slain at least five thousand of his enemies in battle, without any considerable loss on his own part: to this purpose an express law was established, and he was obliged to make oath before the quæstors, that the account delivered to the senate was true. But this law became obsolete, and intrigue and faction procured a triumph in favour of generals whose merit was not very considerable.

The general who vanquished his enemies in a naval engagement, had also the honour of a naval triumph. These were first granted to C. Duillius, in the year 449, after his defeat of the Carthaginians.

The triumph was of two kinds, the *less* and the *greater*. The *less* triumph was granted upon a victory over some unequal and unworthy enemy, as over pirates, slaves, &c. This they called *ovatio*, because the only sacrifices offered in it were sheep.

The *greater* triumph, called also *curulis*, and simply *the triumph*, was decreed by the senate to a general upon the conquering of a province, or gaining a single battle. The order and economy of the triumph were thus: the general having dispatched couriers with tidings of his success, the senate met in Bellona's temple to read the letters: this done, they send him the title *Imperator*, with orders for him to return, and bring his victorious troops along with him.

When he was arrived near the city, the general and principal officers took oath of the truth of the victory; and the day of triumph was appointed.

The day being arrived, the senate went to meet the conqueror without the gate called Capena, or Triumphalis, and marched in order before him to the Capitol. He was richly clad in a purple robe, embroidered with figures of gold, setting forth his glorious achievements; his buskins were beset with pearl, and he wore a crown, which at first was only laurel, but afterwards was gold; in one hand he bore a laurel branch, and in the other a truncheon. He was drawn in a car, or chariot, adorned with ivory and plates of gold, drawn usually by two white horses; though sometimes by other animals, as that of Pompey, when he triumphed over Africa, by elephants; that of Mark Antony, by lions; that of Hellogabalus, by tigers; that of Aurelian, by deer; and that of Nero, by hermaphrodite maes, &c.

At his feet were his children, or sometimes on the chariot-horses. It is added, that the public executioner was behind him, to remind him, from time to time, that these honours were transitory, and would not screen him from the severity of the laws, if he should ever be found delinquent.

The cavalcade was led up by the musicians, who had crowns on their heads; after them came several chariots, in which were plans of the cities and countries subdued, done in relieve: they were followed by the spoils taken from the enemy, their horses, arms, gold, silver, machines, tents, &c. After these came the kings, princes, or generals subdued, loaded with chains, and followed by mimics and buffoons, who insulted over their misfortunes. Next came the officers of the conquering troops, with crowns on their heads.

After these appeared the triumphal chariot, before which, as it passed, they all along strewed flowers, and the music played in praise of the conqueror amidst the loud acclamations of the people, crying *Io triumphe!*

The chariot was followed by the senate, clad in white robes; and the senate by such citizens as had been set at liberty or ransomed.

The procession was closed by the priests, and their officers and utensils, with a white ox led along for the chief victim.

In this order they proceeded through the triumphal gate,

VOL. XXXVI.

along the Via Sacra, to the Capitol, where the victims were slain.

In the mean time all the temples were open, and all the altars laden with offerings and incense; games and combats were celebrated in the public places, and rejoicings appeared every where.

What was horrible amidst all this mirth was, that the captives, when arrived at the forum, were led back to prison and strangled; it being a point of religion with them, not to touch the victims till they had taken full revenge of their enemies. The rites and sacrifices being concluded, the triumpher treated the people in the Capitol, under the porticoes, and sometimes in Hercules's temple.

The most considerable triumphs were those of Cæsar after the taking of Utica, and of Augustus after the victory of Actium. Cæsar had four triumphs, which lasted four days, and were conducted with the most extraordinary splendour and magnificence. The first was the triumph of the Gauls, on which occasion there were presented to the view of the Romans the names of three hundred nations and eight hundred cities subdued by the death of a million of enemies, which Cæsar had defeated in several battles. The second triumph was that of Egypt: the third represented the defeat of Pharnaces; and the fourth exhibited pictures of Scipio, Petreius, and Cato.

The triumph of Augustus lasted three successive days, and was not less magnificent than the former.

After Augustus, the honour of a triumph became an appendage of sovereignty.

TRIUMPHAL Arch, Car, and Column. See the articles.

TRIUMPHAL Crown, or Garland. See CROWN.

This is said to have been taken from Apollo's crowning his head with a laurel, after killing the Delphian serpent.

TRIUMPHAL Gown, toga triumphalis. See TOGA.

TRIUMPHANT CHURCH. See CHURCH.

TRIUMPHO de la Cruz, in Geography, a cape on the coast of Honduras. N. lat. 15° 56'. W. long. 88° 25'.

TRIUMVIR, one of three persons who govern absolutely, and with equal authority, in a state.

The word is little used but in the Roman History. Cæsar, Crassus, and Pompey, were the first triumvirs, *i. e.* the first who divided the government of the republic among them.

There were also other officers, called *triumvirs, triumviri*; as the *triumviri*, or *tresviri capitales*, created in the year of Rome 463, to take care of prisoners, and superintend the execution of criminals.

Triumviri monetales, who were magistrates created at the same time to superintend the coinage of the money: whence that mark still extant on many ancient coins, III VIRI. They seem to have been created about the time of the first coinage of silver in Rome, or 266 years B.C. Pomponius ascribes their first creation to the year of Rome 463, or 289 B.C. These officers were very considerable, and were chosen out of the senatorial rank, till Augustus appointed them from the equestrian, and the alteration seems to have continued. However this be, the title *triumviri* remained till after Caracalla, as appears from inscriptions given us by Gruter, and by Boutheroué. But under Aurelian it is probable there was but one master of the Roman mint, called the "Rationalis," which change is supposed to have taken place under Gallienus. The "Rationalis" was succeeded by the "Procurator monetæ." The *triumviri* made a part of the *centumviri*. The title they bear on medals, which is common on the coins of Augustus and Tiberius, is III VIRI. A. A. Æ. F. F, *triumviri auro, argento, ære, flando, scribendo,*

R r

which

which signifies, that they had the direction of casting and striking of gold, silver, and brass. Julius made *quatuor viri*, who continued for 15 years, till the battle of Actium, when Augustus restored the *triumviri*.

There were also *triumviri adibus reficiendis*, officers appointed to look at the reparation of temples; *triumviri colonis deducendis*, for the conducting and settling of colonies; *triumviri*, for the railing of troops; *nocturnal triumviri*, to prevent or extinguish fires; *triumviri*, to review the forces, &c.

In the Acilian family we read of one M. Acilius IIIIVIR VALETU; that is, *triumvir of health*, or a magistrate of health. M. Spanheim takes him to have been a magistrate established to perform sacrifices to the gods of health, to dedicate their temples, &c.

Onuphrius and Vaillant read *triumvir valetudinis*; Patin, *triumvir valetudinarius*; but M. Spanheim, with much more reason, reads *triumvir valetudo*; in like manner, as on a medal of the Aquilian family, we read IIIIVIR VIRTUS; signifying that one M. Aquilius had been made *triumvir* to repair the temple of Virtue, and Acilius that of Health.

TRIUMVIRATE, TRIUMVIRATUS, an absolute government administered by three persons, with an equal authority.

There are two famous triumvirates at Rome; Pompey, Cæsar, and Crassus, established the first; and Augustus, Mark Antony, and Lepidus, the second.

This latter triumvirate gave the last blow to the liberty of the republic. Augustus having vanquished Lepidus and Antony, the triumvirate sunk into a monarchy.

TRINE, *Tres in Uno*, three in one; a term sometimes applied to God, to express the unity of the Godhead, in a trinity of persons.

TRIXIS, in *Botany*, from τριζος, *three-fold*, because the florets of the circumference have three deep distant segments. The name is borrowed by Swartz from Browne, who originally applied it to what is now *Perdicium radiale* of Linnæus and other writers.—Swartz Prodr. 115. Ind. Occ. 1374. t. 26. Schreb. Gen. 581. Willd. Sp. Pl. v. 3. 2337. Mart. Mill. Dict. v. 4. (Baillieria; Aubl. Guian. 804. Juss. 188. Lamarek Illustr. t. 712.)—Class and order, *Syngenesia Polygamia-necessaria*. Nat. Ord. *Composita oppositifolia*, Linn. *Corymbifera*, Juss.

Gen. Ch. *Common Calyx* imbricated, ovate, of eight or ten ovate-oblong, pointed, convex, nearly equal scales; the outermost slightly keeled, membranous at the tip. *Cor.* compound. Perfect florets, in the disk, numerous, funnel-shaped, with a very short tube, and upright five-cleft limb. Female ones, in the radius, fewer, shorter, funnel-shaped, with a compressed tube, and a three-cleft limb, whose hinder segment is larger than the two in front. *Stam.* in the florets of the disk, filaments five, the length of the tube; anthers united into a five-toothed cylinder, rising above the limb. *Pist.* in the florets of the disk, Germen linear, downy; style thread-shaped, the length of the stamens, divided at the top; stigmas reflexed: in the female florets, Germen oblong; style thread-shaped, divided at the top; stigmas reflexed. *Peric.* none, except the closed unaltered calyx. *Seed* of the florets of the disk, often abortive: of the female ones ovate, slightly compressed, bordered, convex behind, obtuse, hairy, and somewhat triangular, at the summit. Down none. *Recept.* chaffy, with oblong, acute, concave, membranous scales.

Eff. Ch. Receptacle scaly. Seed-down none. Seeds hairy in their upper part. Florets of the radius three-cleft. Calyx imbricated.

1. *T. terebinthacea*. Balsamic Trixis. Swartz Ind.

Occ. 1375. Willd. n. 1.—Branches rough. Leaves ovate, finely ferrated; rough with minute bristles above; with short dense hairs beneath.—Native of rocky vallies among the mountains of the west side of Jamaica, flowering in May. The *stem* is shrubby, six feet high, rough, with opposite, round, leafy branches, rough with very dense, short, rigid hairs, as are also the *footstalks*. Leaves opposite, crossing each other, from four to six inches, or more, in length, and three, or more, in breadth, bright green, finely and acutely ferrated, veiny, somewhat triple-ribbed; rough like a file above; hairy or downy beneath; tapering at each end. *Stipulas* none. *Flowers* very numerous, small, white, fragrant, but acquiring a turpentine scent when bruised. They compose large, terminal, corymbose, dense panicles, with opposite downy stalks, and hairy awl-shaped bractæas.

2. *T. aspera*. Harsh-leaved Trixis. Swartz Prodr. 115. Willd. n. 2. (T. scabra; Swartz Ind. Occ. 1378. Baillieria aspera; Aubl. Guian. 804. t. 317.)—Branches silky, with close-pressed hairs. Leaves ovate, ferrated, taper-pointed; harsh above; rough with depressed hairs beneath.—Native of Guiana, Cayenne, and the West Indies. As tall as the last, but of a more slender habit. *Branches* smooth to the touch, being covered with close hairs, pointing upwards, not with rigid prominent bristles, as in the foregoing. *Leaves* not half so large, rough like a fine file, on the upper surface, when full-grown; pale beneath, with flattened, not prominent, bristly hairs. *Flowers* larger, but fewer, in looser panicles. We cannot, on an examination of specimens, doubt this being Aublet's plant, and therefore we retain the original specific name. His *B. sylvestris* appears to be, as Willdenow makes it, a mere variety, though his *aspera* only is used for intoxicating fish.

3. *T. erosa*. Jagged Trixis. Swartz Prodr. 115. Ind. Occ. 1377. Willd. n. 3.—Branches bristly. Leaves broadly-ovate, with deep irregular notches and serratures; roughish on both sides; pale beneath.—Native of various parts of the West Indies. This is the size of the first species, but its leaves are more deltoid, deeply jagged, and less hairy, though roughish with minute scattered bristles. *Flowers* white, much like the first, but fewer and rather larger, on hairy stalks. The *calyx-scales*, in every one of our specimens, are much broader and rounder than Swartz's figure represents. Aublet gives five teeth to all his florets.

TROADENSE MARMOR, in *Natural History*, a name given by the ancients to a species of white marble, dug in Mount Ida, and greatly used in building.

TROARN, or TROUARD, in *Geography*, a town of France, in the department of the Calvados, on the Dive; 6 miles E. of Caen.

TROAS, the Troade, in *Ancient Geography*, a country of Asia Minor, commencing at the promontory Lectum, and extending as far as the Propontide. It took its name from the famous city of Troy, its capital. It extended a little towards the south. If indeed under the appellation of Troade we comprise the whole extent of the country which was subject to the Trojans, that is, almost the whole kingdom of Priam, we must comprehend almost the whole extent of the two Mysia and Lesser Phrygia. But the Troade, properly speaking, comprised merely the country which lay between the Dardanis to the north-east, and the country of the Leleges, to the south-east, the Hellespont and the Ægean sea. Ptolemy includes the Troade in Lesser Phrygia. Its principal rivers were the Simois, the Scamander or Xantippus, and the Andrius. Its principal towns were Troja or Ilium Sigeum, Sminthime, &c.

TROAS-ALEXANDRIA. See ALEXANDRIA.

TROAT,

TROAT, among *Sportsmen*, the cry of a buck in rutting time.

TROCADIE, in *Geography*, a small island in the gulf of St. Lawrence, near the north coast of St. John's island.

TROCAR, or **TROCHAR**, an instrument commonly used in *Surgery*, for tapping the abdomen, in cases of ascites and ovarian dropfy; in the tunica vaginalis, in cases of hydrocele; the joints, in bad cases of hydrops articuli, &c. Trocars are also employed for tapping the bladder, when there is no other mode of evacuating the urine, and the symptoms which the patient suffers are so urgent, that no time remains for the trial of milder plans of relief. Abscesses have likewise been opened in some instances with a trocar; though it must be allowed that, in these cases, the lancet is generally a better instrument.

A trocar consists of two pieces, *viz.* a perforator or stilette, and a silver cannula. The latter is so constructed and adapted to the first part of the instrument, that when the puncture is made, they both enter the wound together with perfect ease; after which, the stilette being withdrawn, the cannula remains in the wound, and affords a convenient channel for the escape of the fluid outward.

Such are the uses of a trocar, and the principles upon which the instrument ought to be made. It has been proposed to make the perforator with a flat lancet-point, in order that it may enter the flesh with greater facility; but time and experience seem still to give the preference to the stilette, which is of a triangular shape. It is true, that it cannot so readily make the necessary puncture; yet if sharp, and in good condition, no great fault can be found with it, in regard to the difficulty of making it enter the flesh; and it is certain, that its cannula is better calculated than the tube of a flat trocar to afford an outlet to fluids, which are at all thick and gelatinous.

The trocar is an instrument which should never be used for the discharge of fluids, except when the practitioner knows with certainty, not only that such fluids are present, but also that their quantity is considerable, so that no injury will be done to the parts beyond them by the sudden introduction of the instrument. In all other cases, cautiously making a small puncture with a lancet, is the most prudent practice. Whenever a trocar is used, surfeons likewise avoid introducing the instrument to a dangerous depth. The instant the perforator has passed through such parts as intervene between the fluid and the surface of the body, it has performed all that it ought to do: the attentive operator feels a sudden cessation of resistance to the instrument, and he immediately holds back the stilette, whilst he only pushes forward the cannula. See **PARACENTESIS**.

TROCHAIC, **TROCHAICUS**, in the *Latin Poetry*, a kind of verse consisting of trochees, or in which that foot predominates; as the iambus does in the iambic.

The 18th ode of the 2d book of Horace's Odes consists of strophes of two verses, the first of which is trochaic dimeter catalectic, *i. e.* trochaic, composed of three trochees, and a syllable at the end, or wanting a syllable in the first foot; which some call the *Euripidean* trochaic:

— *Nōn* | *ēbūr* | *nēque* | *āu* | *rēum*
Largiora | *flagūo*.

Long verses of fifteen half feet, which are more particularly distinguished by the name of trochaic, are nothing more than tetrameter iambics, or of eight feet, the first of which wants a syllable; as there are others where it is wanting at the end. Thus,

— *Prō* | *pēcā* | *tō māg* | *uō*, *pāu* | *lūm* *sūp* | *pīcū* | *ſāis* | *ſſ*
pātrū. Ter.

TROCHANTER, *Major* and *Minor*, in *Anatomy*, two considerable processes of the thigh-bone. See **EXTREMITIES**.

TROCHAR, in *Surgery*. See **TROCAR**.

TROCHE, **TROCHISCUS**, in *Pharmacy*, a form of medicine, made into a cake or tablet, to be held in the mouth to dissolve gradually.

The troche is properly a dry composition; the chief ingredients of which, after having been brought into a very fine powder, and mixed with sugar, are incorporated with some proper liquor, as distilled waters, wine, vinegar, or mucilages, and reduced into a mass, which is moulded into little cakes, or balls of any form, at pleasure, and dried in the air, far from the fire. As remedies they are of little importance; and the preparation of them properly belongs to the confectioners; and they should be altogether rejected from the Pharmacopeia, as the London and Dublin colleges have done.

There have been and still are troches of various kinds, and for various intentions; as *purgative*, *alterative*, *aperitive*, *corroborative*, &c. troches.

Latin authors call them *pastilli*, *rotulae*, *placuntulae*, *orbes*, and *orbiculi*; and the English, frequently, *lozenges*.

The following troches are described in the Edinburgh Pharmacopeia; *viz.*

Troches of Carbonate of Lime, prepared by rubbing to powder four ounces of prepared carbonate of lime, an ounce of gum arabic, one drachm of nutmegs, and six ounces of refined sugar, and forming them by means of water into a mass fit for making troches. These are intended as antacids; but in the state of the stomach which requires them, the efficacy of the carbonate of lime is counteracted by the sugar.

Troches of Liquorice are formed by dissolving in hot water extract of liquorice and gum arabic, of each one part, and two parts of refined sugar, and then straining; and afterwards evaporating the solution into a proper state for troches. These troches are demulcent, and serve to allay the tickling irritation which occasions coughing; but the simple extract of liquorice, refined by straining and inspissation, found in the shops under the name of refined liquorice, will answer the same purpose.

Troches of Liquorice with Opium are obtained by well rubbing two drachms of opium, with half an ounce of the tincture of balsam of Tolu; adding gradually eight ounces of simple syrup, and five ounces of extract of liquorice, softened by hot water, and afterwards sprinkling in five ounces of powdered gum arabic; then drying the mass, and forming it into troches, each weighing ten grains. These troches are rendered more efficacious than the former for the same purpose, by the opium; six troches containing one grain of opium, and from six to ten may be taken in twenty-four hours.

Troches, Gum, are prepared by rubbing four parts of gum arabic, one part of starch, and twelve parts of refined sugar to powder, and forming it into a mass with rose-water fit for forming troches. These are simple demulcents, and serve to allay a tickling cough.

Troches of Nitrate of Potash are obtained by beating to powder one part of nitrate of potash, and three parts of refined sugar, and forming them into a mass fit for troches, by means of mucilage of gum tragacanth. Thus nitre may be agreeably taken in the dry state, and these troches may serve to cool the mouth in salivations, and to stop the progress of inflammatory fore-throat, when taken at its commencement. They may also be used as a general refrigerant in fevers, diluting largely during the use of them. The

TROCHILUS.

dole is one or two taken every second or third hour. Thomson's Lond. Disp.

TROCHEE, **TROCHÆUS**, formed of *τρεχω*, *I run*, because it moves quickly, in Greek and Latin *Poetry*, a kind of foot consisting of two syllables, the first long, the latter short: such as the words *vādē* and *mūsā*.

The trochee is the reverse of the iambus, and has just a contrary effect; the latter being light and sprightly, and the former weak and languid, as all those measures are which move from a long to a short syllable.

Some called the trochee, *choreus*, because it is proper for songs and dances. These give the denomination *trocheus* to the tribrachus. Quint. lib. x. cap. 4.

TROCHERA, in *Botany*. See **EPIRHARTA**.

TROCHILUS, in *Architecture*, a hollow member, more usually called, by modern architects, the *scotia*; and, by our English workmen, the *casement*.

TROCHILUS, the *Humming-bird*, or *Honey-sucker*, in *Ornithology*, a genus of birds of the order *Picæ*; the characters of which are, that the bill is longer than the head, subulate-filiform, or cylindrical, slender, with slightly-thickened tip; the upper mandible sheathing the lower; the tongue filiform, consisting of two conjoined slips forming a tube, and extensile; the legs slender and rather short, and feet formed for walking; the tail composed of ten feathers.

The humming-birds constitute a lively brilliant race, distinguished by their beautiful colours and diminutive size, peculiar natives of the American continent and adjacent islands, and, with few exceptions, confined to the hotter regions. The genus is extensive, and it has therefore been found convenient to divide them into two sections, *viz.* the curve-billed and the straight-billed.

* *Curve-billed.*

PARADISEUS. Red; head crested; blue wings, and two of the tail-feathers very long. This is the Paradise humming-bird of Latham. A native of New Spain.

PELLA. Red (purple-red, Shaw), with brown (black, Shaw) head; golden (topazine, Shaw) throat; green rump, and two very long middle tail-feathers. This is the Colibri topaze of Buffon, the long-tailed red humming-bird of Edwards, and the topaz humming-bird of Latham. It is the most brilliant of this section, and has a decided superiority to all the rest by its magnitude as well as colours. The female is far inferior to the male with respect to brilliancy of colour. This bird is a native of several parts of South America, but is principally found in Surinam and Guiana, frequenting the banks of rivers and brooks. During flight, they skim the surface of the water like swallows.

SUPERCILIOSUS. Gilded or shining brown; elongated middle tail-feathers (white at the tips, Shaw), grey beneath, with long bill and white eye-brows. Shaw. The supercilious humming-bird of Latham, distinguished from all others by the great length of its bill, and its strongly cuneated tail. The female differs by being of a pale rufous-grey beneath, by having a shorter bill, the lower mandible whitish, and the tail slightly cuneiform and tipped with white. Found in Cayenne.

POLYTMUS. Glossy-green, with black crown and tail; violet-brown wings, and two very long outer tail-feathers. This is the long-tailed black-cap humming-bird of Edwards, and black-capped humming-bird of Latham. An elegant species, of considerable size. A native of South America, and found also in Jamaica. The female is greenish above and white below; the sides of the neck varied with white and green, and the tail destitute of the two long plumes so conspicuous in that of the male.

FORFICATUS. Gold-green, with blue crown, and gold-blue forked tail, and two outer feathers very long. The long-tailed green humming-bird of Edwards, and fork-tailed humming-bird of Latham. An elegant but rare species; found in Jamaica.

LEUCURUS. Coppery-green, with brown quill-feathers; a reddish crescent in front of the neck, and white even tail. The white-tailed humming-bird of Edwards and Latham. Native of Surinam.

JUGULARIS. Gold-green, with a tinge of dusky-blue; with blood-red throat and breast, blackish abdomen, and even tail. Red-breasted humming-bird of Edwards and Latham. The garnet-throated humming-bird of Latham is of the same species. Found in Surinam.

THAUMANTIAS. Gold-green, with blackish quill-feathers, and tail-feathers edged with white; the exterior one entirely white on the outside. The admirable humming-bird of Latham, first described by Marcgrave. A native of Brazil and several other regions of South America.

DOMINICUS, or **PECTORALIS**. Green-gold, with velvet-black breast; white belly, and purplish steel-blue tail. The black-breasted and St. Domingo humming-bird of Latham. The female is said to be distinguished from the male by having the green on the fore-part of the neck divided by two white streaks, and the breast of a paler black than that of the male. A native of the West India islands.

MANGO. Copper-green, with black descending throat-stripe and abdomen; violet-brown wings, and ferruginous tail edged with black. The Mango humming-bird of Latham. The female is said to differ in having the two middle tail-feathers gold-green, like the back. A native of South America, particularly of Brazil, but found in St. Domingo, Jamaica, and other West India islands. Dr. Latham mentions a variety of this species, in which the throat, on each side of the black stripe, was white. Gmelin makes the "*mellivora avis maxima*" of Ray and Sloane a variety of this.

HOLOSERICUS. Gilded-green, with brown wings; black tail and abdomen, and blue pectoral bar. The black-bellied humming-bird of Edwards and Latham. Native of Mexico and Guiana.

GALERITUS. Green-gold, with brown quill-feathers, and purple crest. Found in Chili.

EXILIS. Brownish-green, with a gloss of red; glossy-green crest with gilt tip, and black wings and tail. The little humming-bird of Latham, and humming-bird of a black colour of Bancroft. The smallest of the curve-billed section. Native of Guiana.

CYANEUS. Velvet-crimson, with blue back, and black wings. The crimson-headed blue humming-bird of Latham. A native of Mexico.

FURCATUS. Glossy violet-blue, with gold-green crown and throat, and black wings, abdomen, and forked tail. The lesser fork-tailed humming-bird of Latham. A native of several parts of South America, and of some of the larger West India islands.

MACRORUS, or **FORCIPATUS**. Gold-green, with violet head and neck; abdomen marked by a white spot, and forked tail. Cayenne fork-tailed humming-bird of Latham.

PURPURATUS. Green, with crown, wings, and bifurcated tail purple, and wreath blue. The purple-crowned humming-bird of Latham.

AURATUS. See **JUGULARIS**. Of this Gmelin gives a variety, *viz.* with cheeks, nape and throat golden-red; head and body black, with shining-green.

GRAMINEUS. See **DOMINICUS** or **PECTORALIS**.

TROCHILUS.

VIOLACEUS. Dark purple-violet, glossy on the foreparts, with green and gold wings and tail, the latter tinged with black. The violet humming-bird of Latham. Native of Cayenne.

MACULATUS. See **GUTTURALIS**.

PUNCTULATUS. Gold-green, with blackish wings; shoulders and back spotted with white, and brown tail with white tip. The spotted humming-bird of Latham. Native of Mexico, where it is called "Hoitzitzil."

ALBUS. See **GUTTURALIS**, of which it is a variety.

AURANTIUS. Brown, with orange head; yellow throat and breast, purple wings, and ferruginous tail. The orange-headed humming-bird of Latham. Native of South America.

FLAVIFRONS. Green, with yellow front, and black wings and tail. The yellow-fronted humming-bird of Latham, and yellow-fronted honey-sucker of Pennant.

VENUSTISSIMUS. See **CYANEUS**.

MARGARITACEUS. Bright-green, pearl-grey beneath, with the tail steel-blue at the base, purple-brown in the middle, and white at the tip. The grey-necked humming-bird of Latham. Conjectured by Dr. Shaw to be female?

HIRSUTUS. See **BRASILIENSIS**.

MULTICOLOR. See **HISTRIO**.

CINEREUS. Green-gold, ash-coloured beneath, with violet-brown wings, and rounded steel-blue tail with white tips. The ash-bellied humming-bird of Latham.

GULARIS. Gold-green; white beneath, with blackish wings and tail, and deep-blue throat and vent. Probably a native of South America.

FULVUS. Yellow, with the tail-feathers and covers thick; beneath brownish. A native of South America.

VARIUS. Green-gold; beneath whitish-brown, with a double pectoral band green-blue and blood-red. Found in South America.

CYANURUS. Green; cinereous beneath, with the throat, breast, and two very long middle tail-feathers blue. The blue-tailed humming-bird of Latham. Native of New Spain.

FURCIFER. Green-gold, with brown wings; white throat, and glossy blue-green breast and forked tail. Native of Paraguay.

MAXIMUS. Green-gold, with white throat, ferruginous vent, and blue crown, quill and tail-feathers. Ekelberg's humming-bird of Latham.

CAPENSIS. Green, with long middle tail-feathers, and blue wing-coverts. Ekelberg's humming-bird of Latham.

CHRYSOBRONCHIOS. Gold-green, with very bright throat and breast; subferruginous wings, and white-edged tail. Native of Guiana.

SPARGANURUS. Gold-green, with emerald throat, and black forked tail, with a gold-crimson bar across the feathers. The bar-tailed humming-bird. A very beautiful species, said to be a native of Peru.

PORPHYRURUS. Brown, with velvet-black throat, and purple neck-stripes and tail. A variety of the mango, according to Latham. Native of South America and the West India islands.

GUTTURALIS. Green-gold, with emerald throat; whitish-rufous on each side; black breast, and black abdominal stripe. The *T. gularis* of Latham; and maculatus of Gmelin. The green-throated humming-bird of Latham.

NITIDUS. Violet-tailed humming-bird of Latham, and *T. albus* of Gmelin's Linnæus. Supposed by Shaw to be a variety of the preceding.

BRASILIENSIS. Gold-green; rufescent beneath, with violet-brown wings and tail; the latter tipped with white,

and white-feathered legs. The rufous-bellied humming-bird of Latham. The *T. hirsutus* of Gmelin's Linnæus. An elegant species. Native of Brasil.

FASCIATUS. Green-gold, with rufous undulations; blackish-rufous head; and a black band edged with white along each side of the body. Banded humming-bird. Native of Paraguay.

PUNCTATUS. Gold-green; beneath brownish undulated with white; with subviolaceous wings, and tail white at the base and tip. Scalloped humming-bird, strongly allied to the *Mango*, and it is not impossible, says Dr. Shaw, that it may be the young, in its first year's plumage.

AUREO-VIRIDIS. Gold-green, with blackish wings; and steel-blue tail with white tip. Native of the West India islands.

AURULENTUS. Dark gold-green, with brighter throat and shoulders; black breast, brown abdomen, and subviolaceous tail. A native of the island of Porto-Rico.

TRIMACULATUS. Gold-green; black beneath, with three white spots on each side; brown quill-feathers, and steel-blue tail. Native of South America. Dr. Shaw conjectures that this may be only a variety of *T. mango*, *holofericeus*, or *pectoralis*.

ELEGANS. Gold-green, with black breast; violet-black wings; and greenish-black forked tail. Native of St. Domingo.

HISTRIO. Brown, with gold-green crown, throat, breast, and shoulders; red belly, and blue cheeks. The harlequin humming-bird of Latham and Shaw, and the multicolor of Latham and others. A highly elegant species, and remarkable for its variety of colours. Native country uncertain.

CRISTATELLUS. Green, with shining gold-green crest; and black wings and tail. Gilt-crested humming-bird of Latham. A small and elegant species, much allied to the *T. exilis*.

* * With straight Bills.

PLATURUS. Gold-green, with brown belly, quill-feathers, and tail; the two middle tail-feathers naked with webbed tips. The racket-tailed humming-bird of Latham. This is a rare species, and a native of South America.

LATIPENNIS, or **CAMPYLOPTERUS** of Linn. Gmel. Gold-green; grey beneath, with brown wings and tail; and the shafts of the greater quill-feathers dilated and incurved. The broad-shafted humming-bird of Latham. One of the larger humming-birds, a native of Cayenne, and a very rare species.

AURITUS. Gold-green; white beneath, with slightly elongated violaceous ear-feathers, black wings, and lateral tail-feathers. The violet-eared humming-bird of Latham; an elegant species. Native of Cayenne. Gmelin mentions a variety with a purple band below the eyes, a large area near the ears, below which is a green-blue spot.

MELLIVORUS. Gold-green, with blue head, neck, and breast, and white nuchal bar, abdomen and tail. White-bellied humming-bird of Edwards and Latham. Native of South America, and not uncommon in Cayenne. The *T. fimbriatus*, or spotted-necked humming-bird of Latham and Gmel. Linn. is supposed to be a variety. There are also other varieties mentioned by Vieillot.

OURISSIA. Gold-green, with blue back, breast, and belly; brown quill-feathers, and golden-brown tail. The green and blue humming-bird of Edwards and Latham. Native of Surinam. N.B. The American word "Ourissia," signifying a sun-beam, is applied by some of the earlier writers to certain species of humming-birds, on account of the

TROCHILUS.

the splendour of their colours. Gmelin mentions a variety, *viz.* T. green; beneath blue, with orange spot on the chin; quill-feathers and tail obscure.

SUPERBUS. Gold-green, with blue crown; double black-and-white cheek-stripe, and crimson throat and breast. Stripe-cheeked humming-bird of Shaw. This superb humming-bird is a most beautiful species, and one of the finest of this brilliant race. Native, probably, of South America.

SAPPHIRINUS. Bright sapphire-coloured, with slightly-gilded back; brown wings; black abdomen, and steel-blue tail. The sapphire humming-bird of Latham. Native of South America. Gmelin mentions a variety, *viz.* T. with sapphire breast, white belly, and tail blue-black.

SMARAGDO-SAPPHIRINUS. With bright sapphire-blue head and throat; gold-green body; brown wings, and steel-blue tail. The sapphire and emerald humming-bird of Latham. Native of South America and the West Indies. Shaw suggests that the two last mentioned humming-birds really constitute one species. He mentions a variety of the last from Viellot, *viz.* the blue-gorge humming-bird.

LUCIDUS. Bright gold-green, with deep-blue throat, breast, and tail; and a white spot behind each eye: supposed by Azara and Sonnini to be the same with the sapphire and emerald humming-bird. Native of Paraguay.

AMETHYSTINUS. Gold-green, varied beneath with grey and brown, with amethystine throat, and forked tail. The amethystine humming-bird of Latham. Native of Cayenne.

MOSCHITUS. Purple-brown; blackish beneath, with ruby-gold crown, topazine throat, and black-tipped tail. The ruby-necked humming-bird of Latham. To this species Dr. Shaw refers the T. elatus of Gmelin's Linnæus, or ruby-crested humming-bird of Edwards and Latham. This is one of the most beautiful of the straight-billed humming-birds. Native of South America, and particularly of Brazil, Guiana, and Surinam. The ruby-crested humming-bird is a variety.

PEGASUS. Gold-green; grey beneath, with brown wings, and blackish-purple tail with greenish hue. Grey-bellied humming-bird and gold-throated humming-bird of Latham. Dr. Shaw suggests that this may be a young female of T. moschitus.

HYPOPHÆUS. Gilded-brown; whitish beneath, with brown crown, and gold-green stripe down the middle of the throat. The brown-crowned humming-bird of Latham, conjectured by M. Viellot to be no other than an advancing young of T. moschitus.

CARBUNCULUS. Glossy-black, with dark-red crown and nape, fiery-red throat and breast, and gilded-rufous tail. The carbuncle humming-bird of Latham is suggested to be a variety of T. moschitus; rare in Cayenne.

CHRYSURUS. Gold-green, with cinnamon throat, brown quill-feathers, and topazine tail. Native of Paraguay.

COLUBRIS. Gold-green; about three inches in length; beneath white, with gold-red throat, and purple-brown wings and tail. The red-throated humming-bird of Edwards and Latham, red-throated honey-sucker of Pennant, guainumbi of Maregrave. A beautiful species. A native of America, breeding in Carolina, Florida, and, as some say, in Canada; and also a native of Jamaica and some other West India islands. The female differs in having the whole under side white, without any redness on the throat, and all the tail-feathers, exclusive of the two middle ones, tipped with white. The general history of this beautiful bird is detailed by Mr. Pennant in his Arctic Zoology. Its flight is rapid, so that it is transient as lightning, and resembling this meteor in the

glare of its colours: it feeds only upon the wing, suspended over the flower from which it extracts nourishment. The most violent passions sometimes agitate the little bodies of these birds. Their contests in disputing possession of the same flower are very violent; tilting against one another with such fury, as if they intended to transfix their antagonists with their long bills. They are fearless of mankind, coming into apartments of houses, the windows of which are left open, but when approached, darting away with admirable velocity. Their nests, made in branches of trees amidst the thick foliage, are found with difficulty: they are of elegant structure, formed on the outside with moss, and within lined with down or gossamer collected from the great mullein, but sometimes constructed of flax, hemp, hair, and other soft materials. The female is said to be the builder, and the male supplies her with materials: both assist in the labour of incubation, which lasts twelve days: they lay only two eggs, which are white, and as small as pease. It is suggested that the patch-necked humming-bird of Latham's first supplement is no other than a young male of this species. The tomieo of Gmelin is a variety.

RUBINEUS. Green-gold, with gold-red throat, purplish-brown wings, and rufous tail. The ruby-throated humming-bird of Latham. Native of South America, and particularly of Brazil, and is considered as one of the rarer kinds of humming-birds.

MELLISUGUS. Gold-green, with glossy blue-green throat, violet-black wings, and feathered legs. The emerald-throated humming-bird of Shaw, the all-green humming-bird of Edwards, and the Cayenne humming-bird of Latham. This is one of Maregrave's guainumbis.

COLLARIS. Rufous, paler beneath, with the feathers elongated on each side. The ruff-necked humming-bird of Latham. This species is numerous in Nootka Sound.

ORNATUS. Brownish, with rufous crest, emerald throat, and elongated rufous neck-feathers with gold-green tips. The tufted-necked humming-bird of Latham. Native of Guiana.

ALBIROSTRIS. Blackish, with gold-green throat; each feather edged with grey, and white bill, thighs, and vent. The white-billed humming-bird of Shaw. Native of Cayenne.

VIELLOTI. Blackish-olive, with golden gloss; beneath whitish, with violet-brown quill-feathers. Viellot's humming-bird, and black humming-bird of Latham. This small species is common in the island of St. Domingo, supposed by Viellot to be the T. niger of Linnæus.

LEUCOCROTAPHOS. Gold-green; beneath grey, with white belly; a whitish stripe behind the eyes, and blue-black quill and tail-feathers. The most common species in Paraguay.

MAUGEANUS. Gold-green; beneath glossed with violet-blue, with violaceous-black wings and tail, the latter slightly forked. Maugean humming-bird, or Tobago humming-bird of Latham. Native of the island of Porto-Rico, whence it was brought by M. Mauge.

RUBER. Sub-ferruginous; slightly spotted with brown, with the side-feathers of the tail violet-brown. The little brown humming-bird of Latham. Brought from Surinam.

CRISTATUS. Gold-green, cinereous beneath; with golden-blue pointed crest, and violet quill-feathers and tail. The crested green humming-bird of Edwards and Latham. The female differs in wanting the crest, and in being ash-coloured beneath. Native of South America, and some of the West India islands.

PILEATUS. Brown, with glossy-blue pointed crest. The T. punitus.

T. puniceus of Linn. Gmel., and crested brown humming-bird of Latham.

MINIMUS. Gold-green; measuring about an inch and half in length; beneath whitish, with violet-brown wings and tail. Least humming-bird of Edwards and Shaw, &c. The smallest of the genus, and consequently of the whole feathered tribe: its general length being somewhat more than an inch and a quarter. Shaw's General Zoology, vol. viii.

STRIATUS. Brown; beneath white, with a longitudinal stria or streak green-gold; brown cap; black quill-feathers; base of the tail cinnamon-coloured, tip obscure. The brown-crowned humming-bird of Latham. Found in the island of Tobago.

OBSCURUS. Blue; crown obscure; chin and throat glossy-green; middle of the back greenish; rump, wings, and tail purple. The dusky-crowned humming-bird of Latham.

CYANOCEPHALUS. Green-gold, with head, tail-feathers, and crown blue; abdomen red. Found in Chili.

GLAUCOPIS. Green-gold, with blue front; white vent; violet-brown tail-feathers; pennated feet; tail steel-blue sub-furcated. The blue-fronted humming-bird of Latham. Found in Brasil.

CYANOMELAS. Variegated with white and blue; throat and breast red. Black and blue humming-bird of Bancroft and Latham. Found in Terra Firma and the Caribbean islands.

GUIANENSIS. Green, with crest and breast red; quill-feathers and tail-feathers green, variegated with red and purple. Guiana humming-bird of Latham.

ELATUS. See **MOSCHITUS.**

TROCHILUS is also a name used by Aristotle, Pliny, and others of the ancient naturalists, for the *regulus cristatus*, or, as we call it, the golden-crowned wren.

TROCHILUS is also the name of a remarkable water-bird, being very long-legged, yet web-footed.

It is a very swift runner on the ground, and is thence called by the Spaniards *corrixa*. Its beak is straight and black at the end, and the opening of its mouth very wide; it has black eyes surrounded by a white naked membrane, and that by a brown one. On its under part it is white; its back, shoulders, and wings, are of a ferruginous colour; its running is so very swift as to equal the flight of most birds. Aldrovand. de Avib. lib. xix. c. 35.

TROCHING, the final branches on the top of a deer's head.

TROCHITÆ, or **TROCHITES**, in *Natural History*, a kind of figured fossil stones, resembling parts of plants; vulgarly called *St. Cuthbert's beads*.

They are usually of an opaque, brownish colour: they break like spar, glossy and shining, and are easily dissolved in vinegar. Their figure is generally cylindrical, sometimes a little tapering, the circumference smooth, and both the lat sides covered with fine radii drawn from a certain hole in the middle to the circumference.

Two or three, or more, of the simple trochitæ, joined together, constitute what the naturalists call an *entrochus*.

In these the trochitæ, or single joints, are so set together, that the rays of the one enter into furrows in the other, as in the sutures of the skull. They are found in great plenty in the bodies of the rocks at Braughton and Stock, two villages in Craven, at all depths under ground; also in Mendip-hills, &c. sometimes only sprinkled here and there, and sometimes in large strata, or beds, of all magnitudes, from the size of the smallest pin, to two inches about.

They are often found ramous or branchy, several rudiments of large branches arising from the stem, or cylinder, and sometimes still smaller from these. The branches being deeply inserted into the stem, the tearing them off leaves great holes in them. See **ENTROCHUS Ramosus**.

Dr. Lister has discovered a sort of little fragment among them, which he takes to have been the apices of them; and another sort, which he imagines to have been the roots: for he supposes them to be a sort of rock-plants.

M. Beaumont, in the Philosophical Transactions, assures us, that he has found, that all the cliffs in some mines are made up of these entrochi, some of which have been converted into a reddish matter; while others, becoming white spar, compose bodies of that substance: and considering that all the cliffs, for a very large circumference in some places, consist almost wholly of these stones, it has been thought by some, who suppose them plants, that there have been, and still are, whole fields or forests of these under ground, as there are of coral in the Red sea. In the courses between the cliffs are found of these fossils, at all stages and degrees of maturity, growing up in the gritty clay, and rooted in the rake-mold stones, many of them of the form and dimensions of a tobacco-pipe, with the evident beginnings of circles and sutures; and others full-grown, formed of perfect spar, and at their point of maturity.

The central matter, in many, continues still white and soft, as the whole substance is, by some, thought to have been at first; and is continually refreshed by the mineral streams and moisture, which have free access to it through five hollow slits, or feet, in the figured roots, or through the mass of clay usually lying under the plain roots.

From the curiosity of their make, and from this accidental resemblance of plants, many have thought them to be such; and affirm, that they may vie with most of the vegetable kingdom, and are shaped and formed like them; having stem, branches, roots, an inward pith, as likewise joints and runnings in their grit, and sometimes cells to supply the place of veins and fibres.

Others have thought it highly probable, these rock-plants are lapides sui generis, and not parts of animals or plants petrified, as many authors have imagined. If the figured roots, on which they sometimes grow, give any suspicion they might have belonged to an animal, particularly a species of the *Stella arborescens*, the trunks seem to them to evince the contrary: nor are they reducible to any known species of vegetables. M. Beaumont tells us, that he had by him above twenty different species of *trochites*, all of them wonderfully regular, and not to be paralleled by any vegetable he knows of in nature; and it is inconceivable how so many species, diffused through many parts of the earth, should come to be lost. They are certainly, indeed, not vegetable remains, but are truly parts of the *Stella arborescens* petrified. See farther, Keppellus *Essai de Entroch.* and the articles **ENTROCHUS**, **STAR-fish**, and **STAR-stone**.

TROCHITIFER GLANS. See **GLANS Trochitifera**.

TROCH-

TROCHLEA, τροχλια, one of the mechanical powers, usually called a *pulley*; which see.

TROCHLEA, in *Anatomy*, a name given to some articular emanations of bones, which resemble in form the groove of a pulley: viz. that of the humerus, adapted to the ulna.

TROCHLEARIS, a muscle of the eye. See EYE.

TROCHMI, in *Ancient Geography*, the name of one of the three Gaulish nations, which, according to Strabo, established themselves in that part of Galatia which respects the Euxine sea, and that which touches on Cappadocia.

TROCHOCARPA, in *Botany*, from τροχος, a wheel, and καρπος, fruit, serving to express the orbicular depressed form of the nut, like a little toothed wheel.—Brown Prodr. Nov. Holl. v. 1. 548.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Eupacridae*, Brown.

Gen. Ch. *Cal.* Perianth inferior, of five equal, erect, ovate leaves, with two smaller ones, of the same shape, at the base, permanent. *Cor.* of one petal, funnel-shaped; tube cylindrical, pervious, longer than the calyx; limb in five deep, ovate, spreading segments, bearded on the upper side. Nectary cup-shaped, five-lobed, surrounding the base of the germen. *Stam.* Filaments five, thread-shaped, the length of the tube, inserted into its lower part; anthers oblong, incumbent, included within the tube. *Pist.* Germen superior, ovate; style very short; stigma simple. *Peric.* Drupa globose, depressed, juicy. *Seed.* Nut orbicular, with ten lobes, finally separating into as many distinct cells, with a kernel in each.

Eff. Ch. *Outer* calyx of two scales. Corolla funnel-shaped, with a pervious naked tube, and a five-cleft, spreading, bearded limb. Stamens within the tube. Drupa pulpy. Nut wheel-shaped, ten-lobed, ten-celled.

1. *T. laurina*. Laurel-leaved Trochocarpa. Br. n. 1. (*Cyathodes laurina*; Rudge Tr. of Linn. Soc. v. 8. 293. t. 9.)—Found near Port Jackson, New South Wales. A small tree, smooth in every part, with very hard wood. Leaves scattered, on short stalks, elliptic-lanceolate, acute, entire, many-ribbed, with somewhat of the aspect of a *Ruscus*, each near two inches long. Spikes rather lax, terminal and axillary, shorter than the leaves. Flowers white, small. Fruit less than a pea.

TROCHOID, TROCHOIS, or *Trochoides*, formed from τροχος, wheel, and εδος, form, in *Geometry*, a curve, whose genesis may be thus conceived: if a wheel or circle be moved with a two-fold motion at the same time, the one in the right line, and the other circularly about its centre, and these two motions be equal, *i. e.* describe two equal lines in the same time: and if in the radius, which at the beginning of the motion reaches from the centre of the wheel, or the first point of the line which describes the circumference: if, I say, in this radius, a point be taken any where, except in the centre, this point will describe a curve, one part of which will be below the line described by the centre, and the other above it. This line, thus described by the point taken in the radius, is called the trochoid.

The right line which joins the two extremities of the trochoid, and which is either the path the wheel makes, or a line parallel to that path, is called the *basis of the trochoid*.

The *axis of the trochoid* is the diameter of the wheel, perpendicular to the base in the middle of the motion; or that part of the radius between the trochoid and its base. The point, in which the axis is cut into two parts by the line described by the centre of the wheel, is called the *centre of the trochoid*; the uppermost point of the axis the

vertex of the trochoid; and the plane comprehended between the trochoid and its base, the *trochoidal space*.

The trochoid is the same with what we otherwise call the *cycloid*; for the properties, &c. of which, see CYCLOID.

TROCHOIDES LACUS, or *Trochoide Lake*, in *Ancient Geography*, a lake in the isle of Delos. It was on the borders of this lake, that, according to the mythologists, Latona was brought to bed of Apollo and Diana; and here the first of these deities had a temple.

TROCHTELFINGEN, in *Geography*, a town of Wurtemberg, lately imperial; 16 miles N.W. of Buchau. N. lat. 48° 16'. E. long. 9° 18'.—Also, a town of Germany, in the county of Oettingen, on the Eger; 4 miles S.W. of Nordlingen.

TROCHUS, in *Antiquity*, denotes the exercise or game of the hoop. The hoop was of iron, five or six feet in diameter, set on the inside with a number of iron rings. The boys and young men used to whirl this along, as our children do their hoops, directing it with a rod of iron, having a wooden handle: which rod the Grecians called ελατηρ, and the Romans *radius*. The clattering of the ring served partly to the diversion, and partly as a notice for persons to keep out of the way. Horace de Art. Poet. ranks this exercise among other manly sports:

“Ludere qui nescit, campestribus abstinet armis,
Indoctusve, pilæ, discive, trochive quiescit.”

TROCHUS, in *Natural History*, the name given by authors to a genus of shells; some of the species of which resemble the figure of the trochus, or top, which boys play with. As there are many species of this shell, however, which are flatted and have nothing of this form, the whole series of them are much better named, by a denomination taken from the shape of the mouth, which is of an oval figure, and is alike in all these species, and different from all other shells. They are therefore aptly characterized by a late French writer under the name of *cochlea ore depresso*.

The trochi, or tops, form the fifteenth family of shells in Da Costa's arrangement; and he defines them to be shells of a conic or pyramidal shape, the top being broad and flattish, and gradually tapering thence to a very sharp point; the aperture or mouth is most generally angular, low, and narrow. This is a numerous family, and abounds with curious and fine shells. See *Trochus*, under CONCHOLOGY.

There is a fossile species of trochus, not yet discovered recent. It is a large kind, flattish, and like a cochlea helix, generally about two inches in diameter, much wrinkled, with sharp prominent edges like plates, which are spiked at regular distances, running across the spires; and the whole shell is likewise striated. This trochus is found in the limestone of Coalbrook-dale in Shropshire, and Dudley in Staffordshire.

TROCKENBERG, in *Geography*, a town of the duchy of Stiria; 4 miles N.N.W. of Rein.

TROCTOU, a small island in the East Indian sea, near the coast of Queda. N. lat. 6° 30'. E. long. 99° 33'.

TROCTUS, in *Ichthyology*, a name given by Aristotle, Ælian, Athenæus, and others of the Greek writers, to the fish called *amia* by Pliny, and most other of the later, as well as ancient Latin writers; but by some, *lechia* and *glaucus*. It is properly a species of the *scomber*; which see.

TROCZENIECZ, in *Geography*, a town of Poland, in the palatinate of Braclaw; 20 miles S. of Braclaw.

TRODEN, a town of Germany, in the principality of Querfurt; 8 miles S.E. of Juterbock.

TRODNA,

TRODENA, a town of the county of Tyrol; 16 miles S.S.E. of Bolzano.

TROEZEN, or **TREZEN**, *Damala*, in *Ancient Geography*, a town situated towards the S.E. extremity of the peninsula of the Argolide, at a small distance from the sea, and at the junction of the two rivers, the Chrysothoos and the Hylycus. This town took its name from a hero, the son of Pelops, and the brother of Pitheus. The last reigned there, and was admired for his virtues and the mildness of his government. The veneration which his conduct had excited, remained to the time of Pausanias.

Troezen abounded with a variety of monuments; among which we may reckon the tomb of Pitheus in a temple constructed in honour of Diana Conservatrix by Theseus, after his return from Crete, as an acknowledgment of his having escaped the fury of the Minotaur; a portico ornamented with the statues of women and children; a chapel consecrated to the Muses, and a great number of temples. The inhabitants of Halicarnassus, in Caria, regarded Troezen as their capital. A great part of the territory of Troezen was an isthmus extending into the sea, and as far as Hermione to the W. The port lay N. of the town, and was called "Pogonis portus."

TROEZEN, a town of the Peloponnesus, in the interior of Messenia. Ptolemy.

TROEZENE, a town of Asia Minor, in Caria. Strabo.

TROGEN, in *Geography*, a town of Switzerland, and chief place of the Protestant part of the canton of Appenzell, celebrated for its manufacture of cloth. Near it is a mineral spring, containing copper, sulphur, and alum, used externally for several complaints; 7 miles S.E. of St. Gall. N. lat. 47° 14'. E. long. 9° 33'.

TROGILIUM, in *Ancient Geography*, a promontory of Asia Minor, in Ionia, W.S.W. of mount Mycale, and S.S.E. of the promontory Posidium.

TROGILUS, a country of Macedonia. Steph. Byz.

TROGLODYTES, **TROGLODYTÆ**, formed of *τρῳγλι*, *caverna*, and *δύω*, *I enter*, a people of Ethiopia, said to have lived in caves under ground.

Pomp. Mela gives a strange account of the Troglodytes. —He says, they did not so properly speak as shriek; and that they lived on serpents, &c. Tzetzes calls them *Ichthyophagi*. Montanus takes them to be the same with those called in Scripture *Ghananim*. Pintianus in Strabo will have the name written without the *l*, *Trogoditæ*.

These Troglodytes, so called by the Greeks from their primeval habitations in natural caverns, or in mountains excavated by their own labour, were probably, as sir William Jones conjectures (*Works*, vol. iii. p. 166, 8vo.) the first inhabitants of Africa, where they became in time the builders of magnificent cities, the founders of seminaries for the advancement of science and philosophy, and the inventors (if they were not rather the importers) of symbolical characters. Upon the whole he concludes, that the Ethiops of Meroë were the same people with the first Egyptians, and hence likewise, as might be easily shewn, with the original Hindoos. We have already, aided by the conjectures and historical details of the learned Bryant, and of the indefatigable traveller Bruce, traced the probable origin of these people under the article **CUSII**. Having accompanied the Cushites or Cuthites in their migrations to Abyssinia, and suggested the reason of their forming excavations in the mountains and rocks for their habitations, we shall now attend them in their peregrinations towards the south. Besides other arts, with which they seem to have been

acquainted, they employed themselves in astronomical observations; and accordingly wished to disengage themselves from the tropical rains and cloudy skies, that hindered their correspondent observations with their countrymen, descended from the same ancestors, who had established themselves at Meroë and Thebes. But upon advancing within the southern tropic, they still found rains; and, therefore, constructed houses, such as the fears of a deluge had induced them to prepare. They found solid and high mountains in a fine climate; but, more fortunate than their countrymen to the northward, they found gold and silver in large quantities, which determined their occupation, and constituted the riches and consequence of their country. In these mountains, called the "mountains of Sofala," large quantities of both metals were discovered in their pure and unmixed state, lying in globules without alloy, or any necessity of preparation or separation. The balance of trade, so long against the Arabian and African continents, turned now in their favour, from the immense influx of these precious metals, found in the mountains of Sofala, just on the verge of the southern tropical rains. The northern colonies advanced gradually from Meroë to Thebes, intent upon the improvement of architecture and building of towns, which they began to substitute for the caves which they and their ancestors, the Cushites, originally occupied; and they thus became traders, farmers, artificers in various branches, and even practical astronomers, from having a meridian night and day free from clouds, for such was that of the Thebaid. As their brethren, who still inhabited the mountains, did not enjoy similar advantages, being confined by six months' continued rain to their caves, we may naturally imagine that their sedentary life would render them useful in reducing to practical purposes the observations daily made by those of their countrymen who lived under a purer sky. Letters too, or at least one sort of them, and arithmetical characters, as we are informed, were invented by this middle portion of the Cushites; while trade and astronomy, the natural history of the winds and seasons, were employing that part of the colony which was established at Sofala, more to the southward. The very nature of the commerce of the Cushites, the collecting of gold, the gathering and preparing of spices, necessarily fixed them perpetually at home: but his profit depended on the dispersion of these spices through the continent, otherwise his mines, and the trade produced by the possession of them, would be of little avail. A carrier was necessary for the dispersion of their disposable commodities; and such they found in their own vicinity. These carriers were denominated Berbers or Shepherds, as well as distinguished by other appellations of similar import. These shepherds of the Thebaid and Ethiopia were wholly employed in the dispersion of the Arabian and African goods all over the continent; and they rose to be a great people. As that trade increased, their cattle multiplied, and consequently they increased in number, and the extent of their territory was enlarged. Nothing was more opposite than the manners and life of the Cushite, and his carrier the shepherd. The first, although he had forsaken his caves, and now lived in cities which he had built, was necessarily confined at home by his commerce, amassing gold, arranging the invoices of his spices, hunting in the season to provide himself with ivory and with food through the winter. The mountains, and the cities he afterwards built, were situated upon a loamy, black earth, so that as soon as the tropical rains began to fall, he was deprived of his cattle, by swarms of flies (see **ZIMB**) which appeared wherever that loamy earth was; which made him

absolutely dependent upon the shepherd, who was himself also affected by this circumstance. The shepherd, as a carrier, was enabled to perform his long and toilsome journeys across Africa by means of the camel, emphatically called by the Arabs "the ship of the desert." When Carthage was built, the carriage of this commercial city fell into the hands of the Lehabim, or Lubim, the Libyan peasants, and became a great accession to the trade, power, and number of the shepherds. For a further account of these shepherds, see *SHEPHERDS of Egypt*.

As the Abyssinians of the Arabian stock had no symbols of their own to represent articulate sounds, they borrowed those of the Troglodytes above mentioned; and to them we may with probability trace the origin of the Abyssinian written language, or the Ethiopic, which is a dialect of old Chaldaean, and a sister of Arabic and Hebrew; and many improvements in science and the arts, as well as in commerce, at an early period, were introduced into Africa, and through Abyssinia and Ethiopia into Egypt, by these people. It has indeed been suggested that the *Gypsies* (see the article) were Troglodytes from the rocks near Thebes, where a race of banditti still resemble them in their habits and features; but it seems more probable that the Gypsies, whom the Italians call Zingaros and Zinganos, were no other than Zingarians, who might, in some piratical expedition, have landed on the coast of Arabia or Africa, where they might have rambled to Egypt, and at length have migrated, or been driven into Europe.

TROGLODYTES is also an appellation given to a sect of Jewish idolaters.

The prophet Ezekiel relates, chap. viii. ver. 8, 9, 10, &c. that God, among other abominations of the Israelites, which he set before him, shewed him seventy old men, who, with their censers in their hands, adored secretly all kinds of animals and reptiles painted on the wall.

Philastrius, on this vision of the prophet, erects these idolaters into a sect of Israelites, who, hiding themselves under ground, and in caves, adored all kinds of idols.

And yet the prophet plainly shews, that it was in secret parts of their houses, and not in subterraneous caverns, that these seventy Israelites idolatized. The name Troglodytes, then, is feigned; and so, probably, is the sect.

TROGLODYTES, in *Ornithology*. See WREN.

TROGODOS, TROBODOS, or *Trobos*, in *Geography*, a name given by the Greeks of the present day to mount Olympus, which divides the island of Cyprus longitudinally. In order to distinguish it from another mountain of the same name in Natolia, and from another more famous in Macedonia, the ancients gave this the name of "Little Olympus." On its summit they had built a temple dedicated to Venus, the entrance of which, by a regulation very strange for a spot consecrated to the goddess of Love, was prohibited to women: they were even forbidden to look at it. To this temple, an elegant and sacred recess, where were celebrated the enjoyments of nature, had succeeded retreats erected for privations. Numbers of convents were built on the same ground. There, laborious Cœnobites embellished the slope of the mountain with gardens, and plantations of all sorts, laid out with taste. This was the most charming abode in the island; and the rich Cypriots went thither, during the summer, to enjoy the coolness of agreeable groves, watered by limpid streams, directed with considerable art. Insensible to a happy harmony of nature and industry, the Turk has carried his ferocity and ravages into this beautiful district: the monasteries have been demolished,

and cool and cheerful spots have been clothed with the rugged garb of sterility. Sonnini.

TROGON, CURUCUI, in *Ornithology*, a genus of the Picæ; the characters of which are, that the bill is shorter than the head, cultrated, hooked, and ferrated at the margin of the mandibles; the nostrils are covered with bristles; and the feet, short, simple, covered with down, are formed for climbing, having two toes forward, and two backward.

The birds of this genus are mostly inhabitants of South America: they feed on fruits, and all agree in their general habits of life. In Guiana they are denominated *Couroucous* or *Curucui*, from their notes being very much like that word.

Species.

STRIGILATUS. Cinereous, with a fulvous abdomen; wings striated with white; tail-feathers black, the three lateral ones outwardly banded and tipped with white. The cinereous curucui of Latham. Inhabits Cayenne and Guiana.

CURUCUI. Golden-green; of a fulvous red beneath; throat black; wing-coverts and the three exterior tail-feathers white, striped with black. Red-bellied curucui of Latham. Of this species there are several varieties, *viz.* one mentioned by Marcgrave, which had the wing-coverts plain brown, the bill ash-coloured, irides saffron-coloured, and without the bare spot under the eye mentioned by Brisson in his description:—another, with a yellow abdomen; the green yellow-bellied cuckoo of Edwards:—another, described and figured by Buffon, of a cinereous-grey, with very slight traces of green-gold, especially on the back and middle tail-feathers; the lower part of the belly and the vent only being red; the tail very long, having the outer webs of the three lateral feathers and the tips plain white; the three outer quills are also marked with black and white on the exterior webs. This species is a very solitary bird, being found only in the thickest forests; and in pairing time never more than two are found together, when the male has a very melancholy note, never uttered except whilst the female is sitting. They pair in April, and lay three or four white eggs. The male, during the incubation of the female, supplies her with food, and by his song helps to pass away the time. The young, when first hatched, are altogether without feathers, and are fed by the old birds with small worms, caterpillars, and insects; but are deserted by them, when they are able to shift for themselves; and the parent-birds return to their solitary haunts, till August or September, when they are prompted to produce another brood. At St. Domingo and in other islands these birds are called "Demoiselle," or "Dame Anglaise," where attempts have been made to tame them, but ineffectually, as they refuse to eat, and consequently die. They are also found in Cayenne, Peru, Brasil, and Mexico.

VIRIDIS. Golden-green; beneath yellow; throat black; with the three lateral feathers on both sides obliquely dentated with white. The yellow-bellied curucui of Latham. Of this species there is a variety, *viz.* the less, with white abdomen: the white-bellied curucui of Latham. This species inhabits Cayenne.

RUFUS. Rufous, with the body beneath yellow; wings striated with black and grey; the three lateral tail-feathers striated with black and white, with white tips. The rufous curucui of Latham. Found in Cayenne.

VIOLACEUS. Violet-coloured, with a green back; wing-coverts and secondary quills spotted with white; the three lateral tail-feathers barred with black and white, with white tips.

tips. The violet-headed curucui of Latham. Found in Cayenne.

MACULATUS. Striped with dusky and brown; crown green; wing-coverts and secondary quill-feathers green, white at the tips; tail dusky, with white bars. Spotted curucui of Latham; inhabiting Ceylon.

FASCIATUS. With a ferruginous back; body beneath fulvous red; head and neck dusky, with a white fascia on the breast; wings fasciated with black and white; apex of the tail black. Fasciated curucui of Latham; inhabiting Ceylon, but rare, and called by the inhabitants "Rautvan-kondea."

ASIATICUS. Green, with the forehead, crown, and hind part of the neck red; throat blue, with a red spot; quills and tail-feathers black. Blue-cheeked curucui of Latham; inhabiting India.

INDICUS. Dusky, with ferruginous spots above; beneath yellowish, striped with dusky; head black, with white stripes; tail very long, and barred. Indian curucui of Latham; called in India by the natives "Bungummi."

NARINA. Above green, with a red belly. *Male*, with the head, neck, back, throat, jugulum, breast, and wing-coverts green, which last are greyish behind; quills black, bordered externally with white. *Female*, with the throat, jugulum, and wing-coverts brown; abdomen in front cinerascens. Le Vaillant says, that this bird is an inhabitant of Caffraria, and the country of Auteniqua to the river Gamtoo, and that the name Narina, in the Hottentot language, signifies a flower. The female lays four nearly round eggs, and during her incubation the male has a melancholy note, but at all other times he is silent.

TROGUS POMPEIUS, in *Biography*, a Latin historian, flourished in the time of Augustus, and wrote 44 books, under the title of "Philippics," so called from their subject, which was the Macedonian empire, originating with Philip, the father of Alexander. An epitome of this work by Justin is extant. Justin denominates Trogus a man of antique eloquence, and Pliny, who often refers to him in his Natural History, distinguishes him by the appellation of "severissimus auctor," as a most exact author.

TROIA, or **TROJAN Games**, *Ludi Trojani*, were games instituted by Ascanius, son of Æneas; and which afterwards passed to the Romans, and were celebrated in the Circus by the youth of Rome.

One of the number, who presided over the solemnity, was called *princeps juventutis*; and was always of one of the first families in Rome.

At first, it is supposed, they only engaged on foot, and on horseback; because Virgil, who describes these games in the Æneid, lib. v. only speaks of horses and cavaliers, without any mention of bigæ or quadrigæ, which were not in use in Rome till long after Ascanius. And yet Dion, speaking of Cæsar's games, says, the youth there combated in chariots: but it is thought by some, that these were not the Trojan games, but races and combats of a different kind, proper for young people, of a more advanced age.

The Trojan games were renewed by Augustus, after the victory at Actium, A.U. 726; began to decline under Tiberius, and terminated under Claudius.

TROIA, in *Ancient Geography*, a town of Chaonia, in Cestria. Steph. Byz.—Also, a town or rather village of Egypt, in the vicinity of mount Troicus. This was the ancient habitation of the Trojans, who followed Menelaus to his captivity. Strabo.—Also, a town of Italy, at the bottom of the Adriatic gulf, in the country of the Veneti. Steph. Byz.—Also, a town of Asia, in Cilicia.—Also, a

place of Italy, in the territory of the town of Larentum. According to Livy, it gave name to the place where Æneas landed, on his arrival in Italy; situated, according to Dion. Halic., four stadia from the sea.

TROJA, or *Troy*, a celebrated city of Asia Minor, and capital of the small country called *Troas*, or *Troade* (which see), and Phrygia Minor, situated to the north-west. See *PHRYGIA Minor*.

TROJA, in *Geography*, a city of Naples, in Capitanata, on the river Chilare, the see of a bishop, containing six churches and six convents. It was built on an eminence, out of the ruins of Æcas, a city destroyed by Constant II. It is said to have been founded by Bagianus, catapan or viceroy of the province in the eleventh century, by order of the emperors Basil and Constantine, as a bulwark against the inroads of the Norman adventurers, and to have had its name in commemoration of the famous city, which, by its fall, immortalized the heroes of Greece. It was long accounted a key to the Apennines, and as such was exposed to many assaults and sieges; 33 miles S.W. of Manfredonia. N. lat. 41° 24'. E. long. 15° 18'.

TROJA, a small island in the Mediterranean, near the coast of Italy. N. lat. 42° 43'. E. long. 11° 5'.

TROJAN, a town of Serbia; 16 miles S. of Sabacz.

TROIL, among *Tinners*, denotes a feast, or occasion of merriment, by eating and drinking; called also a *duggle*.

TROILINSKAIA, in *Geography*, a town of Russia, in the country of the Cossacks, on the Don; 80 miles E. of Azoph.

TROIS-CINQUE, in the *French Distillery*, a term used to express their brandy, when of a peculiar strength, consisting of five parts alcohol and three parts phlegm.

The method of distilling the wines into brandy in France, is exactly the same with that used with us to draw the spirit from our wash or fermented liquor of malt, treacle, sugar, or whatever other kind. They only observe more particularly to throw a little of the natural lee into the still along with the wine; and the poorest wines are sure to succeed best on the trial, making by much the finest brandies. We are apt to wonder that we cannot, from the wines of particular countries, distil their particular brandies; but the whole mystery consists in this, that they do not send us over the same wines which they use in distilling, because these latter would not be liked as wines, nor would keep in the bringing over. Sometimes in Scotland they meet with the poor and pricked wines, the same that the French distil their brandies from; and from these they distil a spirit, not to be known from the brandy distilled in France.

The lee which the French add in the distillation gives the brandy that high flavour for which we so much esteem it: but they themselves like it so much the worse for it. The French notion of a proof strength, determined by the chaplet or crown of bubbles, is the same with ours; and all their fine spirits are found of this strength.

But they have one particular expedient for those brandies which prove foul and seedy, or retain the taste of certain weeds which grow among the wines; they draw them over again, with a design to free them from that adventitious flavour. In this operation they always leave out the faints, or rather they change the receiver as soon as ever the stream comes proof; then mixing together all that ran off before, they make a brandy stronger than the ordinary kind, and this is what they call *trois-cinque*.

The distillers in France scarcely ever bring their brandies higher than this; for they have the art to persuade the foreign merchant, that the phlegm of French brandy is

natural and essential to it: but the truth is, that the spirit alone contains the flavour and excellence of the brandy, and it might as well be reduced to half its bulk for exportation, and sent over in the state of alcohol, and then lowered with common water to the proof strength.

The French use no art in colouring their *trois-cinque*, any more than their common proof-brandy, nor do they add any thing to give them an additional flavour; the thing which they principally value themselves upon, both in regard to brandies and wines, being to make them perfectly natural: so that all the colour we find in their brandies, is acquired from the cask, and the time they are left in it. This is often twelve or eighteen months, sometimes two or three years; in this time they acquire a brown colour, and lose their acrid taste.

The greatest adulteration of brandies is in England: the French have no temptation to do it, they having no cheaper spirit, since the prohibition of molasses in their country. The Dutch are in the same condition, having no molasses-spirit, and only a very coarse and nauseous sugar-spirit, and a yet worse malt-spirit of their own manufacture; a single gallon of which would spoil a whole piece of brandy. The French brandy also paying no duty in Holland, is as cheap, or nearly so there as in France itself. The duties being high upon brandy in England, it is greatly adulterated, and that with all sorts of spirits; as malt, molasses, cyder, and sugar spirits; and when this is done in a dexterous and sparing manner, the cheat is not easily detected. Shaw's *Essay on Distillery*.

TROIS MARIES, Les, in *Geography*, a town of France, in the department of the Mouths of the Rhône, by the inhabitants of the country held a sacred place, as having been, according to tradition, the residence of the three Marias, and Lazarus after our Saviour's crucifixion; 15 miles S. of Arles.

TROIS RIVIÈRES, Les, a town of the island of Martinico.

TROIS RIVIÈRES, a town of Canada, on the river St. Lawrence, lying nearly midway between Quebec and Montreal, and so called from three rivers, into which the river St. Maurice is divided by two islands, whose streams unite about a quarter of a mile below the town, and afterwards fall into the great river of St. Lawrence. It was formerly the capital of the French government in New France, and much resorted to by several nations which come down those rivers to it, and trade in various sorts of furs. The town contains about 250 or 300 houses, and ranks as the third town, in respect of size, in the provinces. It is one of the oldest settlements in the country, and its founder, it is said, calculated upon its becoming in a short time a city of great extent. It has hitherto, however, increased but very slowly in size, nor can it be expected to improve much, at least until the country bordering upon the river St. Maurice becomes settled. The bank of iron-ore in its vicinity, which promised opulence, is nearly exhausted. The fur-trade also, from which great benefit was expected, is now almost wholly transferred to Quebec and Montreal; and it is merely the small quantity of furs brought down the St. Maurice, and some of the northern rivers that fall into the St. Lawrence, nearer to the town of Trois Rivières than to Quebec or Montreal, that is shipped there. These furs are laden on board the Montreal ships, which stop opposite to the town as they go down the river. The streets of Trois Rivières are narrow, and the houses in general small and indifferent, many of them being built of wood. In the town are two churches, an English Episcopalian, and a large Roman Catholic parish-church,

formerly served by the Recollets, or Franciscan friars, but the order is now extinct in Trois Rivières. The old monastery of the order is deserted, and the houses near it lie uninhabited. The college or monastery of the Jesuits, a large old stone-building in the same neighbourhood, has been converted into a gaol. The only religious order at present existing in the town is that of St. Ursula, the sisterhood of which is as numerous as the convent can well allow. This was founded by M. de St. Vallier, bishop of Quebec, in the year 1677: the building is spacious, and situated near that formerly belonging to the Recollets; and annexed to it under the same roof is an hospital, attended by the nuns, and containing about twelve or fourteen beds, for the convenience of patients, who are well accommodated. The sisters of this convent are particularly distinguished for their curious work made of the bark of the birch-tree, and of which they manufacture pocket-books, work-baskets, dressing-boxes, &c. which they embroider with elk-hair, dyed of the most brilliant colours. They also make models of the Indian canoes, and various warlike implements used by the Indians. Almost all the birch-bark canoes in use on the St. Lawrence and Utawa rivers, and on the nearer lakes, are manufactured in Trois Rivières, and its vicinity, by Indians. These canoes are constructed very neatly, and on the water they appear very beautiful. The canoes are so light, that two men can easily carry on their shoulders one that is capable of containing six people. Their size varies, some being sufficient for only one person, and others capable of accommodating any number as far as twenty. They are navigated with paddles, and move with surprising velocity. The country in the vicinity of Trois Rivières has been represented by some French travellers as wonderfully fertile, and as one of the most agreeable parts of Canada; but, according to Mr. Weld (*Travels through Lower Canada*, vol. ii.) it is totally the reverse. It is a level barren tract, and so sandy, that in walking along many of the streets of the town, and the roads in the neighbourhood, you sink into the land at every step above the ankles. The air also swarms with musquitoes, indicating the low damp situation of the place; 44 miles W.S.W. of Quebec. N. lat. 46° 23'. W. long. 72° 20'.

TROIS RIVIÈRES, a bay on the E. coast of the island of St. John, in the gulf of St. Lawrence.—Also, a river of St. Domingo, formed by the union of three streams, and running into the sea on the N. coast of the island, near Port Paix.

TROISSEREUX, a town of France, in the department of the Oise; 4 miles N.W. of Beauvais.

TROITZ, or *TROITSKOE Monast*, that is, *The Convent of the Holy Trinity*, a convent of Russia, which is so large, as at a little distance to have the appearance of a small town; and, like many convents in this country, is strongly fortified, according to the ancient mode of defence, being surrounded with high brick walls, strengthened with battlements and towers. Beside the convent or habitation for the monks, the walls inclose an imperial palace, and nine churches, constructed by different sovereigns. The convent is a large range of building encircling a court, and is far too spacious for the present inhabitants. It formerly contained 300 monks, together with a proportionate number of students; and was the richest ecclesiastical foundation in Russia. The fraternity possessed considerable estates, upon which were at least 100,000 peasants: these estates, as well as all the other church-lands, being now annexed to the crown, the members receive small pensions. With their revenues their number has been greatly diminished, and they scarcely amount

amount at present to 100 monks. Their habit is black, with a veil of the same colour; they eat no meat, and the discipline of the order is very strict. This convent is distinguished in the annals of this country as the asylum for the Russian sovereigns, in cases of insurrection or danger; and is more particularly known to foreigners for the refuge it afforded to Peter the Great, when he put an end to the administration of his sister Sophia; 40 miles from Moscow.

TROITZK, a town of Russia, in the government of Penza; 76 miles W.N.W. of Penza. N. lat. 54°. E. long. 43° 34'.

TROITZKOE, a town of Russia, in the government of Upha; 200 miles E. of Upha. N. lat. 54°. E. long. 61° 44'.—Also, a town of Russia, in the government of Upha; 16 miles N.E. of Sergievsk.

TROITZKOI, a town of Russia, in the government of Simbirsk; 20 miles N. of Sizran.—Also, a town of Russia, in the government of Archangel, on the Pineg; 28 miles S.E. of Pineg.—Also, a town of Russia, in the government of Upha; 40 miles N.W. of Beleebev.—Also, a town of Russia, in the government of Tobolsk, on the Oby; 204 miles N. of Tobolsk. N. lat. 61° 24'. E. long. 42° 50'.—Also, a town of Russia, in the government of Tobolsk; 40 miles N.W. of Narim.—Also, a town of Russia, in the province of Utiug; 32 miles S. of Lalsk.—Also, a town of Russia, in the government of Kostrom; 40 miles S. of Vetluga.—Also, a town of Russia, in the government of Kostrom; 12 miles N. of Vetluga.—Also, a town of Russia, in the government of Tobolsk; 14 miles N.N.E. of Tasievskoi.

TROKI, or **TROCKI**, a town of Lithuania, and capital of a palatinate to which it gives name. This town was built by the great duke Gedimin, in the year 1321, and is situated among lakes; it was formerly the residence of the great dukes, who afterwards removed their seat to Wilna. In the year 1655, it was demolished by the Russians; 16 miles W. of Wilna. N. lat. 54° 33'. E. long. 24° 44'.

TROLLHETTA, a town, or rather village, of Sweden, in West Gothland; 15 miles E.S.E. of Uddevalla. For an account of the canal of Trollhætta, see **CANAL**.

TROLLING, among *Anglers*. To troll, is to fish for pikes with a rod whose line runs on a reel. See **PIKE-FISHING**.

TROLLIUS, in *Botany*, a name given to this plant, our Globe-flower, by Conrad Gesner, which, though of barbarous etymology, has been universally retained. This might be attributed to respect for its illustrious author, were there not so many bad reasons for which barbarous names have been admitted. The derivation of *Trollius* is said to be from an obsolete German word *trol*, or *trolen*, expressing any thing globular. Hence it is synonymous with the English name of this flower; as well as with the French one, *boule d'or*. Professor Martyn says, after Haller, "*Trollblume*, in German, seems to signify a magical flower." From what we have seen and heard of the festive uses of the Globe-flower in the north of Europe, there appears to be some idea of this kind attached to it, which nevertheless may not be the origin of the name.—Linn. Gen. 282. Schreb. 378. Willd. Sp. Pl. v. 2. 1333. Mart. Mill. Dict. v. 4. Sm. Fl. Brit. 597. Ait. Hort. Kew. v. 3. 359. Pursh 391. Salis. Tr. of Linn. Soc. v. 8. 302. Juss. 233. Lamarek Illustr. t. 499. Gærtn. t. 118.—Class and order, *Polyandria Polygynia*. Nat. Ord. *Multifloris*, Linn. *Ranunculacea*, Juss.

Gen. Ch. *Cal.* none. *Cor.* Petals about fourteen, sometimes fewer, roundish-ovate, concave, converging, deciduous, three in each outer row, five in the innermost. Nectaries about nine, linear, flat, incurved, perforated at the base within side. *Stam.* Filaments numerous, linear, much shorter than the corolla; anthers linear, erect. *Pist.* Germens superior, numerous, sessile, columnar; styles short; stigmas pointed, shorter than the stamens. *Peric.* Capsules numerous, collected into a head, oblong, compressed, curved, pointed, bursting at the inner edge, of one cell. *Seeds* numerous, obovate, angular, polished, inserted along the inner edge of each valve.

Eff. Ch. Calyx none. Petals numerous. Nectaries about nine, oblong, flattened. Capsules numerous, oblong, with many seeds.

Obf. Linnæus erroneously in Gen. Pl. calls the capsules ovate and single-seeded.

1. *T. europæus*. European Globe-flower. Linn. Sp. Pl. 782. Willd. n. 1. Fl. Brit. n. 1. Engl. Bot. t. 28. Fl. Dan. t. 133. Lightf. Scot. 295. (*Ranunculus globosus*; Ger. Em. 955. R. sextus; Camer. Epit. 385. Globe Crowfoot; Petiv. Herb. Brit. t. 43. f. 2.)—Petals closely converging. Nectaries the length of the stamens.—Native of mountainous, rather moist, meadows and pastures in the north of Europe, especially Lapland, Sweden, Germany, Switzerland, Wales, the northern counties of England, and Lowlands of Scotland, flowering in May and June. The root is perennial, of many stout fibres. *Herb* smooth. *Stem* erect, two feet high, round, leafy, branched in the upper part. *Leaves* deeply divided into many wedge-shaped, deeply cut and toothed, acute, spreading lobes; the radical ones on long stalks; the rest nearly sessile, alternate. *Flowers* solitary at the naked summits of the branches, erect, globular, above an inch wide, of an elegant bright uniform yellow. *Nectaries* obtuse. *Seeds* black. Haller and Lightfoot say the flowers are fragrant, which we have not observed. The Scotch call them *Luken-gowans*, or Cabbage-daisies. In Westmoreland we have seen these flowers gathered by the peasants, with great festivity, and made into garlands for the young men and women, as well as to decorate the porches of their cottages. Linnæus mentions them as used in Sweden to strew the floors on holidays.

2. *T. asiaticus*. Asiatic Globe-flower. Linn. Sp. Pl. 782. Willd. n. 2. Ait. n. 2. Curt. Mag. t. 235. (*Heliborus aconiti folio, flore globoso croceo*; Amm. Ruth. 76. n. 101.)—Petals spreading. Nectaries nearly equal to them in length.—Native of the banks of rivers in Dauria. *Amman*.—A hardy, but not very common, perennial in our gardens, flowering in May or June. It requires a mixture of loam and bog earth, in a northern exposure, and must have due supplies of water in dry summers, for want of which we have, after several years successful cultivation, lost the plant. This species is very like the former in habit, though somewhat larger, with more copious and acute teeth, or serratures, to the leaves. The flowers however are distinguished by their spreading petals, of a rich orange-colour, and the still deeper hue of their large and numerous nectaries, almost, or quite, equal to the petals in length. The flower being much more open than in *T. europæus*, the nectaries, as well as stamens and pistils, are displayed in full view, and the whole makes a very handsome appearance.

3. *T. americanus*. American Globe-flower. Muhlent. Cat. 54. Donn. Cantabr. ed. 5. 139. (*T. laxus*; Salis. Tr. of Linn. Soc. v. 8. 303. Pursh n. 1. Ait. Epit. 375.)
—Petals

—Petals spreading, slightly concave. Nectaries hardly so long as the stamens.—Native of Pennsylvania, flowering in May. Specimens and seeds were sent us in 1793, by the late Rev. Dr. Muhlenberg, under the above name, by which he has published the plant in his *Catalogus Plantarum America Septentrionalis*. This name is so singularly apt, one species of this genus being appropriated, as it appears, to each of three quarters of the world, that, though we by no means approve of specific names taken from particular countries, on a limited scale, we cannot reject this: still less can we assent to an arbitrary change of the other two. On this subject we have the universal suffrage of botanists in our favour. The species before us is smaller than either of the other two, and seems to have scarcely more than five petals, which are obovate, and of a yellow, not orange, colour. Their spreading position sufficiently distinguishes the plant from *T. europæus*, as the shortness of the nectaries does from *asiaticus*. The capsules are short and abrupt, crowned by the rather elongated styles.

Mr. Donn mentions two other American species, by the names of *intermedius* and *hybridus*, which we presume to be varieties of *americanus*. We have observed a difference of appearance, with respect to size and colour, in plants raised from our original parcel of seeds, and Dr. Muhlenberg makes but one American species. The date of the introduction of *T. americanus* ought to be 1794, not 1805.

T. patulus, Salisb. Tr. of Linn. Soc. v. 8. 303; *Helleborus ranunculinus*, Sm. Plant. Ic. t. 37, is most evidently no *Trollius*, on account of its tubular nectaries.

TROLLIUS, in *Gardening*, comprises some hardy, herbaceous, flowery, perennial plants, as the globe ranunculus, or globe-flower, among which the species cultivated are the European globe-flower (*T. europæus*); and the Asiatic globe-flower (*T. asiaticus*).

These two plants are of a rather tall hardy growth, affording considerable ornamental effect in their large flowers, which grow in the first sort in a particular converging manner, or turn in an inward direction, or somewhat revolute mode, so as to give them a perfect globular form, from which they derive the name of globe-flower. They appear in both sorts in the beginning of summer. Those in the Asiatic or latter kind, however, are not connivent, but spread out and shew some of the inner parts, which are of a fine saffron-colour, and display a striking elegant singularity in their appearance, which renders them highly valuable for their use in the flower-garden. They are both desirable flower-plants.

Method of Culture.—The means of propagation and increase in these plants are occasionally by sowing the fresh seeds of them, and the parting of their roots.

In the former method, the seeds should be sown in shallow drills, in a somewhat shady border or other place, in the autumnal or spring seasons, covering them in to the depth of nearly half an inch, when they readily grow and produce plants for setting out in other parts.

In the latter mode, the roots should be taken up in the autumnal season, when the leaves decay and fall off, or very early in the spring months, and be divided into several parts, but not by any means into too small slips, and then be planted out either where they are to remain, or in nursery rows, where they are to continue for twelve months, when they will be ready to set out finally.

The seedling plants should be set out in summer, or towards the autumnal season, in rows about six inches asunder, where they are to continue about six or eight weeks, to become

perfectly strong, and be finally planted out in the places where they are to remain.

And the root-plants, which are set out in rows, may be removed in the autumn or spring seasons to the spots where they are finally to grow and continue.

As these plants are natives of moist and shady situations, they are generally the most successfully planted in places where the circumstances are the same in this climate, though they will commonly grow very well in any border or compartment of the garden which is not over dry, or without moisture.

These plants multiply extremely fast by the roots, and are of a great many years duration.

They are highly deserving of a situation in all curious collections in the flower-gardens and pleasure-grounds, where they have a fine effect in the clumps, borders, and other compartments.

TROMBA, in *Geography*, a small island near the coast of Istria. N. lat. 45° 3'. E. long. 13° 52'.

TROMBA, in the *Italian Music*, either denotes the common trumpet, the buccina of the ancients, or the modern facbut, but more properly our trumpet.

TROMBETAS, in *Geography*, a river of Brasil, which runs into the river of the Amazons at Pauxis.

TROMBETTA, in *Ichthyology*, a name given by the Italians to the fish commonly called *scopolax* by authors. See **TRUMPET-FISH**.

TROMBETTA, in the *Italian Music*, a small trumpet, being the diminutive of tromba.

TROMBONE, a wind-instrument blown by the mouth, and resembling in form the military trumpet, of which it is the base, the name implying the *great trumpet*. It differs, however, from the trumpet in being divided into two branches or parts fitted to sockets, giving the performer power to lengthen and shorten the general tube at his pleasure, according to the different tones which he wishes to produce. On which account it is called in Latin, *tuba ductilis*. The Germans call it *paufaune*, and the French *jacqueboute*.

Zarlini has described this instrument under the title of *trombone amovibile*, and the quantity and quality of the sounds it is capable of producing, very exactly.

“The trombone,” says he, *Supplimenti Musicali*, lib. iii. cap. 5. “is an instrument truly worthy of consideration, which I have seen and often heard by good performers, beginning at the lowest sound which it is capable of producing; when, being closed in all the joints, it can produce no sound less than the octave; then from the octave to the 5th; nor from that can it produce a less interval than the 4th; and from the 4th to the 3d major, then the 3d minor, after which another 4th, the key-note, from which it can form a complete series of eight notes. No other sounds than these can be produced without altering, moving, and lengthening the instrument.”

Père Merfenne, in his experiments on this instrument, (*Harmon. Instrum. lib. ii.*) found it capable, by lengthening or shortening the lower part of the instrument, of forming a regular series of fifteen sounds, from double C in the base, to C on the sixth line.

The instrument is made of brass, of which there are five sorts: canto, alto, tenor, base, and double-base. It is much used in the large churches of Germany. They can produce all the tones and semitones in gradation. The manner of writing for them is the same as for different voices, and on the same staff of five lines.

Canto.

Alto.

Tenor.

Bass and Double Bass.

The double-bass of this instrument goes a 5th lower than any other bass. It has the finest effect in funeral processions, and in general in melancholy strains. We never hear it with more pleasure in England than in Handel's dead march in *Saul*. Its use should be rare, and its effects would be more striking. But trombones and double-drums are now so frequently used at the opera, oratorios, and in symphonies, that they are become a nuisance to lovers of pure harmony and refined tones: for, in fact, the vibrations of these instruments produce noise, not musical sounds.

TROMELIA, in *Ancient Geography*, a town of the Peloponnesus, in Achaia Propria.

TROMNES, in *Geography*, a small island in the North sea, near the coast of Lapland. N. lat. $68^{\circ} 5'$. E. long. $15^{\circ} 26'$.

TROMP, MARTIN HARPERTZON, in *Biography*, a famous Dutch admiral, was born at the Brill in 1597. At the age of eight years he was destined for the sea-service, and was sent on board a ship bound for the East Indies. Whilst he was very young he was taken prisoner by an English pirate, with which he continued for two years, acquainting himself with the stratagems and manœuvres practised in that kind of service: and being afterwards employed in the Mediterranean, he was captured by the Turks, from whose custody he had the good fortune to make his escape. In the service of the States, he accompanied the famous Peter Hein in his various expeditions, and being his favourite, fought by his side when he was killed. By various gradations he was advanced to the rank of admiral, and in February 1639, he pursued a Spanish squadron, and in an engagement off Graveline, captured and destroyed five men of war and four frigates. In October of the same year he engaged another Spanish fleet in the Downs, and obtained a glorious victory, taking or destroying the greatest part of the fleet, though sheltered by the English. On this occasion he saved the life of Oquendo, the Spanish commander, by sending a frigate to his relief, when his own ship was sinking. His name now became famous through Europe, and the king of France enrolled him by patent among the French nobility. In 1652, Tromp and Blake, the English admiral, had a rencontre in the Downs, in consequence of which the Dutch fleet, after having sustained some loss, was obliged to retire. Having on another occasion met with a disappointment in fulfilling his orders for attacking Blake by reason of a storm, he was disgraced and recalled, and De Ruyter was appointed to supersede him; but his command was restored to him in the same year. In November he attacked Blake, commanding an inferior force, in the Downs, and after a severe engagement, obliged him to

retire into the Thames, with the loss of five ships. Tromp with some degree of arrogance triumphed, and fixed a broom on his top-mast, intimating vain-gloriously that he would sweep away the English from the Channel. This triumph, however, was of no long duration. In February 1653, the two powerful fleets of Holland and England had an engagement which lasted three days; one of which terminated in the loss of eleven men of war to the Dutch, but it is said that Tromp lost no reputation in this action. This engagement was succeeded by another off Nieuport, in which Tromp and De Ruyter mutually refused each other from imminent peril; but the termination of the contest was unfavourable to the Dutch, who suffered considerable loss. These two Dutch commanders made complaints to the States of the insufficiency of their equipment, and great exertions were made to supply them with both ships and men. In July, Tromp with eighty-five ships descried the English fleet with ninety-four; but before they could come to an engagement, which was prevented by a storm, the Dutch fleet was augmented to 120 sail. On the 6th of August the contending fleets rushed to action. The first day was indecisive: the second was unfavourable to Tromp, who, according to his usual practice, pierced the enemy's line, and was surrounded, being deserted by his own squadron. Whilst he was fighting with desperate valour, he fell by a musket-shot, as he was giving orders on the deck; exclaiming, before he expired, "Take courage, my lads, I have run my course with glory!" The Dutch seamen, having lost their commander, could not be re-animated, and a disastrous, though dearly bought, defeat closed the day, and also the war. The remains of Tromp were interred with funeral honours in the church at Delft, and a magnificent mausoleum was erected to his memory. Un. Hist. Moreri.

TROMP, CORNELIUS, the second son of the preceding, was born at Rotterdam in 1629, and having been educated with a view to the navy, he was appointed, at the age of 19, to the command of a ship of war against the Corsairs on the Barbary coast. When the war broke out between England and the United Provinces in 1665, he was one of the admirals in the sea-fight off Solebay, when the Dutch fleet was defeated, though by his masterly retreat the victors were prevented from making the most of their success. In some subsequent engagements Tromp distinguished himself by his valour, though not always unblended with temerity, and seldom with any great success. Complained of by De Ruyter, who was superior in command, he was superseded; nor was he again employed till the year 1673, when the two rival admirals, being reconciled, fought

in concert and mutual assistance in the engagements with the French and English, off the Dutch coast, in June and August. After peace with England had taken place, Tromp, in 1675, visited London, and being honourably received, was made a baronet by Charles II. Having this year conducted a fleet to succour Denmark in its war with Sweden, he was invested by the king with the order of the Elephant. Upon the death of De Ruyter, in 1677, he was appointed his successor as lieutenant-admiral-general of the United Provinces. He continued, however, in the service of Denmark, and at the peace withdrew from the navy; but in 1691, when the war with France was renewed, he resumed his command. Whilst a fleet was sitting out, he was seized by a disease which terminated his life at Amsterdam, on the 29th of May, in his 62d year. His remains were deposited in the magnificent tomb of his father at Delft. Un. Hist. Moreri.

TROMPE, in the *Manege*. See DECEIVED.

TROMPERWICK, *Gulf of*, in *Geography*, a bay of the Baltic, on the north-east coast of the island of Usedom; a dangerous road for vessels which are driven thither by the wind, or misguided by darknefs. N. lat. 54° 40'. E. long. 13° 40'.

TROMSOË, an islet on the coast of Lapland, near the Storlennüs, or Great Rocky Cape; *flor*, in the Scandinavian dialect, signifying great, and hence probably are derived our words *store* and *store-house*. Here, in the latitude of 69° 38', a village has been lately founded under the protection of the Danish government, and endowed with peculiar privileges and immunities; being intended to facilitate the exchange of commodities, and to diffuse the benefits of civilization over these sequestered regions. For two whole months at Tromsoë the sun never sets; and as he wheels his oblique apparent course, he skirts the northern horizon at midnight, and again attends with fiercer beams in progress of the day, the sky being, with little variation, bright and cloudless. The change of temperature is confined to a very narrow range. The greatest heat, on the 15th of July, was observed at 2 o'clock in the afternoon, when the thermometer rose to 61° or 62° of Fahrenheit, and the greatest cold at 1 o'clock in the morning, when the thermometer stood at 50° or 52°. This low islet is covered with birches, though the prospect was saddened by patches of snow lying still unmelted in the streets, the gardens, and the fields. Von Buch's Travels in Norway and Lapland.

TRONAGE, TRONAGIUM, an ancient custom, or toll, paid for the weighing of wool.

The word comes from *trona*, an old name for a beam used in weighing.

TRONATOR, an officer of the city of London, whose business it was to weigh the wool brought into that city.

TRONCHIN, THEODORE, in *Biography*, a celebrated physician, was born at Geneva in 1709, and being disappointed in his expectations from lord Bolingbroke when he visited in England, he repaired to Leyden in order to study under Boerhaave, whose Elements of Chemistry he had perused; and after passing through a course of medical instruction, he graduated M. D. in 1730, publishing on the occasion a dissertation "De Nympha," patronized by Boerhaave. He settled at Amsterdam, and became a member of the college of physicians and an inspector of hospitals. Here he distinguished himself as a zealous promoter of inoculation. In 1754 he returned to Geneva, and ranked among the most distinguished practitioners in Europe, not only on account of his established reputation, but from the number and quality of his patients. His native city erected

in his favour a chair of medicine, and the Society of Pastors admitted him into their body. He was employed by the duke of Orleans in the inoculation of his children, and by other persons of rank at Paris: and in 1763 he went to Parma, for the purpose of inoculating the family of the duke. Although he declined to comply with the invitation of the empress of Russia to spend two years at Petersburg, he accepted, in 1766, the offer of being principal physician to the duke of Orleans. His practice was simple, administering few medicines, and relying chiefly on diet and regimen, with the regulation of the passions and affections. In nervous complaints abounding in a luxurious capital, he recommended temperance and exercise. With the practice of inoculation, he patronized the cool treatment in the natural small-pox, and also the free admission of air in other diseases. On mothers he urged the suckling of their children. In the exercise of his profession he was exemplary for his humanity and charity. In conversation he was mild and modest, and in his manners agreeable and polite. He had little time for writing: but besides his inaugural dissertation already mentioned, he published a treatise "De Colica Pictonum," in 1757, and he contributed several articles to the "Encyclopædia," and to the "Memoirs of the Academy of Surgery." Of the works of Baillou, he gave an edition in 1762, with a preface on the state of medicine. He had the honour of being enrolled as a member of the chief medical and scientific societies in Europe. He died at Paris in 1781, in the 73d year of his age. Nouv. Dict. Hist. Gen. Biog.

TRONCO, in the *Italian Music*, by the French called *coup de grace*, is used to intimate to the voices as well as instruments, that they are not to draw out the sound to its natural length, but cut it short; that is, only continue it long enough to be heard, by which means there is a small silence between each sound; which has a very good effect in expressions of grief, to make signs; and also in expressions of wonder and surprize, &c.

TRONCONNÉE, or TRONCONNÉ, in *Heraldry*, denotes a cross or other thing, cut in pieces, and dismembered; yet so as that all the pieces keep up the form of a cross, though set at a small distance from one another.

TRONE, in *Agriculture*, a term applied provincially to a drain or small trench of that kind, in some places.

TRONE, in *Geography*, a town of Sweden, in Helsingland; 7 miles N.W. of Soderhamn.

TRONE Pound, in Scotland, contains twenty Scotch ounces. But because it is usual to allow one to the score, the trone pound is commonly twenty-one ounces.

TRONE Stone, in Scotland, according to sir John Skene, contains nineteen pounds and a half.

TRONE Weight was the same with what we now call *troy weight*.

TRONECKEN, in *Geography*, a town of France, in the department of the Sarre; 12 miles S.S.E. of Traarbach.

TRONINGE, a town of Sweden, in the province of Halland; 8 miles E. of Halmstad.

TRONIS, in *Ancient Geography*, a country of Greece, in the Phocide, which contained many ancient monuments.

TRONQUIÈRE, LA, in *Geography*, a town of France, in the department of the Lot; 12 miles N. of Figeac.

TRONTO, a river which forms a boundary between the marquise of Ancona and the province of Abruzzo Ultra, and runs into the Adriatic, N. lat. 42° 52'. E. long. 13° 59'.

TRONUM, in *Ancient Geography*, a place on the route from Dyrrachium to Salome, between Pons Tiluri and Biludium. Anton Itin.

TRONZAN,

TRONZAN, in *Geography*, a town of France, in the department of the Po; 7 miles N.W. of Turin.

TROO, a town of France, in the department of the Loir and Cher; 10 miles S.W. of Vendôme.

TROON BAY, a bay on the W. coast of Scotland, and county of Ayr; N. of Troon Point.

TROON Point, a cape on the W. coast of Scotland, and county of Ayr. N. lat. $55^{\circ} 36'$. W. long. $4^{\circ} 36'$.

TROONGOOMBA, a town of Africa, in the kingdom of Ludamar; 12 miles S.W. of Benown.

TROOP, a small body of horse, or dragoons, usually about fifty or sixty; commanded by a captain, captain-lieutenant, cornet, quarter-master, and three or four corporals, who are the lowest officers in a troop; answering to a company of foot.

TROOP, *Independent*, is a troop that is not embodied in, or joined with, any regiment.

TROOP, *To beat the*, is the same with beating the assembly.

TROOPS of the Household. See HOUSEHOLD.

TROOP-Ship, is generally used to conduct troops from one place to another.

TROOPER, in the *Military Art*, a private man in a troop of horse.

TROPÆA, in *Mythology*, a name given to Juno, because she was thought to preside over triumphs; and in these ceremonies sacrifices were offered to her.

TROPÆA, in *Ancient Geography*, a town of Italy, in Brutium, towards the west. As the name signifies trophy, it is thought that the place assumed it after a victory gained here by Sextus Pompeius.

TROPÆA Drufi, a town of Germany, according to Ptolemy, situated between the Sala and the Rhine, in the place where Drusus died; though this fact is questioned on the authority of Dion Cassius, l. xv. Tacitus reports that it was the place where Tiberius was saluted emperor by the Roman army. The Romans were accustomed, after their victory, to raise a trophy, consisting of the arms of the vanquished, and to inscribe on its base the names of all the nations which had participated in the defeat: and in process of time this trophy became a town.

TROPÆA Pollucis, or *Trophies of Pollux*, were situated in Sparta, beyond the temple of Esculapius, according to Pausanias, who adds, that Pollux erected them after a victory which he gained over Lynceum.

TROPÆA Pompeii, a name given to a monument erected by Pompey, after having terminated the war of Spain against Sertorius, upon which he caused to be inscribed, according to Pliny, that from the Alps to the extremity of Farther Spain, he had subdued 876 towns. This monument was adorned with the spoils which had been preserved, and on this account Strabo (l. iii. p. 156.) designates it by the term *αναθρομια*. It was situated on the way which entered Spain by the plain of Juncaria, at the distance of sixty-three miles from Narbonne.

TROPÆA Romanorum & Syllæ, the trophies of the Romans and of Sylla, were erected by the Romans and by Sylla on the plain of Cheronæa, in Bœotia, to commemorate a victory obtained over Taxilus, general of the army of Mithridates. Pausanias.

TROPÆA, a town of the Peloponnesus, in Arcadia, upon the route from Psophis to Telphusa, to the left of Ladon, and near the wood called Aphrodisium. Pausanias.

TROPÆA Augusti, a town of Italy, in Liguria, according to Ptolemy, near Portus Herculis.

TROPÆA Augusti, or *Trophies of Augustus*, situated near the sea, between Nice and Portus Herculis.

TROPÆOLUM, in *Botany*, the diminutive of *tropæum*,

or *τρωπαιον*, a warlike trophy. This fanciful but elegant name was chosen by Linnæus, in *Hort. Cliff.* 143, for the present singular and striking genus, because he conceived the shield-like leaves, and the brilliant flowers, shaped like golden helmets, pierced through and through, and stained with blood, might very well justify such an allusion. Particularly when the plants are ostentatiously trained over the trellis or alcove of a garden, as is commonly the case. The names of *Nasturtium indicum*, *Cardaminum*, and *Acriviola*, given by preceding botanists, in reference to the cress-like flavour of the herbage, are all liable to exception, for various reasons, explained in the *Philosophia Botanica*. It is remarkable that the first of these has remained, as the popular appellation of this genus; though Indian Cress, conveying the same idea in English, with more precision, is preferable. —Linn. Gen. 186. Schreb. 249. Willd. Sp. Pl. v. 2. 298. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 2. 339. Juss. 269. Lamarck Illustr. t. 277. Gært. t. 79. (*Cardaminum*; Tourn. t. 244. *Acriviola*; Boerh. Lugd.-Bat. ed. 2. v. 1. 244.)—Class and order, *Oxandria Monogynia*. Nat. Ord. *Tribilata*, Linn. *Geraniis affine*, Juss. Rather, in our opinion, totally undetermined.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, five-cleft, slightly spreading, acute, coloured, deciduous; two inferior segments narrowest; base elongated behind into a straight, tubular, awl-shaped, closed nectary, longer than the segments. *Cor.* Petals five, roundish, inserted between the segments of the calyx; the two uppermost sessile; three lower with oblong fringed claws. *Stam.* Filaments eight, awl-shaped, short, unequal, declining; anthers oblong, straight, ascending. *Pist.* Germen superior, roundish, three-lobed, striated; style simple, erect, the length of the stamens; stigma in three acute segments. *Peric.* Berries three, combined, dry and leathery; externally convex, deeply furrowed and wrinkled; internally angular. *Seeds* solitary, roundish, agreeing nearly with the shape of the berries; their coat simple, very thin.

Eff. Ch. Calyx of one leaf, with a nectariferous spur behind. Petals five, unequal. Berries three, dry, coriaceous.

Obf. Willdenow and Hort. Kew. have, by mistake, "petals four."

1. *T. minus*. Small Indian-cress or Nasturtium. Linn. Sp. Pl. 490. Willd. n. 1. Ait. n. 1. Curt. Mag. t. 98. (*Cardaminum minus et vulgare*; Feuill. Peruv. v. 3. 14. t. 8. f. 2. *Nasturtium indicum*; Lob. Ic. 616. Ger. Em. 252.)—Leaves peltate, slightly wavy; their angles bristle-pointed. Petals acute.—Native of Peru, from whence its seeds were brought very early to Europe. Gerard cultivated this species, but it has been supplanted by the following in our gardens. The writer of this found it in general cultivation about Geneva, in 1787, and restored it to the English collections. Like the rest of the present genus, this plant is a hardy annual in the natural climate of Europe, though perennial, if sheltered from frost. The stems are branched, lax and twining, many feet in length, round, smooth, leafy. Leaves scattered, roundish, somewhat laterally peltate, wavy, angular, entire, smooth; their ribs radiating from the spot where the long wavy footstalk is inserted. Flowers axillary, solitary, on long simple stalks resembling the footstalks: their colour a deep yellow, variegated and streaked with orange and red. The calyx is coloured like the petals; its spur near an inch and half long. Petals about an inch. Fruit greenish. The whole plant has a hot pungent taste, resembling cresses of various kinds. The flowers are slightly fragrant.

2. *T. majus*. Great Indian-cress or Nasturtium. Linn. Sp.

Sp. Pl. 490. Willd. n. 2. Ait. n. 2. Curt. Mag. t. 23. (*Cardaminum ampliori folio, et majori flore*; Feuill. Peruv. v. 3. 14. t. 8. f. 1. *Viola indica scandens, nasturtii fapore, maxima odorata*; Herin. Lugd.-Bat. 628. t. 629.)—Leaves peltate, wavy, with blunt naked angles. Petals obtuse.—From the same country. Introduced into England in 1686, as appears by the manuscripts of Peter Collinson. This is now the most commonly cultivated species, seen in every cottage garden; as it rises, without any care, from self-sown seeds. The flowers are abundant from June till the whole plant perishes by the autumnal frosts. This species is larger than the foregoing, especially its petals, which are also much more rounded and obtuse. A daughter of Linnæus is recorded as having observed a kind of flashing light from these flowers in an evening. We have watched for this phenomenon, but know not whether we ever perceived it, or whether our eyes were merely dazzled by the brilliancy of the colours. The seeds are hot and pungent, much used for pickles; and the flowers are often intermixed with salad herbs, both for ornament and flavour.

There is a double-flowered perennial variety of this species, common in greenhouses, and readily increased by cuttings.

Another variety, with small jagged petals, called *T. pinnatum* in Andr. Repos. t. 535, and Ait. Epit. 375, came up under our inspection in a bed of the common *T. majus*, and having been immediately sent to Messrs. Lee and Kennedy at Hammer Smith, in 1800, was preserved, and dispersed by cuttings all over the kingdom. It scarcely ever attempts to form any seed, and is cultivated just like the double kind, on whose botanical history, and origin, it appears to throw considerable light.

3. *T. hybridum*. Mule Indian-crefs or Nasturtium. Linn. Mant. 64. Willd. n. 3. "Berg. Act. Holm. for 1765. 32. t. 1."—Leaves wedge-shaped, five-lobed, entire, scarcely peltate.—A variety of the last, which, according to Linnæus, sprung up accidentally in a garden at Stockholm. It rarely produced seed in the Upsal garden, but was propagated by cuttings. A seedling plant however is preserved in the Linnæan herbarium. The leaves are palmate, but wedge-shaped at the base, deflexed, on very long slender footstalks, whose insertion is quite at the bottom, nor do we find a single leaf in any degree peltate. The nectary is said to be obtuse; the corolla scarcely ever of any determinate form. We retain this as a species, merely in conformity to our predecessors. Its history is presumed to be authentic; but a few varieties are more extraordinary.

4. *T. peregrinum*. Fringed Indian-crefs or Nasturtium. Linn. Syst. Nat. ed. 10. v. 2. 998. Mant. 2. 371. Hellen. Diff. 18. Willd. n. 4, excluding the synonym of Jacquin, and perhaps of Feuillée.—Leaves peltate, palmate, deeply five-lobed. Petals all jagged and fringed. Nectary straight, about twice the length of the corolla.—Native of New Granada, from whence it was sent by Mutis and his pupils to Linnæus, who also received a garden specimen from his friend Duchesne. This species is not known in England. The leaves are all slightly, but uniformly, peltate, with five, rarely seven, deep lobes, various in breadth and acuteness, the middle one sometimes three-cleft, the two next occasionally having a lateral external lobe. Flowers rather smaller than in *T. minus*, though the nectary is as long, and of the same taper form, scarcely curved, and by no means hooked. Petals unequal in size, all deeply and irregularly lacinated, with fine capillary segments. We find these segments variable in breadth, like the foliage, in our numerous native specimens, but their general aspect is the same. Lamarck's t. 277. f. 3, represents this plant. Feuillée's plate and de-

scription, if good for any thing, must belong to a different species, or variety, three of whose petals are very small, and quite entire. His nectary is too imperfectly drawn for us to determine any character from thence. We have seen in the foregoing species how liable the petals are to the most extraordinary variation, so that we dare not, from Feuillée's figure alone, attempt to define his as a distinct species.

5. *T. aduncum*. Hooked Indian-crefs or Nasturtium. Sm. Tour on the Continent, ed. 1. v. 1. 158. ed. 2. v. 1. 165. (*T. peregrinum*; Willd. n. 4. Ait. n. 3. Jacq. Hort. Schoenbr. v. 1. 51. t. 98. Andr. Repos. t. 617. Curt. Mag. t. 1351.)—Leaves peltate, palmate, deeply five-lobed. Two petals jagged; three smaller fringed. Nectary hooked, the length of the larger petals.—Native of Peru. Cultivated in the open air at Gibraltar, where it is called the Canary-bird flower, and perhaps in other parts of Spain. In Germany, England, and even the south of France, this is a greenhouse plant, very tender with us, and seldom ripening seed. The leaves do not much differ from the real *T. peregrinum*, but the flowers are constantly very distinct, nor do any specimens or figures, that we have seen, shew them to be variable in any degree worthy of notice. Their calyx is pale green, with a remarkably hooked spur, hardly an inch long if it could be straightened. Petals lemon-coloured; the two uppermost deeply jagged, rarely hair-pointed; three lower much smaller, oblong, undivided, copiously fringed. Jacquin's figure displays a luxuriance of foliage greater than we have met with, some leaves having seven, more or less pinnatifid, lobes. There can be no doubt of this being a very distinct species. A figure of it was drawn for the 30th plate of our *Spicilegium Botanicum*, but that work never proceeded to a third fasciculus, and the figure would now be superfluous.

6. *T. pentaphyllum*. Five-leaved Indian-crefs or Nasturtium. Lamarck Dict. v. 1. 612. Illustr. t. 277. f. 2. Willd. n. 5. (*T. quinatum*; Hellen. Diff. 20. t. 1.)—Leaves quinate; leaflets ovate, entire, stalked. Petals undivided, shorter than the segments of the calyx.—Gathered by Commerfon at Buenos Ayres, where this elegant and singular species climbs amongst Indian figs, and other shrubs, according to a manuscript note before us. The stem is slender, clothed with numerous, irregularly scattered, leaves, on footstalks an inch or an inch and a half long; leaflets on short partial stalks, acute, all undivided; the central one an inch in length; the two nearest the stalk not half so large. Flowers numerous, solitary, on axillary stalks extending rather beyond the leaves. Tube of the calyx above an inch long, conical, deep orange-coloured, contracted towards the end, which is oval; segments about a quarter as long, ovate, acute, green towards the point, two of them prominent, and rather larger than the rest. Petals not discernible in the flowers we have examined. Professor Hellenius describes them "ovate, entire, nearly sessile, a quarter the length of the segments of the calyx;" which answers to Lamarck's definition.

Three more species of this genus are described in the *Flora Peruviana*, one of them having only two petals; but of these no specimens have fallen under our inspection.

TROPÆOLUM, in Gardening, furnishes plants of the herbaceous, annual, and perennial, trailing and climbing kinds, among which the species cultivated are the small Indian crefs or nasturtium (*T. minus*); and the great Indian crefs or nasturtium (*T. majus*).

In the first sort, there are varieties with deep orange-coloured flowers inclined to red, with pale yellow flowers, and with double flowers.

And in the second kind, there are varieties with pale yellow

yellow flowers, orange-coloured flowers, and the double-flowered.

It may be noticed that they are both natives of Peru, and commonly esteemed to be annual plants, though they may be continued through the winter, if they are kept in pots, and sheltered in a greenhouse or glass-case, in the same manner as the variety with double flowers.

The stalks will climb six or eight feet high, when they are trained up, and thus the flowers make a good appearance; but when they trail upon the ground, they will spread over the neighbouring plants and become unsightly: the flowers are frequently eaten in sallads; they have a warm taste, like the garden cress, and hence the plant has its common name nasturtium; they are likewise used for garnishing dishes: the seeds are pickled, and by some are preferred to most pickles for sauce, under the false name of capers.

Method of Culture.—These plants, in all the single varieties, may be increased by seeds, which should be sown in the spring in patches where they are to flower in the borders, or in drills in the garden.

They afterwards only require to be kept free from weeds, and to be well supported by sticks.

The double variety must be increased by planting cuttings of the branches in pots of light mould in the early part of the summer, placing them in the shade, and giving frequent light waterings, but not too freely in the winter months: those planted early may be rendered more forward by being plunged in a moderate hot-bed.

It requires to be protected in the greenhouse in the winter, being well supported with sticks.

Both the sorts are cultivated in the garden as flowering plants, and for culinary uses in sallads and pickles, being often in the former view trained against fences and walls, or to run on treillages, railings, palings, hedges, the sides of arbours, and some other kinds of supports. Also to run on branchy sticks set in the borders and other parts.

In the latter intention, the common single sorts and varieties are often grown, which supply young tender leaves and berries that are much esteemed by some for the purpose of eating, the former as a warm relishing agreeable sallad article, and the latter as a very pleasant sort of pickle while young and fresh. The flowers are also warm in their taste, and afford a very ornamental garnish, in many cases, both for sallad dishes and those of the meat kind. When the plants are raised in these views, the seeds should be sown in the small compartments of the kitchen garden in the later spring months, in small patches or shallow drills to the depth of an inch, and the plants when up have the support of a few branchy sticks, by which means they afford supplies in each of these ways for two or three months.

They all afford variety in the borders, clumps, &c. in the summer, and the double sorts among potted plants.

TROPÆUM *Q. Fabii Maximi Æmiliani*, the trophies of Fabius, &c. in *Ancient Geography*, were situated, according to Strabo, near the place where the Isere discharges itself into the Rhone, and on this spot 30,000 Romans, commanded by Fabius, defeated 200,000 Gauls, in commemoration of which, the general caused to be erected on the field of battle a trophy of white stone.

TROPÆUS, in *Mythology*, a name given to Jupiter, for the same reason that Tropæa was given to Juno.

TROPATENA, in *Ancient Geography*, a country of Asia, extending, according to Ptolemy, from the territory of the Geli-Margasi to that of the Amariaci.

TROPE, Tropus, in *Rhetoric*, a word or expression used in a different sense from what it properly signifies.—

Or, a word changed from its proper and natural signification to another, with some advantage.

As when we say an *asi*, for a *stupid person*; *thunder-bolt of war*, for a *great captain*; to *wash the blackamoor white*, for a *fruitless undertaking*.

This change of sense is never to be used, but where it gives a force and dignity, or renders the discourse more significant, weighty, and graceful.

It is called *trope*, τροπος, from the Greek, τροπος, *verto*, *I change*; because the words are here transferred from the things they properly import, to others which they only import indirectly: and that tropes only signify the things they are applied to, by reason of the connection and relation those things have with those others, whose proper names they are.

This change, or inversion, is performed various ways; but chiefly four: whence arise four principal tropes; *viz.* the *Metaphor*, *Metonymy*, *Synecdoche*, and *Irony*; which see respectively.

Some authors confound trope with figure; but they are very different things. Most authors, as F. de Colonia, &c. make figure the genus, and trope a species; defining figure to be, an ornament in discourse, by which it is raised above the common language; and trope to be that peculiar kind of ornament which consists in the change of the sense, &c.

But Vossius makes trope and figure to be two collateral and independent things; defining trope to be the change of the sense, &c. and figure to be any ornament, except what becomes so by such change, &c. See *FIGURE*.

With regard to the difference between tropes and figures we may observe, that tropes mostly affect single words, but figures whole sentences: a trope conveys two ideas to the mind by means of one word; but a figure throws the sentence into a different form from the common and usual manner of expression; and besides, tropes are chiefly designed to represent our thoughts, but figures our passions. The reasons which have occasioned the introduction of tropes are, according to Quintilian, three: *viz.* necessity, emphasis, and beauty. Tropes were first introduced from necessity, because no language contains a sufficient number of proper words to express all the different conceptions of our minds. Tropes do also on many occasions express things with greater force and evidence than can be done by proper words; thus when Virgil (*Æn.* lib. vi. v. 842.) calls the Scipios two thunder-bolts of war, he gives us a more lively image of the rapid force and speedy success of their arms, than could have been conveyed by a long description in plain words. And moreover, beauty and ornament have been another cause of the use of tropes: and it is the business of an orator to entertain his hearers, at the same time that he instructs them. Accordingly some subjects require a more florid and elegant address than others, and variety of expression is also pleasing in a discourse.

The following directions, however, are proper to be observed in the choice of tropes. As every trope gives us two ideas, one of the word expressed, and another which by means of that the mind connects with it: it is necessary that the relation between these two should appear very plain and evident; for an obscure trope is always faulty, unless where some particular reason makes it necessary; and therefore tropes ought not to be too far-fetched, lest they should thus be rendered obscure.—Again, as a trope ought to be very plain and evident, so likewise should it bear a due proportion to the thing it is designed to represent, so as neither to heighten nor diminish the just idea of it. Poets, however, are allowed a greater liberty in this respect than orators. Farther, as a moderate use of tropes, justly applied,

beautifies and enlivens a discourse, so an excess of them causes obscurity, by running it into abstruse allegories and riddles. Moreover, as one use of tropes is pleasure and entertainment, we should endeavour to make use of such as are smooth and easy; and if it should be necessary to use a harsh trope, it is proper to soften it by some precaution. Finally, care should be taken how we transfer tropes from one language into another. It was customary for the Roman soldiers to carry their money in their girdles; hence it was the same thing with them to say, *a person had lost his girdle* (Hor. Ep. lib. ii. ep. 3.), as that *he had lost his money*. And because the Romans wore the toga in time of peace, and a different garb when engaged in war, their writers sometimes use the word toga to signify peace. But as neither of these customs is in use among us, so neither would the tropes suit our language, or be generally understood by us. There is also a beautiful trope in the account of St. Paul's shipwreck, in the use of the word *αντοφθιλμειν* (Acts, ch. xxvii. v. 15.) which we translate to *bear up* into the wind, but which properly signifies to *look or keep its eyes against* it: to this purpose Plutarch says of Demosthenes, that he could not *αντοφθιλμειν τω αεγυριω*, *look against or resist the power of money*. Ward's Orat. vol. i. lect. 25. See also on this subject, Blair's Lect. vol. i. lect. 14.

Besides the four capital tropes above-mentioned, there are several inferior ones. When the trope is too bold, it is called an *hyperbole*; when continued, it is an *allegory*; when too obscure, an *enigma*; when it shocks us, or is too remote, a *catachresis*.

Add to these, other tropes: as the *metalepsis*, *antonomasia*, and *litotes*, or *extenuation*. See *METALEPSIS*, &c.

Some also refer the six kinds of scoffing, or derision, to the tropes; *viz.* the *sarcasm*, *diasym*, *charientism*, *ateism*, *mysterism*, and *mimicis*; but this without sufficient reason. See *SARCASM*, *IRONY*, &c.

TROPEA, in *Geography*, a town of Naples, in Calabria Ultra, built on a rock near the sea-coast, the see of a bishop, suffragan of Reggio. It contains five parish-churches, eleven convents, and about 4000 inhabitants, of whom the most wealthy and the handicraftsmen reside within the walls, whilst the husbandmen and labourers dwell in the outskirts, on the lands which they cultivate. Its situation is admirable, on the point of a lofty rock impending over the sea, and joined to the main land by an isthmus that is almost cut through at the gates, and thus leaves only a small passage to the town. A little to the N. lies a large island, on which some sheep are turned to graze, and a small one, with a hermitage placed on its summit, in a most romantic position. The streets of Tropea are narrow, the houses high, and built of stone, with great solidity. Two gates give admittance, one to those who come up the hill from the bay, and the other to such as approach along the high plain, on which is a pleasant walk near two miles long. This level is half a mile broad between the sea and a chain of mountains so steep and rugged, that they apparently cut off all communication by land with the rest of Calabria. The whole flat, and sides of the hills, yield abundance of grapes, mulberries, olives, pulse, vegetables, and garden-fruit. Copious streams rush from the mountains, and after watering the orchards, are collected into one body, and turn a great number of mills. In 1783, it suffered greatly from an earthquake; 37 miles N.N.E. of Reggio. N. lat. 38° 40'. E. long. 16° 13'.

TROPER, in our *Old Writers*, is used for a book of alternate turns and responses in singing mas. Lindewode calls it *liber sequentiarum*.

TROPHIS, in *Botany*, from τροφή, or τροφή, *food, fodder*,

&c. because cattle feed on the leaves and young branches; when there is a scarcity of grafs, in the woody parts of Jamaica.—Browne Jam. 357. Linn. Gen. 516. Schreb. 679. Willd. Sp. Pl. v. 4. 733. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 5. 370. Juss. 442. Lamarck Illustr. t. 806. (Bucephalon; Plum. Gen. 52. t. 20. Linn. Gen. 575.)—Clafs and order, *Dioecia Tetrاندria*. Nat. Ord. *Calycifloræ*, Linn. *Uncertain*, Juss.

Gen. Ch. Male, *Cal.* none. *Cor.* Petals four, obtuse, spreading. *Stam.* Filaments four, capillary, longer than the petals; anthers of two globular lobes.

Female on a separate tree, *Cal.* inferior, of one leaf, undivided or two-lobed. *Cor.* either wanting, or of four concave, roundish petals, closely embracing the germen. *Pist.* Germen ovate, of four cells; style short, thread-shaped; stigmas two, awl-shaped, spreading. *Peric.* Berry nearly globular, corrugated, of one cell. *Seeds* from one to four, roundish, with a brittle skin.

Ess. Ch. Male, *Calyx* none. *Petals* four.

Female, *Calyx* of one leaf. *Petals* four, or none. *Stigmas* two, awl-shaped. *Berry* superior. *Seeds* one to four.

Obs. Nothing can be more obscure or uncertain than the history of this genus, nor do we feel, by any means, confident that the plants assembled under it agree in natural, or essential, characters. We must content ourselves with giving the best account of them in our power, after having to far new-modelled the generic character as to avoid palpable contradictions.

1. *T. americana*. Ramoon Tree of Jamaica, or West Indian Trophis. Linn. Sp. Pl. 1451. Am. Acad. v. 5. 410. Willd. n. 1. Ait. n. 1. Swartz Obf. 372. (*T. foliis oblongo-ovatis glabris alternis, floribus masculinis spicatis ad alas*; Browne Jam. 357. t. 37. f. 1. Bucephalon racemosum; Linn. Sp. Pl. 1661. B. fructu racemoso rubro; Plum. Ic. 55. t. 67. f. 1.)—Thorns none. Leaves ovate, pointed, entire, smooth. Berry oval, furrowed, with a simple point, and solitary seed.—Native of dry exposed situations in the West Indies, flowering in spring. Swartz. A tree, about twenty feet high. Leaves alternate, on shortish furrowed stalks; rounded at the base; about four inches long, with one rib and several transverse interbranching reticulated veins. Spikes axillary, stalked, solitary, many-flowered, much shorter than the leaves, somewhat downy, pale; the female ones shortest. Berries spiked, sessile, the size of large grapes, oval, with four furrows, and of a pleasant flavour. Swartz says, the trunk and branches, when wounded, discharge a very white, viscid, milky juice. He, as well as Browne, assert the foliage and young shoots to afford an agreeable wholesome fodder for all sorts of cattle.

2. *T. laurifolia*. Laurel-leaved Trophis. Willd. n. 2.—Thorns none. Leaves elliptic-oblong, acute at each end, smooth, entire. Berry with two horns, and two or four seeds.—Native of Quito and New Granada. A tree, with thick, nearly round, branches. Leaves alternate, stalked, three inches or more in length, tapering at each end, coriaceous, smooth on both sides; shining above; pale beneath. Clusters axillary, the length of the footstalks. Fruit globose, crowned with two distant, awl-shaped, inflexed horns, rather longer than the fruit itself. Seeds obovate; two only, according to Willdenow; four in a drawing sent by Mutis to Linnæus, which the latter has marked *Bucephalon*, and which answers so exactly to Willdenow's description of the plant gathered in Quito by Humboldt and Bonpland, that we can have no doubt of its being done from the same species. In contemplating Willdenow's specific characters

of this and the foregoing, we cannot help thinking that he took for the fruit of *T. americana*, the nut of *Trapa bicornis*, (see TRAPA,) which Burmann has subjoined to Plumier's t. 67.

3. *T. aspera*. Rough-leaved Trophis. Retz. Obf. fasc. 5. 30. Willd. Sp. Pl. n. 3. Ait. n. 2. — Thorns none. Leaves obovate, unequally ferrated, very rough on both sides. Petals four in all the flowers.—Native of woods and thickets at Tranquebar, flowering in April, from whence we received specimens from the Rev. Dr. Rottler, in 1799. Branches stout, round, subdivided, leafy, without thorns or prickles; slightly downy or hairy when young, and of a rusty hue. Leaves acute, an inch long, on very short stalks; strongly veined; ferrated beyond the middle; wedge-shaped and entire at the base; rough on both sides like a file, with minute callous warts: hence they serve to polish fine cabinet-work. Male flowers six or eight, in axillary, solitary, globose, stalked heads, sometimes accompanied by a small rusty bractea, in the middle, or at the base of the stalk. Perianth none. Petals four, ovate, obtuse, concave. Stamens four, thread-shaped, longer than the corolla, with ovate, furrowed anthers. Female flowers two or three together, axillary, on stalks like that of the male heads. Calyx deeply divided into two rounded, concave, permanent segments, much shorter than the corolla. Petals four, ovate, or nearly orbicular, concave, downy, closely investing the germen, permanent. Germen ovate. Style very short. Sigmata long and slender. Berry orange-coloured, smooth, somewhat compressed, with a small portion of pulp. Seeds one or two, globular, the size of a pea.

4. *T. spinosa*. Thorny Trophis. Willd. n. 4. (Cudranus javanus; Rumph. Amboin. v. 5. 22. t. 15. f. 2.)—Branches thorny. Leaves elliptical, entire, smooth.—Native of Java. Branches round, greyish-brown, armed with axillary solitary thorns, which are incurved when young, but become subsequently straight. Leaves stalked, larger than the last, and very smooth on both sides; paler beneath. Female flowers two or three together, lateral, stalked. Male ones not observed. The wood is used to dye yellow, and, with the addition of indigo, green. The berries are described by Rumphius about the size of a strawberry, with several seeds, and of a yellowish colour. By his account also, it should seem that this fruit is invested with a permanent hardened corolla, evincing the generic affinity of the present species to the last; though their belonging to Trophis must, for the present, remain very doubtful.

TROPHONIUS, Oracle of, in Ancient Mythology, a famous oracle in Bœotia, which was consulted with greater ceremony than those of any deity, and subsisted long after all those of Greece ceased. Trophonius, from whom the oracle took its name, was the son of Erginus, king of the Orchomenians, who, as well as his brother, were famous architects, and built the temple of Apollo at Delphi. The tomb of Trophonius had been altogether disregarded and forgotten, when the Bœotians, on occasion of a great drought, consulting the oracle of Apollo, were directed to have recourse to Trophonius at Lebæda. They pursued the direction of the oracle, and obtained an answer, that suggested the means of removing their calamity. In consequence of this event, they consecrated to Trophonius the wood in which he was interred, and in this wood erected a temple to him, with his statue executed by Praxiteles. The oracle of Trophonius was upon a mountain, within an enclosure of white stones, upon which are elevated obelisks of brass. In this enclosure there was a cavern, in the form of an oven, cut out of the mountain by human art and labour. Within this was another small cavern, with a very

straight entrance, into which those who consulted the oracle were to pass, with a variety of ceremonies.

TROPHY, TROPÆUM, among the Ancients, a pile or heap of arms of a vanquished enemy, raised by the conqueror in the most eminent part of the field of battle.

The word is formed from the Latin *trophæum*, or *tropæum*, which Vossius deduces from the Greek τροπῆ, the flight of an enemy.

The word is also used for an artificial representation of such a pile in marble, stone, or other matter. Such were the trophies of Marius and Sylla, in the Capitol, &c.

The ancient trophies consist of Greek and Roman arms; and the modern ones of arms of the various nations now in use: as in those insulated ones near Blenheim, in the Faubourg S. Antoine, and in the castle of Versailles. Some are done in basso-relievo; as those of the Trajan column, and the Attic of the court of the Louvre. The form of these trophies cannot be better described than in Virgil's second Æneid. Of those which Marius raised after the Cimbric war, still remaining at Rome, Fabricius has given the following account. They are two trunks of marble hung round with spoils; one of them is covered with a scaly corselet, with shields and other military ornaments. Just before it is set a young man in the posture of a captive, with his hands tied behind him; and all round were winged images of victory. The other is set out with the common military garb; having a shield of an unequal round, and two helmets, one open and adorned with crests, the other close, without crests. On the same trophy is the shape of a soldier's coat, with several other designs, which, by reason of the decay of the marble, are not discovered without great difficulty. These two trophies now adorn the front of the Capitol.

Trophies are likewise frequently exhibited on medals of the emperors, struck on occasion of victories; wherein, besides arms and spoils, are frequently seen one or two captives by the sides of the trophy.

Trophies, M. Vaillant observes, were, originally, nothing but trunks of trees, which the victor planted on the most eminent part of the conquered province, and hung them with the spoils of the enemy, to perpetuate the memory of the defeat.

TROPHY, in Architecture, an ornament which represents the trunk of a tree, charged or encompassed all round about with arms or military weapons, both offensive and defensive.

TROPHY-Money, a duty paid annually by the housekeepers, in the several counties of England, towards providing harness, drums, colours, &c. for the militia.

TROPIANA, in Ancient Geography, a town of Italy, in Calabria.

TROPICS, TROPICI, in Astronomy, two immoveable circles of the sphere, drawn through the solstitial points, parallel to the equator.

Such are the circles ME and NL, *Plac. XVI. Astronomy, fig. 140.*

The tropics may be defined, two circles parallel to the equator, at such distance from it, as is equal to the sun's greatest recess from the equator towards the poles; or to the sun's greatest declination; or the obliquity of the celestial.

Of the two tropics, that drawn through the beginning of Cancer E, is called the *tropic of Cancer*. And that through the beginning of Capricorn, the *tropic of Capricorn*.

They have their name from the Greek τροπή, *turn, conversion*; as being the limits of the sun's way, or declination towards

towards north and south; so that when the sun is arrived at either of them, he turns the other way.

Hence, 1. Since the declination of the ecliptic is the arc E A, or L D; E N will be the distance of the tropics; which is double the greatest declination.

2. Wherefore, if the sun's meridian altitude be observed, both in the winter and summer solstice, and the latter be subtracted from the former; the remainder will be the distance of the tropics; half of which is the greatest declination of the ecliptic.

TROPICS, in *Geography*, are two lesser circles of the globe, drawn parallel to the equator, through the beginnings of Cancer and Capricorn.

These tropics are the planes of the celestial tropics, and at the distance of $23^{\circ} 29'$ from the equator, which is the sun's greatest declination.

TROPIC-BIRD, in *Ornithology*, a species of the phaeton, called *lepturus* by Brisson, on account of the slenderness of its tail. See PHAETON.

TROPIC KEYS, in *Geography*, small islands or rocks among the Virgin islands, in the West Indies, between Great Passage island and Porto Rico.

TROPICAL WINDS. See TRADE-WINDS and WIND.

TROPICAL Year. See YEAR.

TROPINO, in *Geography*, an ostrog of Russia, in the government of Tobolsk, on the river Piazida. N. lat. $72^{\circ} 36'$. E. long. $90^{\circ} 14'$.

TROPISTS, or TROPICI, the name of a sect. St. Athanasius, in his letter to Serapion, gives this appellation to the Macedonians, who were also called Pneumatomachi in the East, and Patripassians in the West.

The reason of the name Tropist was, that they explained the scripture altogether by tropes and figures of speech.

The Romanists also gave the appellation Tropists to those of the reformed religion; in regard to their construing the words of the eucharist figuratively.

TROPITES, TROPITÆ, a sect who, according to Philastrius, maintained that the Word was turned or converted into flesh, or into man.

This opinion they founded on that passage of St. John, misunderstood, *The Word was made flesh*; as if it imported, that the Word was converted into flesh; and not that he was clothed with our flesh and our nature.

TROPPAU, or OPPAU, in *Geography*, a principality of Silesia, bounded on the N. by the principality of Oppeln, on the E. by Ratibor and Teschen, on the S. and W. by Moravia. The soil is good for corn and pasture, and abounds in fruit. It contains eleven cities or towns. The principality of Troppau once formed a part of Moravia, and with that marquisate came to Bohemia. It is now divided between the house of Austria and the king of Prussia.

TROPPAU, or *Oppau*, a city of Silesia, and capital of the principality so called. It is situated in a fruitful country on the river Oppa, being walled, and containing an ancient palace of the princes, with three parochial churches, a college, three convents of monks, a nunnery, and a commandery of the order of St. John; besides which, it is also the seat of the regency for the Bohemian part of Silesia. In 1758, the greatest part of this town was destroyed by fire. It belongs to Austria; 45 miles S. of Oppeln. N. lat. $49^{\circ} 50'$. E. long. $18^{\circ} 30'$.

TROPLOWITZ, a town of Silesia, in the principality of Troppau; 70 miles N.N.W. of Troppau. N. lat. $50^{\circ} 1'$. E. long. $17^{\circ} 31'$.

TROQUES, a bay on the S.E. part of lake Huron.

TROSA, a sea-port of Sweden, in Sudermanland, on the Baltic; 18 miles S.W. of Stockholm.

TROSBURG, a town of Upper Bavaria; 13 miles E. of Wasserburg.

TROSSACHS, a tract of rugged rocks or mountains of stupendous height, situated about 10 miles W. from Callander, in the shire of Perth, Scotland, and accessible by a carriage-road. They exhibit an assemblage of wildness and rude grandeur, which fills the mind with the most sublime conceptions. It seems as if a vast mountain had been torn in pieces, and frittered down by a convulsion of the earth, and the huge fragments of rocks, woods, and hills, scattered in confusion for two miles on the sides of Loch Catherine. A huge column of these rocks was some years ago torn with thunder, and lies in very large blocks near the road. Where there is any soil their sides are covered with aged birch-trees. The sensible horizon is bounded by these trees on the summit of every hill. On the north side, the road is cut in some places through the solid rock, which rises upwards of 200 feet perpendicular above the lake: at others the road is at the foot of lofty cliffs, and trees are growing where no earth is to be found.—Beauties of Scotland, vol. iv. Perthshire. Gazetteer of Scotland, 1806.

TROSSULI, among the Romans, a name given by some of the guards that attended the kings of Rome, otherwise called *celerēs*.

TROSSULUM, in *Ancient Geography*, a town of Italy, in Etruria, in the vicinity of the country of the Volsci, according to Pliny.

TROT, in the *Manege*, one of the natural paces of a horse, performed with two legs in the air, and two on the ground, at the same time, crosswise, and continuing so alternately, to raise the hind-leg of one side, and the fore-leg of the other side at once; leaving the other hind and fore-leg upon the ground till the former come down.

This action of his legs is the same as when he walks, except that in the trot his motions are more quick.

In this motion, the nearer the horse takes his limbs from the ground, the opener, the evenner, and the shorter his trot will be. If he takes up his feet slovenly, it is a sign of stumbling and lameness; if he tread narrow, or cros, it betokens interfering or falling; if he tread long, it shews over-reaching; if he steps uneven, he indicates toil and weariness.

Three qualities are essentially necessary to make the trot useful. It ought to be extended, supple, and even or equal; these three qualities mutually depend upon each other; so that you cannot pass to the supple trot, without having first worked upon the extended trot; and you can never arrive at the even and equal trot, without having practised the supple. The *extended* trot is that in which the horse trots out without retaining himself, being quite straight, and going directly forwards; and this, consequently, is the kind of trot with which you must begin. The *supple* trot is that in which the horse, at every motion he makes, bends and plays all his joints, *viz.* those of his shoulders, his knees and feet, which no colts, or raw horses, can execute, who have not had their limbs suppled by exercise, and who always trot with a surprising stiffness and awkwardness, without the least spring or play in their joints. The *even* or *equal* trot is that in which the horse makes all his limbs and joints move so equally and exactly, and his legs never cover more ground one than the other, nor at one time more than another. To do this, the horse must necessarily unite and collect all his strength, and, if the expression may be allowed, distribute it equally through all his joints. To go from the extended trot to the supple, you must gently and by degrees hold in your horse; and when by exercise he has attained sufficient ease and suppleness to manage

manage his limbs readily, you must insensibly hold him in still more and more, and by degrees you will lead him to the equal trot. All horses that are inclined to be ramingue should be kept to the extended trot. A horse of a sluggish and cold disposition, which has, nevertheless, strength and bottom, should likewise be put to this trot: as he grows animated, and begins to go free, keep him together by little and little, in order to lead him insensibly to the supple trot; but if, while you keep him together, you perceive that he slackens his action and retains himself, give him the aids briskly, and push him forward, keeping him, nevertheless, gently in hand: by this means he will be taught to trot freely and equally at the same time.

The only proof, or rather the most certain sign of your horse's trotting well is, that when he is in his trot, and you begin to push him a little, he offers to gallop. The principal effects of a trot are to make a horse light and active, and to give him a just appui.

The manner of trotting a colt who has never been backed is as follows: put a plain snaffle in his mouth; fit a cavesson to his nose, to the ring of which tie a longe of a reasonable length. Let a groom hold this longe, who, having got at some distance from the colt, must stand still in the middle of the circle which the horse will make. Let another follow him with a long whip or chambriere in his hand. The colt, being alarmed, will be forced to go forward, and to turn within the length of the cord; the groom must hold it tight in his hand; by this means he will draw in, or towards the centre, the head of the colt, and his croupe will of consequence be without the circle. See FOAL, and *Backing of a HORSE*.

In working a young horse after this manner, do not press or hurry him. Let him walk first, and afterwards put him to the trot. If you neglect this method, his legs will be embarrassed; he will lean on one side, and be more upon one haunch than the other; the inner fore-foot will strike against the outer one, and the pain which this will occasion will drive him to seek some means of defence, and make him disobedient. If he refuses to trot, the person who holds the chambriere will animate him, by trotting him, or striking the ground with it. If he offers to gallop instead of trotting, the groom must shake or jerk the cord that is tied to the cavesson, and he will fall into his trot. Berenger's Art of Horsemanship, vol. i. ch. 4.

TROTHY, in *Geography*, a river of England, in the county of Monmouth, which runs into the Wye, near Monmouth.

TROTZA, a river of Russia, which runs into the Kama, 16 miles N. of Kofa, in the government of Viatka.

TROU, LE, a settlement in the N. part of Hispaniola. N. lat. 19° 35'. W. long. 72°.

TROUBADOURS, a name given to the ancient poets of Provence, who wrote, set, and sung their own verses. See *PROVENÇAL Poets*.

Some will have the word borrowed from *trouver*, to find, by reason of their inventions, whence they are called *trouverres*; though others take them to have been called *trombadours*; by reason they sung their poems to an instrument called a *trompe* or *trumpet*.

The poetry of the troubadours consisted in sonnets, pastorals, songs, *syrventes*, or satires, which were much to their taste; and in *tensons*, which were love-disputes.

Jean De Notre Dame, commonly called Nostradamus, a procureur in the parliament of Provence, wrote an ample discourse of these poets. He makes their number seventy-six.

Pasquier tells us, he had an extract of an ancient book,

belonging to cardinal Bembo, entitled "Los Noms daquels qui firent Tensons & Syrventes," which made their number ninety-six; among which was an emperor, *viz.* Frederic I. and two kings, *viz.* Richard I. of England, and a king of Arragon; with a dauphin, several counts, &c.: not that all these had composed entire works in Provençal; some of them had not brought forth any thing beyond epigrams.

Petrarch speaks, with applause, of several troubadours in the fourth chapter of the Triumph of Love. The Italian poets are said to have borrowed their best pieces from the troubadours. Pasquier declares expressly, that Dante and Petrarch are, indeed, the fountains of Italian poetry; but fountains which have their sources in the Provençal poetry.

Bouche, in his History of Provence, relates that, about the middle of the twelfth century, the troubadours began to be esteemed throughout Europe; and that their credit and poetry were at the highest about the middle of the fourteenth. So that they flourished in Europe about two hundred and fifty years, *viz.* from 1120 or 1130 till the year 1382. He adds, that it was in Provence that Petrarch learned the art of rhyming, which he afterwards practised, and taught in Italy.

Strolling musicians, under the appellation of *Jongleurs*, (which see,) abounded in France so early as the time of Charlemagne, who forbids their admission into convents; and in the first capitulary of Aix-la-Chapelle, this prince speaks of them as persons branded with infamy. They continued, however, to amuse the great in private, as well as the people in public, as a distinct body of men, till the troubadours introduced poetry into France, in the dialect of that country. Their licentiousness was frequently repressed, and their conduct regulated, by the police; and during the reign of Philip Augustus, the troubadours and minstrels, or *jongleurs*, were involved in the same disgrace, and for some time banished the kingdom; which left such a stigma upon their order, as no efforts of genius, or austerity of manners, could entirely efface, though they were afterwards recalled, and in some degree restored to public favour.

It is observed by a late elegant French writer, that though the proscription of music and poetry, and the kind of inquisition which Philip established against the *jongleurs* in France, may have originated from the laudable intention of repressing those disorders, which the abuse of their profession had occasioned; yet, if he had reflected that the fate of letters was at that time in the hands of the troubadours, and that among every people approaching towards civilization, the progress of virtue is generally proportioned to the cultivation of arts and literature, he would have inflicted a less ignominious punishment on the objects of his displeasure; for such is the empire of prejudice, that the anathema it pronounces against the abuse of a profession remains in full force, even after the reformation of those who exercise it. This author ventures to pronounce the *jongleurs*, or troubadours and minstrels, notwithstanding the contempt with which they are named at present, to have been the fathers of literature in France: they, says he, banished scholastic quarrels and ill-breeding, and polished the manners, established the rules of politeness, enlivened the conversation, and purified the gallantry of its inhabitants. That urbanity, continues he, which distinguishes us from other people, was the fruit of their songs; and if it is not from them we derive our virtues, they at least taught us how to render them amiable. *Tableau Historique de Gens des Lettres*, par l'Abbé de Longchamps, tom. v. cited by Dr. Burney in his History of Music, vol. ii. p. 267.

Mr. T. Warton (*Hist. of English Poetry*) is of opinion that there were two sorts of French troubadours who have not been sufficiently distinguished. If we diligently examine their history, we shall find that the poetry of the first troubadours consisted, as we have already intimated, in fables, moral fables, allegories, and sentimental sonnets. So early as the year 1180, a tribunal called the "Court of Love," was instituted both in Provence and Picardy, at which questions in gallantry were decided. This institution furnished ample matter for the poets, who threw the claims and arguments of the different parties into verse, in a style that afterwards led the way to the spiritual conversations of Cyrus and Clelia. Fontenelle does not scruple to acknowledge, that gallantry was the parent of French poetry. But to sing romantic and chivalrous adventures was a very different task, and required very different talents. The troubadours, therefore, who composed metrical romances form a different species, and ought always to be considered separately. And this latter class seems to have commenced at a later period, not till after the crusades had effected a great change in the manners and ideas of the western world. In the mean time, as Warton conjectures, the art of the troubadours, commonly called the "Gay Science," was first communicated from France to the Italians, and afterwards to the Spaniards. If this be true, it is at the same time highly probable, as the Spaniards had their "Juglares," or convivial bards, very early, because from long connection they were intimately acquainted with the fictions of the Arabians, and were naturally fond of chivalry, that the troubadours of Provence in great measure caught this turn of fabling from Spain. The communication, without mentioning any other obvious means of intercourse, in an affair of this nature, was easy through the ports of Toulon and Marseilles, by which the two nations carried on from early times a constant commerce. Even the French critics themselves universally allow, that the Spaniards, having learned rhyme from the Arabians, through this very channel conveyed it to Provence. Tasso preferred "Amadis de Gaul," a romance originally written in Spain by Vasco Lobeysra, before the year 1300, to the most celebrated pieces of the Provençal poets. The early universality of the French language very much contributed to facilitate the circulation of the poetry of the troubadours in other countries; and thus they contributed in a very considerable degree to the revival and diffusion of literature in Europe. See JONGLEURS, MINSTREL, MYSTERY, PROVENÇAL Poets, ROMANCE.

TROUBLES, in *Geology*. See COAL.

TROVE, in *Law*. See TREASURE-Trove.

TROVER, an action which a man hath against one that, having found any of his goods, refuseth to deliver them upon demand, but converts them to his own use; from which finding and converting, it is called an action of *trover* and *conversion*.

Actions and detinue are frequently turned into actions upon the case, *sur trover* and *conversion*.

The injury in this case lies in the conversion: and, therefore, the fact of the finding, or trover, is now totally immaterial; for the plaintiff needs only suggest (as words of form) that he lost such goods, and that the defendant found them; and if he proves that the goods are his property, and that the defendant had them in his possession, it is sufficient. But a conversion must be fully proved; and then in this action the plaintiff shall recover damages equal to the value of the thing converted, but not the thing itself; which nothing will recover but an action of detinue or replevin. See RESTITUTION of *stolen Goods*.

TROUGH, a hollow wooden vessel for kneading dough

in, or to beat apples in for cyder; also a piece of the trunk of a tree made hollow, to feed swine in; or an open pipe or channel, made of boards, for the conveyance of water.

TROUGH of the *Sea*, is the hollow cavity made between two waves, or billows, in a rolling sea.

When a ship lies down there, they say, she lies in the trough of the sea; in which case she rolls heaviest, because the setting of the sea is always produced by the wind, and, consequently, the waves, and the trough between them, will be at right angles with the direction of the wind.

TROUP HEAD, in *Geography*, a cape of Scotland, on the north coast of the county of Bamff; 10 miles W. of Kinnaid's Point. N. lat. 57° 39'. W. long. 2° 11'.

TROUPSBURGH, a township of New York, in the United States, situated in the S.W. corner of Steuben county, 25 miles S.W. of Bath village, erected in 1808, from the S. part of Canisteo and a small part of Addison, and extended to Allegany county in 1811; bounded N. by Canisteo, E. by Addison, formerly Middletown, S. by the state of Pennsylvania, and W. by Allegany county. It is 18 miles long E. and W., and about 10 miles wide. The population in 1810 consisted of 292 persons and 36 senatorial electors.

TROUS de *Loup*, in *Field Fortification*, are round holes, about six feet deep, and pointed at the bottom, with a stake placed in the middle. They are frequently dug round a redoubt, to obstruct the enemy's approach. At top they are circular, and about four feet and a half in diameter.

TROUSSEQUEUE, in the *Manege*. See DOCK.

TROUSSEQUIN, a piece of wood, cut archwise, raised above the hinder bow of a great saddle, and serving to keep the bolsters firm.

TROUT, *Salmo fario* of Linnæus, in *Ichthyology*, a very valuable river-fish. See SALMO *Fario*.

The colours of the trout, and its spots, vary greatly in different waters, and in different seasons; yet each may be reduced to one species. In Llyndivi, a lake in South Wales, are trouts called *coch y dail*, mentioned by Pennant. See SALMO *Fario*.

In Lough Neagh, in Ireland, are also trouts called *buddaghs*, some of which weigh thirty pounds; and others of a much superior size are taken in Hulfe-water, a lake in Cumberland, supposed to be the same with the trouts of the lake of Geneva. In the river Eynion, not far from Machynlleth in North Wales, and in one of the Snowdon lakes, is found a variety of trout, naturally deformed, having a strange crookedness near the tail.

The Hon. Mr. Daines Barrington suggests, that *gillaroo*, the name given to certain trouts in the Irish lakes, (see SALMO *Fario*;) may be either a corruption of Killaloe, the name of a town near which these trouts are caught, or formed of the Welsh *cylla*, q. d. *stomach*, and the Irish *ruadb*, q. d. *strong*; so that *gillaroo* may be the same as strong stomach. From the observations both of Dr. Watson and Mr. J. Hunter, there is no reason for considering the stomach of these trouts as gizzards, but as true stomachs. That of the English trout is of the same kind with the stomach of the *gillaroo* trout, but its coat is not so thick by two-thirds: and, therefore, the difference in the thickness of the stomach, which may be occasioned by the nature of the waters, or adapted to the purposes of communicating a greater quantity of shell-fish than the stomachs of our trouts, does not warrant its being classed as a distinct species. The stomach even of the *gillaroo* trout can possess scarcely any power of grinding, as the whole cavity is lined with a fine villous coat, the internal surface of which appears every where to be digestive, and by no means fitted for mastication

tication. These stomachs are sometimes served up at table in Ireland, under the name of gizzards. See on this subject, Phil. Trans. vol. lxiv. part i. p. 116. 121. 310.

Trouts are a very voracious fish, and afford excellent diversion to the angler (see *Trout-Fishing*): they shift their quarters to spawn, and, like a salmon, make up towards the heads of rivers to deposit their roes. The under jaw of the trout is subject, at certain times, to the same curvature as that of the salmon.

Mr. Pennant has described a species that migrates out of the sea into the river Esk, in Cumberland, from July to September, and called from its colour the *whiting*. When dressed, its flesh is red, and most delicious eating. On their first appearance from the salt-water, they have the salmon-like adhering to them. They have both melt and spawn, but no fry has as yet been observed. The Scots call this fish *phinos*; they never exceed a foot in length; the upper jaw is a little longer than the lower; in the first are two rows of teeth, in the last one; and on the tongue are six teeth; the back is straight; the whole body of an elegant form; the lateral line straight; the colour between that and the top of the back, dusky and silvery intermixed, beneath the line of an exquisite silvery whiteness; first dorsal fin spotted with black; the tail black and much forked; the first dorsal fin has eleven rays; the pectoral thirteen; the ventral nine, and anal nine. Pennant's Brit. Zool. vol. iii. p. 302.

TROUT, Salmon. See *SALMO Trutta*.

TROUT-Fishing. See *Trout-FISHING*.

TROUT-Coloured. A horse is said to be of this colour, when he is white, and speckled with spots of black, bay, or sorrel; especially about the head and neck.

TROUT Creek, in Geography, a southern branch of Salmon creek, in Franklin county, New York, on which are mills in Ezrville, Dickinson, and Constable.

TROUTBECK, a river of England, in Westmoreland, which runs into the Eden, 3 miles below Appleby.

TROW, a kind of boat, sometimes with square and upright head and stern.

TROWBRIDGE, in Geography, a considerable market and manufacturing town in the hundred of Melksham and county of Wilts, England; is situated at the distance of 28 miles N.W. from Salisbury, and 98 miles W. by S. from London. Neither the etymology of its name, nor the period of its origin, can be ascertained with accuracy; but as it is not mentioned in Domesday book, we may conclude that it had no existence when that work was compiled. The earliest notice of it in history occurs in the reign of king Stephen, about the year 1150, when it appears that Trowbridge castle was occupied by the partisans of the empress Maud, and was besieged and taken by Stephen; but whether there was any town at that era does not appear. It is certain, however, that the lordship of Trowbridge formed part of the estates of Henry, duke of Lancaster, whose daughter Blanche married John of Gaunt, son of Edward III. When Lancaster was constituted a county-palatine, this manor, as part of the duke's property, was recognized in the charters as one of the honors attached to it: and here it is probable the court of chancery for the duchy was held, as the rents for the same are paid at Trowbridge to this day. As the entire duchy of Lancaster was vested in the king in the reign of Henry VII., this town, as belonging thereto, became a royal demesne. In the next reign it was granted to Edward, earl of Hereford, afterwards duke of Somerset, at whose attainder it again reverted to the crown. It was restored to his son by queen Elizabeth, and continued the property of his collateral descendants till the reign of Charles I. when sir Francis Seymour was created baron Seymour of Trowbridge. It afterwards passed

to the family of Manners, by the marriage of lady Frances Seymour with John, marquis of Granby; and from him descended to the present duke of Rutland, who sold it in 1809 to Thomas Timbrell, esq.

Like the generality of manufacturing towns, Trowbridge is very irregularly built. None of the streets seem to have been formed on any regular plan, but have been constructed according as private interest or convenience suggested. Hence, though there are several handsome houses in the town, yet they appear to disadvantage from the narrowness of the streets, and the intermixture of old and mean buildings. The extent and importance of Trowbridge may be best determined by the parliamentary report of 1811, by which it appears to have then contained 1170 houses, and 6075 inhabitants. Of the latter, the greater part was engaged in the woollen manufacture, which was first established here in the early part of the reign of Henry VIII. Leland, who lived in that reign, gives the following account of this town. "From Bradeforde to Thorough-bridge, about a two mile by good corne, pasture, and wood, I enterid into the towne by a stone bridge of three arches. The towne standith on a rocky hille, and is very well buildyd of stone, and florisheth by drapery. Of later tymes, one James Terumber, a very rich clothier, builded a notable faire house in this town, and gave it at his deth, with other landes, to the finding of two Cantuarie prestes yn Thorough-bridge church. This Terumber made also a litle almose-house by Thorough-bridge church, and yn it be a fix poore folkes, having a three-pence by the week towards their finding. Horton, a clothiar of Bradeforde, builded of late dayes dyvers fine houses in this town. Old Bayllie buildyd of late in this town; he was a rich clothiar; Baillie's sun now drapeth yn the town, and also a two miles out of it, at a place yn the way to Farley castel. One Alexandre is now a great clothiar in the towne." The cloths now principally manufactured here are superfine broad-cloths and kerseymeres: the weekly produce is estimated at ninety pieces of the former, and four hundred and ninety pieces of the latter. Trowbridge not being incorporated, its government is vested in the county magistrates, who hold the petty sessions for the Trowbridge division of the hundred alternately here and at Bradford. A court-leet and a court-baron are also annually held; in the former the constables, tything-men, and cornets of the market are appointed. The duty of the last-mentioned officers is to inspect the provisions brought to the market, and to see that the weights and measures accord with the proper standards. The market-day is Saturday; and a fair is held annually, at which considerable quantities of woollen goods, cattle, cheese, &c. are sold. In the market-place formerly stood a stone cross, which was taken down towards the end of the last century, on the pretence of its obstructing the communication of the High-street, and injuring its appearance. It is thus noticed by Leland: "There is a fair standing place for market-men to stand yn, in the harte of the towne, and this is made viij square, and a pillar in the middle, as there is one made in Malmesbyri far fairer than this." The church of Trowbridge, though upwards of four hundred years old, is still characterized by the appellation of *New Church*, which implies that another must have previously existed here. By whom the new structure was raised is not distinctly recorded; but it appears probable, that a great part of the expence was incurred by James Terumber, the rich clothier mentioned by Leland, and the remainder by other benevolent individuals connected with the town. This opinion is founded on the contents of a deed of feoffment by Terumber, dated January 11, 1483, and preserved in the vestry-room; by which he directs that, out of his estates therein enumerated, ten marks should be

paid yearly to a priest to pray for his soul, and the souls of all other benefactors whose names should be comprised in a table hanging at the high altar. Considered in an architectural point of view, this church is deserving of notice. Leland styles it "lightsum and fair," and tells us that one Molines, "a man welle lernid," was parson there in his time. It is a spacious edifice, and consists of a nave, chancel, two side-aisles, with chapels attached, a north and south porch, and a large tower at the west end, surmounted by a taper spire. The nave and aisles are embattled, and are ornamented with crocketed pinnacles. Both porches are unusually lofty. The nave has a flat ceiled roof, highly decorated with flowers; it is separated from the aisles by five arches on each side, supported by clustered columns with ornamented capitals. Some of the windows contain fragments of painted glass, particularly the east windows of the chapels, which are large, and display seven dayes or lights, separated by mullions. The font is lofty, and covered with a profusion of tracery and panelling, with sculptural representations on shields, emblematical of the crucifixion. The living is a rectory, in the gift of the duke of Rutland, he having reserved the advowson when he sold the manor: the present rector is the Rev. Mr. Crabbe. This church is the only place of religious worship on the establishment in the town; but there is a chapel of ease dependent upon it at Staverton, a hamlet within the parish. Like most manufacturing towns, Trowbridge abounds with Dissenters, and consequently contains several meeting-houses. The charitable institutions in Trowbridge are an alms-house, and a school for the education of thirty boys. The former was founded by a person of the name of Yerbury. The school-house stands in the church-yard, near the spot where the alms-house erected and endowed by Terumber was placed, which has been recently taken down, and the funds appropriated to the use of the parish poor generally. Of the castle no part is now standing; but its site is distinguishable by the remains of the moat and valla by which it was surrounded. It is more elevated than the town, and still retains, in the appellation Court-hill, a marked allusion to its ancient appropriation. As there are no data to determine by whom the castle was erected, so the period of its demolition is equally uncertain; but it must have occurred previous to the reign of Henry VIII., for Leland says of it, "The castell stood on the south side of the toune. It is now elene down. There was in it a seven gret toures whereof peaces of two yet stonde." The castle was formerly approached from the town by a drawbridge over the moat, which has given occasion to a plausible conjecture that the name Trowbridge is a corruption of Drawbridge, near which the retainers of the castle might probably have built their houses in the infancy of the town. This supposition derives some support from the fact, that some of the buildings adjoining Court-hill possess considerable marks of antiquity.

Among the distinguished natives of this town is George Keate, a writer of considerable eminence in the last century. He was descended from the ancient and opulent families of the Hungerfords and Seymours. He died June 27, 1797, aged 67.

About two miles to the south-east of Trowbridge is Rowd Ashton, the seat of Richard Godolphin Long, esq. one of the present representatives of the county of Wilts. The house is large and commodious, and has lately undergone considerable alterations and improvements, under the superintendance of Jeffry Wyatt, esq. architect. The park is extensive and well wooded.—Beauties of England and Wales, vol. xv. Wiltshire, by John Britton, F.S.A. 1815.

TROWEL. See BRICK-Layer.

TROWEL, Garden, a tool of the trowel kind, which is

made of iron, in a hollow or scooped form, and is an useful implement in taking up numerous sorts of small plants and bulbous roots, and replanting them in pots, sowing in patches, and various other similar light works: it should be from six to twelve inches long in the plate, and half as broad, and fixed on a short handle, to hold with one hand. From its being hollowed semicircularly, it is remarkably handy in removing many sorts of small plants with a ball or lump of earth whole about their roots, so as not to feel their removal; lifting several sorts of bulbous flower-roots, after the flowering is past in summer; planting bulbs in patches or little clumps about the borders, as also for digging small patches in the borders for sowing hardy annual flower-seeds on; likewise for filling mould into small pots in planting any sort of plants, stirring the surface of the mould in pots, and fresh earthing them when necessary: it is also highly useful for filling in earth about plants in hot-beds, and under frames, or any small compartments where a spade cannot be readily introduced.

They should be had of different sizes to suit different purposes.

TROWERT ISLAND, in *Geography*, a small island in the East Indian sea, near the south coast of Java. N. lat. 7° 2'.

TROWERYN, a river of North Wales, which rises from a lake in Merionethshire, and runs into the Dee.

TROWLE, or TROLE, *the Bowl*, in *English Antiquity*, was a common phrase in drinking for passing the vessel about, as appears from several of our old catches.

TROWSERS, among *Sailors*, a sort of loose breeches of canvas, worn by seamen, &c.

TROXIMON, in *Botany*, from *τρωξιμος*, *atable*, a name chosen by Gærtner, without much propriety, for this genus, which he very justly distinguished from TRAGOPOGON; see that article, as well as ARNOPOGON, thereunto subjoined.—Gærtner. v. 2. 360, no figure. "Perf. Syn. v. 2. 360." Pursh v. 2. 505.—Class and order, *Syngenesia Polygamia-aqualis*. Nat. Ord. *Compositæ-semiflosculosæ*, Linn. *Cichoraceæ*, Juss.

Gen. Ch. *Common Calyx* simple, ovate, of numerous lanceolate equal scales, in two rows. *Cor.* compound, imbricated, uniform. Florets various in number, all perfect, of one petal, ligulate, longer than the calyx, abrupt, with five teeth. *Stam.* Filaments, in each floret, five, capillary; anthers united into a long furrowed tube. *Pist.* Germen, in each floret, oblong; style thread-shaped, the length of the stamens; stigmas two, revolute. *Peric.* none, except the permanent, finally spreading, calyx. *Seeds* solitary, oblong, slender; down sessile, capillary, roughish. *Recept.* naked, dotted.

Ess. Ch. Receptacle naked, dotted. Calyx of several leaves, in a double series. Seed-down simple, sessile.

Obs. We do not find the calyx ever "imbricated with unequal scales," as Gærtner says it sometimes is. Such a character belongs to *Sonchus*. Neither is it perfectly simple; for, as far as we can discern in every known species, the scales, or leaves, stand in a double row, or circle, the outer ones alternate with, and overlapping the inner, at their base. The simple seed-down essentially distinguishes this genus from *Tragopogon*, nor are the habits of the plants similar.

1. *T. glaucum*. Glaucous Troximon. Pursh n. 1. Curt. Mag. t. 1667. (*Tragopogon* Dandelion; Linn. Sp. Pl. 1111. Willd. Sp. Pl. v. 3. 1495. *Leontodon* Dandelion; Linn. Sp. Pl. ed. 1. 798. *L. foliis linearibus integris, caule erecto simpliciter*; Gron. Virg. ed. 1. 90.)—Stalks radical, single-flowered. Leaves linear-lanceolate, entire, smooth, glaucous on both sides. Calyx-scales somewhat beaked.

—Native

—Native of the banks of the Missouri. Biennial, with bright-yellow flowers. *Pursh*. Dr. Sims says perennial. —The original specimen was sent by Clayton from Virginia, in 1734, to Gronovius, who communicated it to Linnæus, inscribed "Dandelion with undivided leaves." Hence the latter took his specific name, the meaning of which he probably did not investigate, and he might perhaps call it *Dandelion!* The name is, at any rate, as bad as can possibly be, and we are happy in getting rid of it, by discovering the plant to be Mr. Pursh's first species of *Troximon*. Of this indeed neither this author, nor any one else, was aware; but though we have seen no specimen from Mr. Pursh, his specific character leaves no doubt in our mind, and Gærtner originally suggested that this Linnæan *Tragopogon* was a *Troximon*. The leaves are radical, glaucous, very smooth, even, quite entire, four or five inches long, taper-pointed, with a solitary mid-rib, and some slight longitudinal veins. *Flower-stalks* half as long in our specimen, but they probably are incomplete; Gronovius says twice as long; they are simple, clothed in the upper part with prominent, tawny, glandular bristles, most crowded just under the flower, which is yellow, above an inch wide. *Calyx* smooth and glaucous, shorter than the corolla, its leaves folding over one another as described in our generic character, but of equal length, not truly imbricated. The point of each is pale, a little dilated and membranous, or, as Pursh says, *cuspidate*. *Seed-down* sessile and rough, not feathery. Gronovius rightly noted this circumstance. We can scarcely doubt the figure in Curtis's Magazine being our plant, though a larger specimen. The roughness of the flower-stalk indeed is wanting, and the points of the calyx not shown.

2. *T. lanatum*. Woolly *Troximon*. (*Tragopogon lanatus*; Linn. Sp. Pl. 1111. Willd. Sp. Pl. v. 3. 1495. *Leontodon lanatum*; Linn. Am. Acad. v. 4. 287; excluding the reference to Rauwolf, 117, not 217, which rather belongs to *Scorzonera tuberosa*; see that article, n. 12.)—Leaves linear-lanceolate, undulated, clothed with shaggy hairs, as well as the radical flower-stalks and calyx.—Native of Palestine, from whence, if we mistake not, the Linnæan specimen was brought by Hasselquist. The root has a perennial aspect, its crown bearing several tufts of upright, narrow, sheathing leaves, three or four inches long, considerably undulated, entire, loosely clothed, on both sides, with long, soft, shaggy, woolly, or rather silky, hairs: the bases of the outer ones pale, dilated, membranous and smooth. *Flower-stalks* radical, solitary from the centre of each tuft of leaves, and rather exceeding them in height, angular, covered with similar hairs to those of the foliage. *Flowers* solitary, erect, yellow, nearly the size of the last, but with fewer *florets*. *Calyx* hardly so long as the *corolla*, very shaggy at the base, its leaves eight or ten, in two rows, lanceolate, equal, straight, hairy, somewhat membranous at the edges. We can just perceive, in the flowers, that the *seed-down* is simple and rough. Gærtner has indicated the true genus of this species, as well as of the foregoing. It appears nearly related to *Scorzonera tuberosa*, a plant we have never seen; but whose pubescence is not described as at all like that before us; and the recurved or revolute points of its *calyx-scales*, which moreover are unequal, and truly imbricated, in Pallas's figure, remove all ambiguity.

3. *T. virginicum*. Virginian Branching *Troximon*. Pursh n. 2. (*Tragopogon virginicum*; Linn. Sp. Pl. 1111. *Hyoseris prenanthoides*; Willd. Sp. Pl. v. 3. 1615. *H. amplexicaulis*; Michaux Boreal.-Amer. v. 2. 87.)—Smooth and glaucous. Stems erect, somewhat leafy, with several flowers.—In meadows and moist shady woods, from

Pennsylvania to Carolina, flowering in July and August. Root perennial. *Herb* about a foot high, with handsome yellow flowers. *Pursh*. The radical leaves are either ovate or lyrate, obtuse, wavy or toothed, tapering down into sheathing membranous *foot-stalks*, together with which they measure about four inches; those of the stem few, ovate-oblong, sessile, sheathing, the uppermost diminished to one or two *bractææ*, at the base of the long partial *flower-stalks*, three or four of which together compose a sort of *umbel*. *Flowers* erect. *Calyx* of eight or ten glaucous smooth leaves, half an inch in length. *Florets* twice as long, not very numerous. *Seeds* few, smooth. *Receptacle* small, dotted, naked.—Specimens from Kalm and others from the late Dr. Muhlenberg differ widely in their foliage, that of the former being deeply lyrate, the latter scarcely toothed; yet the plants are so alike in other respects, that we cannot, without further information, distinguish them as species.

4. *T. cuspidatum*. Pointed-scaled *Troximon*. Pursh 742. "Stalk radical, single-flowered; rather downy in the upper part. Leaves linear, downy and wavy in the margin. *Calyx-scales* imbricated, pointed, smooth."—Found by Mr. Bradbury, in Upper Louisiana. Perennial. *Flowers* large, yellow. Resembles *T. glaucum*. *Pursh*. By the specific character, we should be inclined to suspect this might be the *Leontodon Dandelion* of Linnæus, our first species of *Troximon*, were not the size of the flowers against it.

TROY, or ILIUM, in *Ancient Geography*, a city of Troas, or Phrygia Minor (which see), rendered immortal by the inimitable poems of Homer and Virgil, was built by Tros, king of that country, who called it Troy from his own name, and Ilium from that of his son Ilius. It was seated on a rising ground near mount Ida, and about five miles from the shore. Of this city, there subsisted scarcely any remains in the time of Strabo; and most of the ancient as well as modern writers have confounded the old and new Ilium. The new city, built nearer the sea-coast, was reduced to a village in the time of Alexander the Great, and was remarkable for nothing but a temple of Minerva, which that prince visited, after having defeated Darius on the banks of the Granicus, and enriched with offerings, bestowing ample privileges on the place, and honouring it with the title of city. He likewise ordered the buildings to be repaired, and the whole city to be embellished by Lyfimachus, one of his generals, who surrounded it with a wall of forty furlongs in circumference. It was again reduced to the condition of an inconsiderable village, when the Romans first entered Asia. As they pretended to be the genuine offspring of the ancient Trojans, no cost nor pains were spared to restore it to its ancient lustre, especially in the time of the Cæsars. Augustus sent thither a colony, embellished the city with many stately buildings, and enriched it with ample privileges and exemptions. Bellonius tells us, that in his time the walls were yet standing, with the ruinous monuments of their turrets; and that he spent four hours in compassing them, partly on horseback and partly on foot. He observed round the walls a great many marble tombs of exquisite workmanship, with their covers entire. Two of these were still remaining when M. Spon visited those places; who informs us, that they were in the style of the ancient Romans, and not unlike those that are to be seen at Arles; whence he concludes them to be the remains of that Troy which was rebuilt by the Romans. Bellonius likewise observed the ruins of three great towers, one on the top of a hill not far from the shore, another about the middle, and the third at the bottom, with a great many large cisterns to receive the rain-water. Spon observed on the south of the haven three columns lying among the briars, of which two were entire, and each of one single piece, being

thirty feet long; the third, which was broken in three places, was thirty-five feet in length, and four feet nine inches in diameter: they were all three full of granite. Le Brun speaks of great remains of a most noble structure, which he visited, at the distance of about five miles from the coast. The four gates of this great edifice, at that time entire, were about forty-five feet in height, and near them stood a wall of an extraordinary thickness, with fourteen gates of a competent size. The vestiges of this magnificent structure took up a hundred and thirty feet in length, and a hundred in breadth. Our author thinks, that these ruins may vie with any monuments of antiquity he ever saw. The harbour of Troy, so much spoken of by the ancients, is now quite choked up with sand; however, there are still to be seen fragments of columns, to which they fastened their ships and galleys; and, as these were placed round it, Spon thinks that the port was about a mile and a half in circumference.

The town of Ilium, or Troy, was fortified by Laomedon, the successor of Ilus, with walls of such uncommon strength, that, in the language and belief of the times, they were deemed the work of the gods. It is said that he was assisted by Apollo and Neptune, or that he carried on and accomplished this great work with the treasures that were consecrated to them and lodged in their temples, which he plundered. It is certain, however, that the guilt of Laomedon was believed to entail calamity on his unhappy descendants. His son Priam, who attained old age in the undisturbed possession of a throne, surrounded by a numerous family, beloved by his subjects, and respected by his neighbours, was destined to feel the sharpest pangs of human misery, in a long protracted war and siege, the causes of which are thus detailed by one of the modern historians of ancient Greece.

Hereditary feuds subsisted between the ancestors of Priam and those of Agamemnon, when the latter quitted their establishments in Asia, to seek new settlements in Greece. The insult offered to Ganymede, a beautiful Trojan youth, by the brutal fury of Tantalus, was retorted on Menelaus, the fourth in descent from this infamous prince, by the rape and detention of his queen, the celebrated Helen. Paris, the ill-fated son of Priam, was the author of this new injury. But resentment for the wrongs of his house formed not the only motive which engaged the youthful levity of Paris to dishonour the sister-in-law of Agamemnon. Helen was the daughter of Tyndareus, king of Sparta. The illustrious honours of her family were adorned by the generous magnanimity of her brothers, Castor and Polydeuces, whose exploits shone conspicuous in all the military expeditions of that gallant age. But the native lustre of Helen needed not the aid of foreign ornament. Even in the tender age of childhood, her opening charms had inflamed the heart of Theseus, the most admired and the most virtuous of the Grecian chiefs. The fame of her beauty increased with her ripening age, and her person became an object of eager contention among those who, by birth or merit, were entitled to aspire at the invaluable prize. Tyndareus, solicitous to prevent the violence of a second lover (for, agreeably to the manners of his age, Theseus had carried her off by force), bound the various suitors by oath to defend the honour of his daughter, and to secure the possession of her charms to the man who should be honoured with her choice. The princely mien and insinuating manners of Menelaus, were preferred to the more solid qualities of his numerous competitors. Having married the heiress of Tyndareus, he succeeded, in her right, to the Spartan throne. The graceful pair had not long enjoyed the honours of royalty, and the sweets of conjugal union, when their happiness was

interrupted by the arrival of the son of Priam, the handsomest man of his age, and singularly adorned with the frivolous accomplishments that often captivate the weakness of a female mind. Though a soldier of no great renown, Paris had strongly imbibed the romantic spirit of gallantry, which prevailed in the heroic ages, and was distinguished by an ardent passion for beauty, which, notwithstanding the general softness of his unwarlike character, prompted him to brave every danger in pursuit of his favourite object. Animated by the hope of beholding the inimitable model of what he most adored, he seized the opportunity afforded him by a voyage of Menelaus into Crete, visited the dominions of his hereditary enemies, and solicited the rites of hospitality at the Spartan court.

His person, his accomplishments, his address, and still more the voluntary hardships which he had endured for her sake, seduced the inconstant affections of the Grecian queen. Enamoured of the elegant stranger, she abandoned her country and her husband, and having transported her most valuable treasure within the Trojan walls, defied the resentment of Greece, and the vengeance of heaven.

It was now the time for Menelaus to crave the stipulated assistance of his ancient rivals. His demand was enforced by the authority of Agamemnon. At the summons of the two brothers, the confederates assembled at Ægium, the capital of Achaia; confirmed the obligation of their former promise; settled the proportion of troops to be raised by each prince; determined the time and place of their departure; and named Agamemnon, the most powerful among them, to the chief command, in an expedition which so deeply concerned the honour of his family.

Aulis, a sea-port of Bœotia, was appointed for the place of rendezvous and embarkation. Before the whole armada failed from thence, Ulysses, king of Ithaca, and, what may seem extraordinary, the injured Menelaus, undertook a solemn embassy to Troy, in order to demand restitution and reparation; but returned highly disgusted with their reception and treatment. Some members of the Trojan council had the barbarity to propose putting them to death. Their just indignation increased the warlike ardour of their associates. But contrary winds long retarded their departure. The Trojans had time to strengthen their ramparts, to collect arms and provisions, and to summon the assistance of their distant allies. The martial spirit of the age, together with a sense of common danger, brought many powerful auxiliaries to Priam. His cause was defended by the hardy mountaineers, who covered the back of his kingdom; by the Carians, Lycians, and other nations of Asia Minor, extending from the mouth of the river Halys to the southern extremity of Cilicia; and by the Pelasgi, Thracians, and Pæonians, fierce barbarians who inhabited the European side of the Hellespont and Propontis. Confiding, however, rather in their domestic strength, than in foreign assistance, the Trojans determined to defend their native shores against hostile invasion. The debarkation of the Greeks was purchased by much blood. Having effected a descent, they encamped on the Trojan plain, but lost the only opportunity which they enjoyed, during many years, of crushing at once the power of their enemies; who immediately shut themselves up within their impenetrable walls, leaving the city open only on the side of mount Ida, from which they received corn, cattle, and other necessary supplies.

Agamemnon, as there was reason to expect from the manners of his age, had been more industrious in collecting a great army, than provident in contriving means by which it might keep the field. The provisions, transported from Greece, were speedily consumed, while the operations of the

siege

siege promised little hopes of success, the Greeks being unacquainted with any military engines fitted to make an impression on the Trojan walls. With such a numerous army, they might have converted the siege into a blockade; but scarcity of supplies compelled the greater part of them to quit the camp. The resource of ravaging the adjacent country soon exhausted itself. Many betook themselves to cultivating the rich vales of the Chersonesus, whose industrious inhabitants had recently been expelled, or destroyed, by the fierce incursions of the barbarous Thracians. Others had recourse to piracy, scoured the neighbouring seas, ravaged the unprotected coasts of the Hellespont and Ægean, and plundered or demolished such unfortified places as acknowledged the dominion, or assisted the arms of Troy. These ravages excited the rage of the Asiatics, and rendered them more hearty in the cause of their confederates. In this manner nine summers and winters elapsed, without affording the nearer prospect of a decision to the contest; but, in the tenth year of the war, the seeming misfortunes of the Greeks precipitated the downfall of the proud city of Priam. A dreadful pestilence invaded the camp of the besiegers, and long continued to rage with unabating fury. This calamity was followed by the well-known quarrel between Agamemnon and Achilles, which deprived the Grecian army of its principal strength and ornament. The Trojans derived new spirits from the misfortunes of their enemies; they ventured to abandon the protection of their walls, boldly assailed the Grecian camp, and risked several engagements, in most of which they were victorious. In the last of these, the beloved friend of Achilles was slain by the arm of Hector, the bravest and most generous of the Trojan race. This event, which was infinitely more dreadful than death to the affectionate ardour of the Grecian chief, stifled his hitherto inexorable resentment against the proud tyranny of Agamemnon. His return to the camp restored the declining fortune of the Greeks; and the indignant fury of his rage was quenched in the detested blood of Hector, whose patriotic valour had long been the firmest bulwark of his father's kingdom. The destruction of Troy soon followed the death of her darling hero. The city, whether taken by storm or by surprise, was set on fire in the night; most of the citizens perished by the sword, or were dragged into captivity; and only a miserable remnant escaped through the confused horror of raging flames and expiring kinsmen.

The burning of Troy happened eleven hundred and eighty-four years before the Christian era. Neither the city nor territory ever assumed, in any succeeding age, the dignity of independent government. The sea-coast was planted, eighty years after the Trojan war, by new colonies from Greece; and the inland parts submitted to the growing power of the Lydians, whose arms overspread and conquered all the finest provinces of Lesser Asia.

The Greeks had recovered possession of the admired beauty of Helen; they had taken complete vengeance on the family and nation of her unhappy seducer; but the misfortunes which were the natural consequence of the Trojan expedition, left them little reason to boast of their victory. Of five Bœotian commanders, only one remained, and the siege had been proportionably fatal to the leaders of other tribes, as well as to their warlike followers. Those who lived to divide the rich spoils of Troy, were impatient to set sail with their newly-acquired treasure, notwithstanding the threatening appearance of the skies. Many of them perished by shipwreck; the rest were long tossed on unknown seas; and when they expected to find in their native country the end of their calamities, they were exposed to suffer greater calamities there, than any which they had yet endured. The

thrones of several of the absent princes had been usurped by violence and ambition; the lands of various communities had been occupied by the invasion of hostile tribes; even the least unfortunate of those adventurers found their domains uncultivated, or their territories laid waste; their families torn by discord, or their cities shaken by sedition. And thus the most celebrated enterprise of combined Greece tended to plunge that delightful and once happy country into barbarism and misery. Gillies's *Hist. of Anc. Greece*, vol. i.

All the Roman writers assure us that Æneas settled in Italy, and there founded the kingdom of Alba. From him the Cæsars affected to derive their pedigree. Livy alone seems to betray some sort of doubt as to this particular, insinuating, with a great deal of reserve, that he has not sufficient grounds either to admit or reject the common opinion. But, notwithstanding the unanimous consent of the Latins, there are not wanting arguments of great weight, which the learned Bochart has carefully collected, to prove the arrival of Æneas in Italy to be a mere fable.

Dr. Gillies having carefully examined the evidence given by Bochart (*Epist. num Æneas unquam fuit in Italia*), and by Mr. Wood (*Essay on the original Genius of Homer*), to prove that the descendants of Æneas reigned in Troy, observes, that notwithstanding the learned ingenuity of a profound, and the plausible criticism of an elegant scholar, the matter seems still too doubtful to warrant contradicting the popular opinion. Some few writers, both ancient and modern, have regarded Homer's account of the siege of Troy as a mere fiction, or the result of a poetical imagination. Thus Dion Chrysostom (*Orat. xi.*) attempts to prove that the siege and destruction of Troy by the Greeks is altogether fabulous, and destitute of any foundation in truth. But his performance has been generally regarded as a mere *jeu d'esprit*, since the author elsewhere (*περι ασιατικης*, p. 225.) disproves what he endeavours to establish in the place before cited. Indeed the siege and capture of Troy are transactions so well attested, and form so remarkable an epocha in history, that they cannot be justly questioned. Nevertheless the learned Bryant, not long ago, published two pamphlets with a view of refuting the generally received opinions respecting the existence of Asiatic Troy, and the authenticity of the leading facts in the history of the Trojan war: but his arguments and conclusions have been examined, and, in our opinion, satisfactorily refuted, by Mr. G. Wakefield, in his "Letters to Jacob Bryant, Esq. concerning his Dissertation on the War of Troy," and J. B. S. Morrill, esq. in his "Vindication of Homer, and of the ancient Poets and Historians, who have recorded the Siege and Fall of Troy;" as well as the testimony of Le Chevalier, and other modern travellers. See Olivier's *Travels in the Ottoman Empire*, &c.

TROY, *Epocha of the Destruction of*. See EPOCHÆ.

TROY, FRANCIS DE, in *Biography*, was born at Toulouse in 1645. He was the son of Nicholas de Troy, a painter of little celebrity, from whom he received the first rudiments of design; but he was sent to Paris when young, where he studied historical painting under Nicholas Loir, and became a member of the Academy in 1674. He afterwards attached himself to the more lucrative profession of portrait painting, and became celebrated in that line. He was sent by Louis XIV. to the court of Munich, to paint the portrait of Maria-Christiana of Bavaria, afterwards dauphiness of France. His own portrait is placed in the gallery of Florence. Among the historical pictures which he produced, one of the most renowned was painted for the church of St. Genevieve, in which the magistrates of Paris were represented invoking that saint. He died at Paris in 1730.

TROY, JOHN DE, was the son of Francis, and born at Paris in 1676. After receiving the instruction of his father in the art of painting until he had made considerable progress, he travelled to Italy, where he studied some years, and soon after his return to Paris he was made a member of the Academy. He was employed by Louis XIV., for whom he painted a series of cartoons for tapestry, representing the history of Esther; and several large allegorical subjects for the Hotel de Ville. The king appointed him director of the French Academy at Rome, where he resided great part of his life; and he acquitted himself in the administration of his office in a most respectable manner. His majesty conferred upon him the order of St. Michael, and honoured him with other marks of his particular esteem. He was not less distinguished as a painter of portraits than of history. He died in 1752, aged 76.

TROY, in *Geography*, a post-township, the capital of Rensselaer county, on the E. bank of the Hudson, six miles above Albany; bounded N. by Lansingburgh, E. by Brunswick, S. by Greenbush, W. by the Hudson, or the county of Albany. The flourishing village of Troy is in this township, from which it has its name. Along the river are extensive flats, and the river-hill is mostly arable. In the S. where the hills approach nearest the river, are some fine streams for mills, and falls of a great height. There are few places on the Hudson, of the same area, that combine more advantages for a populous town. The soil is good, and here are excellent facilities for water-works; and near the head of sloop-navigation on one of the best rivers in America. In 1810, the whole population was 3895, including 89 slaves, and the number of electors was 334.

The village of Troy is agreeably situated on a gravelly plain, on the E. bank of the Hudson, six miles N. of Albany; it is regularly laid out in streets and squares, and contains 660 houses and stores, five places of worship, two banks, the court-house and prison for the county, a market-house, and many other buildings. Many of the houses, though built of wood, are large and elegant, and those of brick form a considerable number of the whole. The streets are wide, with sufficient side-walks, but unpaved. River-street, the principal avenue, extends about a mile along the river, and receives all the other streets that run N. and S. as well as E. and W. in right lines, forming the rear space into perfect squares, and the straight streets are sixty feet wide. The manufactures are considerable, and trade is extensive, as it employs a great number of sloops, &c. on the Hudson. In wealth and trade Troy takes the third rank in the state, among its populous towns. The places of worship belong to the Presbyterians, Baptists, Episcopalians, Quakers, and Methodists: and here are several school-houses, as well as two banks, with an aggregate capital of 850,000 dollars. The River-hill, that rises in the rear of Troy, is very appropriately called mount Ida, and its fine sides and summits present elegant scites for building that command an extensive view of Troy and the surrounding country. Troy was incorporated in 1801, and is governed by a president and several trustees.

TROY, a town of Massachusetts, in the county of Bristol, containing 1296 inhabitants.—Also, a town of Vermont, in the county of Orleans, containing 231 inhabitants.—Also, a town of the county of Athens, in the district of Ohio, containing 578 inhabitants.—Also, a township of Trumbull county, in the district of Ohio, containing 239 inhabitants.

TROY, White, White of Orleans, or Spanish White, is a name given to a preparation of chalk, which is finely powdered,

formed into cakes, and used in the arts. This chalk is found in great abundance at a village called Villcloup, about four leagues from Troyes in France. It is dug out of the earth in small lumps, and after having been exposed to the air, is bruised and reduced into a gross powder, which is passed through a sieve: when it is perfectly dry, it is diluted with soft water, and formed into a kind of paste, which, being well tempered, is ground very fine in a mill, and used by painters, gilders, &c.: the qualities that peculiarly recommend that substance are, its being very white, friable, and free from all mixture of adventitious earth and stone. The white of Orleans is prepared at Cavereau, a small village about nine leagues from Orleans, and is reckoned inferior in value to the former. Mem. Acad. Sc. 1754. Ephemerid. Troyennes, an. 1759.

The artificial Troy white, called also Spanish white, is chalk neutralized by the addition of water in which alum is dissolved, and afterwards washed over. It is used by some in water-colours as a white, and may be thus prepared: Take a pound of chalk, and soak it well in water; then wash over all the fine part; and having poured off the first water, add another quantity, in which two ounces of alum are dissolved. Let them stand for a day or two, stirring the chalk once in six or eight hours: wash the chalk again over, till it be rendered perfectly fine, and pour off as much of the water as can be separated from the chalk by that means, taking off the remainder of the dissolved alum, by several renewed quantities of fresh water. After the last water is poured off, put the chalk into a cullender-filtre, with a linen cloth over the paper; and, when the moisture has been sufficiently drained off from it, lay it out in lumps to dry on a proper board. Handm. to the Arts, vol. i. p. 137.

TROY Weight, anciently called *Trone Weight*. See WEIGHT.

TROY Pound. See WEIGHT.

TROYES, in *Geography*, a city of France, and capital of the department of the Aube, on the Seine: before the revolution the capital of Champagne, and the see of a bishop. It contained fourteen churches, four abbeys, ten convents, a college, and an hospital. The inhabitants carry on a considerable trade in linen, flax, hemp, cotton, fustians, &c. The environs produce grain, legumes, and fruit in abundance; 18 posts N.N.W. of Dijon. N. lat. 48° 18'. E. long. 4° 10'.

TRSCHITZ, a town of Moravia, in the circle of Olmutz; 10 miles S.S.E. of Olmutz.

TRSEBON. See WITGENAU.

TRSEMESCHNO, a town of the duchy of Warsaw; 10 miles S.E. of Gnesna.

TRUCE, **TREUGA**, a suspension of arms; or a cessation of hostilities between two parties at war, which does not terminate it, but merely suspends its operations.

The word, according to Menage, &c. comes from the Latin *treuga*, which signifies the same; and which Caseneuve derives further, from the German *traue*, or *treue*, which signifies trust.

A truce is either particular or universal: by the former, hostilities cease in particular places, as between a town and a besieging army; by the latter, they are to cease generally, and in all places between the belligerent powers. Particular truces may also admit of a distinction with regard to the acts of hostility, or to the persons; that is, it may be agreed to abstain for a time from certain hostilities, or two armies may conclude a truce, or suspension of arms, without respect to place. A general truce made for many years, differs from a peace in little else than in leaving the original question of the war undecided, as they found it.

Accordingly

Accordingly, truces are frequently concluded between princes, in order to come to a peace; and truces of many years serve in lieu of treaties of peace between princes, whose differences cannot be finally adjusted.

All truces and suspensions of arms are concluded by the authority of the sovereign, who consents to some of them in his own immediate person, and to others through the ministry of his generals and officers. The truce binds the contracting parties from the moment of its being concluded; but cannot have the force of a law with regard to subjects on both sides, till it has been solemnly proclaimed. A ship being on the open seas at the time of publishing the truce, meets with a ship of the enemy, and sinks her; as in this case there is no guilt, she is not liable to pay any damage. If she has made a capture of the vessel, all the obligation she lies under is to restore it, as not retainable by the truce.

If one of the contracting parties, or any person by his order, or with his consent only, commit any act contrary to the truce, it is an injury to the other contracting party; the truce is dissolved, and the party offended is entitled to take up arms, not only for renewing the operations of the war, but also for revenging the recent injury offered it.

Sometimes a penalty on the infractor of the truce is reciprocally stipulated, and then the truce is not immediately broken on the first infraction: if the party offending submits to the penalty, and repairs the damage, the truce subsists, and the party offended has nothing farther to claim. If an alternative has been settled, that in case of an infraction the delinquent shall suffer a certain penalty, or the truce be broken, the party injured may chuse whether he will demand the penalty, or make use of his right to take up arms again.

The time of the truce should be well specified in order to prevent any doubt or dispute from the moment of its beginning to its period. If no term has been specified for the commencement of the truce, as it binds the contracting parties immediately upon its conclusion, it concerns them to cause it to be published immediately, in order to the observance of it; for it becomes binding on the subjects only from the time of its proper publication; and it begins to take effect only from the moment of the first publication, unless the agreement be otherwise. The rules that concern a truce during its continuance are such as follow: Each party may do, within its own territories, what it has a right of doing in time of full peace: advantage is not to be taken of doing what could not be done during the hostilities, *e. g.* continuing the works of a siege, or repairing breaches, and introducing succours. Nothing is to be undertaken in contested places while the truce continues, but every thing is to be left as it was; *e. g.* if the enemy does not relinquish a port, town, or village, the truce forbids an invasion of it: subjects inclined to revolt against their prince are not to be entertained, much less incited to treason: persons or effects of enemies are not to be seized during the truce. Inter-course may be allowed during a truce. At the expiration of the truce the war is renewed without any fresh declaration. See Vattel's Law of Nations, book iii. ch. 16.

TRUCE of God, Treuga Dei, is a phrase famous in the histories of the eleventh century, when the disorders and licences of private wars between particular lords and families obliged the bishops of France to forbid such violences within certain times, under canonical pain.

Those intervals they called *treuga Dei, treve de Dieu*, *q. d. truce of God*, a phrase frequent in the councils since that time. The first regulation of this kind, was in a synod held

in the diocese of Elno in Rouffillon, anno 1072, where it was enacted, that, throughout that country, no person should attack his enemy from the hour of nones on Saturday, to that of prime on Monday, that Sunday might have its proper honour; that nobody should attack, at any time, a religious priest walking unarmed, nor any person going to church, or returning from the same, or walking with women; that nobody should attack a church, or any house within thirty paces around it. The whole under penalty of excommunication, which, at the end of three months, was converted into an anathema.

These quarrels had prevailed even in the time of Charlemagne, and much more after his death; so that the church found it necessary to interpose. The most early of these interpositions, now extant, is towards the end of the tenth century.

In 990, several bishops assembled in the south of France, and published regulations to restrain the violence and frequency of private wars, ordaining that the transgressor should be excluded from all Christian privileges during his life, and be denied Christian burial after his death. To the same purpose a council was held at Limoges, A.D. 994; and several other councils issued their decrees for restraining the evil. But the authority of councils was insufficient; and, therefore, a bishop of Aquitaine, A.D. 1032, pretended that an angel from heaven had appeared to him with a writing, enjoining men to cease from their hostilities, and be reconciled to each other. Accordingly, a general cessation took place, and lasted for seven years; and a resolution was formed, that no man should attack or molest his adversaries from the evening of Thursday in each week, to the morning of Monday in the week ensuing, the intervening days being peculiarly holy; our Saviour's passion having happened on one of them, and his resurrection on another. This sudden change was considered as miraculous, and the respite from hostilities subsequent to it was called the *truce of God*.

This from being a regulation in one kingdom became a general law in Christendom, and was confirmed by the authority of the pope, and the violators were subjected to the penalty of excommunication. The council of Toulouse in Rouffillon, A.D. 1041, issued an act, containing all the stipulations required by the truce of God. The nobles, however, disregarding the truce, pursued their quarrels without interruption. Toward the end of the twelfth century, a new revelation was pretended, and, in consequence of it, an association formed under the title of the "Brotherhood of God." At length Philip Augustus, or St. Louis, published an ordinance, A.D. 1245, prohibiting any person to commence hostilities until forty days after the offence which caused the quarrel, and the transgressor was to be tried and punished by the judge as a traitor. This was called the *royal truce*, and the regulation was productive of good effects. This was farther enforced by an ordinance of Philip the Fair, A.D. 1296. See Robertson's Hist of Charles V. vol. i. p. 335, &c. 8vo.

TRUCE, Breaking of. See PASSPORT.

TRUCE, Conservator of. See CONSERVATOR.

TRUCHMAN, DRAGOMAN, or *Drogman*, in the countries of the Levant, an interpreter.

TRUCHMENIANS, or ancient *Turkomans*, called by the Russians Terekmenian Tartars, are those tribes whose parent stock still nomadises on the eastern coasts of the Caspian, where their territory extends as far as the lake Aral and Persia. The Truchmenians, in particular, possess on the western side of the Caspian that part of the Caucasian

mountains which stretches from that sea as far as the province Kakhety of the Georgian state. The generality of the districts have their own common princes; others form particular states, and some are under foreign sovereignty. In the former half of the 18th century a part of these hordes fell under the yoke of the Torgotan prince Ayuka, and on that occasion many Truchmenian families withdrew to the Tartars of Orenburg, Ufa, and Astrakhan. In the year 1770, the remainder of these people, who had not been before under the dominion of the Kalmuks, set themselves at liberty, and at present nomadise as free subjects of the Russian empire about the mouth of the Kuma. Their number is continually increasing by such as escape from the Kirghises, and are found though singly among the Tartars of Orenburg and Ufa, yet to no small amount. See **TURKOMANS**.

TRUCHTERSHEIM, in *Geography*, a town of France, in the department of the Lower Rhine; 7 miles W. of Strasburg.

TRUCKING, in *Commerce*. See **PERMUTATION**, **EXCHANGE**, and **COMMERCE**.

TRUCKS, in a *Ship*, pieces of wood of various shapes, and used for different purposes. *Carriage-trucks* are cylinders, the breadth or thickness of which is always equal to that of the side-pieces; but the height of the side-pieces and diameter of the trucks must always depend upon the height of the gun-ports above the deck. *Flag-staff-trucks* are circular flat pieces of elm, with a small sheave at least on each side. They are fixed by a mortise upon the upper end of flag-staffs, and are used to reeve the haliards. *Parral-trucks* are round balls of elm, or other wood, and have a hole through the middle, in which a rope is reeved, to form the parrals. *Seizing-trucks* are similar to parral-trucks, but have a score round the middle, to admit a seizing. They are used to lead ropes through. *Shroud-trucks* are short cylindrical pieces of elm, &c.; they have a hole through the middle, lengthways, a groove down the side the size of the furrows, and a score round the middle to admit a seizing. They are seized to the shrouds to lead ropes through, that they may be more readily found. *Vane-trucks* are small ornamental pieces of wood like an acorn, &c. and are fixed on the uppermost point of the spindle, above the vane on the mast-head. Their use is to prevent the vane's unshipping.

TRUCKS, among *Gunners*, round pieces of wood, in form of wheels, fixed on the axle-trees of carriages, to move the ordnance at sea, and sometimes also at land. See **CARRIAGE**.

TRUCKS are also a very large kind of wheel-barrows, with high wheels moving on planks, used for conveying stuff down a slight declivity in digging canals.

TRUCK-BARROWS are used in rope-making of different sizes; they have three wheels, and are used to take hauls of yarn from the yarn-house, and remnants of yarn, coils of rope, &c. from the ground to the rope-house.

TRUDENAU, in *Geography*, a town of Pomerelia; 9 miles S.E. of Dantzick.

TRUE, something agreeable to the reality of things, or to truth.

In this sense we say, the true God, the true religion, true gold, &c. in opposition to false or pretended ones.

TRUE LOVE, in *Botany*. See *Herb PARIS*.

TRUE LOVE OF CANADA. See *Herb PARIS OF CANADA*.

TRUE PLACE OF A PLANET, or *Star*, in *Astronomy*. See **PLACE**.

TRUE ALTITUDE, *Anomaly*, *Asthma*, *Horizon*, *Proposition*, *Recovery*, *Ribs*, and *Suture*. See the several articles.

TRUENTUS, **TRONTO**, or *Otronte*, in *Ancient Geography*, a river of Italy, in the southern part of Picenum, which passed by Asculum. At its mouth was a fortified place called "Castrum Truentinum."

TRUFFLES, formed from *truffe*, or *truffle*, of the Latin *tuber*, or *tuberculum*, *tubera terra*, in *Natural History*, a sort of subterraneous vegetable production, or a kind of mushroom, the characters of which are these: they are of a fungus fleshy structure, and are of a roundish figure, growing sometimes single, sometimes many together, and always remaining under ground. See **TUBER**.

Bradley calls them *under-ground edible mushrooms*, or *Spanish truffles*, and *under-ground deer's-balls*, or *mushrooms*.

The ancients, it is evident from their writings, were not acquainted with the sort of truffles which we have in use at present; they describe theirs to have been of a reddish colour, and smooth on the surface; we at present know this kind very well; it is common in Italy, and is called the wild truffle, and disregarded. They had indeed the white African truffle, sometimes brought to them, and held it in great esteem for its flavour. The Romans called it the Lybian *tuber*, and the Greeks the Cyrenian *misy*.

Avicenna recommends those truffles as the best, which were of a whitish colour within; and this not being a clear white, he expresses himself by a word which signifies sand-coloured, alluding to dusky-white sand, in common use at that time.

It is certain that the finest truffles were called by some authors by this epithet *arenosa*, with a very different meaning, only expressing that they were produced in sandy countries: the European truffles both then were, and now are, mostly produced in dry ground on the sides of hills; but the Lybian were produced only in the burning sands of that country, and these were therefore called *sand-truffles*. Serapio tells us, that the best of all truffles were those produced in sand; and Martial alludes to these, where he describes the finest truffles as breaking the surface of the earth into cracks, and by that means directing people where to search for them. To which purpose Leo Africanus says of the Lybian truffle, that the places where they are may be known by the earth's being raised into hillocks, and breaking into numerous cracks.

The truffle is most abundantly produced in dry fields of a reddish loamy earth, not too poor, according to Pliny, chiefly after rains and thunders in autumn; and they are found to flourish most near the roots of elms, the ilex, and some other trees. They do not well bear the severity of hard winters, but are usually scarce all the season after such. The smallest are found about the bigness of a pea, reddish without and whitish within, and they grow from this size sometimes to a pound weight, but such are not common; what are taken up in the spring are distinguished by their white colour and inspidity to the taste, and are commonly called white truffles: those taken up in autumn are of a variegated colour within, and are called marble truffles; the inner substance having swelled extremely and changed colour, and the white part now remaining only in form of a number of pipes or tubules, which seem in many places to run to the extremity, and terminate in the chaps and wrinkles of the back. The greyish substance, which is wrapped up among these tubules, when examined by the microscope, appears to be a transparent parenchyma, composed of little bladders or hollow vessels, in the midst of which may be seen small round bodies, which are unquestionably the seeds of the truffle.

What confirms the opinion of their coming from seed is, that there have been truffles discovered in England, and this, at first, only in Northamptonshire, and even only in one place of it, *viz.* Rushton, a place stocked with trees formerly brought from Languedoc; and it is only since then, that any truffles have been there observed; whence it is concluded, that the seed of these truffles was brought from France among the roots of the trees brought thence.

These English truffles were first discovered by Dr. Hatton. Dr. Tancred Robinson assures us, they are the true French truffles, the Italian *tartuffi*, or *tartuffole*, and the Spanish *turmos de tierra*, being not before noted by Mr. Ray as ever known on English ground: indeed he adds, that he has seen them thrice as large at Florence, Rome, &c.

Those observed in England are all included in a studded bark or coat, and the inner substance is of the consistence of the fleshy part of a young chestnut, of a palte-colour, a rank or hircine smell, and unfavoury.

When the truffles are arrived at such a degree of maturity as to yield seeds, which is generally in August, they are of a fine high flavour and agreeable smell; and the heat and rains at this season greatly promoting their growth, has been the occasion of the old error, that thunder produced them; after this they continue good till the middle of winter, and sometimes even till March; but those gathered from this time till the end of July are small, and only white, never marbled, nor of their high taste.

If the truffles are not taken up when fully ripe, they always rot and burst; whence it is plain, that they are an annual plant, which lives no longer than till they have perfected their seeds. And if the place where the old ones have rotted and burst be examined, the seeds will be found after some time to have vegetated, and a great number of young truffles to be produced in the place: these, if not destroyed by the frosts, are what in the ensuing spring furnish the younger white truffles.

The truffle is very apt to be pierced and eaten within by a worm, and this, though a damage to the particular truffle, is of some service to the people who make it their business to seek for them: for this worm, after a proper time passed in that state, changes into a chrysalis state in the body of the truffle; whence he soon after comes out, in the shape of a beautiful violet-coloured fly; and wherever these flies are found, they are an indication that there are beds of truffles near, as they are never bred in any other root.

These communicate a bitterness to the whole truffle, and make it unfit for the table; though if the whole be carefully searched into, the part eaten by the worm, and the hole by which it made its way in, will be found to be in reality the only bitter parts, and the rest of the truffle, when these are cut out, as good as ever: but, besides these destroyers, the microscope usually discovers on the surface of the truffle a multitude of other devourers, which are small animalecules, continually eating, and searching the cracks of the bark, as the places where the pulp is most easily come at; these somewhat resemble mites.

The earth that produces truffles rarely affords any other plants, these taking up all the nourishment it can afford: the earth all about them smells so very strongly of them, that they are easily found out by it, by the animals which carry their noses near the ground: and those who sought after them soon found the way of using hogs to search them out; but these being a sort of unmanageable animals, dogs were found which would supply their place with more certainty, and much less trouble. Mem. Acad. Scien. Paris, an. 1711.

By a chemical analysis, truffles are found to abound in a

volatile alkali salt, mixed with oil, upon which their smell, &c. depend. They never rise out of the ground, but are found, usually, half a foot beneath the surface of it.

Dr. Hatton has observed several little fibres issuing out of some truffles, and insinuating themselves within the soil, which, in all probability, do the office of roots. The truffles grow tolerably globular, as receiving their nourishment all around them; which they suck in through the pores of their bark or rind.

They are tenderest and best in the spring, though easiest found in autumn; the wet swelling them, and the thunder and lightning disposing them to send forth their scent, so alluring to the swine: hence some of the ancients called them *ceraunia*, q. d. *thunder-roots*.

The ancients were exceedingly divided as to the use of truffles; some affirming them to be wholesome food, and others pernicious: Avicenna, particularly, will have them to cause apoplexies. For my own part, says M. Lemery, I am of opinion, they have both good and evil effects: they restore and strengthen the stomach, promote the semen, &c.; but when used too freely, they attenuate and divide the juices immoderately, and, by some volatile and exalted principles, occasion great fermentations, &c. though the pepper and salt, with which they are ordinarily eaten, do doubtless contribute greatly to those effects: their rich taste is owing to their not putting forth any stalk; in effect, their principles being united, and, as it were, concentrated into a little bulb, must yield a richer and more delicious flavour than if the juices were dispersed by vegetation through the several parts of the common plant. Some roast truffles under ashes; and others mix them in fauces.

In Italy, France, England, &c. they eat them as a great dainty, either in fried slices, with oil, salt, and pepper, or boiled thoroughly in their own broth. The hogs are exceedingly fond of them, and are frequently the means of discovering the places where they are; whence the common people call them *swine-bread*. See MISTY and UDNON.

TRUFFLE-Worms, a species of fly-worm which is found in truffles, and lives in and feeds on them, till the time it undergoes the common metamorphosis of these creatures, for the production of a fly, like that from the egg of which it was hatched.

They are very small, and have two brown spots, easily distinguishable near their hinder end, which are the two posterior stigmata. They are all over white, and very transparent; and one may very easily distinguish the two black stocks of their two hooks, with which they tear the substance of the truffle, as the other species do their food: when they have arrived at their full growth, which is usually in a few days, then they leave the truffle, and go to seek some proper place, where they may rest during the time of their transformation; they enter the earth for this purpose, and twelve hours after they have gone into it they are transformed into an egg-shaped shell, of a chestnut-brown, of the same sort with that of the blue flesh-fly.

These are the worms in a manner peculiar to the truffles; but, beside these, they often furnish nourishment to another species, very common in mulhrooms of the ordinary eatable kind, and which has a yellow body, and a black crustaceous head. Reaumur's Hist. Inf. vol. iv. p. 374.

TRUFFLORN, in *Geography*, a town of Bavaria; 13 miles S.S.W. of Vilshofen.

TRUG, or *Trug-Corn*, *Truga Frumenti*, in our *Ancient Customs*, denotes a measure of wheat. "Tres trug frumenti vel avenæ faciunt two bushels, inter preberendum de Hunderton ecclesia Heref." MS. de Temp. E. III.

At Lempster, the vicar has trug-corn allowed him for officiating

officiating at some chapels of ease; as Stoke and Dockey, within that parish.

TRUG is also a country word for a milk-tray, or hod to carry mortar in.

TRUHCHEVSK, in *Geography*, a town of Russia, in the government of Orel, on the Desna; 80 miles W.S.W. of Orel. N. lat. $52^{\circ} 35'$. E. long. $33^{\circ} 34'$.

TRULLIZATION, in the *Ancient Architecture*, the art of laying on strata or layers of mortar, gypsum, or the like, with the trowel, in the inside of vaults, ceilings, &c.

TRULLO, in *Geography*, a small island on the east side of the gulf of Bothnia. N. lat. $63^{\circ} 54'$. E. long. 23° .

TRULLUM, a barbarous word, formed from *trulla*, *cup*, and signifying *dome*; chiefly used in the phrase, *council in trullo*.

This was a council assembled, in the year 692, against the Monothelites, in the dome of the palace of Constantinople, called *trallum*; the name of which it has retained. It was also called the *quinifestum*.

The trullum was properly a hall in the palace of the emperors of Constantinople, where they usually consulted of matters of state. This council, held in *trullo*, was the sixth œcumenical or general council.

TRUMAU, in *Geography*, a town of Austria; 5 miles E. of Baden.

TRUMBULL, a county of the district of Ohio, bordering on lake Erie, and containing 19 townships and 8671 inhabitants.—Also, a post-town of Connecticut, in the county of Fairfield, containing 1241 inhabitants; 165 miles N.E. of Philadelphia.

TRUMENAU, a town of Prussia, in Oberland; 16 miles S.E. of Marienwerder.

TRUMIAN, a town of Hindoostan, in Marawar; 40 miles S.W. of Tanjore. N. lat. $10^{\circ} 15'$. E. long. $78^{\circ} 45'$.

TRUMPE, in *Ichthyology*, a name given by some of the English writers to that species of whale, called by the generality of authors *cetæ*, and *balæna major*. This is the *physeter microps* of Linnæus, or blunt-headed cachalot. The Dutch call it the pot-whale fish.

TRUMPET, a musical instrument, the most noble of all portable ones of the wind-kind; used chiefly in war, among the cavalry, to direct them in the service. Each troop of cavalry has one. The cords of the trumpet are of crimson, mixed with the colours of the facings of the regiment.

The word is formed from the French *trompette*. Menage derives it from the Greek $\tau\rho\upsilon\beta\acute{\alpha}\nu\omicron\varsigma$, *turbo*, a shell anciently used for a trumpet. Du-Cange derives it from the corrupt Latin *trumpa*, or the Italian *tromba*, or *trombetta*; others from the Celtic *trompill*, which signifies the same. It is usually made of brass, sometimes of silver, iron, tin, and even wood. Moses, we read, made two of silver, to be used by the priests (Numb. x.); and Solomon made two hundred like those of Moses, as we are informed by Josephus (lib. viii.); which shews abundantly the antiquity of that instrument.

As to the invention of the trumpet, some Greek historians ascribe it to the Tyrrhenians; but others, with greater probability, to the Egyptians, from whom it might have been transmitted to the Israelites. The trumpet was not in use among the Greeks at the time of the Trojan war; though it was in common use in the time of Homer. According to Potter (Arch. Græc. vol. ii. cap. 9.), before the invention of trumpets, the first signals of battle in primitive wars were lighted torches; to these succeeded shells of fishes, which were sounded like trumpets. And when the trumpet became common in military use, it may well be imagined

to have served at first only as a rough and noisy signal of battle, like that at present in Abyssinia and New Zealand, and perhaps with only one sound. But even when more notes were produced from it, so noisy an instrument must have been an unfit accompaniment for the voice and poetry; so that it is probable the trumpet was the first solo instrument in use among the ancients.

In the 96th Olympiad, before Christ 396, a prize was instituted at the Olympic games for the best performer on the trumpet; and the first person who gained the prize was Timæus of Elis; and Herodotus of Megara, a famous trumpeter, who lived about the 120th Olympiad, or 300 years before Christ, was victor at the different games of Greece no less than ten, or, as some say, fifteen several times. These performers on the trumpet appear to have been heralds and public criers, who not only gave the signals at the games for the combatants to engage, and announced their success, but proclaimed peace and war, and sounded signals of sacrifice and silence, at religious ceremonies. Burney's Hist. of Mus. vol. i. p. 376.

Among the Romans, there were various instruments of the trumpet kind; as the *tuba*, *cornua*, *buccina*, and *lituus*. The tuba is supposed to have been exactly like our trumpet, widening gradually in a direct line to the orifice; the cornua was bended almost round; and the buccina was somewhat less; the lituus, which was almost straight, but crooked at the extremity, in the form of the augural staff, whence its name, was a species of clarion, or octave trumpet, made of metal, and extremely loud and shrill, used for horse, as the straight trumpet was for foot. Horace distinguishes it from the tuba or trumpet. See LITUUS.

The tuba, or long trumpet, called by the Hebrews the *trumpet of the jubilee*, may be seen in several pieces of ancient sculpture at Rome, particularly on the arch of Titus, on Trajan's pillar, and in a basso-relievo at the Capitol, representing the triumph of Marcus Aurelius.

The modern trumpet consists of a mouth-piece, near an inch broad, though the bottom be only one-third so much. The pieces which convey the wind are called the *branches*; the two places where it is bent, *potences*; and the canal between the second bend and the extremity, the *pavilion*: the places where the branches take asunder, or are soldered, the *knots*; which are five in number, and cover the joints.

If an ellipsis (says Dr. Young, Lecture xxxi.) be prolonged without limit, it will become a parabola: hence a parabola is the proper form of the section of a tube, calculated for collecting a sound which proceeds from a great distance, into a single point, or for carrying a sound nearly in parallel directions to a very distant place. It appears, therefore, that a parabolic conoid is the best form for a hearing-trumpet, and for a speaking-trumpet; but for both purposes the parabola ought to be much elongated, and to consist of a portion of the conoid remote from the vertex; for it is requisite, in order to avoid confusion, that the sound should enter the ear in directions confined within certain limits: the voice proceeds also from the mouth without any very considerable divergence, so that the parts of the curve behind the focus would in both cases be wholly useless. A trumpet of such a shape does not very materially differ from a part of a cone; and conical instruments are found to answer sufficiently well for practice. It appears, however, unnecessary to suppose, as Mr. Lambert has done, that they differ essentially in principle from parabolic trumpets. It is not yet perfectly decided whether or not a speaking-trumpet has any immediate effect in strengthening the voice, independently of the reflection of sound.

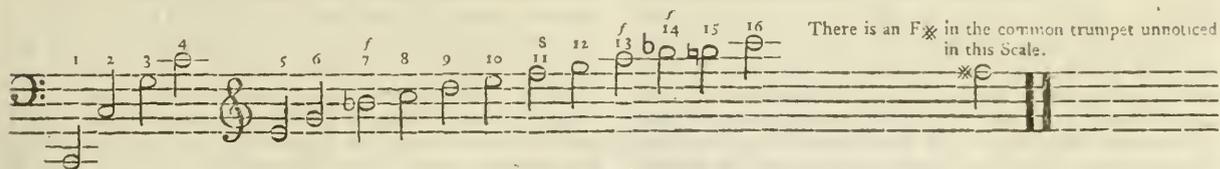

When

TRUMPET.

When the found of the trumpet is well managed, it is of a great compass. Indeed its extent is not strictly determinable; since it reaches as high as the strength of the breath can force it. A good breath will carry it beyond four

octaves, which is the limit of the usual keys of spinnets and organs.

The usual founds of the trumpet are represented by the following musical notes.

Here the loudest found being denoted by 1, the pitch of the rest, or the number of their respective vibrations, during the time that C vibrates once, will be expressed by the numbers denoting the order of their founds, 2, 3, 4, 5, &c. The founds expressed by the musical numbers, that is, by 2, 3, 5, and their composites, which are 4, 6, 8, 9, 10, 12, 15, 16, are all perfectly in tune; but the founds expressed by numbers not musical, as 7, 11, 13, 14, are false. Three of these, viz. B \flat , its octave, and A, distinguished by *f* placed over them, are too flat; and the remaining note F, marked with an S, is too sharp. See MUSICAL Numbers.

The reason of which is, that B \flat ought to be a tone major below C: that is, its pitch to that of C will be as 8 to 9; but the proportion given by the trumpet is as 7 to 8; which being a less proportion than that of 8 to 9, it follows that B \flat will be too flat. The same holds true of its octave. And A being a tone minor above G, it ought to be to G as 10 to 9: but in the trumpet, it is to G as 13 to 12; which being less than the proportion of 10 to 9, it follows that A will be too flat. On the other hand, F ought to be a semitone major above E; that is, F ought to be to E as 16 to 15; but in the trumpet, F is to E as 11 to 10; which being a greater proportion than that of 16 to 15, it follows that F is too high or too sharp.

This system of trumpet-notes is an effectual confutation of those who are for introducing 7, 11, 13, and other primes into music.

In war there are eight principal manners of founding the trumpet: the first, called the *cavalquet*, used when an army approaches a city, or passes through it in a march. The second the *bout-felle*, used when the army is to decamp, or march; at which time the drums beat a *general*, when the troopers boot, saddle, and get ready. The third is when they found to horse, when the *assembly* begins to beat, on which the troopers mount; and then to the standard. The fourth is the *charge*, in the day of battle. The fifth the *watch*. The sixth is called the *double cavalquet*. The seventh the *chamade*: and the eighth the *retreat*. Besides these, there are various flourishes, voluntaries, &c. used in rejoicings.

There are also people who blow the trumpet so softly, and draw so delicate a found from it, that it is used not only in church-music, but even in chamber-music; and it is on this account, that, in the Italian and German music, we frequently find parts entitled *tromba prima*, or 1a, first trumpet; *tromba IIa*, *segonda IIIa*, *terza*, second, third trumpet, &c. as being intended to be played with trumpets.

There are two very great defects in the trumpet, observed by Mr. Roberts, in the Philosophical Transactions for 1692, N^o 195. The first is, that it will only perform certain notes within its compass, commonly called *trumpet-notes*; the second, that though its ordinary compass is from double C-fa-ut to C-sol-fa in alt., yet there are four notes, the 7th,

11th, 13th, and 14th, in this progression, viz. B \flat , *f*, *aa*, and *bb*, which are not exact in tune. The same defects are found in the trumpet-marine; and the reason is the same in both. Phil. Trans. Abr. vol. i. p. 607.

TRUMPET-MARINE, is a musical instrument, consisting of three tables, which form its triangular body. It has a very long neck with one single string, very thick, mounted on a bridge, which is firm on one side, but tremulous on the other. It is struck by a bow with one hand, and with the other the string is pressed or stopped on the neck by the thumb. Plate XXIV. Miscellany, fig. 4.

It is the trembling of the bridge, when struck, that makes it imitate the found of a trumpet, which it does to that perfection, that it is scarcely possible to distinguish the one from the other. And this is what has given it the denomination of trumpet-marine, though, in propriety, it be a kind of monochord. Of the six divisions marked in the neck of the instrument; the first makes a fifth with the open chord, the second an octave, and so on for the rest, corresponding with the intervals of the military trumpet.

The trumpet-marine has the same defects with the trumpet, viz. that it performs none but trumpet-notes, and some of those either too flat or too sharp. This Mr. Fr. Roberts (*ubi supra*) accounts for, only premising the common observation of two unison strings; that if one be struck, the other will move: the impulses made on the air by one string setting another in motion, which lies in a disposition to have its vibrations synchronous to them; to which it may be added, that a string will move, not only at the striking of an unison, but also of that of an 8th or 12th; there being no contrariety in the motions to hinder each other.

Now in the trumpet-marine you do not stop close, as in other instruments, but touch the string gently with your thumb, by which there is a mutual concurrence of the upper and lower part of the string to produce the found. Hence it is concluded, that the trumpet-marine yields no musical found, but when the stop makes the upper part of the string an aliquot part of the remainder, and consequently of the whole; otherwise the vibrations of the parts will stop one another, and make a found suitable to their motion, altogether confused. Now the aliquot parts, he shews, are the very stops which produce the trumpet-notes.

TRUMPET, *Harmonical*, is an instrument which imitates the found of a trumpet, and which resembles it in every thing, excepting that it is longer, and consists of more branches. It is usually called a *sackbut*.

TRUMPET, *Listening or Hearing*, is an instrument invented by Joseph Landini, to assist the ear in hearing of persons who speak at a great distance, without the assistance of any speaking-trumpet.

Instruments of this kind, represented in Plate XXIV. Miscellany, figs. 5. and 6. are formed of hollow conical tubes from eight to sixteen inches in length, with a wide mouth from about two to four inches in diameter, and terminating in a small canal.

canal, whose aperture is not above one-fourth of an inch in diameter, which is applied to the ear. These tubes are often bent in a manner somewhat resembling the letter C, except that in general the small end is bent much less than the other. The construction of these instruments evidently shews how they contribute to assist the hearing; for the weak and languid pulses of the air being received by the large end of the tube, and reflected several times from its sides in passing to the small end, are condensed, and entering the ear in this condensed state, strike the tympanum with a greater force than they could have done without the intervention of the tube: the sound is louder, but less distinct. Hence it appears, that a speaking-trumpet may be applied to the purpose of a hearing-trumpet, by turning the wide end towards the sound, and putting the ear to the narrow end.

TRUMPET, *Speaking*, is a tube from six to fifteen feet long, made of copper or of tinned iron-plates, perfectly straight, and with a very large aperture; the mouth-piece being big enough to receive both lips. The edge of the narrow end is generally covered with leather or cloth, in order that it may more effectually prevent the passage of any air between the trumpet and the face of the speaker.

The mouth being applied to it, carries the voice to a very great distance, so that it may be heard distinctly a mile, or more; hence its use at sea. A person who is not in the direction of the trumpet will hear the sound of it both weaker and less distinct, in proportion as he is more or less distant from the direction of the sound; which is the direction straight before the trumpet.

The words which are spoken through a speaking-trumpet may be heard much farther and louder, but not so distinctly, as without the trumpet.

A speaking-trumpet has also been applied to the mouth of a gun or pistol, by which means the explosion has been rendered audible at a vast distance. Such contrivances may be used as signals in certain cases.

The invention of this trumpet is held to be modern, and is commonly ascribed to sir Samuel Moreland, who called it the *tuba Stentorophonica*.

Of this instrument an account was published at London in 1671, in a work entitled "Tuba Stentoro-phonica," in which the author relates several experiments made by him with this instrument; the result of which was, that a speaking-trumpet constructed by him, five feet six inches long, twenty-one inches diameter at the greater end, and two inches at the smaller, being tried at Deal castle, was heard at the distance of three miles, the wind blowing from the shore.

But Ath. Kircher seems to have a better title to the invention; for it is certain he had such an instrument before ever sir S. Moreland thought of his.

Kircher, in his "Phonurgia Nova," published in 1673, says, that the tromba, published last year in England, he invented twenty-four years before, and published in his *Mufurgia*: he adds, that Jac. Albanus Ghibbifius, and Fr. Eschinardus, ascribe it to him; and that G. Scottus testifies of him, that he had such an instrument in his chamber in the Roman college, with which he could call to, and receive answers from the porter.

Indeed, considering how famed Alexander the Great's tube was, with which he used to speak to his army, and which might be distinctly heard a hundred stadia or furlongs, it is somewhat strange the moderns should pretend to the invention; the Stentorophonic horn, or tube of Alexander, of which there is a figure preserved in the Vatican,

being almost the same with that now in use. See STENTOROPHONIC.

The principle upon which this instrument is constructed is obvious; for as sound is stronger in proportion to the density of the air, it must follow, that the voice passing through a tube or trumpet, must be greatly augmented by the constant reflection and agitation of the air through the length of the tube, by which it is condensed, and its action on the external air greatly increased at its exit from the tube.

In a speaking-trumpet, the sound in one direction is supposed to be increased, not so much by its being prevented to spread all round, as by the reflection from the sides of the trumpet. But as the real action of the instrument, or the true motion of the air through it, is not clearly understood; different persons, according to their particular conceptions of the case, have recommended peculiar shapes for the construction of such trumpets: some having recommended a conical shape, others that which is formed by the rotation of certain curves round their axes; others, again, have recommended an enlargement or two of the cavity in the length of the trumpet, &c. That which has been more commonly recommended as the best figure for such trumpets, is generated by the rotation of a parabola about a line parallel to the axis.

In order to estimate the effect of this instrument, let us suppose A B (*Plate XXIV. Miscellany, fig. 7.*) to be such a length of tube as admits one reflection of the sound, emitted by the speaker, from the side B B; let A F be another length, in which the sound or voice is reflected five times by the sides, *viz.* in B, C, D, E, and F: the sound striking the metal tube in B is the same as that at F; but the number of parts forming the periphery of the circle in B is to that in F, as the diameter B B is to the diameter F F; and therefore the intensities with which the parts of the metal will be moved in these peripheries, will be in the inverse ratio of the peripheries, or of the diameters B B, F F. But the parts of the metal move the air contained within the peripheries of the circle, or constituting their respective areas, which are as the squares of the diameters: *i. e.* the air agitated in B is to that agitated in F, as $B B^2$ to $F F^2$; and consequently, the intensity of the same sound in the tube of the length A B, is to that in the length A F, as $B B^2$ to $F F^2$, and the inverse ratio of the diameter B to F: or, the intensity in A B is to that in A F :: $F F \times B B^2$: $B B \times F F^2$, *i. e.* dividing the last ratio by $B B \times F F$: $B B$: $F F$. But the intensity of the sound increases the more frequently it is reflected from the sides: let then the number of reflections of the sound in B be n , in F it will be $5n$, and therefore the whole intensity of the sound in B is to that in F as $n \times B B$ to $5n \times F F$. Consequently, the longer the tube the more numerous will be the reflections, and the greater will be the increase of the sound, and the farther may it be heard.

A man, speaking through a tube four feet in length, may be understood at the distance of 500 geometrical paces; with a tube of 16 feet, at the distance of 1800 paces; and with a tube 24 feet long, at a greater distance than 2500 geometrical paces.

The sound will be also heightened by having the remoter aperture of the tube wide, more than if it were narrow. However, the effect of the tube in magnifying sound, either for speaking or hearing, depends principally upon its length: nevertheless some advantage may be derived from its particular form and shape.

Some have proposed the figure which is made by the revolution of a parabola about its axis, as the best; where the mouth-piece is placed in the focus of the parabola, and conse-

consequently the sonorous rays will be reflected parallel to the axis of the tube. But Mr. Martin observes, that this parallel reflection is by no means essential to the magnifying of sound; on the contrary, it prevents the infinite number of reflections and reciprocations of sound, in which, according to Sir I. Newton, its augmentation principally consists: the augmentation of the impetus of the pulses of air being proportional to the number of repercussions from the sides of the tube, and therefore to its length, and to such a figure as is most productive of them. Hence he infers, that the parabolic trumpet is the most unfit of any for this purpose.

He observes, that there is one thing more which contributes to the augmentation of the agitations of air in the tube; viz. the proportion which the several portions of air bear to each other when divided by transverse sections, at very small, but equal distances, from one end of the tube to the other.

Thus, let those several divisions be made at the points *a, b, c, d, e, &c.* (fig. 8.) in which let the right lines *ak, bl, cm, dn, &c.* be taken in geometrical proportion. Then will the portions of air contained between B and *a, a and b, b and c, c and d, &c.* be very nearly in the same proportion, as being in the same ratio with their bases, when the points of division are indefinitely near together. But it is known, that when any quantity of motion is communicated to a series of elastic bodies, it will receive the greatest augmentation when those bodies are in geometrical proportion. Therefore, since the force of the voice is impressed upon, and gradually propagated through a series of elastic portions of air in a geometrical ratio to each other, it easily receives the greatest augmentation possible.

And since by construction $Ba = ab = bc = cd, &c.$ and $ak : bl :: bl : cm :: cm : dn, &c.$ the points *k, l, m, n, o, p, q, r, s, A,* will form the logarithmic or logistic curve: whence Mr. Martin concludes, that a trumpet formed by the revolution of this curve about its axis, will augment the sound in a greater degree than any other figured tube whatever.

Cassegrain also is of opinion, that an hyperbola, having the axis of the tube for an asymptote, is the best figure for this instrument. Muschenb. Int. ad Phil. Nat. tom. ii. p. 296, 4to. Martin's Phil. Brit. vol. ii. p. 248, 3d edit.

For other constructions of speaking trumpets by Mr. Conyers, see Phil. Trans. N^o 141. for 1678.

TRUMPETS, *Feast of*, in *Ecclesiastical History*, one of the menstrual feasts among the Jews, kept with greater solemnity than the rest, on the first day of the month Tisri. (Numb. xxix. 1—6. Levit. xxiii. 24, 25.) The day of this feast was the new-year's day of the Jews, in which the people were solemnly called to rejoice in a grateful remembrance of God's benefits to them through the last year, which might be intended by blowing the trumpets, as well as to implore his blessing upon them for the ensuing year, which was partly the intention of the sacrifices offered on this day.

The modern Jews have a notion, which they derive from the Mishna, that on this day God judges all mankind; and therefore, according to Basnage, their zealots spend, some a whole month, others four days, and especially the eve of this feast, in confessing their sins, beating their breasts, and some in lashing their bare backs, by way of penance, in order to procure a favourable judgment on this decisive day.

TRUMPET-Fish, *Scolopax*, in *Ichthyology*, a fish called also the *bellows-fish*. In the Linnæan system it is a species of

the *centrifcus*; but in the Artedian, a species of *balistes*. Pliny calls it *ferra*. See CENTRISCUS *Scolopax*.

TRUMPET-Flower, in *Botany*. See BIGNONIA and LONICERA.

TRUMPET-Honeysuckle. See LONICERA.

TRUMPET-Shell, or *Whelk*, *Buccinum*, in *Natural History*, the name of a large genus of shells, the characters of which are these: they are univalve shells of the form of a trumpet, according to old pictures, with a wide belly, and a large, broad, and elongated mouth; they have a distinct and regular tail, usually long, though sometimes short; they have a crooked beak, and the clavicle is often elevated, though sometimes depressed and contabulated. In the Linnæan system, the characters of this genus are, that its animal is a slug, the shell univalve, spiral, and gibbous, the aperture oval, ending in a short canal or gutter. Linnæus enumerates fifty-one species. See CONCHOLOGY.

The family of the buccina, when examined ever so strictly, is very large; but according to the general custom of authors, of confounding together several genera under the name, it is usually made to appear much larger than it really is. Lister has made it comprehend a vast number of shells, by confounding it with the families of the *murex* and *purpura*.

It is not indeed peculiar to this author, to have confounded these genera: those who went before him have done the same; and Pliny has comprised the buccinum, murex, and purpura, under the general name *ceryx*.

To avoid the general confusion, which arises from not distinguishing the families of the buccinum, murex, purpura, and vis, or screw-shell, it will be proper to observe, that there are regular characters, which distinguish them all, one from another: the characters are these: the buccinum differs from the purpura, in that it has a very long mouth of an oval figure, and has an elevated head; whereas the purpura has a round mouth, and a head somewhat flattened; the tail of the purpura is also usually furrowed, and is shorter than that of the buccinums.

The buccinum differs also from the murex in having a longer tail, by the smoothness and variety of colours of its coat, and by having a larger mouth less furnished with teeth; the murex having a smaller and longer-shaped mouth, its surface covered with points or spires, and several teeth.

It is easier to distinguish the buccinum from the screw-shell, as this is always more long and slender than the buccinum; it has also a flat mouth, and has rarely any tail.

The most singular species of the buccinum class, is one that has its mouth turned the contrary way to all other shells: this has been thence called by authors, the *unique* and the *fans pareille*.

The buccina generate in the warm months, and some species of them are seen very frequently remaining in pairs together, upon the rocks deserted by the tide on that occasion. These have been thence supposed to be of a different genus, and have been called *buccina littoralis*; they are usually found in copulation early in the morning. Rumphius de Test. Aldrovand. de Test. lib. iii. cap. 231. Lister, Hist. Animal. Angl. p. 158.

The species of the buccina being very numerous, they are arranged under several distinct heads, according to certain obvious distinctions, and are as follow: of the buccina, with long distinct tails and oblong mouths, there are thirteen species; of those with a short tail and a wide mouth, we have twelve species; of those with long erect clavicles, there are

are eleven species; and of those with less erect clavicles, and crooked rostra, there are also eleven species.

It appears from the writings of the ancients, that the famous purple dye, which they obtained from a shell-fish, was not peculiar to any one species; but was found in several of the smaller kinds of buccina; some of which they called *murices*, from the hollow spines, or long and slender processes, which run in different directions from their shells. See PURPURA.

M. Reaumur, when on the coasts of Poitou, found certain eggs of fishes arranged in regular order, and in great numbers, on the rocks and salted banks, which had the same property with the purple-dyeing liquor of the buccinum; it is not yet known to what particular fish they belong, or what uses they may hereafter be brought to serve. Mem. Acad. Par. 1711.

Pliny seems to derive the name buccinum from *buccina*, a kind of musical instrument; but it is more probable that instrument took its name from the shell to which it bore resemblance, and of which it might probably have been anciently made. Plin. Hist. Nat. lib. ix. cap. 36. Phil. Trans. N° 282. p. 1277.

Buccinum lapidosum is a figured stone, shaped like the former, and probably only a petrification of the shell above-mentioned.

Ray speaks of a buccinum which was not only petrified, but after petrification was converted into a pyrites.

TRUMPETER, in *Ornithology*, a name given in England to a particular species of pigeon, called by Moore the *columba tibicen*.

This species is of the middle size of the common pigeon, and made considerably like it; but it is pearly-eyed; is of a mottled black, is feathered down the legs and feet, and is turn-crowned like the nun, and some of the other species; sometimes like the finnikin, but much larger: this seems to be the best sort, as being the most melodious. The best character to know them by, is a tuft of feathers growing at the root of the beak; and the larger this tuft is, the more they are esteemed; the reason of their name is, that they imitate in their cooing the sound of the trumpet; but to be often entertained with their melody, it is necessary to feed them frequently with hemp-feed. Moore's Columbarium, p. 45.

Trumpeter is also a name given by Mr. Pennant to the *psophia* of Linnæus; because it makes a strong noise with its mouth, which it answers by a different noise from its belly, as if it came from the anus.

TRUMPETER, in a *Man of War*, one whose office is always to attend the captain's command, and be ready at the entertainment of strangers. In the time of an engagement his proper station is on the poop.

TRUN, in *Geography*, a town of France, in the department of the Orne; 7 miles N.N.E. of Argentan.

TRUNCATED LEAF, among *Botanists*. See LEAF.

TRUNCATED Pyramid, or Cone, is one whose top or vertex is cut off by a plane parallel to its base. See PYRAMID and CONE.

The word is formed of the Latin *truncare*, to cut off a part from the whole; whence also *truncus*, *truncheon*, &c. In *Heraldry*, they say *trunked*.

A truncated cone, or the frustum of that body, is sometimes also called a *curty-cone*. See FRUSTUM. See also GAUGING.

TRUNCATED Roof. See ROOF.

TRUNCHEON, of the French *troncon*, and the Latin *truncus*, a battoon; or a kind of short staff used by kings,

generals, and great officers, as a mark of their command. See BATTOON.

In our military language, it denotes a staff of command borne by a general officer.

TRUNCHEONS, *Columns in*. See COLUMN.

TRUNDLE, in *Rural Economy*, a sort of small framed contrivance with two handles at one end, and two low wheels at the other, which is trundled before the person using it. It is found convenient in conveying many sorts of weighty matters that are in small bulks.

TRUNDLE-Shot, is an iron shot about seventeen inches long, sharp-pointed at both ends, with a round bowl of lead cast upon it, about an hand-breadth from each end.

TRUNGIBIN, in *Natural History*, a name given by Rauwolf, Tournefort, and others, to a sort of manna collected from the *albagi maurorum*, as the common manna is from the ash; and used in the eastern parts of the world as a purge. It is what we call the *manna Persicum*, and though in itself a very fine and clean kind of manna, yet it is usually so carelessly collected, and mixed with so much filth, that it requires to be given in three times the dose of our's in order to purge. The name seems very evidently to be a corruption of *terciabin* or *terenjabin* of the Arabians, which was the word used by all their authors to express the *manna Persicum*.

TRUNK, a strong chest or box of a roundish form, at least on the upper side.

TRUNK, in *Anatomy*, is used for the busto of the human body, exclusive of the head and limbs.

The trunk is divided into three parts; viz. one common, called the *spine*, and two proper, viz. the *thorax* or *breast*, and the *pelvis*; which see respectively.

TRUNK, *Truncus*, is also used for the main body of an artery or vein, in contradistinction to the branches and ramifications of it.

The word is particularly applied to certain parts of the aorta and cava.

TRUNK, in *Architecture*, is used for the fust or shaft of a column. Also for that part of the pedestal between the base and the cornice, otherwise called the *dye*.

TRUNK, in *Gardening* and *Planting*, the common name of the boll, body, or principal stem in all plants of the tree-kind, and of the stalk in those of all the other sorts. It is that part which rises immediately from the root, and is properly the stock or chief body of the plant or vegetable from the root of which it proceeds, and which ramifies itself into the various boughs, branches, buds, leaves, flowers, and fruit which contribute to it, and are the production of it.

The trunks of most trees, and some other kinds of plants, are of a hard ligneous nature, but in others soft, and in the former are constituted of several different original parts, such as an outermost coat or thin layer of hard matter of a fibrous quality, the fibres crossing each other in all directions; and the texture of which in some cases is so very thin and clear, that the direction or net-work of them can be seen by holding the substance up against the light. The use of this finely woven tunic or coat is that of defending the true bark of the trunk, or the layer which lies immediately below or underneath it, from the action and injurious effects of the atmospheric air; the protecting and keeping open, by its callous nature, the fine pores of the exhaling and inhaling systems of vessels; the modifying the various impressions which are made by external objects upon the plant or vegetable; the securing and giving protection to the extreme ramifications of the aerial or aqueous vessels; and the covering

TRUNK.

of the cellular substance, in which the several fluids of it are elaborated and prepared.

A true and somewhat inner bark is situated next to the above in the trunk of the tree, and is of a hard texture, but adhering only loosely in trees to the covering which lies below it. In tender plants this covering is often of a soft pulpy nature, and has the denomination of skin.

A still more inner layer, which is often called *liber*, forms a third part or covering of the trunk in trees, which is of a membranous and flexile nature, being sometimes altogether separable from the true bark above it, and the white lamina which lies below it. This and the former coat of the trunks in trees are formed of different lamina, as is evident from macerating them in water, by which the cellular substance is destroyed, and the laminated appearance becomes fully displayed. These seem to be parts which are very essential to the life of the plant or vegetable, as in them the chief or principal functions of it are carried on; such, for instance, as those of nutrition, digestion, secretion, and some others. This is plainly proved and shewn to be the case, by those trees which have hollow or rotten trunks, the insides being wholly destroyed, and by such plants as are kept in vigour by the perfectly good state of their barks, although the internal parts of their trunks or stalks are wholly rotten and destroyed.

The next part, lamina, or coat, which affords a covering or portion to the trunks in trees, is that which has the title of alburnum or sapwood commonly given to it, and which is situated immediately upon the ligneous or woody part, being mostly composed of a rather soft white substance that is scarcely perceptible in some sorts of trees, but which in others is hard and perfectly visible, as in those of the oak, elm, and some other kinds. This coat or part forms an imperfect sort of wood in the trunk, not having yet put on the consistence which is proper for perfect wood, the former of which must be arrived at before the latter can be put on. The hardness and solidity of this part of the trunk are somewhat in proportion to the vigour of growth in the particular tree or plant.

The succeeding or ligneous part, is that which is composed of a compact fibrous substance, disposed in concentric layers, and which surrounds the middle or pithy part of the trunks. It seems as if it were constituted or made up of a congeries or collection of dried vascular parts; and in plants of the annual and biennial kinds commonly receives the denomination of flesh.

The last, middle, or pithy part of the trunks of trees or plants, is that which is situated in and runs through the hearts of them, and which is of a soft vascular nature, differing from that of the cellular textured kind in the perfect whiteness of its colour. It is in the greatest abundance while the trees or plants are in their young state of growth, diminishing in quantity as they advance in age and size, and at length not unfrequently wholly disappearing. Hence it is obviously necessary to them in the beginning of their lives and growths, but not for the continuance of them. It has been suggested as probable, that nature may reserve a superfluous nourishing fluid in this pithy part, if from any cause the young tree or plant should become dry, that then it may be taken up and converted into its food and support.

It must be evident, that what has been said concerning the trunks of trees and plants, must be equally applicable in every respect to the branches and other ramifications, as having the same parts continued from such trunks, of which they in fact form a part in the ways which have already been pointed out.

The trunks of trees and other vegetable productions during their growths are enlarged in their size and thickness throughout their whole lengths, as well as in their heights, and not at any one particular point or part only, as has been fully proved by numerous and repeated trials of various kinds. And in those which are only of an annual or one year's growth and duration, the enlargement or expansion in length continues simply until they have protruded and completed their flowers and flowering process, when the constituent parts of the trunks, stems or stalks begin to take on a hardened form, and at length, in a gradual manner, become quite dry and rigid.

But in those which are of a perennial nature, or of some years' growth and duration, this enlargement or increase in the trunks, stems, or stalks, continues until such times as the leaves decay and fall off in the autumnal season, when a germ or bud protrudes and fixes itself in the place which contains the basis or rudiment of a new trunk or stem, that by degrees during the winter months increases in size until the advance of the vernal season, when, throwing off its former covering, it continues the enlargement or increase of the new trunk or stem, in the same manner as the inferior or lower part was augmented during the former year; as in the place where a bud is situated, a swelling-out takes place and extends itself, which is so continued with the new trunk or stem, as scarcely to leave any mark or vestige where it was. The increase of the trunks or stems in breadth, however, does not proceed from the dilatation or enlargement of the woody layers of them, but from the generation and production of new laminae or layers, which are every year deposited and added to them, by the vessels which are contained in the barks of them, as has been sufficiently shewn by different experiments.

It has been further shewn by observation and experience, that the trunks or stems of trees and some other plants are augmented every year by two woody laminae or layers, but that the size or thickness of them is by no means each year exactly the same, this depending in some measure upon the vigour of growth, age, and state of the climate, as they are the greatest when the state of growth is the most, the age in the middle degree, and the heat of the situation moderate; for the warmer the summer, the more slender the bark, or outward covering.

The trunks, or stems and stalks, in trees and plants, are of several different kinds, and distinguished by many different names. Some trees have trunks or stems which are very short and thick, others have long large clean ones; and some again have them long, small, and clean, others more knotty; some are very crooked, others quite straight; and there are still many further differences in these and several other respects. Trees of the oak, ash, beech, and elm kinds, and the several sorts of the fir-tribe, have, in general, the largest, thickest, and clearest trunks or bolls; but there are many other varieties of trees which furnish good useful trunks and stems, such as the lime, the walnut, the willow, the poplar, the chestnut, &c. in particular situations. The trunks of trees are valuable as timber, according to the particular uses and purposes for which they are designed, and to which they are put. Thus in ship-building, their being properly crooked is a great recommendation; while in many works of carpentry and other descriptions, their being perfectly straight renders them of the most estimation. In fact, their having a straight clean growth is in general a favourable property, and a circumstance which makes them readily disposed of in the markets.

In plants of other kinds the trunks are often small, so as more properly to deserve the title of stems: and at other times

times they are of a soft and pulpy nature, so as to demand the name of stalks. See PLANT, STALK, and STEM.

In these sorts of plants the *stalk* is the most common sort of trunk or stem, both among small plants of the tree kind, and those of the nature of herbs, as producing and supporting the leaves, flowers, and fruit. The name of *culm* is given to trunks or stalks of the straw or haulm kind, which are peculiar to grasses and grain, and equally bear the leaves, flowers, and produce or fruit. *Fronde* is a term which is constantly applied to the trunks or stems of plants of the palm and fern kinds or tribes, which are of a compound nature, as being formed of a branch and leaf united or blended together, and not unfrequently the flower and fruit too. The *peduncle* is a term signifying that sort of trunk or flowering-stalk which rises sometimes from the root, but more commonly from the branches, raising or elevating the flowers and fruit, but not the leaves. The *petiole* is a term implying that sort of trunk or leaf-stalk which bears the leaves only, and not the flowers.

The term *scape* is a name which is applied to herbaceous naked stems or trunks which serve to elevate and raise up the fructification only, as in those of the hyacinth and daffodil kinds.

The term *stipes* is applied to that sort of trunk or stem which is found in some kinds of fleshy plants, such as those of the common mushroom, and others of the fungus tribe. See these terms respectively.

Trunk is therefore a term which has a very extensive application in the cultivation of garden vegetables of the culinary and flowery ornamental kinds, as well as in planting, to trees of the timber and other sorts, as is more fully shewn and explained in speaking of *stalk*, *stem*, *timber*, and *tree*. See these heads.

TRUNK, in *Canals*, denotes a wooden culvert sometimes made under canals.

TRUNK and *Valve*, is a trunk of wood laid through the bottom of the bank of a canal, by which water can be let out of the canal, by drawing of the valve at its inner end.

TRUNK, in *Mining*, is a strek or strakes (*q. d.* stream) with a very small stream or dribble of water, to wash the slime of tin or copper ore, by which the lighter earthy parts are carried off with the water. The operation is called *trunking the slimes*.

TRUNK is also popularly used for the snout of an elephant, by naturalists called the proboscis.

TRUNK, in *Natural History*, a pointed, hollow, slender, and oblong body; joined to the fore-part of the heads of many insects, and serving them for sucking the blood or juices of the animals, or vegetables, on which they feed.

The trunks of flies serve for distinguishing many genera of those little animals, from their different form and other accidents. Some of these are a tube formed all of one simple piece, and others composed of several shorter pieces, nicely joined together: some are thin and as it were shelly, others thick and fleshy; those of some flies are terminated by a sort of broad foot, or by a sort of thick lips; and those of others have no lips, or at least no sensible ones; and others are made in form of a spindle hollowed at the end.

It is often necessary to have recourse to the microscope, to distinguish with nicety and exactness between these.

Without the assistance of glasses, however, it is easy to distinguish among the flies of different genera, three different manners of carrying this organ when in a state of inaction. Many flies have trunks which they can shorten, when they are not using them; these are fixed in the fore-

part of the creature's head, where there is a cavity destined to receive them when they are not in use. In many species, this cavity is no more than a mere sinus, or hole, in the fore-part of the head; but in others it is more nicely contrived, the anterior part of the head lengthening itself, and forming a kind of arched vault for its reception. Other flies have trunks which in the time of inaction are turned, or somewhat folded from above downwards: the trunks of bees are of this kind.

There are others also, which have their trunks contained entirely in a sort of case, where they lie straight at length, without being either turned or folded; but they are able to incline them in any direction, in regard to the position of their legs: of this kind are the trunks of the cicadae, gnats, &c.

Among the butterfly class, a great number are furnished with a trunk; but there are also a great number that have it not: the fly of the silk-worm, and many, as well larger as smaller kinds, are without this organ. Those species which have it, shew it to the first view; it is placed in the middle of the head, directly between the two eyes. And though in several species it is very long, yet it takes up even in these but very little room; when it is not in use, it is always rolled up in a spiral form, in the manner of the spring of a watch; and even the shortest of them are thus turned as well as the longest.

There are among the butterflies, some which never settle upon any thing, but are eternally upon the wing, in the manner of swallows: these feed on the wing as those birds do. We often see them buzzing about a flower in the manner of a bee, and in that case they sustain themselves in the air with their wings, while they unroll their trunk, and thrust its extremity into the flower, to suck from its bottom the honey-dew, which is the common food of them, of the bees, and of many other insects. It has been much disputed, among the curious observers of nature, whether the trunk be originally composed of two parts, or two trunks laid close to another; or whether it were owing to its slender structure, that it was easily split by breaking its parts.

Mr. Bonani was of the first opinion, and Mr. Riget agreed with him at first, but he afterwards became of the contrary sentiment; and thought that they really broke in this splitting, being originally only one; but Reaumur has determined the question in favour of Bonani: having by repeated observations, found them composed of two parallel trunks, nicely and evenly laid sidewise together.

The action of the trunk in sucking is easily seen on giving a piece of sugar to a butterfly that has been kept without food for some days, after its being produced out of the chrysalis; many of the species will in this case feed on the sugar in the same manner that they would on the juices of flowers, and will shew that the use of their rolling up their trunk at times, is the swallowing what they have received into it. The trunks of the several species of butterflies are as different in colour as in shape: some are black, others reddish, many of a chestnut colour; some are also of a pale brown, and some of a beautiful yellow; many of them also are hairy on the under side, and many are smooth. The thicker trunks are always shorter than the flat ones, and have only one canal. Reaumur, Hist. Inf. vol. i. p. 287. 293. 309.

TRUNK of *Gnats*, the instrument by means of which the gnat strikes the flesh, and sucks the blood from animal bodies.

This is a machine well worth an attentive observation. As fine and small as this instrument appears, it is nevertheless of a very complex structure. The piercer, or more properly

perly the piercers of this instrument, are all entirely hid in the sheath which makes what we call the trunk; and is the only part we have naturally offered to our view. The trunk appears to be cylindrical in the greater part of its length, and is covered with scales resembling small leaves. Near its end it has an oblong button, furnished with an aperture, out of which is occasionally thrust a fine point, which is complex, being made up of a great number of pointed bodies.

The best way to get a regular sight of the trunk of this creature, and of its manner of using it, is to suffer a gnat to fettle upon the hand, and not disturb him in the operation; but with a magnifying-glass in the other hand, to observe all his motions. In this case, we may first see a small and slender point thrust out at the end of the case, and the fly trying several different parts of the skin with this sharp instrument: when it has done this, it chooses that part which is most easily pierced; and where lies a vessel underneath, capable of furnishing as much blood as it will have occasion to suck. As soon as he has made his choice, the wound is given; and since the point of the compound piercer cannot be protruded so far out of the case as is necessary for striking to a proper depth, the use of the slit in this case is seen; for while the button at the end of this remains firmly applied to the orifice of the wound, where the piercer is introduced, and supports that delicate and feeble instrument from bending, the case opens at the slit, and its two sides bend to give room for the piercer to penetrate; and at length, when the piercer is sunk to its utmost depth, the two extremities of each piece touch, and the sides are brought close together.

The several species of gnats have great variety in their trunks; and in the observing of many kinds, the true structure of that organ in all will be most regularly and easily found. Some have the case of the piercers only one single tube split lengthwise along its upper part; others have this slit made by the junction of two cases, which cover closely a great part of its circumference, and others have the two tubes so well adjusted, and nicely fitted to one another, that a good glass cannot discover them from the rest of the trunk, when in a state of rest; but in others this structure is easily discoverable, as the extremity of one of them, when best fixed, is still to be discovered somewhat separated from the trunk, and adorned with a pencil of short hairs, like those of the antennæ. The male gnats, which have their antennæ feathered, are those which have the plumes at the extremities of these additional pieces of the case of the trunk; and these have not the beards which are found situated over the trunks of the other species of gnats.

In some gnats four darts are thrust out occasionally from the opening side, one of which serves as a sheath to the other three. The sides of them are extremely sharp, and they are barbed or indented towards the point.

Out of the immense number of gnats that one sees in summer, in wet places, it is easy to determine that very few have any chance, even once in their lives, to suck the blood of larger animals. The rest, however, are far from being doomed to perpetual famine; the herbs of the field afford them a sufficient nourishment; for these, like many other of the insect tribes, are partly carnivorous, partly otherwise, and feed equally on flesh and vegetables. Reaumur, Hist. Insect. vol. iv. p. 580, seq. Baker's Micr. 1743, p. 205.

TRUNK, *Fire*, in a *Fire-Ship*. See FIRE-SHIP.

TRUNK-*Manna*. See MANNA.

TRUNK-*Roots of a Plant*, are little roots which grow out of the trunks of plants.

VOL. XXXVI.

These are of two kinds: 1. Such as vegetate by a direct descent, the place of their eruption being sometimes all along the trunk, as in mints, &c. and sometimes only in the utmost point, as in some other plants and trees.

2. Such as neither ascend nor descend, but shoot forth at right angles to the trunk, which, therefore, though, as to their office, they are true roots, yet, as to their nature, are a medium between a trunk and a root.

TRUNKED, among *Heralds*, is applied to trees cut off at each end, which are said to be *trunked* or *truncated*.

TRUNNIONS, or TRUNIONS, of a piece of ordnance, those knobs or bunches of metal in a gun, mortar, or howitzer, which project from the piece, and bear it upon the cheeks of the carriage.

TRUNNION-*Ring*, is a ring about a cannon, next before the trunnions.

TRUNNION-*Plates*, are two plates in travelling carriages, mortars, and howitzers, which cover the upper parts of the side-pieces, and go under the trunnions.

TRUNS, in *Geography*, a town of the Grisons, where the independence of the Grey League was first ratified, and an alliance concluded between the chiefs and the communities, on the Rhine; 7 miles W. of Ilantz.

TRUNTZ, a town of Prussia, in Ermeland; 9 miles N.E. of Elbing.

TRURO, a large market-town and borough in the western division of the hundred of Powder, and county of Cornwall, England; is situated in a vale at the conflux of the two small rivers Kenwyn and St. Allen, 22 miles S.S.W. from Bodmin, 46 miles S.W. by S. from Launceston, and 257 miles W.S.W. from London. It is called in ancient records Trevery, Trieureu, and Truru-burgh. It was one of the decayed market-towns for the repairs of which an act of parliament was passed in 1540; but it has now become a place of considerable trade. Its central situation with respect to the commerce and chief products of the county, its improved and still improving state, the regularity and handsome appearance of the buildings, with its increasing population, justify its title to pre-eminence amongst the towns of Cornwall. Leland says, "There is a castille, a quarter of a mile by west out of Truro longing to the erles of Cornwalle, now clene down. The site thereof is now used for a shoting and playing place, out of the town of Truro." This castle is not mentioned in Domesday book, and was therefore erected after the Conquest. William of Worcester speaks of it as being in ruins in the time of Edward IV. It stood on an eminence on the more westerly side of the two currents; its only remains are a waste area, and an artificial mount or keep, the earth of which is daily decreasing by its being applied to other purposes. From the increase of the buildings since the time of Leland, the site is now included within the town, which appears to have derived its origin from the castle; but was so nearly coeval with it, that it is noticed as existing within a century after the Conquest, and as having a charter in the reign of Henry I. The corporation of Truro, as established by a charter of queen Elizabeth, bearing date 1589, consists of a mayor, four aldermen, and twenty capital burgesses. In these twenty-five persons, the right of electing two members to parliament (possessed by the borough ever since the reign of Edward I.) is vested; though the number of inhabitants, as ascertained by the population return of the year 1811, is 2482, when the houses were enumerated at 400. The burgesses of Truro have sundry privileges by grant of their ancient lords; and the mayor's jurisdiction extends even over Falmouth. This last mentioned privilege, which is said to have been granted

by king John, and is recorded in the herald's visitation of 1620, was lost in the early part of the last century; it having been then contested by, and decided in favour of, the inhabitants of Falmouth, who now enjoy the jurisdiction of their own port. This town is situated in the three parishes of St. Mary, St. Clement, and Kenwyn. St. Mary's church is a spacious edifice, of the architecture which prevailed in England about the reign of Henry VIII. It consists of two aisles of equal size, and a smaller one; and has a modern steeple, which does not correspond with the body of the church. In the windows are several fragments of painted glass; and in one of them, on the south side, is the date 1518, the year when the church was erected. Here are seven meeting-houses for the accommodation of dissenters of various denominations. Truro is one of the original coinage towns; and here only, and at Penzance, with the exception of a few times at Helston for the convenience of the merchants, have the coinages of late years taken place. Most of the tin is coined here, and more is exported hence than from any port in the county. The blocks lie in heaps about the streets, and are left entirely unguarded, as their great weight renders it difficult to remove them without immediate detection. Here is a coinage-hall; and Hals, in his Parochial History, mentions the town possessing one so early as king John's reign. Here is also a manufactory for converting block-tin into bars and ingots: the weight of the former is from eight ounces to one pound; that of the latter, from sixty to seventy pounds each. The bars are exported to the Mediterranean and Baltic; the ingots are sent to the East Indies. Considerable quantities of copper-ore are exported from this town to Wales. A manufactory for carpets has been recently established, which is carried on with great success, and forms a material addition to the export trade. The improvements made in Truro of late years have been very considerable, and particularly since the year 1794, when an act of parliament was passed for lighting and paving the town. The principal street was formerly contracted, and disfigured by a row of houses stretching along the middle from the coinage-hall to the market-place. These have been removed, and a spacious opening formed, from which a new street is built, diverging from the other at right angles. A literary society and a county library were established here in the year 1792. A theatre and assembly-room have also been erected in that part of the town called the High-Cross: and on the 12th of August, 1799, a county infirmary, a spacious stone building, was opened in Kenwyn parish, under the patronage of the prince of Wales. A free grammar-school was founded at an early period: and there are two exhibitions, of 30*l.* *per annum*, at Exeter college, Oxford, for scholars of Truro school, founded by the trustees of the charitable bequests of the Rev. St. John Eliot, who died in 1760. A central school on Dr. Bell's plan was established in 1812, in which there are 130 boys and 70 girls. An hospital for ten poor housekeepers in St. Mary's parish was built in 1632, pursuant to the will of Mr. Henry Williams, who endowed it with lands which now produce 120*l.* *per annum*. The corporation make widows the exclusive objects of this charity, and allow them a pension of four shillings each *per week* and clothes. The market at Truro is held by prescription; the claim to it having been certified and allowed in the reign of Edward I. Here are now two market-days, Wednesday and Saturday, both well supplied with butcher's meat, fish, and other provisions. A corn-market is also held on Wednesday. Four annual fairs are likewise kept for cattle.

About a mile from Truro, on the road to Falmouth, at Calinnick, is a large smelting-house for tin. It consists of

ten reverberatory furnaces, six feet in height, and about twelve feet in length, each. Culm-coal is used as the flux, in the proportion of about one-eighth to the ore, of which nearly 600 cwt. is smelted within six hours, and yields about 350 cwt. of tin.—*Beauties of England and Wales*, vol. ii. Cornwall; by J. Britton and E. W. Brayley, 1802. *Lytton's Magna Britannia*, vol. iii. 1814.

TRURO, a town of Nova Scotia; 40 miles N. of Halifax.—Also, a town of Barnstable county, in the state of Massachusetts, on the E. side of Cape Cod bay, containing 1209 inhabitants. N. lat. 42° 1'. W. long. 70° 2'.—Also, a township of Franklin county, in the district of Ohio, containing 672 inhabitants.

TRUSAM, a river which rises in the Brisgau, passes by Friburg, &c. and joins the Eltz, near Riegel.

TRUSS, TRUSSA, a bundle, or a certain quantity of hay, straw, &c.

A truss of hay is to contain fifty-six pounds, or half a hundred weight: thirty-six trusses make a load.

In June, July, and August, a truss of new hay must weigh sixty pounds. The truss of straw is likewise to weigh a certain weight, but this is various, in some degree, in different places. In other matters, the trusses differ greatly according to custom or other circumstances.

A truss of forage is as much as a trooper can carry on his horse's crupper.

TRUSS, or *Bunch*, among *Florists*, is a term applied to the tuft of flowers which is formed at the top of the main stem or stalk of some plants of that kind, and which, in the auricula and polyanthus sort, consists of a small bunch of flowers, to which the title of pips or blossoms is given, and which are supported by as many little foot-stems, proceeding from out of the top part of the main stem; some of the properties of which are these: the pips or blossoms, which are the flower parts, consist of the disk or outer rim, the eye or inner rim, the tube or pipe, and the thrum, chives, or apices. The pips or blossoms, in these kinds of flowers, should always be rich, and of a lively good colour or colours, as such as may immediately strike and captivate the mind of the beholder with the idea of real beauty; as this is the property which is the foundation of all the others in these sorts of flower-plants: consequently, where the colours of the flowers in them have a faint or dead appearance, or are of an ordinary and inelegant tinge or hue, they are good for nothing, even though the whole of their other properties should be the most excellent.

In all the painted or striped flowers of these sorts, the colours should constantly be so equally distributed over the rim or disk, as that there may be an equal uniformity amidst the whole variety; in order that, upon the whole, the sight may not be in the least distracted or offended with any sort of disproportion, or perceive one side to be of a brighter or darker hue or shade than that of another. The edges of the rims should be round, or at least so near it, that the indentures may bear but a small proportion to the disk; as when these are deep, and the points of the petals stand in somewhat the star-form, greatly divided, the largeness of the vacancies will affect the sight with an evident deficiency: and the case is still worse in those pips or blossoms which are liable to run out into a greater breadth on one side of the eye than the other; such irregularities and disproportions are very disgusting in these flowers. The eye, which is the iris or little ring that environs the tube or pipe, and which ought to be formed in the manner of the disk, either perfectly or nearly round, and of an entire clear colour; and of a snowy or pure white, in all painted or striped flowers; and of either a white, bright yellow, or good
straw-

TRUSS.

straw-colour, in self or plain-coloured flowers. The farina, mealy, or dully property should also be fine; as, if coarse, it will be unpleasant to the eye, or in appearance. The eye of the flower should appear entire, though not separate from the disk or rim; that is, it should be blended with or shaded into it in such a manner, as not to occasion any indistinctness between the edges of the one and the other: as, in flowers where these two properties of the eye are imperfect, the lively contrast or difference between the rim and the eye, which otherwise reciprocally display and shew each other off to the best and most advantage, is, in a great measure, lost and destroyed. The face of the whole pip, rim, and eye, should likewise be so opened as to lie perfectly or very nearly flat; as when it either inclines inward, which is termed *cupping*, or throws itself backwards, as in particular flowers, such as the martagan lily, the true form as well as colours are in some degree obscured by being covered and put out of sight. See TUBE and THRUM.

The length of the pedicles which support the pips or blossoms in the truss, should be proportioned to the number and size of the pips which they sustain; as, if they be very long, and the pips small, there will be unsightly vacancies in the truss; or if they be short, and the blossoms many and large, they will be too much crowded together, so that neither the colours can be fully viewed, nor the other properties of the pips be displayed. The pedicles should also be sufficiently elastic, firm, and strong, in order that they may not droop by the weight of the pips or blossoms, and fall loose and in a disarranged manner, but sustain the truss firmly and closely, without either vacancy or crowding. They should, too, be nearly all of the same length, so that the pips may stand together at the same height, and form a regular umbel, or rather corymb, which is the formal perfection of the truss. The pips should also be nearly of the same size and colour, so as not to be readily distinguished from each other; as otherwise the unity and harmony of the truss will be destroyed, and though ever so plentifully formed, would appear as if taken from different sorts of these flowers. A plant of these kinds should blow freely, and expand all its pips or blossoms at the same time; as, by this means, the colours in them all will appear equally fresh and lively; whereas in those which do not blow some of the pips until others have passed their prime, the whole appearance of the truss falls much short of that beauty which would otherwise be conspicuous.

The stem or stalk which supports the truss, and which is mostly termed the main stalk, should be elastic, straight, and sufficiently strong for bearing it without drooping. It is also an excellency in it to be erect and lofty, as thereby the truss, and of course the whole flower, will make a more stately, commanding, and handsome appearance.

Such plants of these kinds as have these properties or qualities can hardly fail to please the curious florist; yet as, on the one hand, some plants may be somewhat deficient in several particulars of less consideration, and still be justly deemed fine and valuable flowers; so, on the other hand, it will be an additional excellency, in such as have all these properties, that they naturally stand long in bloom, and wear their colours without alteration or fading in any way. The truss or bunch is probably so named by florists, in consequence of its having naturally something of that appearance about it.

TRUSS, in the language of *Surgery*, is a particular sort of bandage, or apparatus, employed in cases of ruptures, (see HERNIA,) for the purpose of keeping up the reduced parts, and hindering a fresh protrusion. It mull of course be

adapted to the situation and nature of the rupture. As a truss is of all the inventions of surgery one of the most important, and highly essential to the health of a large portion of the human race, the most advantageous modes of constructing and applying it are objects which it is as much the duty of the surgeon to know something about, as about any other means of curing or lessening the danger of so serious and common a disease as a rupture.

A truss which fulfils its intention properly, should compress the neck of the hernial sac, and the ring or external opening of the hernia, in such a manner, that a protrusion of any of the contents of the abdomen will be prevented with complete security. Hence, it is the indispensable quality of a good truss, first, to make effectual and equal pressure on the parts indicated, without causing pain or inconvenience to the patient; secondly, not easily to slip out of its right situation, in the varying motions and positions of the body.

The different kinds of herniary bandages may be reduced to the two classes of elastic and inelastic. The latter are composed of leather, stuff, dimit, or similar materials. These cannot be at all depended on, and should, therefore, be entirely banished from surgery. Since (as Mr. Lawrence has remarked) the size of the abdomen varies according to the different states of the viscera, and to the motions of its parietes in respiration, a non-elastic bandage must vary constantly in its degree of tightness, and keep up either too great or too little pressure. The omentum, or intestine, easily slips out when the opening is not exactly closed, and the patient who wears such a bandage, must be in a state of constant insecurity. Those who lead an active life, or are obliged to use laborious exertions, will be more particularly exposed to risk. If the patient, after experiencing these defects, endeavours to remedy them by drawing the bandage tighter, he may confine the viscera, but he produces other inconveniencies. The increased pressure injures the spermatic chord, and may affect the testicle: the integuments become red, painful, and excoriated; and the bandage must be entirely laid aside, until the parts have recovered. Richter has often seen painful tumefaction of the testicle, hydrocele, and even circocele, produced from this cause, and entirely dissipated by the employment of a proper truss. *Traité des Hernies*, p. 24.

He also saw the pad of a non-elastic bandage excite, in the region of the abdominal ring, a considerable inflammation, which terminated after a few days in suppuration. The hernia never appeared again after the cure of the abscess. The inflammation had extended to the neck of the sac, and obliterated that part. *Lawrence on Ruptures*, edit. iii. p. 69, 70.

Every truss consists of a pad, for compressing the ring or aperture through which the hernia protrudes, and of another piece, which surrounds the abdomen. To these are sometimes added a thigh-strap, which passes under the perineum, and a scapulary, which is applied over the shoulder. The use of the two latter appendages is to keep the pad from slipping up or down, an inconvenience which it is difficult to prevent in certain cases, unless a scapulary or thigh-strap be worn. In the inelastic trusses, the piece which extends round the body, is a simple girt or band; but in every elastic truss, this part is constructed with a spring, which is the most important thing of the whole instrument.

Elastic trusses, when they are well made, and fit properly, are to be preferred to the inelastic, in regard to security. They yield to the varying motions of the body; are less liable to slip off the part upon which they are intended to

prefs; and, in general, do not require the use of a thigh-strap, which is usually a very disagreeable part of the truss to a patient.

"The valuable properties of this instrument (says Mr. Lawrence) depend entirely on its spring, which keeps the pad constantly pressed against the hernial opening; and gives it a power of reaction, by which an uniform pressure is maintained under varying attitudes. This elasticity can be attained only by the employment of steel. In the first attempts at procuring something better than the non-elastic bandages, iron was used; and the instruments fabricated by Blegny at Paris were constructed of this metal. It is obviously inadequate to accomplish the ends which we have in view, in treating herniæ; yet it is only at a comparatively recent period that its defects have been discovered. Arnaud, whose writings contain much valuable information on this subject, recommends for the spring of a truss a mixture of malleable iron and steel, so that the instrument may be moulded by the hand to any particular shape which the patient may require; and he is followed on this point even by Richter. A truss which admits of such management, must in effect be exposed more or less to the objections which apply to the non-elastic bandage; and the only material which possesses the requisite qualities of firmness and elasticity, is well-tempered steel.

"The most important part, then, of an elastic truss, consists of a flat and narrow piece of steel, adapted to the form of the body, and called the *spring*. This passes round the affected side of the trunk, terminates anteriorly on an expanded plate of iron, to which it is rivetted, placed over the mouth of the sac, and extends behind to various distances beyond the spine. The posterior surface of the plate is furnished with a convex cushion, termed the *pad*, and adapted in form and size to the opening which it is designed to close. The spring is covered externally with leather, and that it may fit easily on the body, its inner surface is lined with some soft substance; a strong strap, extending from its posterior end, passes round the sound side of the trunk, and is fastened to a hook on the front of the plate. This strap, being perforated by several holes, enables the patient to tighten or loosen the truss at pleasure." Lawrence on Ruptures, p. 71, 72. edit. 3d.

In a note, this gentleman observes, that the spring of the truss has commonly been a semicircle, with the posterior end resting on the spine. Camper proposed to carry it round to the anterior superior spine of the ilium on the sound side; and Scarpa very much approves the plan. Trusses of this form fit with a firmness which cannot be given to the others by tightening the strap. They keep up the rupture much better than even a stronger spring of the other kind. Hare-skin, with the hair outwards, is considered the best article for covering the spring, with a view of keeping it from the ill effects of the perspiration.

When it is necessary to make strong compression, as in large old ruptures, and in persons who cannot avoid labour and exercise, the elastic spring should be made accordingly thicker and broader. But an object of the first-rate importance is to make the spring press equally upon every point of the body which it touches. This is what demands the earnest attention both of the surgeon and the instrument-maker, especially as the hips of some individuals are flat and narrow, while those of other persons are broad and prominent. A thick, flexible, metallic wire, accurately applied round the pelvis, will serve to take the measure and proper shape of the spring, which may afterwards be altered a little, if found necessary. The wire, however, should be

somewhat longer, on account of the length of the spring being diminished in the construction of it. Callisen disapproves of springs which extend quite round to the opposite hip; but he thinks a certain bend of the spring downward, near the pad, is useful in trusses for inguinal ruptures, as, by this means, the part of the instrument which goes round the pelvis can be made to fit more closely, and is placed at a convenient distance from the trochanter, so as to be less liable to derangement. The neck of a truss for a femoral hernia should be shorter, and, in general, the instrument requires in this case the employment of a thigh-strap to keep the pad from slipping into the bend of the groin.

The pad of a truss is frequently composed of a piece of cork covered with leather, with the intervention of some wool or horse-hair. Proposals have been made to use pads which are formed of bladder or elastic gum, filled with air, but we know nothing of the real merits of such contrivances, nor should we expect them to answer. Callisen gives a general preference to pads which have a flat and not a conical surface, which last form not only produces less equal pressure, but is more liable to slip. The shape and size of the pad should of course correspond to the figure and dimensions of the ring, or opening, at which the rupture protrudes. In the inguinal hernia, the pad should be long and oblique; in the crural, shorter; in the umbilical, round; and in the ventral, for the most part, oval. In large old ruptures, the pad should be large accordingly; and in small recent cases, it should be small in proportion. For fat subjects, the pad should be firm and prominent; but for thin persons, it should be flatter and softer. Nay, it has even been found sometimes necessary to accommodate the shape of the pad to the various degrees of convexity or flatness of the os pubis.

Trusses are sometimes fabricated with a pad moveable on the spring, instead of being rivetted to it. This may be inclined upwards or downwards, according to the form of the abdomen; and it is retained at the desired point by a spring fitting into the teeth of a rack. In others, the plate contains a screw, by which the cushion is pushed farther inward, or allowed to recede, at pleasure. Although there cannot be a doubt that some of these inventions possess considerable merit, and are, in certain instances, superiorly useful, it must be confessed that, in general, their utility is not so much greater than that of common pads, as to make amends for the want of simplicity and the increase of expense. We should be sorry, however, to say any thing that would unfairly discourage all such ingenious endeavours to improve so difficult an instrument to make perfect as a truss; and we therefore repeat our belief, that there are particular cases, in which pads, with racks, screws, springs, &c. may be employed with great advantage.

Notwithstanding every care, sometimes even elastic trusses cannot be hindered from slipping away from the part which they are designed to compress. Sometimes they slip downwards, which in fat subjects is generally caused by the projection of the abdomen. Occasionally, the fault consists in the instrument becoming displaced in the direction upwards, which mostly happens in thin persons, and is produced by the flatness of the abdomen. In the first case, the displacement is to be prevented by the use of an elastic scapulary; in the second, the slipping of the pad upwards is to be prevented by the employment of a thigh-strap.

When a patient is afflicted with a rupture on each side, the two protrusions may be very well kept up by means of a single truss, made with two pads, which are joined together, at the exact distance of the rings from each other, by

TRUSS.

by a piece of steel, applied over the convexity of the symphysis of the pubes, and proportioned in length to the space between the two openings through which the viscera descend. In such cases, however, it is absolutely necessary to have the spring stronger, than if there were only one rupture. The truss should also be made to put on that side of the body, upon which the hernia, most difficult to retain, is situated. There are some practitioners, who give the preference to the use of two single trusses, joined together in front and behind with suitable straps.

With respect to the application and use of trusses, the following instructions seem to merit attention.

1. A truss should never be first applied, or changed, except when the patient is in the horizontal posture, and it is known with certainty that all the contents of the rupture are completely reduced.

2. The first applications of a truss should always be made under the superintendance of the surgeon himself; and care should be taken to put on the instrument in such a manner, that the lower third of the pad will compress the neck of the hernial sac against the os pubis, while the upper portion will compress the abdominal ring. The surgeon should also make the patient acquainted with the right manner of applying the truss; the principles on which it keeps up the bowels, and affords a chance of a radical cure; the requisite cautions to be observed, &c. When a patient first begins to wear a truss, he should be particularly careful not to be guilty of any imprudent exertions, and it behoves him to observe most attentively, that the instrument does not slip from its proper situation. It will also be necessary for him to pay attention to the instrument being neither too tight, nor too loose.

3. The patient ought to be provided with at least two trusses, which should be changed every morning in bed. In order to save the truss, especially in fat persons, who perspire a great deal, it is a good plan to lay a soft piece of linen under the pad.

4. An uneasiness about the ring, which always gives rise to a suspicion that a portion of intestine, or omentum, is protruded, makes it proper to take off the truss, carefully examine the parts, and reduce them if they have descended.

5. When the skin is excoriated by the truss, the part may be cured by sprinkling upon it the powder of acetite of lead, fuller's-earth, lapis calaminaris, &c. or bathing the part with the saturnine lotion. It will also be right to protect the excoriated place with a piece of linen put under the truss.

6. When the pressure of the truss excites affections and swellings of the spermatic cord and testicle, either the thigh-strap must be relaxed, or the lower part of the pad made less prominent.

7. In children a very tight truss is altogether hurtful, and may be the cause of various curvatures and deformities; but the erroneous opinion, that they ought not to wear a spring truss, we have noticed in another place. See **HERNIA**.

8. Sometimes very old large ruptures cannot be securely kept up by means of a truss, and even when the pad is extremely large, not more success is often experienced. Should they be retained, it may happen that the ill effects of the compression will be felt in the straightened state of the cavity of the abdomen, or in the speedy appearance of another hernial tumour on the opposite side. Ruptures totally irreducible, and various disorders of the testicle and cord, do not admit of the use of a steel truss.

Whoever wears a truss, should be careful to employ it day and night, without interruption, so that there may be

no opportunity for the hernia to protrude again. If, under the employment of a truss, the rupture once descends again, either a strangulation happens from the narrowness of the neck of the sac; or, at all events, the hope of a radical cure, which may have been entertained for months and years, vanishes in a moment. For experience has put it beyond all doubt, that, by the continual unremitting use of a truss, and the steady retention of the contents of the hernia, the neck of the hernial sac, and the ring, may be gradually lessened in diameter, until they are entirely closed, and a radical cure of the rupture effected. This is more frequently observed in young subjects; seldom in adults; and hardly ever in persons of advanced years. But trusses must be worn a long while, nor should the patient venture to lay aside their use till after many cautious attempts; beginning the experiment at first only in the night-time, and not making it in the day, till after a considerable period from the time when he first thinks himself safe. The longer and more attentively a truss is worn, the greater is the hope of a radical cure. Callisen, *Syst. Chir. Hod. tom. ii.*

Representations of various kinds of trusses may be seen in *Plate IX. Surgical Plates. Fig. 1.* exhibits a common truss. *Fig. 2.* the spring terminating in front in the expanded plate of metal, often termed the head of the truss. *Fig. 3.* represents a truss for a double rupture, with two pads affixed to one spring, and furnished with two thigh-straps, which, in such a case, would be almost indispensable. *Fig. 4.* exhibits Dr. Hulme's palm truss, so named by its inventor, from its acting continually like the pressure of a hand. Its particularity consists in its springs not being placed in that part of the truss which goes round the body, but in the pad itself; where there are three spiral springs. A full description of this truss may be found in the *Transactions of the Medical Society of London*; but as the construction of this instrument does not make much provision against the slipping and displacement of the pad, it can afford very little security to the patient, and does not therefore appear to us to be deserving of recommendation. *Fig. 5.* represents a very good ordinary truss, made by Mr. Whitford, a surgeon's instrument-maker in Smithfield. *Fig. 7.* exhibits Mr. Salmon's patent truss, with the additional springs, all three of which together are capable of exerting a force equal to nine pounds weight. A is the spring, made so as to exert a positive force on the cushion at each end. At the front and back ends are different holes, to which the plates and cushions may be instantly shifted by the wearer, so as to admit of being correctly accommodated to the parts. B, C, the additional springs detached, either, or both, of which may be added, so as to increase the power of the truss, if requisite. These springs are simply slipped into a loose leather or other case. D, the front plate with its cushion. This plate will apply to either of the holes in the spring, and is kept on the ruptured part by the pin, on which it turns in all directions; so that whatever be the shape or inclination of the body, the plate adapts itself to such changes, not being confined in its direction by any power of the spring. The cushions are simple cases stuffed with the softest materials. E, the back plate and cushion. FF a strap to be used, if occasion require, to prevent a forcible removal of the cushions.

Fig. 7. represents a section of the pelvis, round which the truss is to be applied. Mr. Salmon contends, that if the spring only passed round to the point diametrically opposite that from which it commenced, it would not remain stationary, as both extremities would rest on planes inclined to their action. For a full explanation of this figure, however,

ever, we must refer to Mr. Salmon's Mechanical Analysis of Trusses.

Fig. 8. a truss for a navel-rupture, invented by the late Mr. Marrifon, of Leeds. It consists of two pieces of thin elastic steel, which surround the sides of the abdomen, and nearly meet behind. At their anterior extremity they form conjointly an oval ring, to one side of which is fastened a spring of steel, of the form represented. At the end of this spring is placed the pad, or bolster, that presses upon the hernia. By the elasticity of this spring, the hernia is repressed in every position of the body, and is thereby constantly retained within the abdomen. A piece of calico, or jean, is fastened to each side of the oval ring, having a continued loop at its edge, through which a piece of tape is put, that may be tied behind the body.

When there is a great projection of the abdomen below the navel, as is often the case in women who have borne many children, the oval ring (especially if made wide) is thrown into an oblique direction, and then does not give the pad so true a bearing upon the hernia. To prevent this inconvenience, Mr. Marrifon made the lower bow of the ring to project more than the upper one; and instead of the calico skirt surrounding the ring, he used a belt fastened to the lower bow only, as is represented in Mr. A. Cooper's work on hernia, part ii. plate 9. fig. 6.

Afterwards Mr. Marrifon usually made his trusses with the lower bow of the ring only; forming this to project so as to suit the pendulous state of the abdomen. To the round end of the spring, which supports the pad, he affixed a strap, in which were contained spiral wires, for the purpose of regulating the degree of pressure upon the hernia. In a flat abdomen he inverted the position of the truss, directing the bow to be placed above the navel.

Fig. 9. represents a new truss for a navel or ventral rupture, invented by James Eagland, truss-maker at Leeds. The truss consists of two femicircular bows of steel; each of which, at its anterior extremity, is fastened by a distinct brass hinge, placed vertically, to the outer side of an intermediate plate of block-tin. This plate is somewhat concave on its inner side. The concavity is filled with a piece of blanket, which is covered with leather. This lining causes the leather covering to project a little; but in so small a degree, that when the concave side of the plate is applied to the abdomen, the pressure of the bows brings the rim of the plate, in every part of its circumference, into contact with the skin.

The posterior part of each bow, for about an inch and a half from its extremity, is turned backward, so as to form a flat surface, where it rests upon the back of the patient. To the inner side of this flattened part is sewed a soft leather cushion, lined with blanket, to prevent the patient from being hurt by the ends of the bows.

A strap of leather is sewed to the covering of the truss, near the posterior end of one bow; and a buckle is fixed, in like manner, near the end of the opposite bow, but resting upon it. By means of this strap, the patient can keep the ends of the bows steady, without being hurt by the buckle. See Hey's Practical Observations in Surgery.

Fig. 10. shews a back view of Eagland's navel truss, and of Salmon's patent inguinal truss, applied.

Fig. 11. represents a front view of the same instruments applied.

Besides trusses for ruptures, there are also trusses for another purpose, namely, supporting the scrotum in cases of hydrocele, inflamed testicle, sarcocele, &c. These last are commonly called bag-trusses, or suspensory bandages. In fact, they simply consist of a linen bag, for the reception

of the scrotum, and of a girt which goes round the body, and to which the bag-part of the truss is fastened by means of little hooks, so as to afford the requisite degree of support to the scrotum. Many persons who hunt, and are accustomed to take violent horse-exercise, make use of bag-trusses, in order to keep the scrotum from being hurt by contusions against the pommel of the saddle.

TRUSS, in a *Ship*, a machine employed to pull a yard home to its respective mast, and retain it firmly in that position. As the truss is generally used instead of a parrel, it is rarely employed, except in flying top-gallant-fails, which are never furnished with parrels. It is no other than a ring or traveller, which encircles the mast, and has a rope fastened to its after-part, leading downward to the top or decks; by means of which the truss may be straightened or slackened at pleasure. The haliards of the top-gallant-fail being passed through this ring, and the sail being hoisted up to its utmost extent, it is evident that the yard will be drawn close to the mast, by pulling down the truss close to the upper part of the fail. For, without the truss, the fail and its yard would be blown from the mast, so as to swing about by the action of the wind, and the rocking of the vessel; unless the yard were hoisted close up to the pulley in which the haliards run; which seldom is the case in flying top-gallant-fails, because they are usually much shallower than those which are fixed or standing. Falconer.

TRUSSES, short pieces of ornamental carved work, mostly in small ships fitted under the taffarel, in the same manner as the *term-pieces*.

TRUSS-Parrel. See **PARREL**.

TRUSS-Pendants. See **PENDANTS**.

TRUSS-Tackles. See **TACKLE**.

TRUSSED, in the *Manege*. A horse is said to be *well-trussed*, in French *bien gigote*, when his thighs are large, and proportioned to the roundness of the croupe. On the contrary, a horse with thin thighs, that bear no proportion to the breadth of the croupe, is said to be *ill-trussed*.

TRUSSELS, in *Rope-Making*, have a back with stout pins and four legs braced together. They are used at the upper end of a rope-ground, or put under ropes of a short length, when the strands cannot be put on the stake-heads.

TRUSSING, in *Falconry*, is a hawk's raising any fowl or prey aloft, soaring up, and then descending with it to the ground.

TRUST. See *CESTUI que trust*.

TRUSTEE, one who has an estate, or money, put or trusted in his hands for the use of another. See *FIDEI commissum*.

TRUSTRA. See **TRISTRA**.

TRUTH, **VERITAS**, a term used in opposition to falsehood; and applied to propositions which answer or accord to the nature and reality of the thing of which something is affirmed or denied.

Thus, when we say, that four is the fourth part of twice eight, that proposition is true, because agreeable to the nature of those numbers.

Truth, according to Mr. Locke, consists in the joining or separating of signs, as the things signified by them do agree or disagree one with another. Now the joining or separating of signs, is what we call making of propositions. Truth, properly, belongs only to propositions, of which there are two sorts, mental and verbal; as there are two sorts of signs commonly made use of, *viz.* ideas and words.

Mental propositions are those in which the ideas in our understanding are put together, or separated, by the mind perceiving or judging of their agreement or disagreement.

Verbal

Verbal propositions are words put together or separated, in affirmative or negative sentences. So that proposition consists in joining or separating of signs; and truth consists in putting together or separating those signs, according as the things they stand for agree or disagree.

Truth, therefore, as well as knowledge, may come under the distinction of *verbal* or *real*; that being only *verbal* truth, where terms are joined according to the agreement or disagreement of the ideas they stand for, without regarding whether our ideas were such as really have, or are capable of having, any existence in nature. But it is then they contain *real* truth, when these signs are joined as our ideas agree; and when our ideas are such as we know are capable of having an existence in nature: which, in substances, we cannot know, but by knowing that such have existed.

Truth is the marking down in words the agreement or disagreement of ideas, as it is. Falseness is the marking down in words the agreement or disagreement of ideas, otherwise than it is: and so far as these ideas, thus marked by sounds, agree to their archetypes, so far only is the truth real.

The knowledge of this truth consists in knowing what ideas the words stand for, and the perception of the agreement or disagreement of those ideas, according as it is marked by those words.

Besides truth, taken in the strict sense before mentioned, which is also called *logical* truth, there are other sorts of truths: as,

TRUTH, Moral, which consists in speaking things according to the persuasion of our own minds, or the conformity of our expressions to our thoughts, called also *veracity*: and, in a more general sense, comprehending also *fidelity*, which is a conformity of our actions to our words. Whereas lying or falsehood, as opposed to truth, is generally a mean, selfish, or malevolent, and always an unjustifiable, endeavour to deceive another, by signifying or asserting that to be truth or fact, which is known or believed to be otherwise; and by making promises, without any intention to perform them.

TRUTH, Metaphysical or Transcendental, which is nothing but the real existence of things conformable to the ideas which we have annexed to their names.

In which sense a clock may be said to be true, when it answers the idea or intention of the person who made it. Others will have metaphysical truth to consist in the agreement of a thing with the idea thereof in the divine understanding.

TRUTINA HERMETIS is used, among *Astrologers*, for an artificial method of examining and rectifying a nativity, by means of the time of conception.

TRUTINATION, formed from *trutina*, a pair of scales, the act of weighing or balancing a thing.

TRUTTACEOUS, in *Ichthyology*, the name of a genus of fish, of the trout kind, which are distinguished from all other fish by a small fat fin, which they all have near the extremity of the back, and which has no rays or nerves. Of the fish of this genus, some live only in fresh waters, never entering the sea or salt rivers; others frequent both the fresh and salt waters, and are therefore called *anadromi* or *catadromi*. These leave the fresh waters while young, and go into the salt rivers to feed and grow, and again return into the fresh rivers at the time of their full growth and spawning, that their offspring may have the same advantages themselves have had, of being hatched into life in fresh water.

The truttaceous fish are divided into two orders, those which have, and those which have no teeth. Of the edentulous kind, or such as have no teeth, are the lavaretus, ferra, thymallus, oxyrinchus, and albula; and of the toothed kind, are the salmo, umbra, trutta, carpio, &c. In dissection, the truttaceous fish have all apophyses to the pylorus, and are all a high-tasted and fine fish for the table. Ray's *Ichthyology*, p. 182.

TRUTULENSIS PORTUS, in *Ancient Geography*, a port of the isle of Albion, according to Tacitus, in his life of Agricola. The situation of this port has not been satisfactorily ascertained; but it has with the greatest probability been fixed at Richborough or Rutupa, in the county of Kent.

TRUXILLO, in *Geography*, a town of Spain, in Estremadura, defended by a citadel; the birth-place of the celebrated Francis Pizarro, the conqueror of Peru; 40 miles N.N.E. of Merida. N. lat. 39° 15'. W. long. 5° 22'.

TRUXILLO, a city of South America, in the viceroyalty of Peru, and see of a bishop. It was built in the year 1535, by Don Francisco Pizarro, in the valley of Chimo. Its site is pleasant, notwithstanding the sandiness of the soil, the general inconvenience of all the towns in the vallies. It is surrounded with a brick wall, and from its circuit may be classed among cities of the third order. It stands on a small river, about half a league from the sea: two leagues to the northward is the port of "Guanchaco," the channel of its maritime commerce. The houses make a creditable appearance. The generality are of bricks, with stately balconies, and superb porticoes; but the others are of baxareques. Both, however, are low, on account of the frequent earthquakes, and few of them have so much as one story. The corregidor of the whole department resides in this city, and also a bishop, whose diocese begins at Tumbes; with a chapter, consisting of three dignitaries, namely, the dean, archdeacon, and chanter, with four canons, and two prebendaries. Here is an office of revenue, assisted by an accountant and treasurer, one of which resides at Lambayeque, several convents, a college, and a hospital. The inhabitants consist of Spaniards, Indians, and all the other casts. Among the first are several rich and distinguished families. The women in their dress and customs follow nearly those of Lima. About a league from the city is a river, the waters of which are conveyed by various canals through this delightful country. The diocese comprehends eight jurisdictions, *viz.* Truxillo, Sana, Piura, Caxamarca, Chachapayas, Lulua and Chilloas, Pataz or Caxamarquilla, and Jean de Bracamoros; the last is situated in the audience of Quito; the rest in the viceroyalty of Peru. The jurisdiction of Truxillo is situated on the coast of the Pacific ocean, and extends twenty leagues in length, and as much towards the interior part of the country, composed throughout of beautiful vallies. In this climate there is a sensible difference between winter and summer; the former being attended with cold, and the latter with excessive heat. The country of this whole valley is extremely fruitful, abounding with sugar-canes, maize, fruits, and garden vegetables, as also with vine and olive yards. The parts nearest the mountains produce wheat, barley, and other grain; so that the inhabitants enjoy not only a plenty of all kinds of provisions, but likewise make considerable exports to Panama, especially of wheat and sugars. This remarkable fertility has been improved to the great embellishment of the country; so that the city is surrounded by several groves and delightful walks of trees. The gardens also are well cultivated,

cultivated, and make a very beautiful appearance, which, with a continual serene sky, prove not less agreeable to travellers than to the inhabitants. The city is situated 480 miles S. of Quito. S. lat. $8^{\circ} 6'$. W. long. $79^{\circ} 20'$.

The progress of this city to splendour and opulence was very rapid; but in the midst of its career it was attacked and desolated by the buccaner Francis Grammont, in the year 1678. The consequence of his invasion was almost a temporary depopulation. However, the salubrity of the air and the fertility of the soil have drawn thither inhabitants sufficient to make their number amount to 7600 persons. The land about it produces sugar, cacao, indigo, coffee, and in general all the productions of the torrid and some few of the temperate zones. Wheat is obtained here of an excellent quality, and in abundance. They also breed sheep and goats: their mutton is large and good; their cheese much commended; and of the wool they fabricate goods, of certain and profitable sale. The women are employed in making sweetmeats, which have an extensive circulation. The commercial articles of Truxillo are conveyed to Maracaibo by the lake; but their most common intercourse is with Carora, where they send their goat and sheep-skins to be dressed. The air enjoyed by the inhabitants of Truxillo is pure; but their waters, though clear and light, are impregnated with metallic particles. The spot occupied by the city lies between two mountains, so as to give it the shape of a coffin. Here is a monastery of Franciscans, and also another of Dominicans. The nuns of Truxillo employ themselves in making delicate articles of bark, which have a ready sale.

TRUXILLO, a sea-port town of Mexico, in the province of Honduras, situated on a hill, near the sea; frequently ravaged by the English and the Dutch, and at present much decayed. N. lat. $15^{\circ} 45'$. W. long. $86^{\circ} 40'$.

TRUXILLO, or *Nuestra Señora de la Paz*, a town of South America, in the province of Venezuela; 120 miles S. of lake Maracaybo. N. lat. $8^{\circ} 45'$. W. long. $69^{\circ} 35'$.

TRUXTON, a post-township of New York, in the N.E. corner of Cortlandt county, 142 miles W. of Albany; bounded N. by Fabius, in Onondaga county, E. by Madison county, S. by Solon, and W. by Preble: its extent is 10 miles E. and W., and 5 miles N. and S., comprising the S. half of the township of Fabius, in the military tract. It resembles Fabius in the general character of surface, soil, timber, &c. and is watered only by branches of the Tioughnioga that rise in that town. The soil is good, the agriculture productive, and the township improving. In 1810 the population was 1012, the senatorial electors 129, and the taxable property assessed at 47,673 dollars. The settlements commenced in 1800. Truxton village is agreeably situated, and has about twenty houses.

TRUZZA, or TRUZZO, a town of Tunis, with a sulphurous spring. Little of the town exists but ruins; 84 miles S.S.W. of Tunis.

TRY, *To*, in *Sea Language*. See TRYING.

TRYAL. See TRIAL.

TRYBERG, in *Geography*. See TRIBERG.

TRYBLION, a word used by the old medical writers, to express the pot or dish in which the medicines used in fumigations were placed at the time of use.

TRYCHNUS, in *Botany*, the same as *strychnus*, the name of nightshade.

TRYDEFFRIN, in *Geography*, a township of Pennsylvania, in the county of Chester, containing 1253 inhabitants.

TRYGGEVELDE, a town of Denmark, in the island of Zealand; 4 miles W. of Store Heddingen.

TRYGUM, in *Ichthyology*, the Greek name given by Ælian, Athenæus, and Appian, to the fish which we call the *pastinaca marina*, or fire-flaire. Aristotle and some others write it *tragum*.

TRYING, in *Pharmacy*, the purifying of fat substances by means of melting, and separating them from their membranes, &c. See SUET.

In the College Dispensatory, the method laid down for the purifying of lard, suet, &c. was this: melt them at a gentle fire, with the addition of a little water intermixed, and, when melted, strain them from the membranes. The addition of water in this keeps the fat from burning and becoming black, which it would otherwise do; for the water not being capable of receiving any greater degree of heat than that of boiling, will keep the bottom of the vessel from growing too hot, much better than the nicest management of the fire could do.

TRYING, in *Sea Language*, denotes the situation in which a ship lies nearly in the trough, or hollow, of the sea, in a tempest, particularly when it blows contrary to her course. In trying, as well as in scudding, the sails are always reduced in proportion to the increase of the storm. Thus, in the former state, the ship may lie by the wind under a whole main-sail, a whole fore-sail, or a whole mizen; or under any of those sails, when diminished by the reef or balance. As the least possible quantity of sail used in scudding is the goose-wings of the fore-sail, so, in trying, the smallest portion is generally the mizen-stay-sail, or main-stay-sail; and in either state, if the storm is excessive, she may lie with all the sails furled, or, according to the sea-phrase, under bare poles.

The intent of spreading a sail at this time is to keep the ship more steady, and, by pressing her side down in the water, to prevent her from rolling violently; and also to turn her bow towards the direction of the wind, so that the shock of the waves may fall more obliquely on her flank than when she lies along the trough of the sea. While she remains in this situation, the helm is fastened close to the lee-side, or, in the sea language, *hard-a-lee*, to prevent her, as much as possible, from falling-off. But as the ship is not then kept in equilibrio by the effort of her sails, which at other times counterbalance each other at the head and stern, she is moved by a slow but continual vibration, which turns her head alternately to windward and leeward, forming an angle of three or four points in the interval. The part where she stops, in approaching the direction of the wind, is called her *coming-to*, and the contrary excess of the angle to leeward is termed her *falling-off*. Thus, suppose the wind northerly, and a ship trying with her starboard side to windward: if, in turning her head towards the source of the wind, she arrives at N.W. $\frac{1}{2}$ N. or N. 39° W. and then declines to the leeward as far as W. $\frac{1}{2}$ S. or S. 84° W. the former will be called her *coming-to*, and the latter her *falling-off*. In this position she advances very little, according to the line of her length, but is driven considerably to leeward. Falconer.

TRYLISIA, in *Geography*, a town of Russian Poland; 10 miles E.N.E. of Zytomiers.

TRYON, a county of the state of New York.

TRYON Mountains, mountains of North Carolina, west of Salisbury, bordering on Tennessee.

TRYPETHELIUM, in *Botany*, from *τρύπα*, a perforation, and *θήλη*, a nipple, on account of the mammillary orifices of the warts containing the receptacles; a genus of the great family of LICHENES. (See that article.)—Achar. Lichenogr.

Lichenogr. 58. t. 4. f. 8, 9. Syn. 104. Act. Gorenk. v. 1. — Class and order, *Cryptogamia Algæ*. Nat. Ord. *Lichenes*.

Eff. Ch. Crust somewhat cartilaginous, flat, uniforme, fixed. Warts of the substance of the crust, coloured, prominent. Receptacles several, concealed in the substance of each wart, of a thick, black, simple texture, the orifice nipple-shaped, projecting as far as the surface of the wart, the globular cellular nucleus being altogether internal.

Professor Acharius defines eight species, all found on the barks of different tropical trees. They are nearly allied to his THELOTREMA. See that article.

TRYPHALIA, in *Ancient Geography*, a maritime country of the Peloponnesus, between Messenia and the Elide, according to Polybius.

TRYPHERA, τρυφερα, in *Pharmacy*, a denomination given to divers medicines, especially of the opiate kind. The great tryphera is composed of opium, cinnamon, cloves, and several other ingredients: it is used to fortify the stomach, to stop fluxes, and is good for some diseases of the womb.

The word is formed from the Greek τρυφερος, delicate, on account of their gentle and pleasant operation, or, according to others, because they make those who use them rest.

The Saracenic tryphera, and Persian tryphera, thus called, because first introduced, the one by the Saracens, and the other by the Persians, were both of them gentle purgatives.

TRYPHIODORUS, in *Biography*, a Greek poet, was a native of Egypt, and commonly referred to the reign of the emperor Aneptasius, in the commencement of the sixth century. Of his history little is known; but he was denominated a grammarian, and wrote many works, the titles of which are given by Suidas. Of these, none are extant besides his poem on the destruction of Troy, τριφιοδος, in about 700 lines, without any discriminating merit besides its being a relic of Greek literature. It was first printed by Aldus, and has passed through subsequent editions by Merrick, Oxon. 1741; Bandini, Florent. 1765; and Northmore, Oxon. 1791, which are those the most esteemed. Vossius. Moreri. Gen. Biog.

TRYSTS, CATTLE, a term applied to fairs for them in some of the northern parts of the island.

TRYSUNDA, in *Geography*, a small island on the W. side of the gulf of Bothnia. N. lat. 63° 9'. E. long. 18° 35'.

TRYVET, a village of Ireland, in the county of Meath. This place was rebuilt by Hugh de Lacy, and peopled by a colony of English; after which it became a considerable town, but is now fallen to decay; 8 miles S.E. of Navan.

TSABA, a town of Asiatic Turkey, in Natolia; 10 miles E. of Boli.

TSA-CHOU, a town of Corea; 43 miles S.S.E. of Koang-tcheou.

TSAKATHURN. See CSAKATHURN.

TSAKTELU, a town of Asiatic Turkey, in Caramania; 28 miles N.N.E. of Akshehr.

TSALGO, a town of Georgia, in the province of Carduel; 50 miles S.W. of Teflis.

TSAL-HASSAR, a town of Arabia, in the province of Hadsjar; 45 miles N.N.W. of Cathem.

TSANG, a city of China, of the second rank, in Petcheli; 102 miles S. of Peking. N. lat. 38° 21'. E. long. 116° 34'.

TSANG-CHIN, a town of Corea, near the sea; 35 miles S.S.W. of Han-tcheou.

'TSANPOU. See SANPOO.

TSANTSE-AGHISI, a town of Asiatic Turkey, in Natolia; 12 miles N.W. of Eregr.

TSAO, a city of China, of the second rank, in Chan-tong; 72 miles W.S.W. of Yeng-tcheou. N. lat. 35° 22'. E. long. 115° 16'.

TSÄO-SU, a small island near the coast of China. N. lat. 25° 22'. E. long. 119° 42'.

TSÄO-TCHANG, a town of Corea; 20 miles N. of Han-tcheou.

TSAPHARI, in the *Materia Medica of the Ancients*, a name given by some to the cadmia, called by Dioscorides *placitis*, and by others of the Greek writers, *zonitis* and *onychitis*. It was a flat kind, forming a sort of coat or crust on the walls or sides of the furnace; hence it had the name *placitis*, or *crustaceous*; and it was called *onychitis* and *zonitis*, because, when broken transversely, it appeared made up of several successive plates, which had the appearance of so many belts or zones. Serapio tells us, that this and the botryoide cadmia were dug out of the mines; that is, that they were natural productions; but this is erroneous, and contrary to all the accounts of the ancients.

TSASMA, in *Geography*, a town of Croatia; 8 miles E. of Ivanitz.

TSATSORKEN, a town of Thibet; 501 miles E.S.E. of Laffa.

TSCHAGATAY, or DSCHAGATAI, a name given to the Mongolian state, which was assigned to one of the sons of Tschingis-khan, so called after the name of its founder, to whom his father assigned the Greater and Less Bucharia, Turfan, the country of the Igures, and part of the present Kalmuckey.

TSCHA-HAFFER, a town of Arabia Deserta; 80 miles W. of Cathem.

TSCHAMA-CALAB, a town of Persia, in Adirbeitzan; 60 miles S.E. of Tauris.

TSCHARSHEBEH, a town of Asiatic Turkey, in Natolia, on the Meander; 20 miles N. of Degnizla.

TSCHASCHWITZ, a town of Silesia, in the principality of Neisse; 4 miles W. of Neisse.

TSCHASLAW. See CZASLAW.

TSCHASTOLOWITZ, a town of Bohemia, in the circle of Koniggratz; 14 miles E.S.E. of Koniggratz.

TSCHAVAT. See JAVAT.

TSCHEAHDORF, a town of Silesia, in the principality of Neisse; 9 miles N.N.E. of Patschkau.

TSCHOKENAGAR, a town of Asiatic Turkey, in Caramania; 50 miles N.N.E. of Cogni.

TSCHELATSCH, a town of Austrian Poland, in Galicia; 28 miles N. of Cracow.

TSCHENGA, a town of Bulgaria, near the Daphue; 50 miles W.S.W. of Varna.

TSCHENSTOCHOWA, a town of Austrian Poland, in Galicia; 46 miles N.N.W. of Cracow.

TSCHEREMISSES, or TCHEREMISSES, a tribe of Finns, who dwell in the governments of Viatka, Kazan, Simbirsk, and Ufa, on both shores of the Volga, especially the left. They call themselves Mari, *i. e.* men. Although their language be mixed with Tartarian and Russian words, it is easily distinguishable as a Finnish dialect. The Supreme Being they call Yuma. In the time of the Tartars they were subject to them, and dwelt more southerly, between the Volga and the Don; but at the downfall of the Tartarian dominion, they fell to the Russian empire, and even in this state they long retained their own khans, which, however, ceased upon

the extinction of the princely race. They were formerly a pastoral people, but under the Russian government they are gradually become husbandmen. The present amount of them is not known; but they have been estimated at 20,000.

TSCHERIKOV. See TCHERICOV.

TSCHERIKOV'S Island, an island in the North Pacific ocean, so called by Capt. Vancouver, after the companion of Beering. In the point of view in which Capt. Vancouver saw the south-west, southern, and eastern sides of this island, it appeared to form a somewhat irregular four-sided figure, about ten leagues in circuit; having from its western part, which is low and flat, and which had the appearance of being insular, a remarkable high, flat, square rock, lying in a direction S. 66° W. at a distance of two miles, between which and the island is a ledge of smaller rocks. The centre of the island appeared to be in N. lat. 55° 49'. E. long. 205° 4'.

TSCHERKASK. See TCHERKASK.

TSCHERKASSIANS. See TCHERKASSES and CIRCASSIANS.

TSCHERNEMBL. See ZERNEMBL.

TSCHERNOIYAR. See TCHERNOIYAR.

TSCHERSK, or CZERSK. See CZERSKO.

TSCHESCHENGIANS, or MIKSCHESSIANS, a tribe of vassals to Russia, living in the eastern part of the great Kabardia, who in time of war can raise 5000 horsemen.

TSCHESME, a small town of Asia Minor, situated almost opposite to the isle of Scio, at the head of a spacious road, to which art has no occasion to add, in order to make it a good harbour. A citadel somewhat extensive, constructed by the Genoese, runs sloping to the sea-shore, and seems intended to secure from all insult both the town and the harbour. Tschesmé is built on the ruins of Cyffus. This road is famous for the victory which the Roman fleet gained there over that of Antiochus, and also for the burning and total destruction of the Turkish squadron by the Russians in 1770. Geographers place at the head of a bay, two or three leagues to the N. of Tschesmé, the ancient Erythræ, celebrated for the oracles of the Sibyl. The territory of Tschesmé furnishes grain and fruit in abundance: a little oil and a great many raisins are also produced here. It is from this harbour that the island of Scio draws a great part of its subsistence, and by means of it frequently keeps up an intercourse with Smyrna.

TSCHETCHES, the name of a colony of strangers and Christians, who are secluded from the world in a most sequestered part of the wilds of Caucasus, so called in the language of the country. These poor people are said to lead lives of the most exemplary piety, and to exhibit a primeval simplicity of manners. They are totally ignorant of their origin, any farther than knowing that they are strangers, and their being considered as such by the scattered neighbouring nations. From an affinity in their language, and some other circumstances, they are supposed to be descended from a colony of Bohemians, who, flying from religious persecution in their own country towards the close of the fifteenth century, found at length a refuge from oppression in the distance from the rest of mankind which these remote deserts afforded.

TSCHIGRI, a town of Russia, in the government of Kurfk; 48 miles E.N.E. of Kurfk.

TSCHILLA, a town of Bohemia, in the circle of Rakonitz; 8 miles S.W. of Rakonitz.

TSCHIRNE, a town of Silecia, in the principality of Glogau; 20 miles E. of Gros Glogau.—Also, a river of Silecia, which runs into the Bober, two miles below Sagan.

TSCHIRNHAUSEN, EHRENFRIED WALTER VON, in *Biography*, an ingenious mathematician, was a descendant of a noble Bohemian family, and born at Kistingfswald, in Upper Lusatia, in 1651. Having studied for some time at the university of Leyden, directing his particular attention to mathematics and philosophy, he entered into the Dutch army in 1672, and for the purpose of further improvement visited France, Sicily, Italy, and Malta. He also established three glass-houses in Saxony, with a view to the improvement of the science of optics, and having shewn how porcelain might be made from an earth found in that country, he may be regarded as the founder of the Dresden porcelain manufactory. As to his claims on the invention of caustic curves, we refer to the article *CAUSTIC CURVE*. His account of them was communicated to the Academy of Sciences at Paris in 1682. See also the same Memoirs for 1703. For the construction and powers of his burning-glasses, constructed about the year 1687, we refer to the article *BURNING-GLASS*. Heedless of the fame which he so justly acquired, Tschirnhausen took delight in encouraging the researches of others, who were engaged in pursuits similar to his own, and was at considerable expence in printing works of public utility. He died, highly esteemed and much regretted, in the month of September 1708. He furnished the Leipzig Transactions with many articles; and also the Memoirs of the Academy of Sciences with the following: *viz.* "Observations on Burning-glasses of three or four Feet Diameter," in the vol. for 1699; "Observations on the Glass of a Telescope convex on both Sides, and of thirty-two Feet focal Distance," 1700; "On the Radii of Curvatures, and finding the Tangents, Quadratures, and Rectifications of many Curves," 1701; "On the Tangents of Mechanical Curves," 1702; and "On a Method of Quadratures." The only work published separately was his "Medicina Mentis," resembling Malebranche's "Recherche de la Verité," but much more extensive; first published in 1687, and again with improvements in 1695. Montucla, *Hist. des Mathem.* Hutton's *Math. Dict.*

TSCHIRNHAUSIANA QUADRATRIX. See *QUADRATRIX Tschirnhausiana*.

TSCHOPA, in *Geography*, a river of Saxony, which rises near Weisenthal, on the borders of Bohemia, and runs into the Mulda, between Dobeeln and Leiffing.

TSCHOPA, or Zschopou, a town of Saxony, in the circle of Erzgebirg, celebrated for its blue manufacture; 7 miles S.E. of Chemnitz. N. lat. 50° 4'. E. long. 13° 2'.

TSCHUDI, ÆGIDIUS, in *Biography*, an eminent Swiss historian, was descended from a noble family, and born at Glarus in 1505. After completing his school education, he went to Basle, and accompanied his preceptor Glareanus to France, with a view to farther improvement. Upon his return to his native place, he was employed, in 1528, on a mission respecting the Reformation, in which he conducted himself to the satisfaction of both Reformers and Catholics; and in the following year he was chosen chief magistrate of Sargans. By his discharge of the duties of this office, he gained increasing reputation, and more extended trusts of a similar kind. His great object was to enlarge his acquaintance with the Helvetic history; nor did he cease to pursue it, even in the military service of France, or in any of the honourable stations which he was appointed to occupy. Towards the close of his life he was severely afflicted with the stone, but death terminated his pains and labours in the year 1572, and 69th year of his age. His principal works were "A Description of the ancient Rhætia," published at Basle in 1538; the "Helvetic Chronicle," commencing with the year

year 1001, and terminating at 1470, edited by Ifelin, in two vols. fol. Balle, 1734—1736; "De vera et prisca Alpina Rhætia, &c." Balle, 1538, 4to. ib. 1560; "Description of the Alps," Balle, 1738, &c. Tschudi was a zealous Catholic, as we may infer from his "Treatise on Purgatory," and another "On the Invocation of Saints;" though he was fully apprised of the errors of popery, the licentious manners of the clergy, and the avarice of the convents, which he very freely exposed.

TSCHUKOTSKOI Noss, or *Cook's Straits*, in *Geography*, a part of the shores of the government of Irkutsk, washed by the Eastern or Pacific ocean, extending to the frontiers of China; or in other words, from the mouth of the river Aimakan; *i. e.* from about 65° to 45° N. lat.

TSCHUKTSCHEs, a people who occupy the north-eastern point of Siberia, towards the Frozen ocean and the Eastern ocean, which is called the Tschuktschy-cape, and in all respects so much resemble the Koriaks, that one might be induced to take the two nations for relational stems. They may be computed at 4000 bows. We may naturally suppose that they are the primitive possessors of these coasts, who either came over from the continent of America, or were divided by the probable infraction of the sea, and the consequent separation of the two quarters of the world. They, as well as the Koriaks, Kamtschadales, Tunguses, and Lamutes, bear a great likeness to the nearest Americans beyond the straits.

TSCHUVASSES are a very numerous nation of Finns, paying the tax for more than 200,000 heads. They reside principally on both sides of the Volga, in the governments of Tobolsk, Viatka, Nishnei-Novgorod, Kazan, Simbirsk, and Ufa. Their language at present borders more upon the Tartarian than that of the Finns, and hence some will not allow them to belong to this stock; nevertheless their manners and customs very much resemble those of the generality of Finns, particularly those of the Votiaks and Tschermises. These three tribes dwell together in villages, but never in towns; they are inured to agriculture, and have abandoned their nomadic way of life; they are fond of horse-flesh; they are mostly heathens, and they have among them enchanters, and a sort of place for divine worship, which they denote by the generic name of Keremet. At their meetings they sacrifice a horse, in which their principal religious solemnity consists. See **TCHEREMISSES**.

TSE, a town of China, in Chan-si; 300 miles S.S.W. of Peking. N. lat. $35^{\circ} 30'$. E. long. $112^{\circ} 26'$.

TSEBID, or **TECEBIT**, a town and district of Africa, in the country of Sugulnessa; 75 miles E. of Sugulnessa. N. lat. $31^{\circ} 40'$. E. long. 1° .

TSELGA, or **THELGA**, a town of Abyssinia; 30 miles N. of Gondar.

TSEMERUITZU, a mountain of Croatia; 20 miles S. of Bihaec.

TSENA, a river of Malacca, which runs into the Chinese sea, N. lat. $7^{\circ} 33'$. E. long. $101^{\circ} 21'$.

TSEKESB, a town of Asiatic Turkey, in Natolia; 36 miles N. of Angura.

TSHAC, a mountain of Little Bucharia; 80 miles S.S.W. of Hotun.

TSHANI. See **TCHANI**.

TSHARISKOI MOUNTAINS, a very extended branch of the Altai mountains that fall to the share of Russia, in the range of Kolhyvan. They comprise the whole space between the highest sources of the Ulba, Onba, and the Kokofun (to the point where the Tshuya falls into the Kokofun), and between the course of this latter river and the Ka-

tunaja, and carries its powerful forked ridges along both sides of the Tsharif, from its origin to its disemboguing into the Oby. The direction of these mountains is from E. to W. and N.W., and on the S. they are parted, by a rude valley, from the Oubinskoi snow-mountains. In several places this range rises to a great height, heaving up enormous pinnacles, which in some parts are covered with never-failing snow, and which, for the most part, consist of granite, porphyry, jasper, and flint breccia. One of these, *viz.* the Tigeretzkoï, to a considerable height consists of marble, which contains a multitude of sea-shells. These in general are found to be 4392 Paris feet higher than the Shlangenberg. One of the highest points is the Kossipnaia-Sopka (the Ragged-head), consisting of monstrous blocks of hoary granite. In several places of these wild and extensive mountains, iron, copper, and lead ores have been dug up, but no regular works have been established.

TSHATSHI, a town of Little Bucharia; 30 miles N.E. of Acfu.

TSHEGULA, an island belonging to the class called Fox islands, and arranged by Muller under the appellation Kavalang.

TSHENIKE', a town of Asiatic Turkey, in the government of Sivas; 20 miles N.E. of Amasieh.

TSHETCHINA, one of the islands comprehended under the name of Andrianofskiye Ostrova, on which a high white mountain overtops the rest, which is apparently an extinct volcano, as there are still hot springs on this island.

TSHETGHINA, one of that class or division of the islands that lie between Kamtschatka and America, called Chao.

TSHIBUK-ABAD, a town of Asiatic Turkey, in Natolia; 18 miles E.N.E. of Angura.

TSHIGAMA, one of the class of islands called Fox islands, distinguished in Mr. Muller's arrangement under the name Kavalang.

TSHI-KOI, a river of Russia, which runs into the Selenga, 12 miles S. of Selenginsk.

TSHIKOTA, one of the Kurile islands, distant from Kunafyr island 70 versts, 120 versts long, and 40 broad. It has lofty mountains, with similar forests to those of Kunafyr, with lakes and streams of wholesome water.

TSHILLIENI, a town of Walachia; 7 miles S. of Caracalla.

TSHINKA, in the *Materia Medica*, a name by which some authors have called the clove-tree, the tree which produces the spice of that name.

TSHIRINKUTAN, in *Geography*, one of the Kurile or Kurilskoi islands, about 30 versts from Ikarma. The island is round, and its diameter is about fifteen versts. A mountain nearly upon the strand is continually emitting smoke, and very frequently large stones roll down one of its sides, by which a valley has been excavated from top to bottom. The coast round about is mountainous and rocky. It has a great number of wild fowl, and in other respects very much resembles Ikarma.

TSHIRPO-OI, one of the Kurile islands, may be estimated in length and breadth at 15 versts. This island has had a volcano, that has discharged stones over the whole face of it. Instead of forest-woods, it presents to view merely bushes of the forbus sylveltris, but no streams, and one small saline lake. In one spot is a salt-spring of that kind called acidula, the water of which loses its acidity by boiling. On an adjacent island is also a volcano.

TSHLUCHOW, a town of Prussian Pomerelia; 44 miles S.S.W. of Dantzic.

TSI, a city of China, of the second rank, in Ho-nan; 242 miles S. of Peking. N. lat. $34^{\circ} 30'$. E. long. $114^{\circ} 34'$.

TSIA, in *Botany*, a name taken from the Japanese, and used by some authors for the tea-tree.

TSJAKELA, H. M.—*Ficus Malabarica*, *femel in anno fructifera*, *fructa minima*, a species of fig-tree growing in Malabar. Of the bark of this tree they make strings for their bows, and prepare a red colour for dyeing the Cambavan cloths.

TSIAM PANGAM, a name used by some authors for the tree whose wood is the log-wood, used in dyeing, and in medicine.

TSIAMAJA, in *Geography*, a town of Laos; which see.

TSIAMP. See CHIAMP.

TSIANA EUA, in the *Materia Medica*, a name given by some authors to the costus root.

TSIAO, in *Geography*, a city of China, of the second rank, on the fourth coast of the island of Hai-nan; 125 miles S.S.W. of Kiang-tcheou. N. lat. $18^{\circ} 20'$. E. long. $108^{\circ} 25'$.—Also, a town on the west coast of the island of Morty. N. lat. $2^{\circ} 5'$. E. long. $128^{\circ} 18'$.—Also, a lake of China, in Kiang-nan, about 60 miles in circumference; 42 miles S.W. of Nang-king.

TSIAO-TING-CHAN, a town of Corea; 50 miles E.N.E. of Koang-tcheou.

TSIAO-TONG, a town of Corea, on an island of the same name. N. lat. $37^{\circ} 48'$. E. long. $124^{\circ} 14'$.—Also, an island in the Hoang-hai, or Yellow sea, near the coast of Corea, about 35 miles in circumference. N. lat. $37^{\circ} 44'$. E. long. $124^{\circ} 54'$.

TSIASSEM, a kingdom of the island of Java, on the north coast, E. of Carawang.

TSIBBA, a town of Japan, in the island of Niphon; 30 miles E.S.E. of Jedo.

TSI-CHU, in *Botany*, the name of a Chinese tree, which furnishes the liquor of which they make their celebrated varnish.

TSIEN, in *Commerce*, a weight in China. The Chinese weigh gold and silver by the gin or catty, of 16 lyangs or taes; and the lyang is subdivided into 10 tiens or maces, 100 fwens or candarines, and 100 lis or cash. The gin is the Chinese denomination for this weight, and the catty that of the European. See TALE.

TSIEN-OUEY, in *Geography*, a town of Chinese Tartary; 40 miles S.W. of Ning-yuen.

TSIERIBON. See CHERIBON.

TSIJA, a town of Thibet; 48 miles W. of Concheoudfong.

TSIKUMMA, a town of Japan, in the island of Niphon; 88 miles W. of Meaco.

TSILI, a town of Corea; 35 miles W. of Sing.

TSILKANI, a town of the principality of Georgia, in the province of Carduel; 20 miles N.W. of Teflis.

TSILON-PALHASIN, a town of Chinese Tartary, in the country of the Monguls; 13 miles S. of Oulan.

TSIM-YUEN, a town of Corea; 650 miles E.N.E. of Peking. N. lat. $42^{\circ} 28'$. E. long. $129^{\circ} 54'$.

TSIN, a city of China, of the second rank, in Chen-fi; 620 miles S.W. of Peking. N. lat. $34^{\circ} 35'$. E. long. $105^{\circ} 24'$.—Also, a city of China, of the second rank, in Hou-quang; 645 miles S.S.W. of Peking. N. lat. $26^{\circ} 36'$. E. long. $109^{\circ} 2'$.

TSIN, or *Tsin*, a town of Corea; 188 miles S.S.E. of King-ki-tao. N. lat. $34^{\circ} 52'$. E. long. $127^{\circ} 44'$.

TSIN, in *Natural History*, the name given by the Chinese

to a stone which they make great use of in their manufacture of porcelain ware. It is of a deep blue colour, much resembling Roman vitriol in appearance, and is found in lead-mines, and supposed to contain some particles of lead; its effects being the same in the porcelain manufacture as those of cerufs, or white lead, in making the other colours penetrate into the substance of the vessels. The deep violet colour that we see so beautiful on the china-ware, is usually made with this stone. They find it about Canton and Peking; but the latter place affords the best, and it sells at greatly the best price.

The painters in enamel melt this stone in their way, and use it very much; they form many beautiful works, by laying it upon silver; but it is apt to come off in time. When the tin is used in the porcelain manufacture, it is only used to the vases that pass a second baking, and are intended as the best kinds.

The tin is prepared by only beating it to powder, not roasting it in the common way. They mix the powder with large quantities of water, and stirring it together, they let it subside a little, to separate any earthy or extraneous matter that might be among it. They then let the powder subside. The water which is thrown away has no colour from this matter, and the powder itself is not of that fine blue it was in the lump, but of a pale ash-colour; but this recovers all its beauty when it is laid on the china and baked. The settlement taken from the water is dried and preserved in powder, and when it is to be used, they only mix it up with gum-water, or a solution of glue, and lay it on with a pencil. *Observ. sur les Costumes de l'Asie.*

TSI-NAN, in *Geography*. See TCI-NAN.

TSINCHAN, a town of Corea; 13 miles N.W. of Sing.

TSIN-CHOU, a river of China, which runs into the Yuen, near Meyang.

TSINEH, a town of Asiatic Turkey, in Natolia; 16 miles W.N.W. of Mogia.

TSING, a city of China, of the second rank, in Chan-fi; 267 miles S.S.W. of Peking. N. lat. $36^{\circ} 42'$. E. long. $112^{\circ} 24'$.—Also, a lake of China, in Kiang-nan, 22 miles in circumference; 45 miles N. of Hoai-ngan.

TSING-HING, a city of China, of the second rank, in Yun-nan; 1162 miles S.S.W. of Peking. N. lat. $24^{\circ} 47'$. E. long. $102^{\circ} 30'$.

TSING-KIANG, a town of China, in Kiang-nan, on the Yang-tse river; 50 miles S.E. of Yang-tcheou.

TSING-LAN-OUEI, a town of China, in Hou-quang, near the source of the river Yuen; 25 miles S.W. of Hoang.

TSIN-KIEN, a river of China, which runs into the Hoang; 12 miles E.S.E. of Yen-tchan.

TSIN-NING, a city of China, of the second rank, in Chen-fi; 585 miles W.S.W. of Peking. N. lat. $35^{\circ} 36'$. E. long. $105^{\circ} 25'$.

TSINO, a town of Japan, in the island of Awafi; 10 miles N. of Awafi.

TSINRAMA, a town on the west coast of the island of Celebes. S. lat. $3^{\circ} 10'$. E. long. $110^{\circ} 14'$.

TSIN-TCHUEN, a town of Corea; 40 miles S.E. of Hoang-tcheou.

TSIN-YANG, a river of China, which rises near Tci-hia, in Chan-tong, and runs into the Eastern sea, near Fou-cha.

TSIN-YUEN-OUEI, a fortress of China, in Chen-fi, near the great wall, on the river Hoang; 75 miles N. of Lingtao.

TSISA-

TSISAGATA, a town of Japan, in the island of Nippon; 110 miles W. of Meaco.

TSISIR, a town of Thibet, now in ruins. N. lat. $34^{\circ} 14'$. E. long. $96^{\circ} 19'$.

TSITA, a lake of Thibet, 45 miles in circumference. N. lat. $33^{\circ} 32'$. E. long. $90^{\circ} 39'$.

TSITCHICHAR. See TCHICAR-HOTUN.

TSIURAC, a river of Tcharfhebeh, which runs into the Meinder, at Tcharfhebeh.

TSO, a city of China, of the second rank, in Petcheli; 22 miles S.S.W. of Peking. N. lat. $39^{\circ} 32'$. E. long. $115^{\circ} 39'$.—Also, a city of China, of the second rank, in Quang-fi; 930 miles S.S.W. of Peking. N. lat. $22^{\circ} 42'$. E. long. $106^{\circ} 49'$.

TSO-CHOUL, a town of Corea; 55 miles S.E. of Kang-tcheou.

TSOKAMA, a town of Japan, in the island of Nippon; 170 miles W. of Meaco.

TSOL-ABAD, a town of Asiatic Turkey, in Carmania; 32 miles S.W. of Akshehr.

TSONDUE, a town of Thibet; 7 miles W. of Painom-Jeung.

TSONG-HE, a town of Corea; 10 miles N. of Hoang-tcheou.

TSONG-KING, a city of China, of the second rank, in Se-tchuen; 857 miles S.W. of Peking. N. lat. $30^{\circ} 38'$. E. long. $103^{\circ} 23'$.

TSONG-MING, a town of China, in the island so called. N. lat. $31^{\circ} 45'$. E. long. $120^{\circ} 51'$.

TSONG-MING, or *Tjung-ming*, an island near the coast of China, in the Eastern sea, at the mouth of the Yang-tse river, belonging to the province of Kiang-nan, about 50 miles in length, and 10 in breadth. This island was formerly a place of banishment for criminals, to whom some poor Chinese families resorted, and they divided the lands amongst them; but not being able to clear all the land they had appropriated to themselves, called other families from off the continent to their assistance, and yielded to them for ever a part of the lands, on condition that they should pay annually, in divers goods, a rent proportionable to their harvest. The country is divided by an infinite number of canals, that have high banks to defend it from inundations, for the land is level, having no hills; the air is healthful and temperate, and the country agreeable. Here are large towns scattered about the island at convenient distances, wherein is a great number of shops, well furnished with all manner of necessaries and conveniencies of life; and, dispersed between each town, there are as many houses about the country as there are families employed in tillage. The highways are very narrow, and are bordered with little shops that sell refreshment to travellers; and, indeed, one would imagine the whole island to be one exceeding large village. Here are no wild fowl, but great numbers of large geese, ducks, hens, hogs, and buffaloes, but these latter are used only for tillage. The land is not alike throughout the island, the produce of it being very different: that towards the north is not cultivated, but the reeds which grow here naturally produce a considerable revenue: as there are no trees in the whole island, they use part of these reeds to build houses in the country; the other part serves to burn, and supplies fuel not only for the whole island, but also for some parts of the neighbouring continent. The second sort of land is that which extends from the first quite to the sea on the south side; this produces two crops every year; one of grain, which is generally in the month of May, the other of rice, or cotton; of rice, in September; of cotton, a little later:

their grain is rice, wheat, barley, and a sort of bearded corn, which, though it resemble wheat, is nevertheless of a different nature. There is a third sort of land, which, though it appear barren, produces a greater revenue than all the rest; it consists of a whitish earth, found in several parts of the north side of the island, from whence they get such a great quantity of salt, that it supplies not only the island, but part of the continent. In this island there is a number of mandarins, and the governor is one of those called "literati." He alone administers justice, receives the tribute paid by every family to the emperor, gives passports to ships, and passes sentence of death on criminals. When the people have occasion for rain, or fine weather, this mandarin proclaims a general fast; butchers and inn-keepers are then forbid to sell any thing, under the severest penalties; they however take care to get rid of their provisions, by paying some money privately to the officers of the tribunal, whose business is to enforce the observance of this order. The mandarin afterwards walks in procession, accompanied by his subalterns, to the temple of the idol whom they intend to invoke; he kindles on the altar two or three small aromatic twigs; they then all sit down: to pass the time, they drink tea, smoke, and converse an hour or two; after which they retire. This is what they call begging for rain or fine weather.

Father Jacquemin relates, that in his time the viceroy of one of the provinces, becoming impatient because rain had not been granted to his repeated requests, sent an inferior mandarin to tell the idol, from him, that if it did not rain before a certain day he would drive him from the city, and cause his temple to be razed. No rain having fallen before the day mentioned, the viceroy, in a great passion, forbade the people to carry, according to custom, their offerings to the idol, and ordered the temple to be shut, and the gates sealed up, which was immediately executed. N. lat. $31^{\circ} 38'$. E. long. $120^{\circ} 54'$.

TSONG-SIO, a town of the kingdom of Corea; 27 miles S.E. of Hoang-tcheou.

TSO-PING-ING, a town of Corea; 30 miles S.E. of Koang.

TSOR, or SOR, or *Sur*, or *Soor*, a town on the east coast of Arabia, in the province of Oman; 22 miles S.E. of Kalhat. N. lat. $22^{\circ} 36'$.

TSORLII, or CIORLI, or *Tziourly*, a town of European Turkey, in Romania; 15 miles N.E. of Rodosto.

TSOTSANG, a river of China, which runs into the Hoang, near Hoai-king.

TSUBSUKI, a town of Japan, in the island of Nippon; 65 miles N.N.W. of Meaco.

TSUEN, a city of China, of the second rank, in Quang-fi; 912 miles S.S.W. of Peking. N. lat. $25^{\circ} 50'$. E. long. $110^{\circ} 44'$.

TSUEN-TCHEOU, a city of the first class in China, in the province of Fo-kien, and reckoned one of the most beautiful cities in China, on account of its situation, extent, trade, triumphal arches, temples, and its well-paved streets. It has in its district seven cities of the third class. In its neighbourhood is a bridge remarkable for its extraordinary size, and the singularity of its construction. It was built at the expence of one governor. It is wholly built of the same kind of blackish stone, without arches; but it has above 300 large stone pillars, which terminate on each side in an acute angle, the more easily to break the violence of the current. Five stones of equal size, laid transversely from one pillar to another, form the breadth of the bridge; of these there are 1000, all of the same

fame size and figure. On each side there are buttresses or props, constructed of the same kind of stone, on the tops of which are placed lions on pedestals, and other similar ornaments. This is merely one part of the work,—that which is between the small city of Lo-yang and the castle built upon the bridge: for beyond the castle there is another part, equally stupendous with the first.

TSUGA, a town of Japan, in the island of Nippon; 45 miles W.N.W. of Nambu.

TSUGARA, a town of Japan, in the island of Nippon; 60 miles N. of Jedo.

TSUI-TSANG, a town of Corea; 40 miles W.S.W. of Sing.

TSUKUKI, a town of Japan, in the island of Nippon; 36 miles N.N.E. of Jedo.

TSUNTINITZ, a town of Croatia; 16 miles W. of Damianovitz.

TSUN-Y, a city of China, of the first rank, in Setchuen; 890 miles S.W. of Peking. N. lat. $27^{\circ} 38'$. E. long. $106^{\circ} 35'$.

TSUR. See TSOR.

TUA, in *Ancient Geography*, an estuary on the south-eastern side of the isle of Albion, between the estuary Vara, or Firth of Tayne in Sunderland, and the mouth of the river Celnus, and the Spay, in the shire of Elgin. The Tua was therefore Cromarty, or Murray Firth.

TUA, in *Geography*, a river of Portugal, which runs into the Duero, 15 miles N.W. of St. Joao de Pefqueira.

TUABO, a town of Africa, in the kingdom of Jaen, on the side of the Senegal. N. lat. $14^{\circ} 56'$. W. long. $10^{\circ} 28'$.

TUACA, a town of Africa; 10 miles S. of Mombaça.

TUAK, a small island in the Red sea, about 12 miles from the coast of Arabia. N. lat. $5^{\circ} 58'$. E. long. $41^{\circ} 58'$.

TUAM, a post-town of the county of Galway, Ireland, which is represented in the "New Traveller's Guide for Ireland," as "a large, populous, well-built town;" but which Dr. Beaufort calls, though an archiepiscopal see, a very poor city. It may have been improved since the publication of Dr. Beaufort's work, but the other account must be received with caution, especially when it speaks of "byelanes and alleys thickly inhabited by an industrious populace and working mechanics." It may, however, have a considerable retail trade, and may have derived great advantage from the introduction of the linen manufacture into its neighbourhood. The archbishop's palace is a spacious, venerable structure. The cathedral is a neat, but not extensive, edifice, which serves also for the parish-church. Tuam lost its privilege of being represented in parliament at the Union. It is 93 miles W. from Dublin, and 16 miles N. by E. from Galway.

TUAM, an archiepiscopal see in Ireland, being the lowest in dignity of the four, and having the smallest jurisdiction; the number of benefices in this province being only 87, whilst in Armagh there are 419, in Dublin 252, and in Cashel 362. The see of Tuam contains the greatest number of acres of any see in Ireland, extending over a great part of the counties of Galway and Mayo, and including a part of Roscommon; yet such is the want of cultivation, and the poverty of the country, that it was found necessary to unite the bishopric of Ardagh in the province of Armagh, to enable the archbishop to support the dignity of his station. The number of parishes is 89, forming 23 benefices, and having 24 churches. The chapter consists of a dean, a

provost, an archdeacon, and eight prebendaries. The suffragan bishoprics are those of Clonfert, Elphin, and Killalla.

TUAPE, a town of New Navarre; 160 miles S. of Casa Grande.

TUARIK, a people of Africa. The west and south of Fezzan, says Mr. Horneman, is inhabited by the Tuarik, a mighty people, who border south-west on Bornou, south on Bornou, Soudan, and Tombuctoo, eastward on the country of the Tibboo and Fezzan, northward on part of Fezzan and the Arabs who live behind the regions of Tripoli, Tunis, and Algiers, and westward on the great empire of Fez and Morocco; of whom a few colonies are found in Sockna, Augela, and Siwah; in such places, the language of the Tuarik is the only one spoken by the inhabitants. The Tuarik are divided into many nations and tribes, who all speak the same language. The Tuarik of Hagara and Kolluvi are thin in growth, rather tall than short, their walk swift but firm, their look stern, and their whole demeanour warlike. Cultivated and enlightened, their natural abilities would render them perhaps one of the greatest nations upon earth. Their character, particularly that of Kolluvi, is much esteemed. The western tribes are white, as much as the climate and manner of living will admit. The Kolluvians who reached the region of Alben, and conquered Agades, and mixed with the nation, are of different colours, many of them black, but their features are not like those of negroes. The Hagara and Mutkara tribes are yellowish, like the Arabs: near Soudan there are tribes entirely black. They are not all Mahometans. In the neighbourhood of Soudan and Tombuctoo live the Tegama, who are white and pagans: they carry on a commerce between Soudan, Fezzan, and Gadames. Their caravans give life to Mourzouk, which without them is a desert; for they love company, song, and music. The greater part of the eastern Tuarik lead a wandering life.

TUAT. See TWAT.

TUB, is used as a kind of measure to denote the quantity of divers things. A tub of tea is a quantity of about 60 pounds. A tub of camphor is a quantity from 56 to 80 pounds. A tub of vermilion from 3 to 4 cwt.

TUB, *Cheese*, in *Rural Economy*, that sort of large tub which is employed in the making of cheese, which, in some districts, is wetted or washed with cold water before it is used, to prevent the milk from sticking to the wood.

TUBS, in *Gardening*, a sort of strong upright boxes, calculated for containing large green-house exotics, and other potted plants and trees, when grown too large for the pots.

These tubs are made by the coopers proper for this purpose, somewhat in the garden-pot form, a little wider at top than at bottom, from a foot and half to two feet and a half deep; the width in proportion; constructed of the strongest thick staves and bottoms, and well hooped with iron, and with two iron handles at top, by which to remove them: these handles being strong, and generally hooked, especially in very large tubs, in order to receive a pole in each occasionally, that the tub and plant together may be more readily moved. The bottom of the tubs have auger-holes bored in different parts, at regular distances, by which to discharge the superfluous moisture, after watering, &c.

In tubbing large-grown plants, they should be removed from their present pots, with the balls of earth about their roots entire; and having earthed the bottom parts of the tubs, the plant should be set in with its whole ball of earth, filling up properly around, and an inch or two over the top of the ball, with more fresh mould, and then watering. See *SHIPPING of Plants*, and *POTTING*.

TUB-Fish, in *Ichthyology*, an English name given to a species of *trigla*, sometimes called the *flying fish*. See *TRIGLA*.

TUB-Man, in the *Court of Exchequer*. See *PRECEDENCE*.

TUBA, in *Antiquity*. See *TRUMPET* and *LITUUS*.

TUBA, in *Natural History*, a name by which many old authors call the *buccinum*.

TUBA, in *Geography*, a river of Russia, which runs into the Enisei, 16 miles S.W. of Abakansk, in the government of Kolivan.

TUBAI, one of the small Society Islands, in the South Pacific ocean; about 12 miles from Bolabola. S. lat. $16^{\circ} 12'$. W. long. $151^{\circ} 44'$.

TUBANSKA, a town of Russia, in the government of Irkutsk; 44 miles N.W. of Ilimsk.

TUBANTES, in *Ancient Geography*, a people of Lower Germany, on the other side of the Rhine. According to Cluvier, they at first inhabited the country now called the counties of Ruvenberg and Lippe; and from hence they traversed the territory which lies between the Rhine and the Sala.

TUBAON, in *Geography*, a town on the north coast of the island of Java. S. lat. $5^{\circ} 50'$. E. long. $112^{\circ} 14'$.

TUBBAULEH, a town of Hindoostan, in Lahore; 10 miles S.S.W. of Callanore.

TUBBER, in *Mining*, a name given in Cornwall to that mining instrument, which is in other parts of England called a *beele*.

TUBBER-Men, in *Cornwall*, the people who work with this tool, and who are, from its other name of *beele*, called in other places *beel-men*.

TUBBERMORE, in *Geography*, a post-town of the county of Londonderry, Ireland, which is $90\frac{1}{2}$ miles N. by W. from Dublin.

TUBE, *TUBUS*, pipe, conduit, or canal; a cylinder, hollow within, either of lead, iron, wood, glass, or other matter, for the air, or some other fluid, to have a free passage or conveyance through.

The term is chiefly applied to those used in physics, astronomy, anatomy, &c. On other ordinary occasions, we more usually say *pipe*.

In the Memoirs of the French Academy of Sciences, M. Varignon gives a treatise on the proportions necessary for the diameters of tubes, to give precisely any determinate quantities of water. The result of his piece turns upon these two analogies; that the diminutions of the velocity of water, occasioned by its friction against the sides of tubes, are as the diameters; the tubes being supposed equally long: and the quantities of water issuing out of the tubes, are as the square roots of their diameters, deducting out of them the quantity each is diminished.

For the tubes of barometers and thermometers, see *BAROMETER* and *THERMOMETER*. For the ascent of liquors in capillary tubes, see *ASCENT* and *CAPILLARY*.

TUBE, in *Astronomy*, is sometimes used for *telescope* (which see); but more properly for that part of it into which the lenses are fitted, and by which they are directed and used.

The goodness of the tube being of great importance to that of the telescope, we shall here add its structure.

The Construction of a Draw-tube for a Telescope.—The chief points to be regarded here are, that the tube be not troublesome by its weight, nor liable to warp and disturb the position of the glasses; so that any kind of tube will not serve in every case: but,

1. If the tube be small, it is best made of thin brass

plates covered with tin, and formed into pipes or draws, to slide within one another.

2. For long tubes, brass or iron would be too heavy; for which reason, some chuse to make them of paper, thus: a wooden cylinder is turned, of the length of the paper to be used; and of a diameter equal to that of the smallest draw. About this cylinder is rolled and pasted paper, till it be of a sufficient thickness: when one tube is dry, provide others after the same manner; still making the last serve for a mould for the next, till you have enough for the length of the tube desired. Lastly, to the extremes of the draws are to be glued wooden ferrils, that they may be drawn forth the better.

3. Since paper draws are apt to swell with moist weather, so as to spoil their sliding; and in dry weather to shrink, which renders them loose and tottering; in both which cases, the situation of the lenses is easily disturbed; the best method of making tubes is as follows: glue parchment round a wooden cylinder, and let the parchment be coloured black, to prevent the reflected rays making any confusion. Provide very thin slits of beech, and bending them into a cylinder, glue them carefully to the parchment; cover this wooden case with white parchment, and about its outer extreme make a little ring or ferril: after the same manner make another draw over the former; and then another, till you have enough for the length of the tube.

To the inner extremes of each draw, fit a wooden ferril, that the spurious rays, striking against the sides, may be intercepted and lost. In those places where the lenses are to be put, it will be proper to furnish the ferrils with female screws. Provide a wooden cover to defend the object-glasses from the dust, and putting the eye-glass in its wooden ferril, fasten it by the screw to the tube. Lastly, provide a little wooden tube of a length equal to the distance the eye-glass is to be from the eye, and fit it to the other extreme of the tube.

TUBE, or *Pipe*, among *Florists*, is that part of a fine flower which has something of a straw-like pipe or opening; and which, to constitute a good flower, in some sorts, as those of the auricula and polyanthus, should stand exactly in the centre of the blossom, and have a truly round or circular form; be well filled with chives or little thread-like parts, something in the manner of a brush at their points, rising even with the face of the pip or blossom; as when only the style or pointal rises like a pin, without being surrounded or encompassed with the chives to the same height, the flower is said to be pinned, and displays a chasm or vacancy, which is so very unpleasant to the eye of the curious in flowers, that though, in many other respects, such flowers may have good properties, yet failing in this central perfection and beauty, nothing else can atone or make up for it; and such flowers are, of course, held in but small estimation by the florist. See *THRUM* and *TRUSS*.

TUBES, in *Artillery*, are instruments used in quick firing, made with us of tin; their diameter is two-tenths of an inch, so as just to enter into the vent of the piece; their length is about five or six inches, with a cap above, and cut slanting below in the form of a pen, and the point is strengthened with some folder, that it may pierce the cartridge.

Through each tube is drawn a quick-match, and the cap is furnished with mealed powder, moistened with spirits of wine. To prevent the mealed powder from falling out by carriage, a cap of paper is tied over it, which is taken off when used; but of late this cap is made of flannel, steeped in spirits of wine, and with saltpetre dissolved in it; and

there is no occasion to take it off, because it takes fire as quick as loose powder.

The French use a small reed, to which is fixed a wooden cap, and they are about two inches long, filled with mealed powder, moistened with spirits of wine; and a small hole is made through them of the size of a needle, through which the fire darts with great violence, and gives fire to the cartridge, which must be pierced before-hand with the priming-iron.

These tubes may be kept a great while without being spoiled; but piercing of the cartridge retards the quickness of firing. Muller's Art. p. 293.

TUBE, *Alimentary*. See DUCT.

TUBE, *Eustachian*, or *Trumpet*, in *Anatomy*, a canal of communication between the throat and the tympanum. See EAR.

TUBE, *Eustachian*, *Disease and Obstructions of*, in *Surgery*. These are often a cause of a considerable degree of deafness, because it is necessary for perfect hearing, that air should be conveyed from the mouth through this passage into the cavity of the tympanum, which now can no longer happen.

A degree of deafness generally attends a severe cold, which is accounted for by the Eustachian tube being obstructed with thickened mucus. Mr. Saunders tells us, that the obstruction most frequently arises from syphilitic ulcers in the throat, or sloughing in the cynanche maligna. The deafness comes on when such sores are healed, that is, when the obstruction is complete. The descent of a nasal polypus into the pharynx, and enlarged tonsils, have also been known to close the tube.

When the Eustachian tube is obstructed, the patient cannot feel the membrana tympani crackle, as it were, in his ear, on blowing forcibly with his nose and mouth stopped. Previous ulceration, or disease, of the throat, will sometimes aid in facilitating the diagnosis.

When the Eustachian tube is obstructed with mucus, it has been proposed to employ injections, which are to be thrown, by means of a syringe and catheter, into the guttural orifice of that canal. This operation, however, is alleged to be always attended with trouble; and when the os spongiosum inferius happens to be situated near the floor of the orbit, the introduction of any instrument like a female catheter would be impracticable. Richerand *Nosographie Chirurgicale*, tom. ii. p. 131. edit. 2.

Mr. A. Cooper had noticed, that hearing was only impaired, not lost, when suppurations in the tympanum had injured, and even destroyed the membrana tympani; and that the degree of deafness by no means equalled what resulted from an obstruction of the Eustachian tube. Hence, when the tube was permanently obliterated, he conceived that a small puncture of the membrana tympani might be the means of enabling the patient to hear. Mr. A. Cooper practised the plan with success, and others have imitated him with the same result.

The operation consists in introducing an instrument, resembling a hydrocele trocar, but curved, into the meatus auditorius externus, and pushing it through the anterior and inferior part of the membrana tympani; a place rendered most eligible, on account of the situation of the chorda tympani and manubrium of the malleus, parts which should be left uninjured. The instrument must not be introduced far, lest it should wound the vascular lining of the tympanum, and cause a temporary continuance of the deafness, by an effusion of blood. When the puncture is made, in proper cases, and in a judicious manner, hearing is immedi-

ately restored. A small hole in the membrana tympani now conveys the air into the cavity of the tympanum, answering the same purpose as the Eustachian tube.

The surgeon will be able to operate with more ease, if he take care to lessen the curvature of the meatus auditorius, by drawing upward the external ear.

There is some chance of a relapse, in consequence of the opening closing up. This consideration has led Richerand to propose making the aperture with caustic, so as to destroy a part of the membrane. (*Nosographie Chirurgicale*, tom. ii. p. 132. edit. 2.) The suggestion is not, however, likely to be adopted, on account of the inconveniences of applying caustic within the ear. Mr. Saunders is an advocate for making the opening large. This gentleman relates, that he instantaneously restored hearing in one case, in which the patient had been deaf thirty years, in consequence of a loss of part of his palate by syphilis. Mr. A. Cooper's cases are in the *Philosophical Transactions* for 1802.

Puncturing the membrana tympani has been attended with some degree of success in France, as well as this country. It is not to be dissembled, however, that there are numerous failures. We are informed that professor Dubois has done the operation in four instances, without success. Richerand *Nosographie Chirurgicale*, tom. ii. p. 132.

In most cases, the patients who have been benefited, are said to have experienced pain just after the trocar was withdrawn. The organ, in consequence of not being accustomed to sound, had become so extremely sensible, that it could not bear the gentlest impression of the sonorous vibrations; and the patient's first request, after the perforation was made, was that they who were near him might speak softly. This excessive tenderness of the sense gradually subsides.

TUBES, *Fallopian*, or *Trumpets*, in *Anatomy*, two small canals, forming communications between the cavities of the uterus and abdomen, and serving to convey the germs of the new beings, in generation, from the ovaries to the uterus. See GENERATION.

TUBE, *Glass*. See GLASS-TUBE, LAMP-BLOWERS, and HERMETICAL SEAL.

In order to bend a glass-tube, if the glass is pretty thick, and the bore narrow, it may be held in the weaker part of the lamp-flame, and softened for about an inch or two of its length, and then bent slowly into any required shape. But if the tube be wide, and the glass thin, this mode of bending will entirely destroy the cylindrical form of the bore at the part that is bent, making a double flattening. In order to avoid this, first seal up one end of the tube, and then, whilst bending it at the required part, blow steadily and gently into the open end, and the pressure of the breath will counteract the falling in of the sides of the bending portion, and keep the bore cylindrical. The closed end is then cut off by the file; for which purpose, make a deep scratch with one edge of a fine three-cornered file on the part intended to be cut, then break the tube with a smart pull in that direction in which the scratched part will be outermost; and it will in general separate accurately at this point.

In order to join two tubes, heat them both in the flame, and apply them together, when quit hot, turning them round to finish the consolidation; or else, to avoid the thick ring of glass which this produces, previously close one end of one tube, and when the two ends are fully joined, blow into the open end of the other tube, and pull them out a little at the point of juncture, till an equal cylinder is formed.

To form a bulb (*c. g.* of a thermometer), chuse a tube of

of a very equal bore, seal the end in the usual manner, and to collect a greater mass of glass at the end, press upwards on it while quite hot with any iron instrument, so as to consolidate and shorten it a little; let it remain in the hottest part of the flame, till the lump of glass is quite white hot; then remove it, put your lips to the open end without loss of time, holding it with the hot part lowest, and blow moderately and steadily. The lump of hot glass will immediately open into a bulb, the size of which may be regulated at pleasure.

TUBE, *Stentorophonic* and *Torricellian*. See the adjectives.

TUBEIPILLY, in *Geography*, a town of Hindoostan, in Myfore; 20 miles W. of Chinna Balabaram.

TUBEL, a word used by some chemical writers to express scales of copper or brass.

TUBELDIE, in *Geography*, a town of Dar-Fur; 180 miles S. of Cobbé.

TUBER, or **TUBERCLE**, in *Botany*, a kind of round turgid root, in form of a knob or turnip.

The plants which produce such roots are hence denominated *tuberosæ*, or *tuberous plants*. See **TUBEROUS ROOTS**.

TUBER, an old Latin name for a sort of excrescence, appropriated also to several things of the fungus tribe. Its derivation is from *tumeo*, to swell. Botanists have retained this name for the present genus, to which it originally perhaps belonged.—Mich. Gen. 221. Perf. Syn. Fung. 126. With. Bor. Arr. v. 4. 371. Sibth. Oxon. 398. Sm. Prodr. Fl. Græc. Sibth. v. 2. 351. Juss. 3. Lamarck Illustr. t. 887.—Class and order, *Cryptogamia Fungi*. Nat. Ord. *Fungi*.

Ess. Ch. Roundish, fleshy, solid, closed; its substance variegated with veins bearing seeds.

1. *T. cibarium*. Common Truffle. Perf. n. 1. With. n. 1. Bulliard. v. 1. 74. t. 356. Sowerb. Fung. t. 309. (*T. brumale*, pulpâ obscurâ odorâ; Mich. Gen. 221. t. 102. Tubera; Tourn. Inst. t. 333. *T. terræ*; Ger. Em. 1583.)—Blackish, rough with prominent warts.—Found under the surface of the ground in most parts of Europe, where the soil is light and dry; as well as in Japan, and the East Indies. Dogs are taught to find this fungus by the smell, and to scratch it out of the earth. It is brought to table, either simply boiled, or stewed in various forms. The French and Italians introduce truffles into different made dishes, sauces, pies, &c. They are reported to have a stimulating, or aphrodisiacal quality, which, whether imaginary or not, perhaps renders them more popular than their flavour, which is trifling. The size of this fungus is about that of a walnut in its outer coat, but the surface is irregularly tumid, and harsh to the touch from innumerable sharp warts. The inner substance is greyish, or pale brown, with numerous curved branching veins, lodging the minute seeds. No signs of a root are observable. There are said to be several varieties of colour in this species.

2. *T. moschatum*. Musky Truffle. Bulliard v. 1. 79. t. 479. Perf. n. 2.—Blackish, smooth.—Native of France. Like the foregoing in size, and general figure; but its surface is smooth, the internal substance rather soft, and the scent musky. By drying the coat becomes wrinkled. Bulliard.

3. *T. griseum*. Grey Truffle. Perf. n. 3. (Truffe grise; De Borch Truffes du Piemont, 7. t. 1, 2.)—Roundish, irregular, smooth, soft, greyish-ashcoloured.—Native of Piedmont, in a light, moderately moist, soil. The size of the two preceding, but more irregular in shape, of a soapy texture and light colour, with a strong scent of garlic.

Vol. XXXVI.

4. *T. album*. White Truffle. Bulliard v. 1. 80. t. 404. Perf. n. 4. With. n. 2. Sowerb. Fung. t. 310. (Bianchetti; De Borch Truff. du Piem. 6, 7? *Lycoperdon gibbosum*; Dickf. Crypt. fasc. 2. 26.)—Light reddish-brown, roundish, half above ground; veins rusty-coloured.—In woods, in England and France, also in Greece, but partly sunk in the earth. The outside is smooth, turning more yellow in drying; the inner substance resembles rhubarb. Its flavour is said to be disagreeable.

Dr. Withering describes a variety, or more probably, as he observes, a distinct species, whose internal substance is uniform, like cork, of the hue of tanned leather; the surface knobby and pitted, hairy in the pits. The whole mass perforated by stems of grass; so that it must have been above ground in a soft state.

5. *T. æstivum*. Summer Truffle. Mich. Gen. 221. n. 2. (*T. album* β; Perf. n. 4. *Lycoperdon æstivum*; Wulf. in Jacq. Coll. v. 1. 349.)—Nearly globular, smooth, brown, or blackish; spongy within; entirely subterranean.—Plentiful in Carinthia and Carniola from May to August. These have little taste or smell, but are used much for the table. When young the surface is whitish and scaly, but gradually becomes brown or blackish. Their size is equal to a chestnut or walnut. Perhaps, as Person thought, this may not be a different species from the last.

6. *T. cervinum*. Bastard Truffle. With. n. 3. (*Tubera cervina*; Lob. Ic. v. 2. 276. *Lycoperdastrum tuberofum* arrhizon fulvum, cortice duriore crasso et granulato, medullâ ex albo purpurascente, semine nigro crassiore; Mich. Gen. 220. t. 99. f. 4.)—Globular, finely granulated, rather solid, finally bursting; powdery in the centre.—Found barely sunk in the ground, in several parts of England, as well as in Bohemia and Silesia, about September. The diameter is about an inch and a half; the outside tawny; inner substance, or nucleus, purplish.

7. *T. solidum*. Hard Truffle. With. n. 4. (*Lycoperdon cepæ facie*; Vaill. Paris. t. 16. f. 5, 6.)—"Globular but compressed, (rather depressed,) brown, reticulated, very firm; blue-black within."—Found in Dr. Withering's park at Edgbaston, near Birmingham, under an oak-tree by the pool, in August. This had a short root, as Vaillant represents it, and appears to be, as Mr. Sowerby supposes, only a nearly sessile variety of his *Lycoperdon defossium*, Engl. Fung. t. 311.

8. *T. radicum*. Rooted Truffle. With. n. 5. (*Lycoperdon cervinum*; Bolt. Fung. v. 3. t. 116. *L. spadiceum*; Dickf. Crypt. fasc. 1. 25. *Lycoperdastrum obscurum*, altiùs radicum, pulpâ atro-purpurâ, cute lacerâ, veluti punctatâ; Mich. Gen. 220. t. 99. f. 3.)—Roundish, depressed, cracked in the surface, with a thick short root.—Found on heaths, and in woods, in Italy and England in the summer, but rare. Two or three inches in diameter, solid, never bursting, nor becoming internally powdery. The outer skin is brown, or olive, cracking into angular portions, but not warty. Inner substance purplish, veined with black; finally quite black. Apparently different from *Lycoperdon aurantiacum* of Bulliard, t. 270; so that the fine smoke in his figure may not be altogether, as Bolton says, "conjectural;" it may represent the powdery seeds, escaping from holes eaten by insects, as Bolton himself supposes.

TUBER, or *Tuberosity*, in *Surgery*, is used for a knob or tumour growing naturally on any part; in opposition to tumours which rise accidentally, or from a disease.

The same term is also used for a knot in a tree.

TUBERA TERRÆ. See **TRUFFLES**.

TUBERAN, in *Geography*, a town of Persia, in the province of Kerman; 171 miles N.E. of Schiras.

TUBERCLE, a small, hard, superficial tumour, circumscribed, and permanent, or suppurating partially.—Bate-man's Synopsis of Cutaneous Diseases.

TUBERCULA QUADRIGEMINA, in *Anatomy*, a part of the brain. See **BRAIN**.

TUBERCULARIA, in *Botany*, so called from its small tubercular figure.—Tode Fung. Mecklenb. fasc. 1. 18. Perf. Syn. Fung. 111. Obs. Mycol. fasc. 1. 78.—Class and order, *Cryptogamia Fungi*. Nat. Ord. *Fungi*.

Ess. Ch. Roundish, compact, smooth, permanent, soluble in wet.

1. *T. discoidea*. Discoid Tubercularia. Perf. n. 1. Obs. Mycol. n. 138. fasc. 1. 79.—Bursting from the cuticle of trees, crowded, even, red; with a discoid permanent base.—On decayed branches of Maple.

2. *T. vulgaris*. Scarlet Tubercularia. Tode 18—20. t. 4. f. 30. Perf. n. 2. (*Tremella purpurea*; Linn. Sp. Pl. 1626. Hudf. 565. *Lichenoides tuberculiformis amœnè purpureum*; Dill. Musc. 127. t. 18. f. 6.)—Aggregate or scattered, bright red, corrugated, with a thick pale base.—Very common on dead or dying branches of trees, especially currant-bushes, where it becomes conspicuous by its scarlet or deep-rose colour.

3. *T. granulata*. Dull Granulated Tubercularia. Perf. n. 3.—“Roundish, dull red, with a corrugated granulated surface.”—On the branches of Sycamore, or other species of *Acer*, but rare. Its colour is brownish and opaque; yellowish within. *Perfoon*.

4. *T. confluens*. Confluent Tubercularia. Perf. n. 4.—“Crowded and confluent, of a fleshy red brick-colour, small, oblong, angular or flattish.”—On dry branches of the Common Maple. Coloured much like *T. vulgaris*, but smaller, and softer.

5. *T. castanea*. Chestnut Tubercularia. Perf. n. 5.—“Scattered, small, sunk in the bark, flattish, very smooth, bright red.”—On the bark of the chestnut-tree. Half the size of *T. vulgaris*, and scarcely projecting out of the cuticle of the bark. Its colour externally is like that of a strawberry, the inside yellowish, firm.

6. *T. rosea*. Rosy Tubercularia. Perf. n. 6. Obs. Mycol. n. 137. fasc. 1. 78. (*Lichen roseus*; Schreb. Lipf. 140.)—Scattered, loose, irregularly globose, rose-coloured.—On trees, especially adhering to *Lichen stellaris, parietinus*, &c. We have found it on the former at Hetherfet, near Norwich. The bright-pink little masses, of which this species consists, might be taken for the tubercles of some *Lichen*; but they dissolve in wet.

TUBERCULUM ANNULARE, in *Anatomy*, a part of the brain. See **BRAIN**.

TUBERCULUM LORVERI, a small eminence in the right auricle of the heart. See **HEART**.

TUBERNICENSE OPPIDUM, *Tubernoke*, in *Ancient Geography*, a town of Africa, built in form of a crescent, between the summits of a mountain, 7 leagues S.W. of Tunis.

TUBERNOKI, in *Geography*, a town of Tunis, anciently the see of a bishop; 21 miles S.S.E. of Tunis.

TUBEROSE, in *Botany*, see **POLIANTHES**. This English name is not compounded of *tube* and *rose*, as most people would naturally conceive, but originates in the old appellation of *Tuberoſe*, or *Tuberous*, *Hyacinth*, *Hyacinthus tuberosus*; alluding to the tuberous root, and the resemblance of the flower to a *Hyacinth*.

TUBEROUS ROOTS, in *Gardening and Agriculture*, such as consist of one or more swelled or knobbed tubers, of a solid fleshy substance. In this tribe are comprised many plants of the ornamental flowery kind, and some esculents of the

kitchen garden; as in the former, *anemone*, *ranunculus*, *filipendula*, many sorts of *iris*, *aconitum*, *pæony*, *orchis*, *cyclamen*, *winter-aconite*, *day-lily*, &c.; some also with bulbous tuberous roots, as *gladiolus*, *polianthes* or *tuberoſe*, *ophrys*, &c.; and of the esculent tuberous roots are the *potatoe* and *Jerusalem artichoke*: all of which plants are principally perennial in their roots, being perpetuated annually by offsets, or cuttings for sets. See **ROOT**.

It has lately been suggested, and in some measure confirmed by experiment, that, in cultivation, the root of this kind, called the *potatoe*, is liable to have the disease termed the curl produced in crops of it, by the tubers which are used for seed-stock or sets having been allowed to become too ripe the preceding year; and that this practice of over-ripening, being repeated year after year, is the real cause of the disease, the vegetative power in the tubers being in this way exhausted.

It has been long known to all cultivators of this sort of crops, that the usual method of reproducing any particular variety of the root is by cuts or sets of the tubers; and that this manner of propagation is continued from year to year, as long as that particular sort is wished for, without ever thinking of reinvigorating the *seed-stock*, or tubers for planting, by raising new plants from the real seed; the *species* being reproduced only by sowing the true seeds of the plant. It is only thus that *new* varieties are obtained. But if seeds be taken from any particular variety which is wished to be preserved, and if care be exercised that the plants shall have no communication with the farina of any other plants of the same species in flower, then the produce of these seeds will probably be the same with that variety from which the seeds were saved; and from the seed-stock being renewed, and reinvigorated in this manner, it seems likely that the variety so obtained may, by observing a proper management, be preserved from this disease, or any other kind of degeneracy, for any length of time.

This opinion of the over-ripening of the seed-stock for the supply of the ensuing year, by allowing it to remain too long in the ground, especially when planted early, and of the repetition and continuance of it rendering the tubers wholly unfit for producing vigorous healthy plants, by exhausting their power, being the chief cause of this disease, has however been almost uniformly objected to, as being quite contrary to experience in regard to seeds in general, as full ripeness has been considered the best recommendation of them. It is notwithstanding apprehended, that this objection arises from the taking of an improper view of the matter. For though it be true, that all of what are properly called *seeds* are improved by being thoroughly ripened; the *cuts* or *sets* taken from the tubers of this sort cannot, strictly speaking, be considered as seeds. The planting cuts of this kind of tuberous root, is analogous, it is supposed, to budding or grafting of trees, being only a secondary mode of propagation, and consequently that such an objection cannot hold good. Besides, the suggestion is illustrated and supported by different other circumstances and considerations, as well as by the well-known powerful cause which weakens the vegetative power in the tubers,—that of allowing the plants that are intended for the supplying of seed-stock for the ensuing year to run to flower, and produce seed. This, it is thought, should in all cases be prevented, by cutting off the flowers as they appear in their embryo state. In this way, by turning nature from her ordinary course, to force her to exert herself in another direction, and to throw back into the tubers that portion of the vital principle of the plant, which would have been exhausted in the formation of flowers and seeds. Nothing will, it is supposed, contribute more to prevent degeneracy in this
form

fort of tuberous root, and especially of the disease to which it is so liable, than this treatment. See the first volume of the Transactions of the Scotch Horticultural Society.

TUBERSOKE, in *Geography*, a town of Tunis, anciently the see of a bishop; 48 miles S.W. of Tunis.

TUBIG, a town on the E. coast of the island of Samar. N. lat. $12^{\circ} 13'$. E. long. $135^{\circ} 27'$.

TUBILUSTRIUM, compounded of *tubus*, trumpet, and *lustrum*, I purify, in *Antiquity*, a feast or ceremony in use among the Romans. This denomination was given to the day on which they purified their sacred trumpets, as also to the ceremony of purifying them. It was held on the fifth and last day of the feast of Minerva, called *quinquatrus*, or *quinquatria*, which was performed twice a year.

TUBINGEN, in *Geography*, a town of Wurtemberg, situated in a valley on the Neckar, between two hills. An university was founded here in the year 1477, and restored in the year 1770. Here is a seminary for the study of divinity, and a college for the nobility. The foundation of the town is unknown, but assuredly of great antiquity. It is the origin of the pfalzgravate of Swabia, and though the descent of the ancient palatines of Tubingen be unknown, yet they had their pfalz or palatium, which stood on the spot of the present castle. One of the eldest pfalzgraves known at present, lived in the year 1080; and the last of them, viz. George Eberhard, died in the year 1631. The two pfalzgraves, Gobz and William, in the year 1342, sold the town to count Ulrich of Wurtemberg. In 1535, duke Ulrich, pulling down the old castle, caused that of Hohen Tubingen, which is the present residence, to be erected, with fortifications. In 1540 the town was damaged by fire. In the thirty years' war it was frequently besieged and taken; and in 1688, was considerably injured by the French; 16 miles S.S.W. of Stuttgart. N. lat. $48^{\circ} 33'$. E. long. $9^{\circ} 10'$.

TUBIPORA, *Red tubular Coral*, in *Natural History*, a name given by Linnæus to a genus of Zoophyta, in the class of worms; the characters of which are, that its animal is a nereis, and that it is a coral, consisting of cylindric, hollow, erect, and parallel tubes.

In Gmelin's edition of the Linnæan System we have the following

Species.

MUSICA. With fasciculated combined tubes; the transverse partitions membranaceous and distant. This is the purple tubipora of Pallas, of which he mentions a variety, or the flexuose tubipora. It is found in the American, Indian, and Red seas, affixed to other corals or rocks; and is used by the Indians as an antidote to strangury and wounds inflicted by poisonous animals.

CATENULATA. With parallel tubes, connected into a lamina anastomosing with a folded wreath. Found on the shores of the Baltic sea.

SERPENS. With cylindric, erect, very short, distant, axillary tubules; divaricated at the dichotomous base: the *Millepora liliacea* of Pallas. Found in the Mediterranean and Northern seas, and on the shores of the Baltic.

FASCICULARIS. With filiform fasciculated tubes; the sides anastomosing. Found on the shores of Gothland.

RAMOSA. With roundish interstices, and simple, flexuose, aggregate, conglutinated tubules of the confluent branches. Found in the White sea.

PINNATA. Dichotomous, erect, with tubules distributed in the form of small feathers. Found in the Mediterranean sea.

PENICILLATA. Stalky; the top incrassated, and formed

of tubules connected towards the base. Found in the Greenland sea, affixed to testacea.

FLABELLARIIS. Depressed, flabelliform, radiated with parallel conjoined tubules. Found as the former.

STELLATA. With separate tubes, combined in layers or tables, many of these tables being remote, horizontally tubulous, and radiated with striæ on the surface. Found among fossils.

STRUES. With distant diverging tubes, loose behind and often bent; with tubules small, simple, and horizontal, combined. Found among fossils.

TUBNA, in *Geography*, a town of Algiers, anciently called Thubana. The Arabs bury their treasure under the ruins; 110 miles S.S.W. of Constantina. N. lat. $35^{\circ} 8'$. E. long. 5° .

TUBOE, a town on the south coast of Mindanao. N. lat. $7^{\circ} 40'$. E. long. $124^{\circ} 32'$.

TUBŒUF, a town of France, in the department of the Mayenne; 6 miles N.N.E. of Laffay.

TUBOR TERRÆ, a name used by some botanical authors for the cyclamen or sow-bread.

TUBUG, in *Geography*, a harbour on the west coast of Mindanao, much frequented by pirates. Near it is the house of a rajah, strongly pallisadoed, and defended with twenty swivel guns; 10 miles N. of Pollock harbour.

TUBUHACAN, a town of Africa, in the country of Sugulmessa; 9 miles from Sugulmessa.

TUBULARIA, in *Zoology*, a genus of the Zoophyta class of worms; the characters of which are, that the animal is vegetating and radicated; the head crested with tentacula, generating small eggs; and that the stem is tubulous, horny, very simple or branched, affixed at the bottom, and the animal thrust out at the apex. Among the following species are included several of the tubular corallines of Ellis.

Species.

CORNUCOPIÆ. With simple tube, attenuated below, flexuous and rough. Found among the corals of the American and Mediterranean seas. Colour dusky-yellow.

INDIVISA. With very simple stalks, and wreathed joints. One of Ellis's tubular corallines. Found in the European and Mediterranean seas. Colour yellowish-grey.

RAMOSA. With branched stalks, and wreathed joints: one of Ellis's. Found in the European sea. The soft tubules sordidly grey.

RAMEA. With compound branched tubes, large and small branches alternate. Found in the Mediterranean ocean. Brownish-grey.

FISTULOSA. With dichotomous articulated stalks, with impressions in form of a rhombus. Bugle coralline of Ellis. Found in the European, Mediterranean, and Atlantic seas. Pale-grey.

FRAGILIS. With dichotomous stalks, and compressed joints. Found in the American sea. White or greenish.

MUSCOIDES. With sub-dichotomous stalks, wholly annulate-rugose. One of the tubular corallines of Ellis. Found in the European and Mediterranean seas. Pale-grey.

PAPYRACEA. With a very large papyraceous tubule, alternately ramose. Found in the Indian ocean.

PENICILLUS. With aggregate, simple, radicated tubules, proliferous and penicillated at the apex. Found in the American sea. It is doubted whether this and the last be of this genus.

ACETABULUM. With filiform stalks; the terminal pelta or shield striated, radiated and calcareous. Found in the Mediterranean and American seas. White and soft, and adjoined to testacea.

SPLACHNEA. With capillary very simple stalks; the terminal pelta smooth and membranaceous. Found in the Mediterranean sea. Of horn-colour.

CORYNA. Sub-ramose, filiform, papyraceous, jointed with ovato-acuminated capsules, and dilatable mouth, and terminated with cylindrical armed tentacula. Found on the shores of Holland and England. Arenaceous and reddish.

AFFINIS. Simple, sub-annulated, soft; with the tentacula of the mouth encompassing the papilla attenuated. Found on the English coast, adhering to fuci, and akin to the last.

FABRICIA. Stellated, with pinnated cirrhi, and six rays encompassing the mouth. Found on the shores of Norway and Greenland, often in the fisheries of rocks. Grey, green, or white.

LONGICORNIS. With two fetaceous cirrhi, longer than the tubule. Habitation unknown.

MULTICORNIS. With more than twenty cirrhi centrally white; body round and hyaline, tubule mace-like. Habitation unknown.

CAMPANULATA. With lunated crest; orifices of the vagina annulated; body concealed within the vagina. Found in the stagnant waters of Europe.

REPENS. Crested, with cirrhi on both sides radiated; vagina extended, tubule opaque, procumbent. Found in the stagnant waters of Northern Europe.

REPTANS. With lunated crest; body tractile beyond the vagina. Found in the stagnant waters of Europe. Hyaline, soft, with about sixty cilia.

SULTANA. With infundibuliform crest, ciliated at the base. Found in the pools of Gottingen.

STELLARIS. Crested, with pectinated cirrhi, brown, annulated erect tubule. Found in the fucus of the Baltic sea.

SIMPLEX. With eight linear cirrhi, and conic hyaline tubule. Found in the fucus of the Norwegian sea.

SPALLANZANI. With five plumose cirrhi, pectinated on both sides, and cylindrical, horny tubules, below incurvated. Found in the Mediterranean sea.

MEMBRANACEA. With a double concentric range of fistulous tentacula, and a membranaceous, contractile, viscid, cylindrical tubule inclosing the inhabitant. Found in calm parts of the Mediterranean; but doubted whether it belongs to this genus.

TUBULARIA Fossilis, in *Natural History*, the name of a species of coral found very often fossil in Germany and Italy, and composed of a great number of tubes, or longitudinal pipes, often resembling so many worms ranged perpendicularly in the mass.

They are usually found either in masses of a lax stone, or in single tubules in those of the harder and firmer texture. In these two states this fossil makes two very different appearances; and, according to the different directions in the mass, or the different views of them that the sections of it place them in, they make a number of very elegant figures. Hill.

TUBULATED FLOWER, *Tubulatus flosculus*, in *Botany*, a term used by authors to express those small flowers, a great number of which go to compose one large compound flower. These are called *tubulated*, by way of distinction from another kind of them, which are, from their shape, called *ligulated*. The tubulated floscules generally compose the disk, and the ligulated ones the radius of the compound flowers. The tubulated ones are formed into a hollow cylinder, which expands into a mouth at the top, and is divided into five equal segments, which stand expanded, and in some measure bent backward.

TUBULI CONCAMERATI, in *Natural History*, the name

of a genus of the *Tubulus marinus*, distinguished abundantly from all the others by its figure and inner structure.

They are long shelly bodies, usually either of a conic or cylindrical form, or else resembling the dentales in shape; and sometimes, but that very rarely, they have their smaller end bent and twisted round. They are composed within of a number of hollow compartments, each of which communicates with the next by means of a siphunculus, which runs through the whole length in the manner of the thick nautilus, or the cornu ammonis. We know not these in their recent state at this time, but frequently meet with them fossil in the stones brought from Sweden for pavements, and in some others.

Some authors have called these by the name *alveoli*, confounding them with the conic body found in the belemnite. See **ALVEOLUS**.

Others have called them *pyramidal entrochi*, others *obelisci marmoris alveolares*; and they are the bodies described by Gesner and Aldrovand, under the names of *lapides caudæ cancri*, or *canerites*. Some late authors have called them also *polythalamii*, and others *cone-stones*. Klein. de Tubul. p. 7.

TUBULI Fossiles, the name given by authors to the cafes or tubules of sea-worms, found buried in the earth.

They are in their native state of very various kinds, but by different accidents attending them in their accidental one, they are subject to a multitude of other appearances. They are found of very various sizes, sometimes complete, and buried in the strata of earth or stone; sometimes they are more or less perfect, and are immersed in masses of the *ludus Helmontii*, or *septaria*, and in this state they make one kind of *lapis syringoides*, or pipe-stone; but the most beautiful *syringoides*, or pipe-stones, are the parts of the bottoms of ships, or posts fixed in the sea, which have been pierced, in their original state of wood, by these sea-worms, and afterwards petrified with the cafes or tubuli of the worms remaining in them.

Of these there are many beautiful specimens on the shore of the island of Sheppey, and in our clay-pits about London and Richmond.

Those tubuli called *dentalia et entalia*, are not less frequent, and found of various kinds in the clay-pits about London and the hills of Yorkshire; but they are more frequent in similar places in France and Italy.

TUBULI Lactiferi, or *Galaetophori*, in *Anatomy*, the canals in which the milk is secreted. See **BREAST**.

TUBULI Seminiferi, the innumerable minute canals composing the body of the testis. See **GENERATION**.

TUBULI Uriniferi, the small tubes terminating on the papillæ of the kidney. See **KIDNEY**.

TUBULI Vermiculares, a name sometimes used by naturalists for certain small oblong and hollow sea-shells resembling worms.

TUBULUS Marinus, or *Canalis*, in *Natural History*, the name of a genus (according to some writers) of univalve shell-fish; the characters of which are these: it is of an oblong figure, terminating in a point, and hollow within, so that it resembles a tube or horn. These are also called by the old writers *dentalia*, from their resembling the tooth of a dog. See **DENTALIUM**, **CONCIOLOGY**, and **SHELLS**.

It has been a common error of authors to confound under the general name of *tubulus marinus*, these shells, and those very different ones of the *vermiculi marini*, which make a number of pipes or tubes joined together; these, by their number and joinings, have induced a late French author to place them among the multivalve shells, while the *canales* are usually single and separate, and can have no title to any class but the tubular univalve one. Aldrovand observes, that the tubuli

tubuli called *dentalia*, and those called *antalia*, differ only in size; and he thinks they have no title to the name *concha*, since they are neither of the nature of the common bivalve nor univalve shells, such as the patella and auris marina; but this is very idle, since by this rule the snails, and many other families, might be excluded as well as these. This author says, in another place, that the *antale* is formed of many circumvolutions; whence he seems to have taken in the *buccina* under this name; but later writers have more nicely distinguished in these cases. The sea-pencil is evidently of this genus, though extremely different from all the other species of it, in having its head pierced with a multitude of holes, in the manner of the head of a watering-pot. Some authors, from the figure of the shell, call this *phallus marinus*, and the French call it *le priape*. Aldrovand. de Testac. lib. lii. p. 382.

TUBULINA, in *Botany*, a diminutive, from *tubus*, a tube, expressing the structure of the fungus in question.—Perf. Syn. Fung. 197.—Class and order, *Cryptogamia Fungi*. Nat. Ord. *Fungi*.

Ess. Ch. Receptacles tubular, combined in a tuft, generally seated on a subjacent membrane. Seeds powdery, naked, farinaceous.

1. *T. fallax*. Doubtful Tubulina. Perf. n. 1. Obf. Mycol. fasc. 2. 28.—“Opaque, indeterminate, brownish. Receptacles combined at the top into an uniform bark.”—Found, very rarely, on the trunks of trees. Perfoon appears to have examined a single specimen only, and therefore knew nothing of the appearance of the plant in an early stage of growth. This specimen was about an inch long, various in breadth, of an earthy or rusty colour. The tubes were full of powder, otherwise he would have thought it rather the early state of some *Boletus* or *Sphæria*.

2. *T. fragiformis*. Strawberry Tubulina. Perf. n. 2. Obf. Mycol. fasc. 2. 29. (Tubulifera arachnoidea; Jacq. Misc. Auftr. v. 1. 144. t. 15. T. Ceratum; Fl. Dan. t. 659. f. 2.)—Nearly globular; first red; then brown; receptacles rather swelling upwards, distinct at the top.—Found on the trunks of trees, after heavy rains in summer, attracting notice by its likeness to a large strawberry. When arrived at maturity, it becomes opaque, of a rusty brown. The author above quoted mentions in his *Observationes Mycologicae*, fasc. 2, numerous fungi allied to this, partly observed by himself, and partly described by other authors, which he was doubtful whether to consider as species or varieties. His doubts seem to have been rather increased than diminished when he wrote his *Synopsis*, and therefore we cannot presume to remove them. Among these obscure productions are *Sphærocarpus fragiformis*, Bulliard t. 384, and *S. cylindricus*, t. 470. f. 3, which appear to answer well to the generic character of *Tubulina*, and to be specifically distinct from *T. fragiformis*, as represented by Jacquin. Perfoon also mentions a *Reticularia multcapsula* of Sowerby's *Fungi*, t. 169, which is an altogether erroneous reference; nor shall we attempt to guess whether it alludes to any thing in that author's t. 399, or any other.

TUBULOSE LEAF, among *Botanists*. See **LEAF**.

TUBURBO, in *Geography*, a town of Africa, in the kingdom of Tunis, on the Mejerda, supposed to be the ancient Tuburbum. Mahomet, a late bey of this kingdom, planted a great number and variety of fruit-trees in the neighbourhood of this town, which were ranged in so particular a method, that each species was confined to one grove, and thereby removed from all influence of another. In the adjacent valley, where the Mejerda conveys its stream, the same curious and generous prince erected out of the ruins of a neighbouring amphitheatre, a large masonry

bridge or dam, with proper sluices and flood-gates to raise the river to a convenient height for watering and refreshing these plantations. But this, which was too laudable an invention to subsist long in Barbary, was soon entirely broken down and destroyed; 16 miles W.N.W. of Tunis.

TUBUS COROLLÆ, in *Botany*, the inferior, more or less cylindrical, part of a monopetalous corolla, supporting the LIMBUS; see that article. The tube differs in length, in different genera or species of plants, as well as in shape. A rotate, or wheel-shaped, corolla has the tube necessarily very short, or scarcely any; a funnel-shaped one has the same part elongated, and dilated upward. Sometimes the tube conceals the stamens, which are inserted either into some part of itself, or more rarely into the receptacle; sometimes, indeed very frequently, the stamens project, with the style, out of the tube. Its mouth is usually pervious; sometimes hairy; in several genera of the tribe *Asperifoliae*, that part is closed by arched or converging valves, covering the anthers. The claws of the petals, in a polypetalous corolla, stand in the place of the tube of a monopetalous one, and in some instances are so far connected, at an early period, as really to constitute a tube, subsequently splitting into claws. Examples occur in the order of *PROTEÆCEÆ*, which have caused some perplexity, and difference of opinion, in the characters given by different botanists of the plants of that order.

TUCABATH, in *Ancient Geography*, a town of Africa, in the interior of Libya. Ptolemy.

TUCANA, in *Ornithology*, a name given by some to the toucan.

TUCAPEL, in *Geography*, mountains of Chili, S. of Conception. S. lat. 37° 30'.

TUCAVAN, a town on the W. coast of the island of Negros. N. lat. 11° 12'. E. long. 122° 57'.

TUCCA TEREBINTHINA, *Sheebak*, in *Ancient Geography*, a town in the interior of Africa, near Assurus and S.W. of it. Ptolemy.

TUCCABAR, in *Geography*, a town of Tunis, on the Mejerda; 24 miles W. of Tunis.

TUCCABATCHE, a town of the state of Georgia; 10 miles S.W. of Oakfulkee.

TUCCI, MARTOS, in *Ancient Geography*, a town of Spain, in Betica, S. of Castulo.

TUCHAN, in *Geography*, a town of France, in the department of the Aude; 12 miles S. of La Grasse.

TUCHEL, a town of Prussia, in Pomerelia; 25 miles N.W. of Culm.

TUCK of a Ship, a name given to that part of the ship where the ends of the bottom planks are collected together, immediately under the stern or counter. When this part, instead of being incurvated, and forming a convex surface, assumes the shape of a vertical or oblique plane, it is said to be square; and a square tuck is accordingly terminated above by the wing-transom, and below, and on each side, by the fashion-pieces. Falconer.

TUCK-Rail, the rail which is wrought well with the upper side of the wing-transom of ships, &c. and forms a rabbet for the purpose of caulking the butt-ends of the planks of the bottom.

TUCKABATCHEES, in *Geography*, a town of the Creek nation of Indians.

TUCKAHOC CREEK, a branch of the river Choptank, in Maryland.

TUCKAHOE, in *Botany*, the North American Indian name of a very extraordinary production, found in various parts of the United States, which appears to be a subterraneous fungus, nearly allied to the genus **TUBER**; see that article.

article. The Tuckahoe is found in irregular, more or less globular or oblong, lumps, from an ounce to thirty pounds in weight, having a brown corrugated bark. Its internal substance is uniform, solid, snow-white, farinaceous, with little or no taste or smell; and has been used by the natives as food. This production is generally found attached to the roots of some tree, especially of the genera *Pinus* and *Quercus*, the fibres of which are interwoven with part of its texture, but in process of time are obliterated. Its growth appears to be very slow. In decay the inner substance assumes an acid flavour, and brown colour. Such are some of the particulars of the history of this fungus, for so we presume it to be, which we have received from Dr. Macbride of Charlestown, South Carolina; who has lately given a more ample and detailed account of it, with specimens, to the Linnæan Society of London.

TUCKAREAH, in *Geography*, a town of Africa, in Sahara, anciently called Tigava; 106 miles S. of Algiers.

TUCKATPOUR, a town of Hindoostan, in the circle of Ruttunpour; 18 miles S.W. of Ruttunpour.

TUCKEA, a town of Hindoostan, in Goondwana; 10 miles W. of Nagpour.

TUCKER, in *Rural Economy*, a term sometimes applied to a person employed in the business of fulling.

TUCKER, JOSIAH, D.D., in *Biography*, a controversial writer, was the son of a small freeholder in Wales, and born in the year 1711. Having completed his education at St. John's college, Oxford, and taken orders, he served a curacy at Bristol, and was promoted by bishop Butler, who made him his chaplain, to the rectory of St. Stephen's in that city. His residence at Bristol drew his particular attention to commercial matters, in reference to which he published, about the year 1747, "A brief Essay on the Advantages and Disadvantages which respectively attend France and Great Britain with regard to Trade;" which was followed by "Reflections on the Expediency of a Law for the Naturalization of foreign Protestants," published in two parts, 1751—2, and advocating liberal and enlarged principles. In these principles he espoused the cause of the Jews in two "Letters to a Friend concerning Naturalizations," 1753. The part he took on this occasion exposed him to much obloquy, and was the occasion of his being burnt in effigy by the populace. However, in 1755 he obtained the degree of D.D., and was made a prebendary of Bristol. His activity in promoting the election of Mr. Nugent, afterwards lord Clare, as a representative for Bristol, was recommended in 1758 by the deanery of Gloucester. In the controversy occasioned by the petitioning clergy in 1771, he took a part, and published in 1772, "An Apology for the present Church of England, as by Law established;" in which, whilst he opposed their claims, he expressed his wish for the omission of the Athanasian creed in the church service, and for excusing students of the universities upon matriculation, and graduates in lay faculties, from subscription to the articles. In the same year he published "Six Sermons," on doctrinal points that were then much agitated. In 1773 appeared his Letters to Dr. Kippis's "Vindication of the Protestant Dissenting Ministers with regard to their late Application to Parliament," which were written with moderation and candour, and in which he seems disposed to unite the claims of the church of England respecting its own members, with liberal concessions to those who dissent from it. In 1774 he published his "Four Tracts, together with Two Sermons, on Political and Commercial Subjects;" in which he unfolded his whole plan for settling the dispute with America, deemed by both the contending parties extravagant; this was "to separate entirely from the North

American colonies by declaring them to be a free and independent people, over whom we lay no claim; and then by offering to guarantee this freedom and independence against all foreign invaders whatever." But he did not wish to concede the point of right in this controversy, as appeared from his publication in 1775, entitled "The respective Pleas and Arguments of the Mother Country and of the Colonies distinctly set forth; and the Impossibility of a Compromise of Differences, or a natural Concession of Rights, plainly demonstrated." Mr. Burke treated his scheme with some degree of contempt, and therefore he addressed to him one of three subsequent publications on this subject. The dean became ardent and irritable in the prosecution of this dispute, and allowed himself in the abuse of the colonists, and particularly of Dr. Franklin. In 1781, apparently deviating from the principles which he had avowed in more early life, he attacked Mr. Locke and his followers on the origin, extent, and end of civil institutions, in his "Treatise concerning Civil Government." The advocates of Locke retorted upon him with warmth, and perhaps with some degree of asperity; but "he might console himself (as one of his biographers says) by having his work quoted by lord Mansfield in the house of peers, with a fine eulogium on the talents of the author, whom he mentioned as a writer of the first class for sagacity and knowledge." Indulging his resentment against the Americans, and predicting consequences likely to result from their independence, which have not been verified by fact, he addressed to M. Necker, in 1782, a pamphlet entitled "Cui Bono? or, An Enquiry, what Benefits can arise either to the English or the Americans, the French, Spaniards, or Dutch, from the greatest Victories or Successes in the present War." In the "Preface" to this work, he undertakes to refute the opinions of the advocates for equal representation. In his subsequent commercial publications he declares himself adverse to all restrictions upon trade, and desirous of leaving it to regulate itself. Having resigned his rectory at Bristol to his curate, he resided at his deanery in Gloucester, and discharged the various duties of his office with exemplary assiduity. Although he was married, he left no issue. He lived to the advanced age of eighty-eight years, and died in 1799, by a paralytic stroke. *Gent. Mag. Month. Rev. Gen. Biog.*

TUCKER, the Rev. WILLIAM, one of the gentlemen of king Charles II.'s chapel, and precentor of Westminster Abbey, was a very judicious composer of choral music. Mr. Mason, in speaking of the full anthem, "O give thanks unto the Lord," by this ingenious dilettante, very truly observes, that "every syllable in this composition has its just length, and each part of a sentence its proper pause; it admits no perplexing alterations or unmeaning repetitions, but proceeds in one full, yet distinct strain, harmonically, yet intelligibly."

So many circumstances must concur in forming a complete musician among the lovers of the art, who have no other view in its cultivation than pure amusement, that however ardent their zeal and sublime their genius, if they have not been early initiated in the mysteries of counterpoint, and pursued its labyrinths with the perseverance of professional students, timidity, embarrassment, ignorance, and confusion, will appear in their scores at the first glance of a regular-bred composer. In general, their practice, reading of scores, experience, and application, are inferior to those of the meanest organist, or ripieno performer: disdain to perform under parts, or to study them in the works of great masters, as soon as they know their gammut, their chief practice consists in solos and amusing melodies; so that they remain to the end of their lives unable to count rests, or
keep

keep time, with professional firmness and accuracy; and either totally neglecting or running away too soon from plain counterpoint to florid, a want of instruction and regular study appear in the bases they put to the slightest and most natural melodies.

TUCKER'S Island, in *Geography*, a small island in the Pacific ocean, so called by Capt. Wilson of the *Duff*, from one of the crew who left the ship there. N. lat. $7^{\circ} 22'$. E. long. $122^{\circ} 5'$.—Also, a small island near the coast of South Carolina. N. lat. $32^{\circ} 36'$. W. long. $80^{\circ} 16'$.

TUCKERTON, a sea-port of New Jersey, in Little Egg harbour.—Also, a town of Burlington county, New Jersey; 201 miles from Washington.

TUCKET, a word used by Shakspeare in "All's well that ends well," act iii. sc. 8. corrupted from *toccata*, Ital. a flourish.

TUCKIN, in *Agriculture*, the name of the fatchel that is sometimes used in setting beans in the field.

TUCKING-MILL, in *Rural Economy*, a name given in some places to a fulling-mill.

TUCKT HAZARA, in *Geography*, a town of Hindoostan, in Moultan; 10 miles N.W. of Toulomba.

TUCKUM, a town of the duchy of Courland; 33 miles E. of Goldingen.

TUCKUSH, a small island in the Mediterranean, near the coast of Algiers, opposite a town of the same name on the continent; 12 miles E. of the Cape of Iron.

TUCKWAPOUR, a town of Hindoostan, in Oude; 14 miles S. of Bahraitch.

TUCKYPARA, a town of Bengal; 24 miles S. of Burdwan.

TUCOPIA, an island in the Pacific ocean, discovered by Quiros in 1606. He could not find any anchoring place, but was near enough to converse with the inhabitants, who offered him a present of nuts, and a piece of cloth made of palm-leaves; and they saw some plantations of fruit-trees. S. lat. 12° . E. long. 167° .

TUCRI, a town of Naples, in the county of Molise; 13 miles E.S.E. of Molise.

TUCUBI, or **TACUBIS**, in *Ancient Geography*, a town of Spain, in Lusitania.

TUCUMAN, or **TACMA**, now called the *Intendancy of Salta*, in *Geography*, a province of South America, in the viceroyalty of Buenos Ayres, extending from 26° to 33° W. long., and from $22^{\circ} 30'$ to 30° S. lat.; bounded on the N. by Chicas and Tarija, on the E. by Chaco and Yapitzlaga, on the S. by Cordova, and on the W. by the Andes, which separate it from Chili. This province is now divided into those of Salta and Cordova. Estalla says that the province of Tucuman was the largest in America, extending from the corner called La Guardia to the river of Quiaca, 380 leagues; of which 314 are fertile lands with carriage-roads, and the remaining 66 barren country with horse-paths. As far as Jujuy the temperature is benign, inclining to the warm and humid, and travellers find much convenience and abundance of provisions. The territory of Tucuman is rich and well cultivated, especially towards Chili, with some desert cantons upon the Magellanic side. The soil is sandy, and almost without stones, but very well watered, producing plenty of cotton, wild cochineal, wax, honey, pastel for dyeing, and a variety of fruits, with roots, Indian wheat, &c. They likewise breed here vast numbers of cattle, and have plenty of deer, and other game, with lions and tygers in their woods. The sheep here are very large and strong, but their wool is fine, and the inhabitants use them also for carriage. The natives were formerly naked, but since somewhat civilized by the Spaniards, and covered with their woollen and cotton manu-

factures; they live in small villages very close to one another. Its two principal rivers are the Dolce and Salado, *i. e.* the sweet and salt ones, besides innumerable smaller streams. In this province a kind of large crow is hunted, and an animal between a hare and rabbit. Here are said to be twelve kinds of bees, all producing honey of different qualities. The chief drink is called "Aloja," but Estalla does not mention its ingredients, but it is the *chica* made of maize. Throughout the province there is, as he says, no person so poor that he does not kill a cow or a heifer every day for the support of his family.

In the jurisdiction of San Miguel de Tucuman (see *St. MIGUEL*) is found the tree called "Quebracho," a name derived from its extreme hardness, which breaks the axe; the outer part being white and the centre red, and the latter, after being steeped in water, becoming hard and heavy like stone. In the same province are found spiders, which weave a thread of great strength and beauty. About a league to the south of San Miguel is the salt river called Sali. This town is remarkable for the manufacture of a kind of cars, used in transporting articles of commerce. The city of Salta (see *SALTA*) is crowded with merchants in February and March, though in the rainy season the roads are scarcely passable: the surrounding vale of Lerma produces excellent wheat, and abundant pasturage, but the poor are tormented with a kind of leprosy. The graziers, who deal in mules, and the merchants, chiefly Gallicians, are robust, and the women are remarkable for their beautiful complexions and flowing hair; yet the sex, after twenty-five years of age, is subject to a swelling in the throat, called "Coto," producing an effect very strange and ridiculous, and which is carefully concealed with neckcloths, but attended with no disease or abbreviation of life. This deformity seems to belong to the goitre, a disorder formerly believed to be restricted to the mountains; but as Salta is situated in a valley, it is probably produced by the water or the fogs.

TUCUMANITA, a town of South America, in the province of Tucuman; 10 miles W. of St. Miguel de Tucuman.

TUCUYO. See *Tocuyo*.

TUCUYO, or *Tocuyo*, a river of Venezuela, which runs into the sea, N. lat. $10^{\circ} 38'$. W. long. $69^{\circ} 22'$.

TUDDER, a town of France, in the department of the Roer; 11 miles S. of Ruremond.

TUDDINGTON. See *TODDINGTON*.

TUDELA, a town of South America, in the kingdom of New Granada.—Also, a town of Spain, in the province of Leon; 5 miles E. of Valladolid.—Also, a town of Spain, in Navarre, on the Ebro; taken from the Moors in 1118; 4 miles S. of Pamplona. N. lat. $42^{\circ} 11'$. W. long. $1^{\circ} 40'$.

TUDER, **TODI**, in *Ancient Geography*, a town of Italy, in Umbria, to the S.W., among the mountains. From being a small place it became a Roman colony.

TUDERGA, in *Geography*, a town of Asiatic Turkey, in Natolia; 32 miles N.N.E. of Eski-Shehr.

TUDES, in *Ancient Geography*, a town of Spain, on the route from Bracara to Asturica, between Lúmia and Burbida. Anton. Itin.

TUDWAY, **DR. THOMAS**, in *Biography*, an ecclesiastical composer, educated under Dr. Blow, at the same time as Turner and Purcell. He was one of the second set of children of the chapel-royal after the Restoration. Soon after quitting the chapel-royal, he was received into the choir at Windsor as a tenor singer. Tudway, like his fellow-disciples, endeavoured to distinguish himself early as a composer, and has inserted into the Collection of Church Music which he transcribed for lord Harley, an anthem of

his own composition, in 1675, when he was only nineteen, with six more of his early productions for the church, of which the counterpoint is but ordinary and clumsy. The words are likewise often inaccurately accented: he throws the accent of the word *triumph* upon the second syllable, like Handel; which, though but slight, is, indeed, the only resemblance between them.

In 1681, at twenty-five years of age, he was admitted to the degree of bachelor of music at Cambridge. And in 1705, upon her majesty queen Anne visiting that university, he composed an anthem, "Thou, O God, hast heard my vows," which he performed as an exercise for a doctor's degree; and, after receiving that academical honour, he was appointed public professor of music in that university.

Dr. Tudway composed an anthem, "Is it true that God will dwell with men upon the earth?" on occasion of queen Anne going to St. George's chapel, at Windsor, for the first time; and for this, and other occasional compositions, was permitted to style himself organist and composer extraordinary to that princefs.

In the latter part of his life Dr. Tudway resided much in London, and was patronized by the Oxford family. The valuable scores of English church music, in six thick volumes quarto, which are now in the British Museum, N^o 7337, were transcribed by himself at this time.

It is said that he used to meet Prior, sir James Thornhill, Christian the engraver, Bridgman the gardener, and other eminent artists, at lord Oxford's, once a week; and that sir James drew all their portraits with a pencil, among which is Tudway playing upon the harpsichord. Prior wrote sportive verses under these drawings, which were in the possession of Mr. West, the late president of the Royal Society.

Dr. Tudway's picture is in the music-school at Oxford: at Cambridge he was longer remembered as an inveterate punster, than a great musician.

In the time of the duke of Somerset's chancellorship at Cambridge, during the discontents of several members of that university at the rigour of his government and paucity of his patronage, Tudway, himself a malcontent, and joining in the clamour, said, "the chancellor rides us all, *without a bit in our mouths.*" Nor did the wicked sin of punning quit him even in sickness; for having been dangerously ill of a quinsy, and unable, for some time, to swallow either food or medicines; the physician who attended him, after long debates and difficulties, at length turning to Mrs. Tudway says, "Courage, madam! the doctor will get up May-hill yet, he has been able to swallow some nourishment:" the doctor cries out, "Don't mind him, my dear, one *swallow* makes no summer."

In the Annals of Queen Anne's reign, 1706, vol. v. p. 333. the following relation of Tudway's disgrace at Cambridge is unaccountable, and mentioned no where that we know of but in these Annals by Boyer, printed in 1707.

"About the latter end of July, the vice-chancellor of the university of Cambridge, having received information that Mr. Tudway had spoken words highly reflecting on her majesty, he convened the heads of houses at the regent's, where Mr. Tudway was cited to appear, which he did, and the words being positively proved upon oath, they all unanimously found him guilty, and proceeded to sentence, which was solemnly pronounced in the presence of the heads, and entered as an act by the public register, as follows: 'That Mr. Tudway be suspended of all degrees taken and to be taken; that he be deprived of his organist's place in St. Mary's church, and of his professorship of music in the university.'

"Mr. Tudway being of King's college, the provost deprived him of that place in the college, and the register there likewise entered his deprivation; and the butler and pantler took his name off the tables in their offices. The master of Pembroke-hall, where he was also organist, in like manner deprived him of that office, and the register there entered it accordingly, so that he was deprived of all he held in the university of Cambridge."

We thought it probable that this sudden paroxysm of disloyalty may have been brought on by the dismissal of his patron Mr. Harley; but that did not happen till a year after. In the account which Tudway gives of himself in his prefaces to the Collection of Choral Music which he made for lord Harley, he speaks with the greatest reverence of the queen, assumes the title of her majesty's composer extraordinary, and speaks of anthems which he composed expressly for her chapels-royal at St. James's and at Windsor. It was perhaps only for the sake of an irresistible pun which offered itself in conversation, that he twisted some sentence or expression into treason, or at least into disrespect; for he recovered all his places, had the degree of doctor in music conferred upon him when queen Anne visited Cambridge, and lived and died music-professor in that university.

TUE IRON, are cones of cast-iron with an aperture to receive the nozzle of smiths' bellows, to prevent the heat of the fire injuring them.

TUECH, in *Geography*, a town of France, in the department of the Ardèche; 18 miles N.W. of Viviers.

TUEL, among *Sportsmen*, denotes the fundament of a horse, or wild beat.

TUELCAR, in *Geography*, a town of Hindoostan; 20 miles N.E. of Travancore.

TUELCOS, savages in the southern part of the American continent, or Terra del Fuego, residing on the Rio Negro or Colachel, N. of the Moluches or Tehuels. (See PATAGONIA.) The Tuelcos are a numerous tribe. They are divided into horse and foot, and are dreaded by the Indians of the Pampas, who amount to five or six thousand souls, with about one thousand warriors; and they often join in attacks on the frontier. Their attachment to war is such, that in case there be no foreign enemy, one *aduar* or village of tents will make war against another. Their lances are generally of strong wild reeds, and they are so dangerous on horseback, that the Spanish fusileers cannot sometimes stand the charge. The head is large and makes a terrible wound, by which, as they express it, they may see through their enemies. In these rencounters the Spanish cavalry prefer the spear, sabre, and pistols, the carbine and cartouch-box being of little avail. The *bola* or bowl is of stone or metal, about the size of those used in billiards; this is fixed to a string about a yard long, and at the extremity, by which it is held, there are some feathers of the American ostrich or cassowary. This string is turned round the head like a sling, and with it they can strike with certainty at a sufficient distance. The bolas or bowls have been adopted by the Spanish soldiery; being two globes of stone or hard wood fastened at the ends of a string, and serving not only to enthrall the wild horses and cattle, but also to annoy their enemies. Poniards, sabres, and cutlasses are more usual among these savages than the bow or the sling. During war they are all cavalry; and they chuse for their general the most robust and valiant of their chiefs. They paint their bodies, particularly the face and hands, with black and red, not only to inspire terror, but to serve as a mark, that they may not be singled out by the enemy. The tents or hovels of all the tribes of savages are similar, being composed of hides of horses, beeves, or other animals, and arranged in streets.

The

The tent of the cazique is distinguished by painting and superior arrangement. The common food is the ostrich and cassowary, and a kind of armadillo; but their chief regale is the flesh of the mare or foal. In case of urgent thirst, they will drink warm blood, which they draw from their horses. The want of food is supplied with bones, grease, and dry dung. The use of clay is universal, in making various sorts of earthenware. They eat salt with their meat roasted or boiled, and are no strangers to some preparations of milk. The Serranos or mountaineers make a paste of carobs, of which they form their bread in loaves, called *pateis*. In Tuelca, and in other southern parts, the guanaco abounds, the flesh of which, with that of a kind of hare, forms the chief food of the Tehuels or Patagonians. But the flesh is eaten half raw. The dress of both sexes is a mantle, extending to the mid-leg, with an opening for the arms, and girt with a leathern belt. On horseback, the skirts are drawn together so as to form loose breeches. These clothes are sometimes made of wool, but they prefer the skins of the guanaco, lion, and tiger; and the Patagonians use those of seals. With the feathers of the ostrich they make fans, and ornaments for bridles, staining them of various colours. These articles they exchange for tobacco, brandy, and the tea of Paraguay, which with them are articles of luxury. Hard-ware and also coarse woollen are much esteemed. The brandy they exhaust at once, making no reserve. The herb of Paraguay, after having served once, is dried, again used, and finally eaten. The tobacco is smoked in a wooden pipe. The caziques or captains have several wives, but monogamy generally prevails. Jealousy is little known, and a payment in kind is the usual penalty for adultery. Homicides and duels are frequent, and these latter open conflicts are deemed honourable; but treason and assassination are capital crimes, and the guilty are put to death with lances or wooden clubs, nor are there any churches to protect murderers. Although all are thieves, they will make war on a tribe that protects robbers. In every tented village, there is a person revered as a forcerer and physician. In the night they have no light but that of fire, which they procure by friction of hard wood. Their conflicts are so violent, that few are seen without marks of deep wounds. The desire of revenge passes from one generation to another. They celebrate their victories with dancing, singing and drinking; painting and adorning themselves for such occasions. Their number has been greatly reduced by the small-pox. They appear to have no religion; but contemplate with reverence the sun, which they call "Antu," and the moon "Quien." The only ceremony that has any aspect of religion is, when they kill a beeve, their sprinkling some of the blood on the ground, with the formulary, "Give me to eat, me, and my people." They think that the moon confers strength and valour; and when the new moon appears, they present their infants, and say "make them strong." They also pray to Quien for courage and strength to avenge injuries, and destroy their enemies. Ineffectual attempts have been made by popish missionaries for their conversion. The missionaries were slain and the few Christians dispersed. Such is Eitalla's account of these savages.

TUELLA, LA, a town of France, in the department of the Dora; 16 miles W. of Aosta.

TVER, a town of Russia, and capital of a government, at the conflux of the Tvertza and Volga. It is the see of an archbishop, and, according to Busching, contains seventy churches and convents. Tver, from a small fortress, became a town, and increased in population and wealth to so great a degree, as to become the metropolis of an independ-

ent sovereignty, called from the town the duchy of Tver. Tver is divided into the Old and New Town; the former, situated on the opposite side of the Volga, consists almost entirely of wooden cottages; the latter was, a few buildings excepted, burned down in the year 1763. The empress was no sooner informed of this calamity, than she ordered a regular and beautiful plan of a new town to be sketched by an eminent architect; and enjoined that all the houses should be reconstructed in conformity to this new model. She raised, at her own expence, the governor's house, the bishop's palace, the courts of justice, the new exchange, the prison, and several other public edifices; and offered to every person who would engage to build a house with brick, a loan of 300*l.* for twelve years without interest. The money advanced by her majesty upon this occasion amounted to 60,000*l.* and she afterwards remitted one-third of this sum. The streets, which are broad and long, issue in a straight line from a square, or rather an octagon, in the centre: the houses of this octagon, and of the principal streets, are of brick stuccoed white, and form a very magnificent appearance. There is an ecclesiastical seminary at Tver, which is under the inspection of the bishop, and admits 600 students. In 1776, the empress founded a school for the instruction of 200 burghers' children; they are taught to read, write, and cast accounts, and a few of them are trained to handicraft trades. In June 1779, an academy was also opened in this town for the education of the young nobility of the province, at the charge of the same imperial patroness. It admits 120 students, who are instructed in foreign languages, arithmetic, geography, fortification, tactics, natural philosophy, music, riding, dancing, &c. Tver is a place of considerable commerce, which it owes principally to its advantageous situation, being near the conflux of the two rivers, along which are conveyed all the goods and merchandize sent by water from Siberia, and the southern provinces towards Petersburgh. Pallas speaks of the delicious sherbet, with which travellers are regaled at all seasons of the year; 72 miles N.N.W. of Moscow. N. lat. 56° 50'. E. long. 36° 14'.

TVERSKOE, a government of Russia, bounded on the N. by Novgorodskoe, on the E. by the government of Jaroslavl and Vladimir, on the S. by Moskovikaia and Smolenskoe, and on the W. by Pskovskoe; about 180 miles long, and 100 broad. This part of Russia produces abundance of wheat, barley, rye, oats, buck-wheat, hemp, flax, and all kinds of vegetables. In the forests are to be found oaks, birches, alders, poplars, ashes, pines, &c. At some distance there are elks, bears, wolves, foxes, wild goats, martens, ermines, squirrels, and marmots. There is also plenty of eagles, hawks, cranes, herons, swans, and all kinds of small game. N. lat. 55° 36' to 58° 30'. E. long. 33° to 38°.

TVERTZA, a river of Russia, which runs into the Volga, at Tver.

TUERYE, a town of France, in the department of Mont Blanc; 4 miles E. of Chambéry.

TUESAH, a town of Hindoostan, in Berar; 21 miles E. of Ellichpour.

TUESDAY. See *Hoke-Day*, *TUISCO*, *TYR*, and *WEEK*.

TUESDAY Bay, in *Geography*, a bay on the coast of Terra del Fuego, in the Straits of Magellan. S. lat. 52° 55'.

TUESIS, in *Ancient Geography*, a town of the isle of Albion, belonging to the Vocomagii, according to Ptolemy.

TUFA, in *Mineralogy and Geology*, a stone formed by depositions from springs or rivulets containing much earthy

matter in solution, or mechanically suspended. Tufa is also formed by the concretion of loose volcanic dust or cinders cemented by water: and also by the consolidation of mud thrown out of volcanoes. The disintegration and subsequent consolidation of basaltic rocks forms a third kind of tufa, which the German geologists call *trap-tuff*.

Calcareous tufa is formed in large quantities in many lime-stone districts. The waters which issue from calcareous rocks rise to the surface impregnated with a considerable quantity of carbonate of lime. On exposure to the air and light, they deposit their contents on whatever substance is presented to them, and in the beds of rivulets form solid incrustations, sometimes of great extent, and many yards in thickness. The stone thus deposited is always more or less porous or vesicular, and contains portions of plants and fresh-water shells which it has enveloped. This stone hardens by exposure to the air, and is frequently employed in architecture. It is not a little remarkable, that St. Peter's church, and some of the grandest works of ancient and modern architecture at Rome, are formed of a species of calcareous tufa, called by the Italians *travertino*. In the vicinity of Stroudwater, in Gloucestershire, many of the springs that issue from the feet of the Cotswold hills make large depositions of calcareous tufa. At one situation, called the Rock-mill, a bed of this stone, more than thirty feet in thickness, has been worked formerly for building, as appears from some of the oldest edifices in the neighbourhood, which proves the hardness and durability of this stone. In Derbyshire, and all the calcareous districts in England, beds of tufa are formed by similar depositions. Beds of tufa are very common among the mountains which terminate the high vallies of the Alps, and there are promontories of calcareous tufa in the vallies of Switzerland. It was generally supposed that the particles of lime-stone were held in solution by carbonic acid in the water, and that the evaporation of this acid, after exposure to the air, occasioned the deposition of the calcareous particles. Dr. Kidd, of Oxford, has made some experiments on the solvent power of simple water on carbonate of lime, which he finds to be much greater than was generally supposed. If, says he, half an ounce of distilled water be agitated for a short time in contact with pulverized carbonate of lime, it will be found, on the addition of oxalate of ammonia, that the water will be rendered turbid. It appears, therefore, that when a spring, charged with as much calcareous matter as it is capable of holding in solution, has issued from beneath the earth, the requisite quantity has been diminished by evaporation, the particles of calcareous matter are liberated and deposited.

Calcareous tufa forms so rapidly in some situations, as entirely to close up the passage in canals and aqueducts through which calcareous waters flow. Many hot springs deposit tufa in abundance: the heat appears to assist the solvent power of water, and to accelerate the precipitation of its contents by a more rapid evaporation from the surface.

The travertine, or travertino, is the most remarkable of all the calcareous tufas, as it has been employed for the construction of some of the proudest monuments of architectural genius in ancient and modern times. Of this stone, Breislak, an Italian mineralogist, gives the following interesting description.

"The Anio, or Tiverone, which descends from the Apennines of Viscovaro and Subiaco to the east of Rome, crosses Tivoli before reaching the plain where it unites with the Tiber. All the land through which the Anio passes in Tivoli, whether near the great cascade or the smaller ones, is filled with masses of a calcareous stone, produced by the de-

position of its waters. Sometimes a piece of rush or reed, or other vegetable matter, is the first point to which the calcareous earth begins to attach itself. It generally deposits in concentric layers, and has the hardness and fibrous tissue of alabastrer. These layers are nevertheless separated by a bed of calcareous earth, friable, yellowish, and very fine. At the foot of the mountain of Tivoli, where the Anio enters the plain which extends to Rome, are the quarries of travertine. This calcareous rock is deposited in horizontal beds: its colour is yellowish-white, its grain earthy, fracture uneven, and its hardness far surpasses that of those calcareous masses produced by the Anio in the neighbourhood of Tivoli. Cavities, where the calcareous substance has assumed a sparry grain and stalaclitic form, are common in travertine. Sometimes these cavities have been since filled by a calcareous stalaclite, whiter, of a finer grain, and harder. This is the origin of those white spots, the regularity of which has caused them to be mistaken for marine bodies enveloped in its paste. Travertine contains no remains of marine substances, but sometimes it affords fragments of vegetables. It is not doubted but travertine owes its origin to the depositions of the Anio; depositions which in the plain may have formed a more solid and compact rock: because its current was less rapid, and perhaps its waters more stagnant in several places. Not far from the quarry of travertine is the Solfatara, so called on account of the great heat of its waters, which abound in sulphuric hydrogen gas, and form a considerable sediment of calcareous matter. A cardinal d'Este caused the canal to be dug which conveys the waters of the lake to the Anio. The calcareous depositions are there so abundant, that if every three years it was not cleaned out, it would be closed up, notwithstanding its depth and breadth. The water which runs in the canal, on meeting with the bits of rush or other bodies, covers them with a white calcareous crust, two or three lines in thickness. These incrustations are known by the name of *confits of Tivoli*. Before this passage was opened, the overflowings to which the lake is subject were often so considerable, that the water spread over the neighbouring grounds, and formed on their surface a stony crust. The waters of the lake so charged with calcareous earth, uniting with those of the Anio in the floods which their union must produce, have themselves contributed to the formation of travertine. I do not think that the Anio alone would have been capable of forming the quantity which is found in that rock.

"Independent of the immense quarries worked by the ancients, there are besides others of such vast extent, that they may supply the demands of many ages. The lake of Solfatara seems to have greatly assisted in the formation of this rock. Its water being charged with gaz, explains the great number of hollows which travertine presents. It proves, that when the rock hardened, a gaz has at the same time escaped in several places, which has prevented the approximation of its parts, which were still soft. As often as the interior of a mass of rocks presents cavities without any indication of foreign substances which might have opposed the union of its parts, I conceive their origin may be attributed to the escape of gaz at the moment when the substance was passing from a state of softness to solidity, by cooling or drying. From what I have just shewn, it follows that the travertine or rock of Tiber or of Tivoli is a carbonate of lime, formed by the depositions of the Anio and the Solfatara of Tivoli. The Roman artists give the name of travertine only to the stone taken from the quarry situated at the foot of the mountain of Tivoli. The lithologists, less slaves

to locality, bestow it on all calcareous rocks which possess the grain, tissue, and formation analogous to that of the travertine of Tivoli. If the ancient and modern Romans have employed this stone in the most noble structures, they have but followed the examples of other people before them. The temples of Pæstum, the most ancient monuments that are known after the pyramids of Egypt, were built with a travertine formed by the deposition of waters which still exist in that district. This stone, when long exposed to the air, acquires a considerable degree of hardness; its colour assumes a reddish tinge pleasing to the eye, and which in no small degree contributes to bestow on monuments of antiquity that majestic character which is so striking. Buch justly observes, that the temples of ancient, and the churches and palaces of modern Rome, would infinitely have lost of their grandeur and majesty, if the bold genius which erected them had not met with such a material as travertine. They would have lost much of their solidity, if the formation of tufa had not given rise to the discovery of puzzolana. The chance which collects in its vicinity the materials most fit for architecture, travertine and puzzolana, was not a little happy for Rome. The mortar or cement which results from a mixture in just proportion of that ferruginous volcanic earth with lime, so much surpasses in hardness all other known cements, that the exportation of puzzolana by the Tiber and the port of Ostia is become a branch of trade."

According to Ulloa, there are fountains of hot water at Guaniavelica, in South America, which form abundant beds of stone in a very short time, of sufficient hardness to be used for building-stone. Probably these springs contain siliceous as well as calcareous earth, siliceous having been found in the waters of most of the hot springs that have had their waters analysed. Siliceous tufa is deposited from the boiling springs in Iceland and the Azores, consisting almost entirely of pure siliceous.

Basaltic tufa consists of fragments of the various kinds of rocks denominated trap, cemented by a loose argillaceous basis formed from decomposed basalt. Sand-stone fragments, and even pieces of wood, sometimes occur in basaltic tufa. The masses of stone in this species of tufa are from the size of a pea to several hundred weight. The larger fragments generally occupy the lower part of the bed. Sometimes beds of coarse and fine tufa alternate with each other, and sometimes they alternate with basalt. The position of the beds is generally horizontal, their thickness varying from a few inches to several fathoms. A considerable portion of Arthur's seat near Edinburgh is composed of this rock. It occurs also in various basaltic districts.

Volcanic tufa is formed by the earthy powder, improperly called ashes, which is thrown out of volcanoes, and subsequently consolidated by the agency of water. It is intermixed with fragments of lava and scoria, lime-stone, pumice, and other rocks. The colour is brown or red, and sometimes spotted. Volcanic tufa is found of different degrees of compactness and hardness; sometimes it forms a durable but light stone, suited for architectural uses.

Beds of volcanic tufa alternate with basalt and lava in Iceland, and according to the account of sir G. Mackenzie, hills of volcanic tufa occur in that country one thousand feet in height. It also constitutes beds of great magnitude in some of the mountains. Lava and beds of tufa, he observes, constantly accompany each other in every part of the island. The mud which issues during volcanic eruptions in South America, forms beds of great extent, which become hard by exposure to the air, and form a species of tufa. See VOLCANO.

TUFAN, in *Geography*. See SIFAN.

TUFARA, a town of Naples, in the province of Capitanata; 5 miles W. of Volturna.

TUFECSEI, a body of the spahis, or horse, in the service of the grand signor.

TUFFE', in *Geography*, a town of France, in the department of the Sarthe; 7 miles S.W. of La Ferté Bernard.

TUFFEN, a town of Switzerland, in the canton of Zurich; 13 miles N. of Zurich.

TUFFENBACH, a town of the duchy of Stiria; 9 miles S. of Judenburg.

TUFFO, in *Botany*, a name given by the people of Guinea to a plant common in that country, and used in decoction to wash sore eyes with. It is of the sun-flower kind, and is called by Petiver, *flos solis Guineensis folio scabra flore minore*. It much resembles some of the American sun-flowers. Phil. Trans. N^o 232.

TUFFOIA, in *Geography*, a town of Africa, on the Slave Coast; 40 miles W. of Assom.

TUFFOONS, in *Meteorology*. See TONQUIN.

TUFT, in *Botany and Vegetable Physiology*, technically implies a head of flowers, *capitulum*, of which each individual is not sessile, but elevated on either a simple or subdivided partial stalk, though all together composing a dense roundish mass. Perhaps tuft would be better retained in English as synonymous to *fasciculus*, in which sense it is often practically used, for any small number of flowers, on short aggregate or subdivided stalks, springing from the bosoms of leaves, or the divisions of a panicle or corymb. In like manner this term is applied, with more laxity, to little bundles of leaves, hairs, &c. on different occasions.

TUFTED DUCK, in *Ornithology*. See *Tufted Duck*, or FULIGULA under DUCK.

TUFTED Vetch, in *Agriculture*, a term commonly applied to a perennial sort of this plant, which is highly deserving of cultivation by the farmer, for either meadow or pasture land. It is frequently found mixed with the other grasses, in rather moist ground. See VETCH, and VICIA *Cracca*.

TUFTONBOROUGH, in *Geography*, a town of New Hampshire, on the north side of Winipiscogee lake; 32 miles N. Concord.

TUG, BAVIN, in *Agriculture*, a sort of carriage used in some districts for loading bavins or faggots, and sometimes other kinds of field produce. It is so made as to be capable of carrying a hundred and fifty faggots, each four feet in length, and three feet in girth, without being over top-heavy, so as to be liable to turn over in bad roads. It is much used in the weald of Kent, and some other counties.

TUGELOO, in *Geography*, a town of the state of Georgia; 95 miles N.W. of Augusta. N. lat. 34° 36'. W. long. 83° 21'.—Also, a river of the state of Georgia, one of the branches of the river Savanna, which joins the Keowee; 28 miles N.W. of Petersburg.

TUGGA, a town of Tunis; 20 miles S.W. of Cairean.

TUGGALA, or TEGLA, a town of Africa, in Kordofan; 150 miles W.S.W. of Sennaar.

TUGGEN, a town of Switzerland, in the canton of Glarus; 5 miles S.W. of Uznach.

TUGGURT, a town of Africa, in the kingdom of Tunis; 60 miles S.W. of Tunis.—Also, a town of Africa, in Nigritia, capital of a district called Wadrag; 360 miles N.E. of Tombuctoo. N. lat. 20° 30'. E. long. 6°.

TUGGURT, or **TOCORT**, a town of Algiers. It was formerly under the protection of the Turks, and paid a trifling acknowledgment. The inhabitants being disgusted with the conduct of their masters, revolted; but were reduced to obedience, the town taken, and great numbers of them put to the sword; 240 miles S.S.E. of Algiers. N. lat. $32^{\circ} 40'$. E. long. $5^{\circ} 50'$.

TUGIA, in *Ancient Geography*, a town of Spain, upon the route from Castulo to Malaca, between Castulo and Traxinum. Anton. Itin.

TUGMA, a town of India, on the other side of the Ganges and near it, with the title of Metropolis, according to Ptolemy.

TUGPINS, in *Artillery*, are the iron pins which pass through the fore-ends of the shafts of the army carts, to fasten the draught chains for the fore-horses.

TUGUESA, in *Geography*, a town of South America, in the province of Darien; 20 miles N.E. of St. Maria.

TUGULIAN, a town of Russia, near the straits which separate the continent of Asia from America. N. lat. $65^{\circ} 54'$. E. long. $189^{\circ} 14'$.

TUGUS, in *Botany*, the name of a sweet aromatic plant, growing up sometimes to eight or nine cubits, much esteemed in the eastern parts of the world, and supposed by father Camelli, who very strictly compared it with the accounts given by Dioscorides and the ancients of their amomum, to be that very plant. The clustered manner of growing of the fruit, together with its oblong shape, and the aromatic taste of the seeds, seem greatly to countenance this opinion.

Each fruit of the tugus contains five or seven seeds; these are of an oblong figure, of a reddish colour, and of an agreeable aromatic taste, but not too acrid. They are much sought after by birds, insects, and field-mice.

The natives seem as fond of these as the ancients were of the amomum; and the young women string them on threads, and wear them as bracelets; sometimes they make the bracelets of the seeds alone; but more usually they string them alternately with pearls, and pieces of red coral: these bracelets they call *caropi*, as well as the fruit itself.

They are supposed, when worn by way of necklace, to keep off the effects of a bad air, and to preserve them from the bites of serpents, or the centipes. If not a preservative, they are, however, found, upon experience, to be a very good remedy in the last case, the common application for the bite of this animal being some of the seeds of the tugus chewed in the mouth to a sort of paste.

The cluster of fruit of the tugus, or true amomum, when newly formed and unripe, somewhat resembles the pseudo-amomum of Garcias; but this likewise wears off as they ripen. For Camelli's accurate description of this plant, illustrated by a figure, see Phil. Transf. N^o 248. p. 2.

TUGUZAK, in *Geography*, a river of Russia, which runs into the Uvelka, 12 miles E. of Troitz, in the government of Upha.

TUGWELL PLOUGH, in *Agriculture*, a light, easy-going, well-contrived implement of this kind, invented by a person of that name. It performs the work well, but not deeply, consequently is improper for weeding lands. It is sometimes termed the Gloucester plough. See **PLOUGH**.

TUHERE', in *Geography*, a town of Brazil; 45 miles E. of Paru.

TUHLOIS, a town of Sweden, in Tavastland; 15 miles N.E. of Tavasthus.

TUI, a river of South America, which runs into the Caribbean sea, N. lat. $10^{\circ} 36'$. W. long. $67^{\circ} 20'$.

TUI, in *Ornithology*, a name by which some call the parrot. See **PSITTACUS**.

The word is originally Brazilian; and the names of several of the Brazilian species of this bird, described by Marcgrave, have the word *tui* as a part of them; as the *tuiete*, the *tuipara*, the *tuitirica*, and the *tuiaputejuba*. See **TUIETE**, &c.

TUIAPUTEJUBA, the name of a Brazilian species of parrot, all over of a green colour, but in different shades, very deep on the wings, very pale, and somewhat yellowish on the belly, and of a faint colour all over the rest of the body; its tail is very long; it is about the size of a swallow; its eyes are large and black, and have a circle of yellowish-green feathers round them, and over the beak, which is black and crooked; and on his head he has one spot of gold-yellow feathers. See **PSITTACUS Pertinax**.

TUICEA, in *Geography*. See **PIROM**.

TUIETE, in *Ornithology*, the name of a Brazilian species of parrot, of the size of a lark, and all over of a pale green colour, variegated with blue; the origin of its wings is blue, as are also the ends of the wing-feathers, so that when the bird sits still, there is, as it were, a blue line seen running down each side; on its rump there is also a blue spot; its tail is but short; its beak is small, crooked, and of a pale red; and its legs and feet grey. See **PSITTACUS Passerinus**.

TUILERIE, or **TYLERY**, French; formed from *tuile*, *tile*, a *tile-work*; a large building, with a drying-place, covered at top, but furnished with apertures on all sides, through which the wind having admittance, dries the tiles, bricks, &c. which the sun would crack, before they be put in the kiln.

The garden of the Louvre is called the Tuileries, as being a place where tiles were anciently made, &c. But the term Tuileries does not only include the garden, but also a magnificent palace, whose front takes up the whole length of the garden.

The palace of the Tuileries is joined to the Louvre by a large gallery, which runs along the banks of the river Seine, and has its prospects on it.

The Tuileries was begun in 1564, by Catherine de Medicis, wife of Henry II., in the time of her regency; it was finished by Henry IV. and magnificently adorned by Louis XIV. The garden of the Tuileries was much improved by Louis XIII.

TUIPARA. See **TAIPARA**, and **PSITTACUS Tuipara**.

TUIROBIUS, in *Ancient Geography*, a river of Albion, on the western side, which lies along the Irish and Vergivian seas: universally agreed to be the river Tyvi.

TUIS, in *Geography*, a town of Italy, in Friuli; 10 miles W. of Udina.

TUISCO, or **TUISTON**, in *Mythology*, a name given by the ancient Germans to a celebrated person, whom they regarded, by the descendants of his son Man or Mannus, as the founder of their nation, and whom they represented to be the son of the earth, because they were ignorant of his origin. He gave them laws, polished them, established religious ceremonies among them, and obtained such a high degree of reputation, that after his death they ranked him among the gods. One of the principal ceremonies of his worship consisted in singing songs in praise of him. These songs, according to Tacitus, were very ancient: "Celebrant," says he speaking of the Germans, "carminibus antiquis Tuistonem Deum, terra editum, et filium Mannum, originem

tem gentis conditoresque." Cæsar thought that Pluto was honoured under this appellation. Accordingly he says (De Bell. Gall. l. 6.) "the Druids report that the Gauls are come from Dis or Pluto, who after his death was worshipped by both nations as their father and founder, by the Gauls under the name of Pluto, and by the Germans under that of Tuiflon, and both of them erected statues to him in the woods."

Some have ascribed the origin of the name Tuesday to this deity. See WEEK.

TUITIRICA, in *Ornithology*, the name of a Brazilian parroquet, which is a little larger than the common kind; all over of a fine beautiful green, but deeper on the back and wings than elsewhere; its beak is very hooked, and of a pale red; its eyes black, and its feet blue; its tail is but a little longer than the wings when closed. This is a species much esteemed in the Brasils, as it easily learns to talk, and becomes so tame as to eat out of any one's mouth. See PSITTACUS *Tirica*.

TUK, in *Geography*, a town of Charasm; 18 miles N. of Urghez.—Also, a town of Egypt, on the left bank of the Nile; 6 miles N. of Nekkadé.

TUK el *Ejfrat*, a town of Egypt; 5 miles N. of Girgé.

TUKERA, a town of Hindoostan, in Oude; 14 miles N. of Lucknow.

TUKKIKARI, a town on the east side of the gulf of Bothnia. N. lat. $65^{\circ} 26'$. E. long. $25^{\circ} 12'$.

TUKLAKTAK, an island in the North sea, near the coast of East Greenland. N. lat. 61° . W. long. $46^{\circ} 20'$.

TUKOOR, a town of Abyssinia; 20 miles W. of Tcherkin.

TUKURN, a town of the duchy of Courland; 32 miles E.S.E. of Goldingen.

TUL, a town of Grand Bucharia; 36 miles S.E. of Anderab.

TULA, a city of Russia, and capital of a government, on the Upha. According to Busching, it contains 144 churches and convents. Near it are some iron mines, and in the city are manufactures of fire-arms, all sorts of cutlery and other works in polished steel, and leather. The number of merchants, including shop-keepers, is estimated at 4000, some of whom are very rich. The number of inhabitants is stated at 30,000: the population is increasing, and besides wooden buildings here are many of stone; 112 miles S. of Moscow. N. lat. $53^{\circ} 45'$. E. long. $37^{\circ} 39'$.—Also, a town of Mexico Proper; 40 miles N. of Mexico.—Also, a river of Mexico, which runs into lake Chapala, near Zamora.

TULACUM, in *Natural History*, a name given by the people of the East Indies to a species of the yellow orpiment, of the coarser kind, variegated with red. They prepare this by several calcinations, and then give it internally in fevers, and many other disorders, esteeming it a sort of panacea. They say that gold may be extracted from it, which is not improbable; for it is well known, that some of the Roman emperors did actually procure gold from one of the other kinds of orpiment, which is now found at Gosselaer in Saxony.

TULAH, in *Geography*, a town of Hindoostan, in Bengal; 31 miles E. of Dacca.

TULBAGIA, in *Botany*, so named by Linnæus in honour of the Dutch governor Tulbagh, long resident at the Cape of Good Hope, who sent numerous plants from that country to professor Burmann, and furnished Linnæus with several of its insects, particularly a fine species of *Papilio*, which is called *Tulbaghia*, being one of the tribe of

Nymphales; see Syll. Nat. ed. 12. v. 2. 775. Linn. Mant. 2. 148. Schreb. Gen. 215. Willd. Sp. Pl. v. 2. 33. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 2. 213. Juss. 54. Lamarck Illustr. t. 243. Gært. t. 16.—Class and order, *Hexandria Monogynia*. Nat. Ord. *Spathaceæ*, Linn. *Narcissi*, Juss.

Gen. Ch. corrected from the Linnæan MSS. *Cal.* Sheath of two oblong membranous valves, containing many stalked flowers. *Cor.* of one petal, inferior, valver-shaped; tube cylindrical; limb in six equal, lanceolate, acute, spreading segments, shorter than the tube. Nectary of three, distinct or combined, cloven, acute, equal, fleshy leaves, crowning the tube. *Stam.* Filaments six, very short, three in the throat of the tube, three lower down; anthers heart-shaped, acute. *Pist.* Germen superior, ovate; style cylindrical, much shorter than the tube; stigma turbinate, depressed. *Peric.* Capsule ovate, with three angles, three intermediate furrows, three cells, and three emarginate valves. *Seeds* few, oblong, obtuse, triangular, compressed, corrugated.

Efl. Ch. Corolla valver-shaped; limb in six equal segments. Nectary of three cloven scales, crowning the tube. Stamens three in the throat, three within the tube. Capsule superior, of three cells and three valves. Seeds compressed.

1. *T. alliacea*. Green and Brown Tulbagia. Linn. Suppl. 193. Willd. n. 1. Ait. n. 1. Thunb. Prodr. 60. Curt. Mag. t. 806. (*T. capensis*; Linn. Mant. 2. 223. Jacq. Hort. Vind. v. 2. 52. t. 115.)—Flowers drooping. Nectary of one leaf, in six segments, as long as the limb of the corolla.—Native of low sandy spots, near the town, at the Cape of Good Hope, flowering about July, and called by the Dutch colonists *Wilde Knoplook*, or Wild Garlic. It is said to be used for disorders of the breast, stewed in milk; but whether internally or externally, is not recorded. This species was sent to Kew by Mr. Masson, in 1774. Jacquin had it a few years earlier. *Root* tuberous, with numerous fleshy fibres. *Leaves* radical, erect, numerous, two-ranked, linear, bluntish, channelled; sheathing at the base. *Stalk* solitary, about a foot and a half or two feet high, roundish, simple, bearing a loose umbel of from ten to fifteen spreading or drooping flowers, whose partial stalks are near an inch and a half long. Each flower is rather smaller than a Harebell, oppressively sweet in an evening. *Corolla* green or slightly glaucous. *Nectary* purplish-brown. *Seeds* black. The whole plant, when ever to slightly bruised, exhales a rank smell of garlic, still perceptible in the old dried specimens of the Linnæan herbarium, whenever they are touched or moved.

2. *T. cepacea*. Purple Tulbagia. Linn. Suppl. 194, excluding the synonyms. Willd. n. 2. Ait. n. 2. Thunb. Prodr. 60.—Flowers erect. Nectary of three distinct cloven leaves, half as long as the limb of the corolla.—Native of the Cape of Good Hope, from whence it was sent by Mr. Masson to Kew garden in 1795. A smaller plant than the foregoing, with much narrower leaves. *Umbel*, in our only specimen, of seven flowers, whose corolla is purple, or crimson. Of the colour of the nectary we cannot judge, but its length is about half that of the segments of the petal.

There can scarcely be a greater example of confusion than the history of these two plants in the *Supplementum* of Linnæus, nor could it be unravelled without the original specimens. If in the character and description of the first, we read *foliis subensiformia*, instead of *sulfiliformia*, it may be intelligible. The root moreover, in one specimen, seems bulbous. All the rest answers tolerably well. In the second

second species, the *leaves* are perfectly linear; the *root* by no means fasciculate, except its fibres, being exactly like the former; to which the synonyms, even of Linnæus himself, undoubtedly belong. A figure of *T. cepacea* is much wanted. The plant is said to flower at Kew in April.

3. *T. hypoxidea*. Short-crowned Green Tulbagia.—Flowers drooping. Nectary very short and obtuse. Segments of the limb of the corolla taper-pointed.—This hitherto nondescript species flowered in March 1792, in the stove of Messrs. Lee and Kennedy, of Hammer Smith, who received the root from Holland. There can be little doubt of its having been brought to that country from the Cape of Good Hope. The *leaves* are linear and very narrow, about one-fourth the breadth of *T. alliacea*. The *inflorescence*, as well as the posture and general aspect of the *flowers*, most resemble that species. The *corolla* is green, but its segments more taper-pointed, and full as long as the tube; while the *nectary* is extremely short and blunt, rising but little above the mouth of the tube, and consisting, if we mistake not, of three undivided lobes.—Mr. Sowerby made a drawing of this species at the period above-mentioned, which, though now mislaid, may one day probably be given to the public.

TULBAGIA, in *Gardening*, contains plants of the tender, herbaceous, exotic kind, among which the species cultivated are, the alliaceous or garlic tulbagia (*T. alliacea*); and the cepaceous or onion tulbagia (*T. cepacea*).

Method of Culture.—In each of these sorts, the young plants may be increased by sowing the seeds, slipping the branches, and offsets from the roots.

The seeds should be sown while fresh in pots filled with light mould, and be plunged into a tan hot-bed any time in the autumn or spring seasons, when they will soon begin to grow. And the slips and offsets may be planted and managed in the same way. The young plants in all the cases must constantly remain in the stove, and have water occasionally given them.

Both these plants afford an agreeable diversity in stove collections.

TULBING, in *Geography*, a town of Austria; 4 miles S.S.E. of Tulln.

TULCZA, a town of European Turkey, in Bulgaria, on the south side of the Danube, opposite Ismail. In the year 1771, this town was taken by the Russians, and again in 1790.

TULCZIN, a town of Russian Poland; 12 miles S.W. of Braclaw.

TULEBRAS, a town of Spain, in Navarre, on the Queios; 7 miles from Tudela.

TULIAN, a town of South America, in the province of Cordova; 110 miles N.W. of Cordova.

TULIPA, in *Botany*, an acknowledged barbarous name, said to be of Persian origin, like the celebrated and popular flower which bears it. The Persian word from whence, with a very little alteration, this name is taken, seems to be nearly synonymous, in that language, with a turban; nor is this article of dress, in a Persian of rank, unlike the swelling form of a tulip.—Linn. Gen. 165. Schreb. 220. Willd. Sp. Pl. v. 2. 96. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 2. 248. Sm. Fl. Brit. 361. Prodr. Fl. Græc. Sibth. v. 1. 229. Juss. 48. Tourn. t. 199, 200. Lamarck Illustr. t. 244. Gært. t. 17.—Class and order, *Hexandria Monogynia*. Nat. Ord. *Coronarie*, Linn. *Lilia*, Juss.

Gen. Ch. *Cal.* none. *Cor.* bell-shaped, inferior, of six ovate-oblong, concave, erect, deciduous petals. *Stam.* Filaments six, awl-shaped, much shorter than the corolla,

taper-pointed; anthers oblong, quadrangular, erect, versatile, distant. *Pist.* Germen superior, large, oblong, bluntly triangular; style none; stigma with three prominent angles, or three divided lobes, permanent. *Peric.* Capsule triangular, somewhat elliptical, of three cells, and three ovate valves fringed towards the edges. *Seeds* very numerous, flat, semicircular, lying horizontally over each other, in a double row, with scales of the same shape (or barren seeds) between.

Eff. Ch. Corolla bell-shaped, of six petals. Style none. Capsule superior, of three cells. Seeds flat. Calyx none.

1. *T. sylvestris*. Wild Yellow Tulip. Linn. Sp. Pl. 438. Willd. n. 1. Fl. Brit. n. 1. Engl. Bot. t. 63. Fl. Dan. t. 375. Curt. Mag. t. 1202. Redout. Liliac. t. 165. (*T. bononiensis*; Ger. Em. 128.)—Flower solitary, somewhat drooping. Leaves lanceolate. Stigma triangular, abrupt, slightly three-cleft. Stamens hairy at the base. Petals acute, hairy at the tip.—Native of Sweden, England, Bohemia, Germany, Switzerland, and France, flowering in April. Root an ovate bulb, flattened at one side, prominent at the other. Stem quite simple, erect, round, smooth, twelve or eighteen inches high; leafy in the middle; tapering at the base. Leaves about three, alternate, lanceolate, acute, keeled, entire, smooth, somewhat glaucous; the uppermost linear and much the narrowest. Flower drooping, till it is fully expanded, of a fine golden yellow, sweet-scented; the three outermost petals greenish at the back; all of them elliptical, acute at each end, and tipped with a little white wool at the summit; three innermost fringed with similar wool at the base. Stamens yellow; their filaments densely woolly at the bottom; anthers linear-oblong. Germen pale yellow or greenish, crowned with a triangular, abrupt, not dilated stigma, gradually splitting into three small notches, slightly downy at the top. The Early Yellow Tulip of the gardens, which is figured in the plates of Redouté and Curt. Mag. cited above, can hardly be distinguished from our wild kind, except being larger, with a rather more decidedly three-lobed woolly stigma. Our Bohemian wild specimens are intermediate between the two.

2. *T. Celsiana*. Small Yellow Tulip. Redout. Liliac. t. 38. Ait. Epit. 375. Curt. Mag. t. 717, erroneously named there *Melanthium uniflorum*. (*T. biflora*; Donn. Caut. ed. 5. 75? *T. perfoliata minima*; Rudb. Elyf. v. 2. 112. f. 8.)—Flower mostly solitary, erect. Leaves lanceolate. Stigma triangular, with three short, rounded, downy lobes. Stamens slightly hairy above their base. Petals smooth at the tip.—Native of the south of Europe, and of the banks of the Wolga. We have known this species for above twenty-five years in Chelsea garden, where it was cultivated by the late Mr. Fairbairn, in pots, amongst alpine plants, protected by a frame in winter, and flowered about May. So little was it understood, that the able writer on this tribe of plants in Curtis's Magazine originally mistook this Tulip for *Melanthium uniflorum*; an error corrected at t. 1135 of the same work. It is very nearly allied to the *sylvestris*, but not half so large, and the flower is tinged with red externally. The three innermost petals are slightly fringed at the lower part, but all six are quite smooth at the extremity. The stamens are smooth at the base, though they bear a tuft of hairs a little way above it. Anthers shorter, and more elliptical, than in *T. sylvestris*. Stigma more decidedly three-lobed, rounded, and downy. Capsule elliptical. Very rarely there are two flowers on a stem. They have no scent. Each petal has sometimes, not always, a green keel.

TULIPA.

3. *T. biflora*. Two-flowered Yellow Tulip. Pallas It. v. 3. 727. t. D. f. 3. Linn. Suppl. 196. Willd. n. 4.—Stem two or three-flowered, with two spreading lanceolate leaves. Stigma triangular, abrupt, downy, scarcely notched. Petals widely spreading, hairy, like the stamens, above their base; smooth at the tip.—Native of salt deserts about the river Wolga, in a stiff clay soil, along with the last, but flowering a few days earlier, and of much shorter duration. This is scarcely half the size of *T. Celsiana*, of which a two-flowered specimen has sometimes been taken for it. The more simple stigma, more elliptical and expanded petals, green at the back, and more oblong anthers, are abundantly different from that species. From the *sylvestris* the present is still more unlike, as to size, smoothness of the tips of its petals, and their flat spreading position, to say nothing of an orange spot at their base. The foliage too is said by Pallas to be more glaucous and succulent. The flowers vary rarely to one or three, and are fragrant.

4. *T. Sibthorpiana*. Yellow Greek Tulip. Sm. Prodr. Fl. Græc. Sibth. v. 1. 229. Fl. Græc. t. 330, unpubl.—Stem single-flowered, smooth. Flower drooping. Petals obtuse. Stigma club-shaped. Filaments hairy all over.—First observed by the late professor Sibthorp, near the ancient Cressa, now *Porto Cavalieri*, in Asia Minor; and afterwards, as Mr. Hawkins informs us, on a small rocky eminence near *Navarin*, in the Peloponnesus. The root is a white, roundish, depressed bulb, scarcely an inch in diameter, surrounded by numerous lateral offsets. Stem a span high, bearing two alternate erect smooth leaves, of which the lowest is largest and most ovate. Flower entirely yellow, pendulous, an inch long. Petals apparently smooth in every part. Stamens whitish as well as the pistil. Anthers linear, beaked, nearly as long as the filaments, which are clothed from top to bottom with short dense prominent hairs. Germen short, obtusely triangular, smooth. Stigma twice or thrice the length of the germen, triangular-clubshaped, obtuse, slightly three-lobed, almost as hairy in every part as the filaments. This is a very distinct species.

5. *T. Clusiana*. Red and White Italian Tulip. Redout. Liliac. t. 37. Ait. Epit. 375. Curt. Mag. t. 1390. Sm. Prodr. Fl. Græc. Sibth. v. 1. 229. Fl. Græc. t. 329, unpublished. (*T. perfica præcox*; Clus. Cur. Post. 9, with a figure. *T. perfica*, flore rubro, oris albidis, elegans; Ger. Em. 142. *T. perfica*; Park. Parad. 52. t. 53. f. 6. *T. variegata perfica*; Rudb. Elyf. v. 2. 111. f. 7.)—Stem single-flowered, smooth. Flower erect. Petals acute, smooth. Leaves linear-lanceolate.—Native of Italy, Sicily, and Persia, flowering in March. About the size of *T. sylvestris*, but the stem bears four or five leaves, gradually smaller and narrower upwards, most glaucous beneath, smooth, somewhat undulated, at least the lower one; all taper-pointed. The three inner petals are white on both sides, sometimes bluntnish; three outer rather larger, acute, white or blush-coloured within, crimson at the back, with white edges, and a green tip; all of them marked at the base internally with a dark-violet spot, and all quite smooth in every part, as are the violet-coloured stamens, and green pistil. The stigma consists of three rounded, compressed lobes, each marked with a downy furrow, like the Garden Tulip hereafter described.

6. *T. suaveolens*. Early Dwarf Tulip. Roth. Catal. v. 1. 45. Curt. Mag. t. 839. Willd. n. 2. Ait. n. 2. Redout. Liliac. t. 111. (*T. Pumilio*; Lob. Ic. 127. Ger. Em. 142. *T. Pumilio latifolia*; Rudb. Elyf. v. 2. 109. f. 2.)—Stem single-flowered, downy. Flower erect. Leaves ovato-lanceolate; downy above. Petals and filaments smooth.—Supposed to be a native of the south of Europe.

Commonly cultivated in Holland, by the name of *Duc Van Thol*, from whence the best roots are brought to us. They flower in the open ground in March or April, but in a room, whether in water, sand, or earth, about January. The whole plant is of a dwarf stature, and glaucous hue. Flower broad-bellshaped, sweet-scented. Petals scarlet, edged with yellow, more or less acute. Stigma like the last, but rather larger.

7. *T. Oculus solis*. Agen Tulip. "St. Amans Rec. Soc. d'Agr. d'Agen, v. 1. 75." Redout. Liliac. t. 219. Ker in Edw. Bot. Regist. t. 204. (*T. boloniensis*, five bombycina, flore rubro, major; Park. Parad. 51. t. 53. f. 1.)—Stem single-flowered, smooth, as well as the petals and filaments. Flower erect. Leaves ovato-lanceolate, finely fringed.—Found about Agen, in France, and several places in the southern part of that kingdom, flowering in April, and lately imported into England, by Messrs. Whitley and Co. of Fulham. This differs from the last in the particulars contained in our specific character, and more nearly approaches the following. The coat of the bulb is said to be internally woolly. Leaves broad, slightly glaucous. Flower large and bell-shaped, of a fine scarlet red, each petal marked with a broad, black, yellow-edged spot at its base. Stigma like the following.

8. *T. Gesneriana*. Common Garden Tulip. Linn. Sp. Pl. 438. Willd. n. 3. Ait. n. 3. Curt. Mag. t. 1135. "Sowerb. Fl. Luxur. t. 5, 6. 11. 17." (*Tulipæ*; Rudb. Elyf. v. 2. 102—108.)—Stem single-flowered, smooth, as well as the petals and filaments. Flower erect. Leaves ovato-lanceolate, glaucous, smooth. Lobes of the stigma decurrent, deeply divided.—Native of the country bordering on mount Caucasus, where it flowers in April, and from whence Dr. Fischer has sent us a wild specimen. Conrad Gesner reports, that it was brought from Cappadocia into the European gardens, in 1559. Nothing is now more common or more famous, particularly the many varieties in form and colour, which florists, especially in Holland, have so much cultivated, and in some cases so highly prized. The old botanical writers, in their wooden cuts, represent many of these, and almost all the supposed species in Bauhin's *Pinax*, are really, as Linnæus indicates, mere varieties. In a wild state, the petals are crimson, yellowish at the base, about an inch and a half long; by cultivation they increase in size, become streaked in colour, and sometimes assume a jagged and spurred appearance, with every variety of scarlet, yellow, purple, and even green, in their colouring. This we first called the Parrot Tulip, a name now generally adopted. It is Rudbeck's *T. flore luteo rubro variegato, petalis laciniatis*, Camp. Elyf. v. 2. 108. A plain yellow Tulip, the blunt points of whose petals are somewhat recurved, and whose whole flower is of a handsome ovate figure, seems to us possibly a distinct species; but this must be decided by cultivation from seed.

TULIPA, in Gardening, furnishes plants of the bulbous-rooted, flowery, perennial kind, among which the species cultivated are the Gesner, Turkey, Cappadocia or common garden tulip (*T. Gesneriana*); and the wild or yellow tulip (*T. sylvestris*).

The first is distinguished from the other sort, according to Martyn, by its pubescent scape, spreading sweet-smelling corolla, the earliness of its flowering, and the smallness of its size.

And in respect to the varieties, the editor of Miller's Dictionary observes, that the old authors divided tulips into *præcoces* or early-blowers, and *serotine* or late-blowers, with an intermediate division of *dubie media*, doubtful or middle-blowers, which flowered between the two others, and for the

TULIPA.

the most part rather belonged to the late-blowers. Modern florists, he asserts, have almost neglected the early-blowers. The first sort, according to him, are not near so fair, nor do they rise half so high as the late ones; they are chiefly valued for appearing early in the spring; some of them will flower the middle of March, in mild seasons, if planted in a warm border near a wall or other shelter, and others will succeed them, so that they will keep flowering until the general season for these flowers is come, which is towards the end of April.

It is said that the several varieties of these early-blowing tulips rise to different heights in their stems, and scarcely any two of them are equal. The Duke Van Toll, which is one of the first that appears in the spring, is generally very short-stalked, and the others, in proportion to their earliness, are shorter than those which succeed them; and the late-blowers are all considerably longer in their stems than any of the early-blowers.

The late-blowing tulips producing much finer flowers than the early ones, have engrossed almost the whole attention of the florists. It would be to little purpose to enumerate all the varieties, since there is scarcely any end of their numbers; and what some value at a considerable rate, others reject; and as there are annually many new flowers obtained from breeders, those which are old, if they have not very good properties to recommend them, are thrown out and despised.

It is observed further, that modern florists in Holland and Flanders, and our English florists from them, boast a prodigious variety of late-blowing tulips. And that Mr. Maddock of Walworth, in his catalogue of flowers for the year 1792, has no less than about six hundred and sixty-five of these admired beauties, all ranged under their proper families and colours, with their names and prices: besides the early sorts, *double tulips*, *parrot-tulips*, *French tulips*, and *breeders*. And moreover that the late-blowers are distributed into five families: 1. *Primo Baguets*, very tall; fine cups, with white bottoms, well broken with fine brown, and all from the same breeder. 2. *Baguets Rigauts*; not quite so tall, but with strong stems, and very large well-formed cups with white bottoms, well broken with fine brown, and all from the same breeder. 3. *Incomparable Verports*, a particular kind of *Bybloemens*; with most perfect cups, very fine white bottoms, well broken with shining brown, and all from the same breeder: some of these are from two to five guineas a root. 4. *Bybloemens*; with bottoms white, or nearly so, from different breeders, and broken with a variety of colours: those of the Verports are cherry and rose. 5. *Bizarres*; ground yellow, from different breeders, and broken with a variety of colours. These barbarous terms, used by the Dutch florists, are, it is said, a mixture of Dutch and French. Baguet is from the French *baguette*, a rod or wand, so named from its tall slender stem. Bizarre is also French, and the tulips of that family have the name from the variety and irregularity of their colours. Rigauts are probably from the name of some eminent florist, as Rigaud. The other terms are Dutch. Breeders are of one colour, and when broken produce new varieties.

It may be more particularly noticed in regard to each of the principal varieties of these tulips, that they, in every instance, comprehend a great number of intermediate ones, in so far as respects the colours and variegation, which takes place in the flower, notwithstanding each has been originally all of one and the same colour, particularly the seedling-raised bulbs, which after they have arrived to the flowering state, each separate flower is either wholly red, purple, violet, grey, brown, black, yellow, or some other indivi-

dual colour, without any sort of variegation or stripe whatever, consisting simply of one-coloured flowers, with white bottoms, with yellow bottoms; and some with blue bottoms, with purple bottoms, and with blackish bottoms; all of which, while they retain this original sameness in the colour, are, in the peculiar language of the florist, termed *whole-blowers* or *breeders*, as each flower is wholly of one and the same colour. But on the bulbs or roots being planted out for one or two years, in properly prepared soils, in order to breed, or dispose them to gradually produce flowers, that break or run from the original single colour into variegations and stripes, in many different modes and forms, they are denominated *breakers* or variegated tulips, each different variegation constituting a separate and distinct variety, which mostly consists of flowers with white bottoms broken, with brown stripes, with blue stripes, with violet stripes, with rose stripes, with red stripes, and with some other kinds, separated by streaks of white, and other colours disposed in various ways; with yellow bottoms, broken with different reds, crimsons, and golden-yellow flakes, and also a variety of other colours; and some with blackish-purple, and other bottoms broken with stripes of dark colours, yellow, and tints of red; so that, particularly in these sorts of *breakers* or variegated tulips, which have white and yellow bottoms, there are, moreover, white and red striped flowers, white and purple striped, white and violet striped, white and rose striped, white and brown striped, violet and white flaked, red and white flaked, red and yellow flaked; and a great number of other intermediate variegations and stripes, disposed in an almost endless diversity of modes or manners.

The principal of these diversities or varieties are usually distinguished, in the language of the florist, by the names or titles of some great personage, eminent admirer or cultivator of flowers, places where first grown, or some other great mark of distinction; but there is such a multitude of new varieties raised annually from seed and seedling plants in different places, which are designated by new titles, without any relation to the old ones, and the same sort of flower so often characterised by a different name, that it would be utterly impossible to give any satisfactory list of the names of such a vast number of continually changing varieties, as has been suggested above.

It is said that the properties of a fine variegated late tulip, according to the best modern florists, are these: 1. The stem should be strong, upright, and tall; about thirty inches high. 2. The flower should be large, composed of six petals, proceeding a little horizontally at first, and then turning upwards, so as to form an almost perfect cup, with a round bottom, rather wider at top. 3. The three outer petals should be rather larger than the three inner ones, and broader at their base: all the petals should have the edges perfectly entire; the top of each should be broad and well rounded; the ground colour at the bottom of the cup should be clear white or yellow, and the various rich stripes, which are the principal ornament of a fine flower, should be regular, bold, and distinct on the margin, and terminate in fine broken points, elegantly feathered or pencilled. 4. The centre of each petal should contain one or more bold blotches or stripes, intermixed with small portions of the original colour, abruptly broken into many irregular obtuse points. Some florists, it is said, are of opinion that the central stripes or blotches do not contribute to the beauty of the tulip, unless they are confined to a narrow stripe exactly down the centre; and that they should be perfectly free from any remains of the original colour: it is certain that such flowers appear very beautiful and delicate, especially when they have a regular narrow feathering

TULIPA.

feathering at the edge : but it is unanimously agreed, that the tulip should abound in rich colouring, distributed in a distinct and regular manner throughout the flower, except in the bottom of the cup, which should indubitably be of a clear bright white or yellow, free from stain or tinge, in order to constitute a perfect flower.

The colours which are generally held in the greatest estimation in the variegated or striped sorts of tulips, are the blacks, the golden yellows, the purple violets, the rose, and the vermilion, each of which being varied in different ways ; but such as are striped with three different colours, in a distinct and unmixed manner, with strong regular streaks, with but little or no tinge at all of the breeder, are supposed the most perfect. However, though it is extremely difficult to meet with such as possess all these estimable properties of good flowers of this sort, yet many are found which have sufficient perfection to become of high value as fine flowers. The double and parrot tulips are, it is said, held in no sort of esteem among florists. Among the first sort, however, there are many distinct varieties, in so far as regards the colouring of the flowers ; as the yellow-flowered, the yellow and red-flowered, the white and red-striped, the white and blush-coloured, besides a great number of intermediate variations. And in the latter, those with long hooked petals of flowers, consisting of yellow-flowered, red-flowered, red-striped, and other kinds.

The second species has the bulb ovate, and gibbous in the shape ; the stem is quite simple, nearly upright, round, smooth, leafy in the middle, and attenuated at the base, with the flower always yellow in its colour, but a little greenish on the outside.

And it is further noticed, that it has most of these characters in common with the garden species ; but the circumstances that abundantly distinguish this sort are, the narrow leaves, the nodding flower, the hairiness at the base of the stamens and on the tips of the petals, and especially the simple obtuse form of the stigma, which is totally different from that of the garden tulip : the flower too is fragrant ; the pollen yellow, not black ; and the anthers remarkably long. But in the *Flora Danica* they are represented as short and round.

As this sort of tulip is of much inferior beauty to those of the other and its several varieties, it is of course not nearly so much known and cultivated in flower-gardens, though it was formerly held in considerable estimation by some, before the Turkey kind became so very general ; and it is still to be found in some of the older gardens of this nature, and is not undeserving of a place in those of the modern ones, among the other sorts of tulips and spring flowers, for the purpose of its early blowing and increasing the variety.

Method of Culture.—All the different sorts of tulips may be increased by offsets from the roots, and by sowing seeds to produce new varieties. The offsets should be separated from the old roots every year in June, especially for the fine sorts, on taking them up when the flowering is over, planting them in nursery-beds, in rows six inches apart, and to the depth of three, four, or five in the beginning of autumn, to remain for one or two years, until they attain the flowering state, and are proper for being set out regularly. They may also, in the old root, be planted in beds, or in the borders or other parts where they are to remain and blow, in patches of four or five, placed regularly ; and to have a succession, they may be planted at different times ; they are usually planted with a blunt dibble : the new roots should always be planted by themselves.

In this way the most approved sorts are propagated and

continued always the same, and the stocks of any good varieties multiplied and increased as may be necessary and convenient to the growers of them.

The early and late sorts should likewise be each put in, in places by themselves ; and it is advised that the roots of the early-blowing kinds should be planted the beginning of September, in a warm border, near a wall, paling, or hedge ; as, when they are put into an open spot of ground, their buds are in danger of suffering by morning frosts in the spring. The soil for these should be renewed every year, where it is intended to have them fair. The best soil for this purpose is that which is taken from a light sandy pasture, with the turf rotted amongst it, and to this should be added a fourth part of sea-sand. This mixture may be laid about ten inches deep, which will be sufficient for these roots, as they need not be planted more than four or five inches deep at the most.

The offsets should not be planted amongst the blowing roots, but in a border by themselves, where they may be set pretty close together, especially when they are small ; but these should be taken up when their leaves decay, in the same manner as the blowing roots, otherwise they would rot if the season should prove very wet, as they are not so hardy as the late blowers, nor do they increase half so fast, so that more care is requisite to preserve the offsets of them.

When these sorts come up in the spring, the earth upon the surface of the beds or borders should be gently stirred and cleared from weeds ; and as the buds appear, if the season should prove very severe, it will be of great service to cover them with mats, for want of which many times they are blighted, and their flowers decay before they blow, which is often injurious to the roots, as is also the cropping of the flowers soon after they are blown ; as their roots, which are formed new every year, are not at that time arrived to their full magnitude, and are of course deprived of proper nourishment or support.

When these flowers are blown, if the season should prove very warm, it will be proper to shade them with mats, &c. in the heat of the day ; and when the nights are frosty, they should be covered in the same manner, by which means they may be preserved a long time in beauty : but when their flowers are decayed, and their seed-vessels begin to swell, they should be broken off just at the top of the stalks, as when they are permitted to feed, it injures the roots greatly.

In these sorts, when the leaves are decayed, which is usually before the late-blowers are out of flower, their roots should be taken up, and spread upon mats in a shady place to dry ; after which they should be cleared from filth, and put in a dry place where vermin cannot come to them, until the season for planting them again, being very careful to preserve every sort separate, that it may be known how to dispose of them at the time of planting.

For this purpose, it is a good method to have large flat boxes made, which are divided into several parts by small partitions, each of which is numbered the same as the divisions of the beds ; so that when a catalogue of the roots is made, and the numbers fixed to each sort in the beds, nothing more is necessary in taking the roots, but to put every kind into the division marked with the same number in the bed. This saves a great deal of trouble in making fresh marks every time the roots are taken up, and effectually answers the purpose of preserving the kinds separate and distinct.

In raising these plants from seed, it is, from the time of sowing, seven or eight years before they produce flowers ; and after all, they at first appear only single-coloured, often requiring two, three, or more years longer before they break

into different colours or variegations ; so that the tediousness of raising seedling tulips to a flowering state often deters from the undertaking. It is, however, the method by which all the fine varieties were first obtained, and by which new varieties are still annually gained ; as many persons sow some every year, in expectation that after the first six or seven years a new show of flowers will be produced, out of which many new varieties may annually discover themselves in each parcel. It is by this process the Dutch are so famous for furnishing such an infinity of fine varieties, supplying almost all other countries.

In effecting this business, great care should be used in the choice of the seed : the best is that which is saved from breeders which have all the good properties before related, for the seeds of striped flowers seldom produce any thing that is valuable ; and the best method to obtain it is to make choice of a parcel of such breeding tulip roots as are wished to save seeds from, and place them in a separate bed from the breeders, in a place where they may be fully exposed to the sun, planting them at least nine inches deep, as when they are planted too shallow their stems are apt to decay before their seed is perfectly ripened : the flowers should be always exposed to the weather, as when they are shaded with mats, or any other covering, it prevents their perfecting the seed. About the middle of July, according to the season, the seeds will be fit to gather, as shewn by the dryness of their stalks and the opening of the seed-vessels, at which time they may be cut off, and the seeds be preserved in the pods till the season for sowing, being careful to put them up in a dry place, otherwise they will be subject to mould and be rendered useless. The beginning of September is the proper season for sowing the seed ; for which there should be provided a parcel of shallow seed-pans, or boxes, which should have holes in their bottoms to let the moisture pass off ; these should be filled with fresh sandy earth, laying the surface very even, upon which the seeds should be sown thinly as regularly as possible ; some of the same light sandy earth being sifted over them, about half an inch thick. These boxes or pans should be placed where they may have the morning sun till eleven o'clock, in which situation they may remain till October, at which time they should be removed into a more open situation, where they may enjoy the benefit of the sun all the day, and be sheltered from the north winds, where they should remain during the winter season ; but in the spring, when the plants appear with grassy leaves, they should be again removed to their first situation ; and if the season be dry, they must be refreshed with water while the plants remain green ; but as soon as their tops begin to decay, no more should be given. The boxes should be placed in a shady situation during the summer season, but not under the drip of trees. The weeds and moss should be kept constantly cleared off from the surface of the earth in the boxes, and a little fresh earth be sifted over them soon after their leaves decay ; and at Michaelmas they should be fresh-earthed again, and as the winter comes on, be again removed into the sun as before, and treated in the same manner, until the leaves decay in the spring, when the bulbs should be carefully taken up, and planted in beds of fresh sandy earth, which should have tiles laid under them, to prevent their roots from shooting downward, which they often do when there is nothing to stop them, and are destroyed. The earth of these beds may be about five inches thick upon the tiles, which will be sufficient for nourishing the roots while young. The distance of planting them need not be more than two inches, nor should they be planted above two inches deep. Toward the end of October it will be proper to cover the beds over with a little fresh earth about an inch deep, which will preserve

the roots from the frost, and prevent moss or weeds from growing over them ; and when the winter is very severe, it may be proper to cover the bed either with mats or pease-haulm, to prevent the frost from entering the ground, as these roots are much tenderer while young, than after they have acquired strength. In the next spring the surface of the ground should be again gently stirred to make it clean, before the plants come up ; and when the spring proves dry, they must be frequently refreshed with water in small portions during the time of their growth ; and when the leaves are decayed, the weeds should be taken off, and the beds covered with fresh earth, as before, which should also be repeated again in the autumn. When the bulbs have been managed in this way two years, they should in the summer following, when their leaves decay, the roots being by that time considerably improved in growth, be again taken up, and planted in a fresh prepared bed, in drills three or four inches asunder, in which to remain two years longer ; then, at the decay of the leaf, be again planted out into fresh beds, in rows as before, where they should be let remain to blow, being afterwards ordered as the flowering bulbs. When they are in full flower, they should be examined, in order to mark such of them as discover the best properties, that they may be separated from the others at the proper lifting season, and be replanted in beds by themselves for breeders ; removing them annually at the proper season into different beds of opposite or contrary soils, as one year in poor hungry earth, the next in a much richer mould ; continuing them so till they break into variegations and stripes of different colours, which are the only modes by which it can be assisted. When the leaves and flower-stems are decayed and withered, and the roots have ceased growing and drawing nourishment from the earth, it is the proper period for lifting or taking the old roots out of the earth, to reserve them till autumn for planting, being preserved in the manner which is directed for them above.

It may be noticed in addition, that all the sorts and varieties of tulips will grow pretty well and succeed tolerably in any soil where the earth or mould is moderately light and dry in the winter season, but that they delight most in such as are of a sandy vegetable earthy nature, and in an open sunny exposure. They are most injured by such as are of a retentive and wet damp quality, in which it is constantly necessary to have the beds in which they are put raised four or five inches above the common level of the rest of the ground. It is customary, however, with florists to have the beds for this purpose composed of and prepared with different kinds of materials of the sea sandy and earthy sorts, particularly for their finest kinds. But such trouble and expence are often quite unnecessary, as they succeed well enough without it ; only care must always be taken not to plant them more than one or two years together, especially these fine sorts, in the same earth or bed, without changing the quality of the soil, in some measure, either altogether or in a partial manner, by some removal of the old and addition of new fresh portions of light mould, garden earth, or compost, or by a complete clearing away of the former earthy matter and the supplying of wholly new ; thus rendering the blow of the tulips more strong as well as fairer. But as this is only practised for the particularly fine sorts in beds, those which are to be planted in the open border may be placed any where in the common soil, without any fear of their not flowering well.

In preparing the beds, or other parts, for the more choice sorts, the ground is to be well dug to the depth of one or two spits, and they are to be formed three or four feet in width, having alleys or intervals of one or two feet

TULIPA.

width between them: the top or surface of each bed being raked quite even and smooth, in order for the bulbs or roots being put into it.

When they are in this state of readiness for being planted, a dry day is to be selected for setting out or planting the bulbs or roots, which is to be done in rows, either in the bedding method, drilling in rows, or that of dibble-planting, a blunt-edged instrument being employed in the last, by way of making the holes for the bulbs as sufficiently wide below as above, and perfectly clean quite to the bottom, making out the lines lengthways of the beds at eight or nine inches distance from each other, the roots being then set in singly to the depth of three or four inches, and at the distance of six from each other in the lines. The work of planting being thus finished, the upper parts of the beds are to be raked even and smooth, which completes the whole.

The tulips intended for the open borders may either be planted in a regular line at a foot or eighteen inches distant from the edge, irregularly along it, or be disposed in separate small patches and clumps of three or four roots together in each, occupying spaces of about eight inches, some of which being placed more forwards, and others backwards, in order to afford greater diversity and variety.

When the old roots or bulbs have been thus planted out in the autumn, as they bear the winter well, nothing farther is required in their culture until the vernal and summer months, when they should be preserved in quite a clean state of growth, and in some cases the buds of the more choice sorts in the beds be sheltered and guarded from cold and severe weather in the nights, and at some other times by mats, supported archways on hoops, or other convenient means, though this is seldom absolutely necessary; or when the bedded sorts are come into flower, to preserve their beauty and duration, to shade and screen them from the excessive noontide sun, heavy rains, and stormy winds, by an awning of canvas or mats raised across the beds, and, in some instances, formed in a tent-like manner, in order to walk under and view the flowers at pleasure; but the flowers will blow in great perfection without these coverings and trouble, only by means of them these fine sorts will blow and continue for a longer time in full beauty than would be the case if they were openly exposed. However, as soon as ever the flowers begin to fade, all such coverings should be carefully removed, in order to permit a free circulation of air, and have the full influence of rains, dews, &c. for the nourishment and support of the root-bulbs. But when the flowering is quite past, and the flowers begin to die away, it is necessary and proper to cut off the heads or seed-vessels, especially of the fine sorts and varieties, that the roots may not be deprived of the proper quantity of nutriment for their full and perfect growth.

And in the middle of summer, when they are at rest, or have ceased growing, and the flower-stems and other parts are quite decayed, it is time to lift or take up the old bulbs or roots, which should be done for the most part every year for the fine sorts, and every other year for the other kinds, not only for the purpose of separating the suckers or young bulbs, but also for preserving both them and the old ones without any sort of growth out of the ground until the autumn, which is the time of planting them again in fresh or newly prepared beds for the future year's bloom. At this period, therefore, when the weather is dry, the work of lifting or taking them up should be begun, which should be done with a garden-trowel, as being the best and easiest method, digging them up singly in a perfect and careful manner; and afterwards spreading them out in a shady, dry,

airy place, where they may remain for a few weeks, without being acted upon by the sun or wet, and then become gradually dry and hardened; when the suckers or young bulbs, the adhering earth, and the outer decayed skins or husks, should be taken away and removed from them, after which both the old and the young offset bulbs should be again exposed to further drying, and more effectual hardening, in the same or other more proper situation, and be ultimately put safely into some dry receptacle separately, to be kept until the proper season of planting them out again takes place. Each sort of bulbs should be planted out in a separate manner, as already noticed. See BULB and ROOT.

It may be remarked, that although the tulip may be said to be a plant of the perennial kind, yet that after the bulb of it has arrived at the flowering state or stage, the same individual old root or bulb does not always remain and continue to flower anew, but gradually wears or wastes away, as is evident by its remains at the lifting season; but previously to its dissolution it affords from its sides a new supply of suckers or young bulbs, which perpetuate the kind, one of which, being large and similar to the parent bulb, is capable of flowering equally strong for the succeeding year; so that at the end of many years, that which is often supposed to be the same individual bulb, is in reality in every way another, or new one. In common, it is, however, termed the old bulb or root, by those who are unacquainted with the nature of such roots.

All the sorts and varieties of the tulip have flowers, which are succeeded by plenty of ripe seed in the later summer months, that is contained in the cells of an oblong capsule, the different seeds being placed on each other in double rows.

In order to save good seed, some heads of the best and stoutest plants of each sort should be selected and left in a proper situation to stand until they become in a perfectly ripe state, which is easily known by the stems taking on a fine hard dry appearance, and the parts containing the seeds opening themselves, when they should be cut away, and the seed be taken out, and wrapt up carefully, or left to remain in them until the time of its being sown, preserving it in either way quite dry and free from any thing of a mouldy nature.

In order to promote the acquisition of the vast and wonderful diversity of colouring which often takes place in tulips, and which, in many instances, is effected in a great measure by nature only, the natural process is sometimes greatly assisted and expedited by means of proper culture and management. Thus, in the first place, when the young seedling bulbs of the whole blower or breeder have reached the full size, and have flowered once, by transplanting or removing them into beds of any sort of weak, poor, unfruitful earths, which, by their want of nutrient properties, may check and restrain the natural luxuriant tendency of the plants, and induce a weak enfeebled general growth, a change may be gradually produced in their general state, whereby they may break out into new variegations in the first, second, or third years. And accordingly, as this happens, they should be planted out into beds of good earth, as has been directed above.

Another means of assisting nature in accomplishing this object is, that of making as great a change in the quality of the soil as possible, as if they were this year planted in a weak poor sort of earth, they should in the following be set out in a highly rich garden mould, and afterwards in a compost of several sorts of earth: or they may be removed and transplanted from one part of a garden to another; and

into different gardens; or in any other similar methods. All these various ways contribute in a great degree to assist in, and promote the production of, this desirable diversity of colours and variegations.

The roots of all the sorts and varieties of the tulip are kept for sale in large collections by the nursery and seedmen, who have them every year in great quantities from Holland and other places, each variety of which is distinguished by some appropriate name, as has been already noticed, and arranged in regular catalogues, the prices being charged in proportion to the estimation in which they are held, which were formerly very extravagant, but are now more moderate, on account of their abundance, as from seven or twelve shillings, to as many pounds the hundred, and not unfrequently considerably more for scarce, curious, and capital sorts. The most eligible and proper season for buying or laying in a collection is in the early part of the autumn, as from August to November.

For the main collection of flowers to blow in the spring and early summer, the most proper time of planting the roots or bulbs is in the autumn, from the end of September to December; but to have a later bloom in succession, some may be planted out about the close of the year, and in the two beginning months of the new one. These last, however, will seldom grow so strong as those of the autumn planting.

The roots of the late sorts of tulips may be planted in any common beds, or in the borders, as they are not much liable to be injured by bad weather. But those of the fine or more valuable sorts of the early, as well as the late kinds, are in general, for the most part, disposed together, as has been seen, in beds by themselves, in order to exhibit a grand blow, and be defended in the manner which has been explained.

However, some of the inferior common sorts, and even any of the capital varieties, may occasionally be distributed about the ordinary borders, in assemblage with other spring flowers of the bulbous-rooted and other kinds, in the ways which have already been directed, where they have often a fine effect when in their blowing state.

The double variety of the common tulip is very beautiful, though not held in such estimation by the florist as the common single variegated sorts, from their not possessing that profusion of variegations in their colours, or such a regularity of stripes. They, however, exhibit an elegant ornamental appearance in their upright, tallish, firm stems, and the crowns of large double flowers at the tops, formed somewhat as in those of the double pæony, but far more beautiful in their diversity of colours, variegations, and stripes of white and red, or yellow and red, &c. On these accounts they certainly deserve to be cultivated either alone in beds, at a little distance from the other sorts, for the sake of increasing the variety; or in patches about the borders, in assemblage with the common large variegated tulips, as blowing nearly about the same time in the later spring months.

The early dwarf sorts are the most proper for forcing for early blowing, and also for being placed in glasses, in rooms, &c.

These sorts are sometimes rendered more early in their blowing than would otherwise be the case, by planting the roots or bulbs in pots or boxes in the autumn or winter season, and placing them in the stove, or a hot-bed of tanner's bark, thereby bringing them into bloom in the month of January, or sooner, and continuing successions of them, until the natural ground blooms are ready. A quantity of bulbs is also sometimes placed upon phial-glasses containing

water, a single bulb in each, during the same seasons, which are then put into a warm light room in the house, near the windows, or into a greenhouse or stove, in which way they often flower very agreeably in the winter and early spring, as they are well suited to such modes of cultivation.

These sorts of roots or bulbs are likewise kept by the nursery and seedmen for the purpose of sale in pretty large collections of the different kinds, under titles which are chiefly French or Dutch, as may be seen by the catalogues of these flowers which they exhibit.

Roots of these sorts may be planted out in any good, light, rich, earthy soil, where the situation is warm at the season, and in the manner stated above, in speaking of the general culture of tulips, when they will rise soon in the vernal months, and reach the blowing state about March, continuing until the late tulips come into flower. They, however, succeed best when allowed a sheltered sunny situation, as they rise and flower so soon in the spring while the weather is often cold and pinching. Some of them look extremely well in the fronts of warm borders, in small patches, in assemblage with anemones, ranunculuses, and other similar kinds.

The second species may be managed in the same manner as those of the common sort, in so far as its culture is concerned, in much the same way, having nearly the same treatment in every respect.

They are all highly ornamental flowers, from their much varied and most beautiful colours; but those of the common garden sort, and its numberless varieties, are the most generally introduced, being admirable ornaments for beautifying the various flower borders and other parts of gardens and pleasure-grounds during some weeks in the spring and summer seasons.

TULIPIFERA, in *Botany*, the Tulip-tree; see **LIRIODENDRON**; see also **MAGNOLIA**, some of whose species are called Tulip-trees.

TULISCHANA, in *Geography*, a river of Russia, which runs into the Podkamenkaia Tunguska, N. lat. 61°. E. long. 97° 34'.

TULISKOWO, a town of the duchy of Warsaw; 16 miles N.N.E. of Kalish.

TULL, JETHRO, in *Biography*, a distinguished agriculturist, was a descendant of a respectable family in Yorkshire, educated at one of the universities, and admitted a barrister of the Temple towards the commencement of the 18th century. Returning from the tour of Europe, in which his attention was particularly directed to agricultural subjects, he married, and settled upon a paternal farm in Oxfordshire, which gave him an opportunity of prosecuting a variety of experiments in husbandry. Upon his return from France and Italy, which he was under a necessity of visiting on account of his impaired health, and with a fortune also impaired, he took a farm near Hungerford, in Berkshire, where he pursued his plans for improved cultivation. His grand principle was, that labour and arrangement would supply the place of manure and fallowing, and raise more grain at a less expence. (See **HÖEING, HUSBANDRY**, and **Drill-HUSBANDRY**.) Tull, in 1731, printed "A Specimen" of his system; and in 1733, "An Essay on Horse-hoeing Husbandry," fol. which was translated into French by Du Hamel. He pursued his system till his death, which happened in Jan. 1740.

TULLA, in *Geography*, a town of Arabia, in the province of Yemen; 20 miles W.N.W. of Sana.

TULLAGH, a small post-town of the county of Clare, Ireland; 102 miles W.S.W. from Dublin.

TULLAGHAN, a bay of the county of Mayo, Ireland
into

into which the river Munry discharges itself, and which is opposite to the northern part of Achill island.

TULLAMORE, a post-town of the King's county, Ireland, so called from the river Tullamore, which divides it into two nearly equal parts. This is a neat thriving town, owing partly to the well-directed exertions of the proprietor, lord Charleville, whose demesne extends to the suburbs, and partly to the advantage of the Grand Canal passing close to it. Here are a barrack and market-house; and, what is of still greater importance, the linen manufactory has been introduced with a prospect of success. Tullamore is 46 miles W. by S. from Dublin.

TULLE, a city of France, and capital of the department of the Corrèze; before the revolution the capital of Lower Limosin, and see of a bishop suffragan of Bourges; 58 posts S. of Paris. N. lat. 45° 16'. E. long. 1° 51'.

TULLEN. See **TOOLEN**.

TULLINS, a town of France, in the department of the Isère; 12 miles N.N.E. of St. Marcellin.

TULLIS CREEK, a river of Virginia, which runs into the Potomack, N. lat. 39° 33'. W. long. 78° 2'.

TULLN, a town of Austria, on a river of the same name; the see of a bishop, suffragan of Passau; 13 miles W.N.W. of Vienna. N. lat. 48° 18'. E. long. 16° 3'.—Also, a river of Austria, which runs into the Danube, at the town of Tulln.

TULLOARGAUM, a town of Hindoostan, in Visiapour. In 1779, when major-general Egerton was marching towards Poonah, this town was burned by the Mahrattas themselves; 12 miles N.W. of Poonah.

TULLOCH-ARD, a mountain of Scotland, in the south-west part of Ross-shire. In feudal times, by burning of pitch on this mountain, all the tenants and vassals of Seaforth assembled at the castle of St. Donan in twenty-four hours.

TULLONG. See **PULO-TULLONG**.

TULLOON, a town of Hindoostan, in the circar of Sirhind; 35 miles W. of Sirhind.

TULLOW, a post-town of Ireland, in the county of Carlow, pleasantly situated on the river Slaney, over which it has a bridge of six arches. The castle, which was deemed formidable, and which was reduced by Cromwell, has been converted into a barrack. Here are a neat church and a good market-house; and near the bridge the ruins of an old abbey, which, with all its possessions, was granted by queen Elizabeth to Thomas, earl of Ormond, in 1557. Tullow is 38 miles S.S.W. from Dublin.

TULLUM, TOUL, in *Ancient Geography*, a town of Gaul.

TULLUS HOSTILIUS, in *Biography*, was elected king of Rome, after the death of Numa, in the year B. C. 672. He began his reign with rendering himself popular, by dividing a portion of the regal lands among those who had no such property; but deviating from the course pursued by his pacific predecessors, he contrived by a stratagem to engage the Romans in a war with the Albans. The Albans declining a combat, Tullus proposed an union between Rome and Alba, and for the accomplishment of this object, that the principal Alban families should settle at Rome. To this proposal the Albans objected, but it was agreed that the superiority of either city should be decided by a combat between three persons of each city. (See **CURIATI** and **HORATH**.) The superiority of Rome having been thus determined, Tullus proceeded to punish the Fidenates for their alleged misconduct in the Alban war; and having summoned Mettius Fuffetius, the Alban dictator, to join him with the troops of his nation, the dictator apparently complied, but in an engagement that ensued proved trea-

cherous. The Romans, however, obtained a complete victory. Tullus and Mettius practised the same kind of dissimulation: whilst the former courteously received the congratulations of the latter, he sent a body of troops to demolish the city of Alba in the absence of its soldiers, and at the same time ordered the Roman and Alban troops to attend him in his camp unarmed, but he privately instructed the Romans to provide themselves with swords under their garments. Charging Mettius with perfidy, he ordered him to be seized, and to be fastened between two chariots, and thus to be torn asunder, as an emblem of his attempt to dissolve the union of the two states; the first and last example, says Livy, of a punishment in which little regard was paid to human laws! His accomplices were also put to the sword; the rest of the Albans were conveyed to Rome, and henceforth formed one people with the Romans. Alba, with the exception of its temples, was razed; and for the accommodation of these new inhabitants, mount Cælius was taken into the compass of Rome.

Having subdued the Fidenates, Tullus made war against the Sabines and conquered them, and then summoned the Latin towns dependent upon Alba to acknowledge the supremacy of Rome, whose country, on their refusal, he invaded. In his old age, however, he exchanged his military prowess for the weakness of superstition; and terrified by prodigies and apprehended tokens of the displeasure of the gods, he had recourse to a variety of expiatory rites. The manner in which his life terminated has been differently represented. Some say that his palace was struck by lightning, which destroyed him and his family; whilst others have charged his murder on Ancus Martius, his successor, who is also suspected of having set fire to his palace. He died, however, after a reign of thirty-three years, during which he enlarged the size and population of Rome, with little addition to its territories. Livy. Dionys. Hal. Gen. Biog.

TULLY, in *Geography*, a town of Hindoostan, in the circar of Ellichpour; 20 miles E.S.E. of Ellichpour.

TULLY, a township of New York, on the S. line of Onondaga county, 14 miles S. of Onondaga; bounded N. by Otisco, E. by Fabius, S. by Cortlandt county, W. by Spafford, which was erected from the W. half of Tully in 1811. It is now formed of the N.E. quarter of the military township of Tully, the S. half being Preble, in Cortlandt county. Its waters are small, being head-streams of Onondaga creek, and also of Tioughnioga creek, of Chenango, of the Susquehanna, &c. The whole is well watered by springs and brooks. Like Spafford, this town has ridges of hills on the E. and W. boundaries, but its vallies are extensive, rich and productive. Tully flats are much admired. The settlements commenced about 1796, and the lands are held by right of soil, principally by farmers from the eastern states. In 1810, the population was 1092, and the senatorial electors 67; but these aggregates are now diminished nearly one-half by the erection of the town of Spafford from the W. part in 1811. Tully is now about five miles square.

TULLYCLEA, a small river of Ireland, rising in the southern part of the county of Tyrone, and discharging itself into lough Erne, a little to the north of Devenish island.

TULMERO, a town of South America, in the province of Venezuela, situated in the vale of Aragoa, two leagues from Maracay. This town is modern, well built, and the residence of a number of planters; but it is peculiarly the abode of all the officers, factors, and persons employed in the administration of the tobacco cultivated in its vicinity,

vicinity, on account of the king. Here are a handsome church, a vicar for the religious department, and a lieutenant of justice for the civil. Its population consists of 8000 persons.

TULOMA, a river of Russia, which runs into the Ladoga lake, 32 miles N.W. of Olonetz.

TULON, a town of Thibet; 45 miles E. of Tankia.

TULONIUM, in *Ancient Geography*, a town of the interior of Spain, belonging to the Varduli, according to Ptolemy. In the Itinerary of Antonine, this place is on the route from Asturica to Burdigala, between Suflatum and Alba.

TULOS, a word used by some medical writers to express a callus.

TULOSTOMA, in *Botany*, so named by Perfoon, from $\tau\upsilon\lambda\omicron\varsigma$, a wart, or other protuberance from the skin, or flesh, and $\sigma\omicron\mu\alpha$, the mouth; which is exactly descriptive of the little orifice, by which the powdery seeds of this fungus are discharged.—Perf. Syn. Fung. 139. (Lycoperdon; Tourn. t. 331. f. E, F. Lamarck Illustr. t. 887. f. 3.)—Class and order, *Cryptogamia Fungi*. Nat. Ord. *Fungi*.

Ess. Ch. Receptacle coriaceous, globular, stalked, discharging the powdery seeds, intermixed with hairs, by a cylindrical cartilaginous mouth.

1. *T. brumale*. Common Stalked-Puff-ball. Perf. n. 1. (Lycoperdon pedunculatum; Linn. Sp. Pl. 1654. Hudf. 643. With. v. 4. 379. Sowerb. Fung. t. 206. Dickf. Dr. Pl. n. 100. Bulliard Fung. v. 1. 161. t. 294.)—Stalk nearly smooth, solid. Orifice flattish.—Found on the mossy tops of walls about Paris and London, in the winter or spring. It may easily be overlooked for some common unexpanded Agaric. The stalk is an inch and a half high, cylindrical, not quite straight, of a light brown, or stone-colour, fixed by fibrous annual roots. Head globose, smooth, half an inch or more in diameter, with a small, regular, orbicular orifice at the top, whose edges are flat and cartilaginous.

2. *T. squamosum*. Scaly Stalked-Puff-ball. Perf. n. 2. (*T. brumale* β ; *ibid.* Lycoperdon pedunculatum; Sowerb. Fung. t. 206, the dissected figure, and some near it. L. pedunculatum axiferum; Bulliard Fung. v. 1. 161. t. 471. f. 2. L. album mammosum, pediculo longo et veluti squamoso, ac fistuloso, donatum; Mich. Gen. 218. t. 97. f. 7.)—Stalk scaly, hollow, with a central thread. Orifice prominent, tubular.—Found by Micheli, on banks near Florence. Mr. Sowerby received his specimens from Norfolk, by favour of the Rev. Dr. Sutton. Bulliard seems to have gathered his in France. We presume this must be a distinct species, well marked by the above characters.

3. *T. giganteum*. Great Stalked-Puff-ball.—Stalk woody, clothed with upright scales.—Gathered at Owhyhee, by Mr. Archibald Menzies. Mr. Sowerby says this is “a gigantic representation, as it were,” of the common kind, the stalk being twice as long, and four times as thick, more woody, and sometimes truly squamose, the squamæ pointing upwards. The size of the head is in proportion. We know this fungus only from Mr. Sowerby’s incidental account, but have no doubt of its being a distinct species, in which more particular investigation might discover more decisive characters; and on this account we record it here.

TULOOR, or **TANNA LABU**, in *Geography*, an island in the East Indian sea, about 90 miles in circumference. N. lat. $4^{\circ} 45'$. E. long. 124° .

TULP, **NICHOLAS**, in *Biography*, an eminent physician, was the son of an opulent merchant, and born at Amsterdam in 1593. Having studied and graduated at Leyden, he settled in his native city, and rose to a high rank, not only in his profession, but as a citizen. Under

the latter denomination he was distinguished by the high posts which he occupied, and by the services which he rendered to his country. As burgomaster, to which station he was advanced in 1652, he resisted the invasion of Holland by Lewis XIV. in 1672, and thus saved his country; on which occasion a medal was struck to his honour with this motto, from the Æneid, “Vires ultra fortemque senectæ.” Having completed his 80th year, he died in 1674. Tulp’s “Observationum Medicarum Libri tres,” 1642, 12mo. have been several times reprinted, and contain many valuable physiological remarks. He is said to have been among the first who observed the lacteal vessels. Haller. Eloy.

TULPEHOCKON, in *Geography*, a township of Pennsylvania, in the county of Berks, which, together with Bern and Bethel, contains 5800 inhabitants.

TULPEHOCKON Creek, a river of Pennsylvania, which runs into the Alleghany, N. lat. $40^{\circ} 22'$. E. long. $76^{\circ} 58'$.

TULSK, a post-town of Ireland, in the county of Roscommon. The promiscuous and indiscriminate ruins of castles and churches, bear ample testimony to its former importance, but it is now a wretched village. Tulsks was represented in the Irish parliament, but lost its privilege at the Union. It is $75\frac{1}{2}$ miles W.N.W. from Dublin.

TULSKOE, a government of Russia, bounded on the north by Moskovskaia, on the east by Riazanskoe and Tambovskoe, on the south by Orlovskoe, and on the west by Kaluzskoe; 120 miles long, and from 40 to 100 broad. Tula is the capital. N. lat. 53° to 55° . E. long. 36° to 38° .

TULUM, a town of Persia, in the province of Ghilan; 10 miles S. of Reshd.

TULUN, a town of Russia, in the government of Irkutsk, on the Ija; 44 miles E. of Niznei Udinsk.

TUMAGURRA, a town of Bengal; 18 miles N. of Toree.

TUMANSKOI, an island of Russia, in the Frozen ocean, of a triangular form, lying north of the isle of Kirlach, from which it is divided by a narrow channel; about 360 miles in circumference. N. lat. $71^{\circ} 50'$ to $73^{\circ} 15'$. E. long. 119° to 126° .

TUMANUNA, in *Ancient Geography*, a municipal town of Africa, in Mauritania Cæsarientis, according to the Table of Peutinger.

TUMARRA, a town of Africa, in Mauritania Cæsarientis. Ptolemy.

TUMB, or **TOMBO**, or *Petombo*, or *Cotombo*, or *Slangen*, or *Great Tomb*, in *Geography*, an island in the Persian gulf, about three miles in length from east to west, and much frequented by trankees from the Arabian shore, which reside here a week or ten days for the benefit of fishing. A sandy bay on the east side seems a good landing-place. N. lat. $26^{\circ} 24'$. E. long. $55^{\circ} 38'$.

TUMB Namu, or *Little Tomb*, a small island in the Persian gulf; 10 miles S.W. of Tomb.

TUMBABA, a word used by chemists to express sulphur vivum, or crude sulphur.

TUMBACH, in *Geography*, a town of Bavaria; 17 miles N.N.W. of Amberg.

TUMBADO, a small island among the Bahamas. N. lat. $26^{\circ} 24'$. W. long. $79^{\circ} 30'$.

TUMBALA, a word used by some authors, to express the squamæ, or scales, of any metal.

TUMBALI, in *Geography*, a town of Hindoostan, on the coast of Malabar; 25 miles S. of Cochin.

TUMBELAN ISLANDS, a cluster of small islands in the East Indian sea. N. lat. 1° . E. long. $107^{\circ} 58'$.

TUMBERIDIPAL, a town of Hindoostan, in Mysore; 22 miles N. of Daraporum.

TUMBEZ,

TUMBEZ, a town of Peru, in the jurisdiction of Piura, near a river of the same name, which discharges itself into the bay of Guayaquil, almost opposite to the island of St. Clare. Barks, boats, balzas, and canoes, may go up and down this river, being three fathoms deep, and twenty-five broad; but it is dangerous going up it in the winter season, the impetuosity of its current being then increased by torrents from the mountains. At a little distance from the Cordillera, on one side of the banks of the river, stands the town of Timbez, in a very sandy plain, interspersed with some small eminences. The town consists only of seventy houses, built of cane, and thatched, scattered up and down, without any order or symmetry. In these houses are about 150 families of Mestizos, Indians, Mulattoes, and a few Spaniards. There are, besides these, other families living along the banks of the river, who having the conveniency of watering their grounds, continually employ themselves in rural occupations. The heat is excessive; nor have they here any rain, for several years successively; but when it begins to fall, it continues during the winter. The whole country, from the town of Tumbez to Lima, contained between the foot of the Cordillera and the sea, is known by the name of *Valles*. Tumbez was the place where, in 1526, the Spaniards first landed in these parts of South America, under the command of Don Francisco Pizarro, and where he entered into several friendly conferences with the princes of the country, but vassals to the Incas. If the Indians were surpris'd at the sight of the Spaniards, the latter were equally so at the prodigious riches which they every where saw, and the largeness of the palaces, castles, and temples, of all which, though built of stone, no vestiges are now remaining; 280 miles N. of Truxillo. S. lat. 3° 13'. W. long. 80° 6'.

TUMBLER, a name given to a particular species of pigeon, called by Moore the *columba revolvens*. See PIGEON.

It has its name from its peculiar property of tumbling when it is in the air, which they are very fond of doing; and effect exactly in the same manner as our posture-masters do it; by throwing themselves over backward. It is a very small pigeon, and is always short-bodied, full-breasted, thin-necked, narrow-beaked, and has a small short head; the iris of the eye in this species is usually of a bright pearl-colour.

The English tumbler is usually of one plain colour; black, blue, or white: the Dutch is much of the same make, but has different colours, and is sometimes feathered on the legs; it has also a larger head, and thin skin round the eye. Some of the finest pigeons of this sort are bred from a mixture of the Dutch and English kinds. These pigeons are remarkable for the height to which they fly; they never ramble far from home, but will rise almost perpendicularly, till they appear no larger than a sparrow, or become quite out of sight; they will often keep at this height five or six hours, and then come gradually down again: they never tumble when they are at any great height, but only as they ascend or come down again. There are particular times also, at which these birds will take much higher flights than at others; but they ought to be kept by themselves, and practis'd to it by the company of one of their own species; for if they mix while young with other pigeons, they will learn to fly as they do; a flight of a dozen of these birds sent out together, will keep so close, as to be all in a compass that might be covered with a handkerchief; but they should never be turned out in foggy weather, or in high winds; in the first case, they lose sight of their home, and perhaps never find it

again; and in the other, they are blown away; and if they return, it is not till another day; in the mean time lying out, they are in danger of cats, and other accidents.

Lastly, the hen should never be turned out with egg, for she is then sick, and not fit for flying; and beside often drops her eggs, and the breed is lost by it. Moore's *Columbarium*, p. 39.

TUMBLER is also a sort of dog, called in Latin *vertagus*, from his quality of tumbling and winding his body about, before he attacks and fastens on the prey. See DOG.

This species took its prey by mere subtlety, depending neither on the sagacity of its nose, nor its swiftness; if it came into a warren, it neither backed nor ran on the rabbits; but by a seeming neglect of them, or attention to something else, deceived the object till it got within reach, so as to take it by a sudden spring.

These dogs are often less than hounds; being lank, leaner, and somewhat prick-eared; and by the form of their bodies, they might be called mungrel greyhounds, if they were a little bigger. They seem to answer to our modern lurchers.

TUMBLING-BAY, in a *Canal*, is the same with *overflow* or *weir*; which see.

TUMBLING Dam, in *Geography*, a place on the river Delaware; 20 miles above Trenton.

TUMBLING-Home, the inclination of the top-sides of ships from a perpendicular towards the centre or middle line of the ship. The top-sides of three-decked ships have the greatest tumbling-home, not only from their being loftier, but for the purpose of clearing the upper works from the smoke and fire of the lower guns. The advantages and disadvantages of tumbling-home sides will be found discussed in *Ship-building*; which see.

TUMBREL, **TUMBRELLUM**, a ducking or cucking-stool, an engine of punishment, which ought to be in every liberty, that has a view of frank-pledge, for the correction and cooling of scolds, and unquiet women.

TUMBREL, in *Artillery*, is a kind of carriage with two wheels, used to carry the tools of the pioneers and miners, and sometimes likewise the money of the army.

TUMBREL is also a common name for a dung-cart.

TUMBREL SHEEP, a contrivance of the basket kind for the purpose of keeping different sorts of food for the use of them. It consists of a sort of circular cage or basket made of osiers, willows, or any other plants of the brushwood kind. It is about ten feet in circumference in the whole, and closely wattled to the height of about one foot, above which it is left open for the space of eighteen inches; it is then wattled again to the height of eight or ten inches more, and an opening, about eighteen inches in breadth, is left at the top, for putting in the hay, roots, or other sorts of food, whether green or dry. The staves which form the skeleton of it are put ten inches asunder, so that twelve sheep may feed at it at the same time.

Considerable advantage may be derived from this simple contrivance in the feeding of these animals, as it not only effects a material reduction in the consumption and expence of the provender, which is by this means prevented from being trodden under foot, or soiled by the dung; but in this state of separation the stronger sheep cannot drive away the weaker, as each is secured by the head. And as the construction of such tumbrels is attended with no difficulty, they may be easily provided and conveyed to any part of a farm, and with due care be kept in constant use for eight or ten years, or even much longer.

TUMBUK, in *Geography*, a town of Africa, in Kordofan; 180 miles S.W. of Sennar.

TUMEFACATION, the act of swelling, or rising into a tumour.

Inflammations and tumefactions of the testes frequently happen in the gonorrhœa; either from the weakness of the vessels, violent motion, unseasonable use of astringents, a neglect of purging, or the like.

TUMEN, in *Geography*, a town of Persia, in the province of Ghilan; 18 miles W. of Reshd.

TUMERIZ, a town of Moravia, in the circle of Brunn; 6 miles W. of Nicolzburg.

TUMEX, in the *Materia Medica of the Ancients*, a name given by authors to a sort of tutty, the same with the *cadmia placitis* of Dioscorides and the Greeks. This was a worse kind than the botrytis. See **TSAPHARI**.

TUMMARRAH, in *Geography*, a town of Africa, in Sahara.

TUMMEL, a large river in Perthshire, Scotland, rises on the confines of Argyleshire. Near its source it forms a broad lake, called Loch Rannock, at the termination of which the river assumes the name of the Tummel. In its progress it forms another lake, called Loch Tummel, in which is a small island, with an old fortress or castle, formerly the residence of the chief of the clan of the Robertsons. The whole course of the Tummel is rapid and furious, and in several places forms very romantic and picturesque cascades. One of its falls, near its junction with the Garry, is particularly grand, as its whole water is precipitating over the broken rocks with astonishing violence. After its union with the Garry, the character of the Tummel seems entirely changed: before, it was an impetuous torrent; it now becomes a quiet and placid stream. The banks below the junction are extremely rich, and the river meanders through a fine valley; now dividing its stream, and forming small islands, now running in a broad sheet. Though the Tummel is smaller than the Garry, it gives the name to the river formed by their union, because it can trace its origin farther back than the Garry, which is composed of the waters of the neighbouring hills, while the source of the Tummel is a considerable lake, in its course from which several distant streams contribute to its importance. The Tummel pours its waters into the river Tay at Logierat.—Garnet's Tour through the Highlands, 4to. 1800. Beauties of Scotland, vol. iv. Perthshire, 1806.

TUMMEROO, a town of Meckley; 25 miles S.E. of Munnypour.

TUMMOO, a town of Meckley; 45 miles S. of Munnypour.

TUMOURS. The meaning of the word tumour, in *Surgery*, is exceedingly comprehensive; for it applies generally to the growth of all distinct superfluous parts, or substances, which did not make any portion of the original structure of the body, as well as to every morbid increase in the bulk of other parts, which naturally and always existed in the human frame. Within this definition will come the greater number of diseases; as *ascites* or *dropsy*, *bronchocele*, *adema*, *fungus hæmatodes*, *hydrocele*, *ganglions*, *inflammations* of various organs, *white swellings*, *aneurisms*, *abscesses*, *hemorrhoids* or *piles*, *exostoses*, *excrescences*, *polypi*, *herniæ* or *ruptures*, *scirrhus*, *warts*, &c. &c. (See these words.) Had it, therefore, entered into our arrangement to consider, in the present article, all the diseases which may be classed as tumours, we should have had a very tedious and laborious task indeed, namely, that of writing out and presenting to the reader, in this part of the Cyclopædia, a description of all the nature and treatment of at least two-thirds of all the diseases usually considered as surgical. Our plan, however, has been different; and for the sake of avoiding all occasion

for so long a production, we have treated of numerous kinds of tumours in separate articles, which are alphabetically distributed in this Dictionary.

In the present article, we propose to offer a few general remarks on the formation of tumours; to describe particularly those of the encysted and sarcomatous kinds; and to give some account of the manner of removing tumours in general.

It is difficult to give altogether an unobjectionable account of the formation of tumours, the secrets of which process will perhaps never be disclosed. We know that parts become thickened and enlarged by inflammation; but the causes of the origin and growth of all such swellings as consist of some new production, which made no part of the original composition of the body, may be said to be totally unknown. In Mr. Abernethy's surgical works will be found some remarks upon this subject, which are far more rational and interesting than those generally advanced.

"The incipient state of tumours," he observes, "will naturally first engage our attention; and those which perhaps form the best example and illustration of the subject, are such as hang into cavities from the membranous surfaces, which form their boundaries. The cause of tumours having a pendulous attachment attracted the attention of Mr. Hunter, who made the following remarks on the formation of one on the inner surface of the peritoneum, as is related by sir E. Home, in the Transactions of a Society for the Improvement of Medical and Chirurgical Knowledge, vol. i. p. 231. 'The cavity of the abdomen being opened, there appeared lying upon the peritoneum a small portion of red blood recently coagulated: this, upon examination, was found connected to the surface, upon which it had been deposited, by an attachment half an inch long; and this neck had been formed before the coagulum had lost its red colour.' Now had vessels shot this slender neck, and organized the clot of blood, as this would then have become a living part, it might have grown to an indefinite magnitude, and its nature and progress would probably have depended on the organization which it had assumed. I have," says Mr. Abernethy, "in my possession a tumour, doubtless formed in the manner Mr. Hunter has described, which hung pendulous from the front of the peritoneum, and in which the organization and consequent actions have been so far completed, that the body of the tumour has become a lump of fat, whilst the neck is merely of a fibrous and vascular texture. There can be little doubt, but that tumours form every where in the same manner. The coagulable part of the blood, being either accidentally effused, or deposited in consequence of disease, becomes afterwards an organized and living part, by the growth of the adjacent vessels and nerves into it. When the deposited substance has its attachment by a single thread, all its vascular supply must proceed through that part; but, in other cases, the vessels shoot into it irregularly at various parts of its surface. Thus, an unorganized concrete becomes a living tumour, which has at first no perceptible peculiarity as to its nature: though it derives a supply of nourishment from the surrounding parts, it seems to live and grow by its own independent powers; and the future structure, which it may acquire, seems to depend on the operation of its own vessels. When the organization of a gland becomes changed into that unnatural structure, which is observable in tumours, it may be thought in some degree to contradict those observations; but, in this case, the substance of the gland is the matrix, in which the tumour is formed.

"The structure of a tumour is sometimes like that of the parts near which it grows. Those which are pendulous into joints

TUMOURS.

joints are of a cartilaginous or osseous fabric; fatty tumours frequently form in the midst of adipose substance; and I have seen some tumours growing from the palate, and having a slender attachment, which in structure resembled the palate. Sometimes, however, they do not resemble in structure the parts from which they grow. The instance, just mentioned, of the pendulous portion of fat growing from the peritoneum, will serve as a proof: the vessels, which had shot into it, made the tumour into fat, whilst the neck was a fibrous and vascular structure. I have seen osseous tumours unconnected with bone, or periosteum; and, indeed, in general, the structure of a tumour is unlike that of the part in which it is produced. Therefore, we seem warranted in concluding, that, in many cases, the nature of the tumour depends on its own actions and organization; and that, like the embryo, it merely receives nourishment from the surrounding parts.

"If, then, the coagulable part of the blood be from any cause effused, if the adjacent absorbents do not remove it, and the surrounding vessels grow into it, the origin of a tumour may be thus formed. It may be right," says Mr. Abernethy, "to reflect a little on the causes which may occasion a deposition and consequent organization of the coagulable part of the blood; as such reflections throw light on the nature and growth of tumours, and lead to the establishment of principles, which are applicable to tumours in general. The deposition of the coagulable part of the blood may be the effect of accident, or of a common inflammatory process; or it may be the consequence of some diseased action of the surrounding vessels, which may influence the organization and growth of the tumours.

"In the former cases, the parts surrounding the tumour may be considered simply as the sources from which it derives its nutriment, whilst it grows apparently by its own inherent powers, and its organization depends upon actions begun and existing in itself. If such a tumour be removed, the surrounding parts, being sound, soon heal, and a complete cure ensues. But if a tumour be removed, whose existence depended on the disease of the surrounding parts, which are still left, and this disease be not altered by the stimulus of the operation, no benefit is obtained: these parts again produce a diseased substance, which has generally the appearance of fungus; and, in consequence of being irritated by the injury of the operation, the disease is in general increased by the means which were designed for its cure. It appears, therefore, that, in some cases of tumours, the newly formed part alone requires removal; whilst, in others, the surrounding substance must be taken away, or a radical cure cannot be effected.

"There is yet another circumstance deserving attention," says Mr. Abernethy, "before I proceed to the particular consideration of the subject; which is, that a tumour, once formed, seems to be a sufficient cause of its own continuance and increase. The irritation which it causes in the contiguous parts, is likely to keep up that increased action of the vessels, which is necessary to its supply; and the larger it becomes, the more does it stimulate, and of course contribute to its own increase.

"Suppose then a tumour to have formed and increased; it will continue to grow, and to condense the surrounding cellular substance, and thus acquire for itself a kind of capsule. Tumours are more closely or loosely connected to the surrounding parts; which circumstance seems to depend upon the degree of stimulus which they occasion, and the inflammation which they thus excite. This irritation perhaps may be the cause why some tumours, which are slow in their first increase, grow rapidly after they have acquired a

VOL. XXXVI.

certain size." See the Surgical Works of John Abernethy, F.R.S., &c. vol. ii. p. 7, et seq.

We regard the preceding account of the formation of tumours as the most rational and probable which has hitherto been offered.

All tumours, which are such as may be termed new-formed parts, and did not enter into the original structure of the body, appear to be endued with inferior powers of life, and are much sooner destroyed by inflammation than other parts, which always naturally existed in the animal frame. The knowledge of this fact has led to the method of curing several kinds of tumours, by the application of stimulating substances to them; but it is not a plan of treatment which will invariably answer. Some tumours are so large, that the constitutional illness, which would arise from the inflammation and sloughing of the whole of their mass, would in all probability be fatal. Some swellings are of a malignant, irritable character, so that applying stimulants to them is more likely to exasperate than cure the disease. Hence, it is generally deemed imprudent to apply caustics to cancerous affections; because unless every particle of such diseases, and a good deal of the surrounding substance, be destroyed by the action of these violent remedies, the case will not be benefited, but rendered ten times worse. Indeed, we may lay it down as a general maxim, that the plan of attacking tumours with stimulants and caustics is a bad one, unless it be certain that every particle of the disease can be in this manner easily and quickly destroyed, without too much local and constitutional irritation being produced.

Encysted Tumours.—In the midst of the subcutaneous cellular substance, of that which separates the muscles, or even of that which enters into the texture of different organs, tumours are observed to form, whose circumference presents a particular structure, and whose cavity is filled with unusual kinds of matter. The parietes of these tumours are composed of a sort of membrane, named a *cyst*, and are connected with the surrounding parts by means of the neighbouring cellular substance. This latter circumstance appears to have attracted the attention of a great many writers, who have conceived the formation of cysts, by supposing that a cavity of the cellular membrane, in consequence of disease, may have all its communications with the other cavities of the cellular membrane destroyed; that it may acquire the property of secreting matter entirely different from that which it secretes in the natural order of things; and that the accumulation of the deposited substance may produce a progressive distention of the small cavity. The layers of the cellular substance, in which the tumour develops itself, are afterwards supposed to undergo a kind of condensation; and by such theories, it is attempted to explain the considerable thickness of some cysts, the extraordinary appearances of their organization, and the possibility of resolving them into cellular substance by maceration, inflammation, suppuration, &c. It is difficult, observes M. Delpech, to adopt this opinion, and reconcile it to the following observations.

1. There are some thin transparent cysts, which have been termed *serous*, whose inner surface is villous, and whose cavity is filled with a sero-mucous secretion, resembling synovia. In the same cavity, hairs are frequently observed, which are of different lengths, and always curled; the roots being implanted into the sides of the cyst.

2. There are other cysts, which are generally of a thin, but much more compact, texture than cellular membrane, being, as it were, almost horny and half opaque. Their inner surface is pulpy, and sometimes irregular. Their cavity

cavity is filled with a fluid, that has more or less consistence, is pultaceous, and of a white or yellowish colour, being compared sometimes to pap, sometimes to liquid honey, and in other instances to fuet imperfectly melted. Hence, the names of *atheroma*, *meliceris*, and *steatoma*, by which they are commonly distinguished. The contents of these encysted swellings have different proportions of fat; and hairs are also frequently found in the cyst, their insertions into it plainly admitting of demonstration, notwithstanding the difficulty arising from the tenacity of the contained matter.

3. We observe some cysts formed of albumen converted into a fibrous texture, and whose organization is more or less imperfect. Particular cysts of this latter kind are composed of several concentric layers, which are only slightly adherent together, and the organization of which is unequally advanced. In such a case, M. Delpech has found the external layers made up of a perfectly fibrous texture; while the vestiges of an organized structure were much less evident in the subjacent layers, and altogether wanting in those most deeply situated, which were purely albuminous. The contained matter is of an albuminous or gelatinous quality.

4. Other cysts are what Delpech calls fibro-cellular; their sides are very thick, extremely compact, and sometimes even ossified in certain parts. The contents are almost like serum, occasionally tinged with blood.

5. Excepting this last sort of cyst, which is closely connected with the surrounding cellular membrane, and almost identical with it, there is, of every kind of cyst, a portion of the surface which scarcely has any adhesion to the circumjacent parts. In extirpating such tumours, if the surgeon makes a perpendicular cut through the parts, covering their external surface, he can afterwards completely detach them with the utmost facility. In short, they can be separated with a spatula, or any other blunt instrument, without any dissection.

6. Sometimes inflammation attacks the cellular membrane around the cyst, and terminates in suppuration. One or more spontaneous openings serve at first for the discharge of the abscess; but these are at length joined together by the effect of ulceration, and the whole mortified cyst sloughs away. The same thing is occasionally seen, when caustic has been applied to the skin covering the most prominent part of the swelling. The application not only produces an eschar of the integuments, it causes also an acute inflammation of all the cellular substance around the tumour, and mortification of the whole cyst, which comes away in a mass. Likewise, when the surgeon has been fearful of cutting out every portion of a cyst, and only opened it, or removed a part of it, with the design of completing the destruction of the rest by local applications, it has often happened that the remainder of the cyst has spontaneously sloughed away, while the surrounding cellular membrane was in a state of acute inflammation.

7. Lastly, an encysted tumour, treated in the preceding manner, has often presented phenomena resembling those of cellular substance, and admitted of being cured in the way which was desired. Healthy suppuration has been established; granulations have arisen; the cavity has been gradually lessened; and a solid cicatrix has at length been formed. But it has much more frequently happened, that the cavity has not been obliterated; but become filled with painful, bleeding, fungous excrescences, which have caused an apprehension of cancer, and a necessity for no longer deferring the extirpation of the disease.

These reflections appear to M. Delpech to justify the conclusion, that encysted tumours do not proceed from an

accidental or mechanical modification of the cellular membrane; but that they are so many new-formed organs, which are not endued either with the same degree or the same mode of vitality as the surrounding parts.

The causes of the formation of encysted tumours are entirely unknown: it is observed, however, that a strongly marked propensity to be afflicted with many such swellings exists in particular individuals, which is a fact that would lead one to suspect the operation of constitutional causes. For instance, it is common for those firm cysts, which contain a pappy matter, and which have received the appellations of *atheroma*, *meliceris*, and *steatoma*, to be very numerous in the scalp, or other particular situations. It is well known also that the fibro-cellular cysts, usually named dropsy of the ovary, are sometimes prodigiously numerous, either in one or both of these organs together. It is superfluous to remark, that external violence, to which encysted tumours have been often ascribed, has in reality no concern with the disease. Besides the evident disproportion between this species of cause and so great an organic change, it may be observed, that if a blow can sometimes be cited, as having preceded the formation of an encysted tumour, the same cause cannot be specified in other cases, where twenty or more of these swellings originate in succession.

An encysted tumour, at its commencement, is always exceedingly small, and of a perfectly indolent nature. It is not known whether, in this early state, the cavity of the cyst already exists. The swelling usually grows with remarkable slowness: indeed, it is often many years before it attains a considerable size. It even frequently happens, that after the tumour has become large enough to be manifest, the cyst remains stationary for years, until some irritation occurs, which renders the disease painful, and accelerates its progress. It appears that, in these circumstances, the latter enlargement of the tumour does not depend upon a brisker secretion of the kind of matter originally contained in it, but rather upon suppuration of the cyst. In fact, the inside of the sac is then found to be inflamed or ulcerated, and a certain quantity of pus blended with the pappy matter, with which the swelling had no doubt been previously filled. This change, however, seldom happens, unless the tumour be, by its situation, exposed to repeated external violence.

An encysted swelling is ordinarily of a spherical shape, except when this form is altered by the disposition of the surrounding parts. The tumour is moveable in a degree proportioned to the mass of cellular substance around it; and its surface is in general smooth and regular. Sometimes, however, bands of aponeurotic fibres press upon certain portions of it, as it enlarges; and thus it is rendered irregular. The same alteration may be produced by great inequality in the thickness and consistence of the sides of the cyst, or by their being weakened by internal ulceration. It is not uncommon in the beginning, and even sometimes in an advanced stage, for the swelling to have a very firm feel, either because the cyst is still of considerable thickness, and the contained matter not copious; or else because the cyst is exceedingly tense, not having yielded to the distention of the matter within it. In this circumstance, the swelling is not compressible; and if, at the same time, its surface should chance to be irregular and tuberculated, and especially if the disease should also be painful, the surgeon may easily make a mistake, and imagine the case to be cancer. The resemblance, indeed, is very great; and M. Delpech assures us, that he has seen practitioners of the highest merit deceived by it. But it more usually happens, that an encysted tumour presents, from the first, a soft, fluctuating,

TUMOURS.

fluctuating, doughy feel. The fluctuation is obvious enough, when the cyst is thin, and the contained matter almost all liquid. This symptom, however, is absent, when the sides of the swelling are very thick and firm, and its cavity is occupied by a pappy sort of matter; but, in this last kind of case, the shape of the mass may be altered by compression, and the tumour will retain every impression made in it. If to these circumstances we add, that the tumour is every where soft and compressible, we have all the proper symptoms of this class of swellings; symptoms by which they may be most frequently distinguished from every other disease that has any resemblance to them.

The stationary condition of an encysted tumour may last during life, if the disease be not exposed to external violence, and it be free from every complication. But, as we have already explained, an accidental irritation may cause an inflammation, and suppuration, and ulceration, of the cyst. The consequence may also be inflammation and ulceration of the integuments. In both cases, the cyst may spontaneously burst, the contents escape, the cyst slough away, and the ulcer heal; or else soft, painful, fungous granulations may shoot from the inner surface of the cyst, and render cicatrization impracticable. With regard to complications, a cancerous affection, which is sometimes joined with the organization of an encysted swelling, is the most afflicting: in this case, when ulceration occurs, the carcinomatous symptoms immediately make rapid and dangerous progress.

Encysted tumours, like aneurisms, may destroy the parts of bones, upon which they make considerable pressure. Delpech, *Précis Élémentaire des Maladies Chirurgicales*, tom. iii. sect. 8.

A curious appearance is sometimes the consequence of an encysted tumour being filled with a substance resembling horn in consistence; for, when the cyst bursts, the indurated contents gradually protrude, and sometimes form an appendage very much like horn. Some years ago, we saw a complete horn removed from the scrotum, by sir J. Earle, in St. Bartholomew's hospital. It had begun as a tumour, which, after bursting, emitted from its inside the horny excrescence. The preparation is now in Mr. Abernethy's museum.

In the British Museum is preserved a curious specimen of a horn, which grew from a woman's head, and, in all probability, was formed by a process similar to that which we have mentioned. In Mr. A. Cooper's possession is a still more remarkable specimen, which was given to him by Dr. Roots of Kingston, and which in shape and size bears a close resemblance to a ram's horn! It also grew from the head, and had been preceded by another horny excrescence, similarly situated and shaped, which had likewise been removed. We have subsequently been informed, that the patient, who was a gardener, had afterwards a third horn, which grew in the same identical place. In this case, we must suppose that a portion of the cyst had not been extirpated in the previous operations, and that it retained the power of secreting the horny matter. *First Lines of Surgery*, p. 142. edit. 3. See also *Horny Excrescences*, in this Cyclopædia; and sir E. Home on the same subject, in the *Philosophical Transactions*.

We have already noticed the curious fact of many cysts containing hairs: we have now to mention the more surprising circumstance of teeth having been sometimes found in the cavities of encysted tumours. A remarkable example was lately published by Mr. S. Barnes, surgeon at Exeter. The case was a double encysted swelling in the orbit; in the extirpation of which disease, a sharp bony process was dis-

covered, and removed, together with the remains of the fac which adhered to it.

On examination, it was found to be in structure a tooth, and much resembling in form and size the supernumerary teeth sometimes found in the palate. The part which projected into the fac was conical, and covered by smooth, shining, white enamel; the fac firmly adherent round a contracted portion at the base of the cone, resembling the neck of a tooth; and on the outside of the fac, the appearance of a root, truncated obliquely, with a passage in the centre, evidently containing blood-vessels. It was by this part that it was connected with the floor of the orbit. See *Medico-Chirurgical Transactions*, vol. iv. p. 316, et seq.

Practitioners are not acquainted with any effectual means of stopping the growth of encysted tumours; nor are the endeavours to promote the dispersion of the cyst and its contents by general or topical treatment, attended with any success. It has been alleged, that, in cases of what have been called sero-mucous cysts, the removal of these cysts and their contents might be brought about, by exciting the action of the absorbents with strong discutient topical applications; and instances of this mode of cure have been cited in relation to such swellings formed upon the patella, or at the extremity of the olecranon. But Delpech remarks, that, in these cases, the nature of the disease is mistaken, because, in the situations specified, there constantly exists a synovial membrane, a bursa mucosa, forming a kind of joint betwixt the bony prominence and the integuments. The synovia may accumulate and lodge in the cavity of the membranous sac; and if the membrane be not so thoroughly diseased, as to render the absorption of the synovial fluid impossible, the natural functions of the part may be re-established, and the swelling admit of being slowly dispersed. This is what is sometimes accomplished by different local remedies, particularly those of the discutient class. But if the synovial membrane is more completely diseased, its properties may be so altered, that the secretion from it is altogether of a different nature, and absorption is totally obstructed. This is what sometimes occurs in persons who are in the habit of kneeling a great deal; in them the synovial membrane is often considerably thickened; sometimes it is partly ossified; and Delpech mentions, that he has even found loose substances in its cavity. Here we see, that in the first instance, an immediate cure is possible, since the disease is not an organic alteration. But in the second example, which more resembles the state of encysted tumours, although it be only the change of a pre-existing organ, the affection cannot be cured without destroying the dis-tempered part. Delpech, with a view of opposing evident facts to such as are wrongly interpreted, or doubtful, adverts particularly to those sero-mucous cysts which so often form in the substance of the eye-lids. The apprehension of a scar upon the face, says he, constantly leads to a trial of topical resolvents, before extirpation is attempted. Surgeons know, however, that the tumours are not removed by absorption; and that, if the local applications sometimes accomplish the cure of the disease, it is by producing an irritation of the skin, which irritation extends itself to the cyst, where inflammation, suppuration, ulceration, and sloughing, are the consequences. But, generally speaking, these effects are not excited, and when they are, a cure of the disease is not uniformly the result. The inflammation, carried to the requisite pitch to produce ulceration of the cyst, may only affect some points of it, and perhaps merely that portion which is next to the integuments. Every where else the inflammation may be very slight, and quite insufficient to cause ulceration and sloughing of the deeper

part of the cyst. Then, external ulceration taking place, the tumour empties itself; and the part either heals up, with the exception of a fistulous opening; or things are brought into their original state by the formation of a perfect cicatrix, so that the encysted tumour makes its appearance again.

Some practitioners have thought that encysted tumours might be cured by the employment of irritating injections, like those so successfully used in the treatment of hydrocele. The experiments which have been made with them, however, are not generally answered; and, if we reflect upon the comparative state of things, it will appear that, in these cases, the object aimed at should not be the same. In the example of hydrocele, it is unnecessary to destroy the tunica vaginalis, and the obliteration of its cavity is all that is needed. Experience also proves, that, in consequence of a very mild degree of inflammation, the cavity of the tunica vaginalis is filled with lymph, which becomes organized, and connected with the adjacent membranous surfaces. This suffices to render all exhalation for the future impossible. But encysted swellings have a peculiar organization, different from that of any originally formed parts. We have no reason for supposing, that any slight inflammation will make them pour out coagulating lymph that is capable of becoming vascular. They even seem so indisposed to be thus affected, that nothing at all resembling it happens, unless the cause of the inflammation is kept up with considerable perseverance. The inflammation also, when it is excited, more readily produces mortification of the cyst, than the other kind of alteration. In fact, it is observed, that while some portions of the inflamed cyst become covered with fungous granulations, others mortify and separate in the form of sloughs. The whole of a cyst has not always the same structure, and ossified parts of it, for instance, are not likely to admit of that process, by which a hydrocele is usually cured. The hairs often growing in the cavity of an encysted tumour, must generally have their attachments destroyed by the inflammation following the use of an irritating injection, and they would then probably operate as extraneous substances.

These circumstances tend to shew, that the practice of making an incision into the swelling must be at all events preferable to that of employing irritating injections. By an incision, all the contents may be discharged, the whole cavity of the cyst exposed, and such applications constantly made as are calculated to keep up the requisite degree of inflammation. This method, also, gives the surgeon an opportunity of destroying particular portions of the cyst with caustic, if necessary. In this way, he is sometimes obliged to destroy the large fungi, which frequently originate from the thickest parts of the cyst, after it has been opened and cauterized, or merely irritated by the dressings. Too often, however, the superficial use of caustic is insufficient to lessen the size of these fungous growths, and not adequate even to restrain their daily increase; while deep cauterizations produce acute long-continued pain, fever, loss of rest, and great irritation of the whole extent of the disease. The train of symptoms, indeed, which the repeated free use of caustic may occasion, must seem still more alarming, when it is recollected that the cyst of the tumour sometimes becomes the seat of cancer; and that all the ravages of the latter disease in the ulcerated state may be the consequence. In this circumstance, the practitioner is obliged to have recourse to the extirpation of the swelling, and this sometimes a long while after the cyst has been opened, and not before the patient has suffered a long series of other painful, unavailing measures. Nor can these dangerous effects be avoided by opening the tumour with caustic instead of with

a cutting instrument. The more certain inflammation of the cyst thus aimed at, is by no means sure of ensuing; and it will never follow, unless the caustic act strongly on the cyst. Besides, the action of caustic is too variable to justify the calculation, that its effects will reach to a precise depth, and always effectually destroy the cyst. See Delpech, Précis Élémentaire des Maladies Chir. tom. iii.

The inconveniences of opening an encysted tumour ought to make us give a decided preference to extirpating or amputating the whole of the swelling, whatever may be the nature of the cyst. Indeed, this method of treatment is superior to all others. The art of doing the operation skillfully, consists in detaching the tumour from the surrounding parts without wounding the cyst. If the latter accident occur, the contents frequently flow out, the cyst collapses, and the continuance of the dissection is attended with more difficulty. It is a great point to remove every particle of the cyst; and hence it is satisfactory to take it out entire, that is, without wounding it. When any portion remains behind, the wound will frequently not heal, in consequence of fungous granulations arising from the diseased part. Unless the swelling be large, a single incision through the skin is sufficient; but in other instances, it is advantageous to

make two semicircular cuts in this manner, ; first, because it facilitates the removal of the tumour; and secondly, because it prevents a redundancy of skin, which would take place if none were removed, and which would have the effect of seriously retarding the cicatrization of the wound.

After the operation, the edges of the wound are to be brought together with sticking-plaster, and a compress and bandage applied.

The excision of encysted tumours, superficially situated, is mostly very easy, as the cyst is only slightly connected with the surrounding cellular membrane. But there may be more difficulty when the swellings have been in a previous state of inflammation; when they are very large, or when a portion of the cyst is deeply situated, or closely adherent to other parts. First Lines of Surgery, p. 144, edit. 3.

We must not quit the subject of encysted tumours, without making a few remarks on those of the scalp.

The encysted tumours met with in this part, are situated between the integuments and the aponeurosis of the occipito-frontalis muscle. Their cysts are mostly of a hard, horny consistence, and filled with a pulsatious matter, being what are termed cases of *atheroma*. It is very common for such swellings to grow in great numbers. The intimate union between the aponeurosis and the skin causes the latter to be considerably stretched by the growth of tumours underneath it; but notwithstanding this effect, and that the integuments are also sometimes rendered very thin from the same cause, they are seldom altered in appearance, excepting occasionally their exhibiting a livid colour, which is a sign of their being about to ulcerate. When encysted tumours of the scalp have slowly attained an immense size, the skin covering them is distended in such a degree, that it is either quite bald, or at most only has a very few hairs upon it, so widely separated are the bulbs. It rarely happens that the pressure of the swelling produces an absorption of the part of the skull underneath the disease; but examples of this kind have sometimes been observed.

Encysted tumours on the top of the head, even when they have acquired a considerable size, may be easily concealed by a hat, cap, or the head-dress; and, unless in a painful, inflamed, or ulcerated state, cause but little inconvenience. But when they are situated at the sides of the cranium, they render the wearing of hats, or any kind of head-dress, less conve-

TUMOURS.

convenient, and are much exposed to frequent causes of irritation, by which their enlargement, and even external ulceration, may be promoted.

The solidity and simple structure of the surrounding parts make the extirpation of these tumours very easy of accomplishment. A great portion of the skin which covers them, thin as it may be, ought to be saved and laid down immediately upon the subjacent parts. It is only when the skin has been enormously distended, that it becomes necessary to cut away the redundant quantity of it. No endeavour should ever be made to cure encysted swellings of the scalp by opening them, or applying caustic. The safest method is to remove them altogether with the knife. The surgeon need not be afraid of extending his incisions under the deepest part of the swelling; for if he be careful to cover the denuded part of the cranium with the skin which he is to save, no exfoliations will generally follow. They do not necessarily follow, even when the pressure of the swelling has caused an absorption of some of the subjacent bone. Delpech is of opinion, that, as the scalp is very disposed to erysipelous inflammation after wounds, surgeons ought not to cut out encysted tumours of that part, unless they produce serious inconvenience. On this point, however, we think differently; because we regard the objection to the operation, on the score of the danger of erysipelas from the wound, as exaggerated, and by no means sufficiently valid to justify leaving the tumour to itself. The disease would then continue to increase; the operation required hereafter would consequently be more serious; and, in the event of the tumour ulcerating, both more difficult in its execution, and more uncertain in its event.

In another part of the Cyclopædia, the reader will find a few observations on the encysted tumours which frequently form upon the eye-lids. See *EYE-LIDS, Encysted Tumours of*.

Of Fatty Tumours, Adipose Sarcoma, or Lipoma.—Fatty tumours, often termed also *lipomatous*, or *adipose*, are formed by an accumulation of fat in a limited, and generally very circumscribed, extent of the cellular substance. The structure of a lipoma is absolutely the same as that of the adipose substance, such as it appears to be in those situations where fat naturally collects; with this difference, however, that the interstices of the cellular membrane, thus affected, are of considerable size, and obviously enlarged. The integuments, which are distended, and rendered much thinner, constitute a true sac spread over the mass of fat, of which the tumour is composed; nothing appearing to be interposed between them and the swelling itself. There are some cases, where the partitions of the cellular substance, which separate the cavities in which the fatty matter is deposited, are thicker and more compact than in the natural state; and when a section is made of these swellings, the exposed surface presents a marbled appearance of a yellow and white colour. Delpech remarks, that this species of lipoma is more disposed to become cancerous, than the common forms of it; but of this, very rational doubts may be entertained. In fact, our experience teaches us that true adipose tumours have as little tendency as any sort of swelling to change into true carcinoma, or that disease which is characterized by the peculiar alteration of structure, seen only in scirrhus affections.

Fatty swellings are mostly of an oblong pyramidal shape, and have a narrow pedicle, which is itself of a fatty texture; but sometimes they have a base, which is as broad as the whole mass of the tumour.

Lipomatous or fatty tumours are met with in persons of all ages; but they are most frequently observed in adults. The shoulders, the back, and the neck, are very common

situations for these swellings. But their occurrence is so frequent, that there are few surgeons who have not had many opportunities of seeing them in almost every region of the body. We once saw an adipose tumour which grew on the thigh, and after it had been removed by Mr. Cline, in St. Thomas's hospital, was found to weigh between fourteen and fifteen pounds. Sometimes adipose tumours are formed in parts where there is naturally but a small quantity of fat: thus Delpech has seen a fatty swelling formed in the labia pudendi, the structure of which is very different from fat. Sometimes adipose swellings are formed betwixt the peritoneum and the parietes of the abdomen, in which circumstance the tumours make their way outwards under the integuments, drawing along with them the part of the peritoneum to which they are attached. Such cases have been improperly named by the French surgeons "hernies graisseuses."

The causes of the growth of adipose tumours are not known: the disease has been sometimes ascribed to blows, and other kinds of external violence; but we agree with M. Delpech in believing, that this doctrine is altogether incorrect and unfounded.

The shape and slow growth of adipose tumours might suffice to indicate their nature; but they present other characters, amongst which the consistence of the mass of the swelling deserves particular notice. These tumours are not elastic, but of a peculiar soft feel, resembling what is perceived on handling a bag filled with cotton. Their surface is unequal, but the irregularities which are distinguishable through the thin integuments have no firmness, and are obliterated by compression. These circumstances, however, are only strongly marked in such adipose tumours as have not yet acquired an immense size, and which remain free from every complication. When the swelling has become exceedingly large, its weight, its magnitude, its pressure on the surrounding vessels and integuments, materially obstruct the circulation; and an œdema then taking place between the skin and adipose substance, the consistence of the latter part may appear to be increased. A manual examination, however, made by a surgeon of experience, will still detect the kind of softness which is peculiar to all fatty tumours, and discriminate it from the firmer feel of the cellular membrane immediately under the skin. Any previous attacks of inflammation may produce the same effect, and this even in a more remarkable degree. Such attacks are very common in those adipose swellings whose situation particularly exposes them to frequent causes of irritation. Thus, M. Delpech once saw a large lipoma growing in one of the labia pudendi, the incessant motion of which swelling, together with the friction of the thighs against it, and the irritation of the urine, had frequently made the skin inflame, and caused deep ulcerations in the sides of the tumour. The swelling was heavy and indurated; the irregularities of its surface were much firmer than usual; but in handling the mass attentively, the peculiar consistence of lipoma could be distinguished in the deeper part of the tumour, and be discriminated from the hardness of the integuments and cellular substance. Such induration is accidental; it seldom affects the whole of an adipose tumour; when it occurs, it is always confined to the layers of cellular membrane in which the adipose substance is lodged; it originates from repeated external irritation; and it should always be well discriminated from the hardness arising from a cancerous disease.

Adipose tumours, for the most part, grow in a regular, slow, and progressive manner; and their vessels are generally neither large nor numerous. Hence the removal of these swellings is attended with little danger of any serious degree

of hemorrhage, and they are very easily separated from the surrounding parts. The detachment of the tumour, however, may be more difficult when there have been previous attacks of inflammation in the part. An adipose tumour, even when large, may continue a great many years without producing any material inconvenience, provided no complication attend the disease. The swelling may grow with more or less rapidity, or remain stationary; but it has never been observed to disappear spontaneously; and every means which has been hitherto tried with a view of dispersing it, has proved ineffectual. The only method of cure consists in cutting away every part of such a swelling, which ought to be done before the diseased mass is of very large size.

Of some other Kinds of Sarcomatous Tumours.—It is extremely difficult to name and describe, clearly and unobjectionably, all the different varieties of sarcoma. Mr. Abernethy has proposed naming them according to their anatomical structure, or their supposed resemblance in texture to particular organs. Thus he adopts the terms *common vascular*, or *organized sarcoma*; *adipose sarcoma*, which we have already described; *pancreatic sarcoma*; *cystic sarcoma*; *mastoid* or *mammary sarcoma*; *tuberculated sarcoma*; *medullary sarcoma*, &c.

Under the title of common vascular, or organized sarcoma, Mr. Abernethy comprehends all tumours which appear to be composed of the gelatinous part of the blood, rendered more or less vascular by the growth of vessels through it, without having any distinguishing peculiarity of structure. Mr. Abernethy conceives that this kind of organization in tumours is the most simple, and, perhaps, may always precede other descriptions of structure. Vascular sarcoma not only makes its appearance as a tumour, which is altogether extraneous in regard to the original conformation of the body, it also enlarges natural parts, especially the testis, mamma, and absorbent glands.

When this sort of swelling has attained a considerable size, the superficial veins become quite varicose. If left to itself, the tumour generally grows till the skin is so distended, that it ulcerates and exposes the new-formed substance, which sloughs and falls out.

In this manner the disease might be got rid of; but such are the constitutional irritation attending it, and the fetor and frightful appearance of the part, that the surgeon generally waits no longer, but removes the whole mass of the disease with his knife.

Pancreatic sarcoma is the name which Mr. Abernethy applies to those fleshy tumours which resemble the pancreas in structure. The substance of which they consist is composed of irregularly-shaped masses, connected together by a fibrous kind of texture. This species of sarcoma is sometimes formed distinctly in the cellular substance; but most commonly occurs in the female breast, perhaps originating in the lymphatic glands. The tumour increases slowly, and generally has little tendency to inflame and suppurate. The morbid structure in question frequently takes place in the breast, a little above, and on that side of the nipple which is next to the arm. In general the disease is chronic, and does not involve the neighbouring absorbent glands. But, in a few instances, this species of sarcoma, when situated in the breast, deviates from its ordinary indolent nature, and occasions severe, lancing pain, an inflammatory state of the integuments, and an adhesion of them to the tumour, the axillary glands also becoming enlarged. Pancreatic sarcoma is sometimes so irritable a disease, that Mr. Abernethy thinks it may frequently be considered as bad as cancer. When the glands in the axilla become affected, one generally first swells, and is extremely tender and painful; afterwards

the pain abates, and it remains indurated; another then becomes affected, and runs through the same course.

Those sarcomatous tumours which contain cysts or cells, Mr. Abernethy distinguishes by the term *cystic*. The disease sometimes occurs as a distinct swelling; but it is more commonly observed in the testicle and ovary. The cysts are very vascular, so that they admit of being made quite red with an anatomical injection. They generally contain a serous fluid; but sometimes a caseous substance. Mr. Abernethy believes that this species of sarcoma is peculiarly intractable when situated in the testicle.

The *mastoid* or *mammary* sarcoma is so named from its resemblance to the mammary gland in structure. Mr. Abernethy has not frequently seen this kind of tumour, and his attention was called to the nature of the disease by a case, in which a swelling, partaking of the above structure, and about as large as an orange, was removed from the front of the thigh. The wound seemed at first disposed to heal; but it afterwards degenerated into a malignant ulcer, which in about two months proved fatal. As this sort of tumour is gradually lost in the surrounding parts, which probably retain a disposition to assume a similar morbid alteration, Mr. Abernethy very judiciously recommends a more extensive removal of them than was practised in the foregoing example.

Tuberculated sarcoma is the name proposed by Mr. Abernethy for those fleshy swellings which consist of an aggregation of small, roundish tumours, of various sizes and colours, connected together by a kind of cellular substance. This gentleman has principally seen the disease in the lymphatic glands of the neck. The tumours ulcerated, became painful sores, and ultimately destroyed the patients. Mr. Abernethy regards the tuberculated sarcoma as an incurable and fatal disease; though, fortunately, its occurrence is unfrequent.

Medullary sarcoma is the term applied by Mr. Abernethy to a malignant and dangerous kind of tumour, which resembles in its structure and appearance the medullary substance of the brain. It is often seen affecting the testis, and has been termed the *soft cancer* of that part. Many surgeons consider this affection and the fungus hæmatodes as the same: we do not therefore deem it necessary to offer here any remarks in addition to those already delivered on the latter disease in another article. See FUNGUS.

Treatment of Tumours.—Surgeons not only remain ignorant of those particular causes which produce the commencement of the growth of the various descriptions of fatty, fleshy, indolent tumours; they also know no effectual means by which the progress of the disease can be stopped, and the patient freed from the inconveniences of continually bearing about with him a mass of redundant matter, which, in a chronic state, is both a deformity and an oppression; and in an inflamed or ulcerated state, is a source of severe pain, and even of fatal mischief. It has been conjectured that topical bleeding and cold applications would check the growth of indolent tumours; but experience teaches us to place no dependence upon the plan. Mercurial frictions, electricity, blisters, and local stimulants, have also been repeatedly tried, with a view of exciting the action of the absorbents, and dispersing the swelling. These methods, however, are not recommended by many examples of success; and they are attended with some risk of irritating the tumour, without lessening it, in which case the disease sometimes changes from an indolent quiet form to an irritable state, in which it inflames, enlarges, ulcerates, emits fungi, and assumes a character as dangerous and intractable as that of cancer itself. Whenever a swelling is suspected of being either a mammary, tuber-

TUMOURS.

tuberculated, or medullary sarcoma, it is particularly necessary to abstain from doing any thing which may irritate the part.

Of the Operation of removing a diseased Breast, and Tumours in general.—The operation of cutting away a diseased breast, is done nearly in the same manner as the removal of tumours in general, and is indicated whenever the part is affected with an incurable disease, which admits, however, of being entirely removed with the knife. When the breast is affected with scirrhus, or ulcerated cancer, the imprudence of tampering with the disease cannot be too severely censured. Were the disorder unattended with a continual tendency to increase, some time might properly be dedicated to the trial of those internal remedies, and external applications, which have acquired any character for doing good in these unpromising cases. But, unfortunately, by endeavouring to cure the disease by medicine, we only afford time for it to increase in magnitude, and, at length, to attain a condition, in which even the knife cannot be employed so as to take away the whole of the diseased parts. When the case is marked by the characteristic features of scirrhus, the sooner the tumour is cut out the better. There are also some malignant kinds of sarcoma to which the female breast is subject, which cannot be removed at too early a period after their nature is suspected or known. Indeed, though there is not equal urgency for the operation when the tumour is only an indolent, simple, fatty, or sarcomatous disease, yet as all these tumours are continually growing larger, and little success attends the attempt to disperse them, the practitioner should never devote much time to the trial of unavailing medicines and applications, and let the swelling attain a size, which would require a formidable operation for its excision. Besides, every simple, fleshy, or fatty tumour, is always accompanied with a certain hazard of changing into a malignant or cancerous one.

Certainly there are many swellings and indurations of the breast, which it would be highly injudicious and unnecessary to extirpate, because they generally admit of being discoloured. Such are many tumours which are called *scrophulous*, from their affecting patients of this peculiar constitution: such are nearly all those indurations which remain after a sudden and general inflammatory enlargement of the mamma: such are most other tumours which acquire their full size in a few days, attended with pain, redness, &c.: and of this kind, also, are the hardnesses in the breast, occasioned by the mammary abscesses.

In the removal of all tumours, their malignant or cancerous nature makes it necessary to observe one important caution in the operation; *viz.* not to rest satisfied with cutting away the tumours just at their circumference; but to take away also a considerable portion of the substance in which they lie, and with which they are surrounded. In cutting out a cancerous breast, if the operator were to be content with merely dissecting out the disease, just where his eyes and fingers might equally lead him to suppose its boundary to be situated, there would still be left behind white diseased bands, which radiate from the tumour into the surrounding fat, and which would inevitably occasion a relapse. In a vast proportion of the cases also in which cancer of the breast unfortunately recurs after the operation, it is found that the skin is the part in which the disease makes its reappearance. Hence the great prudence of taking away a good deal of it in every case suspected to be a truly scirrhus or cancerous disease. This may also be done so as not to prevent the important objects of uniting the wound by the first intention, and covering the whole of its surface with sound integuments. So frequently does can-

cer recur in the nipple, whenever it does recur any where, that many of the best modern operators always make a point of removing this part in every instance in which it is judged expedient to take away any portion of the skin at all. The surgeon, indeed, would be inexcusable, were he to neglect to take away such portion of the integuments covering scirrhus tumours, as is evidently affected, appearing to be discoloured, puckered, and closely attached to the diseased lump beneath. Nor should any gland in the axilla, at all diseased, nor any fibres of the pectoral muscle, in the same state, be ever left behind. There is no doubt that nothing has stamped operations for cancers with disrepute, so much as the neglect to make a free removal of the skin and parts surrounding every side of the tumour. Hence the disease has frequently appeared to recur, when, in fact, it had never been thoroughly extirpated; the disease, though entirely a local affection, has been deemed a constitutional one; and the operation frequently rejected as ineffectual and useless.

But, strongly as we have urged the prudence, the necessity of making a free removal of the skin covering, and of the parts surrounding every cancerous or malignant tumour, the same plan may certainly be regarded as unnecessary, and therefore unscientific, in most operations for the removal of simple, fatty, or fleshy tumours. However, even in the latter cases, when the swelling is very large, it is better to take away a portion of skin; for otherwise, after the excision of the tumour, there would be a redundancy of integuments, the cavity of which would only serve for the lodgment of matter. The loose superfluous skin, also, would lie in folds, and not apply itself evenly to the parts beneath, so as to unite favourably by the first intention; nor could the line of the cicatrix itself be arranged with such nice evenness as it might be, were a part of the redundant skin taken away at the time of operating.

The best method of removing a diseased breast is as follows: The patient is usually placed in a sitting posture, well supported by pillows and assistants; but the operator would find it equally convenient, if not more so, to remove the tumour with his patient in a recumbent position; and it certainly is better whenever the operation is likely to be long, or much blood to be lost, which circumstances are very apt to bring on fainting. We remember that Mr. Abernethy, in his lectures, used to recommend the latter plan; which, however, without the sanction of any great name, or authority, possesses such obvious advantages, as will always entitle it to approbation.

The arms should be confined back, by placing a stick between them and the body, by which means the fibres of the great pectoral muscle will be kept on the stretch, a state most favourable for the dissection of the tumour off its surface. The stick also prevents the patient from moving her arm about, and interrupting the progress of the operation.

When the tumour is not large, and only a simple sarcoma, free from malignancy, it will be quite unnecessary to remove any of the skin, and of course this need only be divided by one incision, of a length proportionate to the tumour. The cut must be made with a common dissecting knife; and, as the division of the parts is chiefly accomplished with the part of the edge towards the point, the instrument will be found to do its office best when the extremity of the edge is made of a convex shape, and this part of the blade is turned a little back, in the way in which dissecting knives are now often constructed. The direction of the incision through the skin should be made according to the greatest diameter of the tumour to be removed, by which means it will be most easily dissected out.

TUMOURS.

The direction of the incision is various with different practitioners; some making it perpendicular, others transverse. In general, the shape of the tumour must determine which is the best. In France, it has been said, that when the incision follows the second direction, it heals more expeditiously, because the skin is more extensible from above downward, than laterally, particularly towards the sternum, and consequently allows the sides of the wound the more readily to be placed in contact; and that the action of the pectoral muscle tends to separate the edges of the wound when it is perpendicular. On the other hand, it is allowed that the wound, made in the latter manner, is the most favourable for the escape of the discharge, if suppuration should occur. See *De l'usage de la ligature* par Bichat, tom. ii. p. 312.

The cut through the skin should always be somewhat longer than the tumour; and as it is, perhaps, the most painful part of the operation, and one attended with no danger whatever, it should be executed with the utmost celerity. Pain is certainly more or less to be dreaded, according to its duration. The fear, however, of giving pain, has probably led many operators to err, by not making their first incision through the integuments large enough, the consequence of which has often been, that there was not room enough to get at the tumour so as to dissect it out with facility: the patient has been kept nearly an hour in the operating room, instead of five minutes, and the surgeon censured by the spectators as awkward and tedious. It is clear, also, that, besides the great deal more blood lost from this error than would otherwise happen, the vessels being commonly not tied till all the cutting is finished, the avoidance of pain, that fear which led to the blunder, is not effected, and the patient suffers much more, and for a much longer time, in consequence of the embarrassment and obstacles in the way of the whole operation.

When the disease is of a scirrhus or malignant nature, the skin covering the tumour should at all events be in part removed. All that portion which is discoloured, puckered, tuberculated, or otherwise altered, should be taken away. Some must also be removed, in order to prevent a redundancy, in all cases in which the tumour is large. We have said too, that in cases of scirrhus and cancer of the breast, the nipple is considered a dangerous part to be left behind. For the purpose of removing the necessary portion of skin, the surgeon must obviously pursue a different mode from that above described; and instead of one straight incision, he is to make two semicircular ones, one immediately after the other, and which are to meet at their extremities. The size of these wounds must be determined by that of the disease to be removed, and by the quantity of skin which it is deemed prudent to take away; for the part which is included in the two semicircular cuts, is that which is not to be separated from the upper surface of the swelling, but taken away with it. The shape of the two cuts together may approach that either of a circle or oval, as the figure of the tumour itself may indicate as most convenient. The direction of the incisions is to be regulated by the same consideration.

In the above ways, the first division of the integuments is to be made in removing tumours of every description covered with skin. The same principles and practice should prevail in all these operations; and, whether the swelling is the mamma, or any other diseased mass, whether situated on the chest, the back, the head, or extremities, the same considerations should always guide the operator's hand.

The incision or incisions in the skin having been made, the next object is to detach every side of the tumour from its connections, and the separation of its base will then

be the last and only thing remaining to be done. When the tumour is a scirrhus, or other malignant disease, the operator must not dissect close to the swelling, but make his incisions on each side, at a prudent distance from it, so as to be sure to remove with the diseased mass, every atom of morbid mischief in its vicinity. But when the tumour is only a mere fatty or other mass, perfectly free from malignancy, the cellular bands and vessels forming its connections may be divided close to its circumference. It is astonishing with what ease fatty tumours are removed, after the necessary division is made in the skin; they may almost be turned out with the fingers, without any cutting at all. When they have been inflamed, however, they are then more adherent to the surrounding parts.

Thus we see, that the first stage of the operation of removing a tumour, is the division of the skin; the second, the separation of the swelling from the surrounding parts on every side; the third and last stage is the division of the parts to which its under surface, or base, is attached. The latter object should be accomplished by cutting regularly from above downward, till every part is divided.

It is a common thing to see many operators constantly embarrassed and confused, whenever they have to remove a large tumour, on account of their having no particular method in their proceedings. They first cut a few fibres on one side, then on another; and turning the mass of disease now to this side, now to that, without any fixed design, they both prolong the operation very tediously, and present to the bystanders a complete specimen of surgical awkwardness. On the contrary, when the practitioner divides the cutting part of the operation into the three methodical stages above recommended, in each of which there is a distinct object to be fulfilled, he proceeds with a confidence of knowing what he is about, and soon effects what is to be done, with equal expedition and dexterity.

Having taken out the tumour, the operator is immediately to tie such large vessels as may be pouring out their blood; indeed, when the removal of the swelling will necessarily occupy more than three or four minutes, it is better to tie all the large arteries as soon as they are divided, and then proceed with their dissection. This was the celebrated De-fault's plan, and it is highly deserving of imitation in this country, not only because many subjects cannot afford to lose much blood, but also because the profuse effusion of this fluid keeps the operator from seeing what parts he is dividing.

The largest arteries being tied, the surgeon should not be immediately solicitous about tying every bleeding point which may be observed. Instead of this, let him employ a little time in examining every part of the surface of the wound, in order to ascertain that no portion of the swelling, no hardened lump, nor diseased fibres remain behind. Even if any part of the surface of the pectoral muscle should present a morbid feel or appearance, it must, on every account, be cut away. Also, if any of the axillary glands are diseased, the operator should now proceed to remove them. After the time spent in such measures, many of the small vessels, which bled just after the excision of the swelling, will now have stopped, the necessity for several ligatures will be done away, and of course the patient saved a great deal of pain, and more of the wound be likely to heal by the first intention.

Some information may be derived, respecting whether any of the tumour is left behind, by examining its surfaces, when taken out, and observing whether any part of them is cut off; for if it is, it may always be found in the corresponding part of the wound.

TUMOURS.

The axillary glands may always be taken out, without the least risk, if the plan pursued by Desault in France, and fir Charles Blicke, and other eminent surgeons in this country, be adopted. The method alluded to is, after dividing the skin covering the gland, and freeing the indurated part from its lateral connections, to tie its root, or base, with which it is connected, with the parts on the side towards the cavity of the axilla. Then the indurated gland itself may be safely cut off just above the ligature. Were the gland cut off in the first instance, the artery which supplies it with blood would be exceedingly difficult to tie, on account of its deep situation; and, by reason of its shortness and vicinity to the heart, it would bleed almost like a wound of the thoracic artery itself. In this way, there is also not the least hazard of injuring the latter vessel. It would be a great improvement in the mode of operating for the removal of these glands, if surgeons were always to make the patient lie down, with the arm placed in such a position as would let the light fall into the axilla. How much the steps of the operation would be facilitated in this way, we need not attempt to explain.

The above directions will enable a surgeon to remove tumours in general. They apply also in a great measure to encysted tumours; but in the latter cases, particular care must be taken not to wound the cyst, as it then collapses, and the dissection of it out is much more difficult. One half of each ligature is always to be cut off before dressing the wound. The edges of the incision are to be brought together with strips of adhesive plaster; and, before this can be done with ease, the stick confining the arm back must be removed, and the os brachii brought forward, so as to relax the pectoral muscle and integuments of the breast. No futures should ever be employed, as they are useless, painful, and irritating. The wound being closed with sticking plaster, and a pledget of simple cerate, a compress of folded linen, or flannel, may be put over the dressings; these are to be secured with a broad piece of linen, which is to encircle the chest, be fastened with pins or stitches, and kept from slipping down by two tapes, one of which is to go from behind forward, over each shoulder, and be stitched to the upper part of the bandage both in front and behind. The arm on the same side as that on which the operation has been done, should be kept at rest in a sling: every motion of the limb must evidently disturb the wound by putting the great pectoral muscle into action, or rendering its fibres sometimes tense, sometimes relaxed.

In the article SURGERY, we have adverted to the plan of cutting off both ends of the ligatures applied to the arteries, with a view of lessening the quantity of extraneous substance in the wound, and rendering union by the first intention more probable. This method has been tried by Mr. Lawrence after operations on the breast, and also by M. Roux and professor Delpech in France, who all make favourable reports of the practice.

The removal of tumours from the neck is frequently an operation of delicacy and difficulty, especially when the exact attachments and depth of the swellings are not precisely known. The many large arteries in this part of the body, and its being the situation of the carotid artery, and internal jugular vein, are considerations which ought to deter every surgeon who is not an anatomist, from venturing to cut away swellings from the neck, particularly such as have bases extending more or less deeply, and not very moveable. Unfortunately for the man who is deficient in anatomical knowledge, the neck is as common a situation for tumours requiring the use of the knife, as any part which can be specified.

One of the boldest operations, for the removal of a tumour from the neck, was that lately performed by Mr. William Goodlad, surgeon at Bury, in Lancashire, and recorded in the seventh volume of the *Medico-Chirurgical Transactions*, p. 112. In order to do away the danger of hemorrhage from arteries, this gentleman began with tying the trunk of the carotid artery: some conception of the nature of the whole proceeding may be formed from the view which the wound presented after the entire swelling had been removed. "The whole sterno-mastoid muscle was exposed, and its fibres dissected clean, except about half an inch from its insertion into the clavicle. The wound extended backwards from behind the mastoid process to the trachea anteriorly, but became narrowed in the direction of the muscle at the lower part of the neck. The sub-maxillary gland was exposed, and about one-fifth of its substance, not appearing healthy, was removed. The digastric and the greater part of the mylo-hyoideus were exposed, the ramus of the jaw was only covered by periosteum, except where covered by the masseter muscle, part of which, not appearing healthy, was dissected away. The whole of the condyloid process of that bone was laid bare in the same manner, and behind it the pterygoid muscles were also exposed. The membrane of the cheek was only covered by a cellular substance, which did not appear healthy; but sufficient skin was saved to cover the zygoma. The parotid gland was entirely removed!"

This, which is one of the boldest operations on record, proved successful, the wound having completely healed in ten weeks, and no recurrence of the tumour having followed. See Abernethy's *Classification of Tumours*. *Delpech Précis Élémentaire des Maladies réputées Chirurgicales*, tom. iii. *Cooper's Dictionary of Practical Surgery*. *Medico-Chirurgical Transf.* vol. vii. pt. 1, &c.

TUMOUR, among *Animals*, is a preternatural swelling or enlargement in any part, arising either from an external injury, or an internal cause. Tumours in them are of several different kinds, according to the nature of the causes.

Where tumours or swellings are caused by external accidents, such as blows, bruises, and other such means, they should at first be treated with restraining applications; such as having the parts bathed frequently with warm vinegar or verjuice; and where they will admit of bandage, a flannel wetted with the same should be rolled or laid on, and fastened by it. When by this method the tumour or swelling does not give way and subside, a poultice made with red-wine lees, strong-beer grounds, and oatmeal, or with vinegar, oil, and oatmeal, should be applied, especially when on the legs; either of which applications may be used and continued twice a day after bathing the parts in the above manner, until the swelling abates, when, in order to wholly disperse them, the vinegar should be changed for camphorated spirits of wine; to four ounces of which, one of spirit of sal ammoniac may be added; or they may be bathed with a mixture of two ounces of crude sal ammoniac boiled in a quart of chamber-ley, twice a day, and cloths dipped in the same be put on them. Fomentations, too, made by boiling wormwood, bay-leaves, and rosemary, with a proper quantity of spirits, are not unfrequently of use in a high degree.

However, in bruises where there may be extravasated blood, which is not taken up or dispersed by these means, the shortest and most convenient way is to open the skin, and to let out the grumous blood.

The critical tumours or swellings in horses or other animals, which terminate fevers, or other diseases, should by no means be dispersed, except, when in the horse, they fall

upon the pattern or coffin-joint, so as to endanger them; in which cases the discutient fomentation may be applied three or four times a day, and a cloth or flannel frequently wrung out of the same may be bound on the parts.

But when the swellings fix themselves under the jaws, behind the ears, on the poll, the withers, or in the groin, sheath, or other parts of the horse, or any other animal, they should be encouraged and brought forward by ripening poultices, wherever they can be applied: oatmeal boiled soft with milk, to which a proper quantity of oil and lard is added, may answer this purpose; or the poultice composed of linseed-meal, as used in other cases: these should be applied twice a day, until the matter is perceived to fluctuate, by the feel, under the finger, when it should be let out; for which purpose a knife or strong lancet should be used, making an opening the whole length of the tumour, where it can be safely done, as nothing contributes so much to a kind healing of the parts, as the matter having a free discharge, and the opening being sufficiently large to dress it to the very bottom.

After this, pledgets of lint or tow, spread thinly with black or yellow bassilicon, or the wound ointment, and dipped in the same, melted down with a fifth part of oil of turpentine, should be laid to the bottom of the sore, and the whole filled up in a very light manner with the same, without any sort of stuffing. It may be dressed in this way once or twice a day, if the discharge be great, until a proper digestion be brought on, when it should be changed for pledgets spread with the ointment with red precipitate, used in the same manner. If the sore should not digest kindly, but look pale, and discharge a thin watery fluid, it should be fomented as often as it is dressed with the above fomentation, and the strong-beer poultice be applied over the dressing, continuing the same until the matter grows thick, and the sore has a florid appearance.

There are other indolent tumours sometimes occurring in animals, but which are noticed under their proper heads.

TUMOURS, Moory, in *Agriculture*, a term applied to the small hilly spots or swells of boggy plots which are formed on the banks of hanging slopes, or dispersed over flatter surfaces, in particular cases and situations. They may be formed in various ways, as in the manner of quicksands, by the waters which fall in their immediate vicinities, but which, to produce certain defects of the wet kind in the lands, find a receptacle sufficient to give the affected tumoury parts a constant supply of moisture, or what is enough for giving the bog plants that take root upon them strength and support. Thus, such rising grounds as are formed of open, porous, or freely conducting materials, having the lower borders of them imperfectly covered with an impermeable soil, are peculiarly liable to be affected with this sort of tumoury defect. They are likewise capable of being caused by masses of impenetrable matters, which are lodged on the sides of the declivities, or at the feet of them; also by internal wetness, descending through the land in partial channels that lead it to the surface; and by the same sort of wetness when confined beneath an impermeable soil, but which is defective, and by reason of the weight thereof above it, admits of the confined moisture rising through veins of the sandy kind, or other conducting substances and passages to the surface where these sorts of tumours are produced.

Wherever lands are troubled with these kinds of tumours, which is not unfrequently the case, they are to be removed by drawing away the wetness in proper methods, and the suitable manuring, stocking, and managing of the ground, by which means they may often be converted into good sound land. See *MOOR* and *WASTE-LAND*.

TUMPACH, in *Geography*, a town of Bavaria, in the Upper Palatinate; 32 miles E.N.E. of Nuremberg.

TUMPING, in *Agriculture*, a term applied to the work of moulding up teasel crops, which is done in a close round manner, in order to make them "haddle" out, or throw forth side-shoots, as it is called. It often answers as a kind of fence.

TUMUCHANAIG, in *Geography*, a town of Hindoostan, in Madura; 30 miles S.W. of Madura.

TUN, a town of Sweden, in West Gothland; 24 miles W. of Skara.—Also, a town of Persia, in Khorassan; 25 miles E.N.E. of Pafin.

TUN, or *Ton*, originally signifies a large vessel or cask, of an oblong form, biggest in the middle, and diminishing towards its two ends, girt about with hoops, and used to put up several kinds of merchandizes in, for their better carriage; as brandy, oil, sugar, skins, hats, &c.

Some derive the word from *autumnus*, in regard it is then tuns are most needed. Du-Cange deduces it from *tunna* or *tonna*, words used in the base Latin for the same thing; whence also *tunnare*, to tun.

The term is also used for certain vessels of extraordinary bigness, serving to keep wine in for several years. In Germany, there are many which are scarcely ever emptied: the Heidelberg tun is famous.

The tun we frequently, though improperly, call a *hog-head*.

TUN, or *Ton*, is also a certain measure for liquids; as wine, oil, &c.

The English tun of wine contains 2 pipes, or 4 hog-heads, or 252 gallons. See *MEASURES*, Table XXII.

The standard gauge for foreign wines at the Custom-house of London is as follows: the pipe of Port is 138 gallons; of Lisbon, 140; of Madeira, 110; of Barcelona, 120; of Vidonia, 120. The butt of sherry is 130 gallons, and of mountain, 120. The hoghead of claret is 58 gallons, and of tent, 63. The awm of hock is 36 gallons. The gallon used here is seven inches in diameter and six inches deep. The tun of animal oil is 252 gallons, and of vegetable oil 236 gallons.

The tun of Amsterdam contains six æms or awms; the awm contains 4 ankers, 8 stekans, 21 viertels, 64 stoops, 128 mingels, 256 pints, or 1024 musies; and holds 8966 Dutch, 7705 French, or 9351 English cubic inches, or about 40½ English wine gallons. The tun of beer contains 128 mingels, like the above. A tun of corn is 1¼ mudden, or 1½ sacks, and holds 5 scheepels, 20 vierdevats, or 160 koops: 27 mudden are equal to a last of corn, which contains 173208 Dutch cubic inches, 147120 French ditto, or 178549 English.

A tun of Leyden butter weighs 320 lbs., and a Vierendel 80 lbs.; but the Vierendel of common Holland's butter weighs 84 lbs. A Friesland tun is 328 lbs.; and a Mastenbroeck tun, 400 lbs.

At Bayonne, a muid or hoghead of wine contains 320 French pints, or about 76½ English gallons; and 4 muids at Bayonne are equal to 5 at Bourdeaux. The pipe of brandy holds 80 veltes, answering to about 156 English gallons.

At Bourdeaux, a tonneau of wine contains 4 barriques or hogheads, equal to 50 stekans of Amsterdam = 259 flubgen of Hamburg = 243 English gallons; and weighs with the wood about 2000 lbs. of Bourdeaux. The barrique contains 110 pots, or 32 velts. Brandy is contained in casks of 50 velts, more or less; but it is sold by the barrique of 32 velts, or about 60 English gallons: 5 velts proof of Bourdeaux make 4 velts proof, by which it is sold in London.

don. At Cognac it is sold by the 27 veltz; and 11 veltz proof of Cognac make 10 veltz proof, by which it is sold in London. A tun of butter, great measure, at Bremen, is reckoned at 300 lbs., but a tun of small measure at 220 lbs.; 100 lbs. of Bremen being equal to 110 lbs. avoirdupois. A fuder of wine contains 6 ohms; an ohm, 20 viertels = 45 stubgens = 180 quarters = 720 mingels; 45 stubgens answering to 38 English gallons. Brandy is sold by the 30 viertels. A tonne of beer contains 48 stubgens = 192 quarters. A hoghead of train oil contains 2 tonnes = 12 steckans = 192 mingels.

At Brunswick, a fuder of wine contains 4 oxhofts, or 6 aams; an aam = 40 stubgens = 160 quarters = 320 noffels. A fass of beer contains 4 tonnes; a tonne 27 stubgens; and 63 stubgens = 61 English gallons.

At Dantzic, a tonne or barrel of butter is = 16 lisponds = 256 lbs. A last of beer contains 6 fasses = 12 tonnes or barrels = 1080 stofs; the beer-stof being 141 English cubic inches. A tonne or barrel of herrings contains 13 wahls, each of 80 herrings; a last of herrings, Lüneburgh falt, honey, pitch, tar, ashes, &c. contains 12 tonnes or barrels; and a last of French, Scotch, or Spanish falt, when lying together, contains 18 tonnes, and when in separate tonnes, only 16.

At Elfsineur, in Denmark, the tonneau of French wine is reckoned for 4 hogheads, or 24 ankers; the pipe of Spanish and Portugal wine for 2 hogheads, or 12 ankers; 30 Spanish arobas, or 25 Portuguese almuds of wine, for 1 regular pipe; the pipe of French brandy for 6 ankers; the poinçon ditto for 9 ankers; the tierçon ditto for 4 ankers.

At Embden, corn is sold in tonnes of 4 verps, 8 scheffels, or 144 kruesen: 15 tonnes, or 60 verps, make 1 last, answering to 10½ English quarters.

In France, by the old system, a tonneau of Orleans contains 2 muids of Paris, the muid of wine at Paris being = 71½ English gallons: — a tonneau of Bourdeaux = 4 barriques, each of 216 pintes of Paris, or 53½ English gallons.

In most parts of Germany, a last of lime, tar, pitch, train oil, butter, &c. is 12 tonnes or casks; a last of herrings is 12 tonnes, each tonne containing about 800. See TONNEAU.

At Hamburgh, a tonne of butter, small measure, is 224 lbs.; ditto, great measure, 280 lbs.: a pipe of oil is 820 lbs.; and a small tonne of green soap is 60 lbs.: a tonne of beer contains 48 stubgen; a small ditto, 32 stubgen: a quartel of train oil contains 2 tonnes or 64 stubgen, and is reckoned at 224 lbs. net weight.

In Hanover, a tonne or barrel of honey contains 25½ stubgen, and weighs 300 lbs.

In Holstein, the measure for corn is the same as that of Copenhagen; viz. the tonne of 8 scheffels, or 32 viertels, 100 of which tonnes yield about 49 English quarters. A tonne of beer contains 128 quartiers, or 25 English beer-gallons.

For the value of the tonne at Königsberg in Prussia, see TONNEAU.

At Lisbon, 13½ quintals make a tun; and each quintal contains 4 arobas; the arroba 32 lbs., the pound of Lisbon weighing 708¼ grains English troy weight; so that 83 lbs. of Lisbon are equal to 84 lbs. of avoirdupois weight. The standard gauge, at the Custom-house of London, of a pipe of Lisbon, is (as above-mentioned) 140 gallons, and this pipe is reckoned at 31 almudes, and the almude at 4½ English gallons nearly.

At Nantes, in France, a tonneau of wine contains 2 pipes; a pipe, 2 barriques or hogheads, or 240 pots; the pot holding 2 Paris pintes, and the barrique containing 59½ English gallons, and a poinçon of wine about 54½ ditto.

At Narva, in Livonia, a last of corn contains 24 tonnes, and a tonne 4 viertels, or 32 kapps: 26 tonnes of Narva = 15 English quarters nearly: the last of French and Spanish falt is reckoned at 18 tonnes, each of 34 kapps. The alm of wine contains 4 ankers, and a pipe of Spanish wine is reckoned at 10 ankers; of Alicant and Portugal wine at 13 ankers, Hamburgh measure: a fass of beer or brandy contains 128 stofs, and 44 stofs answer to about 15 English gallons.

At Oporto, the tun is = 2 pipes = 50 almudes = 2 potes = 12 canadas = 24 quartilhos = 8 meios. At Lisbon, both wine and oil are sold by the pipe of 26 almudes; but the pipe of Lisbon wine sent to England contains about 31 almudes, and its standard gauge is 140 gallons: and therefore the Lisbon almude is reckoned at 4½ English gallons. At Oporto, the pipe is divided into 21 almudes, but this almude and its subdivisions are 49½ per cent. greater than those of Lisbon. Thus the standard gauge of a pipe of port, at the Custom-house of London, is 138 gallons, which gives the almude of Oporto equal to 6 English gallons and 5 pints nearly. Ships are measured by the tun, being a cylinder 6 feet high and 3½ feet in diameter, which gives the contents 57¾ cubic feet nearly. The proportion between the almude of Lisbon and that of Oporto is variously given by different authors; some make it 30 per cent., others 23, and others from 25 to 40; but the real proportion, says Dr. Kelly, is 49½ per cent.; but in the common course of business, 2 almudes of Oporto are reckoned equal to 3 of Lisbon.

At Pernau, in Livonia, a last of corn contains 24 tonnes, the last containing about 86½ Winchester bushels, or 16 lasts = 173 English quarters. But a last of linseed is reckoned at 12 tonnes, and a last of falt at 18 tonnes.

At Revel, in Livonia, a last of corn contains 24 tonnes, and a tonne of falt is 4 loefs: 19 tonnes of corn in Revel are = 8 English quarters.

At Riga, a last of rye contains 22½ tonnes; a last of wheat or barley, 24 tonnes; a last of oats, malt, or pease, 30 tonnes: 24 tonnes being = 48 loofs, and 56 loofs of Riga = 13 English quarters.

At Stralsund, a last of corn contains 8 dromts = 32 tonnes = 96 scheffels: 46 scheffels contain 51 English bushels nearly, or 46 dromts = 76½ English quarters. Kelly's Univ. Cambist. passim.

The great tun or Rhenish wine-vessel of Heidelberg, made in 1343, contained 672 urnæ, of 4½ English gallons each; being in all 2600 English gallons, or about 42 hogheads, or 21 pipes of wine.

TUN is also a certain weight, by which the burden of ships, &c. is estimated.

The sea tun is computed to weigh 2000 lbs., or 20 quintals or hundred weight (amounting to 2440 lbs. avoirdupois); so that when we say a vessel carries 200 tuns, we mean it is able to carry 200 times the weight of 2000 lbs.; i. e. 400,000 lbs.: it being found by a curious observation, that the sea-water, whose room the vessel fills when full loaden, weighs so much.

To find the burden and capacity of a ship, they measure the hole or place where she is loaden; allowing 42 cubic feet to the sea tun. See BURDEN, and Tonnage under SHIP-BUILDING.

The price of freight, or carriage of merchandizes, is ordinarily settled on the foot of the sea tun: and yet, though the tun is regularly 20 cwt., there is some difference made in it, either on account of the cumberfomeness or bulk of the commodities, the space they take up, or the like. See FREIGHT.

Accordingly, at Bourdeaux, 4 barriques of wine, and also

of vinegar, honey, and turpentine, are held a tun; 5 of brandy, 3 of fyrup, 20 bushels of chefnuts, and the like of corn, beans, linfeed, walnuts, &c.; 5 bales (each of 100 lbs.) of cork, 5 bales (each of 100 lbs.) of feathers and skins, and 8 of paper; 10 cubic feet of marble, 20 quintals of iron in bars, or lead in pigs, 3 bales of hemp (each of 200 lbs.), 20 quintals, or 150 rolls of tobacco.

At Stettin, the freight of ships is generally valued by the Dutch ship last, 5 of which are equal to 4 lasts of Stettin; and 4000 lbs. of iron, and other heavy goods, 2000 lbs. of lighter goods, such as hemp and flax, 56½ scheffels of corn, 13 casks of herrings, 8 hogheads of wine, 5 schocks (each of 60 pieces) of pipe-staves, 7 schocks of hoghead-staves, 9 schocks of barrel-staves, 65 cubic feet of oak-timber, or 70 cubic feet of fir-timber, arè reckoned for a Dutch last.

A tun or load of timber is forty solid feet, if the timber be round; if it be hewed or square, fifty-four.

TUNS, in *Natural History*, a family of univalves. See SHELLS and CONCHOLOGY.

TUN, *Tou*, in the ends of words or names of places, signifies a town, village, or dwelling-place: from the Saxon, *tun, sepes, vallum, villa, vicus, oppidum*; and this from *dou*, or *dun*, a hill, where they formerly built towns.

TUN-Greave, a name anciently used for a reeve or bailiff, *qui in villis, & quæ dicimus manerius, domini personam sustinet, ejusque vice omnia disponit & moderatur.* Spelman.

TUN-Hoof, in *Botany*. See GLECHOMA.

TUNA, in *Botany*, slightly altered by Dillenius from the South-American or West-Indian appellation of the same plants, *Tune, Tunal*, or *Tunas*, is retained by him for the tribe of American Figs, named *Opuntia* by other modern botanists. He contends, with great probability, that *Opuntia* of the ancients must be something very different. Linnæus refers *Tuna* to CACTUS; see that article.

TUNA, in *Geography*, a small island in lake Menzaleh; 8 miles S.E. of Tennis.—Also, a sea-port of Egypt, in the Red sea. The entrance is between rocks, and within the greater part is filled with shoals and rocks, which make the harbour small. On the north side is a tongue of land, which forms good defence against the north-west wind; 52 miles S.S.E. of Cofeir.—Also, a town of Sweden, in Helsingland; 3 miles N. of Hudwickswall.—Also, a town of Sweden, in the province of Smaland; 56 miles N. of Calmar.—Also, a town of Norway, on the Glanmen; 2 miles N.N.E. of Frederickstædt.—Also, a town of Arabia, in the province of Hedsjas; 280 miles E. of Medina.—Also, a small island and village of Egypt, in the Tennis lake; 21 miles W.N.W. of Tineh.—Also, a town of Sweden, in Dalecarlia; 10 miles S. of Fahlun.

TUNAL, a town of Mexico, in New Biscay; 74 miles N.N.W. of Durango.

TUNALLUS, in *Ichthyology*, a name given by Albertus, and some others, to the *grayling*, or *umber*.

TUNB, in *Geography*. See TUMB.

TUNBATE, a town of Brasil, in the government of St. Paul; 65 miles N.N.E. of St. Paul.

TUNBO, a town of Sweden, in Sudermanland; 50 miles W. of Stockholm.

TUNBRIDGE, or TONBRIDGE, a market-town in the lathe of Aylesford, and county of Kent, England; is situated in an extensive tract called the Lowey-of-Tunbridge, and is distant 13 miles W.S.W. from Maidstone, and 30 miles S.E. from London. The term Lowey is derived from the Norman French, and signifies an exempt jurisdiction round the castle or chief mansion to which it appertained. In the Domesday book this district was included under the name of Haslow, but no mention is made of a castle; whence it

seems probable it was not erected when that furvey was made; though it certainly was very shortly afterwards. It was built by Richard Fitz-Gilbert, afterwards earl of Clare; and under the protection of this fortress the town grew up, and gave its own name to the castle, which name appears to have been derived from the bridges over the different streams of the Medway, which flow on the south side of the town. Of these streams, which have each a bridge, and are five in number, the southernmost was anciently the principal, as the northern now is; though the latter was originally formed to supply the inner moat of the castle. This fortress has been at different periods the scene of war and of festivity. Gilbert Rufus, who possessed it in the reign of Henry III., joining the rebellious barons, was besieged by prince Edward, when the garrison burnt the town to prevent its being useful to that prince, who, however, took the castle: but Gilbert having joined the royal standard, it was restored to him. Here he entertained Edward, then become his sovereign, in a splendid manner for many days, on his return from Palestine. Prince Edward, afterwards Edward II., also made Tunbridge his temporary residence. In the next reign, the castle and manor passed by marriage to Ralph, earl of Stafford, whose descendants rose to a rank that eclipsed all other subjects, having five earldoms vested in them, and being at length advanced to ducal honours. In the reign of Henry VIII. the castle became forfeited to the crown by the attainder of Edward, duke of Buckingham. Queen Elizabeth granted the lordship and castle to her cousin Henry Carey, lord Hunsdon, from whom they descended to the Berkleys: having passed through various possessors, they are now the property of the Woodgates of Summerhill. The remains of the castle stand on the south-west side of the town, but are principally confined to an entrance-gateway, flanked by round towers, and tolerably perfect, (probably rebuilt in the 14th century,) and the artificial mount on which the keep stood. The castle was environed by three moats, within the outermost of which the ancient town was chiefly confined. At a short distance was a priory of Austin canons, founded by Richard de Clare, first earl of Hertford, about the end of the reign of Henry I. The buildings were all destroyed by fire in 1351; but were soon afterwards rebuilt. This was one of the houses suppressed in 1525, to endow Wolfey's intended colleges at Ipswich and Oxford. From the foundations, yet visible, this priory appears to have been very extensive: but only a few fragments now remain, besides the refectory or hall, which is used as a barn.

The town of Tunbridge principally consists of one long and wide street, kept remarkably clean, and containing many respectable houses. At the entrance from London is a stone causeway, the gift of John Wilford, citizen of London, in 1528. The principal bridge was erected in 1775, at the expence of 1100*l.*, from a design by Mr. Milne: near it is a wharf for the reception of the timber brought hither from the Weald, and afterwards sent down the Medway. The church, which is a spacious fabric, was new pewed and ornamented, with a bequest of 500*l.*, made by the late John Hooker, esq. It contains some good monuments of various families. Weever mentions "the portraiture of lord Hugh Stafford, kneeling in his coate-armour, and his bow-bearer, Thomas Bradlaine, by him," as remaining in his time in the north window. Many bequests have been made by different persons for the use of the poor inhabitants of this district; but the principal charitable foundation is the free grammar-school, a capacious edifice at the north end of the town, which was founded and endowed by sir Andrew Judde, a native

of Tunbridge, and lord-mayor of London in the fifth year of Edward VI. He died in 1558; and by his will directed that certain lands, of the annual value of 56*l.* 0*s.* 4*d.*, and situated in various parishes in London, should be vested in the company of Skinners of London, for the perpetual maintenance of this school, for the free education of the boys inhabiting this town and the parts adjacent. Sir Thomas Smith, who married Sir Andrew's daughter, considerably increased the endowments, and founded six exhibitions to the university; and several others were endowed by different persons. The Skinners' company, who are the governors, visit this school every year in May, attended, as the statutes direct, by some eminent clergyman, who is required to examine into the progress made by the different classes. The examination is conducted with much ceremony; and honorary rewards are distributed to the best scholars. The masters have, in general, been men of eminent abilities. The learned Dr. Vicefimus Knox, well known for his literary productions, succeeded his father in this office in 1778. Though the annual income arising from the respective endowments of this school is very great, the number of boys educated on the foundation is very few: which, among other instances, points out the necessity of a parliamentary revision of our ancient charitable establishments. Immediately opposite the school is the seat of George Children, esq. to whose respectable family a very large and valuable tract of land belongs in this vicinity. The population of Tunbridge, as ascertained by the act of the year 1811, amounted to 5932, the number of houses to 958. Four fairs are held annually, and a market weekly on Friday. The adjacent roads have of late years been much improved, and that leading from the town to the Wells particularly so, by a laborious excavation on Quarry-Hill, by which the former steep ascent over it has been reduced to a very easy draught. It appears, from the "Notitia Parliamentaria," that two members were returned in the 23d year of Edward I. for the borough of Tonebrigg.

About a mile and a half to the south-east of Tunbridge is Summerhill, an ancient and celebrated seat, now the property of William Woodgate, esq. The venerable mansion was erected by Richard de Burgh, earl of St. Albans, at a vast expence, in the reign of James I.; of the style of building in whose days it forms a complete specimen; though its external appearance has, in some respects, been injured by injudicious alterations. It is a very extensive and interesting structure, and stands on a commanding eminence amidst romantic scenery.

On Quarry-Hill, about a mile and a half from Tunbridge, on the road to the Wells, is the seat of James Burton, esq. recently erected with the appropriate materials of the country, as the fragment of a castle, but replete with modern conveniences.

Within a mile, on the same road, is Bounds Park and House, now the property of the earl of Darnley. The demesne surrounds the park, and consists of about a thousand acres of well-wooded land.—Hasted's History of Kent, vol. ii. Beauties of England and Wales, vol. viii. Kent; by E. W. Brayley.

TUNBRIDGE-WELLS, a hamlet in the west half hundred of Washlington, lathe of Aylesford, and county of Kent, England; consists of several villages within five or six miles from the town of Tunbridge, and situated in the three parishes of Tunbridge, Frant, and Speldhurst, at the distance of 18 miles S.W. from Maidstone, and 35 miles S.E. by S. from London. The principal villages are, Mount-Ephraim, Mount-Pleasant, Mount-Sion, and the Wells, properly so called. The *Springs*, to which this neighbourhood is wholly

indebted for its origin, rise in the parish of Speldhurst, and were accidentally discovered in the reign of James I. (See *Tunbridge WATERS*.) Their salubrious quality being soon ascertained, wells were sunk, paved with stone, and inclosed with rails in a triangular form. Hither came the afflicted, and returned healthy: but as no accommodations were nearer than the town of Tunbridge, the number was few. Henrietta Maria, queen of Charles I., being much indisposed after the birth of prince Charles, staid here six weeks; but as no house was near, she and her suite remained under tents pitched upon Bishop's-Down. The splendid court formed a fine contrast to the country, every where rude, and in the unadorned attire of nature. In honour of her majesty, the Wells changed their name from Frant to that of Queen Mary's Wells, which afterwards gave place to Tunbridge-Wells. During the civil war the Wells were neglected, and almost forgotten; but at the Restoration, recovered their former fame. Their celebrity was greatly increased in 1664, by queen Catherine being recommended to drink the waters after a dangerous illness. She continued here about two months, in great splendour: hence may be dated an assembly-room, bowling-green, and other appropriate places, at Ruffhall; and another bowling-green and a coffee-house at Southborough. The surrounding country was spotted with neat rural habitations; till whim, and some altercation between the lord of the manor and the tenants, varied the scene. Ruffhall was now deserted for Mount-Ephraim, and that for Southborough, which was soon eclipsed by Mount-Sion. At this changeable era, many of the houses were wheeled on sledges from one site to another, as the caprice or interest of the owners dictated. The town of Tunbridge was now left to its original quiet; for the Wells became a complete village, with houses sufficient to accommodate all the visitors. A chapel and a school were erected by subscription, and the former being found too small for the increasing congregation, was enlarged a few years afterwards. This chapel stands in the three parishes; the pulpit is in Speldhurst, the altar in Tunbridge, and the vestry in Frant. A Presbyterian and also a Methodist meeting-house have been since built. During the last century, the buildings have gradually increased; and many persons of rank and respectability have houses for constant or occasional residence. Trade is carried on similar to that of the Spa in Germany, and consists chiefly in the manufacture of a variety of articles in wood of various kinds: the goods are well known by the name of Tunbridge-ware, as tea-chests, dressing-boxes, snuff-boxes, punch-ladles, children's toys, and many other articles. The air of this district is very pure and salubrious, and probably aids the efficacy of the waters, which are of the chalybeate kind, and nearly of equal strength to those of the German Spa. They are considered to be of great use in removing complaints arising from sedentary occupations, weak digestion, and nervous and chronic disorders. During the last and present reigns, Tunbridge-Wells has been frequently visited by different branches of the royal family. The *Wells*, properly so called, form the centre of the place; near which are the markets, the medicinal water, chapel, assembly-rooms, and public parades, called the Upper and Lower Walks; the Upper Walk was formerly paved with brick, but in 1793 with Purbeck stone, at an expence of 71*0*l.**; the other is unpaved, and used chiefly by country people and servants. On the right of the paved walk, in the way from the Wells, are the assembly-room, library, coffee-house, and post-office, with shops for Tunbridge-ware, millinery, and different kinds of toys. A portico extends the whole length of the parade, supported by Tuscan pillars, where the company occasionally

occasionally walk. On Mount-Sion, Mount-Pleasant, Mount-Ephraim, and Bishop's-Down, are dispersed some neat villas. That of the late celebrated writer, Richard Cumberland, Esq., is on Mount-Sion, and was his retreat for many years.

The High Rocks, about a mile and a half south-westward from the Wells, are much celebrated, and certainly form a very romantic and striking picture. This spot is said to have been first brought into notice by James II., who, when duke of York, came hither with his duchess and his two daughters, afterwards the queens Mary and Anne.—Burr's History of Tunbridge-Wells, 8vo. 1766. Beauties of England and Wales, vol. viii. Kent; by E. W. Brayley.

TUNBRIDGE, a township of Vermont, in the county of Orange, containing 1640 inhabitants; 20 miles N.N.W. of Hanover.

TUNE, the title of a short melody, or series of notes, in some specific measure. If vocal, it is a ballad; if merely instrumental, it is a country-dance, a jig, or a hornpipe. Our parochial psalmody consists of *psalm* tunes. The music of the "Beggar's Opera" is a medley of tunes selected from the streets of all nations, that are never honoured with the name of airs. See BALLAD.

Scotch, Irish, and Welsh songs and dances, are called *national* tunes. The tonadillas and seguidillas of Spain are likewise national tunes; as are the elegant little street-songs of Venice, called Venetian ballads; and such are the pleasing and popular Provençal and Languedocian melodies, very different from the *Vaudevilles* and ballad tunes of the Pont-neuf and streets of Paris.

Thus far concerns tune as a substantive: as a verb, *to tune*, is a preparation for the performance of music. A sound may be sweet, clear, and very perfect in itself, yet agree with none of its relatives on any instrument, or in any key: it is then said to be *out of tune*. The regulator of all sounds in a musical composition is the key-note of a diatonic scale, in which every sound must be *in tune* with all the intervals. "Tune your harps to cheerful strains;" that is, render your harps fit for tune or song. This belongs to *intonation*, sound, musical tones. *Intonazioni perfide*, in Italian, is an expression for false intonation, *out of tune*, in singing or playing. So in French, *intonation vraie*, *intonation fausse*, are musical expressions for true or false intonation. *Entonner*, in Romish cathedrals, is to give the tone of an anthem, a hymn, with the organ; and in our cathedrals, of the responses.

Our great lexicographer, though no musician himself, has defined the expression, *to tune*, with true technical accuracy, in saying that it is "to put instruments into such a state, as that the proper sounds may be produced." Dr. Holder well defines the word *tunable*, when he says, "all tunable sounds, of which the human voice is one, are made by a regular vibration of the sonorous body, and undulation of the air, proportionable to the acuteness or gravity of the tone."

Cause and Measure of Tone, or that on which a Tone of a Sound depends.—Sonorous bodies, we find, differ in tone:

1. According to the different kinds of matter; thus the sound of a piece of gold is much graver, than that of a piece of silver of the same shape and dimensions; in which case, the tones are proportional to the specific gravities.

2. According to the different quantities of the same matter in bodies of the same figure; as a solid sphere of brass, one foot in diameter, sounds acuter than a sphere of brass two feet in diameter; in which case the tones are proportional to the quantities of matter. See GRAVITY.

Here then are different tones connected with different specific gravities, and different quantities of matter: yet cannot the different degrees of tone be referred to those quantities, &c. as the immediate cause. In effect, the measures of tone are only to be sought in the relations of the motions that are the cause of sound, which are no where so discernible as in the vibrations of chords.

Sounds, we know, are produced in chords by their vibratory motions; not, indeed, by those sensible vibrations of the whole chord, but by the insensible ones, which are influenced by the sensible, and, in all probability, are proportional to them. So that sounds may be as justly measured in the latter, as they could be in the former, did they fall under our senses: but even the sensible vibrations are too small and quick to be immediately measured. The only resource we have, is to find what proportion they have with some other thing: which is effected by the different tensions, or thickness, or lengths of chords, which, in all other respects, excepting some one of those mentioned, are the same.

Now, in the general, we find that in two chords, all things being equal, excepting the tension, or the thickness, or the length, the tones are different; there must, therefore, be a difference in the vibrations owing to those different tensions, &c. which difference could only be in the velocity of the courses and recourses of the chords, through the spaces in which they move to and again. Now, upon examining the proportion between that velocity, and the things just mentioned, on which it depends, it is found to a demonstration, that all the vibrations of the same chords are performed in equal times.

Hence, as the tone of a sound depends on the nature of those vibrations, whose differences we can conceive no otherwise than as having different velocities; and as the small vibrations of the same chord are all performed in equal time; and as it is found true in fact, that the sound of any body arising from one individual stroke, though it grows gradually weaker, yet continues in the same tone from first to last; it follows that the tone is necessarily connected with a certain quantity of time in making every single vibration; or that a certain number of vibrations, accomplished in a given time, constitutes a certain and determinate tone: for the frequenter those vibrations are, the more acute is the tone; and the slower and fewer they are in the same space of time, by so much the more grave is the tone; so that any given note of a tone is made by one certain measure of velocity or vibration, *i. e.* such a certain number of courses and recourses of a chord or string, in such a certain space of time, constitutes a determinate tone. See SOUND.

This theory is strongly supported by our best and latest writers on music, Dr. Holder, Mr. Malcolm, &c. both from reason and experience. Dr. Wallis, who owns it very reasonable, adds, that it is evident the degrees of acuteness are reciprocally as the lengths of the chords; though, he says, he will not positively affirm, that the degrees of acuteness answer the number of vibrations, as their only true cause: but his diffidence arises hence, that he doubts whether the thing has been sufficiently confirmed by experiment. Indeed, whether the different number of vibrations in a given time be the true cause, on the part of the object, of our perceiving a difference of tone, is a thing which we conceive does not come within the reach of experiment; it is sufficient the hypothesis is reasonable.

TUNE by Water, *To*. See LASUS, HYPPASUS, and WATER.

TUNEKA, in *Geography*, a town of Russia, in the government of Irkutsk, on the Ilim; 84 miles N. of Balaganskoi,

T U N

TUNES, in *Ancient Geography*, a town of Africa, mostly on a hill, to the W., and on the border of the port named Stagnum by Procopius, situated S.E. of Carthage, and surrounded by lakes and marshes. See **TUNIS**.

TUNG, in *Natural History*, the name given by the Indians to a little insect, called by the Spaniards *pique*, which is very common and very troublesome in some parts of the East and West Indies.

It is of the size of a small flea; its place of laying its eggs is within the skin of the human body, and it diligently searches opportunities of doing this, and often succeeds in the attempt, to the great pain and trouble of the person who suffers it.

The creature, knowing that it shall be soon crushed to death under the skin, generally makes its way either under the nails, or where there is some callus on the surface; there it eats its way along, and, in fine, lays its eggs, which hatch into so many young ones, and spread themselves between the flesh and skin all over the finger and hand, if not prevented by taking out the old one in time.

The person often does not perceive the creature's getting in, it enters so gradually and easily; but he is soon advertised of the place where it is by a violent gnawing pain, the creature really eating its way as it goes along. The only remedy in this case, is to enlarge the orifice at which it entered, and take it out whole; the wound soon heals up, and there is an end of the matter. This may often be done with the point of a needle; but if not, it is much better to submit to the opening it with a lancet than to the ill consequences which otherwise will attend it. *Observ. sur les Coutumes de l'Asie*, p. 184.

TUNGA, in *Geography*, a town of Africa, in the kingdom of Tunis.

TUNGEBADRA, a river of Hindoostan, which runs into the Kibnah, 7 miles E. of Rachore, in the country of Golconda.

TUNGERSHEIM, a town of the duchy of Wurzburg, on the Maine; 9 miles N. of Wurzburg.

TUNGINSKOI, a town of Russia, on the Irkut; 80 miles S.W. of Irkutsk. N. lat. 51° 18'. E. long. 103° 14'.

TUNGONG, a town of Meckley; 16 miles S.E. of Munnypour.

TUNGRI, or **TONGRES**, in *Ancient Geography*, the name of a people who, according to Tacitus, succeeded that of German, by which were designated the first people who from the other side of the Rhine had abandoned their territory to the Gauls. But according to other authors, the Tongres inhabited the country of Liege for a long time before the entrance of the Romans into the Gauls. Conquerors of the Eburons, they succeeded them, so that they were entirely forgotten. Their conquests were very extensive; and though they were subjugated by the Franks, and Attila, commanding the Huns, completed their extermination, yet their bishops long after retained their title.

TUNGSTEN, in *Mineralogy*; *Scheelin calcaire*, Haüy. The name tungsten, denoting heavy stone, was given to this mineral on account of its great specific gravity. Its appearance is not metallic, it has a yellowish or greyish-white colour, and is more or less translucent. The structure is lamellar; it is infusible by the blowpipe, but becomes opaque. When powdered and digested with nitric acid, it communicates to it a yellow colour. These properties distinguish it from carbonate of lead, white tin-stone, and barytes. Tungsten occurs both massive and crystallized; the form of the crystals is most frequently the octahedron. The primitive form of the crystal, according to Haüy, is an acute octahedron, having the angle at the summit 62° 24', and the angle

T U N

formed by the junction of the planes at the base of each pyramid 113° 36'. The principal planes of the crystals are smooth, the lustre splendid. Tungsten yields to the knife, and is brittle; its specific gravity varies from 5.800 to 6.015. This mineral occurs with wolfram, (see **WOLFRAM**,) tin-stone, magnetic iron-stone, and brown iron-stone: it sometimes forms large or small granular distinct concretions with streaked and shining surfaces. It is found in the mines of Cornwall, Sweden, Bohemia, and Saxony. Its constituent parts are,

Acid of tungsten	-	-	75.25
Lime	-	-	18.70
Silex	-	-	1.56
Oxyd of iron	-	-	1.25
Oxyd of manganese	-	-	0.75

TUNGSTEN, in *Chemistry*, is the metal obtained from the ore of the same name above described. By some of the German chemists it is denominated *Scheelum*, from Scheele, who first pointed out the peculiar nature of one of its oxyds.

Tungsten was first obtained in the metallic state by the Messrs. D'Elhuyart from another of its ores called *wolfram*. New experiments have been since repeated by Vauquelin, Klaproth, Messrs. Allen and Aikin, and others, with various success, and very lately they have been confirmed by Bucholz.

This metal has been obtained by exposing the tungstate of ammonia to a violent heat. It has never been procured in the state of a solid button, or in large panes, but only in small panes as fine as sand, having a strong metallic lustre, a light iron-grey colour, and slightly agglutinated. It is one of the hardest of the metals, and very brittle. Its sp. gr. according to the D'Elhuyarts, is 17.6; according to Messrs. Allen and Aikin, 17.2; and according to the late experiments of Bucholz, 17.4, which is about the mean of the others, and probably very near the truth. Hence, next to gold and platinum, it is one of the heaviest metals.

This metal requires a heat of at least 170° of Wedgwood (probably much higher) to melt it. It is not attracted by the magnet. Exposed to heat in an open vessel, it gradually absorbs oxygen, and is converted into an oxyd. Two oxyds of this metal were formerly known, *viz.* the dark blue or black, and the yellow or tungstic acid; but besides these, Bucholz has lately described another of a dark brownish-red or reddish-brown colour, and which he considers to be intermediate to the other two. Of these, the best brown and most important is the yellow oxyd, or tungstic acid. This oxyd is without taste. It is insoluble in water, but remains long suspended in it. It has no active or vegetable colours. It is stated to be composed of

Tungsten	-	-	80
Oxygen	-	-	20
			100

Little is known of the nature and composition of the other oxyds of this metal, so that we cannot with any degree of certainty ascertain the weight of its atom. This metal combines with sulphur and phosphorus, and forms alloys with many of the metals; but these compounds do not appear to be interesting. The yellow oxyd, or tungstic acid, seems capable of forming compounds with all the alkaline, earthy, and metallic bases, though very little is known at present of the nature of these compounds.

TUNGURAGUA, in *Geography*, a mountain of Peru; 21 miles S. of Riobamba.

TUNGURAGUA. See **MARANON**.

TUN-

TUNGUSES, a branch or division of the Mandshures, or Mandshu, who originally composed one people with them, as appears not only from their mutual resemblance in features, manners, and customs, but chiefly from their agreement in language. The Tunguses call themselves *Œvœes*, probably from the supposed founder of their race; or, like most of the Siberian tribes, from the word which in their language signifies *men*. They are called Tunguses only by the Ostiaks of the Yenissey and the Tartars. By the Mandshu, they are denominated *Solomi*, protectors, or *Oronschou*, people with reindeer. The extensive deserts in which they now nomadize, reach from W. to E. from the Yenissey across the Lena, as far as the Amoor and the Eastern ocean. From S. to N. they keep between about the 53d and 65th degree of N. lat., and accordingly touch neither upon the Soongarian borders, nor upon the coasts of the Frozen ocean. Being of an accommodating disposition, they have admitted into their seats Ostiaks, Samoyedes, and particularly Yakutans. The districts now mentioned lie mostly in the government of Irkutsk; nevertheless, some few races of the Tunguses are reckoned as belonging to the government of Tobolsk. The first accounts which the Russians obtained of these people were received from the Ostiaks of the Yenissey; and in the year 1607, Cossacks were first sent from Mangaséy against the Tunguses, to force them into submission. On occasion of these Russian attacks, the Tunguses displayed a greater degree of courage than the other Siberians; nor were they brought to the imperfect state of submission in which they are now held, till the latter half of the last century. By the enumeration of the year 1766, they consisted of 12,000 males; but besides these, distinct Tungusian stems wander among the Siberian nations, who together amount to about 1700 youths, or families. Although they constitute one of the most numerous nations of Siberia, yet, on account of their roaming mode of life, few stems of them can be actually registered. The Tunguses who nomadize about the coasts of the Eastern ocean, are known under the name of "Lamuts." Of these, in the forementioned year, only about 400 men were enrolled to the payment of tribute.

The Tunguses are indefatigable in the chase, and are constantly changing their habitation. In the seasons of fishing and of collecting berries, they remain for some time nearly stationary; and then they remove their tents, leaving their supplies of dried fish and berries in large boxes, constructed on trees or poles, for the benefit of themselves and their tribes, in travelling during the winter. They seem callous to the effects of heat or cold; their tents are covered with shamoy, or the inner bark of the birch, which they render as pliable as leather, by rolling it up, and keeping it for some time in the steam of boiling water and smoke. Their winter dress is the skin of the deer, or wild sheep, dressed with the hair on it; a breast-piece of the same, which ties round the neck, and reaches down to the waist, widening towards the bottom, and neatly ornamented with embroidery and beads; pantaloons of the same materials, which also furnish them with short stockings, and boots of the legs of rein-deer, with the hair outward; a fur cap and gloves. Their summer dress only differs in being simple leather without the hair. They are religious observers of their word, punctual and exact in traffic; some few are christened; but most of them are Demonolatrians, have their forcerers, and sacrifice chiefly to evil spirits. They commonly hunt with the bow and arrow, but some have rifle-barrelled guns. Instead of burying the dead, they place the body, dressed in its best apparel, in a strong box, and suspend it between two trees. The implements of the chase belonging to the deceased are buried under the box. Except a forcerer is very near, no ceremony

is observed; but in his presence they kill a deer, offer a part to the demons, and eat the rest. They allow polygamy, but the first wife is the chief, and is attended by the rest. The ceremony of marriage is a simple purchase from her father; and the price is from 20 to 100 deer, or the bridegroom works during a stated time for the benefit of the bride's father. The unmarried are not remarkable for chastity. A man will give his daughter for a time to any friend or traveller to whom he is attached; if he has no daughter, he will give his servant, but not his wives. They are in size somewhat below the common stature, very active, and have lively inviting countenances, with small eyes; and both sexes are very fond of brandy. The Tunguses wander about the mountains, and seldom visit such plains as are occupied by Yakuts; but frequently resort to the solitary habitations of the Cossacks, appointed to the different stages; as they are there generally supplied with brandy, needles, thread, and such trifles as are requisite among them and their women, who always accompany them in their wanderings. See **MANDSHURES**.

TUNGUSKA, a river of Russia, which rises in lake Baikal, and runs into the Enisei, about 20 miles S. of Eniseisk: in the former part of its course it is called *Angara*, in the latter *Tunguska* or Yenissey.

This *Upper* Tunguska, for there are three rivers of the same name, which bears the name of Angara till it unites with the Ilim, takes up several other rivers, as the Koda, the Tshalovetch, the Iriki, the Kamenka, the Olenka, and the Tatarskaia, all on the right; and to the left, the Oka, and the Tshuna or Uda. This Tunguska has for the most part a bed strewed with rocks, and forms several cataracts, five of which are very considerable. Although it be navigable, the navigation is toilsome and difficult. The *Middle* or *Podkammenaia* Tunguska rises in the government of Irkutsk, among the Baikal mountains, not far from the origin of the Lena; and after a course of about 800 versts, and after having, on the right, taken up the Thiucha and the Tshorna, falls into the Yenissey in 62° N. lat. The *Lower* or *Nivnei* Tunguska takes its source in the same district, but bends its course northward, and after having taken up on the left the rivers Niepa, Svetlaia, with many others, and on the right the Rosmakaika, the Turiga, and the Gorela, and running a course of about 1500 versts, strikes into the Yenissey, not far from Turukanik. In this river are several dangerous whirlpools.

TUNGUSKOI, **UST**, a town of Russia, in the government of Tobolsk; 24 miles S. of Eniseisk, at the conflux of the Enisei and Tunguska.

TUNGUSLI, a town of Russia, in the government of Tobolsk, on the Oby; 56 miles S. of Tara.

TUNIA, or **TUNJA**, a town of South America, in the viceroyalty of New Granada; 60 miles N. of Santa Fé de Bogota. Tunia, founded in 1539, was formerly an opulent town, but has now declined, the inhabitants not exceeding 400. The edifices retain marks of former splendour, and the parish-church might well serve for a cathedral. Here are three convents, that might answer the purpose of manufactories. N. lat. 5° 5'. W. long. 72° 56'.

TUNIC, in *Botany* and *Vegetable Physiology*, the English name of the appendage to certain seeds, termed **ARILLUS** in Latin; see that article, where, however, the explanation given by our predecessor, Dr. Woodville, refers only to the use of the term *Arillus* in the genus **CAREX**. The Tunic, or *Arillus*, is attached to the base only of the seed, immediately adjoining to the Scar, *Hilum*, and envelops the rest of the seed more or less completely and closely. Its size and texture, as well as colour, are various. In the Spindle-tree,

tree, *Euonymus*, the part in question is a pulpy, wrinkled, orange-coloured wrapper; in *Afzelia* a beautiful, firm, close, scarlet cup, embracing great part of the lower half of the black hard seed; in *Hippophaë* a double membranous, but tough, coat, within the pulp of the berry; in *Myristica*, the Nutmeg, a jagged, brittle, highly aromatic, complex integument, well known by the name of Mace. *Narthecium*, and great part of the *Orchideæ*, have each of their minute seeds clothed in a lax membranous Tunic, extending beyond them at each end, and probably designed to give them buoyancy, like a sort of wing. *Oxalis* has an elastic pouch-like Tunic, serving to project its polished seeds to a distance, like the hard rigid bivalve Tunic of *Distamnus*, *Boronia*, and their allies. (See *RUTACEÆ*.) That curious genus named by M. König, in *Ann. of Bot.* v. 2. 569, *Blighia*, the *Akee* of Guinea and the West Indies, has each seed supported by a large, fleshy, lobed Tunic, for which alone, as a delicate article of food, the tree is cultivated. Some difficulty occasionally arises in discriminating between a real *Arillus* and the *Testa* of certain seeds, or at least the outer coat of the latter. (See *TESTA*.) This difficulty occurs in the order of *Asperifolia*; witness *Cynoglossum*; while the real capsules of *Geranium*, *Pelargonium*, *Malva*, &c. have, on the other hand, been sometimes called *Arilli*.

TUNICA, a kind of waistcoat, or under garment, worn by the ancients, both at Rome and in the East.

The common people ordinarily wore only a tunica; but those of better fashion wore a toga or gown over it. The philosophers wore a gown without a tunica, as professing to go half naked.

The tunica was peculiar to the men; the under garment of the women not being called tunica, but *stola*.

The senators wore their tunica enriched with several little pieces of purple, cut in form of large nails; whence it was called *laticlavata*: the knights had less nails on their tunica, which was hence called *angusticlavata*: the common people wore their tunica without any *clavi* at all. And it was by these three different sorts of tunicas, that the three different orders of the Roman people were distinguished in habit.

It has been a common opinion, that the *angusticlavata* distinguished the knights from the common people, in the same manner as the *laticlavata* did the senators from those of the equestrian rank. But Rubenius avers that there was no manner of difference between the tunics of the knights and those of the commons. As to the persons who had the honour of wearing the *laticlavata*, it may be maintained, says Kennet (*Ant. of Rome*, p. 308.), that the sons of those senators who were patricians had the privilege of using this vest in their childhood, together with the *prætecta*. But the sons of such senators as were not patricians, did not put on the *laticlavata* till they applied themselves to the service of the commonwealth, and to bearing offices. Yet Augustus changed this custom, and gave the sons of any senators leave to assume the *laticlavata* presently after the time of their putting on the toga *virilis*, though they were not yet capable of honours. And by the particular favour of the emperors, the same privilege was allowed to the more splendid families of the knights.

In the declension of the empire, the tunics did not only reach down to the ancles, whence they were called *talares*, but had sleeves too coming down to the hands, whence they were called *chirodotæ*. And now it was counted as scandalous to appear without sleeves, as it had been hitherto to be seen in them: and, therefore, in the writers of that age, we commonly find the accused persons at a trial habited in a tunic without sleeves, as a mark of disgrace and infamy.

Besides the different sorts of tunicas above-mentioned, there was also the *tunica palmata*, worn by generals in a triumph, and perhaps always under the toga *picata*. It hath its name either from the great breadth of the *clavi*, equal to the palm of the hand, or else from the figures of palms embroidered on it.

Among religious, the woollen shirts, or under garments, are styled *tunicas*, or *tuniques*.

TUNICA, in *Anatomy*, a technical name applied to the membranes which compose various organs; thus the serous and mucous membranes, and the muscular stratum of the stomach or intestines, are called their tunics: in the same way we have the tunics or coats of the eye, the blood-vessels, the testes, &c. &c.

TUNICA, in *Botany*, a name adopted by Dillenius, as he himself avows, from the apothecaries, and perhaps originally corrupted by them from *Vetonica*, or *Betonica*, its synonyms. These names all belong to the *Flos Caryophyllus*, Clove-flower, Carnation, or Pink; and Dillenius was led to the above choice, for the purpose of removing the ambiguity arising from *Caryophyllus*, (see that article,) as properly belonging to the valuable spice called Cloves. Linnæus, not satisfied with either appellation, invented a new one, which has been generally approved. See **DIANTHUS**.

TUNICATED ROOTS, among *Botanists*, such as are formed of a multitude of coats surrounding one another. See **ROOT**.

TUNIOK, in *Geography*, a town of Hungary, on the river Samos; 6 miles E. of Etfed.

TUNIS, a city of Africa, and capital of the country so called, situated on a rising ground, on the west bank of a lake, or rather a shallow in form of a lake, communicating with the gulf by a narrow channel. The situation of Tunis, probably first chosen by some fishermen, to whom that of almost all the maritime cities is to be ascribed, appeared to the inhabitants to be preferable to that of Carthage; as soon as, enriched by rapine, they dared openly to attack the trade of every nation. The eminence on which the ruins of Carthage, N.E. of Tunis, that ancient rival of Rome, advances into the middle of the gulf, and on that account would have exposed the Tunicians to be taken by surprise. This city was called, by Diodorus Siculus, "Léucon Tunéta," that is, White Tunis; perhaps from the chalky cliffs which lie round it, when viewed from the sea; and was founded about 1250 or 1300 years B.C., as appears from Herodotus and the Parian chronicle. It is surrounded by lakes and marshes, which, however, do not render it unhealthy, which is, by Dr. Shaw, attributed to the number of mastic and myrtle trees, rosemary, and other gummy and aromatic plants, with which they heat their ovens and their baths: the water is obtained a mile distant, for the general use of the inhabitants. The infected atmosphere of Tunis is attributed by baron de Tott to the putrid emanations of a channel, which conveys all the filth of the city to a neighbouring lake; which lake likewise produces exhalations that appear no less dangerous; and the salubrity of Tunis, he says, can only be attributed to the depth of the valley, which comes down to the gulf, and which, by attracting the vapours of the channel and the lake, does not allow them to acquire that degree of corruption which would render them hurtful to the constitution of the inhabitants. The Tunicians are the most civilized nation of Barbary, with little of the insolent haughtiness of the Algerines; and affairs with the government are transacted with ease: the English, French, Dutch, and several European states, having consuls here, who are treated with civility and respect. Including the suburbs, Tunis is, by Dr. Shaw, supposed

to be rather more than three miles in circumference, and the number of houses 10,000 or 12,000, and of inhabitants about 50,000. But Bruns, on the authority of Sprengel, reckons the houses at 12,000, and the inhabitants, by an exaggerated statement, at 300,000 or 200,000, of whom more than one-half perished by the plague of 1789. There are few buildings of any magnificence, except the great mosque, the bey's palace, called Barda, at some distance from the city, encompassed with walls and flanked with towers, and a few others: there are five gates, but none of them grand. Near the centre of the city is a piazza of vast extent, which is said formerly to have contained 3000 shops for the sale of woollen and linen goods; in the manufacture of both which this city has been long famous. Here are several colleges and schools, with many learned men and doctors of the Mahometan law, partly maintained by the public; the janizaries are quartered in barracks: other public buildings are, an exchange, a custom-house, and an arsenal. On the side of a canal is the fortress of Goletta, but not carefully supported. The chief defence is the castle. In 1655, Tunis was bombarded by the English under admiral Blake. N. lat. 36° 44'. E. long. 10° 20'.

TUNIS, the central region of Northern Africa, usually dignified with the title of kingdom; bounded on the north and east by the Mediterranean, on the south by Tripoli, and on the west by Algiers. This is the western part of the proper Africa of antiquity, and was formerly the chief seat of Carthaginian power; and in the middle ages, Tripoli was subject to Tunis, which was seized by Barbarossa in 1533. It is now about 200 miles from north to south, and 120 from east to west. According to Desfontaines, this kingdom begins in the east at the isle of Garbi, and terminates in the west at the river Zaine, called also Tufca or Sufca. After the decline of the Roman empire, this country came under the power of the Vandals and Goths; and after them, under the Saracens, when they were governed by viceroys, called emirs. It afterwards became subject to the emperor of Morocco. For a space of time it was an independent and powerful kingdom. In the year 1538, it was overrun by Barbarossa; and notwithstanding the endeavours of Charles V. and his successors, the kingdom was made a province of the Ottoman empire, under the dominion of Selim II., by Sinan, bashaw of the Levant. At present the whole kingdom is divided into two circuits, the summer and the winter, which the bey makes in person through his dominions at those two seasons. The summer circuit, or northern district, is by far the most pleasant, fertile, and populous, and has the greatest number of cities, villages, and dowars, and carries the fairest appearance of plenty, prosperity, and cheerfulness of the two; advantages owing to the mildness of its government, and its being freer from tyranny and oppression than that of Algiers. The Tunisiens, in general, are like the Algerines; a mixture of Turks, Moors, Kabits or indigenous inhabitants of the mountains, Arabians, Jews, and Christians, merchants, and slaves; with this difference, that they are here polite and civilized. They are much more kind and humane to their slaves, in general; though they treat the knights of Malta with greater severity. In other respects, the Tunisiens are courteous to strangers; and all affairs with the regency are transacted in a very friendly manner: the consuls that reside here are treated with greater affability and condescension, justice, and dispatch, than in any other court on the African coasts: in a word, this nation hath, for many years, been more intent upon trade, and the improvement of their manufactures, than upon plundering and cruising; upon which account, it hath cultivated the alliance of many Christian

powers. The dress of the Tunisiens, of both sexes, is much of the same fashion with that of the Algerines. The women are handsome, neat, and more familiar: they go, indeed, veiled out of doors, but are allowed to be seen and converse with strangers, their husbands not being tainted with such jealousy as reigns among other Africans. The religion is the same as that of the Algerines. This kingdom, as well as Algiers, and others along the Barbary coast, are very subject to earthquakes, which commonly happen after heavy rains, at the end of the summer, or in autumn, and are often felt at a great distance from land, where the depth of water hath been above 200 fathoms: in other respects, the country is, for the most part, as healthy and fertile as any under the same climate. The northern parts, which are the best cultivated, enjoy a wholesome temperature. The southern part is sandy, barren, and parched by a burning sun; that near the sea is rich in olive-trees, and presents a great number of cities and populous villages. But the western part abounds with mountains and hills, and is watered by numerous rivulets; its environs being extremely fertile, and producing the finest and most abundant crops. The soil is in general impregnated with marine salt and nitre, and springs of fresh water are more rare than salt. The chief river is the Mejerda, or ancient Bagrada, which in summer is not navigable. The chain of Atlas seems here to terminate in Cape Bon, being called the mountains of Megala, Uzelette, &c. The winds are mostly from the sea, consequently refreshing; but those that blow from the southern sandy deserts are quite suffocating, especially as they prevail mostly in July and August: if they continue five or six days successively, the inhabitants are obliged to keep themselves cool by sprinkling their floors with water. The sea-winds, that blow west-north-west and north, bring dry weather in summer, and rain in winter; but the easterly, as well as the southerly, are for the most part dry, though attended with a thick cloudy atmosphere in most seasons. Their first rains commonly fall in September, and sometimes in October; about three weeks after which, the Arabians break the ground, sow their corn, and plant their beans, barley, lentils, and garvancos; their harvest usually begins in May, or the beginning of June, according to the quality of the preceding season. The Tunisiens are much more addicted to agriculture than their neighbours, the Algerines, and are for making the most of every inch of their ground. Mines of metal and minerals they disregard; though Dr. Shaw observed, among the mineral productions of Tunis, alabaster, crystal, boles, plumbago, iron, and lead. The cattle are small and slender, and the horses have degenerated. Here are lions, panthers, hyenas, chakals, and other ferocious animals. The manufactures are velvets, silks, linen, and red caps worn by the common people. The government of Tunis at present, like that of Algiers, is altogether despotic; but with this difference, that there it is elective, and here not only hereditary, but the bey hath power to name which of his sons he pleases for his successor, without regard to eldership; or, in case he doth not think him worthy, he may appoint a brother, or a nephew, to the succession: in all other cases, likewise, they are equally absolute and independent, either on the Porte, or the Douwan or Divan. They were once, indeed, under the protection of the former; and the rapacious extortion and tyranny of its bashaws had, in some measure, obliged them to shake off their yoke, and form a government of their own, which they settled in such a manner, that their deys, as they were then called, could do nothing without the advice and consent of the Douwan or Divan; but they have found means, in time, to rid themselves of this uneasy clog also, though they

they still retain a kind of form or shadow of both. The Porte hath a bashaw residing here, but in power and influence he is a mere cypher, and serves only to remind the Tunisiens, that they were once subject to the Turkish sultans. The Douwan, being chiefly composed of friends and creatures of the beys, is rather assembled to give a forced approbation to their resolutions, than to consult them about the justice or expediency of them. At the first settling of this new form of government, the deyship was the supreme dignity, as it is still at Algiers; as that of bey was the next in rank, but wholly subordinate to it. However, having since built their power upon the ruins of the deys, they have, by degrees, raised the beyship to be despotic and independent; and by making it hereditary, have prevented, in a great measure, those frequent depositions, rebellions, and massacres, which are the almost constant concomitants of the regal authority, wherever it is made elective. Yet far from preventing jealousies, cabals, and rebellions, in spite of all their precautions, the dignity oftener falls to the share of that son who has been able, by his address, to form the strongest party, than to him who hath been appointed to it by the father. Hence it is, that whenever the throne becomes vacant, whether in the course of nature, or by open treason and rebellion, it is seldom filled up again without a great deal of bloodshed, rapine, and violence, in proportion to the number of competitors. In the summer the bey of Tunis resides in the northern part, and in the winter retires to the south, where is a lake of considerable extent, the "Palus Tritonis" of antiquity. The authority of the bey extends over a large tract of country, of which he receives the tribute, with a small army, which marches out annually for that purpose. Tunis, which had formerly a considerable commerce with France, exports thither corn, oil, beans, lentils, wax, wool, hides, and Morocco skins; and receives, in exchange, Spanish wool, Languedoc cloths, vermilion, sugar, pepper, cloves, wine, brandy, paper, hardware, iron, and steel. The Italian trade is wholly carried on by the Jews, who send the same commodities to France, and import from thence Spanish cloths, damasks, several sorts of silk and woollen stuffs, gold and silver tissue. The French pay 3 *per cent.* for all the goods they bring from France, and the Jews 10 *per cent.* on their imports from Italy. The Turks and Moors export to the Levant woollen stuffs, lead, gold-dust, and chequins, and a vast number of bales of caps; and bring, in return, silks, calicoes, iron, alum, and vermilion. They send much the same kind of commodities into Egypt; but the oil that is carried thither must be put up in jars, and not in casks, because the greatest part of it is designed for the lamps of Mecca and Medina; and the Arabians would think it polluted, as the vessels might formerly have contained wine. They import, in exchange, from thence, linen, cotton, rice, flax, and coffee. The number of French ships freighted at Tunis, by Turks, Moors, and Jews, has amounted yearly to one hundred and fifty to the Levant, and fifty for France and Italy: as for those of the English, their number is uncertain. All public conventions and instruments are written in the Arabic tongue, but the public commerce is commonly carried on by the medium of the Lingua Franca. Gadames, or *Galames* (which see), had formerly a flourishing commerce; but it has ceased since the caravans passing from Tripoli to Tombuctoo do not stop there, but at Agadez. The caravans of Tombuctoo bring slaves, ostrich feathers, ivory, and amber; those of Salée, gold, as well as those of Gadames, which also bring Negro slaves. Ruins of ancient monuments are found near Zowan, Spitala, Cassa, Phradisa, Hammamel, and Claspia. Desfontaines

mentions in particular with admiration a large and beautiful amphitheatre near Elgem. Some vestiges are also found here and there of an ancient Carthaginian aqueduct, which served to draw water from the springs of mount Zowan; but there scarcely exist any other remains of Carthage. Near the river Mejerda are still seen some ruins of Utica, which are, at present, at the distance of about 4000 fathoms from the shore; though this city was formerly a sea-port.

At Tunis, accounts are kept in piastras of 52 aspers, each asper being divided into 12 burbes. The coins consist of gold sultanins, valued at 100 aspers; of silver nataras (a square or shapeless coin), valued at 52 aspers; and of doublas, valued at 24 aspers. The burbes are a small copper coin. Gold, silver, and pearls, are weighed by the ounce of 8 termini; and 80 ounces of Tunis = 81 ounces English troy. The cantaro, which is a weight for merchandize, contains 100 rottoli, weighing about 111 pounds avoirdupois. The cassiso, a corn measure, contains 18 weabs, or 216 saws; 53 cassisi = 67½ English quarters. The mattaro, an oil measure, is = 32 rottoli, = 35½ pounds avoirdupois, and is about 5 English gallons. The mattaro, wine measure, is only half that for oil measure. The pic, long measure, is for woollen 298.3 French lines, or 26½ English inches, for silk 24½ English inches, and for linen 18½ English inches.

TUNKAT. See TONCAT.

TUNKERSTOWN. See EPHRATA.

TUNKHANOCK, a township of Pennsylvania, in the county of Lucerne, containing 884 inhabitants.

TUNKHANOCK *Creek*, a river of Pennsylvania, which runs into the east branch of the Susquehanna, N. lat. 41° 31'. W. long. 75° 57'.

TUNNA, in *Commerce*, a measure of grain in Sweden, equal to four bushels five quarts Winchester measure.

TUNNAGE, or TONNAGE, a duty or custom due for merchandize brought or carried in tons, and such like vessels, from or to other nations; thus called, because rated at so much *per tun*.

Tunnage is properly a duty imposed on liquids according to their measures; as poundage is that imposed on other commodities according to their weight. See POUNDAGE and CUSTOMS.

TUNNAGE is also used for a certain duty paid the mariners, by the merchants, for unloading their ships arrived in any haven, after the rate of so much *per tun*.

TUNNEL, or FUNNEL, an instrument through which any liquor is poured into a vessel.

Part of a draught of a chimney, above the mantle-piece, is also called by the same name.

TUNNEL is a large subterraneous arch, driven through a summit or hill, for the passage of boats upon a canal continued through the same: also, smaller drains or culverts are called *tunnels*; and the execution of making and driving them is called *tunnelling*.

TUNNEL-Pit, a well or shaft sunk to the line of an intended tunnel, through which the stuff excavated from it is drawn up to the surface.

TUNNEL-Kiln, in *Agriculture*, a term applied to a lime-kiln in which coal is burned, in contradistinction to that in which wood, peat, and other such matters are used, termed the *flame-kiln*. See LIME-Kiln.

There is much less waste of heat in the former sorts than in those of the latter, and they have much advantage in the quick dispatch in drawing the lime; as, in the flame-kilns, after the matters are burnt, much time is lost by waiting until the lime be cold, and by emptying it at the mouth

part instead of below. The nature of these different kinds of kilns, and many useful particulars relating to them, may be seen in detail in the Corrected Report on Agriculture for the County of Suffex.

TUNNEL-Net is a kind of net much used for the catching of partridges; thus called from its form, which is a cone fifteen or eighteen feet long.

This net must be made of three-twisted thread, and must not be too thick: it should be dyed green, that the colour may give no suspicion to the birds, and the meshes should be about two inches and a half broad.

Into the hind meshes, at the larger end, there must be put a smooth wooden rod, about the bigness of a gun-rammer; of this must be made a sort of hoop, both ends being tied together; and at different distances from one another, there must be placed many more such, which are to be rounded in the same manner, and are to support the net its whole length in the tunnel form. Two stakes, or strong pegs, must be fastened at the sides of the entrances into the net, and one at the farther end, or narrow part: the two first are to keep the mouth of the net sufficiently extended, and the last is to keep it pulled out lengthwise to its full dimensions, the hoop preventing its falling in.

There must be used with this net two others, of that kind which they call *balliers*. These are long and straight nets, and are to be fastened down to the mouth of the tunnel-net on each side, extending seven or eight fathoms on each side from it, so as to take in fourteen or sixteen fathoms in front, beside the breadth of the mouth of the tunnel-net, and to direct all that shall move forward within that compass into the net.

In order to use this net, a covey of partridges is to be found, and then the net is to be placed at a considerable distance behind them: when this is fixed, the sportsman is to take a compass, and get before the birds with a stalking horse or stalking ox, and then to move forward, driving them towards the net. This is to be done gently and carefully; they are not to be driven at once straight forwards, but the sportsman is to wind and turn about, and at times to stand still, as if the horse was grazing. If the partridges, in the time of driving, make a stand, and look at the machine, it is a sign they suspect it, and are ready to take wing: in this case the sportsman must stand still, or even go back a little; and when they are become composed again, he is again to advance upon them. If any single bird lies remote from the rest, the sportsman must take a compass round him, and fetch him in; for if he takes wing the rest will all follow; in this manner, with patience and caution, the whole covey may be driven like a flock of sheep up to the nets. A real horse, trained to the purpose, is, however, much better than a stalking machine. The balliers, or wings of the tunnel, must not be pitched straight, but in a sort of semicircle; and the birds, when they stop their march, will run along them to the middle, where the mouth of the tunnel is open.

When they come to the mouth of the tunnel, the old ones will make a stand, as if to consider what was before them; but on pressing gently on them with the horse, the young ones will run in, and then all the rest will follow.

The sportsman must then make all the haste he can to the mouth of the net, to secure them from coming back again.

TUNNING, or **TONNING**, a part of the process of brewing, or rather an operation which is the sequel of it.

The tunning of beer, &c. is performed various ways; some being of opinion it is best tunned as it cools, or begins to come; while others let it stand longer to become riper.

The most regular method is, to cleanse and tun just as it comes to a due ferment, and gets a good head; for then it has the most strength to clear itself. What works out of the cask is to be supplied with fresh beer of the same brewing.

TUNNING-Dish, a term applied to a large wooden dish, employed with a funnel, in tunning malt liquor.

TUNNUDTIORBIK, in *Geography*, an island near the coast of East Greenland. N. lat. 60° 45'. W. long. 46° 50'.

TUNNY, in *Ichthyology*, a name given by us to the Spanish mackarel, a large fish of the scomber kind, called by authors *thynnus* and *arcynus*, by Salvia *limosa*, and *pelamys* by Aristotle, Ælian, and the other old writers. See **SCOMBER**.

In the lochs on the western coasts of Scotland, as well as in the Mediterranean (see **SCOMBER Thynnus**), tunnies are also found in pursuit of herrings, and sold to people, who either carry them fresh to the country markets, or salt and preserve them in large casks. The pieces, when fresh, look like raw beef, but when boiled turn pale, and have somewhat the flavour of salmon. One of them has been found to weigh four hundred and sixty pounds.

TUNS, *The*, in *Geography*, rocks in St. George's Channel, near the coast of Ireland, and county of Wexford; 3 miles N.E. from the Saltee islands.

TUNSLA, a town of Sweden, in the province of Savelax; 52 miles N. of Nyfot.

TUNSTALL, JAMES, D.D., in *Biography*, a learned divine, was born about the year 1710, and educated at St. John's college, Cambridge, of which he was a tutor and fellow. In 1741 he was chosen public orator of the university, and became one of the chaplains to archbishop Potter. It was said of him, that many came to Lambeth humble, but no one left it so but Dr. Tunstall. He was created D.D. in 1744, and in 1757 took possession, upon an exchange, of the valuable vicarage of Rochdale, in Lancashire; but his life terminated in 1772. He had a controversy with Middleton concerning the letters between Cicero and Brutus, of which he had made great use in his "Life of Cicero," and which Tunstall not only suspected, but proved, in the judgment of Markland, to be supposititious. He was also the author of some other publications: the principal of which is his "Academica, Part I., containing several Discourses on the Certainty, Distinction, and Connection of Natural and Revealed Religion," continued, as it is supposed, by Part II. printed after his death, under the title of "Lectures on Natural and Revealed Religion, read in the Chapel of St. John's College, Cambridge." Nichols's Anecdotes.

TUNSTED, or **TUSTED**, an English D.D., and a learned musician, who flourished in the fourteenth century. Pits, Bale, Tanner, and all our biographical writers, speak of him with respect. And among the MSS. at Oxford, we found, in 1780, a Tract on Music, entitled "Quatuor Principalia Artis Musicæ," by this writer, dated 1351, Bodl. 515. bound up with other tracts.

What this author calls the *four principals of music*, will best appear from his own manner of dividing the work. In the first part or *principal*, consisting of nineteen chapters, he treats of music in general, its constituent parts and divisions. Secondly, of its invention, intervals, and proportions; twenty-four chapters. Thirdly, of plain chant and the ecclesiastical modes; fifty-eight chapters. Fourthly, of measured music or time, of dance, and their several divisions. This last principal is divided into two sections, of which the first contains forty-one chapters, and the second

forty-nine. The whole treatise fills a hundred and twenty-four folio pages: the diagrams, which are very numerous, are beautifully written, and illuminated with different coloured inks; and it seems to be in all respects the most ample and complete work of the kind which the fourteenth century can boast.

TUNUB, in *Geography*, a town of Egypt, on the west branch of the Nile; 6 miles N.N.W. of Amrus.

TUNUPOLON, in *Zoology*, the name of an East Indian species of viper, found principally in the island of Ceylon; it is of a small size, and of a fine fatten-like gloss, beautifully variegated with shades of brown. Ray.

TUONI ECCLESIASTICI, Ital., in *Musie*, tones of the church. (See *CANTO Fermo* and *MODI*.) The *modi autentici* are the odd numbers 1, 3, 5, 7; and the *modi plagali*, the even numbers 2, 4, 6, 8.

TUONO, Ital., a musical tone or sound. (See *TONE*.) "Tuoni," says the Crusca, "appresso a' musici, sono i gradi, per cui passano successivamente le voci e i suoni nel salire verso l'acuto, e nello scendere verso il grave colla regolare interposizione de' semitoni a' loro luoghi per riempire gl'intervalli maggiori consonanti, e dissonanti."—"Tones among musicians are those degrees or gradations by which voices and instruments ascend and descend successively from the grave to the acute, and descend from the acute to the grave, with the interposition of the necessary semitones to fill the greater consonant and dissonant intervals." Varchi. In this arrangement of the scale, all the simple and perfect consonances are found, that is, the key-note, the fourth, the fifth, and the diapason or octave.

TUP, in *Rural Economy*, a term often applied to a ram in different districts.

TUPELO TREE, in *Botany*. See *NISSA*.

TUPERSDORF, in *Geography*, a town of Saxony, in the Vogtland; 4 miles N.E. of Oelnitz.

TUPES, a town of Bohemia, in the circle of Chrudim; 8 miles N.W. of Chrudim.

TUPICA, a town of Peru; 30 miles S.E. of Lips.

TUPINAMBAS, a nation of South American Indians, who inhabited near Rio Janeiro; but after the settlement of the Portuguese, removed towards the river of the Amazons, where the Tapayos are now their descendants.

TUPISTRA, in *Botany*, an unexplained name, used by Mr. Ker, in *Curt. Mag.* t. 1655.—The plant which bears it, *T. squalida*, was imported by Messrs. Loddiges from Amboyna, in whose slove it flowered, for the first time, in April 1814. The learned author did not examine the specimen in a perfect state, so that his ideas, like our's, must be chiefly derived from Mr. Edwards's figure, the accuracy of which there is no reason to doubt, and from which the close affinity of this plant to *Orontium japonicum* is apparent. No botanist however is as yet sufficiently acquainted with the parts of fructification in either to determine their generic character, or to distinguish them generically from *O. aquaticum*. See *ORONTIUM*.

T. squalida has a perennial tuberous root, with thick fibres. *Stem* none. *Leaves* few, erect, equitant, lanceolate-oblong, entire, coriaceous, smooth, about two feet long. *Stalk* solitary, erect, not a span high, simple, cylindrical, smooth, firm, purplish, bearing a dense spike of numerous scentless flowers, of a pale dingy, or brownish lead-colour, quite sessile, with a bractea at the base of each. *Calyx* none. *Corolla* of one petal, bell-shaped; the limb in six or more spreading segments, each bearing on its disk a sessile, two-lobed, but seemingly imperfect, anther. A cylindrical body, four-lobed at the top, in the centre, looks like a germen and stigma.

TUPMAN, in *Rural Economy*, a term frequently applied to a breeder and dealer in tups, in some districts, as those of the midland parts of the kingdom. See *RAM*.

TUPPA, a name given in Thibet to children, who at the age of eight or nine years are admitted into the monastery at Teshoo-Loomboo, and who are occupied in receiving the instruction suited to their age, and the duties for which they are designed. See *TOHBA*.

TUPPING, in *Rural Economy*, a term applied to the impregnating of ewes by the tups or rams.

TUPPING-Time, the period or season of putting tups or rams to the ewes. It should be done neither too early nor too late, as in the former case the lambs are dropped too much in the cold weather, while in the latter they are liable to be of inferior size for the markets. It is consequently best done according to the nature of the situation and circumstances. See *SHEEP*.

TUQUILIGASTA, in *Geography*, a town of South America, in the province of Tucuman, on the Salado; 4 miles S. of St. Yago del Estero.

TUR RABAIN, a town of Asiatic Turkey, in the government of Mosul; 20 miles E. of Nisbin.

TURA, a river of Russia, which rises about 40 miles W. of Verchotura, in the province of Ekaterinburg, and runs into the Tobol, opposite Turchanskoi, in the government of Tobolsk. See *TOBOL*.—Also, an island in the Grecian Archipelago. N. lat. 39° 34'. E. long. 24° 15'.—Also, a town of Hungary; 24 miles W. of Topoltzan.—Also, a town of the county of Tyrol; 24 miles S.W. of Trent.

TURA Bamba, a spacious plain, in which stands the city of Quito.

TURALINZES, one of the first colonies which constructed for themselves permanent habitations, when the Tartars subjugated Siberia in the 13th century; hence their name (from *Tura*, signifying in the Tartar language a town), which signifies the same with settlers. Ever since their arrival, they have inhabited the region on both sides of the river, which from them is denominated the Tura, between the Tavda and the Iser, in the Ekatarinemburg and Tobolskoi districts of the governments of Perme and Tobolsk. Their oldest fixed seat was the city of Tschinghiden; but when Yermak made the conquest of these parts, the khan Yepansa resided higher up the Tura in a city, which after their restoration by the Russians was named Turennsk, and bears this name at present, though it is also called by the Tartars Yepantschina.

TURAMIANA, in *Ancient Geography*, a town of Spain, in the eastern part of Bactica, S.W. of Urbi. According to the Itinerary of Antonine, it was on the route from Castulo to Malacca, between Urbi and Murgi.

TURAN, in *Geography*. See *TARAZ*.

TURANCOURCHY, a town of Hindoostan, in Madura; 12 miles N. of Nattam.

TURANNO, a town of Hindoostan, in Malwa; 18 miles N.E. of Ougein.

TURANO, a town of Naples, in Calabria Citra; 3 miles W. of Bisignano.

TURAPHILUM, SHIH-ELLAH, in *Ancient Geography*, a town of Africa, in Mauritania Cæsariensis, situated in the mountains of the interior, S. of Icosium.

TURATTE, in *Geography*, a town of the island of Celebes, and capital of a powerful kingdom; 180 miles N. of Macassar.

TURBA, in *Ancient Geography*, a town of Novempopulani, belonging to the Aquitains, in Gaul.

TURBAN, **TURBANT**, the head-dress of most of the Eastern

Eastern and Mahometan nations; consisting of two parts, viz. a cap, and a sash of fine linen or taffety, artfully wound in divers plaits about the cap.

The word is formed from the Arabic *dar*, or *dar*, or *dar*, or *dal*, or *dul*, which signifies *to encompass*, and *band* or *bend*, which signifies *sash*, or *scarf*, or *band*; so that *durbant*, or *turbant*, or *tulbant*, only signifies a *scarf*, or *sash*, tied round; it being the sash that gives the denomination to the whole turban.

The cap is red or green, without any brim, pretty flat, though roundish at top, and quilted with cotton, but does not cover the ears. About this is wrapped a round piece of fine thin linen or cotton, in several wreaths variously disposed.

There is a good deal of art in giving turbans the fine air; and the making of them up constitutes a particular trade, as the making of hats does among us.

The emirs, who pretend to be descended of the race of Mahomet, wear their turbans green: those of the other Turks are ordinarily red, with a white sash. The genteel people have frequent changes of turbans. M. de Tournefort observes, that the turban, all things considered, is a very commodious dress; and that he even found it more easy to him than his French habit.

The grand signor's turban is as big as a bushel, and is so exceedingly respected by the Turks, that they dare scarce touch it. It is adorned with three plumes of feathers enriched with diamonds and precious stones: he has a minister on purpose to look to it, called *tulbentoglan*. See CROWN.

That of the grand vizir has two plumes; so have those of divers other officers, only smaller one than another; others have only one, and others none at all. The turban of the officers of the divan is of a peculiar form, and called *mugenezek*.

The sash of the Turks' turban, we have observed, is white linen; that of the Persians is red woollen. These are the distinguishing marks of their different religions; Sophi, king of Persia, who was of the sect of Ali, being the first who assumed that colour, to distinguish himself from the Turks, who are of the sect of Omar, and whom the Persians esteem heretics.

TURBAN, or *Clavicle*, in *Conchology*, denotes the aggregate, or whole set of the whirls of a shell, and forms its lower part. The flat, or helix turban, is one so slightly prominent, as to be nearly on a level. There are also the short turban, the produced turban, and the long turban.

TURBAN-Top, in *Botany*. See HELVELLA.

TURBAN-Shell, *Cidaris*, in *Natural History*, the name of a genus of the echinodermata, which are of a hemispheric or spheroidal figure, and have their name from the Latin *cidaris*, a Persian turban, as in some degree resembling that head-dress.

Of this there are several genera, and subordinate species.

This class of the echinodermata is made out by the assistance of the fossil, as well as the recent animals; many of the kinds being now unknown on any shores. Klein's Echinod. p. 17. See ECHINODERMA.

TURBANIA, in *Ancient Geography*, a fountain of Palestine, at the foot of mount Gilbon, according to William of Tyre.

TURBARY, TURBARIA, a right to dig turf in another man's ground; from *turba*, an old Latin word for a turf.

TURBARY, *Common of*, is a liberty which some tenants have by prescription to dig on the lord's waste. See COMMON.

TURBARIA is sometimes also taken for the ground where turfs are digged.

TURBARIA *Bruaria*, more particularly denotes flaw-turf, or heath-turf; mentioned in the charter of Hammon *de Masly.

TURBED, in *Geography*, a town of Persia, in the province of Chorafau; 90 miles S.S.W. of Meschid.

TURBELA, in *Ancient Geography*, a town of Hither Spain, situated towards the south, and supposed to be the same with that which Livy calls Turba.

TURBET, in *Geography*, a town of Pennsylvania, in the county of Northumberland, containing 2917 inhabitants.

TURBICO, or TURBIGO, a town of Italy, in the department of the Olona; 18 miles W. of Milan.

TURBINATA OSSA, in *Anatomy*, turbinated bones; certain bony plates belonging to the nose. See NOSE and CRANIUM.

TURBINATED, is a term applied by naturalists to shells which are spiral or wreathed, conically, from a larger basis to a kind of apex.

TURBINES, in *Natural History*. See TURBO.

TURBINITÆ, fossile shells of the turbo kind, or itoues found in those shells.

TURBIT, in *Ichthyology*, the same with turbot.

TURBIT Pigeon, a particular species of pigeon, remarkable for its short beak, and called by the Dutch *cort bek*, that is, *short beak*. Moore calls it in Latin *columba fimbriata*; and its English name seems no other than a bad pronunciation of its Dutch one. It is a small and short-bodied pigeon, and has a beak no longer than that of a partridge; the shorter this is, the more the pigeon is esteemed. It has a short round head, and the feathers upon the breast open, and reflect both ways, standing out like the frill of the bosom of a shirt. This is called by many the *purle*, and the more the bird has of it, the more it is esteemed; the tail and back are generally of one colour, as blue, black, red, yellow, or dun, and sometimes chequered; the flight-feathers, and those of all the rest of the body, are white; they are a light nimble pigeon, and, if trained to it, will take very high flights, in the manner of the tumblers.

TURBITH, TURPETH, or *Turpethum*, a medicinal root, brought from the East Indies, particularly from Cambaya, Surat, and Goa; though others will have it, that the true turbit comes chiefly from Ceylon.

It is the cortical part of the root of a species of convolvulus, viz. the *convolvulus turpethum* of Linnæus.

The turbit of the moderns bears so little resemblance to that of the ancients, that it is difficult to suppose them the same. That sold by our druggists is a longish root, about the thickness of the finger, resinous, heavy, and of a brownish hue without, and whitish within. It is brought to us cloven in the middle, lengthwise, and the heart or woody matter taken out. The best is ponderous, not wrinkled, easy to break, and discovers to the eye a large quantity of resinous matter.

This root, on the organs of taste, makes at first an impression of sweetness; but when chewed for some time, betrays a nauseous acrimony. It is accounted a moderate strong cathartic, but does not appear to be of the safest or most certain kind; the resinous matter, in which its virtue resides, being very unequally distributed; insomuch that, as it is said, some pieces taken from a scruple to a drachm purge violently, whilst others in larger doses have very little effect. Lewis.

It is commonly supposed to take its name *turbit* from *turbare*, on account of the violence of its operation, as disturbing

turbing the whole economy; and has accordingly been used in the dropy, palsy, and apoplexy.

It yields a deal of resinous matter in a spirituous menstruum, which Quincy observes does not affect the larger passages much; but is very active in the smaller vessels, and glandulous contorsions, which it wonderfully clears of all viscid adhesions.

Some apothecaries, either through ignorance or parsimony, substitute white thapsia, which they call *grey turbith*, or *turbith garganicum*, for the true turbith; though both as to taste, colour, and qualities, they are very different.

TURBITH Mineral, Turpethum Minerale, is a name which the chemists give to a yellow precipitate of mercury, now called yellow sub-sulphate of mercury.

For the method of preparing it, see *HYDRARGYRI Sub-sulphas flavus*.

Turbith mineral may also be made by precipitating mercury from its solution in nitrous acid by means of vitriolic acid, or of some vitriolic salt. For this purpose the nitrous acid must be well saturated with mercury.

We may observe that turbith mineral becomes yellow only by being deprived of the adhering vitriolic acid, and that it remains white till it has been washed with a large quantity of water; and, in general, the more perfectly it is deprived of acid, the deeper yellow colour it acquires. Some chemists have supposed, that a portion of vitriolic acid remains united with the turbith, though not enough to render it soluble in water: M. Beaumé affirms, that when sufficiently washed it contains no acid; but the latter experiments of M. Bayen prove the contrary.

This powder is called mineral turbith, from the resemblance it bears to the vegetable turbith of the Arabians, in strongly purging the most internal recesses of the body; for though it be insipid upon the tongue, yet it is possessed of very considerable virtues. Being boiled with water, it loses more of its salts, and thereby grows milder, and more safe; so it does also by being deslagrated twice or thrice, or distilled with spirit of wine.

The powder, prepared in the manner above described, proves, though not corrosive, strongly emetic; operating, in this intention, the most effectually of all the mercurials that can be given with safety. It is used chiefly in virulent gonorrhœas, and other venereal cases accompanied with a great flux of humours to the parts: it is said likewise to have been employed with success in robust constitutions, against leprous disorders, and obstinate glandular obstructions. The dose, as an emetic, is from two grains to six or eight; though some constitutions, habituated to mercurials, can bear larger quantities. It may be given in smaller doses, as half a grain or a grain, as an alterative, after the same manner as the red calx of mercury; and even when intended as an evacuant, it may perhaps, as Malouin observes, be most adviseable to give only a small quantity at a time, as one grain, and repeat the dose every hour till the vomiting succeeds. Lewis's *Mat. Med. and Dict. Chem. Art. Turbith mineral*.

Turbith mineral appears to have been the grand secret of Paracelsus, which, in his scarce German book of hospital medicines, he praises so extravagantly for the venereal and all chronic diseases. Sydenham also commends it in venereal cases, given in the quantity of six or eight grains, in strong habits of body, so as to prove emetic; but when imprudently used, it is apt to bring on a dysentery.

Turbith mineral has been used as a sternutatory, and is said to have made wonderful cures in distempers of the eyes. Mr. Boyle relates a cure of this sort, performed by the famous empiric Adrian Glas-maker on Mr. Vatteville, a

Swiss officer of distinction in the French service, and totally blind. This gentleman was ordered to snuff about a grain of turbith up each nostril, which immediately operated in a violent manner, by vomit, stool, sweat, salivation, and the lacrymal glands, for twelve hours together; and also caused his head to swell greatly; but within three or four days after this single dose had done working, he recovered his sight. Boyle's Works, Abr. vol. i. p. 103.

We read of this preparation being given to the quantity of ten grains, with the same quantity of camphor, and fifteen grains of the *pilul. ex duob.* to remove the swelling of the testicles. This medicine, which in the beginning vomited and purged, at last operated chiefly as an alterative. It is said to be successful in obstinate venereal and serofulous disorders. See *Medic. Ess. Edinb. vol. iv. art. 4.*

Turbith mineral is an excessive bright true yellow, of a great body like vermilion; will stand equally well, and work with oil or water much in the same manner. These qualities (says the author of the *Handmaid to the Arts*, vol. i. p. 107.) render it very valuable for many purposes; as it is much brighter than any other yellow used in oil, except king's yellow, and is free from its nauseous smell, and cooler. Mixed with Prussian blue it yields a much finer green than from the king's yellow without ultramarine. As it is now procured, it requires levigation in water before it be used.

TURBO, in the *Linnean System of Zoology*, is a genus of the Testacea order of worms. Its characters are; that its animal is a slug; the shell univalve, spiral, and solid; and the aperture straightened, orbiculated, and entire. Gmelin, in his edition of Linnæus, enumerates one hundred and seventeen species, besides several varieties. See *TURBO* under the article *CONCHOLGY*.

In Da Costa's system, the turbo is a genus of snails, with a lengthened clavicle or turban; which have generally a perfect round mouth; the columella, or inner lip, not much faced outwards, and the body spire very bellied, so that the turban is suddenly, and not insensibly, produced from it. See *SHELLS*.

The most remarkable species of the turbo, or screw-shell, is that called *scalare* by Rumphius, from its spires running up hollow, or with a space between them. This is a very scarce and valuable shell when large, but is often found small in the Adriatic.

Aldrovand, and many others of the old authors, make no difference between the turbines and screw-shells, though the distinction of the genera is very obvious; the screw-shells having a long, large, and dentated mouth, which terminates towards the base in a narrower aperture than elsewhere; and the shell itself always runs to a very sharp point at the end: whereas the turbines terminate in a less sharp point, and have thicker bodies, and always much wider mouths. The screw-shells are indeed very easily confounded with the buccina; and it requires more accuracy to distinguish them, than has fallen to the share of the generality of writers on these subjects an age or two ago. Aldrovand and Rondeletius have confounded these genera, and have brought in a third among them, by the epithet *muricatum*, which, when applied to the buccinum, is generally observed to bring into that family a shell of the murex class, and which might have been very properly called by that shorter name.

For the sake of distinguishing these, it may be observed, that the screw-shell is of a very long and slender shape, terminating in a very sharp point, with its spires running on imperceptibly, without any great cavity, and the base small and flat, as well as the mouth.

TURBO Cochlea, in *Natural History*, a name by which some authors have called the Persian shell, a species of *concha globosa*, or *dolium*.

Many have been puzzled with this shell, not knowing in what class to rank it; and Aldrovand has placed it at the end of his work, saying, that it would seem to belong to the turbinated kinds, but that it wants the turbo.

TURBOT, in *Ichthyology*, a name given to the fish which, in the systems of Artedi and Linnæus, is a species of pleuronectes, being the *pleuronectes* of the former, with the eyes on the left side, and a rough body, and the *pleuronectes maximus* of the latter, and the *rhombus maximus asper non squamosus* of Ray. See **PLEURONECTES Maximus**.

Turbots grow to a large size, some of them weighing from twenty-three to thirty pounds. They are taken chiefly off the north coast of England, and others off the Dutch coast. The large turbots (as well as several other kinds of flat fish) are taken by the hook and line, for they lie in deep water; the method of taking them in weirs, or staked nets, being very precarious. When the fishermen go out to fish, each person is provided with three lines, which are coiled on a flat oblong piece of wicker-work; the hooks being baited, and placed regularly in the centre of the coil. Each line is furnished with fourteen score of hooks, at the distance of six feet two inches from each other. The hooks are fastened to the lines upon sneds of twisted horse-hair, twenty-seven inches in length. When fishing, there are always three men in each coble, and consequently nine of these lines are fastened together, and used as one line, extending in length near three miles, and furnished with 2520 hooks. An anchor and a buoy are fixed at the first end of the line, and one more of each at the end of each man's lines; in all four anchors, which are common perforated stones, and four buoys made of leather or cork. This line is always laid across the current. The tides of flood and ebb continue an equal time upon our coast, and, when undisturbed by winds, run each way about six hours; they are so rapid that the fishermen can only shoot and haul their lines at the turn of tide, and therefore the lines always remain upon the ground about six hours; during which time the *myxine glutinosa* of Linnæus will frequently penetrate the fish that are on the hooks, and entirely devour them, leaving only the skin and bones. The same rapidity of tides prevents their using hand-lines; and therefore two of the people commonly wrap themselves in the sail, and sleep while the other keeps a strict look-out, for fear of being run down by ships, and to observe the weather. For storms often rise so suddenly, that it is with extreme difficulty they can sometimes escape to the shore, leaving their lines behind. Besides the coble, the fishermen have also a five-men boat, which is forty feet long, and fifteen broad, and of twenty-five tons burthen; it is so called, though navigated by six men and a boy, because one of the men is commonly hired to cook, &c. and does not share in the profits with the other five.

This boat is decked at each end, but open in the middle, and has two large lug-sails.

All our able fishermen go in these boats to the herring-fishery at Yarmouth, in the latter end of September, and return about the middle of November. The boats are then laid up till the beginning of Lent, at which time they go off in them to the edge of the Dogger, and other places, to fish for turbot, cod, ling, skates, &c. They always take two cobbles on board, and when they come upon the ground, anchor the boat, throw out the cobbles, and fish in the same manner as those do who go from the shore in a coble; with this difference only, that here each man is provided with double the quantity of lines, and instead of waiting the

return of the tide in the coble, return to their boat and bait their other lines; thus hawling one set, and shooting another every turn of tide. They commonly run into harbour twice a week to deliver their fish.

The best bait for all kinds of fish is fresh herring cut in pieces of a proper size; the five-men boats are always furnished with nets for taking them. Next to herrings are the lesser lamprey. The next baits in esteem are small haddocks cut in pieces, sand-worms, and limpets, here called *stidders*, and when none of these can be had, they use bullock's liver. The hooks are two inches and a half long in the shank, and near an inch wide between the shank and the point. The line is made of small cording, and is always tanned before it is used.

Turbots, and all the rays, are extremely delicate in their choice of baits; for if a piece of herring or haddock has been twelve hours out of the sea, and then used as bait, they will not touch it. Pennant's Brit. Zool. vol. iii. p. 234, &c.

TURBOWKA, in *Geography*, a town of Russia, in Poland; 32 miles S.E. of Zytomiers.

TURBUNNY, a town of Napaul; 60 miles S.W. of Catmandu.

TURCÆ, in *Ancient Geography*, the name of a people who inhabited the environs of the Palus Mæotides, according to Pomponius Mela. See **TURK**.

TURCHANS, or **ROOHANS**, in *Zoology*, a kind of wild horses in the great desert about Azof. They are higher than the *tarpan*s, (which see,) moss-grey in colour, with long upright standing ears, their manes and tails thinner and shorter than the common breed, their coats long and thick. They feed by thousands together in one taboon. The Khirges Rhaissaks shoot them with guns, and eat them.

TURCICA SELLA. See **SELLA**.

TURCICA Terra, Turkey Earth, in the *Materia Medica*, a very fine bole or medicinal earth, dug in great plenty in the neighbourhood of Adrianople, and used by the Turks as a sudorific and astrigent, and famous among them in pestilential diseases. It is sometimes brought over to us also made up into flatfish orbicular masses, of two or three drachms weight, and sealed with some Turkish characters. The earth is of a somewhat lax and friable texture, yet considerably heavy, of a greyish-red colour, but always redder on the surface than within; extremely soft, and naturally of a smooth surface. It breaks easily between the fingers, and melts freely in the mouth, with a considerably strong astrigent taste. It adheres but slightly to the tongue, raises no effervescence with acids, and burns to a dusky yellow colour. Hill.

Many authors who have written of the materia medica, and of fossils in general, have indiscriminately called the various kinds of Lemnian earth by this name; but the true terra turcica, described by Schroder, Wormius, &c. is a different substance, though not sufficiently characterized by those authors to distinguish it from all the other earths.

TURCKHEIM, in *Geography*, a town of Germany, in the lordship of Mindelheim; 6 miles E. of Mindelheim.—Also, a town of France, in the department of the Upper Rhine, formerly imperial; 3 miles W. of Colmar.

TURCKHEIM Rhein, a town of France, in the department of Mont Tonnerre; 4 miles N. of Worms.

TURCO, a town of Peru, in the diocese of La Plata; 60 miles E.N.E. of Atacama. S. lat. 20° 30'. W. long. 68° 20'.

TURCOCORIA, a town of European Turkey, in Livadia; 14 miles N. of Livadia.

TURCOIN,

TURCOIN, a town of France, in the department of the North, and chief place of a canton, in the district of Lille. The unfortunate conflict between the French and the duke of York, who commanded the allies, may be said to have decided the fate of the Netherlands; 6 miles N.N.E. of Lille.

TURCOIS, or **TURQUOIS**, in *Natural History* and *Mineralogy*, a substance found in Persia and other parts of Asia, and formerly classed with stones. It has a beautiful light-green colour, and is susceptible of a high polish. The surface is smooth and polished; it has also a smooth shining fracture, and is so hard as to scratch glass slightly: the specific gravity is 3.127. It has for a long time been considered as the tooth of an unknown animal impregnated with copper; but by a series of analytical experiments, La Grange has proved that it does not contain a particle of copper, but is in reality bone coloured by phosphate of iron. The constituent parts are as under:

Phosphate of lime	-	-	80
Carbonate of lime	-	-	8
Phosphate of iron	-	-	2
Phosphate of magnesia	-	-	2
Alumine	-	-	1½
Water	-	-	6

Guyton Morveau suspected that the turcois contained filix, but this is supposed by other chemists to have been accidental. This celebrated chemist made some experiments on fossil bones, and found that they assume in the fire the colour of turcois; and when digested in a weak solution of potash, they turn blue, varying from a greenish to deep blue. Messrs. Fourcroy and Vauquelin have also observed that bones strongly calcined often assume a blueish tinge, which they considered to be caused by a small portion of phosphate of iron.

Turcois is employed in jewellery. See **GEMS**.

The Greeks and Latins seem to have known it under the name *callais*: and it appears to have had a place in the rationale of the high-priest of the Jews.

Some writers mention turcoises both oriental and occidental, of the new rock and of the old. The oriental partakes more of the blue tincture than the green; and the occidental, more of the green than the blue. Those of the old rock are of a finer blue, and those of the new rock are often whitish, and do not keep their colour.

The oriental ones come from Persia, the Indies, and some parts of Turkey; and some even suppose, that it is hence they derive their modern name *turcois*. The occidental are found in various parts of Europe, particularly in Germany, Bohemia, Silesia, Spain, and France.

Turcoises are found of a round or oval figure; they cut easily, and besides seals, which are frequently engraved on them, some are formed into crucifixes, or other figures, near two inches high: though De Boodt mistakenly affirms, that none have been known to exceed the bigness of a walnut; for the specimen exhibited by Mr. Mortimer to the Royal Society was twelve inches long, five inches broad, and in some places near two inches thick.

The turcois is easily counterfeited; and that often is done so perfectly, that it is impossible to discover the deceit, without taking it out of the collet.

In the Memoirs of the Academy of Sciences for the year 1715, we have a very curious account of the formation of the turcois, and the manner of managing its naturally irregular colour, by M. Reaumur. The turcois, he observes, is one of the softest of precious stones, its hardness usually not coming up to that of a crystal, or a transparent pebble;

VOL. XXXVI.

though some are much harder than others: and still the harder, *ceteris paribus*, the more valuable, by reason of the vivacity of the polish, which is always proportionable to the hardness.

Rofnel, a jeweller, and the author of a scarce treatise, called *Mercurie Indien*, estimating the several precious stones, sets a hard turcois, whose blue is neither bright nor deep, on the foot of the most perfect emeralds, that is, nearly on a level with a diamond; but such are scarcely ever met with. Those with any defect, he only values at a French crown the carat.

Tavernier affirms, but erroneously, that there are but two mines of turcoises known in all the earth, and those are both in Persia; the one called the *old rock*, near a town called Necabourg, three days' journey to the north-east of Mached; the other, called the *new rock*, is five days' journey from it. The stones from the latter, he adds, are but little valued; and the king of Persia hath for many years prohibited the digging in the former for any but himself. M. Reaumur takes the old rock to be now exhausted; in effect, the common division of turcoises into the old rock or oriental, and new rock or occidental, is very arbitrary and precarious. All the best, and most perfect, wherever they occur, in India or Europe, are reckoned among the former, and the rest among the latter. Near Simore, in the Lower Languedoc, there are several considerable mines of turcoises; but that fine blue colour, admired in the turcois, is not natural to those of these rocks; the prevailing colour being sometimes white, and sometimes much like that of tripoli of Venice. Other precious stones are dug out of the mine with all their colour, to the force of which nothing can be added, though it may frequently be diminished, as we see fire bring down the too deep colour of the sapphire, and quite take away that of a pale sapphire: these turcoises, on the contrary, are naturally whitish or yellowish, of a colour as ordinary as that of a free-stone; and by opposing them for some time to the action of the fire they assume a blue colour.

It seems a paradox, and yet M. Reaumur has attempted to prove, that turcoises are originally the bones of animals. In the mines in France, pieces have several times been found in the figure of teeth, bones of the legs, &c. And turcoises which are yet imperfect, or half-formed, are apparently composed of laminæ, or leaves, like those of bones, between which some petrifying juice, insinuating itself, binds them close together; and still, the softer, the more imperfect the stones are, the more distinguishable are the different directions of the fibres and laminæ, with their interfections, and the great resemblance they bear to fractured bones, and the less to any kind of stones known.

To give them a blue colour, they dry them awhile in the air, then heat them gradually in a furnace made after a particular manner. If they be heated too hastily, the humidity between the laminæ wanting time to evaporate, the whole will separate into scales or flaws. Some of the stones require a greater degree of heat to bring them to their colour than others; and even in large pieces, the several parts ordinarily require several degrees of heat.

On this account a great deal of care is to be taken in the heating of them; for the fire, which gives them their blue by degrees, if they be exposed beyond a certain degree, takes it away again.

M. Reaumur accounts for their taking a blue colour by heat very well; when fresh cut out of the rock, it seems their substance is found sprinkled and streaked all over with spots, veins, little circles, &c. of a dark blue colour; these he takes to be sources of a deep blueish matter, which the fire

rarefying, spreads and diffuses throughout the whole substance of the stone. This matter, again, he concludes to have been either originally the juice contained in the bones, since mixed and coagulated with the petrifying juice, or some other mineral matter insinuated into the pores of the stone.

According to M. Reaumur's Mem. Par. 1715, nitrous acid will not dissolve that of Persia, though it will that of France, which shews a difference between them.

Dr. Woodward maintains, that the *turcois*, or *callais* of Pliny, is nothing else but fossil ivory tinged with copper; but Mr. Mortimer, who produced a specimen of the turcois to the Royal Society, is of opinion, that those which authors call stones of the old rock, and in which the colour is permanent, are real mineral stones; the form and size of the sample which he produced evincing this; for its shape shews that it could not be part of any animal bone, but its botryoid form seems to prove, that it is the product of fire, which has once melted this substance, and that when it cooled, its surface was formed into blisters and bubbles, in the same manner as the hæmatites botryoides, or blood-stone, whose surface consists of knobs, resembling a bunch of grapes. He apprehends the *elephas εβουτος*, or *ebur fossile* of Theophrastus, to be what Dr. Woodward calls the turcois, and suspects that it is what De Boodt calls the new rock. He thinks that, for distinction sake, all these stones of ivory origin should be called *pseudo-turcois*, or *bastard turcois*. By a chemical analysis he concluded, that his stone was a rich copper ore; some of it pounded and dissolved in spirit of hartshorn gave a deep blue; in aqua fortis, a fine green; and an iron wire put into it was in an hour's time incrustated with copper; some of it, being calcined without any flux in a crucible, ran to a slag or half-vitrified substance; whereas the same heat, if it had been ivory or bone, would have reduced it to a white ash, like bone-ashes, for it was exposed to a fire that vitrified the tile which covered it. Its hardness and consistence to an engraver's tool seemed to be the same as that of common white marble; its colour was not improved by heat, and it became brittle when red-hot.

Sir Hans Sloane had several specimens of these oriental turcoises, which are all botryoid, and seem to be copper ores; and in his museum there are also samples of turcoises from Spain and the south of France, which are small, and seem to be pieces of ivory tinged with copper. Phil. Transf. vol. xlv. art. 17.

The great defect of turcoises in general is, that in time they lose their blue colour, and become green; and then cease to be of any value.

The pale blue of the natural turcois gem, is a very favourite colour in the glass-trade, and is given to glass in the following manner. First calcine common sea-salt, and beat it into fine powder; then make a pot of the sea-green glass, of a fair and full colour; to this, when in fusion, throw in at times the powder of salt, till the mass has lost all its transparency, and is become paler and opaque; then add, by very small quantities at a time, more and more salt, till the colour is exactly that of the turcois gem; and when it is so, work it immediately, for the salt is soon burnt off, and the glass becomes transparent, and of its green colour. If it become transparent while working, more salt must be thrown in, and that will reduce it to the same opacity again. Neri's Art of Glass, p. 57. See GLASS.

For making a paste resembling the turcois, see PASTE.

TURCOMANIA, in *Geography*, that part of Armenia which belongs to the Turks.

TURCOMANS. See **TURKOMANS**.

TURCZYŃKA, a town of Poland, in Volhynia; 38 miles N. of Zytomiers.

TURDE, in *Ancient Geography*, a town of Italy, belonging to the Velumbri, according to Ptolemy.

TURDETANI, or **TURDETANS**, a considerable people of Spain, in Betica, a great part of which they occupied. The Turdetans were considered as the most distinguished people of Spain. They studied their language; they were in possession of ancient histories, and of laws written in verse: they were regarded as the most polished people of the whole province, on account of the commerce which they carried on with strangers, and particularly with the Phœnicians. When the Phœnicians first landed on the coasts of Turdetania, they found silver so abundant, that all the moveables of the inhabitants, not excepting the meanest and most trivial, were made of this metal. Strabo says, that when the Turdetani became subject to the Romans, they assumed the manners of their conquerors, and forgot their own language, adopting that of the Romans. Their provinces surpassed all others in riches and cultivation, in honesty and religious zeal. This country supplied great abundance of cheese, wine, oil, honey, wax, saffron, vermilion, &c. particularly fine wool.

TURDULI, a people of Spain, in Betica, towards the S.E. According to Strabo, the Turduli and Turdetani were the same people.

TURDUS, **THRUSH**, in the *Linnean System of Ornithology*, the name of a genus of birds, of the order of the Passeres. The distinguishing characters of this genus are, that the tongue is jagged, and has a rim or margin round it; the bill is of a conic-pointed figure, the upper mandible bent at the apex, and emarginated; the nostrils naked, but half covered above with a small membrane, and the chaps ciliated. Gmelin enumerates 125

Species.

VISCIVORUS. With a brown back, neck with white spots, and a yellowish bill. This is the mistle thrush of Pennant and Latham. Found in the woods of Europe.

PILARIS. With black tail-feathers, the outermost whitish at the apex and interior margin, the head and rump hoary. The fieldfare of Ray, Willughby, Pennant, and Latham. Of this there are four varieties. Found in the woods of Europe, Siberia, and Syria.

AFRICANUS. Blackish, the breast covered with black feathers, with red margin; the bill yellow; and the legs cinereous. Found in Africa.

TRIPOLITANUS. Olive-yellow, whitish beneath; black quills; equal blackish tail and yellow apex. The Tripoli thrush of Latham. Found in Barbary.

BARBARICUS. Green; breast spotted white, rump and tail at the tip yellow. The green thrush of Shaw's Travels, and the Barbary thrush of Latham, so called from its habitation.

AONALASCHKE. Brown spotted black; the breast yellow spotted black; the wing-coverts, the greater quills and tail-feathers black, with a testaceous margin. The Unalaska thrush of Pennant, and Aonalashka thrush of Latham, so called from the place of its abode.

ILIACUS. With wings ferruginous beneath, and whitish eye-brows. The red-wing, fwine-pipe, or wind-thrush of Ray, Willughby, Pennant, and Latham. An European bird, migrating in large flocks.

MINOR. Light-red, beneath white; breast yellowish, varied with black spots. The little thrush of Pennant, Edwards, and Latham. Found in Jamaica and North America; seven inches long, migrating and feeding on berries.

JAMAICENSIS. Above cinereous; bill, head, and legs brown;

TURDUS.

brown; quill-feathers and tail black; chin and throat white, striated with brown; breast cinereous; abdomen white. The Jamaica thrush of Latham.

GUIANENSIS. Above greenish-brown, underneath ochre-coloured, with black longitudinal striæ. The Guiana thrush of Latham.

MUSICUS. With quill-feathers at the inner base ferruginous. The Mavis thrortle or song-thrush of Ray, Willughby, Pennant, and Latham. Found in the woods of Europe, imitating in the mornings of spring the song of the nightingale, and continuing it for almost nine months. Of this there are three varieties.

OLIVACEUS. Brownish; beneath yellow. Found at the Cape of Good Hope.

INDICUS. Olive-coloured; bill and legs blackish; quills brown on the inner side. The Indian thrush of Latham; so called because it is found in India.

CINEREUS. Ash-coloured, with the two intermediate tail-feathers cinereous; the next on both sides black at the margin, and cinereous at the apex; the rest black. The ash-coloured thrush of Latham. Found in India.

MIGRATORIUS. Grey; abdomen red; eye-lids white; the external tail-feather white at its interior apex. The American fieldfare of Forster, and red-breasted thrush of Latham. Found in North America, from Hudson's Bay as far as the bay of Natka and Carolina.

TRICHAS. Olive-coloured; the body beneath yellow; the ocular band black. The Maryland yellow-throat of Edwards, and the yellow-breasted warbler of Pennant and Latham. Found in summer in the moist low woods of Carolina, Maryland, and Pennsylvania.

CANORUS. Brown; beneath ferruginous; with a white line on the sides of the head, and a rounded tail. The crying thrush of Latham. Found in Bengal and China.

RUFUS. Red; beneath spotted whitish, with quill-feathers of the same colour; the tail rounded and red. The ferruginous thrush of Pennant and Latham. Found in America, from Newfoundland to Carolina.

POLYGLOTTUS. Obscurely ash-coloured; beneath palely ash-coloured, with the greater quill-feathers white on the exterior half. The singing-bird, mocking-bird or nightingale of Sloane, the mock-bird of Catesby and Kalm, and the mimic thrush of Pennant and Latham. Found in Jamaica, and the moist woods of America, practising in the way which its name imports.

ORPHEUS. With brown back; breast and lateral wing-feathers whitish; eye-brows white. The polyglott bird of Willughby, the lesser mocking-bird of Edwards, and the mocking-thrush of Latham. Found in Jamaica, and the warmer parts of America. It has two varieties.

SANDWICHENSIS. Above and abdomen brownish; beneath and front cinereous-white. The Sandwich thrush of Latham. Found in the Sandwich islands.

PACIFICUS. Above cinereous; beneath brownish-white; the lori black; the tail black, with a white tip. The Pacific thrush of Latham. Found in the Friendly islands.

SURATENSIS. With the head somewhat crested; the neck, tail, and greater quill-feathers and legs black; the body above amber-coloured; beneath dirty-grey; the wing-coverts and second quills green. The Surat thrush of Latham: named from its habitation.

PHILIPPENSIS. Above olive; neck and breast red, spotted with white; abdomen and vent ochre-coloured. The Philippine thrush of Latham; so called from the islands which it inhabits.

SIANBU. With chin, throat, and the ocular area black, with a large white streak at the ears; the rest of the

head, neck, breast, and abdomen grey; the back and wings greenish-brown. The black-faced thrush of Latham. Found in the woods of China.

NOVÆ HOLLANDIÆ. Blueish lead-coloured; the anterior part of the head, the bill, chin, throat, and legs black; the quill and wing-feathers black, with lead-coloured margin; the intermediate white at the apex. The New-Holland thrush of Latham.

PLUMBEUS. Black, with yellow axillæ, and cuneated tail. The red-legged thrush of Pennant and Latham. Found in North and South America, and in the Bahama islands.

CRASSIROSTRIS. Above from red, and beneath from black to brown, with the quill-feathers acuminate; the two intermediate obscure. The thick-billed thrush of Latham. Found in New Zealand.

ULIETENSIS. From red to brown; quill-feathers black at the margin, and rounded tail black. The bay thrush of Latham. Found in Ulietea.

PALLIDUS. From yellowish to ash-coloured; beneath whitish; tail-feathers from cinereous to brown; the side ones white at the apex. Pale thrush of Latham. Found in Siberia, beyond the lake Baikal.

SIBIRICUS. Black, with yellow mouth; eye-brows and space under the wings white. White-browed thrush of Latham. Rare in the alpine and more northerly woods of Siberia.

RUFICOLLIS. Above brown, below snowy; neck and equal tail-feathers red; the two intermediate cinereous. Red-necked thrush of Latham.

OBSCURUS. Brown; with eye-brows, chin and vent blue. Dark thrush of Latham. Found beyond the lake Baikal, in the woods of Siberia.

PIŒNICULUS. Above olive, with white eye-brows; ocular band black; tail-feathers and two intermediate quills spadiceous; sides with throat and breast red. The red-tailed thrush of Latham. Found at the Cape of Good Hope.

RUFICAUDUS. Above olivaceous; beneath purplish and white; tail-feathers and quills black; sides for the most part red. The rufous-tailed thrush of Latham. At the Cape of Good Hope.

MALABARICUS. Ash-grey; beneath red-brown; bill and tail-feathers black; legs yellow. The Malabar thrush of Latham. Found in Malabar.

PAGODARUM. Black; back and rump grey; vent white; head crested. The pagoda thrush of Latham. Found in Malabar and Coromandel.

CAYENNENSIS. Cinereous; beneath whitish; vent white; greater wing-feathers and tail-feathers black; throat, bill, and legs black. The Cayenne thrush of Latham.

VARIEGATUS. Above brown; beneath whitish; feathers whitish and black interspersed. Variegated thrush of Latham. Found in Surinam.

STRIATUS. Varied with yellow and grey; a longitudinal streak of the back yellow. Yellow-backed thrush of Latham. Found in Surinam.

FUSCUS. Olivaceous-brown; breast and abdomen whitish, spotted with brown; greater quills and legs black. Brown thrush of Latham and Pennant. In New York.

MUSTELINUS. Beneath white, spotted with black; cheeks brown, spotted with white; rump and greater quills acuminate, and tail-feathers brown. The tawny thrush of Latham. In New York.

KAMTSCHATKENSIS. Brownish; beneath from brownish to white; eye-brows pale; chin and throat caryophyllous-coloured. Kamtschatka thrush of Pennant and Latham. Found in Kamtschatka.

TURDUS.

NÆVIUS. With head and pectoral band black; streak from the eyes to the hind part of the head ferruginous; body above cinereous; beneath ferruginous. The varied thrush of Pennant, and spotted thrush of Latham.

HUDSONICUS. From blueish to cinereous; bill and legs black; feathers of the crown, nape, wing-covers and primary quills pale at the margin, red. The Hudsonian thrush of Pennant. Found in Hudson's Bay.

NOVEBORACENSIS. With head, neck, and breast varied from black, and dilutely ferruginous; feathers of the back ferruginous at the margin; with double band above and below the eye, wings, and roundish tail shining-green, and legs black. The New York thrush of Pennant. Found in North America.

CURACUS. Shining-black; bill sub-striated, and tail emarginated. Found in Chili.

NITENS. Green; spot on the wing-covers violet. Shining thrush of Latham. Of this there is a variety, the green merula: beneath violet; throat and rump blueish. Found in Angola, and at the Cape of Good Hope.

ÆNEUS. Shining-green; beneath brassy; head blackish to shining-gold; rump and intermediate tail-feathers purplish; tail wedge-formed. Glossy thrush of Latham. Found in Senegal.

AURATUS. Violet; back and wings green-gold; band of the wings at the internal margin and tail, with the superior wing-covers, blue. The gilded thrush of Latham. Found at Whidah, in Africa.

LEUCOGASTER. Violet; with white belly; blackish quills; bill and legs cinereous. The Whidah thrush of Latham.

ROSEUS. Subincarnate; head, wings and tail black; occiput crested. Merula rosea of Aldrovand, Ray, and Brisson; rose or carnation-coloured ouzel of Pennant, Willughby, and Edwards; the rose-coloured thrush of Latham. Found in various parts of Europe, Siberia, and Syria, migrating in flocks, and feeding chiefly on locusts.

LEUCURUS. Black; rump and tail white; tail-feathers black at the apex. White-tailed thrush of Latham. Found about Gibraltar.

CAPER. Blackish; somewhat crested; rump and belly white; vent red. Cape thrush of Latham. Of this there is a variety, the merula above brownish to cinereous; striated brownish; beneath hoary. Found in China, and at the Cape of Good Hope.

MACROURUS. From purplish to shining-black; beneath from ferruginous to yellow; rump and three tail-feathers on both sides exteriorly white. The long-tailed thrush of Latham. Of this there is a variety with the two intermediate tail-feathers black; the rest half white. Found in Pulo Condore and Malabar.

AMBOINENSIS. Spadiceous; beneath yellow; secondary quill-feathers yellowish from the base to the middle; tail cuneiform; beneath yellow. The Amboine thrush of Latham.

BORBONICUS. From cinereous to olive; black crown; abdomen and vent from olive to yellow; tail brown, with two obsolete bands towards the apex. The Bourbon thrush of Latham. Found in the island of Bourbon.

OCYROCEPHALUS. With the larger quill-feathers, tail, and legs green; vertex and cheeks yellowish; collars black; abdomen and breast cinereous; the latter varied with fagittated spots. The yellow-crowned thrush of Latham. Found in Ceylon and Java.

ORIENTALIS. Black; beneath white; rump cinereous; ocular band black; three tail-feathers on both sides externally white. Ash-rumped thrush of Latham. In India.

NIGERRIMUS. Wholly black; feathers yellow at the margin; cheeks and throat holoferreous. The black-cheeked thrush of Latham. Found in Madagascar.

HISPANIOLENSIS. Olive-coloured; beneath varied from olive to grey; brown tail-feathers, whitish at the interior margin, olive at the exterior; with the intermediate altogether olive. The Hispaniola thrush of Latham.

ALBIFRONS. From black to lead-coloured; beneath yellowish; with the spot on the front white; and brown legs. The white-fronted thrush of Latham. There is a variety black; beneath white, tail beneath cinereous. Found in New Zealand.

CAPENSIS. Brown; abdomen yellowish; vent yellow. A variety has the head and tail black. Found at the Cape of Good Hope.

ATRICAPILLUS. Brown; black head; abdomen and rump red; spot on the wing white. Found at the Cape of Good Hope.

MAURITIANUS. From greenish to deep blue; the feathers of the head and neck narrow and long; bill cinereous; and legs lead-coloured. The Mauritius thrush of Latham.

MINDANAENSIS. Steel-coloured; beneath white; the longitudinal band of the wings white; tail subcuneated. The Mindanao thrush of Latham.

MADAGASCARIENSIS. Brown; abdomen and vent white; tail subfurcated; two intermediate tail-feathers wholly, and the rest at the exterior margin green-gold; the exterior margin of the outmost on both sides white. The Madagascar thrush of Latham.

SENEGALENSIS. From grey to brown; abdomen whitish; bill, tail-feathers, tail and legs brown. The Senegal thrush of Latham.

LONGIROSTRIS. From olivaceous to pale-brown; beneath pale sulphureous; rump and eye-brows yellowish; tail round and yellow; intermediate tail-feathers brown. The long-billed thrush of Latham. Found in the islands of Eimeo and York.

GRISEUS. Grey; crown and neck whitish; breast, abdomen and vent from very pale red to grey. The grey thrush of Latham. Found in Coromandel.

PALMARUM. Green-olivaceous; beneath sub-cinereous; black head, with three white spots on each side. The palm thrush of Latham. There is a variety, *viz.* merula palmarum atricapilla; found among the palms of Cayenne.

MONACHA. Above yellow, with brown; beneath yellowish; black head; terminating with black on the breast acutely. The nun thrush of Latham. Found in the woods of Abyssinia.

ÆTHIOPICUS. Black; beneath white; with a transverse white band on the wings; tail round, tail-feathers quadrated at the apex. The Ethiopian thrush of Latham. Found in the thick woods of Abyssinia.

ABYSSINICUS. Brown; beneath yellow; brownish throat, and black legs. The Abyssinian thrush of Latham.

COCHINCHINENSIS. Green; with blue spots on both sides at the base of the bill; face, chin, and throat black; the latter encompassed with a yellow arc. Found in CochinChina.

CINNAMOMEUS. Beneath more diluted cinnamon; throat, legs, temples, cheeks, chin, covers of the wings, and breast black; with white nebulous wreath. The black-breasted thrush of Latham. Found in Cayenne.

RUFIFRONS. Brown; beneath, and the front and temples red; vent white; tail and legs cinereous. The rufous thrush of Latham. Found in Cayenne.

CANTANS. From red to brown, varied with transverse black or blackish streaks; beneath whitish; chin, cheeks,

TURDUS.

and throat from red to orange; with black area, spotted with white on both sides of the neck. Musician thrush of Latham. In the recesses of the forests of Cayenne.

CORAYA. Red-brown; beneath more diluted; vertex and sides of the head and neck black; tail grey, varied with blackish lines. The barred-tailed thrush of Latham.

FUSCIPES. Cinereous; beneath red; vertex black; legs and tail-feathers brown; tail sub-cuneated. The buff-winged thrush of Latham; supposed to be found in Cayenne.

ALAPI. From olive to brown; throat and breast black; abdomen cinereous; tail wedge-formed, blackish. The white-backed thrush of Latham. In Guiana.

CIRRHATUS. Cinereous, with wedge-formed tail, white at the margin and apex; crested crown; throat varied with white and black; breast black. The black-crested thrush of Latham. Found in Cayenne.

TINTINABULATUS. Vertex and temples white, spotted with black; eye-brows black; chin white; incarnated breast spotted with black; back, wings and tail brown; rump, abdomen and vent from red to orange. The chiming thrush of Latham. Found in Cayenne and Guiana.

BAMBLA. Spotted; above from red to brown; beneath cinereous; wings black; with a white transverse band. The black-winged thrush of Latham. Found in Cayenne.

AURITUS. Varied from red and olive-coloured; beneath white; vertex and wreath from red to brown; chin and throat black; feathers near the eyes, and at the sides of the neck, shining-white; elongated and more wide. The white-eared thrush of Latham. Found in Cayenne.

COLMA. From red to brown; beneath cinereous; chin and throat white, spotted with black; breast from grey to brown. The rufous-naped thrush of Latham. It has a variety from black to brown; the occiput and neck red. Found in Cayenne.

TINNIENS. Above brown; beneath white; breast spotted with black; equal tail. The alarum thrush of Latham. Found in Cayenne.

LINEATUS. From olive to brown; chin, throat and breast white; the latter spotted with brown; the sides of the neck marked with white lines. The speckled thrush of Latham. Found in Cayenne.

FORMICIVORUS. Above from red to brown; beneath cinereous; chin, throat, and breast black; band varied with white and black. The ant thrush of Latham. Found as the former.

CYANURUS. Spadiceous; beneath varied with blue and yellow transverse alternate streaks; vertex at the nape to the quill-feathers and ocular band black; another orange; pectoral band and wedge-formed tail blue. The blue-tailed thrush of Latham. In Guiana.

REX. From red to brown; beneath more dilute; occiput lead-coloured; front varied from white to brown. The king thrush of Latham. Found in South America, particularly Guiana and Brasil.

SINENSIS. Reddish; head brown striated; white eye-brows; tail-feathers marked with obscure brown streaks, and legs yellow. The Chinese thrush of Latham. Found in China.

ARCUATUS. Above spadiceous; with eye-brows, collars, chin and vent white; cheeks and bow of the throat white; tail rounded, black towards the apex; apex white. The crescent thrush of Latham. Found in China.

MELANOPIS. Grey; back and wings from green to brown; orbits, chin, and throat black; spot on the ears white. The black-faced thrush of Latham. In the woods of China.

VIOLACEUS. From violet to blue; feathers of the head,

neck, breast, and covers of the wings steel-fasciated at the apex; bill and legs black. Found in China.

LEUCOCEPHALUS. Grey; black quill-feathers; the lesser with the covers of the wings and tail green-brassy and shining-violet. The white-headed thrush of Latham. In China.

NIGRICOLLIS. Brown; head, chin and nape white; ocular band and breast yellowish; neck, back and tail-feathers black; tail wedge-formed, lead-coloured. The black-necked thrush of Latham. Found in China.

BUBIL. Of the colour of terra umbra; longitudinal band near the eyes black. The chanting thrush of Latham. Found in the southern part of China.

PERSPICILLATUS. With head and neck cinereous; front and streak under the eyes on both sides black; body above from greenish to brown; beneath ochroleucous. The spectacle thrush of Latham. In China.

FLAVUS. Yellow; white orbits; band from upper mandible produced near the eye black; bill and legs red. The yellow thrush of Latham. In China.

VRIDIS. Green; with eye-brows, spot below the eye, abdomen and vent white; throat grey, spotted with white; breast reddish. The green thrush of Latham. In China.

ATER. From grey to brown; beneath from greenish to yellow, spotted with black; bill, legs, front, face, chin, and throat black; the latter with a red margin. The black-throated thrush of Latham. In the island of St. Domingo.

DOMINICUS. Brownish; beneath white; with the principal tail-feathers white at the base; the three outer tail-feathers white. The St. Domingo thrush of Latham. Found in St. Domingo and Jamaica.

BRASILIENSIS. Black; beneath from ferruginous to yellowish; rump ferruginous; tail sub-cuneated; outermost tail-feathers wholly, the rest at the apex, white. The yellow-bellied thrush of Latham. Found in Brasil.

MERULA. Black; with bill and eye-lids yellow. The blackbird of Pennant, Ray, Willughby, and Latham. Of this there are the varieties of merula leucocephala of Brisson, merula varia of the same, or pied blackbird of Albin, and merula alba of Brisson. Found in the woods of the temperate parts of Europe.

AURANTIUS. From blackish to brown; throat and abdomen whitish; bill and legs orange-coloured. The thrush of Sloane and Ray; the white-chinned thrush of Latham. The varieties are, merula gula fusca, merula nigra, and merula americana. Found in the woody mountains of Jamaica, in New Caledonia, in Surinam, and the warmer parts of America.

LABRADORUS. Shining-black; with a blue and green tint; bill and legs black. The Labrador thrush of Pennant and Latham.

TORQUATUS. Blackish, with a white wreath, and bill yellowish. The ring-ouzel or amfel of Pennant, Ray, Willughby, Albinus, and Latham. The varieties are, merula torquata alba, merula torquata albo-maculata, merula albo-maculata, non torquata. Found in Europe, Asia, and Africa.

SAXATILIS. Brown; beneath fordidly orange, undulated with brown and white; rump ferruginous; chin white; throat and intermediate tail-feathers brown, the latter in the margin; side ones wholly orange. The greater red-start of Willughby, and rock thrush of Latham. Found in Italy and Spain.

EREMITA. With whitish orbits; olivaceous vertex; the upper feathers of the occiput brown, near the whitish apex black-banded, and the lower ones from red to white; brown at the margin; and cinereous rump. The hermit thrush of Latham. Found in the Philippine Isles.

MANILLENSIS. From cinereous to blue; blue rump; tail-feathers and tail red at the margin, blackish; throat and breast spotted with yellow; abdomen orange-coloured, undulated with blue and white. The penfive thrush of Latham. Found in the Manillas.

SOLITARIUS. Brown; spotted for the most part with whitish; and blackish tail. The solitary sparrow of Ray and Willughby, and solitary thrush of Latham. Found in France, Italy, and the islands of the Mediterranean and Archipelago.

CYANUS. With feathers cinereous-blue at the margin; mouth and eye-lids yellow. The Indian mockbird of Ray, the solitary sparrow of Edwards, and blue thrush of Latham. Found in Candia, the Archipelago islands, and the rocks of Italy.

ARUNDINACEUS. Brown-ferruginous; beneath whitish-testaceous; with tail-feathers banded and reddish at the apex. The junco of Gesner, Aldrovand, Ray, and Willughby. The varieties are *T. arundinaceus*, with red rump and tail; the *T. arund.*, above varied with black darts; and least *T. arund.*, above from yellowish to green; with covers of the wings ferruginous. Found among the reeds of Europe.

MORIO. Shining-black, with the greater tail-feathers red, and apex black. The African thrush of Latham. Found at the Cape of Good Hope.

BICOLOR. Brown tinted with green; abdomen and vent white. The white-rumped thrush of Latham. Found as the former.

ERYTHROPTERUS. Black, with red wings; wing-covers and lower quill-feathers of the tail, the intermediate excepted, white at the apex; tail wedge-formed. The rufous-winged thrush of Latham. Found near the Senegal river.

CHRYSOGASTER. Green tinted with orange; beneath orange; bill and legs brown. The orange-bellied thrush of Latham. A variety is from blue to green; beneath orange. Found near the river Senegal, and at the Cape of Good Hope.

UROVANG. Cinereous; vertex greenish-black; rest of the head, neck, breast, and body above varying to olive-coloured; the abdomen and crest yellowish. The cinereous thrush of Latham. Found in Madagascar.

SURINAMUS. Shining-black; vertex, rump, and lateral spot on the breast yellow. The Surinam thrush of Latham.

COLUMBINUS. Green, reflecting different sorts of colours; the rump and vent sometimes white. The pigeon thrush of Latham. Found in the Philippine isles.

DOMINICANUS. Above brown; here and there tinted with violet and steel; beneath from brownish to white; tail steel-coloured at the base, greenish towards the apex. The Dominican thrush of Latham. Found in the Philippine isles.

CANTOR. From greenish to black, shining-blue and violet; with tail-feathers and tail black. The songster thrush of Latham. Found as the former.

MALABARICUS. Shining-green; yellow front; throat, bill and legs black; covers of the wings and streak on the lower mandible blue. The yellow-fronted thrush of Latham. Found in Malabar.

SELEUCIA. With bill and legs yellowish; abdomen and back incarnate; tail, wings, and thighs brown. Found in Smyrna.

ZEYLONUS. Green; beneath yellow; ocular line on both sides extended as far as the black breast. The Ceylon thrush of Latham. Found at Ceylon and the Cape of Good Hope.

TURDUS Aquaticus of Brisson. See *TRINGA Macularia*.

TURDUS Chiappæ, the name of a bird of the West Indies, called also *passer faber*.

TURDUS, in *Ichthyology*, the name of a genus of fishes, according to Mr. Ray, of the class of those which have only one back-fin, the anterior rays of which are prickly; the hinder ones soft and smooth.

Of these fish there are several species, which may properly be divided into two orders; the first, of those which are smaller and broad; the second, of those which are larger and oblong.

Of the first order are the *tinca marina*, or *wrasse* (see *LABRUS Tinca*); the *merula*, or *turdus niger* (see *LABRUS Merula*); the *lepras*, and *pira pixanga*; and the *turdus viridis*, or *verdone*. Ray's *Ichthyogr.* p. 320.

Of the second order are the *pavo*, or *peacock-fish* (see *CHÆTODON Pavo*); and the *turdus viridis major*, and *turdus fuscus maculosus*.

The *turdus viridis major*, or great green wrasse, is of a fine green on its back and sides, even to the side-lines; and the lower part of the sides and belly are of a pale whitish yellow, variegated with greyish and pale blue spots; its body is long, and not much unlike that of the pike in figure; its back-fin is long, and has thirty-two ribs, the anterior nineteen of which are rigid and prickly, the hinder twelve soft, flexile, and ramose; the scales are large, the eyes small, and the teeth very large and strong.

The *turdus fuscus maculosus*, or brown spotted wrasse, scarcely at all differs from the others, except in colour. It is of a dusky hue on the back and sides, variegated with blue spots; and on the belly blue, with lines and spots of red. All the fins, except those of the gills, are of a red colour, spotted with blue; the tail also is of this colour, and the gill-fins are yellow. Ray's *Ichthyogr.* p. 322.

TURDUS Oculo Radiato of Catesby. See *SPARUS Radiatus*.

TURDUS Primoris Branchialibus Carens. See *LABRUS Griseus*.

TURDUS Flavus. See *LABRUS Rufus*.

TURECUATO, in *Geography*, a town of Mexico, in the province of Mechoacan; 60 miles W. of Mechoacan.

TUREE, a town of Bengal; 40 miles S.S.E. of Curuckdeah. N. lat. 24° 30'. E. long. 86° 56'.

TURENBERG, a town of Prussia, in Samland; 16 miles W.N.W. of Königsberg.

TURENNE, HENRY DE LA TOUR, *Viscount of*, in *Biography*, a famous general, was the son of Henry de la Tour d'Auvergne, duke of Bouillon, by Elizabeth, daughter of William I. prince of Orange, and born at Sedan in 1611. Destined from his childhood to the military profession, his education and habits were conducted and formed with this view. Having acquired the necessary qualifications, he was placed, in 1634, at the head of a French regiment, in which post he acquitted himself with honour; and having pursued a career of distinguished services, cardinal Richelieu, in 1638, offered him one of his nieces in marriage; but his attachment to the reformed religion led him to decline the proposal. After he had served 17 years in Italy and elsewhere with singular reputation, he obtained, in 1644, the staff of marshal of France, and was entrusted with the command of the army in Germany, the wants of which he supplied out of his own purse. When the war of the Fronde broke out in 1649, he withdrew to Holland, but afterwards returned and engaged with the party opposed to the court. In this connection he was defeated near Rhetel in 1650; and when asked how he had lost this battle, he replied, "By my own fault; but when a man commits no faults in war, it is because he has not been long engaged in it." In 1651 his difference with the French

French court was accommodated, and he was appointed general of the royal army. In 1653 he married the daughter of the marshal duke de la Force, a Protestant, by whom he had no issue. After several campaigns of alternate successes and defeat between him and d'Enghein, now prince of Condé, in the service of Spain, Turenne in 1657, having gained the battle of Dunes, captured Dunkirk from the Spaniards, and the greatest part of Flanders; so that Mazarin was enabled to make the peace of the Pyrenées. Upon a renewal of the war with Spain in 1667, Lewis XIV. made choice of Turenne, now marshal-general of the French armies, as his tutor in war; and the result of the first campaign was the conquest of the greatest part of Flanders, and afterwards of Franche Comté. In the following year, Turenne, from motives not satisfactorily ascertained, but not redounding much to his honour, abjured Calvinism, and was reconciled to the church of Rome. In the year 1672, it was determined by Lewis to conquer Holland, and the command of the army was assigned to Turenne; to whose arms resistance was in the course of the campaign ineffectual. The elector of Brandenburg, proposing to relieve the Dutch, was pursued to the gates of Berlin, and obliged to sue for peace. When at this time it was proposed to the marshal to gain 400,000 livres without the knowledge of the court, he thanked the general officer who made the proposal, and told him, that as he had often declined such advantages, he did not intend to alter his conduct at his age. On another occasion, a considerable city offered him 100,000 crowns for not passing through its territory; and his reply to the deputies was, "As your city is not in my proposed line of march, I cannot in conscience take your money." We should exceed our limits, if we detailed his various successful movements during the following campaign. The soldiers reposed confidence in their commander, and to this confidence he owed the prosperous issue of various expeditions. The glory of his conquests, however, was tarnished by his cruel devastation of the Palatinate, which Voltaire has justly reprobated; observing at the close of his account, that "he rather chose to be called the father of the soldiers that were entrusted to him, than of the people, who, according to the laws of war, are always made the sacrifice." The imperial court, determined to make every possible effort to check the progress of Turenne, called forth Montecuccoli, its best general, to oppose him. As these two masters of war were preparing for an engagement, Turenne, whilst he was reconnoitering a fit place to fix a battery, on July 27, 1675, was struck by a cannon ball, which killed him on the spot, in the 64th year of his age; and with him terminated the good fortune of the French in that campaign. His remains were interred with the highest funeral honours at St. Denis. The greatness of Turenne's soul was disguised by a rude and vulgar appearance. His temper was cool, and his manners modest and unassuming. He was not always successful in war, and committed faults, which he had the magnanimity to acknowledge; but, as Voltaire says, (Age of Lewis XIV.) "by always repairing them, and doing much with small means, he passed for the ablest general in Europe, at a time when the art of war was more studied than ever before. Though he was reproached for his defection in the war of the Fronde; though at the age of near sixty, love caused him to reveal a state-secret; though he exercised cruelties in the Palatinate, which seemed unnecessary; he preserved the reputation of a man of worth, wise and moderate, because his virtues and great talents, which were his own, covered weaknesses and faults which were common to him with so many other men."

Ramsay, in his "Life of Turenne," mentions the following anecdote, as an instance of his strict performance of a promise. Being attacked one night by robbers near Paris, and stripped of his money, watch, and rings, he engaged to give them 100 louis d'ors, if they would return him a ring, of no great worth, but which he highly valued. The highwaymen complied; and one of them had the boldness to go to his house the succeeding day, and in the midst of a large company to demand, in a whisper, the performance of his promise. The viscount gave orders for the money to be paid, and suffered the villain to escape, before he related the adventure.

TURENNE, in *Geography*, a town of France, in the department of the Correze; before the revolution, the capital of a viscounty; 9 miles S. of Brive.

TUREVSKOI, a town of Russia, in the province of Ustiug, on the Vim; 60 miles N.E. of Yarensk.

TURF, in *Agriculture*, a term often used to signify the green sward or surface of grass-land. It is of great use and importance to the farmer to have the turf of such land close, firm, and well set, as where this is not the case, it soon declines, grows thin, and becomes of little value either for the purpose of mowing or pasturing. It has been noticed, in the "Georgical Essays" of Dr. Hunter, in speaking of the improvement of the turf of poor pasture land, that, on such, it constantly gets worse a few years after having been laid down for that purpose: the cause of which is plainly this. There are a few spiry grasses, natural to most poor lands, which are denominated *natural* grasses; while those from the seeds of clover, and others of similar kinds, which are introduced, are in general termed *artificial*. The roots of these latter are not very durable, especially on poor land; and as the cattle as well as other sorts of live-stock are greedy of such sown grasses, they constantly crop them, and prevent their going into seed, by which the land is deprived of fresh supplies of young plants; whereas the former sort, or the natural grasses, being, in general, much inferior to the other in quality, are refused by such stock, and the land, consequently, soon becomes plentifully stocked and provided with them.

It is suggested too, that the general method of practice for improving land, when the turf gets thin and bad, is to bring it under a course of tillage. But when that is not proper or convenient, or when the occupier of such land is not inclined to introduce this mode, it may be greatly improved by having fresh seeds of the grass sort sown upon it; the best season for which is in the beginning of the first spring month. The ground should first be well wrought over with a heavy harrow of the bush kind, which will brush up and raise the soil, and prepare it well for the striking of the seeds in it. Compost earth should then be used as a dressing, and the seeds sown thereon: after which the ground may be lightly brushed over again, and well rolled. When the season proves moist and kind, the seeds will be found to thrive to admiration, and to wonderfully improve both the turf and verdure. And where the turf of land has been greatly cut up by carriages, or much trod up by cattle, it is also capable of being improved in this way, without the dressing of compost earth. Even in paddocks where the turf of the land has been cut up to an extreme degree by rude and wanton horses, a new and verdant turf has been seen to arise, even to amazement, in a few weeks after sowing the seeds. It is, however, necessary that cattle should be prevented from coming upon the land until the turf get well set, and in a firm state.

The turf, in all sorts of land, may be greatly benefited by

by the proper use of manure upon it, and at the same time properly feeding it down with suitable kinds of live-stock. See GRASS, GRASS-Land, and GRAZING.

TURF is likewise a term applied to a blackish fibrous vegetable earthy substance, which is used in many parts of the country as fuel. It varies considerably in its nature and composition in different places, being, in some cases, hard and of a dark or black colour, while in others it is soft and very spongy, and of a brownish colour. It is cut and formed into turfs for the purpose of fuel, by means of a particular sort of instrument, employed in a certain manner. See TURFING Spade.

It is a substance which is not only very useful in this way, but for burning calcareous stones into lime, and many other purposes in agriculture.

Turf or peat-earth is capable of extensive use as a manure, but it mostly requires some preparation to properly fit it for this sort of application; as it is found that it is a substance which is held together partly by the intertexture of its fibres, and partly by its natural viscosity; and that when it is allowed to dry steadily in that state, it becomes almost incorruptible; and that it does not yield food to growing vegetables, unless its natural conformation be destroyed, and its parts separated by the intervention of other substances. This strongly shews that its structure or texture should be somehow broken down and reduced, and the water which it originally contains be forcibly discharged from it, as soon as possible after it is taken from its native bed, in order to prepare it for manure. There are different methods of effecting this. It has been suggested, that as this sort of fibrous matter will not ferment unless some substances are mixed with it, which act the same part as the mucilage, sugar, and extractive or albuminous matters, with which it is usually associated in herbaceous and succulent vegetables; a mixture of common yard-dung has been lately properly recommended for the purpose of bringing turf or peat-earth into fermentation: any putrescible or fermentable substance will, however, answer the end; and the more a substance heats, and the more readily it ferments, the better it will be fitted for the purpose. In forming this mixture, it is stated, that one part of dung is sufficient to bring three or four parts of the turf or peat into a state in which it is fitted to be laid upon land; but that, of course, the quantity must vary with the nature of the turf and the dung. In circumstances where some living vegetables are mixed with the turf or peat, the fermentation will be more readily accomplished.

Turf or peat of this sort, after being reduced in its parts, may also be prepared for this use by being soaked in the urine of cattle, in putrid water, and other such liquids; likewise by the action of lime, and by being ridged up and mixed in the manner below.

This material, both in mixture with dung and lime, has been used with great success and advantage in Cheshire. The method of preparing it there, in the practice of some, is, before the winter sets in, to trench and throw it up into narrow ridges, that it may be dried and reduced into a powdery state by the action of the atmosphere. After some time it is turned over and laid flat, being then usually found much lighter than when first dug up. It is now covered over with dung, in the proportion of a fourth or fifth part of the weight, and left so for about three weeks, when it is turned over, mixed perfectly with the dung, and thrown into heaps. A fermentation commonly soon takes place, that varies in its duration in proportion to the moisture in the turf. When it has subsided, the mixture is

turned over again, as before, and the turf or peat at the same time broken very small, that it may mix the more intimately with the dung. This often produces another fermentation, more powerful than the first. The mixture is mostly ready for use in the beginning of the spring. If lime be used, the quantity is very much less than that of the dung, but the process otherwise much the same.

If, for this purpose, the turf or peat were thrown up in long narrow ridges, and a little quick-lime dusted between the different layers, it would, it is supposed by some, expedite its separation, and dispose it sooner to incorporate with putrid matters.

This substance has likewise been used with great benefit in both of these mixtures, as well as in its simple reduced state in different instances, in Lancashire, by Mr. Paterfon and others. See a paper in the third volume of the Transactions of the Highland Society of Scotland, and Lord Meadowbank's Directions.

TURF, in Gardening, the green surface or sward cut from pastures, &c. for the purpose of laying down grass-grounds; as lawns, plats, bowling-greens, banks of pieces of water in pleasure-grounds, &c.

It is flayed off with the turfing-iron, in regular lengths of two or three feet, and a foot wide; and being properly laid down close and regular in the places intended, it immediately forms an even grass sward, which quickly strikes root in the ground, in proper growth and verdure. This sort of work may be performed any time in autumn, winter, and spring, in open weather, or occasionally in summer, in a moist season; but the autumn is the best season. The best turf is mostly procured from fine close-fed pastures, commons, or downs, &c. where the sward is close and even; or that of any grass-field of similar close, firm sward, where the grass is not rank and coarse, nor abounding in weeds, or much over-run with the common wild daisy, dandelion, or other similar plants.

In the operation of cutting the turf, a line should be drawn tight lengthways of the grass-ground, and then the cutting-racer be fricken into the surface of the sward, close to the line, pushing it along so as to cut or score the sward in a straight cut the length of the line, about an inch and half deep; and having thus raced out one length, the line should be moved a foot width further to race out another length as before, proceeding in the same manner to a third, and so on to as many lengths of the line, in foot widths, as may be necessary; then, by the same means, the sward is to be raced cross-ways in yard distances, and thus the proper widths and lengths are formed. After the sward has been thus raced out, it should be flayed, or cut up with the turfing-iron, beginning at one side, cutting evenly longways the whole length of each raced line, about an inch or inch and half thick; a person following immediately after to roll them up separately in yard lengths, grass-side inward, as close and tight as possible: having thus cut up one range, proceed with another in the same manner, and so continue with the whole. As the turfs are rolled up, they should be piled close and regular together, ready for carrying away. When cut by the hundred, as is often the case where large quantities are required, they are commonly piled up in tens; four below, three next, then two, and one at top, for the more ready reckoning of the number wanted.

In performing this sort of work, it is constantly necessary to keep a steady even hand, in order that the turf may be cut all of an even regular thickness without any sort of lumpiness, which renders it less difficult and troublesome to lay down, as such lumps cause many inequalities that cannot

not be easily made level, but require so much beating as often to greatly injure and destroy the turf, as well as to be productive of a great waste of time and labour, thereby causing a great deal of unnecessary expence. Besides, such work under these circumstances can never be done so well as where the contrary is the case.

TURF-Ashes, in *Agriculture*, those formed from any sort of turfy or peaty matters. Turf-ashes have been used as a manure on poor thin soils, in some districts, with great effect and advantage, and for potatoe crops; but they are probably, in general, the best when employed as top-dressings for grasses and certain kinds of crops. See *TOP-Dressing*.

The ashes formed from turf or peat in Berkshire have lately increased greatly in value, in consequence of their general application as a top-dressing to clovers and other sorts of artificial grasses, as well as to tares, turnips, and occasionally wheat in the young state of its growth. The usual time of applying them is the very early spring. They are there commonly taken in carts, and sown by the hand over the ground, either before or after the seed for the crop is sown. But when used only as a top-dressing, they are merely sown on the surface of the land evenly by the hand. The quantity made use of is mostly from twelve to fifteen statute bushels to the acre, as the soil and crops may be. It is believed, that too large quantities would be hurtful. Some do not hold them in much estimation for grain crops, or those of the pea kind; but they are preferred to all other manures, especially for all sorts of artificial grasses. In turnip crops, they are said to assist much in preventing the ravages of the fly; and in those from the seeds of grasses, the farmers suppose, that on an acre which is manured with them, the produce in hay will be nearly a ton more than what it would have afforded without them.

On meadow-land too, in some cases, from fifteen to twenty bushels of these ashes may be laid with great improvement to the grasses. The effect of them is supposed to be not of longer duration than two years.

Several acres may be gone over with the sowing of the ashes in the course of a day, by one person and a two-horse cart. See *ASHES* and *SULPHATE*.

TURF-Drain, a term applied to that sort which is formed in turfy situations, and filled with turves or peats; and which is done in an useful, neat, and successful manner in many districts, especially in Lancashire, as may be seen in the corrected agricultural report of that county. It also signifies a sod-drain. See *SURFACE-Drain*.

An improved mode of turf or sod-draining may likewise be met with in the report on agriculture for Cheshire.

TURF-Hedge, that sort of fence which is formed by means of sods, or the dug-up turf, and plants of different kinds. For turf-hedges that are to be six feet high when finished, six-foot bases are allowed in some places, as in Cornwall; and as they settle a good deal, half the height is only built at a time, with the filling well ridged up in the middle to throw off the wet. This remains to settle perfectly, when the other half is laid, and the proper plants or cuttings put in. This is thought to be an improvement in the forming of this sort of fence. See *FENCE*.

TURF-House, in *Rural Economy*, that sort which is formed of the turf cut from land, and which is common in the northern parts of the island.

TURF-Moss, or *Bog*, a term applied to a tract or extent of turfy, mossy, or boggy land, from which turf is cut, or which stands in need of being reclaimed and brought into order by suitable draining, and the proper application of weighty earthy substances of different kinds. See *BOG*, *MOOR*, and *MOSS*.

VOL. XXXVI.

TURF-Spade, a tool of this kind, which is used in cutting turf for fuel. It is about four feet in length with the handle, and four inches in breadth, being made sharp in the mouth-part, and having an ear or sharp iron on one side of it, which is bent or turned up to a right angle, that serves to cut and separate one side of the turf from the bed of turfy matter, as the back and mouth of the implement do the other.

The work of cutting the turves for burning by means of this spade, is performed somewhat in this manner: the ground being first marked out on the surface in a straight line, of a length at pleasure, and between three and four feet in width, is then dug level on the surface with a common spade, the whole of the bad and imperfect turfy parts being removed. The turf is then cut by a person standing in the pit or ditch, with the narrow spade described above, which is shod at the lower end with iron, as has been said, in a sharp manner. By this means every turf is cut and formed into a long sort of square, which is then taken from the workman, and spread on the ground in a close manner, until dry, when they are set up on end, three or four together, and afterwards put up into windrows and small stacks, till ready to be led or carried home for use.

The spade which is made use of in cutting the turf or peat for being reduced into ashes in Berkshire, is somewhat of this form too, but it has a considerably greater length of the mouth-part. The turf or peat, when dug by it, is carried from the spot in little wheel-barrows, to a short distance, where it is spread on the ground, and after lying some days, the pieces are turned, which after being several times repeated, a heap is made of it, in the middle of which dry turf is put, which is set fire to, and the whole slowly burnt, additional quantities of turf or peat being occasionally supplied, so as that the burning may be slow and smothering. The heap is mostly of a circular form, and rather flat at top, being small at first, but ultimately sometimes two or three yards in depth, and six or seven in diameter.

The remaining materials, when passed through a riddle, are taken away, in a covered manner, to great distances.

TURF-Sweating, an Indian method of curing diseases, which has been found to succeed very happily on many trials.

Paul Dudley, esq. gives an account of a man of seventy-four years old in New England, who drinking cold water when very hot, had a pain settled in one side and arm, which baffled all art to remove; till after nine weeks' confinement to his bed, when he was given over by every body, it was proposed to try this method of cure upon him.

An oven full of turf was ordered to be cut; the turves were of about eighteen inches square each, and were of the nature of the English turf used in gardens.

The Indian doctor, before the turf was put into the oven, rubbed over their grassy side with some sort of oil or spirit, and then putting the two grass sides together, placed them in the oven. When they had been two hours there, and were well baked, he took them out, and made a bed upon the floor, the place for the head being a little raised; the old man was then taken out of bed without his shirt, but wrapped in a sheet, and being laid on the turf-bed, such another parcel of the hot turf was laid over him. The turf was laid thickest on that side where the pain was, but none of it was put on his breast or head.

He was then covered with a blanket to keep in the heat, and while he was in this warm bath, he was continually supplied with warm cordials to keep him from fainting, of which he was in great danger. After he had lain in this bath about three quarters of an hour, which was as long as

he could bear it, he was put into a bed very well warmed, without his shirt, where he soon fell asleep, and sweated to that degree, that it run through the pillow and bed on the floor. After about two hours' sweat, they rubbed and dried him, and put on his clothes, and the old-gentleman found himself much eased and refreshed. The operation was performed in the morning, and before night he walked about the house comfortably, his pain being almost all gone. The cordials were, after this, repeated, and, on the fourth day, the sweating was performed again; the day after which, the old gentleman was well enough to go about his business. He lived eleven years afterwards in perfect health, and free from pain.

Great care is to be taken in this operation that the patient do not lie too long in the turf: in many cases, a quarter of an hour is found to be long enough; and the general rule is, that as soon as the patient begins to fetch his breath short or faint, he must be put to bed immediately, and the cordials must by no means be omitted, for the life of the patient is endangered without them. Phil. Trans. N^o 384, p. 129.

TURFAN, in *Geography*. See *TOURFAN Hotun*.

TURFING, in *Gardening*, the operation of laying down turf. In preparing the ground for this purpose, it should, where loose, be well trodden, or occasionally rolled and rammed; then be properly levelled on the surface with the spade, and afterwards raked smooth; when it will be ready for laying. In laying the turfs, they should be unrolled regularly on the ground, each in its place, making them join close edge to edge, so as to form at once a close even sward; beating the whole down close and even afterwards with a heavy wooden beater, to settle the roots of the grass close to the earth, as well as to form the surface equally close, firm, even, and smooth; the turf thus soon strikes root below, and grows above, without any further care in this part of the business, except occasionally beating down any swelling inequalities, and sometimes rolling it with a heavy iron roller. Sometimes, when turf is laid in the summer, or in the early part of autumn, in dry hot weather, it will shrink and open considerably at the joinings, and assume a decayed-like appearance. In this case, a few good waterings would be serviceable; but should this be omitted, the first heavy rain will mostly recover the whole effectually, and swell the sward, so as to close all the chafms, and revive the verdure of the grass plants, when a heavy rolling should be given, to settle the whole firm and even, and to give the surface a neat appearance. The principal circumstance to be regarded in this sort of work, is to have the surface of the ground well levelled before the turfs are laid down, for where this is neglected, it is utterly impossible to do the business so as to look well.

In respect to the after-culture of ground formed with turf, it is chiefly to give occasional mowings, from the spring through the summer till October, and occasionally posing and rolling the surface to keep it even and level. The mowings in these cases should constantly be performed before the grass gets to too high a growth, so as to injure the surface appearance by rendering it tender and of a bad colour.

TURFING-Iron, an implement made use of for slaying or cutting up grass, turf, or sward from land for the purpose of turfing: it is formed with an iron plate for the cutter, from six to seven or eight inches wide, a little rounding forward at the edge, which is thin and sharp for cutting, but thickening gradually behind to the upper part, where it is forged to a long bent iron handle, the bending so formed as to admit of the plate or cutter resting flat with its back on the

ground, in the proper position for readily cutting or slaying the turf or sward evenly off, of a regular depth or thickness; the handle at top being either formed of iron, with an opening like the top of a spade, or a socket in which to fix a short wooden handle of that kind. In using it in cutting the turf or sward, the workman takes hold with one hand in the top handle, the other below, with the latter guiding the tool in the proper position, whilst the upper hand is placed against his knee, &c. which assists him in thrusting it forward into the ground evenly under the sward; and thus he proceeds along in a regular manner, moving the tool gradually along at each stroke, level and even, at an equal depth. Thus, as one range of turf or sward is pared off, another is begun with until the whole work is done.

It is necessary that the edges of the cutting iron should be well steeled, and ground perfectly sharp, as the labour by such means is rendered much less, and the work far better performed.

TURFING-Spade, in *Agriculture*, the name of an implement used to under-cut the turf, after it is marked out with the plough, in the old practice of paring and burning the turfy surface of land.

TURGA, in *Geography*, a town of Bengal; 40 miles S. of Doefa. N. lat. 22° 22'. E. long. 85° 5'.

TURGANA, in *Ancient Geography*, an island on the coast of Arabia Felix, in which was a very magnificent temple dedicated to Serapis, according to Ammianus Marcellinus.

TURGESCENCE, **TURGESCENCY**, a swelling or growing bloated.

TURGHE, in *Geography*, a river of Wales, which runs into the Cothey, in Caermarthenshire.

TURGOT, ANNE-ROBERT JACQUES, in *Biography*, an enlightened and patriotic minister of state, was born at Paris in the year 1727, and studied theology at the Sorbonne, where, in his 22d year, he delivered two Latin discourses, "On the Advantages derived to Mankind from the Christian Religion," and "On the Progress of the Human Understanding." At the age of 24 he translated Virgil's *Georgics*, and thus a change took place with regard to the direction of his studies; so that he became attached to the principles of Quesnay, and of the sect called Economists. Having quitted the Sorbonne, he was appointed intendant of Limoges; and in the course of twelve years, during which he occupied this office, his conduct in distributing alms and providing a supply of food in a time of scarcity, and in introducing various improvements in the province, established his character, and commanded for him great respect. With him, it is said, first originated the institution of charitable work-shops. As comptroller-general of the finances, he adopted various regulations, which, without injuring the revenue, encouraged industry, promoted agriculture and commerce, and lightened the burdens of the lower classes. Although many of his beneficial plans of reform were treated with contempt and ridicule, he succeeded to a considerable degree in ameliorating the state of the country. His resolution, diligence, and activity, overcame many obstacles and difficulties, inasmuch that the benevolently disposed Lewis once said, on leaving the council-chamber, "No one loves the people but M. Turgot and I:" nevertheless, the cabals against him prevailed, and he was dismissed from the important office which he occupied with so much advantage to the people. As an incitement to his industry, he alleged, that in his family life was not protracted beyond the age of 50; and, therefore, having but a few years before him, he determined to leave nothing unfinished. Accordingly he died in 1781, at the age of 49. Of the pieces which

which he published, Condorcet has given an account in a "Memoir on his Life and Writings," 1782, 8vo. La Harpe has given us the following sketch of his character. "He was a man of a strong mind, whom nothing could divert from justice, even at court, and in the highest places; of an unalterable equanimity, even in the midst of the oppositions and disgusts of his ministry; of a laborious activity, which disease could not slacken. He had only two passions, that of science, and that of the public good. During the few years in which he occupied the post of minister of finance, he bent all his views to the relief of the people. Attached to the doctrines of the Economists, he developed them in edicts which tended to the encouragement and improvement of agriculture. He was the first among us who changed acts of the sovereign authority into works of reasoning and persuasion; and it is perhaps a question whether this method may be useful or dangerous. His suppressions and reforms in the finance raised him many enemies; but among all who complained against him and reproached him, not one attacked his integrity. No one disputed the purity of his motives, but fault was found with his measures. Perhaps there was something unyielding in his character, which impeded the good which he wished to effect. Further, the courtiers could not pardon a minister who encircled himself with men of letters and philosophers." His innovations in favour of the people created a prejudice against him, on the ground of his being one of the promoters of the French revolution. *Nouv. Dict. Hist. Gen. Biog.*

TURGUT, in *Geography*. See **DURGUT**.

TURHUSSY, a town of Bengal; 17 miles N.N.E. of Palamow.

TURIA, in *Botany*, an Arabic name, retained by Forskall, *Fl. Ægypt.-Arab.* 165, and cited by Jussieu, *Gen.* 395, under *Anguria*. The above name, if wanted, might not be inadmissible; at least, if any such, of barbarous origin, are allowed to remain. But whether the five, partly doubtful, species on which Forskall has founded his genus be really entitled to stand alone, or whether they may be referrible, as Jussieu hints, to *Anguria*, or to any other genus of the Cucumber tribe, no one, conversant with Forskall's works, will, surely, venture to determine. He attributes a pentapetalous *corolla* to these plants, which is unexampled in their natural order, and which, by other parts of his account, appears to be an error. The villous cylindrical *fruit*, tapering at each end, and marked with ten furrows, will scarcely afford a generic character.—Forskall's first species, *Turia* of the Arabs, to which he has given no specific name, is cultivated in Yemen, but we are not told for what purpose. Some of the others are called, in that country, *Leloja* or *Lua*, *Gijef*, and *Moghadd*.

TURIAMO, *Bay of*, in *Geography*, a bay of Caraccas, three leagues to the windward of Porto Cabello, which extends one league from north to south. Having no shelter from the north wind, and the country round it affording no commodities sufficient for inducing merchants to encounter its inconveniences, scarcely any ships resort to it. The case is the same with regard to Patanemo, Borburata, and Sianega. The whole population of these bays consists of no more than a small party of soldiers, stationed there to prevent smuggling.

TURIANO, a river of Sicily, which runs into the sea, 10 miles N.E. of Mistrretta.

TURIAS, the *Guadalavir*, in *Ancient Geography*, a river of Hither Spain, on the banks of which was built the town of Valentia.—Also, a river or torrent of Italy, mentioned by Silius Italicus (*l. xiii. v. 5.*), and thought to be

the same with that mentioned by Livy, and placed six miles from Rome. But the orthography is much controverted.

TURIASO, **TARACONA**, or *Tarazona*, a town of the interior of Hither Spain, towards the south-west. Pliny speaks with high commendation of its iron. It was municipal. It was situated east of Numantium, and south-west of Calaguris.

TURICUM. See **ZURICH**.

TURIGA, a town of Spain, in Bætica.

TURIGA, in *Geography*, a river of Russia, which runs into the Niznei Tunguska, N. lat. 66° 12'. E. long. 98° 44'.

TURIN, a city of France, capital of the department of the Po, during the revolution, before and since capital of Piedmont, situated at the conflux of the Po and the Grand Doria, about seven miles from the foot of the Cottian Alps, in the road from France to Italy, by the way of Mount Cenis. According to Pliny, the inhabitants derive their origin from the Ligurians, and were anciently called "Taurini." Hannibal, the Carthaginian general, when he invaded Italy, took and destroyed the town, because the inhabitants would not take part with him; which frightened the other people who inhabited the banks of the Po. It was erected into a Roman colony by Julius Cæsar, who gave to it the name of "Julia," and it was called "Augusta Taurinorum" by his successor Augustus. It was successively subjected to the Goths, Huns, Eruli, and Burgundians, who ruined and destroyed it; but it was soon rebuilt, though not so large as before. When the Lombards became masters of the country, it became the capital of one of their principal duchies. Some of the dukes became kings of Italy. After Charlemagne had abolished the kingdom of the Lombards, Turin became subject to the marquis of Susa, who had the charge of guarding the passages of the Alps, and continued in that family to the death of Ulric Manfred, the last marquis of Susa, in 1302; whose daughter, Adelaide, married Odo, comte of Maurienne and Savoy. Turin submitted to him and to his descendants, who since possessed it with little interruption till its union with France; before which Turin was the see of an archbishop, and was said to contain 110 churches or chapels, several hospitals, and about 80,000 inhabitants. The approach to it is magnificent, and the environs beautiful, though thick fogs from the two rivers are frequent in autumn and winter; so that the air of Turin is then very thick and moist. The four gates are highly ornamental; the streets in the New Town are wide, straight, clean, having plenty of water running through them, well built, in a good taste, chiefly of brick stuccoed, and generally terminating in some agreeable object. No inhabitant could rebuild or repair his house but on an uniform plan, laid down by government, for the improvement of the city. The fortifications of Turin were regular, and kept in excellent repair. The citadel is a regular pentagon, consisting of five strong bastions, and is reputed one of the strongest in Europe. At the end next the new gate is the arsenal, which, besides the armories found in such places, contains a cabinet of minerals, a good chemical laboratory, a library of books in mineralogy and metallurgy, and furnaces for casting cannon: here, also, are mathematical, mechanical, and other masters, for the instruction of engineers, miners, &c. The garrison of Turin was changed at the end of two years, and then there was a general review. The university was founded first in 1405, by Amadeo, duke of Savoy, and consists of schools, wherein 24 professors read lectures, from the 3d of November to the 24th of June; the royal library, in which are about 50,000 volumes of printed books, besides manuscripts, is open every

day, except holidays, both morning and afternoon. The royal museum has a good cabinet of medals, and a collection of antiquities, found chiefly in Piedmont or Sardinia, and elegantly arranged: also of natural history, as shells, and English minerals, polished marbles, and hard stones, petrifications, corals, zoophytes, and some minerals, collected by Donati in the Adriatic; also, some chests of natural curiosities, which Donati during his travels in Egypt and Arabia, sent from Goa. In the military academy, young gentlemen, both natives and strangers, might be instructed in the exercises at a moderate expence, the king defraying a part of the charge attending this institution. The palace is in a simple and noble style of architecture. The apartments are handsomely fitted up and furnished; the ceilings painted by Daniele di Santerre and others. They contained a great collection of pictures, among which were many good ones. The king's theatre, or great opera-house, is reckoned one of the finest in Europe. The buildings which are most esteemed in point of architecture, are the palace of the duke of Savoy, called Castello Reale, by Filippo Giuvara; the Carignano palace, by Guarini; the buildings of the university, and the town-house. There is a literary society at Turin, which has published memoirs, under the title of "Miscellanea Philosophico-Mathematica." The chief trade of this city and country is in thrown silk, which is sent to England and Lyons; they manufacture, however, some of it into excellent stockings, and good silk for furniture. In the year 1536, Turin was taken by the French, and again in the year 1640, after a long siege. In the year 1706, the same enemy made another attempt; but after besieging it upwards of three months, under the conduct of the duke of Orleans, they were driven away with great loss, by the duke of Savoy and prince Eugene. In December 1797, the French took this city, and levied on the king of Sardinia a contribution of 2,000,000 livres. In May 1799, it was taken by the Austrians and Russians, and the citadel surrendered soon after. It was afterwards surrendered, with the whole of the principality of Piedmont, to the French republic, but restored after the revolution and re-establishment of the French government. N. lat. $45^{\circ} 3'$. E. long. $7^{\circ} 40'$.

At Turin, accounts are kept in lire, foldi, and denari, Piemontese currency: 12 denari = 1 foldo, and 20 foldi = 1 lira: accounts are also kept in francs and centimes, as in France. The gold coins now in circulation are carlini, of 5 doppie or pistoles, with half carlini in proportion, and doppie, with halves and quarters in proportion: the carlini passes for 120 lire, and the doppia for 24 lire, Piemontese currency. The silver coins are scudi of 6 lire, with halves, quarters, and eighths in proportion. Here are also base silver coins of $3\frac{1}{2}$ and $2\frac{1}{2}$ foldi; and copper coins of 1 foldo; also pieces of 3 denari, called quattrini. The doppia contains $172\frac{1}{2}$ troy grains of fine gold, or $139\frac{1}{2}$ grains of English standard gold, and is worth *l.* 2*s.* 6*d.* in English gold coin: the scudo contains 492 troy grains of fine silver, or 532 of English standard, and is worth *s.* 8*d.* in sterling silver coin: thus the lira Piemontese currency may be valued at $11\frac{1}{3}$ *d.* sterling. The rubbo, commercial weight, is 25 lbs., each pound containing $1\frac{1}{2}$ mark, or 12 oz. of the gold and silver weight: so that 70 lbs. of Turin = 57 lbs. avoirdupois. The sacco, corn measure, contains 3 staga, 6 mine, or 48 coppelli; and 22 sacchi = 9 English quarters nearly: the brenta, wine measure, contains 6 rubbi, or 36 pinte; the rubbo weighs 25 lbs. of Turin, and holds about $2\frac{1}{2}$ English gallons. Oil is sold by the rubbo of the same weight, or $20\frac{1}{2}$ lbs. avoirdupois: the raso or ell is = $2\frac{2}{3}$ Genoese palmi = $23\frac{2}{3}$ English inches;

the foot = 143.2 French lines = $3\frac{1}{4}$ English inches; so that 180 Piemontese rasi = 119 English yards, and 33 Piemontese feet = 35 English feet.

Turin exchanges with, and gives Amsterdam, 38 foldi, more or less, for 1 florin banco; Augsburg, 46 foldi for 1 florin current; Geneva, 86 foldi for 1 ecu of 3 livres current; Genoa, 199 foldi for 1 sequin; Leghorn, 82 foldi for 1 pezza of 8 reali; London, 409 foldi for 1*l.* sterling; Lyons and Paris, 50 foldi for 3 livres Tournois; Milan, 98 foldi for 1 filippo of $7\frac{1}{2}$ lire current; Rome, 90 foldi for 1 scudo of 10 paoli; Venice, 54 foldi for 1 ducat piccoli.

The usance for bills drawn from London is three months after date, from Holland two months, and from France one month. The holder of a bill payable after date, may either demand payment when it becomes due, or wait till the fifth day; but bills at sight must be paid when presented. Kelly.

TURIN, a large post-township of New York, in the S.W. corner of Lewis county, 143 miles N.W. of Albany. It comprises seven townships, viz. Pomona and Lucretia, adjoining Black river, and on which are the settlements; Flora, Xenophon, Rurebella, Hybla, and Penelope, unsettled. The settled part is about nine miles along Black river and seven back. The inhabitants are emigrants from the eastern states, farmers of plain domestic habits. Here are nine school-houses, in which are also held the meetings for worship. The whole population in 1810 was 856, and the senatorial electors were 111; in 1812, 170. The Black river road from Johnstown leads through this settlement, which has an excellent soil, and in which are two grain-mills, six saw-mills, a carding machine, and two distilleries of grain and fruit spirits.

TURING, a town of Sweden, in the province of Blekingen; 7 miles N. of Carlscrona.

TURINGE, a town of Sweden, in Sudermanland; 24 miles W.S.W. of Stockholm.

TURINI, FRANCESCO, in *Biography*, an eminent Italian composer of the seventeenth century, who gained great reputation by the composition of canons. He was organist of the Duomo at Brescia, and published many learned compositions for the church and chamber; but particularly a mass in 1643, for four voices, in canon.

In this work there is a perpetual fugue, upon the subject of which Handel has composed one of his finest instrumental fugues; but, according to his usual practice, whenever he adopted another's thought, he has enlivened and embellished Turini's theme, like a man of true genius, with a counter subject; and shewn that he saw farther into the latent fertility of the same series of notes, than the original inventor, whose theme was the following.

The first sonatas for two violins and a base, which our musical enquiries have been able to discover, were published by Turini, with a set of "Madrigali à una, due, tre Voci, con alcune Sonate à due et à tre," Venezia, 1624. We were instigated by this early date to score one of these sonatas, which consisted of only a single movement, in fugue and imitation throughout; in which so little use was made of the power of the bow in varying the expression of the same notes, that each part might have been as well played on one instrument as another.

The violin does not appear to have been Turini's instrument. A canonist need have nothing else to think of, than the

the solution of harmonical problems, which require such intense application as to leave him not a single idea to bestow on any thing else.

TURINSK, in *Geography*, a town of Russia, in the government of Tobolsk, containing a wooden fort, seven churches, and about 350 houses; 144 miles W. of Tobolsk. N. lat. 58°. E. long. 63° 44'.

TURINSKOI, a town of Russia, in the government of Tobolsk, on the Niznei Tunguska; 132 miles E. of Turuchansk.

TURIONES, in *Botany*, the first young tender shoots which plants annually put forth.

TURIRANA, in *Geography*, a river of Brasil, which runs into the Atlantic, S. lat. 1° 30'. W. long. 46° 46'.

TURISSA, in *Ancient Geography*, a town of Spain, at the foot of the Pyrenées, in the country of the Vasconi, N.E. of Pampela.

TURK, in *Geography*, an appellation of very ancient origin and of very comprehensive extent. It is said to be derived from the name of one of the sons of Japhet, the eldest son of Noah, who is generally allowed to be the progenitor of the Moguls and Tartars. This opinion has been adopted by those who have been most conversant with Oriental literature, and the Tartars themselves have expressed their persuasion of its truth. Accordingly it is said, that the progeny of Magog, Meshech, and Tubal, subverted both the Scythias, and consequently the country of the ancient Moguls and Tartars. If it be admitted that the Turks and Tartars were originally the same people, whatever is advanced concerning the first progenitors and early antiquities of the one, must, with the strictest propriety, be applicable to those of the other. It has been alleged as highly probable, that both the present Turks and Tartars are descended from the Scythians of Aristeas Proconnesius, and the Scythian Nomades of Herodotus (lib. iv.) Upon this supposition, the ancient Turks or Tartars cannot be considered as one of the earliest nations of antiquity, nor as occupying a tract for many ages of very considerable extent. For they scarcely made any figure at all before the reign of Cyaxares, king of the Medes, or the time of Ogus Khan, about 637 years B.C., when they drove the Cimmerians from their territories bordering upon the Palus Mæotis into the Upper Asia. Nor could their primitive seat, upon the eastern bank of the Volga or Araxes, have been at that time very extensive; since it is well known that they were then a people of little note, and in the vicinity of some nations who were contending for unlimited empire. In the time of Herodotus, Scythia lay only between the 45th and 57th degrees of longitude, and the 47th and 55th degrees of N. latitude, so that the Scythians at that period cannot be regarded as a very formidable power. The first Scythian king, according to this historian, did not live above 1000 years before Darius Hystaspes invaded Scythia, in the year B.C. 514; or by reducing the calculation of the Greeks and other ancient nations, as sir Isaac Newton has done, it may reasonably be supposed that the first Scythian prince could not have preceded Darius Hystaspes above 800 years. At this early period, therefore, or 1300 years before the commencement of the Christian era, the countries bordering upon the Palus Mæotis, as well as the Euxine and Caspian seas, must have been very thinly peopled. The Tartars, however, though they derive their name from Tatar Khan, pretend that this was not their primitive appellation, but that they are the descendants of Turk, as we have already said, the eldest son of Japhet, whom they call Japhis; and accordingly they maintain that they were originally denominated Turks;

which name they seem to have retained till the time of Genghis Khan. But when that prince reduced all the tribes bearing the name of Turks under his obedience, they, with regard to their neighbours, gradually lost it, and were by them afterwards called Tatars. Nevertheless, though this was the case with respect to their neighbours, most of them have always denominated themselves Turks; nor do they allow, that any other nation has the least title to that denomination. The name of Tatars was at first probably applied to one particular tribe or horde of the Turkish nation, consisting of persons more considerable, warlike, and better known to the Asiatics, on account of their military exploits than the rest, till the time of Genghis Khan. This was succeeded by that of Moguls, which prevailed as long as the dominion of the people so called lasted over the southern provinces of Asia; when that expired, the former appellation was resumed. It is observable, that Sherif al Edrisi, commonly called the Nubian geographer, makes no mention either of Moguls or Tartars; but intimates that the whole country bearing now the denomination of Eastern and Western Tartary, was peopled by different cantons of Turks. This is the more remarkable, as that author wrote but a little before the reign of Genghis Khan, about the year of Christ 1170.

Turk, it is said, was appointed by his father Japhet to bear the chief rule in his family after his death; and being a man of superior genius, he invented many of the conveniences of life, made tents, and governed his family and subjects with great justice, prudence, and moderation. He also formed a body of salutary laws for his descendants. Turk is said by the Tartars to have had four sons; and from him the country in which he settled was called Turkestan, and his subjects were denominated Turks. From Tatar Khan, the Tatars or Tartars derived their name, as the Moguls did their's from Mogul or Mung'l Khan. These two branches of Turks, being rendered independent of one another, formed two considerable empires, which flourished for several generations. See MONGOLES and TARTARS.

The name Turk, says Volney, originally, was not peculiar to the nation to which it is now applied; it denoted, in general, all the hordes dispersed to the east and even to the north of the Caspian sea, as far as beyond lake Aral, over those vast countries which have taken from them the denomination of Turkestan. These are the same people, who were known to the ancient Greeks by the names of Parthians, Massagetæ, and even of Scythians, for which we have substituted that of Tartars. These formed a nation of shepherds, continually wandering like the Bedouin Arabs; and in every age exhibiting themselves as brave and formidable warriors. Neither Cyrus nor Alexander was able to subdue them. The Arabs, however, about 80 years after Mahomet, by order of the caliph Waled I. invaded the country of the Turks, subdued them, and imposed upon them their religion; and obliged them to pay tribute. But the power of the caliphs was resisted and vanquished. Like the Bedouins, the Turks were divided into tribes or camps, called "ordou," of which has been formed the term *horde*; and these tribes, allied or at variance, according to their several interests, were perpetually engaged in wars. Hence we see, in their history, several nations, all equally called Turks, alternately attacking, destroying, and expelling each other. Volney, in order to avoid this confusion, has confined the name of Turks to those of Constantinople, and given that of *Turkomans* to their predecessors. (See **TURKOMANS**.) For a further account of the Turks, see **TURKESTAN** and **TURKEY**.

TURK's-Cap, in *Botany*, a name given to a species of lily. See *LILIUM*.

TURK's-Head, a name sometimes given to the melon thistle.

TURK's Turban, a name given to a species of ranunculus.

TURK Islands, or *Turk's Islands*, in *Geography*, a cluster of small islands among the Bahamas, the largest situated N. lat. 21° 20'. W. long. 71°.

TURKAL, a town of Asiatic Turkey, in the province of Sivas; 25 miles S.E. of Amafreh.

TURKAREL, a town of Candahar; 30 miles W. of Cabul.

TURKEIM. See *TURCKHEIM*.

TURKESTAN. See *TARAZ*.

TURKESTAN, (formed of *Tourk* and *estan*, a Persian word signifying *country*;) or *Turan*, a country of Asia, bounded on the N. by deserts, which separate it from the dominions of Russia, on the E. by a part of Tartary, belonging to the Kalmucks, on the S. by Bucharia, and on the W. by Charafm or Kharafm, near 300 miles in length, and not much less in breadth. It is at present divided between two Tartar khans or chiefs; one of them, residing at Tashkund, possesses the eastern part; the other, who possesses the western part, resides at Turkestan or Taraz. The latter is generally called the khan of the Karakalpahs. Turkestan, taken in a larger sense, is understood to include all the country between Russia to the N. and Bucharia to the S., and between the Caspian sea to the W. and Chinese Tartary on the E., not less than 700 miles from E. to W. and 350 from N. to S.

In ancient periods, Western Turkestan and the N. of the Caspian were the seats of the Massagetæ; to the S. of whom were the Scythians, on this side of the Imaus or Belur-Tag. In the sixth century, the Turks, having migrated from their habitations near the mountains of Bogdo, adjoining to those of Altai, or the mountains of gold, and having imparted to the country the name of Turkestan, and forming a grand branch of the Tartars, or Huns, spread themselves to the Caspian. They soon after subdued the people of Sogdiana, and the Nephthalites of Great Bucharia, called in that ignorant age White Huns. As the Turks founded their first western settlements in the regions now held by the Kirguses, they thence received the name of Turkestan, the capital city being denominated Otrar, and sometimes Taraz, also called Turkestan. From the centre of their power issued those Turkish armies, which have changed the destinies of so many nations. Little Bucharia was called Eastern Turkestan from a similar cause; but appears to have been first subdued by the Turks of Cathay, on the N.W. of China. The Turks and Huns may be considered as one and the same Tataric race, totally unknown to Europeans till the appearance of the latter, who first passed the steppes, deserts and mountains which had concealed them from observation till the fourth century. The Huns, who appeared about A.D. 375, seemed to the writers of the period as a new and unknown race, having passed in a course of uniform depredation from Asia to Europe; while the Gothic and Slavonic nations had left many of their settlements vacant, in their progress into the Roman empire. But the Turks, though originally the same people, perhaps warned by the fate of their brethren, made a slow and gradual progress, and appear to have been blended by marriages and conquests with the Slavonic and Gothic tribes on the N. and E. of the Caspian. Such was the origin of the name of Turkestan, from which the Turks spread desolation over the most beautiful countries of the East, and

even threatened the liberties of Europe. Pinkerton's *Geog.* vol. ii. See *BUCHARIA* and *Independent TARTARY*.

TURKEY, an extensive empire, comprehending a great number of countries on the continents of Europe, Asia, and Africa, and several adjacent islands.

Turkey in *Europe* extends, according to the statement of Pinkerton, about 870 miles in length, from the northern boundary of Moldavia to Cape Matapan in the Morea; and its breadth, from the river Unna to Constantinople, is about 680 British miles. It is computed to contain 182,560 square miles. Its eastern and southern boundaries are formed by the Euxine or Black sea, the sea of Marmora, the Archipelago, and the Mediterranean. Its utmost northern limit is now the river Dniefter, and the western consists of an arbitrary line, sometimes supplied by rivers or mountains. In its whole extent it comprehends many ancient kingdoms and republics, which, since the subjugation of its greater part in the 15th century, after the fall of Constantinople and of the Byzantine empire, afford only the records of classical names and events. Moldavia, the most northern province, was part of ancient Dacia; and Jassy or Yassy, the capital, was the "Jassiorum Municipium" of the Romans. Budzac, or Bessarabia, was the country of the Getæ and Peucini. Walachia was also a province of the ancient Dacians; and Bulgaria, on the S. of the Danube, embraces nearly the two provinces of Mœsia. Romelia, a spacious territory, contains ancient Thracia, Pæonia, Macedonia, and the northern part of the classical country of Greece; and the Morea is equivalent with the ancient Peloponnesus. Dalmatia retains its ancient appellation; while Serbia and Bosnia represent ancient Pannonia. Turkish Croatia, the most western province of the empire, forms a portion of ancient Pannonia, with probably a small district of Noricum; but the Turkish part of Croatia is a diminutive province, about 40 miles in length by 20 in breadth, bounded by the river Save on the N., and partly by the river Unna on the W. In modern times Turkey, sinking before the power of Russia, has lost the provinces of the Crim and New Serbia, which, with several Asiatic districts, have surrendered to Russia; and on the W., Transylvania, Sclavonia, with the Buckovin and part of Moldavia, and a great part of Croatia, have been subjugated by Austria. Of the original population of the Turkish empire, we have already given some account under the article *TURK*; and it appears to have been derived from the ancient Scythians on the Euxine, the progenitors of the Dacians, Thracians, &c. and even of the Greeks. These were originally blended northward with many Sarmatic or Slavonic tribes; which on the fall of the Roman empire migrated towards the S., so that about one-half of the population may now be regarded as Slavonic. Walachia, however, is supposed to contain many descendants of the ancient Roman settlers in Dacia. This original population, in consequence of the extent of the Turkish empire, has been blended with various Asiatic tribes, among whom the Turks constitute a part. Of that branch called Ottomans, and the commencement of the appellation of Ottoman empire, we have already given a brief account under the articles *OTHMAN* and *OTTOMAN*; and for the more remote antiquity of the name and power of the Turks, we refer to *TURK*. Those Turks, or Turkomans, descending, about the middle of the sixth century, from the Altaian mountains, spread as far as the lake Mæotis; but their progress was restricted to the region near the river Oxus: from the Oxus and Samarcand they afterwards spread to the E. of Persia, where Mahmoud of Gazna established a powerful kingdom, subdued by the Turks of Bochara, who in the 11th century

TURKEY.

century founded the dynasty of the Seljuks. The sultans of this race gradually extended their power towards the W. and took possession of Armenia and Georgia, their first acquisitions in the Byzantine empire; and it is remarkable that these should have continued, when it is considered, that the Turks had subdued almost the whole of Asia Minor before the beginning of the 12th century. Nevertheless the extension of their dominion was restrained by the progress of the Crusades, which obliged them by the capture of Nice to remove the seat of power to Iconium. About the middle of the 14th century the Turks first passed into Europe, and soon after seized the greatest part of Thrace. In the 15th century their sultan, Bajazet, extended his conquests even to the Danube, and the provinces of Thrace and Macedonia fell under the Turkish sceptre, while Adrianople became the seat of their government.

Although the Turks, as we have above intimated, formed a part of the people denominated "the Scythians beyond the Imaus," and originally proceeded from the Altaian mountains, they were intermixed by their settlement on the Oxus with Sogdian and Bactrian tribes, and after their subversion of the Byzantine empire, in which they were assisted by European troops, many different nations joined their standard, and various circumstances, beside their intermarriages with Circassian women, contributed to render them a very mixed race. When the Roman arms had subdued many of those countries and cities which were comprehended under the widely extended Turkish empire, they became in the fifth century an important part of the Byzantine empire; and we shall follow Mr. Pinkerton in tracing their principal historical epochs. Accordingly he observes, that the first dawn of Turkish history preceding the reign of Othman, occurs A.D. 1299. In the reign of his successor, Orkan, the Turks took Gallipoli, and penetrated into Thrace, so that Adrianople was taken A.D. 1360; two years after which period, Amurath established the military bands called Janizaries. The Turkish power was for some time restrained after the famous battle near Ancyra, A.D. 1402, between Bajazet and Timur; nevertheless the dominion of the Turks increased in Europe, though they received several checks from the Hungarians under Hunniades, and from the Albanians under the command of George Castriots, called by the Turks Scanderberg. On the 20th of May, A.D. 1453, Constantinople was taken by the Turks. Crimea and the Morea were subjugated A.D. 1458; and in 1480, Otranto in Italy was captured by the Turks. The conquest of Egypt in 1517 made a considerable accession to the Turkish power; Rhodes submitted in 1522; and soon after the battle of Mohatz, in 1526, the sultan Soliman took Buda. In 1552 the Turks seized the bannat of Temeswar, and they took Cyprus from the Venetians in 1571. Although after the famous naval engagement of Lepanto, in this year, their power at sea ceased to be formidable, they invaded Hungary with various success, yet Europe obtained an interval of security by their wars with Persia: however, in 1642, the sultan Ibrahim took Azof from the Cossacks, and about the middle of this century the Turks took possession of some Grecian isles. Hungary became the scene of repeated Turkish and Austrian conquests until the year 1699, when, by the peace of Carlovitz, the Turks surrendered Transylvania to the Austrians, the Morea to the Venetians, and Azof to the Russians. By the peace of 1739 the Turks refused Belgrade and Orsova, with parts of Servia and Walachia, formerly ceded to Austria, and Russia was constrained to abandon Azof. The last epoch of Turkish history would lead to a detail of the Russian wars against

the Turks, and the decline of the Ottoman empire. We may here observe in general, that the Turkish dominion, wherever it has prevailed, has been detrimental in a very high degree to the best interests of humanity, and to every improvement, mental or moral, ecclesiastical or civil.

The religion of the Turks is the Mahometan; although in this European division of the empire, it is supposed that two-thirds of the inhabitants are Greek Christians. The Turkish sultan has for some centuries been the principal leader and support of that attachment to the religion of the Koran, which has been the stay and guard of the Mahometan faith. The Mahometan pontiff, or mufti, presides at Constantinople. The next in rank to him are the moulahs, and from these are selected the inferior muftis, or judges, through the empire, and the cadifschers or chief justices. The next class of divines consists of the imams or parish priests, who perform the service of the mosques, or places of worship, while the cadis are judges annually appointed to administer justice in the towns and villages. The Turks have also their monks, denominated derviches, of four orders, dedicated to religious offices, public prayer and preaching. Of these, the Kadri constitute a singular order, appearing almost naked, and displaying their devotion by frantic and extravagant dances. The Greeks retain their priests, bishops, archbishops, and patriarchs; but their church is in the lowest state of degradation, and its dignities are openly sold by the Turks.

As to the government of Turkey, the sultan is a despotic sovereign, but so restricted by the laws of the Koran, to which he is bound to submit, that many Christian sovereignties are reckoned more arbitrary. The despotism of the monarch is balanced by a religious aristocracy; and many circumstances have lately occurred, such as the insurrections of the Janizaries, and the power usurped by the pashas over their own provinces, which indicate the decline and approaching perdition of the empire. The Turkish laws are contained in the Koran, and in the comments of approved and renowned doctors, which have acquired the force of laws. The Turkish empire is chiefly guided by those of Abou-Hanife.

The number of inhabitants in Turkey in Europe has been estimated at 8,000,000, or about 43 to each square mile: but as the countries which it comprehends are intersected by many mountains and barren tracts, this estimate is supposed to exceed the truth. The navy is stated at about 30 ships of the line, and the army at 150,000 of ill-disciplined soldiers. The revenues of the whole Turkish empire are computed at about 7,000,000*l.* sterling, and the usual expence as not exceeding 5,000,000*l.* Their revenue is partly derived from a capitation tax on unbelievers, and from the "zecchat," or customs, but principally from a tax on land of about 6*s.* an acre, called the "jizie." Upon the whole, the Turkish empire may be regarded as in a declining state, notwithstanding all its endeavours to secure the friendship of various European powers.

Of the manners and customs of the Turks, our limits will not admit of a minute detail. Marriage is a civil contract, managed by female mediation, and liable to dissolution at the pleasure of either party. Circumcision is performed at the age of 12 or 14. The dead are perfumed with incense, and buried in a kind of shroud, open at both ends, that the deceased may be able to sit up and reply to the interrogatories of the angels of death. The burial grounds are near the highways, and as one grave does not intrude upon another, they are very extensive. With regard to diet the Turks are moderate, and their favourite food is rice, of which they prepare their pilau, boiling it

with

TURKEY.

with mutton or fowl, their lappa, which is merely boiled rice, and the tchorbe, a kind of broth made of the same vegetable. The fish of the Archipelago is very good, and the beef tolerable; the hares, partridges, and other game are excellent. The meat is usually spread on a low wooden table, over which the master of the house pronounces a short prayer. The frugal repast is followed by fruits and cold water, and these are succeeded by hot coffee and pipes with tobacco. The houses are expensive, and the most costly part of the furniture is the carpet that covers the floor. Their dress consists of a calico shirt, and the loose robe is fastened by a girdle, in which is stuck a dagger; while the tobacco-box, pocket-book, &c. are worn in the bosom. The robe is commonly made of English broad cloth, trimmed with furs. The shoes are light slippers. The dress of the women resembles that of the men, differing only in that of the head, which is a sort of bonnet, formed of pasteboard covered with cloth of gold, or other elegant materials, with a veil reaching to the eye-brows, and a fine handkerchief concealing the lower part of the face. In their persons the Turks are very cleanly; the females, however, stain their nails with a red tincture. Their amusements are principally such as favour indolence, hunting and military exercises excepted. They are fond of reclining on an elegant carpet, or in a hot season by the side of a stream, and smoking the delicate tobacco of Syria. With opium they procure what they call "rief," or a placid intoxication, but a stronger dose produces irritation and ferocity. Chess and draughts are favourite games; whereas those of chance are regarded as immoral. Their coffee-houses and baths afford other means of amusement; and the beiram, or festival succeeding their long lent, is a season of universal dissipation.

The Turkish language is far inferior to the Persian or Arabic, and is formed by a mixture of several dialects. Literature is not wholly neglected, but they have some schools and libraries. In the 18th century a printing-office was set up at Constantinople by Ibrahim Effendi, which was at first much opposed, but afterwards allowed to print all kinds of books, those on religion excepted. Their market for books contains many shops well supplied with Oriental MSS.; and they have their ancient poets, historians, and divines, though of little estimation compared with those of Persia or Arabia. Education, however, is little encouraged: so that ignorance forms the distinguishing character of the nation. Law, connected with their theology, is the chief subject of their study; but they have no institution that merits the appellation of a college or university.

The chief city of European Turkey, and of the whole Turkish empire, is Constantinople: next to this in dignity and extent is Adrianople, two miles in circuit, and possessing several splendid works, and a considerable share of commerce; Philippopoli is a city of considerable importance; Sofia, though meanly built, contains about 70,000 inhabitants, and has considerable trade; Silistria in Bulgaria, on the Danube, contains about 60,000 souls; and Bucharest, the chief city of Walachia, is said to have the same number; while those of Jassy or Yassy, the principal town of Moldavia, and Bender of Bessarabia, are each estimated only at 10,000 or 14,000. Belgrade, the capital of Servia, is supposed to contain about 25,000 inhabitants; and those of Banjaluka, which is a considerable town in Bosnia, are estimated at 18,000. In the southern provinces we may first mention Salonica, containing 60,000 inhabitants, and distinguished by a considerable commerce; Larissa, 80 British miles to the S., an inland town, containing 25,000 souls; and Atini, the ancient Athens, of small population. See each article.

If we except the seraglios and royal palaces, the chief edifices in Turkey are the mosques and caravanferas.

The manufactures and commerce of Turkey in Europe are chiefly conducted by foreigners. The Levant trade almost entirely centres in Smyrna and the Asiatic shore. The manufactures principally exported from European Turkey are inconsiderable, being chiefly carpets and some few other articles; but the products are currants, figs, saffron, statuary marble from Paros, silk, and drugs.

The climate and seasons vary with the different regions comprehended within the limits of European Turkey; and to these we refer for an account of them. The general appearance of Turkey in Europe is mountainous, here and there interspersed with delicious plains and vales; enriched by the Danube, which intersects its provinces, and the numerous gulfs of the Archipelago and Mediterranean. The soil is generally fertile, the northern parts producing wheat and rich pasture, the middle and southern abundance of rice: but agriculture, as well as almost every other art and science, is neglected by the Turks. The principal rivers of Turkey are the Danube, already mentioned, the Maritz or ancient Hebrus, the Vardari or ancient Axios, the Esker or ancient Oeskus, the Morava or ancient Margus, and the Drin, rising N. of Albania, and falling into the Save. Budzac and Walachia, as well as Albania and the southern provinces, contain considerable lakes. The chains of mountains in Turkey are numerous and extensive. Here we might mention, if they were not elsewhere noticed, the Carpathian chain, anciently called the Bastarnic Alps; the grand range of the Hæmus with its branches; and mount Athos of ancient celebrity. European Turkey also abounds with forests. Of its zoology we shall merely notice the jackal, the camel, and horse, and also its cattle and sheep, which are numerous and of different kinds. Its mineralogy has been little investigated. The gold mines of Philippi, about eighty miles E. of Salonica, produced in the time of Philip of Macedon annually about 1000 talents, or 2,880,000 sterling; and silver mines were found in Attica, and other quarters.

The chief islands belonging to Turkey in Europe are those of the Archipelago; for an account of these we refer to their names, such as Crete or Candia, Negropont, the Cyclades, Sporades, Lemnos, &c. &c.

Turkey in Asia extends from the shores of the Ægean sea or Archipelago, to the confines of Persia, through a space of about 1050 British miles. The boundaries towards Persia are the mountains of Ararat and Elwend. Towards the N. the Turkish territories are divided from the Russian by the river Cuban and the chain of Caucasus; in the S. they extend to the junction of the Tigris and the Euphrates, which last river separates, for a considerable interval, the Turkish possessions from those of the Arabs. The distance from the Cuban to the junction of the Tigris and Euphrates may be estimated at about 1100 British miles. This extensive empire is divided into nine or ten provinces, *viz.* Natolia W., Karaman S., and Roum N.E. N. of Armenia are Guria or Guriel, Mingrelia, and the Abkhas of Caucasus, the ancient Circassias. To the S. of Armenia, also denominated Turcomania, are Curdistan and Irak-Arabi, part of ancient Persia, round the celebrated capital Bagdad. The ancient Mesopotamia, between the Tigris and the Euphrates, now partly corresponds with the province of Algezira; and Syria, or Soria, comprehends the celebrated countries along the eastern extremities of the Mediterranean. These provinces are subdivided into governments, arbitrarily administered by pashas. The original population of these regions consisted chiefly of Scythians blended

TURKEY.

blended with some few Assyrians from the south. See *TURK*, and *Turkey in Europe*, supra.

The prevalent language is the Turkish, to which we may add the modern Greek, together with the Arabic, Syrian, Persian, and Armenian, with the various dialects used by the tribes on the Black sea, and indicating the diversity of population. To the account already given of the historical epochs of Turkey, we may here subjoin the following from Pinkerton. Armenia and Georgia were subdued by the Turks in the eleventh century, and the whole of Asia Minor soon followed. Their kingdom of Rourm extended from the Euphrates to Constantinople, and from the Black sea to the confines of Syria. Successive warlike princes acquired additional territory from the Mamelukes of Egypt and the Persians. Syria, formerly an appendage of Egypt, was conquered by Selim II. in 1516; Tauris and Diarbekir, the last of which had formerly belonged to Persia, were subjugated by the same monarch; and in 1589 Abbas, the great sovereign of Persia, was obliged to yield three provinces to the Ottomans, though he extended his conquests to the east; and Bagdad, with the surrounding province of Irak-Arabi, became subject to the Turks in 1638. The present limits seem to have been fixed by the treaty between the Porte and Persia in 1736, since which period the Turks have been chiefly employed in defending themselves against the Russians; but such had been their ascendancy over Persia, that in 1727 they had acquired the territory from Erivan to Tauris or Tebriz, and thence to Hamadan, a boundary which seems to be more precisely marked by nature than the pencil.

The antiquities of Asiatic Turkey are those of Balbec and Palmyra or Tadmor in the desert, and those that have been discovered in the scite and plain of Troy; for which see these articles.

The Turkish empire in Asia is estimated at 470,400 square miles, and the population at 10,000,000; which, allowing 8,000,000 for the European part, will render the total 18,000,000. The reader will find a sketch of the manners and customs of the inhabitants of Asiatic Turkey under this article, which we shall now proceed to mention. The Curds or Kurds pass in summer from Moufoul to the sources of the Euphrates, and they are never punished either for robbery or murder. They are a pastoral people, who conduct their herds from one country to another, and extending sometimes as far west as Tocat; where Tournefort, in his time, found other hordes called Turkomans. The Armenians, though Eutyechian Christians by profession, and of course irreconcilable enemies of the Greeks, are distinguished by many singular manners and customs. They are represented as a sensible and polite people; and by their frugality and enterprise, are admirably qualified for conducting the Levant trade, which is chiefly their province. For an account of the Druzes and Maronites, see these appellations. In the northern extremities of Asiatic Turkey, there are many tribes which have adopted singular practices. Six or seven languages are said to be spoken in the country between the Euxine and the Caspian. The Abkhas, called by the Circassians "Kush-Halip," a people beyond the mountains, retain some traces of Christianity. The territory of the Tcherkasses, or Circassians, is extensive: part of it is subject to Russia, but their manners are invariable. The princes cannot possess lands, and their nobles are chosen by the princes from the vassals, or third class. Public measures are proposed by the prince, and debated by the nobles and deputies of the people, on a spot destined for this purpose, near the royal residence. The agriculture of these people is barely sufficient for their own

VOL. XXXVI.

consumption; but they export sheep and horses, and slaves taken in their predatory excursions. The beauty of their women has been much extolled. Having received a suitable education, and formed from their youth according to their own standard of beauty, they are sold from 20*l.* to 100*l.*, and sometimes at a much higher price. Soon after the birth of a girl, a belt is sewed round her waist, and when this bursts, it is replaced by a second; so that their waists become very small, and their shoulders broad, which is a defect little regarded, on account of the beauty of their breasts. On the wedding-night the belt is cut by the husband with a dagger, an operation which is sometimes accidentally fatal. The bridegroom pays for his bride a present, or "kelym," consisting of arins, or a coat of mail; but he must not then, nor on any future occasion, see her, or cohabit with her, without the greatest mystery. The young men recommend themselves by their activity and address in military exercises; and those who are most alert have the privilege of choosing the most beautiful partners. Their musical instruments are a long flute, with only three stops, a species of mandoline, and a tambourin. Their dances are in the Asiatic style, with little gaiety or expression. The women pride themselves on the courage of their husbands, and severely reproach them when they are defeated. It is their business to polish and take care of the armour of the men. The habitation of a Circassian consists of two huts, because the wife and husband are not supposed to live together. At meals the whole family is assembled. Their food consists only of a little meal, paste made of millet, and a kind of fermented beer, prepared from the same grain. The Mamelukes of Egypt are slaves regularly imported from Circassia and Georgia. In Imeritia, Mingrelia, and Gurjel, as well as in Georgia, which forms a Persian province, the barons have power of life and death over their vassals, and form a very powerful aristocracy, very formidable to the prince, who resides at Cutais. The religion of all these provinces is the Greek; but they can scarcely be regarded as subject to Turkey. It may be observed in general, after this brief detail, that the most striking feature of manners and customs in the Turkish empire, is that half the people may be considered as somewhat civilized, while the other half may be regarded as pastoral wanderers ranging over extensive wastes. Next to the capital of the Turkish empire, the next city of Asiatic Turkey in dignity and importance is Aleppo, containing about 250,000 inhabitants, where the manufactures of silk and cotton are flourishing, and whither large caravans frequently resort from Bagdad and Bassora, with the products of Persia and India. Damascus is supposed to contain 180,000 souls:— Smyrna may be regarded as the third city in Asiatic Turkey, and contains about 120,000 souls:— Prusa is a beautiful city at the northern bottom of mount Olympus, and its number of inhabitants is estimated at about 60,000:— Magnisi, or Magnesia, is also a city of some repute in this quarter of the empire; and Kircagatch has risen to importance by the cultivation of cotton, being situated about 40 miles N.E. of Magnisi, on the route to Prusa:— Angora contains 80,000 inhabitants, and trades chiefly in yarn for shalloons, and in Angora stuffs of its own manufacture from the hair of a breed of goats:— Tokat is flourishing, and its inhabitants are about 60,000; its manufactures are silk and leather, and chiefly copper utensils:— Basra, or Bassora, on the estuary of the Euphrates and Tigris, contains about 50,000 inhabitants, and is a place of great consequence; as the various products of Europe and India are here exchanged for those of Persia; and opulent

TURKEY.

caravans proceed from this most central port of the Oriental trade to the chief cities of Asiatic Turkey: — Bagdad, the seat of the caliphs, and scene of many Eastern fictions, is now reduced to a town of about 40,000 inhabitants: — the ancient and celebrated city of Jerusalem is now a mean town, chiefly depending on the piety of pilgrims; and towards the frontiers of Persia frequent wars have spread desolation; nevertheless Erzeron, the capital of Armenia, has still about 25,000 inhabitants; but Kars, the extreme town upon the frontiers of Persia, though tolerably fortified, is an inconsiderable place. The chief articles of commerce in Asiatic Turkey are carpets, rhubarb, and several other drugs. The Levant or Turkey trade was formerly of great consequence to Great Britain; but from the middle of last century it has been more advantageous to France. The state of the Levant trade chiefly carried on at Smyrna appears from the following documents:

France sends coffee, sugar, indigo, cloths, and cochineal.

England, shalloons, muslins, iron, tin, spices, refined sugars.

Holland, muslins, India goods, cloths, spices.

Austria, from Trieste, cloths, glass, hard-ware, linen, wood, amber.

Russia, iron, corn, caviare, dried fish, furs.

Italy, silks and velvets, wax and paper.

European Turkey, wines, silks, tobacco.

Natolia and Syria, woollens, cottons, silks, drugs.

Egypt, coffee of Yemen, rice.

Barbary, dates, woollen caps from Tunis, butter, wax.

The port of Marseilles, which carries on the French trade with Smyrna, draws the wool and cochineal from Spain; but this country has lately begun to conduct her own commerce. Venice, under the Austrian power, might become the chief port of the Levant business. Of the French commerce, the chief staple is coffee: but this cannot be resumed with much vigour till France shall acquire a greater naval power.

Upon the whole, says Pinkerton, if the commerce of Smyrna be at present valued at fifty millions of francs, the English trade for thirty millions, the Dutch for ten, while France shares the remaining ten millions with the emperor, Italy, and other states above-mentioned.

The climate of Asia Minor has been always considered as excellent. The heat of the summer is tempered by numerous chains of high mountains, some of which are covered constantly with snow. The aspect of Asiatic Turkey is mountainous, intermingled with spacious and beautiful plains, which afford pasture to the numerous flocks and herds of the Turkomans. The soil is various; but the chief agricultural products are wheat, barley, and durra. It abounds also with grapes, olives, and dates. In Syria the agriculture is deplorable, and the peasants are in a wretched condition, being sold, as in Poland, with the soil, and their constant fare being barley bread, onions, and water.

The principal river of Asiatic Turkey is the Euphrates, the course of which may be estimated at about 1400 British miles: next in importance is the Tigris, whose course is about 800 miles; and both these rivers are navigable to a considerable distance from the sea. The third river is called by the Turks Kizil Irmak, the celebrated Halys of antiquity, rising in mount Taurus, and discharging itself into the Euxine sea on the W. of the gulf of Sanfoun: the river Sacaria, or ancient Sangarius, rises about fifty miles S. of Angora, and joins the Euxine about seventy miles E. of Constantinople: next in rank is the Mæander, rising N.

of Apamæa, and winding its course about 250 British miles: the Sarabat is the ancient Hermus, famous for its golden sands. The chief river of Syria is the Orontes, now called Oron or Asi, which runs into the Mediterranean.

The lakes of Asiatic Turkey are numerous. The most remarkable are the Van and Urmiah: others are the Dead sea in Syria, fifty miles long, and twelve or thirteen in breadth: that of Rackama, S. of Hilla and the ancient Babylon, about thirty miles long, and flowing into the Euphrates: the Tatta, or Palus Salaria of D'Anville, a saline lake about seventy miles long, and one or two in breadth towards the centre of Asia Minor, being the modern T'oussa or salt lake: that of Ulubad in Natolia, anciently denominated the lake of Apollonia, twenty-five miles in circumference, and in some places seven or eight miles wide, sprinkled with several isles and peninsulas, and the grand receptacle of the waters from mount Olympus: the largest of these isles is called Abouillon, probably from the ancient name of the city which stood upon it: and about fifty miles to the N.E. was the lake anciently called Afcanius, now Isnik.

The mountains of Asiatic Turkey are of ancient celebrity: such are the Taurian chain; the Caucasian mountains, ranging from the mouth of the river Cuban in the N.W. to the place where the Kur enters the Caspian in the S.E., and furnishing various chains, such as the Antitaurus of antiquity, and others branching out into Persia; mount Taurus, terminating at the Euphrates and delarts of Algezira: the chain of Taurus is now called Duran, and extends about 600 miles E. and W. from the Euphrates to the vicinity of the shores of the Archipelago. These and other mountains of Asiatic Turkey are conjectured to be calcareous; while the Caucasus alone aspires to the rank of a granitic or primitive chain. Towards the E. of Armenia is Ararat, properly belonging to Persia; and beyond Ararat are branches of the Caucasian chain, to which probably belong the mountains of Elwend, or Niphates of antiquity. In Syria, the most celebrated mountains are Lebanon or Libanon, and Antilibanon. On the eastern side of the Archipelago was Olympus (now Keshik Dag); and 140 miles W. of Olympus is mount Ida, the branch of which was called by the ancients Garganus, which gave source to the Granicus, the Simois, and other streams, most of which directed their course to the N., and extended in western prominences to the Hellespont, amidst which was situated the celebrated city of Troy. Other remarkable mountains on this classical shore, as it has been denominated, were those of Rhea, Pedafus, &c. &c. S. of the Mæander, the Taurus detaches a chain called Cadmus and Grius, bending towards the isles of Cos and the Cyclades. The numerous mountains of Asiatic Turkey are frequently clothed with immense forests of pines, oaks, beeches, elms, and other trees; and the southern shores of the Black sea present many gloomy forests of great extent. The inhabitants are hence supplied with abundance of fuel, in defect of pit-coal, which has not been explored in any part of Asiatic Turkey. Sudden conflagrations arise from the heedless waste of the caravans, which, instead of cutting off a few branches, set fire to a standing tree. The extensive provinces of Natolia, Syria, and Mesopotamia, have been little accessible to European curiosity, since their reduction under the Turkish yoke. In Pinkerton's Geography we have a catalogue of those plants and trees that have been found wild in the Asiatic part of the Ottoman territory. Several dyeing drugs and articles of the materia medica are imported from the Levant, among which are madder, and a variety called alizari, which grows about Smyrna, and affords a much finer red dye than the European kind; jalap, scammony, sebesten, the ricinus

TURKEY.

yielding by expression castor oil, squirting cucumber, coloquintida, opium poppy, and spikenard. The best horses in Asiatic Turkey are of Arabian extract; but mules and asses are more generally used. The beef is scarce and bad, the mutton superior, and the kid a favourite repast. Other animals are the bear, tiger, hyæna, wild boar, jackal, and dogs in great abundance. On the summits of Caucasus is found the ibex, or rock-goat; at Angora, singular goats and cats; the gazel, and deer and hares in great abundance are found in Asia Minor. The partridges are generally of the red-legged kind, larger than the European: fish is plentiful and excellent. The mineralogy of these extensive provinces has not been yet sufficiently explored. The most noted mineral waters are those of Prufa, at the bottom of mount Olympus: the baths are splendid, and paved with marble. Walachia furnishes many other hot-springs.

The chief islands belonging to Asiatic Turkey, situated in the Archipelago, are Mitylene, Scio, Samos, Cos, and Rhodes. Along the southern shores of Asia Minor are some small isles, such as that of Castel Rosso, S.E. of Patira; but these are of no moment compared with Cyprus, about 160 miles long and nearly 70 at its greatest breadth; the chief cities of which are Nicosia and Famagusta.

Some geographers, in opposition to the testimony of travellers, have considered Egypt as a Turkish province; whereas it was only occasionally tributary, and subject to the military aristocracy of the beys. Some of the maritime Mahometan powers have likewise assisted the Porte with ships in time of war; but they cannot be regarded as subject to the Ottoman sceptre.

TURKEY, Coinage, &c. of. As the Turks, though aspiring to a very ancient derivation, comprehending Tartars and Moguls, (see **TURK**,) are merely a mixture of Sarmatæ or Slavi, Arabs and Greeks, which began to form a nation in the fourteenth century, they seem to have issued no coins till they seized Constantinople in 1453; and their coins resemble those of Persia and Arabia, having merely inscriptions on both sides. Turkey keeps accounts in piastræ, commonly called grouch by the Turks, and by the English dollars. Each piastræ is divided into 40 paras, and each para into 3 aspers. Sometimes, instead of these real coins, the piastræ is divided into 80 or 100 imaginary parts, called aspers, or minas. Jux or juck is a sum of 100,000 real aspers; a chife or purse is 500 ditto. The gold coins of Turkey are the sequin or chequeen (see **SEQUIN**): the silver coins are the two-dollar piece of 80 paras; the altmichlic of 60 paras; the dollar or piastræ of 40 paras; the zolotta or izelotta of 30 paras; the roup of 10 paras; the beslick of 5 paras; the para of 3 aspers; and the asper. The Turkish coins, notwithstanding the regulations of 1780, when a single piastræ weighed 5½ drachms, or 277 English grains, have been gradually deteriorated; so that a piastræ of the latest coinage, weighed and assayed by the king's assay-master of the Mint, was reported to be as follows: weight 8 dwts. 6 grs., fineness 5 oz. 6 dwts. worse than the English standard: hence its fineness was 47 car. 2 grs. Turkish, and its value in sterling 13½d.

The Turkish chequee or pound, with which gold, silver, diamonds and precious stones are weighed, is divided into 100 drachms, and the drachm into 16 killots or carats, or 64 grains. A chequee weighs 10 oz. 5 dwts. 3 grs. troy weight, and a drachm 49¼ grs. ditto; so that 48 chequees = 41 lbs. troy very nearly.

The cantaro, quintal or kintal contains 44 okes, or 100 rottoli; the oke, 4 yndromes or chequees, or 400 drachms; the rottolo, 176 drachms. A metecal is 1½ drachm. The kintal of cotton-yarn is 45 okes.

The cantaro weighs about 123¼ lbs. avoirdupois; the oke, 2 lbs. 13 oz.; the rottolo, 19½ ounces; the chequee, 11¼ ounces avoirdupois.

Silks from Persia are weighed by the batman of 6 okes, or 2400 Turkish drachms, or 16 lbs. 14 oz. avoirdupois: silks from Brussa are weighed by the taffee of 610 Turkish drachms, or 4 lbs. 4 oz. 10 drs. avoirdupois.

The chequee of goats' wool is 800 Turkish drachms, or 5 lbs. 10 oz. avoirdupois: the chequee of opium 250 Turkish drachms, or 27 oz. 10 drs. avoirdupois.

Corn is measured by the quillot or killo, weighing, in wheat, about 22 okes, or 60 lbs. avoirdupois; 4 killos make 1 fortin: 8½ killos answer nearly to 1 English quarter. A killo of rice is 10 okes.

Oil and other liquids are sold by the meter, or almud: the meter weighs 8 okes, or 22½ lbs. avoirdupois; and 8 almuds equal 11 English gallons.

The pic or pike is of two sorts; the longest, called halebi or archim, with which silks and woollens are measured, is 314 French lines, or 27¾ English inches long; the other, called endassè, with which cotton goods and carpets are measured, is 3 per 100 shorter. But, in the general course of European trade, the pike is reckoned at ¾ths of an English yard.

The exchanges of Constantinople with the principal commercial places in Europe are as follow: Constantinople gives

Amsterdam 60 paras, more or less, for 1 florin current.

Genoa 23 paras, more or less, for 1 lira fuori banco.

Hamburgh 1 piastræ, for 24 grotes Flemish banco, more or less.

Leghorn 145 paras, more or less, for 1 pezza of 8 reali.

London 18 piastræ, more or less, for 1l. sterling.

Marseilles 1 piastræ for 1 franc 45 centimes, more or less.

Naples 120 paras, more or less, for 1 ducat regno.

Paris 210 piastræ, more or less, for 100 ecus of 3 livres, or 300 francs.

Venice 360 paras, more or less, for 1 sequin of 22 lire piccoli.

Vienna and Trieste 50 paras, more or less, for 1 florin current.

The exchanges between Constantinople and other trading places, where Turkish money is used, are done at a premium of 10 per cent. more or less, in favour of Constantinople.

Bills between Constantinople and the principal trading places of Europe are commonly drawn at 31 days' sight; but from one place, in Turkey, on another, at 11 days' sight. Some European merchants pay their bills on the very day on which they become due; and others take as many days grace as are allowed in their respective countries.

Trieste keeps accounts in fiorini or florins of 60 creutzers; also in lire of 20 soldi; the creutzer being subdivided into 4 pfenings, and the soldo into 12 denari. These monies of account are valued in Austrian currency, in Trieste currency, and in Valuta di Piazza: the first is chiefly used in foreign exchanges, the second in wholesale trade, and the third in retail business. A florin Austrian currency is worth 5½ lire of Trieste currency, or 5¼ of lire di piazza. For the coins, &c. see **VIENNA**.

Tripoli keeps accounts in piastræ of 13 grimellini, or 52 aspers: the grimellin is valued at 6 sous Tournois, which makes the piastræ of Tripoli worth 3s. 3d. sterling. The weight for gold and silver is called *Metecal* (which see); 50 of which are equal to a Venetian mark; so that 1 metecal weighs 73½ English grains. The cantaro weight contains 100 rottoli, each of 6 ounces, or 128 termini; the cantaro

answering to 168 lbs. peso sottile of Venice, or about 112 lbs. avoirdupois. The corn measure, called *caffiso*, contains 20 *tiberi*, and is equal to 4 *staja* of Venice: so that 13 *caffisi* = 15 English quarters. The oil measure, called *matтары*, weighs 42 *rottoli*, or about 47 lbs. avoirdupois. The pic, or ell, is equal to $2\frac{1}{2}$ of *Genoese palmi*, or $21\frac{1}{4}$ English inches. Kelly's Universal Cambist.

TURKEY, a town of the state of New Jersey; 13 miles N.N.W. of Amboy.

TURKEY *Creek*, a river of South Carolina, which runs into the *Cangaree*, N. lat. $34^{\circ} 50'$. W. long. $81^{\circ} 35'$.—Also, a river of America, which runs into the Ohio, N. lat. $38^{\circ} 22'$. W. long. $83^{\circ} 12'$.

TURKEY *Foot*, a township of Pennsylvania, in Somerset county, containing 975 inhabitants.

TURKEY *Hill*, a township of Illinois territory, in the county of St. Clair, containing 1151 inhabitants.

TURKEY *Point*, a cape on the coast of Maryland, at the mouth of the *Susquehanna*, where it takes the name of *Cheapeake*. Here the British army landed in August 1777, as they were advancing to Philadelphia; 16 miles S.E. of Elkton.—Also, a cape on the N. coast of lake Erie.

TURKEY *River*, a river of Louisiana, which runs into the Mississippi, N. lat. $42^{\circ} 10'$. W. long. $91^{\circ} 55'$.

TURKEY *Town*, a town of the state of Georgia; 60 miles N. of *Oakfuskee*.

TURKEY, *Melcagris*, in *Ornithology*, a distinct genus of birds, of the order of the Gallinæ. For the distinguishing characters and species, see MELEAGRIS.

Wild turkies preserve a sameness of colouring; the tame varying; but the black approaching nearest to the original stock. Of late a beautiful kind has been introduced into England of a snowy whiteness, finely contrasting with its red head. The usual weight of the wild turkey is about 30 lbs.

The passions of the males are strongly expressed by the change of colours in the fleshy substance of head and neck, which alters to red, white, blue, and yellowish, as they are differently affected. One cock serves many hens, who retire to an obscure place in order to sit, the cock being apt to break the eggs. The females are very affectionate to their young, and though the eggs addle, will almost perish with hunger, unless they are removed, before they will quit the nest.

Turkies delight much in the seeds of nettles, but those of the purple fox-glove are fatal to them. They are stupid, quarrelsome, and cowardly birds; they are swift runners, but indifferent flyers; they love to perch on trees, and in a wild state, get so high as to be beyond the reach of the musket.

In the state of nature they go in flocks, even of five hundred, and feed much on the small red acorns, frequenting the swamps of their native country, where they roost, but at sun-rising repair to the dry woods in search of acorns and berries. The flesh of the wild turkey is said to be preferable to that of the tame, but redder.

Wild turkies are now very rare in the inhabited parts of America, but are found in numbers in the distant and most unfrequented spots.

The Indians make a very elegant clothing of the feathers, twisting the inner webs into a strong double thread of hemp, or inner bark of the mulberry-tree, and working it like matting: it appears rich and glossy, and as fine as silk shag. They also make fans of the tail, and the French of Louisiana were wont to make umbrellas by the junction of four of the tails.

Turkies are natives only of America, or the New World,

and of course unknown to the ancients: this is a point which Mr. Pennant has established by an elaborate induction of various particulars in the history of these birds; evincing that they are natives neither of Europe, Asia, nor Africa. The first precise description of them is given by Oviedo, in 1525; they are also mentioned as natives of the main land of the warmer parts of America, by Fernandez, physician to Philip II. who wrote between the years 1555 and 1598: they were also frequently seen, both in their wild and tame state, by Dampier, in the province of Yucatan, now a part of Mexico.

In North America they were observed by the first discoverers. They were first introduced into Europe from Mexico or Yucatan, and imported into England, probably from Spain, as early as the year 1524. Since that period they have been successfully cultivated in this kingdom, so that in the year 1585 they made a dish even in our rural feasts. But in France they were so rare, that the first which was eaten in that kingdom appeared at the nuptial feast of Charles IX. in 1570. Phil. Transf. vol. lxxi. part i. p. 67, &c. See POULTRY.

TURKEY-Berry *Tree*, in *Botany*. See CORDIA.

TURKEY *Company* and *Silk*. See COMPANY and SILK.

TURKEY *Leather*. (See MOROCCO *Leather*.) The processes for dyeing leather red and yellow, as practised in Turkey, with the directions for preparing and tanning the skins, as communicated by Mr. Philippo, a native of Armenia, who obtained 100*l.* and a gold medal from the Society for the Encouragement of Arts, as a reward for the discovery, are as follow.

1. *First Preparation of the Skins, both for Red and Yellow Leather, by dressing them in Lime*.—Let the skins, dried with the hair on, be first laid to soak in clean water for three days; let them then be broken over the flesh-side, put into fresh water for two days longer, and afterwards hung up to drain half an hour. Let them now be broken on the flesh-side, limed in cold lime on the same side, and doubled together with the grain-side outward. In this state they must be hung up within-doors over a frame for five or six days, till the hair be loose; which must then be taken off, and the skins returned into the lime-pit for about three weeks. Take them out, and let them be well worked flesh and grain, every sixth or seventh day during that time; after which, let them be washed ten times in clear water, changing the water at each washing. They are next to be prepared in drench, as below mentioned.

2. *Second Preparation of the Skins for both the Red and Yellow Dyes by drenching*.—After squeezing the water out of the skins, put them into a mixture of bran and water, warm as new milk, in the following proportions; viz. about three pounds of bran for five skins, and water sufficient to make the mixture moderately fluid, which will be about a gallon to each pound of bran. In this drench let the skins lie three days; at the end of which time they must be well worked, and afterwards returned into the drench two days longer. They must then be taken out and rubbed between the hands; the water squeezed from them, and the bran scraped off clear from both sides of the skins. After this they must be again washed ten times in clear water, and the water squeezed out of them.

Thus far the preparatory process of all the skins, whether intended to be dyed red or yellow, is the same; but afterwards those which are to be dyed red, must be treated as follows.

3. *Preparation in Honey and Bran of the Skins that are to be dyed Red*.—Mix one pound of honey with three pints of lukewarm water, and stir them together till the honey is dissolved.

dissolved. Then add two double handfuls of bran; and taking four skins (for which the above quantity of the mixture will be sufficient), work them well in it one after another. Afterwards fold up each skin separately into a round form, with the flesh-side inwards; and lay them in an earthen pan, or other proper vessel; if in the summer, by the side of each other; but in the winter, on the top of each other. Place the vessel in a sloping position, so that such part of the fluid as may spontaneously drain from the skins, may pass from them. An acid fermentation will then rise in the liquor, and the skins will swell considerably. In this state they must continue for seven or eight days; but the moisture that drains from them must be poured off once or twice a day, as occasion may require. After this a further preparation in salt is necessary; and which must be performed in the following manner.

4. *Preparation in Salt of the Skins to be dyed Red.*—After the skins have been fermented in the honey and bran, as above-mentioned, let them be taken out of that mixture on the eighth or ninth day, and well rubbed with dry common sea-salt, in the proportion of about half a pound to each skin; the salt must be well rubbed and worked with them. This will make them contract again, and part with a further considerable quantity of moisture: which must be squeezed out by drawing each skin separately through the hands. They must next be scraped clean on both sides from the bran, superfluous salt, and moisture that may adhere to them. After which dry salt must be strewed over the grain-side, and well rubbed in with the hand. They are then to be doubled, with the flesh-side outwards, lengthwise from neck to tail, and a little more dry salt must be thinly strewed over the flesh-side, and rubbed in; for the two last operations, about a pound and a half of salt will be sufficient for each skin. They must then be put, thus folded on each other, between two clean boards, placed sloping, breadthwise; and a heavy weight laid on the upper board, in order gradually to press out what moisture they will thus part with. In this state of pressure, they must be continued two days or longer, till it is convenient to dye them, for which they will then be duly prepared.

5. *Preparation of the Red Dye, in a proper Proportion for four Skins.*—Put eight gallons of water into a copper, with seven ounces of shenan tied up in a linen bag. [Shenan is a drug much used by dyers in the East; and may easily be procured at any of the ports of Syria and Africa, in the Levant. It is the Eastern jointed kali, called by botanists *falcoria*; and grows in great plenty in those and other parts of the East.] Light a fire under a copper; and when the water has boiled about a quarter of an hour, take out the bag of shenan, and put into the boiling fluid or lixivium, 1st, two drachms of alum; 2dly, two drachms pomegranate bark; 3dly, three quarters of an ounce of turmeric; 4thly, three ounces of cochineal; 5thly, two ounces of loaf-sugar. Let the whole mixture boil about six minutes, then cover the fire, and take out a quart of liquor, putting it into a flat earthen pan; and when it is as cold as new milk, take one skin, folded lengthwise, the grain-side outwards, and dip it in the liquor, rubbing it gently with the hands. Then taking out the skin, hang it up to drain, and throw away the superfluous dye. Proceed in the same manner with the remaining three skins; repeating the operation of each skin separately, eight times, squeezing the skins by drawing them through the hands before each fresh dipping. Lay them now on one side of a large pan, set sloping, to drain off as much of the moisture as will run from them without pressure, for about two hours, or till they are cold; then tan them as below directed.

6. *Tanning the Red Skins.*—Powder four ounces of the

best white galls in a marble mortar, sifting it through a fine sieve. Mix the powder with about three quarts of water, and work the skins well in this mixture for half an hour or more, folding up the skins fourfold. Let them lie in this tan for 24 hours; when they must be worked again as before; then taken out, scraped clean on both sides from the first galls, and put into a like quantity of fresh galls and water. In this fresh mixture they must be again well worked for three quarters of an hour; then folded up as before, and left in the fresh tan for three days. On the fourth day they must be taken out, washed clean from the galls in seven or eight fresh quantities of water, and then hung up to dry.

7. *Manner of dressing the Skins after they are tanned.*—When the skins have been treated as above, and are very near dry, they should be scraped with the proper instrument or scraper on the flesh-side, to reduce them to a proper degree of thickness. They are then to be laid on a smooth board, and glazed by rubbing them with a smooth glass. After which they must be oiled, by rubbing them with olive-oil, by means of a linnen rag, in the proportion of one ounce and a half of oil for four skins: they are then to be grained on a graining-board, lengthwise, breadthwise, and cornerwise, or from corner to corner.

8. *Preparations with Galls, for the Skins to be dyed Yellow.*—After the four skins are taken out of the drench or bran, and clean washed as before directed in the second article, they must be very well worked, half an hour or more, in a mixture of a pound and a half of the best white galls, finely powdered, with two quarts of clean water. The skins are then to be separately doubled lengthwise, rolled up with the flesh-side outwards, laid in the mixture, and close pressed down on each other, in which state they must continue two whole days. On the third day let them be again worked in the tan; and afterwards scraped clean from the galls, with an ivory or brass instrument (for no iron must touch them). They must then be put into a fresh tan, made of two pounds of galls finely powdered, with about three quarts of water, and well worked therein fifteen times. After this they must be doubled, rolled up as before, and laid in the second tan for three days. On the third day, a quarter of a pound of white sea-salt must be worked into each skin; and the skins doubled up as before, and returned into the tan, till the day following, when they are to be taken out, and well washed six times in cold water, and four times in water lukewarm. The water must be then well squeezed out, by laying the skins under pressure, for about an hour, between two boards, with a weight of about 200 or 300 pounds laid upon the uppermost board, when they will be ready for the dye.

9. *Preparation of the Yellow Dye, in the proper Proportion for four Skins.*—Mix six ounces of cassiari gehira, or dgehira, or the berries of the Eastern rhamnus, with the same quantity of alum; and pound them together till they be fine, in a marble or brass mortar, with a brass pestle. [The cassiari gehira is the berries of an Eastern rhamnus, or buckthorn-tree; and may be had at Aleppo, and other parts of the Levant, at a small price. The common Avignon or yellow berries may be substituted, but not with so good an effect; the cassiari gehira being a stronger and brighter yellow dye, both for this use and also that of colouring paper-hangings, &c.] Then dividing the materials, thus powdered, into three equal parts of four ounces each, put one of those three parts into about a pint and half of water, in a china or earthen vessel, and stir the mixture together. Let the fluid stand to cool, till it will not scald the hand. Then spreading one of the skins flat on a table, in a warm room, with the grain-

side

side uppermost, pour a fourth part of the tinging liquor, prepared as above directed, over the upper or grain-side, spreading it equally over the skin with the hand, and rubbing it well in. Afterwards do the like with the other three skins, for which the mixture first made will be sufficient.

This operation must be repeated twice more on each skin separately, with the remaining eight ounces of the powder of the berries and alum, with the above-mentioned due proportions of hot water, put to them as before directed.

The skins, when dyed, are to be hung up on a wooden frame, without being folded, with the grain-side outwards, about three quarters of an hour to drain; when they must be carried to a river or stream of running water, and well washed therein six times or more. After this they must be put under pressure for about an hour, till the water be well squeezed out; afterwards the skins must be hung up to dry in a warm room.

This being done, the skins are to be dressed and grained as before directed for those dyed red; except the oiling, which must be omitted.

The processes for dressing and preparing the skins of lambs, sheep, goats, and other thin hides are various, according to the nature of the article. This branch of the manufacture supplies the large demand of white and dyed leather for gloves, the leather called morocco of different colours and qualities, used for coach-linings, book-binding, pocket-books, &c. This leather is applicable to a variety of other purposes. The white leather is not tanned, but finished by the mere process of tawing; but the coloured leather receives a tanning, generally by fumach, independent of the other materials. The previous preparation of each, or that in which the skin is thoroughly cleansed and reduced to the state of simple membrane, in which it is called *pelt*, is essentially the same, whether for tawing or dyeing. It is thus performed at the best manufactories at Bermondsey, near London, a place long celebrated for all branches of the leather business.

By far the greater number of the skins are imported: if lambs, they are thus prepared; the skins are first soaked for a time in water, to cleanse them from any loose dirt and blood, and put upon the beam commonly used for the purpose, which is a half cylinder of wood covered with strong leather, and scraped on the flesh-side with the semicircular blunt knife with two handles, used in this operation. They are then hung up in considerable numbers in a small close room heated by flues, where they remain to putrefy for a given time. During this process a thick filthy slime works up to the surface of the skin, by which the regularity of the process is judged of; and the wool is loosened, so that it readily comes off with a slight pull. Each skin is then returned to the beam, the wool taken off and preserved, and all the slime worked off with the knife, and the rough edges pared away. The skin is then put into a pit filled with lime-water, and kept there from two to six weeks, according to the nature of the skin, which has the effect of checking the further putrefaction, and produces a very remarkable hardening and thickening of its substance, and probably also it detaches a further portion of the slime. The skin is again well worked upon the beam, and much of its substance pared down, and all inequalities smoothed with the knife. Much pains and judgment are required in these operations, on the one hand not to endanger the substance of the skin by the putrefaction (which if carried on too long would soon reduce it to an incohesive pulp), and on the other hand to work out every particle of the slime, of which the least, if retained, will prevent the skin from dressing well in the subsequent processes, and from taking the dye uni-

formly and well. The skin is then again softened and freed from the lime by being thrown into a vat of bran and water, and kept there for some weeks in a state of gentle fermentation, being occasionally returned to the beam. All the thickening produced by the lime is thus removed, and the skin is now highly purified, and is a thin extensible white membrane, called in this state a *pelt*, and is fit for any subsequent operation of tawing or dyeing, or oil dressing, or shammying.

The method of bringing kid and goat's skins to the state of pelt is nearly the same as for lambs, except that the liming is used before the hair is taken off, the hair being of but little importance, and only fold to the plaiters; but the lamb's wool, which is more valuable, would be injured by the lime. Kids' skins will take a longer time in tanning than lambs'.

If the pelts are to be tawed, they are put into a solution of alum and salt in warm water, in the proportion of three pounds of alum and four pounds of salt to every 120 middle-sized skins, and worked about therein till they have absorbed a sufficient quantity. This again gives the skin a remarkable degree of thickness and toughness.

The skins are then taken out and washed in water, and then again put into a vat of bran and water and allowed to ferment for a time, till much of the alum and salt are got out, and the unusual thickening produced by it is for the most part reduced. They are then taken to a lofty room with a stove in the middle, and stretched on hooks and kept there till fully dry. The skins are then converted into a tough, flexible, and quite white leather; but to give them a glossy finish, and to take off the harshness of feel still remaining, they are again soaked in water to extract more of the salt, and put into a large pail containing the yolks of eggs beat up with water. Here the skins are trodden for a long time, by which they so completely imbibe the substance of the egg, that the liquor above them is rendered almost perfectly limpid, after which they are hung up in a loft to dry, and finished by glossing with a warm iron. There are other smaller manipulations, which need not be here mentioned.

The essential difference therefore between *tanning* and *tawing* is, that in the former case the pelt is combined with tan and other vegetable matter, and in the latter with something that it imbibes from the alum and salt (possibly alumine), and which is never again extracted by the subsequent washing and brauning.

The morocco leather prepared chiefly from sheep's skins and used for coach-linings, the best kind of book-binding, &c. is prepared by the following process. The skin, cleansed and worked in the way already described, is taken from the lime-water, and the thickening thereby occasioned is brought down, not by bran liquor as in tawing, but by a bath of dogs' or pigeons' dung diffused in water, where it remains till sufficiently suppled, and till the lime is quite got out, and it becomes a perfectly white clean pelt. If intended to be dyed red, it is then sewed up very tight in the form of a sack, with the grain side outwards (the dye only being required on this side), and is immersed in a cochineal bath of a warmth just equal to what the hand can support, and is worked about for a sufficient time till it is uniformly dyed, a process that demands much skill and experience. The sack is then put into a large vat containing fumach infused in warm water, and kept for some hours till it is sufficiently tanned.

The skins intended to be blacked are merely fumached without any previous dyeing. After some further preparation, the colour of the fine red skins being finished with a weak

weak bath of saffron, the skins when dry are grained and polished in the following way. They are stretched very tight upon a smooth inclined board, and rubbed over with a little oil to supple them. Those intended for black leather are previously rubbed over with an iron liquor, by means of a stiff brush, which uniting with the gallic acid of the fumach, instantly strikes a deep and uniform black. They are then rubbed by hand with a ball of glass cut into a polygonal surface, with much manual labour, which polishes them and makes them very firm and compact. Lastly, the *graining* or ribbed surface by which this kind of leather is distinguished, is given by rubbing the leather very strongly with a ball of box-wood, round the centre of which a number of small equi-distant parallel grooves are cut, forming an equal number of narrow ridges, the friction of which gives the leather the desired inequality of surface.

The process for the real morocco leather, as prepared from goat-skins at Fez and Tetuan, is thus described by M. Broussonet. The skins are first cleansed, the hair taken off, limed and reduced with bran, nearly in the way already described for the English morocco leather. After coming from the bran they are thrown into a second bath made of white figs, mixed with water, which is thereby rendered slimy and fermentable. In this bath the skins remain four or five days, when they are thoroughly salted with sal-gem (or rock-salt) alone (and not with salt and alum), after which they are fit to receive the dye, which for the red is cochineal and alum, and for the yellow, pomegranate bark and alum. The skins are then tanned, dressed, suppled with a little oil, and dried.

Much excellent leather of every kind is prepared in different parts of the Russian empire. The preparation of the fine Russian leather, so well known for its quality and for its peculiar smell, is described at large in Mr. Tooke's "View of the Russian Empire," to which we must refer the reader for the minuter particulars. In general it may be stated that the hides are first put into a weak alkaline ley to loosen the hair, and then scraped on a beam, then (if calves) are reduced by dogs' dung, and a four oatmeal drench, then tanned with great care and frequent *handling*. The bark used here is seldom oak, but, where it can be got, the bark of the black willow, or if this cannot be had, birch-bark. They are then dyed either red or black, these being the two colours the most esteemed. For the red, the hide is first soaked in alum, and then dyed with Brazil wood. The black is given as usual with an iron liquor. The leather is then smeared with birch-tar, which gives the peculiar smell so much prized (and which, when used for book-binding, has the valuable property of protecting the book from worms), and is finished by various other manipulations. The streaked or barred surface is given to the leather by a very heavy steel cylinder wound round with wires. See YUFTS.

A valuable saffian or dyed maroquin leather, almost equal to that of Turkey, is prepared largely at Astrachan and other parts of Asiatic Russia. Only bucks' and goats' skins are used for this purpose. The favourite colours are red and yellow. The general method of preparing the pelt is the same as in this country for the dyed morocco leather, that is by lime, dogs' dung, and bran. Honey is also used after the branning. The honey is dissolved in warm water, and some of this liquor is poured on each skin spread out on wooden trays till it has imbibed the whole of the honey, after which it is let to ferment for about three days, and then salted in a strong brine and hung up to dry. The skin is then ready to receive the dye, which for red is made with cochineal and the *falsola ericoides*, an alkaline plant grow-

ing plentifully on the Tartarian salt deserts, and the colour is finished with alum. When dyed, the skins are tanned with fumach. To the very finest reds, a quantity of forrel is used with the cochineal bath, and the subsequent tanning is given with galls instead of fumach, which renders the colour as durable as the leather itself. The roughness always observed on the surface of the skin, is given by a heavy kind of iron rake with blunt points. The yellow saffians are dyed with the berries of a species of rhamnus (the Avignon berry would answer the same purpose, and is used in other countries), or with the flowers of the wild camomile. For other kinds of leather, see SHAGREEN and SHAMOY.

TURKEY-Pod, in *Agriculture*, a troublesome weed in dry sandy pastures, but which is only an annual.

TURKISH Coins, Measures, and Year, see the substitutes, and **TURKEY**.

TURKOMANS, TURCOMANS, or Turkmans, in *Geography*, a denomination distinguishing some of those Tartar hordes, who, on the great revolutions of the empire of the caliph, emigrated from the eastward of the Caspian sea, and spread themselves over the vast plains of Armenia and Asia Minor. After having been introduced into the Arabian empire, they proceeded to give law to those who called them in, either as mercenaries or allies. This was signally experienced by the caliphs themselves. In 834, Motazzam, brother and successor of Almamoun, having taken a body of Turkmans for his guards, was compelled to quit Bagdad on account of their disorders, and, after his time, their power and insolence increased to such a degree, that they became the disposers of the throne and life of their princes, and murdered three of them in less than thirty years. The caliphs, when freed from this bondage, did not profit by their experience; for about the year 935, Radi B'ellah, having again resigned his authority to a Turkman, his successors were entangled in their former chains, and guarded by the Emirs-el-Omara, possessed only the shadow of power. Amidst the disorders of this anarchy, a multitude of Turkman hordes penetrated into the empire, and founded different independent states, in the Kerman and the Khorasan; at Iconium, Aleppo, Damascus, and in Egypt. Until this time the Turks, called "Ogouzians," had remained to the E. of the Caspian and toward the Djihoun; but, about the beginning of the 13th century, Genghis Khan, having united all the tribes of Upper Tartary against the princes of Balk and Samarcand, the Ogouzians did not think proper to wait for the Moguls, but marched under their chief Soliman, and driving their herds before them, encamped (in 1214) in the Aderbeidjan, to the number of 50,000 horsemen. The Moguls followed them, and pushed them still farther to the west, into Armenia. Soliman, being drowned in 1220 in endeavouring to pass the Euphrates on horseback, Ertogrul, his son, took the command of the hordes, and advanced into the plains of Asia Minor, where he was relieved by the abundant pasturage which they afforded for his cattle. The good conduct of this chief procured for him, in these countries, a power and respect which made his alliance sought after by other princes.

Among

Among these was the Turkman Ala-el-din, sultan of Iconium. Ala-el-din, advanced in life and harassed by the Tartars of Genghis Khan, granted lands to the Turks under Ertogrul, and even made their chief general of all his troops. Ertogrul proved himself deserving the confidence of the sultan, vanquished the Moguls, acquired still greater power and reputation, and transmitted his honours to his son Osman, who received from Ala-el-din, successor of the former of that name, the Kofetan, drum, and horse-tails, which are symbols of command among all the Tartars. This Osman, to distinguish the Turks, his followers, from the others, gave them the name of "Osmanles," from which we have made Ottomans; which new name soon became formidable to the Greeks of Constantinople, from whom Osman conquered a sufficient extent of territory to found a powerful kingdom. He soon bestowed on it that title, by assuming, in 1300, the dignity of sultan, which signifies absolute sovereign.

No one is ignorant in what manner his successors, the heirs of his ambition and activity, continued to aggrandize themselves at the expence of the Greeks; till, continually depriving them of whole provinces in Europe and Asia, they at length shut them up within the walls of Constantinople; and Mahomet II. son of Amurath, having taken that city in 1453, annihilated this branch of the Roman empire. The Turks, now finding themselves disengaged from the affairs of Europe, turned their ambitious arms against the southern provinces. Bagdad, subjugated by the Tartars, had been without caliphs for two hundred years, but a new power, established in Persia, had succeeded to a part of their domains; and another, formed in Egypt, so early as the tenth century, and subsisting, at that time, under the name of Mamlouks, had seized on Syria.

The Turks determined to despoil these two rivals. Bayazid, the son of Mahomet, executed a part of this plan, by taking Armenia from the Sofi of Persia, and Selim his son completed it, by the conquest of the Mamlouks. This sultan having drawn them near to Aleppo, in 1517, under pretext of desiring their assistance in the war with Persia, suddenly turned his arms against them, and took from them successively Syria and Egypt, whither he pursued them. From that time the Turks established themselves in that country; but they are not settled much among the villages. We rarely meet with any individuals of that nation, except at Cairo; there they exercise the arts, and occupy the religious and military employments. Formerly they also were advanced to posts under government, but, within the last thirty years, a tacit revolution has taken place, which, without taking from them the title, has deprived them of the reality of power. See **TURK** and **TURKEY**.

Volney observes, that the language of the Turkmen is the same with that of the Turks, and their mode of life nearly similar to that of the Bedouin Arabs. Like them, they are pastors, and consequently obliged to travel over immense tracts of land to procure subsistence for their numerous herds. But there is this difference, that the countries frequented by the Turkmen being rich in pasturage, they can feed more cattle on them, and are therefore less dispersed than the Arabs of the desert. Each of their "ordous" (hence *borderes*), or camps, acknowledges a chief, whose power is not determined by fixed laws, but governed by custom and circumstances. It is rarely abused, because the society is compact, and the nature of their situation maintains sufficient equality among its members. Every man able to bear arms is anxious to carry them, since on his individual force depend both his personal safety, and the

respect paid him by his companions. All their property consists in cattle, that is camels, buffaloes, goats, and especially sheep. They live on milk, butter, and meat; which are in great abundance among them, and the surplus of which they sell in the towns and the neighbouring country, for they are almost able alone to supply the butcheries. In return, they take arms, clothes, money, and corn. Their women spin wool, and make carpets, the use of which is immemorial in these countries, and consequently indicates their manner of living to have been always the same. As for the men, their whole occupation consists in smoking, and looking after their flocks. Perpetually on horseback, with their lances on their shoulders, their crooked sabres by their sides, and their pistols in their belts, they are expert horsemen and indefatigable soldiers. They have frequent differences with the Turks, who dread them; but as they are divided among themselves, and form separate camps, they do not assume that superiority which their combined forces would ensure them. The pachalics of Aleppo and Damascus, which are the only parts of Syria they frequent, may be computed to contain about 30,000 wandering Turkmen. A great number of these tribes pass, in summer, into Armenia and Caramania, where they find grass in greater abundance, and return to their former quarters in the winter. The Turkmen are reputed Mussulmen, and generally bear the distinguishing mark, circumcision. But they trouble themselves very little about religion, and they have neither the ceremonies, nor the fanaticism of sedentary nations. As for their manners, to describe them accurately, it would be necessary to have lived among them. They have, however, the reputation of not being robbers, like the Arabs, though they are neither less generous, nor less hospitable than they; and when we consider that they live in plenty, without being rich, and are inured to war, and hardened by fatigue and danger, we may presume they are equally removed from the ignorance and servility of the peasants, and the corruption and selfishness of the inhabitants of the towns. See **TRUCHMENIANS**.

TURLACH-MORE, *i. e.* the Great Turlach, in the county of Galway, Ireland, a kind of lake, formed by the expansion of the rivers Clare and Moyne, which is upwards of six miles in length, and two in breadth; but which in summer, from the water being carried off by subterranean passages, becomes a beautiful and found sheep-walk.

TURLAH, a town of Hindoostan, in the circar of Cicacole; 25 miles E. of Kimedey.

TURLOS, a small island in the gulf of Engia, near the N.E. point of the island of Engia.

TURLUPINADE, a term used chiefly among the French for a low jest or witticism. The occasion of the name is said to be derived from a famous comedian at Paris, called *Turlupin*; whose talent consisted chiefly in raising a laugh by miserable puns and quibbles.

TURLUPINS, **TURLUPINI**, a denomination given to the *brethren of the free spirit*; whose external aspect and manners carried a very shocking air of lunacy and distraction.

They called their sect the *fraternity of the poor*, and spread themselves over England and France. They are said by some to have had their name *turlupines*, *quod ea tantum habitarent loca, que lupis exposita erant*.

They attempted to settle themselves at Paris in 1372, but were a great part of them burnt, with their books; as is related by Gaguin and Du Tillet, in the life of Charles V.

TURMERIC, or *Indian Saffron*, in *Botany*. See **CURCUMA**.

TURMERIC, *Curcuma*, in the *Materia Medica*, a medicinal

nal root, being the root of the *curcuma longa* of Linnæus, used likewise by the dyers, to give a yellow colour.

It is externally greyish, and internally of a deep lively yellow or saffron colour, very hard, and not unlike, either in figure or size, to ginger.

It is brought chiefly from the East Indies, but it is common in the gardens of the Chinese, who use it as a sternutatory, and grows abundantly in Malacca, Java, and Balesa. In England it was first cultivated by Mr. P. Miller in 1759. It has been long officinally known. That should be chosen which is big, new, resinous, hard to break, and heavy.

Some people have mistakenly imagined, that there was a native red turmeric; their error was owing to this, that the yellow root, as it grows old, turns brown; and when pulverized, is reddish. It is much used by the glovers, &c. to dye their gloves. The Indians use it to dye their rice, and other foods, of a yellow colour: whence some call it *Indian saffron*.

Our dyers do not find that it gives so steady a yellow as the luteola, or weld; nor can any of the mordants give it a sufficient degree of durability; common salt and ammoniacal muriate fix its colour fast, at the same time rendering it deeper; but it is admirable to brighten and heighten the red colours dyed with cochineal and vermilion; as scarlets, &c.

Turmeric has a slight aromatic, and not very agreeable smell; and a bitterish, slightly acrid, and somewhat warm taste. It readily gives out its active matter, both to aqueous and spirituous menstria; communicating to the former its own deep yellow, and to the latter a fine yellowish-red tincture. Distilled with water, it yields a small quantity of a gold-coloured essential oil, of a moderately strong smell, and pungent taste: the remaining decoction, inspissated, leaves a bitterish, considerably saline mass. The inspissated extract from rectified spirit is moderately warm and bitter, and not a little nauseous. In the Eastern countries, this root, besides its use in colouring and seasoning their food, is much recommended as a medicine; being accounted one of the most effectual remedies in obstructions of the viscera and mesentery, which are there frequent; in uterine disorders, difficulties of urine, and affections of the kidneys. Among us it has also been employed by way of decoction, infusion, and powder, as a deobstruent, in hypochondriac, leuco-phlegmatic, and cachectical constitutions; and esteemed by some as a specific in the jaundice: the dose in substance is from a scruple to a drachm; in decoction or infusion twice as much. It tinges the urine of a deep yellow colour. Lewis.

Although the use of this root has been highly commended, it is now very rarely employed.

A plaster of turmeric, well bruised, top and roots, is thought to be good against the bite of the rattle-snake. See Phil. Trans. N^o 479. p. 144.

TURMERIC-Wash, is the gum of the turmeric-root dissolved in water.

The qualities and uses of it are much the same as those of the yellow-berry wash for water-painting; but it is a brighter and cooler yellow; for which purpose it should be dissolved in spirit of wine instead of water, by putting two ounces of proof-spirit, and one ounce of water, in a phial, with two drachms of powdered turmeric-root, shaking them well together, and letting them stand, with a repetition of the shaking, for three or four days.

TURMERO, in *Geography*, a town of South America, in the government of Caraccas; 40 miles S.W. of Leon de Caraccas.

TURN, a town of Walachia, at the conflux of the Alaut and the Danube; 24 miles S. of Brancovani.

VOL. XXXVI.

TURN is used for a circular motion; in which sense it coincides with *revolution*.

TURN, in a *Clock* or *Watch-work*, particularly denotes the revolution of a wheel or pinion.

In calculation, the number of turns which the pinion hath is obtained by common arithmetic; thus 5)60(12, where the pinion 5, playing in a wheel of 60, moves round 12 times in one turn of the wheel. Now, by knowing the number of turns which any pinion hath in one turn of the wheel it works in, you may also find how many turns a wheel or pinion has at a greater distance;

as the contrate-wheel, crown-wheel, &c. by multiplying together the quotients, and the number produced is the number of turns, as in this example:

The first of these three numbers has 11 turns, the next 9, and the last 8. If you multiply 11 by 9, it produceth 99; that is, in one turn of the wheel 55, there are 99 turns of the second pinion 5, or the wheel 40, which runs concentrical or on the same arbor with the second pinion 5. If you multiply 99 by the last quotient 8, it produces 792, which is the number of turns the third pinion 5 hath. See *CLOCK-Work* and *PINION*.

TURN, in *Mining*, is a pit sunk in some part of a drift. If the mine be deep, there are many of these turns one below another.

TURN-HOUSE. When a drift is driven across the country N. and S. to cut a lode, the miners make a right angle from their drift, and work on the lode itself; which, as it is in a contrary direction to their past drift, they call *turning-house*, in order to work on the course of the lode.

TURN, in the *Manege*, is a term commonly used in direct- ing to change hands. See *CHANGE* and *ENTIER*.

TURN, in the *Sea Language*. See *LAND Turn*, *TACK*, and *TURNING*.

TURN, or *TOURN*, is also used for the sheriff's court, kept twice a year in every hundred within his county, viz. a month after Easter, and within a month after Michaelmas.

From this court none are exempted but archbishops, bishops, earls, barons, religious men and women, and all such as have hundreds of their own to be kept.

It is a court of record in all things that pertain to it; and is also the king's leet through all the county, of which the sheriff is judge; this court being incident to his office. The attendance on it is called *secta regalis*, or *suit-royal*.

It is called the *sheriff's turn*, because he takes a turn or circuit for this purpose through the shire, holding the same in several places.

TURN in the Head, in *Rural Economy*, a disease in calves and young cattle, in which external objects would appear to turn round. The affection in this case seems to arise from some diseased state of the brain, or parts about it.

In the cure, bleeding is advised, in proportion to the size and strength of the animal; after which a powder, composed of camphor, valerian, nitre, and birthwort, in the quantity of a drachm of the first to an ounce of each of the other ingredients, should be well powdered and mixed together, and then given at once in a pint of rosemary tea, repeating it as occasion may require.

By this means much advantage has been gained, it is said, in some instances of this disease.

TURNADO. See *TORNADO*.

TURNAGAIN ARM, in *Geography*, a branch of the north part of Cook's inlet, extending east from Point Possession.

TURNAMENT, or TOURNAMENT, a martial sport or exercise, which the ancient cavaliers used to perform, to shew their bravery and address.

The first tournaments were only courses on horseback, in which the cavaliers tilted at each other with canes in manner of lances; and were distinguished from *jousts*, which were courses or careers, accompanied with attacks and combats, with blunted lances and swords.

Others say it was a tournament when there was only one quadril or troop; and that where there were several to encounter each other, it was a *joust*; which see. But it is certain that the two became confounded together in process of time; at least we find them so in authors.

The prince who published the tournament used to send a king at arms with a safe-conduct, and a sword, to all the princes, knights, &c. signifying that he intended a tournament and a clashing of swords, in the presence of ladies and damsels: which was the usual formula of invitation.

The first engaged man against man, then troop against troop; and after the combat, the judges allotted the prize to the best cavalier, and the best striker of swords; who was, accordingly, conducted in pomp to the lady of the tournament; where, after thanking her very reverently, he saluted her, and likewise her two attendants.

The tournament made the principal diversion of the thirteenth and fourteenth centuries. Munster says, it was Henry the Fowler, duke of Saxony, and afterwards emperor, who died in 936, that first introduced them; but it appears from the Chronicle of Tours, that the true inventor of this famous sport, at least in France, was one Geoffry, lord of Preuilli, about the year 1066.

It is difficult to fix the epocha of their institution, as many nations have laid claim to it. Nithard relates, that at the interview of Charles the Bald, king of France, who succeeded to the throne in the year 840, and his brother Lewis of Germany, at Straßburg, the gentlemen of the retinue of both princes fought on horseback, to display their courage and skill.

Du-Cange says, that these sports were so peculiar to the French, that they were called *conflictus Gallici*, or French combats. To this purpose Matthew Paris, under the year 1179, says, "Henricus rex Anglorum junior mare transiens in conflictibus Gallicis, et profusioribus expensis, triennium peregit, regiaeque majestate deposita, totus est de rege translatus in militem."

The Historia Byzantina tells us, that the Greeks and Latins borrowed the use of it from the Franks; and we find mention made of them in Cantacuzenus, Gregorias, Bessarion, and others of the late Greek authors.

Instances of them occur among the English in the reign of king Stephen, about the year 1140; but they were not much in use till Richard's time, towards the year 1149. After which period these diversions were performed with extraordinary magnificence in the *Tilt-yard*, near St. James's, Smithfield, and other places. At last, however, they were found to be productive of bad effects, and the occasion of several fatal misfortunes; as in the instance of Henry II. of France, and of the *tilt* exhibited at Chalons, which, from the numbers killed on both sides, was called the little war of Chalons. These and other inconveniences, resulting from these dangerous pastimes, gave the popes occasion to forbid them, and the princes of Europe gradually concurred in discouraging and suppressing them.

Budæus derives the word tournament from *Trojana agmina*; others from *Trajamentum, quasi ludus Trojae*. Menage deduces it from the Latin *torneris*, or the French *tourner*, because the combatants rode in rings and circles, and were obliged

to make many turnings with their horses, as the laws of the game required.

M. Paris calls them in Latin *hastiludia*; Neubrigenfis, *meditationes militares*; others, *gladiatura*; others, *decuriones ludicra*, &c.

It is natural, however, to conclude *ex vi termini*, that although the sport itself may owe its rise to the Trojan game, yet that its name is of French extraction, and not only given with great propriety, but seems to be a tacit agreement of its superior antiquity among that people, whose historians assert that it was first known in France. Berenger's Art of Horsemanship, vol. i. p. 104, &c.

Pope Eugenius II. excommunicated those who went to tournaments, and forbid them burial in holy ground. King Henry II. of France died of a wound received at a tournament. One Chiaoux, who had assisted at a tournament under Charles VIII. said very wisely, "If it be in earnest, it is too little; if in jest, too much."

It is to the exercise of tournaments that we owe the first use of armories, of which the name blazonry, the form of the escutcheons, the colours, principal figures, the mantlings, labels, supporters, &c. are undeniable evidences.

In Germany it was anciently a custom to hold a solemn tournament every three years, to serve as a proof of nobility. For the gentleman who had assisted at two was sufficiently blazoned and published; *i. e.* he was acknowledged noble, and bore two trumpets, by way of crest, on his tournament casque. Those who had not been in any tournaments had no arms, though they were gentlemen.

TURNAU, in *Geography*, a town of Bohemia, in the circle of Boleslaw; 14 miles N.E. of Jung-Buntzel. N. lat. 53° 32'. E. long. 15° 11'.

TURNDORF, a town of Bavaria; 21 miles N.N.W. of Amberg.

TURNEBUS, ADRIAN, in *Biography*, a learned critic and scholar, was born at Andeli, in Normandy, in the year 1512, educated at Paris, and intimately acquainted with every branch of classical literature. After having been employed for some time in teaching the classics at Toulouse, he became, in 1547, a professor of Greek at Paris, in which station he was very popular. He also superintended the royal press for Greek books, which he declined on being appointed professor-royal of Greek in 1555. In his manners, which were mild and condescending, meek and modest, he differed, as we regret to observe, from many eminent scholars; so that Henry Stephens pronounces this eulogy upon him,

"Hic placuit cunctis, quod sibi non placuit."

His fame spread through Italy, Spain, Germany, and England; from which several countries he was honoured with many lucrative proposals, which he declined, though at home his income was scanty. He closed his life at Paris in 1565, at the age of 53 years, and his remains were privately interred in the cemetery of poor scholars, at Montaigu-college. Catholics and Protestants, claiming him respectively as one of their own body, concurred in their testimonies to his learning and character. His works consist of "Annotations upon Cicero, Varro, Thucydides, and Plato;" "Writings against Ramus;" "Translations from Aristotle, Theophrastus, Plutarch, Plato, and other Authors;" "Poems, Latin and Greek;" "Treatises on particular Subjects;" and "Adversaria; or, Miscellaneous Remarks on Writers," which latter was printed at Paris in 1 vol. fol. 1580. Of his versions, Huet says, that they possess every quality necessary for perfect translations; as he understood Greek thoroughly, and turned it into elegant Latin, without deviating from his author, and his style was clear and agreeable. His works

were printed collectively at Strasburg, in 3 vols. fol. 1606. *Nouv. Dict. Hist. Huet de Interpret. Gen. Biog.*

TURNEFF ISLAND, in *Geography*, an island in the bay of Honduras, about 20 miles long, and 10 broad, abounding in cocoa-nut trees, and much frequented by fishermen. N. lat. 17° 16'. W. long. 88° 20'.

TURNEP, in *Botany*, &c. See **BRASSICA** and **TURNIP**.

TURNER, **WILLIAM**, in *Biography*, one of the fathers of English botany as well as of the English Protestant church, was born at Morpeth in Northumberland, probably about the year 1520. He was educated at Pembroke college, Cambridge, under the patronage of sir Thomas Wentworth, and about the year 1538 had already distinguished himself for science and learning, being justly dissatisfied with the little real information he could obtain from those about him. Natural philosophy, medicine, and botany, chiefly engaged his attention at this time, but the great questions involving the vital interests of religious truth and liberty, having been stirred up, he devoted himself also to their examination, and incurred the danger and obloquy incident, more or less, in every age and country, to the honest prosecution of such enquiries. Turner, like many others in England, at this period, united the characters of a physician and a divine. He became an itinerant preacher, of so zealous a character that the infamous bishop Gardiner threw him into prison; from whence he was, after a long time, released, we are not informed by what means, and became a voluntary exile from his native land. He resided on the continent with many other English refugees, principally at Cologne, and Basle, till the death of Henry VIII. During this interval, Turner travelled into Switzerland and Italy, where he contracted a friendship with many distinguished botanists and physicians, especially the great Conrad Gesner of Zurich, and professor Ghini of Bologna, the founder of the physic-garden, and of the botanical chair, in that university, and the preceptor of Cæsalpinus and Anguillara. At Ferrara Turner received the degree of doctor of physic, which was confirmed to him at Oxford, when he returned to England on the accession of Edward VI. He was made physician to the Protector Somerset, and his ecclesiastical merits were still more amply rewarded, by a prebend of York, a canonry of Windsor, and the deanery of Wells. He had deserved this preferment by several publications in defence of Protestantism, which very cause, however, obliged him to fly from the persecutions of the bloody Mary, during whose whole reign Dr. Turner remained abroad. The accession of Elizabeth restored him to his liberty and native soil, as well as to all his ecclesiastical benefices. The rest of his life was devoted to his clerical duties, and his botanical amusements; two pursuits which in many honest and good men have "gone very lovingly together," to their mutual advantage and honour. He had a botanic garden at Wells, and another at Kew, and appears to have divided his time between his deanery, and his residence in Crutched Friars, London. Dr. Pulteney thinks, from Turner's frequent mention of the plants of Purbeck, and Portland, that he had some intimate connections in Dorsetshire. This worthy man died July 7, 1568, apparently at no very advanced age, leaving several children. "His son Peter was educated to physic, travelled, and took degrees abroad; was incorporated doctor at Cambridge, and at Oxford, and died, aged 72, in 1614, but does not seem to have inherited his father's turn for botany."

Turner's earliest botanical work is said to have been printed at Cologne in 1544, in octavo, under the title of *Historia de naturis herbarum, scabellii et notis vallata*. But

this is mentioned by Bumaldus, or rather Ovidius Montanus, only, in his *Bibliotheca Botanica*, Seguier's edition, p. 18, without notice of any other publication of our author; nor does it appear to be known to English collectors, any more than the following. "Names of Herbes in Greek, Latin, English, Dutch, and French," printed at London, 1548, in 12mo., by the same writer.

The chief publication of Dr. Turner is his well-known Herbal, in small folio, black letter, with wooden cuts, of which the first part was originally printed at London in 1551, and is now, on account of its rarity, much valued by collectors. The second part appeared at Cologne in 1562, accompanied by a reimpression of the first. In 1568 these first and second parts were republished at the same place, with a new title page, a dedication to queen Elizabeth, from which many of the above particulars of the author's life are taken, and the addition of a third part of the same work. To the whole are subjoined "A booke of the natures and properties as well of the bathes in England as of other bathes in Germanye and Italye, very necessarye for all sycke perones that can not be healed without the helpe of natural bathes:" and "A most excellent and perfecte homish apothecarye or homely physick booke, for all the grefes and diseases of the bodye, translated out of the Almaine speche into English, by Jhon Hollybusch." For this last sapient production Turner is, perhaps, not responsible. The Herbal is arranged alphabetically, and is more original and practical, than the more popular and celebrated publications of Lyte, Gerarde, or even Parkinson. The object of the author was to determine the plants of the ancients, and to record their reputed virtues. But this is accomplished with more caution and discretion than are common to most of his contemporaries, and with far less dogmatical confidence than Fabius Columna subsequently assumed. The third part, dedicated to the company of surgeons, professes more especially to treat of medical plants not known to the ancients. The author apologizes in these terms for its imperfections. "For surely being so much vexed with sicknes, and occupied with preaching and the study of divinitye and exercise of discipline, I have had but small leasure to write Herballes." This dedication is dated "at Welles 1564." The wooden cuts of all the three parts of Turner's Herbal are taken from those of Fuchsius, and at first sight appear to be the very same blocks as those used in the octavo edition of the latter author, printed at Lyons, in 1595. A careful inspection however will easily detect minute differences; and we especially observe slight damages in Turner's figures, not occurring in this later impression, which decisively prove it to have been printed from more recent cuts. Haller gives our author credit for having first figured the true *Medica*, and the *Rhus Cotinus*; see part 2d, 52 and 115. Under the former he describes various species of *Medicago*, distinguishing their different seed-vessels; and of the latter exhibits a sufficiently expressive delineation, with a correct, though brief, history.

Turner ranks moreover amongst our earliest British zoologists. He published at Cologne, in 1544, an octavo of ten pages, entitled *Avium præcipuarum, quarum apud Plinium et Aristotlem mentio est, historia*. Conrad Gesner, to whose museum he repeatedly contributed, after his settlement in England, speaks of him as eminently deserving of praise in the department of ornithology; and Merret in his *Pinax* mentions the above little book, as great in authority, though small in bulk. Gesner has prefixed to the third volume of his own ponderous *Historia Animalium*, a letter of Dr. Turner's, dated Willenburg, Nov. 1557, in which the various

kinds of Fishes known in England, amounting to more than fifty, are briefly distinguished, with their Latin and English names. At the conclusion of the dedication of his Herbal to the queen he promises a book of the names and natures of fishes that are within her majesty's dominions, if he might have rest and quietness in his old age, and defence from his enemies, "whiche," says he, "have more then these eight yeares continually troubled me verie much, and holden me from my booke." He speaks here also of sickness, as an impediment to his labours. His work upon baths is marked with the same originality of thought, and practical observation, as his botanical and zoological writings. Turner wrote also on the "Wines commonly used in England," and on the "Nature and Vertue of Treacle." His numerous treatises on controversial divinity, published and unpublished, were chiefly in defence of the Reformation; but his most valuable undertaking of this kind we presume to have been his collation of the translation of the Bible, with Hebrew, Greek, and Latin copies, in consequence of which he found occasion to correct it in many places. How far his corrections were turned to advantage by the translators in James I.'s time, we are not informed.

Dr. Pulteney observes, that "he procured to be printed at Antwerp, a new and corrected edition of the *Historia Gentis nostræ, s. Angliæ*, written by William of Newburgh, from a manuscript he found in the library of Wells;" but he complains of the printer, for omitting his preface as well as other communications. Turner translated several works from the Latin, particularly "The Comparison of the old Learning and the new;" written by Urbanus Regius; printed at Southwark in 1537, in 8vo.; and again in 1538 and 1548. We regret having never met with this book, as the subject promises much; and in the hands of Turner, or any man like him, who dared to think for himself, and whose judgment was regulated by prudence and learning, it could not but be valuable and instructive.—Turner's Herbal. Haller's Bibl. Bot. Pulteney's Sketches of the Progress of Botany. Dryand. Bibl. Banks. S.

TURNER, WILLIAM, a fellow student with Purcell and Dr. Tudway, among the second set of chapel-children under Dr. Blow, was sworn in gentleman of the royal chapel in 1669, as a counter-tenor singer, his voice settling to that pitch; a circumstance which so seldom happens, naturally, that if it be cultivated, the possessor is sure of employment; and, in consequence of its utility, soon after his reception into the chapel royal, he was appointed vicar-choral in the cathedral of St. Paul's, and a lay-vicar of the collegiate church of St. Peter, Westminster. In 1696, he was admitted to the degree of doctor in music at Cambridge.

Dr. Turner arrived at the great age of eighty-eight, and dying in 1740, was buried in the cloister of Westminster Abbey, in the same grave with his wife; who, being nearly of the same age, died but four days before him, after living together with great harmony of disposition, and felicity, near seventy years.

In many of our cathedral books there is an anthem, "I will always give thanks," which is called the *club-anthem*, on account of its having been composed by three masters in conjunction; but not, as has been said, by Dr. Boyce and others, "as a memorial of the strict friendship that subsisted between them;" for, according to Dr. Tudway, who remembered the transaction, and records it with the anthem in the Mus. Collect. vol. iii. "the anthem was composed by order of Charles II. at a very short notice, on account of a victory at sea over the Dutch, the news of which arrived on Saturday, and the king wishing to have the anthem performed the next day, and none of the masters

choosing to undertake it, three of the children of the chapel, Humphrey, Blow, and Turner, performed the task."

There are two whole services, and several anthems, of Dr. Turner's composition in Tudway's collection, with an ode for the solemnity of St. Cecilia's day, 1697, accompanied with violins and trumpets. To this there is a long symphony or overture, consisting of two movements, the second of which is in triple time, upon a ground, seemingly in imitation of Purcell, as the first movement is of Lulli. After this production, is inserted his anthem, "The King shall rejoice," which is more in the style of a secular ode, than a composition for the church. The divisions, light and common in the last century, are now become extremely old-fashioned.

TURNER, in *Geography*, a township of the province of Maine; 172 miles N. of Boston.

TURNER'S *Cerate*. See CERATUM *Epuloticum*.

TURNERA, in *Botany*, was dedicated by Plumier to the memory of Dr. WILLIAM TURNER, (see that article,) whom he characterizes, in spite of his heresy, as "a man of solid learning and judgment."—Plum. Gen. 15. t. 12. Linn. Gen. 149. Schreb. 201. Willd. Sp. Pl. v. 1. 1503. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 2. 172. Juss. 313. Lamarck Illustr. t. 212. Gærtn. t. 76. (Piriqueta; Aubl. Guian. 298. Juss. 295.)—Class and order, *Pentandria Trigynia*. Nat. Ord. *Columnifera*, Linn. *Portulacæ* & Juss. *Rather Tiliacæ*.

Gen. Ch. *Cal.* Perianth inferior, double; the outermost of two combined, oblong, permanent leaves; inner of one leaf, funnel-shaped, deciduous; tube oblong, erect, cylindrical, slightly angular; limb erect, in five deep lanceolate segments, the length of the tube. *Cor.* Petals five, inversely heart-shaped, pointed, flat, moderately spreading; claws narrow, inserted into the tube of the calyx. *Stam.* Filaments five, awl-shaped, shorter than the corolla, inserted into the tube of the calyx; anthers pointed, erect. *Pist.* Germen superior, conical; styles three, thread-shaped, the length of the stamens; stigmas in many capillary divisions. *Peric.* Capsule ovate, of one cell and three valves. Receptacles linear, attached lengthwise to the valves. *Seeds* numerous, oblong, obtuse, dotted, each furnished with an oblong, membranous, lateral tunic.

Effl. Ch. Outer calyx of two permanent leaves; inner funnel-shaped, five-cleft, deciduous. Petals five, inserted into the calyx. Stigmas many-cleft. Capsule superior, of one cell, and three valves. Seeds numerous, each with a lateral tunic.

Of this well-marked genus, which we presume to belong to Jussieu's *Tiliacæ* rather than to any other of his orders, Linnæus has described but four species, to which Willdenow has added five from Aublet and Jacquin. We are enabled to furnish three new species from the Linnæan herbarium. Aublet's *Piriqueta* differs from the rest merely in having five styles, a point of no generic importance in the present case. All the species are found within the tropics, in South America, or the West Indies; none in the East Indies, nor in Europe. Their stems are either shrubby or herbaceous. Leaves alternate, stalked, simple, and mostly undivided, though crenate or serrated. Pubescence rather silky. Flowers yellow, stalked, axillary, or occasionally racemose; their stalks in some instances combined with those of the leaves. Outer calyx wanting in some of the species.

1. *T. ulmifolia*. Elm-leaved Turnera. Linn. Sp. Pl. 387. Willd. n. 1. Ait. n. 1. Lamarck t. 212. (*T. frutescens ulmifolia*; Plum. Gen. 15. Mart. Cent. t. 49. f. 1. *T. e petiolo florens, foliis ferratis*; Linn. Hort. Cliff. 112. t. 10. T. n. 2; Mill. Ic. 179. t. 268. f. 2.)

β. T.

TURNERA.

β. *T. ulmifolia*; Mill. *Illustr. t. 14.* (*T. angustifolia*; *Curt. Mag. t. 281.* *T. frutescens, folio longiore et mucronato*; *Mart. Cent. t. 49. f. 2.* *T. n. 1.*; *Mill. Ic. 179. t. 268. f. 1.* *Cistus urticæ folio, flore luteo, vasculis trigonis*; *Sloane Jam. v. 1. 202. t. 127. f. 4, 5.*)

Flowers sessile on the footstalks. Leaves ovato-lanceolate, acute, coarsely ferrated, with two glands at the base. Outer calyx ovato-lanceolate, notched.—Native of the red hills, and other places, in Jamaica; cultivated by Miller, and frequently seen in our stoves, especially the narrow-leaved variety, β, flowering from June to November. The stem is shrubby, but soft, or partly herbaceous, lasting a few years only, several feet high, with roundish, wavy, downy branches, leafy at the ends. Leaves ovate, or lanceolate, varying in length from two to three inches, and in breadth from half an inch to above an inch, unequally and bluntly ferrated, strongly ribbed and veined, soft and downy on both sides, fetid when bruised. Footstalks half an inch or an inch long, bearing two peltate glands near the top. Flowers large, bright yellow, short-lived, solitary, on the footstalks of several of the upper leaves, close to the leaf itself. Outer calyx of two ovato-lanceolate, strongly notched or ferrated, permanent leaves, resembling the proper foliage; inner tubular, silky, yellowish, in five lanceolate, entire, deciduous segments, shorter than the corolla. We can scarcely think there is any specific difference between the broad and the narrow-leaved varieties. Willdenow's β and γ are precisely the same plant. He, like Linnæus, erroneously refers Sloane's synonym to the broad-leaved variety, though Martyn had previously, like Miller, considered it as belonging to our β. His figure, in fact, represents that intermediate form of leaf which most usually occurs.

2. *T. subulata*. Awl-shaped Turnera.—Flowers sessile on the footstalks. Leaves ovate, acute, coarsely ferrated, with two glands at the base. Outer calyx awl-shaped, entire.—Gathered in New Granada by Mutis, whose specimen was very incautiously referred by Linnæus to *T. ulmifolia*. The leaves are ovate, not much above an inch in length, very downy and hoary, like the stalks and branches. Flowers likewise smaller than those of *ulmifolia*; their petals, in the dried specimen at least, nearly white, with a purple radiating spot on the disk. Calyx clothed with dense silky bristles; the leaves of the outer one very narrow, awl-shaped, channelled, and quite entire, affording a decisive specific character. Capsule the size of a pea, clothed with long silky bristles. The peltate glands, on the edge of the leaf itself, are very large and conspicuous in this species.

3. *T. obtusifolia*. Blunt-leaved Turnera.—Flowers sessile on the footstalks. Leaves obovate, obtuse, coarsely crenate, with two glands at the base. Outer calyx linear-lanceolate, flat, entire.—Native of Brasil. Communicated to the younger Linnæus by Thouin, probably from Commerçon's collection. This is very clearly distinguishable from the two former by its broad obtuse leaves, scarcely an inch and a half long, and one inch in breadth; wedge-shaped at the base; broadly and bluntly crenate. The leaves of the outer calyx are broader, flatter, and rather shorter, than in the last, measuring about half an inch. Capsule twice as large as in that species, coriaceous, densely covered with rigid bristles. Seeds club-shaped, beautifully reticulated, with intermediate depressions; their tunica nearly of their own length.

4. *T. Pumila*. Nettle-leaved Dwarf Turnera. Linn. *Sp. Pl. 387.* *Am. Acad. v. 5. 395.* *Willd. n. 2.* *Ait. n. 2.* *Swartz Obf. 116.* (*Pumilea n. 1*; *Browne Jam. 188.* *Chamæcistus urticæ folio, flore luteo*; *Sloane Jam. v. 1. 202. t. 127. f. 6.*)—Flowers sessile on the footstalks.

Leaves lanceolate, deeply ferrated, without glands. Outer calyx linear, minute, hairy.—Native of dry sandy fields in Jamaica, flowering late in the year. *Swartz.* Root annual, fibrous. Stem herbaceous, from one to three inches, or more, in height, simple or branched, erect or decumbent, round, hairy, leafy. Leaves about an inch long, so deeply ferrated as to be almost pinnatifid, clothed with long scattered hairs, but destitute of glands at the base. Flowers small, yellow, seldom expanded, solitary, sessile at the base of each upper leaf, on its hairy footstalk. Outer calyx of two small, linear, upright leaves; inner in five linear hairy segments, pressed close to the corolla. Petals convolute, with long orange-coloured claws. Seeds roundish, compressed, corrugated. *Swartz.* The Linnæan specimen, from Browne, has no flowers, nor is it easy to say whence Linnæus took his account of the inflorescence, which, nevertheless, is confirmed by *Swartz.*

5. *T. sidoides*. Sida-leaved Turnera. Linn. *Mant. 58.* *Willd. n. 4.*—Flower-stalks axillary. Outer calyx linear. Leaves nearly sessile, obovate-wedged-shaped, sharply ferrated, downy and hoary on both sides, without glands.—Gathered in Brasil by Father Panegai, whose specimen was sent by Arduino to Linnæus. The stem is shrubby at the base, four or five inches high, erect, simple, round, leafy, clothed with hoary down, and long, soft, tawny hairs. Leaves rather more than an inch long, covered on both sides with dense, entangled, somewhat starry, soft, hoary pubescence; strongly and acutely ferrated upwards; entire at the base, and tapering down into a very short hairy footstalk. Flowers axillary, nearly sessile, tawny, their stalks and calyx downy, and clothed with long, yellow, shining hairs. The specific character of Linnæus, *pedunculis bifidis*, seems to allude to the two linear or awl-shaped leaves of the outer calyx.

6. *T. setosa*. Bristly Turnera.—Flower-stalks axillary, partly combined with the footstalk. Outer calyx linear. Leaves obovate-wedged-shaped, deeply ferrated or pinnatifid, very hairy on both sides, without glands.—Gathered by Commerçon at Monte Video and Buenos Ayres. The size of the last. Stem shrubby at the base, throwing up a few simple, wavy, nearly upright, hairy, leafy branches, from three to five inches high. Leaves more stalked, and much more deeply cut, than in *T. sidoides*, being sometimes sharply pinnatifid; they are scarcely at all hoary or downy, but covered with long, silky, yellow hairs, such as are extremely copious on the branches, stalks, calyx, and capsule. The flowers are said to be of a tawny red. Their outer calyx is very long and linear. Their stalks, as far as we can judge, are connected, for about half their length, with the adjoining footstalks. This species is certainly near akin to the last, and the segments of its leaves are evidently variable. We cannot, without spoiling our only specimen of *T. sidoides*, determine whether its flower-stalk be really separate from the footstalk or not. What Linnæus in the *Mantissa* terms *bractæas*, are what we have all along called, after his own example in the *Systema Vegetabilium*, an outer calyx; nor is this part perhaps, as professor Swartz says, entirely wanting in the next species, though we must allow it to be there still more like *bractæas*.

7. *T. cistoides*. Betony-leaved Turnera. Linn. *Sp. Pl. 387.* *Willd. n. 7.* *Ait. n. 3.* *Swartz Obf. 117.* (*Pumilea n. 2*; *Browne Jam. 189.* *Helianthemum betonicæ folio, caule hirsuto*; *Plum. Ic. 141. t. 150. f. 1.* *Chamæcistus caule hirsuto, folio oblongo angusto sinuato, flore luteo, pediculo infidente*; *Sloane Jam. v. 1. 202. t. 127. f. 7.*)—Flower-stalks axillary, many times longer than the footstalks. Outer calyx obsolete. Leaves linear-oblong, obtuse, with shallow ferratures.—Native of dry barren ground

ground in Jamaica. Sent by M. Richard, in 1774, to Kew garden, where it flowered in the stove, from June to October. The *root* is annual, long and simple. *Stems* one or more, subdivided, erect, from six to twelve inches high, round, leafy, hairy. *Leaves* on short stalks, spreading, bluntly toothed or ferrated, about an inch and a half long, clothed on both sides with minute starry hairs; paler beneath. *Flowers* small, yellow, on long slender hairy stalks swelling upwards, bent or jointed about the middle, when are sometimes to be seen two minute *bracteas*, hardly to be deemed an *outer calyx*. The proper *calyx* is hairy, in five lanceolate acute segments. *Capsule* somewhat hairy, pale. *Seeds* buff-coloured, curved, elegantly impressed with numerous rows of minute dots.

8. *T. racemosa*. Cluster-flowered Turnera. Jacq. Hort. Vind. v. 3. 49. t. 94. Willd. n. 8. Ait. n. 4.—Flower-stalks in a terminal cluster; the lower ones axillary, many times longer than the footstalks. *Outer calyx* wanting. *Leaves* ovate, bluntly ferrated, downy.—The native country of this species is not known, but we have little doubt of its West Indian origin. Jacquin received its seeds with the name of *T. cistoides*, under which a specimen lies in the Linnæan herbarium. M. Thouin sent seeds to Kew in 1789, and we have what seems a garden specimen from him. The *root* is annual. *Herb* much larger than the *cistoides*, with a very hairy, slightly branched, stem. *Leaves* broadish-ovate, two inches long, unequally ferrated, clothed with extremely soft, starry, depressed hairs. *Footstalks* bristly, almost an inch in length. *Flowers* small, dull or tawny yellow, on very long and slender hairy stalks. *Calyx* hairy. *Capsule* slightly hairy, each of its valves splitting into two. *Seeds* pale, rough with minute points between the depressed dots.—The *calyx* in this and the last species does not answer well to the idea of the genus, the tube, though present and permanent, being very short, nor are there any traces of the two outer leaves. Perhaps the latter had best be omitted in the generic character, which is sufficiently marked without them.

9. *T. guianensis*. Slender Guiana Turnera. Aubl. Guian. 291. t. 114. Willd. n. 9.—Flower-stalks in a terminal cluster, smooth. *Outer calyx* linear, entire, naked. *Leaves* linear, smooth, slightly ferrated, with two glands at the base.—Gathered by Aublet in the marshy meadows of Timoutou in Guiana, flowering in April. *Root* fibrous, probably annual. *Herb* slender, smooth, with a rushy, angular, slightly branched stem, two feet high. *Leaves* nearly sessile, two inches long, much less distinctly ferrated in Aublet's specimens than in his figure. *Flowers* small, yellow, on short smooth partial stalks, collected, very few together, into a *cluster*. *Outer calyx* permanent, glandular at the bottom, rather longer than the *inner*, whose segments are, as in all the species we have hitherto described, deciduous, the permanent base being short, like that of *T. racemosa*. *Capsule* very smooth, of three undivided valves.

10. *T. rupestris*. Rock Turnera. Aubl. Guian. 289. t. 113. f. 1. Willd. n. 3.—Flower-stalks axillary, very short. *Outer calyx* linear-lanceolate, toothed, somewhat bristly. *Leaves* nearly linear, toothed, very smooth, almost sessile.—Found by Aublet, in the moist mossy clefts of rocks about the great water-falls of Sinémari in Guiana, flowering in November. A rigid, slender, branched shrub, about a yard high, whose stems are more or less covered with *Jungermannia*. *Leaves* crowded about the ends of the branches, nearly sessile, an inch and a half long, very narrow, tapering at each end, slightly revolute, furnished with distant teeth, and by no means ferrated, as in Aublet's plate, from which Willdenow took his specific definition. *Flowers*

small, yellow, nearly sessile, solitary in the bosoms of two or three of the uppermost leaves. *Outer calyx* toothed, or rather ferrated, longer than the *inner*, whose segments are lanceolate and entire; both are slightly clothed with close, silky, white hairs. *Petals* oblong, jagged at the end.

11. *T. frutescens*. Shrubby River Turnera. Aubl. Guian. 290. t. 113. f. 2. Willd. n. 5.—Flower-stalks axillary, very short. *Outer calyx* linear-lanceolate, toothed, somewhat bristly. *Leaves* lanceolate, ferrated, very smooth, almost sessile.—Observed by Aublet, on the rocky banks of the Sinémari river, above the great fall, flowering in December. The natives call this shrub, as well as the former, *Nopotogomoti*. The present appears to us a variety of the last, differing only in its more luxuriant growth, being seven or eight feet high, with larger more dilated leaves, whose length is two or three inches, their breadth above half an inch, their veins far more numerous, and their margins rather ferrated than toothed. These differences may arise from a more favourable situation, or more fertile soil. In the *flowers* or *inflorescence* there seems no difference whatever.

12. *T. rugosa*. Wrinkled Turnera. Willd. n. 6. (*Piriqueta villosa*; Aubl. Guian. 298. t. 117. *Burcardia*; Schreb. Gen. 206, adopted from Scopoli; expunged at p. 827, and referred to Turnera.)—Flower-stalks axillary, many times longer than the footstalks. *Outer calyx* wanting. *Leaves* ovate, unequally crenate, wrinkled, downy. *Styles* five.—Native of the sandy sea-shores of Cayenne and Guiana, flowering and bearing seed almost all the year round. The *root* is annual. *Stem* erect, about two feet high, branched, leafy, villous. *Leaves* on very short stalks, bluntish, two or three inches long, rather elliptical, veiny, rugged, clothed with reddish hairs. *Flowers* small, yellow, on long, slender, hairy stalks. *Capsule* very like that of *T. racemosa*, n. 8, which this species so nearly resembles in many respects, that, were it not for the five styles, and the more crenate and rugged leaves, we should be disposed to unite them. We place this at the end, for future examination, not having seen a specimen to determine the question.

TURNERA, in Gardening, comprises a plant of the woody, flowering, exotic kind, for the stove, the species of which cultivated is the elm-leaved Turnera (*T. ulmifolia*); which has a shrubby stem, rising eight or ten feet in height, and a bright yellow flower. It is found in the West Indies.

There is a variety with narrow leaves, which also rises with a shrubby stalk to the height of eight or ten feet, with branches less slender and stiff than in the broad-leaved sort: the leaves narrow-lanceolate, hairy, near three inches long, and about three quarters of an inch broad, terminating in acute points, obtusely ferrate on their edges, and standing upon very short footstalks; when rubbed they emit a disagreeable odour: the flowers are of a pale yellow: the petals large and oval, with the tails or claws twisted, and joining: they are not so large or half so bright a yellow as in the true elm-leaved sort. This is a native of Jamaica.

Culture.—Both these plants are easily raised from seed, which should be sown in the spring, in pots, and plunged in the bark-bed, or any other hot-bed, under glasses; and when the plants are come up two or three inches in height, they should be planted separately in small pots, plunging them in the bark-bed of the stove, to forward them a little in growth: they may afterwards be placed in any part of the stove, and be managed as other stove exotic plants. They are also capable of being increased by cuttings, planted in pots, and forwarded in the above manner.

They afford a good variety among stove-plants, but they are seldom of long duration, as they mostly go off in the course

course of two or three years, being therefore rather of a biennial nature.

TURNESOLE, or **TURNSOLE**, in *Botany*. See **HELIOTROPIMUM**, and **CROTON Tinctorium**.

Some have translated turnefole by the English word *sun-flower*, which has led many to suppose that the great yellow sun-flower, which we keep in gardens, was the plant that afforded the turnefole colour: but this is a mistake; and it is to be observed, that the true turnefole plant, or *heliotropium tricoecum*, is very common in the fields of France, especially about Montpellier, and in Germany, but does not grow wild with us in England.

The juice of the berries of the turnefole, rubbed upon paper or cloth, at the first appears of a fresh lovely green, but presently changes into a kind of blueish purple. It is said that the common blue paper receives its colour from this juice. The same cloth, afterwards wet in water, and wrung out, will turn the water into a claret colour; and it is to be observed, that the rags of cloth tintured by this juice, and turned red by acids, are usually called turnefole in the druggists' shops, and employed for colouring wines and other liquors. M. Niffole, of the French Academy of Sciences, says, that the colouring juice is obtained, not from the berries, but from the tops of the plant, gathered in August, ground in mills, and then committed to the press. The juice is exposed to the sun about an hour; the rags dipt in it, dried in the sun moistened by the vapour which arises during the slaking of quicklime with urine, then dried again in the sun, and dipt again in the juice. The Dutch and others are said to prepare these rags and turnefole in the mafs from other ingredients, of which archil is a principal one. Boyle's Works abr. vol. ii. p. 19. Neumann's Chem. by Lewis, p. 433.

The Dutch process for making the blue called turnefole is as follows: Lichen, archil, or in case this last cannot be obtained, the greater moss of the oak, is dried, cleaned, and pulverized in a mill, resembling the oil-mill, and then sifted through a brass wire sieve, the interstices of which do not exceed one millimetre in width ($\frac{1}{25}$ th of an inch). The sifted powder is then thrown into a trough, and mixed with an alkali called vedas, which is nothing else but the cendres gravelées in powder. The proportion is one part by weight of the alkali, to two parts of the pulverized vegetable. This mixture is moistened with a small quantity of human urine; the urine of other animals does not contain a sufficient quantity of ammoniac. The mixture ferments, and is kept moist by successive additions of urine. As soon as the materials have become red, they are transferred into another trough, where they are again moistened with urine, and stirred to renew the fermentation. Some days afterwards, the paste acquires a blue colour, in which state it is carefully mixed with one-third of excellent potash well powdered; and with this new mixture certain trays are filled, which are one metre (39 $\frac{1}{2}$ inches) deep, and eight decimetres (31 $\frac{1}{2}$ inches) wide. When the fermentation which takes place for the third time has given the paste a considerably deep blue colour, chalk or powdered marble is added, and the whole is well and perfectly mixed. This last addition is made, not to improve the quality of the blue, but to add weight. It is merely an affair of profit. The blue thus prepared is put into iron moulds 32 centimetres long and 22 square at the end (1 $\frac{1}{4}$ inch by $\frac{1}{5}$ ths of an inch). The moulded pieces are then placed upon deal planks, in well-aired lofts, to dry; after which they are packed in casks for sale.

The Hollanders made a secret of this process: and in order to mislead, they have published, that the blue was

made with rags coloured by the plant turnefole; whence it has obtained its appellation. The English writers have used this denomination: but the dry-salters, or dealers in drugs, distinguish these pastils by the name of litmus. We may derive much profit by carrying this discovery into practice.

The principal use of this plant is in dyeing: in order to which, the juice is inspissated and prepared with calx and urine, into blue cakes; which are used also with starch, instead of smalt.

The lixivium of this plant in lime-water and urine, or in the volatile spirit of wine, turns marble blue. See *Colouring of MARBLE*.

TURNNESS, in *Geography*, a cape on the east coast of the island of Hoy. N. lat. 58° 41'. W. long. 3° 10'.

TURNETUM, in our old *Law Books*, a duty paid to the sheriff for holding his turn, or county-court.

TURNHOUT, in *Geography*, a town of France, in the department of the Two Nethes, built in the year 1212, by Henry IV. duke of Brabant. In the year 1545, the emperor Charles V. gave it to his sister Mary, queen of Hungary, to enjoy during her life. In the year 1648, after the peace of Munster, Philip IV. gave it to princefs Amelia, widow of Frederick Henry of Nassau, from whom it came to the house of Orange. The quarter of Turnhout comprehends fifteen villages; 25 miles S.S.W. of Bois-le-Duc.

TURNING, in the *Mechanical Arts*, is the operation of shaping wood, metal, or other hard substances, into a round or oval figure, by the aid of a machine called a *lathe*; which see.

In turning, the work or substance to be operated upon is placed in the lathe, and made to revolve with a circular motion about a fixed right line as an axis of motion; and the exterior surface is worked to its intended figure by means of some kind of edged tool, which is presented to it and held fast down upon a fixed rest. The protuberant parts of the work, by its rotatory motion, are carried against the cutting edge, and cut off, so as to reduce every part of the outside surface, to an equal distance from the axis of motion, and of course it will be of a circular figure.

The articles which admit of being turned to give them their figure, are all such as combine the three following properties: 1. That they may be supposed to have an imaginary right line or axis passing centrally through the whole length of the piece: 2. That all the sections which can be made by planes perpendicular to such axis shall be circular: and 3. That the centre of all such circles shall coincide with the axis or centre line.

It should be observed, that a piece of work may have two or more centre lines in different parts or in different directions; but it must in that case be formed or turned at two or more successive operations, because what can be done at once fixing in the lathe, must come within the above definition.

The work may be turned hollow, so as to make a cavity within; or work may be turned on the outside, to give form to the external surface; and frequently work is turned both without and within; but in either case, the above definitions will apply.

Diodorus Siculus says, the inventor of the art of turning was a nephew of Dædalus, named Talus; and that the reputation which he acquired by this invention excited the jealousy of Dædalus, and induced him to put Talus secretly to death. Pliny ascribes it to Theodore of Samos, and mentions one Thericles, who rendered himself very famous by his dexterity in managing the lathe. With this instru-

TURNING.

ment, it is said, the ancients turned all sorts and kinds of vases, many of which they enriched with figures and ornaments in basso relievo. Thus Virgil says:

“Lenta quibus torno facili superaddita vitis.”

The Greek and Latin authors make frequent mention of the lathe, and Cicero calls the workmen who used it, *vascularii*. It was a proverb among the ancients, to say a thing was formed in the lathe, to express its delicacy and justness.

The art of turning is of considerable importance, as it contributes essentially to the perfection of many other arts. The architect uses it for many ornaments, both within and without highly finished houses. The mathematician, the astronomer, and the natural philosopher, have recourse to it, not only to embellish their instruments, but also to give them the necessary dimensions and precision: in short, it is an art absolutely necessary to the mechanist, the goldsmith, the watchmaker, the joiner, the smith, and others.

As the operation of turning is to be performed by the aid of the lathe, the structure of that machine is the first thing to be considered. In our article *LATHE*, we have given a description of the most perfect kind of lathe, made in iron, with a triangular bar; and in the article *ROSE-Engine*, we have described a curious lathe for ornamental turning; but it is to be observed, that a much more simple machine will answer all the common purposes of turning.

The essential properties of a lathe for *outside* work are, first, that it shall have two points which will firmly sustain the work at each end, by penetrating into the ends of the work, and, at the same time, allow it to turn freely round upon the points: there must be a rest or support to hold the tool upon, and also some means of turning the work round upon the points. A lathe to turn hollow or *inside* work will not admit of a point of support at each end of the piece, and therefore the work is firmly fixed to the extremity of a spindle, which is called a *mandrel*; when the mandrel is turned round, the work revolves with it, and the tool can be applied at the end of the work, to excavate or turn it hollow within, or to turn it on the outside, as required.

Lathes are made in a great variety of forms, and put in motion by different means: they are called *centre lathes*, where the work is supported at both ends; and *mandrel, spindle, or chuck lathes*, when the work is fixed at the projecting extremity of a spindle.

From the different methods of putting them in motion, they are called *pole lathes*, and *hand-wheel lathes*, or *foot-wheel lathes*. For very powerful works, lathes are turned by horses, steam-engines, or water-wheels.

The lathes used by wood-turners are generally made of wood, in a simple form, and are called *bed lathes*: the same kind will serve for the common turning of iron or steel, but the best work in metal is always done in iron lathes, which are sometimes made with a triangular bar, and are called *bar lathes*, (such an one is described in the article *LATHE*); small ones, for the use of watch-makers, are called *turn-benches*, and *turns*; but there is, in fact, no proper distinction between these and the centre lathes, except in regard to size, and that they are made of iron and brass instead of wood.

The *centre lathe* is the most simple of all others. Two beams of wood are fixed horizontally upon legs, like a bench, and form what is called the *bed*. The two beams are fixed together, parallel to each other, and at a small distance asunder, so as to leave a space or narrow groove between them, nearly the whole length of the bed. This groove is to receive the tenons at the lower ends of the *puppets*, which are short posts rising perpendicularly from the bed, and firmly fixed thereto

by means of cross wedges, put through the tenons beneath the bed; for the tenons are of sufficient length to descend quite through the groove in the bed, and project beneath sufficiently to receive the cross wedges, which being driven in, draw the bases of the puppets or posts so firmly down upon the surface of the bed, that they will stand firmly erect upon it; or by withdrawing the wedges, the puppets become loose, and can be fixed in another part of the bed, in order that the distance between the two puppets may be made to correspond with the length of the piece of work to be turned. One of the puppets has a pin or *pike* of iron fixed into it, and the other one has at the same level the centre *screw*, working through a nut fastened in the puppet: both the screw and pike have sharp points made of steel, hardened and tempered, that they may not wear away. They must be exactly opposite, and in a line with each other. The piece of work, suppose for instance it is a roller of wood, is supported by its ends between the points of the pike and the screw, that it may turn round freely. The *rest* for the support of the tool is a rail or bar, extending from one puppet to the other; it lies in hooks, projecting from the faces of the puppets.

The work is put in motion by means of the *treadle*, which is worked by the turner's foot; a *string* or catgut is fastened to the treadle, and passing two or three turns round the work, it is fastened to the end of an elastic *pole*, fixed to the ceiling over the turner's head.

The workman stands before his lathe, having one of his feet on the treadle to give it motion; he places a sharp *gouge* or *chissel* on the rest, and approaches the edge of it gently to the piece of work; then pressing the treadle down by his foot, the string turns the work round, and the chissel or gouge being held firm upon the rest, and so as to touch the wood, it will cut it to a circular form. When he has brought the treadle to the ground, he releases the weight of his foot, and the elasticity of the pole draws up the treadle, turning the work back again; during which retrograde motion, he withdraws the chissel from the work, as it would not cut in this direction, though it might impede the motion of the wood, and would injure the edge of the tool. He must perform his work gradually, without leaving ridges; and when he meets with a knot in the wood, he must go on still more gently, otherwise he would be in danger both of splitting his work and breaking the edge of his tool. For turning light work, a bow, such as is used for shooting arrows, is suspended by its middle over the lathe; the string is then tied to the middle of the bow-string, in lieu of the pole, and acts in the same manner.

The common centre lathe is a very imperfect machine, when worked in this manner; yet its simplicity is a great recommendation, especially among country workmen, who use it to make various sorts of common articles of household furniture in soft wood, as stool and table legs, stair-case rails, &c.

In centre lathes, the work is sometimes put in motion by means of a large wheel, turned by one or more labourers; the wheel should be heavy, that its momentum may be sufficient to overcome any moderate obstacle in the work; and the frame in which it is mounted must be of sufficient weight to stand steady, and not be liable to move, by the exertions of the man turning it. An endless line is used, to communicate the motion of the wheel to the work; it passes round a groove in the circumference of the wheel, and after crossing, like a figure of 8, goes round a small pulley, fixed upon the work. By this means, when the great wheel is turned, it gives a rapid rotatory motion to the matter to be turned, and with a much greater power than can be obtained from the treadle, with the additional advantage of the work turning always

the

TURNING.

the same way round, so that the turner has no need to take his tool off the work.

The centre lathe will turn any kind of work which will admit of being supported at both ends; and it is used by mill-wrights and iron-founders, for turning mill-shafts, axles, rollers, and other iron-work. For such purposes, the lathe must be made exceedingly strong, and with nuts and screws to fasten the puppets down upon the bed, instead of wedges; the rest must be made in iron, with the requisite adjustments for placing it close to the work, at that part where it is required to be turned. To put the work in motion, the centre pin or point in one of the puppets is made to project considerably, and has a pulley fitted upon it, so that it can turn freely round upon the pin by means of an endless band or strap, which communicates the motion from a great wheel. In these large lathes for iron-work, the wheel is commonly turned by horses, or by a water-mill or steam-engine. From the pulley a pin projects in a direction parallel to the centre pin, and a piece of iron, called a *driver*, is screwed or clamped fast upon the end of the piece of work, so as to project from it sufficiently to be intercepted by the pin which is fastened into the pulley: by this means, the motion of the pulley is communicated to the work. The tools employed for turning iron and other metals are different from those used for wood, as we shall afterwards describe.

The *spindle* or *mandrel lathe* will turn hollow or internal work, and is equally well adapted to turn centre work as the centre lathe. In *Plate Turning*, fig. 1. we have given a representation of one of these, which is on a very good construction, made by Messrs. Holtzapfel and Deyerlien: it is put in motion by the foot, so that the turner has both his hands at liberty to direct the tools. A A are upright legs, to support the bed B, which consists of two pieces or bars of cast-iron, put together, and leaving a small crack between them: C D is a cast-iron frame, which is fastened down upon the bed B, and supports the spindle or mandrel *a b*: E is the back puppet, which is used to support one end of a piece of work, as is shewn in the figure at G, when the other end is fixed to the end of the mandrel, and turned round by it: the back puppet, E, has a cylindrical pin accurately fitted into it at the upper part, and the end of the pin is formed to a sharp conical point, proper to penetrate and support the end of the work: this point is called the *back centre*. A screw *e* is tapped into the puppet, so as to press on the opposite end of the pin, and force it towards the work; and there is likewise a clamp screw, E, at the top, to bind or fasten the pin into its socket. The back puppet is fastened down upon the bed, by means of a tenon entering into the groove, through the bed B, and a screw descends from the tenon quite through the bed, and projects beneath it: upon this screw a nut *g* is tapped, and by turning it, the shoulder of the puppet E is drawn down firmly upon the bed; but when the nut is loosened, the puppet can be slid along the bed to place it at any required distance from the end of the spindle, according to the length of the piece of work G. It is necessary that the point of the back centre should in all cases be precisely in the centre line of the axis of motion of the spindle *a b*; and for this purpose, the bed must be made very straight, and flat on the upper surface; the groove through it should also be perfectly straight and parallel, and the tenon at the lower end of the back puppet must be exactly fitted to the groove: the frame of the mandrel must be so fixed on the bed, that the centre line of the mandrel will be exactly parallel to the bed, and to the groove in the bed.

Mandrels are mounted in different ways, but they are always made of steel at the parts where they are supported

in the collars, which collars should be also made of steel, and hardened, so as to have little friction. The neck of a mandrel must be very accurately fitted into the collar, so as to have no shake or looseness, at the same time that it can turn round quite freely.

The neck at one end projects beyond the collar, and the projecting part is formed to a screw, for the purpose of fixing the work to it. A variety of pieces, called *chucks*, are fitted upon this screw, and each chuck is adapted to hold a different piece of work: the chucks screw up against a shoulder on the end of the mandrel, and by the motion of turning round in the direction in which the lathe works, the chuck screws itself fast on against the shoulder; but if the lathe is stopped, and the chuck is turned in the opposite direction, it will unscrew and come off, and a different chuck may be put on. In some lathes, the neck of the mandrel is perforated, and cut within side, with a female screw adapted to receive a male screw on the chuck: the effect is just the same as the above described. The opposite end of the mandrel to that on which the chucks are screwed, must be supported either by a point or in a collar. In general, the mandrel is made with a point at one end; and the other end, which has the screw to fix the work to it, is formed with a neck, proper to run in the collar, and with a shoulder on the neck, to stop the neck from going through the collar. The mandrel represented in the drawing has a neck and collar at each end, for a purpose which will be explained. When the mandrel is made with a pointed end, the point must be received in the end of a screw tapped through the part D of the frame of the mandrel, just in the place of the end *a* of the mandrel. By turning this screw, the mandrel can be adjusted to run very correctly in length; and to prevent the screw from turning back when the lathe is in motion, a nut is placed on the screw, beyond the part *d*: this causes such a pressure upon the threads of the screw, that it is in no danger of turning back, as it would otherwise do with rough work. The mandrel, by this means, runs very steadily and accurately in its bearings, and it is plain that any piece of work, which is firmly attached to the end of it by means of the screw before mentioned, may be turned by a tool held over the rest, in the same manner as if it were mounted between centres, but with the advantage that it be turned at the end, to make hollow work when required.

The mandrel is turned round by a band of catgut passing round the pulley *b*, and also round the large foot-wheel H, which is made of cast-iron, and fixed on the end of the axis I. This axis is bent in the middle, as in the figure, to form a crank, which crank is united, by an iron link K, to the treadle L, on which the workman presses his foot. This treadle is affixed by three rails to an axis M, on which the treadle moves. The wheel H is of considerable weight in the rim, and being fixed fast on the axis I, turns round with it: the momentum acquired by the wheel is the power that continues to turn the work while the crank and treadle are rising, and consequently while the workman exerts no power upon them.

When the crank has passed the vertical position, and begins to descend, the workman presses his foot upon the treadle, to give the wheel a sufficient impetus to continue its motion until it arrives at the same position again. The length of the iron link K, which connects the crank with the treadle, must be such, that when the crank is at the lowest position, the board L of the treadle, to which the link is hooked, should hang about two or three inches from the floor. To put the lathe in motion, the turner gives the wheel a small turn with his hands, till the crank rise to the highest, and

passes a little beyond it; then by a quick tread he brings the crank down again, putting the wheel in motion with a velocity that will carry it several revolutions: he must observe to begin his next tread just when the crank passes the highest point, and then it will continue running the same way with a tolerable regular motion, if he is punctual in the periods of his treads. The foot-wheel, by means of the band, causes the mandrel to revolve very rapidly, so that it will perform its work very quick, and the workman must acquire a habit of standing steady before his work, that he may not give his whole body a motion when his foot rises and falls with the treadle.

The rest N of this lathe is fixed on the bed of the lathe by its foot, which is divided in the manner of a fork, to receive a screw-bolt: this bolt passes down through the lathe-bed, and fastens the rest at any place along the bed, by a nut *k* beneath. The groove in the foot is for the purpose of allowing the rest to be moved to and from the centre of the work, to adjust it to the diameter of the work which is turning. The height of the rest is a matter of some importance in turning, and in some work it should be fixed higher than others; therefore the piece upon which the tool is laid, is made with a shank of the form of the letter T. This shank is a round pin, and is received into a socket in the foot of the rest, and can be held at any height by a clamp-screw. As the socket and shank are cylindrical, the edge of the T of the rest can be placed inclined to the axis of the work when turning cones, or other similar work, though the same purpose may be accomplished by the screw, which holds the foot of the rest down to the bed of the lathe, admitting the fork to stand in an oblique direction across the bed.

The wood-turner employs gouges of all sizes, and chissels of different forms: the gouges are used in the first instance to rough out and form the wood, as they cut very rapidly, because they can take a very strong chip, and the angles will not stick in, as would be the case with the chissels. The later are used to smooth the work, and to reduce it exactly to shape and size.

The blade of the turning-gouge is formed nearly half round to an edge, and the two extreme ends of this edge are a little sloped off, in the manner of an apple-scoop, that the middle part of the edge may cut away the prominences of the work; and it has no corners, which would catch and get fast in the rough wood. The hollow part is whetted upon a piece of Turkey-stone, made with a convex edge, for the purpose; the outside is whetted upon a common flat Turkey-stone, taking care to turn the gouge round, that all parts of the convex edge may successively be sharpened. In turning, the blade of the gouge must be held considerably inclined, by depressing the handle (see *fig. 42.*), so that the bevel, or outside of the edge of the gouge, may come very nearly in the tangent to the circumference of the work, and the cutting edge be above the level of the centre. The turner holds the tool down firmly upon the rest, keeping it steady, by placing the long handle under his arm.

The turner's chissels are mostly ground with a bevel on both the flat sides, so that either side may be indifferently applied to the work: they are ground up and sharpened on the oil-stone to a keen edge. In some chissels, the line of the edge is inclined to the direction of the blade, instead of being perpendicularly across it, as in the chissels used by carpenters; in others, the edge is rounded to a semicircle, instead of being a straight line; and others are made with angular points, like spears. It is difficult to describe the proper use of each particular tool, as the turner must employ one or other, according to the

particular part of the work which is to be executed. In using the chissel, the rest is raised considerably above the centre of the work, so as to be nearly on a level with the top of it (see *fig. 41.*), and the line of the cutting edge must stand oblique to the axis of the cylinder, so as to prevent either angle of the chissel from running into the work. It is necessary to traverse the chissel gradually along the work, but not too fast, otherwise it will leave a roughness on the surface.

The turning-tools should be fixed in long handles, and the turner holds them firmly down upon the rest, steadying them by placing the end of the handle under his arm.

The turner should be provided with a grindstone, and an oil or Turkey-stone to sharpen his tools; and he must have callipers and gauges to ascertain the dimensions of his work. In order to fix the work in the lathe, he must have a great assortment of chucks. The chucks for wood-turning are blocks of wood, each having a screw, by which it can be attached to the mandrel. The end of the chuck being turned true, and the shoulder of the screw upon the mandrel being also turned true, the chuck fixes so tight to the spindle, that it becomes as it were one piece with it. Most of the wood chucks are bored out like a box, and the work is jammed into the cavity. There are other chucks, which are only flat round boards, and the work is cemented or screwed against them; but the generality of chucks are cylindrical blocks, with a cylindrical or conical hole turned in the end, like a box, into which the piece of wood to be turned is driven fast, so as to be turned round with the mandrel. The chucks are generally hooped with iron, to prevent them from splitting. When centre-work is to be turned in a mandrel lathe, a chuck must be screwed on the end of the mandrel, which terminates in a sharp conical point.

The lathe should be fixed in a place very well lighted; it should be immovable, and neither too high nor too low.

The puppets should neither be so low as to oblige the workman to stoop in order to see his work properly, nor so high, that the little chips, which he is continually cutting off, should come into his eyes.

The piece of wood to be turned should be rounded, before it is put in the lathe, either with a small hatchet made for the purpose, or with a plane or rasp, fixing it in a vice, and shaving it down till it is every where almost of an equal thickness, leaving it a little bigger than it is intended to be when finished off. Before putting it in the lathe, it is also necessary to find the true centres of its two end surfaces, so that they shall be exactly opposite to each other, in order that, when the centre points of the puppets are applied to them, and the piece is put in motion, no one side may project out more from the centre line than another. To find these two centres, lay the piece of wood to be turned upon a plank, open a pair of compasses to almost half the thickness of the piece, lay one of the legs on the plank, and let the point of the other mark on one of the ends of the piece when laid flat on the plane with the plank, like a roller, from which plank the point of the compasses stands up at a given height above the plane on which the piece lies. Describe four marks or arcs on that end at equal distances from each other round the circumference of the end, by laying the piece successively on four different sides, which arcs intersecting one another, the point within the intersections will be the centre of the end. In the same manner, the centre of the other end must be found.

After finding the two centres, make a small hole at each of them, into which insert the centre points of the back centre and the mandrel, and screw up the back centre, to fix

TURNING.

the piece so firmly as not to be shaken out, and yet loose enough to turn round without difficulty.

This is the manner of fixing the work when it is to be turned between centres; but if it is required to be hollowed out, the back puppet is removed, and the work must be fixed in a chuck at the extremity of the mandrel. For this purpose, a chuck is selected which has a hole in it nearly the size of the piece of wood, the diameter of which being taken in the callipers (*fig. 35.*), the chuck is screwed to the mandrel: the rest is fixed in a convenient position, and the hole in the chuck turned out by a proper tool to the size measured by the callipers: the hole should be rather conical, and the wood, being rasped to the same figure, is driven in fast by a hammer. By turning the mandrel slowly round, it will be seen if the wood is fixed straight in a line with the mandrel, and if not, a blow or two of the hammer, properly directed, will rectify it.

If the piece of wood is not very long, the chuck will be sufficient to hold it firm whilst it is turned; but if it is not, then a small centre hole must be made in the extreme end, and into this the point of the back centre screw must be inserted to steady the work, until the rough part of the turning is done, and then it may be removed; but it is much more convenient to turn without the back centre, and therefore the turner fits the chuck to the wood with care, so that it will fix fast in the chuck.

The work being thus chucked, or fixed in the lathe, the rest is set, so that its edge is close to that part of the work which is required to be turned, and the top of the rest being raised considerably above the level of the centre of the work, it is there screwed fast.

The turner now puts the lathe in motion by treading with his foot, and takes a gouge, of a proper size, in his right-hand, and holds it by the handle a little inclined, keeping the back of the hand lowermost: he grasps the blade of the tool with his left-hand, the back of which is to be turned upwards, and he holds it as near the end as possible on the front side of the rest; then leaning the gouge on the rest, he is to present the edge of it a little higher than the horizontal diameter of the piece, so as to form a kind of tangent to its circumference: see *fig. 42.* This is the best position for cutting, and the tool must be held very firmly, to prevent the edge being depressed by the motion of the work, for if it does, it will take hold too deep, and tear the work. The gouge is applied first to one end of the work, and gradually advanced to the other, turning the work true all the way, and reducing it till the callipers (*fig. 36.*) determine it to be near the intended diameter.

The chisel is next employed to smooth the cylinder: its handle is held in the right-hand, whilst the left grasps the blade, and keeps it steady upon the rest, holding the edge a little inclined over the work, as in *fig. 41*; so that one side of the flat part of the blade lies on the rest, and the other side is elevated, that the plane of the blade, and consequently the line of the edge, is not horizontal, but inclined thereto, so that one corner of the edge of the chisel is elevated above the work: then the bottom of the edge of the chisel, or near the bottom, cuts away a shaving from the work, and this is the only way in which it will cut; for if the edge of the chisel is held parallel to the axis of the cylinder, it acts parallel to the length of the grain of the wood, scraping away the fibres, one by one, without cutting, and leaves a very rough surface. In the same manner, the narrow chisels, formers, and other instruments, are to be used according to the work which is to be done, taking care that the wood be cut equally, and that the instrument be not pushed suddenly forwards, or sometimes more strongly than at others;

and taking care also that the instrument does not follow the work, but that it be kept firm on the rest, without yielding. The gouge and chisel are the instruments by far the most frequently used, and the most necessary in this art. Soft woods are almost entirely turned by them.

To make the end of the work exactly flat, the thin side of the chisel is laid upon the rest, so that the plane of the edge may stand exactly upright. The hand is depressed, that the lower corner of the edge may rise against the work, and cut a deep circle into it, near the end, and being steadily advanced, cut to the centre, separating a thin round chip, and leaving the end quite flat. The cutting corner of the chisel must be directed exactly perpendicular to the length of the work, in advancing it, otherwise the end will be either concave or convex, and care must be taken to keep the plane of the edge truly upright, and hold it very firm, for there is danger of the work drawing the chisel into the end of it, with a deep spiral cut, like a screw, and tearing the work out of the chuck.

A cylinder of wood being formed by the process we have just described, if it is required to turn it hollow within, the rest is fixed opposite the end of it, with the edge of the rest perpendicular to the length: then a sharp-pointed tool is used, to bore such a hollow in the end as will form the required cavity, using the inside callipers (*fig. 35.*) to determine the size of it. The side-tool, which is made with a cutting edge on the side, like a knife, may be used, if it is required to make the bottom of the cavity square; or a hooked tool, with the cutting edge at the end of the hook, may be employed to enlarge the inside to the proper size: the gauge (*fig. 34.*) is used to determine the depth to which it is to be turned.

This is the process for turning soft woods, which are generally of a fibrous texture: but hard woods, ivory, and bone, are turned with different tools. The points or cutting edges of some such tools are represented in *figs. 23.* and *24*; they are bevelled only on one side, and the angle of the edges is obtuse. The round-pointed tool, and the sharp angular-pointed tool, are those employed for first roughing out the work, and by them a number of contiguous grooves are cut in the wood, until its grain is broken and divided, and the irregularities reduced; then an edged tool can remove the remainder: but as the edged tools will only cut or scrape off thin shavings, they are not used when the work is to be reduced to size, but only to finish it. The manner of applying the tools to the work is shewn in *fig. 39.* and is nearly the same as for turning brass, or other soft metal: the upper surface of the tool is directed to the centre of the work, the intention being to scrape away shavings in hard wood, and in soft to cut chips, as at *figs. 41.* and *42.* The graver (*fig. 40.*) is a very useful tool for hard wood: the manner of using it, as well as other tools, will be described when we come to speak of turning in metal.

After the work is completely turned, it is next to be polished, and this cannot be done with the instruments hitherto mentioned. Soft woods, as pear-tree, hazel, maple, &c. ought to be polished with shark-skin, or Dutch rushes. There are different species of sharks, some of which have a greyish, others a reddish skin. Shark's skin is always better when it has been used; at first, it is too rough for fine polishing.

The Dutch rush is the equisetum hyemale: it grows in moist places, among mountains, and is a native of Scotland. The oldest plants are the best. Before using them, they should be moistened a little, otherwise they break in pieces almost directly, and render it exceedingly difficult to polish with them: they are particularly proper for smoothing the

TURNING.

hard woods, as box, lignum vitæ, ebony, &c. After having polished the piece well by such means, it should be rubbed gently either with wax or olive-oil, then wiped clean, and rubbed with its own turnings or shavings, or with a cloth a little warm. Ivory or horn is polished with pumice-stone or chalk, finely pounded and put upon leather, or a linen cloth a little moistened with this: the piece is rubbed as it turns round in the lathe; and to prevent any dirt from adhering to any part of it, every now and then it is rubbed gently with a small brush dipped in water. To polish metals very finely, the workmen make use of a particular kind of earth called tripoli, and afterwards of putty, or calx of tin. Iron and steel are polished with very fine powder of emery; this is mixed with oil, and put between two pieces of tin or pewter, and then the iron is rubbed with it. Tin and silver are polished with a burnisher, and that kind of red stone called blood-stone. Iron and steel may also be polished with putty, putting it dry into shamoy-skin.

All kinds of articles in wood are turned in the above manner; but many contrivances are necessary to mount different things in the lathe.

The small figures in the plate represent various chucks, which are occasionally employed, and which are adapted for turning different kinds of work.

Figs. 2. and 3. exhibit a small wood chuck, which is adapted to be screwed to the mandrel at *a*, a hole being perforated in the centre of it, at *b*, into which a small piece of wood or ivory is to be inserted, in order to turn it. To hold the work fast in this chuck, it is divided at the end *b* by two saw-kerfs, at right angles to each other, as shewn in *fig. 3.* so as to separate the end into four segments, which admit of expanding or closing: a hoop or ferril is fitted on the outside of the chuck, which part is made tapering, so that forcing the ferril farther on, will close the four segments together, and bind fast upon the work, which is introduced into the cavity *b*. This is a very convenient chuck for holding small pieces of ivory, and particularly for the purpose of polishing.

Figs. 12. and 13. exhibit a similar chuck, made in brass, for more delicate work; it is only divided into two segments.

Fig. 4. is a brass box, to screw to the mandrel, and hold a wood chuck, such as we have before explained. Wood chucks are usually made to screw on the mandrel by means of a hole in the chuck, which is cut with a female screw within. The objection to this mode is, that the threads of the screw on the wood wear away by constant use. In *fig. 4.* a brass female screw, *a*, is cut to fit the screw of the mandrel, and at the other end, *b*, is a box, also cut with a screw within, into which the wood block or chuck is screwed, as shewn by the dotted lines, so as not to come out without great force: by this means, the fitting of the chucks to the mandrel is not with a wooden screw, as in general, but with a brass one, which will not be liable to get out of the truth, but will always screw up to the same shoulder. The lathe should have at least two dozen of these wood chucks, with cavities of different sizes, and some of them hooped with iron at the outer end, to prevent them splitting. The brass box is a great security against splitting.

Fig. 5. is a very useful arbor for turning wheels, collets, or any other flat piece of work that will admit of having a small hole in the centre of it. A brass screw-chuck, *a*, is fitted to the mandrel, and a steel pin, *b*, is fixed into it, and projects an inch or more: the pin is turned true, and the work is fitted fast upon it, either by turning the pin to the size, or by broaching the hole in the work: and to prevent the work from slipping round upon the pin, it is pinched fast up against the flat surface of the chuck, as shewn by the dotted lines, by a nut *d*, which is screwed on the end of the steel

pin *b*: by this means, the work will be held fast, and will be carried round by the chuck, so as to be turned by the application of proper tools upon the rest. These kinds of arbors should be of all sizes, to fit the holes in different wheels, &c.

Fig. 10. is a brass chuck, which is very useful for holding small pieces of brass work; it screws to the mandrel at the end *a*: the hollow part, *b b*, has six screws tapped through it, and pointing to the centre, as shewn in *fig. 11.* By screwing in these screws, their points will pinch upon any piece of work which is put into the chuck, as shewn at *d*, and will hold it firm. The screws being regulated, admit of adjusting the work *d* to a true centre with the line of the mandrel.

Figs. 16. and 17. are views of chucks having similar properties to the preceding: *a* (*fig. 16.*) is the end which is screwed to the mandrel; *b b* is a circle of brass, having a mortise or opening across the centre of it, as in *fig. 17*; into this opening two steel dies are fitted, and screws *d, d*, are placed behind them, to approach them together: the screws come through the outside of the chuck, and have square heads, which are to be turned by means of a key. The adjacent surfaces of the two dies are hollowed, so that they will embrace a piece of wire or other similar substance which is put between them, and the dies may be cut like a file, to hold it fast. By means of the two opposite screws *d, d*, the work may be adjusted to the centre line of the mandrel.

Figs. 20. and 21. are a table-chuck, proper for holding wheels or flat plates by the circumference, whilst the centre parts are turned: *a* is the screw to fix it to the mandrel: *b b*, a large circular plate, turned perfectly flat on the front surface. In this plate are grooves, pointing from the centre to the circumference, as shewn in *fig. 21*: the grooves are adapted to receive clamp-pieces, *d, d, d*, by means of which the wheel or other work is bound fast against the flat surface of the chuck. The grooves admit the clamps *d, d, d*, to be placed at any distance from the centre, according to the size of the work, and to place them at those parts where it will be most convenient to apply them.

The form of these clamps is shewn more particularly in *fig. 22*: *f* are sliders of metal, which are fitted to the grooves in the chuck; and the grooves are dove-tailed, so that these sliders can be put into the grooves at the back of the chuck, but will not draw through the grooves into the front. Screws are tapped into the sliders, and draw the clamps, *h*, against the face of the chuck, and hold fast the work, which is placed beneath their claws. The clamps, *h*, have shanks projecting from them at right angles, which pass through the grooves, and keep the clamp from turning round to one side.

Figs. 35. and 36. represent the callipers used by turners to take the measure of their work: they are made of two curved pieces of steel-plate, united together by a joint. When they are opened, as in *fig. 36*, the dimensions of a round piece of work may be conveniently taken between their points, as shewn by the dotted circle; but if the points are closed together, as in *fig. 35*, so that they pass each other, then the callipers are adapted for measuring the diameter of internal cavities, by the distances of their points from each other.

Several other kinds of callipers are used by turners, but these are the most convenient, as they serve equally well for inside and outside dimensions. Some callipers are made double, like a pair of scissars; and the points at one end are for inside measures, whilst the others are for outside measures; and the distances of all the points from the joint being exactly the same, the inside measure of any hollow

TURNING.

being taken by one end of the callipers, the opposite end will be readily opened to the requisite dimensions for a solid to fill such hollow.

Fig. 34. is a gauge for measuring the depth of hollow work. *A* is a ruler, through which is a socket to receive another ruler *B*; and a clamp-screw is fitted through the side of the socket, to hold the ruler, *B*, fast in the socket. The edge of the ruler, *A*, is applied to the end of the work, and the other ruler is then slid through its socket, until the end of *B* touches the bottom of the cavity; and in this state, the clamp-screw being fastened, the gauge may be applied to the piece of work in the lathe, to ascertain if the cavity is turned out to the required depth.

Fig. 6. is a chuck for turning wood when it is a long piece, which will admit of being supported at both ends, or between centres, as it is called. The chuck has a screw within the part *a*, to fix to the mandrel, and the other end is of steel, with a pin *b* in the centre; and on each side of the pin is a sharp edge *c*, like a chissel, the line of the edge pointing to the centre of the pin. When a piece of wood is mounted between the points of this centre pin and of the back centre, as we have before described, if the back centre screw is turned, it will force the piece of work against the mandrel and the pin *b*, and the edges *c* will penetrate into the opposite end of the wood; in this case, the motion of the mandrel and chuck *a* will be communicated to the wood, to turn it round. The centre pin *b* is made to project beyond the edges *c*, and by this means the work may be removed from the lathe, and put in again if required, because the centre pin will enter again into the same hole in the end of the work, and restore the work to its original position.

Fig. 7. is a chuck for the same purpose, but it is made with a flat circle of brass, and three pins, *c*, are fixed in it instead of the edges *c, c*. This kind of chuck is shewn in use in *fig. 1*, to turn a pillar for a balustrade.

When a piece of metal work is to be turned between centres, the edges or points of the last chucks cannot be made to penetrate the end of the piece, and therefore a small chuck, *b*, (*figs. 14.* and *15.*) is screwed to the mandrel: in the end of this chuck, at *b*, is a hole, which is made square within side, and the work has a square filed at one end to fit the hole. The other end of the work is supported by the back centre, a small hole being made in the end to receive its point; or if the end of the work is sharp-pointed, the back centre pin is drawn out of its socket, and turned end for end: the end of the pin opposite to the point has a small centre hole for the reception of such pointed work. Iron and steel work may be turned very conveniently by means of a square, but not very accurately; and after the work has been taken out of the lathe, and the square cut off, if it be required to turn the work again in the lathe, it is very difficult to find the true centre.

All works requiring great accuracy, as arbors, screws, axles, spindles, &c. are turned between centre points, thus: a chuck (*fig. 8.*) is screwed to the mandrel by the screw in the part *a*, a steel centre point *b* being formed at the end of it. The point is turned very truly, to be exactly in the centre line of the mandrel. The work is mounted between this point and the point of the back centre; and to communicate the motion of the mandrel to the work, a driver (*fig. 9.*) is screwed fast on that end of the work nearest the chuck. The driver is an iron ring, with a screw *d* tapped through one side of it, to pinch the work so fast as to prevent the driver slipping round upon the work; and on the side opposite to the ring is a projecting tail *f*.

The chuck (*fig. 8.*) has a steel claw *k e* fitted through it, and fastened by a screw: the end of the claw is bent at *e* paral-

lel to the direction of the mandrel, so that the end of it will catch the tail *f* of the driver, and turn it round, together with the work on which the driver is fixed.

The stem *k* of the claw slides in and out of the socket, through the chuck, in order to remove the claw *e* to a greater or less distance from the centre point *b*, and adapt the chuck to operate upon different sized drivers, for delicate or large work. This is the most accurate method of turning iron work in a mandrel lathe, because the centre points at the ends of the piece are preserved. When one end of the work is finished, the driver may be shifted to the other end. Such work may at any time be mounted again upon its original centre points, in any kind of lathe, to turn wheels, collets, &c. which may be fitted upon it.

The form of the driver is shewn in *fig. 30.* In order to make it fit different sizes, the side of the ring opposite to the screw *d* is made angular, and the point of the screw forces the work into the angular part.

This driver may be fixed on either end of the work, whilst the other end is turning; but when it is necessary to fix the driver on that part of the work which is finished, the end of the screw *d* is apt to pinch and bruise it; it is therefore proper to interpose a piece of iron between the point of the screw and the work. But it is better to use the driver shewn in *fig. 31*: it is composed of two bars of iron, united by two screws passing through one bar and tapped into the other: both bars are somewhat hollowed out in the middle, that they may encompass the work. If this should be found to injure the work, a piece of sheet-lead wrapped round it before the driver is put on will prevent it from damaging the work; and if the screws of the driver are drawn very tight, it will carry the work about with sufficient force to bear turning.

When a piece of iron or steel work is to be turned, the centre points at the ends must be found with great precision before it is turned, because it is difficult to cut away great protuberances in metal. The centres are first found by the compasses, and marks are slightly punched in the ends by a conical-pointed punch. The workman now places the work in the lathe, between the points of the mandrel and that of the back centre, but without fixing any driver on the work; he then screws up the centres, so as to hold the work just tight enough to prevent its falling down. In this state, by turning it round with one hand, while he holds a piece of chalk against it with the other, he ascertains whether it is pitched nearly concentric on the points; and if it varies much at any one point, he turns back the screw to take out the work, and punches new centre points, or alters the old ones, taking care to move them nearer to that side which appeared to project farthest in revolving, and was of course marked by the chalk.

When he has, by repeated trials, found the true centre, he screws up the centre point so hard, that it may effectually mark the end of the work, by forcing the points to the bottom of the marks punched; then taking the work out of the lathe, he drills holes in the ends, at the places which the centre points have marked, and to such a depth, that the points of the lathe will not reach the bottom. When the work is again returned into the lathe, it will run very nearly concentric, and the driver being screwed fast on either end of the work, as is most convenient, the work will be turned round by the clutch projecting from the chuck.

The work is now ready for turning, which is done by different tools, and applied in a very different manner from the chissels and gouges for turning wood. *Figs. 37.* to *40.* are different examples of the manner of turning metals: a tool applied in the manner of *fig. 39.* operates very well upon

upon brads and bell-metal. The cutting edge should be ground nearly to the angle which is there represented, and the upper side should be directed nearly to the centre of the piece; the edge will then scrape away shavings from the metal. The tool has some tendency to retreat backwards from the work, and must be held firmly thereto. The edges of tools, applied as shewn in *fig. 39*, may be formed to any of the shapes shewn in *figs. 23*. and *24*. the angle of the cutting edge being in all cases nearly the same.

The graver (*fig. 40*.) is an extremely useful tool, and fit for turning any metal or hard wood: it is a square bar of steel, cut off obliquely, and the greatest obliquity of the cutting plane is in the direction from one angle of the square to the opposite angle. This produces a prominent point on one of the angles, which point is applied to the work in the manner shewn in *fig. 40*. and cuts off continuous shavings instead of scrapings: this is owing to the direction of its edge, which is disposed obliquely to the motion with which the work meets the edge in its rotation. The turner should be provided with gravers of all dimensions.

Fig. 37. is the action of what is called a *heel* tool for turning wrought iron or copper: the edge of this is applied nearly in a tangent to the work, on the same principle as the chissel is applied to cut wood. The heel of the tool is placed upon the rest, and being just opposite to the edge on which the pressure or drift of the work lies, the tool cannot escape from its work, although the pressure upon it is very great, so much so, that it would be impossible to keep the tool to its work, if it were held upon the rest, as in the case of the wood chissel, merely by the lateral friction on the rest. The handle of the heel tool is long, and is held inclined upwards, so that the workman can rest the end of it on his shoulder, whilst he holds it very firmly down on his shoulder and on the rest with both hands. This firm position is very necessary, because the heel tool is liable to draw deep into the work, and take away too large a chip. This tool will cut away thicker chips than any other, being what the workmen term a greedy tool. The requisite height of the rest, to make the edge of the tool a tangent to the proper point, is a matter of importance, and requires the attention of the workman, who can only learn the management of this tool by experience. It is not well adapted for finishing work with accuracy, but is very expeditious in roughing out wrought iron: it generates so much heat in working, that it is necessary to keep it constantly wet; and in large lathes, a constant stream of water is made to fall on the edge at the place where it is cutting. The graver and all other tools work wrought iron and steel to the greatest advantage when wetted.

Fig. 39. is the tool used for turning cast-iron; this substance must be scraped away, and it is plain from the figure, that the cutting edge is presented very nearly in the same manner, with respect to the work, as in *fig. 39*; but from the hardness of cast-iron, it requires a very considerable force to press the edge against the work, and it would be impracticable to hold it up effectually on the plan of *fig. 39*; hence the tool in *fig. 38*. is bent at the end, and is lodged over the edge of the rest, in the manner of a lever; the handle is pressed down at the extremity, and lifts up the edge against the work with very great force. The workman must bear on the handle of this tool with the requisite pressure; and in large work, such as cannon and mill-shafts, he usually seats himself upon the end of the tool, which is made very long in the handle.

Different substances require different velocities of motion to cut with the greatest advantage. Wood can scarcely be made to move too quick; and it is always preferable to take a very thin chip, and move as quick as possible, than to move

slowly, and compensate for the loss of time by cutting deep. Brads and bell-metal may be moved very quick, but not with half the velocity of wood. Wrought iron and copper must be turned more slowly, and the tool must be kept wet. Steel should go rather slower than wrought iron, for it is liable to have hard veins in it, which the workmen call pins: these will be cut through if the work moves slowly, but with a quick motion they will destroy the edge of the tool: this makes some workmen think that the pins are actually formed, or that they become hard during the operation of turning, if too great a velocity is used. Cast-iron must move very slowly, indeed it can scarcely turn too slowly, and the tool applied as at *fig. 38*. will cut a thick chip.

To obtain these different degrees of velocity, the foot-wheel of the lathe *fig. 1*. is made with several grooves of different diameters, and the mandrel pulley *b* has also different sizes. A band can be applied upon any of these grooves at pleasure, and the workman finds by experience what velocity is best for different kinds of work.

The most experienced workmen prefer a centre lathe to a mandrel lathe, when they have to turn accurate iron-work, which will admit of being poised between centres; and it is obvious, that the revolving motion of the centre point at the end of the mandrel is of no use; and if the point should be the least out of the centre line, or if the mandrel has any shake in its collar, the work would not be turned truly. But in a centre lathe, where both points are fixed immovably, or, as the workmen say, with dead centres, this cannot happen; and if the work is screwed up tight between the centres, so that there is no shake, the centre points at the ends of the work must be precisely in the centre line of the work.

The manner of giving motion to a piece of work in the centre lathe is, as we have before described, by a loose pulley fitted on the centre pin, and from this pulley a pin projects in a direction parallel to the centre line, so that it comes exactly in the place of the claw *c* (*fig. 8*.), and turns the driver round when the pulley is put in motion by the band, either from a foot-wheel or hand-wheel.

When the mandrel lathe is used for centre work, the centre of the chuck must be turned very exactly, so that it does not vary in the least from the same position when it turns round; and in all cases, the mandrel must be fitted with the most scrupulous accuracy into its collar, so that there will be no shake; for unless this is the case, the lathe will not turn chuck-work with any accuracy.

Messrs. Holtzapfel and Deyerlien make very excellent lathes on the plan represented in *fig. 1*. The bed and the puppets are made of cast-iron, and very correctly fitted, such lathes possess great strength: some of them are fitted up, as in the figure, with a pattern screw at the end *a* of the mandrel, for the convenience of cutting screws on work. For this purpose, the mandrel is fitted in a collar at each end, and the necks are cylindrical, so as to admit of the mandrel moving endways at the same time that it turns round. On the extreme end of the mandrel, beyond the collar *D*, a pattern screw is fixed, which has the distance of its threads corresponding with the screw that is desired to be cut upon the work, which is fixed in the lathe by a chuck: a piece of brads, *n*, is provided, which is cut with threads adapted to the pattern screw, and which can, by turning a screw, be drawn up against the pattern screw, so as to work in its threads; and in this state the mandrel, at the same time that it turns round, will move endways in its collars with a screwing motion; and in consequence, a pointed tool being presented to the work, and held fast on the rest, will cut a spiral groove or screw upon its circumference. This contrivance is more fully

TURNING.

fully explained in the article *ROSE-Engine*. It is the most convenient method of all others for cutting screws, and very accurate, if the pattern screws which are fixed on the mandrel are correctly cut. For all purposes of wood turning, it is undoubtedly the best method, and far preferable to the common one of cutting screws flying, as it is called, that is, by means of the tools 32 and 33, which are applied to the work, and moved along endways at the same time that the work turns round, so that they cut a spiral. (See *ROSE-Engine*.) The rapidity and accuracy with which some workmen cut screws in this way exceed belief; but it is only by long experience that this habit can be acquired, and for those who have not had such experience, some mechanical help is necessary. The objections made by accurate workmen to the flying or screw mandrel are, that as the necks must be cylindrical, it cannot be kept so perfectly fitted in its collars as the common mandrels, which have a point at the extremity, and the neck at the other end is made slightly conical, so that it can always be screwed up to fit in the collar. Messrs. Holtzapfels mandrels are made of hardened steel at the necks, and the collars are also hard; they are accurately fitted, and have no shake when new. From the hardness of the materials, they will wear a long time before they get any looseness.

Mr. Maudslay has the most complete set of tools for all kinds of mechanical works at his manufactory, and is particularly well provided with turning apparatus. All his lathes are made with triangular bars, such as is described in our article *LATHE*, and the mandrels are all formed with conical necks and collars. The bar lathes are very accurate, particularly when the slide-rest is applied to them, as there described. The bed lathe may also have a slide-rest applied, as is shewn under *ROSE-Engine*.

If a piece of metal, after being properly turned, is to be bored hollow within, like a gun-barrel, the back puppet is to be removed from the bed of the lathe, and another substituted in its place, having a hole or collar through it, into which the neck or end of the iron is to be correctly fitted, the other end of the iron being supported and turned round by being fitted into a chuck at the end of the mandrel, or else by means of the centre point at the end of the mandrel, and with a driver, as in *figs. 8. and 9.* The rest is to be set opposite the end of the piece where it comes through the collar, and drills or borers are to be applied, similar to those used by locksmiths in boring keys, beginning with a small one and afterwards using larger ones, until the hole is made as wide and deep as necessary. The borers must be held very firm on the rest, otherwise there is danger of not boring the hole straight. The borer should be withdrawn from time to time, to oil it and clean the hole. As it is difficult to make a hole quite round or concentric with the outside by means of borers alone, it is necessary to have also a turning tool considerably smaller than the hole, one of the sides of which is sharp, very well tempered, and a little hollow in the middle. This instrument being fixed in a long handle, is to be introduced into the hollow, and applied with steadiness to the inner surface of the hole, and it will entirely remove every inequality that may have been there before its application.

The collar puppet is only resorted to, when the piece which is to be bored is of considerable length; for if it is short, it will be held sufficiently fast in the chuck, without the necessity of supporting the extreme end.

A collar puppet is sometimes necessary in turning centre work when the work is long, and so slender, that it bends or springs by the stress of the tools: the collar is then applied to support the work at the part where it is weakest and bends most.

Turning of elliptical or oval Work, such as Picture-frames, Snuff-boxes, &c.—This is performed in the same lathe, and with the same tools, as the circular work; but the lathe is provided with a chuck, which causes the work to traverse in a very curious manner, by a motion given to it in a direction to and from the centre of the mandrel as it revolves; so that a tool held up against the work will cut an elliptical figure instead of a circle. Elliptical work has a very singular appearance when in motion; for after the work has been turned truly elliptical, every part of the circumference, except the exact point where the tool was applied, appears to vibrate, or be excentric in a great degree, but that one point of the circumference runs perfectly true and regular, the same as the whole circumference of a piece of circular work does. The mode of action of this ingenious apparatus is rather difficult to describe, and it is first necessary to understand the principle of its action. This is the same as the trammel or elliptic compasses; see *fig. 29.* An octagonal or square board A A, B B, has two grooves cut in its surface, which intersect each other at right angles; this board is held down upon the surface where the ellipse is to be described, with the centre lines of the cross grooves coincident with the two diameters of the intended ellipsis, and of course their intersection will be its centre. The curve D D is traced beyond the circumference of the board, by means of a pen or pencil, which is fixed at F, to a radical bar or beam F G H; this bar carries two other points or pins, G and H, which are attached to sliders, inserted into the cross grooves of the board, as shewn in the figure: the sliders are fitted in truly, so that each of them will have a motion in its respective grooves: thus the slider of the pin H will move along A A; and the slider of G, along the groove B B. By turning about the beam F G H, the sliders go backwards and forwards in their cross grooves with a simultaneous motion; so that when the beam has gone one-fourth way about, one of the sliders will have moved from the circumference of the board A A, to the common centre of the cross grooves; and when the beam has gone half round, the same slider will have proceeded the whole length of the cross, and arrived at the opposite side of the circumference. The same applies to the other slider, and when one slider is at the centre, the other will always be at the circumference.

The pins F and G H can be fixed at any part of the beam at pleasure, (though this is not so represented in the drawing,) for the purpose of setting the trammel to draw any particular ellipsis: thus, place the beam in the direction of the line A A, then the pin G will be in the centre of the cross grooves; now fix F at such a distance from the centre, as is equal to half the small diameter of the ellipse, and set H so far distant from G, as the difference of the two diameters; consequently, from F to H will be equal to half the longest diameter. Now, in turning the beam round from the direction A A, till it comes to the direction B B, the point G will depart from the centre along B B, and H will approach it along A A, till it gets to the centre. Then will the pencil F be so much farther from the centre, as G is distant from H, and the pin has in its circuit traced one-fourth of an ellipse. The beam being turned quite round, will complete the whole curve.

This apparatus may be applied to turning by some modification. Suppose the two cross grooves made in a round board, as large again as that represented in the figure; then, if the whole apparatus be inverted, and the beam F G held fast in a vice, or otherwise, the board with the cross may be traversed round upon the fixed sliders, in the same manner as the beam could be traversed round upon the fixed board. Suppose a tracing point is held to the back of the board,

exactly opposite to the place where the tracing point *F* is fixed to the beam, and held fast; it is evident that its point will trace the same ellipse on the back of the board, that was described on the surface which the board lay upon in the former instance: or a chisel being held fast in the same spot, will cut the board elliptical when it is turned round; and the chisel being successively applied at different points along the line of the beam, a series of concentric ellipses may be turned in the board, to make mouldings for picture-frames or other ornaments. If the distance of the two fixed pins *G* and *H*, and the chisel *F*, is altered, it will vary the proportion between the two diameters of the ellipsis, in the same manner as before described of the trammel.

The oval chuck is constructed in a different manner from this, though it preserves the same movements. It consists of three parts, the chuck, the slider, and the excentric circle. The chuck *ee f* (*fig. 27.*) is attached to the mandrel by a screw-socket, cut in a piece *f*, which projects from the centre of it behind; and hence the chuck turns round with the mandrel with a circular motion.

The chuck has a dove-tailed groove, formed in it at the front side, for the reception of a slider *g b*, (*fig. 26.*) which traverses freely in the groove: the groove is formed, as the figure shews, by pieces *i, i*, screwed to the chuck on each side. In the centre of the slider, in front, is a screw *b*; see also the plan, *fig. 25.* The screw *b* projects from the slider, and by means of it, a wooden chuck may be screwed against the slider, and any work can be fixed in the chuck in the usual manner. The work so fixed, at the same time that it turns round by the motion of the chuck, has a sliding motion across the centre, which motion being given according to a certain law, produces an elliptic motion. The sliding motion is given by the excentric circle (*fig. 28.*); this is a ring of brass, attached fast to the puppet of the lathe, close to the collar, in which the neck of the mandrel runs. The mandrel passes through the aperture *l*; the ring has a flat plate, *m*, to strengthen it, and forming two bends at the ends *m, m*, which bends have screws tapped through them, and pointing exactly to each other: these screws are sharp at the points, and are inserted into small holes in each side of the puppet, as is shewn in the plan *fig. 25.* at *C*, the back of the plate *m* of the circle lying flat against the front of the puppet *C*; by this means the circle is fixed fast; the two screws are horizontal, and both point to the centre of the mandrel *b*; therefore, by screwing one screw in, and the other out, the whole circle may be moved sideways horizontally, so as to give it any required degree of excentricity from the centre line of the mandrel, and it will be held stationary wherever it is placed.

Fig. 27. is a back view of the chuck, and shews two grooves made through it in the direction of the length of the slider; these admit the shanks of two pieces of steel *n, n*, to pass through the chuck, and they are firmly attached to the slider *g*, by a screw for each in front of the slider, as shewn in *fig. 26.* The two inside edges of the pieces *n, n*, are exactly parallel to each other, and the distance between them is exactly equal to the diameter of the outside of the ring *28*, which ring is included between them, when the chuck is screwed to the mandrel *b*, and the circle fixed to the puppet *C*, as shewn in *fig. 25.*

Suppose then the circle is set concentric with the mandrel; if the mandrel is turned round, it will cause the chuck *e*, and slider *g*, together with the work attached to the slider by the screw *b*, to revolve. The work will now run in a circle, and turn circular work as usual, because the slider is guided by means of its claws *n, n*, which embrace the circle; and will keep the same position in its groove in the

chuck during all the parts of a revolution, because the circle is concentric with the mandrel.

To set the chuck for an ellipsis, place the point of a tool opposite the work, at such a distance from the centre of the work, that it will describe a circle of a diameter equal to the breadth or smallest diameter of the ellipsis intended to be turned. This is best done by fixing the tool in the slide-rest. Now turn about the mandrel, till the slider *g* comes horizontal, and set the circle *28* excentric from the mandrel by its screws *m, m*; it will of course move the slider *g* in the groove of the chuck, and also the work will move with it to a greater distance from the centre, because the two steel pieces *n, n*, at the back of the slider include the circle between them. The quantity of excentricity given to the ring, must be equal to the difference between the two diameters of the required ellipsis, so that the work shall move, or throw out a sufficient distance, to bring the point of the tool as much beyond the circle first described, as the length of the ellipse exceeds the breadth. The point of the tool will now be at one end of the longest diameter, and here we will commence to trace the curve all round. In turning the mandrel round till the slider comes vertical, it must return in its groove to the place it first occupied, *viz.* the centre; because the excentric circle which guides the slider is not excentric in a vertical direction, though it is in the horizontal. In this motion, the point of the tool has cut or described one quadrant of an ellipse, because it gradually approached the centre a quantity equal to the excentricity of the circle. By continuing to turn the mandrel round farther, the circle will cause the slider to move out the other way from the centre in its groove until it comes again horizontal, when it will be at the greatest *throw out*, as the turners term excentricity, and the point of the tool will be at the other end of the longest diameter, having described one half the curve: continuing to move forwards till the slider becomes vertical, it will become concentric again, and the tool will be at the breadth of the ellipse, having finished three quarters of the ellipse; and in turning the next or fourth quarter, the slider throws out till it comes horizontal, and brings the work to the position where we first set out, *viz.* at its greatest excentricity; and with the tool at the end of the longest diameter of the ellipse.

The simple trammel (*fig. 29.*) is not easily recognized in this complicated chuck, although it has all the same movements. Thus, let us return to our first idea of a board with two cross grooves in the back of it, turning round on two fixed pins, which enter the sliders in those grooves. Suppose that one of the pins is extended to a large ring, and the groove proportionably widened to receive it, this will have the same effect. Such a groove is formed by the two pieces of steel *n, n*, which have straight edges made truly parallel to each other, and perpendicular to the length of the slider which carries them. The other fixed pin is represented by the mandrel; and the slider being always confined in a right line across it, has the same effect as a pin entering a straight groove.

This ingenious apparatus was invented early in the last century by the celebrated mathematician Abraham Sharp. Before his time, oval-work was always turned in a rose-engine, which had an elliptical pattern.

In turning oval work, the tools must be delicately used, because the circumference moves with an unequal velocity at different parts of its revolution.

Method of ornamenting turned Articles by an Excentric Chuck.—This produces a similar effect to the rose-engine; but as a chuck of this description can be applied to any lathe which has a mandrel and slide-rest, it has been referred to the present article.

Figs. 18. and 19. are two views of an excentric chuck: *a*

is a socket, which is screwed to the mandrel; and *bb* the chuck, which is formed in the same piece with the socket *a*; a dove-tailed groove is formed in the front of the chuck, by means of two pieces *d, d*, which are screwed to the chuck, and into this groove a slider, *ee*, is fitted: to this slider a centre pin is fixed very firmly, and upon the centre pin a circle, *f*, is fitted, so as to turn round freely; in the front of the circle a screw, *g*, projects, for the purpose of fixing chucks to the circle. The slider is applied to the chuck, just the same as in the oval chuck, but is not left at liberty to slide in the groove, for a screw, *k*, is applied, which will move the slider gradually in the groove, but always holds it fast where it is placed. By means of this screw, the centre pin of the circle, *f*, can be made either to coincide with the line of the mandrel, or it can be set with any required degree of excentricity from the mandrel, as is shewn in *fig. 19*, by the difference between the line of the screw *g*, and that of the socket *a*.

The circle is divided round the edge with notches or teeth, cut at equal distances; and a tooth or catch, *h*, is fitted on the slider by a centre screw, and has a tooth which can be inserted into any of the teeth at pleasure, and will hold the circle fast from turning round upon its own centre pin. In this case, any piece of work, which is fixed to the screw *g*, will turn round with the mandrel, just as though it was fixed immediately thereto. The manner of using this tool is as follows: when the excentric chuck is screwed to the mandrel at *a*, the screw, *k*, is turned, until the screw, *g*, is brought exactly into the line of the mandrel. A wood chuck is now screwed on at *g*, and a piece of work fitted into it; which work is turned to its required figure, just as though the wood chuck was screwed to the mandrel itself, without the interposition of the excentric chuck, which hitherto has been passive. The work being turned, it can be beautifully ornamented on the flat surface, by tracing a number of circles upon it. To do this, turn the screw *k*, until the centre of the circle, *f*, is removed to a given distance from the line of the mandrel; now apply a tool to the end or flat surface of the work, by means of the slide-rest, and turn the mandrel round, until the tool has cut a fine circular line in the surface of the work. Now it is evident that this circle will not be in the centre of the work, but removed from the centre thereof a distance equal to the degree of excentricity given to the slider. Having thus described one circle, stop the lathe, and release the catch *h*; then turn the circle, *f*, round one tooth or notch.

Put the lathe again in motion, and describe another circle by the point of the tool, held exactly in the same spot as before; but the circle so described will fall on a different part of the work to that circle which was before made, although its centre will be at the same distance from the centre of the piece of work. The lathe is stopped, and the circle, *f*, turned round another tooth: a third circle is then described; and when as many circles are described as the whole number of teeth in the circle *f*, the ornamenting is finished. It will consist of as many circles as there are divisions in the circle *f*, all of an equal size, and their centres arranged at equal distances, around the circumference of a small circle, which is concentric with the work. The whole produces a rosette or engraved figure upon the surface of the work, and the numerous intersections of the excentric circles have a very pleasing effect to the eye. This kind of work is seen on the cases of many watches; and when well executed, is much esteemed.

TURNING *Horizontal Hand-Mill*, in *Rural Economy*, an useful contrivance of the hand corn-mill kind. It was invented by Mr. Wright, and consists of a sort of tub or

box; the frame of the mill-part of which is three feet square, and three and a half in height. The mill-stones are eighteen inches in diameter, and inclosed in the tub or box, supported by two cross-bearers, under which is a lever, having an iron pin or pivot, which runs through the centre of the bed stone into a socket in the bridge of the upper stone or runner, to which is attached the shaft and spindle, running through the eye of the runner and hopper, and supporting the fly-wheel and crank. A piece of wood of a round form, fastened on the shaft, serves as a feeder; and above is a screw to regulate the feed according as the mill is turned. On the side of the tub or box is a thumb-screw, fixed to the lever underneath, which regulates the stones, according as they are turned. The shaft runs through the crown-tree or cross-bar at the top of the frame, on which is the horizontal fly-wheel and crank; to which are attached one or two handles, by means of which the mill is put in motion. Under the stones is a drawer; in which are placed three sieves of different finesses; one for taking away the broad bran, another for the coarse pollard, and the third for stopping the fine pollard, and letting the flour pass into the drawer, which is effected by a sort of iron fork running through a hole in front of the drawer, and fixing on one of the sieves.

Small hand-mills of this nature are extremely convenient and useful in many cases.

TURNING *Palisades*. See PALISADE.

TURNING-*Evil*, in *Cattle*, a disease that causes them frequently to turn round in the same place. It is also called the *sturdy*; which see. See TURN in the *Head*.

The common remedy, recommended by Mr. Markham, is to throw the beast down, and bind him; then to open his skull, and take out a little bladder, filled with water and blood, which usually lies near the membrane of the brain, and then gradually heal the wound. Boyle's Works, abr. vol. i. p. 87.

TURNING to *Rot*, in *Agriculture*, a term used in tillage to signify stripping, ribbling, baulking, and combing, according to the manner in which it is performed. It is the leaving of a narrow strip of ground whole, on which the furrow-sluice is turned. It is much used in Devonshire, Cornwall, and some other districts.

TURNING to *Windward*, in *Sea Language*, denotes that operation in sailing, in which a ship endeavours to make a progress against the direction of the wind, by a compound course, inclined to the place of her destination. This method of navigation is otherwise called *plying*. See TACKLING.

TURNIP, or TURNER, in *Agriculture*, a most useful and nutritious bulb-rooted plant, of which there are many different sorts in cultivation by the farmer. It has been long known in this country, but only more lately introduced as a field-crop, probably from Holland, or the Low Countries. It is from a more general introduction of this root into field-husbandry, that much improvement and advantage have been produced, not only in the management of arable land, but in the general system of feeding and supporting different kinds of live-stock. The culture of this root has, indeed, contributed much towards exploding the expensive and wasteful practice of naked fallowing, as well as to cleanse and ameliorate the soil, and render it more abundantly productive.

The turnip belongs to the genus *brassica*, and is well-known by its having a round, or rather long, fleshy, catable root, that varies considerably in these respects, as well as size and colour, in different sorts, under the state of cultivation. The leaves proceeding from the top of the root in

the middle part are large, and mostly of a full green colour, being ragged on the edges. The stem arises from the midst of these in the second season of the growth of the plant, to the height of four feet, or more, producing a yellow flower, with cylindrical pods of some length, filled with small purple, or reddish-brown coloured seeds. See BRASSICA.

All the different sorts of this excellent plant are, for the most part, distinguished by the form or shape of the bulb or root, which appears in some measure to depend upon the diversity of soil, and the nature of the culture of the plant. But the sorts that have been had recourse to as field-crops, with the greatest success and benefit in different parts of the country, are principally of these two kinds; those having a round or flattish-formed root, that rests much on the surface of the land, and those in which the root is of the more long tap-rooted form, penetrating deeper into the mould with the lower part of the root, but standing higher above it with the upper portion of the bulb.

In the first, or *round flat-rooted* sort, there is likewise much variety in the appearances of the tops as well as the roots, though the latter are mostly a little round and flattish. They are commonly distinguished in field-culture into the *red-round* or *purple-topped*, the *green-topped*, the *white-topped*, the *yellow-rooted*, the *black* or *red-rooted*, the *hard* or *stone*, and the *Dutch* turnip.

In the latter, too, or *long tap-rooted* sort, there is some degree of variety in their roots. They are usually known and discriminated by the farm-cultivator under the titles of the *tankard*, the *tap-rooted*, the *pudding*, the *oblong*, the *long*, *round*, and the *hardy* or *Russian* turnip.

It may be noticed, that the different varieties of the former of these kinds of turnips, in consequence of the roots of them being formed more on the ground close to the surface, than in those of the latter kind, which often stand high, naked, and much exposed in their upper parts, above it, are better suited to the purposes of general field-culture, in cases where there is much risk of their being hurt by the effects of frosts in the more severe winter months; but that in other cases, as where they are to afford an early feed, as for suckling ewes, and in the fattening of forward sheep at an early period, the latter kind may be had recourse to as the most proper and beneficial. This is said to be the practice of some districts in the vicinity of the metropolis, where it is of importance to have forward lambs.

In different districts where this root is largely cultivated, different sorts of this plant are employed; and it is not improbable that some sorts may be more proper for some qualities of land than others, though little has yet been done in the view of deciding this point. Nor is it unreasonable to suppose, that among the many varieties of this highly valuable plant, there may not be some which, in addition to their superior hardiness, possess a greater proportion of the nutrient principle than others. It has, indeed, been stated that, in a great northern turnip district, the green-topped and white-topped are generally esteemed as more sweet and nourishing than the red-topped sort, which possesses a degree of bitterness, and is disposed soon to become stringy and bad as food: that the white-topped sort, on the better kinds of land, is probably the most proper and beneficial, as while it has the property of being hardy, it grows to a large size; and that this and one of the stone or small hard sort, are the most commonly grown, and held in the greatest estimation in some of the best turnip districts still more towards the north. The latter of these sorts is, indeed, by some farmers in those districts, supposed to stand the severity of the winter season much better than most of the other sorts; but then the produce on the acre is commonly much less. And by others

in more southern districts, it is thought to bulb quicker, to have a greater solidity, a finer grain, a thinner skin, and to be smoother in the crown of the bulb; consequently to be less liable to injury from wetness and severe frost. And that although it may not grow so quick, or to so large a size, the latter of these defects may be obviated by leaving the plants a little thicker on the ground at the time of thinning and setting them out. Indeed, both the white and green-topped sorts are also much grown and approved in all these districts, and by some highly extolled on account of the qualities just noticed, as well as their being of a large growth, and continuing longer in a state fit for use, especially the latter. The yellow-rooted or straw-coloured turnip, too, is found to be a firm-fleshed and sweet-tasted nourishing sort, but it has not yet been much cultivated, so that its properties are but imperfectly known. The red sort, which was formerly much esteemed, has now mostly given way to other sorts. And the black-rooted sort is very rarely cultivated in any district of the kingdom; nor even those of the Dutch sort, though the early kind of them might answer well for forward crops. Much might probably be done in getting good sorts, by collecting seed from such as are the most hardy, and which grow to a large size, and sowing it in continuance.

In some northern and other districts turnips are grown much in mixture, which is a bad plan, as they have different growths, and of course rise unequally. And in the southern ones, the white globe prevails much in some instances; and the green round sort is found to stand well, and be larger as well as more certain in the produce.

The turnip is a sort of crop which is grown after many other different kinds, as those of a wheat stubble, a pease lay, a tare, potatoe, or any other similar kind of crop, as well as after the process of paring and burning the layers of old grass-lands. It is the practice too, in some districts of this sort, to have two turnip crops in succession, as the means of cleaning the land more effectually, which has been found to answer greatly in the barley or other crops that may be grown after them.

The soils which are the most proper for the growth of this sort of crop, are all those of the more light, friable, loamy, medium sandy, and other kinds, which have a sufficient depth; but it may often be raised with success and advantage on many other sorts, which have the surface mouldy parts sufficiently fine, without there being too much moisture below, as those of the thin gravelly, loose chalky, and many other sorts and qualities; even on the loamy clays, in some cases, when properly managed in their tillage preparations, and other ways.

A late practical writer has well remarked, that from the success of the culture of this useful crop, on lands that differ greatly in their nature and qualities, it is plain that the plant admits of more latitude in respect to soil than many other sorts; though an opinion appears to have been too general among the cultivators of it, that it is only capable of being had recourse to with advantage, on such as are of a light, mellow, and open texture and quality. It is suggested too, that this has probably had considerable influence in preventing the culture of the turnip from becoming so general as, from its great utility and importance, it ought at present to have been. But though the turnip may be grown with success and benefit on soils that vary considerably in their natural friabilities and compositions, it is constantly necessary, to the perfect growth of such crops, that at least the more superficial parts of the soil, or the beds of earth in which they grow, should be in as fine a reduced powdery condition as possible, as more is found to depend

TURNIP.

depend on this, than even on the nature or qualities of the soil.

In the view of bringing land into a state of suitable preparation for this sort of crop, much breaking down and reduction of its parts are, of course, requisite. This sort of breaking and pulverization is supposed to be necessary and beneficial in many different ways, as by rendering the land more penetrable to the roots of the plants, by promoting the growth of the small weeds more fully on the surface, and thereby making them capable of being more perfectly eradicated, and the young turnip plants, of course, be less endangered by them; while, at the same time, a more fine and mellow bed of mouldy earth is provided for the reception of the turnip-feed, and its vegetation and growth rendered more quick and strong in consequence of the more equal diffusion of moisture that must take place among the parts of the soil. Without such a state of mould in the soil being produced, it is found to be in vain to expect good crops of this sort. In order to provide this state of preparation in the soil, it is the practice in some of those districts where turnip husbandry is carried on in the most complete and successful manner, when the seed is to be put in on a fallow, to have recourse to three, four, and frequently five ploughings or stirrings of the land, having the cloddy parts of it well broken down, between the times, by harrowing in different directions, and the occasional use of the roller or other such means, as by these modes almost every particle of the soil becomes divided, and exposed completely to the influence and action of the atmosphere, and perfectly aerated and saturated with moisture. In these cases, some advise that the first operation should be performed towards the close of the year in a shallow manner, so as merely to take off the rough surface; the land may then remain in this situation until just before the beginning of the spring, when it should be well broken and reduced by harrowing, and then cross-ploughed to the full depth. When the land is weedy, it should be again broken down by the harrow in the course of a little time; but when clean, it is better to remain in its rough state. In this condition it may then be left until the spring be a little advanced, when it should have another ploughing to the full depth, and where the season is dry, and the soil of the more heavy or stiff kind, be immediately after harrowed, but where it is light, this may be deferred for a week or two. By repeating these operations sufficiently, the soil is mostly soon brought into a fine clean state of preparation for the crop.

Others, however, think the first ploughing should be deep, and the after ones and harrowings be continued to a later period, but at the same time, suggest that they must, in general, be much regulated by the nature of the soil, the circumstances of the season, and the convenience of the cultivator.

In preparing fallows, as well as other lands for turnip crops, some, in different places, besides these means, make great use of scarifiers and scufflers, and find them particularly beneficial in foul states of them.

Where the seed of this sort of crop is, however, to be put in after corn, early pease, tares, or other such crops, the preparation of the land is seldom carried to such an extent of ploughings and other operations. Much fewer are commonly thought sufficient for the purpose, as two, or three at most.

In preparing for this crop, after the surfaces of coarse pasture or other grass-lands that have been long in that state, old faintsoil lays, or downs, have been taken off and reduced by means of paring and burning them, the practice is to have recourse to once ploughing over the lands in a

light manner, the ashes having been previously spread out equally on the surface. In this way the most advantage is afforded to the turnip crops, and they have been well produced by it.

There are some other local practices of preparing for turnip crops, but they need not be noticed in this place, as being only in little use in certain cases.

In the application of manure in the preparing of land for this crop, in the first of these ways, and where it is of the calcareous kind, such as lime, marle, or other similar sorts, it may be the best mode to make use of it after the second or third ploughing, especially in the former of these kinds, in the proportion of from one and a half to about three chaldrons, or thirty-two bushels; and in that of the latter, from eight to ten or fifteen ordinary cart-loads to the acre, as the circumstances and nature of the land may be; as in this manner such matters may become the most perfectly blended and incorporated with the mould of the soil. Each of these sorts of substances has been found highly useful, in this way, in several different districts of the kingdom.

It is, however, clear, from the success of different cultivators of this sort of crop, that substances of the dung-kind, where they can be fully supplied, and used in the preparation of the land, or other ways, are the most suited to the growth of the root. And that for such soils as possess a proper degree of lightness, and are in a fine mellow state of mould, those which are in the more reduced, or rotten short condition, may be the most suitable, as they are capable of being the most intimately mixed and incorporated with them; but that where they are more close and heavy, the longer and less reduced kinds may be more proper and beneficial, as they will not only tend to preserve these soils in a more open and loose state, but by their more gradual decay in them, render the earth more friable and mellow. Some, however, think them best applied in the medium state between these extremes. This sort of manure, when used in preparing land in this intention, should vary, in some measure, not only as the nature of the soil may be, but according to the manner in which the crop may be cultivated: in general, however, it should be put into the soil as nearly as possible to the period at which the seed is sown; as, in this case, in consequence of the new fermentation that necessarily takes place in the soil, the crop receives the most benefit from it. When, therefore, the crop is to be put in, in the broad-cast manner, the dung may be spread out equally over the land, and be turned in with the seed-furrow; though some advise it to be lightly turned in by the ploughing that precedes the seed-earth, and to be well intermixed with the mould of the soil, by harrowing immediately before that earth be given. The former would appear, however, to be the better practice, especially when the manure is in a sufficiently reduced state, as the plants will have the more full advantage of it. The quantity must necessarily depend in a great measure upon the different circumstances of the soil, and the richness of the dungy material; but less than from ten to twelve good three-horse cart-loads can seldom be made use of with advantage on the acre.

Where earthy and other matters, in mixture with dung, are had recourse to in this way, after being well prepared, as is sometimes the case, the proportion should mostly be considerably larger.

In cases where the crops are put in, in the ridge or drill manner, as the manure is wholly confined to the middle parts of the ridged-up earth, and does not occupy all the superficial portions of the land, a somewhat less quantity of it may answer the purpose; though a full and rather liberal

TURNIP.

allowance should always be made, as the safety and success of the crops depend much upon the rapidity and strength with which the young plants are at first pushed forward by such means.

In whatever way this sort of manure is made use of in this preparation, it should constantly be applied in an even manner, and be turned into the soil as soon as possible afterwards; as where this is not the case, great loss must often be sustained by the dissipation of the more liquid parts of it.

There are many different practices, in the preparation and application of this kind of manure, recurred to in different districts, in using it for the purpose of raising turnip crops, as may be seen by consulting the Corrected Agricultural Report of the County of Norfolk; and different kinds of it are sometimes preferred by cultivators, as that from fattening beasts, hogs, and the sheep-fold. But good clean dung of any sort is capable of answering the purpose.

The dungs of rabbits, poultry, and pigeons are occasionally used with success in the raising of crops of this sort, after being rendered dry, and dispersed over the surface of the land in an equal manner. They are mostly used for this purpose in the quantities of from about twenty to thirty bushels to the acre, just before the time of sowing the seed. And as they require to be put into the soil to only a slight depth, harrowing may, in many cases, be sufficient for the purpose, or a very light and shallow ploughing. Rape-cake has long been employed as a manure in some districts, in preparing for turnips, as that of Norfolk, by having it sown over the land in a coarsely reduced state, five or six weeks before the time at which the seed is to be put into the soil, in the quantity of about a ton to three or four acres, and leaving it so, or turning it in very lightly at the period of sowing. But it is considered a great improvement by some, and practised to much extent by Mr. Coke, of the above district, to have it ground by proper mills into a perfect state of powder; and applied at the same time with the seed over it, in the drills or small openings in the land made for the purpose. It is effected by a contrivance of the drill kind, that contains alternate divisions, with small and large cups for delivering the seed as well as the cake into the same drills. The stream of powdered cake is thus rendered constant and regular, the proper cups and funnels being capable of ready application. In this way, it is not necessary to have the cake applied before hand, and a ton is sufficient for six acres, by which there is a considerable saving in labour as well as the material. It is said to answer perfectly in the practice, though some dislike it.

Different other sorts of manures that can be reduced into a powdery state may likewise be employed in this manner, in the growth of this crop, with great economy and advantage in many cases. Malt-dust or combs too, might be made use of in the same way with advantage, though it is commonly applied over the surface in the proportion of about twenty sacks, of three bushels each, to the acre.

Sheep-folding, in some districts, is used as a means of providing manure for the growth of turnips, from the time of first ploughing up the land, to that at which the seed-earth is given. From the treading and consolidating of the soil so much in these cases, it may however be best only to fold during dry weather, and always to plough over the land in a light manner as soon after the sheep are removed as possible.

The quantity of seed, which is necessary must be different in different cases, as a great deal must constantly depend on the nature and quality of the soil, the period of sowing, and

the manner and circumstances under which it is put into the ground. In some good soiled districts in the southern parts of the country, where the turnip culture in the broad-cast method is carried on to a considerable extent, the quantity made use of is commonly from about one pound to one pound and an half; but on those of a more light, and those of the sandy kinds, a pound is mostly found quite sufficient; while on some more heavy turnip soils, nearly two pounds are employed. On the calcareous and loose chalky soils too, a large quantity of seed is mostly necessary. It is indeed, in common, a good practice in sowing for turnips, not to be too sparing of seed, as the unnecessary plants are readily capable of being removed by the first hoeings and thinnings of the crops.

In the culture of the crops in the ridge or drill method, as is commonly practised in some northern districts, in consequence of the seed being deposited in a more regular and exact manner, and the whole of the land not being occupied by plants, a somewhat less quantity of seed may be sufficient.

As the success in the growth of turnip crops has been found to depend greatly on the quick early sprouting of the seed, and the young plants being expeditiously pushed into broad leaf, it may be useful to have the seed steeped a little in water, or some other liquid, before it is put into the ground, especially in dry seasons; but it must become externally dry before it be sown in all cases.

Soaking the seed in strong-scented oils, and drying it by means of brimstone, have likewise been practised in the view of preventing the destruction of the crops, but probably with but little success.

The time which is most proper for sowing crops of this sort, must be principally regulated by the intentions of the farmer in respect to the disposal and use of them; but for the general more early consumption of them, the most proper season for putting them in may be about the beginning of the month of June; but where it is intended that the crops should serve as food for stock in the more early spring months, or at late periods, the sowing should take place proportionately sooner or later. Indeed, where the root is grown on a large scale, it may often be of great utility and advantage, as well as very convenient, to have the times of sowing still more considerably varied; as the crops by such means not only come more suitably in succession to the hoe, but are likewise ready for the purpose of consumption by different sorts of live-stock, at the different periods when they may be most wanted.

In cases where the practice of lamb-suckling is had recourse to for getting them ready soon, it is essential to have crops of turnips as early as possible, in which intention the seed is to be put into the soil often a month sooner than the above period; such land being set aside for the purpose as is well enriched with manure, in a fine state of tilth, and perfectly free from weeds.

In common, however, early sown crops of turnips are not only less sweet and nutritious for stock, but more exposed to injury from mildew and other causes of the same kind, than those which are sown later in the season: but though this may be the case, the sowings in no circumstances should be deferred so long as that the plants cannot have time to fix themselves fully in the soil, and cover it well before their growth is checked and restrained by the coldness of the approaching autumn and winter seasons, as in such cases the crops never answer well for the farmer.

In regard to the methods of sowing or putting this sort of crop into the ground, they vary in different districts, but are chiefly of two different kinds, the broad-cast, and the ridge

TURNIP.

ridge or drill. In the great turnip district of Norfolk, and most of the southern parts of the country, it is the most prevailing practice to sow this sort of crop in the broad-cast manner on the level surface: while in the large turnip districts of Northumberland and Berwickshire, where this kind of husbandry has undergone considerable improvement, and in most of the more northern parts of the island, it is more common to have recourse to the drill mode, depositing the seed in rows, either in hollows or ridges mostly raised by one bout of the plough, or in drills on the level surface; at the distances of from twenty-four to thirty inches in the former case, as the circumstances of the land and the intentions of the cultivator may be, and from ten to twelve or thirteen inches in the latter.

These different general methods may each of them probably be had recourse to with propriety, success, and benefit under different circumstances and qualities of the soil. As on the light, mellow earthy, deep sandy, gravelly, and other similar sorts of land, which are apt to part with their moisture too quickly, and consequently liable to become too dry and parched for the healthy perfect growth of the turnip, it may be the best and most successful practice to sow in the broad-cast or drill mode on the plain or level surface, as by such means, the moisture which is necessary for the crop, may be more effectually preserved in the land for the supply of the plants. And on the contrary, where the lands are of a somewhat more heavy quality, and not so much disposed to part with their moisture, but to retain it in a sort of stagnant state, the ridged-up drill method may be the most suitable and advantageous, as by the mellowness and fineness of mould which it affords, and its tendency to keep it dry and preserve the plants from being hurt by the retention of too much wetness about their roots, the growth and security of the crops will be much promoted. It has a superiority too in some cases in other ways; as on soils which are rather thin in the staple, this plant, in consequence of its long tap-root standing in need of a good depth of mould, can seldom be grown in a perfect or beneficial manner; by ridging up the land considerable advantage may be gained in providing a more suitable depth of cultivated soil for the plants to grow in, and a better bed for putting in the seed, as the operation has been found to more than double the common depth of mould in some such cases. The plants in this way grow more strongly, and besides, by the manure being confined to the ridges on which they grow, are less exposed to the atmosphere, and not demanded in so large a quantity, in consequence of which more land may be employed in raising this sort of crop; while by its concentration, and the seed being placed more immediately upon it, the nourishment and means of support to the plants may be more fully and effectually supplied, and a larger produce, of course, be afforded. This mode of sowing may be beneficial too in affording the means of more easily and readily getting up the crops, as food for stock in particularly severe seasons, when eaten off very early in the winter months. It is of importance also in several other circumstances, as the hoeing, working, and cleaning of the land between the rows of the plants can be easier, better, and more perfectly executed, less expert persons can be employed in much of the work, and from the earth or mould being laid up to the plants by the use of the plough or some tool of that kind, the roots of the crops are better protected and preserved from the effects of severe frosts and other causes of injury. They can be raised in this way likewise on land that has been less prepared and is less dry, as the tops of the ridges are preserved by it in a proper state, and the crops are mostly more abundant in this manner of sowing.

Different objections have, however, been made by some to the ridged or raised drill method of putting in the seed; but the principal of those that appear to have any sort of weight or importance are, that in consequence of the roots of the crops, in such cases, being more elevated or standing higher, they are, on account of being so much exposed, less capable of standing the severity of the winter season; and that larger spaces or distances are allowed than are necessary for the roots to attain a proper size in, consequently that the quantity of produce on the acre will not be so great. Notwithstanding the latter supposition, it is probable, however, that from the nourishment or food of the plants being so greatly increased, and the growth of the crops thereby rendered so much more healthy and strong, the amount of the produce must be increased rather than diminished. Different statements and calculations would indeed seem to shew this to be the case, and that even a greater weight of turnip is raised on wide intervalled ridges than those that are narrow within certain limits.

It has been contended too, in opposition to the raised mode of sowing, that there is difficulty in restoring the land to the level state again, and that the ground in the intervals becomes unproductive in consequence of the want of manure; but by forming the ridges in a suitable and proper manner, according as the nature of the soil may be, all these inconveniences may readily be removed. In this intention, it has been advised to form the ridges in diagonal and other directions over the fields, keeping the lands dry.

It is further objected to the raised practice of sowing, that in lands of the more heavy turnip kinds, which have little irregularity of surface for taking away moisture when in excess, though larger crops of this root may often be produced, the grounds are so much injured by being poached in getting them off, that the crops of grain or other kinds which succeed them, are lessened in a far larger proportion than is compensated by the greater value of the turnips. In such cases and circumstances, it is advised, as more beneficial, to form the land into large ridges, so convex as to throw the wetness quickly into the furrows, as about fifteen feet in width, that a cart may be easily passed along them without pressing the earth in and obstructing the furrows on the sides, the seed, where the land is disposed to throw up weeds of the annual kind, being sown in the drill manner on the surfaces without being raised, as by that means the work of hoeing may be rendered more easy and convenient: but where this is not the case, and where the seed is put in at a late period, or the land much infested with the grub, it may be preferable to have recourse to the broad-cast mode of sowing, as being more certain, from the plants being left so much closer to each other at the first hoeings, as to admit of thinning out and removing the bad and unhealthy ones in the succeeding operations of the same sort. Besides, they are supposed to have the advantage of growing more strongly, from the shelter being more complete, and from the ground being less stirred about them in their early growth, before their tap-roots are sufficiently fixed in the soil to support them perfectly.

It would, however, appear from the success which has attended the sowing and raising this sort of crop in the ridged-up or other drill mode in different districts, and from the greater facility and cheapness of performing the necessary after-culture, that it is, in many instances, the most beneficial manner of sowing; but that the nature of the ridges or drills, and the distance of the rows, must often require to be varied according to the quality of the soil, and many other circumstances. See a paper in the second volume of "Communications to the Board of Agriculture," for the

com-

TURNIP.

comparative benefits of the drill and broad-cast methods of sowing, as ascertained by experiment.

In explaining the practices which are mostly made use of in putting in turnip crops in the above two different methods, it may be observed, that where the former or broad-cast manner of sowing is in use, which may be proper and advantageous in some cases, as has been just shewn, it is of much consequence to their success, that the more superficial parts of the land be brought into as mouldy and fine even condition as possible previously to the putting in of the seed, and that in sowing, the seed be dispersed over the surface of it in as perfectly even and exact a manner as may be, as soon as it can be done after the ground has been made ready, as upon these circumstances being well attended to, the goodness and abundance of the crops in a great measure depend. An expert seedsman is required for performing this sort of work, but as it can seldom be done by the hand in a suitable manner by persons who have not been long in the habit of putting in small seeds in this way, a sort of box or trough has been invented and constructed for the purpose, which is in frequent use; and when proper care is taken to prevent the perforations of it from becoming obstructed by two or more seeds being fastened in them, it is of great utility in dispersing the seed in an uniform and regular manner over the surface of the land. After this has been properly effected, the seed is mostly covered in, in a shallow manner, by means of harrowing, a light short-tined harrow being used for the purpose, as from the turnip plant forming its bulb in some measure above the surface of the ground, it should not probably be put in to too great a depth in the soil. Some advise the passing of the tool twice over the land only in the same direction, in the first going slowly, and in the latter more quickly, in order to give a neater finish and finer surface; the ridges having been laid out to the breadths of from four to ten yards, as the land may be inclined to be more moist or dry. This is the Norfolk practice in some measure, and found to be extremely beneficial in many cases of broad-cast sowing for this crop.

In the drill method of sowing turnips, the land, after being prepared in the manner already described, is either formed into little ridges by the plough, and the seed put in, in drills upon them, or these are struck in the level surface, as noticed above; but the first is by far the most common. In the great turnip-drilled district of Berwickshire, the little ridges or drills, in cases where the ground is not well reduced, but remains in rather a rough and cloddy state, are, it is said, formed with the common fwing plough, drawn by two horses, which lays together three or four small rinds or furrow-slices for one such ridge or drill. But that the most common and expeditious method of laying up these ridges or drills is by a double mould-boarded plough, which has the boards hung on the sheath with hinges, and which can be set wider or narrower, as may be necessary. This too is drawn by two horses abreast, and forms two sides of the little ridges or drills at the same time; the width of such ridges or drills being commonly, as has been seen, from twenty-seven to thirty inches. In cases where the large ridges or lands are not much rounded, the little ridges or drills for sowing on are not laid in exactly the course of them, which is mostly parallel to one or other of the sides of the fields, but are angled a little, for the purpose of having the manure better mixed with the soil, when it comes to be ploughed up into ordinary sized ridges or lands for other crops, after the turnips have been eaten or taken off the ground, as already suggested.

But in another district, where this mode of sowing turnips is largely practised, in the extensive cultivation of the root

by some, the manner of performing the work is, after the land has been prepared and made very fine, as directed above, for the ploughman to set up three sticks or poles in a right line where it is thought most proper to begin, and by having the horses yoked double, and driven by himself with cords, these poles are seen between the horses, and by keeping the plough to bear always upon the poles, the first furrow is drawn as straight as possible. In returning, the far-side horse is kept in the new-made furrow, and the plough at such a distance as to form a one-bout ridge or drill in a complete manner, which has somewhat this appearance Δ : by proceeding in this manner over the whole, the land, when finished, displays the forms of alternate

little ridges and furrows in this way ; the distances of which are mostly as stated above, as smaller ones do not admit of ploughing between the little ridges or drills. However, in the practice of the former of these districts, the land when ridged up or formed into narrow raised divisions, the ridges have a less sharp form: thus 

In the latter of these districts, or that of Northumberland, the next processes are those of applying and turning in the dung or other manure into the little ridges or drills, which is effected in this way: a cart goes down every third interval between the small ridges or drills, and lays such matters in small heaps in it; when labourers, as women and children, are ready, and with small three-pronged forks place them out evenly in the bottoms of the three furrows of the ridges or drills; that is, in the one where the matters are dropped, and in those on each side of it. This being done, the ploughman splits the one-bout ridges, and covers up the manure exactly in the middles of new-formed ridges of the same sort: but before the sowing can take place, the tops of the ridges require to be flattened, which is done by means of a small roller, four feet eight inches in length, and nine inches in diameter, which flattens two ridges at once. On the tops, and exactly in the middles of these flattened ridges, the seed is deposited in small openings, made by one or more drill-sowing implements tied to the roller by a rope of six or seven feet in length, at which distance the roller is followed, the sowing-drill or tools being guided by a man, the

work when finished appearing in this form ; the letter *s* shewing the place of the seed, and *d* that of the substance used as manure. The ridging-up the land, and covering in the manure, are done in the same way as in the first district, by ploughs of the same kind.

And in the mode of this district, or Berwickshire, the work of manuring and covering it in go hand in hand, and succeed each other as fast as possible; the matters thus used being laid in heaps in the furrows of the different ridges or drills, from the third to the sixth, at the distance of from eight to ten feet, and immediately put carefully in along the furrows of them, when, a few being completed from end to end, the double mould-boarded plough is used, as before, to split the ridges or raised drills, and cover in the manure, which it does at one bout, leaving the ridge-tops immediately above the manure put in, rather high. These are sometimes here, in some cases and circumstances, a little levelled down before sowing, in a sort of sharp convex manner, by a light harrow run once or twice over them. But the most usual mode of flattening them is by the light wooden roller, as above, to which the drill or sowing-plough is attached, in the manner already seen. Sometimes, however, instead of the roller, a kind of sled, made of wood or iron, is had recourse to in some places, for flattening the tops of one or

TURNIP.

more bout-ridges; but the light rolling mode is much the neatest, most convenient, and ready manner of executing the work.

There are different other modes and practices of performing the business of putting in the seed, in the ridged-up and drill manners made use of in different places; but as they are not common, or of much practical importance, they need not be mentioned here.

In putting in the seed of turnip crops in this way, a great number of different kinds of drill-sowing implements and contrivances are made use of; but those wrought by horses, and which are so formed and attached in their different parts, as to perform all or most of the several operations of the process at the same time, are, in general, the most proper and convenient for the purpose. Whatever contrivance of this nature is, however, employed, it is constantly necessary to take care that the seed be regularly delivered and put into the soil; as from the smallness of the perforations in the revolving cylinders of most of them, the seeds are liable to be obstructed in passing, and the regularity of the delivery and sowing thereby prevented.

Every district has mostly its favourite drill-sowing implement for this purpose. In the first of the above, they, for the most part, make use of a tool of this sort for sowing turnips, which has a cylinder or small barrel of white iron or copper, and that is mounted on an axle with two wheels. The barrel is perforated with holes at equal distances, and as it turns round with the wheels, the seed falls equally out, and exactly in a straight line. This cylinder and wheels are fixed to a light frame-work, which has two stilts, and is kept on the top of the ridge or drill by them, by a man or boy, who walks behind, as in managing a common plough. Before the cylinder there is fastened to the frame-work a sort of coulter, which makes a kind of small rut-like opening for the seed, and behind is fixed a rake with two or three teeth, which mixes the seed that is dropped with the mould of the soil, and covers it; and as the horse and implement return by the next furrow or interval to the right or left, the opposite end of the roller rolls the ridge sown, and compresses or flattens the top of that on which the sowing implement follows. When it is necessary to do much work at a time, two sowing tools are had recourse to, which follow the same roller, and sow two ridges at once, and the seed is rolled in by a second roller.

An improved tool of this kind has been invented, which flattens two ridges or drills, forms the little ruts or openings on their tops, puts in the seed, and covers it in all at the same time, by which much saving in tools and labour is made. It is a very complete implement for sowing in the raised drill or ridge method. It is made and much used in Berwickshire.

Sometimes the roller used for the seed in these cases is a kind of low broad wheel, which is attached to the sowing tool, and rolls only on the track or rut where the seed is put in, which may answer where the work is on a small scale.

On fine land, fully prepared with reduced dungy matter, and on which it is considered unnecessary to horse-hoe, a sowing implement of this sort is sometimes used, which is attached to the common sowing-plough; and one tool following the other, the seed is sown in rows, at a regulated distance and depth. This tool and mode of sowing answer well in such cases, and are much employed in some parts of Yorkshires.

In cases where powdery substances of the rape-cake, or other such kinds, are to be put in as manure with the turnip-seed, in this way, a sowing implement of this sort has lately been contrived and had recourse to in some of the southern

turnip districts, with much utility and benefit. It sows the seed and dust in regular lines and quantities, on two ridges at the same time, the horse passing in the furrow or interval between them. This is effected by having proper cups and funnels for depositing the cake in addition to the other parts, as seen above. It is a very complete and useful tool for the purpose.

Where, however, the seed is to be sown in the drill manner on the level surface, without its being raised in ridges, as is the practice in some districts, especially when formed at narrow distances, as not more than twelve or thirteen inches apart, the larger contrivances of this sort, which sow a number of rows or drills at the same time, may be the most proper and advantageous, as being more quick in performing the work. There are many other implements of the same kind, which are useful, and suited to different cases of sowing in this way. See *TURNIP-Drill*.

In whatever manner turnip-seed is put into the ground, experience has shewn that it is of much consequence to have it done in such a way, and under such circumstances, as that the germination and early growth of it may be in as ready a manner as possible, as upon this a great deal in the goodness of the crops depends, as has been already seen. It has been supposed by some that the seed, in order to secure these effects in the most certain manner, should be put into the soil to the depth of three or more inches; and that the superiority of the drill method of sowing partly arises from the seed being placed to a greater depth, and growing more rapidly, on account of having more moisture, so as to have the plants become sooner out of danger from insects, or other such causes of destruction; while others think, from these circumstances, that it should be covered in only in a light manner.

A late able practical writer, however, suggests, that as air is necessary as well as moisture to the vegetation of seeds when placed in the ground, it would seem probable that the quick sprouting and growth of such crops may be the best and most effectually secured, by only putting them into a middling depth, and according as the particular nature of the land, and state of the season may be, as from an inch and a half to about two inches, as the soil or season may be inclined to be wet or the contrary. In this way, it is believed, the inconveniences arising from the seed being too much parched and dried by its being exposed near the surface, and from the want of the action of the air on account of its too great depth, may be equally avoided. As crops of this sort are, for the most part, put into the earth during the hotter months, there is another circumstance that may be of equal consequence, it is supposed, in promoting the quick shooting and growth of the young plants; which is, that the seed, especially in such hot seasons, be well imbued with moisture by soaking it, and consequently with the oxygen principle of the air, as already suggested, before it is committed to the ground; as by such means, there will be less required to be drawn from the mould of the soil which surrounds the seed, and the process of vegetation almost immediately takes place. Sir George Staunton, in his account of the "Embassy to China," as well as Mr. Gillet, in the "Bath Papers," have likewise ascribed the preservation of turnip-crops in that country as well as this chiefly to this practice; and by it good crops of this sort may often be produced, where they would otherwise almost wholly fail. And the correctness of the practice and principles on which it depends, is further supported by the success of the general custom of putting in these crops on the moist, new or fresh turned-up mould. Some interesting and useful observations and experiments on the shooting and growth of turnip-seed, may be

he seen in a pamphlet "On the Failure of Turnip-Crops," by the Rev. H. B. Stacey, but which we have not room to introduce here.

After-culture of the Crop.—It is of much consequence in the production of good crops of this sort, to have this part of the culture of them well performed, and at such times as are most suited for promoting the growth of the young plants, as well as preventing those of the weed kind from rising and injuring them by the shade and obstruction which they produce; as without considerable attention in these respects, the labour and expence employed in preparing the land, and putting in the crops, mult, in a great measure, be thrown away, from the want of a sufficiently adequate return being afforded. This culture is constantly to be accomplished by means of the hoe, in some way or other. Where the crop has been put into the soil in the broad-cast manner, the hand-hoe only can be made use of for the purpose; but where the seed has been sown in rows by the drill, or in other ways, and a sufficient space of interval allowed, those of the horse kind may be employed, either alone, or in addition, after the plants have been properly set out in the hand manner, to suitable distances.

It is the common practice, when the plants have produced four or five leaves, or when they cover a circle of three or four inches in diameter, which mostly happens, in favourable seasons, in the course of about a month or six weeks from the time of the seed being put in, to begin the different operations in this sort of work. In the first of which, such plants as stand too close are to be struck out, to leave the others at a suitable distance, according as the circumstances of the season, the nature of the soil, the period of sowing, and the use to which the crop is to be applied, may be. When the season is hot and dry, the striking out of the plants in the first hoeings should not, however, be such as to leave them at too great a distance; as by keeping the remaining plants pretty close together, the moisture may be better preserved in the land, and the crop rendered more secure; but in rich soils, when early sown, and when intended to be consumed by stock at an early period, a greater striking out of plants at first may be advantageous. In the practice of some, the most usual custom is to leave the plants in the first hoeings at the distance of from six to eight inches from each other, but others prefer a still greater distance. In the second hoeing, which should be performed in the course of about a fortnight, or three weeks, from the first, according as there may be a necessity, the plants that are to remain for a crop may be left at the distances of from eight or nine to twelve or more inches in the broad-cast practice, and at those of from nine or ten to fifteen, or a greater number, in the rows where the drill method is employed.

In these second hoeings, the mould between the plants should always be well stirred, in order that it may be rendered perfectly mellow and well aerated, and any weeds that may have risen be effectually destroyed. The future hoeings that may be necessary in crops of this sort are to be regulated by the particular circumstances of the cases; but the mould should never be allowed to become too stiff and compact about the roots of the plants, or any weeds be suffered to interfere with them.

It is the practice in some places, especially with the broad-cast crops, to pass a light harrow over the land once in a place, as soon as the plants are sufficiently strong, in order to render the first hoeing more effectual; and even in particular cases, where they push forward rapidly, it is made use of a second time in the contrary direction. In performing the work, however, great care is necessary, particularly when the plants are thin upon the ground, as otherwise too

many of them may be dragged up, and the crop be much injured from the want of a sufficient plant.

In the ridged crops in the latter of the above drilled turnip districts, it is the practice, when the plants have got four leaves, to begin to hoe, leaving the plants at only eight or nine inches distance in the rows; and as they have so much room sideways, or from row to row, the hoers go in that manner and pull out the surplus plants, weeds, and other matters into the furrow or hollow space between ridge and ridge, and the turnip plants are left as regular as if they had been planted out with the greatest care and exactness, the work being performed by women and children at but a trifling expence. After this, when the plants left have perfectly recovered and established themselves again in the soil, as is mostly the case in about eight or ten days, the earth is taken from the rows where the turnip plants stand, by a light plough contrived for the purpose, and turned upon the pulled and struck-out plants and weeds left by the hand-hoers, in the furrows or intervals of the ridges. And when they have once more recovered themselves from this part of the work, and are become again in a vigorous state, or when other circumstances render it necessary; the mould, which was in the former process turned from the turnip rows, is now divided and laid up equally to the different rows by the same tool, or a similar one with a double mould-board. By these means, where the land is clean and free from weeds, the work is completed; but when the contrary is the case, additional hoeings and ploughings are given, according as the state and other circumstances of the land may be.

But in the former of these districts, where the horse as well as the hand methods are had recourse to, they proceed in a different manner. In the former or horse mode, when the turnip plants are from one to three or four inches high, or when weeds begin to appear, a small light common plough of the swing kind, drawn by one horse, goes along one side of the ridge or drill, and turns off the earth from the young plants, and returns on the other side, doing the same, leaving the plants standing on sharp ridges. But sometimes, instead of this plough, the work of turning the earth off from the different sides of the plants on the ridges is done by a tool of the same nature, mounted with two sharp coulter, which cut or pare from both sides at once, and which on smooth fine land performs the work equally well and much more expeditiously. It is indeed an excellent tool for the purpose, when properly formed and made use of in the work.

In the latter or hand method of hoeing, which is had recourse to two or three days after the earth is turned off from the plants, the hoers go to work, making use of a hoe of from five to eight inches in breadth, and at one stroke across the ridge, cut out the weeds and unnecessary turnip plants, and leave the crops sufficiently thinned and set out.

When the crop has been horse and hand hoed in this manner, the field is left in that state for ten or fifteen days, and if weeds grow fast, the same work is repeated. In ordinary circumstances, the whole work of horse and hand hoeing only costs about 7s. the acre.

The turnips are now to be furrowed, or earthed up, which is done after they have been clean hoed, and are beginning to bottle, by having the earth lying between the rows, which was turned off as above, from both sides of the plants, again laid up to them by means of a double mould-boarded plough with one horse. The whole work is now finished, except only removing any weeds that may afterwards arise.

TURNIP.

It has been suggested by a large cultivator of this sort of crop, that these advantages may be equally well attained, and with more success and less danger and inconvenience, by means of paring only one side of a ridge at a time, leaving the other to be performed some time afterwards. It is thought too, that this practice of paring one side only at a time with a single plough, and leaving the other untouched for several days, has many important uses and some superiority. The tool, in this manner, is capable of going nearer to the plants; the drought has not so much impression on their growth; and the land has more benefit from the atmosphere by being stirred at different times, than when the mould is directly thrown into its first bed, as in the common manner.

In this mode of proceeding, the work is reversed at times in an alternate manner, and continued as long as a passage is allowed to the plough by the stems of the turnips; and they are never *set up* at all.

Much advantage in the hoeing of turnip crops may often be gained by having the seed put in at different times, as by this means six labourers have been found capable of performing the work twice over more than one hundred acres, while in the contrary circumstances, a much larger number is always necessary for the purpose. See HOEING.

In the hoeing culture of turnips, many different tools of different sorts are in use; but in the horse method, the work can be well and correctly performed by any light small plough. In this work, some use one which is about five inches in width at the bottom behind, and eleven at the top, which answers well for working the intervals of the drills or ridges. But in setting or earthing up the rows, one of the double mould-boarded sort is probably better, as being more expeditious and convenient. Improved tools of this sort have been contrived, with coulters that are moveable, for cleaning these crops, which by their capability of being readily set to different distances, so as to suit the different widths of the rows, not only perform the work of paring off and removing the earth from the different sides of rows at one operation, but which, by having their earth-boards so attached, as to be set differently as to width, effect the work of moulding up the plants. In managing the business by this tool, there is evidently not only an advantage in double the quantity of work being performed, but in the different operations and processes of it being effected in a more correct manner, such as those of stirring the mould in the intervals of the ridges or drills, and the application of it to the stems of the young plants on or in them. For these purposes, the tool of this sort, which has lately been invented by Mr. Waistall, may also be found very useful in different cases. See TURNIP-Hoe.

In whatever way the work may be performed, or whatever tool may be employed for the purpose, it will always be of great utility to have the earth and mould well loosened near to the roots of the plants, when they are stiff in any way, and to have all weeds well cleared out from about them.

Dangers to which exposed.—Turnip crops are liable to danger from different causes during the more early stages of the growth of the plants, but the principal of them are those of the attacks of the fly, the slug, and the black caterpillar.

The fly chiefly preys upon the sweet tender seed-leaves of the young plants, and its presence is rendered sufficiently evident by its leaving many little brown spots on them, and by its eating away their fleshy green parts down to the fibres of the leaves. It is said to increase in size, and the number to become larger, until the plants be wholly de-

stroyed. It is supposed by some, that from these insects being extremely numerous on such leaves of turnip plants, and not eating, but, as it were, *sucking* their sap or juice through long probosces or organs, that serve to attach them to the leaves in somewhat the manner of leeches, they may, in some measure, be the cause of the very slow progress that is sometimes made in such plants to push into *rough leaf*.

The ravages of the slug are readily ascertained by looking to the edges of the leaves, as it begins first to feed upon them, gradually afterwards proceeding from one part of them to another, until each is more or less consumed, sometimes exhibiting in the whole of the crop a partially eaten state. In many cases, almost the whole of the plants is destroyed.

The depredations of the black caterpillar mostly take place after the crops are in a more advanced state of growth, and the plants have formed considerable tops, and are in what is usually termed *rough leaf*; the green parts of the leaves in such cases being eaten through and destroyed, consequently the growth of the plants greatly retarded.

A great many different practices have been proposed and had recourse to at different times, for guarding against the destruction produced in these ways, but hitherto probably without any great success in effectually preventing it. In this intention, the blending of new and old turnip-seed together, or such as has been moistened, and such as is dry, and using them as seed for raising the crops, has been advised by some, as by this means the plants, as crops, coming up at different times, may be less in danger of being wholly destroyed, or may escape in sufficient quantity for the purpose, especially as such insects are well known to frequently make their attacks suddenly in large numbers, destroying the plants as they rise, and as suddenly disappearing again, leaving those that come a few days afterwards untouched.

On the supposition that other sorts of plants are more desirable and liable to be fed upon by this destructive insect than that of the turnip, the old practice of mixing and sowing other kinds of seeds with turnip-seed, as those of the radish and some other sorts, has lately been revived, and much extolled by different persons, but probably the method is extremely uncertain, as it cannot be successful, except when the different kinds of plants rise pretty exactly at the same time, which, from the great difference in the vegetative powers of different seeds, will rarely be the case. Any use that can be gained in this way, must probably be by employing the seeds of such preferred plants, as are rather more quick in their sprouting and growth than those of the turnip, as, where this is not the case, the turnip plants may often be destroyed before the others are in a state to be fed upon. The dusting of the leaves of turnip crops over with caustic lime in the state of fine powder has been tried, and found useful in saving them in some cases. The same substance, as well as those of vegetable ashes and soot in their reduced states, when used by being thrown over the crops by the hand in pretty large quantities, have likewise occasionally been used with benefit against this insect as well as the slug. The sprinkling of tobacco-water, either simply, or in mixture with soap-suds and urine by proper means upon the plants and land, has been found to destroy the slugs in a ready manner and to prevent their increase. Heavy night-rolling has long been practised with supposed success against both the fly and the slug. And the practice of treading with sheep, by keeping them in constant motion on lands cropped with turnips, as well as that of sowing barley-chaff over them, has been

TURNIP.

thought useful against the latter. This last too, as well as the tobacco mixture, has been tried with benefit against the black caterpillar, a bush-harrow being previously passed over the crop to dislodge the insects. The barley-chaff is to be applied over the crop on their first appearance.

A great variety of other means has been proposed in these intentions, but probably with no very great success. See *BLACK-Canker*, *SLUG*, and *TURNIP-Fly*, *Prevention of*.

In turnip crops, the roots of the plants are liable to have a large sort of excrescence formed below the small apples or bulbs, which, after becoming in a state of something like maturity, takes on the putrid process, and sends forth a most offensive smell. Plants in this condition are mostly stunted in their growth, and the crops indifferent. It is said to depend on soil, and that the soils of some turnip districts are subject to it until they have been clayed or marled, which is almost a certain remedy for it. This is the case with Norfolk; the soil is perhaps too light. The knobs often contain a small worm in the centres of them, which may be the cause. Taking out the affected plants and stirring the earth about the others may be useful. See *ANBURY*.

On some thin light soils too, especially in dry seasons, these crops are sometimes liable to be affected with a sort of white mouldy state, which injures and checks the growth of the young plants greatly; the chief means of removing which, is that of proper thinning and stirring the mould about the roots of the plants. When it occurs in deeper soils, benefit may be derived from rendering them more dry by deeper furrowing between the ridges. See *MILDEW*.

Turnip-plants often send off numerous stringy roots with knobby lumps at the ends of them, which are liable to decay and come to nothing, or what farmers term *fingers* and *toes*, instead of bottling or forming bulbs. This mostly happens in new or fresh land, and no mode of preventing it has probably yet been discovered. Utility in such cases may, however, be derived from better tillage and preparation.

Where these crops have been destroyed by the fly, or in other ways, the same lands should not be re-sown without a slight ploughing, as is too often the practice, as there must always be great danger of the crops of the second sowing in such cases. It is better either to leave the land wholly for wheat, or to give a shallow ploughing or scuffling before the turnip-feed is again put in. Transplanting is said to have been employed with benefit in such cases, as the young turnip plant is found to succeed in this way.

The seasons most favourable to crops of this sort, are those in which the weather is warm and showery, without much continued rain. In the autumn and winter periods, when the changes from frosts to thaws are frequent with rain, the roots are liable to much injury, by becoming decayed and rotten; and where they stand well in them, seldom afford the quantity of nourishment and support for stock that may be fed on them that is usual under other circumstances. They are liable too to be much hurt in the winter season by the wounds and punctures made in them by different sorts of birds, as wood-pigeons, rooks, and some others; against which they should be guarded as much as possible.

The expenses of raising crops of this sort must necessarily vary considerably according to the nature of the soil, the crops which they succeed, the methods of putting them into the ground, the situation, and many other circumstances of different kinds; but in the ridge or drill practice, they may in many cases stand in this way.

Expences per Acre.

	<i>£</i>	<i>s.</i>	<i>d.</i>
Ploughings, three at 8s. - - -	1	4	0
Harrowings, ditto at 4s. 6d. - - -	0	13	6
Cleaning by hand-picking - - -	0	7	6
Making up ridges or drills - - -	0	4	6
Manure and labour, half allowed - - -	2	5	0
Covering up ridges or drills - - -	0	4	6
Seed - - - - -	0	1	8
Sowing by the drill - - - - -	0	1	0
Horfe-hoeing twice - - - - -	0	1	8
Hand-hoeing once - - - - -	0	6	0
Earthing up rows - - - - -	0	1	0
	5	10	4

In the broad-cast practice, the expenses may mostly perhaps be a little lower than in the above estimate.

It is in most cases the practice to sow barley after turnip crops, but in some northern districts, wheat, and other crops with seeds, are occasionally put in after them, when fed off with sheep, and cleared early on one ploughing.

The quantity of produce or food for stock which is afforded by crops of this sort, must, of course, differ much according to the differences of season, the nature of the soil, and the mode of culture that is pursued; but a medium crop, where the land is good and suited to the purpose, may afford fifteen tons or more on the acre; in many cases, however, it will be much less. The value of such crops must depend upon many different circumstances, as their quality and abundance, the manner in which they can be consumed, as on the land, or in cribs and stalls, in feeding or rearing live-stock of different sorts, and on the state of the market for the sale of such stock; but in common, it may be from about three or four to six or seven pounds the acre, and in some cases considerably more, as ten and upwards. An acre of good turnips will fatten a beast of forty stone and more, or about eight sheep.

Seeding Crops.—In raising crops for seed, which is the produce of the second year's growth of the plant, considerable attention is necessary in the view of producing such as is good; as when it is collected from such crops as have been sown three or four years in succession, without transplanting, the roots are liable to be numerous and long, and the necks, or parts between the bulbs and leaves, coarse and thick; and when taken from such as have been transplanted every year, these parts are apt to become too fine, with too great a diminution of the tap-roots. The best and most certain way is, therefore, to take seed from turnip plants that have been transplanted one year, and sown the next; or transplanting once in three years is supposed by some sufficient for preserving it good. The most suitable manner of performing this is to select such turnips as are the hardiest, the best of their kinds, and that have the most perfect forms, from the common crops; and after cutting their tops off, to transplant or remove them, in the latter end of the autumn, into ground that has been well prepared for them, where birds can be kept off. The seed will become ready for gathering towards the close of the ensuing summer. Some prefer that the seeds taken from a few roots, transplanted in this manner, should be preserved and sown in the drill method, for the purpose of providing plants for affording seed for the general crops, taking out all such as are weak and improper, leaving only those that are strong, and which have the best growth; and that when these have *appled*, or formed bulbs, to again take out such as do not appear good and perfect; as, by this means, turnip-feed may be procured,

TURNIP.

procured, which is not only of a more vigorous quality, but which is capable of vegetating with less moisture, and which produces stronger and more healthy plants, and, of course, better crops. The custom of transplanting the whole of the turnips in this intention is said to be too expensive, as well as injurious in some respects.

In either of these modes very good turnip-feed is capable of being raised and provided. When the feed, in these cases, is become fully ripe, the crops are mostly reaped by cutting part of the stems with the seed-pods upon them, afterwards tying them up into wads or sheaves, which, when properly dry, are carried and put into long narrow stacks, to be kept through the winter, and threshed out near the time when wanted in the spring. As in this way, however, much feed is liable to be shed and lost, on account of its readiness to escape from the pods in which it is contained, it is probably a much better practice to have it immediately threshed out, either upon a cloth in the place where it grew, or in some other more convenient spot, being then put into proper bags, and placed in a situation which is perfectly dry.

As crops of the seed kind are subject to injury and loss in many different ways, the quantity of produce must be different under different circumstances; but it may be said in common to be about twenty or twenty-four bushels on the acre. And as the price of turnip-feed is seldom less than seven or eight shillings the bushel, from the great demand for it, the culture may seem at first to be very beneficial; but from the exhausting nature of the crop, the loss in that of the grain, and the quantity of manure afterwards necessary, it is probable that turnips can only be seeded to advantage in particular circumstances of soil and situation. As often as possible, however, the farmer should raise his own, as that of the shops is in general less to be depended upon.

Application and Use of the Crop.—The turnip is a plant or root that is capable of being made use of in different intentions, but the principal are those of feeding, supporting, and fattening different sorts of live-stock, in which there are great differences in the practices of different districts of the kingdom; but the most economical and beneficial modes of applying and consuming it, under different circumstances of soils, situations, and animals, have probably not yet been sufficiently investigated and ascertained by those engaged in the cultivation of the root. It is stated by a practical writer, that though few trials have been made to determine the particular state or condition in which these roots afford the greatest and most suitable proportion of nourishment for different animals that are fed on them, it would seem, from their containing a much larger quantity of rich nutrient matter in their fresh state, before being taken from the ground, than afterwards when removed and packed up, as shewn by the shrinking and loss of weight that takes place, to be a more saving and useful practice, particularly where the nature and situation of the land and season will admit of it, as on dry lands in most of the southern parts of the country, to consume them under the former rather than the latter circumstances; but in more cold and exposed situations, as in many places in the northern districts of the kingdom, and wherever the lands are inclined to moisture or heaviness, as the roots may be greatly injured by frosts and other causes, and the animals receive much harm from the coldness of such places, while feeding on them, as well as the lands be much damaged by their treading, it may be better to eat them under the latter conditions. There are likewise other situations and circumstances, it is supposed, in which it may be particularly necessary, as well as bene-

ficial, to make use of turnips after being drawn, removed, and stored up, as those where it is difficult or inconvenient to raise and provide other sorts of green food for the winter and spring use of stock.

Wherever crops of this sort are, however, taken from the land, to be consumed by animals in other places, as from their nature and large growth they must exhaust and deprive it of its fertility greatly, it will constantly be proper and necessary to return an equivalent in manure, otherwise the harm done in this way may more than equal the benefits of the crop. And in all such cases, the tap-roots and other waste parts should always be removed and left on the land, that neither soil nor manure may be taken away, by adhering to them.

In cases where the lands are properly dry, in a high state of fertility, and under good management, it may often too be an advantageous and economical practice to have a partial recourse to both the methods, by having one part of the crop drawn, removed, and eaten off the land, in some adjoining convenient place for the purpose, and the other fed off on the field where they grow; as, by such means, a much larger quantity of land may be benefited and improved, without injury to the crops that may afterwards be grown on the turnip land.

In this mode of improving lands, a great deal more is yet probably capable of being done than has hitherto been the case, when its vast utility and powers in different ways are fully considered.

Some difference in the use and manner of consuming this sort of crop likewise takes place, from the kind of stock to which it is applied; as when used in the rearing, keeping, and fattening neat-cattle stock, it is, for the most part, pulled up and eaten, either after having been removed to some proper dry field or spot of ground of the grass or stubble kind, or to some shed or other building near the straw-yard or feeding-house; in the latter case, being given the stock in bins, troughs, or cribs, or placed before the heads of the cattle in stalls, when tied up, that are contrived for the purpose. The latter of these two modes of eating the root is supposed the better, though less frequently made use of, as there is the least possible waste, while, at the same time, the dung and urine of the cattle are the most extensively and effectually preserved. In the former of these methods, the usual practice is first to admit the fattening flock, and then to allow the lean to follow them, and eat up what may remain. In this way there is the least loss.

The cattle are mostly confined wholly upon the roots, except when prevented by the state of the season, when they are consumed in other places, or as above. In some cases, the lands to which the roots are removed, in this method of feeding, are those intended to be used for other crops in the ensuing year, by which the different fields, of course, in their turn, have the benefit of being improved in this way most conveniently; and the practice is found more useful than feeding them on the land where they grow. The roots, in these cases and modes of consuming them, should not be scattered over the ground in too thick a manner; as, where that is the case, much loss must necessarily be sustained by their being crushed and bruised by the feet of the stock, while upon them.

These several different practices are much had recourse to in some southern turnip districts, where great numbers of different sorts of this kind of stock are every year fattened on turnips.

In cases where milk is a principal object with the farmer, this plant and root are also capable of great use as a proper juicy food for cows, care being taken that the decayed

leaves and other parts be not given, as they are apt to communicate a disagreeable flavour to it. The offal produced in such cases may be given to the dry stock, by which little or no loss will be sustained in the consumption of the root. This taste in milk is said to be completely removed by the use of a very weak solution of nitre in water.

These roots, too, have been usefully applied in the feeding of work-horses, as by their means the usual quantity of corn may, it is said, be lessened nearly one-half, and the horses rise in condition at the same time, as well as perform their labour equally well, and be more free from bowel complaints than in the common manner of feeding them. When used in this way, they should, however, be chopped, and have dry food of some sort joined with them in proper quantity.

The most extensive use and application of this crop is, however, in its consumption by sheep, particularly where the more suitable improved sorts prevail, in which the most general practice, where the lands are properly light and dry for the purpose, is that of confining them upon a suitable proportion of the crop by hurdles, or other means, and removing them to fresh parts, portions, or *breaks*, as they are sometimes called, every eight or ten days, or oftener, according to circumstances, or as the spaces may be eaten and cleared by the stock. Where the crop is used as the food of ewes and lambs, the former are sometimes confined in this way, and the latter left at liberty, as feeding more readily in this manner. But where the soils are of a more deep and heavy retentive quality, it is more usual, and a better and more beneficial method, to have the roots drawn and removed, as wanted, to some adjoining field to be consumed by the sheep, somewhat in the way noticed for cattle; as, in this manner, there is not only less injury and waste by soiling and treading the turnips into the ground, but the sheep get a more certain and regular supply of fresh roots, by which they do better, and the shells, by being left clean, are more fully and completely eaten up by the store cattle that are afterwards put upon them for the purpose. In some cases and states of the land too, in the former mode, it is the practice to have the crop partly eaten off on the land on which the turnips grow by sheep, and partly drawn and removed, to be consumed in other places. In such cases, the method is usually to turn the sheep upon them as they stand in the field; but, except the bulbs be much exposed above the soil of the land, it is probably a better practice to have the roots pulled up on the part, before the sheep are turned in and confined on it, as in this way they are not only less apt to break and soil the turnips, but feed and fatten much better upon them. This practice is much in use in some southern districts.

In some situations, the hilly parts have the turnips fed off in this manner by sheep, with a certain quantity of hay allowed for every acre thus eaten off, beginning with a break or portion from the lowest part of the field, and allowing a new portion or *bitch* every day, still gradually rising, clearing the whole off in time for preparing the land for the following crop. The crops on the more flat and heavy parts of the lands are drawn and removed, to be eaten with hay or other dry food in proper places.

It has been suggested, that much loss is often sustained in these modes of feeding off turnips by folding sheep upon them, particularly where the crops are raised in the broad-cast manner, and it is the custom to give the sheep large folds or breaks at a time, in consequence of frost or snow taking place. In such cases, it is supposed the ridge or drill method is far preferable, as it is easy to have the pens or trays made and fixed in such a manner as to constitute a sort of moveable crib or trough, the bars being set near the

sides of the rows, and the boards from ten to twelve inches in breadth, having flakes of suitable lengths, as the depths of the soils may be, nailed to them, and secured on the sides from which the sheep feed. The narrower the spaces the turnips are included in, the better. As it may be imagined that the animals may get in among the turnips so fenced off, it is said that, supposing the roots may occupy a regular space of about twelve inches, the troughs may be made little more than a foot in width at the bottom, having a sloping direction upwards. The bars may likewise have an inclination towards the sheep, and hang over the troughs or the parts in which the turnips are inclosed, and thus prevent them from getting in. It is supposed that in this way the sheep will have their food quite clean, and that by setting off only at a time the quantity necessary for a day, they may eat it with more avidity, and without the danger of spoiling so much by their discharges, as is mostly the case in the common circumstances of feeding upon the root.

On examination, it is contended that this mode, when even largely employed, will be found to be better in many respects, as well as a great deal cheaper, as, on the most moderate calculation, three sheep may be kept in this way to two by the common old method, or perhaps even double the number, and they will fatten much sooner. And on the principle that animals do not feed so well when a redundancy of food is before them, it is thought that if the sheep, in such cases, were driven into the straw-yards for the night, and even to eat straw in the morning, they would retain the turnips longer, and fatten quicker; while, in the mean time, the persons employed in looking after them might move the hurdles a row further, and thus little time be lost. If both fattening and store sheep should be kept in this manner, it would be proper to give the feeding stock rather more roots than are sufficient for the day, and to turn in the store sheep the succeeding day to consume what may be left. In this mode, the length of turnips that may be necessary, without waste being committed, may soon be discovered. It would seem, however, that from the constant trouble, difficulty, and expence of the plan, in providing hurdles, and fixing them for the folds, they would render it incapable of being put in execution, except in cases of a small number of sheep, where it may be an improvement, and a more economical manner of feeding off turnip crops by such sorts of stock.

In the practice of hurdling for this purpose, great attention is necessary to see that the hurdles are at first well set into the ground, and secured by flakes of sufficient length, with proper withs for tying them together, as after frosts and thaws, or snows, they are very apt to be thrown down by the wind, and other causes. The best sort of hurdles for this use is that of the flatted kind; and a material of the netting kind is sometimes employed, which is called *toiling*, but it is more expensive. See HURDLE.

In whatever manner the feeding off turnips by sheep is done, the hurdles should always be set in such directions and forms, as that labour and expence may be saved as much as possible.

In some districts, the practice of feeding off these crops in a partial manner, or that of *pull and throw*, has given way to that of consuming them wholly upon the land, from the full conviction of its greater utility and profit; while in others, the mixed method of eating the root is still had recourse to, as being preferable for the purpose, and affording more benefit.

As it is found, in the fattening of sheep on this crop, that they make the greatest progress just before the turnips begin to run and form their seed-stems, which is supposed to

TURNIP.

to depend partly on their containing the greatest proportion of rich nourishing matter at that time, and partly on the weather becoming more dry, warm, and settled; the shoots are sometimes mown off in the spring, and by the lateral sprouts and leaves, a more copious supply of green food is not only afforded, but the roots are preserved longer in a condition fit for use in this application. The feeding or fattening qualities of these roots are, however, much disputed by some, except when some sort of dry food is made use of with them.

In the feeding of these crops off by all sorts of stock, regard is to be had on first turning upon them, that they do not continue too long, as otherwise injury may be sustained by the distension that is sometimes occasioned by their eating too freely of them, or their being *hoven* or blown.

Where these crops are drawn for winter and spring use, it is sometimes necessary to have them preserved in some way or other. See TURNIPS, *Preserving of*.

Great attention in many ways is necessary to turnip crops, as being the foundation of several of the most beneficial practices of the farmer.

Stealing or otherwise destroying turnips, when growing, is by statute punishable criminally, by whipping, small fines, imprisonment, and satisfaction to the party wronged, according to the nature of the offence. By 13 Geo. III. c. 32. the offender shall, on conviction before one justice, by confession on oath of one witness, forfeit such sum, not exceeding 10s. over and above the value of the goods stolen, as to the justice shall seem meet; and in default of payment, be committed to hard labour, for a time not exceeding one month.

No person shall be prosecuted for any such offence, unless the prosecution be begun within twenty days after the offence committed. The provisions of this act have been extended by statute 42 Geo. III. c. 67. in three particulars; *viz.* in the description of the offence, inserting *injuring barns and orchards*; in the penalty, making the sum not exceeding 20s.; and in the term of imprisonment, which is made two months.

TURNIPS, with regard to *diet and medicine*, are accounted a salubrious food; demulcent, detergent, somewhat laxative and diuretic, but liable in weak stomachs to produce flatulencies, and prove difficult of digestion; the liquor, pressed out from them after boiling, is sometimes used medicinally, in coughs and disorders of the breast. The seeds have been accounted alexipharmic or diaphoretic; they have no smell, but discover to the taste a mild acrimony, seemingly of the same nature with that of mustard-seed, though far weaker. Lewis.

TURNIPS, *Preserving of, in Agriculture*, the means of guarding and securing them against the effects of severe frosts and other such causes, by which they are not unfrequently much injured and rendered improper as the food of stock. In cases where they are designed for the feeding or supporting of neat cattle or other kinds of stock, during the winter and very early spring seasons, as they are then extremely liable to become hurt and destroyed in this way, on account of the sudden alternations of frost and thaw that take place in the former period, this becomes particularly useful and necessary. For want of this attention, the roots often become quite rotten and wholly unfit for use, as well as difficult to be got up when wanted.

In the intention of preserving them, many different methods and practices have been attempted and had recourse to at different times, but hitherto probably without any of them having been attended with complete success, and at the same time so cheap as to answer the farmer's purpose.

The only perfectly secure mode would be that, probably, of having them drawn, topped, and piled up with layers of dry straw in houses properly formed and constructed for the purpose, and conveniently situated for the sheds and other feeding places; but it would be liable to objection, except on a small scale, as being both troublesome and expensive.

A method of preserving this root, which is much in use, very effectual, little expensive, and attended with no great trouble, is that of drawing and piling the turnips up in different portions on the field where they are raised, with layers of dry straw put betwixt each of those of the turnips. In this mode, which is much practised in some southern counties, a load of straw is used to about thirty or forty tons of the turnips. The manner of effecting the work is said to be this: the turnips, on being drawn in a dry time, and the tops and tap-roots removed, a layer of straw is spread out on a dry part of the ground, and a layer of turnips placed upon it to the thickness of eighteen inches or two feet; after this another layer of straw, and then a layer of turnips; proceeding on, alternately in the same manner, until the pile or heap be brought to a sort of ridge or point; when the edges of the different layers of straw are turned up and fastened, which serves to prevent the roots from falling out, and at the same time affords a sort of external covering to the heap or pile, which is completed by being well thatched over the top with long straw.

It is supposed too, by some, that the difficulty of getting them out of the ground, and the dangers they are exposed to in severe frosty seasons, as well as the inconveniences the stock experience in feeding upon them from their coldness, and the hazard of their injuring the land by remaining too long, may all be avoided by piling them up in a similar manner, in small heaps in the stack form, the tops upwards, near to the places in which they are to be consumed, covering them over with wattles or hurdles lined with straw.

In some cases, turnips have been attempted to be preserved by being formed, without straw, after the tops and small roots have been taken off, and the former used green, into a sort of heaps termed *pies*, in the manner in which potatoes are sometimes kept, being well thatched over on the outside by straw or some other more cheap material.

They have also been attempted to be preserved in the field by covering them by deep ploughing in different manners, when perfectly dry.

A great many other modes of preserving these roots have likewise been suggested and practised by farmers and others, but they need not be noticed here, as they mostly appear less useful than the above.

In all cases of preserving these roots in the heap manner, care must be taken not to have them made too large, or too closely packed up together, as the danger of their heating and being spoiled, may thereby be, in a great measure, avoided.

By some means of these sorts, turnips may mostly be preserved, kept ready, and fit for use as food for live-stock, even in situations and seasons which are the most exposed and severe, which under different circumstances are often matters of much consequence to farmers. See TURNIP, *supra*.

TURNIP, *Swedish*. See RUTA BAGA.

TURNIPS, *Stubble*, the crops raised on lands after grain as sheep-feed, which on good dry soils often answer well. See STUBBLE-Turnips.

TURNIP-Cutter, or Slicer and Chopper, contrivances of the cutting kind, which are made use of in preparing this sort of root for being eaten by different kinds of live-stock. Implements of this nature are formed and constructed on very different

different principles, but those which have the greatest simplicity are almost always to be preferred, as performing the work in the most easy and ready manner. There is a very useful tool for this purpose, in which the roots are cut by means of a knife fixed upon a fly-wheel, the turnips being forced upon it through an inclined hopper or sort of trough. Some turnip-slicers are so effective as to cut a bushel of the root in a minute.

The chopper is made by a sort of sharp small spade, either fixed or loose, working in a box, into which the roots are thrown for being cut or chopped. The work is readily executed in this way by those who are in the habit of performing it in this manner.

TURNIP-Drill, that sort of drilling implement which is employed in the sowing of turnip-feed in the row manner. An improved tool of this sort for one-bout ridges is in use in some districts, which obviates the defects of sowing too much or too little feed. It consists of a solid cylinder, made of iron or brass, about two inches in diameter, and one inch broad, on the surface of which are formed fifteen or sixteen cavities, resembling the shape of a semi-egg when cut longitudinally, and as deep as to hold four or five feeds each. On the back of the cylinder, a little from the top, is placed the hind part of the hopper, to which is fixed a piece of iron or brass, one inch long and half an inch broad, hollowed on the inside in the form of a Gothic arch, the sides of which meeting the sides of the cavities in an oblique angle, prevent the feed from being bruised: at the lower end of this piece of iron, or gatherer, there is a slit, three-tenths of an inch long and one-tenth wide; and at the back of it, a thin flat piece of iron moves up and down by means of a screw at the top of the hopper, which enlarges or lessens the orifice directly above the cavities, and increases or diminishes the quantity of feed delivered, as the workman may think proper. This slip of iron, or regulator, is let into a groove made in the board, which forms the back-part of the hopper. The cylinder is fixed, before the cavities are made, on an iron axle one inch square, turned very true, as well as those parts of the axle which turn in the collars fixed in the handles. To the ends of the axle are fixed two wheels, twenty-six inches in diameter, which turn the axle and cylinder round, and which, in passing through the hopper containing the feed, bring forward in each cavity a number of feeds and drop them into the spout, by which means they are conveyed to the coulter, which forms a rut or channel on the top of the one-bout ridge in order to receive them. If the cavities in this sowing implement be made to hold five feeds, when the regulator is screwed close down, and there be sixteen of them, it will deposit eighty feeds each revolution; and from the diameter of the wheels being twenty-six, and the circumference eighty-one inches and a half, eighty feeds will be sown in eighty-one and a half inches, or nearly twelve feet. This being the minimum quantity, by screwing up the regulator, the number may be increased gradually to fifty or sixty in a foot, which is far more than is necessary in almost any case.

There are various other improved implements of this nature, which suit different purposes of this sort of culture made use of in different circumstances and places. See **DRILL** and **TURNIP**.

TURNIP-Hoe, a hoe employed in the culture of turnips, which is of the hand as well as the horse kind: the latter is the most ready and effectual, but both are frequently made use of in raising the crops.

A turnip-hoe chopper has lately been contrived, which is both useful in this way and for cutting the roots in feeding stock on the land. It has in the first part the make of the

common nine-inch hand-hoe, but forming an oblong square, with an eye to receive the handle from the centre of the first part or hoe, another crosses it at right angles, but this second is not made solid, as in the first common one, but, like the Dutch-hoe, the centre part is open the whole length of it. In working, the turnip being pulled out of the ground by the angles of the hoe, is immediately struck with it about the centre, which divides it into four pieces, and if these be not small enough, the stroke is repeated upon each of the pieces until they be sufficiently so. It is imagined capable of much improvement, by having two stoutish prongs on the back or reverse part of the hoe, proceeding from the neck of the eye; these prongs would pull up the turnips with a great deal more expedition, it is supposed, and the increased weight of the hoe would rather be in its favour, by lessening the force necessary to split the roots. The whole is simple and the expence trifling, which render it more valuable.

It is said that by means of this tool the turnips may each readily be sliced into as many parts, according to their sizes, as that each piece may be small enough for wether lambs, or, which is of more consequence, for being eaten by the *crores*, or old toothless ewes, which may fatten in this way with nearly equal facility as the young sheep, as they are capable of picking them up, and by a slight toss of the head, to place them so as to be properly consumed. They can thus feed on the root, when they would otherwise find it difficult to supply themselves with a sufficient quantity of food in the usual manner of nibbling the turnip, either while in the ground, or when picked up without being so cut. It is the invention of Mr. Malcolm, and is in much use in the county of Surrey, but may be beneficial in many other districts, where the practice of feeding off the crops on the land by stock is a material object to the farmer.

Hand-hoes of from four to twelve inches in width are in use, in this kind of culture, for setting out the plants and other purposes, as the nature of the crops may be. See **HOE** and **TURNIP**.

TURNIP-Rack, a contrivance of the rack kind, for sheep eating this and some other sorts of food out of with less waste than in some other ways. It is usually made about eight and a half feet long, and on one side two feet high, and on the other two feet three inches, without the feet, which are about three inches long. In the top, the middle part folds back on the rack, and on the lower part or side of it there is a bend, which serves as a gutter for preventing the rain-water falling from it on the sheep's back. The bottom opens the other way and leans against the top, for the convenience of carrying it. It is sometimes placed on low wheels. It is very useful and convenient in many cases of feeding and fattening sheep.

TURNIP Sowing Trough, a contrivance of this kind for the purpose of sowing turnip-feed with regularity in the broad-cast manner, where it cannot be done by the hand. It is somewhat in the box form, and so contrived as to disperse such small feeds with great exactness over the land. See **TURNIP**.

TURNIP-Tray, a long narrow shallow sort of trough or box contrived and made use of for the purpose of sheep eating turnips out of in consuming them upon the land, in order to prevent waste in such modes of feeding.

TURNIP-Cabbage. See **CABBAGE** and **KOHLRABI**.

TURNIP-Rooted Cabbage. See **CABBAGE**.

TURNIP-Rooted Celery, a root of that sort of the turnip form. See **APIUM**.

TURNIP-Fallow, in *Agriculture*, a term applied to that sort of preparation for the crop which is made by repeatedly working

working over the land in some way or other. The most improved practice is that of not having the autumn broken-up lands stirred again, until the surface-working in the early spring has well loosened the mould, to favour the growth of weeds, which is best performed by means of tools that operate the more superficially, as by this tillage keeping the upper parts fine and unburied that have been broken and reduced by the frosts, it is more suited to the rising of such plants than that of turning it down in a deep manner, and the work is done with greater expedition, which is a material object at such a season. This is a most excellent method; but much must constantly depend on the nature and state of the land in such sorts of work. See FALLOWING and TURNIP.

TURNIP-Fly, Prevention of, the means of guarding and protecting young seedling turnip-plants against its attacks and ravages. Though many different means of this nature have been proposed, few have been attended with much success in preserving the crops. The substances which appear to be the most promising in this intention, are those of foot and quick-lime, and urine and quick-lime, in a state of mixture proper for being thrown over the plants on the land, in a watering manner, by some sort of contrivance for the purpose, or for being put in with the feed. It is supposed that the volatile alkali, which is given off by these mixtures, may be offensive to the insects; while at the same time they afford nourishment and ready growth to the plants. In a trial with lime slaked in urine, in mixture with three parts of foot, applied by means of a small barrel, perforated all round with little gimblet holes, so as to let the quantity of about four bushels to the acre pass out, and fall into the drills with the turnip-feed, the adjoining rows were found to be eaten away, while those to which the composition was applied were scarcely touched at all. The mixture of sulphur with lime has been used, but on a full trial found wholly inefficient. Ammoniacal fumes are said to be successful by some, but further trials are wanting, and they are not very well suited for the farmer's purpose. See SEED, STEEPING, and TURNIP.

TURNITZ, or TWARDONICE, in *Geography*, a town of Moravia, in the circle of Brunn; 30 miles S.S.E. of Brunn.

TURNO VICECOMITUM, in *Law*, a writ that lies for those that are called to the sheriff's turn, out of their own hundred.

TURNPIKE, a gate set up across a road, watched by an officer for the purpose, in order to stop travellers, waggons, coaches, &c. to take toll of them, or money towards repairing or keeping the roads in repair. See ROAD.

There are several statutes, which have established regulations relating to turnpike-roads, the principal of which, besides those recited under HIGHWAY, are as follow. No person shall be capable of acting as a trustee in superintending turnpike-roads, who is not possessed of lands, &c. of the clear yearly value of 40*l.*, or personal estate to the value of 800*l.*; to which purpose he makes oath before two trustees, or their apparent of a person possessed of an estate in land of the clear yearly value of 80*l.* No alehouse-keeper, nor persons retailing liquors of any kind, are capable of acting as trustees, or holding any place under them, or collecting the toll; but they are not precluded from farming the tolls, provided some other person collects them. No gate-keeper, or person renting the tolls, and residing in the toll-house, shall gain a parish settlement, nor shall the tolls, or toll-house, be assessed to the poor-rate, or any other public or parochial levy. Any gate-keeper, permitting a violation of the orders pertaining to carriages and horses, and not proceeding with-

in one week for the recovery of forfeitures, shall forfeit 40*s.*; and both he and the surveyor shall render upon oath, when required by written notice from the trustees, an account of all money received, on pain of 5*l.*; and all officers shall deliver up their books, &c. relating to the execution of their offices, within ten days after written notice, on pain of 20*l.*; and all persons concerned in the execution of acts relating to turnpike-roads, neglecting their duty, shall forfeit 10*l.* The trustees, whose meetings are assembled by ten days' notice affixed on the toll-gates, or other conspicuous places, and adjourned for no longer time than three calendar months, or any five of them, may cause weighing-engines to be erected at the toll-gates, order the weighing of carriages and their loads, and take an additional toll for every hundred weight, over and above the following weights: *viz.* for every four-wheel carriage, having the felines of the wheels sixteen inches broad, eight tons in summer, and seven in winter: for every waggon and wain, with axles of different lengths, having the distance of the nearer pair of wheels on the ground not more than four feet two inches, and the distance of the other pair such, that the fore and hind wheels shall roll only a single surface sixteen inches wide, at the least, on each side of the carriage, and the felines nine inches from side to side, six tons ten hundred in summer, and six tons in winter: for every four-wheeled carriage, having the bottom of the felines of the wheels nine inches broad, six tons in summer, and five tons ten hundred in winter: for every cart, having felines of nine inches, three tons in summer, and two tons fifteen hundred in winter: for every waggon, having the felines of the wheels six inches broad, four tons five hundred in summer, and three tons fifteen hundred in winter: for every waggon, rolling a surface of eleven inches, five tons ten hundred in summer, and five tons in winter: for every cart of the same dimensions, two tons twelve hundred in summer, and two tons seven hundred in winter: for every waggon, having the bottom of the felines of the wheels of less breadth than six inches, three tons ten hundred in summer, and three tons in winter: and for every cart of the same dimensions, one ton ten hundred in summer, and one ton seven hundred in winter: summer, in all these cases, being determined from May 1, to October 31; and winter from November 1, to April 30. (13 Geo. III. c. 84.) The additional toll shall be as follows: *viz.* for the first and second hundred of overweight, the sum of 3*d.* for each hundred: for every hundred above two, and not exceeding five hundred, 6*d.*: for every hundred above five, and not exceeding ten hundred, 2*s.* 6*d.*: for every hundred above ten, and not exceeding fifteen hundred, 5*s.*: and for every hundred above fifteen hundred, 20*s.* The trustees, however, of the several turnpike-roads within ten miles of London, Westminster, and Southwark, are allowed to lower these additional tolls at pleasure. (14 Geo. III. c. 82.) The toll-taker offending against these regulations, incurs a forfeiture of 5*l.*; but the preceding regulations of weight do not extend to any carriage employed in husbandry, and carrying manure for land, hay, straw, fodder, or corn unthrashed; excepting hay or straw carried for sale; nor shall any toll be taken for horses belonging to officers or soldiers upon their march, or upon duty, or for any horses, cattle, or carriages, employed in carrying their arms or baggage, &c. It is required that a table of the several tolls be put up at every toll-gate. (18 Geo. III. c. 63.) For the encouragement of broad wheels, the trustees are empowered to reduce the toll of carriages, having wheels six inches broad, so that it may not be greater than that which is taken for four-wheeled carriages drawn by four horses; and for carts, having the felines of their wheels six inches broad, no more than ten carts drawn

by three horses; but for every carriage, having the felloes of the wheels of less breadth than six inches at the bottom, and for the horses, &c. one-half more than the tolls payable for the same respectively, except carriages carrying corn in the straw, hay, straw, fodder, dung, lime for the improvement of land, or other manure, and implements of husbandry. The felloes of the wheels of carriages entitled to the above exemptions, and the tire upon them, are required to be so flat, as not to deviate more than one inch from a flat surface. And all carriages, moving upon rollers sixteen inches broad on each side, with flat surfaces, shall pay only so much toll as shall not exceed half of the full toll payable for carriages having the felloes of the wheels six inches broad, and not rolling a surface of sixteen inches on each side; and half-toll shall be paid for waggons having the felloes of the wheels nine inches broad, and rolling a surface of sixteen inches on each side. These regulations do not extend to any chaise-marine, coach, landau, berlin, chariot, chaise, chair, calash, or hearse; nor to the carriage of ammunition or artillery for his majesty's service; nor to any carriage drawn by one horse, or two oxen; nor to any carriage having the felloes of the wheels nine inches broad, and laden with one block of stone or marble, one cable-rop, and one piece of metal or timber; and no toll shall be paid at any turnpike-gate for carriages employed in carrying materials for the repair of any turnpike-road, or public highway. No four-wheeled carriage, having the felloes of the wheels of less breadth than six inches, shall pass on any turnpike-road with more than four horses. Two oxen or neat cattle shall be considered as one horse. For other regulations relating to the number of horses, see HIGHWAY. Any carriage may be drawn with any number of horses upon a turnpike-road, where a weighing-engine shall be erected, provided the carriage be weighed at such engine; and the trustees may allow for hills, the rise of which shall be more than four inches in a yard, such number of horses as they shall think necessary, not exceeding ten for waggons with nine-inch wheels, nor six for carts with nine-inch wheels; and not exceeding seven for waggons with six-inch wheels, nor five for carts with six-inch wheels; and not exceeding five for waggons with wheels of less breadth than six inches, nor four for carts of such dimensions. There is also an exception in favour of carriages that are drawn in deep snow or ice. No carriages, with the felloes of the wheels of less breadth than nine inches, shall be allowed to pass upon any turnpike-road, if the same shall be drawn by horses in pairs; except such, having the breadth of the felloes six inches, authorized by seven or more trustees, and carriages drawn by two horses only. The penalty, on conviction, by confession or oath of one witness, is a forfeiture not exceeding 5*l.* nor less than 10*s.* The penalty of evading the tolls, by unloading goods, is 5*l.*; by turning out of the road, for the owner, any sum not exceeding 5*l.* nor less than 20*s.*; but for the driver, if he be not the owner, any sum not exceeding 50*s.* nor less than 10*s.*; by taking out horses, 5*l.*; or by taking the benefit of any exemptions fraudulently, a sum not exceeding 5*l.* nor less than 40*s.* Exemptions in favour of cattle going to or from water, or pasture, shall extend only to such as shall be driven from one parish to the next adjoining, or that shall not pass upon the turnpike-road more than the space of two miles. Turnpike-roads are kept in repair by the statute-duty, required by the several acts, or if this be insufficient, by contracting for labour, &c. The surveyor of any turnpike-road, who shall suffer to remain in any part, within ten feet on either side of the middle of it, for four days, any heap of stones, rubbish, &c. obstructing the passage of it, shall forfeit 40*s.*; and any person

encroaching on it by a ditch, fence, &c. shall forfeit 40*s.*; and the trustees may direct prosecution by indictment for any nuisance, at the expence of the tolls. See HIGHWAY and ROAD.

If any person shall wilfully or maliciously destroy any turnpike-gate, post, rail, wall, chain, bar, or other fence, set up to prevent passengers from passing without paying toll, or any house erected for the use of such gate, or any weighing-engine, or rescue any person in custody for such offences, he shall be found guilty of felony, and transported for seven years, or committed to prison for any time not exceeding three years. The indictment for such offences may be inquired of, heard, and determined in any adjacent county; and the hundred shall answer damages, as in cases of robbery. If the trustees erect a gate where they have no power, the justices upon complaint may order the sheriff to remove it. As for direction-stones, &c. see HIGHWAY.

The trustees are empowered to let the tolls to farm, in consequence of public notice, to the best bidder; and if the farmer of the tolls shall take a greater or less toll than he ought to do, he shall forfeit 5*l.* and the contract; and every other gate-keeper, offending in the same way, shall forfeit 40*s.* The trustees may also lessen the tolls during such time as they shall think proper, provided that the persons entitled to five-sixths of the money remaining due upon such tolls consent. The penalty for obstructing the execution of any turnpike-act is a forfeiture of a sum not exceeding 10*l.* nor less than 40*s.* to be paid to the surveyor for the use of the road, or commitment to the common gaol, or house of correction, for any time not exceeding three months, unless the money be sooner paid. Persons aggrieved by proceedings in the execution of turnpike acts may appeal, with previous notice, to the general quarter-sessions, when the justices shall determine the appeal, and award costs, &c. But all actions are limited to thirty-three calendar months after the fact committed, and to the county where the defendant resides, or the fact was done; and the defendant may plead the general issue, and if he prevails in the action, have treble costs. 13 Geo. III. c. 84. 14 Geo. III. c. 82. 16 Geo. III. c. 39. 17 Geo. III. c. 16. 18 Geo. III. c. 28. c. 63. Burn's Justice, art. *Highways*.

The first turnpike-road erected by law was A.D. 1663. 16 Car. II. c. 1.

TURNPIKE is also used, in the *Military Art*, for a beam stuck full of spikes, to be placed in a gap, a breach, or at the entrance of a camp, to keep off an enemy. See CHEVAL *de frise*.

TURNSOLE. See TURNESOLE.

TURNSPIT, VERSATOR, in *Zoology*, a variety of the dog (which see), which belonged, in the arrangement of Dr. Caius, to the class of degeneres, curs, or mongrels.

This breed is much on the decline in England; though still used in some other countries.

TURNSTONE, in *Ornithology*, the English name of a bird, the *tringa morinellus* of Linnæus, called by authors *morinellus marinus*, or sea-dotterel.

It is a little larger than the blackbird; its head moderately thick, and its body of a longish shape; its beak a finger's breadth long, thick and whitish at the base, and sharp and black at the point; and its head, neck, shoulders, wings, and the upper part of its breast, are of a brownish colour; its throat and forehead are ash-coloured; the back and rump are white; the middle of its back is marked with a very large triangular black spot; the tail consists of twelve feathers, the lower half white, the upper black, and the tips white; the quill-feathers are dusky, but from the third or fourth the bottoms are white, increasing to about the ninetenth, when the

the feathers are entirely of that colour. Its legs are short, and of a reddish-yellow or orange-colour.

These birds take their name from their method of searching for food, by turning up small stones with their strong bills, to get at the insects that lurk under them. Ray and Pennant.

Mr. Pennant mentions another species, which is the turnstone from Hudson's Bay, and the *tringa interpres* of Linnæus; often shot in the north of Scotland and its islands, and also in North America. This bird is of the size of a thrush; the forehead, throat, and belly are white; the breast black; the neck surrounded with a black collar, whence another bounds the sides of the neck, and passes over the forehead; the head and lower part of the neck behind white; the first streaked with dusky lines; the back ferruginous, mixed with black; the coverts of the tail white, crossed with a black bar; the tail black, tipped with white; and legs rather short, and of a full orange.

TURN-UP COMPASSES. See COMPASSES.

TURNWRIST PLOUGH. See PLOUGH.

TURO, in *Geography*, a town of Naples, in the province of Bari; 22 miles S.S.W. of Conversano.

TUROE, a small island of Denmark, in the Little Belt; 12 miles S.W. of Assens, in the island of Funen.

TUROC, a mountain of Persia, in Khorassan; 15 miles S. of Mefchid.

TURON, a sea-port town of CochinChina, in a bay to which it gives name, and which is deeply indented, so as to afford shelter in some or other of its inlets from every blast of wind; the bottom is mud, and the anchorage safe, with a smooth water throughout. N. lat. $16^{\circ} 9'$. E. long. $108^{\circ} 6'$.

As this harbour affords a safe retreat for ships of any burden, during the most tempestuous seasons of the year, Mr. Barrow undertook to draw a plan of it agreeably to geometrical admeasurement. The particulars of the operation and its result are detailed in Macartney's Embassy to China, and minutely illustrated by means of a chart. This chart exhibits an irregular mountainous peninsula, inaccessible on every part of the coast, except that adjacent to the harbour, and at two small sandy bays in the entrance. This peninsula was named New Gibraltar, on account of the local natural advantages which it possesses, and which renders it capable of being made, like our Gibraltar, impregnable. The natives call this peninsula Tien-tcha. United to this peninsula is a level isthmus, from three-quarters of a mile to a mile in width, containing several small villages and patches of ground, under cultivation, chiefly of rice, tobacco, pulse, and sugar-canes. The chart presents also to view the principal town in the vicinity of the harbour, at which the market is held: the adjoining land is well cultivated; and the name given to the place by the natives, as well as to the harbour, is Han-san. Connected with the peninsula by a reef of rocks, unobserved at low water, is the northern point of a small island clothed with trees and thick brush-wood: and as the depth of water is three fathoms within a ship's length of the southern extremity of the island, a convenient place might be prepared, at a small expence, for heaving down and repairing ships. The rocks might be the foundation of a pier or causeway, and thus an excellent dock might be constructed between the island and this peninsula. Such a place would be well adapted for a repository of naval stores, magazines, or warehouses. Other appendages to this harbour are described and represented in the chart; and particularly a valley with a small village, and about forty or fifty acres of land under tillage, mostly bearing rice; a large village on the banks of a considerable river, meandering through an extensive and apparently fertile and po-

pulous valley, a cove with plenty of water for ships of any burden, good anchoring ground, well sheltered, especially from the north-east monsoon, and having at its head an extensive plain, with two villages separated by a small running stream, with forty or fifty acres employed in the culture of rice; and a group of curious marble rocks, extending across the isthmus, one end being washed by the sea, and the other overhanging the river. The adjacent country is supposed to be, in general, healthy, the violent heat of the summer months being tempered by regular breezes from the sea. September, October, and November, are the season of rains; which are also frequent in December, January, and February, attended at this time by cold northerly winds. The inundations, which take place, generally, once a fortnight, and last two or three days at a time, have an effect similar to that of the periodical overflowings of the Nile, in rendering the country one of the most fruitful of the globe. In many parts, the land produced three crops of grain in the year. Its most valuable produce, besides the precious metals, consisted in pepper, cinnamon, sugar, silk, and cotton, which the natives give in exchange for a variety of European manufactures. Not far from the harbour of Turon is the town of Fai-foo, a place of some note, and about eight miles E. of the mouth of a considerable river on the coast of CochinChina, on the banks of which lies Fai-foo; and opposite to the said mouth of the river is Callao, or, as the Europeans call it, Campello, the bearing of its highest peak from the harbour of Turon being about S.E., and the distance from it thirty miles. Staunton's Emb. to China, vol. i. See CALLAO.

TURONES, or TURONI, in *Ancient Geography*, a people of Gaul, described by Lucan (l. i. v. 437.) under the epithet of *unstable*.

“Instabiles Turones circumfita castra coercent.”

According to Ptolemy, they had a town, which he calls “Cæsarodunum,” and he names the people “Turupii.” Their city was situated in the midst of the Loire, and they inhabited the territory that lay to the N.W. of it, and belonged to the third Lyonnese, of which their city became the metropolis. They had the character of not being fond of war: Tacitus calls them “Turones imbelles,” and Sidonius Apollinaris says of them, “bella timentes defendit Turones.” When the Roman empire was destroyed in Gaul, the Visigoths became masters of this city under the reign of Euric, and it belonged to them under that of Alaric in the year 506. But Clovis, having vanquished and killed this prince in 507, took possession of the whole territory from the Loire to the Pyrenées, and also of the city of Turones, the name of which has been since changed to that of *Tours*; which see.

TURONILLA, in *Ichthyology*, a name given by some authors to the common little prickly fish called the *slick-back*, or *barnsickle*.

TUROOT, in *Geography*, a town of Hindoostan, in Lahore; 25 miles S.E. of Jummo.

TUROQUA, in *Ancient Geography*, a town of Spain, on the route from Bracara to Allurica, between Burbida and Aque Celenæ. Anton. Itin.

TUROWLA, in *Geography*, a town of Poland; 20 miles S.E. of Ploczko.

TURPE, a town of Westphalia, in the bishopric of Paderborn; 3 miles S.E. of Salzkotten.

TURPENTINE, TEREBINTHINA, a transparent sort of resinous juice, flowing either naturally, or by incision, from several unctuous and resinous trees: as the terebinthus, larch, pine, fir, &c.

Medical writers distinguish four kinds of turpentine; 20

that of Chio or Cyprus, that of Venice, that of Strasburg, and the common turpentine.

The turpentine of Chio, or Cyprus, which is the finest genuine kind, and that which gives the denomination to all the rest, is generally about the consistence of thick honey, very tenacious, clear, and almost transparent, of a white colour, with a cast of yellow, and frequently of blue, of a warm, pungent, bitterish taste, and a fragrant smell, more agreeable than that of any of the other turpentines.

This is the produce of the common terebinth, or *pistacia terebinthus* of Linnæus (see *PISTACIA*), an evergreen bacciferous tree or shrub, growing spontaneously in the Eastern countries, and in some of the southern parts of Europe. The turpentine brought to us is extracted in the islands whose name it bears, by wounding the trunk and branches a little after the buds have come forth: the juice issues thin and clear as water, and by degrees thickens into the consistence in which we meet with it. A like juice, exuding from this tree in the East, inspissated by a slow fire, is said by Kæmpfer to be used as a masticatory by the Turkish women, for preserving the teeth, sweetening the breath, and promoting the appetite.

The turpentine of Venice is usually thinner than any of the other sorts, of a clear whitish or pale yellowish colour, a hot, pungent, bitterish, disagreeable taste, and a strong smell, without the aromatic flavour of the Chian kind. The true Venice turpentine is said to be obtained from the larch-tree, or *pinus larix* of Linnæus (see *PINUS*), growing in great abundance on the Alps and Pyrenées, and not uncommon in the English gardens. For this purpose, incisions are made at about two or three feet from the ground into the trunk of the trees, and into these they fix narrow troughs, about twenty inches long. The end of these troughs is hollowed, like a ladle; and in the middle is a small hole bored, through which the turpentine runs into a receiver placed below it. The people who gather it visit the trees morning and evening, from the end of May to September, to collect the turpentine out of the receivers. When it flows out of the tree, it is clear, like water, and of a yellowish-white; but as it grows older, it thickens, and becomes of a citron colour. No trees under twelve inches in diameter are tapped; but vigorous trees will yield annually seven or eight pounds for forty or fifty successive years, or during the term of their life. Though this kind of turpentine bears the name of Venice, it is not the produce of the Venetian territories: it is brought from some parts of Germany, and one greatly resembling it, as it is said, from New England. It is also procured in great abundance in the neighbourhood of Lyons, and in the valley of St. Martin, near Lucern, in Switzerland.

The turpentine flowing naturally, and called by the peasants *bijon*, is a kind of balsam, not inferior in virtue to that of Peru. That drawn by incision, after the tree has ceased to yield spontaneously, is also of considerable use in several arts, and it is even of this that varnish is chiefly made. It must be chosen white and transparent; and care should be taken it have not been counterfeited with some other turpentine.

In the shops, turpentine of Venice is often supplied by a composition of rosin, and the distilled oil of common turpentine.

Turpentine of Strasburg is generally of a middle consistence between the two former, more transparent and less tenacious than either, in colour yellowish-brown, in smell more agreeable than any of the other turpentines, except the Chian; in taste the most bitter, yet least acid. This juice is extracted, in different parts of Germany, from the

silver and red fir, (see *PINUS Picea*), by cutting out successively narrow strips of the bark, from the height which a man can reach, to within two feet of the ground. In some places, a resinous juice is collected from certain knots, under the bark: this, called *lacryma abiegna*, and *oleum abietinum*, is accounted superior to the turpentine. Neither this turpentine, nor any thing under its name, is at present common in the shops.

Common turpentine is about the consistence of honey, of an opaque, brownish, white colour, the coarsest, heaviest, and in smell and taste the most disagreeable, of all the kinds of turpentine. It is obtained from the wild pine, (see *PINUS Sylvestris*), which is extremely resinous; inasmuch that, if not evacuated of its juice, it often swells and bursts. The tree is at its perfection when between seventy and eighty years old; but is fit to yield turpentine at the age of forty. Those trees which are most exposed to the sun, and have the thickest bark, afford it in the greatest abundance. The operations for procuring it commence in the month of May: the outer bark is stripped off for six inches, so as to expose the inner smooth bark, near the foot of the tree, and a wound made with a sharp tool three inches square, and an inch deep. The resinous juice soon begins to exude in transparent drops, which fall into a hole previously dug at the foot of the tree: fresh incisions are successively made till September, when the cold begins to check the further exudation. The warmer the weather is, the greater quantity of turpentine is obtained; and a healthy tree may thus yield from six to twelve pounds of turpentine annually, for a century of years. Part of the juice concretes in the wounds, and is called *galipot* in Provence, and *barras* in Guienne; but although it contains oil, yet it is not used for the purpose of procuring it. The proper turpentine is purified by being exposed to the sun's rays in barrels perforated in the bottom, through which it filters when liquefied by the heat.

The juice, as it issues from the tree, is sometimes received in trenches made in the earth, and afterwards freed of its grosser impurities by colature through wicker baskets. The cones of the tree appear to contain a resinous matter, of a more grateful kind than that of the trunk; distilled while fresh, they are said to yield a fine essential oil, called by the Germans *carpathicum oleum*, much superior to that of the turpentines.

The oil of turpentine is obtained by distilling the resin with water in a common still, when the oil is found in the receiver swimming on the water, from which it is easily separated: the average proportion is 60 lbs. of oil from 250 lbs. of good turpentine. This process is carried on both abroad and at home; but the oil drawn in this country is always preferred.

The Canada turpentine (see *BALSAM*) is obtained from a tree which is a native of North America, that flowers in May, and is brought to this country in casks, each of which contains about one hundred weight. It has a strong not disagreeable odour, and a bitterish taste; it is transparent, whitish, and has the consistence of Copaiva balsam.

Although Linnæus, and several other writers on the *Materia Medica*, refer the common turpentine to the *pinus sylvestris*, and the terebinthina *argentoratensis*, or Strasburg turpentine, to the silver fir-tree; yet upon the authority of Murray, who follows Du Hamel and Haller, Woodville has ascribed the terebinthina *vulgaris* to the *pinus picea*, which pours out the turpentine so freely, that it is seldom necessary to make incisions through the bark for the purpose.

All these juices dissolve totally in rectified spirit, but give out little to watery menstrua: they become miscible with

TURPENTINE.

water into a milky liquor, by the mediation of the yolk or white of an egg, and more effectually by mucilages. Distilled with water, they yield a considerable quantity of a subtile, penetrating, essential oil, vulgarly called *spirit*. Neumann says, that sixteen ounces of Venice turpentine, being distilled with water, yielded four ounces and three drachms of essential oil; and the same quantity, distilled without water, yielded with the heat of a water-bath, two ounces only. The essential oil cannot without great difficulty be dissolved in spirit of wine: one part of the oil may be dissolved in seven parts of rectified spirit of wine; but on standing a while, the greatest part of the oil separates, and falls to the bottom. After distillation of turpentine with water, a yellow or blackish resin remains in the still, which is the common rosin of the shops. See ROSIN and *Burgundy Pitch*.

The essential oil, re-distilled by itself in a retort, with a very gentle heat, becomes more subtile, and in this state is called ethereal; a thick matter remaining behind, called balsam of turpentine. A like balsam is also obtained by distilling with a stronger fire, the common resin; from which there arises, first, a thin yellow oil, and afterwards the thicker dark-reddish balsam, a blackish resin, called colophony, remaining in the retort.

All the turpentines are hot stimulating corroborators and detergents. They are given, where inflammatory symptoms do not forbid the use of them, from half a scruple to half a drachm and upwards, for cleansing the urinary passages, and internal ulcerations in general, and in laxities of the feminal and uterine vessels. They seem to act in a peculiar manner on the urinary organs, impregnating the water with a violet smell, even when applied externally, particularly the Venice sort. This last is accounted the most powerful as a diuretic and detergent, and the Chio and Straßburg as corroborators. They all loosen the belly, but the Venice most; and on this account they are supposed by Riverius and others to be less hurtful than such irritating diuretics, as are not accompanied with that advantage. Dr. Cullen remarks, that terebinthinate glysters, in obstinate costiveness, are much preferable to saline, as being more certain and durable. When turpentine is carried into the blood-vessels, it stimulates the whole system; and hence its use in chronic rheumatisms and paralysis.

Turpentine readily passes off by urine, which it imbues with a peculiar odour; also by perspiration, and probably by exhalation from the lungs: and to these respective effects are to be ascribed the virtues it may possess in gravelly complaints, scurvy, and pulmonic disorders. In all these diseases, however, and especially the last, this medicine, as well as some of the gums and balsams of the terebinthinate kind, by acting as stimulants, are often productive of mischief, as was first observed by Boerhaave, and since by Fothergill.

Turpentine has been much used in gleets and fluor albus; its efficacy in the former of these disorders is ascribed by Dr. Cullen to its inducing some degree of inflammation of the urethra: in proof of which he says; "I have had some instances, both of turpentine and balsam of copaiva producing a manifest inflammation in the urethra, to the degree of occasioning a suppression of urine; but when these effects went off, the gleet which had subsisted for some time before, was entirely cured." Of those turpentines which we have described, the Venice and Canada turpentines are more generally employed for internal purposes, the Chian not being easily procured; and the common turpentine is offensive to most stomachs, so that its principal use is in some external applications, among the farriers, and for the distillation of the oil.

The oil is a most potent, stimulating, detergent diuretic. It is sometimes given, in doses of a few drops, in rheuma-

tisms and fixed pains of the joints; and some have ventured on much larger quantities. Cheyne recommends (*Ess. on the Gout*, p. 199, ed. 10.), as a perfect cure for sciaticas, though of many years standing, from one to four drachms of the ethereal oil, to be taken with thrice its quantity of honey, in a morning fasting, with large draughts of sack-whey after it, and an opiate at bed-time: this medicine is to be repeated, with the occasional intermission of a day, if daily repetitions cannot be borne, for four or five days, or eight at farthest. It appears, however, says Dr. Lewis, highly imprudent to venture on such large doses at once, of a medicine so very hot and stimulating. Boerhaave, after recounting, not without some exaggeration, its Ægyptic, anodyne, healing, antiseptic, and discutient virtues, when applied hot externally, and its aperient, warming, sudorific, and diuretic qualities, when taken internally, adds, that it must be used with great caution; that when taken too freely, it affects the head, excites heat and pain therein, and, violently urging a diabetes, brings on a flux of the semen and of the liquor of the prostates; and that in venereal runnings, in which it has by some been commended, it tends to inflame the parts, and increase the disorder.

The oil of turpentine, taken in too large a dose, hath often very bad consequences; such as a strangury, bloody urine, and its total suppression, with a fever, violent thirst, and vomiting.

In the *Medic. Ess. Edinb.* vol. ii. art. 5. we have an account of such symptoms produced by the taking of two drachms of this oil in warm ale. The patient was cured by a warm bath, and drinking plentifully of Fuller's *emulsio Arabica*.

The oil has lately been given with beneficial effect in unusually large doses for the expulsion of the tape-worm. It differs in its action from the other remedies which have been employed against tape-worms, by killing the worm before it throws it out, and hence it promises to be more permanently useful. The oil is useful when dropped into the ear in deafness occasioned by defect of wax. As a discutient, it is applied to indolent tumours, and is an useful primary application to burns.

Turpentines are usually given in doses of grs. x to ʒj; either made into pills with powdered liquorice-root, or diffused in water by means of almonds, mucilage, or yolk of egg. The dose of the oil may be ℥ x to ʒj, to produce its diuretic effect; but for the expulsion of tænia, it is necessary to give from ʒss to ʒij, repeated every eight hours till the worm is thrown out. In these large doses, it is more easily taken when exhibited uncombined. The officinal preparations of turpentine are, the "*oleum terebinthinae*;" the "*emplastrum Galbani comp.*;" the "*unguentum elemi comp.*;" and of the oil, "*linimentum terebinthinae*."

This oil is generally used as a drier, to mix with the other oils; for which purpose it has greatly the advantage of drying-oil, with regard to colour, as it is perfectly transparent and white. It is used without any other preparation than mixing it, either alone or together, with drying-oil, with the other oils and colours. Turpentine is sometimes used with other bodies, to render spirit of wine a fit vehicle for colours.

The balsam and the inspissated resins are used chiefly externally: the balsam is less pungent than the oil, and the resins much less so than the turpentines in substance. The common yellow resin, in taste considerably bitter, is sometimes given as an internal corroborant, in preference to the turpentines themselves, as being divested of the stimulating oil. Turpentine, formerly much used as a digestive applica-

cation, is, in modern surgery, almost wholly exploded. Lewis. Woodville. Thomson.

Turpentine may be of use to preserve the bodies of insects. Mr. Boyle took clear Venice turpentine, and evaporating to two-thirds, obtained a reddish transparent gum, clear of bubbles, easily soluble by heat, and as easily rendered brittle by cold. Having first pulverized it, he melted it for use, with a gentle heat, and dipped the body to be preserved several times in it, till it acquired a case of due thickness.

TURPENTINE, *Balsam, Oil, and Spirit of.* See TURPENTINE, *supra.*

TURPENTINE-Tree. See PISTACIA.

This tree, besides its proper fruit, which succeeds the flowers in the usual way, is remarkable for producing what authors of little curiosity have named another fruit, called its *horn*. This horn is a membranous production, of the length and thickness of a man's finger; and what surprised those authors who esteemed it a sort of pod, was to find that it produced, not seeds, but living animals, which they called flies.

The true history of this horn is, that it grows from the surface of the leaves, not from the stalks, in the manner of fruit, and is no natural production of the tree, but a mere accidental thing, occasioned by the wound of an insect on the leaf.

A certain species of animals called pucerons, is peculiarly fond of the juices of the turpentine-tree, and always takes its abode upon its leaves; and these horns are produced in the same manner with the galls of other plants. See PUCERON.

TURPETH. See TURBITH.

TURPIN, F. H., in *Biography*, an historical and biographical writer, was born at Caen in 1709, where he became a professor, but afterwards removed to Paris, and employed himself as a copious writer. As he avowed free principles of government, he was under a necessity of quitting France for some time; but he died at Paris in a state of indigence, betraying neither impatience nor regret, at the advanced age of 90 years. *Nouv. Dict. Hist.*

TURPINIA, in *Botany*, according to De Théis, is a new genus, dedicated by Humboldt and Bonpland, in their 5th fasciculus, to the honour of M. Turpin, an able botanical draughtsman, as well as a distinguished naturalist, the author of several articles in the *Annales du Musée d'Histoire Naturelle*. Respecting the characters, class, or order of this genus, we have no information; but the abilities of the person whose name it bears are conspicuous in the *Flora Parisiensis*, published by M. Poiteau and himself, in folio, with splendid plates, printed in colours, a work which unfortunately remains imperfect, for want of encouragement.

TURPNI, in *Geography*, a mountain of Silesia, in the principality of Teschen; 4 miles E. of Jablunkau.

TURPO, a town of Peru, in the diocese of Guamanga; 36 miles W.N.W. of Guanaca Velica.

TURQUOIS. See Turcois.

TURRÆA, in *Botany*, received that name from Linnæus; but whether he designed to commemorate George à Turre, superintendant of the botanic garden at Padua, in the latter part of the 17th century, or Anthony Turra, a botanist of his own time, remains uncertain. The former published at Padua, in 1685, a folio history of plants, without figures, entitled *Dryadum, Amadryadum, Cloridisque Triumphus*, which Linnæus, when he wrote his *Bibliotheca Botanica*, had never been able to meet with, and which, when he afterwards acquired it, certainly could contribute little to his information, being a mere compilation of obsolete opinions. Anthony Turra, who lived at Vicenza,

printed in 1765, a 4to. dissertation on the *Farfetia*, a genus now established by Mr. Brown in *Ait. Hort. Kew.* v. 3. 96. He also published, in 1780, a *Floræ Italicæ Prodromus*, and is the author of an Italian dissertation on the febrifuge virtues of Horse-chestnut bark. We cannot but regret that so distinct a genus, remarkable for its elegance as well as rarity, should not be more decidedly or satisfactorily appropriated.—Linn. Mant. 2. 150. Sm. Plant. Ic. fasc. 1. 10. Schreb. Gen. 285. Willd. Sp. Pl. v. 2. 555. Mart. Mill. Dict. v. 4. Cavan. Diff. 7. 360. Juss. 264. Lamarck Illustr. t. 351.—Class and order, *Decandria Monogynia*. Nat. Ord. *Tribilata, sect. 1*. Linn. *Meliæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, bell-shaped, five-toothed, small, permanent. *Cor.* Petals five, linear, moderately spreading, very long, slightly dilated upward. Nectary a cylindrical tube, as long as the petals, or longer; its margin in ten acute spreading segments, sometimes divided. *Stam.* Filaments ten, very short, inserted between the teeth of the nectary; anthers erect, nearly ovate, emarginate. *Pist.* Germen superior, roundish, style thread-shaped, about the length of the nectary; stigma rather obtuse, corrugated. *Peric.* Capsule roundish, depressed, five-lobed, five-celled, with ten valves, bursting lengthwise. *Seeds* kidney-shaped, two in each cell.

Ess. Ch. *Calyx* with five teeth. Petals five. Nectary cylindrical, bearing the anthers between its segments. Capsule superior, five-lobed, five-celled. Seeds in pairs. Linnæus knew but one species of *Turræa*, sent him by Koenig. The writer of the present article has delineated that, with two new species, in his *Plantarum Icones*, and has now an opportunity of adding a fourth; making, with one described by Cavanilles, and another by Hellenius, six species in all. The whole are of a shrubby habit, with alternate, stalked, entire, simple, mostly undivided, leaves, without stipules, and stalked, lateral flowers, remarkable for their great length.

1. *T. virens*. Evergreen *Turræa*. Linn. Mant. 237. Willd. n. 1. Sm. Plant. Ic. fasc. 1. t. 10. Cavan. Diff. 361. n. 524.—Leaves elliptic-lanceolate, emarginate, very smooth. *Calyx* and fruit silky.—Gathered by Koenig among the lava of extinct volcanoes in the East Indies. This is an evergreen tree, or shrub, with scattered, divaricated, round, brown, leafy branches, slightly silky in their youngest state only. Leaves about three inches long, on short thick stalks, smooth and shining on both sides, terminating in a short, broad, notched point; furnished with a strong midrib, and innumerable finely reticulated veins; their under side much the palest. Flowers in little, short, axillary tufts, on angular partial stalks, and accompanied by a few small leaves, as well as many linear silky bracteas. *Calyx* very small, silky, with five angles, and five small teeth. Petals and nectary smooth, slender and delicate, above an inch long; we should suppose them to be white, or pale flesh-coloured; Linnæus thought the former, at least, were yellow. Capsule a quarter of an inch in diameter, clothed with silky prominent hairs.

2. *T. pubescens*. Downy-leaved *Turræa*. "Hellenius in Stockh. Transf. for 1788. p. 296. t. 10. f. 3." Willd. n. 2.—Leaves ovate, undivided or emarginate; downy beneath. Flowers aggregate. *Calyx* villous.—Native of the island of Hainan. The fruit of this species has not been observed. We have never seen a specimen, nor are we possessed of that particular volume of the Stockholm Transactions, in which alone it is described and figured. Having formerly however examined that work, in order to contrast this with the other species, we have no doubt of its being well defined.

3. *T. maculata*. Spotted-leaved *Turræa*. Sm. Plant. Ic.

Æ. t. 11. Willd. n. 3. (*T. glabra*; Cavan. Diff. 360. n. 521. t. 204.)—Leaves elliptical, smooth. Calyx fringed.—Gathered by Commerfon in Madagafcar. This appears to be a tree, with deciduous leaves, which are perfectly smooth, of a broad, elliptical figure, bluntly pointed, two inches or more in length; marked with pale blotches on the under fide, especially near the ribs. *Footstalks* channelled, half an inch long. *Flowers* two or three together, on smooth simple stalks, hardly an inch long, erect. *Calyx* quite smooth, except its filky edges; the teeth short. *Petals* three inches long, yellow in the dried specimen, a little downy externally at the upper part. *Neftary*, about the fame length, flightly dilated, or funnel-shaped, at the top, with undivided fegments.

4. *T. fericea*. Silky-leaved Turræa. Sm. Pl. Ic. t. 12. Willd. n. 4. (*T. tomentofa*; Cavan. Diff. 361. n. 522. t. 205. f. 2.)—Leaves elliptical; villous on both fides. Calyx and flower-ftalks downy. Segments of the neftary divided.—Gathered by Commerfon in Madagafcar. The leaves are denfely clothed, especially when young, on both fides, with short, fhaggy, filky hairs, and ftand on downy *footstalks*. Some of them, in our fpecimen, betray fymptoms of being occafionally angular, or very flightly lobed. The flowers are even larger than the laft, their *petals* and *neftary* meafuring each five inches. Their colour appears to be reddish, and both are externally downy. The fegments of the *neftary*, an inch long, are each divided half way down, into two almoft capillary points. The *fruit* of this, as well as the preceding, is unknown.

5. *T. lanceolata*. Pink and Green Turræa. Cavan. Diff. 361. n. 523. t. 205. f. 1. Willd. n. 5.—Leaves elliptic-lanceolate, fomewhat wavy, smooth. Teeth of the calyx downy, twice the length of its tube. Neftary longer than the petals, its fegments bearing the anthers.—Gathered likewife in Madagafcar, by Commerfon. The leaves are quite smooth, rounded at each end, about two inches long, rather coriaceous; fome of them wavy at the edge. *Footstalks* rather fhort and ftout. *Flower-ftalks* folitary or in pairs, erect, angular, smooth, fcarcely longer than the *calyx* with its teeth. *Petals* linear, an inch and half long; rofe-coloured in their lower half; yellow above; green and externally hairy, at the extremity; they cohere in our fpecimen, forming a tube, fo as to refemble fome of the tubular-flowered *Ericæ*, whose ftamens moreover are imitated by the pale, prominent, ribbed *neftary*, bearing the feffile anthers, about the middle of its taper-pointed fegments. This peculiar infertion of the anthers, the apparently monopetalous *corolla*, and our ignorance of the *fruit*, have always prevented our publishing this beautiful plant as a *Turræa*; but Cavanilles feems to have found the *petals* diftinct, and we follow his example in admitting it here, though ftill with great fcruples, on account of the anthers.

6. *T. heterophylla*. Various-leaved Turræa.—Leaves ovate; undivided or three-lobed, with downy veins. *Calyx* downy, with fhort teeth. *Petals* fomewhat fpatulate, longer than the neftary.—Gathered on the Cape Coaft of Africa, by Mr. William Brafs, and communicated to us by the right honourable fir Jofeph Banks, in 1798. This has fender, downy, leafy branches. *Leaves* two, or two and a half, inches long, on fhortifh, downy stalks; fome of them ovate, pointed, quite undivided; others, rather the largeft, wedge-fhaped at the bafe, dilated beyond the middle, into two, more or lefs diftinct, blunt, lateral lobes; all thin, copioufly veined, paler beneath; their principal veins downy on both fides. *Flowers* red, fmallier than any of the foregoing, on downy stalks not an inch long, ftanding in pairs on one fhorter, more downy, axillary *common-ftalk*, accompanied by a few fmall *bracteas*. *Calyx* angular, with broad,

fhort, pointed teeth. *Petals* fcarcely an inch in length, much dilated upwards, paleft on the infide. *Neftary* two-thirds as long as the petals, exactly cylindrical, fmooth. It feems to have almoft capillary marginal teeth, between which are feated the large tumid anthers; but our fpecimen is not in fufficiently good order to allow us to fpeak pofitively to this point. The *ftigma* is club-fhaped, large and prominent. *Fruit* wanting.

TURREBA, the *Earth-Apple*, in *Natural History*, a name given by the people of Guinea, and fome other parts of Africa, to a very fine kind of truffe, which they find in great plenty in their barren deferts, four or five inches under the fand.

TURREFF, in *Geography*, a market-town in the diftrict of the fame name, and fhire of Aberdeen, Scotland; is fituated on the banks of the Deveron, 34 miles N. by W. diftant from Aberdeen, and 155 N. by E. from Edinburgh. It is a free burgh of barony, by a charter of James IV. granted in 1511, whereby it was entitled to hold a weekly market and two annual fairs: the market is well fupplied; and the number of fairs has been increafed to feven. The principal manufactures are thofe of linen-yarn, thread, and brown linen; and here is a confiderable bleach-field. The church was rebuilt in 1794. Here was formerly an hofpital belonging to the knights Templars; and alfo one for twelve old men, founded in 1272 by Cumyn, earl of Buchan, and richly endowed in the fucceeding century by king Robert Bruce. The parifh of Turreff extends round the town about $4\frac{1}{2}$ miles in every direftion, except to the N.W. where it is bounded by the Deveron. Agricultural improvements have been lately introduced; and here are feveral confiderable plantations. In the population return of the year 1811, the inhabitants of the parifh are ftated to be 2227; the number of houfes 502.—*Beauties of Scotland*, vol. iv. Aberdeenshire, 1806. Carlifle's *Topographical Dictionary of Scotland*, 1815.

TURRETS, *Moveable*, in the *Roman Art of War*, were of two forts, the lefs and the greater: thofe of the leffer fort were about 60 cubits high, with fquare fides, 17 cubits broad; they had five or fix, and fometimes ten ftories or divifions, each of which was open on all fides. The greater turrets were 120 cubits high, and 23 cubits fquare, containing fometimes fifteen, fometimes twenty divifions. They were of great ufe in making approaches to the walls, the divifions being able to carry foldiers, with engines, ladders, cafting-bridges, and other neceffaries.

The wheels on which they moved were contrived to be within the planks, to defend them from the enemy, and the men who were to drive them forwards ftood behind, where they were moft fe cure; the foldiers within were protected by raw hides thrown over the turrets, and guarding thofe parts that were moft expofed. See TOWER.

TURRET *Island*, in *Geography*, a fmall ifland in the Mergui Archipelago. N. lat. $10^{\circ} 24'$.

TURRETINI, BENEDICT, in *Biography*, an eminent Proteftant divine, was the defendant of an ancient family of Lucea, and born at Zurich in 1588, being the fon of a refugee from his country on account of his attachment to the principles of the Reformation; and in 1612 became a paftor and profefor of theology at Geneva. He was employed in feveral fuccefsful miffions, by the conduct of which he gained diftinguifhed reputation; and died in 1631, with the character of an eminent theologian, and a man of prudence and moderation. His works were, "A Defence of the Fidelity of the German Verfion of the Bible," written in French, and comprifed in 3 vols. 4to. 1618—20, with a fequel in 1626; a variety of theological difputations in Latin, on the Calviniftic fyftem of divinity; and fermons in Italian and French. Moreri.

His son, FRANCIS TURRETINI, was born at Geneva in 1623, and received his education under several eminent German professors, also at Leyden, and afterwards at Paris, where he attended the lectures of Gassendi. Returning to Geneva, he was admitted to the exercise of his ministry. Having for some time officiated as pastor of the Calvinist church at Lyons, he became, on his return to Geneva in 1653, professor of theology, in which station he continued through life. He was employed in various departments of public business, and died in 1687. Among other theological writings, didactic and controversial, he published "Institutionum Theologiæ Elencticæ Partes tres," 1679—1685, exhibiting a fair and candid view of the points that were controverted between the different communions. Moreri.

A son of the preceding, JOHN ALPHONSO TURRETINI, and the most celebrated of the name, was born at Geneva in 1671, and having, in consequence of distinguished talents and application, the tuition of able masters, access to a well-stored library, and an ample patrimony, laid the foundation of learning at home, he commenced, in his 20th year, his travels, and at Leyden studied ecclesiastical history under Spanheim. During his residence here he published, in 1692, his "Pyrrhonismus Pontificius, five Theses Theologico-Historicæ de Variationibus Pontificiorum, circa Ecclesiæ Infallibilitatem," designed to counteract the influence of Bossuet's book "Les Variations des Eglises Protestantes," by shewing that the Roman Catholic church had been equally fluctuating in its opinions. At this time he visited England, and being introduced to Burnet, Tillotson, and Wake, he laboured to cancel the false notions that were entertained by some English divines concerning the Genevan church. Upon his visit to Paris, he is said to have astonished the doctors of the Sorbonne, in a public disputation, by the purity of his Latin, the depth of his reasoning, and his polite manner of arguing. When he returned to Geneva, he commenced the exercise of his ministry in 1694, and was much admired as a preacher. The magistrates established for him, in 1699, a professorship of ecclesiastical history, the duties of which he discharged without any salary. These lectures were introduced with an oration, "De Sacrarum Antiquitatum usu et Præstantia;" and the substance of these lectures comprised a body of ecclesiastical history, divided into more than 300 dissertations. In 1701 he was chosen rector of the academy of Geneva; and in this station, which he occupied for ten years, he delivered ten annual discourses, displaying eloquence united with erudition and excellent moral sentiments. Upon being appointed to the office of professor of theology in 1705, he delivered an inaugural speech, "De Theologo Veritatis et Pacis studio." In his course of divinity lectures, he discussed the most important topics of divinity, without the formality of system; such as natural religion, the excellence and evidences of the Christian revelation, the perfections of the Deity, the interpretation of Scripture, and similar subjects. It was very much the object of his wish to unite all Protestants; and with this view he took part with those German ministers who, in 1706, obtained a dispensation from the necessity of signing the formulary, intitled "Consensus," introduced during the violent disputes that had occurred concerning Grace and Predestination. Some other public offices were devolved upon him, which engaged his attention, and occupied much of his time and labour. His assiduous exertions, together with the uneasiness that was occasioned by the perturbed state of Geneva, are thought to have shortened his life, which terminated in May 1737, at the age of nearly 66 years. His works in 3 vols. 4to. were published in 1737; and after his death appeared his Com-

mentaries on the Epistles to the Romans and Thessalonians. Moreri. Gen. Biog.

TURRITIS, in Botany, so called, as Clusius says, from *turris*, a tower, in allusion to its pyramidal form of growth; whence also its English name of Tower-mustard.—Linn. Gen. 341. Schreb. 444. Willd. Sp. Pl. v. 3. 542. Mart. Mill. Dict. v. 4. Brown in Ait. Hort. Kew. v. 4. 108. Sm. Fl. Brit. 715. Prodr. Fl. Græc. Sibth. v. 2. 29. Pursh 438. Juss. 238. Gartn. t. 143.—Class and order, *Tetradynamia Siliquosa*. Nat. Ord. *Siliquosæ*, Linn. *Cruciferae*, Juss.

Gen. Ch. Cal. Perianth inferior, of four ovate-oblong, erect leaves, converging in a parallel manner, deciduous. Cor. cruciform, of four ovate-oblong, obtuse, erect, undivided petals, with erect claws. Stam. Filaments six, awl-shaped, erect, the length of the claws, two of them shorter; anthers simple. Pist. Germen the length of the flower, roundish, slightly compressed; style none; stigma obtuse. Peric. Pod remarkably long, straight, quadrangular, but with two opposite angles obsolete and flattened, of two cells, and two keeled ribbed valves, scarcely equal in length to the partition. Seeds very numerous, roundish, emarginate; their cotyledons accumbent.

Ess. Ch. Pod very long and straight, linear, two-edged; its valves ribbed and keeled. Calyx closed, erect. Corolla erect.

All botanists, who have examined into the subject, have found great difficulty in distinguishing this genus from ARABIS (see that article); the character of the four prominent scales, or nectariferous glands, in the latter, being very uncertain. The best attempt at discriminating these genera that has ever perhaps been made, is Mr. Brown's, in the *Horius Kewensis*, which is founded on the seeds of *Arabis* being ranged in a simple row in each cell, while those of *Turritis* compose a double one; for this is, in fact, the only real difference in our learned friend's characters. By his rule, *Turritis hirsuta* and *alpina* are removed to *Arabis*; while *Braffica arvensis* and *Sisymbrium Loefelii*, with probably some others, become species of *Turritis*. In the latter case, great violence is offered to natural affinity, but perhaps the character itself is not clear in *S. Loefelii*, and its merit is therefore not invalidated by this species, whose close relationship to *S. Irio* we have noticed in the proper place. (See SISYMBRIUM.) We are almost persuaded of the merit of the above distinction, in sending away to *Arabis* all the species of *Turritis* which have a simple row of seeds, and some of which have always been ambiguous. They meet in that genus with their natural allies. Nevertheless, as we have not yet treated of these species, we shall retain them here, for the present at least, indicating under each Mr. Brown's alterations, for the guidance of those who may wish to judge of his sentiments, or hereafter to conform to them. On subjects connected herewith, the reader will find some remarks under TETRADYNAMIA.

1. *T. glabra*. Common Smooth Tower-mustard. Linn. Sp. Pl. 930. Willd. n. 1. Ait. n. 2. Fl. Brit. n. 1. Engl. Bot. t. 777. Curt. Lond. fasc. 4. t. 47. Fl. Dan. t. 809. (Turritis; Ger. Em. 272. Turrita vulgarior; Clus. Hist. v. 2. 126.)—Radical leaves toothed, hairy; the rest entire, clasping the stem, smooth.—Native of dry open gravelly places, in most parts of Europe, from Sweden to Greece, flowering early in summer. In England it is not one of the most common plants, being confined to a gravelly, chalky, or limestone soil. The root is annual, or biennial, tap-shaped. Stem simple, erect, wand-like, two or three feet high, round, smooth; covered with numerous, somewhat crowded or imbricated, erect, very smooth, ovate, acute, glaucous leaves, arrow-shaped at their base; while the

TURRITIS.

the numerous spreading *radical leaves* are very rough with partly forked hairs, toothed, or pinnatifid. *Flowers* cream-coloured, corymbose, very numerous, their common stalk greatly elongated, after flowering, into a dense cluster of long, slender, smooth, erect, stalked *Pods*, each two inches long, and full of numerous small *seeds*, imbricated in two rows, as we have already mentioned, and not alternately crossing each other, so as to form a simple row. These seeds were formerly an article of the *Materia Medica*, being esteemed hot and dry, stimulating to the generative faculty, preserving against apoplexy, &c. virtues scarcely intelligible, or consistent.

2. *T. levigata*. American Smooth Tower-mustard. Willd. n. 2. Muhlenb. Cat. 61. Pursh n. 1.—Leaves all smooth, glaucous; radical ones obovate, stalked, serrated; the rest linear-lanceolate, entire, clasping the stem.—Sent from Pennsylvania by the Rev. Dr. Muhlenberg. On rocks from Pennsylvania to Virginia; rare; flowering in May and June. Very smooth and glaucous, about a foot high. *Pursh*. Root biennial. *Stem* quite simple. Radical *leaves* obtuse, slightly serrated; those of the stem arrow-shaped, the lowermost an inch long, lanceolate, obtuse, serrated at the extremity; the rest smaller, narrower, entire. *Flowers* like the first species, but rather less. *Pods* erect. Willdenow.

3. *T. stricta*. Slender Tower-mustard. Allion. Auctuar. 18. Willd. n. 3.—Leaves all smooth and shining; radical ones ovate, somewhat stalked, slightly toothed; the rest lanceolate, strongly toothed, sessile.—In meadows, and rather moist pastures, in several parts of Piedmont. *Root* white, woody. *Stem* two feet high, erect, quite simple, round, smooth, firm, clothed from top to bottom with alternate, close-pressed *leaves*, which are tapering, not arrow-shaped, at the base. *Flowers* small, white. *Pods* linear, flat, acute, erect, above an inch long, thin at the margin; the lower ones on longish stalks, and least crowded. This species is akin to *T. hirsuta*. Allioni.

4. *T. hirsuta*. Hairy Tower-mustard. Linn. Sp. Pl. 930. Willd. n. 4. Fl. Brit. n. 2. Engl. Bot. t. 587. Jacq. Ic. Rar. t. 126. Fl. Dan. t. 1040. Ehrh. Herb. 159. (T. n. 456; Hall. Hist. v. 1. 198. *Arabis hirsuta*; Scop. Carn. v. 2. 30. Brown in Ait. n. 11. *Erysimum similis hirsuta alba*; Bauh. Prodr. 42. *Barbarea muralis*; Bauh. Hist. v. 2. 869.)—Leaves all rough, toothed in the middle. *Stem* hairy; the hairs simple and spreading. *Branches* straight, erect. *Pod* slightly quadrangular.—Native of dry open pastures, and old walls, in most parts of Europe; not very common in England; flowering in May. The *root* is strong, woody, and, we believe, perennial. *Stems* generally several, one of which is much stronger than the rest, erect, a foot or eighteen inches high, leafy, branched, round, clothed with thick-set, prominent, simple hairs, the flowering part only being smooth. *Leaves* toothed, chiefly about the middle, bluntish, all more or less hairy; the radical ones obovate, slender at the base, but not stalked; those on the stem sessile, or partly embracing it, rarely dilated at each side into a small auricle. *Flowers* numerous, small, white, not coloured. *Pods* forming a very long, close, erect cluster, all narrow, compressed, but the valves are more or less strongly keeled, so as to render the pod quadrangular; its surface is smooth and shining, beaded, in a manner, with the projecting *seeds*, which though inserted, of course, alternately, in two rows, range in one simple series. When ripe the *Pods* droop a little. Linnæus originally confounded with this his *T. alpina*, whose leaves are all smooth on both surfaces; and also the following.

5. *T. praxos*. Early Tower-mustard. (T. n. 2; Ge-

rard Galloprov. 367.)—Leaves all rough, obtuse, toothed in the middle. *Stem* hairy; the hairs forked and depressed, like those on the leaves. *Branches* straight, erect. *Pod* flat.—Native of Provence and Switzerland. Nearly out of flower when the *hirsuta* first expands, being full a month earlier than that species, from which, though very like in general habit, it differs in having larger *flowers*, tinged with purple in both *calyx* and *petals*; *Pods* nearly flat, their valves with scarcely any sign of a rib or keel; and the hairs of the *stem* forked, or branched, depressed and entangled, as are all those on the *leaves*. The late Mr. Davall of Orbe in Switzerland first distinguished this plant from the foregoing.

6. *T. patula*. Spreading Tower-mustard. Ehrh. Beitr. v. 7. 159. Pl. Select. n. 28. Willd. n. 5. (*Tourrete cotoneuse*; Reyn. Mem. de la Suisse v. 1. 169. *Arabis faxatilis*; Allion. Ped. v. 1. 268.)—Leaves all rough with spreading forked hairs, ovate, toothed, clasping the stem. *Branches* spreading.—Native of rocks in Switzerland, in a southern exposure. *Favrod*. *Root* annual, tapering. *Stem* one, or more, erect, about a foot high, round, leafy, clothed with forked or starry hairs, intermixed with longer simple ones. *Branches* axillary, alternate, slender, loosely spreading. *Leaves* hardly an inch long, clasping the stem with their heart-shaped base, hoary with minute, bristly, divided hairs, and bordered with tooth-like serratures; radical ones contracted at their base, disappearing early. *Flowers* corymbose, very small, white. *Calyx* not always, as Ehrhart describes it, quite smooth: we find it sometimes tipped with fine hairs. *Pods* spreading, very slender, an inch and a half long, their valves without any ridge or keel. The general habit of this species, except the *Pods*, is more like *Draba muralis* than any other *Turritis*. Allioni's synonym, hinted by Reynier, is confirmed by a Piedmontese specimen from Dr. Moleneri.

7. *T. pubescens*. Downy Tower-mustard. Desfont. Atlant. v. 2. 92. t. 163. Willd. n. 6.—Leaves all rough with prominent hairs, coarsely toothed; those of the stem sessile. *Branches* spreading. *Pods* erect, downy.—Native of hills about Algiers, flowering early in the spring. This resembles *T. hirsuta*, but is less shaggy, rather larger, with more spreading *branches*, and downy, less crowded, *Pods*. The *leaves* are all more deeply serrated or toothed.

8. *T. ovata*. American Hairy Tower-mustard. Pursh n. 2. (T. *hirsuta*; Muhlenb. Cat. 61.)—Radical leaves stalked, ovate, toothed, obtuse, rough on both sides with starry hairs; those of the stem oblong, somewhat arrow-shaped, serrated, smooth above. Hairs on the stem depressed. *Pods* flat, smooth, scarcely keeled.—On rocks from Pennsylvania to Virginia, flowering in May and June. Biennial. *Pursh*. This also resembles *T. hirsuta*, to which we have formerly been disposed, like Dr. Muhlenberg, to refer it. The close-pressed hairs of the *stem*, less prominent keels of the *Pods*, and the smoothness of the upper surface of the *stem-leaves*, appear sufficient marks of distinction.

9. *T. alpina*. Alpine Tower-mustard. Linn. Syst. Veg. ed. 13. 502. Willd. n. 8. Sm. Compend. ed. 2. 101. Engl. Bot. t. 1746. (T. *ciliata*; Willd. n. 7. Schleich. Catal. 59. *Tourrete ciliée*; Reyn. Mem. de la Suisse, v. 1. 171. *Arabis ciliata*; Brown in Ait. n. 10.)—Leaves somewhat toothed, smooth, distantly fringed and bearded; the radical ones obovate; the rest elliptical, half-embracing the stem.—Native of Gothland, Austria, Switzerland, and the west of Ireland, flowering about July or August. It was first observed in the latter country by Mr. J. T. Mackay, who gathered this plant by the sea-side at Rinville, Cunnamara, in 1806. Linnæus originally considered his own Gothland specimens as a mere variety of *hirsuta*

hirfuta (see Fl. Suec. 236.), but afterwards corrected that error. The root is apparently biennial. Stem one, or more, from two to twelve inches high, simple, erect, leafy, round, mostly smooth. Leaves all smooth on both sides, fringed with simple or forked, scattered, spreading hairs, a few of which are often clustered into a little tuft at the tips; the radical ones are frequently tinged with red. The more evidently the leaves are toothed, the less they seem to be fringed, as observed in Engl. Bot. Flowers white, larger than in *T. hirfuta*, forming a simple corymb, soon becoming a long cluster of narrow smooth pods, whose valves are very perceptibly keeled. Reynier's original specimen from Favrod proves his plant, and consequently that of Schleicher and Willdenow, to be the Linnæan *T. alpina*.

The *T. carulea* of Allioni, Fl. Pedem. v. 1. 270. t. 40. f. 2, being considered as an *Arabis* by Wulfen, who is followed by Willdenow, *Sp. Pl.* v. 3. 537, as well as by Mr. Brown in Ait. Hort. Kew. v. 4. 104, we shall leave it there. However naturally allied this plant may seem to be to our last-described *Turritis*, it is at least as much akin to *A. alpina*, *bellidifolia*, and others of that genus.

TURRORAH, in *Geography*, a town of Hindoostan, in Goondwana; 20 miles S.W. of Coomtah.

TURROW, a town of Hindoostan, in Bahar; 26 miles S.W. of Arrah.

TURRUNG, a river of Asia, which empties itself into a lake, 18 miles S. of Candahar.

TURSHISH, sometimes written *Terchiz* and *Tersbiz*, a town and district of Persia, in the province of Khorassan, 63 furlongs W.N.W. of Herat, lately taken possession of by the troops of his Persian majesty. The old city, called Soltanabad, is small; but to this a new one has been added, where the governor and his principal officers reside. They both together contain about 20,000 people, amongst which are 100 Hindoo families. The trade of this place arises principally from the importation of indigo, and other drugs, from the westward; wool and cloths, and rice, from Herat; and the chief export is iron, wrought in thick plates. The trifling quantity of European goods required is brought from Mazanderaun. Between this city and Herat the country is in general mountainous, wild, and uncultivated. Kinneir's Mem. of the Persian Empire.

TURSI, a town of Naples, in the Basilicata, the see of a bishop, suffragan of Matera; 24 miles S. of Matera. N. lat. 40° 17'. E. long. 16° 30'.

TURSIO, in *Ichthyology*, a name by which Bellonius, Scaliger, and several others, have called the *phocæna*, or porpoise, distinctively from the dolphin, with which it is confounded by the vulgar. See PORPESSE.

TURSOSKA, in *Geography*, a town of Hungary; 16 miles N. of Bolesko.

TURTALA, a town of Sweden, in West Bothnia; 45 miles N. of Tornea.

TURTEREBES, a town of Hungary; 14 miles N.N.E. of Zatmar.

TURTLE, in *Ornithology*. See COLUMBA.

TURTLE, in *Ichthyology*, the name by which we commonly call the great sea-tortoise. See TORTOISE.

TURTLE-Shell. See TORTOISE and TORTOISE-Shell.

TURTLE Bay, in *Geography*, a bay on the west coast of Africa. S. lat. 14° 56'.—Also, a bay on the south coast of New Ireland, so called by captain Carteret. Dampier before called it "St. George's Bay;" and from Bougainville it obtained the name of "Praslin Bay."

TURTLE Creek, a branch of the Monongahela river. At the head of this creek general Braddock was killed in 1755.—Also, a township of Ohio, in the county of Warren, containing 3442 inhabitants.

TURTLE Inlet, a channel between two small islands, on the coast of New Jersey. N. lat. 39° 2'. W. long. 74° 47'.

TURTLE Island, a small island in the East Indian sea. S. lat. 6° 35'. E. long. 132° 51'.—Also, a small island in the South Pacific ocean, surrounded by a reef of coral rocks. S. lat. 19° 50'. W. long. 177° 57'.

TURTLE Lake, a small lake of Canada. N. lat. 48° 34'. W. long. 71° 31'.

TURTLE Point, a cape on the south coast of Java. S. lat. 7° 42'. E. long. 109° 58'.—Also, a cape on the coast of West Florida, in the gulf of Mexico. N. lat. 29° 54'. W. long. 89° 4'.

TURTLE River, a river of the state of Georgia, which runs into the sea, N. lat. 31° 12'. W. long. 81° 40'.

TURTON, a township of England, in Lancashire, with 1782 inhabitants; more than half employed in trade and manufactures; 6 miles S. of Blackburn.

TURTUCAIA, a town of European Turkey, in Bulgaria, on the Danube. In 1773, it was taken and burned by the Russians; 34 miles S.W. of Driftra.

TURTUR, in *Ornithology*. See COLUMBA.

TURTUR, in *Ichthyology*, a name given by Paulus Jovius, and some other writers, to the fish called the *passinaca marina*.

TURTUR, the *Turtle-shell*, in *Natural History*, the name given by the collectors of shells to a very beautiful species of murex, common in the cabinets, but not found any where on the shores. This is owing to its having greatly altered its appearance in polishing; for it is no other than the white and brown-mouthed murex, which is common in its rough state, with its outer coat taken off.

TURTURA, in *Geography*, a town of Naples, in Basilicata; 40 miles S. of Potenza.

TURTURANO, a town of Naples, in the province of Otranto; 5 miles S. of Brindisi.

TURUCHAN, a river of Russia, which rises from a lake, N. lat. 67° 42'. E. long. 84° 14', and runs into the Enisei, a little south of Turuchansk.

TURUCHANSK, a town of Russia, in the government of Tobolsk, on the Enisei, formerly called "Mangafæa." According to an old tradition delivered down from father to son, a colony from Archangel built the old otrog of Mangafæa, before any other Russian town existed in Siberia. It derives its name from a Samoiedean tribe, who inhabited this country, calling themselves Mangafæ; who, by promising to pay tribute to the Russians, occasioned the building of the town. Old Mangafæa, which stood on the river Taz, gradually fell to decay; in 1600, the present town was built, and the inhabitants of the old otrog were removed hither. This new otrog was also called "Mangafæa;" but as it lies at the mouth of the river Turukan, it had also the name of Turukanfsk, which it retains to this day. As this otrog proved the means of several nations becoming tributary to the Russians, it was probably on that account afterwards endowed with the privileges of a town. The houses in this town are not contiguous, and at most do not exceed one hundred. The greatest part of it is inclosed within a small wooden fortification, with four pieces of cannon; and in this stands the house of the governor or prefect, and the principal church; and without it are two other churches. Most of the inhabitants have always been Cossacks; who were placed here, in order to subdue, or at least to check, the Pagan nations, of this country, particularly the Tungusians and Samoiedes; 724 miles N.E. of Tobolsk. N. lat. 65° 40'. E. long. 88° 44'.

TURUNDA, a tent, so called in *Surgery*, is usually composed of a bit of lint rolled up, or else of a piece of common sponge, or prepared sponge. Its general use is to keep

an opening from healing up too soon, in cases of abscesses, diseased bone, &c. Sometimes, also, it is used for dilating the aperture, by which means extraneous substances can be removed, without employing the knife. Tents have even been used for dilating the meatus urinarius, and thus enabling the surgeon to extract stones of considerable size from the bladders of female subjects.

TURUNGA, in *Geography*, a town of Hindoostan, in the circar of Ruttunpour; 24 miles N. of Raypour.

TURZA, or **TURCETA**, in *Ancient Geography*, *Boussa*, a town of Africa, 6 leagues S.W. of Tunis, now a heap of ruins.

TURZEC, in *Geography*, a town of Lithuania, in the palatinate of Novogrodek; 24 miles E. of Novogrodek.

TURZO, **TRUZZEA**, in *Ancient Geography*, a town of Africa, mentioned by Ptolemy, situated eight leagues W. of Vicus Augusti.

TURZONZA, in *Geography*, a town of Mexico, in the province of Mechoacan, on the side of a lake; 25 miles W. of Mechoacan.

TUS. See **MESCHID**.

TUSA, a fortress on the north coast of Sicily; 8 miles S.E. of Cefalu.

TUSANTLU, a town of Mexico, in the province of Mechoacan.

TUSBY, a town of Sweden, in Nyland; 15 miles N. of Helsingfors.

TUSCA, the *Zaine*, in *Ancient Geography*, a river of Africa, which separated Africa Propria from Numidia. Pliny.

TUSCAN, in *Architecture*, the first, simplest, and most massive of the five orders.

The Tuscan order takes its name from the ancient people of Lydia, who, coming out of Asia to people Tuscany, first executed it in some temples, which they built in their new plantations.

Vitruvius calls the Tuscan the *rustic order*; with whom agrees M. de Cambray, who, in his Parallel, says, it ought never to be used but in country-houses and palaces. M. le Clerc adds, that in the manner Vitruvius, Palladio, and some others, have ordered it, it does not deserve to be used at all. But in Vignola's manner of composition, he allows it a beauty, even in its simplicity; and such as makes it proper not only for private houses, but even for public buildings, as in the piazzas of squares and markets, in the magazines and granaries of cities, and even in the offices and lower apartments of palaces.

The Tuscan has its character and proportions, as well as the other orders; but we have no ancient monuments to give us any regular Tuscan pillar for a standard.

M. Perrault observes, that the characters of the Tuscan are nearly the same with those of the Doric; and adds, that the Tuscan is, in effect, no other than the Doric, made somewhat stronger, by shortening the shaft of the column; and simpler, by the small number, and largeness of the mouldings.

Vitruvius makes the whole height of the order 14 modules, in which he is followed by Vignola, M. le Clerc, &c. Serlio only makes it 12. Palladio gives us one Tuscan profile, much the same as that of Vitruvius; and another too rich; on which side Scamozzi is likewise faulty. Hence it is, that that of Vignola, who has made the order very regular, is most followed by the modern architects. See **COLUMN**.

Of all the orders, the Tuscan is the most easily executed, as having neither triglyphs nor dentils, nor modillions to

cramp its intercolumns. On this account, the columns of this order may be ranged in any of the five manners of Vitruvius, *viz.* the pycnostyle, systyle, eustyle, diastyle, or aræostyle. For the parts and members of the Tuscan order, their proportions, &c. see **CAPITAL**, **BASE**, **PEDESTAL**, **FREEZE**, &c.

TUSCANY, in *Geography*, now called *Etruria* (which see), a grand duchy or kingdom, long celebrated for the arts; the capital of which is *Florence*, which see. Pinkerton states its length at about 120 British miles, and its breadth at 90; and its area of 7040 square miles as containing about 1,250,000 persons. The revenue is computed at about half a million sterling; but the forces do not exceed 6000 or 8000. Tuscany is one of the most beautiful and fertile regions of Italy, with a temperate and healthy climate. It abounds in corn and cattle, and produces excellent wines and fruit. The mountains in the Siennese, or southern part of Tuscany, contain valuable ores of antimony, copper which is wrought at Massa, and other metals, with slate and yellow marble. The serpentine of Impruneta, 7 miles S. from Florence, presents beautiful varieties used in ornamental architecture. Borax has been found in the lakes of Tuscany, near Sienna and Volterra. The Florentine marble is remarkable for picturesque representations of ruins, &c. caused by the infiltration of iron streams; and the Ombrone is a considerable river which pervades the Siennese.

TUSCARAWA, a county of the district of Ohio, containing 3045 inhabitants.—Also, a township of Stark county, in the district of Ohio, containing 145 inhabitants.

TUSCARORA, a village of New York, inhabited by a tribe of Indians of the Tuscarora nation, consisting of about 300 souls, in the county of Niagara, about 2½ miles E. of Lewiston. They have a good meeting-house and a Presbyterian clergyman; and also an English school. These Indians are sober and orderly in their general deportment, and many of them are respectable in point of wealth, as well as moral conduct. This tribe came from the S. about the year 1712, and joined the Five Nations or Iroquois. The land on which they now live was given them many years ago by the Senecas.

TUSCARORA, a town of North Carolina; 20 miles S.E. of Halifax.

TUSCARORA Creek, a river of Pennsylvania, which runs into the Juniatta, 12 miles S.E. of Lewiston.

TUSCHAMA, a town of Russia, in the government of Irkutsk; 28 miles N.N.W. of Ilimsk.

TUSCHAMSKA, a town of Russia, in the government of Irkutsk; 100 miles N.W. of Ilimsk.

TUSCHGER SEE, a lake of Carinthia; 11 miles N. of Millstatt.

TUSCHNITZ, a town of Bavaria, in the bishopric of Bamberg; 10 miles N.E. of Lichtenfels.

TUSCI, in *Ancient Geography*, a people of Asiatic Sarmatia, between mount Caucasus and the Ceraunian mountains, according to Ptolemy.

TUSCOMARTEE, in *Geography*, a town of Kurdistan, pleasantly situated to the north of the Tigris, at the foot of some hills, and well watered by several clear streams that flow from them. It commands a very fine prospect over an extensive vale to the south. In the summer season the sun is so powerful as to destroy all vegetation, except near the rivulets that flow from the mountains, where are found numerous flocks of sheep and herds of cattle. These, however, the shepherds are always obliged to drive to the town

in the evening, on account of the wild beasts. In this vale no single habitation is visible for near 15 or 20 miles. Jackson's Journey from India, p. 120.

TUSCULAN, in *Matters of Literature*, is a term which frequently occurs in the phrase *Tusculan Questions*. Cicero's "Tusculan Questions" are disputations on several topics in moral philosophy, which that great author took occasion to denominate, from *Tusculum*, the name of a country seat, or villa, where they were composed, and where he lays the scene of the dispute.

They are comprised in five books; the first on the contempt of death; the second of enduring pain; the third on alluaging grief; the fourth on the other perturbations of the mind; and the last, to shew, that virtue is sufficient to a happy life.

TUSCULUM, in *Ancient Geography*, a town of Latium, at a small distance from Rome, towards the S.E. Its origin was referred to the time of Ulysses, whose son Telegonus, by Circe, is said to have been its founder. Its inhabitants were distinguished for their courage, and placed themselves at the head of the allies in the war of the Latin people. It was afterwards subdued by Rome and became municipal. Its situation on a mountain and between the hills induced the rich inhabitants of Rome to select it as the site of their country-houses. It had a citadel of no less importance with regard to this city than the Capitol with regard to Rome. It had also an amphitheatre and aqueducts. It was afterwards denominated *Frescati* or *Frascati*, which see.

TUSCUM, or **THUSUM Mare**, the name of a part of the Mediterranean sea, which washed the coasts of Etruria, as far as the coasts of Sicily.

TUSGEL, in *Geography*, a town of Asiatic Turkey, in Caramania; 42 miles N.W. of Cogni.

TUSHES, in the *Manege*, are the fore-teeth of a horse, seated beyond the corner teeth, upon the bars, where they shoot forth on each side of the jaws, two above, and two below, about the age of three, three and a half, and sometimes four; and no milk or foal-teeth ever come up in the place where they grow. See **TEETH**.

TUSHETI, in *Geography*, a town of Asia, in Daghestan; 80 miles S. of Teflis.

TUSIAGATH, in *Ancient Geography*, a town of Africa, in the interior of Mauritania Cæsariensis, according to Ptolemy.

TUSIS, in *Geography*, a town of the Helvetic republic, in the Grisons, on the Rhine. In 1799, it was taken by the French; 15 miles S. of Coire. N. lat. 46° 32'. E. long. 9° 30'.

TUSK, in *Carpentry*, a bevel-shoulder, made to strengthen the iron of the joist, which is let into the girder.

Tusk, in *Zoology*, is used to denote the long tooth of a fighting animal; and in the same sense with tushes, as applied to other animals besides horses.

TUSKAR, in *Geography*, a small island, or rather rock, off the coast of the county of Wexford, Ireland, forming a conspicuous object for mariners. N. lat. 52° 13'. W. long. 6° 10'.

TUSKAU, a town of Bohemia, in the circle of Pilsen; 6 miles N.W. of Teinitz.

TUSKAWARA, a township of Muskingum county, in the district of Ohio, containing 1151 inhabitants.

TUSO, in *Ancient Geography*, a river of India, on this side of the Ganges, into which it runs.

TUSPA, in *Geography*, a town of Mexico, in the province of Mechoacan; 25 miles N.N.E. of Colima.—Also,

a town of Mexico, in the province of Tlascala, at the mouth of a river so called; 140 miles N.N.E. of Puebla de los Angeles.—Also, a river of Mexico, which runs into the gulf of Mexico, N. lat. 21° 28'. W. long. 98°.

TUSSER, **JOHN**, in *Biography*. In Henry VIIIth's time, when music was more cultivated in England than it had ever been before, an arbitrary and oppressive power was given to the deans of cathedrals and collegiate churches, to impress children possessed of good voices, in order to supply their several choirs with choristers. And John Tusser, the subject of this article, and the unfortunate author of the "Five Hundred Pointes of Good Husbandrie," one of the most pleasant and instructive poems of the time, tells us, that he was impressed from Wallingford college, in Berkshire, into the King's chapel. Soon after, by the interest of friends, he was removed to St. Paul's, where he received instructions in music from John Redford, an excellent contrapuntist, and organist of that cathedral. There seems, however, to have been care taken of the general education of boys so impressed, as we find that Tusser was sent from St. Paul's to Eton school, and thence to Cambridge. He afterwards tried his fortune in London about the court, under the auspices of his patron lord Paget, where he remained ten years; then he retired into the country, and embraced the occupation of a farmer, in the several counties of Suffex, Suffolk, and Essex; but not prospering, he procured a singing-man's place in the cathedral of Norwich; where he does not seem to have remained long before he returned to London. But being driven thence by the plague, he retired to Trinity college, Cambridge; returning afterwards, however, to the capital, he there ended his restless life in 1580; not, as has been said, *very aged*, if he was born about 1523.

TUSSEY, in *Geography*, the name of mountains of Pennsylvania; 10 miles N. of Huntingdon.

TUSSILAGO, in *Botany*, an ancient name, composed of *tussis*, a cough, and *ago*, to act upon, or cure; in allusion to the reputed virtues of this herb, as a remedy for coughs and other pectoral diseases.—Linn. Gen. 423. Schreb. 554. Willd. Sp. Pl. v. 3. 1962. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 5. 34. Sm. Fl. Brit. 878. Prodr. Fl. Græc. Sibth. v. 2. 175. Pursh 531. Juss. 181. Tourn. t. 276. Lamarck Illustr. t. 674. Gært. t. 170. (Petasites; Tourn. t. 258. Gært. t. 166.)—Class and order, *Syngenesia Polygamia-superflua*. Nat. Ord. *Compositæ discoideæ*, Linn. *Corymbifera*, Juss.

Gen. Ch. *Common Calyx* cylindrical, tumid at the bottom, of from fifteen to twenty linear-lanceolate, equal, somewhat membranous scales, the length of the disk. *Cor.* compound, various. Florets in some all perfect, tubular, funnel-shaped, with an acute, four or five-cleft, reflexed limb, longer than the calyx; in others such florets are found in the disk only. Female florets when present either ligulate, very narrow, undivided, longer than the calyx; or tubular, and rather longer than the perfect florets. *Stam.* in the perfect florets, Filaments five, capillary, very short; anthers more or less united into a cylindrical tube. *Pist.* Germen in the perfect florets, short; style thread-shaped, longer than the stamens; stigma thickish, emarginate; in the female ones, Germen short; style thread-shaped, the length of the former; stigma deeply divided, acute. *Peric.* none, except the scarcely altered calyx. *Seeds* solitary, oblong, compressed, generally abortive in the florets of the disk, or centre thereof. Down capillary, sometimes stalked. *Recept.* naked, dotted.

Ess. Ch. Receptacle naked. Seed-down simple. Calyx simple,

TUSSILAGO.

simple, of many equal, somewhat membranous leaves; tumid at the base.

Obf. Linnæus remarks, that *Petafites* of Tournefort has no ligulate florets in the radius, though some female naked ones occur: *Tussilago* of the same author has always female florets in the radius, furnished with a ligulate corolla: *Anandria* of Linnæus himself, Am. Acad. v. 1. 243, has sessile seed-down; and *T. frigida* varies with or without a radius. These circumstances are indeed variable at all times, but especially in the genus now under consideration. We have mentioned in Fl. Brit. that some reputed species appear to be but different sexes of one and the same. Of this the British *T. hybrida* and *Petafites* are one instance. We shall indicate other similar cases, in which it seems Ehrhart has forestalled us, in his Beiträge, v. 3. His discoveries are confirmed by Hoppe; and both these authors are followed by Willdenow, without any reference to the *Flora Britannica*, to which however the publication of Hoppe is three years posterior. We are well assured that this apparent neglect was not intentional, and the observations in question, having been made by each person independently, derive from thence the more authority. The whole genus of *Tussilago* is herbaceous, without any stem. Leaves stalked, simple, angular, toothed, more or less heart-shaped. Pubescence of the herbage cottony, dense, generally remarkable for its pure whiteness, and soft texture. Flowers white, or pale red; sometimes yellow; either solitary, or densely paniced. Seed-down of a brilliant silvery white.—Willdenow reckons up twenty-one species, but his first two, *T. Anandria* and *lyrata*, will be found under our article PERDICUM, sp. 3. and 4; his *T. lyrata* being Gmelin's t. 67. f. 2, mentioned under our *Perdicium populifolium*, n. 4, as a probable variety of *Anandria*. Willdenow's 4th species, *T. integrifolia*, is *Chaptalia tomentosa*, Venten. Jard. de Cels 61. Pursh 577. If not a good genus, it must be referred to *Perdicium*; being certainly no *Tussilago*. Very possibly the third species of Willdenow may also belong to *Perdicium*; but this being a very uncertain plant, known from Plumier's figure only, we must leave it as we find it, amongst other species placed here by authors, but which to us are by no means free from doubt as to their generic characters; nor can that question be decided without an investigation and comparison of their fresh flowers.

1. *T. dentata*. Toothed West Indian Colt's-foot. Linn. Sp. Pl. 1213. Willd. n. 3. (After acaulos, hieracii villosis foliis; Plum. Ic. 28. t. 40. f. 2.)—Stalk single-flowered, naked. Flower radiated, erect. Leaves sessile, oblong, wavy, toothed, villous.—Gathered by Plumier in the West Indies. The root appears to be fibrous. Leaves numerous, three or four inches long, with an undulated strongly toothed margin. Flower-stalks also numerous, though fewer than the leaves, smooth. Flowers radiated, somewhat like our common *T. Farfara*, but much smaller.

2. *T. albicans*. Whitish Jamaica Colt's-foot. Swartz Ind. Occ. 1348. Willd. n. 5. (Leontodon tomentosum; Linn. Suppl. 347.)—Stalk single-flowered, naked; cottony at the top. Flower radiated, drooping. Leaves stalked, obovate, with slight reversed serratures; cottony beneath; tapering at the base.—Native of dry grassy inland pastures, in the western part of Jamaica. Swartz. Sent to Linnæus in Browne's herbarium. Root fibrous, probably perennial, though marked annual. Leaves two or three inches long, of a narrow obovate form; green and nearly naked above; snow-white beneath; their margin slightly wavy, beset with minute distant teeth, all pointing backwards. Stalks few, often a foot high, round, reddish, destitute of scales or bractæas, clothed about the top, for near two inches, with dense cottony down. Flower white, drooping as it

fades; according to Swartz's description it answers to the characters of this genus. Seed-down shining, with a reddish, or pink, hue.

3. *T. pumila*. Dwarf Jamaica Colt's-foot. Swartz Ind. Occ. 1350. Willd. n. 6.—Stalk single-flowered, naked, downy. Flower radiated, erect. Leaves obovate, with reversed teeth; sinuated at the base; downy beneath.—Found on the lofty calcareous mountains of the fourth part of Jamaica, near *Cold-spring*, flowering in summer. Smaller than the last, to which it seems nearly allied; but the leaves, only an inch or two in length, are pinnatifid in a lyrate manner. Stalk mostly solitary, from three to six inches high, roundish, cottony; purplish in the lower part. Flower small, white; erect according to Willdenow, and the specific character of Swartz, though the latter calls it drooping in his description. Its structure is that of a *Tussilago*.

4. *T. nutans*. Drooping Jamaica Colt's-foot. Linn. Sp. Pl. 1213. Am. Acad. v. 5. 406. Willd. n. 7. Ait. n. 1. Swartz Obf. 305. (Leontodon n. 1; Browne Jam. 310. Dens leonis, folio subtus incano, flore purpureo; Sloane Jam. v. 1. 255. t. 150. f. 2. After primula veris folio, flore singulari purpureo; Plum. Ic. 29. t. 41. f. 1.)—Stalk single-flowered, naked, cottony. Flower radiated, pendulous. Leaves stalked, oblong-heart-shaped, wavy, toothed; cottony beneath; sinuated at the base.—Native of cultivated and grassy places in Jamaica. Swartz describes it as annual. Mr. Aiton marks it biennial, flowering in the stove in June and July. The much larger leaves, near a span long, pinnatifid in a lyrate manner, and the stalks twelve or fifteen inches high, distinguish this species from all the preceding. The flower is pendulous, with a white disk and radius, but the slender points of the calyx-scales being tipped with purple, have, as it appears to us, been mistaken for a purple radius by Sloane, and even by the more learned professor Swartz. When in seed, the stalk becomes erect. The down is rather tawny, or reddish.

5. *T. trifurcata*. Three-forked Colt's-foot. G. Forster, Pl. Magell. 28. Willd. n. 8.—Stalk single-flowered, scaly. Flower radiated, erect. Leaves spatulate, with three or more oblong segments, smooth.—Native of dry hilly situations about the straits of Magellan. Root perennial, somewhat tuberous. Leaves radical, tufted, an inch long, divided into three, four, or five, oblong, erect, finger-like segments, spreading, quite smooth and naked. Stalk from one to three inches high, round, clothed with awl-shaped scaly bractæas. Flower white, with all the characters of its genus. Inner scales of the calyx largest, with spreading horizontal points.

6. *T. alpina*. Alpine Colt's-foot. Linn. Sp. Pl. 1213. Willd. n. 9. Ait. n. 2. Jacq. Austr. t. 246. Curt. Mag. t. 84. (*T. alpina secunda*; Cluf. Hist. v. 2. 113. Afarina; Matth. Valgr. v. 1. 34. A. Matthioli; Ger. Em. 836.)—Stalk single-flowered, with oblong scattered bractæas. Flower without rays. Leaves kidney-shaped, toothed, smooth on both sides.—Native of the alps of Austria, Bohemia, Switzerland, &c. flowering in June and July. The root is perennial, tuberous, and creeping, brown, with many long fibres. Leaves few, radical, stalked, from one to two inches broad, bluntly toothed; quite smooth, and of a shining green, reticulated with depressed branching veins above; paler beneath, but equally smooth, except some hairs on the ribs or veins. Stalk solitary, a foot or more in height, erect, purplish, hairy, bearing a few distant, variously shaped, concave, upright bractæas. Flower erect, half an inch broad. Calyx purple, smooth. Florets white, sometimes purplish, all regular and five-cleft, with purple anthers and stigmas.

7. *T. discolor*. Two-coloured Colt's-foot. Jacq. Austr.

t. 247. Willd. n. 10. Ait. n. 3. (*T. alpina* β ; Linn. Sp. Pl. 1214. *T. alpina* prima; Clus. Hist. v. 2. 112. *T. alpina*; Ger. Em. 812.)—Stalk single-flowered, nearly naked. Flower without rays. Leaves kidney-shaped, toothed, downy and white beneath.—Native of the alps of Austria, Carniola, &c. growing along with the last, and flowering at the same season. This is rather smaller than the preceding, usually with fewer bractees. The under side of the leaves is clothed with dense white cottony down, which affords the most distinguishing mark of the plant, and presumed by recent authors to prove it specifically distinct. Linnæus thought it but a variety.

8. *T. sylvestris*. Lobed Alpine Colt's-foot. Scop. Carn. v. 2. 157. Jacq. Austr. v. 5. Append. 33. t. 12. Willd. n. 11.—Stalk mostly single-flowered, with dilated scattered bractees. Flower without rays. Leaves smooth, kidney-shaped, many-lobed and toothed.—Native of mountainous, chiefly beech, woods of Styria, Carinthia, Carniola, &c. flowering in May. Allied to *T. alpina*, with which its synonyms have been confounded by Scopoli, Haller, and even Jacquin; but the last has the merit of subsequently distinguishing this very well-marked species. It is larger than *alpina*, and the stem sometimes bears two or three flowers, scarcely differing from those of *alpina* or *discolor*. The bractees however are broader, often terminating in a leafy appendage, particularly the lower ones. The radical leaves are very different, being cut into about seven rather shallow lobes, of which the middle ones more especially have about three pointed teeth. The upper surface is green, sometimes roughish to the touch, slightly marked with veins; the under paler, peculiarly smooth and even, a little shining. We have not heard of this plant in any British garden, nor had Linnæus a specimen.

9. *T. Farfara*. Common Colt's-foot. Linn. Sp. Pl. 1214. Willd. n. 12. Fl. Brit. n. 1. Engl. Bot. t. 429. Curt. Lond. fasc. 2. t. 60. Woodv. Med. Bot. t. 13. Bulliard Herb. de la Fr. t. 329. Fl. Dan. t. 195. (Tussilago; Ger. Em. 811. Matth. Valgr. v. 2. 198. Camer. Epit. 590, 591.)—Stalk single-flowered, scaly. Flower radiated. Leaves heart-shaped, angular, toothed; downy beneath.—Native of moist chalky shady situations, throughout Europe, flowering in March or April, before the leaves appear. Dr. Sibthorp met with it about rills and inundated places in Greece, nor can there be any doubt of our Colt's-foot being the $\beta\eta\chi\iota\nu$ of Dioscorides, of which FARFARA, see that article, is an ancient synonym. The roots of this species are perennial, creeping to a great extent. Stalks five or six inches high, erect, simple, downy, clothed with numerous, alternate, ovate, erect, purplish, nearly smooth scales, three-quarters of an inch long. Flower drooping before it expands, then erect, yellow, an inch broad; the radius of very numerous, long, narrow, spreading, ligulate florets, which Dr. Stokes has observed to be the only ones that ever perfect their seed. Indeed the plant increases so much by root, that scarcely any seeds are ever ripened. The leaves come forth on erect footstalks, after the flowers and their stalks have withered, and are from three to six inches wide, sharply toothed; very smooth, and rather glaucous, above; covered beneath with dense, white, cottony down. They are mucilaginous and astringent, slightly bitter, and are recommended either in infusion, or smoked like tobacco, as a cure for coughs. The latter mode of application is advised by Dioscorides in difficulty of breathing, dry cough, &c. and he prescribes these leaves bruised, with honey, as an external remedy for erysipelas, and other inflammations of the skin. The cottony web of this herb serves extremely well for tinder, and to staunch the blood of

slight wounds.—Willdenow says there is a variety with perfectly smooth leaves.

10. *T. japonica*. Japan Colt's-foot. Linn. Mant. 113. Willd. n. 13. Thunb. Jap. 313. Banks Ic. Kæmpf. t. 27, 28. (*Arnica tussilaginea*; Burm. Ind. 182. *Doronicum tussilaginis folio*, &c.; Pluk. Amal. h. 71. t. 390. f. 6. Twa; Kæmpf. Am. Exot. 827.)—Stalk with several radiated flowers, corymbose, bracteated. Leaves roundish-heart-shaped, toothed; slightly downy beneath.—Native of Japan, flowering in October. Root perennial, tuberous. Stalks twelve or fifteen inches high, angular, furrowed, reddish, downy in the upper part, bearing a few scattered scaly bractees, and terminating in from five to eight large yellow radiated flowers, on downy alternate partial stalks. Rays wedge-shaped. The seed-down is sessile, like the last. Leaves coming after the flowers, on long upright footstalks; their breadth three or four inches; length much less; their under side paler, but scarcely downy. The root, according to Thunberg, is bitter, and esteemed a counter-poison by the Japanese. Kæmpfer says the stalks are used as a pot-herb.

11. *T. frigida*. Lapland Colt's-foot. Linn. Sp. Pl. 1214. Fl. Lapp. ed. 2. 246. Willd. n. 14. Ait. n. 5. Pursh n. 1. Fl. Dan. t. 61. (*T. n. 128*; Gmel. Sib. v. 2. 150. t. 70.)—Stalk with many radiated flowers, corymbose, bracteated. Leaves triangular-heart-shaped, with deep triangular teeth; downy beneath.—Found by Linnæus plentifully in woods and pastures among the Lapland alps, flowering towards the end of May, and scattering its seeds about a month afterwards. It occurs likewise in Norway and Siberia, as well as, according to Mr. Pursh, in Canada, and on the highest peaks of the Vermont and New Hampshire mountains, at the same season. The root is somewhat tuberous and creeping, though less fleshy than the last, with copious long fibres. Leaves and flowers appearing nearly together, on stalks about equal in height, from ten to fifteen inches; the former remarkable for their very large angular teeth. The flower-stalk bears several alternate, large, tumid, smooth bractees, sometimes ending in a small leaf. Flowers white; the florets of the disk tinged with pale purple, especially their large, club-shaped, hairy, prominent, but we believe useless, stigmas. Seed-down sessile, above an inch long, silvery.

12. *T. fragrans*. Sweet-scented Colt's-foot. Villars Actes de la Soc. d'Hist. Nat. de Paris, v. 1. 72. t. 12. Willd. n. 15. Ait. n. 6. Curt. Mag. t. 1388.—Stalk panicled, level-topped, somewhat leafy. Flowers radiated. Leaves roundish-heart-shaped, obtuse, equally and finely toothed; rather hairy beneath.—Native of the neighbourhood of Naples, and of Sicily near Palermo; introduced into England by Messrs. Lee and Kennedy in 1806. It flowers in the winter, or early spring. The leaves, which are green on both sides, rounded, obtuse, not at all lobed or cut, appear with the flowers. The latter are large, fragrant like *Heliotropium peruvianum*, with broad light-purple rays, and a white disk, the tumid stigma of whole florets is dark-purple. The panicle is compound, rather dense; its stalk taller than the foliage, clothed with very large inflated bractees having leafy terminations.

13. *T. levigata*. Smooth Straw-coloured Colt's-foot. Willd. n. 16. (*T. scapo imbricato, floribus spicatis radiatis, foliis utrinque glaberrimis*; Gmel. Sib. v. 2. 148. n. 126.)—Stalk panicled, level-topped. Flowers radiated. Leaves heart-shaped, acute, slightly angular, toothed, smooth on both sides.—Abundant about the banks and shallows of rivers in Siberia, flowering in spring, at which time all but the flowers is generally under water. Gmelin. Root fleshy,

purplish,

purplish, creeping to the extent of many feet, with many long, thick, simple fibres. *Leaves* about two inches broad at the flowering period, but when full grown, eighteen inches in diameter; bright green and smooth on both sides, purplish at the edges, fleshy; copiously veined beneath; their margin irregularly and sharply toothed, sometimes angular. *Stalks* smooth, a foot or more in length. *Flower-stalk* taller than the leaves, thick, succulent, reddish, striated, slightly cottony, bearing many large, inflated, sheathing *bractæas*, and terminating in a more or less compound, level-topped, or corymbose, *panicle*, whose downy stalks are furnished with many smooth, linear-lanceolate, flat, much smaller *bractæas*. *Flowers* from eight to twenty, scarcely half an inch broad, straw-coloured, with shortish rays. Willdenow's opinion of this being a very distinct species, is confirmed by Gmelin's own specimens in the Linnæan herbarium; which also, unless we are greatly mistaken, shew n. 127. t. 69, D, E, of the same author, to be the very same plant, totally different from the common *T. Petasites*, with which he compares it, in many other points besides the colour of the *flowers*.

14. *T. alba*. White Colt's-foot, or Double-toothed Butter-bur. Linn. Sp. Pl. 1214. Willd. n. 17. Ait. n. 7. Fl. Dan. t. 524. (*Petasites flore albo*; Camer. Epit. 593. P. n. 139; Hall. Hist. v. 1. 61.)—*Panicle* dense, level-topped. *Flowers* without rays. *Leaves* roundish-heartshaped, doubly and sharply toothed; white and shaggy beneath.—In mountainous woods, and about the banks of rivers, in the alpine parts of Europe, not rare in Switzerland, but unknown as a native of Britain. It appears to have been cultivated at Edinburgh in the time of Sutherland, 1683, and we obtained a specimen from the botanic garden there 100 years after, under the erroneous name of *T. hybrida*. This is a large species, distinguished from all the rest, of those which bear many flowers on a stalk, by its strongly, doubly, and acutely-toothed *leaves*; quite smooth above; very veiny and cottony beneath, when young, but afterwards the pubescence of that side becomes more grey, shaggy, and loose. The tall downy *flower-stalk* bears a great number of broad, concave, rather cottony *bractæas*, and terminates in a branched many-flowered corymbose *panicle*. The *flowers* are rather small, snow-white, without rays. *Down* sessile. Willdenow and other botanists have observed, that some individual plants have but very few, and others many, female *florets*, in comparison to those furnished with both *stamens* and *pistils*; but the author just named has been misled by Villars to cite, as the female plant of this species, Gmelin's t. 69. f. D, E, which has yellow *flowers*; see our n. 13.

15. *T. nivea*. Snowy Colt's-foot, or White-leaved Butter-bur. Villars Actes de la Soc. d'Hist. Nat. de Paris, v. 1. 73. t. 12. f. 2. Willd. n. 18. Ait. n. 8. (*T. frigida*; Villars Dauph. v. 3. 175. *T. paradoxa*; Retz. Obf. fasc. 2. 24. t. 3. *Petasites* n. 141; Hall. Hist. v. 1. 62. P. minor, tussilaginis folio; Moris. sect. 7. t. 10. f. 4.)—*Panicle* dense, rather oblong. *Flowers* without rays. *Leaves* triangular-heartshaped, simply toothed, with spreading angular lobes; densely downy and white beneath.—Native of the mountains of Switzerland, Germany, Dauphiny, &c. flowering in April. Differs from the last in the snowy whiteness, and dense pubescence, of the under side of the *leaves*, as well as in their triangular form, and their simple series of marginal teeth. *Flowers* pale flesh-coloured. *Common stalk* clothed with similar large *bractæas*. *Seed-down* near an inch long. The female plant, termed *paradoxa*, as a distinct species, by Retzins, has but about three apparently perfect *florets* in each *calyx*, and of these the *anthers*

are unconnected. In a remark on the *sexes* of this tribe of plants, at p. 431 of Engl. Bot. *T. alba* is inadvertently mentioned for *nivea*.

16. *T. Petasites*. Common Butter-bur. Linn. Sp. Pl. 1215. Willd. n. 19. Fl. Brit. n. 3. Engl. Bot. t. 431. Curt. Lond. fasc. 2. t. 59. Fl. Dan. t. 842. Bulliard Herb. de la Fr. t. 391. (*T. major*; Matth. Valgr. v. 2. 199. Camer. Epit. 592. *Petasites*; Ger. Em. 814. Fuchf. Hist. 644. P. n. 138; Hall. Hist. v. 1. 61.)

β . *T. hybrida*; Linn. Sp. Pl. 1214. Fl. Brit. n. 2. Engl. Bot. t. 430. (*Petasites major, floribus pediculis longis infidentibus*; Dill. Elth. 309. t. 230. P. n. 140; Hall. Hist. v. 1. 61.)—*Panicle* dense, ovate-oblong. *Flowers* without rays. *Leaves* roundish-heartshaped, unequally toothed, slightly angular, with rounded converging lobes; paler and somewhat shaggy beneath.—Native of moist, boggy, shady meadows, the borders of rivers, pools, &c. throughout Europe. Dr. Sibthorp found it in Greece, but not common, except in rather mountainous, as well as watery situations. There can, however, be little doubt of this plant being, as all botanists have thought, the *πικραστος* of Dioscorides. Our β grows with the common kind, though far less frequently. Both flower in April, before the leaves expand, and are, of course, perennial. The *root* is thick and fleshy, creeping very far, and hard to be extirpated. *Stalks* a span high, thick, downy, clothed with oblong reddish *bractæas*, partly leafy at their extremity, and terminating in a dense ovate *panicle*, of pale dusky flesh-coloured *flowers*. The *florets* are all tubular, furnished with united red *anthers* and a thick cloven *stigma*. The younger Linnæus, and Haller, have detected a few female ones, laid to afford good *seed*; but many botanists have remarked that the Common Butter-bur never perfects *seed*, nor does even its *seed-down* make a very conspicuous appearance. *T. hybrida*, which we have marked as a variety, because its *leaves* are rather smaller, and the *panicle* rather longer, with smaller *flowers*, is allowed to be the female plant, or at least an individual in which that sex prevails. In this most of the *florets* are female, with a slender *corolla*, and a taper, acute, efficient *stigma*. One or two of the central ones only are male, having separate *anthers*, and a thick useless *stigma*. The *panicle* when in seed is much elongated, and becomes cylindrical, conspicuous for its copious, brilliant, though short, *seed-down*, forming an elegant silvery plume, a foot or more in length. The *leaves* of the common *T. Petasites* are the largest of any British plant, being often three feet broad. They are grey or hoary beneath, far less white than those of *T. nivea*, as well as more rounded, and with their lobes approaching each other.

17. *T. spuria*. Cloven-lobed Butter-bur, or Colt's-foot. Retz. Obf. fasc. 1. 29. t. 2. Willd. n. 20. (*T. tomentosifolia*; Ehrh. Beitr. v. 3. 65.)—*Panicle* corymbose. *Flowers* without rays. *Leaves* triangular-heartshaped, simply and finely toothed, with spreading, angular, cloven lobes; densely downy beneath.—Native of Lapland, Scania, and Germany, about the banks of rivers. The general outline of the *leaves*, with their spreading acute lateral lobes, is most like *nivea*, n. 15, but those lobes are remarkable for being always divided, or double. The marginal teeth of the whole *leaf* are also more numerous, crowded, regular, and smaller, as well as more obtuse, than in *nivea*; the *leaf*, cottony, very white downiness of the under side nearly accords with that species; the upper is green, and quite smooth, except when young. *Flowers* corymbose, rather than panicled, cream-coloured, with linear *bractæas*. *Anthers* have distinguished two varieties; one with a more short dense *inflorescence*, and only three female *florets*, all

distinct

destitute of a *corolla*, which is Ehrhart's *tomentosa*; the other with a more elongated *corymb*, and numerous female *florets*, each with an oblique tubular *corolla*, but whose *stigma* nevertheless is said to be small and barren; this is the original *paradoxa*. We presume the idea of the barren *stigma* may be a mistake of Retzius; that part, when imperfect, being, in this tribe of plants, always thickened; but we have had no opportunity of examining living specimens of *T. spuria*, which is a stranger to the gardens of England.

18. *T. sagittata*. Arrow-leaved Colt's-foot. Herb. Banks. Pursh n. 2.—“Panicle dense, ovate, level-topped. Flowers radiated. Radical leaves oblong, acute, arrow-shaped, entire; with obtuse lobes.”—Gathered by Mr. Hutchinson, at Hudson's Bay. Perennial. *Pursh*.

19. *T. palmata*. Cut-leaved Colt's-foot. Ait. n. 10. ed. 1. v. 3. 188. t. 11. Willd. n. 21.—Flowers corymbose, level-topped, radiated. Leaves seven-lobed, palmate, cut; downy beneath.—Native of Newfoundland and Labrador. Introduced into England by Dr. Fothergill, in 1777. Perennial, flowering in April. The *stalk* and *inflorescence* resemble the last. The *flowers* are light flesh-coloured, or purplish, with short obtuse rays. The *leaves*, which by Willdenow's account vary in the depth of their lobes, afford a clear specific difference from all the other species.

TUSSILAGO, in *Gardening*, comprehends plants of the low, hardy, herbaceous, creeping-rooted perennial kinds; among which, the species most commonly cultivated in gardens for different purposes are, the common tussilago or colt's-foot (*T. farfara*); the mountain colt's-foot (*T. alpina*); the Siberian colt's-foot (*T. anandria*); the petasites, tussilago major, or common butter-bur (*T. petasites*); the hybrid German tussilago, greater colt's-foot, or long-stalked butter-bur (*T. hybrida*); and the white alpine tussilago, or smaller butter-bur (*T. alba*).

The first sort has a creeping perennial root, short, thickish stalk, with fine roundish hoary leaves; which are produced after the stem and flower; hence it is denominated one of the *filius ante patrem*, or son before the father, tribe or class of plants, or those in which the flowers rise before the leaves.

It is not much cultivated in the garden manner, except in herbaceous collections as a medicinal herb for making decoctions and other mild balsamic drinks, and for the use of its leaves as a principal ingredient in the preparation of the British herb tobacco, and other similar compositions. Sometimes, however, it is employed for variety in patches in the borders and other parts of ornamented grounds.

In the second kind, there is a variety which has round hoary leaves.

The fourth sort is also sometimes cultivated and employed as a medicinal plant in different intentions.

Method of Culture.—They are all capable of being raised and increased by sowing the seeds of them in any proper and suitable soil and situation in the early spring season, but not to too great a depth, when they will freely rise and become good plants. But the best and most expeditious method is that of parting the roots and planting them, which may be done either in the autumnal or spring season, when the smallest slip will readily take root and grow, multiplying in a very quick manner.

Most of the sorts possess the singular property of producing and sending up their flowers and stalks before the leaves are formed and seen.

The plants mostly affect rather moist soils and situations, but they will grow and succeed almost any where, and may

be employed for affording greater variety and ornament, as well as some of them for the purposes and intentions which have been suggested above.

TUSSIS. See COUGH.

TUSSLENG, in *Geography*, a town of Bavaria; 4 miles W.S.W. of New Oetting.

TUT, in *Armory*, &c. an imperial ensign of a golden globe, with a cross on it.

TUT *Bargain*, among the *Miners*, denotes a bargain by the lump; as when they undertake to perform a piece of work at a fixed price, however it may prove.

TUTACORIN, or TUTUCORIN, in *Geography*, a town of Hindoostan, in the Carnatic, where the Dutch have a factory; 25 miles E. of Palamcotta.

TUTARY, a town of Sweden, in the province of Smaland; 24 miles W. of Wexio.

TUTBURY, or STUTESBURY, a market-town in the hundred of Offlow, and county of Stafford, England; is situated on the western bank of the river Dove, at the distance of 4 miles N.W. by N. from Burton-upon-Trent, and 134 miles in the same bearing from London. It was erected a free borough at an early period, and the burgesses and other inhabitants were invested with a variety of privileges and immunities; but never had the right of sending members to parliament, though the town still retains the appellation of a borough. The parish-church is an ancient and spacious edifice, with a square embattled tower surmounted by four small pinnacles; its principal entrance is decorated with fine specimens of Saxon sculpture. A free school was founded and endowed by Richard Wakefield in the year 1730: it was rebuilt in 1789. Here is also a meeting-house for Dissenters. According to the population return of the year 1811, the parish of Tutbury contained 242 houses, occupied by 1235 persons. Wool-combing constitutes the principal business of the inhabitants; and a cotton manufactory, recently established, gives employment to a considerable number. Three fairs are held annually, and a market weekly, on Tuesdays. On the north side of the town are the remains of the castle of Tutbury, which was erected soon after the Conquest, by Henry de Ferrars, a noble Norman, to whom the Conqueror gave large estates in this county. In the family of Ferrars it continued till the reign of Henry III., when, being forfeited by the attainder of Robert de Ferrars, earl of Derby, the king granted it to his second son Edmund, earl of Lancaster. It again reverted to the crown, in consequence of the rebellion of Thomas, earl of Lancaster, who fortified it against Edward II., but was obliged to surrender. Having sustained considerable damage during this contest, and being afterwards suffered to fall into decay, John of Gaunt rebuilt the greater part of it upon the ancient site in 1350. This castle, being the principal seat of the dukes of Lancaster, was long distinguished as the scene of much festivity and splendour. So great was the number of minstrels resorting to it, that it was found necessary to adopt special regulations for the preservation of order. Accordingly, one of their body was invested with the title of king of the minstrels, with officers under him for the due execution of the laws. A charter for that purpose was granted by John of Gaunt in 1381: and a court was established for determining all controversy connected with minstrelsy. At this court, which was annually held with great formality, the king and his officers were appointed for the year ensuing; and the business of the day concluded with a bull-running and baiting. This barbarous custom was abolished, by commutation, about the middle of the last century; but the court still continues to be held. Tutbury castle was twice the residence, or rather prison, of Mary queen

queen of Scots; in 1568, and again in 1585. At the commencement of the civil war in the reign of Charles I. it was garrisoned by lord Loughborough, a zealous supporter of the royal cause; but was besieged and taken by sir William Brereton, one of the parliamentary commanders. The damage sustained by the castle on this occasion was very great; but it was not doomed to total destruction till 1646, when, by order of the parliament, it was reduced nearly to its present ruinous condition. What still remains, sufficiently declares its former extent and grandeur; the ancient gateway is tolerably entire; and towers, staircases, divisions of rooms, and fire-places, can yet be discovered in different parts of the walls, which appear to have been of immense strength and thickness: the whole was surrounded by a broad and deep ditch, over which, Dr. Plott informs us, there was in his time an extraordinary timber-bridge, composed of distinct pieces of wood, none of them above a yard long, yet unsupported by any arch-work, pillars, or other prop. Coeval with the castle, and founded by the same person, was a Benedictine priory, largely endowed by king William Rufus. The site was granted by Edward VI. to sir William Cavendish. Scarcely a vestige of the ancient building is now left, and we know little more of its structure, than that it was of large extent, and contained a splendid monument to the memory of the founder. A portion of the old priory church constitutes a part of the present parish-church.—Description of the Castle and Priory of Tutbury, 8vo. 1796. Beauties of England and Wales, vol. xiii. Staffordshire, 1814.

TUTELA, in *Ancient Geography*, a town of Spain, in Celtiberia, according to Martial.

TUTELA, in *Mythology*, a goddess worshipped at Bourdeaux, of which city she was patroness, and where she had a magnificent temple. She is supposed by learned antiquaries to have been a divinity peculiar to sailors and merchants, who trafficked upon the rivers, as it was a common practice to put upon their ships the figures of certain gods, who gave names to them, and were called by the ancients "Tutela Navis," the tutelary divinity of the ship.

TUTELARY, **TUTELARIS**, one who has taken something into his patronage and protection.

It is an ancient opinion, that there are tutelary angels of kingdoms and cities, and even of particular persons, called *guardian angels*.

The ancient Romans, it is certain, had their tutelary gods, whom they called *Penates*; which see. And the Romish church to this day, hold an opinion not much unlike it; they believe that every person, at least every one of the faithful, has, from the time of his birth, one of those tutelary angels attached to his person, to defend him from all temptations; and it is on this, principally, that their practice of invoking angels is founded.

F. Antony Macedo, a Portuguese Jesuit of Coimbra, has published a large work in folio on the tutelary saints of all the kingdoms, provinces, and great cities of the Christian world; "Divi Tutelares Orbis Christiani," at Lisbon, 1678.

TUTELINA, or **TUTILINA**, in *Mythology*, the goddess of corn, who had the care of it when deposited in the granary. She had a chapel on the Aventine mount, and a statue in the Circus.

TUTENAG, a name given in India to the semi-metal zinc. It is also sometimes applied to denote a white metallic compound, brought from China, called also *Chinesse*, or *white copper*, the art of making which is not known in Europe. It is the best imitation of silver which has been made: it is very tough, strong, malleable, may be easily cast, ham-

mered, and polished; and the better kinds of it, when well manufactured, are very white, and not more disposed to tarnish than silver is.

Three ingredients of this composition may be discovered by analysis, *viz.* copper, zinc, and iron. See *Alloys of COPPER*.

TUTESERAI, in *Geography*, a town of Hindoostan, in Lahore; 14 miles E. S. E. of Sultanpour.

TUTIA, or **TUTTIA**, in *Ancient Geography*, a town of Hither Spain.

TUTICUM, a town of Italy, in Samnium, called in the Itinerary of Antonine, "Equus Tuticus."

TUTLING, in *Geography*, a town of Bavaria; 10 miles N. of Passau.

TUTOR, in the *Civil Law*, is one chosen to look to the person and estate of children left by their fathers and mothers in their minority. See **GUARDIAN**.

By the custom of Normandy, the father is the natural tutor of his children. A person nominated tutor, either by testament, or by the relations of the minor, is to decline that office if he have five children alive; if he have any other considerable tutorage; if he be under twenty-five years of age; if he be a priest, or a regent in an university; or if he have any law-suit with the minors, &c.

The marriage of a pupil, without the consent of his tutor, is invalid. Tutors may do any thing for their pupils, but nothing against them; and the same laws which put them under a necessity of preserving the interest of the minors, put them under an incapacity of hurting them. See **PARENT**.

TUTOR, *Honorary*. See **HONOURARY**.

TUTOR is also used in our universities for a member of some college or hall, who takes on him the instruction of young students in the arts and faculties.

TUTORAGE, **TUTELA**, in the *Civil Law*, a term equivalent to guardianship in common law, signifying an office imposed on any one, to take care of the person and effects of one or more minors. See **GUARDIAN**.

By the Roman law there are three kinds of tutorage. *Testamentary*, which is appointed by the father's testament. *Legal*, which is given by the law to the nearest relation. And *dative*, which is appointed by the magistrate.

But in all customary provinces, as France, &c. all tutorages are dative and elective; and though the father have by testament nominated the next relation to his pupil, yet is not that nomination of any force, unless the choice be confirmed by that of the magistrate, &c.

By the Roman law, tutorage expires at fourteen years of age; but in France, not till twenty-five years. A minor quits his tutorage, and becomes free by marriage; in which case a curator is given him.

TUTOVA, in *Geography*, a river of Moldavia, which runs into the Birlat, 4 miles S. of Birlat, in the province of Moldavia.

TUTSAN, in *Botany*. See **HYPERICUM**.

TUTTI, in the *Italian Music*, is used to signify that all the parts are to play together, or to make a full concert.

In this sense, *tutti* stands opposed to *sol* or *solo*.

It is often found expressed by *omnes*, *ripieno*, *choro*, &c.

TUTTI, in *Geography*, a town of Bengal; 13 miles N. N. E. of Burwa.

TUTTLINGEN. See **DUTTLINGEN**.

TUTTUM, a town of Hindoostan, in Bundelcund; 20 miles N. E. of Chatterpour.

TUTTY, *Tutia Alexandrina*, or *Lapis Tutie*, an argillaceous ore of zinc, found in Persia, formed on cylindrical moulds into tubulous pieces, like the bark of a tree, and baked

baked to a moderate hardness. This account of its original is supported by the authority of Teixeira and Douglas, and by its chemical properties. That the common opinion of its being a sublimate produced in the European founderies, where zinc is melted with other metals, is erroneous, appears from hence, that tutty is not found, upon strict enquiry, to be known at those founderies; and by its consisting, in a great part, of an earth not capable of rising in sublimation. This, however, is probable, that sublimate, or the common ores of zinc, are often mixed with argillaceous earths, and baked hard, in imitation of the genuine oriental tutty.

Bontius, in his animadversions upon Garcias ab Orta, informs us, that it is made of a glutinous or argillaceous earth, like clay, found in great quantities in a province of Persia, called Kirman, which the Indians, who gather it, put into earthen pots made on purpose, and, adding water to it, stir it with a stick: these pots are then placed in furnaces till the water is evaporated; afterwards removing the dregs which remain at the bottom, they pick off from the sides of the pots the calcined earth or tutty, which they carefully preserve for sale. He adds, that it is used in India as a cosmetic for destroying hair, more especially by the women, when they bathe.

Tutty is generally of a brownish colour, and full of small protuberances on the outside, smooth and yellowish within, sometimes whitish, and sometimes with a blueish cast. Like other argillaceous bodies, it becomes harder in a strong fire; and after the zinc has been revived and dissipated by inflammable additions, or extracted by acids, the remaining earthy matter affords with oil of vitriol, an aluminous salt.

Tutty, levigated into an impalpable powder, is, like the lapis calaminaris and calces of zinc, an useful ophthalmic, and frequently used as such in ointments and collyria.

Ointments for this intention are prepared in the shops, by mixing the levigated tutty with so much viper's fat as is sufficient to reduce it to due consistence, or, by adding one part to five parts of a simple liniment made of oil and wax. See ZINC.

TUTUACA, in *Geography*, a town of Mexico, in the province of Hiaqui; 100 miles E. of Riochico.

TUTULUS, among the *Romans*, a manner of dressing the hair, by gathering it up on the forehead into the form of a tower.

TUTULUS likewise signifies a woollen cap with a high top.

TUTURA, in *Geography*, a town of Russia, in the government of Irkutsk, on the Lena; 160 miles N. of Irkutsk. N. lat. $54^{\circ} 40'$. E. long. $105^{\circ} 44'$.

TUTZIS, in *Ancient Geography*, a town of Egypt, between Talinx and Pfelcis. Anton. Itin.

TUUE, in *Geography*, a lake of Norway, about 20 miles in circumference; 52 miles from Christianland.

TUXAL, a town of Hindoostan, in the circar of Sirhind; 60 miles N.N.E. of Sirhind.

TUXFORD, a small market-town in South Clay division of the wapentake of Bassetlaw, in the county of Nottingham, England; is situated 24 miles N.E. by N. from the county-town, and 138 miles N. by W. from London. It was destroyed by fire September 8, 1702; consequently its appearance is more modern than that of many other towns in the county. Great part of it consists of farm-houses; agriculture being the chief employment of the inhabitants. Scarcely any trade is carried on here, except in hops, of which a considerable quantity is raised in this and the adjacent parishes. A fair for this article is annually held in September; and another in May for cattle, sheep, pigs, and poultry.

A weekly market on Mondays is well supplied in proportion to the population of the parish; which, in the return to parliament in the year 1811, is stated to be 841, occupying 197 houses. The church is an ancient structure, and consists of a nave, side-aisles, and chancel; with a spire. It contains the mutilated remains of monuments and other sculpture of a remote period. A rude representation of St. Laurence on a gridiron is still entire: one man is employed in blowing the fire, another is turning the faint with tongs, and a third appears to be a spectator, or director. A free grammar-school, still in high repute, was founded, and liberally endowed, by the will of Mr. Charles Read, dated the 30th of July, 1699. A manuscript copy of the regulations, as contained in the will, is preserved in the British Museum.—History of Nottinghamshire, by J. Throsby, 3 vols. 4to. 1797. Beauties of England and Wales, vol. xii. Nottinghamshire.

TUXIUM, in *Ancient Geography*, a town of Italy, and capital of Samnium. When Fabius Fabricianus pillaged this city, he removed the statue of the victorious Venus, worshipped here, to Rome. Plutarch.

TUY, in *Geography*, a town of Spain, in Galicia, situated on a mountain, near the north side of the Minho, opposite Valença, in Portugal; the see of a bishop, suffragan of Compostella. In a war between Spain and Portugal, this is one of the places of rendezvous for the Spanish troops; 50 miles S. of Compostella. N. lat. $42^{\circ} 3'$. W. long. $8^{\circ} 37'$.

TUY, a navigable river of Caraccas, which discharges itself into the ocean, 30 leagues E. of the port of Guayra. It rises in the mountains of San Pedro, 10 leagues from Caraccas, and being joined by the Guayra, becomes navigable, and serves for the transportation of produce, abounding in the vallies of Aragoa, Tacata, Cua, Sabana, Ocumara, St. Lucia, and St. Theresa, through which it passes, and particularly cacao, which is here of the best quality.

TUYU, a country of South America, in Patagonia, to the south of the viceroyalty of Buenos Ayres.

TUZ-KURMA, a town of Curdistan; 50 miles S.S.W. of Sherezur.

TUZLA, a town of Asiatic Turkey, in Caramania, situated at the western extremity of a lake, to which it gives name. The lake is 36 miles in length, and about 4 in breadth; 28 miles N. of Cogni.—Also, a town of Asiatic Turkey, in Natolia; 24 miles E. of Constantinople.

TWAGER, a town of Sweden, in the province of Haland; 28 miles N.N.W. of Halmstad.

TWAITE, in *Ichthyology*. See SHAD.

TWAITE, in our *Old Writers*, a wood grubbed up and converted into arable land.

TWA-NIGHTS GESTE, in our *Ancient Customs*. See THIRD-NIGHT AWN HYNDE.

If the *twa-night's geste* did any harm to any, his host was not answerable for it, but himself.

TWARDONICE, in *Geography*. See TURNITZ.

TWARSIMIRKA, a town of Silesia, in the principality of Oels; 6 miles N.E. of Militzch.

TWASHTA, or TWASHTI, in the *Mythology of the Hindoos*, a name of the sun, or of its regent Surya. The name occurs as of the sun in the article SARASWATI. Other legends make Twashta the parent of Suranuh, one of Surya's wives. In some points he corresponds with Vulcan, or Dædalus; being profoundly skilled in the mechanical arts, and hence deified in gratitude for his useful inventions. He seems to be the same personage with Viswakarma: being, like him, called the "chief engineer of the gods." Mr. Wilford's learned Essay on the sacred isles of the West, in the

the eleventh volume of the Asiatic Researches, contains many curious particulars of this deified person, proving his identity with some western fable. See SURANUH, SURYA, and VISWAKARMA.

TWAT, in *Geography*, a country of Africa, in the Great Desert. N. lat. 22° to 25°. E. long. 1° to 6°.

TWEDA, a town of Sweden, in the province of Smaland; 42 miles N.N.W. of Calmar.

TWEDS, a town of Norway, in the province of Christiansand; 4 miles N. of Christiansand.

TWEED, a large river, which rises in the parish of Tweedmuir, in the shire of Peebles, Scotland. It is remarkable, that from the base of the same hill three large rivers have their source. The river Annan rises on its south side, the Clyde on the north-west, and the Tweed on the north-east side. Taking a north-east direction, the Tweed runs a serpentine course of about forty miles through the county of Peebles. When it has reached the town of that name, which is about the centre of the shire, it has fallen nearly 1000 feet, as that town stands only about 500 feet above the level of the sea. In its course from Peebles, running nearly east, its stream is augmented by the Etterick near Selkirk, the Gala at Galashiels, the Leader near Melrose, and the Teviot at Kelfo. A few miles below the latter town it leaves Roxburghshire, and forms, for 22 miles, the boundary between Berwickshire and England, till it falls into the German ocean at the town of Berwick: its whole course is 102 miles, being the longest river in the south of Scotland.

On the banks of the Tweed are many beautiful and romantic seats, embosomed in plantations of various kinds of trees: but small are the vestiges that now remain of those extensive natural woods with which its banks were once adorned. Being near the southern borders of the kingdom, and exposed to the frequent incursions of the English, there is perhaps no river in Scotland, on the banks of which are to be seen so many places of defence against their hostile depredations. Still the ruins of castles and towers (as they are called) are visible; but they now only exhibit faint remains of their former magnitude, the wealth of their ancient inhabitants, and the depredatory spirit which formerly prevailed. The Tweed abounds with trout of every species: the salmon-fishery was formerly very productive, but has been nearly destroyed through interested artifice. The Tweed is open to fishing from the 10th of January to the 10th of October. On this river, 41 different salmon fisheries have been rented for several thousand pounds a year.—Beauties of Scotland, vol. ii. Tweeddale, 1805. Chalmers's *Calendonia*, vol. ii. 4to. 1810.

TWEEDMOUTH, a sea-port of England, in the county of Durham, separated only by the Tweed from Berwick. In 1811 the number of inhabitants was 3917.

TWEELING, an operation in weaving, which is performed by multiplying and varying the number of leaves in the harness; by the use of a back harness, or double harness; by increasing the number of threads in each split of the reed; by an endless variety of modes in drawing the yarns through the harness; and by increasing the number of treadles, and changing the manner of treading them. When the number of treadles requisite to raise all the variety of sheds necessary to produce very extensive patterns would be more than one man could manage, recourse is had to a mode of mounting, or preparing the loom, by the application of cords, &c. to the harness; and a second person is necessary to raise the sheds required, by pulling the strings attached to the respective leaves of the back harness, which are sunk to their first position by means of leaden weights underneath.

VOL. XXXVI.

This is the most comprehensive apparatus used by weavers for fanciful patterns of great extent, and it is called the drawloom. In weaving very fine silk tweels, such as those of sixteen leaves, the number of threads drawn through each interval of the reed is so great, that, if woven with a single reed, they would obstruct each other in rising and sinking, and the shed would not be sufficiently open to allow the shuttle a free passage. To avoid this inconvenience, other reeds are placed behind that which strikes up the weft; and the warp threads are so disposed, that those which pass through the same interval in the first reed are divided in passing through the second, and again in passing through the third. By these means the obstruction, if not entirely removed, is greatly lessened.

In the weaving of plain thick woollen cloths, to prevent obstructions of this kind, arising from the closeness of the set, and roughness of the threads, only one-fourth of the warp is sunk and raised by one treddle, and a second is pressed down to complete the shed, between the times when every shot of weft is thrown across. See WEAVING.

TWELFTH-HIND, in our *Ancient Customs*, imports much the same with *thane*.

Among the English Saxons, those who were worth 1200s. were called *twelve-hindi*; and if any injury was done to them, satisfaction was to be made accordingly. See HINDENI.

TWELFTH-Day, or *Twelfth-tide*, the festival of the Epiphany, or the manifestation of Christ to the Gentiles, so called, as being the twelfth-day, exclusive, from the Nativity, or Christmas-day.

TWELVE MEN, *duodecim homines legales*, otherwise called *jury*, or *inquest*, is a number of twelve persons, or upwards, as far as twenty-four; by whose oath, as to matters of fact, all trials pass, both in civil and criminal cases, through all courts of the common law in this realm. See JURY.

TWELVE Tables, *Laws of the*. See TABLE.

TWELVE Apostles, in *Geography*, a number of small islands at the west extremity of the Straits of Magellan, on the coast of Terra del Fuego, between Cape Pillar and Cape Deseada.

TWELVE Isles, or *Twelve Apostles*, islands on the south side of lake Superior.

TWELVE Pins, *The*, or *Beannabeola*, a vast ridge of almost perpendicular rocks in the western part of the county of Galway, Ireland, called *Cunnemara*. These mountains belong to the primitive formation.

TWELVE-MILE CREEK, a river of South Carolina, which runs into the Saluda, N. lat. 34° 50'. W. long. 81° 16'.

TWELVE-MONTH, the space of a year, according to the calendar months.

TWENTE, in *Geography*, a district of the state of Overissel, of which Oldenzel is the capital.

TWENTY-FOUR MEN, men chosen every half year to redress the grievances of the mines and miners; but every man generally serves his year when chosen.

TWENTY-MILE CREEK, in *Geography*, a branch of the river Tombighe, in Georgia.

TWICE-LAID CORDAGE, is made of cast rigging, as shrouds, stays, mooring and other cables, which, if not much worn, will make good ropes, &c. for many purposes, as small cable-laid ropes for warping ships, worming and woolding for cables, worming for large stays, netting for ships' sides, &c.; ratlings, scaffolding-ropes, spun-yarn for seizings, &c.

To open a cable for making it into small ropes, hang the

strand upon three hooks in the tackle-board, stretch it out tight upon the hooks in the sledge, and heave till they are untwisted; then draw out the yarn.

When the yarn of this worn stuff is overhauled, a little thin tar should be poured upon it, which will make it pliable, and lie better. The yarn unfit for knotting will pick into oakum for caulking.

TWICKENHAM, in *Geography*, an extensive and populous village in the hundred of Isleworth, and county of Middlesex, England; is situated on the banks of the river Thames, at the distance of twelve miles W.S.W. from St. Paul's cathedral, London. The parish extends about three miles and a half in length, one and a half in breadth, and is nine miles in circumference: it is bounded on the east and north by Isleworth, on the west by Hanworth, Hampton, and Teddington, and on the south by the river Thames. It contains about 1850 acres, of which, according to a survey taken in the year 1635, about 630 were arable, 490 pasture, 40 wood, and 690 common: which does not much vary from the present proportion, reckoning the fruit gardens, of which there are above 150 acres, among the arable land. The gardens have long been celebrated for good management and abundant produce, and they afford a constant supply to the London markets: one gardener, Mr. West, has, in a good season, sent upwards of 4000 gallons of raspberries to a distiller within fifteen days. Twickenham is not mentioned in the Domesday record, as the whole of this hundred seems to have been included, when that survey was made, in the manor of Isleworth. In ancient records, the name is written Twitham, Twittanham, and Twiccanham: and the most popular writers of the early part of the last century often termed it Twitenham. The manor of Twickenham appears to have been possessed by the religious long antecedent to the Norman conquest; for the jurisdiction of the lord of Isleworth did not extend to church lands. This manor appears to have been vested in the crown in the time of Henry VIII., and by him annexed to the honor of Hampton-Court. By Charles I. it was settled as part of the jointure of his queen, on whose death, Charles II. settled it for life on his consort, Catherine. A lease under the crown has since been granted to several persons. The manor-house stands opposite to the church, and is traditionally said to have been the residence of Catherine of Aragon, the divorced queen of Henry VIII. The parish-church is situated near the river-side: the old church fell to the ground in the night of April 9, 1713; the tower, which is composed of free-stone, is still remaining; the body was rebuilt, and completed in the year 1715. This is a brick fabric of the Tuscan order, with stone coigns and cornices, and was erected after the design of John James, architect, who likewise built the churches of St. George, Hanover-square, and St. Luke, Middlesex. The interior is spacious, with galleries on the two sides, and at the west end. The monuments, tablets, and other sepulchral memorials, are numerous. A chapel, called Montpelier, was built about the year 1720, and is the private property of the Rev. G. O. Cambridge, archdeacon of Middlesex. Here is also a meeting-house for Wesleyan Methodists. A charity-school for boys, and a similar institution for girls, were established many years back: an extensive and appropriate building has been recently erected by subscription; and one hundred boys and seventy girls are now educated according to Dr. Bell's plan. Thirty of the boys, and twenty-four girls, are likewise clothed. Here are also two Sunday schools. Six alms-houses were built in 1704, and six more in 1721. In the population return of the year 1811, this parish is stated to contain 685 houses, and 3757 inhabitants. The principal manufacture is that of gun-

powder: the powder-mills, formerly the property of Mr. Hill, but now of Mr. Butts, are seated on the small river Crane, which, rising in the vicinity of Harrow, is here augmented by an artificial cut from the Colne. Accidents frequently occur in this dangerous business: one corning-house for graining powder was thrice blown up in the year 1796; in the months of January, July, and November. Fourteen lives were lost by the three explosions. Five similar casualties have since happened, by which twelve men were killed. Yet, notwithstanding the frequency of these accidents, and though the wages of the workmen is but small, employment in the mills is eagerly sought after: the only apparent reason is, that the labour is light.

Twickenham Park, Isleworth Park, or the New Park of Richmond, was, towards the end of the sixteenth century, the property of the great sir Francis, afterwards lord, Bacon, who passed in this retirement the earlier and more happy part of his life. He here entertained queen Elizabeth, on which occasion he presented her with a sonnet in praise of her favourite, the earl of Essex. The estate has recently been divided into lots, and the greater part purchased by Francis Gosling, esq. The grounds contain some fine cedars: and it is believed, that the first weeping willow known in this kingdom was planted in this park in the early part of the last century. Part of the mansion is in the parish of Isleworth: in the meadows, between this house and the river, was the original site of Sion monastery, founded by king Henry V. in 1414.

Twickenham has for a century past been the retreat of persons distinguished by their rank or literary fame; and has been embellished with various mansions and villas, to which a degree of celebrity has attached. We shall briefly notice the most interesting.

Marble Hill was built by king George II. as a villa for his mistress, the countess of Suffolk. The purchase of the estate is said by lord Orford to have cost the king ten or twelve thousand pounds. The house was erected after a design of Henry, earl of Pembroke, who superintended the progress of the structure. Its exterior is of a plain but well-proportioned character; the interior contains the principal attractions, and is finished in a delicate, costly, and ornamental style. The great staircase is entirely composed of mahogany, finely carved; and the flooring of the best rooms are of the same wood. This seat is now the residence of Charles Augustus Tulk, esq.

Pope's Villa, as it has long been emphatically called, from its having been, for nearly thirty years, the residence of our great poet Alexander Pope, was purchased by him in the year 1715. The improvement of the house and gardens was for many years his favourite employment; and he was particularly interested in the construction of a grotto, which he enriched with many curious spars and gems; from the grotto was a subterraneous passage to the gardens. On the decease of Pope, which occurred May 30, 1744, the estate was sold to sir William Stanhope, who added wings to the house and enlarged the gardens. From him it passed to his son-in-law, Welbore Ellis, afterwards lord Mendip, who guarded every memorial of the poet as a sacred relic, particularly a fine willow planted by his own hand. This tree his lordship propped with assiduous care, but notwithstanding his utmost attention, it perished and fell to the ground in 1801, about a year before the death of its noble owner. The estate was afterwards sold to sir John Brisco, on whose decease it was purchased by baroness Howe in 1807; under whose direction the house has been taken down, and a new dwelling erected about a hundred yards distant from the site. The grotto has been stripped of its most curious spars and minerals, by the zeal of those who

wished

wished to preserve a memorial of the poet: For a particular description of this celebrated villa, with a beautiful engraving, we refer to "The Fine Arts of the English School," by J. Britton, F.A.S. See also a very interesting work by Messrs. W. and G. Cookes, entitled "The Thames," 2 vols. 4to. and 8vo.

Strawberry Hill, the well-known residence of the late Horace, earl of Orford, better known as Mr. Horace Walpole, was originally a small tenement, built in 1698, by the earl of Bradford's coachman, and let as a lodging-house. Colley Cibber was one of its first tenants. Dr. Talbot, bishop of Durham, lived in it eight years; and after him Henry, marquis of Carnarvon. In 1747, Mr. Walpole bought the lease, and in the following year purchased the fee-simple of the estate. Having formed a design of enlarging his villa, and fitting it up in the old English style, he commenced his improvements in 1753, and completed them in 1776. The interior is arranged in strict accordance with the outside of the structure; the ceilings, screens, niches, and other decorations, even the more ordinary articles of furniture, are consonant in style with the leading features of the fabric. The extensive collection of curiosities and works of art, with which every apartment is stored, was progressively made by Mr. Walpole during the affluent leisure of a long life, which was chiefly devoted to the light parts of literature and the fine arts. The most considerable part consists of miniatures, enamels, and portraits of remarkable persons. The noble owner drew up a complete catalogue of his collection, together with what he calls a description of the villa: this work occupied 113 quarto pages; of which more than twenty are filled with the contents of one small room, called the Tribune, or Cabinet. A private printing-press was fitted up by Mr. Walpole in 1757. Most of his own works, and several other books, were here printed under his inspection. Strawberry Hill was bequeathed by lord Orford to the honourable Mrs. Damer for life, together with 2000*l.* for keeping the building in repair. She resided here for several years, but has lately declined possession in favour of the countess dowager of Waldegrave, in whom, and her heirs, the remainder was vested under his lordship's will.

At Whitton, a hamlet in Twickenham parish, is a villa which was built about the year 1711 by sir Godfrey Kneller, and was his principal residence during the latter part of his life. It is a substantial brick mansion, now the property of Mr. Calvert.

On the edge of Hounslow-Heath, within this parish, are two villas of considerable elegance, formerly in the possession of Archibald, duke of Argyle, now occupied, one by sir Benjamin Hobhouse, bart. the other by George Gosling, esq.—Lysons's Environs of London, 5 vols. 4to. 1792—1811. Beauties of England and Wales, vol. x. Middlesex, by J. N. Brewer, 1816.

TWIFALLOW, in *Agriculture*, a term used to signify a second stirring or fallowing of land.

TWIFALLOWING, the operation or work of repeating the tillage of land in fallowing, which is mostly best performed about the middle of the summer. It is sometimes written twyfallowing.

TWIGGS, in *Geography*, a county of Georgia, in the United States, containing 3405 inhabitants.

TWIGHTWEES, Indians in the state of Ohio, near the river Miami.

TWI-HINDI, or TWYHINDI, among our Saxon ancestors, were men valued at 200*s.* See HINDENI.

These men were of the lowest degree; and if such were killed, the mulct was 30*s.* Thus in Leg. Hen. I. cap. 9. "de twihindi homines interfecti, vera debet reddi secundum legem." Where note, that this was not an introduction of a new law, but a confirmation of the old, made in the reign of king Alfred.

TWILIGHT, in *Astronomy*, denotes the dubious or faint light which is reflected to us by means of the atmosphere, for some time before the sun rises, and after he sets. See CREPUSCULUM and ATMOSPHERE.

The following table shews the duration of twilight in different latitudes: it is calculated on a supposition that the twilight begins and ends when the sun is 18° below the horizon: the letters *c. d.* signify that it is then continual day; *c. n.* continual night; *w. n.* that the twilight lasts the whole night.

Long's Airon. vol. i. p. 258.

TWIN, in *Geography*, a township of Preble county, in the district of Ohio, containing 719 inhabitants.—Also, a township of Ross county, in the same district, containing 1053 inhabitants.

TWIN, *North*, an island in James's Bay, Hudson's Bay. N. lat. 53° 20'. W. long. 80° 40'.

TWIN, *South*, an island in James's Bay, Hudson's Bay. N. lat. 53° 10'. W. long. 80° 36'.

TWIN *Oat*, in *Agriculture*, a name sometimes applied to an early kind of white oat, which is very productive on deep good land, and which affords full crops on moist sorts that

are not too poor in quality. It commonly yields somewhat more than the pollard sort. See OAT.

TWINE. *Bolt-rope twine*, used in sewing sails to their bolt-rope, is made of the long hemp, or from the long rough hemp unbeat. It contains two or three threads, is twisted slack, and wound into half-pound skains containing two hundred yards. Eight threads are spun out of half a pound of hemp, each fifty yards long.

Seal-twine, for seal-nets, is made of twelve thread, two threads first twisted together, then six of them hardened together, and wound up into half-skains, or eighty yards.

Seaming or *fail-maker's twine*, for sewing the seams of fails, is made of the best long hemp, beaten, spun fine, and well dressed over a line clearer: eighteen threads are spun out of half a pound of hemp, every thread being fifty yards in length: two threads are twisted together slack, and wound on a reel, in half-pound skains containing four hundred and fifty yards: but twine of three threads is used in the navy.

Sean-twine is made from good long hemp, each thread spun fifty-four yards: three threads are laid together. When hardened and stretched, each cord stands fifty yards; nine hundred yards are wound on a reel, and eighteen cords weigh two pounds.

Store-twine, used by fail-makers for old work and on board of ships, is made from good long hemp, well dressed. Fourteen threads are spun from half a pound; two threads are twisted together, and wound into half-pound skains of three hundred and fifty yards.

Turtle-twine, for turtle-nets, is made of good bar hemp, spun one hundred yards: three threads are laid together, stand ninety yards, and weigh one pound.

Whipping-twine, the same as bolt-rope twine.

TWINING IRONS, square bars with an eye-hook at one end, which grasp the porter or the shank of an anchor to turn it over.

TWINKLING of the Stars, denotes that tremulous, vibratory, intermitting motion, which is observed in the light proceeding from the fixed stars: Alhazen, an Arabian philosopher of the twelfth century, considers refraction as the cause of this phenomenon.

Vitellio, in his *Optica*, published in 1270, p. 449, ascribes the twinkling of the stars to the motion of the air in which the light is refracted; and he observes, in confirmation of this hypothesis, that they twinkle still more when they are viewed in water put into motion.

Dr. Hooke (*Microgr.* p. 231, &c.) very reasonably attributes this phenomenon to the inconstant and unequal refraction of the rays of light occasioned by the trembling motion of the air and interspersed vapours, in consequence of variable degrees of heat and cold in the air, producing corresponding variations in its rarity or density, and also of the action of the wind, which must cause the successive rays to fall upon the eye in different directions, and consequently upon different parts of the retina at different times, and also to hit and miss the pupil alternately; and this is also the reason, he says, why the limbs of the sun, moon, and planets appear to wave or dance.

These tremors of the air are manifest to the eye by the tremulous motion of shadows cast from high towers; and by looking at objects through the smoke of a chimney, or through streams of hot water, or at objects situated beyond hot sands, especially if the air be moved transversely over them. But when stars are seen through telescopes that have large apertures, they twinkle but little, and sometimes not at all. For, as sir Isaac Newton has observed, (*Opt.* p. 98.) the rays of light which pass through different parts of the aperture, tremble each of them apart, and by means of their various, and sometimes contrary tremors, fall at one and the same time upon different points in the bottom of the eye, and their trembling motions are too quick and confused to be separately perceived. And all these illuminated points constitute one broad lucid point, composed of those many trembling points confusedly and insensibly mixed with one another by very short and swift tremors, and thereby cause the star to appear broader than it is, and without any trembling of the whole.

Dr. Jurin, in his *Essay upon Distinct and Indistinct Vision*, has recourse to sir Isaac Newton's hypothesis of fits of

easy refraction and reflection for explaining the twinkling of the stars: thus, he says, if the middle part of the image of a star be changed from light to dark, and the adjacent ring be at the same time changed from dark to light, as must happen from the least motion of the eye towards or from the star, this will occasion such an appearance as twinkling.

Mr. Michell (*Phil. Trans.* vol. lvii. p. 262.) supposes that the arrival of fewer or more rays at one time, especially from the smaller or more remote fixed stars, may make such an unequal impression on the eye, as may, at least, have some share in producing this effect: since it may be supposed, that even a single particle of light is sufficient to make a sensible impression upon the organs of sight; so that a very few particles arriving at the eye in a second of time, perhaps not more than three or four, may be sufficient to make an object constantly visible. See **LIGHT**.

Hence, he says, it is not improbable, that the number of the particles of light which enter the eye in a second of time, even from Sirius himself, may not exceed three or four thousand, and from stars of the second magnitude they may, therefore, probably not exceed a hundred. Now the apparent increase and diminution of the light, which we observe in the twinkling of the stars, seem to be repeated at not very unequal intervals, perhaps about four or five times in a second. He, therefore, thought it reasonable to suppose, that the inequalities which will naturally arise from the chance of the rays coming sometimes a little denser, and sometimes a little rarer, in so small a number of them, as must fall upon the eye in the fourth or fifth part of a second, may be sufficient to account for this appearance. An addition of two or three particles of light, or perhaps a single one, upon twenty, especially if there should be an equal deficiency, out of the next twenty, would, he supposed, be very sensible, as he thought was probable from the very great difference in the appearance of stars, the light of which does not differ so much as is commonly imagined. The light of the middlemost star in the tail of the Great Bear does not, he thinks, exceed the light of the very small star that is next to it, in a greater proportion than that of about 16 or 20 to 1; and M. Bouguer found, that a difference in the light of objects, of one part in sixty-six, was sufficiently distinguishable.

Since these observations were published, Mr. Michell (as we are informed by Dr. Priestley, *Hist. of Light*, p. 495.) has entertained some suspicion, that the unequal density of light does not contribute to this effect in so great a degree as he had imagined; especially in consequence of observing that even Venus does sometimes twinkle. This he once observed her to do remarkably when she was about six degrees high, though Jupiter, which was then about sixteen degrees high, and was sensibly less luminous, did not twinkle at all. If, notwithstanding the great number of rays, which, without doubt, come to the eye from such a surface as this planet presents, its appearance be liable to be affected in this manner, it must be owing to such undulations in the atmosphere, as will probably render the effect of every other cause altogether insensible.

M. Muichenbroeck (*Introd. ad Phil. Nat.* vol. ii. sect. 1741, p. 707.) suspects, that the twinkling of the stars arises from some affection of the eye, as well as the state of the atmosphere. For, he says, that in Holland, when the weather is frosty, and the sky very clear, the stars twinkle most manifestly to the naked eye, though not in telescopes; and since he does not suppose there is any great exhalation, or dancing of the vapour at that time, he questions whether the vacuity of the light, affecting the eye, may not be concerned in the phenomenon.

But

But this philosopher might have satisfied himself with respect to this hypothesis, by looking at the stars near the zenith, when the light traverses but a small part of the atmosphere, and therefore might be expected to affect the eye most sensibly. For he would not have perceived them to twinkle near so much as they do near the horizon, when much more of their light is intercepted by the atmosphere.

Some astronomers have lately endeavoured to explain the twinkling of the fixed stars, by the extreme minuteness of their apparent diameter; so that they suppose the sight of them is intercepted by every mote that floats in the air. To this purpose Dr. Long observes (*Astron.* vol. i. p. 170.) that our air near the earth is so full of various kinds of particles, which are in continual motion, that some one or other of them is perpetually passing between us and any star which we look at, and this makes us every moment alternately see it and lose sight of it: and this twinkling of the stars, he says, is greatest in those which are nearest the horizon, because they are viewed through a great quantity of thick air, where the intercepting particles are most numerous; whereas stars that are near the zenith do not twinkle so much, because we do not look at them through so much thick air, and therefore the intercepting particles being fewer, come less frequently before them.

With respect to the planets, it is observed, that they, because they are much nearer to us than the stars, have a sensible apparent magnitude, so that they are not covered by the small particles floating in the atmosphere, and therefore do not twinkle, but shine with a steady light. The fallacy of this hypothesis appears from the observation of Mr. Michell, that no object can hide a star from us that is not large enough to exceed the apparent diameter of the star, by the diameter of the pupil of the eye; so that if a star was a mathematical point, the interposing object must still be equal in size to the pupil of the eye: and, indeed, it must be large enough to hide the star from both eyes at the same time.

The principal cause, therefore, of the twinkling of the stars is now acknowledged to be, the unequal refraction of light, in consequence of inequalities and undulations in the atmosphere.

Besides a variation in the quantity of light, it may here be added, that a momentary change of colour has likewise been observed in some of the fixed stars. Mr. Melville (*Edinb. Ess.* vol. ii. p. 81.) says, that when one looks steadfastly at Sirius, or any bright star, not much elevated above the horizon, its colour seems not to be constantly white, but appears tinted, at every twinkling, with red and blue. Mr. Melville could not entirely satisfy himself as to the cause of this phenomenon; observing, that the separation of the colours by the refractive power of the atmosphere is, probably, too small to be perceived. Mr. Michell's hypothesis above-mentioned, though inadequate to the explanation of the twinkling of the stars, may pretty well account for this circumstance. For the red and blue rays being much fewer than those of the intermediate colours, and therefore much more liable to inequalities, from the common effect of chance, a small excess or defect in either of them, will make a very sensible difference in the colour of the stars.

TWINS, two young ones delivered at a birth by an animal which ordinarily brings forth but one.

It has been greatly disputed, which of two twins is to be esteemed the elder? The faculty of Montpellier have given it, that the latter born is to be reputed the elder, because first conceived: but by all the laws which now obtain, the

first-born enjoys the privilege of seniority; and the custom is confirmed by the scripture instance of Esau and Jacob.

But if two twins be born so intermixed, that one cannot distinguish which of the two appeared first, it should seem that neither the one nor the other can pretend to the right of primogeniture, which ought to remain in suspense by reason of their mutual concurrence. In such case, some would have the decision left to the father, and others to the chance of a lot.

In cattle, twins are seldom desirable, as they can rarely be well supported, though occasionally cows are capable of suckling two calves; but in sheep, it is often greatly desirable in different breeds or varieties. The frequency of twins in sheep is much influenced both by the condition of the ewes, and the state of vigour in the rams. Such flocks as are well fed, and pasture easily about the tupping time, usually produce a far larger proportion of twins, than those which have higher walks, or pastures which are of inferior quality. Twins too are the most frequent in the early part of the lambing season: all which shew the propriety of keeping the ewes well supported, and of not letting the rams have too great a number put to them at such seasons.

Nice attention is necessary to twins at the time of lambing, by the person who has the charge of the business, to see that they are in every way properly taken care of. See SHEEP.

TWINS, in *Astronomy*. See GEMINI.

TWINS, in *Geography*, two small islands in the East Indian sea, near the island of Paraguay. N. lat. $9^{\circ} 18'$. E. long. $118^{\circ} 3'$.—Also, two small islands in the East Indian sea, near the north coast of the island of Flores. S. lat. $8^{\circ} 2'$. E. long. $122^{\circ} 33'$.

TWIST of a Rope, Cord, &c. See ROPE.

TWIST, again, is used for the inside, or flat part of a man's thigh, upon which a true horseman reils when on horseback.

TWIST a Horse, To, is violently to wring or twist his testicles twice about, which causes them to dry up, and deprives them of nourishment, and reduces the horse to the same state of impotency with a gelding.

TWISTE, in *Geography*, a river of Germany, which runs into the Erpe, near Valckmarsen, in the duchy of Westphalia.

TWISTED COLUMN. See COLUMN.

TWISTED Silks. See SILK.

TWISTED Thumb-Band, in *Rural Economy*, a term used to signify the band of hay or straw which is formed by means of the thumb and fingers, by twisting it with them, and employed in binding up trusses of these kinds for sale. See TRUSS.

TWITCH, in *Agriculture*, a name often applied to a very troublesome plant of the weed kind in tillage-land, of which there are several sorts, as the black, white, creeping, and some others. See COUCH-Grass.

TWITCH-Rake, a name sometimes applied to a large tool of this kind, made use of in dragging and collecting the roots of couch together in arable land, by means of a horse. See COUCH and RAKE.

TWITE, in *Ornithology*. See LINNET.

TWO BROTHERS, in *Geography*, two small islands in the Chinese sea. N. lat. $8^{\circ} 30'$. E. long. $105^{\circ} 48'$.—Also, two small islands in the East Indian sea, near the W. coast of Borneo. S. lat. $1^{\circ} 32'$. E. long. $109^{\circ} 13'$.—Also, two small islands in the East Indian sea, 27 miles from the E. point of the island of Madura. S. lat. $6^{\circ} 50'$. E. long. $114^{\circ} 43'$.—Also, two small islands in the East Indian

Indian sea, near the W. coast of the island of Celebes. S. lat. $4^{\circ} 40'$. E. long. $119^{\circ} 22'$.—Also, two small islands in Cook's Straits, near the N.E. coast of the southern island of New Zealand. S. lat. $40^{\circ} 5'$. E. long. $184^{\circ} 35'$.—Also, two small islands in the East Indian sea, near the S. coast of Borneo. S. lat. $4^{\circ} 10'$. E. long. $114^{\circ} 4'$.—Also, two small islands in the East Indian sea, between the island of Borneo and the continent of Asia. S. lat. $9^{\circ} 10'$. E. long. $109^{\circ} 24'$.

Two-Head Island, a small island near the S. coast of Ireland, and county of Kerry; 1 mile W. of Lamb's-Head.

Two-Headed Point, a cape on the S.W. coast of the island of Kodiak, in the North Pacific ocean, composing a small island, which terminates to the N.E. by a low flat rocky point. South-westward from Two-headed island the coast is low, and appears to be compact; but immediately to the northward of it, the shores descend abruptly into the sea, appear to be much broken, and form an extensive sound, of which the flat rocky point may be considered as its S.W. point of entrance; from this, its N.E. point being low projecting land, lies N. 58° E. at the distance of nine miles. The several branches that appeared to flow into the Sound, seemed to wind toward the base of a connected range of high snowy mountains, which no doubt gave boundaries to their extent. N. lat. $56^{\circ} 54'$. E. long. $207^{\circ} 5'$.

Two Hills, a small island among the New Hebrides, in the South Pacific ocean. S. lat. $17^{\circ} 15'$. E. long. $160^{\circ} 38'$.

Two-Hill Island, a small island in the Mergui Archipelago. N. lat. $11^{\circ} 27'$.

Two Keys, two small islands in the bay of Honduras. N. lat. $17^{\circ} 30'$. W. long. $87^{\circ} 52'$.

Two-Saddle Island, an island in the Mergui Archipelago, about four miles long, and two broad. N. lat. $10^{\circ} 42'$.

Two Sisters, two small islands in the East Indian sea, covered with wood, and surrounded by a reef of coral-rocks. S. lat. 5° . E. long. $106^{\circ} 12'$.—Also, two small islands in the Spanish main, near the Mosquito shore. N. lat. $11^{\circ} 17'$. W. long. $82^{\circ} 55'$.

Two Spots, small islands in the bay of Honduras, surrounded with rocks. N. lat. $16^{\circ} 40'$. W. long. $88^{\circ} 20'$.

TWOBILL, in *Agriculture*, the name of a tool commonly employed in cutting up roots in the work of paring and burning in the old mode. It is seen in *fig. 7.* in the plate on paring ploughs. It has sometimes the title of double-bitted mattock.

TWO-FURROW PLOUGH, a term sometimes applied to that of the double kind. It is often useful for cross-cutting land in different cases, and in giving the last earth for turnip-crops.

TWO-FURROWING, a term used to signify double furrows, or the breaking up land by the double plough: it also implies trench-ploughing and sod-burying.

TWO-MEAL CHEESE, in *Rural Economy*, a term applied to that sort which is made from the skimmed milk of the evening, added to the new milk of the meal of the morning; that made from the neat milk being termed one-meal. In some districts, as that of Gloucester, two-meal cheese is made of one meal or portion of coward or clean milk, and the same of such as is skimmed; but often two of the latter are used to one of the former. Hence this sort is sometimes called coward-cheese.

TWO-MOULD-BOARDED *Cleaning and Earthing*

Hoe for Potatoes, in *Agriculture*, a tool of somewhat the plough kind, contrived for the purpose of cleaning and earthing up these crops with. It has a wheel before to direct the depth of its working, with handles behind to regulate it. There is a sharp hoe attached to a sort of coultter-bar in front, with a mould-board on each side, capable of being set to different distances, by a kind of screw in the middle, by which means the ground is pared and laid to the crops. It is considered a tool that produces much saving and advantage in the culture of potatoes, and which performs its work very effectually.

TWOPENCE, HERB, in *Botany*, a species of *Lythraea*; which see.

TWO-THIRDS SUBSIDY. See **DUTY** and **SUBSIDY**.

TWUNT, in *Geography*, a town of Algiers, on the coast of the Mediterranean, defended by a fort; 30 miles N.W. of Tremecen. N. lat. $35^{\circ} 18'$. W. long. $1^{\circ} 2'$.

TWYBLADE, in *Botany*. See **OPHRYS**.

TYACUL, in *Geography*, a town of Hindoostan, in Mysore; 10 miles S. of Colar.

TYAHTATOOA BAY, a bay on the coast of Owbyhee, one of the Sandwich islands. N. lat. $19^{\circ} 37'$. E. long. $203^{\circ} 54'$.

TYANA, in *Ancient Geography*, a town of Cappadocia, in the Tyanitide prefecture; the only one in this prefecture, according to Strabo; but according to Ptolemy, there were three others. It was known as the native country of Apollonius Tyanæus, the celebrated impostor.

TYANA, in *Geography*, a town of Asiatic Turkey, in Natolia; 25 miles S.W. of Sis.

TYBEE, an island near the coast of Georgia, at the mouth of the Savannah: on it is a light-house. N. lat. 32° . W. long. 81° .

TYBEIN. See **DUINO**.

TYBER. See **TIBERIS** and **TYBERINUS**. The Tyber appears on the reverse of a medal of Vespasian, not only as a divinity, but also as the patron and protector of Rome. When Æneas resided in Italy, he performed religious ceremonies to this river, gave himself up to his protection, and prayed that he might be propitious to him.

TYBERINUS, a king of Alba, and from this prince having drowned himself in the Albula, that river gained the name of Tyber, which it has ever since retained.

TYBOINE, in *Geography*, a township of Pennsylvania; 100 miles W. of Philadelphia.

TYCHE, in *Ancient Geography*. See **SYRACUSE**.

TYCHONIC System, or *Hypothefis*, is an order or arrangement of the heavenly bodies, of an intermediate nature between the Copernican and Ptolemaic, or participating alike of them both. See **SYSTEM**.

TYDAL, in *Geography*. See **RUDEN**.

TYDII, in *Ancient Geography*, a people of Asiatic Sarmatia, who inhabited mount Caucasus, according to Pliny.

TYE, DR. in *Biography*, the best English composer of church music, anterior to Tallis, that our country can boast; for though his name does not appear in the list of musicians of the chapel royal, or household establishment in the short reign of Edward VI., he was, doubtless, at the head of all ecclesiastical composers of that period. Neither the state of the church, nor religious principles of its nominal members, were so settled as to render it possible to determine, in these times, who among quiet and obedient subjects were Protestants, and who Catholics; for, during the conflict between the zealots of both religions, the changes were so violent and rapid, that great flexibility or great

great dissimulation must have been practised by those who not only escaped perfection, but still continued in offices, either of church or state. The few who seem to have been truly pious and conscientious on both sides, suffered martyrdom in support of their opinions; the rest seem to have been either unprincipled, or fluctuating between the two religions. One of the principal evils which the champions for reformation combated, was the use of the Latin language in the service of the church; however, the best choral compositions produced by the masters of these times, that are come down to us, are to Latin words. Specimens remain of Dr. Tye's clear and masterly manner of composing for the church in that language, when he was at least a nominal Catholic, either during the reign of Henry VIII. or queen Mary; and the late worthy Dr. Boyce has given an admirable example of his abilities in the anthem for four voices, "I will exalt thee, O Lord," inserted in the second volume of his excellent "Collection of Cathedral Music, by English Masters." There is hardly any instance to be found in the productions of composers for the church during his time, of a piece so constantly and regularly in any one key, as this is in the key of C minor, and its relatives; the harmony is pure and grateful; the time and melody, though not so marked and accented as in those of the best compositions of the last century, are free from pedantry, and the difficulty of complicated measures which this composer had the merit of being one of the first to abandon. That he translated the first fourteen chapters of the Acts of the Apostles into metre, in imitation of Sternhold's Psalms, which were the delight of the court in which he lived, was doubtless an absurd undertaking, and was not rendered less ridiculous by the elaborate music to which he set them, consisting of fugues and canons of the most artificial and complicated kind. Dr. Tye, however, if compared with his contemporaries, was perhaps as good a poet as Sternhold, and as great a musician as Europe could then boast; and it is hardly fair to expect more perfection from him, or to blame an individual for the general defects of the age in which he lived.

TYE, in *Geography*, a river of Virginia, which runs into James river, N. lat. $37^{\circ} 30'$. W. long. $79^{\circ} 8'$.

TYE, in *Mining*. See STREAMING.

TYE, in *Sea Language*, denotes a sort of runner, or thick rope, used to transmit the effort of a tackle to any yard or gaff, which extends the upper part of a sail.

The tye is either passed through a block fixed to the mast-head, and afterwards through another block moveable upon the yard or gaff intended to be hoisted; or the end of it simply fastened to the sail, yard, or gaff, after communicating with the block at the mast-head. Falconer. See JEERS.

TYER, in *Geography*, a river of South Carolina, which runs into the Cangaree, N. lat. $34^{\circ} 30'$. W. long. $81^{\circ} 45'$.

TYERS, JONATHAN, in *Biography*, the late proprietor, and indeed the creator of Vauxhall gardens, (see VAUXHALL,) deserves a place among our biographical articles on many accounts. His taste, liberality, and spirit in supporting and ornamenting this elegant place of amusement with paintings by Hogarth and Hayman; an excellent band of music; an orchestra in the form of a temple in the open air, with an organ equal in size and workmanship to many of the most noble instruments of that kind in our churches; and a constant succession of ingenious exhibitions; rendered it a public place more attractive, admired, and imitated by foreigners, than any one our country could boast. In every part of Europe a nominal Vauxhall has been established; nor

was there a theatre on the continent thirty years ago, with scenery and ballet pantomimes, without an attempt at representing Vauxhall.

The proprietor began with a small band of wind-instruments only, before he erected an orchestra, and furnished it with an organ; but in the summer of 1745, to render it still more attractive, he added, for the first time, vocal to his instrumental performances. Here the talents of many of our national musicians were first displayed and first encouraged; here Collet and Pinto on the violin, Snow on the trumpet, Millar on the bassoon, Worgan on the organ, &c. annually increased in merit and favour. Here Messrs. Arne, Lowe, and the elder Reinhold sung during many years, with great applause, Dr. Arne's ballads, duets, dialogues, and trios, which were soon after circulated throughout the kingdom, to the great improvement of our national taste. During this first summer, his little dialogue of Colin and Phœbe, written by the late Mr. Moore, author of "Fables for the Female Sex," was constantly encoered every night for more than three months successively.

But here the good sense, sound judgment, and good taste of the spirited proprietor of Vauxhall, deserve a record for the veneration and respect which he manifested for Handel; at a time when the health and favour of this great master were on the decline, and opposition had almost ruined him: it was then that Tyers erected, at his sole expence, the marble statue which still adorns the gardens; an honour which has seldom been conferred on a subject and a professional man, during his life-time, in any country, since the flourishing state of the Greeks and Romans. And as this transaction does honour, not only to the genius of Handel, but to the public spirit of his votary, we shall relate it as recorded in the registers of the times.

April 15th, 1738, in the London Daily Post, a paragraph says: "The effigies of Mr. Handel, the famous composer of music, is going to be erected at Vauxhall gardens, at the expence of Mr. Jonathan Tyers." And on the 18th of the same month, "We are informed, from very good authority, that there is now near finished a statue of the justly celebrated Mr. Handel, exquisitely done by the ingenious Mr. Roubillac, of St. Martin's-lane, statuary, out of one entire block of marble, which is to be placed in a grand niche, erected on purpose in the great grove at Vauxhall gardens, at the sole expence of Mr. Tyers, conductor of the entertainments there; who, in consideration of the real merit of that inimitable master, thought it justice and propriety that his effigies should preside in that place, where his harmony has so often charmed even the greatest crowds into the most profound silence and attention. It is believed, that the expence of the statue and niche cannot cost less than 300*l.*; the said gentleman, likewise, very generously took at Mr. Handel's benefit, fifty of his tickets."

May 2d, we have a farther account of this species of apotheosis, or laudable idolatry, in the following words: "Last night at the opening of the Spring-gardens Vauxhall, the company expressed great satisfaction at the marble statue of Mr. Handel, who is represented in a loose robe, sweeping the lyre, and listening to its sounds; which a little boy sculptured at his feet seems to be writing down on the back of a violoncello. The whole composition is in an elegant taste."

Soon after, the following verses appeared:

"That Orpheus moved a grove, a rock, or stream,
By music's power, will not a fiction seem;
For here as great a miracle is shewn—
A Handel breathing, though transform'd to stone."

TYFORY,

TYFORY, in *Geography*, a small island in the East Indian sea; 45 miles W. of Gilolo. N. lat. $1^{\circ} 6'$. E. long. $126^{\circ} 28'$.

TYGART'S VALLEY, a district of Pennsylvania, watered by the Monongahela river.

TYGER, in *Zoology*. See TIGER.

TYGER, in *Geography*, a river of South Carolina, which joins the Saluda, 5 miles N. of Columbia; and both together form the Cangaree.

TYGER'S POINT, a cape of Asia, on the south-west coast of Ava, at the mouth of the Perfaim. N. lat. $15^{\circ} 50'$. E. long. $94^{\circ} 45'$.

TYGER'S CREEK, a river of Kentucky, which runs into the Ohio, N. lat. $38^{\circ} 22'$. W. long. 83° .

TYGER'S ISLAND, a small island in the Chinese sea, near the coast of Chiampa. N. lat. $10^{\circ} 47'$. E. long. $107^{\circ} 45'$.—Also, a small island in the Chinese sea, near the coast of Cochinchina. N. lat. $16^{\circ} 51'$. E. long. $106^{\circ} 13'$.

TYGER ISLAND, a small island in the Pacific ocean, at the entrance of the bay of Amapalla. N. lat. $13^{\circ} 10'$.

TYGER'S ISLANDS, a cluster of small islands and shoals in the East Indian sea; 30 miles E. from the island of Saleyer.

TY-GWYN, a village of South Wales, in the county of Caermarthen, where Howel Dha, first monarch of all Wales, had a palace: and in the year 942, a council was held, to form a body of laws. On this spot a Cistercian monastery was founded, called Whetfand Abbey; 5 miles W. of St. Clare.

TYING, in *Musik*. See LEGATE-Note and SYNCOPE.

TYKOCZYN, in *Geography*, a town of Poland, in the palatinate of Bielsk. In 1705, Augustus II. instituted the order of the White Eagle in this town; 28 miles N.N.W. of Bielsk.

TYLANGIUM, in *Ancient Geography*, a town of the Peloponnesus, in Triphylia, according to Polybius.

TYLE, or TILE, in *Building*, a sort of thin, factitious, laminated brick, used on the roofs of houses, or, more properly, a kind of fat clayey earth, kneaded and moulded of a just thickness, dried and burnt in a kiln, like a brick, and used in the covering and paving of houses.

It is thus called from the French *tuille*, of the Latin *tegula*, which signifies the same.

Tyles are made, says Mr. Leyburn, of better earth than brick-earth, and something near akin to the potter's earth.

By 17 Geo. III. c. 42. all combinations for enhancing the price of tyles and bricks, shall be void; and every tyle-maker, or brick-maker, offending, shall forfeit 20*l.*, and every clerk, agent, or servant, 10*l.*; half to the poor, and half to him who sues within six calendar months.

By 43 Geo. III. c. 69. schedule (A.) and the 45 Geo. III. c. 30. in lieu of any duties of excise then subsisting, new duties were imposed.

The said duties on bricks and tyles to be paid by the maker or makers thereof respectively.

For the duties on exportation and importation, see the schedules annexed to the said act of 43 Geo. III. c. 69.

Provided always, that tyles made for the sole purpose of draining land, $19\frac{1}{8}$ inches long by $13\frac{3}{8}$ inches broad, and bent into a semi-elliptical form, the inside of the crown of the arch thereof being not less than seven inches perpendicular, from a straight line drawn from the one to the other side thereof after the same is so bent, and such sides not being at any part thereof more than five inches distant from each other on the inside, and as nearly of the dimensions, and bent as nearly into the form aforesaid as may be, to be used for the purposes aforesaid, shall not be subject to any

of the said duties. 34 Geo. III. c. 15.—And the exemption is extended to tyles made for such purpose not less than nine inches long; such being in every other respect of the same description and dimension as before prescribed. 42 Geo. III. c. 93.

And by the 46 Geo. III. c. 138. it is further enacted, that semi-elliptic tyles not exceeding in inside width six inches, and the height of which from the outside of the crown of the arch in a perpendicular line to the extreme edge shall in all cases exceed the width, but with a foot from the bottom of the arch where necessary, not exceeding two inches in breadth, made for draining wet or marshy lands, are exempted from the excise duty.

And any person using any such tyle for any other purpose than above-mentioned, incurs the penalty of 6*l.* each tyle so used.

And every maker of bricks or tyles, before he begins to make, shall leave or give notice in writing at the next excise office of his name and place of abode, and of the sheds, workhouses, or other places where such bricks or tyles are intended to be made; on pain of 100*l.* 24 Geo. III. c. 24. *seff.* 2.

All bricks and tyles chargeable with the said duties shall be taken account of and charged by the officer whilst they are drying, after being turned out of the moulds, and before removed to the kiln or clamp for burning, for which purpose any officer may enter into the fields, sheds, or other places where making, and shall take an account thereof in writing, and leave a copy (if demanded) with such maker, on pain of 40*s.*; and if any person shall obstruct such officer, he shall forfeit 50*l.*

The officer charging the duty shall allow ten for every hundred when charged in the field before burned, in compensation for all waste, loss or damages.

And if the maker shall remove any bricks or tyles to the kiln or clamp or other place of burning from out of the field or place where they shall be put or placed to dry before the officer shall have taken an account thereof, he shall forfeit 50*l.* And all so carried away, and found in the possession of any maker, or trader therein, or person for his use, shall be forfeited and may be seized, or the value thereof shall be forfeited. 25 Geo. III. c. 66.

Provided, that no such maker shall be subject to the said penalty, if the officer shall fail to take an account, on due notice given him three days before such removal. 24 Geo. III. c. 24. *seff.* 2.

The maker shall keep the bricks and tyles unsurveyed separate from those that have been surveyed; on pain of forfeiting 50*l.* 25 Geo. III. c. 66.

And such maker shall, while the same are drying, place them in such manner as the officer may easily and securely take an account thereof; and if he shall place them in an irregular or unusual manner, with intent to make it difficult or unsafe for the officer to take such account, he shall forfeit 50*l.*

If any maker shall fraudulently conceal or hide any bricks or tyles in any part of the operation of making, with intent to evade the duties, he shall forfeit the same, and also 20*l.* 24 Geo. III. c. 24. *seff.* 2.

Every such maker shall once in every six weeks make entry in writing upon his oath, or on the oath of his chief workman, at the next excise office, of all bricks and tyles by him made within that time, on pain of 50*l.* And shall also, within six weeks after such entry, clear off all the duties then due thereon; on pain of double duty. And if any person shall carry away such bricks or tyles before the duty be cleared off, he shall forfeit double the value thereof. But such

such maker shall not for making such entry be obliged to go further than the next market-town.

And all tools, implements, and utensils used in making such bricks or tyles, in custody of the maker, &c. shall be liable to be seized for any debts or penalties, (arising or incurred under this act,) whether the debtor or offender be the lawful owner thereof or not. 28 Geo. III. c. 37.

Bricks or tyles for which the duties have been paid may be exported, and on security given before the shipping thereof that the same shall not be reloaded, the person exporting the same shall be allowed a drawback of such duties; and in case such bricks or tyles shall be reloaded, the same shall be forfeited to the use of his majesty, over and above the penalty of such bond. 27 Geo. III. c. 13. sched. (F.)

All penalties and forfeitures are to be sued for, levied, and mitigated as by the laws of excise, or in the courts at Westminster, and to be distributed half to the king, and half to him that shall sue. 24 Geo. III. c. 24. sect. 2.

For the method of burning tyles, see BRICK.

As to the applying of tyles, some lay them dry, as they come from the kiln, without mortar, or any thing else; others lay them in a kind of mortar made of loam and horse-dung. In some parts, as in Kent, they lay them in moss.

There are various kinds of tyles for the various occasions of building; as *plain, thack, ridge, roof, crease, gutter, pan, crooked, Flemish, corner, hip, dorman or dormar, scallop, astragal, traverse, paving, and Dutch tyles.*

TYLES, *Plain or Thack*, are those in ordinary use for the covering of houses. They are squeezed flat, while yet soft, in a mould. They are of an oblong figure, and by stat. 17 Edw. IV. c. 4. are to be ten inches and a half long, six and a quarter broad, and half an inch and half a quarter thick. But these dimensions are not strictly observed.

Plain tyles are not laid in mortar, but only pointed in the inside.

TYLES, *Ridge, Roof, or Crease*, are those used to cover the ridges of houses, being made circular, breadthwise, like a half cylinder. These are what Pliny calls *laterculi*, and are by statute to be thirteen inches long, and of the same thickness with the plain tyles.

TYLES, *Hip or Corner*, are those which lie on the hips or corners of roofs. As to form, they are first made flat, like plain tyles, but of a quadrangular figure, whose two sides are right lines, and two ends arcs of circles; one end being a little concave, and the other convex. The convex end is to be about seven times as broad as the concave end; so that they would be triangular, but that one corner is taken off: then, before they are burnt, they are bent on a mould, breadthwise, like ridge tyles. They have a hole at their narrow end to nail them on by, and are laid with their narrow end upwards. By statute, they are to be ten inches and a half long, and of a convenient breadth and thickness.

These, as well as the ridge tyles, are to be laid in mortar, because they seldom lie so close as not to admit any water to pass between them.

TYLES, *Gutter*, are those which lie in gutters or valleys in cross-buildings. They are made like corner tyles, only the corners of the broad end are turned back again with two wings. They have no holes in them, but are laid with the broad end upwards, without any nailing. They are made in the same mould as corner tyles, and have the same dimensions on the convex sides. Their wings are each four inches broad, and eight long.

These tyles are seldom used where lead is to be had.

TYLES, *Pan, Crooked, or Flemish*, are used in covering

of sheds, stables, out-houses, and all kinds of flat-roofed buildings. They are in form of an oblong parallelogram, as plain tyles, but are bent breadthwise forwards and backwards, in the form of an S, only one of the arches is at least three times as big as the other, which biggest arch is always laid uppermost, and the less arch of another tyle lies over the edge of the great arch of the former. They have no holes for pins, but hang on the laths by a knot of their own earth. By 17 Geo. III. c. 42. they are to be, when burnt, not less than thirteen inches and a half long, nine and a half inches wide, and half an inch thick, on pain that the maker shall forfeit 10s. for every 1000.

Pan-tyles are laid in mortar, because the roof being flat, and many tyles being warped in the burning, they will not cover the roof so well as that no water pass between them.

TYLES, *Dormar or Dorman*, consist of a plain tyle, and a triangular piece of a plain one, standing up at right angles to one side of the plain tyle, and swept with an arc of a circle from the one end, which end terminates in a point. Of these tyles there are two kinds; the triangular piece, in some, standing on the right, in others on the left side of the plain tyle. And of each of these, again, there are two kinds, some having a whole plain tyle, others but half a plain tyle. But in them all, the plain tyle has two holes for the pins, at that end where the broad end of the triangular piece stands.

Their use is to be laid in the gutters, betwixt the roof and the cheeks or sides of the dormars, the plain part lying on the roof, and the triangular part standing perpendicularly by the cheek of the dormar. They are excellent to keep out the wet in those places, and yet they are hardly known any where but in Suffex. The dimensions of the plain tyle part are the same as those of a plain tyle, and the triangular part is of the same length, and its breadth at one end seven inches, and at the other nothing.

TYLES, *Scallop or Astragal*, are, in all respects, like plain tyles, only their lower ends are in form of an astragal, viz. a semicircle, with a square on each side. They are used in some places for weather tiling.

TYLES, *Traverse*, are a kind of irregular plain tyles, having the pin-holes broken out, or one of the lower corners broken off. These are laid with the broken end upwards, upon the rafters, where pinned tiles cannot hang.

TYLES, *Flemish or Dutch*, are of two kinds, *ancient* and *modern*. The ancient were used for chimney foot-pieces; they were painted with antique figures, and frequently with postures of soldiers, some with compartments, and some with morefque devices; but they came greatly short, both as to the design and colours, of the modern ones.

The modern Flemish tyles are commonly used plastered up in the jambs of chimneys, instead of chimney corner-stones. These are better glazed, and such as are painted (for some are only white) are much better performed than the ancient ones.

But both kinds seem to be made of the same whitish clay as our white-glazed earthen-ware. The ancient ones are five inches and a quarter square, and about three-quarters of an inch thick; the modern ones six inches and a half square, and three-quarters of an inch thick.

When these tyles are set with good mortar they look beautiful, and cast a greater heat than stone: for, being very smooth and glazed, the rays of heat striking upon them are all reflected into the work, especially when the sides of the chimneys are oblique, or in the form of circular arches. But they are little used.

Tiling is measured by a square of 100 square feet; and the number of tyles required for such a square depends on

the distance of the laths, which, when six inches, requires 800; when six and a half inches, 740; when seven inches, 690; when seven and a half inches, 640; and when eight inches, 600 tyles.

TYLE, in *Affaying*. See TILE.

TYLER, one that covers or paves with tyles.

Tylers and bricklayers were incorporated 10 Eliz. under the name of "Masters and Wardens of the Society of Freeman of the Mytery and Art of Tylers and Bricklayers." See COMPANY.

TYLERS, *Great*, in *Geography*, a small island in the Gulf of Finland. N. lat. 59° 50'. E. long. 27° 12'.

TYLERS, *Little*, a small island in the Gulf of Finland. N. lat. 59° 48'. E. long. 26° 54'.

TYLERY. See TUILERIE.

TYLIS, in *Ancient Geography*, a town of Thrace, on mount Hæmus.

TYLOPHORA, in *Botany*, from *τυλοσ*, a wart or tubercle, and *φειωσ*, to bear, apparently in reference to the five fleshy tumid leaves of the crown of the flower; though no explanation is given by the author.—Brown Tr. of the Wern. Soc. v. 1. 28. Prodr. Nov. Holl. v. 1. 460.—Clafs and order, *Pentandria Digynia*. Nat. Ord. *Contortæ*, Linn. *Apocynæ*, Juss. *Aclepiadæ*, Brown.

Eff. Ch. Corolla wheel-shaped, in five deep segments. Crown of the stamens of five depressed fleshy leaves, whose inner angle is simple, without a tooth. Anthers terminated by a membrane; masses of pollen erect, attached by their base, with simple margins. Stigma pointless. Follicles smooth. Seeds comose.

The plants of this genus have twining, either herbaceous or shrubby, stems. Leaves opposite, membranous, flat. Umbels standing between the footstalks. Flowers for the most part small. Four of the species are natives of New Holland, chiefly within the tropic, but extending as far as thirty-three degrees of south latitude. As many are found either in the East Indies or the equinoctial parts of Africa, but of these four latter, none of them described in any botanical work, the learned author has favoured us with no account. We can therefore merely give the characters of the New-Holland species, from his Prodrusus. It only remains for us to observe, that *Tylophora* comes very near *HOYA*, see that article; differing scarcely in any part of the essential character, except the want of a tooth at the inner angle of each leaf of the crown; and with respect to habit, distinguished from one only of the two species of that genus, by having membranous, not fleshy, leaves.

1. *T. grandiflora*. Large-flowered *Tylophora*. Br. n. 1.—Umbels nearly sessile, simple, of few flowers; their partial stalks smooth. Leaves heart-shaped, ovate, acute, downy as well as the branches.—Native of Port Jackson, New South Wales.

2. *T. barbata*. Bearded *Tylophora*. Br. n. 2.—Umbels mostly in pairs; their common stalk shorter than the leaves. Corolla bearded. Leaves ovate, acute, very smooth.—Gathered near Port Jackson, by Mr. Brown himself.

3. *T. flexuosa*. Zigzag *Tylophora*. Br. n. 3.—Umbels alternate, sessile on a zigzag common stalk. Leaves heart-shaped, oblong, veiny. Corolla beardless.—Found by Mr. Brown, in the tropical part of New Holland.

4. *T. paniculata*. Panicked *Tylophora*. Br. n. 4.—Panicles forked. Segments of the corolla ligulate upwards. Leaves ovate, pointed, nearly smooth; the lowermost somewhat heart-shaped.—Discovered in the neighbourhood of Port Jackson, by Mr. Ferdinand Bauer, the botanical companion of Mr. Brown, to whose exquisite pencil the duty of perpetuating the acquisitions of their hazardous expedition,

undertaken at the national expence, was entrusted. Yet so little has the engagement to the public been fulfilled, that except a small but exquisite fasciculus of plates, and the excellent but incomplete publications of Mr. Brown, all the discoveries of these naturalists have as yet remained fruitless: not, certainly, for want of their ability or inclination to complete what they have undertaken, but because, as we presume, the due injunctions, as well as the necessary aids, have been withheld.

TYLOS, in *Ornithology*, a name by which many authors have called the *turdus iliacus*, or redwing.

TYLOTICA, medicines supposed to promote the formation of callus.

TYLSEN, in *Geography*, a town of Brandenburg, in the Old Mark, on the Dichme; 5 miles S.W. of Salzwedel.

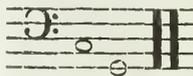

TYLUS, in *Ancient Geography*, a town of the Peloponnese, on the coast of the gulf of Messenia, between the isles Tyrides and the town of Leuctrum, according to Strabo; it is called *Ætyle* by Pausanias, who places it between the port of Messa and Talama.—Also, an island of the Persian gulf, at the distance of twenty-four hours' navigation from the mouth of the Euphrates, according to Arrian.—Also, Tylus minor, distant 10 miles in the same gulf from the greater Tylus; named Arados by Strabo, and Arathos by Ptolemy.

TYLWITH, in matters of *Heraldry* and *Descent*, is sometimes used for a tribe or family branching out of another, which the modern heralds more usually call the *second* or *third house*.

TYLYDAN, in *Geography*, a river on the S. coast of the island of Java, which runs into the sea, S. lat. 7° 38'. E. long. 108° 47'.

TYMARA, a town of Hindoostan, in Bahar; 25 miles E. of Chuta Nagpour.

TYMBALES, Fr. kettle-drums, instruments of percussion, consisting of two metalline globes covered with parchment; beaten with two drum-sticks, in the form of round hammers or mallets, from eight to nine inches long. The tone is short and dull. They are tuned 4ths to each other. The smallest drum produces the key-note of the compositions in which they are employed, and the largest, the 4th below; as in the key of C the tones are these:

There are braces, by which the pitch

can be raised or lowered at pleasure. See DRUM, and KETTLE-Drum.

TYMBER of Skins. See TIMBER.

TYMBRA, in *Ancient Geography*, a town of Asia, in Pisidia.

TYMBRE, Fr. in *Music*, is a term used to express that quality of tone or sound which renders a voice or instrument rough or smooth, harsh or sweet, coarse or mellow in tone. Sweet-toned instruments seem always feeble, and harsh-toned too loud. A perfect voice or instrument would be that which united force with sweetness. The quality of tone generally determines our idea of its force. The voice of Manzoli, at once extremely powerful and extremely sweet, was miraculous.

There are perhaps no instruments that can be at once loud and sweet, except those of the violin family, played with a bow; as the violin, tenor, and violoncello.

TYMENEUM, in *Ancient Geography*, a mountain of Asia, in the vicinity of Phrygia.

TYMES, a town of Africa, in Libya.

TYMIUM, a small town of Asia, in Phrygia.

TYMNISSUS, a town of Asia Minor, in Caria.

TYMNUUS, a town of Asia Minor, in Caria, which derived its name from the promontory called by Mela Tymnias.

TYMPAN, or TYMPANUM, in *Architecture*, the area of a pediment, being the part which is in a level with the naked of the freeze. Or it is the space included between the three cornices of a triangular pediment, or the two cornices of a circular one.

Sometimes the tympan is cut out, and the part filled with an iron lattice, to give light; and sometimes it is enriched with sculpture, in basso-relievo, as in the west front of St. Paul's, in the temple of Castor and Pollux at Naples, &c.

Tympan is also used for that part of a pedestal called the trunk or dye.

TYMPAN, among *Joiners*, is also applied to the pannels of doors.

TYMPAN of an Arch, is a triangular space or table in the corners or sides of an arch, usually hollowed and enriched, sometimes with branches of laurel, olive-tree, or oak; or with trophies, &c.; sometimes with flying figures, as Fame, &c. or sitting figures, as the cardinal virtues.

TYMPAN, in *Anatomy, Mechanics, &c.* See TYMPANUM.

TYMPAN, among *Printers*, is a double frame belonging to the press, covered with parchment, on which the blank sheets are laid in order to be printed off. See *PRINTING-Press*.

TYMPANA, τυμπανα, among the Athenians, a capital punishment, in which the criminal, being affixed to the pole, was beaten to death with cudgels. Potter, *Archæol. Græc.* lib. c. 25. tom. i. p. 134.

TYMPANIA, in *Ancient Geography*, a town of the Peloponnesus, in the interior of the Elide. Ptolemy.

TYMPANITES, in *Medicine*, from τυμπανον, *tympanum*, a drum, a flatulent distension of the belly, which, when struck, emits a sound which has been compared to the noise produced by that instrument. It has been called, in English, the *tympany*, and *windy dropsy*.

The tympanites is a swelling of the abdomen, in which the integuments appear to be much stretched by some distending power within, and they are equally stretched in every position of the body. The swelling does not very readily yield to any pressure; and so far as it does, being extremely elastic, it very quickly recovers its former state, when the pressure is removed. Being struck, it gives an obscure sound, somewhat like that of a drum, or other stretched animal membrane. No fluctuation within is to be perceived; and the whole feels less weighty than might be expected from its bulk. The uneasiness from the distension is partially relieved by the discharge of wind from the alimentary canal, either upward or downward.

These are the characters, then, by which the *tympanites*, or flatulent swelling of the belly, may be distinguished from the *ascites*, or dropsy of that cavity, and from *physconia*, or solid tumours, sometimes occurring there; and many experiments shew that the *tympanites* always depends upon a preternatural collection of air somewhere within the teguments of the abdomen. But the situation which the air occupies in different instances is somewhat different; and this produces the different species of the disease which nosologists have described.

One species, and indeed the most common and curable species, is that in which the collected air is confined within the cavity of the alimentary canal, and chiefly in that of the intestines. This species, therefore, has been named the *tympanites intestinalis*. (See Sauvages *Nosol. Method.*

Clafs. x. spec. 1.) To this species, indeed, which is the most frequent, the character above given especially belongs.

A second species is, when the air collected is not entirely confined to the cavity of the intestines, but is also present between their coats; and such is that which is named by Sauvages *tympanites enterophysodes*. (Sauv. *spec. 3.*) This has certainly been a rare occurrence; and has probably occurred only in consequence of the *tympanites intestinalis*, by the air escaping from the cavity of the intestines into the interstices of the coats. It is, however, possible, that an erosion of the internal coat of the intestines may give occasion to the air, so constantly present in their cavity, to escape into the interstices of their coats, though in the whole of their cavity there has been no previous accumulation.

A third species is, when the air is collected in the sac of the peritoneum, or what is commonly called the cavity of the abdomen, that is, the space between the peritoneum and viscera; and then the disease is named *tympanites abdominalis*. (Sauv. *sp. 2.*) The existence of such a *tympanites*, without any *tympanites intestinalis*, has been disputed; and it certainly has been a rare occurrence; but from several dissections, it is unquestionable that such a disease has sometimes truly occurred.

A fourth species of *tympanites* is, when *tympanites intestinalis* and *abdominalis* are joined together, or take place at the same time. With respect to this, it is probable that the *tympanites intestinalis* is the primary disease; and the other only a consequence of the air escaping, by an erosion or rupture of the coats of the intestines, from the cavity of these, into that of the abdomen. It is indeed possible, that in consequence of erosion or rupture, the air which is so constantly present in the intestinal canal, may escape from thence in such quantity into the cavity of the abdomen, as to give a *tympanites abdominalis*, whilst there was no previous considerable accumulation of air in the intestinal cavity itself; but we have no facts by which to ascertain this matter properly.

A fifth species has also been enumerated. It is when a *tympanites abdominalis* happens to be joined with the *ascites*, or dropsy of the belly; and such a disease therefore is named by Sauvages *tympanites asciticus*. (Sauv. *spec. 4.*) In most cases of *tympanites*, indeed, some quantity of serum has, upon dissection, been found in the sac of the peritoneum; but that is not enough to constitute the species now mentioned; and when the collection of serum is more considerable, it is commonly where, both from the causes which have preceded, and likewise from the symptoms which attend, the *ascites* may be considered as the primary disease; and therefore that this combination does not exhibit a proper species of the *tympanites*.

As this last is not a proper species, and as some of the others are not only extremely rare, but even, when occurring, are neither primary nor to be easily distinguished, nor, as considered in themselves, admitting of any cure, it will be unnecessary to take any farther notice of them; we shall therefore confine ourselves, in what follows, to the consideration of the most frequent case and almost the only object of practice, the *tympanites intestinalis*.

With respect to this, it does not appear that it arises in any peculiar temperament, or depends upon any predisposition, which can be discerned. It occurs in either sex, at every age, and frequently in young persons.

Various remote causes of it have been assigned; but many of these have not commonly the effect of producing this disease; and although some of them have been truly antecedents of it, we can in few instances discover the

manner in which they produce the disease, and therefore cannot certainly ascertain them to have been causes of it.

The phenomena of this disease, in its several stages, are the following.

The tumour of the belly sometimes grows very quickly to a considerable degree, and seldom in the slow manner the ascites commonly comes on. In some cases, however, the tympanites comes on gradually, and is introduced by an unusual flatulency of the stomach and intestines, with frequent borborygmi, and an uncommonly frequent expulsion of air upwards and downwards. This state is also frequently attended with colic pains, especially felt about the navel, and upon the sides towards the back; but generally, as the disease advances, these pains become less considerable. As the disease proceeds, there is a partly constant desire to discharge air, but it is accomplished with difficulty; and when obtained, although it give some relief from the sense of distension, this relief is commonly transient and of short duration. While the disease is coming on, some inequality of tumour and tension may be perceived in different parts of the belly; but the distension soon becomes equal over the whole, and exhibits the phenomena mentioned in the character. Upon the first coming on of the disease, as well as during its progress, the belly is bound, and the fæces discharged are commonly hard and dry. The urine, at the beginning, is usually very little changed in quantity or quality from its natural state; but as the disease continues, it is commonly changed in both respects, and at length sometimes a strangury, and even an ischuria, comes on. The disease has seldom advanced far, before the appetite is much impaired, and digestion ill performed; and the whole body, except the belly, becomes considerably emaciated. Together with these symptoms, a thirst and uneasy sense of heat at length come on, and a considerable frequency of pulse occurs, which continues throughout the course of the disease. When the tumour of the belly arises to a considerable bulk, the breathing becomes very difficult, with a frequent dry cough. With all those symptoms, the strength of the patient declines; and the febrile symptoms daily increasing, death at length ensues, sometimes probably in consequence of a gangrene coming upon the intestines.

The tympanites is commonly of some duration, and to be reckoned a chronic disease. It is very seldom quickly fatal, except where such an affection suddenly arises in fevers. To this, Sauvages has properly given a different appellation, that of *meteorismus*; and it may perhaps always be considered as a symptomatic affection, entirely distinct from the tympanites which we are now considering.

The tympanites is generally a fatal disease, seldom admitting of cure: but we shall mention what may be attempted in this way, after having endeavoured to explain the proximate cause, which alone can lay the foundation of what may be rationally attempted towards its cure.

To ascertain the proximate cause of tympanites is somewhat difficult. It has been supposed, in many cases, to be merely an uncommon quantity of air present in the alimentary canal, owing to the extrication and detachment of a greater quantity of air than usual from the alimentary matters taken in. Our vegetable aliments probably always undergo some degree of fermentation; and in consequence, a quantity of air is extricated and detached from them in the stomach and intestines; but it appears, that the mixture of the animal fluids which our aliments meet with in the alimentary canal, prevents the same quantity of air from being detached from them that would have been in their fermentation without such mixture; and it is probable that the same mixture contributes also to the re-absorption of

the air that had been before in some measure detached. The extrication, therefore, of an unusual quantity of air from the aliments, may, in certain circumstances, be such, perhaps, as to produce a tympanites; so that this disease may depend upon a fault of the digestive fluids, by which they become unfit to prevent the too copious extrication of air, and unfit also to occasion that re-absorption of air, which in sound persons commonly happens. An unusual quantity of air in the alimentary canal, whether owing to the nature of the aliments taken in, or to the fault of the digestive fluid, does certainly sometimes take place; and may possibly have, and in some measure certainly has, a share in producing certain flatulent disorders of the alimentary canal; but cannot be supposed to produce the tympanites, which often occurs when no previous disorder had appeared in the system. Even in those cases of tympanites which are attended at their beginning with flatulent disorders in the whole of the alimentary canal, as we know that a firm tone of the intestines both moderates the extrication of air, and contributes to its re-absorption or ready expulsion, so the flatulent symptoms which happen to appear at the coming on of a tympanites, are probably referred to a loss of tone in the muscular fibres of the intestines, rather than to any fault in the digestive fluids.

These, and other considerations, lead us to conclude, that the chief part of the proximate cause of tympanites, is a loss of tone in the muscular fibres of the intestines. But further, as air of any kind accumulated in the cavity of the intestines should, even by its own elasticity, find its way either upwards or downwards, and should also, by the assistance of inspiration, be entirely thrown out of the body; so when neither the re-absorption nor the expulsion takes place, and the air is accumulated so as to produce tympanites, it is probable that the passage of the air along the course of the intestines is in some places interrupted. This interruption, however, can hardly be supposed to proceed from any other cause than spasmodic constrictions in certain parts of the canal; and we may conclude, therefore, that such constrictions concur as part in the proximate cause of tympanites. Whether these spasmodic constrictions are to be attributed to the remote cause of the disease, or may be considered as the consequence of some degree of atony first arising, cannot with certainty be determined.

Cure of Tympanites—Having thus endeavoured to ascertain the proximate cause of tympanites, we proceed to treat of its cure; which indeed has seldom succeeded, and almost never but in a recent case of the disease. It may be proper, however, to state what may be reasonably attempted; what has commonly been attempted; and what attempts have sometimes succeeded in the cure of this disease.

It must be a first indication to evacuate the air accumulated in the intestines: and for this purpose, it is necessary that those constrictions, which had especially occasioned its accumulation, and continue to interrupt its passage along the course of the intestines, should be removed. As these, however, can hardly be removed but by exciting the peristaltic motion in the adjoining portions of the intestines, purgatives have been commonly employed; but it is at the same time agreed, that the more gentle laxatives only ought to be employed, as the more drastic, in the overstretched and tense state of the intestines, are in danger of bringing on inflammation. It is for this reason, also, that glysters have been frequently employed; and they are the more necessary, as the fæces collected are generally found to be in a hard and dry state. Not only on account of this state of the fæces, but, farther, when glysters produce a considerable evacuation of air

and thus shew that they have some effect in relaxing the spasms of the intestines, they ought to be repeated very frequently.

In order to take off the constrictions of the intestines, and with some view also to the carminative effects of the medicines, various antispasmodics have been proposed, and commonly employed; but their effects are seldom considerable; and it is alleged that their heating and inflammatory powers have sometimes been hurtful. It is, however, always proper to join some of the milder kinds with both the purgatives and glysters that are employed; and it has been very properly advised to give always the chief of antispasmodics, that is, an opiate, after the operation of purgatives is finished.

In consideration of the overstretched and tense state of the intestines, and especially of the spasmodic constrictions that prevail, fomentations and warm bathing have been proposed as a remedy; and are said to have been employed with advantage: but it has been remarked, that very warm baths have not been found so useful as tepid baths long continued.

Upon the supposition that this disease depends especially upon an atony of the alimentary canal, tonic remedies seem to be properly indicated. Accordingly, chalybeates and various bitters have been employed; and, if any tonic, the Peruvian bark might probably be useful. But as no tonic remedy is more powerful than cold applied to the surface of the body, and cold drink thrown into the stomach; so such a remedy has been thought of in this disease. Cold drink has been constantly prescribed, and cold bathing has been employed with advantage; and there have been several instances of the disease being suddenly and entirely cured by the repeated application of snow to the lower belly.

It is hardly necessary to remark, that, in the diet of tympanitic persons, all sorts of food disposed to become flatulent in the stomach are to be avoided; and it is probable, that the mineral acids and neutral salts, as antizymics, may be useful.

In obstinate and desperate cases of tympanites, the operation of the *paracentesis* (tapping) has been proposed; but it is a very hazardous remedy, and there is no satisfactory testimony of its having been practised with success. It must be obvious, that this operation is a remedy suited especially, and almost exclusively, to the tympanites abdominalis; the existence of which, separately from the intestinalis, is very doubtful, at least not easily ascertained, yet it is not very likely to be cured by this remedy: and how far the operation might be safe in the tympanites intestinalis, is not yet determined by any proper experience. There would be a danger, indeed, of converting the tympanites intestinalis into the tympanites abdominalis, by allowing the air to escape through the puncture of the intestine into the sac of the peritonæum, and thus of converting a less disease into a greater, and, in fact, of producing irreparable mischief.

TYMPANOTRIBA, among the *Ancients*, a designation given to an effeminate person, who could do nothing but play on the tympanum.

TYMPANUM, in *Anatomy*. See EAR.

TYMPANUM, *Diseases of*. The cavity of the drum of the ear is sometimes affected with a puriform ichorous discharge, attended with a loss of hearing, proportionate to the degree of disorganization which this part of the ear has sustained. In general, on blowing the nose, air is expelled at the meatus auditorius externus: and, when this is the case, it is evident that the discharge is connected with an injury, or destruction of the membrana tympani. However, when the Eustachian tube is obstructed with mucus, or

matter, or when it is rendered impervious, and permanently closed by inflammation, the membrana tympani may not be perfect, and yet, it is clear, no air can in this state be forced out of the external ear in the above manner. An examination with a blunt probe, or with the eye, while the rays of the sun fall into the passage, should therefore not be omitted. If the membrane have any aperture in it, the probe will pass into the cavity of the tympanum, and the surgeon feel that his instrument is in contact with the ossicula.

In this manner the affection may be discriminated from a herpetic ulceration of the meatus auditorius externus. The causes are various: in scarlatina maligna, the membrana tympani occasionally inflames, and sloughs; all the ossicula are discharged, and, if the patient live, he continues quite deaf. An ear-ache, in other words, acute inflammation of the tympanum, is the most common occasion of suppuration in this cavity, in which, and the cells of the mastoid process, a good deal of pus collects. At length, the membrana tympani ulcerates, and a large quantity of matter is discharged; but, as the secretion of pus still goes on, the discharge continues to ooze out of the external ear.

Instead of stimulating applications, inflammation of the tympanum demands the rigorous employment of antiphlogistic means. Unfortunately, it is a too common practice, in this case, to have recourse to acrid spirituous remedies. Above all things, the repeated application of leeches to the skin behind the external ear, and over the mastoid process, should never be neglected. As soon as the inflammation ceases, the degree of deafness, occasioned by it, will also disappear. This, however, does not always happen.

When an abscess is situated in the cavity of the tympanum, Mr. Saunders seems to think, that the membrana tympani should not be allowed to burst by ulceration, but be opened by a small puncture. Sometimes the disease, of which we are treating, is more insidious in its attack: slight paroxysms of pain occur, and are relieved by slight discharges. The case goes on in this way, until, at last, a continual discharge of matter from the ear takes place. The disorder is destructive in its tendency to the faculty of hearing, and it rarely stops until it has so much disorganized the tympanum and its contents, as to occasion total deafness. Hence Mr. Saunders very properly defends the propriety of making attempts to arrest its progress,—attempts which are free from danger; and he censures the foolish fear of interfering with the complaint, founded on the apprehension, that bad constitutional effects may originate from stopping the discharge.

If the case be neglected, the tympanum is very likely to become carious; before which change, the disease, says Mr. Saunders, is most commonly curable.

Mr. Saunders divides the complaint into three stages: 1. A simple puriform discharge. 2. A puriform discharge complicated with funguses and polypi. 3. A puriform discharge with caries of the tympanum. As the disease is a local one, direct applications to the parts affected are chiefly entitled to confidence. Blisters and setons may be advantageously employed in aid of topical applications. Mr. Saunders's practice, in these cases, consists in administering laxative medicines, and fomenting the ear while inflammatory symptoms last, and afterwards injecting a solution of zincum vitriolatum, or cerussa acetata.

In the second stage, when there are funguses, he removes or destroys them with forceps, afterwards touches their roots with the argentum nitratum, or injects a solution of alum, zincum vitriolatum, or argentum nitratum.

TYMPANUM, in *Architecture*. See TYMPAN.

TYMPANI, *Chorda*. See CHORDA.

TYMPANUM, *Tympan*, in *Mechanics*, is a kind of wood

placed round an axis, or cylindrical beam, on the top of which are two levers, or fixed flaves, for the more easy turning the axis about, in order to raise a weight required.

The tympanum is much the same with the peritrochium; but that the cylinder of the axis of the peritrochium is much shorter and less than the cylinder of the tympanum. See *Axis in Peritrochio*.

TYMPANUM of a machine is also used for a hollow wheel, in which one or more people, or rather animals, walk to turn it; such as that of some cranes, calenders, &c.

TYMPANUM, Lat. a drum, in *Antiquity*; but in modern *Music*, it is equivalent with *tymbales*, or a pair of *kettle-drums*; which see. See likewise TIMPANO, Ital. for a kettle-drum.

TYMPHÆI, in *Ancient Geography*, a people of Thesprotia, towards the sources of the Peneus. Strabo.

TYNA, a river of India, in the eastern part of the peninsula on this side of the Ganges, according to Ptolemy; marked by D'Anville to the N. of Maliarpha.

TYNAN, in *Geography*, a small post-town of the county of Armagh, Ireland; 69 miles N. by W. from Dublin.

TYNDALE, WILLIAM, (named also *Hitchins*), in *Bio-graphy*, a learned martyr to the Reformation, was born towards the latter part of the fifteenth century, on the borders of Wales, but the precise place of his nativity is not known. He received part of his education at Magdalen-Hall, Oxford, where he imbibed the doctrines of Luther, which caused his being dismissed from Wolsey's new college of Christ-church, into which he had been admitted; so that he removed to Cambridge, where he took a degree. From hence he removed to Gloucestershire, to take the charge of sir John Welch's children; and, during his residence here, he translated Erasmus's "Enchiridion Militis Christiani" into English, for the benefit of the family with which he resided, and he often preached in and about Bristol. By the company which visited sir John, Tyndale was reproached as a heretic, and articles were preferred against him by the chancellor of the diocese, so that he was under a necessity of removing to London, where he preached at St. Dunstan's in the West. Desirous of being admitted one of bishop Tonstall's chaplains, he made application for that purpose, but was disappointed. In a retirement near London, he prepared a translation of the New Testament into English, which he accomplished, by unwearied assiduity, in about half a year; but the times would not admit of its publication. The author therefore withdrew to the continent, and at length took up his abode at Antwerp; and here he completed his work, which was printed in 1526, 8vo., without a name. The number of copies was 1500, most of which were bought in England, and industriously circulated. The zealous papists were alarmed, and foreseeing the diffusion of error and heresy, obtained orders from Warham, archbishop of Canterbury, and Tonstall, bishop of London, that those who possessed any copies should deliver them up on pain of excommunication. Tonstall procured all that were unfolded at Antwerp, and having purchased them, they were brought over and burnt at St. Paul's Cross. This circumstance favoured Tyndale's design, who took occasion to prepare a more correct edition, which was printed in 1534; and cheaper editions increased the circulation. In order to discourage and restrain these measures for disseminating the Scriptures, sir Thomas More ridiculed Tyndale's version in a dialogue in 1529, to which Tyndale replied: and the king, in a court of star-chamber in 1531, with the concurrence of the prelates, universities, and clergy, pronounced a severe condemnation of it, together with other heretical books. Tyndale, however, persevered with undaunted resolution, and engaged

in a translation of the five books of Moses from the Hebrew. But in a voyage to Hamburg he was shipwrecked, and lost his books, papers and money. At Hamburg, where he at length arrived, he met with Miles Coverdale, and cooperating in their labour, they completed the Pentateuch, and printed it in 1530. Tyndale published a translation of the prophecy of Jonah, with a prologue, in 1531, and thus ended his labour on the Old Testament. At Antwerp he took up his residence in 1534, as a place of safety; but Henry VIII. and his council employed a person to betray him under the mask of friendship, and he was conveyed as a prisoner to Vilvorden, where he remained for a year and a half. At length, in 1536, he was brought to trial upon the emperor's decree at Augsburg; and here he was condemned, and strangled at the stake; and his body was reduced to ashes. He expired with uttering this prayer, "Lord, open the king of England's eyes!" It is needless to make any reflections on the conduct of such savage persecutors, who thus treated a man of irreproachable manners, and who was pronounced, by the emperor's procurator, who assisted in his condemnation, "Homo doctus, pius, et bonus," for no other crime besides that of enabling Christians to peruse a book which is the only authoritative directory of their faith and practice. Tyndale's other works were introductions to, and comments upon, parts of Scripture. Biog. Brit.

TYNDARIDÆ, in *Mythology*, a name given by the poets to Castor and Pollux, the sons of Jupiter and Leda.

Though, according to the fable, Pollux and Helena proceeded from the egg which Leda had conceived by Jupiter, and were therefore immortal; whereas, out of another egg, which she conceived by Tyndarus, her husband, came Castor and Clytemnestra, who were mortal. See CASTOR and Pollux.

TYNDARIS, in *Ancient Geography*, Pandari, a town of Asia, in the Colchide, on the right bank of the Phasis, E.N.E. of Circæum, and S.W. of Cyta (Cutatis.) Pliny. —Also, a town of Sicily, towards the S.W., which was a Roman colony. It is called by Ptolemy Tyndarium.

TYNDIS, DANDA, a port of India, upon the coast of the country denominated Limyrica, according to the Periplus of the Erythræan sea.

TYNDIS, *Yanaon*, a river of India, in the peninsula on this side of the Ganges. Ptolemy.

TYNE, in *Geography*, a river of Scotland, which rises a few miles S. of Dalkeith, crosses the county of Haddington, and runs into the German sea, N. lat. 56° 2'. W. long. 2° 38'.

TYNE. See TINE.

TYNEMOUTH, a township in the east division of Cattle-Ward, in the county of Northumberland, England; is situated on the banks of the river Tyne, 9 miles E.N.E. from Newcastle, and 286 miles N. by W. from London. It is a place of remote antiquity; and recent discoveries have proved that the Romans had buildings here. It is chiefly noted for its ancient monastery, which is reckoned to be one of those founded by Oswald, the first Christian king of Northumberland. Great local sanctity was soon attributed to it, and several kings and other illustrious persons were buried here. St. Herebald, the companion of St. John of Beverley, was abbot here at the beginning of the eighth century; but before the end of it, the monastery was plundered by the Danes, as it was again in the next century by the forces under Hungar and Hubba, and a third time in the reign of king Athelstan. The old church seems to have lain desolate for a century, till a short time before the Norman conquest, when Tosti, earl of Northumberland, rebuilt and

and endowed it. On the banishment of Tofti, the Conqueror gave his possessions to Robert de Mowbray, who then became earl: he refounded Tynemouth priory, and filled it with Black monks from St. Alban's, to which abbey the priory was subordinate. In his conspiracy against William Rufus, he converted the place into a fortress, which, after a siege of two months, was taken by storm. The priory progressively increased in consequence. In 1244, the prior mediated a peace between England and Scotland; and soon after obtained a charter from Henry III. to hold a market in his manor of Bewicke. He also claimed a market for Tynemouth; but in a suit on that account, judgment was given against him. Many privileges and immunities were, however, obtained for the inhabitants. At the surrender of the priory, in 1539, its possessions were very large, having twenty-seven villas with their royalties, besides the impropriations of many churches: its annual income being estimated at 70*l.* 10*s.* 8½*d.* The chief remains are those of the church, at the east end of which is a neat little chapel or oratory. Till 1659 the church was parochial, but being decayed and damaged during the civil war, another was erected, and completed in 1668; but the old cemetery is still much used in preference to the new one. The castle, erected by earl Mowbray, appears to have been a place of great strength. It was garrisoned in the reign of queen Elizabeth; and again in that of Charles I., when it was besieged and taken by the parliamentary forces. Little remains of this ancient fortress except a strong gateway, the approach to which has been recently flanked with bastions. The village of Tynemouth is much frequented in the bathing season, and commodious warm and cold baths have been erected. Here are some considerable salt-works; and it is estimated that 700,000 chaldrons of coals are annually sent hence to London. In the population return of the year 1811, the number of houses in this township is stated to be 930; and of inhabitants, 5834.—*Beauties of England*, vol. xiii. Northumberland, by the Rev. — Hodgson.

TYNIDRUM, or *Thunudronum Colonia, Hydrab*, in *Ancient Geography*, a town of Africa, mentioned by Ptolemy, and placed by him two degrees W. of *Sicca Veneria*.

TYNIECZ, or **TYNEZ**, in *Geography*, a town of Austrian Poland, on the Vistula; 4 miles S.W. of Cracow.

TYNNA, in *Ancient Geography*, a town of Asia, in the Lesser Armenia, and in the prefecture named *Catæonia*. Ptol.—Also, a river of India, on this side of the Ganges, the mouth of which was in the country of the *Avari*. Ptolemy.

TYNSBOROUGH, in *Geography*, a town of Massachusetts, in the county of Middlesex, containing 704 inhabitants; 31 miles N. of Boston.

TYONISTA, a river of Pennsylvania, which runs into the Allegany, N. lat. 41° 29'. W. long. 73° 30'.

TYORA, in *Ancient Geography*, furnamed "*Matienna*," a town of the *Aborigines*, on the coast of Latium; distinguished by a very ancient oracle of Mars.

TYPA, in *Geography*, a harbour on the coast of China, at the entrance of the river of Canton, formed by several islands. The anchoring place is N. lat. 22° 9'. E. long. 113° 49'.

TYPÆA MŌNS, in *Ancient Geography*, a small mountain of Triphylia, near the banks of the river *Alpheus*. It was a law of the *Eleans*, that any female who was surprised in attendance at the Olympic games, should be precipitated from this mountain, the reason of which law is said to have been, that the *Athletæ* were naked in their exercises.

TYPE, **ΤΥΠΟΣ**, formed from *τυπος*; *form, figure*, a copy, image or resemblance, of some model.

The term type is less in use than its compounds *prototype* and *archetype*, which are the originals that are made without models.

TYPE is also a scholastic term, much used among divines, signifying a symbol, sign, or figure, of something to come.

In this sense the word is commonly used with relation to *antitype*, *αντιτυπος*, which is the thing itself, of which the other is a type or figure.

Thus Abraham's sacrifice, the paschal lamb, &c. were types or figures of our redemption; and the brazen serpent was a type of the cross, &c.

Types are not mere conformities, or analogies, which the nature of things holds forth between them; nor arbitrary images arising merely from the casual resemblance of things; but there is farther required a particular institution of God to make a type, and a particular declaration of his that it is so.

Gale divides types into *historical* and *prophetical*. The first are those used by the ancient prophets in their agitations and visions: the second, those in which things done, or ceremonies instituted in the Old Testament, prefigure Christ, or things relating to him in the New Testament. Or, they are things which happened and were done in ancient time, and are recorded in the Old Testament, and which are found afterwards to describe or represent something which befell our Lord, and which relates to him and his gospel. *E. gr.* Under the law, a lamb was offered for a sin-offering, and thus an atonement was made for transgressions. John the Baptist calls Christ "the lamb of God who taketh away the sins of the world," and St. Peter tells Christians that they are redeemed "by the blood of Christ, as of a lamb." Hence we infer and conclude that the lamb was a type of Christ; and upon considering it, we find that it has all that can be required to constitute a type; for it is in many respects a very just and lively representation of Christ. The lamb died for no offence of his own, but for the sins of others; so did Christ: the lamb could not commit sin by his nature, nor Christ by his perfection: the lamb was without bodily spot or blemish; Christ was holy and undefiled: a lamb is meek and patient; such was the afflicted and much injured Son of God.

These types are useful to persons who have already received Christianity upon other and stronger evidence, as they shew the beautiful harmony and correspondence between the Old and New Testament; but they seem not proper proofs to satisfy and convince doubters, who will say perhaps, with the schoolmen, "*theologia symbolica non est argumentativa.*"

Unless we have the authority of the Scriptures of the New Testament for it, we cannot conclude with certainty that this or that person, or this or that thing mentioned in the Old Testament is a type of Christ, on account of the resemblance which we may perceive between them: but we may admit it as probable.

The ancient fathers, as well as the modern critics, have been greatly divided about the nature and use of the types and typical representations in the Old Testament; and it is this makes one of the great difficulties in understanding the ancient prophecies, and in reconciling the New and Old Testament together.

There is no denying but that there were some types which the divine wisdom instituted to be the shadows and figures of things to come; and yet people run into an excess that way; some looking for types in every thing, like Origen, who discovered mysteries in the very cauldrons of the tabernacle. A prudent man should be contented with the more sensible and obvious ones, nor propose any

without

without proving them as much as possible, and shewing that they were really intended for types, in order to justify the solidity of the reasoning of the apostles, who argued from them.

An author, in reference to this subject, maintains, that not the fathers only, but St. Paul himself, was of the opinion, "that Christianity was all contained in the Old Testament, and was implied in the Jewish history and law; both which are to be reputed types and shadows of Christianity." In order to which, he quotes Hebrews, viii. 5. x. 1. and Colof. ii. 16, 17. He adds, "that the ritual laws of Moses, being in their own nature no other than types and shadows of future good things, are to be considered as having the effect of prophecies." This is likewise the sense of Mr. Whiston, and others; but the same author even quotes our Saviour speaking in behalf of this typical reasoning in that passage, Matth. xi. 13. where he affirms that, "the law prophecies; and that he came to fulfil the law as well as the gospel." (Matth. v. 17. Disc. of the Grounds, &c.) An ingenious divine takes this occasion to observe, that had the ancients, with the modern retainers to the typical way, expressly designed to have exposed Christianity, they could not have done it more effectually than by thus making every thing types and prophecies.

Not that he denies the reality of such things as types. It is manifest there were many under the Old Testament; such were Zechariah's staves, beauty, and bands, ch. xi. 7. 10. 14; such was Hosea's adulterous wife, chap. i. 2; and such were his children, ver. 4. 6. The prophets designed by these to prefigure future events; but in these instances the reader is at once, by the declaration of the prophet, made to understand as much, and not left to his own conjectures about them after the events are over.

In effect, all that is urged from Scripture for the typical or allegorical interpretations of the Jewish law, history, ceremonies, &c. it is asserted, may be set aside, without any violence to the Sacred Text, which may be explained on more natural and intelligible principles, and more consistently with grammar.

The word *τυπος*, we have observed, literally denotes no more than a copy or impression of any thing; and accordingly, in our translation, we find it sometimes rendered by *print*, sometimes by *figure*, sometimes by *fashion*, and sometimes by *form*.

Hence also the word is figuratively applied to denote a moral pattern; in which sense it signifies no more than *example* and *similitude*.

Again, the word *αντιτυπος*, *antitype*, in Scripture, signifies any thing formed according to a model or pattern; and thus, in the Epistle to the Hebrews, the tabernacle, and holy of holies, being made according to the pattern shewn to Moses, are said to be antitypes, or figures, of the true holy places. In the like sense, St. Peter, speaking of the flood and the ark, by which eight persons were saved, calls baptism an antitype to them; by which he expresses no more than a similitude of circumstances.

The other words used in Scripture to imply a future event, prefigured by some foregoing act, are,—*υποδειγμα*, rendered by *imitation* and *example*; and *σκια*, *shadow*.

Such being the import of all the terms used in the New Testament writers, seeming to imply any prefiguration of future events under the Gospel, it is observed,

1. That to argue from types, is only to argue from examples or similitudes; and, consequently, that all inferences drawn from such reasonings are no farther conclusive than reasonings from similitudes are. The intent of similitudes is only to help to convey some ideas more clearly or strongly;

so that to deduce consequences from a simile, or infer any thing from other parts of the simile, than what are plainly similar, is absurd.

The same author also alleges, 2. That it cannot be proved, that the ceremonies of the Mosaic law were ever designed to prefigure any future events in the state of the Messiah's kingdom. No such declared prefigurations are mentioned in the writings of the Old Testament, whatever notions prevailed among the writers who immediately followed. It is granted, that the apostles argued from the rites in the Mosaic institution; but this (he says) appears to have only been by way of illustration and analogy.

There is certainly a general likeness in all the dispensations of Providence; an analogy of things in the natural as well as the moral world, from which it is easy arguing by way of parity, and it is very just and usual so to do; but that one of these dispensations was therefore given to prefigure another that was future, can never be proved, unless it be expressly declared.

It is in the same way of similitude (he maintains) we are to understand St. Paul, where he says, "that Christ our pass-over is sacrificed for us." And thus we are to understand John the Baptist, when he calls our Saviour the "Lamb of God." There was this similitude of circumstance, that Christ was slain on the same day with the paschal lamb; that he died about the same time of the day when the priests began their hillel; that not a bone of the one or the other was broken. Add, that as the paschal lamb was without blemish, so was Christ without sin. From these, and other circumstances, the apostle applied the term *passover* to Christ.

Thus, also, we are to account for what St. Paul calls the baptism of the children of Israel in the cloud, and in the sea; and for the comparison betwixt the high-priest entering the holy place every year, and Christ entering into heaven. Sykes's Essay on the Truth of the Christian religion, 1725.

TYPE, *τυπος*, is also a name given to an edict of the emperor Constant II. published in 648, to impose a general silence both on the orthodox and the Monothelites.

It had the name of type, as being a kind of formulary of faith; or rather a form on which men were to regulate their conduct.

The type owed its original to Paul, patriarch of Constantinople, who persuaded that emperor to take away the echeſis, compiled and hung up in all the public places by Heraclius (as occasioning great complaints from the orthodox, by its favouring the Monothelites); and to publish an edict to impose silence on both parties.

But such kinds of pacifications are held inexcusable in matters of religion; accordingly pope Theodore soon procured the patriarch Paul to be deposed; the type was examined in the council of Rome, consisting of a hundred and five bishops, in 649, and condemned; and an anathema was pronounced against all such as admitted either the impious echeſis or *typus*.

TYPE, *Typus*, is also used to denote the order observed in the intension and remission of fevers, pulses, &c.

TYPE, among *Letter-founders* and *Printers*, denotes the same with letter. See **FOUNDERY**.

TYPHA, in *Botany*, Cat's-tail, or Reed-mace, *τυφη* of the ancient Greeks, from *τυφος*, a bog or marsh, of which situations the plants of this genus are among the most conspicuous inhabitants. They are often vulgarly mistaken for the Bull-rush, a very different plant. (See **SCIRPUS**, sect. 2.)—Linn. Gen. 479. Schreb. 620. Willd. Sp. Pl. v. 4. 197. Mart. Mill. Dict. v. 4. Sm. Fl. Brit. 959. Prodr. Fl. Græc. Sibth. v. 2. 225. Ait. Hort. Kew. v. 5. 234.

Brown Prodr. Nov. Holl. v. 1. 338. Pursh 34. Juss. 25. Tourn. t. 301. Lamarck Illustr. t. 748. Gært. t. 2.—Class and order, *Monœcia Triandria*. Nat. Ord. *Calamariæ*, Linn. *Typhæ*, Juss. *Aroideæ*, Brown.

Gen. Ch. Male Flowers numerous, in a catkin at the top of the stem. *Cal.* Common Catkin cylindrical, very dense. Perianths of three setaceous leaves. *Cor.* none. *Stam.* Filaments three, varying to one or four, capillary, the length of the calyx, combined at the base; anthers oblong, pendulous.

Female Flowers numerous, in a catkin surrounding the same stem, very densely crowded together. *Cal.* Perianth of many capillary bristles. *Cor.* none. *Pist.* Germen ovate, on a bristle-shaped stalk; style awl-shaped; stigma capillary, permanent. *Peric.* none, the numerous fruits form a cylinder round a common receptacle. *Seed* solitary, ovate, stalked, subtended, in the lower part of the stalk, by the permanent capillary calyx, as long as the style, forming a sort of down or wing.

Ess. Ch. Male, Catkin cylindrical, dense, chaffy. Anthers about three on each filament.

Female, Catkin cylindrical, inferior. Seed solitary, on a feathered stalk.

1. *T. latifolia*. Great Cat's-tail, or Reed-mace. Linn. Sp. Pl. 1377. Willd. n. 1. Fl. Brit. n. 1. Engl. Bot. t. 1455. Pursh n. 1. Fl. Dan. t. 645. (*T. major*; Curt. Lond. fasc. 3. t. 61. *Typha*; Ger. Em. 46. Matth. Valgr. v. 2. 216. *T. palustris major*; Bauh. Hist. v. 2. 539. Morif. sect. 8. t. 13. f. 1.)—Leaves linear, flat; very slightly convex beneath. Male and female catkins close together.—Common in pools, ditches, and slow streams throughout Europe and North America, growing in the water, and flowering in July; after which the tall pole-like stems, with the enlarged female catkins, remain long, till the seeds are blown away. The creeping, stout, perennial roots run deep into the mud. The stems are six feet, or more, in height, straight, simple, round, solid, smooth, leafy at the bottom. Leaves erect, as tall as the stem, linear, sharpish and entire at the edges; smooth on both sides; flat on the upper, slightly convex on the under side, at least in the lower part; from half an inch to an inch wide. Catkin uninterrupted; the female part four or five inches long, dark brown, feeling like plush or velvet; male shorter, yellowish, tapering, with a membranous leaf, or sheath, at the base, and another about half way up. Flowers crowded, innumerable, horizontal, forming a dense mass, with hairs between like a fine soft brush. Anthers quadrangular, two, three, or four on each compound filament, soon falling off, and leaving a naked stalk above the enlarged seed-catkin, till the seeds and their feathery stalks likewise fly away.

2. *T. angustifolia*. Lesser Cat's-tail, or Reed-mace. Linn. Sp. Pl. 1377. Willd. n. 3. Fl. Brit. n. 2. Engl. Bot. t. 1456. Pursh n. 2. Brown n. 1? Fl. Dan. t. 815. (*T. minor*; Curt. Lond. fasc. 3. t. 62. *T. palustris media*; Bauh. Hist. v. 2. 540. Morif. sect. 8. t. 13. f. 2.)—Leaves flattish upwards; channelled and semicylindrical below. Catkins a little distant, leafless.—Much less common than the last, though like it a native of all parts of Europe, as well as of Pennsylvania and Virginia, flowering at the same season. Mr. Brown doubts whether his New Holland plant be the same species or not, its size exceeding what is found in Europe. He suggests that it may possibly be what Pursh has called *T. dominicensis*, in his *Synopsis*, v. 2. 532. This is a doubt we have no means of removing. Our *angustifolia*, though nearly as tall as the *latifolia*, is in every part much smaller and more slender. The leaves are more convex on their under side, and to-

wards the base at least they are concave, or channelled on the upper. There is always a naked space between the male and female catkins. The roughness between the male flowers is rather chaffy than hairy, and seems to take place of the perianths. The fruit-bearing catkin sometimes splits longitudinally, in growing, into four dismembered portions. The original Linnæan names have been retained in *Fl. Brit.* and by subsequent writers, in preference to Mr. Curtis's *major* and *minor*, which latter might have led only to confusion.

3. *T. minor*. Dwarf Cat's-tail, or Reed-mace. Fl. Brit. n. 3. Engl. Bot. t. 1457. Willd. n. 2. Ait. n. 2. Bauh. Hist. v. 2. 540. Lob. Ic. 81. (*T. angustifolia* β; Linn. Sp. Pl. 1378. Hudf. 400. *T. minima*; Willd. n. 4. *T. palustris minima, duplici clavâ*; Morif. sect. 8. t. 13. f. 3.)—Leaves linear; convex at the back. Catkins a little distant; the male leafy; female short and turgid.—Native of marshy, rather sandy, places in England, Switzerland, and Germany, flowering in July or August.—The root is perennial and creeping, and the habit of the plant like the two foregoing species, but its size much smaller than either, the stem being only twelve or eighteen inches high, and very slender, sheathed with broad scales about half its length, which have been mistaken for leaves. The real leaves spring, as described in English Botany, from a different parcel of similar scales, and are as tall as the stem, scarcely a line in breadth, slightly channelled, convex at the back. Catkins each about an inch long, a little distant from each other; the male with a leafy scale or two at its base, middle, or summit; the female somewhat elliptical, tumid, often divided. Anthers mostly solitary. Flowers not much interspersed with hairs or chaffy scales.—There can be no doubt, from Willdenow's description, of his *T. minima* being the same plant as *minor*, of which latter he was not conscious of having seen a specimen.—*T. minor* was found on Hounslow Heath in the time of Dillenius. We have not heard of it from any recent collector.

TYPHÆ, one of Jussieu's natural orders, the eighth of his general series, the second of his second class. Its name is derived from one of the only two genera which constitute this order, (see TYPHA); the other being SPARGANIUM, which the reader will find in its proper place.

The second of Jussieu's classes is formed of monocotyledonous plants, whose stamens are inserted below the germen. Their calyx is either of one or more leaves, or wanting. Corolla (in Jussieu's opinion) none. Stamens inferior, mostly definite in number. Germen superior, simple; style either one or more, or wanting; stigma simple or divided. Seed solitary, naked or covered; or the fruit is of one cell, with one or many seeds. Leaves mostly alternate and sheathing. Flowers sometimes distinct in sex, by the failure of one or other of their organs of impregnation.—The orders are four; *Aroideæ*, *Typhæ*, *Cyperoideæ*, and *Gramineæ*; for the two last, see CALAMARIÆ and GRAMINA. The *Aroideæ* consist of *Ambrosinia*, *Zostera*, *Arum*, *Calla*, *Dracontium*, *Pothos*, *Houttuynia*, *Orotium*, and *Acorus*.

The *Typhæ* are thus characterized. Flowers monoecious; the males aggregate, triandrous, with a three-leaved calyx; females likewise aggregate, with a three-leaved (rather, we would say, many-leaved) calyx; germen superior; style simple; seed solitary. Leaves all alternate and sheathing. Plants herbaceous and aquatic.

Mr. R. Brown makes the *Typhæ* of Jussieu but a section of his *Aroideæ*. He observes that their seeds are pendulous; those of *Sparganium* each in a dry drupe, those of *Typha* in that kind of membranous close capsule termed by Gærtner *utriculus*.

TYPHIUM, a name used by some authors for colt's-foot.

TYPHIUM, in *Ancient Geography*, a mountain of Greece, in Bœotia.

TYPHLE, or TYPHLINE, a name by which some authors have called the fish more usually known by the name of the *acus*.

TYPHLINUS, in *Zoology*, the name by which the Greeks, and from them some others, have called the *cæcilia*, or slow-worm.

TYPHLOSIS, from τυφλος, *blind*; blindness.

TYPHODES, FEBRIS, in *Medicine*. See TYPHUS.

TYPHOMANIA, probably from τυφος, *smoke*, and μανια, *phrensy*, but the propriety of which is not very obvious, a term used by the older writers in medicine to denote a state of disease in which lethargy was combined with delirium, or, as some have stated, an apparent sopor with actual watchfulness: whence the appellation has been deemed synonymous with *coma vigil*. A more accurate pathology has discarded these vague distinctions; for every degree of morbid somnolency, from lethargy up to complete apoplexy, appears to be the same in kind, differing only in violence. See APOPLEXY, COMA, and LETHARGY.

TYPHON, or TYPHŒUS, in *Mythology*, the name of one of the rebel giants.

The fable of Typhon is one of the most mysterious among the ancient mythologists. The Greeks and Latins, depending upon traditions received from the Egyptians, describe him as a horrid monster, produced, as they say, from the Earth by the jealous Juno, in order to avenge herself of Latona, her rival. Hesiod says, that this giant was the son of Tartarus and Terra. Manilius expresses himself to this purpose:—

“ ————— Merito Typhonis habentur
Horrendæ sedes, quem Tellus fœva profudit,
Cum bellum Cælo peperit.”

Apollodorus makes Typhon the most terrible of all monsters; describing him as having a hundred heads, and as issuing from his hundred mouths devouring flames, and howlings so dreadful, that he equally terrified gods and men. His body, whose upper part was covered with feathers, and the extremity entwined with serpents, was so vast, that he touched the skies with his head. His wife, says this author, was Echidna, and his offspring were the Gorgon, Geryon, Cerberus, the Hydra of Lerna, the Sphinx, and the Eagle which preyed upon the unfortunate Prometheus; in a word, all the monsters that were hatched in the country of fables. Hyginus adds, that Typhon no sooner sprung from the earth, than he resolved to declare war against the gods, and to revenge the overthrow of the giants. A contest took place between Typhon and Jupiter, which, after various dreadful conflicts, terminated in the defeat of Typhon, who, being pursued by Jupiter and assailed with thunderbolts, was at last driven into Sicily, and there buried under mount Ætna. The conjectures of modern authors in their attempts for explaining this fable have been very various. Some, among whom is G. Vossius, are of opinion that Typhon was the same with Og, king of Basan. Bochart supposes that he was the same with Enceladus. Some authors think that Typhon was king of Sicily, and others that he was the same as Esau. Huet apprehends that Typhon was the legislator of the Hebrews, become extremely odious to the Egyptians by the destruction of their first-born. Banier supposes, that Typhon and his brother Osiris were much more ancient than Moses; and that the idolatrous worship of the oxen Apis and Mnevis, consecrated to Osiris, was spread through Egypt before the Israelites entered there, since it was upon

this model, according to Selden, that Aaron made the golden calf which the Jews worshipped in the wilderness. A dispute arose between Typhon and Osiris, and he was drowned, as it is said, on the authority of Herodotus, in the marshes of the lake Serbonis, or killed in a battle fought with his nephew Orus, whence the Egyptian priests made the people believe, that the gods interested themselves in avenging Osiris, by destroying his persecutor with a thunder-bolt. Thus, however, perished the cruel tyrant of Egypt, and the kingdom was left to young Orus, under the regency of his mother Isis. For further particulars we refer to Banier's *Mythology*, vol. i.

TYPHON, or *Typho*, in *Physics*. See WHIRLWIND.

TYPHONIS INSULA, in *Ancient Geography*, an island of the Mediterranean sea, upon the coast of the Troade.

TYPHUS, *Febris Typhodes*, in *Medicine*, a term used by Hippocrates to denote a fever of an inflammatory character, probably derived from τυφωω, *I inflame*. The disease, however, not having been very distinctly described by that writer, other authors have applied the term to fevers of a nervous character, and it is now received as the appellation of ordinary low fever, and stands in opposition to inflammatory fever. In short, by the word *typhus*, we now understand the common contagious fever of this and other northern climates, which has received various appellations, according to the situations in which it has prevailed, or to some of its symptoms, or to the degree of its severity; such as hospital, gaol, and ship fever; petechial, spotted, or purple fever; putrid, malignant, infectious fever; continued fever, &c. This common fever, or typhus, differs essentially from the eruptive fevers, small-pox, measles, chicken-pox, and scarlet fever, which affect any individual but once during life; it differs from the plague of the East, which is accompanied with buboes, and from the yellow fever, the bilious remittent fever of hot climates; and from the remittent and intermittent fevers, the effect of marsh effluvia, in more northern latitudes: but, under all the circumstances and denominations above alluded to, it appears to be of the same nature, and is usually understood by physicians in Europe, when they speak of *fever* simply. As we have entered at great length into the nature of this disease, and the doctrines of pathologists respecting it, under its proper head, it would be superfluous to enter more largely into the subject here. See FEVER.

TYPIC FEVERS, an appellation given by medical writers to those fevers which are regular in their attacks, and in their general period: they are thus called by way of distinction from the erratic, which observe no regular type, or determinate appearance.

TYPOGRAPHY, formed from τυπος and γραφω, *writing*, the art of printing.

TYPOLITES, or TYPOLITHUS, formed of τυπος, *type*, and λιθος, *stone*, in *Natural History*, names given to stones or fossils, on which are impressed the figures of various animals and vegetables. See STONES, *Adventitious Fossils*, &c.

TYR, in the *Ethiopian Calendar*, the name of the fifth month of the Ethiopian year. It commences on the 25th of December of the Julian year.

TYR, in *Mythology*, a name given to a warrior deity, the protector of champions and brave men, invoked by the ancient northern nations.

The third day of the week was consecrated to Tyr, from whom, it is said, the name given to it in most of the northern languages is derived: it is called in Dan. *Tyrstag*, or *Tislag*; in Sued. *Tislag*; in English, *Tuesday*; in Low Dutch, *Dings-tag*; and in Latin, *Dies Martis*: whence it is inferred, that Tyr answered to Mars.

The Germans, in High Dutch, call this day *Erichs-tag*, from the word *heric* or *hærec*, a warrior, which comes to the same thing.

Tyr must be distinguished from another deity called Thor Mallet's North. Ant. vol. i. p. 99.

TYRA, in *Ancient Geography*, a town of European Sarmatia, upon the banks of the river Thyras; sometimes called Ophiusa.

TYRA, in *Geography*, a river of Germany, which runs into the Kelm, one mile W. of Kelbra, in the county of Schwartzburg.

TYRAMBE, in *Ancient Geography*, a town of Asiatic Sarmatia, 600 stadia from the river Rhombites, according to Strabo; but Ptolemy places it between Azabites Mitra and the mouth of the river Atticirus.

TYRAN, or TYRON, in *Geography*, a small island in the Red sea. N. lat. 27° 40'. E. long. 34° 28'.

TYRANNICIDE, formed of *tyrannus* and *cædo*, I kill, denotes the act of killing a tyrant.

TYRANNIO, in *Biography*, a Greek grammarian, was a native of Amisa, in Pontus, and a disciple of Dionysius of Thrace at Rhodes. Upon the conquest of the kingdom of Mithridates by Lucullus in the year B. C. 70, Tyrannio became a captive, but was liberated by Muræna, and taken to Rome, where he opened a school, in which he gave instruction to the son and nephew of Cicero, and also to Strabo. In this situation he acquired considerable wealth, and accumulated a library of more than 30,000 volumes. Among other valuable works which he possessed, he preserved the writings of Aristotle and Theophrastus, which he obtained from the librarian of Sylla, and which he afterwards imparted to Andronicus of Rhodes. Tyrannio lived to an advanced age; but none of his works are extant. Bayle.

TYRANNUS, in *Ornithology*, a name given by some to the lanus, or butcher-bird, a species of hawk not larger than a thrush, but a very fierce and fatal enemy to the small birds. See LANIUS.

TYRANNY, in *Political Government*, is the exercise of power beyond right, to which nobody can have a right; and thus it is distinguished from *Usurpation*, (which see,) or the exercise of power which another hath a right to: and it is the use of power which any one possesses, not for the good of those who are subject to it, but for his own private separate advantage; when the governor, however, intitled, makes not the law, but his will the rule; and his command and actions are not directed to the preservation of the property of his people, but the satisfaction of his own ambition, revenge, covetousness, or any other irregular passion.

It is a mistake to think this fault peculiar to monarchies; other forms of government are liable to it as well as that. For wherever the power that is put in any hands for the government of the people, and the preservation of their property, is applied to other ends, and made use of to impoverish, harass, or seduce them to the arbitrary irregular commands of those that have it, there it becomes tyranny, whether those who thus use it are one or many.

Accordingly we read of the thirty tyrants at Athens, as well as one at Syracuse; and the intolerable dominion of the decemviri at Rome was nothing better. Every wanton and causeless restraint of the will of the subject, whether practised by a monarch, a nobility, or popular assembly, is a degree of tyranny.

Whenever the constitution of a state vests in any man, or body of men, a power of destroying at pleasure, without the direction of laws, the lives or members of the subject, or of alienating their property, or of depriving them of their

liberty at pleasure, such constitution is tyrannical. In a word, wherever law ends, tyranny begins, if the law be transgressed to another's harm. And whoever in authority exceeds the power given him by the law, and makes use of the force he has under his command, to compass that upon the subject which the law allows not, ceases in that to be a magistrate, and, acting without authority, may be opposed as any other man, who by force invades the right of another. The end of government, whatever be its name or nature, is the good of mankind: and upon this principle, whoever uses force without right, as every one does in society who does it without law, puts himself into a state of war with those against whom he uses it; and in that state all former ties are cancelled, all other rights cease, and every one has a right to defend himself, and to resist the aggressor.

If it be asked who shall be judge; whether the prince or legislative act contrary to their trust? The answer is obvious, the people shall be judge; for who shall be judge whether the trustee or deputy acts well, and according to the trust reposed in him, but he who deposes him, and must, by having deputed him, have still a power to discard him when he fails in his trust? If this be reasonable in particular cases of private men, why should it be otherwise in that of the greatest moment, where the welfare of millions is concerned; and also where the evil, if not prevented, is greater, and the redress very difficult, dear, and dangerous? Locke, of Civil Government, ch. xviii. and xix. in his Works, vol. ii. p. 214, &c.

TYRANT, TYRANNUS, among the *Ancients*, denoted simply a king or monarch.

But the ill use several persons invested with that character made of it, has altered the import of the word, and tyrant now carries with it the idea of an unjust and cruel prince, who invades the people's liberty, and rules in a more despotic manner than the laws of nature, or the country, do allow.

The term *tyrant*, we are told, became odious among the Greeks, those zealous lovers of liberty, almost as soon as introduced; but Donatus assures us, it was never taken so among the Romans till the latter ages of that empire.

The motto of a tyrant is, *Oderint dum metuant*. Rowland contends, that this word, as well as the correspondent Greek and Latin, is derived from *tir*, Welsh and Erse, *land*, and *rhanner*, Welsh, *to share*; q. d. *tirhanner*, a sharer or divider of land among his vassals. Johnson.

TYRANTS, THIRTY, an appellation under which the thirty persons, established by the Lacedæmonians in Athens, in order to enslave and keep it in slavery, are denominated. Thrafsybulus formed the generous design of driving them from Athens, and succeeded; upon which event Cornelius Nepos has remarked, that many have desired, and few had the happiness to rescue their country from a single tyrant! but Thrafsybulus delivered his from thirty.

One of the means which these tyrants used for carrying on their scheme of enslaving the Athenians, was the ordering of the suffrages of the Areopagites to be public, that they might manage them as they pleased. See Montefquieu's Spirit of Laws, vol. i. p. 17.

TYRAS, in *Ancient Geography*. See DNIESTR.

TYRAWLEY'S POINT, in *Geography*, the south-west extremity of Trevanion's island, in the South Pacific ocean. S. lat. 10° 48'. E. long. 163° 41'.

TYRBE, *τυρβη*, in *Antiquity*, a festival celebrated by the ancients in honour of Bacchus.

TYRE, in *Ancient Geography*, a city of Phœnicia, distant 23 miles from Sidon, its rival, according to the Itinerary of Antoninus. (See SIDON.) This city was anciently deno-

minated *Sor*, whence it derived its name (see *SUR*), and was called the daughter of Sidon. It was situated upon the sea. Tyre has been distinguished, in the order of time, into three cities; as Tyre on the continent, or Pæle-Tyr (old Tyre), Tyre on the island, and Tyre on the peninsula, after the island was joined to the main land. There were four different places in Phœnicia which bore the name of Tyre. Tyre, of which we are now speaking, had two havens, one looking towards Sidon, the other towards Egypt. These havens were formed by the isthmus which joined the island to the main land, and were called, the one open, the other close. The former looked towards Egypt, and was the most southern of the two: it was accordingly called the Egyptian port. The sheriff Edrii says, that one of these ports had an arch over its entrance, through which the shipping passed; and that it was fortified with a chain drawn across it. These bays or ports are still pretty large, and, in part, defended from the ocean by a long ridge, resembling a mole, stretching directly out on both sides from the head of the island; but whether these ridges are walls or rocks is uncertain; they were most probably walls. (See *SUR*.) Tyre, including Palæ-tyrus, was 19,000 paces in circumference, whence it is plain, that Tyre on the island, and old Tyre on the main, were considered as but one city, after the isthmus was thrown up between them; and possibly they might have had buildings contiguous to each other. If Pliny's numbers are right, the old city must have been by much the most extensive part of the whole, and especially as the place appears at this day. According to Pliny, the island was but 700 paces from the continent: whereas Strabo says that it was 30 stadia, or somewhat more than three of our miles from Palæ-tyrus; and according to the same geographer, Tyre was wholly an island, like Aradus, excepting the artificial isthmus, which formed it into a peninsula. The city by itself, according to the statement of Pliny, measured only twenty-two furlongs, or not quite three of our miles, and this is too great an allowance, if we may rely on our modern accounts; which represent Tyre itself as a small city in extent, though it covered the whole island; and the scantiness of the space on which it stood, induced the inhabitants to raise their buildings so high, which plan they would have otherwise avoided, from fear of earthquakes, that threatened them with destruction. At present the island appears to have been, in its natural state, of a circular form, hardly containing forty acres of ground; and the foundations of the wall which surrounded it are still to be seen at the utmost margin of the land. If it be true then, that the whole circuit of the old and new Tyre amounted to 19,000 paces, or 19 Roman miles, and that they were distant from each other but 33 stadia, or $3\frac{3}{4}$ of the same miles, it is evident that the old city stood upon a much greater space of ground than the new. A considerable part of the island was, what we call, made ground. The buildings were in general spacious and magnificent; and above the rest appeared the temples built by Hiram to Jupiter, Hercules, and Astarte. The walls of Tyre were 150 feet high, proportionably broad, and firmly built of large blocks of stone, bound together with white plaster. For its present reduced and ruinous state, see *SUR*.

Herodotus ascribes to Tyre situated on the island a very ancient epocha: and its priests, according to his account, represent that their temple, which was of greater antiquity than the city, subsisted about 450 years before the Christian era. Josephus refers the foundation of this city to 1255 years B.C., whilst the Israelites were under the government of judges. But these dates cannot be applied to insular Tyre, which was more modern than that of con-

tinental Tyre, which is said to have been built and known before the Israelites took possession of Canaan. (See Joshua, xix. 29.) The Sidonians, with a view of extending their commerce, sent out a colony to ancient Tyre, which contributed very much to its augmentation; and hence it became powerful, eclipsed the metropolis, and became itself the metropolis of several cities, which it furnished with colonies. The Tyrians were not known in the time of the Trojan war, according to Strabo (lib. xvi.) and Homer, who often speaks of the Phœnicians, mentions only the Sidonians, under which general appellation the Tyrians were probably comprehended.

Josephus and Theophilus Antiochenus begin the succession of kings of Tyre with Abibal, upon the authority of Menander the Ephesian, and Dius a Phœnician, authors of credit. Abibal was contemporary with David, and his reign is referred to 1056 B.C. He was succeeded by his son, Hiram (1046 B.C.), who maintained an intimate friendship with David and Solomon: under this prince the kingdom of Tyre was very prosperous and flourishing; the city was enlarged, and by means of a dam, joined to the temple of the Olympian Jupiter, standing in an island. He also built two temples, one to Hercules and another to Astarte, enriching them with donations. Besides erecting a statue to Hercules, he repaired the temples of other gods, and endowed them to a very great value. Tatian relates, on the authority of three Phœnician historians, that he gave his daughter in marriage to king Solomon, who, by her influence, was induced to worship Astarte, the goddess of the Sidonians. Hiram, having lived fifty-three years, and reigned thirty-four, was succeeded by his son, and a series of other princes, until Nebuchadnezzar, king of Babylon, laid siege to the city, in the reign of Ithobal II. 585 years B.C. This siege lasted thirteen years (see Ezekiel, xxvi. 8, &c.); and at last it was taken by Nebuchadnezzar and utterly destroyed. Some Phœnician historians have said, that Ithobal was succeeded by Baal; nor is it improbable, that the inhabitants of Tyre, during the siege, retreated with their effects to an island about half a mile distant from the shore, where they built for themselves a new city; which, after the destruction of the old town, submitted to Nebuchadnezzar, who appointed Baal to be his viceroy; and that, upon Baal's death, in order to render the government more dependent on the Assyrians, he changed the royal dignity into that of temporary magistrates, called suffetes, or judges, 562 years B.C. After Tyre had been thus governed for some years, the royal dignity was restored, and Balator created king, 556 B.C. Both he and his successors were dependent on, and tributary to the Assyrians for seventy years; at the expiration of which they recovered, according to the prophecy of Isaiah (ch. xxiii. 15. 17), their ancient liberty. In the year 480 B.C., under the reign of Marten, the Tyrians, as well as the other Phœnicians, were tributaries to the Persians, though they had a king of their own, being favoured by the Persian monarchs on account of the services which they rendered to them in their naval expeditions. About this time reigned Strato, whose accession to the throne, in consequence of an insurrection of the slaves, is particularly related by Justin, lib. xviii. cap. 3. He was succeeded by his descendants, among whom was Azelmic, in whose reign happened the memorable siege and reduction of Tyre by Alexander the Great. This siege commenced about the year 333 B.C. which was rigorously carried on and as obstinately resisted by the Tyrians. At length Alexander, having battered down the walls, took the city by storm, 332 B.C., after seven months siege, and fully executed the sentence which the Tyrians had, by their pride and other

vices, drawn down upon themselves and their country. The city was burnt down to the ground, and the inhabitants, (those whom the Sidonians secretly conveyed away in their ships excepted,) either destroyed or enslaved by the conqueror, who, upon his first entering the city, put 8000 to the sword, caused 2000 of those whom he took prisoners to be crucified, and sold the rest, to the number of 30,000, says Arrian, for slaves. His cruelty towards the 2000 that were crucified was highly unbecoming the character of a generous conqueror, and reflects eternal disgrace upon his fame.

After the city was reduced, king Azelmic took sanctuary in the temple of Hercules, and was not only spared by the conqueror, but restored to the throne, after Alexander had repopled the place; for having cleared it of its former inhabitants, he planted it anew with colonies drawn from the neighbouring parts; and thenceforth styled himself the founder of Tyre, a city which he had most ungenerously destroyed. From hence, having unchained Apollo, whose statue the Tyrians had fastened, during the siege, with golden chains, to the altar of Hercules, returning him thanks for his intention of coming over to the Macedonians, and offered sacrifice to Hercules, Alexander continued his march into Egypt. This city afterwards regained a considerable degree of power; for in the year 313 B.C. it sustained a siege against Antigonus of fifteen months, before it was compelled to capitulate. It afterwards belonged to several masters, until Antiochus the Great, who took possession of it in the year 218 B.C. It afterwards became subject to the Seleucidæ. Cassius, a Roman governor, sold it to Marion, whose wealth enabled him to purchase the principality. Tyre, formerly called Tzor (Josh. xix. 29.), renowned for its trade and the numerous colonies which it transplanted into several parts of the world, and the wars in which its inhabitants valiantly engaged, was in all its glory when Alexander took it, about 300 years after its capture by Nebuchadnezzar. Tyre was still in great repute in the time of our Saviour. (See Matth. xi. 21. xv. 21. Mark, iii. 8. Luke, vi. 17.) It made a considerable figure in the reign of Herod Agrippa, who designed to wage war against it, if it had not secured peace by its deputies. (Acts, xii. 20.) When the apostle Paul travelled through this place, it had some Christian inhabitants. (Acts, xxi. 4.) In the second century it was a bishop's see; and St. Jerome tells us, that in his time it was the most famous and most beautiful city of Phœnicia, and a mart for all the nations of the world. This ancient father alleges this circumstance as an objection to the accomplishment of Ezekiel's prophecy (ch. xxvi. 14.), and replies to it, that the prophet's declaration is to be understood as intimating, that Tyre should no longer be the queen of nations, and enjoy the same authority and dominion as it possessed under Hiram, and its other kings, but should be subject to the Chaldæans, Macedonians, Ptolemies, and at last to the Romans. Others have supposed, that the prophet does not speak of the ruin of Tyre by Nebuchadnezzar, and Alexander the Great, but of its final destruction, of which the other events were forerunners. And indeed Tyre, as we have said, is now only a poor village, inhabited by fishermen (see SUR); so that the prophecy is fulfilled, which declared, "that it should be a place for fishermen to dry their nets on." Ezekiel may also be explained by the prophet Isaiah (xxiii. 15.), who limits the destruction of Jerusalem to 70 years. But the prophecy of Ezekiel may be more satisfactorily explained, with sir J. Marsham, Le Clerc, and other learned authors, who interpret it concerning Old Tyre, *i. e.* Palæ-tyrus, which stood a little

lower on the continent, and the best materials of which were used by Alexander the Great, in making the isthmus which now joins Tyre to the continent. (See Q. Curtius, l. iv. c. 2.) This Tyre was destroyed by Nebuchadnezzar, and never rebuilt. The inhabitants, finding themselves upon the brink of destruction, removed, as we have already said, with their wives and children, and most valuable goods, to the island of Tyre, where they built a city of the same name; so that Nebuchadnezzar, according to the prophecy (Ezek. xxix. 18.), was no gainer by his expedition. The Jews at Tyre, as Josephus informs us, suffered much from the Tyrians. This city was formerly the metropolitan see of the province of Phœnicia. Tyre was transferred to the Arabians, with the rest of Syria; and before it was reduced to its present miserable state, it was twice besieged by the Christians in the time of the Crusades, *viz.* in 1112, and again in 1124. It was unsuccessfully attacked by Saladin in 1192; but in 1291, Kabil, sultan of the Mamelukes, obtained it by capitulation, and razed its forts.

TYRESIO, in *Geography*, a sea-port town of Sweden, in Sudermannland; 9 miles S.E. of Stockholm.

TYRI, a lake of Norway, in the province of Aggerhuus; 15 miles N.W. of Christiania.

TYRIÆUM, in *Ancient Geography*, a considerable town of Asia, in Pisidia, called also *Tyros*.

TYRINGHAM, in *Geography*, a town of Massachusetts, in the county of Berkshire, containing 1689 inhabitants; 140 miles W. of Boston.

TYRIUM MARMOR, a name given by the ancients to a species of marble of a beautiful white, sometimes free from veins, and sometimes variegated with dusky blackish-grey ones. When pure, it was little inferior to the Parian, and often was used instead of it by the statuaries. See MARBLE.

TYRNAU, in *Geography*. See TIRNAU.

TYRNAU, a town of Moravia, in the circle of Olmutz; 14 miles N.W. of Olmutz.

TYRNITZ. See DYRNITZ.

TYRNSTEIN. See DIERNSTEIN.

TYRO. See TYROCINIUM.

TYROCINIUM, TYROCINY, formed of *tyro*, a *razu beginner*, a novice or apprenticeship in any art or science.

We have several writings under the title of tyrociniums; *tyrocinium chymicum*, *tyrocinium chirurgicum*, &c. containing the rudiments of those arts, accommodated to the apprehensions of beginners.

TYROL, in *Geography*, a citadel which gives name to the Tyrolese county; 1 mile N. of Meran. N. lat. 46° 37'. E. long. 11°.

TYROLESE, or *Upper Austria*, a county, bounded on the north by Bavaria, on the east by Salzburg and Carinthia, on the south by Italy, and on the west by Bavaria and the Grisons; in this circle are included the county of Tyrol Proper, the bishopric of Trent, and the bishopric of Brixen. The bishopric of Trent is situated to the south; the bishopric of Brixen occupies the north-east part; and the county of Tyrol the centre. This county is mountainous, and capable of making a powerful stand against an invading enemy; but the Tyrolian mountains, though covered with snow to the very utmost summits of them, are also fertile; where are found not only the finest woods, abounding in a variety of game, but also large and good corn-fields; or, where these mountains are barren, there are, for the most part, mine works, or excellent marble, of all colours. Corn thrives well in many, nay in most places here; and in some places flax. On the eminences grow also all sorts of fine fruits which Italy yields, and likewise small woods of chestnut trees, together with fine vines. Among the wild beasts

here

here are chamois and wild goats. There are, likewise, in this county, several species of precious stones, as granites, rubies, amethysts, and emeralds, a species of diamonds, agates, cornelians, chalcedonies, &c. Hot baths and medicinal springs are found in several places; at Hall are profitable salt-pits. Not far from Schwatz is a mine of silver and copper; and some miles distant from the latter is also a mine work, which yields a very soft and malleable copper. The copper contains in it some silver and gold. Good lead, together with fine mineral colours, alum, vitriol, and fine silver ore, are also found here. The principal rivers in this county are the Inn, or Inn, the Adige, the Lech, and the Iser. In this county are twelve towns and ten villages, which have markets. The common people here, exclusive of the subsistence which the mines and salt-works yield them, have not much to earn; so that a great part of them seek for subsistence out of the country, either by trade or labour. Tyrol was formerly a part of Rhaetia, but, in the sixth century, the greatest part of it descended to the dukes of Bavaria, and this was afterwards reckoned in Noricum; but, over the southern part, the Longobards, at the same time, extended their dominion. The dukes of Bavaria appointed marggraves here; but Henry the Lion, duke of Bavaria and Saxony, being, in 1180, put under the ban of the empire, by the emperor Frederic I., this last dismembered the present province of Tyrol from Bavaria, investing therewith the marggrave Berchtold, under the title of duke of Meran. Otto II., grandson to this Berchtold, dying without male issue, in the year 1248, this county came to count Albrecht III., who resided at the citadel of Tyrol, gave up the title of duke of Meran, and styled the whole country the county of Tyrol. Tyrol had, afterwards, frequently princes of its own, of the house of Austria; the last of whom, named Sigismund Francis, died in 1665, upon which the emperor Leopold received homage on that account, in person, at Inspruck; and by the peace of Presburg it was ceded to Bavaria. The high sovereign colleges over Tyrol, when subject to the house of Austria, were seated at Inspruck; and towards the maintenance of the military state, it contributed yearly 100,000 florins.

TYRONE, a county of Ireland, in the province of Ulster, which is entirely inland, and very irregular in its shape. On the north it has the county of Derry; on the west, Donegal; on the south, Fermanagh and Monaghan; and on the east, Armagh, with Lough-Neagh. Its divisions from these counties are seldom marked by nature, but the river Blackwater bounds it for about 30 miles on the south-east and east, and the rivers Fin and Foyle for about 10 miles on the north-west. The greatest length from east to west is 43 Irish miles, or $54\frac{1}{2}$ English; and the greatest breadth 33 Irish, or 42 English. The area measures 467,700 acres, or 724 square miles Irish, which is equal to 751,387 acres, or 1163 square miles English. Dr. Beaufort states the number of houses at 28,704, which, at $5\frac{1}{2}$ per house, would give a population of near 158,000, or about 40 to each square Irish mile. As this was the statement in 1792, the increase must have been considerable. The number of parishes is only 35, and these have 38 churches. Most of these are in the diocese of Armagh, but there are some in the dioceses of Derry and Clogher. Tyrone is represented in the imperial parliament by two members for the county, and one for the borough of Dungannon. The northern part of the county is rough and mountainous. The Cairntogher and Munterlony mountains occupy a large space; and to the south of these are the high hills called "Bessy Bell" and "Mary Grey." These produce very little, being in general wet and spongy. Where, however, gravel or any

porous substance forms the substratum, the surface is dry and wholesome, and well calculated for pasture. The other parts of the county contain very good land; and some districts are remarkable for their fertility, especially the neighbourhood of Dungannon, extending eastwards towards the Blackwater, and about Cookstown. The produce of this county, and the state of manufactures, agree in the leading features with those of the other northern ones. The farms, except in the mountainous districts, are usually small; and the produce in general oats, barley, potatoes, and flax. The linen manufacture is extensively carried on; and it gives a favourable idea of the industry of the inhabitants, to learn from the county survey, that much cultivated ground has been gained from the bogs and mountains. "In all parts of this country," said Dr. Beaufort in 1792, "cultivation is creeping, and that not slowly, up the sides of all the hills and mountains that are capable of improvement." In this county, the culture of the grass called *florin* was commenced by Dr. Richardson at Clonfeale, near May, the excellencies of which have been laid before the public in various publications, and have attracted the attention of many eminent agriculturists. Many parts of Tyrone contain large quarries of lime-stone, though it is not generally used for manure. There are also many quarries of free-stone; and good mill-stones are hewn out of detached rocks. It is probable that iron-ore is abundant; but without greater plenty of fuel, it can be of no use. Clay fit for bricks, and for various kinds of pottery ware, is also found in many places. But that mineral which has engaged most attention is coal. At Coal-Island, in the eastern part of the county, coal-works have been carried on with some success. Five pits were working in the year 1800, with the appearance of industry. There seemed, however, a want of encouragement; and the canal, which had been made from this place to the Blackwater, was choked up with mud and weeds. A similar account may be given of the collieries at Drumglass, near Dungannon; so that though above 140,000*l.* were expended from the national purse in making canals, independently of private exertions, the object has not been obtained; and the Newry canal, instead of conveying the Tyrone coals to that port, to be shipped for Dublin and other places, supplies the county through which it passes with English and Scotch coal. At the time of making these grants, from 1751 to about 1770, there was a surplus of the revenue, which was spent on various public works, but not always to advantage, and very seldom with economy. In the instance above mentioned, the object was to save the large sums sent annually out of Ireland for coal, or rather to procure a supply of that article on lower terms than it was usually obtained. But though some advantage has arisen from the Newry canal, so great has been the expence attending it, and so complete the failure of all the other parts of the speculation, except for the supply of the adjoining country, as seems to illustrate the opinion, that the interference of government in such plans seldom succeeds, and that the grants intended to encourage them are too commonly abused and perverted. It has been said, that there are indications of a rich coal-mine near the village of Drumquin, in the south-west of the county, and in a district abounding with iron-ore; and as this is only 12 miles distant from Lough Erne, a canal has been recommended; but since the union, and especially since the taxes have pressed so heavily on all ranks, such speculations are not so readily adopted. The report of Mr. Griffith, the mining engineer of the Dublin Society, on the Ulster coal district, will throw much light on the subject; but his opinion, as expressed in his report on the

Leinster district, is not favourable to the extent or value of that in the county of Tyrone.

The rivers of this county are very numerous, so that it is well supplied with water for bleaching, &c. The principal river is the Mourne, which passes through the centre of the county from south to north. It rises in the mountains near Clogher, and receives several streams before it comes to Omagh, where it is joined by the Cameron from the south; and a few miles lower, by the Po from the west. At Newtown-Stewart the united streams of the Moyle, and another river from the mountains between Tyrone and Derry; and at Ardstraw the Derg, which flows from Lough Derg, in the county of Donegal, add their stores. Thence it runs to the town of Strabane, below which it meets the river Fin, from the county of Donegal; and they proceed together, under the name of Foyle, to the sea, being navigable for large boats. The river Blackwater, which is also navigable for about ten miles of its course, is of great service to the eastern part of the county. The Ballinderry passes by Cookstown, and afterwards becomes the northern boundary, until it flows into Lough Neagh. The other streams are inconsiderable, and there are no lakes which deserve notice. The towns of this county are not large. Omagh is the county-town, probably on account of its central situation; for it is inferior to Dungannon or Strabane. Dungannon was the principal residence of the O'Neils, when chieftains of Ulster. These towns, and Cookstown, May, &c. are mentioned under their respective names. The country and inhabitants near Newtown-Stewart were much improved by the exertions of lord Mountjoy, who was killed at the battle of Rofs in 1798, fighting against the rebels, at the head of his regiment. His useful and benevolent plans have not, however, been neglected. About Fintona good flooring and ridge tiles are made, and a great variety of crockery ware for country use. Near Coal-Island is a pottery, supposed to be the best in Ireland for rough crockery ware, fire-bricks, and tiles for malt-kilns, which are of as good a quality as any imported. The same clay made into small oblong pieces, and dried in the sun, is used for cleaning of leather, &c. and is sent for this purpose to very distant places.

Having thus given an account of the present state of Tyrone, with respect to its productions and manufactures; it may be added, that when O'Neil, the descendant of the kings of Ulster, was compelled to submit to queen Elizabeth, he was created earl of Tyrone; and when his rebellion, in the reign of James I., occasioned the forfeiture of his possessions, this was one of the counties *planted*, that is, allotted to settlers, chiefly from Scotland, whose descendants are at present the principal landed proprietors.—M'Evoy's Survey of Tyrone. Beaufort's Memoir of Map of Ireland, &c.

TYRONE, a township of Pennsylvania, in the county of Adams, containing 648 inhabitants.—Also, a township of Pennsylvania, in the county of Cumberland, containing 2604 inhabitants.—Also, a township of Pennsylvania, in Huntingdon county, containing 753 inhabitants.—Also, a township of Pennsylvania, in Fayette county, containing 989 inhabitants.

TYROOT, a circar of Hindoostan, in the subah of Bahar, bounded on the north by Morung, on the east by Purneah, on the south by Boglipour, on the south-west by Hajypour, and on the west by Bettiah. Durbungah is the capital.

TYROSIS, τυροσι; formed of τυρος, *cheese*, in *Medicine*, a coagulating or curdling of milk in the stomach, after the manner of cheese.

TYRRELL, JAMES, in *Biography*, a political writer and historian, was the son of sir Timothy Tyrrell, knt., of Shotover,

near Oxford, by Elizabeth, the only daughter of archbishop Usher, born at London in 1642, and admitted, in 1657, a gentleman-commoner of Queen's college, Oxford. Devoting himself to the study of the law at the Inner Temple, he was called in 1665 to the bar. But declining the practice of his profession, he resided at Oakley, in Buckinghamshire, and studied the history and constitution of his country, of which he entertained more liberal sentiments than those with which he commenced his researches. In 1681 he published an answer to sir Robert Filmer's patriarchal scheme, under the title of "Patriarcha non monarcha; or, The Patriarch unmonarched." Having refused to assist in the abolition of the penal laws, and the test against popery, he was struck out of the commission of the peace by James II. As a zealous friend to the Revolution, he vindicated king William's right to the crown in "Fourteen Political Dialogues," printed from 1692 to 1695; which were afterwards collected into one volume folio, with the title of "Bibliotheca Politica, &c." in which all the chief arguments, both for and against the late revolution, are impartially represented and considered. He also composed an abridgment of bishop Cumberland's work "De Legibus Naturæ," 1692, 8vo. of which work a second edition, corrected and enlarged, was printed in 1701. But his principal performance was "The General History of England, both Ecclesiastical and Civil, from the earliest Accounts of Time," concluding with the reign of Richard II., and comprised in 5 vols. fol. 1700—1704. The political purpose of this work seems to have been to confute the leading doctrines of Dr. Brady, who maintained that all the liberties and privileges of the people of England were concessions from the kings, and derived from the crown; and that the representation of the commons, as now existing, was not introduced before the 49th of Henry III. These points are still controverted, and serve to distinguish two parties in the state. Mr. Tyrrell died in 1718, in his 76th year. Biog. Brit.

TYRREL, in *Geography*, a maritime county of North Carolina. It contains about 3364 inhabitants.

TYRREL'S Bay, a bay on the south coast of St. Vincent; 2 miles E. of Kingstown.

TYRREL'S Pass. See TERRIL'S Pass.

TYRRHENIA, in *Ancient Geography*, that part of Italy which is now called Tuscany; but more extensive towards the north and south-east. This country has changed both its name and its inhabitants.

The Umbrians were expelled by the Pelasgi, and these by the Lydians, under the conduct of Tyrrhenus, the son of the king of Lydia, whence the name Tyrrhenia. As the Tyrrhenians were a religious people, and offered many sacrifices, the Greeks called them Thufis, or Thufci, denoting sacrificers, from θυς, *to sacrifice*. See ETRURIA and TUSCANY.

TYRRHENUS STRUS, a gulf of Italy, on the coast of Etruria. According to Dionysius of Halicarnassus, this gulf was denominated "Autonias Sinus."

TYRTÆUS, in *Biography*, a Greek poet, is supposed to have been a native of Miletus, and to have resided at Athens, as a poet, musician, and school-master. Somewhat deformed in body, he possessed a manly and elevated soul. In a contest between the Lacedæmonians and Messenians, the former, having experienced some ill success, are said to have consulted the oracle of Delphi. B.C. 623, and to have been directed to seek a general at Athens. The Athenians, as some say in derision, sent Tyrtaeus, who, by the recital of poems in praise of valour and patriotism, animated the Spartans, so that they became victorious, and reduced the Messenians to subjection. He is said to have also given them

useful

useful advice as a military leader, in consequence of which the Spartans conferred upon him the right of citizenship, and honoured him whilst he resided among them. His war-poems have been celebrated by the ancients, and particularly by Horace, who joins him with Homer in his eulogy :

“ ——— Post hos insignis Homerus
Tyrtaeusque mares animos in Martia bella
Versibus exacuit.” — Art. Poet.

Besides these poems, he composed, also, “Moral Precepts,” and a work “On the Polity of the Lacedæmonians.” Some fragments of his “War-Poems” are extant, which are published with the other minor Greek poets, and are said to be characterized by a masculine simplicity. *Moreri. Anc. Un. Hist. Gen. Biog.*

TYRVANDO, in *Geography*, a town of Sweden, in Tavastland: 10 miles N.N.W. of Tavasthus.

TYRVIS, a town of Sweden, in the government of Abo; 35 miles E.S.E. of Biorneborg.

TYRUS, in *Ancient Geography*, a town of the Peloponnesus, in Laconia.—Also, a town of Asia Minor, in Lydia.—Also, an island situated on the coast of Syria, near the continent, according to Ptolemy.—Also, an island situated in the Persian gulf. *Strabo.*

TYRUS, a word used by some of the barbarous writers for a serpent or viper.

TYRWHITT, THOMAS, in *Biography*, a profound scholar and acute critic, was born in 1730, sent to Eton school in 1741, and entered at Queen’s college, Oxford, in 1747. In 1755 he was elected fellow of Merton college, and in 1756 acted as under secretary of war. In 1762 he became clerk to the house of commons, which post he retained till the year 1768. At this time he retired to pursue those studies which were adapted to his genius and taste, and to the acquirements he had already made in the knowledge of ancient and modern languages, and of the old as well as modern writers of his own country. He commenced his publications with compositions in poetry; such were “An Epistle to Florio,” and Latin versions of the “Messiah” and “Splendid Shilling,” with an English one of “Pindar’s eighth Isthmian Ode.” In 1766 appeared his “Observations and Conjectures on some Passages of Shakspeare,” which enabled him to communicate ingenious remarks to Mr. Steevens and Mr. Reed, for their editions of the works of this great dramatist. His “Proceedings and Debates in the House of Commons in 1620 and 1621, from an original MS. in Queen’s College, Oxford,” appeared in the same year; and in 1768 he published a corrected and enlarged edition of “Elfyng’s Manner of holding Parliaments in England.” His first publication in critical literature was “Fragmenta duo Plutarchi,” 1773, from one of the Harleian MSS. This was followed by a very valuable edition of Chaucer’s “Canterbury Tales,” in 4 vols. 8vo. 1773, which, besides corrections of the original text, contains an introduction and admirable essay on the author’s language and versification. In 1776, he further displayed his Latin erudition and critical acumen, by a Latin dissertation on Babrius, one of the writers of the Æsopian fables. In 1777 he gave a complete edition of the poems attributed to Rowley, with a preface and glossary. In a subsequent edition, which appeared in 1778, he expresses his full conviction, with the grounds of his opinion, that they were written solely by Chatterton, and he afterwards satisfied all unprejudiced judges with regard to this subject of literary controversy. (See CHATTERTON.) We shall merely enumerate his remaining works, which were, an edition of a Greek poem, Πίρις Διέων (on Stones), ascribed to Orpheus, together

with a supplement to his dissertation on Babrius, 1781; “Conjecturæ in Strabonem,” 1783; and a newly discovered “Oration of Isæus against Menocles,” 1785. Mr. Tyrwhitt was a member of the Royal and Antiquarian Societies, and a curator of the British Museum. He died, much lamented, in 1786, in his 56th year; having established a character that was truly estimable. He bequeathed to the British Museum all those of his books which were not before in that repository. *Nichols’s Lit. Anecd. Gen. Biog.*

TYSCA, in *Ancient Geography*, a country of Africa, in which there were fifty towns. Massinissa and the Carthaginians disputed the possession of this country, and the dispute was referred to the senate of Rome, according to Appian.

TYSERRA, in *Geography*, a town of Hindoostan, in Bahar; 32 miles S. of Doela.

TYSHAS, among the *Ethiopians*, the name of the fourth month of their year, commencing the 27th of November in the Julian year.

TYSNASOE, in *Geography*, a small island in the North sea, near the coast of Norway. N. lat. 60°.

TYSENS, PETER, in *Biography*, was born at Antwerp in 1625, and practised painting in portraiture and history with very great success. In the latter, however, he acquired the most substantial portion of his fame; and after the death of Rubens, he was made director of the Academy at Antwerp in 1661. His compositions are rich and ingenious, and are conducted in a style more correct and grand than that of most of his countrymen, and his colour is clear and harmonious. Amongst the best of his works are his “Martyrdom of St. Benedict,” in the church of the Capuchins at Brussels; the “Crucifixion,” at the Carmelites; and the “Assumption of the Virgin,” at the church of St. James at Antwerp. He died in 1692, aged 67, leaving two sons, painters.

TYSTED, in *Geography*, a town of Denmark, in North Jutland, situated on a river which runs into the Lymford gulf; 40 miles W. of Aalborg. N. lat. 57° 3′. E. long. 8° 45′.

TYTERSAARI, a round island of the Baltic, belonging to Russia: it is pretty high, but not above ten versts in circuit. It lies 18 versts to the S.E. of Hochland. As appendages, on the western side, or in the Sound, between it and Hochland, it has four small isles, quite low, but pretty far asunder: Kleintitter, the two Viri, and Væotcalla, and on the southern side a stony ground, seven or eight versts in length, to the Narva passage; hence, it is hardly possible to land on this island. A third part of it is rock, another third is morass, and the remaining part an arid and sterile sand-hill. The island has no springs. The seal-fishery is here considerable: the inhabitants live together in one village.

TYTH, or rather *Tithe*. See TITHE.

TYTHING, and *Tything-man*. See TITHING, DECINERS, TENMENTALE, HUNDRED, WAPENTAKE, &c.

TZAGANUSKOI, in *Geography*, a town of Russia, in the government of Irkutsk, on the borders of China; 48 miles S.S.W. of Selenginsk.

TZAGONIA, a district in the south part of the Morea, between Mistra and Cape Malio.

TZAMAMENI, a town of Asiatic Turkey, in the government of Marasch; 40 miles S.E. of Marasch.

TZAMANDUS, in *Ancient Geography*, a town of Asia, in the vicinity of the Lesser Armenia.

TZANATL, in *Ornithology*, the name of an American bird described by Nieremberg, which, he says, has all over very long and beautiful feathers, of a fine green, and of the shining gloss of the feathers of the peacock. The upper
side

side of the wings is black, but their under part is of a very fine and shaded green; it has a very beautiful crest on its head; its throat and breast are of fine scarlet; the wing-feathers are very long, and very beautifully variegated with several colours. The Indians esteem the feathers of this bird more valuable than gold; they dress up the images of their gods with them. Ray's Ornithol. p. 303.

TZANGÆ, among the *Ancients*, a kind of Parthian garments, according to some; but others will have them to have been shoes fet with precious stones, formed into the figure of eagles, and designed for the emperor's use.

TZANI, in *Ancient Geography*, a people of Asia, in the vicinity of Armenia. According to Procopius, they were formerly independent, and lived a savage life; worshipping birds and other animals, and inhabiting mountains covered with thick and dark forests. They paid no regard to agriculture, and had neither corn nor pastures, so that the culture of the soil was wholly neglected. They had no restraint on their liberty, till they lost it under Justinian, to whom they voluntarily surrendered themselves. In process of time they embraced Christianity, which produced a total change in their manners and habits. They afterwards served in the Roman armies. Justinian contributed, by the regulations which he introduced, to civilize them. But some authors say, that at this day the Tzanians have no kind of religion; that they have neither temples, nor altars, nor priests, nor any worship.

TZANPAU, in *Ornithology*, the name of an American bird described by Nieremberg, and famous for the modulations of its voice, and is by many esteemed the female of the *polyglotta avis*, or *cencontlatolli* of the Indians.

TZAREVAGOR, in *Geography*, a town of Russia, in the government of Tobolsk, on the Tobol; 28 miles S.E. of Okunevsk. N. lat. 55° 20'. E. long. 64° 34'.

TZAREVOKOKCHAISK, a town of Russia, in the government of Kazan; 68 miles N.W. of Kazan. N. lat. 54° 50'. E. long. 47° 54'.

TZAREVOSANGURSK, a town of Russia, in the government of Viatka; 100 miles S.W. of Viatka. N. lat. 57° 8'. E. long. 47° 54'.

TZARI, a town of the principality of Georgia, in the province of Kaketi; 95 miles S.E. of Tefisi.

TZARITZIN, a town of Russia, in the government of Saratov, on the Volga, defended by a ditch and rampart, with artillery and a considerable garrison; 180 miles S. of Saratov. N. lat. 48° 35'. E. long. 44° 34'.

TZEKINSKOI, a fortress of Russia, in the government of Irkutsk, on the borders of China; 100 miles W.S.W. of Selenginsk.

TZEPHETH. See **SAFAD**.

TZERIMISH, a horde of tartars, pretty numerous, in the neighbourhood of Kazan.

TZERNA, a river of Romania, which runs into the Mariza, near Tzernitz.

TZERNITZ, a town of European Turkey, in Romania, near the Tzerna; 32 miles N.N.E. of Adrianople.

TZERVINKA. See **ZERVINKA**.

TZETZES, JOHN, in *Biography*, a Greek poet and grammarian, flourished in the twelfth century, and was distinguished by his talents, natural and acquired, and particularly by a retentive memory, inasmuch that he had the whole Scriptures by heart. He was the author of "Allegories on Homer," and of "Miscellaneous Histories," in thirteen chiliads, written in that lax kind of verse which is called political, or popular. The characteristics of this poet, says one of his biographers, appear to be tediousness and infir-

pidity with arrogance. As a critic, he gave scholia upon Hesiod. His Allegories were published by Morel, Paris, 8vo. Gr. and Lat., with notes, 1616; and his Histories or Chiliads at Basil, fol. 1546.

The brother of the preceding, ISAAC TZETZES, published learned commentaries on Lycophron, which have been considered as the joint productions of both brothers: they are inserted in Potter's edition of Lycophron, Oxon. 1697. Moreri. Gen. Biog.

TZICATLINÁ, in *Zoology*, a species of serpent, said to be found in America, and reckoned among the most beautiful of that kind of animals. It is nine inches long, about the thickness of a man's little finger, and variegated with alternate swaths of white and red crossing its body. It is likewise one of the harmless kind of serpents.

The name signifies the *serpent of ants*, because it lives always in their nests, and comes out along with them.

TZIECHANOW, in *Geography*. See **CIEKANOW**.

TZIEL, a town of the duchy of Warsaw; 35 miles W. of Posen.

TZIGENO, a town of Croatia; 10 miles S.E. of Creutz.

TZIKIRSKOI, a fortress of Russia, in the government of Irkutsk; 120 miles W.S.W. of Selenginsk.

TZILEI, a town of Walachia, on the Danube; 20 miles W. of Nicopoli.

TZIMLIANKA, a town of Russia, in the country of the Cossacks, on the Don; 116 miles E.N.E. of Azoph.

TZINITZIAN, in *Ornithology*, the name of a very beautiful American bird, described by Nieremberg, of the size of a small pigeon, and ornamented with variously-coloured feathers. The beak is short, crooked, and of a pale colour; the head and neck are like those of the pigeon; the breast and part of the belly are red; but that part which is next the tail is of a fine elegant blue, and a bright white, beautifully intermixed with one another; the tail is green on the upper part, and black underneath; the wings are variegated with white and black; the feet and legs are grey, and the shoulders of a very beautiful green. It is most frequent near the South Sea, and feeds on vegetables. It is kept in cages for its beauty, but never sings. The Indians make several beautiful works of its feathers. Ray's Ornithol. p. 303.

TZIOURLY, in *Geography*. See **TSORLI**.

TZIVILSK, a town of Russia, in the government of Kazan; 56 miles W. of Kazan. N. lat. 55° 40'. E. long. 47° 34'.

TZNA, a river of Russia, which rises 20 miles S. of Tambov, and runs into the Moksha, 20 miles N.W. of Temnikov, in the government of Tambov.

TZTACTZON, in *Ornithology*, an American name, under which Nieremberg has described a species of duck, remarkable for the variable and beautiful colours of its head, which are purple, blue, white, and green, and shine like satin; its body is variegated with black, grey, and white; its legs are red, and is eaten as the other water-fowl. It is common in the lakes of Mexico, and has feet much more adapted to swimming than to walking. Ray's Ornithol. p. 299.

TZURUCHATU, STAROI, in *Geography*, a town of Russia, in the government of Irkutsk, on the Argunia, on the borders of China. This is one of the towns in which a private trade is carried on between the Russians and the Chinese. It has a small garrison; 160 miles S.E. of Neretchinsk. N. lat. 49° 18'. E. long. 119° 32'.

U. and V.

V A A

U, The twentieth letter in the alphabet, and the fifth vowel.

Besides the vowel *u*, there is a consonant of the same denomination, wrote *v* or *v*.

V consonant and U vowel ought to be considered as two letters; but as they were long confounded while the two uses were annexed to one form, the old custom still continues to be followed.

U, the vowel, has two sounds; one clear, expressed at other times by *eu*, as *obtuse*; the other close, and approaching to the Italian *u*, or English *oo*, as *obtund*.

V, the consonant, has a sound nearly approaching to those of *b* and *f*. With *b* it is by the Spaniards and Gascons always confounded, and in the Runic alphabet is expressed by the same character with *f*, distinguished only by a diacritical point. The sound in English is uniform: it is never mute.

V is also a numeral letter, and signifies *five*; according to the verse,

“V vero quinque dabit tibi, si recte numerabis.”

When a dash was added at top, \bar{V} , it signified 5000.

V. R. among the Romans, stood for *uti rogas*, as you desire: which was the mark of a vote, or suffrage for the passing of a law.

The following abbreviations sometimes occur; viz. V. A. for *veterani assignati*; V. B. *vero bono*; V. B. A. *virum boni arbitrati*; V. B. F. *vir bone fidei*; V. C. *vir consularis*; V. C. C. F. *vale, conjux charissime, feliciter*; V. D. D. *voto dedicatur*; V. G. *verbi gratia*; V. L. *videlicet*; V. N. *quinto nonarum*.

V, on the French coins, denotes those that were struck at Troyes.

V, in *Music*, besides its numerical import of *five*, in ancient madrigals implies *quinta pars*, a fifth part added to the treble, counter tenor, tenor, and base. In instrumental music it stands for violin, as V V do in the plural for violins. V. S. are the initials of *verto subito*, Lat.; and *volti subito*, Ital., for turn over quick.

VAAGEN, EAST, in *Geography*, an island in the North sea, 20 miles from the coast of Norway. N. lat. 68° 26'.

VAAGEN, WEST, an island in the North sea, 30 miles from the coast of Norway. N. lat. 68° 12'.

VAAGSOE, a small island in the North sea, near the coast of Norway. N. lat. 61° 57'.

VAARSOE, a small island of Denmark, on the E. coast of Jutland, at the mouth of the gulf of Horsens. N. lat. 55° 53'. E. long. 10° 1'.

VAAS, a town of France, in the department of the Sarte; 21 miles S. of Le Mans.

V A C

VAAST, ST. See ST. *Vaast*.

VABAR, in *Ancient Geography*, a town of Africa, on the coast of Mauritania Cæsarientis. Ptolemy.

VABAR, *Ash-oune-man-kar*, a promontory of the eastern part of Mauritania Cæsarientis. Ptolemy. The port *Salda*, mentioned by Strabo, lay S.E. of this promontory.

VABBA, a town of Africa, in Mauritania Tingitana, formerly sometimes denominated Julia Campestris.

UABE, in *Geography*. See HILAUI.

VABELIRAKE, an island in the Red sea. N. lat. 25° 8'.

VABRES, a town of France, in the department of the Aveyron, at the union of two small rivers, which soon after run into the Tarn. Before the revolution, it was the see of a bishop, suffragan of Alby; 2 miles S.W. of St. Afrique.—Also, a town of France, in the department of the Cantal; 4 miles E. of St. Flour.

VACAN, one of the small Philippine islands, near the N. coast of Samar. N. lat. 12° 47'. E. long. 121° 15'.

VACANCY, in *Philosophy*. See VACUUM.

VACANCY, in *Law*, &c. a post or benefice wanting a regular officer, or incumbent.

The canonists hold, that the kind of vacancy is to be expressed in the impetration of a benefice.

A future vacancy, or voidance of a spiritual living, some writers call *vacatura*. *Devolution* is a species of canonical vacancy.

VACANCY of the Throne. See *Right of Crown*, and *REVOLUTION*.

VACANT EFFECTS, *Prædia Vacata*, or *Vacua*, are such as are abandoned for want of an heir, after the death or flight of the former owner.

In our law-books, *vagantes terræ*, for *vacantes*, expresses forsaken or uncultivated lands.

A Romish benefice is said to be vacant *in curia Romana*, when the incumbent dies in Rome, or within twenty leagues of it; though it be only by accident that he was there. The pope nominates to all benefices vacant *in curia Romana*, excepting those of the neighbouring bishoprics.

VACANT Cylinder, in *Gunnery*. See CYLINDER.

VACARIA, *Aucaria*, or *Caucaria*, in *Ancient Geography*, a place of Africa Propria, on the route from Hippone to Carthage, between Vicus Augusti and Tuburbo Minus, according to the Itinerary of Antonine.

VACARIA, in *Geography*, a town of Egypt; 8 miles N.E. of Habasfeh.

VACARICA, a town of Portugal, in the province of Beira; 18 miles S.E. of Bragança.

VACAS, a river of Mexico, which rises in the province of Guatimala, and runs into the Pacific ocean, N. lat. 14° 22'. W. long. 92° 48'.

VACAS Bay, a bay on the S. coast of Africa. S. lat. $34^{\circ} 15'$.

VACASA, a small island near the W. coast of Lewis. N. lat. $58^{\circ} 11'$. W. long. $6^{\circ} 57'$.

VACATAMA, a river of Peru, which runs into the Pacific ocean, S. lat. $9^{\circ} 25'$.

VACATING RECORDS, in *Law*. See IMBEZZLE.

VACATION, *Non-term*, all the time included between the end of one term, and the beginning of the next succeeding one. See TERMS.

This intermission was called by our ancestors *pax Dei*, and *ecclesiæ*; and sometimes, the *time* or *days of the king's peace*. Among the Romans, it was called *jussum* or *feriæ*, or *dies nefasti*.

The time from the death of a bishop, or other spiritual person, till the bishopric, or other dignity, be supplied by another, is also called vacation.

During the vacation of a bishopric, the dean and chapter are guardians of the spiritualities, by the canon law; and of common right they are so at this day in England, and the archbishop hath this privilege only by prescription or composition, to whom with us, during the vacancy of any see within his province, all episcopal rights of the diocese belong; and all ecclesiastical jurisdiction is exercised by him and his commissioners. But when an archiepiscopal see is vacant, the dean and chapter of his diocese are guardians of the spiritualities, and exercise the spiritual jurisdiction of his province. And the perquisites that happen by the execution of such power belong to the guardian, but the new-elected bishop may by law, after election and confirmation, execute the same. See *Custos Spiritualium*.

The custody of the temporalities of every archbishopric and bishopric within the realm, in the time of vacation, belong to the king by his prerogative; and upon the filling of a void bishopric, the king, and not the new bishop, hath the temporalities of it from the time that the same became void to the time that the new bishop shall receive them from the king: which the king *ex gratia* may grant him by his letters patent after his confirmation, and before his consecration: but after he is consecrated, invested, and installed, he may sue for his temporalities out of the king's hands by a writ directed to the estreator; the metropolitan testifying the time of consecration. See *Custos Temporalium*.

During the vacation of a benefice, the profits, by the common law of the church, were to be laid out for the benefit of the church, or reserved for the successor; and by special privilege or custom the bishop or archdeacon might have the same, wholly or in part: and it is said, the king might take the profits of a free chapel, and the patron those of a donative. But by statute 28 Hen. VIII. c. 11. it is enacted, that the tithes and profits of spiritual promotions, offices, benefices, and dignities, during the time of their vacation, shall belong to the person next presented, promoted, instituted, inducted, or admitted, towards the payment of his first-fruits. Anciently, upon the death of an incumbent, the rural dean, without any formal sequestration, took the vacant benefice into his custody; but in process of time, the chancellors of bishops, or their archdeacons, laid claim to this jurisdiction, and by forms of sequestration assigned vacant churches to the *aconomi* or lay guardians of the church: and now the ordinary way of managing the profits of vacation is by sequestration granted to the church-wardens, who are to manage all the profits and expences of the benefice for the successor; whose right to the profits commences from the voidance of the benefice, and to whom the sequestrators are to account for such as they have received, deducting their reasonable expences,

and those of supplying the cure during the vacation. By 28 Hen. VIII. c. 11. an incumbent before his death may make his testament of all the profits of the corn growing upon glebe lands which he has manured and sown: but if his successor is inducted before the severance of it from the ground, the successor shall have the title of it; otherwise, if the parson dies after the severance of it, and before it is carried off, the successor shall have no title. Where there is no proper lease of tithes, the person who receives them shall be accountable to the executor for those received by him, and which became due before the incumbent's death, and to the successor for tithes which he received, and which became due after the incumbent's death; but glebe lands, and tithes demised or leased, are comprehended under statute 11 Geo. II. c. 19. which enacts, that the executors or administrators of a tenant for life may, in an action upon the case, recover of the under tenant, if such tenant for life die on the day on which the rent was made payable, the whole, or if before such day, a proportion of such rent, according to the time such tenant for life lived, of the last year, or quarter of year, or other time in which the said rent was growing due. As to *modus in lieu* of tithes, which, if taken in kind, would have been due before the death of the incumbent, whereas the *modus* for the same is not due till after his death, it seems that the executors are not entitled to the said *modus*, nor any part thereof, but that the whole shall go to the successor.

Cicero, in his Orations, mentions a law, by which the priests were exempted from service in all wars, except only in uproars, and civil tumults; which exemptions he calls *vacationes*.

VACCA, in *Ancient Geography*, a town of Spain, in the Pyrenean mountains, according to Isidore.

VACCA, *Vage*, *Bata*, or *Vagenſe Oppidum*, thus differently named by Sallust, Ptolemy, Plutarch, and Pliny, *Bay-jah*, a town of Africa, in Numidia, 10 leagues from Meterense Oppidum. According to Sallust, it belonged to Jugurtha, and he says, that when it revolted, he established in it Italians. Metellus was sent to reduce it.

VACCA, or *Vacua*, a river of Spain, in Lusitania, which pursuing its course from E. to W. passed to Talabriga, and soon after ran into the sea.

VACCA, *La*, in *Geography*, a small island in the Mediterranean, near the S. coast of Sardinia; 3 miles S. of St. Antioco.

VACCA, in *Zoology*, the female of the ox-kind. See *Cow*.

VACCA Marina. See *SEA-Cow*.

VACCARIA, in *Botany*, so named from *vacca*, a cow, because, according to Ambrosinus, cows are fond of the plant. His *Vaccaria*, like that of Dodonæus and Gerarde, is the Linnæan *Saponaria Vaccaria*, referred by the writer of this to *Gypsophila*, see that article; with which genus its bell-shaped angular calyx, roundish capsule, and whole habit, accord so exactly, that we are at a loss to account for Linnæus's having placed it elsewhere. The *Vaccaria* of Tabernæmontanus is very different, being our *Turritis glabra*; an herb agreeing with the former in the glaucous, smooth, entire leaves, of its stem at least, but otherwise having no character or property in common therewith, and certainly of too infrequent occurrence, as well as of too slender a habit, to afford much support for a dairy. The above *Gypsophila* belongs to a natural order of plants to which farmers have, as yet, scarcely resorted for any sort of fodder, the Campion tribe. Might not the name before us authorize an experiment at least, upon the qualities of this plant, as well as on those of its near relation *Silene inflata*? *Spergula arvensis*,

VACCINATION.

one of this order, is reported to enrich the milk of cows, but has not come into any general notice. See *SILENE*, sect. 2, and *SPERGULA*, n. 1.

VACCARY, *VACCARIA*, in our *Old Writers*, a house or place to keep cows in; a dairy-house, or cow-pasture.

VACCEI, *VACCEANS*, in *Ancient Geography*, a people of the interior of Hither Spain, S. of that part of the country which was inhabited by the Asturi. According to Diodorus, the Vacceans were the most gentle and polished of the Celtiberians. They were subjugated by L. Lucullus and Ch. Marcellus. It appears that they were a considerable people by the number of towns which Ptolemy assigns to them.

VACCINATION, or the *Cow-pox inoculation*, in *Surgey*, one of the greatest and most important discoveries of modern times. The discovery of the circulation of the blood, made by the celebrated Harvey, has unquestionably been the source of infinite improvement in every part of the healing art, and produced incalculable benefit; but vaccination, the discovery of another Englishman, the immortal Jenner, is a thing, which in its consequences certainly outdoes every previous innovation in practice, since it may be said to save annually the lives of millions.

Vaccination being the only known means of arresting altogether the fatal ravages of the small-pox, the most depopulating contagion upon the face of the earth, mankind will probably for ever feel a deep interest in the subject. In fact, nothing less than the well-established total extermination and permanent cessation of the small-pox, could ever justify a diminution of the laudable solicitude of the public for the continuance of vaccination. For it is not to be presumed, that a still milder and more effectual means of rendering the human body insusceptible of the effects of the small-pox contagion, will ever be discovered. A milder method, indeed, is hardly conceivable; since the symptoms produced by it amount only to a very slight indisposition, which never has any fatal or unpleasant consequences. Its efficacy also is now fully confirmed by abundance of evidence, collected from the united observations and experience of the best informed practitioners, who, it is obvious, can have no interest in the success of vaccination, but the general good of their fellow-creatures. Were medical men so base as to suffer their judgment to be influenced by mercenary considerations, they would decry with all their force the practice of vaccination, which occasions too trifling an indisposition to put many fees into their pockets; and they would necessarily praise the small-pox inoculation, by which a frequently long and lucrative attendance on their patients might be calculated upon as a matter of certainty.

A general account of the origin of vaccination has been delivered in the article *Cow-pox*, and on this interesting part of the subject we shall therefore merely recapitulate a very few particulars. As, however, it is an object of the first-rate importance to be perfectly acquainted with every criterion of the genuine disease, we mean to introduce into this article some valuable instructions, which have been published by the latest and best medical writers, or which have been circulated by the National Vaccine Establishment, respecting the appearances of the true affection, and of some others, which are either spurious, or not to be depended upon. In this account will be comprehended a brief explanation of the method of practising vaccination. The rest of the article will be principally devoted to the consideration of the occasional failures to which the practice is liable.

It was an observation made long ago in several of the dairies in England, particularly in those in Gloucestershire,

that the milch cows were frequently affected with an eruption upon their udders and teats, which was communicated not only from one cow to another, but frequently also to the hands of the milkers; and farther, that such of the milkers as had been thus affected, were never afterwards infected with the small-pox, either by inoculation, or by exposure to the most virulent contagion of that disease, even although such persons had not previously undergone that dreadful malady.

It is curious, that the knowledge of a fact of so singular a nature, and one of so much importance to the general interests of society, should have been confined, from time immemorial, almost entirely to those occupied in the business of dairies, without being fully investigated by such persons as could duly appreciate its value.

Dr. Jenner, a physician at Berkley, in Gloucestershire, was the first person who set himself about examining this subject with that care and attention which its importance seemed to demand.

In the year 1798, after much diligent labour and investigation, Dr. Jenner published "An Inquiry into the Causes and Effects of the Variolæ Vaccinæ;" and his observations soon excited the attention of the whole medical world. For a considerable time, the accuracy of the account was received among medical men with hesitation. The character, however, of Dr. Jenner, and the singularity and important nature of the ailment, led to farther investigation; and although many arguments were urged, and circumstances stated, which seemed adverse to the plan of the general introduction of cow-pox among mankind, yet the great utility of it was at last clearly evinced. Every statement made by the accurate Jenner was confirmed, and the credit of the cow-pox, as a preventive of small-pox, was established on a basis too firm to be shaken by the shafts of envy, malice, or ignorance—the basis of immutable truth.

Dr. Jenner, not satisfied with the assertions of the dairy farmers and servants, that persons who had been affected with cow-pox were rendered thereby secure against the attacks of small-pox, determined to ascertain the truth of this fact by the test of experiment. He inoculated for small-pox many persons who had formerly undergone the cow-pox, some so long as thirty and even fifty years previously; and these he uniformly found, as had been predicted to him, completely resisted that disease.

So far the nature of cow-pox was known to others before it was known to Dr. Jenner. In the year 1796, however, this ingenious gentleman pushed his investigation farther; and on the 14th of May, he first intentionally infected the human constitution with the virus of cow-pox by inoculation, with the design, as he informs us, of observing more accurately the progress of the infection. The experiment succeeded; and the affection, though remarkably slight, was clearly marked in all its stages.

Dr. Jenner next conceived the idea of inoculating this person with the virus of small-pox, in order to ascertain whether so slight an affection as had taken place from the cow-pox, could possibly give security from that dreadful disease. Several slight punctures and incisions were accordingly made in both arms, and the virus of small-pox was carefully inserted, but no disease followed. Some months afterwards, the same person was again inoculated for small-pox, but still no sensible effect was produced upon the constitution.

This is to be reckoned the first discovery of Dr. Jenner respecting the nature of cow-pox, *viz.* that the matter of cow-pox, taken from the vesicles on the cow, and intentionally inserted into the human subject, produces an affection,

VACCINATION.

tion, which, at the same time that it is more mild in its symptoms than that produced by accidental infection, does nevertheless still operate such a change in the constitution, as renders the person infected unsusceptible of the small-pox.

The want of vaccine matter now prevented Dr. Jenner from prosecuting his experiments until the spring of the year 1798, when the cow-pox again became prevalent among the cows in the dairies in his neighbourhood, and afforded him an opportunity of investigating farther this interesting subject.

With matter taken from cow-pox vesicles on the teats of a cow, Dr. Jenner now inoculated several persons; and from these persons he propagated the affection to others, also by inoculation, even so far as the fifth change, without recurring to the original source, the vesicles on the teats of the cow. The experiments were completely successful. The affection, in all those inoculated, was regularly produced. All the persons who had been thus infected, were afterwards subjected to inoculation with the virus of the small-pox, but ineffectually, no disease in any instance succeeding to this operation. See Jenner's Inquiry, p. 43.

From these experiments, we derive another most important fact concerning the nature of cow-pox, *viz.* that the virus of cow-pox may be propagated from one human subject to another, through several gradations, and still retains the power, not only of producing the affection, regular in all its stages, but also of rendering those constitutions which are infected, secure against the attacks of small-pox.

By unwearied attention to all the circumstances under which he was accustomed to observe this ailment, Dr. Jenner was led to conclude, that persons who have already had the small-pox, are still susceptible of the action of cow-pox, though not to such a degree as those who have never been subjected to that of small-pox.

That in the cow-pox no eruption takes place, unless on the part where the virus is applied to the skin.

That the cow-pox, even under the most unfavourable circumstances, has never proved fatal.

That the cow-pox cannot be propagated by contagion, but only by actual contact, or inoculation with the virus.

That the virus of the cow-pox, inserted into the human body, may produce an affection which is merely local, the general constitution remaining unaltered; and that, in such cases, the person is still liable to be infected with the small-pox.

Soon after Dr. Jenner's publication appeared, *viz.* in November, 1798, Dr. George Pearson published "An Inquiry into the History of Cow-pox, principally with a View to supersede and extinguish the Small-pox." In this treatise, the positions and conclusions of Dr. Jenner are examined with that candour and attention, which their importance demand. The evidences adduced are numerous and respectable, and the result is highly favourable to the general introduction of inoculation for the cow-pox among mankind, not only as a preventive of small-pox, but also as a certain mode of ultimately extinguishing that loathsome malady.

In May, 1799, were published "Reports concerning a Series of Inoculations for Cow-pox, with Remarks and Observations on this Disease, considered as a Substitute for Small-pox, by Dr. Woodville, Physician to the Small-pox and Inoculation Hospital in London." The account here given by Dr. Woodville is very different from that given by Dr. Jenner, and by no means favourable to the general introduction of the new inoculation as a substitute for small-

pox. Such a report, coming from a man of Dr. Woodville's known character and reputation as an accurate observer, naturally produced a strong sensation in the minds of medical men concerning the discoveries of Dr. Jenner. The circumstances, however, under which Dr. Woodville's observations were made, and upon which his reports were founded, were such as led him to be much deceived respecting the true nature of the cow-pox.

This report of Dr. Woodville, so very different from the general statement of Dr. Jenner, naturally called for a reply from the latter, who accordingly, in 1800, published "A Continuation of Facts and Observations relative to the Variolæ Vaccinæ." In this publication, Dr. Jenner is anxious to recover his favourite subject from that degree of shade, which had been thrown upon it by the hasty reports of Dr. Woodville; and this he appears to have done with great success, both by farther observations of his own, and by the concurring evidence of many respectable correspondents. See Bryce's Practical Observations on the Inoculation of Cow-pox, chap. 1. edit. 2.

With regard to Dr. Woodville's publication, we shall merely add in the present place, that the cases reported by him as examples of inoculated cow-pox, attended with many severe symptoms, and particularly with an eruption over the body, have been fully proved, and indeed have been since allowed by that respectable physician himself, to have been in fact cases of genuine small-pox, the infection having been contracted in the place where the patients were inoculated with cow-pox virus, before this latter affection had produced the effects and changes in the constitution, which render it a preventive of the other loathsome malady.

For additional particulars relative to the first progress of vaccination, we must refer to the article Cow-pox: suffice it here to say, that every objection to the practice was gradually removed; the public became convinced of its value and beneficial consequences; the great founder of it received an honourable remuneration from his country; both neighbouring and remote nations soon took a deep interest in the subject, and imitated our example; public institutions for the gratuitous inoculation of the poor were in a short time established in every civilized country; and the great benefits of the new plan were quickly extended to all the four quarters of the globe.

Description of the regular vaccine Vesicle.—When vaccination succeeds, a small red spot is observable on the third day, the day upon which the operation is performed being reckoned the first. If the spot be touched, an elevation is felt; and if examined with a magnifying glass, the little tumour appears to be surrounded by a very slight effluence.

The spot gradually enlarges; and between the third and sixth day, a circular vesicle appears. The edge of the vaccine vesicle is elevated; the centre depressed. The colour is at first of a light pink, sometimes of a bluish tint, and changes by degrees to a pearl colour. The centre is somewhat darker than the other parts.

The vesicle is hard to the touch.

In its internal structure it is cellular, the cells being filled with transparent lymph.

The vesicle commonly augments, till the tenth or eleventh day.

In the early stages, there is usually round the base an inflamed ring; or this takes place on the seventh or eighth day. About the ninth, it spreads rapidly; and near the tenth, it forms an areola of an inch and a half in diameter. This areola is of the usual colour of inflamed skin; it is hard, and accompanied with some degree of tumefaction.

It continues out for a day or two, and then begins to fade, sometimes forming two or three concentric circles.

After the areola is formed, the vesicle begins to decline. The centre first turns brown, and the whole gradually changes into a hard smooth scab, of a very dark mahogany colour. This dry crust usually drops off about the end of the third week, leaving a permanent circular cicatrix, about five lines in diameter, and a little depressed; the surface being marked with very minute pits, or indentations, denoting the number of cells of which the vesicle had been composed.

Varieties in the Progress and Appearance of the vaccine Vesicle, not preventing the Success of Vaccination.—The first appearance is seldom earlier, but often later, than has been described. In some rare instances, the vesicle commences even a fortnight or three weeks after vaccination; and if the progress is then regular, it is equally efficacious.

When the vesicle is ruptured at an early period, if the progress continues regular, success is not prevented; nor is it when the crust of a regular vesicle is rubbed off in the decline of the disease, though ulceration should ensue.

Of irregular and imperfect Vesicles and Pustules, which are not to be depended upon.—In these deviations, there is usually a premature itching, irritation, inflammation, vesication, or suppuration; or the progress of the vesicle is too rapid, its texture soft, its edge not well defined, its centre elevated, and the contents discoloured or purulent; or, instead of a proper areola, a premature efflorescence of a dusky purple hue takes place, and the scab is of a light brown or amber colour.

The irregular vesicle or pustule is more liable to be broken than the other, both from its more pointed form and softer texture, and also from its being usually so irritable as to provoke scratching. When broken, or even without this happening, ulceration often ensues.

A vesicle, apparently regular at first, sometimes does not augment to the proper size, but dies away without completing the regular process. This usually leaves no cicatrix, or one which is almost imperceptible.

When these, or any other considerable deviations from the regular course of the disease, take place, no dependence can be placed upon the operation, and vaccination should be repeated.

Probable Causes of irregular Vesicles and Pustules.—These accidents may be occasioned by matter or lymph being taken from an irregular vesicle or pustule at any period, or from a regular vesicle, at too late a period; or by lymph, though originally pure, which has been injured by long keeping, by heat, or otherwise. Or it may be caused by performing the operation with a rusty or unclean lancet, or in a rude manner, or by destroying the vesicle at an early stage, and thereby exciting too much inflammation, or interrupting the regular progress of the disease. Herpetic eruptions, and other cutaneous affections, have also been supposed to be the cause of these irregularities; and occasionally to prevent the vaccine lymph having any effect.

As Dr. Bateman observes, there are two causes for these imperfect inoculations: "the one is the insertion of effete or corrupted virus; and the other the presence of certain cutaneous eruptions, acute and chronic.

"The lymph of the vaccine vesicle becomes altered in its qualities, soon after the appearance of the inflamed areola; so that if it be taken for the purposes of inoculation after the twelfth day, it frequently fails to produce any effect whatever; and, in some cases, it suddenly excites a pustule, or ulceration; in others, an irregular vesicle; and, in others, erysipelas. If taken when scabs are formed over the

vesicle, (as in the case of pustules of small-pox,) the virus is occasionally so putrescent and acrid, that it excites the same violent and fatal disease which arises from slight wounds, received in dissecting putrid bodies.

"Again, the lymph, although taken from a perfect vesicle, on the sixth, seventh, or eighth day, may be so injured, before its application, by heat, exposure to the air, moisture, rust, and other causes, as to be rendered incapable of exciting the true disease.

"The most frequent cause of these imperfections, however, seems to be the presence of chronic cutaneous eruptions, or the concurrence of eruptive fevers, or even of other febrile diseases. The chronic cutaneous diseases, which sometimes impede the formation of the genuine vaccine vesicle, have been described by Dr. Jenner under the ordinary indefinite term herpes and tinea capitis. In the more accurate phraseology of Dr. Willan, they are herpes, (including the shingles and vesicular ring-worm,) psoriasis, and impetigo (the dry and humid tetter); the lichen, and most frequently the varieties of porrigo, comprising the contagious eruptions denominated by authors *crusta lactea*, *area*, *achores*, and *savi*. Dr. Willan thinks that the itch and prurigo likewise have the same influence.

"Of the interference of eruptive fevers, measles, scarlet fever, and chicken-pox, with the progress of the vaccine vesicle, when they occur soon after vaccination, numerous instances have been recorded. The *suspension* of its progress, indeed, would be expected, under such circumstances, from the known facts respecting the reciprocal action of these contagious fevers on each other. But the action of the vaccine virus is not only suspended by these fevers, so that the vesicle is very slow in its progress, and the areola not formed till after the fourteenth day, or later, and sometimes not at all; but it is occasionally rendered altogether inefficient. Even typhous fever, and the influenza, have been observed to produce a similar interruption in the progress of vaccination.

"Finally, the vesicle without an areola, takes place if the person inoculated have previously received the infection of small-pox, or if he be affected with some other contagious disease during the progress of vaccination.

"Other irregularities may probably have occurred. At all events, though the constitution is sometimes fully secured from the infection of small-pox, even by the irregular vesicles; yet as it is more commonly but imperfectly guarded by such vesicles, the propriety of Dr. Jenner's caution is obvious, that, when a deviation arises, of whatever kind it may be, common prudence points out the necessity of re-inoculation." See Bateman's Synopsis of Cutaneous Diseases, p. 219—221. edit. 3.

The Methods of taking Vaccine Lymph for Vaccination.—The lymph of a regular vesicle is efficacious from the time it is secreted, till the areola begins to spread. It may, therefore, commonly be taken till the ninth day; but not after the areola is fully formed.

The lymph is to be taken by small superficial punctures made in the vesicle, with the point of a lancet introduced horizontally. Time should be allowed for the liquid to exude, which will form small pellucid drops. When requisite, a very slight pressure may be cautiously applied with the flat surface of the lancet. Great delicacy is requisite in this operation; for if the vesicle is rudely treated, or too much opened, inflammation and ulceration may ensue.

Lymph intended to be used immediately, or in a few days, may be received on a lancet; but this is an improper instrument for preserving it longer; for the lymph soon rusts the lancet, and it is then liable to be inefficacious, or injurious. Quills and tooth-picks succeed; but small bits

VACCINATION.

of ivory, shaped like the tooth of a comb, and properly pointed, are the most convenient instruments; and to render them more certain, they should be charged repeatedly.

In order to preserve lymph for a long period, the best method is by two bits of square glass. The lymph is to be received on the centre of one of them, by applying it to a punctured vesicle. When fully charged and dry, it is to be covered with another bit of glass of the same size, and wrapped up in paper or in gold-beater's skin.

In whichever way the lymph is taken, it should be allowed to dry without heat, in the shade, and be kept in a dry and cool place. When inclosed in a letter, if great care is not taken, it may be injured by the heat of the melted wax in sealing the packet.

The Mode of Vaccinating.—Liquid lymph is better than dry, because it seldom fails, and the operation is more lightly and quickly performed. Therefore in every instance, where it is practicable, the patient from whom the lymph is to be taken should be present, and the lymph should be transferred immediately from him to the person who is to be inoculated.

Vaccination is generally performed in the arm, near the insertion of the deltoid muscle; but in order to hide the scar, and in adults who are likely to use the arm much, it may be advisable to vaccinate the outside of the leg, a little above or below the knee.

The lancet being charged, the skin should be stretched, and a small superficial puncture made with the point of the lancet, held nearly in a horizontal direction.

The lancet should be dipped in water and wiped after each operation, even when several successive inoculations are to be performed.

Dry lymph on glass may be moistened with a very little cold, or tepid water, on a point of a lancet, allowing it some time to dissolve, and blending it by a little friction with the lancet. It must not be much diluted, but ought to have a thick consistence; it is to be inserted in the same manner as the recent fluid.

When quills, ivory lancets, or tooth-picks charged with dry lymph are used, the lymph should not be diluted, but a puncture having been first made with a common lancet, the point of the instrument is to be inserted, and held in the puncture half a minute or more, that the lymph may gradually dissolve and remain in the wound. If the part of the instrument which is charged be afterwards wiped repeatedly upon the edges of the puncture, it will tend still farther to ensure success.

Vaccinated patients must be cautioned not to wear tight sleeves, nor to injure the vesicle by pressure, friction, or any other violence, lest inflammation or ulceration should ensue.

One perfect vaccine vesicle is sufficient; but for various reasons it may often be prudent to make two or three punctures, especially when the danger of receiving the small-pox is imminent, the lymph dry, or the patient's residence distant. Besides, greater security is obtained against a chance of failure from the derangement or destruction of one vesicle by accidental injury, or by the taking of matter for vaccination. When two punctures are to be made in one limb, they should be at least two inches asunder, on account of the irritation they may occasion. And one of them should be always permitted to go through its course undisturbed. Lancets for vaccination should be kept clean and bright.

Constitutional Symptoms.—Constitutional symptoms sometimes occur at a very early period, but more commonly from the seventh to the eleventh day. These are drowiness, restlessness, a chilliness succeeded by heat, thirst, head-ache,

and other marks of febrile affection. Now and then sickness or vomiting takes place, especially in infants.

The constitutional symptoms are in general slight and transient, and such as require no remedy.

In a great proportion of cases, there is no perceptible indisposition; nevertheless, the person vaccinated is not the less secure from the future infection of the small-pox, provided the progress of the vesicle has been regular and complete.

Care should be taken not to confound the symptoms of other diseases with those produced by vaccine inoculation.

Medical Treatment.—In general, no medicine is required in this mild affection; but if the symptoms happen to run a little higher than usual, the same remedies are to be applied, as if they proceeded from any other cause.

No preparatory medicines are necessary before vaccinating, and commonly no cathartics need be given afterwards.

Should the local inflammation exceed the usual bounds, which rarely happens, unless from tight sleeves, pressure, or friction, it may soon be checked by the frequent application of compresses of linen dipped in water, in aqua lithargyri acetati composita, or in a solution of one drachm of cerussa acetata in a pint of water. These are to be applied cold.

If the scab be rubbed off prematurely, and ulceration take place, cooling and astringent applications may be used; such as a drop of aqua lithargyri acetati, which should be allowed to dry on the part, and then be covered with compresses dipped in water, or in either of the preparations of lead above-mentioned, and frequently renewed.

When the ulceration is deep or extensive, a poultice either of bread and milk, or of bread with any of the preparations of lead, may be applied, as the case seems to require. They must never be applied till they are nearly or quite cold.

In such foul and obstinate sores as resist the foregoing applications, the unguentum hydrargyri nitrati, mixed with an equal quantity of unguentum ceræ, or other similar applications, may sometimes be resorted to with advantage. And at other times, these sores may be healed with the unguentum cerussæ acetatæ, or the mildest applications.

The irregular vesicles and pustules are frequently followed by ulceration at an early period, and this ulceration is to be treated in the same manner, as if it proceeded from the regular vesicle.

When the patient has been previously exposed to the infection of small-pox, this disease will be either superseded or not, according to the time which may have elapsed before vaccination.

Observations on the occasional Inefficacy of Vaccination.—When the vaccine vesicle possesses the above-described characters, and passes through the regular gradations, whether accompanied with any perceptible disorder of the constitution or not, it effectually and permanently secures the individual from the danger, and almost universally from the contagion of the small-pox.

It is now nearly twenty years since the first promulgation of Dr. Jenner's discovery; and yet the truth of the preceding observation remains unimpeached. As a well-informed physician has remarked, the very exceptions to this statement may be said, without a solecism, to corroborate it. For, in the very small number of cases, (such as that of the son of earl Grosvenor), where an extensive eruption of small-pox has occurred subsequently to vaccination, the controlling influence of the cow-pox has been invariably and strikingly manifested, by the sudden interruption of the small-pox in the middle of its course, and the rapid convalescence of the patient. See Bateman's Synopsis, p. 216.

With

VACCINATION.

With very few exceptions, indeed, persons who have undergone both the local and constitutional affection of cow-pox, are thereby rendered unsusceptible of small-pox.

It is not meant to assert, however, as has been too generally imagined, that every person who has been inoculated for the cow-pox, is rendered secure against the contagion of small-pox. As Mr. Bryce has ably explained, there are many circumstances, besides the mere inoculation, absolutely necessary to be ascertained, before this security can be guaranteed.

Again, says Mr. Bryce, 'it is well known, that a person having undergone the small-pox is not absolutely secure from a future attack of the same malady, as well authenticated instances are recorded, where the same person has undergone this disease a second time, and these attacks were neither of them local, but very certainly general constitutional affections. See the case of Mr. R. Langford, recorded in the fourth volume of the Memoirs of the Medical Society of London. This gentleman was infected with the small-pox at a very early period of life, and was much marked from the severity of the disease. Many years afterwards, he was again infected with the small-pox, which was of the confluent kind, and proved fatal on the twenty-first day from the attack. See also Dr. Woodville's History of Inoculation, p. 217; Mr. Ring's Answer to Dr. Moseley, where many such cases are recorded; and the case of lord Westmeath's child, published in the Medical and Physical Journal, vol. xiv. p. 256.

Now, as Mr. Bryce remarks, with regard to the cow-pox, it may also happen, that a person who has undergone that affection, may yet be afterwards affected with small-pox; but, as is well known in the former case relative to small-pox, so also in the latter relative to cow-pox, the instances of the second attack from small-pox, or of the failure of the cow-pox to prevent the small-pox, are so very rare, as by no means to affect the general established rule; that persons who have once undergone the small-pox, or the cow-pox, as a constitutional affection, may thenceforth be reckoned secure against all future attacks of variolous contagion. (See Bryce's Practical Observations on the Inoculation of Cow-pox.) Besides the examples of the recurrence of small-pox a second time in the same individual, to be found in the publications already specified, additional instances are recorded by Dr. Jenner himself, Mr. Bryce, and in the Reports of the National Vaccine Establishment.

We shall here present the reader with the history of two remarkable cases published by this last institution; the one illustrating the occurrence of small-pox a second time in the same person, the other exemplifying the equally uncommon circumstance of an individual who had perfectly undergone vaccination, being afterwards affected with the small-pox.

Dr. Bree was called to visit Miss Sarah Booth, of Covent Garden theatre, on Monday, June 25th, 1811. She was said to be ill with the small-pox, and the following circumstances were reported by the mother and sisters.

Miss Booth was then eighteen years of age. She had been inoculated for the small-pox at five years of age, and had been affected with the usual degree of fever. The arm had been violently inflamed, and an eruption of small-pox pustules had appeared round the inoculated part, from which matter had been taken by Mr. Kennedy, the surgeon who attended her. Mr. Kennedy expressed himself satisfied that Miss Booth had passed regularly through the disease.

The usual fear of small-pox inoculation was perfectly evident on the arm.

On Thursday, June 20th, 1811, Miss Booth was seized

with fever, distinguished by vomiting, violent head-ache, and pains in the back and loins.

The symptoms continued till Saturday, June 22d, in the evening of which day, some pustules came out on the forehead and scalp.

Sunday, June 23d, a more complete eruption appeared on the face and neck, and she was relieved from the violence of the fever. The vomiting however continued, the throat became very sore, and a salivation began.

Monday, June 24th, the eruption extended itself on the body, the fever was still more abated, but the salivation, soreness of the throat, and vomiting, were urgent symptoms.

Tuesday, June 25th, the fourth day of the eruption, the salivation and retching continued, with soreness of the throat.

Wednesday, June 26th, fifth day of the eruption, pustules were noticed on the lower extremities, those on the face advanced, the eyes were swelled; and the number of pustules on the head and face was about two dozen.

Thursday, June 27th, sixth day of the eruption, the pustules on the face began to turn. She still suffered from sore throat and salivation.

Friday, June 28th, the pustules on the face turned, those on the lower extremities were few in number but well filled, and not yet changed.

Saturday, June 29th, eighth day of the eruption, she only complained of sickness. After this day, the pustules turned and dried on the lower extremities, and no complaint remained.

Dr. Bree considered this as a mild case of distinct small-pox.

On Sunday, May 26th, 1811, the Hon. Robert Grosvenor, who was recovering from the whooping-cough, became much indisposed and threw up his dinner. Fever followed, and he complained most particularly of excruciating pain in his back. He dwelt on this symptom until Thursday, when he became delirious, and there were observed on his face about twenty spots.

He had been vaccinated by Dr. Jenner, in his infancy, about ten years ago, and the mark left in his arm indicated a perfect disease.

On Friday morning, the eruption had not increased materially in point of number, but the appearance of the spots and the previous symptoms, suggested strongly a suspicion that the disorder was the small-pox.

Sir H. Halford had occasion to go to Windsor in the afternoon of Friday, and did not see Mr. Robert Grosvenor until the Monday following, (June 2d,) but he learned from Sir W. Farquhar, who attended him most carefully during Sir Henry's absence, and subsequently, that the eruption had increased prodigiously in the course of Friday; that on the evening of that day, Mr. Robert Grosvenor began to make bloody water, and that he continued to do so until Monday morning.

On the tenth day of the disease, the pustules began to dry upon the face, which was swollen to a considerable degree, but not to the extent of closing his eyes, and was attended by a salivation which lasted several days. Petechiæ had occurred in the interstices of several of the spots, particularly on the limbs, and there was that particular smell from the whole frame which is remarkable in bad cases of confluent small-pox.

It was obvious that the first symptoms of which Mr. Grosvenor complained, were such as indicated a violent disease about to follow, and Sir Henry confesses that he entertained a most unfavourable opinion of the issue of such a malady, when it was fully formed; having never seen an instance

VACCINATION.

instance of recovery under so heavy an eruption attended by such circumstances. It seemed, however, that the latter stages of the disease were passed through more rapidly in this case than usual, and it may be a question whether this extraordinary circumstance, as well as the ultimate recovery of Mr. Grosvenor, were not influenced by previous vaccination.

The Board of the National Vaccine Establishment are of opinion, that the case of the Hon. Robert Grosvenor was a case of confluent small-pox: that the attack and progress of the disorder were attended by symptoms which almost invariably announce a fatal termination. But they observe, that the swelling of the face, which is generally so excessive as to close the eyes, and is considered as a favourable symptom, was slighter than usual; that on the tenth day the pustules began to dry upon the face, and that from that time the disease passed with unusual rapidity through the period when life is generally esteemed to be in the greatest hazard.

Those who are acquainted with the nature of the confluent small-pox, are aware that this peculiarity cannot be attributed to the effect of medical treatment.

In most cases of small-pox which have succeeded to vaccination, the pustules have been observed to dry more rapidly, and the disorder has concluded at an earlier period than usual.

If allowance be made for the relative periods in which the confluent and distinct small-pox complete their course, the rapid progress towards recovery through the latter stage of confluent small-pox, as exhibited in the case of Mr. Grosvenor, may be compared with the rapid desiccation of the pustules in the distinct and peculiarly mild form of the disorder which is considered as small-pox modified by vaccination. Both forms of the disorder proceed in the usual course, the one attended with violent, the other with mild symptoms, till they arrive near to the height, when they appear to receive a check, and the recovery is unusually rapid.

From this correspondence of circumstances, the Board are induced to infer, that in the case of Mr. Grosvenor, which has been more violent than any yet submitted to them, the progress of the disease, through its latter stage, and the consequent abatement of symptoms, were influenced by an anti-variolous effect produced upon the constitution by the vaccine process.

The occurrence of small-pox after vaccination, has been foreseen and pointed out in the report on vaccination made to parliament, by the College of Physicians, in the year 1807, to which the Board are desirous of calling the attention of the public; in which it is stated, that,

“The security derived from vaccination against the small-pox, if not absolutely perfect, is as nearly so as can perhaps be expected from any human discovery; for amongst several hundred thousand cases, with the results of which the College have been made acquainted, the number of alleged failures has been surprisingly small; so much so, as to form certainly no reasonable objection to the general adoption of vaccination; for it appears that there are not nearly so many failures in a given number of vaccinated persons, as there are deaths in an equal number of persons inoculated for the small-pox. Nothing can more clearly demonstrate the superiority of vaccination over the inoculation of the small-pox than this consideration; and it is a most important fact, which has been confirmed in the course of this enquiry, that in almost every case in which the small-pox has succeeded vaccination, whether by inoculation, or by casual infection, the disease has varied much from its ordinary course; it has

neither been the same in violence, nor in the duration of its symptoms; but has, with very few exceptions, been remarkably mild, as if the small-pox had been deprived, by the previous vaccine disease, of its usual malignity.” Report of the College of Physicians, p. 4.

The peculiarities of certain constitutions with regard to eruptive fevers, form a curious subject of medical history. Some individuals have been more than once affected with scarlet fever and measles; others have been through life exposed to the contagion of these diseases without effect; many have resisted the inoculation and contagion of small-pox for several years, and have afterwards become susceptible of the disorder, and some have been twice affected with small-pox.

Among such infinite varieties of temperament, it will not appear extraordinary, that vaccination, though so generally successful, should sometimes fail of rendering the human constitution unsusceptible of small-pox; especially since it has been found that in several instances small-pox has occurred to individuals over whom the small-pox inoculation had appeared to have produced its full influence. Three instances of this kind have taken place within the last month; and, in another instance, the natural small-pox has occurred a second time. See Report of the National Vaccine Establishment, July 1811.

It has been imagined by some, that although the human constitution is apparently shielded from the action of small-pox by having undergone the cow-pox, yet that this security may not be permanent; but that, at the end of a certain period of time, the person will again become susceptible of small-pox. This objection, however, must now have little weight; for Dr. Jenner himself inoculated with the virus of small-pox, persons who had been affected with the cow-pox twenty-five, twenty-seven, thirty-one, and fifty-three years before; but who had never been infected with the small-pox, and these he found completely resisted this disease.

For further evidence and reasoning on this point, see Ferriar's Reflections on the Cow-pox; Edin. Rev. No. XVII.; and Bryce's Practical Obs. on the Cow-pox.

Experience has proved that, in certain instances, the cow-pox virus has merely a local action, and such cases have been mistaken for the regular constitutional affection; a thing very likely to happen, when it is remembered that the general ailment of the system is seldom marked by any very strong symptoms; and that, in the cases alluded to, the local appearances would pursue a regular progress. Yet, in these circumstances, the patient is left unprotected from an attack of small-pox. As Mr. Bryce has pointed out, therefore, *a certain test of the constitution being really affected* in every inoculation of cow-pox must be a most important desideratum. Indeed, until there be demonstrated and generally known some unequivocal mark of a constitutional affection, which does constantly occur during the course of cow-pox when effectual, and which may be as easily distinguished as the fever and eruption consequent to the inoculation for small-pox, this new inoculation ought never to be performed, except by persons well acquainted with every appearance of the ailment. For, as much as it is more difficult to distinguish between the cow-pox and some other affections, and also clearly to ascertain the presence of a constitutional affection, than to form a similar judgment in the inoculated small-pox, the more does the cow-pox inoculation require attention to every symptom which may occur during its progress, in order that mankind may reap every advantage which has been promised from the general adoption of cow-pox as a preventive of small-pox.

Mr. Bryce has endeavoured to discover a criterion of the

patient being constitutionally affected with the cow-pox, and the following observations upon this important subject merit particular attention. "I recollected (says he) some experiments which had been made with regard to the inoculation of small-pox. It was found, that if the same person was inoculated every day, until the fever induced by the first inoculation supervened, all the other punctures quickly advanced in their progress; and that, in the course of a day from the time the fever or general affection began, even that puncture which had been last made, perhaps only twenty-four hours before, equalled in maturity the one first made, perhaps eight or nine days before, and from which the fever had arisen.

"In this case it appears to me evident, and I think it must be admitted by every person, that even had no other pustules appeared on the body but those occasioned by the repeated inoculations; nay, had there even been no fever observed in consequence of the inoculation; yet as the pustule occasioned by the last puncture had been suddenly accelerated in its progress to maturation, at the time the general or constitutional affection should have appeared; this alone was a sufficient proof of the presence of the variolous action in the system.

"Judging again from analogy, I expected that the same thing, which thus happened in the small-pox inoculation, might also take place in that for the cow-pox; and the unexpected appearance of one or two vesicles upon children that I had inoculated, which vesicles were quite characteristic of the ailment, and the appearance of which I could only account for from a second and accidental inoculation during the course of the disease, strengthened my hopes. And, certainly, if we find in cow-pox, where the inflamed and hard areola does not take place, at least in the regular course of that affection, until the end of the seventh, or beginning of the eighth day from inoculation, that a second inoculation, performed, for example, at the end of the fifth, or beginning of the sixth day, is so much accelerated in its progress, about the time the general affection of the system usually takes place, as to have an areola formed within a few hours, or very shortly after the first, and that this areola increases with the first, and again fades at nearly the same time, we must be struck with the similarity, and be forcibly led to draw the same conclusions in this case as in the former, respecting the small-pox, *viz.* that although the inoculated affection had appeared very slight, and no fever had been observed, yet that a certain action had been excited in the constitution. That this was the true constitutional affection of cow-pox, may be judged by the acceleration of the second vesicle to a state of maturity five days before this could have happened, had there been no consentaneous general action, or change in the system."

Mr. Bryce next details a series of experiments, which tend to prove, that if, during the regular progress of cow-pox, a second inoculation be performed a certain number of days after the first, the affection produced by this second inoculation will be accelerated in its progress so as to arrive at maturity, and again fade at nearly the same time as the affection arising from the first inoculation; and that this will take place, although the constitutional affection be so slight as otherwise to pass unnoticed.

From several examples related by Mr. Bryce, and a great many other cases, in which the second inoculation was performed at different periods of the primary affection, it is concluded, that the most proper time for performing the second inoculation, is about the end of the fifth, or beginning of the sixth day, from the first inoculation; reckoning each day to consist of twenty-four hours. Thus, if the first inoculation be performed on Wednesday at noon, the second

inoculation should be performed on Monday, at the same hour, at which time the fifth day is considered to be finished, and the sixth day to begin. If the second inoculation be delayed beyond the sixth day, the affection produced by it will be very indistinct, and of short duration; and if performed at an earlier period than the fifth day, the contrast between the progress of the two affections, with regard to duration, will not be so great as may be thought necessary.

"These observations, however, (says Mr. Bryce,) are applicable to those cases only, in which the first inoculation advances by a perfectly regular course, and in which the areola begins to form about the end of the seventh, or beginning of the eighth day; for in those cases, in which the first inoculation is from certain causes accelerated or retarded one or two days, as frequently happens, then the second inoculation should be performed at a more early or late period accordingly.

"In short, my observations on this point lead me to conclude, that in order to obtain the proposed criterion in the greatest perfection, the second inoculation should be performed between thirty-six and forty-eight hours before the areola of the first inoculation begins to appear. This is necessary in order that the secondary affection may have proceeded some length, and that a small vesicle, containing virus, may have been formed by it, before the constitutional action from the first inoculation begins, otherwise no areola, but merely a slight degree of hardness will take place from the second puncture.

"As, on the one hand, the acceleration of the second inoculation in the manner above-mentioned, is to be regarded as a certain mark of a constitutional affection in cow-pox, so, on the other, if it shall be found that no such acceleration takes place, but that the second inoculation proceeds by a slow progress through all the stages, and has the duration of a primary affection, it is to be concluded that no constitutional action has taken place from the first insertion of the virus; and when this is the case, the second inoculation must be regarded as a primary affection, and a third puncture be made according to the plan laid down for conducting the second inoculation; and thus we may go on until the proper test be obtained, or until we be satisfied that the constitution completely resists the action of cow-pox." See Bryce's Practical Observations on the Inoculation of Cow-pox, edit. 2.

Many other particulars relating to the subject of vaccination will be found in another place (see COW-POX), and we shall therefore merely add, that the new practice is on every account deserving of the confidence and encouragement of the public. The cow-pox is greatly milder than the small-pox, even under the most approved mode of treatment; being never attended with danger, seldom with sickness, and never producing pustules generally over the body, nor indeed any disfigurement of the skin, except at the part where the virus has been directly inserted by the inoculator. The small-pox is one of the most contagious diseases to which the human race is subject; and, when propagated in this way, it is one of the most fatal. On the other hand, the cow-pox is not at all contagious, and can only be communicated by the application of the vaccine virus to the part affected, as happens in the accidental inoculation of the hands of milkers, and the ordinary practice of vaccination.

Many hundreds of thousands have now been vaccinated in these kingdoms, and yet there is not on record a single unequivocal instance of the cow-pox having proved fatal. Corresponding agreeable accounts are also received from every part of the civilized world. The weight which this consideration ought to have may be well conceived, when it

VACCINIUM.

is remembered, that in Great Britain and Ireland alone, the yearly mortality arising from the small-pox used to be estimated at about 45,000 persons. In the Russian empire, and other cold countries, the ravages of the small-pox were far more dreadful, and this contagion sometimes broke out in such regions with a degree of fury far exceeding any thing ever heard of the plague itself. See INOCULATION.

VACCINIA, the new scientific name of the cow-pox, and which is now adopted by all the latest and best medical writers. See COW-POX, and VACCINATION.

VACCINIUM, in *Botany*, an ancient Latin name, whether of a flower or a berry has always been a point in dispute among critics, as well as the etymology of the word. Some conceive it to have been derived from the Greek *ὄξυς*, and therefore to be either precisely synonymous with the Latin *Hyacinthus*, or at least to belong to something agreeing with that plant in colour. The line of Virgil,

“*Alba ligustra cadunt, vaccinia nigra leguntur,*”

has afforded scope for the commentators, being equally obscure, whether we suppose *ligustra* to mean the flowers of the privet, and *vaccinia* its black berries, (which, by the bye, are not gathered by any body,) or whether, as is the most general opinion, the latter word may express our Bilberry, or any other black or dark berry in general use. We have already observed, in its proper place, that our Privet is not the original *LIGUSTRUM*; see that article. Linnæus however declares, very reasonably, that no future contentions or discoveries of the learned shall unsettle his name of *Vaccinium*, as applied to the Bilberry or Whortleberry tribe, for which this generic appellation is now universally adopted.—Linn. Gen. 191. Schreb. 258. Willd. Sp. Pl. v. 2. 348. Mart. Mill. Dict. v. 4. Sm. Fl. Brit. 414. Prodr. Fl. Græc. Sibth. v. 1. 255. Ait. Hort. Kew. v. 2. 355. Pursh 284. Juss. 162. Lamarck Illustr. t. 286. Gært. t. 28. (*Vitis idæa*; Tourn. t. 377. *Oxycoccus*; Tourn. t. 431. Pursh 263.)—Class and order, *Octandria Monogynia*. (*Decandria Monogynia*, Pursh.) Nat. Ord. *Bicornes*, Linn. *Erica*, Juss.

Gen. Ch. Cal. Perianth superior, of one leaf, small, permanent. Cor. of one petal, bell-shaped, more or less deeply four-cleft; the segments revolute. Stam. Filaments eight, simple, inserted into the receptacle; anthers two-horned, bursting at the summits, and sometimes furnished at the back with two spreading spurs, or bristles. Pist. Germen roundish, inferior; style simple, longer than the stamens; stigma obtuse. Peric. Berry globose, depressed at the top, of four cells. Seeds few, small.

Eff. Ch. Corolla of one petal. Stamens inserted into the receptacle. Anthers with two terminal pores. Berry inferior, of four cells, with several seeds.

Obs. Linnæus remarks, that “one fifth is often added to every part of the fructification;” hence Mr. Pursh has removed *Vaccinium* to the class *Decandria*. The Swedish naturalist also mentions, that “the calyx, four-cleft in many of the species, is entire in *V. Myrtillus*; and that almost the whole of the fresh corolla of *V. Oxycoccus* is rolled back to its base.” The latter character caused Tournefort, who relied so much on the corolla, to separate *Oxycoccus* as a genus, in which Pursh, with one or two other botanists, have followed him. But Tournefort erroneously supposed this flower to have four distinct petals, a mistake corrected by Linnæus; see Fl. Lapp. n. 145 γ, where sufficient reasons appear for considering the plant as a *Vaccinium*. The character of the tubular deeply divided anthers in *Oxycoccus*, superadded by Mr. Pursh, tends only to deceive, being found in several indubitable species of *Vaccinium*.

The genus before us, mostly confined to Europe and North America, is peculiarly abundant in the latter country. It is very remarkable that, as no *Erica* occurs in America, so no *Vaccinium* has been found at the Cape of Good Hope. These genera, similar in many of their flowers, differ no less widely in the situation of their germens, and texture of their fruits, than in the insertion and habit of their foliage, which in *Vaccinium* is scattered, dilated, generally membranous and deciduous; always indeed simple and undivided; but totally unlike the narrow, whorled, evergreen leaves of *Erica*. The flowers in *Vaccinium* are copious, stalked, either solitary, simply racemose, or tufted, drooping, inodorous, generally very elegant, tinted with various shades of red or pink, never blue, scarcely yellowish. Berries black, purple, blueish or red, generally eatable, though not pleafant, nor always wholesome, in a crude state. Stem shrubby, bushy, of humble stature. Stipules none.

The species of *Vaccinium* were ill understood by Linnæus, but we hope to trace the origin of many of his errors, which have never been cleared up, and have led all following authors astray. Murray defines but fifteen species in the fourteenth edition of Syst. Veg.; Willdenow has twenty-seven, of which five are European, three natives of Japan, one of Otaheite, one of Jamaica, the rest North American. Pursh has twenty-five species of *Vaccinium*, besides three of *Oxycoccus*, from North America only. In reviewing the whole of the genus, we find something to add, though we have many specimens that are dubious. We are obliged to follow the distribution of Linnæus, by which the evergreen species are separated from those which are deciduous, though some uncertainty must always attend that character, respecting species known from dried specimens only.

SECT. 1. *Leaves deciduous.*

1. *V. Myrtillus*. Common Bilberry, or Bleaberry. Linn. Sp. Pl. 498. Willd. n. 1. Fl. Brit. n. 1. Engl. Bot. t. 456. Fl. Dan. t. 974. (*Vaccinia nigra*; Ger. Em. 1415. *Myrtillus*; Matth. Valgr. v. 1. 210. Camer. Epit. 135.)—Stalks solitary, single-flowered. Leaves deciduous, serrated, ovate, smooth. Stem acutely angular. Calyx scarcely divided.—Native of heaths, stony moors, and mountainous woods, throughout most parts of Europe, especially the more northern, flowering in May. Dr. Sibthorp gathered it also on the Bithynian Olympus. The root is woody. Stem from six or eight inches to two feet high, erect, bushy, smooth; the young green branches leafy, a little zigzag, furnished with very acute dilated angles. Leaves about an inch long, on short footstalks, pellucid, veiny, rather acute, copiously serrated; paler beneath. Flowers pendulous, on simple, naked, smooth, axillary stalks. Calyx dilated, angular, seldom so much lobed as in Engl. Bot. Corolla globose, generally five-cleft, of a very delicate waxy pink hue. Anthers horned. Germen glaucous. Berry the size of a currant, blueish-black, acid, eaten in tarts, or with cream, in the north and west of England. In the eastern counties this plant is not plentiful. Its fruit is sometimes sent into Norfolk from Devonshire. Mr. Menzies brought, from the west coast of North America, what we can scarcely make more than a gigantic variety of this species, seven or eight feet high, larger in every part, with less distinctly serrated leaves.

2. *V. ovalifolium*. Oval-leaved Bilberry.—Stalks solitary, single-flowered. Leaves deciduous, elliptical, obtuse, point-les, entire, smooth, strongly veined beneath. Stem angular. Calyx scarcely divided.—Brought by Mr. Menzies from the west coast of North America. A shrub ten or twelve feet high, whose smooth branches are less acutely angular than in the foregoing, and whose leaves are very essentially different.

being either perfectly elliptical, or slightly ovate, blunt, and quite entire, about an inch and a half long, copiously reticulated with fine veins, quite smooth on both sides; rather paler beneath. *Flowers* solitary at the base of each tuft of budding leaves, drooping, each accompanied, at the base of its *stalk*, by a large ovate, acute, coloured *bractea*. The *flowers* seem to agree with those of *V. Myrtillus* in size, colour, and structure, except that the *corolla* is more ovate. The *berries* are black, crowned with the cup-shaped, slightly four-lobed, *calyx*.

3. *V. parvifolium*. Small-leaved Red Bilberry.—Stalks solitary, single-flowered. Leaves deciduous, elliptical, obtuse, pointed, entire, smooth; glaucous, and slightly veiny, beneath. Stem acutely angular. Calyx scarcely divided. Stalk of the fruit club-shaped.—Gathered by Mr. Menzies on the west coast of North America. The shrubby *stem* is eight or ten feet high, with smooth zigzag *branches*, whose angles are as much dilated and prominent as in our first species. The *leaves* most agree with those of *ovalifolium* in shape, but are at their full growth scarcely a quarter so large, and each tipped with a small point; their under side rather glaucous, with less copious, and far less prominent, veiny reticulations. We have seen no *flowers*. The *berries* are red, and make excellent tarts. They appear to be smaller than the last, crowned with a similar *calyx*, but their *stalk* is shorter, measuring scarcely half an inch, more drooping, and very remarkably swelling upward, so as to be quite club-shaped, contracted at the summit, of which the foregoing shews but slight traces. There is no doubt of these two species being very distinct from each other, as well as from all hitherto described by authors.

4. *V. pallidum*. Pale Whortle-berry. Ait. n. 2. Willd. n. 2. Pursh n. 6.—“Clusters bracteated. Corolla cylindrical-bell-shaped. Leaves ovate, acute, finely serrated, deciduous.”—Native of North America, from whence it is said to have been sent to Kew garden in 1772, by Dr. Samuel Martin. Mr. Pursh never met with this species, nor was he able to ascertain it, even by a strict examination of the Banksian herbarium. Neither are we furnished with a specimen, nor with any information concerning this plant, which, on account of its *inflorescence*, seems here misplaced.

5. *V. hirtum*. Hairy Japan Whortle-berry. Thunb. Jap. 155. Willd. n. 3.—Stalks solitary, single-flowered. Leaves deciduous, ovate, serrated, hairy all over as well as the young branches.—Gathered on hills between Miaco and Jedo in Japan, by professor Thunberg, one of whose specimens is before us. A taller *shrub* than our *Myrtillus*, flowering in April. The *branches* are round. *Leaves* like that species in size and shape, but covered with soft hairs; their under side rather pale. *Flowers* drooping, on very short stalks.

6. *V. uliginosum*. Great Bilberry. Linn. Sp. Pl. 499. Willd. n. 5. Fl. Brit. n. 2. Engl. Bot. t. 581. Fl. Dan. t. 231. Pursh n. 15. (*Vitis idæa magna quibusdam, sive Myrtillus grandis*; Bauh. Hist. v. 1. 518. Raii Syn. 457. *V. idæa foliis subrotundis major*; Ger. Em. 1416.)—Stalks somewhat aggregate, single-flowered. Leaves deciduous, obovate, entire, smooth. Branches round.—Native of marshy mountainous heaths, and alpine bogs, in Sweden, Germany, Switzerland, Savoy, Scotland, and the north of England; as well as in the more northern parts of America, and on its west coast; flowering in April or May, and ripening the berries, which are eatable, but not either very grateful or wholesome, in August. Taller than the Common Bilberry, and of a more glaucous hue. *Leaves* smooth and even above; veiny and glaucous at the back; quite entire, by which this species is readily distin-

guished from all that in other respects bear any resemblance to it. *Flowers* drooping, flesh-coloured, mostly four-cleft, with eight long-horned *stamens*. *Calyx* short and blunt. *Berry* large, juicy, black, with a glaucous hue. *Seeds* finely striated. A variety with slightly pointed *leaves*, was published by an apothecary at Berne, in 1787, as *V. mucronatum*, an imaginary species, of which we shall speak at the end of our eighth.

7. *V. calycinum*. Large-cupped Whortle-berry.—Stalks solitary, single-flowered. Leaves deciduous, obovate, serrated, smooth, with downy ribs. Branches angular. Segments of the calyx deep, ovate.—Gathered by Mr. Menzies, in woods, upon lofty mountains, in the Sandwich islands. This appears to be of a much taller stature than the preceding. The *leaves* at the flowering season are an inch and a quarter long, near an inch wide, pliant, with fine, copious, pointed, incurved serratures, and a small, blunt, terminal point; their under side palest. *Flowers* about the lower part of each young leafy branch, axillary, drooping, each on a simple, naked, slightly downy *stalk*, an inch long. *Calyx* in five, rather unequal, deep, ovate, entire, bluntish, smooth, finely reticulated segments, exceeding the *germen* in length. *Corolla* oblong, with five angles, enclosing the *anthers* and *style*. Of the *fruit* we have no knowledge.

8. *V. flamineum*. Green-wooded Whortle-berry. Linn. Sp. Pl. 498. Willd. n. 4. Ait. n. 3. Pursh n. 1. Andr. Repof. t. 263. (*V. album*; Pursh n. 2, excluding the synonym of Willdenow. *Arbuscula americana baccifera, sicculis comosis, &c.*; Pluk. Mant. 22. Phyt. t. 339. f. 3.)—Clusters downy, with oval bractæas as long as the flowers. Anthers twice as long as the spreading bell-shaped corolla. Leaves elliptical, acute, entire; glaucous and rather downy beneath.—Common in dry woods, from New England to Florida, flowering in May and June. The *trunk* is firm, about two feet high, with numerous green *branches*, downy when young. *Leaves* an inch and a half or two inches long at the flowering season, on very short downy stalks. *Flowers* copious, white, with remarkably conspicuous, tawny, linear *anthers*, spurred near the base. *Corolla* broader than long. *Berries* greenish, or white, called Deer-berries. Analogy leads us to consider the inflorescence of this species as racemose. Indeed the *bractæas*, though resembling the leaves in every respect but size, are usually but one-fourth as large, and sometimes not a quarter of an inch in length. Mr. Pursh's *album* can scarcely, by his definition or Andrews's figure, be marked even as a variety, though he says the *flowers* are larger, and *berries* more globose, than in the common *flamineum*. That his plant is not the Linnæan *album*, appears from the original specimen, sent by Kalm to Linnæus, under the denomination of “a *Vaccinium* with white berries;” but which proves *Xylosteum ciliatum* β, Pursh 161. No wonder that no subsequent investigator could ever ascertain *V. album*! We must notice another error of Linnæus, to prevent mistake. He cites under *V. flamineum* the proper figure of Plukenet, but with a wrong synonym or definition. Here also it falls to our lot to correct our great master respecting another of Kalm's plants, *V. mucronatum*, which has ever remained as unintelligible as the *album*. His described specimen is certainly one of the *Mespilus* or *Pyrus* tribe, but not in a condition for us precisely to ascertain the species, nor can we refer it to any thing in Mr. Pursh's work.

9. *V. arboreum*. Shining-leaved Tree Whortle-berry. Marsh. in Michaux Boreal.-Amer. v. 1. 230. Pursh n. 3. (*V. diffusum*; Ait. n. 5. Willd. n. 8.)—Stalks axillary and solitary, or terminal and racemose, naked. Leaves ovate, acute, with slight glandular serratures; polished above;

VACCINIUM.

above; rather downy beneath. Corolla bell-shaped, acute. Stamens the length of its tube.—In dry woods, on the rocky banks of rivers, from North Carolina to Florida, flowering in May and June. A large *shrub*, sometimes twenty feet high, very elegant. Flowers white, tinged with red. Berries globular, black, almost dry. *Pursh*. Our numerous wild as well as cultivated specimens, compared with the Banksian herbarium, and answering to every particular of the published accounts of this plant, leave no doubt of its identity, and therefore we do not scruple to adopt Michaux's name, in preference to the older one, *diffusum*, the latter being founded in some mistake. The branches are round, downy when young. Leaves peculiarly shining, and strongly reticulated with veins. Flower-stalks an inch long, angular, marked with two or three glands; some of them axillary, solitary, from several of the lower leaves of each branch; others forming a nearly leafless cluster, at the end of the same branch. In one instance we find two such clusters, with a small leafy bractea, or two in the middle, terminating a short lateral branch whose leaves are fallen. This proves that Nature has drawn no precise line of demarcation between the racemose and the solitary inflorescence of this genus, which in many species, by the ambiguous nature of their floral leaves, run into each other.

10. *V. angustifolium*. Narrow-leaved Whortle-berry, or Bluets. Ait. n. 6. Willd. n. 9. (*V. myrtilloides*; Michaux Boreal.-Amer. v. 1. 234. Pursh n. 16.)—Stalks scattered, mostly solitary, single-flowered, naked. Leaves lanceolate, nearly entire; downy at the ribs and margin.—In Canada, about Hudson's Bay and Labrador, flowering in April and May. Berries large, blueish-black, known by the name of Bluets. *Pursh*. Michaux says this species has the habit of *V. Myrtilus*; its leaves being membranous, of a narrow lanceolate form. We have seen no specimen. Dr. Solander's original name, in Hort. Kew. and Willdenow, appears preferable to that of Michaux adopted by Pursh.

11. *V. dumosum*. Bushy Whortle-berry. Ait. n. 7. Pursh n. 4. Curt. Mag. t. 1106. Andr. Repof. t. 112. (*V. frondosum*; Michaux Boreal.-Amer. v. 1. 230. *V. hirtellum*; Ait. n. 12, according to Pursh, from a comparison with the Banksian herbarium.)—Clusters downy, with oval bracteas; partial stalks with two lanceolate ones. Leaves obovate, pointed, entire, downy and viscid. Germen hairy. Corolla bell-shaped, obtuse, longer than the stamens.—In dry sandy woods, particularly pine forests, from New Jersey to Florida, flowering in June and July. A low bushy *shrub*, with round branches. Leaves an inch and a half long, varying in breadth, reticulated with veins; paler beneath, but not at all glaucous; covered all over, especially when young, with short viscid pubescence, and glandular dots, as are also the branches, stalks, and bracteas. The latter are as long as the flowers, and leafy, like those of *V. stamineum*, n. 8; but each partial flower-stalk bears also, about its middle, two smaller, lanceolate, sometimes coloured, partial bracteas. The germen is particularly shaggy. Segments of the calyx deep, ovate, fringed, coloured. Corolla white, tinged with pink, rather large. Berries black, globular. A comparison of the two figures above cited will shew the ambiguous nature of the inflorescence, and account for this species having been described twice in the accurate publication of Mr. Aiton.

12. *V. cespitosum*. Dwarf Tufted Whortle-berry. Michaux Boreal.-Amer. v. 1. 234. Pursh n. 17.—Flowers lateral, solitary, nearly sessile. Leaves somewhat wedge-shaped, rounded, obtuse, serrated, membranous, very smooth.—In the more northern regions of America, parti-

cularly about Hudson's Bay. A little *shrub*, with many crowded stems, from two to four inches high, very smooth in every part. Corolla of a short pitcher-shape. Berry nearly sessile, globose, glaucous-black. Michaux.

13. *V. corymbosum*. Naked-flowering Whortle-berry. Linn. Sp. Pl. 499. Willd. n. 10. Pursh n. 8. (*V. amœnum*; Ait. n. 13. Willd. n. 18. Pursh n. 9. Andr. Repof. t. 138. *V. difomorphum*; Michaux Boreal.-Amer. v. 1. 231.)

β. *V. virgatum*; Ait. n. 14. Willd. n. 19. Pursh n. 10. Andr. Repof. t. 181.

γ. *V. fuscatum*; Ait. n. 8. Willd. n. 13. Pursh n. 11. (*V. formosum*; Andr. Repof. t. 97.)

Flowering branches nearly leafless. Clusters corymbose, drooping. Bracteas membranous, shorter than the downy flower-stalks. Leaves elliptical, acute, minutely serrated, smooth, with downy ribs.—Native of swamps and wet woods, from Canada to Carolina and Georgia, flowering in May and June. A tall *shrub*, sometimes seven or eight feet high, with numerous roughish round branches; somewhat angular and downy when young. Leaves for the most part following the flowers, an inch and a half or two inches long, elliptic-oblong, acute at each end, various in breadth, veiny, but not strikingly reticulated; very minutely, more or less evidently, serrated; tipped with a glandular point; smooth, except the rib and veins, which are finely hairy or downy, especially at an early period. Footstalks short and broad, downy. Clusters from branches of the preceding year, seldom accompanied with leaves, alternate, about an inch long, and rather compact, often corymbose, of six or eight drooping flowers, whose partial stalks are finely downy, with short curved hairs, and furnished at the base with membranous, reddish, smooth, fringed, deciduous bracteas, varying in length and acuteness, but mostly much shorter than their corresponding stalks. Segments of the calyx broad and shallow. Corolla white or reddish, cylindrical, somewhat angular, contracted at the mouth, with five shallow, spreading, marginal segments. Stamens ten, downy. Anthers within the corolla, having a double pouch at the base, but no spurs. Style sometimes, but not always, a little prominent. Berries black, insipid. Some apology may seem necessary for our thus uniting four reputed species, a measure of which Michaux first, in part, suggested the propriety. With respect to the *corymbosum* and *amœnum*, original specimens of each, and the total want of any distinctive character in authors, will abundantly justify us. The calyx spreads equally in both. Indeed the former being always unknown, by name, in our gardens, and its specific character in Linnæus being insufficient, if not incorrect, that species could be ascertained by his herbarium only, which in this instance was neglected, and the same plant appeared in the first edition of Hort. Kew. under the name of *amœnum*, acquired in England. It had here once been called *elevatum*, as appears by a specimen given to the younger Linnæus. Some gardeners subsequently transferred to *stamineum* the name of *amœnum*, and hence perhaps when the latter appeared afresh from America, it received the new appellations of *virgatum* and *fuscatum*, perpetuated likewise in Hort. Kew., between the original specific characters of which there can be little discovered that is essential. In Mr. Andrews's plate of *virgatum* indeed the clusters are accompanied by leaves, of which we have seen no example in *corymbosum*, and the flowers are smaller than usual in this latter; but Mr. Pursh, under the name of *amœnum*, allows that it "has a number of varieties in size, shape, and colour." The elegant *fuscatum*, as figured by Mr. Andrews, evidently betrays a close affinity to

VACCINIUM.

to *corymbosum*, colour being avowedly of no importance, and the erect *calyx* we have good reason to mistrust. Having formed our opinion from the best materials in our power, we leave its refutation or confirmation to those who may have opportunities of future inquiry, without any intentional disrespect to the great authorities from which we dissent.

14. *V. bracteatum*. Braçteated Japan Whortle-berry. Thunb. Jap. 156. Willd. n. 11.—Clusters axillary, longer than the smooth, acute, ferrated leaves. Braçteas lanceolate, ferrated; partial stalks with two smaller awl-shaped ones.—Gathered by Thunberg in the island of Niphon, Japan, flowering in June. The *branches* are always smooth, leafy, slightly angular when young. *Leaves* elliptic-lanceolate, acute at each end, an inch and a half long, on short stalks, sharply but not deeply ferrated, very smooth on both sides; paler, and most reticulated, beneath. We should suspect them to be evergreen, as they accompany the flowers, on what seem to be last year's shoots; but having no particular information, we, like Willdenow, place this species among those to which it appears to be naturally related. *Clusters* two or three inches long, axillary, solitary, simple, slender, many-flowered, very smooth. *Partial stalks* short, drooping, turned all one way, each having at its base a lanceolate, acute, smooth *bractea*, mostly twice its own length, and about the middle two others of a very small size. Segments of the *calyx* short, acute, spreading. *Corolla* cylindrical, white. Nothing is known of the fruit. The Japanese call this plant *Ki Fusi*.

15. *V. ciliatum*. Hairy-ribbed Japan Whortle-berry. Thunb. Jap. 156. Willd. n. 12.—Clusters axillary, longer than the ovate, bristly, nearly entire leaves. Braçteas lanceolate, smooth.—Native of Japan, where it is called *Sasjebu*. The *stem* is smooth, ash-coloured, with upright villous *branches*. *Leaves* ovate, acute, unequal, from one to two inches long, ribbed; the ribs hispid all over. *Flowers* red, turned one way, in terminal, solitary, braçteated *clusters*, as long as the finger. *Braçteas* about one-third of an inch in length. *Calyx* very short. *Thunberg*. We formerly examined this species in professor Van Royen's herbarium, but are not possessed of a specimen. It must be presumed that by "*folia integra*" is not meant *undivided leaves*, the true sense of that expression; because no *Vaccinium* has any other. The learned author evidently contracts this phrase with the *folia ferrata* of the preceding species, and means that the leaves are *nearly* entire; in contradistinction to *integerrima*.

16. *V. galiformis*. Larger Gale-leaved Whortle-berry. (*V. galezans*; Michaux Boreal.-Amer. v. 1. 232. Pursh n. 12.)—"Flowers on very short stalks, in sessile tufts. Leaves sessile, lanceolate-wedged-shaped, slightly ferrated, downy. Calyx pointed. Corolla ovate, much contracted at the mouth. Style prominent."—Found in the shady woods and swamps of Virginia and Carolina, flowering in May and June. *Flowers* small, yellowish-white. *Berries* small, globular, black. *Pursh*. Michaux describes this shrub as having the aspect of *Myrica Gale*, with slightly downy *branches*. *Leaves* veiny. The *flower-stalks*, shorter than the *flowers*, burst from a *bud*, composed of numerous crowded scales, but become naked and corymbose as the fruit advances. We trust that we need not labour under the necessity of precisely retaining the original specific name. *V. tenellum* of Hort. Kew., cited doubtfully by Michaux, is not known to us; but Mr. Pursh describes it as distinct from the present species; see n. 20.

17. *V. frondosum*. Blunt-leaved Whortle-berry or Blue Tangles. Linn. Sp. Pl. 499. Willd. n. 14. Ait. n. 9.

Pursh n. 5. Andr. Repof. t. 140. (*V. glaucum*; Michaux Boreal.-Amer. v. 1. 231.)

β. *V. venustum*; Ait. n. 10. Willd. n. 15. Herb. Banks. *Pursh*.—Clusters lax. Braçteas obovate, not half so long as the slender partial flower-stalks, which bear two smaller linear ones. Leaves obovate-oblong, pointless, entire, smooth.—In open woods, on a sandy soil, from New Jersey to Carolina, flowering in May and June. About three feet high. *Flowers* small, almost globular, white. *Berries* large, blue, globular, eatable, called by the country people Blue Tangles. *Pursh*. The *branches* are round, smooth, and slender. *Leaves* from two to three inches long, thin and pliant, generally obtuse, but in the variety β acute; bright green above; glaucous beneath, sprinkled with minute resinous dots, and reticulated with copious veins. *Clusters* lateral, from the last year's wood, about the length of the leaves, loose, slender, and spreading. *Partial flower-stalks* about an inch long, with a small obovate, pointed, entire *bractea*, covered with resinous dots, at the base, and two, much smaller and narrower, deciduous ones about the middle. *Flowers* drooping, greenish-white, shaped like Lily of the Valley, but smaller. Segments of the *calyx* broad, deep, nearly triangular.

18. *V. ligustrinum*. Privet-leaved Whortle-berry. Michaux Boreal.-Amer. v. 1. 233. Pursh n. 13, excluding the synonym of Willdenow.—"Flowers nearly sessile, in sessile tufts. Leaves nearly sessile, erect, lanceolate, pointed, finely ferrated, veiny, downy. Corolla longish-ovate. Branches angular.—In dry woods, from Pennsylvania to Virginia; common on the mountains, flowering in May and June. An upright straight shrub. *Leaves* membranous, furnished with conspicuous, often purplish, veins. *Scales* of the flower-buds also purplish. Tufts of *flowers* sometimes springing leafless from the branches, sometimes axillary. *Corolla* purplish-red. *Berries* black. The *leaves* vary extremely in shape and size. *Pursh*, *Michaux*. We adopt this species, which we have never seen, from the authors quoted, under the name by which they have distinguished it. But the Linnæan *V. ligustrinum* is a nonentity, or rather no *Vaccinium*, being the very same plant with *Andromeda paniculata*; Linnæus having received it in flower, from Kalm, as a *Vaccinium*, and in fruit, as an *Andromeda*. The latter specimen, having flowers of another species annexed, could not but mislead him, though we must allow that he too implicitly trusted his pupil, in all the strange blunders, which we have had the mortification of recording and explaining, relative to this genus.

19. *V. resinofum*. Clammy Whortle-berry. Ait. n. 11. Willd. n. 17. Pursh n. 7. Curt. Mag. t. 1288. (*V. parviflorum*; Andr. Repof. t. 125. "Andromeda baccata; Wangenh. Amer. t. 30. f. 60.")—Clusters leafless, viscid, downy, with lanceolate braçteas on the partial stalks. Leaves obovate-lanceolate, bluntish, pointless, entire, covered with resinous dots. Calyx in five deep ovate segments, longer than the germen.—In woods and on mountains frequent, from Canada to Carolina, flowering in May and June. From two to four feet high. *Berries* black, eatable. *Pursh*. The *branches* are round; downy when young. *Leaves* usually an inch and half long, bright green on both sides, more or less obtuse, viscid; veiny beneath. *Clusters* lateral, from last year's wood, drooping, lax, shorter than the leaves. *Flowers* small, either red or tawny, or of a greenish-yellow. *Calyx* reddish or brown, remarkably large in proportion to the germen, not well expressed in either of our English figures.

20. *V. tenellum*. Gale-leaved Dwarf Whortle-berry. Ait. n. 15. Willd. n. 20. Pursh n. 14. (*V. pennsylvanicum*;

VACCINIUM.

vanicum; Lamarck Dict. v. 1. 74. Michaux Boreal.-Amer. v. 1. 232.)—Flowers in dense sessile tufts. Leaves nearly sessile, ovato-lanceolate, pointed, finely serrated, smooth, except the rib and margin. Branches angular, with a downy line at each side. Calyx in five deep acute segments.—On dry hills on a gravelly soil, from New England to Virginia, flowering in May. A low, very branching shrub. *Flowers* pale red. *Calyx* green. *Berries* large, bluish-black, extremely sweet and agreeable to eat. The mountains of Pennsylvania produce an immense variety of this species, in size and shape of the fruit, leaves, and flowers. *Pursh*. Specimens from the late Rev. Dr. Muhlenberg, which we cannot but refer to this, have green rather warty branches, distinguished by a fine downy line along each side. The leaves are an inch long, resembling those of some dwarf Willows, beautifully reticulated, sometimes purplish; most shining beneath; their serratures minute, glandular, downy, as well as the mid-rib. *Flowers* few, in tufts, from scaly axillary red buds, about the tops of the branches. *Calyx* very smooth.

21. *V. arctostaphylos*. Oriental Bear-berry, or Whortle-berry. Linn. Sp. Pl. 500. Willd. n. 21. (*Vitis idæa orientalis maxima, cerasi folio, flore variegato*; Tourn. Cor. 42. Voyage v. 2. 98, with a figure.)—Clusters lateral. Bractæas all at the base of the partial stalks. Leaves elliptical, acute, minutely serrated; hairy beneath. Stamens as long as the bell-shaped corolla, with very hairy filaments. Calyx slightly five-lobed.—Gathered on the coast of the Black sea, by Tournefort, two of whose specimens are before us. He describes this shrub as the height of a man, with a trunk as thick as one's arm. The young leafy branches are downy on two opposite sides, like the foregoing, but more broadly. Footstalks extremely short and broad, hairy. Leaves pliant, broadly elliptical, tapering at each end, two inches and a half long, and nearly one and a half broad, bright green, sometimes reddish above, and quite smooth, except the midrib, on that side; paler beneath, and besprinkled with short prominent hairs, especially about the lower part of the rib; their margin furnished with copious, but blunt and shallow, serratures. Clusters from the wood of the preceding year, below the fresh leafy shoots, drooping, one and a half or two inches long, somewhat hairy, composed of eight or ten pendulous flowers, of a dirty white, striped or stained with purple. Bractæas several at the base of each partial flower-stalk, fringed; one of them large, ovate, often half an inch, or more, in length; the rest linear-lanceolate, much smaller, one or two in number, scarcely more, being analogous to those found about the middle of the partial stalks, in several species already described, though differently situated in the present species and its allies. Calyx with five shallow, more or less evident, marginal segments, smooth. Corolla bell-shaped, five lines long and four wide, with five shallow, recurved, marginal segments. Filaments ten, nearly half as long as the corolla, stout, gibbous, extremely hairy at the back. Anthers longer than the filaments, yellow, smooth, and tubular above, furnished with two granulated pouches, descending much below their insertion, at the inner side of the filament, and with two small dorsal spurs, at the base of the tubes above those pouches. Style shorter than the corolla. The berries were seen by Tournefort in an unripe state only. He judges this plant, with great probability, to be the *αειλοσάφυλος*, or Bear-grape of Galen.

What the variety β of Linnaeus may be, we know not, as nothing answerable to his reference is to be found in Tournefort's *Corollarium*.

22. *V. padifolium*. Madeira Whortle-berry. (*V. Arctostaphylos*; Ait. n. 16. Curt. Mag. t. 974. Andr. Repof. t. 30. Pallas Ross. v. 1. p. 2. 45.)—Clusters lateral. Bractæas all at the base of the partial stalks. Leaves ovato-lanceolate, acute, finely serrated, smooth on both sides, except the mid-rib. Stamens nearly as long as the bell-shaped corolla, with smooth, slightly fringed, filaments. Calyx five-lobed.—Native of the loftiest parts of the island of Madeira, where it forms impenetrable thickets, flowering in July, according to Mr. Maffon, who sent a specimen to the younger Linnæus in 1777. This so precisely agrees with Mr. Edwards's figure in Curtis's Magazine, drawn from a plant obtained from mount Caucasus, by Mr. Loddiges, that we cannot doubt its being what Pallas found in the alpine beech forests of that neighbourhood. The younger Linnæus obtained a specimen of the same, from the English gardens; and we received one in flower, from the present duke of Marlborough's garden, at White Knight's, in June 1806. So far therefore our cultivated plant is identified, nor can any thing be more clearly distinct from the true *V. Arctostaphylos*. The leaves, well compared by Pallas to those of the Bird-cherry, are of a more firm rigid texture, and not half so large as the former; they are more rounded at the base; their serratures, though small, more evident; under surface quite smooth, except at the very base about the mid-rib, which is also a little hairy on the upper side. Footstalks longer. Calyx more decidedly five-lobed, though it appears to vary in the depth of its segments. Corolla larger, pale green, with a purple tinge; sometimes it seems to be all over purple externally. Partial or internal bractæas rather broader. Germen very glaucous. The filaments differ essentially, in being flat, quite smooth at each side, and only slightly fringed in the margin, especially about the top. We can discern no spurs on the anthers, which moreover are rather shorter with respect to the corolla. The style is sometimes a little prominent, but not constantly. Pallas says the berries are black, juicy, eatable, gratefully acid. Sometimes, though very rarely, he found the flowers four-cleft.

23. *V. cylindraceum*. Azorian Whortle-berry.—Clusters lateral. Bractæas serrated, all at the base of the partial stalks. Leaves elliptic-lanceolate, acute, finely serrated, quite smooth, except the base of the mid-rib. Stamens half the length of the cylindrical corolla, with hairy filaments. Calyx slightly five-lobed.—Native of mountains in the Azores, where this species is called *Uva de Serra*, or Mountain Berry. We believe our specimen to have been gathered by Mr. Maffon. The stem appears to be arborescent. The branches are stout, round, those only of the present year leafy, and finely downy at the two opposite sides. Leaves like the last, but rather larger, more tapering at the base, and quite smooth, except a little short down at the bottom, about the mid-rib and footstalk. Clusters numerous, on the leafless branches of the preceding season, under the leafy shoots of the present year, spreading the length of the leaves, with smooth, angular, reddish stalks; and deciduous bractæas, of which the inner ones are lanceolate and sharply toothed. Flowers drooping, nearly an inch long, apparently red or purple. Calyx with a dilated border, very slightly and obtusely five-lobed. Corolla twice as long as the last, cylindrical, with five erect, short, marginal segments. Stamens but half the length of the corolla; their filaments loosely hairy all over; anthers shorter than the filaments, destitute of spurs. Style rather longer than the corolla. Of the fruit we have no account, nor do we know whether this species has ever found its way into the English gardens.

See.

VACCINIUM.

Se&t. 2. *Leaves evergreen.*

24. *V. meridionale.* Jamaica Whortle-berry. Swartz Ind. Occ. 676. Willd. n. 22. Ait. n. 17.—Clusters erect, downy. Bractæas solitary, ovate. Leaves ovate, crenate, permanent, smooth. Stem arborescent.—Native of the lofty Blue mountains in the southern part of Jamaica, flowering in February, and ripening fruit in August. This is from ten to thirty feet high, with a very straight smooth trunk, and hard wood. Branches straight, spreading, leafy, round; downy when young. Leaves rigid, an inch or rather more in length, on short, broad, downy stalks, flat, and somewhat shining, veiny; paler beneath. Clusters solitary near the end of last year's branches, twice as long as the leaves; their partial stalks naked, except a large, solitary, ovate, smooth, coloured, deciduous bractæa, at the base of each, and equal to it in length. Flowers drooping, reddish-white. Calyx in four broad, acute, permanent segments. Corolla ovate, quadrangular before expansion, contracted at the mouth, with four acute, recurved, marginal segments. Stamens eight, as long as the corolla, their filaments hairy in the middle. Dr. Swartz mistakes the tubular points of the anthers for horns or spurs. Style the length of the corolla. Berry roundish, juicy, pleasantly flavoured, pale red, resembling that of *V. vitis idæa*. The flowers are very rarely five-cleft and decandrous.

25. *V. cereum.* Otaheité Whortle-berry. Forst. Prodr. 28. Willd. n. 25. (*Andromeda cerea*; Linn. Suppl. 238.)—Stalks axillary, solitary, single-flowered, with two lanceolate bractæas about the middle. Leaves roundish-ovate, serrated, smooth, permanent. Calyx in five broad pointed segments.—Gathered by Forster in Otaheité. The branches are round, smooth, leafy; slightly downy when young. Leaves about an inch long, pointed, coriaceous, veiny, twice the length of the smooth simple flower-stalks. Corolla ovate-oblong, with five angles, and five erect small segments. Anthers, according to Linnæus, with two dorsal horns.

26. *V. vitis idæa.* Red Whortle-berry, or Cow-berry. Linn. Sp. Pl. 500. Willd. n. 24. Fl. Brit. n. 3. Engl. Bot. t. 598. Pursh n. 18. Fl. Dan. t. 40. (*Vaccinia rubra*; Ger. Em. 1415. *Vitis idæa rubra*; Camer. Epit. 136.)—Clusters terminal, drooping; with ovate concave bractæas, longer than the flower-stalks. Leaves obovate, revolute, minutely toothed; dotted beneath. Corolla bell-shaped.—Native of dry barren stony woods and heaths, in the north of Europe, plentiful in Scotland, Westmoreland, Derbyshire, Wales, &c. flowering in June, and ripening fruit in August. Mr. Pursh says it occurs on rocks near the sea-coast, from Canada to New England, but the American plant is more robust than the European, with considerably larger leaves. The roots are creeping, woody. Stems ascending, in England about a span high, wavy, but little branched, smooth, leafy; young branches round, downy. Leaves evergreen, somewhat like box, but darker on the upper side, smooth and shining. Flowers pale pink, four-cleft, in elegant, dense, solitary, pendulous clusters. Calyx in four deep, broad, ovate, red segments. Anthers without horns. Stigma small, slightly notched. Berries blood-red, acid, austere and bitter, less palatable in tarts than either the Cranberry or Bilberry, but excellent in a rob or jelly, for colds and fore-throats, as well as to eat with roast meat, to which latter purpose this jelly is universally applied by the Swedes.

27. *V. myrtifolium.* Myrtle-leaved Black Whortle-berry. Michaux Boreal.-Amer. v. 1. 229. Pursh n. 19.—“Creeping, quite smooth. Leaves stalked, oval, shining, revolute, sparingly and minutely toothed. Clusters axillary,

nearly sessile, of few flowers. Corolla bell-shaped, somewhat inflated, minutely five-toothed. Anthers without dorsal horns.”—Found by Michaux only, in Carolina. He describes the berries as small, globose, crowned with the calyx, black, on short stalks.

28. *V. crassifolium.* Thick-leaved Whortle-berry. Andr. Repof. t. 105. Ait. n. 19. Pursh n. 20. Curt. Mag. t. 1152.—Clusters lateral and terminal, corymbose. Bractæas shorter than the flower-stalks. Leaves elliptical, crenate, smooth; paler and veiny beneath. Corolla bell-shaped. Stem diffuse.—Brought by Mr. Frazer from Carolina, in 1787. It flowers in May and June. A trailing evergreen species, requiring some shelter from our variable winters and springs. The leaves are not an inch long; their upper surface very smooth and even, with a little minute pubescence on the mid-rib and footstalk. Flowers five-cleft, prettily variegated with pink and white, drooping, on red corymbose stalks. Stamens hairy. We have no account of the fruit.

29. *V. villosum.* Hairy Mexican Whortle-berry.—Clusters longer than the leaves. Flower-stalks, calyx, corolla and lanceolate bractæas densely hairy. Leaves elliptical, entire, revolute, coriaceous, with a blunt point; hairy on the upper side.—Sent by Mutis to Linnæus from Mexico. The branches are round, leafy, densely hairy when young. Leaves crowded, an inch long, on thick downy footstalks; their upper side convex; under paler, veiny, scarcely hairy, except the rib. Clusters towards the ends of the younger branches, axillary, dense, drooping, nearly twice as long as the leaves, very hairy all over, the germen particularly. Bractæas coloured, internally smooth; those of the partial stalks very narrow. Calyx in five deep, lanceolate, densely fringed segments. Corolla purplish, oblong, with five hairy angles, and as many small recurved teeth. Fruit unknown, but the habit, and the inferior germen, sufficiently announce the genus.

30. *V. reticulatum.* Reticulated South-sea Whortle-berry.—Stalks axillary, solitary, single-flowered, downy. Leaves obovate, more or less serrated, coriaceous, with a blunt point; strongly reticulated on both sides and nearly smooth. Germen hairy.—Gathered by Mr. Menzies, in woods on high mountains, in the Sandwich islands.—The branches are leafy; when young angular and finely downy. Leaves an inch long, remarkable for their reticulated veins, prominent on both sides; their margin somewhat revolute, strongly serrated, but sometimes nearly entire. Flower-stalks numerous, erect, about an inch long, swelling upwards, without bractæas; reflexed as the fruit advances. Calyx in four or five deep, oblong, ribbed, downy, coloured segments, at length involute. Corolla cylindrical, thrice as long as the calyx, purple, slightly hairy, with four or five upright blunt teeth. Style hairy, shorter than the corolla. Berry globular, depressed, nearly or quite smooth.

31. *V. dentatum.* Toothed South-sea Whortle-berry.—Stalks axillary, solitary, single-flowered, smooth. Leaves obovate, with sharp tooth-like serratures, coriaceous, veiny, very smooth. Calyx longer than the smooth germen.—Found by Mr. Menzies, in woods on the lofty mountains of the Sandwich islands. The branches of this are angular, always smooth, like every other part. Leaves rather longer than the last, more strongly and uniformly toothed, with less prominent veins. Flower-stalks naked and smooth; recurved when in fruit. Calyx in five deep, oblong, obtuse, smooth, keeled segments, longer than the germen, even after the corolla is fallen, which latter is wanting in our specimens.

32. *V. nitidum.* Glossy Whortle-berry. Andr. Repof. t. 480.

VACCINIUM.

t. 480. Pursh n. 21. Ait. Epit. 376. Curt. Mag. t. 1550.—Clusters terminal, corymbose. Bractæas shorter than the flower-stalks. Leaves elliptic-obovate, acute, crenate, smooth and shining. Corolla cylindrical.—Native of Carolina, flowering in May and June. The stem is of humble growth, either erect, as in Andrews's figure, or diffuse, as in the Botanical Magazine; the young branches downy on two opposite sides. Leaves evergreen, from half an inch to an inch long, numerous, very smooth; paler and veiny beneath; on very short red footstalks. Flower-stalks, bractæas, and calyx very smooth, of a shining red or purple. Calyx in five broad, rather shallow, segments. Corolla ovate-oblong, white or pink, with five slight spreading teeth, longer than the style. This species bears some affinity to the following, as well as to *crassifolium*, n. 28; but differs from the latter essentially, as Mr. Pursh observes, in the shape of its corolla; to which may be added the form and polish of its leaves, and the young branches being downy on two sides only.

33. *V. myrsinites*. Small-leaved Whortle-berry. Michaux Boreal.-Amer. v. 1. 233. Pursh n. 22.—“Flowers in terminal and lateral scaly tufts, nearly sessile. Leaves sessile, oval, pointed, obscurely serrated; smooth and shining above; somewhat hairy and dotted beneath. Stem erect, much branched. Corolla oblong-ovate.”—In the dry sandy woods of Carolina and Florida, flowering in May and June. A beautiful little shrub, with slightly downy branches. Leaves glandular beneath; varying either to roundish-obovate, or to lanceolate, acute at each end. Tufts axillary, with purple scales. Segments of the calyx scarlet. Corolla of a fine purple, five-toothed. Michaux, Pursh.

34. *V. buxifolium*. Box-leaved Whortle-berry. Salisb. Parad. t. 4. Ait. n. 18. Pursh n. 23. Curt. Mag. t. 928. (*V. brachycerum*; Michaux Boreal.-Amer. v. 1. 234.)—Clusters axillary, of few flowers. Leaves stalked, obovate, toothed or crenate, smooth on both sides. Stems tufted. Corolla roundish-ovate. Filaments glandular. Stigma capitate.—In dry woods, on lime-stone rocks, in the western parts of Virginia, near Winchester and the Sweet-springs, flowering in June. Pursh. A handsome little shrub, in stature and general aspect resembling *V. vitis-idaea*, n. 26. The leaves however are smooth, even, and not dotted, on the under side. Clusters shorter, but more numerous. Flowers five-cleft. Corolla globular, contracted at the mouth, not bell-shaped. Anthers with shorter horns, discharging their pollen by lateral, not terminal, apertures. Stigma dilated, or capitate. Of the berries we have no account. The flowers are white, delicately striped with red. Anthers without spurs.

35. *V. ovatum*. Ovate Whortle-berry. Pursh n. 24.—“Leaves stalked, ovate, acute, revolute, serrated, smooth, coriaceous. Clusters axillary and terminal, bracteated, short. Corolla cylindrical. Calyx acute.”—Found by governor Lewis, on the Columbia river; by Mr. Menzies on the north-west coast of America, flowering in May. Pursh.

36. *V. obtusum*. Blunt Whortle-berry. Pursh n. 25.—“Stem creeping. Leaves small, oval, rounded and blunt at each end, pointed, entire, coriaceous, smooth. Stalks axillary, solitary, single-flowered.”—Gathered by Mr. Menzies, on the north-west coast of America; seen in the Banksian herbarium, without flowers. Pursh.

We can find nothing, amongst our specimens from Mr. Menzies, that answers to the characters of either of these two last species. Our *parvisolium*, n. 3, agrees in some points with the description of the last, but the stem is rather

arborescent than creeping, and the leaves are certainly neither coriaceous nor evergreen.

37. *V. Oxycoccus*. Common Cranberry. Linn. Sp. Pl. 500. Willd. n. 25. Fl. Brit. n. 4. Engl. Bot. t. 319. Fl. Dan. t. 80. Lamarek f. 3. (*Vaccinia palustris*; Ger. Em. 1419. Lcb. Ic. v. 2. 109. Oxycoccus; Cord. Hist. 140. 2. f. 1. Oxycoccus vulgaris; “Perf. Syn. v. 1. 419.” Pursh 263.)—Corolla deeply four-cleft. Leaves ovate, entire, revolute, acute, smooth. Stems creeping, thread-shaped. Flowers terminal.—Native of turfy mossy bogs in the mountainous parts of Europe; common in Switzerland, Russia, Scotland, Ireland, and the north of England, as well as in Lincolnshire, and the neighbouring part of Norfolk, flowering in June. Mr. Pursh speaks of it as common on the boggy mountains of North America, from Canada to Pennsylvania, flowering from May to July. Few plants are more elegant. The wiry shrubby stems creep among bog-moss, with long, branching, fibrous roots, which often appear to imbibe nourishment from the clear water alone. Branches scattered, procumbent, smooth, reddish, leafy. Leaves evergreen, stalked, from a quarter to half an inch long, coriaceous; convex and of a dark shining green above; glaucous beneath. Flower-stalks few together about the tops of the branches, somewhat corymbose, above an inch long, simple, red, slightly hoary, bearing two minute bractæas in the lower part, and a solitary, drooping, very beautiful, four-cleft flower at the top. The germen is smooth. Calyx-lobes broad and shallow. Corolla pink, with reflexed oblong segments, a quarter of an inch in length. Filaments purple, downy. Anthers yellow, converging, without spurs. Berry pear-shaped or globular, often spotted, crimson, of a peculiar flavour, somewhat like black currants, with a strong acidity, grateful to most people, in the form of tarts, for which purpose they are largely imported from Russia. We can remember Cranberries from Lincolnshire, and the north-west corner of Norfolk, being sold in cart-loads about the streets of Norwich; but the extensive enclosures have, in many parts, destroyed and drained their native bogs. Lightfoot records that at Longtown, on the borders of Cumberland, not less than twenty or thirty pounds-worth were sold each market-day, for five or six weeks together, and dispersed over different parts of the kingdom. In Sweden these berries serve only to boil silver plate to its due degree of whiteness, their sharp acid corroding the superficial particles of the copper alloy.

38. *V. macrocarpon*. American Cranberry. Ait. Hort. Kew. ed. 1. v. 2. 13. t. 7. ed. 2. n. 22. Willd. n. 27. Lamarek f. 4. (*V. Oxycoccus* β; Michaux Boreal.-Amer. v. 1. 228. “*V. hispidulum*; Waugenh. Amer. 108. t. 30. f. 67.” Oxycoccus macrocarpus; Pursh 263.)—Corolla deeply four-cleft. Leaves elliptic-oblong, entire, slightly revolute, obtuse, smooth. Stems ascending. Flowers lateral.—In bogs principally in a sandy soil, and on high mountains, frequent, from Canada to Virginia, flowering from May to July. A larger and more upright plant than the last, with less convex, more oblong, much larger leaves. Several flowers come forth at the ends of the last year's branches, surmounted by the shoots of the present year. Their bractæas are situated towards the top of each stalk, and, as well as the segments of the corolla, are larger than in the Common Cranberry. The filaments however are shorter in proportion to their anthers, which are unusually long. The berries are larger, and of a brighter red, than the last, collected in great abundance, for making tarts, in America, and exported from thence to Europe; but they always prove here far inferior in quality to the Russian Cran-

berries, however excellent in America. The best method of having American Cranberries in Europe, is by cultivation in an artificial bog with great plenty of water, as first contrived by sir Joseph Banks. A very few square yards of ground thus employed, will yield as many Cranberries as any family can use. If allowed to hang till they are full ripe, as late as October, they are even better than the *Oxycoccus*, and may be kept dry in bottles throughout the year. Our wild Cranberries have generally been gathered too early; as may also be the case with those brought from America.

39. *V. erythrocarpum*. Scarlet Carolina Cranberry. Michaux Boreal.-Amer. v. 1. 227. (*Oxycoccus erectus*; Pursh 264.)—"Corolla deeply four-cleft. Leaves oval, pointed, finely serrated, fringed. Stem erect. Flowers axillary."—On high mountains of Virginia and Carolina, flowering in June. *Berries* scarlet and quite transparent, of an exquisite taste. *Pursh*. The stem is shrubby, erect, generally with divaricated zigzag branches. *Leaves* rather large, thin and membranous, somewhat hairy at the ribs on each side. *Calyx* minute, sharply four-cleft. *Corolla* before expansion long and conical; finally revolute. *Antbers* prominent, without spurs. *Berry* globose, shining. *Michaux*.

We have seen no specimen of this species. Its fruit might be an acquisition to our tables, if raised in the same mode as the last.

In the above ample detail of the genus *Vaccinium*, which we trust will prove acceptable to those who have ever attended to its former confusion, we have removed eight of Willdenow's species. Four of these are *album*, *mucronatum*, *ligustrinum* and *hispidulum* of Linnæus, the latter being referred by Mr. Pursh to GAULTHERIA by the name of *serpyllifolia*; see that article, where this species should be introduced next to *procumbens*, with the following character. "Stem creeping, hispid. Leaves roundish-oval, acute. Flowers four-cleft, axillary, solitary, nearly sessile. Corolla bell-shaped." (*Vaccinium hispidulum*; Linn. Sp. Pl. 500. Willd. n. 26. Michaux Boreal.-Amer. v. 1. 228. t. 23.)—In mossy swamps, particularly where Cedars and other evergreens abound, from Canada to Pennsylvania, flowering in April and May. A small creeping plant. *Berries* white, very sweet, and agreeable to eat. *Pursh*.—The other four discarded species of Willdenow are *fuscatum*, *venustum*, *amœnum* and *virgatum* of Dr. Solander, in Ait. Hort. Kew. ed. 1; the reasons of which rejection are to be found under our 13th and 17th species.—On the other hand, we have augmented this genus with seven entirely non-descript species, for most of which we are obliged to the bounty of our often-mentioned friend Mr. Archibald Menzies; as well as with twelve others from Michaux, Pursh, and our several English garden botanists and publishers. On this subject we would particularly direct our fellow-labourers to the plants hitherto confounded under *V. Arctostaphylos*, and the still-supposed varieties of that interesting species; relating to which, discoveries are probably yet to be made, in the wilds of Tartary and the Levant, and possibly even in the greenhouses of France and England.

VACCINIUM, in *Gardening*, comprehends many sorts of hardy, dwarf, under-shrubby, ligneous, evergreen, and deciduous plants, among which the species most commonly cultivated are those of the black whortle, or bilberry (*V. myrtillus*); the white Pennsylvanian whorts, or bilberry (*V. album*, see the preceding article); the red whortle-berry (*V. vitis idæa*); the cranberry, moss, or moor berry (*V. oxycoccus*); the marsh whortle, or great bilberry-

bush (*V. uliginosum*); the hispid-stalked American whortle-berry (*V. hispidulum*, see the preceding article); the corymbose-flowering American whortle-berry (*V. corymbofum*); the privet-leaved Pennsylvanian whortle-berry (*V. ligustrinum*); and the stameneous American whortle-berry (*V. stamineum*).

The first has slender, branching, shrubby stalks, about two feet in height, and produces large eatable berries of a blackish-red colour. The second is a similar plant, producing small berries of a whitish colour. The third is a more dwarfish plant, producing clusters of nodding, reddish flowers, and red juicy berries of great value for tarts, and other culinary uses. The fourth has slender creeping stalks, which produce reddish eatable berries of great value and importance for different culinary well-known purposes, as in pies, tarts, &c. The fifth has a woody, shrubby, branching stalk of some height, and affords whitish purple flowers, and large berries. The sixth grows with slender, trailing, rough stalks, and yields large red berries. The rest are all American plants.

Method of Culture.—They may all be raised from seeds, or offset root-suckers, creeping roots, and trailing rooting stalks. Those also growing with several rooted stalks and branches, may be divided in the root and top, into separate plants, in which way they succeed very well.

The seeds should be sown, where that method is pursued, in the autumn as soon as they are ripe and gathered, in a shady border, or the places where the plants are to grow and remain; and when the young plants are up, they should be kept clean, and be removed with earth about their roots, as there may be occasion.

The offsets and root-plants may be set out in the same season in proper places, which for the first four sorts are those where the soil is of a cold, light, sandy, heathy, mossy, moory, or woody nature, and for the two succeeding ones in marshy and boggy situations; as these have the most resemblance to those in which they grow naturally, and are the most prosperous. It may likewise be advisable in many cases to take the plants from their native situations with balls of earth about their roots. Some, however, succeed in the common borders and other parts. They may in some cases be removed in the spring season, but the other is the better way.

They are admitted into gardens and pleasure-grounds for the sake of variety, curiosity, and ornament, and some of them are cultivated for the use of their fruit. In its natural situation, that of the cranberry is often an object of very great importance, affording the poor gatherers of its berries considerable employment as well as much money. It delights most in rather wet, moory, mossy situations.

The *vaccinium oxycoccus* of Linnæus, or cranberry, may be preserved perfect for several years, merely by drying it a little in the sun, and then stopping it closely in dry bottles. The *vaccinium myrtillus*, or bilberry, yields a juice, which has been employed to stain paper, or linen, purple. In autumn the moor-game chiefly live upon the product of this shrub.

VACERRI. See DRUIDS.

VACH, in *Geography*, one of the smaller Lipari islands, in the Mediterranean.

VACH, or *Vakh*, in *Mythology*, a name of the Hindoo goddesses Sarafwati; fakti or consort of the creative power in the Trimurti, or divine Triad of the East. The name Vach, or Vachi, is derived from *speech*, Sarafwati being goddesses of eloquence; and hence called also Vachdevi. Vachaspati, a title equivalent to lord of eloquence, is sometimes applied to

to the regent of the planet Jupiter, whom the Hindoos call *Vrihaspati*; which see.

VACHA, in *Geography*, a town of Germany, in the principality of Upper Hesse, on the Werra; 20 miles N.E. of Fulda.—Also, a town of Germany, in the marggravate of Anspach, on the Rednitz; 25 miles N.E. of Anspach.—Also, a town of Peru, in the diocese of La Paz; 8 miles S.W. of La Paz.

VACHE, or *Cow's Island*, an island about twelve miles from the south coast of Hispaniola, about twenty-four miles in circumference. It was formerly a place of rendezvous for pirates and freebooters, and is provided with three ports, one of which can receive vessels of 300 tons. N. lat. $18^{\circ} 5'$. W. long. $74^{\circ} 25'$.

VACHE *et le Torreau*, or *Cow and Bull Rocks*, rocks on the south coast of Newfoundland, a little to the east of Placentia bay.

VACHELUSE, one of the Lipari islands; 3 miles S. of Stromboli.

VACHIER, a town of France, in the department of the Upper Loire; 9 miles S. of Le Puy en Velay.

VACHON, PIERRE, in *Biography*, an eminent performer on the violin, was born in Provence, 1730. After performing at the concert spirituel with great applause, he was placed at the head of the prince of Conti's select band. In 1784 he was appointed concert-master to the king of Prussia at Berlin, after residing some time in London, and leading at the Opera. He was one of the most certain and agreeable performers on the violin of his time, particularly in trios and quartets. He was likewise a composer of considerable merit, having furnished the different theatres of Paris with six or eight successful musical dramas, and the performers on his instrument with several books of solos, quartets, and concertos, which were practicable and in a pleasing style. He had an extreme melancholy expression of countenance, of which he was not insensible, and used to say, in pleasantry, "Ma triste contenance m'a fait beaucoup de mal auprès les dames."

VACIA, or VACZ, in *Geography*. See WAITZEN.

VACIAN, a town of Abascia; 15 miles S. of Askafia.

VACKALEER, a town of Hindoostan, in Mysore; 27 miles E.N.E. of Bangalore.

VACOMAGI, in *Ancient Geography*, a people of the isle of Albion, S. of the Caledonii, whose towns were Banatia, Tamaa, the Winged Camp, or Alata Castra, and Tuesis.

VACONE, in *Geography*, a town of the Popedom, in the duchy of Spoleto; 8 miles S.E. of Narni.

VACONTIUM, in *Ancient Geography*, a town of Lower Pannonia, at a distance from the Danube.

VACUA, Ital., in *Music*, a white open note; in old English, a *void*; in opposition to notes with black heads, like crotchets and quavers. In the first time-table all the notes were black, till the invention of the femibreve and minim.

VACUNA, in *Mythology*, a goddess held in high veneration among the Sabines.

VACUNALIA, a festival kept in honour of the goddess Vacuna, who presided over those that were unemployed or at rest.

It was celebrated in December by the country labourers, after the fruits were gathered in, and the land tilled.

Ovid speaks of it in his *Falli*, lib. vi.

"Nam quoque cum fiunt antiquæ sacra vacunæ,
Ante vacuales stantque, sedentque focos."

The worship of Vacuna was very ancient in Italy, and established among the Sabines long before Rome was founded. Some take her for Diana, Venus, or Ceres, and

others for Bellona or Victory. Varro thinks she was Minerva.

VACUP, in *Geography*, a town of Bosnia; 32 miles S.W. of Serajo.

VACUUM, VACUITY, in *Physics*, a space empty or devoid of all matter, or body.

Whether there be any such thing in nature as an absolute vacuum; or whether the universe be completely full, and there be an absolute plenum, is a thing that has been controverted by the philosophers of all ages.

The ancients, in their controversies, distinguished two kinds; a *vacuum coærvatum*, and a *vacuum interspersum*, or *difffeminatum*.

Vacuum coærvatum, is conceived as a place destitute of matter: such, *e. gr.* as there would be, should God annihilate all the air, and other bodies within the walls of a chamber.

The existence of such a vacuum is maintained by the Pythagoreans, Epicureans, and the Atomists, or Corpuscularians; most of whom assert such a vacuum actually to exist without the limits of the sensible world. But the modern Corpuscularians, who hold a *vacuum coærvatum*, deny that appellation; as conceiving, that such a vacuum must be infinite, eternal, and uncreated.

According, then, to the later philosophers, there is no *vacuum coærvatum* without the bounds of the sensible world; nor would there be any other vacuum, provided God should annihilate divers contiguous bodies, than what amounts to a mere privation, or nothing; the dimensions of such a space, which the ancients held to be real, being by these held to be mere negations; that is, in such a place, there is so much length, breadth, and depth wanting, as a body must have to fill it. To suppose, that when all the matter in a chamber is annihilated, there should yet be real dimensions, is to suppose corporeal dimensions without body; which is absurd.

The Cartesians, however, deny any *vacuum coærvatum* at all; and assert, that if God should immediately annihilate all the matter, *v. gr.* in a chamber, and prevent the ingress of any other matter, the consequence would be, that the walls would become contiguous, and include no space at all. They add, that if there be no matter in a chamber, the walls can be conceived no otherwise than as contiguous; those things being said to be contiguous, between which there is not any thing intermediate: but if there be no body between, there is no extension between: extension and body being the same thing: and if there be no extension between, then the walls are contiguous, and where is the vacuum?

But this reasoning is founded on a mistake, *viz.* that body and extension are the same thing. See MATTER.

Vacuum difffeminatum, or *interspersum*, is that supposed to be naturally interspersed in and among bodies, in the pores of the same body, and in the interstices between different bodies.

It is this kind of vacuum which is chiefly disputed among the modern philosophers; the Corpuscularians strenuously asserting it; and the Peripatetics and Cartesians as tenaciously impugning it. See CARTESIAN and LEIBNITZIAN.

The great argument the Peripatetics urge against a *vacuum interspersum* is, that there are divers bodies frequently seen to move contrary to their own nature and inclination; and that for no other apparent reason, but to avoid a vacuum; whence they conclude, that nature abhors a vacuum, and gives us a new class of motions ascribed to the *fuga vacui*, or nature's flying a vacuum. Such, they say, is the rise of water in a syringe, upon the drawing up of the piston; such also is the ascent of water in pumps, and the

swelling of the flesh in a cupping-glass, &c. But since the weight, elasticity, &c. of the air have been ascertained by sure experiments, those motions and effects are universally ascribed to the gravity and pressure of the atmosphere.

The Cartesians deny not only the actual existence, but even the possibility of a vacuum: and that on this principle, that extension being the essence of matter, or body, wherever extension is, there is matter; but mere space, or vacuity, is supposed to be extended; therefore it is material. Whoever asserts an empty space, they say, conceives dimensions in that space, *i. e.* he conceives an extended substance in it; and therefore he denies a vacuum, at the same time that he admits it.

Des Cartes, if we may believe some accounts, rejected a vacuum from a complaisance to the taste which prevailed in his time, against his own first sentiments; and among his familiar friends used to call his system his philosophical romance.

On the other hand, the corpuscular authors prove, not only the possibility, but the actual existence of a vacuum, from divers considerations; particularly from the consideration of motion in general; and that of the planets, comets, &c. in particular; from the fall of bodies; from the vibration of pendulums: from rarefaction and condensation; from the different specific gravities of bodies; and from the divisibility of matter into parts.

1. It is argued, that motion could not be effected without a vacuum. This is what Lucretius urged long ago. "Principium quoniam cedendi nulla daret res,—undique materies quoniam stipata fuisset."

The force of this argument will be increased from the two following considerations; *viz.* first, that all motion is either in a straight line, or in a curve, which returns into itself, as the circle and ellipsis; or in a curve that does not return into itself, as the parabola, &c. And, secondly, that the moving force must always be greater than the resistance.

From hence it follows, that no force, even though infinite, can produce motion where the resistance is infinite; consequently, there can be no motion either in a straight line, or a non-returning curve; because, in either of those cases, the protrusion, and consequently the resistance, would be infinite. There remains, therefore, only the motion of a revolving curve practicable; this must either be a revolution upon an axis, or an annular motion round a quiescent body; both which are, again, impossible in an elliptic curve; and, consequently, all motion must be in circles geometrically true; and the revolving bodies must either be spheres, spheroids, cylinders, or portions of them, exactly geometrical; otherwise the revolutions in a plenum would be impossible: but such motions, or such figured bodies, we do not know in nature. Therefore there is a vacuum.

2. The motions of the planets and comets demonstrate a vacuum: thus sir Isaac Newton,—“That there is no such fluid medium as æther,” (to fill up the porous parts of all sensible bodies, as the air and interstellar parts, and so make a plenum,) “seems probable; because the planets and comets proceed with so regular and lasting a motion through the celestial spaces, both from and to all parts; for hence it appears, that those celestial spaces are void of all sensible resistance, and consequently of all sensible matter. For the resisting force of fluid mediums arises partly from the attrition of the parts of the medium, and partly from the inactivity of matter. Now, that part of the resistance of any medium, which arises from the tenacity or attrition of its parts, may be lessened by dividing the matter into smaller parts, and rendering those parts more smooth and slippery:

but that part of the resistance which arises from the inactivity of matter, is always in proportion to the density of the matter; nor can it be diminished by dividing the matter, nor by any other means, except by diminishing the density thereof.

“Consequently, if the celestial regions were as dense as water, or as quicksilver, they would resist almost as much as water or quicksilver; but if they were perfectly dense without any interspersed vacuity, though the matter were ever so fluid and subtle, they would resist more than quicksilver does: a perfectly solid globe, in such a medium, would lose above half its motion, in moving three lengths of its diameter; and a globe not perfectly solid, such as the bodies of the planets and comets are, would be stopped still sooner. Therefore, that the motion of the planets and comets may be regular and lasting, it is necessary the celestial spaces be void of all matter, except perhaps some few, and much rarefied effluvia of the planets and comets, and the passing rays of light.”

3. The same great author deduces a vacuum also from the consideration of the weights of bodies; thus: “All bodies about the earth gravitate towards the earth; and the weights of all bodies, equally distant from the earth’s centre, are as the quantities of matter in those bodies. If the æther, therefore, or any other subtle matter, were altogether destitute of gravity, or did gravitate less than in proportion to the quantity of its matter; because (as Aristotle, Des Cartes, and others, argue) it differs from other bodies only in the form of matter; the same body might, by the change of its form, gradually be converted into a body of the same constitution with those which gravitate most in proportion to the quantity of matter: and, on the other hand, the most heavy bodies might gradually lose their gravity, by gradually changing their form; and therefore the weights would depend upon the forms of bodies, and might be changed with them; which is contrary to all experiment.”

4. The descent of bodies proves, that all space is not equally full; for the same author goes on, “If all spaces were equally full, the specific gravity of that fluid with which the region of the air would, in that case, be filled, would not be less than the specific gravity of quicksilver or gold, or any other the most dense body; and therefore neither gold, nor any other body, could descend therein. For bodies do not descend in a fluid, unless that fluid be specifically lighter than the body. But, by the air-pump, we can exhaust a vessel, till even a feather shall fall with a velocity equal to that of gold in the open air: the medium, therefore, through which this feather falls, must be much rarer than that through which the gold falls in the other case.

“The quantity of matter, therefore, in a given space, may be diminished by rarefaction: and why may not it be diminished *in infinitum*? Add, that we conceive the solid particles of all bodies to be of the same density; and that they are only rarefiable by means of their pores: and hence a vacuum evidently follows.”

5. “That there is a vacuum, is evident from the vibrations of pendulums; for since those bodies, in places out of which the air is exhausted, meet with no resistance to retard their motion, or shorten their vibrations; it is evident there is no sensible matter in those spaces, or in the occult pores of those bodies.”

As to what Des Cartes urges of his *materia subtilis*, that its tenuity prevents its resistance from being sensible; and that a small body, striking against a greater, cannot in the least move, or resist the motion of that other; but is reflected

VACUUM.

lected back again with all its momentum; it is contrary to all experience. For sir Isaac proves, that the density of fluid mediums is proportionable to their resistances, very nearly; and that they are exceedingly mistaken, who suppose the resistance of projectiles to be infinitely diminished, by dividing the parts of the fluid, even *in infinitum* (Princip. lib. ii. prop. 38.): when, on the contrary, it is clear the resistance is but little diminished by the subdivision of the parts (ibid. prop. 40.), and that the resisting forces of all fluids are nearly as their densities.—For why should not the same quantity of matter, whether divided into a great number of subtile parts, or into a few larger ones, have the same resisting force? If then there were no vacuum, it would follow, that a projectile moving in the air, or even in a space whence the air is exhausted, should move with as much difficulty as it would in quicksilver; which is contrary to experience.

Nor will it avail to suppose the particles of the subtile fluid, constituting a plenum, to move constantly and equally in all directions; and by favour of this hypothesis, to imagine that they act, but do not resist. Because the motion of a fluid favours the motion of a body in it, only as far as it is in the same direction; and an intestine motion of the parts of the fluid, equal in all directions, cannot make the resistance less than if there was no motion of the parts. It is supposed by many that the particles of common fluids, *e. g.* water or air, are in a constant intestine motion: but this does not hinder those fluids from resisting in proportion to their density.

If it should be alleged, that by supposing this dense fluid which replenishes space to penetrate the pores of bodies with the utmost freedom, (as light passes through transparent bodies, and the magnetic and electric effluvia through most kinds of bodies,) its resistance will then be incomparably less than in proportion to its density; the resistance in this case not being measured by the density of the fluid, because the greater part passes through the pores of the body in motion freely, without resistance: yet even on this hypothesis, the resistance of a golden ball in a plenum would be still very great. For this subtile fluid, how penetrating soever it be, must resist the solid parts of the ball; which cannot move in the fluid without displacing its parts, and losing as much motion as must be communicated to those parts; and this resistance depends on the quantity of solid parts in the ball; whereas the resistance which the same ball meets with in quicksilver (which we suppose to have no passage through the ball), depends on the quantity of the solid parts in an equal bulk of the quicksilver, which must be moved to make way for the ball. And this being less than the quantity of solid parts in an equal bulk of the golden ball, in proportion as the specific gravity of quicksilver is less than that of gold, it follows that the resistance of a golden ball, moving in such a subtile penetrating plenum, would still be greater than its resistance in quicksilver. The resistance of a golden ball in a plenum (how freely soever the matter constituting it pass through the pores of the ball, and how large and numerous soever these pores may be) must correspond to the solid matter in the ball; which is greater than the solid matter in any equal bulk of any of our fluids, upon which their resistance depends.

6. That there are interspersed vacuities, appears from matter's being actually divided into parts, and from the figures of those parts; for, on supposition of an absolute plenitude, we do not conceive how any part of matter could be actually divided from that next adjoining, any more than it is possible to divide actually the parts of absolute space

from one another: for by the actual division of the parts of a continuum from one another, we conceive nothing else understood, but the placing of those parts at a distance from one another, which, in the continuum, were at no distance from one another: but such divisions between the parts of matter must imply vacuities between them.

7. As for the figures of the parts of bodies, upon the supposition of a plenum, they must either be all rectilinear, or all concavo-convex; otherwise they would not adequately fill space; which we do not find to be true in fact.

8. The denying a vacuum, supposes what it is impossible for any one to prove to be true; *viz.* that the material world has no limits.

However, we are told by some, that it is impossible to conceive a vacuum. But this surely must proceed from their having imbibed Des Cartes's doctrine, that the essence of body is constituted by extension; as it would be contradictory to suppose space without extension. To suppose that there are fluids penetrating all bodies and replenishing space, which neither resist nor act upon bodies, merely in order to avoid admitting a vacuum, is feigning two sorts of matter, without any necessity or foundation; or is tacitly giving up the question.

Since then the essence of matter does not consist in extension, but in solidity, or impenetrability, the universe may be said to consist of solid bodies moving in a vacuum: nor need we at all fear, lest the phenomena of nature, most of which are plausibly accounted for from a plenitude, should become inexplicable when the plenum is set aside. The principal ones, such as the tides; the suspension of the mercury in the barometer; the motion of the heavenly bodies, and of light, &c. are more easily and satisfactorily accounted for from other principles. See TIDES, &c.

VACUUM, or *Vacuum Boyleano*, is also used, somewhat abusively, to express that approach to a real vacuum, which we arrive at by means of an air-pump.

Thus, any thing put in a receiver so exhausted, is said to be put *in vacuo*: and thus, most of the experiments with the air-pump are said to be performed *in vacuo*, or *in vacuo Boyleano*. Some of the principal phenomena observed of bodies *in vacuo*, are; that the heaviest and lightest bodies, as a guinea and a feather, fall here with equal velocity:—that fruits, as grapes, cherries, peaches, apples, &c. kept for any time *in vacuo*, retain their nature, freshness, colour, &c. and those withered in the open air recover their plumpness *in vacuo*:—all light and fire become immediately extinct *in vacuo*:—the collision of flint and steel *in vacuo*, produces no sparks:—no sound is heard, even from a bell rung *in vacuo*:—a square phial, full of common air, well closed, breaks *in vacuo*; a round one does not:—a bladder half full of air will heave up forty pounds weight *in vacuo*:—cats, and most other animals, soon expire *in vacuo*.

By experiments made in 1704, Dr. Derham found, that animals that have two ventricles, and no foramen ovale, as birds, dogs, cats, mice, &c. die in less than half a minute; counting from the first suffocation: a mole died in one minute, a bat lived seven or eight. Insects, as wasps, bees, grasshoppers, &c. seemed dead in two minutes; but, after being left *in vacuo* twenty-four hours, they came to life again in the open air: snails continued twenty-four hours *in vacuo*, without appearing much incommoded.

Seeds planted *in vacuo* do not grow:—small beer dies, and loses all its taste, *in vacuo*:—lukewarm water boils very vehemently *in vacuo*:—and air, rushing through mercury into a vacuum, throws the mercury in a kind of shower upon the receiver, and produces a great light in a dark room.

The air-pump can never produce a perfect vacuum; as is evident from its structure, and the manner of its working: in effect, every exsuction only takes away a part of the air: so that there will still be some left after any finite number of exsuctions. Add, that the air-pump has no longer any effect than while the spring of the air remaining in the receiver is able to lift up the valves: when the rarefaction is come to that degree, you can come nearer to a vacuum. Sir Isaac Newton, observing that a thermometer suspended *in vacuo*, and in that state removed to a warm or a cold room, receives the heat or cold, and rises, or falls, almost as soon as another in open air; takes thence occasion to suspect, that the heat of the warm room is conveyed through the vacuum, by the vibrations of a much subtler medium than air, which remained in the vacuum after the air was drawn out. Opt. p. 323.

VACUUM, *Torricellian*. See TORRICELLIAN.

VADA, in *Ancient Geography*, a place which belonged to the Batavi, W. of Batavodurum.

VADA *Sabatia*, *Vai*, a town of Italy, in Liguria.

VADA *Volaterra*, a place of Italy, in Etruria.

VADA, in *Geography*, a sea-port town of Etruria, at the mouth of the river Cecina; 18 miles S.W. of Volterra. N. lat. 43° 17'. E. long. 10° 30'.

VADACOURCHY, a town of Hindoostan, in Calicut; 10 miles S.W. of Palicaudchery.

VADAGARY, a town of Hindoostan, in Madura; 25 miles W. of Coilpetta.

VADAMADERRY, a town of Hindoostan, in the province of Dindigul; 15 miles N.E. of Dindigul.

VADAMIA, a town of the Arabian Irak, on the Euphrates; 105 miles W.N.W. of Bassora.

VADARI, in the *Civil Law*, denotes a person to pledge, undertake, or give security, in behalf of another, that he shall, on a certain day, appear in court, to prosecute, or answer.

If he fails, his surety has an action *vadimonii deserti* against him; that is, an action for deserting his bail. See WAGER.

Properly speaking, *vadari reum*, among the Romans, was the act of the plaintiff himself, who here demanded surety, or bail from the defendant, that he would appear before the praetor on a certain day.

VADDAL, in *Geography*, a town of Hindoostan, in Soonda; 27 miles S.E. of Goa.

VADDER, LOUIS DE, in *Biography*, an eminent landscape painter, was born at Brussels in 1560. It is not known under whom he studied, where he resided, or how long he lived; but he has left works behind him which exhibit him as a diligent observer of nature, with taste and feeling to select her most fascinating effects, and ability to execute what he attempted, so as to afford the greatest pleasure to all admirers of the art.

It is not improbable that he resided some time in Italy, and had studied the pictures of Titian; perhaps wrought in the same scenery; for his finest works have a great degree of resemblance to those of the Venetian, in the choice of forms and colour however more than in the execution, in which he more resembles Pynacher in freshness and fulness.

Two large pictures by Vadder found their way into this country some time ago, and fully justify these remarks; but in general his works are scarce, or most probably have been introduced under fictitious names. In his native country he is better known and justly esteemed. He has left a few spirited etchings in the style of Lucas Van Uden.

VADÉ', JOHN JOSEPH, was born at Ham, in Picardy,

and is distinguished as the inventor of a kind of humorous French poetry. In his youth he resided at Paris, and led a dissipated life; but in more advanced age he perceived the defects of his early education, and endeavoured to supply them by a perusal of the best French authors. As he was original in his mode of thinking, he adopted a new kind of writing, to which he was led by his familiarity with vulgar life. This species of writing was called the "Poissarde manner," and he was hence denominated the "Teniers" of poetry. His productions, which consisted of tales and songs, were amusing and popular; and as he possessed many amiable qualities, he was generally beloved in the gay societies which he frequented. But he was thus led to pursue a course of debauchery, which terminated his life in 1757, at the early age of 37 years. His works, consisting of comic operas, parodies, songs, &c. have been collected in 4 vols. 8vo., to which has been added a volume of posthumous pieces of a similar nature, though of superior merit, and indicating talents of a higher class, which he might have cultivated to advantage. Moreri. *Nouv. Dict. Hist.*

VADELECT. See VALET.

VADE-MECUM, or a VENI-MECUM, a Latin phrase, used in English, to express a thing that is very familiar; and which any one usually carries about with him: it is chiefly applied to some favourite book.

Some make Virgil, others Horace, their *vade-mecum*; others an Epicætetus, &c.

This is what the Greeks call *εγχειριδιον*, or *manual*. The Arabs have a phrase of equal import; viz. *Habib al feir*, comes *iitineris*, companion of the journey. In Latin it is best expressed by *comes*; as *comes theologicus*, *comes rusticus*, &c.

VADENAGORCHY, in *Geography*, a town of Hindoostan, in Coimbetore; 15 miles W. of Damicotta.

VADIANUS, JOACHIM, in *Biography*, was born in 1484, at St. Gall in Switzerland, where his father, Leonard Von Watt, was a senator. Having studied at Vienna, he was chosen professor of the belles lettres, and rector of the university. In 1514 he was honoured at Lintz by the emperor Maximilian with the poetical laurel. In his subsequent travels, he applied to the study of geography, and in 1518, having taken the degree of M.D. at Vienna, he returned to St. Gall, and devoted himself to the practice of physic, to which he joined theology upon the principles of the reformers, whose cause he promoted as a senator, and also by his discourses and writings. Having been honoured eight times with the office of consul, he died in 1551, and bequeathed his library to his fellow-citizens. On the various subjects of mathematics, geography, antiquities, medicine, and theology, he published works, as well as several Latin poems. His "Commentary on Pomponius Mela de Situ Orbis," and his "Scholia on the second Book of Pliny's Natural History," are the most generally known of his literary performances. Scaliger regarded Vadianus as one of the most learned men in Germany; and on account of his able conduct of public affairs, Thuanus presents him to notice, as an example, that men of letters and philosophers are not, as such, disqualified for business. Moreri.

VADIATION. See VADARI.

VADICASSES, in *Ancient Geography*, a people of Gaul, who have been distinguished by different denominations: the Bodiocasses of Pliny being the same with the Vadicasses of Ptolemy, and both are supposed to comprehend the ancient inhabitants of Bayeux, anciently called Næomagus.

VADILCORÀ, or *Vadi al Kora*, in *Geography*, a town

town of Arabia, in the province of Hedsjas; 56 miles N. of Medina. N. lat. $25^{\circ} 30'$. E. long. $38^{\circ} 20'$.

VADIMONIS LACUS, in *Ancient Geography*, a lake of Italy, in Etruria, in the vicinity of Ameria.

VADIMONIUM, in the *Civil Law*, a promise, or bond, given for appearance before the judge upon a day appointed. See VADARI.

VADIN, in *Geography*, a town of European Turkey, in Bessarabia, on the Danube; 32 miles W. of Nicopoli.

VADIUM. See GAGE and PONE *per Vadium*.

VADNIA, in *Ancient Geography*, a town of Hither Spain, belonging to the Cantabri. Ptolemy.

VADO, or VADI, in *Geography*, a sea-port town of the Genoese, situated in a bay of the Mediterranean, with a good harbour; 3 miles S. of Savona. N. lat. $44^{\circ} 14'$. E. long. $8^{\circ} 30'$.

VADO, *Il*, a town of Naples, in Abruzzo Citra, near the Adriatic; 16 miles E.S.E. of Lanfiano.

VADO Sacta, a town of Naples, in Capitanata; 6 miles S.E. of Troia.

VADOCNDES, a town of Spain, in old Castile; 26 miles W.S.W. of Osma.

VADORANIUM, a town of Hindoostan, in the Carnatic; 12 miles S. of Negapatam.

VADUTZ, a town and castle of Germany, in the principality of Lichtenstein; 26 miles S. of Lindau. N. lat. $47^{\circ} 5'$. E. long. $9^{\circ} 31'$.

VÆIROE, a small island in the Baltic, near the north coast of Laland. N. lat. $55^{\circ} 57'$. E. long. $10^{\circ} 46'$.

VÆELUE, a river of the island of Ceylon, which runs into the sea, near Mago.

VA-EMBU, in the *Materia Medica*, a name given by some authors to the *acorus Asiaticus*, or Asiatic sweet flag.

VAENA, in *Geography*, a town of Spain, in the province of Cordova; 18 miles E.S.E. of Cordova.

VÆROE, a small island in the North sea, about 20 leagues from the coast of Norway. N. lat. 67° .

VÆSAPA, in *Ancient Geography*, a town of Asia, in the Lesser Armenia, towards the mountains, and at a distance from the Euphrates.

VAG BESTER, in *Geography*, a town of Hungary, on the river Waag; 6 miles N.E. of Bolefko.

VAGA, PIERINO DEL, in *Biography*, whose real name was Pietro Buonacorsi, was one of those ingenious painters employed by Raphael to assist him in adorning the Vatican. He was born at a village near Florence in 1500, of indigent parents. His father was killed in battle, and his mother died of the plague before he was two months old. He is said to have been reared by goat's milk, and as a destitute orphan, was taken under the protection of an indifferent artist named Andrea de Ceri, whose house was frequented by several young artists of Florence.

As Pierino had discovered a decided inclination for painting, he was placed, when eleven years old, under the tuition of Ridolfo Ghirlandaio, and with his assistance soon became a very able designer, and more particularly, as Vasari observes, by studying with many other Florentine youths as well as strangers the Cartoon of M. Angelo, known by the name of the Cartoon of Pifa.

His talents acquired for him the attention and approbation of a Florentine painter of inferior quality, but who had nevertheless much employment, and was in want of a skilful designer to assist him in conducting his undertakings. With the consent of his guardian Ceri, Pierino accompanied this man, whose name was Vaga, to the neighbourhood of Rome, whence, when the work was completed which

he had undertaken, he was conveyed by his employer to Rome in 1515, and there introduced to several painters, to whose care and assistance Il Vaga recommended him during his absence; and thence he was called Pierino del Vaga. In Rome he endured great miseries, and obtained bread with difficulty; but ever intent upon improvement, he studied hard the pictures of Angelo in the Sistine, and designed from the pieces of antique sculpture which by chance came to his hand, and after a short time, his ardent exertions were repaid by a degree of success, which led to his adoption into the school of Raphael.

Julio Romano and Francesco Penni first did justice to his talents by recommending him to their master, who, upon the first sight of his productions, placed him under Giovanni da Udine, who had the management of the ornamental parts of the works then going on in the Vatican. But Pierino was soon found equal not only to assist Giovanni in the grotesque ornaments and in the stuccoes, but also Polidoro da Caravaggio in the antique subjects in chiaro-scuro, and sometimes also in executing the scripture subjects from the sketches of Raphael, as among others may be seen, according to Vasari, in the Hebrews crossing the river Jordan, the surrounding Jericho, the combat of Joshua with the Amorites, Abraham preparing to sacrifice Isaac, Jacob wrestling with the angel, Joseph and his brethren, &c. &c. The praise which he gained by these labours inspired him only with a more earnest desire to improve, and the mildness and attention of his manner procured for him the esteem and even love of his master Raphael.

After the death of Raphael, he was employed, with J. Romano and G. F. Penni, to continue and complete the adornment of the Vatican, great part of the execution of which is the work of Del Vaga.

For a short time he went to Florence, when the pope Leo X. was there, but quickly returned to Rome and pursued his labours, adding to them many original ones, the inventions of his own mind. Among them was the hall of the house of Machione Baldassini, which he adorned with subjects from the Roman history, with arms, trophies, &c. Perhaps the most perfect of these minor works was the birth of Eve, which he painted in the church of S. Marcello, and in which he exhibited his decided predilection for the style of the Florentine school, and the success with which he had studied the works of M. Angelo.

Pierino was in full possession of public repute when he was compelled to fly for safety from Rome, by the sacking of that city in 1527. He took refuge in Genoa, where he was graciously received by prince Doria, who at that time projected the embellishment of his superb palace near the gate of St. Thomas. He had here a full opportunity of displaying his imagination, as well as his executive powers; and here he indulged in those inventions which breathe the spirit of Raphael himself, and rival the exertions of his fellow pupil J. Romano, in the palazzo del T at Mantua: both do honour to the school they had studied in, and the patron who employed them. He is said not to have been sufficiently scrupulous in the choice of his coadjutors, and the grandeur of his designs is consequently weakened by their imperfect execution. He died at Rome in 1547, aged 47.

VAGA, Tagadempt or Swamma, in *Ancient Geography*, a town of Africa, in Mauritania Caesariensis, E. of Cirta. Ptolemy. This town, named Baga by Plutarch, was situated S.E. of Victoria. It was one of the episcopal sees of Numidia.

VAGA, in *Geography*, a river of Russia, which rises near Poprovkoe, in the government of Vologda, and runs

VAGABOND.

into the Dwina, at Uft Vagkoi, in the government of Archangel.

VAGABOND, a person that wanders about, having no certain dwelling; or a sturdy beggar, &c. mentioned in divers statutes.

“De vagabundis, et aliis hominibus mendicantibus, qui fe nominant.”—Travelling men, &c. Charta 22 Hen. VI. “Item utemur, quod nullus vagabundus vegetur feu deambulet de nocte in villa feu suburbio post pulsationem campanæ nostræ communis, vocatæ Coverfeu: et si aliquis ibidem capiatur post pulsationem dictæ campanæ, ducatur ad gaulam domini regis, et ibi morabitur usqua in crastinum, ut notitia personæ suæ habeatur,” &c. MS. Cod. de Leg. et Stat. Burgi villæ Mountgomer. temp. Hen. II.

All itinerant beggars, fortune-tellers, collectors for gaols, fencers, bearwards, players of interludes, minstrels, jugglers, gypsies, &c. shall be reputed vagabonds, rogues, and sturdy beggars. 39 Eliz. c. 4.

The court of Areopagus at Athens punished idleness, and exercised a right of examining every citizen in what manner he spent his time. The civil law expelled all sturdy beggars from the city; and, in our own law, all idle persons or vagabonds, (whom our ancient statutes describe to be “such as wake in the night, and sleep in the day, and haunt customable taverns, and alehouses, and routs about; and no man wot from whence they come or whither they go;” or such as are more particularly described by statute 17 Geo. II. c. 5. called the Vagrant Act, and divided into three classes, *idle and disorderly persons, rogues and vagabonds, and incorrigible rogues,*) are offenders against the good order, and blemishes in the government, of any kingdom.

Idle and disorderly persons are thus described by the said statute: *viz.* all persons who threaten to run away, and leave their wives or children to the parish: all persons who shall unlawfully return to the parish or place from whence they have been legally removed by order of two justices, without bringing a certificate from the parish or place whereunto they belong: all persons, who, not having wherewith to maintain themselves, live idle without employment, and refuse to work for the usual and common wages given to other labourers in the like work, in the parishes or places where they are: all persons going about from door to door, or placing themselves in streets, highways, or passages, to beg or gather alms in the parishes or places where they dwell. And by 32 Geo. III. c. 45. all persons who by their wilful default and neglect permit their wives and children to become chargeable to their parishes or places; and it shall be made appear to two justices that such persons do not use proper means to get employment, or being able to work do neglect to work, or spend their money in alehouses or places of bad repute, or in any other improper manner, and do not employ a proper proportion of the money earned by them towards the maintenance of their wives and families, by which they or any of them become chargeable to such parish or place; and these shall be deemed idle and disorderly persons.

Rogues and vagabonds are, by the same statute, such as follow: *viz.* all persons going about as patent-gatherers, or gatherers of alms, under pretence of loss by fire, or other casualty; persons going about as collectors for prisons, gaols, or hospitals; fencers; bearwards; common players of interludes, and all persons who shall for hire, gain, or reward, act, represent, or perform, or cause to be acted, represented, or performed, any interlude, tragedy, comedy, opera, play, farce, or other entertainment of the stage, or any part therein, not being authorized by law; minstrels;

jugglers; and all persons pretending to be gypsies, or wandering in the habit or form of Egyptians; fortune-tellers, or persons pretending to have skill in physiognomy, palmistry, or like crafty science, or to tell fortunes; or using any subtle craft, to deceive and impose on any of his majesty's subjects; or playing or betting at any unlawful games or plays; all persons who run away, and leave their wives or children, whereby they become chargeable to any parish or place; all petty chapmen, and pedlars, wandering abroad, not being duly licensed, or otherwise authorized by law; all persons wandering abroad, and lodging in alehouses, barns, out-houses, or in the open air, not giving a good account of themselves; all persons wandering abroad, and begging, pretending to be soldiers, mariners, or seafaring men (but by 43 Geo. III. c. 61. soldiers, sailors, marines, and the wives of soldiers therein mentioned, are relieved against the penalties of the vagrant acts); or pretending to go to work in harvest, without a certificate signed by the minister, and one of the churchwardens or overseers where he shall inhabit, that he hath a dwelling-house or place there; illegally dealing in lottery tickets and shares; persons to the number of two or more assembling to destroy game in the night-time (39 & 40 Geo. III. c. 50.); and all other persons wandering abroad and begging, shall be deemed rogues and vagabonds. By 23 Geo. III. c. 88. any person apprehended, having upon him any picklock key, crow, jack, bit, or other implement, with an intent feloniously to break and enter into any dwelling-house, warehouse, coach-house, stable, or out-house, or who shall have upon him any pistol, hanger, cutlafs, bludgeon, or other offensive weapon, with intent feloniously to assault any person: or shall be found in or upon any dwelling-house, warehouse, coach-house, stable, or out-house, or in any inclosed yard or garden, or area belonging to any house, with intent to steal any goods or chattels, shall be deemed a rogue and vagabond within the meaning of the statute of the 17 Geo. II. So also by 39 & 40 Geo. III. c. 87. suspected persons and reputed thieves frequenting the Thames, and the quays and warehouses, &c. adjoining, with a felonious intent.

Incorrigible rogues are by 17 Geo. II. c. 5. thus described: all end-gatherers offending against the statute of 13 Geo. I. being convicted of such offence, which offence, by 13 Geo. I. c. 23. is this, *viz.* the collecting, buying, receiving, or carrying any ends of yarn, wests, thrums, short yarn, or other refuse of cloth, drugget, or other woollen goods; and the punishment of such persons is in order to prevent their committing abuses, by such practices, in the woollen manufacture: all persons apprehended as rogues and vagabonds, and escaped from the persons apprehending them; or refusing to go before a justice; or to be examined on oath before such justice; or refusing to be conveyed by such pass as is hereinafter directed; or knowingly giving a false account of themselves on such examination, after warning given them of their punishment: all rogues or vagabonds who shall break or escape out of any house of correction, before the expiration of the term for which they were committed or ordered to be confined by this act: all persons who, after having been punished as rogues and vagabonds, and discharged, shall again commit any of the said offences: all these shall be deemed incorrigible rogues. To which may be added, any person convicted of a third offence against the 6 Geo. III. c. 48.

Idle and disorderly persons are punishable by the statute 17 Geo. II. c. 5. with one month's imprisonment in the house of correction, upon conviction before one justice, by his own view, confession, or oath of one witness. Any person

VAGABOND.

person may apprehend or carry before a justice any such person, going about from door to door, or placing themselves in streets, highways, or passages, to beg alms in the parishes or places where they dwell; and if they shall resist, or escape from the person apprehending them, they shall be punished as rogues and vagabonds. The reward for apprehension is 5s., to be paid under order of the justice, by any overseer where such offender shall be apprehended.

Rogues and vagabonds are to be apprehended by a constable, or any other person, and conveyed to a justice of the peace. The reward for apprehending is 10s., by order of the justice, payable by the high constable, or, in case of no high constable, by the petty constable; and on refusal, the justice may by his warrant levy the sum of 20s. by distress and sale of the constable's goods, &c. (17 Geo. II. c. 5.) But the justice shall not order the reward to be paid until the rogue or vagabond be publicly whipped (women excepted), or sent to the house of correction, and till the examination required by the said act shall be actually transmitted to the next sessions. (32 Geo. III. c. 45.) The penalty for not apprehending such offender shall be, on conviction before one justice, or view or oath of one witness, a forfeiture of 10s. to the poor by distress. The justices, or any two of them, shall, four times a year at least, order by warrant search for and apprehension of rogues and vagabonds. (17 Geo. II. c. 5.) And by 25 Geo. II. c. 36. two justices may examine persons apprehended on a privy search on oath as to their settlement and means of livelihood; and upon their failure of shewing that they have a lawful way of getting a livelihood, or of procuring some responsible housekeeper to testify to their character, and to give security (if required) for their future appearance, the justices may commit them to some prison or house of correction, for any time not exceeding six days, and order the overseers of the poor to advertise and describe them, &c.; and if no accusation shall be laid against them, they shall be discharged, or otherwise dealt with according to law. After examination by a justice, such justice shall order the offender apprehended to be publicly whipped by the constable, petty constable, or some other person appointed by them, or order him to be sent to the common gaol (27 Geo. III. c. 11.), or house of correction, till the next sessions, or for any less time (such time not being less than seven days, 32 Geo. III. c. 45.) as such justice shall think proper.—N. B. It is only here expressed generally, that he shall be publicly whipped; the form and manner thereof may perhaps be best collected from the provisions of former vagrant acts. By the 22 Hen. VIII. c. 12. the vagrant was to be carried to some market-town or other place, and there tied to the end of a cart naked, and beaten with whips throughout such market-town or other place, till his body should be bloody by reason of such whipping. By the 39 Eliz. c. 4. he was to be stripped naked from the middle upwards, and only whipped till his body should be bloody.

The justices of the next sessions, after commitment of the offender, may, after examination, order a rogue or vagabond to be detained in the house of correction to hard labour, for any further time not exceeding six months, and an incorrigible rogue for any further time not exceeding two years, nor less than six months; and during the time of confinement, to be whipped in such manner, and at such times and place, as they shall think fit. Such person may, if the sessions think convenient, afterwards be sent away by a pass; and if such person, being a male, is above the age of twelve years, the court may, before he is discharged from the house of correction, send him to be employed in his majesty's service by sea or land; and if such incorrigible rogue, so or-

dered by the sessions to be detained in the house of correction, shall break out or make his escape, or shall offend again in like manner, he shall be guilty of felony, and be transported for seven years. 17 Geo. II. c. 5.

By 13 & 14 Car. II. c. 12. the justices in sessions may transport such rogues, vagabonds, and sturdy beggars, as shall be duly convicted, and adjudged to be incorrigible.

By 17 Geo. II. c. 5. if the child of any vagrant, above the age of seven years, shall be committed to the house of correction, the justices in sessions, if they see convenient, at any time before such child be discharged, may order such child to be placed out as a servant or apprentice to any person who is willing to take such child, till such child shall be of the age of 21 years, or for a less time; and if any offender, who was found wandering with such child, shall be again found with the same child which was so placed out, he shall be deemed an incorrigible rogue. Where any vagrants have been committed to the house of correction till the next sessions, if, on examination of such persons, no place can be found to which they may be conveyed, the sessions shall order them to be detained and employed in the house of correction, until they can provide for themselves, or until the justices in sessions can place them in some lawful calling, as servants, apprentices, soldiers, mariners, or otherwise, either within this realm, or in the plantations in America.

After such whipping or confinement as aforesaid, the justice may, if he think convenient, by a pass under hand and seal, cause the offender to be conveyed to the place of his last legal settlement; but if it cannot be found, then to the place of his birth; or if he be under the age of 14 years, and have any father or mother living, then to the place of the abode of such father or mother, there to be delivered to some churchwarden or overseer. 17 Geo. II. c. 5.

And it shall be certified in the pass, that such person has been actually publicly whipped, or confined in the house of correction as aforesaid. 32 Geo. III. c. 45.

The justice shall make a duplicate of the pass and examination, and sign the same; and shall afterwards transmit the duplicate of the pass, annexed to the examination, to the next sessions, there to be filed and kept on record; and shall annex the duplicate of the examination to the pass, and send it with the same; and the said pass, examination and duplicate thereof, shall and may be read in any court of record as evidence. 17 Geo. II. c. 5.

And the justice who shall make the pass shall with the pass cause likewise to be delivered to the constable a note or certificate, ascertaining how they are to be conveyed, by horse, cart, or on foot, and what allowance such constable is to have for conveying them. The constable who shall receive such pass and certificate, shall convey the person according to the direction of the pass, the next direct way to the place whither he is ordered to be sent, if it be in the same county, riding, division, corporation, or franchise; if not, he shall deliver the said person to the constable of the first town, parish, or place, in the next county, riding, division, corporation, or franchise, in the direct way to the place whither he is to be conveyed, together with the pass and duplicate of the examination, taking his receipt for the same. And such constable shall, without delay, apply to some justice in the same county or division, who shall make the like certificate, and deliver it to such constable, who shall with all speed convey such person unto the first parish town or place in the next county or division, in the direct way to the place to which he is to be conveyed; and so from one county or division to another, till they come to the place to which such person is sent. And the constable, who shall

deliver such person to the churchwarden or other person ordered to receive him, shall at the same time deliver the said pass, with the duplicate of the examination, taking their receipt for the same. And whereas the present mode of conveying vagrants in the custody of a constable is frequently insufficient, it is enacted, that the justices in sessions may order that all rogues and vagabonds apprehended within their liberties, and ordered to be conveyed by pass, shall be conveyed by the master of the house of correction, or his servants, or by a constable, as they shall think proper; and they may make an order, that all constables, to whom rogues and vagabonds brought from another county are delivered, shall forthwith convey them to the nearest house of correction or within their liberty, to be afterwards removed by such master or his servants as aforesaid, and according to the provisions of the aforesaid act. 32 Geo. III. c. 45.

The passing of vagrants may be suspended on account of sickness by 35 Geo. III. c. 101.

By 49 Geo. III. c. 124. it is enacted, that in all cases whenever the execution of any order of removal, or of any vagrant-pass, shall be suspended by virtue of the 35 Geo. III. c. 101. any other justice of the peace of the county, or other jurisdiction within which such removal or pass shall be made, may direct and order the same to be executed, and the charges incurred to be paid, and may carry into execution any such amended orders, as fully as the same can be done by the justices who shall make the order of removal, or the justice who shall grant the pass.

Any justice before whom a vagrant shall be carried may order him to be searched, and his bundles to be inspected, by the constable or other officer in his presence; and if it shall appear that such vagrant shall be found to have sufficient wherewithal to pay for his passage, either in whole or in part, the justice shall order so much of the money to be paid, or other effects found upon such vagrant to be sold, and employed towards the expence of taking up and passing such vagrant, returning the overplus, after deducting the charges of such sale. 17 Geo. II. c. 5.

The justices in sessions shall limit what rates and allowances, by the mile or otherwise, shall be made for conveying or maintaining rogues, vagabonds, or incorrigible rogues; and make such other orders for the more regular proceeding therein, as they shall think proper. 32 Geo. III. c. 45.

If any petty constable or governor of any house of correction shall counterfeit any such certificate or receipt, or knowingly permit any alteration to be made therein, he shall forfeit 5*l.* And if he shall not convey or cause to be conveyed such vagrants, or not deliver them to the proper person; or if any constable shall refuse to receive any such person, or to give such receipt, he shall forfeit 20*l.* by distress and sale, by warrant of the justices in sessions, where the offence shall be committed; half to the informer, and half to the treasurer, to be applied by him as part of the public stock; returning the overplus upon demand, charges of distress being first satisfied. 17 Geo. II. c. 5.

The parish or place to which any rogue, vagabond, or incorrigible rogue, shall be conveyed, shall employ in work, or place in some work-house or alms-house, the person so conveyed, until he shall betake himself to some service or other employment; and if he shall refuse to work, or not betake himself to some service or other employment, the overseers may cause him to be carried to some justice, to be sent to the house of correction, there to be kept to hard labour. 17 Geo. II. c. 5.

But if the churchwarden, or other person who shall receive any person so sent, shall think the examination to be

false, he may carry the person so sent before a justice, who, if he see cause, may commit such person to the house of correction till the next sessions; and the justices there, if they see cause, may deal with such person as an incorrigible rogue: but the person so sent shall not be removed from the place to which sent, but by order of two justices, in the same manner as other poor persons are removed to the place of their settlement.

If any person shall knowingly permit any rogue, vagabond, or incorrigible rogue, to lodge or take shelter in his house, barn, or other out-house or building, and shall not apprehend and carry him before a justice, or give notice to the constable so to do; and shall be convicted thereof by confession, or oath of one witness, before one justice, he shall forfeit not exceeding 40*s.* nor less than 10*s.*, half to the informer, and half to the poor, by distress and sale; and if any charge shall be brought on any parish or place by means of such offence, the same shall be answered to the said parish or place by such offender, and be levied by distress and sale of his goods as aforesaid. And if sufficient distress cannot be found, such offender shall be committed to the house of correction by the justice, for any time not exceeding one month. 17 Geo. II. c. 5.

To defray the expences of apprehending, conveying, and maintaining rogues, vagabonds, and incorrigible rogues, and defraying all other expences necessary for the execution of this act not hereinbefore provided for, the justices in sessions may cause such sums as shall be necessary to be raised in the same manner as the general county rate.

Any person aggrieved by any act of any justice out of sessions, in or concerning the execution of this act, may appeal to the next general or quarter-sessions of the county, riding, liberty, or division, giving reasonable notice thereof; whose order thereupon shall be final.

Persons sued for any thing done in the execution of this act may plead the general issue; and if they recover, shall have treble costs.

In all cities and towns, where by virtue of special acts of parliament the charge of passing vagrants is to be defrayed in other manner than is by this act directed, or where such vagrants, by virtue of special statutes, are to be apprehended and conveyed by any person or officer, other than those named in this act, the same shall not be altered hereby. And persons conveyed in London, shall not be delivered in any other precinct within the city, but in the next county. 17 Geo. II. c. 5.

VAGAI, in *Geography*, a river of Russia, which runs into the Irtysh, 8 miles S.E. of Tobolsk.

VAGAL, in *Ancient Geography*, a town of Africa, in Mauritania Cæsariensis, on the route from Rufucurum to Catama, between Gadaum Castra and Castellum Tingitanum, according to the Itinerary of Antonine.

VAGENI, BAGENI, or *Vagienni*, a people of Italy, in Liguria, towards the sources of the river Eridanus, according to Silius Italicus. Pliny calls them Vagienni Ligures.

VAGERA, in *Geography*, a town of Arabia, in the province of Nedsjed; 90 miles N.E. of Mecca.

VAGESA, in *Mythology*, a name of the Hindoo god Siva. He is also called Vageswara, or the lord Vagesa; sometimes pronounced Bagis, and Bagiswar. His consort Parvati, as his energy or fakti, is named Vageswari. (See PARVATI and SIVA.) In the latter article, it will be seen that some etymologists, from this similarity of name, strengthened by other characteristic coincidences, conceive Bagisa and Bacchus to be names of the same person.

VAGESWARA, a name of the Hindoo god Siva; meaning the lord Vagesa, as noticed under that article.

VAGINA,

VAGINA.

VAGINA, a Latin term, literally signifying a sheath, or scabbard; used on divers occasions. As,

VAGINA, in *Architecture*, is used for the lower part of a terminus; because resembling a sheath, out of which the statue seems to issue. See **TERMS**.

The vagina is that long part between the base and the capital; and is formed in divers manners, and with divers ornaments.

VAGINA, in *Anatomy*, the membranous canal leading from the external organs of generation to the neck of the uterus, and receiving the male organ in coitu. See **GENERATION**.

The vagina is liable to an inflammation after delivery, occasioned by the head of the child being long retained in the pelvis. If the swelling and inflammation are not very great, they are generally removed by the discharge of the lochia; but if the internal membrane of the vagina be inflamed, emollient injections must be occasionally used, and a piece of prepared sponge should be introduced, to prevent its coalescing. The sponge may be thus prepared: Take a piece of a proper size for keeping the vagina open, when it is expanded; soak it in warm water; then roll it tight from end to end with a string; cut off any hard lumps, and lay it to dry; then take off the string, anoint it with lard, and introduce it into the vagina, the moisture of which will expand it. If the pressure on this part was so long continued, as to obstruct the circulation in it, a mortification will ensue, which may be either total or partial: if it be total, the patient will die; if partial only, the mortified parts will slough off. This may be known by great pain after delivery; a fetid smell, and a discharge of sharp ichor at first from the vagina, then pus and matter. When this is the case, emollient fomentations may be thrown up from time to time; doffils of lint may be dipped in some proper balsam, and applied to the parts in order to deterge and heal them; and when the sloughs are all cast off, great care should be taken to prevent the vagina from growing together, either by introducing doffils of lint, or pieces of sponge into it.

VAGINA, *Imperforate*. The vulva is liable to two different kinds of imperforation, which ought to be discriminated. First, the labia and nymphæ may be every where united and blended together, the orifice of the meatus urinarius being totally covered by them, so that no urine can be voided. Secondly, the hymen may form a complete septum, or else some part of the vagina may be closed with a membrane of similar structure; in which circumstances, although the vagina be imperforate, there is no impediment to the free issue of the urine.

The first case constitutes a species of malformation, attended with the greatest urgency, and which indeed admits of no delay of that operation by which the conjoined parts are to be separated. The kind of raphe, situated where the natural opening ought to be, should be immediately sought for, and here the requisite division of the parts is to be made, the incisions being carried to the necessary depth, yet always with a cautious hand, lest an opening be made into the bladder, or rectum. Concretions of the labia and nymphæ together may be the consequence of ulcerations of these parts; but the closure of the vulva is then never complete. The frequent evacuation of the urine separates the parts; and, if not capable of preventing their union entirely, it is at least sufficient to maintain an aperture opposite the meatus urinarius. The narrowness of the external opening, however, may obstruct the free discharge of the urine; and urinary calculi may even form more or less deeply in the vagina. Now, without taking into the account other functions of the sexual organs, the motives already explained

are quite pressing enough to make the removal of the deformity right and adviseable.

Before the age of puberty, no inconvenience can arise from the vagina being completely shut up by the hymen, or some other analogous membrane. But, at this period, the menstrual blood collects first in the vagina, and then in the uterus. Severe periodical colic pains, a gradual distension of the uterus, the absence of the menses, impairment of the health, a variety of nervous complaints, and sometimes even inflammatory symptoms, which recur, or are exacerbated periodically, afford strong presumptive grounds for suspecting an imperforation of the vagina. More information may be acquired from a careful examination of the parts. In the greater number of instances, the membranous septum is distended with the menstrual blood, and even sometimes protrudes from the vulva, in the form of a brownish, elastic, fluctuating tumour. Almost an immediate stop has been often put to alarming symptoms of long duration, by making an incision through the membrane causing the obstruction. A crucial wound will be sufficient, without cutting any of the membrane away; but we are recommended not to neglect to keep the newly divided parts asunder for a few days, by means of a tent, or a doffil of lint.

Labours are sometimes so difficult, and attended with such injury, that inflammation, and even ulceration of the vagina, may be thus produced. These effects may be followed by considerable contractions of this canal, arising from the shrinking of the cicatrices. However, such a case is not what we have now to consider, our remarks being at present restricted to examples in which the vagina is altogether impervious.

The os tincæ may be entirely obliterated by congenital malformation, the effects of difficult labours, or any other circumstances producing inflammation in the part. In all these cases, menstruation and conception are rendered impossible, and a train of phenomena is observed, resembling those of the congenital imperforation of the vulva and vagina. But the os tincæ may become closed, from some accidental cause, subsequently to conception, and then the defect cannot be known until the period of delivery. In this last case, it is highly important to ascertain correctly whether the orifice of the womb is really obliterated; or whether an obliquity of that organ, or some other derangement of it, may not impose upon us?

The re-establishment of the natural opening is always indispensable, and it is materially facilitated by the distended state of the uterus. The operation can be most conveniently done, either with the instrument called a pharyngotomus, or a curved bistoury, which has a cutting edge that extends only a short distance from the point. See *Delpech, Précis Élémentaire des Maladies réputées Chirurgicales*, tom. i. p. 497, &c.

VAGINA, *Prolapsus of*, denotes, in *Surgery*, a species of bearing down, arising from a protrusion or descent of the vagina. The vagina is liable to two kinds of prolapsus. In one case, all its tunics are included in the protrusion, and at the same time that the part falls downwards, it becomes inverted. In the other example, it is only the relaxed lining of the vagina which descends and makes a protrusion.

The first species of prolapsus vaginae is subject to varieties. For instance, sometimes the whole circumference of the part falls down; sometimes only a portion of one of its sides. In the first event, the prolapsus forms a cylindrical tumour, which consists of all the coats of the vagina, presenting an opening at its lower termination, and having an external covering, which is composed of the internal lining

VAGINA.

of the vagina. But when the protrusion comprehends only a portion of one of the sides of this tube, the tumour occurs in the form of a cul-de-sac, which can be put back into the vagina with the finger or probe, and the lower end of which is without any aperture. The following differences are also remarkable in cases where the lining of the vagina constitutes the prolapsus. In some instances, the lining of the whole circumference of the part protrudes in the form of a cylindrical swelling, consisting of a duplicature of that coat. In other examples, the membrane lining the vagina is relaxed and elongated only at one or more particular points, and produces one or more external swellings of the cul-de-sac figure. This last case is liable to be mistaken for polypi of the vagina.

The possibility of a prolapsus of the whole of the vagina, together with all its coats, has been doubted by Sabatier and Levret; but, as Richter conceives, without any real foundation. If, as the latter author observes, it is possible for the inner coat of the vagina to separate from the external, with which it is intimately connected, an event which every body admits as happening in the second kind of prolapsus vaginæ, why should it be impossible for the whole of this tube, together with all its coats, to be separated from the surrounding parts, to which it is not so closely adherent? Sometimes the rectum, inclusive of all its coats, forms what is termed a *prolapsus ani*, and why may not the vagina be displaced in a similar manner, since it must be much more liable than the rectum to be propelled downwards in the violent straining which takes place during parturition? Richter asks, whether every prolapsus uteri is not accompanied with such a displacement of the vagina? Cases are upon record, where the prolapsus of the vagina happened all on a sudden, in consequence of falls, the starting of a horse, &c. (Hoin, Levret, *Journal de Médecine*, tom. xl.) Here it cannot be supposed, that the case was merely a protrusion of the inner coat, which can only be gradually relaxed and elongated. Lastly, instances in which the prolapsus of the vagina was several inches in length, have been gradually reduced by means of external pressure. (Hoin.) How can we imagine, says Richter, that such cases could proceed from any degree of relaxation, to which the membranous lining of the vagina is liable?

It must be acknowledged, however, that this species of prolapsus is much less common than the second kind; that when it occurs, it is generally as a consequence of a prolapsus of the uterus; and that it cannot easily happen at all, except about the time of delivery. A prolapsus of the inner coat principally occurs in married women who have had many children, and been frequently troubled with fluor albus. It has, however, been occasionally met with in young unmarried females. The prolapsus of one particular portion of the inner coat of the vagina, is generally the consequence of a hernia in this part; but sometimes in cases of dropsy, a portion of the vagina, containing fluid, protrudes in the form of a cyst, or sac.

When the whole circumference of all the coats is involved in the prolapsus, if a finger, or probe, be introduced into the cylindrical tumour, which the vagina then forms, the os uteri will be found to be situated closely behind the external pudenda; for this sort of bearing down is always attended with a displacement of the womb, in the direction downwards. In many instances, particularly when the prolapsus has taken place suddenly, and is quite recent, the patient experiences a variety of complaints about the bladder and rectum, and the evacuation of the urine and feces becomes more or less interrupted. That the protrusion comprehends all the coats of the vagina, is frequently quite manifest

from the thickness of the cylinder. Also, when the accident has occurred suddenly, or it can be easily reduced, there is always reason to conclude that the prolapsus is of the preceding description.

The prolapsus of the inner membrane of the vagina generally arises gradually, and often as a consequence of a long-continued fluor albus. It either does not admit of reduction, or, if reduced, it lies in the vagina, and fills its cavity. It has very little effect upon the uterus itself, which usually remains in its natural position, and it seldom produces any difficulty in the evacuation of the urine and feces. When only a part of one side of the inner membrane of the vagina is relaxed, elongated, and protruded, the swelling can be pushed back into the vagina with the finger, and thus the nature of the complaint becomes manifest. The prolapsus, arising from a hernia in the vagina, can only be ascertained by attending to the symptoms which characterize this sort of rupture, and which are noticed in the article *HERNIA*.

A prolapsus of all the coats of the vagina, while it is small and recent, can be reduced by pressure without difficulty. But the thing which demands the greatest care, is to hinder a relapse. This is accomplished by the employment of a pessary, and the use of astringent applications.

When, however, the last species of prolapsus has existed a long while, its reduction is more difficult; for the vagina, after it has remained displaced a certain time, begins to be affected with swelling and induration. According to the reports of Hoin and Levret, a large protrusion of this kind, ten inches in length, was so diminished by keeping the patient invariably confined upon her back, that in the course of a month the rest of the tumour admitted of being reduced. Indeed, as Richter observes, there can be little doubt, that the treatment which has been advised by some authors for the diminution of very old enormous omotal ruptures, would here be equally applicable; *viz.* long confinement in bed upon the back, with the buttocks somewhat elevated; continued, well-directed, external pressure; a very low diet, and repeated mercurial purges. By such means, no doubt, the swelling might be in many instances sufficiently lessened to admit of reduction.

During the state of pregnancy, a prolapsus of the foregoing kind may be attended with considerable embarrassment, and even danger. In one case, where such a prolapsus, five inches in length, took place during labour, it became necessary to turn the child, and the displaced vagina was also lacerated. The woman, however, recovered. (Pietfch, *Journal de Médecine*, tom. xxxiv.) In another case, where the prolapsus became as large as a man's head at every return of the labour-pains, the practitioner succeeded in holding the parts back, while the woman was delivered with the aid of the forceps. (See Loder's *Journal*, 1 b. p. 490.) When this is impracticable, it is necessary, according to Richter, to make an incision through both sides of the prolapsus; a proceeding, says he, to which the practitioner may the more readily make up his mind, inasmuch as the parts have even been lacerated, without any ill consequences, as we have already related.

The prolapsus of the inner membrane of the vagina, while small and recent, may perhaps be removed by astringent applications. When, however, it is of long standing, indurated, and of large size, much expectation of success from this treatment cannot be entertained. Richter sees no reason why, in such a case, the redundant relaxed part should not be cut away, especially when the disease is accompanied with ulceration, and other serious complaints. As he observes, there can be no doubt that a prolapsus of the inner membrane of the vagina, when limited to one part of this

this canal, may always be safely extirpated either with a knife or a ligature. Richter's *Anfangsgr. der Wundarzneykunst*, b. 7. Vierte Kapitel.

VAGINÆ Femoris Tensor, in *Anatomy*, a name given by Albinus to a muscle in the thigh, called by others the *membranosus*, and the *musculus fasciæ latæ*; and by some *musculus APONEUROTICUS*; which see.

VAGINÆ Uteri Splinæter. See GENERATION.

VAGINA Foliarum, in *Botany* and *Vegetable Physiology*, the sheath of the leaves, (see LEAF and SHEATH,) most peculiarly observable in grasses, and their allies, consists of that part of the leaf which is below the *stipula*, by which it is crowned. The *Vagina* embraces the stem, or straw, more or less closely. Its inside is usually quite smooth, and polished, while the outside is generally ribbed, rough, or hairy, though commonly less so than the leaf itself. The pubescence in some instances is directed contrariwise to that of the leaf. In most grasses, particularly the corn tribe, the sheaths of one or two of the uppermost leaves are much dilated, serving the important purpose of protection to the young panicle or spike of flowers. A singular theory respecting the cause of smut in grain was, many years since, published by the Rev. Henry Bryant, of Heydon, Norfolk. (See SMUT.) The mischief was, by this writer, attributed to an accidental tightness in the summit of the sheath of the leaf, by which the young ear was, in a manner, strangled; an hypothesis totally insufficient to account for the phenomenon.

The term *vagina* is, in like manner, applied to the lower part of the foliage of the Crocus, the Snow-drop, and various stemless plants related to one or the other, in which the leaf tapers down into a sort of sheathing *footstalk*. But it is erroneously exemplified by professor Willdenow, in his *Principles of Botany*, by the genus *Polygonum*, whose cylindrical membrane, attached to the inner side of each *footstalk*, and surrounding the stem above every joint, is a real sheathing STIPULA, see that term; the *footstalk* being interposed between it and the leaf. So in *Spermacoce*, and other plants of the extensive and various order of *Rubiaceæ*, the membranous intrafoliaceous *stipula* must not be taken for a *vagina*, though it be connected, ever so closely, with the *footstalks* at each side; because the analogy of most plants of that order shew it to be a real *stipula*, which from its situation, and the varieties in its form, structure and aspect, is of peculiar botanical importance.

VAGINALIS GULÆ, in *Anatomy*, the muscular stratum surrounding the mucous membrane of the œsophagus. See DEGLUTITION.

VAGINALIS Testis, the serous membrane surrounding the testicle, and forming the bag, in which it is included. There is also a covering, composed of condensed cellular membrane and the fibres of the cremaster, which surrounds the spermatic cord and the testis with its membranes. This is called *tunica vaginalis communis*. See GENERATION.

VAGINALIS, in *Ornithology*, a genus of the order Grallæ of birds, of which there is one species, *viz.* the *V. alba*, or white sheath-bill of Latham. Found in New Zealand, and other islands of the Southern ocean.

VAGINARIA, in *Botany*, named from *vagina*, a sheath; because the stem is clothed with leafless sheaths. Pursh 58. This genus is adopted by Pursh from Persoon, and its distinctive character consists in the seed being surrounded at the base with three scales, and three intermediate bristles. One or the other of these parts doubtless originates in the three *stamens*. The *stigmas*, moreover, are said to be three.

The only species mentioned by Pursh is *V. Rickardii*.

(*Fuirena scirpoidea*; Michaux Boreal.-Amer. v. 1. 38. t. 7.) —“Stem leafless, sheathed. Spike ovate, mostly solitary. Scales lanceolate-spatulate.”—Native of inundated fields, from Georgia to Florida. Perennial. Pursh. The aspect of the plant is like a RESTIO; see that article, FUIRENA, and SCIRPUS. When we advert to the many different appearances of these scales, or bristles, in different species of the last-named genus, and even their absence in some, we hesitate to admit the *Vaginaria*, without examining one species at least, or being informed of any others on which it is founded.

VAGIOW, in *Geography*, a town on the W. coast of the island of Celebes.

VAGLIANO, a town of Italy, in Friuli; 10 miles W. of Udina.

VAGNEY, a town of France, in the department of the Vosges; 4 miles E. of Remiremont.

VAGNIACIS, in *Ancient Geography*, a place of Great Britain, marked in the 2d Iter of Antonine, between Noviomagus, situated, according to Camden, Gale, and Horsley, at Woodcote near Croydon and Durobrivæ or Rochester; and supposed to be Northfleet.

VAGOS, in *Geography*, a town of Portugal, in the province of Beira, near the Atlantic coast; 6 miles S. of Bragança Nova.

VAGRAM, a town of the archbishopric of Salzburg; 6 miles S. of Salzburg.

VAGRANTS, in *Law*. See VAGABOND.

VAGSKOI, UST, in *Geography*, a town of Russia, in the government of Archangel, at the union of the rivers Vaga and Dwina; 20 miles N.N.W. of Schenkursk.

VAGUM, in *Anatomy*, a name given to the eighth pair of nerves of the medulla oblongata, called the *par vagum*, because dispersed to divers parts of the body. See NERVOUS System.

VAGUM, in *Ancient Geography*, a promontory situated, according to Ptolemy, on the eastern coast of the isle of Corica.

VAGUS, in *Geography*. See WAAG.

VAHALIS, or VACHALIS, *Wahal*, in *Ancient Geography*, a name given to the left branch of the Rhine, after its separation at its entrance into the country of the Batavi, which afterwards joined the Meuse. The territory between these rivers was denominated “*Insula Batavorum*.”

VAHAN, in *Hindoo Mythology*, is the general name of the different vehicles by which their gods and goddesses are conveyed. The goddesses are usually seen accommodated with the vehicles of their lords; being indeed, as is declared, the same. We will here notice such vehicles as are appropriated to the different deities. *Brahma*, being a personification of the earth, or matter, and remotely participant also in representing humidity, rides the semi-aquatic bird, the sluggish swan or goose, called *Hahnsa*: his consort *Saraswati*, goddess of harmony and arrangement, is sometimes seen mounted on a species of heron. See SARASWATI and SIVA.

Vishnu, the conservator, is the air; and he, like his brother Jupiter of Greece, cleaves his own element on a towering eagle, which the Hindoos call by several names; among them *Garuda* and *Superna*.

Siva, the changing or destroying power, is a personification of fire; he also corresponds in character with some of the Jupiters of the West, and rides a white bull, called *Nandi*. His sakti or consort, *Parvati*, is often seen turret-crowned, in a car drawn by tigers or lions. Virgil's description of *Cybele* applies equally to the mountain-goddess *Parvati*.

"Alma parens Idæa deum, cui Dindyma cordi,
Turrigeræque urbes, bijugique ad fræna leones."
Æn. x. 258.

Dryden changes her lions into tigers.

"Hear thou great mother of the deities,
With turrets crowned, on Ida's holy hill,
Fierce tigers reined and curbed obey thy will."

Pitt, however, in his invocation, restores the lions.

"Great guardian queen of Ida's hills and woods,
Supreme, majestic mother of the gods!
Whose strong defence proud tow'ring cities share,
While roaring lions whirl thy mighty car."

In most languages of the East, it may be observed, the same word means both lion and tiger. The Greeks or Romans, borrowing the attribute from the East, may easily be misconceived its name. (See *CYBELE* and *PARVATI*.) It might be shewn that most of the mystical ceremonies practised by the Western heathens in honour of the goddesses *Cybele*, were, and are, common also in India in honour of *Parvati*. The peacock is likewise sacred to the latter, and is, as we shall presently notice, the vahana of one of her family, *Kartikya*, otherwise called *Komara*; and the being deemed his *fakti* is called *Kaumari*, and is likewise so conveyed.

Having thus seen that the vehicles of the three great powers composing the Hindoo triad are severally the swan, the eagle, and the bull, we proceed to notice how the inferior deities are accommodated.

Surya, or the sun, rides sometimes a lion, but generally in a golden car drawn by seven horses, or by one horse with seven heads. The horse is sometimes called *Oochirava* (which see); but we are in some doubt if correctly. *Soma*, the moon, is drawn in his silvery car (the moon is masculine in India) by an antelope. *Pavaka*, the god of fire, rides an ardent ram. *Kama*, the Indian Cupid, rides a luri, or parrot. *Varuna*, genius of the waters, bestrides a fish, as does also *Ganga*, the Ganges, primal goddess of rivers. *Ganesa*, the god of prudence and policy, has an elephant as his vahana, it being supposed the animal of greatest forecast: a rat is also deemed a very sagacious animal, and *Ganesa* is sometimes seen so mounted. He is reputed the eldest son of *Parvati*, and is otherwise named *Pollear*; which see. *Kartikya*, her second son, or rather her lord's son, is borne by a peacock, as before noticed. *Indra*, regent of the firmament, has a three-trunked elephant, named *Iravat*. *Vairava*, a son of *Siva*, rides a buffalo, sometimes a dog. *Vyagrabi*, and *Vrisbadwaja*, are names of *Parvati* and *Siva*, meaning tiger-mounted, and one who rides a bull.

Astrologers have mounted the rest of the planets, as well as the sun and moon. *Mangala*, or Mars, on a horse, sometimes on a ram: his fiery nature connects him sometimes with the igneous *Pavaka*, who rides the latter animal. *Boodb*, or Mercury, being by some accounts a manifestation of *Vishnu*, at any rate bearing the same name with a disputed avatara or incarnation of that god, shares his vehicle, and the planet is mounted on an eagle. *Vribaspati*, or Jupiter, on a boar. *Sukra*, or Venus, on a rat, sometimes on a camel. The slow-moving *Sani*, or Saturn, on the heavy elephant, or ill-omened raven. *Rabu*, the dragon's head, on a tortoise or owl: and *Kebu*, the tail or descending node, on a frog.

The word *vahana* is usually pronounced as one broad syllable; and it has been surmised that the English *van* and *vain* may bear some etymological affinity to it.

VAHARA, in *Geography*, a town of Arabia Deserta; 150 miles W. of *Jamama*.

VAHINGEN. See *VAYHINGEN*.

VAHL, **MARTIN**, in *Biography*, a botanical writer of good and original authority, born in Norway in 1751, received his first education at the school of Bergen, which he left in 1766, and was then entered a member of the university of Copenhagen. Residing two years with the Rev. Hans Ström, an able zoologist and botanist, (see *STROEMIA*,) he imbibed a taste for similar studies, especially for systematic botany, to which he, from that period, to his last hour, devoted himself. In order to obtain every possible advantage in this branch of his education, he repaired to Upsal, where he studied for five years under the celebrated Linnæus, and became one of the most distinguished pupils of that great man. Some personal estrangement unfortunately took place between the preceptor and his promising disciple, from a domestic cause, to which we have already alluded, at the conclusion of our article *LINNÆUS*. It was scarcely to be expected that the dignified professor, then in the zenith of his prosperity and honours, could favourably regard the inclination of one of his daughters, for a student who had his own fortune to seek; nor is any thing recorded of this daughter, which might have justified a romantic attachment, or adventurous pursuit, on the part of the young man. We know not in what year Mr. Vahl quitted Upsal, but in 1779 he was appointed lecturer, or demonstrator, of Botany, in the garden at Copenhagen, where he taught his science, with great applause, for three years. After this period had elapsed, he was chosen, by the king of Denmark, to undertake a scientific tour, at his majesty's expence; in the course of which he visited Holland, France, Spain, and part of Barbary, as well as Italy, Switzerland, and England. He not only investigated and collected the wild and garden plants of the countries through which he passed, but, in consequence of liberal introductions, to all who were learned or occupied in the same study, he was admitted to the chief libraries and museums in Holland, France, and England; of all which advantages he made the most diligent use. He was allowed free access to the collection of sir Joseph Banks, and the manuscripts of the deceased Solander, and the writer of the present article used habitually to devote a day in every week to study with him the herbarium of Linnæus, for their mutual benefit. If the acute and learned Dane did not, in every instance, conduct his enquiries and communications with that high sense of honour and delicacy which have been exemplified in the characters of a Banks, a Davall, Afzelius, Hofack, and many others, in the same circumstances, he by no means neglected to improve science, or to benefit its cultivators. We should not here have alluded to what is best forgotten, had not a circumstance of this kind been already before the public, in the Transactions of the Linnæan Society, v. 2. 209; and had not the remark there made been justified by a subsequent communication of the late Mr. Dryander, relative to the unauthorized and unacknowledged use of Solander's papers, discoverable by some little mistakes copied from thence.

On returning to Copenhagen in 1785, Mr. Vahl was made professor of natural history in that university; and was appointed editor of the *Flora Danica*, begun at the royal expence by Oeder, continued with much imperfection by Muller, but restored to its original excellence by Vahl. The better to perform his duty, he visited certain tracts of country, previously little explored by botanists; especially the coasts and mountains of Norway, as far as Wardöe. Being now married, and settled in his native land, he undertook the publication of his discoveries and remarks, in a folio work, entitled *Symbolæ Botanicæ*, of which the first fasciculus appeared in 1790, the second in 1791, and the third in 1794. Each is accompanied by twenty-five un-

coloured

coloured plates, not highly finished, but expressive and correct. The principal object of this work was, in the first instance, to illustrate Forskall's discoveries, very incorrectly displayed in his own posthumous *Flora*; and the materials for the exemplification of which are, it seems, but partially and imperfectly preserved. Vahl's *Symbola* are moreover enriched with descriptions and figures of new or rare plants, from various other sources. The communications of the author's numerous correspondents, particularly of Von Rohr and others from the Danish West Indian colonies, are added to the acquisitions of his own journeys; and the whole forms a large body of valuable practical information. His *Eclogæ Americanae*, published in 1796, are a sequel to the *Symbola*, on the same plan, but devoted to American plants.

In 1799 and 1800 professor Vahl received the pecuniary support of the Danish government in a second tour to Holland and Paris, for botanical purposes; chiefly, we presume, with a view to the composition of a great work, long in his contemplation, on the model of the Linnæan *Species Plantarum*. Of this he just lived to publish the first volume, under the title of *Enumeratio Plantarum*, in 1804, in 8vo. including the classes *Monandria* and *Diandria*. The second, containing only the *Triandria Monogynia*, was published by his widow in 1805. The copious introduction of new species, the ample original descriptions, the well-chosen synonyms, and judicious remarks, render this work far superior to any other of its kind, giving it all the merit of an original performance. Besides the addition of the essential generic characters, as in the *Sytema Vegetabilium* of Linnæus, Vahl's *Enumeratio* is enriched with a compendious description of the peculiar habit of each genus, after a plan first introduced by Gouan, in his *Flora*, as well as *Hortus Monspeliensis*, and which Linnæus justly commended, as leading the way to improvement in natural classification. Nor must we pass by, without commendation, the excellent generic and specific index to each volume, an appendage of whose value we are seldom duly sensible, but from its inaccuracy or omission in other instances. The neglect, or bad construction, of indexes, and the omission of references to pages, are defects of the modern French school, which may be avoided by any botanical writer, even of the most humble scientific pretensions, and which the most learned ought not to neglect. The sequel of professor Vahl's last publication, as far as concerns grasses, was reported to have been left by its author in considerable forwardness, and was, if we mistake not, announced for publication. Something to this effect is found in the preface to the second volume; but we know not that any part of these valuable materials has appeared. The botanical professorship at Copenhagen was conferred on Mr. Vahl, after his return from his second visit to France, but he lived not long to enjoy his well-merited fame and distinction. He died on the 24th of December, 1804, in the 54th year of his age, leaving a widow and six children. His library, herbarium, and manuscripts were purchased by the king of Denmark for 3000 dollars, about 675*l.*, besides an annual pension of 400 dollars, or 90*l.*, to his widow, and of 100 dollars to each of his children. It was intended that the above-mentioned manuscripts, including a finished treatise on the class *Syngenesia*, should be edited by the successor of professor Vahl, Mr. Horneman, to whom the continuation of the *Flora Danica* was likewise confided. We are not informed of the progress of either.

Besides the botanical writings of professor Vahl, he has published some zoological papers in the Danish language, especially relating to birds; and has described a fish, constituting a new genus, by the name of *Holocentrus lentiginosus*, in the third volume of the *Transactions of the Natural His-*

tory Society of Copenhagen.—A more detailed review than we could here undertake, of the first volume of the *Enumeratio Plantarum*, may be seen in Sims and König's excellent *Annals of Botany*, v. 2. 179, where Mr. König has noticed every new article of information, and corrected every incidental mistake, with consummate accuracy and knowledge. We have already advanced an opinion similar to that of this able critic, respecting Vahl's removal of the Linnæan *SCITAMINEÆ*, see that article, from the class *Monandria* to *Gynandria*; a measure barely to be excused by our supposition, and not at all to be justified by any alleged reason.—Vahl's Works. Sims and König's *Ann. of Bot.* v. 1 and 2.

VAHLIA, in *Botany*, received that name from Thunberg, in honour of his contemporary professor Vahl. (See the last article.) The same genus was originally destined by the great Linnæus to commemorate Jean Jacques Rousseau, as appears by specimens in the Linnæan herbarium, marked *Roussæa capensis*; but he did not live to publish this genus, which his son, through inadvertence probably, introduced into the *Supplementum Plantarum*, by the name of *RUSSELLIA*, see that article and *ROUSSEA*. Those names being otherwise appropriated, the *Vahlia* is finally established.—Thunb. *Nov. Gen.* 36. Schreb. 176. Willd. *Sp. Pl.* v. 1. 1354. Mart. *Mill. Dict.* v. 4. Juss. 318. Lamarck *Illustr.* t. 183. (*Russelia*; Linn. *Suppl.* 24. Murr. in Linn. *Syst. Veg.* ed. 14. 270.)—Class and order, *Pentandria Digynia*. *Nat. Ord.* *Calycanthemæ*, Linn. *Onagrea*, Juss.

Gen. Ch. *Cal.* Perianth superior, of five lanceolate, acute, concave, spreading, permanent leaves. *Cor.* Petals five, ovate, concave, spreading, undivided, not half so long as the calyx. *Stam.* Filaments five, inserted into the calyx, between the petals, and full as long as its leaves, thread-shaped, erect; anthers incumbent, oblong, with four furrows. *Pist.* Germen inferior, roundish; styles two, thread-shaped, slightly spreading, longer than the stamens; stigmas simple, obtuse. *Peric.* Capsule ovate, abrupt, marked with five elevated lines, and crowned with the calyx, of one cell and two valves. *Seeds* numerous, minute.

Ess. Ch. Calyx of five leaves. Petals five, alternate with the stamens. Capsule inferior, of one cell and two valves, crowned with the permanent calyx. *Seeds* numerous.

1. *V. capensis*. Cape Vahlia. Thunb. *Nov. Gen.* 36, with a plate. *Prodr.* 48. Willd. n. 1. (*Russelia capensis*; Linn. *Suppl.* 175.)—Gathered by Thunberg, in sandy ground, near the valley of Verkeerde, at the Cape of Good Hope, flowering in December. It has not yet been brought to England. The root is woody and perennial. *Stems* several, herbaceous, erect, a span or more in height, simple or branched, leafy, clothed with short, soft, prominent, viscid pubescence, like all the rest of the herbage. *Leaves* opposite, sessile, linear-lanceolate, entire, pale green, an inch or inch and half long. *Flowers* yellow, in small, axillary, nearly sessile, tufts, about the upper part of the branches, accompanied by a small lanceolate bractea. The petals and filaments assume a violet hue when dried.

VAHNI, in *Mythology*, a name of the Hindoo regent of fire, who is more commonly called *Parvaka*; which see. A similar name, usually indeed written *Vani*, is given to Saraswati, consort of Brahma. See *SARASWATI* and *MARUT*.

VAIDYA, the name of a respectable class of Hindoos, who follow the profession of physic. Individuals of different religious sects are comprised in this denomination. (See *Sects of Hindoos*.) Sir W. Jones, speaking of the Vaidyas, says, "they have more learning, with far less pride, than any of the Brahmaus: they are usually poets, grammarians, rhetoricians, and moralists; and may be esteemed, in general, as the most virtuous and amiable of the Hindoos."

(Asiatic Researches, vol. i.) When not Brahmans, they are not permitted, legally, to read the holiest of the Hindoo books. See RETI and VEDA.

VAIGAL, in *Geography*, a town of Hindoostan, in Golconda; 20 miles S.S.E. of Combamet.

VAIGAR, an island of Russia, in the Frozen ocean, on the N. side of the straits of Vaigatskoi, about 24 miles in length, and about 8 broad. N. lat. $75^{\circ} 30'$. E. long. $52^{\circ} 24'$.

VAIGATSKOI, **PROLIV**, or *Straits of Vaigatz*, between Nova Zembla, and the continent of Russia.

VAIGE, a town of France, in the department of the Mayenne; 12 miles E. of Laval.

VAIHEND, or **SCANDERIE**, a town of Persia, in the province of Segestan, anciently Alexandria; 50 miles E. of Arokhage. N. lat. $31^{\circ} 10'$. E. long. $66^{\circ} 40'$.

VAI-HIO, in the *Materia Medica*, a name used by some authors for a kind of lignum aloes, which is brought from China, and is very black, and scented.

VAIJAYANTA, the name of a palace of the Hindoo god Indra, situated in a celestial city named Amrovati. (See **INDRA**.) Another of his abodes is called *Sitanta*; which see. See also **VAIKONTHA**.

VAIKONTHA, the paradise of the Hindoo god Vishnu. It doth not precisely appear whether this abode is celestial, terrene, or subterrene. Sometimes it is described rather of the latter sort in a sea of milk, called *Krirkamudra*, where Vishnu is pictured reposing on a mighty serpent named *Sesha*, accompanied by his delightful consort *Lakshmi*. (See **LAKSHMI** and **SESHA**.) A commentator on a Sanscrit work entitled *Khetra Nirmana*, the most ancient perhaps of Hindoo geographical books, places Vaikontha in the Frozen ocean: a circumstance that would have afforded curious confirmation to an idea of Buffon and Baillie as to the site of Eden, had these eminent men been aware of it: an idea more ancient, indeed, than the day of these philosophers, as Postellus had a similar notion. See **PARADISE**.

Several of the Hindoo deities have residences especially assigned them, by European writers usually called the paradise of those deities respectively; thus Indra's abode is called *Sitanta*, *Swerga*, and *Vaijayanta*; that of Siva, *Kailasa*; that of Varuna is *Subhavati*. Generally, these palaces or places of the Hindoo gods are described as situated on a mytical trifurcated hill named *Meru*, to which word we refer the reader for some of the extravaganzas connected with the Olympia of the Hindoos.

VAILATA, in *Geography*, a town of Italy, in the department of the Adda; 18 miles E. of Milan.

VAILLAC, a town of France, in the department of the Lot; 15 miles N. of Cahors.

VAILLANT, **JEAN FOI**, in *Biography*, an eminent antiquary and medallist, was born at Beauvais, in Picardy, in the year 1632. His maternal uncle, to whose care his education was entrusted, designed him for the profession of the law; but inheriting the fortune of this relation, he devoted himself to the study of physic, in which faculty he took a degree. Having accidentally gained possession of a box of medals, he relinquished his medical pursuits, applied to antiquarian and medallist researches, and soon formed a valuable cabinet, to the increase of which his various travels very much contributed. In one of his excursions for this purpose, he was attacked by an Algerine corsair and carried into slavery; and after his release, he was on another occasion attacked by a Tunisian; and in order to secure fifteen or twenty gold medals which he had in his possession, he swallowed them, and in process of time nature relieved him of his burden, which he disposed of to an amateur with advantage. On his return to Paris, he distinguished himself by

various dissertations on medals. He was thus recommended to the court, and employed on a commission for the prosecution of the same object. His ardour urged him to visit Egypt and Persia, and he was recompensed by obtaining a rich cargo of medals. To the Memoirs of the Academy of Inscriptions and Belles Lettres, of which he was a member, he communicated several valuable papers on his favourite subject: his reputation gained him the post of keeper of the duke of Maine's cabinet of medals: and even at Rome he was so highly esteemed, that he obtained a dispensation from the pope to marry successively two sisters. His private character was highly estimable. His labours were terminated by death in 1706, at the age of seventy-four years. The titles of some of his principal works, independently of several separate dissertations, tending to illustrate medallist science in its connection with history, are as follow: "Numismata Imperatorum Romanorum," 1674, 4to. of which an enlarged edition was published by Baldini at Rome in 3 vols. 4to. 1743: "Seleucidarum Imperium, five Historia Regum Syriæ ad fidem Numismatum accommodata," 1681, 4to.: "Selecta Numismata Antiqua ex Museo Petri Seguni," 1684, 4to.: "Numismata Ærea Imperatorum, Augustarum, et Cæsarum in Coloniis, Municipiis, et Urbibus, &c." 2 vols. fol. 1688: "Numismata Imperatorum, &c. Græca," 1698, 4to.: "Historia Ptolemæorum Ægypti Regum ad fidem Numism. &c." 1725, 4to.: "Achæmenidarum Imperium, &c." 1725.

The son of the preceding, *viz.* **JOHN-FRANCIS FOIVAILLANT**, born at Rome in 1665, was instructed by his father in medallist science, and was graduated for the profession of physic. He published several dissertations on medals in the Memoirs of the Academy of Inscriptions, of which he was a member, and also a dissertation on the "Dii Cabiri." His life terminated in 1708, in the 44th year of his age. Moreri.

VAILLANT, **SEBASTIAN**, a distinguished French botanist in the early part of the 18th century, was born May 26th, 1669, at Vigny, near Pontoise, being the eldest son of a shopkeeper in that town. He is described as having, like many other botanists of eminence, imbibed a taste for plants at a very early age, and even before his sixth year to have cultivated, in a little garden of his own, with which his father indulged him, all the plants he could collect from the country around, or from the gardens of his neighbours. We can hardly wonder that his illustrious biographer Boerhaave, should, as a physician, delight also to record an instance of Vaillant's early medical talents, in curing himself clandestinely of an intermittent fever, with lettuces and vinegar. He is reported to have made a rapid proficiency at the grammar-school of Pontoise, where he gave extraordinary proofs of attention to study, as well as of attachment to practical botany. His father was anxious to have him instructed in music, in which he made such progress, that he was found competent, at the age of eleven years, to succeed his master, as organist in the Benedictine convent of St. Macloud, in the town above-mentioned. Soon afterwards, he obtained a similar appointment, in a neighbouring nunnery, where he was accommodated with board and lodging as a remuneration. The decided bent of young Vaillant's mind appears to have been towards medicine and surgery, in consequence, probably, of his primary disposition to an observance of natural objects, and a consideration of the qualities of plants. Hence he was led to frequent the public hospital, and even to become an assistant to the surgeon of the house, and in his leisure hours he read medical books, and pursued anatomical enquiries. In this manner he passed his time till he reached his nineteenth year, when

VAILLANT.

when he removed to Evreux in Normandy, to place himself under another surgical teacher. Here he gained the good opinion of the marquis De Goville, captain of the royal fusiliers; who engaged M. Vaillant as surgeon to his company, with the rank of lieutenant. Thus the peaceable botanist, the organist of a nunnery, became a soldier; encountered the dangers of a campaign; came off with honour and safety; performed the last duties to his patron, who fell in the battle of Fleurus, July 1, 1690; and after visiting several towns in Flanders, returned to Evreux, which he quitted next year to pursue his studies, with more advantage, at Paris.

On the theatre of the metropolis, the talents of our young candidate for scientific distinction and improvement found every possible encouragement and advantage. Here, although the practice of surgery seems to have been his first object, probably with more direct views to a maintenance; he soon resigned every other pursuit for the first passion of his youth, and botany henceforth engaged all the faculties of his mind. He soon discovered the science to be just then in a state to make the scientific fortune of a man of enterprise and genius. Botany had, for some time, become a leading taste among persons of rank and opulence, by which the materials for its improvement had accumulated, but the advancement of the science itself had not, by any means, kept pace with its riches. Men of the first rank in human intellect, who had fixed everlasting landmarks in other departments of knowledge or literature, though they had done much in botany and other branches of natural history, had but imperfectly accomplished any great systematic plans of technical distribution or discrimination, without which mere practical knowledge is but an indigested chaos. The lucid order, and rapid perceptions, of Tournefort's mind, with whom Vaillant was now soon familiarized, as one of the most diligent of pupils, could not but strike him with peculiar force, while supplying light of which he so sensibly felt the necessity. But as a lamp, however brilliant, serves to betray the surrounding darkness in an unlimited unexplored cavern; so the achievements of Tournefort, like those of his predecessors and contemporaries, tended as yet to display more of the arduous nature of their undertaking, than of its perfect accomplishment. The common herd of their pupils and admirers, are like the animalcules on a blue-bottle fly; who, as a witty writer observes, "doubtless think their fly the greatest and the bluest object in the universe," and they can only go where it pleases to lead. But Vaillant, though adoring the genius of Tournefort, and loving his truly amiable social qualities, could not but perceive the imperfect execution of much of his plan, and detected at once perhaps many of those faulty principles, which have gradually displayed themselves to subsequent observers. That he had performed an Herculean task, could not be denied, but that much remained to be done, was but too evident to an acute observer. The great preceptor soon became aware of the talents of his pupil; he held him up as an example to his colleagues, and adopted him as a coadjutor in the elucidation of the plants about Paris.

After residing some time at Neuilly, Vaillant was chosen secretary to Father de Valois, a Jesuit, confessor to the younger branches of the royal family. Here he became known to M. Fagon, first physician to the king (see FAGONIA); who finding him investigating and arranging mosses, was much struck with the specific definitions, written in Vaillant's beautiful hand under each, as they still remain. Fagon soon afterwards took him under his immediate protection, promised to further his wishes of travelling, and invited him to reside at Paris, till he could procure

him an appointment of that kind from the king. This object however was soon given up. Vaillant became secretary to his patron, and was taken into his house. Having free access to every part of the royal gardens, he enriched his own herbarium, and those of Fagon and Tournefort, with exotic, as well as native, specimens, which he prepared with skill and dexterity. He likewise added daily to the collection of living plants, and became, under M. Fagon, the director of the *Jardin du Roi*. At length, in 1708, this faithful and disinterested friend resigned, in favour of Vaillant, his own appointment, of professor and subdemonstrator of plants in that garden, which Tournefort had repeatedly solicited from him in vain. To this great benefit, which Vaillant was anxious, by all possible exertions, to deserve, was added the construction of new and ample hot-houses, at the wish of the new professor, and the formation of a splendid cabinet of *Materia Medica*. His lectures on botany, and especially a "discourse on the structure of flowers," since published, were received with great applause. He was admitted, without solicitation, into the *Academie des Sciences*; it is even said that he was desirous of declining this honour, which his friends had great difficulty in persuading him to accept. A piece of self-denial, or excessive modesty, the reasons for which are not very apparent.

In the intervals of his other occupations, Vaillant visited, at different times, various parts of France, for the sake of botanical enquiries; but it does not appear that, except his martial expedition into Flanders, he ever extended his travels beyond the limits of his native country. His foreign correspondence, nevertheless, was very extensive, and by this means he greatly augmented the riches of the royal garden.

Notwithstanding Vaillant's original admiration of Tournefort, and his personal intimacy with that great and amiable man, of whom we have given an account in its proper place; he very soon, as we have already hinted, became dissatisfied with some of the fundamental principles of his preceptor. He adopted and clearly explained the sexes of plants, and consequently asserted the importance of the stamens and pistils, in a physiological as well as systematic point of view. This was the subject of his discourse above-mentioned, delivered June 10th, 1717, before his pupils at the *Jardin du Roi*. On the 17th of December, 1721, he read a professed criticism on the method of Tournefort, before the Academy of Sciences, printed in the Memoirs of that learned society for 1723. We regret to find, in both these performances, much disrespectful mention of his illustrious predecessor; which has been but too severely retaliated upon himself, by the neglect which his own just pretensions have received from his countrymen. To have been more in the right than Tournefort, was of itself a sufficient offence; and to have asserted his opinion with asperity and indecorum, served only to authorize part of the hostility which he incurred. Whatever progress Vaillant had made towards the foundation of a new system of classification, he did not live to lay it, in any regular form, before the public. His active life was devoted to the acquisition of materials, which he had no opportunity of employing. His difficulties, doubtless, increased with his progress. What parts he did perfect are admirably done; particularly his elaborate exposition of the genera and species of the syngenesious, or compound flowers, published in the Memoirs of the Academy, between the years 1718 and 1722. But the observations and enquiries of this great botanist had been extended to various other classes and families of plants, though they never ripened into any complete systematic work. The writer of the present article has long ago recorded, *Tr. of Linn. Soc.*

v. 1. 24, that the herbarium of Vaillant, preserved at Paris, displays astonishing instances of his profound knowledge and acute judgment, with respect to the genera, species, and synonyms of plants. The specimens are copious and fine, especially of Tournefort's oriental plants, which are far more perfect and abundant than in that author's own collection. These were obtained by Vaillant, either from Gundelsheimer, the travelling companion of Tournefort, or from others who subsequently pursued the same track. We know not that any competition, or open controversy, arose between these distinguished men, during Tournefort's life, who dedicated a genus to his pupil. (See VALANTIA.) Vaillant is reported to have critically examined the whole of the *Institutiones Rei Herbarie*, as soon as that great work appeared, in 1700, and to have communicated his remarks to M. Fagon. This intelligent friend declared, that though in the morning he had admired the performance of Tournefort, he could not withhold his approbation of Vaillant's remarks by the light of mid-day. Tournefort died in 1708, and Vaillant's first public attack, except what might incidentally fall from him in lecturing, was made, as we have said, in 1721. We are informed thus much of the principles and aims of Vaillant, that, having established the doctrine of the sexes of plants, he proposed to distinguish his classes by the parts of the flower, and his genera by characters taken indifferently from the whole plant, according as might best suit his purpose. In this latter respect, he was but returning towards the darkness of former ages, and we can have nothing to regret. His boldest and most meritorious attempt respected nomenclature. He wished to distinguish every genus by an expressive name, by which its essential characters might at once declare themselves. He flattered himself with extending the same principle to every species of plant, so that a word or two might give its name and character together. The learned reader will be aware of the similarity of this scheme to that of Rivinus, and of its failure, even on the very limited theatre of that writer's scientific operations. (See RIVINUS.) He will also recollect that it succeeded with Linnæus, only because the latter had the good fortune, or good sense, after discovering that these two objects, of nomenclature and clear discrimination, were in themselves incompatible, to reconcile both by division.

While these pursuits engaged the mind of Vaillant, his bodily constitution was yielding to the fatigues he had too long imposed upon it. Exposure to cold and wet, and to the night air, in many of his botanical rambles, did but ill suit a delicate frame, prone to pulmonary diseases. In proportion as he perceived a decay of strength, he only exerted himself the more, to complete the undertakings which had been the object of his life, and which might have demanded something like a patriarchal term of existence. He suffered for about four years under a consumptive attack, in the course of which he expectorated little hard concretions, amounting, says Boerhaave, to above 400, and at length expired, in a tranquil manner, on his birthday, May 26th, 1722, aged fifty-three. He was tall, well-proportioned, and active; of an open generous disposition, hating flattery, and mistrustful even of his due praise. The character of his criticisms upon Tournefort is rather, as we should hope, to be attributed to blunt sincerity, than to any portion of jealousy or envy, of which his conduct, in other instances, betrays no traces. He had the satisfaction of soothing, by the most assiduous care, the sufferings of his friend Fagon, who underwent an operation for the stone at a very advanced age; and who would gratefully have ceded to Vaillant, as a recompense, the profits of an impost which he enjoyed upon

mineral waters. This Vaillant had the still higher gratification and honour of declining.

His rich and splendid herbarium, comprehending that of M. Fagon, which had been given him by the son of his old friend, as well as his own cabinet of various natural curiosities besides, were purchased by the king, Louis XV., and deposited in the museum at the Jardin du Roi, where they have fortunately remained in safety amid the wreck and the restoration of a kingdom. His library was left in the hands of his widow, whose name was Françoise Nicole Bofsonet. Vaillant married this lady on the 14th of October, 1701, and enjoyed with her twenty-one years of great conjugal happiness, but had no offspring.

The greatest object of temporal concern, on his death-bed, was a work on the plants around Paris, which he had long been preparing, and for which Claude Aubriet, the inimitable botanical draughtsman of that day, had made, under the inspection of the author, above 300 drawings. Anxious that his labours should not prove altogether fruitless, Vaillant wrote, a year before his decease, to the famous Boerhaave, requesting him to take this orphan work under his protection. To this request, backed by their mutual friend William Sherard, Boerhaave readily acceded. Vaillant declared that he had particular and very strong reasons, which he could not explain, for making this request. He probably feared that his countrymen, venerationers of Tournefort, who no longer stood in their way, might not be over-anxious to preserve the relics of his rival, whose fame and activity had so lately clashed with their own. Whatever were his feelings on this subject, Vaillant was satisfied with Boerhaave's acceptance of this trust, and awaited his long-expected change with the piety and composure becoming a Christian and a true philosopher.

Boerhaave published the work of his departed friend in 1727, under the title of *Botanicon Parisiense*, making a very handsome folio volume, with thirty-three admirable plates, comprehending above 300 figures, of rare or obscure species, in which the cryptogamic plants are very abundant. The flowers alone of all the Orchis tribe are exhibited; their herbage being so nearly uniform as to be deemed less necessary. These figures, though uncoloured, leave scarcely any thing to be desired. The arrangement of the work is alphabetical, and its language, except the specific definitions, French, like all the author's compositions. The elegancies of style, or refinements of language, do not seem to have made a part of his studies, and he was rather a scientific than a learned botanist, except what was necessary for the accurate appropriation of synonyms, in which no one, so far as we have traced his progress, was superior to Vaillant. Dillenius, a professed and elaborate botanical critic, was undoubtedly, by many degrees, below him. Certain imperfections of this popular work, justly indicated by Haller, arose, as he observes, from Boerhaave's inability to bestow sufficient time on the correction of the unfinished manuscripts. Hence many repetitions occur, and some of the figures want references. Following authors have generally cited the beautiful figures, without adverting to the text; in which, notwithstanding, much may be found worthy of notice, especially all the practical observations, and original descriptions, of Vaillant himself. We cannot too strongly commend him as a botanist of originality, acuteness and accuracy, who has contributed to the general stock of botanical knowledge, and whose genius, had he lived longer, might have greatly extended the limits of philosophical speculation, on the subject of arrangement.—Vaillant's Works, and his life by Boerhaave. Haller Bibl. Bot.

VAILLY, in *Geography*, a town of France, in the department

partment of the Aifne; 8 miles E. of Soissons.—Also, a town of France, in the department of the Cher; 9 miles E. of Aubigny.

VAIR, in *Heraldry*, a kind of fur, or doubling, consisting of divers little pieces, argent and azure, resembling a Dutch U, or a bell-glass.

Vairs have their point azure opposite to their point argent, and the base argent to the azure.

When there are only two or three vairs, the ancient heralds call it *great vair*; and when there are more, *small vair*.

Vair is intended to represent a kind of skin, used anciently by the kings of France, in lieu of a fur, and with which the gowns of the presidents à mortier, the counsellors of the court, the heralds' coats, &c. were lined till the fifteenth century.

It was properly the skin of a kind of squirrel, called also in French *vair*, and in Latin *sciurus*; which was white underneath, and of dove-colour at top. It is described by Aldrovandus under the name of *sciurus vario*, and is the same, according to Gesner, with the *mus Ponticus* of Aristotle and Pliny; which the Latins call *varus* or *varius*, from the variety of its colour. Its two skins, joined together, make the figure of the vairs in armories; being naturally white and azure.

Vair, Colombiere observes, is the second sort of fur anciently used as a lining of the garments of great men, consisting of little pieces, sewed by the furriers on white skins: and because these pieces were usually blue, those who first settled the rules of heraldry, decreed, that this fur, in its natural blazon, should always be argent and azure. So, if it be absolutely said, such a family bears vair; it is supposed to be argent and azure.

Regularly there must be but four rows or ranks of vair in the shield; if there be either more or less, the number must be specified. The smallest number, being three rows, is called *besfroy de vair*; the most, being five or six, is called *menu*, or small vair.

The *besfroy* is also known by the first figure on the dexter side of the escutcheon being always of metal, and in form of a belt; whereas that of *menu vair* is in shape of a glass.

VAIR, *Counter*. See COUNTER-VAIR.

VAJRA, the name of the weapon placed in the hand of the Hindoo god Indra, regent of the firmament, and of atmospheric phenomena. It is in fact lightning, or the thunder-bolt or fulmen of the western Jove. Indra is hence named Vajrapani, or "grasper of the thunder." (See INDRA.) It is usually described as a discus or quoit, with a central hole, on which it is whirled round on the forefinger of the right hand, and sent missilely with a terrible effect. This is similar to the chakra, or circle, the common attribute of the god Vishnu. (See VISHNU.) Such things are now seen in the hands of holy mendicants variously called Saniasly and Yogi. (See SECTS of Hindoos, and YOGI.) They are usually a foot or less in diameter, of metal or hard wood, sharp at the edge. In pictures, fire is sometimes flaming from its periphery, as if from the vehemence of its centrifugal energy. The only representation we ever saw differing from this description, is in the frontispiece to Kirkpatrick's account of Nepaul. The god Siva, sometimes appearing in the character of the thunderer, is named *Vajreswara*, which see: it means riding on the thunder.

VAIRAC, in *Geography*, a town of France, in the department of the Lot; 4 miles N.E. of Martel.

VAIRAVA, in *Mythology*, a name of the Hindoo god Siva. It is sometimes written and pronounced Bhairava; and, derived from Bheru, means the *tremendous*. The Mahrattas ex-

tensively worship Siva under this name, which in their mouths is corrupted into *Bheroba*. They have legends relating to an avatara or incarnation of Siva under this name and form; and images are very common of him in the Mahratta country. Other accounts make Vairava and Virabadra the offspring of Siva, and give the former name likewise to Parvati, when speaking of her in her terrific characters, such as *Kali*; which see. Sometimes all the offspring of Siva are denominated the Bhairavas. See VIRABADRA.

The Mahrattas assign to Bheroba a consort or fakti, whom they name Jogafery: it would perhaps be more correctly written *Yugafiri*. In the Hindoo Pantheon several representations are given of this couple, and the author of that work says that he has in his collection nearly a hundred metallic casts of them, mostly rude and old, with an appearance of having been buried. The figures are usually accompanied by Sivean attributes, such as the trisula or trident, the patra or cup, the linga, &c. (See TRISULA, &c.) Sometimes he rides a buffalo. See VAHAN.

There are fables in Hindoo legends of Brahma having had one of his heads cut off. This decapitation is by some accounts attributed to Vishnu, or Narayana, by others to Siva and to Vairava, and the latter is in pictures sometimes represented holding the ghastly head, and a cup or patra to receive the blood; with a collar of blanched skulls, and attended by a dog. Sometimes he, usually four-handed, and his wife, are represented as skeletons.

The sect who exclusively or especially adore Siva, are called Saiva. It appears that this sect has spread to Java; for an image of him has been recognized in the interior of the island, and a well-executed drawing of it is in the possession of Mr. Marsden, author of the Malayan Grammar and Dictionary. Batu-Bharavé is the name under which this tremendous pair are known in Java; where, as Mr. Marsden is informed, our officers, during the late service, frequently recognized Hindoo figures, especially of Pollear, to which they had been familiarly accustomed on the continent of India. See POLLEAR.

Sonnerat notices this deity as honoured in the Carnatic: he calls him Vairevert, third son of Siva, produced from his breath to humble the arrogance of Brahma, one of whose heads he wrenched off, and used the skull to receive the blood of his other antagonists. He is described as mounted on a dog.

VAIRE, in *Geography*, a river of France, which runs into the Var, about 3 miles N.W. of Glandeves.

VAJRESWARA, in *Mythology*, a name of the Hindoo god Siva, derived, it is said, from the weapon more usually given to Indra, called Vajra, meaning lightning or thunder. Siva under this name will therefore correspond with the Jupiter fulminator or tonans of the West. Siva's consort, Parvati, is furnished Vajreswari, pronounced sometimes Bajreswari; the initials being so extensively interchangeable.

VAIROE, in *Geography*. See VÆIROE.

VAIRY, VAIRE, *Verry*, or *Varry*, is applied to a coat, or the bearings of a coat, when charged, or chequered, with *vair*.

When the colours are argent and azure, or white and blue, it is *vairy proper*: if it be otherwise, the colours are to be expressly named; *vairy* of such a colour or metal. He bears *vairy*, or, and *vert*; this is particularly called *vair composé*. The bearings are likewise said to be *vairy*, when they are charged with vairs. When chiefs, crosses, pales, fesses, &c. happen to be *vairy*, the number of ranks are to be specified.

Vairy gowns are observed, by Julius Pollux, to have been

the habit of the ancient Gauls, as ermines were of the Armenians.

VAIRY-cuppy, or *Vairy-tassy*, or *Potent-counter*, *Counter-potent*, is a bearing in heraldry, composed of pieces representing the tops of crutches, or potents counter-placed.

In blazon, the colours must be expressed; as azure, argent, &c.

VAISETTE, JOSEPH, in *Biography*, a native of Guillac, in the diocese of Alby, was born in 1685, and entered among the Benedictines of St. Maur, at Touloufe. In 1713 he settled at Paris, and engaged, in concurrence with Claude de Vie, of the same fraternity, in the history of Languedoc, of which the first volume appeared in 1730, in folio: and upon the death of his coadjutor in 1734, it was continued by himself, four more volumes having been published, and a sixth being in preparation at the time of his own death. This history is highly commended, on account of both the learning and moderation displayed by the author. An abridgment of this history, in 6 vols. 12mo., was published by Vaisette in 1740; and he was also the author of an "Universal Geography," in 4 vols. 4to., and 12 vols. 12mo., 1755, which at the time of its publication was generally approved. The author's erudition was extensive, and his disposition was amiable, so that he died, much regretted, in 1756. Moreri.

VAISHNAVA, the general name of all the different sects of Hindoos who worship Vishnu, either directly or indirectly, through his consort Lakshmi, or in one of his incarnations called avataras. In the article *SECTS of Hindoos*, we have concentrated the chief of what we have to offer on the subject of the numerous individuals comprehended under the denomination of Vaishnava; which, in its most extended sense, includes considerably more than half of the whole race of Hindoos. The distinction of Saiva, or Siva-Bakht, comprehends the other portion. See SAIVA.

The second plate of the Hindoo Pantheon contains many sectarial marks, or symbols, by which the different sects distinguish themselves: generally speaking, horizontal lines on the forehead mark the Saiva, while perpendicular forehead-lines indicate some sect of Vaishnava. These lines are red, white, or yellow, with different coloured spots over, under, or between them; all of which are said to have some mystical allusion.

VAISHNAVI, in *Hindoo Mythology*, is a name of the goddess Lakshmi, the consort or energy of Vishnu: as such, she is called his fakti. In the different incarnations of Vishnu, Lakshmi accompanied him, either under her own name, or under some other denomination.

VAISHIKA, in *Philosophy*, is the name of one of the six Hindoo schools, or systems. Under the article *PHILOSOPHY of the Hindoos*, we have enumerated the principal schools of that thinking race. The Vaisika is a division of the Nyaya, and we refer to the latter word for some notice of the doctrines of its followers.

VAISON, in *Geography*, a town of France, in the department of the Vaucluse, on the Oueze: before the French revolution the see of a bishop, suffragan of Avignon: the old town has been long in ruins; 22 miles N.N.E. of Avignon.

VAISRAVA, in *Mythology*, a name of the Hindoo Plutus, who is more commonly called *Kuvera*; which see. *Vaivra*, or *Vivra*, is a name given also to Ravena, half-brother to *Kuvera*. (See *RAVENA*.) *Vivra* is sometimes called their father, and they are then named *Vaivravana*.

VAISSEAUX ENFILEZ, a term used by the French writers in *Chemistry*, for the vessels used in distilling in an

open fire, or in sand, which do not consist in the common way of a retort, joined immediately to a receiver, but have a receiver with a double opening, and a neck at each end, placed between the retort and the ordinary receiver. The neck of the retort is let into one of the necks of this middle vessel, and its other neck is thrust into that of the receiver; by this means the receiver, into which the liquor is to fall, stands at a greater distance than it otherwise would from the fire, and the vapours are more easily condensed in it by its coldness, while they have also a double or treble space to expand in, and by that means are not so likely to burst the vessel.

VAIVASWAT, in *Mythology*, a name of Surya, the Hindoo regent of the sun, as noticed in the article *SURYA*, where he is under this name styled, on the authority of sir William Jones, "lancer of the golden ray." The very important deity Surya is frequently called in Hindoo books by the title of *Vaivafwat*; and those personages who, like the ancient Incas of Peru, are pretended to be of solar origin, are called *Vaivafwata*. In the *Gita*, Krishna says, "this immutable system of devotion I revealed to *Vaivafwat*, ('or,' says the commentator, 'the sun,') *Vaivafwat* declared it to his son *Menu*; *Menu* explained it, &c." This *Menu* is the author of the celebrated *Institutes* that bear his name: he is also named *Satyavrata*, and is reasonably believed to be the same with the Noah of Scripture. (See *MENU* and *SATYAVRATA*.) These offspring of the sun are likewise called *Suryavansa*; which see: and some farther notice of their curious coincidence with the solar race of Peruvians will be found in our articles *RAMA* and *SITA*. The Hindoo *Pluto* is sometimes called *Vaivafwata Yama*; denoting, we conclude, his solar origin.

VAKEF, in *Geography*, a town of Arabia, in the province of Nedsjed; 100 miles N. of Jamama.

VAKIA, in *Commerce*, a weight in Persia and Arabia. At Bassorah, the weights for merchandize are, the maund attary, the maund sedy, and the oka of Bagdat. The maund attary contains 25 vakias tary (sometimes reckoned at 24 or 26 vakias), and weighs 28½lbs. avoirdupois, or the vakia 19 ounces. The maund sedy, or maund Bassorah, contains 24 vakias sedy (called okas of Bassorah), equal to 76 vakias tary, or 90lbs. 4 oz. avoirdupois. The oka of Bagdat is 2½ vakias tary, or 47½ oz. avoirdupois. In sales of ginger, pepper, and coffee, 26 vakias are allowed to the maund; in sales of cardamoms, sugar-candy, and benzoin, 25 vakias per maund; and in sales of sugar and metals, 24 vakias per maund. The vakia tary, which should be about 115 mifcals (the miscal weighing about 72 English grains), varies from 110 to 118, and the others in proportion.

At Betelfagui, or Betlefackee, in Arabia, a rattle of coffee contains 14½ vakias, and a parcel, or farzil, of the same, 290 vakias; of dates, candles, and iron, 16 vakias are reckoned to a rattle; of all other sorts of goods, 15 vakias make a rattle. At Mocha, gold and silver are weighed by the vakia of 10 coffalas, or 160 carats: 24 carats = a miscal, and 1½ vakia = a beak: 100 Spanish dollars weigh 87 vakias, so that a vakia weighs little more than 1 oz. English troy weight; the bahar contains 15 farzils, or 150 maunds; the maund = 40 vakias. A rattle is = 15 vakias, but in coffee, 14½ vakias are reckoned for a rattle, 2 rattles for a maund, and 10 maunds, or 290 vakias, for a farzil. Kelly's *Univ. Cambist*.

VAKUNAIIKA, in *Geography*, a river of Russia, which runs into the Kifenga, N. lat. 56° 16'. E. long. 88° 14'.

VAL, LA. See *LAVELD*.

VAL, La, a town of France, in the department of Mont Blanc; 20 miles E. of Montier.

VAL, Le, a town of France, in the department of the Var; 3 miles N. of Brignolles.

VAL di Compare. See TEAKI.

VAL de Morea, a town of Spain, in the province of Leon; 12 miles E. of Ponferrada.

VAL de Prades, a town of Portugal, in the province of Tras os Montes; 16 miles E.N.E. of Mirandela.

VAL Richer, or *Val de Richer*, a town of France, in the department of the Calvados; 12 miles N.W. of Caen.

VAL Rotondo, a town of Naples, in Lavora; 15 miles S.E. of Sora.

VAL de Salas, a town of Spain, in Galicia; 22 miles S. of Orenfe.

VAL de Santiago, a town of Portugal, in the province of Alentejo; 27 miles S.W. of Beja.

VAL de Travers, a district of the principality of Neuchâtel, about 18 miles in circumference, and containing about 3500 inhabitants. It is situated between Neuchâtel and Pontarlier.

VAL di Trompia, a valley of Italy, in the Bressan, containing 19 parishes, and about 13,000 inhabitants, chiefly employed in the manufacture of iron.

VAL de Vacas, a town of Spain, in the kingdom of Seville; 10 miles from Lucena.

VAL de Uxo, a town of Spain, in the province of Valencia; 17 miles S.E. of Segorbe.

VALA, in *Ancient Geography*, a town of the interior of Thrace. Ptolemy.—Also, a town of Africa, in Mauritania Tingitana. Ptol.

VALADARES, in *Geography*, a town of Portugal, in the province of Entre Duero e Minho; 5 miles S.W. of Melgaffo.

VALAGODE, a town of the island of Ceylon; 60 miles S. of Candy.

VALAIS, or **VALLAIS**, an independent republic in alliance with the thirteen cantons of Switzerland, and which has formed a particular league with the seven Catholic cantons, for the defence of their religion. This tract of country stretches from E. to W. about 100 miles, and contains 100,000 inhabitants, professing the Roman Catholic religion. It is divided into Upper and Lower Vallais; the former reaching from the Furca to the Morge, below Sion, which is its capital; and the latter, from that river to St. Gingou, situated upon the lake of Geneva. From the mountain of Furca, its eastern boundary, two vast ranges of alps inclose the Vallais: the southern chain separates it from the Milanese, Piedmont, and part of Savoy; the northern from the canton of Bern. These two chains, in their various windings, form several small valleys, watered by numerous torrents that rush into the Rhone, as it traverses the whole district, from the Furca to St. Maurice. A country thus entirely inclosed with high alps, and consisting of plains, elevated valleys, and lofty mountains, may be naturally supposed to exhibit a great variety of situations, climates, and productions. Accordingly, the Vallais presents to the curious traveller a quick succession of prospects, as beautiful as diversified. Vineyards, rich pastures covered with cattle, corn, flax, fruit-trees, and forests, occasionally bordered by naked rocks, crowned with everlasting snow.

The productions of the Vallais vary according to the great diversity of climates by which this country is distinguished. It supplies more than sufficient wine and corn for interior consumption, and exports a considerable quantity of both; the soil in the midland and lower districts being exceedingly rich and fertile. In the plain, where the heat is collected and confined between the mountains, the harvest is usually finished in July; whereas, in the more elevated

parts, barley is the only grain that can be cultivated with any success, and the crop is seldom cut before November. About Sion, the fig, the melon, and all the other fruits of Italy, come to perfection. In consequence of this singular variety of climate, the traveller in the same day may indulge himself with strawberries, cherries, plums, pears, and grapes, each of which is the natural growth of the country.

Both the hills and valleys of the Vallais breed cattle in abundance, and yield plenty of game. The mountains are supposed to contain lead, copper, and silver mines; but the produce, it is supposed, would not defray the expence of working them. Here is likewise pit-coal. The Vallais is noted for two hot-baths of celebrated virtue, as those of Brug, or Glense, and Leuck, the latter of which is commonly known by the appellation of the Vallais bath. In the upper tythings the prevailing language is the German, but the inhabitants of Sion, in the Upper Vallais, with all in the Lower, speak a corrupt French; though in both parts, especially in the chief burg, they apply themselves to the German, French, Italian, and Latin; being all indispensably necessary to them in their intercourse with the cantons of Bern and Uri, Savoy, Piedmont, and the Milanese; therefore a stranger cannot but be surpris'd at the fluency with which the meanest people here speak those four tongues.

The ancient inhabitants of this country were the Lepantii, Viberi, with the Seduni and Veragri, who sold their liberty dear to Sergius Galba, general of Julius Cæsar. In the middle ages it came to be called Valesia, and in 1032, under the emperor Conrad II., devolved to the German empire, as a part of the second Burgundian kingdom. In the year 1035, that prince made over the Lower Vallais to the counts of Savoy. The inhabitants of the Upper Vallais resolutely maintained their liberties, as well against the dukes of Zaringen, who, in the year 1157, were by Frederic I. appointed guardians of the bishopric of Sion; as against the bishops of that see, who assumed the title of counts of the Vallais, and after that drove out the families of the barons Tour and Raren, who had usurped a dangerous authority among them. In 1475, the bishop of Geneva fell on the Upper Vallais with a body of 18,000 men, consisting of Lower Vallaisans and Savoyards; but the Upper Vallaisans, being assisted with 3000 troops by Bern, Friburg, and Solothern, their allies, defeated the bishop, and even made a conquest of the Lower Vallais, which ever since that time has been subject to them. In the same year, also, they formed a perpetual alliance with Bern, which was renewed in 1643; and in 1529, with the whole Helvetic body. In 1533 they entered into a more particular union with the seven papish cantons.

At an early period of the French revolution, the disaffected party of the Lower Vallais appealed to France to emancipate their country from their subjection to the Upper Vallais, but the French not having matured their scheme of fraternization, their petition was rejected.

In February 1798, however, the people of the Lower Vallais were enfranchised, and admitted to an equality of rights by the Upper Vallais; but after the conquest of Bern, and the revolution of the greater part of Switzerland, the inhabitants of the Upper Vallais rejected the new constitution, took up arms, and defended themselves with great spirit. After several bloody defeats, and the capture of the castle of Sion, which was stormed by the French, the natives submitted, and both districts were moulded into one department, called the Vallais.

There are no manufactures of any consequence; and indeed the general ignorance of the people is no less remark-

able than their indolence; so that they may be considered, in regard to knowledge and improvements, as some centuries behind the Swifs, who are an enlightened nation. The peasants seldom endeavour to meliorate those lands where the soil is originally bad, or to draw the most advantage from those which are uncommonly fertile: having few wants, and being satisfied with the spontaneous gifts of nature, they enjoy her blessings without much considering in what manner to improve them.

The Upper Vallais is sovereign of the Lower Vallais, and comprises seven independent *dixains*, or commonwealths; namely Sion, Goms, Brieg, Vifp, Leuck, Raren, and Siders; of these, Sion is aristocratical, and the others democratical. They are called *dixains*, because the Upper Vallais being divided into seven, and the Lower into three districts, each division is a *dixain*, or tenth of the whole.

The bishop of Sion was formerly absolute sovereign over the greater part of the Vallais; but his authority is at present limited to a few particulars. He has the sole power of pardoning criminals, and signs the warrants for execution; the money is coined in his name, and with the arms of the republic. In his acts he styles himself bishop of Sion, prince of the German empire, and count and præfect of the Vallais: in days of high ceremony he dines in public, and is waited upon by the first noble of the Vallais, who is hereditary treasurer. He nominates also the bailifs or governors of the two bailliages of Martigny and Arden, and possesses considerable influence from his patronage of church preferment. Upon a vacancy in the see, the canons of the chapter of Sion present from their own body four candidates, one of whom is appointed bishop by the landfrath, or general diet.

The seven *dixains* form, conjointly with the bishop, the republic of the Vallais, and all affairs are transacted in the diet, called landfrath, which meets twice every year at Sion. This assembly consists of nine voices; the bishop; the lands-hauptmann, who is chosen or confirmed by the diet every two years; and the seven communities. The bishop presides; the lands-hauptmann collects the votes; and all resolutions are decided by the majority. Each *dixain*, although it has but one vote, sends as many deputies as it pleases; they generally consist of four; a judge, a banneret, a captain, and a lieutenant. The judge and the lieutenant are appointed every two years: the two others hold their offices for life.

In all civil causes of a certain importance, an appeal lies from the inferior courts of justice to the diet in the last resort. Thus, by the institution of this supreme council, the communities in this country are firmly united, and form in conjunction one body politic, or republic, for the general affairs of the nation. In other cases, each of the commonwealths is governed by its own particular laws and customs.

Both the Upper and Lower Vallais were formerly dependent upon the bishop of Sion; but the inhabitants of the two districts united in order to limit his power; and, having succeeded, quarrelled for superiority. A bloody war ensued; which terminated in 1475, by the total defeat of the Lower Vallaisans. Since that period, they have continued subject to the Upper Vallais, with the enjoyment, however, of some considerable privileges.

The inhabitants are generally of low stature, and those of that part of the Vallais in which the capital (see SION) is situated, are very subject to goiters, or large excrescences in the neck, which frequently increase to an enormous size, and what is more extraordinary, idiocy is no less prevalent. The weather in this inclosed vale is exceedingly sultry and oppressive. This languid heat is probably

one of the causes which occasion the inconceivable indolence of the inhabitants: much, however, must at the same time be attributed to the richness of the soil, which precludes the necessity of labour by almost spontaneously producing the fruits of the earth. In fact, the people assist nature very little: they suffer the vines in the vineyards to trail upon the ground; whereas, if the branches were properly supported, the owner would be well rewarded by the superior quantity and quality of the produce.

The uncleanness of the common people is disgusting beyond expression. Although the Lower Vallais exhibits as much uncleanness, its natives are not altogether so indolent as those of Sion and its environs. This imputation of indolence will not hold good with respect to all the inhabitants of the Upper Vallais: for in the eastern part of that district, the soil, though far inferior, was much better cultivated, and the people seemed industrious. Some physical reasons may be assigned for this difference; for *there* the weather is not so sultry, the water is not unwholesome, the air remarkably salubrious, and none of those goitrous persons or idiots were observed common in the midland parts. See MARTIGNY and St. MAURICE.

VALANTIA, in *Botany*, was originally so named by Tournefort, in honour of his pupil SEBASTIAN VAILLANT; see that article. The latter, as Linnæus remarks, was dissatisfied with this appropriation, and wished, on that account, to set aside all names of botanists, as applied to genera, because he perceived the *Valantia* of Tournefort not to be distinct from *Cruciata* of the same author. He was so far correct; but there have been several species referred since to *Valantia*, which appear to constitute a good genus, whose limits the writer of this has attempted to define, in the *Flora Græca* and its *Prodromus*, and which will here be exemplified.—“Tourn. in Mem. de l’Acad. des Sc. for 1706. t. 3.” Sm. Fl. Græc. Sibth. v. 2. 28. Prodr. v. 1. 95. Linn. Gen. 543. Schreb. 723. Willd. Sp. Pl. v. 4. 947. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 5. 434. Dill. Gen. 147. t. 8. Mich. Gen. t. 7. Juss. 197. Lamarck Illustr. t. 843. (*Galium hispidum*; Gærtn. t. 24.)—Class and order, *Tetrandria Monogynia*. (*Polygamia Monoecia*; Linn.) Nat. Ord. *Stellata*, Linn. *Rubiaceæ*, Juss.

Gen. Ch. Cal. Perianth none. Common Receptacle three-flowered, variously shaped, enlarged after flowering, containing the solitary fruit. Cor. superior, of one petal, flat; that of the central flower with four, of the lateral, or male, ones with three, deep ovate segments. Stam. Filaments in the central flower four, in the lateral ones three, thread-shaped, curved, alternate with the segments, and half as long; anthers roundish, of two cells. Pist. Germen solitary, inferior, concealed in the receptacle, belonging to the central flower, with the rudiments of two seeds; style in the central flower only, deeply divided, scarcely so long as the stamens; stigmas obtuse. Peric. formed of the enlarged permanent receptacle, gibbous, inflated, of one cell. Seed generally solitary, sometimes two, ovate, concealed in the receptacle, smooth.

Ess. Ch. Corolla of one petal, flat, superior. Common receptacle three-flowered, single-fruited. Lateral flowers male, three-cleft. Seeds concealed in the receptacle.

Obs. The above limitation of the genus before us excludes *V. pedemontana*, Willd. n. 4; *humifusa*, Willd. n. 6; *taurica* and *cherfonensis*, Willd. n. 9. and 10.; with *V. Aparine*, *articulata*, *Cruciata* and *glabra*, of Linnæus, all which eight species belong, if we mistake not, to *Galium*. Willdenow has already properly removed from this genus *V. hypocarpa*, which is, as Browne and Pursh make it, a species of *Rubia*, very remarkable, however, for its apparently superior

rior *germen*. But we apprehend that what looks like an inferior *calyx*, may be four *bractæas*, and that this species, like *Rubia tinctorum*, may have no real *perianth*.

1. *V. muralis*. Wall Cross-wort. Linn. Sp. Pl. 1490. Willd. n. 1. Ait. n. 1. Sm. Fl. Græc. Sibth. v. 2. 28. t. 137. (*V. annua quadrifida verticillata, floribus ex viridi pallefcentibus, fructu echinato*; Mich. Gen. 13. t. 7. *Cruciata nova romana minima muralis*; Column. Ecpfr. 298. t. 297. f. 2. *Rubia quadrifolia, verticillato femine*; Bauh. Hist. v. 3. 718.)—Fruit lobed; its angles fringed with teeth. Whorls crowded.—Native of walls and dry banks in Italy and the south of France, as well as in Greece. Dr. Sibthorp gathered it on mount Hymettus, near Athens, and on the hills of the country of Argos. The *root* is small and annual. *Stems* several, about a finger's length, ascending, clothed with numerous whorls of small, obovate, entire *leaves*, four in a whorl, a little hairy on each side. *Flowers* axillary, one to each leaf, small, sessile, pale yellow. *Fruit* of a singular appearance, much larger than the flowers, deflexed; gibbous and smooth at the base, lodging a solitary, ovate, smooth *seed*; its lobes divaricated and toothed.

2. *V. hispida*. Bristly Cross-wort. Linn. Sp. Pl. 1490. Willd. n. 2. Ait. n. 2. Sm. Fl. Græc. Sibth. v. 2. 29. t. 138.—Fruit bristly. Whorls rather remote.—Native of the south of Europe. Dr. Sibthorp gathered it on the mountains of Crete, and has supplied the only figure that exists of this species. An annual herb, twice the size of the foregoing, and distinguished by its longer, narrower, more distant *leaves*; but more essentially by the oblong form of its *common receptacle*, or *fruit*, beset with pale rigid bristles, and not fringed, in whose gibbous smooth base is lodged a solitary *seed*, whose insertion is erroneously represented by Gærtner. Miller cultivated both these species, but nothing can be less likely to interest a mere flower-garden botanist. To those who study natural genera, and their affinities, these plants are highly curious, and sufficiently demonstrate *Valantia* to be distinct from *Galium*.

3. *V. filiformis*. Leaf Cross-wort. Ait. n. 3. Willd. n. 3.—Fruit cylindrical, scaly, without prickles, longer than its stalk. *Leaves* lanceolate, somewhat fringed. Gathered by Mr. Masson, in Teneriffe. *Root* annual. *Stems* simple, a span long, hispid. *Leaves* four in each whorl, somewhat stalked, reticulated with veins; the lower ones roundish. *Common receptacle* beset with minute, lanceolate, chaffy scales.

4. *V. Cucullaria*. Hooded Cross-wort. Linn. Sp. Pl. 1491. Amoen. Acad. v. 4. 296. Willd. n. 5. Ait. n. 5. (*Cucullaria*; Buxb. Cent. 1. 13. t. 19. f. 2.)—*Bractæas* ovate, stalked, deflexed, concealing the oblong furrowed hairy fruit.—Gathered by Buxbaum, in Cappadocia, and by Hasselquist in Arabia, on hills, flowering in May. A small, branching, annual *herb*, with square rough-edged *stems*. *Leaves* ovate, stalked, revolute, rough with minute prickles. *Flowers* very small, yellowish, on branched axillary *stalks*, each stalk bearing three flowers, and as many large, pale, reticulated, smooth, overshadowing *bractæas*, which well mark this species, and caused Buxbaum to distinguish it as a genus, by the name of *Cucullaria*. The plant is, however, a true *Valantia*.

VALARSA-KERD, in *Geography*, a town of Turkish Armenia; 15 miles W. of Diadin.

VALAY, a small island near the west coast of North Uist. N. lat. 57° 37'. W. long. 7° 29'.

VALBASE, a town of Spain, in Old Castile; 15 miles W.S.W. of Burgos.

VALCA, a river of the Popedom, which runs into the Tiber, about 5 miles above Rome.

VALCALDE, or VILLA CALDE, a town of the Genoese republic; 10 miles N. of Genoa.

VALCKENBURG, a town of Holland; 3 miles N.W. of Leyden.

VALCKENSTEIN, a town of the duchy of Wurzburg; 5 miles N. of Geroltzhofen.

VALCOUR. See WALCOUR.

VALDAGNO, a town of Italy, in the Vicentin; 17 miles W. of Vicenza.

VALDAJA, or VALDAY, a town of Russia, in the government of Novgorod; 72 miles S.E. of Novgorod. N. lat. 57° 50'. E. long. 33° 44'.

VALDARACETE, a town of Spain, in New Castile; 22 miles S.E. of Madrid.

VALDASNES, a town of Portugal, in the province of Tras os Montes; 9 miles E.S.E. of Mirandela.

VALDAY MOUNTAINS, mountains of Russia, in the government of Novgorod, which are crossed in travelling from Petersburg to Moscow, and are probably a continuation of the Lapland mountains. They were known to the ancient geographers by the name of Mons Alaanus. At present they are indifferently called Vhifokaya Ploitchade, high rising ground, or the mountains of Valday, from the town and the lake Valday, which are situated on their summits. The country about Valday, being the highest point of the mountain, is extremely pleasant. Fine, slow-rising hills, a charming pellucid lake, with an island on which stands a noble monastery, delightful groves, and an extensive scenery, form the most pleasing variety. These mountains afford numerous and large blocks of granite, quartz, and sand-stone, together with felspar, hornblende, mica, schorl, porphyry, jasper and steatites. The granite blocks are covered with sand and clay. The Valday eminence, which is the highest ridge of these mountains, shapes its course from the north, and appears to take its departure from between the lakes Ladoga and Onega. It then stretches across the Msta, runs between the Ilmen lake and the Seliger, and extends its foot as far as into the governments of Smolensk, Orel, and Novgorod-Severski. About its western, southern, and eastern declivities, are several strong strata of chalk and marl, which in farther progress are lost in marshy and sandy plains. Some naturalists are of opinion, that the whole of this Valday chain of mountains is the effect of violent inundations, and that it entirely consists of a chalk-stone risen from crumbled and destroyed marine productions. But it is no less probable, that the middle part is a primitive mountain, having granite for its principal stratum, which, through a long interval of time, and perhaps under water, is so much decayed as to be in a manner smoothed. No chalk-pit has yet been opened on its summit. Upon the whole it is supposed, that all these elevations may be an original mountain decayed and destroyed on its surface, on which, round about its declivities, the loose chalk and marl are floated and deposited. Among these mountains no mine has yet been explored. Some specimens have been obtained of copper and lead; but here is plenty of iron and stone. The extreme elevation of the Valday mountains is very moderate, as the highest point is scarcely 200 fathoms above the level of St. Petersburg. Besides the Valday lakes, there are others of inferior note; and at the western foot is the great lake Ilmen, at the southern, the Seliger, &c. Of the rivers, some spring from the mountains, and others are supplied by the lakes that lie at their feet; such are the Volga, the Duna, the Volkhof, the Lovat, the Pola, the Tshagedo, the Kolp, the Dnieper, the Don, the Oka, &c. These mountains are sparingly

sparingly clothed with forests, but so much the more with beautiful meadows and fields, so that the graziers derive from them considerable profit. The species of wood are the several sorts of pines and firs, the birch, the linden, the aspen, the alder, &c. The soil in the valleys mostly consists of clay and marle, and is generally fertile. Tooke's View of the Russian Empire, vol. i.

VALDEBURON, a town of Spain, in the province of Leon; 34 miles N.N.E. of Leon.

VALDECONA, a town of Spain, in Catalonia, on the borders of Valencia; 15 miles S. of Tortosa.

VALDEMANZANAS, a town of Spain, in the province of Leon; 8 miles S.W. of Astorga.

VALDEMORO, a town of Spain, in New Castile; 13 miles S. of Madrid.—Also, a town of Spain, in New Castile; 13 miles E.N.E. of Cuença.

VALDENSES, in *Ecclesiastical History*. See VAUDOIS.

VALDEPENAS, in *Geography*, a town of Spain, in the province of Jaen; 8 miles S.W. of Jaen.—Also, a town of Spain, in New Castile; 22 miles S.E. of Ciudad Real.

VALDERAS, a town of Spain, in the province of Leon; 23 miles S. of Leon.

VALDERIES, a town of France, in the department of the Tarn; 6 miles N.N.E. of Alby.

VALDES, JOHN, in *Biography*, a Spanish reformer and a lawyer, was knighted by Charles V. During a tour in Germany he imbibed the principles of Luther; and afterwards settling in Italy, and chiefly at Naples, he became secretary to the king. During his abode in this city, he communicated his sentiments to several persons, and particularly to Peter Martyr and Ochinus. But though in his religious sentiments he concurred with the reformers, and in his notions with respect to the Trinity with those that were denominated Unitarians, he does not appear to have formed any separation from the church of Rome. His disciples, however, were numerous, and attracted the notice of the Inquisition; the dread of which induced several of them to quit the country, and others to retract their opinions. Valdes died at Naples about the year 1540, with an established character for piety and virtue, and leaving several works, particularly "Commentaries on various Parts of the New Testament, &c." some of which have been inserted in the Index of the Inquisition, and others censured by the reformers. Beza condemns his treatise entitled "Considerations," charging it with being the source of the errors of Ochinus. Bayle.

VALDESIA, in *Botany*, a genus in the *Flora Pedemontana*, page 57, so named in memory of Don Antonio Valdez, a Spaniard, minister of the Spanish marine, founder of a botanic garden. *De Théis*.

VALDIA. See OVIDEA.

VALDIGEM, in *Geography*, a town of Portugal, in the province of Beira, near the Duero; 3 miles N.E. of Lamego.

VALDIVIA, a river of Chili, which runs into the South Pacific ocean, near Valdivia.

VALDIVIA. See BALDIVIA.

VALDORE, a town of Hindoostan, in the Carnatic; 8 miles W.N.W. of Pondicherry.

VALDORF, or WALDORF, a town of Westphalia, in the county of Ravenberg; 3 miles S.W. of Bielefeld.

VALDROME, a town of France, in the department of the Drôme; 18 miles S.S.E. of Die.

VALDUS, or WALDUS, PETER, in *Biography*, was the son of a rich merchant of Lyons, who lived in the twelfth century, and derived his name from Vaux in Dauphiné, the

place of his nativity. With a mind deeply impressed by the sudden death of a friend, he directed his views entirely to another world, distributed his wealth in alms, and employed himself in propagating just sentiments, as he conceived them to be, of true religion. From another account of this reformer we learn, that about the year 1160, he employed a priest in translating the four gospels from Latin into French, and by the perusal of them adopted opinions very different from those of the Romish church. In 1180, connecting himself with a small society of sentiments similar to his own, he assumed the character of a public preacher. Attempts were made to seduce him, but they proved ineffectual; and the number of his followers gradually increased. Expelled from Lyons, he retired to the mountains of Dauphiné and Savoy, and propagated his opinions, which were eagerly adopted by the multitude through the adjacent valleys, where they took deep root, so that no persecution or violence could eradicate them. From him, as some say, sprung the sect of the Waldenses. For other particulars, we refer to the article VAUDOIS.

VALE of a Pump, at Sea, a term for the trough by which the water runs from the pump along the ship's sides, to the scupper-holes.

VALE or Valley Lands, in *Agriculture*, are terms applied to any of those which lie in low, narrow, hollow tracts or depressions between hills or rising grounds on their different sides: They are, for the most part, applicable in a more particular manner to grass and dairy practices than others, but sometimes, when suitably dry, to those of the arable kind. They are in many cases very quick in vegetation, and extremely productive; being readily capable of improvements by warping, watering, and other such means, at but little expence, which should always be well attended to, in all such lands where there is the possibility of effecting them.

The latter is likewise a term sometimes applied to a gutter or channel in a road or other such situation.

VALEDIA, in *Geography*, a sea-port town of Africa, in the kingdom of Fez, situated on the coast of the Atlantic, in a stony plain: here is a very spacious natural basin, surrounded by rocks, capable of containing above 1000 ships; but the entrance, which is entirely open to the west, is extremely difficult and dangerous. The coast is lined with rocks near 30 feet in height, which anciently must have been washed by the sea, the Moors living in the caverns hollowed out by the water. At the bottom of the rocks, the sands heaped up by time have formed a plain, laid out into gardens and cultivated: the town is little more than a circle of walls, containing but few inhabitants; 27 miles S.S.W. of Mazagan.

VALEGAR, a town of Hindoostan, in Coimbatore; 15 miles W. of Damiccotta.

VALEGGIO, or VALEZZO, a town of Italy, in the department of the Benaco, on the river Mincio; 14 miles S.W. of Verona.

VALEGGIO, a town of Italy, in the department of the Gogna; 4 miles N.E. of Lumello.

VALENÇA, a town of Portugal, in the province of Entre Duero e Minho, on the S. side of the Minho, opposite Tuy in Spain, and said to have been founded by the soldiers of Viriatus. It contains two parish-churches, an hospital, two convents, and about 900 inhabitants; 16 miles W. of Oporto. N. lat. 42°. W. long. 8° 20'.

VALENÇA de Alcantara, a town of Spain, in Estremadura, on the borders of Portugal; 24 miles S.W. of Alcantara.

VALENÇA de Duero, a town of Portugal, in the province of

of Beira, situated about half a league from the Duero; 12 miles W. of St. Joao de Pefqueira.

VALENCE, a town of France, and principal place of a district, in the department of the Lot and Garonne; 12 miles S.W. of Agen. N. lat. $44^{\circ} 6'$. E. long. $0^{\circ} 59'$.—Also, a city of France, and capital of the department of the Drôme, on the left side of the Rhône; anciently a Roman colony, called Julia Augusta. Before the revolution it was the see of a bishop, and capital of a principality called Valentinois. An university was brought hither from Grenoble in the year 1454; $16\frac{1}{2}$ posts N. of Avignon. N. lat. $44^{\circ} 55'$. E. long. $4^{\circ} 59'$.

VALENCE en Albegeois, a town of France, in the department of the Tarn; 12 miles N.E. of Alby.

VALENCIA, a province of Spain, bounded on the N. by Aragon and Catalonia, on the E. and S.E. by the Mediterranean, on the S.W. by Murcia, and on the W. by New Castile, about 220 miles in length from N. to S.; the breadth is unequal, from 20 to 45. Valencia is, in proportion to its extent, one of the best peopled provinces of Spain, and contains seven cities: has four sea-ports, the most considerable of which is that of Alicant; the soil is extremely fertile, although divided by mountains. These contain mines of sinopica, or blood-stone, iron, and alum. There are also found quarries of marble, jasper, plaster, lapis calaminaris, and potter's-clay, of which different kinds of earthen vessels are made. The climate is mild and pleasant, but there is something enervating and faintish in the air; vegetables with the finest outward show imaginable are not good to the taste. No women work in the fields; but this may proceed from their constant employment within doors, as much as from any remains of Moorish jealousy, though the Valencians still retain much of the features and manners of their old Saracen masters. To this day the farmers will not allow their wives to sit at table, but make them stand at their elbow and wait upon them. The inhabitants of this province are said to have more of the filth and sullen unpolished manners of the old Spaniards, and to have adopted less of foreign improvements in civilization, than most other parts of Spain. This kingdom and city were conquered by the Moors under Abdallah Cis, and recovered in 1094, when the famous Cid Ruy Dias de Vivar, taking advantage of the confusion and civil war that raged in Valencia, after the murder of Sultan Hiaya, made himself master of the city by storm, at the head of a chosen band of valiant knights. This was the last exploit of that hero, so long the terror of the Mussulmen. A few days after his death, the king of Castile, finding it too far distant from his other dominions to be conveniently succoured in case of a sudden attack, thought proper to withdraw his troops, and suffer the Moors to repossess themselves of it. It was again taken from them by James I., king of Aragon, in the year 1238, and for ever united to that crown, the fate of which it has ever since followed through all its various revolutions. In the beginning of the reign of Charles V. this province was distracted by civil commotions and struggles between the nobility and commons. The population of the whole kingdom of Valencia amounts to 79,221 vecinos, or 716,884 souls, resident in 570 towns and villages. The manufactures of silk are the cause of a population that may be reckoned considerable, if compared with that of other provinces of Spain. The produce of this article, on an average of one year with another, amounts to about 900,000 pounds, worth a doubloon *per* pound, in the country. Government has prohibited the exportation of Valencia raw silk, in order to lay in a stock to keep the artificers constantly employed in bad years; for it has sometimes happened, that half the

workmen have been idle for want of materials. The great nurseries of mulberry plants in the plains of Valencia are produced from seed, obtained by running a rope of *Esparto* over heaps of ripe mulberries, and then burying the rope two inches under ground. As the young plants come up, they are drawn and transplanted. The trees, which are all of the white kind, are afterwards set out in rows in the fields, and pruned every second year; in Murcia only every third year; and in Granada never. The Granada silk is esteemed the best of all, and the trees are all of the black sort of mulberry. The fruit exported from Valencia to the N. of Europe may be estimated, *communibus annis*, at two millions of pesos, about 334,000*l.* sterling. The annual crop of hemp may be worth 300,000 pesos, at three pesos *per* arroba: 140,000 loads of rice, at 10 pesos a load, make 1,400,000 pesos. The vintage of 1767 produced 4,309,000 measures of wine, which, at three reals a measure, come to 861,133 pesos. There is also much cotton made in this province from the cotton-plant, which rises to the height of three feet at most, and very much resembles the raspberry-bush. They make in good years 450,000 arrobas, worth 1,350,000 pesos, and in middling years 285,600 arrobas. Notwithstanding all this abundance, nothing can be more wretched than the Valencian peasantry, who can with difficulty procure food to keep their families from starving. Valencia is watered by 35 rivers, all of which run towards the E. It was formerly inhabited by the Celtiberians, the Turdetani, the Lusoni, &c. &c. Valencia was erected into a kingdom, in the year 788, by Abdalla, governor of Valencia, who revolted from the king of Cordova, but was however obliged to pay an annual tribute of 17,000 maravedis. This kingdom continued till the 13th century, when the last king, Zahen, was dispossessed of his capital, and compelled to leave his dominions with 50,000 Moors.

VALENCIA, a city of Spain, and capital of the province so called. Its ancient name is unknown; but it is said to have been taken and fortified by Scipio, destroyed by Pompey, and rebuilt by Cæsar. It was taken from the Romans by the Goths, and from the latter by the Moors, who twice possessed it 230 years; for it was taken in 1094, by the famous Cid Ruy Diaz de Vivar, and bore, during four years, the name of *Valencia of the Cid*. The Moors retook it, but it was finally conquered in 1238, by the king Don Jayme, and embellished as well as enlarged by Don Pedro IV. king of Aragon. It is about half a league in circumference, and the walls are built for ornament rather than defence. Mariana the historian says, that in Valencia cheerfulness enters at the doors and windows: the description he gives of this city is in many respects devoid of truth, and such that the author proves himself more a poet than an historian. Several geographers who have had implicit faith in Mariana, have even exaggerated his account of Valencia, and said the houses here are all palaces, on which account the name of *Bella* was given to the city, an epithet difficult to reconcile with narrow, crooked, and unpaved streets, impassable after rain; and in which there are but two or three houses built with taste, and a few churches distinguished by their architecture. It is the see of an archbishop, and an university, instituted in the year 1470. Here is a tribunal of inquisition, with a royal audience, in which the governor, the captain-general of the province, and a royal regent, preside. The number of inhabitants is estimated at 100,000, but perhaps 80,000, or between both, is nearer the truth; 170 miles E.S.E. of Madrid. N. lat. $39^{\circ} 27'$. W. long. $0^{\circ} 27'$.

Accounts are kept at Valencia in libras of 20 sueldos, or 240 dineros; also in reals of new plate of 24 dineros. The libra of Valencia is equal to the peso of plate,

or dollar of exchange; it is, therefore, worth 8 reals of old plate, 10 reals of new plate, or 15 reals 2 maravedis vellon. The real of Plata Valenciana, $13\frac{1}{2}$ of which make a libra, is worth $1\frac{1}{2}$ sueldo, or 18 dineros, that is, $\frac{3}{4}$ ths of a real of new plate. The libra is worth $39\frac{1}{2}d.$ sterling nearly; or, more accurately, 1*l.* sterling = 6 libras, 1 sueldo, 5 dineros of Valencia. A carga or carica weighs 3 quintals, or 12 arrobas; the arroba, 24lbs. peso grueso, or 36lbs. peso futile: the former pound is 18 oz. the latter 12 oz.; and the ounce is $\frac{1}{7}$ heavier than the Castilian ounce: hence 50lbs. peso grueso, or 75lbs. peso futile, answer nearly to 59lbs. avoirdupois. The futile, or lighter weight, is used for bread, sugar, tobacco, and spices; the grueso, or heavier weight, for most kinds of merchandize.

Corn is measured by the cahiz of 12 barfellas, or 48 celemines: 100 cahizes produce $58\frac{1}{2}$ English quarters. The cantara, or arroba, liquid measure, contains 4 azumbres; and 25 such arrobas = 88 English wine gallons nearly. The carga of wine consists of 15 arrobas; the carga of oil of 12 arrobas. The vara or ell is divided into 4 palmos, and is about $\frac{1}{7}$ th longer than the Castilian vara, measuring, therefore, $36\frac{5}{7}$ English inches. Kelly's Un. Camb.

VALENCIA, a town of South America, in the government of the Caraccas; 16 miles S.W. of Caraccas. This city was founded in 1555, under the government of Villacinda, with a view of establishing a port near to Caraccas, in order to facilitate the conquest of the country, which had been much extolled by Faxardo. But Alonzo Dias Moreno preferred a situation farther distant from the lake Tacarigua, now Valencia, or half a league W. of it on a beautiful plain, where the air was pure and the soil fertile. N. lat. $10^{\circ} 9'$. W. long. from Paris $70^{\circ} 45'$. Its population in 1801 consisted of 6548 persons, according to some reports, but according to others, said to be more accurate, of 8000 souls. The inhabitants are generally Creoles, and the issue of very ancient families, excepting some from the Canaries, and very few Biscayans. The streets are wide, and for the most part paved. The houses are built like those of Caraccas, but not with stone. There is one church tolerably well built, and in the eastern part of a beautiful square, from which it receives, and to which it gives an embellishment, that constitutes the principal decoration of the city. In 1804 another church was erected, and dedicated to our Lady of la Chandaleur. The Franciscans have a monastery, occupied by eight monks, which has a very neat and elegant church. The inhabitants had formerly the character of being the most indolent in the whole province; but in consequence of some vigorous measures that have been lately adopted, a spirit of greater activity and industry has been excited among them. The situation of Valencia is peculiarly favourable for trade: being separated by only ten leagues of good road from Porto Cavello, it may transport its commodities thither at a small expence; and besides, every commodity from the interior of the country shipped at Porto Cavello goes through Valencia, and that which is destined for Guayra passes through Caraccas. The adjacent country produces every sort of provision and fruit in the greatest abundance, and of a most exquisite flavour; and its plains furnish its markets, at a very low price, with every kind of animal which they can consume. Depons's Travels in South America, vol. ii.

VALENCIA, *Lake of*, called by the Indians *Tacarigua*, but different from the bay or lake of the same name, (see *TACARIGUA*), a lake of the government of Caraccas, less extensive but more useful than that of Maracaibo. This lake stretches $13\frac{1}{2}$ leagues from E.N.E. to W.S.W., and its greatest breadth is four leagues. Its form is oblong; it lies

at the distance of one league from Valencia, and is situated in a valley surrounded with mountains, excepting on the W. where it extends into the interior of the country. It receives the water of twenty rivers without any visible outlet. It is six leagues from the sea, and separated from it by inaccessible mountains. It probably discharges itself by a subterraneous passage, as well as by evaporation, so beneficial to vegetation. Its eastern part is appropriated to the cultivation of tobacco for the king's benefit; and this tract being divided into five plantations, employs 15,000 persons. The remainder of the land gained from the lake is laid out in other kinds of culture. Its vicinity is enlivened by a variety of birds, whose plumage is beautiful, and whose notes are melodious. It also abounds with aquatic game, and its borders are embellished with unfading verdure. It is interspersed with a number of small islands, which are inhabited; and one of them, called Caratapona, contains a population sufficient to raise provisions, fruits, and vegetables for market. It furnishes a great quantity of fish, that called by the Spaniards, guavina, being the most abundant. Many reptiles are seen upon its borders; and among these are two kinds of lizard, which are particularly distinguished; and of which the Indians and some Spaniards make their most delicious meals. Depons's Travels, vol. i.

VALENCIENNES, a city of France, and principal place of a district, in the department of the North, situated on the Scheldt, which runs through the town in several places, and here becomes navigable. It is supposed to have derived its name from the emperor Valentinian I., who, taken with the temperature of the climate, and charming situation of the place, laid the foundation of a town, about the year 367, endowing it with many privileges and immunities, and particularly of being an asylum for debtors and criminals. This privilege, which extended over the greater part of the town, was called "banlieu;" but it has since been limited, to prevent abuse from fraudulent bankrupts and assassins. Before the revolution, it belonged to Hainaut, and contained several churches and convents. The town-house is an ancient building of free-stone, founded in the 14th century; the square or grand place is handsome, but the streets are in general narrow, dark, and crooked. The form of its municipal government was considered so good as to serve for the model of several republics, particularly Venice and Nuremberg, which sent deputies to collect the laws. Near the town is a coal-mine. Valenciennes was one of the first towns which revolted against Philip II. king of Spain; it took part with the States and the Protestant religion, and refused to receive a garrison sent by Margaret of Parma; in consequence of which it was besieged, in the year 1567, by John de Noircames, baron of Selles, and at the end of three months surrendered at discretion: thirty-six of the principal ringleaders were punished, and the town deprived of its privileges. It was afterwards several times taken and retaken by the duke of Alva and the States General. In the year 1656, it was besieged by the French, under the command of marshals Turenne and La Ferté; but they were compelled to raise the siege, after the loss of 4000 men killed and wounded, in several assaults. In the year 1677, it was besieged by Louis XIV. in person; and after 17 days, taken by assault. It remained to France by the peace of Nimeguen, which happened in the following year, when a new and handsome citadel was built, at the expence of the citizens, and other fortifications added. In 1793, Valenciennes was invested by the allies, under the conduct of the duke of York, and the governor Ferrand summoned to surrender. On the 14th of June, the trenches were opened. The British commander then summoned the garrison;

garrison; but receiving an unsatisfactory answer, the artillery began to play upon the town with great vigour, and in the course of the night above 500 red-hot balls were poured upon it. Towards the beginning of July, the besiegers were able to bring 200 pieces of heavy artillery to play without intermission on the town, and the greater part of it was reduced to ashes. The most singular fact in the history of this siege is, that a considerable part of the war was carried on under ground, mines and counter-mines innumerable having been formed both by the besiegers and besieged. The principal of these, on the side of the former, were one under the glacis, and one under the horn-work of the fortrefs; these mines were completed and charged on the 25th of July, and in the night between nine and ten o'clock were sprung with the most complete success. The English and Austrians immediately embraced the opportunity to throw themselves into the covered way, of which they made themselves masters. The die was now cast, and on the 26th the duke of York again summoned the place, which surrendered on capitulation the succeeding day; the duke of York taking possession of it in behalf of the emperor of Germany. The following year, however, in consequence of the successes of the French arms, Valenciennes surrendered to the republicans, by capitulation, on the 26th of August. The garrison were made prisoners of war, but to be conducted to the first post of the imperial and Dutch armies, on condition that they were not to serve against the republic till regularly exchanged. Considerable stores of every kind, with 200 pieces of cannon, 1,000,000 pounds of gunpowder, and 3,000,000 florins in specie, and 6,500,000 livres, were found in Valenciennes; 1000 head of horned cattle, and great quantities of oats and other corn, were also included within the fortrefs. So earnest indeed had the emperor been to retain this important place, that he is said to have expended 3,000,000*l.* in repairing and improving the fortifications. What is the most to be lamented is, that upwards of 1000 unhappy emigrants were surrendered on this occasion to the vengeance of their enraged countrymen. The principal manufactures are lace, cambric, and woollen mitts, camlets, &c.; $4\frac{1}{2}$ posts E. of Douay. N. lat. $50^{\circ} 21'$. E. long. $3^{\circ} 36'$.

VALENGIN, or **VALENGIN**, or *Valengin*, a town and capital of a lordship, in the county of Neufchâtel; 3 miles N.N.W. of Neufchâtel. See **NEUCHATEL**.

VALENS, **FLAVIUS**, in *Biography*, a Roman emperor, was born at Cibalis in Pannonia, and associated in the empire with his brother Valentinian A.D. 364, at the age of thirty-six. To him his brother, to whom he was much attached, assigned the eastern portion of the Roman dominions, comprehending the whole of Asia, with Egypt and Thrace; upon this division, Valens made Constantinople the seat of his empire. Alarmed by the movements of the Persians on the borders of his territory, he departed for Syria, and at Cæsarea, in Cappadocia, he was informed that Procopius had taken possession of his capital. The emperor was so terrified by this intelligence, that he intended to negotiate with the usurper, and to propose to him an abdication of the empire. His ministers, however, advised him to detach a body of troops, in order to suppress the insurrection at its commencement: but these troops joined Procopius, and contributed to his success. At length many of the insurgents abandoned their commander, who rendered himself unpopular by his rapacity and tyranny, and he was ultimately betrayed to Valens, who ordered him to be beheaded. The emperor was thus established on the throne; but his conduct was such as to cool the ardour of his friends, and to excite enmity and opposition. In process of time, from the year 366 to

369, he contended successfully with the Goths, and having reduced them to great distress, consented to conclude a treaty with them, which was ratified with great magnificence in barges upon the Danube. Having accomplished this object, Valens returned in triumph to Constantinople.

Valens, having received his Christian creed from Eudoxus, the Arian bishop of Constantinople, disgraced himself by becoming a persecutor of the Athanasians: and in a contest between these two parties, he acted in a manner so rigorous and violent, as to entail indelible reproach on his memory. In 371 he lost his only son, and in the following year he defeated the Persians, and afterwards readily consented to a truce. Whilst he was passing the winter at Antioch, in the year 374, he manifested, in his treatment of persons who recurred to magical practices for ascertaining the name of the future successor to the imperial throne, the jealous cruelty of his character. Many persons were involved in real or suspected guilt, and consigned to the punishment of torture, banishment, or death. Having resided five years at Antioch, watching the motions of the Persian king, repressing the incursions of the Saracens and Isaurians, and conducting state inquisitions and religious persecutions, his attention was excited by a terrible inroad of the Huns upon the territories of the Visigoths, and these Goths, having obtained permission to cross the Danube, penetrated into the cultivated part of Thrace. The Gothic tribes were joined by the Huns and Alans. The emperor arrived at Constantinople in 378, and urged by the clamours of the people, marched against the enemy to the vicinity of Constantinople. An engagement ensued, which proved singularly disastrous to the Romans. Valens, deserted by his guards and wounded, betook himself to a cottage, in which his attendants were dressing his wound: the cottage was beset by the enemy, who being resisted, set fire to a pile of faggots, that consumed the emperor and all that were with him. Thus did Valens terminate his life at the age of fifty, and in the sixteenth year of his reign. His character, as it has been delineated by historians, merits in many respects contempt and detestation. He was nevertheless modest and temperate in his mode of living; addicted to no private vice or superfluous expence; ready to listen to the complaints of his subjects, and to protect them from the oppression of the military, among whom he preserved exact discipline; and it has been said that the Eastern provinces in general were never happier than under his government. *Anc. Un. Hist. Gibbon's Rom. Emp. Gen. Biog.*

VALENSOLE, in *Geography*, a town of France, in the department of the Lower Alps; 18 miles S. of Digne.

VALENTANO, a town of the Popedom, in the duchy of Castro; 14 miles S.W. of Orvieto.

VALENTIA, in *Ancient Geography*, a town of Hispania Citerior, upon the Turia. See **VALENCIA**.

VALENTIA, a town and colony of Gallia Narbonensis, belonging to the Segalauni, according to Ptolemy, but to the Cavares, according to Pliny. In the Itinerary of Antonine, this town is marked on the route from Mediolanum to Lugdunum, between Augusta and Ursolæ. At the fall of the Roman empire this town became subject to the Burgundians, afterwards to the Merovingians; but under the Carlovingians, it belonged to the kingdom of Burgundy and Arles.—Also, a country of the isle of Albion, according to Ammianus Marcellinus. It was conquered by Theodosius the elder, and made a fifth Roman province. (See **OTOLINI**.)—Also, a town of Italy, in Messapia, between Chpiz and Civitas Brindisi, according to the Itinerary of Jerusalem.—Also, a town situated in the interior of the isle of Sardinia.

VALENTIA, in *Geography*, a small island on the coast of

Kerry, Ireland, in the barony of Iveragh, from which it is separated by a channel, which is a safe harbour. Though Valentia contains extensive bogs, it has more inhabitants and better culture than could be expected in so remote a spot; it is indeed esteemed the granary of the country. Oliver Cromwell had forts erected at both ends of the channel, which have gone to ruin. Valentia is the property of the marquis of Lansdowne. Its northern point is in N. lat. $51^{\circ} 54'$. W. long. $10^{\circ} 10'$.

VALENTIA Harbour, a bay of Ireland, on the east side of Dingle bay, between the isle of Valentia and Dowlas Head.

VALENTIAM. See *CAPE ad Valentiam*.

VALENTINE, PETER, in *Biography*, was born at Colonies on Brie in 1600, and studied some time under Simon Vouet, but leaving that master before he had made any considerable progress, travelled to Rome, where he passed the remainder of his life: he may therefore be rather considered of the Roman than the French school. The powerful and vigorous style of Michael Angelo Caravaggio made so strong an impression on him, that he attached himself to an imitation of it, with a devotion that was never diminished. Like that artist, he indulged in an extravagant, but effective contrast of light and shadow; like him, he was a faithful follower of nature, and was equally indifferent and unfortunate in his choice of it; like him, he was frequently incorrect, and always ignoble. He was, however, an intelligent master of the chiaro-scuro, and his masses are disposed so as to produce the most striking effect. Though he occasionally painted altar-pieces for the churches, his powers appear to have been better adapted to other subjects, which he also appears to have painted in preference. His best pictures represent fortune-tellers, gamesters, concerts of music, and corps de gardes; to which his taste was more competent than to the dignity of historic painting. The patronage of cardinal Barberini, nephew to Urban VIII., procured him the commission to paint a large picture for the Basilica of St. Peter, representing the Martyrdom of S. S. Processo e Martiniano, which is esteemed his best historical picture. He also painted for his patron, the Decollation of St. John, in the Palazzo Barberini; and there is an admired picture by him in the Corsini palace, of Peter denying Christ. This pleasing painter died in 1632, at the early age of thirty-two, of a fever, being brought on by going into a cold bath when he was heated.

VALENTINE, in *Geography*, a town of France, in the department of the Upper Garonne; 2 miles S.W. of St. Gaudens.

VALENTINE'S Bay, a bay on the south-east coast of Terra del Fuego, west of Cape Success.

VALENTINI, MICHAEL BERNHARD, in *Biography*, a native of Giessen, in Germany, where he was born in 1657, and became a medical professor, and where he died in 1729. The subjects of his writings, which are numerous, chiefly comprehend botany and the materia medica: of these we shall here mention his "Letters from the East Indies;" "Praxis Medica," in two parts; "Amphitheatrum Zootomicum," fol.; and a "Corpus Juris Medico-legalis," fol. referring for other works to the botanical article VALENTINIA. Haller.

VALENTINI, PIETRO FRANCESCO, of Rome, who flourished about the year 1645, and whose patience and abilities in the construction of canons seem to have made every subsequent canonist despair of emulating his subtilties and dexterity in the art. Indeed he appears to have surpassed all that the most determined canonists had ever achieved, by the several works which he published on the subject, in the

following order: "Canon to the words *Illos tuos misericordes oculos ad nos converte*, with the Resolution in more than two thousand ways, for two, three, four, and five Voices, Rome, 1629;" "Canon, called the Knot of Solomon, for ninety-six Voices, Rome, 1631;" "Canon on four Subjects for twenty Voices, Rome, 1645." The first and most curious of these works seems to have been reprinted in 1655, as M. Marburg of Berlin, and several other musical writers, in speaking of it, refer to an edition of that date. But P. Martini, who is in general very accurate in dates and citations, mentions Valentini's first canonical work under the year 1629. Kircher gives the subject, and an account of this canon, in his *Musurgia*. M. Marburg, in a periodical work called *Kritische Briefe*, or "Critical Letters on the Art of Music," vol. ii. 1763, 4to. has bestowed upwards of fifty pages on this canon, and not only given it a hundred different ways in notes, but explained more than two hundred of the several contrivances used by Valentini in the construction of canons on the subject given.

Numerous musicians of the name of Valentini have been recorded by musical writers; among whom Gerber gives an article to a namesake of the canonist, Pietro Francesco Valentini, an opera composer at Rome in the middle of the seventeenth century, who, besides *Intermezzi*, set to music several dramatic fables written by good poets, such as "La Metra," a Greek fable; "The Death of Orpheus;" "Pythagoras finding Musical Proportions," 1654; "The Transformation of Daphne," a moral fable. His *Intermezzi* were the Rape of Proserpine, and the Captivity of Mars and Venus in the Net.

VALENTINI, ROBERTO, an Englishman, a voluminous composer for the common flute, whose works were chiefly published by Roger, at Amsterdam.

VALENTINI, GIUSEPPE, about the latter end of the seventeenth century, among other composers for the violin, à *dozzina*, published in Holland nine different works for that instrument, the seventh and last of which were "Concerti Grossi," for four violins, tenor, and two basses; but they have been long since consigned to oblivion, without any loss to the public, or injustice to the author.

VALENTINI, URBANI, the first soprano opera singer who appeared on our stage, arrived in England 1707, after the attempts that were made at operas upon the Italian model.

VALENTINIA, in *Botany*, received that appellation from Dr. Swartz, in memory of two writers of the name of Valentini, who have both of them contributed to the general stock of botanical information, particularly with relation to the *Materia Medica*. Michael Bernard Valentini, professor of medicine at Giessen, who died in 1729, aged 72, published *Prodromus Historiæ Naturalis Hassiæ*, in 1707, *Viridarium reformatum*, in 1719, *Museum Museorum*, in 1704, and *Historia simplicium reformata*, printed at different times; besides several dissertations, illustrative of the natural history of Sago, Cloves, Nutmegs, Pepper, Cinnamon, Dates, Aloes wood, &c. His son, Christopher Bernard Valentini, published *Tournefortius contractus*, being an arrangement of Tournefort's *Institutiones* in the form of tables; with some other works.—Swartz Prodr. 63. Ind. Occ. 687. t. 14. Schreb. Gen. 801. Willd. Sp. Pl. v. 2. 344. Mart. Mill. Dict. v. 4.—Class and order, *Ostendria Monogynia*. Nat. Ord. uncertain.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, concave, coloured, in five deep, obtuse, concave, spreading, undivided segments. *Cor.* none, unless the calyx be taken for such. *Stam.* Filaments eight, awl-shaped, erect, rather shorter than the calyx; anthers roundish. *Pist.* Germen superior, roundish; style one, the length of the stamens, thick, cylindrical; stigma

stigma capitate. *Peric.* Capsule pulpy, roundish, bursting into three or four revolute valves, juicy within, of one cell. *Seeds* four, oblong.

Ess. Ch. Calyx coloured, in five deep spreading segments. Corolla none. Capsule superior, pulpy, of one cell, and four seeds.

1. *V. ilicifolia.* Holly-leaved *Valentia*. Swartz Ind. Occ. 689. Willd. n. 1. (*Malpighia aquifolii amplioribus foliis*; Plum. Ic. 160. t. 167. f. 2. *Ilex folio agrifolii americana*; Pluk. Phyt. t. 196. f. 3.)—Native of the most barren stony parts of Hispaniola, towards the ocean; also of Cuba, about the Havannah, flowering in January. A shrub, two or three feet high, branched, of a rigid habit, without thorns; the branches smooth. *Leaves* alternate, oblong, rigid, stalked, with axillary buds; their length three or four inches; their breadth more than one; their margins undulated, and beset with broad spinous teeth, like our common Holly; both surfaces smooth and veiny. *Flowers* at the ends of the branches, stalked, somewhat umbellate, scarlet. *Calyx* permanent. *Fruit* in an early state snow-white, afterwards scarlet. *Seeds* three or four, smooth, imbedded in yellow pulp.—Burmah, with more than his usual sagacity, suspected this plant was not really a *Malpighia*, because of its alternate leaves. Dr. Swartz thinks it belongs to the same natural order as *Ilex*, but the want of a corolla, and the structure of the fruit, cause some difficulties.

VALENTINIAN I., in *Biography*, a Roman emperor, descended from an obscure family of Cibalis, in Pannonia, and born A.D. 321. Dedicated to the profession of arms, he distinguished himself by attention to military discipline, and in the reign of Constantine commanded a body of cavalry in Gaul. Under Julian he was tribune of one of the bands of imperial guards, and displayed his zeal for the Christian religion. On the accession of Jovian, he served in Gaul; and returning to the East, he was at Ancyra at the time of Jovian's death: and here he was raised to the purple by general applause in 364, in the 43d year of his age. On his arrival at Constantinople, he declared his brother Valens his partner in the empire. On the division of the empire (see **VALENS**), he reserved to himself the western portion, consisting of Illyricum, Italy, Spain, Gaul, Britain, and Africa. After this event he resided at Milan. Soon after, his reign was disturbed by an irruption of the Alemanni into Gaul. In 368 he crossed the Rhine with a powerful army, and having forced the camp of the Alemanni, he returned to Treves, and fortified the banks of that river, so that Gaul was secured from any hostile attacks during the remainder of his reign. The spirit of his government was that of vigorous discipline; and till he was corrupted by power, he paid a regard to justice and the public good; enacting many salutary laws in favour of the poor and diseased, providing for the instruction of youth, and exercising toleration in matters of religion. Accordingly he allowed unmolested liberty to Jews and Pagans, whilst he proscribed magical rites, and punished those who practised them. He also restrained the avarice and luxury of the clergy, and declared donations, that were injurious to families, illegal; and proceeded so far as to incapacitate all persons of the ecclesiastical order from receiving any testamentary bequest, except such as came to them by inheritance.

Valentinian was rash and violent in his temper, and liable to be imposed upon by his ministers and officers. Among the other events of his reign, we may mention an invasion of the Alemanni by the Burgundians, at his solicitation; the predatory incursions of the Saxons on the maritime provinces of Gaul; and the recovery of the Roman province in Britain from the invasion of the Picts and Scots. Being en-

camped near Basil, in 374, he received intelligence that the Quadi had entered Pannonia, and that the Sarmatians had invaded Mœsia; he advanced to the Danube, and crossing that river, laid waste the country of the Quadi with fire and sword. When the Quadi sued for peace, he menaced and reproached them with such an excess of passion, that he broke a blood-vessel, and fell speechless into the arms of his attendants. This disaster was soon followed by his death, which happened in 375, in the twelfth year of his reign, when he attained the age of about fifty-four years. The historian Socrates affirms that he had two wives at a time, issuing an edict that extended the same privilege to all his subjects. But this circumstance has been doubted, as no less inconsistent with the religion and manners of the period in which he lived, than with his own disposition and character, for he does not seem to have been addicted to licentious pleasures. Habituating himself to scenes of torture and death, he at length took delight in them; and he is said to have kept two enormous bears near his person, which he employed as executioners, for his private amusement. Upon the whole, however, his government was beneficial; and whilst he defended the empire with vigour, he promoted its reputation and prosperity by good laws and useful institutions. *Anc. Un. Hist. Gibbon's Rom. Emp. Gen. Biog.*

VALENTINIAN II., a Roman emperor, was the son of the former by the empress Justina, and born in 371. On the death of his father, when his half-brother Gratian, his partner in the empire, was at a distance, he was declared emperor by the principal ministers and officers of his deceased parent, and Gratian acquiesced in the appointment. His portion of the empire comprehended Italy, Illyricum, and Africa. As his mother was attached to the Arian sect, she was involved in a contest with Ambrose, archbishop of Milan, and thus the people became disaffected to her son; so that upon the death of Gratian, the usurper Maximus invaded Italy, and obliged Justina and Valentinian to take refuge in Aquileia. Hence they proceeded to Thessalonica, and implored the assistance and protection of Theodosius, emperor of the East. Theodosius having prevailed with Valentinian to renounce the Arian doctrine, promised to support his cause, and the consequences of his interposition were the defeat and death of Maximus, in the year 388. Upon this the young emperor was restored to his dominions; and displayed those virtues which served to gain for him the eulogy of Ambrose and other ecclesiastical writers. Such was his religious zeal, that he refused to grant to his pagan subjects a restoration of their privileges to the heathen priests and temples. Whilst Valentinian was at Vienne, in Gaul, the barbarians on the frontiers of Italy threatened an invasion; but the emperor, before he exposed himself to the hazards of war, determined to be baptized, and sent for Ambrose to administer the rite. He also wished to engage the prelate's mediation with Arbogastes, the Frank, who had assumed an almost uncontrolled power over the government. He also sought the assistance of Theodosius. In the mean while he received Arbogastes, whilst he was seated on his throne, and delivered to him a paper, expressing his dismissal from all his employments. The Frank told him that his authority did not depend upon the will of a monarch, and threw the paper contemptuously on the ground. Valentinian was enraged, and attempted to avenge himself by wresting a sword from one of his guards: but his violence was restrained. However, a few days after he was found strangled in his apartments, May, A.D. 392, being then in his twenty-first year, and having nominally reigned 16½ years. *Anc. Un. Hist. Gibbon's Rom. Emp. Gen. Biog.*

VALENTINIAN III., a Roman emperor, the son of Placidia,

didia, sister of the emperor Honorius, by Constantius, one of that emperor's generals, was born in the year 418, and after the death of Honorius, declared emperor of the West. In 437 he was married to Eudoxia, the daughter of Theodosius II.; but during the life of his mother, who died in 450, he took no part in the government. The dread of Attila caused him to retire from Ravenna to Rome, where he proposed terms of accommodation with this formidable enemy, which were accepted. The weakness and timidity of this emperor occasioned a jealousy of the famous general Aetius, and base measures were secretly concerted for putting him to death. Valentinian himself perpetrated the foul deed of his assassination; and this act was followed by the murder of several of his friends. This detestable act, which took place in 454, was succeeded by the violation of the chaste and beautiful wife of Petronius Maximus, a wealthy senator. Her husband, as soon as he was informed of it, determined upon revenge; and for this purpose engaged two of the imperial guards who had served under Aetius. One of these seized the opportunity of some military sports in the Campus Martius to stab the emperor to the heart. This event happened in March 455, when Valentinian was thirty-four years of age, and after he had borne the title of emperor twenty-nine years. He was the last emperor of the race of Theodosius, and had all the weaknesses, with none of the virtues of that line. *Anc. Un. Hist. Gibbon. Gen. Biog.*

VALENTINIANS, in *Ecclesiastical History*, an ancient and famous sect of Gnostics; thus called from their leader Valentinus, an Egyptian by birth, who was eminently distinguished by the extent of his fame, and the multitude of his followers. His sect, which took rise at Rome towards the close of the second century, grew up to maturity in the isle of Cyprus, and spread itself through Asia, Africa, and Europe, with amazing rapidity. His principles were much the same with those of the Gnostics, though, in many respects, he entertained opinions peculiar to himself. He placed in the pleroma, as the Gnostics called the habitation of the deity, thirty æons, half male and half female: to these he added four others, which were of neither sex, *viz.* Horus, Christ, the Holy Ghost, and Jesus. The youngest æon, called Sophia, or Wisdom, conceived an ardent desire of comprehending the nature of the Supreme Being, and by the force of this propensity, brought forth a daughter, named Achamoth; who being exiled from the pleroma, fell down into the undigested mass of matter, and arranged it; and, by the assistance of Jesus, produced the demiurge, the lord and creator of all things. This demiurge separated the animal from the terrestrial matter; and out of the former created the superior world, or visible heavens; and out of the latter, the inferior world, or the terraqueous globe. He also made man, uniting in his composition the animal and terrestrial matter, to which Achamoth added a spiritual and celestial substance. The demiurge, according to Valentinus, arrogating the honours of God alone, sent prophets to the Jewish nation to urge his claims; and his ambition was imitated by the other angels that preside over the different parts of the universe. In order to chastise this lawless arrogance, and to illuminate the minds of rational beings with the knowledge of the true and supreme Deity, Christ appeared on earth, composed of an animal and spiritual substance, and clothed, moreover, with an ærial body. The Redeemer, in descending upon earth, passed through the womb of Mary; and Jesus, one of the supreme æons, was united to him when he was baptised by John in Jordan. The creator of this world, perceiving that the foundations of his empire were shaken, caused him to be apprehended and nailed to the cross; but before Christ submitted to this

punishment, not only Jesus the Son of God, but the rational soul of Christ, ascended up on high; so that only the animal soul and the ærial body suffered crucifixion. Those who, abandoning the service of false deities and the worship of the God of the Jews, live according to the precepts of Christ, and submit the animal and sensual soul to the discipline of reason, shall be truly happy; and when all the parts of the divine nature, or all souls, are purified thoroughly and separately from matter, then a raging fire shall spread its flames through the universe, and dissolve the frame of the corporeal world. Such is the doctrine of Valentinus and the Gnostics; and such, in general, are the tenets of the oriental philosophy. The sect of the Valentinians was divided into many branches. See PTOLEMAITES, SECUNDIANS, HERACLEONITES, and MARCOSIANS. *Mosheim's Eccl. Hist. vol. i.*

VALENTINUS, the founder of a sect of heretics, for an account of which, see VALENTINIANS.

VALENZA, in *Geography*, a town of Italy, in the department of the Gogno, on the Po; 6 miles N. of Alexandria.

VALEPONGA, in *Ancient Geography*, a town of Hispania Citerior, at the eastern foot of mount Ubeda, near the source of the river Turia. In the Itinerary of Antonine it is marked on the route from Laminium to Toletum, between Ad Putea and Urbiaca.

VALERE. See PERINDE *Valere*.

VALERIA, VALERA, in *Ancient Geography*, a town in the interior of Hispania Citerior, S. of Ergavica. Pliu reckons it in the number of colonies, and Ortelius gives it the epithet of Julia. It was situated in Celtiberia, E. of Sucro, and W. of Lobetum.—Also, a town of the isle of Corfica, which had the title of a colony, according to Ptolemy.—Also, a country of Germany, comprehending a part of Pannonia, and so called by Maximian, after the name of Valeria, his wife, the daughter of Dioclesian. It was situated between the Danube and the Drave.—Also, the thirteenth province of Italy, to which Nurta was annexed. It was between Umbria, Campania and Picenum, and comprehended the country of the Marfi and their lake, called "Fucinus."—Also, a town of Italy, in Latium, on the Valerian way.

VALERIAN, P. LICINIUS VALERIANUS, in *Biography*, a Roman emperor, the descendant of an illustrious family at Rome, was betimes so distinguished by his attention both to civil and military affairs, that he was appointed consul and prince of the senate, and also censor. He occupied other stations of considerable trust and importance. At length his own troops proclaimed him emperor, in which choice every individual of the empire was disposed to concur. Accordingly he was invested with the purple A.D. 253, after having passed his sixtieth year. The commencement of his reign was rendered illustrious by many popular and laudable acts, from which eulogy, however, we must except the appointment of his son Gallienus, a vicious youth, to be his colleague in the empire; more especially as in the progress of it he had many enemies with whom to contend; among whom we may enumerate Franks, Goths, Allemans, and Persians, the latter of whom may be deemed the most formidable. When Antioch was surprized and pillaged, under the instigation of Sapor, king of Persia, by Cyriades, who assumed the title of emperor, Valerian marched to the restoration of this city, and having expelled the Scythians, who had taken possession of it, he hastened to cross the Euphrates, in order to relieve Edeffa, which was besieged by Sapor. After a vain attempt for this purpose, he was reduced to the necessity of negotiating with the Persian king. The result, however, was, that

VALERIANA.

that he became a captive to Sapor, A.D. 260, and was treated cruelly and ignominiously in his captivity. This distress was aggravated by the ingratitude of his son Gallienus, who afforded him no relief in his captivity, but took advantage of a report of his death to raise him to the rank of a god. After languishing in this state for a considerable time, he died in Persia; and it was rumoured, that after his death, his skin, stuffed with straw, was hung up in a temple, where Sapor exhibited it as an humiliating spectacle to the ambassadors from Rome. Valerian, whose administration was charged with want of vigour and activity in resisting the foes of the empire, was not unjustly reproached as a persecutor of the Christians. Regarding them as the enemies of paganism, he issued an edict, which produced the eighth persecution, as it has been called by ecclesiastical historians, and which was both general and severe, and lasted from the year 257 to the period of his captivity. The calamities which he suffered have been represented as a judgment upon him for this cruelty. He was twice married, Gallienus being the offspring of the first marriage; and by the second he had at least two sons. *Anc. Un. Hist. Crevier. Gibbon.*

VALERIANA, in *Botany*, a name which seems to have originated with the physicians of the dark ages, and which is evidently derived from *valeo*, to be powerful, or efficacious, in allusion, as Caspar Bauhin and Ambrosinus tell us, to the many virtues of the plant. Linnæus, in *Phil. Bot.* 171, unaccountably ranks this name among those derived, like *Gentiana*, *Eupatorium*, &c. from kings.—*Linn. Gen.* 22. *Schreb.* 29. *Willd. Sp. Pl.* v. 1. 175. *Vahl Enum.* v. 2. 1. *Mart. Mill. Dict.* v. 4. *Ait. Hort. Kew.* v. 1. 73. *Sm. Fl. Brit.* 37. *Prodr. Fl. Græc. Sibth.* v. 1. 20. *Pursh* 28. *Juss.* 195. *Tourn.* t. 52. *Lamarek Illustr.* t. 24. *Gærtner.* t. 86.—Class and order, *Triandria Monogynia*. *Nat. Ord. Aggregatae*, *Linn. Dipsaceae*, *Juss.*

Gen. Ch. Cal. scarcely any, except a slight border at the top of the germen. *Cor.* of one petal, irregular; tube swelling, or spurred, underneath at the base, where it bears honey; limb in five obtuse segments. *Stam.* Filaments three, in some cases fewer, awl-shaped, erect, the length of the corolla; anthers roundish. *Pist.* Germen inferior; style thread-shaped, the length of the stamens; stigma thickish. *Peric.* a crust, which does not split, deciduous, crowned. *Seed* solitary, oblong.

Ess. Ch. Calyx obsolete. Corolla superior, of one petal, gibbous on one side, at the base. Seed solitary.

Obs. Linnæus remarks as follows on the wonderful diversities of form and number in the parts of fructification, among the various species of this genus.

The *calyx* in some is a scarcely discernible border; in others five-cleft. Tube of the *corolla* in some oblong; in a few furnished with a spur-shaped nectary: in others very short. Its limb in some equal; in others two-lipped, the upper lip divided. *Stamens* in several three; in some two; in others one or four; in some removed to a different flower from the pistil. *Stigma* in some three-cleft; in others emarginate; in others globose. *Pericarp* in some scarcely any; in others a thick capsule; in others of two cells. *Seed* sometimes crowned with feathery down, whose form is various; sometimes without any.

By the above detail, the reader will be aware that Linnæus includes under this genus the *FEDIA* of Adanson, (see that article,) which is what Tournefort, Vaillant, and recently Decandolle, have called *Valerianella*. The same genus is adopted, under the last-mentioned name, by our worthy friend Mr. W. J. Hooker, in his continuation of Curtis's *Flora Londinensis*. Such diminutives of already established names, however, being contrary to the laws of

Linnæus, *Phil. Bot. sect.* 227 and 228, and, which is still more important, repugnant, in the highest degree, to good sense, have never been admitted by any writer, even the least correct, since Linnæus first promulgated sound principles of nomenclature, and can have been resorted to by the above excellent botanists, through inadvertence only. *Fedia*, being unexceptionable, and received by Vahl in his *Enumeratio*, must supersede *Valerianella*, provided the genus be allowed to remain, of which we have already expressed our doubts. We have indeed little scruple, all things considered, in rejecting it. (See our 33d, 45th, and following species.) But having already noticed *Fedia* in its proper place, we shall here confine ourselves to the generally admitted *Valeriana*, which constitute an ample genus, recently augmented by Vahl, whose arrangement of species we follow, from the *Flora Peruviana*, and other sources; to which we have also something to add.

The genus under consideration is composed of herbaceous plants, either perennial or annual, with an upright round stem, and opposite leaves; which are mostly simple; rarely ternate or pinnate. *Flowers* terminal, numerous, opposite, corymbose or paniced; generally reddish, or flesh-coloured; rarely yellowish; scarcely blue. The *roots* of some are distinguished by a most potent and very peculiar odour.

1. *V. rubra*. Red Valerian. *Linn. Sp. Pl.* 44. *Willd.* n. 1. *Vahl n. 1.* *Fl. Brit.* n. 1. *Engl. Bot.* t. 1531. (*V. rubra* *Dodonæi*; *Ger. Em.* 678. *V. marina*; *Riv.* *Monop. Irr.* t. 3. f. 2. *Phu peregrinum*; *Camer. Epit.* 24.)—Stamen one. Spur of the flower elongated. Leaves lanceolate, nearly entire.—Native of walls, waste ground, chalk-pits, and dry hilly places, in England, Switzerland, France, the north of Africa, Greece, and other parts of the Levant. Certainly wild in the chalk-pits of Kent; flowering from June to September. The plant is common in gardens, and on old walls. A deep red variety is usually preferred for cultivation. The root is perennial, fœtid, rather fleshy. Whole herb very smooth, a little glaucous, eighteen inches or two feet high. Upper leaves often toothed, broadly ovate, with a long point. *Flowers* pink, rarely white, slender, not inelegant, very numerous, in a dense repeatedly branched corymb. *Seed-crown* of many feathery entangled rays, gradually unrolled after the flower is past.

2. *V. angustifolia*. Narrow-leaved Red Valerian. *Willd.* n. 2. *Vahl n. 2.* *Ait. n. 2.* *Cavan. Ic.* v. 4. 32. t. 353. *Sm. Fl. Græc. Sibth.* v. 1. 22. t. 29. (*V. rubra* ♀; *Linn. Sp. Pl.* 44. *V. rubra angustifolia*; *Bauh. Hist.* v. 3. part 2. 211.)—Stamen one. Spur of the flower elongated. Leaves linear-lanceolate, bluntish, entire.—Native of hilly situations in France, Italy, Switzerland, and the Levant, but not yet observed in England. Dr. Sibthorp gathered it on the highest hills about Athens. This is very nearly related to the former, with which it agrees altogether in habit and flowers, but the leaves are all uniformly narrow, almost linear, quite entire, and more obtuse at the extremity.
