The food of the *urtica marina* is not less wonderful than its structure and motions. It should seem very strange that an animal, soft like this creature, with no feet nor instrument of that kind to help itself with, should be able to feed on the flesh of muscles, sea-snails, and other shell-fish; yet these are its constant food. They find means to take in the shell-fish whole into the body, and then close the aperture fast upon it, so that it is not to be seen that they have any such thing within them; they keep them here as long as they please, and afterwards throw out the empty shells by the same aperture, which they can, as before observed, widen and contract at pleasure. By what means the *urtica* is able to get out the body of these fish, is not known, as it all passes in the body; but it very often fails, and the creature is obliged to throw out the shell-fish alive again; and sometimes when it has greedily gorged too large a morsel, and it is got into a wrong position to be thrown out the same way, it is obliged to let it through the base, where there is no
natural

natural aperture, and where its passage must be attended with a terrible wound. The manner in which the larger shells are thrown out by the mouth, is by opening it extremely wide and turning it back, so that the inside appears outward for a little way down; and this motion is also used on another very necessary occasion, the excluding of the young ones, for these animals are viviparous. Mem. Acad. Par. 1710.

It has been found that this creature has the remarkable property of the polype, in reproducing such parts as it had lost. M. Reaumur tried many experiments on the various species of this, and of the star-fish kind, and found that whatever parts were cut off, the wound soon healed; and M. de Villars had opportunities of watching the whole progress of the growth of the animals afterwards, and found that they not only seemed alive and well after cutting, their wounds soon cicatrizing, but that they, in a very little time, regained what had been cut off, and became as perfect as before. See *Sea-ANEMONES*.

Dr. Gærtner refers the *urtica marina*, or sea-nettles, to the hydra of Linnæus, commonly called the polype; for he says, that they agree with that genus in the following general characters, besides many of its less essential or accidental qualities: they are of a gelatinous substance; they have only one opening in their bodies which gives a passage to the food, as well as to the excrements of the animal; and they have also a set of feelers, which surround this opening, and serve these creatures for claws, to catch their prey with, and convey it to their mouths. Phil. Transf. vol. lii. art. 13. P. 73, &c.

These animals were known to the Greeks and Romans by the names of *πυγμα θαλασσιου*, and *pulmo marinus*, or sea-lungs. They attributed medicinal virtues to them. Accordingly Dioscorides informs us, that if rubbed fresh on the diseased part, they cured the gout in the feet, and kibered heels. Ælian says that they were depilatory, and if mixed in vinegar, would take away the beard. Their phosphoric quality was noticed by Pliny, who says that a tick rubbed with them will appear to burn, and the wood to shine all over: he also adds, that when they sink to the bottom of the sea, they portend a continuance of bad weather. Pennant's Brit. Zool. vol. iv. p. 59.

URTICÆ, in Botany, so named from the great genus *URTICA*, see that article, is the 98th natural order in Jussieu's system, the third of his 15th, or last, class. The characters of this class are given under *EUPHORBIÆ*, where we have ventured to observe that the class is by no means a really natural one. To the order before us, though clogged with doubtful genera at the end, there is little or no exception. It is analogous to the *Scabride* of Linnæus, and may serve to give an idea of that tribe, which we have omitted in its proper place.

Jussieu's characters of his *Urticæ* are these.

Flowers monoecious or dioecious, rarely united. *Calyx* universally of one leaf, divided. *Corolla* none. The *male flowers* with a definite number of *stamens*, inserted into the calyx, opposite to its segments. *Female* ones with a solitary superior *germen*; *style* either wanting, or one, or two, often lateral; *stigmas* often two. *Seed* one, enclosed in a brittle crust, or tunic, either naked, or enclosed in the calyx, which sometimes turns pulpy. *Corculum* straight or incurved, without *albumen*. The plants are either trees, shrubs or herbs; in some cases milky. *Leaves* generally accompanied by stipules, and either alternate or opposite. *Flowers* sometimes solitary, sometimes racemose; in some genera seated on a many-flowered catkin-like receptacle; in others

concealed within a simple-leaved common involucrem. *Fruit* therefore sometimes many-seeded, in consequence of the assemblage of the seeds of numerous aggregate flowers in one involucrem or receptacle.

SECT. 1. *Flowers* concealed in a common simple-leaved involucrem. This contains five genera.

Ficus; *Ambora* of Jussieu, which is MITHRIDATEA of Commerçon and Schreber, see that article; *Dorstenia*; *Hedycaria* of Forster, doubtfully placed here by Jussieu, as he suspects it may be more akin to his *Annona*, or to his *Ranunculaceæ*; and, lastly PEREBEA of Aublet, of which we have spoken in its proper place, as a genus undoubtedly of this order, notwithstanding our present incomplete acquaintance with its fructification.

SECT. 2. *Flowers* either situated on a common many-flowered receptacle; or collected into heads, with involucrel scales; or separate and scattered.

Cecropia; *Artocarpus*; *Morus*; *Elaeagnus* of Forster, to which belongs *Procris* of Commerçon and Jussieu, as already mentioned, see ELATOSTEMA; *Boehmeria* of Jacquin. Willd. Sp. Pl. v. 4. 340; *Urtica*; *Forstkælea*; *Parietaria*; *Pteranthus* of Forsthal, the *Louichea* of L'Heritier, Schreb. Gen. 840; *Humulus*; *Cannabis*; and *Theligonum*.

SECT. 3. *Genera* related to *Urticæ*.

Gunnera, to which we have united *Misandra* of Commerçon, see GUNNERA, and to which also the *Panke* of Feuillée undoubtedly belongs; *Piper*; *Gnetum* of Linnæus, from which *Thoa* of Aublet and Jussieu cannot be separated, see GNETUM; *Bagassa*, Aublet Guian. t. 376; *Coussapoa*, Aubl. Guian. t. 362, 363; and *Pourouma* of the same author, t. 341; the three last but imperfectly known.

Ulmus and *Celtis* are reckoned by Linnæus amongst his *Scabride*, but Jussieu refers them to the *Antennææ*; *Bofea* and *Acida*, as well as *Trophis*, are *Scabride* of Linnæus; Jussieu considers the two first as *Atriplices*, and the last stands amongst his *Planta incerta sedis*, Juss. Gen. 442.

URVASI, in *Hindoo Mythology*, is the name of one of the numerous race of chorifiers, dancers, minstrels, &c. attending on the gods of that polytheistic and poetical people. The name of Urvasi does not often occur.

Urvasi is to be classed among the Upfaras, answering to the Nereids of western fable; as she arose from the ocean, with Rhemba, queen of the Upfaras, and a glorious train, when churning by the gods and demons, as described in the article KURMAVATARA.

URUBU, in Ornithology. See VULTUR.

URUBUARA, or URUBA-CUARA, in Geography, a town of the Brazils, on a river of the same name, at its union with the Amazons; 90 miles W. of Para.

URUBU, a river of Brazil, which runs into the Amazons river; 100 miles above Pauxis.

URUCUYA, a river of Brazil, which runs into the St. FRANCIS, S. lat. 15° 20'.

URUGNAY, a river of South America, which rises about S. lat. 26° 30', and runs into the river Plate, S. lat. 34°.

URUGUNDI, in *Ancient Geography*, a people of Scythia, on the bank of the Danube. Zofimus.

URUMEA, in Geography. See URMAH.

URUNCÆ, or URUNCIS, in *Ancient Geography*, a place of Germany, between Ariabnum and Mons Brifacus. Anton. Itin.

VRUNDI, in *Mythology*, one of the wives of the Hindoo deity *Krishna*; which see.

URUP, in Geography. See URJUP.

URUS, a lake of Russia, in the government of Archangel; 48 miles N. of Schenkursk.

URUS, in *Natural History*, the name of a species of wild bull, of a very remarkable size and strength. Cæsar, in his Commentaries, has described them as little inferior to elephants in size, and resembling the bull in shape, figure, and colour. He adds, that they were very swift and fierce, and had horns very much larger, and very different from those of the common bull. And Mentzelius tells us, that it is a vast and terrible species of wild bull, common in Livonia, &c. and that when killed its brain is found scented like musk. Mr. Ray wishes very much, that some one, who has an opportunity of seeing this creature, would give a more accurate and perfect account than those we already have of it.

This animal is the *bos ferus* of Pliny, the *bonafus* and the *bison* of Pliny, Gesner, Aldrov. and Linnæus, the *bos taurus* of the Linnæan system with round horns curving outer, and loose dewlap; and it is the species of *Bos* from which the several races of cattle have been gradually derived. It is found wild in many parts both of the old and new continent, inhabiting woody regions, and attaining to a size much larger than that of the domesticated or cultivated animal. In his wild state, the bison was distinguished, not only by his bulk, but by the superior depth and shagginess of his hair, which, about the head, neck, and shoulders, is sometimes so long as to touch the ground; his horns are rather short, sharp-pointed, extremely strong, and situated at a distance from each other at their basis, like those of the common bull. His colour is sometimes a dark blackish-brown, and sometimes rufous-brown; his eyes are large and fierce; his limbs are very strong, and his whole aspect extremely savage and gloomy. The principal European regions where this animal is now found, are the marshy forests of Poland, the Carpathian mountains, and Lithuania. Its chief Asiatic residence is the vicinity of Mount Caucasus; but it is also found in other parts of Asia. The American bison differs in no respect from the European, except in being more shaggy, and in having a more protuberant bunch over the shoulders; the fore-parts of the body are very thick and strong; the hinder parts comparatively weak. The colour of the American bison is a reddish-brown; and the hair in winter is of a woolly nature, falling down over the eyes, head, and whole fore-parts of the animal. In summer, it often becomes wholly naked, particularly on the hinder parts of the body. It grows to a vast size, and has been found to weigh 1600, and even 2400 pounds; nor can the strongest man lift one of the skins from the ground. It has been a question of difficult solution, how these animals migrated from the old to the new world; but it was probably from the north of Asia, which anciently might have been stocked with them, though they are now extinct in those regions. At that time, the two continents might have been united between Tchutkinofs and the opposite headlands of America; and the many islands that lie off that promontory, with the Aleutian or New Fox islands, somewhat more distant, might be fragments of land, which joined the two continents, and formed their insular state by the mighty convulsion which divided Asia and America.

The American bison is found in the regions 600 miles W. of Hudson's Bay, and this is its most northern residence. From thence these animals occur in large droves as low as Cibola, in lat. 33° a little N. of California, and also in the province of Mivera, in New Mexico; and immediately to the S. of these parts the species seems immediately to cease. They also inhabit Canada, W. of the lakes, and more abundantly the rich savannas which border the river Mississippi, and the large rivers that flow into it from the W., in Upper Louisiana, where innumerable herds of them

are seen, intermixed with those of stags and deer; feeding chiefly in the morning and evening, and retiring into the shade of the lofty rocks which border the rivers during the heat of the day. They are very wild, and shy from mankind; but if wounded, they become furious, and pursue their enemy.

The chase of these animals constitutes a favourite diversion of the Indians, and they are killed either by shooting them, or by gradually driving them into a small space, by setting fire to the grass round the place where a herd is feeding. They are much terrified by fire, and crowd together to avoid it: they are then killed by bands of Indians, without any personal hazard. On such occasions, it is said that 1500 or 2000 have sometimes been killed at a time. The flesh is used as food, and the skins and hair as commercial commodities, which latter, being of a woolly nature, may be spun into cloths, gloves, &c. that are very strong, and appear as if manufactured from the best wool. The fleece or hair of one of these bison has been known to weigh eight pounds. These animals are not domesticated by the Indians, who have long lived in a savage state, and subsist chiefly by the chase. The common ox is the bison reduced to a domestic state. (See OX and CATTLE.) The Indian ox is a variety found in many parts of India, and the Indian and African islands: it is of a reddish colour, very large size, and distinguished by a very large protuberance above the shoulders. (See ZEBU.) The loose-horned ox is found in Abyssinia and Madagascar, and is distinguished by its pendulous ears, and horns attached only to the skin, so as to hang down on each side. The bourey is a native of Madagascar and some other islands, and is of the size of a camel, and of a snowy-white colour, with a protuberance on the back. The ox of the island of Timian is of a white colour, with black ears. Pennant's Arctic Zool. and Shaw's Zoology.

URY, in *Geography*, a town of France, in the department of the Moselle; 8 miles N.E. of Metz.

URZAN, in *Ancient Geography*, a town of Asia, in the interior of Susiana. Ptolemy.

URZUM, in *Geography*, a town of Russia, in the government of Viatka; 72 miles S. of Viatka.

USA, a town of Japan, in the island of Ximo; 22 miles S.S.E. of Kokura.

USA *Baſi*, a lake of Asiatic Turkey, in Natolia; 5 miles E. of Palatka.

USAD, a town of Russia, in the government of Viatka; 16 miles S. of Malmisch.

USADIUM PROMONTORIUM, in *Ancient Geography*, a promontory of Africa, in Mauritania Tingitana, on the coast of the western ocean.

USAGE, in *Law*. See PRESCRIPTION and CUSTOM.

USAGE, in *Language*. See LANGUAGE.

USAGE, *St.*, in *Geography*, a town of France, in the department of the Saône and Loire; 3 miles N. of Loudun.

USALITANUM OPPIDUM, (*Jalloulah*), in *Ancient Geography*, an ancient town in the interior of Africa, mentioned by Pliny, situated W.S.W. of Adrumetum.

USANAS, in *Astronomy*, a Hindoo name of the planet Venus, more commonly called *Sukra*; which see.

USANCE, *Uso*, in *Commerce*, is a determinate time fixed for the payment of bills of exchange, reckoned either from the day of the bills being accepted, or from the day of their date; and thus called, because regulated by the usage and custom of the places on which they are drawn. See BILL of Exchange.

Bills of exchange are drawn at one or more usances, either from sight, or from date. The Italians say, *uso doppio*, for double usance, or two usances.

This term is longer or shorter, according to the different countries. In France, the usance for bills drawn from Spain and Portugal, is sixty days date; from other countries, thirty days date. Bills are generally drawn on Amsterdam, Cadiz, Genoa, Hamburg, Leghorn, London, Madrid, Naples, and Venice, at sixty days date. Marseilles, however, draws on Genoa at thirty days, and on Leghorn and Naples, at forty-five days date. Ten days grace are allowed on bills payable at one or more usances, at so many days date or sight, or on a specified day; but bills drawn *à vue* must be paid on being presented. Bills made payable at a fair must be settled on the last day, or on the very day, if the fair lasts only one day.

At London, the usance for bills drawn from Holland, Germany, or France, is one month; from Spain and Portugal, two months; and from Italy, three months; all after date.

At Amsterdam, the usance is, for all Germany and Switzerland, fourteen days sight; Dantzic, Konigsberg, and Riga, one month's sight; Antwerp, Geneva, London, and Paris, one month after date; Italy, Spain, and Portugal, two months after date. Six days of grace are allowed for the payment of bills of exchange; but the general practice in Amsterdam is, that bills payable in banco be presented for payment the very day on which the written term is expired. At Antwerp, the usances and days of grace are the same as at Amsterdam. Bills drawn at sight must be paid within twenty-four hours after having been presented.

At Augsburg, the usance is fifteen days; half usance, eight days; double usance, thirty days; one and a half usance, twenty-three days, after acceptance. Bills have from one to eight days of grace; for such as fall due on the Tuesday must be paid the next day, but such as fall due on the Wednesday are not paid till that day week: however, bills drawn *à vista*, or at sight, must be paid within twenty-four hours after being presented, and also any other bills which are not presented until after the Wednesday subsequent to the day on which they become due.

At Bergamo in Italy, the usance is the same as at Venice for foreign bills; but for bills drawn from Zurich, it is fifteen days after acceptance. Bills payable *à vista*, or sight, must be paid on being presented; those that are at some days sight, or at usance, must be paid on the very day they become due, no days of grace being here allowed.

The usance for bills drawn on Berlin is fourteen days after acceptance. Berlin draws on Amsterdam, Breslau, Hamburg, and Leipzig, at four or five weeks date, and at sight, on London and Paris, at two months date; the days of grace by the edict of 1751 are three.

At Bern in Switzerland, there is no law or custom respecting usance, nor are any days of grace allowed. At Bologna bills of exchange are paid in banco, except when they are expressly drawn in money Fuori banco, or when the acceptor and holder of the bill both agree that they shall be paid in currency; in the latter case, the payment is regulated by the *Agio* in banco. Bills drawn on Bologna from other parts of Italy are usually paid eight days after acceptance, in which neither the day of acceptance nor the day of payment is included. No other days of grace are allowed. Bills payable after date, or on a determined day, must be paid the first day after their written term. Bills drawn on Bolzano, or Botzen in the Tyrol, are mostly payable at the fairs; nor have any regulations been made with regard to the usance or days of grace. At Bremen, the usance for bills drawn from several parts of Germany, is fourteen days sight; from London and Paris, one month

after date: the days of grace are eight; but for promissory notes and bills at short sight no days of grace are allowed.

The usance for bills drawn on Breslau is fourteen days after acceptance; half usance, eight days; and the days of grace are three. For bills, however, payable at the fairs, two of which are held every year by a royal edict of 1742, no days of grace are allowed; but such bills must be settled on the last day of payment in those fairs, or else be protested. Breslau draws on Amsterdam and Hamburg at sight, or at four or five weeks date; on Berlin and Konigsberg at sight, or eight or twelve days date; on Vienna, Leipzig, and other parts of Germany, at usance of fourteen days sight; on Paris and London, at two or three months after date.

At Brunswick, the usance is fourteen days after acceptance. Three days are allowed to the holder of a bill to present it for payment; but no days of grace are allowed to the acceptor. At Cadiz, the usance is, for bills drawn from France, one month after date; but two months for bills from all the rest of Europe. Six days grace are allowed, on the last of which bills must be either paid or protested.

In Castile, a province of Spain, the usance for bills drawn from London, Paris, or Genoa, is sixty days; from Amsterdam, two months; and from Rome, three months after date.

Foreign bills, when they are accepted, have fourteen days grace allowed, except bills drawn from Rome, which, as well as bills that have not been accepted, must be either paid or protested on the very day on which they are made payable. Bills drawn from Bilboa are allowed nineteen days; and from other parts of Spain, eight days grace. Bills at sight must be paid when presented. At Cologne, the usance is fourteen days sight; six days grace are allowed; and if the sixth should fall on a Sunday, or holiday, the bill must be either paid, or protested, on the first day of business following.

Bills between Constantinople and the principal trading places of Europe are commonly drawn at thirty-one days sight; but from one place in Turkey on another, at eleven days sight. Some European merchants pay their bills on the very day on which they become due; and others take as many days grace as are allowed in their respective countries.

At Copenhagen, there is no established usance; but bills are made payable on a certain day. Eight days grace are allowed; and if bills be not paid within that time, they may be protested immediately, and the protest cannot be delayed beyond the tenth day; otherwise the holder of the bill is to bear all risks and expences. The days of acceptance and protest, as also Sundays and holidays, are included in the ten days; but in Altona, bills may be protested on the eleventh day.

At Dantzic, the usance is fourteen days after acceptance, and the days of grace are ten; and when the tenth day falls on a Sunday or holiday, the bill must be paid on the preceding day. But bills at sight, or such as are protested, after the days of grace are elapsed, must be either paid or protested within twenty-four hours after being presented, which may be done even on a Sunday. Bills at fourteen days sight have three days grace allowed. Bills drawn in Dantzic cannot be negotiated there a second time, but must be remitted by the first holder to the place on which they are drawn.

In India, the business of exchange is chiefly carried on between the three presidencies; namely, Bengal, Madras, and Bombay: which draw on each other at various dates, and mostly in the denomination of money of the place where the bill is to be paid; but as there is always the greatest demand

for Geo. on Bengal, being considered the capital of the English possessions in India, the course of exchange is mostly in favour of that place.

London draws on Bengal in current rupees at 2s. more or less; or in sicca rupees at sixteen *per cent.* above current; also on Madras in pagodas at 7s. 6d. more or less; and on Bombay in rupees at 2s. 2d. more or less.

Such bills are mostly at sixty or ninety days sight; but bills from those places on London are generally drawn at six, nine, or twelve months sight; in which case the sicca rupee is valued at 2s. 6d., the pagoda at 8s., and the Bombay rupee at 2s. 4d. sterling, more or less.

The bank of Bengal has been incorporated by a charter for seven years, granted under the governor-general in council, by virtue of the authority vested in him by the act of the 47 Geo. III. c. 28.

The capital of the bank is 5,000,000 sicca rupees, that is, 50 lacks. It is divided into 500 equal shares, 100 of which belong to the government, and the other 400 to individuals.

The interest of money in India fluctuates from eight to twelve *per cent. per annum*, and it has been even higher; but the bank, which engages not to charge above twelve, has already lowered the rate of interest, and has in many other respects rendered essential service to trade and commerce.

Bills drawn from Rome, or Venice, on Florence, are accepted on Saturday, and paid on that day fortnight; but bills from Bologna, accepted on Saturday, must be paid on the next Saturday following, or be protested on the same day. The usance with other places is the same as in Leghorn. Florence has no days of grace; but a bill must, on the day it becomes due, be paid or protested before the departure of the post for the place where it was drawn.

Bills drawn on Frankfort at one usance (*i. e.* fourteen days after acceptance), also bills drawn at four days or more after sight, or after date, have four days grace allowed, besides Sundays and holidays. But when a bill has no acceptor, or when it is payable by the drawer himself, if not honoured when due, and if the first indorser, or the person to whose order the bill is drawn, refuses to accept it, the bill must be protested on the day when it becomes due. Neither are any days of grace allowed on bills *a vista* (at sight), or at less than four days sight or date. All such bills must be paid within twenty-four hours of the specified time.

The usance of bills drawn on Geneva from Holland, England, and France, is one month of thirty days; from Germany and Italy, fifteen days sight. In defect of payment on the maturity of a bill, it must be protested on the fifth day afterwards, exclusive of Sundays. Geneva draws on Amsterdam, Paris, and London, at three months, and sometimes at two months date; on Genoa, Leghorn, Milan, and Turin, at eight days sight; on Lyons, at sight and at the payments. The usance for bills drawn on Genoa from Amsterdam, Spain, and Sicily, is two months, and from London and Lisbon, three months after date; from Naples, Ancona, and Trieste, three weeks sight; Venice and Rome, fifteen days; Augsburg and Vienna, fourteen days; Leghorn, Milan, and Turin, eight days sight. Thirty days are allowed to the holder of a bill to demand payment; but no days of grace are allowed to the acceptor. A bill may be presented on the next day after it becomes due, though it is usual to delay the protest till the first post day for the place from which the bill came.

The usance for bills drawn on Hamburg from all parts of Germany is fourteen days sight; when bills are drawn at usance, the day of acceptance is reckoned for the first; but

when at any other number of days after sight, the day after acceptance is reckoned for the first. The usance for bills drawn from England, France, and Holland, is one month; from Spain, Portugal, Trieste, and Italy, two months, after date. Twelve days of grace are allowed for payment, or protest; the day on which the bill would become due, if no grace were allowed, is reckoned for the first day; and Sundays and holidays are also included in the twelve days.

The exchanges of Ireland are chiefly with England. The par of exchange is as their monies; that is, 100*l.* English = 108*l.* 6*s.* 8*d.* Irish; but the course of exchange has been known to vary from 105 to 120 *per cent.* Of late years, the price has been between 109 and 113. Bills on Dublin are mostly drawn at twenty-one days sight, or, what is considered as equivalent, at thirty-one days date, and such are called "bills in course." If the term be longer, an advance is accordingly made in the price of exchange. Thus, bills at forty-one days date are charged one-eighth *per cent.* more; but, beyond this term, the advance is in a higher proportion, being at the rate of half *per cent.* per month. Days of grace, and all other usages and laws of exchange, are the same in Ireland as in England, except that when a bill becomes due on Sunday, it is not customary here to present it on the preceding Saturday, as in England, but on the Monday following.

At Konigsberg, the days of grace are three, as at Berlin.

The usance at Leghorn for bills drawn from Amsterdam, Antwerp, Cadiz, Madrid, Cologne, and Hamburg, is two months after date; from Paris, Lyons, and Marseilles, thirty days after date; from London and Lisbon, three months after date; from Augsburg and Vienna, twenty-two days after date; from Venice, Cremona, Bergamo, Brescia, Modena, and Naples, twenty days after date; from Bologna, Ferrara, Lucca, Florence, and Pisa, three days sight; from Genoa, Milan, and Turin, eight days sight; from Sicily, one month sight, or two months date; from Sardinia, one month sight; from Perugia, five days sight; from Tarento, Bari, and Lecce, twenty-seven days sight; from Rome, ten days sight, or fifteen days date; from Ancona and Rimini, ten days sight; from Switzerland, eight days sight. No days of grace are allowed on bills; but they are paid three times a week at the "Stanza," a place where merchants meet on Mondays, Wednesdays, and Fridays, from eleven in the forenoon till half past two in the afternoon; thus, bills which become due on Tuesdays, Thursdays, or Saturdays, are not payable till the following days of meeting and payment.

At the fairs of Leipzig, three of which are held every year, and each fair lasts fourteen days, bills are presented for acceptance in the four first days of the fair; and the acceptance can be delayed, at new-year's fair, which begins on the 1st of January, only till the day before the second proclamation; but at the other two fairs, *i. e.* the Easter and Michaelmas fairs, till the Friday in the first week, at ten o'clock in the forenoon at the latest; and if the acceptance should not then have taken place, the bills must be protested. The time of payment of bills of exchange is during the five first days after the close of the fair is proclaimed; so that, at new-year's fair, payment must be made on the 12th of January at the latest; and at the other two fairs, on the Thursday in the second week; in default of which, the bills must be then protested before ten o'clock at night, or all resource is lost against the drawer.

The usance in Leipzig is fourteen days after acceptance. No days of grace are allowed here; but on the day a bill becomes due, the holder must demand payment; and in

case of non-payment, he is not permitted to connive at any delay, but must, on the very day, have it protested, with interst, expences, &c. and return the bill the first opportunity. If he neglects any of these regulations, he loses all claim on the drawer and indorsors. Bills payable à vista, or on demand, may be presented and accepted even on a Sunday or holiday, and must be paid within twenty-four hours after acceptance.

The usance at Lisbon for bills drawn from Spain is fifteen days sight; from London, thirty days sight; from Germany and Holland, two months after date; from France, sixty days ditto; from Italy, and also Ireland, three months after date. Six days of grace are allowed on foreign bills, when they have been accepted; but unaccepted bills must be either paid or protested on the very day when they become due. Bills drawn from any part of the Portuguese dominions, both in Europe and in other parts of the world, are allowed fifteen days grace.

In London, the usance for bills drawn from Holland, Germany, or France, is one month; from Spain and Portugal, two months; and from Italy, three months; all after date. Three days grace are allowed on all bills payable at usance, or after date, or at so many days sight; but if the third day should fall on a Sunday, payment must be made on the preceding Saturday. Bills at sight, or on demand, must be paid on the day when they are presented.

At Lubec, usances are the same as at Hamburg; and ten days grace are allowed.

The usance, and all other regulations respecting bills of exchange, in Lucca, are the same as in Leghorn.

The usance at Marfeilles, for bills drawn from Spain and Portugal, is sixty days; and from other countries, thirty days after date. Bills at sight must be paid on being presented, and the payment of other bills may be claimed on the next day after their term is expired; but it is not customary among the merchants to demand payment till a few days after, and the bills are not protested till the ninth or tenth day. This is also with regard to notes payable to order, for value received in merchandise.

The usance at Milan, for bills drawn from Genoa, Leghorn, Piedmont, and all Lombardy, is eight days sight; from Rome, Florence, Augsburg, Vienna, and all Germany, fifteen days sight; from Venice, twenty days date; from Naples and Sicily, twenty days sight; from France and Savoy, one month after date; from Spain, Holland, and Flanders, two months; from London, three months after date; the month always reckoned at thirty days. Bills at sight must be paid on being presented; bills payable at usance, or some days after date or sight, must be paid the day after their written term; and if this should fall on a Sunday or holiday, payment is to take place on the next working day. Accordingly no days of grace can be claimed at Milan; yet the holder of the bill may grant to the acceptor of it three days; in which case, however, the bill must be carried to the notary of the chamber of commerce, who writes upon it "seen on such a day;" and when the bill is afterwards accepted, the acceptance is to be dated from the day on which it was first presented; but if refused, the protest is to take place on the day marked by the notary. The same grace may be allowed with regard to payment, when the bill becomes due; but any delay is always at the option of the holder.

The usance in Naples, for bills drawn from any part of the kingdom of Naples, is fifteen days after acceptance; and from Sicily, Genoa, Venice, Leghorn, and Rome, twenty-two days; from Spain, two months after date; and from London, three months. The acceptance is to take

place on the Saturday after the arrival of the post from the place where the bill was drawn. But bills payable at so many days sight or date must be accepted or protested on being presented, without any delay. Three days grace are allowed, except for bills at sight.

The usance at Novi, in Italy, for bills on Genoa, Milan, and Bergamo, is twenty days from the clearing day; on Florence, Venice, Rome, Lucca, and Bologna, twenty-five days; on Naples, Valencia, and Barcelona, thirty-days; on Palermo, Messina, and Madrid, forty-five days; on Lisbon and Seville, two months; all reckoned from the clearing day inclusive. No days of grace are allowed.

At Nuremberg, the common usance for bills of exchange is fifteen days; half usance, seven days; double ditto, thirty days; one and a half ditto, twenty-three days; all reckoned from the day after acceptance. When bills are payable after date, the time is reckoned from the day after that on which the bill was drawn; Sundays and holidays, and vacations of the bank, are included. When bills are made payable at one or more months after date or sight, they become due on the same day of the month on which they were drawn or accepted. Six days grace are allowed; but none on bills at sight, or two, three, or four days sight, or at a shorter date than half usance. If a bill payable after date should not arrive until after some of the days of grace are elapsed, these days are not to be reckoned from the arrival of the bill, but from the day on which it is made payable; and if all the six days should be elapsed, the bill must be paid within twenty-four hours of its arrival.

The usance at Prague is fourteen days after acceptance; and three days grace are allowed, as in all the Austrian dominions.

Rome draws on Amsterdam, Ancona, Bologna, Florence, Genoa, Leghorn, London, Lyons and Paris, Madrid, Milan, Naples, and Venice, at usance, which is three weeks after acceptance; but bills on Paris are drawn at thirty-five or forty days after date. Bills drawn on Rome at usance from any part of the ecclesiastical states are accepted on the Wednesday or the Saturday; bills from foreign parts are generally accepted on the Saturday in the week in which they are received, except those from the kingdom of Naples, which are accepted on the Friday. Protests for non-acceptance or non-payment are to take place on those days. The usance is properly two weeks after acceptance, and it has been the constant practice of bankers to pay their bills at the expiration of the fourteen days; a week of grace however is allowed, and merchants and all other traders, except bankers, avail themselves of it. This week is understood in the following manner:—Bills accepted on a Friday or Saturday, are paid twenty-one days after acceptance; but the period for bills accepted on a Wednesday is only eighteen days. Bills drawn at so many days sight must be paid on the day their written term expires.

At Rotterdam, six days grace are allowed; and when bills become due during the time the bank remains shut, it is not usual to demand payment until the third day after the opening.

Bills drawn in Russia, which are payable after date, are allowed ten days grace; but if payable at sight, three days only; Sundays and holidays are included in both cases. Payment must be demanded in the morning of the day the bill becomes due; and in case of non-payment, the protest should take place at latest on the following day. The ten days grace are allowed, even though the written term of the bill should be elapsed before it is presented or accepted. But bills payable at so many days after sight, are not allowed any days of grace; and if the acceptance be delayed, the

USANCE.

term is reckoned from the day on which the bill was presented. See *RUSSIA*.

At *St. Gall*, in Switzerland, usance is fifteen days; double usance, thirty days; half usance, eight days; the day of presentation being reckoned the first. Three days grace are allowed on bills drawn at usance, but two only on bills payable at a longer or shorter term than usance. Sundays and holidays are always included.

The days of grace, and other customs and laws relating to bills of exchange, are the same in Scotland as in England.

Bills are drawn in Sicily on Leghorn and Genoa, at usance of one month after acceptance, or at two months date, or at a few days sight; on Rome, Venice, and Naples, at eight or fifteen days sight; on London, at three months date. The usance for foreign bills, drawn on Palermo and Messina, is twenty-one days sight, including the day of acceptance; the usance for bills between Messina and Palermo is four days after acceptance. No days of grace are allowed here in any case.

The usances and days of grace vary in different parts of Spain; thus, at Madrid and Seville, the usance for bills drawn from England, France, Genoa, and Leghorn, is sixty days after date; from Amsterdam, Hamburg, and other places in the north of Europe, two calendar months.

At Cadiz, the usance from France is one month after date; and from the other parts of Europe, sixty days.

At Bilbao, the usance from France is one month, and from the other parts of Europe, two months after date.

At Barcelona, the usance for all foreign bills is sixty days after date.

In all parts of Spain, the usance for bills drawn from Rome is ninety days after date, without any days of grace.

The days of grace for all other bills drawn on Madrid, Seville, Bilbao, and Barcelona, are fourteen days, provided the bills be accepted before they become due, otherwise no days of grace are allowed. Such bills must be protested immediately.

At Cadiz, six days grace are allowed in all cases.

In drawing bills of exchange upon Spain, it has become necessary, of late years, to write "payable in effective, and not in *vales reales*," otherwise they may be paid in this paper, which is generally at a discount.

The usance at Stettin, in Prussian Pomerania, for bills drawn from London and France, is one month; from Amsterdam, six weeks; from Hamburg, four weeks, after date. Stettin draws generally on Amsterdam, Copenhagen, and Hamburg, at six or eight, or sometimes three or four weeks date; on England and France, at two months date. The days of grace are three, as in Berlin.

The usance at Strasburg, for bills from Germany, is fifteen days after sight; and from France thirty days after date. The acceptor of a bill cannot claim any days of grace; but the holder may allow ten days, after which the bill must be either paid or protested.

The usance in Sweden is reckoned at one month after sight. Six days of grace are allowed for the payment of bills, Sundays and holidays included; if the sixth day, however, should fall on a Sunday or holiday, the bill must be paid on the preceding day; but those six days are not understood to be granted, except in cases of necessity; and a person who wishes to prefer his credit, must not claim any days of grace, but pay his bills on the day they are made payable.

Bills payable on demand, or at two or three days sight, are not allowed any days of grace; bills payable in the middle of a month become due on the fourteenth, whatever may be

the number of days in that month; and the six days of grace are allowed.

When a bill, payable after date, is not presented till two or three days after its written term is expired, no more days of grace are allowed than may remain unelapsed at the time of presentation.

The usance at Turin, for bills drawn from London, is three months after date; from Holland, two months; and from France, one month. The period allowed for the payment of bills drawn from any other country besides the foregoing, begins on the day they are presented for acceptance, and ends on the day when an answer can be had, by the regular post, from the place where the bill was drawn or negotiated. Hence the usance for bills drawn in Geneva, Genoa, and Milan, is commonly reckoned at eight days after sight; for those drawn in Venice, Florence, Leghorn, Rome, Augsburg, and Vienna, at fifteen days sight; and for those drawn in Naples and Sicily, at twenty-one days sight.

The presentation for acceptance of a bill payable at a determined period, cannot be delayed beyond two months after the date of the bill. The same regulation is observed with regard to claiming the discharge of a bill payable at sight; if it is not claimed within that period, it is supposed that the necessary steps have not been taken to obtain payment.

The day on which a bill is dated is always reckoned in the term it has to run.

The holder of a bill, payable after date, is at liberty either to demand payment when it becomes due, or to wait till the fifth day; and if this should fall on a Sunday or holiday, payment is to take place on the next following day of business; but bills at sight must be paid when presented.

The usance at Venice, for bills drawn from London, is three months after date; from Amsterdam, Antwerp, and Hamburg, two months; from Bergamo, Milan, Modena, and Mantua, twenty days after date; from Augsburg, Frankfurt, Genoa, Naples, Bari, St. Gall, Nuremberg, Bolzano, and Vienna, fifteen days after acceptance; from Rome and Ancona, ten days after acceptance; from Bologna, Ferrara, Lucca, Florence, and Leghorn, five days after acceptance.

Bills are allowed six days grace, after which they must be either paid or protested; Sundays or holidays are not included. Formerly payment could not be claimed, nor a bill protested, during the time the bank remained shut, except in case of a bankruptcy; and if two or three of the days of grace had elapsed before the bank was shut, the remaining days were reckoned after the opening, so as to make six days in all.

Protests are made by the *fanti* or clerks of the commercial college, who enter all the bills they have protested in a book, to which every merchant has free access. Thus many bills, which would otherwise be returned, are accepted and paid for the honour of the drawer or indorser. This practice is likewise useful in giving early notice of approaching insolvency.

At Vienna, the following regulations are established for bills of exchange:—

When the written term of a bill is expired, three days of grace are allowed; and if the bill should not be paid by five o'clock on the third day, it must be immediately protested and returned. In these days of grace, Sundays and holidays are included; but if the day of payment should fall on a Sunday or holiday, the bill must be paid on the next following day of business. This allowance of three days, however, is only made in order that the holder of a bill, if

he should not be able to demand payment sooner, may have the advantage of that delay; but a good payee will not avail himself of the days of grace, in order to delay the payment of a bill beyond the written term.

If a bill which is not duly paid is not protested immediately, as above, the holder has no recourse except against the acceptor.

Bills drawn at sight, or on demand, or at less than seven days sight, or date, are not allowed any days of grace, but must be paid within twenty-four hours at the latest, unless they fall due on a Sunday or holiday.

Ufance is fourteen days after acceptance; half ufance, seven days; one and a half ufance, twenty-one days, including Sundays and holidays; but the day of acceptance is not included.

Bills payable *medio mense* (in the middle of the month) are reckoned due on the fifteenth, and are allowed, like other bills, three days grace, if necessary.

The ufance at Zurich, for bills drawn from Amsterdam, or any part of Germany, is fourteen days after sight. No days of grace are allowed. The exchanges at Zurzach in Switzerland, in which there are two great fairs annually, are regulated by those of Zurich. Kelly's Cambist, vol. i. passim. See EXCHANGE and BILLS of Exchange.

USBEKS, in *Geography*. See UZBEKS.

USBIUM, in *Ancient Geography*, a town of Germany, near the Danube. Ptolemy.

USCHEAU, in *Geography*, a town of Bohemia, in the circle of Boleslaw; 5 miles N.W. of Nimburg.

USCHECH, a town of Arabia, in the province of Yemen; 10 miles S.E. of Chamir.

USCOKAN, a small island in the East Indian sea, near the south-west coast of Borneo. N. lat. 6° 21'. E. long. 116° 25'.

USCUDEMA, in *Ancient Geography*, a town of Thrace, belonging to the Bessi, taken by Lucullus.

USCUP, in *Geography*. See SCOPIA.

USDAW, a town of Prussia, in Oberland; 7 miles N. of Soldau.

USDICESICA, in *Ancient Geography*, a prefecture of Thrace, on the side of the two Mærias, in the vicinity and to the W. of mount Hæmus. Ptolemy.

USE, in *Geography*, a river of Germany, which runs into the Nidd, near Assenheim.

USE, *Ufus*, in *Law*, denotes the benefit or profit of lands and tenements.

Use imports a trust and confidence reposed in a man for the holding of lands; that he, to whose use or benefit the trust is intended, shall reap the benefits of it.

A deed consists of two principal parts; the *premisses*, which include all that comes before the habendum, or limitation of the estate; and the *consequent*, which is the habendum itself; in which there are two limitations; the one of the *estate*, or property the party shall receive by the deed; the other of the *use*, expressing to or for what use and benefit he shall have the same.

Uses, some say, were invented upon the stat. of Westminster, *Quia emptores terrarum*; before which time no such uses were known. And because, in course of time, many deceits got footing, by settling the possession in one man, and the use in another, it was enacted, anno 27 Hen. VIII. cap. 10. that the use and possession of lands should stand united, or that the possession should be given to him who had the use.

Hence this statute is called the Statute of Uses; or, in conveyances and pleadings, the statute for transferring uses into possession.

USE and Custom, in *Ancient Law-Books*, denotes the ordinary method of acting or proceeding in any case, which, by length of time, has obtained the force of a law.

USE, *Cestui que*. See CESTUI.

USE, *Contingent*. See CONTINGENT.

USE, *Refusing*, is an use which, being limited by the deed, expires, or cannot vest, and returns back to him who raised it, after such expiration, or during such impossibility: as if a man makes a feoffment to the use of his intended wife for life, with a remainder to the use of her first born son in tail; here, till he marries, the use reverts back to himself; after marriage, it is executed in the wife for life; and if she dies without issue, the whole reverts back to him in fee.

USE, *Secondary*, or *Shifting*, is that which, though executed, may change from one to another by circumstances *ex post facto*; as, if A makes a feoffment to the use of his intended wife and her eldest son for their lives, upon the marriage the wife takes the whole use in fealty; and upon the birth of a son, the use is executed jointly in them both. Blackst. Com. book ii.

USES, *Covenant to stand seized to*. See COVENANT.

USES and Customs of the Sea are certain maxims, rules, or usages, which make the base or ground-work of the maritime jurisprudence; by which the policy of navigation, and commerce of the sea, are regulated.

These uses and customs consist in three kinds of regulations. The first, called laws, or judgments of Oleron, were made by order of queen Eleanor, duchess of Guienne, at her return from the holy war; and that chiefly from memoirs which he had gathered in the Levant, where commerce was at that time in a very flourishing condition. She called them *rolls of Oleron*, because she then resided in an island of that name, in the bay of Aquitaine. These were much augmented, about the year 1266, by her son Richard, king of England, on his return from the Holy Land. See *Laws of OLERON*.

The second regulations were made by the merchants of Wisby, a city in the island of Gothland, in the Baltic, anciently much famed for commerce; most of the nations of Europe having their particular quarters, magazines, and shops, in it. These were compiled in the Teutonic language, and are still the rule in the northern countries. Their date does not appear; but it is probable they were made since the year 1288, when the city of Wisby was destroyed the first time, and afterwards restored by Magnus, king of Sweden. See *Marine INSURANCE*.

The third set of regulations was made at Lubeck, about the year 1597, by the deputies of the HANSE-TOWNS.

USEDOM, in *Geography*, a town of Anterior Pomerania, situated on the south-west coast of the island of Usedom, on the bay of the Frische Haff; 8 miles E. of Anclam.—Also, an island in the Baltic, separated from the coast of Pomerania, partly by the river Peene, and partly by the Frische Haff; about 30 miles in length, of a very irregular form, and in no part above three miles from the sea. N. lat. 54° 15' to 54° 45'. E. long. 13° 11' to 13° 58'.

USEFF, a town of Tunis; 32 miles N.W. of Cairoan.

USEL, a river of Bavaria, which runs into the Danube, 3 miles W. of Neuburg.

USELETT, a long range of mountains in Tunis, called by the ancients *Mons Usalianus*, W. of Cairoan.

USELLIS, in *Ancient Geography*, a town on the western side of the island of Sardinia, between the mouths of the rivers Thyrsus and Sacer, with the title of a colony.

USER DE ACTION, in *Law*, is the pursuing or bringing an action in the proper county, &c. See **ACTION**.

USETIN, or **WZETIN**, in *Geography*, a town of Moravia, in the circle of Hraditch; 30 miles N.E. of Hraditch.

USEU, a town of Spain, in Catalonia; 37 miles N. of Balaguer.

USEVASKOI, a town of Russia, in the government of Archangel, on the Mezen; 64 miles N.E. of Pineg.

USHA, in *Hindoo Mythology*, is a name of Reti, the wife of Kama, the god of love. She is fabled to have been incarnate in the person of a daughter of a raja named Bhima, to be espoused terrestrially by Kama, in an incarnation of his in the form of Anirudha, a son of Krishna. Kama is more commonly called Pradyumna in this avatara, or incarnation. The amours and adventures of Anirudha and Usha are the subject of a pretty tale, and a very interesting drama in several of the languages of the East.

USHANT, or **OUessant**, in *Geography*, a small island in the Pacific ocean, discovered in 1768 by M. Bougainville, near the coast of New Guinea. S. lat. 11° 5'. E. long. 146° 33'.

USHANT. See **OUessant**.

USHENICK POINT, a cape on the east coast of Lewis. N. lat. 57° 56'. W. long. 6° 25'.

USHER, **HUISSIER**, signifies an officer or servant who has the care and direction of the door of a court, hall, chamber, or the like.

In the king's household there are four gentlemen-ushers of the privy chamber, appointed to attend the door, to give entrance, &c. to persons that have admittance thither: four gentlemen-ushers, waiters, and an assistant gentleman-usher, and eight gentlemen-ushers, quarter-waiters in ordinary.

There are also in the queen's household three gentlemen-ushers of the private chamber, three gentlemen-ushers, daily waiters; each of whom has the same annual appointment with those of the king's household; and three gentlemen-ushers, quarterly waiters. In the French court, there are two ushers of the ante-chamber, or hall, where the king dines in public. They wait, sword by side, all the year, and open the door to such as are to come in. There are above fifteen ushers of the chamber, two of the cabinet, and one of the order of the Holy Ghost.

The ushers of the Inquisition in Spain and Portugal were persons of the first quality, who thought themselves highly honoured, by only looking to the doors of that sacred tribunal.

USHER is also used for an officer in the exchequer; of which sort, three or four attend the chief officers and barons at the court at Westminster, as also juries, sheriffs, and other accountants, at the pleasure of the court. See **EXCHEQUER**.

USHER of the Black-rod. See **BLACK-rod**.

In a chapter held at Whitehall, 13 Car. II. it was ordained, that this office should be fixed to one of the gentlemen-ushers, daily waiters at court; the eldest of which always holds the place, and is called gentleman-usher, and black-rod.

In relation to the order of the Garter, he is appointed to carry the rod at the feast of St. George, and other solemnities, which he also makes use of as an authority to attach delinquents, who have offended against the statutes of the order, which he frequently does by touching them with it. He wears a gold badge, embellished with the ensigns of the order. He has a house in Windfor-castle, and other privileges.

USHER, JAMES, in *Biography*, archbishop of Armagh,

and primate of Ireland, was born at Dublin, January 4, 1580-1, being a descendant of an English family of the name of Neville, long settled in Ireland. He was taught to read by two maternal aunts, who had been blind from their infancy; and having been instructed in the elements of literature by two excellent scholars, who had removed from Scotland to Dublin, his proficiency was such, that in his 13th year he was fit for admission into the newly founded university of Dublin; and he was one of the three matriculated students on its opening in 1593. At this early period he is said to have been inclined to poetry; but at the age of 14, he was seriously engaged in historical studies. Such was his progress in this department of literature, that between his 15th and 16th years he had drawn up a chronicle of the Bible, as far as the book of Kings. Divinity was also an object that engaged his early attention, and the circumstances of the times led him to study the points in controversy between the Catholics and the Protestants; and he devoted no less than 18 years of the prime of his life to this kind of employment. He was diverted, however, from his academical career; yet in 1596 took his degree of B.A.

It was the wish of his father that he would pursue the profession of law; but his views and purposes were of a different kind: and that he might not be embarrassed and obstructed by law-suits, to which his patrimonial property might be subject, he resigned his inheritance to his brother, relieving only for himself a sufficiency to maintain him at college, and to procure a supply of books. Of his proficiency in the Popish controversy, he gave an extraordinary proof when he was about 18 years of age; a challenge was published by a Jesuit to maintain in disputation the Catholic cause against the Protestants. Usher accepted the challenge, and had an interview with the Catholic champion. The dispute terminated by a discontinuance of the conference on the part of the Jesuit. In 1600 Usher took the degree of M.A., and was chosen proctor and catechetical lecturer of the university; and in his 21st year he was persuaded, though under the canonical age, to become a candidate for ordination, which was conferred upon him by his uncle, the archbishop of Armagh. The subject of his first sermon was the controversy between the Protestants and Catholics; and he took occasion, in the ardour of his zeal, to oppose the toleration, or indulgence, with regard to the exercise of their worship, which the Catholics were then endeavouring to obtain, because he considered their religion as superstitious and idolatrous, and the established government in church and state as endangered by it. The first ecclesiastical preferment conferred upon Usher was the chancellorship of St. Patrick's, Dublin, and this he held till he was promoted to the episcopal bench. In 1606 he revisited England, and contracted an intimate acquaintance with the two eminent antiquarians, Camden and sir Robert Cotton. To the former he communicated information relating to Ireland and Dublin, which was very serviceable to him in the composition of his "Britannia." In 1607 he took the degree of B.D., and was soon after made professor of divinity in the university of Dublin, which office he occupied during 13 years. About this time his attention was directed to a dispute concerning the Corban lands, anciently appropriated to the chorepiscopi, and free from secular imposts and jurisdiction, but liable to certain payments and services to the bishops. The substance of the treatise composed by him on this subject was translated into Latin, and afterwards published by sir Henry Spelman, in the first part of his *Glossary*. On his next visit to England, in 1609, he was noticed at court, and very much augmented his literary connections; and from this time he visited England regularly
once

once every three years. When Usher had attained his 30th year, he was unanimously elected to the provostship of the college; but he thought proper to decline this honourable office. Two years afterwards he was admitted to the degree of D.D. In 1613, upon a visit to England, he printed at the royal press his first publication, entitled "*Gravissimæ Quæstionis de Christianarum Ecclesiarum, in Occidentis præsertim Partibus, ab Apostolicis temporibus ad nostram usque ætatem, continua successione et statu, Historica Explicatio.*" This work may be regarded as a continuation of bishop Jewel's "*Apology for the Church of England,*" intended to prove that the tenets of the Protestants were the same with those of the primitive Christians. In this year he married the daughter of Dr. Luke Chaloner, who charged his daughter, on his death-bed, to marry no one but Dr. Usher, if he ever proposed the connection. She was an heiress with a considerable fortune; and they lived together in the greatest harmony for 40 years, and left an only child, who was a daughter, and afterwards lady Syrrle.

At a convocation of the prelates and clergy of the Irish establishment, held at Dublin in the year 1615, it was determined that they should assert their independence on the church of England. Usher was principally employed on this occasion; and as he was known to maintain the opinion, that bishops were not a distinct order in the church, but only superior in degree to presbyters, he was represented to king James as a favourer of puritanism, which was the object of that monarch's invincible antipathy. When he visited England in 1610, he thought proper to bring with him a recommendatory letter from the lord-deputy and his council to the English privy-council, containing a testimonial to his orthodoxy, and a high encomium on his professional and moral character. This attestation, together with the satisfaction which he gave to the king of his orthodoxy religious and political, more especially with regard to the head of the church, and the unlawfulness of resistance to the royal authority, not only removed the prejudice which had been conceived against him in the royal mind, but obtained for him a spontaneous nomination to the see of Meath. On his return to Ireland in the following year, he was consecrated, and took possession of his see, with a resolution faithfully to perform the duties of his office. In a sermon preached before the lord-deputy in 1622, from the following text, "*He beareth not the sword in vain,*" he gave offence to the Recusants, who considered it as a kind of call upon the new governor, lord Falkland, to employ the sword against the enemies of the established religion. Some exceptionable passages were pointed out to him by his metropolitan, primate Hampton, who advised a voluntary retractation. In this instance, the good prelate seems to have been urged by his zeal to overpass the limits both of discretion and equity. However this be, the persons then in power did not disapprove his sentiments; and the king was so pleased with the support he gave to his spiritual supremacy, that he soon after nominated him a privy counsellor of Ireland. In order to oppose the errors and superstitions of Popery, which were then prevalent, he published an English treatise concerning "*the Religion of the ancient Irish and Britons;*" the design of which was to evince the conformity of the doctrines and rites of the early ages of Christianity in these countries with those of the Protestants; and to point out the periods in which the practices of the church of Rome were introduced. This learned treatise was reprinted at London in 1631. He was afterwards engaged, by command of king James, in an elaborate work on the antiquities of the British church; and he came over

to England, in order to obtain every kind of necessary information on his subject. On his return to Ireland in 1624, he employed some time in writing a reply to the challenge of an Irish Jesuit, in which work he displayed a very accurate acquaintance with ecclesiastical history and the writings of the fathers. Dr. Hampton having by his death left a vacancy in the see of Armagh and primacy of Ireland, Usher was nominated by the king to the vacant dignity, and received some other tokens of the king's predilection in his favour. The same attachment was manifested to our author by Charles I., who succeeded to the throne. In November 1625, our prelate was invited by the earl Mordaunt, afterwards the first earl of Peterborough, to visit him at his seat at Drayton, in Northamptonshire. The object of this visit was a disputation on the points in controversy between the churches of Rome and England. His lordship was a zealous Catholic, and his lady, the daughter and heiress of Howard lord Effingham, an equally zealous Protestant, who being desirous of converting her husband, had solicited Usher as her champion. The Catholic advocate was an English Jesuit. The conference between the disputants lasted three days, five hours in each day. The Catholic champion, upon a trivial pretence, withdrew from the contest, and lord Mordaunt became a convert. Upon his return to Ireland, after this adventure, in 1626, he was installed in his new dignity, and took his place at the head of the Irish church. As war subsisted at this time both with France and Spain, it was proposed to augment the military of Ireland; and to engage the concurrence of the Catholics, they were led to expect a more enlarged toleration of religion. The primate summoned a meeting of prelates, and they protested against the proposed indulgence; alleging, "*that the religion of the Papists is superstitious and idolatrous; their faith and doctrine erroneous and heretical; and their church, in respect of both, apostatical.* To give them, therefore, a toleration, or to consent that they may freely exercise their religion, and profess their faith and doctrine, is a grievous sin." Upon this protestation, Bayle observes, "*that the archbishop and his suffragans acted according to the principles of the extremest intolerance; for they did not found their reasoning upon maxims of state, like the advocates for mitigated intolerance, but solely upon the nature of the Roman Catholic worship; without making any mention of its persecuting spirit, which is the only cause why even the friends of toleration argue that it ought not to be tolerated;*" and this censure is unquestionably well grounded. Milton, though a friend to toleration in general, adds to his reasons for not tolerating Popery, that of its being idolatrous. But it is well observed by Dr. Aikin (*ubi infra*), that the argument against the toleration of Popery, on account of its being a false religion, is such as every established religion may with equal right urge against every other, and may therefore justify universal intolerance. See TOLERATION.

The primate, besides attending to the various duties of his office, employed himself and obtained the assistance of others in augmenting his library, and in promoting the common interests of literature. In order to procure oriental books and MSS., he corresponded with an intelligent merchant at Aleppo, and by his means obtained a curious copy of the Samaritan Pentateuch, a Syrian Pentateuch, and a Commentary on a great part of the Old and New Testaments, and several other valuable MSS. From the Samaritan Pentateuch he furnished some extracts for his friend Selden, in his "*Arundelian Marbles;*" and he deposited the MS. itself in the Cottonian library. Dr. Walton availed himself of Usher's collection in his Polyglott Bible; and

and his oriental treasures were finally centred, for the most part, in the Bodleian library. The primate, being with respect to doctrine Calvinistical, was alarmed by the progress of Arminianism in the English church at the commencement of king Charles's reign, and took part in the predestinarian controversy of that period. Accordingly he published, in 1631, a history of the Benedictine monk Gottschalch, who, in the ninth century, strenuously vindicated the doctrine of predestination. This history, the first Latin production of the Irish press, is entitled "Gottschalchi et Prædestinarie Controversiæ ab eodem Hiltoria." Nevertheless he fervently submitted to royal instructions, communicated to him under the influence of Laud, a zealous partisan of Arminianism, for seizing all remaining copies of a work, published in Ireland by Dr. Downham, bishop of Derry, against the Arminians, avowing his purpose "that nothing should be hereafter published contrary to his majesty's sacred direction." In conformity to a circular letter from his majesty to the Irish archbishops, Usher was active in resisting the spread and prevalence of Popery. With this view he adopted a much better method than that of enforcing penal laws; which was that of cultivating an acquaintance with Catholics of different ranks, and treating them with hospitality and kindness.

In 1632 Usher appeared before the public as editor of an antiquarian work entitled "Veterum Epistolarum Hibernicarum Sylloge, quæ partim ab Hibernis, partim ab Hibernos, partim de Hibernis vel rebus Hibernicis sunt conscriptæ." Under the administration of lord-deputy Wentworth, who wished to render the government of Ireland in every respect dependent on the crown of England, the independency of the Irish church, which had articles and canons of its own, became a subject of litigation. When it was proposed in convocation, that the whole body of the English canons should be adopted by the Irish church, the primate at first resisted; but after much discussion, a compromise took place, by admitting a certain number of the English canons, and retaining such of the Irish as had a particular reference to the circumstances of that church and kingdom. It was afterwards stipulated that the candidates for ordination in the Irish church should subscribe both sets of articles, those of the English, and those of the Irish church; but this double subscription was found to be the cause of great confusion: and therefore, after the Restoration, the English articles alone were subscribed, as they have ever since been. In 1638 Usher published at Dublin a short treatise, entitled "Immanuel, or the Mystery of the Incarnation of the Son of God;" and in the following year, his great work "De Ecclesiarum Britannicarum Primordiis," of which an edition, corrected and improved by the author, was published at London in 1677. In the year 1643, the primate visited England; and in a parliamentary debate concerning church-government, he offered (says Whitelock) an expedient for conjunction, in point of discipline, that episcopal and presbyterial government might not be at a far distance, reducing episcopacy to the form of a synodical government in the ancient church. The parliament was speedily dissolved, and nothing resulted from this proposal. In 1641, a collection of tracts in defence of episcopacy was published at Oxford: and in this collection were two pieces of Usher's, viz. "A Discourse on the Origin of Bishops and Metropolitans," and "A Geographical and Historical Disquisition on the Lydian or Proconular Asia;" which last was reprinted with additions at Oxford in 1643. By these tracts, it appears that Usher adhered to his early opinion, that bishops and presbyters differed not in *order*, but in *degree*, though he asserted the apostolical origin and authority of

episcopacy. In defence of the cause of monarchy, he composed, by the king's command, a treatise concerning "The Power of the Prince, and Obedience of the Subject," which remained in MS. till after the Restoration, and was then published by the primate's grandson, James Tyrrel, esq., with a preface by bishop Sanderson.

On occasion of the impeachment of lord Strafford, Usher's conduct has been much censured. It was generally considered that the bishops were instrumental in persuading the king to consent to Strafford's death; and Usher not only shared in this imputation, but was charged with having taken this part in revenge for having been obliged by Strafford to concur in abrogating the articles of the Irish church. But the moral character of Usher raised him far above the suspicion of such malignity. Dr. Parr has produced the king's own attestation to the primate's innocence as to the charge of contributing to Strafford's fate. The Irish rebellion, which broke out in 1641, was very detrimental to the prelate in a variety of respects; so that for his support at the interval, he was obliged to sell his plate and jewels. His library, however, on which he set the principal value, in the midst of the wreck of all his other property, was preserved, having been conveyed to Chelster, and thence to London. Soon after this disastrous event, he had a grant from the king of the temporalities of the see of Carlisle, then vacant, which supplied his moderate wants till the seizure of the episcopal lands by the Long parliament. It has been said by some, but doubted or denied by others, that in this time of his distresses he was offered the place of honorary professor in the university of Leyden, with an increase of salary; and that cardinal Richelieu invited him to France, where he should enjoy an ample pension, and freedom of religion. After the commencement of the civil war, Usher resided at Oxford, where he pursued his literary studies, occasionally preached, and had frequent conferences with the king, who, it is said, assured him of his attachment to the Protestant religion. Such, at this time, was his attachment to the royal cause, that he declined being a member of the assembly of divines at Westminster in 1643, and controverted their authority; and this conduct gave great offence to the parliament, so that his library was confiscated; but by the interposition of Selden, it was redeemed by Dr. Featly, a member of the assembly, for a small sum, and afterwards returned to the original owner.

In 1644 Usher finished his corrected edition of the epistles of Ignatius, which was printed at Oxford, and entitled "Polycarpi et Ignatii Epistolæ, una cum veterum interpretatione Latina, ex trium Manuferiptorum codicum Collatione integritati suæ restituta, &c. &c."

He had also prepared for the press the Epistle of Barnabas, but the copy being destroyed by fire at the printer's, the author's "Premonition," concerning the age, author, and purpose of the epistle, which alone was preserved, was afterwards inserted in a mutilated state, in bishop Fell's edition of the same epistle, Oxford, 1685. In 1645, the royal cause being on the decline, Usher obtained the king's leave to quit Oxford; and from thence he went to Cardiff, to his son-in-law, sir Timothy Tyrrel, who was then governor of the place. When Tyrrel was obliged to quit his command at Cardiff, Usher was under a necessity of seeking another refuge. Whilst he was in a state of suspense, he received an invitation from the dowager lady Stradling, to take up his abode at her residence in the castle of St. Donat's, Glamorganshire. On his way thither, in company with his daughter, he was met by a party of stragglers, who conducted him and his train to the main body of the army, who, though nominally raised for the king's service,

considered them as lawful objects of pillage, because they were English. They were rudely treated and plundered; but a party of officers interposed, and restored as much of the baggage as they could find. They then conducted the travellers to the house of Sir John Aubrey, where they were lodged for the night. During his abode at St. Donat's, he was seized with a disorder which had nearly proved fatal, and which, indeed, occasioned a report of his death; but he afterwards slowly recovered, and continued in Wales nearly a year and a half. Failing to succeed in his attempt to cross the Channel, he accepted the invitation of the countess of Peterborough to reside at her house in London, and arrived thither in 1646. About this time there was an order of parliament to pay him the sum of 400*l. per annum*; but it does not appear that this pension was paid above once or twice. Early in the year 1647 he was elected preacher to the society of Lincoln's-Inn, and here he continued to enjoy comfortable apartments, and to officiate for nearly eight years. It is said that his sermons were chiefly extemporaneous, and no trace of them remains. His literary labours were continued. In the year 1648, when the king was confined at Carisbrook castle, in the Isle of Wight, Usher, and five others of the episcopal clergy, were deputed to visit him, and to treat with him on the subject of church-government. The primate renewed his former proposition of "Episcopal and Presbyterian Government conjoined;" but the parliamentary commissioners being determined upon the total abolition of episcopacy, the treaty terminated without effect. In a conversation which occurred between Baxter and Usher, it appears that the latter admitted the validity of presbyterian ordination. "I asked him," says Baxter, "his judgment about the validity of presbyters' ordination, which he asserted, and told me, that the king asked him at the Isle of Wight, where ever he found in antiquity that presbyters alone ordained any? and that he answered, I can shew your majesty more, even where presbyters alone successively ordained bishops; and instanced in Hierom's words (Epist. ad Evagrium) of the presbyters of Alexandria choosing and making their own bishops from the days of Mark till Heraclius and Dionysius." After this interview with the king, Usher saw him only once more, on the scaffold. The fight was so affecting, that he was obliged to withdraw; and being overpowered by it, he was led down from the leads of lady Peterborough's house, at Charing-cross, and laid upon his bed, where abundant tears and prayers gave relief to the deep sorrow with which he was overwhelmed. His great chronological work, entitled "*Annales Veteris Testamenti*," was so far completed, that in 1650 he published the first part of it, and the second part was printed in 1654. In 1652 he published his "*Epistola ad Ludovicum Capellum de Textu Hebraici variantibus lectionibus*," in which he displays varied and profound erudition concerning the Greek Septuagint and the Samaritan Pentateuch. It appears that Cromwell requested a conference with Usher, and that the former promised the primate a lease for twenty-one years of part of the lands belonging to the archbishopric of Armagh, which he did not refuse to accept; but the grant was never passed during his life, and after his death was refused to his daughter and son-in-law on the pretext of "malignancy." On occasion of the death of his old friend Selden, towards the close of the year 1654, he delivered a funeral discourse at the Temple-church before a splendid and numerous audience; and this was the last of his public pulpit services. His work "*De Græca Septuaginta Interpretum Versione Syntagma*," &c. was printed in 1655. In an interview with the Protector, whilst he was attended by a surgeon who dressed a boil on

his breast, Cromwell said, "If this core (pointing to the boil) were once out, I should quickly be well." "I fear," replied Usher, "the core lies deeper; there is a core at the heart that must be taken out, or else it will not be well." "Ah!" rejoined the unhappy great man, "so there is indeed!" pronouncing the words with a sigh. At Ryegate, whither the primate soon after retired, he employed himself in the completion of his "*Chronologia Sacra*;" and here he felt symptoms of decay; for in his almanac, opposite to his birth-day, in 1655-6, was found written the following note: "Now aged seventy-five years: *my days are full*;" and after a small interval, in capital letters, the word RESIGNATION. On the 20th of March he was attacked with a pleuritic inflammation, which occasioned acute pain, and indicated his approaching end. Having taken respectful and grateful leave of his noble hostess, the countess of Peterborough, he withdrew, and requested to be left to his private devotions. The last words he was heard to utter were, "O Lord, forgive me; especially my sins of omission!" and presently after expired, March 21, 1655-6, having completed his 75th year nearly three months. It was proposed to bury him at Ryegate, in lady Peterborough's family vault; but Cromwell sent an order that his body should be brought for burial in Westminster-abbey, with the ceremony of a public funeral. On the 17th of April his remains were met, near London, by the carriages of most persons of rank then in town; and from Somerset-house to the Abbey they were attended in procession by all the clergy, and a great concourse of people. The funeral sermon was preached by Dr. Nicholas Bernard, the primate's former chaplain, upon the following appropriate text: "And Samuel died, and all Israel were gathered together, and lamented him, and buried him."

Primate Usher was in person moderately tall and well-shaped, with an erect carriage to the last; of a sanguine complexion, and features expressing gravity and benevolence combined. His constitution was firm, and enabled him to bear uninjured his early hours of study, and the various fatigues of a life both active and contemplative. His mode of living was simple; his manners were free and affable, void of all pomp and affectation; his temper was remarkably sweet and placable, though he could rebuke with severity when he thought the occasion required it. Among his numerous eulogists, no one, perhaps, has eulogized him more correctly than bishop Burnet, who, in his "*Life of Bishop Bedell*," mentions the primate in the following terms:

"Together with his great and vast learning, no man had a better soul, and a more apostolic mind. In his conversation he expressed the true simplicity of a christian; for passion, pride, self-will, or the love of the world, seemed not to be so much as in his nature; so that he had all the innocence of the dove in him. He had a way of gaining people's hearts, and of touching their consciences, that looked like somewhat of the apostolic age revived. He spent much of his time in those two best exercises, secret prayer, and dealing with other people's consciences, either in his sermons or private discourses; and what remained he dedicated to his studies, in which those many volumes that came from him shewed a most amazing diligence and exactness, joined with great judgment; so that he was certainly one of the greatest and best men that the age, or perhaps the world, has produced. But no man is entirely perfect: he was not made for the governing part of his function. He had too gentle a soul to manage that rough work of reforming abuses, and therefore left things as he found them."

Usher, through life, seemed to have had gloomy forebodings with regard to the return and temporary triumph of popery,

popery, and he founded his predictions of such an event on his interpretation of some passages of Scripture; and it has been said, that at some seasons he seemed to think himself warranted to speak of future events in a higher tone of authority than as a mere conjecturer. A popular opinion prevailed, that Usher was endowed with a prophetic spirit; but there is no sufficient evidence that he himself pretended to this extraordinary gift. It was his intention to have left his library, consisting of nearly 10,000 books and MSS. to his "alma mater" at Dublin; but being stripped, by the difasters of the times, of all other property, he thought it right to bequeath it to his daughter, to whom he had given nothing, and who had a large family. The king of Denmark and cardinal Mazarin bid for it; but the Protector conceiving it disgraceful to his administration to allow such a treasure to be sent out of the kingdom, prohibited the disposal of it without his consent. Probably through his private suggestion, the officers and soldiers of the victorious army in Ireland purchased it for 2200*l.*, with a view of appropriating it agreeably to the first intention of the primate. It lay at the castle till the Restoration, and after suffering various depredations, it was bestowed by Charles II. upon Dublin college.

It has been a subject of dispute, how far the opinions of Usher differed from those of the established church. Dr. Peter Heylin alleged against him many charges of non-conformity. These are summed up under distinct heads, and particularly examined by Dr. Parr. Our limits will merely allow a recital of them. 1. The divine authority for keeping the sabbath, or seventh day's rest, as transferred to the Christian Sunday. 2. His opinion that bishops and presbyters differ in degree only, not in order; and, as an inference, that presbyterian ordination and sacraments are valid. 3. His limitation to the elect of that universal redemption of mankind by the sufferings and death of Christ, which is the doctrine of the church of England. It is, however, a subject of controversy not yet decided, whether the articles of the English church, as to these points, are to be understood in a Calvinistic or an Arminian sense. In early life, the theological system of Usher was Calvinistic; but it has been said that he changed his sentiments concerning the doctrines of Calvinism before his death. 4. The primate is accused by Heylin of not holding the doctrine of the true and real presence of Christ's body and blood in the sacrament of the eucharist, conformably to the church of England. But it is hardly conceivable that any modern divine of the church of England would go farther than the primate, who distinguished between the outward and inward act of the communicant: "in the first of which he really receives the visible elements of bread and wine; in the second, by faith, really receives the body and blood of our Lord, that is, is truly and indeed made partaker of Christ crucified to the spiritual strengthening of the inward man." 5. The next charge is, that he did not admit the power of the priest to forgive sins, in the sense of the church of England. Heylin contends for an *authoritative* power in the priest to remit sins; whereas the primate's opinion seems to have been, that the priest's absolution is only *declarative*, or on condition of repentance; or *optative*, by the way of prayers and intercession. Dr. Parr contends, that the doctrine of the church is that held by the primate. 6. His opinion concerning Christ's descent into hell is alleged to have deviated from that of the church, inasmuch as he did not admit of a local descent into the real hell, or place of punishment for the wicked, but a mere separation between the soul and body during the time that Christ lay in the grave.

As a man of learning, Usher's name became celebrated

throughout Europe, and he carried on a correspondence with several learned persons, both at home and abroad. Of his works we shall here subjoin a catalogue.

Publications of archbishop Usher:—*De Ecclesiis Christianarum Successione et Statu*, 1613; *The Religion of the ancient Irish and Britons*, 1622; *Gottschalci et Prædestinariæ Controversiæ ab eo Motæ Historia*, 1641; *Veterum Epistolarum Hibernicarum Sylloge*, 1632; *Immanuel, or the Mytery of the Incarnation of the Son of God*, 1638; *De Ecclesiis Britannicarum Primordiis*, 1639; *A Discourse on the Origin of Bishops and Metropolitans*, 1641; *A Geographical and Historical Disquisition on the Lydian or Proconular Asia*, 1641; *Polycarpi et Ignatii Epistolæ*, &c. 1644; *Appendix Ignatiana*, 1647; *Diatriba de Romanæ Ecclesiæ Symbolo Apostolico aliisque Fidei Formulis*, 1647; *De Macedonum et Asianorum Anno Solari*, 1648; *Annalium Pars prior*, 1650; *Epistola ad Ludov. Capellum de Textus Hebraici variantibus Lectiobus*, 1652; *Annalium Pars posterior*, 1654; *De Græca Septuaginta Interpretum Versione Syntagma*, 1655.—*Posthumous: Various Tracts*, edited by Dr. Bernard, 1657; *Chronologia Sacra*, edited by Dr. Barlow, 1660; *The Power of the Prince, and Obedience of the Subject*, written 1641, printed after the Restoration; *Historia Dogmatica Controversiæ inter Orthodoxos et Pontificios de Scripturis et Sacris Vernaculis: Accessere Dissertationes duæ*, 1690.

See the life of Usher by Dr. Aikin, who appeals for the facts which he has recited to the Life of Usher by Dr. Parr, who was the primate's chaplain at the time of his death; and who has annexed to his account a large collection of letters, that passed between Usher and his correspondents; and also to the Life of Usher by Dr. Smith, which is the first and principal article of his work, entitled "Vitæ quorundam eruditissimorum et illustrium Virorum," 1707, 4to.

USIA, in *Geography*, a river of Russia, which runs into the Vaga; 8 miles S. of Vieslk, in the government of Vologda.

USIATIN, a town of Poland; 28 miles N. of Kaminiac.

USIDICANI, in *Ancient Geography*, a people of Italy, in Umbria.

USIDITANA, a town of Mædia, in the vicinity of Thamyris.

USIJES, in *Geography*, a town of Arabia, in the province of Yemen; 12 miles N.W. of Chabar.

USILLA, INS-KILLS, in *Ancient Geography*, a place of Africa, upon the coast of the Mediterranean sea, S. of Rufa.

USIMADO, in *Geography*, a town of Japan, in the island of Nippon; 86 miles S.W. of Meaco.

USINGEN, a town of Nassau Usingen, which gives title to a branch of the house of Nassau, with a family seat. In 1793, it was taken by the French; 12 miles S.S.E. of Weilburg.

USIPII, or USIPIANS, in *Ancient Geography*, a people of Germany, who at occasional intervals of time, inhabited the same places with the Teuchteri. The Usipii anciently dwelt between the Cherasci and the Sicambri; but the Catti expelled them; and after having wandered for about three years in different countries of Germany, they established themselves upon the Rhine, in the vicinity of the Sicambri. The Menapii occupied the two banks of this river; and therefore it must have been with their consent that the Usipians and Teuchteri took possession of the country of the Menapians, situated to the E. of the Rhine. In the year 698 of Rome, the Usipians and Teuchteri were almost

entirely exterminated. A very small remnant of a populous nation repassed the Rhine, and established themselves with the Sicambri: but in the time of Augustus, or a little more than half a century after the terrible defeat just mentioned, they found themselves in a condition to make war, first with the Sicambri, and then with the Romans. From the expedition of Drusus into Germany, we learn that the country of the Ulpiani and that of the Teuchteri were then different. The Ulpiani extended along the right bank of the Lippe; but when Drusus passed the Rhine, and subjugated the Ulpiani, he threw a bridge over the Lippe, by which he entered into the country of the Sicambri. The Teuchteri inhabited a territory W. of the Sicambri, and the Rhine separated them from the Menapians. Tiberius, having afterwards transported the Sicambri into Gaul, the country which they had occupied in Germany was given to the Ulpiani and Teuchteri; at length the Teuchteri extended themselves along the Rhine from the Segos (the Sige) as far as the Roer, and along the Lippe and the Alise (the Alene). As to the Ulpiani, they remained on the two banks of the Lippe and the Rhine, perhaps as far as the place where the Rhine divides to form the isle of the Batavi. At the commencement of the reign of Trajan, it appears that the Teuchteri had been almost exterminated by the Clerufci and Angrivarians, who took possession of a great part of their territory. The Ulpiani must also have suffered. In the time of Constantine, the Ulpiani and the Teuchteri ceased in a manner to have any political existence, having probably submitted to some people more powerful than themselves.

USITZA, in *Geography*, a town of Servia, taken by the Turks in 1738; 23 miles N.W. of Jenibafar.

USK, a borough and market-town in the upper division of the hundred of the same name, and county of Monmouth, England, is situated at the confluence of the rivers Olwy and Ulk, at the distance of 14 miles S.W. from the county-town, and 144 miles W. by N. from London. Though scarcely a vestige of Roman remains has, at least in modern times, been discovered at this place, all antiquaries, except Salmon, who makes this the site of Isca Silurum, have agreed to fix here the Burrium of Antoninus' Itinerary, and the Bulæum of Ptolemy. It is evident that Ulk is a place of high antiquity, and has been of much larger extent and greater importance. The history of its castle furnishes the earliest written records of the place; and though from some of its architectural features, it appears to have been of Roman or Roman-British origin; yet the remotest notice that has hitherto been discovered is, that, in the time of Henry III., it formed part of the possessions of Richard de Clare, earl of Gloucester: from his family it came to the Mortimers, earls of March. In the third year of Henry VI., on the death of Edmund Mortimer without issue, his great possessions were granted to his nephew Richard duke of York, whose favourite residence this castle appears to have been: his sons, Edward IV. and Richard III., were born here. On the death of the latter, it became the property of Henry VII.: it afterwards belonged to William Herbert, first earl of Pembroke: the duke of Beaufort is the present proprietor. This fortress experienced frequent assaults during the alternate successes of the Welsh chieftains and the Anglo-Norman lords: and it suffered particularly, together with the town, in the ravages of Owen Glendwr, who, at length, here met with a complete defeat. The present remains of the castle consist of a court, the principal entrance to which is by a tower gateway, having a pointed arch with a groove for a portcullis: an area of considerable extent is surrounded by walls, flanked with round and square towers,

destitute of windows, but having occasional narrow apertures: within are the keep, a square tower, and several apartments, one of which appears to have been the baronial hall. A priory was founded in this town, previous to the year 1236: a few remains of the building are still standing; and in an apartment on the first floor, the frieze of the ceiling is decorated with thirty emblematic devices and emblazoned arms. Ulk is a borough town and since the 27th year of Henry VIII. has been privileged with elective franchise, being, in conjunction with Monmouth and Newport, represented by one member of parliament. By a charter granted in 1398, the civil government is vested in a bailiff, community, and burgeses. The town is of considerable extent, but, according to the population return of the year 1811, contains only 164 houses, and 844 inhabitants. Several ways bear the name of streets, though scarcely deserving that appellation: for the houses in general are isolated, having gardens, orchards, and paddocks intervening; which, though they give an irregularity to the town, tend much to comfort and convenience. Two fairs are held annually, and a small market weekly on Mondays: the town has no trade, and only a small manufactory of japan ware. Some of the inhabitants derive advantage from its being a thoroughfare; some are employed in husbandry; and some gain a maintenance by the salmon fishery, which is abundant in the river Ulk. The church, which belonged to the priory, appears to have been erected in the Anglo-Norman era. By foundations yet remaining, it was built cruciform, in the manner of a cathedral: the square embattled tower, now standing at the east end, was in the centre, and seems to have communicated with a transept and choir, both of which have long been destroyed. Many alterations have taken place in the building; the circular columns and arches of the tower exhibit the Norman character; but the nave is separated from the north aisle by four pointed arches, and the windows and doorways are in the same style. The interior affords nothing worthy of notice, except an inscription on a brass plate, which has for more than half a century been a perplexing subject to antiquaries, and still appears to defy critical disquisition. It was first published in the second volume of the *Archæologia*, thence copied into Gough's edition of Camden, and since given more correct by Mr. Coxe. A stone bridge of five circular arches, flanked on each side by triangular buttresses, is the only other public structure deserving mention. Near the foot of the bridge was formerly a Roman Catholic chapel: it is now the common prison. In the vicinity of Ulk are several ancient encampments: almost every two or three miles exhibit vestiges of hostile positions, and the tumuli of heroes slain.—*Beauties of England and Wales*, vol. xi. Monmouthshire, by J. Britton, F.S.A. Coxe's *Historical Tour through Monmouthshire*, two vols. 4to. 1801.

USK, a river of South Wales, which rises in the S.W. part of the county of Brecknock, and runs into the Severn, below Newport, in Monmouthshire.

USKALINMAA, a small island on the E. side of the gulf of Bothnia. N. lat. 61° 18'. E. long. 21° 5'.

USKEI, an island belonging to Russia, in Beering's straits. N. lat. 65° 58'. E. long. 186° 21'.

USKELA, a town of Sweden, in the government of Abo; 27 miles E. of Abo.

USKER, a town of Asiatic Turkey, in the government of Kur, on the Kur; 12 miles N.N.E. of Akalziké.

USKOLOMSKOI, a town of Russia, in the province of Utiuga, of the Vitcheгда; 80 miles E.N.E. of Ekâ Sifolk.

USKUBS, a town of Natolia; 36 miles N.W. of Boli.

USLAH, a town of Bengal; 9 miles S. of Curruck-deah.

USLAR, a town of Westphalia, in the principality of Calenberg. In the year 1755, duke Frederic ordered the name to be changed to Freudenthal; 17 miles W.N.W. of Göttingen.

USMAN, a town of Russia, in the government of Tambow, on a river of the same name; 40 miles S.W. of Tambow. N. lat. 52° 8'. E. long. 40° 24'.

USNAU, *Island of*, sometimes called *Hutten's Island*, a small island in the lake of Zurich, Switzerland, about an English mile in circumference, belonging to the abbey of Einsiedlin. It contains only a single house, two barns, a kind of tower or summer-house, a chapel that is never used, and a church in which mass is said once a year. Within is the tomb of St. Alderic, who built an hermitage in the island and retired hither, where he died, after a life of reputed sanctity, in 1473. It is called Hutten's island, from an extraordinary person of that name, famed for his learning and valour, and for his intemperate ardour in defence of the opinions of Luther. After having renounced himself an object of terror both to Lutherans and Catholics, he sought repose in this sequestered island, and died here in 1523, in the 36th year of his age. The island, which is agreeably diversified with hill and dale, is very fertile in pasture, produces hemp, flax, a few vines, and a small tufted wood, which overhangs the margin of the water. This is the only island in the lake, except an uninhabited rock, which yields a small quantity of hay.

USNEA, in *Botany*, a name retained by Dillenius, for which he modestly solicits the indulgence of botanists, notwithstanding its Arabian origin, being derived from the *Azuech* and *Ufnee* of Serapio. It has long been the official name of one of this genus, which, though sunk in *Lichen* by Linnaeus, is now restored by Acharius, under the above appellation.—Dill. Musc. 56. Achar. Prodr. 223. Meth. 306. Lichenogr. 127. t. 14. f. 5. Syn. 303. Sm. Prodr. Fl. Græc. Sibth. v. 2. 322. Hoffm. Germ. v. 2. 132.—Class and order, *Cryptogamia Algæ*. Nat. Ord. *Algæ*, *Lichenes*.

Eff. Ch. Receptacles orbicular, peltate, scarcely coloured, without a border; subtended by a dilatation of the frond, which is branched, and contains a central elastic pith.

The filamentous Lichens of Linnaeus chiefly compose this genus. (See *LICHEN*, sect. 9; and *LICHENES*, n. 6, n. 28, and n. 21.)—We need not repeat the account and observations there given, respecting the fructification of the genus before us. With respect to its technical discrimination, Acharius considers as essential the very tough, elastic, central thread, which pervades the whole frond and its branches, remaining unbroken when the outer coat, tumid and cracked, assumes, in several species, a jointed or beaded appearance. The orbicular disks are not circumscribed by any tumid border from the frond, but are often bounded by an indeterminate, or irregular, dilatation of that part, very frequently subtended, or fringed, with prominent bristles, or threads, resembling young branches. How far these disks are real receptacles of seeds must appear, from the observations above cited, very doubtful; or rather it seems clear that they are not so, and that the convex more coloured tubercles, destitute of any border, found in some of the species, are more probably the receptacles. According to this idea, we should rather prefer the following:

Eff. Ch. Receptacles lateral, sessile, tumid, rugged, coloured, without a border. Frond thread-shaped, branched, with a central elastic pith.

Leaving the question thus open, for future examination and determination, we proceed to the elucidation of the species, which are very prudently curtailed in the last work of Dr. Acharius, his *Synopsis*.

1. *U. melanantha*. Orange and black *Ufnea*. Ach. Syn. n. 1. Meth. 307. (Lichen aurantiaco-ater; Jacq. Misc. v. 2. 369. t. 11. f. 2. Linn. Syst. Veg. ed. 14. 965.)—Frond nearly erect, tufted, rough, tawny: ultimate branches tapering, black. Disks concave; black above; corrugated underneath; naked at the margin.—Commerlon, Menzies, and other voyagers, have gathered this handsome species, at the straits of Magellan, Staten land, Falkland islands, &c. The stem is simple at the root, but divides immediately into a dense bushy mass of subdivided, entangled, round, very tough branches, and is three or four inches high. The surface is rough with minute points, partly tawny or orange-coloured, partly black and shining; the smaller branches are beautifully annulated with tawny and black alternately; the ultimate ones black, tapering to a sharp point. The internal substance is solid, white, very hard. Receptacles lateral, solitary, causing the branch to form an acute angle at the insertion of each. When young they are almost globular, then hemispherical, or nearly flat. Their disk is dark brown or black, and of a distinct substance from the pale or tawny accessory border, formed from the frond, inflexed when young, corrugated beneath, remaining thin, even, smooth, naked and uninterrupted, encompassing the disk.

We admit this species here chiefly in conformity to our distinguished guide. While we beg leave to protest against his change of the excellent original name, we decline restoring that name combined with *Ufnea*, because we feel some suspicion that the plant may belong to Dr. Acharius's new genus *Evernia*, Syn. 244. The frond, though corticated, is solid, and the receptacles are shield-like, sessile, with a thin coloured concave disk, surrounded by an elevated inflexed margin from the substance of the frond, which are the characters of *Evernia*, rather than of *Ufnea*.

2. *U. jamaicensis*. Jamaica *Ufnea*. Ach. Syn. n. 2. "Lichenogr. 619. Nov. Aët. Upfal. with a figure, unpublished."—"Frond nearly erect, rough, pale, forked; branches divaricated, widely spreading. Disks peltate, nearly sessile, rather concave, of the colour of the frond; smooth, appendiculated and proliferous beneath; naked in the circumference."—Native of trees in the West Indies. *Acharius*.

3. *U. coriularia*. Brown-horned *Ufnea*. Ach. Syn. n. 3. "Lichenogr. 619. Nov. Aët. Upfal. with a figure, unpublished."—"Frond spreading, rigid, very smooth, thread-shaped, slender, white, much branched; branches intricate, zigzag; ultimate ones partly brownish."—Found on the trunks of trees in New Zealand. *Acharius*.

4. *U. ceratina*. Intricate-horned *Ufnea*. Ach. Syn. n. 4. "Lichenogr. 619. Nov. Aët. Upfal. with a figure, unpublished."—"Frond prostrate, rather pendulous, rigid, very rough, whitish, slightly fibrous; branches very long, subdivided, spreading, diffuse. Disks concave, of the colour of the frond; somewhat proliferous beneath; encompassed with long, stout, curved rays."—Found on trees in Silesia. The author mentions a variety, found on rocks in France, Spain, and North America, thus distinguished.

b. *scabrofa*. "Frond erect, rough, rigid, somewhat tufted, pale, branched; branches straight or zigzag, tapering, widely spreading."

Some specimens from America are furnished with red tubercles, or *cephalodia*.

5. *U. florida*. Flower *Ufnea*. Ach. Syn. n. 5. Meth. 307. Sm. Prodr. Fl. Græc. n. 2482. Hoffm. Pl. Lich.

v. 2. 19. t. 30. f. 2. (*U. vulgatissima tenuior et brevior*, cum orbiculis; Dill. Musc. 69. t. 13. f. 13. Lichen floridus; Linn. Sp. Pl. 1624. Ehrh. Crypt. n. 148. Engl. Bot. t. 872.)—Fronde nearly erect, rough, greyish, with crowded horizontal fibres; branches widely spreading, scarcely divided. Disks flat, very broad, whitish, with long rays. Tubercles flesh-coloured, nearly globular, wrinkled.—Frequent on old trees, especially about the tops of aged oaks, sometimes on pales, in various parts of Europe. The fronds form upright, bulky tufts, of a pale greenish-grey when moist, whiter when dry, springing from a hard black base; they are round, consisting of a crustaceous bark, enclosing a tough white fibre, the bark slightly cracking here and there, but not widely. The innumerable branches, crowded with taper fibres, are polished, though minutely warty. When of full age, they bear very broad, unequal, irregular disks, at first lateral, but by the flexure of the branch, and the stoppage of its growth, becoming terminal. They are smooth on both sides, paler or slightly flesh-coloured on the upper, having all the appearance of the shield of a *Parmelia*, &c.; their border of the substance of the frond, narrow, elevated when young, copiously fringed with radiating fibres. The same plant bears, though rarely, small flesh-coloured tubercles, situated like the disks, destitute of rays; having when young a tumid even border, of their own substance and red colour, which is subsequently obliterated, as in the genus *Lecidea*, by the great elevation and swelling of the middle part, forming a tubercle like those of a Cup-Lichen, *Boomyces*. These were noticed by Hoffmann, Persoon, and Schrader, though that circumstance was unknown to us, before they appeared in *English Botany*; and the discovery is the most curious that has for a long while been made in the history of the *Lichen* tribe.

Acharius enumerates the following varieties.

b, *rigida*. "Fronde elongated, straight, rigid, slender, somewhat dependent, rough; branches rather long, zigzag, beset with fibres and small branches."—Native of Lusitania and England.—We have not met with any thing answering to this.

c, *frigosa*. Ach. Meth. 310. t. 6. f. 3.—Fronde spreading, branched, dirty grey, rough; branches elongated, zigzag, forked, lax, closely beset all over with prominent parallel fibres. Disks flesh-coloured, very broad, somewhat lobed, with radiating teeth.—Found in North America. This seems merely the effect of age.

d, *villosa*. "Fronde and branches dirty ash-coloured, diffuse and entangled, clothed with very short and crowded villous fibres."

e, *rubiginosa*. Michaux Boreal.-Amer. v. 2. 332.—"Fronde somewhat fibrous, of a rusty red, with disks of the same colour."—Native of North America.

f, We have a very long, straggling, minutely fibrous, variety, brought by Mr. Menzies from the Cape of Good Hope, which hardly comes under any of the above definitions. On this we have seen one solitary flesh-coloured tubercle, situated on the main stem, as in *U. hirta*.

6. *U. hirta*. Common Rough Usnea. Hoffm. Pl. Lich. v. 2. 17. t. 30. f. 1. Sm. Prodr. Fl. Græc. n. 2483. (*U. florida* β; Ach. Meth. 309. *U. plicata* c; Ach. Syn. 305. n. 6. *U. vulgatissima tenuior et brevior*, sine orbiculis; Dill. Musc. 67. t. 13. f. 12. Lichen hirtus; Linn. Sp. Pl. 1623. Ehrh. Crypt. n. 138. L. floridus β; Hudf. 560. Ach. Prodr. 224.)—Fronde erect, somewhat shrubby, much branched, greenish-grey; branches spreading, wavy, fibrous, roughish, entangled, tapering. Tubercles lateral, slightly elevated, flesh-coloured, rugged. Radiating disks none.—Extremely common on trees, posts,

and pales, throughout Europe, as well as in America. We cannot conceive this to be a variety, either of the preceding or the following species. The whole plant is more finely fibrous than *U. florida*, and rather greener. The tubercles are lateral, and do not disturb the direct continuation of the branch beyond them; nor are they so perfectly sessile, but rather elevated on a short thick stalk. Sometimes we find them accompanied by a few radiating fibres, but never approaching to the nature of an expanded disk.

To this we presume must belong the variety d, *glabrata*, of Ach. Syn. 306. n. 6.—"Fronde nearly upright, rather shrubby, white, very smooth and naked; branches crowded, widely spreading, nearly simple, fibrous; powdery at the summit."—Native of Switzerland. Wool boiled in water with *U. hirta*, without alum, takes a fine permanent tawny yellow.

7. *U. plicata*. Stringy Usnea. Ach. Syn. n. 6. Meth. 310. (*U. vulgaris*, loris longis implexis; Dill. Musc. 56. t. 11. f. 1. Lichen plicatus; Linn. Sp. Pl. 1622. Engl. Bot. t. 257. Westring Lich. t. 8.)—Fronde pendulous, smoothish, pale grey; branches lax, compound, entangled, partly fibrous; the ultimate ones capillary. Disks flat, fringed with slender fibres.—Found hanging from the branches of old trees, in dark shady woods of the more mountainous countries of Europe. The whole plant, when full grown, measures from one to two feet in length, being a dense mass of entangled branching fibres. Its hue is less green than that of *U. hirta*, nor have any flesh-coloured tubercles been remarked on this species. The disks at first resemble such tubercles in form, but not in colour; soon becoming concave, with an inflexed somewhat radiated margin; and at length expanding into a flat shape, smooth and even on both sides, very slightly fringed with red-brown above, their border more or less fringed with radiating, sometimes elongated, fibres. To this is now reduced, as a variety,

b, *comosa*. (Lichen comosus; Ach. in Stockh. Transf. v. 16. 209. t. 8. f. 1.)—"Fronde rather erect and shrubby, pale and whitish; lateral branches widely spreading, diffuse, crowded, smooth, much divided; the ultimate ones taper-pointed, roughish, slightly drooping. Tubercles pale-flesh-coloured, finally brown."—Found chiefly on tall stems of Birch-trees, in Sweden. We have not examined this plant, but its tubercles seem to agree rather with *U. hirta*, as well as its habit.

8. *U. barbata*. Bearded Usnea. Ach. Syn. n. 7. Meth. 313. Sm. Prodr. Fl. Græc. n. 2484. (*U. barbata*, loris tenuibus fibrosis; Dill. Musc. 63. t. 12. f. 6. Lichen barbatus; Linn. Sp. Pl. 1622. Engl. Bot. t. 258. f. 2.)

b, *dafopoga*; Ach. Syn. 306. n. 7. (*U. plicata* γ, *dafopoga*; Ach. Meth. 312. "*U. barbata*, Hoffm. Germ. v. 2. 132, excluding the reference to Dillenius." *Achar.*)

c, *articulata*; Ach. Syn. *ibid.* (*U. barbata* β; Ach. Meth. 313. *U. capillacea* et *nodosa*; Dill. Musc. 60. t. 11. f. 4. Lichen articulatus; Linn. Sp. Pl. 1623. Engl. Bot. t. 258. f. 1.)

d, *intestiniiformis*; Ach. Syn. *ibid.*

Fronde pendulous, smooth, tumid, cracked, inflated, greyish-white; branches divaricated, fibrous, with capillary points. Tubercles lateral, flesh-coloured, somewhat lobed.—Found on the branches of old trees in various parts of Europe, scarcely bearing tubercles but in Italy, and other southern countries. The variety d we have from Exmouth warren, Devonshire, where it grows on the sandy ground, in large patches. This elegant and striking species has always more or less of a jointed, or bearded, appearance, the principal

capal stems resembling a necklace: in the last variety, *d*, they are singularly inflated and pitted, though less interrupted or broken, while the subdivided branches are more suddenly capillary than the usual habit of the plant. That the *Lichen barbatus* and *articulatus* of Linnæus constitute but one species, and are hardly varieties of each other, Mr. Lightfoot first hinted, nor could any one have a doubt on the subject after examining the Dillenian specimens. What the variety, *b*, *dafopoga*, of Acharius may be, we have no authentic information. It has been referred to *plicata*, but if at all like that species, it can have no affinity to the present. *U. barbata* never exhibits, as far as we can learn, any traces of radiated disks. Its proper fructifications are the lateral, flesh-coloured, much wrinkled or lobed, *tubercles*, ranged numerously along some of the branches, without causing any flexure, or change in their direction. These we have gathered near Viterbo. (See Tour on the Continent, ed. 2. v. 1. 335.) They are represented in Engl. Bot. t. 258, and in Micheli, Nov. Gen. 76. t. 39. f. 1, 2. The central pith in this species is very slender, appearing between the disunited portions, like a rough thread of very white cotton.

9. *U. longissima*. Long Slender Ufnea. Ach. Syn. n. 8. Nov. A&T. Upfal. with a figure, unpublished.—“Fronnd pendulous, thread-shaped, slightly compressed, rough and somewhat powdery, pure white, very long, scarcely branched, clothed with horizontal, twisted, simple, ash-coloured fibres.”—Found on the branches of trees, in the woods of Lusatia. The *frond* is slender, with a few *branches*, two, three, or four feet in length. *Receptacles* unknown. *Acharius*.

10. *U. angulata*. Angular Ufnea. Ach. Syn. n. 9.—“Fronnd pendulous, nearly simple, zigzag, pale grey, with acute rough angles; fibres horizontal, crowded, simple, short, round, tapering.”—Native of trees in North America. *Fructification* unknown. At first sight this species resembles the variety *c*, *strigosa*, of *U. florida*, but is more related to *longissima*, from which, as well as from the rest of the genus, it is sufficiently distinguishable by the conformation of the *frond*. *Acharius*.

11. *U. trichoides*. Capillary Ufnea. Ach. Syn. n. 10. Meth. 312. t. 8. f. 1.—Fronnd prostrate, smooth, whitish, thread-shaped, very slender, branched; fibres horizontal, scattered, partly turned one way. Disks of the same colour, terminal, with a narrow, elevated, naked, entire border.—Found in Nova Scotia, at the Cape of Good Hope, and in the isle of Java. Differs from the rest of its genus in the capillary, spreading, not pendulous, *frond*, and in the want of rays to its *disks*, which are very slightly concave. The medullary thread is blackish; the cortical substance crustaceous, thin, scarcely jointed. *Ach. Meth.*

12. *U. gracilis*. Slender Ufnea. Ach. Syn. n. 11. Nov. A&T. Upfal. with a figure, unpublished.—“Fronnd pendulous, white, very smooth and shining, thread-shaped: branches scattered, uniform, straight, simple, slightly fibrous.”—Native of the isle of Bourbon. Acharius thinks this a distinct species, though he never met with the *fructification*.

13. *U. filaris*. Greenish Thread Ufnea. Ach. Syn. n. 12. (“*U. gracilis*; Perf. in A&T. Soc. Wetteran. 2. t. 10. f. 6.”)—“Fronnd thread-shaped, greenish. Disks scattered, small, fringed with bristles.”—Native of America. *Perfoon*. Acharius had not seen a specimen, but he conceived this species to be really distinct from the last, and was, therefore, obliged to change Perfoon’s specific name.

14. *U. incarnata*. Red-pithed Ufnea.—Fronnd pendulous, pale, smooth, capillary, cracked, with numerous horizontal tapering fibres; the medullary thread reddish.

Disks lateral, concave, fringed with long distant bristles.—Gathered in Nova Scotia, by Mr. Archibald Menzies, to whom we are obliged for specimens. We cannot refer them to any of the preceding species, but without a comparison with some of those, particularly the two last, the question must remain in a little uncertainty. The *fronds* are six inches long, of an ivory white, polished, not at all warty or powdery, very slender, copiously cracked, but not tumid nor inflated; the central thread, when laid bare, appearing of a flesh-colour, or light red. *Disks* copious, small, slightly reddish, with a thick inflexed border, beset with a few unequal, rather long, spreading bristles. In a young state, when smaller than mustard-seed, they greatly resemble the shields of a *Parmelia*.

15. *U. denudata*. Naked-branched Ufnea.—Fronnd thread-shaped, tawny, greenish, rough with minute points, subdivided, destitute of lateral fibres. Disks lateral, flat, glaucous, fringed with tapering bristles.—Gathered by Mr. Menzies in Otaheité. We cannot tell whether this be pendulous or erect, but the *frond* and *branches* are all nearly of equal thickness, without any fine tapering lateral fibres or subdivisions. They are slightly cracked here and there, but not tumid; their colour partly tawny, partly a dirty greenish-white. *Disks* ranged along the uninterrupted frond; when young globular, concave, naked at the edge; finally flat, a quarter of an inch wide, brown, with a glaucous bloom; their border narrow, wavy, slightly elevated, more or less copiously fringed with cracked bristles; very unequal in length.

USNEN, a name given by Avicenna and Serapion to the plant kali, of which the alkali salt called *pot-ashes*, and used in the compounding of our soap, is made. There are also several other things called by this name, and, in general, all that were used in the scouring or cleaning of clothes. The dung of sparrows was used by some people for this purpose, as the dung of hogs is at this time; and this was, therefore, called by some *usnen*. Hyflop, a plant famous for its cleaning virtue, was also called by the same name; and some have also applied it to the soldanella, or sea bind-weed.

Wherever, in the Arabian writers, the word *usnen* is used in any of these latter senses, there is something added to distinguish which of the things before expressed is meant by it; but whenever it stands alone and unexplained, it is to be understood as meaning the kali.

USOZA, in *Geography*, a river of Russia, which runs into the Svopa, near Phatez, in the government of Kursk.

USPALLATA, a spacious plain, about 50 miles long and 6 broad, situated on the eastern mountains of the Andes, in the province of Acacacagna, which gives name to the most celebrated silver mine, as Chili. The vein of silver, on the skirts of the eastern chain of this plain, has been traced to the enormous length of 90 miles; nor is its termination yet fixed. It is supposed by many to extend to Potosi, which lies in the same direction, or through a space of 14°, or 84° geographical miles. The grand vein is always nine feet in thickness, and on both sides throws off numerous branches, which may be said to penetrate a chain of mountains 30 miles in breadth. This productive mine, though discovered in 1638, was neglected till the year 1762, when the people of Mendoza, a town not far from Ufpallata, invited two expert miners from Peru; and they continued to work the mine with prodigious advantage.

USPENSKOE, a town of Russia, in the government of Ekaterinoflav; 16 miles S. of Donetzsk.

USPENSKOI, a town of Russia, in the province of Ufiug; 28 miles S. of Ufiug.—Also, a town of Russia, in the government of Archangel; 80 miles S. of Kola.

USQUEBAUGH, a strong, rich, compound liquor, chiefly taken by way of dram; its basis being brandy, or a more ordinary spirit.

The manner of making it is somewhat various, and the ingredients numerous. We shall give a receipt, much commended formerly, as a specimen.

To two gallons of brandy, or spirits, put a pound of Spanish liquorice, half a pound of raisins of the sun, four ounces of currants, three of dates, sliced; tops of thyme, balm, fava, and mint, and tops or flowers of rosemary, of each two ounces; cinnamon and mace bruised, nutmegs, aniseeds, and coriander-seeds, bruised likewise, of each four ounces; citron, or lemon and orange-peel, scraped, of each an ounce: all these are to be left to infuse forty-eight hours in a warm place, often shaking them together; then let them in a cool place, for a week; after which, the clear liquor is to be decanted off, and to it is to be put an equal quantity of net white port-wine, and a gallon of calvary. The whole is finally to be sweetened with a proper quantity of double refined sugar.

USRENUM, in *Ancient Geography*, a river of Asia, in Syria, which had its source in a branch of mount Amanus, and by a south-west course discharged itself into a lake, near the gulf called Issicus.

USSAC, in the *Materia Medica of the Arabians*, a name given by Serapio to the gum ammoniacum of the Greek writers. It seems no other than a false spelling of the word *assac*, which is the common name of the gum in Avicenna, and other of the writers of that nation; but this does not seem to be the same drug, which we call gum ammoniacum at this time.

USSARA, in *Ancient Geography*, a town of Africa, in Mauritania Cæsariensis, situated in the vicinity of Lamida.

USSASI, or USSASYE, in *Botany*. Rumph. Amboin. v. 3. 60. t. 33. Poiret in Lamarck Dict. v. 8. 261. This is a tree found in Ceram, and some other spice islands, but not in Amboyna. Its stature equals the Lemon-tree. Branches opposite, crossing each other in pairs; quadrangular when young. Leaves opposite, stalked, ovate, acute, entire, single-ribbed, from four to six or seven inches long, and the breadth of three or four fingers, nearly smooth, of an acid, not unpleasent, flavour, like that of an unripe grape. Fruit lateral, sessile, irregularly ovate, or somewhat globular, green, various in size, with a thin tough skin, inclosing a watery acidulous grateful pulp, full of numerous thin flat seeds, like those of a cucumber, or gourd. The smaller-fruited variety, perhaps a distinct species, has a firmer pulp, with only four or five seeds. Both kinds raise the base of the stem, upon forked roots, high out of the ground. Nothing is known of the parts of the flower, nor indeed of the true structure of the fruit, by which these plants could be scientifically described or classed.

USSASSYR, in *Geography*, one of the Kurile islands, which lies 17 versts from Rallagu, and in length and breadth may be 25 versts each. It consists properly of two islands lying close together, composed of considerable rocks and cliffs. Opening to the south is a round bay, in the shape of a kettle encompassed with hills, where the strand is sandy; and along it, as well as on the sea-shore, runs a source of almost hot water, and not far from it another. Here too are some spouts, running strong, and throwing the water to a considerable height in the air. In many places are perceived chaps and chafms in the earth, 100 fathoms in length, and sometimes more. Near the great spout the shore is steep and high, producing large lumps of sulphur and salmiak, which partly fall down, and partly

are collected there. In other respects, the island is like *Rallagu*; which see.

USSEL, a town of France, and principal place of a district, in the department of the Correeze; 32 miles E.N.E. of Uzerches. N. lat. 45° 33'. E. long. 2° 23'.

USSES, a river of France, which runs into the Rhône, near Seiffel.

USSETTA, a town of the state of Georgia; 160 miles W.S.W. of Augusta.

USSITERNA, a town of Servia; 24 miles W. of Piftrina.

USSITZA, a town of Servia; 32 miles W.N.W. of Novibafar.

USSON, a town of France, in the department of the Puy-de-Dôme; 16 miles W. of Ambert.—Also, a town of France, in the department of the Vienne; 12 miles N.E. of Civray.

USSORA, a river of Bosnia, which runs into the river Bofna; 32 miles N. of Serajo.

USSUBUM, in *Ancient Geography*, a place marked in the Itin. of Anton. on the route from Bourdeaux to Agen, between Sarione and Fines.

USSUL, in *Geography*, a town of Japan, in the island of Niphon; 86 miles N.W. of Jedo.

USTAK, a town of Natolia; 22 miles N. of Karahisin.

USTARITZ, a town of France, and principal place of a district, in the department of the Lower Pyrenées; 48 miles W. of Pau. N. lat. 43° 23'. W. long. 1° 23'.

USTAYANTHO, a lake of New York, from which the river Delaware takes its rise.

USTCHOTZKOL, three islands on the west coast of Kamtschatka. N. lat. 57° 10'. E. long. 156° 14'.

USTERIA, in *Botany*, so named by Willdenow, in honour of Dr. Paul Usteri, of Zurich, member of several learned academies, as well as of the legislative body of his own country, and well known by his very useful periodical compilation, entitled *Annalen der Botanik*, as well as by the *Magazin für die Botanik*, edited by Römer and himself. These works extend to many octavo volumes, and have been eminently serviceable to German readers, in making them acquainted with some of the most valuable and expensive botanical publications of other countries, at a cheap rate; several of such works being copied entire in these volumes. Willd. in Röm. and Ust. Mag. fasc. 8. 151, without a name. A.G. Soc. Berol. v. 10. 52. t. 2. Schreb. Gen. 782. Willd. Sp. Pl. v. 1. 18. Mart. Mill. Dict. v. 4. Afzel. Gen. Pl. Guineens. part. 1. 1—11, with a figure.—Class and order, *Monandria Monogynia*. Nat. Ord. *Rubiaceae*, Juss.

Gen. Ch. Cal. Perianth inferior, of one leaf, four-cleft, permanent; the three inner segments minute, close-pressed, acute; the outer one very large, petal-like, horizontal, linear-lanceolate, very blunt. Cor. of one petal, salver-shaped, deciduous: tube narrow, cylindrical, twice the length of the longest segment of the calyx: limb in four deep, lanceolate, acute, unequal segments, rather turned to one side. Stam. Filament solitary, short, tapering, inserted into the margin of the tube, between the two larger segments of the limb; anther prominent, arrow-shaped, versatile, of two oblong diverging cells. Pyl. Germen superior, ovate-conical; style thread-shaped, longer than the tube of the corolla; stigma quite simple, slightly corrugated. Peric. Capsule ovate-oblong, compressed, with two furrows, two, partly cloven, concave valves, and two cells, the partition transverse, double, from the inflexed parallel margins of the valves,

valves, so that the capsule easily separates into two lobes. Seeds imbricated in two rows, upon a large, deciduous, convex, longitudinal *receptacle* in each cell, numerous, ovate, peltate, depressed, small, obtuse, each encompassed with a large, nearly orbicular, cellular, reticulated wing.

Eff. Ch. Calyx four-cleft; the outer segment very large. Corolla salver-shaped, four-cleft. Capsule of two cells, with inflexed partitions. Seeds imbricated, winged.

Obf. We have adopted Dr. Afzelius's more accurate description of this curious and very distinct genus, compared with dried specimens. That of Willdenow is in many respects very incorrect; nor can all his mistakes be well accounted for. He took the *receptacle* for a solitary seed.

1. *U. volubilis*. Twining Usteria. Afzel. as above, five. (*U. guineensis*; Willd. n. 1. *Monodynamis Ifertia*; Gmel. Syst. Nat. Linn. v. 2. 10.)—Native of the Guinea coast, especially of the hills of Sierra Leone, and of Bananas and Plantain islands, in dry stony places, where Dr. Afzelius found it in great abundance, flowering from September to December, and bearing ripe capsules from February to May. The negroes know this plant by the name of *Makbòt*, or *Makbòt-T'bòt*. Willdenow received it from Mr. Ifert, fœ *ISERTIA*; but the first specimens ever brought to Europe by any botanist, were those of Mr. Smeathman, many years before. The stem is shrubby, with long, slender, round, smoothish, opposite, twining branches, supporting themselves on any thing that stands in their way; their bark, when first tasted, sweetish, afterwards bitter. Leaves stalked, opposite, crossing each other in pairs, elliptical, entire, smooth, from two to four inches long, bluntish, with one rib, and many transverse veins. Footstalks two or three lines long, connected by a very short, annular, intrafoliaceous stipula. Panicles terminal and axillary, large, compound, corymbose, forked, finely downy or hoary, as well as the calyx; and the tube of the white, or partly violet, corolla. Capsule one inch and a quarter long, much resembling that of a *Cinchona*, to which genus this plant is naturally allied, though so distinct in its flower. Dr. Afzelius confirms this affinity, by informing us that the natives of Guinea sometimes cure fevers with an infusion of the leaves and young branches.

USTERIA is also the name of a genus in Cavanilles' *Icones*, v. 2. 15. t. 116, now called *MAURANDIA*; see that article.

USTIA, in *Geography*, a town of European Turkey, in Moldavia, on the Dniester; 88 miles E. of Jassy.

USTJAK, a town of Asiatic Turkey, in Natolia; 20 miles N. of Kiutaja.

USTIANO, a town of Italy, in the department of the Mincio, on the Oglio; 26 miles W. of Mantua.

USTICA, an island in the vicinity of Sicily, with a town of the same name. It was opposite to Pacopus, and appears as one of the Lipari islands. This island was for centuries uninhabited, except by some wild goats, till, in the year 1765, a citadel was built here, furnished with a garrison: at the same time a colony was sent, which flourishes, though the island is without springs, and only supplied with fresh water by rain kept in cisterns; 25 miles from the coast of Sicily. N. lat. 38° 44'. E. long. 13° 36'.

USTILAGO, in *Botany*. See *UREDO*.

USTION, *Ustio*, formed from *urere*, to burn, in *Pharmacy*, the preparing of certain substances, by burning them.

The ancients made use of burnt horns, nails, feathers, and other parts of animals, for divers remedies; and the moderns still use as *ustum*, which is burnt copper, or copper that has undergone the *ustion*, with sulphur.

Vol. XXXVII.

The *ustion* of minerals is a more imperfect kind of calcination. It is a degree beyond torrefaction.

USTIUG, or *VELIKI*, in *Geography*, a town of Russia, and capital of a province, in the government of Vologda, situated on the Dwina, at the conflux of the Suchona and the Jug, the see of an archbishop. It contains ten or twelve churches, built of stone, with some others, which, with the houses, are of wood. The merchants are numerous, and great quantities of grain are sent to different parts. The city is chiefly on the left side of the Dwina; 1002 miles from Peterburg. In order to characterise the weather of the northern region of Russia, we observe, that Ustug lies 516 miles from the nearest shore of the Frozen ocean, and 15½° more to the N. than St. Peterburg; and that the mean heat and cold here is above Reaumur's freezing point in the month of April until September; below the freezing point in the month of October until March. The mercury in the same thermometer, in the month of June alone, falls never below 0, and only in January never rises above 0. The cold increased at times so late as in the middle of April to 30°, and the quicksilver may, sometimes so early as November, and again in the first days of March, be hammered. In every winter are 120 days, in which the cold is more than 5°; and of these, 65 days in which it exceeds 10°; yet the summer has more hot than the winter has cold days. The thermometer stood, upon an average of several years, the whole day above 0, on 152 days, and below 0, on 150; and consequently there were 63 days on which it stood alternately above and below 0. The rivers are navigable about the 10th of May; at the end of that month the summer corn is sown, and about the middle of June the fields are manured for winter sowing; the harvest is commonly in August. The trees shed their leaves sometimes so early as the 10th of August, but usually about the 20th. On the 4th of November, 1786, the quicksilver froze in the open air, during a cold of 30½° of Reaumur's thermometer; the 1st of December, at 40°, it fell the same day to 51°, and the 7th of December was down to 60°. The quicksilver then froze to a solid mass, so as to bear beating with a hammer, in a warm room, several times before any pieces flew off from it. See the Observations of Mr. Fries, in *Crell's Annals*, 1787, p. 2, cited in *Tooke's Russia*, vol. i. N. lat. 60° 50'. E. long. 45° 40'.

USTIUG, a province of Russia, and by far the most considerable part of the government of Vologda, being 400 miles in length, and 240 in breadth.

USTIUZNA, a town of Russia, in the government of Novgorod, on the river Mofga; 144 miles E. of Novgorod.

USTRINA, among the Romans, the place where they burnt the bodies of the dead. It was commonly in the Campus Martius, or some other place in the suburbs, and sometimes in the city for persons of quality; and for the common people on the Esquiline mount. See *BUSTUM*.

USTVIANSKOI, in *Geography*, an otrog of Russia, in the government of Irkutsk, on the Yana. N. lat. 70° 30'. E. long. 131° 38'.

USTULATION, *Ustulatio*, a word used by pharmaceutical writers to express the roasting or torrefying of humid or moist substances over a gentle fire, so as to render them fit for powdering. The same word is also used by some for what we call burning of wine.

USTUM, *Æs*. See *Æs Ustum*.

USTURANTZKOI, in *Geography*, a fortress of Russia, in the government of Irkutsk, on the borders of China; 76 miles S. of Selenginfk.

USUBIS, in *Botany*, a name of Burmann's. See SCHMIDELIA.

USUCAPTION, *Ufucapcio*, in the *Civil Law*, is an acquisition of the property of a thing by a possession and enjoyment of it for a certain term of years prescribed by law.

Some make a difference between prescription and usucaption; maintaining that the latter is only used with regard to moveables, and the former with regard to immoveables. But there is no essential difference between them; and, accordingly, prescription and usucaption are generally held synonyma.

Usucaption denotes the acquisition of domain founded on a long possession uninterrupted and undisputed, or on an acquisition solely proved by this possession. Wolf defines it, an acquisition of domain founded on a presumed desertion; by which definition he explains the manner in which a long and peaceable possession may serve to establish the acquisition of domain. Modestinus says, in conformity to the principles of the Roman law, that usucaption is the acquisition of domain from a continued possession, during a time expressed by the law. These three definitions, says Vattel, are not incompatible with each other. Prescription is the exclusion of all pretensions to a right founded on the length of time during which it has been neglected; or, as Wolf defines it, the loss of a proper right in virtue of a presumed consent: this definition is allowed by Vattel to be just; that is, to explain how a long neglect of a right occasions its being lost; and it agrees with the nominal definition which he has given, and in which he explains what is commonly understood by this term. Usucaption, however, is a term little used; prescription being adopted in lieu of it. Many celebrated authors (Grotius, Puffendorf, and Wolfius) have asserted and proved, that usucaption and prescription are derived from the law of nature; and Vattel has investigated and established this point, which some others have disputed. Nature, says this excellent writer, has not herself established property with respect to wealth, and in particular with regard to lands: she only approves this introduction, for the advantage of the human race. It would therefore be absurd to say, that domain and property being once established, the law of nature can secure to a proprietor any right capable of introducing disorder into human society. Far from giving such a right, the law of nature prescribes to the proprietor the care of what belongs to him, and lays him under an obligation to make known his right, that others may not be led into an error: for nature does not approve his property, and only secures it to him on those conditions. If he neglects this for a time long enough not to be admitted to reclaim it, without endangering the rights of others, the law of nature will not permit him to reclaim it. Why does the law of nature order all to respect this right of property in him who possesses it, if it be not for the peace, safety, and advantage of human society? Nature must then, from the same reason, require that every proprietor, who for a long time, and without any just reason, neglects his right, should be presumed to have entirely renounced and abandoned it. This forms the absolute presumption, or *juris et de jure*, of its being abandoned, and upon which another is legally entitled to appropriate the thing abandoned to himself. This presumption composes a title as firm and just as that of property itself, established and supported by the same reasons. The honest possessor, who had founded a presumption of this kind, has then a right approved by the law of nature; and this law,

which requires that the right of every one should be firm and certain, does not permit their being disturbed in their possession.

The right of usucaption properly signifies, that the honest possessor is not obliged to suffer his property to be disputed; he proves this by his possession itself, and he repulses the demand of the pretended proprietor by prescription. Nothing can be more equitable than this rule. Prescription, being only founded on an absolute or lawful presumption, has no place, if the proprietor has not really neglected his rights. This condition implies: 1. That the proprietor cannot allege an invincible ignorance, either on his own part, or on that of his friends: 2. That he cannot justify his silence by lawful and solid reasons: 3. That he has neglected his right or kept silence during a considerable number of years. These remarks relate to *ordinary* prescription. *Inmemorial* prescription, founded on immemorial possession, that is, on a possession, the origin of which is unknown or obscure, secures the possessor's right, and it cannot be taken from him.

Usucaption and prescription, founded on the law of nature, form a part of the law of nations, and ought to take place between different states: for the law of nations is nothing but the application of the law of nature to nations, rendered, in a manner, suitable to the subject: and so far is the nature of the subject from forming here any exception, that usucaption and prescription are much more necessarily used between sovereign states than between individuals. However, they are often more difficult in their application to nations, as these rights are founded on a prescription drawn from a long silence. The tranquillity of the people, the safety of states, the happiness of the human race, do not allow that the possessions, empire, and other rights of nations, should remain uncertain, subject to dispute, and always ready to occasion bloody wars. It is, therefore, necessary to admit between nations a prescription founded on a long interval of time, as a solid and incontestible method. Usucaption and prescription being necessary to the tranquillity and happiness of human society, it is justly presumed that all nations have consented to admit the use of them as lawful and reasonable, with a view to the common advantage, and even to the particular benefit of each nation. Prescription of many years standing, as well as usucaption, is therefore established by the voluntary law of nations. Vattel's Law of Nations, b. ii. ch. 11. See PRESCRIPTION.

USUFRUIT, *Ufus fruſtus*, in the *Civil Law*, the temporary use or enjoyment of any lands or tenements; or the right of receiving the fruits and profits of an inheritance, or other thing, without a power of alienating or changing the property thereof.

When the usufructuary dies, the usufruct returns to the proprietor. The dower of the jointure of a widow is only an usufructuary due; that is, she only enjoys the usufruct thereof, and cannot dispose of the principal.

All mutual presents between man and wife only import the usufruct of the goods of the first that dies, to the profit of the survivor. The incumbents of benefices are only usufructuary. An usufructuary has full right over the coppice, but he cannot fell timber-trees.

USUM, in *Geography*, a river of Romania, which runs into the Mariza, 4 miles S.E. of Assarli.

USURA *Maritima*, terms applied to contracts for the repayment of money borrowed, not on the ship and goods only, but on the mere hazard of the voyage itself; as when a man lends a merchant 100*l.* to be employed in a beneficial

cial

cial trade, with condition to be repaid with extraordinary interest, in case such a voyage be safely performed. This kind of agreement is sometimes called *fenus nauticum*. See **BOTTOMRY**, and **RESPONDENTIA**.

USURER, a person charged with a habit or act of usury.

The laws of our ancient Saxon and Norman kings are very severe upon usurers, or letters-out of money upon interest. "Ufurarios quoque defendit rex Edvardus (Confessor), ne remaneret aliquis in toto regno suo; & si quis inde convictus esset, quod fenus exegerat, omni substantia propria careret, & postea pro ex lege habeatur: quoniam usura radix omnium malorum." Leg. Edv. Confess. cap. 37.

They were, indeed, allowed to dispose of their goods before conviction, and whilst they were living; but after their death they were confiscated, if it could be proved they lent money to use within a year before their death.

If a clergyman were an usurer, his goods were not to be confiscated, but to be distributed to pious uses. In those days usury was thus defined:

"Est usura suos quisquis tradit mihi nummos
Spe lucri, fœnus duplex usura vocatur."

USURIOUS Contract is any bargain, or contract, where a man is obliged to pay more interest for money than the statute allows.

It is enacted by statute 13 Eliz. cap. 8. that all brokers shall be guilty of a *premunire*, who transact any usurious contract where more than ten per cent. interest is taken.

USURPATION, in Law, an injurious using or enjoyment of a thing for continuance of time, that belongs of right to another. See **TYRANNY**.

USURPATION, in a more peculiar sense, denotes an absolute ouster or dispossession of the patron of a church; and happens when a stranger, that hath no right, presenteth a clerk, and he is thereupon admitted and instituted. In which case of usurpation, the patron lost by the common law not only his turn of presenting *pro hac vice*, but also the absolute and perpetual inheritance of the advowson, so that he could not present again upon the next avoidance, unless in the mean time he recovered his right by a real action, viz. a writ of right of advowson. However, because bishops, in ancient times, either by carelessness or collusion, frequently instituted clerks upon the presentation of usurers, and thereby defrauded the real patrons of their right of possession, it was in substance enacted by the statute Westm. 2. 13 Edw. I. cap. 5. sect. 2. that if a possessory action be brought within six months after the avoidance, the patron shall (notwithstanding such usurpation and institution) recover that very presentation which gives back to him the seisin of the advowson. Yet still, if the true patron omitted to bring his action within six months, the seisin was gained by the usurper, and the patron to recover it was driven to the long and hazardous process of a writ of right. To remedy which, it was further enacted by statute 7 Ann. cap. 18. that no usurpation shall displace the estate or interest of the patron, or turn it to a mere right; but that the true patron may present upon the next avoidance, as if no such usurpation had happened. So that the title of usurpation is now much narrowed, and the law stands upon this reasonable foundation, that if a stranger usurps my presentation, and I do not pursue my right within six months, I shall lose that turn without remedy, for the peace of the church, and as a punishment for my own negligence; but that turn is the only one I shall lose thereby. Usurpation now gains no right to the usurper, with regard to any future avoidance, but only

to the present vacancy: it cannot indeed be remedied after six months are past; but, during those six months, it is only a species of disturbance. Blackst. Comm. book iii.

USURPATION of Franchises and Liberties, is when a subject unjustly uses any royal franchises, &c. And this is said to be an usurpation upon the king, who shall have the writ of quo warranto against the usurpers.

USURY, **USURA**, in the general, denotes a gain or profit which a person makes of his money, by lending the same; or it is an increase of the principal exacted for the loan thereof; or the price a borrower gives for the use of a sum credited to him by the lender: called also *interest*, and in some ancient statutes, *dry exchange*. For lawful interest, see **INTEREST**.

The word usury is usually taken in an evil sense; viz. for an unlawful profit which a person makes of his money; in which sense it is, that usury is forbidden by the civil and ecclesiastical law, and even by the law of nature. In this sense it also is, that it is held usury to lend money on pawns, to exact interest for money, without surrendering the principal, and to stipulate interest for money which is not employed in trade, nor brings any profit to the person who receives it: but, as the Latin word *usura*, at least the plural of it, *usure*, may be understood of a lawful interest, *usury*, in English, might also be used in the same harmless sense.

Use or interest, by the civil law, is divided into *lucrative* and *compensatory*. *Lucrative* is, when it is paid where there hath been no advantage made by the debtor, and no delay or deceit in him: and this is condemned by the civil law. *Compensatory* is, when it is given, where the thing lent hath been advantageous to the debtor, and disadvantageous to the creditor that he was not sooner paid: and this is permitted by that law. Wood. Civ. L. 213.

And by the civil law (Swinburn tells us), a manifest usurer cannot make a testament; and though he make one, it is void in law concerning goods and chattels, unless he satisfy for the usury, or put in caution for satisfaction to be made. Swinb. 101.

And as manifest usurers are forbidden to make testaments themselves, or to dispose of their goods by their last wills; so are they forbidden to reap any benefit by the testament of others, or to be capable of any legacy of goods. Swinb. 376.

These are the anathemas of the popes, and not the re-
scripts of the emperors. (See Cod. 5. 5.) The punishment by the civil law was once a quadruple penalty, (L. 2. Cod. Theod. de Usuris,) but this seems to have been mitigated by Justinian, who contents himself with declaring that whatever is paid more than the legal interest, shall be accounted part of the principal. Cod. 4. 32. 26. Noct. de Fœn. et Us. lib. 2. cap. 16.

By a constitution of Edmund archbishop of Canterbury; "We forbid any man to detain a pledge, after he hath received the principal out of the profits, after deduction of the expences, for this is usury." Lind. 160. The pledge in this case must be supposed to be lands, cattle, or such like, out of which a profit ariseth. Johnf.

And by Can. 109. If any offend their brethren by usury; the churchwardens or questmen and siders, in the next presentments to their ordinaries, shall faithfully present every such offender, to the intent that he may be punished by the severity of the laws, according to his deserts; and such notorious offenders shall not be admitted to the holy communion, till they are reformed.

And in general, it is said, that by the ecclesiastical laws, if a man be a manifest usurer, not only his testament is void (as hath been said); but his body, after he is dead, is not

to be buried amongst the bodies of other Christian men, in any church or churchyard, until there be restitution or caution tendered, according to the value of such goods. Swinb. 102.

Most of the early fathers of the church have condemned usury in the strictest sense, *i. e.* any profit made of the loan of money, as contrary to the divine law. Alexander III. in the council of Lateran, prohibited the taking of all interest for money; and it has been observed, that Gregory IX. places the chapter of usury after that of theft. But the Mosaic law, though it forbade the Jews to take interest from their brethren, allowed them to take interest from strangers, or to borrow from them on the same terms; and that this law has not condemned the lending of money on interest as *malum in se*, and contrary to the law of nature and of nations, which many have thought, but merely prohibited it amongst the Jews, as dangerous in a political view, considering their itinerant and agricultural life, has been ably demonstrated by Noodt in his *Treatise de Fœnore et Usuris*, c. 10. and 11. (See INTEREST.) Nearly the same regulations obtained amongst the Romans in the infancy of the republic; but when commerce was introduced amongst them, the contract of lending money at a certain profit became frequent. The highest rate of legal interest among the Romans, from the time of Cicero and Justinian, was the *centesima* or twelfth part paid every month, amounting to 12 *per cent. per annum*; but the satirists inform us that some usurers exacted three, four, or even five times that profit. Justinian in his code fixed the legal rate of interest at 4, 6, 8, or 12 *per cent.* according to the station of the lender and the nature of the contract. (Cod. 4. 32. 26.) Various evasions of the laws, however, were practised at Rome, and some of these were not unknown to the canonists; for usurious profit might be secured under the contract of a sale and repurchase, or letting to hire, or might be stipulated for in consideration of the gain of the borrower, or of the loss which the lender suffered by the detention of his money. To these, modern money lenders have added the purchase of annuities, in which, as the purchaser risks his capital, he is allowed to take a greater share of interest, though this must be within equitable bounds. (Vaughan v. Thomas, 1 Bro. 556. Heatcote v. Paignon, 2 Bro. 167.) But if any of these transactions appear from circumstantial evidence to be merely the covering of an usurious contract, they are held to be within the statute of Ann. See *Chesterfield v. Janfen*, 2 Vesey, 125.

By the laws of king Alfred, it was ordained, that the chattels of usurers should be forfeited to the king, their lands and inheritances should escheat to the lords of the fee, and they should not be buried in the sanctuary. Swinb. 102. 1 Haw. 245.

Also it seems to have been the opinion of the makers of divers acts of parliament since the Reformation, that all kinds of usury are contrary to good conscience. 1 Haw. 245.

However, custom has now distinguished betwixt usury and legal interest; and appropriated the term usury to that which exceeds the interest determined by statute. The legal interest is five *per cent.* by 12 Anne, st. 2. cap. 16. commonly called the statute against usury, which ordains not only that all contracts for taking more than 5*l.* *per cent.* and proportionably for a greater or less sum, are in themselves totally void, but also that the lender shall forfeit treble the value of the money borrowed. And farther, if any scrivener or solicitor takes more than 5*s.* *per cent.* procreation money, or more than 1*2d.* above the stamp duties for making a bond or bill for loan or forbearing thereof, or for any counter-bond or bill concerning the same, he shall for-

feit 2*0l.* with costs, and shall suffer imprisonment for half a year.

As this act declares all usurious contracts void, the indorsee of a bill of exchange give nupon an usurious consideration cannot recover, although he had no notice of the usury, and had given a valuable consideration for the bill. (Low v. Waller, Doug. 736.) And if more than the principal and legal interest be paid, an action will lie to recover the surplus: *per* Ld. Mansfield, in *Smith v. Bromley*, 1b. 696.

In these days, a distinction seemeth to be made betwixt usury and legal interest: for what exceedeth the legal interest is properly usury; and he who exacteth it seemeth still to be punishable as an usurer. 1 Dom. 126.

And, upon the whole, it seemeth now to be generally agreed, that the taking of reasonable interest for the use of money is in itself lawful, and consequently that a covenant or promise to pay it, in consideration of the forbearance of a debt, will maintain an action. See INTEREST.

The usury laws have lately become a subject of parliamentary and public discussion; and an excellent treatise of Mr. Jeremy Bentham, of which a new edition was published in 1816, has claimed peculiar attention. The prejudices in which these laws had their foundation maintained their ground, notwithstanding the ruins of the mercantile system to which they naturally belong; and they soon derived support from an opinion in their favour, delivered by Dr. Smith, in a work which powerfully operated towards dispelling the other errors of the mercantile theory. Mr. Bentham was the first writer who openly and systematically attacked them, and this he did with such success, as to produce a general conviction of their injustice and impolicy. He ascribes, perhaps, too much importance to religious bigotry: to this purpose, he observes that the practice of self-denial was substituted at a very early period for active virtue; and as the greater the temptation the greater the merit, much virtue was arrogated to themselves by those who declined the use of means for making money, which was generally regarded as a favourite pursuit. Hence, he says, the obvious method of making wealth productive, by lending it for a profit, was proscribed as an illegal gratification; and besides, as the Jews were much addicted to this practice, and had the money-trade principally in their own hands, the Christians, very anxious to avoid their customs, deemed it peculiarly sinful. The authority of Aristotle had also great weight in determining the judgment and conduct. (See INTEREST.) Our author also remarks, that the natural antipathy of the spendthrift towards the saving man, arising from the envy with which he regards him, had no inconsiderable influence. To which it may be added, the feeling excited against a rich man, as the trader must always be compared with the borrower, and in favour of a poor one, by the very circumstance of the former making the latter pay for half, according to his necessities, and reaping a profit without any labour or even trouble on his own part. The reasons commonly alleged in justification of the laws against usury have been such as follows; the first is the prevention of prodigality. Mr. Bentham replies, that if this be a good work at all, it is at least a work of supererogation, but in reality, the restraints under consideration do not operate in this way. Would any man of sound mind think of giving six *per cent.* for the use of money, howsoever pressing his wants, if he could get it for five! Or, can a man, however prodigal, be prevented from selling all he can get rid of by sale, and pledging all which he cannot sell? Those who have security of any kind to offer the lender are not protected by the law; for the lender never makes his bargain upon a view of the borrower's character and habits, but

but of his security. If the spendthrift has no security to offer, how is he more likely to get money at a high than at a low rate? A friend is the only person likely to accommodate him, and he will not take more than the ordinary rate. Prodigals usually borrow money in moderate sums, at the usual rate, in various quantities; and when they can find a lender disposed to speculate, and obtain a compensation for the great risk of trusting them in the high profits of the transaction, such a person will neglect the prohibitions of the usury laws, and make the poor man pay so much more for the additional risk they make him run. Besides, the most certain road to ruin for all prodigals is to obtain goods upon credit, as long as their credit lasts, and here no law interferes.

The protection of indigence is another reason urged in behalf of these restraints: but it may be asked, Can any one rate of interest be adapted to every man's situation? To some it may be profitable to borrow even at ten per cent., whilst others may find six per cent. too high, compared with the sum in prospect, whereas the usury laws determine one standard of exigency for all. This arrangement operates, not in protecting, which is the pretext, but in crushing the indigent. If the protection of indigence were the object of these laws, they stop short of their pretended object: they without doubt prevent a poor man from borrowing at a high rate; but they take no means of compelling the rich to lend him at a lower rate.

A third reason alleged is the protection of simplicity. But how simple must that man be who gives more than he knows, or may easily learn to be necessary, for the use of money! Nothing may be more easily ascertained than the market rate of interest. It is to a very great degree invariable, and it is the same throughout the whole community. A simple man, or a man who is not very simple, may be deceived in other bargains; but in case of loans, the legislator neither does, nor can afford, him the least assistance. The unwary borrower has always the security in his own hands; and if he has been really over-reached, he can have no difficulty in obtaining redress. If, indeed, persons may be supposed to be so simple as to need protection in their money bargains, they are exposed to as great a danger in all their other transactions, in which no lawyer ever dreamed of affording protection to simplicity.

As a fourth reason in favour of these restraints, it is alleged that a free access to the money-market tends to encourage projectors. Dr. Smith has very much contributed to the prevalence of this notion. He classes projectors with prodigals; stigmatizes both as persons likely to waste the capital of the community, and approves of the *maximum* for its tendency to keep a portion of that capital out of their hands. We cannot, within our limits, do justice to Mr. Bentham's elaborate refutation of this dogma, and the exposition of the prejudices upon which it is founded.

The restraint, as he justly remarks, professing to fall upon rash, imprudent, useless schemers, does in fact fall upon such persons as, in the "pursuit of wealth, or even of any other object, endeavour, by the assistance of wealth, to strike into any channel of invention. It falls upon all such persons as, in the cultivation of any of those arts which have been by way of eminence termed *useful*, direct their endeavours to any of those departments in which their utility shines most conspicuous and indubitable; upon all such persons as, in the line of any of their pursuits, aim at any thing that can be called *improvement*; whether it consist in the production of any new article adapted to man's use, or in the meliorating the quality, or diminishing the expence,

of any of those which are already known to us. It falls, in short, upon every application of the human powers, in which ingenuity stands in need of wealth for its assistant."

It is indeed manifest, that, in this view, the usury laws are absurd, unless it be possible to distinguish, before trial, good from bad, that is, successful from losing projects; in which case, the law ought to fix a *maximum* for the loans to the one, and leave the other free access to the market,—which is plainly impossible. Those who are too prudent to risk their money upon an unpromising scheme, will risk it upon no scheme at all, but will lend only to established concerns. The temptation of higher profit than usual is absolutely necessary, to prevail upon capitalists to embark in new trades. The usury laws prevent, therefore, any capital from finding its way into those channels by way of loan, and directly discourage projects, that is, invention and improvement in all the arts of life; for, without discouraging the useful and the good, they cannot discourage the wild and the bad. Shall we then say, that the danger to the capital of the community, from a failure of certain schemes, is so alarming as to justify us in putting down all manner of schemes, as far as lies in our power? Let it only be remembered, that every thing valuable in civilized life is the fruit of schemes; that all we enjoy above the lot of savages, comes from arts that were once mere projects; and we shall not be disposed to condemn, in one sweeping sentence, every innovation. This is in truth to denounce, as rash and ill-grounded, (we use the author's forcible illustration,) all those projects by which our species has been successively advanced, from feeding upon acorns, and covering themselves with raw hides, to the state in which it at present stands. Whatever (as he says) is now the routine of trade, was, at its commencement, *project*; whatever is now *establishment*, was at one time *innovation*.—And why such fears, after all, of our being impoverished by failing schemes? Long before the existence of the usury laws, the prosperity of our race was running on in an accelerating course;—long before the statutes in this country, its wealth and general improvement was rapidly and constantly advancing. There were every now and then failures, and individual losses in consequence; still their proportion to the bulk of successful projects was trifling; and no one can maintain, that, since the restraints were imposed, the proportion has diminished. Were the law silent on this head, money would still be lent to projectors, by those most deeply interested in the prudent disposal of it. We may safely trust their discretion for its being kept out of desperate risks. No one, indeed, has ridiculed the over-anxiety of such regulations as pretend to save men's capital from injudicious application, more happily than Dr. Smith himself. It is the great text, of which his immortal work is the illustration, almost in all its pages; and in no passage is he more severe, than where he reprobates the intermeddling of government to prevent private imprudence. After remarking, that the number of prudent and successful undertakings is every where much greater than that of injudicious and unsuccessful ones; he administers the following memorable correction to rulers for their love of meddling, and we may observe, that it is quite as well merited by the promoters of the usury laws, as by any other class of legislators. "It is the highest impertinence and presumption, therefore, in kings and ministers to pretend to watch over the economy of private people, and to restrain their expence, either by sumptuary laws, or by prohibiting the importation of foreign luxuries. They are themselves always, and without exception, the greatest spendthrifts in the society. Let them look well after their own expence, and they

they may safely trust private people with theirs. If their own extravagance does not ruin the state, that of their subjects never will."

However presumptuous and impertinent it may be, says Mr. Bentham, for the sovereign to attempt in any way to check by legal restraints the prodigality of individuals; to attempt to check their *bad management* by such restraints, seems abundantly more so. To err in the way of prodigality is the lot, though, as you well observe, not of many men, in comparison of the whole mass of mankind, yet at least of any man: the stuff fit to make a prodigal of is to be found in every alehouse, and under every hedge. But even to err in the way of projecting is the lot only of the privileged few. Prodigality, though not so common as to make any very material drain from the general mass of wealth, is however too common to be regarded as a mark of distinction, or as a singularity. But the stepping aside from any of the beaten paths of traffic, is regarded as a singularity, as serving to distinguish a man from other men. Even where it requires no genius, no peculiarity of talent, as where it consists in nothing more than the finding out a new market to buy or sell in, it requires however at least a degree of courage, which is not to be found in the common herd of men. What shall we say of it, where, in addition to the vulgar quality of courage, it requires the rare endowment of genius, as in the instance of all those successive enterprises by which arts and manufactures have been brought from their original nothing to their present splendour? Think how small a part of the community these must make, in comparison of the race of prodigals; of that very race, which, were it only on account of the smallness of its number, would appear too inconsiderable to you to deserve attention. Yet prodigality is essentially and necessarily hurtful, as far as it goes, to the opulence of the state: projecting, only by accident. Every prodigal, without exception, impairs, by the very supposition, if he does not annihilate, his fortune. But it certainly is not every projector that impairs his: it is not every projector that would have done so, had there been none of those wise laws to hinder him: for the fabric of national opulence—that fabric of which you proclaim, with so generous an exultation, the continual increase—that fabric, in every apartment of which, innumerable as they are, it required the reprobated hand of a projector to lay the first stone, has required some hands at least to be employed, and successfully employed. When, in comparison of the number of prodigals, which is too inconsiderable to deserve notice, the number of projectors of all kinds is so much more inconsiderable—and when from this inconsiderable number must be deducted, the not inconsiderable proportion of successful projectors—and from this remainder again, all those who can carry on their projects without need of borrowing—think whether it be possible, that this last remainder could afford a multitude, the reducing of which would be an object deserving the interposition of government by its magnitude, even taking for granted that it were an object proper in its nature?

But we forbear, and proceed with the same admirable writer, to state the mischiefs which the usury laws create in all directions. The most obvious mischief is, the depriving many persons altogether of the loans of which they stand in need. A person having the means of supplying himself with money, and being also pressed by necessity, is precluded from all chance of obtaining it, unless he has still further means of meeting his wants by evading, at an additional cost, the laws in question. Had it not been for these laws, such a person might have relieved his wants with

ease: and he is one of those who have the greatest occasion for assistance, and the best claims to it. Since, by the supposition, they cannot do without the loan, and are both able and willing to pay the extraordinary rate of interest.

The next mischief is that which the law of usury inflicts upon those who have the means of giving, not only such an extraordinary rate of interest as the lenders, but for the restrictions, would be satisfied with, but somewhat more. These are not excluded altogether from the money market, like the former class; but the terms of the bargain are raised to them. Suppose they have nothing to sell, by which they can raise the money they want, then they must pay for the breach of the law, and this in two ways, both by giving a sufficient premium to the lender to make him run the extraordinary risk, and because the illegality of the trade keeps many dealers out of it, and by narrowing the competition, raises the profits. In the course of the last twenty years, a great trade has been driven in annuities, which admirably illustrates the operation of these laws, this being a perfectly legal mode of evading them, and yet one attended with ruinous expence to the borrower. The law has imposed a number of regulations upon such transactions, with the view of preventing them from becoming too easy a means of evading the usury laws. Those regulations increasing the risk of the lender, somewhat raise the price to the borrower. Then the nature of the transaction renders an insurance necessary upon the life of the borrower; and this is a large increase of price. Moreover, the number of lenders at usurious interest in the illegal way being narrowed by the competition, as all who are driven from this traffic do not necessarily resort to the line of annuities, the market is, notwithstanding the legal method of evasion, considerably narrowed. It has thus happened, that persons with excellent security, and who could easily have gotten loans at six and a half or seven *per cent.* but for the law, are obliged to pay eight or nine, besides the insurance, or from ten to twelve in all; and this, not to private money-lenders, who exact much more, but to the great insurance-companies, who have fallen upon this way of employing their superfluous capital, tempted by the double gains of lenders and insurers.

Moreover, suppose now, that the laws have prevented a man from borrowing at seven *per cent.*, and that he has still goods which he can part with to raise the money. But for the law he might keep his goods; and nothing can prevent his selling them at an under price, according to his necessities. No one who has known any thing of sales made in distressed circumstances, will think a loss of fifteen *per cent.* very extraordinary in such cases. To such a loss as this, the most exorbitant usury bears no proportion; yet this is exactly the premium which the distressed man is compelled to pay for money, by the law which says he shall not borrow at the rate of five and a half. The pressure upon proprietors of real estates is still more severe. Suppose a man comes into possession of an estate worth two hundred a-year, charged with a thousand pounds; and that the incumbrancer wishes to have his money rather than the legal interest, but would be satisfied with one or two *per cent.* above that rate;—at any rate, if he would not, some other certainly could be found to advance the money at that premium, upon the same security.

The last mischief occasioned by the usury laws is, perhaps, more important than all the rest; viz. the corrupting influence upon the morals of the people, by the pains they take, and, as Mr. Bentham observes, cannot but take, to give birth to treachery and ingratitude.

“To purchase,” says the author, “a possibility of being enforced, the law neither has found, nor, what is very material, mult it ever hope to find, in this case, any other expedient, than that of hiring a man to break his engagement, and to crush the hand that has been reached out to help him. In the case of informers in general, there has been no truth plighted, nor benefit received. In the case of real criminals invited by rewards to inform against accomplices, it is by such breach of faith that society is held together, as in other cases by the observance of it. In the case of real crimes, in proportion as their mischiefousness is apparent, what cannot but be manifest even to the criminal is, that it is by the adherence to his engagement that he would do an injury to society, and, that by the breach of such engagement, instead of doing mischief he is doing good. In the case of usury this is what no man can know, and what one can scarcely think it possible for any man, who, in the character of the borrower, has been concerned in such a transaction, to imagine. He knew that, even in his own judgment, the engagement was a beneficial one to himself, or he would not have entered into it: and nobody else but the lender is affected by it.”

It has been further alleged, that the laws against usury allow of transactions substantially usurious; and, indeed, that they cannot prevent these, without wholly putting a stop to the course of trade. Some of the most ordinary occurrences in commerce, are in their nature usury. The practice of drawing and redrawing, by which merchants are accommodated with money for a short time, at a certain commission over and above the five per cent., and then for as much longer, until they pay ten, twelve, and more per cent. during the whole year, is only a more cumbrous and expensive method of borrowing above the legal rate of interest. But other well-known lines of traffic, though apparently more remote from usury, are not less closely connected with it:—paw-broking, bottomry, and repondentia, will immediately occur to the reader. Nay, insurance in all its branches, and the purchase and sale of *post-obits*, with all cases in which a man is allowed to undertake an unlimited risk for an unlimited premium, are in their principle usurious transactions. Of these, the most notorious is the traffic in annuities; which, accordingly, has been found to be the easiest and safest mode of evading the usury laws, although we have already shewn how greatly it increases the rate of interest. For further particulars we must refer to the Treatise above cited; and also to the Edinburgh Review, N^o liv.

USUS, in Roman Catholic times, was a term for the particular manner of performing the cathedral service; as almost every diocese had its own plain-chant, or at least differed in performing some parts of the mass from the rest. The *Ufe of Salisbury*, *Secundum usum Sarum*, was the most general.

USWAY, in *Geography*, a river of Northumberland, which runs into the Coquet.

USZCZA, a town of Poland; 25 miles E. of Cracow.

USZTERNNA, a town of European Turkey, in the province of Servia; 25 miles S. of Jenibasar.

USZOMER, a town of Russian Poland, in Volhynia; 70 miles N.W. of Kiev.

USZTAN-UTAR, a town of Charasm; 250 miles N. of Urkonje.

UT, a Latin term, signifying, literally, *as*; much used in the stating of ratios and proportions.

Sir Isaac Newton assigns its use thus: if indeterminate quantities of divers kinds be compared together, and one of them be said to be *ut, as*, any other, directly, or inversely; the meaning is, that the first is increased, or diminished, in

the same ratio as the latter. And if one of them be said to be, *ut, as*, two or more others, directly, or inversely; the meaning is, that the first is increased, or diminished, in a ratio compounded of the ratios in which the others are increased or diminished.

Thus if A be said to be *as B* directly, and *as C* directly, and *as D* inversely; the meaning is, it is increased, or diminished, in the same ratio with $B \times C \times \frac{1}{D}$; that is, A

and $\frac{BC}{D}$ are to each other in a given ratio.

UT, the name of the first found in each of the hexachords of Guido. By transpositions, *ut* (or *do*) is the key-note in formation of all major keys, and the mediant or 3d in minor keys.

This note, with the rest, were taken out of the hymn of St. John the Baptist, composed about the year 770, in the time of Charlemagne, according to Possévin, by Paulus Diaconus of Aquileia. *Ut queant laxis*, &c. See *MUSIC*.

UTAJARVI, in *Geography*, a town of Sweden, in the government of Ulea; 28 miles S.E. of Ulea.

UTAMANIA, in *Ornithology*, the name of a bird of the web-footed kind, wanting the hinder-toe. It is common about the island of Crete, and is very expert at diving. It is of the size of a teal, and has its head and back black, and its belly white. Its feathers resemble down rather than plumage; but though they are soft and slender, they are very firmly affixed to the skin. Its beak is sharp at the edges, and covered in a great part with down. From the description of Bellonius, as well as his figure, this bird approaches to the common razor-bill, if it is indeed essentially different from it.

UTAS, OCTAVA, in our *Statutes*, the eighth day following any feast or term, as the *utias of St. Michael*, &c. And any day between the feast and the octave is said to be within the utas. The use of this is in the return of writs, as appears by stat. 51 Hen. III.

UTAWAS, or UTWAS, in *Geography*, a river of Canada, which joins the St. Lawrence, near lake St. Francis.

UTENDORF, a town of the county of Henneberg; 4 miles N.E. of Meiningen.

UTENSIL, UTENSILE, a little domestic moveable, particularly such as belong to the kitchen. Such as pots, pans, plates, &c.

UTENSILS are more particularly used in war, for the moveables which the host is obliged to furnish the soldiers quartered with him; which are a bed with bed-cloaths, a pot, and a spoon. They are likewise to have a place at their host's fire, and candle. Utensils are sometimes furnished in money, and sometimes in kind.

UTERINE, in *Anatomy*, an epithet applied to various parts belonging to the uterus; as its arteries, veins, &c. The uterine portion of the placenta is the part immediately adhering to the uterus. See *EMBRYO*, and *GENERATION*.

UTERINE, *Falus extra*. It sometimes happens that the fecundated or impregnated ovum, instead of falling from its calyx into the fimbriated end of the corresponding Fallopian tube, (see *CONCEPTION*;) and thence descending into the uterus, its natural nidus, either continues adherent to the ovarium, and is there nourished and increased; or, separating from the ovarium, and missing the mouth of the tube, falls into the cavity of the abdomen, and adhering to the mesentery, or some of the bowels, absorbs and takes its nourishment from thence; or, lastly, having entered one of the Fallopian tubes, and not able, from the straightness of the passage, to pass on to the uterus, it is there detained and nourished.

nourished. In this case, it frequently happens that after the ovum has attained the size of a hen's or a goose's egg, the sides of the tube (not being able to bear further distension) burst, and hæmorrhage from the ruptured vessels ensuing, the woman dies. De Graaf and Santorinus have each of them related a case of this kind that fell under their notice (see *Obf. Anatom. J. D. Santorini*, 4to. p. 225.), and have given engravings, representing the appearance of the parts on dissection. In which it is remarkable, that though the fœtus, in neither case, had reached the uterus, yet that viscous had increased, and its cavity was distended, nearly to the same size it would have been if the fœtus had been there. But when the ovum is not restricted in its growth by the straightness of the place where it happens to be deposited, or is not blighted and destroyed by any other cause, it continues increasing, and the inclosed fœtus grows, and attains nearly the same size it would have done if it had been lodged in the uterus, and at the end of nine months, the usual term of gestation, the woman has pains similar to those of labour; but as there is no opening by which the fœtus can be excluded after she has been tormented with pains for some days, they cease, and the child dies. If the cyst or bag in which the ovum is contained happens to be placed in a part not very susceptible of pain, it may remain in a quiescent state many weeks, months, or even years, without occasioning much disturbance to the woman, and the fœtus, with its involucre, attain a cartilaginous consistence. It more frequently happens, however, that the fœtus becoming putrid soon after death, and the flesh dissolving, the now denuded bones, pressing against the cyst, excite inflammation and pain in the parts of the woman to which it is contiguous, which at length suppurating, or sloughing away, an opening is made either externally, through the muscles and teguments of the abdomen, or internally, through the coats of the bowels, and the bones of the fœtus are either voided with the stools, or through the abscess in the abdomen. Women after these distressing circumstances, during which their sufferings have been extreme, not unfrequently recover a good state of health, and live many years.

In these cases, though art can do but little, yet some assistance may be occasionally given. When the cyst has opened internally into the bowels, after the discharge of the putrid colluvies, into which the soft parts of the child has been dissolved, the bones begin to come away; and if one of them should lie across the rectum, occasioning violent straining and pain, by passing a finger into the gut, the position of the bone may be altered, and its exit promoted. The passage of the bones may also be facilitated, and the pain occasioned by them alleviated, by injecting emollient glysters, to which it may be sometimes useful to add thirty or forty drops of the tincture of opium. When the abscess is external, its suppuration may be promoted by poultices, or the aperture, after it has burst, may be enlarged with a lancet or knife, and the bones taken out with a pair of forceps. When the fœtus makes its exit through the bowels or vagina, it may sometimes be many weeks, months, or even years, before the bones are completely evacuated; but when the opening is external, through the parietes of the abdomen, the whole process is usually over, and the abscess healed in the space of a few weeks.

Ordinarily there are no symptoms, in the early months of pregnancy particularly, by which we may suspect the fetus not to be in the uterus. The menses cease, and there is the same nausea, sickness, and fullness of the breasts, as in natural conception or pregnancy. The uterus increases in bulk, and its cavity enlarges, though not to the same extent

as when the fetus is included. At the end of the period of gestation, pains are excited so like to those in a natural labour, as to deceive for a time even experienced practitioners.

Many cases of this kind have been recorded by medical writers, besides those mentioned by De Graaf and Santorinus. The following account of a fetus of six months, which was voided entire by the anus, is taken from Mr. William Giffard's Collection of Cases in Midwifery, N^o 157, published by Dr. Edward Hody, in 4to. 1734. The woman died a few days after the exclusion of the fetus, and was opened by Mr. Giffard, assisted by Mr. Nourfe, one of the surgeons to Bartholomew's hospital, in the presence of Dr. Dodd, physician to the same hospital. The parts were exhibited to the Royal Society, and drawings of them taken, under the direction of Sir Hans Sloane, the president. From them two engravings were executed, which are published with the volume.

The ovum appears not to have completely left the ovarium, which, with the fimbriated end of the Fallopian tube, and the ligamentum latum of the right side, appear to be confusedly joined together, and each of them contributing towards forming the facculus, or bag, containing the ovum. The fetus had been perfect, but was beginning to be putrid. It was of the size fetuses usually are at six months. It is not delineated. The woman had the usual signs of breeding, and at the proper time felt the motion of the child, which increasing, and by its weight sinking down behind the uterus, and dragging the fundus of that viscus with it, at length, by its pressure on the rectum, occasioned inflammation, and a portion of the rectum, and of the bag sloughing off, the fetus fell into the gut, and was voided by the anus.

The uterus was not examined, but it appears by the drawing to have been of a larger size than it is usually seen to be in women who are not pregnant, and if it had been opened, the cavity would doubtless have been found proportionably increased.

De Graaf, in his work "De Organis Mulierum," p. 252. tab. 21, has given a delineation of an ovum that was detained in one of the Fallopian tubes, from Vesalius, who dissected the body of the woman. The embryo was between three and four months old, when the sides of the tube giving way, the woman died. Vesalius thought the cavity in which the ovum had been retained was a second uterus.

Cipriani, in a letter to Dr. Millington, president of the college of physicians, London, has given the case of an extraordinary fetus that had continued in the abdomen of its mother twenty-one months. He extracted it by enlarging the opening of an imposthume that had broken naturally. The letter is dated Leyden, 1707.

Strausius gives an account of a woman, aged sixty-three years, who died in consequence of a fall. She had, for twenty years previous to her death, complained of a pain and swelling in the middle and lower part of the abdomen. On opening the body, a fetus was found perfectly formed, but of the hardness of stone. "Cutiferat faxi in modum dura," he says, "Caput erat malleo frangendum, &c." Laur. Strausii, Resolutio casus Muscipantani fetus extra uterum, &c." p. 39.

UTERINE Hæmorrhages. See FLOODING.

In this dangerous disorder the styptic powder of Helvetius is much recommended: and the stibium ceratum has also been tried with great success. See *VITRUM antimonii ceratum*.

In the Stockholm Acts, 1770, there are several cases of uterine hæmorrhages cured by a third or half a grain of ipecacuanha, rubbed with sugar, given every four hours or oftener.

oftener. In one case, the hæmorrhage returned on discontinuing the medicine, and ceased on repeating it. These small doses had good effects in catarrhal coughs, even in those which attend consumptions; and if not beneficial, are at least not hurtful, in bloody coughs, in which vomiting has several times been observed to come on, without any increase of the hæmorrhage. They may be useful in peripneumony and pleurisy, in which cough is often the most troublesome symptom, and in which seneka root (which in increased doses proves also emetic) has been so much recommended.

UTERINE Brothers or Sisters are those born of the same mother, but by different fathers.

UTERINUM JECUR. See *JECUR.*

UTERINUS, FUROR, in Medicine. See *FUROR.*

Men are subject to the like disease, as well as women; so that it might with more propriety be called, the *furor venerus*, or venereal fury. It had its name, *furor uterinus*, from an opinion, that it proceeded from vapours, rising from the womb to the brain.

It has been frequently found, that maids, supposed to be possessed, were only seized with uterine fury.

UTERINUS Lapis, in *Natural History*, a name given by some authors to a stone found in New Spain, and in some other parts of America; it is very hard and heavy, of a beautiful black, and capable of a very elegant polish. The natives cut it into various shapes, and apply it to the navel in diseases of the womb, and pretend that it possesses very great virtues.

UTERUS, in *Anatomy*, the womb, the organ in which the embryo is received from the ovarium, to which it becomes adherent so as to receive the materials of its growth, and in which it is retained for a longer or shorter time in various species, until its expulsion in the process of parturition. A proper uterus belongs only to the mammalia; oviparous generation, under various modifications, is found in the other classes, and the female organ is therefore reduced to a mere canal (oviduct) for the transmission of the ova. See *GENERATION.* See also *CONCEPTION, GESTATION, and EMBRYO.*

UTERUS, Inversion of. Sometimes the uterus descends through the os tincæ into the vagina, and occasionally quite out of the vulva. The first case is termed the *incomplete*; the second, the *complete* inversio uteri. In the latter, the vagina is also drawn downward, and inverted, so that the whole tumour, situated before the parts of generation, seems to hang by a pedicle, composed of the inverted vagina. Between this pedicle and the labia, there is no interstice which will admit a probe. The outer surface of the tumour is, in fact, the lining of the uterus itself.

It being obvious, that the fundus uteri cannot descend through the os tincæ, unless this aperture be considerably dilated, it follows, that an inversio uteri can only happen just after delivery; and one common cause of the accident is, the unskillful employment of force in the extraction of the placenta. Polypi, growing from the fundus uteri, however, are particular cases, in which the inversion of this organ may take place from its being drawn downwards by the weight of such tumours.

Great pain, inflammation, tumefaction, and hæmorrhage, are the usual consequences of an inversion of the uterus. Even mortification, convulsions, and death may result from the complete form of the disease, especially when it has occurred in a very sudden manner.

The reduction of an inverted uterus ought to be attempted without the least delay. The longer the operation is de-

ferred, the more difficult it becomes; for, in these cases, pain, inflammation, and swelling, generally come on with great rapidity. If inflammation should already prevail, there are some practitioners, who think it best to apply leeches and fomentations to the swelling, before undertaking its reduction. It is certain, however, that very little time should be allotted to any proceedings, before endeavouring to reduce the part, which can hardly be kept from inflaming more and more, the longer it remains out of its natural situation. Leeches, fomentations, and even venesection, must, however, be highly proper, whenever the first attempts at reduction do not immediately succeed.

In very old cases, in which the fundus uteri has suffered long compression in the vagina, such an alteration takes place in the shape and structure of the uterus, that the inversion is totally incurable; and all that can then be done is to restrain its further descent by means of a pessary.

The uterus, besides being inverted, may also be in a scirrhus, or actually cancerous state. In this circumstance, the propriety of amputating the diseased organ has been established by several precedents recorded in the annals of surgery. Yet the prudence and utility of this operation must very much depend upon, whether the uterus is the only part affected with the disease; whether the lymphatic glands in the groin and within the abdomen are found; and whether the general state of the patient is such as to justify a rational hope of recovery.

UTERUS, Polypi of. See *POLYPUS.*

UTERUS, Procidencia or Prolapsus of. See *PROLAPSUS Uteri.*

UTERUS, Retroversion of. See *RETROVERSIO Uteri.*

UTERUS, Rupture of. This accident may happen in any kind of labour; the cause of it is probably the uterus being thinner and weaker in some part than is usual, particularly near to its union with the vagina, that being found to be the most common seat of the accident. That it is not occasioned by any peculiar disease of the uterus, is probable, as there are no symptoms occurring during pregnancy from which we might judge it to be likely to happen, but in the course of the labour, an hour or two before the accident takes place, the women complain of an exceedingly acute pain in some part of their bellies. At the moment of the rupture, they feel that something has given way within them. The labour-pains cease; and, if the head of the child has not passed the veins of the pelvis, it recedes, and gradually gets out of the reach of the fingers. Vomiting, paleness of the face, sighing, and a cold sweat, shewing the magnitude of the disaster, succeed. The pulse becomes weak, quick, and scarcely perceptible; and at the end of twenty-four, thirty-six, or forty-eight hours the woman dies.

If the person attending is competent to the business, it is right to follow the child with his hand through the rent in the uterus, into the abdomen, and to bring it away by its feet. This is not done so much with a view to preserve the life of the woman, who almost inevitably perishes, as to save the child, which, if the operation is immediately performed, may often be done. The late Dr. Andrew Douglas relates the history of one case in which the woman was also saved. It is the only case of the kind on record, or perhaps that ever occurred. To give the woman this chance, the operation must be performed immediately, for as the uterus is found speedily to contract, and diminish the aperture, to attempt it after that has taken place, would be to reopen the wound, to renew the hæmorrhage, and consequently to hasten the death of the woman.

UTERUS of fish. Among the fish kinds, all those which

are oviparous have no uterus; but, on the contrary, all the viviparous fishes have this part. The whales, and all the cetaceous kinds, as also many of the cartilaginous ones, have the uterus very fair. It is probable that the eel kind also have it; but this is less certain, the generation of those fishes being yet somewhat obscure. The uterus in the cetaceous fishes is always divided into two proceffes or horns; but in the cartilaginous ones it is divided into two glandulous bodies, which are pervious, and, according to the opinion of Needham, discharge a whitish liquor into the womb, and are of great use in gravitation.

UTERI, *cornua*, are also called horns of the womb.

UTERI, *hydrops*. See DROPSY.

UTERI, *vagina*, or *cervix*. See those articles.

UTFANGTHEE, in our *Law-Books*. See OUTFANTHEE.

UTHINA, in *Ancient Geography*, a town of the interior of Africa Propria, between Tabraca and the river Bagrada. It had the title of a colony.

UTHISIA, a town of Africa, in Numidia.

UTHLEDE, in *Geography*, a town of the duchy of Bremen; 23 miles N.N.W. of Bremen.

UTICA, (*Boothatter*), in *Ancient Geography*, a maritime town of Africa, between Carthage and the promontory of Apollo. It was a colony of Tyrians, and named by the Greeks *Ἰτικα*, *Itica*. This town, by its magnitude and dignity, was inferior only to Carthage; and after the destruction of this city, it became the capital of the province. According to Strabo, it was situated upon the same gulf with Carthage. Augustus granted the title of Roman citizens to its inhabitants. It is often mentioned in the history of the civil war of Cæsar; and it became still more famous by the death of Cato. On its seite are found old walls, a very large aqueduct, cisterns, and other vestiges of edifices, which announce a large and magnificent city. To the S.W. of these ruins may be seen spacious fields, which the Romans rendered famous by their military exercises. Boothatter, by the accumulation of mud brought down by the river Bagrada, is now about 7 miles from the sea.

UTICA, in *Geography*, a flourishing incorporated post-village of New York, the commercial capital of the great western district of this state, situated on the S. bank of the Mohawk, 93 miles W. of Albany, in the town of White-town, Oneida county. It stands on the seite of Old Fort Schuyler, 13 miles N.E. of Rome, anciently Fort Stanwix, and is handsomely laid out in streets, squares, &c., and was incorporated as a village in 1798, and again in 1805. Although Utica is small in area, it contains a population of 1700 persons, and has 300 houses and stores, a Presbyterian and an Episcopal church, a grammar-school, &c. Besides these buildings it has many others, with mills, factories, shops of mechanics, printing-offices, and large book-stores. Weekly papers are published here, and widely circulated through the surrounding country. The Manhattan bank has established a bank at Utica, and in 1812 it obtained a charter for a bank, with a capital of one million of dollars. The soil is fertile, and the situation healthy and pleasant. This village is the central point for all the principal avenues of communication by common roads and turnpikes, and forms the key of trade and travel between the western country and Atlantic ports and towns. N. lat. 43° 6'. W. long. 1° 12' from New York.

UTICNA, in *Ancient Geography*, a town of Africa Propria, situated to the S. of Adrumetum.

UTIDAVA, a town of Dacia. Ptolemy.

UTIDORSI, a people of Asiatic Scythia, upon the

coast of the Caspian sea, towards the river Cyrus. Pliny.

UTIEL, in *Geography*, a town of Spain, in New Castile; 48 miles S.E. of Cuença.

UTII, in *Ancient Geography*, a people who were Persians, or subjects or allies of the Persians. They had for their commandant, in conjunction with the Myci, Arfamenes, son of Darius, according to Herodotus. From various circumstances, it has been inferred that the Outians or Utians of Herodotus are the Uxians of Strabo and Ptolemy.

UTIKON, or OETIKON, in *Geography*, a town of Switzerland, in the canton of Zurich; 12 miles N.E. of Zurich.

UTILA, an island in the gulf of Honduras, about 30 miles from the coast; about 15 miles long, and 5 broad. N. lat. 16° 4'. W. long. 87° 45'.

UTILE, a Latin term, signifying probable, or useful; sometimes used, by English authors, in the same sense.

The *utile* and the *dulce*, profit and delight, are both to be aimed at in poetry; but it is disputed, which of them is to be aimed at in the first place. Corneille says, expressly, "Dans la tragedie l'utile n'entre que sous la forme du delectable."

In the language of the philosophers, there is nothing *utile*, but what is just and honest: *nihil bonum, nisi honestum: nihil malum, nisi turpe*. Cic. de Fin. lib. ii.

UTILE DOMINIUM. See DOMINIUM.

UTILITY, in *Moral Philosophy*, is the tendency of any action to promote the general happiness. According to archdeacon Paley, actions are to be estimated by their tendency. Whatever is expedient is right: and it is the utility of any moral rule alone which constitutes the obligation of it, and this is the criterion of right. On this subject, see OBLIGATION, MORAL PHILOSOPHY, and VIRTUE.

UTILLO, in *Geography*, a town of the island of Cuba; 50 miles S.S.E. of Havanna.

UTINA, in *Ancient Geography*, a town of ancient Venetia, now Ondina.

UTIS, a river of Italy, or rather of Gallia Cisalpina.

UTKINSKAIA, or UTKINSKOI, in *Geography*, a town of Russia, in the province of Ekaterinburg, on the Tschufovaia; 36 miles N.W. of Ekaterinburg.

UTLAGARIÆ PERDONATIO. See PERDONATIO.

UTLAGATIO, in *Law*, an outlawry.

UTLAGATO *capiendo*, *quan to utlagatur in uno comitatu, & postea fugit in alium*, a writ for apprehending a man who is outlawed in one county, and flies into another. See OUTLAWRY.

UTLAGATUM CAPIAS. See CAPIAS.

UTLAGH, UTLAGHUS. See OUTLAW.

UTLAND, *Outland*, is opposed to *Inland*.

UTLARY, or UTLAWRY, UTLAGARIA. See OUTLAWRY.

UTNEMSKOI, in *Geography*, a town of Russia, in the province of Utlug, on the Vitcheгда. N. lat. 62° 56'. E. long. 54° 14'.

UTON, an island near the east coast of Sweden, in the Baltic. N. lat. 58° 57'. E. long. 18° 5'.

UTPHA, a town of Germany, in the principality of Solms Laubach, on the Horlof; 2 miles S.W. of Hungen.

UTRACH, a town of Austria; 7 miles N. of St. Wolfgang.

UTRAQUISTE, in *Church History*, an appellation given by way of reproach to those in Bohemia who communicate under both species, bread and wine.

UTRECHT, in *Geography*, a department of Holland, late one of the Dutch States, which, excepting in one small

small strip of land to the northward, and bordering on the Zuyder See, is wholly environed by Holland and Guelderland; it enjoys a good air, and in most parts the soil is very fruitful; to the eastward it is indeed a high and sterile country, consisting either of sandy hills or small eminences, which are in general over-run with wood; and westward the country perfectly resembles Holland, being for the most part rich meadow, though in many parts full of turf grounds.

UTRECHT, a city of Holland, and capital of the state or department so called; in Latin, *Ultrajectum, Trajectum Inferius, Trajectum Uricense, Antonina Civitas*, which last name was given it from Antoninus, a Roman senator, by whom it was built, in the time of Nero; and *Trajectum ad Rhenum*, to distinguish it from Maelricht, which was called *Trajectum ad Mosam*. It is a handsome, large, and rich city, situated on the ancient Rhine. The Wiltes ruined it, and left nothing but the castle, which they called *Wiltensbourg*. In the year 718, Clotaire king of France rebuilt it, and first called it Utrecht, from the word *Trecht*, which signifies passage, because it was the grand passage over the Rhine, before that river had changed its bed. It was enlarged, and surrounded with walls, about the year 934, by Balderic de Cleves, the fifteenth bishop. Its figure is oval, and it is about four miles in circumference, besides four large faubourgs; but though fortified with some bastions and half-moons, it is not strong. The emperor Charles V. when he became master of the signiory and city of Utrecht, in the year 1529, built a chateau, which he called *Vrcbourg*, or the *Chateau of Peace*; and in the year 1546, celebrated a chapter of the order of the Golden Fleece in the cathedral church, when Maximilian king of Bohemia, and afterwards emperor, Cosmo duke of Florence, Albert duke of Bavaria, Emanuel Philibert duke of Savoy, and eighteen other lords, were installed knights. The dome, or the cathedral church, it is said, was first built in the year 630, by king Dagobert I., and St. Willebrord made it an abbey church, and soon after it became a cathedral. The height of the tower is 380 feet, and from the top in a clear day fifteen or sixteen cities may be seen. The cathedral was at first dedicated to St. Thomas, afterwards to St. Martin. The church of Notre-Dame, commonly called *Buur-Kerck*, and English church, has a small library, which contains some ancient manuscripts; the other parishes are St. James, St. Nicholas, and St. Gertrude. It has likewise hospitals for orphans, foundlings, &c. Before the Reformation, it had many religious houses. The magistracy is composed of a grand Bailly, two burgo-masters, twelve echevins, a treasurer, an intendant of buildings, a president, three commissioners of finances, and a senator, which are changed every year on the 12th of October, and assemble in the town-house, which is a handsome structure. The principal streets are cut through with canals, two of which run through the whole city, namely, the Vaert, and the new Gracht, over which there are thirty-five bridges. These are the principal canals of the town, and the buildings on the banks of the new Gracht are magnificent. The market-place is very large, and the centre of several handsome streets. The houses are of brick, and many of them slated; they have in general good cellars, which they cannot have in the state of Holland, the ground there being too marshy. Without the town there are beautiful rows of trees, to which the English have given the name of the Mall, by reason of their having some resemblance to St. James's Park. This place was the seat of an archbishop, before it fell into the Protestants' hands, and had four

collegiate churches, two commanderies, and several abbeys, which have been all secularized by the States, and applied to other uses. As it stands in a very healthful air, it is frequented by persons of distinction, who have very fine houses in this city. The university, which has been very famous, was originally only a public school, founded by David of Burgundy, bishop of Utrecht; but in the year 1636, it was converted into an university by the States. The university is subject to the magistrates of the city, and has not many privileges. The students wear their ordinary dress, and board in private houses in the town, for there are scarcely any endowed colleges in Holland. Here the states of the province assemble to take cognizance of the affairs of the whole province. There is a public library, well stocked with books in all branches of learning. The town is famous for the treaty of union, signed in 1579, between the Seven Provinces, which laid the foundation of the republic; as likewise for the treaty of peace, signed here in 1713, between France and the Grand Allies. Utrecht gave birth to pope Adrian VI., whose house they always shew to foreigners; and to the celebrated Ann Mary Schurman, so admired in the last century for her learning; 18 miles S. S. E. of Amsterdam. N. lat. 52° 6'. E. long. 5° 11'.

UTRECHT, a township of New York, in Long island.

UTRERA, a town of Spain, in the province of Seville. It contains two parishes, four hospitals, and eight convents; near it is a salt spring; 21 miles S. of Seville.

UTRICULARIA, in *Botany*, so named by Linnæus, from the numerous little bladders, *utriculi*, which often accompany the leaves, and serve to float the plant.—Linn. Gen. 14. Schreb. 19. Willd. Sp. Pl. v. 1. 111. Mart. Mill. Dict. v. 4. Vahl Enum. v. 1. 194. Sm. Fl. Brit. 28. Prodr. Fl. Græc. Sibth. v. 1. 11. Brown Prodr. Nov. Holl. v. 1. 430. Pursh 15. Ait. Hort. Kew. v. 1. 45. Epit. 376. Juss. 98. Poir. in Lamarck Dict. v. 8. 267. Lamarck Illustr. t. 14.—Clas and order, *Didandria Monogynia*. Nat. Ord. *Corydalis*, Linn. *Lychnis affinis*, Juss. *Leptibularia*, Richard and Brown.

Gen. Ch. *Cal.* Perianth inferior, of two equal, ovate, concave, small, mostly undivided, permanent leaves. *Cor.* of one petal, ringent; upper lip flat, obtuse, erect; lower larger, flat, undivided; its palate heart-shaped, more or less prominent between the lips. Nectary a simple or double spur, protruding from the base of the petal behind. *Stam.* Filaments two, inserted into the base of the corolla, very short, incurved; anthers small, cohering together. *Pist.* Germen superior, globose; style thread-shaped, the length of the calyx; stigma conical, sometimes divided. *Peric.* Capsule large, globose, of one cell. *Seeds* numerous, small, attached to a large globular receptacle.

Ess. Ch. Corolla ringent, spurred. Calyx of two equal leaves. Capsule superior, of one cell.

A very curious and elegant genus, of herbaceous, stemless, aquatic or bog plants, found in various parts of the world, but perhaps more numerous in New Holland than in any other country. Linnæus in the 14th edition of his Syst. Veg. has but nine species in all. Willdenow has eleven, Vahl thirty-four, Poir. thirty-six. Three are found in Britain; nine, according to Mr. Pursh, in North America. But Mr. Brown defines twenty-four *Utricularia*, natives of New Holland alone. Of these several were detected by Sir Joseph Banks and Dr. Solander. We have heard the former of these eminent botanists relate, that almost every morning's walk afforded them a new *Utricularia*; but the delicate flowers were generally so frail and transient, or the distinctive characters of the species so difficult to de-

fine, that several of these beautiful novelties were necessarily left undetermined. Any botanist possessed of an extensive herbarium, cannot fail to acknowledge that he is reduced to the same necessity; for Vahl, who has given the best general account of the species of this genus, confesses that he had seen many more, that were undoubtedly distinct, but for which he could not hit upon specific characters, such being scarcely discernible in dried specimens. None of these plants appear capable of cultivation, at least none have as yet been introduced into gardens. Vahl distributes them into four sections, which we shall adopt, with such additions and corrections as we are enabled to attempt. Our kind friend Dr. Afzelius has supplied several apparently new species from Sierra Leone, which, as far as possible, we shall try to reduce to order. It is very probable, especially as the whole genus is more or less aquatic, that the same species may occur in the old and new continent, or other widely distant countries. But as we find not a single instance of this kind recorded, we shall not venture to refer any of our unknown species, from one quarter of the globe, to the descriptions of any found in another. The Guinea species, for instance, we must presume to be all different from those of New Holland, or of South America. The herbarium of the younger Linnæus contains perhaps eight species, without any indication of their native country, or any mark whatever. These must of course be omitted, as they may possibly be New Holland species, communicated, like many other plants, to their late possessor, by his friend Solander; and it would be too precarious to refer them, by examination in their dried and imperfect condition, to any of Mr. Brown's descriptions, however excellent the latter may be with a reference to living plants. Vahl has a numerous section, fifteen species, said to have no leaves. Such indeed is the frequent appearance of many of the plants, in the dried state, in which alone he had an opportunity of examining them. But Mr. Brown, who saw so many alive, mentions none that are truly leafless, though he says the foliage is often deciduous in those with undivided leaves. There is great likelihood, therefore, that several of Vahl's last section may properly belong to his first; as proves to be the case with his *uliginosa*, asserted by Mr. Brown to be either *graminifolia*, or *cyanea*, he could not positively say which. For the rest we can only trust to his opinion or observation.

SECT. 1. *Leaves radical, simple.*

1. *U. alpina.* Alpine Bladderwort. Linn. Sp. Pl. 25. Willd. n. 1. Poir. n. 1. (*U. montana*; Jacq. Amer. 7. t. 6. "U. unifolia; Fl. Peruv. v. 1. 20. t. 30. f. b.")—Nectary awl-shaped. Stalk mostly single-flowered. Roots tuberous. Leaves elliptic-lanceolate. Lips of the corolla nearly equal.—Gathered by Jacquin, on the loftiest mountains of the island of Martinico, in wet exposed situations, flowering in February. *Root* fibrous, furnished with many small elliptical knobs. *Leaves* two, radical, stalked, acute, entire, an inch and a half long, smooth, shining, rather fleshy. *Flower-stalks* solitary, simple, erect, smooth, six inches high, bearing two opposite bractæ, and one, sometimes two, large handsome flowers, above an inch in diameter, whose corolla is white, the calyx and nectary only being slightly tinged with yellow. *Jacquin.* This seems to have the largest flower of any known species, except the following.

2. *U. montana.* Mountain Bladderwort. Poir. n. 2.—Nectary conical, acute. Stalk naked, mostly two-flowered. Roots verucular. Leaves radical, ovato-lanceolate.—Native of Martinico. This might be supposed the same as the last,

but Poir. says "the lower leaves, or rather the roots, are brown, consisting of numerous spreading fibres, a little compressed, laden with short setaceous filaments, which bear a few minute globular vesicles. Radical leaves stalked, at least an inch long, bluntish, smooth, fleshy, entire, with fine branching veins. Footstalks full as long as the leaves. Flower-stalks six or eight inches high, bearing several distant, minute, membranous, oval-oblong, scaly bractæ, and divided at the top into two widely spreading branches, each bearing one flower, an inch at least in diameter, apparently white; with a tinge of blue. Calyx-leaves oval, obtuse, very thin, broadest at the base, marked, like the corolla, with straight longitudinal lines. The two lips of the latter are flat, very broad, nearly equal, rounded, almost entire. Spur rather shorter than the lips, awl-shaped, slightly curved."

3. *U. hispida.* Branched Rough Bladderwort. Lamarck Illust. v. 1. 50. Vahl n. 2. Poir. n. 3.—"Nectary awl-shaped, reflexed. Stalk branched; hispid in the lower part. Leaves linear. Calyx-leaves roundish."—Found in Cayenne, by M. Richard. *Roots* fasciculated, subdivided, hardly an inch long. *Leaves* three, radical, an inch long, acute, smooth, without rib or veins, each tapering at the base into a footstalk. *Flower-stalk* half a foot high, or more, round; smooth in the upper part, where it divides into two or three zigzag branches; *partial stalks* four or five, distant, single-flowered. *Flowers* small. *Nectary* nearly the length of the petal. *Vahl.*

4. *U. volubilis.* Twining Bladderwort. Brown n. 3.—"Stalk twining, round, about two-flowered. Lips of the corolla undivided; the upper wedge-shaped; lower very large, hatchet-shaped. Spur descending, obtuse, depressed. Calyx obtuse."—Gathered by Mr. Brown, on the southern coast of New Holland.

5. *U. spiralis.* Spiral-stalked Bladderwort.—Stalk twining spirally, with several distant flowers. Lower lip very large, cloven. Spur descending, awl-shaped, pointed. Calyx acute.—Native of Sierra Leone. *Afzelius.* The stalk of our only specimen is a foot or more in height, slender, smooth, unbranched, twining round the stem of a grass, and bearing four flowers, two inches at least apart, except the two uppermost. Each flower stands on a slender partial stalk, half an inch long, accompanied by two small ovate bractæ. The spur is very sharp, the length of the partial stalk, and rather longer than the lower lip. The colour of the flowers, as far as can be judged, is purplish. We have seen no leaves nor root, and therefore place this species here merely from the agreement of its stem with the last, of which we have but few examples.

6. *U. speciosa.* Handsome Bladderwort. Brown n. 4. (*U. dichotoma*; Labillard. Nov. Holl. v. 1. 11. t. 8. Poir. n. 9.)—Stalk straight. Flowers opposite. Upper lip abrupt; lower very large, hatchet-shaped, undivided. Spur obtuse. Leaves linear-spatulate, ribbed; tapering at the base.—Native of New South Wales and Van Diemen's island. *Root* of many tufted fibres, bearing small knobs. *Leaves* radical, spreading, above an inch long, immersed in water, as well as half the stalk, which is twelve or fifteen inches high, quite smooth and naked till within three or four inches of the top, where it bears about three distant pairs of opposite, stalked, bractæ, large and handsome purple flowers; whose palate is bearded; spur thick and abrupt, half the length of the lower lip; one leaf of the calyx cloven.

7. *U. oppositiflora.* Opposite-flowered Bladderwort. Brown n. 5.—"Stalk straight, round. Flowers opposite.

Lips

UTRICULARIA.

Lips undivided; the lower very large, hatchet-shaped. Palate lobed. Spur obtuse. Leaves ovate, obtuse, stalked."—Gathered by Mr. Brown, near Port Jackson, New South Wales. The *stalk* grows altogether out of the water.

8. *U. uniflora*. Single-flowered Bladderwort. Brown n. 6.—"Stalk straight, round, single-flowered. Leaves few, roundish, deciduous. Upper lip wedge-shaped, abrupt; lower very large, hatchet-shaped, undivided. Palate lobed. Spur obtuse."—Native of the same country, and of Van Diemen's island; growing likewise above water.

9. *U. Baueri*. Baerian Bladderwort. Brown n. 7.—"Stalk capillary, mostly simple, with a few distant scales about the middle. Flowers racemose. Lips undivided; the upper linear; lower broader than long. Spur straight, descending, bluntish, longer than the lips."—Gathered near Port Jackson, by Mr. Ferdinand Bauer.

10. *U. lateriflora*. Lateral-flowered Bladderwort. Brown n. 8.—"Stalk capillary, simple, round, with distant scales at the base. Flowers lateral, somewhat spiked. Upper lip linear, rather abrupt; lower roundish, obscurely crenate. Spur emarginate."—Native of Port Jackson, and Van Diemen's island. *Brown*.

11. *U. parviflora*. Small-flowered Zigzag Bladderwort. Brown n. 9.—"Stalk nearly simple, angular, somewhat zigzag, with minute scales at the base. Flowers lateral, distant, nearly sessile. Upper lip linear, emarginate; lower roundish, undivided. Palate rugose. Spur straight, bluntish. Lower calyx-leaf emarginate."—Sent by Dr. White, from New South Wales, in 1792. The *stalk* is from four to six inches high, and though seldom branched, seems to elongate itself annually by a lateral shoot just below the top. Of the *leaves* we know nothing. There are many minute pointed *scales*, scattered along the *stalk*. The *spur* is thick, full as long as the lips. *Palate* downy.

12. *U. simplex*. Simple Capillary Bladderwort. Brown n. 10.—"Stalk capillary, quite simple, single-flowered. Lips rounded, undivided; the lowermost broader than long. Spur straight, depressed, emarginate."—Found by Mr. Brown, on the fourth coast of New Holland.

13. *U. violacea*. Simple Violet Bladderwort. Brown n. 11.—"Stalk capillary, quite simple, single-flowered. Lips nearly entire; the lower deflexed, as long as the descending, nearly cylindrical, undivided spur. Leaf ovate, generally solitary."—Gathered by Mr. Brown, in the same country.

14. *U. Menziesii*. Menziesian Bladderwort. Brown n. 12.—"Stalk thread-shaped, single-flowered. Leaves numerous, spatulate. Lower lip undivided. Spur descending, cylindrical, obtuse, twice the length of the lips."—Gathered by Mr. Menzies, on the south-west coast of New Holland. We do not discover it amongst the specimens with which he has favoured us; nor did Mr. Brown gather this species himself.

15. *U. albiflora*. Small White-flowered Bladderwort. Brown n. 13.—"Stalk thread-shaped, single-flowered. Upper lip emarginate; lower wedge-shaped, with three teeth. Spur conical, descending."—Gathered by Banks and Solander, in the tropical part of New Holland.

16. *U. compressa*. Flat-spurred Bladderwort. Brown n. 14.—"Stalk . . . Upper lip emarginate; lower somewhat three-lobed, the middle lobe emarginate. Spur conical, flattened, pointing upwards."—Found by the distinguished botanists just named, in the same part of New Holland as the preceding.

17. *U. striatula*. Little Striated Bladderwort.—Leaves

orbicular. Stalk simple, angular, with a few racemose flowers. Spur awl-shaped, acute, as long as the lips. Calyx-leaves permanent, very unequal; the upper one orbicular, emarginate, striated.—Brought from Sierra Leone, by Dr. Afzelius. A small delicate species, whose fibrous roots bear a few minute tubercles. The *leaves* are several, stalked, scarcely a line in diameter, smooth, with divaricating veins; some of them apparently concave, or bladder-shaped. *Stalk* near three inches high, slender, smooth, bearing scarcely more than one scale towards the middle, and terminating in a cluster of three or four purplish flowers, on capillary stalks, whose lower lip seems cloven. The membranous capsule is accompanied by the likewise membranous, pale, permanent, spreading calyx, whose lower leaf is small and obtuse; the upper five times as large, orbicular, with several purplish longitudinal ribs.

18. *U. cyanea*. Sky-blue Bladderwort. Brown n. 15.—"Stalk simple, straight, with a few lateral remote flowers; partial stalks with three bractæes. Calyx acute, about equal to the corolla. Lips entire. Spur conical-awl-shaped, acute, descending. Capsule compressed. Leaves linear, decumbent."—Gathered by Mr. Brown, at Port Jackson, New South Wales.

19. *U. graminifolia*. Grassly Bladderwort. Vahl n. 3. Brown n. 16. (*U. cærulea*; Herb. Linn. but not Sp. Pl. *U. uliginosa*; Vahl n. 25?)—Stalk simple, angular, distantly racemose; partial stalks with three bractæes. Calyx acute. Upper lip of the corolla emarginate; lower somewhat three-lobed. Spur descending, conical. Capsule compressed. Leaves linear-elongated.—Native of the dried margins of ponds, in the East Indies. We have specimens from Dr. Buchanan, gathered in the Mysore country. Sir Joseph Banks found this species in the tropical part of New Holland. Linnæus confounded it with his original *cærulea*, described in our 4th section, n. 47, but the present plant is furnished with one or more grassly, acute, sessile, radical leaves, half as tall as the stalk, detected by professor Vahl and Mr. Brown. The common flower-stalk is rather stout, from three to six inches high, not branched, but sometimes, as in several other species, elongated by a lateral shoot, either in consequence of its having flowered before, or having been broken off. Cluster wavy, lax, of three or four blue flowers, whose partial stalks spread horizontally as they ripen feed. Calyx permanent, its leaves ovate, acute, membranous, striated, closely embracing the capsule; one of them emarginate. One of Koenig's original specimens of his *U. uliginosa*, now before us, is so imperfect, that we labour under the same difficulty as Mr. Brown, in deciding whether it belongs to this or the last species.

20. *U. bifida*. Divided Yellow Bladderwort. Osbeck It. 243. t. 3. f. 2. English ed. v. 2. t. 3. f. 2. Linn. Sp. Pl. 26. Willd. n. 8. Vahl n. 24.—Stalk simple or divided, racemose. Bractæes solitary. Calyx acute. Upper lip of the corolla ovate, undivided; lower cloven. Spur descending, conical, acute, the length of the upper lip. Leaves linear, stalked.—Gathered by Osbeck, near the watering-place on the Danish island, off Canton, in swampy ground, but not under water, flowering in October. It has also been found in Ceylon, from whence we have specimens, one of which is accompanied with leaves, hitherto unnoticed by any botanist. The very specimens delineated in Osbeck's voyage, are preserved in the Linnæan herbarium. This species is certainly allied to the last, but rather smaller, with yellow flowers. The stalk is sometimes divided, or interrupted, as in that. Leaves very small, narrow and obtuse, springing from the fibrous roots, or rather from small

small tuberous offsets. *Stalk* three or four inches high. *Calyx* permanent, membranous, as in the foregoing, but more orbicular, and less evidently striated.

21. *U. biloba*. Two-lobed Bladderwort. Brown n. 17.—“*Stalk* simple, round, with distant close-pressed scales. Cluster of few flowers. *Bractæes* solitary. Upper lip of the corolla emarginate; lower in two blunt lobes. *Spur* straight, descending, obtuse, somewhat flattened.”—Found by Mr. Brown, in the vicinity of Port Jackson, New South Wales.

22. *U. limosa*. Mud Bladderwort. Brown n. 18.—“*Stalk* simple, round. Cluster many-flowered. Upper lip of the corolla undivided; lower in two sharply divaricated lobes. *Spur* prominent, somewhat flattened.”—Gathered by Banks and Solander, in some part of the tropical region of New Holland.

23. *V. pygmaea*. Dwarf Bladderwort. Brown n. 19.—“*Stalk* simple, about two-flowered. Upper lip of the corolla undivided; lower in three deep undivided segments, the lateral ones linear, divaricated. *Spur* conical, prominent.”—Found by the same travellers, along with the preceding species.

24. *U. tenella*. Delicate Bladderwort. Brown n. 20.—“*Stalk* nearly simple, few-flowered. Upper lip of the corolla deeply divided; lower in three undivided lobes, the central one largest. *Leaves* elliptical.”—Found by Mr. Brown in the southern part of New Holland.

25. *U. barbata*. Bearded Bladderwort. Brown n. 21.—“*Stalk* nearly simple, few-flowered. Upper lip of the corolla emarginate; lower three-cleft, the middle segment divided. *Palate* internally bearded. *Spur* awl-shaped, descending.”—Found by Banks and Solander, in the tropical part of New Holland.

26. *U. flavata*. Slender Yellow Bladderwort. Brown n. 22.—“*Stalk* thread-shaped. Cluster of many dispersed flowers. Upper lip of the corolla divided; lower in three undivided lobes. *Spur* awl-shaped, descending.”—From the same part of New Holland, gathered by the same botanists.

27. *U. chrysantha*. Branched Golden-flowered Bladderwort. Brown n. 23.—“*Stalk* somewhat branched. Clusters many-flowered. Upper lip of the corolla cleft; lower four-lobed. *Spur* conical-awl-shaped, descending. *Bractæes* three to each partial stalk, coloured like the calyx.”—Gathered by Sir Joseph Banks, in the tropical region of New Holland.

28. *U. multifida*. Many-lobed Bladderwort. Brown n. 24.—“*Stalk* simple, thread-shaped, about two-flowered. Upper lip of the corolla oblong, with two awl-shaped segments; lower in three, nearly equal, divided lobes, with emarginate segments. *Spur* obtuse, compressed. *Leaves* spatulate.—Gathered by Mr. Menzies, at King George’s Sound, on the south-west coast of New Holland. *The roots* are fibrous, beset with small knobs. *Leaves* numerous, collected into a tuft at the crown of the root, spatulate, or obovate, tapering down into slender stalks, about twice their own length, both together scarcely exceeding half an inch. *Stalk* six inches high, straight, smooth and naked, bearing at the summit two crimson flowers, whose large subdivided lower lip makes a very conspicuous appearance, and is thrice as long as the short broad spur.

SECT. 2. *Leaves radical, compound. Stalks whorled with leafy bladderly bractæes.*

29. *U. inflexa*. Inflexed Whorled Bladderwort. Fork. Ægypt.-Arab. 9. Vahl n. 4.—“*Whorled bractæes* lanceolate, somewhat cylindrical, undivided, slightly bearded at

the end. *Nectary* conical, ascending.”—Found by Forskall plentifully in the ditches of rice-fields at Rosetta. The Arabians name it *Hamul*. The same was observed by Thonning, in stagnant waters on the coast of Guinea. *Vahl*. The radical *roots* are a span long or more. *Leaves* three or four in a whorl, with scattered, very narrow, forked leaflets. *Bractæes* from four to eight towards the base of the flower-stalk, sessile, often an inch long, acute at each end, bearded at the summit with leafy fragments. *Stalk* a finger’s length, thread-shaped, bearing from six to nine flowers, with a dry, lanceolate, sheathing *scale*, at the base of each partial stalk, and of the same length. The radical *leaves* are with or without bladders. *Vahl*. Mr. Thonning, quoted by this author, informs us that the inflated cellular *bractæes* serve to float the upright flower-stalks upon the surface of the water. The *corolla* is whitish, with purple veins; its upper lip tapering, obtuse, emarginate, concave; lower roundish; mouth closed by the palate. *Spur* nearly the length of the lower lip, conical, obtuse, curved upwards. *Capitate* the size of a pea, globose, very smooth, pointed with the style, bursting all round, its base attached to the fleshy enlarged calyx.

30. *U. stellaris*. Yellow Whorled Bladderwort. Linn. Suppl. 86. Willd. n. 11. Vahl n. 5. Roxb. Coromand. v. 2. 42. t. 180.—“*Whorled bractæes* globose-oblong, undivided, copiously bearded.—Native of deep ditches in the rice-fields of the East Indies, where it was first noticed by Koenig. Very nearly akin to the last, which was long confounded with it, but Vahl observed truly, that the radical stalks, bearing the *leaves*, in the true *U. stellaris*, are not so stout, nor, as far as can be ascertained from dried specimens, at all cellular. *The flower-stalk* also is more slender, bearing its whorl of *bractæes* above half way up, towards the flowers, not at the base. These *bractæes* are but a quarter the size of the others, being scarcely three-quarters of an inch long, and are obtuse, much more copiously bearded, though we do not find them, as he says, all over covered with leafy fragments. *The flowers*, too, are smaller, and yellow, not whitish veined with purple. *The spur* is thick and blunt, twice the length of the calyx, but shorter than the lower lip of the corolla, as Koenig rightly describes it. Roxburgh’s figure has no beard to the *bractæes*.

31. *U. ceratophylla*. Horn-leaved Bladderwort. Michaux Boreal.-Amer. v. 1. 12. Vahl n. 6. Pursh n. 1. (*U. inflata*; Walt. Carol. 64.)—“*Whorled bractæes* cylindrical, bladderly, divided, copiously bearded at the extremity.”—Floating in the ponds and lakes of Virginia and Lower Carolina, flowering in June and July. *Flowers* yellow. *Pursh*. Like the foregoing. *The leaves* are five or six, an inch and a half long, first deeply divided, then three-cleft, slightly dilated towards the ends. *Stalk* smooth, a span high, or more, bearing from four to six distant racemose flowers, their lower partial stalks an inch in length. The beards of the *bractæes* are longer, and more branched, than in *U. stellata*. *Vahl*.

SECT. 3. *Leaves radical, compound. Stalks leafless.*

32. *U. foliosa*. Fennel-leaved Bladderwort. Linn. Sp. Pl. 26. Willd. n. 2. Vahl n. 7. (*U. n. 197*; Loefl. It. 281. *Linaria palustris*, foeniculi folio; Plum. Ic. 158. t. 165. f. 2.)—*Spur* conical, acute. Cluster cylindrical, many-flowered. Fruit drooping. Root creeping. *Leaves* without bladders.—Native of South America. The floating horizontal thread-shaped roots throw out long fibres, and from the same point alternate, repeatedly compound leaves, two or three inches long, with brittle-shaped, or almost capillary, leaflets, but unattended by the remarkable bladders of

UTRICULARIA.

of our European species hereafter described. Some leaves are accompanied by an erect racemose *flower-stalk*, from four to eight inches high, bearing from six to twelve erect yellow *flowers*, the size and shape of *U. vulgaris*, but with a more pointed *nectary*, and the *fruit* is bent downwards as it ripens.

33. *U. flexuosa*. Zigzag-stalked Bladderwort. Vahl n. 8. Poiret n. 11.—Stalk zigzag, racemose. Fruit-stalks reflexed. Leaves furnished with bladders. — Native of the East Indies. *Leaves* and *bladders* as in the following, but the *flowers* are smaller, six or seven upon each *stalk*; their *scapes* and *bractees* similar to that species.

34. *U. vulgaris*. Greater Bladderwort, or Hooded Milfoil. Linn. Sp. Pl. 26. Willd. n. 3. Vahl n. 9. Fl. Brit. n. 1. Engl. Bot. t. 253. Pursh n. 2. Poit. et Turpin Paris. t. 30. Fl. Dan. t. 138. (Lentibularia; Riv. Monop. Irr. t. 79.) — Spur conical. Stalk straight. Cluster somewhat corymbose. Upper lip of the corolla the length of the palate, reflexed at the sides.—Native of ditches and deep standing waters, throughout Europe, from Lapland to Greece; also in the western parts of New York and Pennsylvania, according to Mr. Pursh; flowering in July. The trailing or floating perennial *roots*, or *runners*, bear alternate, repeatedly compound, capillary *leaves*, furnished with minute bristles, and bearing numerous little oval compressed curved *bladders*, open and bearded at the tip, each containing a bubble of air, along with a drop of watery fluid. Minute aquatic insects take up their abode in these bladders. *Flower-stalks* solitary, a foot high, though rising but a few inches above the surface of the water, each bearing a corymbose *cluster* of from five to eight large handsome yellow *flowers*, each of whose partial stalks is subtended by an elliptical, blunt, purplish, scaly *bractea*, similar to what are scattered down the main stalk. *Calyx* purplish; its lower leaf emarginate. *Palate* of the *corolla* tumid, orange-coloured, striped, projecting nearly as far as either of the lips.

It seems best to consider the floating shoots of this herb, and the species of the same section, which bear alternate, repeatedly compound, *leaves*, rather as *runners* from the *root*, than real *stems*. At least this hypothesis is countenanced by many of the plants in the first, as well as second, section.

35. *U. intermedia*. Intermediate Bladderwort, or Hooded Milfoil. Hayne in Schrad. Journ. for 1800. 18. t. 5. Vahl n. 10. Sm. Compend. ed. 2. 5. Engl. Bot. t. 2489. (*U. vulgaris* minor; Linn. Sp. Pl. 26. Fl. Suec. 9. Millefolium aquaticum, luteo flore galericulato; Lob. Ic. 791. M. palustre galericulatum; Ger. Em. 828.) —Spur conical. Stalk two or three-flowered. Upper lip of the corolla flat, twice as long as the palate. Leaves with deep, forked, flat segments. Bladders radical.—Native of lakes and stagnant waters, in Sweden, Germany, and Ireland, flowering in July. The *runners* seem to originate from an ovate, scaly, hairy, tuberous *root*, or *knob*, and are thickly clothed with much smaller, more simple, *leaves* than the last, whose fringed segments are broader and flatter. These *leaves* scarcely bear any bladders, the latter being found on other parts of the runners, on branching stalks, and more sparingly. *Stalk* slender, bearing but two, or at most three, *flowers*, smaller than those of the *vulgaris*, but in like manner streaked with red; their *palate* less prominent; upper lip flatter.

The wooden cut in Lobel and Gerarde exactly represents the herbage of this species, with its large *knobs*, and no doubt their synonyms are to be transferred hither. The flowering portions may have been, partly at least, delineated from the last, both being, as it seems, nearly equally com-

mon on the continent, and having been generally confounded together, even by Linnaeus himself. We must not, however, omit to observe, that M. Turpin, in his exquisite plates of the *Flora Parisiensis*, represents *knobs*, or as he perhaps more correctly terms them, *buds*, in the *vulgaris*, and even the *minor*, though of a smaller size, in both, than we find them in the *intermedia*. These appear destined to produce plants in the following season.

36. *U. australis*. Southern Bladderwort, or New Holland Hooded Milfoil. Brown n. 1.—“Stalk with few flowers. Lips undivided; the lower twice as broad as long. Spur ascending; flat in front; keeled underneath. Leaves bearing bladders.”—Observed by Mr. Brown, about Port Jackson, New South Wales, as well as in the island of Van Diemen. Very nearly related to *U. vulgaris*. Brown.

37. *U. minor*. Lesser Bladderwort, or Hooded Milfoil. Linn. Sp. Pl. 26. Willd. n. 4. Vahl n. 11. Fl. Brit. n. 2. Engl. Bot. t. 254. Pursh n. 3. Poit. et Turpin. Parif. t. 31. Fl. Dan. t. 128. Schmidel Ic. t. 21. f. 1. (Millefolium palustre, galericulatum minus; Pluk. Phyt. t. 99. f. 6, very bad. Aparine aquæ innatas Terevifana, &c.; Boec. Mus. v. 1. 23. t. 4, without flowers, but otherwise sufficiently correct.)—Stalk with few flowers. Spur short, obtuse, keeled, deflexed. Corolla gaping; palate nearly flat; lips undivided.—Native of ditches, on bogs in moist parts of Europe, but not common in England, flowering in July. Mr. Pursh met with it in swamps and ditches on the “pine-barrens” of New Jersey, flowering in August. This species is not half the size of *U. vulgaris*, with which it agrees in habit, *foliage*, though less compound, and *bladders*. The *stalk* is less straight, more slender. *Flowers* rather fewer, with a much shorter and very blunt spur; lips scarcely divided, or notched; *palate* to little elevated as not to close the mouth.

38. *U. exoleta*. Faded Bladderwort, or Hooded Milfoil. Brown n. 2.—“Stalk with one or two flowers. Lower lip undivided; upper sometimes half three-lobed. Spur ascending, emarginate.”—Found by Mr. Brown, near Port Jackson, New South Wales. It is said to be closely related to the last.

39. *U. fibrosa*. Fibrous Bladderwort. Walt. Carol. 64. Vahl n. 12. Pursh n. 4.—Stalk with one or two flowers, almost capillary. Spur obtuse. Leaves bristle-shaped.—In morasses on the pine-barrens of Carolina, flowering in July. *Stalks* purple. *Flowers* orange. *Pursh*. Vahl terms the *leaves*, as well as *stalk*, peculiarly slender. The former are furnished with roundish-oblong *bladders*; the latter is a finger’s length, compressed, bearing one or two large *flowers*.

Poiret confounds this species with the *fitacea* of Michaux; but as Vahl, who appears to have seen both, keeps them distinct, we confide in his opinion. Pursh considers *fitacea* as the *scabulata* of Linnaeus, sec. n. 45.

40. *U. obtusa*. Abrupt-spurred Bladderwort. Swartz Prodr. 14. Ind. Occ. 41. Willd. n. 5. Vahl n. 13. (U. n. 1; Browne Jam. 119.)—Stalk with two or three flowers. Spur inflexed, somewhat emarginate. Mouth of the corolla closed.—Native of stagnant waters, and boggy rivulets, in Jamaica, flowering throughout the summer. Linnaeus mistook Browne’s plant for his own *foliosa*, n. 32, which is much larger, and very different in other respects. The *obtusa* is rather smaller than our *minor*, with more capillary *leaflets*, and smaller *bladders*. *Stalk* two to four inches high, slender, without scales, racemose, bearing from two to four small, yellow *flowers*, “in beautiful succession,” as Dr. Browne expresses it. Their upper *lip* is ovate, convex, undivided; *lower* rather smaller, ovate, its prominent

heart.

UTRICULARIA.

heart-shaped *palate* closing the mouth of the *corolla*. *Spur* scarcely longer than the lip, inflexed towards its under side, conical. *Swarts*.

41. *U. gibba*. Tumid-spurred Bladderwort. Linn. Sp. Pl. 26. Willd. n. 7. Vahl n. 30. Pursh n. 9. (*U. florum* nectario gibboso, fucopunc unifloro, nunc bifloro; Gron. Virg. ed. 1. 129. *Fucoides viride* non ramifloro, folia ad gemcula diverfa, tenuiffima, fericea, oppofita, veficulis nonnullis compreffis lentibus fimilibus, colore antimonii, obfita, gercus; Clayton n. 759. *Herb. Linn.*)—Stalk wavy, almoft capillary, with one or two flowers. *Spur* conical, tumid, bluntifh. Lips of the *corolla* rounded.—Native of the boggy foil of New Jerfey and Carolina, flowering in July. *Flowers* yellow. *Purfh*. This has been erroneoufly arranged among the leaflefs fpecies. The *leaflets* are brittle-shaped, accompanied by numerous *bladders*, larger than in the laft, though the *flower-ftalks* are fmall, from two to three inches high, almoft capillary, and fometimes zigzag. *Flowers* about the fame fize. The Linnæan fpecimens, from Gronovius and Clayton, will not allow us clearly to ascertain the fhape of the *corolla*. The *spur* feems ftraight and prominent, rather fhorter than the *lips*.

42. *U. hydrocarpa*. Reflexed-ftalked Bladderwort. Vahl n. 14.—“Stalk thread-shaped; partial ftalks alternate, remote; reflexed when in fruit. Leaves brittle-shaped.”—Found by M. Richard in Cayenne. *Leaves* very fender, fhort, fcarcely divided, furnifhed with *bladders*. *Stalk* the length of the middle finger, with five partial ftalks, half an inch long. *Braçtes* ovate. *Calyx* of the fruit ovate, fpreading at the fummit. *Corolla* purplifh. *Capsule* globofe, the fize of the calyx, beaked with the *style*. Koenig fent from Ceylon, under the name of *U. major*, what feemed the fame with this in its whole ftructure, and in which the *spur* was conical, obtufe, the length of the upper lip. They could fcarcely be fpecifically diftinguifhed, efppecially as the *spur* of the *U. hydrocarpa* is unknown. *Vahl*.

43. *U. aurea*. Golden Floating Bladderwort. Loureir. Cochinch. 26. Vahl n. 22.—Stalk round, erect. Flowers racemofe. *Calyx* lanceolate. *Spur* conical, compreffed. Leaves capillary, with bladders.—Native of flow freams in Cochinchina, where this fpecies is known by the name of *Cây raong*. The *runners* are very long, fender, branched, floating. *Leaves* very numerous, capillary, green, fubdivided, furnifhed with bladders. *Stalk* three inches high. *Flowers* of a golden yellow. *Calyx* incurved. *Corolla* deeply divided, its *throat* (rather *palate*) convex, emarginate. *Loureiro*. It is evident that what Loureiro calls *ftem*, is what we have in fome preceding fpecies termed *runners*, and that his *roots* are real *leaves*. Vahl, therefore, might juftly doubt whether he had done right in placing this among the leaflefs fpecies. He appears by fome account to have tranfposed the places of *aurea* and *recurva*; fee n. 51.

44. *U. biflora*. Little Two-flowered Bladderwort. Lamarck Illuftr. v. 1. 50. Vahl n. 16. Pursh n. 5. (*U. pumila*; Walt. Carol. 64.)—Stalk moftly two-flowered, thread-shaped. *Spur* awl-shaped, ftraight, about equal to the upper lip. Leaves brittle-shaped.—On the margins of ponds in Lower Carolina, flowering in July. *Flowers* fmall, yellow. *Purfh*. *Leaves* fhort, furnifhed with bladders. *Stalk* fender, four inches high, fometimes zigzag, in a dry ftate angular below, naked. *Partial ftalks* one or two at the top, as long as the nail. *Braçtes* membranous, abrupt, at the bafe of one of the partial ftalks, and on the other towards the *calyx*. Upper lip as long as the nail. *Vahl*. We

are not without a fufpicion of this being the fame plant as *U. gibba*, fee n. 41, but have no means of proving it fo.

45. *U. fubulata*. Awl-shaped Bladderwort. Linn. Sp. Pl. 26. Willd. n. 113. Vahl n. 34. Pursh n. 6. (*U. fetacea*; Michaux Boreal.-Amer. v. 1. 12. Vahl n. 17. Poirer n. 14, excluding the *fibrofa* of Walter and Vahl. *U. nectario* fubulato; Gron. Virg. 6, excluding the abfurd reference to Clayton, of a *Pyrola* with round ferrated leaves.)—“Stalk about two-flowered. *Spur* obtufe, fhorter than the upper lip.”—In fandey wet places, near ponds and rivers, from Canada to Carolina, common, flowering in July and Auguft. *Root* annual. *Flowers* fmall, bright yellow. *Purfh*. This author compared his fpecimens with the original ones of Gronovius, the only authority in this cafe. No fpecies has given us more trouble than the prefent. Linnæus, in *Mant.* 2. 317, fays, on the authority of Clayton, that the *leaves* are capillary, and the *flowers* white. This is tranfcribed by Willdenow, but noticed by no other perfon. Linnæus, fubfequently to the publication of *Sp. Pl.*, laid into his herbarium for *U. fubulata*, a totally different plant of Kalm’s, which happens to have an awl-shaped *spur*, and is the *cornuta* of Michaux, Vahl and Pursh. This cannot be the plant of Gronovius. The reader will perceive that, though Vahl has kept *fubulata* and *fetacea* diftinct from each other, his fpecific characters are of little avail, unlefs the latter fpecies be deftitute of *leaves*, in which cafe it ought to have been placed in the next fection.

46. *U. purpurea*. Little Purple Bladderwort. Walt. Carol. 64. Vahl n. 28. Pursh n. 7.—Stalk with two or three flowers. *Spur* keeled, very fhort. Lips of the *corolla* rounded. Leaves capillary.—An annual fpecies, found floating in the lakes and ponds of Carolina; alfo in thofe of Pennsylvania, on the broad mountains; flowering in Auguft. *Flowers* bright purple, fmall. *Purfh*. Sect. 4. *Deftitute of leaves*.

47. *U. carulea*. Blue Ceylon Bladderwort. Linn. Sp. Pl. 26, excluding the fynonym of Rheede. Willd. n. 10. Vahl n. 20? (*U. fcapo* nudo-fquamis alternis vagis fubulatis; Linn. Zeyl. 9.)—Stalk erect, thread-shaped, with fcattered awl-shaped fcales. Spike denfe. *Calyx*-leaves orbicular. *Spur* the length of the lips.—Native of Ceylon. Examined in Hermann’s herbarium, from whence Linnæus defcribed this fpecies, referring to it fynonyms which belong partly to the following. The *ftem* is without leaves, about fix inches high, terminating in a fhort denfe *spike*, of nearly feffile *flowers*, whole colour, according to Hermann, is blue. The orbicular *calyx-leaves* clearly diftinguifh this from the following, as well as from our *graminifolia*, n. 19, confounded herewith by Linnæus, in his own herbarium.

48. *U. reticulata*. Reticulated Bladderwort. Sm. Exot. Bot. v. 2. 119. t. 119. (Nelipu; Rheede Hort. Malab. v. 9. 137. t. 70.)—Stalk twining, round, with fcattered acute fcales. *Calyx* pointed, as long as the *corolla*. *Spur* awl-shaped. Lips rounded. *Palate* reticulated, two-lobed. Native of inundated rice-ground, in various parts of the East Indies, which, according to Dr. Buchanan, are covered with its moft elegant blue flowers, in December. *Root* fmall, with whorled fibres, apparently annual. *Leaves* none. *Stalk* from nine to twelve inches high, twining round the rice-ftems, in the manner of our *fpiralis*, n. 5, fmoother, either fimple or divided, bearing many fmall, alternate, clofe-prefled *fcales*. *Clufters* one or more, terminal, lax. *Flowers* the fize of violets, and nearly of the fame colour; their *palate* closing the mouth, very prominent, divided, white, reticulated with pale blue veins; their *partial ftalks* tapering at the bafe, each accompanied by three fmall permanent

UTRICULARIA.

manent *bractææ*. *Spur* bluish-white, the length of the lower lip, which is somewhat the largest.

49. *U. juncea*. Rufy Bladderwort. Vahl n. 21.—*Stalk* straight, racemose, with minute distant scales. *Spur* awl-shaped, the length of the upper lip.—Native of Cayenne, and Porto Rico. *Roots* fibrous, very short, and nearly simple. *Stalk* a foot high, erect, straight, quite simple, round, smooth. *Scales* ovate, acute. *Flowers* from five to eight, on very short *partial stalks*, with a minute dry *bractææ* at the base of each. Vahl.

50. *U. angulosa*. Angular Bladderwort. Poir. n. 23.—*Stalk* thread-shaped, angular, with minute distant scales. *Flowers* somewhat racemose, nearly sessile. *Spur* awl-shaped, scarcely so long as the upper lip.—Native of wet situations in Cayenne. Very nearly related to *U. juncea*. *Roots* composed of short and slender fibres, without leaves. *Stalk* simple, stiff and straight, ten or twelve inches high, quite smooth, compressed and angular, yellowish; cylindrical, and of a brighter yellow, sometimes bluish or purplish at the base. *Scales* short, oval, pointed, scarcely discernible. *Flowers* from four to six, or more, in a straight terminal spike rather than cluster, with a small *bractææ* to each. *Calyx-leaves* short and obtuse. *Corolla* middle-sized, deep yellow. *Spur* straight, acute. *Capsule* smooth, the size of a pepper-corn, crowned with the style. Poir.

51. *U. recurva*. Recurved Bladderwort. Loureir. Cochinch. 26. Vahl n. 15.—*Stalk* slender. *Flowers* spiked. *Spur* conical, recurved, about the length of the lip.—Found in the river *Hòn Mô*, not far from the royal city, in Cochinchina.—*Root* short, without bladders. *Leaves* none. *Stalk* four inches high, simple, erect. *Flowers* yellow, in a simple oblong spike. *Calyx* large, round, compressed. *Capsule* lenticular. Loureiro. It can only have been from some accidental error, that Vahl placed this species in the former section, all his information concerning the plant being derived, like ours, from Loureiro, who is sufficiently clear as to its having no leaves. See n. 43.

52. *U. pusilla*. Little Cayenne Bladderwort. Vahl n. 23.—*Stalk* capillary, subdivided; zigzag in the upper part. *Flowers* racemose, remote.—Found in Cayenne, by Richard, and Von Rohr. *Root* very short, subdivided. *Stalk* a finger's length, either quite simple, or divided towards the top, with a minute ovate scale. *Partial stalks* from five to eight, half the length of the nail, occupying nearly the upper half of the main stalk, and each having at its base an extremely minute *bractææ*. *Capsule* very small. Vahl. We have specimens from Sierra Leone, gathered by Smeathman, and others by Afzelius, which so strikingly answer to every tittle of this description, that we cannot but consider this as one of the very few species of its genus found in Guinea as well as in South America.

53. *U. pubescens*. Downy-stalked Bladderwort.—*Stalk* capillary, downy, about two-flowered. *Spur* obtuse, the length of the upper lip; half the length of the lower, which is divided.—Gathered at Sierra Leone, by Dr. Afzelius. The *root* is a tuft of small fibres, without leaves or bladders. *Stalk* three or four inches high, erect, simple, slender, round, or slightly angular, perhaps from drying, clothed all over with fine prominent pubescence, not visible to the naked eye, but, as far as we can perceive, quite destitute of scales. *Flowers* two, one below the other, smaller than *U. minor*, each with a broad, obtuse, membranous *bractææ*. *Lower lip* broad, deflexed, two-lobed.

54. *U. nivea*. Snowy Bladderwort. Vahl n. 26.—*Stalk* about four-flowered, with close-pressed scales, separate at the base. *Spur* conical, obtuse. *Capsules* drooping, globose.—Gathered by Koenig, in moist dewy places

in Ceylon. *Stalk* slender, from four to seven inches high, generally bearing four, rarely but three, large white flowers, on short partial stalks. Vahl.

55. *U. humilis*. Humble Bladderwort. Vahl n. 27.—*Stalk* angular, with few flowers. *Spur* conical, acute, shorter than the upper lip. *Calyx-leaves* roundish. *Capsule* keeled.—Native of the East Indies. *Roots* very short, scarcely branched. *Stalk* hardly above an inch and a half high, often bearing a solitary flower, sometimes two, three or four. *Scales* two or three, remote, ovate as well as the *bractææ*. Vahl.

56. *U. crenata*. Crenate-lipped Bladderwort. Vahl n. 28. ("U. aphylla; Fl. Peruv. v. 1. 20. t. 31. f. d.")—*Stalk* about three-flowered. *Roots* furnished with bladders. *Bractææ* sheathing. *Spur* awl-shaped. *Lips* crenate.—Native of moist or inundated ground at Lima. Annual. *Root* of several long fibres, bearing a few bladders, the size of mustard-seed. *Stalk* thread-shaped, from four to six inches high, smooth, naked, terminating in from two to four distant *partial stalks*, each an inch long, spreading, furnished at its base with a sheathing, abrupt, membranous, entire *bractææ*. *Corolla* yellow; its upper lip with three or five notches; lower with three.—Our specimen, from the late abbé Cavanilles, though destitute of any evident leaves, or leaflets, yet having bladders attached to a long simple fibre, seems to indicate the propriety of ranging this species in the preceding section. We submit, nevertheless, to the decision of Vahl, and the authors of the *Flora Pademontana*; more especially as the opinion of Mr. Brown, founded on such wide-extended observation as few botanists have had in their power, seems in favour of there being no *Utricularia* destitute of leaves at every period of its growth. This being the case, the whole genus must require to be distributed afresh. The next species stands in the same predicament.

57. *U. tenuis*. Brittle-stalked Bladderwort. Cavan. Ic. v. 5. 24. t. 440. f. 2. Vahl n. 29.—*Stalk* single-flowered. *Roots* furnished with bladders. *Bractææ* opposite. *Spur* awl-shaped, twice the length of the shortest lip.—Gathered by Louis Née, in moist places, near the town of Coquimbo, in Chili, flowering in April. A small annual species, whose roots, consisting of several zigzag fibres, about an inch long, are copiously furnished with small, alternate, sessile bladders. (See our remarks on the last.) The *stalk* is brittle-shaped, an inch and a half or two inches high, quite naked, except two or three opposite *bractææ* near the top, which mark the base of the solitary *partial stalk*. *Flower* solitary, yellow. *Calyx* ovate, bluntish, permanent. *Lips* of the *corolla* very unequal, undivided, nearly ovate, the larger erect, accompanied by a prominent *plate* bordered with red; smaller deflexed, as well as the *nectary* behind it. The flower therefore seems to be reversed. The *capsule* is globular.

58. *U. micropetalæ*. Small-lipped Bladderwort.—*Stalk* about two-flowered. *Partial stalks* club-shaped. *Bractææ* opposite. *Spur* conical, dependent, thrice as long as the lips.—Gathered by Dr. Afzelius at Sierra Leone. A very distinct and remarkable species. The *root* is small and fibrous, without leaves or bladders. *Stalk* three inches high, bearing a few distant, ovate, white-edged scales. *Flowers* in our specimen two, one above the other, yellow, on stalks of unequal length swelling upwards, and having two opposite, ovate, pointed *bractææ* at the base of each. *Calyx-leaves* ovate, pointed; the lower one emarginate. *Lips* of the *corolla* about the length of the *calyx*, nearly equal, undivided; the lower of a deeper yellow, with a prominent *plate*, not closing the mouth. *Spur* remarkably large in proportion, making the chief part of the flower, stout, pointed. *Capsule* elliptical.

59. *U. ranosa*. Branching Drooping Bladderwort. Vahl n. 31.—“Stalk simple or branched, with few flowers. Spur conical, short. Fruit-stalks drooping.”—Found by Koenig in the East Indies. *Roots* simple, and very short. *Stalk* a finger’s length, angular, sometimes simple, often divided, the branches once or twice subdivided, two or three-flowered. *Scales*, as well as *bractææ*, ovate. *Flowers* small. *Vahl*.

60. *U. capillacea*. Capillary Bladderwort. Willd. n. 9. Vahl n. 32.—“Stalk capillary, with about three drooping flowers. Spur round, bluntish. Capifules awl-shaped.”—Gathered by Dr. Rottler, in watery places in the East Indies. *Root* of several naked, somewhat branched, fibres. *Vahl* found, in one specimen, at the side of the crown of the *root*, an oblong-roundish bulb, the size of a Coriander-seed, clothed with bristles; separate at the summit and base, but attached to the root by a central ring. He justly presumed this to be a bud, by which the plant increases itself. The *stalk* is often hardly an inch high, angular, bearing one, two or three *flowers*, on short, drooping *partial stalks*, each accompanied, at the base, by an extremely minute ovate *bractææ*. *Capifule* awl-shaped; covered by the permanent *calyx*.

61. *U. minutissima*. Little Malacca Bladderwort. Vahl n. 33.—Stalk capillary, two or three-flowered, unbranched. *Scales* and *bractææ* pointed. Spur conical. Lower calyx-leaf broadest, concave, keeled.—Gathered by Koenig, in the neighbourhood of Malacca. *Root* fibrous, small. *Stem* two inches high in our original specimens, Vahl says half an inch, or an inch. It appears to elongate itself, after flowering, by a lateral, upright, simple shoot, as is the case with *graminifolia*, n. 19, and some others. *Scales* one or two, tapering at each end, small. *Flowers* one, two, three or even four, each on a very short *partial stalk*, with several taper-pointed *bractææ* at its base. *Corolla* blue, extremely small, with a prominent *spur* full as long as the *lips*. *Calyx* inflated and enlarged considerably as the *fruit* ripens.

62. *U. cornuta*. Great Horned Bladderwort. Michaux Boreal.-Amer. v. 1. 12. Vahl n. 19. Pursh n. 8. (*U. subulata*; Herb. Linn. but not Sp. Pl.)—Stalk erect, slightly scaly, with about two nearly sessile flowers. Spur awl-shaped, acute, rather curved, nearly as long as the very broad lower lip.—Near mountain lakes, from Canada to Virginia, flowering in July. *Pursh*. Our specimens from Mr. Francis Boott, a young botanist of great zeal and activity, have dense alternate tufts of numerous *radical fibres*, without leaves or bladders. *Stalk* a foot high, straight, smooth, bearing a few small, distant, pale, membranous scales, and terminating in two or three crowded *large flowers*, of a bright yellow. *Calyx-leaves* broad, ovate, unequal, coloured; the lowermost not half the length of the *spur*. *Lower lip* very broad, deflexed, cloven. *Palate* downy.—Linnaeus received this plant from Kalm, and laid it into his herbarium for *U. subulata*, which he had long before described from Gronovius’s herbarium, but had forgotten the appearance of it; see our n. 45. We therefore adopt the name given by Michaux, for what must be considered as not described by Linnaeus, he having no where adverted to Kalm’s specimens. Vahl erroneously ranges this with the leafy species.

UTRICULUS, (a little bladder,) a term used by Gartner, for a particular sort of capsule, which he defines as “of one cell, and containing a solitary seed; it is often very thin and semitransparent; constantly destitute of valves, and of a shape approaching to ovate, or somewhat globose.” He adds, that “all naked seeds may, strictly speaking, be said to be inclosed in such a pericarp; but he limits the applica-

tion of the above term to those coverings of seeds, which, in the first place, are capable of being rubbed off by a slight friction between the fingers, as in *Chenopodium*, *Atriplex*, and *Beta*; secondly, to such as are furnished, within their cavity, with an evident umbilical cord, as in *Adonis*, *Thalictrum*, and *Atragene*; thirdly, to those between which and the seed there is a vacant space, or cavity, sufficiently evident, of which *Elaeagnus*, *Achyranthes*, *Zueria*, *Illecebrum* and *Polygonum* are examples; and fourthly, to such as contain their seed in an inverted position, so that the radicle of the embryo is turned towards the style, as *Callitriche*, *Zinnichelia*, *Zostera*, &c.; the contrary position being most usual in the greater number of naked seeds, as in the natural orders of *Gramina*, *Compositæ*, *Verticillatæ*, and *Stellatæ*.” See PERICARP and SEED.

UTRUM, *Juris Utrum*. See JURIS, ASSISE, &c.
UTSCHENYA, in *Geography*, a cape on the north coast of Nova Zembla. N. lat. 77° 20'. E. long. 67° 24'.
UTSCHING, See VOLGA.

UTSJKI, a town of Swedish Lapland; 240 miles N. of Tornea. N. lat. 69° 45'. E. long. 26° 54'.

UTTA, a town of the island of Sardinia; 6 miles W.S.W. of Cagliari.—Alfo, a river of Sardinia, which runs into the sea, near Cagliari.

UTTAMA, in *Hindoo Mythology*, is the name of one of the seven holy men bearing the appellation of *Menu*, under which article their names and some notice of them will be found. In some theogonies Uttama is made the son of Pavaka, the regent of fire.

UTTARI, in *Ancient Geography*, a town of Hispania, on the route from Bracara to Aiturica, between Pons Novæ and Bergidam. Anton. Itin.

UTTENDORF, in *Geography*, a town of Bavaria, on the Mattig; 7 miles S. of Braunau.

UTTER, BARRISTER, in *Lavo*. See BARRISTER.

UTTERCUL, in *Geography*, a province of Assam, north of the Burhampooter.

UTTINGEN, a town of the county of Wertheim; 8 miles E. of Wertheim.

UTTOXETER, an ancient market-town in the fourth division of the hundred of Totmanlow, in the county of Stafford, England, is situated 13 miles N.E. by E. from the county-town, and 136 N.W. by N. from London, on the western bank of the river Dove, over which is a stone bridge, connecting the counties of Stafford and Derby. Great damage has been formerly sustained by this town from fire; but it is now large and well built, having a spacious market-place in the centre, with three streets branching out from it. The market, which is held on Wednesdays, is considered as the greatest in this part of the country, for cattle, sheep, pigs, butter, cheese, corn, and all kinds of provision and agricultural produce. This is attributed to the extensive meadow and pasture lands in this district, which are justly esteemed the most fertile and luxuriant England can boast. Leland says, “Uttok Centre one paroch church. The menne of the towne usith grasing. For there be wonderful pastures upon Dove. It lengthith to the erldom of Lancafter.” Here are four annual fairs. In the population return of the year 1811, this town is stated to contain 637 houses, occupied by 3155 persons. Of these, the chief source of employment is the manufacture of iron, which is carried on to a great extent, the town being surrounded by forges. A great increase in this trade has taken place, in consequence of the facility of communication the town now enjoys by means of the inland navigation, not only with the metropolis, but; directly or indirectly, with every port in the kingdom. The church is an ancient edifice, with a lofty steeple, but no way remarkable

remarkable either for structure or embellishments. Here are several meeting-houses for Dissenters; and a free-school founded and endowed by Thomas Allen, a distinguished antiquary and mathematician of the sixteenth century. The late admiral lord Gardner was born at Uttoxeter, April 12, 1742; he died in 1810, and was buried in the abbey church of Bath.—*Beauties of England and Wales*, vol. xiii. 1813.

UTUGARI, in *Ancient Geography*, the name of a people, who made part of the Huns. Ptolemy.

UTUS, a river, which, according to Pliny, had its source in mount Hæmus, and watered Mœsia.—*Allo*, a town of Dacia Ripensis. Anton. Itin.

UTZHOF, in *Geography*, a town in the territory of Dantzic; 5 miles E. of Dantzic.

UTZNACH, a town of Switzerland, and capital of a bailiwick, which belongs to the cantons of Glaris and Schwitz, formerly belonging to the counts of Toggeburg. In the year 1469, it was sold to those two cantons, who alternately appoint a bailiff, whose office continues two years. The inhabitants are Roman Catholics; 23 miles S.E. of Zurich. N. lat. 47° 8'. E. long. 8° 59'.

UVA, a lake of Ruffia, in the government of Tobolsk, about 28 miles in circumference; 68 miles S.E. of Tobolsk.

UVA, *Grape*. See VINE.

UVA Græna, in the *Materia Medica*, the name of the fruit of the great American *vitis idæa*, or cranberries.

UVA Lupina, *wolf-berries*, in *Botany*, a name given by some authors to the common water-elder, and by others to the *herba Paris*, or herb true-love.

UVA Marina, *Sea-side Grape*, *Uvette* of the French. See EPHEDRA.

UVA Passia, in the *Materia Medica*, the dried fruit of the vine, of which two kinds were formerly mentioned in our Pharmacopœias, *viz.* *uva passia majores* et *minores*, or raisins and currants; the latter is a variety of the former, or the fruit of the *vitis corinthiaca* feu *apryna*, of C. B. The manner of preparing them is by immersing them in a solution of alkaline salt, and soap ley made boiling hot, to which is added some olive oil and a small quantity of common salt, and afterwards drying them in the shade. These fruits are used as agreeable lubricating acescent sweets, in peccoral decoctions, and for obtunding the acrimony of other medicines, and rendering them grateful to the palate and stomach. They are directed in the decoctum hordei compositum, tinctura fennæ, and tinctura cardamomi composita.

UVA Quercus, in *Natural History*, a name given to certain accidental productions of the oak, a tree famous for producing many such, besides its common fruit; the best account we have of this in particular is from Mr. Marchant. He observed a vast quantity of this production upon an oak of about twelve feet high; this tree had no acorns, but there hung from almost all the branches a great number of greyish threads, of two inches or more in length, and of a silky flexible matter; to several parts of these there were fixed certain round berries, sometimes two or three, sometimes ten or twelve on a thread; these were of the size of a half-ripe red gooseberry, but they had no umbilicus, nor any appearance of fibres; they were hard and not hollow, but filled with a cottony matter, very closely compacted. The threads on which these berries were produced all grew out of the axæ of the leaves, in the very places where the buds of the rudiments of young branches should have come; and over these filaments there were often a few small leaves, of the regular shape of the oak-leaf.

It is generally asserted, that there are eggs of insects lodged in all these extraordinary productions of the oak, which are supposed to be produced by a wrong derivation of the juices, occasioned by the puncture of the fly which leaves those eggs; but the most accurate search could not discover the least appearance of any animal remains in any part of these productions, neither in the berries, nor in the threads that support them.

There is another species of this remarkable production, differing from the former, by not having the long threads on which the berries of that are supported: this, however, has been confounded by the generality of naturalists under the same name, and of this Mr. Marchant has given an equally accurate description. In the month of October he observed a young oak of about six feet high, in a coppice-wood, in a very flourishing condition, very full of branches and leaves, but without fruit. The young branches of this oak were loaded with clusters of red berries, of the shape and size of common red gooseberries; they stood principally at or near the extremities of the branches, and were of a very polished and shining surface, and of a spongy and tender substance. They stood in clusters of three, four, and five together, and each grew immediately to the branch, without any pedicle; they had some appearance of fibres, but not the least mark of an umbilicus, as in the regular fruits. On opening these berries, they were found full of mucilaginous and viscous juice, of a red colour, tolerably fluid, and having some fibres intermingled with it; the taste of this juice was acrid, and its smell disagreeable, and like that of rotten wood; but there appeared not in these, any more than in the other species, any the least appearance of any thing belonging to an animal, no egg, no worm, no fly, nor indeed any foreign body of any sort whatever.

These berries, though so large and succulent, are but of a very short duration; for Mr. Marchant going three days after he had seen them in the greatest perfection, to gather some of them, with intent to try their juice on different liquors, found they were all become flaccid and withered; and returning again three days after this, they were so entirely perished and gone, that there remained only a few vestiges of thin skins on the places where they had been fixed to the tree, and some few fallen ones among the bushes that grew under the tree; and upon inquiring of the people who lived thereabout, to know whether these berries were a regular annual production of the tree, they told him that they never remembered to have seen any thing of the kind before.

It may not be easy, perhaps, to account regularly for these fortuitous productions, for they seem merely of the nature of monsters among animals; and it may be allowed no improbable conjecture in regard to them, that the roots of these small trees having taken in more nourishment than they could circulate, when it came to load the tender extremities of the young branches, may have made its way through their laxer texture, and being retained yet in some of their membranes, may have swelled out more and more, by the addition of fresh matter, and finally have been matured by the sun's heat into these seemingly regular productions. *Mem. Acad. Par. 1692.*

UVA Urfs, in *Botany*, the name of a species of arbutus, (see ARBUTUS, n. 9.) with trailing stalks, and entire leaves, called in English *bear's whortleberry*. This plant is found on the snowy hills of Austria and Styria, but more plentifully on the Swedish hills: it is also a native of the Highlands of Scotland, and is now cultivated in some of our gardens. The leaves of this plant have a bitterish astringent taste, without any remarkable smell. Infusions of them in

water strike a deep black colour, with solution of chalybeate vitriol, but soon deposit the black matter, and become clear. For their use in dyeing, see *DYEING of Cloths*, &c.

The leaves of the *uva ursi*, though employed by the ancients in several diseases requiring astringent medicines, had almost entirely fallen into disuse, till about the middle of the last century, when they first drew the attention of physicians as a useful remedy in calculous and nephritic complaints, and other disorders of the urinary organs. See *STONE*.

De Haen relates, after large experience of this medicine in the hospital of Vienna, that suppurations, though obstinate and of long continuance, in the kidneys, ureters, bladder, urethra, scrotum, and perineum, without any venereal taint or evident marks of a calculus, were in general completely cured by it; that of those who had a manifest calculus, several found permanent relief, so that, long after the medicine had been left off, they continued free from pain or inconvenience in making water, though the catheter shewed that the calculus still remained; that others, who seemed to be cured, relapsed on leaving off the medicine, and were again successively relieved on repeating the use of it; while others obtained only temporary and precarious relief. In several cases, pargories were joined to the *uva ursi*, and other mild astringents have been recommended for the same intentions.

Encouraged by his success, and by the practice of the physicians at Montpellier, who had been in the habit of prescribing *uva ursi* in the disease above mentioned for many years before his time, many medical men in this country have been induced to try its effects; and though the use of this plant has been frequently observed to mitigate the pains in calculous cases, yet in no instances do we find that it has produced that essential or permanent relief, which is said to have been experienced by the German physicians.

From the experiments of Dr. Alexander, the leaves of *uva ursi* seem to possess very little diuretic power, and what made by Murray shew that they have no material effect upon the urinary calculi: the efficacy they may, therefore, have in relieving the calculous diseases, we are disposed to ascribe to their astringency; and in confirmation of this opinion we may cite the observation of Dr. Cullen, who, in his chapter on Astringents, notices the dissertation of De Heucher, under the title of "Calculus per adstringentia pellendus;" and though he does not think, with this author, that astringents are lithontriptics, yet from his own experience, and that of others, he believes they often have a powerful effect in relieving calculous symptoms; and in proof of this he refers to the exhibition of the *uva ursi*. The leaves may be employed either in powder or decoction; the former is most commonly preferred, and given in doses from a scruple to a drachm two or three times a day.

Dr. Lewis observes, that the trials of the *uva ursi*, made in this country, have by no means answered expectation: in all cases within his knowledge, it produced great sickness and uneasiness, without any apparent benefit, though continued for a month. And in a case of incontinence of urine, Dr. Fothergill observes, the *uva ursi*, so much extolled of late in ulcers of the urinary passages, seemed but to aggravate the symptoms. (*Med. Obs. and Inf.* vol. iii. p. 144.) But in the preface to this volume we are told, that the *uva ursi* had been frequently prescribed successfully by many of the members of the Society of Physicians in London. It is observed by Murray, the calculi were macerated in a strong decoction of the *uva ursi*. Dr. Withering, speaking of the effects of this plant, says: Perhaps, upon the whole, we shall find it no better than other vegetable astringents;

some of which have been long used by the country people in gravelly complaints, and with very great advantage; though hitherto unnoticed by the regular practitioners. Cullen. *Lewis*. Woodville.

UVA Vulpis, a name given by some authors to the common nightshade.

UVARIA, in *Botany*, so named by Linnaeus, from *uva*, a grape, or bunch of grapes, in allusion to the appearance of its fruit.—*Linn.* Gen. 279. Schreb. 374. Willd. Sp. Pl. v. 2. 1261. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 3. 333. Juss. 284. Lamarck Illustr. t. 495. De Candolle Sylt. v. 1. 481. Gært. t. 114.—Clais and order, *Polyandria Polygynia*. Nat. Ord. *Coadunatae*, Linn. *Anona*, Juss. *Annonaceae*, De Cand.

Gen. Ch. Cal. Perianth inferior, of one leaf, flat, in three deep, ovate, acute, permanent segments. Cor. Petals fix, lanceolate, sessile, spreading, longer than the calyx. Stam. Filaments none; anthers numerous, oblong, abrupt, covering the convex receptacle. Pist. Germens numerous, crowded, concealed by the anthers; styles numerous, the length of the anthers; stigmas obtuse. Peric. Berries distinct, numerous, somewhat stalked, nearly globular, of several cells. Seeds four or more, in two rows.

Ess. Ch. Calyx in three deep segments. Petals fix. Berries numerous, stalked. Seeds several, in two rows.

Linnaeus and several following authors have referred to this genus a considerable number of species, with the nature of whose fruits they were not, in every instance, perfectly acquainted; especially without sufficient discrimination between such as were true berries, and others of a capsular nature. The learned professor De Candolle, now happily escaped from public persecution in France, as a Proteitant, and settled, with distinction, at Geneva, has just published the first volume of his *Regni Vegetabilis Systema Naturale*, a most profound and elaborate work, where the natural order to which the present genus belongs is illustrated, by a far greater number of species than it had ever before been supposed to contain. This author removes to *UXORA* (see that article) many things hitherto considered as *Uvaria*, making the character of *Uxora* to consist in its dry fruits, of an ovate-oblong, or somewhat beaded, shape. Hence the said genus is extended to thirty-fix species. We regret that our account of it had been sent to the press, before the work of our learned friend reached us. We can now only profit by his labours, and trace his steps, through the genus *Uvaria*, of which he makes but eight species. These are all natives of the East Indies, or the adjacent islands. They are trees or shrubs, with erect or trailing stems; the flower-stalks either axillary, opposite to the leaves, or lateral, solitary, or two or three together, bearing from one to four flowers, and often furnished with small bractæe, or jointed in the middle. Several species referred by various botanists to the genus before us, now help to constitute a new one in professor De Candolle's work, by the name of *Gutteria*, consisting of twenty in all. Its fruits, numerous likewise in each flower, are dry, coriaceous, ovate or globose, single-seeded. *Uvaria japonica* of Linnaeus, Thunberg, Willdenow, &c. stands by itself in a genus bearing the barbarous Japanese name of *Kadsura*, which Justicium, it seems, has unhappily selected, in the *Annales du Muséum*, v. 16. 340. It comes next to *Anona*, having like that an aggregate pulpy fruit, but with two seeds in each cell, instead of the solitary ones of *Anona*.

1. *U. zeylanica*. Ceylon *Uvaria*. Linn. Sp. Pl. 756, excluding the synonyms of Rheede and Rumphius. De Cand. n. 1. Gært. f. 1. Lamarck f. 2. (*Uvaria*); Linn. Zeyl. 100. n. 224, not 234. *Uva zeylanica* sylvestris,

tris, mali armeniæcæ sapore; Burm. Zeyl. 231.)—Branches trailing. Leaves ovato-lanceolate, smooth. Berries numerous, ovato-cylindrical, with tapering stalks. Internal processes of the coat of the seed in parallel plates.—Native of Ceylon. Linnæus and Burmann describe this as a trailing shrub, with smooth, pointed, stalked leaves, and scarlet flarry flowers, each producing six or seven small, soft, grey, rather hairy, somewhat cylindrical berries, half an inch long, with a visous taste, resembling that of an apricot. A specimen communicated, if we mistake not, by Thunberg to the younger Linnæus, for *Uvaria zeylenica*, has ovate, acute, smooth, entire leaves. The common flower-stalks are axillary, stout, half an inch long, each bearing two or more single-flowered, angular, downy partial stalks, thrice that length. Calyx half an inch in diameter, in three deep, broad, obtuse, coriaceous, downy segments, like Lamarck's fig. 1. d, f, g. Anthers oblong, spreading, yellow. We cannot say this is the true plant of Linnæus, Burmann, &c. because our specimen wants the fruit, which is almost all that is known of that species, with any precision.

2. *U. Gærtneri*. Gærtner's Uvaria. De Cand. n. 2. (*U. trifoliata*; Gærtner. f. 2. Lamarck f. 3.)—"Berries ovate, with tapering stalks. Internal processes of the coat of the seed awl-shaped."—Native probably of Ceylon. Nothing is known of this species but from Gærtner's figure of the fruit, which is rather larger, and less cylindrical, or constricted, than the foregoing, and differently constructed within.

3. *U. lutea*. Yellow Uvaria. Roxb. Coromand. v. 1. 32. t. 36. Willd. n. 8. De Cand. n. 3.—Leaves elliptic-oblong, acute, smooth, shining. Stalks solitary, from one to six-flowered. Berries oval, with six seeds.—Native of the hills of Hindoostan, adjoining to the coast of Coromandel, flowering in the hot season. A large evergreen tree, with a smooth brown bark, and alternate branches. Leaves two or three inches long, alternate, two-ranked, on short stalks. Flower-stalks opposite to the leaves, solitary, short and thick, each bearing usually about three dull-greenish flowers, above half an inch broad. Petals five times the size of the calyx. Berries four to six for each flower, spreading in the form of a star, on short stalks, nearly oval, orange-coloured, pulpy, each of them hardly an inch in length. Nothing is recorded of their flavour or qualities, nor of any use to which this tree is put. The Telingas call it *Muoy*.

4. *U. tomentosa*. Downy Uvaria. Roxb. Coromand. v. 1. 31. t. 35. Willd. n. 5. De Cand. n. 4.—Leaves ovate-oblong, acute, downy. Stalks single-flowered, usually solitary. Berries globular, with four seeds.—Native of the Circar mountains of Hindoostan, flowering in the hot season. This is also a large tree, with wide-spreading branches. Leaves soft and downy, on short stalks, their size rather exceeding those of the last species. Flowers solitary or in pairs, of a brownish-green, on stalks above an inch long. Three outer petals small and awl-shaped; three inner ovate, acute, above half an inch long. Berries nearly globular, from ten to fifteen, dull purple, the size of a bullock plum.

5. *U. dulcis*. Sweet Uvaria. "Dunal Monogr. 90. t. 13." De Cand. n. 5—"Leaves oblong-elliptical; tapering and heart-shaped at the base; velvet-like beneath, as well as the branches. Flower-stalks in pairs, axillary, or opposite to the leaves; jointed and bracteated in the middle.—Native of Java, described by De Candolle from the herbarium of M. De Lessert. Branches round; villous and rusty in the upper part. Leaves from two to four inches long, on short villous stalks; sometimes pointed, and occa-

sionally undulated; nearly smooth above; rusty, with a reddish rib, beneath. Calyx villous, rusty, in three broad, ovate segments. Petals villous, slightly wavy; the outer ones rusty at the back; inner broader, but rather smaller. Pistils villous. Dunal.

6. *U. javana*. Java Uvaria. "Dunal Monogr. 91. t. 14." De Cand. n. 6—"Leaves oblong-elliptical; heart-shaped at the base; rusty and downy, like the young branches, beneath. Stalks axillary, or opposite to the leaves, few-flowered; partial ones somewhat umbellate, bracteated in the middle."—Gathered in Java, by M. Lahaie. The branches are round, marked with whitish spots; their young extremities clothed with rusty down. Leaves on very short stalks, sometimes pointed, sometimes blunt, waved at the edges, slightly falcate, with pinnate ribs; shining and nearly smooth on the upper side. Stalks solitary or in pairs, rusty, each bearing a sort of umbel, of from two to four flowers, whose partial stalks are jointed at the base, and furnished about the middle with one large clasping bractæa. Segments of the calyx deep, broad, rather acute. Three inner petals reddish, rather larger and more oblong than the three outer. Pistils villous. Dunal.

7. *U. velutina*. Velvet-leaved Uvaria. De Cand. n. 7. (*U. villosa*; Roxb. MSS. Dunal Monogr. 91.)—"Leaves nearly sessile, ovate, pointed, clothed, like the branches, with velvet down; heart-shaped at the base. Stalks lateral, branched, downy; partial ones corymbose, single-flowered."—Sent by Dr. Roxburgh, from the East Indies, to Mr. Lambert. The young branches, both surfaces of the leaves, the footstalks, flower-stalks, and calyx, are clothed with very short, soft, grayish, velvet down. Branches round. Leaves almost perfectly sessile, two or three inches long, an inch and a half or two inches broad, with pinnate ribs, which are prominent and most downy at the back. Partial flower-stalks three or four, elongated, single-flowered, somewhat corymbose. Calyx small. Petals three, ovate, thick, bluntnish; downy externally; brownish and smooth on the upper side; it is supposed there may be three others, which are deciduous. Anthers very short, nearly sessile. Germens densely crowded, somewhat downy. De Candolle.

8. *U? spectabilis*. Handsome-flowered Uvaria. De Cand. n. 8—"Leaves oblong, pointed, almost smooth; clothed, like the branches, with rusty velvet down when young. Stalks lateral, or opposite to the leaves, single-flowered. Petals obovate; inner ones cloven at the end."—Gathered in Guiana by M. Martin. Branches round, clothed when young with rusty-coloured velvet down. Footstalks very short, callous. Leaves six or eight inches long, two broad, entire, abruptly pointed; scarcely tapering at the base; their lateral ribs alternate, all terminating in one which runs parallel to the margin: when young they are clothed beneath with reddish velvet pubescence; as are also the very short flower-stalks. Flowers large. Segments of the calyx three or four lines long, ovate, coriaceous, downy at the outside only. Petals six, obovate, nine or ten lines long, coriaceous, silky on both sides with close-pressed whitish hairs; rather contracted at the base: three outer ones rather the smallest, entire; three inner divided at the point, one segment very rarely again cloven. Outer row of the stamens abortive, coriaceous, oblong, brown, smooth, rather longer than the perfect ones, and lying over them, with two internal furrows at the end. Germens very densely crowded, scarcely distinct. Fruit unknown. The author doubts whether this species ought not to constitute a genus by itself.

VUBARANA, in Ichthyology, the name of an harengiform fish, caught in the American seas.

It resembles in figure our river trout. Its body is very nearly of the same thickness all the way, but it is elevated a little on the back, and somewhat slender just near the tail. It grows to a foot in length, and to six inches in thickness. It is a very well-tailed fish, and is generally dressed with the scales on, they being not offensive in eating. Margraave's History of Brazil.

UVEA, in *Anatomy*, the posterior surface of the iris. See *EYE*.

It is called *uvea*, on account of its resembling the figure and colour of a grape, called by the Latins *uva*. For which reason, also, some have given it the name of *acini-formis*, from *acinus*.

UVEDALIA, in *Botany*, received its name from Mr. R. Brown, in memory of — Uvedale, LL.D., the friend and fellow-colleague of PLUKENET (see that article), who resided at Enfield, where he had a botanic garden, on the old walls of which, if we are rightly informed, the *Hieracium mucronatum*, from the north, is naturalized, and still remains. His herbarium makes a part of the botanical collections in the British Museum, but we have no particulars of his domestic or personal history. We only know by tradition that his name was popularly pronounced *Oodle*. Petiver established, under the appellation of *Uvedalia*, a syngeneis genus, now sunk in POLYMNIA (see that article), from which the synonym *Tetragonoloba*, Linn. Gen. 438, should be erased.—Brown Prodr. Nov. Holl. v. 1. 440.—Class and order, *Didymia Angiospermia*. Nat. Ord. *Perfonate*, Linn. *Scrophularia*, Juss. *Scrophularine*, Brown.

Ess. Ch. Calyx prismatic, five-toothed. Corolla ringent: upper lip two-lobed; lower three-cleft; its middle segment rather dissimilar, with two prominences at the base. Anthers with divaricated lobes. Stigma flattened. Capsule covered by the permanent calyx, of two cells and four valves: the partition from the inflexed margins of the valves, inserted into the central receptacle.

A genus of herbaceous plants, with opposite leaves. Flower-stalks axillary and terminal, single-flowered, without bractes. Corolla blue. Mr. Brown himself suspects it may be scarcely distinct, in reality, from *MIMULUS*. (See that article.) He mentions no other species than one from New Holland, the rest, whatever they may be, are, we presume, natives of other countries; perhaps of the East Indies.

1. *U. linearis*. Linear Uvedalia. Br. n. 1.—“Leaves linear, several times shorter than the flower-stalks.”—Gathered by Mr. Brown in the tropical part of New Holland.

This genus being confessedly very near *Mimulus*, we have not attempted to draw up its natural characters at full length.

UVELEN, in *Geography*, an island of Russia, in the Frozen sea; 12 miles N. of Cape Tchukotkoi. N. lat. 66° 25'. E. long. 188° 44'.

UVELKA, a river of Russia, which runs into the Tobol.

UVELSKAIA, a fort of Russia, in the government of Upha; 56 miles W.S.W. of Tcheliabinsk.

UVELSKAIA, *Nizanci*, a fort of Russia, in the government of Upha, on the Uvelka; 28 miles S.S.W. of Tcheliabinsk.

VUERTIER, a town of France, in the department of Mont Blanc; 10 miles S.S.E. of Annecy.

VUESICKER, a town of Norway, in the province of Christiania; 32 miles E. of Christiania.

VUKA, a river of Slavonia, which runs into the Danube, 8 miles N.W. of Illok.

VUKOLANI, a fortress of China, in Chen-si; 27 miles N. of Han-tchong.

VUKOVITZA, a town of Slavonia; 8 miles W. of Verovitz.

VULCAN, in *Mythology*, the son of Jupiter and Juno, who, on account of his deformity, was cast down from heaven into the island Lemnos, and breaking his leg with the fall, is always represented as lame. At Lemnos he set up the trade of a smith, and taught the Lemnians, in recompence of the succours they afforded him, the manifold uses of fire and iron: he is also represented as the manufacturer of Jupiter's thunder, and the arms of the other gods. The poets describe him as blackened and hardened from the forge; with a face red and fiery, whilst at his work; and tired and heated after it.

This poor god is almost always the subject either of pity or of ridicule. He is the great cuckold of heaven; and his lameness serves to divert the gods. The great celestial deities seem to have admitted Vulcan among them merely to make them laugh, and to be the butt of the whole company. Spence's *Polymetis*, p. 81.

Cicero mentions three other Vulcans: one the son of Caelum; the second the son of the Nile, acknowledged by the Egyptians as their protector, and called Opas; and the other the son of Menalius, who inhabited the Vulcanian isles. Banier mentions another Vulcan, more ancient than either of these, viz. the Tubal-Cain of scripture, who, having applied himself to the forging of iron, as Moses informs us, became the model and original of all the rest. The Vulcan of the Greeks was the god of blacksmiths, and a blacksmith himself; accordingly Diodorus Siculus (lib. v.) gives this account of him: Vulcan is the first founder of works in iron, brass, gold, and silver; in a word, of all fusible materials. He also taught the uses to which the artists and others can employ fire; and for this reason all those who work in metals, or rather men in general, call fire by the name of Vulcan, and offer sacrifices to that god, in acknowledgment of so useful an invention. The second Vulcan above mentioned, or the son of Nilus, was probably an ancient Egyptian king; or rather he was the most ancient divinity of the Egyptians, since we find him in Herodotus, Syncellus, and other authors, at the head of the divinities of these people, unless we revert backwards to Tubal-Cain, or to some one of the kings of those countries, who signalized himself in the art of forging iron.

Vulcan, the son of Jupiter and Juno, is supposed to have been a Titan prince, the same, according to Sir Isaac Newton, with Thos, king of Lemnos, whose wife had an intrigue with Bacchus, and the husband soon discovering it, Bacchus contrived to appease him by causing him to drink wine, and creating him king of Byblos and Cyprus; after which he passed the Hellespont with his army, and conquered Thrace. To these events the poets are thought to allude, when they feign that Vulcan fell from heaven into the island of Lemnos, and that Bacchus, after having pacified his wrath, succeeded in recalling him to heaven. He fell, it is said, from the heaven of the gods of Crete, when he departed from Crete to Lemnos to forge medals; he was reinstated in heaven, when Bacchus made him king of Byblos and Cyprus; for the courts of the princes of those times, in imitation of that of Jupiter, were looked upon as heaven. Newton's *Chronology*.

As the island of Lemnos was very subject to earthquakes and volcanoes, or as the art of forging arms was invented in this island, Vulcan is represented as falling into it. The forges of this god were also established in Mount Ætna for the same reason, and in the Vulcanian islands.

Of all the ancient nations, the Egyptians were the principal worshippers of this god. Accordingly he had at Memphis a magnificent temple, and a colossal statue, seventy-five feet high. His priests were much esteemed by the Egyptians, so that one of them, named Sathos, ascended the throne. This god was also highly honoured by the Romans. Tatiüs is said, by Dionysius of Halicarnassus, to have erected for him a temple, and Romulus consecrated to him a chariot of brass drawn with four horses. His sacrifices were holocausts: and Tarquin the elder, after the defeat of the Sabines, burned their arms and spoils in honour of this god. The lion was, who seems to dart fire from his mouth, consecrated to Vulcan; and dogs were set apart for guarding his temples. Of these he had several in Rome, but the most ancient one, built by Romulus, was without the bounds of the city; the Augurs being of opinion, that the god of fire ought not to be within the city itself. But the highest token of respect rendered by the Romans to this god, according to Dion. Halic. was their holding in his temple those assemblies, where the most important affairs of the republic were debated; the Romans thinking that they could invoke nothing more sacred, for the confirmation of their decisions and treaties, than the avenging fire of which that god was the symbol. All men in general, sensible of their obligations to this god for the discovery of the various uses which artists and others make of fire, offered sacrifices to him. There were also festivals instituted in honour of Vulcan, of which the principal was that, at which it was the custom to run with lighted torches, that were to be carried to the goal without being extinguished, under pain of disgrace; and Pliny informs us, that he who embraces another had his torch for his reward. Most of the medals of the island of Lemnos represented this god, with the legend, "Deo Vulcano." The Gauls paid adoration to this god 150 years before Julius Cæsar entered into their country.

VULCANALIA, among the *Romans*, a festival in honour of Vulcan, which was kept, as some say, from the 23d to the 29th of August, or, according to others, on the 10th before the calends of May, or the 22d of April. On this occasion the people used to throw animals into the fire.

VULCANI INSULA, in *Ancient Geography*, an island near that of Sicily, consecrated to Vulcan, according to Diodorus Siculus. Strabo calls it the temple of Vulcan, and Virgil denominates it the house and territory of Vulcan. It was under this name that the Lipari islands were described, and they were also named the isles of Æolus. Thus Virgil says, *Æneid*. l. viii. v. 416.

"Infula Sicanium juxta latus, Æoliumque
Erigitur Liparea fumantibus ardua Saxis.

Vulcani domus, et Vulcania nunc tellus."

VULCANIÆ, the name of the Æolian isle where Vulcan's forges were erected. See **LIPARI**, &c.

VULCANO and **VULCANELLO**, in *Geography*. Vulcan is one of the Æolian isles situated to the south of Lipari. Vulcanello was formerly a small island near Vulcan, but is now joined to it by the matter ejected from a volcano, which has been continually burning in Vulcan since the earliest records of history, though in modern times the violent eruptions are less frequent. Vulcan has been estimated to be twelve miles round; but, according to the account of it given by lieutenant-general Cockburn, the circuit of this island is about nine miles. The side of the island which looks towards Lipari is entirely barren, and does not produce any kind of vegetable; but the other sides, which

front the west and the south, are partly covered with the ilex and the oak, besides quantities of broom and other shrubs. As the whole of the island is composed of volcanic substances, it may be inferred that those parts which support vegetation have been more subject to decomposition than the barren parts. The substances, of which the soil is composed in the fertile parts of the island, are lavas softened to a great depth by atmospheric agency. On removing this soil, Spallanzani found the subjacent lava hard and porphyritic. Mixed with the lava were large pieces of obsidian, similar to that of Lipari. Vulcan is not inhabited, but is visited by sportsmen from Lipari, who go there to shoot rabbits. The first account we have of Vulcan is given by Thucydides, who relates, in his history, that Vulcan threw out flames by night and smoke by day. Aristotle, in his Treatise on Meteors, describes an ancient eruption of Vulcan, a part of the ground swelled and rose with a great noise, forming a hill which burst, and from whence a violent wind issued forth, with flames. At the same time so great a quantity of ashes were thrown out, as entirely to cover the neighbouring city of Lipari. The eruptions of Vulcan were visible in his time.

Polybius, as quoted by Strabo, says there were three volcanoes in this island, two well defined, and one with the crater partly fallen in. The mouth of the larger was five stadia in circuit. The bottom was only fifty feet in diameter, and situated about one stadium above the level of the sea. The form of the other two craters were similar. At a later period, in 1726, there were two burning craters on this island. See **VULCANO**.

From the text of Strabo, it may be inferred, that the volcanoes in this island threw out lava, since he says the burning matter ejected filled up a part of the sea to a considerable extent. Callias, in his life of Agathocles, tyrant of Syracuse, relates that, on a lofty eminence of Vulcan, there are two craters, one of which was three stadia in circumference, casting a great light to a vast distance, and that from this mouth burning stones of great size were thrown out, with so loud a noise that it might be heard to the distance of 500 stadia.

Cluverius and Fazello, in more recent times, describe Vulcan as being in a state of active eruption. The small island of Vulcanello, which now joins Vulcan, rose from the sea about the year of Rome 550. It was separated from Vulcan by a very narrow strait, which was open in the time of Fazello, but afterwards filled up by new eruptions from Vulcan.

At present there is only one burning crater on Vulcan, from which there have been two considerable eruptions in modern times, the one in 1775, the latest in 1786, which threw out an immense quantity of sand mixed with volumes of smoke and fire, accompanied with subterranean noises and thunders. This eruption continued for fifteen days, and appears to have changed the form and depth of the crater. See **VULCANO**.

The present crater of Vulcan nearly equals in size that of Vestivus, and greatly exceeds it in the variety of productions with which the sides are lined. These present the most beautiful colours, red, orange, deep yellow, and green. They consist of sulphur in various states of combination, and of saline and metallic matter and volcanic glasses. (See **VULCANO** and **VULCANIÆ Produçts**.) About half way down the crater, a hot spring issues from the side; but the quantity of water which flows is small, and is soon lost among the masses of scorix and lava. Above the spring are pendant stalactites of alum of various forms and sizes. The height of the summit of the crater of Vulcan is not given by any traveller

that we are acquainted with; but from a comparison with Stromboli, it can scarcely be estimated at more than 1500 feet above the level of the sea. The sand on the shore, in some parts of the island, though covered with the sea, preserves a certain degree of heat.

The ancients attached much importance to the appearance of the smoke of Vulcano. They inform us, that before a fourth wind blew, the island was enveloped in so dark a cloud, that Sicily could not be seen from it. When a north wind was to be expected, a pure flame rose above the crater. The various sounds of the explosions likewise, and the different places where the eruptions began, with the appearance of the flames, were all prognostics of the wind which would blow three days afterwards. This account, given by Polybius, does not accord with the present phenomena of Vulcano; and in all probability, it originated not in any accurate observations, but from the prejudices of ancient mariners.

Modern observers have also pretended to predict the state of the weather from the appearance of Vulcano. If it could be established that there was any connection between the state of the atmosphere, and the intensity of the volcanic fire, the fact would be well deserving attention. It is however necessary to observe, that the smoke and vapour from common fires and breweries, &c. assume a very different appearance in different states of the atmosphere, and that this should be the case with the vapour and smoke issuing from volcanoes appears highly probable, without allowing that any real change takes place in the volcano itself. In a book entitled "Tracts by Sicilian Authors," printed at Palermo in 1761, there is a dissertation on the manner in which the weather may be foretold twenty-four hours before hand, in which the following account is given by a native of Lipari, who made his observations between the years 1730 and 1740. "The change of weather and winds is indicated by mount Vulcano twenty-four hours before it takes place, by a louder noise than usual, resembling distant thunder, and if we then observe the smoke that issues in a greater quantity than usual, we may discover what kind of wind will succeed. When the wind is about to change to the south-east, the smoke rises so dense and black, and in so great a quantity; and to such a height, and afterwards falls in so black a dust, as to strike the beholder with awe. At the same time a loud roaring is heard, frequently accompanied with tremblings of the earth. When the wind is on the point of changing to the north-north-east, or north-north-west, or north-west, the smoke rises more slowly, is less dense, and the colour is entirely white, as is that of the dust which falls from it. Nor does any loud noise or trembling of the earth take place. When the wind is about to change to the east, or east-north-east, an explosion is heard in the body of the mountain, which soon after throws out a little white smoke, of which colour are likewise the ashes which fall when the smoke is dispersed. The mountain in the mean time explodes, and roars so violently at intervals, that the shock of an earthquake is dreaded. Lastly, previous to a change of wind to the west, the west-south-west, or west-north-west, vast volumes of smoke arise of a dark ash-grey, approaching the colour of lead, and so thick that when they disperse they occasion a continued shower of ashes."

These observations, whether correct or not, indicate a more active state of the volcano than what it presents when it has recently been visited. Spallanzani, who notices the above predictions relative to Vulcano, says, "I should justly incur the imputation of rashness were I absolutely to deny these facts, without having sufficient reason so to do, especially as they are so precise, and are said to have been observed on the spot. Besides, it does not appear credible

that Abbate Roffi, who gives them, would have published his observations in a place where he was liable to be contradicted by all his countrymen. I must, however, with philosophic candour, say, that during my residence of several weeks in Lipari, where I continually saw Vulcano during the blowing of the different winds mentioned in this extract, particularly the south-east, the west, and the south-west, I never observed, either before they began, or while they continued to blow, any tremblings of the earth, subterranean roarings, lofty columns of smoke, or showers of ashes. Once only, when a violent south-west wind was on the decline, the column of smoke which issued from Vulcano increased prodigiously, but when it had risen a little distance above the upper edge of the crater, it grew thinner, and soon after vanished. Though the wind continued to blow, this prodigious cloud of smoke still continued to rise from the crater for several hours. I once observed the smoke to be exceedingly rare when a strong west wind blew; and twice, when the air was perfectly calm, I observed the smoke extremely copious, and rising to a great height. To conclude, after carefully noticing day by day every change that took place in the phenomena exhibited by Vulcano, during my stay in its vicinity, I could perceive none which afforded support to these famous prognostics. The sailors at Lipari also were not agreed respecting them. I am not, however, so positive as to deny the whole of these observations. To know with certainty whether any direct relations exist between the various symptoms of Vulcano, and the changes of the atmosphere, it would be necessary to reside for some years in the island, a place truly wild and desolate; and he who, like Empedocles at Etna, should go to erect his dwelling there, in order to observe the changes of the volcano, would have no other companions than the rabbits which make their burrows in the southern side of the island." Spallanzani's Travels in the Two Sicilies, vol. ii.

When M. de Luc visited Vulcano in 1757, it appeared to be in a more quiet state than at present; for though smoke and vapour issued from the crater, he does not mention being incommoded by the heat when he descended into it. Yet he noticed a fact which we believe has not since been remarked. The sulphureous vapours had a communication with the sea, which was in many places of a yellowish colour, and in others emitted fumes; and in the places where the fumes issued, the heat was intolerable, so that the fish which approached the coast died, and the beach near the level of the sea was covered with dead fish. Pliny states, that when the island of Vulcanello was thrown up, a great number of fish were found dead, and caused the death of those who ate them.

An opinion exists, and has existed for centuries, that the ground under Vulcano is hollow, and that it will some time be swallowed up. This opinion probably originated from the hollow sound occasioned by the throwing of a stone, or any hard substance, on the bottom of the crater. Probably Vulcano, Stromboli, and all the Æolian isles, are only the chimneys of one immense subterranean fire, extending under the whole, and communicating from thence to Etna and Vesuvius. Stromboli threw out unusually dense and suffocating volumes of smoke for some days before the earthquakes which desolated Calabria in 1783; and was uncommonly violent at the time of the great earthquake which destroyed Euphemia. See VOLCANO.

VULDEP, a river of Bavaria, which runs into the Inn, near Ratenburgh in the Tyrol.

VULGAGO, a name given by some botanical authors to the asarum or asarabacca, whose leaves and root are used in medicine.

VULGAR *Arithmetic, Fractions, and Purgation.* See the substantives.

VULGATE, a very ancient Latin translation of the Bible; and the only one the church of Rome acknowledges to be authentic.

The ancient Vulgate of the Old Testament was translated, almost word for word, from the Greek of the Septuagint. The author of the version is not known, nor so much as guessed at. See *VERSIOS, Italic and Latin.*

It was a long time known by the name of the *Italic*, or old version; as being of very great antiquity in the Latin church. It was the common, or vulgar version, before St. Jerom made a new one from the Hebrew original, with occasional recurrences to the Septuagint; whence it has its name *Vulgate*.

Nobilius, in 1558, and F. Morin, in 1628, gave new editions of it; pretending to have restored, and re-collected it, from the ancients who had cited it. The Vulgate was held, by St. Augustine, to be preferable to all the other Latin versions then extant; as rendering the words and sense of the sacred text more closely and justly than any of the rest. It has since been retouched from the correction of St. Jerom; and it is this mixture of the ancient Italic version, and some corrections of St. Jerom, that is now called the Vulgate, and which the council of Trent has declared to be authentic.

It is this Vulgate alone that is used in the Romish church, excepting for some passages of the ancient Vulgate left in the Missal, and the Psalms; which are still fung according to the old Italic version.

St. Jerom declares that, in his revival of the Italic version, he used great care and circumspection, never varying from that version but when he thought it misrepresented the sense. But as the Greek copies to which he had access were not so ancient as those from which the Italic version had been made, some learned authors have been of opinion that it would have been much better if he had collected all the copies, and by comparing them, have restored that translation to its original purity. It is plain that he never completed this work, and that he even left some faults in it, for fear of varying too much from the ancient version, since he renders in his commentaries some words otherwise than he has done in his translation. This version was not introduced into the church but by degrees, for fear of offending weak persons. Rufinus, notwithstanding his enmity to St. Jerom, and his having exclaimed much against this performance, was one of the first to prefer it to the Vulgar or Italian. This translation gained at last so great an authority, by the approbation of pope Gregory I. and his declared preference of it to every other, that it was subsequently in public use through all the Western churches, although it was not regarded as authentic, except by the council of Trent: it is certainly of considerable use, as it may serve to illustrate several passages both of the Old and New Testament.

The two principal Popish editions of the Vulgate are those of popes Sixtus V. and Clement VIII. The former was printed in 1590, after pope Sixtus had collected the most ancient MSS. and best printed copies, summoned the most learned men out of all the nations of the Christian world, assembled a congregation of cardinals for their assistance and counsel, and presided over the whole himself. This edition was declared to be corrected in the very best manner possible, and published with a tremendous excommunication of every person, who should presume ever afterwards to alter the least particle of the edition thus authentically promulgated by his holiness, sitting in that chair, *in qua Petri vivit potestas, et*
VOL. XXXVII.

excellit auctoritas. The other edition was published in 1592, by pope Clement VIII.; which was so different from that of Sixtus, as to contain two thousand variations, some of whole verses, and many others clearly and designedly contradictory in sense; and yet this edition is also pronounced authentic, and enforced by the same sentence of excommunication with the former. See Kennicott's *State of the printed Hebrew Text, &c.* vol. ii. p. 198, &c.

VULGATE of the *New Testament.* This the Romanists generally hold preferable to the common Greek text, because it is this alone, and not the Greek text, that the council of Trent has declared authentic: accordingly that church has, as it were, adopted this edition, and the priests read no other at the altar, the preachers quote no other in the pulpit, nor the divines in the schools.

Yet some of their best authors, F. Bouhours for instance, own, that among the differences that are found between the common Greek and the Vulgate, there are some wherein the Greek reading appears more clear and natural than that of the Latin; so that the second might be corrected from the first, if the holy see should think fit. But those differences, for the generality, only consist in a few syllables, or words; they rarely touch the sense. Besides, in some of the most considerable, the Vulgate is authorized by several ancient manuscripts. Bouhours spent the last years of his life in giving a French translation of the New Testament, according to the Vulgate. In 1675, a new edition of the Greek Testament was published by the university of Oxford; and great care taken therein to compare the common Greek text with all the most ancient manuscripts in England, France, Spain, and Italy; and to note the differences observed therein.

In the preface of this work, the editors, speaking of the divers versions of the Bible in the vulgar tongues, observe of the Vulgate, that there is no version of any language to be compared with it. And this they justify, by comparing passages that occur in the most celebrated Greek manuscripts, with the same passages in the Vulgate, where there is any difference between that and the common printed copy. In effect, it is probable, that at the time the ancient Italic or Vulgate version of the New Testament was made, and at the time it was afterwards compared with the Greek manuscripts by St. Jerom, as they were then nearer the times of the apostles, they had juster Greek copies, and those better kept, than any of those used when printing was first set on foot.

"Highly as the Vulgate is extolled by the church of Rome," says professor Michaelis, "it has been depreciated beyond measure at the beginning of the 16th century by several learned Protestants, whose example has been followed by men of inferior abilities. At the restoration of learning, when the faculty of writing elegant Latin was the highest accomplishment of a scholar, the Vulgate was regarded with contempt, as not written with classical purity. But after the Greek manuscripts were discovered, their readings were preferred to those of the Latin, because the New Testament was written in Greek, and the Latin was only a version; but it was not considered that these Greek manuscripts were modern in comparison of those originals from which the Latin was taken; nor was it known at that time, that the more ancient the Greek MSS. and the other versions were, the closer was their agreement with the Vulgate. This has been already evinced by Simon, who made it a particular object of his attention in his '*Hist. Crit. du Texte et des Versions du N. T.*' and has pointed out the real merits of the Latin version. Our ablest writers, such as Mill and Bergel, have been induced by this treatise

to abandon the opinion of their predecessors, and have ascribed to the Vulgate a value perhaps greater than it deserves." Michaelis's Introduction to the New Testament by Marsh, vol. ii. part 1. Campbell's Prelim. Dissertation to his Comment on the Four Gospels. A complete account of all the editions of the Vulgate is given in Le Long Bibl. Sacra, ed. Masch. part 2. vol. iii. cap. 2.

M. Simon calls the Greek version of the Septuagint, before it was revised and reformed by Origen, *the ancient Vulgate Greek*. Origen's correction was preferred to the ancient Greek, which was consequently disused; so that we have now scarcely any copies of it. See SEPTUAGINT.

VULGIENTES, in *Ancient Geography*, a people of Gallia Narbonensis, N. of the Salgii; to whom Pliny assigns the town of Apta Julia.

VULKAN, in *Geography*, a mountain of Transylvania; 24 miles W. of Weiffemburg.

VULNERARY, formed from *vulnus*, wound, in *Medicine*, an epithet given to remedies proper for the cure of wounds and ulcers.

There are divers vulnerary herbs; as aristolochia, or birth-wort; faniol, or felt-heal; plantain, mouse-ear, veronica, or fluellin; agrimony, vervain, or the holy herb, &c.

There are also vulnerary potions, composed of various simples; vulnerary balsams, unguents, plasters, &c. See BALSAM, &c.

VULNERARY Water. See WATER.

VULPANSER, in *Ornithology*, a name given by some authors to the shell-drake, or borrow-duck, a very beautiful species of duck, common on some of our coasts, and called by the generality of authors *ladorna*. See DUCK.

VULPECULA, in *Ichthyology*, a name given by Belonius and Gesner to the fish called by the generality of authors *centrine*. See CHIMERA and SQUALUS.

VULPECULA *anfer*, *Fox and Goose*, in *Astronomy*, a constellation made out of uninformed stars by Hevelius, in which he reckons twenty-seven stars; but Flamsteed enumerates thirty-five. See CONSTELLATION.

VULPES, in *Entomology*, a species of SCARABÆUS, which fee.

VULPES, in *Zoology*. See FOX.

VULPES *Babamensis*, in *Ichthyology*, a species of ESOX, with a fin in the middle of the back, and the branchioteous membrane three-rayed. It is found in America.

VULPES *Marina*. See SEA-FOX.

VULPES *Putoria*, in *Zoology*. See DIDELPHIS *Opoffum*.

VULPINALIA, among the Romans, a feast celebrated on the 10th of April, in which they burned foxes.

VULSINIENSIS LACUS, or *Vulfinian Lake*, in *Ancient Geography*, a lake of Italy, in Etruria, nearly S. of the lake of Trasimené. It took its name from that of *Vulfinii*, which fee. See also VOLSINENSIS LACUS.

VULSINI, *Bolsina*, a town of Italy, in Etruria, upon the northern bank of the lake above-mentioned. It was one of the most considerable towns of Etruria; and its inhabitants armed themselves against the Romans in the year of Rome 363. This town afterwards fell under the power of slaves; but when they were introduced into the order of senators, they would not suffer any assembly to be convened without their consent, and they asserted their own impunity for many crimes which entailed dishonour on families. This singular fact occurred in the year 489. According to Florus, these slaves were under the conduct of a person named Fabius Gurges. The Romans established the order in Vulsinii; but they despoiled it of a great number of statues. This town was ravaged at three different times: first by the Romans; then

by a monster, of whom no adequate idea can easily be given; and lastly, by a thunderbolt.

VULSON, MARC DE, *Sieur de la Colombière*, in *Bio-graphy*, an heraldic writer, lived at Grenoble in 1618, and discovering his wife in the act of adultery, killed her and her gallant, and obtained a pardon at Paris, whither he fled. His work, entitled "La Science Heroique, traitant de la Noblesse, de l'Origine des Armes, &c." 1644, folio, reprinted with additions in 1669, is reckoned the most complete French work on Heraldry. He also published, "Le Theatre d'Honneur et de Cavalerie, ou le Miroir Historique de la Noblesse," 2 vols. folio, 1648, and "Recueil de plusieurs Pièces et Figures d'Armoiries," folio, 1689: and died in 1658. Nouv. Dict. Hist.

VULTONA, *La Boutonne*, in *Ancient Geography*, a river of Aquitania in Gaul; and after pursuing the course nearly from E. to W., it discharges itself into the Charante. This river is also denominated "Vultumna."

VULTUR, or VULTURE, in *Ornithology*, a genus of birds belonging to the order of Accipitres, or hawks. The characters of which are, that the bill is straight, and hooked only at the apex, and covered at the base by a cere or skin; that the head has no feathers, and covered in front with a naked skin; that the tongue is fleshy, and generally bifid, the neck retractile, and the feet strong, with moderately crooked claws. Gmelin, in his edition of the Linnæan system, reckons 13 species, besides varieties, which are as follow:

GRYPHUS, or Vulture *Condor*, or large vulture, or black vulture, with the shorter wing-feathers white; the head furnished with an upright, compressed, fleshy crest or comb; the throat naked and red; and the neck carunculated on each side. We are enabled, by Dr. Shaw, who had an opportunity of examining two birds of this kind in excellent preservation in the Leverian Museum, to give a more correct description of this genus than that which was furnished when the article condor was written. (See CONDOR.) These birds, which are more frequently seen in Peru than in any other parts of South America, were brought from the straits of Magellan. They were supposed to be male and female. The male bird has "a kind of gular pouch, or large dilated skin, of a bluish colour, proceeding from the base of the lower mandible, and reaching to some distance down the neck. On each side of the neck is also situated a row or series of flat, carneo, semicircular, or ear-shaped flaps or appendages, to the number of seven on each side, and which gradually decrease in size as they descend; being so disposed as to lap slightly over each other. The whole neck and breast are of a red colour, and perfectly bare of feathers; being only coated here and there with a few straggling filaments of blackish hair or coarse down. The colour of the lateral wattles or caruncule inclines to bluish. The crest or comb on the head is large, upright, thick at the base, sharpened on its edge, and not entirely even in its outline, but somewhat sinuated, sinking slightly in the middle, and rising higher on the back part: it is smooth, and irregularly convex on the sides, and in its texture or substance not greatly dissimilar to that of the V. papa of Linnæus, or king vulture. At a slight distance behind this, on each side, is situated a much smaller, semi-oval nuchal crest, of a similar substance, and beset with coarse down. The colour of the crest is blackish, slightly inclining to red and blue in some parts. Towards the lower part of the neck is a pendent pear-shaped tubercle: the lower part of the neck is surrounded by a collar of milk-white down or fine plumes, representing exactly a tippet of white fur. The extent of the bird, from wing's end to wing's end, was said to

to be more than twelve feet when measured immediately after it was shot."

The back of the bird has been erroneously described as white, whereas it is coal-black; an error evidently owing to the bird's having been seen with the wings closed over the back, so that the white secondaries covered it from view. Gmelin copied this error from Molina, and thus Mr. Latham was misled. In their descriptions, the tail is said to be small, which, on the contrary, is rather large in proportion to the bird. The supposed female had not the least appearance of a comb on the head, which, with some other particulars, inclined Dr. Shaw to conclude that it was either a young bird or a female. The extent of its wings from tip to tip was not far short of 10 feet. Another of these birds, mentioned in the 18th volume of the Phil. Trans. and shot in Chili, had wings which extended more than 16 feet. The beak of the fore-mentioned female was of a dark lead colour, becoming gradually whitish towards the tip. The head and neck were destitute of feathers, but covered with a short straggling sort of hairy down; the top of the head inclined to a dark colour, but the rest of the neck was paler, and probably in the living bird of a reddish colour. Towards the lower part of the neck, where it joins to the shoulders, was a ruff or circle of white downy feathers; and beneath the breast a considerable bare space: the rest of the bird was black, except the shorter or secondary wing-feathers, which were white with black tips: the legs and feet were blackish, very strong, but the claws not much incurved: the tail even at the end, and very slightly rounded at the sides. On comparing the remiges or wing-feathers of this bird with some of those which were brought over by Mr. Byron as those of the real condor, Dr. Shaw found them to be exactly similar, except in size. From an examination of these specimens, Dr. S. concluded that the physiognomy of this bold and formidable vulture is not of a ferocious cast, but rather exhibiting an appearance almost bordering on mildness. M. Humboldt makes some deduction for the alleged size of this bird, as he had seen none which exceeded 3 feet 3 inches in length, and 8 feet 9 inches in extent from the end of one wing to that of the other. He admits, however, that the condor may sometimes be supposed to arrive at a much greater magnitude, and to measure in extent of wings 11 or 12 feet. Its usual residence, as he informs us, is among lofty rocks in the region of the Andes, just below the boundaries of perpetual snow, and it may be considered as a co-inhabitant with the guanaco.

Nothing can exceed the sagacity with which the condor perceives the scent of its prey at a distance, or the boldness with which it flies down to seize it. It preys both on dead and living animals, and two birds will seize on a heifer, and begin their work of destruction by picking the eyes and tearing the tongue out.

A method of taking condors alive is often practised in Peru and Quito, and is as follows:—A cow or horse is killed; and in a little time the scent of the carcase attracts the condors, which are suddenly seen in numbers in places where no one would suppose they existed. They always begin with the eyes and tongue, and then proceed to devour the intestines, &c. When they are well fated, they are too heavy and indolent to fly, and the Indians take them easily with nooses. When thus taken alive, the condor is dull and timid for the first hour, and then becomes extremely ferocious. M. Humboldt had one in his possession for some days, which it was dangerous to approach. The condor is extremely tenacious of life, and will survive for a long time such wounds as might be supposed to prove immediately fatal; and such is the fulness of its plumage, that it has the

power of resisting or repelling the force of a ball fired at it from a gun. This indeed is not peculiar to the condor, but has been observed in some other well-feathered and thick-skinned birds, particularly those of the order *Anseres*.

BENGALENSIS, the Brown Vulture. With the head and neck naked before, and faintly chestnut-colour; the bill lead colour, with black tip; or brown vulture, paler beneath, with the head and neck covered by fulvous down; the lower part encircled by a brown ruff. This is the Bengal vulture of Latham, two feet six inches in length; bill and legs dusky black, and crop hanging over the breast, as is the case in many others of the vulture tribe. It is a native of Bengal.

PAPA, Vulture. With carunculated nostrils, and naked crown and neck; or whitish-rufescent vulture, with naked variegated head and neck; nostrils furnished with a loose orange-coloured caruncle, and neck with a grey ruff. This is the *cozcaquauhli* of Hernand. Mex., king of the vultures of Edwards, and exceeds every other species in the elegance of its appearance, about the size of a hen turkey, and of a light-reddish brown or buff colour, with black wings and tail, accompanied with a gloss of green, the edges of the wing-feathers being of a whitish cast; the under parts of the body are white, with a slight cast of yellow; the legs and feet pale flesh-colour; but what constitutes the peculiar ornament of the bird is the vivid colouring of the head and neck, which are bare of feathers. This beautiful species is a native of many parts of South America, and is also found in the West Indies: it feeds on carrion, like the rest of the tribe, and occasionally preys on several of the smaller animals, as lizards, &c.

MONACHIUS, Monk Vulture. With gibbous crown, and black body; or brown vulture, with lengthened ruff, and downy occipital crest. This is the crested black vulture of Edwards; the cinereous or Arabian vulture of Latham; and vautour, or grand vautour of Buffon. This bird is an inhabitant of the deserts of Arabia, and is said to be not uncommon in the Pyrenean mountains.

AURA, the Brown-greyish Vulture. With black wing-feathers, and white bill; or blackish vulture, with purple and green reflexions, and red, naked, papillated and wrinkled head and neck. This is the *tzeipolit* of Hernandez; the *uruba*, &c. of Willughby and Marcgrave; the *gallinazo* of Ulloa; the turkey-buzzard of Catby; and the carrion-crow of Sloane; the carrion-vulture of Pennant and Latham; and vautour de Brasil of Buffon. Some say that there are two distinct species, *viz.* the *V. aura*, which is of a blackish-brown, and the *V. uruba*, which is entirely black, the bill, head, and neck excepted, which latter is most prevalent in South America. Gmelin mentions a variety, black, with brown wing-feathers, and cinereous bill. This species, with some variations, appears to be generally diffused over the whole continent of South America, but mostly in the warmer regions. In some parts of British America it is popularly called the turkey-buzzard, and in other parts carrion-crow. It is somewhat smaller than a turkey; it feeds on every kind of animal matter, and is highly esteemed in the West Indies on account of its activity in clearing away substances that might otherwise render the air noxious in those warm climates. In consequence of this mode of life, the birds themselves have always a very offensive odour. According to Mr. Pennant, these birds are common from Nova Scotia to Terra del Fuego, and though they are mischievous in attacking and destroying cattle in a weak or diseased state, they are beneficial in lessening the number of alligators, which would otherwise become intolerable by their multitudes.

VULTUR.

CINEREUS, the Brown-blackish Vulture. With wing and tail-feathers verging towards cinereous, and legs covered with brown feathers. This is referred by Shaw to the *V. monachus*. It is the *V. cinereus* of Ray; the cinereous or ash-coloured *V.* of Willughby and Latham. It inhabits high mountains of Europe. Gmelin suggests it to be a variety of *percnopterus*.

FUSCUS, the Brown Vulture. With wing-feathers brown or blackish, the primary white at the apex spotted with brown, and tail-feathers grey-brown, and naked legs. This is the *vautour de Malte* of Buffon, and found in Europe, chiefly in the island of Malte. Gmelin questions whether it be different from the *percnopterus*?

NIGER, Black Vulture. With wing and tail-feathers brown, and legs covered with black feathers. This is described as larger than the golden vulture, of a black colour, and is said to be common in Egypt and Sardinia. Gmelin suggests that it is a variety of *percnopterus*, and Dr. Shaw also inclines to think that it is a variety.

LEUCOCEPHALUS, Vulture. With snowy feathers, wing and tail black, with a white ruff. This is the white or cinereous vulture of Willughby, and the *vautour de Norvege* of Buffon; found in Sardinia and Norway; and suggested to be a variety.

FULVUS, Vulture. From grey to reddish above, head, neck, and ruff white, wing and tail-feathers black; or fulvous-chestnut vulture, with black wing and tail-feathers, downy whitish head and neck, and white ruff. This is the *V. fulvus* of Brisson, the fulvous *V.* and golden *V.* of Willughby, and the griffon of Buffon. This is one of the largest of the genus, exceeding the size of the golden eagle. The general colour of the plumage, when the bird is in its best state, is a full rufous or tawny chestnut; and the legs and feet are ash-coloured. This bird, often confounded with others, is found in the mountains of Persia.

PERCNOPTERUS, Vulture. With black wing-feathers, the exterior margin, that of the outmost excepted, greyish or hoary; or white *V.* (the female brownish) with lengthened narrow beak, naked face, and black wing-feathers with grey edges. This is the *V.* (*percnopterus*) with naked head and plump throat, or Egyptian mountain-falcon of Haffelquist; the aquiline *V.* of Albin.; the vulture eagle of Al-drovand.; and the *rachamah* of Bruce's Travels. Its size, according to Gesner, is that of a stork. Shaw thinks it probable, that the *rachamah* of Bruce, the Angola vulture of Pennant, the ash-coloured vulture of Latham, and the *petit vautour* or *vautour de Norvege* of Buffon, are in reality the same species, and constitute the male *V. percnopterus* of Linnaeus. He also inclines to believe that the *Maltese V.* of Latham, or *vautour de Malte* of Buffon, is merely the female of this species. If this be the case, the *V. percnopterus* seems to be a pretty general inhabitant of the old continent, being found not only in many of the temperate and warmer parts of Europe, but in various parts of Asia and Africa. It is plentiful in Egypt, where it is esteemed for its beneficial services in destroying various putrid substances in the vicinity of towns and cities. Its general size is that of a female turkey, but in this respect it varies in different countries. The male also varies in the cast of its colour, which is sometimes nearly white, and sometimes a dirty pale rufous-white; the quills are black, but the secondaries are externally of the same colour with the rest of the plumage. The female is said to exceed the male in size. Bruce informs us, that it is a very great violation of order, or police, to kill any of these birds near Cairo.

CRISTATUS, the Crested Vulture. From reddish to blackish, the breast more inclining to red, the legs naked.

This is the brown vulture of Willughby and Latham. It is found in thick and desert forests.

BARBARUS, or **BARBATUS**. The vulture brown to black, underneath white inclining to brown, woolly legs, lead-coloured toes, and brown nails; or blackish-brown *V.*, fulvous beneath, with the head and neck covered by lanceolate whitish plumes, and the bill bearded beneath. This is the bearded *V.* of Edwards and Latham. It is one of the largest of the European vultures, and is principally observed among the Alps of Switzerland, where it is called *lammer-geyer*, or *lamb-vulture*. It is described and figured in the works of Gesner, under the title of *V. aureus*. It exceeds the golden eagle in size. This species seems to be a native of the wilder regions both of Asia and Africa, and seems to be recorded by Mr. Bruce under the name of "*nisser-werk*." Mr. Bruce's description, for which we refer to the Appendix to his Travels, affords a striking instance of the boldness and voracity of this bird. This vulture is said to build in the inaccessible cavities of lofty rocks, and they sometimes assemble in small flocks about the mountainous regions of the countries which they inhabit.

Dr. Shaw mentions some other species, besides those that are above enumerated.

CALIFORNIANUS, Black Vulture. With whitish beak; head and neck unfeathered, and of a pale colour; the plumes of the collar and breast lanceolate. This bird is one of the largest of the genus, and approaches to the size of the condor. It was brought over from the coast of California, and is now in the British Museum.

AURICULATUS, Brown Vulture. With naked neck, skin of the ears lengthened, and pale ruff. This is the oricon of Levaillant, and it is a very large bird, measuring ten feet from one wing's end to the other: its general colour is brown, the throat being black, and covered with coarse hairs. These birds inhabit the southern parts of Africa, and are of a gregarious nature, assembling in large flocks about the caverns of the rocky mountains, where they breed. This bird is very voracious, and when attacked or wounded defends itself with surprising strength and resolution; but it is naturally of an indolent and sluggish character.

PONTICERIANUS, Black Vulture. With nearly naked flesh-coloured head and neck, and a fleshy red caruncle down each side of the neck. It is the *vautour royal de Pondicherry* of Sonnerat, whence its name. Its size is that of a very large goose, with black bill and yellow legs; and is a native of India, particularly about Pondicherry.

INDICUS, Brown Vulture. With naked, rufous head and neck, and black wing and tail-feathers. It is the Indian *V.* of Latham, and the *grand vautour des Indes* of Sonnerat. It is of the size of the preceding, and native of India, extremely voracious, principally frequenting the sea-banks, and preying upon dead fish and other putrid substances; and, like other birds of this genus, sometimes assembling in vast numbers on a field of battle.

CASTANEUS, Chestnut Vulture. With whitish downy head and neck, brownish ruff, and black wing and tail-feathers. This is the *percnoptere* of Buffon, and differs little from the fulvous vulture, so that it might be thought to be a mere variety of that species. This bird is remarkable for a brown spot shaped like a heart, and edged with a straight white line, situated on the breast under the ruff. It is deformed in figure, and disgusting in appearance, from a continual flux of rheum from its nostrils, and of saliva from two other holes in the bill. According to Buffon, it is of the size of an eagle, and an inhabitant of the Alps and Pyrenees, and of the mountains of Greece.

GINGIANUS, White Vulture. With black wing-feathers,

feathers, and grey beak and legs. The vulture gingi of Sonnerat, who says it is of the size of a turkey, and is found about the coasts of Comorandel. Its flight is strong and rapid, and its voracity insatiable; it lives on carrion and reptiles; is generally seen single and in marshy places.

PLANCUS, Whitish Vulture. With transverse blackish lines, brown wings, and slightly crested black crown. This is the *V. plancus* of Latham, the *falco plancus* of Linnaeus and Gmelin, the plaintive eagle and plaintive vulture of Latham. It is a native of Terra del Fuego.

CHERIWAY, Vulture. With rose-coloured cere, yellow legs, ferruginous body, and whitish head with ferruginous crest. This is a kind of doubtful species, which may be considered either as a vulture or an eagle. Jacquin first described it, after having observed it in the island of Aruba, near the coast of Venezuela in South America.

The following species are denominated by Dr. Shaw doubtful: *viz.*

Tawny Vulture of Latham, said to be a native of Falkland islands, with very short bill, large cere, and chin slightly bearded.

Hare Vulture, probably a species of eagle rather than vulture.

Armed Vulture. Mentioned by Brown in his African travels, and said to be very frequent in the country of Darfur, flying about by thousands, and devouring all kinds of carrion, &c.

Bold Vulture of Latham, so bold as to attack the natives in New Holland, where it is called "Boora Morang."

It is said that there are no vultures in Great Britain, nor any north of the Baltic; but the various species are found in the southern parts of Europe, Asia, Africa, and America, as low as Terra del Fuego. They are a sluggish ungenerous race, preying oftener on dead animals, and even on putrid carcases, than on living creatures: their sense of smelling is most exquisite: they collect in flocks from great distances; and are directed to their prey by the sagacity of their nostrils: they fly slowly and heavily; are very greedy and voracious to a proverb; and they are bold and fearless, preying in the midst of cities, undaunted by mankind. Pennant's Genera of Birds, p. 2.

The vulture was a bird consecrated to Mars and Juno; and used among the Romans in the exercise of angury.

VULTUR, *Mons*, (*Mount Vulturno*), in *Ancient Geography*, a mountain of Italy, in Apulia, forming a chain which extends from the S.W. to the N.E. south of Venetia. We learn from Livy, that the inhabitants of the country called the wind which proceeded from this mountain Vulturinus; which wind is said to have blown in the faces of the Romans during the battle of Cannæ. But Polybius does not mention this circumstance; and it appears that the Romans were to the S., and the Carthaginians to the N., so that the faces of the former were turned towards the N. or the E. Accordingly, the wind of which Hannibal speaks, was one of the collateral winds, which the ancients called Vulturinus, and which was E.S.E.

Horace speaks of this mountain in one of his Odes (lib. iii. od. 4.); and Lucan also mentions it (lib. ix. v. 183.)

VULTURIA, or **VULTURINA**, a fortified place in Gallia Cisalpina, S.E. of Cremona; which surrendered to the Lombards.

VULTURIUS, among the Romans, a throw of the *tali*, otherwise called *canis*. See **TALARIS Ludus**.

Also, an epithet given to Apollo, from a whimsical circumstance, which was that of releasing a poor shepherd, who had been deserted with stolen treasure by his companion, and left in the cavern of a rock, from which he had no

means of ascending. Apollo advised him to wound his body with a flint, upon which a number of vultures, allured by the scent of blood, flocked round him, and planting their bills in his wounds and cloaths, mounted upwards with him, and delivered him from the cave. The fable further reports, that the other shepherd was sentenced to death by the Ephesian magistrates, and the survivor having received by their award half the gold which was found in the cave, and which his companion had purloined, built with it, upon the mountain where the adventure had occurred, a temple in honour of his deliverer, under the name of Apollo Vulturinus.

VULTURIUS Lapis, a name given by many to the stone called *quandros*.

VULTURNALIA. See **VOLTURNALIA**.

VULTURNIA, in *Ancient Geography*, an island situated between Sicily and the coast of Africa, according to the Itin. of Anton.

VULTURNUM, a town of Italy, at the mouth of the *Vulturinus*.

VULTURNUS, (*Le Vulturno*), a river of Italy, in Campania. It commenced towards the north, in Samnium, among the Caraceniens, and for a long interval separated Samnium from Campania. At Benevento, it turned to the W., and discharged itself into the sea. Towards the sea, on the right of the river, was the territory of Falerna, on this side of mount Mafficus, which was celebrated for its excellent wine; but in the time of Pliny it was neglected, and began to decline in reputation: that of the vineyard of Faustinus being more esteemed. Livy informs us, that in the second Punic war, a fort was erected at the mouth of this river, which afterwards became a town, in which was established a Roman colony. Varro gives this town the name of a colony.

VULTUS de Luca, the fame with veronica.

VULVA, *quasi Vulva*, *doors*, a name which some physicians give to the vagina, and others to the uterus, or womb.

VULVA is sometimes also used for the cunus, or whole pudendum muliebres.

VUNENA, a name given by the people of Guinea to a kind of catch-fly, or lychinis, common in that part of the world, and much used by them in a decoction to cure swellings of the legs. Petiver has called it *lychnis Guineensis fructu caryophylloide foliis roris marini, hirsutis, angustioribus*. Phil. Trans. N^o 232.

VUOD, in *Mythology*, a god of the Arabians.

VURNWEY, in *Geography*, a river of North Wales, in the county of Montgomery, which runs into the Severn, on the borders of Shropshire.

VUSHOU, a town of Persia, in the province of Irak; 60 miles N. of Iphahan.

UVSKOI, a town of Russia, in the government of Tobolsk, on the Irtysh; 68 miles N. of Tobolsk.

VUTSHIM, a town of Slavonia; 18 miles N. of Pefoega.

UVULA, in *Anatomy*, the small conical body, projecting from the middle of the soft palate. See **DEGLUTITION**.

UVULA, *Disease and Amputation of*. When the uvula is permanently elongated, so as to interrupt swallowing, and occasion uneasiness in the throat, coughing, vomiting, &c. it is proper to remove the redundant part.

Slight relaxations of the uvula may generally be cured by astringent gargles, composed of the infusion of roses, alum, tincture of bark, &c. When, however, the inconvenience cannot be removed by such means, the superfluous portion of the uvula may be cut off with a pair of sharp scissors.

The

UVULARIA.

The fear of hemorrhage, and the recommendation of the ligature, in these cases, are almost absurd, notwithstanding the contrary statements of a few modern writers.

UVULARIA, in *Botany*, a genus established and named by Linnæus, is recorded, *Philos. Bot.* 168, to owe this appellation to the resemblance of its inflorescence to the *uvula*, "*figura inflorescentiæ uvulæ*." Now this not being the case with the genus in question, though Linnæus says, in *Hort. Cliff.* 121, "*fructificatio uvulæ inflar pendet*," we might have wandered far in search of a meaning, or, like our predecessors, been content with little or no enquiry, had we not stumbled, at the outset, upon *Uvularia* as an old synonym for *Rufcus Hypoglossum*, to which the first explanation is obviously applicable, on account of the diminutive leaf, not unlike the *uvula* of the human throat, lying over the inflorescence. Perhaps, therefore, Linnæus, finding this name unoccupied, was the more induced to adopt it for his new genus, on account of the affinity, and resemblance in general habit, of the latter to *Rufcus*. We cannot justify the measure, but it is, at any rate, preferable to deriving the name, as a diminutive, from UVARIA, (see that article), according to the explanation of De Theis. This indeed would be even less intelligible, the *Uvaria* and *Uvularia* having no characters in common; it would also be totally inadmissible, no generic names being more contrary to rule, or good sense, than diminutives of others already established. (See VALERIANELLA and FEDIA.)—Linn. Gen. 164. Schreb. 219. Willd. Sp. Pl. v. 2. 93. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 2. 246. Pursh 231. Juss. 48. Lamarck Illustr. t. 247. f. 2.—Clafs and order, *Hexandria Monogynia*. Nat. Ord. *Sarmentaceæ*, Linn. *Liliæ*, Juss.

Gen. Ch. Cal. none. Cor. Petals six, inferior, oblong-lanceolate, acute, erect, straight, very long. Nectary an oblong groove in the base of each petal internally. Stam. Filaments fix, short, rather broad; anthers vertical, longer than the filaments, erect, oblong, about half the length of the corolla. Pist. Ovary superior, roundish; style one, divided half way down into three parts, thread-shaped, longer than the stamens; stigmas simple, reflexed, longitudinally downy. Peric. Capsule ovate-oblong, triangular, of three cells and three valves, each with a central partition. Seeds several, nearly globular, with a tunicated scar.

Eff. Ch. Corolla of six upright petals, inferior. Nectary a chink in the base of each. Stamens shorter than the corolla. Stigmas reflexed. Capsule triangular, of three valves, with central partitions. Seeds several, globose, with a tunicated scar.

Obs. From this genus is now separated the *U. amplexifolia* of Linnæus. (See STREPTOPUS.) The genuine species are perennial herbaceous plants, with alternate, simple, undivided, entire, simple-ribbed leaves. Flowers axillary or terminal, solitary or umbellate, drooping, yellow, whitish, or brown. They are all strangers to Europe, inhabiting rather mountainous umbrageous situations, in temperate climates, and flowering early in the year. They are obviously allied to *Fritillaria*, but have not flat seeds, nor are the *stamens* equal in length to the corolla.

1. *U. perfoliata*. Pale Perfoliate Uvularia. Linn. Sp. Pl. 437. Willd. n. 4. Ait. n. 3. Pursh n. 1. Sm. Exot. Bot. v. 1. 95. t. 49. (*U. perfoliata* minor; Michaux Boreal.-Amer. v. 1. 199.)—Leaves perfoliate, elliptical, obtuse with a small point. Corolla bell-shaped, rough on the inside. Anthers pointed.—Native of North America; in shady woods, among rocks, in rich vegetable mould, from Canada to Carolina, flowering in May and June. *Pursh*. Root of several spreading, tapering, fleshy, pale fibres. Stem solitary, annual, erect, twelve or

fifteen inches high, round, smooth, leafy; often a little branched, or subdivided, in an alternate manner. Leaves perfoliate at near half an inch from their base, where they are quite flat, not undulated; they are two inches long, smooth on both sides; paler, and rather glaucous, beneath. Flowers terminal, solitary, pendulous, on short stalks. Petals three-quarters of an inch, or an inch, long, of a pale greenish buff-colour; their inner surface rough with yellowish protuberances. Nectariferous furrow linear, and very small. Stamens full half as long as the petals. Anther about the length of its filament, bursting longitudinally at the inner side of each cell, and tipped with an awl-shaped point.

The synonyms collected under this species belong to various others, which Linnæus, in his early acquaintance with the genus, considered as all the same, nor have they hitherto been reduced entirely to order, though much has been done to that effect in the *Exotic Botany*, as well as by Mr. Pursh. *Polygonatum latifolium perfoliatum Brasiliænum*, Bauh. Prodr. 136, described as "two cubits high, with perfoliate leaves, two inches broad, and four long, and a large white flower, whose narrow petals, five in number, are two inches long," cannot be clearly referred to any known species. The specimen is reported to have been obtained by Burfer from Toupinambault, in Brasil, and Linnæus, by a mark in his copy of Bauhin's *Prodromus*, appears to have seen it. He hints, by a note in the Sp. Plant., that Burfer's supposed Brazilian plants all seemed to have really come from Canada. However this may be, Linnæus's own herbarium shews that he confounded specimens of different species, as well as their synonyms, under *U. perfoliata*, and therefore we dare not confide in him for the above reference, which possibly appertains to some plant unknown to modern botanists. See n. 3.

2. *U. flava*. Small Yellow Uvularia. Sm. Exot. Bot. v. 1. 97. t. 50. Pursh n. 2. Ait. Epit. 376. (*U. perfoliata* α ; Ker, late Gawler, in Curt. Mag. t. 955. *U. caule perfoliato*; Gron. Virg. 51, according to Clayton's description. Anonymus pudica; Walt. Carol. 123.)—Leaves perfoliate, elliptic-oblong, bluntish; waved at the bottom. Corolla tapering at the base; rough on the inside. Anthers pointed.—In shady woods, on a sandy soil, from New Jersey to Lower Carolina, flowering in May and June. *Pursh*. We have no doubt of this being a very distinct species from the former. The leaves are more oblong, and more revolute; angular or wavy at the base. Flower larger, more taper and elongated, with narrower, sharper petals, one inch and a quarter long, yellow, with orange-coloured granulations on the inner surface. Point of the anthers longer and more conspicuous.

3. *U. grandiflora*. Large Yellow Uvularia. Sm. Exot. Bot. v. 1. 99. t. 51. Ait. n. 4. Pursh n. 3. Curt. Mag. t. 1112. (*U. perfoliata*; Redout. Liliac. t. 184, with many erroneous synonyms. *U. perfoliata* major; Michaux Boreal.-Amer. v. 1. 199. *U. lanceolata*; Ait. n. 2. Willd. n. 3. *Polygonatum ramifolium flore luteo majus*; Cornut. Canad. 38. t. 39. Barrel. Ic. t. 723. *Sigillum indicum flore luteo*; Stap. in Theophr. 1067. f. 3.)—Leaves perfoliate, oblong, acute; wavy at the base. Petals smooth on both sides. Anthers almost pointless. Nectary roundish.—On shady hills, in a fertile soil, and amongst rocks, from Canada to Carolina, flowering in June. *Pursh*. Nearly twice the size of the last; the leaves more oblong and taper-pointed, as well as more wavy, and in some degree plaited, at the base. Flowers of a brighter yellow; their petals full an inch and a half long, more conspicuously ribbed, destitute of internal granulations, and furnished with a green roundish nectariferous depression, more like that of a *Fritillaria*,

UVULARIA.

loria, at the base. *Anthems* longer, and quite linear, with but a slight membranous rudiment of a point, not always discernible. This flowers in our gardens nearly a month earlier than either of the last. We humbly presume that if any two species of any genus be distinct, this and the *perfoliata*, to say nothing of *flava*, must be so, or botany will prove a most uncertain study. The truth is, that no competent botanist had, till lately, seen them together, in a sufficiently perfect state for discrimination. Bauhin's *Polygonatum*, mentioned under our first species, may possibly be the *grandiflora*, the petals being supposed white, from their appearance when dry, and being commonly no more than five in the lowermost flower of our plant. Mr. Pursh has verified the *lancoolata* of Mr. Aiton, by an authentic specimen. Indeed the synonym of Cornuti sufficiently determines that point.

4. *U. sessilifolia*. Sessile-leaved *Uvularia*. Linn. Sp. Pl. 437. Willd. n. 5. Ait. n. 5. Pursh n. 4. Sm. Exot. Bot. v. 1. 101. t. 52. Curt. Mag. t. 1402.—Stem smooth. Leaves sessile, elliptic-lanceolate; glaucous beneath. Petals smooth on both sides. Nectary oblong. Capsule stalked.—In shady woods, from Canada to Carolina, flowering in May and June. The size of this species, and the pale colour of its flowers, most accord with *U. perfoliata*, but its essential difference from all the preceding consists in the leaves being sessile, not in any manner perfoliate. They are sometimes very finely downy beneath, or rather at the edges. Petals rather spatulate, with a greenish oblong nectary, and no roughness. *Anthems* very slightly pointed. Stem smooth, purplish. All these species thrive in moist shady borders of bog-earth, with a portion of loam, and as the herbage dies down to the root, survive our ordinary winters without injury. *U. sessilis*, Thunb. Jap. 135, is probably distinct from our *sessilifolia*, but the author furnishes no discriminating characters.

5. *U. puberula*. Downy *Uvularia*. Michaux Boreal-Amer. v. 1. 199. Pursh n. 5.—Stem rather downy. Leaves sessile, ovate; rounded at the base. Petals smooth on both sides.—Found by Michaux, on the loftiest mountains of Carolina. He describes it as related to the last, but distinct in its petals, being rather larger, though in like manner smooth on the inside, tapering at the upper part into an acute point. The leaves are green on both sides, partly embracing the stem. We have a specimen gathered by Mr. Menzies on the west coast of North America, which answers exactly to this description. The leaves are truly ovate, pointed, having strong ribs, connected by conspicuous transverse veins, and are nearly twice the size of the last. The stem is reddish, besprinkled with loose hairs. Flower-stalks hairy, as is likewise the style. *Anthems* linear, pointlike, like those of the *grandiflora*. This specimen answers in foliage and inflorescence to *U. lanuginosa*, Curt. Mag. t. 1490, our *Streptopus*, n. 3; but the flower-stalks and style are there represented smooth.

6. *U. hirta*. Hairy *Uvularia*. Thunb. Jap. 136. Willd. n. 2.—“Stem shaggy. Leaves hairy, clasping the stem.”—Gathered by Thunberg, near Jedo, in Japan. The stem is round, a foot high, erect, the thickness of a quill, and clothed with long dense hairs. Leaves alternate, spreading, heart-shaped, oblong, pointed, seven-ribbed, two inches long, clothed with very short hairs. Flowers not observed. Thunberg.

7. *U. cirrbosifolia*. Tendril-leaved *Uvularia*. Thunb. Jap. 136. Willd. n. 6.—Leaves sessile, linear, each ending in a tendril.—Found by Thunberg, in Japan. “Stem round, jointed, striated, smooth, simple, erect. Leaves two from the same bud, smooth, a finger's length. Flowers from the

same bud as the leaves, stalked, drooping. Footstalk reflexed, single-flowered, the length of the nail. Petals six, oblong, yellow, nearly an inch long. Filaments half that length, white. *Anthems* oblong, two-lobed, within the flower. Style one, rather shorter than the corolla, but longer than the stamens. Stigmas three, reflexed.” Thunberg. This description does not leave any doubt respecting the generic character, but it does not express whether the flowers are solitary, as in all the American genuine *Uvularia*, or aggregate, as in the following oriental doubtful ones. There being two leaves from one bud with the flowers, is remarkable, but the author has not clearly expressed whether there are all the leaves borne by one stem, of which his description excites some suspicion.

Mr. Gawler (Ker) has described in Curt. Mag. t. 916, an *U. chinensis*, of which we were favoured, in May 1811, with an authentic specimen from the stove at Kew. This may be defined—flowers in an umbel, sessile on the footstalk of a leaf. It is reported to be a native of China. The stem is herbaceous, about eighteen inches high, angular, smooth, leafy, a little zigzag, branched alternately in the upper part. Leaves alternate, on short stalks, ovato-lanceolate, pointed, many-ribbed, smooth, two or three inches long; three of their ribs stronger than the rest. Umbel of three or four drooping flowers, sessile on the footstalk of one of the leaves; its partial stalks about half an inch long, with several roughish angles. Petals pointed, brown, twice as long as the stalks; smooth within, all elongated and gibbous, almost spurred, at the base. Filaments two or three times the length of their anthers, both together nearly equal to the petals. Germen turbinate, triangular. Style nearly as long as the stamens, with three recurved stigmas. Nothing is known of the fruit. The close affinity of this plant to one we shall now describe, which is certainly no *Uvularia*, will not allow us to admit either into our list of species. We allude to a specimen gathered by Dr. Buchanan, on the moist banks of rivers at Chitlong, in Upper Nepal, in April 1802. This bears its flowers in a stalked umbel, from the footstalk of a leaf.—The stem and leaves closely accord with the Chinese species just described; but the umbels, consisting of seven or eight green flowers, are each supported by a common deflexed stalk, almost as long as the partial ones, and, like them, rough-edged. Petals but half the length of the stalks, gibbous, and almost tubular at the base; the three outermost a little the broadest and shortest. Filaments thrice the length of the anthers, which are linear, cloven at each end. Stigmas three, recurved, deeply separated. Berry, according to Dr. Buchanan, three-lobed, of three cells, with solitary seeds. Such a fruit cannot belong to *Uvularia*. These two species must therefore, in the present state of our knowledge, be referred to *Streptopus*, (see that article,) to which we would make the following additions.

2. *S. rosea*. (*Uvularia rosea*; Curt. Mag. t. 1489).—Flowered in Kew-garden, in May 1812. The flowers are bigger than those of *S. amplexifolius*, and are elegantly spotted with red.

3. *S. lanuginosus*. (*Uvularia lanuginosa*; Curt. Mag. t. 1490).—Brought from North America by Mr. Lyon, with whom it flowered in May 1812. The flowers stand in pairs, their stalks slightly combined at the base. Stamens but half the length of the narrow green petals.

4. *S. chinensis*. Brown Chinese *Streptopus*. (*Uvularia chinensis*; Curt. Mag. t. 916. Ait. n. 6).—Leaves on short stalks. Umbels sessile. See its description above.

5. *S. peduncularis*. Long-stalked *Streptopus*. (*Uvularia Pitfutu*; Buch. MSS.).—Leaves on short stalks. Umbels

bels on general flaks, nearly as long as the partial ones. Of this also we have just given a description. We know nothing of the shape of the *seeds* in this species, nor whether they are furnished with any appendage, or tunic, at their base. If they should prove to want this character, that circumstance, added to the gibbous, almost tubular, nectariferous bases of their *petals*, and the great comparative length of their *filaments*, with respect to the *anthers*, might almost lead to their establishment as a new genus. Before this could be done, however, we ought to be well acquainted with the *fruits*, *seeds*, and their *pear*. In *Streptopus lanuginosus*, whose twin *flowers* connect these two umbellate species with the solitary inflorescence of the *S. amplexifolius* and *roseus*.

The concluding paragraph of our article STREPTOPUS should now be erased.

UVULARIA, in the *Materia Medica*, the name given by authors to the plant called *hypoglossum*, or double tongue.

UZZEDERINA, in *Geography*, a town of Bulgaria, on the Danube; 50 miles W. of Nicopolis.

UWCHLAND, a township of Pennsylvania, in Chester county, containing 1178 inhabitants.

UXACONA, in *Ancient Geography*, a town of Great Britain, in Antonine's second Itin., marked between Uriconium (Wroxeter) and Pannocrucium (at or near the river Penk, and town of Penkridge). Dr. Gale and Mr. Camden place Uxacona at Okenyale, and Mr. Baxter at Newport; but Mr. Horsley, following the tract of the military way, and observing the distance, fixes it at the banks of a rivulet near Sheriff-Hales.

UXAHVER, OX-SPRING, a boiling fountain of water, about a mile from a place called Hufavik, in the north of Iceland, not far from Skalholt, more regular, and nearly equal to the Geyser in the magnificence of its operations. It is said that this name was given to it from the circumstance of an ox having fallen into it by accident, and having been boiled alive.

We shall here add, that the Geysers are celebrated fountains, about 16 miles N. of Skalholt, situated in a country indicating many traces of volcanic eruptions. They lie on the side of a hill, which does not exceed 300 feet in height, and which is separated from the mountain towards the W. by a narrow stripe of flat boggy ground, connected with that which extends over the whole valley. On the E. side of the hill there are several banks of clay, from some of which steam arises in different places, and in others there are cavities in which the water boils briskly. Below these banks there is a gentle slope, composed of matter, which, at some distant period, has been deposited by springs that no longer exist. The strata or beds thus formed seem to have been broken by the shocks of earthquakes, particularly near the Great Geyser. Within the space of about a mile there are numerous orifices in the old incrustations, from which boiling water and steam issue, with different degrees of force; and at the northern extremity is the Great Geyser, sufficiently distinguishable from the others by every circumstance connected with it. Amidst the depositions of matter is a mount about seven feet high, lying on the W. side, where a disruption has taken place. On the top of this mount is a basin, extending 56 feet in one direction, and 46 in another. The basin was full of hot water, a little of which was running over. Above the Great Geyser, and near it, is a large irregular opening, the beauties of which it is hardly possible to describe. The water which filled it was as clear as crystal, and perfectly still, though nearly at the boiling point. Through it were seen white incrustations, forming a variety of figures and cavities, to a great depth; and below was perceived a vast and dark abyss, over which the

crust that supported the observers formed a dome of no great thickness; a circumstance which contributed much to the effect of this awful scene. Near this spot are several holes, from which vapour continually rises; and from one of which a rumbling noise proceeded. One of the most remarkable of these springs threw out a great quantity of water; and from its continual noise it was called the Roaring Geyser. The eruptions of this fountain were incessant. The water dashed out with fury every four or five minutes, and covered a great space of ground with the matter it deposited. The jets were from thirty to forty feet high. They were shivered into the finest particles of spray, and surrounded by great clouds of steam. The situation of this spring was eighty yards distant from the Geyser, on the side of a hill. It is probable that an earthquake has damaged the mechanism of this spring, or the production of heat, at the particular spot where it is situated, has ceased to be sufficient to produce the phenomena which it formerly exhibited. In collecting incrustations near the basin, and striking on its brink many blows with a hammer, a sound was heard like the distant discharge of a piece of ordnance, and the ground shook. The sound was irregularly and rapidly repeated; and then the water, after having several times suddenly risen in a large column, accompanied by clouds of steam, from the middle of the basin to the height of ten or twelve feet, the column seemed as if it burst, and sinking down, it produced a wave which caused the water to overflow the basin in considerable quantity. After the first propulsion, the water was thrown up again to the height of about 15 feet; and there was a succession of jets, to the number of eighteen, none of which appeared to exceed fifty feet in height, and they lasted about five minutes. After the last jet, which was the most furious, the water suddenly left the basin, and sunk into a pipe in the centre. The heat of the basin soon made it dry, and the wind blew aside the vapour almost immediately after the spouting ceased. The pipe, into which the water had sunk about ten feet, was immediately examined, and it appeared to be rising slowly. The diameter of the pipe, or rather pit, is 10 feet, widening near the top to 16 feet. The perpendicular depth of the basin is three feet, that of the pipe is somewhat more than 60 feet. When the water was still, stones were thrown into the pipe, and a violent ebullition followed. The temperature of the water within reach, when the pipe was full, was found to be 239°. At repeated intervals fresh jets occurred, none of which exceeded 30 feet in height. But we have not room to enlarge in the detail of various other circumstances observed by those who examined these extraordinary fountains. The depositions of the present and former springs are visible to a great extent, about half a mile in every direction, and they probably extend themselves under the surface, now covered with grass and water to a very considerable distance.

Although hot springs occur in every part of the country, the Geysers are the most remarkable, and must have existed for a long time; but as they are situated on the verge of that vast district of uninhabited and desolate country which forms the interior of Iceland, they have not been particularly noticed by the early Icelandic authors; nor are they now much visited by the natives. In order to account for the phenomena exhibited by the operations of these springs, it is supposed that they are occasioned by sudden productions of heat, whatever may be the causes of that heat. A column of water is suspended in a pipe by the expansive force of steam confined in cavities under the surface. An additional quantity of steam can only be produced by more heat being evolved. The heat is suddenly evolved, and

elastic

elastic vapour suddenly produced, we may account for the explosions accompanied by noises. The accumulation of steam will cause agitation in the column of water, and a farther production of vapour. The pressure of the column will be overcome; and the steam escaping, will force the water upwards along with it. For a further account of these springs, and of the causes that produce them, illustrated by appropriate engravings, we refer to Mackenzie's *Travels in Iceland*, p. 211, &c. See *Boiling Springs*.

UXAMA, (*Ofma*), in *Ancient Geography*, a town in the interior of Hispania Citerior, belonging to the Arevaci, S.E. of Clonia.

UXAMABAREA, a town of Hispania Citerior, belonging to the Autrigones. Ptolemy.

UXBRIDGE, in *Geography*, a market-town in the hundred of Elthorne, and county of Middlesex, England, is situated 18 miles W. by N. from St. Paul's cathedral, London. Though the most considerable town in the county, it is only a hamlet to the parish of Hillingdon. The name of this place was anciently written *Oxebruge*, and in subsequent records *Woxebruge* or *Woxeburige*: the mode of orthography in present use appears, however, to have been adopted for several centuries. The compound term of which this appellation was formed, appears easy of explanation: the place was noted, in remote ages, for the passage of oxen from the adjacent rich pasture lands of Buckinghamshire, and a bridge was constructed over the river Colne at a very early period. Leland says of this town—"In it is but one long street, but that, for timber, well builded. There is a celebrate market once a week, and a great fayre on the feast-day of St. Michael. There be two wooden bridges at the west end of the towne, and under the more weste goeth the great arme of Colne river. The lesser arme goeth under the other bridge, and each of them serve there a greate mille." Uxbridge, at present, consists principally of one long and wide street: the greater part of the houses are old; but there are several of modern construction, which are at once commodious and ornamental. The main stream of the Colne, and several of its diverging branches, water the town on the Buckinghamshire side, where the principal channel is crossed by a substantial bridge of brick. Over the Grand Junction Canal, which passes the same division of the town in its progress along the western border of Middlesex, is likewise a bridge of a similar description. The difference, as to the appearance and character of the place, between the 16th century and the present period, thus seems to consist chiefly in the substitution of brick for timber, in the houses and bridges. The most memorable historical event connected with Uxbridge, is the unsuccessful treaty which here took place between commissioners appointed, by the king on one side, and by the parliament on the other, during the civil disturbances of the 17th century. These commissioners, sixteen on the part of the king, and twelve for the parliament, met in January 1645; all of them distinguished noblemen or persons of great eminence on each side: commissioners from the parliament of Scotland likewise attended the meeting. It was soon found that no rational discussion could be expected: the demands of the parliament were exorbitant, and their commissioners were not inclined to accommodation: after twenty days passed in debate, in which the result appeared to be predetermined, the commission was dissolved, and the decision unhappily left to the sword. The mansion in which the commissioners met is still remaining, and is situated at the western extremity of the town. It has been recently converted into an inn, bearing the sign of the Crown, and has undergone considerable alterations. Two principal rooms

Vol. XXXVII.

remain in their original state; one of which, from tradition, and from its capacious dimensions, appears to be that used by the commissioners. To the present day, the building is termed the Treaty House. This mansion, with the ceremonial and procedure of the commission, is particularly described by lord Clarendon in his "History of the Great Rebellion." Uxbridge does not afford any public buildings peculiarly interesting. Its chapel is an irregular edifice, chiefly composed of flint and brick: it is in the pointed style of architecture, but quite destitute of the imposing beauty which that mode of building is capable of producing: its interior comprises a chancel, a nave, and two aisles, divided by pointed arches. It is believed that a chapel existed here so early as the year 1281; but it is not mentioned in the records of Hillingdon till 1469: yet, that Uxbridge did possess a chapel prior to the latter date is evident; for, in 1447, Robert Oliver and other inhabitants founded a guild "in the chapel of St. Margaret at Woxbridge;" and in 1459 a chantry in this chapel was founded and endowed by sir Walter Shirleyngton. In 1682, George Townsend, esq. taking into consideration that in such a populous town the place of worship was destitute of a suitable endowment, bequeathed certain tenements in London for the maintenance of a minister to reside in or near Uxbridge: and in 1706, a house was built by the inhabitants for the use of the resident minister, on condition of his instructing six poor boys in reading and writing, or otherwise paying *6l. per annum* to the churchwardens. This house is let by the present minister, and six boys are instructed at his cost in the parochial school. Here are meeting-houses for Quakers, Presbyterians, and Methodists. In 1695, George Pitt, esq. conveyed the manor of Uxbridge, with its tolls and appurtenances, to certain inhabitants of the town, in trust, that the profits should be applied to charitable purposes. This liberal grant is immediately connected with the schools for gratuitous education, of which there are two in the town, both much enlarged in 1809. The school for boys is assisted with fifty guineas annually from the fund; and the girls' school with twenty guineas; and both are further aided by voluntary contributions. Two hundred boys and sixty girls are thus educated; and the girls are clothed and further qualified to become valuable servants. The Lancaster system is adopted in each school; and both establishments are accommodated with convenient school-rooms in the upper part of the market-house, which is an extensive brick edifice, erected in 1789. Beneath it is a spacious area for pitching corn, and for the resort of the farmers and dealers. Henry de Lacy, earl of Lincoln, obtained, in 1294, the grant of a weekly market on Mondays, and an annual fair on the feast of St. Michael. The market is now held on Thursdays, and is one of the most considerable marts for corn in this part of the kingdom. A fair is still held on Michaelmas day for hiring servants, &c., and here are three other fairs for cattle. The internal police of the town is regulated by two bailiffs, two constables, and four tything-men or headboroughs. In the survey of the year 1811, the population of Uxbridge was returned as 2411, occupying 450 houses. No manufactures of importance are cultivated; but here are several corn-mills on a large scale, and meal may be said to form the chief trading pursuit of the town. Great advantages in trade arise from the market, and from the numerous fairs in the vicinity. This town gives the title of earl to the Paget family. Henry lord Paget was created earl of Uxbridge in 1744: by the death of his grandson, the title became extinct in 1769; but was revived in 1784, in the person of Henry Bailey, a cousin and heir of the deceased, who had assumed

the name and acceded to the barony of Paget: the son of this nobleman is now earl of Uxbridge, and has recently been created marquis of Anglesey, in consequence of his military achievements on the continent.

At a short distance from the town, on the eastern side of the road leading towards London, is the seat of Richard Henry Cox, esq. This mansion was erected in 1717 by the last duke of Schomberg, who had resided several years in an ancient house on the estate. It was afterwards the property and residence of the Chetwynd family, and about 1785 was purchased by the late marchioness of Rockingham, who passed the remainder of her life here. It was afterwards purchased by Josiah Du Pre Porcher, esq. who sold it to Mr. Cox, the present proprietor.

On the border of Uxbridge Common, in the immediate vicinity of the town, is the residence of Thomas Harris, esq. joint patentee of Covent Garden theatre. This is a spacious brick dwelling, with extensive gardens, on which the proprietor has been lavish in embellishments. One portion of this domain requires particular notice—a mimic hermitage, decked with sculpture, spars, &c. opens to a spacious room, in which are preserved portraits of the principal theatrical performers, from the date of Garrick to the present period.

About one mile N.E. from Uxbridge, in the parish of Ickenham, is Swakeley or Swatley House, the property and residence of Thomas Clarke, esq. It was erected in 1638, by sir Edmond Wright, who, in 1641, was appointed lord mayor of London by the parliament, after the removal of sir William Acton from that office. The mansion was afterwards successively the property of sir William Harrington, one of the judges of king Charles I., and of sir Robert Vyner, the facetious lord mayor of London, who entertained Charles II. at Guildhall. It was subsequently the seat of Benjamin Lethieullier, esq. of whom it was purchased in 1750, by the father of the present proprietor. The house, which is a square substantial structure, with two slightly projecting wings, is composed of brick, with stone coignes, window-cases, and finishings. The entrance is through a porch in a square central turret, which opens into a hall paved with black and white stone. Here is a carved screen, surmounted by a bust of Charles I. A staircase of oak, with the sides and ceiling painted, leads to a suite of apartments, in which the capacious and well-proportioned dimensions are pleasingly blended with an air of domestic comfort.

Within two miles of Uxbridge, on the south-west, is Delaford-Park, the seat of Charles Clowes, esq. The ancient mansion of Delaford, which stood in a low and unfavourable spot, was taken down about the year 1790, and the park attached to it was added to the adjacent grounds belonging to Mr. Clowes, whose dwelling occupies a more elevated site, and was partly built by the late viscount Kilkeny, but has been considerably enlarged by the present owner.

The village of Hillingdon, in which parish Uxbridge is comprised, is one mile distant from the town, to the south-east, and contains many substantial and commodious houses. The parish church, which stands on the side of the high road, is an ancient structure, chiefly composed of flint and stone, having a square tower at the west end, with an embattled parapet, and a bell-case of wooden frame-work: the interior is divided into a nave, chancel, and two aisles, separated by octangular pillars and pointed arches. Monuments and other sepulchral memorials are unusually numerous, both in the church and cemetery, in consequence of the parochial connection of this place with Uxbridge. In the church-yard is the tomb of John Rich, esq. formerly a patentee of

Covent Garden theatre, well-known as the inventor of the English harlequin, and for his excellent performance of that character, under the assumed name of Lun. On the north side of the church is an ancient mansion, commonly called the Cedar-house, from the celebrated cedar-tree which grew in the garden. This tree was planted by Samuel Reynardson, esq., who appears to have resided in this house from 1678 till his death in 1721. The first introduction of the cedar into England was in 1683; and it is probable, as Mr. Reynardson was a naturalist, and had a curious garden of exotics, that this was one of the earliest planted. It was accurately measured in 1779, when its dimensions were in perpendicular height fifty-three feet; diameter of the horizontal extent of the branches, from east to west, ninety-six feet; from north to south, eighty-nine; girth of the trunk, close to the ground, fifteen feet six inches, and at the height of fourteen feet and a half, just under the division of the principal branches, fifteen feet eight inches. The girth of the larger branch, at a foot and a half from its division, was twelve feet; it then divided into two secondary branches; one of which was eight feet six inches in girth, the other seven feet ten inches; the other principal branch, at its division, measured ten feet in girth, and soon dividing, formed two secondary branches, each five feet six inches in girth. In September 1789, one of the largest branches was broken off by a high wind, in consequence of which the tree was cut down. Above eighty years' growth were discernible beyond the centre-piece. The tree produced 450 feet of timber, six loads and three-quarters of stack-wood, and one hundred and a quarter of faggots. Mr. Lovett, a carpenter of Denham, purchased the tree for 10*l.*, and retailed it for 22*l.* 17*s.* After the death of Mr. Reynardson, the Cedar-house was the seat of general Rich Russell, who died in 1735. It is now the property of Richard Heming, esq., and in the occupation of Lacey Primatt, esq. At a short distance from the church, to the south, is the rectory-house, a spacious building, erected in 1604. It appears that a mansion on this site was formerly held by the bishops of Worcester as an inn, or resting-place, in their journeys to London.

On Hillingdon Heath, a considerable tract of land to the south-east of the village, are several respectable villas, chiefly of a modern date. One of these, an old mansion, formerly occupied by the duke of Buccleugh, is now the residence of Thomas Bent, esq. by whom it has been greatly improved, and who has been at a very considerable expence in ameliorating part of the heath. In this vicinity is Hillingdon-Place, a seat erected by the late admiral Drake, and now in the occupation of the Miss Fullers. On the south side of the heath is a spacious dwelling, built by the late Peter de Salis, count of the Roman empire, who resided here several years. This house stands on an estate called Coomes, alias Little London, and sometimes termed Hillingdon Park. The parish of Hillingdon, exclusive of Uxbridge, was, in the year 1811, stated to contain 419 houses, and 2250 inhabitants.—Beauties of England and Wales, vol. x. Middlesex. By J. N. Brewer, 1816. Lyfons' Middlesex Parishes, 4to. 1800.

UXBRIDGE, a town of the state of Massachusetts, in the county of Worcester, containing 1404 inhabitants; 35 miles W. of Boston.

UXELA, or UXELLA, in *Ancient Geography*, a town of Britain, belonging to the Damnonii, the ancient inhabitants of Devonshire and Cornwall; supposed by Mr. Camden to have been situated at Lostwithiel; by Mr. Baxter, at Salsath; and by Mr. Horley, at Exeter. Others have placed it on the river Parret, near Bridgewater. See DAMNONII.

UXELLO-

UXELLODUNUM, a place which was the last which Cæsar held in Gaul; but its situation has been much disputed. Sanfon refers it to the territory of the Cadurci, or Cahors; others have fixed it to Cadenac, upon the confines of Kouergue; and others again at Luzet, upon the Olt, but below Cahors. But the position of Uxellodunum, and which unites the greatest number of suffrages, is that of Pucach d'Ifolla. "Podium Uxelli" is the northern part of Querci, towards the frontier of Limosin.

UXELUM, a town of the Selgove, placed both by Horsley and Baxter at Caerlaveroch near Dumfries; and this opinion is the more probable, because the two names, Uxelum and Caerlaveroch, seem to be derived from British words, which signify a town near the sea-coast. Carbantorium, placed by Camden at Caerlaveroch, below Dumfries, was probably situated where Dumfries now stands, or near it.

UXENA, a town of Hispania, in Bœtica.

UXENTUM, a town of Italy, in the interior of Messapia, belonging to the Sulentini; situated S.W. of Hyaruntum. Ptol.

UXENTUS, a mountain of India, on this side of the Ganges. Ptol.

UXIA, a town of Asia, in the Perfide, at a small distance from the sea. Ptol.

UXII, a people of Asia, in the Elymaide. They inhabited a territory on the other side of the town of Suze, beyond the Pasitigris, and on the confines of proper Perfide, according to Quintus Curtius and Arrian. The river Pasitigris had its source in the mountains of the Uxians, according to Diodorus Siculus. These people were divided into two nations: those who inhabited the plain were subject to the Persians, and of these Diod. Sic. speaks (l. xvii. c. 67.) Those who inhabited the mountains before the Perfide maintained their liberty, and of them Strabo speaks (l. xv.) This author calls the country of the Uxians by the name of Uxia, and he says that they were great robbers; and Pliny gives them the same character. See **URI**.

UXITICO, in *Geography*, a town on the fourth coast of the island of Rhodes. N. lat. 36° 9'. E. long. 27° 34'.

UXOR, in the *Language of the Chemists*, the mercury of metals. This is the wife they say, and sulphur is the husband. See **MARITUS**.

UXORIUM, in *Antiquity, a fine, or forfeit, paid by the Romans for not marrying.*

UXUMI, or **OOSUMI**, in *Geography*, a town of Japan, on the island of Ximo. N. lat. 32°. E. long. 133°.

UYA, a small island near the west coast of Shetland. N. lat. 60° 43'. W. long. 1° 54'.

VYAGRAYAH, in *Mythology, a name of the Hindoo goddess Parvati, consort of Siva. The name means *tiger-mounted*; this goddess, like Cybele, being seen riding in a car drawn by lions or tigers, and turret-crowned.*

VYAHRITIS, mystical words used by enthusiastic Hindus in their abstracted modes of worship called *Jap*, which see. Every thing ternary being mysterious with the Hindus, the Vyahritis are of course three; viz. *bhur, bhuvah, swah*, or earth, sky, heaven. This trivocal phrase is profoundly mystical.

VYASA, in *Biography*, a personage of great celebrity and sanctity in the history of the Hindus, as arranger or compiler of their sacred books called the Veda. His real name is supposed to have been Dwapayana, or Krishna Dwapayana; and his surname of Vyasa, or *Divider*, to have been given him from his great work. An incarnation of the god Vishnu is sometimes mentioned as the arranger of the Hindoo scriptures in their present form. In the eighteenth Purana, called Sri-Bhagavata, twenty-two incarnations of Vishnu,

there called Krishna, the Preserver, are enumerated; the seven-teenth is thus noticed: "As Vyasa he divided the Veda for the instruction of mankind." See **KRISHNA**, **PURANA**, and **SRI-BHAGAVAT**. But this probably means that he acted under the influence of immediate inspiration; an idea fully concurred in by the numerous believers in the divine origin of the Vedas.

It is usual with the Hindoos to ascribe to Vyasa the Puranas and Mahabarata, as well as the Vedas. (See **MAHABARAT** and **PURANA**.) But it is not credible that the talent and industry of any human being, and we are not, in this instance, required to believe in any superhuman aid, could effect so much. Nor, from internal evidence, is it possible that they could have originated in the same age.

To Vyasa is likewise ascribed a celebrated and popular system of philosophy, grounded wholly on the doctrines of the Veda, and thence named *Vedanta*; which see. It is written in a very dogmatical, sententious style, and is very obscure. A commentary by the learned Sankaracharya (see his article) explains, however, in a very admirable manner, almost every sentence and difficult word.

The doctrines of Vyasa were expounded and supported also by a disciple named Jaimini, who appears to have been cotemporary with his master. His school is called *Minansa*, which see, and **JAIMINI**.

It is not necessary to inquire into the time in which an author flourished, who connects himself with works stated to be thousands of years old; and on which considerable differences of opinion exist among the best informed. Nor is it very profitable to inquire after the family of a person believed to have been an incarnation of a deity. It may, however, be noticed, that some books mention a son of Vyasa named Sucha; Parafara his father, grandson of Vasishta, is mentioned in the Veda as an author of some portions of the work; but this is explained to mean that he was one of the Rishis, or saints, to or through whom such portions were revealed by Brahma. See **RISHI** and **VASISHTA**.

The encomiums on Vyasa scattered through the poetical works on all subjects, since his embrace all throughout the East, are endless. See an instance of this in our article **TRIVENI**.

UZAN, in *Ancient Geography*, a town of Africa Propria, of the number of those which Ptolemy places between the river Bagradas and the river Tabraca.

UZBEKS, or **USBEKS**, in *Geography*, a tribe of Tartars, who inhabit Kharasim, (which see,) and Great Bucharia, and who, according to Abulgasi, consist of four main stocks, of which the Naimanes and Igures are known from the history of Jenghis, Tchingis or Zingis khan. Those two hordes formerly dwelt, the former on the western side of the native territories of Tchingis, and the latter in Turfan. Of their settlement in Great Bucharia, and other circumstances relating to them, we have already given an account under that article. They are said to have derived their name from Uzbek, khan of Kipjak.

UZECIA, in *Ancient Geography*, a town of Africa Propria, S. of Adrumetum, and at a small distance from Thydrus.

UZEDA, or **UCEDA**, in *Geography*, a town of Spain, in New Castile, on the Xarama; 30 miles N. of Madrid.

UZEL, a town of France, in the department of the North Coasts; 6 miles N.N.W. of Loudeac.

UZERCHE, a town of France, and principal place of a district, in the department of the Correze; 13 miles N.W. of Tulle. N. lat. 45° 25'. E. long. 1° 39'.

UZES, a town of France, and principal place of a district, in the department of the Gard. Before the Revolution, the

the see of a bishop; near it is a medicinal spring, and a little below the bishop's palace is a spring which supplies the aqueduct of Nîmes; 12 miles N. of Nîmes. N. lat. 44° 1'. E. long. 4° 30'.

UZES, called also KUMANIANS or POLOOTZES, in *Ancient Geography*, are mentioned both by Herodotus and Strabo. At the period when history records their activity as a nation, (A. D. 883,) that is, when, in conjunction with the Khazars, they drove the Petschenegs from their homesteads, they had already extended themselves from Alhava toward the mountains of Kitzig-tag, as far as the nether Volga. They now took the countries of the expelled Petschenegs into possession, and one of their stems seized the occupancy of the original abodes of the Khazars (see KHAZARES), on the western side of the Volga and the Caspian as far as Derbent. In the eleventh century, they spread into the eastern parts of Europe. They wrested from the Petschenegs almost all which they had hitherto possessed in that quarter of the globe, particularly the Krim, the countries between the Don and the Dnieper, with Moldavia and Walachia. After they had continued their ravages for a long time in Bulgaria, Thrace, Transylvania, and Hungary, and were in a great measure brought to ruin, they at last settled in Hungary. Towards the end of the eleventh century, they captured the north-eastern part of the Kuban from the Russians, who were at that time torn to pieces by intestine dissensions. In the former half of the thirteenth century, they lost by the Tchingises, Moldavia, Valachia, and the Krim. In the year 1302, the Kumanians were numbered among the nations which belong to the state of Hungary; but from

that time they cease to be an historical nation. The Petschenegs above mentioned, named by themselves Kengar or Kengh, were a powerful wandering nation on the rivers Volga and Ural. They became first known in Europe by their marches into the Khazarian empire in 839, and by their wars in 867 with the Slavonians, a little time before made tributary to the Khazars. Driven from their seats by the Uzes and Khazars, they made themselves masters of the country between the Don and the Dniefter, and expelled thence the Hungarians subject to the Khazars. In the eleventh century, they migrated towards Moravia, Bulgaria, and Thrace, and established themselves, after committing frequent ravages, in the countries of the East Romans in Dardania and the lesser Scythia. At the close of the twelfth century, they possessed a part of Transylvania, and about that time they gradually vanished out of history. Tooke's *Russia*, vol. i.

UZETTE, in *Geography*, a town of France, in the department of the Gironde; 6 miles W. of Bazas.

UZIFIR, UZUFAR, or UZIFUR, in *Chemistry*, a name which some authors give to cinnabar.

UZITA, in *Ancient Geography*, a town of Africa Propria, S. of Adrumetum. Ptolemy.

UZKUND, in *Geography*. See URKEND.

UZMEY, a district of Daghestan, situated between two small rivers, extending about 60 versts along the Caspian, and about the same distance in breadth. See DAGESTAN.

UZNEK, a town of Persia, in the province of Adirbeizan; 10 miles S. of Selmas.

W.

W

W, A letter peculiar to the northern languages and *w*, people; as the English, Dutch, Polish, and others of Teutonic and Slavonic original.

The form and the sound of *w* are excluded from all the languages derived from the Latin; though it is not improbable, says Dr. Johnson, that by our *w* is expressed the sound of the Roman *v*, and Eolic *f*. However, the *w* is sometimes admitted into the French, Italian, &c. in proper names, and other terms borrowed from the languages in which it is originally used.

In English, the *w* is usually a consonant; and as such, may go before all the vowels, except *u*; as in *want*, *weapon*, *winter*, *world*, &c.

If it be a consonant, its sound is uniform. Some grammarians have doubted whether *w* ever be a consonant; and not rather, as it is called, a double *u* or *ou*, as *water* may be resolved into *ouater*: but letters of the same found are always reckoned consonants in other alphabets; and it may be observed, says Dr. Johnson, that *w* follows a vowel

W A A

without any hiatus or difficulty of utterance, as *frosty winter*.

It is sometimes also a vowel; and, as such, follows any of the vowels *a*, *e*, *o*; and unites with them into a kind of double vowel, or diphthong; as in *law*, *ewe*, *fove*, &c. The English *w* is sounded as in Latin *u*, in *quantum*, *suadeo*, *lingua*. Its sound is commonly like the gross, or full *u*, rapidly pronounced. In French, the sound of the *w* does not differ from that of the single *u*, or rather *ou*. See U.

WA, or WAHE, in *Geography*, a town of Sweden, in the province of Schonen; 4 miles N. of Christianstad.

WAACKHAUSEN, a town of the duchy of Bremen, on a moor, near the river Hamme; the houses of which are built of stone, sand, and turf. On the Hamme's overflowing its banks, whole districts on this moor, with the oaks growing thereon, (though, to speak more properly, their roots only run along the surface,) the firs, elders, barns, and ovens, are raised by the water to the height of ten or twelve feet.

feet. The trees, however, subside again with the foil, but on the water's ebbing suddenly, frequently fall down; 12 miles N. of Bremen.

WAAG, or VAG, a river of Hungary, which rises in the N. part, and runs into the Danube, 6 miles below Comorn.

WAAL. See WAHAL.

WAALIA, in *Ornithology*, a pigeon, so called by Bruce, which frequents the low parts of Abyssinia, perching upon the highest trees, and sitting quietly in the shade during the heat of the day. These birds fly to a great height, in large flocks, and seem to select a species of the beech-tree for their customary abode, on the mast or fruit of which they chiefly depend for their food. They are rarely seen in the high country, which is supposed to be too cold for them. They are very fat, and the best, without exception, of all pigeons. The Abyssinians, however, do not eat this bird; and dread being defiled by touching it, when it is dead. The waalia is less than the common blue pigeon, but larger than the turtle-dove. Its whole back, and some of the short feathers of its wings, are of a beautiful unvarnished green, more light and lively than an olive; its head and neck are of a duller green, with less lustre; its beak is of a blueish-white, with large nostrils; the eye black, with an iris of dark orange; the pinion, or top of its wing, is a beautiful pompadour; the large feathers of the wing are black; the outer edge of the wing narrowly marked with white; the tail a pale dirty blue; below the tail it is spotted with brown and white; its thighs are white, with small spots of brown; its belly a lively yellow; its legs and feet are a yellowish-brown; its feet stronger and larger than those of birds of this kind. Bruce's Travels, Appendix.

WAALWYK, in *Geography*, a town of Brabant; 10 miles W. of Bois le Duc.

WAAREN. See WAHREN.

WABASH, a beautiful river of America, with high and fertile banks, which waters the Indiana territory, and discharges itself into the Ohio, about N. lat. $37^{\circ} 33'$. W. long. $80^{\circ} 30'$, by a mouth 270 yards, 1020 miles below Fort Pitt. In the spring, summer, and autumn, it is passable with bateaux, drawing three feet water, 412 miles to Ouiatanou, a small French settlement on the W. side of the river, and for large canoes 197 miles farther, to the Miami carrying place or portage, 9 miles from Miami village. The communication between Detroit and the Illinois and Ohio countries is up Miami river to Miami village, thence by land 9 miles, when the rivers are high, and from 18 to 20 when they are low, through a level country to the Wabash, and by the various branches of the Wabash to the respective places of destination. A silver mine has been lately discovered about 28 miles above Ouiatanou, on the N. side of the Wabash; salt-springs, lime, sand-stone, blue, yellow, and white clay, are found plentifully on this river.

WABASH, *Little*, a river of America, which runs into the Wabash, N. lat. $37^{\circ} 40'$. W. long. $88^{\circ} 35'$.

WABASH, a township of Indiana, in Knox county.

WABEN, a town of France, in the department of the fraits of Calais; 7 miles S.W. of Montreuil.

WABUSKAGAMA, a river of Canada, which runs into the Saguenay, N. lat. $48^{\circ} 20'$. W. long. $70^{\circ} 18'$.

WACHBRUN, a town of the county of Henneberg; 9 miles S.E. of Meinungen.

WACHEIN, a river of Carniola, which rises in the lake of Wacheiner, and runs into the river Save, near Retmaufdorf.

WACHEINER, a lake of Carniola; 10 miles W. of Feldeis.

WACHENBUCHEN, a town of Germany, in the county of Hanau Munzenberg; 1 mile N.W. of Hanau.

WACHENDORFIA, in *Botany*, was so named by Burmann, in honour of his countryman Everard James van Wachendorff, professor of physics, as well as of botany, at Utrecht, who died in 1758, aged fifty-six. He published, in 1743, an oration on the infinite wisdom of God, as displayed in the Vegetable Creation; and in 1747, *Horti Utrechtani Index*, an 8vo. of 394 pages.—Linn. Gen. 27. Schreb. 38. Willd. Sp. Pl. v. 1. 248. Mart. Mill. Dict. v. 4. Vahl Enum. v. 2. 163. Burm. Monogr. Amitt. 1757. Ait. Hort. Kew. v. 1. 106. Ker in Sims and Kon. Ann. of Bot. v. 1. 234. Juss. 59. Lamarck Illustr. t. 34. Gærtn. t. 15.—Clafs and order, *Triandria Monogynia*, Nat. Ord. *Enfalæ*, Linn. *Iridetæ*, Juss.

Gen. Ch. Cal. none. Cor. inferior, permanent, withering, irregular, of six obovate-oblong petals; three upper ones most erect, of which the two lateral ones have each a spur at their base; three lowermost widely spreading. Nectary in the spur of each lateral petal, accompanied by a bristle. Stam. Filaments three, thread-shaped, divaricated, declining, curved upward, shorter than the corolla; anthers oblong, incumbent. Pist. Germen superior, roundish, with three furrows; style thread-shaped, declining; stigma simple, tubular. Peric. Capsule three-lobed, triangular, obtuse, of three compressed cells, and three valves, enveloped in the faded corolla; partitions from the centre of each valve. Seeds solitary, rough or hairy, compressed.

Ess. Ch. Corolla inferior, irregular, of six petals; two of them spurred at the base. Capsule of three cells. Seeds solitary, rough.

1. *W. thyrsiflora*. Tall-flowering Wachendorfia. Linn. Sp. Pl. 59. Willd. n. 1. Vahl n. 1. Ait. n. 1. Thunb. Prodr. 12. Burm. Monogr. 2. t. 1. f. 2. Curt. Mag. t. 1060. Redout. Liliac. t. 93.—Leaves perennial, smooth. Panicle oblong, close.—Native of the Cape of Good Hope; thriving in our green-houses with little care, and indeed almost hardy, flowering in May and June. The root is perennial, fleshy, saffron-coloured or red, with long simple fibres. Stem solitary, simple, erect, leafy, round, or a little compressed, downy, slightly zigzag, about a yard high. Leaves numerous, two-ranked, plaited, many-ribbed, tapering at each end, sheathing, permanent. Panicle racemose, erect, a span or more in length, compound, downy, composed of numerous large and handsome, but odorless and short-lived flowers, of a fine golden yellow; externally downy, with an orange or tawny hue. The lobes of the capsule are much compressed, and sharp-edged. Seeds clothed with shaggy chaffy pubescence.

2. *W. paniculata*. Spreading Panicle Wachendorfia. Linn. Sp. Pl. 59. Willd. n. 2. Vahl n. 2. Ait. n. 2. Thunb. Prodr. 12. Burm. Monogr. 4. t. 1. f. 1. Sm. Ic. Picé. t. 5. Curt. Mag. t. 616. (*Aphodelus latifolius*, floribus patulis flavescensibus, rubicundis intus maculis notatis; Brey. Prodr. 3. 22. t. 9. f. 1.)—Leaves annual, smooth. Panicle spreading.—Native of the Cape of Good Hope, in sandy ground. It seems from Plukenet's Mant. 70, where it is called Red-bulb, to have been cultivated by Dr. Uvedale. (See UVEDALIA.) This species however is more tender than the preceding, and rarely flowers in the English collections. The knobs of the root are browner, oblong, and nearly vertical. Stem but a foot high. Leaves fewer, entirely deciduous. Flowers larger and handsomer of a deeper orange at the outside; their three upper petals marked

marked with a transverse green or brownish line, and all nearly equally spreading, though the central one is rather smaller than the other two.

3. *W. hirsuta*. Narrow-leaved Hairy Wachendorfia. Thunb. Prodr. 12. Willd. n. 3. Vahl n. 3. Ait. n. 3. (*W. villosa*; Andr. Repof. t. 398.)—Leaves linear-sword-shaped, hairy. Panicle rather oblong.—Gathered at the Cape by Thunberg, from whom we have a specimen. It flowers in our green-houses in June, but is not common. Mr. Andrews received his specimen from Mr. Vere's garden at Kennington-gore, where the plant flourished abundantly under the care of Mr. W. Anderson, now curator of the Chelsea garden. This species is well distinguished by the narrowness, and remarkable long shaggy white hairs, of its leaves. The stem and panicle also are rather more hairy than in the preceding, and the form of the latter is more elongated, less corymbose. Flowers large and handsome, bright yellow; externally tawny; their central uppermost petal concealed in front by the two next, which meet before it: they are all broadish-obovate, shaggy at the back.

4. *W. brevifolia*. Short-leaved Hairy Wachendorfia. Ait. n. 4. Ker in Curt. Mag. t. 1166. (*W. hirsuta*; Ker in Curt. Mag. t. 614? *Silyrinchium ramosum* aethiopicum, foliis plicatis nervosis et incanis, radice tuberosâ phoenicæ; Breyer. Cent. t. 37. Rudb. Elyf. v. 2. 13. f. 10.)—Leaves elliptic-sword-shaped, hairy. Panicle spreading.—Native of the Cape, from whence, according to Mr. Aiton, it was introduced into the English green-houses, in 1795. It flowers in March or April. We have seen no specimen, and therefore can only presume, not assert, that the dingy-flowered plant, figured in t. 1166 of the Botanical Magazine, and the brighter yellow one in t. 614 of the same work, are varieties of each other. The shortness of the leaves, compared with their great breadth, distinguishes the present species. The two lateral upper petals nearly conceal the central one, seen in front, according to Mr. Ker's just remark, by which the flowers obviously differ from those of *W. paniculata*.

5. *W. tenella*. Linear Smooth-leaved Wachendorfia. Thunb. Prodr. 12. Willd. n. 4. Vahl n. 4.—“Leaves linear, three-ribbed, smooth. Panicle spreading, somewhat compound.”—Gathered at the Cape by Thunberg, whose specific character it is all we know of this species.

6. *W. graminea*. Grass-leaved Wachendorfia. Thunb. Prodr. 12. Willd. n. 5. Vahl n. 5. (*W. graminifolia*; Linn. Suppl. 101.)—Leaves sword-shaped, channelled, smooth. Panicle spreading, compound.—From the same country. Thunberg considers this as the rarest Cape plant of its tribe. He has favoured us with a specimen of the panicle only, not having a duplicate leaf. The inflorescence is hairy, as in all the species we have seen; the branches of the panicle racemose, somewhat zigzag. Flowers yellow; externally tawny. German very hairy, but this seems to be more or less the case with the whole genus, the species of which differ less in their parts of fructification than usual.

WACHENDORFIA, in Gardening, furnishes plants of the exotic flowering perennial kind, for the green-house, in which the species cultivated are, the simple-stalked wachendorfia (*W. thyrsiflora*), the paniced wachendorfia (*W. paniculata*); and the hairy wachendorfia (*W. hirsuta*).

The first is a red thick tuberous-rooted plant of the flowering kind.

The second sort has a creeping tuberculated root, and is single-flowered.

The last chiefly differs from the above in the hairiness of its leaves, and its long reddish-brown stem.

Method of Culture.—These plants may be increased by offsets, taken from the heads of the roots, in the beginning of autumn, planting them in pots filled with soft loamy earth, mixed with a little sea-sand; and when the season proves dry, placing them so as to have only the morning sun, until the offsets have taken new roots, when they must be placed in a sheltered situation, so as to have the full sun. On the approach of frosts, they should be placed in frames, and managed as plants of the tender kind. They are also sometimes capable of being propagated by root-suckers and feeds.

The second sort is very impatient of cold, and seldom flowers in this climate.

They produce variety among other potted plants of the green-house kind, in collections of that sort.

WACHENHEIM, in Geography, a town of France, in the department of Mont Tonnerre; 15 miles W. of Mannheim. N. lat. 49° 25'. E. long. 8° 12'.

WACHENROTH, a town of Bavaria; 111 miles S.S.W. of Bamberg.

WACHINELLORE, a town of Hindoostan, in Madura; 20 miles W. of Coilpetta.

WACHOVIA, or *Dobbs Parish*, a tract of land so called in North Carolina, consisting of 100,000 acres, purchased of lord Granville, in 1751, by the Moravians, who named it Wachovia after an estate belonging to count Zinzendorf, in Germany. In 1755, it was made a separate parish, and named Dobbs by the legislature. Salem is the principal town.

WACHOWICZE, a town of Poland, in Volhynia; 40 miles S.E. of Lucko.

WACHQUATNACH, a Moravian settlement in Connecticut; 20 miles N. of Stratford.

WACHTENDONK, a town of France, in the department of the Roer, situated in a marshy country, on the river Niers, whose waters fill the ditches; 22 miles N.W. of Duffeldorf.

WACHTERSBACH, or WÄCTERSBACH, a town of Germany, which gives name to a branch of the counts of Iffenburg, with a château, in which the counts of Iffenburg Wachtelbach reside; 15 miles E.N.E. of Hanau. N. lat. 51° 25'. E. long. 6° 14'.

WACHUSET MOUNTAIN, a mountain of Massachusetts, 2990 feet above the level of the sea.

WACKE, or WACKEN, in Mineralogy and Geology, a name given to a rock nearly allied to basalt, and which may properly be regarded as a more soft and earthy variety of the latter rock: it passes both into basalt and green-stone. See TRAP.

Its colour generally inclines to greenish-grey, brown, or black; it is opaque and dull, yields easily to the knife, and has rather a greasy feel. It occurs with basalt and green-tuff in beds, or mountain masses, and graduates into the above-named rocks. Wacke is sometimes compact, and sometimes vesicular or amygdaloidal. At Calton-hill, near Edinburgh, it is porphyritic, containing distinct crystals of augite and feldspar.

The wacke which is said to occur in mineral veins, was suspected to be indurated green earth. The specific gravity of wacke varies from 2.617 to 2.887.

Wacke is classed with simple minerals by Werner, but is considered by Cordier as a compound rock of volcanic origin, and composed of minute crystals and particles of augite, feldspar, and the other minerals which are found in the different varieties of lava. (See *Volcanic Products* at the end of the article VOLCANO.) In compound rocks, no two chemical

mical analyses can be expected to agree, as they must vary with the proportions of the prevailing ingredient. A specimen of amygdaloidal wacke analysed by Withering gave

Silex	-	-	63
Alumine	-	-	13
Lime	-	-	7
Iron	-	-	17

Wacke, is fusible, melting into a vitreous slag, the colour of which will vary according to the prevailing ingredient which composes this rock. This mineral must not be confounded with another rock called grey wacke or grau wacke.

WACKE, *Grey*, or *Grey Wacke*, or *Wacke*, a name given by later geologists to a very extensive series of rocks, the members of which differ greatly from each other in composition, structure, and appearance: indeed the name has been applied to indefinitely, that it has occasioned much confusion and obscurity in geological descriptions, and we consider the introduction of the term as having tended greatly to retard the progress of practical geology. A great variety of very different rocks, the nature of which was not precisely known, have been classed with grey wacke, which served as a name to conceal ignorance under the veil of scientific arrangement. Some geologists restrict the term to those rocks which have a basis of clay-slate; others extend it to all the coarse grit stones which contain rounded and angular fragments united by a cement of any kind; and the French, under the name of psammite (which they have recently introduced), comprise along with grey wacke all the coarse sand-stones of the coal formation. In all extensive formations of clay-slate, the upper beds will frequently contain particles of quartz, flinty slate, and other minerals, which sometimes give them a coarse and sometimes a granular appearance; and even in the midst of beds of pure slate, beds of this coarse slate frequently occur, which, when they have a schistose structure, are the grey wacke slates of the German geologists. Mr. Jameson defines grey wacke to be a kind of sand-stone very different from any of those that occur in the flint rocks. It is composed of grains of sand, which are of various sizes, and sometimes even approach in magnitude to rolled masses. These are connected together by a basis of clay-slate, and hence this rock derives its grey colour and solidity. These fragments are quartz, a kind of indurated clay-slate, or flinty slate.

When the sandy particles of grey wacke become so small as scarcely to be perceptible by the eye, it acquires a slaty structure, and then forms grey wacke-slate, which, he adds, bears a striking similarity to clay-slate. "This slate has seldom a greenish or yellowish colour, as is the case with primitive slate, but is usually bluish, ash and smoke grey. It does not shew the silvery continuous lustre of primitive clay-slate, but is rather glimmering, which originates from scales of mica. Quartz scarcely occurs in it in layers, but usually traverses it in the form of veins. It does not contain crystals of felspar, schorl, tourmaline, garnet, or hornblende, nor beds of garnet, talc, chlorite-slate, or magnetic iron-stone. Grey wacke-slate contains petrifications, particularly three varieties that border on grey wacke.

"Grey wacke and grey wacke-slate alternate, and are distinctly stratified; but the stratification of the former is more distinct than that of the latter. They sometimes alternate with beds of transition lime-stone, trap, flinty slate and coal-blende. This rock is uncommonly productive of metals, not only in beds but in veins, which latter are frequently of great magnitude. Almost all the mines of the Hartz are situated in grey wacke. The whole of the lead veins of Lead Hills and Wanlockhead, in Scotland, are situated in grey wacke."

It was for a long time contended, that the killas or slate of Cornwall was grey wacke: it is now considered as a true clay-slate, resting immediately on the granite of that district. Grey wacke was, by the Wernerian geologists, regarded as partly of chemical and partly of mechanical formation; the fragments which it contained were supposed to be the debris of older rocks; but on this hypothesis it must appear extraordinary that these fragments should be so limited in their kind, and that granite, syenite, gneiss, and the other primitive rocks, should rarely, if ever, occur in it.

The hypothesis of the mechanical formation of grey wacke is now abandoned by its former supporters; and it is even contended, that the rounded masses in many conglomerated rocks and in sand-stones have been formed chemically, and that plum-pudding stones are in many instances chemical formations, as these stones sometimes graduate into the adjoining rocks, and the nodules themselves not unfrequently also graduate into the rock in which they are imbedded.

The occurrence of grey wacke, imbedded in what has been called primitive slate, offers a further proof that the origin of this rock, in such instances, is not derived from the debris of pre-existing rocks, but is more analogous to the formation of porphyries, though the process by which it has been solidified did not allow the imbedded particles or nodules to take a regular crystalline form. From what has been stated, it will appear, that under the name of grey wacke may be classed a great variety of rocks, some approaching to the nature of porphyry, others to plum-pudding stone; others again, where the fragments are imbedded in a paste, resemble coarse grit-stones, whilst many rocks of clay-slate, which are not perfectly homogeneous, may be also classed with grey wacke, though they nearly resemble primitive slate. Whilst such latitude is allowed to the application of the term, it is obvious that no geological description can convey accurate information where it is introduced, unless it be accompanied with a definite account of the composition of the rock to which this name is given; and geologists would do well to restrict its use, or to banish it altogether from the nomenclature of rocks.

WACKENITZ, in *Geography*, a river which runs from Ratzeburg lake into the Trave at Lubeck.

WACKMOYJUST, a town of Birmah; 12 miles S. of Raynangong.

WACSAW, a town of America, on the line which divides North from South Carolina, where, in the year 1781, 700 British troops, under the command of lieutenant-colonel Tarleton, came up with a party of Virginian troops, under colonel Burford, amounting to 300 men; the latter being summoned to surrender refused, and a most bloody engagement ensued, when few of the Americans escaped; 53 prisoners only were taken, except the wounded.

WADAN, or ZALA, a town of Fezzan, in the road from Tripoli to Mourzouk; 160 miles N. of Mourzouk. N. lat. 29° 59'. E. long. 15° 12'.

WADD, or WADDING, in *Gunnery*, a stopple of paper, hay, straw, old rope-yarns, or tow, rolled firmly into the form of a ball, and forced into a gun upon the powder, to keep it close in the chamber; or put up close to the shot, to keep it from rolling out, as well as to prevent the powder, when fired, from dilating round the sides of the ball, by its windage, as it passes through the chase, which would considerably diminish the effort of the powder. From some experiments recited in the *Military Dictionary*, it is inferred, that the judicious ramming of a little wadding over the powder adds about one-fourth part of the whole effect.

WADD, or *Wad*, in *Mineralogy*, a name given to a species of

of manganese ore, of which there are four kinds: fibrous wad, ochrey wad, pulverulent ochrey wad, and dendritic wad. See MANGANESE.

The wad of Derbyshire is composed of nearly equal proportions of the oxys of manganese and iron.

The plumbago of Borrowdale, in Cumberland, is provincially called wad. See PLUMBAGO.

WAD is also sometimes applied to the light tufts of hay which are shaken together; and, in which case, the hay is then said to be wadded. It is likewise occasionally used in some places, to signify the plant woad or would, which is used in dyeing. See WOAD.

WADD, *Pea and Bean*, in *Agriculture*, the small handfuls or portions of these crops which are set up together in a slanting manner, after being cut or pulled, for the purpose of drying, and which are sometimes afterwards tied.

WADD-Hook. See WORM.

WADD-Mill is a hollow form of wood, to make the wads of a proper size.

WADDEL, in *Geography*, a town of North Carolina; 30 miles W. of Exeter.

WADDEN, a channel of the German sea, between the island of Ameland and the coast of Friesland.

WADDLE, in *Agriculture*, a name applied in some places to the flatted hurdle of the split-wood kind. It is a very preferable sort of hurdle for many different purposes on farms. See HURDLE.

WADDO, in *Geography*, a town of Sweden, in the province of Upland, on a narrow creek, which communicates with Aland's Haff; 15 miles N. of Nortelge. N. lat. 60°. E. long. 18° 40'.

WADE'S POINT, a cape on the coast of North Carolina. N. lat. 36° 7'. W. long. 76° 20'.

WADEBRIDGE, an inconsiderable market-town in the hundred of Trigg, and county of Cornwall, England, is situated partly in the parish of St. Breock, and partly in that of Egloshale, at the distance of 25 miles W.S.W. from Launceston, and 239 in the same bearing from London. A weekly market on Fridays, and two annual fairs, were granted by king Edward II., in the year 1312, to Walter Stapleton, bishop of Exeter, then lord of the manor. The market is still held, though on a very small scale, for butchers' meat and other commodities; and here are now three fairs. The only object of notice in the town is the bridge over the river Alan, about 320 feet in length, and consisting of 17 arches, which connects the two parishes wherein the town stands. It was built in the reign of Edward IV. by public contributions, and begun by John Lovibond, then vicar of Egloshale. Hals says, that an indulgence was granted to the contributors in the year 1485; but no record of this appears in the registers of the see of Exeter. The same author adds, that Lovibond gave lands, then worth 2*cl. per annum*, for the support of the bridge: these lands are not now let for quite so much. This bridge was made a county-bridge in the reign of James I. Paditow-Haven is navigable to Wadebridge, whither vessels of about 40 or 50 tons carry coals, salt, lime, &c.—Lytson's *Magna Britannia*, vol. iii. Cornwall, 4to. 1814.

WADEIJ, a town of Arabia, in the province of Yemen; 80 miles S.S.W. of Saade.

WADELS, a river which rises in Radnorshire, and runs into the Lug, in Shropshire, about 3 miles E. of Preetign.

WADENSCHWEIL, a town of Switzerland, in the canton of Zurich; 9 miles S. of Zurich.

WADERO, an island near the west coast of Sweden, in the North sea. N. lat. 56° 24'. E. long. 12° 30'.

WADESBOROUGH, a town of North Carolina; 76 miles S.W. of Fayetteville.

WADEY, a country of Africa, situated to the west of Darfur. It formerly consisted of several states, but being conquered by the Arabs, they were all united into one. The Arabic is the principal language, though many others are said to be spoken.

WADHAM ISLANDS, a cluster of small islands, near the north-east of Newfoundland. N. lat. 49° 57'. W. long. 53° 37'.

WADI ABASSI, a river of Arabia, which runs into the Red sea, 10 miles S.S.E. of Hodeida.

WADI *l'Artik*, a small river of Arabia, which waters the city of Medina.

WADI *Elmahad*, a river of Arabia, which in rainy seasons runs into the Red sea, 25 miles S.S.E. of Hodeida; at other times loses itself in the sands.

WADI *Faran*, a river of Arabia, which runs into the Red sea, 25 miles N.W. of Tor.

WADI *Fatima*, a small river of Arabia, which runs north-west of Mecca.

WADI *Gamus*, or *Valley of Buffaloes*, a valley of Egypt, on the east side of the Nile; 5 miles S. of Enfeneh.

WADI *l'Kbir*, a river of Arabia, which in rainy seasons runs into the sea near Mocha.

WADI *Meidam*, a river of Arabia, which runs into the sea, 8 miles W. of Aden.

WADI *Schab*, a river of Arabia, which loses itself in the sands, about 18 miles N. of Hodeida.

WADI *Schan*, a river of Arabia, which in rainy seasons runs into the Red sea, 6 miles N.N.W. of Hodeida; in dry seasons it loses itself in the sands.

WADI *Suradaj*, a river of Arabia, which in rainy seasons runs into the Red sea, about 18 miles S.W. from Zebid.

WADI *Zebid*, a river of Arabia, which passes by Zebid. This river, at a particular season of the year, overflows and fertilizes the soil; it afterwards spreads itself into a shallow lake, and is lost among the sands.

WADING, LUKE, in *Biography*, an Irish ecclesiastic, more distinguished for probity and piety than for discrimination of judgment, resided at Rome, where he died in the year 1655. His works, in which he has occasionally intermixed fabulous relations, are "Annals of his Order," which was that of St. Francis, in 8 vols. folio, continued by other authors till they amounted to 17 vols. folio; and a "Bibliotheca of Writers of the Franciscan Order," 1630, folio, held in considerable estimation. Moreri.

WADMELAW, in *Geography*, a river of South Carolina, which separates the island of St. John from the continent.—Also, a small island on the coast of South Carolina, which communicates with St. John's island by means of a bridge.

WADREAG, a district of Africa, in the country of Sahara.

WADSAOS, a town of Norway, in the diocese of Drontheim; 120 miles N. of Drontheim.

WADSETT, in *Agriculture*, a term applied to an ancient sort of tenure or lease of land, in the Highland parts of Scotland. The writer of the account of the agriculture of the county of Inverness has remarked, that wadsetts were, at a former period, frequent and numerous there; but that they have now been mostly resumed, the price being paid up so soon as the term of redemption arrived. These wadsetts were commonly, it is said, granted to the younger sons and near relations of the great barons, and for these

these reasons: 1st, Being more attached to the head of the tribe than any other description of men, they were appointed the officers of the clan, when an expedition was undertaken; 2d, The scarcity of money made it more convenient for the needy nobility or chieftains to borrow or raise money in this way than in any other, or to give their children a patrimony, when about to settle in life; and 3d, When every man's occupation was war, or farming and grazing, before the spirit of adventure in going abroad to acquire wealth was known, the youth remained at home, on wadsetts or leases of ground at a moderate rent. In this manner, it is said, a clan, during the patriarchal no less than the feudal system or state, were in fact a battalion of armed men, living closely together, and united by the most powerful ties of consanguinity and interest. Accordingly, it is said, we find the Highland tribes settled in clusters, in the same valley or strath, unmixed with any other people; nor was it at one period, it is thought, very safe for a stranger to attempt settling amongst them. A few, and but very few, of these redeemable rights now exist, it is asserted, in any part of the Highlands; and that if the wadsetter continue in the same possession, the right of wadset is changed into an ordinary lease. See TENURE.

WADSOË, in *Geography*, an island in the Frozen ocean, N. lat. 70° 6', with a copious hot spring, the heat of which is about 36½° of Fahrenheit.

WADSTENA, a town of Sweden, in East Gothland, on the Wetter lake, with a castle, built by Gustavus Vasa in the year 1544, and defended at its four corners by round towers, covered with small domes. In the year 1567, this town was burned by the Danes; 20 miles W. of Linköping. N. lat. 58° 25'. E. long. 14° 59'.

WADSWORTH, a town of New York, on the Geneve river; 90 miles W.N.W. of Chenango.

WADWORTH, a township in the West Riding of Yorkshire; 5 miles N.W. of Halifax.

WÆLHEIM, a town of France, in the department of the Two Nethes; 3 miles N.W. of Malines.

WÆLWYK, a town of Brabant; 10 miles W.N.W. of Bois-le-Duc.

WÆR, a town of Hindooistan, in the country of Agra; 20 miles S.W. of Fattipour.

WÆRDER, a town of Holland; 5 miles N.E. of Gouda.

WÆRFLIET, a town of Germany, in the county of Delmenhorst; 8 miles N. of Delmenhorst.

WÆRTH, a town of France, in the department of the Lower Rhine; 9 miles S.S.W. of Wissenburg.

WÆS, a district of Flanders so called, situated on the bank of the Scheldt, between Ghent and Yfendick.

WÆFE. See WÆF.

WÆFERS for sealing letters are made by mixing fine flour with glair of eggs, isinglass, and a little yeast, and beating the mass into a paste; then spreading it when thinned with gum-water, on even tin-plates, and drying it in a stove, and cutting it for use. The different colours may be given by tinging the paste with brazil or vermilion for red; indigo, or verditer, &c. for blue; saffron, turmeric, or gamboge, &c. for yellow, &c.

WÆFT, in *Sea Language*, a signal displayed from the stern of a ship for some particular purpose, by hoisting the ensign, furled up together into a long roll, to the head of its staff. It is particularly used to summon the boats off from the shore to the ship to which they belong; or as a signal for a pilot to repair aboard. Falconer.

To *wæft a ship*, is to convoy her safe, as men of war do by merchants' ships.

Vol. XXXVII.

WÆFTERS, WÆFTORS, conductors of vessels at sea.

King Edward IV. constituted a triumvirate of officers with naval power, whom the patent styles *custodes, conductores, and wæftores*; their business chiefly was to guard our fishermen on the coasts of Norfolk and Suffolk.

WAGA, or VAGA. See WEIGH.

WAGA, in *Botany*, H. M. a filiquous Indian tree, with a tetrapetalous stellated flower, and flat pods, three inches in length. It is very like the intsia, but without spines, and climbs about high trees. The pods are two inches in breadth, thin, and very flat; when dried, of a reddish colour, and have a cortex of a snow-white colour on the inside. The beans are astringent, bitter, round, and smooth, a little flattish, lying in a transverse position with respect to the pod, and of a green, inclining to a chestnut colour. It is evergreen, and grows in Malabar.

The juice of this tree, together with lemons and green turmeric, boiled for a considerable time in cocoa-nut oil, is a good ointment for the leprosy, and of great use in inveterate ulcers. Raii Hist. Plant. 1766.

WAGEERAH, in *Geography*, a town of Hindooistan, in Balana; 20 miles W.N.W. of Nafuck.

WAGENAAR, JOHN, in *Biography*, a Dutch writer, distinguished by his moral qualities as well as literary acquirements, was born in 1709 at Amsterdam, of which he was appointed historiographer in 1758. He died in 1773. His principal work, which is reckoned one of the chief ornaments of Dutch literature for depth of research and purity of style, is a "History of Holland from the earliest Period till 1751," in 21 vols. 8vo.; of which a second edition with engravings, both maps and portraits, was printed at Amsterdam in 1752—1759. Among his other performances are enumerated, "An Historical Description of the City of Amsterdam," Amst. 1760, 3 vols. folio; "The Character of John De Witt placed in its true Light;" and "Historical and Political Miscellanies," Amst. 8vo. 1776. Gen. Biog.

WAGENDRISL, in *Geography*, a town of Hungary; 5 miles S. of Kapfdorf.

WAGENINGEN, a town of Holland, in the department of Guelderland, situated in a marshy country, on the north side of the river Leck, supposed to be the Vada of Tacitus, which was so stoutly defended by Julius Briganticus against his uncle Civilis, the famous Batavian general. On one side there is a large barren heath, and on the other are pleasant meadows and arable lands. It is tolerably well built, and reckoned the third town of that part of Guelderland called the "Veluwe." Its inhabitants have a pretty good trade in cattle and tobacco; 7 miles W. of Arnheim.

WAGENIZ, a town of Bohemia, in the circle of Koniggratz; 12 miles E. of Koniggratz.

WAGENSELL, JOHN CHRISTOPHER, in *Biography*, was born at Nuremberg in 1633, and having studied at several universities, he became tutor to the son of a nobleman at Altdorf, and accompanied him in his travels through a great part of Europe. At Turin he discovered in the cabinet of the duke of Savoy the famous Isaac Table, which had been lost ever since the pillage of the duke of Mantua's cabinet. In the progress of his life he acquired a high degree of reputation, and was distinguished among other foreign literary persons by the munificence of Lewis XIV. Having been honoured with the degree of LL.D. at Orleans, he became professor of law and history in the university of Altdorf in 1667, and afterwards was advanced to the chair of Oriental languages, and the station of public librarian. He was also a member of the academies at Turin and Padua; and died at Altdorf, at the age of 72, in the

year 1705. The most distinguished of his writings are, "A Differtation on a suppos'd Fragment of Petronius;" "Fasciculus Opusculorum variorum Historicorum et Philologicorum;" "Tela ignea Satanae," 2 vols. 4to. being a collection, with a refutation, of some of the principal Jewish works against Christianity; "Differtatio de Monetali veterum Romanorum;" "Commentatio de Civitate Norimburgensi;" and "Differtatio de Academicis." He had a daughter, named *Helen-Sibilla*, celebrated for her knowledge of the Latin, Greek, and Hebrew languages. Moreri.

WAGENSEIL, GEORGE CHRISTOPHER, a harpsichord master and composer at Vienna, a disciple of the learned Fouchi, first maestro di capella to the emperor. Till Emanuel Bach changed the style of playing on keyed instruments throughout Germany, Wagenseil's compositions for the harpsichord were in favour throughout Europe, and justly admired for their spirit and originality; as he had quitted the dry, labour'd, and crowded style of his predecessors, and given way to fancy, with no unsuccessful attempts at new effects in his accompaniments.

Wagenseil was many years harpsichord master to the archduchess Maria Theresia, afterwards empress-queen, on which account he enjoyed a pension of 1500 florins a year. But in 1772, when we saw and heard him at Vienna, he had been confined to his room several years by a lameness, which came on by degrees in a very uncommon manner. The sinews of his right thigh were contracted, and the circulation stop'd, so that it was become incurably withered and useless. Besides this calamity, which constantly confined him to his couch, his left hand had been so ill treated by the gout, that he was hardly able to move two of his fingers. However, at our urgent request, he had a harpsichord wheeled to him, and played several capricios, and pieces of his own composition, in a very spirited and masterly manner; and though we could certainly believe that he had been a much greater player, yet he had sufficient fire and fancy remaining to please and entertain, though not to surprize us very much.

He was at this time nominal master to the archduchesses, for which he had a small pension. Though utterly unable to quit his room, he had scholars who attended him there; and he continued to compose for foreign countries, where his fame was established by his early compositions.

In a second visit which we made this worthy and ingenious man, he had with him a little girl, his scholar, about eleven or twelve years old, with whom he played duets on two harpsichords, which had a very good effect. The child's performance was very neat and steady. There was a young count with him at this time, another of his scholars, who had a very rapid finger, and executed some very difficult harpsichord lessons with great precision.

Wagenseil, with all his corporeal complaints and infirmities, was allowed very extraordinary longevity; as, according to Gerber (*Hist. and Biogr. Lexicon*), he lived till 1777, when he had arrived at his 92d year.

We never heard of more than three vocal compositions by this composer, which were an oratorio, "Gios Re di Cruda," written by Metastasio, and two cantatas for the imperial court, by the same author; but for the harpsichord, nine different works of his composition were published in different capitals of Europe, some with and some without accompaniments; which, like their author, were allowed to live longer than usual.

WAGER, WAGING, in *Law, vadari*, signifies the giving of security for the performance of any thing.

Thus, to wage law, is to put in security, that you will

make law at the day assigned, *i. e.* take the benefit which the law has allowed you.

Our ancestors considered, that there were many cases in which an innocent man, of good credit, might be overcome by a multitude of false witnesses; and, therefore, established this species of trial, by the oath of the defendant himself. This method of trial is not only to be found in the codes of almost all the northern nations that broke in upon the Roman empire, and established petty kingdoms upon its ruins, but its original may be traced back as far as the Mosaic law. Exod. xxii. 10.

A manifest resemblance may also be discerned between this species of trial, and the *canonical purgation* of the Popish clergy, when accused of any capital crime. Similar to this is also the *sacramentum decisivum* of the civil law. But, though a custom somewhat like this prevailed formerly in the city of London, yet in general the English law does not thus, like the civil, reduce the defendant, in case he is in the wrong, to the dilemma of either confession or perjury.

The manner of waging and making law is this. He that has waged, or given security, to make his law, brings with him into court eleven of his neighbours; a custom which is particularly described so early as the league between Alfred and Guthrun the Dane. The defendant then, standing at the end of the bar, is admonished by the judges of the nature and danger of a false oath; and if he still persists, he is to repeat this or the like oath: "Hear this, ye justices, that I do not owe unto Richard Jones the sum of ten pounds, nor any penny thereof, in manner and form as the said R. hath declared against me. So help me God." And thereupon his eleven neighbours, or compurgators, shall avow upon their oaths, that they believe in their consciences that he says the truth; so that himself must have sworn *de fidelitate*, and the eleven *de credulitate*. Some have maintained, that fewer than eleven compurgators will suffice; but Sir Edward Coke is positive, that there must be this number; and his opinion is approved and supported by Judge Blackstone, who observes, that as wager of law is equivalent to a verdict in the defendant's favour, it ought to be established by the same or equal testimony, namely, by the oath of twelve men.

In the old Swedish or Gothic constitution, wager of law was not only permitted, as it still is in criminal cases, unless the fact be extremely clear against the prisoner, but was also absolutely required in many civil cases. But with us in England, wager of law is never required; and is then only admitted, where an action is brought upon such matters as may be supposed to be privately transacted between the parties, and in which the defendant may be presumed to have made satisfaction without being able to prove it; as in actions of debt upon simple contract, or for an amercement in actions of detinue and of account, where the debt may have been paid, the goods restored, or the account balanced, without any evidence of either; and not, when there is any speciality, as a bond or deed to charge the defendant, but when the debt groweth by word only. Nor doth it lie in an action of debt, for arrears of an account, settled by auditors in a former action. By such wager of law, when admitted, the plaintiff is perpetually barred; for the law, in the simplicity of ancient times, presumed, that no one would forswear himself, for any worldly consideration. Wager of law, however, lieth in a real action, where the tenant alleges he was not legally summoned to appear, as well as in mere personal contracts. A man outlawed, attainted for false verdict, or for conspiracy or perjury, or otherwise become infamous, shall not be permitted to wage his law. Neither shall an infant under the age of twenty-one,

one, for he cannot be admitted to his oath; nor shall the defendant, where the plaintiff is an infant, wage his law. But a feme-covert, when joined with her husband, may be allowed to wage her law; and an alien shall do it in his own language. It is, moreover, a rule, that where a man is compellable by law to do any thing, by which he becomes creditor to another, the defendant in that case shall not be admitted to wage his law; for then it would be in the power of any bad man to run in debt first, against the inclinations of his creditor, and afterwards to swear it away. But where the plaintiff hath given voluntary credit to the defendant, there he may wage his law. In no case where a contempt, trespass, deceit, or any injury with force is alleged against the defendant, is he permitted to wage his law. Executors and administrators, when charged for the debt of the deceased, shall not be admitted to wage their law. The king also has his prerogative; for, as all wagers of law import a reflection on the plaintiff for dishonesty, therefore there shall be no such wager on actions brought by him; and this prerogative extends and is communicated to his debtor and accoptant; for, on a writ of *quo minus*, in the exchequer for a debt on simple contract, the defendant is not allowed to wage his law.

Notwithstanding all the restrictions to which wagers of law were subject, it was at length considered, that it threw too great a temptation in the way of indigent or profligate men; and, therefore, by degrees new remedies were devised, and new forms of action were introduced, in which no defendant is at liberty to wage his law; so that wager of law is quite out of use, being avoided by the mode of bringing the action; but still it is not out of force. And, therefore, when a new statute inflicts a penalty, and gives an action of debt for recovering it, it is usual to add, in which no wager of law shall be allowed: otherwise a hardy delinquent might escape any penalty of the law, by swearing he had never incurred, or else had discharged it. Blackst. Comm. book iii.

WAGER of Battle. See BATTLE and DUEL, &c.

WAGER's Straits, or River, in Geography, a river of North America, which empties itself into Hudson's bay, N. lat. 65° 8'. W. long. 87°.

WAGES, the plural of the obsolete singular *wage*, denote the pay or recompence given, according to custom, stipulation, and enactment of law, for any kind of work or service. (See LABOUR, LABOURER, and SERVANT.) As disputes have often occurred between masters and servants, the law has interposed to fix the wages of those that are employed in various departments of service. Accordingly by 5 Eliz. c. 4. the justices of every shire, riding, and liberty, or the major part of them, the sheriff, and every mayor, and other head officer within any city or town corporate, and in which is any justice of the peace within the limits of the said city or town corporate, and of the said corporation, shall yearly in Easter sessions, or within six weeks afterward, assemble such discreet persons as they shall think meet, and having respect to the plenty or scarcity of the time, and other circumstances, shall have authority to limit, rate, and appoint the wages as well of such artificers, handicraftsmen, husbandmen, or any other labourer, servant, or workman, whose wages in any time past have been by any law rated and appointed, as also the wages of all other labourers, artificers, workmen, or apprentices of husbandry, which have not been rated, as they shall think meet by their discretions, to be rated, limited, or appointed, by the year, or by the day, week, month, or otherwise, with or without meat and drink, and what wages every workman or labourer shall take by the great for mowing, reaping, or thrashing of corn and grain, or for

mowing and making of hay, or for ditching, paving, railing, or hedging, by the rod, perch, lugg, yard, pole, rope, or foot, and for any other kind of reasonable labour or service. Also, by 1 Jac. c. 6. the justices, or major part of them, resident in any riding, liberty, or division, where the sessions are severally kept, shall have power to rate the wages within such divisions, as if the same were done in the general sessions of the county; and by the said statute, the said act of 5 Eliz. shall extend to the rating of wages of all labourers, weavers, spinsters, and workmen or workwomen, whatsoever, either working by the day, week, month, or year, or taking any work by the great or otherwise.

If any justice resident within the county, or mayor, shall be absent at the rating of wages, and not hindered by sickness or other lawful cause to be allowed by the justices then assembled for rating of wages, upon the oath and affidavit of some credible person, he shall forfeit to the king 10*l.* to be recovered in the sessions or other court of record, by indictment or otherwise.

And the justices shall yearly, between September 29. and December 25, and between March 25 and June 24, make special and diligent enquiry of the good execution of this statute, and punish defaulters; and shall have for every day that they sit about the execution thereof (not exceeding three days at a time) 5*s.* each out of the forfeitures due to the king.

By the aforesaid act of 5 Eliz. the rates were to be certified into the chancery; but by the 1 Jac. c. 6. they need not to be certified into the chancery, but shall be kept amongst the records of the county or town corporate.

And after the said rates are made and engrossed in parchment under the hands and seals of the persons having authority to rate the same, the sheriff or mayor may cause proclamation thereof to be made in so many places as to them shall seem convenient, and every person shall be bound to observe the same.

If any person upon the proclamation published shall directly or indirectly retain or keep any servant, workman, or labourer, or shall give any more or greater wages, or other commodity, than shall be so appointed in the said proclamation; he shall on conviction before any of the justices or other head officers above mentioned be imprisoned for ten days without bail, and shall forfeit 5*l.*; half to the king, and half to him that shall sue before the said justices in their sessions.

But yet masters may reward a well-deserving servant over and above his wages, according as he shall deserve, so it be not by way of promise or agreement upon his retainer.

And every person that shall be so retained and take wages contrary to the said statute of the 5 Eliz. or to the said proclamation, and shall be thereof convicted before the justices aforesaid, or any two of them, or before the mayor or other head officers aforesaid, shall be imprisoned for 21 days without bail.

Every retainer, promise, gift, or payment of wages, or other thing contrary to the said act, and every writing and bond to be made for that purpose, shall be void.

If any clothier, or other, shall refuse to pay so much wages to their weavers, spinsters, workmen, or workwomen, as shall be rated, and be convicted thereof by confession, or oath of two witnesses, at the assizes, or sessions, or before any two justices (1 *Q.*); he shall forfeit 10*l.* to the party grieved, to be levied by distress and sale.

All artificers and labourers, being hired for wages by the day or week, shall, betwixt the mid of March and mid of September, be and continue at their work from five in the morning till after seven at night (except in the time of break-

WAGES.

fast, dinner, or drinking, which shall not exceed two hours and an half in a day, that is to say, at every drinking, one half hour, for his dinner one hour, and for his sleep, when he is allowed to sleep, that is, from the mid of May to the mid of Auguft, half an hour at the most, and at every breakfast one half hour :) and all the artificers and labourers between the mid of September and the mid of March shall be and continue at their work, from the spring of the day in the morning until night, except it be in the time before appointed for breakfast and dinner; on pain to forfeit 1*d.* for every hour's absence, to be deducted out of their wages.

And every artificer and labourer lawfully retained in building or repairing any church, house, ship, mill, or other piece of work taken in great, in task, or in grofs, or who shall take upon him to make or finish any such thing or work, shall continue and not depart therefrom (unless for non-payment of the wages or hire agreed on, or appointed to serve the king, or other lawful cause, or without license from the master or owner of the work, or of him that hath the charge thereof,) before the finishing thereof, on pain of imprisonment by one month, without bail, and forfeiture of 5*l.* to the party from whom he shall so depart, recoverable by action of debt in any court of record; besides such ordinary costs and damages as may be recovered by the common laws for any such offence.

We shall here observe, that the first statute, regulating the wages of labour in England, passed in the reign of Edward III. ; and in the same year (1351) the earliest law in Spain on the same subject was published by Peter the Cruel. At an earlier period, labourers were serfs, and consequently no laws were required to regulate their wages. The immediate cause of the laws passed in both countries, in the middle of the 14th century, was the plague which laid waste Europe from 1347 to 1349, and carried off a great portion of its inhabitants. The consequence of this devaluation was a scarcity of labourers, and a rise in the price of labour; which alarmed the employers of labourers both in Spain and in England, and induced them, in their legislative capacity, to enact laws, which reduced the price of labour to its former standard, and imposed heavy penalties on all who gave or accepted more. A few years probably restored Europe to its former population, and rendered these laws superfluous; but they served as examples to future times, and encouraged governments to interfere and regulate the wages of their subjects. In England, the statute of labourers was frequently renewed, with such alterations as the change of circumstances required; and, by an equitable provision, the justices of every county were empowered, by the statute 13 Richard II. c. 8. to meet once a year between Easter and Michaelmas; and after taking into consideration the price of provisions, to regulate, by proclamation, the wages that should be received in the ensuing year. But though this power was confirmed to the justices by the statute 5 Eliz. c. 4. they seem to have exercised it sparingly; and, when they acted, to have been guided by a steady bias in favour of the masters.

By the statute 11 Henry VII. c. 22. a common labourer was allowed 4*d.* a day, without diet, from Easter to Michaelmas. In the 35th of Elizabeth the justices in the East Riding of Yorkshire, determined that the wages of the common labourer, without meat or drink, should be limited to 5*d.* a day, from the 1st of March to the feast of All Saints. At the former period, a labourer who had 4*d.* a day could earn a quarter of wheat (at 6*s.* 8*d.* its price) by 20 days labour, a quarter of rye (at 4*s.*) by 12 days labour, and a quarter of barley (at 3*s.*) by 9 days labour. At the

latter period, or in the latter part of the reign of queen Elizabeth, a common labourer could not earn a quarter of wheat (at 20*s.*) by less than 48 days labour, nor a quarter of rye (at 13*s.* 4*d.*) in less than 32 days, nor a quarter of barley (at 12*s.*) in less than 28½ days. In other words, a common labourer could earn a greater quantity of wheat in 1495, than he could of barley in 1593. If, therefore, barley was his common sustenance, he could earn more than three times as much in 1495 as in 1593; if rye, 2½ as much; and if wheat, 2½. Consequently, as far as the necessities of life are concerned, the situation of the labourer was not one-half so advantageous in 1593 as it had been in 1495. In the interval, America had been discovered, the precious metals depreciated throughout Europe, and the currency of England deteriorated by the operations of the government.

A change in the value of money, similar to what happened in the 16th century, has taken place in our own times. The precious metals have been depreciated throughout Europe, in consequence of the increased productiveness of the American mines during the last 40 years; and in our own country, the rise of prices, which this necessarily produced, has been aggravated by a depreciation of our currency, occasioned by the excessive issue of paper not convertible into specie. What have been the consequences? The price of labour has not risen in proportion to the rise of commodities. But the labourer has the difference made up to him in the shape of poor's rate. An unmarried man can still support himself by his nominal wages. But a married man, who has two children to maintain, receives as a matter of course assistance from his parish. A calculation is made of his wages, and of the price of bread. So much bread is allowed to him, according to the number of his family. What his wages will not furnish, the parish provides. This beneficent system, as it has been called, turns out to be an engine in the hands of masters, to keep wages as low as will suffice for the maintenance of the labourer and his wife, with a provision in the shape of charity for the support of his children. It cannot be doubted, that if such a provision had never existed, the wages of the labourer would have been higher—that what he now receives as charity, he would then have received as his own—and that the operation of this scheme of benevolence is to increase the gains of the rich, and to deprive the poor of that share in the good things of this life, which the provisions of nature, and their own industry, might otherwise have given them. In thus keeping down the wages of labour, the poor-laws have accomplished, under the mask of charity, what the old statute of labourers had vainly attempted by the infliction of pains and penalties.

WAGES, in *Agriculture*, a term employed to signify the price or hire which is paid to servants or labourers for the performance of different kinds of farm-work. It is noticed in the Report on the Agriculture of the County of Peebles, in Scotland, that the demand for labour, as for every other marketable article, necessarily varies according to circumstances; and that the price must, of necessity, be regulated by the proportion between the existing quantity of the article and the demand. That where capital, and profitable employment for capital, abound in proportion to the population, the demand for, and consequent reward of labour, will necessarily rise to the highest rate; but that the reverse must as necessarily ensue upon the opposite supposition. That if, in the former case, it should be attempted to lower the wages of labour below what the demand can afford, the competition of employers, possessed of capital, would lead them to break through, or evade, all such regulations. If, in the latter case, it should be attempted to raise wages above

WAGES.

above what the demand can allow, the competition of labourers for employment would beat them down, avowedly or secretly, to their natural market price. And that the only effect of such nugatory regulations, must issue in the occasioning of more or less embarrassment, in the contrivance of evasions to escape the penalties of their contravention.

Indeed, in the above way alone, it is said, could the existing capital in employment be equally diffused among the labourers of a country, so as that each should receive his proper share of it, in proportion to his willingness and ability to work: if it were possible to carry into effect any regulations for raising wages to an higher rate, the infallible consequence must be, it is thought, that the distribution of the above noticed capital would be confined to a smaller number of labourers, and that the remainder could get no work or employment, and must therefore subsist on charity. But that if the charity comes exclusively from the pockets of those possessed of capital, the capital, thus shortened, is able to employ still fewer at the regulated rate: if it comes, in part, from the employed labourers, it is to them, it is said, all one whether this diminution of wages arises from their giving it in charity to the idle, or from its being taken from them through the competition of the indutrious.

The writer of the corrected account of the Agriculture of Middlesex, too, states, that the high value of the landed estates of this country depends very much upon the low price of labour: that if the farmers could have their work executed for one moiety of the present cost, other things remaining the same, it would enable them to pay a much higher rent for the land which they hold. Supposing the labour of land, it is said, to be twenty shillings an acre, in case this could be reduced to ten shillings, proprietors might then add fifty *per cent.*, it is thought, to their rentals, and that the farmers could pay such increased rent, with more convenience to themselves, than they can pay their present rents at the present price of labour. The rent of land is, it is said, about fourteen shillings an acre; if the price of labour could be lowered ten shillings, the farmer, by adding fifty *per cent.* to his rent, would pay his landlord seven shillings, it is said, and increase his own profits three shillings. That, on the other hand, if, by any means, the price of labour should be increased from twenty to twenty-four shillings *per acre*, the rent would, it is said, be absorbed in the price of the labour, in which state of things the landlord would be unable to procure any rent. The then (1807) price of labour, and rent of land, being as much as the farmer can afford to pay; increasing the labour at once, so much as to be equal to the present labour and rent, would, it is supposed, reduce the rent to nothing. It would seem to be evident, it is thought, that an addition to the then price of labour of about seventy *per cent.* would annihilate the rental of land. It is consequently asked, if the advocates for increasing the price of labour or rate of wages, are aware of the evil tendency of their arguments and opinions? have they, it is enquired, contemplated the distress which would take place, if the land should not produce any rent?

Advancing the hire of labour, without, at the same time, increasing the price of the produce of land, would create, it is supposed, a struggle of short duration between the landlords and the farmers, which would reduce the former to farmers, and the latter to labourers. The labouring class would be inordinately increased in number, and the work to be done greatly reduced in quantity. The former would be employed two or three days in a week; this would create a competition among the labourers to obtain constant work, which could only be done by working for less money than usual; the price of labour would fall greatly below what it

was at this time; the land would be imperfectly cultivated, and the agricultural part of the nation would be thrown, it is said, some hundred years back.

Every advance in the cost of agricultural labour must, it is said, be paid either by the community or the landlords. If grain and animal food are made to advance in price, in order to enable the farmers to pay additional wages to their labourers, it becomes a tax, it is said, on the community, and to which those identical labourers contribute. If the price of grain and animal food should continue stationary, and labour should increase in price, it will infallibly, it is thought, occasion an equivalent deduction in the rents of the land. It is of high importance, it is contended, to the landed interest, that the labourers in agriculture should be fed at a very low rate of expence. Any material increase of the wages of labour can only be made, without doing great injustice to the landlords, by a proportionate advance, it is said, in the prices of grain and cattle.

The writer would feel much satisfaction at measures being taken to increase the price of labour, and ameliorate the condition of the workmen of the country, if it could be accomplished without greatly injuring the nation, and particularly if it could be effected without any material interruption to the progress of science, of arts, and of commerce. But the success of agriculture, manufactures, and commerce, all depend upon the price of labour being low, even very low: in order that our arts and our commerce should be highly successful, the price of labour, it is maintained, should be low as possible.

It is further remarked, that the circumstances of the country have of late, until within this little while, made greater calls than usual on the labouring class; the consequence of which has been, what under similar causes always will be the case, an advance in the wages of labour. At the former price of corn, that would have lowered the rent of land, which would, it is said, have fallen exclusively on the landed interest; therefore, to prevent so considerable an inconvenience, the corn laws and regulations have been altered in such a manner as to allow the price to rise. The same able writer, in speaking of the bad effects of public-houses on labourers, remarks it as almost a general rule, that the higher their wages are, the less they carry home, and consequently, the greater is the wretchedness of themselves and their families. Comforts in a cottage are mostly found, it is said, where the man's wages are low, at least low as to require him to labour six days in every week. For instance, a good workman, at nine shillings *per week*, if advanced to twelve, will spend a day in the week at the ale-house, which reduces his labour to five days, or ten shillings; and as he will spend two shillings in the public-house, it leaves but eight shillings for his family, which is one less than they had when he earned only nine shillings. And that if by any means he be put into a situation of earning eighteen shillings in six days, he will get drunk, it is said, on Sunday and Monday, and go to his work in a stupid state on the Tuesday; and should he be a mechanical journeyman of some genius, who by constant labour could earn twenty-four shillings or thirty shillings *per week*, as some of them can, he will be intoxicated half the week, insolent to his employer and every one about him. Further, too, should his master have business in hand that requires particular dispatch, he will then, more than at any other time, be absent from his work, and his wife and children will experience the extreme of hunger, rags, and cold.

It has also been suggested by Mr. Ruggles in another situation, that if greater wages are given, they will be given for expences in articles widely different from the necessities of life

life — they will be given for the encouragement of idleness, and for the increase of the excise revenue. Idleness is the root of all evil, it is said — articles of excise are the moisture which nourishes that root.

The increasing number of public-houses is consequently to be greatly deplored as it operates in this way. As there the poor and thoughtless labourers are irresistibly, it is said, tempted to squander their money, in bad beer and spirits, to the manifest injury of their constitutions; whereas, it is thought, a substantial meal at home, with a little good ale, would ensure that health and vigour so essential to those who must earn their bread by the sweat of their brows. It cannot but be noticed, it is said, that the *increase* of these sorts of houses is *more* ruinous to the lowest orders of society than *all* other evils put together. The depravity of morals, and the frequent distresses of the poor labourers' families, if traced to their true source, would, it is thought, be generally found to originate in the public-house. That, on the contrary, where there is not such a house in the parish, and some such parishes there still are, though in distant situations, the wife and children of the labourer, generally speaking, it is said, enjoy happiness, compared with those where many public-houses are seen. They are also, it is thought, less disposed to deceive and pilfer; are better clothed, more cleanly in their persons, and agreeable in their manners.

In all cases, a great deal more, probably, depends upon the manner of training and bringing up the working class than is commonly supposed; as where they are taught and accustomed from infancy to depend upon themselves and their own industry, exertion, hard labour, and honesty, they will form much better and more orderly servants and labourers than where they are made to place their dependance, from such an early period, on the bounty or charity of others, as is too much the case, without having the example of such habits of honest industry, exertion, and independence before them. A better, more industrious, and suitable mode of educating and bringing up the children of the labouring poor, is indeed a matter which is much to be desired.

The wages of servants and labourers differ greatly, in different districts and situations, as the nature of them may be, and according to the goodness or indifference of the workmen they may contain, but in all they have considerably increased for the last fifteen or twenty years, except very lately. They may, perhaps, be stated, as varying under different circumstances, from eight or nine to sixteen or eighteen shillings by the week, and from eight or nine pounds to fourteen or fifteen by the year. This is nearly the case in the two great arable districts of Essex and Norfolk.

However, in addition to the stipulated wages, the labourers have often other advantages from their employers, such as corn or meal at a reduced price, pieces of potatoe grounds or gardens, cow grounds, or cows kept, small houses, and many others, which increase the real, though not the nominal wages.

A plan and form of book for regulating and keeping an account of the time and wages of all sorts of work-people employed by the day, or in other ways, have lately been prepared and printed at Liverpool, by which, it is said, the trouble of arranging and managing such accounts will not be a tenth of what it is in the usual modes of proceeding in such business. If these means should be found capable of lessening the difficulty and trouble of this sort of accounts on a full trial, they will certainly be of great utility in many departments of labour, as something of this sort has long been wanting.

WAGGAMAW, in *Geography*, a lake of North Caro-

lina; 30 miles S.W. of Exeter.—Alfo, a river of North Carolina, which runs into the Great Pedee, 15 miles S. of Kington, in South Carolina.

WAGGEL, in *Ornithology*, a name given by the people of Cornwall to a species of the *larus*, or sea-gull, known among authors by the name of *martinazzo*.

WAGGON, in *Agriculture and Rural Economy*, a kind of vehicle or carriage in common use. There are divers forms of waggons, accommodated to the divers uses they are intended for. The common waggon consists of the *shafts*, or *rads*, which are the two pieces the hind horse bears up; the *welds*; the *stets*, which are the cross pieces that hold the shafts together; the *bolster*, being that part on which the fore-wheels and axle-tree turn, in wheeling the waggon across the road; the *chess*, or body of the waggon, having the flaves or rails fixed thereon; the *bales*, or hoops, which compose the top; the *till*, the cloth thrown over the hoops; besides the *wheels*, *axle-tree*, &c.

Waggons are too frequently constructed without that proper attention to the nature of the roads, or the sorts of articles which are to be conveyed by them, which is necessary, being in general heavy, clumsy, and inconvenient conveyances. There is, however, a waggon of this kind, which is much employed in the county of Berks, that is formed and built on a more simple and convenient principle than those commonly met with in most other southern parts of the country, and which has not either the height or weight of them, while it possesses sufficient strength, and is easy in the draught. The writer of the first account of the agriculture of that district has, however, suggested an improvement to be made in it, which is that of leaving the space sufficiently deep in the body or bed for the fore-wheels to lock round in the shortest possible curve, as in the present manner of its construction, a great deal of time is necessarily lost in the turning at the ends of the swaths and plats in carrying hay or corn, as well as on some other occasions, as in this way the inconvenience may be removed without doing the smallest injury, it is said, to the symmetry or strength of the carriage or waggon.

In the corrected report on the agriculture of that district, which has been more lately drawn up, it is however noticed, that some farmers of the forest part remark on the above, that the waggon would be much weakened by the proposed alteration; and add, that an improvement has lately been made on the waggons of this county, which is found to answer the purpose of the above suggested alteration, which is the locking chain, as it is called; which is a chain from the pillar of the waggon, to about six inches before the middle bed stay, which is made of such a length, as effectually to prevent the waggon catching on the lock. Where the beds of the waggons are straight, as is common, it is said, in the southern parts of the same county, the improvement first proposed would probably, it is thought, be useful; but that in the vale and middle parts, the beds are otherwise constructed, and scarcely admit of alteration for the better.

A waggon, too, which is peculiar to Cornwall, is said to be light and elegant, being used there for carrying corn and hay in harvest time, and faggot-wood, as well as for many other purposes. The body is open, which with a lade of five bars fixed before and behind gives it great length, while an arch put over the hind wheels gives it breadth; the fore-wheels turn clear under the body, so that it can sweep round in a very narrow compass; the load is secured by two ropes tightened by a sort of wheel fixed behind the waggon; it carries about three hundred inches of corn at a time. A tongue tree, sometimes called a middle tree, or shafts, are
occa-

WAGGON.

occasionally fixed to the axle of the fore wheels, according as it is intended to be drawn by an ox or a horse-team. This light waggon is thought to be deservng of a place on almost every large farm in the kingdom.

But the writer of the rural economies of the different counties of the kingdom, who has attended much to the subject, thinks that those which are employed in the county of Gloucester are to be preferred to any others in the country; as by means of crooked side rails, bending archwise over the hind wheels, the bodies or frames of them are kept low, without the diameter of the wheels being much lessened. The bodies are likewise, it is said, made wide in proportion to their shallowness, and the wheels run six inches wider than those of most other waggons, whereby advantages in carrying top-loads are, it is said, evidently obtained. Mr. Rudge, too, in his account of the agriculture of the same district, has remarked that, in many parts of it, waggons are the principal carriages employed in getting in the hay and corn, and are either full-bedded or with three-quarter beds. That the former have the advantage of a greater length of bed, but are not so convenient for turning; and that the latter, though diminished in size, have the convenience of locking the fore wheels, and turning in almost as narrow a compass as a chaise, in consequence of the bed being hollowed out on each side near the middle, to admit the exterior part, or fel-loes of the fore wheels. Both these sorts of waggons are capable of carrying nearly, it is said, the same weight, though the former, as being deeper in the bed, is somewhat better adapted, it is thought, for the carriage of heavy articles, such as bags of corn, and other such materials. For the purpose of carrying hay and straw, or of harveiting, their length and width are, it is said, increased by light ladders before and behind, and of similar contrivances, called "rathes," the whole length of the sides. The ladders are put on and taken off at pleasure in both kinds, but the side additions are generally fixed; except in the straight-headed sort, which are in use, it is said, on the western side of the Severn, in this county; in these they are made removeable, so as to leave the bed quite naked.

Another sort of waggon, which partakes, in some measure, of the properties of both the waggon and cart, on which account it has been appropriately denominated the *hermaphrodite*, is, it is said, frequently made use of in the county of Norfolk, when the pair of fore wheels and shafts are occasionally attached to a common cart by a pole connected with the axle, to which are added the ladders. This is, it is said, a light, cheap, and convenient sort of waggon, which is capable of carrying nearly as much hay or straw as that of the Berkshire.

As it has been observed, that from its having been long a complaint among large farmers, and others, whose business requires the constant use of carts, and only the occasional use of waggons, that the waggon, however well preserved by a shed or other such building, is daily decaying and getting worse while out of use, particularly the iron work of it, which is shortly destroyed by rust; and that, in like manner too, with those whose concerns require the almost constant use of waggons, and but the occasional use of carts; the latter, while unemployed, bear a very considerable proportion to the wear and tear of carts which are in constant use: these circumstances and effects have led and induced a Mr. Rood to devise and bring to perfection, at a very considerable expence, a contrivance of this particular kind, by which the same carriage may, in a few minutes, be made by the carter into two complete tip carts of the common dimensions, and applicable to all the uses of carts in general, or into one waggon, so complete, that a narrow inspection is, it

is said, necessary to distinguish it from a common waggon. And that there is no complication of parts in this waggon, the whole being so contrived, that none of its parts are ever out of use, consequently not liable to be mislaid or lost. The carts, too, when it is formed into them, have a contrivance by which to render them more safe and easy to the horse in going down a hill, and have moveable side ladders, which will, it is said, be found of great use in carrying corn, bark, and other such materials. It is noticed, that it may be constructed by the wheelwrights of any county or district with perfect ease and facility, and that its shape and particular dimensions are capable of being suited to the wishes of the owner, or to the local fashion of the neighbourhood in which he lives. That the result of considerable experience and enquiries enables the inventor to state that it may be completed, in any county or district, for about five pounds more than the cost of two common carts. It is admitted, however, that it is somewhat more clumsy than a common waggon.

It is united and held together by four strong pins, which are to be removed when it is disunited and used in the separated state.

A representation of it may be seen in the second volume of the "General Dictionary of Agriculture and Husbandry."

In the county of Norfolk, Mr. Douton, of Brandon, according to the writer of the corrected report on the agriculture of that district, has found a considerable saving by the use of light caravan waggons for two horses abreast, with which he carries, it is said, a chaldron and half of coals, and other loads in proportion; and that, it is thought by him, every man, who reduces the teams of any county or district, will be sure to do this until he arrives at perfection in a one-horse carriage.

In most counties, however, still much too heavy carriages of the waggon kind are in use for the business of farming as well as road purposes. In Kent, the carriages of this sort employed in conveying the corn to market and other places are large, and called hitches, being drawn by four horses; and generally loaded with not more than from seven to twelve quarters of corn, according to its weight, and the distance it is to be carried. They are thirteen feet long, are made crooked at the sides, the width cannot however be positively ascertained; but they are generally three feet wide before, and four behind at the bottom; and about six or eight inches wider at the top, being twenty inches deep: they are boarded at the sides and ends close enough to carry sand. If made with wooden axle-trees, they coil, it is said, about twenty guineas: if with iron, twenty-five. Such waggons are, however, quite unfit for many farm uses.

In Staffordshire, it has been observed by Mr. Pitt, that the reduction of the weight of waggons, in most cases, but particularly to those who are common carriers, is highly beneficial, being a gain of not less than fifty pounds a year by each team constantly employed on the road; and that if it be made with good materials a light waggon will last as long as a heavy one. The cost of a narrow-wheeled waggon there is twenty-six pounds; six inch, thirty-six; the axle-tree is most commonly of wood.

The author of the "Present State of Agriculture and Husbandry in Great Britain," remarks that waggons are chiefly used in getting in the hay and corn harvests, carrying the hay and grain to market, and bringing manure and coals from a distance. That they are generally drawn by the whole team on the farm, where one only is kept, whatever number of animals it may consist of, and that two men

and a boy are mostly necessary to attend them. That in performing distant carriages, when the roads are level and substantially made, and the waggons at all times fully loaded, one of them may probably be as advantageously used as two or more carts of less dimensions. But that where the labour is required to be performed with expedition, as in the hay and corn harvests, these unwieldy machines and contrivances are without doubt ill calculated for the purpose; and that on every occasion, when they return half or a third loaded, it is evident the farmer sustains a considerable loss. Influences have occurred to the writer, it is said, in more than one open-field parish in this part of the country, where a waggon, with three or four persons and as many horses, has been dispatched to collect and carry home scattered parcels of hay from the ends of ridges, which, after going over a great extent of the parish or district, returned only partly loaded. Considering the very high rate of labour, and the shamefully extravagant manner in which, in hay or corn harvest, labourers and farm servants are maintained in this part of the kingdom, it is surprising, it is thought, that every farmer does not exert himself to devise and find out means by which he may perform his work with greater expedition, and at less expence. There are some, however, who think that this sort of carriage or conveyance, however well formed and constructed, from its necessary great weight and unwieldiness, as well as its expence, is mostly far from being advantageous to the interest of the farmer; as while it is highly destructive to the roads, it requires great power to draw it, which must be procured at much cost, without affording an adequate compensation in the increased quantity of materials which it carries.

Waggons unquestionably require much more power in the draught in proportion than carts, which is certainly a material objection against them, though they are capable of conveying a much greater load; but, besides, they are far from being so handy and convenient for many sorts of farm-work; and some too are of opinion that more business may be done in any particular space of time, with the same number of horses, by carts than by waggons, in the general run of husbandry work, especially where the distance is small between the places of loading and unloading. That where waggons are used for farm-work, they should be made wide and low, as the most suitable in different intentions. Manures may be carried in these sorts of waggons almost as well, it is supposed, as in carts. Broad wheels are improper for passing and repassing upon tillage lands; as if in fallow they press the land too much, making it so hard as to prevent its being ploughed until wet comes; but on grass-land, wheels of the broad kind are proper and suitable for all purposes. In Berkshire, Mr. Loveden is said to put narrow fore-wheels to his waggons, and broad ones behind, in order to prevent injury to tender grass-land. The hind-wheels in this way roll over the tracks made by the fore, and remove the mischief they have done. The method is thought to be excellent, and of very easy application.

On the whole, waggons are probably the most proper and suitable sort of conveyances for different kinds of heavy loads that are to be carried to a distance; but that for home uses, especially field and other work, which requires to be executed in a speedy manner, carts with proper shelvings and other conveniences are to be preferred, as more ready and economical. See CART.

In the work of reducing the weight of waggons for farm uses, as well as for road and other purposes, it should always be done with much care and attention, in order that it may be taken from such parts of them as have not great force of draught or pressure upon them, and that those parts which

are much exposed in these ways may be left sufficiently strong. In the weight and shape of the wheels some reduction and alteration may likewise take place, as may be seen in speaking of wheels. See WHEEL.

WAGGON, in the *Military Economy*, is a four-wheeled carriage, drawn by four horses, and applied to various purposes.

WAGGON, *Ammunition*, in *Military Language*, is a waggon used in carrying all kinds of stores, and also bread; for which purpose it is lined on the inside with basket-work.

WAGGON-Master-General is he who has the ordering and marching of the baggage of the army. On a day of march he meets the baggage at the place appointed in the orders, and marshals it according to the rank of the brigade or regiment each waggon belongs to, which is sometimes in one column, sometimes in two; sometimes after the artillery; and sometimes the baggage of each column follows their respective column.

WAGGON-Way, the same with RAIL-Way; which see. WAGGONER, in *Astronomy*, a kind of constellation, called also Charles's wain.

WAGGONER is also used for a routier, or book of charts, describing the seas, their coasts, &c.

WAGGONER, in farm work, the person or labourer who has the care and management of the waggon teams in driving, feeding, and other ways. It is of considerable advantage to the farmer to have good and careful waggons, in saving time, waste, and labour. A waggoner is also a term applied to the man who drives and directs waggons on the public roads. See ROAD.

WAGGONERS, *Royal*, or *Royal Waggon Train*, a corps of waggoners lately established, consisting of nine troops, each troop being 60 rank and file: but since its first establishment reduced.

WAGHUNK, in *Geography*, a town of New York; 7 miles N.W. of Kingston.

WAGING, a town of the archbishopric of Salzburg; 17 miles N.W. of Salzburg.

WAGIOL, one of the smaller Papuan islands. See *New GUINEA*.

WAGNA, a town of the duchy of Stiria, on the Salm; 17 miles S. of Gratz.

WAGNAGUR, a town of Hindoostan, in Guzerat, on the gulf of Cambay; 45 miles S.S.W. of Gogo.

WAGNER, JOACHIM, in *Biography*, a celebrated German organ-builder, who erected a large organ, in the garison church at Berlin, in 1725, which is remarkable for compass, &c. having 50 keys in the manuals, and for its number of pipes, amounting to 3220; but still more so for the ornaments and machinery of the case, which are in the old Teutonic taste, and extremely curious.

At each wing is a kettle-drum, which is beat by an angel placed behind it, whose motion the organist regulates by a pedal; at the top of the pyramid, or middle column of pipes, there are two figures, representing Fame, spreading their wings when the drums are beat, and raising them as high as the top of the pyramid; each of these figures sounds a trumpet, and then takes its flight.

There are likewise two funs, which move to the sound of cymbals, and the wind obliges them to cross the clouds; during which time two eagles take their flight, as naturally as if they were alive.

The name of Wagner occurs twelve times in Gerber's continuation of Walther's Musical Dictionary. Seven of the number have distinguished themselves in music, some way or other

other by their talents. The other five have been organ-builders and makers of keyed instruments.

WAGOE, in *Geography*, one of the Faroer islands, west of Stromoe.

WAGOLY, a town of Hindoostan, in Dowlatabad; 15 miles N.E. of Poonah.

WAGON, a small island on the west side of the gulf of Bothnia. N. lat. $63^{\circ} 12'$. E. long. $13^{\circ} 38'$.

WAGRA, a town of Austria; 6 miles S.E. of Mautern.

WAGRAN, a town of the archbishopric of Salzburg, near the Gros Arl; 6 miles W. of Radlfadt.

WAGRAM, a town of Austria; 2 miles N.E. of Voglabruck.

WAGRAM, or *Deutsch Wagram*, a town of Austria; 8 miles E. of Korn Neuburg.

WAGRIA, a district of Holstein, situated in the N.E. part, between the Baltic and the Trave.

WAGSTADT, or BILOWES, a town of Silesia, in the principality of Troppau; 24 miles W. of Teschen. N. lat. $49^{\circ} 28'$. E. long. 18° .

WAGTAIL, in *Ornithology*. See MOTACILLA.

WAGTER, NORD, in *Geography*, a small island in the gulf of Tonquin, near the coast of China. N. lat. $21^{\circ} 13'$. E. long. $100^{\circ} 30'$.

WAGTER, *Zuyd*, a small island in the Chinese sea, near the coast of Cochinchina. N. lat. $17^{\circ} 18'$. E. long. $106^{\circ} 34'$.

WAGUOIT BAY, a bay of the Atlantic, on the S. coast of Massachusetts. N. lat. $41^{\circ} 30'$. W. long. $70^{\circ} 28'$.

WAGUR, LITTLE, a district of Hindoostan, on the coast of the gulf of Cutch.

WAHABEES, WAHABIES, or *Wehhabis*, appellations that distinguish a formidable body of warlike sectaries, who sprung up in Arabia about a century ago, commenced their career as reformers of the Mahometan religion, and extended their migrations and conquests. According to Niebuhr, the founder of this sect was one Abd ul Wehhab, (Abdoulwehhab, or Ubdool Wahab), a native of Aijene (Ujuna), a town in El Ared (Ool Urud), one of the two districts of Nedsjed in Arabia. This man, in his youth, is said to have studied at home (or at Medina) those sciences which are chiefly cultivated in Arabia; he afterwards spent some time at Bosra, and made several journeys to Bagdad, and through Persia. After his return to his native place, says Niebuhr, he began to propagate his opinions among his countrymen, and succeeded in converting several independent sheicks, whose subjects became followers of this new prophet. Those sheicks, who had before been in a state of hostility against one another, were reconciled by the mediation of Abd ul Wehhab, and agreed for the future to undertake no enterprise without the advice of their apostle. In process of time, Abd ul Wehhab reduced great part of El Ared; and being afterwards joined by sheick Mecrami, of Nedsjeran, who was also the head of a particular sect, he, or rather his son Mahomet, as he succeeded his father, was enabled to reduce the Sunnite sheicks, and as they acted in concert to subdue many of their neighbours. After the death of Abd ul Wehhab, his son retained the same authority, and profecuted his father's views, of course he sustained the supreme ecclesiastical character in El Ared; and though the hereditary sheicks, which were more independent, still retain a nominal authority, yet Mahomet is in fact the sovereign of the whole, and exacts a tribute, under the name of "fikka," or aid, for the purpose of carrying on the war against the infidels. The Sunnites complain of his per-

secution; but, more probably, as Niebuhr says, this bigotted and superstitious sect hate and calumniate Mahomet for his innovations in religion. However—this be, the inhabitants of Nedsjed, who demur against embracing the new religion, are retiring to other parts of the country. Zobaner, the ancient Basra, which had decayed to a condition little better than a hamlet, has been peopled by these refugees, and is now a large town.

As to the religious doctrine taught by Abd ul Wehhab, and adopted by his followers, Niebuhr states, that he believed God to be the only object of worship and invocation, and the creator and governor of this world. He forbade the invocation of saints, and so much as the mention of Mahomet, or any other prophet, in prayer, as practices favouring of idolatry. He considered Mahomet, Jesus Christ, Moses, and many others, respected by the Sunnites, under the character of prophets, as merely great men, whose history might be perused with improvement; at the same time denying that any book had ever been written by divine inspiration, or brought down from heaven by the angel Gabriel. He also forbade, as a crime against Providence, the making of vows, in the manner of the Sunnites, with a view of obtaining deliverance from danger. This new religion of Abd ul Wehhab, according to the account given of it by the sheicks, which, however, in some respects, differs from the statement of the Sunnites, may be regarded as a reformation of Mahometanism, proposing to reduce it to its original simplicity. Experience must decide whether a religion, so stripped of every thing that might serve to strike the senses, can long maintain its ground among a people so rude and ignorant as the Arabs. Abd ul Wehhab has also thought it necessary to impose some religious observances on his followers; and has interdicted the use of tobacco, opium, and coffee; and he has enacted a variety of civil regulations, with regard to the collection and distribution of the revenues.

Of these Wahabees other travellers have more recently detailed a variety of particulars, and we shall here avail ourselves of the information concerning them, communicated in the travels of Ali Bey, whose residence in Arabia, and pilgrimage to Mecca, afforded him an opportunity of acquainting himself with the history and religious usages of this tribe of sectaries. Of their founder we have already given a brief account. He commenced his career among the wandering Bedouin Arabs of the desert; and his first profelyte of any importance is said to have been Ibn Saouud, a prince of certain tribes inhabiting the country to the east of Medina; and this prince took occasion, in the dissemination of his new doctrine, to attack and subjugate the neighbouring tribes. His successor, or, as some say, his coadjutor, was Abdel-aaziz (Ubdool Zeeze), who prosecuting his system, carried in one hand his creed of reform, and his sword in the other; and having made himself master of the interior of Arabia, extended his military excursions as far as the vicinity of Bagdad; and in the year 1801, totally destroyed by fire the town of Imam Hossien, near this capital. The men and male children were all put to the sword; while a Wehhabite doctor, from the top of a tower, excited the massacre, by calling on the soldiers to kill "all the infidels who gave companions to God." In 1802, Mecca was taken after a trifling opposition by Saouud, the son of Abdel-aaziz, who razed to the ground all the mosques and chapels consecrated to the prophet or his family. This young warrior succeeded to the command of the Wehhabis the following year, on the assassination of his father; and, in 1804, made himself master of Medina, which had before resisted his arms. The conquest of Arabia was now nearly completed; and

the sultan Saoud became a formidable neighbour to the surrounding pachas of Bagdad, Damafcus, and Egypt.

The constitution of this new sovereignty was singular in its kind. The town of Draaiya, among the deserts, 390 miles to the east of Medina, formed a fort of capital, or centre, of the governments of the Wehhabis. The various tribes of Arabs, scattered widely in tents and barracks over this vast extent of country, yielded obedience, both civil and military, to the sultan Saoud. The tenth of their flocks and fruits was paid in tribute; an order from the sultan rapidly assembled a multitude of armed men, subsisting themselves at their own expence, totally unorganized as soldiers, but deriving force from their numbers—from their active spirit as sectaries—and from the large plunder they obtained in their military expeditions. Descending frequently from their desert recesses upon the coast of the Red sea, they arrested the caravans, and levied contributions upon the pilgrims journeying to Mecca and Medina. In the year 1807, when Ali Bey visited Mecca, the Wehhabis were in their greatest power. Their army, which he saw encamped in the vicinity of the sacred mount of Arafat, he estimates at 45,000 men,—a large proportion of the number mounted on camels and dromedaries, and with a train of a thousand camels attached to the different chiefs of the army. He describes with some spirit the appearance of another body of Wehhabis, whom he saw entering Mecca, to take possession of the city, and fulfil the duties of their own pilgrimage:—a multitude of copper-coloured men, who rushed impetuously into the place, their only covering a narrow girdle round their waist, to which was hung a *khanjear*, or large knife, each one carrying besides a firelock on his shoulder. Their devotions were of the most tumultuous kind; the lamps surrounding the sacred kaaba were broken by their guns; and the ropes and buckets of the well of Zemzem destroyed in their eagerness to reach the holy water. All the other pilgrims quitted their more decorous ceremonies, till the Wehhabis, having fatished their zeal, and paid their alms to the well in gunpowder and coffee, betook themselves to the streets, where, in conformity with the law of Abd ul Wehhab, their heads were all closely shaved by the barbers of Mecca. The sultan Saoud, whom Ali Bey saw at Arafat, was almost as naked as his subjects, distinguished chiefly by the green standard carried before him, with the characters, "*La illabâ illa Allah*,"—"there is no other God but God," embroidered upon it.

With respect to their religious tenets, the Wehhabis may be described, generally, as the Socinians of the Mohammedan church. Abd ul Wehhab, while acknowledging fully the authority of the koran, professed obedience only to the literal text of this book; rejecting all the additions of the imams and doctors of law, and condemning various superstitions which had sullied the purity of the faith. He forbade all devotion to the person of the prophet, and pilgrimage to his tomb at Medina; regarding him simply as a man charged with a divine mission; which being completed, he became again an ordinary mortal. The story of Mahomet's ascent to Paradise on El Borak, the horse of the angel Gabriel, he wholly denied; together with a host of other miraculous events, with which history has celebrated the life of the prophet. The Wehhabis simply say "Mohammed," instead of "Our Lord Mohammed," according to the usage of other Mussulmen. They have equally rejected the indirect worship of certain saints, who had been gradually insinuated into the Mussulman calendar, destroying the chapels and tombs which had been consecrated to them. The grand doctrine of the sect, and what they regard as the basis of true Islamism, is the unity of God. This forms their cry

when they go to war, and justifies to themselves the violences they commit upon the corrupters of the faith. The Mussulmen who deviate from this simple principle of belief they call Mouschrikims, or schismatics; making a distinction between this term and that of Coslar, or idolaters.

As it was the general custom of Mussulmen to shave the head, with the exception of one tuft of hair, the law of the Wehhabis forbade the tuft, and enjoined the shaving of the whole head. Their founder also prohibited not only the use of tobacco, but that of silk and the precious metals. Their religious services are performed underneath the open sky, and not below the roofing of a mosque. Notwithstanding these changes, however, and the general spirit of their doctrine, they still retain certain superstitions, common to other Mussulmen. While forbidden to make some pilgrimages, others are permitted to them. They kiss the stone of the Kaaba, drink of the water of Zemzem, and throw stones against the pillar said to have been built by the devil at Mina.

The pacha of Egypt, with a view of employing his troops, amounting, at this time, to 15,000 men, and in order to gain favour with the Porte, and reputation among true Mussulmen, determined to liberate the holy city and shrine from the power of these heretics, and declared war against them. In the vigorous prosecution of it, his army was transported to the Arabian coasts; and the men and horses composing it, were supplied with provisions, carried up the Nile as far as Kennel, thence transported across the desert on camels to Cofferin, and shipped for Janbo, or some other port on the eastern coast of the Red sea. Several armed vessels also were built at Alexandria, taken to pieces, and conveyed on the backs of camels to Suez, where they found a small fleet, which greatly aided his military operations on the Arabian coast. The pacha, it is said, received some arms from the English; but permission was refused, as we are told by Mr. Legh, to his request that his vessels might go round the Cape of Good Hope, to enter into the Red sea. The Wehhabis, on the other hand, are reported to have received assistance from the French government, conveyed through the Ile of France, and with the policy of creating a French interest in Arabia, which might be subservient to their pretensions in the East.

The campaign of the pacha of Egypt against the Wehhabis, in 1812, had been unsuccessful; and his army suffered very greatly in an engagement at Jedda, the port of Mecca on the adjoining coast. He redoubled, however, his exertions; organized new troops; and, early in the spring of 1813, brought the war to a triumphant termination. The Wehhabis were driven with loss from the coast; Mecca, Medina, and Jedda, were all retaken, and restored again to the authority of the Porte, and to the worship of the true believers. Mohammed Ali sent his youngest son, Ismael-Pacha, to Constantinople, to lay the keys of Mecca at the feet of the grand signior. The acquisition was rendered of the utmost importance, by the peculiar feeling of all Mussulmen towards the actual possessor of the holy city.

The progress of this sect, says Mr. Kinneir, appears to be now at a stand; few proselytes have been made for a number of years past; and the most paltry fortifications have been found sufficient to arrest the career of their conquests.

It does not appear certain, however, that this success is complete, or that its consequences will be permanent. The Wehhabis retired from the coast to their desert recesses in the interior of Arabia; where their losses may easily be repaired, if the spirit of the sect is maintained in its former vigour.

vigour. We have very recently heard, from what we believe to be good authority, that they are again becoming more active; and, though the military talents of the pacha of Egypt may refrain them at the present moment, we shall not be at all surpris'd, amidst the many revolutions of the East, if they should re-establish their power in Arabia; and concur, with other causes, to overthrow the tottering fabric of Turkish empire in this part of the world. Kinneir's *Geog. Mem. of Persia*. Edinb. Rev. No. liv.

WAHAL, a river which branches off from the Rhine at Schencken Schans, joins the Meuse first at the small island of Voorn, separates from that river, and washes the north side of the island of Bommelwaert, and joins the Meuse again at Worcum, when both rivers form one stream, sometimes called Merwe, and sometimes Meuse. See SAHALIS.

WAHE. See WA.

WAHLBO, a town of Sweden, in Gestricia; 4 miles S.W. of Gefe.

WAHLBOMIA, in *Botany*, named by Thunberg, in honour of his countryman, Dr. John Gustavus Wahlbom, of whom he speaks as an ardent botanist, and celebrated physician.—Thunb. *Act. Holm.* for 1790. 215. t. 9. Willd. *Sp. Pl.* v. 2. 1244. Lamarck *Illustr.* t. 485. Poirat in *Lam. Dict.* v. 8. 782.—Clas and order, *Polyandria Tetragynia*. Nat. Ord. *Scitocoz*, Linn. *Rafaece*, Juss. *Dilleniaceae*, De Candolle.

Eff. Ch. Calyx of four leaves. Petals four. Fruit oblong. Styles permanent. *Willdenow*.

1. *W. indica*. Thunb. as above. Willd. n. 1.—The only species, found by Thunberg in the island of Java, near Batavia, flowering in January. A *frub*, with round alternate *branches*, covered with hoary pubescence. *Leaves* alternate, stalked, elliptic-lanceolate, acute, serrated, three or four inches long; entire at the base; paler, but scarcely downy, beneath. *Flowers* somewhat umbellate, or cymose, near the ends of the branches, on downy stalks. *Calyx* externally downy. *Petals* yellowish, deciduous. *Stamens* brown, with yellow *anthers*. *Pericarps* four, beaked with the permanent *styles*.

We have mentioned already that Willdenow was inclined to sink this genus in TETRACERA; see the end of that article. Professor De Candolle has actually done so, in his *Syst. Nat.* v. 1. 403, where the plant in question stands under the following name and character.

T. Wahlbomia. "Leaves elliptical, pointed; serrated towards the end; downy beneath, like the footstalks; furnished with stipulas at the base? Panicle of four or five flowers. Segments of the calyx four, externally downy."—The author doubts whether this plant be even specifically distinct from his *T. Affa*, described in the same place, the *Affa indica* of Houttuyn, of which we have already spoken likewise at the conclusion of TETRACERA.

WAHLIS, in *Geography*, a town of Germany, in the county of Henneberg; 5 miles N.W. of Smalkalden.

WAHLSTADT, i. e. *The Field of Battle*, a town of Silesia, in the principality of Lignitz; near which, in the year 1241, a most bloody battle was fought between duke Henry II. and the Tartars, wherein the latter were victorious, and the duke slain. In memory of this event the place was built; and the narrative of this engagement is annually read to the people from the pulpit, in the Lutheran church; 5 miles S.E. of Lignitz. °

WAHLWINKEL, a town of Saxony, in the principality of Gotha; 4 miles S.W. of Gotha.

WAHOE, one of the Sandwich islands, 37 leagues to the N. of Morotai, and about 30 from Owhyhee, nearly 40 miles long, from N.W. to S.E., and about half that extent in breadth. It is the most important island in the group, on account of its superior fertility, and because it possesses the only secure harbour in these islands. The capital of the island is Hanarooro, the residence of the king. Pearls and mother-of-pearl shells are found here in great abundance.

WAHR, a river of Germany, which rises near Frankena, in the principality of Hesse, and runs into the Lahn near Kirchhayn.

WAHREN, or WAAREN, a town of the duchy of Mecklenburg, situated near the lake of Calpin; 22 miles S.E. of Gultrow. N. lat. 53° 30'. E. long. 12° 39'.

WAHREN See, a lake of the Ucker Mark of Brandenburg; 11 miles W.N.W. of Prenzlau.

WAHRENBRUCK, a town of Saxony; 2 miles N.N.W. of Liebenwerda.

WAHRIEN, a town of Mecklenburg, in the principality of Schwerin; 14 miles N.E. of Schwerin. N. lat. 53° 50'. E. long. 11° 38'.

WAHTO, a town of Sweden, in the government of Abo; 10 miles N. of Abo.

WAIBLINGEN, a town of Wurtemberg. This town was almost destroyed in the thirty years' war; 7 miles E.N.E. of Stuttgart. N. lat. 48° 50'. E. long. 9° 25'.

WAICHMAR. See WECHMAR.

WAIDENHOLZ, a town of Austria; 5 miles W.N.W. of Efferding.

WAIDERSFELDEN, a town of Austria; 12 miles E. of Freystatt.

WAIDGUNGE, a town of Hindoostan, in Oude; 30 miles E. of Allahabad.

WAIDHAUSEN, a town of Bavaria; 16 miles N.N.E. of Nabburg.

WAIDHOVEN, or *Bavarian Waidhoven*, a town of Austria, on the river Ips; 26 miles S.S.W. of Ips. N. lat. 47° 54'. E. long. 14° 43'.

WAIDHOVEN, or *Böhmisch Waidhoven*, a town of Austria, on the river Taya; 40 miles W. of Laab. N. lat. 48° 48'. E. long. 15°.

WAIDPOUR, a town of Bengal; 25 miles N.N.W. of Islamabad.

WAIF, or WAFF, a term primarily applied to stolen goods, which a thief, being either pursued, or overburdened, flies, and waives or throws away in his flight.

The king's officer, or the bailiff of the lord within whose jurisdiction such waifs or waif goods were left (having by grant, or prescription, the franchise of waif), may seize the goods to his lord's use; except the owner come with fresh suit after the felon, and sue an appeal of robbery within a year and a day, or give in evidence against him, and he be attained. In which cases, the owner shall have his goods again.

Waived goods do also not belong to the king, till seized by somebody for his use; for if the party robbed can seize them first, though at the distance of twenty years, the king shall never have them. If the goods are hid by the thief, or left any where by him, so that he had them not about him when he fled, and therefore did not throw them away in his flight; these also are not *bona waivata*, but the owner may have them again when he

pleases. The goods of a foreign merchant, though stolen and thrown away in flight, shall never be waifs.

Waifs, things lost, and estrays, are said to be *pecus vagrans*, and are *nullius in bonis ubi non apparet dominus*. And therefore they belong to the lord of the franchise where they are found; who must cause them to be cried, and published in the markets and churches near about: else the year and day do not run to the prejudice of him that lost them. See ESTRAY.

Though waif be properly spoken of things stolen, yet it may also be understood of goods not stolen. As, if a man be pursued with huc and cry, as a felon, and he flies, and leaves his own goods, these shall be forfeited as goods stolen; and they are properly called *fugitive goods*.

WAJIDA, in *Geography*, a town of Algiers; 25 miles S.W. of Tremecen.

WAIJOO, or WADJOO, one of the most considerable of the Papuan islands, situated at the N.W. extremity of Papua, or *New GUINEA*; which see. This island is said to contain 100,000 inhabitants. The land is high, with lofty mountains, and on the N. side are two excellent harbours, Papis and Ofsak. This island is called by the natives Ouairido; it is covered with very large trees, and abounds with mountains of a considerable height, even at a small distance from the shore. Cottages of bamboo wood are seen, elevated on stakes about 12 feet above the ground; and covered with leaves of the macaw tree. The natives are wholly naked, except the parts generally concealed, which are covered with a coarse cloth. Their chiefs are dressed in very large pantaloons, and waistcoats of cloth, which they buy of the Chinese, whose language they speak, and like them they wear conical hats made of the leaves of a tree. They have thick and long curly hair; their skin is not very dark, and some of them let their whiskers grow. They subsist upon hogs, tortoises, fowls, Siam oranges, cocoa, papays, pompions, rice, sugar-canes, potatoes, lemons, allspice, and ears of maize, which they boil when green. Labillardiere found in this island the beautiful promerops of *New Guinea*, of Buffon, the large cockatoo, quite black (*pittacus aterrimus*), and a new species of hydrocorax. The wild cock and ground-pheasant of the Indies are very common in the woods.

WAIL, a town of France, in the department of the straits of Calais; 5 miles S.E. of Hesdin.

WAIN, in *Agriculture*, a term sometimes applied to an ox or horse-cart of a particular form, and which, in some districts and places, is without any side-rails, or ladders; but which in others has shelveings added to it, the body being large and open. The Cornish wain, the writer of the account of the agriculture of that county represents as a light useful carriage for conveying corn and hay: it consists of a light open long body, borne upon two wheels; a railed arch put over the wheels prevents the load bearing upon them: it will carry from two hundred to two hundred and fifty sheaves of corn, they being secured by ropes, as in the waggon. Mr. J. Dayman, of that district, considers it also as an admirable contrivance for clearing hay or corn-fields; and that when well constructed, it is thought the best invention for that purpose yet contrived. That it is likewise cheap, as the shafts and wheels of a common cart may be used with it, and, of course, the only additional expense is the body. Besides the railed wings, which prevent the load from choking the wheels, it has a roller behind, with a hole in it, in which is fastened the rope which crosses the load, and which, after taking a turn round a crook put for the purpose, returns again to the back of the carriage,

and then forward to the other side, where it is fastened; the whole is then drawn tight by the roller, which is wrought by two iron handles, in the manner of a smith's vice. These wains are made either with tongue-trees, or shafts, as they may be designed for oxen or horses.

In the county of Gloucester, too, they adapt their wains to harvest-work, it is said, by fixing ladders and rathes on them. In the lower part of the vale of that district, they are called, it is asserted, dung-pots; but in the forest part, where drawn by oxen, wains.

They are a sort of carriage which is not very commonly met with at present in many farming districts. See CART.

WAIN, in *Astronomy*. See CHARLES'S *Wain*.

WAIN-HOUSE, in *Rural Economy*, a term made use of in some districts to signify a waggon and cart house, or lodge.

WAINFLEET, or WAYNFLETE, in *Geography*, a market-town in the wapentake of Candleshoe, in Lindsey division of the county of Lincoln, England, is situated in a marsh, on a small creek through which the river Limb flows into Boston deeps, at the distance of 17 miles N.E. from Boston, and 132 miles N. by E. from London. Dr. Stukeley affirms it to be the *Vainona* of Ravennas; whence he supposes the name to be evidently derived. He observes that Salter's Road, which crosses the fen, was probably the Roman road between *Banowallum* and *Lindum*. Leland describes Wainfleet as "a praty market standing on a creke neare to the fe." To this town long small vessels. It hath bene a very godde toune, and yn it 2 paroch churches. The schole, that Wainflete bishop of Winchester made and endowid with xli. lande, is the most notable thing. Shippeletes cam in hominum memoria up to the schole. The haven now decayith." The neglect of the haven was in consequence of the waters of the fens being diverted more southerly towards Boston, by which that place became the port town: Wainfleet haven, however, affords security to vessels driven on the coast in tempestuous weather. It is probable that the town, previous to the decay of the harbour, stood higher up the creek, for the church of All Saints stands at a place called High Wainfleet. This church is a respectable edifice, but apparently not older than the time of bishop Waynflete: it has a brick tower of modern date, and is rapidly decaying. In the fourth aisle is an alabaster monument, which was erected by the pious bishop to the memory of his father. St. Mary's church, in Low Wainfleet, has nothing worthy of note. The school-house, founded in 1459, is yet standing, and has a handsome window, also two octagonal turrets. Four annual fairs are held, and a small weekly market on Saturdays. In the return to the population act of the year 1811, the number of houses in Wainfleet is stated to be 229, inhabited by 1165 persons. This town is memorable as the birth-place of that celebrated prelate above-named, who was lord chancellor, and founder of Magdalen college, Oxford. He died August 11, 1486.—*Beauties of England and Wales*, vol. ix., Lincolnshire: by J. Britton, F.S.A. See *Chandler's Life*, &c. of Waynflete.

WAINSCOT, in *Building*, the timber-work serving to line the walls of a room; being usually made in panels, and painted, to serve in lieu of hangings.

Even in halls, it is common to have wainscot breast-high, by reason of the natural humidity of walls.

It was formerly the custom to wainscot rooms up to the ceiling, and to terminate it by a cornice; but it is now commonly raised only chair high, or from two to three feet; the rest of the wall is either covered with paper,

which

which is often pasted on thin cloth, and fixed in frames, to prevent its being spoiled by the dampness of the wall, or else it is finished with stucco. Walls should be thoroughly dry before they are waincotted, and the stuff of which the waincot is made should be dry and well seasoned.

Some joiners put charcoal behind the panels of the waincot, to prevent the sweat of stone and brick-walls from ungluing the joints of the panels. Others use wool for the same purpose. But neither the one nor the other is sufficient for some houses; the only sure way, is by priming over the backfides of the joints with white lead, or Spanish brown and linseed oil.

Waincotting is measured by the square yard of nine feet; and in taking dimensions, they use a string, which they press into all the mouldings; it being a rule, that they are to be paid for all where the plane goes.

The cornice is measured and paid by the foot in length.

WAIORA, in *Geography*, a town of Africa, in Kaarta. N. lat. 14° 48'. W. long. 6° 10'.

WAISCHOWIZ, a town of Moravia, in the circle of Olmutz; 3 miles S.E. of Profnitz.

WAIST, in *Ship-building*, a name given to that part of the topside of a ship, above the upper-deck, between the main and fore drifts: or it is that part which is contained between the quarter-deck and fore-castle, being usually a hollow space, with an ascent of several steps to either of those places. When the waist of a merchant-ship has only one or two steps of descent from the quarter-deck and fore-castle, she is said to be galley-built; but when it is considerably deeper, as with six or seven steps, she is called frigate-built. Falconer.

WAIT'S RIVER, in *Geography*, a river of Vermont, which runs into the Connecticut, N. lat. 43° 58'. W. long. 72° 5'.

WAITS, in *Musick*, attendant musicians on great personages, mayors, and bodies corporate, generally furnished with superb dresses, or splendid cloaks. We have an account in Rymer's *Fœdera*, (tom. ix. "De Ministris propter Solutum Regis providendis,") and in the "Liber niger Domus Regis," of the establishment of the minstrels and waits, in the service of the court during the reign of Edward IV. The account of the allowances to the waits at this early period is curious.

"A wayte, that nightelye from Mychelmas to Shreve Thorfdaye pipethe the watche withen this courte fower tymes; in the somere nyghtes iij tymes, and makethe bon gayte at every chambere-doare and offyce, as well for feare of pyckeres and pillers. He eateth in the halle with mynstrielles, and takethe lyverey at nighte a galone of ale, and for somere nightes ij candles pich, a bushel of coles; and for wintere nightes half aloafe of breid, a galone of ale, iij candles piche, a bushel of coles; daylye whilste he is presente in courte for his wages in cheque roale allowed iij d. ob. or else iij d. by the discreffion of the stewart and treforer, and that, after his cominge and discharging; also cloathing with the houshold yeomen or mynstrielles lyke to the wages that he takethe; and he by syke he taketh twoe loves, ij messe of great meate, one gallon of ale. Also he partethe with the housholde of general gyfts, and hathe his beddinge carried by the controllours assygnment; and under this yeoman to be a groome water. Yf he can excuse the yeoman in his absence, then he takethe rewarde, clotheinge, meat, and all other things lyke to other grooms of houshold. Also this yeoman-waigte, at the makinge of knightes of the bathe, for his attendance upon them by nighte-tyme, in

watchinge in the chappelle, hathe to his fee all the watchinge-clothing that the knight shall wear upon him."

WAITSFIELD, in *Geography*, a town of America, in the state of Vermont, and county of Chittenden; containing 647 inhabitants.

WAITZEN, or VAITZ, a town of Hungary, situated on the Danube; the see of a bishop, founded in the year 1074. This town chiefly owes its prosperity to a large annual fair, and a good market for cattle. The number of inhabitants is about 8000; 72 miles E.S.E. of Presburg. N. lat. 47° 20'. E. long. 18° 38'.

WAITZENKIRCH, a town of Austria; 4 miles W.N.W. of Efferding.

WAIVE, in *Law*, a woman that is put out of the protection of the law.

She is called *waive*, as being forsaken of the law; and not *outlaw*, as a man is; by reason women cannot be of the decenna, and are not sworn in leets to the king, nor to the law, as men are; who are therefore within the law; whereas women are not, and so cannot be outlawed, since they never were within it.

In this sense we meet with *convivaria mulieris*, as of the same import with *ulagatio viri*.

WAIWODE, or WAYWODE, the appellation that distinguishes, in the Ottoman empire, the governor of a small province, or of a town, which not forming part of a pachalik, is sometimes the appendage of a sultana, of the grand vizir, of the captain-pacha, or of any other great officer of the empire. He enjoys all the prerogatives of a pacha with two tails, but occupies an inferior rank. When he is required to march at the head of the armed force of his department, he joins his colours to those of the pacha with three tails. Both the one and the other are charged with carrying into execution, in their provinces, the sentences pronounced by the judges.

In the islands of the Archipelago, the Mussulmen or Greeks simply charged by the Porte with the gathering of the tax, and with the police of the place, are likewise distinguished by the name of waiwode.

The palatines, or governors of provinces in Poland, also bear the quality of *waywodes*, or *waiwodes*. See PALATINE.

The Poles likewise call the princes of Walachia and Moldavia *waywodes*; as esteeming them no other than on the foot of governors; pretending that Walachia and Moldavia are provinces of Poland, which have withdrawn themselves from the obedience of the republic. Every where else these are called *hospodars*.

Du Cange says, that the name *waywode* is used in Dalmatia, Croatia, and Hungary, for a general of an army; and Leunclavius, in his *Pandects of Turkey*, tells us, it usually signifies *captain or commander*.

WAKARI, in *Geography*, a small island on the east side of the gulf of Bothnia. N. lat. 60° 51'. E. long. 20° 47'.

WAKAYGAGH, or FORT, a river of America, which runs into lake Michigan. N. lat. 42° 58'. W. long. 87° 0'.

WAKE, WILLIAM, in *Biography*, a famous English prelate, was born at Blandford, in the county of Dorset, in 1657, and admitted at Christchurch college, at Oxford, in 1672, where he took his degrees in arts, and entered into holy orders. He afterwards accompanied his fellow-collegian, lord viscount Preston, to France, as his chaplain, and returning from thence to England after the accession of James II. was elected preacher to the society of Gray's Inn. In 1686 he published "An Exposition of the Doctrine of the Church

of England," upon the plan of Bossuet's "Exposition of the Doctrine of the Catholic Church;" and he also published two defences of his treatise against the replies of Bossuet and his coadjutor. In the popish controversy, which at that time occupied the public attention, he wrote other pieces, and closed the dispute with his "State of the Controversy." In 1685, having abandoned his patron lord Prenton, who was attached to king James, he arrived in 1688, took a degree of D.D. at Oxford, became canon of Christchurch, and in 1689, deputy-clerk of the closet to king William and queen Mary. In 1693 he published "An English Version of the genuine Epistles of the Apostolical Fathers, with a preliminary Discourse concerning the right Use of the Fathers." In this work, of which an enlarged edition was published in 1710, he ascribes an "authority to the fathers in matters of doctrine next to infallible." In 1694 he was presented to the rectory of St. James's; and in 1697 he published his "Defence of the Power of Christian Princes over their Ecclesiastical Synods, with particular respect to the Convocations of the Clergy and Church of England." By this and some subsequent publications of a similar kind, such as his "Vindication of the King's Supremacy against both popish and fanatical Opposers of it," and "The State of the Church and Clergy of England," 1703, fol. he recommended himself to the crown; so that in 1702 he obtained the deanery of Exeter, and in 1705 the bishopric of Lincoln. During the prevalence of whig principles, which were then fashionable, the bishop recommended a comprehension with the Dissenters, and zealously concurred in the censure and punishment of Dr. Sacheverel. He maintained his moderation in the reign of queen Anne, and opposed the intolerant measure of the schism-bill. Soon after the accession of George I. he was advanced, January 1715-16, to the see of Canterbury. This elevation gave a new turn to his sentiments and temper, so that in 1718 he opposed the repeal of the schism and conformity bill, and also of the test and corporation acts, alleging that "the Dissenters were never to be gained by indulgence;" and expressing much displeasure against Hoadly's celebrated sermon, "Christ's Kingdom not of this World;" and concurring in a bill for imposing a new test against the opinions of the Arians. These measures, which did no credit to the consistency of his character, were justified under a pretence of zeal for the church. By his earnest endeavours to effect an union between the English and Gallican churches, on the condition that each should retain the greatest part of its peculiar doctrines, he incurred a considerable degree of censure, particularly on the part of the author of the "Confessional;" but his character and intentions were vindicated by Dr. Maclaine, in an appendix to his Translation of Mosheim's Ecclesiastical History, to which, as well as to the Biographia Britannica, we refer for a statement of this business. After all, his discretion and sagacity as to the object and conduct of this transaction did not escape just animadversion. Such, however, was his conciliatory disposition, and his disposition to promote concord and union, that he acknowledged the foreign Protestant churches to be true members of the Christian community, and recommended forbearance and toleration with regard to theological doctrines. It is, however, a matter of regret, that his treatment of separatists at home did not manifest, to the degree that might have been wished, a similar spirit of toleration. His conduct towards father Courayer, an eminently liberal Catholic, redounded greatly to his honour. In the latter period of his life, his increasing infirmities rendered it necessary for him to transfer the exercise of his ecclesiastical duties to Dr. Gibson, bishop of London; and at length he closed his life and labours, January 1736-7, in

his 80th year, leaving six daughters, who were all married, and bequeathing his library, MSS., and coins, to the college in which he was educated. Four editions of a treatise, intitled "A Preparation for Death," &c. and three volumes of his Sermons, Charges, &c. were published.—Biog. Brit. Mosh. E. H. Appendix, N^o iv. vol. vi. ed. 8vo. 1811.

WAKE, in *Geography*, a county of North Carolina, containing 17,086 inhabitants, including 5878 slaves.

WAKE of a *Ship* denotes the print or track impressed by the course of a ship on the surface of the water. It is formed by the reunion of the body of water, which was separated by the ship's bottom whilst moving through it, and may be seen to a considerable distance behind the item, as smoother than the rest of the sea. Hence it is usually observed by the compass, to discover the angle of lee-way.

By this, a guess also may be made of the speed she makes.

When, in a ship's staying, she is so quick, that she does not fall to leeward, upon a tack, but that, when tacked, her wake is to the leeward, they say, *she stays to the weather of her wake*; which is a sign she feels her helm well, and is nimble of steering.

Also, when one ship, pursuing another, is got as far into the wind as she, and sails directly after her, on the same tack, or on a line supposed to be formed on the continuation of her keel, they say, *she is got into her wake*.

Two distinct objects observed at sea are said to be in the wake of each other, when the view of the farthest is intercepted by the nearest; so that the observer's eye, and the two objects, are all placed upon the same right line.

WAKE-Robin, or CUCKOO-Pint, in *Botany*. See ARUM. The root of arum, dried and powdered, is used by the French for washing their skin, and is sold at a high price under the name of Cyprus powder; it is both a good and an innocent cosmetic.

Thee roots are said to possess a saponaceous quality, and have been used in washing linen instead of soap. In their dry state, when they have been deprived of their acrimony, they have been made into bread, and also prepared as starch.

The leaves and flowers of *arifarum aqualis*, broad-leaved friar's cowl, are detergent and vulnerary; and applied either in the form of ointment or decoction to malignant ulcers. Its root taken in powder is esteemed against the plague, the dose being from a scruple to a drachm. Of the root also are made collyria, which are used in curing fistulas of the eyes. Vide Lemery, des Drog. in voc.

WAKEFIELD, GILBERT, in *Biography*, an eminent classical scholar, was the son of the Rev. George Wakefield, rector of St. Nicholas, Nottingham, and born in that town in the year 1756. After a previous grammatical education, he was admitted, in 1772, into Jesus college, in the university of Cambridge. Here he pursued his studies with an assiduity which established his reputation; and having taken his degree of B.A. in 1776, he was soon afterwards elected a fellow of his college. At this early period, he published a small collection of Latin poems, and a few critical notes on Homer. Having directed his particular attention to theological inquiries, he began betimes to entertain doubts concerning the articles of the church, and though he took deacon's orders in 1778, he reproached himself for complying with the previous forms. He commenced his ministerial labours as a curate at Stockport, and thence he removed to Liverpool, discharging the duties of his office with a suitable sense of their importance. Dissatisfied, however, with the doctrines and liturgy of the church, he determined to surrender his connection with it; and having married in 1779, he accepted

an invitation to be classical tutor at the dissenting academy of Warrington, without avowing himself as a Dissenter.

Having in 1781 published his plan of a new version of the New Testament, with a specimen of the proposed work, he presented to the public, in 1782, "A New Translation of the Gospel of St. Matthew, with Notes critical, philological, and explanatory," &c., which was well received. Upon the dissolution of the academy at Warrington, he removed to Bramcote in Nottinghamshire, where he received private pupils; and here he published in 1784 the first volume of an "Enquiry into the Opinions of the Christian Writers of the first Three Centuries concerning the Person of Jesus Christ," 8vo., which was received in a manner that discouraged him from pursuing his plan. Being disabled by the attack of a disorder in one arm to undertake any literary performance that required any considerable exertion, he intermitted his constant occupations; till at length in 1789 he commenced his "Silva Critica, five in Auctores sacros prophanosque Commentarius Philologicus;" of which three parts appeared successively to the year 1795, the three first being issued from the Cambridge press. Mr. Wakefield, in 1790, removed from Nottingham to Hackney, in order to assume the office of classical tutor in the dissenting college of that place, where his services were highly acceptable, till the publication of his "Enquiry into the Expediency and Propriety of public or social Worship," in 1791; which being intended to justify the disuse of the public exercises of devotion, occasioned a termination of his connection with that institution. From this time he employed himself in attention to the instruction of his own family, and to several literary works; the principal of which were his "Translation of the New Testament, with Notes critical and explanatory," 3 vols. 8vo. 1792, of which a second edition appeared in 1795, 2 vols. 8vo.; and "Memoirs of his own Life," published in the same year. His other productions were "Evidences of Christianity," and "Replies to the Two Parts of Thomas Paine's Age of Reason;" a volume of Pope's Works, a volume of "Notes on Pope," and an edition of his version of the Iliad and Odyssey of Homer. His "Silva Critica" was also enlarged to the 5th volume; and he presented to the public editions of select "Greek Tragedies," of "Homer," "Bion and Moschus," "Virgil," and "Lucretius," in 3 vols. 4to., a work highly esteemed.

Avowing himself an enemy to war in general, and to the war against France in particular, he published a pamphlet in 1798, entitled "A Reply to some Parts of the Bishop of Landaff's Address to the People of Great Britain," which subjected him to a prosecution: this terminated in a trial and conviction in February 1799. His sentence was imprisonment for two years in the county gaol of Dorchester. Many concurring circumstances contributed to render this punishment singularly grievous to him; but it was in a considerable degree alleviated by the sympathy and respect of his friends, and by a liberal subscription towards the support of himself and his family. His course of study was thus unfortunately interrupted, so that he could only prepare for the press "Select Essays of Dio Chrysostom, translated into English from the Greek, with Notes," 1800, 8vo., and "Notæ Carcerariæ, five de Legibus Metricis Poetarum Græcorum, qui Veribus Hexametris scripserunt, Disputatio," 1801, 12mo.; and make collections for his proposed Lexicon, Greek and English. In May 1801 he was liberated from his confinement; but on September the 9th of the same year, a typhus fever terminated his life, in his 46th year, to the grief of his family and the regret of numerous friends, by whom he was highly esteemed.

The assiduity of his literary application, and the singular

temperance of his habits, though they occasioned a seclusion from much of that social intercourse which was interesting to his family, and a degree of reserve in his own temper, enabled him, however, to acquire great reputation as a philosophical writer and critic during comparatively a short life. Under this character, he resembled Bentley and Markland, being, like them, in his conjectural criticism, "always learned, sometimes bold, and frequently happy." Possessing a very retentive memory, his extensive reading furnished him with an ample store of passages for illustration or parallel, of which he could avail himself as occasions occurred. With regard to his moral disposition and character, they were marked, as a biographer who knew him well has delineated them, "by an openness, a simplicity, a good faith, an affectionate ardour, a noble elevation of mind, which made way to the hearts of all who nearly approached him, and rendered him the object of their warmest attachment." The second edition of his "Memoirs," published after his death, contains a catalogue of all his works, several of which have been omitted in this concise account of his life and labours. A collection of letters between him and Mr. Fox, by whom he was highly esteemed, chiefly on subjects of Greek literature, has also been published. *Memoirs. Gen. Biog.*

WAKEFIELD, in *Geography*, a large market-town in the lower division of the hundred of Agbrigg, in the West Riding of the county of York, is situated on the side of an eminence, gently sloping southward to the river Calder, at the distance of 9 miles S. from Leeds, 32 miles S.W. by S. from York, and 182 miles N.N.W. from London. It consists of nine streets, of which three are very large and commodious; and many of the houses are spacious and lofty. The market-place is small, but has been recently rendered much more convenient by the removal of the corn-market into West-gate, an adjacent street of great extent. Here is a neat building called the Market-cross, formed of an open colonnade of the Doric order, supporting a dome, with an ascent of a circular flight of stairs leading to a large room, which receives its light from a lantern at the top; in this chamber most of the business of the town is transacted. The market is held on Fridays, which is well attended, particularly for the sale of wool, which is sent from various parts of England to the factors in Wakefield, who dispose of it among the manufacturers in the adjacent districts. Here are two annual fairs, each of which continues two days, for horses, horned cattle, pedlary ware, &c. A fair is also held every fortnight, on the alternate Wednesdays, for cattle and sheep, which affords a constant supply of butchers' meat to almost the whole of this riding, and the borders of Lancashire. The parish church of Wakefield is a spacious and lofty edifice; and the spire is one of the highest in the county. By the Domelday record there appears to have been a church here at the time of the Conquest, but no part of the present structure can be referred to a more early period than the reign of Henry III., and it has undergone many modern repairs and improvements. In 1724 the south side was entirely rebuilt; and the greatest part of the north side, together with the east end, towards the close of that century; a vestry-room has likewise been erected. About half a mile to the north is the new church, built about the end of the eighteenth century. The ground on which it stands was bequeathed for that purpose by Mrs. Newstead, a widow lady, together with 1000*l.* towards the support of a minister. But the will being litigated, the matter lay dormant for some years, till the whole property of the testatrix was purchased by Messrs. Maude and Lee, who, in concurrence with some other opulent persons, procured an

act of parliament for building the church and enlarging the town. The church was accordingly erected, and a great number of houses, disposed in streets and squares, forming a district, which, as well as the church, is denominated St. John's. In the town are three meeting-houses for Dissenters of the Presbyterian, Calvinistic, and Methodist denominations. Here is also a free grammar-school, founded and endowed by queen Elizabeth, but much improved by private benefactions: the school-house is a spacious structure, erected by the Savilles, ancestors of the earl of Mexborough. A charity-school is also established here for the instruction and clothing of 106 boys and girls. Charitable donations to this town are very considerable, amounting to 100*l.* per annum, under the direction of fourteen trustees, called governors: this money is applied to the maintenance of several exhibitions in both universities, to the apprenticing of poor boys to various trades, to the support of aged and infirm persons, and to other benevolent purposes at the discretion of the governors. At the end of West-gate, the principal street in the town, is the house of correction for the whole riding: this prison is a spacious stone building, surrounded by an outer wall, and contains above 150 cells. A commodious sessions-house has been recently erected; and great improvements are consequently taking place in the adjacent streets. The quarter sessions for the West Riding are held here in January; and private sessions every fortnight by the justices in the vicinity. At the south-east entrance into Wakefield is a stone bridge, of nine large arches, over the Calder: it exhibits a fine specimen of the masonry of Edward III.'s reign, in which period it was built. In the centre of this bridge, projecting from the eastern side, and partly resting on the starlings, is an ancient chapel, formed in the richest style of ecclesiastical architecture, about ten yards in length and eight in breadth. The east window, overhanging the river, is adorned with tracery, and the parapets are perforated; the windows on the north and south are equally rich; but the west front facing the passage over the bridge exceeds all the rest in profusion of ornament, being divided by buttresses into compartments forming recesses with lofty pediments and pointed arches, with spandrels richly flowered, and above is an entablature supporting five basso relievos, the whole being crowned with battlements. This chapel was built by Edward IV. in memory of his father, Richard duke of York, and those of his party who fell in the battle of Wakefield. This superb relic of antiquity has of late years been used as a warehouse, and its embellishments have received considerable damage.

Wakefield was noted in Camden's time for its extent, buildings, cloth trade, and markets, as well as for the chapel above described. Since that period, the improvements in the woolen-cloth manufacture, with the introduction of those of tammies, camblets, and fancy articles, have greatly increased its wealth and population. A handsome hall has recently been erected by subscription for the sale of the stuffs: it is two stories high, extending in length about seventy yards, and ten in breadth; through the middle, in each story, is a row of repositories, in all about two hundred, facing each way, and properly labelled, so that the stand of any manufacturer may be readily found. Wakefield being situated on the edge of the manufacturing district, of which the Calder forms the eastern boundary, scarcely a single manufacturer is seen to the eastward. The navigation of the Calder has greatly promoted the trade of this town, to which the river was rendered navigable in 1698. Great quantities of coals are carried hence by water for the supply of York, Hull, and the adjacent parts. In the population return of the year 1811, Wakefield is stated to contain 1959 houses,

and 8593 inhabitants. The manor of Wakefield is very extensive, including that of Halifax, and stretching from Northampton westward to the confines of Lancashire: it is more than thirty miles in length, from east to west, and comprises 118 towns, villages, and hamlets. By the Domesday-book it appears to have been part of the royal demesnes of Edward the Confessor, and at the time of the survey it belonged to the crown. During the four subsequent centuries, it was granted to various branches of the royal families, and other distinguished nobles. In 1461 it reverted to the crown in the person of Edward IV., and remained in the possession of the kings of England till 1554, when it was united to the duchy of Lancaster. In the reign of Charles I. it was granted to Henry earl of Holland, who was beheaded in 1649, by the sentence of the high court of justice. Being afterwards granted to Robert earl of Warwick, the manor went, by the marriage of his daughter, to Sir Gervase Clifton, who, in 1663, sold it to Sir Christopher Clapham, from whose heirs it was purchased in 1700 by the duke of Leeds, in whose family it still continues.

About a mile and a half to the east of Wakefield is the village of Heath, which, for situation, variety of seats, and beautiful lawns, is justly esteemed the finest in the kingdom. Here is an elegant seat of W. Farquhar, esq.; and at this place was also the seat of the late right honourable John Smyth, member for Pontefract, and a lord of the admiralty.

Two miles south of Wakefield is Sandal, a small village chiefly remarkable for its ancient castle, built in the reign of Edward II. by John earl of Warren, and afterwards the property of Richard Plantagenet, duke of York, who, aspiring to the crown, was slain before its walls, December 31, 1460, in the memorable "battle of Wakefield," so called from Wakefield Green being the scene of action. The place where he fell was inclosed with a wall, and on it was erected a cross of stone, which was destroyed in the civil war of Charles I., in whose behalf the castle was garrisoned; but it surrendered after a siege of three weeks in October 1645, and in the following year the castle was demolished by order of parliament. At present scarcely a vestige is left of its former strength and magnificence; the principal remaining part is occupied as a farm-house.—Beauties of England and Wales, vol. xvi. Yorkshire. By J. Bigland.

WAKEFIELD, a town of America, in the state of New Hampshire, and county of Strafford; containing 1166 inhabitants; 30 miles E. of Concord.

WAKEFIELD, *Upper*, a township of Pennsylvania, in the county of Bucks, containing 1271 inhabitants.

WAKEFIELD, *Lower*, a township of Pennsylvania, in the county of Bucks, containing 1089 inhabitants.

WAKEFULNESS, or WATCHING, *infamia*. See WATCHING.

WAKES, formed from the Saxon *wacce*, *vigilia*, *ex-cubie*, *watch*, *vigils*, or *country-wakes*, are certain ancient anniversary feasts, in several parishes; wherein the people were to be awake at the several vigils, or hours to go to prayer. See VIGIL.

They are usually observed, in the country, on the Sunday next before the faint's day to whom the parish-church is dedicated.

The learned Mr. Whitaker, in his History of Manchester, hath given a particular account of the origin of wakes and fairs. He observes, that every church at its consecration received the name of some particular faint: this custom was practised among the Roman Britons, and continued among the Saxons; and in the council of Cealchythe, in 816, the name of the denominating faint was expressly required to be inscribed

on the altars, and also on the walls of the church, or a tablet within it. The feast of this faint became of course the festival of the church. Thus Christian festivals, in the room of the primitive *αγνιας*; or love-feasts, were substituted for the idolatrous anniversaries of heathenism: accordingly at the first introduction of Christianity among the Jutes of Kent, pope Gregory the Great advised what had been previously done among the Britons, *viz.* Christian festivals to be instituted in the room of the idolatrous, and the suffering-day of the martyr whose relics were reposit in the church, or the day on which the building was actually dedicated, to be the established feast of the parish. Both were appointed and observed; and they were clearly distinguished at first among the Saxons, as appears from the laws of the Confessor, where the *die dedicatiois*, or *dedicatio*, is repeatedly discriminated from the *propria festivitatis sancti*, or *celebratio sancti*. They remained equally distinct till the Reformation; the dedication-day in 1536 being ordered for the future to be kept on the first Sunday in October, and the festival of the patron faint to be celebrated no longer. The latter was, by way of pre-eminence, denominated the church's holiday, or its peculiar festival; and while this remains in many parishes at present, the other is so utterly annihilated in all, that bishop Kennet, says Mr. Whitaker, knew nothing of its distinct existence, and has attributed to the day of dedication what is true only concerning the faint's day. Thus instituted at first, the day of the tutelar faint was observed, most probably by the Britons, and certainly by the Saxons, with great devotion. And the evening before every faint's day, in the Saxon-Jewish method of reckoning the hours, being an actual part of the day, and therefore like that appropriated to the duties of public religion, as they reckoned Sunday from the first to commence at the sun-set of Saturday; the evening preceding the church's holiday would be observed with all the devotion of the festival. The people actually repaired to the church, and joined in the services of it; and they thus spent the evening of their greater festivities in the monasteries of the North, as early as the conclusion of the seventh century.

Their services were naturally denominated from their late hours *waccan* or wakes, and vigils or eves. That of the anniversary at Rippon, as early as the commencement of the eighth century, is expressly denominated the vigil. But that of the church's holiday was named *cyric waccan*, or church-wake, the church-vigil, or church-eve. And it was this commencement of both with a wake, which has now caused the days to be generally preceded with vigils, and the church-holiday particularly to be denominated the church-wake. So religiously were the eve and festival of the patron faint observed for many ages by the Saxons, even as late as the reign of Edgar, the former being spent in the church, and employed in prayer. And the wakes, and all the other holidays in the year, were put upon the same footing with the octaves of Christmas, Easter, and of Pentecost. When Gregory recommended the festival of the patron faint, he advised the people to erect booths of branches about the church on the day of the festival, and to feast and be merry in them with innocence. Accordingly, in every parish, on the returning anniversary of the faint, little pavilions were constructed of boughs, and the people indulged in them to hospitality and mirth. The feasting of the faint's day, however, was soon abused; and even in the body of the church, when the people were assembled for devotion, they began to mind diversions, and to introduce drinking. The growing intemperance gradually stained the service of the vigil, till the festivity of it was converted, as it now is, into the rigour of a fast. At length they too justly scandalized the Puri-

tans of the seventeenth century, and numbers of the wakes were diffused entirely, especially in the east and some western parts of England; though the order for abolishing them was reversed by the influence of Laud: but they are commonly observed in the north, and in the midland counties.

This custom of celebrity in the neighbourhood of the church, on the days of particular faints, was introduced into England from the continent, and must have been familiar equally to the Britons and Saxons; being observed among the churches of Asia in the sixth century, and by those of the west of Europe in the seventh. And equally in Asia and Europe, on the continent, and in the islands, these celebrities were the causes of those commercial marts which we denominate *fairs*; which see. The people resorted in crowds to the festival, and a considerable provision would be wanted for their entertainment. The prospect of interest invited the little traders of the country to come and offer their wares; and thus, among the many pavilions for hospitality in the neighbourhood of the church, various booths were erected for the sale of different commodities. In larger towns, surrounded with populous districts, the resort of the people to the wakes would be great, and the attendance of traders numerous; and this resort and attendance constitute a fair. Basil expressly mentions the numerous appearance of traders at these festivals in Asia, and Gregory notes the same customs to be common in Europe. And as the festival was observed on a feria or holiday, it naturally assumed to itself, and as naturally communicated to the mart, the appellation of feria or fair. Indeed, several of our most ancient fairs appear to have been usually held, and have been continued to our time, on the original church-holidays of the places: besides, it is observable, that fairs were generally kept in church-yards, and even in the churches, and also on Sundays, till the indecency and scandal were so great as to need reformation. See Burn's Eccl. Law, art. *Churches*.

WAKI, in *Geography*, a town of Japan, in the island of Nippon; 60 miles W. of Meaco.

WAKKAMAW, a lake of North Carolina, which communicates, by means of a river of the same name, with Winyah Harbour, after a course of about seventy or eighty miles.

WAKOW. See WIGSTADSEL.

WAKUA, a small island on the E. side of the gulf of Bothnia. N. lat. 60° 45'. E. long. 21° 15'.

WALA, a town of Sweden, in the province of Westmanland; 26 miles N. of Stromholm.

WALACHIA, a province of European Turkey, bounded on the north by Moldavia and Transylvania, on the east by Bessarabia, on the south by Bulgaria, and on the west by the bannat of Temesvar and Transylvania; about 280 miles from E. to W., and 150 from N. to S., where widest; but in some places hardly 60: by the inhabitants it is called "Romulia," and by the Hungarians "Havafaloldgye." The air is temperate, the soil very fruitful, particularly in grain, wine, and melons; graziers here, too, is very considerable; but its principal reputation is for excellent horses. The country is watered by a considerable number of large and small rivers, most of which run from N. to S., discharging themselves immediately into the Danube, or in conjunction with other rivers. The principal of these are the Alaut, which rises in the mountains of Transylvania, and divides Walachia into two unequal parts, namely, the West and East; the Jalonitza, which has also its source in the borders of Transylvania; and the Sirch, or Sirsch, the boundary on the side of Moldavia. Their bridges are all built with wood, which is plentiful in the country. The Walachians, considered as

Inhabitants of the country, are descended from the old Roman colony settled here by the emperor Trajan. They profess the Eastern Greek religion; and as in writing they use the same letters with the Russians, so they agree with them in all their religious ceremonies. According to the account given of them by Jackson (Journey from India), they seem to be very superstitious. They erect crucifixes, some of stone and others of wood, near the roads; all of them are painted; some having Jesus Christ, some the Virgin Mary, others the twelve apostles, some the ten commandments, prayers, &c. depicted upon them. These crucifixes are very numerous, and most of the country-people pay respect to them as they pass. The commonalty are most wretchedly ignorant; and even the highest attainments which the ecclesiastics themselves aim at, seldom go beyond reading and singing well. Bucharest is a kind of university to them, whither they go to learn a polite deportment, the elegancies of the Walachian language, and ceremonies of the church. The persons of rank among the Walachians are so fond of the Italian language, that they apply themselves to it more than their mother-tongue, and generally send their sons to study at the university of Padua. Great numbers of Mahometans live also intermixed with the Walachians; some Jews, and also Germans. The Romans, after their decisive victory over Decebalus, king of Dacia, made themselves masters of his kingdom. Trajan sent hither several Roman colonies, who not only cultivated the land, but built them towns, which they embellished with fine edifices. His successor, however, in the empire, transplanted the greatest part of them into Mæsia and Thracia, where, mingling with the Bulgarians, Thracians, Servians, and Ligurians, they came to speak a new language or jargon. These kingdoms, which lie on the Danube, afterwards constituted part of the dominions of the emperors of the East. In process of time, the Walachians moved farther north, to the borders of Podolia and Russia, where they applied themselves to agriculture and the breeding of cattle. The conversion of the Bulgarians and their neighbours to Christianity was followed, in the ninth century, by that of the Walachians, who embraced the Grecian doctrines. Towards the beginning of the twelfth century, a numerous colony of Walachians, under the conduct of one Nigers, or Negrovot, for the sake of pasturage, religion, and other motives, passed on towards the south, and settled in the modern Walachia, founding the towns of Tergovista, Bucharest, and Pitesti. They choose their own princes, whom they style waywodes, or despots. The kings of Hungary, becoming powerful, made several attempts on the Walachians; and, in the fourteenth century, obliged them to pay tribute. But in the year 1391, and 1394, they were greatly harassed by the Turks, who, in the year 1415, also laid the whole country waste with fire and sword, compelling Dan, the waywode, to pay them an annual tribute. It was in the year 1608, before the Walachians could rid themselves of this burthen, when they put themselves under the protection of the emperor of Germany. But the treaty of Carlowitz resigned them up again to the Turkish dominion. In the beginning of the seventeenth century, they suffered various calamities by the plague, war, and the many revolutions among their princes. At the treaty of Passarowitz, in 1718, the western part of Walachia, as far as the river Alaut, was ceded to the emperor, but lost again in the year 1739. Walachia is governed by a waywode, or prince, styled also the hospodar, who is a vassal of the Ottoman Porte, and whose yearly tribute generally amounts to 58 or 60,000 ducats.

WALADIA, EL, a town of Morocco, situated in an extensive plain, 35 miles S. of Mazagan. Annexed to it is

a spacious harbour, capable of containing 500 sail of the line, but the entrance is obstructed by a rock or two, which might, it is said, be easily blown up; otherwise this would be one of the finest harbours for shipping in the world. The coast of El Waladia is lined with rocks, at the bottom of which, and between them and the ocean, is a table land, almost even with the surface of the water, abounding with springs, where every necessary and luxury of life abound. The view of the land from the plains above the rocks is extremely beautiful and picturesque. The town of El Waladia is small, and uncompassed by a square wall, and contains but few inhabitants. Its name seems to indicate that it was built by Muley El Walad, towards the middle of the seventeenth century. Jackson's Morocco.

WALÆUS, JOH, in *Biography*, a celebrated anatomist, was born in 1604, near Middleburg, in Zealand, and studied physic at Leyden, where he graduated in 1631. In 1632 he was nominated a medical professor extraordinary, and in 1648 he obtained a chair in ordinary. His practice was extensive, and his academical duties numerous; and yet he employed himself much in the dissection of living animals, and was enabled to illustrate the functions of digestion, the distribution of the chyle, and the action of the heart. He first taught publicly the Harveian doctrine of the circulation of the blood; though from jealousy of the honour of the inventor, he was disposed to announce vestiges of the fact which he discovered in the writings of the ancients. He died at Leyden in 1649. His Anatomical Observations, which are reckoned excellent, are contained in "Epistolæ duæ de Motu Chyli et Sanguinis ad T. Bartholinum," Lugd. B. 1641. Haller. Eloy.

WALAFRIDUS, surnamed *Strabo*, or *Strabus*, from a squint in his eyes, was born in Swabia in 807, and educated in the monastery of Reichenau, whence he proceeded to Fulda, to receive further instruction from Rabanus. After his return to his monastery he became director of its school, and very much contributed to its reputation. Being sent on an embassy by king Louis to his brother Charles the Bald, he died in the year 849. Of his works, which are numerous, those most worthy of notice are his "Glossa ordinaria," or short observations on the whole text of the Bible, chiefly derived from the exposition of Rabanus, and annexed to many editions of the Vulgate, printed in the fifteenth and sixteenth centuries; "De Exordiis et Incrementis Rerum Ecclesiasticarum;" "De Vita beati Galli Confessoris, lib. ii.;" "Vita Otmarii Abbatis S. Galli;" "Poemata," among which are, "Hortulus," or a description of the garden which he cultivated, with its herbs and flowers, and their medical use. Gen. Bio.

WALAJABAD, in *Geography*, a town of Hindoostan, in the Carnatic; 10 miles E. of Conjeveram.

WALAKA, a low, insalubrious, but fertile, province of Abyssinia, situated between the two rivers Geshen and Samba, having to the S. of it Upper Skoa. This province is surrendered by the reigning prince to the Galla, who, at his desire, have surrounded Skoa on every side. But as it is full of the bravest and best horsemen, and best accoutred of any in Abyssinia, they can, whenever they please, dispossess the Galla.

WALAN, in *Botany*, Rumph. Amboin. v. 3. 214. t. 139. Poir. in Lamarck Dict. v. 8. 783, the Amboyana name of a tree, which Rumphius also calls *Ichthyophanes montana*, from its use in killing fish, but of whose botanical characters little or nothing is known.

This tree has a straight *trunk*, whose *bark* is thick, dry, brittle, reddish, of a bright fiery red towards the root; the wood white, and of little value, except the heart

heart of old trees, which is brown and compact. The roots are red and copious. Leaves scattered, stalked, obovate, pointed, entire, eight or ten inches long, three or four wide, smooth, rather fleshy, having a mid-rib, with several slight transverse veins. Of the flowers no description is given, but they are represented on simple lateral stalks, solitary or in pairs, and seem formed of four round petals. The fruit is said to be as large as an orange, and of the same colour, drooping, making a beautiful appearance, intermixed with the green leaves, in October. Its shape, however, is more ovate, with a point, and the base is embraced by a cup-shaped, five-angled, permanent calyx, not unlike that of an acorn. This fruit after a while turns red, and finally blackish. The pulp is insipid, dry, and fungous, containing four or five seeds, or nuts, attached to the point of the fruit by four cords. Each seed is near two inches long, and one broad, compressed, roughish, of a fine brown colour. Sometimes there is but a solitary seed.

The Walan-tree grows, not very frequently, in the mountainous woods of Amboyna, where the soil is rich, and of a red colour. The only use made of it is to catch fish. For this purpose the roots are collected and prepared, with many foolish ceremonies. An entire root, with its bark, is beaten to pieces upon a stone, and when this is nearly accomplished, one person, of the party assembled on the occasion, commands all the rest to lie down at once in a circle, while he stands in the centre. They are to remain thus in perfect stillness, till one of them crows three times, like a cock, upon which they start up all together. While the bruising of the root goes on, they are forbidden to speak, cough, or spit, or to make any noise whatever. The powder of the root thus prepared is collected into baskets, and taken very early in the morning, about the crowing of the cock, to the river side. It is there thrown, by a handful at a time, into the water, and stirred about till a foam is raised to the height of several inches. This being accomplished, the whole party preferre lie down as if dead, but if any one of them crows, they all start up. While the powder is mixing with the water, no one may go within sight of the river, except with some cutting instrument, for fear of defeating the whole intention. At some distance, lower down in the stream, a net is placed across, which in the course of an hour becomes filled with fish, floating, half dead, upon the surface of the water; the acrimony of this root causing such an irritation in their eyes, as they cannot endure. If thrown into fresh water, they recover. Fish thus caught are wholesome for immediate eating, but will not keep for any time. Rumphius employed his servants successfully to catch fish in this manner, omitting, as may be supposed, the above-mentioned peculiar ceremonies. Persons who bathe in the water thus impregnated, feel only a slight itching of the skin; but the same water is not good for drinking. The natives of Amboyna refrain the exercise of this kind of fishing, to persons of particular families; and endeavour to promote a belief that others, who should attempt it, would be afflicted with incurable ulcers, or malignant cutaneous disorders.

WALBACH, in *Geography*, a town of France, in the department of the Upper Rhine; 4 miles S.W. of Colmar.

WALBECK, a town of Germany, belonging to the principality of Halberstadt, insulated in the duchy of Mecklenburg; 24 miles S. of Halberstadt.

WALBY, a town of Sweden, in the province of Uppland; 23 miles S.S.W. of Upsal.

WALCA, a town of the duchy of Warsaw, on a lake; 56 miles N. of Posen.

WALCHEN SEE, a town of Austria, on the Atter See; 4 miles S.W. of Voglabruck.

WALCHEREN, the most westerly and most considerable island of the Rate of Zealand, about thirteen miles from north to south, and eight from east to west; situated in the German sea, at the mouth of the Scheld. Middleburg is the capital. N. lat. 51° 34'. E. long. 3° 29'.

WALCHEREN or *White Carrot*, in *Agriculture*, a sort of that root, which is said to be cultivated there with much success and advantage, as some sorts of the parsnip are in the island of Guernsey. See a paper on the latter subject in the first volume of the "Memoirs of the Caledonian Horticultural Society."

WALCKENSTEIN, in *Geography*, a town of Austria; 2 miles N.W. of Eggenburg.

WALCKERSBRUN, a town of the territory of Nuremberg; 3 miles W. of Grafenberg.

WALCOUR, a town of France, in the department of Gempape, on the Heure. It was surrounded with walls in the year 910; 21 miles W.S.W. of Namur.

WALD, a town of the duchy of Berg. Here is a manufacture of knives; 4 miles N.W. of Solingen.—Also, a town of Austria; 3 miles S.S.E. of St. Polten.

WALDACH, a river of Wurtemberg, which rises 3 miles E.S.E. of Dornstett, and runs into the Nagold, about two miles S. from Nagold.

WALDAU, a town of Silesia, in the principality of Lignitz; 3 miles N.W. of Lignitz.

WALDAW, a town of Prussia, in the province of Samland; 8 miles E. of Königberg.

WALDBECK. See WOLBECK.

WALDBURG, a town and castle of Germany, which gives name to a county, situated between the Iller and the Danube; 7 miles N. of Wangen.

WALDEBA, a town of Abyssinia; 5 miles S.W. of Siré.

WALDECK, a county of Germany, bounded on the north by the bishopric of Paderborn, on the east by Hesse, and prefecture of Fritzlar, in the electorate of Mentz, on the south by Hesse, and on the west by the duchy of Westphalia. The length is computed at twenty-four miles, and its breadth twenty. The county abounds in grain and cattle, having also large woods, and the mountains in it contain lead, iron, and copper, and even some gold, which is esteemed equal in value to that of Hungary. Of the gold which is gathered out of the Eder, the princes have caused medals to be struck; and a magnificent sideboard to be made. Some parts also afford marble, alabaster, slate, and turf. This county contains thirteen towns and a market village. The greater part of the inhabitants are Lutherans, and the rest Calvinists, with some Roman Catholics intermixed. The manufactures are, coarse cloth, barragon, callimanco, dimity, ratoon, and other stuffs; as also paper, and great quantities of iron-ware, for exportation. The county of Waldeck is thought to bring in above 100,000 rix-dollars per annum to the prince, and that not improbably, it being one of the most considerable counties in the whole empire, and preferable even to not a few principalities. The prince's circular contingency was two companies of foot, but he generally maintained three more.

WALDECK, a town of Germany, capital of a county of the same name, so called from an ancient castle, which has been repaired within the last century, and fitted up to receive a garrison; part of the records of the principality are kept here, and it is likewise used as a prison; 18 miles W.S.W. of Cassel. N. lat. 51° 13'. E. long. 9° 2'.

WALDECK, *Hohen*, a town of Bavaria, and capital of a lordship, formerly belonging to the princes of Waldeck, but which, in the year 1734, fell to the elector of Bavaria; 30 miles S.E. of Munich.

WALDEN, SAFFRON. See SAFFRON-WALDEN.

WALDEN, a town of America, in the state of Vermont and county of Caledonia, containing 455 inhabitants; 40 miles N. of Rutland.

WALDEN'S *Inland*, a small island in the North sea. N. lat. 80° 37'. E. long. 18° 10'.

WALDENBERG, a town of Westphalia, in the bishopric of Hildesheim; 13 miles S.E. of Hildesheim.

WALDENBRUCK, a town of Wurtemberg; 8 miles S. of Stuttgart.

WALDENBURG, a town of Germany, in the principality of Hohenlohe; 6 miles E. of Ohringen.—Also, a town of Saxony, in the lordship of Schonburg, on the Mulda. The old town of Waldenburg, which lies directly fronting Waldenburg, on the other side of the Mulda, is famous for its brown and white earthen-ware, which consists of vessels for laboratories and apothecaries' shops, together with pots of several kinds, such as pitchers, drinking vessels, &c. Here is likewise a considerable linen manufacture. It is a lordship, invested in the house of Schonburg, called Schonburg-Waldenburg; 44 miles W. of Dresden. N. lat. 50° 48'. E. long. 12° 21'.—Also, a town of Switzerland, and capital of a bailiwick, in the canton of Bale; 15 miles S. of Bale.—Also, a town and citadel of the duchy of Westphalia; 6 miles N. of Olpe.

WALDENBURG, or *Waldenburg*, a town of Silesia, in the principality of Schwidnitz; 8 miles S.W. of Schweidnitz. N. lat. 50° 35'. E. long. 16° 5'.

WALDENFELS, a town of Austria; 3 miles N.W. of Freystatt.

WALDENFELS, or *Waldenfels*, a town of Bavaria, in the bishopric of Bamberg; 34 miles N.E. of Bamberg.

WALDENGELCH, a town of Wurtemberg; 5 miles N.N.E. of Gochsheim.

WALDENSES. See VAUDOS.

WALDERSDORF, a town of Saxony, in the circle of Erzgebirg; 1 mile N.N.W. of Freyberg.

WALDHAUSEN, a town of Austria; 4 miles E.S.E. of Zwettl.

WALDHAUSER, a town of Saxony, in the Vogtland; 1 mile N.W. of Plauen.

WALDHEIM, a town of Saxony, in the circle of Leipzig, on the Zschopa; 25 miles S.E. of Leipzig. N. lat. 51° 4'. E. long. 12° 51'.

WALDKAPPEL. See CAPPEL.

WALDKIRCH, a town of the Brisgau, on the Elz; 6 miles N. of Friburg. N. lat. 48° 7'. E. long. 8°.

WALDKIRCHEN, a town of Bavaria, in the bishopric of Passau; 10 miles N.N.E. of Passau.—Also, a town of Austria; 7 miles N.W. of Efferding.

WALDMICHELBAACH, a town of Hesse Darmstadt; 8 miles N.E. of Heidelberg.

WALDMUNCHEN, a town of Bavaria; 30 miles N.E. of Ratibon.

WALDNEUKIRCHEN, a town of Austria; 6 miles S.W. of Steyr.

WALDOBOROUGH, a sea-port town of America, in the district of Maine, and county of Lincoln, containing 1260 inhabitants; 50 miles N.E. of Portland. N. lat. 44° 2'. W. long. 60° 16'.

WALDRAN, a town of Austria; 8 miles S.W. of Aigen.

WALDRAPP, in *Ornithology*, a name given by some to the wood-raven, or *corvus sylvaticus* of Geseur, a bird of the size of a hen, of a glossy black, and adorned with a crest on its head.

WALDREICHS, in *Geography*, a town of Austria, near the Kamp; 10 miles E. of Zwettl.

WALDSAXEN, or WALDSACH, a town of Bavaria, formerly imperial, but pillaged and almost destroyed in the wars of the Hussites and the Palatinate; since which it has never recovered itself. Near it is a rich Cistercian abbey, founded in the year 1133, the abbots of which were formerly princes of the empire. In 1802, this abbey was given to the king of Bavaria; 4 miles S.S.W. of Egra.

WALDSCHACH, a town of the duchy of Stiria; 14 miles S. of Gratz.

WALDSCHMIDIA, in *Botany*, a name given to the *Menyanthes nymphoides* of Linnæus, by Wiggers, in his *Primitivæ Floræ Holsticæ*, 20; which, like Gmelin and a few other botanists, he considered as a distinct genus from MENYANTHES; see that article and VILLARIA. If, however, this opinion were correct, the name is foretold by *Limnanthemum*, given to the same supposed genus by Gmelin, near twenty years before, and liable to no exception. *Waldschmidia* was intended to commemorate William Ulrick Waldschmidt, formerly professor at Kiel, who wrote a treatise on the sexes of plants, in which he is said to have well explained the use and physiology of the anthers.

WALDSEE, in *Geography*, a town of the duchy of Baden; 12 miles N.N.E. of Ravensberg.—Also, a lake of Stiria; 6 miles E. of Schlamberg.

WALDSHUT, a town of the duchy of Baden, on the Rhine; 19 miles W. of Schaffhausen.

WALDSICH, a town of the county of Henneberg; 4 miles N.N.E. of Salzungen.

WALDSTADT, i. e. *The Forest Towns*, a name given in Switzerland to the cantons of Lucern, Uri, Schwitz, and Underswalden, probably on account of the quantity of forests found in them.

WALDSTADTER SEE, or *Lake of Lucern*, or *Lake of the Four Cantons*, one of the largest lakes of Switzerland, extending from Lucern to Altdorf, 20 miles in length. Its figure is very irregular, and it is for the most part surrounded with high mountains. The river Reufs passes through it. See *Lake of Lucern* and *Lake*.

WALDSTEIN, a town of the duchy of Stiria; 12 miles N.W. of Gratz.

WALDSTEINIA, in *Botany*, was so named by the late professor Willdenow, in compliment to a botanist of great eminence, Francis von Waldstein, author of the *Flora Hungarica*.—"Willd. Nov. Act. Soc. Nat. Scrut. Berlin. v. 2. 105." Sp. Pl. v. 2. 1007. Ait. v. 3. 204.—Clafs and order, *Ursandria Digynia*. Nat. Ord. *Seneciofe*, Linn. *Rofaceæ*, Juss.

Eff. Ch. Calyx in ten segments, the alternate ones smaller. Petals five. Styles club-shaped, deciduous. Seeds two, obovate, without awns.

1. *W. geoides*. Avens-like *Waldsteinia*. Willd. as above, v. 2. 106. t. 4. f. 1. Sp. Pl. n. 1. Ait. n. 1. "Waldst. et Kitib. Hung. v. 1. 79. t. 77."—Native of umbrageous forests in Hungary, from whence it was introduced into Britain, by the late Mr. George Don, in 1804. A hardy perennial, flowering in June and July. *Aiton*. Stem ascending, round, striated, rather hairy, the length of the radical leaves, which are stalked, five-lobed, ribbed, some-

what hairy; their lobes obtuse, slightly three-cleft, toothed. *Stem-leaves* three-lobed, deeply toothed. *Stipulas* oblong, acute, entire. *Flower-stalks* two or three, terminal, thread-shaped, very long. *Flowers* yellow. This plant is allied to GRUM, (see that article,) but is distinguished by the small number of *pisils*, and the club-shaped deciduous *styles*. From POTENTILLA, (see that article and TORMENTILLA,) it differs widely in habit, number of *pisils*, and form of the *styles*. Willdenow.

WALDSTETTEN, in *Geography*, a town of Germany, in the marquise of Burgau; 7 miles S.W. of Burgau.—Also, a town of the county of Wertheim, in the Spessart; 11 miles E. of Alchaffenburg.

WALDT, a town of Upper Bavaria; 8 miles S. of Neu Oetting.

WALDT *Aus*, a river of Austria, which rises on the borders of Bohemia, and runs into the Danube, 8 miles below Steyregg.

WALDTHURN, a town of Germany, in the county of Sterntin; 21 miles N.E. of Amberg.

WALDTNIEL, or NIEL, a town of France, in the department of the Roer; 2 miles E. of Ruremond.

WALDUBBA, a small province of Abyssinia, situated between the rivers Guangua and Angrab. Waldubba, signifying "the valley of the hyæna," is a territory entirely inhabited by monks, who have retired to this unwholesome, hot, and dangerous country voluntarily, to spend their lives in penitence, meditation, and prayer. This too is the only retreat of great men in disgrace or disgust. These first shave their hair, and put on a cowl like the monks, renouncing the world for solitude, and taking vows which they resolve to keep no longer than exigencies require; after which they return to the world again, leaving their cowl and sanctity in Waldubba. These monks, however, are held in great veneration, and are believed to have the gift of prophecy, and to work miracles; and they are very active instruments to stir up the people in the time of trouble. There are also women, who should be called nuns, that occasionally go to Waldubba, though not constantly resident there, and live in familiarity with these faints, not altogether consistent with their sanctity. A hermit and a nun sometimes sequester themselves for months, to eat herbs together in private upon the top of the mountains. These, on their return, are exhibited as wonderful patterns of holiness, lean, emaciated, and exhausted. Mr. Bruce (*Travels*, vol. iii.) does not presume to decide, whether this change is to be wholly ascribed to the herbs, as he never was at these retirements of Waldubba. Those who inhabit this district are perpetually subject to fevers, and their colour is that of a corpse: many of them are destroyed by their neighbours the Shangalla; though it is said that they have been lately stopped by the prayers of the monks: but Mr. Bruce ascribes the discontinuance of the inroads of the Shangalla to the ravages of the small-pox, by which their strength and number are reduced, and whole tribes of them extinguished.

WALE, SAMUEL, in *Biography*, an artist of some celebrity in his day, was born in London, and was one of the founders of the Royal Academy. He was first engaged as an engraver on plate, but having studied drawing in the Academy in St. Martin's-lane, he applied himself to painting, imitating the manner of Francis Hayman. He executed several decorative pieces for ceilings, but was chiefly employed in making drawings of historical designs for the bookellers, the greater part of which was engraved by Mr. Grignion. He assisted Gwynn the architect in his drawings, and as he had made himself acquainted with perspective, he was appointed the first professor in that science

in the Academy. Upon the death of Wilson he was appointed librarian, and held both places till his own death, which happened in 1786.

WALE-KNOT, or WALL-Knot, *Single*, is made by intertwining the ends of a rope, and making a bight with the first strand; then passing the second over the end of the first, and the third strand over the end of the second, and through the bight of the first, and haul the ends tight. (See *Plate 1. Rigging*, figs. 4, 5.)

WALE-Knot, *Double*, is made by passing the ends, singly, close underneath the first wale, and thrusting them upwards through the middle, only the last end comes up under two bights. *Fig. 6.*

WALE-Reared, an obsolete phrase, implying *wall-sided*.

WALEN, EL, in *Geography*, a town of Africa, in the country of Twat; 115 miles W. of Gadamis. N. lat. 22° 15'. E. long. 3° 30'.

WALENBURG, a town of the county of Henneberg; 5 miles N.W. of Smalkalden.

WALES, a large district or portion of Great Britain, situated at the north-western extremity of the island, and bounded on the north and west by the Irish sea, on the south and south-east by the Bristol channel, and limited on the east by the English counties of Monmouth, Hereford, Salop, and Cheshire. The length from north to south is, on an average, 150 miles; and the width from east to west 65 miles. This area comprises about 8125 square miles, or 5,206,900 acres of land: of which, it appears, by the reports to the board of agriculture, 900,000 acres are arable, and 2,500,000 under pasturage; leaving 1,700,000 acres in a state of waste, of which 700,000 acres are reported as capable of being brought into cultivation. Wales was formerly of greater extent, having for its boundaries the rivers Severn and Dee, as natural lines of demarcation. The ancient dimensions were, however, at various periods, contracted, by severing from it portions of the several counties, situated westward of those rivers; and taking out of it the whole county of Monmouth. The limits of the various districts of Wales, with the above exception, and their names, have been retained from a very remote period to the present time, independently of the modern arrangement of them into shires, as imposed by the English government. The division made in the time of Llewelyn ap Gruffydd, the last prince of North Wales, was into the three provinces of Aberfraw, Mathral, and Dinevwr. In the distribution of these into cantrefs or hundreds, Aberfraw comprised fifteen, which were again subdivided into thirty-eight comots, or smaller districts; Mathral, fourteen cantrefs, subdivided into fourteen comots; and Dinevwr, twenty-four, further divided into seventy-eight comots. Nearly similar to this, is the present civil division of the principality into twelve counties, six included in North Wales; viz. Anglesea, Caernarvon, Denbigh, Flint, Montgomery, and Merioneth; and six in South Wales, viz. Cardigan, Radnor, Brecknock, Glamorgan, Caermarthen, and Pembroke. The centurial divisions remain nearly the same as in Llewelyn's time. The whole contains 58 market-towns, and 751 parishes; and according to the enumeration made under the population act of 1811, the number of houses amounted to 123,512, inhabited by 611,788 persons; viz. 291,633 males, and 320,155 females: 36,044 families were returned as employed in trade, manufactures, or handicraft; and 72,846 in agriculture: and the average scale of mortality, according to registered burials, for a period of ten years, appears to have been in the proportion of 1 to 60 of the existing population. For the administration of justice, Wales is divided into four circuits,

cuits, *viz.* the Chester circuit, including the counties of Chester, Flint, Denbigh, and Montgomery: the northern circuit, for those of Anglesea, Caernarvon, and Merioneth: the south-eastern, for those of Radnor, Brecknock, and Glamorgan: and the south-western, comprising the three shires of Cardigan, Caermarthen, and Pembroke. By a statute, passed in the reign of Elizabeth, the king was empowered to appoint two persons learned in the law to be judges in each of the Welsh circuits, which before had but one justice. And by another statute of George II., it was enacted, that where the kingdom of England is mentioned in any act of parliament, the same shall be understood as comprehending the dominion of Wales, and the town of Berwick-upon-Tweed. Wales sends twenty-four members to the British senate, one knight for each shire, and one burgess for each county-town, except that of Merioneth; in lieu of which, two towns in Pembrokeshire return a member each, *viz.* Pembroke and Haverford-west. The eldest son of the kings of England has, ever since the time of Edward I., been invested with the title of prince of Wales: and several branches of the peerage derive their titles from various places in the principality.

Ancient History, Roman Stations, and Roads.—Cambria, the ancient name of this portion of the island, is deduced by historians from the original inhabitants having been a tribe of the Celtae, or Gauls, known under the denomination of *Cimbri*; or *Cynri*; and the Romans called the country inhabited by such people Cambria. Wales appears to have been the acknowledged name of this region in the poetry of a Welsh bard, so early as the sixth century. The derivation of the Britons from the Gauls, both Cæsar and Tacitus deduce from the vicinity of the two countries, and the similarity of the manners and character of the people: but a stronger argument is found in the national appellation of Gael and Gaul, equally attached to both countries. It appears that the inhabitants of Wales were part of the aboriginal possessors of the island, whose numbers must have been greatly increased by those Britons, who, retreating before the victorious Romans, fled to this district, as a dernier resort, to preserve their independence. After the invaders had secured the central part of Britain, by forming stations, and appointing garrisons, and had given to it the name of *Britannia Prima*, they turned their attention to the reduction of the unconquered country lying west of the Severn. When Ostorius, the Roman general, surveyed this country, which he was sent with an army to subdue, he found it possessed by three tribes of people, denominated from their respective districts, Ordovices, Silures, and Dimetae. The *Ordovices* possessed all the country comprised in the present North Wales: the *Silures* occupied the district now comprehended in the counties of Hereford, Radnor, Brecknock, Monmouth, and Glamorgan, and the small portion of Gloucestershire now west of the Severn; and had for their capital *Caer-Cwent*, in Monmouthshire: the *Dimetae* were situated west of the Silures, and possessed the country at present including the counties of Cardigan, Pembroke, and Caermarthen. Such were the inhabitants of Wales, when the Romans first entered it with an hostile army. Respecting the condition or state of these Britons, at the period in question, a great difference of opinion prevails among our historians. Some, in despite of unexceptionable authorities, treat these people as illiterate savages, destitute of cloaths, dwellings, and arts: while others, following the British history, describe them as a martial, learned, and flourishing nation, possessing foreign trade, and at home erecting stately edifices. Both these accounts are probably much exaggerated. The best historians state that

the Britons had a religion remarkable for its numerous ceremonies; they possessed an established government; and had regular and well-disciplined troops, divided into charioteers, cavalry, and infantry. With respect to any great naval power, though attempted to be proved by the learned Selden, well-founded objections may be urged; but as to smaller vessels, Cæsar bears ample testimony to the ingenuity of their construction, and their great convenience: the facility with which these vehicles were made, and their peculiar portability, has occasioned a continuance of their use, and *corracles* still form the fishing-boats employed on some of the rivers of Wales. They had sufficient corn for their support, and their pastures were abundantly stocked with cattle, sheep, and hogs. In their dealing with each other, for money they used rings, or small plates of iron strung together, which passed among them by weight, as well as tale: supposing they possessed no minted coins, this circumstance alone would be a sufficient evidence of their civilization; since it is deducible from history, that no nation in a state of barbarism ever adopted a circulating medium in buying and selling. From the earliest periods, the Britons breathed a spirit of genuine freedom, and always studied to procure and preserve their liberty. Stimulated by a noble ambition, never to be satisfied but by victory, nor extinguished but by death, they fought with a degree of bravery that astonished the legionary troops; and disputed every acre of ground with a tenacity and obduracy that extorted from their conquerors the tribute of admiration. Suetonius Paulinus overcame the Ordovices, and extirpated the remainder of the Druids, and their followers, who had fled to the island of Mona, or Anglesea. Notwithstanding this, the heroic Silures for years continued their struggle for liberty, till at length Julius Agricola was sent with a powerful army by the emperor Vespasian; and having entirely defeated the Britons under their intrepid leader Caractacus, in a decisive battle near *Caer-Caradoc*, on the borders of Salop, he completely reduced that part of the island to the Roman yoke. The assiduity of Agricola gained the affections of the people, and disposed them to imitate the Roman manners: he bestowed on them the privileges of citizens; received them into his armies; provided for the education of their youth; and lived amongst them in a style of great hospitality. Thus, securing by policy what he had gained by force, Cambria was dignified with the name of *Britannia Secunda*: and the conquerors, as they had previously done in *Britannia Prima*, began to establish jurisdictions, and adopt measures for the due administration of the laws. Towns were built, stations appointed, and roads formed for communication between them. So speedily and successfully did they proceed in their settlement of this country, that in a few years Wales assumed all the appearance of a Roman colony. The following stations were then formed. *Caer Gybi*, Holyhead, in Anglesea;—*Segontium*, *Caer-Seiont*, Caernarvon;—*Varis*, Bodvay, in Flintshire, near Denbigh;—*Caer-gwrl* and *Holl*, also in Flintshire, appear to be sites of stations;—*Bancborium*, Bangor-Iscoed, on the banks of the Dee;—*Herri Mons*, placed by Stukeley near Bala, in Merionethshire; but, with greater probability, at Tommen-y-mur, near Festiniog;—*Caer Gai*, in the vicinity of the former place, seems also to have been a station;—*Mediolanum*, Meivod, or Myfod, in Montgomeryshire; three other places in this county seem to lay claim to such honourable distinction, *viz.* *Penalt*, near Machynlleth; *Caer-Saus*, in the vicinity of Newtown; and the *Caer*, near Montgomery;—*Magna*, Gale and Stukeley place at Old Radnor, but Horsley has removed it to Kenchester, near Hereford;—*Loventium*, Llanio-isa, in Cardiganshire;

WALES.

digaushire;—*Advegeffum*, mentioned only in the Itinerary of Richard of Cirencester, is supposed by some to have been situated at Cafler Fleming, and by others near Narberth, in Pembrokehire;—*Menapia*, the port for Ireland, near the present St. David's;—*Maridunum*, Caermarthen;—*Llanvar ar y Bryn*, in Caermarthenhire, is evidently the scite of a station;—*Lucuarum*, Louchar, or Lougher, in Glamorganshire;—*Bonium*, Boverton, near Ewenny;—*Nidum*, Neath;—*Tibia Annis*, Caerdiff;—*Gobannium*, Abergavenny, in Monmouthshire;—*Blestium*, Monmouth;—*Burrium*, Ulk;—*Ifea Silurum*, the capital of the colony, and residence of a prætor;—*Venta Silurum*, Caerwent;—*Ad Sabrinum*, on the Severn, near the new or old passage.

Of the *Roman Roads*, though more distinct traces might be supposed to exist in Wales than in England, from their vestiges not having been equally liable to obliteration from cultivation; yet for want of due investigation, few of them have been traced in a satisfactory manner.—*Via Julia Maritima*, which received the name of Julia, from Julia Frontinus, who successfully conducted the Roman arms against the Silures, is supposed to have connected the stations contained in the eleventh Iter of Richard of Cirencester. This road was a continuation of the Akeman-street from *Aqua-Solis*, Bath; and directing its course westward across the Severn, passed through Glamorganshire, Caermarthenhire, and Pembrokehire, to Ad Menapium, near St. David's: few traces of this road have been discovered.—*Via Julia Montana* was an upper road, forming a communication from the more central parts of the island, by the Ryknild-street, coming from Glevum, Gloucester, and passing through part of Monmouthshire, entered the county of Brecknock, proceeded over the mountains to Llanvar ar y Bryn, and thence along the vale to Caermarthen, where it coalesced with the maritime or lower road above mentioned, and both terminated at St. David's.—*Via Occidentalis* appears to have extended along the western coast of Wales, from Ad Menapium to Segontium, and formed connecting links between the intermediate stations.—*Via Devana* takes a direction through the centre of the principality from the southern coast about Nidus, Neath, to Deva, Chester.—*Via Orientalis* took a north-easterly direction from Ifea Silurum, to Uriconium in Staffordshire.—A branch of the *Northern Watling-street* entered Wales at Chester, and inclining to the west, passed the station Varis, to Conovium, near Conway.—A branch of the *Southern Watling-street*, extending from Uriconium to Segontium, enters Wales near the village of Llandrinio, and proceeding to Mediolanum, is there met by the *Via Devana*; it afterwards joins the *Via Occidentalis*, and continues with it to Segontium. Numerous vicinal roads also traversed the country from station to station, vestiges of which are traceable in various places. A road of communication branched off from the *Via Occidentalis* at Penallt, and proceeded easterly to Caer Sws. Another road extended north-easterly from Llanvar ar y Bryn towards the station on the river Ython, between which places it is discoverable on the extensive wailes in the vicinity of Llanrindod Wells. From Maridunum, a road leads to Loventium: the construction is evidently Roman, being formed of various stratifications; is about thirty feet wide, and edged with stone. Another may be traced from Llanio, running easterly by Llanvar mountain, and passing through Caio, it goes to Llanvar ar y Bryn, thence to the Gaer near Brecknock, and so to the grand station Glevum, Gloucester. In several places, having the denomination of Sarn, traces of vicinal roads are distinguishable; and wherever this British word occurs, it is probable a Roman road passed near; as Talfarn, Penfarn, and Saruau

in Cardiganshire. Numerous villas, sudatories, aqueducts, walls, millaria, or mile-stones, statues, votive altars, inscribed stones, tessellated pavements, urns, pottery, bricks, tiles, medals, coins, and various other remains, have been discovered, which evidently point out the vestiges of Roman residence, and by which the occupation of the country by the Romans may be clearly deduced.

Civil History of Wales.—After domineering over Britain above four centuries, the Romans bade a final adieu to the island; which was soon exposed to the inroads of numerous enemies. Affailed on the north by the Picts and Scots, it was equally infested by the Irish on the west. The native strength of the country had been exhausted by war; the number of its inhabitants further diminished by famine and pestilence; and the navy was fallen into decay. Under these disadvantages, the people were also in want of that unanimity so essential in times of emergency. They had recourse to their ancient form of government, and elected for their governors certain reguli, or chieftains; but these, instead of combining to oppose the common enemy by well-concerted plans of co-operation, were principally occupied in securing their separate interests. In this sad situation, without union, order, or discipline, and attacked on all sides by inveterate foes, the Britons adopted the most impolitic of all expedients for national safety,—that of calling in the assistance of one barbarous nation to drive out another; which subjected them to a new and heavier yoke. At this period, besides the many chieftains under whom the island was divided, a personal competition existed between one who tyrannized over the rest and held the sovereign authority, named Gwtheyrn, or (as called by most English writers) Vortigern, and a chief of Roman parentage, called Ambrosius, but by the Welsh, Emrys Wledig. During this contest, Gwtheyrn, to repel the incursions of the Scots and Picts, called in the assistance of the Saxons, an army of whom arrived under the command of Hengist and Horsa, descendants of Woden, the founder of their nation. The Saxon generals having driven back the enemy, and discovered the pusillanimity of the British monarch, turned their attention towards establishing their troops, and securing to themselves a portion of the territories they had defended: this plan, through the treachery or incapacity of Gwtheyrn, they were enabled to accomplish. The enraged Britons deposed Gwtheyrn, and placed Emrys on the throne: he for a time prevailed against the Saxons, but fresh troops arriving under the command of Ella, they became victorious, and extended their territory. On the death of Emrys, his brother Uther, commonly called, from his office, Pendragon, was elected to the sovereign dignity. The intestine warfare was carried on with varied success between the Britons and Saxons; but numerous hordes continually arriving from the north, the latter became formidable in several parts of the island. Arthur, the celebrated son and successor of Uther, for a series of years conducted the war against the invaders; and in many desperately-fought battles led on the Britons to decisive victory. During the reigns of Uther and Arthur, the ancient Britons had attained the meridian of their glory; but it was now drawing to a close: the death of Arthur decided the fate of Britain. Civil dissensions prevailed among the Britons, which were promoted by their crafty adversaries. During these troubles, many of the people submitted to the Saxons and Scots; others, to preserve their freedom, fled to Armorica, which, from the number of the refugees, acquired the name of Bretagne; some retired into the wilds of Devonshire and Cornwall; some took shelter in the mountainous parts of the north of England; but by far the

greatest

greatest number found an asylum in the fastnesses of Wales, where they defended and preserved their independence long after the expiration of the Saxon dynasty.

At the period when the Saxons had conquered the greater part of Britain, and made their approaches to the borders of Wales, this country appears to have been divided into six principalities, over which Maelgwyn, king of North Wales, was invested with the sovereign dignity, about the year 552. The contest was continued under several succeeding monarchs, till the death of Cadwallader, in the year 703, closed the imperial dignity, which for many centuries had been annexed to the British government; during which time the paramount princes chiefly resided at Diganwy, on the water of Conway, and at Caer Segont near Caernarvon. Roderic Moelwynoc nominally succeeded to the sovereignty in 720; but by continual and unhappy divisions, the strength of the country was diminished, as to be unable successfully to resist the incursions of the Saxons. The Mercians, under king Offa, frequently laid waste the country, and at length wrested a portion from the Welsh princes; and to prevent the new occupants from the retaliating vengeance of the Welsh, Offa caused that famous boundary to be made, from the mouth of the river Dee to the Wye, which still goes under the appellation of Clawdd Offa, or Offa's Dyke. By this the region was considerably narrowed, and nearly reduced to its present limits. Though the Saxons made frequent inroads, yet they do not appear to have had any permanent footing in the country; so that though the pages of history record many sanguinary conflicts between them and the Welsh, yet scarcely any vestiges remain to mark the incursions of the invaders. The Danes called off the attention of the Saxons from Wales, which from this circumstance was left for many years in unusual tranquillity, and furnishes but few subjects of historical record during the Danish dynasty. The Danes made some incursions on the coast, but effected no permanent conquest of the country. On the accession of William I. to the throne of England, the Welsh having refused the annual tribute, which had been extorted from them as a mark of submission by king Edgar, the conqueror invaded their country with a powerful army, quickly awed them into submission, and obliged them to do homage, and take an oath of fealty, as due from vassals to their superior lord. From this period the English monarchs preferred a claim to Wales, as their heritable property. On the death of William, the Welsh, feeling the galling yoke of their humbled condition, attempted to recover their lost independence; and joining in revolt with some refractory English barons, entered England, and by fire and sword carried their devastation to the banks of the Severn. These outrages determined William Rufus to attempt the subjugation of the country; and for this purpose he excited his barons to conquer, at their own charge, under homage and fealty to him, the territories of the Welsh. These barons, who were denominated lords marchers, endeavoured to secure their conquests, by peopling them with English, and erecting strong fortresses to defend them from the inroads of the Welsh. Thus was the last asylum of the Britons broken into on every side, and invested by their enemies. South Wales was subdued; while North Wales, now greatly reduced, alone preserved the national character, and supported its independence; and the inhabitants, aided by the valour of their princes, still upheld the struggle; and acquiring vigour from union, dictated by necessity, not only prevented the marchers from achieving further conquests, but rendered their existing acquisitions of precarious tenure. For a long period the Welsh, favoured by the mountainous nature of the country, supported an unequal but spirited

contest with their unjust invaders. The death of David, who had succeeded his unfortunate brother Llewelyn, in the reign of Edward I., closed the only sovereignty that remained of the ancient British empire. Edward having at length obtained the object of his ambition, by the entire conquest of Wales, annexed it to the crown of England. He did not, however, for some time, enjoy a tranquil possession; for three insurrections broke out at one time in different places. To such a height did these commotions arrive, that Edward was constrained to conduct the war in person, when he shortly compelled the insurgents to lay down their arms, and make an unqualified submission. These disturbances, the subsequent revolt of sir Gryffydd Lludd, and the rebellion of Owen Glendower, were the last efforts the Welsh made to recover their independence. From that period the concerns of the country, till the time of Henry VII., are little interesting; for the inhabitants were reduced to a state of the severest bondage. Henry VII., from the assistance the Welsh had afforded him in obtaining the crown, was more favourably inclined towards them than preceding monarchs, and granted the principality considerable immunities. Several ameliorating statutes were passed in the reign of Henry VIII., to exonerate them from the tyrannical oppressions of the lords marchers; and at length the people, awake to their true interest, solicited the king to give his liberal designs a more salutary effect, by extending to them all the privileges of the English jurisprudence. The prayer of their petition was granted, and Wales was formally united and incorporated with England.

Wales abounds with the remains of encampments, hill-fortresses, castles, and castellated mansions: specimens of military architecture, therefore, in the diversified styles of different and distant periods, constitute some of its most prominent and interesting features. While the Romans generally chose for the site of their camps, or forts, a rising ground near some river, or a lingua formed by the confluence of two; the Britons selected the most lofty, insulated, and inaccessible mountains, the summits of which they fortified by excavating deep trenches in the solid rock, adding valla, by heaping up the loose stones dug out of the fosses; and in succeeding times, by adding strong walls, and erecting massy circular towers. The Normans introduced a new style of military fortification; and to secure their unjustifiable seizures, and proceed in their aggressions, they erected castles, more formidable both in number and extent, so that what are termed the marches of Wales consist of a series of fortresses from the mouth of the Dee to the embouchure of the Wye. Flint, Denbigh, Montgomery, Powys, Brecknock, Caerphili, and Caerdiff, furnish bold examples of the style of those people. More were erected by the Anglo-Normans, as they progressively encroached on the country; for, to secure the conquered possessions from the retaliating vengeance of the expelled owners, they were necessitated to repair and strengthen the fortresses they took, or build others. Thus did these buildings so far increase, that Mr. Pennant enumerates 143 castles in the principality; and that number is probably short of the actual amount. On the conquest of Wales by Edward I., that monarch, who had been crusading in the holy land, and had there imbibed a spirit of eastern magnificence, for the purpose of overawing his new but refractory subjects, constructed three castles in a style, which for strength and grandeur have never yet been surpassed in this country. Harlech, Caernarvon, and Conway, remain the proud monuments of that monarch's age and taste.

Ancient Constitution, Government, and Laws.—From the accounts given by the Roman writers, a monarchical form of

of government was prevalent among the early Britons. The island was divided into several petty sovereignties, each subject to a separate prince; but in time of emergency and danger, they were united in one, under an officer, similar to a dictator among the Romans, called a *pendragon*. To him, by joint consent, was committed the whole military government of the independent states. Nor was this dignity temporary, like the power; for though the latter appears to have ceased with the necessity that demanded it, yet the former continued for life, and was hereditary to the male heir. But the right of succession to the separate governments does not seem to be strictly indefeasible; for, in some instances, the lineal succession was violated by the rule of tanistry. By this the king's son, brother, or nephew, became the customary inheritor of the crown; the particular person being selected by the reigning monarch, with the advice of his nobles. This sovereign elect was denominated by the law the *tanil*, or second in dignity. The Britons were not unacquainted with that rational restraint on monarchical despotism, parliamentary suffrage; for a decisive argument in favour of the existence of British parliaments is found in the preface or introduction to the laws of the great Cambrian legislator, Howel Dda. Six of the most intelligent and powerful persons were summoned out of every cantref, or hundred, to assist the king in the great work of legislation. This parliament being assembled, proceeded to examine the ancient laws, cancelled some, reformed others, enacted new ones, and digested all into one regular code of jurisprudence. This revision they presented to good king Howel, who having approved it, gave the ratifying sanction of royal authority. Both the monarch and parliament then impreciated the power of the state and the wrath of heaven upon any persons who should violate, or attempt to abrogate, any of these institutes, unless they should be constitutionally annulled in a national council, similar to the one in which they had been recently decreed. From the circumstances of this revision, many of those in the code of Howel Dda were pre-existent statutes, by which the early Britons had been regulated in previous times. From these it appears, that immediately below the sovereign ranked the *Uchelwys*, or great men holding their lands from the crown, and each presiding as lord over his particular domain. As immediate tenants of the king, they were obliged to perform certain services. Inferior to these, and holding from them as feudatory lords, were the general mass of the community, being in a state of villinage, but divided into two classes: first, such as might retain or relinquish their lands at discretion, possessed the power of buying and selling, and whose feignorial service was the least degrading of the menial kind; the other, denominated *Cæths*, were considered the property of the lord, attached to the soil, and saleable with the estate. These were bound to services the most servile, to build or repair houses for the *Uchelwyr*, and perform all the drudgeries of husbandry. Both were subject, like the chiefs, to military attendance in time of war, and to contributions in money or kind. Such were the tenures of lands in Wales, prior to the introduction of English customs, as appears by the laws of Howel Dda, not formed by him, but referable to previous institutes, ascribed to the early Britons. And as they were evidently feudal in their essence, and military in their design, the opinion of antiquaries, who deduced the introduction of a system of feuds into this island from the Normans, must be erroneous; for the laws in which it is found to have existed in Wales were collected into a digest, in the early part of the tenth century. The most prominent feature in the Howellian code is the law of inheritance, denominated *gavel kind*, by which the property

VOL. XXXVII.

was divided among the sons; the females of every degree being excluded till the utter extinction of the males, among whom no distinction was made between the legitimate and the spurious. While the Welsh preserved their independence, this law of descent universally prevailed; but on the conquest of the country by king Edward I., he directed certain commissioners to inquire upon oath into all the former laws and usages of the principality; and the first law promulgated by that monarch for the use of Wales was the celebrated statute of *Rhyddlan*. By this he permitted the ancient stem to continue, but lopped off two of its principal branches, *viz.* the admission of spurious offspring to the inheritance, and the preclusion of females. But in the 34th year of Henry VIII., the venerable trunk was for ever levelled with the ground, all the lands in Wales having been required "to be holden as English tenures to all intents." Since which period the laws of England, with the exception of a few formal peculiarities, have continued to form the jurisprudence of Wales.

Ecclesiastical History, Religion, &c.—The religion of the Britons, when Cæsar first visited the island, was of a kind peculiar to them, and to the kindred tribes of Gaul. It abounded with singular tenets, and the mode of worship comprised numerous superstitious rites, the remaining vestiges of which form some of the most interesting antiquities in the country. *Bardism*, or the Druidical system as it is generally called, has been variously represented; and the term *bard*, given to the Welsh poets who were not of the Bardic order, has tended to increase the confusion on the subject. What may be considered as the foundation of the order was the principle of universal benevolence, so that a bard was prohibited by his tenets from bearing arms; and being recognised as the herald of peace, he could pass, when clad in his azure robe, unmolested from one hostile country to another. The bards were divided into three classes, the *bard brant*, *ovydd*, and *derwydd*. To the bards brant belonged the perpetuation of the customs and privileges of the system, and of its moral and civil institutes; the *ovyddon*, or ovides, particularly attended to the cultivation of the arts and sciences; the *derwyddon*, or *druids*, were the priests who officiated in religion: from which circumstance, and from the great influence they consequently obtained over society, this class was most conspicuous, and became the general denomination of the whole.

Their origin, learning, religion, authority, revenues, decline, and extinction, have been fully detailed in this work under the article DRUIDS.

In the sixth century, the archiepiscopal seat of Wales was removed from Caerleon to Menevia, which was subsequently known by the appellation of St. David's. At that time the archbishop had under him three suffragans, the bishops of St. Asaph, Bangor, and Landaff. In the tenth century, St. David's lost its archiepiscopal honours; and in 1101, it became subject to the metropolitan see of Canterbury; to which, on the subjugation of the country by Edward I., the whole of Wales, as to ecclesiastical affairs, submitted; and at the dissolution of monasteries, the Welsh having been subjected to the English laws, the clergy in Wales were brought under the same regulations as those in England. And from the close incorporation of the two countries, the history of the church, after that time, is nearly similar in both. In Wales are many sects of what are considered regular Protestant dissenters from the established church, which had their rise in the reigns of James I. and Charles I., and more especially during the protectorate of Oliver Cromwell. But the greatest number of seceders from the established church are the dissent descriptions of Methodists, whose places of

assembling, multiplied over the face of the country, receive the appellation of chapels. Of this increasing dissent, one reason is assigned to be the generally illiterate state of the regular clergy: for most of the livings in Wales are so small, and the stipends of curates so scanty, that no inducement is held out for youth being properly instructed for the ministry, and consequently the churches must be served by incompetent ministers. But this evil is likely soon to be remedied; for by the zealous endeavours of the present worthy bishop of St. David's, two seminaries are instituted for the education of youth designed for holy orders, who are provided with tutors. Most places in Wales have the benefit of a free-school; and in the year 1749, for the instruction of the children of the lower orders, 142 itinerant schoolmasters were appointed by the society for promoting Christian knowledge. Those among Protestant dissenters have been provided for in this respect by the pious bequest of Dr. Daniel Williams, many years the respectable pastor of a congregation in London, who left a large sum of money for establishing charity-schools, where such institutions were wanted; by virtue of which the trustees have erected many in the principality.

The lovers of *ecclesiastical, monastic, and sepulchral architecture*, will find ample scope for amusement and admiration, in the remains of religious edifices, both in an integral and dilapidated state, still visible in various parts of the principality.

Mountains, Lakes, Rivers, and Climate.—Wales exhibits all the features of a detached district from England, consisting of almost continued ranges of lofty mountains, and impending crags, intersected by numerous deep ravines with extensive valleys, and affording endless views of bold, wild, or romantic scenery. To enumerate the mountains which are nominally known to the natives, and form very striking objects to the traveller, would be superfluous; but a general view of them, as they are grouped with multifarious ramifications, may be useful. The chains generally extend in a direction from south-east to north-west, having their escarpment, or most abrupt declivity, on the latter bearing. Numerous projecting ridges laterally expand on various parts of the compass, in countless ramifications, many of which are surmounted by lofty eminences, that are formed into so many distinct mountains, so that, like the Alps, they seem to be mountain piled upon mountain, and hills conglomerated upon hills. The principal range in North Wales is that denominated the *Snowdonian* chain, from the lofty mountain Snowdon occupying its centre. Commencing at Bardsey island, in the south-west extremity of Caernarvonshire, the line, varied at irregular intervals by conical peaks, extends in a north-easterly direction to the promontory of Penmaen-bach, in the bay of Conway. The intermediate parts consist of the loftiest mountains in Wales. The *Ferwyn* chain occupies the eastern part of Merionethshire, and branches out into Denbighshire. Its length is about sixteen miles, and the breadth varies from five to ten: Cader Ferwyn, Cader Frownen, and the Syllatin, are the most elevated points. Another line branches off into Montgomeryshire, and joins the Breiddin chain, extending into Shropshire. Another chain, or rather a continuance of the same, extends in a south-west direction from Pennant, near the vale of Tanad, in Montgomeryshire, to the sea-coast near Langyllin in Merionethshire. In this extensive ridge are conspicuous several lofty mountains, known under the appellation of the Arrans and the Arrenigs; the most eminent of which are Arran-ben-llyn and Arran-fowddy, and the extremity of the line is grandly marked by the triple head of the lofty Cadir Idris. The celebrated *Plinlimmon*

proudly elevates his crest above a range of table land, extending from the vicinity of Llanfair in the north-east, till they decline in the south-west, and end in the abrupt cliffs, which bound part of the bay of Cardigan, near Aberystwith. Among particular elevations in this line, after the sovereign of the group, the Carno mountains stand the most pre-eminent. South Wales, though not equally mountainous with the northern part of the principality, nor so distinguished for its Alpine heights, is yet far from being deficient in elevations and depressions. An extensive chain of mountains stretches from Bledvda forest, north-east of Llandrindod Wells, in Radnorshire, crosses the northern part of Brecknockshire, continues in a south-westerly direction through Caermarthenshire, and terminates in the conspicuous ridge of the Prescelly or Prescelau mountain in the county of Pembroke. The Fothoc hills, on the eastern side of Brecknockshire, commence another line, principally known under the general appellation of the *Black Mountains*, from the appearance given to them by the dark vegetable covering of heath and ling. Among individual elevations, remarkable for their height, are Tre-beddw mountain, Pen Mallard hills, the black mountains strictly so denominated, and the high table land which in the fourth part of Caermarthenshire is closed by the isolated mountain, called Pembre hill. In this mountainous region, lakes are exceedingly abundant; an attempt to describe, or even to enumerate them, would be endless: Mr. Gough reckoned from fifty to sixty in Caernarvonshire only. The most distinguished for extent, or the beauty of the surrounding scenery, are, in North Wales, Llynian Nantle, Llyn Cywellin, Llynian Llanberis, and Llyn Conway, in Caernarvonshire; with Pimble-mer, and Tallyllyn, in Merionethshire. In South Wales, Llyn Bichlyn, in Radnorshire, and Llyn Savathan, or Langor's pool, in the county of Brecknock.

Rivers.—Wales, though a mountainous country, is equally remarkable with England for its numerous streams, which issuing from considerable lakes, or aided by their waters, meander through the country, and form excellent harbours at their confluence with the sea. The principal rivers are the Severn, the Wye, and the Towy, in South Wales; the Conwy, the Clwydd, and the Dee, in North Wales: these have not only attained pre-eminence in fame for the utility of their navigation; but, by poets, have been celebrated in song. The former constitutes the eastern, and the latter the north-eastern boundary of the country, between the embouchures of which many others, though less distinguished in a commercial point of view, are highly valuable for their fisheries and other properties. These, tracing their sources in the order in which they unite their waters with the ocean, are, in North Wales, the Ogwen, Sciout, Gwynedd, Drwydd, Avon, and Dovey; in South Wales, the Rheidol, Ystwith, Eiron, Tivy, Nevern, Gwyn, Cleddy, Itrog, Taf or Tave, Loughor, Tawy, Nedd, Avon, Taf or Tasse, Rhyminy, and Usk. A particular description of the most considerable, will be found under their respective names.

The *climate* of Wales differs materially from that of the portion of England, lying in the same parallel of latitude; and assimilates more with the northern parts of the island. In a general view the air is sharp; in the mountainous parts bleak; moderately mild in the vales, and those parts adjacent to the ocean, especially on the southern coast, and particularly in the celebrated vale of Glamorgan. From the greater degrees of cold prevalent in the Cambrian atmosphere, snow is more frequent in Wales than in England, lies much deeper, and is seen covering the tops of the highest mountains, for many months in the year. The wet season in this country is not usually confined to the winter months; for

for rains are frequent at all times of the year. The gaged quantity of rain which annually falls in England, according to the experiments of Dr. Hales, is about twenty-two inches; while the average that descends in Wales may be estimated at thirty-four. From numerous observations respecting this subject, the result has uniformly been, that more falls on the western than on the eastern side of the kingdom, and most in the mountainous districts; consequently Wales must participate largely in such an excess of humidity. In the year 1802, the quantity of rain which fell in London was fifteen inches, and in Brecon twenty-six inches. Moist is the climate of Wales most consequentially by from this vaporous state of its atmosphere, yet the air is in general highly salubrious, and the country healthy. Scarcely a cemetery in the principality, but bears some testimony to the longevity of the inhabitants, even to the protracted age of a century, and in some instances even to a greater extent.

Natural Productions and Minerals.—Few countries can vie with Wales in the multifarious variety of its productions, while none perhaps have been so long and undeservedly neglected. Some animals, rarely to be met with, frequent the wilds of this diversified country. The goat is here found in its native state, and is far superior in size, and in the length and fineness of his hair, to that of most other mountainous countries. Though this useful animal has been long domesticated, yet many of the inhabitants of North Wales suffer the goats to run in a wild state, and bound from crag to crag. These they are accustomed to kill during autumn for the sake of the fat and skins: thus goat-shooting and goat-hunting are still practised by the people in Wales. Roebucks were anciently numerous, but are now confined to the most intricate parts of the country, and they are rarely to be seen. Of the feathered tribes, many species, not found in other parts of the island, are to be met with here. The golden eagle is an inhabitant of the Snowdonian mountains, which thence are supposed to have derived their appellation of the Eagle rocks. The peregrine falcon, supposed to be the bird which furnished the amusement of falconry to our ancestors, and formed a sort of criterion for nobility, breeds abundantly among the rocks of Llandidno, in Caernarvonshire. The merlin, used in hawking, migrates from Wales to England generally in September. The water rail is found in Anglesea, early in the spring; and immense flocks of puffsins visit the island of Priestholme about the same time. The guillemot, and the black-backed gull, frequent the Welsh coast during the winter. Among the numerous fish, which abound in the rivers of Wales, in addition to those generally known in England, may be noticed the crooked perch found in Llyn Raithlyn, Merionethshire, and the deformed trout, said to be peculiar to a brook, called Syrcian, in Cardiganshire: (these two species are described by Daines Barrington, in a communication to the Royal Society 1767): also the samlet is frequent in the upper part of the Severn and the Wye; the sewin, the red char, the silver char, and the gwiniaid. Some of these, however, are not exclusively peculiar to the principality, but are found in some of the rivers of Scotland, and in the lakes of Westmoreland and Cumberland.

The mineral productions of Wales form the most interesting part of the subject, and furnish an inexhaustible source of profitable investigation to individuals, and of national wealth. The mountains and hills may be separated into three distinct classes, *viz.* primitive, secondary, and derivative, which in a general view may also be distinguished by the peculiarities of their form, as well as their relative situation. Primitive granite mountains consist of craggy

steep rocks, tending in the ascent more or less towards an acute or slender pointed summit, the loftiest mountains are centrally situated in the chain, which commencing and terminating in abrupt precipices, with the insulated peaks that interrupt the general outline, form a striking and distinctive character. Secondary mountains, chiefly composed of schistose substances, range next in the scale, and are distinguishable from the former by their inferior height, the evenness and squareness of the individual links which compose the chain, and by the easy waving though varied line of the general contour: instances of which are conspicuous in the Ferwyn and Breddin mountains previously noticed. Derivative, or calcareous and siliceous hills, range considerably lower than the secondary or slate mountains, usually rising by a gradual ascent at one extremity, and terminating abruptly at the other. The lime-stone hills frequently assume a pyramidal shape, while the ridges of the sand rocks, and banks, are broader and rounder than those of lime. These, however, often trap into each other, and then little dissimilarity is discoverable in their form. The primitive mountains in mass contain no metals; copper is however found in several of the horn-stone stratified mountains, of which the Parys mine, and those at Llanberis and Pont-Aberglafflyn, are examples. In these mines, the ore is for the most part yellow, sulphuret of copper, the green and blue malachites or carbonates of copper, are found in lime-stone, as at Ormes-head and Llanymynech hill, where copper is not produced in any other state but that of carbonate, which is also found in the calcareous cement of sand rocks. The strata generally most productive of the metallic ores are lime-stone; and most species of whin-stones, or the argillaceous mountain rocks, of which there are many varieties appearing in thick, thin, and mediate strata; some of these rocks are moderately and others exceedingly hard. They affume various colours, though principally one or other of the numerous shades of grey. Several rich and valuable mines are discovered in granite or moor-stone mountains. These three orders or classes of rocks, with their concomitant strata, are usually intersected by mineral fissures, and contain the largest quantity of mineral substances, and metallic ores. But of all classified strata, in which the richest mineral veins have been discovered, the indurated argillaceous mountain rocks are the most prolific and extensive. Many of the mines in North Wales, nearly the whole of the numerous valuable lead mines in the county of Cardigan, and most of the mines in other parts of South Wales, are found in this kind of matrix or strata. The principal subterraneous substances produced in Wales, may be divided into three classes, metalline, mineral, and lapideous; and the places where they are dug receive the distinctive appellations of mines, pits, or quarries. Silver is obtained in considerable quantities, though not at present found in what may be exclusively denominated silver mines. Cwmlymlog mine in Cardiganshire consists of silver ore, lead ore, and quartz; which, from the rich produce of the more precious metal, received the appellation of the Welsh Potosi. Daren vawr, Daren vach, Goginan Cwm Ewyn, and Mynydd bach, contain similar substances to those of Cwmlymlog, though not equally productive of silver. Llanvair is at present the richest mine worked in the principality; comprising silver, lead, quartz, spar with a small portion of copper, and yields about one-sixth of lead ore. About sixty to eighty ounces of silver are extracted from a ton of ore, and twelve hundred and a half weight of lead. Copper, which was known and appreciated by the Romans while in possession of Britain, is abundant through different parts of the island, but was not an object of commercial investigation till within

about two centuries past; nor in Wales to any considerable purpose till the middle of the last. The copper works of the Romans lay for ages neglected; and to the public and enterprising spirit of Nicolas Bailey, the country owes the revival of research for this valuable metal. Parys mountain in Anglesea consists wholly of copper, either in a state of native copper, sulphate, black ore, or malachite: the matrix is a dark grey chert, and the superstratum aluminous slate. The copper ore found at Llanberis in Caernarvonshire, is of a very superior quality to that of Parys mountain, yielding from eight to ten *per cent.* weight of metal. This ore subsists in the primitive stratified rocks, and generally in a matrix of schistose hornblende, or quartz. The same mountainous ridge, consisting principally of whin and horn-stone, divided by the immense chasm over which is thrown the bridge called Pont-aber-glaslyn, contains another copper mine producing ore similar in quality to that of Llanberis; and it is highly probable the whole of this district is pregnant with copper. Efcair vraith mine in Cardiganshire consists of copper ore, spar, quartz, and a substance, termed by the miners *gozin*, which forms an envelope to the quartz. *Lead*, for which this island was always famous, is found in a variety of places through Wales, but particularly in the counties of Flint, Caernarvon, Montgomery, Caermarthen, and Cardigan; indeed the latter may be considered as the most extensive and richest mining field in Britain. A mineral tract stretches from Pen-yr-allt, or Bryndrigi, in a line to the western borders of the parish of Holywell in Flintshire, and is known under the name of Whiteford rake. The ores differ in quality; the lamellated, or common kind, usually named potter's ore, yields from fourteen hundred to sixteen hundred and a quarter of lead, out of twenty hundred of the ore; but the last produce is rare. The veins are found either in chert or lime-stone rocks, and some of the best ore has been dug at the depth of ninety yards. In this tract several levels have been driven and shafts sunk, and lead continues to be obtained in very considerable quantities. Between Gwydir and Capel Cerrig in Caernarvonshire, within an extensive dip between lofty mountains, are very extensive lead works. The surrounding rocks consist of slate, bituminous shale, and trap or whin; the matrix of the ore is quartz, and calcareous spar; they produce lead and calamine, mixed with iron ochre, and a small quantity of copper pyrites. These different substances are so blended, that in the same specimen a variety of them may be found. But Cardiganshire may be peculiarly denominated the region of lead mines, the whole country apparently having its rocks cemented together with veins of this metal. For a vast extent the land is excavated, and the surface covered with the opening of mines already worked, or the vestiges of numerous others that have furnished their subterraneous treasures to remote generations. The principal lead mines in this county are Cwm-yftwyth, Llewerneg, Inys Cynvelin, Penybanch, Bron-y-goch, Llwynnwnweh, Grogwynn, Gellan Erin, and Nant-y-Crier. The ore found in most of the Cardiganshire mines is nearly of a similar nature, consisting chiefly of lead, mixed with quartz and spar, accompanied frequently with quantities of an ore of zinc, denominated by the miners, from its dark appearance, black jack. This, which formerly was appropriated to the repair of the roads, has lately been discovered to be a valuable article, constituting an excellent flux for brass; and, mixed in due proportions with copper, makes a hard metal, similar to the orichalcum of the ancient Romans. *Iron*, the most useful, and through the wise distribution of Providence, the most common of all metals, is plentifully dispersed over the British isles; and Wales is not deficient in this particular. Yet, notwithstanding

the mountains of this country are full of iron-stone, it was not till within about half a century, that the public attention was turned to this inexhaustible source of internal wealth. Iron is most abundant in South Wales, though evident marks of its existence may be traced in North Wales; and it has lately been procured, and works erected in the vicinity of Ruabon in Denbighshire. The several species of iron which have been discovered are hematites, kidney ore, or compact brown iron-stone; grey ore, or black iron-stone; bog ore swampy iron-stone; and a variety of sulphurated and arsenical ores, which class under the general denomination of pyrites; but the kidney and grey ores are the most frequently found. The principal iron works are Merthyr Tydvil, Aberdare, and Cyfartha, in Glamorganshire; and the Union, Llanelly, Beaufort, and Hirwan, in Brecknockshire. *Coal* is found in every county of Wales except Cardigan, Merioneth, and Caernarvon. The coal sometimes underlays the calcareous strata, or, in the miner's phrase, has a lime-stone roof; but more frequently it is found on the northern or southern side of a lime-stone ridge; and when a tract of low land is included between two such ridges, it may be inferred, that coal lies beneath. Two parallel lines of calcareous strata extend through South Wales in an easterly direction, from St. George's Channel across the whole country. These are accompanied by two lines of coal. Upon the upper line, coal has been found at Johnstun, Picton, Jeffreston, and Begeley, in Pembrokehire. Thence keeping on the southern side of the lime-stone ridge, it crosses the Towy, forming the bar at the mouth of that river; and passing through the upper part of Caermerthenshire, Brecknockshire, and Monmouthshire, crosses the Severn to the collieries of Kingwood near Bristol. The different species of coal in Wales are the newcastle, the rock, the stone, or splent, the cannel, or parrot, and the culm, or blind coal, denominated in England Welsh coal, because almost peculiarly the produce of Wales. Some varieties of the cannel coal are so fine and solid in the contexture, and so susceptible of a high polish, as to be capable of being turned in the lathe, and formed into various utensils, toys, and trinkets. The schistose mountains of Wales afford another substance, if not of equal importance, yet of general utility. *Slates*, customarily called Cornish tile, because originally procured from Cornwall, constitute an elegant and useful roofing to houses much cheaper than lead, for which it is latterly become a very common substitute. Slate quarries are numerous scattered over the country, but the principal are those of the Rheidiol near Aberystwith, Cardiganshire; Llangynnog, Montgomeryshire; and the extensive ones in Snowdonia, Caernarvonshire. Those of the former place produce specimens of the large and coarsest kind of slate, which lie in compact masses, resembling flag-stone, of a rough texture, but separating easily into large plates. Llangynnog slate also divides into large plates, is not of quite so coarse a quality, and forms a very profitable building article. These quarries, Mr. Pennant observes, yielded from November 1775 to the same month in the following year 904,000 slates, which were sold from six to twenty shillings per thousand. The Snowdonian slates are generally of a very fine grain, a beautiful blue colour, and when quarried separate into exceedingly thin laminae; properties, which render them particularly eligible for handsome roofing, and manufacturing into writing slates. So great have been the quantities of late years procured from this district, that a small insignificant creek has been dignified with the name of Port-Penrhyn, from the export trade of this article only. On viewing the different apertures of the schistose mountains,

tains, a striking geological fact will result, correspondent with the principle of uniform though unequal declivity. It is observable that the strata are always coarsest in their texture on the northern or north-western sides of the ridge, and less so on the south and south-western sides; becoming gradually finer as they approximate the lime-stone hills. Wales affords numerous quarries of other valuable stones; *viz.* different kinds of marble fit for monuments, columns, chimney-pieces, and other ornamental sculpture; serpentine and other species of horn-stone; chert or petri-folent, and pure quartz, for the use of the potteries. Nor should that rare and curious substance be omitted, which furnishes the asbestos, indestructible by fire, found on the shores of Anglesea. The mona marble, from the isle of Anglesea, is now much used in chimney-pieces and fancy furniture. (See *MARBLE, Britisb.*) The Britons, as already observed, understood the use of metals, and were further instructed in the arts of mining by the intelligent Romans; but after the departure of the latter, self-preservation occupied the attention of the natives, and peaceful science sunk under the devastating hand of war. Yet their mines were not wholly neglected, for it was probably by means of this subterraneous wealth, that the Welsh were enabled to support against the English an unequal warfare for so long a time. During centuries after the conquest, in England the crown asserted its exclusive right to all mines and minerals; and no person could search for ore unless empowered by a royal grant, under conditions imposed at the discretion of the monarch. Edward I., on his conquest of Wales, extended his mining authority over that country; and it does not appear that the proprietor of the land, on which a mine was opened, had any share in the profits, till the reign of Henry VI., when the duke of Bedford having obtained a lease of all mines containing any gold or silver, a reservation was made of a twentieth part of the proceeds to the owner of the land. Queen Elizabeth, however, adopted a sound policy: she sent over for some experienced Germans, and granted letters patent to them and their heirs for ever, to search for and conduct the business of mines, through several specified English counties, and the whole principality of Wales. The patentees divided part of their tenure into shares for sale; and with the purchasers of such shares, they were incorporated by the style of the "governor, assistants, and commonalty of the mines royal." But though the foundation was thus laid for the present success in mining, yet little of importance was effected till the reign of Charles I. According to the testimony of Schlutter, the lead mines in Flintshire were not worked before the year 1698, when Dr. Wright and his associated adventurers established a smelting-house at Halkin. The subsequent extension of mining concerns was encouraged by the repeal of former restrictive statutes, and by the enactment in the first year of William and Mary, that persons having mines shall enjoy the same, although claimed as royal mines; the king having the right of pre-emption in the ore at certain regulated prices.

Agriculture, Bridges, Roads, and Canals. Wales in a general view may be considered a century, at least, behind England in its state of agriculture. The mode of ploughing, the course of crops, the deficiency of manure, the want of draining, and the rude implements of husbandry, are all calculated for making a progress in agricultural amelioration. Many of the errors evidently arise from the ignorance, prejudice, indolence, and poverty of the tenants; but other causes are attributable to the proprietors of estates. One is, not granting proper leases, the lands for the most part being let from year to year: a still more injudicious custom is the

letting farms by auction. But though this is the general state of agriculture, yet striking and honourable instances occur, in divers places, of more rational conduct. Many gentlemen are setting the example of the most improved practice; and almost in every county, associations of intelligent agriculturists have been formed for the introduction and encouragement of a better system of husbandry. From the nature, as well as number of the rivers in Wales, the erection of bridges must have excited, at an early period, the attention of the Welsh. Insupermountable barriers must have been opposed to the traveller, without the aid of which may be termed pendent bridges; that is, such as are thrown from crag to crag, at a prodigious height above the water. Of this kind is the bridge, or rather two bridges, called Pont-ar-Mynach, near Hafod, in Cardiganshire, forming a pass over an awful yawning chasm, through which the river rolls its waters to the Rheidol. Another, called Pont-aber-glas-lyn, forms a communication over a narrow defile in the mountainous ridge separating the counties of Caernarvon and Merioneth. Numerous bridges, of a single arch, are scattered over the country; of this class is the celebrated Pont-y-Prydd, crossing the boisterous Taffe in Glamorganshire. Among those bridges composed of more than one arch, the triangular-arched bridge over the river Dee at Llangollen, is curious for its mode of construction, and great antiquity: the bridge across the Conwy, near Llanrwit, is an elegant structure, and does honour to the skill of its architect, Inigo Jones. The bridge of five arches at Bangor-Iscoed, in Flintshire, is a fine specimen of architecture. The town of Caermarthen is entered by a long ancient bridge; but the stupendous aqueduct, by which the continuation of the Ellesmere canal is carried over the Dee, at Pont Cyffyllte, between Llangollen and Chirk, in Denbighshire, is the chef d'œuvre of this species of architecture; and can only be exceeded in grandeur or utility, by the projected bridge over the Menai straits, by which it is proposed to form a land communication between the county of Caernarvon and the island of Anglesea. Wales, though long famed for its bridges, was, till of late years, nearly a stranger to good roads. Except the two great mail-roads, forming the communication with the north and south of Ireland, by the way of Milford and Holyhead, whence the packets sail for that country, scarcely a road could be found, calculated for the passing of carriages. But to this essential point for profit and convenience, the land proprietors have recently directed their attention with the most beneficial effects; and the country may now be traversed in almost every direction. Under the auspices of that public-spirited nobleman, the late lord Penrhyn, a grand road has been cut through the immense range of lofty mountains, denominated Snowdonia, by which an extensive communication has been opened between the internal parts of North Wales and the coast; and the great thoroughfare from London to Dublin by way of Holyhead diminished in length, compared with the former one by way of Shrewsbury and Conway, twenty-five miles. Numerous roads have been widened, shortened, and otherwise improved, by the addition of drains, arches, bridges, &c. to the great accommodation of travellers, and general benefit of the inhabitants. Already has the country begun to experience the advantages by new communications having been opened for the produce of the interior, in the reduction of the rate of carriage, and in the easy access thus afforded for the conveyance of ponderous articles to the sea-coast, or to the inter-communications with the navigable rivers by inland canals.

Improvement by internal navigation was long neglected in this country, though equally capable of such advantages

as England. In North Wales, the first project which engaged the attention of the landed interest, was the junction of the navigation on the rivers Severn and Dee, by opening an aquatic communication through the counties of Denbigh and Flint, with various ramifications into the mining and manufacturing districts in the adjacent counties. This is called the Elfemere canal, connected with which is the Montgomery canal. Those in South Wales are the Kidwelly, Cardiff and Merthyr Tydvil, Aberdare, Neath, Brecknock, and Swanley canals. For a particular description of each, see their respective names under the article CANAL.

Manufactures, till within these few years, were not very extensively diffused, nor could be considered of much account in the general scale of productive industry. Wales, however, has for centuries been celebrated for its flannels, and may be considered as standing unrivalled in this useful article. The woollen substances manufactured are webs, flannels, stockings, wigs, gloves, and socks. Webs are distinguished by the trade into two sorts; the strong or high country cloth, and the small or low country cloth. Strong cloth is made in Merionethshire, and principally in the vicinity of Dolgelly and Machynlleth: at the latter place is a manufactory upon a small scale, a circumstance only worthy of notice, as forming the commencement of a change in preparing the wool, which will probably soon become general. The standard width of this cloth is seven-eighths of a yard; the length of a piece, or what is emphatically styled a web, is about 200 yards; the quality is of various degrees. Small cloth is the produce of Denbighshire; it is chiefly manufactured within the parish of the Glynn, a large tract of country including Llangollen and Corwen. This article is about one-eighth of a yard narrower than strong cloth; the length is the same. Flannel constitutes the most important of the Welsh manufactures: it is chiefly the produce of Montgomeryshire; but by no means confined to that county, being made in various places within a circle of about twenty miles round Welshpool. A manufactory of note has been established a considerable time at Dolobran; and two on a large scale have been recently erected near Llanydloes, where the various machines, used in the woollen trade by the English, are applied to the purposes of manual labour. The principal markets for webs and flannels are Welshpool and Shrewsbury; the quantity made is not easily ascertained. Mr. Pennant, in his *Snowdonia*, published in 1781, mentions, that there were brought "annually to Salop 700,000 yards of webs; and to Welshpool annually between 7 and 800,000 yards of flannel." Stockings, wigs, socks, gloves, and other small knit articles, are sold chiefly at Bala, Merionethshire, being made in that town and neighbourhood. Stockings, to the amount of from two to five hundred pounds worth, are sold each weekly market-day. Very considerable manufactories of cottons and cotton twill have been established in the counties of Flint and Denbigh, the principal of which are Northop, Greenfield, Seceving, Newmarket, and Denbigh. In some of these factories cotton yarn is spun of so fine a texture, that 130 hanks, each being 830 yards in length, make but a pound weight. Numerous manufactures of copper, iron, lead, tinplates, &c. have also been recently set up in various towns both in North and South Wales. *Commerce* may justly be considered at present in its infancy, being chiefly confined to the coaling trade. Except Caernarvon and Swansea, which have lately extended their views to Spain, Portugal, and the West Indies, few of the Welsh ports possess vessels of very considerable tonnage; though no part of the island contains a greater proportion of harbours and roads, some

of which are safe and good, and more might soon be made so, by the building of piers and other improvements, which are obvious at the respective places.

Peculiar Customs, Superstitions, &c.—Among a variety of Welsh customs, those in courtship, marriage, and at funerals, excite particular attention. Hymenal negotiations are frequently carried on by the Welsh peasantry in bed: the young swain goes sometimes several miles to visit the object of his choice at her residence; the lovers retire to a bed-chamber, and between the blankets converse on those subjects which the occasion suggests. This usage is confined to the labouring classes of the community; and is scarcely ever productive of those improprieties which might naturally be expected. Previous to the celebration of a wedding, a friend undertakes the office of a bidder; who goes round the neighbourhood to invite all persons of nearly the same situation of life as the contracting parties: in consequence, the friends and neighbours for a great extent make a point of attending the wedding, laden with presents of money, butter, cheese, and other provisions; these are carefully recorded by the clerk of the wedding, opposite to each respective name, and are to be repaid in the same public manner, on similar occasions, whenever demanded. This custom is called *pwrs* a *gwegrys*; and making the presents is termed paying *prwydion*. As an ancient usage, it is considered as recoverable by law; but a sense of the reciprocal duty generally prevents litigation. Funerals in Wales are attended by greater crowds of people than even their weddings. When the procession sets out, every person kneels, and the minister repeats the Lord's prayer. At every cross-way, the same ceremony is repeated, till they arrive at the church; the intervals of time being filled up by singing psalms and hymns. A remarkable custom prevails, in some parts of Wales, of planting the graves of departed friends with various evergreens and flowers. Box-thrift, and other plants fit for evergreen, are planted round in the shape of the grave for a border, and the flowers are placed within, so that the taste of the living may be known by the manner of embellishing these mansions of the dead. The snow-drop, violet, and primrose, denote the infant dust; the rocket, rose, and woodbine, shew maturer years; while tansey, rue, and star-wort, mark declining life. Each has its little evergreen, fond emblem of that perennial state where change is known no more. It has been observed, that mountainous scenery is peculiarly friendly to those aerial and imaginary existences which constitute the objects of superstition. This is exemplified in Wales. The belief of witchcraft is still strong, and many are the fatal effects supposed to be produced by supernatural agents: at every house may be seen a horse-shoe, a cross, or some charm of defence. Many old women, on account of their age, and perhaps deformity, bear the odium of preventing the cows from yielding milk, and of inflicting disorders on men and cattle. The supposed witches find it their interest to deny nothing that is alleged to them; and thus become held in superstitious fear by the people, and obtain a livelihood from their imagined extent of power. The belief of those elvish beings called fairies appears to have been ancient and general, and is not yet wholly eradicated. In some degree connected with fairies, is another species of supposed aerial beings, called knockers: these, the Welsh miners say, are not to be seen, but are heard under ground, in or near mines, and by their noises, which represent the different stages in the progress or mining, generally point out to the workmen a rich vein of ore. An opinion is prevalent within the diocese of St. David's, that previous to the death of a person, a light is sometimes seen to proceed from the house, and pursue its way

way to the church, precisely in the track that the funeral will afterwards follow. This is traditionally attributed to the special prayer of St. David, that no one in his diocese should die without this intimation of departure, which is called *Cancuyll corpb*, or the corpse candle.

Language, &c.—The Welsh language, has an undeniable claim to very high antiquity, as a dialect of the Hebrew, spoken by the descendants of Japhet: in its formation, as well as grammatical construction, it has a near resemblance to the original tongue; and is, perhaps, without exception, the most primitive and uncorrupt living language in the western world. It abounds with original words, more especially technical terms, which other languages borrow from the Greek, or express by circumlocution, and is said to be peculiarly fitted for poetry. The orthoepy of the Welsh is very different from that of the English. In the language of Cambria are forty-three letters; sixteen of which are radicals, expressive of the primary sounds; and the rest may be considered as ferveles, because used as inflexions or mutations of the former; for each of these there is an appropriate character. But the language is gradually getting into disuse, especially in the southern part of the principality. The gentry of the country are principally educated in England, and consequently few of them speak it, and many wish for its extermination. The example of the higher classes extends, and ere long the language and manners of Cambria may coalesce with those of the inhabitants to the east of the Severn. See grammar attached to Owen's Dictionary of the Welsh Language, which contains an ample critical dissertation, &c. 2 vols. 4to. 1803.

Poetry was in high estimation among the ancient Britons: Wales, as their place of refuge, was early the seat of the poetic muse, and modern effusions of original genius evince that she has not deserted her favourite mountains. In no nation, except the Hebrew, was genealogy considered of so much importance, or carried to an equal extent, as in Wales. Family distinction is pursued so far, that perhaps it induces the Cambrian to think more highly of himself than is rational. Pride of ancestry was a delicate and essential point among the ancient Britons, and consequently they were more desirous of noble than of rich connections. So deeply was this principle rooted, that even the lowest classes of the people carefully preserved the descents of their families, and were in general able from memory not only to recite the names of their proximate progenitors, but to trace their various relations back through numerous generations.

Whoever reads the history of the most ancient inhabitants of this island, the Cambro Britons, will find innumerable instances of the reverence which they paid to their poet-musicians, the bards, both of Pagan and Christian times; and songs of very high antiquity have been preserved in the Welsh language, though not all the tunes to which they were sung. The harp, with which these songs used to be accompanied, was in such general favour in Wales, as to be regarded among the possessions necessary to constitute a gentleman. (*Leges Wallicæ.*) The most ancient Welsh poetry that is now intelligible was written about the year 1100, and some of the tunes that are preserved in the late Mr. Morris's MS., which were transcribed from the music-book of William Penllin, the harper in queen Elizabeth's time, are supposed by Dr. Davies (*In Præf. ad Gram. Brit.*) to be coeval with the verses to which they were sung, when he composed his grammar and catalogue of ancient Cambro-British songs. Unluckily the notation, or tablature, in which these tunes have been written, is so uncommon and difficult to reduce to modern characters, that

though the gravity or acuteness of the several notes can be ascertained, yet their lengths, or duration, cannot be established with any degree of certainty, by any rule which we have been yet able to devise.

The northern annals abound with pompous accounts of the honours conferred on music by princes who were themselves proficient in the art, and the Cambro-British institutes, with laws and privileges in favour of its professors. As the first musician, or bard, was the eighth officer in dignity, at the court of the Welsh kings, and had a place in the royal hall next to the steward of the household, so the respect and dignity with which bards in general were treated about this time, in all the courts of Europe, were equal to those which Homer tells us their predecessors Demodocus and Phemius enjoyed in Greece. Music was now a regal accomplishment, as we find by all the ancient metrical romances and heroic narrations in the new-formed languages of the times; and to sing to the harp was necessary to a *perfect prince and complete hero.*

The first Greek musicians were gods; the second heroes; the third bards; the fourth beggars! During the early times of music, in every country, the wonder and affections of the people have been gained by *surprize*; but when musicians became numerous, and the art was regarded of easier acquirement, they lost their favour, and from being seated at the tables of kings, and helped to the first cut, they were reduced to the most abject state, and ranked among rogues and vagabonds.

For more particular accounts of different parts of Wales, the reader is referred to the names of the twelve counties: *viz.* ANGLESEA, BRECKNOCKSHIRE, CAERNARVONSHIRE, CAERMARTHENSHIRE, CARDIGANSHIRE, DENBIGHSHIRE, FLINTSHIRE, GLAMORGANSHIRE, MERIONETHSHIRE, MONTGOMERYSHIRE, PEMBROKESHIRE, and RADNORSHIRE.—Hoare's *Giraldu Cambrensis*, 2 vols. 4to. 1806. *Beauties of England and Wales*, vol. xvii., North Wales, by Rev. J. Evans, 1812. Ditto, vol. xviii., by Rev. T. Rees, 1815. *Warrington's History of Wales*, 2 vols. 8vo. 1788. *Malkin's Scenery and Antiquities of South Wales*, 2 vols. 8vo. 1807. *Aikin's Journal of a Tour through North Wales*, 12mo. 1797. *Evans's Tour through North Wales*, 8vo. 1802. Ditto *through South Wales*, 8vo. 1804.

WALES, a town of America, in the district of Maine, and county of Lincoln, containing 471 inhabitants; 55 miles N.E. of Portland.

WALES, *New*, a name given to a part of North America, situated to the south-east and south-west of Hudson's bay, and divided into north and south: the former name is lost in the more general term of Labrador. *New South Wales* is situated to the north-west of Canada, and extends along the south borders of Hudson's bay 450 miles, from N. lat. 54° to 58°. W. long. 85° to 95°.

WALES, *New South*, a name given to the eastern part of *New HOLLAND*; which see.

WALES, in a *Ship*, an assemblage of strong planks extending along a ship's side, throughout her whole length, at different heights, and serving to reinforce the decks, and form the curves by which the vessel appears light and graceful on the water. As the wales are framed of planks broader and thicker than the rest, they resemble ranges of hoops encircling the sides and bows. They are usually distinguished into the main-wale, and the channel-wale. The situation of the wales, being ascertained by no invariable rule, is generally submitted to the fancy and judgment of the builder. The position of the gun-ports and scuppers ought, however, to be particularly considered on this occasion,

fion, that the wales may not be wounded by too many breaches. Falconer.

Those strokes of thick stuff that are wrought on the outside of the ship upon the main-breadth, or broadest part of the body, are called the *main-wales*. Those that are wrought between the ports, which are the *channel-wales* in two-deck ships, and the *channel-wales* and *middle* or *sheer-wales* in three-deck ships. See *SHIP-Building*.

WALÉT, in *Geography*, a city of Africa, and capital of Beeroo, or Biroo; 250 miles W. of Tombuctou. N. lat. 15° 45'. W. long. 2° 45'.

WALGOM, a town of the island of Ceylon; 10 miles N. W. of Candi.

WALGRUND, an island in the gulf of Bothnia, and one of the cluster called the Quarcken Islands, about ten miles long, but of unequal breadth, in some places three miles, in others not half a mile. The figure is very irregular. N. lat. 63° 13'. E. long. 20° 58'.

WALHAUSEN, a town of Saxony, in Thuringia; formerly an imperial palatine town; 3 miles W.S.W. of Sangerhausen.—Also, a town of Switzerland, in the canton of Lucerne; 10 miles W. of Lucerne.

WALHEIM, a town of France, in the department of the Sambre and Meuse; 4 miles N. of Gemblours.

WALHOF, a town of the duchy of Courland; 34 miles E. of Mittaw.

WALHORN, a town of France, in the department of the Ourthe; 9 miles S. of Aix-la-Chapelle.

WALI, or WALLA, the title of an officer of the police in various parts of the Ottoman empire; who is the deputy of the pacha, and patrols night and day, keeping a watchful eye on the seditious, apprehending robbers, and, like the pacha, judging and condemning without appeal. This officer has a multitude of spies, most of whom are thieves, and by their means knows every thing that passes. It is not, therefore, astonishing, says Volney, that cities like Cairo, Aleppo, and Damascus, should be safer than Genoa, Rome, or Naples; but how dearly is this safety purchased! and how many innocent lives are sacrificed to the partiality and injustice of the wali and his agents! The wali likewise presides over the police of the markets, inspecting the weights and measures, and punishing delinquents with extreme severity. For the smallest deficiency in the weight of bread, meat, dates, or confectionary, he inflicts 500 strokes of the bastinado, and sometimes even death. However, the office of wali does not comprehend various objects of utility that ought to be under the regulation of the police, such as the cleanliness of the streets, and the salubrity of the cities. They are never paved, swept, or watered, neither in Syria, nor in Egypt.

WALILABO, in *Geography*, a river of the island of St. Vincent, which runs into the sea, one mile north from Prince's bay.

WALINCOURT, a town of France, in the department of the north; 6 miles S.S.E. of Cambray.

WALINGHURU, in *Botany*, a name by which some authors have called the plant, of which the medicinal zerumbeth is the root.

WALK, in *Gardening*, a dry firm track in the garden or pleasure-ground, which is formed of different sorts of materials, as gravel, sand, &c.; but where these cannot be procured, it is sometimes laid with powdered coal, sea-coal ashes, and powdered brick: these are, however, rarely used, when either gravel or sand can be procured. Where sea-coal ashes can be had they are preferable to powdered coal or bricks, as they bind very hard, and never stick to the

feet in frosty weather. And for wilderiness-walks they are better than most other subitances. There are likewise walks sometimes formed of turf, or what are called grafs-walks.

In forming the first sort of walks, when they have been marked out, the earth should be taken away to a certain depth, that the bottoms may be filled with lime-rubbish, coarse gravel, flint-stones, or other rocky materials, to prevent weeds from growing through the gravel, as well as to keep away worm-casts. It should be laid ten inches or a foot thick, over which the coat of gravel should be six or eight inches, which should be very fine, but not screened, the large stones only being taken out. When the gravel has been laid to this thickness, they must be exactly levelled, and raked true from all great drips, as well as little holes: by this means, most of the stones will be raked under the feet, which may either be evenly sprinkled back over the last length that is raked, or buried in the bottom. Walks are frequently laid too round, so as scarcely to be walked upon with pleasure, and so as to lessen the effect of their breadths. The usual allowance for a gravel-walk of five feet breadth, is about an inch rise in the crown: consequently, if twenty feet wide, it will be four inches higher in the middle than on each side; and for twenty-five feet, five inches; for thirty feet, six inches; and so on in the same proportion. When the walk has been carefully laid, trodden down, and raked, either in lengths, or the whole together, it should be rolled well, both in length and cross-ways; the person who rolls wearing shoes with flat heels, that he may not make holes; as, when these are once made in a new walk, they are not easy to roll out again. In order to lay them firm, it will be necessary to give them three or four rollings, after good waterings or heavy rains, as this will cause the gravel to bind, so that when they become dry they will be as hard as terrace. Iron-mould gravel is said to be the best for binding, or such as has a little binding loam amongst it; which latter, though it be apt to stick to the heels of shoes in wet weather, binds better than any thing else in dry weather; and when the gravel is over-sandy or sharp, clay is frequently mixed with it, which, when cast together in heaps and well mixed, binds like a rock: loose gravel is very uncomfortable and uneasy to walk on.

Walks of this sort are not only necessary near the house, but one should always be carried quite round the garden, as being soon dry after rain, and proper for walking on in all seasons and times.

Those about the house should be larger than the others, and laid out according to the particular nature and situation of the grounds in which they are to be formed.

And the walks laid with sand or other materials, in the other different parts of gardens or pleasure-grounds, should be formed in the same manner, having regard to the nature of the soil, so as to render them as dry as possible at all seasons. The breadth in these walks should be in some measure according to the nature of the ground. Where this is small, five or six feet may be sufficient; but in large grounds much wider, as ten or twelve. In modern grounds of this sort, they are mostly laid out in winding or serpentine directions, according to the nature of the scites, so as to have them concealed, and rendered as private as possible, by the trees and plants on their sides; the turns being contrived in as easy and natural a way as can be effected. See *GARDEN*, *GRAVEL*, &c.

In forming grafs-walks, different methods are had recourse to; but previous to any of which, it is constantly necessary

WALK.

to have the ground properly prepared by suitable levelling, treading, and raking, as well as other means, in the view of making the surfaces perfectly firm and even for the purpose. In making walks of small and moderate extents, the common practice is then to have them laid with turf cut from some neighbouring waste-ground, or other place, beating it well down at the time, so as to form a close, smooth, even surface. But where the extents of them are very considerable, it is mostly found more convenient and proper to have the fward formed by the fowing of them with proper grafs-seeds at suitable seasons, in doing which, they should be sown in rather a thick and regular manner, and the feed be raked into the earth in an even way, the surfaces being afterwards, when quite dry, rolled regularly with a moderately heavy roller, in order to render their upper parts level, and to close the earth or mould well over the feeds. See TURNING.

The walks of pleasure-grounds and gardens have a relation to utility as well as ornament. In the former, they are for the most part more spacious and extensive than the necessary ones in those of the common latter kinds, being usually made in conformity with the other decorative compartments, so as to form and constitute variety in the composition of the general plan and design, and for connecting with them, and the pleasure of walking through them, to enjoy the view and beauty of their differently varied arrangements, and the diversified growths of their respective plants, trees, shrubs, flowers, and fruits, as well as any thing else that may be curious.

In the latter, or gardens, they are necessary as forming the communication between the different parts, and for dividing the ground into suitable portions, as may be needful in any sort of culture, as well as for the purpose of occasional walking on for pleasure, and by way of ornament.

In general, all those walks of the garden, whether of the kitchen or other kinds, may be said to be useful, which are required for the separation of the ground into quarters, beds, and borders, as well as other similar parts; and which serve to connect and lead to the different parts, or from one to another cross-wise; and which extend round them at the distance of a proper border from the boundary fence. And where kitchen-gardens and pleasure-grounds are connected, the principal walks should be of a more capacious nature, having handsome borders on the sides, such borders being destined for small esculent plants, as well as those of the flower and ornamental kind.

Walks which are very much wheeled and wrought upon in kitchen-gardens should always be made of such firm solid materials as the above; but where they cannot be had, good road-stuff, that is, the scrapings of them, may be employed. Grafs-walks are never to be had recourse to in these cases.

The walks in the principal divisions, or more conspicuous parts of pleasure-grounds, should in general be of larger dimensions, and more elegantly formed, than those of the ordinary kitchen-garden, those near the residence being often of very considerable width, as already noticed. They should mostly be laid with some of the above sorts of hard materials, though, in some cases, large turf-walks are in use in particular parts.

The walks in pleasure-grounds are usually varied as much as possible, running in winding irregular directions, and occasional varying straight lines, as may be most suitable to the nature, plan, and quality of the grounds; and the same is the case in large gardens; but in those of the smaller sort, they are commonly made in somewhat straight and cross directions. In most large pleasure-grounds a large walk is

run somewhat parallel to the main residence, extending to the interior of them and the gardens and other parts, having other walks connecting with it, with shrubberies, clumps, and flower-borders; but in some others, the chief walks go off to the right and left towards the sides, leaving the middle parts in lawns with shrubberies, flower-borders, and plantations of other kinds, or lead to some side plantation of a shady nature, as private walks, or are carried forward in an easy, winding, natural manner through the whole extent of the grounds and plantations in different turnings to other more extensive grounds of the nature of parks, &c. at a greater distance; there being other similar smaller walks within the confines of the pleasure-grounds, branching off and diverging in a varied irregular manner to other internal parts of the shady kind, as those of groves, thickets, and shrubberies, as well as to those of the more open and airy sort, as large grafs divisions, detached planted clumps, and other kinds, in various bendings for the purpose of exhibiting various views of the different shrubby compartments, trees, plantations, flower-borders, grafs lawns, plots of water, and other curious and interesting rural ornaments. However, on the whole, the best and most modern modes of laying out the walks of pleasure-grounds and gardens, are those which most perfectly accord with the nature and situations of them, and which are the most remote from any sort of regularity and formality in their designs.

In ornamented grounds, Mr. London thinks, that walks have partly one of the effects of buildings, which is that of giving force and spirit to the scenes of verdure and cultivation. Their directions, it is supposed, should be dictated by their propriety and convenience, and their width by the utility of them. In respect to their ornamental effects, they chiefly depend upon their margins, their surfaces, and the colour of the materials from which they are formed. In awkward artificial situations, the first should be parallel to each other, and properly limited; but where the contrary is the case, they should be irregular in their directions as well as compositions, as in natural pleasure-grounds, pasture-fields, parks, forests, dingles, &c. In loose scattered bushy lawns with trees, the sweeps and turns of the walks should, in a comparative degree, be abrupt, the breadths being varied to a great extent, groups of shrubs, or single trees, frequently dividing them, and reducing their widths to narrow courses which are nearly in the same direction, by which they shortly unite again in the same track, and assume their former breadths. Woody banks and commons, it is said, abound with walks of this nature. In thickets and woods, whether of natural trees and undergrowths, or of exotics, as in complete shrubberies, the edges of the walks or paths should be wholly annihilated on both sides, and be bounded only by the irregularity of the lowest growths. Many places, as those of Foxly and Dungslass, afford beauties in full illustration, it is supposed, of the propriety of these principles.

In short, the formal, stiff, harsh edges of made walks, it is thought, constitute one of the most striking deformities in rural works of this kind.

In cases where grafs-walks are intended, they should commonly be of some extent in respect to width, as narrow trifling slips have a bad effect, as already seen. In large pleasure-grounds they should be sufficiently spacious to suit their different extents; and in those of the smaller kinds, as well as in gardens, they should seldom have less breadths than eight, ten, or twelve feet. Their situations and directions may be various, according to the nature and positions of the grounds; as some near the residence for ornament and summer-walking upon in dry seasons; others more distant,

distant, in the internal parts, chiefly for variety. They may be laid out in various irregular directions, so as to suit the taste and the nature of the grounds, having broad, irregular borders of flowers, sloping winding shrubberies, and trees or plantations on their sides, and in other parts.

In regard to the general care and management of walks, those of the gravel, sand, or other hard kinds of materials, should be constantly kept in neat and clean order by occasional weeding, sweeping, and cleaning them, and by frequently rolling them well with an iron or stone-roller, as once or twice a week during the summer months, as their surfaces may appear in a loose and disordered state, taking the opportunity of doing it, as often as possible, after showers of rain. This renders them firm and solid, settling any inequalities that may be present, and brings them into a smooth even state of surface. They should also be occasionally rolled in dry open weather, during the winter and spring months, to keep them in a level regular state.

When the surfaces of them become foul, mossy, or full of weeds, the gravel or other materials should be turned, which is best done in the early spring, by means of digging them up to a slight depth, and placing the former surface part downwards, by which the fresh bottom gravel will become the top, and then treading, raking, and rolling the whole well down again, by which means a new clean surface for the ensuing spring and summer seasons is obtained without any great trouble or expence.

The different grass-walks should have the sward constantly kept close and clean by frequent mowing, sweeping, and rolling, during the spring and summer months; and in the winter time by occasional poling and rolling when the weather is open and dry, the former scattering the worm-cast earth about, while the latter, which is commonly of the wooden kind, cleans up the dispersed earth by its adhering to it, and thereby not only renders the surface free from dirt, but the whole surface close, firm, and even, whereby it becomes capable of being mown with ease and facility.

The walks of pleasure-grounds, gardens, and other such places, should never be suffered to have leaves, weeds, or any sort of rubbish, remaining upon them for any length of time, as they soon become injured and spoiled by them.

Where seats are had recourse to in the walks of such grounds, they should be introduced and managed with considerable judgment, taste, and nicety, so as to suit the nature of them and the grounds, and be at the same time as ornamental as possible.

WALK, in the *Manege*, is the slowest and least raised of all a horse's goings. The duke of Newcastle says, that this motion is performed with two legs, diametrically opposite in the air, and two upon the ground at the same time, in form of a St. Andrew's cross; but this, in reality, is the motion of a trot; and accordingly all the latter writers agree, that this author is mistaken, and that the walk is performed, as any one may observe, by the horse's lifting up his two legs on a side, the one after the other, beginning with the hind leg first. Thus, if he leads with the legs of the right side, then the first foot he lifts is the far hind-foot, and in the time he is setting it down (which in a step is always short of the tread of his fore-foot on the same side) he lifts his far fore-foot, and sets it down before his near fore-foot. Again, just as he is setting down his far near-foot, he lifts up his near hind-foot, and sets it down again just short of his near fore-foot, and just as he is setting it down, he lifts his near fore-foot, and sets it down beyond his far fore-foot.

This is the true motion of a horse's legs in a walk; and this is the pace in which many things are best taught. For

instance, when the horse is to be taught to turn to the right and left, or from one hand to another, he is first to be taught it on the walk, then on the trot, and finally on the gallop.

The walk is a pace to which team, carriage, and road horses, should constantly be well broke, as being of great use in all such cases and intentions. It is an excellent pace, too, in a saddle-horse, when well performed by being properly taught.

WALK, *Ring*, among *Hunters*. See *RING-Walk*.

WALK, *Terrace*. See *TERRACE*.

WALKS, *Sheep*, in *Agriculture*, the high dry lands where sheep pasture in some districts. These walks and pastures may, it is supposed, be rendered more found and healthy, in some cases, by sowing parts of them with artificial grass seeds, such as those of rye-grass, rib-grass, white clover, or trefoil, and others of the same kind, in mixture with those of the natural grass sort, and keeping them closely fed down in a proper manner. In different instances, a number of valuable plants of this nature are found to rise spontaneously on the foundest sheep-walks, and most of them, when desirable, are capable of being raised and produced by seed as above. Such plants are said to protect sheep well against the rot or poke, and some other diseases, in such walks and pastures. See *ROT* and *SHEEP*.

WALK-Mill, in *Rural Economy*, a name sometimes applied to the fulling-mill.

WALKÆPETHIGA, in *Botany*, a name by which some authors have called the tree, on which the gum lacca of the hops is usually found.

WALKENRIED, in *Geography*, a town of Germany, in the lordship of Klettenberg, with an abbey, founded in the year 1127, by Adheida, consort to Volkmar, count of Klettenberg, and countess of Lohra. The doctrine of Luther was introduced in the year 1546; at the peace of Westphalia, the abbey was assigned to the duke of Brunswick; 8 miles N.W. of Nordhausen.

WALKENSEE, a town of Bavaria, situated by the side of a lake of the same name; 18 miles S.S.E. of Weilheim.

WALKER, **ROBERT**, in *Biography*, one of the earliest of our portrait painters: he was contemporary with Vanduyck, and improved himself by studying the works of that eminent artist. He did not attract much public notice till the time of the Commonwealth, when Cromwell made him his portrait painter, and he drew that extraordinary personage several times. One picture of him by Walker is at Horleth, the seat of lord Mountford in Cambridgeshire: it was given to his lordship by Mr. Commissary Greaves, who found it at an inn in that county. Another is at Cashibury, the earl of Essex's. Another picture of him, with general Lambert, was in lord Bradford's collection. A fourth was purchased at the cost of 500*l.* for the grand duke of Tuscany. Walker had for some time an apartment in Arundel House, and died a little before the Restoration. His own picture which is a very fair specimen of his power is in the gallery at Oxford.

WALKER, **GEORGE**, F.R.S., a dissenting divine, and eminent mathematician, was born at Newcastle-upon-Tyne, about the year 1734, and completed his education at the university of Edinburgh, under the celebrated mathematician Dr. Matt. Stewart, and at Glasgow, where he studied theology and ethics. In 1756 he settled at Durham as a dissenting minister, and thence removed to Yarmouth, where he remained for some years, and was highly esteemed. During his residence at Yarmouth he

married; and soon after, in 1772, he undertook the office of mathematical tutor at the academy in Warrington. In this place he published, in 1775, his "Doctrine of the Sphere," a work highly appreciated, not only as a complete treatise on the subject, but as a model of geometrical demonstration. In the same year he removed to Nottingham, and became one of the ministers of the high pavement meeting-house. Ardently attached to the principles of liberty, and feeling no diffidence or timidity in the declaration of his sentiments, his talents and disposition concurred to give him influence amongst those who assembled for political purposes; and his characteristic energy of spirit and style is discernible in the addresses and petitions that issued from the corporation of the town. Of one of these productions Mr. Burke declared, that he had rather have been the author of it than of all his own compositions. So much was Mr. Walker esteemed for his talents and temper, that those who detested his political principles fought his company and conversation, and both honoured and loved him. His hospitality and beneficence far exceeded his ability. After a residence of twenty-four years at Nottingham, he was induced by a variety of circumstances to undertake the office of theological tutor and director of a dissenting academy at Manchester. For the office of superintendent of a public ceremony he was not peculiarly qualified, either by the liberal disposition of his mind, or the habits of his life; and he soon found this situation unpleasant to him, more especially as he was now advancing in years, and relaxation from constant labour became essential to his enjoyment. He therefore quitted this connection, and retired to the vicinity of Liverpool. Since he had left Warrington, he had published several single sermons; two volumes of sermons, characterized by original thought and fervid expression; "An Appeal to the People of England," upon the test-laws, much admired and commended by Mr. Fox; and the first part of a "Treatise on Conic Sections," referred to with deserved commendation in our article *CONIC SECTIONS*. In 1807 Mr. Walker visited London, in order to publish two additional volumes of sermons, and two volumes of Philosophical essays; but he was seized with a disorder, which terminated his life at the age of seventy-three, and his remains were interred in Bunhill-fields, on which occasion Dr. Rees delivered, at the vault, an oration, which was printed by his friends, and which contained a brief sketch of his character. "To a stock of classical knowledge," says one of his biographers, "he added an intimate acquaintance with history, ancient and modern, a familiarity with the best authors of various classes, a natural and glowing eloquence, and a heart, in which every kind of social affection occupied a place." Athenæum.

WALKER'S COVE, in *Geography*, a harbour on the west coast of North America, in Behm's canal: so called from Mr. Walker, surgeon of the Chatham. N. lat. 55° 42'. E. long. 220° 20'.

WALKER'S KEY, one of the small Bahama islands. N. lat. 26° 50'. W. long. 78° 54'.

WALKERIA, in *Botany*, was so called by Schreber, in just commemoration of the founder of the botanic garden at Cambridge, the Rev. Richard Walker, D.D. vice master of Trinity-college. To this foundation a lectureship is attached, and both together are in the gift of five trustees, unshackled by any of those limitations which usually tend only to defeat the purpose of such establishments; for Dr. Walker expressly orders, by his will, that any person, even a foreigner, shall be eligible to the appointment, and may, if he pleases, read his lectures in Latin. The present worthy professor of botany, the Rev.

Thomas Martyn, B.D. is the only person who has hitherto held the lectureship in question, of which, as long as his health would permit, he regularly performed the duties. Another *Walkeria*, in honour of the same liberal patron of botanic science, was named by Miller and Ebrat; but that genus having accidentally had various previous appellations, is now established by the Linnæan one of *NOLANA*, which the reader will find in its proper place.—Schreb. Gen. 150. Willd. Sp. Pl. v. 1. 1145. Mart. Mill. Dict. v. 4. (Mecfia; Gært. t. 70. Lamarek Illustr. t. 143.)—Class and order, *Pentandria Monogynia*. Nat. Ord. uncertain; akin to *OCHNEA*.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in five ovate, acute, concave, spreading, permanent segments. *Cor.* Petals five, lanceolate, acute, spreading, rather longer than the calyx. *Stam.* Filaments five, capillary, ascending, half the length of the petals; anthers roundish. *Pist.* Germen superior, globular, five-cleft; style bristle-shaped, erect, as tall as the stamens; stigma simple. *Peric.* Drupus five, obovate-kidney-shaped, of one cell. *Sed.* Nut solitary, kidney-shaped, rather bony.

Ess. Ch. Calyx inferior, in five deep permanent segments. Corolla of five petals. Drupus five. Nuts solitary, kidney-shaped.

1. *W. ferrata*. Serrated *Walkeria*. Willd. n. 1. (*Mecfia ferrata*; Gært. v. 1. 344. Tsjocatti; Rheede Hort. Malab. v. 5. 95. t. 48.)—Native of various parts of the Malabar coast, flowering and bearing fruit at various seasons. We have not heard of this plant in any garden, nor are its dried specimens frequent in collections. The stem is shrubby, about twelve feet high, with round, smooth, leafy, alternate branches. Leaves evergreen, smooth and shining, alternate, on short stalks, elliptic-lanceolate, acute, more or less evidently and acutely serrated, four or five inches long, furnished with a strong mid-rib; and many fine, transverse, reticulated veins. *Stipules* none. *Panicles* terminal, with racemose, compound, angular, smooth flower-stalks. *Flowers* yellowish, about half an inch in diameter, without scent. *Fruit* reddish, shining, acid and bitter, seated on the dark-red enlarged calyx. Some of the drupus, in each flower, are often abortive. The qualities of the various parts of this shrub seem to be of an astringent and tonic nature.

Gærtner gives, as a synonym to his *Mecfia*, *Walkera*, a Ceylon name, found attached to the seeds in the collection at Leyden, from which he made his figure and description. Schreber, in adopting Gærtner's genus, found it necessary to change his name, *MEESIA* being appropriated to a genus of mosses, which however is now sunk in *BRYUM*; see those articles. We presume he meant to re-establish the old name *Walkeria*, of which, therefore, we retain the proper orthography. It is not to be supposed that, in this instance alone, he would adopt an entirely barbarous appellation; but the coincidence is singular. Even this appellation indeed proves to be corrupt. We have sought it in vain in Hermann's *Museum Zeylanicum*, but we find there *Malkira*, p. 9, whence, no doubt, it originated; for Linnæus has written *Ochna* against this *Malkira* in his own copy of Hermann's work, the very copy used by him in writing his *Flora Zeylanica*; and the description of the leaves in p. 93, 94, of the latter book, shews his *Ochna*, var. *a*, to be our *Walkeria ferrata*, whatever doubt may attach to Burmann's t. 56.

WALKERS, a sort of forest-officers, appointed by the king to walk about a certain space of ground, committed to their care and inspection.

Walkers are the same with what we otherwise call foresters.

WALKERSPACH, in *Geography*, a river of Wurtemberg, which runs into the Rems.

WALKERTON, a town of Virginia, on the Mattaponi; 30 miles N.E. of Richmond.

WALKING-FIRE. See *IGNIS FATUUS*.

WALKOOG, in *Geography*, a town of Holland; 10 miles N. of Alcaemar.

WALKUFFA, in *Botany*, a tree which grows in the Kolla, or hottest part of Abyssinia. This does not flower immediately after the rains, like the other Abyssinian trees, that is, between the beginning of September and the Epiphany, but towards the middle of January it appears first covered with flowers. Although beautiful, it has no smell, and is found to be destructive to bees, so that it is rooted up in those countries that pay their revenue in honey. In its appearance it resembles the English Kentish cherry-tree: the wood immediately under the bark is white, but under that a brownish-yellow, somewhat like cedar. Although the wood is heavy, it swims in water, contrary to the opinion of the natives. Mr. Bruce has given a botanical description of this tree in the Appendix to his Travels.

WALL, in *Architecture*, &c. a work of stone, brick, or the like, making the principal part of a building; as serving both to enclose it, and to support the roof, floors, &c.

Walls, though built very thick and strong, and their foundations laid deep, yet, if carried on straight in a line, are apt to lean, or fall; and such as are built crooked, though thin and weak, are much more lasting. A wall raised over a river, on arches of pillars, stands as firm as others, whose foundation is entire.

Hence, it appears, that a wall built much thinner than usual, by only having at every twenty-feet distance an angle set out about two feet, or more, in proportion to the height of the wall; or by having, at the like distance, a column, or pilaster, erected along with it, six or eight inches on each side, over and above the thickness of the rest of the wall, will be much stronger than if five times the quantity of materials were used in a straight wall.

Walls are distinguished into divers kinds, from the matter of which they consist; as *plastered or mud-walls*, *brick-walls*, *stone-walls*, *flint*, or *boulder-walls*, and *boarder-walls*. In all which these general rules are to be regarded:

1. That they be built exactly perpendicular to the ground-work.

2. That the massiest and heaviest of materials be the lowest; as being fitter to bear, than be borne.

3. That the walls, as they rise, diminish proportionally in thickness, for ease both of weight and expence.

4. That certain courses, or ledges, of more strength than the rest, be interlaid, like bones, to strengthen the whole fabric.

Mud and plastered walls are chiefly used in ordinary timber-buildings. These walls, being quartered and lathed between the timber, or sometimes lathed over all, are plastered over again with white mortar.

In the constructing of brick-walls, which are the most important and usual of any kind, it is necessary to take particular care in laying and managing the materials; that in summer they be laid as wet, and in winter as dry as possible, in order that they may be made to bind the better with the mortar; that in summer, too, they be covered over as fast as they are laid, in the view of guarding and preventing the mortar and other matters from drying too quickly. That in winter also, they be covered well, to protect them from heavy rain, snow, and frost, which are all enemies to, and greatly destructive of mortar; that they be laid joint on

joint, in the middle of the walls, as seldom as may be; so that good bond be made there as well as on the out-sides. Care is likewise to be taken that the angles be firmly bound, as they may be considered as the nerves and sinews of the whole fabric. In order to which, in working up such walls, it is not advisable to raise any of them above eight feet in height, before the next adjoining ones be brought up to them; so that a good bond may be made as the work proceeds. It may be noticed that a wall of this kind, a brick and a half thick, with the joint, will be in breadth fourteen inches, or very near it; and in which one hundred and fifty, or one hundred and sixty bricks will lay a yard square, measured on the face of the wall; and that for the square of ten feet, seventeen or eighteen hundred bricks are usually allowed.

In building a house in the city of London, the walls are to be of such thicknesses as are enjoined by act of parliament. See *BUILDING*, and *PARTY-WALLS*.

In the forming of stone-walls, the same sort of care and attention is requisite in protecting and preserving them from the injurious effects of external causes of the above kinds, as well as in that of building them in a solid and secure manner. The foundations are also to be well looked to. The two sides or faces are to be evenly carried up, and the fillings to be put well and sufficiently in the middle parts between them, proper long stones being occasionally placed across, to bind the two faces securely together, and prevent their separating. These attentions are equally necessary in the stone-walls of buildings, as in those of the better sort of stone-walls for other uses and purposes.

In the raising of double walls in this way, as defences in fields and grounds, which is sometimes done, the faces may be bound in, where proper stones as throughs cannot be had, by thin layers or strips of the stones, laid in mortar, at about every fourteen inches in height, as they rise, the mortar being in such cases kept soft, so as that it may lay firm hold of the stones. And with the similar intention of keeping them upright, and preventing their separation, they may be carried up with a considerable inclination inward, towards each other, tapering upward as they rise, in the proportion of about one inch, on each side, to every foot or foot and a half of rise or height.

In raising single field-walls, which is not uncommon in some high situations, and where large stones are met with in plenty upon the surface of the land, two benefits are attained, in some cases, by running them up in as open a manner as the nature of the materials will permit, so as to form good work. Such open-work walls are less liable to be thrown down by the winds in such exposed situations, than those of the close kind; which is an inconvenience to which single walls are exposed in such cases; as by means of part of the blast passing through them, its force is considerably diminished. And the wild mountain-breeds of sheep are less apt to scale walls so constructed, than they are those which are formed in a closer manner, and have a more solid appearance. This is particularly the case if they be laid with small stones loosely on the tops.

It is said that stone-walls of the field sort, which are apt to shatter with frosts, if laid only a foot deep in the middle with mortar, or even road-stuff made into it, are held well together, and become durable.

Flint, or boulder-walls, are said to be much used, in some parts of the counties of Sussex and Kent, for fence-walls in surrounding court-yards, gardens, and other such places. In performing the work of building them, a right and left-handed man suits well, as they have the hod of mortar poured down upon the work, which they part between them,

them, each spreading it towards himself, and in this way they lay in the flints; the mortar in this case being made very stiff. Stone and earth walls are only of a temporary, and not by any means of a complete nature; they may, however, in some cases, serve to defend rabbit-warrens and other such places, when fones are not wholly to be had for the purpose, and they are formed and constructed in a proper manner. They are, however, very apt to be thrown down by large animals, and to be soon destroyed, consequently to be expensive in the end.

Turf or sod walls are in pretty much the same situation in regard to their use, and form but a very indifferent fort of defence; they are, however, found useful on some occasions, where other kinds of materials cannot be met with.

Boarded walls are only had recourse to in particular cases, as from their perishable nature they are constantly required to be kept coated over with some substance as a protection at a considerable expence. They are formed in several different ways, according to the nature of the circumstances, and their intended uses.

Walls of different kinds, and banks of earth, are sometimes employed in defending plantations of young trees from the injuries to which they are liable and exposed in many cases; and in some situations they form cheap and eligible modes of effecting the business.

In speaking of building field-walls, Mr. London has remarked, that when lime is employed in such walls, if, in place of slacking it, and letting it lie to mellow or four for some weeks, no more were slaked and made ready for use than what was worked up in the same day;—if the sand were clean and rough, and well incorporated with the lime, and the coping put carefully on, such walls would last an inconceivable length of time. Lime used in this way, it is said, binds immediately; and that the longer it stands the harder it becomes. The surfaces of such walls, too, would acquire a coating of mosses, which, it is thought, would add greatly to their beauty, and at the same time prevent decay. Our ancestors, it is said, used lime in this way; and their buildings, in walls of the field kind, as well as in houses, though under every disadvantage, remain, it is observed, as monuments of their superior knowledge in this particular. But the modern builders in general, it is thought, destroy their mortar before they make use of it: it is saturated, it is said, with fixed air, or, in common language, has *lost band* before it is put in the walls: hence the weakness and speedy decay of modern walls and buildings, especially those of the rubble work kind. A proper notion of the importance of this hint is, it is thought, too seldom formed. But let it be asked, whether it be most desirable to build walls that will stand for centuries with little or no repair, or to build them in the common way, when, if they stand half a century, they are to be pointed or rough casted every eight or ten years; while the different modes cost nearly the same in the original expence?

The uses of stone-walls as field defences are limited to particular districts and situations, and the nature of their construction and magnitude must rest materially upon the kinds and sizes of the stones which are employed, and the purposes for which they are designed. In erecting such walls, those of the particular vicinity should be attended to, and the most suitable forms of them adopted, proper estimates of their expence of building being first procured. WALLS, *Roman,* were barriers or defences constructed by the Romans for securing the northern frontiers of their British territories. Where they could not avail themselves of seas, firths, rivers, woods, and mountains, for their protection, they had recourse to a variety of artificial modes of defence; guarding those parts of their frontiers that were most accessible by chains of forts, deep ditches, elevated mounds and ramparts of earth, and even stone-walls. Agricola, having in the second year of his government, A.D. 79, conducted his army northwards, and reduced the Brigantes, the Ottadini, the Gadeni, and perhaps the Selgovæ, to obedience, obliged them to give hostages, and begirt them with garrisons and fortresses to secure his conquest. The forts which he built are supposed to have been on or near the tract where Adrian's rampart and Severus's wall were afterwards erected. In his third year he proceeded as far N. as the river Tay, and in the following summer employed his forces in constructing a chain of forts between the firths of Forth and Clyde. The spot was wisely chosen for this purpose; and this chain of forts, each of which was garrisoned and furnished with provisions for a year, served to keep the adjacent country in obedience, and retrained the incursions of the Caledonians, while Agricola prosecuted his operations in Britain. But by the negligence of his successors, these forts became an insufficient security after his departure. Although little is known of the occurrences that filled up the interval between the departure of Agricola, A.D. 85, and the arrival of Adrian A.D. 120; yet we have sufficient reason for believing, that the British nation, in the south of Scotland and in the north of England, had in that interval thrown off the Roman yoke. The emperor Adrian, more intent upon securing than enlarging his empire, contracted its limits in Britain; and for its protection dug a deep ditch, and threw up a lofty and spacious rampart from sea to sea; and this was the second artificial barrier of the Roman territories in Britain. This rampart was constructed of earth, and extended from the Solway firth, a little W. of the village of Burgh on the Sands, in as direct a line as possible, to the river Tyne on the east, at the place where the town of Newcastle now stands; so that it must have been above sixty English, and near seventy Roman miles in length. This work consisted of the principal Agger or Vallum (rampart) on the brink of the ditch; the ditch on the N. side of the Vallum; another agger or mound of earth on the S. side of the principal vallum or rampart, at about five paces distant from it, which may be called the fourth agger; and a large agger or mound on the N. side of the ditch, denominated the north agger. This last is supposed by Horsley to have been the military way to the ancient line of forts, built by Agricola, and also serving as a military way to this work. The fourth agger is supposed to have been made for an inner defence, in case the enemy might beat its defenders from any part of the principal rampart, or to protect the soldiers against a sudden attack from the Provincial Britons. It is generally somewhat smaller than the principal rampart, but in some places it is larger. These four works preserve a constant parallelism one to another. The distance of the north agger or mound from the brink of the ditch is about twenty feet. It is conjectured that the principal rampart was at least ten or twelve feet high; the fourth one not much less, but the north one considerably lower. The ditch was near nine feet deep, and

eleven feet wide at the top, but somewhat narrower at the bottom. Such was the rampart or defence erected by command of the emperor Adrian, A. D. 120, for guarding the Roman territories to the south of it from the incursions of the Britons on the north. This work was defended by a competent number of Roman soldiers and auxiliary troops, who garrisoned the forts and stations, which were situated at proper distances along the line of it. Most, if not all, of these forts and stations had been fixed and constructed before by Agricola and others. Adrian's rampart, however, did not long continue to be the extreme boundary of the Roman territories to the north in Britain; for Antoninus Pius, having brought the *Mæatæ* again under the yoke, commanded another rampart to be erected much farther north, between the firths of Forth and Clyde, in the tract where Agricola had formerly built his chain of forts. From an inscription on the fragment of a Roman pillar, it is inferred that this work was executed in the third consulship of Antoninus, A. D. 140. This wall or rampart, as some imagine, reached from Caer-ridden on the firth of Forth to Old-Kirkpatrick on the Clyde; or, as others think, from Kinniel on the E. to Dungalas on the W. Its length appears to have been about 37 English or 40 Roman miles. Capitolinus says, that it was constructed of turf; but from remaining vestiges it is concluded with certainty that the foundation was stone. Camden says, that the principal rampart was faced with square stone, to prevent the earth from falling into the ditch. Its chief parts were as follow:—A broad and deep ditch, said to be twelve feet wide; the principal wall or rampart, about twelve feet thick at the foundation, situated on the S. brink of the ditch; a military way on the S. side of the principal wall, well paved, and raised a little above the level of the ground. This work, as well as that of Adrian, was defended by garrisons placed in forts and stations along its line. The number of these was eighteen, at the distance of two miles from each other. In the intervals between the forts, there were turrets or watch-towers. After the lapse of more than 1600 years, we are enabled to ascertain by what particular bodies of Roman troops almost every part of it was executed. This discovery is made by means of inscriptions upon stones, originally fixed in the face of the wall, and found near its ruins. The number of stones with inscriptions now extant is eleven; and from these it appears in general, that this great work was executed by the second legion, the vexillations of the sixth legion and of the twentieth legion, and one cohort of auxiliaries. If these corps were all complete, they would compose a body of 7800 men. This wall was not long the boundary of the Roman territories in Britain; for we are told, by an author of undoubted credit (Dio), that, in the reign of Commodus, A. D. 180, he had wars with several foreign nations, but none so dangerous as that of Britain; for the people of that island, having passed the wall which divided them from the Romans, attacked them and cut them to pieces. We also know, that the country between the walls of Adrian and Antoninus continued to be a scene of perpetual war and subject of contention, between the Romans and Britons, from the beginning of the reign of Commodus to the arrival of the emperor Septimius Severus in Britain, A. D. 206. This last emperor, having subdued the *Mæatæ*, and repulsed the Caledonians, determined to erect a stronger and more impenetrable barrier than any of the former, against their future incursions. This last wall, the greatest of all the Roman works in Britain, was begun A. D. 209, and finished A. D. 210.

It was built nearly on the same tract with that of the rampart of Adrian, at the distance only of a few paces

north. Its length, from Cousins-houfe near the mouth of the river Tine on the east to Boulness on the Solway firth on the west, was a little more than 68 English miles, and a little less than 74 Roman miles. To the north of the wall was a broad and deep ditch, supposed to have been larger than that of Adrian. The wall itself, standing on the brink of the ditch, was built of solid stone, strongly cemented with the best mortar; the stones which formed both the faces being square ashlers, and the filling stones large flags, set a little slanting. The height of this wall was twelve feet besides the parapet, and its breadth eight feet, according to Bede, who lived near the W. end of it, and in whose time it was almost entire in many places. Considering the length, breadth, height, and solidity of this wall of Severus, it was without doubt a work of prodigious labour and extraordinary magnificence. But the wall itself was only a part, and not the most distinguishing part of this work. The great number and different kinds of fortresses which were built along the line of it for its defence, and the military ways that pertained to it, are much more worthy of admiration; for an account of which see STATIONS. The castella, or castles, were the second kind of fortifications, which were built along the line of this wall for its defence. They were neither so large nor so strong as the stations, but much more numerous, being no fewer than eighty-one. They were exact squares of sixty-six feet every way; fortified on every side with thick and lofty walls, but without any ditch, except on the N. side, on which the wall itself, raised much above its usual height, with the ditch attending it, formed the fortification. The castles were situated in the intervals between the stations, at the distance of about seven furlongs from each other. In these castles, guards were constantly kept by a competent number of men detached from the nearest stations. The towers, or turrets, were much smaller than the castles, forming a square of about twelve feet, and standing out of the wall on its S. side. (See TURRETS.) The usual complement of troops allotted to the defence of this, consisted of twelve cohorts of foot, each cohort including 600 men, one cohort of mariners in the station at Boulness, one detachment of Moors, probably equal to a cohort, and four *alæ* or wings of horse, consisting at the lowest computation of 400 each; the whole number being 10,000. For the convenience of their march from one part of the wall to another, to the wall were annexed two military ways, paved with square stones, in the most solid and beautiful manner, one larger, and one smaller: the latter ran close along the S. side of the wall, from turret to turret, and castle to castle, for the use of the soldiers in relieving their guards and sentinels, and such services; the larger way was not so near the wall, nor did it touch at the turrets or castles, but pursued the most direct course from one station to another, and was designed for the convenience of marching large bodies of troops. This wall of Severus proved an impenetrable barrier to the Roman territories for near 200 years. But about the beginning of the fifth century, the *Mæatæ* and Caledonians, now called Scots and Picts, took advantage of the withdrawal of many of the Roman forces from Britain, and broke through the wall, while others failed round the ends, carrying their ravages into the very heart of Provincial Britain. These invaders were often repulsed by Roman legions sent to the relief of the Britons; and the last of these legions, under the command of Gallio of Ravenna, assisted by the Britons, regained the walls and its fortresses, and then took their last farewell of Britain. The Scots and Picts found little resistance in breaking through the wall, whose towers and castles were tamely abandoned to their destructive rage. In many places
they

WALL.

they levelled it with the ground; and in subsequent times it was so far disregarded, that it became the common quarry for more than 1000 years, and of which all the towns and villages around were built; and it is now so entirely ruined, that the most patient and penetrating antiquarian can hardly trace its vanishing foundations. Henry's History, vol. ii. See *PICTS Wall*, and *SCOTLAND*.

WALLS, Sea. See *DIKE*.

WALL, in Fortification. See *RAMPART*.

WALL, in Gardening, a sort of fence erection in gardens, composed of hard materials, built for the purpose of ripening all such fruits as are too delicate to be perfected in this climate, without such assistance. Walls are raised with different kinds of materials, as stone, brick, earth, or mud, &c. according as they can be best procured, and at the cheapest rate. But for fruit-trees, brick is the best, as being not only the handsomest, but the warmest and kindest for the ripening of fruit, as well as affording the best convenience of nailing; for smaller nails will serve in them than in stone-walls, where the joints are larger; and brick-walls, with copings of free-stone, and stone pilasters or columns at proper distances, to separate the trees, and break off the force of the winds, make not only the most beautiful but the most profitable walls that can be erected.

Rammed earth-walls, as well as those formed of muddy clay, answer very well in some intentions, being very close, compact, and warm.

Sometimes walls are built of mixed materials, as stones and bricks; but in this way they should be carefully built, or the brick front will separate from the stone behind.

Where walls are built entirely of stone, there should be trellises fixed up against them, for the more convenient fastening the branches of the trees: the timber of these espaliers need not, however, be more than an inch and a half thick, and about two inches and a half broad. These should be fixed across each other, at about four inches distance; for if they are at a much greater distance, it will be difficult to fasten the shoots of the trees properly. As this trellis will be laid close to the wall, the branches of the trees will lie about two inches from the wall; in which position the fruit ripens better than when it lies quite close to the wall.

Many improvements have been attempted in building walls in different forms, as in semicircular methods, in angles of various forms, and projecting more towards the north, to screen off the cold winds; but not any method has yet been found which succeeds so well as that of making them straight, and building them in an upright manner. Something of the long-oval from east to west might probably be beneficial in the production of fruit, as there would be the smallest space of it hid from the influence of the sun at any one time.

Many other schemes of expediting the ripening of fruits on walls have been tried, such as painting them black, or of a dark colour, as the dark colour is supposed to imbibe more of the sun's rays, and retain the warmth longer. This has, however, on the same principle, answered better in theory than practice.

Walls, where substantially built, answer much better than those which are slight, not only in their duration, but also in their warmth. A wall two bricks thick will be found to answer better than one brick and a half; and if, in the building of garden-walls, they are grouted with soft mortar, to fill and close all the joints, the walls will be much stronger, and the air not so easily penetrate through them, as it does through those which are built in the usual manner.

In respect to the aspect for walls in this climate, those

which have one point to the eastward of the fourth are the best, as they enjoy the benefit of the morning sun more, and are less exposed to the west and south-west winds, which are very injurious to fruits, than those which are built due south: and the next best aspect is due south, and after that the south-east. But as there will, for the most part, be south-west and west walls, these may be planted with some sorts of fruit which do not require so much heat to ripen them as those designed for the best walls: but wherever there are north walls, those will only be proper for baking pears, plums, and morello cherries, for preserving; or duke cherries may be planted against these walls, to continue them longer in the season.

The usual thickness of building walls with brick is thirteen inches, or a brick and a half; but this should be proportionable to the height: for if they are built twelve or fourteen feet high, or more, as is often practised, then the foundations of the walls should be at least two bricks and a half in thickness, and brought up a foot or more above the level of the surface of the ground, of the same thickness; then be set off two inches on each side, which reduces them to two bricks; and five or six feet above the surface of the ground, they may be diminished on each side, to reduce them to the thickness of a brick and a half, which must be continued to the top. The piers in these high walls should also be proportionably stronger than is commonly allowed to lower walls; for, as being more exposed to strong gales of wind, if they are not well built, they are in danger of being blown down. The piers in these cases should be projected the length of a brick in the back side, and the thickness of a brick in the front, and be built about ten or twelve feet asunder. There is, however, no necessity for building walls higher than nine or ten feet, unless for pears. Mr. London, however, thinks that garden-walls should seldom be made lower than twelve or thirteen feet, and that they never need be higher than sixteen, except where they are connected with buildings of the hot-house kind.

In building of hot-walls, the ordinary height is usually about ten feet, which is sufficient for any of those sorts of fruits that are generally forced; for by forcing the trees, they are mostly weakened in their growth, so that they do not grow so vigorously as those which are exposed to the open air; and where there is not a quantity of walling planted sufficient to let one part rest every other year, the trees are never very healthy, and last but a few years. In these walls the foundations should be made four bricks and a half thick, in order to support the flues; otherwise, if part of them rest on brick-work, and the other part on the ground, they will settle unequally, and soon be out of order: for wherever there happens any crack in the flues, through which the smoke can make its escape, it will prevent their drawing; and if the smoke gets within the glasses, it will greatly injure the fruit, and give it a smoky taste. This thickness of wall need not be continued more than six inches above the ground, where the foundation or the bottom of the first flue should be, which will be sufficient to raise it above the damps of the earth: then the wall may be set off four inches on each side, which will reduce it to the thickness of three bricks and a half, so that the back wall may be two bricks thick, which is absolutely necessary to throw the heat out more in front; for when the back walls are built too thin, the heat escapes through them. The wall in front next to the fruit should be only four inches thick, whereby there will be an allowance of nine inches for the flues, which may be covered with twelve-inch tiles; for if they have an inch and a half bearing on each side, it will be sufficient. The places in which the fires are made must be contrived on the

the back side of the walls, which should be in number proportionable to the length of the walls. The length usually allowed for each fire to warm is forty feet, though they do very well for fifty feet: they should be shewed over with brick and tile, to keep out the wind and rain, otherwise the fires will not burn equally; and as it is quite necessary to have the fire-places or ovens below the foundation of the first flues, there must be steps down into the sheds, to come to the mouth of them to supply the fuel: of course, they should not be narrower than eight feet in the clear. Where the length of walling requires two ovens, they may be in the middle, being included in one shed, which will save expence, and allow more room to attend the fires; as, in this case, the sheds must be at least ten feet long, but not more than six in breadth, the steps down being at one end.

In regard to the lower flue, through which the smoke first passes from the fire, it may be two feet and a half deep: of course, the back wall should be at least two bricks and a half thick, as high as the top of this flue; and then it may be set off to two bricks, which must be continued to the top of the wall. The second flue, which should return over the first, may be made two feet; the third, a foot and a half; and the fourth, one foot deep; which four flues, with their coverings, will rise near eight feet in height, so that there will be about two feet left for fixing of the frames at the top to support the glasses, and for the coping of the wall: these four returns will be sufficient to warm the air in the frames. But in the carrying up these walls, some strong iron hooks should be well fastened at convenient distances, projecting about two inches from the wall, to which the trellis must be fastened, which is to support the trees. The flues must be well pargeted with loam on their inside, and loam be spread under the tiles which cover them, to the thickness of the hooks, that the flues may be very smooth. At each end of these flues small arches should be turned in the back walls, in such a manner that there may be holes opening to clean the flues of soot, whenever there is a necessity for it. With respect to the borders in the front of these walls, they should be about four feet wide, which will make a sufficient declivity for the sloping glasses; and on the outside of them should be low walls, rising four or six inches above the level of the borders, upon which the plate of timber must be laid, on which the sloping glasses are to rest. The glasses must be divided into two ranges, being contrived in such a manner, as that the upper row may slide down, and be fastened at suitable distances, but the lower may be either fixed or moveable; and the sloping timbers, which support the glass-frames, must be fastened at bottom into the ground-plate in the front of the border, and at the top into strong iron cramps, fixed in the upper part of the wall for the purpose. They are best made of fir, which does not twilt, as oak and some other wood, where it is laid in such position; and on the top should be fixed, in a close manner, a strong board, under which the upper row of glasses should slide, in order to secure the upper part of the glasses from being raised by the winds, and keep the wet from the trees. It may project on the top glasses about two inches. The width of the frames may be about three feet, or according to the extent of the wall, the bars being placed lengthways of them. See *STOVE*, and *WALL, Hollow or Forcing*.

Walls in gardens are not only of great utility, importance, and advantage, as serving the purpose of defences against external injuries, and as sheltering against cold, cutting winds, high stormy blasts, and all sorts of severe exposure, but also as affording the means of having different sorts of fruit-trees trained against them, for the production

of finer, more early, and better perfected fruit. Indeed, without their assistance, many of the more tender sorts of fruit-trees cannot be made to mature and ripen their fruit in any full perfection, in this climate.

These are those of the peach, nectarine, apricot, vine, fig, and other similar kinds, all of which stand in need of nearly the best full south walls to produce their fruits in the fullest and finest proportion, having their branches trained in close, in a regular expanding manner upon them, in order to have the full benefit of their warmth and protection during the time of their early blossoming, and setting their fruits in the spring months; and afterwards to obtain the most complete influence and advantage of the sun, in bringing them forward in the most effectual manner to the above noticed state of maturity, in due season, and with the greatest richness of flavour.

Walls are likewise useful for most or all of the more common hardy sorts of fruit-trees, notwithstanding they are capable of producing good fruits abundantly without the aid of them, as they are thereby afforded more early, and in superior states of perfection as to size, beauty, and fineness of flavour. Where any of the better sorts of these have the advantage of being grown against a south, south-west, or east wall, their fruits become ripe early, and in a perfectly mature manner; and commonly the early as well as later kinds acquire still more improved states of perfection and fineness of flavour, some of them for immediate eating, others for keeping different lengths of time. This is the case in the chief sorts of the cherry kind, in the choicer sorts of plums, the capital sorts of the finest eating pears, of the summer, autumn, and winter kinds; as also in some highly valued sorts of the eating apples of these different seasons.

And by planting some of these several hardy sorts of fruit-trees against walls fully to the south, others against those which have a westerly aspect, and a few on those towards the east and north, the best sorts of their different fruits will be produced in succession, both at an early and late period.

Where walls are situated in the interior parts of garden grounds, or near their boundaries, with pieces of ground and boundary fences exterior to them, they may be furnished and planted with the most choice sorts of fruit-trees on both sides, suiting them to the nature of the aspect, in both the tenderer and more hardy kinds, some being placed on the full south walls, others on the west and east aspects of them, as well as on their northern exposures: however, in general, allotting those of the best sorts, of the former as well as latter description, to the walls with southern exposures or aspects, as all those of the peach, nectarine, apricot, vine, fig, and other like sorts of the tender varieties of fruit-trees, as noticed already; and some of those of the finest kinds of cherries, plums, pears, and apples, in the more hardy fruit-tree kinds.

The less fine kinds of all or most of these tender and hardy sorts, but chiefly of the latter, may be planted against the walls which have western and eastern aspects; and those which have northern exposures or aspects may have some of the latter sorts, as some kinds of summer pears, plums, morello cherries, and currants, for later successional ripening, placed against them.

Experience has now pretty fully shewn, that the crops of fruit are the most abundant, and of the best quality, where the walls, against which the trees are arranged and nailed, are well built in the perfectly straight form, as they protect the blossoms and young fruit in the most favourable manner for the purpose.

WALL, Hollow or Forcing, that sort of wall which is constructed

fructed in such a manner as to contain fire-heat for the purpose of forwarding and ripening the fruit of the trees planted and trained against it at an early season, as already seen in speaking of garden-walls. It is commonly supplied with a frame of glass-work in the front of it, extending to different distances according to circumstances; but is sometimes without this convenience, in which case the most material circumstance, besides the arrangements for the conveyance of the fire-heat, is that of the furnace, and the contriving and constructing of a covering of canvass or netting which is to be let down over the trees in severe weather, and in the night time. The flues being constructed in such a manner as to distribute the fire-heat equally over the whole, and of sufficient thickness to prevent its too great escape or dissipation, the most fit and best adapted furnace for the purpose, is that made in the foundery of Cook and others in London, as well as in those of some other places, and which is employed in most modern hot-houses, to which a damper is connected. Its great superiority has been found, in a striking manner, in many different instances where trials were made with it by Mr. London. The covering is best contrived and constructed of Scotch gauze, or a small sort of netting, on small rafters fixed from the top of the wall into the border about three feet distance from the roots of the trees; along the lower ends of which the roller for containing the covering is to be fastened; when by means of cords and pulleys it can readily and with facility be drawn up to the top of the wall, or rolled down, as there may be occasion.

On all walls of the hollow or forcing kind, a covering of this nature is essentially necessary, and should not be omitted, as is too often the case, as it is of much importance in preserving the heat, and preventing the chilling effects of frosts, dews, and other similar wetness which are continually taking place. The common modes of forming walls of the hollow or forcing kind have been described in considering garden-walls, and improved methods of constructing the flues in such cases may be seen under the head *STOVE*.

Hollow walls too, it is supposed, may be advantageous for those of the common garden kind, in many cases, by containing air, &c. See a paper by Mr. Stevenson, in the first volume of the *Memoirs of the Caledonian Horticultural Society*.

Hollow, flued, or forcing walls, are very great acquisitions to fruit gardens in the northern parts of the kingdom on many accounts; and it is said to be a great improvement in them not to have the furnaces placed too close upon the walls, or the flues to lead too directly forward to the front, but the former to be kept back, and the latter to sweep along five or six feet, before they reach the front brick-work.

WALL-Fruit is the name of all that sort which is produced by the trees which are planted and trained against walls, and which is raised and procured by means of them, mostly in the finest perfection. It comprehends a great number of different sorts of fruits both of the finer and more common kinds, as all the peach and nectarine sorts; most of the apricot, fig, and vine kinds; many of the finer varieties of the plum, cherry, and pear sorts; some of the best and most early eating apples; sometimes the early and large mulberry; the earlier and finer kinds of the gooseberry and the currant; besides a variety of other sorts in different cases. It consists of much of the best of our finer as well as commoner sorts of fruits, and is that which is generally held in most estimation, and of the greatest value for the uses of luxury. In order to have it at the table in

the greatest perfection, it should always, in most of the kinds, be used as soon as possible after it is taken from the trees, and while it has its peculiar bloom upon it, as it becomes afterwards far inferior in its qualities for the purpose of eating as well as the beauty of its appearance.

WALL-Trees, such fruit-trees as are planted against walls, and have their branches trained to them in a fanned or some other regular manner, from three or four to five or six inches asunder, in order to produce their fruits more early and in a superior degree of perfection. They are trees of the more tender kinds, or such as will not ripen their fruits in this climate, unless trained against walls of a southerly aspect, to have the advantage of the full sun; and of the several sorts of the hardier kinds, to obtain their fruits in earlier maturity, and of an improved growth and flavour.

The trees of this sort may be considered as consisting of two orders or forms of growth; one of which is of the common dwarf wall kind, and the other of the half standard wall sort. But those of other forms of growth may occasionally be employed in this way with convenience and advantage.

Those of the first of these kinds are such as are trained with short dwarf stems of only a few inches in height, and which, of course, are made to branch out near to the surface of the ground, in order that they may cover the wall by their different branches in a regular manner quite from the bottom of it in an upward direction to the very top, being laid in in somewhat a horizontal or fanning direction, at the distance from each other of not more than from three or four to five or six inches, according to circumstances as already suggested.

These are the common sort of wall-trees for general planting in this way, all the different kinds being usually originally trained in the wall-tree order; and for which use those commonly raised by means of grafting and budding are always grafted and budded low in the stock or stem, as within four or five inches of the upper part of the ground, the first main shoots proceeding directly from the inserted grafts or buds, being when of one year's growth headed down or cut in, in the early spring months, to four or five eyes, in order to the production of a proper supply of lateral shoots, the same year, from them near to the ground, to give the trees the suitable form of head at first, they being trained and laid in on the walls in a spreading order both ways of them, at their full lengths during the summer; and in the early spring afterwards they are pruned or cut in to six or eight eyes for a further supply of similar lateral shoots, for the purpose of increasing the bottom branches, which are trained in the same manner, in order to afford a suitable foundation, as it were, in the advanced heads, for furnishing in a gradual manner all the other necessary branches in a regular way up to the top of the walls, as they may be wanted. And the same methods must be pursued with such trees as are raised and propagated by layers, cuttings, and suckers, as those of vines, figs, and some other sorts, when they are intended for wall-trees; their proper after-management being such as is directed under the proper head of each individual sort. See these different heads.

The latter sort, or the half standard wall-trees, are usually trained with rather high stems of the standard kind, as from three, four, or five, to six feet, being grafted or budded at such heights, in order that they may branch or throw out shoots above in the way which has been already noticed.

These forms of trees are suited for occasional planting against high walls between those of the common dwarf kind, in the view of having the whole of them, both above

and below, covered as soon as possible, as the dwarf trees occupy the lower parts, while the half standards take up the higher, and, of course, there is not any loss of empty space sustained. This sort of wall-trees have likewise their first and second year's shoots from the grafting or budding pruned in the same manner as directed above, for the formation of the heads of the common wall-trees, and they are trained to the walls in exactly the same modes; their after-management having a relation to their particular natures, as may be seen under their respective heads. See also *STANDARD TREES*, and *TRAINED TREES*.

The other sorts are only admitted as wall-trees, in particular cases and situations, and where they are of such natures and kinds, as do not permit of the methods of pruning and training, which are necessary for the trees which are commonly employed as wall-trees.

Wall-trees may therefore be either young plantable ones of one year's growth with proper heads, raised by means of budding or grafting, planted at once where they are constantly to stand and grow, to be pruned and trained in the above manner; or they may be ready trained young trees, of three or four years' growth or more, furnished with spreading branchy heads, which have been regulated and wrought on the walls, palings, flakes, or other sorts of supports in nursery grounds for the above lengths of time, and which are advanced to the proper states of growth for immediate bearing, being kept in such public grounds for the supplying of such persons as are desirous of having their walls immediately covered with such sorts of trees. The particular methods to be pursued in pruning, training, and managing each sort, may be seen described under the above heads of *STANDARD* and *TRAINED TREES*.

But there are besides, mostly in these nursery grounds, a great choice of all the different sorts and varieties of the fruit-tree kind for walls, both of the young untrained descriptions for being first planted out and trained from the beginning, as common dwarf or half standard wall-trees, and which will reach the bearing state in from two or three to four or five years, according to their kinds; and of those which have been already trained as above in all the different sorts proper for bearing in the following season.

These sorts of trees must be trained to south walls, for the principal sorts of the more delicate or tender kinds, such as peaches, nectarines, apricots, grapes, figs, &c., to have the benefit of the full sun, as they do not ripen in good perfection without this assistance. Some of the best varieties of the principal sorts of the hardier fruit-trees, as the most esteemed cherries, plums, and pears, should be also trained to these walls to produce early fruit in the greatest perfection; also some trees of the choicer sorts of summer and autumn apples, to have the fruit earlier, and of an improved rich flavour for immediate eating: likewise some of the best red and white currants and gooseberries; and on west and east walls to have trees of most of these sorts, to ripen in good perfection, in succession to those on the south walls, especially cherries, plums, and pears, and occasionally some common peaches, nectarines, and apricots; but vines and figs generally on south walls, especially vines, which require all possible benefit of the full sun to ripen the grapes in proper season, and with a rich flavour: the north walls are eligible for any of the common hardier summer and autumn fruits, as cherries, particularly morellos, plums, and pears, for late ripening, to succeed those of the more sunny exposures, and to continue a longer succession of particular sorts, which ripen for immediate eating from the trees; also white and red currants for successional ripening in the autumn as has been already seen.

The proper season for planting wall-trees is either in autumn, as in October, November, &c., or in spring, as February and March, or not later than the beginning of April, but before that time, if possible; as late spring-planting, after the young trees begin to push their shoot-buds, is often attended with bad success, as they are apt to become stunted or quite stopped in their growth.

The soil for wall-trees should be a good dry mellow garden-earth, not less than one full spade deep; but if two or more it will be advantageous: or where a good moderately light loamy soil prevails, it is superior for most sorts of fruit-trees; and when enriched by good garden compost it is still more beneficial. The poorer borders should be enriched by means of good surface loam and rotten dung before the trees are planted in them.

In planting wall-trees, the borders should either be wholly dug over a good depth, as two spits, or the parts about where the trees are to be placed only, proper sized circular holes or pits being made in depth and width according to the nature of the roots of the tree plants, the mould taken out being laid on the sides; the distances from each other being regulated by the height of the walls and the nature of the growths of the trees. For those of the peach, nectarine, apricot, fig, plum, and cherry kinds, fifteen or eighteen feet are little enough. Vines require from five to ten and fifteen or more feet, according as they may be trained in upright, horizontal, or other directions, as they admit of all these several modes of regulating their heads. Pears, apples, and other trees of similar growths, should have eighteen or twenty feet, especially when worked on free stocks, and those on dwarf stocks not less than fifteen or eighteen feet of distance from each other.

The wall-trees intended to be planted are then to be carefully taken up from the nursery or other grounds, with their full spread of roots as perfect as possible, the broken, bruised, and injured parts, with any tap-roots and straggling ones, being only cut away and shortened at the moment of re-planting them; and in the heads where they are young trees of one or two years' growth only, with the first main branches or shoots from the budding or grafting quite entire, not having been headed down or cut in, in the nursery, they may be retained whole until after they are planted, or not be pruned in until the spring; and where they are trained trees of some years growth with regular trained heads of some years standing, the very irregular ill placed fore-right shoots, disorderly growths, and rank summer shoots, which are unfitly situated for training in should be cut away: all the well placed side and terminal shoots being left quite entire until after the time of planting the trees at least. Then in planting, place the trees in the pits or holes with the bottoms of the stems about five or six inches or more from the walls, inclining the top parts and heads to them in a close manner, spreading the roots out with regularity in the pits or holes, shovelling in the mould or earth from the sides with exactness and equality, breaking the lumps and clods well, and shaking the trees up and down a little, in holding them by the stems, in order to make the mould sink in well between the roots, fibres, and other parts, then filling them in to the tops of the holes in a careful way, seeing that the upper roots are at least three or four inches below the surface, and ultimately treading the whole down in a moderate manner, to settle the earth about the roots, and give the trees their proper positions against the walls. Proper watering will mostly be immediately necessary in most cases, and which may be repeated as there is occasion, to settle the earth more closely, and promote the striking and growth of the trees.

Wall-trees require the above methods of pruning and training to form their different heads in their young growths; and afterwards in an annual manner to retrench their over-luxuriant shootings, and keep them within due limits and in regular order, for the production of full crops of the best sort of fruit of their different kinds. In these views they stand in need of a regular summer and winter pruning every year, as well as a constant unnailling and renailing in the proper methods and times of the season.

The methods of planting, training, pruning, and nailing of the different sorts, are explained in the several heads, under their particular culture.

Wall-trees besides walls are sometimes planted and trained against wooden erections, such as palings and those made in a close manner with boards, which though they are not so warm as brick or stone walls, and consequently not so productive of early good fruit, yet they sometimes afford it in tolerably good perfection at a little later period.

Great advantage is said to have been lately attained in bringing some sorts of wall-trees into a bearing state, especially pears, by turning the branches of them over the walls, and nailing them in an inverted manner on the other side.

It is stated by sir Joseph Banks, in a paper in the first volume of the Memoirs of the Caledonian Horticultural Society, that he has practised this method, which seems to have been learned from a market-gardener in the vicinity of London, with the best success on the gasnel bergamot pear, which is not very free of bearing. It had stood against a north wall for several years, without once making a fruit bud. About three years ago, he turned it over the wall, and had it nailed with the branches pointing downwards; the spring after, it bore, it is said, about a dozen of very fine pears, and this autumn, the south-side wood, which has increased very much, produced at least ten dozen of the finest pears his garden afforded.

This practice, it is suggested, is now become not unfrequent in the royal gardens, where pear-trees on a west wall have been turned over to the east side, and considerable crops annually obtained from such inverted branches.

Sir Joseph has likewise succeeded perfectly in bringing duke cherries over from the north wall, on which aspect they here produce a valuable crop of cherries for the months of July and August. The branches brought over to the fourth wall afforded the earliest fruit, it is said, and had the largest and fairest berries. This, in our climate, is supposed a material improvement, as duke cherries seldom succeed on a fourth wall: the tree requires to have its root cool, and when it is exposed to the rays of a fourth fun, produces in general small and imperfect fruit.

The same mode, and some other similar ones, will probably succeed with many other sorts of wall-trees, as well as these.

The taller sorts of wall-trees are sometimes termed wall-stands.

Wall-Cress, in *Botany*. See *ARABIS*.

Wall-Flower. See *CHEIRANTHUS*.

Wall-Pennywort. See *COTYLEDON*.

Wall-Pepper. See *SEDUM*.

Wall-Rue. See *ASPLENIUM*.

Wall of a Stack, in *Agriculture*, a term sometimes made use of to signify the stem, body, or that part which extends from the ground to the eaves, and which spreads out in its upward direction so as to throw off the water. It is of some consequence to have the walls of stacks built in a neat and exact manner, in the preserving of the grain as well as in the keeping of vermin out of them. See *STACK*.

Wall-Eyes, in *Horses*, are those in which the iris, or

middle part, is of a very light grey colour. Such horses are not considered handsome; but some say that those horses which have wall-eyes are mostly of a good kind. See *HORSE*.

Wall-Springs, in *Agriculture*, a term applied to those which break out through some laminated rocky strata, or on cold spray or springy wet clayey ground. The water in these cases mostly drops or oozes out in a slow manner. See *SPRING*.

Wall-Creeper, in *Ornithology*. See *PICUS Murarius*.

Wall-Moss. See *Moss*.

Wall-Sided, denotes the figure of a ship's side, when, instead of being incurvated so as to become gradually narrower towards the upper part, it is nearly perpendicular to the surface of the water, like a *wall*; whence the phrase. See *SHIP*.

Wall's End, in *Geography*, a township of England, in Northumberland, famous for its collieries; 5 miles E.N.E. of Newcastle.

WALLA, the name of an officer in the eastern nations. See *WALI*.

WALLACE, *Sir WILLIAM*, in *Biography*, a hero of Scottish fable and romance, was a distinguished patriot and warrior in the thirteenth century, who belonged to an ancient family in the west of Scotland. Hardy and magnanimous, and ardently attached to his country, he engaged in the arduous undertaking of liberating the land of his nativity from the foreign yoke of Edward I., king of England. Having killed an English officer in a quarrel, he retired for safety into the woods, and put himself at the head of a band of outlaws, and commenced an incurive war against the English, who were stationed in that country. Succeeding in his first enterprises, he was joined by many barons, whose cause was secretly favoured by Robert Bruce. But earl Warren, appointed by Edward to the government of Scotland, collected an army of 40,000 men in the north of England, and marching into Annandale, terrified the insurgents, so that many of the Scotch nobles submitted, and others joined the English army. Wallace, with his adherents, retired northwards, and being pursued by Warren with his forces, he engaged them near Stirling, and defeated them with great slaughter. This success enhanced the reputation of Wallace, and he was declared regent of the kingdom under the captive Baliol. Wallace retaliated on the English, and extended his ravages as far as Durham, and recovered Berwick. Edward, upon receiving this intelligence in Flanders, hastened his return, and marched with 90,000 men to the northern frontier. Wallace, perceiving the jealousy and discontent occasioned among the nobility by his high rank, resigned the regency, and merely retained his command over his own followers. When the Scotch were joined by Edward at Falkirk, in 1298, a battle ensued, in which the English obtained a victory; but Wallace, whose body of forces was unbroken, retired behind the banks of the Carron. After this defeat Wallace still maintained an unsubdued spirit, and asserted his independence. Edward, apprized that he was insecure whilst such an adversary as Wallace lived, used various means for discovering his retreat and seizing his person. He at length succeeded, by the treachery of his friend, sir John Monteith. The captive was conveyed to London, where, though he had never sworn fealty to the English sovereign, he was tried, condemned, and executed as a traitor, August 23, 1305. His memory is still revered in his native country, and he has been celebrated by national songs, and a variety of eulogies, the subjects of which have been partly true, and partly fabulous. Hume Henry.

WALLACE, in *Geography*, a small island near the coast of South Carolina. N. lat. 33° 54'. W. long. 78° 35'.

WALLACE-TOWN, a town of Scotland, in Ayrshire, founded about the middle of the eighteenth century by Sir Thomas Wallace; 3 miles N.E. of Ayr.

WALLAGE, a river of Germany, which runs into the Ems, at Lingen.

WALLAPATAM, a town of Hindoostan, in the country of the Nays; 14 miles W.N.W. of Palicaudchery.

WALLASEA, an island in the German sea, on the coast of Essex, at the mouths of the Coln and Black Water. It contains two parishes, East and West Mersey. It is about four miles long, and one and a half broad. N. lat. 51° 38'. E. long. 0° 48'.

WALLE, a town of Germany, in the county of Verden; 4 miles N. of Verden.

WALLEBERGA, a town of Sweden, in the province of Schonen; 38 miles S. of Christianstad.

WALLENBURG, or WALENBURG, a town of Switzerland, and capital of a bailiwick, in the canton of Bâle; 12 miles S. of Bâle.

WALLENFELS, a town of Bavaria, in the bishopric of Bamberg; 7 miles E. of Cronach.

WALLENIA, in *Botany*, was so denominated by professor Swartz, in honour of Matthew Wallen, esq., an Irish gentleman, long resident in Jamaica, the friend and coadjutor of Dr. Patrick Browne, in his well-known *Natural History* of that island. Mr. Wallen spared no expence in the cultivation of plants. The stoves of our most distinguished gardens are indebted to him for their choicest rarities. His name occurs amongst the contributors to Kew Garden, and he also sent many fine plants to the late marquis of Rockingham; amongst others, in the year 1778, the splendid *Euphorbia punicea*, Sm. Ic. Pict. t. 3. Curt. Mag. t. 1961, which, being supposed a new genus, for some time bore the name of *Wallenia*, though without any scientific claim to be separated from its congeners.—Swartz Prodr. 31. Ind. Occ. 247. t. 6. Schreb. Gen. 789. Willd. Sp. Pl. v. 1. 618. Mart. Mill. Dict. v. 4. Poir. in Lamarck Dict. v. 8. 785. Pefefioides; Jacq. Amer. 17.—Clafs and order, *Tetrandria Monogynia*. Nat. Ord. uncertain.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in four erect obtuse segments, permanent. *Cor.* of one petal, tubular: tube cylindrical, erect, longer than the calyx: limb in four shallow, ovate, obtuse, erect, converging segments. *Stam.* Filaments four, inserted into the base of the corolla, dilated at the bottom, half erect, as long again as the corolla, and rather spreading in that portion beyond its limb; anthers ovate, incumbent. *Pist.* Germen superior, oblong; style awl-shaped, shorter than the stamens and corolla, permanent; stigma simple, obtuse. *Peric.* Berry roundish, of one cell. *Seed* solitary, roundish, with a brittle shell.

Obf. Some male flowers occasionally occur, which have no pistil, rendering the genus polygamous. Swartz.

Eff. Ch. Calyx four-cleft, inferior. Corolla tubular, four-cleft. Berry with one seed.

1. *W. laurifolia*. Laurel-leaved Wallenia. Swartz. Ind. Occ. 248. Willd. n. 1. Poir. n. 1. (*Pefefioides laurifolium*; Jacq. Amer. 17, a temporary name only. *Bryonia nigra fruticosa*, foliis laurinis, floribus racemosis speciosis; Sloane Jam. v. 1. 234. t. 145. f. 2.)—Branches round.—Native of bushy places, on the mountains of Jamaica and Hispaniola, flowering in spring and autumn. The Spaniards call it *Laurier*. The stem is woody, from ten to twenty feet high, having a smooth bark, and no thorns or prickles. Branches long, subdivided, round, as thick as a goose-quill,

twining about every thing in their way, marked with scars from the insertion of former foliage. Leaves on round smooth footstalks, (whether alternate or opposite, Dr. Swartz does not mention, nor can Sloane's figure be trusted; Jacquin says alternate,) obovate, obtuse, entire, smooth, shining, slightly ribbed and striated, about four inches long, and almost half as broad in the middle. *Stipulas* none. *Panicle* terminal, with spreading, alternate, partly level-topped, subdivided branches. *Flowers* stalked, yellow, inodorous, about half an inch long, numerous, and, according to Sloane, very beautiful. *Berry* scarlet. The calyx, corolla, fruit, and organs of impregnation, are sprinkled with glandular, orange-coloured dots. The ripe berries are slightly acid and aromatic, like the parts of the flower; the seed tastes like the pepper tribe. Swartz.

We cannot but remark that Willdenow copies, without examination or scruple, two errors from Swartz, in the reference to Sloane.

2. *W. angularis*. Angular-branched Wallenia. Jacq. Hort. Schoenbr. v. 1. 13. t. 30. Poir. n. 2.—Branches angular.—Native of the East Indies. Jacquin says it is cultivated in the island of Mauritius, from whence a living plant was brought to the imperial garden at Schoenbrunn. It has flowered there in the stove, every year in May, but never bore any fruit. The stem, in the island above mentioned, attains the height of twenty-five feet, and is as thick as a man's leg. Branches all angular, smooth. Leaves much like the foregoing, but larger; alternate on the lower part of each branch; opposite, or even whorled, above; all very smooth and shining. *Panicle* terminal, erect, many-flowered, somewhat corymbose; its ultimate divisions umbellate, or capitate. *Flowers* green, about the size of *W. laurifolia*, but the calyx seems less deeply divided, more hairy, and the corolla smoother. *Stigma* downy.

WALLENSEN, in *Geography*, a town of Westphalia, in the principality of Calenberg; 15 miles S.E. of Hameln.

WALLENSTADT, a town of Switzerland, near the E. end of Wallenstadt Lake, in the county of Sargans, and principal place of a bailiwick. This place has a Schultheise, and council of its own; the first of whom is nominated by the landvogt out of three burghers, presented for his approbation. It is a great thoroughfare for goods to and from Italy. It is the place likewise where the Switzers and Grisons hold their conciliatory meetings on all claims made by either party; 35 miles E.S.E. of Zurich.

WALLENSTADT, a lake of Switzerland, surrounded with mountains and sharp rocks, which render the navigation dangerous; 9 miles long, and 2 wide; 9 miles S. of Utznach.

WALLER, EDMUND, in *Biography*, an English poet of distinguished celebrity, was the descendant of an eminent family, and born at Colehill, Hertfordshire, in March 1605. His mother was the sister of the famous John Hampden. By the death of his father, when he was an infant, he came into possession of an estate of 3500*l.* a year. Having received his school education at Eton, he was admitted at King's-college, in Cambridge; and exhibiting superior talents, as well as possessing powerful interest, he became a member of parliament in his sixteenth or seventeenth year. Of his poetical talents he exhibited an interesting specimen in his eighteenth year, by his verses on the "Prince's Escape at St. Andero," which far surpasses in poetical melody the productions of his predecessors. He also, at an early period, augmented his patrimony by marrying a rich city heiress. During the intermissions of parliament, which occurred after the year 1628, he lived in a retired

retired manner at his house near Beaconsfield; pursued his classical studies under Morley, afterwards bishop of Winchester; and acquired improvement as well as celebrity from the society of polite scholars into which he was introduced. At the age of twenty-five years he lost his wife, and soon afterwards became the suitor of lady Dorothea Sydney, eldest daughter of the earl of Leicester, whom he has immortalized under the appellation of Saccharissa. But much as he admired this majestic and scornful beauty, as he denominates her, he was more delighted with the gentle Amoret, supposed to have been lady Sophia Murray; but failing to engage the attachment of either of these ladies by his poetic strains, he sought comfort under the anguish of disappointment in a second marriage. When parliament met in 1640, after a long suspension, Waller was again returned for Agmondesham, and joined the party which thought that a redress of grievances should precede a vote of supplies, urging their plea by an energetic speech. He was also a member of the long-parliament, and warmly opposed the exaction of ship-money, after the example of his jolly celebrated uncle, Hampden. He farther distinguished himself by his eloquence in the impeachment of judge Crawley, with the conduct of which he was entrusted by the commons. He continued for three years to give his vote in general with the opposition, without concurring in all the measures of this party; particularly the abolition of episcopacy. In the progress of the dispute between the king and parliament, he discontinued for a time his attendance; though he manifested his inclination to the royal side by court panegyric, and when he again returned to the house, by remonstrating against its proceedings; and when the king set up his standard at Nottingham, it is said that he sent him 1000 broad pieces. As he was one of the commissioners appointed by parliament for treating with the king at Oxford, he was kindly noticed by his majesty; and he was probably thus induced to engage in a plot in his favour. Accordingly, he concerted measures with Tomkyns, clerk of the queen's council, for resisting the payment of the taxes levied for the support of the army, and promoting petitions for peace, and thus constraining parliament to adopt pacific measures. In the prosecution of this plan, they sought the concurrence of persons of influence in the city. Whilst they were thus employed, sir Nicholas Crispe, who was a zealous loyalist, was exciting the king's friends among the citizens to resist openly the authority of parliament, and with this view he had actually obtained a commission of array from his majesty. These two plots were, as Clarendon supposes, independent of each other; but however this be, the commission was known to Waller and Tomkyns. When these measures became known to persons in power, they were arrested; and the deficiency of evidence against them was amply supplied by the pusillanimity of Waller, who disclosed every secret of his party, and basely betrayed a number of persons, of different rank and station, who had reposed their confidence in his honour. Of this number were the earl of Portland, lord Conway, and the earl of Northumberland. He attempted also to persuade lord Portland to confess the charge, and to lay the blame on the two other noblemen just mentioned. Two conspirators, *viz.* Tomkyns and Chaloner, were hanged, and Waller saved his life by affecting a remorse of conscience, which disordered his understanding; so that he was merely expelled the house, tried and condemned, and after a year's imprisonment, and the payment of a fine of 10,000*l.*, permitted to go into exile. Thus disgraced in the estimation of all who made any pretensions to probity and honour, he first resided at Rouen, and from

thence removed to Paris, where he lived like a man of fortune, and in the exercise of hospitality, on the means which he derived from the sale of his wife's jewels. After the interval of ten years, being reduced to his *rump* jewel, as he called it, he solicited permission to return to his native country, and having obtained a licence to this purpose, he took possession of a house which he had built near Beaconsfield. Unrestrained by principle, he paid his visit, by the effusion of his profligate muse, to Cromwell, to whom he also paid a tribute of adulation after his death. He loit no time, however, in congratulating Charles II. on his restoration; and when the king took notice that his panegyric on Cromwell surpassed his congratulatory poem, he replied, with a happy courtly turn, "that poets always succeed better in fiction than in truth." Waller was again received into the best company, and though he drank only water, his wit and vivacity made him an agreeable associate to those who lived more freely and intemperately. He also obtained a seat in the house of commons, of which, though advanced in years, he was a lively and pleasant member. From the king he procured, in 1665, the appointment of provost of Eton college; but Clarendon, who was then lord-chancellor, refused to sanction it, because he was a layman. The conduct of the chancellor gave great offence to Waller, so that he joined the duke of Buckingham in his hostility against him, and both spoke and voted for his impeachment. Upon the accession of James II., Waller, in his eightieth year, was returned for Saltash, and availing himself of the privilege of age, spoke freely to the king, whilst he was treated by him with condescension and kindness. Once in conversation with the king he spoke of queen Elizabeth as the greatest woman in the world, to which James retorted, "I wonder you should think so; but it must be confessed she had a wife council." "And when, sir," replied Waller, "did you know a fool choose a wife one." When Waller was about to marry his daughter to Dr. Birch, the king expressed his wonder, "that he should think of marrying his daughter to a fallen church." He returned a message, in which he expresses his sense of the honour done him by the king's interest in his domestic affairs; adding, "I have lived long enough to observe that this church has got a trick of rising again." Foreseeing the storm that was gathering at the close of king James's reign, he observed, "that he would be left like a whale upon the strand." In his "Divine Poems," indicating the state of his mind towards the close of life, "it is pleasing (says Dr. Johnson) to discover that his piety was without weakness, and that his intellectual powers continued strong and vigorous." His death happened at Beaconsfield, in October 1687, in the eighty-third year of his age; and of several children by his second wife, his son Edmund, who represented Agmondesham in parliament, became a profelyte to quakerism. Of his moral principles and conduct, especially in the earlier period of his life, we can form no very high opinion. Lord Clarendon represents him as abject, and wanting courage to support him in any virtuous undertaking, and as combining servile adulation with a vain and imperious temper; but Clarendon, it will be recollected, was somewhat prejudiced in forming a judgment, which is, upon the whole, too just. He acknowledges, however, that he possessed superior powers of eloquence, and that the exuberance of his wit, and pleasantness of his conversation, which made him a chosen companion, were sufficient to cover a multitude of great faults. As a poet, he is said by one of his biographers to have possessed "character and intrinsic merit enough to retain no mean seat on the English Parnassus;" "he trifles with ingenuity, and is serious with

an air of grandeur:"—and "his works can never fall into neglect with the student of poetry." *Biog. Brit. Johnson's Lives of the Poets.* Clarendon. Gen. Biog.

WALLER, in *Rural Economy*, a term applied to a person employed in building wall-fences, and other forts of walls, as well as to a labourer engaged in manufacturing salt from brine in salt-works, who is so called in consequence of raising a bank or walling round the pit, by means of the rubbish collected in long preparing salt. They both require to be well experienced persons. See FENCE, SALT, and SALT Brine Springs.

WALLER See, in *Geography*, a lake in the archbishopric of Salzburg, of an oval form; four miles long, and two broad, where widest; 4 miles N. of Salzburg.

WALLERIUS, NICHOLAS, in *Biography*, an eminent Swedish philosopher and divine, was born in Nerika in the year 1706, and completed his education at Upsal, whither he removed in 1725. Having here distinguished himself by his proficiency in the Wolfian philosophy, he commenced, in 1737, a course of lectures on both philosophy and mathematics, which employed, in consequence of the number of attendants, a very considerable portion of his time. In 1751 he took orders; in the following year he was honoured with the degree of doctor in theology; and in 1755 he was advanced to the chair of the new theological professorship, founded by Dr. Kellenius, bishop of Westera, with a view of vindicating the truth, and evincing the excellence of Christianity; and in this situation he gained universal esteem. He was also a member of the Academy of Sciences at Stockholm, and of the Academy at Upsal, the transactions of which were enriched by several of his communications. His important and useful life was terminated by a fever in August 1764. His principal works are "Systema Metaphysicum," 1750, 4 vols. 8vo.; "Compendium Logicæ," 1754, 8vo.; "Compendium Metaphysicæ," 1755, 8vo.; "Psychologia Empirica," 1755, 8vo.; "Psychologia Rationalis," 1758, 8vo.; "Prænotionum Theologicarum," six parts, from 1756 to 1765, 8vo. Gen. Biog.

WALLERN, in *Geography*, a town of Austria, on the Inn; 4 miles S. of Efferding.—Also, a town of Bohemia, in the circle of Prachatitz; 9 miles S.S.W. of Prachatitz.

WALLERSDORF, a town of Prussia, in Natangen; 18 miles S.W. of Brandenburg.

WALLERSTEIN, a town of Germany, with a castle belonging to the counts of Oettingen, called Oettingen Wallerstein; 4 miles N. of Nordlingen.

WALLERSVILLE, a post-town of the state of Georgia; 729 miles S. of Washington.

WALLETZ SEE, a lake of Brandenburg, in the Ucker Mark; 1 mile W. of New Angermunde.

WALLEY, or **WALLIA**, a town of Africa, with an European factory, in the kingdom of Yani.

WALLHAUSEN, a town of the marggravate of Anspach; 4 miles N. of Creilheim.

WALLI, a kingdom of Africa, to the sovereign of which Mr. Park paid custom in his journey.—Also, a second river.

WALLING of Brick. See BRICK.

WALLING, Lead. See LEAD-Willing.

WALLINGFORD, in *Geography*, a very ancient borough and market-town in the hundred of Moreton, and county of Berks, England, is situated on the western banks of the Thames, at the distance of 15 miles N.N.W. from Reading, and 45 miles W. by N. from London. There are reasons for supposing it to have been a town in the time of the Romans, though its ancient name is lost: the

present, whether derived from the British word Gualen, or the Roman Vallum, owes its origin to the ancient fortification with which it was surrounded, and its ford over the Thames. The earliest mention of Wallingford in history is in the year 1006, when it was destroyed by the Danes: it appears to have been soon rebuilt, as Swein, king of Denmark was there in 1013. In Edward the Confessor's reign it was a royal borough, and contained 276 houses, the inhabitants of which owed personal service to the king. The town was incorporated by king James I.; by whose charter the civil government is vested in a mayor, five aldermen, a town-clerk, and other officers, chosen out of the burgesses, who are eighteen in number. Wallingford has sent members to parliament from the 23d year of Edward I.: the right of election is in the corporation, and inhabitants paying scot and lot. That eminent lawyer, Sir William Blackstone, who had a seat here, now the property of his son, represented this borough in parliament. Wallingford is a market-town by prescription: it appears by the Norman Survey, that in the reign of William Rufus the market was held on Saturday; it was afterwards changed to Sunday; and by a charter bearing date 1218, from that day to Monday. Here are now two weekly markets, on Tuesday and Friday, and four annual fairs. The market-house is a convenient structure, having a town-hall, and sessions-house over it. The town consists of two principal streets: its population, in the return of the year 1811, was stated to be 1901; the number of houses 380. The chief employment of the inhabitants is in agriculture and malt-making; of the latter article, 120,000 bushels have been annually made here. Leland says, here were anciently fourteen parish-churches, and that in his time there were persons living, who could shew the places where they stood. At present here are but three; St. Mary's, St. Peter's, and St. Leonard's: the two latter were nearly destroyed in 1646, when the town, being garrisoned for the king, was besieged for the parliament. St. Leonard's was repaired and opened for divine service in 1704: St. Peter's continued in ruins till the present reign; it was rebuilt principally by the exertions of Sir William Blackstone, who erected the spire at his own expense; the new church was finished in 1769, the spire in 1777. St. Mary's, which is the principal church, has a tower surmounted by the figure of an armed knight on horseback. Here are also four meeting-houses for dissenters of different denominations; a free-school, founded by Walter Bigg, alderman of London, in 1659; and an alms-house for six women, endowed by Mr. William Aungear and his sister, about the year 1687. Wallingford-bridge, which crosses the Thames, is a substantial stone structure, three hundred yards in length, and consists of nineteen arches: from its appearance, it seems to vie with the oldest fabric of the kind on the river, but the time of its erection cannot be ascertained: the pointed angular arches on the upper side are so well constructed, as to be able to resist the most violent floods; and the whole appears to be of immense strength. Near the river side are the mouldering ruins of the ancient castle, which, in the estimation of former ages, was regarded as impregnable, but they give no idea of that strength which regal armies besieged in vain. Camden was of opinion that it was of Roman origin; and Mr. Gough adds, that "the outer work of the castle is evidently Roman, and in a fragment of the wall at the entrance, the stones are laid herring-bone fashion, just as in the walls of Silchester." Having been destroyed by the Saxons and Danes, the castle was rebuilt and enlarged by William the Conqueror, when we learn, from Domesday-

day-book, that eight houses were demolished to make room for this fortress. During the contest between king Stephen and the empress Maud, the latter resided in this castle, which was strongly fortified in her behalf: Stephen besieged it several times; but all his assaults were fruitless; the strength of the place, and the bravery of the garrison, effectually resisted his utmost exertions. In the reigns of king John and Henry III., this fortress was the scene of negotiation between the kings and the discontented barons: it also bore a conspicuous part in the civil war between Edward II. and his nobles. When cardinal Wolsey was about to found a college in Oxford, Henry VIII. gave him this castle as a part of the endowment of his intended college; but on the cardinal's attainer, the grant appears to have been resumed. Leland, who visited Wallingford about that time, says, "the castle joineth to the north gate of the town, and hath three dikes, large and deep, and welle watered. About each of the two first dikes renneth an embatellid waule, now fore yn ruine, and for the most part defaced. Al the goodly building, with the tourres and dungeon, be within the three dikes." Camden, speaking of this castle, says, "Its size and magnificence used to strike me with astonishment when I came hither a lad: it is environed with a double wall and double ditch, and in the middle, on a high artificial hill, stands the citadel, in the ascent to which by steps, I have seen a well of immense depth." At an early period of the civil war between Charles I. and his parliament, Wallingford-castle was put into a state of repair; and being well garrisoned, was esteemed one of the most important fortresses in the king's possession. It escaped a siege till nearly the termination of the war: in 1646 it surrendered to the parliamentary forces; and an order of council for its demolition was issued November 18, 1652. So well was this order obeyed, that the greater part of it was destroyed. Within the walls of the castle was an ancient college, founded and endowed by Edmund, earl of Cornwall, nephew to Henry III., for a dean, four prebendaries, six clerks, and four choristers. Its revenues were further augmented by Edward the Black Prince and king Henry VI. Just within the west gate of the town was a convent of Benedictine monks, founded in the reign of William the Conqueror, by Paul, abbot of St. Alban's. The priory estate is now the property of William Hucks, esq. who has a farm-house on the site. Among the more distinguished natives of Wallingford, were Richard, abbot of St. Alban's, and John, a monk of the same place, who both derived a surname from the place of their birth: the former was eminent as a mathematician, the latter as an historian.

One mile south of Wallingford is Cholesey-farm, one of the largest and most compact in England; being let for 1000*l.* per annum: there is a barn on it 100 feet in length. It was formerly in the possession of the earls of Warwick; but is now the property of lord Kensington.—*Beauties of England and Wales*, vol. i. Berkshire; by J. Britton and E.W. Brayley, 1801. *Lysons's Magna Britannia*, vol. i. Berkshire, 4to. 1806.

WALLINGFORD, a town of the state of Vermont, in the county of Rutland, containing 1386 inhabitants; 40 miles N. of Bennington.—Also, a town of Connecticut, in the county of New Haven. This town, called by the Indians Coghinchauge, was settled in 1671. It now contains 2320 inhabitants; 12 miles S.W. of Middleton.

WALLIS, JOHN, in *Biography*, a well known mathematician, was born at Ashford, in Kent, in the year 1616, and after finishing his school education, was admitted, in 1632, at Emanuel college, Cambridge, with a view to the church.

Having taken orders, he commenced the duties of his ministerial office in 1641, as chaplain to sir William Darnley, in Yorkshire; and whilst he occupied the same station in the family of lady Vere, he had an opportunity of exhibiting his extraordinary talent in the art of decyphering. In 1643 the parliament, to which he was then attached, conferred upon him the sequestrated living of St. Gabriel, in Fenchurch-street, London; and in this year he published a quarto volume, entitled "Truth tried, or Animadversions on Lord Brookes's Treatise of the Nature of Truth." At this time he became possessed of a handsome patrimony by the death of his mother; and in 1644 he was appointed one of the secretaries of the assembly of divines. In the following year he concurred with those persons who laid the foundation of the Royal Society, and communicated specimens of his skill in mathematics; and in 1647 he discovered a new method of solving cubic equations. When the independents acquired an ascendancy over the covenanters, Wallis united with other ministers, who assembled at Sion college, in subscribing a paper, entitled "A Testimony to the Truth of Jesus Christ, and to the Solemn League and Covenant, as also against the Errors, Heresies, and Blasphemies of those Times, and the Toleration of them." In 1648 he subscribed a remonstrance against putting the king to death, and another paper, denominated "A serious and faithful Representation of the Judgment of Ministers of the Gospel, within the Province of London, in a Letter from them to the General and his Council of War." In the next year he was appointed by the parliamentary visitor Savilian professor of geometry, and quitting his church in London, entered himself of Exeter college, Oxford, where he became master of arts, and sedulously discharged the duties of his office, connecting himself with those who formed the Philosophical Society in that city. Towards the end of this year he became acquainted with Cavalieri's method of indivisibles, which he thought applicable to the quadrature of the circle; but after bestowing considerable attention upon it, it failed in completely answering his expectations. In 1653 he published, in octavo, his "Grammar of the English Tongue, in Latin," with an "Introductory Treatise on Speech," containing a philosophical inquiry into the formation of articulate sounds. MS. copies of letters which he had decyphered were this year deposited in the Bodleian library, together with an "Account of the Origin and Progress of Cryptography, or Secret Writing." In the following year he was admitted to the degree of doctor in divinity. In 1655 he printed the proposition in his "Arithmetica Infinitorum," relating to the quadrature of the circle, which he sent to Oughtred, and he afterwards published the whole work in quarto, with an introductory treatise on the conic sections, the principal properties of which he demonstrated, independently of the cone, by his method of infinites. At this time he published his "Elenchus Geometrie Hobbianae," containing a confutation of Hobbes's method of quadrating the circle, which was followed by an angry controversy of some continuance. In 1656 he brought out his tract "On the Angle of Contact," in which he contradicted the opinion of Peletarius, who had maintained that this angle had no magnitude. In the following year he published his "Mathesis Universalis, &c." and carried on a controversy with M. Fermat and M. Frenicle, in letters, which appeared in the "Commercium Epistolicum," in 1658. About this time he was chosen "custos archivorum" to the university; and he solved some prize questions proposed by Pascal, that related to the cycloid. His letter to Huygens, "De Conoide et Corporibus inde genitis," and also "De Cycloide,

Cycloide, &c." was published in 1659. His talent for deciphering recommended him to Charles II., by whom he was graciously received after his restoration; and who, besides continuing him in his offices at the university, made him one of his chaplains in ordinary. In 1660 he was concerned with those who were employed in reviewing the book of common prayer; and having complied with the requisitions of the act of uniformity, he retained his connection with the church till his death. Having suggested that it was possible to teach a deaf man to speak, he tried his skill, in 1660, upon two deaf subjects, with a considerable degree of success. After the establishment of the Royal Society in 1663, Dr. Wallis, who was one of its first members, very much contributed to its reputation and permanence by his own communications, and by his account of mathematical papers, transmitted to it by other persons. He also published, in 1663, his tract "De Proportionibus," and his illustration of the laws of motion in the collision of bodies; and in 1668 he presented to the public his hypothesis concerning the tides, in his treatise "De Æstu Maris, Hypothesis nova." In the following year appeared the first part of his principal work, intitled "De Motu," which was followed in the two succeeding years by the other two parts; and in 1671 he completed the whole, under the title of "Mechanica, sive de Motu, Tractatus Geometricus." His other publications were "Horocii opera Posthuma, with Flamsteed's Discourse on the Equation of Time," 1673, and "Archimedes' Arenarius," and "Dimensionis Circuli," "Ptolemæi Opus Harmonicum," with Latin version, and notes, 1680, and an "Appendix de Veterum Harmonica, ad hodiernam Comparata;" "Porphyrus in Harmonica Ptolemæi Commentarius ex Codice Manucripto, Græcè et Latine editus, et Manuensis Bryennii Harmonica ex Cod. Man.;" his "Algebra," 1684, with his Arithmetic of Infinites, the Infinitesimal Method of Leibnitz; and that of Fluxions, by Sir I. Newton;—"Three Dissertations upon Melchizedek, Job, and the Titles of the Palms," 1685;—"Institutio Logica," 1687; "Aristarchus Samius de Magnitudine Solis et Lunæ," with "Pappi Alexandrini Libri Secundi Collectio Mathematicarum hæcenus desiderata Fragmentum," 1689; and also a letter to Sir Samuel Moreland, in order to prove that Des Cartes borrowed his improvement in algebra from his countryman Harriot:—"The Doctrine of the Ever-blessed Trinity," 1690; and "On the Christian Sabbath," 1691. About this time the curators of the university-press at Oxford began to collect his mathematical works, with a view of publishing them in the Latin tongue. The first volume was committed to the press in 1692, and the first two volumes appeared in 1696; and the third volume, containing the *Commercium Epistoliarum*, or Letters concerning the original Author of the Method of Fluxions, and a Letter concerning the annual Parallax of the Earth, from Mr. Flamsteed, was published in 1698. Thus closed the scientific and literary labours of Dr. Wallis, who died in October 1703, in the 88th year of his age; leaving behind him one son and two daughters. Of his general character, moral and political, it will be sufficient to say, that he was prudent and moderate, endeavouring, in the collision of parties, to promote what he conceived to be the true interest of religion and science, and of the public community. As a mathematician, he is thought to have excelled in judgment and industry more than in genius. *Biog. Brit.* Hutton's *Math. Dict.*

Dr. Wallis was the first in our country who wrote on sympathetic vibrations, and the discovery of Lessons Harmoniques, or the harmonics of a single string (*Phil. Transf.*);

but he seemed not to know that Galileo and Lemni Roffe in Italy, and Pere Merfenne in France, had preceded him in accounts of that phenomenon. See *BASSE FONDAMENTALE*, and *HARMONICS*.

Dr. Wallis was the first man of science in England who had read the Greek writers on music published by Meibomius, who understood modern harmony, and who denied it to the ancients. He published Ptolemy's Harmonics, with a Latin translation, and notes; Porphyry; and Bryennius. He seems to have studied and understood the subject of the music of the ancient Greeks better than any of our countrymen. His papers in the *Phil. Transf.*, his Appendix to Ptolemy's Harmonics, and notes on the authors he has translated, are such as manifest at once, by their clearness, learning, meditation, and science.

WALLIS'S Bay, or Harbour, in Geography, a bay in the straits of Magellan; 12 miles N.E. of Cape Forward.

WALLIS'S Island, a small island near the south-east coast of New Ireland, at the entrance of Gover's-harbour, called Isle de Marteaux by M. Bougainville; 9 miles N.W. of Cape St. George.

WALLIS'S Islands, in the South Pacific Ocean, discovered by Capt. Wallis in the year 1767, surrounded by a reef of rocks. The inhabitants were robust and active, quite naked, except a kind of mat wrapt round the middle. No other animal was seen, either bird or beast, except sea-fowl. The trees were of different sorts, and many of them large, the only fruit were a few cocoa-nuts. S. lat. 13° 18'. W. long. 177°.

WALLISHOFEN, a village of Switzerland, in the canton of Zurich. Here the French were defeated by the Austrians; 1 mile S.W. of Zurich.

WALLKILL, a post-township of New York, in Orange county, with 4213 inhabitants, on a creek of the same name; 20 miles W. of Newburgh.

WALLOE, or VALLOE, a town of Denmark, in the island of Zealand; 3 miles S. of Kioge.

WALLOE, a town of Africa, on the Ivory coast. N. lat. 5° 20'. W. long. 4° 55'.

WALLOOR, a town of Hindoostan, in the Carnatic; 5 miles S.E. of Ongole.

WALLOP'S ISLAND, an island in the Atlantic, near the coast of Virginia. N. lat. 37° 48'. W. long. 75° 28'.

WALLSEY, one of the Shetland islands, on the North Atlantic Ocean, situated near the east coast of Sbetland; about six miles in length, and three in breadth. N. lat. 60° 35'. W. long. 1° 5'.

WALMER CASTLE, a fort of England, on the east coast of Kent, near Deal. See *DEAL*.

WALMERSLEY, a township of England, in Lancashire; 4 miles N. of Bolton.

WALNEY, a narrow island in the Irish sea, separated from the coast of the county of Lancaster by a narrow channel; about nine miles in length, but hardly one in breadth. It has two or three small villages, and a chapel. The south end is about 16 miles W.N.W. from the mouth of the Lune. N. lat. 54° 3'. W. long. 3° 10'.

WALNUT, a township of Ohio, in the county of Fairfield, containing 694 inhabitants.—Also, a township of Ohio, in the county of Pickaway, containing 759 inhabitants.

WALNUT Hills, a mountainous ridge in the Mississippi territory, on the east bank of the Mississippi, near the mouth of the Yazoo; N. lat. 32° 20'.

WALNUT-TREE.

WALNUT-Tree, in *Botany, Gardening, and the Materia Medica*. See JUGLANS.

WALNUT-Tree, in *Agriculture*, the common name of a tree which is well known for the use of the nuts which it produces for the table, as an article for the dessert, and of their rinds, hulks, or coats, as well as themselves in their unripe state, as an elegant, valuable, and agreeable pickle; also for its wood as timber, and its ornamental effect. It is on these and other accounts a very desirable tree for cultivation; but, in the first intention, this is often in a great degree prevented, from the very great length of time which is required, in the ordinary modes of raising it, before it becomes capable of bearing fruit in any sufficient quantity. The inconvenience arising in this way has, however, lately, in a great measure, been obviated by directing the following methods and means of producing and growing it. In addition to what has been said of its modes of culture under JUGLANS, it may be farther noticed, that an ingenious cultivator of garden and orchard plants has, within these few last years, from considering the nature of what takes place in raising fruit-trees of the apple and some other kinds, from old bearing branches of other trees of the same sorts, by the practice of grafting; suspecting that they never form what may with propriety be denominated young trees, the stocks into which they are inserted only affording them nourishment; and the new plants retaining, in all cases, the characters and habits of the particular bearing branches of which they once formed parts, and commonly producing, in two or three years from the periods of their insertion, supplies of fruit; been induced to believe that the effects of time might be anticipated in the culture of this and several other fruit-trees, which remain unproductive for a great many years after their being planted; and that parts of the bearing branches of them, when cut and detached from the old trees, and made use of as grafts, would still retain the character and habits of bearing branches.

Some walnut-trees of two years old or growth, which had been planted in the spring season, some time before, in garden-pots, were, in consequence, raised up to the bearing branches of an old walnut-tree, by placing them on the tops of poles set into the earth, and grafted by approach with parts of them. Their union took place during the summer, and in the autumn the grafts were detached from the parent stock. The plants thus obtained were afterwards planted in a nursery-ground, and, without any peculiar care or management, produced both male and female blossoms in the third succeeding spring, and have since afforded blossoms every season. It is noticed, however, that the frost has rendered their blossoms, as well as those of other trees in their neighbourhood, wholly unproductive during the last three years; and in the spring of the year 1805, almost wholly destroyed the wood of the preceding year.

It is remarked that a similar experiment was made the same year on the mulberry-tree, but under many disadvantages. Not having any young plants of this tree, the experiment could only be made with scions of one year old or growth; and of these there were only two, which had sprung from the roots of a young tree, in the preceding year. These were planted in pots, and raised in the former method, to the bearing branches of an old tree. One of the scions died; the other, which had very few roots, succeeded; and the young grafted tree bore fruit the third year, and has continued annually productive. In the last spring it was introduced into the vinery, where its fruit ripened in the truest state of perfection.

The walnut as well as mulberry-tree succeeds so ill in

grafting, in any other manner than that by approach, that attempts to propagate them in any other way can scarcely be recommended; but when they succeed by other modes of this nature, nearly the same advantages will probably be obtained. It is suggested, however, that the habit of the bearing branch is least disturbed by grafting in the approach method. The latter has been found capable of being produced by layers and cuttings from the strong bearing branches, and to be equally productive in these ways of raising them. Great advantages, too, have attended pruning them in a careful manner, and training them against south walls, palings, and other such fences.

The Spanish chestnut succeeds, it is observed, readily, when grafted in almost any of the usual ways; and when the grafts are taken from bearing branches, the young trees afford blossoms in the succeeding year. And it is further suggested, that there is reason to think, from experiments which have been made on this tree, that by selecting those varieties which ripen their fruit early in the autumn, and by propagating with grafts or buds from young and vigorous trees of that kind, which have only just attained the age necessary to enable them to bear fruit, it might be cultivated with much advantage in this country, not only for the use of the fruit, but for that of the wood as timber.

Similar experiments have likewise been tried on many other different sorts of trees, which, it is remarked, have constantly been attended with the same result; and no doubt is entertained but that the effects of time might be thus anticipated in the culture of any fruit, which is not produced until the seedling trees acquire a considerable age. For the conviction of long and extensive experience has fully shewn, that the graft derives nutriment only, and not growth, from the young stock into which it is inserted; and that with the life of the parent stock, the graft retains its habit and constitution, as well as perhaps other properties, as already suggested. See JUGLANS. See also different papers in the Transactions of the Horticultural Society of London.

The walnut is also a well-known deciduous tree, which was formerly much grown and cultivated in the field, and held in great esteem in this country for its wood, which is not unfrequently very finely veined; but which, in consequence of its aptness to be worm-eaten, has now, for the most part, given place to mahogany. It is likewise an useful tree for the purposes of ornament, and for its produce in fruit.

There are different sorts of it, which are capable of being raised and grown in these intentions with advantage; such as the common sort of walnut, which is a very large, lofty, spreading tree, and which has many varieties, as the oval and round walnut, the large and small-fruited walnut, the double early and late walnut, the tender thin-shelled walnut, and the hard thick-shelled walnut; the white sort of walnut, which has the fruit shaped like the common walnut, but in which the shell is not furrowed, the tree being of a light colour. It is said by some to be a tall tree in North America, where it greatly prevails under the title of hiccory nut-tree; and the black walnut-tree, which is large, and has the outer covering of the nuts rough, with the form of them more round than in the first of these sorts. The shell is very hard and thick, but the kernel small, though very sweet and agreeable to the taste. These two latter sorts of walnut-trees are less hardy than that of the common kind, though very proper in some cases of planting. It has been noticed that all the first sorts of these trees vary again, when raised from the seed, and that as the nuts from the same tree will produce different fruit. Those who plant the

walnut for the produce of its fruit should make choice of the young trees for that use, in the places where they stand, when they have their fruit upon them.

However, where these trees are intended for timber, it is probably the best practice to plant them out at once in the places where they are to stand or grow, as they thrive faster, and form better trees, it is said, in that method of raising them, than by any other means. The seed or nuts of the two latter sorts are to be procured from North America, and should be such as have been well ripened and secured.

These trees delight in a firm, rich, loamy soil, or such as is inclinable to chalk or marl; but they will thrive very well, it is said, in ground which is of a stony nature, or on chalk-hills, as is evident from those large plantations of them about Leatherhead, Godstone, and Carshalton, in the county of Surrey, where great numbers of these trees, planted on the downs near these places, produce, it is said, annually large quantities of fruit, to the no small advantage of their owners. Mr. Carlisle found the walnut raised from seed to be productive of fruit at a very early period, in one case, when grown on a soil the surface mould of which was of a dark colour, and of from eighteen to twenty inches in depth: it was what the workmen called a light soil; and immediately beneath which was a fine siliceous sand, about two feet thick; then a stratum of ochrey flint gravel; after which a red clay; and, at the depth of twelve feet, good water, arising from clean white sand.

The writer of the corrected account of the agriculture of Gloucestershire has, however, stated that this sort of tree will grow almost in any soil, that it wants no pruning or care, and that in less time than the oak it will make a large tree.

In planting these trees, when they are designed for the purpose of fruit, in such situations, it should not be done at less distance apart than about forty feet; and if more, it will be the better in many cases, where the soil is particularly suitable. But when for the wood or timber only, it may be performed in somewhat a closer manner with propriety, in most instances; though the trees, in such cases, should never be too much crowded together. When for ornament, single conspicuous trees have probably the best effect; but sometimes a few may be planted together with good effect.

The above writer remarks that the wood of this tree is too valuable to apply to the usual purposes of timber-trees, and is consequently always used either for cabinet-work, or for gun-stocks: for the latter use indeed, so great, it is said, has been the demand for a few years past, from the Birmingham gun-makers, that the district he is speaking of has been ransacked for this timber-wood, and very high prices have been held out to tempt the sale of it. In consequence of which, the stock has been much diminished there, so that, with very few exceptions, only a solitary walnut-tree is seen growing here and there; but that in the parish of Arlingham, in that county, there are more perhaps than in many other parishes of the same district combined: so abundant indeed was the fruit, it is said, that year (1805), that it became an article of commerce, and two vessels were then, in the beginning of October, being laden with walnuts for Scotland, at the above place, at a rate as low as four or five shillings a thousand; and that even at this price, the produce of a tree of this sort is highly valuable, as 20,000 nuts are not considered an extravagant calculation for a large tree.

Nay, were it only for the oil that these nuts afford, the trees that produce them would, some think, be worthy of some care. Evelyn has indeed observed, that one bushel of

them will yield fifteen pounds of peeled kernels, and that these will yield half that weight of oil, which the sooner it is drawn is the more in quantity, though the drier the nut the better in quality. It is added too, that the lee, or marc of the pressing, is an excellent substance for feeding hogs with. It would certainly be good manure for land, as are the cakes of linseed, rape, and some others, after the oil has been squeezed out of them. The green husks boiled, without any mixture, it is said, make a good colour for dyeing a dark yellow; and that the kernel rubbed upon any crack or chink of a leaky vessel, will stop it better than either clay, pitch, or wax.

These trees may, of course, be said to be doubly profitable, as in their annual crops of fruit, while growing, and in their timber, when felled or cut down.

The nuts are the best preserved, for planting and raising the trees, in some sort of dry sandy material; and advantage is said to be gained, in rendering the trees more early productive, by such means as prevent their roots from running too much downwards.

In the intention of preserving and using the nuts or fruit as seed, they should be left upon the trees until they be perfectly ripe, which is shewn by the outer husks easily separating from the nuts, and by these husks occasionally opening and letting the nuts drop out. It is usually about the latter end of September. In trees of large growth, the nuts are usually beaten down by long poles, as it would be difficult and troublesome to gather them by the hand; but it should not be done with such violence as is commonly used, from the mistaken notion that the trees are thereby improved, as most certainly they cannot be benefitted by such a rough manner of forcing off the young wood, upon which this fruit mostly grows at the extremities of the branches. As soon as gathered, they are to be laid in heaps a few days to heat and sweat, to cause the complete separation of the husks, then be cleaned from the rubbish that hangs about them, and be deposited in a dry room for use, covering them well with dry straw, when they will keep some months.

Walnuts are always of ready sale in the markets of large towns, in which, at their first coming in, they are commonly bought with their husks on, and sold by the sack or bushel, but afterwards cleaned, and disposed of both by measure and the thousand.

The ordinary length of time required for the walnut to bear well, when raised from the nut or seed, is mostly about twenty years.

WALO, in *Geography*, a town of Sweden, in the province of Upland; 30 miles N.E. of Upsal.

WALOM, a town of Hindoostan, in Guzerat; 16 miles S. of Puttan.

WALOON, or WALLOON, a kind of old French; being the language spoken by the Walloons, or the inhabitants of a considerable part of the French and Austrian Low Countries; viz. those of Artois, Hainault, Namur, Luxemburg, and part of Flanders and Brabant.

The Walloon is held to be the language of the ancient Gauls, or Celts.

The Romans, having subdued several provinces in Gaul, established pretors, or proconsuls, &c. to administer justice in the Latin tongue. On this occasion, the natives were brought to apply themselves to learn the language of their conquerors; and thus they introduced abundance of the Roman words and phrases into their own tongue.

Of this mixture of Gaulish and Latin was formed a new language, called Romans; in contradistinction to the ancient unadulterated

unadulterated Gaulish, which is called Waloon, or Walloon. This distinction is kept up to this day; for the inhabitants of several of the Low-Country provinces say, that in France they speak Romans; whereas they speak the Walloon, which comes much nearer the simplicity of the ancient Gaulish.

WALOUGA, in *Geography*, a town of Africa, in the country of Whidah; 10 miles N. of Sabi.

WALPACK, a town of the state of New Jersey, in the county of Sussex, containing 591 inhabitants; 25 miles W.N.W. of Morristown.

WALPERSDORFF, a town of Austria, on the Trafen; 4 miles N. of St. Polten.

WALPING SEE, a lake of Prussia, in the province of Ermeland; 4 miles S.W. of Allenstein.

WALPIT, a town of France, in the department of the Lis; 3 miles N.N.E. of Courtray.

WALPO, or WALPON, a town of Sclavonia, which gives name to a county, situated on a river which runs into the Drave, defended by an ancient castle; 20 miles N.W. of Etzek.

WALPO Taro, a rock in the Spanish Main, near the Motquito shore. N. lat. $14^{\circ} 30'$. W. long. $82^{\circ} 40'$.

WALPOLE, ROBERT, in *Biography*, earl of Orford, the third son of Robert Walpole, esq., was born at Houghton in Norfolk, the feat of his father, in August 1676, received his preparatory instruction at Eton, and completed his course of education at King's college, Cambridge; being distinguished at school for his talents for public speaking, and at the university by the ardour of his attachment to Whig principles. He was originally designed for the church; but his views were changed by the death of his eldest surviving brother in 1698, and he was initiated in the habits and pursuits of a country gentleman. In 1700 he married a lady, whose fortune enabled him to clear the incumbrances of an estate of 2000*l.* a year, which came into his possession after his father's death, and in this year he became an active member of parliament in connection with the Whig party, as a representative of the borough of Castle Rising. In queen Anne's first parliament, 1702, he was returned for Lynn, and continued to represent that borough till he became a member of the house of peers. Having availed himself of two or three opportunities which occurred for gaining the esteem and confidence of his party, he was appointed by the Whig administration in 1708 secretary of war, which office he held for a short time in connection with that of treasurer of the navy. After the trial of Sacheverel, which issued unfortunately, he published a pamphlet, in which he fixed the stigma of Jacobitism on the abettors of that turbulent priest. Upon the dismissal of the Whig ministry, he resigned his office; but having provoked the displeasure of the ruling party by his spirited defence of lord Godolphin, he was charged with venality and corruption, while he held the place of secretary at war, expelled the house, and committed to the Tower in January 1712. During his confinement, he was regarded as a martyr to the Whig cause, and visited by several persons of distinction; and he employed himself in writing a pamphlet in his own vindication. After his release in July, though he could not take his seat, he served his party by his counsel and by his pen. The dissolution of parliament took place in 1713; and Walpole was induced to expose the measures of the Tory ministry by a pamphlet, intitled "A short History of the Parliament," to which he affixed the motto, "Venalis populus, Venalis Curia Patrum." Being returned again for Lynn in February 1714, he was active in opposing the queen's Tory ministry; and particularly

distinguished himself by a speech in favour of Steele, who was prosecuted by the house for two publications. Towards the close of this reign, he displayed great zeal for the Protestant succession in the house of Hanover. Upon the death of the queen in August 1714, and the accession of George I., a new Whig ministry was formed; and Walpole was recompensed for his sufferings and losses by the two lucrative places of paymaster of the forces, and of Chelsea Hospital. He was actively employed in connection with lord Townshend, principal secretary of state, who had married his sister; and became chairman of the secret committee appointed to inquire into charges against the late ministers, and moved the impeachment of lord Bolingbroke. Being a zealous supporter of government in the rebellion of 1715, he was advanced to the important posts of first lord of the treasury and chancellor of the exchequer. Although illness prevented his supporting the septennial bill in parliament, he was decidedly attached to the measure. During the divisions that afterwards occurred in the cabinet, he steadily maintained his connection with lord Townshend, and on his dismissal in 1717, resigned his office; and even joined the Tories in opposing measures, for which, as a minister, he would have been an advocate. He contributed by a speech delivered on the occasion to the rejection of the peerage bill in 1719, and he opposed in 1720 the South-sea scheme for the liquidation of the national debt. Lord Townshend and Walpole received overtures from the earl of Sunderland, whose ministry was embarrassed, and a partial coalition was effected, in consequence of which the latter was restored to the post of paymaster of the forces. He had previously effected a reconciliation between the king and the prince of Wales, between whom a variance had long subsisted. To him the public attention was directed during the disasters that succeeded the failure of the South-sea scheme in 1721; an event which served to displace lord Sunderland from the post of first lord of the treasury, in which Walpole was re-established. At this time he adopted measures for advancing the trade and manufactures of the country, which have been much applauded by dean Tucker. In 1722 a new parliament assembled, in which the Whigs composed a majority; and Walpole distinguished himself in the prosecution of bishop Atterbury for his plot in favour of the pretender, which terminated in the banishment of this pretense. In recompence of his services, which were such as not to allow his removal from the house of commons, his son was made a baron. His brother, Horace Walpole, was appointed minister to the court of France, and he was honoured with being nominated knight of the garter. Sir Robert Walpole was at this time prime minister. In 1725 he promoted the bill for restoring lord Bolingbroke to his country and estate, though his attender was still subsisting; and this partial benefit gave such offence to his lordship, that he became a powerful antagonist to Walpole's administration. His pacific measures highly recommended him both to the nation and the king; but the death of his majesty in 1727 occasioned changes that are generally incident to a new reign. Walpole was no favourite with George II., but the influence of queen Caroline prevailed against the intrigues of both Putney and lord Bolingbroke, and when he was considered as a fallen minister, re-established in the offices of first lord of the treasury and chancellor of the exchequer, with a greater degree of power than he had ever before possessed. Of course his deserted levees were crowded with those who bask in the sun-shine of court favour. Walpole, however, was assailed by a host of able and active adversaries; among whom were Putney at the head of discontented Whigs, Sir William Wyndham and the Tories,

WALPOLE.

and a group of Jacobites. For self-defence, when argument, which derived every possible advantage from his eloquence, failed, he had recourse to the more powerful influence of corruption; and this latter mode of conviction which he not only practised from necessity, but systematically vindicated and recommended, gave a distinguishing character to his administration, and entailed reproach on his memory. In order to secure the favour of the court, he augmented the civil list, and obtained for queen Caroline a jointure of 100,000*l.* Soon after, *viz.* in 1730, the differences with the court of Spain were terminated by the treaty of Seville in 1729, but Townshend, disgusted by the superiority which his kinsman Walpole was assuming, resigned his office of secretary of state, and withdrew from public business with dignity and honour. In the year 1733, Walpole proposed two measures of finance, which occasioned much opposition and clamour; one was the alienation of the sinking fund, and the other the introduction of the excise; but notwithstanding the dissatisfaction produced by these measures, and by his disappointing expectations which he had encouraged the Dissenters to indulge with regard to the repeal of the Test Act, the minister maintained his ground; and succeeded in his endeavours for preserving peace with foreign nations. The disagreement between Frederick prince of Wales and his father was the source of much uneasiness and trouble, and these were aggravated by the death of queen Caroline, who had been long attached to him, and supported his interest with his royal master. Differences that occurred between this country and Spain, on account of the commerce in South America, was the occasion of additional anxiety; and though he much wished for the continuance of peace, the discontented party prevailed, and in 1739 war was declared against Spain. With a mind thus agitated, and contending with a powerful opposition, he fought leave to resign, but the king would not consent. At length, *viz.* in 1740, a motion was made in the house of commons for his removal from the king's presence and councils; but though it was then negatived, the clamour against him increased; and losing the support of the house, he was created earl of Orford in February 1742, and resigned. He succeeded, however, by his influence, in forming a Whig ministry, at the head of which was Pulteney. His conduct during his administration became the subject of parliamentary inquiry, but his enemies could not prevail against him; and he so far retained his majesty's regard and confidence, as to be consulted by him, and to advise Pelham to be placed at the head of the treasury. Having long been afflicted with calculous complaints, which were aggravated by a journey from Norfolk to London, by command of the king in November 1744, he was obliged to recur for temporary relief to large doses of opium; but after a display of extraordinary fortitude and resignation during the progress of his severe disorder, it terminated in his death, on March 18th, 1745, in the 60th year of his age. As to his political character, one of his biographers says, "that the desire of preserving peace abroad, and avoiding all subjects of contention at home, and promoting gradual improvements in the trade and finances of the country, and pursuing useful rather than splendid objects, joined with a sincere zeal for the Protestant succession, were the leading principles of his government; and the means which he employed were prudence, moderation, vigilance, and, it must be allowed, corruption, though it may well be doubted whether he left public men more corrupt than he found them." As a man of business, he was methodical and diligent; and, according to lord Chesterfield, "an artful rather than an eloquent speaker;" and more a man of sound sense and quick dis-

cernment than of genius. In private life, he is said to have been good-humoured, easy and agreeable in his temper, frankly familiar in his manner, and of course much esteemed by his friends and conciliatory to his enemies. His manners, however, were inelegant, his mirth coarse, his conversation and morals licentious, accessible to flattery, and the easy dupe of women. In his domestic relation, he was kind and benevolent; but he neither loved nor patronized literature. Coxe's Memoirs of Sir Robert Walpole. Gen. Biog.

WALPOLE, HORACE, lord Orford, the youngest son of the preceding nobleman, was born in 1718, and educated first at Eton and afterwards at King's college, Cambridge, where he wrote "Verses in Memory of King Henry VI." dated in 1738. Having been nominated on leaving the university to some patent finance places, he commenced his tour to the continent in 1739, in which he was accompanied by Gray, from whom he parted, as he candidly acknowledges, by his own fault, and to whom in 1744 he was reconciled. His most intimate friend, however, was his natural cousin, general Scymour Conway, to whom he was attached from his youth, and with whom he corresponded from 1740 to 1795, the year of the general's death. His first appearance in parliament was in 1741, as a representative for Callington. But more attached to literature and the arts than to the occupations of public life, and unambitious of obtaining any emoluments besides those which his places afforded him, or any rank and station connected with political pursuits, he rather chose to retire from the world than to take an active part in parliamentary business. On all occasions, however, he manifested his steady adherence to those Whig principles which he had imbibed from his youth, and his conduct as a member of the legislature was always pure and independent. Having, in 1748, purchased a small house at Twickenham, called Strawberry-hill, he devoted his time and attention to the improvement of it in the Gothic style of architecture; and to the furnishing of it with such a collection of books, pictures, and other specimens of the fine arts, as made it a very desirable place of resort in the vicinity of the metropolis, and he gratified the public curiosity and taste by appropriating three hours a day in the summer months for the accommodation of visitors. In this singular and interesting mansion, he amused himself with the cultivation and exercise of his literary talents by contributing some papers to a periodical publication, entitled "The World;" by his "Catalogue of Royal Noble Authors," printed by his own press; and by a collection of his "Fugitive Pieces;" by his "Anecdotes of Painting in England," published in 1761, in 2 vols. 4to., to which he afterwards added two more volumes; by a political pamphlet on general Conway's dismissal from the army for his vote in parliament on general Warrants, which appeared in 1764; and tale of the "Castle of Otranto," published in 1765. During his visit at Paris in 1765, he provoked the resentment of the irritable Rousseau, by addressing to him a letter in the name of the king of Prussia, exposing his vanity and self-conceit. This letter was afterwards printed, and led Rousseau to suspect, that this was part of a concerted plan to ruin his reputation, and that Hume and the French philosophers had contrived it for this purpose. Walpole was justly censured for the part he took in this business; nor could his well friends vindicate him for the contemptuous treatment with which he treated those who were authors by profession. In 1767 Walpole withdrew from public business, and declined a return for the borough of Lynn in the ensuing parliament. Soon afterwards he published his "Historic Doubts on the Life and Reign of King Richard III." In 1768, he printed at his own press his tragedy of the "Myf-

terious

terious Mother;" and about the same time he was concerned in the transactions that occurred between him and the unfortunate Chatterton. In 1791 the death of his nephew elevated him to the rank and title of earl of Orford; but this circumstance requiring some change in his fixed habits, gave him rather uneasiness than satisfaction. Towards the close of his life he was much afflicted with a constitutional gout, by which he was much debilitated; and yet he attained to his 79th year, quietly expiring in March 1797. His printed and MS. writings, of which an edition was published in 1798 in 5 vols. 4to., were bequeathed to Robert Berry, esq. and his two daughters. A posthumous work, viz. "Letters from the Hon. Horace Walpole, Esq. to George Montague, Esq. from the Year 1736 to 1770," royal 4to. has been published.

Although Horace Walpole, as to the habits of his life, was more inclined to personal enjoyment than to social intercourse, his disposition was affectionate, and he was occasionally generous to his friends. Although he was not profoundly learned, he encouraged literature and the arts by his own writings, and by various domestic arrangements and conveniences adapted to this purpose. Nichols's Lit. Anecd. Walpole's Works. Gen. Biog.

WALPOLE, in *Geography*, a town of New Hampshire, in the county of Cheshire, on the Connecticut, containing 894 inhabitants; 76 miles N.W. of Boston.—Also, a town of the state of Massachusetts, in the county of Norfolk, containing 1098 inhabitants; 21 miles S.W. of Boston.

WALPUSCH, a river of Poland, which runs into the Narew, near Pultusk.

WALRABENSTEIN, a town of Germany, in the principality of Nassau Weilburg; 3 miles N. of Idstein.

WALRING, a town of the duchy of Wurzburg; 4 miles N.W. of Melrichstadt.

WALRUS, in *Zoology*, the name by which some authors call the morse, or sea-horse, called also by others *rofmorus*, a creature very different from the hippopotamus, or river-horse. See MORSE.

WALSALL, in *Geography*, an ancient market-town in the fourth division of the hundred of Offlow, in the county of Stafford, England, is situated on an eminence at the distance of 16 miles S.E. by S. from the county-town, and 126 miles S.W. from London: It is a place of remote antiquity, and is regarded as the second town in the county. The civil government is vested in a mayor, recorder, twenty-four aldermen, and a town-clerk: the mayor, late mayor, and senior aldermen, are in the commission of the peace, and regularly hold quarter-sessions. According to the return of the year 1811, the inhabitants of the town amounted to 5541, occupying 1150 houses, which are disposed in twelve streets. The manufacture chiefly carried on here is that of buckles, spurs, stirrups, and in general all sorts of hardware articles connected with saddlery. A well-supplied market is held on Tuesdays; and three fairs annually for horses, cattle, cheese, and bacon. A remarkable custom, mentioned by Dr. Plot, still prevails here: on the eve of Epiphany, a gift of one penny is regularly distributed to every person residing in the town, or in the villages thereto belonging; not only to the fixed inhabitants, but to all strangers who may happen to be there. This was an ancient endowment of an inhabitant of the name of Morley. The church is a very ancient edifice, of a cruciform construction. At the fourth-west angle rises a strong, plain tower, surmounted by an octagonal spire. The interior is lofty and spacious, and presents a singular appearance: each side of the chancel has seven stalls, the seats of which are ornamented with a great variety of grotesque figures carved

in basso-relievo. Under this part of the church is an archway of masonry workmanship, forming a common passage through the eastern division of the church-yard. Here are also several places of worship appropriated to various classes of dissenters: and a free grammar-school founded by queen Elizabeth.

This parish includes the *foreign of Walsall*, a district comprehending the hamlets of Great Bloxwich, Little Bloxwich, Caldmoor, Little London, and the Windmill. In the year 1811, the population of this district was stated to be 5648; the number of houses 1099: making the inhabitants of the whole parish 11,199; the houses 2249.

About a mile and a half to the north of Walsall is *Rusball-Hall*, the seat and park of the Rev. W. Leigh.—Bescot-Hall is one mile from the town, and occupies the site of the ancient baronial mansion of the Hillarays and Mountfords: it is surrounded by a moat, over which is a picturesque bridge: the iron-gates, formerly standing close to the house, are now placed at a considerable distance, greatly improving the approach.—*Beauties of England and Wales*, vol. xiii. Staffordshire.

WALSCHIED, a town of France, in the department of the Meuse; 6 miles S.E. of Sarburg.

WALSDORF, a town of Germany, in the principality of Nassau; 3 miles N.E. of Idttein.—Also, a town of Bavaria; 4 miles W. of Bamberg.

WALSEE, a town of Austria, on the Danube; 14 miles E. of Ens.

WALSH, WILLIAM, in *Biography*, was born at Abberly in Worcester-shire in 1663, and having finished his education as gentleman-commoner of Wadham college in Oxford, he travelled abroad for further improvement, and after his return attracted notice as a man of letters and of fashion. He also assumed a political character, and represented his native county in parliament, and distinguished himself by actively promoting the Revolution. He is supposed to have died in 1709. Dryden, with whom he cultivated friendship, repaid his attentions with that praise which he was disposed liberally to bestow on those whom he wished to distinguish, denominated him "the best critic of our nation," and he furnished a preface to his "Dialogue concerning Women." Pope also acknowledges early obligations to him in the following terms:

"And knowing Walsh would tell me I could write."
In his "Essay on Criticism," he denominates him the "Mufe's judge and friend," and with the ardour of youth, gives him the credit of having "taught his early voice to sing." It has been observed, however, that Mr. Walsh's rank in the scale of literature scarcely entitled him to the high panegyric either of Dryden or of Pope; for neither his miscellaneous poems, nor his prose pieces, of which one was his "Essay on Pastoral Poetry," justify the very distinguished honour which they conferred upon him. Biog. Brit. Johnson's Lives of the Poets. Gen. Biog.

WALSH, JOHN, opened a music-shop in Catherine-street in the Strand, 1710; and was the first in our country who stamped music on pewter. He was succeeded by his son, who was Handel's publisher; the publisher of Corelli, and of the solos and concertos of Geminiani. Indeed he and Hulse in the city, seemed for a long time to monopolize the sale of music throughout the kingdom; till Johnson of Chesham, who attended all the great fairs in the kingdom, and Bremner from Edinburgh, opened a shop in the Strand, and became extensive publishers, and formidable rivals to Walsh and his successor and relation, Randal.

The Dutch, during the whole last century, engraved or stamped music on copper, superior to the natives of all other countries. The only engraver in that metal in our own country

country was Cluer in Bow church-yard, who engraved in 8vo. several of Handel's operas in score, in the neatest and most correct manner which we remember to have seen, particularly Julius Cæsar, in 1720, which we keep as a curiosity.

WALSH, in *Agriculture*, a term provincially applied in some cases to the peculiarly insipid taste of some vegetables, roots, and other such substances.

WALSIB, *Cape*, in *Geography*, a cape on the coast of New Guinea. S. lat. 8° 24'. E. long. 137°.

WALSHAM, NORTH, a market-town in the hundred of Tunstead and county of Norfolk, England, is situated in a level near the sea, at the distance of 15 miles N.N.E. from Norwich, and 124 miles N.E. by N. from London. In the year 1600, a destructive fire occurred here, which consumed 118 houses, besides many barns, stables, malt-houses, &c.; the value of which was estimated at 20,000*l*. The town now consists of three streets, which form an irregular triangle. At the junction of these is the parish-church, the tower of which fell down in 1724. In the chancel is a fine monument, with an effigy, &c. to the memory of sir William Paflon, knt., who died in 1608, aged eighty years. He agreed, in 1607, with John Key, a mafon of London, to erect and fit up this tomb, with his effigy in armour, five feet and a half long, for which he was to pay 200*l*. Sir William settled 40*l*. per annum on the free-school, and 10*l*. a year on a weekly lecturer. In this parish are meeting-houses for Quakers, Methodists, Presbyterians, and Anabaptists. An annual fair is held here, and a weekly market on Thursday. In the reign of Edward VI. bishop Thirlby built a market-cross here, which, being damaged by the fire above mentioned, was repaired by bishop Redman. In the population return of the year 1811, this parish is stated to contain 448 houses and 2035 inhabitants.

In the adjacent parish of Bacton stood *Broomholme Priory*, founded by William de Glanville, in 1113, for monks of the Cluniac order; the remains of this building, near the sea-side, some time since formed an interesting ruin; but most of the walls are now incorporated with a farm-house, and the rooms converted into domestic offices.

St. Bennet's Abbey, at *Holme*, in the parish of Horning in this hundred, was founded in a fenny place, called Cowholme, where formerly was an hermitage, which king Canute, in the year 1020, established for black monks of the Benedictine order. The ample endowments first granted were further extended by Edward the Confessor, the empress Maud, and other royal personages. It was one of the mitred abbeys, and its abbots had a seat in the house of lords. This abbey was so strongly constructed, that it appeared more like a castle than a cloister; and was so well fortified, that William the Conqueror in vain besieged it, till a monk, on promise of being made abbot, betrayed the place: the king performed the condition, but hanged the new abbot as a traitor. Some foundations of the walls, which inclosed an area of thirty-five acres, are yet traceable; but the remains of the once-stately building are now no more, except part of the magnificent gate-way, and this is partially obscured by a draining-mill erected over it.—*Beauties of England and Wales*, vol. xi. Norfolk. By J. Britton, F.A.S. 1810, from *Blomesfield's History*, &c. of Norfolk.

WALSINGHAM, Sir FRANCIS, in *Biography*, an eminent statesman, was descended from an ancient family of Walsingham in Norfolk, and born at Chislehurst in Kent. Having completed his education at King's college, Cambridge, he sought farther improvement by foreign travels, and having remained abroad during the reign of queen Mary, he was introduced to public business by Cecil on his return to his own country. He commenced his political

career as ambassador to France, where he continued, discharging his public duties with great assiduity and injury to his own fortune, until the year 1573. His conduct in this office is highly commended by Wicquefort; and Dr. Lloyd, in his "State-Worthies," pronounces a very flattering eulogy on his political character. In 1573 he was appointed secretary of state, admitted into the privy-council, and knighted; and such was his vigilance in guarding against plots which threatened to disturb the tranquillity and security of queen Elizabeth, that he is said to have maintained 53 agents and 18 spies in foreign courts. In 1581 he went to France as ambassador for the purpose of treating concerning a marriage between Elizabeth and the duke of Anjou; and on this occasion, it is said, that "the fickle coquetry of his mistresses tried his patience, and exercised all his diplomatic dexterity." The result of his embassy to Scotland in 1583 was a report of James's abilities and learning more favourable than he really merited. In the unhappy dispute that terminated in the execution of Mary, Walsingham was a principal agent, and he has been charged, as the reader will find under the article ELIZABETH, with recommending some private method of putting that unfortunate princess to death; but it has been thought that the letter mentioned under that article, and said to have been signed by him, is not genuine; and that this is the case is rendered more probable by the evidence alleged in proof of Walsingham's having warmly opposed such an act of villainy when proposed by the earl of Leicester. After the death of Mary, Walsingham was principally instrumental in producing a reconciliation between the English and Scottish courts. This minister was a zealous Protestant, and seemed disposed to countenance the Puritans, as the most zealous opponents of popery; and he also manifested his attachment to the reformed religion by establishing a divinity-lecture at Oxford in 1586, for the purpose of discussing the fundamental truths of Christianity, derived from the scriptures, and of thus forming a wider separation between the church of England and that of Rome. In advanced life, Walsingham retired from business; and died in April 1590, so much in debt, notwithstanding the various posts and dignities which he occupied, that he was buried in St. Paul's privately and by night, lest his body should be arrested. His poverty, however, seems to have been exaggerated, though his expences in the conduct of public business were known to be very great. His only daughter was successively married to sir Philip Sidney, to the earl of Essex, and to the earl of Clanrickard. The negotiations and dispatches of Walsingham, during his residence at the French court in 1570, were collected by sir Dudley Digges, and published in 1655, fol. *Biog. Brit.*

WALSINGHAM, THOMAS, a native of Norfolk, was a benedictine monk of St. Alban's, where he was chanter, and probably regius professor of history about the year 1440, in the reign of Henry VI., as he styles himself historiographer royal. One of his works is intitled "Historia brevis," and commences with the close of the reign of Henry III., where that of Matthew Paris terminates. Another performance is intitled "Hypodigma Neultrie," and gives an account of the affairs of the duchy of Normandy, from the time of Rollo to the sixth year of Henry V. The materials of this chronicler's narratives are in good estimation; and were published by archbishop Parker, Lond. 1574, fol. Nicolson's Hist. Lib.-Gen. *Biog.*

WALSINGHAM, THOMAS, in the *History of Music*, was the author of a treatise in the MS. of Waltham Holy Cross; for an account of which, see *Lionel Power*. For an account of Walsingham's treatise, see the article PRO-LATION.

WALSINGHAM, a tune in queen Elizabeth's Virginal Book, with thirty variations by Dr. Bull; so difficult, that the famous singer, Margarita, after she had quitted the stage, and was married to Dr. Pepusch, though she became a great harpsichord player, could never entirely conquer them. See VIRGINAL Book of queen Elizabeth and Dr. BULL.

We at first imagined that this tune might have had its name of Walsingham, from the composer of whom we have been speaking in the preceding article; but find that in Ward's Lives of the Prof. of Gres. Coll. it is said to have been first composed by Birde, with twenty variations, and that Bull composed his variations at different times. Afterwards, we thought then that the name might have been a compliment to sir Francis Walsingham, the queen's minister; but that idea was relinquished on finding that it was the tune of an old song, beginning, "As I went to Walsingham," in queen Elizabeth's book; and "Have with you to Walsingham," in lady Nevil's virginal book, where it is inserted with twenty-two variations by Birde. Now it is well known by tradition, in Norfolk, that Henry VIII., previous to the suppression of the monasteries, visited that of our lady of Walsingham, so rich in votive gifts from those who had been cured of diseases, or imagined themselves cured, by the waters of the holy well, that it has been supposed that Henry, tempted by the riches and splendour of the religious houses at Walsingham, precipitated their fall; and it is probable, that the words to the tune called Walsingham were written about this time.

WALSINGHAM, *Little, or New, in Geography*, a considerable market-town in the hundred of North Greenhoe and county of Norfolk, England, is situated on the banks of a small river at the distance of 29 miles N.W. from the city of Norwich, and 114 miles N.N.E. from London. The great celebrity which this town obtained for several centuries was originally derived from the widow of Ricoldie Faverches founding, about the year 1061, a small chapel in honour of the Virgin Mary, similar to the Sancta Casa at Nazareth. Sir Geoffrey Faverches, her son, confirmed the endowments, made an additional foundation of a priory for Augustine canons, and erected a conventual church. Immense wealth was accumulated by grants and offerings; and the image of the *Lady of Walsingham* was as much frequented, if not more than the shrine of St. Thomas à Becket at Canterbury. Foreigners of all nations came hither on pilgrimage; many kings and queens of England also paid their devours to it; so that the number and quantity of her devotees appeared to equal those of the lady of Loretto in Italy. Erasmus, who visited this place, says, that "the chapel, then rebuilding, was distinct from the church, and inside of it was a small chapel of wood, on each side of which was a little narrow door, where those who were admitted came with their offerings and paid their devotions; it was lighted up with wax torches, and the glitter of gold, silver, and jewels, would lead you to suppose it to be the seat of the gods." This far-famed image was, in the 30th year of Henry VIII., conveyed to Chelsea, and there publicly burnt. The present remains of this once-noble monastic pile are, a portal, or west entrance gateway, a richly ornamented lofty arch, sixty feet high, which formed the east end of the church, supposed to have been erected in the time of Henry VII.; the refectory, seventy-eight feet long, and twenty-seven broad, and the walls twenty-six feet and a half in height; a Norman arch, part of the original chapel, which has a zigzag moulding; part of the old cloisters, a stone bath, and two wells, called the Wishing Wells, from a charm which superstition attached to them. The principal parts of these venerable ruins are included in the pleasure-

grounds of Henry Lee Warner, esq. who has a commodious house, which occupies the site of the priory. The present proprietor has progressively, for several years, been making improvements in planting, and laying out the grounds in the immediate vicinity of his mansion. The church of Walsingham is a spacious and interesting pile, displaying in its architecture, ornaments, monuments, and very elegant font much to gratify the antiquary. The latter is not only the finest specimen of the sort in the county, but perhaps in the kingdom. It is of an octangular shape, and the whole of its base, shaft, and projecting upper portion, is covered with sculpture, representing buttresses, pinnacles, niches, crocketed pediments, &c. with several figures in basso-relievo. It is elevated on a plinth of four steps, the exterior faces of which are also decorated with tracery mouldings. (See an account and view of it in Britton's *Architectural Antiquities of Great Britain*.) A house of grey friars was founded in this town about the year 1346 by lady Elizabeth de Burgh, countess of Clare; but its fame was eclipsed by the superior grandeur of its neighbour, and poverty thrust it still further into obscurity. An hospital for lazars was founded here in 1492: the building of which is used now as a bridewell. A fair is held annually; and a market weekly on Fridays. The population, by the return of the year 1811, was stated to be 1008, occupying 236 houses.

At the distance of a mile and a half N. by E. is the village of Old Walsingham, which contains two churches; and in 1811 was returned as having 71 houses, and a population of 347 persons.

In the adjoining parish of Binham are the remains of Binham Priory, formerly an edifice of great extent and liberal endowment. Its ruins are now very considerable and interesting, but are gradually mouldering away. Of the once-spacious collegiate church, only the nave and north aisle, the chief part of the western front, and fragments of the transept, are now left. Excepting the west façade, the whole is of the early Norman architecture, and most probably constitutes part of the original structure founded in the beginning of the reign of Henry I. The exterior of the western front is wholly in the pointed style, and is an interesting specimen of the ecclesiastical architecture of the thirteenth century.

Holkham House, in the adjacent parish of Holkham, the magnificent seat and residence of Thomas William Coke, esq., was begun in the year 1734 by the earl of Leicester, and completed by his dowager-countess in 1760. The central part of this spacious mansion extends three hundred and forty-five feet in length, by one hundred and eighty in depth, and is accompanied by four wings or pavilions, which are connected with it by rectilinear corridors or galleries; each of the two fronts, therefore, displays a centre and two wings. In the centre are comprised the principal rooms; and each wing has its respective destination, and suite of family apartments. There may be houses larger and more magnificent than this, but scarcely any one in the kingdom that can equal it for convenience and appropriate arrangement. The sitting up of the interior is in the most splendid style, and in some of the apartments with the most elegant taste. A corresponding style prevails in laying out the extensive pleasure-grounds and park. On the north side of the latter, a lake, covering about twenty acres, extends in nearly a right line for 1056 yards; it includes a small island, and the shore is finely clothed with wood.—*Beauties of England and Wales*, vol. xi. Norfolk. By J. Britton, F.A.S. 1810. Blomefield's *Topographical History of Norfolk*, vol. ix. 8vo. 1808.

WALSINGHAM of *Davis, Cape*, a cape on the E. coast of America, at the N. side of the entrance into Cumberland Straits. N. lat. $64^{\circ} 10'$. W. long. 66° .

WALSINGHAM of *Frobisher, Cape*, a cape at the S.E. extremity of Hale island in Davis's Straits, at the entrance of Frobisher's Straits. N. lat. $62^{\circ} 50'$. W. long. $64^{\circ} 58'$.

WALSRODE, *i. e.* WALO'S CROSS, a town of Westphalia, in the principality of Lüneburg Zell, on the Bolme. It owes its rise to a monastery founded in 986, by Walo a prince of Anhalt, and is now a considerable town with a good trade in wool, beer, &c.; 3 miles N.W. of Zell. N. lat. $52^{\circ} 54'$. E. long. $9^{\circ} 35'$.

WALSTORP, a town of the duchy of Holstein; 11 miles S.W. of Lutkenborg.

WALT, in *Sea Language*, an obsolete or spurious term, signifying crank.

WALTDORF, or WALTERSDORF, in *Geography*, a town of Silesia, in the principality of Neisse; 5 miles N.N.E. of Neisse.

WALTENBUCH, a town of Wurtemberg; 8 miles S. of Stuttgart.

WALTER NIENBURG, a town of Germany, in the principality of Anhalt Zerbst; 6 miles W. of Zerbst.

WALTERSDORF, a town of Bohemia, in the circle of Chrudim; 13 miles N.E. of Leutmischl.

WALTERSDORFF, a town of Austria; 5 miles E. of Ziltendorf.

WALTERSHAUSEN, a town of Germany, in the principality of Gotha; 4 miles S.S.W. of Gotha. N. lat. $50^{\circ} 56'$. E. long. $10^{\circ} 38'$.

WALTERSKIRCHEN, a town of Austria; 8 miles N.W. of Ziltendorf.

WALTHAM, a town of Massachusetts, in the county of Middlesex, containing 1014 inhabitants; 11 miles N.W. of Boston.—Also, a town of Vermont, in the county of Addison, containing 244 inhabitants.

WALTHAM, or *Weslham*, a town of Virginia, on the left bank of James river; 4 miles N.W. of Richmond.

WALTHAM *Abbey*, or WALTHAM *Holy-Crofs*, a large irregular market-town in the half hundred of Waltham and county of Essex, England, is situated on low ground near the river Lea, at the distance of twenty-three miles W. by S. from Chelmsford, and twelve miles N. by E. from London. This spot was originally part of the forest of Essex, and derived the appellation of Waltham from the Saxon words *Ham*, a place, and *Weald*, woody; the whole site being anciently overgrown with trees. The additional names were derived from the abbey afterwards founded here, and the crofs to which the abbey was dedicated. The first mention of Waltham occurs in the reign of Canute the Great, when Tovy, the king's standard-bearer, founded here a village and a church, placing three score and six dwellers in the former, and two priests in the latter. After his death, Waltham reverted to the crown, and was granted, in 1062, by Edward the Confessor, to earl Harold, on condition that he should build a monastery there. Harold accordingly, in the same year, re-founded and enlarged the building erected by Tovy, and endowed it as a college for a dean and eleven secular canons of the order of St. Augustine. A distinct manor was assigned for the maintenance of each canon, and six for the support of the dean; the church was enriched with a great number of relics and costly vessels. The possessions of the college were afterwards considerably augmented by various benefactions, and it continued in a state of progressive advancement till the reign of Henry II. This monarch, by a charter of licence from pope Alexander, changed the old foundation of secu-

lars into an abbey of regular canons of the same order, enlarging the number to twenty-four, and proportionably increasing their revenues; and the abbey and church were re-dedicated to the Holy Crofs. Walter de Gaunt was appointed the first abbot, with an exemption by the pope from episcopal jurisdiction; and this privilege has descended to modern times, Waltham being still exempted from the arch-deacon's visitation. Richard I. granted to the abbey the whole manor of Waltham, with various privileges and gifts, which were greatly augmented by Henry III., from whose time it became so distinguished by a series of royal and noble benefactors, as to rank with the most opulent in the kingdom. Henry frequently made the abbey his residence; and, to provide, in some measure, for the increased consumption which his presence and retinue occasioned, granted to the town the privilege of a weekly market, and an annual fair of seven days. The abbey having existed during the government of twenty-seven abbots, exclusive of the deans of the first foundation, was dissolved in the year 1539; when its annual revenues were valued at *900l. 4s. 11d.* according to Dugdale; or, as recorded by Speed, at *1079l. 12s. 1d.* The site was granted to sir Anthony Denny; from whose family it passed in the next century, by marriage, to James Hay, earl of Carlisle: it has since been in the family of sir William Wake, bart. The abbey-house is said to have been a very extensive building; but it has been long since wholly demolished; a gateway into the abbey-yard, a bridge which leads to it, some ruinous walls, an arched vault, and the church, are now the only vestiges of the ancient magnificence of Waltham abbey. The church, which was of a much earlier style of architecture than the other remains, was built in the usual form of a crofs, and consisted of a nave, transept, choir, ante-chapel, &c. Some idea may be formed of its great extent, from the situation of king Harold's tomb, which stood about 120 feet east from the termination of the present building, in what was then the east end of the choir: the intersection of the transept is still visible; above this rose the ancient tower, part of which falling through mere decay, the remainder was undermined and blown up, and the whole choir, tower, transept, and east end, were wholly demolished, so that nothing was left standing but the nave, which has since been fitted up, and made parochial, and constitutes the present church. This venerable relic, though much disfigured and mutilated, contains several interesting and curious specimens of the ornamented columns, semi-circular arches, and other characteristics of the Norman style of architecture. Its length is about ninety feet; and its breadth forty-eight. The body is divided from the aisles by six arches on each side; five are semicircular and decorated with zigzag ornaments; the sixth is pointed, and apparently of a later construction. At the west end is a heavy square embattled tower, rising to the height of eighty-six feet, and having the date of 1558. Almost every ornamental vestige of grandeur and antiquity, which formerly distinguished the exterior of this church, has been industriously defaced; and what remains owes its preservation to the durable nature of its materials. In the inside the hand of violence is less conspicuous; but every thing displays marks of the most wretched parsimony: the grandeur and simplicity of the ancient remains are much injured by white-washing; the brasses are torn from the grave-stones, and it is with difficulty that their impressions can be traced. In this church were interred king Harold and his two brothers, Girth and Leofwin, slain with him at the battle of Hastings. Many other persons of rank and authority in early times were also buried here. The history of Waltham town is so nearly identified with that of the abbey,

abbey, that but little remains to be said of the former. In the population return of the year 1811, the inhabitants of this town are enumerated as 2287; the houses as 422. Tuesday is the market-day, and here are now two annual fairs. The chief manufactures are those of printed linens, and of pins; for the latter purpose some large buildings have been recently erected, in which a great number of children of both sexes are employed. One of the branches of the Lea, near the town, are some gunpowder mills, now in the occupation of government; these have been partly rebuilt since the year 1801, when considerable damage was done by the explosion of the Corning-house. The various streams of the Lea, in this vicinity, are traditionally supposed to flow in the same channels which the great Alfred made to divert the current, when he drew off the water, and left the Danish fleet on shore. Waltham parish includes the hamlets of Holyfield, Sewardstone, and Uphire, which are stated to contain 297 houses and 1398 inhabitants; making the aggregate population of the parish 3685, the number of houses 719.—*Beauties of England and Wales*, vol. v. Essex. By J. Britton and E. W. Brayley, 1803. History, &c. of Waltham Abbey, by J. Farmer, Gent. 8vo. 1735.

WALTHAM, *Bishop's*. See BISHOP'S WALTHAM.

WALTHAM, *West*, or WALTHAM CROFS, a hamlet in the parish of Cheshunt, hundred and county of Hertford, England, is situated half a mile from Waltham abbey, nine miles S. by E. from Hertford, and twelve miles N. from London. It derives the appellation of *Crofs* from one of those elegant stone crosses which Edward I. erected to the memory of his consort queen Eleanor, who died in November 1291, at Hareby near Grantham, in Lincolnshire. Her bowels were interred in Lincoln cathedral; her body was brought to London, and deposited in Westminster abbey. At each of the places where the procession rested, during this journey, the king afterwards erected a cross; of which only those of Geddington, Northampton, and Waltham, now remain. Waltham cross is the least perfect of the three, though the Society of Antiquaries have twice interested themselves in its preservation; once in 1721, and again in 1757, when lord Monson, then lord of the manor of Cheshunt, at the request of the Society, surrounded the base with brick-work: it was originally encompassed by a flight of steps, but these have been long removed. The upper parts are also greatly mutilated; much of the foliage is defaced, and the pinnacles and battlements are broken. The form of the cross is hexagonal: it is separated into three stories; the middlemost of which is open, and displays statues of queen Eleanor crowned; her left hand holding a cordon, and her right a sceptre or globe. Each side of the lower story is divided into two compartments, beneath an angular coping, charged with shields exhibiting the arms of England, Castile, Leon, and Pontieu. The cornice over the first story is composed of various foliage and lions' heads, surmounted by a battlement pierced with quatrefoils. The second story is formed of twelve open tabernacles, in pairs, terminating in ornamented pediments with a finial on the top: this story also finishes with a cornice and battlement like the first, and supports a third story of solid masonry, ornamented with single compartments in relief, somewhat resembling those below. In this hamlet is an ancient Spital, consisting of four rooms below, and three above, from time immemorial appropriated for poor lame people. The work-house for the parish of Cheshunt is situated in this hamlet.—*Beauties of England and Wales*, vol. vii. Hertfordshire. By E. W. Brayley. 1808. Lyfons's Environs of London, vol. iv. 4to. 1796. Britton's Architectural Antiquities of Great Britain, vol. i. 4to. 1807.

VOL. XXXVII.

WALTHAM, *Great*, a township of England, in Essex; 4 miles N. by W. of Chelmsford.

WALTHAM on the *Wold*, a town of England, in the county of Leicester, which had formerly a weekly market on Thursday, now discontinued; 18 miles S.E. of Nottingham. N. lat. 52° 50'. W. long. 0° 48'. See WALTON-on-the-Wolds.

WALTHAMSTOW, an extensive village in the hundred of Becontree and county of Essex, England, is situated near the borders of the river Lea, at the distance of six miles and a half N.E. by N. from St. Paul's cathedral, London. Its name is derived from the Saxon word *wæald*, a wood, *ham*, a manor, and *stowe*, a place. It covers a considerable tract of ground, and is divided into the following streets, or hamlets: Wood-street, Clay-street, Marsh-street, Hoo-street, Hale-end, and Chapel-end. The parish church, a spacious brick structure, consists of a chancel, nave, and two aisles. At the west end is a square tower, which was rebuilt by sir George Monox, alderman of London; who also built the chapel at the east end of the north aisle about the year 1535: the south aisle was built about the same year with a part of some monies bequeathed for charitable uses by Robert Thorne, merchant-taylor, and citizen of London. About the year 1740, a meeting-house for Protestant dissenters was established in this village: in 1787 some disputes among the congregation occasioned the building of a new meeting-house, which was opened in July in that year: it has a cemetery adjoining. Sir George Monox, before mentioned, built and endowed thirteen alms-houses on the north side of the church-yard, for eight men and five women; with a school-house and apartments for a master: the endowments were augmented in 1686, by the will of Henry Maynard, esq. Thirty boys are now clothed and educated in the school; and the benefits have been extended to twenty girls, in a school established in 1780. Here is also a school for very young children, who are taken care of till of age to be admitted into the other schools. In the year 1795, six alms-houses were built and endowed by Mrs. Mary Squires, for widows of decayed tradesmen. The parish of Walthamitow contains about 4320 acres of land, of which upwards of 3000 are inclosed; chiefly pasture land. The population return of the year 1811 states the number of houses to be 562; the inhabitants 3777.—Lyfons's Environs of London, vol. iv. 4to. 1796.

WALTHARN, a town of Hesse Darmstadt; 26 miles E.N.E. of Heidelberg.

WALTHAUSEN, a town of Austria, with a convent; 4 miles N.E. of Grein.

WALTHER, AUGUSTINE FREDERIC, in *Biography*, an anatomist and physician, was appointed in 1723 professor of anatomy and surgery, in the university of Leyden. Several of his dissertations on anatomical subjects are upon the whole commended, and have been reprinted by Haller. The best of his larger pieces are, "De Lingua Humana Libellus," 1724, 4to. As a botanist, he published a catalogue of the plants in his own garden, and a work on the structure of plants. He died about the year 1746. Haller. Eloy. See WALTHERIA.

WALTHER, BERNARD, an eminent astronomer, was born at Nuremberg in the year 1430, and having applied principally to the study of mathematics, and more especially of astronomy, under Regiomontanus, was eminently useful by his talents and opulence in encouraging the inventions and aiding the observations of his preceptor, whilst he continued at Nuremberg; and when by the invitation of pope Sixtus IV. he removed to Rome, with a view to the reformation of the calendar, he continued his observations for

nearly forty years, viz. from 1475 to the time of his death in 1504. His instruments were of the most perfect kind which he could then procure, and he was skilful and persevering as well as successful in the use of them. He was the inventor of a chronometer, or clock with wheels, which indicated the time of noon with an accuracy corresponding to the result of calculation; and he is also celebrated as the first of the Moderns who observed refraction. (See the article JOHN MULLER.) The singularity of his character, however, restricted the benefit which astronomy might otherwise have derived from his own observations and those of his preceptor Regiomontanus, or John Muller. After the death of Muller, he purchased his papers and instruments, which he kept in his own possession, without allowing any one to see them; and after his death, they were neglected by his heirs, so that many of them were lost. At length the senate of Nuremberg purchased the writings of these two mathematicians which they could procure, and deposited them in the library of that city. Several parts of them were afterwards extracted, and published by Schoner and his son. In the work entitled "Vranies Norice Basis Astronomice, five Rationes motus annui ex Observacionibus in Solem hoc nostro et Seculo ab hinc tertio Norinbergæ, habitis, a Johanne Philippo a Wurzelbau," Norimb. 1709, are contained observations by Walther and Wurzelbau, with inferences drawn from a comparison of them, which are said by Kältner to be very valuable, as the observations were made under the same meridian, and at the interval of a century. Montucla Hist. du Mathem. Kältner Geschichte du Mathematik, cited in Gen. Biog.

WALTHER, JOHN GODFREY, author of an excellent historical and biographical musical dictionary, published in German at Leipzig, 1782, in 8vo. The German title is: *Musikalisches Lexicon oder Musikalische Bibliothek*. Of all the books which we have consulted for information concerning musicians and their works, we have never met with more satisfaction than from this Lexicon; which though compressed into an octavo volume, is so ample and accurate, that we have been seldom disappointed, and never led into error by it. This little volume contains, not only all the technica of ancient and modern music, but biography, as far as names, dates, and works, of almost every eminent musician that has existed in ancient and modern times, till the year in which the book was published. The author's information, of course, concerning Germany, is the most ample, but Italy and France have had a considerable share of attention.

In 1790 and 1792 a new edition of this work, with additions to the time of publication, was printed at Leipzig in two vols. 8vo. by Ernst Ludwig Gerber.

WALTHER, JOHN LUDOLPH, author of another very curious and useful dictionary, published at Ulm in folio, 1756, in Latin, intitled "Lexicon Diplomaticum Abbreviationes syllabarum et vocum in diplomatibus et codicibus a Seculo VIII. ad XVI. usque occurrentes exponens. Junctis Alphabetis et scripturæ Speciminibus integris." The author was librarian and private secretary to his British majesty Geo. II. as elector of Hanover. With a very learned preface by John Harry Young, regius secretary in the university of Gottingen.

The whole book is engraved on copper-plates; and in the second part, among the specimens of writing without abbreviations, we have examples of the first attempts at musical notation from the ninth century, not only before lines were in use, but even before *points* of different elevation were the vocal guides of the priests in canto fermo.

This very curious, learned, and elegant publication seems

to have escaped the notice of all our periodical works of criticism, nor have we ever seen it mentioned in any of our catalogues of old and curious books.

WALTHERIA, in *Botany*, received its name from Linnæus, in honour of Augustus Frederick Walther, professor of Pathology at Leipzig, where he published, in 1735, an alphabetical catalogue of his own garden, with twenty-four plates, no very great acquisition to science. The author, being an able anatomist, gave some attention to the structure of plants, on which he published an academical treatise in 1740; but, as it appears by Haller's account, without much that is new or instructive. He wrote also on the essential oils of vegetables, on the Egyptian *Lotus*, and on the *Silphium* of the antients, as elucidated, if such a term be allowable, by their coins. This author died in 1746, at the age of 58. There have been several others of the same name, but scarcely entitled to claim a share in the botanical distinction here conferred.—Linn. Gen. 348. Schreb. 453. Willd. Sp. Pl. v. 3. 586. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 4. 138. Cavan. Diss. 315. Juss. 289. Lamarck Illustr. t. 570. Poir. in Lamarck Dict. v. 8. 323.—Class and order, *Monadelphia Pentandria*. Nat. Ord. *Columbifera*. Linn. *Malvacea*, Juss.

Gen. Ch. *Cal.* Perianth inferior, double; the outer unilateral, of three leaves, deciduous; inner of one leaf, cloven half way down into five acute segments, cup-shaped, permanent. *Cor.* Petals five, inversely heart-shaped, spreading, their claws inserted into the lower part of the tube of the filaments. *Stam.* Filaments five, united into a tube, their upper part separate, spreading, short; anthers ovate. *Pist.* Germen superior, ovate; style thread-shaped, longer than the stamens; stigmas tufted. *Peric.* Capsule obovate, of one cell and two valves. *Seed* solitary, obtuse, dilated upwards.

Ess. Ch. Calyx double; the outer lateral, of three leaves, deciduous. Petals five. Style one. Capsule of one cell, and two valves. Seed solitary.

A tropical genus, whose flowers are smaller than in most of the Mallow tribe, and always assembled numerously into little tufts or heads. The stem is shrubby. Leaves undivided, more or less ovate, serrated, generally downy. The simple capsule, with only one seed, makes the peculiar character of *Waltheria*, opposed to others of the same natural order.—Jussieu refers this genus, along with *Hermannia* and *Mabernia*, to a section of his *Tiliaceæ*, which he terms *dubie*. We make no scruple to follow the example of Cavanilles, in removing it to the *Malvaceæ*, with which it accords in every essential point of character and habit.

1. *W. Americana*. American *Waltheria*. Linn. Sp. Pl. 941. excluding the syn. of *Breynius*. Willd. n. 1. Ait. n. 1. (W. India; Jacq. Ic. Rar. t. 130. Misc. Austr. v. 2. 323. W. arborefcens; Cavan. Diss. 316. t. 170. f. 1. Monoperm-althæa arborefcens villosa, folio majore; Inard Mem. de l'Acad. des Sciences for 1721, German ed. 751. t. 32. *Betonica* arborefcens, foliis amplioribus; Pluk. Almag. 67. Phyt. t. 150. f. 6.)—Leaves oval, plaited, downy, unequally and sharply toothed. Heads of flowers stalked.—Native of the Bahama islands, and South America. Cultivated in the royal gardens at Hampton-court, in Plunkenet's time. A stove plant, flowering at various seasons, after which it usually dies, though shrubby, and perhaps naturally perennial. The branches are round, downy, leafy, wand-like, very soft when young. Leaves alternate, stalked, one to two inches, or more, in length, strongly veined, plaited at the edges, extremely soft on both sides, with dense, hoary, minutely starry, pubescence. *Sipulas* awl-shaped. Flowers small, yellow, in dense axillary

solitary tufts, each on a stout straight downy stalk, various in length, but usually about equal to the corresponding *foot-stalk*.

2. *W. Indica*. East Indian Waltheria. Linn. Sp. Pl. 941. Willd. n. 2. Ait. n. 2. (*Malvinda ulmifolia*, *strobilus* *puffilis mucosifis confispatis*; Burn. Zeyl. 149. t. 68. *Betonica arborefcens maderaspatana*, *villosis foliis profundè venosis*; Pluk. Almag. 67. Phyt. t. 150. f. 5.)—Leaves oval, plaited, downy, bluntly toothed. Heads of flowers sessile.—Native of the East Indies. Cavanilles unites it with the foregoing, but the blunter more shallow teeth of the *leaves*, which are perhaps less densely downy, and the constantly sessile heads of *flowers*, of a tawny yellow, appear sufficient marks of distinction, especially as the native countries of these two plants are so remote from each other. Mr. Aiton marks the *W. Indica* as a shrub, flowering in the stove from June to August, and cultivated by Miller before the year 1759. To the *Americana* he attaches the character of biennial.

3. *W. Lophanthus*. Crested South-sea Waltheria. Forst. Prod. 47. Willd. n. 3. (*Lophanthus tomentosus*; Forst. Gen. t. 14; see *LOPHANTHUS*).—"Leaves roundish-heart-shaped, serrated, stalked, clothed with silky pubescence. Heads of flowers stalked. Bractæas imbricated."—Native of the Marquis islands. *G. Forster*.

4. *W. ovata*. Roundish-leaved Waltheria. Cavan. Diff. 317. t. 171. f. 1. Willd. n. 4.—Leaves roundish-ovate, acute, unequally toothed, densely downy. Heads of flowers sessile.—Gathered in Peru by Dombey, who, unaware of its real genus, named the plant *Aubentonia*. This is a bushy shrub, three or four feet high, downy and very soft in every part. *Leaves* of a very broad ovate figure, obscurely lobed or angular, one and a half or two inches long, sharply toothed. *Flowers* yellow, in small sessile tufts, some of the lower ones assembled upon short, leafy, axillary branches, not near so long as the leaves.

5. *W. angustifolia*. Narrow-leaved Waltheria. Linn. Sp. Pl. 941. Willd. n. 5. (*W. microphylla*; Cavan. Diff. 317. t. 170. f. 2.)—"Leaves oblong, obtuse, plaited, toothed, hoary. Heads of flowers nearly sessile."—Native of the East Indies. Willdenow says, "the stem is shrubby. Whole plant invested with thin pubescence. Leaves half an inch long, obtuse at each end. Heads supported by very short stalks." We are obliged to adopt from him our ideas of this species, having no certain means of knowing what Linnaeus intended. The plant of *Fl. Zeylanica*, n. 244. is probably different from that of *Sp. Pl.* but the synonyms of this and *W. indica* are so confused, that they embroil rather than illustrate the subject, nor does the Linnaean herbarium throw any certain light upon it.

6. *W. elliptica*. Elliptic-leaved Waltheria. Cavan. Diff. 316. t. 171. f. 2. Willd. n. 6.—Leaves elliptic-oblong, obtuse, plaited, toothed, downy. Heads of flowers sessile.—Gathered by Sonnerat in the East Indies. The leaves are more downy, and thrice as long as in the last, though not broader; the petals, according to Cavanilles' plate, obtuse, not emarginate.

7. *W. glabra*. Smooth-leaved Waltheria. Poiret in Lam. n. 7.—Leaves smooth, ovato-lanceolate, bluntish, with tooth-like serratures. Heads of flowers alternate, on axillary stalks.—Native of Guadeloupe, described by Poiret from the herbarium of professor Desfontaines. A shrub related in many respects to the *W. americana*, but smooth in all its parts. The branches are slender, a little compressed, very smooth, dark brown. Leaves stalked, oval, somewhat lanceolate, two or three inches long, one and a half or two inches broad; smooth on both sides; paler beneath; rarely

pointed. *Footstalks* slender, six or eight lines long. *Stipulas* lanceolate, pointed, deciduous. *Flowers* in dense, almost sessile, leafless tufts, ranged alternately on an axillary stalk. *Outer calyx* of three very narrow, smooth, deciduous leaves: inner permanent, bell-shaped, very smooth, with long, almost thread-shaped teeth. *Corolla* yellow, scarcely longer than the inner calyx. *Capsule* membranous, with one seed. *Poiret*. The genus is clear by this description.

8. *W. cordata*. Heart-leaved Waltheria. Leaves smooth, heart-shaped, sharply and unequally toothed. Heads of flowers ovate, solitary, on straight axillary stalks.—Native, we believe, of the West Indies. The branches are round, elongated, brown; very smooth below; their younger shoots roughish to the touch with minute points. *Leaves* from one to two inches long, on roughish *footstalks* about a quarter of their own length, broadly ovate, bluntish, veiny, but not plaited; more or less heart-shaped at the base; very unequally toothed; paler beneath. *Stipulas* awl-shaped. *Common flower-stalks* generally much longer than the *footstalks*, stout, each bearing a dense head of *flowers*, about half an inch long. *Calyx*, &c. answering nearly to the description of the last. The seed is solitary, turbinate, rather hard. The younger Linnaeus received this plant by the name of *W. angustifolia*, which it cannot be. The smoothness of the leaves and most other parts distinguish it from every described species, except the last, with whose description its leaves and inflorescence will by no means accord.

WALTHERIA, in Gardening, affords plants of the woody exotic kind, in which the species cultivated are the American waltheria (*W. Americana*); the Indian waltheria (*W. Indica*); and the narrow-leaved waltheria (*W. angustifolia*).

The first is a soft woody-stalked plant of small growth.

The second sort has a branching shrubby growth. And the last is of the woody-stalked kind.

They all afford flowers during the summer months.

Method of Culture.—These plants may be increased by seeds, which must be sown on a hot-bed; and when the plants are fit to plant out, they must be each removed into a separate small pot, and plunged into a fresh hot-bed, being afterwards treated in the same manner as other plants of the same nature, being kept in the bark-stove. In the second year they flower and produce seeds, but may be continued three or four years if they be often shifted, and the roots pared to keep them within compass. In the view of keeping the roots out of the tan, they should be drawn up out of it at least once in six weeks, during the summer season, and the plants be shifted out of the pots once in two months: with this management the second and third sorts may be continued several years, but the first seldom endures longer than two.

They have a good effect in stove collections among other potted plants.

WALTON, BRIAN, in *Biography*, editor of the English Polyglott Bible, was born about the year 1600 in the district of Cleveland, Yorkshire, and in 1615 admitted into Magdalen college, Cambridge, whence he removed to Peter-house. In 1623 he took the degree of M.A. being then curate and master of a school in Suffolk. Upon his removal to London, he became in 1626 rector of St. Martin's Orgar, and was distinguished for his talents and diligence among the London clergy. After having been instituted to other preferments in the church, he took the degree of D.D. in 1639; but in the civil war his livings were sequestered, and he was under a necessity of seeking shelter among the royalists at Ox-

ford, where he formed the design of the Polyglott Bible, and which he actually commenced, upon his removal to London, in 1653. Indefatigable in his application, he completed this work in six vols. fol. in 1657; and it was the first work published in England by subscription. The protector's government also allowed him to import paper exempt from duty. For an account of this, as well as the other principal polyglotts, with a brief statement of their respective contents, we refer to the article POLYGLOTT. It is somewhat curious in the history of literature, that in the first preface to this work, Dr. Walton acknowledged his obligations to the protector for his patronage; but that after the Restoration, several alterations were made in this preface, and the paragraph in which he acknowledges his obligations to the protector is suppressed, and another transferring his respects to Charles is introduced in its room. (See Hollis's Memoirs, vol. i. p. 425. Bowyer's Origin of Printing, Appendix.) These alterations have occasioned a distinction among those who are curious in the editions of books between *republican* and *royal* or *loyal* copies of the Polyglott. The republican copy now before us is the rarest, and therefore bears the highest price. Dr. Owen in 1659 made an attack upon the prolegomena or appendix of this bible, which was annexed to two of his tracts published at Oxford, and in the same year Dr. Walton published an elaborate reply.

Soon after the Restoration, Dr. Walton presented his Polyglott to Charles II., who, in recompence of his services to religion and learning, appointed him his chaplain in ordinary, and bishop of Chester, to which see he was consecrated in December in 1660. In the following year, he was one of the commissioners at the Savoy conference. After his return to London from a visit to his diocese, in the autumn of that year, he was seized with a disease, which terminated his life on the 29th of November. His remains were interred in the cathedral of St. Paul's, and a sumptuous monument was erected to his memory. Biog. Brit.

WALTON, ISAAC, was born at Stafford in 1593; and settling in London as a shop-keeper, he married, about the year 1632, the sister of Dr. Ken, afterwards bishop of Bath and Wells. Satisfied with a moderate competency, he left business, and removed from London. Upon the decease of Dr. Donne, in 1631, whose ministry he attended during his residence in the city, he undertook, at the request of sir Henry Wotton, to collect materials for his life; but as Wotton, for whose use they were intended, died before he had an opportunity of executing his purpose, Walton, though destitute of a literary education, wrote this life, which he published in 1640, and also that of Wotton, which appeared in 1644. After his recess from business, his favourite amusement was fishing; and being expert in the practical part of this art, he wrote a book upon the subject, which he published in 1653 under the title of "Complete Angler, or Contemplative Man's Recreation," 12mo. This small tract, drawn up in the form of dialogue, was rendered interesting by the reflections that were introduced, and by the engravings of fishes that adorned it. Accordingly it became popular, and five editions of it, with successive improvements, appeared to the year 1676; and it is now a kind of standard book among those who pursue this recreation. Having lost his wife in 1662, he associated chiefly with the clergy, and whilst he was resident with Dr. Morley, bishop of Winchester, he was induced, by the suggestion of Dr. Sheldon, to write the life of Richard Hooker, which was followed by that of George Herbert; and both were published in 1670. In 1677 he published the life of Dr. Sanderfon, which closed his literary labours. His life was prolonged to the age of

ninety, when he was carried off at Winchester, in December 1683, by the feverity of a hard frost. In his disposition and character, he was amiable, loyal, and religious; and in his style of writing simple and unaffected. A collection of his lives with notes was printed by Dr. Zouch in 1796, 4to. and again in 8vo., to which is prefixed a copious life of the author. Gen. Biog.

WALTON, in *Geography*, a post-township of Delaware county, in New York, about 85 miles from Albany; about 7 miles square, situated on both sides of Conaquo, or the W. branch of the Delaware river; it is mountainous and hilly, with good soil along the streams; much of the hills is arable or meadow land, and good for grazing. The township is well watered, and affords timber, which is rafted to Philadelphia. Here are a Presbyterian meeting-house, and several schools. In 1810 the whole population was 1311, with 128 electors, 173 taxable inhabitants, and 183,357 dollars of taxable property.

WALTON, a town of Virginia; 60 miles S.W. of Richmond.

WALTON, a town of England, in Derbyshire; 3 miles S.W. of Chesterfield.—Also, a village of England, in the county of Gloucester, where there is a medicinal spring, similar to Cheltenham; 1 mile E. of Tewkesbury.

WALTON *le Dale*, a township of Lancashire; 7 miles W. of Blackburn.

WALTON *on-the-Wolds*, a village and parish in the hundred of East-Goscote, and county of Leicester, England; 4 miles E. of Loughborough. See Nichols's History, &c. of Leicestershire.

WALTON *upon-Thames*, a village in the hundred of Elmbridge and county of Surrey, England, is situated on the southern bank of the river, 14 miles N.E. by N. distant from Guildford, and 18 miles W.S.W. from London. Mr. Gough says it probably derived its name from an encampment on St. George's-hill, in the vicinity, called Wall-town. These works are laid to have been of Roman construction as well as a larger encampment at Otlands, and some topographers contend that Julius Cæsar raised a bridge over the Thames near this place. This however is very doubtful, although it seems satisfactorily proved, that many piles and pieces of timber have been raised from the bed of the river, and that these as well as the spot have long been called Cowey-itakes. In Walton are two annual fairs, one of which was established by grant of king Henry VIII. Apfe-court, in this parish, is an old mansion, belonging to Edmund Hill, esq.; but the land and extensive walled gardens are now let to a gardener. At Burwood-park is a handsome modern house, built by sir John Frederick, bart., who has lately much enlarged and improved the estate. Burhill is a feat in this parish, belonging to sir Charles Kemys Tynte, grandson of general Johnson, who obtained this estate in 1720 by the bequest of Peter de la Porte. Pains-hill is much celebrated for its fine grounds and beautiful gardens, which were first laid out by the honourable Charles Hamilton, and obtained very considerable popularity from having been formed from a sterile heath. Thus an apparent desert was transformed to a terrestrial paradise. Walpole, Gilpin, and other authors, have descanted on the beauties of this famed feat. One of these states, "there may be scenes where Nature has done more for herself, but in no place that I ever saw has so much been done for nature as at Pains-hill. The beauty and unexpected variety of the scene, the happy situation, elegant structure, and judicious form of the buildings; the flourishing state, uncommon diversity, and contrasted groupage of the trees, and the contrivance of the water, will not fail to awaken the most pleasing sensations." Mr. Hamilton sold this place to Benjamin Bond Hopkins, esq.,

efq., who erected a large manſion on the brow of the hill Pains-hill is now the feat of the earl of Carhampton. At Walton is a very long bridge over the Thames. In the church is a large coſtly monument by Roubiliac, to the memory of Richard, viſcount Shannon, who died in 1740, and who was at that time field-maſtral in the army, and commander-in-chief in Ireland. William Lilly, the aſtrologer, was buried in the chancel of this church; and in other parts were interred the following perſons: Jerome Welton, earl of Portland, who died in 1662; ſir Jacob Edwards, bart., and his lady; Henry Skrine, eſq., author of a tour in Wales, &c. Several of the Rodney family were buried in the church. In the chancel is a braſs-plate engraved with the figures of a man on the back of a ſtag, and ſaid to commemorate the following perſon and fact:—John Selwyn, a keeper in Oatlands park, was particularly noted for his ſtrength, agility, &c. One day when hunting a ſtag in the ſaid park, in the preſence of queen Elizabeth, he ſprung from his horſe's back on that of the deer, and there preſerved his feat, till the animal had reached a ſpot near her majeſty, when Selwyn plunged his ſword into the throat of the deer, and killed him on the ſpot.—See Antiquarian Repertory, yol. i. 1807. For an account of Oatlands, &c. ſee WEYBRIDGE. Hiſtory and Antiquities of Surrey, by the Rev. Owen Manning and William Bray, eſq., three vols. fol.

WALTUNGI, a ſmall iſland on the E. ſide of the gulph of Bothnia. N. lat. 65° 34'. E. long. 25°.

WALTWIESE, a town of France, in the department of the Meſoſe; 7 miles N.W. of Sar Louis.

WALTZ, in *Biography*, a German baſe finger, with a courſe figure, and a ſill coarſer voice, whom Handel, when abandoned by all the great fingers who had performed in the operas which he compoſed for the Royal Academy, was obliged to employ in the place of Montagnana. It has been ſaid, that Waltz was originally Handel's cook. He frequently ſung in choruſes and comic entertainments at Drury Lane, in our own memory; and, as an actor, had a great deal of broad humour. He played a little on the violoncello, and uſed to divert the band in the muſic-room under the ſtage when not wanted in the orchestra, with accompanying himſelf in ridiculous and ſatirical ſongs.

WALTZ, the name of a riotous German dance, of modern invention; of which the definition has not yet had admiſſion in any muſical lexicon. The tune is gay, and always in triple time. All our great performers on keyed inſtruments have compoſed and publiſhed tunes of this kind. The verb *waltzen*, whence this word is derived, implies to roll, wallow, welter, tumble down, or roll in the dirt or mire.

What analogy there may be between theſe acceptations and the dance, we pretend not to ſay; but having ſeen it performed by a ſelect party of foreigners, we could not help reflecting how uneaſy an English mother would be to ſee her daughter ſo familiarly treated, and ſtill more to witneſs the obliging manner in which the freedom is returned by the females.

WALUWE, in *Geography*, a town on the S.E. coaſt of Ceylon; 40 miles S. of Yale.

WALWARNO, a river of England, which runs into the Lee, in the county of Cheſter.

WAMAR, a ſmall iſland in the Eaſt Indian ſea, near the W. coaſt of Aroo. S. lat. 5° 30'. E. long. 134° 57'.

WAMBA, a town of Spain, anciently called Gertica; 6 miles N. of Valladolid.—Alfo, a province of the kingdom of Anziko, S.E. of Pombo.

WAMBERG, a town of Bohemia, in the circle of Koniginigratz; 20 miles E.S.E. of Koniginigratz.

WAMBRE, a river of Africa, in the kingdom of An-

ziko, which runs into the Bancaro, 25 miles N.E. of Concabella.

WAMBULA, a town of Sweden, in the province of Abo; 48 miles S.S.E. of Biornborg.

WAMMELOF, a town of Sweden, in the province of Schonen; 25 miles S.E. of Lund.

WAMPACH, a town of France, in the department of the Foreſts; 6 miles E.N.E. of Houfalie.

WAMPOOL, or WAMPUL, a river of England, in Cumberland, which runs into the Eden, at its mouth.

WAMPJU, a town of China, ſituated on the river between Macao and Canton, where veſſels of different nations lie to take in their lading; not being allowed to go up higher. The air is ſaid to be unwholeſome; 7 miles S. of Canton.

WAMPUM, a fort of ſhells, ſeveral of which, being ſtrung upon threads, are uſed as money among the Indians.

It is formed of the inſide of the clam-shell, a large ſea-shell bearing ſome reſemblance to that of a ſcallop, which is found on the coaſts of New England and Virginia. This ſhell is made into ſmall cylinders of about one quarter of an inch long, and a fifth of an inch over, and being bored as beads, is ſtrung in great numbers upon long ſtrings. In this ſtate it paſſes among the Indians in their uſual commerce, as ſilver and gold among us; but being looſe it is not ſo current.

It is both white and black or purple; and the meaneſt is in ſingle ſtrings, of which the white goes at five ſhillings a fathom, and the black at ten; or by number, the white fix a penny, the black at three. The next in value to theſe ſingle ſtrings, is that which is wove into bracelets of about three-quarters of a yard long, black and white, in ſtripes, and fix pieces in a row, the warp conſiſting of leather thongs, and the woof of thread; theſe the gentlewomen among them wear, wound twice or oftener about their wrifts.

The moſt valuable of all is that woven into girdles or belts. Theſe are compoſed of many rows, and the black and white pieces woven into ſquares or other figures. Theſe girdles are ſometimes worn as their richeſt ornaments; but they are oftener uſed in their great payments, and make their nobleſt preſents, and are laid up as their treaſure. Grew's Muſæum, p. 370.

WAMWALO, in *Geography*, a town of Hindooſtan, in Guzerat; 55 miles W. of Noanagur.

WANA, a town of Sweden, in the province of Tavafland; 5 miles S.E. of Tavaithus.

WANASPATUCKET, a river of Rhode iſland, which runs into Providence river.

WANDA, a town of Algiers, in the province of Tremegen; 35 miles S.W. of Tremegen.

WANDASS. See WINDASS.

WANDECHY, in *Geography*, a town of Bootan; 4 miles N.W. of Tallaſudon. N. lat. 27° 52'. E. long. 89° 31'.

WANDERSLEBEN, a town of Saxony, in the principality of Altenburg; 9 miles S.W. of Erfurt.

WANDESBECK, a town of the circle of Holſtein; 3 miles N.E. of Hamburg.

WANDIPOUR, a town of Bootan, defended by a citadel, and conſidered as a place of great ſtrength; 15 miles E. of Tallaſudon. N. lat. 27° 50'. E. long. 89° 47'.

WANDIWASH, a town of Hindooſtan, in the Carnatic; taken by the Britiſh troops in 1760; 38 miles N.N.W. of Pondicherry. N. lat. 12° 31'. E. long. 79° 46'.

WANDLACKEN, a town of Pruſſia, in the province of Natangen; 4 miles E. of Cerdaven.

WANDLE, a river of England, in the county of Surrey, which runs into the Thames, below Wandsworth.

WANDO, a river of South Carolina, which runs into the Ashley, N. lat. $33^{\circ} 50'$. W. long. $79^{\circ} 58'$.

WANDSU, in *Zoology*, the name of a species of monkey found in the island of Ceylon. It is all over of a fine deep black; but has a long white beard hanging from its chin.

WANDSWORTH, or **WANDLESWORTH**, in *Geography*, a village in the western division of Brixton hundred, in the county of Surrey, England, is situated on the banks of the small river Wandle (which falls into the Thames in this parish), at the distance of six miles S.W. from St. Paul's cathedral, London. The parish, according to the population return of the year 1811, contained 905 houses, and 5644 inhabitants, of whom 620 families were employed in various trades and manufactures. Aubrey, in his "Antiquities of Surrey," mentions a manufacture of brass plates for frying-pans, kettles, and other culinary vessels, which was established here by Dutchmen who kept it a mystery: the houses where this business was carried on bore the name of frying-pan houses. Towards the close of the 17th century, when great numbers of French Protestants fled from the persecution which prevailed in the reign of Louis XIV., many of them settled at Wandsworth, and established a French church, which is now used as a meeting-house for Methodists. Among these refugees was a considerable number of hatters, who introduced their manufacture at this place with great success. Though diminished in its extent, the manufacture still exists. The art of dyeing cloth has been practised here above a century, and is now carried on to a considerable extent: as is also calico-printing, of which here are two extensive manufactures. Here are also establishments for printing kerseymeres, for bolting cloth, and for whitening and pressing fluffs: likewise iron-mills, oil and white-lead mills, vinegar works, and distilleries. Wandsworth church, which stands nearly in the centre of the village, is a brick structure, and consists of a nave, chancel, and two aisles: at the west end is a square tower, built in the year 1630. In 1780 the greater part of the church was rebuilt, at the expence of about 3500*l*. The Quakers have a meeting-house and two schools in this parish. Among the benefactions to the poor of Wandsworth is 500*l*. bequeathed by Henry Smith, alderman of London, who was born here about 1540, died in 1627, when he was buried in the church. He also left large estates, real and personal, to be allotted to the poor of various parishes, according to the discretion of his executors. In this distribution the county of Surrey has been principally regarded.

Garrett, a hamlet within this parish, appears to have been about two centuries ago a single house, called the Garvett. It now contains about fifty houses, and is well-known as the scene of a mock election on the meeting of every new parliament: when several noted characters in low life appear as candidates, being furnished with clothes and equipages by the publicans, who derive considerable profits from the crowds of people who assemble on such occasions.—Lyfons's Environs of London, vol. i. 1796.

WANFRIED, a town of Germany, in the principality of Hesse Rhinfels, on the Werra; 13 miles W. of Mülhausen. N. lat. $51^{\circ} 12'$. E. long. $10^{\circ} 14'$.

WANG, a town of Bavaria, in the bishopric of Freyding; 20 miles S. of Weilheim.—Also, a town of Austria; 12 miles S. of Ips.

WANG-TOOTH, a term sometimes applied to the jaw-tooth of an animal.

WANGA, in *Geography*, a town of Sweden, in East

Gotthland; 11 miles N.N.E. of Linkioping.—Also, a town of West Gotthland; 46 miles E. of Uddevalla.

WANGARA, or **GUANGARA**, a country of Africa, watered by the Niger, which passes through it from W. to E. and is supposed soon after to lose itself in a lake or the sandy desert. This country is subject to Bornou, to the S. of which it lies. It was formerly, *i. e.* about the 11th century, subject to the sovereign of Ghera, which was called by the Arabians, according to the Arabian writers on the eastern part of the great central river, the Nile of the Negroes. Wangara, denominated the land of gold, is represented as formed into a species of island by branches of the Nile, which furrowed it on all sides, and which overflowing during the rainy seasons, laid waste the whole country under water. When the inundation subsided, the inhabitants are described as rushing with eagerness, and digging up the earth, in every part of which they found gold. Soon afterwards the merchants arrived from every part of Africa, to exchange their commodities for this gold. The principal cities of Wangara were Raghaid and Samagonda, situated on the shore of large fresh-water lakes. In the time of Leo Africanus, Ghera, mentioned under the name of Caro, no longer held the supremacy among the states of the Niger, but had become subject to the kingdom of Tombuctoo, founded A.D. 1215. Wangara, or Guangara, had become an independent kingdom, whose sovereign maintained a considerable army; and the gold, for which this region is so celebrated, is represented by Leo as found, not within itself, but in mountains to the south. It appears that at a later period the caravans traded to Wangara for gold.

WANGEN, a town of Switzerland, and capital of a bailiwick, in the canton of Berne; 20 miles S. of Berne.—Also, a town of France, in the department of the Lower Rhine; 12 miles W. of Strasburg.—Also, a town of Germany, on the Argen, lately imperial, till, in 1802, it was given among the indemnities to the elector of Bavaria. Its territory only included a few villages. The inhabitants are Roman Catholics; 22 miles W. of Kempen. N. lat. $47^{\circ} 43'$. E. long. $10^{\circ} 50'$.

WANGENDORFF, a town of the duchy of Stiria; 8 miles S.W. of Gnaa.

WANGERIN, a town of Pomerania; 20 miles N.E. of Stargard. N. lat. $53^{\circ} 38'$. E. long. $15^{\circ} 32'$.

WANGEROEG, an island in the German Ocean; about 12 miles in circumference; 4 miles from the coast of Friesland. N. lat. $53^{\circ} 44'$. E. long. $7^{\circ} 45'$.

WANGEROW, a town of Pomerania; 12 miles S.E. of West Stettin.

WANGWELL, a small island in the Pacific Ocean, near the S. coast of Waygoo. S. lat. $0^{\circ} 23'$. E. long. $131^{\circ} 35'$.

WANHOM, in the *Materia Medica*, a name by which Kæmper has called the plant, of which the great galangal of the shops is the root.

WANJEW, in *Geography*, a town of Poland, in the palatinate of Bielsk, near the conflux of the Narew and the Wanjewka; 24 miles N.N.W. of Bielsk.

WANJEWKA, a river of Poland, which runs into the Narew, near Wanjew, in the palatinate of Bielsk.

WANKANER, a town of Hindoostan, in Guzerat; 45 miles N. of Junagur.

WANKAREY, a town of Hindoostan, in the country of Vishapour; 6 miles W. of Poonah.

WANLASS, in *Hunting*. See **WINDASS**.

WANNAS, in *Geography*, a town of Sweden, in West Bothnia; 22 miles N.W. of Umea.

WAN-NASH-REESE, a lofty rugged mountain of Algiers,

Algiers, generally covered with snow, supposed to have been anciently called Zalacus; 45 miles S. of Shershell.

WANNOUGAH, a mountain of Algiers; 100 miles W. of Constantina.

WANO, a town of Sweden, in the province of Tavastland; 4 miles S.E. of Tavasthus.

WANOAEETTEE, a small island in the Pacific Ocean; 10 miles W.N.W. of Watechoo.

WANORA, a small island on the W. side of the gulf of Bothnia. N. lat. $64^{\circ} 32'$. E. long. $21^{\circ} 14'$.

WANQUL, a country of Africa, on the Gold coast.

WANSAR, a town of Hindoostan, in Guzerat; 25 miles N. of Junagur.

WANSBECK. See WENSBECK.

WANSEN, a town of Silesia, in the principality of Brieg; 10 miles S.S.W. of Ohlau.

WANSINGAR, a small island on the W. side of the gulf of Bothnia. N. lat. $63^{\circ} 5'$. E. long. $18^{\circ} 32'$.

WANSLEBEN, JOHN-MICHAEL, in *Biography*, the son of a Lutheran minister at Erfurt, in Thuringia, was born in 1635; and having studied philosophy and theology at Konigsberg, he acquired a knowledge of the Ethiopic language under the instruction of Ludolf, by whom he was sent to London to publish his Ethiopic dictionary in 1661; and he was also employed by Castell in compiling his "Lexicon Heptaglotton." Upon his return to Germany, Ernest, duke of Saxe-Gotha, engaged him to visit Abyssinia, for the purpose of acquainting himself with the language and natural history of that country; but having reached Cairo in 1663, he was prevented from proceeding to Abyssinia, as it is thought, by his own misconduct, and embarking at Alexandria in 1665, he arrived in Italy; and in the following year abandoned Lutheranism, and entered into the Dominican order. Upon his being introduced to Colbert at Paris, in 1670, he was engaged to make a visit to Abyssinia, and to bring home all the manuscripts which he could purchase. During his residence of twenty months in Egypt, he transmitted for the Royal Library at Paris 334 manuscripts, Arabian, Persian, and Turkish. But not being able to enter Abyssinia, he went to Constantinople, and from thence in 1676 he was recalled to France, on account of his irregular conduct. Being at length reduced to want, he gained a mere subsistence by serving the village church of Bouron as vicar, where he died at the age of fifty-eight, in the year 1693. His principal publications are, "The Liturgy of Diodorus, Patriarch of Alexandria," Lond. 1662; "An Account of the present State of Egypt, in Italian," 1671; "Nouvelle Relation en forme de Journal d'un Voyage fait en Egypte au 1672 et 1673;" "Histoire de l'Eglise d'Alexandria," 1677; which is said to contain a more accurate catalogue of the patriarchs of Alexandria than that of Ludolf communicated to the Jesuits of Antwerp. Moreri.

WANSTA, in *Geography*, a town of Sweden, in the province of Schonen; 25 miles E. of Lund.

WANSTEAD, a village and parish in the hundred of Becontree and county of Essex, England, is situated eight miles N.E. from St. Paul's cathedral, London. The old parish-church was repaired and enlarged in the early part of the last century, principally at the expence of the first earl Tylney; but being still found small and inconvenient, it was pulled down, and a new church erected on a larger scale, nearly adjoining to the old site. The first stone of the present structure was laid July 13th, 1787: it was finished in 1790, and consecrated June 24th in that year. It is built with brick, and cased with Portland stone; the portico is of the Doric order: at the west end is a cupola,

supported by eight Ionic columns. The interior consists of a nave, chancel, and two aisles, separated by columns of the Corinthian order. In the chancel is a beautiful window of stained glass, by Eginton of Birmingham, representing our Saviour bearing the cross, from the picture at Magdalen college, Oxford: here is also a superb monument, with the effigy of the deceased in white marble, to the memory of sir Josiah Child, bart., who died in 1699. The population of the parish, as enumerated under the act of the year 1811, was 210; the number of houses 1127.

Wanstead-house was designed by Colin Campbell, in the year 1715, and executed under his direction for sir Richard Child, who was afterwards advanced to the peerage by the title of earl Tylney. This edifice occupies the site of an ancient mansion, which, with the annexed demesne, had previously been possessed successively by sir William Mildmay, George, marquis of Buckingham, king James I., Charles Blount, earl of Devonshire, Robert Rich, earl of Leicester, and his father Robert, lord Rich. The latter built the old house, which was called Naked-hall-house, and in which queen Elizabeth and her court were sumptuously entertained in May 1578 for several days. Sir Richard Child, finding this house inadequate to his domestic establishment, employed Mr. Campbell to build the present splendid mansion. It consists of a centre with two uniform flanks or wings, and extends about 260 feet in front by nearly 80 feet in depth. The middle portion has a noble pediment, supported by six columns of the Corinthian order, which rest on a bold projecting basement. This forms the entrance, by a double flight of steps, to the great hall and saloon, the former of which measures 51 feet by 36, and 36 feet in height; and the latter forms a cube of 30 feet. These communicate with a double suite of state apartments, which extend along the whole of both fronts, and are connected at the fourth end by a grand ball-room, which is 64 feet by 24. In strict accordance with the principal front, and imitative of the style of Italian villas, the architect has raised a stone parapet, with a series of detached obelisks, to form two sides of the entrance court, the third being bounded by a ha-ha. The whole of this area has lately been laid out as a rich parterre or flower-garden; and executed from the designs of Mr. Repton. Of a style and character with the exterior architecture is the interior finishings and furniture of the house. Thus formed and thus embellished, Wanstead-house may be said to vie with many foreign palaces, and to rank with those English mansions which proclaim the riches and splendour of the country. At the commencement of the present century, this house was the residence of the royal family of France; and here also was the first splendid entertainment given to congratulate the marquis, now duke of Wellington, on his return from his victorious campaigns in Spain and Portugal. Wanstead-house, with its contiguous property, and extensive estates in Essex, Hants, Wilts, Yorkshire, and Dorsetshire, came into the possession of William Welleley Pole, esq., by marriage, in March 1812, with Catherine Tylney Long, daughter and heiress of sir James Tylney Long, bart.—Beauties of England and Wales, vol. v. Essex. By J. Britton and E. W. Brayley, 1803. Lyons' Environs of London, vol. iv. 4to. 1796.

WANT, in *Zoology*, a name sometimes given to the mole.

WANTAGE, anciently WANATING, in *Geography*, a market-town of considerable antiquity in the hundred of the same name, in the county of Berks, England, is situated on the skirts of the prolific vale of White-horse, at the distance of 10 miles S.W. from Abingdon, 26 miles N.W. by W. from Reading, and 59 miles in the same bearing from London.

London. A variety of concurring testimonies render it probable that this place was once a Roman station; though the numerous alterations which it has undergone almost preclude the possibility of tracing those remains which would decide the question. The vallum, said to be part of a Roman station, was plainly to be seen when Mr. Wise visited it about the year 1738, "inclosing a space called the High garden." A hollow way into the town from Farringdon, Grove-street, a morass, and a brook, form the sides of an oblong square, containing about six acres of ground. On this spot, continues Mr. Wise, "stood the Saxon palace where Alfred was born." North of the brook is an inclosure where Roman coins have been found; and the remains of a building called king Alfred's cellar, which was paved with brick, and appears to have been a bath. Wantage was probably of consequence in the Saxon times, as it was undoubtedly a royal villa, and appears, together with the surrounding country, to have been the patrimony of the West Saxon kings: by the will of Alfred, it was bequeathed to his cousin Alfrith. It is a market-town by prescription, having obtained that privilege about the beginning of the 13th century, through the interest of Fulk Fitzwarine, on whom it was bestowed by Roger Bigod, earl marshal of England, as a reward for military services. The market-day is Saturday; and here are four annual fairs. The civil government is vested in a chief constable. In the population return of the year 1811, the town is stated to contain 510 houses, occupied by 2386 persons. The chief employment of the inhabitants is the manufacture of coarse cloth and facking. The parish church is a spacious cruciform structure, built either wholly, or in part, by the Fitzwarine family, whose arms and effigies are to be seen in various parts of the edifice; which also contains some old pompous monuments, and a large ancient font constructed of porphyry-stone. An act of parliament passed in the year 1598, for vesting the town lands of Wantage given in the reigns of Henry VI. and Henry VII. for charitable uses, in twelve of the "better sort of inhabitants" to be deemed a body corporate. By this act the revenues of the said lands are appropriated to the relief of the poor, the repairs of the highways, and the support of a grammar-school. An English school has, from an early period, been added to the other charitable objects provided for out of the profits of these lands. The governors allow 30*l.* per annum to the master of the grammar-school, who must be a graduate in one of the universities; and 15*l.* per annum to the master of the English school. In 1680 an alms-house for twelve poor persons was founded and endowed by Mr. Robert Styles. Dr. Joseph Butler, a learned divine, and bishop of Durham in the last century, was born in this town: but its chief celebrity is its having been the birth-place of king Alfred, peculiarly styled the Great. See ALFRED.—Lylons' Magna Britannia, vol. i. Berkshire, 1806. Beauties of England and Wales, vol. i. Berkshire. By J. Britton and E. W. Brayley, 1801.

WANTAGE, a town of New Jersey, in the county of Sussex, containing 2969 inhabitants; 15 miles N. of Newtown.

WANTI. See GLOVE.

WANTING, in *Geography*, a town on the E. coast of Lower Siam. N. lat. 7° 39'. E. long. 100° 55'.

WANTSUM, a name given to the river Stour, which divides the Isle of Thanet from the rest of the county of Kent, and runs into the Downs, below Sandwich.

WANTY, in *Rural Economy*, the name usually given to a broad girth of leather, by which the load is bound upon the back of the horse. It is very useful in hilly districts for securing various kinds of loads.

WANTZENAU, in *Geography*, a town of France, in

the department of the Lower Rhine; 6 miles N. of Strasbourg.

WANTZLAU, a town of the Middle Mark of Brandenburg; 9 miles S.S.W. of Brandenburg.

WANZCY, in *Botany*, a tree very common throughout all Abyssinia. Every house in Gondar has two or three planted round it, so that, when first viewed from the heights, it appears like a wood, especially through the whole season of the rains, but very exactly on the 1st of September, for three years together, in a night's time, it was covered with a multitude of white flowers. Gondar, and all the towns about it, then appeared as if covered with white linen, or with new-fallen snow. It grows to a considerable magnitude, being from eighteen to twenty feet high; the trunk is generally about three feet and a half from the ground; it then divides into four or five thick branches, which have at least 60° inclination to the horizon, and not more. These large branches are generally bare, and half way up the bark is rough and furrowed. They then put out a number of small branches, circular at top, in figure like some of our early pear-trees. (See the description of it in the Appendix to Bruce's Travels.) This tree and the coffee-tree have divine honours paid by each of the seven nations; under this tree their king is chosen; here he holds his first council; his sceptre is a bludgeon made of this tree, which, like a mace, is carried before him wherever he goes; it is produced in the general meetings of the nation, and is called "Bucco."

WANZLEBEN, in *Geography*, a town of Westphalia, in the duchy of Magdeburg; 10 miles W.S.W. of Magdeburg.

WAPENTAKE, or WEAPENTAKE, a division of certain northern countries, particularly those beyond the Trent, answering to what in other places is called a *hundred*, or a *cantred*.

Authors differ as to the origin of the word. Brompton brings it from the Saxon *wæpen*, and *taecan*, to deliver, by reason the tenants anciently delivered their arms to every new lord as a token of their homage.

Sir Thomas Smith gives a different account. Mufers, he observes, were anciently taken of the armour and weapons of the several inhabitants of every hundred; and from such as could not find sufficient pledges for their good abearing, their *wæpens* were taken away, and delivered to others.

Others give a different account of its rise; viz. that when first the kingdom was divided into wapentakes, he who was the chief of the division, and whom we now call *high-constable*, as soon as he entered upon his office, appeared in the field, on a certain day, on horseback, with a pike in his hand; and all the chief men of the hundred met him with their lances, who, alighting, touched his pike with their lances, as a signal they were firmly united to each other, by the touching of their weapons. Whence the denomination *wapentakes*, from the Saxon *wæpen*, and *tae*, touching.

WAPESSAGA, in *Geography*, a lake of Canada. N. lat. 48° 10'. W. long. 71° 40'.

WAPITWAGO ISLANDS, a cluster of islands near the fourth coast of Labrador. N. lat. 50° 4'. W. long. 60° 20'.

WAPLES, a town of Prussia, in the province of Oberland; 16 miles S.E. of Osterode.

WAPNO, a town of Bohemia, in the circle of Konigin-gratz; 14 miles S.W. of Konigin-gratz.

WAPP, in a *Ship*, that rope with which the throwds are set taught with wale-knots; one end is made fast to the throwds, and to the other are brought the laniards.

WAPPE, a species of cur. The name is derived from

its note; its only use was to alarm the family by barking, if any person approached the house. See Dog.

WAPPER, in *Ichthyology*, a name given by some to the smaller species of the river gudgeon.

WAPPING'S CREEK, in *Geography*, a river of New York, which runs into the Hudson, 7 miles S. of Poughkeepsie.

WAPPO, a town of Africa, on the Grain coal. N. lat. $4^{\circ} 55'$. W. long. $8^{\circ} 20'$.

WAPPACOMO, a river of Virginia, which runs into the Potomack, 9 miles E.S.E. of Fort Cumberland.

WAPSTENO, a town of Swedish Lapland; 115 miles N.W. of Umea.

WAPUWAGAN ISLANDS, a cluster of islands near the coast of Labrador. N. lat. $50^{\circ} 2'$. W. long. $60^{\circ} 14'$.

WAR, BELLUM, a contest or difference between princes, states, or large bodies of people; which, not being determinable by the ordinary measures of justice and equity, is referred to the decision of the sword: or, it is that state in which a nation prosecutes its right by force.

Hobbes's great principle is, that the natural state of man is a state of warfare; but most other politicians hold war to be a preternatural and extraordinary state.

War may be considered, says archdeacon Paley, with a view to its *causes* and to its *conduct*. The *justifying* causes of war are *defensive* invasions of right, and the necessity of maintaining such a balance of power amongst neighbouring nations, as that no single state, or confederacy of states, be strong enough to overwhelm the rest. The objects of just war are precaution, defence, or reparation. In a larger sense, every just war is a *defensive* war, inasmuch as every just war supposes an injury perpetrated, attempted, or feared.

A *defensive* war is opposed to that which is *offensive*; and as in the former case, the sovereign power of a nation takes up arms to repel the attacks of an enemy, so, in the latter, arms are taken up in order to attack a nation that lived in peace with the others. War is so dreadful an evil, and so destructive in its progress and effects, that it should never be undertaken without the strongest reasons. Humanity is shocked at a sovereign who, without imperious necessity, lavishes the lives of his most faithful subjects, and who exposes his people to the havoc and miseries of war, when they might enjoy an honourable and salutary peace; and if this want of love for his people be accompanied with injustice towards those whom he attacks, what guilt does he incur, or rather what a dreadful series of crimes does he commit? The slaughter of men, the pillage of cities, the devastation of provinces, are his crimes. He is responsible to God, and accountable to man, for every person that is killed. The violences, the crimes, the various disorders attendant on the licentious tumult of arms, pollute his conscience, and blacken his account, as he is the original author of them all.—May this faint sketch, says the excellent Vattel, affect the hearts of the leaders of nations, and in military enterprises suggest to them a circumspection proportional to the importance of the subject! Vattel states the following triple end as the distinguishing characteristic of a lawful war: 1. To recover what belongs or is due to us. 2. To provide for our future safety by punishing the aggressor or offender. 3. To defend ourselves from an injury by repelling an unjust violence. The two first are the objects of an offensive, the third that of a defensive war. Camillus, when he was going to attack the Gauls, concisely represented to his soldiers all the causes which can justify a war: "Omnia quæ defendi, repetique et ulcisci fas est." Liv. l. ix. c. 49.

VOL. XXXVII.

The *insufficient* causes, or unjustifiable motives of war, according to Paley, are the family alliances, the personal friendships, or the personal quarrels of princes; the internal disputes which are carried on in other nations; the justice of other wars; the extension of territory, or of trade; the misfortunes or accidental weakness of a neighbouring or rival nation. There are *two* lessons of rational and sober policy, says this excellent writer, which, if it were possible to inculcate into the councils of princes, would exclude many of the motives of war, and allay that restless ambition which is constantly stirring up one part of mankind against another. The first of these lessons admonishes princes to "place their glory and their emulation, not in extent of territory, but in raising the greatest quantity of happiness out of a given territory." The enlargement of territory by conquest is not only not a just object of war, but, in most instances in which it is attempted, not even desirable. What commonly is gained to a nation, by the annexing of new dependencies, or the subjugation of other countries to its dominion, but a wider frontier to defend, more interfering claims to vindicate, more quarrels, more enemies, more rebellions to encounter, a greater force to keep up by land and sea, more services to provide for, and more establishments to pay? And in order to draw from these acquisitions something that may make up for the charge of keeping them, a revenue is to be extorted, or a monopoly to be enforced and watched, at an expence which costs half their produce. Thus the provinces are oppressed, in order to pay for being ill governed; and the original state is exhausted in maintaining a feeble authority over discontented subjects. Do opulence and extent of dominion always constitute the happiness of states? Among the multitude of instances that present themselves to notice, let us confine ourselves, says Vattel, to the Romans. The Roman republic ruined itself by its triumphs, the excess of its conquests and power. Rome, the mistress of the world, when enslaved by tyrants, and oppressed by a military government, had reason to deplore the success of its arms, and to look back with regret on those happy times when its power did not reach beyond Italy, or even when its dominion was almost confined within the circuit of its walls. Dr. Paley mentions two cases in which the extension of territory may be of real advantage, and to both parties. The first is, where an empire thereby reaches to the natural boundaries which divide it from the rest of the world. Thus we account the British Channel the natural boundary which separates the nations of England and France; and if France possessed any counties on this, or England any cities or provinces on that side of the sea, the recovery of such towns and districts, to what may be called their natural sovereign, though it might not be a just reason for commencing war, would be a proper use to make of victory. The other case is, where neighbouring states, being severally too small and weak to defend themselves against the dangers that surround them, can only be safe by a strict and constant junction of their strength: here conquest will effect the purposes of confederation and alliance; and the union which it produces is often more close and permanent, than that which results from voluntary association.

The second rule of prudence, to which we have above referred, and which ought to be recommended to those who conduct the affairs of nations, is, "never to pursue national honour as distinct from national interest." "The dignity of his crown, the honour of his flag, the glory of his arms," in the mouth of a prince, are stately and imposing terms; but the ideas they inspire are insatiable. The pursuit of honour, when set loose from the admonitions of prudence,

becomes in kings a wild and romantic passion; eager to engage, and gathering fury in its progress, it is checked by no difficulties, repelled by no dangers: it forgets or despises those considerations of safety, ease, wealth, and plenty, which, in the eye of true public wisdom, compose the objects, to which the renown of arms, the fame of victory, are only instrumental and subordinate. The pursuit of interest, on the other hand, is a sober principle; computes costs and consequences; is cautious of entering into war; stops in time: when regulated by those universal maxims of relative justice which belong to the affairs of communities, as well as of private persons, it is the right principle for nations to proceed by; even when it trespasses upon these regulations, it is much less dangerous, because much more temperate than the other.

Another object of consideration, in reference to this subject, is the *conduct* of war. If the cause and end of war be justifiable, all the means that appear necessary to the end are justifiable also. War is a contest by force, between parties who acknowledge no common superior; and as it does not include in its idea the supposition of any convention which should restrict the operations of force, it has naturally no boundary, but that in which force terminates, the destruction of the life against which the force is directed. Nevertheless, the licence of war authorises no acts of hostility but what are necessary or conducive to the end and object of the war. Gratuitous barbarities borrow no excuse from this plea. The slaughter of captives, the subjecting of them to indignities or torture, the violation of women, the profanation of temples, the demolition of public buildings, libraries, statues, and, in general, the destruction or despoiling of works that conduce nothing to annoyance or defence:—these enormities are prohibited not only by the practice of civilized nations, but by the law of nature itself; as having no proper tendency to accelerate the termination, or accomplish the object of the war; and as containing that, which in peace and war is equally unjustifiable, ultimate and gratuitous mischief.

The laws of war, which are part of the law of nations, impose other restrictions upon the conduct of war. To this head we may refer the duty of refraining in war from poison, and from assassination. Such practices are at present excluded by the usage and opinions of civilized nations; and the first recourse to them would be followed by instant retaliation. The licence of war then acknowledges *two* limitations: it authorizes no hostilities which have not an apparent tendency to effectuate the object of the war; it respects those positive laws which the custom of nations hath sanctified, and which, whilst they are mutually conformed to, mitigate the calamities of war, without weakening its operations, or diminishing the power or safety of belligerent states.

Before a just war is undertaken, we owe, says Vattel, this further regard to humanity, and especially to the lives and tranquillity of the subjects, to declare to the unjust nation with which we are about to contend, that we are at length recurring to the last remedy, and going to make use of open force, for bringing it to reason. This is called "declaring war." All this is included in the Roman manner of proceeding, regulated in their *Feacial* law. They first sent the chief of the *Feaciales* or heralds, called "*Pater Patratus*," to demand satisfaction of the people which had offended them; and if within the space of thirty-three days this people did not return a satisfactory answer, the herald called the gods to be witnesses of the wrong, and came away saying, that the Romans would consider what they had to do. The king, and afterwards the consul, used

to ask the senate's opinion; and the war being resolved on, the herald was sent back to the frontier, where he declared it. It is surprising to find among the Romans such justice, such moderation, and wisdom, at a time too when apparently nothing but courage and ferocity were to be expected from them. By this religious conduct, previous to its war, Rome laid the most solid foundation for its future greatness.

A declaration of war being necessary as a farther trial for terminating the difference without the effusion of blood, by making use of the principle fear, for bringing the enemy to more equitable sentiments; it is, at the same time that it declares the resolution taken of making war, to set forth the cause of that resolution. This is at present the constant practice among the powers of Europe.

If in consequence of such declaration, the enemy offers equitable conditions of peace, the right of war ceases. Formerly the powers of Europe used to send heralds or ambassadors to declare war; at present this is only done in the capital, the principal towns, or on the frontiers. Manifestoes are issued, and the communication, so easy and expeditious from the establishment of posts, soon spreads the intelligence. Besides, it is in some cases necessary for a nation to publish the declaration of war for the instruction and direction of its own subjects, in order to fix the date of the rights belonging to them from the moment of this declaration, and relatively to certain effects which the voluntary law of nations attributes to a war in form. Without such a public declaration of war, it would be difficult to settle, in a treaty of peace, those acts which are to be accounted the effects of the war, and those which each nation may consider as wrongs, for obtaining reparation. He who is attacked, and makes only a defensive war, need not declare it; the state of war being sufficiently determined by the declaration of the enemy, or his open hostilities. Nevertheless, from dignity, or for the direction of his subjects, a sovereign, though attacked, seldom fails of declaring war in his turn. By the law of nations, the declaration of war need not be made till the enemy has reached the frontiers; but it must always precede the commission of any hostility. Thus we provide for our own safety, and equally procure the end of the declaration of war, which is, that an unjust adversary may still seriously consider his measures, and avoid the horrors of war, by doing justice. The sovereign, having entered a country, and declared war, may proceed, if equitable conditions are not offered him, to hostile operations. The sovereign declaring war can neither detain those subjects of the enemy, who are within his dominions at the time of the declaration, nor their effects. He is to allow them a reasonable time for withdrawing with their effects; and if they stay beyond the term prescribed, he has a right to treat them as enemies, though as enemies disarmed.

Because the Christian scriptures describe wars, as what they are, says Paley, as crimes or judgments, some have been led to believe that it is unlawful for a Christian to bear arms. But it should be remembered, that it may be necessary for individuals to unite their force, and, for this end, to resign themselves to the direction of a common will; and yet it may be true, that that will is often actuated by criminal motives, and often determined to destructive purposes. Hence, although the origin of wars be ascribed in scripture to the operation of lawless and malignant passions; and though war itself be enumerated amongst the forest calamities with which a land can be visited, the profession of a soldier is no where forbidden or condemned. See Luke, iii. 14. Luke, vii. 9. Acts, x. 1. On the subject of this article,

article, see Paley's Phil. vol. ii. Vattel's Law of Nations, book iii.

The sole prerogative of making war and peace belongs, by the English constitution, to the king. But as a king of England can neither raise money nor compel his subjects to take up arms, without the concurrence of parliament, his right of making war is only a slender prerogative, unless the parliament second him with supplies. Levying war against the king in his realm is a species of treason.

WAR, *Civil*, or *Intestine*, is that between subjects of the same realm; or between parties in the same state.

In this sense we say, the civil wars of the Romans destroyed the republic; the civil wars of Granada ruined the power of the Moors in Spain; the civil wars in England began in 1641, and ended in the king's death, 1648.

When a party is formed in a state, which no longer obeys the sovereign, and is of strength sufficient to make head against him; or when, in a republic, the nation is divided into two opposite factions, and both sides take arms; this is called a civil war. Some confine this term only to a just insurrection of subjects against an unjust sovereign, to distinguish this lawful resistance from rebellion, which is an open and unjust resistance: but what appellation will they give to a war in a republic torn by two factions, or in a monarchy between two competitors for the crown? Use appropriates the term of civil war to every war between the members of one and the same political society. If it be between part of the citizens on one side, and the sovereign with those who continue in obedience to him on the other; it is sufficient that the malcontents have some reason for taking arms, to give this disturbance the name of civil war, and not that of rebellion. This last term is applied only to such an insurrection against lawful authority, as is void of all appearance of justice. The sovereign indeed never fails to term rebels all subjects openly resisting him; but when these become of strength sufficient to oppose him, so that he finds himself compelled to make war regularly on them, he must be contented with the term of civil war.

If we consider the reasons why a civil war is warranted or justified, we recur to a question of very delicate investigation, and of very difficult solution. It involves the inquiry, in what cases a subject may not only refuse to obey, but even resist a sovereign, and by force repel force. (See SOVEREIGNTY.) But omitting the justice of the cause, we shall here advert to the maxims that ought to be observed in a civil war, and consider whether it be incumbent on the sovereign to keep within the laws of common war. A civil war breaks the bands of society and government, or at least it suspends their force and effect; it produces in the nation two independent parties, considering each other as enemies, and acknowledging no common judge: therefore of necessity these two parties must, at least for a time, be considered as forming two separate bodies, two distinct people, though one of them may be in the wrong in breaking the continuity of the state, to rise up against lawful authority, they are not the less divided in fact. Besides, who shall judge them? who shall pronounce on which side the right or the wrong lies? On earth they have no common superior. Thus they are in the case of two nations, who having a dispute which they cannot adjust, are compelled to decide it by force of arms.

In this state of the case, the common laws of war, or maxims of humanity, moderation, and probity, should be observed on both sides in civil wars. The same reasons on which the obligation between state and state is founded, render them even more necessary in the unhappy circumstance when two incensed parties are destroying their com-

mon country. Should the sovereign conceive he has a right to hang up his prisoners as rebels, the opposite party will make reprisals: if he does not religiously observe the capitulations, and all the conventions made with his enemies, they will no longer rely on his word: should he burn and destroy, they will follow his example; the war will become cruel and horrid; its calamities will increase on the nation. Whenever a numerous party thinks it has a right to resist the sovereign, and finds itself able to declare that opinion sword in hand, the war is to be carried on between them in the same manner as between two different nations; and they are to leave open the same means for preventing enormous violences, and restoring peace.

A sovereign having conquered the opposite party, and reduced it to submit and sue for peace, he may except from the amnesty the authors of the troubles, and the heads of the party; may bring them to a legal trial, and on conviction punish them. He may especially act thus with regard to disturbances, raised not so much on account of the people's interests as the private views of some great men, and which rather deserve the appellation of rebellion than of civil war.

When subjects take up arms, without ceasing to acknowledge the sovereign, and only to procure a redress of grievances, there are two reasons for observing the common laws of war towards them. 1. Left a civil war becoming more cruel and destructive by the reprisals, which, as we have observed, the insurgents will oppose to the prince's severities. 2. The danger of committing great injustice, by the hastily punishing those who are accounted rebels; the tumult of discord, and the flame of a civil war, little agree with the proceedings of pure and sacred justice: more quiet times are to be waited for. It will be wise in the prince to secure his prisoners till, having restored tranquillity, he is in a condition of having them tried according to the laws.

As to the conduct of foreign nations, they ought not to interfere in the constitutional government of an independent state. It is not for them to judge between contending citizens, nor between the prince and his subjects: to them the two parties are equally foreigners, equally independent of their authority. They may, however, interpose their good offices for the restoration of peace; and this the law of nature prescribes to them. But if their mediation proves fruitless, they who are not tied by any treaty may, for their own conduct, take the merit of the cause into consideration, and assist the party which they shall judge to have right on its side, in case this party shall request their assistance, or accept the offer of it: they may, for the same reason that they are at liberty to espouse the just quarrel of a nation entering into a war with another. As to the allies of a state distracted by a civil war, they will find a rule for their conduct in the nature of their engagements, combined with the circumstances of the war. Vattel's Law of Nations, book iii.

WAR, *Gladiators*. See GLADIATORS.

WAR, *Holy*, is that anciently maintained by leagues and croisades, for the recovery of the Holy Land.

WAR, *King's*, *Bellum Regis*. At the time when particular lords were allowed to make war with one another, to revenge injuries, instead of prosecuting them in the ordinary courts of justice, the appellation *king's war* was given to such war as the king declared against any other prince, or state: on which occasion, the lords were not allowed to make private war against each other; as being obliged to serve the king, with all their vassals.

WAR, *Religious*, is a war maintained in a state, on ac-

count of religion; one of the parties refusing to tolerate the other.

WAR, *Social*. See *SOCIAL War*.

WAR, *Art of*. See *MILITARY Art*.

WAR, *Council of*. See *COUNCIL*.

WAR, *Habiliments of*. See *HABILIMENTS*.

WAR-Horse. See *HORSE*.

WAR, *Man of*. See *SHIP, RATE, &c*.

WAR, *Officers of*. See *OFFICERS*.

WAR, *Place of*, is a place fortified on purpose to cover and defend a country, and stop the incursion of an enemy's army; or it is a place in which are disposed the provisions of war, for an army encamped in the neighbourhood; or whither an army retires into winter-quarters. See *PLACE*.

WAR-Cry, was formerly customary in the armies of most nations, when just going to engage. Sometimes they were only tumultuous shouts, or horrid yells, uttered with an intent to strike terror into their adversaries; such as is now used by the Indians in America, called the *war-whoop*.

WARA, in *Geography*, a city of Africa, capital of the country of Bergoo; 35 miles S.S.E. of Bornou. N. lat. 15° 30'. E. long. 25° 30'.

WARADIN. See *WARDEIN*.

WARADURA, a town of Hindoostan, in the circar of Cuddapa; 18 miles W.S.W. of Cuddapa.

WARANG, or FORMOSA, a small island near the coast of Guinea. N. lat. 11° 26'. W. long. 16° 28'.

WARANGER, a town of Finmark; 22 miles S.W. of Wardhus.

WARANGOLE, a town of Hindoostan, in Golconda; 45 miles N.N.E. of Hydrabad. N. lat. 17° 55'. E. long. 79° 15'.

WARASDIN. See *VARASDIN*.

WARASDINS, a kind of Scævonian soldiers, clothed like the Turks, with a fugar-loaf bonnet instead of a hat. Their arms are a fuzee and pistols; the butt-end of their fuzee serves for a spade, when they have occasion to throw up earth.

WARBEETLES, in animals, the name by which the large maggots or worms, which are bred in the backs of neat cattle and other animals, are sometimes provincially called.

WARBERG, or WARBURG, in *Geography*, a town of Westphalia, in the bishopric of Paderborn. It contains two churches, two convents, and two castles. It was formerly imperial, and one of the Hanse towns. In the year 1760, the French were defeated by the British and allies, under the hereditary prince of Brunswick; 16 miles S.S.E. of Paderborn. N. lat. 51° 37'. E. long. 9° 11'.

WARBERG, a sea-port town of Sweden, in the province of Halland. It has a harbour on the North sea, which, at present, has only depth enough for small vessels. Warberg carries on a considerable trade, and had flood on three different situations before the year 1666, when it was built the fourth time on the spot where it now stands. A very ancient fortified castle stands at the harbour's mouth, on a rock, surrounded with water, but at present is of little service; 32 miles N.N.W. of Halmstadt. N. lat. 57° 7'. E. long. 12° 4'.

WARBLERS, in *Ornithology*, a name by which Mr. Pennant distinguishes an order of birds, comprehending the nightingale, red-start, red-breast, black-cap, petty-chaps, hedge-sparrow, yellow, gold-crested, and common wren, the sedge-bird, or lesser reed-sparrow, the tit-lark, or grasshopper-lark, the wheat-ear, whinchat, stone-chatter, and white-throat: their general characters are, that the bill is slender and weak, the nostril small and sunk, and the ex-

terior toe joined at the under part of the last joint to the middle toe. Some of these birds have tails of one colour, and others have party-coloured tails. Brit. Zool. vol. i. p. 363. See *MOTACILLA*.

WARBLES, in animals, a term sometimes applied to the small hard tumours or swellings on the sides or saddle part of the horse's back, that are occasioned by heat in travelling, or the uneasiness of its situation; and also to the large worms or maggots in the backs of these animals, neat cattle, and some others. It is said that a hot greasy cloth, at first frequently applied, will sometimes remove the first of these sorts of tumours; and camphorated spirit of wine is always very effectual for dispersing them, more especially if a little spirit of sal ammoniac be mixed with it. If the horse should be wanted for work, care should be taken to have the saddle nicely chambered and fitted. In these kinds of tumours, especially where they are caused by sandy or gravelly matters insinuating themselves between the skin of the animal and the saddle, or its girths, much may often be done in dispersing them, by applying to the parts fast dissolved in water, brandy, or warm vinegar, and in some cases a mixture composed of four parts of opodeldoc to one of spirits of turpentine.

In all cases where horses are returned to the stables, after long journeys, the saddles should not be removed for fifteen or twenty minutes, the girths being only loosened; as, by this simple means, many of these swellings may be prevented, which would otherwise take place.

In cases where the skin is rubbed off the parts, the tincture used for wounds, or friar's balsam, may be applied three or four times a day, and the places defended by diachylon plasters, with great benefit.

But in the case of real warbles, which are produced from a fly, known by the name of ox or gad-fly, by the puncturing of small holes in the backs and sides of these different sorts of cattle stock, and there depositing its ova or eggs, which are speedily hatched by the heat of the animal's body, small tumours arising in consequence, which contain grubs, and which have small openings in their middle parts, that answer as spiracula, and for casting out the superfluous matter, which, if confined, might soon produce considerable abscesses, and destroy the grubs; other modes of cure or removal are to be had recourse to. With more it is the practice to attempt to dislodge them, by pressing strongly the different sides of the lumps or tumours with the thumb and fingers. But a more ready and certain way of eradicating and destroying such grubs is that of pulling off the scabs, that commonly cover the holes or openings on the tops of the swellings, and pouring a few drops of the oil of linseed, in mixture with the spirits of turpentine and vitriolic acid, into the openings on the parts, or by the use of the turpentine alone.

WARBLING of the *Wings*, in *Falconry*, is when a hawk, after having mantled herself, crosses her wings over her back.

WARBURTON, WILLIAM, in *Biography*, an English prelate, was the son of an attorney at Newark-upon-Trent, where he was born December 24, 1628, and declined by his father for his own profession. With this view, after he had finished his ordinary grammar education, he was articled, in 1714, to an attorney at East Markham, in Nottinghamshire; and when he had completed his clerkship of five years, he was admitted in one of the courts at Westminster; and returning to Newark, commenced the exercise of his profession. But it was soon found, that his talents and disposition were more adapted to the church than to the law; and, therefore, in 1723, he took deacon's orders. To his first

first work, consisting of "Miscellaneous Translations in Prose and Verse," from Roman authors, was prefixed a Latin dedication to sir George Sutton, who, in 1726, presented him to a small vicarage. Towards the close of this year he visited London, and became acquainted with some of the inferior literati of that period, and particularly with Theobald, to whom he communicated some notes on Shakspere. He joined with these in their confederacy against the reputation of Pope, of whom Warburton said, that, whilst "Milton borrowed by affectation, and Dryden by idleness, Pope borrowed by necessity." In 1727 he evinced his ability for original writing, by "A Critical and Philosophical Inquiry into the Causes of Prodiges and Miracles, as related by Historians, with an Essay towards restoring a Method and Purity in History, in which the Characters of the most celebrated Writers of every age, and of the several Stages and Species of History, are occasionally criticised and explained." This work was dedicated, in very respectful and complimentary language, to sir Robert Sutton, his first patron; by whose interest he was placed in the list of king's masters of arts, upon his majesty's visit to Cambridge in 1728; and by this academical degree he supplied the defects of his education. He was also presented by the same patron to the rectory of Broad Broughton, in Lincolnshire, where he remained some years in the assiduous prosecution of his studies. In 1736 he engaged the public attention as a writer by his well-known work, entitled "The Alliance between Church and State; or, the Necessity and Equity of an established Religion and a Test-law, demonstrated from the Essence and End of Civil Society, upon the fundamental Principles of the Law of Nature and Nations." The design of this work, as it is stated by a defender of it against an attack of lord Bolingbroke, was "to vindicate our present happy constitution on a principle of right, by adjusting the precise bounds of the two societies, by shewing how they came to act in conjunction, and by explaining the nature of their union; and from thence, by natural and necessary consequence, inducing, on the one hand, an *established religion*, with all its rights and privileges, secured by a *test-law*; and on the other, a full and free *toleration* to all who dissent from the national worship." This was a popular performance, and four editions of it appeared in the author's life-time; but it gave satisfaction neither to the high church party, nor to the advocates for religious liberty. Our author's greatest work was published in 1738, and entitled "The Divine Legation of Moses, demonstrated on the Principles of a religious Deist, from the Omission of the Doctrine of a future State of Rewards and Punishments." This adventurous and paradoxical performance found adversaries amongst persons of all parties, who concurred in criticising and censuring the theory on which it is founded. Undismayed by his opponents, he not only published a "Vindication" of his opinion, but persevered in the prosecution of his work, abounding with learning and paradoxes, and calculated to amuse rather than to convince its readers. In a second corrected and enlarged edition of the first volume of his "Divine Legation," he professes to have omitted "passages, which were thought vain, insolent, and ill-natured." In the year 1738 he published a sermon, entitled "Faith working by Charity to Christian Edification," and became chaplain to the prince of Wales. Wishing probably to regain the good opinion of Mr. Pope, he published, in the "Works of the Learned," a defence of his "Essay on Man," against the remarks of M. de Croufaz. Whatever was his design, Mr. Pope acknowledged his obligations; and an intimacy commenced between them, which very much contributed to the subsequent advancement of the apologist.

The second volume of the "Divine Legation" was published in 1741, and the work became the general repository of the author's literary effusions, and of various controversies in which he was engaged. In the course of this year he was introduced by Pope to Mr. Allen, at his house near Bath, where he was afterwards a frequent visitor. In return for the poet's attention, he vindicated his writings by notes and comments, and thus so far confirmed and enhanced the friendship that subsisted between them, that when Pope died, in 1744, he bequeathed to Warburton half his library, and the property of all his works already printed, and not otherwise disposed of, the value of which legacy is estimated by Johnson at 400*l.*

The controversial antagonists of Warburton and of his "Divine Legation" were numerous, and comprehended such names as those of Drs. Middleton, Pococke, Grey, Sykes, and Stebbing; against whom he defended himself, in 1744 and 1745, in a publication, entitled "Remarks on several occasional Reflections, &c." with a degree of asperity, and conscious superiority and self-confidence, which discriminated his style of writing. The introduction to Mr. Allen's friendship terminated in a marriage with his favourite niece, Miss Gertrude Tucker, which took place in 1745, and which ultimately put him in possession of the splendid seat of Prior-Park. His Three Sermons, in defence of the Protestant establishment and civil constitution, preached on occasion of the rebellion, were held in high estimation. In the year 1746 he became preacher to the Society of Lincoln's Inn; and in the following year he appeared as an editor of Shakspere. Bold and original in his criticisms and conjectures, the absurdity of several of which has been exposed by Edwards, Johnson, and others, he has nevertheless thrown light on some obscure passages, and drawn forth into view latent beauties, so that many of his notes will find a place in the approved editions of this admirable dramatist. Warburton's "Julian, or a Discourse concerning the Earthquake and fiery Eruption which defeated that Emperor's Attempt to rebuild the Temple at Jerusalem," published in 1750, on occasion of Dr. Middleton's "Inquiry concerning the miraculous Powers," is commended for its candour, a quality for which the writer was not remarkably distinguished, and of which few specimens occurred in the controversy produced by Dr. Middleton's publication. The notes annexed to his complete edition of Pope's works, in 9 vols. 8vo., are said by the most competent judges to have dignified and perverted the author, and to have aggravated the satirical asperities of the poet by the malignities of the annotator. Two volumes of Warburton's sermons, preached at Lincoln's Inn, were published in 1753 and 1754; and in these, as well as in a series of letters addressed to a friend in the following year, he exhibits "A View of Lord Bolingbroke's Philosophy." He was now rapidly advancing from one stage of preferment to another; from that of prebend of Gloucester, obtained in 1753, to that of king's chaplain in ordinary in 1754; and in 1755 to that of prebend of Durham, in exchange for that of Gloucester, to the honour of a Lambeth degree of D.D. conferred upon him by archbishop Herring, to the deanery of Bristol in 1757, and in 1759 to the see of Gloucester. Being appointed on the following 30th of January to preach before the house of lords, he closed his sermon with the following summary of the character of the martyr: "In a word, his princely qualities were neither great enough nor bad enough to succeed in that most difficult of all attempts, the enslaving a free and jealous people." Of the Methodists Dr. Warburton had spoken with some degree of asperity, in the second volume of his "Divine Legation," in 1742; and

and in 1762 he more directly and severely attacks their leading principles, in his work entitled "The Doctrine of Grace, or the Office and Operation of the Holy Spirit vindicated from the Insults of Infidelity and the Abuses of Fanaticism." In 1763 he was the mover in the house of lords of a charge against Mr. Wilkes, as the author of an indecent "Essay on Women;" for which he was abufively attacked by Churchill, and others of that party. In 1765, a fourth edition of the second part of his "Divine Legation" appeared, as the third, fourth, and fifth volumes of that work. In this edition he treated the father of the learned Dr. Lowth in a manner fo illiberal, as to occasion an acrimonious controversy between thefe antagonifts. A third volume of his "Sermons" was publifhed in 1767; and in 1768 he transferred fchool to trustees, for defraying the charge of a lecture at Lincoln's Inn, inflituted with a view of proving the truth of Chriftianity from a completion of the prophecies in the Old and New Teftament relating to the Chriftian church. The decay of his faculties was foon afterwards accelerated by the death of his only child, who was carried off by a confumption in his 19th year; and his life terminated at Gloucefter, June 7th, 1779, in the 81ft year of his age. His works were collected and printed by Dr. Hurd, bifhop of Worcester, in 1788, comprehended in 7 vols. 4to., to which the editor has prefixed an account of his life, writings, and character. In 1809 appeared "Letters from a late eminent Prelate to one of his Friends," (Warburton to Hurd,) containing reflections on the literature of the times; but "lamentably deformed," as a biographer before us juftly obferves, "by the arrogance and imperative fpirit of one prelate, and the adulation of the other." Dr. Johnson, in his "Life of Pope," has juftly delineated the literary character of bifhop Warburton, of whom it is faid that he was kind in the domeftic relations of life, and ardent in his friendship, in the following paffage: "He was a man of vigorous faculties, a mind fervid and vehement, fupplied by incessant and unlimited inquiry, with wonderful extent and variety of knowledge, which yet had not oppreffed his imagination, nor clouded his perfpicuity. To every work he brought a memory full fraught, together with a fancy fertile of original combinations; and at once exerted the powers of the fcholar, the reafoner, and the wit. But his knowledge was too multifarious to be always exact, and his purfuits were too eager to be always cautious. His abilities gave him a haughty confequence, which he difdained to correct or mollify; and his impatience of oppofition difpofed him to treat his adverfaries with fuch contemptuous fuperiority, as made his readers commonly his enemies, and excited againft the advocate the wifhes of fome who favoured the caufe. He feems to have adopted the Roman emperor's determination, "Oderint dum metuant." He ufed no allurements of gentle language, but wifhed to compel rather than perfuade. His ftyle is copious without felection, and forcible without neatnefs: he took the words that prefented themfelves; his diction is coarfe and impure, and his fentences are unmeafured." Hurd. Nichols. Johnson. Gen. Biog.

WARD, SETH, D.D., in *Biography*, an eminent mathematician, was born at Buntingford, in Herts, in 1617, and completed his education at Sidney college, Cambridge, of which he became a fellow. Mathematics were his favourite ftudy; but his purfuits were interrupted by the civil war, as he chofe to fhare the fate of his friend and patron, Dr. Samuel Ward, the mafter of his college, to accompany him in his imprifonment, and to attend him even on his death-bed, in 1643. In confequence of refufing to take the covenant, he was deprived of his fellowship in 1644, and of

all means of fupport at the univerfity. Many opportunities of private inftruction in families of diftinction prefented themfelves; but preferring refidence with Ralph Freeman of Apenden-hall, efq., whose fons he taught, he continued with him till the year 1649, when he was appointed chaplain to Thomas lord Wenman of Tame-park, in Oxfordshire. On the expulfion of Mr. Greaves, civilian professor of aftronomy at Oxford, he was chofen to fucceed him, but with the condition of taking the oath called the engagement. Having raifed the aftronomical lecture to reputation, he, together with his friend Dr. Wallis, was made doctor of divinity; and they both concurred in attending thofe meetings at Wadham college, which laid the foundation of the Royal Society, of which he became a fellow in 1661, and for feveral years fecond prefident. In 1659 he was chofen prefident of Trinity college, but refigned it in favour of the legal owner. After the Reftoration, he became vicar of St. Lawrence-Jewry, in London, in 1660; foon after dean of Exeter, and, by the intereft of Monk and Clarendon, bifhop of that fee, which he improved in a variety of refpects by his munificence. At Salifbury, to which he was tranflated in 1667, he conciliated univerfal refpect by his charity and hofpitality. To this fee he was a diftinguifhed benefactor, obtaining for its bifhop the perpetual honour of being chancellor of the order of the Garter, which had been for more than a century alienated from it; and founding in the town the college of matrons in 1682, for the maintenance of ten widows of orthodox minifters in the diocefe. Although he was not naturally of a perfecting difpofition, yet he was active in executing the orders which he received from court for the fuppreffion of conventicles. In confequence of a fever, with which he was attacked in 1660, his bodily ftrength declined, and his intellectual faculties were impaired; and at length he clofed a melancholy life in 1689, in the 72d year of his age. Mr. Oughtred gives him the character of a prudent, pious, and ingenious perfon, skilled not only in mathematics, but in all branches of polite literature. According to Burnet, he was, in many refpects, one of the greateft men of his age; but he elfewhere fays, that his fincerity was much queftioned; being a profound ftatefman, but an indifferent clergyman. His various works on mathematics and aftronomy were valued at the time when they were written, but they have been fuperseded by modern difcoveries and improvements. For an account of the hypothefis that bears his name, fee the article ANOMALY. He publifhed, befides fermons, "A philofophical Effay towards the Eviction of the Being and Attributes of God, the Immortality of the Souls of Men, and the Truth and Authority of Scripture," Oxford, 1652, 8vo.; "De Cometis, ubi de Cometarum Natura differitur, nova Cometarum theoria ex noviffima Cometæ Hiftoria proponitur. Prælectio Oxonii habita, et Inquifitio in Ifmaelis Bullialdi Aftronomiæ Philolaicæ Fundamenta," Oxon. 1653, 4to.; "Idea Trigonometricæ demonftrata, in Ufum Juventutis," Oxon. 1654, 4to.; "In Thomæ Hobbii Philofophiam Exercitatio Epitolica, ad D. J. Wilkinfium Guardianum Coll. Wadkani," ibid. 1656, 4to.; "Aftronomia Geometrica: ubi Methodus proponitur qua primariarum Planetarum Aftronomia five Elliptica five Circularis poffit geometricè abfolvi," Lond. 1656, 8vo. Biog. Brit. Hutton's Dict.

WARD, JOHN, LL.D., the fon of a nonconformift minifter, was born in London in 1679, and for fome years, after a competent education, occupied a place in the Navy-office; but devoted to literary purfuits, he quitted this fituation in 1710, and became a fchool-mafter. As a member of a fociety, eftablifhed for literary improvement, he read,

in alternation with others, lectures on civil law, and the law of nature and nations. His first production as a writer was a small Latin essay, containing rules for composition, published in 1712. In 1720 he was chosen professor of rhetoric in Gresham college; and in 1723 a fellow of the Royal Society, having in that year translated into Latin Dr. Mead's treatise on the plague. To Vossius's "Elementa Rhetorica," printed in 1724, he added a valuable appendix, "De Ratione Interpungendi." He engaged in the controversy between Dr. Mead and Dr. Middleton concerning the condition of physicians in ancient Rome; and he annexed to Horsley's "Britannia Romana" an "Essay on Peutinger's Table so far as it relates to Britain." In 1736 he became a member of the Society of Antiquaries, of which he was afterwards vice-president. His "Lives of the Gresham Professors" was published in 1740; and in 1751 he was honoured by the university of Edinburgh with the title of LL.D. When the British Museum was established in 1753, he was chosen one of the trustees, to which he rendered considerable service by his advice and co-operation in forming the rules of that important and useful institution. Notwithstanding the variety of his literary occupations, and his studious habits, he prolonged his life to his 80th year, and died in 1758. After his death, a valuable work, which he had prepared for the press, was published, entitled "A System of Oratory, delivered in a Course of Lectures publicly read at Gresham College," in 2 vols. 8vo. The Transactions of the Royal and Antiquarian Societies contain several of his papers, chiefly on subjects of antiquity. In his religious profession he was a Protestant dissenter, distinguished by rational piety, and great moderation and candour towards persons of all persuasions. To persons engaged in literary pursuits he was ready at all times to communicate advice and assistance; and his modesty was equal to his learning. Nichols' Lit. Anecd. Gen. Biog.

Unfortunately, before we perused Dr. Ward's Lives, &c., says a coadjutor, we had read Fontenelle's Eloges of the members of the Royal Academy of Sciences at Paris; paucity, which not only afford amusement, but instruction to readers; as that elegant and ingenious writer so describes the science, learning, and peculiar character and abilities of each individual whom he celebrates, that the reader of taste, if neither scientific nor learned before he has seen these Eulogies, becomes both in the course of perusal.

But Mr. Prof. Ward's work, says Dr. Burney, neither amuses us by the grace, dignity, or eloquence of style, nor instructs by its science. His materials are scanty, nor has he sufficiently applied to useful purposes those which he had amassed. The genealogy of the professors is all that he has laboured, and that not very successfully. Our chief inquiry of him was confined to the music-professors; but we obtained no information concerning any one of them, except Dr. Bull; and all he knew of that great musician he had from Dr. Pepusch, the studious, learned, and worthy organist of the Charter-House. Out of thirteen professors of music, who had had the honour of being placed in the chair, after Bull, previous to the year 1740, when Ward's biographical work was published, there appears no reason for the election of any one of them for their musical science or talents, except Dr. Bull. None of the rest had ever distinguished themselves either in the theory or practice of music, or been authors of any work on the art or science, which could qualify them for becoming candidates for the professorship.

The long and dry list of Dr. Bull's fugitive pieces is given in a language now utterly obsolete, and unintelligible to the generality of readers.

WARD, —, an English madrigalift of the second class, during the reign of James I. Ward was one of the first who transformed his madrigals into *fancies* for lutes and viols. No instrument, except the organ, had been much cultivated in England at this time; so that sonatas, solos, or concertos, were wholly unknown to us; and like our betters, the ancient Greeks, our instruments had nothing but vocal music to perform: in choruses, doubling the voice parts in unisons and octaves, and playing notes, and other vocal airs, for their solos.

WARD, *Warda*, *Custody*, or *Keeping*. See GUARD. WARD is a word used in our *Law Books*, in divers significations. Thus, a ward, in London, is a part of the city, committed to the special charge of one of the aldermen of the city. There are twenty-six wards in London, which are as hundreds, and the parishes thereof as towns.

A forest is also divided into wards; so also are most of our hospitals. See HOSPITAL.

A prison is sometimes also called a ward. The heir of the king's tenant, who held by knights-service, or in capite, was also called a ward, during his non age. But this sort of wardship is taken away by the statute 12 Car. II. cap. 24. See GUARDIAN, in *Chivalry*.

WARD, *Watch and*. See WATCH.

WARD, *Castle*. See CASTLE.

WARD-ROOM, the apartment in a ship in which the officers mess, &c. next under the captain's cabin.

WARD, *Warda*, *Wardagium*, is also used, in our *Ancient Writers*, for the custody of a town or castle, which the tenants and inhabitants were bound to keep at their own charge. See WARDSHIP.

WARD'S MEDICINES, a denomination given to certain medicinal nostrums, originally prepared and dispersed by Mr. Ward, and which were some years ago much celebrated for their efficacy in a variety of disorders.

The methods of compounding the principal of these medicines was communicated to the public about fifty years ago by I. Page, esq., to whom Mr. Ward left his book of receipts; and in order to their being procured at a cheap rate, his late majesty settled a pension on Messrs. White and Ollerman, the two chemists who had been employed by Mr. Ward in preparing them, on condition that the profits arising from the sale of them should be applied to the support of the Asylum and Magdalen charities.

These medicines are the red pill and emetic sack drop, the white drop, sweating powders, liquid sweat, paste for piles and fistulas, dropy purging powders, and essence for the head-ache.

The method of preparing the antimony for the pill and drop is as follows:—The finest and purest crude antimony is powdered, and ten or twelve ounces of it put into an earthen unglazed pan that holds three or four quarts, and set on a fire; the mass is stirred with an iron spatula, and the fire raised till it sends forth fumes, and a flame like burning brimstone; and the same degree of fire is continued, and the mass stirred, till no fumes escape from it, and it becomes a grey or ash-coloured powder. If it should melt and run into lumps, it must be taken out of the pan, and pounded again, and then put in and stirred as before, till it be thoroughly calcined. Then four ounces of the crude matter must be added; and the process repeated, till a sufficient quantity has been thus prepared. The process must be performed in a chimney, lest the fumes should injure the operator. Into a clean crucible, holding about a quart, put about two pounds of the calcined antimony; set it in a melting furnace, and make a gradual fire under it; and
round

round the crucible nearly to the top; keep the mafs in a ftate of moderate fufion, occasionally ftirring it with an iron rod. When the matter that adheres to the rod appears bright and tranfparent, which, with a proper degree of fire, will be in about half an hour after it is in fufion, pour the vitrified matter on a fmooth marble, well dried, and heated as hot as the hand can bear; repeat the procefs, in order to obtain more of the matter, if neceffary; and thus will be had a fair and pure glafs of antimony, of a light red colour.

In order to prepare the *pill*, take a quantity of this glafs of antimony; pound it in a clean iron mortar, and fift it through a fine lawn fieve; then grind, or levigate it, on a fmooth marble, to an impalpable powder: take alfo dragon's blood dried and powdered; and put one ounce of this to four ounces of the levigated glafs; grind them well together; and with good fack, or rich mountain wine, make them into a mafs for pills, of about one grain and a half each, which is a full dofe for a man or woman.

The *drop* is made by putting about half an ounce of the levigated glafs of antimony into a quart of the richeft Malaga mountain or fack; fhake them well together, and let them ftand two or three days to fettle, and grow clear; then pour it off gently, to be quite fine. The full dofe for a man or woman is half an ounce; but it is advifable to begin with the half or two-thirds, according to the age, or ftrength of conftitution. Thefe medicines, it is faid, cannot be fafely administered, if the vifcera are unfound. They have been ufually given in diforders occafioned by foul ftomachs and indigeftion; and the pill has been very fuccefsful in inveterate rheumatifms: both the pill and the drop frequently operate upward and downward, but with lefs ftaining than the emetics ufually given. The pill muft be bruifed, and taken in a fpoonful of any fmall liquid, on an empty ftomach: if it works upwards or downwards, it will be proper to drink a fmall quantity of balm or fage-tea, between each motion; and if it fwears, as it fometimes does, let the patient keep himfelf warm, and encourage it by drinking the above fmall liquors; when it is taken, milk, greens, and fruit, muft be avoided. The potion, called the *drop*, requires no vehicle: when the ficknefs comes on, let the patient drink about half a pint of warm water, or thin water gruel, and continue to do fo every time it works.

The *white drop* is prepared by bruifing fourteen pounds of the cleaneft coppers into a rough powder; then drying it with a gentle heat, and fpreading it thin, till it becomes a dry and fubtile powder, refembling quick-lime, but much whiter. When this operation is finifhed, which requires about fix or feven days, take an equal quantity of good and clean rough nitre, or falt-petre, tolerably dry; pound the nitre and coppers together; fift the powder through a fine hair-fieve, put it into a large glafs retort, coated at bottom, and fet it in a fand-furnace about an inch from the bottom and fides of the fand-pan; fix on with lute a large receiver, leaving a fmall vent-hole in the joint to prevent the burfting of the retort or receiver; make a gentle fire for the firft three hours; and gradually increafe it for three or four hours longer, till the iron pan be red-hot at bottom; continue the fire about thirty hours; and then let it out, and when it is cool, you obtain a very powerful aqua-fortis; put this into a bottle, ftop it clofe, and let it ftand fix or eight days to digeft itfelf. Put this aqua-fortis into a glafs retort about half or two-thirds full; fet it in the fand-heat, and fix on a receiver; make a moderate fire, till the aqua-fortis is come over into the receiver, leaving behind only a brown, reddifh earth: by this procefs is obtained a very ftrong and pure aqua-fortis. Put a quantity of this rectified aqua-fortis

into a large bolt-head, with a long neck, fo as to make it about a quarter full; then take of the pureft and fineft volatile fal ammoniac, in which there is not the leaft acid falt, or lime. To fixteen ounces of the aqua-fortis in the bolt-head, add, by half an ounce at a time, feven ounces of the volatile fal ammoniac, flopping the mouth of the bolt-head, (a vent-hole excepted,) till the fermentation ends; let it ftand two or three hours, till the fumes are fettled. Next put it into a fmall bolt-head, half full, and fet it in a moderate fand-heat; when it is warm, put four ounces of the fineft quickfilver to each pound of fixteen ounces of the folution, and let it ftand in the heat till the quickfilver is diffolved; increafe the fire, and add quickfilver; and when it will difsolve no more, take it out of the bolt-head, and put it into an open glafs vefel, or a white, large ftone bowl; fet it in a moderate fand-heat, and let it evaporate till a pellicle or fkin comes over the top of it; then put it in a cool place to congeal. The heavy liquor, or oil, which remains congealed, muft be poured off, and thoroughly drained, and the remaining falt muft be put into a glafs body; to each pound adding three pounds of the fineft rofe-water, and flopping the mouth of the glafs with a piece of double brown paper. Set it again in the fand-heat with a moderate fire, till the falt is wholly difolved, which is ufually effected in twenty-four hours; and thus is the white drop prepared.

This medicine, it is faid, cannot be accounted dangerous; as there is not in two drops, ufually taken in twenty-four hours, half a grain of mercury. It has been administered with fuccefs as an antiferbatic in all ftages of the fcurvy, and even when the difeafe has been hereditary. The dofe of two drops is to be taken in a fmall quantity of water in the morning, falting, or at night, going to reft, for two or three days together; then after an interval of as many days, proceeding as before. It generally produces its effect without any fenfible operation; except that in fome conftitutions it produces one or two motions.

Mr. Ward administered two forts of fweating powders: one fort is directed to be made by rubbing together in a mortar four ounces of refined nitre, and as much vitriolized tartar, into a powder; and putting into a red-hot crucible half of this mafs, and ftirring it with an iron fpatula: when the red fumes that arife from it ceafe, put in the remainder of the matter, and ftir it till no more fumes arife; then pour it into an iron mortar; and when cool, add opium, ipecacuanha, and liquorice powder, of each an ounce: pound and fift them through a lawn fieve, and mix all together. When the powders are thus prepared, they fhould be fprecd thin on white ftone difhes, and fet in a cool place for about two days, mixing them well, and fpreading them twice a day; then dry them before the fire, or with any other gentle heat.

The other fort of fweating powder is prepared by fulminating together common tartar, and refined nitre, of each one pound, in a crucible or iron pot, which will reduce them to about fifteen ounces: to thefe add white hellebore, and liquorice powder, of each fix ounces; powder them together, and fift them through a fine lawn fieve. The dofe is from twenty-five to fifty grains.

Thefe fweating powders are faid to remove rheumatic and other pains, occafioned by obftuctions; though it is faid that the *red pill* has been found to anfwer better in ftubborn rheumatic cafes, and other fettled pains in the limbs. They may be taken in any liquid, going to bed between the blankets, and now and then drinking fome warm diluting liquor, as white wine vney, baum tea, &c. They may be repeated every other night at difcretion.

The *liquid sweat* is prepared by putting a gallon of good spirits of wine, and half a gallon of good white wine, into a strong bottle, and adding half a pound of saffron, four ounces of cinnamon, two ounces of salt of tartar, and one ounce of opium, cut into small pieces. Stop the bottle close, and set it near the fire for eight days, shaking it three or four times a day; then filter the contents through a filtering paper. The dose is from thirty to sixty drops, in a glass of good white wine.

The *paste* for the piles and fistulas is prepared by pounding separately a pound of elecampane root, three pounds of fennel-seeds, and one pound of black pepper, and sifting the powders through a fine sieve; then melt two pounds of honey, and two pounds of powder sugar, over a gentle fire, scumming them, till they become bright as amber: when they are cool, mix and knead your powder into them in the form of a soft paste. This paste is said to be a specific remedy for the fistula, piles, &c. The dose is the quantity of a nutmeg, morning, night, and noon, drinking after it a glass of water, or white wine.

The *dropy purging powder*, as made by Mr. Ward, was formed by powdering separately jalap, cream of tartar, and Florentine iris, of each four ounces, and mixing them well; as prepared by M. D'Osterman for Mr. Ward, it consists of a pound of jalap in powder, a pound of cream of tartar, and an ounce of bole armoniac, in fine powder, mixed well together. The dose is from thirty to forty grains, in broth, or warm water, to be repeated two or three days successively, and longer, at proper intervals, if necessary.

The *essence for the head-ache* was formed by Mr. Ward of four ounces of spirits of wine, two ounces of camphor, and two ounces of volatile spirit of camphor, well mixed, and applied with the hand. M. D'Osterman prepared it for Mr. Ward, by putting two pounds of true French spirit of wine into a large strong bottle, and adding two ounces of roch alum in fine powder, four ounces of camphor cut small, half an ounce of essence of lemon, and four ounces of the strongest volatile spirit of sal ammoniac. Stop the bottle close, and shake it three or four times a day for five or six days. The method of applying it is, to rub a little of it gently upon the palm of the hand, and then holding it to the part affected till it is dry. If the pain is not relieved, it should be repeated two or three times.

For some remarks on Mr. Ward's pill and drop, by Mr. Clutton, see True and candid Relation of their good and bad Effects, and Med. Ess. Edinb. abr. vol. ii. p. 434-470, &c. and Ed. Med. Ess. and Obs. vol. vi. p. 423.

WARD, in *Geography*, a township of Massachusetts, containing 540 inhabitants; 6 miles S. of Worcester.

WARD, a river of Denmark, in North Jutland, which runs into the North sea, 15 miles N.N.W. of Ripen.

WARD *Lacus*, a mountain of Scotland, in the county of Ayr; 16 miles E. of Ayr.

WARD'S *Creek*, a river of Virginia, which runs into James river, N. lat. 37° 10'. W. long. 77° 11'.—Also, a river of Maryland, which runs into the Chesapeake, N. lat. 38° 8'. W. long. 76° 52'.

WARDA ECCLESIASTICUM denotes the guardianship of churches; which is in the king during vacancies by reason of the regalia, or temporalities. See VACATION.

WARDAGE, WARDAGIUM, is sometimes used, in our ancient law-writers, in the same sense with wardpenny. Sometimes it also seems to denote a being free from wardship.

WARDAN, or *Ras Wardan*, in *Geography*, a cape on the coast of Arabia, in the Red sea; 5 miles S. of Mal-tura.

WARDAN. See VARDEN.

WARDE, or VARDE, a town of Denmark, in North Jutland, on the river Ward. It was formerly a considerable city; but as the depth of its river, which abounds in fish, particularly salmon, is so much decreased, as to be no longer navigable for ships of burthen, it is fallen into decay. It has two churches; 18 miles N. of Ripen. N. lat. 55° 35'. E. long. 8° 28'.

WARDE *Mauger, La*, a town of France, in the department of the Somme; 4 miles W.N.W. of Montdidier.

WARDECORNE, among our *Ancient Writers*, a duty incumbent on the tenants, to guard the castle, by founding a horn upon the approach of an enemy; called also *cornage*.

WARDEIN, in *Geography*. See PETER WARDEIN.

WARDEIN, *Gros*, a town of Hungary, on the river Koros, surrounded by good fortifications; the see of a bishop. The town itself is not large, but has three suburbs of very considerable extent. The adjoining fortrefs is a regular pentagon, well fortified, besides a deep and broad moat. Near the city is an excellent cold-bath; 66 miles N. of Temesvar. N. lat. 46° 53'. E. long. 21° 32'.

WARDEN, GUARDIAN, one who has the charge or keeping of any person, or thing, by office. See GUARDIAN. Such is the warden of the Fleet, who is the keeper of the Fleet prison, and has the charge of the prisoners there; especially such as are committed from the court of chancery for contempt.

Such also are the warden of the fellowships, warden of the marshes, wardens of peace, warden of the west marshes, warden of the forest, warden of the alnage, warden of the king's wardrobe, &c.

WARDEN, in an university, is the head of a college; answering to what in other colleges we call the *master* thereof.

WARDEN, or *Lord Warden of the Cinque Ports*, is the governor of those noted havens; who has the authority of an admiral, and sends out writs in his own name. See CINQUE-PORTS, and GUARDIAN.

WARDEN of the *Mint*, is an officer, whose business is to receive the gold and silver bullion brought in by the merchants; to pay them for it, and oversee the other officers. He is also called keeper of the Exchange, and Mint.

WARDENS, *Church*. See CHURCH.

WARDEN, *Renter*. See RENTER.

WARDEN *Ledge*, in *Geography*, a rocky shoal on the west coast of the Isle of Wight. N. lat. 50° 41'. W. long. 1° 23'.

WARDENBURG, a town of Germany, in the county of Oldenburg; 6 miles N. of Oldenburg.

WARDER, *Yeomen Warders of the Tower*, are officers, forty in number, who are accounted the king's domestic servants, and are sworn by the lord chamberlain; their duty is, to attend the prisoners of state, and to wait at the gates.

Ten of them are usually upon the day's wait, to take an account of all persons who come into the Tower; to enter their names, and the names of the persons they go to, in a book, to be perused by the constable or lieutenant.

WARDFEOH, or WARDFEGH, the value of a ward, or heir under age; or the money paid to the lord of the fee for his redemption.

WARD-HOOK, in *Gunnery*, the same with *quad-hook*, or worm.

WARDHUS, or WARDHUY, or *Vardhuys*, in *Geography*, a town of Norwegian Lapland, and chief place of a govern-

government, defended by a cattle, in which a governor resides, but without bastions; the town is chiefly inhabited by fishermen, and is situated on an island called Wardoe, the largest of three. N. lat. $70^{\circ} 16'$. E. long. $30^{\circ} 28'$.

WARDMOTE, in London, is a court so called, which is kept in every ward of the city; answering to the *curiata comitia* in ancient Rome.

WARDO, in *Geography*, a small island in the Baltic, E. of Aland, with a town. N. lat. $60^{\circ} 15'$. E. long. $20^{\circ} 12'$.

WARDPENNY, *Wardpeni*, was formerly a customary due paid to the sheriff, or other officer, for maintaining *watch* and *ward*.

It was payable at the feast of St. Martin; and is still paid within the manor of Sutton-Colfield, in Warwickshire; and that with some very singular ceremonies.

WARDROBE, a closet or little room adjoining to a bed-chamber; serving to dispose and keep a person's apparel in; or for a servant to lodge in, to be at hand to wait, &c.

WARDROBE, in a prince's court, is an apartment in which his robes, wearing apparel, and other necessaries, are preserved; under the care and direction of proper officers.

His majesty has a great wardrobe, a removing wardrobe, and divers standing wardrobes, belonging to his bed-chamber, in each of his palaces; *viz.* at Whitehall, Kensington, Windsor, Hampton Court, and the Tower; each under its respective keeper.

The removing wardrobe always attends on the king's person; as also on ambassadors, at christenings, masques, plays, &c. It is under the command of the lord chamberlain: the under-officers are, a yeoman, two grooms, and three pages.

The great wardrobe is of great antiquity. Anciently it was kept near Puddle-wharf, in a house purchased for that purpose by king Edward III.; but, after the fire of London, it was kept in York-buildings. The master or keeper of which is an officer of great dignity: high privileges were conferred on him by Henry VI.; and James I. enlarged the same, and erected the office into a corporation.

The officers are, the master or keeper, his deputy, and his clerk, besides several other officers; and above sixty tradesmen, all sworn servants to the king.

This office is to provide for coronations, marriages, and funerals, of the royal family; to furnish the court with beds, hangings, carpets, &c.; to furnish houses for ambassadors, at their first arrival here; presents for foreign princes and ambassadors; furniture for the lord lieutenant of Ireland, and our ambassadors abroad; robes for the knights and officers of the garter, heralds, pursuivants, ministers of state; liveries for the officers of the bed-chamber, and other servants; liveries for the lord-chief justices, and barons of the exchequer, and other officers in those courts; as also yeomen, warders, trumpets, kettle-drums, messengers, coachmen, grooms, &c. with coaches, harnesses, saddles, &c. the watermen, game-keepers; linen and lace for the king's person; tilts, &c. for his barges, &c.

WARDS. See COURT of *Wards*.

WARDSBOROUGH, *North District*, in *Geography*, a town of Vermont, in the county of Windham, containing 1159 inhabitants.

WARDSBOROUGH, *South District*, a town of Vermont, in the county of Windham, containing 894 inhabitants.

WARDSBRIDGE, a post-town of New York; 36 miles S. of Kingston.

WARDSHIP, in *Chivalry*. See GUARDIAN, in *Chivalry*, and WARD, *supra*.

WARDSHIP, in *Copyholds*, is incident only to those of inheritance. It partakes both of that in chivalry, and that in focage; like that in chivalry, the lord is the legal guardian, who usually assigns some relation of the infant tenant to act in his stead; and he, like guardian in focage, is accountable to his ward for the profits. See GUARDIAN.

WARDSHIP, in *Socage*. See GUARDIAN and SOCAGE. WARD-STAFF, the constable's or watchman's staff.

The manor of Lambourn, in Essex, is held by service of the ward-staff; *viz.* by the carrying of a load of straw in a cart with six horses, two ropes, and two men in harness to watch the said ward-staff, when it is brought to the town of Abridge, &c.

WARDWAN, in *Geography*, a town of Hindoostan, in Guzerat; 80 miles S.W. of Amedabad.

WARD-WITE, compounded of the Saxon *ward*, *watch*, and *wite*, *mulā*, is defined by Fleta, as signifying a being exempted from the duty of watching. Others rather take it for a duty paid towards the charge of it.

WARE, Sir JAMES, in *Biography*, a descendant of an ancient English family in Yorkshire, was born at Dublin in 1594, and finished his education at Trinity college, Dublin. His proficiency was such as to entitle him to the particular notice of Dr. Usher, then bishop of Meath, with whom he contracted an intimate friendship. On his first visit to England in 1626, he was introduced by Usher to sir Robert Cotton, from whose library he derived much assistance in his researches; of which he again availed himself in a second journey to England in 1628. In 1629 he was knighted by the lords justices of Ireland, and in 1632 he succeeded to his father's estates, and to his office of auditor-general. He was greatly confided in and often consulted by the earl of Strafford, and by him made a member of the privy council. In 1639 he represented the university of Dublin in parliament, and was steadily attached to the interest of lord Strafford. He was active in his endeavours for suppressing the Irish rebellion which broke out in 1641, and he was held in such estimation by the marquis of Ormond, that he was one of three persons deputed by him to inform his majesty at Oxford, in December 1644, of the state of affairs in Ireland. On his return he was captured by a ship of war belonging to the parliament, and committed to the Tower, whence he was released by exchange. During the progress of the civil war, he was invariably attached to the royal cause, and when Dublin surrendered to the parliament, he was one of the hostages for the fulfilment of the treaty. After his return to Ireland, he was suspected, and ordered to depart to any place except England. He chose France as the place of his exile, and removed thither in 1649, and here he associated with men of learning. In 1651 he was allowed to come to London, and from thence he returned to Ireland, which was then in a tranquil state. During the embroiled state of the country, sir James Ware employed his time in the elucidation of historical antiquities, and published, at different periods, a variety of biographical and other works; and particularly his treatise "De Scriptoribus Hiberniæ," lib. ii. commencing with the introduction of Christianity into Ireland, and continued to the close of the sixteenth century; and also his principal work, entitled "De Hiberniæ et Antiquitatibus ejus," and first published in London in 1654, of which an enlarged edition appeared in 1658, with

an appendix; "Rerum Hibernicarum regnante Henrico VII. Annales." His next publication was "A Collection of the Works ascribed to St. Patrick," 1656; and this was followed by "Two Epistles of the Venerable Bede," and some other ecclesiastical pieces. In 1662 appeared at Dublin, fol. "Rerum Hibernicarum Annales, regnantibus Henrico VII., Henrico VIII., Edwardo VI., et Maria." His last work, in 1665, was his "Complete History of Irish Bishops," comprehending his former narratives of them, under the title of "De Præfulibus Hiberniæ Commentarius, a prima Gentis Hiberniæ ad Fidem Christianam conversione ad Nostra usque Tempora," Dub. fol.

Sir James Ware is denominated by Nicolson the "Camden of Ireland," and highly commended both for his industry and judgment. After the Restoration he was restored to his office of auditor-general, and in 1661 chosen representative in parliament for the university of Dublin; he was also appointed to some other posts under government, and he refused the dignities of baronet and viscount, though he manifested his attachment to his country till his death in 1666. He left two sons and two daughters. After his death his works were collected by his second son Robert, and published in one folio volume in 1705; and a more complete edition was given by Walter Harris, eq., who married one of his descendants, in 3 vols. fol.; printed at Dublin in 1739, 1745, and 1746. Biog. Brit.

WARE, in *Geography*, an ancient and populous market-town in the hundred of Braughin, and county of Hertford, England, is situated on the west side of the river Lea, at the distance of three miles E.N.E. from the county-town, and twenty miles N. from London. At the time of the Domesday survey it was a small village, and was held by Hugh de Grentraufail, to whom it was given by the Conqueror, and from whose family it passed to Robert Blanchmains, earl of Leicester. In the reign of king John, it descended by marriage to Sayer, earl of Winchester. "Before his time," says Salmon, "a great iron chain was put across the bridge, to prevent a road here to the disadvantage of Hertford. The bailiff of Hertford had the keys in his power; and no carriage with horses or harness could go over without paying a toll to him, which toll was esteemed worth 10*l.* 13*s.* 4*d.* yearly. But the earl broke the chain, and laid the road open, which made this a great thoroughfare, brought trade to the town, and occasioned buildings in it." The high road to the north, which before went through Hertford, was now turned through this town. At a tournament held at Ware, 25 Henry III., Gilbert le Marechal, the potent earl of Pembroke, was killed by falling from his horse, and being trampled on; Robert de Say, one of his knights, was also slain in the diversion, and several others were wounded. In 1408, the town was greatly damaged by a flood: its low situation rendering it very liable to this inconvenience, several weirs and sluices have been raised at different times to remedy it. There were anciently two religious establishments in this town: one was a priory of Benedictines, subordinate to the abbey of St. Ebrulph, at Utica, in Normandy, to which Hugh de Grentraufail granted the church of Ware: "Whereupon," says Tanner, "it became a cell to that abbey; and in process of time was so well endowed, that, upon the seizure of the alien priories by Edward III. this was farmed at 20*l.* *per annum.*" Some remains of the priory buildings are yet standing at a little distance from the church near the banks of the river: they chiefly consist of ancient walls fitted up and accommodated to the purposes of a modern dwelling; a small obtusely-pointed arch, within the north-east angle of the building, is supported by corbels displaying the upper parts of human figures; one of which appears to be clad in

mail. The other establishment, which stood in the north part of the town, was for Grey or Franciscan friars; but by whom, or when founded, is uncertain. The town of Ware at present consists of one principal street, a mile in length, intersected by several smaller. In the return of the year 1811, the population is stated to be 3369, occupying 687 houses. Considerable traffic is carried on in corn and malt, which are conveyed to the London markets by the river Lea and the new navigable canal: the barges load back with coals and other articles. A weekly market, granted in the reign of queen Elizabeth, is held on Tuesdays; and two fairs annually. At an inn in this town was formerly a remarkable bed, twelve feet square, called the Great Bed of Ware; it is said to be of remote antiquity, but its origin is not mentioned in history. Ware church, a spacious edifice, consists of a nave, chancel, and aisles, with an embattled tower at the west end. The inner roofs are of timber, and have been ornamented with paintings and inscriptions, of which there are still considerable remains; particularly in the south chancel or chapel, where the roof is divided into squares, in each of which is some figure or legendary subject. The sepulchral memorials are numerous, among which are various ancient slabs, most of which have been pillaged of their brasses. The font is ornamented with various sculptures, representing St. George, and other subjects. At the west end of the church is a handsome gallery, erected by the governors of Christ's hospital, London, for the use of the school that was formerly established here for the younger children of that institution, but which has been many years removed to Hertford. Among various benefactions for charitable purposes are several well-endowed alms-houses, established in different parts of the town. In a piece of ground called the Bury-field, at the south-west corner of Ware, in February and March, 1802, at about the depth of three feet, were found four stone coffins, each of them formed of one mass of stone, hewn with tolerable squareness: each lid was also of one piece. At a spot, called Lemonsfield, were dug up, in 1729, several Roman vessels of reddish earth, &c. At Roadmill are the remains of a Roman camp.

Ware-park, the seat of Thomas Hope Hyde, eq., is situated on an eminence, commanding the rich meadows which extend between Ware and Hertford. The ancient manor-house, which had been the retirement of the Fanshaws, and the occasional residence of their predecessors in the possession of the manor, was pulled down by Thomas Hyde, eq.; and a new mansion erected on the acclivity of a hill. This is elegantly fitted up, and forms the present residence of the family; the park and grounds are well diversified, and are rendered extremely pleasant by the contiguity of the rivers Lea and Rib. Sir Richard Fanshaw, a distinguished statesman in the seventeenth century, was born in the old manor-house in 1607, and was interred in Ware church in 1666.

In the meadows opposite to Ware-park, on the south-east, are the springs of Chadwell, the proper source of the New River. These are concentrated in a small pool or basin, surrounded by a light railing, from which the stream slowly issues in its course towards London, and is swelled at a small distance by a cut from the river Lea. See NEW RIVER.—*Beauties of England and Wales*, vol. vii., Hertfordshire; by E. W. Brayley, 1808. Salmon's *History of Hertfordshire*, fol. 1728.

WARE, a town of Massachusetts, in Hampshire county, containing 996 inhabitants; 15 miles N.E. of Springfield.

WARE, a river of Massachusetts, which runs into the Connecticut, at Springfield.—Also, a river of Virginia,

which runs into the Chesapeake, N. lat. $37^{\circ} 25'$. W. long. $76^{\circ} 26'$.

WARE, *Earthen, Queen's, and Stone*. See POTTERY.

WARE-SEA. See SEA-WARE.

WARECTUM, in *Ancient Writings*, signifies land that has lain long neglected, and untilled.

In ancient records, we meet with *tempus wwarecti*, for the time in which land lies fallow, or else the season of fallowing.

WAREE, in *Geography*, a town of Africa: capital of a country of the same name; 60 miles S. of Benin. N. lat. $5^{\circ} 25'$. E. long. $4^{\circ} 48'$.—ALFO, a country of Africa, near the west coast, south of Benin.—ALFO, a town of Hindoostan, in Guzerat; 50 miles W. of Radunpour.

WAREHAM, a borough and market-town in the hundred of Winfrith, Blandford fourth division of the county of Dorset, England, is situated on a peninsula, formed by the rivers Frome and Piddle, near their confluence with the waters of Poole harbour, at the distance of 18 miles E.S.E. from Dorchester, and 110 miles S.W. by W. from London. It appears to have been a British town, from its earthen vallum, and from the barrows in its vicinity; and that the Romans had a station here is evinced, by a military way which proceeds immediately hence to Dorchester, and by Roman coins found in the neighbourhood. Mr. Baxter and other antiquaries consider it to have been the *Morinio* of Ravennas and Richard of Cirencester. Wareham was a place of some consequence in the time of the Saxons; but was made a theatre of war by the Danes for a century and a half; in which period its principal notoriety arose from its misfortunes and desolation. In the reign of Athelstan it had recovered so much importance, that the king appointed it to have two mints and mint-makers; a greater proportion than any town in the county possessed, except Shaftesbury. Here also Edward the Martyr was privately buried, after his assassination at Corfe castle; though within three years his body was removed to Shaftesbury abbey. In the year 998, Wareham was visited by the Danes; and likewise in 1015, when Canute entered the Frome, and ravaged the adjacent country. It seems to have been the constant practice of these pillagers, when the invasion of the western counties was their object, to make this town their head-quarters; so that it was in a state either of continual apprehension or of absolute warfare. In *Domesday-book*, it is described as being in a desolate state in the time of Edward the Confessor: after the conquest, it gradually became of greater importance; but from the year 1138 to 1146, it was a scene of confusion and war, arising from the contentions between king Stephen and the empress Maud, during which the town and castle were burnt. From this period scarcely any thing important occurred in Wareham, till the civil war in the reign of Charles I., when it was early fortified for the parliament; but in a short time it was possessed by the king: it was afterwards again taken by the parliamentary forces, who relinquished on the surrender of Corfe castle. On the 25th of July 1762, Wareham experienced a dreadful calamity, in a fire which broke out nearly in the centre of the town, and spread with such violence and rapidity, that in three hours two-thirds of the town were reduced to a heap of ruins: 133 dwelling-houses, with the town-hall and other buildings, were destroyed; and the loss, exclusive of insurance, was estimated at 10,000*l*. The subscriptions for the relief of the sufferers did honour to the nation, and the town rose out of its ashes to greater advantage than before. Wareham is built in a flat country, and forms a long square: the buildings, which are chiefly constructed of brick, are

disposed in four spacious streets, intersecting each other at right angles. The area on which it stands is computed at an hundred acres, and is inclosed, except on the fourth side where the Frome runs, by a high rampart or bank of earth, which was cast up by the Danes in the ninth century, and measures 5360 feet. The space between the bank and the town was anciently occupied by houses, the foundations of which still remain. At present it consists chiefly of extensive garden grounds, divided into regular quadrangles, the sites of ancient streets; the holders of these grounds are entitled to vote for members for the borough. These gardens produce vast supplies of vegetables, considerable quantities of which are sent by water to Poole and Portsmouth. The soil is favourable for the cultivation of hops, which grow wild and luxuriant in the hedges and fields. This town was anciently a borough by prescription, and is so styled in *Domesday-book*. By a charter of queen Elizabeth, the government of the town was vested in a mayor, six burgessees, and other corporate officers; but, from some peculiar circumstances, these privileges were neglected, and became obsolete. The mayor, by prescriptive right, is coroner of the town, and of the isles of Purbeck and Brownsea: this right is still claimed and exercised. By a charter of the second year of queen Anne, the town is incorporated by the style of "the mayor, the capital, and assistant burgessees;" and, among other privileges, is empowered to have a gaol and house of correction; and to hold three fairs, and a court of pie-powder; the profits of the fairs and courts to be for the sole benefit of the mayor. A weekly market is held on Saturdays. Two members have been returned to parliament ever since the 13th of Edward I. The right of election was anciently vested in four burgessees; but in the year 1747 it was determined to be in the mayor and corporation, jointly, with such inhabitants as paid scot and lot, together with such freeholders who hold lands in their own occupation, or by descent, marriage-settlement, or promotion in the church. Wareham had formerly eight churches, of which only three remain. Trinity is reputed the mother-church, but does not contain any thing remarkable. St. Martin's is an ancient structure, neatly fitted up: St. Mary's is a lofty fabric, and with the exception of Sherborne and Wimborne, the most spacious and ancient in the county; in the fourth aisle is a chapel, said to be the burial-place of the Saxon kings; within it is a neat mural pyramidal monument, to the memory of the Rev. John Hutchins, rector of Wareham, and author of the *History and Antiquities of Dorsetshire*. The building that was formerly St. Peter's church is now used as a town-hall, school-house, and gaol. This parish is singular for a house in the market-place, called *Homo cum cane*, the owner of which is always a tithing-man, and obliged to attend at the wool-court, twice a year, with a one-eyed bitch. Here are two meeting-houses for Dissenters, a free-school, a charity-school, and an alms-house: the latter founded by John Streche, esq. of Exeter, and rebuilt, in 1741, by Henry Drax, esq. and John Pitt, esq. The priory, situated on the river side, near St. Mary's church, is one of the most ancient in the county: it is said to have been founded by Adhelm, bishop of Sherborne, who died in 709; and appears to have been a nunnery antecedent to 876, when, together with the town, it was destroyed by the Danes. Robert Bellamont, earl of Leicester, changed it into a convent for monks, subject to the Benedictine abbey of Lira, in Normandy. At the dissolution of alien-houses, it was bestowed on the Carthusian monastery of Shene, in Surrey; and on the general dissolution of monasteries, it shared the common wreck of those monuments of religious splendour. By various descents, it is now the property of lord Rivers. In a clove, denominated Castle close,

close, formerly stood the castle, of which no remains are now visible: it was famous for the imprisonment and death of Robert de Belesme, earl of Montgomery, who, for rebelling in the year 1114 against Henry I., was doomed to the most rigid confinement in this castle, where he starved himself to death. The port of Wareham was formerly considered; but, owing to the shallowness of the shore, and the retreat of the sea, it is nearly choked up; though at very high tides the water flows up to Holm bridge, nearly five miles. It had anciently a court of admiralty belonging to it: the quay lies on the fourth side of the town, but the trade is now very inconsiderable; it chiefly consists in the exportation of pipe-clay, vast quantities of which are obtained from the clay-pits round the town; and nearly 10,000 tons are annually shipped for London, Hull, Liverpool, Glasgow, &c. for the use of the potteries. This clay is particularly useful in the composition of Staffordshire ware; the digging it employs many hands. According to the population return of the year 1811, the inhabitants of Wareham were 1709, occupying 383 houses. South Bridge, which, crossing the Frome, connected this town with the Isle of Purbeck, was an ancient structure, probably coeval with William Rufus; but being ruinous was presented at the Easter sessions for the county in 1775. A handsome bridge of Purbeck stone has been since erected, having five arches, the expence of which amounted to 2932*l.* 10*s.* The salmon fishery on the Frome anciently belonged jointly to the abbey of Bindon: the hoop-net, or weir, for taking the salmon, was fixed in the Wareham royalty for several centuries; and its antiquity appears from various grants. The fishery is now held by Thomas Weld, of Lullworth, and John Calcraft, esqrs.—Hutchins's History of Dorsetshire, 4 vols. fol. 1796. Beauties of England and Wales, vol. iv. Dorsetshire; by J. Britton and E. W. Brayley, 1803.

WAREHAM, a town of the state of Massachusetts, in the county of Plymouth, on a river which runs into Buzzard's Bay, containing 851 inhabitants; 35 miles S.S.E. of Boston.

WAREM. See BORCHWORM.

WAREN. See WARREN.

WAREN, in *Geography*, a small island in the North sea, near the coast of Lapland, but the principal of a group. N. lat. 66° 48'.

WARENDORFF, a town of Germany, in the bishopric of Munster, on the Ems; 12 miles S.E. of Munster. N. lat. 51° 52'. E. long. 8° 6'.

WARENDORP, a town of the duchy of Holstein; 6 miles W.S.W. of Cismar.

WARESTAS, a small island on the east side of the gulf of Bothnia. N. lat. 60° 43'. E. long. 21° 4'.

WARGAM, a town of Hindoostan, in Guzerat; 45 miles S. of Cogo.

WARGELA, a town of Africa, in Sahara; 250 miles N.W. of Agades. N. lat. 23° 35'. E. long. 9° 50'.

WARGEN, a town of Prussia, in Samland; 6 miles W.N.W. of Konigsberg.

WARGENTIN, PETER WILLIAM, in *Biography*, an eminent Swedish astronomer, was the son of a clergyman, and born in Yamtland in 1717. In his earlier years he made rapid proficiency in the learned languages and in mathematics, and in those other branches of learning which were adapted to his original destination for the church. In 1733 he was admitted at the academy of Upsal, where he enjoyed peculiar advantages under Klingenshierna and Celsius for pursuing his favourite studies of mathematics and astronomy; gaining, after the death of his father, the means of subsistence by the instruction of private pupils. The

subjects of his disputations, preparatory to his degree of master of arts, which he obtained in 1743, were the satellites of Jupiter, and the political system of Machiavel. His views were directed in the course of his studies to the office of lecturer in mathematics in the gymnasium of Heriöland, and this object he succeeded in attaining. Having calculated new tables of Jupiter's satellites, which were inserted in the transactions of the society of Upsal for 1741, he was chosen a member of that body. After the death of Celsius, he commenced a correspondence with some of the French astronomers, and in 1743 was nominated a member of the Academy of Sciences at Paris. In 1749 he was chosen successively to Elvius, as secretary to the Academy of Sciences at Upsal, the duties of which office he discharged for 34 years. Wargentins tables for the satellites of Jupiter, published in 1741, were much approved by all foreign astronomers; and in 1742 he communicated, in the transactions of the society of Upsal for 1742, more than 1000 observations made by various astronomers, which he compared with his tables, and the result of the comparison was, that the difference seldom amounted to a minute, and for the most part to seconds. In the same transactions for 1743, he inserted about 400 observations of the other satellites, which, compared with the tables, gave a difference that seldom amounted to four minutes of time, but for the most part to seconds. From this time he directed his attention to the improvement of the theory of Jupiter and his moons, and to the perfection of his tables. He was thus led to revise them to the year 1753; and when his tables of the four satellites were completed, he transmitted a copy of them to M. de la Lande, by whom they were inserted, in 1759, in a new edition of Halley's tables, published at Paris. In 1769 he sent a copy of them, further improved, to Dr. Maskelyne, who published them in the Nautical Almanack for 1771. They were again published, with improvements by De la Lande, together with his own astronomical tables; and another edition of them, with some variations from the last edition of Paris, appeared at Berlin in 1776. The result of Wargentins assiduity in this department of astronomy was communicated to the public in the "Connoissance du Mouvements Celestes" for 1766, the "Nautical Almanack" for 1771 and 1779, and the "Astronomisches Jahr-buch" for 1777, 1779, 1781, and 1782; and the fruits of his last labour in these tables appeared in the fourth volume of the "Nova Acta Societatis Literariæ Upsaliensis," which contained 1250 observations of the third satellite, with appropriate remarks. This indefatigable astronomer contributed to the transactions of the Royal Academy of Sciences papers on different subjects, amounting to the number of sixty. All these papers, besides several others, and one written in 1744, on the velocity of the rays of light, were produced by him after he became secretary to the academy. Many of them "relate to the history of the sciences; such as on thermometers, and the best sorts of them; on the attempt made to determine the real figure of the earth; on the parallax of the fixed stars, and the experiment made to discover it; on logarithms; on the flux and reflux of the sea; on comets; on the use of ventilators on board ships; and on the northern lights." Some of them treat of climate and its differences, in reference to which he observes in general, "that milder and colder winters, summers more or less warm, earlier or later springs and autumns, depend not only on the greater or less degree of latitude of the place, but also on other circumstances, such as the vicinity of the sea, lakes, marshes, large woods, uninhabited deserts, &c. from which he deduces this conclusion, that the climate of Sweden is much more temperate than many others lying

under the same parallel." On parallaxes and transits he also made a variety of observations, which were published in the transactions of the different societies to which he belonged. The phenomena of the magnet and of the northern lights were also objects of his attention; and he suggested that some connection subsisted between them, and that the variations of the magnetic needle are violent in proportion to the intensity of the lights. He likewise furnished the Academy of Sciences, and also our ingenious traveller, Mr. Coxe, with tables and observations relating to births and deaths, as well as to population in general, not only in Stockholm, but in various other places.

In sketching his character, one of his biographers says, that "he was a man of great integrity, modest and friendly in his disposition; zealous for the advancement of science, and ever ready to make any sacrifice which could tend to promote the good of his country." His merit induced king Adolphus Frederick to create him, in 1759, a knight of the Polar Star; and he was a fellow of the Royal Society of London, and member of the Academies of Peterburgh, Paris, Göttingen, Copenhagen, and other learned institutions. Although his genius was not brilliant, his judgment was found and discriminating, and his labour, industry, and perseverance, were indefatigable. Notwithstanding the intenseness of his application, which allowed him few intervals of relaxation and amusement, his habits were regular and temperate, and served to prolong his life to an advanced period. Towards the close of it, however, his sight and hearing decayed; but neither his strength nor spirits seemed to decline till the summer of 1783, when a diabetes, which baffled all medical skill, carried him off in the month of December in that year. His papers on a variety of subjects occur in the following volumes of the Philosophical Transactions, viz. xlvii. lii. liii. lvi. lviii. lix. lxx. and lxxvii. Coxe's Travels in Sweden, &c. vol. iv. Gen. Biog.

WARGO, in *Geography*, a small island in the gulf of Bothnia, near the east coast. N. lat. 63° $0'$. E. long. 20° $57'$.—Also, a small island on the west side of the gulf of Bothnia. N. lat. 65° $17'$. E. long. 21° $47'$.

WARGOCZYN, a town of Poland; 40 miles N.W. of Lublin.

WARGRAVE, a town or populous village of England, in Berkshire, on the right bank of the Thames; 7 miles N.E. of Reading.

WARI, a town of Hindoostan, in Baglana; 28 miles E. of Bahbelgong.

WARIANAGUR, a town of Hindoostan, in the Carnatic; 16 miles S. of Tiagar.

WARIBA, a river of Guiana, which runs into the Atlantic. N. lat. 6° $54'$. W. long. 59° $8'$.

WARGARI BAY, a bay on the island of St. Vincent, south of Hungary Point.

WARIN, a town of Mecklenburg; 10 miles S.E. of Wismar.—Also, a river of Brazil, which runs into the Atlantic. S. lat. 4° $55'$. W. long. 36° $58'$.

WARING, EDWARD, M. D., in *Biography*, descended from an ancient family at Milton, in the county of Salop, was born in 1734, and finished his education at Magdalen college, Cambridge, where he was considered, when he took his first degree in 1757, as a prodigy in those sciences which form the subject of the bachelor's examination. At the age of 25 years, in 1759 he was elected Lucasian professor of mathematics, not without giving offence to some of the senior members of the university, who disapproved the appointment of so young a man to occupy a chair which had been dignified by a Newton, a Saunderson, and a Barrow; and the first chapter of his "Miscellanea Analytica," which

was circulated in vindication of his scientific character, was the occasion of a controversy of some continuance. The attack was commenced by Dr. Powell, master of St. John's, and the young professor was ably defended by Mr. Wilton, afterwards judge Wilton, a gentleman held in high estimation. In 1760, Waring received the degree of master of arts by royal mandate; and in 1762, his "Miscellanea Analytica" was published, with a dedication to the duke of Newcastle. This work amply vindicated his early elevation to the professorship, and extended his scientific fame through Europe; so that he was elected member of the societies of Bologna and Göttingen, and honoured by expressions of high regard by the most celebrated mathematicians, both at home and abroad. Speaking of this miscellany, comprehending most subjects in pure mathematics, he himself says, "In my preface I have given a history of the inventions of different writers, and ascribed them to their respective authors, and likewise some account of my own. To every one of these sciences I have been able to make some additions, and in the whole, if I am not mistaken in enumerating them, somewhere between 300 and 400 new propositions of one kind or other, considerably more than have been given by any English writer; and in novelty and difficulty not inferior; I wish I could subjoin, in utility. Many more might have been added, but I never could hear of any reader in England out of Cambridge, who took the pains to read and understand what I have written. But I must congratulate myself that D'Alembert, Euler, and La Grange, three of the greatest men in pure mathematics, of this or any other age, have since published and demonstrated some of the propositions contained in my 'Meditationes Algebraice,' or 'Miscellanea Analytica,' the only book of mine they could have seen at that time; and D'Alembert and La Grange mention it as a book full of excellent and interesting discoveries in algebra. Some other mathematicians have inserted some of them in their publications. The reader will excuse my saying so much, there being some particular reasons which influenced me." Medicine also engaged our author's attention, and in 1767 he took his degree of doctor; but though he took pains by attending lectures and hospitals in London to perfect himself in the medical art, it does not appear that he ever gained much practice. His manner, it is said, was not very prepossessing; but his want of success he had the less reason to regret, as he had a very liberal patrimony, and as he was sufficiently amused by his favourite science. He resided for some time at St. Ives, after taking his doctor's degree, and in 1776 he married; but as the air of Cambridge, whither he removed, did not agree with Mrs. Waring's constitution, he went to live on his own estate at Plaistly, about eight miles from Shrewsbury, and prosecuted his mathematical inquiries. He also directed his attention to other subjects, and printed at Cambridge, in 1796, a work entitled "An Essay on the Principles of Human Knowledge," which was never published. Attached to his country retreat he seldom left it, except when he occasionally attended the Board of Longitude in London, of which he was a member. A violent cold terminated in his death, which happened in August 1798, in the 64th year of his age. His integrity was inflexible, his modesty disguised the superiority of his understanding, and his habits and manners were simple and plain.

In the extract we have given from his own account of his writings, some may suppose that he incurs the charge of vanity and self-adulation; but occasions may occur in which the most modest men are called upon to do themselves justice, which was the case with regard to Dr. Waring. To say nothing of the disparaging reflections which his early appointment

pointment to the Lucasian professorship produced, he was induced, for the honour of his country, to retort to the charge of Lalande, the French astronomer, who, in his life of Condorcet, asserts, that in 1766 there was no first-rate analyst in England. In order to repel this accusation, he takes occasion, in a letter to Dr. Maskelyne, to mention with respect the writings of several celebrated British mathematicians, two of whom were living in 1764, and then to take notice of his own discoveries, many of which had been published before that year; it should be remembered, that this account was not published by himself. It is not without reason that he intimates the neglect with which his writings were treated; the fact is certain, and it was owing partly to the abstruseness of the subjects, but principally to the perplexed style and manner in which they are discussed. His principal works, besides those that have been mentioned, are "Meditationes Algebraicæ," 1770; "Proprietates Algebraicarum Curvarum," 1772; and "Meditationes Analyticæ," 1773, 1774, 1775, 1776. His papers in the Philosophical Transactions may be found in vols. liii. liv. lv. lxi. lxxvi. lxxvii. lxxviii. lxxix. lxxxii. lxxxiv. For these communications he was honoured with Sir Godfrey Copley's medal. Nichols's Anecd. of the 18th century. Gen. Biog.

WARING, in *Geography*, a town of Virginia; 15 miles E.S.E. of Port Royal.

WARINGSTOWN, a town of the county of Down, Ireland, about 3 miles from Lurgan, where the linen manufacture is extensively carried on; 67 miles N. from Dublin.

WARISE, a town of France, in the department of the Moselle; 4 miles S. of Boulay.

WARKA, a town of the duchy of Warfaw. In 1656, the Poles were defeated here by the Swedes; 30 miles S. of Warfaw.

WARKALLEN, a town of Prussian Lithuania; 4 miles N. of Gumbinnen.

WARKULLEN, a mountain of Sweden, in the province of West Gothland, from which may be seen 23 lakes, great and small.

WARKWORTH, a market-town in the east division of Morpeth ward, and county of Northumberland, England, is situated on the banks of the river Coquet, distant 7 miles S.E. from Alnwick, and 305 miles N. by W. from London. It consists chiefly of one principal street; and in the population return of the year 1811 is stated to contain 108 houses, and 568 inhabitants; the latter are mostly employed in taking and curing salmon. A weekly market is held on Thursdays; and three fairs annually. Warkworth is a borough by ancient prescription, and is governed by a mayor chosen by the free burgesses. In the centre of the town is the market-place, having a stone cross inclosed in a spacious area. The church exhibits some remains of ancient architecture, and has a spire one hundred feet in height. Adjoining to the church was formerly a cell for two Benedictine monks from Durham, for whose maintenance here Nicholas de Farnham, bishop of Durham, who died A.D. 1257, appropriated the church of Brankellon, which was confirmed by Walter de Kirkham, his successor. Over the Coquet is a stone bridge of three arches; on the middle of it is a pillar, and at its south end an ancient tower. At the south end of the town is Warkworth castle, the ancient residence of the earls of Northumberland; in Leland's time it was, he says, "well manteyned;" but in 1672 its timber and lead were granted to one of their agents, and the principal parts of it unroofed. It contains within its moat above five acres. The whole stands on a rock, and its walls were well guarded

with towers. The keep is square, with the angles canted off, and having at the middle of each side a projecting turret, semi-hexagon at its base, and of the same height as the rest of the structure. It contains a chapel, and a variety of spacious apartments, and is finished with a lofty watch-tower, commanding an almost unbounded prospect. Half a mile above the castle is the Hermitage of Warkworth, celebrated in 1771, by the late bishop of Down, in his ballad of the "Hermit of Warkworth." It was only for one priest or hermit, but its origin and foundation are uncertain. The earl of Northumberland, in his grant to the last hermit in 1572, calls it "min armitage, belied in a rock of stone, in my parke, in honour of the Holy Trinity." The most perfect and curious part of it consists of a chapel, sacristy, and vestibule, hewn out of a fine freestone-rock, twenty feet high, and overshadowed with shrubs and lately forest trees. The chapel is about eighteen feet long, and seven feet broad and high; and executed with great neatness, in columns, groins, and arches, in the old style. Parallel with the chapel, five feet wide, and stretching five feet round its west end, is the sacristy, lighted from the chapel with a window, and having the remains of an altar in it, and over its door a shield, with instruments of the Passion. Its west end communicates with the vestibule, in which are two square niches, and from which has been a way into an apartment of masonry, having remains of a chimney. A staircase led from the chapel door to the top of the cliff, where were the hermit's house and garden.—Beauties of England and Wales, vol. xii., Northumberland; by the Rev. J. Hodgson, 1813. History and Antiquities of Northumberland; by Nicholson and Burn, 2 vols. 4to.

WARLAX, a small island on the east side of the gulf of Bothnia. N. lat. 63° 18'. E. long. 21° 29'.

WARLEY, a township of the West Riding of Yorkshire; 3 miles N.W. of Halifax.

WARMBRUNN, a town of Silesia, in the principality of Jauer, celebrated for its warm baths; 3 miles S.S.W. of Hirschberg.

WARMELAND, a province of Sweden, bounded on the north by Norway and the province of Dalecarlia; on the east by Westmanland and Nericia; on the south by the Wenner Lake; and on the west by Norway; about 200 miles in length from north to south, and 130 in breadth from east to west. This country is almost every where mountainous; but the east and south parts are more level and fertile than the west and north parts. However, the woods and mines of silver, lead, copper, and iron, with the forges, founderies, &c. belonging to them, furnish the inhabitants of the latter with a great variety of employments. In the year 1726, some pure silver was found in an iron mine not far from Philipstadt, and the memory of this extraordinary circumstance has been preserved in some medals struck on the occasion. The chief occupation of the inhabitants is mining, smelting, &c. together with fishing, and a little agriculture. Their trade consists mostly in masts, planks, timber, the bark of birch-trees, &c. The chief river in this province is the Clara, or Stor Elbe, in which there is a very profitable salmon-fishery. The principal lake, besides the Wenner, is the Fry-ken, which is eight Swedish miles in length, but narrow: it has communication with the Wenner lake.

WARMENSTEINACH, a town of Germany, in the principality of Culmbach; 9 miles E.N.E. of Bayreuth.

WARMINSTER, a considerable market-town, of antiquity, in the hundred of the same name, and the county of Wilts, England, is situated near the western confines of the county, at the distance of 20 miles W.N.W. from Salisbury,

WARMINSTER.

bury, and 98 miles W.S.W. from London. At the time of the Conquest, Warminster appears to have been exempted from the payment of taxes, which circumstance, together with the evident derivation of its name, seems to point it out as the site of an ancient monastery. At a later period it was celebrated for its corn-market. Leland, in his Itinerary, says, "Worminster, a principall market for corne, is 4 myles from Brookehaulle, a myle to Westbury, and fo 3 myles forthe." At the present day, the market of this town continues to be abundantly supplied with wheat, barley, oats, &c. and here are three annual fairs. Warminster possesses no corporation within itself, and is therefore under the government of the neighbouring county magistrates, with the aid of constables chosen every year, at the court-leet of the marquis of Bath, who is lord of the manor. The chief trade carried on here is that of malting, and a considerable manufacture of woollens: the latter has been rapidly on the increase within the last century. According to the parliamentary returns of the year 1811, the town and parish of Warminster contained 1073 houses, and a population of 4866 persons. The houses in the town are principally ranged in one very long street, stretching along the sides of the turnpike-road. At the western extremity stands the parish-church, which is a spacious edifice of stone, with a square tower; and near the centre of the town is a chapel of ease, erected some years ago for the convenience of the parishioners. There are besides two places of worship belonging to the Dissenters; also a good market-house, an assembly-room, and a free grammar-school for the education of twenty poor boys. This institution is endowed with a salary of thirty pounds *per annum*, and is in the gift of the marquis of Bath. The lordship of Warminster in ancient times formed part of the estate of the family of Mauduit, whence it passed to the Hungerfords. Mary, an heiress of that family, conveyed it by marriage to Edward, lord Hastings, who was beheaded by order of the duke of Gloucester, afterwards Richard III. That monarch subsequently bestowed it on John Howard, whom he created duke of Norfolk. It is now the property of the marquis of Bath. Dr. Samuel Squire, a learned writer, and bishop of St. David's, was born at Warminster in 1714, and died in 1766.

Southley Wood, so called from its lying to the south of Warminster, is distinguished by a small intrenchment, denominated Robin Hood's Bower, which is nearly of a square form, and comprises about three-quarters of an acre. Close to the eastern boundary of this wood is another similar earthen-work; and on its eastern side is a third intrenchment, resembling an amphitheatre in miniature. This last is a very curious work, and consists of a ditch and two vallus. The outer vallum is about eighteen feet in height, and is very neatly formed; the breadth of the ditch is seven feet; the height of the inner work from fifteen to sixteen feet; and the length of the area of the inner work on its longest side (for it is of an oval shape) is one hundred and eleven feet.

Clee or Clay Hills, in this vicinity, are two very singular knolls; one of which is much larger than the other, and is surrounded by a ditch and rampart, bearing the marks of very high antiquity; and on its summit are placed two barrows, and the pedestal of a stone cross. Both these tumuli were opened by sir Richard Hoare, who ascertained one of them to be decidedly sepulchral; but no remains of any interment appearing in the other, it is supposed to be designed for a beacon.

At the distance of a quarter of a mile N.E. from Warminster, is a conical-shaped eminence, called Cop-Head Hill,

which is crowned by a large barrow, encircled by a ditch and vallum. This tumulus was opened in 1809 by sir Richard Hoare, and found to contain the skeletons of several males, one female, and a child; besides an interment of burnt bones.

About three-quarters of a mile further to the eastward, on the summit of an irregular hill, is Battlebury Camp; on the west and north-east sides it is nearly inaccessible, from the steep and difficult nature of the ground; and on those sides where it is more easily approached, additional ramparts have been constructed exterior to the double ditch and vallum which surround the whole. The circuit of the outer vallum is seven furlongs and sixty-six yards, and the greatest height of the ramparts is sixty feet: the area, within the interior vallum, measures twenty-three acres and a quarter, and is wholly under tillage. At the fourth-west angle of the camp are three barrows: one of them fills the entire space of the inner ditch; and the other two are placed in the line of the inner rampart. These last, on opening, proved to be sepulchral; but no interment could be discovered in the other.

Between these fortrefs and the village of Boreham, is one of the largest barrows in Wiltshire, from which circumstance it has been dignified with the appellation of King Barrow. It extends two hundred and six feet in length, fifty-six in breadth, and from fifteen to sixteen in height. When first opened in 1800 by Mr. Cunnington, the skeleton of a horse, and three of human beings, were discovered, together with some pieces of flags' horns, boars' tusks, and rude pottery; also a single-edged iron sword, about eighteen inches in length, and two in breadth, which lay on the thigh of one of the skeletons.

Westward from Warminster four miles and a half, on the immediate confines of this county with Somersetshire, is Longleat, the magnificent seat of the marquis of Bath. The old house was originally part of a priory, founded by sir John Vernory, lord of Horningham. On its surrender to Henry VIII. the site and lands attached were granted to sir John Horsey, and Edmund, earl of Hertford, from whom the whole was afterwards purchased by sir John Thynne, an ancestor of the present proprietor. Towards the close of his life he laid the foundation of the superb mansion, which still continues the proudest architectural ornament of this part of Wiltshire; but he only lived to finish the shell and a small portion of the interior. The remainder was completed by his son and by his grandson; the latter of whom was created lord Weymouth by king Charles II. This nobleman likewise furnished the house in a most splendid manner. His lordship died in 1714; the third lord, who was afterwards raised to the dignity of marquis of Bath, new-modelled the gardens and grounds by the advice of the celebrated Brown, whose plan his lordship unremittingly pursued till his death, which happened in 1796. The situation of Longleat is peculiarly fine and picturesque. An extensive park surrounds the mansion; and both nature and art have co-operated to render this place highly important and interesting. The whole domain, within the plantations, is about fifteen miles in circumference. Longleat-house is built on a scale of magnificence proportionate to the extent and grandeur of the park in which it is seated. The architecture is the mixed style which prevailed at the end of the sixteenth century; but it partakes far more of the Roman than of the pointed or English character. The form of the edifice is a parallelogram two hundred and twenty feet in length, by one hundred and eighty feet in depth; it is built entirely of free-stone, and is adorned with pilasters of the Doric, Ionic, and Corinthian orders, with
enriched

enriched capitals, friezes, entablatures, parapets, and cornices. In the centre are two quadrangular courts; and externally it presents four principal fronts, each divided into three stories in height, and into different portions in width by square projections. The interior of this princely mansion corresponds with its exterior in character and effect; every thing is vast, and every part is grand. The principal apartments, with all the out-offices, have been recently formed and arranged by Jeffery Wyatt, esq., architect; who, well acquainted with the style of architecture in which the house was originally erected, has judiciously adhered to the same style in his additional works. Hence, when the whole is completed, it may be safely asserted, that for grandeur of effect, commodiousness of arrangement, and adaptation for a splendid establishment, it will equal any mansion in Great Britain. The libraries and other apartments are enriched with numerous pictures, among which are portraits of many personages of distinguished celebrity in the three last centuries.—*Beauties of England and Wales*, vol. xv., Wiltshire; by J. Britton, F.S.A. Hoare's "Ancient Wiltshire," fol. 1812. A fine view of this house, with a particular description of the seat, are published in Havel's *Views of Seats*, fol. 1817.

WARMSTER, a post-town of Virginia, on James river; 90 miles W. of Richmond.—Also, a township of Pennsylvania, in the county of Bucks, containing 564 inhabitants.

WARMSDORF, a town of Germany, in the principality of Anhalt Cothen; 8 miles W. of Bernberg.

WARMSRING MOUNTAINS, or *Jackson's Mountains*, mountains of Virginia. N. lat. $54^{\circ} 30'$. W. long. $79^{\circ} 40'$.

WARMSTADT, or WORMIT, a town of Prussia, in the province of Ermeland; 42 miles S.S.W. of Königsberg. N. lat. $54^{\circ} 3'$. E. long. $20^{\circ} 7'$.

WARMTH. See HEAT.

WARMTH, in *Painting*, denotes that fiery effect which a small addition of yellow gives to a true red; and that glowing appearance which red imparts to either yellow or blue. By warmth, in red, is to be understood a small inclination towards orange; by the same term, applied to yellow, a like tendency by the admixture of red; and by the same again, in the case of blue, must be understood its slightly verging on the purple. Coolness is opposed to warmth; but it is seldom used except in speaking of yellow and blue; and then it means either the negation of that which causes warmth, or a tendency to green, in either colour, by a slight admixture of the other. The sense of the term warmth, when applied to colouring, or the combined appearance of various tints, must not be confounded with that which it bears when we are speaking of particular colours. For then it relates to the procuring of a strong effect, by the disposition or contrast of the colours, or the grossness of the tints; and not the qualities peculiar to, or inherent in the colours themselves.

WARN, in *Law*, to summon a person to appear in a court of justice.

WARNA, in *Geography*, a town of Sweden, in East Gothland; 14 miles E.S.E. of Linköping.

WARNAMMA, or WERINAMA, a town on the south coast of the island of Ceram. S. lat. $3^{\circ} 45'$. E. long. $129^{\circ} 34'$.

WARNAS, a name by which some of the chemical writers express what others of them call the *acetum philosophorum*, or vinegar of the philosophers.

WARNE, or WARNOV, in *Geography*, a river of Mecklenburg, which passes by Rostock, and runs into the Baltic, at Warnemunde.

WARNE, a river of England, in the county of Northumberland, which runs into the Irish sea, 4 miles S. of Holy island.

WARNE, a river of England, in the county of Northumberland, which runs into the Irish sea, 4 miles S. of Holy island.

WARNEMUNDE, a town of the duchy of Mecklenburg, at the mouth of the Warne, where vessels bound to Rostock pay a toll, which formerly amounted to 80,000 rix-dollars a year; at present to not more than 6000; 9 miles N. of Rostock.

WARNENAS, a town of Sweden, in the province of Smaland; 11 miles S.S.W. of Calmar.

WARNER, a town of New Hampshire, in the county of Hillborough, containing 1838 inhabitants; 20 miles W. of Concord.

WARNER'S *Patent*, a town of New Hampshire, in the county of Coos, containing 35 inhabitants.

WARNERIA, in *Botany*, was so called by Miller, in honour of Richard Warner, esq. of Woodford-row, Essex, author of the *Plante Woodfordienses*, published in 1771. This gentleman, rather a patron of the science than a deep botanist, is mentioned by Dr. Pulteney, as a successful cultivator of exotic plants, and a lover of indigenous botany. On his death, April 11, 1775, he left his valuable library to Wadham college, Oxford, where he received his education; this bequest was accompanied by a stipend for a botanical lecture, of which we have never heard the result. He is also celebrated for his critical knowledge of Shakspeare, of whose plays he had long meditated an edition; but resigned his pretensions to Mr. Steevens. The genus dedicated to Mr. Warner, has not however been allowed to retain his name. It is the *HYDRASTIS* of Linnæus; see that article.

A small pamphlet of twelve pages, entitled "Additions to Warner's *Planta Woodfordienses*," was printed in 1784, by Thomas Farleigh Forster, esq. F.L.S. a distinguished British botanist.

WARNESS, in *Geography*, a cape on the south coast of the island of Eday. N. lat. 59° . W. long. $2^{\circ} 42'$.

WARNETON, a town of France, in the department of the Lys. This town was ceded to the Dutch in 1715, as a barrier town, and before the revolution, with its territories, belonged to the prince of Orange; 2 posts N.W. of Lille.

WARNING-*Picce*, in the *Military Art*. See *Evening Gun*.

WARNING-*Wheel*, in a clock, is the third or fourth, according to its distance from the first wheel. See *Clock*.

WARNITZ, in *Geography*, a town of European Turkey, in Bessarabia, remarkable for being the place where, in the year 1709, Charles XII. of Sweden broke up his camp, and continued till the year 1713, when the Turks were obliged to make use of force to get rid of him; near Bender.

WARNOth, in our *Old Writers*, an ancient custom, by which if a tenant, holding of the castle of Dover, failed in paying his rent at the day, he was to forfeit double; and for the second failure, treble; and the lands so held were called *terris cultis*, and *terris de warnoth*.

WARO, in *Geography*, a town of Sweden, in the province of Halland; 13 miles S. of Königsberg.

WAROLA, a town of Sweden, in West Gothland; 66 miles E. of Uddevalla.

WARP, in *Agriculture*, a slimy sort of subitance or material which is deposited or let fall upon land by the sea's tides in some particular situations, and by which a new, rich, and fertile sort of alluvial soil is formed. The term is also sometimes applied to the ooze or slimy matter thrown up by the sea in ordinary cases. It is in both instances a

very productive material when employed as manure in composition with other matters, or used alone.

WARPS are applied to flat, wide beds or ridges of ploughed land in some districts. It is often a bad mode of laying land when in the state of tillage.

WARP in *Cows*, in *Rural Economy*, a term made use of in some places to signify to miscarry or slip their calves. Where cows are liable to warp or slip their calves, and it has taken place in different cases, it is considered dangerous to permit them to continue in the yards with the whole of the same sort of stock, from the fear of the same effect being produced on the others. For though some cows may probably, by constitutional weakness, or some bodily imperfection, be more liable to warp than others; such accidental circumstances as produce sudden fright are very often the cause. Putrid disagreeable smells, and the exposure of putrid animal substances, have frequently too the same effect. It is stated, that in an inclosure in the parish of Arlingham, in the county of Gloucester, near to which was a dog-kennel, eight heifers out of twenty warped, in consequence, as it was supposed by the farmer, of the frequent exposure of the flesh, and the skinning of the dead horses before them: the remainder being removed to a distant pasture, it is said, did well. Many other cases of this sort have likewise been noticed.

WARP, in the *Manufactures*, is the threads, whether of silk, wool, linen, hemp, cotton, or the like, that are extended lengthwise on the weaver's loom, and across which the workman, by means of his shuttle, passes the threads of the woof, to form a cloth, ribband, fustian, or other matter.

For a woollen stuff, &c. to have the necessary qualities, it is required, that the thread of the warp be of the same kind of wool, and of the same fineness throughout; that they be sized with Flanders or parchment-size, well prepared; and that they be in sufficient number, with regard to the breadth of the stuff to be wrought. See *WOOF*, *CLOTH*, &c.

WARP, in a *Ship*, is a small rope employed occasionally to remove a ship from one place to another, in a port, road, or river. Hence,

To WARP, in *Sea Language*, is to change the situation of a ship, by pulling her from one part of a harbour, &c. to some other, by means of warps, which are attached to buoys, to anchors sunk in the bottom, or to certain stations upon the shore, as posts, rings, trees, &c. The ship is accordingly drawn forwards to those stations, either by pulling on the warps by hand, or by the application of some purchase, as a tackle, windlass, or capstern, upon her deck. When this operation is performed by the ship's lesser anchors, these machines, together with their warps, are carried out in the boats alternately towards the place where the ship is endeavouring to arrive; so that when she is drawn up close to one anchor, the other is carried out to a competent distance before her, and being sunk, serves to fix the other warp, by which she is farther advanced.

Warping is generally used when the sails are unbent, or when they cannot be successfully employed, which may arise from the unfavourable state of the wind, the opposition of the tide, or the narrow limits of the channel. Falconer.

WARP also denotes a towing-line, by which boats are hauled in a canal, &c.

WARP of *Shrouds*, the first given length, taken from the bolster at the mast-head to the foremast dead-eye.

WARPED into *Junks*, in *Rope-Making*, is yarn warped into short lengths for spun-yarn.

WARPEN, in *Geography*, a lake of Sweden, in Dalecarlia.

WARPENI. See WARDPENNY.

WARPING of *Land*, in *Agriculture*, the practice of forming, fertilizing, and improving lands of the tillage kind, which is employed in some particular situations on the borders of large rivers and channels into which the sea-tides flow, and where the level of the ground is such as to admit of their being overflowed with much facility. This practice has hitherto been chiefly confined to the extensive sea-districts of Lincolnshire and Yorkshire, but is little known to most others. It has been remarked by the writer of a late calendar of husbandry, that the waters of the tides that come up the Trent, Ouse, Dun, and other rivers of the former of the above counties, which empty themselves into the great estuary of the Humber, are muddy to an excess; inasmuch that in the summer season, if a cylindrical glass, twelve or fifteen inches long, be filled with the water, it will presently deposit an inch, and sometimes more, of this muddy matter, or what is there called warp. Where it comes from is, it is said, a disputed point: the Humber, at its mouth, is clear water; and no floods in the countries washed by the warp rivers bring it, but, on the contrary, do much mischief by spoiling the warp. In the very driest seasons and longest droughts, it is found the best and most plentiful.

The improvement in land, which is made by this means, is, it is said, perfectly simple and easy, consisting in nothing more than merely letting in the tide at high water to deposit the warp, or muddy material, and permitting it to run off again as the water falls. But in order to render it fully efficacious, the water must be at command, so that it may be kept out and let in at pleasure, consequently there must be not only a cut or canal made to join the river, but a sluice at the mouth of it formed so as to open or shut, as wanted; and that the water may be of a proper depth on the land to be warped, and also prevented flowing over contiguous lands, whether cultivated or not, banks are necessary to be raised around the fields to be warped, of from three or four to six or seven feet high, according as the circumstances of the cases may be. Thus, if the tract be large, the canal which takes the water, and which, as in the practice of irrigation, might, it is said, be called the grand carrier, may be made several miles long: it has been tried, it is said, as far as four, so as to warp the lands on each side the whole way, and lateral cuts made in any suitable direction for the same purpose; it is, however, to be observed, that the effect lessens as the river is receded from; that is, it demands longer time for the water to deposit warp enough for producing the benefit.

It is to be noticed in this case, however, it is said, that the effect is very different from that of irrigation or watering; as it is not the water that works the effect or improvement, but the mud or material which is deposited, so that in time of floods the business ceases, as also in winter; and that it is not in this case to manure the soil, but to create and form it. What the land is, it is supposed, which is intended to be warped, is not of the smallest consequence: a bog, clay, sand, peat, or even a barn floor, all one and the same; as the warp raises it in one summer from six to sixteen inches thick, and in the hollows or low places, two, three, or four feet, so as to leave the whole piece or field level. Thus, a soil of any depth that may be required is formed, which consists of mud, or a material of that sort, of vast fertility, though not containing much besides sand; but a sand unique, it is supposed.

It is stated in addition, too, by the same writer, that Mr. Dalton, of Knäth, on Trent, in the same county, sent some

WARPING OF LAND.

of this material to an eminent chemist, whose report of it was, that it contained muckilage, and a very minute portion of saline matter; a considerable one of calcareous earth: the residue is mica and sand; the latter in far the largest quantity, both in very fine particles. Here, it is said, there is no mention of any thing argillaceous; but from examining in the fields much warped, the writer is clear that there must be clay in some, from its caking in small clods, as well as from its cleansing cloth of greafe, almost like fuller's earth. He was told too, by a considerable warp farmer, that the stiffest warp was the best; but in general it has the appearance, it is said, of sand, and all of it glitters with the micaeous particles.

It is evident therefore that the soil or bed which is formed in the cases of warping is somewhat of the alluvial kind, and of course well constituted for the growth of most sorts of tillage crops.

Warping is a practice which begins in the month of July, and which proceeds during the summer season; and as it can only be performed at that particular period, every occasion of having it executed should constantly be embraced, by having the works in perfect repair and readiness, that every tide may be made to produce its full effect. In regard to the utility and advantage of doing this sort of work in the summer months, it may be noticed, that at these times the lands not only become the soonest dry, a circumstance which must always fully take place before the process of cultivation can be carried on, but the tides are less mixed with fresh water, in which situation they are constantly found the most effectual in the business.

In respect to the method of performing the work, it is described by lord Hawke, in one of the Reports on the Agriculture of Yorkshire, in the manner which is given below.

The land to be warped must, it is said, be banked round against the river; the banks for which are made of the earth taken on the spot from the land: they must be formed so as to slope six feet; that is, three feet on each side of the top or crown of the bank, for every foot perpendicular of rise: their top or crown part being made broader or narrower, according to the impetuosity of the tide, and the weight and quantity of water; and they extend from two feet to twelve: their height is regulated by the height to which the spring-tides flow, so as to exclude or let them in at pleasure. In these banks, there are to be more or fewer openings formed, according to the size of the field or ground to be warped, and the choice of the occupier or proprietor; but in general they have only two sluices, it is said; one called the flood-gate, to admit, the other termed the clogh, to let off the water in a gentle manner; these are sufficient, it is observed, for ten or fifteen acres: when the spring-tide begins to ebb, the flood-gate is opened to admit the tide, the clogh having been previously shut by the weight of the water brought up the river by the flow of the tide. As the tide ebbs down the river, the weight or pressure of the water being taken from the outside of the clogh next the river, the tide-water that has been previously admitted by the flood-gate opens the clogh again, and discharges itself slowly but completely through it. In forming the cloghs, they are walled on each side, and so constructed, as to let the water run off between the ebb of the tide admitted, and the flow of the next; and to this point particular attention is, it is said, paid by the workmen. The flood-gates are placed so high in these intentions as only to let in the spring-tides when opened. They are, of course, placed above the level of the common tides.

Willows are also, it is said, occasionally planted on the

fronts of the banks, to break the force of the tides, and defend the banks, by raising the fronts of them with warp thus collected, accumulated, and detained: but these willows must never, it is remarked, be planted on the banks themselves, as they would in that way destroy them, by giving the winds power to shake and disturb them.

In regard to the expence, it is stated that the first cost of a sluice for warping, which is five feet in height, and seven feet in width, may be estimated at from four to five hundred pounds. And that such a sluice will in general be adequate to the warping of fifty acres annually; and where the soil or land is contiguous to the river, for seventy or more.

In these cases, the nature of the culture which is proper, the crops, and various other circumstances that require attention are well shewn and pointed out in the observations that are given below, which were taken by the first of the above writers on the farm of Mr. Webster, at Bankside, in the county of Lincoln, who has made to great an improvement by warping, that it merits, it is said, particular notice and regard. His farm of two hundred and twelve acres, it is said, is all warped; and that to shew the immense importance of the improvement, it would be necessary only to mention that he gave eleven pounds an acre for the land, and would not now take seventy pounds an acre for it; he considers it worth eighty pounds, and some of it even one hundred pounds the acre: not that it would sell so high at present however; yet the whole expence of his sluices, cuts, banks, and other things, did not, it is said, exceed two thousand five hundred pounds, or twelve pounds the acre; from which, however, to continue the account, one thousand five hundred pounds may, it is said, be deducted, as a neighbour below him offers five pounds an acre for the use of his sluice and main cut, to warp three hundred acres by, which will, it is said, reduce Mr. Webster's expence to one thousand pounds, or about five pounds an acre. Take it, however, it is said, at the highest, twelve pounds, and add eleven pounds, the purchase, together twenty-three pounds an acre; if he can sell at seventy pounds, it is forty-seven the acre profit. This, it is thought, is prodigious, and sufficient to prove that warping exceeds all other improvements. Mr. Webster has, it is observed, warped to various depths, to eighteen inches, two feet, two and a half feet, &c. He has some, it is said, that, before warping, was moorland, worth only one shilling and sixpence the acre, now as good as the best. Some of it would let at five pounds the acre for flax or potatoes; and the whole at fifty shillings. He has twenty acres that he warped three feet deep, between the beginning of June and the end of September, and eighteen acres, part of which is three feet and a half deep. He has applied it, too, on stubbles in autumn by way of manuring, it is said; for it should be noted, the writer says, as a vast advantage in this species of improvement, that it is renewable at any time: were it possible to wear out by cropping or ill-management, a few tides will, it is asserted, at any time restore it. As to the crops he has had, they have, it is said, been very great indeed; of potatoes from eighty to one hundred and thirty tubs of thirty-six gallons each, felling the round sorts at from three shillings, to three shillings and sixpence a tub; and kidney's at from five shillings to eight shillings the tub. Twenty acres warped in 1794, could not, it is said, be ploughed for oats in 1795; he, therefore, sowed the oats on the fresh warp, and scuffled in the seed by men drawing a scuffler, eight to draw, and one to hold: the whole crop was very great; but on three acres of it, measured separately, they amounted, it is said, to fourteen quarters one sack the

WARPING OF LAND.

acre. The writer here observes, that he little thought of finding exactly the husbandry of the Nile in England. He had, however, before heard of clover-seed being sown in this manner on fresh warp, and succeeding greatly.

It is stated in addition, that Mr. Webster warped twelve acres of wheat-flubble, and sowed oats in April, which produced twelve quarters an acre; and then wheat, thirty-six bushels an acre: that his wheat is never less than thirty bushels; and that six acres of beans produced thirty loads the acre, or ninety bushels; that one acre, measured to decide a wager, yielded ninety-nine bushels; that he has had one hundred and forty-four pods from one bean, on four stalks; and Tartarian oats seven feet high; that one piece, warped in 1793, produced oats in 1794, six quarters an acre. White clover and hay-seeds were sown with them, and mown twice the first year: the first cutting yielded three tons of hay on the acre; the second, one ton; and after that, an immense eddih. Warp, it is observed by Mr. Webster, brings weeds never seen there before, particularly mustard, cresses, and wild celery, with plenty of docks and thistles; also flax, from forty to fifty stones the acre.

It is remarked too, in the same agricultural work, that Mr. Nicolson, at Rawcliffe, when this practice is intended, takes the levels first, then builds a sluice; that if a quarter of a mile or half a mile in length, sixty acres may be done the first year; the drier the season the better, as suggested above. The clough or sluice, when eight feet wide, and five or six feet high, will be 400l.; and a drain made fourteen feet at the bottom, and as much more at top, from thirty to forty shillings an acre of twenty-eight yards; banks made from four to eight feet high, and the expence from seven to twenty shillings the acre of twenty-eight yards: that he begins the business at from Lady-day till Martinmas, but all depends on season; the depth will depend on and be regulated by circumstances. If a landlord warp, it should be deep, it is said, at once; if a tenant, shallow and repeated; for as good corn will grow at six inches as six feet; at three inches, great crops; the stiffer the warp the better, as already noticed. Some seasons, corn is sown the year after. Warp is cold, and, if deep, takes time; a dry year best; great seed crops. The crops ought to be beans, twenty loads; oats, ten quarters; wheat, ten or twelve loads: never barley. After six years, potatoes, and good flax: he makes it worth from forty to fifty pounds an acre, it is said. And Mr. Willson's idea of warping is considered by the writer as very just; which is to exhault the low lands in favour of the hills; then to warp six inches deep, to exhault that to make the hills; then to warp again: and by thus doing, to keep the warp-land in the highest order, and at the same time to work a great improvement to all the higher grounds.

The substance of the observations of a commissioner much employed in warping is, that warp leaves one-eighth of an inch every tide on an average; and that these layers do not mix in an uniform mass, but remain in leaves or layers distinct. That if there be only one sluice, then only every other tide can be used; as the water must run perfectly off, in order that the surface may incur; and that if the canal be not empty, the tide has not the effect. At Althorp, Mr. Bower has warped, it is observed, to the depth of eighteen inches in a summer.

Ten quarters of oats an acre is common, on raking in the seed on warp; the more salt there is in the warp, the better; but one fallow, in that case, is, it is said, necessary to lessen the effect, or it hurts vegetation.

It is remarked, that as a sort of new soil is created by this mode of practice, it is of but little consequence what the

original nature or quality of the land may be, almost all kinds being improved by it, as seen already; but that, at the same time, it may be the most beneficial in such light foiled lands as are very open and porous, and such stiff ones as are defective in calcareous matter, and which require substances of this kind to render them less tenacious: and that land, when once well warped, will continue for a vast length of time in a good state of fertility. But still it is suggested, by some experienced warpers, as a better practice, in this mode of tillage improvement, to apply a small portion of warp whenever the land is in the state of fallow, which will be about every five or six years; as, by this means, the farmer will be more secure of having good crops. The depth to which the lands are covered by the tides must, it is said, be regulated according to their levels, and the height to which the tides rise in the rivers from which they proceed.

It is stated in the Agricultural Report of the West Riding of the County of York, that where it can be done, the water may be admitted to the height of three, four, or more feet; and that the deposit of the muddy sediment or material is in some measure proportionate to the height of the tide-water; but that the same effects may be gained from much smaller quantities of water, by continuing the process or practice a great number of tides: also, that such lands as have been subjected to this method of improvement, should constantly be kept in the state of tillage for some length of time afterwards, in order that they may be brought to a proper condition for the production of grass.

In respect to the expence of this mode of improving lands, it must necessarily differ much, it is said, in different cases, according as the circumstances of situation, distance, &c. may vary; but it can seldom exceed twelve or fifteen pounds the acre, according to some, as the first of the above writers; and in most instances it must, it is thought, be greatly below such estimates. It is, however, properly remarked by Mr. Day, another experienced writer on the subject, that no estimate can be made, without viewing the situation of the lands to be warped, and the course and distance it will be necessary to carry the warp to such lands: as, 1st, the situation of the lands must be fully considered; 2dly, the quantity of land the same drains and cloughs will be sufficient to warp; and 3dly, the expence of building the cloughs, cutting the drains, embanking the lands, &c. An estimate of which expence being made, then it will be necessary to know the number of acres such cloughs and drains will warp, before any estimate *per* acre can be made; consequently it will be easy to conceive, that the greater quantity of land the same cloughs and drains will warp, the easier the expence will be *per* acre. It is his opinion, that there are great quantities of land in the above county, and others, which might be warped at so small an expence as from four to eight pounds the acre, which is nothing, it is thought, in comparison to the advantages which would arise from it.

The writer has known land which has been raised in value by warping, from five to upwards of forty and even fifty pounds the acre; therefore it is easy to conceive, it is said, that the greatest advantages arise upon the worst land, and the more open and porous the soil the better, as has been noticed, as the wet filters through readily, and it soon becomes fit for use. The advantages of warping are, it is thought, very great; as, after lands have been properly warped, they are so enriched thereby, that they will bring very large crops for several years afterwards, without any manure; and, when it is necessary, the lands may be warped again, by opening the old drains, which may be done at a very trifling expence, and will bring crops in succession for

many

WARPING OF LAND.

many years, with very little or no tillage at all, if the lands be kept free from quick grass, and other weeds, which must be the case in all lands where they are properly managed; besides, the drains which are made for the purpose of warping, are the best drains, it is said, that can be constructed for draining the lands at the time they are not used for warping, which is another very great advantage, it is thought, in low lands in this sort of business.

As to the disadvantages in warping, it is conceived there can be very few, if any, as the land may be warped in the year in which it should be a summer fallow. Indeed all lands that are warped, it is said, should be prepared in the spring as fallow lands, so that they may be ready to let in the warp by the month of June, as the three succeeding months are the most proper ones in the whole year for warping; but they might be continued in warping longer when necessary, therefore the rent is, it is thought, out of the question. The only inconveniences that can arise are, in the writer's opinion, from the blowing up of the cloughs, or the breaking of the banks, which is seldom the case, except where there is some neglect in the works, and thereby overflowing the adjoining lands, and very probably destroying the crops; it, however, very much enriches the land that is overflowed: such accidents and circumstances should notwithstanding be guarded against by every cautious contriver of such works.

It is noticed that warped land seldom fails of carrying good crops of most sorts; but that oats are most to be depended on the first season. It is thought that warped land is better calculated for the growth of oats, wheat, and beans, than barley, as the soil by that means becomes so very rich, that barley in general grows too coarse. It never fails growing artificial seeds of all kinds, and is the best of all land for pasture.

When once well warped, land lasts a considerable length of time, and is generally the most conveniently and best done in a gradual manner, as suggested above, as by such means the farmer will seldom fail of having great crops. In short no sort of field management is known that is so cheap as warping, when properly applied. Land of all qualities is warped; but in general it is not warped more than one year in seven; one year's warping will do for that length of time in most cases. The land is various as to the preference of the grain or crops to be sown upon it, as in other cases.

In some cases, land has been raised considerably by warping; in one instance of bad corn land, almost good for nothing, it was raised in three years fourteen inches: it lay idle for that time, that it might be raised by this means; it was then sown with beans, and promised a crop of eight quarters.

The warp consists of mud and salts deposited by the ebbing-tide, as supposed above: near Howden, one tide will, it is said, deposit an inch of mud, and this deposit is more or less in proportion to the distance from the Humber, at which the place is.

Cherry-cob sands were gained, it is asserted, by warping from the Humber; and they are supposed to be at least four yards thick of warp: some of these were ploughed for twelve, fourteen, or sixteen years, it is said, before they would grow grass-seeds: the greater part is now in feeding land, and makes very fine pasture.

The land must always be in tillage for some considerable time after warping, as pointed out above; and if laid down for grass, and continued in that state, it is not warped; for the salts in the mud would, it is said, infallibly kill the grass-seeds.

When it is proposed to sow the land again with corn, then

it is warped: when the farmers find the grass decline, they then warp and plough it out: as the land varies in quality, so does the time during which it will produce good grass. It is never in the state of fallow, but in the year when it is warped, as suggested already.

In regard to the practice of warping in the low part of the West Riding of the above district, it is conceived, that it originated from the tides overflowing the banks of the rivers, and thereby leaving a sediment, which was found to be excellent manure, and that the land brought very large crops after being covered or flooded in that manner. Indeed, it is believed that the first trial of warping was made by a small farmer, who had some low land adjoining a certain river called the Dutch river, which was a very poor soil, the lowest part of which was levelled with the highest, by the overflowing of some very high tides, which convinced the farmer that he could, by banking the land round, and laying a tunnel through the bank of the river, raise the same, and make it of considerably more value. He consequently applied to the commissioners of sewers for the level of Hatfield chafe, as being appointed for draining that part of the district, &c. to grant him an order, giving him leave to lay a tunnel, a few inches square, through the bank of the said river, for the purpose of warping his land, which was granted him with a great deal of reluctance, for fear of overflowing the country thereabouts with water, on his giving a proper security for indemnifying the county against any injury which might happen thereby, which answered his purpose, it is said, very well. But now, it is observed, there are cloughs laid of six or eight feet wide, and drains made of proper dimensions, to carry the water as circumstances may be. The writer is not certain how long it is since warping came much into practice, but it is not, however, many years; it is believed not more than (1799) than twenty or twenty-five years, or thereabouts.

It is stated, however, that Mr. Richard Jennings, of Armin, near Howden, was the first person who tried the experiment of warping, about fifty years since at the above period. It was next attempted, then about forty years ago, by a Mr. Farham, steward to — Twisleton, esquire, of Rawcliffe, as well as by a Mr. Mould, of Potter Grange; and it has been tried, it is said, by a great variety of persons since that time, to their great advantage.

It is observed in the work first noticed, that a very great object in the husbandry of warping, is the application and extension of it in other districts. They have much warp, it is said, on all the coast from Wisbeach to Boston, and other places in that vicinity, and which through a long succession of ages has formed a large tract of warp country, called there the *Silt* district, yet no attempts that have been heard of have been made there to warp artificially. It is therefore suggested to the proprietors and farmers living near a muddy river, that they should consider the position of their grounds well, and try the amount of the subsidence of the mud in the water, in a cylindrical glass jar, as a treasure may be near them without their knowing any thing of it. See the Corrected Agricultural Reports of Lincolnshire and the West Riding of Yorkshire.

WARPING-Banks, the mounds of earth that are raised up round the fields or grounds to be warped against the rivers. See **WARPING of Land**.

WARPING Cuts, Drains, or Gutters, the open passages which are formed for taking away the water in *warping of land*. See the article.

WARPING Clough, Hatch, or Sluice, the strongly framed wood-work which is placed in the inlet cut in the bank of the warping river, which cut is walled on each side with a strong

strong wall, and this frame or gate for the flood-tide firmly fixed in the middle part, in order to let in and out the water. They are sometimes constructed nearly on the same principle as those which are used at water-mills, and commonly like the gates and sluices in canals for raising the water to assist the passage of boats on them; in some cases, too, such gates are placed above the clough in a perpendicular manner. The sizes and dimensions of them are different according to the differences in the circumstances of the cases, as well as the cost of them. Some notion of each of which has been given in speaking of the practice of warping. See *WARPING of Land*.

WARPING, in *Rope-Making*, is running the yarn off the winches into hauls to be tarred.

WARPING-Hook, for hanging the yarn on when warping into hauls for tarring, is a large iron hook hung occasionally to the warping-posts.

WARPING-Post, a post fourteen or sixteen inches diameter, fixed in the middle of a rope-ground, for warping the yarns into hauls.

WARRAN, in *Geography*. See *ORAN*.

WARRANAROU, a small island near the east coast of the island of St. Vincent. N. lat. 13° 22'. W. long. 61° 11'.

WARRANT, an act, instrument, or obligation, by which a person authorizes another to do something, which he had not otherwise a right to do.

WARRANT, in *Law*, is a precept under the hand and seal of some officer, to bring any offender before the person granting it.

A warrant may be granted in extraordinary cases by the privy-council, or secretaries of state; but ordinarily by justices of the peace. This they may do in any cases where they have a jurisdiction over the offence, in order to compel the person accused to appear before them. And this undoubtedly extends to all treasons, felonies, and breaches of the peace; and also to all such offences as they have power to punish by statute.

Sir Edward Coke lays it down, that a justice of the peace cannot issue a warrant to apprehend a felon upon mere suspicion, nor even till an indictment be actually found; but this opinion has been combated by Sir Matthew Hale, who maintains that a justice of peace hath power to issue a warrant to apprehend a person accused of felony, though not yet indicted; and that he may also issue a warrant to apprehend a person suspected of felony, though the original suspicion be not in himself, but in the party that prays his warrant. But in both cases it is proper to examine upon oath the party requiring a warrant, as well to ascertain that there is a felony or other crime actually committed, without which no warrant should be granted; as also to prove the cause and probability of suspecting the party, against whom the warrant is prayed. This warrant ought to be under the hand and seal of the justice; should set forth the time and place of making, and the cause for which it is made; and should be directed to the constable, or other peace officer, or it may be to any private person by name, requiring him to bring the party either generally before any justice of the peace for the county, or only before the justice who granted it: the warrant in the latter case being called a *special* warrant.

A general warrant to apprehend all persons suspected, without naming particularly, or describing any person in special, is illegal and void for its uncertainty; for it is the duty of the magistrate, and ought not to be left to the officer, to judge of the ground of suspicion; and a warrant to apprehend all persons guilty of a crime therein specified, is no legal warrant; because the point, upon which its autho-

riety rests, is a fact to be decided upon in a subsequent trial; namely, whether the person apprehended upon it be really guilty or not. It is, therefore, in fact, no warrant at all; for it will not justify the officer who acts under it; whereas a warrant, properly penned (even though the magistrate who issues it should exceed his jurisdiction) will, by statute 24 Geo. II. cap. 44. at all events indemnify the officer, who executes the same ministerially. A practice, indeed, had obtained in the secretaries' office, ever since the Restoration, grounded on some clauses in the acts for regulating the press, of issuing general warrants to take up (without naming any person in particular) the authors, printers, and publishers, of such obscene or seditious libels as were particularly specified in the warrant. When those acts expired in 1694, the same practice was inadvertently continued in every reign, and under every administration, except the four last years of queen Anne, down to the year 1763; when such a warrant being issued, its validity was disputed; and the warrant was adjudged, by the whole court of king's bench, to be void. After which, the issuing of such general warrants was declared illegal by a vote of the house of commons. Com. Journ. 22 April, 1766.

When a warrant is received by the officer, he is bound to execute it, so far as the jurisdiction of the magistrate and of himself extends. A warrant from the chief or other justice of the court of king's bench, extends all over the kingdom; and is tested or dated England, and not any particular county. But the warrant of a justice of peace in one county must be backed, that is, signed by a justice of the peace in another, before it can be executed there. Formerly, regularly speaking, there ought to have been a fresh warrant in every fresh county; but the practice of backing warrants had long prevailed without law, and was at last authorized by statutes 23 Geo. II. cap. 26. and 24 Geo. II. cap. 55. And now, by statute 13 Geo. III. cap. 31. any warrant for apprehending an English offender, who may have escaped into Scotland, and *vice versa*, may be indorced and executed by the local magistrates, and the offender be conveyed back to that part of the united kingdoms in which such offence was committed. Blackit. Comm. book iv.

WARRANT of Attorney, is that by which a man appoints another to do something in his name, and warrants his action.

It seems to differ from a *letter of attorney*, which passes under hand and seal of him that makes it, before credible witnesses; whereas *warrant of attorney*, in personal, mixed, and some real actions, is put in course by the attorneys for the plaintiffs or defendants. Though a warrant of attorney, to suffer a common recovery by the tenant, or vouchee, is to be acknowledged before such persons as the commission for the doing of it directs.

It is usual, in order to strengthen a bond creditor's security, for the debtor to execute a warrant of attorney to any one, empowering him to confess a judgment by *nihil dicit, cognovit actionem, or non sum informatus*, in an action of debt to be brought by the creditor for the specific sum due; which judgment, when confessed, is absolutely complete and binding.

In the court of common pleas, there is a *clerk of the warrants*, who enters all warrants of attorney for plaintiff and defendant.

WARRANT, Search. See *SEARCH*.

WARRANT Officers. See *OFFICERS*.

WARRANT, in the *Manege*. A jockey that sells a horse is, by custom, in some countries, obliged to warrant him, that is, to refund the money that was given for him, and re-deliver the horse in nine days after the first delivery, in case

case he sold him when under such infirmities as may escape the view of the buyer, and as are not obviously discovered. These infirmities are puriveness, the glanders, and unfoundness, hot and cold: but he does not warrant him clear of such infirmities as may be discerned. Not only jockeys or horse-merchants, but also persons of what quality or condition soever, are obliged to take back the horse, and repay the money, if he is affected with the said disorders. But the rule of the law of England is, *caveat emptor*, unless the seller expressly warrants. See WARRANTY.

WARRANTS, *Dividend*. See DIVIDEND.

WARRANTS for impressing Choristers. See TUSSEY.

WARRANTIA CHARTA, a writ that lies for a person who is infeoffed in lands and tenements, with clause of warranty; and is pleaded in an assize, or writ of entry, in which he cannot vouch, or call to warranty. See VOUCHER.

WARRANTIA Diei, a writ which lies in a case where a man, having a day assigned personally to appear in court to an action in which he is sued, is, in the mean time, by commandment, employed in the king's service; so that he cannot come at the day assigned. It is directed to the justices, ordering them not to find or record him in default.

WARRANTIZANDUM. See SUMMONS *ad Warrantizandum*.

WARRANTO. See QUO WARRANTO.

WARRANTY, WARRANTIA, in Law, a promise or covenant, by deed, made by the bargainer for himself and his heirs, to warrant and secure the bargainee, and his heirs, against all men, for enjoying the thing agreed on or granted between them.

Such warranty passes from the seller to the buyer; from the feoffee to the feoffee; from him that releases to him that is released from an action real. The form of it is thus: "Et ego verò præfatus A. et hæredes mei, prædictas quinque acras terræ cum pertinentiis suis præfato B. hæredibus et assignatis suis, contra omnes gentes warrantizabimus in perpetuum, per presentes."

Note, under *hæredes*, heirs, are comprised all such as the first warrantor's lands come to, whether by descent, purchase, or the like.

Warranty is either *real*, or *personal*. *Real*, when it is annexed to lands and tenements granted in fee, or for life, &c. which, again, is either *in deed*, or *in law*.

Personal either respects the property of the thing sold, or the quality of it.

By the civil law, an implied warranty was annexed to every sale, in respect to the title of the vendor: and so too, in our law, a purchaser of goods and chattels may have a satisfaction from the seller, if he sells them as his own, and the title proves deficient, without any express warranty for that purpose. But, with regard to the goodness of the wares so purchased, the vendor is not bound to answer; unless he expressly warrants them to be found and good, or unless he knew them to be otherwise, and hath used any art to disguise them, or unless they turn out to be different from what he represented to the buyer. And if he, who selleth any thing, doth upon the sale warrant it to be good, the law annexes a tacit contract to this warranty, that if it be not so, he shall make compensation to the buyer; also, it is an injury in good faith, for which an action on the case will lie to recover damages. The warranty must be upon the sale; for if it be made after, and not at the time of the sale, it is a void warranty. Also the warranty can only reach to things in being at the time of the warranty made, and not to things in futuro: as, that a horse is found at the time of buying him, not that he will be found two years hence.

Any artifice to disguise goods shall be equivalent to an express warranty, and the vendor is answerable for their goodness.

A general warranty will not extend to guard against defects that are plainly and obviously the object of one's senses, as if a horse be warranted perfect, and wants either a tail or an ear, unless the buyer in this case be blind. Also, if a horse is warranted found, and he wants the sight of an eye, though this seems to be the object of one's senses, yet as the discernment of such defects is frequently matter of skill, it hath been held that an action on the case lieth, to recover damages for this imposition. Blackst. Com. book iii.

Real warranty, again, in respect of the estate, is either *lineal*, *collateral*, or *commencing by disseisin*.

Lineal warranty was where the heir derived, or might by possibility have derived, his title to the land warranted, either from or through the ancestor who made the warranty; as, where a father, or an elder son in the life of the father, released to the disseisor of either themselves or the grand-father, with warranty, this was *lineal* to the younger son.

Collateral warranty was where the heir's title to the land neither was, nor could have been, derived from the warranting ancestor; as, where a younger brother released to his father's disseisor, with warranty, this was collateral to the elder brother.

But where the very conveyance, to which the warranty was annexed, immediately followed a disseisin, or operated itself as such, (as, where a father tenant for years, with remainder to his son in fee, aliened in fee-simple with warranty,) this, being in its original manifestly founded on the tort or wrong of the warrantor himself, was called a warranty *commencing by disseisin*; and being too palpably injurious to be supported, was not binding upon any heir of such tortious warrantor. Blackst. Com. book iii.

WARRAWARROW, in Geography, a bay of the island of St. Vincent; 1 mile S. of Kingiton bay.

WARRELL, a river of Hindoostan, one of the arms of the Indus.

WARREN, WARENA, a franchise, or place privileged, either by prescription, or grant from the king, to keep beasts and fowl of warren in; as rabbits, hares, partridges, pheasants, &c.

A man that has the franchise of warren is in reality no more than a royal game-keeper: but no man, not even a lord of a manor, could by common law justify sporting on another's soil, or even in his own, unless he had the liberty of free-warren. This franchise is almost fallen into disregard, since the new statutes for preserving the game. There are, indeed, many instances of eager sportsmen in ancient times, who have sold their estates, and reserved the free-warren, or right of killing game, to themselves; by which means it comes to pass that a man and his heirs have sometimes free-warren over another's ground.

By a statute, 21 Edw. III., a warren may lie open, and there is no need of closing it in; as there is of a park.

If any person be found an offender in any such free-warren, he is punishable for the same at common law. See BLACK ACTS, and GAME.

The word warren is now generally applied to a piece of ground set apart for the breeding and preserving of rabbits.

In the setting up of a warren, great caution is to be used for the fixing upon a proper place, and a right situation. It should always be upon a small ascent, and exposed to the east or the south. The soil that is most suitable, is that which is sandy; for when the soil is clayey or tough, the rabbits find much more difficulty in making their burrows, and never do it so well; and if the soil be boggy or moorish,
there

there would be very little advantage from the warren, for wet is very destructive of these animals.

All the due precautions must be taken, that the warren be so contrived, that the rabbits may habituate themselves to it with ease. Many would have it that warrens should be enclosed with walls; but this is a very expensive method, and seems not necessary nor advisable; for we find but very few that are so, and those do not succeed at all the better for it.

Mr. Chomel's opinion is, that it ought to be surrounded with a ditch. This indeed is no fence to prevent the rabbits from going out, unless there be water in it; but it marks the intended bounds of the warren, and the rabbits generally confine themselves within its circumference, though not necessarily compelled to do so. The space proper for a warren has no limits but the owner's pleasure; but, in general, the larger it is, the more profitable it also proves; and the rabbits, when once accustomed to the place, will keep within their bounds, though they are hemmed in neither with walls nor ditches, nor any other fence whatever.

Some have prescribed the making of deep ditches, and constantly keeping them supplied with water in the summer as well as winter season, that they may serve as fences to the rabbits; but as it is not found necessary to fence them in at all, it is extremely injudicious to do it, by means of a thing known to be so very prejudicial to these creatures as water is. If the person who has set up a warren has but few rabbits to stock it with, the more patience he must have as to the profit of it; but the best method of getting quickly into the scheme of profit in it, is the buying at first a large number of doe-rabbits all big with young. These being unweildy and heavy, will naturally stay in the place, and the young ones will be habituated to it, as their native place, and will never run from it. These young ones will soon breed again, and the warren will begin quickly to be stocked with inhabitants, almost all natives of the place. They should not be hunted at all the two first years, and but very moderately the third. After this they will increase so fast, that scarce any body can conceive the numbers that may be taken, and the profit that may be annually made without hurting it.

The warren is the next franchise in degree to the park, and when spoken of in law, the terms used are, the liberty and franchise of a free-warren.

A forest, which is in dignity the highest and greatest franchise, comprehends in it a chase, a park, and a free-warren; for which reason the beasts of the park, and the beasts and fowls of the free-warren, are as much privileged within the forest, as the beasts of the forest itself are.

WARREN is also applied to a contrivance for preserving fish in the middle of a river, to be taken at pleasure.

WARREN, in *Geography*, a post-township of New York, in the S.E. corner of Herkimer county; 10 miles S. of Herkimer, and 70 W. of Albany. The situation is elevated at the head of the lakes that form the Susquehanna, and the surface pleasantly undulated by arable hills and fertile valleys; and it has many cedar swamps that supply fencing-timber. The rocks are calcareous, and much of the soil of the same quality. There are large springs, but the waters of the town are small; it has five grain-mills, nine saw-mills, a carding-machine, a forge, and trip-hammer. It has one meeting-house belonging to united Lutherans, Calvinists, and Presbyterians, and a competent number of school-houses. Iron-ore is found, and a pigment from which is prepared a durable brown paint. The principal settlements in this town have been made within the last twenty-five years. In 1810 Warren contained 664 families, 444 senatorial electors, and a

total population of 3974 persons.—Also, a county of West Tennessee, containing 5725 inhabitants, of whom 476 are slaves.—Also, a town of the Mississippi territory, containing 1114 inhabitants, including 473 slaves.—Also, a town of the state of Rhode-island, in Brittol county, containing 1775 inhabitants; 4 miles N. of Brittol.—Also, a post-town of the district of Maine, in the county of Lincoln, near the coast, containing 1443 inhabitants; 55 miles N.E. of Portland.—Also, a town of New Hampshire, in Grafton county, containing 506 inhabitants; 16 miles N. of Hanover.—Also, a township of New York; 55 miles W. of Albany.—Also, a town of Connecticut, in the county of Lichfield, containing 1096 inhabitants; 5 miles W. of Lichfield.—Also, a county of Georgia, with 8725 inhabitants, of whom 3048 are slaves.—Also, a county of the state of Ohio, containing five townships, *viz.* Deerfield, Franklin, Turtle-creek, Hamilton, and Wayne, and 9925 inhabitants.—Also, a county of Pennsylvania, bordering on the west part of New York. It contains two townships, *viz.* Conewango and Broken-braw, and 827 inhabitants.—Also, a county of Kentucky, bordering on the Ohio, containing 11,783 inhabitants, of whom 1447 are slaves; and its town Bolin Green 154 inhabitants, including 51 slaves.—Also, a town of the state of Vermont, in the county of Addison, containing 229 inhabitants; 30 miles N. of Rutland.—Also, a post-town of Virginia; 178 miles W.S.W. of Washington.—Also, a town of the state of Ohio, with a gaol, in the county of Belmont, containing 734 inhabitants.—Also, a township, in the state of Ohio, and county of Jefferson, containing 2122 inhabitants.—Also, a township of Ohio, in the county of Trumbull, containing 875 inhabitants.—Also, a township of Ohio, in Washington county, containing 260 inhabitants.—Also, a county of North Carolina, with 11,044 inhabitants, of whom 6282 are slaves.—Also, a town of New Jersey, in the county of Somerset, containing 1354 inhabitants.

WARREN, or *Warentown*, a post-town of North Carolina, and capital of the county of Warren; 16 miles N.E. of Hillsborough.

WARREN, *Fort*, in Governor's island, is situated in Suffolk county, and state of Massachusetts, within the jurisdiction of Bolton, and contains 64 inhabitants.

WARREN'S *Island*, an island in the Pacific ocean, at the entrance of the Duke of Clarence's straits, near the west coast of the Prince of Wales's archipelago, so called by captain Vancouver, in compliment to Sir John Borlase Warren. N. lat. 55° 56'. E. long. 226° 22'.

WARREN'S *Point*, or *Waring's Point*, a post-town of the county of Down, Ireland, situate upon the bay of Carlingford; 5½ miles from Newry, and 5½ N. from Dublin.

WARRENTON, a post-town of Georgia, in the county of Warren; 68 miles S. of Washington.

WARRI, a town of Hindoostan, in the Carnatic; 10 miles S. of Golconda.

WARRINGTON, a large, populous manufacturing town in the hundred of West Derby, and county palatine of Lancaster, England, is seated on the northern bank of the river Mersey, about midway between Manchester and Liverpool, at the distance of 51 miles S. by E. from the county-town, and 187 miles N.W. by N. from London. Some authors have contended that a Roman station was established here, as a guard to the ford; but no particular discoveries have been made to justify this opinion. Leland describes Warrington as "a paved town of pretty bigness, with a churche at the taile end of al the townne: it is a better market than Manchester." The town of Warrington consists of four principal streets, which are long, narrow, ill built, crowded with carts and passengers, and unpleasant to the inhabitants;

inhabitants; but, a few modern buildings being interspersed, afford a striking mixture of mean and handsome houses. According to the population return of the year 1811, the town contained 2639 houses and 11,728 inhabitants. A charter for a market and two fairs was obtained in the reign of Edward I. by Sir Thomas Boteler, of Bewfey, where a moated mansion still remains. The market-day is Wednesday. The principal trade of the place consists in the manufacture and sale of sail-cloth, or poleday; but some coarse linens and checks are made in the town and in its vicinity. The former is chiefly composed of hemp and flax mixed, and some sorts are manufactured with flax alone: the raw materials are mostly brought from Russia, and imported into Liverpool, whence to Warrington is a cheap and expeditious water carriage by the Merley. Among other manufactures of this place, may be specified pin-making, glass-making, and ironfounding. Warrington may, in some measure, be considered as a port-town, the Merley admitting, by the help of the tide, vessels of seventy or eighty tons burthen to Bank Quay, a little below the town, where warehouses, cranes, and other conveniences for landing goods, are erected. The spring-tides rise to the height of nine feet. Upwards, the river communication extends to Manchester. The parish-church of Warrington is an ancient structure, and contains many old handsome monuments: here is also a chapel of ease, erected in 1760: likewise places of worship for Catholics, Presbyterians, Anabaptists, Methodists, and Quakers. A well-endowed free-school is established here; and a charity-school for educating and maintaining poor children of both sexes. About the middle of the last century, a seminary for educating youth on a liberal academical plan was instituted, and supported by subscriptions, chiefly among the Dissenters: it was denominated the Warrington Academy, and flourished a considerable period under the care of tutors of eminence; but at length sunk, through want of adequate support, and the difficulties in maintaining proper discipline. A stone bridge crosses the Merley from Warrington, built by the earl of Derby in the reign of Henry VII. As there is no other bridge over the Merley between this place and Liverpool, nor for many miles east of it towards Manchester, the pass here has been a post of consequence in the civil commotions of this kingdom. The most memorable event of this kind occurred in 1648, when a large body of the fugitive Scotch army, under the duke of Hamilton, was pursued from Ribbles-ton-moor; and though they made an obstinate resistance for some hours at this bridge, yet above 1000 men were killed, and 2000 taken prisoners. Again, in 1651, general Lambert, who commanded on the former occasion, fixed on this spot to oppose the Scotch army under the young king, who was here repulsed. In the year 1745 also, the middle arches of the bridge were broken down, to check the progress of the rebels, and restored again on the termination of the insurrection.—*Beauties of England and Wales*, vol. ix. Lancashire. By J. Britton, F.S.A. 1807. Aikin's Description of the Country round Manchester, 4to. 1795.

WARRINGTON, a township of Pennsylvania, in the county of York, containing 1105 inhabitants.—Also, a township of Pennsylvania, in Bucks county, containing 429 inhabitants; 20 miles N.N.E. of Philadelphia.

WARRIOR, MARK, a township of Pennsylvania, in Huntingdon county, containing 672 inhabitants.

WARRIORE, a town of Hindoostan, in the Carnatic; 32 miles N.N.E. of Tanjore. N. lat. 11° 16'. E. long. 79° 25'.

WARRIORS' BRANCH. See *RED River*.

WARSAW, a city of Saxony, and capital of a duchy, late a city of Poland, and capital of the palatinate of Masovia,

situated on the Vistula, almost in the centre of the kingdom. It is surrounded with a moat and double wall, and consists of Old and New Town, and two suburbs, Kraka and Praga. The general diets of Poland were usually held here, as well as the provincial assembly, and court of judicature. Here are several elegant stone buildings and palaces, a great number of beautiful churches and convents, a hospital, and an arsenal. King Sigismund III. was the first who made this city the royal residence, and his successors resided here ever after. In the year 1569, in order to gratify the Lithuanians, the diet was removed to Warfaw. The Poles laid siege to it in the year 1656, and after a most vigorous defence, obliged the town to surrender. By the articles of capitulation, the Swedes were permitted to leave the place; but the best part of the plunder they had amassed together fell into the hands of the Poles. However, Charles Gustavus approaching with an army to the relief of the town, king John Casimir marched against him, and a battle was fought near the suburb of Praga, which lasted three days. At last the Poles were obliged to retreat, leaving behind them their baggage and artillery, upon which the Swedes placed a small garrison in the town, and destroyed the fortifications. In the year 1702, Charles XII. of Sweden made himself master of Warfaw, which happened to be then without a garrison, and fixed his head-quarters at Praga. In the month of June 1794, the king of Prussia laid siege to Warfaw; but on a rumour of disturbances in his own dominions, his forces were, after a fruitless attempt for three months, withdrawn. The Russians afterwards summoned Warfaw to surrender, and on being refused, after the junction of the different corps under Ferfen, Dernfeld, Denisow, and Suwarrow, they proceeded, on the 4th of November, to attack the suburbs of Praga. In the mean time, the generale Madalinski and Dambrowski threw themselves into Warfaw, and prepared for resistance. The suburb of Praga was defended by more than a hundred pieces of cannon, disposed upon thirty-three batteries. Little intimidated by so formidable a force, the ferocious Suwarrow commanded his soldiers to mount to the assault in the same manner they had done at Ismail, by climbing over the dead and wounded bodies of their comrades, as well as of their enemies. His farther commands were, that they should fight only with the sabre and bayonet. The Russians sprung to the charge with almost inconceivable impetuosity; they eagerly began to climb the works, and the six Russian columns, by singular good fortune, presented themselves at the same moment before the lines of Praga. Thus surrounded, the Polish generals found themselves unable to oppose with 10,000 soldiers, which was the whole of their force, the united attack of 50,000 men: and to add to their distress, the fire which they immediately commenced, from the darkness of the night, was so ill directed, as to pass over the heads of the assailants. The cry raised by the successful columns penetrated to the intrenchments on the other side of the Vistula, and added to the consternation of the Poles engaged with the other part of the Russian force; and they endeavoured to find safety by retiring into Warfaw, over a bridge. In their retreat they were met by another body of Russians, and a dreadful carnage ensued, in which a great part of the garrison of Praga was miserably slaughtered. After a severe conflict of eight hours, the resistance on the part of the Poles ceased; but the massacre lasted for two hours longer, and the pillage lasted till noon on the following day. Five thousand Poles were computed to have been slain in the assault, the remainder were either imprisoned or dispersed. The citizens were compelled to lay down their arms, and their houses were plundered by the merciless Russians; who, after the battle

had ceased nearly ten hours, about nine o'clock at night let fire to the town, and began to maffacre the inhabitants; 9000 perfons, unarmed men, defencelefs women, and harmlefs infants, perifhed either in flames or by the fword, and nearly the whole of the fuburb was reduced to afhes. In the whole of this fiege, it is computed that not lefs than 30,000 of the Poles were inhumanly put to death. It was loon after given up to Pruffia, and with the reft of Mafovia continued fubject to that power, until by the peace of Tilitz, this part of Poland, which had been feized by Pruffia fince the year 1772, was given to Saxony, and formed into a principality under the title of the duchy of Warfaw; 150 miles S. of Königberg. N. lat. 52° 12'. E. long. 21° 9'.

WARSAW, a duchy annexed to Saxony, formed out of that part of Poland which had been feized by Pruffia after the year 1772. It was united to the empire of Ruffia by the Vienna congress in 1815: that part called the grand duchy of Pofen is to be poffeffed in full fovereignty and property of the king of Pruffia.

WARSAW, a poft-townfhip of New York, in Genefsee county; 260 miles from Albany. It is a good tract of land, and comprises three townfhips. In 1810 there were 201 fenatorial electors, and the whole population is ftated at 1317 perfons.

WARSAW. See WASSAW.

WARSMOW, a town of Poland, in the palatinate of Brzecz; 32 miles W. of Brzecz.

WARSWOKA, a town of Poland, in Volhynia; 48 miles N.E. of Zytomirz.

WARSTEN, a town of Germany, in the duchy of Weftphalia; 3 miles S.W. of Rhuden.

WART, in Latin *verruca*, denotes, in *Surgery*, a kind of excrefcence from the cutis, or true fkin, covered with a production of cuticle, which is ftrong and hard, or more delicate, according to the natural quality of the cuticle which is fpread over the furrounding integuments. In the arrangement of Drs. Willan and Bateman, warts conftitute a genus of the order *tubercula*. Some warts are connected with the fkin by pedicles; while others have a broad bafe. They are moft frequently moveable; but fometimes they are firmly fixed to the fubjacent parts. Their general fize does not exceed that of a pea. Much larger ones, however, often form about the anus, perineum, and pudenda. Sometimes the excrefcence is fingle; fometimes it prefents itfelf in large numbers, occupying different fituations in the body, though moft frequently occurring on the hands and face. The complaint, as every body knows, is much more common in children and young perfons, than in people more advanced in life. As Mr. Hunter obferves, warts are radiated from their bafis to their circumference. The furface of the radii appears to be pointed, or granulated, like the furface of healthy granulations, with the exception of being harder, and rifing higher. The furface on which a wart is formed, appears to be capable of producing only one fuch tumour; for the furrounding and connecting furface does not throw out a fimilar fubftance. Thus, when a wart has once begun to grow, it rifes higher and higher, without becoming larger at its bafis. Such excrefcences feem to have within themfelves the power of growing larger; for, after they have rifen above the furface of the fkin, on which their bafis cannot grow larger, they fwell out into a round thick fubftance, which becomes rougher and rougher. In confequence of having this ftructure, warts are very liable to be hurt by bodies rubbing againft them, by which means they are fometimes made to bleed very profufely, and to become fore and painful.

Almoft all writers on furgery confider warts as depending upon caufes which are fometimes quite *local*, and, in other inftances, *general*, or *confitutional*. The opinion, that many of thefe excrefcences arife from confitutional caufes, is fupported chiefly by the following facts: firft, Many warts, growing about the pudenda, anus, &c. reputed to be venereal, and certainly very often yielding to mercury, feem to favour the doctrine, that fuch excrefcences are a confequence of fyphilis, and true venereal complaints. Secondly, The circumference of warts growing in large numbers, and often recurring in a very fhort time after their removal, has ftrengthened this mode of thinking. Thirdly, The unqueftionable greater propenfity to warts obfervable in young fubjects than in elderly perfons, is another fact which affords a ftrong argument in fupport of the opinion. Indeed, we believe that, in particular habits, a difpofition to the formation of warts muft be admitted as a pofitive truth, and of courfe we cannot reject the doctrine, that thefe excrescences frequently arife from certain ftates of the confitution. With refpect to venereal warts, we have always doubted the reality of their exiftence; becaufe, although we know that many fuch tumours may be cured by a courfe of mercury, we have never met with any which could not be difperfed or deftroyed by efcharotics, the ligature, or the knife.

Warts are generally quite free from all rifk of any ferious confequences; but, on account of their fize and fituation, they frequently give trouble, and occafion deformity; and fometimes, when they are irritated, they are attended with confiderable inflammation, and even obftinate ulcerations.

In the treatment of warts one thing is to be recollected; *viz.* that they are adventitious fubftances not conftituting any original part of the body, and therefore poffeffing only an inferior degree of vitality. Hence, when ftimulated, they generally diminifh or feparate in floughs. Another circumftance feems alfo particularly deferving of the furgeon's recollection; namely, that warts will always grow again, if any part of them be left behind unextirpated.

When warts are dependent upon confitutional caufes, writers on furgery agree in recommending the internal exhibition of alterative medicines. In particular, they enjoin a change of diet, with the ufe of refolvent or mercurial remedies; or fuch other means as feem beft calculated to obviate the caufe of the complaint. When the ftate of the confitution has been rectified, the warts frequently difappear of themfelves. The tendency to warts obfervable in young perfons, fpontaneously ceafes as they grow older; and, in them, after the adult age, how common is it to find warts difappearing of themfelves, though they had previously refifted every ordinary means of cure!

When warts are altogether dependent upon a local caufe, they can be moft effectually treated by external applications. Should the wart have a narrow neck, or pedicle, it may be made to fall off by constricting the part near its root with a fine filk ligature, or a piece of horfe-hair, which is to be rendered gradually tighter. However, although this plan answers very well, and fometimes does not give fo much alarm as the ufe of a cutting inftrument, the fame fort of warts may alfo be ftill more expeditioufly removed with a knife, or a pair of fciffars. When a wart is large and has a very broad bafe, if an attempt is to be made to deftroy it with a ligature, the furgeon muft pafs a double ligature through the centre of its root, or pedicle, and then tie each half of the filk feparately over the two portions of the excrescence. Were an endeavour made to extirpate a wart with a large bafe by a fingle ligature, the procefs would be tedious, painful, and often ineffectual.

Warts with a broad attachment, however, are unfavourable

able for the ligature; and it is generally best in such cases, either to have recourse to stimulating applications, escharotics, or cutting instruments.

Rubbing warts with soapy liniments, or lotions containing the muriate of ammonia, vinegar, the muriate of soda, the liquor ammoniac, &c. frequently brings about their gradual removal by absorption. The stimulating properties of the juice of a variety of herbs also have the same effect, as well as the school-boy's practice of smearing them continually with ink.

A more certain method, however, is to attack warts with escharotic and caustic applications, such as the tincture of cantharides, the plaster of cantharides, the pulv. cantharidum et ærguinis aris, the nitrate of silver, muriate of antimony, sulphate of copper, concentrated mineral acids, &c. In the use of the stronger caustics, it is necessary to protect the surrounding skin from their action by covering it with adhesive plaster. The surgeon must also be cautious in their use, lest he excite very painful and troublesome sores.

When warts are very large, we conceive it best to cut them away, and apply the lunar caustic to the surface from which they grew. In doing this operation, let the surgeon always remember, that removing only a part of the wart is worse than doing nothing; since the portion left behind will afterwards grow with increased rapidity. Hence, when warts have been removed either with ligatures, or cutting instruments, it is generally prudent to touch the situation of their roots with some active caustic.

WARTS, in *Animals*, the horny excrescences which are formed in the skin of different parts of them, and which are caused by any thing that hardens it in a local manner. In horses, they are said to be of the same nature as those excrescences that take place on their legs and pasterns, and to be more or less hurtful, as they may be situated nearer to, or at a greater distance from, the larger sinews of the parts. See *Rat-Tails*, *SCRATCHES*, &c.

In regard to the removal of them, they are capable of being destroyed by touching them occasionally with any powerful caustic substance, by the use of ligatures, and by being cut off, in some cases, when superficially situated. In the first of these intentions, three ounces of the powder of copperas are directed to be put into a crucible, and placed on a charcoal fire, keeping the powder stirred from time to time, but being careful to avoid the steam; continuing a pretty strong heat until the powder grows somewhat reddish; when it is to be taken off the fire, and after it is cooled broken, the parts being beaten and reduced into a very fine powder; some of which is then to be incorporated with some soft unctuous material, and an ointment formed; which is to be applied cold to the warts, anointing them lightly with it every day, when they will soon, it is said, fall off in the manner of the kernels of nuts, without causing any sort of swelling or uneasiness. Care is, however, to be taken not to touch any thing but the warts. And if the animal be a horse, he should not be wrought or rode during the application of the ointment or caustic.

The other modes of cure are equally easy and effectual in many cases of warts in animals.

WART, in the *Manege*, is an excrescence, or superfluity of spongy flesh, that rises in the hinder pasterns of coach-horses, almost as big as a walnut. It suppurates, and voids red stinking matter, and does not heal but for a time, for it returns again. See the preceding article.

WART-Wort, in *Botany*, a name sometimes given to two very different plants. See *NIPPLE-Wort* and *SPURGE*.

WART-Wort, in *Gardening*, the common name of a thick-

leaved plant, which is studded with hard warty knobs or knots. See *EUPHORBIA*.

WARTA, in *Geography*, a town of the duchy of Warfaw, on a river of the same name, which runs into the Oder; 10 miles N.N.E. of Siradia.—Also, a town of Silesia, in the principality of Neisse; 5 miles E. of Neisse.—Also, a river which rises near Cracow, and runs into the Oder at Cuftrin.

WARTAU, a town of Switzerland, in the county of Sargans; 20 miles N. of Sargans.

WARTBERG, a town of Austria; 7 miles N.E. of Steyregg.

WARTBURG, a town of Switzerland, in the canton of Soleure; 16 miles N.E. of Soleure.

WARTBURG, or *Wartenburg*, a castle of Saxony, in which Martin Luther was imprisoned eleven months, near Eifenach.

WARTENBERG, a town of Bavaria, on the Strong; 4 miles S.E. of Mofpurg.—Also, a town of Silesia, and capital of a lordship of the same name, containing scarcely above 100 houses. It was formerly much larger; but in the year 1444, 580 houses were destroyed by fire. The circle was afterwards contracted, and the town surrounded with a rampart, wall, and moat. The Roman Catholics, the Lutherans, and the Calvinists, have each a place of worship; 14 miles N.E. of Oels. N. lat. 51° 18'. E. long. 17° 45'.—Also, a town of Bohemia, in the circle of Boleslaw; 4 miles N.E. of Nimes.—Also, a lordship of Silesia, having by the principality of Oels, to which it once belonged, but was erected into a particular lordship in the year 1490; it has frequently changed proprietors, and lately belonged to the duke of Courland.

WARTENBURG, a town of Austria; 1 mile N.W. of Voglabruck.—Also, a town of Prussia, in the province of Ermeland; 63 miles S. of Königsberg. N. lat. 53° 43'. E. long. 20° 40'.—Also, a town of Vermont, in the county of Chittenden, containing 866 inhabitants.—Also, a castle of France, in the department of Mont Tonnerre, late in the circle of the Upper Rhine, which gave name to a county, the lands of which were not united together, but lay in detached parts. It was made an imperial county in the year 1707. The castle is situated 6 miles N.E. of Lautern.

WARTH, in our *Old Writers*, seems to be the same with ward-penny, being a customary payment for some castle-guard.

WARTHA, in *Geography*, a town of Silesia, in the principality of Munsterberg, on the Neisse; 6 miles N.E. of Glatz. N. lat. 50° 20'. E. long. 16° 35'.

WARTHEBERG, a town of Austria; 13 miles S.W. of Steyr.

WARTHENBERG, a town of Silesia, in the principality of Glogow; 18 miles N.W. of Gros Glogau. N. lat. 51° 52'. E. long. 15° 45'.

WARTHENBURG, a town of Saxony; 6 miles S.E. of Wittenberg.

WARTON, JOSEPH, D.D., in *Biography*, son of the poetry-professor of the same name at Oxford, and vicar of Basingstoke, was born in 1722, and entered at the age of fourteen years on the foundation at Winchester-school, and in 1740 at Oriel college, Oxford. After having taken the degree of B.D. he became curate to his father, and in 1744 exercised the same office at Chelsea. In this year he published a small volume of "Odes," and in 1748 he was presented by the duke of Bolton to the rectory of Winslade, and soon after married. In 1751 he accompanied his patron on a tour to the south of France, and in 1753 completed his

edition of Virgil in Latin and English; the *Æneid* being in Pitt's translation, and the *Eclouges* and *Georgics* in his own; adding notes and three essays on pastoral, didactic, and epic poetry. His translations are characterized as superior in accuracy to Dryden's, and in poetry to Trapp's, but not distinguished by spirit or brilliancy. To the "Adventurer" he became a contributor, by the recommendation of Dr. Johnson, of twenty-four papers, which were of an humorous cast, and mostly essays on critical topics. In 1754 he was preferred to the rectory of Tamworth, and in the following year became second master of Winchester-school. In 1756 he published, without his name, an "Essay on the Writings and Genius of Pope," in which he intermixes praise with reflections that tend to degrade this poet to the class of those who have been votaries of reason rather than of imagination. Failing to convince the public that his estimate of his talents was just, he deferred the publication of his second volume for twenty-six years. In 1766 he was advanced to the situation of head-master of Winchester-school, which he long occupied with distinguished reputation, and in which he formed many scholars, who afterwards rose to literary eminence, and retained a grateful sense of his tuition. On this promotion he visited Oxford, and was honoured with the degrees of bachelor and doctor of divinity. His subsequent preferments were numerous but small, and he obtained them late in life: in 1782, the friendship of bishop Louth procured for him a prebend of St. Paul's, and the living of Thorley in Hertfordshire; and in 1788 he was advanced to a prebend of Winchester and the rectory of Easton. In 1793 he resigned his mastership of Winchester-school, and retired to the rectory of Wickham, which he enjoyed in exchange for another. As he was fond of literary employment, he was engaged by the booksellers to superintend an edition of Pope's Works, which appeared in 9 vols. 8vo. in 1797, with notes critical and biographical, partly selected from his former essay, and a life of the poet. When this work was finished, he undertook an edition of Dryden, and had prepared two volumes at the time of his death, which happened in February 1800, in his 78th year. He was twice married, and left one son and three daughters. In his private character, says his biographer, he was amiable, and in social life no less estimable than in his literary connections. The Wickhamites, gentlemen who had been educated at Winchester-school, testified their respect for his memory by erecting a monument over his tomb in Winchester cathedral. His "Ode to Fancy," first printed in Doddsley's Collection, is thought to have been most admired, and to afford the fairest specimen of his talents. Gen. Biog.

WARTON, THOMAS, brother of the preceding, was born at Basingstoke in 1728, and manifested, by his translation of an epigram of Martial in his ninth year, an early taste for verification. In 1743 he was admitted a commoner of Trinity college, Oxford, where he distinguished himself, in his twenty-first year, by his "Triumph of Isis," in vindication of the university against the reflections of Macon's elegy of "Isis." This poem, however, he afterwards excluded from his volume of collected pieces. His "Progress of Discontent," said to have been written as a college-exercise in 1746, gained him reputation. Having taken his degree of M.A. in 1750, he became in the following year a fellow of his college; and seems to have formed his purpose of university-residence, and of devoting himself to poetry and elegant literature. Besides his "Newmarket," a spirited satire against the ruinous passion for the turf; his ode for Music; Verses on the death of the prince of Wales; and his editorship, in 1753, of a collection of poems, entitled the "Union," and containing several of his own pieces, severally contributed to his re-

putation; but his observations on Spenser's *Fairy Queen*, published in 1754, first in one volume and afterwards in two volumes, were of more essential service in making him known as a critic, and as conversant with poetical antiquities; and prepared the way for his election, in 1757, to the office of professor of poetry to the university, which he occupied for ten years, with an erudition and taste that rendered his lectures instructive and amusing. Our limits will not allow us to enumerate his various publications, but we shall proceed to other details of greater importance. Having taken the degree of B.D. in 1761, he was instituted to the small living of Kiddington, in Oxfordshire, in 1771. His edition of Theocritus, in 2 vols. 4to., was published in 1770, and very much contributed to his literary celebrity both at home and on the continent. It was probably about this time that he formed a design of writing a "History of Poetry," which had been contemplated by Pope, Gray, and Macon. However, the first volume in quarto was published in 1774, the second appeared in 1778, and a third was presented to the public in 1781. His plan was much more extensive, and intended to terminate only with the commencement of the eighteenth century; but he became tired of the task, and wished for relaxation, so that he prepared only a few sheets of a fourth volume. This *Opus Magnum*, as it may be well denominated, exhibits an extent of research and reading, and a correctness of taste and critical judgment, which do him great honour; and we may justly regret that he did not finish it, and that no one, equal to the undertaking, has had resolution to prosecute and complete it. In such a comprehensive and multifarious work, some inaccuracies are unavoidable; but the most fastidious critic must acknowledge, that it abounds with curious and interesting information. In 1781 he projected a county history of Oxfordshire, and in 1782 he published a specimen of his undertaking in a topographical account of his parish of Kiddington; but he was probably discouraged by the magnitude and labour of such a work. In this year he took part in the controversy concerning Rowley's poems, which he decidedly pronounced to be the fabrication of their pretended editor. His views with regard to promotion were restricted; however, his income was at this time increased by a donative in Somersetshire, and in 1785 by the office of Camden-professor of history at Oxford; and soon after by the king's offer of the post of poet-laureat, which he accepted with a design of rendering it respectable. As the indolence of age and of a collegiate life was advancing upon him, he no longer indulged extensive views and projected great undertakings, but he contented himself with accomplishing a task which to him must have been very easy, and that was an edition of Milton's juvenile poems, with notes for illustrating their beauties and explaining their obsolete and peculiar phraseology. The first edition appeared in 1785, and the second in 1791, a little while before his death. In his 62d year he was attacked with a paroxysm of the gout, and this was succeeded in May 1790 by a paralytic seizure, which terminated his life at his lodgings in Oxford. His remains were interred, with every academical honour, at the chapel of Trinity college. Although his character was marked by some peculiarities, he is said to have been substantially good-humoured, friendly, and placid. Several editions of his poems appeared in his life-time; and since his death an edition of his works has been given by Mr. Mant, in 2 vols. 8vo. 1802, to which is prefixed a biographical account of the author. Nichols's Liter. Anecd. Gen. Biog.

Musical historians have considerable obligations to this poetical antiquary: as in his long, extensive, and diligent researches, he has furnished them with anecdotes and narra-

tives concerning the harpers and minstrels of our country, and the high estimation in which the former stood with our princes and the latter with the nobility, till they became too numerous and licentious, that they lost the favour of the great, and reverence of the vulgar. Till about the end of queen Elizabeth's reign, there was no great personage who had not a band of musicians attached to his household, and a choir to his chapel, in England; in Ireland and Wales a domestic harper, and in Scotland a bagpiper domiciliated. The late lord Marshal, who had a very good taste in Italian vocal and German instrumental music, had a Scots bagpiper in his service at Potsdam and elsewhere, till the time of his decease. The laureat and Oxford poetry-professor was fond of music, and loved to be talking and writing on the subject; and in his history of poetry has kept back nothing which he accidentally found in the course of his other inquiries. As Milton's ninora perhaps delight the generality of his readers more than his sublime epics, so the ballads and smaller pieces of T. Warton were in more general favour than those of length, upon graver subjects, which had cost him more meditation and midnight oil.

WARTON, or WHARTON, in *Geography*, a township of Pennsylvania, in the county of Fayette, containing 922 inhabitants.

WARWICK, the county-town of Warwickshire, England, is situated in the Warwick division of the hundred of Kington, on a rocky eminence on the banks of the Avon, near the centre of the county, at the distance of 10 miles S.S.W. from Coventry, and 90 miles N.W. from London. It is a neat pleasant town, enriched with a castle of stupendous grandeur, and several public buildings possessing great attractions. Dugdale, and more early writers, conjectured this to be a Roman station, but no vestiges have been found, or other circumstances shewn, to strengthen the supposition, and its origin has been assigned to the Saxon era. Dugdale shews, from several authorities, that this town was highly favoured by the patronage of Ethelfleda, daughter of king Alfred, who in the year 915 constructed a fortified building (termed the Dungeon) on the artificial mount, which still remains on the west side of the castle; and that the town, under such protection, advanced rapidly in population and repute. In Domesday-book it is called a borough, and is there stated to contain 261 houses. The same record states, that in the time of Edward the Confessor, a castle was erected here, which belonged to the crown; that it was "a special strong hold for the midland part of the kingdom," and that Turkill was appointed governor. When William the Conqueror obtained the crown, he ordered Turkill, who was vicecomes of Warwick, to fortify and enlarge the castle, which at that time consisted of little more than the keep or dungeon. The king afterwards gave the castle to his adherent, Henry de Newburgh, whom he created earl of Warwick; and under the patronage of this nobleman, and a long line of descendants, the town advanced in importance and prosperity, and obtained many privileges and immunities. The paving of the town, and the building of the walls, commenced in the latter part of Edward I.'s reign, and the expense was defrayed by several tolls granted in this and the two following reigns; but these proving very prejudicial to the markets and trade, were abolished in the thirty-second year of Edward III. The appearance of the town in the reign of Henry VIII. is thus described by Leland: "The town of Warwick hath been right strongly defended and walled, having a compass of a good mile within the wall. The dike is most manifestly perceived from the castle to the west gate, and there is a great creel of earth that the wall stood on. Within the precincts of the town is but one parochial church, dedicated to St. Mary, standing in the middle

of the town, fair and large. The town stands on a main rocky hill, rising from east to west. The beauty and glory of it is in two streets, whereof the High-street goes from east to west, having a right goodly cross in the middle of it; and the other crosslieth the middle of it, maketh a quadrivium, and goeth from north to south." A charter of incorporation was granted to the burgessees in the first year of Philip and Mary; and in the year 1572 the town received a visit from queen Elizabeth, an account of which is preserved in a curious manuscript, called the Black Book, which is in the possession of the corporation. The active part taken by lord Brooke in the civil wars of the seventeenth century, produced here, as might be expected, great confusion and dismay. The castle was placed in a regular file of garrison; at one period it sustained a siege, and several skirmishes took place in the neighbourhood. In the year 1694, the greater part of the town, including the High-street, and nearly the whole of St. Mary's church, was consumed by fire; and 120,000*l.* were collected by briefs, a royal grant, and private subscriptions. The town was rebuilt by act of parliament in a more commodious form, partly of free-stone, from the rock on which it stands. It now consists principally of two streets: the High-street, which is spacious and handsome, is formed in a direct line from east to west, with an ancient gateway at each extremity; that at the west end is surmounted by a chapel. The two churches which now ornament the town are those of St. Mary and St. Nicholas. A church, having a similar dedication to the former, occupied the same spot before the Conquest. Henry de Newburgh, the first earl of Warwick of the Norman line, formed the design of making it collegiate, which was carried into execution by his son, earl Roger, in the year 1123. The latter bestowed on the associated canons tithes and other property of considerable value, and his successors, the earls of Warwick, and other benefactors, continued to protect and foster them during several ages. Through the munificence of the earls of Warwick, St. Mary's church was rebuilt in the fourteenth century. The choir was commenced by the first Thomas de Beauchamp, the earl so much distinguished in the French and Scottish wars of Edward III., and the whole structure was completed by his son, of the same name, in the year 1394. At the dissolution, this church was granted by letters patent to the inhabitants of Warwick and their successors. The great fire of 1694, as before observed, consumed the greater portion of this church. In the middle of the choir is an altar-tomb to Thomas Beauchamp, earl of Warwick, who died Nov. 13, 1370, and his wife, Catherine, daughter of Roger Mortimer, first earl of March. This monument is pronounced by Mr. Gough to be one of the most beautiful of its kind in the kingdom. On the fourth side of this church is St. Mary's chapel, usually termed the Beauchamp chapel, which was erected according to the directions of the will of Richard Beauchamp, earl of Warwick: it was begun in 1443, and was finished in the year 1464. The total expence of the structure, including the tomb of the founder, was 2481*l.* 4*s.* 7*d.*, equal at present to more than twenty times that sum; what being then only 3*s.* 4*d.* per quarter. The architecture and decorations of this chapel are at once very beautiful and interesting. It consists of one oblong apartment, having one large window at the east end, three others on the south and north sides, a door of entrance from the west, a richly ornamented altar-screen at the east end, some carved seats, and three oratories, or inclosed seats, on the north side. Nearly in the centre of the chapel is a large and elegant altar-tomb, for the founder, whose effigy in brass, very finely executed, is laid on the top. Of this curious tomb and chapel some interesting documents are preserved and published in the "Architectural Antiquities of the Great

WARWICK.

Great Britain," which contains a plan, sections, and views of the building.

St. Nicholas church is a recent structure, though a religious edifice stood on the same spot at an early period. The old tower was taken down in 1748, and the present, crowned with a spire, erected on its site. In 1779 the body of the church was taken down, being in a state of decay, and the present edifice raised in its stead. Besides these places of worship on the establishment, here are meeting-houses for the various classes of Dissenters; Presbyterians, Independents, Baptists, Methodists, and Quakers. The public buildings are numerous: the court-house, or town-hall, is a respectable stone building on the south side of the High-street, erected about 1730, at the expense of the corporation. The county-hall is a spacious and magnificent edifice, erected about 1776, by Mr. Hiorne, a native of Warwick. A plain but large stone building, adjoining the hall, has lately been erected by Mr. Hakewill, for the accommodation of the judges at the assizes. The county gaol adjoins the great hall, and is a large, substantial, and well-designed modern fabric, surrounded by a strong wall, twenty-three feet high, which incloses nearly an acre of ground. The county bridewell is also a spacious modern structure, of a very judicious character. The market-house is a substantial stone building: the lower and open part is appropriated to the use of those who attend the markets. Leicester Hospital is an ancient edifice, situated at the western extremity of the High-street, and was originally the hall belonging to two guilds which were founded in the time of Richard II., but were afterwards united. After the dissolution of this fraternity by Henry VIII., the building became the property of Robert Dudley, earl of Leicester, who, in the twenty-eighth of Elizabeth, converted it into an hospital for twelve poor men, and one master, a professor of divinity. The land with which it was endowed was at that time valued at 200*l. per annum*; but in 1811 the clear annual value amounted to nearly 2000*l.*, owing to the augmentation of the rents of land; and each of the pensioners received about 13*l.* from the surplus. In 1813 important changes were introduced by act of parliament, by which the number of pensioners was to be increased to twenty-two, with an allowance of 80*l. per annum* to each, and the salary of the master was to be progressively advanced to 400*l. per annum*. The appointment of the master and brethren is in the heir-general of the founder, who is, at this time, John Shelly Sidney, esq. of Penshurst-place, in the county of Kent. The buildings of the hospital consist of lodgings and a public kitchen for the brethren, ranged in a quadrangular form, a chapel, and a spacious hall, in which the guild is supposed to have held their meetings, but which is now converted into apartments for the ten additional brethren. Various charity-schools and alms-houses have been erected and endowed; and a new institution is now established for providing a refuge for juvenile delinquents, who are brought to the bar of justice at the several gaol-deliveries for the county; and for bringing them up (after the term of their imprisonment) in habits of industry and virtue. The estates and monies appropriated to charitable and public uses for the benefit of the town are also very considerable. In 1811 a subscription was commenced for paving the streets, and was supported with great spirit and liberality. All the principal streets have by this means been handsomely flagged; and the work has been completed (at the expense of about 6500*l.*) to the perfect satisfaction of the subscribers and the public in general. Warwick has a weekly market on Saturdays, which was formerly inconsiderable, but it is now large, well supplied, and numerously attended. Here are also twelve annual fairs; and horse-races take place twice in the year.

Manufactures are established here to some extent, particularly those for worsted and cotton; and one of lace has been recently established from Nottingham. The civil government of the town is vested (under a charter granted by William and Mary, in 1694) in a mayor, a recorder, 12 aldermen, and 12 principal burgesses, with a town-clerk. It appears, from the rolls of parliament, that Warwick was represented as early as any of the boroughs. It returns two members, chosen by the inhabitants paying scot and lot, the mayor being the returning officer. But for many years past, one of the members has, by tacit agreement, been returned by what is called the independent interest, and the other by the Warwick family. According to the enumeration under the act of 1811, the population of Warwick was 6497; the number of houses 1283.

On the south-east of the town is *Warwick castle*, built on a rock, to which it seems united rather by the hand of nature than by human art. It is not known, with precision, at what period a castle was first built on this spot, but the foundation is supposed to have taken place by Ethelfleda, daughter of king Alfred, in the year 915: nothing, however, is thought to remain of this erection, except the mound of earth on which the keep, or dungeon, is supposed to have stood. From the period when William the Conqueror gave this fortress to his adherent Henry de Newburgh, whom he created earl of Warwick, it became of consequence in English history, and so continued during the union of its fortunes with those of the succeeding earls, through the lines of Beauchamp, Neville, Plantagenet, and Dudley. The latter family being extinct, James I. granted the castle with all its dependencies to sir Fulk Greville, afterwards lord Brooke. At his time it was in a ruinous condition, and the strongest part was used as the county gaol. This proprietor restored it, and, it is said, expended in repairs and embellishments the sum of 20,000*l.*; and in his family it has continued, without interruption, to the present time. During the civil wars of Charles I. it was converted (as before noticed) into a garrison for the parliament. In consequence it was besieged in 1642 by lord Northampton, who also surprised the artillery dispatched from London for its defence. Notwithstanding this misfortune, sir Edward Peto had the gallantry to defend it with a single piece of ordnance, until it was relieved by lord Brooke. In the time of Charles II. Robert lord Brooke greatly embellished the state apartments. Francis, his successor, was created earl Brooke of Warwick castle in 1746, and earl of Warwick in 1759. The whole castle consists of a connecting series of walls, towers, and other buildings, surrounding a large irregular court. At the south-east angle is Cæsar's Tower, the most ancient part of the whole. Of its exact date no trace however remains, but it is still in the most perfect state of strength and repair. Guy's Tower, at the north-east angle, is named after the legendary champion, and was erected in the reign of Richard II.: it is 128 feet in height. In the centre of the east front is the great arched gateway, leading into the inner court, flanked with towers, and succeeded by a second arched gateway, with other towers and battlements above it. Before this whole front is a moat, over which an arch is thrown, where the drawbridge formerly was. Passing the entrance tower, the display is truly magnificent. The area is clothed with verdure; but the mighty remains of ancient fortifications are spread around. The habitable part of this immense structure lies to the left of the great court; and in the progressive ameliorations of feature effected in latter ages, every desirable attention has been paid to consistency of character. The interior surpasses the expectation raised by the external view; for with the ponderous towers, and ramparts of stone, we associate only ideas

ideas of chivalric hardihood, and unpolished baronial pride. The grand suite of apartments extends in a right line 333 feet, and are furnished in a chaste but magnificent manner. They contain many fine and interreling pictures, and in a gallery is some curious armour, painted glass, and other ancient relics. The park attached to the castle is very extensive, and finely ornamented with wood and water. The gardens and pleasure-grounds are arranged with great taste; and a broad gravel-walk conducts to a green-house, a spacious building, erected purposely for the reception of a large antique vase, which is considered as one of the noblest specimens of ancient art now in England. It is of white marble, and is of a circular form, sufficiently capacious to hold 163 gallons: it is placed on a square pedestal, and is made to move round by means of a mortise and tenon. This exquisite antique was found (as a Latin inscription states) at the bottom of a lake, not far from Adrian's villa, near Tivoli, about twelve or fourteen miles from Rome: it was first purchased by the late sir William Hamilton, of whom it was bought by the late earl of Warwick, and conveyed to England at his expence. In Britton's "Architectural Antiquities," are two views of the castle, with a particular history and description of the edifice.

In the vicinity of Warwick, on the north, stood the Priory of St. Sepulchre, founded by Henry de Newburgh, earl of Warwick, in the reign of Henry I. It was designed for a society of regular canons, instituted in imitation of one of the same order, established at the holy sepulchre in Jerusalem. In the 38th of Henry VIII., the building and adjacent lands were granted to Thomas Hawkins, the son of a person who sold fish at the market-crofs in Warwick. The ancient edifice was then pulled down, and the present eligible residence was erected.

About a mile and half from Warwick, on the north-east, is Guy's Cliff, an ancient hermitage, and traditionally said to be the retirement of the celebrated champion Guy of Warwick. It is now the seat of Bertie Greathead, esq. distinguished by his mental and moral qualities, to whom a tribute of respect is due by all who have the honour of his acquaintance. The capacious stables, cellars, and out-houses, are formed by excavations in the solid rock.

About half a mile from Guy's Cliff is Blacklow Hill, rendered memorable by the summary execution of Piers Gaveston, earl of Cornwall, the favourite of Edward II. in 1312, on this spot.

Myton, a short distance from Warwick, was formerly a considerable village, but in the time of Dugdale, "there was no more left than a grove of elms, in the place where the village stood." It has now one house, a modern structure, called Myton House.

At a small distance also from Warwick, on the Stratford road, is Longbridge House, the seat of William Staunton, esq.—Dugdale's History and Antiquities of Warwickshire. Beauties of England and Wales, vol. xv. Warwickshire. By J. N. Brewer, 1814.

WARWICK, a town of the state of Rhode island, in the county of Kent, containing 3757 inhabitants; 7 miles S. of Providence.—Also, a county of Virginia, containing 1835 inhabitants.—Also, a town of Virginia; 6 miles S. of Richmond.—Also, a town of Virginia, and capital of a county, established in 1628; 65 miles E.S.E. of Richmond. N. lat. 37° 8'. W. long. 76° 30'.—Also, a town of Massachusetts, in the county of Hampshire, containing 1227 inhabitants; 80 miles W. of Bolton.—Also, a post-township of New York, in Orange county; 120 miles S. of Albany, and 10 miles E. of Gothen; its form is triangular; its area may be 110 square miles: the S. part is broken by ranges of hills, in which are

several large ponds that run S. to the Pullaic of New Jersey: the N. part, which is less broken, is watered by the Walkill and other streams that run N. to the Hudson, in Orange and Ulster counties. Few towns have a greater quantity of fruit, and the apple-orchards are very fine. Here are five places of worship and sixteen school-houses; nine grain-mills, ten saw-mills, six carding-machines, and sixteen distilleries of fruit-spirits. Here are a furnace, several forges, an anchor-shop, being the oldest in America, that of Rhode island excepted, and a steel-furnace. The village of Warwick, in which is the post-office, 11 miles E. of Gothen, has two houses of worship, and about thirty dwellings. Florida village is situated $\frac{1}{2}$ miles N. of Warwick: it has a church, an academy, and about thirty dwellings; and Amity in the W. has also a church. The whole population in 1810 was 3978, when there were 323 electors.—Also, a township of Pennsylvania, in the county of Bucks, containing 1287 inhabitants.—Also, a township of Pennsylvania, in Lancaster county, containing 3439 inhabitants.—Also, a post-town of Maryland, on the east shore of Chesapeake bay; 14 miles S. of Elkton.

WARWICK'S, *Earl of, Powder.* See *Scammony Powder.*
WARWICKSHIRE, an inland county of England, is situated near the centre of the kingdom. In form it approaches to an oval; and is bounded on the S.E. by the counties of Oxford and Northampton; on the N.E. by the great Roman road termed Watling-street, which separates it from Leicestershire; on the N.W. it is limited by Staffordshire; the county of Worcester lies on the W.; and part of Gloucestershire on the S.W. The greatest length, from N. to S., is 51 miles; and the greatest breadth, from E. to W., is 36 miles; the circumference being about 150 miles. It forms an area of 984 square miles, or 639,760 acres; of which about 154,530 acres are in a constant course of tillage; 190,000 acres are arable, and 300,000 in pasture.

Civil and Ecclesiastical Divisions: Population.—When Domesday-book was compiled, this county contained ten hundreds; a circumstance which seems to prove the consequence and great population of the district at that period. These hundreds did not exist long under the names mentioned in that roll; but though they fluctuated in title, the number for some time remained nearly the same. There are now only four hundreds; Barlichway, Hemlingford, Kington, and Knightlow, which are subdivided for convenience into eighteen parts. The city and county of Coventry, though forming a district politically distinct from Warwickshire, is usually considered as a fifth hundred. Warwickshire, thus constituted, contains a half city, Coventry; one borough, Warwick; and eleven other market-towns, viz. Alcester, Atherstone, Birmingham, Colehill, Henley, Kington, Nuneaton, Rugby, Southam, Stratford-on-Avon, and Sutton-Colfield; together with part of the town of Tamworth. The whole county comprehends 193 parishes. According to the population return of the year 1811, the number of houses was 46,157, of inhabitants 228,735; viz. 109,539 males, and 119,196 females; 15,131 families were stated to be employed in agriculture, and 29,775 in trade and manufactures. Six members are returned to the imperial parliament; two for the shire, two for Coventry, and two for the town of Warwick. This county is comprised in the province of Canterbury, and in the dioceses of Lichfield and Coventry, and of Worcester; it is included in the Midland circuit.

Antient State: Historical Events.—Warwickshire was one of the five counties which, at the time of the Roman invasion, were possessed by the *Cornavii* or *Carnabii*. Mr.

WARWICKSHIRE.

Whitaker, in his "History of Manchester," observes, that these and the Britons of Cornwall in the south-western regions of the island, and those of Caithness in the north-eastern, are all equally termed *Carnabii* by Richard of Cirencester, who expressly declares that these people were originally situated in the neighbourhood of the Dee, and extended their possessions across the whole of Warwickshire, to Bannock, or Cleychester, on the skirts of the adjoining county of Leicester. Of the history of this district while under the Romans, but little can now be satisfactorily ascertained. In the year 50, Ostorius first visited the Arden of Warwickshire. He led his troops from the banks of the southern Ouse, taking in his northward progress the course of the Watling-street, and probably fixing his encampments on the sites of British stations. In order to increase his security, and to extend the line of military communication, he constructed forts and entrenched camps along the banks of the rivers Avon and Severn. As the woodland recesses of the district emphatically termed Arden, then comprised the greater part of Warwickshire, and were chiefly inhabited by the *Ceanigi*, or herdsmen, Ostorius probably did not deem it expedient to fix any military station in the interior of the county on the north of the Avon. His great Ardenian station was assuredly *Tripontium* (Lilburn, Northamptonshire, on the border of this county). At High-Crofts was a second settlement, now included in the county of Leicester. Further north, on the Watling-street, was *Mandueffedum* (Manchester). The chain of camps on the Avon communicated with these places, and at Warwick, nearly in the centre of the line, some writers have placed the *Praesidium* of the Romans; but this still remains a subject of dispute among antiquaries. With greater certainty the honour of a Roman station may be ascribed to *Alester*, on the Icknield-street, in the south-west division of the county. The second journey of Antoninus passes through this part of England, from north to south; but as he adhered strictly to the track of the great street, when on the confines of Warwickshire, he only gives in his Itinerary the name of one station—*Mandueffedum*. Cogidunus, who had been originally king of the Dobuni, was not only permitted by the Romans to retain nominal authority, or, in other words, to become an imperial legate, but had various extents of country added to his dominions. Among these was a part of Warwickshire; and he retained his titular supremacy to the days of Trajan. When Severus, in the beginning of the third century, divided the Roman territories in Britain into two provinces, the greater part of this county was comprehended in *Britannia Secunda*. During the period between the secession of the Romans and the conquest of the midland district of England by the Saxons, the silence of historians respecting this tract, induces us to suppose, that the inhabitants wisely avoided civil contention. Credda was the first Saxon commander who obtruded on this peaceful disposition of the natives. On the formation of the heptarchy, Warwickshire was constituted a part of the powerful kingdom of Mercia; and with this new political arrangement recommence those military details which form the grounds of ordinary history. The kings of Mercia often maintained the rude pomp of their court in this county. Tamworth was a favourite seat with several sovereigns, until that town was destroyed by the Danes. A charter of Burthwulf, king of Mercia, in the Textus Roffensis, is dated from Warwick: Kinbury was also a regal abode. Among the numerous conflicts produced by the ambition of those fresh invaders, to which the country was now subject, the battle of Seckington is especially memorable. Here Ethelbald, the tenth king of Mercia, fought

Cuthred, king of the West-Saxons, and was slain by Burgred, his own officer. The Danes committed great ravages in Warwickshire; and in the course of their several irruptions, burned and destroyed the principal towns. The war between the houses of York and Lancaster forms the next great historical era. During this calamitous period, the people of this county, in common with other districts, was much divided in sentiment, and lost some of its best blood in the field, though it was not the immediate scene of any important action. As the chief members of the house of Neville, of which the earl of Warwick was a distinguished branch, supported the pretensions of the duke of York, it will be supposed that his interest was strong in the county. But in those infuriate days, when even families were divided in motive, no citizen could depend on the integrity of a neighbour. The town of Warwick was swayed by its earl; but the city of Coventry had equally strong reasons for attachment to the house of Lancaster. Henry and Margaret had won the esteem of the inhabitants by frequent visits, and had conferred on them a particular favour, in constituting their city, and some adjacent parishes, a separate county. The citizens were firm in affection and gratitude. In 1460, when a strong power, under the earl of Warwick and the earl of March (afterwards Edward IV.), proceeded from London in search of the royal forces, the Lancastrians were quartered in Coventry. They shortly, however, quitted that city, and the battle of Northampton ensued. In 1470 the earl of Warwick, then a partisan of the Lancastrians, possessed himself of Coventry, and the citizens refused admission to Edward IV., who met with a more friendly reception in the town of Warwick. When Richard III. took arms to oppose the earl of Richmond, the sheriff of this county levied men for the king. But it is probable that they were not engaged in the decisive action, as it appears, from an inquisition then taken, that the sheriff (Richard Boughton) was slain two days before the battle of Bosworth; whence it is supposed, that marching to the aid of the king, he was encountered and overpowered by some of the earl's troops. In the 17th century, when the nation was again plunged into the miseries of civil contest, the inhabitants of Warwickshire evinced a greater unanimity of sentiment. Some were found ready to adventure life and fortune in support of their king; but these were few in number. The influence of lord Brooke, one of the earliest and most strenuous advocates of the popular faction, did much in kindling the zeal of the natives; and his local resources were of distinguished service to his party. The castle of Warwick, situated near the centre of the kingdom, and strong by nature and art, was a most convenient place of arms; and the possession of such a garrison gave confidence to the first hostile movements of the parliament. The flame of opposition spread through every town; and no county exhibited a more decided inclination to take an active part in the sanguinary business. In June and July 1642, lord Brooke arrayed the militia of the county, in attention to a commission received from the parliament; and, in October following, was fought the first great battle between the opposed parties at Edgehill, on the south-east border of this county. On this eventful day, lord Brooke's own regiment, composed of prime Warwickshire men, fought in the right wing, and entirely broke the left of the king's army. At different periods of this war, the castle of Warwick sustained a siege, the town of Birmingham was fired by the troops under prince Rupert, and many inferior skirmishes took place. Though only a comparatively small part of the population of England was actively engaged in these degrading hostilities, yet Warwickshire furnished its

WARWICKSHIRE.

full quota to the parliamentary forces. During these scenes of violence, some religious structures, and numerous mansions of the gentry, suffered much dilapidation. After that complete destruction of the hopes of the Royalists, which followed the battle of Naseby, Warwickshire, among other midland counties, remained under the quiet controul of the parliament, until the entire restoration of national good order.

General Aspect, Soil, Produce.—Warwickshire is described by early writers as naturally divided into two parts, the Feldon (or Champaign) and the Woodland. The river Avon formed the line that separated these tracts; and the sylvan district was emphatically denominated *Arden*, which term is well known to have been common among the Celts in general for a forest however situated. The *Arden* of this county is asserted to have been the largest of the British forests, as it extended from the banks of the Avon to the Trent on the north, and to the Severn on the west; on the east the tract was bounded by an imaginary line drawn from High Cross to Burton. When England was divided into shires, the counties of Worcester and Stafford took their respective portions of this wild, and bestowed on the forests so claimed the names by which they are still distinguished; the part remaining within Warwickshire alone retained the title by which the whole was originally designated. But this large division has been long cleared of those thick-matted woods which formerly encumbered, rather than ornamented its soil. A colouring, however, of its pristine character remains; and an occasional air of wildness is found to denote the complexion of the country when occupied by the *Ceangi* or the *Cornavii*, and their numerous herds. In general aspect Warwickshire presents a face of country agreeably diversified by such an alternation of hill and valley as is equally gratifying to the eye of the pictorial traveller, and beneficial to the more important views of the agriculturist. The insulated situation of the county, and its freedom from any great inequalities of surface, render the climate mild, and vegetation early. The most general winds are from the south-west, and usually accompanied with rain. Warwickshire, upon the whole, however, is not to be considered as subject to any particular excess of damp or frost. The soil, as is usual in the midland district, possesses great variety. Nearly every species is to be seen, except that incorporated with chalk and flint; and often many of these varieties occur within one field or inclosure. The greater part of the soil is, however, of a description highly favourable to the purposes of agriculture; and it may safely be asserted that few counties possess less bad or sterile land, in proportion to that which corresponds readily and abundantly with the husbandman's toil. The crops usually cultivated are wheat, barley, oats, peas, beans, vetches, and turnips. The crops partially raised, but which are not admitted into the ordinary rotation of farms, are rye, potatoes, and flax. The live stock reared by the grazing farmers is of various descriptions; but the long-horned cow is the sort chiefly bred in the county. The Warwickshire sheep of the large polled kind have been judiciously crossed with the Leicester; and a very serviceable breed has resulted. The farms of Warwickshire are in general far from large; but the system of consolidation appears to be rapidly growing into favour with the great landholders. At present about 150 acres are the average size of farms throughout the county. Few leases are granted; but the rent of land, with the exception of such districts as border on great commercial towns, is very moderate. The principal woodlands of this county are still to be found in the neighbourhood of its former great forest, in the middle, western, and northern districts; but nearly every

division is interspersed with valuable and ornamental timber. Oak, matured and grand, conveying the story of former ages, yet likely to flourish in the days of succeeding generations, is attached to almost every residence of hereditary consequence. Elm, in the most flourishing condition, is also abundant. Nor does the county entirely depend for its wealth in woodland recesses on the liberal providence of past ages; the recent plantations are numerous and carefully attended. There are also many coppices, consisting of oak, ash, hazel, alder, birch, and beech. Concerning the management of these nothing peculiar occurs. They are cut in regular allotments, so as to admit of a fall in every year. As coals abound in this county, the wood is seldom consumed as fuel, but is used chiefly for hurdles, hoops, rails, &c.

Rivers, Springs, Canals.—Warwickshire is watered by numerous streams, which impart richness to large tracts of pasture, and add much to the pictorial charms of the county, though (with the exception of the Avon) they are of a character too trivial to bestow important facilities on commercial interchange. The principal are, the Avon, the Tame, the Leam, the Rea, the Stour, the Alne, the Arrow, the Anker, the Blythe, the Swift, the Cole, and the Dove. The Avon, (termed the Upper, or Warwickshire Avon,) the only one which claims particular notice, derives its source from a spring in the village of Naseby, Northamptonshire, and enters the county of Warwick at Bensford bridge; whence proceeding in a south-west direction, but with devious windings, it reaches the town of Warwick, through valleys which conspicuously increase in beauty. Passing close to Warwick castle, whose lofty towers so finely decorate its course, it expands in some places to the breadth of two hundred feet, as it pursues its track through the grounds attached to this princely residence. It now draws near to the neighbourhood which imparts classic immortality to its name. It passes Fulbroke, and taking a large sweep towards the north, washes the border of the celebrated town of Stratford. Hence it proceeds, with no deviation of interest, to Bidford, supposed to have been Shakspeare's retreat for convivial relaxation. At the distance of a mile from Bidford, near the village of Cleve, the river, though broad, is only four feet in depth. It shortly after leaves the county, having, in its progress through it, received the aid of several minor streams. The Avon was made navigable for vessels of forty tons burthen, from Stratford to its conflux with the Severn at Tewkesbury, in the year 1637; but the numerous canals which have since been formed have much diminished its traffic. The chief medicinal springs are those of Leamington and Newnham-Regis. The former are found so efficacious in many chronic disorders, in diseases of the skin, and visceral obstructions, that the village in which they rise is rapidly augmenting in buildings of a costly and ornamental character. The latter is a weak chalybeate, and a bath formed from its waters was once in great repute for the cure of scorbutic complaints; but it is now resorted to only by a few. The canals of the county are the great objects of consideration while treating of artificial water. Warwickshire is conspicuous for commercial enterprise, and for the spirit with which manufactures are cultivated. It will naturally be supposed that a people so industrious and intelligent have been active in profiting by the great medium of canal conveyance. No county, indeed, can boast of more numerous facilities of this description; and some diversions from original channels are yet projected, which a more prosperous era may bring to perfection. The canals in this county are, the Birmingham Old Canal, the Birmingham and Fazely, the Warwick and Birmingham, the Worcester

ter and Birmingham, the Coventry, the Warwick and Napton, the Stratford, and the Ashby-de-la-Zouch Canal. (See their respective names under the article CANAL.) While so much liberality has been evinced in the extension and improvement of water conveyance, the chief roads of the county have been far from experiencing neglect. The materials principally used are lime-stone and gravel; and with these the high turnpike ways are kept in good repair. This is a circumstance of public accommodation pre-emptorily required by the manufacturing interest; but where the agriculturists are left to their own exertions, we return to such rough and homely channels as were tediously trodden by the unambitious tenantry of past centuries. The cross-country roads are treated with too little attention in nearly every part of the county.

The minerals and fossils of Warwickshire are, coal, lime-stone, free-stone, iron-stone, blue flag-stone, marble and blue clay. The best coal in the county is that found at Bedworth. The seam at this place is from three to four feet in thickness. It falls at the pit for 12s. per ton. Lime-stone abounds in many parts, and the lime fold at the kiln from 2s. 6d. to 3s. per quarter, or from 43s. to 45s. per waggon load. Free-stone rock is found in most divisions where the soil is a light sand; and considerable quantities of blue flag-stone are wrought in the vicinity of Bidford and Wilnecote. The west part of the county is prolific of good marble; and blue clay abounds in the eastern districts.

Manufactures of various descriptions are carried on to a considerable extent. The manufactory of hardware goods at Birmingham has obtained for that town the appellation of "the toyshop of Europe," and is a just subject of national pride. Not less than 16,000 people, in the city of Coventry, and neighbouring towns and villages, are employed in the manufacture of ribbons. Watch-making is likewise carried on by numerous workmen in all its branches. Horn combs of all descriptions are made at Kenilworth. At Warwick are manufactories of worsted for hosiery; of calicoes, and other cotton goods, from yarn spun at Manchester and its vicinities; and a mill for the spinning of cotton yarn. At Alcester about six hundred persons are employed in the making of needles; and in other parts of the county are considerable flax manufactories, and much linen yarn spun.

Antiquities.—The state of the county, while occupied by the Britons, and during the invasion and settlement of the Romans, and their Saxon successors, we have already noticed. It remains to mention the relics of those eras, the tangible memorials of days long past. Although Mr. Shaw, in his history of Staffordshire, conjectures that the chief seat of the Arch-Druid of Britain was situated in the vicinity of Sutton-Colfield, yet we find few vestiges that can be safely ascribed to the Britons. The Romans, warlike, successful, and vast in undertaking, worked for posterity; and their connection with Warwickshire would be obvious, if every other record had sunk amidst the wrecks of time. The roads, which at once facilitated conquest, and aided the progress of civilization, form the most interesting relics of this great people. The *Walling-street*, that most stupendous of their works in Britain, divides this county from Leicestershire on the north-east. From Weedon to Lilburn it is only a private road, though distinctly marked, and well known. It then forms the public way between Daventry and Lutterworth, when it again becomes private, and so continues till it reaches High-Crofs. Here the turnpike-road from Lutterworth to Atherlone passes over it. Beyond Atherlone it is in good repair, and shortly becomes the basis of the great Chester road. The *Fosi-way* intersects the *Walling-street* at High-Crofs. Passing near

Monk's Kirby and Stretton, it goes through Brinklow; Bretford on the river Avon, and Stretton-upon-Dunmoor; then crossing the river Leam, near Stretton-on-Foss, it enters Gloucestershire. This road, which is supposed to have been constructed in the third consulship of Hadrian, nearly 1700 years back, is still firm through many parts of its progress, and likely to mock the assaults of time for centuries. A third Roman way, connected with Warwickshire, is the *Icknield* (or, as termed by some modern writers, *Ryknild*) *street*. It enters on the south, and is clearly distinguishable in the neighbourhood of Bidford. Between Wixford and Alcester few traces remain; but to the north of the latter place, it again rises to notice, and is known by the name of the *Haden-way*. After passing Studley, it enters a recess of Worcestershire, and returns in the vicinity of Birmingham. Touching the margin of Staffordshire, it proceeds to Sutton-Park, where it is to be distinctly traced. A minor road, termed the *Ridgeway*, likewise borders Warwickshire on the east; and several branches appear to have diverged from each of the great tracts. The principal stations of the Romans in this county have been already mentioned. The remains of various camps constructed by that people are found in different states of preservation. The chief of these are seen on the Foss-way, where places of accommodation were formed for the troops on their marches; and on the banks of the Avon, where Ostorius arranged a chain of minor fortifications to keep the natives in awe. Many tumuli are found in the vicinity of the roads and camps, and coins and other vestiges of the Romans have been discovered in almost every district. Here are few military remains of the Saxons, or of the Danes; and the relics of Saxon architecture are far from numerous, and are by no means conspicuous for the rude but commanding grandeur of effect sometimes produced by that people. This county contains many instances of fine castellated and ancient domestic architecture; and mansions of more recent erection are frequent, and in a highly creditable taste. Few religious edifices will be found remarkably conspicuous either for magnitude or beauty, with the exception of those of Coventry, St. Mary's, Warwick, with its attached chapel, and the church of Stratford.—Dugdale's History and Antiquities of Warwickshire. Beauties of England and Wales, vol. xv. Warwickshire, by J. N. Brewer, 1814.

WARY. See CARLSBAD.

WASA, or VASA, a sea-port of Sweden, and capital of a government to which it gives name, built by Charles IX. This government comprehends all the northern part of East Bothnia; 50 miles N. of Abo. N. lat. 63° 5'. E. long. 21° 29'.

WASANGO, a town of Africa, in Whidah; 5 miles E. of Sabi.

WASASHE, or OSAGES (which see), a people of Louisiana, who are divided, according to Mr. Brackenridge (Views of Louisiana, 8vo. 1814), into three bands: the Great Osage, the Little Osage, and the band of Big Track, from a chief who left the nation some years ago, and is now settled on the Arkansas. Their language may be considered as the primitive of several others, which are spoken by neighbouring nations, without any great difference; as the Arkansas, Kansas, and Mahas. They trade principally in deer-skins, bear-skins, beaver, otter, musk-rat, and the buffalo. These people are noted for their uncommon stature, which has sometimes been exaggerated. They are reputed warlike, though not possessing any uncommon degree of bravery. When compared with the Shawanoe, and the nations west of the Mississippi, they might with greater propriety be regarded as a treacherous

and cowardly race. The Ofages have their villages on the Missouri. The Kanfas were, a few years ago, the most abandoned tribe of the Missouri, robbing traders and all trading whites; but of late, in consequence of a severe defeat from the Panis, in which their greatest warriors fell, they have been humbled. They are brave, and are esteemed great warriors. They have their villages on the Kanfas river. Their country abounds with the beaver, but they do not hunt much. They speak the Ofage language with some difference of dialect. The *Mabas*, or *Oo-ma-ba*, reside on the Maha creek, about 80 leagues above the latter, in some villages, and raise corn. They are a friendly and industrious people, and have a considerable trade. Their language is that of the Ofages. All the Sioux bands, except the Yankfons, make war upon them. Their numbers have been lately much reduced.

WASEN. See WESEN.

WASEN, a town of Austria; 8 miles S.S.W. of St. Polten.

WASERHITEN, a town of the duchy of Carinthia; 2 miles N.W. of Eberndorf.

WASH, the distiller's name for the fermentable liquor, made by dissolving the proper subject for fermentation and distillation in common water.

The wash of the malt-distiller is made by mixing the water hot with the malt ground into meal. If the water be too hot, the mixture will become gluey; and if too cool, a part of the virtue of the malt will be lost. Under the right application of the water is to be considered the proper manner of agitating the mafs, so that all the parts of the aqueous fluid may come fully and freely in contact with the insoluble particles of the subject. When once the water is well saturated by standing on the malt a proper time, it may be drawn off, and fresh poured on, till at length the whole virtue, or all the fugary sweetness of the malt is extracted, and nothing but a fixed husky matter remains behind, incapable of being farther dissolved by the action of hot or boiling water, or of being advantageously washed or rinsed out by the bare affusion of cold. This artificial and external agitation, or stirring about of the mafs, is necessary not only in the common way of brewing for the malt-distillery, but also in that more expeditious way, now in use with some, of reducing the operations of brewing and fermenting to one, and grinding the malt to a fine meal, which is to be kept in the wash during the whole time, and even put into the still with it, and worked together. The stirring may be repeated to great advantage more than once in each operation, as at the affusion of every parcel of fresh water, in the common way, and at any shortly distant times in the short way, in which it is of greater service.

The difference of seasons is found to require some alteration in the direction and management of the business of brewing for the malt-distillery. The water must always be used colder in summer than in winter, and the tincture must be cooled suddenly in close sultry weather, to prevent it from becoming eager or sour. The summer season also gives malt an over-forward disposition to ferment, and this impairs the quantity of spirit, and is to be checked by the addition of a quantity of unmalted meal, which, being less disposed to ferment than the malted meal, will restrain and moderate its impetuosity. The action of fermentation works such a change in the body of the tincture or solution, called the wash, as to render it separable by the action of fire, into parcels of matter that are specifically different, and of a nature entirely foreign to what the same liquor would have yielded without the fermentation. With respect to the

proper workings of this liquor, great regard is to be had to the containing vessel. Its purity, and the provision for its occasional closeness, are the things to be principally considered. Though it is necessary that the vessel be perfectly clean, yet in the cleansing of it great care must be taken that no soap, or other unctuous body, be used, for this would check the fermentation in it; and for the same reason, all strong alkaline lixiviums are to be avoided. Lime-water, or even the turbid solution of quick-lime, however, may be safely used for this purpose; and this is, indeed, particularly proper to destroy a prevailing acid, which is very apt to be generated about the sides and bottoms of those vessels, if the warm air has access to them, and thus prevents the order of the fermentation.

It is a very prejudicial mistake, in the business of fermenting the wash, to suppose that the free concurrence or admission of the external air is necessary to the operation. The contrary is the truth, and a great advantage will be found in practising upon this supposition. A constant influx of the open air, if it does not carry off some part of the already-formed spirit; yet certainly catches up and dissipates the fine subtle oleaginous and saline particles, of which the spirit is formed, and thus considerably lessens the quantity to be procured. This inconvenience is wholly avoided by the way of close fermentation, by which all air, except that which is contained in the vessel, is kept out.

This method of close fermentation is practicable to good advantage in the small way of business; but it requires such a considerable time, that it will never be liked by the large dealers, who are in a manner forced to admit the free air, and thus sustain a very considerable loss in the spirit, only to get the operation over in a proper time. Excepting for the necessity of expedition of this kind among the large dealers, it is certain that this slow and imperceptible vinous fermentation is greatly preferable, on all accounts, to the other.

The operation is known to be over in this close way of fermentation, as soon as the hissing noise ceases, and can no longer be heard on applying the ear to the vessel; and when, on opening it, the liquor is found to be clear, and of a vinous pungent taste; when it is arrived at this state, it should be set by for a time in a cooler place than that in which it was fermented; in this manner it will thoroughly purge itself of its lees, and will become perfectly clear, vinous, and pungent; in this state it should be drawn clear off from the lees, and immediately committed to the still; and by this method a perfectly pure vinous spirit will be procured, much better than that which can be obtained by the common way, which those who work large quantities fall into for the sake of expedition.

The particular intention of the operator may render various other additions necessary; thus some, to dispose the wash to yield more spirit, or to give the spirit a greater degree of pungency and a better flavour, add to it the strong and pungent aromatics; the cheapest chosen for this purpose, and the most used, are the cortex Winteranus, ginger, and grains of paradise.

In the common way, these additions, however, do very little, though, by a proper artifice in the management, they may be made of considerable use. Upon this foundation stands a very instructive method, used abroad, of making geneva *ab origine*, by mixing the bruised juniper-berries among the malt, and brewing the whole together; by this means a compound tincture, or wash, is prepared, which, by fermentation and distillation, affords a spirit much more intimately and homogeneously impregnated with the

effence of the berry than that prepared by our distillers, in the common way of adding the berry to the malt-spirit, and distilling it from them again.

Wash, being of a mucilaginous or somewhat glutinous nature, requires management to prevent its scorching, and make it work kindly in the still: if it should happen to be burnt in the operation, the spirit will have a most disagreeable flavour, and such as can never be got off again, without very great labour, and a particular treatment not known to every body. To prevent this ill effect, there must be three things observed; the liquor, or wash, must be made dilute, the fire must be well regulated, and the whole kept in a constant agitation. The manner of making the wash dilute has been long known among the more judicious distillers in this branch, and they have always found their spirit the purer for it. The fire is easily kept regular by a constant attendance, and avoiding hasty stirring it, or throwing on new fuel; and the stirring of the liquor in the still is to be effected by means of a paddle, or bar kept in the liquor, till it just begins to boil, which is the time for luting on the head; and after which there is no great danger, but from the improper management of the fire: this is the common way, but it is hard to hit the exact time when to lute down the head; and the doing it either too soon, or too late, is attended with great inconvenience, so that many have found out the other methods, of either putting some moveable solid bodies into the still with the wash, or placing some proper matter at the bottom and sides of the still, which are the places where the fire acts strongest.

There is another inconvenience attending the distilling of malt-spirit, which is, when all the bottoms, or grofs mealy feculence, are put into the still along with the liquor, the thinner part of the wash going off in form of spirit, the mealy mass grows by degrees more and more stiff, so as to scorch towards the latter part of the operation. The method used to remedy this, is to have a pipe with a stop-cock, leading from the upper part of the worm-tub into the still; so that, upon a half or quarter turn, it may continually supply a little stream of hot-water in the same proportion as the spirit runs off, by which means the fear of scorching is taken away, and the operation at the same time not at all retarded. In Holland, the malt-distillers work all their wash thick, with the whole body of the meal among it; yet they are so careful in the keeping of their stills clean, and so regular and nice in the management of their fires, that, though they use no artifice at all on this head, only to charge the still while it is hot and moist, they very rarely have the misfortune to scorch, except now and then in the depth of winter. When such an accident has once happened in a still, they are extremely solicitous and careful to scrape, scrub, and scour off the remains of the burnt matter, otherwise they find the same accident very liable to happen again in the same place. But beyond all the other methods in use on this occasion, would be the working the stills not by a dry heat, but in a balneum Mariæ, which might possibly be so contrived by the basin being large, and capable of working a great many stills at once, as to be extremely worth the proprietor's while in all respects. Shaw's Essay on Distillery. See FERMENTATION, and MALT-Distillery.

WASH is also used for the shallow part of a river, or arm of the sea, as the washes in Lincolnshire.

WASH, the blade of an oar, or the thin broad part that is pressed against the water in rowing. See OAR.

WASH-Board, in a Ship, a broad thin plank, fixed occasionally on the top of a boat's side, so as to extend the

height thereof, and be removed at pleasure. It is used to prevent the sea from breaking into the vessel, particularly when the surface is rough, as in tempestuous weather. Falconer.

WASH, in *Painting*. See WASHING.

WASH-Lime, for boarding, walls, &c., in *Rural Economy*, that used for covering and preserving such works. An excellent wash for this use is said to be prepared by putting into a tub of six or eight gallons five a quantity of water sufficient to half fill the same; and then adding thereto of clean sharp sand, and of lime *freib* burnt, in about equal quantities, as much as will make, when well-stirred up and mixed, a wash of moderate consistence. By means of this wash, as soon as it is made, the boarding and walls, &c. of any barns or buildings, are to be passed or laid over, keeping the sand constantly well stirred up, so that the brush may take it up as well as the lime. As the quantity of the wash in the tub decreases, more sand and more lime are, by degrees, to be added in small proportions, being careful to make up no more wash at one time than will be immediately made use of by the workman. The quicker or the more fresh the lime the better, which, if good and proper for the purpose, will make the wash hot; and if it be required to make the wash particularly hard and durable, it will be the best and most certainly effected by making use of boiling water instead of such as is cold, taking care to make it only in such quantity that it can be laid on the boards while hot.

This wash is cheap, and of admirable use, it is said, in many cases of boarding, saving the heavy charge of painting with oil paint.

WASH, in *Agriculture*, the refuse liquid which is formed and left in many ways and cases; and also that which remains after the distillation of grain for spirit. The former, as well as the latter sorts, are much used as the food of swine, whence they are frequently called hog-wash. The wash of the distilleries has likewise been lately found very beneficial and advantageous in the fattening of neat cattle. See HOG, STALL-Feeding, and SWINE.

Any of these liquid matters, when thickened a little with some sort of mealy substance, form good fattening food for young hogs. See HAY, TEA, and SOUP.

Hard, dry, cut fodder, of some kind or other, should constantly too be used with the last sort of wash.

WASH for rough-cast Stone and Wall-Buildings, in *Rural Economy*, that which is used for preserving and rendering them more durable and handsome. It is said that a highly protecting and ornamental wash for these purposes is formed and prepared by mixing well together four parts of powdered lime, three of good sharp sand, two of powdered wood-ashes, and one of the drossy refuse matter left in the making of iron; making them into a sufficiently fluid state, so that they may be applied by means of a proper brush. The appearance which is thus afforded to such buildings, when they become dry, is that of new Portland stone, and they render the penetrating effects of wet and moisture of little or no disadvantage from whatever quarter they may come.

It may be noticed, too, that great benefit in the way of durability and ornament may be produced in such cases by the cornices, window-soles, door-frames, and other such parts being fanded. The method of doing which is, by first painting them with thickish white paint, and then immediately dashing them with sharp white sea or other sand, by means of a sort of dredging-box: the effect is, it is said, that of an exceedingly good imitation of *stone*. In this way

way they last nearly double the length of time they do in ordinary cases where sand is not employed.

WASH-Off, To, a technical expression used in *Calico Printing*, which denotes the soaking and rinsing of printed pieces in water, in order to dissolve and remove any gum or paste that had been employed with the colours in printing them. For want of this operation, the printed pieces will neither endure the rays of the sun nor moisture. The first shower of rain to which they may be exposed will not fail to wash out the pattern, and reduce them to a worse state than that of plain white calicoes. Parkes's *Ess.* vol. ii.

WASH-À-CUM-MOW, or **CLEARWATER River**, in *Geography*, a river of North America, which runs into the Athapescow lake, N. lat. 56° 36'. W. long. 110° 40'.

WASHBROOK, a river of England, which runs into the Wharf, near Otley in Yorkshire.

WASHEDEMOIAC, a river of New Brunswick, which runs into the St. John, N. lat. 45° 47'. W. long. 66° 6'.

WASHER, in *Rural Economy*, the name of a thin, flat, circular ring, or piece of iron, which is put upon the end of the axle-tree of a cart, waggon, or carriage of any kind, between the linch-pin and the small end of the nave of the wheel, in order to diminish the friction against the nave, to keep the wheel from having too much play, and to prevent the nave from rubbing against the linch-pin, so as to wear away too much. It is a term which is also applied to the thin rings and small pieces of iron that are used for many other purposes, as in the hanging of gates and many other such operations.

WASHES, The, in *Geography*, lands on the coast of England, between the counties of Norfolk and Lincoln, which are passable at low water, but overflowed by every tide, called by Ptolemy, *Æstuarium Metaris*. They are dangerous to strangers, who are unacquainted with the quick-sands. The parts which run into the land have particular names; below Spalding it is called Fofdike Wash; below Wisbeach, at the mouth of the Nen, the immediate boundary between the two counties, it is called Crofs-Keys Wash.

WASHILABO, a river of the island of St. Vincent's which runs into Cumberland bay.

WASHING. See **ABLUTION**, **LOTION**, &c.

Washing the feet was a common piece of civility among the Jews, practised in regard to strangers, visitors, &c. at their arrival.

Washing the feet of twelve poor people, is an anniversary ceremony to be performed both by the kings of England and France; in commemoration of our Saviour's washing the feet of his apostles. See **MAUNDY**.

Arnobius, *Adv. Gentes*, lib. vii., mentions a feast in use among the ancients, called *lavitio matris Deum*. See **LAVATION**.

WASHING of Ores. See **Dressing of ORES**.

WASHING of a Ship, in *Sea Language*, is when all the guns are brought to one side; and the men getting upon the yards, wash her other side, and scrape her as far as they can reach.

WASHING, in *Painting*, is when a design drawn with a pen or crayon has some one colour laid over it with a pencil; as Indian ink, bitre, or the like; to make it appear the more natural, by adding the shadows of prominences, apertures, &c. and by imitating the particular matters of which the thing is supposed to consist.

Thus they wash with a pale red, to imitate brick and tile; with a pale Indian blue, to imitate water and slate; with green, for trees and meadows; with saffron or French

berries for gold and brags; and with several colours, for marbles.

These washes are usually given in equal tints, or degrees, throughout; which are afterwards brought down, and softened over the lights with fair water, and strengthened with deeper colours for the shadows.

The colours which require only to be dissolved in water, are, for red, red ink; for blue, litmus; for green, sap-green and verdigrise in vinegar; for yellow, gamboge, the yellow berry wash and turmeric wash; for purple, the log-wood wash and archil; for brown, Spanish liquorice; and for black, Indian ink.

The yellow-berry wash, which is a solution of the gum of the French berries in water, may be prepared by putting a pound of the French berries in a gallon of water, with half an ounce of alum; boiling them an hour in a pewter vessel, and then filtering off the fluid through flannel or paper. Put them again into the boiler, and evaporate the fluid till the colour appear of the strength desired; or part may be taken out while less strong, and the rest evaporated to a proper body. The turmeric wash is the gum of the turmeric root dissolved in water; it has much the same qualities with the former, except that it is a brighter and cooler yellow; but in order to procure a bright tincture, it must be dissolved in spirit of wine instead of water. For this purpose add 2 oz. of proof spirit to 1 oz. of water, and having put them into a proper phial, add 2 drachms of turmeric root in powder. Shake them well together, and let them stand three or four days, repeating the shaking as soon as convenient, and thus a strong tincture will be obtained. Tincture of saffron is used as a yellow wash with water-colours. This is made by pouring hot water on the best English saffron in a proper phial or other vessel, which should be placed for some time in a heat next to that which would make the water boil, and the tincture should then be filtered through a piece of linen cloth. This tincture is a fine warm yellow; and when very strong, makes a very proper shade for the gamboge or other light yellows that are bright, and it will stand equally well any of the vegetable tinctures.

The zedoary wash may be prepared by boiling one ounce of zedoary root in a quart of water, till the water appears sufficiently tinged to make a stain on paper, of a full yellow colour; and then the fluid must be strained through linen, to free it from the dregs. This wash will be a stronger colour than can be made of turmeric without spirit of wine, and it is a cooler yellow than saffron, though full as bright. It is valuable for many purposes in painting with water-colours, as flowers, yellow draperies, &c. It may be dried in shells, and will afterwards dissolve and spread kindly, with the addition of water.

The colouring of maps, or other prints, is performed, either by spreading opaque colours so thinly on the subject, that the full effect of the printing may appear under them; or by using transparent colours, which stain the ground, and dry away, without leaving any opaque body, which last method is called *washing*. In employing the opaque or semi-transparent colours, care should be taken that no parts be so strongly covered with them as to prevent the distinct appearance of the shades of the printed design; as they are to shew themselves through the colours, and form the shades of the picture made by the colouring.

M. Cochin, in order to produce washed prints much more beautiful than the common, proposes to print upon the colours, instead of applying the colours upon the impression, in the following manner:

Having a plate already engraved, with a figure, in which it is required to introduce two or three colours, as the hat

grey,

grey, the hair brownish, the cloak red, the coat and the flockings of different colours; let another plate of well polished copper be procured, and fitted to the size of the first: when this ungraved plate is varnished with white varnish, let a proof fresh drawn from the engraved plate be laid upon it, exactly in the place where the engraved plate has made the impression, and then spread two blankets upon the table of the press, and lay the varnished plate upon them, with the proof lying upon it; and having covered them with two or three other blankets, pass them under the roller of the press. When the blankets and proof are taken off the plate, the white varnish will have the same impression with that of the proof, in the manner of a counter-proof; and the outlines of the hat, hair, cloak, &c. must be traced with a very fine needle, and the plate then gently corroded. After this, the varnish should be taken off the plate; and some proofs should be taken from it on strong paper allumed, or upon cartoon, very thin and well beaten; which should be previously moistened, by lying in a damp cellar for a night, or two, or by putting it among the paper moistened in order to be printed. The proofs being made, and the cartoons or paper on which they were printed being dry, the part enclosed in the outline of the cloak should be coloured with a red ground; that within those of the head with a brown ground of bistre, and the same of the rest. The sheet thus coloured must then be put into the cellar, in order to moisten it; and having spread some of the blankets on the table of the press, the coloured sheet must be laid upon them, with the blank side downwards. After having inked all the first plate, that has the entire engraving upon it, in the manner for printing at other times, it must be put upon this leaf with the engraved side downwards, so that the parts of which the outline is marked on the sheet, may exactly coincide with those corresponding to them in the plate; and then two or three blankets being laid over them, the whole must be passed through the rollers. After which, the sheet being uncovered, will be found printed upon the colours, in a manner that renders the effect much more beautiful than that of those printed and coloured upon the printing, as in the common way. *Handmaid to the Arts*, vol. ii. p. 212, &c.

WASHING Colours, a denomination given to such colours as are transparent in water; in contradistinction from those called *glazing colours*, which are pigments possessing the property of becoming transparent in oil.

WASHING over of Colours. The washing or cleansing of some colours may be thus performed:—Take the colours to be washed, and put them, after having been well levigated or pounded, into a vessel of fair water; stir it about till the water be all coloured with it, and if any filth swim on the top of the water, scum it clean off, and when you think the grossest part of the colour is settled at the bottom, then pour off that water into another earthen vessel, that may contain the first vessel full of water four or five times; then pour more water into the first vessel, and stir the remaining colour till the water be thick, and after it is a little settled, pour that water also into the second vessel. Let this be repeated till all the finest of the colour is drawn off, and nothing but coarse gritty stuff remains behind. Then letting the water in the second vessel stand to settle, till it is perfectly clear, pour it off, and reserve the washed colour in the bottom of the vessel for use.

The colours to be thus washed are red-lead, blue and green bice, verditer, blue and green smalt, Spanish brown, yellow ochre, &c.

WASHINGS, or *Washes*, among *Goldsmiths, Coiners, &c.* are the lotions by which they recover the particles of gold

and silver out of the sweep, *i. e.* ashes, earths, sweepings, &c.

This is either performed by simply washing them again and again, or by putting them in the washing-mill.

To make one of these furnaces, they not only gather together the ashes of the furnaces, and sweepings of the work-houses; but they also break and pound the old earthen crucibles, and the very bricks of which the furnaces are built; little particles of gold, &c. being found to stick to them, by the flying off natural to those metals, when in their last degree of heat.

These matters being well ground, and mixed together, are put in large wooden basons, where they are washed several times, and in several waters, which run off, by inclination, into troughs underneath; carrying with them the earth, and the insensible particles of the metals, and only leaving behind them the larger and more considerable ones, which are visible to the eye, and are finally taken out with the hand without more trouble.

To get out the finer parts, gone off with the earth, they use quicksilver, and a washing-mill. This mill consists of a large wooden trough, at bottom of which are two metalline parts, serving as mill-stones; the lower being convex, and the upper, which is in form of a cross, concave.

At the top is a winch, placed horizontally, which turns the upper piece round; and at bottom is a bung, to let out the water and earth, when sufficiently ground.

To have a wash, then, the trough is filled with common water; into which they cast thirty or forty pounds of quicksilver, and two or three gallons of the matter remaining from the first lotion. Then turning the winch, they give motion to the upper mill-stone; which grinding the matter and the quicksilver violently together, the particles of gold and silver become the more easily amalgamated with it; this work they continue for two hours: when opening the bung, the water and earth runs out, and a fresh quantity is put in.

The earths are usually thus passed through the mill three times; and the same quantity of mercury usually serves all the three times. When there is nothing left in the mill but the mercury, united with the gold and silver which it has amalgamated, they take it out, and washing it in divers waters, they put it in a ticken bag, and lay it in a press, to squeeze out the water, and the loose quicksilver: the remaining quicksilver they evaporate by fire, in a retort, or an alembic. And the metal which remains they refine with lead, or part it with aqua fortis.

WASHING Fruit-Trees and Plants, in *Gardening*, the practice of cleaning and removing insects and diseases from them by such means. It is well known that these sorts of trees and plants are very liable to be infested and injured in these ways by many different kinds of insects, and the diseases which are produced by them, as well as in other ways. It has been found greatly useful in destroying and removing the blue insect, the coccus, and the pine-bug, as well as in curing and clearing the trees of the mildew, honeydew, and some other such affections. The blue insect that breeds on the bark of different sorts of wall-trees has been beneficially treated in some cases by simply washing the trees with stale chamber ley, by means of a garden-engine, they being unnailed for the purpose. This has been done in so severe a frost, it is said, that the liquid was soon converted into ice upon the branches, with much seeming advantage. It does not appear, however, that the applying of the liquor in the time of hard frost is absolutely necessary to the success of the method; as trees washed in fresh weather are equally cleaned and cleared by the use of it. When on apple-trees, the brushing and washing with a mixture formed by soft-soap,

foap, fulphur, and the juice of tobacco, in the quantity of about one pound each to eight pints of soft water, has been used also with benefit. They are to be well mixed together, and shaken well when made use of, being applied all over the trees. The insects will be fill more completely removed, it is said, if the earth about the roots of the trees be opened, and some of the liquid poured in, the earth being closed after a little time, as they are found to lodge much about the roots of such trees. It is supposed that summer is the most proper time for this operation, as the juices of the trees are then in motion, and appear to be much more easily acted upon, than when they are in a dormant state. If trees should chance to be got which are suspicious, it would, it is thought, be worth while to wash them all over, and soak their roots some length of time in the above mixture, before planting of them in the places where they are intended to stand and grow.

In the removal of the coccus, and some other insects, from old peach-trees, great advantage has occasionally been found from washing them well, after being brushed and cleaned with strong soap-suds, by means of a sponge dipped in them; and then applying the following composition in a liquid state, or in that of a sort of paint: two pounds of the flowers of sulphur, and the same quantity of soft-soap, well mixed together with as much boiling water as is sufficient to make the whole of the consistence of a paint. The trees are to be payed over with this liquid substance, so as not to miss any part of them, whether old wood or new. And it should be suffered to remain on the trees as long as possible, that it may act the more fully, and in the most perfect manner. It may be applied on the trees at any season of the year, but they are probably the most conveniently dressed in this way in the winter months. It is sometimes necessary to repeat the dressing for several seasons.

The wounds in peach, and other kinds of stone fruit-trees, are likewise said to be effectually prevented from cankerings, by being laid over with the same composition, and then coated over with tar.

Brushing over peach and nectarine trees alone, is said in some cases too, to be effectual in removing insects from them.

The black insect that attacks the young top-shoots of cherry-trees is said to be effectually destroyed by burning the composition directed below, in small pieces, the size of common eggs, under the trees with damp straw, the smoke being made to pass as much as possible where the insects are the most numerous: and soon afterwards washing the trees, where the state of the fruit will admit of it, well by means of the garden-engine, so as to clear away such vermin, and prevent others spreading themselves on the trees: pitch any quantity with a sixteenth part of powdered orpiment, and the same proportion of sulphur, dissolved over a slow fire in an earthen pipkin, until they be well incorporated and mixed together.

In the destruction and prevention of the pine-bug, the method of washing and soaking that is given below has been found very effectual. A small brush is first prepared with bals-mat, tied on a small flock, which is that at the other end, in order to go down to the under end of the leaves where the bugs harbour molt. Then with the brush and water they are to be washed and cleaned very well, after which one pound of the flowers of sulphur is to be put into a common garden-pan full of water; but if a little more, there is no danger of hurting the plants: the pine-plants are to be put into this liquid, and let remain for twenty-four hours; taking care that they are all covered,

which may be done best by putting a piece of board over them, with a small weight upon it: when they have been immerged the above length of time, they are to be taken out, and set on end with their tops downwards, in which way they are to stand until quite dry; when they are to be potted in the usual manner, and put separate.

It is not necessary that as much sulphur-liquid should be made up at once as may be sufficient to dress and cure the whole stock of plants; but that as one quantity of plants are finished and come out, it may be prepared, and another put in. It has not, however, been found to lose the effect from standing. If made up and used as the plants become ready at different times, no defect will be found in the cure of the plants. But when made use of in the winter season, it will be advisable to take the chill off the water, and to keep it in a stove; when convenient to be done in the summer time, the plants will, however, take growth sooner and better. It is not thought advisable to apply the cure to fruiting plants; as by shaking off the earth from their roots, and otherwise going through the operation, the fruiting would be injured too much.

The mildew on peach-trees may be kept under, though perhaps not wholly cured, by washing such as are affected with a mixture of sulphur and lime-water. The mode of applying it is by the garden-engine, with a little soap, or any other matter that may tend to separate it from the trees: this mode cleans them at the time, but it does not prevent the recurrence of the disease. The disease has been successfully prevented, too, it is said, by picking off the diseased leaves as they appeared; and the points of any shoots affected being dipped in water in which black soap was dissolved, they being afterwards well dredged by means of a bellows-pluff, filled with sulphur, and occasionally mixed with Scotch snuff. This work is to be performed in the evening, and the matters washed off with the engine or squirt and water in the ensuing evening, if the state of the trees, in respect to flowering or ripe fruit, do not forbid it. But the disease is to be strictly watched and checked in its first appearance.

The green and blue flies that appear, especially on plum-trees, a few days after the honeydew comes on, may often be got rid of by washing and watering the trees two or three times a week, in a perfect and plentiful manner, when the weather is dry; and while this dew continues upon the trees, adding a little common salt, and a quantity of the decoction of common broom to the water. This mixture, it is said, effectually kills the flies, without injuring the trees, provided that too great a quantity of salt be not added. It is beneficial, too, in preventing the breeding of such insects.

There are many other cases, in which washing with such mixtures may be useful. See the Scotch Horticultural Memoirs.

Washing Seed-Wheat, in *Agriculture*, a term often applied to the practice of rendering it clean for sale, and sowing by the use of pure water, or such as is impregnated with different substances of various kinds. See *STEERING-Seed*, *SWIMMING*, &c.

Washing Sheep, in *Agriculture and Rural Economy*, the practice of laying the wool of these animals cleaned by washing them in clear running water before they are clipped in the summer season. It is observed by the author of a late work on "Agricultural Chemistry," that in washing sheep the use of water containing carbonate of lime should be avoided; as this substance decomposes the yolk of the wool, which is an animal soap, the natural defence of the wool; and that wool often washed in calcareous water becomes

comes

comes rough, and more brittle. The wool in some breeds of sheep, as those of the finer kind, have it in larger quantity than others. See SHEEP and YOLK.

WASHING Machine. See LAUNDRY.

WASHINGTON, GEORGE, in *Biography*, first president of the United States, the descendant of a respectable family in the north of England, was born in February 1732, on an estate in Westmoreland county, Virginia, on which his great-grandfather, John Washington, settled, after his emigration from England, about the year 1657. Having lost his father when he was about ten years of age, his advantages of education were inconsiderable; but he acquired a sufficient knowledge of mathematics to qualify him for a land-surveyor. In his youth he was grave and thoughtful, regular and diligent in the management of the business assigned him, dignified in his deportment, and exemplary and honourable in his whole conduct. Ardent in his temper, he manifested, at the age of fifteen, an inclination to enter into the British navy, and the place of a midshipman was procured for him; but his mother diverted him from his purpose. In his nineteenth year he was nominated one of the adjutants-general of Virginia, with the rank of major; and in 1753 he was entrusted with a commission which required prudence and resolution. At this time the French were projecting a communication between Canada and Louisiana by a chain of forts, which would have confined the English to the east side of the Alleghany mountains. Washington was the bearer of a letter of remonstrance to the French from Mr. Dinwiddie, the governor of Virginia. He executed the business committed to him, and returned in seventy-eight days. As the French persisted in their plans, the assembly of Virginia raised a body of three hundred men for the protection of their frontiers, and appointed Washington lieutenant-colonel. Hostilities commenced, though war was not declared between Great Britain and France; and Washington, with a detachment of his regiment, falling in with a party of French, surprised and made them all prisoners, after their commander was killed. With an augmentation of force, he proceeded for the purpose of dislodging the French from fort Duquesne; but receiving intelligence that a large force was approaching, he fell back into a stockaded fort, which he had previously erected at a place called Great Meadows, where he was attacked by the enemy. However he defended his post, incompletely fortified, for a whole day, and capitulated with the French commander upon honourable terms.

In 1755 war actually took place, and general Braddock was sent to command in America. Washington, now a colonel, offered to accompany him as a volunteer; and notwithstanding a severe illness, made haste to join the army. The carnage of the day was dreadful, and proved fatal to the general and many of his officers and men; but Washington maintained the most perfect self-possession, notwithstanding the scene he witnessed, and the personal danger to which he was exposed. He brought back the shattered remnant of the army; and his countrymen generally thought, that if he had had the command, instead of a man who was unacquainted with the Indian mode of fighting, the disaster would have been prevented. The assembly of Virginia determined, after the withdrawal of all the regular troops, to raise sixteen companies for the defence of their frontiers, and they entrusted the command with Washington; such was the degree of reputation which he had acquired at his early age! His situation was trying and perilous, an extensive frontier being open to the incursions of a savage enemy; he recommended more vigorous measures, and at length,

when fort Duquesne was evacuated by the French, in 1758, in consequence of the success of the British troops in the northern colonies, the back-settlements of the southern were secured. When this service was accomplished, Washington retired from the military service with the cordial esteem of his countrymen, and with tokens of respect from the officers of the British army. Soon afterwards he married Mrs. Custis, an amiable and opulent widow; and by the death of an elder brother he obtained an estate on the Potomack, called Mount Vernon, whither he removed, and commenced the life of a country-gentleman; sedulously improving his property by his agricultural skill, exercising the office of judge of the court in the county where he resided, and attending as a representative in the house of burgesses of Virginia. This was the honourable and useful life he led for fifteen years. But after the peace of 1763, contests commenced between the American colonies and the British legislature; and Washington determined in the assembly of Virginia to oppose the claim of the parent-state to a right of taxing its colonies. Accordingly he was elected a member of the first congress, which assembled at Philadelphia in 1774. He was a member of all the committees appointed for arranging measures of defence; and when it was determined to raise a general army, the arduous office of commander-in-chief was unanimously conferred upon him by the deputies of the twelve united colonies, to which Georgia afterwards acceded. He with becoming modesty and diffidence accepted the office, but declined all pecuniary compensation, desiring only the payment of his expenses.

On his first assuming the command, the American army consisted of about 14,500 men, entrenched at different posts near Boston, and opposed to the British army on Bunker's-hill. An army like that of the Americans, consisting of raw recruits, enlisted for a limited time, and furnished by different colonial governments, and very indifferently provided with arms, ammunition, and stores, afforded a discouraging prospect to its commander, and required the exercise of singular talents. Washington seemed to possess such talents. Accordingly, notwithstanding all disadvantages, he was enabled, in March 1776, to commence active operations against the British army at Boston, by fortifying the heights of Dorchester, which commanded both the lines and harbour. The British were soon reduced to the necessity of quitting Boston and removing to Halifax; and the American general was welcomed at the former place as a deliverer. When general Howe, with a strong force, took possession of Staten island, the Americans were posted on Long island, under general Sullivan; but in August they were attacked and defeated with great slaughter. Washington was in the city of New York, endeavouring to preserve and rally the troops that had escaped in a dispirited state from this conflict. But being unequal to a successful resistance to the victorious army, he withdrew from New York to the interior of the country, and having retreated through the Jerseys, found himself at the head of no more than 7000 men. However, he maintained his self-possession and firmness, and determined to retaliate. The first object of his attack was a body of Hessians, stationed at Trenton. Crossing the Delaware, and halting towards the town, he took them by surprise, and about nine hundred of them laid down their arms, besides others that were killed and wounded. This success was peculiarly fortunate, as the Americans dreaded the ferocity of the Hessians, and their spirits were thus roused to new exertions. Washington gained also an advantage over the British at Prince-town, and by these bold movements they were obliged

obliged to abandon all their posts except two, which they retained to the southward of New York. Sir William Howe commenced the campaign of 1777 with attempts to bring the American army to action; but Washington, apprized of his design, evaded it by his manœuvres. Philadelphia was the next object to which the views of the British were directed: the American commander posted himself on Brandy-wine creek, in order to dispute their passage; and finding it necessary to risk a battle, he suffered a defeat, and was under a necessity of leaving the passage to Philadelphia open to the enemy. Having been reinforced, he made an attack upon the British troops at German-town, but was repulsed with loss, and took up his winter-quarters at Valley-forge, about 25 miles from Philadelphia. The events of this year had proved disastrous, and Washington experienced many difficulties in providing food and clothing for his army; and the people became discontented, alleging, in a tone of loud complaint, the success of general Gates, and the surrender of Burgoyne, as a contrast against his want of success. His patience and forbearance were invincible; he justified his conduct, and evinced his patriotism, by not yielding to a faction at such a critical period. The public voice, however, was in his favour, and thus supported, he determined to persevere. With the commencement of the year 1778, Washington concerted measures with Congress for ameliorating the whole military system. Washington has been called the American Fabius; but enterprising as his own spirit was, he was obliged by circumstances to assume this character. The alliance with France very much improved the situation of the Americans; this obliged the British army to evacuate Philadelphia, and their retreat was harassed, as much as possible, by the vigilance and activity of Washington. By a partial action at Monmouth court-house, they lost some men, and then pursued their march to Sandy-Hook. Washington received the thanks of Congress for his activity in this combat, whilst general Lee incurred censure, and was suspended from his command for a year by the sentence of a court-martial. Washington retired to New Jersey; and by his conciliatory manners and address compromised the differences that subsisted between the Americans and their French auxiliaries.

During the campaigns of 1779 and 1780, no great occasion presented itself for the display of Washington's military talents. The Americans had derived confidence in their expectation of ultimate success from the alliance and co-operation of France. The year 1781 commenced with a mutiny in the Pennsylvania line of the army, which was occasioned by the inattention of Congress to the redress of their grievances. Washington on this occasion acted with great wisdom, and left the matter in litigation to be settled by the civil authorities, which granted their principal demands. But when the same mutinous spirit was extended to the Jersey brigade, he thought it right to interpose; and by a punishment of the ringleaders, the others were restored to their duty. He took this occasion of urging the different states to make exertions for removing the causes of discontent among the troops. This was a year that called for extraordinary activity. The British were pushing forward their successes with uncommon ardour in the southern provinces, and Virginia was experiencing the calamities of war. Washington was urged to defend his native province; but he knew no private interest in this general contest; and regarding America, rather than any particular district, as his country, he would not be induced to abandon his central post. It was now determined to combine the operations of the American and French forces, and the first object in contemplation was the siege of New York. But this measure

VOL. XXXVII.

was afterwards changed for that of an attempt against the army of lord Cornwallis, posted at York-town. Whilst Washington and Rochambeau kept up the deception of a design against New York, by passing Clinton's army without molestation, and marching by Philadelphia to Williamsburgh, the land and naval forces made an united attack upon the British troops at York-town. Their gallant commander was compelled to surrender his whole force on October 19, which event, in fact, terminated the war on the American continent. Its importance was such in the opinion of Washington, that he issued an order on the following day, that all under arrest should be pardoned and set at liberty, and that a thanksgiving service should be performed with due solemnities in the different brigades and divisions. He then returned, with the greatest part of the army, to the vicinity of New York. The British parliament, at an early period of the year 1782, declared its sense of the impolicy of the war by a vote against further offensive measures. Washington, however, with his customary precaution, urged the necessity of remaining fully prepared for another campaign; but in the course of the year the preliminaries were signed, and the independence of America fully recognized. Discontents prevailed in the army, under an apprehension that its claims for past services would be neglected; and, as an expression of such existing discontents, inflammatory addresses were circulated among the troops. Washington on this occasion exercised his conciliatory powers with wonderful effect. He cautioned the officers, individually, to avoid intemperate measures; and then, at a general meeting convoked by himself, he delivered to them an address, which produced an unanimous determination to trust their cause to the justice of Congress and their country. On the other side, Washington thought it his duty to urge Congress to make an adequate compensation to those who had so well served their country, and his advice was duly regarded. When the army was disbanded, in November 1783, their commander-in-chief took his leave of them by a most affectionate and admulatory address. He also, in the same month, made a public entry into New York, and soon after took a solemn leave of all his officers. The scene is described as equally tender and dignified. "The manly demeanour of the chief, softened by sensibility, filled every eye with tears. After grasping the hand of each in silence, he proceeded to the place of embarkation, followed by the officers in mute procession, with dejected countenances. On entering the barge he turned to his companions in arms, and waved his hat as a last adieu. Many answered with their tears; and all kept their eyes upon him till he was no longer distinguishable. On his way to Annapolis, then the seat of Congress, he delivered to the comptroller at Philadelphia an exact account, in his own hand-writing, of all the public money he had received, the whole amount of which, in eight years, was only between 14 and 15,000*l*. Nothing was charged for personal services. He then proceeded to the Congress, which received him as the greatest and best citizen of the United States. After a suitable address, he resigned his commission into the hands of the president, who in energetic terms expressed the national sense of his high merits. Such were the feelings of public gratitude towards him, that he could have asked nothing which would not readily have been granted; but making no request for himself, his family, or relations, he limited himself to an indirect recommendation to Congress of some young gentlemen without fortune, who had served him as aides-de-camp. He then hastened to mount Vernon, where he instantly laid aside the statesman and general for the country gentleman."

Not satisfied with attending merely to his own interest, he

took pleasure in suggesting and accomplishing any scheme that tended to the improvement of the country. Accordingly, he zealously promoted a plan of inland navigation; and in gratitude for his services, the legislature of Virginia passed an act in order to vest in him 150 shares in the navigation of the rivers James and Potowmac. But this grant he would not accept, as he had resolved to decline all personal recompense for his services; but he consented to the act on condition of appropriating the proceeds to the maintenance of a seminary of learning in the vicinity of each river; which appropriation he confirmed by his last will.

When a general convention was agreed upon for revising the federal system of government, this convention assembled at Philadelphia in 1787, and unanimously chose Washington as president; and when the new form of government was settled, the late commander-in-chief was unanimously elected the first President of the United States, the honour of which election was announced to him at mount Vernon on the 14th of April, 1789. Independently of his reluctance to embark again in the toils of public life, he foresaw peculiar difficulties that would embarrass the measures of government in the first settlement of the American states. Nevertheless, having for many years devoted his time and services to the public cause, he still considered the welfare of his country, in preference to all considerations of personal tranquillity and retired enjoyment. With these views he accepted the arduous office that had been so honourably assigned to him, and immediately commenced, as he faithfully continued, the discharge of its important duties. "After having steered the vessel of the state," says one of his biographers, "during an unquiet period of eight years, being now in the sixty-sixth year of his age, he thought proper to decline a new election to his high office. He announced this intention in a long and minute address to the people of the United States, replete with the most excellent advice for their future conduct, and the soundest views of their political fate. It was a legacy of wisdom, which set the seal to all his past services."—"It was in the beginning of 1797 that Washington resigned his authority to his successor, Mr. Adams; on which occasion, whatever might be the feelings of a few party-zealots, he received abundant proofs of the general esteem and affection. He returned with pleasure to the comforts of domestic life, and resumed his agricultural and literary pursuits. From this state of privacy, however, he was called in the following year by the aggravated injuries of the French rulers, which produced a determination in Congress to arm by sea and land for a defensive war; and in consequence Washington was once more nominated to the chief command of the armies of the United States. The countenance, however, thus assumed, and the subsequent deposition of the Directory by Buonaparte, brought on an accommodation, and all military preparations were at an end."

When the services of this truly "great man," unparalleled perhaps in the history of the world, terminated, his life was hastening to a close. Having exposed himself to the rain, December 13, 1799, in attending to some improvements at mount Vernon, he was seized with an inflammatory affection of the wind-pipe, attended with fever, which baffled the efforts of his physicians, and terminated his life within thirty-five hours after his first seizure, without a struggle, and in the full possession of his reason, in the sixty-eighth year of his age. He left a widow, but no children. We shall close this article with the following delineation of his character by one of his biographers. "His moral and intellectual qualities were so happily blended, that he might seem expressly formed for the part assigned to him on the

theatre of the world. His firm mind, equally inaccessible to the flatteries of hope and the suggestions of despondence, was kept steady by the grand principles of love to his country; and a religious attachment to moral duty. In him even fame, glory, and reputation, were subordinate to the performance of the task imposed upon him; and no one ever passed through the ordeal of power more free from the remotest suspicion of selfish or ambitious designs. Capable of strong and decisive measures when necessary, they were tempered with the lenity which flows from true benevolence. In person he was tall and well proportioned. His form was dignified, and his port majestic. His passions were naturally strong, but he had obtained a full command over them. In the character of his intellect, judgment predominated; to fancy and vivacity he had no pretension; but good sense displayed itself in all that he said or wrote. It was a proof of strong powers of acquisition, that, scanty as his literary education had been, by a careful study of the English language in its best models, he became master of a style at once pure, elegant, and energetic; and few better specimens of public addresses can be shewn than in the products of his pen. Many more brilliant characters appear in the pages of history and biography; scarcely any so thoroughly estimable." *Ramfay's and Marshall's Lives of Washington.* Gen. Biog.

WASHINGTON, in *Geography*, a county of the United States, in the district of Maine, bounded on the N. by Lower Canada, on the E. by New Brunswick, and on the S. by the Atlantic. The chief town is Machias, which contains 1570 inhabitants. The population of the whole county consists of 7870 persons.—Also, a town of Massachusetts, in the county of Berkshire, containing 942 inhabitants.

WASHINGTON, *Mount*, a town of Massachusetts, in the county of Berkshire, containing 474 inhabitants.

WASHINGTON, a town of New Hampshire, in the county of Cheshire, containing 820 inhabitants.—Also, a town of Vermont, in the county of Orange, containing 1040 inhabitants.—Also, a town of Connecticut, in the county of Litchfield, containing 1575 inhabitants.—Also, a county of New York, which received its present name in 1784, in honour of George Washington, having been before called Charlotte county, when it also included a part of the present state of Vermont. It was organized in 1788 and 1801. It is bounded N. by Essex county, E. by the state of Vermont, S. by Rensselaer and Saratoga counties, and W. by Saratoga and Montgomery. Its form is irregular, being in its greatest length, N. and S. 59 miles, and greatest breadth, 45. The area is about 1612 square miles, or 1,031,680 acres, including the waters. It is situated between 42° 55' and 43° 48' N. lat., and 45° E. and 12° W. long. from New York. It includes 21 towns, of which the capitals are Kingsbury and Salem. In 1810 its population consisted of 44,289 persons, and its senatorial electors were 4079. The country round lake George is hilly, and, especially in the northern part, presents summits of 6, 8, 900 to 1100 feet altitude; but the hills are interperfed with valleys, that afford a tolerable good soil for farming. But the southern part contains a large proportion of arable land, with a warm light soil. The agriculture of the southern part of Washington county is very respectable and productive. In the northern part the pine forests supply large quantities of lumber, in logs, square timber, boards, shingles, &c., that descend the Hudson in rafts. Few counties produce more of clothing from household industry. The mineralogy of this county includes slate, limestone, marble, bog iron-ore, lead-ore, and some mineral springs.

frings. Washington sends five members to the house of assembly.

WASHINGTON, a post-township of New York, in Dutchess county; 80 miles S. of Albany; about 7 miles square, and watered by Wappinger's creek. The soil is good for farming, and affords excellent wheat, being under good cultivation. The inhabitants are principally farmers; and there are 80 looms in families, which in 1810 produced 20,750 yards of cloth for common clothing. Near the centre of the township is the handsome village of Mechanic, containing about 20 dwellings, a quaker-meeting, and a school. About 2 miles N.W. from Mechanic is another village, including about 20 houses, a woollen manufactory, and several mills, and called Hartville. In 1810 the whole population comprised 2854 persons, and 180 electors.

WASHINGTON, a town of New Jersey, in Burlington county, containing 1273 inhabitants.—Alto, a town of New Jersey, in Morris county, containing 1793 inhabitants.—Alto, a county of Pennsylvania, containing 36,289 inhabitants, of whom 36 are slaves.—Alto, a township of Pennsylvania, in the county of Northumberland, containing 438 inhabitants.—Alto, a township of Pennsylvania, in the county of York, containing 941 inhabitants.—Alto, a township of Pennsylvania, in the county of Franklin, containing 2709 inhabitants.—Alto, a township of Pennsylvania, in the county of Indiana, containing 755 inhabitants.—Alto, a town of Pennsylvania, in the county of Washington, containing 1301 inhabitants.—Alto, a township of Pennsylvania, in the county of Westmoreland, including 1695 inhabitants.—Alto, a township of Pennsylvania, in the county of Lycoming, having 675 inhabitants.—Alto, a county of Maryland, on the W. coast of the Chesapeake, containing 18,730 inhabitants, of whom 2656 are slaves.—Alto, a county of Virginia, bordering on North Carolina, containing 12,136 inhabitants.—Alto, a sea-port town of North Carolina, formerly called Bath, situated on the north side of Pamlico river, with a good harbour; 20 miles N.N.E. of Newbern. N. lat. 35° 31'. W. long. 77°.—Alto, a county of Ohio, bordering on lake Erie, containing 5991 inhabitants.—Alto, a township of Ohio, in the county of Clermont, containing 1527 inhabitants.—Alto, a township of Ohio, in Franklin county, including 280 inhabitants.—Alto, a township of Ohio, in the county of Miami, containing 787 inhabitants.—Alto, a township of Ohio, in the county of Montgomery, including 1584 inhabitants.—Alto, a township of Ohio, in Pickaway county, containing 974 inhabitants.—Alto, a township of Ohio, in Preble county, containing 440 inhabitants.—Alto, a county of Kentucky, including 12,999 inhabitants, of whom 2185 are slaves. Its town of Springfield contains 249 inhabitants, 60 being slaves.—Alto, a town of Kentucky, in Mason county. The county contains 11,071 inhabitants, 2065 being slaves; and the town includes 815 inhabitants, 251 being slaves.—Alto, a county of North Carolina, containing 3464 inhabitants.—Alto, a county of East Tennessee, containing 7740 inhabitants, 850 being slaves.—Alto, a county of Georgia, containing 9940 inhabitants, 3513 being slaves.—Alto, a town of Georgia, near which is a medicinal spring; 13 miles S.W. of Peterburg. N. lat. 33° 47'. W. long. 82° 16'.—Alto, a town of Georgia, in Wilkes county; the county and town containing 14,887 inhabitants, of whom 7666 in the county, and 218 in the town, are slaves.—Alto, a county of the Mississippi territory, containing 2920 inhabitants, of whom 900 are slaves.

WASHINGTON, *Town of*, in the territory of Mississippi, containing, together with the city of Natchez and Adams county, 10,002 inhabitants, 459 in Natchez, 182 in Wash-

ington, and 5030 in Adams county being slaves.—Alto, a township of Harrison county, in Indiana territory, containing 1257 inhabitants, 6 being slaves.—Alto, a city of Columbia, containing 8209 inhabitants, of whom 1437 are slaves. George-town includes 4943 inhabitants, of whom 1162 are slaves. This city is situated on the river Potomack, and intended to be the capital of the United States, and the seat of the Congress. According to the plan, the city is to be divided into squares or grand divisions, by streets intersecting each other from the cardinal points, with diagonal streets from some of the principal parts, as from the president's house to the capitol, and some other points. All houses to be built of brick or stone, with the walls parallel to the streets; and the walls in streets measuring 160 feet in breadth, to be at least 30 feet in height. The area of the capitol, or house for the legislative bodies, is to be situated on an eminence about a mile from the Potomack, and nearly the same distance from the eastern branch. The house for the president to be near the Potomack, within view of the capitol. In different parts of the city, where the principal streets cross each other, are areas in a variety of regular forms; of these fifteen are appropriated to the different states of United America, for the erection of monuments, obelisks, or statues; and on a small eminence, west from the capitol, is to be erected an equestrian statue of general Washington; at the junction of the rivers, a fort is to be erected, with an arsenal and magazines. Most of the streets have been marked out, and the squares divided into lots in the year 1792, since which time some thousand workmen have been constantly employed; 140 miles S.W. of Philadelphia. N. lat. 38° 57'. W. long. 77° 8'.—Alto, a county of Columbia, which, exclusive of the city and George-town, contains 2315 inhabitants, 955 being slaves.

WASHINGTON'S ISLANDS, islands near the west coast of North America. Captain Dickson discovered these islands in 1787, and called them *Queen Charlotte's Islands*. Captain Gray, of the United States, discovered them in 1789, and called them *Washington's Islands*.

WASHITA, or OUACHITTA, or *Ouachitau*, called also *Black River*, a river of Louisiana, which is the principal tributary stream of Red river; the latter commencing in the low sandy hills, or Caous mountains, near Santa Fé. Black is now used to designate the united waters of Ouachitau, (properly so called,) Ocatahoolu, and Tenaw rivers; but Ouachitau having gained a more deserved attention than the other branches, the name of that is used, without impropriety, to designate the valley between the Mississippi, Arkansas, and Red rivers. This valley is upwards of 350 miles in length, and its broadest part from the Quepa village on Arkansas, to the heads of Derbene river, 150 wide. It is nearly elliptic in its form, and averages from 70 to 80 miles wide, extending over more than 25,000 square miles of surface, and upwards of 16,000,000 American acres, which contain large tracts of fine arable soil, many places that indicate mineral wealth, and an excellent climate. The principal branch of the Ouachitta takes its source from the mountainous prairies between Red and Arkansas rivers, about 34° N. lat., and W. long. 95° 30'. The mountains from which it flows are composed of secondary materials: marine exuvia are found every where mixed with the schistus, argillaceous earth, and other matters that compose the face and interior of these rugged mountains. No granitic mass is found; but the whole face of the country indicates marine submerision at some remote period. The Fourche au Cado, Little Missouri, and Saline branches of Ouachitta, rise in the same ridge with the principal stream. The soil round the head of Ouachitta resembles that of the

falt plains of Texas in fertility ; but it improves in quality below the nucleus of the mountains. Indications of metal become more rare, and timber, particularly pine, upland black oak, ash, linden, and logwood, is abundant. The soil is adapted to the culture of small grain, legumes, the potatoe, and almost every plant and herb suitable to the climate. Cotton succeeds on all the arable lands of Ouachitta. Here are also some falt springs of good quality. About N. lat. $35^{\circ} 10'$, Ouachitta is joined by the Saline, and also the Derbene, which rises in N. lat. $32^{\circ} 50'$, and W. long. $92^{\circ} 10'$. About three miles below the Derbene the river Barthelemy falls into it. The last and largest branch of Ouachitta is the Rivière aux Bœufs, or Ox river, which rises in the angle formed between the Missour and the Arkansaw. Below the mouth of the Bœuf river, all the waters which form the Ouachitta being united, the river, though apparently not longer than 200 miles above, becomes much deeper, and may be navigated at all seasons. In this situation, on the same side with Bœuf, Sicily island rises from the bank of Ouachitta. The hill of Sicily is very fruitful, its surface being a black loam. On this island are several settlements. Fourteen miles below the Bœuf, the Ouachitta loses its name by its union with the rivers Tenaw and Ocatahooli. The united stream is hence called Black river, which, after a short and very winding course of thirty miles, unites with Red river. Its banks are very fertile, its width about 200 yards, the current gentle, and the water throughout the year deep enough for large boats. Thirty miles below the mouth of Black river, the Red river joins the Mississippi. Red river rises about thirty or forty miles east of Santa Fé, about N. lat. 37° , and W. long. 105° ; and having pursued a course S. E. by E. 450 miles, receives the Falte Ouachitta from the N. This latter river rises in the Caous mountains, N. of Red river, and is a beautiful stream nearly as large. These two rivers form a junction at a small distance below the Panis, or Towiache towns, and about 70 miles lower down receives the Blue river from the N. This latter issues from the Caous mountains, and runs in a course nearly parallel to the Falte Ouachitta. The united waters of these rivers form Red river, now a large stream, turbid and brackish from the waters of Red river, properly so called, and Blue river. The immense column of water brought down by the various streams that form Red river, causes it to overflow its banks during the spring floods. About N. lat. 33° , a chain of lakes commences on each side, near to or farther from the river; and these lakes are the natural deposit of the water, which would otherwise overflow the whole country. The beds of these lakes are much lower than that of the channel of the river. When the waters have been drained by the depression of the river in the fall months, the beds of most of these lakes become dry, and exhibit a meadow of succulent herbage, with channels for the water that continues meandering through them. The Red river enters the Mississippi in N. lat. $31^{\circ} 1'$, and W. long. $91^{\circ} 45'$; and if the Atchafalaya be considered as the continuation of the Red river, it leaves the Mississippi three miles below. See Darby's Description of Louisiana; Philadelphia, 1816.

WASHMINSKER ISLANDS, a cluster of islands near the fourth coast of Labrador. N. lat. 50° . W. long. 60° .

WASIGNY, a town of France, in the department of the Ardennes; 9 miles N. of Bethel.

WASILAX, a town of Sweden, in North Finland; 55 miles S. E. of Bjorneborg.

WASILISKI, a town of Lithuania; 16 miles S. W. of Lida.

WASILKOW, a town of Lithuania; 30 miles S. W. of Grodno.

WASKEMASHIN, an island in the gulf of St. Lawrence, near the coast of Labrador. N. lat. $50^{\circ} 3'$. W. long. $50^{\circ} 56'$.

WASKLOT, a small island on the east side of the gulf of Bothnia. N. lat. $63^{\circ} 6'$. E. long. $21^{\circ} 20'$.

WASKUACHAOUIPIOU, a river of Canada, which runs into the Saguenay, N. lat. $48^{\circ} 20'$. W. long. $70^{\circ} 18'$.

WASMA, a town of Sweden, in the province of Smaland; 7 miles S. S. W. of Calmar.

WASMUT, a town of Prussia, in the province of Oberland; 14 miles S. of Marienwerder.

WASP, in *Natural History*. See VESPA.

Wasps are not unfrequently dangerous and hurtful to many forts of animals by their sting, in consequence of the pain and irritation that are thereby produced. The best remedies in these cases are probably the full use of ammoniated vinegar, or saturnine washes, as cold as possible to the parts, keeping them constantly wet with them by means of cloths wrung out of them. Such insects are, however, capable of being destroyed in many different ways, as by finding their works and retreats, and smoking them well with any combustible material, but especially sulphur: by putting cyder, verjuice, wine, or any other four or sweet liquid, into short-necked phials, many of them may be readily taken and destroyed; and by laying treacle, sweet apples, or any such substances, in earthen dishes, mixed with a little water, or of any liquid of which they are fond, great numbers of them may be exterminated without difficulty. When pieces of lighted brittoned rags are thrust into the nests and holes formed by wasps, they should be immediately covered by the foot, or with earth, when they will be speedily destroyed without any escaping.

In the garden-culture of various kinds of fruit, as well as in the hot-house, vinery, and other such houses, wasps are often particularly troublesome, destructive, and rapacious; it is of course necessary to destroy them, and to prevent the means of their depredations in many cases. The best and most effectual means of getting quit of them is that of destroying their nests, which is effected simply by noticing the course of their flight from the garden or place in a quiet sunny day, and pursuing them as far as they can be seen flying, then waiting until others pass, and doing the same until they reach their habitations. The place being thus found and marked, in the evening when they are all in, a lantern and candle, with a match of damped gunpowder, made into a roll on the end of a small piece of wood, is to be provided; it is lighted when at the nest, and burns like a squib, when it is introduced into the hole leading to the nest, the foot being put on it for a few minutes. The ground is then dug until the works are seen, when the whole is wrought together like mortar by means of water. In case the nest happens to be on a bush or tree, the match is put below it, when the wasps soon fall stupified to the ground, and are destroyed without difficulty.

In this way, wasps' nests, in one season, have, it is said, been destroyed to the amount of more than fifty, within the distance of three hundred yards of a garden, and without getting a single sting, or passing a single wasp. They thus diminish every year in number, and if the same method were generally used, there is not the smallest doubt, that much fine fruit would be preserved, and at the same time many honey bees saved, which are now much destroyed by wasps.

By the common mode of hanging up phials against trees and other objects, many wasps may be taken and destroyed too, but the hive is still breeding more: large white glass vessels

vessels of this sort are, however, very useful for destroying the large *black flies*, which are also so destructive of peaches. Putting a little jam or jelly into them is found to have a good effect in enticing them to enter such bottles.

Cherries, strawberries, raspberries, gooseberries, plums, and many other sorts of fruit, are frequently almost instantly destroyed, as they become ripe and ready for use, by the voracity of wasps.

The prevention of wasps from entering hot-houses, vine-ries, and other houses, where fine fruit is raised, and committing their voracious depredations, has been attempted in different ways, as lately by covering them with a kind of cloth, which is called *serime*, that is found by experience in repeated trials to answer the purpose extremely well. The cloth is made in the form of a sheet or sail to suit the dimensions of the houses, and is bound round the outfiles with a sort of tape. Barking it, as in fish-nets, would be serviceable, but it will do without it. The cloth is about a yard in width, and costs eight-pence or nine-pence the yard. Another kind, a little different, is higher priced.

As soon as the grapes are beginning to ripen, or the wasps make their appearance, it is time to put on the cloth, which is done with small tacks, and only in such a manner as will let the wasps go up and down freely; the cloth will not need to come any farther down than the bottoms of the top sashes. The cloth is so very thin, that it will permit plenty of air to pass, without the wasps attempting to go through. It does not exclude much sun, nor will it hurt the grapes in the smallest degree.

When the hot-house or vine-ry stands by itself, or in the middle of a range, the manner of preventing the wasps from getting in when the door is opened, or when any person is passing from one house to another, is this. The cover being fastened at the top of the door with small tacks, as upon the outside roof, and the sides of it upon small hooked wires, is thus capable of being taken off at one side in such cases; and if the door be wanted to stand open for the sake of air at any time, the same purpose will be answered.

In case the house has sashes in front, the cloth may be nailed upon the outside or inside, according as the sashes shift by the hand, or are drawn up and down by a rope, still giving plenty of air as wanted. A single wasp has never been seen, it is said, to attempt to get in by the tops of the glass.

Various ways are attempted and practised of keeping wasps from grapes. The bunches of grapes are sometimes put in paper-bags; but the exclusion of air causes them to damp off. Gauze bags are also occasionally put upon them, which are still more expensive, and give a good deal of trouble. The above method, however, affords free air and free access at all times, and preserves the grapes in good order: besides, it is pleasant for the owner or others to go into the vine-ry and pull the grapes without being molested by wasps, rather than having it to resemble a hive of bees with the buzzing that is produced by them.

As soon as the fruit is all cut or pulled, the cloth should be taken off, well washed, and then kept in a dry place until wanted again.

Another method of effecting the same purpose, which is perhaps better and more ready in some cases, is that of wire-grates or frames. Where the glass in vine-ries is cross-putted, frames or grates are made three feet square for the top and bottom of every third sash, the sashes being all moveable: these frames or grates are formed so as exactly to fit in between the rafters, and are placed so as that the sashes can move up and down over them, and that there

may not be so much vacuity between them and the frames as to admit a wasp, a groove is cut on the under side of the upper bar of each sash, to admit the rope by which the sashes are hung. When it comes in contact with the under part of the wire-grate or frame next to the wall-plate, there is an aperture to admit the pulley; the end of which inclines downward from the run of the sash, in order to give room for the rope and pulley to work with freedom in opening and shutting.

The frame is made of fir-wood well seasoned to prevent its warping, and is an inch and a quarter thick; the sides and lower end are two inches, and the upper end, where the pulley is inserted, is six inches in breadth. The open space is covered with wire of the size number seventeen, worked about one-eighth of an inch asunder, and inserted into the wood at both ends. There are cross wires of the size number five, placed at six inches distance from each other, to which the longitudinal wires are warped, in order to keep them firm. In each of the frames, holes are made with small wire turned down, similar, in some measure, to those in the entrance into wire mouse-traps. At these, large phials half filled with four beer are placed. The wasps are eager to get into the grapes by every possible means of entry, and are next enticed by the beer to get into the phials, where they perish in numbers.

The frames or grates are constructed in this open manner in order to admit the air freely, as it is of great importance, especially in the ripening of fruit.

These frames are capable of being made at a very trifling expence; and as they are in use but a very short time in a season, the cost of making new ones will but seldom recur.

WASP-Fly, a species of fly having very much the external figure of a wasp, but harmless, without a sting, and with only two wings.

It is black and yellow on the body, and marked exactly as the wasp, and is produced from a species of the rat-tailed fly-worms. See *DRONE-fly*.

But beside these there is another small fly produced of the puceron-eaters, which has extremely the appearance of a small wasp; but is perfectly harmless, and has only two wings. Reaumur, *Hist. Inf. vol. iv. p. 486*.

WASP-Tipula, the name of an insect described by M. Reaumur, and being properly a tipula, or long-legs, though greatly resembling a wasp.

This is produced of a worm found in the earth, lodged in the cavities of old trees; the worm has no legs, but has a regularly figured scaly head. The fly produced from it has the long legs and the mouth of the tipula, with the remarkable double beard which covers it, and which makes the real character of this class of insects; but then the body is short and thick, whereas the bodies of the common kinds are very bony and thin. This, as also the breast, is variegated with streaks of black and yellow, in the manner of the wasp; and its antennæ are very beautifully feathered, and bearded like those of the males of many of the gnatk-kind. The head is black, and the legs are yellowish. The wings have a yellowish cast, and near their end have each a large spot of brown. The body of the female of this species is always much thicker than that of the male; and the sexes are easily distinguished by this. Reaumur, *Hist. of Inf. vol. ix. p. 19*.

WASS ISLAND, in *Geography*, an island of the Atlantic, near the coast of America. N. lat. 44° 28'. W. long. 67° 30'.

WASSAB, or *WARSHABS*, a country of Africa, on the Gold Coast; the soil is barren, but abounds in gold.

WASSAIL,

WASSAIL, or WAS-HEAL, the salutation of our ancestors on occasion of drinking to each other, signifying "health be to you."

The term is purely Saxon; and though it is now used in a very limited sense, and only at the time of Christmas, it anciently signified mirth and festivity in general; and in this sense it occurs in Shakspere's Hamlet and Macbeth. Dr. Percy also uses it in a general sense; and Ben Jonson personifies Wassel, as "a Songster," &c. In the "Ordinances for the Royal Household," published by the Society of Antiquaries, there is a curious account of the ceremony of wassailing at court on twelfth night in the reign of Henry VII. "When the steward cometh in at the doore with the wassel, he must crie three times, 'wassell, wassel, wassel,' and then the chaplain was to answer with a good songe."

In the 1st vol. of the Antiquarian Repertory is an account and engraving of an oaken chimney-piece in a very old house at Bexley in Kent, on which is carved a wassel-bowl, resting on the branches of an apple-tree. On one side is the word *Wassellheit*, and on the other *Sinnelheit*. This is at least as old as the 14th century.

Grofe, in his Provincial Glossary, says, that the custom of throwing toast, and pouring out libations to apple-trees for proving a fruitful year, which seems to be a relic of the heathen sacrifice to Pomona, was called "Wassel:" the term is still applied to the drinking-fongs sung in the cyder-counties on the eve of Epiphany, when that ceremony is performed.

In Holderness, and other parts of Yorkshire, and probably in other counties, it is the custom to carry about with the wassel-cup an image of our Saviour, together with a quantity of roasted apples. The image seems to have been connected with wassailing originally, and to have become an appendage to the wassel-cup. Hence this ancient custom has been restricted to the convivial season of Christmas. But the apples seem to have been connected with it at a much earlier period. The custom also of roasting apples on Christmas eve still continues in some districts. The origin of the term wassel is traced to the story of Vortigern and Rowena, the daughter of Hengist. On their first interview, she knelt before him, and presenting a cup of wine, said, *Hlaford Kyning, Waes-beil*, i. e. Lord king, health be to you! The king being unacquainted with the Saxon language, asked the meaning of the terms, and being told that they wished his health, and that he should answer by saying *drinc beil*; he did so, and commanded her to drink: then taking the cup, he kissed the damsel and pledged her. From this time the custom long remained in Britain, that whoever drank to another at a feast said *Wacht beil*, and he that received the cup answered *drinc beil*. The *wassel-fongs* were sung during the festivities of Christmas, and in earlier times by the itinerant minstrels; of whom, with the practice, some remains may be traced in our present *vaults and carols*. One of them is preserved in the British Museum. (Bib. Reg. 16. l. viii.) It is an Anglo-Roman drinking-song, probably older than the 13th century, and composed when the Norman language was familiar in this country. See *Archæolog.* vol. xi. p. 411.

WASSAIL-BOWL. See *GRACE-CUP*.

WASSANAH, in *Geography*, a city of Africa, within sight of the river Zolibib (the Joliba of Park), whither the king of Tombuctoo sent a caravan, accompanied by Sidi Hamet; and where they were welcomed by the king, and lodged in a square inclosure, remaining there two moons, and exchanging their goods for slaves, gold, elephants'

teeth, &c. The river, as Sidi Hamet informs us, which passes by Wafanah, is called Zadi; it flows nearly fourth, and is so broad, that a man can scarcely be seen on the opposite bank. On each side is a ridge of mountains, but separated by an interval on both sides from the river. The city appeared to contain twice as many inhabitants as Tombuctoo; it was surrounded by a very large wall, built of great stones loosely piled up; and a whole day was required to walk round it. The country around it is highly cultivated. The houses are constructed of stones without cement, and roofed with reed and palm-leaves. The king of Wafanah is called Oleekow; he is tall and young; his palace is very large, square, and high, built of stone, with a species of cement. He was said to have 150 wives, and 10,000 slaves; he has also a large army, which fight with guns, spears, bows, and arrows. When he goes out he rides on a huge beast called *il fement* (elephant), and is attended by 200 guards. The people are not Mussulmans, but addicted to various Pagan superstitions; for which reasons, though they are honest, hospitable, and kind-hearted, Sidi Hamet allows the pious wish "that they may soon be driven out of the goodly land." The inhabitants catch many fish; they have boats made of large trees, hollowed out, and capable of holding ten, fifteen, or twenty negroes; and the king told Sidi Hamet that he was soon to take sixty boats and 500 slaves to the great water, where he should sell them to a pale people in large boats, with muskets, powder, tobacco, blue cloth, knives, &c. He said it was a long way, and would take him three moons to get there, and that he should be gone twenty moons before he could return, but that he should then be very rich. Some persons who had seen these pale people, and used to deal with them for slaves and teeth, said, that they lived in great boats, and had guns as big as their bodies, that made a noise like thunder, and would kill all the people in 100 negro boats, if they went too near them. Sidi Hamet staid in this place during the months of March and April; and it rained incessantly. Sidi Hamet's narrative, if authentic, is important, in a variety of respects. The description of Tombuctoo (which see) corresponds to that of Adams. We may say the fame of the name Zolibib, answering to the Joliba of Park, Gallu, or Julbi, of Horneman. Horneman also states, that this river on the eastern part of its course is called Zad, and it there turns rapidly northwards. On the whole, the presumption seems to be in favour of the narration, and it certainly opens very interesting views of the interior of Africa. See Riley's Narrative of his Capture and Adventures in 1815, in Murray's Historical Account of Discoveries and Travels in Africa, vol. i. 8vo. 1817.

WASSAW ISLAND, *Great*, an island in the Atlantic, near the coast of Georgia, 16 miles in circumference. N. lat. 32° 52'. W. long. 81° 8'.

WASSAW ISLAND, *Little*, an island in the Atlantic, near the coast of Georgia, to the south-west of Great Wassaw.

WASSAW SOUND, a bay on the coast of Georgia, between Great Wassaw island and Tybee island.

WASSELA, a country of Africa, bounded on the north and west by Mandinga and Bambarra, on the east by Kong, and on the south by Guinea. N. lat. 10° 50' to 12° 20'. W. long. 4° 50' to 5° 45'.

WASSEMBERG, a town of France, in the department of the Roer, on the Roer; 9 miles E.S.E. of Ruremond. N. lat. 51° 4'. E. long. 6° 6'.

WASSEN, a town of Switzerland, in the canton of Uri; 13 miles S. of Altorf.

WASSEN'S Bay, a bay on the east coast of Cochinchina. N. lat. $12^{\circ} 5'$. E. long. $109^{\circ} 6'$.

WASSEN'S Point, a cape on the east coast of Cochinchina, and south boundary of Wasfen's bay. N. lat. $12^{\circ} 3'$.

WASSERBILlich, a town of France, in the department of the Forests, at the union of the Sour and Mofelle; 15 miles N.E. of Luxemburg.

WASSERBURG, a town and lordship of Germany, belonging to the family of Fugger, situated on a projected point of land in the lake of Constance; 1 mile N. of Buchorn.—Also, a town of Bavaria, with a castle and four churches; the chief trade is in salt; 38 miles W.N.W. of Salzburg. N. lat. $48^{\circ} 3'$. E. long. $12^{\circ} 13'$.

WASSERLEBEN, a town of Germany, in the county of Wernigerode; 4 miles N.W. of Wernigerode.

WASSER-MUNGENAU, a town of the marggravate of Anspach; 4 miles S.E. of Windsbach.

WASSERNDORF, or WECHSELDORF, a town of Germany, in the lordship of Seinhelm; 3 miles S.E. of Mark Breit.

WASSERTRUDINGEN, a town of Germany, in the principality of Anspach, on the Wernitz; 13 miles S. of Anspach. N. lat. $49^{\circ} 2'$. E. long. $10^{\circ} 35'$.

WASSIGNY, a town of France, in the department of the Aisne; 16 miles N. of Vervins.

WASSIHOO, a small town of Africa, in the kingdom of Ludamar, in N. lat. $14^{\circ} 49'$, where the cultivation of corn is carried on to such an extent, that hunger is never known; men and women labouring in concert; 75 miles E.S.E. of Benowm.

WASSILT, a town on the east coast of Gilolo. N. lat. $1^{\circ} 17'$. E. long. $128^{\circ} 6'$.

WASSLONNE, a town of France, in the department of the Lower Rhine; 12 miles W. of Straßburg.

WAST, a town of France, in the department of the Straits of Calais; 9 miles E. of Boulogne.

WASTARA, a town of Hindoostan, in Bednore; 15 miles W.S.W. of Sacrapatam.

WASTCHEID, a town of France, in the department of the Meurte; 6 miles S.E. of Sarrebourg.

WASTE, or WAST, *Vastum*, in Law, has divers significations.

It is used for a spoil, made either in houses, woods, lands, &c. by the tenants for life, or for years, to the prejudice of the heir, or of him in reversion, or remainder.

Waste is either voluntary, as by pulling down a house; or permissive, as by suffering it to fall for want of necessary repairs. Whatever does lasting damage to the freehold or inheritance is waste: therefore the removing of waincot, floors, or other things, once fixed to the freehold of a house, is waste.

Waste may also be committed in ponds, dove-houses, warrens, and the like; by so reducing the number of erections therein, that there will not be sufficient for the reversioner when he comes to the inheritance. To cut down trees that are deemed timber, as oak, ash, and elm, and other trees generally used in building, or to lop them, or do any other act by which the timber may decay, is waste. The conversion of land from one species to another is waste; and also to convert one species of edifice into another, even though it is improved in its value. To open the land to search for mines of metal, coal, &c. is waste; and, in general, whatever tends to the destruction, or depreciating the value, of the inheritance, is constituted by the law as waste.

In consequence of the statute of Marlbridge, 52 Hen. III. cap. 23. and that of Gloucester, 6 Edw. I. cap. 5. all tenants for life, or for any less estate, are punishable or liable to be impeached for waste, both voluntary and permissive; unless their leases be made, as sometimes they are, without impeachment of waste, *absque impetitione wastii*; that is, with a provision or protection that no man shall *impetere* or sue them for waste committed.

The punishment for waste committed was, by common law and the statute of Marlbridge, only single damages, except in the case of a guardian in chivalry, who also forfeited his wardship by the provisions of the great charter, 9 Hen. III. cap. 4. But the statute of Gloucester directs, that tenants in dower, by courtesy, for life, and for years, shall lose and forfeit the place in which the waste is committed, and also treble damages, to him that hath the inheritance. For this purpose a writ of waste is brought by him who hath the immediate estate of inheritance in reversion or remainder, calling upon the tenant to appear and shew cause why he hath committed waste; and if the defendant makes default, or doth not appear at the day assigned him, then the sheriff, with a jury of twelve men, is to go to the place alleged to be wasted, and there inquire of the waste done, and the damages; and make a return or report to the court, upon which report the judgment is founded. But if the defendant appears, and afterwards suffers judgment to go against him by default, or upon a *nihil dicit*, this amounts to a confession of the waste; and the sheriff shall then only make inquiry of the quantum of damages. When the waste and damages are thus ascertained, by confession, verdict, or inquiry of the sheriff, judgment is given, in pursuance of the statute of Gloucester, cap. 5, that the plaintiff shall recover the place wasted, for which he has immediately a writ of seisin, and also that he shall recover treble the damages assessed by the jury.

The redress of this injury of waste is also preventive, by writ of estrepment: and, besides, the courts of equity, upon bill exhibited therein, complaining of waste and destruction, will grant an injunction to stay waste, until the defendant shall have put in his answer, and the court shall thereupon make farther order: which is now become the most usual way of preventing waste. Blackst. Com. book ii. book iii. &c.

WASTE is also taken for those lands which are not in any man's occupation, but lie common.

They seem to be so called, because the lord cannot make such profit of them as of his other lands; by reason of the use others have thereof, for passing to and fro. Upon this none may build, cut down trees, dig, &c. without the lord's licence.

Much land of this kind is met with in almost every district of the kingdom, which is very capable of being converted to a state of profitable cultivation without any very great expence, after it has been inclosed. The whole extent of the land yet in the state of waste is very considerable, and stated by different writers, as drawn from the best authorities, at upwards of six millions of acres, four of which at least are supposed capable of being brought into cultivation for the growth of crops of the most useful kinds.

It has been suggested by the writer of an excellent paper on the "production and consumption of corn, &c." in the fifth volume of Communications to the Board of Agriculture, that if this addition of land were cultivated, it would very much extend the productive territory of the country, and that as it must be cultivated chiefly for tillage, would

be a timely and desirable addition to the corn land of the kingdom.

It is, of course, a question of much general interest and importance, whether a considerable portion of the capital employed in the enclosure and improvement of waste land, may not often be more beneficially applied in the amelioration of land already in a state of partial cultivation.

The scarcity of corn, which prevailed throughout the kingdom a few years since, acted, however, it is said, as a powerful stimulus to the enclosure and improvement of waste land in this country, and that the spirit which was then excited has not yet by any means subsided. And it is now perhaps still more necessary, as affording a means of providing a large increase of productive labour for a portion of the working class of society. As there is now a great deal less than a sufficiency of labour for the demand of the country, it would probably be politic in the state to convert a part of such unrequired portion of it to the means of extending the culture and fertility of the territory of the nation. It has been properly suggested, that new land ought not to be improved at the expence, or by the neglect of the old, but in addition to it, and from new resources.

In a subject of this kind, particular circumstances must be regarded. In some waste lands, from their situations and the quality of their soils, they are capable of being brought into a state of high cultivation and improvement, with comparatively but little labour and expence; while, in others, the circumstances are such as to render any attempts at the amelioration of them productive of great expence, and probably of but little profit. Indeed the same quantity of labour and expence which would be necessary to divide and cultivate them, would in all probability raise a much larger proportion of produce, if applied to lands already enclosed, but in an imperfectly cultivated state.

It is remarked, by the able writer of an agricultural report of a northern district, in support of improving waste land, that as there is reason to believe that many landlords, or proprietors of ground, do not advert to the gain of improving such wastes, it may be proper to state it, and to shew that in no other way can money be laid out to such advantage. Whenever it is laid out with judgment, as it always may and ought, the risk is less and the gain greater, it is said, than in manufactures or in commerce. The improver of land is, in the first place, free of all hazard; and in the next place, may be supposed, in general, to gain at least twelve or twenty *per cent.* upon his outlays. The average expence of removing the wetness or improving waste ground is commonly estimated, it is said, to be under three pounds the acre. Now if by these three pounds, land worth only from one shilling to three shillings is raised to fifteen or twenty shillings, the improver has at the lowest rate twelve *per cent.* for his money; or, in other words, by laying out three pounds, he adds fifteen pounds to his stock, as every shilling *per annum* which the acre is improved, is worth at least twenty-five years' purchase. Inclosing and manuring are not reckoned, as lands already in tillage need these ameliorations as well as those that are yet uncultivated. The only expence peculiar to the improvement of waste lands is, it is said, that of draining and reducing the surface to an arable state; and this, it is believed, was stated fully high, as the value of the improvement is probably stated too low. At least this is generally estimated higher, it is said, wherever it has taken place, as might be shewn in numberless instances throughout the kingdom.

In speaking of the same district, the writer farther observes, that it is often said that the soil and climate are more

adapted for producing grass than corn, but the truth is, that the soil and climate of the greater part of it are well suited for either; and that wherever toil and skill are exerted in raising either, they are sure of being well rewarded. But supposing grass should be the great object, ought we not, it is asked, to put more of the land there in a capacity for raising it? The meadows there are bad, but we may, says the writer, mend them; they are few, but we may add to them, and almost to any degree we please, and create both pasture for the summer and provender for the winter. By such improvement of our waste lands, the writer says, and by the introduction of green crops, it is possible enough that in half a century some parts of this district might be made to rear more than double the black cattle or sheep that are reared at present. It is impossible to say what the quantity of waste land in this district, it is said, if improved, might one day be made to produce. It is certain that much of it would be found to be more productive than a great part of what is in tillage at present.

Profitable, however, as this business would entirely turn out, both to the individual and to the public, it is to be regretted, the writer thinks, that they who are able are not often disposed to attempt it. Instead of this, they choose, it is said, to buy more, and to enlarge their quantity of wildernesses, rather than to improve what they already have. If they would duly weigh these two different plans, they would probably, it is thought, make a different choice. For it is indeed a common observation in this district, it is said, that proprietors seldom make much of farming or improving land.

A statement in the report on the agriculture of the county of Montgomery in North Wales, however, shews that the advantages of improving waste lands is much greater than is suggested in the above detail, considerable as it may appear. It is there said, that Mr. Corbet now draws fifty *per cent. per annum* for the money laid out in improving his peaty or turbary lands; which is the same as buying an estate at two years' purchase. And that were it not for some particular expences attending the inclosing and defending of it, as those of embanking, the profit instead of this would be above one hundred pounds *per cent. per annum.*

In the account of the agriculture of the northern counties, it is stated too, that a spirited farmer there, who many years ago took in lease a tract of fourteen hundred acres of waste land, finds some of the worst of them now very cheap at forty shillings each even in pasture; that one hundred of them are worth more than the whole farm when he took it; and that, though formerly covered with heath, and in a high unsheltered situation, the parts improved were brought, in one or two years, at a moderate expence, to produce as abundant pastures as any near the banks of the Clyde.

It is therefore conceived, by the writer of the report noticed above, that in every view the improvement of waste lands is a gainful business to the owner or undertaker of it. That it is found to be so even in this part of the county, though often so charged, as that the improvement upon an acre of land has from five to ten shillings a year of tithes and poor rates. This, it is said, of itself, would be no small gain in some cases, but which is had there, the writer says, over and above that in the case of their neighbours. It is evident, therefore, it is supposed, that he who is able should lose no time in improving his waste land; and that he who cannot do it otherwise, would find it his interest rather to sell the one half in order to improve the other, than that the work should be left undone. When a proprietor is not disposed, it is said, to improve his waste grounds himself, he ought

ought to give the most liberal encouragement to tenants and the labouring poor to do it for him. The foundation of the encouragement, however, it is thought, should there be certainly a long lease to poor, honest, and industrious labourers; with a small allowance to build a house, and to help them to live until they can raise food to support themselves; after which they should pay interest for the money, and a small rent for the ground. Proprietors, &c. should indeed, it is thought, give any encouragement short of their own loss, rather than allow such lands to lie any longer as they are. It may be noticed here too, that in improving these sorts of land, the open drains or ditches may often be made to serve as fences; so that the expence of inclosing may be saved, which will contribute greatly to the advantage of this sort of improvement.

It is evident, from what has been advanced, that there are different sorts of waste land, which must of necessity require different methods of practical management and working to bring them into a proper state of cultivation, and consequently demand more or less expence in making the improvement which is necessary.

Such lands may, however, for the most part, be arranged and considered under the three general heads stated below.

1. Elevated barren lands, covered with different sorts of coarse plants.
2. Low lands of the swampy, boggy, morassy, and other such watery kinds, infested with various descriptions of coarse vegetable productions.
3. Peaty, mossy, turfy, and other such lands, of which there are many different kinds.

Under each of these heads a great many varieties will obviously be met with in the practice of improving them, which are to be constantly kept in view and fully regarded, in order to effect the business in the most easy, cheap, and effectual manner.

First Division of Waste Land.—This comprehends all the varieties and denominations of moory, heathy, mountain, down, and other such lands, however diversified and changed by the particular circumstances of quality, situation, coarse herbage, and other such matters.

In regard to the nature of the soil, and the means of improving it where the ground is covered with fern, heath, furze, and other similar plants, the remarks of Mr. Phillips, a writer on the improvement of waste lands in North Wales, are highly interesting and useful. In speaking of the improving of them there when of the barren mountain kind, and covered with furze and fern, it is said that the thin layer of soil or mould upon these lands seems to have been created and formed by the annual decay and decomposition of portions of the gorse, which is a plant admirably calculated to produce, and afterwards to detain, in spite of rains and storms, the vegetable earth, afforded by such means, upon these steep declivities. Around each bush of the gorse is always found, it is said, a heap, more or less high, of excellent mould or soil; and so completely do the prickles of this plant defend the grasses that grow among it from the attacks of sheep, that the earth produced by the successive decay of vegetable matter constantly accumulates, and renders land, that a few centuries ago would probably have been unproductive, proper for the growth of corn. It is impossible, it is said, to traverse the mountains there, without observing how wisely these things are contrived by Him who provides for us all. The highest mountains of North Wales, where the rock does not every where appear, are clothed with heath. As ages roll by, the soil or earth, produced by the annual decay of portions of the heath, becomes fit to produce gorse. If the water have a ready fall, and

the land be dry, this plant appears in abundance on the most exposed sides of such mountains. Where soil or earth has accumulated in sufficient quantities, the next protector and fertilizer of the mountain is fern. Wherever this plant flourishes, still richer quantities of vegetable earth or mould are, it is said, every year added to the surface soil; and the ground is rapidly prepared for the plough.

The nature, situation, circumstances, and some other points, in respect to the ground, mud, in these cases, constantly regulate the modes of clearing the surface, dividing, inclosing, and laying out the lands, as well as the buildings that may be necessary, and direct the kind and extent of the different operations which are afterwards the best and most proper and advantageous to be established and carried on in the improvement of it. Where the land is thin, too much ploughing is mostly, however, to be avoided, though in other circumstances it may, for the most part, be used freely, especially where any sort of suitable ameliorating substances are at hand ready to be applied.

It is stated that a great deal of moorish land, which is covered sometimes with heath, and sometimes with bent grass and *sprouts*, is met with in the district of Argyle, in Scotland, and probably prevails in other northern counties; and that as this sort of land there has commonly a good descent, and rests upon gravel at no great distance from the surface, which is generally a black earth of the peat kind, it may be cultivated with the plough at no great expence. In which case, it is directed that it should first be ploughed in summer, in narrow ridges; and soon after either cross-ploughed, or well broken down in some other manner, as by spades, where it can be done. It should then be covered with lime, or some other proper manure, receive a gentle harrowing, and lie in that state until it get the seed-furrow in the spring. It is found that lime is peculiarly suited to heathy and new land, as, by its caustic quality, it converts these and other vegetable matters into fine mould. The effect of lime upon new land is much greater than upon old. The summer's heat, the winter's frost, and the fermentation caused by the manure, will, in most cases, make it mellow and manageable enough by that time. If, in any case, it should not, it is best, it is said, to let it have another summer ploughing, and to let it lie until the next year, when the crop will be so much the better as to pay for the delay. After the ground is seeded and harrowed, the plough should be run lightly through all the ridge furrows, in order to carry off superfluous moisture, and keep the ridges dry. With the second crop, it should mostly be laid down with grass-seeds for pasture, and the furrows be well cleaned. If the ground be of a good staple, three crops may, however, be taken, provided the middle one be turnips, with dung. It is said in the twelfth volume of the "Statistical Account of Scotland," that in this way Mr. Barclay, of Ury, has improved three hundred acres of barren land of this sort. This, after the lime given to the first crop, will leave the land in better heart, it is thought, than if only two white crops were taken simply with the lime.

In the above district, the improvement of waste lands of this description is so cheap a purchase, it is said, that even tenants upon a nineteen years' lease, having access to lime, might pursue it to great advantage. A few of them do so, and more, it is expected, will follow their example. Some in the parish of South-end, who belong to the duke of Argyle, have done much of late years in this way, by which their farms and their profits are enlarged, and the face of the district beautified. But the greatest improvement of this kind that has yet taken place there, is that by the late sheriff Campbell, of Stonefield, who rescued mostly from

the state of barren heath a large farm of many hundred acres, which now of itself would be no small estate. And yet it may be said, the writer observes, that this vast improvement cost him nothing; for he used to say that the work always defrayed its own expence. It was besides the means and afforded the pleasure of giving employment to a great number of labouring poor, and of doing much good to all around in different ways, but especially by furnishing seed-corn, which is found to do the best when taken from new lands, a consideration that should more powerfully recommend the improvement of these sorts of land.

In the improvement of this sort of waste land, where the heath and other coarse plants on the surface are considerable, it is the practice with some to apply lime in large proportions some time before the ground is to be broken up, as it is found to have great power and effect in destroying such coarse matters, and in preparing the superficial parts of the soil and ground for the operation of the plough and the action of other tools, and of bringing it into the necessary cultivation. It is a mode which is thought to succeed well, and to be highly useful and advantageous in many such cases.

A large part of an extensive tract of barren heath of no great value near Cardiff, in South Wales, has not long ago been improved to vast benefit at a moderate expence, by breast-ploughing, or paring and burning the surface, carefully spreading and turning in the ashes in a light manner, mixing them well with the soil by dragging and harrowing, and then applying lime in not too large a quantity, cropping with wheat, turnips, or some other more suitable crops. In some instances, the lime was mixed with the ashes to better advantage. This, it is asserted, is the cheapest and most effectual method of bringing such sort of waste land into a state of cultivation and improvement.

Though objections have been made to the cultivating of wheat in the first instance, in such cases, it would appear, it is said, to be the most profitable mode of proceeding. This crop should be followed by turnips, or by oats with ray-grass and red clover, but the former is to be greatly preferred in general, especially if the necessary quantity of suitable manure can be procured in a ready manner; when barley with feeds may be tried in succession to the turnips, particularly where they succeed in such a manner as to keep sheep a sufficient length of time on the field. The course of the crops will then run thus: wheat, the stubble carefully turned down in the autumn, then turnips, and these followed by barley or oats, with ray-grass and red clover. The first crop of these grasses grazed by sheep, or other sorts of live-stock, as most convenient. Land thus managed, when broken up a second time, will soon become, without doubt, it is supposed, nearly equal to most other land in the vicinity of it.

It may be necessary in many cases, and on many accounts, to vary the first crop. In some it may be most useful and proper to begin with turnips; in others with oats and feeds, or with the former only. In lands where mucklage appeared deficient, buck-wheat, turned in, has been tried with great success, especially when afterwards mixed with lime and dung. But the above method of beginning with wheat was found the best in all cases where circumstances would permit it. Wheat, when the ground is properly prepared, will always, it is thought, best repay the expence of such preparation; and green leguminous crops, eaten off by sheep or cattle, will afterwards improve the land considerably, even without other means, which should, however, never be neglected where the expence of providing them is moderate. See a tract on the cultivation of waste land in the above district of Wales, by Col. Capper.

Heath land, where the staple is very thin before small stones and gravel are reached, may be improved in somewhat the same way in some cases; and after the surface materials have been reduced and spread out, by nine-share ploughing it, and sowing it with grass-seeds well harrowed in. By this simple method, the sward soon becomes sweet, good, and productive, the heath that originally covered the ground soon disappearing. Wastes that are naturally poor, thin, and barren, should never, or but in few cases, have corn attempted to be raised upon them in the first instance. Heath lands of this sort intended for sheep-walks may be improved by breast-ploughing, burning, and spreading out the ashes upon a certain proportion of them every year; half of such portion being directly prepared for early turnips; the other half for the same crop in the spring. The turnips on the first part, when fed off on the land by sheep, should have the ground they occupied sown after being prepared early in the spring with tares, in the quantity of three bushels to the acre, with a few oats; these to be fed off with sheep also, then sowing turnips again for the spring, which being fed off as before, the land is to be sown with oats and white clover seeds, eight pounds to the acre, with a bushel of good hay-seeds. The clover not to be in any way stocked, after the oats are cut, until the spring. This land, by being hurdled off, where practicable, and fed with sheep for two or three years, will, it is said, become an excellent sward, and form a great improvement, affording the improver vast profit in the increase of the sheep it can support.

There are other modes of bringing waste lands of these different kinds into cultivation, as by planting potatoes in the ridge and other methods, which is well suited to the means of improving small portions by the labouring poor, in many instances, as they often produce good abundant crops, and render the lands soon fit for other purposes, without scarcely any expence being incurred.

The sowing of the seeds of leguminous plants among those of the grass kind, too, has been found not only to increase the herbage much, but to greatly ameliorate the earth of the land in different cases. See *HEATH, MOOR, WOULD, &c.* Also *PARING and BURNING*.

Planting these sorts of wastes with proper kinds of trees may also answer well in many cases, and afford great advantage to the owners. See *PLANTING*.

Second Division of Waste Land.—This comprises all the sorts and varieties of soft, boggy, and watery land that are formed by the deposition of different rich earthy or other such matters; and is, in many cases, a collection of the rich mud and sediment which is washed down from the higher grounds, so mixed with the remainments of different decayed vegetables of its own growth, and so over-charged with stagnant water, that no sort of animal can scarcely pass upon it. It is a sort of waste land that is, for the most part, more difficult of improvement than heathy moor, or any of the kinds included in the first division, but which will mostly pay better for the expence when it has been accomplished than any of them. It is indeed a sort of land that, when well freed of its wetness, is the richest and most productive of any; nor is the clearing of it of its water in many cases so difficult as may at first be supposed. Sometimes the water which produces the mischief comes from higher grounds, so that it may be easily intercepted, and afterwards be made to serve it, in the way of manure, by being thrown over the surface of it. In other cases, the water is afforded by internal springs, which are easily discovered, when the land has got an outlet on the lower side of it, to which the water thus produced can be conducted
by

by open cuts as the mud-earthly material subsides. It may then be drawn off in the usual way, and the land converted to valuable pasture or corn crops, as may be the most suitable and proper.

In this manner, and by the application of proper substances of different kinds on the surface when necessary, many considerable tracts of such sorts of waste land in different parts of the kingdom have, within these late years, been brought into an excellent state of cultivation for the production of corn as well as grafs. And besides such advantages, the removal of the stagnant wetness in the lands, in many instances, is of much benefit in promoting the healthiness of the neighbourhoods, by removing the cold and putrid exhalations that proceed from them.

The writer of the tract already alluded to remarks, that the improvement of boggy ground of this sort, in his trials, required more attention, and likewise more expence, to bring it into cultivation, than that of the first division. That in five or six fields, under the management then pointed out and practised, there were small spots of this kind of land, arising from internal wetness on the breasts of the opposite hills, which had been long choked up, and made swamps of a temporary nature some distance around them; but which have been removed by tapping and forming surface cuts from them, to conduct the superfluous internal and the top water, by the side ditches, to the main cuts, and in some particular instances by strong covered or open deep cuts to the same channels or passages. Since this method has been had recourse to, these fields have, it is said, been sown with wheat, and have borne very excellent crops. At the bottom of the hills on the different sides runs a small brook, it is observed, which has been converted into one of the main passages for taking away the wetness of the whole of the waste: on each side of the brook, the earth has been gradually washed down from the adjacent hills, and a quantity of black mould deposited from it, to the depth of about two feet and a half, and in some places three feet: underneath this soil or mould is in general a fine white sand upon a gravel, but in some places the mouldy material only covers a common peat earthy matter. Various trials, it is said, have been made in bringing these different soils or lands into cultivation: with a mixture of lime, a tolerable crop of wheat has been obtained, even from the peat earth part; and on the other, by the same means, abundant crops of oats have been had. It is intended to try if cabbages, by the help of lime and dung in mixture, will thrive in these bottoms. By such means, it is not doubted, but that in the course of a few years these bottom parts will throw up abundant crops of excellent grafs, which, in many places, indeed already begins, it is said, to appear. One half of these boggy bottoms was capable of being ploughed the first year after they had been freed from wetness; the other part was either sown with oats after being dug over, or planted with proper aquatic trees, such as withys and others.

But for wastes of this nature, where there is much coarse, rushy herbage on the surface, and they are considerably dry, the method advised below is suggested as very beneficial and proper. It is, in the months of April and May to pare and burn the surface; and after the matters thus produced are spread equally over it, the ground to be turned over with a very ebb furrow, and at the proper season to be sown with turnips in the broadcast manner. From the almost entire absence of root-weeds, in consequence of the burning, the crop will require little care in dressing by the hoe. The turnips are to be sown upon the ground, by folding sheep upon it by means of flakes or hurdles. As soon as the land is cleared of the turnips, it is to be ploughed with

a good furrow, and to remain in that state until the season for sowing the same crop again arrives. If well worked, and laid into ridges or fitches of the usual breadth of two feet and a half, the dung produced by the sheep that consumed the first turnip crop will render the land capable of giving a superior crop of the same kind the second season. This second crop, like the first, is to be consumed by folding sheep on the land in the same manner; which being finished, the land is to be ploughed and laid into ridges for a corn crop, which is to be either barley or oats, as the nature of the soil and situation of the lands may be. If rich and well sheltered, they should be cropped with barley; if otherwise, with oats; in either case to be sown off with grafs-seeds for pasture. It is thought that under this process of management the smallest possible expence is incurred, and that the lands, at the end of three seasons only, are thrown into pasture in high condition, while in the course of the process one valuable corn crop, and one good crop of turnips, have been afforded, together with a less valuable one of the same sort; which last, however, may be sufficient to defray all the expence of tillage attending it, over and above that of reducing the coarse surface. The expence of preparing for the second turnip crop, and for the corn crop, will amount to no more than the price of ordinary light tillage; and the lands, from being brought into the state of grafs in high condition, will not only afford abundant profitable pasture, but at the same time be ready, when broken up at a future period, to yield full crops of corn.

In low wet bottoms, another experienced improver of waste lands states too, that the most beneficial mode that has been attempted is, to pare and burn for the same crop to be eaten off by sheep; then to sow oats, and afterwards to lay on five chaldrons of lime to the acre as a preparative for another crop of turnips to be eaten by sheep as before; after which to sow oats, with seeds in the quantity of sixteen pounds of white clover, five pounds of rib-grafs, and a quarter of good hay-seeds to the acre. Land so managed, it is said, will carry considerably more stock than it did in its original state. If the water has been completely removed, these seeds may be broken up at the end of two years, or as soon as they appear to decline in productiveness, for wheat, and be put into the four-shift husbandry, namely, turnips after wheat, to be succeeded by barley, clover, turnips, and wheat again. Until the land becomes tired of red clover, there cannot, it is supposed, be a more judicious method adopted for such waste lands than this. When it becomes tired with the red clover, which it will mostly be after two successive rounds, either beans, peas, or seeds, may be substituted. The two former are ameliorating crops, and will be found beneficial where such wastes are of a strong quality of soil, particularly the former, where the land is strong enough for beans. The best substitute for red clover, in such cases, is small seeds for two years, which throws it from the four into the five-shift system.

There are some other methods of improving and bringing these sorts of wastes into cultivation, but which will be seen under their proper heads. See *BOG, SWAMP, MORASS, &c.* Also *SPRING-Draining*, and *SALT-Marsh*.

Planting with willows and osiers may often be highly profitable in such lands.

Third Division of Waste Land.—This includes all sorts of peaty or mossy lands, from those of the smallest depths to those of the greatest, however different they may be in their qualities, textures, and other circumstances. As they vary very greatly in all these respects, as well as in some others, and in the quantities of moisture or wetness which they contain, it is obvious that there must be great diversity

WASTE.

in the means and methods of cultivating and bringing them into a state of improvement. As there is almost always a degree of wetness in them, which is unfriendly to the culture and growth of all or most sorts of plants which are objects of the farmer's attention, it is mostly necessary, but especially in those of the deeper kinds, to free them as much as possible from the excess of moistness which is present, as a first step towards their improvement. This is effected in different ways by different improvers of wastes of this nature, as will be seen below. After which the surface is to be attended to and rendered as even as may be by some proper means, as the nature of it may direct. It is then to be consolidated and rendered more compact by the application of different sorts of weighty substances of the earthy and other kinds, and by all other means by which it can be promoted. This is particularly necessary where such wastes are of a fungous open quality, and may be effected by any sort of materials of the above kinds which are in quantity and at hand. In different cases, sand, clay, marle, and other such matters, may be met with under such waste lands, and answer the purpose very effectually at but little expence.

There are improvers of wastes of this sort too, especially where they are of the less deep kind, who pare and burn the surface after the land has been well freed from superfluous water, and by means of the ashes often procure tolerable crops of the corn kind, speedily reducing the surface into good order.

It has been observed, that the great point in reducing wastes of this kind to corn lands is, in the first place, to lay them to dry so as to favour vegetation, but not so dry as to deprive the plants as crops of the necessary moisture. This sort of medium is, therefore, to be carefully attended to; as the value of such lands is not unfrequently diminished by the last as well as the first of these causes.

This sort of waste is of such a porous and open quality, that if deprived entirely of its natural moisture, it will, it is said, admit the drought too greatly for the dews to reach.

Waste land of this kind, several feet deep, is said to be made capable of carrying natural clover, and other fine grasses, in some cases, by no other means than removing the wetness, smoothing the surface, and giving a good covering of ditch scourings, and the mud scrapings of the sides of the roads.

In some cases of wastes of this kind resting upon fine clayey or strong loamy bottoms, they are floated away, in case a stream sufficiently strong can be procured for the purpose, in the view of the rich soil underneath being reached and brought into cultivation. This process and practice were probably first suggested and had recourse to by the late ingenious and intelligent lord Kaimes, and most successfully and extensively followed out by his son and successor, in the improving of a very large tract of low waste of this sort in the northern part of the kingdom; which is now made to support numerous families, from being wholly barren and unproductive before.

In other cases of a similar nature, the mossy material is not, it is said, floated down by a stream of water, but only improved upon the surface; which is done by cutting a large canal or passage on that side the waste next the fall, which is intended to convey the water from the field or land. Smaller ditches are then cast, which form the field or land into ridges, which are made of more or less breadth, as the waste may happen to be more or less solid, but all terminating in the great cut or passage. The land of the field is next turned over by digging it, and where potatoes are to be the first crop, they are planted in the lazy bed mode

across the ridges; but in case the first crop is to be grain, the earth or soil of the ridges is turned over the lengthways of them, or in the direction of the smaller cuts or openings.

It is thought by the writer of the corrected Report of the Agriculture of the County of Inverness, in Scotland, that of all the different methods practised for overcoming this sort of waste, and for procuring a first crop, none appears to be so successful as potatoes. The mould or soil expands so easily, it is said, that the root gets room to swell and attain its full size. The stem and leaves of the plant retain the dew better than any culmiferous plant; by which means more nourishment is procured, in case the soil and season be dry, and the decomposition of the cloddy earth is promoted: while on the other hand, if the field or land be rather too much overcharged with water, the alleys or openings along the sides of the beds help to draw away what might prove injurious; and lastly, the planting and covering, with the hoeing and digging up of the crop, work the ground more perfectly into the mouldy state.

It is noticed, that whatever may have been the original colour and texture of this sort of land, it, by being wrought for a few years, acquires the appearance and some of the qualities of loam. It, however, takes a long time, if ever it can possess the strength of it, so as to bear a frequent return to white crops; but by suitable judicious changes of turnips, potatoes, and grass, raised alternately with white crops, it may, it is thought, be made to continue any length of time in a productive state.

Some suppose this kind of waste land is best adapted to the raising of grass; and that, for that purpose, more than of growing corn, it should mostly be improved and brought into cultivation. Clover will grow in it, if it be sufficiently dry, it is said; and rye-grass fill better, as it is less delicate. But that the sort of grass that suits it best, is the meadow soft-grass or Yorkshire white. This grows close and quickly, keeps the ground well, and is equally fit for pasture and for hay.

In Lancashire, where extensive improvements of this sort of wastes have lately been effected, and where vast tracts still remain to be improved, the methods of practice in bringing them into such states are in some measure these. In the southern part of the district they are first divided into suitable fields or portions by large open ditches, so cut and formed as to be prevented from being forced in by the pressure of the water that is contained in the land, by which they are freed of a considerable part of it. They have then smaller covered drains formed in them in proper directions for taking off more of the superfluous wetness that may be present, the distances of which are regulated by the nature of the waste, and the quantity of moisture that may be in it. After this the surface is levelled and brought into order by taking off the coarse, hilly, uneven parts, and putting them into large heaps to be consumed in a slow smothering manner, spreading the reduced materials evenly out over the whole, adding a good full covering of clay, marle, or fine lime-stone gravel, some of which are mostly found under the lands.

When they have remained for some time in this situation, they are broken up by a proper plough contrived and prepared for the purpose, by having the irons in a perfectly sharp condition, and by the coulter being so fixed as to operate without resistance. The horses employed as the team in the first breaking up, and sometimes afterwards, are under the necessity of having pattens put upon their hind feet, as this saves the labour of men, except in particular instances of very soft lands of this sort. The cropping is such as has
been

been already seen, but the great objects as first crops are oats, turnips, potatoes, and a few others. By these means, this kind of waste is there frequently soon got into a profitable state.

The tracts of waste of this description in the middle part of this district are chiefly, especially where in the wild state, brought into the improved condition, by paring and burning the surface, the application of marl or lime, and the breaking up for oats. The marl is mostly laid on before the other operations take place. Some think this practice answers well, but much remains to be done, and better modes are to be used for the purpose.

In the northern part of the same district, where great improvements of this nature have been well accomplished in deep unfavourable cases, the most improved practice is now, after a proper quantity of large open cuts have been made for taking away the stagnant water, and for promoting the dryness and solidity of the land, to begin with effectual cutting of drains in the land at nine feet distance from each other, made to the width of two feet and the depth of three, below which a deep opening is formed by a long pointed spade, which is left open, but the whole space above it covered and filled in. When the surface is levelled where necessary, and the land wholly ploughed over by beginning on the sides of the drains, and laying the furrow-lices well over them, it is well harrowed lengthways of the ridges. Then in winter, in time of frost, if it can be done, sand or clay is applied in the quantity of three or four thousand single-horse cart-loads to the customary acre, and spread out evenly over the surface, in which state it and the land remain until the beginning of the spring. It is then barrowed well in, and the land ploughed and sown with oats. In the next spring the land is set with potatoes in drills four feet apart, using a little littery dung, and they are kept repeatedly well earthed up. As soon as the potatoes are taken off, wheat and rye are put in upon one ploughing, and good crops afforded.

In the winter afterwards these stubbles are ploughed down, and in the ensuing spring a compost of some kind of heavy material with lime laid on, and the land sown with barley, which affords good crops.

After the barley, turnips are often had with a slight manuring; and the land then laid down with oats, or wheat and feeds.

Leds red clover than formerly is now sown, but the quantities of trefoil, white clover, and rib-grass, are increased.

This method of improving such land is found the best, and by far the cheapest, after great experience, by a very intelligent improver of this kind of waste land in that part of the county.

The large open ditches and water-courses first made in these lands are now found best formed there with long slopes on one side, so as to have the appearance of a fort of sunk fences, by which means the whole slopes are rendered capable of being covered with some heavy earthy substance, and of being then sown with grass-seeds, so as to afford a sward to the very water's edge; and thereby to admit stock to lie more sheltered and warm, as well as to afford more pasturage.

The practice of paring and burning is here now never had recourse to in bringing this sort of waste land into a state of improvement. The bringing of it into such a state is, it is thought, a process or business that should proceed in a very gradual and regular manner, as there is much loss and inconvenience in pushing it on too rapidly. In all such attempts, as frost is considered by many as having great power and effect in reducing the particles of such soils into a mouldy

mellow condition, they should be exposed as greatly as possible to its action and influence at the time when it takes place, by being laid up for the purpose. See the *Corrected Report on the Agriculture of the County of Lancaster*.

In different districts of the more northern parts of the kingdom, immense tracts of wastes of this kind are almost every where to be met with. In that of the county of *Burgyle*, according to the writer of the account of the state of its agriculture, they are to be found in every parish; and though capable of cultivation and improvement are wholly useless, and of little or no value. They have different depths, as from two or three to eight or ten feet, and differ in size, so that some of them are to be estimated not by the number of acres, but of square miles. They have in some cases every advantage of situation for manure and markets, vast quantities of lime-stone being near on one side, and vast masses of sand and sea-ware on the other; besides many other facilities and conveniences of improvement. There can therefore be no great difficulty in bringing them into such a state, when once it is set about, the means of doing which have been well and ably pointed out, as applicable in different cases, by the writer. It is evident, from what has been already done there, that this sort of waste, though of no utility in its usual state, may be turned to very great account, in many instances, by cultivation. See the agricultural report of the above county.

It has been suggested, that by rendering the extensive turf boggy wastes of this country, Scotland, and Ireland fertile and productive, a very great addition is capable of being made to the wealth of the nation, and to the means of subsistence of its population. See *MOSS, PEAT, TURF, &c.*

WASTE Matters, Useful as Manure, the refuse materials produced in various ways and by different operations; such are, the blood and offal matters of the slaughter-house, the refuse of the skin and leather dresser, the offals of the tanyard and the glue-maker, the waste fat oily matters of some large fishes, (see *WHALE-Blubber*), the waste of soap-makers. See *ASHES, SOAPER'S Ashes, and WOOD-Ashes*.

WASTE of the Forest, is, properly, where a man cuts down his own woods within the forest, without licence of the king or lord chief justice in eye.

Year, Day, and Waste. See *YEAR, Day and Waste*.

WASTE of a Ship. See *WASTE*.

WASTE-Board. See *WASH-Board*.

WASTE-Cloths, in a *Ship of War*. See *FIGHTS*.

WASTE-Trees, in a *Ship*, are those timbers which lie in her waste, or waif.

WASTE-Gates, in *Canals*, are sluices to let off spare water from a canal, mill-dam, &c.

WASTE-Weir, an over-fall or weir for superfluous water in a canal.

WASTEL BREAD, *Wastelli*. This word, which has puzzled bishop Lowth, in his *Life of Wykeham*, &c. appears, by the *Confectudines Glastonienses apud Will. Malm.* to have been a kind of fine bread or rolls, which were served up in our ancient communities when the use of the waffal-bowl was allowed.

WASTERAHS, in *Geography*. See *WESTERAHS*.

WASTERO, a small island on the E. side of the gulf of Bothnia. N. lat. 63° 22'. E. long. 21° 34'.

WASTORELS, or *WASTRELS*, in *Rural Economy*, a term applied to any sort of waste or outcast substances or matters, such as bricks, tiles, slates, and many other such like things, when badly formed, or of a bad kind. The young lambs, pigs, and calves, sold to the butchers, which are improper for keeping as stock, are sometimes also called by this name.

WASTORS,

WASTORS, in our *Statutes*, a kind of thieves so called, and mentioned among robbers, draw-latches, &c.

WASUNGEN, in *Geography*, a town of Germany, in the county of Henneberg, on the Werra; 3 miles N. of Meinungen. N. lat. $50^{\circ} 41'$. E. long. $10^{\circ} 38'$.

WATAGUAKI, a river of Labrador, which runs into the gulf of St. Lawrence, N. lat. $50^{\circ} 12'$. W. long. $60^{\circ} 5'$.

WATAGUAKI *Iles*, a cluster of small islands in the gulf of St. Lawrence, near the coast of Labrador.

WATARA, a town of Hindooftan, in the circar of Cicacole; 14 miles S. of Cossimcootta.

WATARAS, a town of Africa, in the country of Agades; 50 miles N. of Agades.

WATAS, a town of Sweden, in West Bothnia, on the Calix; 50 miles N.W. of Tornea.

WATAUGA, a river which rises in North Carolina, and runs into the Holston, in Tennessee.

WATCH, GUET, a person posted as a spy in any place, to have an eye to it, and to give notice of what passes.

WATCH is also used for a corps de garde posted at any passage; or for a company of guards who go on the patrolle. Some officers are exempted from watch and guard.

In the same sense they say, *night-watch*, *guet de nuit*; *watch-word*, *mot de guet*; *royal watch*, and *city watch*.

Chevalier du guet is a name given by the French to the officer who commands the royal watch, &c.

WATCH, *Vigilia*, in *Roman Antiquities*, a division of their night; being the fourth part of the space of time between sun-set and sun-rising, and consequently varying according to the season of the year.

In the Roman army, there were night-guards or vigiles, *viz.* four in every manipulus, who kept guard three hours, and were then relieved by four others; so that there were four sets in a night, according to the four watches. The way of setting this nightly guard was by a tally or tessera, with a particular inscription, given from one centurion to another quite through the army, till it came again to the tribune who first delivered it: upon the receipt of this the guard was immediately set. Besides, they had the *circuitio vigiliam*, or a visiting of the watch, performed commonly about four times in the night by some of the horse. Upon extraordinary occasions the tribunes and lieutenant-generals, and sometimes the general himself, made these circuits in person, and took a strict view of the watch in every part of the camp.

WATCH, at Sea, signifies the space of time in which one division of a ship's crew remains upon deck, to perform the necessary services, whilst the rest are relieved from duty, either when the vessel is under sail, or at anchor. The length of the sea-watch is not the same in the shipping of different nations. It is always kept four hours by our British seamen, if we except the dog-watch between four and eight in the evening, that contains two reliefs, each of which is only two hours on deck. The intent of this is to change the period of the night-watch every twenty-four hours; so that the party watching from eight till twelve in one night, shall watch from midnight till four in the morning on the succeeding one. In France the duration of the watch is extremely different, being in some places six hours, and in others seven or eight; and in Turkey and Barbary it is usually five or six hours.

A ship's company is usually classed into two parties: one of which is called the starboard, and the other the larboard watch. It is, however, occasionally separated into three divisions, as in a road, or in particular voyages.

In a ship of war, the watch is generally commanded by a lieutenant, and in merchant-ships by one of the mates: so

that if there are four mates in the latter, there are two in each watch; the first and third being in the larboard, and the second and fourth in the starboard watch: but in the navy, the officers who command the watch usually divide themselves into three parts, in order to lighten their duty. Falconer.

WATCH-Glasses, in a Ship, are glasses employed to measure the period of the watch, or to divide it into any number of equal parts, as hours, half hours, &c. so that the several stations therein may be regularly kept and relieved, as at the helm, pump, look-out, &c.

To set the watch, in Sea Language, is to appoint one division of the crew to enter upon the duty of the watch; as at eight o'clock in the evening.

WATCH, Death. See DEATH.

WATCH, in *Horology*, is a portable machine that measures and indicates the successive portions of transient time. This useful piece of mechanism, when planned on the best scientific principles, and executed in the most perfect manner, contains within itself a collection of inventions, that have exercised the skill of the most ingenious mechanists through a succession of three if not four centuries; and when we contemplate the curiously-contrived and nicely-adjusted means by which the never-varying period of our globe's rotation on its axis is divided and subdivided into hours, minutes, and seconds, we need not be surprized that a *Paley* has selected this curious machine as a striking specimen of human ingenuity.

It is a matter of difficult research to ascertain what artist first reduced the portable spring-clock into the size of a watch, which is supposed to have been first effected in Germany; but it is evident that watches had become common in France before the year 1544, in which the corporation of master clock-makers in Paris had a statute enacted, to ensure to themselves the exclusive privilege of making, and of causing to be made, clocks, alarums, and watches, large or small, within the precinct of the said city.

The small clocks and watches, however, which were made antecedently to the time of Huygens and Dr. Hooke, were very imperfect performers, and professed not to subdivide the hour into minutes and seconds; the double lever, and the balance arising out of it, were very imperfect regulators of the motion, produced in the train of wheel-work by the maintaining power, inasmuch as they were under the influence of various opposing agents, such as friction arising from coarse workmanship, the inertia of matter, resistance of the air, &c.; the consequence of which was, that the weight of the moving balance was to be determined by experiments, such as would be a proper counterpoise to the agency of the main-spring on the moving train, and at the commencement of each returning oscillation, a considerable pause took place, which made a part of the measure of time to be indicated. These inconveniences at length were obviated by the introduction of a balance-spring, which became to the balance what gravity is to the pendulum; and the acceleration given to the moving balance during the first half of the oscillation, is thus sufficient to overcome the resistance opposed to its motion during the second half; and when the shape, length, and strength of the regulating spring are duly proportioned, its isochronal performance approaches very nearly to the regularity of the pendulum. The contest for the honour of this useful invention was warmly disputed between Huygens and Dr. Hooke, for several years subsequently to 1658; but if priority of publication can be considered as a proof of priority of invention, the palm is due to our ingenious countryman.

In our articles CHRONOMETER, CLOCK, COMPENSATION-Balance,

WATCH.

Balance, DIAL-Work, ESCAPEMENT, POWER, Maintaining, and REMONTOIR, we have anticipated the consideration of the most material parts of a watch, and have given such a detailed account of most of the varieties that occur in the practical construction of this machine, that little remains to be done in this place, but to describe an ordinary watch, without reference to its history, scientific principles, compensations, or superior workmanship; all which have been amply diffused, and the constituent parts explained by accurate engravings of the corresponding mechanism. We may, however, comprehend in this article the appendages which have been applied to or actuated by the common watch, for the purpose of either amusement or utility in civil society, such as chimes, alarms, striking-work, and repeating mechanism, most of which operate as a drag upon the works, and are therefore never introduced in chronometers, and seldom in watches of the most perfect construction.

Fig. 1. Plate XLIV. of Horology, represents the interior works of an ordinary watch with the crown-wheel escapement, as they remain on the pillar-plate when the upper plate of the frame, shewn by *fig. 5*, is unpinned and removed; and *fig. 2*, which is a section of the whole frame and of its contents, shews the connection of all the parts, as though the calliper were in one right line. These two figures, by having the same letters of reference, mutually explain each other. The main-spring, which actuates all the wheels and pinions that are called in one general term the movement, is contained in the circular box *a*, seen in different views in the separate figures 1, 2, and 3, in the last of which its parts are given in their detached state, *viz.* the box; the relaxed spring immediately above, lying in a spiral form; the arbor with its pin, on which the interior end of the spring is hooked; and the lid through which the pivot of the arbor penetrates: this spring is forced into the box by a tool on purpose, when it is strong, and then the exterior end is hooked to a pin in the circular edge of the box, so that if the box is made to turn round while the arbor is held fast, the spring begins to coil at the centre, and is thereby wound close round the arbor, and is by this action said to be *wound up*. The same effect would be produced if the box were held fast, and the arbor only were turned; but in the latter case the chain, which requires to be uncoiled from the spring-box as this spring is wound up, would remain unmoved; it is necessary therefore that the box be turned while the arbor is at rest, which is thus effected: one end of the chain is made fast to the side of the spring-box, and the other to the fusee *b*, after being coiled several times round the circumference of the box; then as the square end of the spring-box arbor is held by the small ratchet and click *c*, seen on the reversed face of the pillar-plate in *fig. 7*, so that it cannot revolve, it is obvious that inserting a key on the square of the fusee-arbor, and turning it in a proper direction, will wind the chain upon the spiral-groove of the fusee, while it is unwound from the box; and during this operation the spring will be coiled up to the centre of the box, or be put into its state of greatest tension for pulling the fusee back again. The rapid motion which the fusee would have in a retrograde direction, when pulled by the whole force of the coiled spring, is prevented by the train of wheel-work and balance thus; the great wheel *d* is not fast to the thick end of the fusee, as appears in the drawings, but carries a click and click-spring *2*, as seen in *fig. 3*, while the ratchet-wheel, seen in *fig. 4*, is made fast to the fusee; the consequence of which contrivance is, that while a key applied to the fusee-arbor winds up the watch and fills the fusee-groove with the chain, until the guard driven by it catches the beak at the small end of the fusee;

the click in *fig. 3*, slides over the sloping teeth of the ratchet in *fig. 4*, without acting on them, and thus leaves the great wheel *d* at rest, in connection with the pinion *e*, on the centre or minute-wheel arbor; but when the spring acts on the fusee in a contrary direction, the click attached to the great wheel is laid hold of by the teeth of the ratchet, which thus makes it fast to the end of the fusee, so long as the chain is unwinding from the fusee; or, in other words, till the spring wants winding up again, which happens usually once in 28 or 30 hours; but it is commonly wound up once in every 24 hours, more or less. The action of the great wheel *d* on the pinion *e*, is that of a long lever driving a short one; or this wheel may be said to act under a mechanical disadvantage, where an increase of velocity, but a loss of power, is experienced by the pinion; again, on the same central arbor of this pinion *e* is riveted the centre-wheel *f*, which revolves in an exact hour, as we shall see presently, and this wheel drives the pinion *g*, on the arbor of the third wheel *h*, also with a mechanical disadvantage, for the force it imparts to the pinion *i*, on the arbor of the contrate-wheel, is again diminished in the ratio of the diameter of the wheel to that of its pinion; thus, the force of the main-spring is continually diminishing, as it is transmitted through the train, and when the contrate-wheel comes to be actuated, it has just force enough to drive the horizontal pinion on the balance-wheel *l*, so that the alternate impulses given by its teeth to the pallets of the balance-verge are just sufficient to perpetuate the oscillations to the right and left, under all the obstacles of friction, dirt, wear, and the air's resistance. It is a curious fact that this crown-wheel escapement, though the *oldest* that we know of, is still the most in use in common watches, probably from the facility with which it is constructed; for certainly it is more under the influence of the irregularities of the main-spring's force than any other escapement. The properties and action of this escapement have been minutely explained under No. 1. of the article ESCAPEMENT, with reference to *fig. 6. Plate XXXI. of Horology*, to which explanation and figure therefore we request our reader's attention.

In order that the force applied to the pallets of the verge at each oscillation may not sensibly vary, it was found necessary to equalize, as much as possible, the variable forces of the main-spring in its different states of tension; and the most practicable way of doing this has been found to convert the cylinder on the arbor of the great wheel, which would have been proper for a gravitating body, used as a maintaining power, into a figure of a parabolic form, that is, into a solid, generated by the revolution of a parabola, in order that, as the force of the spring becomes greater by increased tension, its action on the great wheel might be lessened in a similar proportion, by a gradual decrease of the radius of the fusee, round which the chain is wound, to impart the force thus modified. Every separate spring, therefore, has not only its average force proportioned to the balance it is destined to actuate, when diminished by transmission through a given train, but requires its *scale* of varying forces to be nicely counteracted in every degree of tension by the *shape* of the fusee; and this is done by means of a tool, called a fusee adjusting-tool, which is nothing more than a lever with a sliding weight attached to the squared end of the fusee-arbor, as represented in *fig. 10. Plate XXI. of Horology*; for when the weight on the lever is an exact counterpoise to the force of the main-spring in every part of the successive revolutions of the fusee, as the spring is wound up by the lever instead of a key, then the shape of the fusee is proper, but not otherwise. Hence, whenever a new main-spring is put into a watch, the fusee ought to be adjusted in
the

WATCH.

the fusee-engine accordingly as the adjusting-tool determines. The comparative forces of the spring at the two extreme ends of the fusee may be adjusted by the small ratchet *c*, on the back of the pillar-plate in *fig. 7*; but when the spring is put to a suitable degree of tension to act well at both extremities of the fusee, it must not be altered by the ratchet-click, but the intermediate forces must be equalized by a due shape given to the fusee. We have insisted the more on this part of the mechanism being attended to, because, as the *primum mobile*, it is the basis of all the other motions. The number of rounds that the spiral of the parabolic fusee may be cut into, depends on the length of the pillars of the frame, or, which is the same thing, on the shallowness of the watch. The French frequently leave out the fusee, and attempt to equalize the forces of the main-spring by tapering it, and with detached escapements this mode may sometimes answer tolerably, but with the crown-wheel escapement a fusee is indispensable. Again, the number of teeth in the great wheel, and in the centre pinion, depends on the number of rounds in the spiral of the fusee; in a 30 hours watch, with six turns of the fusee, the

great wheel must have $\frac{30}{6}$, or 5 times as many teeth as the

centre pinion; so that if this has 6 leaves, the wheel must have $5 \times 6 = 30$ teeth; but if 8, then $5 \times 8 = 40$; if the spiral has 7 turns, the great wheel 48, and the pinion 12,

then the time of going will be $\frac{48}{12} \times 7 = 28$ hours; also if

there be $5\frac{1}{2}$ turns on the fusee, 50 teeth in the wheel, and 10

or $\frac{50}{10} \times 5\frac{1}{2} = 5 \times 5\frac{1}{2} = 27\frac{1}{2}$; but if 24 hours only were

required as the period, with 6 turns and a pinion of 12, the great wheel would be required to have 48. Thus, when an alteration is made in either the pinion, the wheel, or the turns in the fusee, a corresponding variation may be made in the others, to produce the same period of going, but still the centre-wheel revolves once in an hour. In the commonest watches the pinions have only six leaves each, which do not act so well as pinions of higher numbers; but in the best watches, and in all chronometers, the leaves and teeth are more numerous. The pivot-holes, particularly of the verge and escapement-wheel arbor, have jewels for the purpose of diminishing the friction in the best watches; but detached and remounted escapements are the best correctives of the unequal impulses given through the medium of the train in the different states of its foulness. The potance *m*, and small or counter potance *n*, that hold the pivots of the balance-wheel, are small cocks seen in *fig. 2*, both in their attached and detached states, and are screwed to the top or upper plate within the frame, but the springs, buttons, and joints of the case are not exhibited, as forming no part of the movement. *Fig. 5*, represents the outer face of the upper plate, with the balance *b*, cock *o*, and balance-spring *s*, called the pendulum-spring, from its having the properties of the pendulum; by means of this spring not only is the regulation made steady, but the adjustment for time is effected. In every balance-spring there is a certain length, to be taken as the effective length, by which the going of the watch, to which it is applied, is limited to exact performance, and when this length is determined by experiment, a pin is put in the stud that holds the exterior end, as at 4, in *fig. 5*, to prevent its being altered; but as the variation of temperature will alter the momentum of the moving balance, the effect thereby produced is a loss of time, in the rate, in hot

weather, and a gain in cold, by an alternate increase and decrease in the dimensions of the balance itself, as well as by some alteration in the spring: to remedy this defect, in an ordinary watch, the contrivance shewn in *fig. 6*, is introduced; the wheel *t* is placed under the graduated circle *r*, seen in *fig. 5*, and a circular rack *u*, *fig. 6*, that holds the curb or slit-piece *5*, seen in both figures, is moved by a sliding motion given to it, when a key is applied to the squared arbor of the figured circle, and thus the effective length of the spiral spring is limited by the position of the curb *5*; and accordingly as the key is turned forwards or back, towards the words *fast* or *slow*, engraved on the cock, the shortened or lengthened spring alters the rate of going, till the proper length is found, that suits the season in question. In Harrison's time-piece the curb was moved by an expansion-lever of two metals, that acted by means of the change of temperature; but in the best chronometers of more recent date, the compensating levers constitute the three portions into which the rim of the balance is divided, and the adjustment for time, as well as compensation for temperature, are by means of heavy screws, which form a part of the moving balance. In these more perfect machines, the length of the spring, which is now made helical, or cylindrical, is first determined such, that the long and short vibrations are performed in the same time, and this is called the isochronal length, which is not afterwards altered by subsequent adjustments. But of these niceties we have treated more fully under our long article CHRONOMETER. The last portion of the watch, which demands our explanation, is the dial-work, for producing the hours and minutes; this will be easily understood by a reference to figures 2 and 7: when the pinion, called the cannon-pinion, seen near the minute-hand in *fig. 2*, is inserted on the arbor of the hour or centre-wheel, to which it fits rather tight by friction, it revolves therewith in an hour, and receives the minute or long hand on its protruding squared end; then this pinion drives the wheel *x* round a stud on the pillar-plate, and with it a pinion *v* made fast to its centre; which pinion again drives a second wheel *v* round the tube of the cannon-pinion in twelve hours, and to this the hour-hand is attached. This diminution of twelve revolutions from the cannon-pinion to the hour-wheel might be effected by one pinion driving a single wheel of twelve times its number of teeth; but as the motion must be brought back to the centre of the dial again, two more wheels, or a wheel and pinion, are necessary to be introduced, and these are therefore made a part of the train, and no large wheel or small pinion is wanted, for the ratio 12 : 1 may be more conveniently obtained by two factors, *viz.* 4 : 1 and 3 : 1; thus, suppose the cannon-pinion to have 15 leaves, its wheel may have $4 \times 15 = 60$ teeth for wheel *x*, and if wheel *v* be made the same its pinion will be $\frac{60}{3} = 20$, and the train $\frac{60}{15} \times \frac{60}{20} = \frac{360}{30} = \frac{72}{6}$ or $\frac{60}{5} = \frac{12}{1}$ or 12; so that when the pinions are fixed upon for the dial-work, the wheels are readily determined, and *vice versa*. Under our term CLOCK-Movement, we have given three tables, containing the several varieties of the three different portions of a clock-movement, which are equally applicable to a watch-movement, and we presume will be found useful to the practical workman, who is disposed to vary his construction to shew seconds, or for other particular purposes. The following table, somewhat differently arranged, was published by W. Shirt, balance-wheel and fusee-cutter, No. 25, Coleman-street, Bunhill-row, London, with which we will conclude this division of our article.

WATCH.

A TABLE of Trains for Watches, shewing the Number of Turns on the Fufee and Teeth in the Balance-wheel, with the Beats in an Hour, and the Number of Seconds in which the Contrate or Fourth Wheel revolves, for the easy Timing of Watches by the Vibrations of the Pendulum.

If we divide *double* the product of all the four wheels by the product of all the three pinions, the quotient will be the number of *beats* as given in any of the trains contained in this table; also, if we take the second and third wheels and their pinions respectively, as a compound fraction of an hour, they will give the *seconds* in which the contrate-wheel, attached to the latter pinion, will revolve; and, if the beats be 18000, or 14400, there will be five or four beats respectively in a second, which are the best trains for measuring fractional parts of a second.

French Repeater.—The mechanism which constitutes the

repetition portion of a French, and also of a Swiss watch, was originally employed by Tompion, Quare, and other English artists, and is represented by the various figures contained in *Plate XLV. of Horology*; it is easier of construction than the repetition-motion of Stockten, which follows, but is not considered so perfect. We have put the same letters of reference to the detached parts, that stand near them in the larger figures, where they occupy their respective situations; and that the reader may be able to accompany us through our description of the action of the relative parts, we will explain previously the appellations by which the workmen designate these acting pieces. In *figs. 1.* and *2.* A denotes the pendant-bow, carried at the end of a cylindrical piece, called the pendant, and the hollow piece, into which it is occasionally pushed, is the pendant-socket; BCD the triple lever is called the *crémaillère*; E is a fixed pulley; and F the hour-snail, by which the number of hours to be struck by the hour-hammer is limited; H is the star-wheel, to which the hour-snail F is fixed fast; IK is the *tout-ou-rien* and G its spring lying on its plane; L and N are the two sets of teeth, that take hold of the hammer-tails, which strike quarters by double blows; O is one of the quarter hammer-

mer-tails, and Q, or Q 5, the other, which is attached to the hammer that strikes also the hours; S is the quarter-fnail that determines the number of quarters to be struck at any time, when the hour-hammer has struck the hours, and has three steps or arcs of different radii, presented successively to the part that acts on, or rather rests on it; 7, 8, is the loose piece attached to, and secured under the quarter-fnail S; *a* is the end of the middle lever of the crémillère; *b* the jumper, that makes the star-wheel jump a whole space when a tooth, in raising it, has arrived at its angular point, so as to give its spring *d* its full tension; *e* is the chain made fast at one end to the crémillère at D, and after passing round the pulley E, attached at the other to a second pulley Z, which is inserted on the arbor of the repeating main-spring, *f* is the quarter-piece spring, pressing on a pin in the quarter-piece M; *h* is the quarter hammer-spring; *i* its counter-spring; *g* the quarter hammer-tail spring; *p* the hour-hammer spring, and *o* its counter-spring; *q* is the hour-hammer quarter tail-spring, and *r* the gathering piece or arm fixed on the arbor of the great wheel of the repeating train of wheels, over the pulley Z, that causes the quarter-piece to act on the hammer-tails, and is the same arbor which we have before called the arbor of the repeating main-spring. These are the pieces of mechanism that lie under the face of the watch, and appear above the frame when the face is removed, together with the dial-work represented by the dotted circles in *fig. 1*, but by unshaded wheels and pinions in *fig. 2*, that the other parts might not be concealed below them. *Fig. 3*, contains the works under the upper plate of the frame, of which the repetition-train (*petit rouage*) only is shaded, the ordinary movement being given in outline. The connection between the pieces exhibited in *figs. 1* and *2*, and the repetition train in the frame, shown in *fig. 3*, is by means of the arbor of the great wheel and its circular rack G, seen in this figure, for this arbor protruding above the upper plate of the frame receives on its square the main-spring of the repeating mechanism, and also the gathering-piece *r*, so that whenever this main-spring, exhibited in *fig. 4*, is wound up, the ratchet on the great wheel, seen in *fig. 5*, allows the great wheel to move with it without the rest of the repeating train; but when the spring unbends itself, and pulls the chain and attached crémillère back, the click of the ratchet catches and actuates the whole train, which terminates with a fly on the last pinion-arbor, as in the striking part of a clock, and thus regulates the velocity with which the hammers respectively strike.

We will now proceed to explain the action of the repeating mechanism, which we have described above, and see how the effect is produced by means that are thus apparently complex. When the pendant has been pushed in slowly a short space, the end *a* of the middle prong of the crémillère, being kept down by the small cock Y, approaches one of the steps of the hour-fnail F, and at the same time pulls the chain, by means of the prong D, round the pulley or friction-roller E, and winds up the main-spring coiled in the box of pulley Z, at the same time making the gathering-piece *r* retrograde from its pin, inserted into the quarter-piece; in *fig. 1*, this motion is just commencing from a state of quiescence; suppose now, the retrograde motion of the gathering-piece to take place, while the pendant is pushed very slowly in; and conceive the circular rack on the face of the large wheel within the frame, *viz.* G in *fig. 3*, to be retrograding also, as being on the same common axis; presently the end *a* of the third prong of the crémillère meets with one of the steps of the hour-fnail, and pushes against it; this fnail, and its at-

tached star-wheel, having their common pivot borne by the *tout-ou-rien* at H, communicate the push received by them to this piece, which turning on its centre of motion at I, has its remote or loose end K carried from its quiescent position, notwithstanding the opposing action of its spring; and when considerable force is applied to push the pendant home, this end K, which forms a detent to the quarter-piece at the points of their contact, quits its hold, and leaves the quarter-piece at liberty to be urged by its spring *f*, till its heel-piece *c* drops upon one of the steps of the quarter-fnail, as in *fig. 2*, where it is seen resting on the third step, or shortest arc. At this instant the repeating main-spring begins to relax itself, and brings forward the concealed rack G, (*fig. 3*.) which had retrograded as many teeth only as the hour-fnail permitted, before the *tout-ou-rien* was displaced; its nearest tooth to the tail-piece 2, 3, of the hour-hammer R R, catches now this tail-piece, and makes the hammer strike on the circular rim of steel, which is substituted for a bell, and as many blows are given in succession, as there are teeth in the rack to fall against the hammer-tail, while the repeating train is running down; and during the time in which these strokes are going on, the little pin between the hammer-tail spring *p*, and its counter-spring *o*, may be seen moving backwards and forwards, as though it gave the strokes on the counter-spring. No sooner are the hours limited by the hour-fnail struck, than the gathering piece *r* returns with the relaxing spring, till it catches the pin of the quarter-piece, which piece is moveable round a pivot at M, and is now gradually brought back by its pin till one of its teeth N catches O, the tail-piece of the quarter-hammer P, *fig. 3*, and then one of the teeth at L, at the opposite end of the quarter-piece, catches Q the upper tail-piece of the hour-hammer, which instantly repeats the blow with the hour-hammer, and thus as many double blows are given by the two hammers in immediate succession for the quarters, as there are teeth to act on the said tail-pieces, when the quarter-piece begins to return; and this number entirely depends on the step of the quarter-fnail S, on which the heel-piece falls, when the *tout-ou-rien* is displaced; hence if any blow is given, all the blows that the two snails limit will be given, from which necessity, the piece *tout-ou-rien*, (all-or-nothing,) takes its name. But lest the quarter-piece should return by a jerk before the *tout-ou-rien* has produced its full effect, the angular point *m* of the quarter-piece, in its return, slides down the interior face of the *tout-ou-rien*, in opposition to the action of its spring G, while the strokes of the quarters are making, and arrives at the point K, at the termination of the strokes, thus performing the office of a train and fly, after which the *tout-ou-rien* resumes its quiescent position, and its end becomes a detent to the quarter-piece. It is not necessary to describe the action and re-action of the two hammer-tail pieces, which perform their operations, as in the striking work of a clock heretofore described; but it may be proper to shew how the lower tail-piece 3, 4, of the hour-hammer is detached from the rack G, *fig. 3*, while the quarters are struck, by means of the upper tail-piece Q acting with the teeth of the quarter-piece at L only; this will be best understood by a reference to the detached figures in the group denoted by *fig. 6*, as will also the action of several other parts, which we have described and explained as being in their places in *figs. 1* and *2*; the three pieces marked Q 5 are the same quarter tail-piece seen in different views, 2 C 1 R, is a part of the hour-hammer, and its arbor 6 passes the socket of the piece 3, 4, which we have called the lower tail-piece of the hour-hammer, before it receives the upper tail-piece Q on its square;

now the part 3, 4, is that which takes hold of the circular rack G in *fig. 3*, and is thus occasionally detached from the said rack; viz. its pin 3 ascends through the upper plate of the frame, so that its superior end is visible at 3 both in *fig. 1*. and *fig. 2*, and falls in the way of the extreme end of the quarter-piece, which, on its return from the quarter-fnail, catches it and turns the piece 3, 4, round the central arbor 6 of the hour-hammer, and thereby takes the end 4 out of the circular rack, while the quarters are being struck, but whenever the hours are to be struck, the proper spring restores the due position of the tail-piece. As the repeating train of five wheels, and as many pinions, are introduced to give motion to the regulating fly, it is of no consequence what the numbers of their teeth be, provided they be duly proportioned to act smoothly, and to produce the requisite velocity for the proper intervals between the successive strokes. The dial-work for hours and minutes is the same as in any ordinary watch, except that the quarter-fnail is attached to the cannon-pinion, and lies under it, so as to partake of its hourly motion, together with that of the minute-hand, shewn in dots, as being above the face, the piece, however, in *fig. 6*, denoted by the figures 7, 8, and called the loofe-piece, (or surprife,) is also fast by friction to the same hour-arbor, and revolves contemporaneously with the snail and minute-hand, and when its pin 8 meets with one of the points of the star-wheel H, it moves it forwards until the angular point on the face of the jumper *b* has passed an opposite point of the star, when it will jump or move at once the remainder of the space; in this star are twelve points, and as the hour-fnail, which has twelve steps, is made fast to it, the snail also jumps to the succeeding step once every hour, while the three steps of the quarter-fnail follow one another by a constant slow motion, keeping pace with the minute-hand. Hence the times at which the respective hours and quarters are to be struck, corresponding with the positions of their proper snails, are guided by the common dial-work, and when once they are duly adjusted, a motion given to the minute-hand, by a suitable key, will always keep both the snails in their requisite positions for regulating the number of hour and quarter strokes, that the face of the clock has indicated by the hour and minute-hands; and in the same way the quarters even of the minute might be repeated, if such addition were deemed desirable. In our *figs. 1* and *2*, we have put the characters of the hours on the rim or edge of the case, as the face is removed, merely to shew how the hands, pointing to the divided spaces, are connected with the snails of the repeating mechanism. From this explanation, it will appear that the movement of the watch is not at all affected by pushing in the pendant, nor yet by the motions of the repeating parts, otherwise than as the heel of the quarter-piece falls against the quarter-fnail carried by the cannon-pinion, and at the moments when the loofe-piece, under this snail, moves the star at its hourly period; but trifling as these obstacles may appear in a common watch, they are seldom, if ever, introduced into a chronometer.

In the construction which we have here described, a large semi-circular rack and pinion are sometimes substituted for the chain and pulleys, in which case the rack is attached to the crémaillère, and the pinion to the arbor of the repeating main-spring; and it is obvious that such a substitution will remove the objection to the liability of the chain's breaking, and the consequent derangement of the works.

English Repeater.—The construction of the repeating motion, called, after the name of its inventor, a *Stockten* motion, differs in many respects from and is very superior to the original repeating motion, which, with a very little alteration

in the mode of arranging its parts, is now generally known by the term *French* motion: this appellation is however improper, since the repeating watch is indisputably an English invention, the merit of which was disputed by Tompion, Quare, and other English watch-makers of celebrity of the last century.

Stockten was an Englishman, but his history, like that of many other ingenious men, is so little known to posterity, that even his ipsosorial appellation is lost, and his birth-place unknown; all that can with any certainty be recorded respecting him is, that he lived in London, and worked for the celebrated Mr. George Graham, watch-maker and F. R. S. the successor to Mr. Tompion, the motions of whose repeaters were always made upon this construction. The houses of Mudge and Dutton, Fleet-street; of Ellicott, Royal Exchange; and of Vulliamy, Pall-mall; who, for many years after the death of Mr. Graham, were the principal makers of repeaters in London, constantly employed this construction of motion; and it is now generally made use of by all the London watch-makers in the manufacture of their best repeaters.

To enumerate very briefly the advantages of this repeating work, its main-spring is wound up by a rack and pinion; from its construction the action of the parts is uniform and gradual, and not depending on several springs, whose actions interfere with each other; and moreover it is susceptible of being made to strike the half-quarters, without inconvenience or additional work.

To understand the general action of this repeating motion, it is necessary to be well acquainted with its construction, the detail of its parts, the manner in which the different pieces come together, and their separate actions. The pieces composing the pendant work, and the action of the pushing-piece upon the crémaillère, or, as it is generally termed in this construction of a repeating motion, the *rack*; the brass edge, and its use and mode of being fixed to the pillar-plate; the dial, and the manner of fixing it to the brass edge, and the hands; the repeating main-spring and its barrel; the barrel arbor, and the mode of hooking the spring into the barrel; the repeating train of wheels, or, as they are frequently called, the running train, and the situations of the hammers, relative to the wheels between the plates, and their respective uses and actions are all so nearly the same as in the common motion, previously described, that any further description becomes unnecessary: the ratchet, click, and click-spring of the great wheel of the repeating train, are also the same; but the ratchet-wheel G, of twelve teeth (*fig. 3. Plate XLV.*) which in the common motion acts upon the hour-hammer, is in this construction of the repeating motion omitted.

In *Plate XLVI. fig. 1.* represents the repeating work complete in its quietest state, with the wheel Q of 48, the hour-fnail F, retrograding ratchet P, and wheel of communication R; and also the lantern-pinion *v*, quarter-fnail G, and hour-wheel S; by which parts the motion is communicated to the hour-hand, and the hands carried round, perfectly detached from the other parts of the motion.

Fig. 2. represents the repeating work complete, as it appears at the instant of unlocking; the arm *f* of the piece D bearing on the hour-fnail F, the arm *y* of the quarter-rack on the quarter-fnail G, the little all-or-nothing piece I disengaged from the piece K, and the hammer-tails L and M in a proper situation to be acted upon by the hour and quarter ratchets N and O.

Fig. 3. represents merely the rack A B and pinion C; the piece D; and the two all-or-nothing pieces H and I, in their relative situations to one another on the pillar-plate, the rest of the work being supposed to be taken off.

WATCH.

Fig. 4. represents the pinion C, and the hour and quarter ratchets N and O, separate in plan, and in profile; and also a section of the three together.

Fig. 5. represents the cannon-pinion *w* seen from above, as well as below; and also in perspective, with the quarter-snail G attached to it.

Fig. 6. represents the wheel Q of 48, the hour-snail F, the retrograding ratchet P, and the wheel of communication R, separate in plan, and in profile; and also a section of them together.

Fig. 7. represents the hour-snail F on the wheel Q of 48, and the little spring *z* in the notch of the socket of the hour-snail.

The rack A B (see *Plate XLVI. figs. 1, 2, and 3.*) is the piece first put in motion when the watch is made to repeat, and is that by the action of which with the pinion C of twenty teeth, concealed in *figs. 1. and 2.* by the hour and quarter ratchets N and O, the main-spring of the repeating part is wound up; this rack may be considered as a portion of a very large wheel, whose axis or centre of motion is placed, as near as it conveniently can be, to the edge of the watch: this axis is a hollow tube, passing through a well fitted hole in the pillar-plate, and pivoted into the upper plate; (the reason of its being a tube will be presently shewn;) it is set upright in the frame, and consequently at right angles to the face of the pillar-plate; hence it follows, that the rack, which is also fixed at right angles to its axis, moves parallel to the pillar-plate, and is placed as near the plate as it can be, to move freely without rubbing it; the rack is cut into twenty-two teeth. Immediately connected with the rack are the two pieces D and E, called, the piece D the unlocking-arm, and the piece E the quarter-rack: the use of the piece D is twofold; first, to determine the number of blows to be struck by the great or hour-hammer, by means of its arm *f*, which, when the watch is made to repeat, comes to bear upon one of the steps of the hour-snail F; second, to unlock, or, as it is commonly termed, discharge the striking. This effect is produced, as will be explained hereafter, by a motion of the piece D peculiar to itself. This piece D is attached to the rack, at its greatest distance from its centre of motion, by the screw 1, which screw is tapped into the rack up to a shoulder, leaving a plain part equal to the thickness of the piece D, and as much more as is necessary for the piece not to be bound, between the under side of the screw head and the upper surface of the rack; and the hole in the piece D, through which this screw 1 passes, is made to fit very correctly on the plain part of the screw, upon which it moves as its centre of motion. The quantity of motion of the piece D is determined by a circular hole at its other extremity, through which the axis of the rack passes, somewhat larger than that axis, which, in order to pass through the end of this piece D, and for it to act against, is purposely prolonged above the surface of the rack, a very little more than the thickness of this same piece D: in *fig. 3.* the quarter-rack and the cock *a* are omitted to shew the shape of this piece.

The quarter-rack E, situated above the piece D, has its centre of motion within the centre of motion of the rack A B, or considering the centres of motion of both the pieces as lines, they may, under that supposition, be considered as possessing one common centre of motion: this rack is also fixed at right angles to its axis, which passes through the tube that forms the axis of the rack A B, the whole length of that axis to the upper plate; the under side of this quarter-rack bears upon the top of the tube, or centre of motion of the great rack, which terminates a little above the centre of motion of the piece D, as has been before mentioned; and the upper extremity *e* of the axis of this

piece is pivoted into the cock *a*, *figs. 1 and 2*, which cock is screwed fast to the pillar-plate Y Z: in this manner is the quarter-rack confined in its place between the upper end of the hollow arbor of the rack A B, prolonged through the piece D, as before described, and the under side of the cock *a*. The use of this piece is to determine the number of quarters, if any, or the half-quarter, as the case may be, to be repeated after the hour: this effect is produced by the action of one, and one only, of the eight teeth at the end of the rack, on the little *all-or-nothing* piece I; and according to the tooth which so acts, the watch, after having repeated the hour, repeats the half-quarter, the quarter, or the quarter and half-quarter, &c. as shewn by the hands; or if the minute-hand has not passed the 7^m and 30^s after the hour, the first tooth of the eight causes the repeating to cease immediately after the repeating of the hour is completed. Which of the teeth shall act on the little all-or-nothing piece is determined by the advance of the quarter-rack, which is regulated by the step on the quarter-snail G, upon which the arm *y* comes in contact, when the watch is made to repeat. The arm *y* is made a separate piece from and fixed to the quarter-rack E, by means of the screw 2, on which screw it moves as its centre of motion, in the same manner as the piece D moves on the screw 1, and is kept in its place by the spring *g*: the reason of this piece being thus made, is to prevent the possibility, in the case of the watch being made, to repeat exactly at the quarter, of the repeating work stopping the watch, by the arm *y* holding back the quarter-snail, during the striking of the hours: the arm *o*, which is a portion of the quarter-rack, by its action with the retrograding-ratchet P, brings the hour-snail F into its proper place to receive the arm *f*, of the piece D. The quarter-rack E is kept in its place by the pin 3, tapped into the piece D, which bears against its edge; and is carried forward when the watch is made to repeat, by the action of its spring *b*, which is screwed to its extremity the farthest from the centre of its motion, and set up by its other extremity being confined in a notch in the cock *a*.

The total surface of the piece D rests on the rack A B, and, consequently when, in the act of unlocking, it moves on its centre, or screw 1, its under face rubs on the surface of the rack A B; but the quarter-rack E, on the contrary, is entirely detached from, and does not touch the surface of the piece D, its under side bearing upon the prolonged arbor of the rack A B, through the hole in the piece D; and is kept down by the cock *a*, which bears against the shoulder of its upper pivot, as has been before mentioned. There is what is termed, in the peculiar dialect of watch-makers, a *light* between the under side of the rack and the pillar-plate, and between the under side of the quarter-rack and the piece D; and from their construction, it is evident that they move in planes parallel to one another, and to the pillar-plate.

Having described the rack, and the parts connected with it, we will next in order proceed to the description of the pinion C, and the hour and quarter ratchets N and O attached to it, and also their mode of connection, by which the hammers are raised to cause them to hit the blows, or to *strike*. The larger of the two ratchet-wheels, N, the one next the pinion, has originally been cut into twenty teeth, of which twelve consecutive teeth are left; then three more teeth, at an interval apart from each other, and from the last of the twelve teeth, equal to the space of a tooth; the remainder of the teeth, that occupied the space from the last of the three to the first of the twelve teeth, are taken away. The upper ratchet, O, which acts on the small hammer, has been originally cut into ten teeth, of which only four consecutive

WATCH.

cutive are left. The pinion C fits by a long square hole on the arbor of the great wheel of the running train, prolonged through the pillar-plate, which arbor is pivotted into the upper plate, and the cock *b*, which is screwed to the pillar-plate. The hour ratchet, of fifteen teeth, is fitted to this pinion C, by means of a socket, attached to and forming part thereof; and the upper ratchet, of four teeth, is attached by a hole through its centre, in a similar manner to the under ratchet; and the two are firmly held together, and also to the pinion, by means of two screws which pass through them both, and are tapped into the pinion, as represented in section in *fig. 4*; consequently, whatever portion of a circle the pinion is made to revolve by the action of the rack, the two ratchet-wheels necessarily do the same. It may not be amiss to notice in this place, that the arbor of the great wheel passes through the barrel which contains the repeating main-spring; and that the barrel is screwed to the under side of the pillar-plate, and is connected with it exactly in the same manner as in the case of the common repeating motion, and its operation is the same; but the barrel arbor is not pivotted between the upper and pillar-plates, as in the case of the common motion, but into the upper plate and the cock *b*, screwed to the pillar-plate; and the connection between both the hammers and the motion is entirely above the pillar-plate, through the medium of the hammer-tails, as will be explained.

The pieces next to be described are the two hammers, and their connection with the motion. The two pivots or centres of motion of the hammers are generally placed at equal distances from the arbor that carries the pinion C, and perpendicular to the plates, and, consequently, parallel to that arbor, and to one another; they are pivotted into the frame, and their upper pivots are prolonged through the pillar-plate, to receive the hammer-tails, L and M: there is a pin planted in each hammer, at a short distance from its centre of motion, which also passes through the pillar-plate, in which there are notches or fits forming portions of circles concentric with the centres of motion of the hammers, for these two pins to pass through, as seen in *fig. 3*; it is by means of these pins 4 and 5, *figs. 1* and 2, which pass into notches, made on purpose to receive them, in the hammer-tails L, M, that these tails, when acted upon by the two ratchets, in their turn act upon the hammers; were it not for this contrivance, the hammer-tails, when impelled by the ratchets, would turn on the pivots of the hammers, as their centres of motion, without raising the hammers. The hammers are kept to their places by the two hammer-springs *v* and *p*, which press against the pins 4 and 5, that pass through the hammers, below the hammer-tails, and as close to the surface of the pillar-plate as they can be, to be free from the surface of the plate: it is by these springs that the hammers, raised by the action of the ratchet-wheels, are impelled forward to strike; and the stronger they are, provided they are not too strong for the power of the main-spring, the louder will be the blow struck. Immediately connected with the hammers are the hammer-tails L, M, through the agency of which the hammers are raised to strike, by means of the two ratchets N and O; these tails require to be extremely well fitted on the upper pivots of the hammers, prolonged through the pillar-plate, which are their centres of motion, though not so tight but that they will move with ease up and down on those pivots; for on this action depends the whole performance of the motion: the part of the hammer-tail, which, by way of distinction, is called the acting lever or pallet, is that against which the teeth of the ratchets act to raise the hammers, the upper ratchet being the smaller of the two; the lever of

the quarter hammer-tail is left as much longer than the lever of the other hammer-tail, as is necessary for it to reach the ratchet. To prevent the hammer-tails, when acted upon by the ratchets, from turning on their centres of motion, there is, as has been noticed in describing the hammers, a notch in each hammer-tail, to receive a pin planted in each hammer, parallel to its centre of motion, and which pin for this purpose is made to pass through a circular notch in the pillar-plate.

The next piece to be described is the cross-piece, or piece K. The surface of this piece, when at rest, is in a plane parallel to the pillar-plate, and the piece moves upon two pivots, which act in holes in the two small cocks *c* and *d*, screwed, the cock *c* to the foot of the cock *b*, and the cock *d* to the pillar-plate YZ. This piece K is maintained in its place, when the motion is at rest, by the end of the little all-or-nothing piece I, which presses against its arm 8, on the one side of its centre of motion, and by the spring *g*, which presses against the under side of its arm 9, on the other side of its centre of motion, causes it to bear against the little all-or-nothing piece I; the hammer-tail L is maintained in its place, depressed, or raised on its centre of motion solely by the action of this piece K; the hammer-tail M is also depressed in the same manner, but is raised on its centre of motion by the spring *u*, the end of which is made to bear on the under side of the hammer-tail for that purpose; and by the power of this spring it is impelled upwards, and made to follow the piece K, when it is raised by the little all-or-nothing piece I, as before described.

The use of the piece K, when the unlocking takes place, is to depress the hammer-tails on their centres of motion, (the prolonged upper pivots of the hammers) to bring them into the same planes as the hour and quarter ratchets N and O, they being, when the motion is at rest, situated considerably above those planes; and as soon as the striking is finished, to raise up again the hammer-tail L, and by relieving the other tail M from its pressure, suffer it to be raised by its spring *u*. For this purpose the arm *g* enters into a groove, made on purpose to receive it in the hammer-tail L, and the arm *6* is made to bear upon the top of the other hammer-tail M. The action of the piece I will be more fully explained presently.

The pieces next to be described are the large *all-or-nothing* piece H, and the little *all-or-nothing* piece I. The upper surface of the piece H is in the same plane, and it is of the same thickness with the piece D, by which it is acted upon: the upper surface of the piece I is on the same plane with the upper surface of the quarter-rack, and as thick as it can be for its under side to be perfectly free from the springs *v* and *p* on the pillar-plate: it is necessarily required to be of a certain thickness, being acted upon by the two pieces E and H. Both the *all-or-nothing* pieces move on studs, screwed into the pillar-plate, which thus become their centres of motion, the piece H on the stud *r*, the piece I on the stud *i*: it is indispensable that these studs should be perpendicular to the face of the pillar-plate, and the pieces perfectly well fitted upon them: it is moreover absolutely necessary that both the *all-or-nothing* pieces should, in all situations, be parallel to the plane of the pillar-plate; on which account, the piece H, being a thin piece, is fixed to a socket, the hole through which socket is perfectly well fitted to the stud, and the stud is left as high as it can be, to avoid touching the under side of the dial. The unlocking is effected by the action of the piece D on the piece H, in the following manner: when the pendant is pushed in to make the watch repeat, the arm *f* of the piece D comes into contact with the hour-stud, and causes

causes this piece D to move on its centre of motion, (*viz.* the screw r); its opposite end is then pressed against the extremity of the *all-or-nothing* piece H, and causes that end of the piece to move in a direction outwards; consequently the other end of the piece H, which presses against the little *all-or-nothing* piece I, is moved inwards: the necessary effect of this motion in the *all-or-nothing* piece H, is, from the shape of the two pieces, to cause the little *all-or-nothing* piece to move outwards from under the arm 8, of the piece K; and this action is called the *unlocking* of the motion. The piece I being thus, by the act of unlocking, disengaged from under the arm 8, of the piece K, this piece K, by the power of the spring g , depresses the hammer-tails, and brings them into the same planes as the two ratchets, and consequently into a situation to be acted on by these ratchets: after the striking is completed, the piece I is returned by the quarter-rack into its former situation, and with it the piece K, and the two hammer-tails necessarily resume their situations. It is to be observed, that the *all-or-nothing* piece H acts upon the little *all-or-nothing* piece I, very nearly at its centre of motion i , and on the end opposite to that which passes under the arm 8, of the piece K.

We come now to describe the wheels that carry the hands, commonly called the dial-work, and their mode of communication, together with the two snails attached to them, which determine the hour and the quarter, or half-quarter, if any, to be struck.

The arbor of the centre-wheel, which makes one revolution in an hour, is prolonged through the pillar-plate, and on this arbor the pinion w is fitted, sufficiently tight to be carried round by the wheel, but not so tight as to prevent its turning on the arbor, the upper end w only of the socket of this pinion is seen in *figs.* 1 and 2, but the pinion is fully represented, in *fig. 5*, detached from the pieces with which it is connected. The centre-wheel arbor is turned with a shoulder to receive the bottom of the cannon-pinion's socket, and for it to bear against, in order to prevent the extremities of its four teeth, that stand parallel to the arbor of the wheel from rubbing on the surface of the pillar-plate: the upper part of its socket, above the dial, is squared to receive the minute-hand, and the hand fits down to the shoulder, formed, by the reduction of the original cylinder, into a square. At the bottom of this pinion's socket is a collar turned out of the same piece, of which the pinion is made, purposely to receive the quarter-snail; and to this collar in the same plane with the quarter-rack, is the quarter-snail G fixed by two screws. This snail is cut into eight steps, by which the number of blows to be struck is regulated: if the arm y reaches the step next the centre, the striking ceases with the repeating of the hour; if it only descends to the next, or second step, the watch, after having repeated the hour, repeats the half-quarter, which is invariably designated by a single faint blow; if it descends to the third step, the quarter only is repeated; if to the fourth step, the quarter and half-quarter; if to the fifth step, the half hour; if to the sixth step, the half hour and half-quarter; if to the seventh step, the three-quarters; and if to the eighth step, the three-quarters and half-quarter. Under the snail is the cannon-pinion, which communicates the motion to the wheel Q of 48, and through it to the hour-hand, and which, from its singular shape, obtains the name of lantern-pinion. This pinion is of a very peculiar construction, and consists of four upright, equidistant, cylindrical teeth, attached at one end to the under side of the collar, and made out of the same piece of steel that forms the socket and collar above-mentioned, as seen in *fig. 5*.

Above the cannon-pinion, and resting on it, is the hour-wheel S, which makes one revolution in twelve hours; and this wheel carries the hour-hand by means of its socket, which fits on the wheel's socket prolonged through the hole in the centre of the dial. To explain the mode by which this wheel is made to perform one revolution in twelve hours, it will be necessary to describe the wheel Q of 48, so called from being cut into 48 teeth; the hour-snail F, with its ratchet P; and the wheel R of communication to the hour-wheel. These four pieces have one common centre of motion, which is a stud x , screwed perpendicularly into the pillar-plate, similar to the studs r and i ; the wheel of 48, to which are attached the other three, is placed as close as it can be to the plate to turn freely. To the centre of the wheel is fixed a long socket, well fitted to the stud, by which means the perfect parallelism of the wheel's plane to the surface of the plate is preserved: from the face of the wheel upwards, equal to the thickness of the hour-snail, this socket is left of a considerable diameter, equal to the hole in the centre of the hour-snail; for on this part of the socket it is that the hour-snail fits, but not so tight as to prevent its turning easily on the socket, while its under side bears on the upper surface of the wheel: above the surface of the snail the socket is reduced in diameter to the size of a common socket. The ratchet P is fastened to the hour-snail by two screws, and thus becomes one piece with it; the centre of the ratchet being cut out a quantity equal to about half its diameter, (see *fig. 6*), and it is so placed on the hour-snail, that the small circle thus cut out is concentric with its centre of motion. The wheel of communication R (see *fig. 6*) forms the last of the four; it fits tight, by a hole through its centre, on the socket of the wheel of 48, and on its under side a collar is left, which fits, but not tight, into the space formed by the cutting out of the centre of the ratchet, and which collar bears on the shoulder of the large socket above-mentioned, that is formed by the reducing it from the size, at which it passes through the hour-snail, to the smaller size: in this manner the hour-snail and ratchet are confined between the wheel of Q 48 and the wheel of communication R. To ensure the snail being carried round once in twelve hours by the wheel of 48, and its being preserved in its relative situation with respect to the hour-hand, so that the hour struck shall accord with the hour shown; and also to ensure the safe bearing of the arm f , of the piece D, on the step of the snail, there is a notch in the thick part of the stud on which the snail is fitted, and a corresponding long slit, commencing at the centre of the snail, and extending nearly to its circumference; in which slit is a straight spring z , that takes into the notch in the socket, (see *fig. 7*); the effect of this contrivance is twofold: first, by the action of the spring in the notch it preserves the snail, when not acted upon by the arm o of the quarter-rack E, constantly in the same situation relatively to the wheel of 48; and secondly, it allows of its being moved on its centre when required, and at the same time regulates the quantity of that motion by the width of the notch in the socket. The case in which the hour-snail is required to turn on its centre, independently of the wheel of 48, is, when the minute-hand having just past the 60^m, and consequently the hour only being required to be struck, there would, without this peculiar additional motion of the snail, be danger of the arm f , which cannot be a line, but must possess width as well as thickness, not coming down safe on the step of the snail it ought to reach, but, by being stopped by the preceding step, of its causing the watch to repeat one hour less than it shews; to prevent this, the arm o , of the quarter-rack, when the watch is made to repeat exactly at the hour, and

WATCH.

for some few minutes after, coming into contact with the ratchet, which is situated in the same plane as the arm *o*, causes it, and also the snail, to advance a sufficient quantity to ensure the safe bearing of the arm *f* on the snail, and consequently the correct striking of the watch: this effect, from the construction of the parts as just described, is produced, without disturbing either the wheel *Q* of 48, or the wheel of communication *R*, and consequently without moving the hands. But it yet remains to explain the mode in which motion is communicated to the hour-hand: the cannon-pinion of four teeth, or pins, revolving with the centre-wheel once in an hour, necessarily causes the wheel of 48, in which it acts, and with it the wheel of communication, to revolve once in $\frac{1}{48}$, or twelve hours; and the wheel of communication acting on the hour-wheel, so called because it carries the hour-hand, is of the same size and number of teeth as itself, and therefore causes it and the hour-hand to make one revolution in twelve hours.

The several parts of the motion and their respective uses being now described in detail, it remains lastly that we describe the general action of the whole.

Let us suppose the watch made to repeat in the usual manner, by pushing in the pendant at the three-quarters and a half-quarter past seven o'clock, the rack *A B*, *fig. 2.* by the pressure of the pushing-piece, is carried forward until its further advance is stopped by the arm *f*, of the piece *D*, reaching the seventh step from the exterior point of the hour-snail *F*; at the same time the rack, by its action on the pinion *C*, winds up to a certain degree the main-spring; and the hour and quarter ratchets *N* and *O*, being attached to this pinion, are carried forward with it, or rather, relative to the shape of the teeth of those ratchets, are carried backwards with it: the piece *D*, necessarily advancing with the rack, being immediately attached to it, disengages the quarter-rack *E*, previously kept in its place by the pin *3*, which quarter-rack being disengaged, is by the power of its spring *b* immediately brought forward after the rack *A B*, until it is stopped by its arm *y*, reaching the quarter-snail *G*; but in this case, the watch being to strike the three-quarters and the half-quarter, the advance of the quarter-rack is almost immediately stopped by its arm *y*, coming against the step, the farthest removed from the centre of the quarter-snail *G*: the instant the arm *f*, of the piece *D*, has, by its pressure against the hour-snail *F*, acted sufficiently upon the large *all-or-nothing* piece *H*, the unlocking is effected. By unlocking is meant that portion of the total action of the motion, every time the watch is made to repeat, which consists in the hammer-tails being set at liberty to descend into the same planes the two ratchet-wheels are in. By the action of the piece *D*, with the *all-or-nothing* piece *H*, which in its turn acts on the little *all-or-nothing* piece *I*, this piece *I* is thrown from under the piece *K*; and this piece *K*, being no longer supported by the little *all-or-nothing* piece *I*, has its two arms *6* and *7*, by which the situation of the hammer-tails, on their centres of motion is determined, depressed by the action of the spring *g*, on its arm *9*, until the two hammer-tails are brought into the same planes as the two ratchets *N* and *O*, and are thus placed in a situation to be acted upon by those ratchets, and through them the hammers. The power of the blows struck by the hammers depends on the strength of the hammer-springs *o* and *p*; which power is communicated to the hammers, by the springs bearing against the pins *4* and *5*, planted in them, which pass through the pillar-plate into the hammer-tails: when by the action of the ratchet-wheels on the hammer-tails the hammers are raised, these pins press against the hammer-springs and continue so to do, thus gradually increasing the power of the springs until the hammer-tail escaping from

the tooth of the ratchet, the hammer is by the strength of the spring suddenly thrown forward, and made to strike. The friction of the running-train and of the parts of the motion, added to the resistance of the two hammer-springs, is the whole power the repeating main-spring has to overcome; and the stronger these springs are, provided they are not too strong for the power of the main-spring, the louder will be the blows struck. The number of the teeth of the ratchets that are brought to act on the hammer-tails, is the same as of the hour to be struck, which are determined by the two snails. The unlocking being thus effected, the act of striking commences; the power by which the repeating main-spring was wound up, being removed, the spring immediately uncoils, and returns into its former state, carrying with it the pinion *C*, the two ratchets *N* and *O*, and the rack *A B*; the hammer-tails *L M*, having been depressed, and from the action of the arms *6* and *7* of the piece *K* upon them, continuing in the same planes with the ratchets, are necessarily acted upon by them, and thus is the striking of the hours and quarters effected. The instant the striking is completed, the rack *A B* continuing to return overtakes the quarter-rack *E*, and by means of its pin *3*, carries it with it: at the moment the quarter-rack begins to move, one of its teeth, which tooth is regulated by the quarter or half-quarter that has been struck, acting on the pallet of the little *all-or-nothing* piece *I*, this piece is brought back to its former situation, and through it the piece *K*, and the hammer-tails; and all the pieces of the motion return by the power of the repeating main-spring, into the same situations they were in before the watch was made to repeat.

The mode by which, in this construction of repeating work, the proper number of quarters, and the half-quarter, if any, as shewn by the hands, is struck, is peculiar to itself, and requires to be particularly explained. The hour-snail and the great ratchet are so proportioned to one another, that, as has been before observed, according to the step on the snail, the arm *f* of the piece *D* descends upon; so is the number of teeth of the great ratchet sent back, previously to the unlocking taking place, to engage as soon as the unlocking shall be effected, in the hammer-tail of the hour-hammer: thus, suppose the watch to repeat *twelve*, the arm *f* descends to the twelfth or lowest step of the hour-snail, and at the same time the ratchets revolve a sufficient quantity for the twelve successive teeth, that act on the great hammer-tail, to come into action: if, on the contrary, the watch were required to strike *one*, the arm of the rack would descend to only the first or exterior step of the snail, and the ratchet would revolve a sufficient quantity for the first only of the twelve teeth to come into action with the hour hammer-tail. It is evident, from the above description of the action of the twelve teeth of the great ratchet that act on the hour hammer-tail, that the three teeth in the same wheel which, conjointly with the small ratchet of four teeth, are employed to strike the quarters, must be so situated relatively to the twelve teeth that strike the hours, that when the watch is made to repeat they will precede those teeth, in their advance towards the hammer-tails; otherwise the quarters would be repeated before the hours; for if the action of these pieces is attended to, it will be seen, that, in the act of winding up the repeating main-spring, as many teeth of the two ratchets will pass under the hammer-tails, as are to act on them before the unlocking is effected: consequently, the tooth that first passes under the hour hammer-tail would be the last to act upon it in returning; and every time the watch is made to repeat, the three teeth of the great ratchet,

ratchet, and the four teeth of the small ratchet, must, by being in advance of the other twelve teeth of the great ratchet, be carried forward, and so situated, if not prevented by some external cause, as invariably to occasion the watch to repeat the three-quarters and half-quarter, after the hour, every time the watch is made to repeat. Such effect is prevented taking place by the action of the quarter-rack: the extremity of this rack is cut into eight teeth; (the acting face only of the first tooth being cut, and the remainder of that tooth left fold, to insure the safe action of the little *all-or-nothing* piece I, when the watch has finished striking,) and these eight teeth correspond with and are proportionate to the eight steps in the quarter-snail; if the hour only is to be struck, the quarter-snail is so situated with respect to the quarter-rack, that the arm *y*, of the latter, descends to the deepest step in the snail, allowing the first tooth of the eight just to pass the flort lever, or, as it is frequently called, *pallet* of the little *all-or-nothing* piece I, and, from the construction of the parts, the quarter-rack is in such a situation, relative to the great rack, that the latter, through the medium of the pin *z*, coming into contact with it, at the instant the last blow of the hour is struck, carries the quarter-rack with it, and causes it to return into its original situation: now the effect produced by the great rack, carrying the quarter-rack back, is, to occasion the latter, by the action of its first tooth on the little *all-or-nothing* piece I, to bring that piece suddenly into the same position it was in before the striking was discharged, and thus to raise the piece K, and consequently the hammer-tails, and to disengage them from the three teeth of the great ratchet that strike the quarters, and also from all the teeth of the small ratchet, which along with the rack-pinion, all now return into their original situation.

We are indebted to Mr. Benjamin Lewis Vulliamy, of Pall Mall, clock and watch-maker to the King and Prince Regent, for this minute description and accompanying plate of the Stocken repeater, which has never before been described, and for which, therefore, we beg to acknowledge our obligation to him.

Elliot's repeating Watch.—A new, cheap, and simple apparatus for repeating the hours and quarters was contrived by J. M. Elliot of Aylesbury-street, Clerkenwell, and published in Nicholson's Journal (vol. vii. 8vo. Series, p. 157.), as being applicable to either clocks or watches. The sketches that are given in the original drawings are not calculated to give a clear conception of the connection of the parts employed; and, therefore, we have given such a new arrangement of the figures, as we trust will enable our readers to comprehend the construction and action of Elliot's mechanism, as applied to a watch. *Fig. 1.* of *Plate XLVII. of Horology*, exhibits the repeating work of Elliot's watch, published in 1804; and *figs. 2, 3, 4,* and *5,* shew the parts detached, with the same letters of reference as in *fig. 1.* In this construction, the usual apparatus of wheels, pinions, chains, pulleys, and racks, are dispensed with; and the acting pieces, instead of being spread over the surface of the upper plate of the frame, are arranged concentrically on the axis of the pendant, which is not pushed in, but made to turn round to the right or left, accordingly as the hours or quarters are required to be struck; either of which may precede, or one only may be struck, at the option of the wearer. A A B, in *fig. 2,* is called the repeating potance, screwed to the upper plate at *x,* in *fig. 1,* and bears the works surrounding the axis of the pendant C D. The portion for striking the quarters, seen in *fig. 3,* is attached to the axis *b;* but the part seen in *fig. 2,* for striking the hours, is on a tube through which the axis

passes, so that each part will revolve separately; a circumstance not adverted to in the original description. The quarter-snail S, in *fig. 1,* with its loose piece, the star-wheel and its hour-snail H, the jumper G, and its spring I, with the dial-work Y, are such as we have already described. But the levers or detents M and N, with their springs *r* and *t,* act here with the circular racks on the common axis of the pendant, thus; the pendant socket D, in *fig. 2,* has a connection with the axis, seen in *fig. 5,* by means of the pin *f,* on the axis, taking hold of its projecting piece *a,* which may be called the hour-pallet; *e* is the hour-locking snail, in *figs. 2* and *4,* with its projecting pin, placed without or beyond the repeating potance, and fixed on a socket that surrounds the axis; on which socket also are fixed the repeating wheel *g,* and its ratchet R, with a spiral spring, exhibited in *fig. 4;* then while the tail-piece *x,* of detent N, of the hour-snail, falls on the proper step of snail *e,* to regulate the number of strokes to be made for the hours, the tail-piece *k,* in *fig. 1,* of the hammer V, is caught by the sloping teeth of the striking-wheel *g,* and raises the hammer under the plate of the frame, that strikes a circular rim of steel surrounding the works, instead of a bell; but before these strokes will be made, the pendant must be turned round by hand gently and regularly, and continued till all the blows are given: this manual turning, therefore, supercedes the necessity of a repeating train of wheels and pinions. The striking mechanism for the quarters is similar in construction to that for the hours, and is seen detached in *fig. 3,* where *l* is the pallet; *m,* the locking-snail, with its projecting pin to be caught by the pallet in the retrograde motion of the pendant; *o,* the ratchet-wheel, and *n,* its spiral spring; and lastly, *p,* the contrate wheel for striking the quarters, by means of the second elongated hammer-tail S, while the hammer has its centre of motion at Z. Thus, when the hours and quarters are both struck by the same hammer, as regulated by their respective snails, the springs *n* and *b,* connected with the concentric snails and their ratchets, bring back the acting parts to their original situations, for repeating the same strokes as many times as may be wished, for the purposes of either utility or curiosity. It may be necessary to notice further, that the rim substituted for a bell has a notch cut into it, to admit the arbor of the pendant to pass without obstruction; and that we give this construction without having seen the watch itself, and, therefore, without making any remark on its merits or demerits, further than that it appears to have the recommendations of simplicity and cheapness.

In the same year and month in which this watch was first described, the inventor presented the model of another repeating watch to the Society of Arts at the Adelphi, an account of which is published in the 22d volume of their Transactions, for which he received their bounty of thirty guineas. We have not given a drawing of this second repeater, as being accessible to all scientific men properly introduced to the Society's rooms, and particularly as the mode of usage it does not differ from what we have just described, so far as the rotatory motions to be given to the pendant, direct and retrograde, are concerned. In this watch the snails for the hours and quarters, the star-wheel, dial-work, jumper with its spring, and locking detents, are nearly the same as in the other; but instead of the striking-wheels, ratchets, and springs, being on the arbor of the pendant, they are placed on a flat circular rim of steel, that revolves, by means of friction-rollers, round the dial-work on the same plane, to about one quarter of a revolution. This rim is indented about a quarter of its circumference, and is actuated by a beveled pinion, placed on the inner extremity of

the pendant's axis, which, by being turned to the right or left, will cause either the hours or quarters to strike first, according to the direction of motion; and pins inserted into the plane of the rim, at the side opposite to the indentation, lift the hammer-tail to strike as many blows as the hour and quarter notches made on the inner edge of the rim, and acting with the second arms of the detents, respectively determine. In this mechanism, a chain wound round a barrel containing a spring, and fixed on the pillar-plate, brings the steel rim back again to its original situation, which entirely depends on the position of the nails.

A patent was taken out for a repeating watch by the same ingenious man, dated 30th October, 1806; but as we have not seen the description thereof, we are unable to say how it differs from either of those which we have just described.

Berrollas' Repeater.—Joseph Anthony Berrollas of Denmark-street, in the parish of St. Giles in the Fields, London, took out a patent for what he calls an *infallible* repeating watch, bearing date 31st October, 1808, of which watch we shall give a brief description in this place. In the plate to which we last referred, *fig. 6.* shews the repeating portion of Berrollas' watch, in a state of action; *fig. 7.* shews the calliper of the common movement, hammer, and ring used for the bell; and the detached pieces of the repeating portion are represented singly in the group of *fig. 8.* Like Elliot, Berrollas founds his pretensions to public approbation on the simplicity of his contrivance, and on the consequent cheapness, where the repeating motion by wheels and pinions is dispensed with, and where one hammer only is necessary for striking both the hours and quarters. Though we have not seen the watch we now undertake to describe, yet as it has some peculiarities in its construction, not quite so intelligible as could be wished in the description given in the Repertory of Arts, vol. xiv. p. 364, we will venture to deviate a little from the author's own account. The outside of the watch resembles common watches, except in the pendant, which is mounted with a button, consisting of two parts, C and X: the lower one, X, does not move, and the upper one, C, having an endless screw annexed to it, turns round and comes out to the extent of four turns, and is cut into four turns and a half. The upper part of the button C, being turned to the right, screws off from the lower part X, and operating upon the hour-rack A, can be continued to be unfreewed until it has struck the hour which the hand indicates, when it cannot be further unfreewed. The same part C, being afterwards screwed to the left, to bring it back again to join the lower fixed part X, operates upon the quarter-rack B, and quarters are struck in the same manner as the hours, until the part C is completely joined to the part X. The piece W draws piece B back to its former station. The motion is composed of three principal parts, A, B, and C: A contains the hour-rack, B the quarter-rack, and C the pendant and endless screw. The piece C, turning on itself, ascends perpendicularly, and is kept in a proper direction by the piece E, which performs two objects. The interior of it forms the catch-work of the screw, whilst the exterior is fixed by two screws on the pillar-plate; and when the piece C is turned, it acts upon the piece A, and gives it a circular motion, first by means of the piece DD, whose interior is caught in the notch at the extremity of the piece C, while the exterior part of it is caught in the piece A; secondly, by the piece F, which holds the piece DD in a groove; thirdly, by the piece G, which is fixed to the pillar-plate with three screws, and under which the piece A is fixed by means of a pivot, on which it moves. The piece A, being thus moved, catches by means of twelve teeth, cut in its in-

terior part, the piece H, which puts in action the hammer Q, that strikes on the bell-spring R, fixed to the pillar-plate S, as seen in *fig. 6.*

The piece A passes under the piece K, which is a brass bar with two screws to keep piece A from rising. In order to give a free and a steady motion to the piece A, it is operated upon by a pivot fastened to a spring U, placed on the inside of the pillar-plate; which pivot, passing through a hole in the pillar-plate, causes a steady friction under the teeth of the piece A. The piece A is regulated by the star N and hour-nail M, in the common way, with a jumper and spring, when the hours are struck; also the quarter-nail P, the quarter-piece B, and its spring O, regulate the same, when the quarters are struck, through the agency of the forked piece J, which is on the same arbor as the tail-piece H and hammer. The tooth V, on the piece A, falls on one of the steps of the hour-nail, and determines the number of strokes for the hours, when A is turned one way round, and the heel-piece of the quarter-piece near P falls on the quarter-nail, when the motion is given to A in the contrary direction, and thus determines the strokes given for the quarters, while two springs keep the tail-pieces H and J in their respective places; one of which springs, L, is seen upon the plate, and the other is fast to the piece K, not seen. Thus the striking in this watch is produced by manual pressure, as is done in Elliot's watches, and the mechanism differs from that at the rooms of the Adelphi Society only in these respects:—that the motion is produced by a screw, instead of a pinion; and the piece A moves round a pivot at the end of the cock G, and instead of being formed into an exact ring to move within friction-rollers.

Alarm, l'alarm, or warning Watch.—The watches which we have above described under the denomination of repeating watches, can be useful only to persons who are awake, and, therefore, do not answer the purpose of giving previous notice of the approach of any particular hour and minute, at which it may be required to be roused from sleep. This purpose is usually effected by a l'alarm clock; but we will now describe how the same thing has been done by some additions to a pocket-watch. We will first describe the former method of adding the warning mechanism to a watch, and then explain the construction lately adopted by Berrollas, and secured to himself by a patent. The old l'alarm watch has been so well described by Berthoud, in the first volume of his "Histoire de la Mesure du Temps," p. 66, &c. that we cannot do better than give a similar drawing and description, after omitting his account of the ordinary movement.

In the frame of the watch a spring-box is made fast to the under side of the upper-plate, and has a great wheel, ratchet, and click, to wind up by; but the winding is performed by the key inserted on the square end of the spring-arbor, while the box remains at rest. When the great wheel is made to revolve by the ratchet, it drives two other wheels and pinions, which, with it, constitute the warning train, and is in every respect similar to a repeating-train, except that there is an escapement-wheel instead of a fly. This train, therefore, will be the more easily understood, from our preceding description of the striking or repeating train. *Fig. 8. of Plate XLVI.* exhibits so much of the warning mechanism as appears on the exterior face of the upper-plate, and will suffice to explain the construction and action of all the essential parts, if we bear in mind that a part of the warning train and the spring-box are within the frame, of which this plate forms the cover. The arbor of the concealed spring-box is seen at A, bearing a finger that acts with three teeth cut in the femicircle of the circular piece F, pivoted

pivoted into the cock G. In the present position, the finger carried by the spring-arbor is resting on the plain or unindented part of piece F, and is keeping the spring to its required degree of tension. When the key for winding is applied to the square of this arbor, the teeth of piece F regulate the number of turns that the spring requires to be wound, before it comes to its due tension for driving the warning-train. The wheel *n*, under the cock H, is on the arbor of the pinion driven, within the frame, by the great wheel, and may be called the second wheel of the warning-train; and the pinion driven by it is on the same arbor as the escapement-wheel R, (pivoted also into cock H,) which is the third or last wheel of the train. The teeth of the escapement-wheel, when put in motion by the main-spring urging it through the train, acts with the two pallets *a* and *b* alternately, which are connected by the portions of two small wheels: that represented by *a* is fast to the square end of the hammer-arbor, concealed in the frame; and the other, *b*, turns on a fixed stud on the plate. The forked piece or angular lever *1*, of the piece *b*, embraces the angular end *d* of the warning-detent *d f 4*, which is moveable at *f*, while the remote end *4* presses on a spiral plate *p*, made fast to the wheel of the hours C, by the action of the spring *g*. Now as plate *p* revolves once in twelve hours, and has only one step at *e*, the end of the spiral, it is obvious that, when this step comes to the angular point *4* of the detent, this point will drop suddenly towards the centre of the hours-wheel, and at the same instant the angular end *d* will quit the fork *1* of the piece *b*, which will now be at liberty to obey the force of the escapement-wheel R, exerted on the pallets *a* and *b* alternately; and the concealed semi-circular hammer, on the arbor of pallet *a*, will strike at both ends alternately against the sonorous ring that produces the warning noise, until the finger of A has gathered up all the teeth of piece F, and is again arrested on the opposite point of the diameter beyond the last tooth. At *x* the piece *b* has a tail-piece, which vibrates between the elastic prongs of the fixed fork P, and thus brings back the hammer after each stroke to the right and left; and the frequency and loudness of these reiterated strokes are competent to rouse any person, not too lethargic, from a state of sleep. A small dial-plate lying over the centre of the watch-face, and divided into twelve hours and parts, is so connected with the spiral-plate *p*, that turning this dial to a pointer, made on the short end of the hour-hand, will put the step *e* into a proper situation for making the point *4* of the detent fall at the time required, and will consequently produce the alarm at the time for which the small dial is thus adjusted.

Warning Watch by Berrollas.—In the year 1810 we find J. A. Berrollas residing in Coppice-row, Clerkenwell, and taking out a patent, on the 26th of May of that year, for a warning watch of a new construction, which we will next proceed to describe; but the description given of this invention in the Repertory of Arts, &c. is so imperfect, at least to us so unintelligible, that we have been obliged to alter both the drawings and explanation, before we could make the mechanical contrivances understood. The reasons which seem to have induced Berrollas to attempt a new construction of a warning watch, were the inconveniences attending winding up, setting to time, and turning the small dial-plate, all which he professes to have obviated. We have shewn the different parts of this mechanism in several figures in Plate XLIV., which we shall now proceed to explain in our own way. In fig. 10, *a* shews the place of the main-spring, and *b* the fusee of the ordinary works, which are constructed in the common way, but which are not seen in fig. 11, that represents an elongated section of

the warning mechanism and dial-work only. At *c* is the arbor of the warning-spring box, of the great wheel of 60 teeth, and of a ratchet-wheel, which is made of steel with 33 teeth, that catch the tail of the hammer *d*, and make it strike against the circular rim of steel, while the spring *e* brings back the hammer after each stroke. This part of the mechanism is not given in the original drawings, nor yet fig. 11, which explains the action. As the strokes are made by a wheel on the arbor of the spring-box, it was necessary that it should wind five times round, that the blows might be sufficiently numerous and loud for giving the alarm: hence 165 (33 × 5) strokes are given at once winding, and the first is the loudest, as being urged by the warning-spring, without a fusee, at its greatest degree of tension; an advantage which the inventor seems to have overlooked in his own account. These parts, and also the pinion *f*, are planted within the frame, as seen in fig. 11; but the parts shewn in figs. 9, 13, and 14, are on the exterior face of the upper-plate, agreeably to the calliper given in fig. 9, but acting together, as more clearly represented in fig. 11, where the pivot-holes are supposed to be in a right line, for the sole purpose of explanation. The arbor of pinion *f* ascends through the upper-plate of the frame, and has the wheel *g* attached to it, which drives a second pinion on the arbor of an escapement-wheel *h*; which two wheels are pivoted above into a long cock, screwed to the upper plate; all which positions are clearly seen in fig. 11, as well as the mode by which the motion and force are transmitted from the main-spring *c* to the pallets *i*, *i*. The wheel *g* has 45 teeth, the escapement-wheel 20, and the two pinions each six leaves. This assemblage of wheels and pinions constitutes the warning-train; but the warning detent, on which much stress is laid by the inventor, remains yet to be described. This detent *k* is seen in two detached positions, in fig. 14, where the parts 1, 2, and 3, are taken off, to render their uses more obvious. The dial-work consists of a cannon-pinion of 12 leaves, the wheel *q* of 36 teeth on the stud, its pinion *r* of 10, and the hours-wheel *n* of 40, which are

common numbers, that may be thus expressed: $\text{viz. } \frac{36}{14} \times \frac{40}{10} = \frac{1440}{120} = 12$. Between the hours-wheel and the

cannon-pinion the ring of the detent *k* surrounds the arbor of the centre-wheel, or rather the tube of the cannon-pinion, but not so as to be tight upon it: on the hours-wheel *n* is a pin projecting above and below its plane, as seen in fig. 13, against which pin the rim of the said ring is pressed by the spring *t*, as seen in fig. 9. Now as the screw 1 takes into the cock 3, made fast to the plate, after it has passed through a hole in the lever of the detent, this screw becomes the centre of motion of the detent, and the pressure of the spring *t* at one end elevates the ring at the other, and with it the perpendicular bar *l*, which reaches to the teeth of the escapement-wheel *h*; so that when the elevation of this bar *l* exceeds the plane of the escapement-wheel, the train will be at liberty to run on, and the hammer will be made to strike a repetition of blows; but while the elevation of the said bar *l* lies in the same plane with the teeth of the escapement-wheel, it will operate as a detent to the train, and silence will be preserved. Above the hours-wheel *u*, and on its tube, revolves a large additional wheel *m*, bearing a circular piece of steel, with an oblong notch cut through it, as seen in fig. 13; and the pressure of the upper end of the pin in the hours-wheel is against this circular steel piece at all times, except when it arrives at the said notch, and then it ascends into it by the downward action of the

WATCH.

spring t , beyond the centre of motion i ; and at this instant the bar l , ascending also, quits the teeth of the escapement-wheel, and suffers the alarm to commence, and to continue until the warning-spring is relaxed. It does not, however, appear by what means the pin of the hours-wheel is disengaged from the oblong hole in the steel circle of wheel m , when the blows of the hammer are finished, unless the second edge of the slit be made sloping; and its continuance there must obviously stop the watch, by preventing the free progress of the hours-wheel. Either the mechanism or the original description must be defective in this part. Within the ring of the pendant is a button, in form of an acorn, which constitutes the head of a steel arbor, terminating with a pinion s , that actuates a contrate-wheel o , which has teeth also on the edge, that drive the double pinion p ; the upper portion of which pinion again impels the large wheel m , that carries the small hand, and also the circular piece of notched steel. This train is introduced for the purpose of setting the warning-hand, which is the shortest of the three seen in *fig. 12*, to the requisite hour on the small fixed dial, without opening the case, and deranging the other hands for shewing hours and minutes in the usual way. At the bottom of the acorn there is a small ratchet-wheel, with a click and spring, seen detached between *figs. 11* and *14*, the use of which is to allow the acorn to turn only in one direction, while the warning-hand is set to its place. It is a condition to be observed in setting the hour-hand, that it lie exactly over the pin in the hours-wheel, and also that the warning-hand lie parallel to the slit of the steel circle, attached to the wheel m . Lastly, the warning mechanism may be put into a state of action, or of inaction, by moving the button v , in the case, to the right or left, so as to fall in the way of the end of the detent k , or to escape it.

Rolling Watch.—After having described various constructions of watches adapted for the pocket, and contributing to the punctuality with which social intercourse is carried on in civilized life, we proceed lastly to describe the mechanism of a watch, which will measure time only by its descent down an inclined plane, and which therefore is more curious than useful. During the time that various experiments on the laws of moving bodies were made, and applied to the regulation of horological machines by Dr. Wallis, sir Christopher Wren, Dr. Hooke, Huygens, Leibnitz, Dr. Halley, sir Isaac Newton, and others, M. de Gennev and the marquis of Worcester contrived watches, the former of which would *ascend*, and the latter *descend* along an inclined plane, by means of a spring coiled up at the centre of the frame, which relaxed as the rolling motion proceeded; but as no explanation had been given of these contrivances in the year 1684, Mr. Maurice Wheeler published an account of a rolling watch, invented by him, in the first volume of Lowthorp's Abridgment of the Philosophical Transactions of London, p. 468, et seq., which account has been copied into other works of science; but which we will abridge, agreeably to our own plan of description. In *fig. 15. Plate XLIV.*, let ab be the diameter of the circle $afbb$, standing on the dotted horizontal base bm , on the point b . In this situation, supposing the circle to be an uniform plate of metal, it will remain at rest when placed truly vertical, while the line bm remains horizontal; but make this line to coincide with the inclined line nb , and the circle will roll down this inclined plane, because the vertical line, or line of direction, de , raised from the point d , which will be the new point of contact, falls behind e , the centre of gravity of the uniform circular plate; so that the portion efd becoming smaller than the portion ebd , the cen-

tre of gravity will be before the bearing point d , and the plate will roll down the plane; and the motion thus produced will have the greater velocity, the more the plane nb is inclined to the horizontal line. But if such a piece of metal g be attached to the portion efd as will form a counterpoise therewith to the larger portion ebd , then the plate will have no tendency to roll, but become stationary, so long as the inclination of the plane, and the position of the additional piece g , remain unaltered; but lessen the angle of inclination, or remove the weight g towards f ; and, in either case, the plate will actually ascend, till the weight g , in its new position, balances the new angle of inclination. Also, if the angle be increased, or the weight g be brought nearer to d , in either case the plate will descend; but as the descent of the plate down the increased inclination, by a rolling motion, throws the weight g farther from the point of contact d , the rolling motion will stop as soon as the retrograde motion of the weight shall have produced a counterpoise to the portion ebd of the plate in the new inclined plane. These premises being granted, we are now prepared to show how the train of a watch in motion may be made to change the position of an appended weight in such way as to render that weight a maintaining power during the whole time that a cylindrical box, which contains the weight and movement, shall gradually and slowly descend down a corresponding inclined plane, while a pendulous hand or index shall point out the successive hours and parts during the said descent. Let the four wheels and pinions, shewn in *fig. 17*, be placed like the common train of a watch, with the arbor α of the great wheel in the centre of the box, and conceive a balance and escapement to allow one tooth of the last wheel to escape at every alternate oscillation of the moving balance; then let the weight w , at the end of the lever ω , be made fast to the said arbor at the hole π , *fig. 16*, as is seen in *fig. 17*; and let its position be between d and f ; and the tendency of the weight w to come to d , will draw round the great wheel, pivotted to the ends of the box, and give such motion to the train as will keep up the oscillations of the balance; but this motion of the great wheel will be so slow, that it will be scarcely perceptible when the angle of inclination is small; but increase this angle, or alter the position or the magnitude of the weight, and the force will be increased by which the train is actuated; so that by one alteration or other, or all, such a final adjustment may be made, that the box will revolve exactly in twenty-four hours. But before this can be duly effected, the train of wheels must be counterpoised by a load, attached to the box at the opposite side of the centre, so that there may be one common centre of gravity of all the materials, exclusive of the weight w , falling in every position of the box, at the centre of motion of the weight w ; *i. e.* at the arbor of the great wheel round which the box revolves. When this is the case, and the angle of elevation of the plane is nicely adjusted by a screw A , as in *fig. 18*, the regulated train of the watch will allow the weight w to approach d , just as fast as the rolling motion of the box will throw it back, and the equipoise of these two contrary actions of gravity, and of the rotation of the box produced thereby, will keep up an uniform slow motion down the inclined plane. In some constructions detailed in the "Recueil d'Ouvrages curieux de Mathematique et de Mechanique; ou Description du Cabinet de Monsieur de Serviere," à Lyon, 1733, the hours are drawn on the face of the inclined plane, and indicated by the point of contact of the box; but in the watch before us, one end of the box contains the figures from 1. to XII. twice over, and a pendulous hand, made heavy below, and revolving loosely on the pivot of the great wheel,

always

always points upwards to the passing hour, as represented in *fig. 18*.

In the work of which we have just given the double title, there are various devices for making balls descend on spiral and zigzag planes in a given time, which are again elevated by a spring, and which indicate the time by the number of their descents; but these matters of curiosity are no longer useful as horological machines in the present state of the science of horology.

Musical Watch.—The works of a watch may be applied moreover to give motion to various devices and pieces of machinery, at the same time that the watch performs its own operations; such as actuating the handle of a planetarium, or orrery, exhibiting the motions of any of the celestial bodies by means of its dial-work, or urging the barrel of small musical chimes; but after the detailed accounts we have given of *PLANETARY Machines*, it will only be necessary here to explain how a tune may be played by a musical watch, from which our reader will perceive that the application of similar means to other amusing purposes is equally practicable. In *Plate XLII. of Horology, fig. 4*, exhibits, on an enlarged scale, the internal disposition of a watch-movement, as seen on the pillar-plate from above, when the other plate of the frame is removed, and the watch laid down on its face; the pillars being supposed to be at the circles N, N, N, and N; the box A contains the main-spring; B is the fusee, with the chain or cord winding round it, as it comes from the circumference of the said box; D is the great wheel, and within it are the ratchet, click, and spring, as usual; E is the pinion of the centre wheel, or hour-wheel, F, and is driven by the great wheel as soon as the main-spring is wound up; G is the pinion on the arbor of the second wheel, and is driven by F; and H, that revolves in the same time with the pinion G, is the third wheel, which wheel again actuates a pinion, I, on the arbor of the fourth wheel, K; which here is not a contrate-wheel, because the balance-wheel I is made for the cylinder escapement, which we described under the article *ESCAPEMENT*, N^o 8. The arbors of these wheels and pinions pointing upwards to meet the eye, appear only in plan; and the dial-work, lying under the plate, is concealed from view. The parts done only in outline exhibit the calliper of the watch, independently of the musical train, barrel, spring, and other appendages, which are *shaded*, for the purpose of distinguishing this portion from the ordinary movement of the watch. In this figure, the calliper of the musical train and spring-barrel may be observed to lie on one side of the frame; but the mode of their action will be better explained by *fig. 5*, which is a section of the frame, in which the calliper is so altered into a straight line, for the purpose only of explanation, that the effect to be produced may be clearly comprehended. In both the figures, 4 and 5, the great wheel attached to the spring-barrel is denoted by the unit 1, and the wheels that follow, with their respective pinions in the musical train, are denoted by 2, 3, 4, and 5, till we come to the regulating fly, 6, placed on the arbor of the last pinion. This fly performs the same office as in the striking part of a clock, or repeating train of a watch; that is, it regulates the velocity with which the main-spring shall unbend itself, and give motion to the barrel in which it is contained; so that if a quick motion be required, a few wheels and pinions only are necessary, and a light fly; but when the motion is required to be slow, there must be a longer train, or a heavier fly, proportioned to the strength of the main-spring. The interior end of the spring is, as in the common main-spring boxes, hooked to a pin on the arbor *d*, and the exterior end

to the side of the box, so that turning the arbor *d* round by a key, coils the spring into its state of greatest tension, which is adjusted by the notched piece, or ratchet, *e*, which is held to its place by the click and spring in the usual way, as represented in *fig. 6*. Upon the rim or cylindrical side of the box *a*, containing the main-spring, are inserted various pins in parallel lines, but at unequal distances, according to the frequency of the occurrence of the respective notes to be sounded by the corresponding prongs of the forked piece of steel *b c*, in any given tune which is to be played; and the number of prongs must be equal to the number of musical tones and semi-tones to be produced. In the drawing before us the fork has eight prongs, and the notes are produced by the catching of the pins, inserted into the revolving barrel, on the ends of the prongs, which are elastic and tapered, as well as tempered, to produce the requisite succession of tones that are required in the tune to be performed.

The upper pivots of all the arbors of the musical train are callipered in the cock *b h*, while the lower pivots have their holes on the pillar-plate; and upon this cock *b h* the bent detent, or double lever *f e*, with a hook at *e*, is placed so as to be moveable round a screw at the angular point in the middle: the hook of this detent is kept close to the revolving barrel by the pressing spring *i*, and when the tune is finished, a hole is caught on the side of the barrel, free from the pins, by the hook *e*, which flays the motion till the button *g*, in the case of the watch, is pushed in against the tail-piece of the detent, and frees the hook again from its hole, when the tune is repeated nearly in the same manner that chimes are usually performed. (See *CHIMES*.) The parts drawn in perspective in *fig. 6*, represent a construction in which the elastic prongs of the musical fork are bent into a curve, so as to occupy less space than in *fig. 4* and *5*, or to produce more powerful tones where the space will admit of an enlargement of their dimensions. But instead of a barrel containing the main-spring, sometimes a cylinder, A, revolving in the cocks *o* and *p*, contains the pins, as is seen in *fig. 7*, where a pinion on the projecting arbor of the cylinder is actuated by the great wheel attached to the spring-box; and this construction is best calculated for a fork with more tones, and consequently for a tune of greater compass. *Fig. 8* shews how the prong of the fork is caught by the pins in succession, and *fig. 9* explains how a number of double-pronged forks, *b c*, are separately screwed into a frame, *k*, where the difference in the tones is produced by a corresponding difference in the dimensions of the prongs. The hole in which the hook *e* falls is here in the end of the cylinder, but the motion is not stayed thereby; for the slender spring, pressing against it, lays hold of the fly-pinion, when it follows the detent, and thus stops the part that has the greatest velocity, and least power; whereas considerable strain takes place on the barrel when its motion is stopped by the hook of the detent, as in *fig. 4* and *6*. The arrangement in *fig. 4* is best suited for a small watch, but does not produce the most audible tones; and is that which is usually concealed in the Swiss musical seals, that have been lately introduced into England: but the cylinder in *fig. 7* is that which the musical boxes contain, and which, from its length, is capable of containing two tunes, as well as notes on both the treble and bass clefs. When the elastic prongs are tempered, they are brought to an exact musical scale by grinding with oil-stone dull, and the prongs that require to have their tones much flattened, are made more slender at the end most remote from the cylinder or barrel, where their resistance to motion is diminished, so that the vibrations are rendered less frequent, and the tones less acute. When a

WATCH.

found tune is played, the cylinder is pushed into and held in a new situation, as in a barrel-organ.

WATCH-Maker is a term that might originally denote the maker of a watch out of the rough materials; but this was the case only in the infancy of the art; for when the demand for pocket-watches became so great as to render the manufacture an object of commerce, the consequent division of labour was soon found to facilitate the execution; and each branch of the trade had its appropriate tools and artificers; so that thousands of families have at length been employed and maintained by their respective manipulations, without interfering with the business of their neighbours, who are equally occupied in their respective departments. In this art, the materials are of very little value in their original state; but the workmanship is so various, and requires such delicacy in the management, that, as has been stated to a committee in the house of commons, materials that did not cost sixpence in the state of ore, have been and frequently are manufactured into a watch that is worth 100*l.* and upwards. This view of the subject induced ministers to withdraw their projected plan of taxing watches, as being, in fact, a tax on ingenuity and industry.

We have anticipated much of the subject of watch-making under the articles we have already referred to in horology, for a watch may be considered as a spring-clock in miniature; and what we have said about calculating, calipering, making, and adjusting the various portions of a small clock, is therefore equally applicable to a watch, except that the balance must be substituted for the pendulum. It may gratify the curiosity of our readers, however, to explain how the labour, we have adverted to, is divided and subdivided into various branches of manufacture; and how persons situated at different parts of the kingdom conspire, without any mutual knowledge of each other, to bring this small piece of mechanism into its finished state.

The best watch-movements are made at Prescot, in Lancashire, by persons called movement-makers, who furnish the movement complete to the London watch-makers.

The following is a list of the principal workmen employed in manufacturing a movement, previously to its coming into the hands of the London watch-maker.

1. The frame-maker, who makes the frame; that is to say, the two plates, the bar, and the potance.
2. The pillar-maker, who turns the pillars, and makes the stud for the stop-work.
3. The cock-maker, who makes the cock and the stop-work.
4. The barrel and fusee-maker, who makes the barrel, great wheel, fusee, and their component parts.
5. The going fusee-maker, who makes the going fusee, (the means by which the watch is kept going while winding up,) when made use of.
6. The centre wheel and pinion-maker, who makes the frame.
7. The small pinion-maker, who makes it of wire, previously drawn by another workman, called pinion-wire; the third and fourth wheels, and escapement-wheel pinion; and in the case of repeaters, the pinions of the repeating train of wheels: these are all finished in the engine.
8. The small wheel-maker, who makes the third and fourth wheels, and the wheels of the repeating train for repeating movements, and rivets them to their pinions.
9. The wheel-cutter, who cuts the wheels.
10. The verge-maker, who makes the verge of vertical watches.
11. The movement-finisher, who turns the wheels of a proper size previously to their being cut, forwards them to

and receives them from the wheel-cutter, examines all the parts as they are made, to see that they are as they should be; and finally completes the movement, and puts it together.

12. The balance-maker, who makes the balance of steel or brass.

Note.—The brass balance is preferred to the steel balance by some watch-makers, in consequence of the latter being subject to the influence of magnetism: but others prefer the steel to the brass balance, in consequence of the latter being more influenced by variation of temperature than the former.

13. The pinion wire-drawer, who prepares the pinion-wire; this, however, may be considered as only a branch of the trade of wire-drawing.

The plates and wheels are now all made out of rolled brass; but formerly, when it was to be had, they were made of Dutch brass, it being considered preferable to the English.

The movement, in the state in which it is sent to the London watch-maker, consists of the frame, composed of two plates, connected together by four or five pillars, as the case may be, which pillars are riveted to one of the plates, called the pillar-plate; the wheels, consisting of the great wheel attached to the fusee, the second or centre wheel, the third and fourth wheels, the fusee and barrel, potance and stop-work, which latter are attached to the upper plate, (so called in contra-distinction to the pillar-plate,) but the potance screwed to it is between the plates; and lastly, the cock ferred to the outside of the upper plate.

The following is a list of the principal workmen employed on a watch to complete it from the state in which the movement is received from the country.

1. The slide-maker, who makes the slide.
2. The jeweller, who jewels the cock and potance, and, in a more forward state of the watch, any other holes that are required to be jewelled.
3. The motion-maker, who makes the brass edge; and, after the case is made, joints and locks the watch into the case, and makes the motion-wheels and pinions.
4. The wheel-cutter, who cuts the motion-wheels for the motion-maker.
5. The cap-maker, who makes the cap.
6. The dial-plate maker, who makes the dial.
7. The painter, who paints the dial.
8. The case-maker, who makes the case.
9. The joint-finisher, who finishes the joint of the case.
10. The pendant-maker, who makes the pendant.
11. The engraver, who engraves the name of the watch-maker on the upper plate; and also engraves the cock and slide, or index, as the case may be.
12. The piercer, who pierces the cock and slide for the engraver, and afterwards engraves them.
13. The escapement-maker, who makes the horizontal, duplex, or detached escapements; but the escapement of a vertical watch is made by the finisher.
14. The spring-maker, who makes the main-spring.
15. The chain-maker, who makes the chain.
16. The finisher, who completes the watch, and makes the pendulum-spring, and adjusts it.
17. The gilder, who gilds the watch.
18. The fusee-cutter, who cuts the fusee to receive the chain, and also balance-wheel of the vertical escapement.
19. The hand-maker, who makes the hands.
20. The glass-maker, who makes the glass.
21. To these must be added the pendulum-spring wire-drawer,

drawer, who draws the wire for the pendulum-springs, which is almost a distinct trade.

The above are the principal workmen employed in the manufacture of a plain watch; in the manufacture of a repeater, the same workmen are employed, with the addition of the repeating motion-maker, in the place of the maker of the plain motion, who makes the brass edge and motion, and joints and locks or fixes in, which ever way it is done, the watch into its case; and when the repeater is made to strike on bell-springs, the motion-maker makes the springs. Formerly, repeaters were made to strike what was termed dumb; that is to say, a dead blow against the case or cap, or else on a bell, which bell was made by a separate workman, entitled the bell-maker. But the bell-springs have now entirely superseded the old bells. The same spring-maker who makes the main-spring of the watch, also makes the main-spring of the repeating train of wheels.

The springs of a hunting-case are made by a separate workman, called a secret spring-maker. Single cases (not hunting-cases) are frequently made to open with springs: pairs of cases (the old-fashioned box and case) are sprung, lined, and polished by a workman called a springer and liner; the better description of single cases and hunting-cases are polished by a person simply called the polisher: this is sometimes done by women, particularly by the wives of some of the case-makers; and this is the only branch of the trade, probably, in which women are employed in this country.

The compensation-balances for chronometers are sometimes made by the escapement-maker, and sometimes by a separate workman, who confines himself entirely to making compensation-balances.

Plain watch-movements are made of all prices, from 2s. 6d. to 2l. 12s. 6d.; but repeating movements cost from 2l. to 4l. 4s. each, according to their quality. There are many inferior movements, made as low as 21s. a dozen. The lowest prices at which the movements called Lancashire movements are sold, is 7s. for plain, and 2l. 10s. for repeating movements.

The principal London watch-makers order the movements, as above described, of the movement-makers of Prescot, who make them according to the callipers they receive from each maker with their orders. But the ordinary description of movements may be purchased at most of the watch-tool shops in London; one of the chief of which is Fenn's, N° 105, Newgate-street, where every description of clock and watch-makers' tools and engines may also be procured at moderate prices.

At and near Geneva, but chiefly at Locle and Chaux de Fond, in the principality of Neuchâtel, the Swiss watches are manufactured in great numbers. In these manufactories women are very generally employed, and the subdivision of labour is carried still further than in our's; and this concurs with the poverty of the workmen, and other causes, to render these watches cheaper than the English manufacturers can make them. The Swiss watches have accordingly supplanted the English in many countries of Europe. In general, the workmanship of the Swiss watches is exceedingly slight.

WATCH-Making is the art of making watches. See WATCH-Maker.

WATCH-Tools are the tools with which watches are usually made, such as vices, pliers, files, hammers, drills, gravers, turning-tools, broaches, turn-benches, balance-tools, spring-tongs, gauges, spring-tools, fusee-adjusting tools, pitching-tools, callipers, crew-plates, burnishers, wire-nippers, crew-drivers, and various others, which would require several

plates to represent them, but which greatly resemble the clock-tools that we have described and explained by a reference to Plates XIX., XX., and XXI., of *Horology*.

WATCH-Glafs, the concavo-convex portion of a glass-sphere usually employed to cover the dial of a watch. The spheres out of which the watch-glases are cut are blown of various dimensions, according to the degree of convexity required: the edges are then ground to fit the groove of the cover of the watch-case. There is a superior description of watch-glases, technically called *bottoms*, which are not portions of spheres, but are flat on the top, the edges only being concave. Each of these is cut from a separate piece of hollow glass, blown in the shape of a cone, of which the watch-glass forms the bottom; whence it takes its name. The waste of glass is, therefore, considerable, and the flat glases are consequently much more expensive than the spherical. The method of converting a circular piece of plain glass into a concave, by a heated convex piece of iron, as recommended by Boyle, (see Works Abr. vol. i. p. 135.) is no longer practised in the construction of watch-glases; but large convex glases for clock-faces are frequently made in this way.

WATCH and Ward, in *Law*, constitute one of the principal duties of constables, who, by the statute of Winchester, 13 Edw. I. cap. 4., are appointed to keep watch and ward in their respective jurisdictions. Ward, guard or *custodia*, is chiefly intended of the day-time, in order to apprehend rioters, and robbers on the high-ways; the manner of doing which is left to the discretion of the justices of the peace and the constable; the hundred being, however, answerable for all robberies committed therein, by day-light, for having kept negligent guard.

Watch is properly applicable to the night only (being called among our Teutonic ancestors *wacht* or *wachta*), and it begins at the time when ward ends, and ends when that begins; for, by the statute of Winchester, in walled towns the gates shall be closed from sun-setting to sun-rising, and watch shall be kept in every borough and town, especially in the summer season, to apprehend all rogues, vagabonds, and night-walkers, and make them give an account of themselves. The constable may appoint watchmen at his discretion, regulated by the custom of the place; and these, being his deputies, have for the time being the authority of their principal. Blackst. Com. book i.

WATCH Point, in *Geography*, a cape on the E. coast of Rhode island. N. lat. 41° 13'. W. long. 71° 50'.

WATCHER, NORTH, or *Seven Islands*, a cluster of small islands, in the straits of Macassar, near the W. coast of Celebes. S. lat. 0° 27'. E. long. 110° 33'.

WATCHER, South, a small island in the straits of Macassar, near the W. coast of Celebes. S. lat. 0° 3'. E. long. 110° 24'.

WATCHET, an ancient borough, market, and sea-port town, in the parish of St. Decumans, hundred of Williton and Freemanors, and county of Somerset, England, is situated in a fruitful vale on the verge of the Bristol channel, at the distance of five miles E. from Dunster, 20 miles W. from Bridgewater, and 157 miles W. by S. from London. In the year 918, the Danes under Ochtor and Rhoad landed here, but were attacked by the inhabitants, and routed with immense slaughter. The scene of this victory is marked by three large barrows, called Grab-barrows, in which have been discovered several cells, containing human bones, and a variety of weapons anciently used in war. In 987 the Danes returned, and succeeded in laying waste the town, but did no further injury: about ten years afterwards they made a third descent; and in order to

remove

remove every obstacle to a future landing, they set fire to the houses, and put nearly all the inhabitants to the sword. This place was one of the villis conferred by William the Conqueror on sir William Mohun, as an appendage to the castle of Dunster. The town of Watchet is now composed of four streets, mostly paved, and containing about 140 houses. It was formerly a place of considerable trade, and had a very large fishery; but now very few vessels belong to the port, and the trade is limited to a trifling freightage of coal, kelp, alabaster, and lime-stone. In the time of queen Elizabeth the harbour was cleaned out, and a pier built at the expence of the Wyndham and Luttrell families, then joint lords of the manor: this pier was repaired at the beginning of the last century, by the care of sir William Wyndham; and a duty granted by parliament on all goods imported, has been applied to making good the expence of further reparations. Two fairs are held annually, and a market weekly on Saturdays. The population, in the return of the year 1811, was included in that of the parish of St. Decumans, which comprehends the town of Watchet, the village of Williton, (whence the hundred derives its name,) and the hamlets of Orchard, Donniford, Kentsford, and Stream, and was then stated to contain in the whole 345 houses, and 1659 inhabitants. The church of this parish, which stands on an eminence about a mile to the south of Watchet, is a handsome structure, a hundred and eight feet in length, and forty-eight in breadth, and consists of a nave, two side aisles, and a chapel, with an elegant embattled tower, eighty feet in height at the west end: in the north aisle are several monuments in memory of the Wyndham family.—Collinson's History and Antiquities of Somersetshire, 4to. 1791.

WATCHING. See SLEEP.

WATEEOO, in *Geography*, an island in the South Pacific Ocean, discovered by Capt. Cook in March 1777; lying in S. lat. 20° 1' and E. long. 201° 45'; about six leagues in circumference. It is a beautiful spot, with the surface varied by hills and plains, and covered with verdure. Some gentlemen who landed from Capt. Cook's company, found the soil where they passed the day to be light and sandy. But farther up the country, where a different sort perhaps prevails, was seen from the ship, by the help of glasses, a reddist cast upon the rising grounds. There the inhabitants have their houses; for they could perceive two or three which were long and spacious. Its produce, with the addition of hogs, was the same as that of *Mangeea*, which they had last visited. (See MANGEEA.) From cir-

cumstances that are recited, it appears that Wateoo can be of little use to any ship that wants refreshment, unless in a case of the most absolute necessity. The natives, knowing now the value of some of our commodities, might be induced to bring off fruits and hogs, to a ship standing off and on, or to boats lying off the reef. It is doubtful, however, if any fresh water could be procured: for, though some was brought in cocoa-nut shells to the gentlemen, they were told that it was at a considerable distance, and probably it is only to be met with in some stagnant pool, as no running stream was any where seen. The manners of these islanders, their method of treating strangers, and their general habits of life, appear to be much like those that prevail at Otaheite, and its neighbouring isles. Their religious ceremonies and opinions are also nearly the same. The language spoken at Wateoo was equally well understood by Omai, and by two New Zealanders. What its peculiarities may be, when compared with the other dialects, Capt. Cook was not able to point out. The natives of this island sprung originally, without doubt, from the same stock, which has spread itself so wonderfully all over the immense extent of the South sea; though from a circumstance mentioned by Omai they put in their claim to a more illustrious extraction; for they dignified their island with the appellation of "Wenooa no te Eatooa," that is, a land of gods, esteeming themselves a sort of divinities, and possessed with the spirit of the Eatooa: and this notion Omai informed our voyagers was entertained by some at Otaheite, and prevailed universally amongst the inhabitants of Mataia, or Oinaburg island. It appears that Omai, on landing in this island, found three of his own countrymen, natives of the Society islands; one born at Matavai in Otaheite, another at Ulietea, and the third at Huahine. By them he was informed, that about twenty persons, of both sexes, had embarked on board a canoe at Otaheite to cross over to the neighbouring island Ulietea; but they were driven by a storm far from their course, and having exhausted their stock of provisions, they passed many days without food or drink. Many of them fell victims to famine and fatigue, and four only survived to reach this island at the distance of 200 leagues from their native abode, by the inhabitants of which the survivors, clinging to their canoe which was overfet, were rescued from their danger and distress, hospitably received, and treated with so much kindness, that the three who remained, and who had lived on this island above twelve years, had no inclination to return, though an opportunity now offered itself for this purpose.
